Technical and Bibliographic Notes/Notes techniques et bibliographiques

The Institute has attempted to obtain the best original copy available for filming. Features of this copy which may be bibliographically unique, which may alter any of the images in the reproduction, or which may significantly change the usual method of filming, are checked below.

L'Institut a microfilmé le meilleur exemplaire qu'il lui a été possible de se procurer. Les détails de cet exemplaire qui sont peut-être uniques du point de vue bibliographique, qui peuvent modifier une image reproduite, ou qui peuvent exiger une modification dans la méthode normale de filmage sont indiqués ci-dessous.

The copy filmed here has been reproduced thanks to the generosity of:

Library of the Public  
Archives of Canada

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last page with a printed or illustrated impression, or the back cover when appropriate. All other original copies are filmed beginning on the first page with a printed or illustrated impression, and ending on the last page with a printed or illustrated impression.

The last recorded frame on each microfiche shall contain the symbol  $\rightarrow$  (meaning "CONTINUED"), or the symbol  $\nabla$  (meaning "END"), whichever applies.

Maps, plates, charts, etc., may be filmed at different reduction ratios. Those too large to be entirely included in one exposure are filmed beginning in the upper left hand corner, left to right and top to bottom, as many frames as required. The following diagrams illustrate the method:

L'exemplaire filmé fut reproduit grâce à la générosité de:

La bibliothèque des Archives  
publiques du Canada

Les images suivantes ont été reproduites avec le plus grand soin, compte tenu de la condition et de la netteté de l'exemplaire filmé, et en conformité avec les conditions du contrat de filmage.

Les exemplaires originaux dont la couverture en papier est imprimée sont filmés en commençant par le premier plat et en terminant soit par la dernière page qui comporte une empreinte d'impression ou d'illustration, soit par le second plat, selon le cas. Tous les autres exemplaires originaux sont filmés en commençant par la première page qui comporte une empreinte d'impression ou d'illustration et en terminant par la dernière page qui comporte une telle empreinte.

Un des symboles suivants apparaîtra sur la dernière image de chaque microfiche, selon le cas: le symbole  $\rightarrow$  signifie "A SUIVRE", le symbole  $\nabla$  signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être filmés à des taux de réduction différents. Lorsque le document est trop grand pour être reproduit en un seul cliché, il est filmé à partir de l'angle supérieur gauche, de gauche à droite, et de haut en bas, en prenant le nombre d'images nécessaire. Les diagrammes suivants illustrent la méthode.

**N**otwithstanding the various and extensive Information relative to Foreign Countries, communicated by different Authors, no work has hitherto been published, that comprises an Account of the Universe upon such a Plan as is calculated to convey an adequate Idea of the Subject. Books of Travels and Voyages, though the great Repositories of useful Observation, generally abound with tedious and uninteresting Details, which, at the same time that they preclude the Entertainment of the Reader in one of the most delightful Provinces of human Enquiry, never fail to excite such a Disgust, as, if it does not extinguish the Ardour of Research, at least relaxes the Efforts in pursuit of Improvement.

While the Narratives of Travellers and Voyagers consist of a Profusion of Materials injudiciously collected, those Writers who have abridged their Works, have not proved more happy in their Compilations. Averse, for the most Part, to the Duty of examining Facts, and of collating the Recitals of different Travellers with each other, they often sacrifice Truth indiscriminately to the Illusion of plausible Error; and if they sometimes venture to reject the Marvellous, they frequently exclude essential Objects of Attention, by contenting themselves with the Information of a single authority, and even that, perhaps, not the most respectable.

But neither Redundance nor Defect, neither Prejudice nor Inaccuracy, are the only Faults conspicuous in Works of this Kind. The Arrangement is no less confused and desultory than the Materials are frivolous, if

not liable to Refutation : the most unimportant Circumstances frequently forming the principal Subject of the Narrative, while the Government of the various Nations, their Polity and commercial Interests, as not being so obvious to Enquiry, are passed over with very little Notice, or are at least so imperfectly treated, as to afford only faint and unsatisfactory Information. By those Circumstances, the great End of Observation is almost entirely frustrated ; and the Recitals of Travellers and Voyagers, from being rendered a valuable Miscellany of Instruction and Entertainment, are degraded to Vehicles of inaccurate Description, unauthentic Intelligence, and useless and impertinent Detail.

To correct those Errors, and supply those Defects, was the Object of *THE GENERAL MODERN TRAVELLER*, of which had the Publication begun as soon as the greater Part was ready for the Press, it would have anticipated several Productions of a similar Nature, that have appeared within these few Years. But Accuracy of Information being the Editor's principal Aim, and that on which he chiefly depended for the Success of his Undertaking, he was less solicitous either to precede or accompany the other Candidates for public Favour, than to afford such a complete geographical System as was calculated to obtain, not a casual and temporary, but, he hoped, a well-founded, and, therefore, more permanent Reputation.

That uncommon Pains and Attention have been bestowed on collecting Information for this Work, the Editor can affirm with Truth. Not only the Writings of the most approved Travellers and Voyagers have been searched with great Care, but oral Authorities, of unquestionable Credit, been consulted. By the Delay of Publication, the Editor has been enabled to give a fuller Account of the Northern Countries in particular than any preceding Writer, in this Species of Composition, could obtain ; while, by the same Means, he has greatly enlarged his Fund of Observations, respecting the other Parts of the World.

The same Accuracy which has been observed in describing the present State of every Country, has also been extended to a historical Abstract of each. It was, however, thought proper not give any Place to the History of the Romans, or to that of Britain, as a useful Detail of those Subjects could not be comprised within the Limits which seemed necessary to this Work.

Upon the whole, if the most extensive, the most curious, and the most interesting Information, relative either to foreign Countries, or the Dominions of Great Britain, in the various Departments of elegant and ornamental, or of solid and useful Knowledge; if the utmost Care to procure authentic Intelligence, and the most scrupulous Fidelity in relating it, with the Editor's own Observations, can recommend any Work to the Attention of the Public, *THE GENERAL MODERN TRAVELLER*, it is hoped, will not be disappointed of its Object.

# UNIVERSAL TRAVELLER.

---

## A S I A.

**O**F the four great parts into which the terraqueous globe is distinguished, that of Asia claims the pre-eminence in point of precedence, whether we proceed on the survey of the world by a geographical or chronological order of arrangement. Situated on the East of Europe, it is the extremity of the universe whence the researches of the traveller ought naturally to begin; and it is also the quarter in which, according to the evidence of history, both sacred and profane, the race of mankind appears not only to have derived its origin, but to have produced the earliest examples of human observation and achievement. The soft and genial temperature of the Asiatic climates in general, with the great variety of delicious fruits which the soil produces without culture, peculiarly dispose the inhabitants to the indulgence of voluptuous gratification. The extremes of luxury and effeminacy, therefore, have ever been regarded as the predominant characteristics of those nations, which, though perhaps more remarkable than any other for magnificence, and

improvements in some of the elegancies of life, have but rarely afforded any illustrious instances of heroic virtue. Nor is mention to be found in the whole annals of Asia, of a people that ever formed a resolution of asserting their right to civil liberty.

Asia is bounded on the north by the Frozen Sea; on the East by the Pacific Ocean; on the South by the Indian Ocean; on the West by the rivers Oby and Don, the Palus Mæotis, the Euxine Sea, the Bosphorus, Hellespont, Egean Sea, or Archipelago; and by the Levant, the Red Sea, and the isthmus of Suez, which separate it from Europe and Africa. It extends between the equator and 72 degrees of north latitude, and between 25 and 148 degrees of east longitude: comprehending, besides islands, the empire of China, the several nations of Tartary, Siberia, India, Persia, Arabia, and a great part of Turkey. We shall proceed to describe these countries in the order in which they have been mentioned.

## C H I N A.

### C H A P. I.

*Of its situation—boundaries—provinces—great wall—rivers—lakes—volcanoes—climate.*

**C**HINA, including Chinese Tartary, lies between 21 and 55 degrees of north latitude, and between 95 and 135 degrees of east longitude; being about 2000 miles long, and 1500 broad. It is bounded on the north by the dominions of Russia, on the east and south by the Pacific Ocean; and on the west by Tonquin, Tibet, and Russian Tartary.

This extensive empire consists of sixteen provinces, viz. Pe che li, Kyang nan, Kyang si, Fo kyen, Che kyang, Hu quang, Ho nan, Shang tong, Shan si, Shen si, Se chuen, Quang tong, Quang si, Yun nan, Qew chew, and Lyau ton.

The Great Wall that divides China from Tartary, is the most extraordinary work of the kind ever projected by any nation; in comparison of which, the Roman ramparts in Britain must appear to have been extremely diminutive. This celebrated mural fortification stretches fifteen hundred miles in length, being carried over mountains and valleys from Mongul Tartary in the west, to the Kang sea in the east. At the latter extremity it is a huge bulwark of stone, jutting a great way into the ocean; but in its progress westward is composed of earth, generally terraced and cased with brick on both sides, but almost every where on the outermost. The height is mostly from twenty to twenty-five feet, and the breadth sufficient for five or six horsemen to travel a-breast with ease. It is paved on the top, and the gates, on the side of China, are defended

A

defended

fended by forts of considerable strength, which are likewise placed at equal distances along the whole extent of the wall. This wall is said to have been erected two hundred and twenty-two years before the Christian æra, with the view of preventing the incursions of the neighbouring Tartars. It answered the intention while those people remained divided by their separate interests; but the union of the Western Tartars, which happened in the beginning of the thirteenth century, surmounted the barrier that had before been impregnable, and over-ran China with an impetuosity which terminated in the total conquest of the empire.

The provinces of China, a few excepted, are remarkably level, and supplied with a great many rivers, of which the most considerable are Kiam or Yance, and Hoamho. The former of those takes its rise in the province of Yun nan, and, running four hundred leagues, discharges itself in the East sea, opposite to the isle of Teoumin, which has been formed by the sand that is carried along by the force of the river. The Chinese are said to have a proverb which imports, that Kiam has no bottom; but from this hyperbole we may at least infer, that, in many places, the river is of extraordinary depth. In its course, which is exceedingly rapid, it forms a great many islands, particularly beneficial to the country, on account of the bull-rushes, ten or twelve feet high, that they produce, and which serve for fuel to all the inhabitants of the adjacent parts, where there is scarce wood sufficient for necessary buildings and ships. From those bull-rushes likewise a great revenue accrues to the emperor.

Such is the rapidity with which this river is sometimes poured from the mountains, that it frequently changes the situation of those islands, or totally destroys them, forms new aggregations in their place. On which account, they are surveyed by the mandarines every three years, in order to adjust the imposts according to the state in which they are found.

The second river of China is called Hoamho, or the Yellow River, because the earth which it washes away, especially in high floods, renders it of that colour. It arises at the extremity of the mountains which bound the province of Se chuen in the west; whence it proceeds to Tartary, directing its course, for a considerable way, along the Great Wall, at which it re-enters China, between the provinces of Shan si and Shen si; and, having flowed about six hundred leagues, discharges itself into the East Sea, not far from the mouth of the Kiam.

This river has, in former times, proved the cause of great desolation in China; and notwithstanding the bulwarks which have been erected in many places to oppose its irruption, the inhabitants of the neighbouring parts live under almost perpetual apprehension of a future encroachment.

Innumerable lakes of a prodigious extent are likewise to be seen in all the provinces of this country, one in particular, named Tong ting hou, is thirty leagues in circumference. Such of them as are produced in winter by the torrents from the mountains, lay waste the fields, which are rendered through the whole summer barren, sandy, and full of stints. Those that arise from springs abound in fish, and yield a considerable

revenue to the emperor by the salt they afford. With respect to fountains, they are not in general very frequent, nor of the best quality; which is perhaps the reason why the Chinese, for the most part, use water that has been boiled.

There are also in China several volcanoes, or burning mountains. The most remarkable of those, which is called Linosing, is of a great height, and often alarms the adjacent country with terrible eruptions.

In a country so extensive as China, it is reasonable to imagine that the air in the different provinces partakes of various degrees of temperature, as well as that the soil is distinguished by a regular declension of fertility. Accordingly in travelling across the empire from south to north, we behold a progressive diversity of vegetation from the luxuriant climate of Quang tong, to the Tartarean frontiers of Pe che li. In the latter of those provinces, though the air be temperate, the rivers are frozen during four months of the year, that is, from towards the end of November, to the middle of March. It is however remarkable, that unless a certain north wind blows, they never feel those piercing colds which the frost produces in Europe; a circumstance probably owing to the nitrous exhalations that arise from the earth, and especially to the clearness of the sky, the sun, even in the winter, being hardly ever covered with clouds. About the end of July and the beginning of August, the province of Pe che li is annually visited by periodical rains, which very seldom happen at any other season, but are compensated by the dew which falls every night, and is succeeded in the morning by a fine dust, that frequently incommodes the inhabitants, not only when abroad, but in their houses. The southern provinces, however, though peculiarly happy in the extraordinary fertility of the soil, are often exposed to pestilential winds, which prove extremely destructive.

#### C H A P. II.

*Of beasts—birds—fishes—plants—fossils—minerals.*

**H**AVING given a geographical account of the country, we proceed to take a view of its natural produce, under the divisions of the animal, vegetable, and mineral tribes.

The indigenous animals of China are, camels, horses, oxen, sheep, hogs, a few elephants, and a prodigious number of all kinds of wild beasts, except lions. Their best horses, however, are brought from Chinese Tartary; those in the south parts of the empire being a small breed, unfit for draught or to carry burthens.

There is a species of camel no higher than an ordinary horse, with two bunches on their back covered with long hair, which forms a kind of saddle. The anterior bunch is upon the shoulder, and the other immediately before the buttocks. This animal has not such long legs in proportion as the common camels, and differs also from those in having a shorter and thicker neck, covered with hair as long as that of goats. They are generally of a yellowish dun colour, but some are inclined to red, and marked with an ash colour in particular places. Their legs are much thicker

thicker than those of the common dromedary, and therefore better accommodated for supporting the weight of a heavy load, and enduring the fatigue of a long journey.

In the mountains near Peking, there is an animal much resembling the roe-buck, which the Chinese call *kiang tchang tse*, that is, the musk roe-buck. It carries no horns, and the hair is of a blackish colour. The musk is included in a bag, composed of a very thin membrane, covered with extremely fine hair; to which it adheres all round the cavity in the form of a salt. The female of this species produces no musk, or such at least as is totally destitute of fragrance. Those animals are said to feed on serpents, which are so much affected by the scent of the musk, at a certain distance, as to be rendered incapable of stirring. The flesh of the buck is reckoned exceeding good, and frequently used at the best tables.

In the southern provinces there are all kinds of parrots, exactly resembling those of America, both in plumage and loquacity. But they are surpassed by the *kni ki*, or golden hen, so named from its superior beauty to every other species of the winged race. The delicate and splendid plumage on the head of this bird, the liveliness of the yellow and red, the inimitable shadowing of the tail, with the variety of colours in the wings, and its well-shaped body, conspire to bestow upon it that unrivalled distinction which it has universally obtained from all the writers on ornithology. Though this bird might seem to be endowed by nature with such qualities as ought for ever to exempt it from falling a sacrifice to the voluptuousness of the human palate, we are nevertheless informed that its flesh is more delicate than that of the pheasant.

Another beautiful bird of this country is the *hai tsing*, which resembles our finest falcons, but is far superior in strength and size. It is chiefly found in the province of Shen si, and in some parts of Tartary.

Here are likewise domestic birds, or poultry, of all kinds, the eggs of which, as in Egypt, are hatched in ovens heated with horse-dung. To which we may add, that the rivers and lakes afford great plenty of water-fowl, especially wild-ducks. The manner of catching those in this country, as well as in India, is very curious, and deserves to be mentioned.

When the fowler spies his game, he wades with only his head above the water, which is covered with a pot full of holes, for the convenience of breathing and seeing his object. The pot is stuck all over with feathers, to deceive the game; so that when he approaches them, either by swimming or otherwise, they discover no marks of apprehension: the fowler then lays hold of them by the feet, drawing them down under the water; and the rest of the fowls, imagining that their companions have only dived, are not in the least disturbed, but continue swimming round the place, till perhaps they are all taken in the same manner.

In the province of Quang tong there is a species of butterfly, which, on account of the size, and the great beauty of the variegated colours, is held in peculiar estimation, and used at court as ornaments.

They lie motionless on the trees in the day time, when they are easily taken; but in the night they flutter about much like our bats, and several of them appear to be not inferior to those in dimensions.

China abounds in all the same kinds of fish that we meet with in Europe, such as sturgeons, carp, soal, trout, salmon, &c. and also in several others of a delicious taste, unknown in this quarter of the world. One of the most remarkable among those is the *tcho kia yu*, or the armour-fish, so named from its being covered with sharp scales, placed in right lines one over another, in the manner of tiles on the roof of a house. The flesh of it is very white, and greatly resembles veal in taste.

Another delicate fish is caught in calm weather, which is distinguished by the name of the meal-fish, on account of its extraordinary whiteness. The fish of this species are found in such prodigious shoals on some parts of the coast, that it is not uncommon to take four hundred weight of them with one draught of the net. A third species, called the *hoang yu*, is likewise described as being of an excellent taste, and some of them are so large as to weigh eight hundred pound.

The gold-fish are generally between three and four inches in length, and proportionably thick. The male is of a beautiful red from the head half way down the body, and the remaining part seems to be gilded in a manner incomparably superior to all the similar performances of art. The female is white, and has the tail, and some part of the body perfectly like silver: their tail is not flat, like that of other fish, but forms a kind of tuft peculiar to this beautiful species. The delicacy of those fish is represented as being correspondent to their elegant and splendid appearance; for we are told that they are much hurt, sometimes killed, by a great noise, such as that of guns or thunder; as they are likewise by a violent motion, or strong smell.

No country produces greater variety of plants than this extensive empire, which abounds not only in the European, but the tropical fruits, and likewise in some plants not to be found in any other part of the world. Among those the following deserve particularly to be mentioned.

The first is the *tsi chu*, or the varnish-tree, more remarkable for the valuable gum which it yields, than for any thing grand in its own appearance. Its size is but small, its bark whitish, and the leaf resembles that of the wild cherry-tree. The gum of this plant is greatly esteemed as a varnish, and universally applied to that purpose. It receives all colours alike, and if well managed, neither loses its lustre by the changes of the air, nor the age of the wood on which it is spread.

The second tree is *tong chu*, from which a liquor is obtained of a similar nature to the varnish. It so nearly resembles the walnut-tree, as sometimes to be mistaken for it. The nut contains a thickish oil mixed with pulp, which, as well as the varnish, is supposed to have a poisonous quality. It is often used alone to varnish wood, which it preserves from the bad effects of rain; and likewise to give a lustre to the floors of the emperor's apartments, and those of the grantees.

The

The third remarkable tree is the tallow-tree. It is nearly about the height of a large cherry-tree: the fruit is contained in a rind, which, when ripe, opens in the middle like a chestnut. It consists of white kernels of the size of a hazel-nut, whose pulp has the properties of tallow, and of which candles are accordingly made.

The fourth, which is the most extraordinary of all, is called *pe la chu*, that is, the white wax-tree. It grows not so high as the tallow-tree, from which it also differs in the colour of the bark being whitish, and the leaves of an oblong shape. A small worm fixes itself to the leaves, and forms a sort of comb, the wax of which is very hard and shining, and of far greater value than their common bees-wax.

The different kinds of *fantal* or *fanders-tree* likewise grow here in great plenty, as well as a tree that produces *pease*, and which, for tallness, spreading branches, and thickness, gives place to very few.

The wood in greatest esteem among the Chinese for their buildings is what they distinguish by the name of *nan mon*, and imagine will never decay. The most beautiful, however, is the *tsetam*, of a reddish black, and variegated with numerous veins, which seem as if painted. Of this wood is made the finest sort of their cabinet work.

We may rank in the same class of natural productions a sort of reed or knotty cane, called the *bamboo*, which sometimes grows to such a height that it is often reckoned among their trees. Of those bamboos are often made canoes or wherries, which, on account of the lightness of the cane, are rowed with incredible velocity.

Among the shrubs in China, there are but three or four kinds that bear odiferous flowers; and in the catalogue of herbs we meet with one named the herb of a thousand years, which the natives pretend never dies. But of all the shrubs of this country, the *teaplant* particularly merits attention, on account of the almost universal use in which it seems now to be established. This celebrated exotic, which bears a great affinity to the myrtle, seldom grows beyond the size of a rose-bush, or at most six or seven feet high. Its leaves are about an inch and a half long, narrow, tapering to a point, and indented like those of our sweet briar, which it also resembles in the flower. The shrub is an evergreen, and bears a small fruit, which contains several round blackish seeds, about the bigness of a large pea. The tea leaves are usually gathered at three seasons: the first about the latter end of February, or beginning of March; the second in the beginning of April; and the third about two months later. The method of preparing the tea is by drying the leaves over a furnace, after which they are rolled with the hands in one direction, while some assistants are fanning them, that they may cool the more quickly, and retain longer the curl they have received. This process is performed two or three times before the tea is laid up in the stores. *Kämpfer* is of opinion, that the difference of teas depends upon the soil and culture of the plant, the age of the leaves when gathered, and the particular method of curing them; and that the qua-

lity of tea must be greatly affected by those circumstances is the more probable, as it is affirmed that there is only one species of the tea tree.

The use of the infusion of tea is supposed to have been introduced by the Chinese, for the purpose of correcting the water, which, in many parts of that country, possesses a disagreeable taste. It was first imported into Europe by the Dutch East India Company, about the beginning of the last century, since which time, the use of it has gradually increased, till it has become universally familiar with people of every rank. It is computed, that, exclusive of the immense quantity of tea annually smuggled into these kingdoms, three millions of pounds, at least, are allowed every year for home consumption in England.

Various are the opinions which have been entertained relative to the effects of tea-drinking. That it produces watchfulness in some constitutions, is most certain, when drank in the evening in a considerable quantity. That it enlivens, refreshes, exhilarates, is likewise well known. From these circumstances, it would seem that the tea contains a penetrating principle, speedily exciting the action of the nerves; in very irritable constitutions, to such a degree as to give uneasy sensations, and produce spasmodic affections: in less irritable constitutions it rather affords pleasure, though not without occasionally producing some tendency to tremors, and agitation bordering upon pain. The finer the tea, the more obvious are those effects; which perhaps is one reason why the lower classes of people, who can only procure the most common, are in general the least sufferers.—In judging of the effects of tea, an allowance ought certainly to be made for those of the water in which it is infused, which being generally drank warm, may at least contribute to excite the complaints usually ascribed to the ingredient alone. Should we determine our opinion by an enquiry into the constitutions of the Chinese, who drink it in great quantities, there will appear to be strong reason for concluding that it is actually of a relaxing quality. For inflammatory diseases seem to be less frequent in China than in some other countries; and even in Britain we have authority for the assertion, that disorders of the same kind are much more rare in the present age, than at the time before the use of tea became so general among the inhabitants. It is certain that this beverage is not equally injurious to all constitutions; but from the symptoms it excites in persons of an irritable state of body, and also from the effects of the infusion of tea, when applied to the nerves of living animals, we must admit that it possesses such a sedative quality as is found in narcotic substances, and which seems to exist chiefly in tea of the highest flavour. Those who think otherwise, may find an advocate for their opinion in *Dr. Bontikoe*, a Dutch physician, who maintained that it may be drank with safety to the quantity of one or two hundred cups in a day. It is proper to observe, however, that *Bontikoe's* vindication of tea was published at a time when the Dutch entirely engrossed that trade, and were solicitous to extend the consumption of their new commodity over Europe.

Another plant, of which both the leaves and roots

are

are used by the Chinese in the manner of tea, but drank in less quantity, is the ginseng. It is supposed by them to contain the virtues of almost every other simple, and one of the pompous names with which it is dignified, is, *the plant that dispenses immortality*.

In some parts of China there is found a sort of earth, which, being boiled and crystallized, yields a good white salt; and in some places the ground, after rain, exudes a kind of froth, which is made into an excellent soap. The province of Quang si in particular affords that valuable earth or clay of which their porcelain or China ware is made, so universally admired for its elegance. This earth is of two kinds, the one called kaolin, which is full of glittering particles, the other called petunse, which is of an unmixed white, exceeding fine and soft to the touch. The petunse is cut out of the mine in form of bricks, and is much harder than the kaolin, the latter of which, however, is what gives the strength and firmness to the porcelain. Here is also found in considerable quantities the lapis lazuli, together with a species of jasper, small rubies, rock crystal, and quarries of fine marble, equal to the best in Europe, but little used by the Chinese in their public buildings.

The mountains of China abound in great variety of metals and minerals, among which are gold and silver. Their gold mines, however, are not permitted to be opened, on account of the great quantities of that commodity washed down by torrents in the rainy seasons, and which multitudes of people are constantly employed in gathering. In respect of silver, the quantity they have amassed must be prodigious, for what comes once into the country can never go out again, the laws that prohibit it are so severe. They have also in this kingdom mines of copper, iron, quicksilver, and some lead; but the last of these metals is very scarce, as appears by our English lead finding so quick a market in China. Besides these, they have several compound metals, the manner of mixing which they keep as a great secret; particularly the sort called tonbaga, of the colour of very pale brass, to which they ascribe several extraordinary virtues, as those of expelling poison, stopping hemorrhages, and the like, merely by wearing it in the form of a ring or necklace.

### C H A P. III.

*Of the canals—cities—public buildings—populousness—government.*

**A**MONG the improvements which this country has received by means of cultivation and art, the first objects that attract our attention are the great and numerous canals, with which all the provinces are so intersected, that internal navigation is maintained between the different extremities of the empire, and a traveller may be carried by water to almost every town. Over these canals are magnificent bridges, the arches consisting of marble, and so high that vessels may pass through them with their masts standing. The rivers and canals may be said to be inhabited as well as the land; for in many places they are almost entirely

No. 1.

covered with boats, which are rendered as commodious as houses, and are the perpetual dwellings of great numbers of people. Besides these vessels there are rafts or floats constantly moving along the rivers and canals, upon which are built little huts or cabins, where the men, and sometimes their families live, till they have disposed of the timber; of which great quantities are conveyed from the southern provinces almost to Peking, being upwards of a thousand miles.

The cities are generally built of a square or oblong form, surrounded with great high walls and towers, and furnished with at least one stately gate in each front, though sometimes there are more. The streets run in straight lines, intersected by lanes running parallel to each other, and adorned with spacious piazzas, temples, and other public buildings. Some cities are perfectly round, others oval, but all within side of the same invariable uniformity. They are for the most part well supplied with water, from rivers or artificial canals. The houses are commonly of wood, raised on pillars, and covered with tiles; and are rather commodious than elegant. They have no windows fronting the streets; the gates and principal apartments always face the south, as often as the situation will admit of that aspect.

The most expensive buildings, however, and those in which the Chinese discover a whimsical extravagance, are the temples, which they rear to a considerable height. These are filled with an incredible number of idols, and before them hang lamps continually burning. Of temples of the first rank, they reckon about four hundred and eighty, besides a prodigious number of others, which are served by three hundred and fifty thousand bouzes or priests. The number of bridges almost exceeds belief: one of the most celebrated is that over the river Saffrany, which joins the mountains together: it is four hundred cubits long, five hundred high, and all of one single arch, whence travellers call it the flying bridge. The structure of several of these bridges, for the convenience of traffic, is very extraordinary; of which we meet with an example in that over the city of Chan chew. It is built upon a hundred and thirty barges, chained to one another, yet so as to open in any part, for the passage of vessels which are continually sailing up and down. A third sort stands on pillars, without any arch. Some of these are of considerable length and breadth, particularly one in the province of Fo kyen: it is erected on three hundred pillars, is six hundred and sixty perches in length, and one and a half broad; curiously built and adorned with parapets, containing much sculpture and imagery. A fourth sort are made with arches, likewise of great length, breadth, and beauty. That at Oxu, the capital of Fo kyen, consists of an hundred arches, and is above a hundred and fifty fathoms long.

Among the public buildings the triumphal arches hold a conspicuous place. These are commonly built of square stone, carved with figures of men and beasts, and have panegyric inscriptions to the persons for whom they were erected: the number of these, and the fine towers in every considerable city, is said to amount to one thousand one hundred and fifty-nine; and among

B

them

them are about one hundred and eighty-five mausoleums of exquisite beauty and magnificence. When we consider the great expence that is lavished on these edifices, as well as the purposes for which they were erected, it is surprizing that the Chinese have never yet built them on such a plan as could render their existence more durable. They dig no foundation, as in other countries, but lay the first stone on the surface of the ground; so that the most sumptuous buildings soon decay.

After this general account of the buildings, we shall take a more particular view of the three principal cities, which are, Nanking, Canton, and Peking.

Nanking, once the capital of China, is situate at the end of a deep bay of the river Yangs ke han, which is two leagues broad, and covered with an astonishing number of trading vessels. While it continued to be the residence of the court, this city is said to have been ninety miles in circumference. From the ruins of its old walls, it evidently appears to be greatly diminished in extent, and is now said to be but twenty miles in compass at most. Hardly any remains are left of its ancient magnificent palace, and other sumptuous buildings; and we only see the ruins of some temples, imperial sepulchres, and other monuments. The houses are well built, and filled with inhabitants, who carry on a flourishing commerce. There are still many lofty towers, temples, and other handsome edifices. The streets are paved in the middle with large marble slabs, and on the sides with variety of pebbles and other stones curiously inlaid. By some it has been said that the inhabitants of Nanking amounted to thirty-two millions of souls. This incredible account, however, appears to be greatly exaggerated. According to Kao it contains at present two millions, though others fix the number at one million; but this computation is supposed to fall considerably short of the truth. In the environs of the city there are a vast many temples, palaces, pleasure-houses, and fine gardens; there is particularly, about six miles from the city, a pleasant wood, about twelve miles round, of stately pines, in the middle of which is a mount covered with sepulchral temples of ancient monarchs. About the like distance there is raised on another eminence, a spacious terrace of large square stones, with four flights of marble steps, on which a magnificent temple is erected: the roof is supported by a row of columns finely carved and polished, twenty-four cubits high, and proportionably thick. The gates are curiously carved in bas-relief, and inlaid with gold and silver. The windows are fenced with a kind of gold net, so extremely fine as hardly to be perceptible: within are several thrones, enriched with all sorts of pearls and precious stones of immense value.

The most curious edifice in the city is the high octogon tower, or pagod, covered with porcelain, painted in various colours: it has nine galleries over one another, all adorned with windows, fine balustrades, festoons, and other ornaments in relievo. A bell hangs at every end of the galleries, and the ascent to the top is by a hundred and eighty-four steps. The rooms are richly painted, carved, and gilt; and the

upper gallery is adorned with variety of large figures carved in stone. On the top is a spire, which renders the whole fabric two hundred feet high. The breadth at the bottom is eighty feet, but diminishes gradually upwards. A winding stair-case leads to the top, whence is a most noble prospect of the city and adjacent plain. Among the numerous objects which diversify this landscape, are some hills situate at a distance, and formed into various fantastic shapes, in the manner peculiar to the nation.

The city of Nanking is yet the largest in the empire, and usually the residence of the most eminent mandarines when out of employment. The gates of the city are of iron, and there are four at every entrance, one within another. Here are likewise two of the largest bells in the world, fallen to the ground by their vast weight: the height of one is eleven feet, and the weight, including that of the clapper, is fifty thousand pounds.

In going along the streets of Nanking, a most offensive smell arises from the ordure which the porters are carrying in tubs for manuring the orchards, and sell to the gardeners for greens, vinegar, or money; they giving a better price for that which is come of flesh, than of fish, which they know by tasting it with their tongue. Nothing is more frequent on the river than boats loaded with that filth; and along the roads there are convenient places, whitened, with seats, and covered, for the use of passengers, erected with an economical view of accumulating the same kind of produce.

Canton, or Quang tong, capital of the cognominal province, is situate on the east side of the large river Ta, about fifty miles from its mouth, and is not only the greatest port in China, but the most frequented by Europeans. The city wall is about five miles in circumference, and is entered by seven iron gates, through which no European, if known, is ever permitted to pass. Here are many triumphal arches, and pagods stocked with images; but the houses are not magnificent, consisting generally of one, and none of more than two stories. They have no chimneys, instead of which a shallow iron pot, filled with charcoal, is planted in the middle of the room in winter. The windows are made of cane or rattan. In winter they cut oyster-shells in the shape of lozenges, and set them in wooden frames, which afford a very good light. In the market places, it is common to see dogs, cats, rats, and the most loathsome animals, exposed to sale by the butchers; for such is the taste of the Chinese, that they make no scruple of eating any sort of meat. It is common here to meet with beggars, of both sexes, extremely offensive by their nastiness, and who have lost their sight. It has been imagined by some, that this endemial blindness is the consequence of living so much on rice; but the disease is with more justice ascribed to the hot winds which blow at certain seasons.

About the months of December or January, Canton is subject to very tempestuous and rainy weather, at which time all the streets of the city are overflowed, and the water is in many places so deep that a small boat might be rowed without difficulty. It is computed

puted that there is in this city one million two hundred thousand inhabitants; and the number of trading vessels constantly in the river, is seldom less than five thousand. It is the great mart of the European trade with China, and among those of some other nations, the English have established here a factory.

Peking is situated in a fruitful plain, twenty leagues distant from the Great Wall, and ever since the conquest of China by the Tartars has been considered as the capital of the empire, on account of its being the residence of the court. The walls of this city are much less in circuit than those of Nanking, but greatly superior in beauty. The gates, of which there are nine, are high and well vaulted, supporting large pavilions that consist of nine stories. The streets run in a straight direction at least a league in length, and are about one hundred and twenty feet wide, with shops for the most part on both sides. The houses, however, are far from corresponding with this magnificence, for they are meanly built, and extremely low.

The emperor's palace stands in the centre of the city, fronting the south, inclosed by a double wall of brick; being in length two Italian miles, and half as much in breadth. It consists of a large mass of buildings, with courts and gardens intermixt. Though it possesses neither the symmetry nor beauty of European architecture, yet when we view its numerous arches sustained on massy pillars, the towering roofs shining with gilt tiles, the splendid ornaments of carving, varnishing, gilding, and painting, with the pavements which are almost all of marble, or porcelain, it excites in the mind of the spectator that pleasure which arises from great and magnificent objects, where novelty compensates for the capriciousness of taste, and profusion of embellishment supplies the place of more regular design.

The walls of the cities in China are generally erected so high as to hide the prospect of the buildings, and are so broad that one may easily ride on horseback upon them. Those of Peking, which consist of brick, are forty feet in height, and are flanked with a great number of square towers uniformly disposed at equal distances. In several parts there are likewise staircases to serve for the admission of cavalry.

The multitude of inhabitants in this kingdom is almost incredible. It has been computed that the number of families amounts to upwards of eleven millions, exclusive of beggars, mandarines in employment, soldiers, bachelors, licentiates, doctors, mandarines above age, all who live on the rivers, bonzes, eunuchs, and all persons of the blood royal; because those only are polled who till the land, or pay taxes to the king. There are in the empire, according to the same authority, more than fifty-nine million of men. Some even make them three times the number that there is in all Europe. So astonishing a populousness naturally affords presumption that the government of China must be peculiarly favourable to the domestic interests of the subject. Other causes, however, conspire to this extraordinary multiplication, which are, the great plenty of all sorts of commodities, the indelicate appetite of the people, which can be gratified with food of the vilest kind, the universal practice of marrying at an early

age, the great internal navigation of the country, the reluctance of the inhabitants to emigrate, with their remote and uninviting situation in respect of powerful and ambitious princes; to which we may add, the unrivalled veneration of the Chinese for the parental character.

The constitution of China is that of an absolute monarchy, limited in some particulars by the aristocratical part of the nation; though we may safely affirm that the supposed restriction of the imperial power is in reality rather nominal than operative and efficacious. The emperor, say the Chinese, is invested by the laws with unbounded authority, but he is obliged by the same laws to use that authority with moderation; a distinction too indefinite to be considered as an impregnable bulwark to the public freedom. But even admitting such a coercive principle in the constitution, the probability of its ever being exerted seems hardly to be compatible with the extraordinary influence annexed to the royal prerogative. The veneration in which the emperor is held by his subjects is little short of idolatry: he is styled The Son of Heaven, and Sole Governor of the Earth. All places in the empire are in his disposal: he is the source of honour; by him all taxes are imposed; his authority extends even to the lives of his subjects; and he is the unquestionable arbiter of peace and war. Even the dead, that ought to be exempted from mortal jurisdiction, remain under the vassalage of this unbounded potentate, who either disgraces or honours them, rewards or punishes their families, as his own almighty caprice and uncontrollable will shall determine. The title of duke, count, or others for which our language has no name, he frequently confers when the vanity of human distinction is no more. He may canonize them as saints, or even command his subjects to pay them divine adoration.

The executive government, under the emperor, is lodged in the body of mandarines, who are divided into nine classes, and these subdivided into nine degrees; the rank of mandarine, however, being merely titular, and conferred upon them by the emperor without any regard to their employments. The subordination of those different orders is so perfect, that the obedience and veneration of the inferior for the higher classes, as well as of the highest for the emperor, are totally without example in the institutions of any other country.

The mandarines of the first class are members of the council of state, which is the greatest honour or dignity a learned man can rise to in the empire. This is the supreme court of the kingdom, and is composed of two other ranks of mandarines, besides the first already mentioned. Their business is to examine and judge of all petitions to his majesty upon the most important affairs of the state. When they come to a resolution, they present it to the emperor in writing, who either confirms or cancels it as he thinks proper.

There are likewise eleven other great courts, among which the affairs of the nation are divided. Six of them belong to the learned mandarines, and five to the military. None of those courts, however, can deter-

mine

mine the affair committed to it without the concurrence of the other: each of them has a superior, who examines all that is transacted, and if he finds any error, presently acquaints the emperor with it. In China, those men are called Mad Dogs, on account of the mischief of which they are frequently the instruments. The peculiar employment of the first of those courts is to furnish all the kingdom with mandarines; to enquire into their merits and demerits, and to represent them to the emperor, that they may either be promoted or degraded, as a reward or punishment for their conduct. The second court is the emperor's great treasury or court of exchequer, which has the management of all the treasuries, revenues, and taxes; as also of the expences. The third court has the inspection of the ceremonies, rites, sciences, and arts: it has the charge of the emperor's music, of the temples, and of the sacrifices which the emperor offers to the sun, moon, heaven, earth, and to his ancestors. It has full power over arts and mechanics, and over all the religions professed in the empire. The fourth sovereign court has the direction of war and military affairs through the whole kingdom: it chooses and prefers all officers, whose station it likewise regulates in the different provinces. The fifth tribunal is the criminal court of the empire: and the sixth is called the court of public works; it has the care of building and repairing the royal palaces and tombs, and the public temples; it also inspects the towers, bridges, canals, and high roads. These six courts have under them forty-four of inferior authority. One court contains a great number of learned mandarines, the members of which are the preceptors of the prince who is to succeed to the imperial dignity. They write all the transactions at court, or in the empire, which deserve to be transmitted to posterity. They compose the general history of the kingdom; and they are properly the emperor's men of learning whom he chooses to be counsellors. Another court is the royal school of the empire. A third court is appointed, the privilege of which is to tell the emperor what faults he commits in government; but notwithstanding the manly freedom which some of the members of this court are said to have exercised on particular occasions, there is reason to think that, if it has not really been instituted for the purpose rather of gratifying the vanity, than controuling the power of the prince, its authority is entirely nominal, and that the language of remonstrance never was held to the emperor with constitutional and inviolable security to the person from whom it proceeded.

Besides the courts already mentioned, resident at Peking, each province has a sovereign court on which all the others depend. The president of this court has the title of viceroy, and acts immediately under the emperor and the six supreme courts in the capital. Some viceroys have the government of two, three, or four provinces, especially on the frontiers of Tartary. Besides the viceroy, there is in every province a visitor, and another officer of great note, who has the command of all the troops in the province. There is likewise no metropolitan city without its civil and criminal court, which acts in the same affairs as the

sovereign courts at Peking. Every province is subdivided into districts, each of which has a mandarine, who is an inspector of all public transactions. It is his business to cause the governors of cities and towns to pay the emperor's duties punctually.

The number of learned mandarines throughout the empire is thirteen thousand six hundred and forty-seven, and that of the military eighteen thousand one hundred and sixty-seven. They are promoted to higher employments by regular progression every three years. When a mandarine's father or mother dies he must resign his office to mourn for the same space of time; sleeping upon a little straw by the tomb, eating for some months nothing but rice boiled in water, and wearing, for the first year, a garment of sackcloth.

The emperor, like other eastern princes, is seldom seen in public; spending his time chiefly in the palace amidst the ladies of his court. He has the liberty to nominate his successor, whom he may not only choose from the royal family, but from amongst his other subjects. We are informed that some of the sovereigns of China, finding none of their own children, though numerous, fit to support the weight of a crown, have chosen for their successors men of obscure birth and fortune, but who were eminent for their virtue and abilities. For many ages, however, it has been the practice to restrict the election to their own family, though it appears that the object of royal favour is not always the oldest.

A few salutary maxims impressed on the minds of the Chinese from their earliest age, seem to be productive of greater influence on the public tranquillity, than the political constitution of the nation is calculated to maintain. One of those is, that the emperor is universally considered as the father of his people, between whom and their sovereign, as head of the great family of the empire, all the reciprocal duty and affection of parent and children are supposed to exist, almost without the possibility of violation on either side. This opinion, so favourable to public order, pervades the whole body of the empire, and is remarkably diffused through all the different degrees of subordination; which it likewise tends to preserve from the meanest subject in the kingdom, to those of the most elevated rank. The same principle that secures the patriarchal authority of the sovereign, enjoins children such love and obedience to their parents, as never was carried in any other country to an equal pitch of enthusiasm; and it is extended with more than common veneration to all who administer the executive department of the state. Another moral principle established among them is, that all people ought to observe towards each other the strictest rules of civility and complaisance, as the most effectual means both of securing obedience to the laws, and restraining individuals from any encroachment on the rights of society. So great is their attention to this object, that certain ceremonies and modes of behaviour are prescribed for the use of the people, almost in every circumstance of life; to neglect or deviate from which etiquette, would be considered as indelible infamy. By the laws of the empire parents are laid under such an inducement to give their children good

good education, that if any of the latter commits a crime, and cannot be taken, the magistrate secures the father, who is severely bastinadoed for not having taught his son good manners. Amidst all the specious restraints, however, which the singular constitution of China appears to have imposed on the inhabitants for the security of public virtue, the administration of government is perhaps the most corrupt that is to be found in any country. From the highest sovereign tribunal, to the mandarines of the lowest rank, venality universally prevails, and the most rapacious speculation is exercised by all orders of the magistrates over every province of the empire. That sedition and popular commotions prove not more frequently the consequence of those flagrant abuses of the state, is to be imputed chiefly to the profusion of all the necessaries and luxuries of life, in which the empire abounds; and we may add, to the dissimulation, mutual distrust, and suppression of the spirit of enterprize, that naturally result from the established mode of education; with the extreme difficulty of moving the springs of revolt, and exciting a general insurrection in so unwieldy and extensive an empire.

## C H A P. IV.

*Of the revenues—military force—high-roads—manner of travelling—agriculture—gardening.*

IT is difficult to ascertain the revenues of China with any degree of precision, because, besides the pecuniary taxes, vast sums are levied on commodities. According to the most authentic information, the treasury receives every year in money about twenty-two millions of Chinese crowns; each of which amounts to six shillings of British coin. But the rice, corn, salt, silk, cloth, and other articles of produce and manufacture, with the customs and forfeited estates, are computed to be upwards of sixty millions of crowns. By a particular calculation, the ordinary revenue of the emperor is said to be at least twenty-one millions six hundred thousand pounds of our money, which is carried to the mandarines by the inhabitants, without the intervention of any officer appointed to collect it.

The military force, as in most other countries, consists of cavalry and foot soldiers. The latter of these is computed at about five hundred thousand, and the number of cavalry, which is usually stationed round Peking about one hundred thousand. This prodigious multitude is constantly kept in pay, for the purpose of suppressing robberies, or extinguishing any sedition that may arise in the empire, rather than as a defence from invasion; and it is said, that upon occasion of any such internal tumult, the cavalry perform their march with extraordinary celerity. Their uniforms are short gowns of blue Nanking stuff, with rattan caps, ornamented with a bunch of red hair.

The common arms of the Chinese are the bow, and a long scymiter. Fire arms have hitherto been little used, yet muskets begin to be more generally carried by the emperor's order. Though cannon had long since been invented in this country, it neither was well cast

No. 1.

nor proportioned, till the foundery was put under the direction of a person named Verbiert, a Jesuit, who went thither in the quality of a missionary. The profession of soldier here descends from father to son; the emperor not only allowing them competent pay, according to their station, but also rice sufficient for their whole families, which is furnished by the provinces for that purpose. They are instructed in military exercise, though greatly inferior to the dexterity of European troops; and they are far from meriting the character of warlike, especially since their conquest by the Tartars. Their education, it must be acknowledged, is very unfavourable to the spirit either of valour or activity: for their minds, from an early age, are chiefly habituated to subjects of moral speculation; and the perfect security of the empire from abroad, joined to the pacific disposition of the natives, seldom or never affords any opportunity of exerting courage, or improving those talents which constitute the merit of a soldier. The infantry are for the most part stationed in fortresses, of which the number is very great. These are distinguished into seven different orders, and amount to upwards of two thousand, without including the towers, castles, and redoubts of the great wall, which have each their separate garrisons. There are besides more than three thousand towers or castles, called tay, in which are constantly kept centinels and other soldiers on duty, whose business it is to watch the rise of any commotion, and communicate the alarm to the neighbouring forts. On this internal defence of troops and fortresses rests entirely the security of China; for though a maritime country, it possesses not a single vessel which can come into any competition with the lowest order of English frigates.

The tranquility, as well as convenience of the inhabitants, is greatly promoted by the excellence and disposition of the numerous high roads, which stretch from the different extremities of the kingdom, facilitating not only the march of troops on any emergency, but likewise the progress of travellers; though many of the latter, on account of the commodiousness of water carriages, frequently perform their journeys on that element. Over valleys and low grounds, the roads are considerably raised; and, in some places, passages are cut through mountains and rocks. The roads are generally about twenty yards wide, furnished with Mercuries at proper distances to direct the traveller, and likewise with guards of militia, as a protection from robberies. They are kept in good repair, in expectation of the emperor, who annually makes a tour, or at least gives out that he designs it, through some part of his dominions; and if he finds them in bad condition, the governors of the provinces through which he passes are in danger of being severely punished. It is, however, very inconvenient travelling by land in a dry season, on account of the dust which the lightness of the soil occasions to rise in great quantity. The beasts used for this purpose are horses, mules, and camels; and the vehicles either chariots with two wheels, litters, or chairs made of cane; the poles of which are carried by the chairmen on their shoulders, and not in their hands as with us. Upon

C

all

all the roads are houses for the entertainment of the mandarines, going to or returning from their posts, where they live at the public expence, and at every stage have horses and carriages provided for them. Other travellers may be accommodated with the same conveniences, that can procure an order for the purpose, which is not difficult to obtain; or they may be supplied with every thing at their own charge, at a moderate price. A book of the roads is published by authority, containing an account of the distances of towns, and the most convenient stages.

The journeys of the mandarines are performed with particular pomp and solemnity. If he be of the military order, he rides on horseback, but if an officer of the civil department, he is accommodated with a chair. Before them are carried several painted flags, with large characters in gold, expressing their titles and dignities, while they are shaded by splendid umbrellas from the heat of the sun. In the front of the procession walk a number of men, with high crowned hats, making a hideous noise, and calling incessantly to clear the way for the mandarine. These are followed by others with chains in their hands, which they are ready to throw round the necks of such as should not instantly obey the summons, who are dragged in that manner as a punishment for their atrocious offence; while a band of lictors that succeeds, and armed with various implements of torture and execution, exercise the most merciless cruelty on the miserable victims of their resentment. There happens, however, but very few instances of this kind; for the respect which is paid by the people to the mandarines in general, even exceeds the bounds of moderation. When a person of that character admits justice in the courts, he is never addressed but on the knee: and when he takes a journey, all the inhabitants of the towns through which he passes run to to meet him, proffering their services, and conducting him on the road with great solemnity, while tables elegantly covered with sweetmeats, tea, and other liquors, are displayed on each side in honour of the venerated traveller. If he proceeds by water, which is often the case, his retinue is equally magnificent.

In travelling through China neither hedge nor ditch is to be observed, and but few trees, so much are the natives averse to losing the smallest space of ground. Agriculture is here in the greatest esteem, and profecuted with uncommon ardour. Such is the industry of those people that even the mountains are not exempted from cultivation; and it is common to see them cut into terrasses, one above another, from the bottom to the top, which form a most beautiful prospect. The hills indeed are for the most part not rocky, as in Europe, but composed of a light and porous soil; in such as are rocky, however, the Chinese loosen the stones, making of them little walls to support the terrasses, which they afterwards level and sow with grain. The provinces that lie to the north and west produce wheat, barley, several kinds of millet, tobacco, pease which are always green, with black and yellow pease, that serve instead of oats for horses. They also produce rice, but in less quantity, and, in some places, of such a hardness as to require extraordinary boiling.

The southern provinces produce great quantities of rice, as the land lies low, and the country abounds much in water.

One method of watering the ground seems to be peculiar to this country, and affords a striking instance not only of the invention, but the laborious application of the people to the practice of husbandry. The fields which are of the same level are divided into plots, but where great inequalities occur, these are cut into stories in the form of an amphitheatre; and moisture being necessary to the growth of the rice, the farmers make reservoirs at proper distances, to retain both the rain and the water that descends from the mountains, for the purpose of distributing the collection over the adjacent fields. The conveyance is performed by means of a hydraulic engine, extremely simple in construction as well as management. It is composed of a great number of small pieces of board, six or seven inches square placed at equal distances, and strung through the middle in the form of a ring. This chain is laid in a wooden trough made of three planks, in such a manner that the lower part of the ring lies at the bottom of the cavity, which it exactly fills, and passes round a moveable cylinder that turns on an axle: the upper part of the ring is supported by a kind of drum, furnished with small boards, so fixed that they tally with the boards of the chain. This drum, when turned about by a power applied to its axle-tree, puts the chain in motion, the inferior part of which being plunged into the water, and the upper part placed at the same height to which the fluid is to be raised, discharges it in a continued stream, by means of a tube, on the spot that is intended to be watered. This engine is likewise used for the cleansing of canals, on which occasion all the peasants in the neighbourhood assist at the operation.

The soil is so light that they plow with a single buffalo or heifer; after which they clean the ground of all weeds, and if the field be intended for rice, they drench it plentifully with water. They sow the rice in small beds or plots, whence, having attained to the height of six or eight inches, it is transplanted in straight lines, as our gardeners do their beans. The growing crop is constantly supplied with water till it is almost ripe; when, the water being dried up, they cut, and frequently also thresh it out in the field. This species of grain has an ear nearly resembling that of barley, and usually grows four feet, or sometimes two yards high.

They prepare the ground for wheat and barley by grubbing up the grass and roots, and burning them with straw; after which, and having sifted the earth fine, they lay the seed in a straight line in drills, not according to the common practice in other countries.

It is usual with the Chinese to bury in the rice-fields balls of hog's-hair, or that of any other animal, which they imagine enriches the land, and meliorates the crop. On this account, those whose business it is to shave the head, are very careful of preserving the hair for the market. The price of this article is generally a halfpenny a pound, and barks may be often seen loaded with no other commodity.

Whea

When the plant begins to ear, if the land be moistened with spring-water, they mix quick-lime with it, from an opinion that it kills worms and insects, destroys weeds, and increases the fertility of the ground.

It is remarkable that the Chinese have no meadows, natural or artificial, nor have the least conception of fallowing, but sow all their lands with grain. So far, however, is the ground from being exhausted by this uninterrupted course of agriculture, that it annually yields two crops. With manure, as a manure, they are totally unacquainted, but make use of common salt, lime, ashes, and all sorts of animal dung, particularly ordure. Urine also is universally preserved for the same purpose, and sold to advantage. Instead of hay, their horses, buffaloes, and other labouring animals, are fed with straw, roots, beans, and grain of every kind.

Amidst all the attention bestowed on husbandry by this industrious and economical people, their hopes of a plentiful harvest are often disappointed by the prodigious swarms of locusts with which many of the provinces are visited, which happens particularly when great floods are followed by a very dry season.

The peculiar prosperity of agriculture in this country seems to be greatly owing to the high estimation in which it is universally held. We are informed that, through a long succession of ages, it has been the ambition of every emperor to merit the distinction of being the first husbandman in the realm; and two instances are mentioned of persons being nominated to the royal dignity, on no other account than that they had cultivated their humble farms with extraordinary application and success. To honour and protect this useful art appears to be one of the most important objects of government; and the practice of it, as well as receiving encouragement by advantageous privileges, is farther promoted by an annual solemnity, to which the history of no other people affords any similar example. On the fifteenth day of the first moon, in every year, which generally corresponds to the beginning of March, the emperor in person performs the ceremony of opening the ground. In great pomp he proceeds to the field appointed for the ceremony, accompanied by the princes of the blood, the presidents of the great tribunals, and a vast number of mandarines. Two sides of the field are occupied by the emperor's officers and guards; the third is allotted for the husbandmen of the province, who repair hither to behold their art honoured and practised by their sovereign; the fourth is reserved for the mandarines.

The emperor entering the field alone, prostrates himself on the ground, and nine times strikes his head against it in adoration of Tien, the God of heaven. Afterwards, in a prayer composed by the tribunal of public rites, he invokes the blessing of the Almighty on his labour, and that of his people; when, in quality of grand pontiff of the empire, he sacrifices a bullock, which he offers up to Heaven, as the origin of all happiness. While the assistants cut the victim in pieces, and place it on the altar, the emperor is presented with a plough, to which are yoked a pair of bullocks magnificently caparisoned: then laying aside his royal robes, he takes hold of the handle of the

plough, and turns up several furrows the whole length of the field; when, with a complaisant air, resigning the instrument to the mandarines, they successively follow his example, emulating each other in performing this honourable labour with the greatest dexterity. The ceremony ends with distributing money, and pieces of stuff, among the husbandmen present; the most active of whom finish the remaining labour, before the emperor, with great alacrity and address.

Some time after, when the lands are sufficiently prepared, the emperor returns to the field in procession, and begins the sowing of the grain, in the presence of his usual retinue and the husbandmen of the province.

Similar ceremonies are performed on the same day in all the provinces of the empire, by the viceroys, assisted by all the magistrates of their departments.

As a farther incitement to agricultural industry, the viceroys of the several provinces send every year to Peking the names of such husbandmen as have particularly distinguished themselves in their employment. These names are presented to the emperor, who confers on those who bear them some honourable title, as a mark of the royal approbation. But if any person has made an useful discovery, which tends to the improvement of husbandry, he is invited to the capital, his journey being defrayed at the public charge, where he is introduced to the emperor, who, after a reception full of the most attentive affability, sends him home, not only distinguished by honourable titles, but loaded with benefits and favours.

The Chinese ascribe the invention of the plough, and several instruments of agriculture, with the proper method of sowing wheat, rice, barley, and other grains, to some of their emperors; whose successors are said to have written treatises on tillage, the nature of soils, and the manure proper for each, which serve to this day as the standard of practice on those subjects. It is certain, however, that the patronage shewn by the monarchs of this country is productive of the most beneficial effects to the state, and merits the imitation of other sovereigns.

The gardening of the Chinese appears to be regulated by the same fantastic taste that is observable in the style of their buildings. The beauties of nature are those which they justly admire; but in endeavouring to copy her, they constantly deviate into the finical intricacies of art. We seldom meet here with avenues or spacious walks, as in our European plantations; but the ground is laid out in a variety of scenes, where the visitant is led by winding passages cut in the groves, to the several points of view, each of which is marked by a seat, a building, or some other object. The perfection of their gardens consists in the number, beauty, and diversity of those scenes, to which they give the different appellations of pleasing, horrid, and enchanted. Their enchanted scenes answer, in a great measure, to what we call romantic, and in those they make use of several artifices to excite surprize. Sometimes a rapid stream or torrent is conducted under ground, the noise of which strikes the ear of a stranger, who is at a loss to know whence it proceeds. At other times the rocks, buildings, and other objects

which

which form the composition, are disposed in such a manner that the wind, passing through various interstices and cavities, causes strange and uncommon murmurs; while different kinds of trees, plants, and flowers, with a variety of the rarest birds and animals every where occur, and complicated echoes, from innumerable places, reverberate the mixt modulation of vocal and inanimate sounds.

In their scenes of horror, they introduce impending rocks, dark caverns, and impetuous cataracts rushing down the mountains from all sides; the trees are apparently shattered by the violence of tempests; some are thrown down, and intercept the course of the torrents; others seem as if blasted by lightning: the buildings are some in ruins, others half consumed by fire; and some miserable huts scattered in the mountains serve both to indicate the existence and wretchedness of the inhabitants. Those scenes are generally succeeded by such as are of a pleasing kind, for the sake of producing the stronger contrast.

When the ground is extensive, and a multiplicity of scenes is to be introduced, they generally adapt each to one particular point of view; but where there is not room for variety, they endeavour to remedy this defect by such a disposition of the objects, that being viewed at different stations, they afford appearances totally distinct. In their large gardens they contrive different scenes for morning, noon, and night, erecting, at the proper points of view, buildings adapted to the recreation of each of the seasons. The climate being generally exceeding hot they employ a great deal of water in those scenes of amusement; with which the smaller gardens are frequently so much covered, that nothing is to be seen but some islands and rocks: the latter of these are formed of a kind of stone found on the southern coasts of the country; the manufacture of them gives employment to a great number of people, and is particularly cultivated by the Chinese.

A large Chinese garden may be considered, in some degree, as an epitome of the universe; consisting of a multiplicity of uncommon objects, disposed in innumerable modes of arrangement, it is particularly calculated to gratify the spectator with those perceptions of pleasure which arise from novelty and surprize; though it seems to be rather the offspring of exuberant whim and conceit, than of a great and regular imagination.

*Of the persons of the Chinese—dress—diet—diversions—festivals—salutations—miscellaneous customs.*

**I**N the southern provinces of China, the men are generally a good deal under middle size, and of a tawny colour; but towards the north both their stature and complexion are improved. They have flat broad faces, black hair, little dark eyes, short noses, and thin beards; pulling off the greater part of them with tweezers, instead of shaving, and reserving only whiskers, with some long hairs on the bottom of the chin. The nail on the little finger of the left hand is suffered to grow upwards of an inch and a half long by people of condition, and scraped and polished with great care,

being universally considered as one of the distinguishing marks of a gentleman. Before their conquest by the Tartars, the Chinese used to wear their hair of great length, and tie it up as our women do in a roll; but since that period they have been commanded to cut it off upon pain of death, and to go after the Tartar fashion with their heads shaved, leaving only one long lock hanging from the crown, over which they wear a cap in the form of a bell. This covering, however, not coming so low as their ears, they carry a fan in their hands to defend them from the sun. Their garments consist of a long vest, that reaches to the ground, having one lapel folded over the other towards the right side, where it is fastened with five or six gold or silver buttons. The sleeves, which are large towards the shoulder, grow narrower by degrees, and, ending in the shape of an horse shoe, leave nothing to be seen but their fingers. They gird themselves with a large silken sash, the ends of which hang down to the knees. They never appear abroad without hoots, but the form of those is different from ours, having neither heel nor top: such as are used on a long journey are made of leather or black pinked cotton, but in the towns they are generally made of satin, with a border of plush or velvet upon the knee. Within doors, instead of shoes, they wear pattins of black linen, or silk, which flick close to the feet by means of a border that covers the heel. In summer they wear a pair of linen drawers under the vest, which is sometimes covered with another pair of white taffety; and during the winter they use fatten breeches, with cotton or raw silk quilted in them; but in the more northern parts these are generally made of skins. Their shirts are made of different kinds of cloth, according to the season, and are very wide and short; under which, in summer, to prevent them from sticking to the skin, some wear a silken net. Their vest in the winter is generally lined with sheep-skin, or sable imported from Tartary. When they visit any person of quality, or go abroad, their dress is a long silk gown, for the most part blue, girded about the loins; over which they wear a black or violet cloak, that reaches almost to the knees, and is accommodated with wide and short sleeves. These, with a pyramidal cap, for the most part covered with tufts of silk or red hair, a fan in their hands, and stuff boots on their legs, are the usual habiliments of a Chinese man of fashion. The outward appearance of those people is exceedingly grave and modest, in so much that an air of levity, or the style of gallantry, would be considered by them as offences of a very criminal nature; but such indeed is the chastity of the nation, that their language hardly contains one word which expresses the most delicate emotion of virtuous love, far less a lascivious idea.

The features and complexion of the women approach much more to the European comeliness than those of the men, and though they have small eyes lying deep, and flat noses, they are for the most part highly agreeable not only in their faces, but their shape. Little sect, however, they esteem their principal beauty; to attain which, those parts are so fettered in their infancy, that they never grow to their natural size; the foot of a woman being no bigger than that of a child of three

*Physiognomy—Manners—Institutions—Customs*

**I**N the southern provinces of China, the men are generally a good deal under middle size, and of a tawny colour; but towards the north both their stature and complexion are improved. They have flat broad faces, black hair, little dark eyes, short noses, and thin beards; pulling off the greater part of them with tweezers, instead of shaving, and reserving only whiskers, with some long hairs on the bottom of the chin. The nail on the little finger of the left hand is suffered to grow upwards of an inch and a half long by people of condition, and scraped and polished with great care,

indeed is the chastity of the nation, that their language hardly contains one word which expresses the most delicate emotion of virtuous love, far less a lascivious idea.

The features and complexion of the women approach much more to the European comeliness than those of the men, and though they have small eyes lying deep, and flat noses, they are for the most part highly agreeable not only in their faces, but their shape. Little feet, however, they esteem their principal beauty; to attain which, those parts are so fettered in their infancy, that they never grow to their natural size; the foot of a woman being no bigger than that of a child of three years

years old. This capricious custom obliges them to move very awkwardly; but by the no less arbitrary custom of being entirely excluded from public life, and all social intercourse with the other sex, it is not much that they indulge themselves in walking. The head-dress of the Chinese ladies consists of several curls, interspersed with little tufts of gold and silver flowers, or other ornaments of the same substance. The young ladies wear for the most part a kind of crown made of pasteboard, and covered with fine silk, the front of which rises in a point above the forehead, and in some covered with diamonds. In those, the upper part of the head is adorned with flowers, either natural or artificial, mixt with small bodkins, the ends of which shine with jewels. Elderly women, however, particularly of the lower class, are contented with a piece of fine silk wrapt several times round the head. Their gowns are very long, and cover them from head to foot in such a manner, that nothing but their face can be seen. Their hands are always concealed under long wide sleeves, which almost drag on the ground. Their garments are of different colours, red, blue, or green, according to their fancy; but violet or black is worn only by elderly women. On their feet they wear embroidered shoes, with long piqued toes. The whole dress of the Chinese ladies is such as sets off the uncommon modesty which appears in their looks and deportment.

In the dress of the Chinese, especially the men, the ear is always left bare, and it is remarkable that among this people, this part of the body is universally long, broad, dangling, and of a substance rather fleshy than cartilaginous. To the custom of the ears being constantly exposed, is probably owing the kind of deafness so common in the country, that a Chinese who has attained his fortieth year, is seldom free from it. The nails of the ladies' fingers are never paired, but kept very clean: they allow them to grow more than two inches in length, to shew that they are not employed in servile work.

The Chinese not only use the same kinds of flesh, fish, and fowl as the Europeans, but even such as we should reckon abominable. In general, however, their food consists chiefly of rice, roots, and garden-stuff, with, frequently, broths and soups. Their meat is either broiled or boiled, and instead of bringing a joint to table, it is previously cut into square bits, of the size of dice. Salt or pepper are likewise never brought before company, but only used in dressing. They use neither table-cloth, napkins, spoons, knives nor forks, but instead of those, two little short sticks of ebony tipped with silver, with which they lift their meat very dextrously. Their tables and chairs are remarkably high; and at an entertainment, each person sits at a separate table, on which meat and rice are served in plate, or China cups and saucers. They eat their meat cold, but drink their liquor hot: of the latter, tea is the principal, which they always drink without sugar. In the morning a large tin vessel is made full of it, to serve the family for the day.

In the manner of conducting an entertainment they are of all people the most ceremonious. A person stands

No. 2.

in the room, whose business it is to keep time, and regulate the motions of the company in the exercise of the table. At a signal given by him they all lift the meat to their mouths at once, and afterwards drink by the same direction; in performing which they take the cup in both hands, first carrying it as high as the head, and then put it to their lips, without expressing any compliment to each other either in word or gesture. Not to observe punctuality in these motions is reckoned extremely rude. When a fresh dish appears, the company again flourish their chopsticks, and having taken two or three mouthfuls, the master of the ceremonies makes a sign for them to conclude the repast; at which they all lay down their instruments with the same exactness of discipline. The liquor is next presented, of which they sip a little: by the etiquette, however, they are not obliged to drink unless they please, though it be absolutely necessary that they accompany each other in the motion of the cup. They remain silent at table three or four hours, till the master gives the signal to rise; when they walk into the garden, and afterwards return to a desert, consisting of dried fruits and sweet meats, which they eat with their tea.

They use no wine, though they have plenty of grapes; but they make a strong liquor, resembling mum, by an infusion of wheat in boiling water; and a distilled spirit from rice, which is always drank hot, and reputed by our European sailors to be of a very innocent quality.

When the ceremonies of the table are concluded, it is usual to introduce a set of players for the entertainment of the company. No women are allowed to bear any part in those theatrical performances, but the female character is personated by young men or boys of an effeminate air and countenance. The exhibitions are either of the tragic or comic kind, but generally of both in succession; the subjects of the former being chiefly taken from the life and heroic actions of some brave man among their ancestors. The players are habited in sumptuous dresses, and are said to perform with great propriety both of gesture and expression; often sensibly affecting an European spectator, though ignorant of the language with which the action is accompanied. The public plays are generally concluded either with tumbling, and combating with wild beasts, or by some humorous pantomime.

The Chinese are wonderfully addicted to gaming, for so grave and industrious a people, and they practise all the kind's with which we are acquainted in Europe; such as cards, dice, chess, &c. Of those the latter is so fashionable, that it is reckoned a necessary part of the education of young women, with whom it seems to occupy the place of dancing. This extraordinary propensity is the more surprising, as the indulgence of it is prohibited by the laws; notwithstanding which there are instances of men who have so immoderately given way to their passion, as to play away their estates, wives, and children, at hazard upon a card, or a single cast of the die.

The greatest festival in the country is that of the lanterns, which is celebrated by all ranks of the people

D

with

with a profusion of expence. On this occasion, a multitude of idols are set up in different quarters of the towns and villages, round which the inhabitants assemble in fantastic habits and masks. Thus dressed, a great number make the circuit of the place, either riding upon asses, or a-foot, while before them marches a long procession of lanterns carried on poles. Those vehicles, which are of various forms, are lighted with many lamps, and accompanied with the discordant rattling of drums and instruments of brass. The chief solemnity, however, is to be seen in the pagodas and the palaces of the great mandarines, where some of the lanterns cost no less than two or three hundred crowns. They are hung up in the stateliest halls, some of them being twenty cubits square, and illuminated by a vast number of lamps and candles, the light of which displays the paintings, while the smoke communicating motion, the figures within the lantern are variously agitated in a thousand different directions: there may be seen horses galloping, carts drawn, ships under sail, armies marching, and innumerable deceptions too tedious to be mentioned. This splendid festival is celebrated on the fifteenth of February, when the whole extent of China appears as a general conflagration, from the multitude of illuminated lanterns, and of the curious fire-works, in which the inhabitants of this country excel all the nations of the world.

Another great festival is kept at the conclusion of the old year, and the beginning of the new, which always commences with the first new moon subsequent to the fifth of February. On the last night of the old year, in all houses, the sons kneel before their fathers, the younger brothers before the elder, the servants before their masters, &c. touching the ground with their heads, in token of the highest respect. The same ceremony is performed by the women among themselves. Previous to this scene, the masters of the families prostrate themselves before the pictures of their ancestors, touching the ground likewise thrice with their heads. The whole family meet afterwards together, and a great feast is made. Such is the superstition of some, that on this occasion, they will not admit a stranger among them, nor even one of their nearest relations who is not of the household, from an apprehension that the happiness of the family might incur the danger of being transferred. The morning of the new year is ushered in with burning incense to the idols in the pagodas, after which every house-keeper rejoices at home with his family; but on the next of the following days during the space of a whole month, they visit their friends, which is sufficiently performed by leaving it written on a piece of red paper, that they had been to wait on them. All the shops are shut, and the inhabitants, in their gayest dress, universally employed in feasts, sports, and plays. In a word, the whole empire is in motion, and nothing is heard but demonstrations of pleasure and joy.

The usual way of salutation in China is to lay the hands across the breast, and bow the head a little; but when extraordinary respect is to be shewn, the hands are joined, and carried almost to the ground, the body being at the same time bent forward in an attitude of

the profoundest reverence. In passing by a person of eminent quality, or receiving such into the house, the custom is to bend one knee, and remain in that posture, till he who is saluted puts an end to the compliment, by vouchsafing to raise the other party, which is always immediately performed. But when a mandarine in office appears in public, it would be reckoned a mark of great insolence to accost him with any salutation, unless when there is occasion to speak with him. The rule in such cases is, stepping a little aside, to keep the eyes on the ground, and the arms across the sides, till he be gone past.

Very intimate acquaintances are permitted to make visits without ceremony, but those who are not on this footing must conform to certain modes which arbitrary custom has prescribed from time immemorial. The visitor dispatches his servant before with a piece of red paper, on which are written his own name, and a great many marks of respect to the person he visits, according to the rank he maintains. The message being delivered, the visitor enters the house, where, if the host be of superior quality, he is generally received with much state; but if otherwise, when they come into view, they run towards each other, and make a low bow. Very few words are interchanged by the parties during the whole visit, and such compliments as pass are entirely in the established form. Should it happen that they meet without doors, they make a halt at every gate, where the ceremonies begin afresh, and mutual bows are renewed to decline the honour of precedency. On this occasion they only use two ways of speaking: these are, *tsin*, "pray be pleased to enter," and *ponkan*, "it must be so." Each repeats his word four or five times, when the stranger, suffering himself to be persuaded, goes on to the next door, where the ceremony commences anew.

When they arrive in the room where the interview is to be held, if the company consists of several persons, they stand in a row, and every one makes a low bow. Then follow the ceremonies of kneeling, and retiring to different sides of the apartment to give each the right hand. The chairs are next saluted with compliments, to which they likewise are entitled by the inviolable laws of ancient usage; when, after another stated ceremony in mutually declining the first place, the company at length take their seats, which are ranged in such a manner that one is opposite to another. The next part of the ritual is to sit straight, with the eyes fixed on the ground, the hands stretched on the knees, the feet even, not across, a grave composed behaviour, and not to be over forward to speak. The Chinese think that a visit consists not so much in conversation, as in formal compliment and ceremony; and so much are they governed by this opinion, that it is positively affirmed some visits are made without a word being spoken on either side.

During the visit, the tea goes round two or three times, when different ceremonies are also to be used, at taking the dish, carrying it to the mouth, and returning it to the servant. The same forms which preceded the seating of the company are punctiliously repeated at their rising. In a word, their visits are equally

equally ceremonious as the r feasts, which seem to be not so much intended for eating as the making of grimaces; and it is with good reason that, at the court of Peking, ambassadors are allowed forty days to prepare for an audience of the emperor, lest they should omit any of the numerous and whimsical evolutions necessary to be practised on that occasion.

The grandees in China follow the example of the western Asiatics, in keeping eunuchs to attend them; who also are their counsellors, and chief confidants. Their principal business is to take care of the women, who employ themselves in painting, embroidery, and needle work. Castrating is here a frequent trade; and many parents, when apprehensive of not being in a condition to maintain their male children, subject them to this operation, as the means of obtaining a livelihood.

There are no barristers or lawyers in China; every man is permitted to manage his own cause, and if he thinks himself aggrieved by an inferior, he may apply to a superior court. It appears, however, that in all the tribunals, from the highest to the lowest, bribery is notoriously practised; and its influence extends to the most flagrant evasion of justice, even in crimes of the highest enormity. The common punishment for small offences is the bastinado; but of the capital kind, there are several. Persons of mean rank have their heads cut off, while on the contrary those of eminence are strangled; and in cases of treason recourse is even had to the torture.

#### C H A P. VI.

##### *Of Arts—Manufactures—Commerce—Money.*

**A**MIDST all the invention of the Chinese, they discover but an indifferent capacity for any of the elegant arts. Their genius seems to be ill adapted to poetical composition; their music is the most rude and barbarous that can be conceived; their paintings of human figures are rather caricatures than beautiful copies of nature; and their architecture is no less destitute of sublimity of design, than redundant in those fantastic embellishments that characterize a puerility of taste. In such arts, however, as are more immediately useful to society, they have doubtless made considerable progress; and in the discovery of that of printing in particular, though their method be both peculiar and defective, they seem to have preceded the Europeans by the space of many centuries.

Their usual manner of printing is thus: the manuscript being previously executed by a good writer, upon a fine, thin, and transparent paper; the engraver passes every sheet upon a plate of smooth wood, following the traces with his instrument, and carving out the characters in bas relief. They make no use of a press, both on account of the nature of their plates and the thinness of their paper; and likewise for the latter of those reasons, they only print one side.

They make their paper either of cotton, or the inner bark of the bamboo, and other trees: the former

of those is reckoned the most durable, but they are all exceedingly subject to the moth. Instead of pens, the Chinese use a pencil made of the hair of some animal, especially of rabbits, as being softest. This they hold perpendicularly, not obliquely as painters, beginning at the top, but writing from the right to the left in the manner of the Hebrews. Their ink, known likewise by the title of Indian, is not a fluid, but solid substance. It is made of lamp black, of several kinds, but the best is that obtained from hogs grease; with which they mix a sort of oil, to render it more smooth, and add some odorous ingredients.

The staple manufacture of the Chinese is that of silk, with which, besides their home consumption to a prodigious amount, they furnish several both of the Asiatic and European nations. Plain silks are the kind to which they chiefly confine themselves, though they also make cloth of gold; but they do not fabricate the gold into wire, as in Europe, being contented with gilding a long sheet of paper, afterwards cut into small pieces, with which the silken threads are ingeniously covered. When this cloth first comes from the workman's hands it is very elegant, but does not last long, and is unfit for garments; because the lustre of the gold is soon tarnished by the air. For furniture, however, it is found to answer sufficiently well.

The Chinese have likewise a great number of other silks unknown in Europe, as well as gauzes, damasks of all kinds and colours, striped satins, taffeties, grograms, &c. Although wool be very plentiful in China, especially in the provinces of Shan si and Shen si, which abound with sheep, yet they make very little cloth; blankets, and a sort of russet woollens, of which their students have gowns for the winter, being almost their only manufactures of this kind. English cloth is much esteemed among them, and sells dearer than the richest silks.

They manufacture a great deal of cotton, and make a kind of linen of a plant called co, found only in the province of Fo kyen, and is a species of the former. One of their principal commodities, however, is the porcelain manufacture, so well known by the name of the country in which it is produced. It is almost inconceivable what a number of people are employed in this manufacture; there being hardly a piece of porcelain that does not pass through more than sixty hands before it is brought to perfection. In smoothness of polish, and elegance of shape, it is not inferior to any production of human dexterity; and it is only to be regretted that its painting is not equally excellent. The flowers and landscapes indeed are sometimes executed with elegance, and the borders are prettily variegated; but the human figures appear to be the designs of a wild and extravagant imagination. Several circumstances contribute to keep the price of this manufacture much higher than might be expected, considering the vast quantity that is annually made by those people. One reason is, the miscarriage which frequently happens in the baking of it: another, the increasing scarcity of the materials, and the wood made use of for burning. To which may

may be added, as not the least considerable, that the porcelain ware intended for Europe is generally formed on new models, executed often with great difficulty, which yet for the smallest defects are returned upon the hands of the manufacturer; who not being able to sell them to the Chinese, because not to their taste, is obliged to put a higher price upon the porcelain he vends, to indemnify himself for what is refused.

Japanned works are likewise a capital production of the Chinese, though in this article they are excelled by the inhabitants of Japan; not however from any defect of ingenuity, but on account of their executing this kind of work with too much expedition, which ought to be done with leisure, that the varnish may appear to advantage.

The internal trade of China is so great, on account of the facility of transporting merchandize by means of the rivers and canals, that they maintain but very little commerce with any nation far distant from their own; though since the conquest of the Tartars, their ports have been open to all foreigners. Japan however is a kingdom which they often frequent, and commonly set sail for it in the month of June or July. They likewise carry on a trade with Camboye or Siam; to which they export such commodities as are proper for those countries, bartering them with others that there is a demand for at Japan. By this trade it is usual to make two hundred per cent. on the voyage. They also carry on a great trade to Manilla, and a yet more flourishing commerce with the island of Batavia.

In respect of the commerce maintained with China by European nations, that of England is very considerable. The profit of the English in this traffick arises chiefly from the goods imported from that empire, and not from what are carried thither: we pay with silver the greater part of what we purchase. Lead is almost the only commodity for which our merchants get more than prime cost. We also export scarlets, blue, black, green, and yellow broad cloths; but the remnants procured cheap in England, turn to better account than whole pieces. Of those the Chinese make long purses, which hang by the side from their girdles.

The following goods turn also to considerable account, if they can be conveyed ashore without paying the duties, otherwise the charge and trouble will be equal to the profit. These are, large looking glasses, coral branches, flint ware for cups, ordinary horse pistols with gilt barrels, old wearing apparel of scarlet or blue cloth, sword blades about fourteen shillings a dozen, spectacles set in horn, about eight shillings and sixpence a dozen, clocks and watches of small price, small brass tweezer cases, and any new toy not before imported.

The commodities imported from China, are teas, porcelain, quicksilver, vermilion, and other fine colours; china root, raw and wrought silks, copper in bars of the size of sticks of sealing wax, camphire, sugar-candy, fans, pictures, lacquered wares, soy,

borax, lapis lazuli, galingal, rhubarb, gold, with many things made of mother of pearl.

To trade to China with success, a great deal depends on a person's knowledge of what things are likely to sell in England, and the usual price at which they are furnished. Previous to such a voyage therefore, an adventurer ought to consult with the hard-ware, china or toy merchants in London, as being the persons best qualified to give information on those subjects.

Particular care ought to be taken in dealing with the Chinese to avoid imposition; for of all people they are the most addicted to cheating. Their weights and measures are generally false, and their balances so formed, that with dexterity in the use of them, the stipulated quantity of goods will be greatly diminished to the purchaser. They have been known to cram their poultry with stones and gravel; they have sold for a gammon of bacon, a piece of wood covered with the skin of a hog; and where they have been trusted in package, damaged goods, or things of no value, have been artfully substituted in the room of secreted commodities, and the deception not discovered till the unpackage in England.

The only coin in China is the li or cash, made of the scum of copper mixed with other coarse metal: it is a little broader than our English farthing, but not so thick, with some Chinese characters on the sides, and in the center of each is a square hole, in order to put them on a string for the ease of numbering. When convenience will not permit the use of this small coin, they have recourse to plates of gold or silver, which they clip with a pair of scissars, weighing afterwards the quantity, and usually practising in this operation no less artifice and deceit than in other parts of their commerce.

#### C H A P. VII.

*Of Marriages — Funerals — Confucius — Religion — Language — Sciences — History — Character.*

ONE of the institutions in China most unfavourable to domestic happiness, is the manner in which marriages are conducted. The bridegroom is not permitted to see the woman he marries, till the instant of solemnization arrives. Before that time, his inquiries concerning her person and accomplishments can only be gratified by her parents, whose interest it may be to deceive him; or he must take the report of old women, who are no less mercenary than the former. The custom of the Chinese is to buy their wives, for whom they pay various prices, according to particular circumstances. When the parties are agreed, the contract is made, and the stipulated sum paid down. On the day of marriage, the bride is carried in a sumptuous chair, before which proceeds a band of music, accompanied with the particular friends of her family. All the portion she brings is her marriage garments, and household furniture, with which she is presented by her father. The bridegroom stands at his door, richly attired, to receive

receive her. He opens the sedan in which she is carried, and having conducted her into a chamber, introduces her to several women invited for that purpose, who spend there the day in feasting and merriment, while the husband in another room entertains his friends and acquaintance. There are some instances of the bridegroom having sent immediately the bride back to her relations, when upon opening the chair he has been disgusted with her personal appearance; but on such occasions he has no claim to a restitution of the money which he had paid.

By the laws of China, the husband is allowed to divorce his wife only for adultery, and a few other exceptions, for which there is rarely any foundation. In such cases, he is at liberty to sell her, and purchase another; but if the transaction takes place without just reason, both the buyer and seller are severely punished, yet the husband is not obliged to take her again.

A man is permitted but one wife, but may have as many concubines as he pleases. All the children have an equal claim to the father's estate, though the mothers of the illegitimate be entirely under the authority of the wife.

The Chinese in general are so jealous of their wives, that they suffer them not to speak in private even with their own brothers. Some husbands, however, there are, who allow their spouses to commit adultery with perfect freedom; and sometimes a grant of this liberty is stipulated by the female before marriage. But such families are usually held in abhorrence, and their children, however deserving, can obtain no degree, or be employed in any honourable office.

Among the Chinese, the being well buried is considered as a matter of the highest importance: for which reason, every man, while living, takes care to provide his own coffin. The size of this must be large, and the outside of it sumptuously adorned, if his circumstances allow. A fortunate place must likewise be fixed upon for the interment, the choice of which is usually referred to the fortune-teller; but no person can be buried within a city.

As soon as the father is dead, the son in a furious manner tears down the curtains of the bed, and with them covers the body. He then prostrates himself with his hair all dishevelled, and soon after sends his servants to the kindred and friends, informing them by letter of what has happened. To receive them, the largest apartment is covered with mats or white hempen cloth, that being the colour of their mourning. The body mean while being wrapt up in fine thin silk, is put into the coffin, which is afterwards shut; when placing it at the upper end of the room, the son stands by it, clad in white hempen cloth, with two girdles of thick rope round his body, the ends hanging down to the ground. It is indispensable, that for several months he lie every night close by the coffin, upon no other bed than some straw. Luxury, particularly flesh, must be totally banished from his table, and he is obliged to continue the appearance of mourning for the space of three years.

The religion of the Chinese may be distinguished into three principal sects, namely, that of the literati  
No. 2.

or learned, the professors of the doctrine of Lanza, and thirdly that of the commonalty. In respect to the first of those, the object of their institution appears to be of a mixed nature, comprehending both the public good of the kingdom, and the happiness of individuals; the latter of which they consider as the result of virtuous actions, governed by the dictates of reason, and therefore give particular application to the science of moral philosophy. The origin of this sect is ascribed to Confucius, of whom it may not be improper to deliver a general account.

This celebrated personage is said to have been born in one of the provinces of China, about five hundred and fifty-one years before the birth of Christ. By his father he claimed descent from an emperor of the race of the Chang, and his wife was likewise sprung from one of the most illustrious families in the kingdom. He appears however to have enjoyed no other inheritance than that of an honourable ancestry. His improvement in knowledge is said to have been amazingly rapid; and by an uncommon gravity in deportment, he gave prefaces in his earliest years, of the great proficiency in moral science to which he should afterwards attain. But what chiefly distinguished him was an extraordinary degree of piety. He never eat any thing, but he first prostrated himself on the ground, and paid adoration to the supreme Lord of the universe. He greatly honoured his relations, and particularly endeavoured to imitate his grandfather, who was then alive in China, and reputed a most holy man. After the death of this venerable progenitor, Confucius applied himself to Teem-se, an eminent doctor of his time, under whose direction he made great progress in the study of antiquity, which he considered as the source from which all genuine knowledge was to be derived.

At the age of nineteen Confucius married, and had by his wife a son, named Pe-yu. He divorced her however, after a cohabitation of four years, that he might devote himself more entirely to the propagation of his philosophy over the empire, which he meditated to reform from the corruption of manners in which it was at that time involved. He began by enforcing the great virtues of temperance and justice; he recommended the contempt of riches and outward pomp; he endeavoured to inspire magnanimity and greatness of soul, and to reclaim his countrymen, by every argument, from voluptuousness to a life of reason and sobriety. His extensive knowledge and great wisdom soon rendered him universally celebrated; and he was no less beloved for his extraordinary virtues, than admired for the endowments of his understanding. Kings were governed by his counsels, and the people revered him as a saint. Several high offices in the magistracy were repeatedly offered to him, which he sometimes accepted with the view of being serviceable to the state; but he never failed to resign them, as soon as he perceived that the exercise of his authority could be productive of no public advantage. It appears however, that during a very short space in which he administered the affairs of the kingdom, a great reformation was effected. He corrected many frauds  
E  
and

and abuses in the mercantile transactions of life: he reduced weights and measures to a determinate standard: he inculcated fidelity and candour among men, and exhorted women to chastity and a simplicity of manners. But the severity of the precepts which he taught, not proving acceptable to the temper of a dissolute prince, he quitted his employment at court, and retired a voluntary exile into the neighbouring provinces, each of which was then a separate kingdom. He continued, however, to propagate the principles of his philosophy wherever he went; for which purpose he likewise sent a great number of his disciples into the various parts of China. Those he divided into four classes. The first were to improve the mind by meditation, and purify the heart by virtuous precepts; the second were to cultivate the arts of reasoning justly, and of composing elegant and persuasive discourses: the study of the third was to be employed on the rules of good government; and the fourth class was to deliver to the people the doctrines of morality, in a concise and polished style.

Confucius is said to have composed many valuable books, yet extant, on the subjects of moral science, in which, however, he modestly acknowledged, that he had only collected into a body the scattered fragments of preceding legislators and philosophers. According to the most authentic account, he died at the age of seventy-three, of a lethargy, occasioned by sorrow for the obstructions he had experienced in his endeavours to reform the manners, and promote the happiness of mankind. His death was universally lamented in all the provinces of China, the inhabitants of which have ever since honoured him as a saint, and established such a veneration for his memory, as never before was attained by a philosopher in any other age or nation. His sepulchre is visited at certain times by all the learned men in the empire, with almost enthusiastic idolatry; a thousand edifices, with inscriptions that mark the highest respect, have been erected in honour of his name; and his posterity, to this day, enjoy the peculiar distinction of being the only persons in China, except princes of the blood, who are entitled to the rank of nobility, in virtue of hereditary right.

With respect to the most essential doctrine of religion, the immortality of the soul, it appears that the followers of Confucius do not entertain uniform sentiments. The greater part of them regard the precepts of morality no farther than as they contribute to the happiness of the present life; while others, though not regarding immortality as a natural property of the soul, consider it, however, as the destined reward, and just retribution of virtue. This sect use neither temples, priests, idols, sacrifices, nor any sacred rites.

The second sect, which has at present but few followers, is denominated of Lanzu, from a philosopher of that name, contemporary with Confucius, and who, they pretend, was carried in his mother's womb during the term of eighty years. They believe that the sovereign God is corporeal, and governs other deities with authority similar to that of a king

over his subjects. They are much addicted to the same ridiculous notions respecting chemistry, which were the foible of those who cultivated that species of natural knowledge in Europe, about two centuries ago; believing that by means of a certain liquid, men may be rendered immortal. The priests of this sect particularly employ themselves in exorcism, arrogating likewise an uncontrollable dominion over the weather, with the additional power of averting both private and public calamities.

The third sect is that of the Bonzes, who have idols and deities represented in strange and monstrous figures; and among the rest, two famous through all the East, namely Amida and Schiaca. It is the principle of this sect, contrary to that of the learned, to take no care of the public, and only be mindful of their own interest. In some respects they bear a resemblance to the Epicureans of old; maintaining that the excellence of morality consists in avoiding vehement desires, and that the chief attention of a wise man ought to be, to pass his life without solicitude. They allow, however, the soul's immortality, and that it is rewarded or punished after death, according as it deserves; but they condemn matrimony, and live in common.

From these three sects have originated many others of inferior note; and an incredible multitude of idols proceeds from the erecting statues to men, who, for some memorable actions, deserved the gratitude of their country; as also from their opinion, that there are particular spirits in the woods, hills, rivers, and seas, to whom they consecrate representations of the same kind, in testimony of their pious attachment.

The Christian religion seemed once on the point of receiving the imperial sanction in China, through the indefatigable zeal of some missionaries. The prospect of such an event, however, is now totally vanished, though Christianity be tolerated in the empire, and the number of those who profess it is computed at two hundred thousand.

The Chinese are in nothing more remarkable, than for the singular nature of their language and alphabet, which are entirely different from those used in every other nation. In the language of this country, there is not an alphabet of a few characters, of which to compose words, but the latter have each a particular symbol, by which no other word is represented. Another peculiarity in this tongue is, that all the words are monosyllables, and are not originally above three hundred and twenty; yet, considered with their accents, they are sufficient to express all the ideas of the people. For this purpose, in writing, no less than fifty-four thousand four hundred and nine characters are used.

A few years ago Mr. Turbeville Needham, a fellow of the Royal Society, endeavoured to evince that there was a great connection between the hieroglyphical writing of the ancient Egyptians, and the characters which are in use at this day among the Chinese. What suggested this hypothesis, was the inscription on the bust of Turin, of which a cast was sent to England by the late Mr. Montague, and pre-

presented by his majesty to the British Museum. In order to determine the point, application was since made by the Royal Society to the Jesuits at Peking, in China, to consult the literati of that country, for their opinion on the subject. The result of the inquiry was, that the characters were not Chinese; having no connected sense, nor proper resemblance to the different forms of writing in that country.

The Chinese, we are informed, have two kinds of language, or perhaps they may be reckoned more properly different dialects of the same. The one, which varies in the several provinces, is spoken by the common people, and the other by mandarines and persons of rank. To these some add a third language, namely, that which is used in books composed in an elevated style. The style used by the Chinese in writing, is said to be concise, allegorical, and sometimes obscure, to such as are not perfectly skilled in the characters. Their expressions are animated, and interspersed with bold comparisons and metaphors.

From the representation here given of the language of China, it might seem to be extremely well adapted to poetry in particular, especially the lyric, which is the only kind used in the country. Of this species of composition they are said to have two sorts, one in measure, and the other without any regularity, in respect of the number of syllables. The latter consists entirely in the antithesis or opposition of thoughts; so that if the first thought be concerning the spring, the second shall be upon the autumn, or if the one relates to fire, the other must of consequence to water. It will readily be acknowledged, that sonnets written upon such a plan, afford too strong indications of childish conceit, to be considered as genuine productions of poetical genius; and we may safely conclude, as has been hinted on a former occasion, that the Chinese have very little pretension either to the ivy or the bay.

If the people of China were justly distinguished for any kind of literary composition, history seems the province to which they have the most plausible claim, at least in respect to the accuracy with which they are said to register the public events in their own country. According to the most candid opinion, however, which we can form on this subject, their most approved chronicles hardly deserve the name of history. They appear to be only jumble and incoherent materials, selected without judgment, and arranged without regularity; which neither awake the fancy, nor improve the understanding, and of which even the authenticity is greatly liable to suspicion.

The knowledge of the Chinese in medical subjects has been represented as extremely profound, owing perhaps to the air of mystery with which it is particularly distinguished. But though this circumstance may impose upon such as are unacquainted with the art, it affords to others the strongest presumption, that under the apparent mask of learning, ignorance is actually concealed. The multiplicity of frivolous distinctions relative to the pulse alone, it may be affirmed, were never drawn from faithful obser-

vations on nature; not to say that the fantastic and unintelligible jargon, in which they are described, characterize in the liveliest colours the chimerical proficiency and skill of a people, to whom even the elements of genuine science are almost utterly unknown. It is not however meant to insinuate, that the Chinese have never derived from experience any of the most simple observations, respecting the use of particular remedies in the endemic diseases of their country. Some degree of empirical knowledge in medicine is naturally acquired by every people, but such attainment can never be considered as any evidence, that the principles of the art are really cultivated amongst them.

The Chinese are said to have studied astronomy with particular success, and have made many hundred observations on eclipses, comets, and conjunctions. It is however an unquestionable fact, that they were obliged to the Romish missionaries for reforming the calendar: and though they likewise pretended to astrology, it appeared that their boasted accomplishment in that visionary art, amounted to no more than what a common juggler may perform. With some rude literature, of the moral kind, it must be acknowledged that they are not unacquainted: they have a great number of universities, and reckon two hundred and seventy-two libraries, well stored with books.

As China was totally unknown to the inhabitants of Europe before the fifteenth century, we can procure no other historical evidence, respecting their ancient state, than what is to be obtained from their own records; the first part of which is palpably fabulous, as themselves acknowledge; the originals of those of later date having been lost or destroyed. They pretend however, that their first monarch Fohi, who is supposed to have lived about the time of the flood, was sent down from heaven to instruct and govern mankind; and to him they ascribe the invention of cloathing, characters, and music. Having reigned a hundred and fifteen years, he was succeeded by Chint-ong, who taught them agriculture and physic; after whom are mentioned a long series of successive kings, who likewise proved each the author of some useful invention or improvement. Almost the only authenticated transaction, we find in their history, is the conquest of China by the Tartars, about the year 1644; since which time no event of importance occurs in their country.

From the account which has been delivered, of the manners and customs of the Chinese, the striking lineaments of their national character, may readily be traced. Trained up from infancy to the external command of their passions, and incumbered through life with an intolerable load of oppressive ceremonies, they contract towards each other a latent antipathy, the consequence of which is universal dissimulation, which breaks forth in a propensity to every species of artifice and fraud. Let it be acknowledged at the same time, that while, on account of the great extent of their empire, they live under such various climates, they are neither infected with the rude barbarity of the one extreme, nor the effeminate luxury of the other.

## O F T H E T A R T A R E A N N A T I O N S .

## C H A P . I .

*Of Chinese Tartary.*

Quitting the extensive empire which has hitherto employed our attention, we next enter Tartary, the ancient Scythia, a country that occupies the whole northern part of the Asiatic continent, and is divided into several distinct nations. The first of those we shall mention is the Niuche, Manchew, or Chinese Tartary, usually distinguished into the provinces of Keching Tartary on the East, and Tigurran and Solun Tartary on the West. It is situate between 105 and 135 degrees east longitude, and between 41 and 55 degrees north latitude; being bounded on the south by China, on the west and north by Russian Tartary, and on the east by the Pacific Ocean.

This country, which is naturally mountainous and barren, has been much deserted since the conquest of China, the seat of government being removed thither, and all the Tartars of distinction having followed the court. The inhabitants are generally of a robust constitution, and spend most of their time in hunting or fishing, which they practise rather as a necessary employment than diversion. Their game is chiefly wild deer, and those they hunt in a peculiar manner. Their method is to surround a large tract of country, driving the animals into a narrow compass, when they shoot or take them with nets, which are purposely made very strong.

The air of this country is excessively cold in the winter, occasioned by the wind blowing over the large tract of frozen territory, which extends towards the north. The Tartars eat all kinds of meat, except hogs; but are particularly fond of the flesh of horses, which the country produces in great numbers, and which are likewise preferred by the Chinese for their cavalry, as being much superior to their own breed. The common drink of the inhabitants is water, or mare's milk. They have very little wheat or rice; oats being almost the only grain which they cultivate; and of this they make their bread, as well as a species of fermented liquor. Notwithstanding their connection with China for upwards of a century, they seem hardly yet to have formed the smallest idea of civilization; continuing still to lead an itinerant pastoral life, without industry, arts, or commerce. Some towns, however, or rather mud-built villages, they have among them; the principal of which is Kirinula, situate in 44 degrees of north latitude, on the slope of a mountain. This was anciently the seat of their kings; and here are yet to be seen the tombs of the royal family, who governed the country before the conquest of China.

The brutal ignorance and depravity of these Tartars is in nothing more conspicuous, than for the adoration which they pay to the Great Lama, or priest of priests, a man, whom they ridiculously consider as a true and living God. It is the opinion of the people, that this personage is endowed with immortality; and, in

order to support the deception, a young man of a similar appearance, and secretly procured, is constantly in training by the inferior priests, with a view of succeeding to the divine honour, on the demise of the present incumbent; an event which is known only to those who officiate about his person. This wretched idol, however, is seldom permitted to end his days by a natural death: for as soon as he verges towards the decline of youth, he is usually dispatched by the priesthood, in order to preserve in the votaries a belief of his unfading age and eternal duration. Nor is the shortness of his life accompanied with any circumstance, which can compensate for his almost total exclusion from every human enjoyment; being one continued scene of solitude, imprisonment, and misery.

## T H I B E T .

The next nation of Tartars is that of Thibet. This country is bounded on the north by the land of the Calmucs, on the east by China, on the south-west by India, and on the west by Usbec Tartary. It is situate in a fine climate, between 30 and 40 degrees of north latitude; but is extremely mountainous, and on that account obstructs the passage between India and China by land. The people are governed by a cham or chan, the denomination of a sovereign prince in that part of the world; but whether his power be absolute or limited, we are not clearly informed. Those of the inhabitants who lie next China usually profess the common religion of that country; while such as border upon Usbec Tartary are generally Mahometans.

## U S B E C T A R T A R Y .

Usbec or Mogul Tartary is bounded by the country of the Calmucs on the north, by Thibet on the east, by India on the south, and on the west by Persia and the Caspian sea. It is a fine fruitful country, lying between 35 and 45 degrees of north latitude, and carries on a flourishing trade both with the eastern and western parts of Asia, by means of the two great rivers Oxus and Sihun. The capital of this country formerly was Samarcand, situate in 66 degrees of east longitude, and 40 degrees of north latitude, the birth-place of Avicenna the physician, and once the residence of the great Tamerlane; but the chief town at present is Bochera, lying on the river Oxus, about sixty miles south-west of the ancient metropolis. The people here, as in the other nations of Tartary, are divided into a great many hords or tribes, but subject to one monarch, their grand Cham; and they have acquired, by means of their extensive commerce, a considerable degree of civilization.

The achievements of the Usbec Tartars, previous to Tamerlane, are veiled in great obscurity, but under the conduct of that celebrated leader, the nation attained a degree of military renown, that is hardly to be surpassed in the history of any other people. This great personage was the son of Cham, the

the chief of all the Mogul tribes, and was born about the middle of the fourteenth century. He married the daughter of his uncle, another cham of the Moguls, to whose dominions he afterwards succeeded in virtue of his alliance. The first action by which he distinguished himself, was repulsing the Russians, who had invaded his country; when, after a total defeat, he obliged them to submit to such terms as he thought fit to impose. He treated with the like success an invasion of the Chinese; but not content with repulsing them, he pursued their army within the limits of their own country; demolished part of the great wall which they had erected for its defence; and making himself master of the capital city of Peking, reduced the emperor to the necessity of suing for peace, at the expence of a great yearly tribute.

The fame of his actions having reached the western parts of Asia, ambassadors were thence dispatched to him, imploring his protection against the furious Bajazet, emperor of the Turks, who was at that time the dread and scourge of all the contiguous nations. Tamerlane, listening to their proposals, set out on the expedition in a short time, accompanied by a numerous army of Tartars, and a great body of Russian auxiliaries. It is computed by some writers, that his force amounted to near a million of men. He first directed his route through the countries north of the Caspian sea, and then bending southward, passed mount Caucasus, continuing his march through Circassia, Georgia, and the territories situated between the Caspian and Euxine seas. The order and regularity maintained among the troops, during the whole of this march, deserves to be mentioned. If a soldier took but an apple, or bowl of milk, without paying for it, he was put to death: so strict a regard was paid by their leader, that nothing should be taken by violence in the countries through which he passed. To preclude the necessity of this resource, provisions for the army were carried by sea, besides such as were voluntarily furnished by the people through whose dominions they marched.

Having arrived at Sebastia, in Armenia, he summoned the city to surrender; but the garrison not complying, and also returning an insolent answer, he immediately invested the place, delaying however any attack for the space of a week. At the end of that time, the inhabitants, who had considered their situation as impregnable, were struck with amazement, at seeing the walls and towers, which had been undermined by the enemy, fall down on a sudden, and themselves reduced to the necessity of surrendering at discretion. According to the Turkish accounts, Tamerlane caused the soldiers of the garrison to be bound hand and foot, and thrown into pits that were dug for the purpose, where they were buried alive. So barbarous an act, however, seems not to be consistent with the general character of this prince, though resentment perhaps induced him to transgress, on this occasion, the bounds of moderation and humanity.

On the approach of Tamerlane, Bajazet advanced towards him with an army equally numerous, and, it

No. 2.

is said, superior in horse. The battle between them was fought at mount Stella, where Bajazet and his son Musa were made prisoners. At first the conqueror treated his royal captives with great lenity; till being provoked by the insolent language of the father, he is said to have put him in an iron cage, and exposed him to the ridicule of the soldiers; not exempting even the wives of the unfortunate tyrant from violation, and other marks of the most humiliating abuse. Since which time, for the sake of avoiding such ignominious accidents, it has been the custom of the Turkish emperors not to marry. In this wretched captivity Bajazet lingered two years, when, as some relate, he put an end to his miserable life by beating out his brains against the bars of the cage. The greater part of the Less Asia submitted to Tamerlane on this victory, among which was Prusa, the capital of the Turkish dominions; whither, while he remained at that place, the Christian emperor of Constantinople resorted, to congratulate him on the success of his arms.

Tamerlane afterwards made a visit to the emperor at Constantinople, and added several provinces of Asia to his dominions; restoring likewise to the little Mahometan princes, the territories of which Bajazet had deprived them. He next marched to attack the dominions of the sultan of Egypt, who was then possessed of Syria and Palestine, and had sent strong reinforcements to Bajazet's army. The first city which he besieged was Damascus, where meeting with an obstinate resistance, he put most of the garrison to the sword. Thirty cities of Syria opened to him their gates, in consequence of the general terror excited by this transaction; and arriving at Jerusalem, where the inhabitants had just before expelled the Egyptian garrison, he visited all the holy places frequented by the pilgrims, and made considerable presents to the church of the sepulchre. Proceeding afterwards to Egypt, he made himself master of Damietta, a strong city at the mouth of the Nile, and advancing to Grand Cairo, laid siege to the capital, in which was the sultan, with a garrison, as is said, of a hundred thousand men. After a long defence, the sultan retired to Alexandria, whence he fled to the desarts of Lybia, while the conqueror took possession of the city. During his residence at this place, above twenty princes from the coast of Barbary, and other parts of Africa, came and made their submission to him, at the same time giving him hostages as pledges of their inviolable fidelity. Leaving garrisons in all the chief towns, he returned towards his own dominions, by the way of Mesopotamia and Persia, which had been reduced to obedience by his generals, while he was in Egypt.

Upon the retreat of Tamerlane, Mahomet's sons reassembled an army, and recovered many places that had submitted to the arms of the conqueror; of which receiving advice, he prepared to return into Turkey, with the resolution of extirpating the whole Ottoman family; but death soon put a period to his victories, in the month of January, 1402. This prince was unquestionably one of the greatest generals of modern

F

times;

times; and, excepting a few excesses, into which the heat of conquest, and personal provocation, betrayed him, he was no less conspicuous for the humanity of his temper, than either his valour or success. Though educated in paganism, he was entirely above the influence of religious prejudices, and he seemed to be actuated more by a regard to liberty and human happiness, in the prosecution of his great undertakings, than either by thirst of dominion, or an ungovernable desire of martial glory.

Tamerlane left one of his sons emperor of Usbec Tartary, and another sovereign of India, whose descendants have since swayed the sceptre of that country, under the title of the great mogul. Usbec Tartary was conquered by the famous Kouli Kan, and united to Persia; but whether it has entirely recovered its independency since his death, appears to be matter of doubt. Under the government of Tamerlane, the Usbec Tartars were pagans, but were soon afterwards converted to Mahometanism, which they continue to profess.

## C H A P. II.

### *Of Astracan Tartary.*

THE kingdom of Astracan is bounded by European Russia on the north; by Siberia and the Calmuc land on the east; by the Caspian sea on the south; and by Circassian Tartary on the west. Astracan, the metropolis, is situate in the latitude of 47 degrees north, and 52 degrees of east longitude, in an island named Dolgoi, on the eastern shore of the Volga, about sixty miles from the Caspian sea. It was for many ages subject to the Tartars, from whom it was taken by Ivan Wassilowitz, czar of Muscovy, in 1557 retaken by them in 1668; and again reduced by the Russians, under whose dominion it remains. It is computed to contain about seventy thousand inhabitants, among whom are many Armenians and Tartars of various denominations, with a few Persians and Indians.\* The city is about two miles and a half in circumference, but including the suburbs, near five miles. It is surrounded by a brick wall in a ruinous condition, about two hundred years old. The houses are of wood, and most of them very mean. The Volga here spreads itself near three miles. In summer the inhabitants are generally disposed to sickness, on account of the marshy grounds in the neighbourhood. The adjacent country, however, being impregnated with salt, which appears on the surface, is extremely fertile, and the city is surrounded by gardens and vineyards, which lie about two miles from it, producing almost every kind of vegetables known in England, except potatoes, collyflowers and artichocks. Among the fruits of this place, the water-melon is particularly celebrated for its delicious flavour. The wine of Astracan is indifferent, but the grapes which it produces are so much esteemed as to be transported to Petersburg, at great expence, by land-carriage. The summers here being generally dry, they are obliged to water

their gardens. This they perform by means of large wheels, some of which are moved by horses, others by the wind. These wheels are of a sufficient height to throw the water into the highest part of the gardens, whence it runs in trenches to the root of every tree and plant. The chief game in the neighbouring country is hares and partridges; and in summer there is plenty of quails. Here are also water and wild fowl of all sorts, in great abundance.

In one circumstance the country adjacent to Astracan is particularly unfortunate, which is, that from the latter end of July to the beginning of October, it is frequently infested with locusts, which fly in such prodigious numbers as to darken the air, and appear at a distance like a heavy cloud. Whenever they fall, they eat up every thing that is green. In order to prevent this calamity, the gardeners, upon their first appearance, endeavour to keep them off, by making as much smok and as great noise as possible; but in spite of all their art, those destructive insects, after flying as long as they are able, sometimes fall in their gardens, on the tops of houses, and even into the fires. Their bodies, compared with the smallness of their wings, are very large. Their size is generally from two to two and a half inches long, and about three quarters of an inch in diameter.

The commerce of Astracan is very considerable, though much diminished by the troubles in Persia, with the frequent revolts of the Tartars. Not many years ago the city traded to Khieva and Bokhara, in Usbec Tartary, but at present its traffic is confined to the empress's dominions and Persia. The foreign trade of the Russians at this place consists in red leather, linens, woollen cloths, and European manufactures, which they export to Persia, chiefly on account of the Armenians. In return, they import several manufactures of Persia, particularly those of Casan, as silk sashes intermixed with gold, for the use of the Polanders, wrought silks and stuffs mixed with cotton; rice, cotton, a small quantity of drugs, and especially raw silk.

For several miles round this city, where the soil admits of cultivation, there are settlements of an industrious people, of the race of the Crim Tartars, who are tributary to the Russians. In the summer they improve their land, the chief products of which are manna, oats, musk-melons, and water-melons; but they reckon that their principal treasure consists in their wives and children, with their sheep, horses, and cattle. When any of their daughters become marriageable, they cover her tent with white linen, and put a painted cloth on the top, which, with a painted waggon, constitutes the whole of her dowry. Those men who design to marry observe this signal, and the girl is usually given to him who offers the father the most valuable present. In religion those people are Mahometans, and are remarkably nice in their burial-places. They dig their graves very deep, and after lining them with bricks dried in the sun, and white-washing them in the inside, they build a cover over them. They also raise thick walls of mud round each tomb, on the top of which

is fixed one or more white flags, according to the quality of the deceased.

The tents which compose the Tartar camps in the neighbourhood of Astracan, are of a circular form, covered with a hair-cloth. The fire hearth is placed in the middle, over which is an opening to let out the smoke. This they cover close in the night, and the tent is then as warm as a stove. The floor is spread with mats or carpets, with a sofa round it, a little raised, after the manner of the Turks. Their tents are kept very neat, and the furniture consists of cabinets, cupboards, trunks, and kitchen utensils. The people are generally reputed very hospitable, but the women extremely lewd.

## C H A P. III.

*Of Circassia.*

CIRCASSIA is situate between 45 and 50 degrees of north latitude, and between 40 and 50 of east longitude. It is bounded by Russia on the north; by Astracan and the Caspian sea on the east; by Georgia and Dagistan on the south; and by the river Don, the Palus Meotis, and the Black Sea, on the west. This country has long been celebrated for the extraordinary beauty of its women; and here it was that the practice of inoculating for the small-pox first began. The chief town is Terki, situate on the Caspian Sea, in 43 degrees 40 minutes north latitude, and 52 degrees of east longitude. It is surrounded by a wall, and has usually a numerous garrison. The government of Circassia is a kind of republic, but the people generally put themselves under the protection of one or other of the neighbouring powers, namely, Persia, Turkey, or Russia. The face of the country is pleasantly diversified with mountains, valleys, woods, lakes, and rivers; and though not much cultivated is far from being unfruitful. In summer, the inhabitants quit the towns, and encamp in the fields like the neighbouring Tartars; occasionally shifting their station along with their flocks and herds. Besides game, in which the country greatly abounds, the Circassians eat beef and mutton, but that which they prefer to all others, is the flesh of a young horse. Their bread consists of thin cakes of barley meal, baked upon the hearth, which they always eat new; and their usual drink is water or mare's milk, from the latter of which they distill a spirit, as most of the Tartar nations. They allot no fixed hours for the refreshments of the table or sleep, which they indulge irregularly, as inclination or convenience dictates. When the men make excursions into an enemy's country, they will pass several days and nights successively without sleeping; but, at their return, devote as much time to repose as the space in which they had before with-held from that gratification. When they eat, they sit cross-legged on the floor, the skin of some animal serving them instead of a carpet. In removing from one part of the country to another, the women and children are carried in waggons, which are a kind of travelling houses, and drawn by oxen or camels, they never using horses for

draught. Their breed of the latter, however, is reckoned exceeding good, and they are accustomed to swim almost any river on horseback. The women and children smoke tobacco as well as the men; and this is the most acceptable commodity, which a traveller can carry with him into the Tartar countries. There are here no public inns, which indeed are unnecessary, for so great is the hospitality of the people, that they will contend with each other who shall entertain any stranger that happens to come among them.

The principal branch of their traffic is their own children, especially their daughters, whom they sell for the use of the seraglios in Turkey and Persia, where they frequently marry to great advantage, and make the fortune of their families. The merchants who come from Constantinople to purchase those girls, are generally Jews, who, as well as the mothers, are said to be extremely careful of preserving the chastity of the young women, knowing the value that is set by the Turks upon the marks of virginity. The greater part of the Circassians are Christians, of the Greek church; but there are also both Mahometans and Pagans among them.

## C H A P. IV.

*Of Siberia.*

SIBERIA is bounded on the north by the Frozen Ocean; on the east, by China and the Pacific Ocean; on the south, by various nations of the Tartars and the Caspian Sea; and on the west, by European Russia. It is situate between 40 and 72 degrees of north latitude, and between 60 and 130 degrees of east longitude; being upwards of two thousand miles in length, and fifteen hundred in breadth. This country comprehends several inferior tribes of the Tartars, such as the Barabinski Tartars, the Calmucs, the Bratshi, and the Samoïds. The northern part of this immense territory is a barren uninhabited country, covered with snow during eight or nine months in the year; but the southern provinces are more fruitful, and in summer extremely hot. In general, however, the inhabitants lead the same vagrant life with the other Tartars, subsisting chiefly by hunting and fishing, or the produce of their flocks and herds. There are not in the whole country above six or seven towns of any note, and very little of the land is cultivated, except near Tobolski, the capital. This town is situate at a small distance from the confluence of the rivers Tobol and Irtysh, in 63 degrees of east longitude, and 57 and a half of north latitude, about a thousand miles east from Petersburg. It is a large and populous place, defended by a wall, the see of an archbishop, and hither the Russians generally send their convicts into exile. In ancient times, this country was inhabited by the race of Huns, who, under their leader Attila, ravaged Italy as far as Rome; and from some sepulchral monuments and ruins yet remaining, it is supposed to have been formerly better peopled than at present, especially towards the south. It can hardly be said to possess any trade or manufac-  
turer,

fature, furs and the skins of martens being almost the only produce which it affords. In this article, the principal traffic of the people of Siberia is by sledges, over the lakes and frozen country, to China in the winter. Attempts have been made to penetrate into the sea of Japan and China, by the rivers which fall into the Frozen Ocean; but hitherto without much success. Some rich mines of silver and copper are said to be discovered in the mountains of Siberia, which they have begun to work.

Instead of bread, of which Siberia is entirely destitute, the inhabitants make use of dry-fish, with which they even feed their dogs, that are kept for drawing their sledges. In cold weather, when other provender fails, it is also given to the cows; by which the milk acquires a disagreeable taste. They have sleds of a very large size, and the Chinese merchants have taught them to drink tea, which they consider as exceeding good against the hypochondria, indigestion, and all disorders of the lungs.

Their sledges are drawn by thirty or forty large dogs; and in those they go a-hunting, wrapped up in skins. They will stay out six or seven weeks together, lying whole nights in the open fields, when the frost is very severe. On these occasions, however, they make stroug fires to keep themselves warm, and broil their fish. Their dogs are exceeding good at starting the marten, which is to be had no where else, and is the chief commodity of the country. The tenderest part of this animal is his nose; for which reason, and that the skin may not be damaged, it is here they commonly bit him, which they have learned to do very dexterously.

The people who inhabit the northern parts of Siberia are reported to eat their prisoners of war, on which account they have acquired the name of Samoieds or Tafambeidans, which signify cannibals or man-eaters. They live in round tents, covered with mats or stag-skins, with a hole at the top to let out the smoke from their fires, about which, being made in the middle of the tent, they lie flat on the ground. In summer they fix their residence on the bank of some river, where they subsist entirely by fishing, and often eat their prey raw. Nor do they scruple feeding likewise on young puppies, of which they are extremely fond. They are much addicted to magic, the knowledge of which is accounted amongst them very honourable.

In the south of Siberia there is a forest five hundred miles in length, in which is a prodigious quantity of red cherries, but of a fourth taste. The trees on which they grow are not above two or three feet high; their dwarfish size being owing to the frequent conflagration of the surrounding grass, which, when kindled in any part by travellers, it is difficult to extinguish, on account of its length and dryness. The riches of those people consists in herds of stags and elks, which are larger than elsewhere, and draw sledges eighty miles a day with ease: they are likewise so tame, that they will stand still to be harnessed.

It is usual for parents to sell their female children at six or seven years old; nor is there wanting a number of merchants ready to purchase them at that age, for the sake of receiving them in the state of virginity. When the men go a-hunting they lock up their wives, and are said to make use of a mechanical device for preventing their infidelity.

The whole country of Siberia is subject to the Russian empire, and the Caarina monopolizes all the trade, particularly that to China, whither caravans go every year with furs, and in return bring gold dust, silks, and other rich merchandize of that country.

In the chief towns of Siberia the Greek church is established; but the most general religion of the country is Paganism. They are said to believe in the supreme God, but worship the sun, moon, and stars, with several kinds of beasts and birds. They have also some rudely carved images in human shape. There is no particular order of priests among them, nor any stated days assigned for divine worship; but the heads of families usually perform the sacerdotal office, and sacrifice to their idols; the offering being afterwards publicly eaten by the people, who sing on the occasion the hymns and songs of the country, which, as may readily be supposed, are extremely barbarous. They do not burn, but bury their dead, in the cloaths which they wore when alive; hanging their arms and instruments of husbandry and trade upon some neighbouring tree.

With respect to the persons of the people of Siberia, those of the north are very different from the southern tribes; the latter being generally more handsome, but the former short in stature, with flat faces, little eyes, a copper complexion, and hardly any beards. They wear their hair at full length, and are clothed with furs from head to foot. Though a rude and ignorant people, they are extremely offensive, and reputed particularly ingenious in contriving methods to catch their game, which they sometimes even pursue on foot, in their snow shoes, with amazing velocity.

#### C H A P. V.

##### *Of the Islands on the Coast of Tartary.*

Quitting for a little time the continent of Asia, we proceed to give an account of the principal islands contiguous to the coasts of those countries which have already been described; and shall begin with such as lie on the east of Siberia, in the sea of Anadyr, denominated by the latest voyagers the Northern Archipelago.

This cluster of islands was first discovered in a voyage performed under the patronage of the late empress of Russia, between the beginning of the year 1764, and the end of 1767. On this expedition the navigators passed the sea of Ochotkoi; went round the southern cape of Kamtschatka into the Pacific ocean; steered along the eastern coast, keeping northward; and at last came to an anchor in the harbour

*A Chinese Lady of Quality.*

Peter Paul, and wintered in the ostrog, or pallisadoed village belonging to it. Thus far they proceeded the first year; and continuing their voyage, they gradually discovered a great number of islands of different sizes, which became more frequent between the 56th and 67th degrees of north latitude. To mention the extent of some of them, and their distance from each other: the island of Afak is about 150 wersts [*about two thirds of an English mile*] in circumference; the island of Kanaha, distant from the former about twenty wersts, is nearly two hundred wersts in circumference; Tschepchina, lying forty wersts from the second, is about eighty wersts in circumference; Tahalan, which lies ten wersts from the last mentioned, measures upwards of forty wersts round; Atcha, distant forty wersts from the former, is said to be about three hundred wersts in circumference; and the extent of Amlai, which is situate five wersts more remote, is found that greater than that of the preceding.

The inhabitants of those six islands live in green huts, which they call jurts, and never use any fire in them, even in winter. But if the weather be uncommonly cold, they kindle a heap of the hay of strong sea-grass, in the open air, and let the warm vapour penetrate beneath their undergarment. Both sexes wear the same kind of cloaths, which are usually made of the skins of sea-fowls, but sometimes of that of the beaver. Their common food is raw fish, of which if they be at any time deprived, on account of contrary winds, they have recourse to sea-kail, and oysters. The men sleep with their wives in their huts, in a cellar dug in the ground, which they strew with grass; but have no other covering than the cloaths which they wear in the day-time. They appear to be entirely void of religion, and have not the least notion of a future state.

Among the many islands discovered by the same voyagers in those remote seas, two others are also considerable; one of which is named Kodjak, and the other, Umanak. The inhabitants, especially of the former, appeared to be extremely numerous, and betrayed a hostile disposition when the Russians landed on their coast. Their common weapons are bows and arrows, lances and knives made of the reindeer's bones, and hatchets of a hard black stone. Of their manners, customs, and history, nothing as yet has been learned; but the inhabitants, like those of the islands before mentioned, are to the last degree rude and uncivilized.

#### C H A P. VI.

##### *The Islands of Japan.*

THE principal islands comprehended under the title of Japonese are usually reckoned three, namely, Nippon or Japan Proper, Saccock, and Tonfa. It has indeed been doubted by some geographers, whether Nippon be not immediately connected with the Asiatic continent, but the most general opinion is in favour of its being surrounded by the sea. The islands of Japan are situate between 30 and 40 degrees of north latitude, and between 130 and 144 degrees of east longitude.

No. 3.

Nippon, or Japan Proper, by far the largest, is six hundred miles long, and upwards of a hundred broad. Jeddo, which is the metropolis of it, and likewise the capital of the whole empire, is situate in a bay of the sea, in the north-east part of the island, and reckoned one of the most beautiful cities in that part of the world. In the middle of it stands the imperial palace, which, including the gardens, occupies a square of five miles in circumference, and is said to be extremely magnificent in the stile of that country. There are in the island two other cities of great note; one of which, named Meaco, is situate on a lake about three hundred miles south-west of Jeddo; and the other, called Saccal, in the south of the island.

The island of Saccock is parted by a very narrow channel from Japan, lying south of it: it is about five hundred miles in circumference, and the capital city is Bongo. The third, or that of Tonfa, is divided from the two former by similar channels: its extent is about four hundred miles in circumference, and the capital city of its own name.

The islands of Japan are under the government of a prince, to whom European voyagers have given the title of emperor, and who is said to be the superior of fifty vassal kings in different parts of his dominions. The half of those vassals attend the lord paramount in their turns, as well as the eldest sons of the principal inhabitants; and to prevent conspiracies, we are informed, that it is the policy of the court always to keep their subjects employed in some public work. A standing army is constantly maintained, of a hundred thousand men; which, in time of war, is sometimes increased to four hundred thousand: but it is probable that such an emergency must very seldom happen, on account of their great distance from any other nation than China, with which they are generally at peace. The revenues of the emperor have been represented as so extremely great by the Portuguese, that the sum exceeds all belief; but the country is generally esteemed one of the richest in Asia, especially in gold.

The persons of the Japonese resemble those of China, who live under the same parallel, and their habits are likewise the same; but they wear no covering on the head, which is half shaved; screening themselves from the sun either with a fan, which they constantly carry, or with umbrellas held over them by their slaves. Every gentleman, when he goes abroad, wears a dagger in his sash, and a great broad sword on his thigh.

The houses in Japan, as for the most part in China, consist only of a ground story. The apartments are divided by skreens; and the floors paved, and covered with mats; the doors and door-cases are varnished; the cycling painted and gilded; and in every house is an arched stone vault, where they keep their most valuable effects, to secure them from fire. They have no glass windows, but instead of them use sliding shutters. Neither have they chairs or tables like the Chinese, but sit cross-legged on mats or carpets, on which they lie at night. The rooms are hung with pictures or painted paper, and furnished with cabinets, skreens, broad swords, and other arms.

G

The

The better sort of families eat chiefly venison, fish, and wild fowl of their own taking. Water and tea are their usual liquors; and some indulge themselves in strong beer, made of wheat and mixed with spirits. Others, however, of certain religious sects, eat no meat, nor use any strong drink, but live entirely upon rice, roots, herbs, and fruit. The diversions in the towns are plays and masquerades; the subjects of the former, as in most of the eastern nations, being taken from the history of some hero or personage of their country.

The Japanese have not an uniformity in religion amongst them, any more than their neighbours on the continent. In general, however, they believe in a Supreme Being and the immortality of the soul; some sects likewise placing faith in the doctrine of transmigration. They worship the sun, moon, and stars, besides the images of famous men; with several others, partly in human shape, and partly in that of various animals. Here nunneries and convents are also said to be known, in which they perform the severest penances. It is reported that they practise auricular confession as well as the Roman Catholics; during which ceremony they are seated on the top of a precipice, whence the bonze or priest, if suspicious of the person's sincerity, tumbles down the sinner to receive the reward of his guilt.

On a mountain near Meaco, stands a magnificent temple with an arched roof, in which is a colossal idol seated, whose chair is seventy feet high; and the head of the image is said to be large enough to contain the bodies of fifteen men. The ascent to the temple is decorated on each side with fifty pillars, on which, in the night-time, are hung lighted lanterns, affording a very agreeable prospect. There are in Meaco sixty other temples, and above three thousand images richly gilt and adorned.

Near Jeddo, on the road side, is erected an image of copper, twenty-two feet high, representing the god Dabis, sitting cross-legged, with extended arms. In a temple at Tencheda the bonzes affirm, that one of their gods appears to them in a human shape. At the new moon he is provided with a young virgin, whom, they relate, he embraces, and sometimes impregnates; but as all the lights are extinguished during the transaction, it is difficult to attain any certainty with respect to the person of the lover. The girl however afterwards is held in the highest veneration, and generally pretends to be endowed with the gift of prophecy.

Polygamy and concubinage are both permitted in Japan; but the consent of the betrothing parties is seldom asked here, any more than in China. It is usual for children to be disposed of in marriage by their parents at a very early age, the young persons ratifying the treaty as soon as they come to years of maturity. On this occasion they are led to the temple, where a bonze places them before an image of some of their gods, putting in their hands a lighted torch, which they hold while he repeats the words of the contract. Oxen or other animals, according to the quality and circumstances of the married pair, are afterwards

sacrificed to the idol; and the ceremony is concluded by a grand procession to the bridegroom's house, where the guests are entertained for several days.

The custom of the wife having no fortune prevails in Japan as in China; and after marriage she is entirely in the power of her husband, who may even punish her with death for a misdemeanour, especially conjugal infidelity. It is not uncommon for the women here to procure abortion; and if they be poor, or bring too many daughters, the mothers will strangle them with their own hands; but the boys are always provided for at the expence of the sovereign.

Prostitutes are tolerated, and no mark of infamy is fixed upon procurers in their life-time; but they are treated as criminals after death, and their bodies prohibited from funeral rites. The Japanese do not inter their dead as the people of China, but burn the corpse, and afterwards put the ashes into an urn. The family and friends of the deceased attend the body to the funeral pile, with lighted torches in their hands; and the eldest son or nearest of kin sets fire to the pile, into which are thrown sweet wood and aromatic gums, to perfume the air; a practice which renders the funerals of people of condition vastly expensive.

By the laws of Japan, theft, lying, and gaming, are usually punished with death; and in cases of treason, murder, and embezzling the royal revenue, all the relations are considered as partaking of the guilt, and punished equally as the principal, except the women, who are reduced to perpetual slavery. The vassal princes or governors are seldom put to death, but banished to a distant island, and forced to work at hard labour, as common felons.

The punishment of convicts in Japan is extremely severe and barbarous. Those unhappy persons are either crucified with their heads downwards, torn in pieces with horses, or burnt alive. If any should fly from justice, an order is published, enjoining that whoever meets with the offender, shall instantly kill him. If the person condemned be a soldier, he may choose whether he shall die by his own hands, or those of the executioner.

The Japanese are reputed to be fair dealers, and an ingenious people, but we are not informed that they discover any knowledge in the liberal arts. They are however excellent mechanics, as appears from their cabinets, screens, pagods, and other manufactures of the country. At present they trade with no foreign nation, except China and the Dutch; the latter having obtained this privilege, either upon the merit of renouncing Christianity, or pretending to discover a plot of the Portuguese against their state. The traffic consists chiefly in gold dust, the articles above specified, and in tea, of which those islands produce a great quantity.

The natives of this country make annually a grand procession to the tomb of their ancestors. It commences at mid-night, when all the houses in the towns are illuminated; and after spending some hours at the tombs in eating, drinking, and festivity, the people present themselves in the morning before the

temple

of their idols, and the houses of persons of distinction; beating upon their drums and brazen vessels, with other noisy and jarring instruments, which are not however unaccompanied with tolerable good voices. Among the Japonese the night is the usual season both for feasting and diversions; and they sleep away the middle of the day, as is the custom in most hot countries. They take off their shoes when they enter either the temples, or the houses of the great, and they approach their princes and magistrates upon their knees. Incredible instances are mentioned by some travellers, of the slaves of this country voluntarily killing themselves at the request of their lord, for the entertainment of him and his company; a savage spectacle, if real, and exceeding in horror that of the devoted gladiators in ancient Rome. It is also related, that the slaves kill themselves on the death of their master, with the view of attending him in another state.

The Japonese islands were utterly unknown in Europe for upwards of forty years after America was discovered by Columbus; when Antonio de Mota, a Portuguese commander, in a voyage towards China, was driven hither by a storm, in the year 1542. The Portuguese began soon after to trade with the people of that country, and continued to monopolize the commerce for more than sixty years, till some English and Dutch vessels likewise failed to those parts. The merchants of Portugal, however, not restricting their views entirely to the objects of traffic, took occasion to introduce their missionaries, and made great numbers of proselytes to the Romish religion, until the year 1630; when the Japonese government suspecting that the Portuguese had formed a conspiracy against the state, massacred or banished all the Christians, and determined thenceforth never to admit into their country any people of that religion, except the Dutch. The exemption of the latter from this prohibition, afforded just ground to imagine that the apprehensions of the Japonese had been fomented, if not entirely excited, by their means. It is probable that their purpose was effected by representing the supremacy of the pope, which was inculcated by the missionaries, as not only derogatory to the dignity of the emperor, but even subversive of his authority. It has been affirmed, that to insinuations of this nature, the Dutch added the impiety of disclaiming the name of Christians, trampling upon the cross, and expressing the utmost detestation of the Christian religion, in order the better to secure the confidence of those islanders. Be this as it may, the Dutch are the only European nation that carries on at present any trade with Japan; though, from the extreme vigilance with which they are watched in that country, it is evident that the opinion entertained of them by the natives is far from being favourable. When any Dutch vessel arrives on the coast, the Japonese immediately take off her rudder, sails, and guns, which are kept on shore till her departure. Not a man is permitted to come on shore, till an express is sent to court and returned, and then the crew are mustered before the Japonese commissary; after which

they are restricted to the island of Dinsia, where the inhabitants are not allowed the use of fire and candle in the night-time, and prohibited from visiting the city of Bongo or Nagasacke for eight months in the year. So great is the jealousy entertained by the Japonese of the Dutch, owing probably to the excesses which have been committed in some of the Indian islands, by the subjects of that republic. The commodities which the Hollanders import to Japan are chiefly cinnamon, nutmegs, mace, and cloves, which renders the trade with that country more profitable to them than it could be to any other nation, whose settlements produce none of those spices.

## C H A P. VII.

*Of the Ladrone Islands.*

**DIRECTING** our course southward from Japan, and passing the islands Lekeyo and Formosa, with others of small extent, adjacent to the coast of China, and subject to that empire, we arrive at the Ladrone or Marian islands. They are situate in the Pacific Ocean, between 12 and 28 degrees of north latitude, and in 140 degrees of east longitude. Their names are, Guam, Sarpanta, Tinian, Sefpara, Anatan, Sarignan, Guagam, Alamaguan, Pagon, the burning mountain of Griga, Magna, Patas, Discocida, and Malabrigo.

Guam, which is the largest, is about twelve leagues long, and four broad, lying north and south. In the middle of the island the ground is high, but slopes gradually to the coast. It produces rice, pine-apples, oranges, and most of the tropical fruits. Among those is the lime, a sort of crab-lemon with a thin rind, containing a very acid juice, and much used in punch in the West Indies. The bread-fruit grows on a tree resembling that which bears our largest apples. When fully grown, it is equal in size to an ordinary foot-ball. It has a dry thick rind, but the inside is soft, white, and crummy, like bread, with a sweet pleasant taste, if eaten in less than twenty-four hours after it is plucked; for then it becomes dry and fizzly. The natives, after baking it in an oven, scrape off the outside. This fruit is in season eight months in the year, during which time it is the only bread used in the island.

The cocoa, which also grows here, is a very hardy tree, thriving almost in every soil, and rising to a very great height. The nut grows at the end of the branches, which are some inches in diameter. It is generally as large as a man's head, and has a rind two inches thick inclosing the shell, which is black, thick, and hard, being manufactured into cups, spoons, and other utensils, which are much esteemed, particularly in Europe. Within the shell is a kernel, which, before it is ripe, tastes sweet, and resembles thick cream; but as it advances in maturity, it becomes of a firm consistence, and is then not easy of digestion. This kernel is hollow, and contains a liquor which is very wholesome, sweet, and refreshing. The outside rind or husk is full of small strings or threads, which, being beaten, become soft, and are

spun

spun into a yarn of which are made cable ropes, and sometimes a coarse sort of sail-cloth. In the South Seas, the Spaniards use it to tow instead of caskum to caulk their ships, and it is said to possess the quality of not rotting.

A liquor is also procured from the cocoa-tree, called toddy, which has the appearance of whey, and is publicly sold, morning and evening, in almost all the towns of the East Indies. The branch which is opened for this purpose produces no fruit, but the discharge from it is said not to affect the vegetation of that which grows on the others. This liquor is vastly agreeable, but turns sour in twenty-four hours. A sort of arrack is distilled from it, which makes excellent punch, but must be put into a brandy cask, to give it spirit, not being sufficiently strong in itself. It is known by the name of Goa arrack, because chiefly used at that place, and is entirely different from the arrack distilled from rice and sugar, which is the most common, as well as the strongest kind.

The inhabitants of Guam are of a good stature, strong bodied, and well shaped, with long black hair, small eyes, high noses, thick lips, and a copper complexion. They have stern countenances, but are courteous and affable. The island is visited with periodical, though not violent rains from June to October. The country however is reputed healthful, especially in the dry season; but sometimes the inhabitants are afflicted with a kind of leprosy.

The people of Guam are particularly ingenious in constructing their sloops, which are the admiration of all voyagers. The keel is of one piece, made in the form of a canoe, twenty-eight feet in length, built sharp at both ends. One side of the vessel is flat, the other rounding with a pretty large belly, being four or five feet broad, with a mast in the middle. Their method of sailing is to turn the flat side to the wind; and having a head at each end, they can sail with either of them foremost, and have never any occasion to tack. It has been computed, that those vessels will sail twenty-four knots an hour: it is certain, however, that they go with prodigious velocity.

Guam, with the other Ladrone islands, was first discovered by Ferdinand Magellan, a Portuguese, who was employed by the emperor Charles the fifth, to find a way to the East Indies by the west. The island remains under Spanish jurisdiction, and in it are several Indian villages, where priests reside, who instruct the inhabitants in the Christian religion; that of the country being the Chinese paganism, of which nation those islanders are descended. The Spaniards have two castles on the shore, viz. St. Angelo, a trifling fortress, where the Manila ship usually anchors, and the castle of St. Lewis, distant from the former about four leagues. Besides those forts, there is a battery of five cannon on an eminence near the shore. The military force usually kept in the island is three companies of soldiers, consisting of fifty men each; and the number of inhabitants is computed to be about four thousand. Sixty years ago, Guam, Tinian, and Sarpanta, were supposed to contain in all above fifty thousand inhabitants, and the rest were peopled in

proportion; but by a pestilential disease which broke out about that period, the greater part of the inhabitants was destroyed. Those in the neighbouring island who survived this calamity, were removed to Guam, whence they never were permitted to return to their former settlements, which have since continued desolate. Many of the inhabitants are still dissatisfied with this restriction; and so apprehensive are the Spaniards of a revolt, that the natives are not suffered to carry arms.

The island of Tinian or Bonavista, which lies north of Guam, is twelve miles in length, and six in breadth. According to the account delivered of it by the writer of Anson's Voyage, the soil is dry and sandy, and the air healthful. The land rises in gentle slopes, from the shore to the middle of the island, interrupted by vallies of an easy ascent, which are beautifully diversified by woods and lawns intermixed. The turf of the lawns was clean and uniform, composed of fine trefoil, blended with a variety of flowers; and the woods consisted of tall spreading trees, delightful in their appearance, or rich in delicious fruits, free from bushes and underwood, and affording the most elegant prospects.

The cattle on the island were computed to amount to ten thousand, all perfectly white, except their ears; besides which, there were hogs and poultry without number. The fruits produced here are cocoa nuts, guavaes, limes, sweet and bitter oranges, and cabbages growing at the tops of trees. There is no rivulet or running stream in it, but excellent well-water, which lies near the surface. With all those advantages, Tinian is not constantly inhabited, and only serves as a plantation to supply the Spaniards in Guam with provisions.

This description of Tinian has been suspected to border on romance, and the supposition may seem to derive some degree of authority from the very different account of the subject delivered in Mr. Byron's Journal. We are there informed, that the island was almost a thicket of bushes and briars, intermixed with swamps and marshes: that the water was brackish and full of worms; the rains violent, and almost incessant; the heats so great as to threaten suffocation; which was likewise almost the consequence, on opening the mouth to speak, on account of the prodigious swarms of flies with which the air abounded. It is remarkable, that Mr. Byron's description of Tinian was drawn in the same season and month of the year, in which the island had been visited by the former voyagers: but it ought to be remembered, that more than twenty years had elapsed between the departure of the Centurion, and the arrival of the Dolphin at this island; and it is well known how much, in that space, particularly in a warm climate, the salubrity and face of a country may be changed, by a total neglect of cultivation.

The habit of the men in the Ladrone islands is a linen frock and drawers, with a small piece of the same cloth tied about their heads. The women likewise wear a similar frock, distinguished only by large sleeves, which come down to their hands; with the  
 addition

addition of a piece of cloth round their waists. Both sexes go bare-foot; and the women tie up their hair in a roll at the hinder part of the head, while the men, like the Chinese, have their heads shaved, all except a lock that is left in the middle of the crown. Persons of figure are clothed in silk or fine callico, and the women of this rank wear bracelets and rings on their arms and fingers.

C H A P. VIII.  
*Of the Philippine Islands.*

**WESTWARD** of the former, in the Pacific Ocean, are situate the Philippine Islands, between 5 and 19 degrees of north latitude, and between 114 and 127 degrees of east longitude. There are some hundreds of them, and several very large. The chief and the most northerly is Manila or Luceña, lying between 13 and 19 degrees of north latitude; about four hundred miles long, and a hundred miles broad in most places. The capital of this island, and of all the rest, is the city of Manila, situate on a bay in the south-west part of the island, and upwards of two miles in circumference, surrounded by a wall and other works. The harbour, of which a castle defends the entrance, is very commodious, but of difficult access, on account of the rocks and sands which lie before it.

The principal buildings of the city are the cathedral, which is large, with the parish churches and convents; to which may be added the college of the Jesuits, where students were, lately, instructed in humanity, philosophy, and divinity. The houses are ornamented with galleries in the Chinese stile, and the streets are spacious, but greatly damaged by earthquakes, which have spoiled their uniformity. The city is supposed to contain about three thousand inhabitants; but the suburbs, which are extensive, a much superior number. Of the Chinese alone, there are said to be here not less than twenty thousand persons, in the different employments of servants, manufacturers, and brokers; for the Spaniards and Indians applying themselves to no business, the labour and trade of the place depend entirely on those industrious people, over whom, however, their tyrannical and impolitic masters exercise great severity.

The adjacent country is full of fine plantations, farms, and villas, belonging to the principal inhabitants. Upon the mountains in the middle of the country, the people live in tents and huts, under the spreading trees; but those who reside in the plains, dwell in houses erected upon high pillars, in order to avoid the periodical inundation caused annually by the rains which fall from the month of June to September. In this season, the people have no communication with those in their neighbourhood, but by boats; the horror of their solitary state is farther aggravated by the terrible storms of wind and thunder, which frequently happen at the same time, accompanied likewise with frequent earthquakes, and the eruption of numerous volcanos. The fair season, however, is usually exceeding pleasant, and the water

No. 3.

in the island accounted the best in the world. Being situate in the torrid zone, the air is extremely hot, but the island nevertheless reputed healthful.

The fertility of the soil, and the beautiful face of the country, seem to vie with each other, for the gratification of the inhabitants. While the fields are clothed with perpetual verdure, the trees are seldom without fruit; and the people in many places live upon what the earth spontaneously produces. The fruits are mangoes, plantains, bananas, coconos, tamarinds, cassia, and the cacao or chocolate nut which has been imported from Mexico, oranges, lemons, and all kinds of tropical produce. The cinnamon and nut-meg trees have been planted here, but do not generally thrive. Here is likewise a great deal of good timber and dying woods. One of those, named the calamba or sweet-wood, a kind of cane which grows in the mountains, yields wholesome water when cut, and often supplies the natives with that element.

Various kinds of flowers and sweet herbs also grow without culture, among which are many of a medicinal, as well as a poisonous quality. Of the latter, the camandag is so virulent a nature, that with the juice of it they poison their darts and arrows. Medicinal and sweet gums, likewise, issuing from the bodies of trees, are part of the produce of the country.

The neat cattle run wild on the mountains, and are hunted in the same manner as deer, wild hogs, and goats. The bees produce such quantities of honey as might almost subsist the natives; and wax is so plentiful; that nothing else is used for making candles. Serpents of various kinds are likewise frequently met with.

The greater part of the people of Manila are of Chinese or Malayan extraction, intermixed with a number of blacks; and the complexion of the different tribes corresponds, in general, with that of the nation from which their race is derived. The blacks are equal in deepness of colour to the Caffres of Africa, but differ from them in respect of their features and long hair, and therefore are supposed to claim an Indian descent. As they possess the mountainous and inaccessible parts of the island, it is probable that they were the original inhabitants of the country, and afterwards restricted to those limits by the superior power of invaders. The descendants of the Malays (inhabitants of Malacca) are very tawny; the Chinese of a complexion less dark; and the Spaniards nearly similar to the Chinese. Besides those, there is here another nation, denominated that of Pintados, on account of the custom which prevails among them of painting their bodies. The natives are for the most part of a middle stature, with regular features. The more civilized islanders have adopted, in great measure, the Spanish habit; but the blacks only tie a cloth about their loins and head, and usually go bare-foot.

Such of the inhabitants as live near the sea-coast, feed chiefly on rice and fish, while the mountaineers subsist on the flesh they take in hunting, and the fruits of the earth, which grow spontaneously in great plenty.

H

Their

Their drink is water, which they commonly use warm, as the Chinese. They have also palm wine, and spirituous liquors distilled from the sugar-cane, rice, &c. They practise cold-bathing twice a day, either for health or recreation; and their diversions consist of rude plays, or of rustic dances and mock fights, in which they discover great agility; but their chief delight is in cock-fighting.

The Chinese custom of purchasing their wives prevails in the Philippine islands, and the marriage is performed by a priestess, who sacrifices some animal on the occasion; after which the bride is conducted home, and the ceremony, as in other places, concludes with an entertainment. They generally marry in their own tribe, and with their nearest relations, except the first degree. Some of the tribes are restricted to one wife, while others permit a plurality of women, and divorces for reasonable causes on either side. In the burial of the dead, and the ceremonies of interment, they likewise copy the Chinese.

The trade between Manila and the adjacent continent consists chiefly in such commodities as are intended to supply Mexico and Peru, namely, spices, Chinese silks, and manufactures, particularly silk stockings, Indian stuffs, calicoes and chints, with other small articles in the hard-ware branch, wrought in the island by the Chinese; all which are transported annually to the port of Acapulco in Mexico. This trade, however, at least formerly, was not open to all the inhabitants of Manila, but was restrained to the convents of the Jesuits, as a fund to support the missions, for the propagation of the Catholic faith.

The trade is limited by the royal edicts to a certain value: according to some, it ought not to exceed 600,000 dollars, but it has been known to amount, on several occasions, to five times that sum. It is carried on by means of a vessel, which sails from the port of Cabite in Manila about the middle of July, taking the advantage of the westerly monsoon, which sets in about that time, and generally arrives at Acapulco about Christmas: in performing this voyage, as soon as they have got clear of the Philippine islands, they stand a little to the northward, till they arrive in 30 degrees, where they expect to meet with a westerly wind that will carry them to California. But it is the opinion of the writer of Lord Anson's Voyage, that if they stood farther north, they might reach the place of their destination in half the time, which the course they now take requires for accomplishing that purpose.

Having disposed of the cargo at Acapulco, and received on board the silver and other commodities from Mexico, the ship quits that port in the March following, and sails in the latitude of 13 or 14 degrees, till she comes in sight of Guam, one of the Ladrone islands; the road of which being very dangerous, ships are ordered to be made on the high lands, all the month of June, for the benefit of the navigation. After refreshing at this place, she continues her course to Cape Spirito Santo or Samar, one of the Philippine islands, whence, if no signal is made of an

enemy being upon the coast, she proceeds to the same port in Manila from which she set out.

Notwithstanding the protection which the Manila trade has received from the Spanish court, it is evidently very prejudicial to the interests of that nation. For the Chinese silks, and cottons from the coast of Coromandel, being afforded much cheaper at Acapulco than European manufactures, the silks and linens sent thither from Cadiz are greatly injured in the sale; at the same time that the traffic drains Mexico and Peru of silver, which would otherwise be brought to Europe, and center in Old Spain; while it has likewise the farther effect of rendering those colonies less dependent on the mother-country. The only advantages arising from the Manila trade, is the enriching some private persons in that part of the world.

Not far from Manila is Capul, three leagues in compass, a pleasant and fruitful island. Eight leagues north-west from the mouth of the frait is Ticao, an island eight leagues in compass, inhabited by Indians. Hence four leagues westward is Burin, five leagues in circumference; south of which is Masbata, thirty leagues in compass, rich in gold mines, inhabited likewise by Indians, who pay tribute in wax, salt, and civet. Fifteen leagues from Manilla is the island of Marinduque, which is eighteen leagues in compass, high, and abounding in cocoa and other fruit trees. Mindora is about eight leagues from Manila, and five from Madrinuque. This island is seventy leagues in compass, likewise mountainous, and produces the same commodities as the preceding. Next to Mindora is Luban, another small island, five leagues in compass; beyond which are the Calamines, consisting of seventeen small islands. The next are the five islands of Cuyo, not far distant from each other; succeeded by that of Panay, an hundred leagues in compass, containing about sixteen thousand tributary Indians, and fourteen parishes belonging to the fathers of St. Augustine. One of the greatest islands next to Manila, is Samar, one hundred and thirty leagues in compass, and inhabited by about five hundred families. It is generally mountainous and craggy, but the plains are fruitful. Another considerable island is Leyte, thirty leagues in compass, and well peopled on the east side, by reason of the fruitful plains, which are said to yield from a hundred to two hundred fold. The inhabitants were under the immediate care of the Jesuits, before the extinction of that order. Another under the patronage of the same body is Bohol, about forty leagues in compass. But the largest of all the Philippine islands, except Manila, is Mindanao, which is likewise the most southerly. It is about two hundred miles in length, and a hundred and fifty in breadth. It is inhabited by people of different nations and religions; but the Mahometans, who occupy the sea-coast, are much the most numerous, whose sovereign is stiled the sultan of Mindanao. Those who possess the middle of the island are called Hillaloons; and another nation styled Solognes, on the north-west coast. The air of this island is not so hot as might be expected, considering its latitude; being frequently refreshed

n the north-west  
so hot as might  
being frequently  
refreshed

refreshed by the sea-breezes, and the periodical rains, which lay the flat country under water. The monsoons or trade-winds, which prevail here, blow from the east, from October to May, when they shift about and set westerly; the next month regularly introducing rains and storms. At first there are not more than two or three moderate showers a day; but they afterwards increase both in duration and violence, accompanied frequently with loud thunder and hurricanes, so that trees are blown up by the roots. In June and July the sun and stars are sometimes not seen in the course of a week; about August the air is very cool, the rain and wind are moderate in September; and in October, the wind returning to the east, the weather continues fair till the usual term of its change.

The soil of Mindanao is fruitful, being well watered with rivers, and the mountains afford excellent timber. There are on this island large groves of the libby or sago tree. The granulated form of the sago has occasioned its being generally considered by the Europeans as a seed, but it is the pith of a tree, and is eat by the natives instead of bread, though the country also produces rice, which is one of the staple commodities in those parts. Beasts of prey are totally unknown in Mindanao, but it is furnished with almost every other useful animal, such as horses, cows, buffalos and hogs, with bunches over their eyes. Here are also snakes, scorpions, and other venomous insects; and among the birds, which in all the Philippine islands generally consist of the same species, are parrots, cacatoes, tavans, and faligans.

The general language in the Philippine islands is the Malayan tongue, besides which every people have a language peculiar to themselves. In Manila the natives write on cocoa-nut leaves, with an iron style, and the arts and sciences have been there introduced by the Spaniards; but in Mindanao and the other islands they are to ignorant of the liberal arts, that they are under the necessity of employing the Chinese to keep their accounts for them.

The bulk of the inhabitants, both in the Ladron and Philippine islands, have nearly the same religion with the Chinese, from whom they are descended. They worship one Supreme God, and their ancestors, paying adoration likewise to the sun and moon, and almost every visible object, whether animate or inanimate. One kind of tree particular they reckon it is sacrilege to cut down; believing the souls of some of their friends may reside in it, which to wound would be the height of impiety. Instead of temples, they place their idols in caves, where sacrifices are likewise offered. Some beautiful virgin first wounds the victim with a spear, after which the priests dispatch the animal, and having dressed the meat, it is eaten by the company. They are remarkably observant of lucky and unlucky days, and so extremely superstitious, that if certain animals cross the way when they are going upon any business, they will immediately return home, and go out no more that day. In the island of Mindanao, particularly along the sea-coast, there are many Mahometans.

In all those islands, it is computed that there are about two hundred and fifty thousand Spaniards and Indians, subject to the crown of Spain, though scarce the twelfth part of the inhabitants be conquered. The governor, who is styled captain-general, has under him a number of deputies, and the same civil and criminal jurisdiction prevails as in Old Spain. Ecclesiastical causes are determined by the archbishop of Manila, the bishop, and commissaries; but there lies an appeal from them to the pope's delegate, who resides in one of the islands. The tribunal of inquisition has also a commissary here.

The city of Manila is the seat of government for all the Philippine islands, except Mindanao and Paragoa; the governor's salary is thirteen thousand three hundred pieces of eight, exclusive of great perquisites, and his authority lasts eight years. Four judges and a solicitor hold their places for life, which are also very profitable. At the expiration of his office, every governor is subjected to a judicial trial, in which a strict inquiry is made into his management of public affairs, which relates, however, more to speculation than any other part of misconduct, and is accordingly never punished but by a pecuniary fine. On this occasion, sixty days are allowed the islanders, after proclamation made through the provinces, to bring in their complaints, and thirty days to prosecute before the judge, who is generally the successor in the government, by special commission from the king and his supreme council of the Indies; when having received all informations, without deciding any thing, he submits the proceedings to court. It is affirmed, that since the conquest of those islands, only two of the governors have returned to Spain, the rest having either died of chagrin at their trial, or of the hardships endured in their subsequent passage home.

It is apparent that with respect to the Philippine islands, the court of Spain is actuated by the same pernicious principles which has misguided her American commerce. For notwithstanding the taxes levied on the inhabitants, there is an annual deficiency of two hundred and eighty thousand pieces of eight, to defray the expence of government, which is remitted every year from New Spain for that purpose. Married men are generally taxed ten reals, others from eighteen to sixty years are rated at five reals, and the same is likewise paid by maids, from the age of twenty-four to sixty. The whole included, the king's revenue is not quite four hundred thousand pieces of eight, while the pay of the military kept at Manila, and the enormous salaries of the civil officers of the crown, amount to an excess of near three fourths of that sum.

Those islands are reputed rich in pearls, cotton, civet, and particularly gold, which is not only found in mines, but mixed with the sand of rivers. Of this commodity, it is said, there is to the value of two hundred thousand pieces of eight a year gathered, without the help of fire.

The Philippine islands received their present name in the year 1543, from the general Luis Lopez de Villa Lobos, in honour to prince Philip, then heir to the Spanish crown. On account of their remote situation

situation, they have remained since that time totally unmolested by any foreign power; till, during the last war between Great Britain and Spain, the city of Manila was reduced by some ships of our navy, but immediately afterwards restored to the Spanish crown, for a stipulated ransom, which has not hitherto been paid, and is probably now fully relinquished.

#### C H A P. IX.

*Of the Molucca Islands, with those of Banda, Amboyna, and others adjacent,*

**P**ROCEEDING southward from the Philippine islands, we arrive at the Moluccas, which are situate between one degree south, and two degrees north latitude, and in 125 degrees of east longitude. The first of them is Ternate, about twenty-four miles in circumference; in which is a burning mountain that has done great mischief by its eruptions. Two leagues from Ternate is the island of Tidora, about twenty miles in compass, enjoying a better soil, and reputed more healthy than the former. The inhabitants are warlike, and can put to sea twenty or thirty large vessels, with six or seven thousand men. The third of those islands is Mutiel or Timor, lying directly under the line. The fourth is Machien, which has a burning mountain like that in Ternate. The fifth is Bachian, about twelve leagues in compass, containing likewise a volcano.

The general produce of those islands is cocoa and sago, with almonds, oranges, lemons, and other tropical fruits; but their greatest riches consisted formerly in cloves, on which account they obtained the name of Spice Islands. The tree which produces this commodity resembles the bay. The cloves grow in clusters at the end of the branches. They are first white, then green, afterwards red, and when full ripe they turn brown, but when gathered and dried become almost of a black colour.

The inhabitants of the Moluccas live chiefly upon sago, made into cakes, having neither corn nor rice, and hardly any meat but goat's flesh. Their drink is water, and the milk of the cocoa-nut, or toddy, drawn from the body of that tree.

The Portuguese and Spaniards were the first Europeans that found the way to those islands, the former sailing eastward, and the other directing their course west. The English and Dutch afterwards traded with the inhabitants, but the Dutch erecting fortresses here, in the beginning of the last century, expelled every other nation; when they even eradicated the cloves, to preclude the inducement to any attack, and planted them in the adjacent island of Amboyna, which they secured with strong fortifications.

The Banda Islands are situate between 127 and 128 degrees of east longitude, and between three and five degrees of south latitude. They are five in number, viz. Pooloway, Rosingen, Genapi, Polezron, and Lantor or Banda Proper. In extent they are generally small, the largest, which is Banda, not exceeding sixty miles in circumference; but they are valuable on account of the nutmeg, which, it is said, will grow

no where else. Pooloway is represented as a most delightful country, the nutmeg and other fruit trees being cut into pleasant walks through the island, which forms one beautiful garden. It is subjected, however, to the great inconvenience of having no springs or rivulets; on which account the inhabitants preserve in cisterns the water that falls in the rainy season of the year. In several of those islands there are volcanos, and in most of them fortifications. The chief town of Banda is situate on an inaccessible rock, the natural strength of which is improved by the works which the Dutch have erected round it.

The same tree that produces the nutmeg is also the parent of the mace, which encloses the fruit as a husk. The Arabs were the first who introduced those spices to the west, by importing them to Egypt and the coasts of the Levant, whence they were distributed over Europe. On the discovery of the East Indies by the Portuguese, about the year 1500, that nation monopolized the trade for upwards of a century, till the Dutch invaded those islands in 1609. The inhabitants put themselves under the protection of the king of England, whom they acknowledged as their sovereign; but the Dutch maintaining their conquests, they ever since enjoyed the exclusive benefit of that important acquisition.

Amboyna is situate in three degrees 40 minutes south latitude, and in 126 degrees of east longitude. This island, which is about seventy miles in circumference, is now the only country that produces cloves, since the Dutch transplanted them hither from the Moluccas, for the more secure possession of that spice. Besides cloves, it likewise abounds in most of the tropical fruits and fish, nor is there here any deficiency of good water, but flesh is very scarce. This scarcity, however, proceeds more from the policy of the Dutch, than either the intemperature of the climate, or the barrenness of the soil. For excepting cloves, they have, in Amboyna as well as the Moluccas, industriously discouraged the cultivation of every esculent commodity, with the view of withholding subsistence from those who might be tempted to invade them. But as a greater security from any hostile attack, the approaches to the island are defended by a strong fortress, in which is constantly kept a garrison of seven or eight hundred men. In the beginning of the last century, the trade of Amboyna was divided between the English and Dutch, who had each their factories in the island; but the latter perfidiously attacking the other settlements, in time of profound peace, rendered themselves masters of the country, after committing such acts of horror and barbarity, as hardly ever were perpetrated by any people, even in a contest with their most inveterate enemies. This dominion, however, so infamously acquired, they have hitherto been allowed to retain, and at present monopolize the cloves, as well as that of the other valuable spices.

The islands of Celebes or Macassar, Gilolo, Ceom, Bourou and Bouton, though situate near the Molucca and Banda islands, produce none of the fine spices; but being of consequence on account of their proximity,

imity, they have been subdued and fortified by the Dutch, as a defence to their other possessions.

Celebes, or Macassar, is situate between 116 and 124 degrees of east longitude, and between two degrees north, and six degrees south latitude. It is five hundred miles long, and for the most part two hundred broad. The air is hot and moist, the rainy season lasting the greatest part of the year; but the mornings usually are fair. During the rains, innumerable torrents pour down from the hills; but at other times, there is only one navigable river, which runs from north to south, and discharges itself into the bay of Macassar, near the city of that name.

Macassar is the capital of the island, situate on the south-west part of it, and consists of spacious streets, planted on each side with evergreens. The houses are generally built of wood, but the palaces and mosques of stone. It formerly contained upwards of a hundred thousand men, able to bear arms; but since the conquest of the Dutch, who now monopolize the trade, it is reckoned that there is not more than half that number of inhabitants. The republic has here a strong fort, garrisoned with seven or eight hundred men.

Another port-town of the island is Jampadan, about fifteen miles south of Macassar, one of the best harbours in India. This was the first town which the Dutch took from the natives, and here they seized or destroyed all the Portuguese vessels, when they were in full peace with that nation. The other towns and villages which lie in the flat country, are generally built with wood or cane, and raised upon high pillars, to preserve them from the annual flood; at which time the inhabitants have no communication but by boats.

The natives are of a middle stature, and a deep copper complexion, having for the most part high cheek bones, flat noses, and black teeth, though the colour of the latter is rather seditious than natural. Their shining black hair they tie up in a roll, wearing on their heads a white cloth, or small turban. They anoint their bodies with oil from their infancy, and the men use hardly any other covering than a linen cloth wrapped about their loins. The princes and great men, however, wear a vest, tied with a sash, in which they carry a dagger, knife, crice, and other trinkets. People of figure dye the nail of the little finger of the left-hand red, and allow it to grow to a great length. The women wear a shift, or rather a waistcoat, close to their bodies, and a pair of breeches, which reach down to the middle of the leg, made of silk or cotton, having no other head-dress than a roll to tie their hair, of which some curls hang on their neck. When they go abroad, they throw a loose piece of linen or muslin over them, with a gold chain about the neck, which is their only ornament.

They are an ingenious people, and seem to be actuated by more refined sentiments of honour and friendship, than are usually met with among those who have not attained to a considerable degree of civilization. They discovered an ardent love of liberty,

No. 3.

by the brave resistance which they so long maintained against the whole power of the Dutch, being the last nation in the Indian seas who were reduced to their subjection: and as the men are warlike, the women are remarkably chaste.

The furniture of their houses consists chiefly of carpets, cushions, and the couches on which they sleep; and, like most of the Asiatics, they sit cross-legged. They are particularly fond of a fine equipage, and a great many servants to attend them; of whom, if they have not enow of their own, they will hire or borrow, to make up the number, when they are to appear in public.

Their food is chiefly rice, fish, herbs, fruit, and roots; for of flesh they eat but little, and their principal meal is made in the evening. What they drink is tea, coffee, sherbet, or chocolate, and they have likewise palm wine, arrack, and other spirits; in which they sometimes indulge themselves, though contrary to the precepts of their religion. They loll upon carpets at their meals, and eat off dishes made of china, wood, silver, or copper, which are set before them on little low lacquered tables; taking up the rice with their hands instead of spoons, of which there is none amongst them. They chew betel and arek, or smook tobacco mixed with opium most part of the day.

Young men of condition here are taught to ride, shoot, and handle the crice and scymetar; also to blow their little poisoned darts through a tube or hollow cane, about six feet long, which is called a sampit. Their armour consists of a light shield made of cane, and covered with a buffalo's hide, a sword, dagger, and the sampit. The latter being furnished with a dagger at the end, serves likewise as a spear, and is used as such, after the missive weapon has been discharged through it, the wound inflicted by which is said to be irrecoverably mortal.

The produce of the island is rice, sugar, oranges, the tropical fruits, and pepper plant; but they chiefly cultivate the poppy, which affords opium. There are here also bamboos, of a great length and thickness, with other kinds of cane; likewise cotton trees, ebony, calambac, sanders, and other dying woods, with timber proper for building houses. No country abounds more with poisonous plants and herbs, whence is procured the liquor into which they dip their darts and daggers.

Here are most kinds of animals, except sheep. Monkeys may be seen in great numbers, some of which are as large as mastiffs, and frequently attack travellers. They hunt in packs, and will run down a wild beast; being afraid of nothing but serpents, by which tribe they are often pursued, even to the tops of trees, and sometimes wounded. There are no elephants in the island, but there is a small breed of horses, on which the natives ride, using, instead of a saddle, a painted cloth, without stirrups, and, for a bridle, a cord, to which is fastened a wooden bit. They also ride in the same way upon oxen and buffaloes.

The principal manufacture of the country is cotton linen, of which the women, who are taught to spin

and weave, make their own and their husbands cloaths, as well as those of their children. The men make their own arms and utensils; there being no particular trades, but every family working for themselves.

Before the invasion of the Dutch, Macassar had a great foreign trade, supplying the Moluccas and Banda with rice and other provisions, and taking their nutmegs and cloves in return; which they again exported to India, Persia, Arabia, and Egypt.

Their common language is the Malayan; but the religion of the island being Mahometanisin, the Alcoran is written in Arabic; and in consequence of their principles, the same marriage rites, as well as the practice of polygamy and concubinage, prevail here as in other Mahometan countries, which will be afterwards more particularly mentioned in treating of Turkey.

There are no written laws in this country, except those contained in the Alcoran. The judges, or cadis, who are Mahometan priests, interpret them, and every man pleads his own cause. In several cases, the party aggrieved is allowed to do himself justice; as in adultery, robbery, and the murder of a relation, when the offender is taken in the fact.

Before the conquest of the Dutch, the island was governed by a prince, whose authority was absolute; and the crown descended by collateral, not lineal succession. The forces of the kingdom were a well-disciplined militia, never chargeable to the government, but when they were called out to actual service. The first Europeans that invaded them were the Portuguese, whom the natives opposed with great vigour; but after being assisted by the Dutch in expelling that enemy, they were at length subdued by their auxiliaries, who now exercise over them an authority unbecoming the spirit of a free republic.

The island of Gilolo is situate between 3 degrees north, and 2 degrees south latitude, and between 125 and 128 degrees of east longitude. The chief town is Tochina, the name by which the island is frequently called. The climate, soil, produce, and inhabitants, differ so little from those of Celebes, that they require no particular description.

Ceram is almost contiguous to the islands of Amboyna and Banda, while those of Bourou and Bouton are situate between Ceram and Macassar; in all which, as well as Gilolo, the Dutch have erected fortifications, to defend the avenues to the Spice Islands.

From the early mention made of spices in sacred writ, it is evident that the islands which produce them were visited by the people on the continent of Asia, at a very remote period, though they remained entirely unknown to the Europeans, till the Portuguese discovered the way to India by the Cape of Good Hope. This memorable event happened in the year 1498, in the reign of Don Emanuel, king of Portugal, under the conduct of the enterprising Vasco de Gama, to whom the charge of the expedition was entrusted. On his arrival at Calicut in India, the admiral was opposed by the Moors or Arabians, and Egyptians, who then monopolized the trade of that coast. Returning to Europe however, the Portuguese

equipped a stronger fleet, with which they made themselves masters of several places on the continent of India. In 1511, Albuquerque, the Portuguese general, took the cities of Goa and Malucca, after which he dispatched Antonius Ambrus in search of the Spice Islands. This officer arriving at the Moluccas, found the two kings of Ternate and Tydore engaged in a war; when most of the adjacent islands being in alliance with one or other of them, and each party courting the friendship of the Portuguese, the latter were permitted to build forts in those territories, where they soon established a settlement, as they likewise did afterwards in the Banda Islands, and monopolized the whole trade of cloves and nutmegs. This traffic they enjoyed without interruption till the year 1520, when Magellan being employed by the Spaniards to discover a way to India by the west, passing the straits in South America, which go by his name, arrived at the Philippines. Here Magellan happening to be killed, John Sebastian del Cano took upon him the command, and established a factory on the clove island of Tydore. Leaving behind him one of his ships, he returned in the other to Spain, by the way of the Cape of Good Hope, with the glory of being the first commander that ever furrounded the globe.

In consequence of an agreement between the two nations, confirmed by the pope, all the discoveries westward were allotted to Spain, as were those eastward to Portugal. The Spaniards therefore considered themselves as justly entitled to a share of the spice trade. Mean time the Portuguese demolishing the Spanish factory upon the island of Tydore, and making prize of the vessel which had been left, a quarrel ensued between the two nations. The rupture however was at length accommodated, on the Portuguese agreeing to lend the Spaniards, or rather Charles the fifth, 350,000 ducats to relinquish their pretensions, a debt which was never discharged. The Portuguese again enjoyed the sole trade to the Spice Islands, till Sir Francis Drake passing the Straits of Magellan, arrived at the island of Ternate on the 14th of November, 1579; when the king of that country, weary of the oppression of the Portuguese, desired his protection, and acknowledged the queen of England as his sovereign, sending also to her majesty his signet, in confirmation of his fidelity. The admiral encouraged him in the hope of returning with a greater force, and having taken in a loading of cloves, set sail, by the way of the Cape of Good Hope, for England, where he arrived on the 3d of November, 1580, being then the second commander that had furrounded the globe.

A multiplicity of other objects engaging the English court, the Indian trade was neglected until the year 1591, when the captains Lancafter, Kendal, and Raymond, were sent on a voyage thither. Captain Lancafter, in one of the ships, arrived in the Straits of Malacca, but lost his vessel on his return home, and the other two never reached India.

In 1596, three other ships were sent to China, under the command of captain Wood, with the view

of opening a commercial intercourse with that nation; but the whole crew died on the voyage, except four, who were cast away on a small island near Hispaniola, and murdered by the inhabitants. Notwithstanding those disasters, however, another effort was soon afterwards made by the merchants of London, for carrying into execution the project of establishing a trade with the East Indies. For this purpose they formed themselves into a company, and were incorporated by queen Elizabeth, by a charter dated the 30th of December, 1600. Thus protected by the royal authority, they immediately equipped four ships, the command of which was given to the same captain Lancaster above mentioned, now promoted to the rank of admiral. They set sail from Dartmouth, April 22, 1601, and arrived at Achin, in the island of Sumatra, June 5, 1602. After taking on board as much cinnamon, cloves, and pepper, as could be procured at that port, and having delivered the queen's letter, he proceeded to Priaman, on the west coast of Sumatra, where he took in a greater loading of cloves and pepper. He next directed his course to Bantam, in the island of Java, where he settled a factory; and after dispatching a vessel to the Molucca and Banda Islands, for the purpose of likewise establishing a commerce with those parts, he set sail for England, where he arrived on the 11th of September, 1603.

Mean while the Dutch were not inactive in prosecuting commercial enterprizes of the same nature with those which now engaged the attention of other maritime powers of Europe. In 1595, the city of Amsterdam fitted out four ships, which arrived next year at Bantam, in the island of Java. Here, at the instigation of the Portuguese, the governor having made prisoners some Dutchmen who were on shore, the ships belonging to the latter immediately seized several Portuguese vessels which lay in the harbour, and fired upon the town. Sailing afterwards to Jacatra, now Batavia, a little to the eastward of Bantam, they there took in a cargo of spice and other merchandize, and returned to Holland in August, 1597. The republic, however, incited by the extensive prospect of commerce which now opened to their view, fitted out eight ships in 1598, under the command of admiral Neccius, who arrived the year following at Bantam; at which place, loading four of his vessels with pepper, he sent the other four to trade with the Moluccas, Amboyna and Banda, where they settled factories, and having taken on board a cargo of cloves, nutmegs, and mace, returned to Holland in 1600. Encouraged by this success, the spirit of enterprize became yet more general among the Dutch, and many new companies were established, for maintaining a commerce with India. But the states foreseeing the great advantage which would accrue to their country, from monopolizing the spice trade, formed all those separate companies into one body, that they might be the more able to contend with such European powers, as should attempt to rival them in so interesting a branch of commerce. For this purpose they proceeded to raise a stock of six millions of florins (600,000l. sterling), and fitting out strong fleets for India, at-

tacked the Portuguese settlements in those parts, making prizes also of their ships wherever they met with them, upon the pretext that the kingdoms of Spain and Portugal being under the same prince, the Portuguese were naturally to be considered as enemies to the Dutch, between whom and the Spaniards a war at that time subsisted.

In 1602, the Dutch equipped another fleet to India, under the command of admiral Neccius, who attacked the Portuguese in the Moluccas the following year, but without much success. In 1605, however, admiral Van Hagen being dispatched with a fleet to the Spice Islands, proved more victorious over the enemy, and reduced the castle of Amboyna. After which he attacked a fort belonging to them in the island of Tydore, when the magazine of powder blowing up, and destroying great part of the wall, the besieged were forced to surrender. But during this enterprize, the Spaniards in the Philippines fitting out a fleet, recovered the forts which the Dutch had taken in the Moluccas.

The Dutch continuing to pursue their favourite object with unremitting ardour, sent a fleet of men of war, with land forces on board, to the Banda Islands, requiring of the orancayas, or states of those islands, permission to erect a fort on the island of Nero; but this request being denied, the Dutch landed a body of troops, and massacred great numbers of the natives, who finding it impossible to defend themselves, submitted to the terms which had been demanded. The Hollanders, however, farther insisting that they should exclude all other nations from any share of their traffic, the Bandanese, under pretence of a treaty, drew the admiral Vanhoof, with several of his officers, into an ambuscade, where falling upon them, they retaliated the slaughter which had lately been committed by the enemy.

Open war being now carried on between the natives and the Dutch, the former invited to their assistance the English, who traded thither at that time, accompanying the invitation with a formal surrender of their country to James I. In consequence of this transaction, captain Keelyng set sail from England on board the Hector, and arrived at the island of Banda the 8th of February, 1608. With the approbation of the orancayas, he erected here a house for the use of the English company's factors, and agreed upon articles of trade; as he likewise did with the government of the island of Pooloway, from which he received 225 cantees of mace, and 1307 pounds of nutmegs. The Dutch admiral, however, soon afterwards landing more men in the island of Banda, laid siege to the town of Sabatata, which he took, and destroyed several Bandanese vessels which he found in the harbour; commanding the English captain at the same time to quit the island. Keelyng nevertheless staid at Banda till he had taken in his loading of spice, whence he proceeded to Bantam, and, having there established a factory, returned to England in May, 1600.

In the year 1616, we find two English vessels again arriving at the Banda Islands, under the command of captain Courthope, when the orancayas of Pooloway and Pooleron ratified the treaty, by which the

fove-

sovereignty of the island had formerly been surrendered to the English crown; the like cession being also made by the islands of Rosinaing and Wayre, by their respective oracayas.

Soon after this transaction, several Dutch ships approached the island of Pooleron, and hoisting a bloody flag, seemed to threaten an attack on the English vessels, when the crews of the latter landing some pieces of cannon, erected a battery with a view of commanding the road. Three other large Dutch ships arriving in a few days, the English informed them of the cession which had been lately made, and demanded that Polloway might be delivered up to them. The Dutch, so far from pretending at that time to any prior grant of those islands, acknowledged they had none; and discovering the English batteries on the shore, dissembled their hostile intentions. But captain Davis, who commanded the Swan, going over to the island of Wayre, which was not then in the power of the Dutch, two ships belonging to the latter poured in their broadsides upon him, and after some resistance made him prisoner, in open violation of the peace which subsisted between the two nations.

After the loss of the Swan, captain Courthope finding it impracticable to defend himself against the Dutch at sea, landed his guns, and erected a fort on the shore, with the design of maintaining his security, till he should be reinforced from England or Bantam. But his men deserting, carried the ship to the Dutch, who plundered it of every thing that was valuable, and threw the rest over-board. The men they loaded with irons, imprisoned them in the most horrible dungeons, and wantonly treated them with every brutal mark of indignity that could reflect reproach on the English name. Captain Courthope, in this situation, dispatched Mr. Spurway, factor to the East India company, to Bantam, with several of the oracayas of the Banda Islands, to represent the state of affairs to the factory at that place. But they not being in a condition to afford any assistance, Mr. Spurway wrote to the company in England, informing them of the outrages that had been committed, and strongly urging the necessity of the interposition of government, both for retrieving the honour of the nation, which had been so flagrantly violated, and for maintaining possession of the Spice Islands, which must otherwise entirely be lost.

This outrage committed by the Dutch, was succeeded by another in March following, when with four large ships they attacked two English vessels, that had come within sight of the port of Pooleron; on which occasion the latter were taken, after a smart engagement which lasted seven hours, and many of the crew were afterwards massacred in cold blood.

Notwithstanding all these misfortunes, the natives continued faithful to the English, and maintained the town of Lanter, in opposition to the whole force of the invaders, whom they frequently attacked with success. They were animated to this resistance, not only by their hatred of the Dutch, but by the gallant example of captain Courthope, who in January, 1628,

received an express from sir Thomas Dale, commander of a strong fleet of English ships, informing him that he was arrived at Bantam, and had defeated the Dutch fleet, which he had compelled to quit the coast of Java; adding that he would be speedily with him at Banda, and oblige the Hollanders to relinquish their unjustifiable enterprise. In expectation of those succours, as well as others from England, a complete year had elapsed, when news was received, that sir Thomas Dale was dead, and that the rest of the captains being divided among themselves, had dispersed to several parts of India, by which unaccountable conduct, seven of their ships had been taken by the enemy. In spite of this mortifying disappointment, and the scarcity of provisions, the brave Courthope resolved to defend his little garrison at Pooleron to the last extremity, the fortifications of which he repaired and improved in the most advantageous manner possible. But unfortunately, as this gallant commander was going over to one of the neighbouring islands to regulate some affairs, he was met by two Dutch vessels on the 26th of October, 1619, when, after an obstinate defence, receiving a shot in the breast, he threw himself in the sea, whether with the view of swimming to the shore, or to prevent his falling alive into the hands of the Dutch, is uncertain. He perished however on the occasion, leaving behind him a name which, for heroic courage, and an inviolable attachment to the interest of his country, has never been surpassed by any of the most celebrated commanders.

In consequence of this fatal event, Mr. Hayes, with the consent both of the English and Bandanese, took upon him the command of the fort of Pooleron, and two or three days after intercepted a Dutch packet, by which it appeared that a treaty of peace had been concluded between England and Holland, in relation to the spice trade. This important information he immediately dispatched to the Dutch governor at Nero, that he might have no pretence for committing any farther acts of hostility. The latter, however, without paying the smallest regard to this intelligence, required the Bandanese to acknowledge themselves subject to the United States, which the natives refusing, the Dutch hoisted a red flag, and attacked the town of Lanter; but they were again repulsed by the Bandanese, who cut many of them to pieces in the pursuit.

In February, 1620, notwithstanding the treaty above mentioned, another Dutch fleet arrived in the Indian seas, with land forces on board, for the purpose of making an entire conquest of the Spice Islands. The oracayas refusing to surrender the town of Lanter to this armament, the admiral took the place by storm, and having plundered and massacred many of the natives, reduced it to ashes. After wreaking his resentment on the English factors, in the most unmanly and illiberal manner, by corporal severities, he caused them to be tied hand and foot, and carried on board his ships, where they were laid in irons. He then seized their effects, consisting of 23,000 weight of mace, and 120,000 weight of nutmegs, besides their money, cloth, and other merchandize.

Banda, with a view of carrying on the trade in the stipulated proportion. It is evident, however, from the repeated outrages of the Dutch, already mentioned, that from the beginning they never entertained any resolution of preserving the treaty inviolate; and this is farther confirmed by the horrible transactions at Amboyna, which happened in less than three years after.

In order to give the more specious colouring to the violent seizure which they meditated of the island of Amboyna, they made use of the false pretext of a conspiracy being formed by the English and Japonese, to dispossess them of one of their forts in this place. The plot, it was alledged, had been confessed by a Japonese and Portuguese in the English service, who were most inhumanly tortured, till they should answer in the affirmative such interrogatories as

No. 4.

The whole of the transaction affords the most irrefragable testimony that it was founded entirely upon a political fiction of the Hollanders, who had themselves formed the design of monopolizing the trade of the Spice Islands; for the accomplishment of which they perpetrated, about the same time, a similar tragedy at Pooleron, where they put to the torture a hundred and sixty-two of the natives, whom they likewise charged with a pretended conspiracy. It may justly be reckoned singular in the fortune of this commercial republic, that they have ever since been permitted to enjoy in peace those invaluable islands, which were originally obtained by such atrocious infringements of humanity, and the laws of nations, as will stain the Dutch annals, to the latest ages, with indelible infamy.

for maintaining possession of the spice islands, which must otherwise entirely be lost.

This outrage committed by the Dutch, was succeeded by another in March following, when with four large ships they attacked two English vessels, that had come within sight of the port of Pooleron; on which occasion the latter were taken, after a smart engagement which lasted seven hours, and many of the crew were afterwards massacred in cold blood.

Notwithstanding all these misfortunes, the natives continued faithful to the English, and maintained the town of Lanter, in opposition to the whole force of the invaders, whom they frequently attacked with success. They were animated to this resistance, not only by their hatred of the Dutch, but by the gallant example of captain Courthope, who in January, 1618,

the pursuit.

In February, 1620, notwithstanding the treaty above mentioned, another Dutch fleet arrived in the Indian seas, with land forces on board, for the purpose of making an entire conquest of the Spice Islands. The orancayas refusing to surrender the town of Lanter to this armament, the admiral took the place by storm, and having plundered and massacred many of the natives, reduced it to ashes. After wreaking his resentment on the English factors, in the most unmanly and illiberal manner, by corporal severities, he caused them to be tied hand and foot, and carried on board his ships, where they were laid in irons. He then seized their effects, consisting of 23,000 weight of mace, and 120,000 weight of nutmegs, besides their money, cloth, and other merchandize.

The

The Dutch next proceeded to attack Pooleron, threatening the natives with inevitable ruin, if they did not immediately surrender. They answered, they were subjects of the king of England; and as there was peace between the two nations, they hoped the Hollanders would not now commit any acts of hostility; but if the English neglected to defend them, they must of necessity submit. In consequence of this declaration, the Dutch took possession of the island, and caused the natives to demolish the fortifications, while the English tamely suffered themselves to be idle spectators of the havoc, from an opinion that they ought not to act in a hostile manner, as peace had lately been ratified in Europe between their nation and the Dutch. Mean while the aggressors compelled all the other islands to submit to their dominion, prohibiting likewise the natives, under the severest penalties, from selling any more spice to the English. They even refrained not from sacrificing to their cruelty, those among the orancayas or magistrates, who had discovered the greatest attachment to their rivals, causing them to be inhumanly massacred in cold blood, under pretence that they were in a conspiracy against the rights of the republic.

The treaty which had been concluded by the English and Dutch, was not that of a pacification, as no acts of hostility had preceded between the two nations in Europe, but a treaty of commerce between the English and Dutch East-India companies, mutually ratified by the sovereign power of each country, and in the framing of which, the interests of the former were apparently relinquished by a weak or corrupt administration, by whom the articles had been dictated. By this treaty, it was agreed that the English should enjoy only a third share of the trade to the Moluccas and Banda, but yet bear half the expence in defending that commerce. It was also stipulated, that each party should remain in possession of the towns and forts which they respectively held at that time. The treaty was signed the 7th, and ratified at London on the 16th of July, 1619.

The English East-India company, not doubting the design of the Dutch to perform their part of the contract so advantageous to the republic, proceeded to settle factories in the Moluccas, Amboyna, and Banda, with a view of carrying on the trade in the stipulated proportion. It is evident, however, from the repeated outrages of the Dutch, already mentioned, that from the beginning they never entertained any resolution of preserving the treaty inviolate; and this is farther confirmed by the horrible transactions at Amboyna, which happened in less than three years after.

In order to give the more specious colouring to the violent seizure which they meditated of the island of Amboyna, they made use of the stale pretext of a conspiracy being formed by the English and Japonese, to dispossess them of one of their forts in this place. The plot, it was alledged, had been confessed by a Japonese and Portugese in the English service, who were most inhumanly tortured, till they should answer in the affirmative such interrogatories as

might favour the secret design of those cruel inquisitors. Upon the injurious evidence of this constrained declaration, they immediately accused the English factors of the pretended conspiracy. Some of them they imprisoned, and others they loaded with irons, and sent on board their ships; seizing at the same time all the English merchandize, with their writings and books.

These acts of violence were followed by a scene of horror unexampled in the punishment of the most atrocious offenders. Some of the factors they tortured, by compelling them to swallow water, till their bodies were distended to the utmost pitch. Then taking the miserable victims down from the boards to which they had been fastened, and causing them to disgorge the water, if they did not acknowledge the imputed guilt the process of torture was repeated.

Others of the English they consumed by burning them gradually from the feet upwards, in order to extort the confession of a conspiracy, which was only pretended by the infernal policy of those savage tormentors. Some had the nails of the fingers and toes torn off, and in some they made holes in their breasts, filling the cavities with inflammable materials, to which they afterwards put fire. Those who did not expire under the agonies of torture, were consigned to the hands of the executioner.

The allegation of this pretended conspiracy was equally void of probability and truth. The Dutch had a garrison of three hundred men in the fort, besides the burghers in the town, and several other forts and garrisons in the island, while the number of the English did not amount to twenty men; nor were even those provided with arms or ammunition, to effect such a design as that with which they were charged. There likewise was not one English vessel in the harbour, whereas the Dutch had eight ships riding near the town: neither, when the Dutch broke open the desks and trunks of the factors, was there found a single paper or letter, which could be construed into the most distant relation to any conspiracy. Add to all this, that such of the unhappy sufferers as could speak to be heard, declared in the most solemn manner their innocence of the plot with which they were charged.

The whole of the transaction affords the most irrefragable testimony that it was founded entirely upon a political fiction of the Hollanders, who had themselves formed the design of monopolizing the trade of the Spice Islands; for the accomplishment of which they perpetrated, about the same time, a similar tragedy at Pooleron, where they put to the torture a hundred and sixty-two of the natives, whom they likewise charged with a pretended conspiracy. It may justly be reckoned singular in the fortune of this commercial republic, that they have ever since been permitted to enjoy in peace those invaluable islands, which were originally obtained by such atrocious infringements of humanity, and the laws of nations, as will stain the Dutch annals, to the latest ages, with indelible infamy.

## C H A P. X.

*Of the Sunda Islands, New Guinea, and New Holland, with the Nicobar, and Adaman Islands.*

**T**HE Sunda Islands are so denominated from lying near the straits of that name, and the principal of them may be reduced to Borneo, Sumatra, and Java.

## B O R N E O.

The island of Borneo is situate in the Indian Ocean, between 7 and 4 degrees north, and 4 degrees south latitude, and between 107 and 117 degrees of east longitude. It is reckoned the largest island in the world, being about seven hundred miles long, and near as much broad. As the sun is here vertical a considerable time, the air must of consequence be hot. It is qualified however by the rains, which continue upwards of six months every year, laying the flat country under water, and by the sea breezes, which blow through the day. On the subsiding of the waters, the coasts are annually flooded for several hundred miles; when the surface being covered with mud, and the sun shining upon it with perpendicular rays, thick fogs are usually occasioned, which are not dispersed till nine in the morning. This season is also rendered particularly disagreeable by an offensive smell, arising from the putrid vermin, and insects which have been left behind by the waters. Besides those disadvantages, the hottest days are generally succeeded by chilling winds, which greatly affect the salubrity of the climate.

From September to April the winds here are westerly, and this is the rainy season, there hardly being two hours fair weather in the four and twenty, and the whole melancholy period likewise accompanied with terrible storms of thunder. Even during the other months of the year, there is almost every day a shower at the rising of the sea breeze.

The interior part of Borneo is mountainous and woody, but round the whole island the coast is flat and level, producing likewise extensive forests of excellent timber. The chief rivers are Banjar, Tatas, Java, Succadanea, and Borneo; the former of which is navigable for several hundred miles.

The produce of this island is rice, cocoa nuts, oranges, citrons, plantains, melons, banana, pine-apples, mangoes, and all kinds of tropical fruits; with cottons, canes, rattans, and plenty of very fine timber; to which may be added, gold, precious stones, some iron mines, camphire, bezoar, load-stone, and pepper. Of this there are three kinds, the first and best of which is the Molucca, or Lont pepper; the second is called Caytongee pepper, and the other Negaree, which is the worst sort, but in the greatest plenty. This species of pepper is small, hollow, and light. The white pepper is said to grow on the same tree which produces the black, but the former bears double the price. It is conjectured to be the best of the fruit which drops of itself, and is gathered by the

poor people in small quantities, before it changes its colour; but of this we are not informed with certainty.

There are here the same animals as on the continent of India, such as elephants, buffaloes, deer, &c. but the most remarkable animal, and which is almost peculiar to this island, is the celebrated oran-outang, or man of the woods, which is reckoned by some naturalists to be of the human species, but seems to belong more properly to that of the monkeys. He is usually described as being near six feet high. He walks upon his hinder legs, has no tail, but a face which resembles the human, and with hair only on the same parts of the body that are distinguished in men by that covering.

The natives of Borneo consist of two different classes of people, namely the Banjareens and Byayos; the former of whom inhabit the sea coasts, and the latter the mountainous parts of the island. The Banjareens are of a low stature, very swarthy, with bad features, resembling most the negroes of Guinea, but their complexions not so dark. They are well proportioned, however, and have black hair, which is kept continually shining with grease. The features and complexion of the women are much better than those of the men, and they are said to move with a good grace.

The common people wear no other covering but a bit of cloth, which hangs down before from a girdle, and a piece of linen tied about their heads. The better sort of the inhabitants however wear drawers, but no shirt; and on days of ceremony they appear in a vest of red or blue silk, with a piece of silk or fine linen tied round their loins, and loosely thrown over their left shoulder. Their legs and feet are bare; their hair is bound up in a roll, and a piece of muslin or calico tied over it. When they go abroad, they always carry a cruce or dagger in their gash, and are reputed to be a hospitable and friendly people.

The Byayos or mountaineers are much larger bodied men than the former, and on account of their more active life, are likewise far superior in point of strength. They generally go naked as the Banjareens, but paint their bodies blue, and like other inhabitants of the hot climates, anoint themselves with oil, which smells extremely offensive.

With respect to the food of the natives of this country, it chiefly consists of rice; but they likewise eat venison, fish, fowl, and almost all kinds of meat, except hog's flesh. Persons of distinction are served in gold or silver plate, but others use only brass or earthen dishes. It is universally the custom to sit cross-legged upon mats or carpets at their meals, and almost the whole day, chewing betel and arek, or smoaking tobacco, which is mixed with opium, and greatly used by both sexes. They are so much addicted to this practice, that they often continue it till they become stupid. The whole company usually smoak with one pipe, which after passing through the service of the master of the feast, is lent to the rest in order. Their rural sports are hunting, shooting, and fishing; but they sometimes perform rude comedies, and have been taught to game by the Chinese.

Their

Their common mode of salutation is the salam, or lifting their hands to their heads, and bowing their bodies a little; but before their princes they throw themselves prostrate on the ground. No person pretumes to speak to a superior without being desired. In the level country, they usually travel in covered boats upon the rivers; but the great men, who live in the interior parts, make use of elephants or horses.

The Banjareens are generally Mahometans, and the Byayos all pagans, differing little in their rites from the same religion on the continent. Both tribes of the inhabitants are extremely superstitious, pretending to charm away diseases, to foretell future events, and the like, each also allowing a plurality of wives and concubines. Their arms are the cruce or dagger, with the lance, and the weapon called the sampit, formerly mentioned in the account of Celebes.

The chief town in Borneo was formerly Banjar Masseen, which once lay about twelve miles up the Banjar, and was built on floats or rafts in the river, but it is now removed to Tatas, six miles farther from the coast. This floating capital forms one long street; each house consisting only of a single floor, divided into apartments, according to the number of the family. The walls and partitions are made of split cane, and the roofs covered with palm branches, the eaves reaching within five feet of the bottom, to defend them from the heat of the sun. The several houses lie at anchor, and are fastened together with hooks and rings, but joined in such a manner as to be easily detached, upon the alarm of a fire having broke out in any part of the town. The tide of ebb is so strong at Tatas, that sometimes the houses on those floats break loose from their moorings, and are driven out to sea. Besides the floating town which is stationed in this part of the river, there is one built of more substantial materials on shore, and others that stand upon pillars, several feet above the surface, and have no communication but by boats during the rainy season. The most noted towns next to Tatas are Caytongee, now the residence of the greatest prince in the island, and lying about two hundred miles up the river Banjar; Metapora, about ten miles from the former, the abode of the prince of Negaree, where there is a good magazine of fire arms, and some great guns mounted before the gates of the palace; Borneo, situate on a fine bay of the sea, in the north-west part of the island, once the residence of the most powerful prince in the country, but now a place of little trade; and Succadanea, lying in a commodious bay in the south-west part of the island, and formerly more resorted to by the Europeans than any other port.

The island of Borneo is divided into a great many governments, which have each their sultan or sovereign, the most powerful at present being the emperor of Caytongee, in whose territories lies the greatest part of the pepper plantations, whither a multitude of foreign merchants resort every year for this commodity. Here are no ships of war, and but few trading vessels belonging to the country. Some however they have, which, like those in the Ladrone Islands, will

sail above twenty miles an hour. The land forces of the sultan consist of militia, embodied as necessity requires. But possessing neither discipline nor courage in an eminent degree, they are far from being formidable; and the fortifications of the towns and castles are likewise too weak to afford defence.

The commodities chiefly imported from Borneo by the Europeans are, pepper, gold, diamonds, camphire, bezoar, aloes, maffick and other gums; and those most proper to be carried thither, besides bullion and treasure, are small cannon, from a hundred to two hundred weight, lead, calimancoes, cutlery wares, iron bars, small steel bars, hangers, nails, red leather boots, spectacles, clock-work, small arms with brass mountings, horse pistols, blunderbusses, gun-powder, and looking-glasses.

It is imagined that the trade to Borneo might be rendered as advantageous as that to any other country of India, by means of the China fleet which lies here great part of year, and could supply the merchants with the goods of that empire, almost as cheap as at Canton; especially considering the far greater length of the voyage to China, with the customs, port charges, and extortions of the revenue officers, with which it is attended. Here the Europeans also meet with the Macassar praws, which, notwithstanding all the vigilance of the Dutch, bring hither cloves, nutmegs, mace, gambuge, cassia, aloes wood, and many other sorts of rich merchandize.

In the beginning of the present century, an attempt was made by the English to establish a factory in this island; but through the mismanagement of those who were appointed to conduct it, the design proved abortive. Should the project be revived, however, and more prudent measures adopted, it probably might be carried into execution with facility and success.

#### S U M A T R A.

Sumatra, another of the Sunda Islands, is situate between  $5\frac{1}{2}$  degrees north, and  $5\frac{1}{2}$  degrees south latitude, and between 93 and 104 degrees of east longitude; being nine hundred miles in length, and about one hundred and fifty in breadth. The air in this island is generally unhealthy near the coast, not only on account of the great heat and moisture, but of the sudden vicissitudes from sultry heat in the day-time, to cold chilling winds in the night. To those causes of infalubrity may be added, the salt stinking ouze, which emits an extremely noxious vapour, so injurious particularly to foreigners, that such as are exposed to it seldom survive three years. A chain of mountains extends along the whole length of the country, from the north-west to the south-east, where the air is considerably more wholesome than in the skirts of the island; and about forty miles south-east of Bencoolen, there is a mountain called Singledemond, which is a mile in height perpendicular. Here are a great many small rivers, but few of them navigable much beyond their mouths, on account of the rapidity with which they are precipitated from the mountains. The rainy season, as in most places near the equinoctial, continues

tinues upwards of six months every year, and no where with greater violence. The waters of all the rivers which overflow the low countries are foul and unwholesome, not fit to be drank till they have been boiled and settled, and been farther corrected by an infusion of tea or some other herb; a circumstance which adds not a little to the insalubrity of the climate.

The produce of Sumatra is pepper, rice, sugar, camphire, gold-dust, bezoar, canes, and cotton. Their fruits are cocoa-nuts, limes, oranges, mangoes, plantains, guavas, jacks, durions, pine-apples, mango-steens, and such others as are indigenous in the tropical climates. Here are also melons, peas, beans, potatoes, yams, radishes, and plenty of all kinds of garden-stuff. The island likewise produces a plant called bang, which nearly resembles hemp, and being taken in infusion, exhilarates the spirits, sometimes even to a degree of madness; on which account it is used by the natives before they go to battle, with the same view as opium by the Turks.

The staple commodity of this island, next to gold, is pepper, of which none produces greater abundance. This plant is cultivated in the level plains, near the banks of rivers. The stalk being slender, it is supported by a thorny tree, and the berries hang from it in clusters, in the same manner as those of the elder. The vine produces no fruit till the fourth year, and from this time to the eighth the quantity annually increases. After which period the crop declines, and about the tenth year totally ceases. The usual time of gathering the crop is about Michaelmas, but there is a small crop in March.

The animals in Sumatra are a small breed of horses, buffaloes, deer, goats, hogs, tygers, monkeys, squirrels, guanoes, porcupines, alligators, serpents, scorpions, with musktoes and other insects. Here are also hens, ducks, and other poultry; with pigeons, parrots, paraquets, maccaws, and small birds. Sea and river fish are likewise in great plenty. Elephants, though some they have, are said not to be natives of the island.

In their persons and habits the natives of Sumatra very much resemble those of Borneo. They are of a moderate stature, and swarthy complexion, with black hair and eyes, flat noses, and high cheek bones. Besides anointing their bodies with oil, they die their teeth black, and let some of the nails of the left hand grow as long as their fingers, scraping them till they become transparent, and tinging them with vermilion. Round their heads they generally tie a piece of blue or white linen, or wear a cap not much unlike the crown of a hat. The better sort wear drawers or breeches, with a piece of callico or silk wrapped about their loins, and thrown over the left shoulder. They wear sandals in the towns, but usually travel bare-foot. In respect of genius and disposition, they are reckoned proud, heavy and indolent.

Rice generally constitutes the greatest part of their diet, with which they eat soup made of flesh or fish, and a very little meat high seasoned.

The Mahometan religion is professed upon all the coasts of Sumatra, but the people are not great zealots,

and their mosques so meanly built, that many of them are no better than cottages. The inhabitants of the mountains are pagans, who are said to venerate a bull, as one of the objects of their worship; on which account they abstain from eating of beef.

The Mabometans speak and write the Malayart tongue, but the mountaineers have a language peculiar to themselves. The former write from the right hand to the left, using ink and a coarse brown paper; but the latter proceed in the contrary direction, and engrave with a stile on the outside of a bamboo cane.

Sumatra is divided into a great number of different kingdoms or states, among which that of Achen is the most considerable. The capital of this kingdom, and of the whole island, is a town of the same name, situate in 5 degrees 30 minutes north latitude, and in 93 degrees 30 minutes east longitude. It stands in a plain, at the distance of a mile from the sea. In circumference it is about a mile and a half, defended by a few small forts, but chiefly by the woods and bogs with which it is surrounded. The middle is occupied by the king's palace, round which, instead of a wall, there are great banks of earth, planted with canes and reeds, that render the place inaccessible. A rivulet runs through the city, lined with stone, in which the inhabitants usually bathe.

It is computed that this metropolis contains upwards of seven thousand houses, which are generally detached at a little distance from each other, and surrounded with pallisadoes; except in some streets where the markets are kept, or where foreigners inhabit, who choose their dwellings to be more contiguous, as a security against theft and robberies, which are here very frequent. Most of the houses are erected upon pillars, ten feet high, the waters overflowing the streets in the rainy season. They are built of split cane or bamboo, with which they are also floored; every house being accommodated with a stone vault, to serve as a repository for their most valuable effects, which would otherwise be frequently exposed to the injuries of fire. Factors both from the European and Asiatic countries reside here, but the Chinese are far the most numerous.

Thirty miles east of Achen is situate Pedir, beyond which, farther to the south-east, lie Pacim and Dely, once capitals of kingdoms, but now extremely declined. On the east coast are the towns of Polambam and Jamby, the latter of which, situate on a river about fifty miles from the sea, is the capital of all the Dutch settlements on this coast.

Proceeding from the south along the west coast of Sumatra, the first settlement we meet with is Sillebar, which stands at the mouth of a river on a fine bay, in about four degrees of south latitude.

At a little distance thence is Bencoolen, the principal English settlement on the coast. This town, which is extremely unhealthy, is two miles in circumference, inhabited chiefly by the natives; the English, Chinese, and Portuguese, having each their respective quarters. It was taken by the French in the last war, but detained only a very short time.

the natives; the having each their by the French ly a very short

Three miles from Bencoolen, stands fort Marlborough, in a dry elevated situation, and therefore much more healthy than the former. Northward on this coast there are several other port towns, particularly Bantall, likewise an English settlement; Indrapour and Padang, Dutch settlements; with Tecon and Passaman, almost under the equinoctial.

In the north part of Sumatra, there are several orang-cayas or great lords, who exercise sovereign authority in their respective territories, but acknowledge the king of Achen as their superior. The throne of this prince is hereditary, not elective; yet he can nominate to the succession one of his younger children, in preference to the eldest son, even though the latter be born of a wife, and the other of a concubine. The south part of the island is likewise divided into a great number of small territories, which are governed by their respective pangarans or rajahs, with the advice of the proatens or principal men of the state. There are some towns upon the coast vested with sovereign power, and governed by their own magistrates, called datos, whose jurisdiction is totally independent of the pangarans or rajahs. Twelve citizens of this class preside over Bencoolen, and four have the direction of Sillebar. The inhabitants of the mountains acknowledge subjection to the chiefs of their respective tribes, who, though mutually independent of each other, maintain a firm alliance, for the preservation of their common security, against the numerous powers which surround them.

In respect of military force, the constitution of Sumatra is exactly the same with that of Borneo; none of the princes having any standing army, a few guards excepted, but depending entirely upon the militia; under which denomination are included all the men capable of bearing arms, who are obliged, whenever they are summoned, to repair to the standard of their leader.

There appears to be no written laws in this country, except those of the Alcoran, and the comments by the priests, which are only received among the Mahometan part of the inhabitants; the decisions in other cases being governed by custom and precedents. For murder and adultery, the usual punishment is death, which is not inflicted by a professed executioner, but jointly by every person who happens to be within reach of the criminal; and the common weapon is a crice or dagger. Women, however, for capital offences, are strangled with the bow-string. Theft is for the most part punished either with the amputation of the fingers or toes, or sometimes of the limbs, according to the aggravation of the crime; but for the third transgression of this kind, the delinquent is put to death, by beheading, impaling, or the like.

Among the foreigners that resort to Sumatra for the sake of traffic, the Chinese are the most numerous. Ten or twelve sail of their junks arrive here annually in the month of June, which bring with them rice and other produce of the country. In this fleet there likewise comes a number of artizans, who immediately go to work in making tables, cabinets, and chests of drawers, with various other articles of household

No. 4.

furniture, utensils and toys, which they expose to sale in one of the streets of Achen, distinguished by the name of the Chinese camp. The fair continues for three or four months of the year, during which time it is greatly crowded, not only by the natives but the Europeans, who resort hither to drink hockshew, a kind of strong beer made of wheat, and preferred by strangers to any liquor which the country affords.

The pepper brought to the English factory at Bencoolen grows in the territories of two rajahs, or Indian princes, one of whom has his capital at Singledemond, ten miles north of the settlement, and the other at Bufar, about as far east from the same. Both these have houses at Bencoolen, where they reside occasionally when they have any business to transact with our people, who pay them two soocas, or half a dollar custom for every bahar, containing five hundred and sixty pounds weight of pepper. In consideration of this acknowledgment, the rajahs undertake to promote the cultivation of the commodity, and to bring their fruit to the English factories. When the pepper is weighed and delivered to the purchasers, it is paid for at the rate of ten molocos or Spanish dollars for every bahar.

The island of Sumatra is supposed by some to be the Ophir mentioned in scripture, whence Solomon imported his gold. It is certain, however, from the Mahometan religion being established on the coasts, that the Arabians afterwards traded hither, though no account is to be found of the commercial transactions of the country, till it was discovered by the Portuguese, about the year 1500 of the Christian era, who enjoyed the exclusive traffic with this, and the adjacent islands, during almost the whole succeeding century.

In the year 1600, the English East-India company having obtained a charter, empowering them to trade to those parts, they fitted out four ships for Sumatra, which arrived at Achen on the 5th of June, 1602, carrying with them a letter from queen Elizabeth to the king of that country. This overture of commencing a traffic between the two nations was received by the latter with particular marks of cordiality, in consequence of which the English erected several forts in the island, and continued to carry on the trade without interruption, till the beginning of the present century. In the year 1719, however, the natives formed a resolution of driving the English from their coasts; being induced to this measure by some impolitic acts of violence exercised by the governor of Bencoolen, who put in the stocks two rajahs or sovereign princes in that neighbourhood, because their people had not brought down pepper to the fort so quickly as he expected. An insurrection immediately succeeded, which was begun by setting fire to the company's plantations, when there being only a hundred and twenty-five English in the fort, most of them unexperienced or disabled men, it was judged proper for the company's service, to put their treasure on board a vessel which then lay in the road. The greater part of the garrison likewise embarking saved their lives, while those who could not effectuate their escape, were cut to

L

pieces

pieces by the enemy. A year had not elapsed, however, after this unfortunate event, when the English were again invited by the natives to return to their settlements on the island, with the view of preventing it from becoming a prey to the Dutch, the severity of whose government they dreaded more than that of the other. The proposal was accordingly accepted by the company, who have ever since maintained a regular traffic with this island, which, considering the great importance of the pepper trade, it would be highly imprudent to abandon.

#### J A V A.

Java, the next of the Sunda Islands, is situated between 5 and 8 degrees of south latitude, and between 102 and 113 degrees of east longitude; being seven hundred miles long, and upwards of a hundred broad. The climate is nearly the same with that of the other islands in this class. The air on the sea-coast is generally unhealthy, where the bogs are not drained, and the lands cultivated, but farther up in the country it is much better. A range of mountains runs along the middle of the island from east to west, which are covered with fine woods, the low lands all round being flooded during the whole of the rainy season.

This island was anciently divided into a number of petty governments, which are at present reduced to a few. The north coast is under the dominion of the Dutch; and the south is subject to the kings of Palambang and Matran. The chief towns are Bantam, and Batavia or Jacatra.

Bantam, which was formerly the capital, is situated in 6 deg. 30 min. south latitude, and in 105 deg. east longitude, in a fine plain at the foot of a mountain, whence run three rivers, two of which surround the town, and the other passes through the middle of it. While this place continued to be the mart of the island, it was twelve miles in compass, and exceeding populous, but it is now greatly declined both in extent and the number of inhabitants.

Batavia, the present capital, lies 40 miles east of Bantam, on a bay of the sea. Before the bay are several islands, that cover it from the winds, so that a thousand sail may ride here securely; the navigation being farther facilitated by two large moles projecting half a mile into the sea, where vessels may lie close to the keys. The town is almost of a quadrangular form, built with white stone, and laid out in spacious streets, through the principal of which run canals, lined with stone, and planted with ever-greens. The town is defended by a fort which commands the harbour, and surrounded by a wall with twenty-two bastions; the suburbs extending a mile and half farther, where there are large gardens and orchards, for the security of which, as well as to guard the avenues to the city, little forts are erected on every side, for the space of six or seven miles round. Most of the great towns in this island, especially such as are subject to the Dutch, are situated on the north coast. Those east of Batavia are Charabon, Samarang, Japara, Roomboing, Tuban, Sidaya, Jortan and Surabija; at the

east end of the island are the towns of Passarvan and Panarucan; and on the south coast, Palembang and Matran.

The principal grain that grows in the island is rice, besides which there are plantations of sugar, tobacco, and coffee. Garden-stuff is likewise in great plenty, and the various sorts of Indian fruit, such as plantains, bananas, mangoes, oranges, &c. with gums of different kinds, particularly benzoin. Here are also good timber, cotton, and other trees natural to the climate, besides oak, cedar, and several kinds of red wood. The cocoa tree in particular is extremely common, and no less useful than frequent. It affords meat, drink, oil, and vinegar; of the fibres of the bark they make cordage; with the branches they cover their houses; on the leaves they write with an iron file; making likewise their houses, boats, and other vessels, of those and the great Bamboo cane.

The indigenous animals of the country are buffaloes and some oxen, with a small breed of horses. The sheep are few, their covering rather hair than wool, and their flesh dry. The hogs, both wild and tame, are esteemed excellent, as is also the venison. The island produces tygers and other wild beasts, crocodiles, porcupines, serpents, scorpions, locusts, and innumerable insects, with monkeys, and poultry of a small breed.

The inhabitants of Batavia, and the island in general, are a compound of different nations, among whom the Dutch are the most powerful and wealthy. Next to those may be reckoned the Chinese, who likewise resort hither in great numbers. They farm the excises and customs, and are more or less concerned in all the civil, as well as commercial business of the country. Such of them as reside in Batavia live under a governor of their own, retaining their native dress, with the difference only of wearing their hair long and neatly twisted, an indulgence from which they are prohibited within the territories of China. A great part of the inhabitants likewise consist of Malaysians, who have very tawny complexions. They wear a short coat with strait sleeves, and a cloth about their loins, binding their temples with a piece of linen, in which they enclose part of their hair, the rest hanging down. The women wear a waistcoat and a cloth about their loins, which reaches half way down their legs. They use no covering on their heads, and go bare-foot. Many of the natives of Amboyna are also to be found in this country. They are for the most part carpenters, and reckoned very dexterous in that employment.

The native Javanese wear a kind of skull-cap, but their bodies are naked from the middle upwards. A piece of silk or callico surrounds their loins, and reaches below the middle of their legs, which are bare. The women cover their bodies with a close robe of silk or callico, wearing about their loins a piece of the same stuff, and dressing in their hair. The men are usually employed in husbandry or fishing, or in building country boats.

Besides the people above mentioned resident in Batavia, there are likewise many natives of other  
 Indian

Indian nations, who have migrated hither, which renders the place at present one of the most populous cities in Asia. It is computed that of the Chinese alone, there are not less than a hundred thousand in the island of Java, and of those the greater part live either in the capital or its environs. By such a multitude of this industrious people, the trade of Batavia is not only greatly increased, but a considerable addition is also made to the revenues of the Dutch; every Chinese inhabitant being obliged to pay a poll-tax for the privilege of wearing their hair, exclusive of so much for every silver and gold bodkin in it.

The Dutch permit no European nation to trade with the island of Java; but from China there usually come hither every year fourteen or fifteen junks of two or three hundred tun, which arrive in the month of November or December, and return home in June. By means of this fleet, the island is supplied with all the merchandize of China, upon easier terms than they could purchase it in the ports of that country. The Dutch however import in their own bottoms the produce of Japan, the Spice Islands, Persia, and India, besides the merchandize of Africa and Europe. To so great an extent is this traffic carried, that we are told there are no where such magazines of goods as in Batavia, except in Amsterdam itself. Their trade with the coasts of India is much more advantageous than that of any other European nation, to the same parts. For subsisting entirely by barter, it is so far from diminishing their treasure, that it brings them more gold and silver than any other article of commerce.

The island of Java is constantly guarded by the Dutch, with a force sufficient for the security of so important an acquisition. They have usually here a standing army, consisting of upwards of twenty thousand men, partly Hollanders, and partly natives of India; but, excepting the guards, their cloathing is mean, and not uniform. As a farther protection to this and the other islands in those parts, they also have for the most part a fleet of thirty or forty men of war in the Indian sea; a force not only capable of defending their settlements, but even of obstructing, against other European nations, the passage to China through the Straits of Sunda and Malacca, should they ever be inclined to monopolize the trade to that country.

The governor of Batavia is invested with great authority, and the state which he assumes is correspondent to the idea of his power. A troop of horse-guards precedes his coach when he goes out; the vehicle is attended by halbardiers, who march on each side, and followed by a company of foot-guards, cloathed in yellow satin, enriched with silver lace and fringe. His lady is likewise accommodated with guards, and treated in all respects with the attention paid to regal dignity.

The princes of the island who are vassals to the Dutch, are permitted the full enjoyment of their former splendor and ostentation. When the king of Bantam goes in or out of his palace, the great guns are fired; four men of the most gigantic stature and

fierce countenances that can be procured, with their shields and broad swords, begin the procession. These are followed by two companies of Javanese soldiers, and a body of Dutch; behind whom rides the king, mounted on a Persian horse caparisoned with gold. A great number of women surround him on foot, carrying golden vessels, with fruits and flowers; and the procession is closed with two companies of soldiers, the one Dutch, and the other natives of Java.

This island, like most of the other countries of India, was discovered by the Portuguese about the end of the fifteenth century, who were the only European nation that traded hither for a hundred years after, when the English and Dutch began likewise to obtain a share of the commerce. Bantam was at this time the most flourishing city in all India: but a misunderstanding happening between the king of this district and the Hollanders, the latter removed to Jacatra, now Batavia, which soon afterwards became the mart of the island. Here the Dutch erected forts, and introduced so many troops, that in a short time they were able to give law to most of the sovereigns in the country. The most formidable of those was the king of Bantam, who continued to dispute the superiority with the new invaders. In order to subdue this antagonist, who was then at variance with his son, the Dutch assisted the latter, and enabled him to usurp his father's throne. By the succours which they lent on this occasion, however, they made themselves entire masters of the new king, taking into their own hands the administration of government, and permitting him only the nominal possession of the crown. Soon after, they expelled all European factors and merchants from the coasts, particularly the English, who enjoyed a very great trade hither so late as the reign of James II. The Dutch are therefore at present the only power in Java, except the kings of Materan and Palambang, whose territories are situate beyond the mountains on the south-east part of the island, from whom they apprehend no disturbance. This unmolested security, however, has not prevented the Hollanders from exercising in Java the same barbarous expedient by which they gained possession of the Spice Islands. In the year 1740, under the pretence that the Chinese who were settled at Batavia, meditated a conspiracy, they inhumanly massacred thirty thousand of that nation, without producing the smallest evidence in justification of so atrocious an act. It must be acknowledged that the States of Holland disavowed their having ever granted to the governor of Batavia any authority for this outrage; but the general suspicion that the conductor of this horrible tragedy was removed by poison, to prevent any inquiry into the affair, with the excesses formerly committed at Amboyna and other places, too palpably under the sanction of the States; these considerations must for ever greatly invalidate the credit due to this profession of innocence, the truth of which is contradicted by circumstances of so unfavourable a nature.

With respect to the two kingdoms of Materan and Palambang, they produce nearly the same commodities with the northern part of the island, but are at present

sent little resorted to by any other people than the Chinese.

Near to Java, is the island of Bally, or the Less Java, separated only by a strait; eastward of which lie the islands of Lomboy, Combova, Flores, Solor, Timor, and several others, where the Dutch have forts, and consider the natives as their subjects. The largest of those is Timor, being about two hundred miles in length, and fifty in breadth. It is divided into a number of petty states, which the Dutch set against one another, and by that means govern the whole. The Portuguese had formerly colonies here, whose descendants are now so intermixed with the natives, as hardly to be distinguished from them. The inhabitants are extremely swarthy. They use no cloathing but a little piece of silk or callico round their loins; and the better sort wear a kind of coronet about their temples, adorned with little thin plates of gold or silver: the others have caps made of palmetto leaves. Their arms are swords, darts, and lances or spears, with which they kill their game. The inhabitants are chiefly Christians, though there are still some Pagans and Mahometans. The produce of these islands, both in fruits and animals, is the same as that of Java; the Dutch, however, seem to derive but little advantage from them, their inducement to build forts here being only the protection of the Spice Islands.

South-east of those islands lie Papous Terra or New Guinea, and New Holland; of both which neither the extent nor internal state is known with any degree of accuracy. According to the report of the Dutch, by whom they were discovered, they are barren inhospitable countries, with few inhabitants. Whether this be really the case, however, or that the Hollanders, who have already as many settlements in those seas as they can well maintain, have industriously propagated such an account, with the view of discouraging other European nations from navigating hither, there may be some reason to doubt. About the year 1700, a vessel was fitted out from England, under the command of captain Dampier, to discover the true situation of those countries. According to his account, the natives were not so barbarous as the Dutch had represented them. He treated with them about entering into an alliance with the English, and received from one of their princes, as a confirmation of their friendly disposition, a crown and sceptre, which were made of wood. Of the discoveries made of this voyage, however, no other circumstances being ever published, we cannot determine whether the design of prosecuting any settlement in those seas, was laid aside on account of the war into which the nation was then entering, or from an improbability that such an enterprize should be attended with success.

Returning from the south towards the coast of India, the principal islands we next meet with are those of Nicobar, at the entrance of the bay of Bengal; situate between 92 and 94 degrees of east longitude, and between 7 and 10 degrees of north latitude. The largest of those islands, which lies most to the south, is forty miles long, and fifteen broad. Towards the southern extremity it is mountainous, but in the

other parts low, and covered with wood; where the soil is esteemed rich, and fit for producing almost any grain, if properly cultivated. It abounds particularly with groves of cocoa-nut trees, which are said to be exceeding pleasant.

The natives are of a middle stature, and have a deep olive complexion, with long black hair, and black eyes. The men wear no cloaths; but a girdle of lines about their loins. That of the women reaches below their knees, and they pull the hair of their eye brows off by the roots. They live chiefly on fish, and the tropical fruits, which the island produces spontaneously. Their houses are built in clusters, each consisting of five or six, erected on bamboo pillars, eight or nine feet above the surface of the ground, and covered with palm branches. The people of this and the other Nicobar islands are said to worship the moon; but some of them have been converted to Christianity by the Danish missionaries, who have reached hither, and for whose protection a fortress has been erected. The inhabitants have little commerce either with any other island or the continent, but furnish ships that sail this way from the straits of Malacca, with hogs, poultry, and such fruits as the country affords, for tobacco, linen, and other articles in return.

Proceeding towards the north, we arrive at the Andaman Islands, situate in 92 degrees of east longitude, and between 10 and 15 degrees of north latitude. The Andaman Islands differ little from those of Nicobar, except in producing rice, which with the fruits of the country, and fish, constitutes the food of the inhabitants. It has been reported by some voyagers, that the natives both of the Andaman and Nicobar Islands were cannibals; but it appears from the most authentic accounts, that this imputation is entirely groundless; they being so far from devouring their own species, that they hardly eat any fish at all.

#### C H A P. XVIII.

*Of Ceylon, and the Maldiva Islands.*

**C**EYLON, which is one of the Spice Islands, is situate between 78 and 82 degrees of east longitude, and between 6 and 10 degrees of north latitude, lying about thirteen leagues south-east of the peninsula of the Hither India. It is computed to be two hundred and fifty miles long, and two hundred broad.

This island is for most part mountainous and covered with wood, but it contains likewise many fertile plains and valleys, which are well watered with rivulets. The most remarkable mountain is that which is named by the natives Hamalet, and by the Europeans, Adam's Peak. It is of a pyramidal form, terminating at the top in a narrow rocky plain, on which there is the print of a man's foot, near two feet long. The islanders relate that this impression was made by their god Buddon, at his ascending hence to heaven; and they come hither in pilgrimage annually to worship the sacred spot. From this mountain the principal rivers in the island derive their source; but they run with such rapidity, and are so full of rocks, that none of them are navigable. The country is generally healthful,

wood; where the  
 producing almost any  
 bounds particularly  
 which are said to be

, and have a deep  
 hair, and black  
 at a girdle of linen  
 men reaches below  
 of their eye brows  
 on fish, and the  
 reduces spontane-  
 ously, each con-  
 no pillars, eight or  
 round, and cover  
 this and the other  
 moon; but some  
 christianity by the  
 hatched hither, and  
 been erected. The  
 mer with any other  
 ships that fail this  
 with hogs, poultry,  
 words, for tobacco,

we arrive at the  
 degrees of east longi-  
 tudes of north latitude.  
 from those of Nico-  
 bar with the fruits of  
 the food of the in-  
 habitants by some voyagers,  
 Malabar and Nicobar  
 islands from the most  
 population is entirely  
 dependent on devouring their  
 food by flesh at all.

#### VIII.

##### of the Islands.

the Spice Islands, is  
 degrees of east longi-  
 tudes of north latitude,  
 east of the penin-  
 sula computed to be two  
 hundred broad.  
 mountainous and covered  
 with many fertile plains  
 watered with rivulets.  
 that which is named  
 the Europeans, Adam's  
 terminating at the  
 which there is the  
 about a foot long. The  
 was made by their  
 ascent to heaven; and  
 usually to worship the  
 the principal rivers  
 but they run with  
 rocks, that none of  
 is generally health-  
 ful,

ful, except near the sea, and the north part of the  
 island, where having no springs or rivers, the inha-  
 bitants suffer great inconveniences from a defect of  
 water in the dry seasons.

The capital of the island is Candy, situate about the  
 middle of it. This, though an open town, and not  
 fortified, is yet almost inaccessible, on account of the  
 rocks and thick woods with which it is encompassed,  
 prohibiting entrance all round, except through some  
 lanes, which are fenced with gates of strong thorn.

Columbo, the capital of the Dutch settlements, is a  
 great port-town, in the south-west part of the island,  
 lying in 78 degrees of east longitude, and 7 degrees  
 of north latitude. The harbour, which is large and  
 commodious, is defended by a castle, and several bat-  
 teries of guns. In this fortress resides the governor,  
 with the merchants, and troops belonging to the East  
 India company; the space between the castle and the  
 sea being occupied by huts, which contain about four  
 thousand slaves.

On the same coast, twenty-five miles north, is  
 situate Negumbo, another port-town, whence twenty  
 miles farther lies Chilao, remarkable for an excellent  
 harbour. On the east side of the island are, Trinco-  
 male, and Batacalao, at the latter of which there is  
 a fortress. Jaffnapatan, the capital of the province of  
 that name, is also regularly fortified by the Dutch, to  
 prevent any other nation from sending colonies hither,  
 though there grows no cinnamon in this part of the  
 island.

The natives of Ceylon are of a moderate stature,  
 and well proportioned. Their complexions are dark,  
 but far inferior in blackness to those of the Indians on  
 the adjacent continent. They have good features,  
 black hair and eyes, and the men wear long beards.  
 The dress of the male sex is a waistcoat of callico,  
 with a girdle of the same, in which they put their  
 knife and a few trinkets. They wear a hanger by their  
 side, in a silver scabbard; every man likewise carrying  
 in his hand a cane, and being attended by a boy with  
 a box, which contains his betel and arek nut. Young  
 men of figure wear their hair long and combed back,  
 but those of a more advanced age, use caps in the  
 form of a mitre.

The dress of the women is nearly the same with that  
 of the men. They wear a callico waistcoat, exactly  
 fitting their body, and a girdle which hangs in general  
 below the knees, but is longer or shorter, according  
 to the quality of the person. On their head they use  
 no covering, except a piece of silk when they go  
 abroad, and their hair hangs down loose at full length.  
 They bore holes in their ears, which are frequently so  
 much enlarged by the weight of jewels depending from  
 them, as easily to admit a half-crown. Their necks are  
 likewise loaded with heavy ornaments, which fall upon  
 their breasts; their arms are furnished with bracelets;  
 and on their fingers, and even toes, they wear a great  
 number of rings, with a girdle of silver wire and plate  
 round their waists.

The inhabitants of this island, like those of the hot  
 climates in general, are addicted to indolence, but not  
 luxurious. Though grave, and of an even temper,

they possess acute understanding, and have an agreeable  
 address. Their social qualities, however, are much  
 tarnished by a propensity to lying, but their disinge-  
 nuity seems not to be attended with any unfavourable  
 opinion of the virtue of others; for in regard to con-  
 jugial fidelity in particular, the men are seldom jealous  
 of their wives.

The common salute here, as in other parts of India,  
 is the salam, or the carrying one or both hands to their  
 heads, according to the quality of the person to whom  
 the compliment is paid. For the nearest relations and  
 friends to talk much on a visit, is considered as a mark  
 of levity, and people of this character are generally  
 held in little esteem.

In Ceylon, as well as other hot countries, rice  
 constitutes a principal article in the diet of the inha-  
 bitants, and in the cultivation of this grain they display  
 remarkable industry, not only in levelling the grounds,  
 but banking them round so that they may contain  
 water. It is not unusual to supply their fields with this  
 element by means of artificial conduits from the tops  
 of mountains; and in those parts of the island where  
 there are neither springs nor rivers, as is the case in  
 the north, they preserve the rain-water in great refer-  
 voirs in the time of the monsoons, conveying it gradu-  
 ally in rills to their fields and gardens, until the rice has  
 attained its full growth. As soon as the grain is ripe,  
 they tread it out with oxen and buffaloes in the field;  
 previous to which operation, they always pay their  
 devotion to some idol, and intreat a blessing on their  
 labours.

Other kinds of grain are likewise used in the country  
 for bread, especially toward the end of the year, when  
 there is a scarcity of rice. The principal of those is  
 the coracan, which is a very small seed. This grows in  
 a sandy soil, and comes to maturity in a short time.  
 Another grain, named tanna, not much different from  
 the preceding, is also used for bread, but it is dry  
 and insipid. Of the feed tolla they use only the oil,  
 with which they anoint their bodies.

Among the fruits of this country, is the betel nut  
 already mentioned, of which the inhabitants used for-  
 merly to export a great quantity to the coast of Coro-  
 mandel, till the Dutch put an entire stop to this traffic.  
 The fruit jack, which is much used in this country,  
 is of a round form, and as large as a peck loaf, covered  
 with a green prickly rind, containing kernels resem-  
 bling the chestnut. They generally gather this  
 fruit before it arrives at maturity, and boil it, in which  
 condition it eats like cabbage; but when allowed to  
 become ripe, it is brought to the table without  
 any preparation. Another indigenous fruit called  
 jambo, tastes like an apple, and has a beautiful ap-  
 pearance on the tree. Besides these several kinds,  
 they have also fruits resembling plums and cherries,  
 with mangoes, cocoas, oranges, and the various pro-  
 ductions natural to the tropical climates.

It is usual in this island to dedicate their fruit trees  
 to some demon, with the view of preventing, as they  
 imagine, the depredation of thieves; and so great is  
 the dread of punishment apprehended from this invi-  
 sible guardian, that the expedient generally proves

successful. Before the owner eats any of his fruit, he always offers a part of it to an idol.

There is here also a great number of flowers, of various colours and exquisite fragrance, that grow spontaneously in the fields, and with which the young people of both sexes adorn their hair. One species, resembling the jessamine, is so highly esteemed, that no subject is permitted to wear it, being reserved for the use of the king.

Among their trees, the tallipot, which grows tall and straight, is remarkable for the size of its leaves. Each of those is so large as to cover fifteen or twenty men, and will fold up like a fan. The natives wear a piece of it on their heads when they travel, to screen them from the sun; and it is likewise frequently used in the way of tents, to lie under in the fields.

Another tree called *issule*, is a kind palm, growing as high as a cocoa-tree, from which they draw a liquor that is pleasant, but not strong. Of this beverage an ordinary tree yields three or four gallons a day, and when boiled, makes a kind of brown sugar, called *jaggory*.

But the most valuable tree in Ceylon is the cinnamon, which is peculiar to this country, and grows commonly in the woods, on the south-west part of the island. This tree is of a middle size, and bears a leaf resembling that of the laurel. When the leaves first appear, their colour is as red as scarlet, and when rubbed between the fingers, they emit the smell of the clove. The fruit, which is similar to an acorn, neither smells nor tastes like the bark; but if boiled in water, a fragrant oil swims on the top, which they use for their lamps, and an ointment in several distempers. The tree having two barks, they strip off the outside bark, which is of little use, and cut the other round the tree with a pruning knife; dividing it afterwards into slips, which they lay in the sun to dry, and roll up in the usual manner. The body of the tree is white, and serves for building and other purposes, but has neither the smell nor the taste of the bark. When the wind sets off the island, the cinnamon groves perfume the air for many miles out at sea.

The animals in Ceylon are oxen, buffaloes, deer, hogs, and goats, with some wild beasts, but neither any lions nor wolves. Horses, asses, and sheep, were likewise unknown here, till they were imported by the Europeans. The island produces an animal which resembles a deer, but is no bigger than a hare. Monkeys also are in great abundance, with black faces, and white beards, having much the appearance of old men. The elephants of the country are of a very large size. They feed upon the tender shoots of trees, corn, and grass, and do great mischief to the husbandmen, not only by eating but trampling upon the produce of the fields. The island is also infested with alligators, and serpents of a monstrous size, and is almost over-run with vermin and insects, especially ants, to the depredations of which it is said that scarce any thing but iron is so hard as not to be subjected. To such a degree do those insects swarm, even in the houses, that if a dish of meat is set down, it is immediately full of them. In

the fields they raise hillocks six feet high, of a pure white clay, so hard that a pick-ax penetrates their substance with difficulty. Those insects are not long-lived: when arrived at maturity they have wings, and fly up in such clouds as to intercept the light of the sun. Soon after which they fall down dead, and are eaten by fowls; the latter, happily for the natives, devouring them likewise at other times.

Besides the common bees, which are in great plenty in the island, and generally build in hollow trees, there is here a larger species, of a much more lively colour, which form their combs on the high boughs.

At the season when the rain begins to fall, the inhabitants are much annoyed with small red leeches, which at first are not much bigger than a hair. They run up peoples legs, on which they fix, and are with difficulty disengaged. Their bite, however, is not dangerous, and the bleeding which ensues is reckoned salutary, when not immoderate.

The fowls of the island are geese, ducks, turkeys, hens, pigeons, partridges, woodcocks, snipes, wild peacocks, and paroquets, with a beautiful sparrow, whose colour is white, except the head, which is black, and ornamented with a plume of feathers standing upright. The tail of this bird is about a foot long.

The natives of Ceylon use chiefly for diet soups made of flesh or fish and garden-stuff, which they eat with rice, seldom having at their tables any solid animal food. When such however is produced, it is cut into little square pieces, and two or three ounces of it laid on the side of the dish by the rice, to which, being high seasoned, it serves to give a relish. They use neither knives nor forks, but have ladles and spoons, made of the cocoa nut shell. Their plates are of brass or China ware: but instead of those the poor people are content with the leaf of a tree, or sometimes several leaves sewed with bents. Their common drink is water, which they pour out of a cruise or bottle, holding it more than a foot above their heads. Some, it is said, will swallow near a quart of water in this manner, without once gulping. Neither wine nor beer is made in the island, but of arrack they draw a great quantity.

The domestic comforts of the table are unknown to the natives of Ceylon. The man eats alone, and is waited upon by his women, who afterwards eat in company with the children.

When a man here is favoured with a visit from one of superior rank, it is usual for the host at night to compliment his guest with his wife or daughter, to sleep with him; but an offer of this kind to an inferior would be considered as a crime; and the violating of a man's wife, without his consent, is severely punished by the laws.

With respect to the nuptial ceremony, it is thus conducted. When a contract has been made by the parents of the young couple designed to be married, the bridegroom sends the bride a piece of callico, and a flowered linen waistcoat. A time being then appointed for the commencement of their cohabitation, he goes the evening before with his friends to her father's,

father's, where he entertains her with the greatest delicacies he can procure. After supper the betrothed parties sleep in the same room, and having dined next day, they set off in a procession to the house of the husband. A marriage in Ceylon, however, is but a temporary agreement, the parties being at liberty to dissolve their connection, if after a trial they find not the happiness they had expected. It is not uncommon for the men to change their spouses in this manner several times, before they fix upon a person with whom they can think of spending their lives. But in such cases the portion received with the woman must be returned to her father.

The women of Ceylon never receive any obstetrical assistance in the time of delivery, and they think it no crime to procure abortion. At the birth of a child, a pretended astrologer is sent for and consulted, whether it is like to prove fortunate. If his opinion is in the negative, they either expose or drown the infant, or sometimes give it to a neighbour; for by such a renunciation, they think that its natural destiny may be altered. Children, during their minority, are called by what name the parents please; but when grown up, they lay aside this appellation, and either assume the name of the family, or the place where they reside.

They burn the dead in this island, as in the adjacent country of India. The corpse is carried on an open bier to some neighbouring eminence, where being laid upon a pile of wood, it is covered with an additional quantity of fuel. If the deceased be a person of distinction, an arch is erected over the pile, and adorned with flags and streamers. When the body has been consumed in the flames, the ashes are collected, and a little wall built round them. Some days after, a priest is sent for to the house in which the person died, when a melancholy dirge is sung; the women, at the same time, with their hair dishevelled, bewailing their loss, and the male relations testifying their grief in sighs and groans. This ceremony is repeated morning and evening, for several days. The laws in this country do not require the woman to be burnt with her husband, as on the continent of India. On the contrary, widows are exempted from all taxes; and it is not uncommon for them to marry again, in a very short time after nature has dissolved the nuptial tie.

The natives, we are informed, worship the Supreme Being, but neither make any image of him, nor dedicate any temples to his name. They have idols, however, the supposed representatives of some great men that formerly lived on the earth, and who, as they imagine, are now mediators for them in heaven. The chief of those demi-gods is Buddon, who is said to have come originally from heaven, to procure the happiness of men, and rescended thither from the hill named Adam's Peak, where he left the impression of his foot. They also pay adoration to the sun and moon, and other planets. Every town has likewise its tutelary demon, and every family their household god, to whom they build chapels, in which they sacrifice and perform their devotions every morning. There are three classes of idols, with corresponding orders of priests, who have their several temples,

and to the maintenance of which certain portions of land are appropriated. Among the several sacerdotal tribes, the people of Buddon are held in the greatest esteem. They wear a yellow vest or mantle, with their heads shaved, and beards that grow to a considerable length. Their disciples fall down on their faces before them; and wherever they visit, a stool is brought for them to sit on, an honour in which only princes and magistrates participate. Those priests are prohibited from all commerce with women, drink no strong liquor, and eat only one meal a day; at which, however, they are permitted to use every kind of meat, except beef; the flesh of oxen, as animals which superstition has here rendered sacred, never being tasted either by the priesthood or laity. In every other respect, an unbounded licence is allowed to persons of this order, and they are not cognizable by the temporal power for the perpetration of any crime.

In regard to the second order of priests, that officiate in the temples of other idols, they are allowed to profess any secular employment, and are not distinguished from the laity by any peculiar habit; but they have a yearly stipend. Every morning and evening they attend the service of their temples, where when the people sacrifice rice and fruits, the priest presents them before the idol, delivering them afterwards to the pontifical assistants, and the attending poor, who eat the provision. To the idols of this class no flesh is ever sacrificed.

The third order of priests enjoys no revenues, but subsists by voluntary contribution. They build temples for themselves, to which they resort every Wednesday and Saturday. At the new and full moon, they offer sacrifice to the god Buddon, as they do also on new-year's day, in the month of March, with great solemnity, on a high mountain, or under a spreading tree, which is esteemed sacred. This tree, according to tradition, like the chapel of Loretto, has travelled through several countries, and passing the sea, at length planted itself in this island, where under its shade the god Buddon used often to repose himself.

The figures of many of their idols are extremely fantastic, representing imaginary creatures, partly human, and partly the resemblance of some fish or quadruped. Those in the temples of Buddon are only the images of men sitting cross-legged in yellow vests, such as are worn by the priests. Before the image is furnished with eyes, it is not accounted sacred, but thrown about like a common block; when those are completed, however, it becomes an object of adoration.

At the new moon in July, every year, a solemn festival is celebrated, which lasts till the full moon. On this occasion forty or fifty elephants, magnificently accoutered, march through the principal streets of the cities, followed by people in the masque of giants, who according to their tradition formerly inhabited the earth. Next come the music and dancing girls, dedicated to the temples, who are succeeded by one of the priests of Buddon, mounted on an elephant of an extraordinary size, covered with white cloth, and the richest trappings, adorned with streamers and flowers.

Over

Over the head of this personage, who represents the *Allat near Dis*, or the Supreme God, another priest lighted an umbrella, and on the right and left are two priests of the inferior deities, mounted likewise upon elephants. Immediately in the rear of those is a crowd of ladies of the first quality, carrying in their hands lighted lamps, and the procession is closed by the military, with the courtiers and officers of state. This ceremonial is regularly performed once in the day-time, and once in the night, during the continuance of the solemnity; the intervals being spent in feasting, singing, and dancing, with a total interruption of all business.

There are in the island great numbers of Christians, descended from the proselytes made by the Popish missionaries, while the Portuguese were masters of the country, and those have some churches near the sea-coast, but none in the interior parts.

The Portuguese tongue is spoken among the Christians in Ceylon, but the vernacular language of the island is a dialect of that which is used on the Malabar coast. There is likewise a dead language spoke only by the bramins or priests, in which the books relating to their religion are written.

They write upon the leaves of the talipot with a steel style or bodkin. The only science they are acquainted with is astronomy, which they have learnt from the Arabian colonies that settled on their coasts, and they can foretel eclipses with a tolerable degree of exactness. To astrological learning they are also great pretenders, entertaining the most superstitious credulity in favour of predictions of that nature. Their year is divided into three hundred and sixty-five days; every day into thirty pavs or parts, and the night into the same number. Having neither clock nor dials, they measure time by means of a small copper vessel with a hole in the bottom, which being placed in a tub of water, is filled in the space of a day, when it sinks and determines the period. It is then immediately emptied for the purpose of renewing the process.

The chief manufacture of the country is callico, or cotton cloth. They also make brass, copper, and earthen vessels, swords, knives, and the implements of various trades, with goldsmith's work and fire-arms. Even painting and carving are said to be executed with a degree of dexterity and taste, beyond what might be expected among a people where the state of civilization is not such as can greatly favour the advancement of the elegant arts.

The foreign trade of this island, in the article of cinnamon, is doubtless of great antiquity. In little more than five hundred years after the flood, we read of this valuable commodity, among other spices, being brought into Egypt through Arabia. Of the history of the country, however, in any remote period, we have no information. The first European nation who possessed themselves of it was the Portuguese, from whom, like the other Spice Islands, it was afterwards taken by the Dutch, who to this day enjoy exclusively the cinnamon trade over the world.

#### M A L D I V A I S L A N D S .

The Maldiva Islands are situate in the Indian ocean, between 68 and 76 degrees of east longitude, and between the equator and 7 degrees of north latitude. They are extremely numerous, consisting of near a thousand little islands or rocks, and are difficult to be approached, but at three or four inlets. Their produce is the tropical fruits, especially the cocoa-nut; with the little sea-shells, or cowries, called black-amoor's teeth, which serve instead of small money on the Indian continent. Those islands abound in fish, but with rice they are supplied from the Hither India. They are all governed by one king; and the inhabitants, who are descended from the Arabs, retain the religion and customs of their mother-country.

Before we leave the Indian Ocean, it may not be improper to subjoin the learned Dr. Edmund Halley's account of the winds that blow in that part of the world, whether the constant trade-winds, or those which are periodical, and go under the name of monsoon. The following is the information he gives on this subject, which he appears to have collected with great pains and industry.

"In the Indian Ocean, the winds are partly general, as in the *Æthiopic* (part of the Atlantic Ocean) partly periodical, that is, half the year they blow one way, and the other half year upon the opposite points; and these points and times of shifting are different in different parts of the ocean. The limits of each tract of sea, subject to the same change or monsoon, as the natives call it, are certainly very hard to determine; but the diligence I have used to be rightly informed, and the care I have taken therein, has in a great measure surmounted that difficulty; and I am persuaded, that the following particulars may be relied upon. That between the latitude of 10 and 30 degrees south, between Madagascar and New Holland, the general trade-wind about the south-east and by east, is found to blow all the year long to all intents and purposes, after the same manner as in the same latitude in the *Æthiopic* Ocean. That the aforesaid south-east winds extend to within two degrees of the equator, during the months of June, July, &c. to November, at which time, between the south latitude of 3 and 10 degrees, being near the meridian of the north end of Madagascar, and between 2 and 12 south latitude, being near Sumatra and Java, the contrary winds from the north-west, or between the north and west, set in and blow for half the year, viz. from the beginning of December till May; and this monsoon is observed as far as the Molucca Isles. That to the northward of 3 degrees south latitude, over the whole Arabian or Indian sea or gulph of Bengal, from Sumatra to the coast of Africa, there is another monsoon, blowing from October to April, upon the north-east points; but in the other half year, from April to October, upon the opposite points of south-west and west-south-west, and that with rather more force than the other, accompanied with dark rainy weather, whereas the north-east blows clear. It is likewise to be noted, that the west winds

are not so constant, either in strength or point, in the gulf of Bengal, as they are in the Indian sea, where a certain and steady gale scarce ever fails. It is also remarkable that the south-west winds in these seas, are generally more southerly on the African side, more westerly on the Indian. That as an appendix to the last described monsoon, there is a tract of sea to the southward of the equator, subject to the same changes of the winds, viz. near the African coast, between it and the island of Madagascar, or St. Laurence, and thence northwards as far as the line, wherein, from April to October, there is found a constant fresh south-south-west wind, which, as you go northerly, becomes still more and more westerly, so as to fall in with the west-south-west winds, mentioned before in those months of the year, to be certain to the northward of the equator. What winds blow in those seas for the other half year, from October to April, I have not yet been able to obtain to my full satisfaction; for that our navigators always returned from India without Madagascar, and so are little acquainted with this matter. The account that has been given me is only this, that the winds are much easterly hereabouts, and as often to the north of the true east, as to the southward thereof. That to the eastward of Sumatra and Malacca, to the northward of the line, and along the coast of Cambodia and China, the monsoons blow north and south, that is to say, the north-east winds are much northerly, and the south-west are much southerly: this constitution reaches to the eastward of the Philippine Isles, and as far northerly as Japan; the northern monsoon sitting in those seas in October or November, and the southern in May, blowing all the summer months. Here it is to be noted, that the points of the compass, whence the winds come in those parts of the world, are not to be fixed as in those lately described; for the southerly will frequently pass a point or two to the eastward of the south, and the northerly as much to the westward of the north, which seems to be occasioned by the great quantity of land which is interspersed in those seas. That in the same meridians, but to the southward of the equator, being that tract lying between Sumatra and Java to the west, and New Guinea to the east, the same northerly monsoons are observed, but with this difference, that the inclination of the northerly is towards the north-west, but the southerly towards the south-east. But the *plaga venti* are not more constant here than in the former, viz. variable five or six points; besides, the times of the change of those winds are not the same as in the Chinese seas, but about a month or six weeks later. That those contrary winds do not shift all at once, but in some places the time of the change is attended with calms, in others with variable winds; and it is particularly remarkable, that the end of the westerly monsoon on the coast of Coromandel, and the two last months of the southerly monsoon in the Chinese seas, are very subject to be tempestuous. The violence of those storms is such, that they seem to be of the nature of the West-India hurricanes, and render the navigation of those parts very unsafe, about that time of the year. Those tempests are by our seamen

No. 5.

usually termed the breaking up of the monsoons. By reason of the shifting of these winds, all those that sail in these seas are obliged to observe the seasons proper for their voyages, and so doing they fail not of a fair wind and speedy passage; but if they outstay their time till the contrary monsoon sets in, as it frequently happens, they are forced to give over the hopes of accomplishing their intended voyages, and either return to the port from whence they came, or else put into some other harbour, there to spend the time till the winds become favourable.

## C H A P. XII.

*Of the Kingdom of Tonquin.*

**R**ETURNING to the continent of Asia, we land in the kingdom of Tonquin. This country is bounded by China on the north and east, by the Bay of Cochinchina on the south, and by Laos on the west. It is situate between 101 and 109 degrees of eastern longitude, and between 21 and 27 degrees of north latitude; being about 500 miles long, and 400 broad. Towards the north and west the territory is mountainous, but level and fruitful in the other parts. The year, as in other tropical countries, is here divided into the wet and dry seasons, the rains beginning in April or May, and continuing till September; during which time, however, there are frequent intervals of fair weather, especially in the mornings. For some weeks before and after the autumnal equinox, the country is much exposed to violent hurricanes, usually called tufoons, which happen for the most part about the new and full moon. The course of those phenomena is generally in this manner: it is fine, fair weather, and little wind, twelve hours before the storm begins. The wind having blown with great fury for twelve hours from the north-east, attended with thunder, lightning, and heavy rain, it suddenly ceases, but shifting to the south-west, in the space of an hour, it blows from that quarter with equal violence.

The produce of the country is cocoa-nuts, guavas, mangoes, oranges, and the other tropical fruits, with the betel and arec nut. Rice is almost the only grain that is cultivated. Here are great numbers of elephants, some horses, oxen, buffaloes, and hogs, with fish and poultry in great abundance, but hardly any sheep or wild beasts. Reptiles and insects, however, are extremely troublesome as in other hot countries; but no species is more destructive than the ants, which march here in large bodies, consuming the fruits of the earth, as well as the manufactures of the inhabitants with incredible havoc.

Tonquin is divided into eight provinces, in which there are several towns. The capital city is Cachao or Keccio, situate on an eminence, about a hundred miles up the river Domea, in 105 degrees of east longitude, and 22 degrees 30 minutes north latitude. It is not defended either by a wall or moat, but contains about twenty thousand houses, which, a few excepted, built of brick, are only mean cottages. The streets are wide, but ill paved, and in the dry season the air

N

is

is much contaminated by offensive exhalations from muddy ponds. The king's palace stands in the middle of the city, which, including the parks and gardens, is computed to be eight miles in circumference. At a small distance from the royal palace is another meanly built, in which the chona or general resides. Before it is a large parade, for exercising the soldiers, and a house which serves as an arsenal, containing fifty or sixty iron guns, and some mortars. Near the parade, there is likewise a stable of war elephants, and another of the king's horses.

The town of Domea is situate about sixteen or eighteen miles up the river of the same name. Here the Dutch vessels which trade to this country have their station; but the English ride three miles higher. On the same river, about eighty miles from the sea, stands Hlean, which consists of near two thousand houses, and is furnished with a garrison of soldiers. At this place the Chinese have factors, who carry on a trade with Japan. Besides these cities, there is a great number of villages in the flat country, surrounded with walls and banks of earth, to defend them against the annual floods.

The natives are of a middle stature, and tawny complexion, with long black hair falling down on their shoulders, black eyes, and their teeth dyed of the same colour. After the manner of the Chinese, they wear the nail on the little finger of the left hand as long as the finger. They are reputed to be more honest in their dealings than the people last mentioned, and are good mechanics.

In this country the sexes are hardly distinguished by their dress. The usual habit is a gown girt about with a sash. Persons of condition wear either English cloth or silk of their own manufacture, but the common people use cotton or callico. All ranks, however, universally wear drawers of cotton, which reach down below their knees. Their caps, which resemble the crown of a hat, are made of the same materials with the gown.

The language of Tonquin is a dialect of the Chinese, to which nation this country had formerly appertained as a province. The same characters are likewise common to both; and their learning consisting chiefly in the knowledge of those rudiments of writing, they are examined with respect to their proficiency in it, when they stand candidates for any office. In mathematics, astronomy, and other sciences, they appear to be upon the level with their neighbours before mentioned; from whom they also differ but little in point of religion. The name of Confucius is here held in equal veneration as in China, but the natives pay adoration to some images unknown in that empire, particularly the elephant and the horse. Their temples and pagodas are frequently so small, as hardly to contain a larger space than is necessary to accommodate the idol. Around those buildings are situate the cells of the priests, who attend to offer up the prayers of such as resort hither for devotion. The petition being delivered in writing, it is read aloud by the priest before the idol, while the person by whom it is presented lies prostrate on the

ground, in the attitude of the most humble supplication. People of figure, however, seldom come to the pagoda, but perform their devotions in a part of their own houses, appropriated to that use, where one of their domesticks officiates instead of the priest. In the written forms of prayer presented on those occasions, the usual mode is to enumerate several instances of good fortune, for which the petitioner returns thanks to Heaven, and concludes with intreating a continuance of its favour through life. When the paper has been read, it is burnt in a pan of incense, and the poor neighbours and dependants are called in, to partake of the entertainment which the master has provided for them; the practice of this hospitality being considered as of no small consequence towards procuring an auspicious regard to the prayers which have been offered.

Superstition is universally predominant among the people of this country. They never undertake any thing of moment, without consulting an astrologer; and have likewise their lucky and unlucky days. Every hour of the diurnal revolution is distinguished by the name of some animal, as the horse, the lion, &c. and the beast which marks the hour of a man's birth, is ever avoided by him.

A plurality of women is allowed here, as in most other pagan countries, and very little difference is made between a wife and a concubine. The children of both are equally entitled to a division of the paternal inheritance. So far are the men from being scrupulous in respect to the fidelity of their females, that they will frequently, for a trifling consideration, indulge the European merchants with the free access to their beds. The Dutch who trade to the country are allowed the use of temporary wives, to transact their business in their absence; by which commerce those women sometimes acquire great fortunes, and afterwards marry the most considerable men in the kingdom.

The men are permitted to divorce their wives upon the most trifling pretext, but they are obliged to restore the effects of which she was possessed at the time of marriage, and likewise to maintain the children. The same indulgence, however, is not allowed to the other party; for a wife cannot be repudiated from her husband, unless he is charged with some very atrocious crime. The punishment of a woman convicted of adultery, is to be thrown to an elephant, who taking her up with his trunk, tosses her in the air, and when she falls, tramples her under his feet, and crushes her to pieces; the animal being bred up for the purpose of such executions.

A man may sell both his wife and children in Tonquin, which not only saves him the trouble of a divorce, but the burdensome consequence attending it. This practice, however, is not very common from motives of resentment or passion, though, in times of scarcity, poor people make no scruple of selling their children to any purchaser, or even of transferring them, without receiving the smallest consideration.

The funerals in this country nearly resemble those of the Chinese, in respect of the procession and mourning; only here they burn the corpse, and deposit the ashes

in an urn. Over the tombs of people of condition, they erect a wooden tower, four or five and twenty foot high, and the priest ascending to the top of it, makes a funeral oration in praise of the deceased. This being concluded, he comes down, and sets fire to the structure; and the people who attend the ceremony are entertained on the spot, with a feast provided for the occasion.

When a king dies, the royal corpse lies in state sixty-five days, and during this time his table continues to be served as when he was alive; the meat being distributed every evening among the priests and poor people. A splendid procession is then begun towards the burying place of his ancestors, which is about two days journey from Cachao: but they seldom reach the tomb in less than seventeen days. The great officers and magistrates are obliged to mourn three years on the occasion, the gentry six months, and the common people three; and no public diversions are permitted for three years after the funeral.

Notwithstanding the great respect which is paid to the king or boua, after his death, he enjoys little more in his life-time than a titular dignity. The person invested with the power of the state is the general, who makes the king a kind of prisoner in his own palace, permitting him only to appear in public at certain times, and receive the homage of his subjects. To qualify in some measure this usurpation, the general affects an air of the most dutiful obsequiousness and awe, declaring that he assumes the reins of government with no other view than to ease his sovereign of the trouble, and afford him leisure to enjoy his pleasures without interruption. This officer has the entire disposal of all places, civil and military, even those of his majesty's household, whose servants he prohibits from suffering any subject to have access to the king. The general's guard consists of two hundred elephants, besides horse and foot. He usually keeps in the neighbourhood of the capital a standing army of thirty thousand men; and in other parts of the kingdom, especially the frontiers of China, about sixty or seventy thousand. When the troops march, the principal officers are mounted on elephants, a large apartment, made of timber being erected on the back of this huge animal, for their accommodation. There is no naval force in the kingdom, except a few insignificant vessels, which never venture to proceed far from the coast.

The chief magistrates and officers of state are generally eunuchs, who revenge by their avarice the operation they had suffered in their infancy. Though incapable of having any offspring, and debarred from the privilege of all testamentary dispositions, they are so extremely oppressive to the lower classes of the people, as hardly to permit them the enjoyment of the necessaries of life. Whatever those tyrants have amassed by their rapaciousness, becomes at their death the property of the governor in whose district they had lived, who considering them as instruments of his own aggrandizement, never fails to connive at their extortion, for which he is also occasionally gratified with a share of the spoil,

The commercial articles of this country are chiefly silk, and lacquered ware; with turpentine, fine perfumes, lignum aloes, and wood for dying, much like logwood: but the trade of the country is not extensive.

## C H A P. XIII.

*Of Cochinchina, Siam, Pegu, Ava, and Arracan.*

COCHIN-CHINA, including Triampa, is situate between 104 and 110 degrees of east longitude, and between 10 and 17 degrees of north latitude. It is bounded by Tonquin on the north, by the Indian Ocean on the east and south, and by Cambodia on the west; being about four hundred miles long, and a hundred and fifty broad. The mountains of Kemois run the whole length of it from north to south, dividing it from Cambodia; but in the other parts, the country is generally level. Though it lies nearer the equator than Tonquin, the temperature of the air is not so hot; for which several reasons may be assigned. In the first place, this country is more advantageously situate, being cooled by breezes from the ocean. In the second place, it is observed, that the regions which extend towards the tropics, as the kingdom of Tonquin, are much hotter than those which are situated near the equator; the sun being vertical in the former almost three months, but in the latter a much shorter time. In the third place, the days are an hour and half longer at the tropics than at the equinoctial, at the same time that the rains and cloudy weather are of shorter duration.

From the account of different travellers, it does not appear that there is any considerable town in the whole country. We are informed, however, that the king resides in the most northern province, and at a town called Touran-Fairo, situate in 16 degrees of north latitude, and 106 degrees of east longitude. They build their houses in this country chiefly with the bamboo cane, and one story high; but during the whole time of the periodical flood, which lasts near half the year, they can live only in the upper apartments, and have no communication with their neighbourhood but by means of boats.

In their persons and habits, the natives of Cochinchina differ little from those of Tonquin; but their complexions are generally more dark, and their teeth remarkably bad, occasioned by the corrosive nature of the materials with which they die them black, and their excessive chewing of betel and arek.

## S I A M.

Siam, in which is comprehended Malacca, Cambodia, and Lao: is situate between 97 and 107 degrees of east longitude, and between 1 and 25 degrees of north latitude; being bounded by Acham and a province of China on the north; by Tonquin, Cochinchina, and the Bay of Siam, on the east; by the Straits of Malacca and Sincapora, on the south; and by the Bay of Bengal, Pegu, and Ava, on the west. It extends

in length about fifteen hundred miles, and its greatest breadth is three hundred.

There are two ridges of mountains that run through the country from north to south, which conduce to moderate the heat of the air in the adjacent parts, and the same effect is produced by the sea-breezes, in the territory contiguous to the coast; but the vallies which lie beyond the influence of either of those salutary causes, are excessive hot, and would be almost uninhabitable were it not for the annual rains, by which the torrid state of the atmosphere is considerably qualified. The monsoons, or periodical winds and rains, prevail here as well as in the Hither India, and the latter are heaviest about Midsummer. The fairest season is in December, when the sun is at the greatest distance from them, and the most stormy weather at the shifting of the monsoons, which usually happens about the equinoxes, or within a month before or after those periods; at each of which seasons the shipping gets into harbour, to avoid the danger of being destroyed.

The two principal rivers are the Menan and the Mecon, which rise in the mountains of Tartary, and run to the south; the former passing by the city of Siam, falls into the bay of the same name, in 13 degrees of north latitude; and the latter running through Laos and Cambodia, discharges itself in the Indian ocean, in 9 degrees of north latitude.

The capital of the country is Siam, called by the natives Siyothoya, situate in 101 degrees of east longitude, and in 15 degrees of north latitude, being almost encompassed by the branches of the river Menan. It is about ten miles in circumference, within the wall, but not a sixth part of the ground is occupied by buildings. In the vacant spaces there are near three hundred pagodas or temples, round which are scattered the convents of the priests, and their burying places. The streets of the city are spacious, and some have canals running through them, over which is a great number of bridges. The houses stand on pillars of the bamboo cane, and are built of the same materials; the communication between different families, during the winter season, being carried on, as in other tropical countries, by means of boats. The grounds belonging to the several tenements are separated by a palisado, within which the cattle are housed in barns, erected likewise upon pillars, to preserve them from the annual inundation.

The royal palace at Siam is encompassed by three walls, with intervening courts or spaces of considerable extent. The innermost court, in which the king resides, is called the veng, and is furnished with spacious gardens, groves, and pieces of water. Whoever passes in or out of this boundary, falls down on his face before the gate; but none is permitted entrance who is armed, or has lately drank any arrack or spirituous liquor; of which the officer of the guard must judge, by smelling the person's breath. There are seven floors in the royal palace, and generally three in the houses of people of distinction; but the dwellings of the other inhabitants consist for the most part of a single story.

The furniture of the houses in this country is extremely simple, there being neither beds, chairs, nor tables. The people of the greatest figure lie on mattresses spread on couches, with a sheet under them, and covered with a quilt or piece of callico; the poorer sort using only a mat on the floor, and their upper garment as a covering.

The Siamese are of a middle stature, well proportioned, and very swarthy. Their faces are broad, and they have high cheek bones; but their foreheads and chins are contracted, and terminate in a point. They have small black eyes, large mouths, and thick pale lips. Like their Indian neighbours, they carefully dye their teeth black, and have a vanity in wearing the nails of some of their fingers of extraordinary length; those being considered, as the personal marks which distinguish people of condition from the vulgar. Their hair, which is generally black, is worn so short by both sexes, that it does not come below their ears; but the women for the most part make it stand upright on their foreheads. It is the custom of the men to pull their beards by the roots. Before they go out, they either bathe, or have water poured upon their heads for the space of an hour.

Men of the rank above the vulgar wear a callico or muslin shirt, with a piece of cotton linen, called a payne, about their loins, and in the rainy season a mantle of chint, or painted callico. The king is habited in a vest of brocaded satin, and wears a cap of a pyramidal form, with a coronet of precious stones about his temples. The great officers and nobility have also coronets, but of inferior value. In time of war, and during the exercise of hunting, their cloaths are generally red. No subject is permitted to wear a vest, without a special licence from the king; neither can a cap be worn, except in his majesty's presence, or when the person presides in a court of justice. Slippers are sometimes used, but always taken off at entering either the temples or houses.

The women wear a linen cloth about their loins, which on those of superior rank reach down almost to the knee, and serves instead of a petticoat. They cover their necks with a loose piece of linen, which likewise spreads over their breasts. A cap makes no part of the female dress; but they adorn themselves with bracelets on their arms and legs, and as many rings on three fingers of each hand as they can put on.

The Siamese are esteemed an ingenious people, and though rather indolent than active in disposition, they are not addicted to the voluptuous vices which often accompany a state of ease; being remarkably chaste and temperate, and even holding drunkenness in abhorrence. They are, however, accounted insolent towards their inferiors, and equally obsequious to those above them; the latter of which qualities appears to be particularly inculcated from their earliest youth. In general, their behaviour is extremely modest, and they are averse to loquacity. Like the Chinese, they avoid speaking in the first person, and when they address a lady, it is always with some respectful epithet, insinuating personal accomplishments.

The

The common form of salutation here, as in most Indian nations, is the salem, or the lifting one or both hands to the head, and inclining the body; but to a person of much superior rank, it is the custom to fall prostrate on the face. When in a recumbent state, the usual posture is to fit on their heels, with their heads a little reclined. The ceremonies used at visits are nearly the same as in China.

The general food in this country is rice and fish, sometimes fresh, but more frequently dried or pickled, and seldom eat before it is stinking. The flesh of all animals is likewise used without distinction, even that of the vilest reptiles, as among the Chinese; but every thing is so highly seasoned with spice, that the taste of the several dishes is almost uniformly the same. The common drink is water, or tea, which is used by all the inhabitants.

Among their public diversions is a rude sort of comedy, and a martial dance, in performing the latter of which, being masked and armed, they counterfeit a battle, at the same time reciting in songs the heroic achievements of their ancestors. Mock fights of elephants are also frequently exhibited, as cock-fighting had formerly been, till an order was procured against it by the priests, who considered it as a criminal entertainment. Here are likewise rowing matches on the rivers, and races, not of horses but oxen. To games of chance the people are as much addicted as the Chinese; playing away not only their wives and children, but venturing their own persons and liberties on the cast of a die. A festival is kept annually when the waters retire; on which occasion they sail on the rivers several evenings successively, their barges being illuminated with painted paper-lanterns. Another festival is kept after harvest, as a thanksgiving for the fruits of the earth; when the streets as well as the boats are illuminated, and a grand fire-work is played off. They admit no diversions at the new and full moon, but keep a strict fast, making offerings to the priests in their convents, and giving alms to the poor.

The vegetable produce of the country is chiefly rice, with some wheat, and European fruits, but mostly those of the tropical climates. The hills are covered with good timber, of which the most valuable for domestic use is the bamboo. The cotton-tree is also very common. It bears a fruit of the size of a walnut, which opens when ripe, and contains within it the cotton.

There is no country in which elephants abound more than in Siam, or where they are held in greater veneration; the Siamese being of opinion that they are animated by illustrious souls. The longevity of this animal is proportioned to its enormous bulk; for it is supposed to be a hundred years old before it attains its full growth. Being both too strong and unwieldy to be governed by force, it is managed entirely by signs, in the apprehending of which it is said to be extremely docile and quick. There are here but few horses, sheep, or goats, and those of an indifferent quality, as well as their venison; the flesh of the hogs being the best of their animal provision. Oxen and

No. 5.

buffaloes are used in their ploughs and carriages. Poultry and wild-fowl are in great plenty, but their flesh is generally dry. Of singing birds there is none; but there are some macaws, parrots, and other birds of beautiful plumage, which are so tame, by never being molested by the natives, that they will often come into the houses.

No man in this country learns any particular trade, but has a general knowledge of all that are commonly practised, and every one works six months for the king by rotation; at which time, if he should be found perfectly ignorant of the business he is set about, he is doomed to suffer the bastinado. The consequence of this burdensome service is, that no man endeavours to excel in his business, lest he should be obliged to practise it as long as he lives, for the benefit of the crown.

The government of this country is extremely oppressive, the king being not only sovereign, but proprietor of all the lands, and chief merchant likewise; by which means he monopolizes almost the whole traffic, to the great prejudice of his subjects. The crown is said to be hereditary, but it is often transferred by revolutions, on account of the exorbitant abuse of power in those who exercise the royal office. In his palace, the king is attended by women, who not only prepare his food, and wait on him at table, but even perform the part of valets, and put on all his cloaths, except his cap, which is considered as too sacred to be touched by any hand but his own. He shews himself to the people only twice a year, when he distributes his alms to the talapoins or priests; and on those occasions, he always appears in an elevated situation, or mounted on the back of an elephant. When he takes the diversion of hunting, he is, as usual, attended by his women on foot, preceded by a guard of two hundred men, who drive all the people from the roads through which they are to pass; and when the king stops, all his attendants fall upon their faces on the ground.

The king's favourite wife is styled queen, who is generally one of his nearest relations; and so much is proximity of blood considered as a title to this honour, that not many years since, the royal consort was the king's own daughter by his sister.

The governors of the provinces are generally appointed by the crown every three years, and knowing that the duration of their offices is limited, they never fail to exercise it with great rapacity. In the province of Patan, however, the people elect their own governor, and for the most part make choice of an old woman, who is called queen, but is obliged to have the concurrence of the chief men, in all transactions of importance. As an acknowledgement of his superiority, she sends annually to the king, two small trees of gold and silver.

By the laws of Siam, submission to parents and governors is as strictly enjoined as in China, and particular reverence is always shewn to the aged. Lying is held in so great detestation, that it is branded with the same infamy as perjury in this part of the world; and a person who has been guilty of theft is

O

aban-

abandoned by his nearest relations. No man is suffered to prosecute another, either in a civil or criminal cause, without giving security to make the charge good; and every judicial process is managed by the parties themselves, or their relations, no such profession as that of a lawyer being allowed.

In doubtful cases, the justice of a cause is determined by the same superstitious methods which were formerly practised by our British ancestors. Both the prosecutor and the defendant are sometimes commanded to walk over burning coals, and he that escapes this ordeal with impunity, is held to have the right on his side. Another method is by diving into deep water, on which occasion the verdict is given in favour of the person, who continues immersed the longest time.

A third mode of trial is conducted by vomits. The priest administers to each of the parties a pill, which is supposed to consist of materials of an emetic quality; and the testimony of the person who retains the pill without vomiting, is considered as unquestionably true.

Sometimes both the plaintiff and defendant are thrown to a tyger, when the cause is likewise decided by the superior good fortune of either of the contending parties.

The methods of punishing criminals are no less severe in several cases, than those of judicial determination. The convicts are sometimes thrown to an elephant, and trampled to death. A person who has robbed the public, has melted metals poured down his throat; and he who has been proved guilty of lying, is doomed to perish by having his mouth sewed up. For less atrocious crimes, they fasten a square board about the offender's neck. Some are set in the ground up to the shoulders, and every person is at liberty to buffet him; a mode of punishment which is considered as extremely ignominious. It is not uncommon for superior officers to be punished for the transgression of their inferiors; and parents and masters of families are amenable for those of their children or dependents.

The military force of Siam consists chiefly of militia, from which service, on extraordinary occasions, except the priests, no man who can bear arms is exempted. The king has likewise a battalion of guards, amounting to twelve hundred men, who are instructed in European discipline.

The inhabitants of this country maintain the doctrine of transmigration, believing in a pre-existent state, and that they shall pass into other bodies, till they are sufficiently purified to be received into paradise. They believe likewise that the soul is material, but not subject to the touch; that it retains the human figure, after quitting a body of that species; and that when it appears to persons with whom it was acquainted, which they suppose it to do, the wounds of one that has been murdered, will then be visible. They are of opinion, that no man will be eternally punished; that the good, after several transmigrations, will enjoy perpetual happiness; but that those who are not reformed, will be doomed to transmigration to all eternity. They believe in the existence of a Supreme Being, but the objects of their adoration are departed

saints, whom they consider as mediators or intercessors for them; and to the honour of this numerous tribe, both temples and images are erected.

The talapoins or priests have their residence contiguous to the temples, adjoining to which are likewise the cells of the talapoinesse, or females who devote themselves to the service of religion. The latter, however, are not admitted into these convents till the decline of life, and even then they are at liberty to forsake their retirement when they please.

The talapoins vow celibacy, and lead very austere lives, the punishment for the transgression of their rules being no less than burning. However severe this penalty, it is said to be rigorously insisted by the king, with a view of restraining too many of his subjects from embracing the sacerdotal life, to which they might otherwise be inclined, on account of the immunities attending it; the priests being obliged to pay no duties, and contributing nothing to the defence or support of the state. They are not, however, entitled to any fixed emoluments, except glebes, to cultivate which they are allowed slaves; nor enjoy a stipend in consequence of their office, but profit largely by the alms of the people, in the manner of begging friars. On this establishment, they are very hospitable to strangers, Christians as well as others, and have accommodations for them adjoining to their own. The priests preach every new and full moon, and during the inundation, every day, from morning to evening, sitting cross-legged on a raised floor, and relieving one another in rotation; at which times they often experience great liberality from the people. At certain seasons, especially after harvest, they are obliged to watch as well as pray, and their vigils are kept in the fields, in the night. They shave their heads, beards and eyebrows, and carry in their hands a talapat, or broad leaf, which serves them for an umbrella. The superior shaves himself, because no other is reckoned worthy to touch his head. Among the rest, the elder always shave the younger, except in case of great age, when the latter are permitted to have the honour of exercising the employment on those who are more advanced in years. They wear a yellow cloth about their loins, and another about their shoulders.

They perform ablution in the morning, as soon as they can see, in doing which they are extremely careful not to destroy an insect. They next proceed to the temple, where they sing their devotions, sitting in a recumbent posture; but on entering and coming out of those places of public worship, both the priests and people prostrate themselves three times before their idols. After this ceremony, they go to the towns and villages, where they place themselves at the doors of those whom they know to be the most liberal, and wait in expectation of their alms. It being criminal in the talapoins to touch money, they take care to be prudently accommodated with servants, in whom it is accounted no fault to accept of pecuniary donations.

The moral duties required of the talapoins, are, that they do not kill, steal, commit uncleanness, drink strong liquor, or tell lies. The first of those injunctions is understood in such a latitude, as extends

to the prohibition not only to the destroying animals, but vegetables, and even the seed of this class. They eat, however, of the fruit, which does not affect the life, and contrive means to evade the precepts in various ways. For, though they do not themselves boil rice, as being a feed, and therefore exposing them to the penalty of murder, yet if others boil it, they esteem the eating of it innocent. In the same manner, though they affirm the making water on the earth to be a sin, as tending to corrupt it, yet if they make use of a vessel, and their servant pours it on the earth, they think themselves not answerable for the crime.

Besides the injunctions above mentioned, there are several others peculiar to the order of priests; such as the avoiding all public diversions, making use of perfumes, touching gold or silver, wearing shoes, or fine cloaths, and being carried in any sort of vehicle. Amidst all their profession of severity and abstinence, they are reckoned extremely proud, taking place of the laity on every occasion, and not deigning a salutation to any but a brother talapoin.

The men of this country are allowed a plurality of women, but excepting one, who is a wife by contract, the others are only concubines, and their children deemed incapable of any legal inheritance. Previous to every nuptial contract, an astrologer must be consulted, who calculates the nativity of the parties, and determines, whether their union is likely to prove fortunate, or otherwise. When his prognostication is favourable, the lover is permitted to visit his mistress three times, at the last of which interviews, the relations being present, the marriage portion is paid, when, without any religious ceremony performed, the nuptials are reckoned complete, and soon after consummated. A few days after, the talapoin visits the married couple, sprinkles them with water, and repeats a prayer for their prosperity.

The Siamese wives are reputed to be extremely chaste, and so industrious, that they often maintain their families by their labour, during the absence of their husbands in the king's service, which is always the half of the year. Divorces, however, are allowed, though they seldom happen, on which occasions the man returns the wife's fortune, and the children are divided between them.

The practice in Siam respecting funerals is both to burn and bury the dead. The corpse being laid upon the pile, it is suffered to burn, till a considerable part is consumed, when the remainder is interred in a burying place, contiguous to some temple. The reason which they give for not burning it entirely to ashes is, that they suppose the deceased to be happy, when part of his remains escapes the fire. Instead of a tombstone, they erect a pyramid over the grave. It formerly was the custom to bury treasure with the corpse; but longer experience evincing, that the sacrilegious light in which robbing the graves was considered, did not prevent the crime, they now discontinue the ancient practice, and instead of treasure, bury only painted papers, and other trifles.

In this country two languages are spoken, namely, the Baly and the Siamese. The former has thirty-

three letters, and the latter thirty-seven, all consonants. The vowels, which are said to be very numerous in both, are certain characters, ranged sometimes above the consonant, sometimes below, in particular cases before it, and in others after. In each of these tongues, the pronunciation depends much upon the tone of the voice, which is modulated in such a manner, that the people rather sing than speak. The Baly is used only by those who are accounted the learned; but this character seems to be unjustly applied to any of the nation, as they pretend to no science but that of astrology, in which, the natives being extremely credulous, the country abounds with impostors.

The history of Siam, before it was discovered by the Portuguese, is, like that of all the other Indian nations, involved in impenetrable darkness. That it was known to the ancients, however, is highly probable, though there seems to be no ground for concluding, that it is the country mentioned by the Greek and Roman geographers, under the name of the Aurea Chersonesus, as gold is not its produce at this day. Since the end of the sixteenth century, the kingdom of Siam and that of Pegu have often been engaged in war, and alternately conquered; but both nations having now abandoned the right of tribute, which they formerly exacted in consequence of their respective victories, are at present independent of each other. The Portuguese continued masters of the coasts of Siam, from the year 1511, to the year 1640, when they were expelled by the Dutch, who have ever since excluded all other foreign nations from the country, which is now considered as in effect entirely subject to their controul.

#### Of PEGU, AVA, and ARRACAN.

These kingdoms are situate between 92 and 100 degrees of east longitude, and between 16 and 22 degrees of north latitude; bounded on the north by Tipra and Acham, on the east by Laos, on the south by Siam, and on the west by the Bay of Bengal. On account of their situation between the tropics, the air in the valleys is excessive hot; but it is generally qualified by breezes, which blow from the sea during a considerable part of the day.

The produce of these countries is rice, sugar-canes, furs, skins, salt-petre, mangoes, tamarinds, cocoanuts, and other tropical fruits; with rubies, sapphires, and the same sorts of animals as in Siam; from the inhabitants of which country, the natives of the three former seem to differ very little, either in their persons or customs, notwithstanding the many fables invented by travellers, of their worshipping the devil, and other ridiculous stories. The sovereignty of these countries appears to be extremely fluctuating; sometimes the three kingdoms have been united under one and the same prince, while at other times, the power has been contended, and successively enjoyed by each country. Amid these internal divisions, however, they have hitherto reaped the happiness of remaining unmolested from abroad, being seldom visited, even in the way of commerce, by the subjects of any maritime nation.

## I N D I A, O R H I N D O S T A N.

## C H A P. I.

*Of the situation—rivers—provinces—settlements.*

**I**NDIA Proper, or Hindostan, is situate between 66 and 92 degrees of east longitude, and between 7 and 40 degrees of north latitude; being bounded on the north by Usbeck and Tibet Tartary; on the east by Acham, Ava, and the Bay of Bengal; on the south by the Indian Sea; and on the west by the same sea and Persia; extending about two hundred miles in length, and fifteen hundred in breadth, in the broadest part.

The principal rivers are, 1. The Ganges, which rises in Mount Caucasus, and, running to the east, divides into several branches, that discharge themselves into the Bay of Bengal; the most easterly of those being the limits between this country and the Farther India. In so great esteem is this celebrated river held by the Indians, that they worship it as a god. 2. The Indus, a river as large as the preceding, and which, were it not for the bar at the mouth, is sufficiently deep to be navigable. It rises likewise in the mountains of Caucasus, and, running south-west, falls into the Indian Ocean. 3. The Attock, or Hydaspes of the ancients, has its source in the same mountains as the Indus, with which, after running parallel almost to the mouth, it unites, and the mixed stream is discharged into the Indian Sea. 4. The Jemmima, which runs southward by the cities of Delhi and Agra, and then turning eastward, falls into the Ganges at Halibas. 5. The Guenga; this river rises in the Baligate Mountains, and running eastward, discharges itself into the western branch of the Ganges, near the Bay of Bengal. 6. The Christena, which rising in the same mountains with the Guenga, runs first to the southward, and then turning to the east, falls into the Bay of Bengal. 7. The Tapte rises likewise in the Baligate Mountains, and running westward to Surat, discharges there its waters in the Bay of Cambaya.

Besides those, there are many other rivers of inferior note, with innumerable torrents in the time of the rains, most of which are dried up in the fair season.

This extensive country may be distinguished into three great divisions; the first comprehending those provinces which lie north of the tropic of Cancer; the second, those that lie under the tropic, or partly north, and partly south of it; and the third, those which lie south of the tropic, in the Hither Peninsula.

The first of the divisions above-mentioned comprehends Cabul, Cassimere, Gor or Gourite, Haican, Attock, Penkab, Bankish, Naugrecut, Multan, Lahor, Jangapour, Janba, Buckor, the Hindoo's country, Delhi, Sambal, Mevat, Patan, Tata or Sinda, Jesselmere, Afmer, or Bando, Agra, Gualoor, Halabas, Patna, Jesuat, Rejapour, Soret, Narvar, and Rotas.

The provinces in the second division are, Guzarat or Cambaya, Chitor, Malva, and Bengal,

Those which lie south of the tropic are, Candich, Bahar and Orixa, Decan or Vinapour, Golconda, Bismagar, Tanjour, and Madura.

After this enumeration of the provinces, we shall proceed to give an account of the maritime parts of the country, in which the European powers have now established so many settlements; beginning at the peninsula of Cambaya, and directing our course along the Malabar coast, to Cape Comorin, the southern extremity of India.

In the province of Guzarat, at the bottom of the Gulph of Cambaya, lies Surat, the most considerable port-town of trade in India. It is situate in 72 deg. 25 min. east longitude, and 21 deg. 10 min. north latitude, on the river Tapte, ten miles east of the sea; being about three miles in circumference, defended only by a slight wall, and some antique forts. The city and castle were taken by the English in 1759; and the next year the latter was ceded, with the revenues annexed, by the Great Mogul, to the English East India Company. Various European nations have here their factors, and trade very largely; but the most considerable merchants are the Moors, Armenians, Banians, Arabs, and Jews. The city is under the jurisdiction of a governor, appointed by the Mogul, and who lives in great splendor; but notwithstanding the almost boundless extent of his authority, the respect that is paid to him by the inhabitants is nearly equalled by the high esteem in which they hold the English president, who maintains the state of a prince, and is usually governor of Bombay, and all the English settlements on the west coast of India.

About a hundred and thirty miles south of Surat, lies the island of Bombay, twenty miles in circumference; the chief town of which is a mile in length, meanly built, and defended by a fort at a little distance. The inhabitants are chiefly British, Portuguese, and Indians, amounting to about fifty thousand. This place is exceedingly well situate for trade with the continent of India, and may be reckoned the principal English settlement in the country. It is attended, however, with the disadvantage of being extremely unhealthy, though in this respect, it has been greatly improved by governor Bohun, who drained the adjacent bogs and swamps, to which the insalubrity of the air had been principally owing. This settlement formerly belonged to the crown of Portugal, but was ceded to Charles the second, on his marriage with the infanta Catherine, and by him presented to the English East India Company, who have ever since been in possession of it. Bombay has an excellent harbour, but the soil of the island is barren, and the water bad, on which account they preserve the rain-water in cisterns.

On the same coast, in 15 deg. 31 min. north latitude, and 73 deg. 5 min. east longitude, is situate Goa, an island of the river Mandoua, about eight miles

miles from the sea. This island is about twenty four miles in circumference, and rendered very hot and unhealthy by the hills, which enclose it at a little distance, on the neighbouring continent. The town, which is likewise named Goa, is about two miles in length, and half a mile in breadth, being the capital of the Portuguese settlements in India. It is not only fortified with walls and ramparts, but the whole island is surrounded by a wall, bastions, and other modern works; and for farther security, the Portuguese have even fortified the banks of the river from the very mouth, with redoubts and batteries of guns; on which account it may be considered as more impregnable than any other town of India. The buildings of this town are of stone, and very magnificent; among which are many convents and nunneries, the place abounding likewise in monks, and other popish ecclesiastics, whose severity has rendered it unhappily celebrated for all the horrors of the inquisition. To the archbishop of Goa, the clergy in the Portuguese towns and settlements in Asia, and the east coast of Africa, are subject; and the viceroy, who resides at this place, is supreme governor of all the settlements of that nation, from the Cape of Good Hope to China, which are very numerous. Though the air of Goa is unhealthy, the island is pleasant, and especially on the side towards the sea, being full of country-seats and villages, and well planted with all kinds of tropical fruits.

Passing several inferior settlements on the coast of Malabar, belonging to different European nations, we turn Cape Comorin, to take a survey of the principal of those on the coast of Coromandel.

The first place of note on this coast, is the town of Pondicherry, situate in 80 deg. 32 min. east longitude, and 11 deg. 57 min. north latitude. It is defended by a fortress, which was besieged by admiral Boscawen, in September 1748, when the periodical rains, that fall annually at this season, obliged him to abandon the enterprize. In the year 1761, however, after a blockade and siege of several months, it surrendered at discretion to colonel Coote and admiral Stephens; but was restored to the French by the peace of 1763.

Sixty-three miles north of Pondicherry, lies Madras a Patan, or the fort and town of St. George, the capital of the English settlements on the coast of Coromandel, and no less healthful than pleasant in situation. The town is distinguished into the White and Black; the first of which, with the adjoining fort, are inhabited only by English, and are not above half a mile in circumference, surrounded by a stone wall. The outward or Black Town, which is now likewise surrounded by a wall, is in circumference about a mile and a half, inhabited by people of every Asiatic nation, some of whom are very rich. In general, however, it consists only of thatched cottages; but the White Town is pretty well built with brick, the houses flat-roofed, and the apartments lofty. In the latter is an elegant English church, with another for the Portuguese catholics; and in the former there is an Armenian Christian church, and several pagodas or Indian temples.

No. 5.

The English East India Company purchased this settlement, with a small territory adjacent, of the king of Golconda; but the Mogul afterwards making a conquest of the country, claims a right to this, as well as the other towns of that kingdom. His generals therefore sometimes visit the settlement, demanding a tribute from the governor, which he is obliged to comply with, for the sake of preserving the communication with the country; where the English purchase callicoes, chintzes, muslins, and sometimes diamonds.

The various commercial settlements of the English East India Company, as well as the ceded provinces of Bengal, Bahar, and Orissa, from which an immense revenue may be produced, are under the direction of a governor-general and four counsellors, of the presidency of Fort William in Bengal, in whom the whole civil and military government is vested. Their commission continues five years from their arrival in India; but they may be removed at any time by the crown, on a charge of any misbehaviour presented by the directors of the Company. The salary of the governor-general is twenty-five thousand pounds a-year; and each of the council ten thousand pounds.

A supreme court of justice is also established at the same place, consisting of a chief justice, and three other judges; the first of whom has a salary of eight thousand pounds a year, and the others six thousand pounds each.

#### C H A P. II.

*Of the principal cities—houses—pagodas—caravanseras—reservoirs—mosques—and tombs.*

HAVING delivered an account of the European settlements in India, we shall next describe the four royal cities of Agra, Delhi, Lahor, and Cassimere, the capitals of the provinces of the same name, which lie near the middle of the northern division of the country.

The city of Agra, which was formerly the capital of the empire of the Great Mogul, is situate in 79 degrees of east longitude, and 26 degrees of north latitude, on the river Jemma or Jemina. It is about eight miles in length, but not proportionally broad, nor defended by any wall. The houses of the greater part of the inhabitants are generally mean, but those of the omrahs, with the numerous Mahometan mosques, caravanseras, bagnios, and stone reservoirs, make a grand appearance. The emperor's palace stands at some distance from the city. It is about four miles in circumference, surrounded by a wall, having a moat on one side, and on the other the river Jemma. This magnificent structure is built of red stone, resembling polished marble, and is divided into several squares. The palace is surrounded with beautiful gardens, and between it and the city lies a spacious plain, on which the rajahs, or Indian princes tributary to the Mogul, used to draw up their troops, when they mounted his guard, as they did every week, with fifteen or twenty thousand men, while he held his court at this place. From the city of Agra to that of Lahor, there runs a grand alley of trees, computed to be no less than five hundred miles in length.

P

Delhi,

Delhi, at present the metropolis of the empire, is situate in nearly the same degree of longitude with Agra, and in 28 degrees of north latitude, lying on the side of the river Jemma, in the form of a crescent, and about ten miles in circumference. The chief public buildings are, a grand mosque or Mahometan temple, covered with extensive marble domes; a caravanera, built by a mogul princess, for the accommodation of travellers; and the tomb of the emperor Amayom. In a grand square, in the middle of the city, stands the palace of the Mogul, fortified in the manner of a castle, and consisting of several large courts, in one of which he gives audience to his subjects. In this court there are three divisions, the outermost allotted to the inferior people, who resort hither with their petitions; the second division, which has a raised floor, being appropriated to those of better quality; and the third, on a floor raised higher, to the omrahs and persons of the first rank. Above the level of the last of those divisions is erected the royal gallery, containing a magnificent throne, almost covered with diamonds, on which the emperor, amidst a symphony from a band of music, places himself on those occasions.

Lahor is situate in 75 degrees of east longitude, and 33 degrees of north latitude, on the river Rava or Ravionc, which afterwards unites its waters with the Indus. It is about three hundred miles north-west of Delhi, and eight hundred north of Surat. By Amayom, who built this city, it was made the capital of the empire, and is yet of considerable extent, evincing its former grandeur by the ruins of several magnificent palaces, mosques, and reservoirs.

Cassimere lies in 75 degrees of east longitude, and 35 degrees of north latitude, on the banks of a lake four hundred miles north-west of Delhi. The province, to which it gives name, is exceedingly fertile in corn and fruits, and on account of the mild temperature of air, is denominated the paradise of India. It has been usual for the Moguls to retire hither with their court, in the hot season.

Among the Pagans in India, the houses of the common people are extremely mean buildings, not exceeding an ordinary English cottage. Even those of their great men are entirely void of elegance. They are constructed almost universally on the same model; consisting of one floor, ranged about a square, into which the several rooms open. They are surrounded on each side by mean sheds, under which, on banks of earth two or three foot in height, the inhabitants sit upon mats or carpets great part of the day, where they either transact business, or receive visits. The interior apartments, being destitute of windows, have no light but what they receive from the door.

The principal edifices of those people are their pagodas or temples, caravaneras, and reservoirs. The former are built of stone, consisting of one long room, likewise without any window; over which is erected a pyramid or steeple of a great height. Within are many images, and a great number of lamps perpetually burning, which, added to the natural heat of the climate, makes those places extremely suffocating.

In the front of the temple is a shed, similar to those in the dwelling houses, where the people sacrifice, and perform their devotions: and here it is common to see monkeys running up and down, who are adored and fed by the superstitious inhabitants.

The *faras* or caravaneras are long buildings, enclosed on three sides, having the front open, and supported by pillars. They supply the place of inns, of which there is none in the country, and are resorted to by travellers, who dress their provision and sleep in them.

The greatest structures among the Indians are their tanks or reservoirs, in which they collect water during the rainy season, to serve them the other part of the year. Some of those basons are very grand and extensive, being almost half a mile in circumference, lined with hewn stone, and furnished all round with several rows of steps. Not a few of them have summer-houses, erected on a mount in the middle, for the purpose of bathing; a privilege, which though desirable in a hot climate, affords an instance of the little delicacy of those by whom the practice is permitted. The water thus preserved, however, by being exposed to the influence of the sun, is constantly tepid, and therefore much inferior, either for drinking or bathing, to well-water; on which account, where the latter can be obtained, it is always preferred by the inhabitants.

The houses of the Moors, or Mahometans of India, differ but little from those of the Pagan tribes, in respect of accommodation and form; only their materials are better, being either stone or brick, while the others, for the most part, use nothing but thatch and clay.

The grandest buildings of the Mahometans are their mosques and tombs, which are both erected of hewn stone. The mosque is in the form of an oblong square, supported on one side by pillars, the intervals of which supply the place of windows. Over the middle of the building there is usually a dome or cupola, and at each corner a minaret or slender tower. The tombs are generally placed in a green field, planted with trees and flowers, and furnished with artificial ducts or reservoirs of water. To have a magnificent tomb, is the great ambition of a Mahometan of figure, and he usually begins to erect it at an early age.

#### C H A P. III.

*Of the air—winds—seasons—soil—and produce.*

THE northern part of India, or that which lies between the latitude of thirty and forty degrees, is exceeding healthful and pleasant, but the southerly provinces are excessive hot in the fair season, especially during the months of April and May. At this time the rivers and waters are mostly dried up, and the wind blowing over a long track of burning sand, is said to resemble the mouth of an oven in heat, from eight o'clock in the morning to eleven.

In this country, the land and sea breezes succeed each other alternately every twelve hours; the former prevailing from about midnight till towards noon, when the latter begins and continues till late in the evening.

evening. During the prevalence of the hot winds in the two months above mentioned, it is usual for the inhabitants to hang up wet cloths against the wind, and to sprinkle water on the floors, not omitting to refresh themselves by the same application to their heads.

In June the use of those means becomes unnecessary, the sun being then obscured by the clouds, and the rainy season commencing, which generally continues four months, or till the end of October; not beginning and ending exactly at the same periods every year, but seldom exceeding three weeks in the term of variation. At first the rains are moderate, and often intermit, but afterwards become more heavy and incessant; till at last they decline, by the same gradation in which they had advanced. The heaviest rains in India are in August and September, at which time they are accompanied every evening with terrible thunder, and the whole flat country is overflowed. When the fair season returns, lightning, without thunder, is very frequent; and on account of the serenity of the sky, so great is the lustre of the stars, during four or five months, that people easily see to travel by their light.

The northern provinces of India produce wheat, barley, pease, and beans; but in that part of the country, which lies within the tropic of Cancer, the only grain that is cultivated, is rice. This is sown in beds, as trees in a nursery, whence it is transplanted into strait trenches, when the blade has attained the height of about half a foot, which usually coincides with the period when the rains begin to fall. In November or December the season of harvest arrives, at which time, the sun having exhales all the water, the earth is hardened, and the rice, after being cut, is for the most part threshed out in the field. When this grain is in the state of vegetation, its appearance is nearly similar to that of oats. The straw, however, is not hollow, but stiff and hard, as may be seen by the whisks or brushes made of it, and imported into Europe. The rice is covered with a thick brown skin, which must be separated by beating in a mortar, and sifting, before it assumes the white colour. It might be imagined, that the tediousness of this process would much inhanse the price of the commodity; but so great is the quantity produced, that enough may be purchased for three-pence, to feed a family of nine or ten persons a whole day, though an Indian will eat three times as much rice as an European, at a meal.

The southern parts of the country produce all kinds of tropical fruits, such as mangoes, guavas, pomegranates, pine-apples, cocoa-nuts, oranges, &c. and in the north they have apples, pears, and most of the European fruits. Both fruit-trees and forest-trees in the south of India, are endowed with perpetual verdure; nor is it uncommon, to see those of the former species bearing blossom, at the same time with fruits in various stages of maturity.

The banian tree, which is peculiar to this country, grows to a great bulk, and in an extraordinary manner. From its horizontal branches, small twigs shoot down-

wards perpendicularly, and taking root, form pillars for the support of the parts whence they sprung; so that one tree will often be multiplied into twenty or thirty trunks, and cover a space of ground, sufficient to shelter a regiment. Under those trees the Banians and other superstitious people place their images; and the hermits voluntarily undergo perpetual penance, sitting or lying constantly in one posture, in the hope of thus qualifying themselves for admission into paradise. Their enthusiasm, in the mean time, is flattered and venerated by the people, who worship them as holy men, and who assist in the feeding and providing for them.

The kitchen gardens afford melons, pot-herbs and roots; pepper grows on the coast of Malabar; where, as well as in other parts, they have also ginger, saffron, turmeric, sugar, cotton, and indigo.

The beasts of burthen in India are oxen, camels, dromedaries, and elephants; but the latter are used only to carry the princes or great officers, and for the purpose of war. The oxen are less in size than those of England, but much more swift, travelling generally upwards of thirty miles a day upon a trot; and between their shoulders is a bunch, to which the pack-saddles are fastened. A camel will carry, for the most part, seven or eight hundred weight and more, and travel eight or nine days without water. For which reason, this animal is particularly well adapted to travelling over sandy deserts; but having a smooth foot, without any hoof, it cannot tread with security upon a clay soil, after any rain is fallen, and the journey is therefore interrupted till the ground becomes dry. The dromedaries are a smaller species of camels, and as remarkable for their swiftness, as the other for strength, trotting frequently two hundred miles a day. Buffaloes also are used in the draught, as well as for food. Those animals resemble the ox in shape, but are more ugly.

The Indian sheep have reddish hair instead of wool: they are likewise much thinner and longer legged than those of Europe, and their flesh is of an inferior quality, being dry and coarse. The black hogs, with low bellies, now so frequent in England, are reared in great numbers: the wild hog also affords excellent meat; and besides those, the natives shoot deer, antelopes, hares, and wild fowl. The wild beasts are chiefly leopards, tygers, and jackalls; for it appears to be uncertain, whether lions are indigenous to the country. Monkeys are very numerous, on account of the protection which they receive from the superstitious inhabitants; and many of them are kept round the temples or pagodas, as objects of popular adoration.

One of the greatest inconveniences attending this country, is its being infested with such swarms of noxious insects and reptiles. The gnat or musketo, which is constantly buzzing about the ears, is extremely troublesome, especially to strangers, whom it stings to a violent degree; but in those who have been accustomed to the climate, this effect is no longer produced. The inhabitants, however, are hardly one moment

moment exempted, night or day, from the uneasy sensation excited by those insects on the skin; to which may be added, that while in bed, the bugs likewise are exceedingly annoying. Another plague which greatly infests the Indians, is the house-scorpion. This animal is about the length of one's finger, of a greenish colour, and carries his sting unsheathed at the end of his tail. It commonly lurks in the corners of the room, near the ceiling, whence it drops down in the night on the beds or couches. The pain occasioned by its bite continues to be so exquisite for twelve hours, that during that period, the person who has received it is totally deprived of his senses. Snakes also will sometimes get into the houses, and lie concealed, where, as well as abroad, they exert their stings, no less to the great annoyance than danger of the inhabitants. The most terrible of this class is the *cobre capelle*, or hooded snake, so-named from a folding of the skin on the back of the head. Its bite is extremely dangerous and quick of operation. There are likewise some other species of serpents, that either do not bite, or at least whose bite is innocuous. One of those, which is of a green colour and small size, will frequently dart from one tree to another, and has thence obtained the name of the flying-serpent.

The millepedes, or centipedes, are very numerous in India, and their bite is as dangerous as the scorpion's sting. They are about two or three inches long, and nearly of the thickness of a common goose quill. The toads, spiders, and rats, as in all hot countries, are at least double the size of those in Europe, and likewise in great number; but one of the most destructive plagues of the country is locusts, which sometimes intercept the light of the sun, for the space of a mile or two in length, devouring not only the herbage but the corn, when it is at the point of being reaped.

The birds of India are chiefly parrots, parroquets, and the lorry, which is of the parrot species, but more beautiful in the plumage. The country produces the same kinds of poultry as Europe, with this difference only, that in many of them the bones are black. Among the fowls, there is a kite with a white head, to which the Banians pay divine honours.

Great variety of sea and river fish is to be met with in India; among the former of which are dolphins, albicores, bonetas, and the flying-fish. The shark is frequent in those seas, as is likewise the crocodile in the mouth of the Ganges.

It is not evident from the best authority, that this country abounds in minerals, or at least that any mines are opened; but it doubtless produces the most valuable diamonds in the world. These are found most frequently upon or near the surface, and chiefly among the rocks in the kingdom of Golconda; though there are likewise mines out of which they are dug, particularly at Raalconda or Gani. Of other jewels, the most common in India is that obtained from the pearl-oyster, for which they fish in the Straits of Ramankoiel, between the continent and the island of Ceylon.

## C H A P. IV.

*Of the persons of the Indians—their dress—genius—diet—diversions—roads—and method of travelling.*

THE Indians are generally of a middle size, and seldom corpulent. Their features are good, with black eyes, and long black hair. In the middle of the country their complexion is likewise of the same colour, but towards the north, and along the coast, they are tawny. The women, if we except their complexion, which may appear to an European incompatible with perfect beauty, are acknowledged to have extraordinary charms. Their stature, shape, and features, are not only highly engaging, but there is in their motion a natural grace and elegance, which captivates every beholder.

The habit of the Indian men is a white vest, girt about with a sash, which contains a cricé or dagger; but those who are poor go quite naked. Their hair is tied up in a roll, and covered with a turban. The women wear a little waistcoat, which conceals their breasts, and round their loins a large piece of muslin or callico, which passing over the shoulder, hangs down upon the back. The men sometimes make use of slippers, but the women seldom or never.

The Indians in general are reckoned an ingenious people, and have a peculiar dexterity in imitating the works either of nature or art. Their temper is courteous, affable, and composed, and it is extremely rare to see them transgress the bounds of sobriety. By some they have been branded with the reproach of effeminate cowardice, but this is by no means the general character of the nation; for there are numbers of men amongst them of the most determinate courage, and who only want the advantage of discipline, to equal the bravest troops of Europe.

The diet of the Indians is different, according to the religious tribes under which they are distinguished. Those of the Banian class eat no animal food, but subsist entirely upon rice, roots, and fruits. The others eat almost every thing, except beef and fish without scales; while the Moors and Mahometans abtain only from such fish as was prohibited to the Jews by the Mosaic law. They all sit cross-legged, or loll upon mats or carpets, at their meals, before and after which it is universally the custom to wash. The principal dish amongst the Moors and Pagans is pilau, made of fowls or mutton, and rice, which are boiled into a strong soup, that is highly seasoned. Soups of the same sort are also made of fish, venison, and almost all kinds of flesh, which are constantly stewed to rags. At meals, a large plate, or a leaf of a foot diameter, is set before each of the guests; on which, out of a capacious bowl, the servants distribute with a ladle, a quart or three pints of boiled rice, moistening it with a sufficient quantity of the strong soup, and laying on the side of the plate a little of the bouillie. Every person in the company is accommodated with a bottle or cruise of water, of which they drink when they please, without ever practising the ceremony

The Indians are so far sociable, that they love to be in company but their motives to association seem to be little more than those of gregarious animals, for they are almost as silent as if nature had formed them without the organs of speech. Nor are they less averse to walking for amusement, than they are to the intercourse of ideas. The usual salute amongst them is the salam, or the lifting one or both hands to the head, according to the quality of the person to whom the compliment is paid. In this ceremony, however, to use the left hand alone would be reckoned extremely disrespectful. When a prince is addressed, the person who approaches him bows low, bringing his hands down to the ground, then upwards to his breast, and lastly to his head, which motions are repeated three times; but others, on the same occasion, fall prostrate on their face. The Moors, when they meet a friend

... yet surely anything is ever done either towards forming or repairing it. At the distance of every ten or twelve miles, however, there is a caravanera or choultry, for the accommodation of travellers, with a tank or reservoir of water near it, and fire for dressing their food. But few destitute are those places of convenience, that even beds are not furnished, and the traveller must provide himself with every necessary before he sets out on his journey.

The common vehicle for travelling is a palanquin, which is a couch covered with an arched canopy, and furnished with a mattra, quilts and cushions, to lie on. It is hung upon a bamboo or hollow cane, about five or six inches diameter, and ten foot long, which is bent in the middle while it is growing. This vehicle is so large, that a person may either sit in it upright, or loll upon the cushions, as he pleases. The smaller number of coolies or chairmen hired for a journey, is ten, four of whom alternately carry the vehicle, two before and two behind, bearing on their shoulders the ends of the bamboo cane, on which the couch hangs; while

without leaves; while the Moors and Mahometans obtain only from such fish as was prohibited to the Jews by the Mosaic law. They all sit cross-legged, or loll upon mats or carpets, at their meals, before and after which it is universally the custom to wash. The principal dish amongst the Moors and Pagans is pilau, made of fowls or mutton, and rice, which are boiled into a strong soup, that is highly seasoned. Soups of the same sort are also made of fish, venison, and almost all kinds of flesh, which are constantly stewed to rags. At meals, a large plate, or a leaf of a foot diameter, is set before each of the guests; on which, out of a capacious bowl, the servants distribute with a ladle, a quart or three pints of boiled rice, moistening it with a sufficient quantity of the strong soup, and laying on the side of the plate a little of the bouillie. Every person in the company is accommodated with a bottle or cruise of water, of which they drink when they please, without ever practising the ceremony

of addressing each other in healths. Their sauces consist chiefly of pickles, made of bamboos, garlic, and mangoes; besides which, the composition known in England by the name of *foy*, is likewise in general esteem. The grand meal in this country is in the evening, the middle of the day, as in other hot climates, being generally devoted to sleep.

The Indians are so temperate in the use of strong liquors, that an instance of intoxication is seldom observed amongst them; and when this happens, it is only in the lower class of the people. But such is the detestation in which this vice is generally held, that even to touch a person addicted to it, is considered as a species of defilement.

The liquors used in this country are drawn either from rice, the juice of the sugar-cane, the cocoa-nut, or palm-trees; the latter of which is regarded rather as a wine than a spirit. All other wines drank in India are imported from Europe, and sold for near a crown a bottle; except some brought from Persia, which is cheaper, but far inferior in quality. Fine ale is here almost of the same price with wine, on account of the frequent loss sustained by flying, in the passage from Europe: but old beer is afforded at eighteen pence a bottle; and instead of small beer, some of the European inhabitants brew a liquor of brown sugar-candy, which they work with toddy or palm wine.

Though the Indians are very sparing in the use of strong liquors, and for the most part abstain entirely from them, yet they frequently intoxicate themselves with opium, or an herb called *bang*, which produces nearly the same effect with the former. Besides these, they indulge themselves to excess in chewing a composition of a stupefactive quality, made of the betel-leaf, combined with the areck-nut and lime. They also smoke tobacco, but in a manner different from that which is practised in Europe. Of this they roll up a leaf about three or four inches long, when lighting it at one end, they apply the other to their mouth, and smoke till the half is consumed, after which they throw away the remainder. The Moors, however, use a pipe of extraordinary length, the bowl of which is supported by a bottle of water, that is purposely placed on the floor.

The Indians are so far sociable, that they love to be in company, but their motives to association seem to be little more than those of gregarious animals, for they are almost as silent as if nature had formed them without the organs of speech. Nor are they less averse to walking for amusement, than they are to the intercourse of ideas. The usual salute amongst them is the *salam*, or the lifting one or both hands to the head, according to the quality of the person to whom the compliment is paid. In this ceremony, however, to use the left hand alone would be reckoned extremely disrespectful. When a prince is addressed, the person who approaches him bows low, bringing his hands down to the ground, then upwards to his breast, and lastly to his head, which motions are repeated three times; but others, on the same occasion, fall prostrate on their face. The Moors, when they meet a friend,

No. 6.

*say, salam alacum*, God preserve you; the common answer to which is, *alacum salam*, or, I wish the same to you.

The Indians practise gaming for amusement as well as the Chinese, but they seldom indulge themselves so much in it as to injure their fortunes, or endanger their tranquillity of mind. At a feast, it is usual for the company to be entertained with vocal music and dancing, which are performed by the girls dedicated to the service of the temple, who are by no means of the order of vestal virgins. In the evenings, during the fair season, plays are acted by torch-light in the fields. But the most common diversion in every village is the dancing of the *cobre capelle*, or hooded snake; of which several are brought by their keepers, to where the inhabitants are assembled, in covered baskets. The owners of them then beginning to sing and play on rude instruments, uncovering at the same time the baskets, those creatures raise themselves erect, and as it were dance to the sound of the music; which, notwithstanding it hardly deserves that name, if discontinued, they get out upon the ground, and hiss in a terrible manner. As soon, however, as the music begins again, they are directed to their former station, where their motions are immediately renewed.

The rural sports most frequently practised are those of hunting and hawking. Their method is to surround part of the country, and drive the game into a narrow compass, where they afterwards shoot at it; using instead of a stalking-horse, an ox that has been accustomed to stand fire. It is said that they teach even tigers and leopards to take the game, which they do by jumping upon it from bushes, or other cover, but never run fairly after it. Racing, performed by oxen, is another diversion of the inhabitants; but that of the court is chiefly the fights of wild beasts.

The Indians have hitherto been extremely neglectful of their high roads, which are doubtless among the worst in the world. In the open country, on account of the sands with which it is covered, no distinct track can be traced; and though a way is sometimes opened through thick woods, yet hardly any thing is ever done either towards forming or repairing it. At the distance of every ten or twelve miles, however, there is a caravansera or choultry, for the accommodation of travellers, with a tank or reservoir of water near it, and fire for dressing their food. But so destitute are those places of convenience, that even beds are not furnished, and the traveller must provide himself with every necessary before he sets out on his journey.

The common vehicle for travelling is a palanquin, which is a couch covered with an arched canopy, and furnished with a mattress, quilts and cushions, to lie on. It is hung upon a bamboo or hollow cane, about five or six inches diameter, and ten foot long, which is bent in the middle while it is growing. This vehicle is so large, that a person may either sit in it upright, or loll upon the cushions, as he pleases. while others are employed in carrying large umbrellas, finely carved and gilt, to screen the sun from the traveller, morning and evening. For when the sun is many degrees above the horizon, he is sufficiently protected by the canopy. Another cooly is employed in brushing the flies off the person who sits in the vehicle, which he performs with an instrument resembling a horse's tail, fastened to a staff. A different cooly carries the traveller's pipe, while the charge of another attendant is the betel and arek, with the furniture belonging to it. During the journey, some of the retinue are dispatched to the neighbouring villages, to procure rice, fowls, and other provisions, with fuel, which they generally find in the way. The part of the cook is performed by one of the coolies; but if the traveller be a person of figure, he is attended by his own servants, and has likewise his music and singing girls to run before him. All the pedestrian attendants, coolies and others, travel quite naked, with only a hand's breadth of linen before them, and another small piece about their heads. In this manner they will run forty miles a day, travelling only early in the morning and late in the evening; for during the fair season, which is the proper time for a journey, they can see pretty well by star-light. There is then indeed some danger from wild beasts and robbers; but as a defence against those, it is usual for a traveller to hire ten additional coolies, who are furnished with arms. The daily expence of this whole retinue of twenty men does not exceed a crown; for they find their own provision, and would not on any account partake of the meat or drink of the traveller, the tasting of which they would consider as the forfeiture of paradise. About noon, the journey is interrupted some hours at the halting place, when the excessive heat of the sun and sands render it impossible to proceed. Merchandize is usually carried by camels or oxen, on which occasions seven or eight hundred people travel in a caravan, to avoid the danger of being attacked by the mountaineers or banditti. Some few persons ride on horseback, but more on bulls; and the princes and nobility use elephants.

There being no stated posts in this country, letters are conveyed by messengers sent on purpose, who are not only faithful, but extremely expeditious, and may be hired at a very easy rate.

#### C H A P. V.

*Of the government—court—revenue—forces—manufactures—trade—navigation.*

**I**NDIA is governed by a sovereign entitled, the Great Mogul, who has under him a number of viceroys or tributary princes, styled nabobs. Besides these, who are placed over the ancient provinces of the empire, there are others, named rajahs, who exercise the supreme authority in the conquered provinces; governing by their own laws and customs, civil and religious, only acknowledging the Mogul as their supreme lord, and paying him an annual tribute; with the additional mark of dependency, that they mount his guard by

turns, and bring their troops into the field when he requires it.

The Mogul's revenues arise from the tribute of the vassal princes, the duties of import and export, and a certain share of corn, which he reserves from the crops of the year. But the most plentiful source of his acquisitions is the estates of the court-eunuchs, and great officers, which he seizes at their death, if not sooner, which often happens on their being charged with mal-administration. His annual income by these means is computed at fifty millions sterling.

This prince has generally in his service three hundred thousand Moorish horse, besides the troops of the rajahs, which consist of infantry, and are very numerous. Of the latter, twenty thousand mount the Mogul's guard at a time, without the gates of the palace, while an equal number of Moors is stationed in one of the courts.

The Mogul, on his accession, always assumes some favourite epithet of distinction, as, *sovereign of the world, ornament of the throne, &c.* He never wears a crown, nor is formally invested with the supreme power, contenting himself with being only proclaimed and recognized by his subjects. The great officers of his court are generally eunuchs, by whom the affairs of state are transacted: but it is not uncommon for the ladies of the seraglio to influence administration, so far as frequently to overturn the most determined measures of government. According to the most authentic account, the number of these amounts to about a thousand; of whom never more than four have the precedency of wives, and bear the title of sultana. To this honour none but the Mogul's own subjects are admitted; for to marry the daughter even of a foreign prince, would be considered as degrading his dignity, though it be not reckoned in the least dishonourable to match with the meanest slave in his own dominions. The first son by any of his wives is deemed heir apparent to the crown, and constantly resides at court; but the younger sons are usually appointed governors of the distant provinces, bearing each the title of sultan, as every one of the daughters does that of sultana. The former are married about fourteen years of age, but the latter not permitted to enter the connubial state, from an opinion, that to marry a person of inferior rank would reflect dishonour on the royal family. This restriction, however, is compensated by the latitude allowed to their gallantries at court, in which they frequently indulge themselves, without any rigorous controul. It is said that the Mogul has his female guards and attendants within the palace, and seldom suffers the other sex to approach his person, though they occupy the outer courts and the avenues to the seraglio.

Though the crown be considered as hereditary, it is usual for all the princes of the blood to have recourse to arms at the death of the Mogul, when the superior force of one of the competitors determines the right of succession. The jealousy, however, which has been fomented by this contention for power, is so seldom extinguished by its attainment, that the barbarous policy is almost perpetually practised, of sacrificing to the security

security of the conqueror, every descendant of the royal family that might have the smallest pretensions to the throne.

The eunuchs, who are the great officers of the crown, are generally Persians or Tartars, and have therefore seldom any connexion in India. On which account, they are entirely dependent on the pleasure of the Mogul, who, without endangering his own security, can seize their effects, or even deprive them of life. For though these persons be almost adored while in office, their ministerial influence is no sooner at an end, than they find themselves abandoned by the creatures of their power, whose attachment had only been maintained from motives of private interest.

In the fair season, which lasts several months, it is usual for the Mogul to make a tour through great part of his dominions, attended by such a retinue of guards, mechanics, ladies of the court, with officers and servants, as sometimes comprises not less than a million of souls. This vast body of people is accommodated with a moving camp, in the middle of which is placed the Mogul's pavilion, surrounded by the tents of the court ladies. These are environed with a fence ten foot high, which folds up like a screen. Beyond this enclosure, is a second circle, containing the nobility and great officers of state, surrounded by other circles, in which the people are disposed according to their rank, in regular gradation; the outermost department being allotted to the meanest of the train. In each of these precincts is a market-place, well stored with provisions; to supply which, not less than twenty or thirty thousand carriers are constantly employed. The length of the march seldom exceeds ten miles a-day. A number of boats, laid on carriages, are drawn after the army, for the convenience of passing rivers. On those expeditions, the Mogul spends part of his time in hearing and redressing the grievances of his subjects, who live at a distance from the capital, and the remainder in the exercise of hawking, hunting, and other sports.

The arms used in India by the cavalry, are a broad sword and dagger, with a bow and arrows, and a lance; and by the infantry, the bow and arrows, with pikes, musquets, and shields. In the management of the musquets, however, they are far from being expert; and the train of artillery is chiefly conducted by European gunners. They fire some small pieces from the backs of elephants, which, before the introduction of fire-arms, were the strength of their army. Those animals were taught to throw bars of iron, and sweep down the enemy with heavy chains.

The manufactures of India are chiefly silk, muslins, cottons, chintzes and callicos; of which the latter are not only finely painted, but their colours are more lasting than any thing of that kind in Europe. The best chintzes and callicos are purchased at Massulapatam; the silks, in Bengal; and muslin, with callico likewise, is to be had in great quantity on the coast of Coromandel. Besides those manufactures, other articles of traffic are pepper, salt-petre, assafœtida, indigo, and a variety of drugs.

Except the cloth which the English East India Company are obliged by their charter to export, they seldom send hither any other goods but lead and flints; finding it more advantageous to purchase imports with silver than any other commodity. Several branches of manufacture, however, are carried to India by the people employed in the Company's trade, and sometimes turn out to good account. These are watches, clocks, arms, glass, haberdashery-ware, gold and silver lace, and toys.

From Surat especially, the Mogul's subjects carry on a prodigious trade to Persia and Arabia; furnishing those countries with all the rich merchandize of India, and bringing thence Persia carpets, pearls, coffee, and other commodities, but chiefly treasure. For the carriage of those imports, they usually hire English or Dutch vessels, as being best able to defend their cargoes against the attack of pirates, who frequently annoy the country ships; and from the freight of this trade, the Company draws considerable profit.

Besides their traffic by sea, the Indians have long had a great trade by land, with Persia, Russia, Tartary, and the dominions of the Turk; which is carried on by numerous caravans, at certain seasons of the year.

It is remarkable, that though the Mogul has a sea-coast of two thousand miles in extent, he has hardly a single sea-port, or a ship of war, to protect the trade of his subjects. For, except Goa, Bombay, and the mouth of the Ganges, which are all possessed by Europeans, there are no harbours fit for the reception of a vessel.

All embarkations on the coast of India are made by means of the country-boats, called messoulas, which are composed of a light spongy wood, the boards about half an inch thick, and fixed together with cocoa nut corlage, without the use of any nails. These boats are six foot deep, and will carry a great quantity of goods at a time. Though they strike frequently before they get to land, they are in no danger of over-setting or splitting; for being exceeding pliant, they yield to every bank that occurs, from which the next wave or surf of the sea sets them afloat, and heaves them to another, till at length they are washed to the shore. These boats are generally rowed by six or eight hands.

For the purpose of carrying very weighty materials on board a ship, they often make use of a cattamaran, which consists of three rough timber logs tied together, on which they sometimes fit up a sail, and at others paddle along with a flat stick, about the breadth of a man's hand. With this vehicle likewise they often go out three or four miles to sea a-fishing.

## C H A P. VI.

*Of marriages—funerals—religion—language—learning—arts and sciences.*

IT is not uncommon for the Gentoos or Pagans of India, to dispose of their children in marriage, even during their infancy, the consent of the parties to the contract being deemed a matter of no importance. The custom, however, is indispensable, that the male

and female thus betrothed shall be the offspring of persons who follow the same occupation. At whatever time the nuptial treaty is concluded, no cohabitation ensues till the woman is twelve years of age, and the man some years older. Premature as those nuptial contracts deserve to be reckoned, they are never entered into by the parents without consulting the astrologer; who not only determines, whether the proposed union shall prove fortunate or otherwise, but likewise what hour is the most propitious for the consummation of it. Every thing being settled, a grand procession is made through the streets for several nights successively, by the light of torches; while the bride and bridegroom are carried each on a palanquin on men's shoulders, with music playing before them. The parties are then set down at the house of the bride's father, where a table being placed between them, they join their hands cross it, and the priest covering both their heads with a cloth, repeats some prayers for their happiness. The company are afterwards sprinkled with perfumed water, and the ceremony concludes with an entertainment. The husband, or his father, if it be a rich family, makes valuable presents to the wife's relations, while all the fortune expected by her is her cloaths, and one or two female slaves. After the consummation of the marriage, however, she is entirely in the power of her husband, who enjoys the privilege of retaining as many wives and concubines as he pleases.

Ten days after a child is born, a name is given to it by the father's sister, or some near relation; in about two months from which time, it is carried to a temple, and formally admitted to the benefit of the religion which they profess. Neither boys nor girls wear any cloaths, until they are seven years old, but before that age their mothers are almost constantly washing them with cold water; and where there is not the conveniency of any river for bathing, it is customary both for young and old to have well-water poured upon their heads several times a-day. To this custom of bathing, so universally practised, and to the freedom of children from those ligatures, which in other countries lay the foundation of various diseases, it is probably owing, that hardly one crooked or ricketty person can be seen in any of the provinces of India.

The most common manner of treating the dead is that of burning the corpse, which is previously washed, and dressed in the best cloaths that had been worn by the deceased in his life-time. But those who have the good fortune to die within a little distance of the Ganges, are heaved into that river, which is worshipped as a God, and considered as the nearest road to paradise. There are likewise some other rivers the objects of adoration, and into which the dead are immersed.

The horrid practice of the wife's burning herself with her husband at his decease, if ever indeed it could prevail so much as some travellers have represented, seems now to be universally disused, no less than prohibited by the positive order of the Mogul.

The customary mourning in India is a tattered neglected dress, which, provided it answer this descrip-

tion, is not fixed to any particular colour. The women shave their heads on the death of a husband, but the men only on the demise of a father, or a sovereign prince. The place where a corpse has been burnt is often visited by the relations, who carry hither rice and other food, as a token of their regard for the deceased.

The greater part of the inhabitants of India are idolaters, who, though agreeing in the general outlines of their religion, are nevertheless distinguished into upwards of sixty tribes, so different in particular principles, as hardly to maintain with each other the ordinary intercourse of life. The chief of those tribes is that of the Bramins or Brachmans, who are the priests of every sect, and esteemed the most respectable of the pagan profession. This venerable order, which derives its origin from the remotest ages of antiquity, is subdivided into five distinct classes; the first of which comprises those Bramins that eat no flesh; the second, those who eat some kinds of flesh; the third, such as consider marriage not unbecoming their sacerdotal function; the fourth, those who vow celibacy; and the fifth, such as almost entirely forbear walking, lest in their motion they should by accident destroy some living creature. It is the custom of the latter of these tribes, to wear constantly a piece of silk or muslin before their mouths, that they may not with their breath draw in a fly. They abstain from burning wood, lest they should kill some insect, and always carry a brush in their hand, to sweep the place or earth which shall sit, with the view of avoiding to dislodge the weight of their body the soul of some animal.

The Bramins in general are esteemed not only the most noble, but the most learned of the Indian tribes. They have a language peculiar to themselves, in which the doctrines of their religion are written, and said to have been transmitted from the earliest times by Bramah, their lawgiver. They hold the existence of one God infinitely perfect, who has endured from all eternity; but that there are three inferior deities, namely, Bramah, whom he invested with the power of creation; Wisnow, the preserver; and Rooteren, the enemy and destroyer of mankind. They seem universally to believe in a pre-existent state, and the doctrine of transmigration; maintaining that some are rewarded, and others punished in this life, according to their respective merits or demerits in a former. Amidst all their superstition, they inculcate to their followers the most essential moral duties, with a zeal which might reflect honour on the professors of the purest religion; it being almost their constant employment to recommend the virtues of temperance, justice, and humanity. These important lessons, however, are sullied by other injunctions of a frivolous nature; such as, that their followers shall go in pilgrimage to certain places esteemed holy, especially to the pagodas near the mouth of the Ganges; that celebrate the river, the washing in which, according to the general opinion of the Indians, will cleanse from a multitude of sins.

The most honourable tribe or cast next to the Bramins, is that of the Rajasute or Rajboot, who make arms their profession. These, being less superstitious than

than the Bramins, scruple not to eat the flesh of most animals, except that of neat cattle, and some other beasts which they worship. The third tribe in honour consists of the Banians, who exceed all the others in their tender regard for the lives of animals; not only prohibiting the killing of them, but studying all means for their preservation. The chief object of their adoration is the ox, to which they never fail of paying their devotions every morning. According to vulgar tradition, this beast is to wade them over a wide river to paradise, whither without its assistance they never could expect to arrive. They imagine likewise, that in the animals of this class, it is the fate of the holiest souls to reside; and even that the terrestrial globe is supported by their horns; believing that when God was provoked to destroy mankind for their vices, he was prevailed on to spare them by a cow. If any creature is observed to frequent the dwelling of a Banian, he immediately concludes that it is animated by the soul of some departed friend, and therefore takes it under his protection. With so much solicitude do the people of this tribe study the happiness of animals, that they even build and endow hospitals for such as are hurt or superannuated. There lately was one of those receptacles within a mile of Surat, where sick and lame horses, dogs, cows, and goats, were nursed and provided for; and there is near the same place, another hospital, erected for bugs, fleas, and other insects. Besides these public endowments, the Banians carry into the fields basons of boiled rice, for the use of the flies and ants, as well as birds. Nor is their regard for animals confined to the care of providing them only with food; they carry their attachment to such a whimsical degree, as to adorn many of the species with pieces of finery; in which kind of bounty even some trees and vegetables, held in veneration, have likewise a share.

The people are taught by the Bramins, to begin and conclude the day with hymns, songs, and prayers. But the ninth and twenty-fourth of every month are particularly appropriated to acts of devotion, and the whole family obliged to fast, or use great abstinence. They are likewise enjoined by their religion, to wash their bodies on many occasions, especially after the touch of any thing which they consider as polluted; of which class, among others, are all those of a different religion. This superstition is frequently of great advantage to the Europeans, by securing their liquors and provision; for of those, they may depend upon it, that the natives, who are their servants, will never rob them. The inhabitants are also extremely superstitious in respect to the right and left hand, abhorring the custom of the Europeans, of frequently using the latter in lifting the food to their mouth. To salute any person with that obnoxious member, would be reckoned the highest affront, it being, in their opinion, fit only to be used in the meanest offices in life.

There is among the Pagans a great number of begging Friars, as well as Mahometans. Those persons, who are called Faquirs, make vows of poverty and celibacy, but their vows of poverty are so far from

No. 6.

depriving them of food, that their profession is the most effectual means of being well provided for; since at every village they come to, the people furnish them with necessaries. They go almost naked, letting their hair grow to a great length, and powdering it with ashes; performing likewise extraordinary penances, with the view of obtaining heaven for themselves and others.

Besides the sects already mentioned, there is another called Gaures, who fled hither from Persia, when the Mahometans made themselves masters of that country. This tribe is descended from the ancient Persians, who worshipped the sun and fire. They adore God the creator of the world, but have a tradition that Zertoof, or Zoroaster, their law-giver, some thousand years since, brought fire from heaven, and commanded his disciples to worship it. The extinguishing the holy fire, which is said to be continually kept burning from that period in their egarees or temples, is accounted a heinous sin; and they do not look with much less abhorrence on the putting out even any other fire. The coc is likewise adored by this people, with as much devotion as the cow by those of the Banian tribe. They set apart the first day of every month for public worship, and have prayers also at some other times.

About a mile from Surat, where a colony of the Gaures resides, they have a repository for their dead, in which the bodies are piled up on stages or raised floors, surrounded by a wall, but uncovered; it being their opinion, that they cannot do their deceased friends greater service than by leaving them to be devoured by birds of prey.

It seems highly probable that the Christian religion was planted very early in India. According to their tradition, St. Thomas the apostle preached here, and suffered martyrdom on a mountain, now called St. Thomas's Mount, near Meliapour, at which place resides the posterity of those Christians, whom the Portuguese found on their arrival. That Christianity was really planted in India before the Romish superstitions were known in the country, is confirmed by several observations. They have no images in their churches but the cross; the priests are permitted to marry once; they administer the sacrament in both kinds to the laity; they use no extreme unction; and lastly, they remained ignorant of the pope's jurisdiction, till of late, that the missionaries have prevailed on them to acknowledge his authority.

The Moors or Mahometans having now the government in their hands, the language used at the Mogul's court is chiefly the Persian; but that in which the Alcoran, and their religious books are written, is the Arabic. The Bramins or Brachmans, of which sect are the Pagan priests, have a language peculiar to themselves, in which likewise the various doctrines and legends of their order are composed. But the laity on the coast of Coromandel speak a tongue called the Gentoo, and those on the west coast another, distinguished by the appellation of the Malabar; while the Portuguese language is likewise spoken in all the maritime parts of India.

R

The

The Moors write upon paper, but the Pagans with a steel bodkin upon a cocoa-nut leaf, two foot long, and about the breadth of three fingers. All their books are written, or rather engraved, they not having the art of printing; and they write from the left hand to the right.

To any degree of learning they can hardly pretend. They have however some traditions concerning Aristotle and Avicenna, and the Moors have some passages of the Old Testament in the Arabic language, from the inhabitants of which country they are descended.

The Pagans begin the year the first of March, and the Moors the tenth of the same month; the latter celebrating a grand festival during the interval between those periods. At this time, every governor and great officer makes a present to his prince, who then nominates to the several offices in the government for the ensuing year.

The science chiefly known to the inhabitants, is arithmetic, in which, by the help of their fingers only, they will cast up a sum sooner than an European shall with his pen. The Bramins calculate an eclipse with tolerable exactness, but in other parts of astronomy, are deficient; and being ignorant of the globular figure of the earth, they imagine, that when the sun sets, he hides himself behind some mountain. They know however the signs of the Zodiac, which they distinguish by the same names as in Europe. But their favourite science is astrology. None of their princes will undertake any thing of moment, without consulting those who are supposed to be conversant with this art.

Though the Indian physicians are generally considered as very ignorant, it is certain that in some cases they perform extraordinary cures, particularly in the venereal disease, and the bite of some species of serpents: whether this success be owing to their knowledge, and judicious application of simple, or, what seems more probable, to the abstinence generally practised in India, in every disease. The most remarkable occurrence respecting physical prescriptions in this country, is their method of inoculation, which deserves to be recited, on account of its extraordinary success.

Inoculation is performed in Hindostan by a particular tribe of Bramins, who are delegated annually for that service. The inhabitants of the different provinces, knowing the usual time of their arrival, observe strictly the regimen enjoined, whether they determine to be inoculated or not. This preparation consists only in abstaining for a month from fish, milk, and ghee, a kind of butter made generally of buffalo's milk. When the Bramins begin to inoculate, they pass from house to house, and operate at the door; refusing to perform on any person who has not strictly observed the preparatory course enjoined them. It is not unusual for them to ask the parents how many pustules they choose their children should have; and though vanity, more than well-founded confidence in their own skill, might seem to prompt such a question, we are assured by good authority, that they hardly ever exceed, or are deficient, in the number required. They inoculate indifferently on any part; but if left to their own choice,

they prefer the outside of the arm, mid-way between the wrist and the elbow for the males, and the same between the elbow and shoulder for those of the other sex. After the operation which, a few superstitious ceremonies excepted, is performed nearly in the usual manner, the diet that had been previously recommended, is ordered to be continued a month longer. It is likewise prescribed, that a quantity of cold water be thrown on the patient every morning and evening, till the fever supervenes; from which time this method of bathing is to be suspended, until the appearance of the eruption, when it is again to be practised in the same manner, through the subsequent course of the disease. The pustules are opened with a fine sharp-pointed thorn, as soon as they begin to change their colour, and whilst the matter continues in a fluid state. Confinement to the house is absolutely forbid, and the regimen is ordered to consist of all the cooling things which the climate and season produces. The disease being entirely subdued, an injunction is laid on the patient to make a thanksgiving to Poojah, or offering, to Gootee ka Tagooran, the goddess of spots.

Among the distempers to which Europeans are subject in India, one of the most dangerous is the *morue dachien*, a complaint occasioned by indigestion, and which seems to be nearly the same with the cholera morbus. For this, the Indian cure is a red-hot iron applied to the soles of the feet; and a similar application to the belly is likewise their remedy for a colic.

#### C H A P. VII.

##### *History of India.*

**T**HOUGH the name of India was not unknown to the ancients, they seem to have been but very little acquainted with the country; neither the expedition of Semiramis, nor that of Bacchus, whether fabulous or real, appearing ever to have cast any other than a glimmering and uncertain light on the subject. Even the better authenticated irruption of Alexander was performed with far too much celerity, to obtain an adequate idea either of this part of the Asiatic continent, or its inhabitants. The first invader whose conquest drew after it any permanent effects, was Tamerlane, from whom may be dated not only the commencement of the more important historical transactions, but likewise of the grandeur of India. At the invasion of this prince, the country appears to have been divided amongst a great number of petty sovereigns, independent of each other, whom he reduced by the force of his arms. He was succeeded by his third son, Miracha, in the northern provinces of India and Persia, as well as in the title of Great Mogul, which his posterity, the emperors of India, enjoy at this day. Miracha fixed the seat of his government at Herat in Persia, but made annually a tour through his Indian dominions, in the fair season, attended by the court and army, when he collected the stipulated tribute from the vassal princes. The usual contingent being refused by one of those rajahs, the Mogul was under the necessity of having recourse to arms, to compel the payment of it, in which war he had the misfortune to be made prisoner,

soner, but obtained his liberty on condition of relinquishing for the future every similar demand on the prince and his successors. Determined, however, not to abide by an engagement which necessity alone had extorted, he no sooner arrived at his capital, than he levied a powerful army, with which he immediately marched again into the territories of the rajah. This expedition proving more successful than the former, the prince was made prisoner in his turn; and such was the repentment of the conqueror, that he filled his victory by commanding the eyes of the unfortunate captive to be put out. Tradition however relates, but with what truth is doubtful, that Miracha fell a sacrifice to the rajah's dexterity as an archer, even after this event.

In the reign of Babar, the great grandson of Miracha, a war broke out between him and another prince of the posterity of Tamerlane, when the former, losing the city of Samarcand, with his Persian provinces, made Delhi the capital of his dominions. Invading afterwards the Indian princes on the south-east, he conquered the kingdom of Patan or Patna, which lies upon the Ganges, and is contiguous to Bengal. Having reigned thirty years in India, he was succeeded by his son Amayum, whom unmerited confidence in a youth who had acquired his friendship, betrayed into an act of imprudence which terminated in the loss of his crown. To the rank of commander of his army, and prime-minister, he had raised a young Patan lord, named Chira, who taking every opportunity of ingratiating himself with the Tartars and Indians in the Mogul's army, and being extremely concerned to find his native country treated as a conquered province, entered into a conspiracy against Amayum. The latter receiving intelligence of his design, assembled a body of forces, and gave him battle; but being defeated in the engagement, he fled into Persia for protection, while his ungrateful rival was immediately after proclaimed sovereign of Hindostan. The royal fugitive was received at the court of Persia with all the marks of cordial attachment, and with promises of assistance towards restoring him to his throne. When he had waited nine years, however, in fruitless expectation of this event, advice arrived from Delhi, that Chira was accidentally killed by the bursting of a cannon, which he went to see fired; and that the Moguls and Patans could not agree in the choice of a successor to the empire. It was farther represented to him, that he had now a fair chance of recovering the throne of his ancestors, by returning immediately to Delhi. Losing therefore no time in communicating the information to the Sophy of Persia, that prince afforded him a body of troops; marching with which to India, and being joined by such of his subjects as continued in his interest, he again took possession of the crown. To this prince it is, that the Indians ascribe the building of caravanteras, or houses for the entertainment of travellers, and the regulating weights and measures. After his restoration he built a most magnificent tomb for himself, which is to this day esteemed one of the greatest curiosities in that country; but he enjoyed not the pleasure of seeing the structure completed. For

while he was walking over the scaffolding, intent on giving directions to the workmen, by the slipping of a plank he fell from a great height to the ground, and received so violent a contusion that he almost instantly expired.

Amayum was succeeded on the throne by his son Akebar, a young prince of a martial and enterprising disposition. The Moguls having hitherto had no communication with the sea-coast of India, whence a very great trade was carried on with the Europeans, particularly from the kingdom of Guzurat and Cambaya, he determined to attempt the reduction of those important territories. Sultan Badar, or Bahadar, a Mahometan prince, of Arabian descent, was at that time sovereign of the country, and engaged in a war with the Portuguese, who had lately taken from him the town of Diu, situate near the entrance of the gulph of Cambaya, almost opposite to Surat. On receiving intelligence that the Mogul was advancing with his army, the contending parties, despairing of being able to oppose him singly, thought it prudent to make a peace, and unite their forces against him. The utmost exertion of their strength, however, though sustained by European artillery, proved insufficient for the purpose. The irresistible army of Akebar bore down all before them. The sultan fled precipitately, but his children were made prisoners, and put to death by the invader, who took possession of the whole kingdom of Guzurat, except Diu, and such other towns as had been previously fortified by the Portuguese.

Animated by this success, Akebar invaded Decan, which lies south of Guzurat. Here he was met by the united forces of Mustapha, king of the country, of the queen of Amadanagar or Cande, and of Ambar prince of Doltabad. The army of the allies, however, was totally routed, and their capitals surrendered to the conqueror. Mustapha was permitted to bear the title of an Indian rajah in Akebar's court; the queen of Cande, notwithstanding her avowed aversion to the Mogul, had the distinction of being numbered among his wives, and of retaining the title of queen; but the prince of Doltabad was killed in an engagement during the war, and his territories seized by the enemy.

Not content with those acquisitions, Akebar next turned his arms eastward against the country of Chitor, then subject to Rama, who possessed the dignity of rajah. This prince, having entered into a confederacy with several of the neighbouring powers, ventured to oppose the Mogul; but being soon obliged to quit the field, he retired into his capital city of Chitor, seated on a high mountain, and naturally one of the strongest fortresses in India. But notwithstanding the advantage of its situation, and its being likewise well supplied with provisions, it was taken after a siege of two years; and with it the rest of the country submitted to the arms of the Mogul. Some historians represent this enterprise as the consequence of a passion which Akebar entertained for the rajah's wife, a woman of extraordinary beauty, but whom he had never seen. With greater probability however, it deserves to be imputed to the insatiable thirst of conquest, which hitherto

marked

marked the character of this ambitious and warlike prince.

Akebar seems henceforth to have devoted himself to the arts of peace, in building of fine towns, and promoting the traffic of his subjects. He it likewise was, who planted the celebrated avenue of trees, extending from Agra to Lahor, near five hundred miles; under the shade of which a traveller might be screened from the sun in the hottest day. His attention to these works, however, was at intervals suspended by some insurrections, which he in the end suppressed.

The Popish missionaries in India had conceived great hopes of converting this Mogul to Christianity; but though his apparent moderation in respect of religious matters, might render their conjecture not improbable, the event which they expected never happened. He is said, however, to have introduced a new religion, in

which he retained the baptism of the Christians, the circumcision of the Mahometans, and the idolatry of the Pagans; but this fantastic mixture of different rites appears to have proved of short duration.

From the time of Akebar, who died in 1605, the throne of Delhi has been successively occupied by a race of princes, almost uniformly distinguished by voluptuousness, and acts of rebellion against their fathers. Aurengzeb, however, though not free from the latter of those charges, was entirely exempted from the former. His moderation and temperance were such as are seldom practised in the luxurious courts of the eastern monarchs; and had his character not been sullied with the imputation of hypocrisy, he might be considered as a pattern of virtue, highly worthy the imitation of the future sovereigns of his country.

## P E R S I A.

### C H A P. I.

*Of the situation—boundaries—face of the country—seas—rivers—air—winds and seasons—provinces—cities—public and private buildings.*

**M**ODERN Persia is bounded by the mountains of Ararat or Dagistan, which divide it from Circassian Tartary on the north-west; by the Caspian Sea on the north; by the river Oxus on the north-east; by India on the east; by the Indian Ocean, with the gulphs of Bassora and Ormus, on the south; and by Arabia and Turkey on the west. It is situate between 45 and 67 degrees of east longitude, and between 25 and 45 degrees of north latitude; extending in length from north to south, about twelve hundred miles, and nearly the same number in breadth. It comprehends the ancient provinces of Persia Proper, Parthia, Media, Hyrcania, Bactria, Drangiana, Arachosia, Gedrosia, Susiana, Caramania, and part of Assyria.

Of all the countries in Asia, this may justly be reckoned the most mountainous; containing, 1. Mount Ararat, on which the ark is said to have rested, and which extends from the Euxine to the Caspian Sea. 2. Mount Taurus, with its several branches, running through the middle of Persia, and obtaining different names, according to the provinces on which they border. 3. The mountains which divide Media from Hyrcania. 4. Those between Hyrcania and Parthia. 5. The mountains which divide Fars, or Persia Proper, from Hyrcania, the chief of which is Mount Jarron. Except the hills of Curdestan and Hyrcania, which are covered with trees and herbage, the most of those mountains are barren rocks. Between them lie many extensive sandy plains, or deserts, where no water is to be found, especially on the frontiers of Turkey and India; interspersed, however, with some fruitful valleys, in which the principal cities stand. Hyrcania not only produces corn in great abundance, but is well planted with mulberry-trees, the foundation of their silk manufactures,

The seas of Persia are the Indian Ocean, with the gulphs of Bassora and Ormus on the south; and on the north the Caspian Sea, which is more properly a lake, having no communication with any sea, but entirely surrounded by land. According to some geographers, the Caspian is four hundred miles in length from north to south, and two hundred in breadth; but in respect to its extent, there are different accounts. It is, however, acknowledged to be the largest lake with which we are acquainted in Asia, and receives the waters of many rivers. In this sea there are no tides; but hard gales of wind either from the north or south, raise its surface three or four foot, and sometimes more: after which the water returns to its ordinary depth, with a prodigious current, and confused agitation of the waves. Those changes are for the most part irregular in their duration and return; but once in fifteen or sixteen years it usually overflows, and deluges the surrounding flat country.

The seas of Bassora and Ormus, formerly called the gulph of Persia, lie on the south-west part of the kingdom; and through them is carried on a vast trade by the Armenians, Banians, and other nations, Bassora and Gombron being the chief ports. During the time that the Portuguese were the only Europeans who navigated the India Seas, the little island of Ormus was one of the greatest marts for trade in the east.

The united rivers of Tigris and Euphrates, which rise in the mountains of Armenia, run towards the south-east, near the confines of Persia and Turkey, and are discharged into the gulph of Bassora. The river Oxus divides Persia from Usbec Tartary on the north-east; the river Kur, the ancient Cyrus, rises in the Dagistan mountains, and running south-east, joins the river Arras, formerly Araxes, their united stream falling afterwards into the west side of the Caspian Sea. Those being the chief, and almost only navigable rivers in Persia, the inhabitants of the country collect several small rivulets, and convey them by arched aqueducts to their fields and gardens, sometimes at the distance

of thirty or forty miles. This being done at the public expence, every one pays a tax to the government, in proportion to the quantity of water received on his ground. The numerous mountains and deep valleys in this country, render the air, which would otherwise be uniformly hot, of various degrees of temperature in the different parts of the kingdom. In the inland provinces, during the winter, they have severe frosts, accompanied with snow, on the mountains; but in the valleys, the season is much milder, and there is very little snow. A high wind generally prevails from March to May; after which, till September, the sky is perfectly serene, and the days very warm; but in the evening and morning are refreshing breezes, which render those hours the most convenient both for pleasure and business. Not the least dew or moisture falls during the summer months in this part of the kingdom, and in winter it seldom rains; but the principal advantage of the interior provinces is, that they are extremely healthful.

The air in the south of Persia is far less salubrious, as the European factors at Gombroon have too often experienced, especially about either equinox. In those parts, the months of June, July and August, are the most healthful, but so excessive hot, that the inhabitants then retire to the mountains, which are at all times cool enough, even in the hottest countries.

In the deserts on the south of Persia, where the winds blow over a long tract of burning sand, from the east, they are exceeding hot in May and June, and sometimes fatal to travellers. There is seldom here any rain to cool the air in those months; and the rain-water which they collect in winter, becomes then extremely unwholesome. It is observed, that the south of Persia, which lies near the tropic of Cancer, is hotter than any country situate even under the equator, on account of the sun's continuing vertical a longer time.

Modern Persia may be divided into sixteen provinces, the boundaries of which, however, are not exactly the same with those that constituted the several divisions of the ancient kingdom; some having received an addition of territory, while others, on the contrary, have been diminished. The sixteen provinces are, Eterabat, Chorassan, Sablufan, Sigistan, Makeran, Kerman, Farrisfan, Chufistan, Curdestan, Erae, Aderbeitzan, Chirvan, Dagliffan, Gilan, Mazanderan, and Georgia, in the latter of which Mingrelia is included.

The chief towns of the province of Eterabat are, Eterabat, and Thufmechid; the capital of Chorassan is Herat; and the chief towns of Sablufan are, Gazna, Bult, and Candahor. Those three provinces lie in the north-east of Persia, and contain part of the ancient Hyrcania, Bactria, and Margiana.

The chief towns of Sigistan are, Sigistan, Maslich, and Robin; and those of Makeran, a cognominal town, Passir, and Tiz. Those provinces are situate in the south-east part of Persia, and comprehend the ancient Arachofia, and Gedrosia, or the greater part of them.

No. 6.

Of Kerman the chief towns are, Kerman, Banderabaffi or Gombroon, Salam, Durabeyerd, Tuberan, and Jasques. Durabeyerd was the ancient Pasagardæ, the royal residence, and the favourite place of Cyrus; where he conquered Astyages, the Mede, and chose to be buried. His monument was a small tower shaded with trees, in a garden or enclosure, of which no vestiges now remain.

Of Farnifan or Fars, the principal towns are, Schiras, ruins of Persepolis, Lar, and Bander Congo. The two last mentioned provinces are situate in the south of the modern Persia, and comprehend the greater part of the ancient.

The city of Persepolis stood near the Araxes, and according to Diodorus, was built out of the spoils of the Egyptian Thebes. Here are the most magnificent remains of a palace or temple, that are any where to be seen. They lie on the north-east end of the spacious plain where Persepolis stood, and are conjectured to be part of the palace of the same Darius who was conquered by Alexander, and which the latter, in a drunken fit, caused to be burnt to the ground, at the instigation of the courtesan Thais.

The building was five hundred paces in length, and the whole contained sixty acres of ground. It stood upon a hill, and was ascended by ninety-five steps, thirty foot in length, twenty inches broad, and three inches deep. The ground stair-case which remains, divides as we ascend it, one part to the right, and the other to the left; after which they meet again in a square landing-place. Here we enter a portico of fine marble, twenty foot wide, on which are carved, in bas-relief, two animals of the size of elephants, but shaped like horses, with the feet and tails of a bull. There is the representation of other beasts with wings, and their heads like those of men. From this hall, we ascend another double stair-case, leading to the upper apartments, on the walls of which is carved, likewise in bas-relief, a grand procession, with standards and various offerings, succeeded by a chariot drawn by horses, and bearing a little altar, from which the fire seems to ascend. On the other side of the same apartment, are represented wild beasts, amongst which the principal figures are a lion and a bull, still entire. On the top of the second stair-case also is a large square, which, as appears by the pedestals that remain, was surrounded by a hundred columns, of which seven are yet extant. They consist of red and white marble, fluted; some sixty, others seventy foot high, and twelve of them six yards in circumference. Those, it is conjectured, sustained the temple of the sun. On the same floor, is a room fifty foot square, in which are figures of yet finer marble, cut in bas-relief and half-relief. They represent men fighting with lions, and a man holding a unicorn by the horn; some figures of giants, and a king giving audience to ambassadors, with inscriptions not defaced. The characters, however, are unknown to the natives of the country, and are equally unintelligible to the learned in Europe, for whom they have been transcribed. On the whole, the remains seem to exhibit evident proofs of its original magni-

S

scence,

science, notwithstanding Tavernier seems to entertain but a mean opinion of its ancient grandeur. The place is now called, Chihilinar, or the Forty Pillars.

Of the two provinces in the south-west of Persia, which comprehend part of the ancient Assyria, the chief towns are, Arnova, Cournebad, Wasset, Banderick, Elenais, whence the ancient Persians were called Elamites, and Schouster, the ancient Shushan, the scene of queen Esther's history.

Erac, or Irac Agem, which is the largest province in the kingdom, is situate near the center of it, and is the ancient Parthia. Its chief cities are, Ispahan or Spahawn, the metropolis of the nation, with Casbin or Caswin Com, Hamadan, Cashan, and Yefid. On a mountain near the last of those towns, it is said that some of the priests of the ancient Persians reside, who are employed in preserving the celestial fire, which, according to tradition, has burnt incessantly upwards of two thousand years.

The principal towns of Aderbeizan are, Ardevil or Ardebil, Sultania, with Tauris or Tabris, the ancient Ecbatana and capital of Media. This city, which stood on a gentle declivity, distant twelve stadia from Mount Oronates, was built, according to Herodotus, by Deioeces, king of the Medes. It was encompassed with seven walls, each of a different colour, and the utmost of which measured an hundred and fifty stadia.

The towns of greatest note in the province of Shirvan are, Derbent, Baku, and Shamakie. These two provinces are situate west of the Caspian Sea, and comprehend the ancient Media and Albania.

The chief town of Dagistan is Tzantzeni; and Georgia, including Mingrelia, has for its principal towns, Teflis, Julpha Janca, and Naxivan, where it is said that Noah's ark rested. The countries of Dagistan, Georgia, and Mingrelia, are situate in the north-west part of the modern Persia, and comprehend part of the ancient Colchis, Iberia, and Armenia. Either in Georgia, or Mingrelia, was the ancient Colchis, celebrated for the voyage made hither by the Argonauts, in search of the golden fleece.

The chief towns of Gilan are, Gilan, Rext or Refcod, and Farrabat; and those of Mazanderan are, Hazaroff, and Danmogan. These two provinces contain great part of the ancient Hyrcania.

Several of the places which have been mentioned are considerable cities; but Ispahan, as the capital of the kingdom, deserves a more particular description.

This metropolis is situate in 32 degrees 30 minutes north latitude, and in 50 degrees of east longitude, in a fine plain, surrounded by mountains three leagues distant on every side. It is of an oval form, about twelve miles in circumference, but destitute of walls. The streets are narrow, unpaved, and some of them arched over, with openings to admit the light. They are generally dirty or dusty; for though there be here no wheel carriages, yet as all people of fashion ride through them with numerous equipages, and as camels and other beasts of burden, with goods or provisions, are constantly either going or returning from the market-place, the passages never fail of being much

obstructed by the crowd. The squares, however, are very spacious, and the buildings grand, especially the Royal Meydan, into which two of the palace gates open. This square is about one third of a mile in length, and half as much in breadth, with piazzas in two sides of it, in which the tradesmen have their shops. Those places are far from being commodious; for the passage within the piazzas has no other light than what is received by narrow openings, left at a distance from each other, and the people ride under the covering. In the middle of the square is a market for cattle, and all forts of provision. The tradesmen's houses stand in a different part of the town, at a distance from their shops.

The palace is situate almost in the middle of the city, and is about three miles in circumference, having in the front a fine walk of trees, and a reservoir of water. Two of the gates open wide into the market-place; upon entering the principal of which, there is on the one hand a court, where the prime vizir and assistant judges hear causes; and on the other a similar building, where criminals are allowed to take sanctuary. Passing thence through a grand avenue, we arrive at a great hall, where the king gives audience. This apartment is divided into three floors, one a step higher than the other, on which the great officers of the court are admitted according to their quality. Beyond those stages, is a kind of long gallery, richly adorned and open in the front, where the king sits cross-legged on a carpet, with cushions at his back and under him, and a canopy over his head. Of the inner parts of the palace, and the haram or women's apartments, we have little account. It is only said in general, that the king's women live in separate houses, surrounded with gardens, in which are pleasant groves, canals, and fountains; and that he frequently hunts with the ladies in a park enclosed by high walls, where no men ever approach.

The other public buildings in the city are their mosques, bagnios, caravanseras, and reservoirs. Their mosques are usually covered with domes or cupolas, and have a kind of minarets or slender steeples, which the priests ascend every day, to call the people to prayers. Of those there are about a hundred and fifty in the city. The courts of the grand or royal mosques are entered by gates covered with silver plates; and on each side of the court are cloysters, in which the priests have their apartments. The entrance to the mosque is by three grand doors, which lead into the isles, adorned with gold and azure. The cupola in the middle is supported by four great square pillars, and the floor of the mosque is covered with carpets. Two large windows on the top give light to the whole building; the roof is covered with shining tiles of different colours, after the manner of Persia, and the walls adorned in the same taste. No images or pictures are ever suffered in these temples; neither are there any seats or pews in them, but a pulpit, from which the mollahs or priests sometimes harangue the people. At entering the mosque, all persons, of whatever rank, put off their shoes and slippers.

The

The bagnios are likewise grand buildings, of a circular form, with domes; the walls of white stone, and the roof covered with painted tiles. In the middle of the inside is a great hall, floored with marble, and a basin to bathe in; the cells or chambers in which to dress, being ranged all round.

A caravanera is built in the form of a square, surrounded with cloysters or piazzas, and accommodated with apartments for lodging, as well as with conveniences for cattle on the outside. It is computed, that of this kind of houses there are in Ispahan about fifteen hundred.

The houses of the Persian quality are for the most part situate in the middle of a garden, with high walls before them, and at some distance from the gate, which, to prevent the curiosity of spectators, is usually guarded by a screen on the inside. In the front of the building is a piazza or cloyster, with a spacious hall behind; on the other side of which is another open piazza, or virando, as it is called, with a fountain playing before it; whence there runs a walk of trees, usually the length of the garden. At each corner of the hall is an apartment, which serves either as a parlour or lodging room. For as they lie on mattresses instead of beds, those are removed every morning, and therefore no room has the appearance of being used as a bed-chamber. On the sides of the hall are several doors leading to the virandos or piazzas, which are all opened in hot weather. By this means, the place is rendered cool, and there is likewise frequently a fountain playing in the middle of the hall. The rest of the apartments are not contiguous to this building, or to each other, but are a kind of summer-houses dispersed about the gardens, where the women usually reside. They have generally but one floor, and flat terraced roofs, where the inhabitants take the air morning and evening; and sometimes, carrying up their mattresses, they even sleep on the top of the house. The kitchens and offices stand apart, and have no communication with the other building. During cold weather, in the northern provinces, there are stoves under the rooms, but no chimney or open fires in the apartments. The furniture consists of carpets and cushions, and the sides of the rooms are commonly lined with a manufacture resembling Dutch tiles, four foot high, while the upper part of the wall is painted or hung with pictures.

#### C H A P. II.

*Of the produce of the country—manufactures—traffic.*

PERSIA is represented by ancient writers, as one of the most fruitful countries in the world, and that such it formerly was, is evident from the numerous armies which it often sent into the field. But though some of the valleys are yet so rich as to produce two, or even three crops, in the year, it is certain that the kingdom is prodigiously declined in fertility, as well as in the number of inhabitants. For this remark, which is indisputable, several reasons may be assigned. The ancient Persians, the worshippers of fire, were expressly enjoined by their religion to cultivate the

ground. The planting of trees, and building of aqueducts to water their fields, were considered by them as actions of the most meritorious kind; while on the contrary, the Mahometans, the present inhabitants, are averse to every species of industry. Another cause of the general neglect of agriculture, is that the proprietors of lands are frequently deprived of their possessions by government, an inheritance seldom descending to the third generation; for which reason they are discouraged from the improvements in which they might otherwise be engaged. It may be affirmed with truth, that hardly a twentieth part of the country is at present cultivated. Neither is there near so much care taken as formerly, to convey water to the fields, without which the dry soil of this country can never be rendered fit for vegetation. Hundreds of aqueducts may be seen in ruins in the different provinces of the kingdom; a proof that the impoverished state of the country is owing more to the inattention of the inhabitants than the natural defects of the soil. The present Persians, however, do not entirely neglect the cultivation of their lands. Their method is, near towns, to manure them with dung; and in places remote from this convenience, to bank them round, and afterwards cover them with water. This is suffered to remain on the fields all night, and greatly fertilizes the ground. The soil is generally so light, that two or three oxen are sufficient to draw a plough; but in the provinces on the coast of the Caspian, where the land is a stiff clay, nine or ten oxen are requisite. The grain chiefly cultivated is wheat and rice, with some rye and a good deal of barley; for having no oats, barley-paste, made into balls, is the food for camels and horses.

The kitchen-gardens abound with melons, of which, it is computed, they have twenty sorts; and cucumbers are likewise much cultivated; for the common people live much on those fruits during the season, which lasts four months in the year, and that without any inconvenience.

The grapes are generally very small, called kishmish, of which they make wine at Ispahan; but the best wines are made at Shiras, where the fruit is very large. Sometimes the grapes are wrapped up in papers, and hang upon the vine almost all winter. For though the Mahometans are prohibited the juice of them converted into wine, they make no scruple of eating the fruit.

The dates in Persia are reckoned remarkably fine; their pulp is exceeding sweet, and being laid in heaps, they melt and candy themselves without sugar. The tree that bears them is a species of the palm, tall and slender, having no branches but at the top, where the fruit grows in clusters of forty pounds weight. Pistachio nuts are in great plenty, and, it is said, peculiar to the climate. They have also oranges and lemons, almonds, olives, sugar and tobacco plantations; and in the northern parts, apples, pears, quinces, nuts, and most of the fruits of our own climate. The nectarines and peaches are so large, that they weigh fifteen or sixteen ounces. All their fruits have a more delicious flavour than those which are produced in more northerly countries; but for every advantage

of this kind, the inhabitants are more indebted to the bounty of nature than to their own skill in gardening, which appears to be extremely deficient. The fenna tree is very much valued, which runs up to a great height, perfectly strait; it bears no branches but at the top, and forms very beautiful walks and avenues. The plane-tree, the fir, the cornel, and the willow, are met with in almost every part of the country. The plane-tree is supposed to prevent contagious disorders; and it is observed that Ispahan has never suffered from the plague, since this plant has been cultivated in its neighbourhood; a remark which coincides with observations lately made in Europe, respecting the usefulness of plants in general, in absorbing putrid particles from the air. Aromatic gums, especially frankincense, distil from several of their trees, and those of another species yield manna. Cotton-trees are common, as is likewise another plant, which affords a kind of silk-down, used in quilting. All those trees, however, are only to be found within a few leagues of the towns and villages, the other parts of the country being a barren desert without any vegetable production. The reason probably is, that the most fruitful spots of the country have been made choice of for the situation of their towns; for it cannot be supposed that the rest of the kingdom was equally barren in ancient times, when such multitudes of people subsisted in it. Though other plants will not grow in their deserts, there are some poisonous shrubs in Caramania, which contaminate the air when in blossom, and prove fatal to travellers. It is conjectured that those flowers render the samiel or hot wind so dangerous in Persia, which is never accompanied in India with any such pernicious effects.

Flowers of various kinds grow here spontaneously, but are seldom planted in their gardens in any order. The fields of Hyrcania and Mazenderan are extremely beautiful with those productions. In Media we meet with tulips, anemones, and ranunculuses; near Ispahan, jonquils, pinks, lilies and violets, with vast quantities of roses, and another flower, a most beautiful scarlet, of which thirty are found on every sprig. All those flowers, however, are here but little regarded; for what the people delight most in, are spacious walks of trees, fountains, reservoirs, and canals, with summer houses and alcoves at proper distances about their gardens.

The drugs produced in Persia are, fenna, sal armoniac, rhubarb, cassia, and gum ammoniac, with poppies, which are highly valued for the strength and quantity of the liquor they yield. The juice is extracted from them in June, by making incisions in the head; and it is observed, that the people employed in this work are extremely liable to paralytic complaints, particularly tremors. The liquor drawn from the poppy soon becomes thick, and is then made up into pills. Asfa fætida is another drug indigenous to this country, and which the Persians reckon as a perfume. From a rock there also distils a gum, on account of its fragrance distinguished by the name of mummy, and which is said to perform many cures. But there is here another sort of mummies, resembling much

rearer the Egyptian, and yet have never been embalmed. These are human bodies which have lain in the parched sands for many ages, by which means the flesh has acquired the hardness of horn.

The bezoar stone, which is found in the bodies of goats, monkeys, and other animals, is met with here in great plenty, and accounted more valuable than that of India.

The most useful Persian animals are, camels, dromedaries, horses, mules, asses, oxen, and buffaloes. All those are used either to ride on, or carry burdens, except the horse, which is only kept for the saddle. The Persian horses are light, sprightly, well proportioned, and beautiful; but not so swift as the Arabian breed, of which the king is always provided with a great number.

A horse is frequently sold in Persia for three or four hundred pounds, and seldom under fifty. A mule is sold for thirty or forty pounds; and an ass for almost as much, after he has been taught to pace. They feed their horses chiefly with barley, and sometimes cut grafs for them, but never make it into hay. They never litter down their horses with straw, but lay their dung dried under them a foot deep; and they shoe both horses and oxen with thin plates. Any person may be furnished with a horse by the government, on condition of keeping and using him well, and having him fit for the king's service, when he may be demanded.

There is in Persia an extraordinary fine breed of sheep, the wool and flesh of which are equally valued. It is not uncommon for them to have tails that weigh eight or ten pounds, and they have six or seven horns; some of which stand out horizontally, and occasion a great deal of blood to be spilt when the rams engage with each other. Their goats likewise are much esteemed for the fine wool on their bellies, as well as for their flesh. Mutton and kid are the kinds of meat chiefly used; they eat very little beef or veal; and hogs, as the Mahometans in general, they hold in abomination. Deer and antelopes they have some, and also hares, but of the latter they never eat. There are no wild beasts in the middle or south of Persia, those parts of the country not affording sufficient cover for them; but the Hyrcanian forests near the Caspian Sea still abound with tygers, leopards, wild hogs, and other beasts of prey.

Few insects are to be seen in the interior parts of Persia, on account of the dryness of the soil; but the fields are often infested with locusts, which fly in such swarms, as to intercept the light of the sun, destroying every green vegetable where they happen to descend. Provisionally, however, some birds visit the country at the same season, and eat up those emigrants, to the no small relief of the farmers, who would otherwise be ruined by their depredations. The country adjacent to the Caspian is rarely infested with this terrible plague, but it is over-run by almost every kind of noxious insects and reptiles, as serpents, scorpions, toads, &c. These being destroyed by the summer heats, or for want of water, they lie putrefying on the ground, and contribute to render the air of the country unhealthy.

few insects are to be seen in the interior parts of Persia, on account of the dryness of the soil; but the fields are often infested with locusts, which fly in such swarms, as to intercept the light of the sun, destroying every green vegetable where they happen to descend. Providentially, however, some birds visit the country at the same season, and eat up those emigrants, to the no small relief of the farmers, who would otherwise be ruined by their depredations. The country adjacent to the Caspian is rarely infested with this terrible plague, but it is over-run by almost every kind of noxious insects and reptiles, as serpents, scorpions, toads, &c. These being destroyed by the summer heats, or for want of water, they lie putrefying on the ground, and contribute to render the air of the country unhealthful.

Domestic fowls of every species are in great plenty, except turkeys, which do not thrive in any part of the Persian dominions. Pigeons are in vast number, and the partridges large and well tasted. The pelican, called the tacob, or water-drawer, has a body as large as that of a sheep, but a very small head, and the bill is above sixteen inches long. Under the latter grows a large bag, which some relate will contain a pail of water. This cavity answers the purpose of a reservoir for the use of their young brood; for those birds having always their nests in the deserts, must sometimes fly to an incredible distance for water. Eagles and birds of prey are much propagated here, being taught to fly at all sorts of game, whether of the winged or quadruped kind; for this method of hunting is the chief rural sport in the country.

The singing birds are of the same species with those of Europe, and there are several parti-coloured birds which have beautiful plumage. Sparrows abound to that degree, that the farmer is obliged to retain men for the purpose of driving them from his grain.

In a country where there are so few rivers, and most of those dried up in the summer, it cannot be expected there should be much river-fish; nor is sea-fish to be met with at the capital city of Ispahan. But in the gulph of Persia in the south, and the Caspian on the north, there is great plenty of sea-fish; as there is of river-fish in the Kur and Arras, which fall into the Caspian Sea. In the gulph of Boffora, on the coast of Arabia, they fish for pearl oysters; this part of Arabia, styled the province of Bahara, being subject to the Persian crown. About a hundred years ago, this was one of the greatest pearl fisheries in the world.

The turquois stone is the most valuable jewel in the country. These are found chiefly in the province of Chorassan, near Nisiapour or Nixabour. Here are no gold or silver mines, though a small quantity of silver may be extracted from their copper and lead mines, of which, as well as of iron, they have several. Sulphur and salt-petre are found in the mountains between Mazenderan and Erac, and antimony in Carmania. There are plains ten or twelve leagues in length, covered with salt; and in other parts, sulphur and alum are found likewise on the surface of the ground. Near Hamadan, and in Susiana, are quarries of red, white, and black marble, with some of a mixed kind; and that which is dug in the neighbourhood of Tauris is almost as transparent as crystal.

The most considerable manufacture in Persia is that of wrought silk, such as satins, tabbies, taffetees, brocades, and gold and silver tissues. Their rich silks are all of a very durable quality, and their gold velvet also is much admired. The best looms are at Ispahan, Cashan and Yezd. Their finest carpets are mixed with silk, and far exceed those of Turkey. Camblets, with silk and worsted stuffs, are made in Carmania, and goat's-hair stuffs in Mazenderan; and they make some calicoes, but inferior to those of India. Their embroidered leather exceeds any thing of the kind. Their tanners use no bark, but salt and galls instead of it. The braziers and tin-men work very well, and

No. 7.

their armourers make good swords, as well as gun-barrels; but the artists here do not attempt gun-locks, no more than clocks or watches, which are purchased of European merchants. Cutlery ware is made with tolerable dexterity, as also are steel mirrors, which they use instead of looking-glasses; having not yet acquired the art of making the latter, though they can fabricate window-glass and glass bottles.

Archery being still in use amongst them, the making of bows is a considerable trade. They are formed either of wood or horn, bound about with the dried sinews of animals, finely painted and varnished. The string of the bow is of twisted silk, and their quivers made either of silk or embroidered leather.

The making earthen ware is another manufacture which they have brought to great perfection, much beyond the Dutch ware, and almost equal to that of China.

The goods chiefly imported from Persia are raw and wrought silks, mohair-yarn, goat's-wool, leather, wine-spirits, dried and preserved fruits, dates, pistachio nuts, almonds, carpets, galls, pearls, raisins, rose-water, salop, assa fetida, gum tragant, opium, with other gums and drugs.

The English import chiefly raw silk, carpets, camels and goats hair and wool, which are brought either by Turkey, from Gombron, in the gulph of Boffora; or by the Caspian Sea, and the river Wolga, through Russia. The English East-India Company trade but little to Persia on their own account, but till lately made considerable advantage by transporting the merchandize of the Armenians, Banians, and Moors, from Gombron in the gulph of Ormus, to Surat in India. This trade however with Gombron, and other parts of Persia, is now disused.

The king being the chief merchant in this country, his factors, the Armenians, have the refusal of whatever is imported, and carry on a trade for the court in almost every country. As there is here no hereditary nobility, a merchant is esteemed a very honourable profession, and the greatest officers of the kingdom do not think it beneath them to engage in commerce.

### C H A P. III.

*Of the constitution—government—laws—customs—forces—revenues—barans.*

PERSIA, like the other nations of the East, is an absolute monarchy, modelled strictly by the principles of the most uncontrollable despotism. Not only the life and property of every subject are at the sovereign's disposal, but he can deprive them of either without any judicial trial, and even without an accusation. This power, however, is said to be exerted only against the governors and great officers of state, whose influence might render it difficult to bring them to justice, in cases of delinquency, by less rigorous procedure; for with respect to the bulk of the people, they are seldom oppressed by the crown. The title of the sovereign is *shaw*, or *pathaw*, the *disposer of kingdoms*; and the princes of the blood are styled *mirzas*. The king has no standing council, but advises with

T

his

his vizir or prime minister, and whom else he pleases. No public act of royal authority is of force, until countersealed by the vizir; a proper restraint, considering the extreme ignorance of those princes who have received their education in the seraglio.

The next great officer in rank is the divan begli, or bey, who is president of the supreme court of justice, and the last resort, either in law or equity. The other personages of distinction at court are the generalissimo, the secretary of state, the lord treasurer, and domestics in high office, with the mirah or lord of the waters, who has the direction of all the aqueducts in the kingdom. The lord chamberlain, who is always a white eunuch, has generally, as well as the ladies of the seraglio, great influence on the affairs of the state. He serves the king on his knees at table, tastes his meat, dresses him, and is seldom out of his presence; constantly carrying, for his majesty's use, some fine handkerchiefs, and a box replenished with perfumes, opium, and cordials.

The Persian throne is commonly said to be hereditary, but the king transfers it to which of his sons he pleases, and sometimes orders the eyes of the eldest to be put out; for by the laws of Persia, a blind man cannot inherit any more than a princess. But though the latter be deemed incapable of territorial succession, the right is admitted in her son.

In every province of the kingdom there is a cham or viceroy, who lives in the state of a sovereign prince, and commands all the forces in his department. This office is sometimes continued for life, and it is not unusual for the son to succeed to the father's government, when it happens that he is acceptable to the court. The king, and not the cham, appoints the lieutenant-governor, and the other important officers in the province. One of these is a vizir, who not only has the jurisdiction and disposal of all the crown lands, and the subjects upon them, but is treasurer and receiver-general of all the taxes and revenues. The subjects are for the most part grievously oppressed by this officer, who usually procures his place by bribing the eunuchs and ministers at court, and promising to encrease the public revenue, which he fails not to perform by fleecing the people; whom he farther oppresses, to enrich himself and his patrons. The meanest of the subjects are allowed to lay their complaints before the king, but they are often counteracted by the artifices of the eunuchs and courtiers, who share the plunder with the vizir.

When a charge against the viceroy is preferred by any province, the deputation by which it is sent usually consists of several hundred men; who planting themselves before the gate of the palace, set up a miserable howl, rending their cloaths, and throwing dust into the air, while they demand justice of his majesty. The king sending an officer to know their complaint, a petition is presented in writing, which is referred to the secretary to examine, and report the substance of it to the king. If the complaint be found just, and the crime very notorious, a person is dispatched to take off the governor's head, carrying with him the lieutenant-governor to see the sentence executed. If

he meets the delinquent, he falls upon him directly with his sabre, and cuts him in pieces, there being no common executioner in Persia. If the offender be in the women's apartment, he comes out and submits to the execution. It is seldom, however, that they proceed capitally against a vizir or receiver of the king's revenue, as his extortion is usually represented to be of service to the government, and the displacing him is of as much advantage to the king, as the taking off his head.

The irrevocable laws of the ancient Medes and Persians are no longer known, having perished, it is probable, with the constitution to which they owed their existence. At present, in Persia, as in every Mahometan country, they have no other law but the Alcoran, and the comments of the ecclesiastics upon it. The priests enjoy the privilege of being judges in all cases, both civil and religious; but such as are criminal, the governors take upon them to decide, not however without this authority being protested against by the priesthood. In respect to the judgments of the king, or his viceroys, they are all arbitrary.

The law in cases of debt is extremely severe. If the debtor be unable to pay, he is delivered to the creditor to be dealt with as he shall determine; the latter having it in his power to sell him, with all his family, or make slaves of the whole, if he pleases.

All persons here plead their own cause, the women as well as the men; only the former are veiled, and have a particular part of the court assigned them to stand in. The principal business for which they appear before a judge, is to obtain a divorce. They usually ground their action on the impotence of their husband, and are always on those occasions exceeding clamorous.

There are no prisons in Persia; but when an offender is apprehended, he is carried to a magistrate's house, where he is confined till his trial, which generally takes place the same or the following day; when, if convicted, he is immediately executed by some of the magistrate's servants. But if the criminal has been guilty of murder, he is delivered to the relations of the deceased, to be tortured and executed in what manner they think fit; though there are instances of those who have committed murder obtaining a pardon, by bribing the judge, and giving a large sum to the other party.

For petty crimes, it is usual for men of substance to commute; but where the offender has not money to buy off the punishment, he is condemned to the bastinado; that is, to receive a certain number of blows on the soles of his feet; not less than thirty, or more than three hundred, by which it sometimes happens that they are rendered cripples for life. The best remedy in this case is said to be, to put the sufferer's feet into a hot horse-dunghill, and foment them afterwards with spirits of wine. House-breakers have their right hand cut off; coiners have the same punishment inflicted on them for the first offence, and for the second their bellies are ripped open; after which, they are dragged in this shocking manner through the principal streets of the town, the cryer going before them, and proclaiming the offence.

Other

Other punishments likewise are inflicted on capital offenders. One of those is tumbling them down from a tower, or steep precipice, which is usually the method of treating women who have been guilty of some extraordinary crime. Another is setting the convicted persons up to the neck in the ground, the sun beating upon their heads all day, and the flies and other insects tormenting them till they expire. To extort confession from a criminal, they sometimes have recourse to the rack, but the usual way of proceeding is by means of the bastinado.

Those punishments, however, are seldom inflicted, nor is it usual to hear of crimes which merit such terrible executions. Murders and robberies rarely occur in Persia, guards being placed on every road to prevent them, or apprehend offenders. Bakers and cooks have sometimes been baked or roasted alive, for defrauding people of their provisions by false weights; but for the most part, they are only fined or condemned to the bastinado.

The Persian forces are distinguished into the troops of the state, and the troops of the crown. The former, which consist of cavalry, are called *coofelashes*, or *redheads*, from the colour of their caps, and have lands appropriated to their subsistence. Their arms are bows and arrows, scimitars, lances, and poyards, with a hatchet, shield, and helmet. The troops of the crown are divided into two bodies, the first of which, amounting to twelve thousand, are called *musketeers*, from their carrying muskets, and fighting on foot, though they march on horseback like our dragoons. The other body consists of ten thousand horsemen armed likewise with muskets, and called *coulars* or *slaves*, from their great attachment to the crown. They are generally natives of Georgia, and the most personable men in the king's dominions. There is yet another body of a thousand men, of a large stature, who act as his majesty's guards. The soldiers are furnished with horses, arms, and all accoutrements by the crown; but they find themselves in cloaths, and neither they nor the servants of the court are obliged to wear a uniform dress.

The Persian troops being for the most part light-horse, march with great expedition, and frequently surprize their enemies with an unexpected attack. This celerity, and their fame as excellent marksmen, concur to render them exceeding formidable in the field; and what increases the terror they inspire, is that they yet retain the practice for which they were anciently celebrated, of molesting the enemy in their retreat, as much as in the onset. The quality of those troops compensates in great measure the defenceless state of the kingdom; there hardly being in it any fortified towns, and the people depending chiefly on their desarts, and the passes of the mountains for their security.

In respect of navigation, though the Persians have some good ports in the gulph of Bosphora, they have no ships of war, and scarce any merchant vessels. They formerly had some armed ships on the Caspian Sea, to defend themselves against invasions of the Cossacks and other Tartars, who sometimes carry

whole villages into slavery; but the Cossacks being now subject to the Russians, who have the sole navigation of the Caspian Sea, the Persians seem little exposed to the incursions of the former nation, while they are at peace with the latter.

The revenues of the crown of Persia are very considerable, and arise from various sources. As the king is proprietor of all the lands, he reserves a quit-rent on every estate, the tenant likewise, at the commencement or renewal of each lease, advancing one year's rent of the improved value. The king also has his demesne lands in every province, for which he receives of his tenants a third part of the nett profits. He has, besides, the seventh fleece, and a seventh of the breed of the cattle on other lands under pasture. The lands of the church, however, being accounted sacred, are subject to no tax. The customs or port-duties constitute another branch of the revenue. Every artificer and tradesman also pays a duty, except carpenters and other builders, who are obliged to work for the crown, whenever they are required. But the greatest part of the revenue arises from the annual presents every governor is obliged to make, and from the confiscations or seizures made of the estates of the great men, either at their death or before, especially of those of the principal eunuchs, who are extremely rapacious, and leave no relations that can pretend any right to their effects. To this general detail of the finances it is to be added, that every person, not of the established religion, pays a poll-tax annually of half a guinea a-head; and that the tax paid for water is also very considerable. It is computed that, one year with another, the revenue amounts to about five millions sterling, the expenditure of which centers chiefly in the court, as the maintenance of the greater part of the forces is defrayed out of the lands of the state.

The *haram* or *seraglio* is a word which signifies a place sacred, or prohibited to all men, but the sovereign or master of it, as is accounted this part of the palace in which the women are kept. These may be divided into three classes; first, the princesses, or daughters of some of their kings, who have the title of *begum*: secondly, those by whom the reigning monarch has any children; with whom he cohabits, who have the title of *canum*, equal to *cham* among the men: thirdly, the ladies whom he has not yet admitted to his bed, who are so numerous that he scarce knows their faces; these are styled *katun*, or barely ladies. There are besides a number of other females that attend the *seraglio* as slaves. None of the ladies are ever suffered to see any person of the other sex, who has attained to the age of puberty; for with respect to the eunuchs, they look upon them only as their jailors. There are many distinct houses and apartments within the limits of the *haram*; in one of which live the women, with whom any of the preceding kings have cohabited; so much secluded from the world, that they are hardly ever permitted to stir out.

The women's apartments in the royal *seraglio* are not only the most inaccessible, but the most elegant part of the palace; and several of the ladies have as

great

great a share in the concerns of the empire as the men; regulating the conduct of the great officers of state, whom they respectively patronise, and informing them of whatever is transacting.

As the princes, the sons or brothers of the Persian monarchs, grow up, the king usually gives them the choice of a wife among the virgins of the haram, or sometimes more than one, establishing at the same time his household, which consists chiefly of eunuchs and female slaves. But they are so closely confined in a distinct part of the haram, that, except with their mother, who sometimes retires with them, they are prohibited from all conversation with any other but the eunuchs, who perform the part of servants, but are in reality so many spies upon their conduct.

There is no where to be found a collection of more beautiful young women, than in the haram of the Mahometan princes. They have not only the choice of all who are made prisoners in war, but of those who are purchased in Georgia and Circassia. Besides, if any governor of a province or town has notice of any celebrated beauty in his government, he immediately sends her to court; which her parents are so far from thinking a hardship, that they consider the event as auspicious to the fortune of the family.

While the king is without children, every lady is ambitious of being the mother of the first son, by which she would obtain the title and power of a sultana, and her son might succeed to the throne. When the king, however, has sons, they never desire any children, but endeavour to procure abortion, as soon as they find themselves pregnant. The reason of which is, that they should live in perpetual apprehension of their offspring being murdered, or at least of having their eyes put out, to prevent them from being advanced to the throne, in prejudice of the eldest prince. The views therefore of the court ladies, whom the king has taken to his bed, are to be married to some governor or great officer. For this end, they endeavour to gain the favour of the queen-mother, or the reigning queen, on whose recommendation they are sometimes disposed of advantageously: or the ministers apply to the queen-mother, to bestow one of the virgins upon them; for none are allowed to touch any of the ladies with whom the king has ever been familiar.

Such ladies as are married to any of the great officers, are much happier than those they leave behind them in the seraglio. They have the government of all the rest of the wives and concubines, whom their husband may entertain, and are treated in almost every respect as queens. The husband finds it his interest to indulge them in all their pleasures; their own advancement and security depending very much on the representations those ladies make to the queen-mother, or the reigning queen, of their conduct. The women in the seraglio sometimes are so numerous, that it becomes expedient to marry them off, on account of the expense of their entertainment, where every one has her particular apartment, and a numerous train of servants to attend her.

Before any of the ladies visits another, she must obtain leave of her governante, who is placed about

her to watch her conduct, that no quarrels may arise amongst the rival mistresses in the haram. Some relate, that the reason of this caution is to prevent the ladies from carrying on an amour, and falling in love with each other, which is said to be an event not uncommon. According to the representation of the women who frequent the seraglio, and sell them toys, it is amazing to behold the proofs of this mutual passion, and the contrivances which are the consequences of it.

As the business of those ladies is chiefly to divert their lord, they sing, and dance, and play before him, or entertain him with sprightly conversation; but there is a necessity of his being extremely cautious in expressing a particular attachment to any of them. The appearance of such a predilection would immediately mark out the favourite as an object of jealousy; and notwithstanding the utmost care of the lover, he is almost incessantly perplexed with their plots to ruin each other. The king is never married, or contracted to any lady, but she that has the first son is the queen of the haram as long as he lives. Should he die, however, and the son of any other mistress become heir apparent to the crown, the honour is then transferred to the mother of the surviving offspring.

Amidst this numerous assembly of rival beauties, the situation of the monarch is far from being favourable either to enjoyment or repose. Considering him as their tyrant, rather than their lover, they submit to his gratification only from the dread of his power; while he never can experience the pleasure which arises from a consciousness of being beloved by the person whose mutual affection he most ardently wishes to obtain. Surrounded by flatterers and hypocrites of both sexes, he is equally a stranger to the delicacies of love, and the delights of friendship.

There are no mosques or chapels in the haram, or women's apartments. For as they exclude all terrestrial ladies from paradise, believing them to be made only for men's pleasure, and the continuance of the species, there can be no occasion for their resorting to temples, in order to prepare themselves for heaven. They are permitted, however, to lead an indolent and luxurious life, indulging themselves in every pleasure but liberty, and an agreeable companion, without which all the rest must prove insipid. It is the general opinion of the Mahometans, that in a future state they shall be accommodated with a race of celestial beauties, formed on purpose for their enjoyment; though some of the Persian doctors hold, that the women shall have a heaven to themselves.

The king's women never visit out of the palace, which, however, is open to the visits of their female relations. When he removes, he is always attended by some of the ladies; and a party of horse marches before the vehicles in which they are carried, crying out couruc, couruc, and firing their small arms to give notice of their approach. On those occasions, all men are required to remove from their habitations, in the towns through which the court is to pass; and it is death for any to be found within view of the road.

The

The eunuchs who guard the ladies, are usually castrated between seven and ten years of years of age; If delayed till the age of puberty, the operation is reckoned exceeding dangerous. Of this class of servants the king retains three or four thousand in Isfahan and other royal palaces. Every man of figure likewise keeps some of them in his family, where they act the part of stewards, as well as guardians of the females; and to such as are qualified, they commit the education of their children. There are both black and white eunuchs in Persia, but the former are most numerous, and the ugliest always preferred.

## C H A P. IV.

*Of the persons—habit—food—salutations—diversions—method of travelling—character of the Persians.*

THE Persians are of a moderate stature, well-proportioned, with good features and complexions, except in the southern provinces, where the latter is injured by the excessive heat. Their hair and eyes are black, and their heads shaved, unless in the middle, where a lock is suffered to grow. The bulk of the people cut their beards short; and the mollahs or priests wear them long, only cutting them into form; while the great men and the soldiers wear large whiskers only, and the natural robe of puberty never falls to be removed.

The men cover their heads with large turbants, of which some are very rich, having gold and silver flowers interwoven. Next their skins they wear a kind of shirt, made of silk or callico, but without collar or wristbands, and the sleeves fit close to their arms. Over the shirt is worn a waistcoat, above which is a loose coat, tied with a sash. They use drawers reaching down to the calf of the leg, with woollen stockings, not shaped to the limbs, and slippers with picked toes of Turkey leather.

Instead of a turbant the ladies wear a stiffened cap, resembling that of a grenadier, but much less. They also use a coat or vest, which reaches down to their feet. Their hair is braided and adorned with jewels, either natural or factitious. The married ladies tie their hair back, and bind round their temple a broad ribband, set with jewels, in the manner of a coronet; and both the married and single wear feathers in their caps. Esteeming large black eye-brows as a mark of beauty, they frequently have recourse to art for acquiring that accomplishment; and in the southern parts particularly, they likewise paint their faces. They wear jewels in their ears, and necklaces of pearl, which hang down gracefully, having a gold box fastened to them, containing rich perfumes.

Both men and women are expensive in their cloaths; their vests being generally made of rich flowered and brocaded silks; and an ordinary turbant will cost ten pounds. Their sashes, which are also brocaded, will sometimes cost a hundred crowns. In winter, the gentlemen often wear fables, a suit of which may amount to a hundred pounds. The furniture for their horses is also exceeding rich, the bits and stirrups being of silver, and the housings embroidered. No

No. 7.

people make a grander appearance abroad. They mount their horses with a splendid retinue, almost every day, should they ride but a quarter of a mile. On account of this extravagance in dress and equipage, however, they are generally extremely necessitous.

When they rise in the morning, they take a dish of coffee, and about eleven o'clock eat lemons or other fruit and sweet-meats, but their principal meal is in the evening. This often consists of a dish of pilau, made of rice and fowls, or mutton stewed. Sometimes the meat is baked or roasted, but always to an extreme degree. If instead of rice they eat bread, it is thin cakes, baked upon the hearth for present use. They in general abstain from the flesh of all the animals which the Jews were forbidden to eat; likewise eating no salt meat, and but very little salt to their meals; owing perhaps to their food being always highly seasoned in dressing. In towns, private people usually purchase meat ready dressed for their families at a cook's shop, and seldom dress any in their own houses. They take up the rice by handfuls, using no spoons except for milk or soup. They wash before and after eating, and their handkerchief serves instead of a towel. At their meals, they either sit cross-legged, on a cloth spread over the carpet, or loll upon cushions. They hospitably invite strangers to eat with them, and if any visitors be left, distribute it amongst their poor neighbours. The usual drink is water or sherbet, cooled with ice. Wine is seldom used by the Mahometans, but the Jews and every sect of Christians drink it here very plentifully. Instead of strong liquor the people of Persia chew opium, which, though it exhilarates a little at first, depresses the spirits soon after, and demands a repetition of the dose. After an elegant supper, it is usual to entertain the company with music and dancing, of which the latter is performed by courtizans.

The manner of salutation in Persia and other eastern countries is the very reverse of that in Europe; for the pulling off the cap or turbant is the greatest affront that can be offered to a superior, and they keep their heads covered even within the walls of their temples. They salute a friend by bringing the right hand to the breast, and inclining their bodies a little; but on coming into the presence of any of the royal family, they bow three times to the ground. It is their custom, to pull off their slippers, when they enter a temple, or a great man's house. In placing their guests at a visit or entertainment, as well as in walking or riding, the left hand is esteemed the most honourable.

The modern Persians are no less remarkable than the ancient, for dexterity in horsemanship and archery; and it is not unusual for the kings to be spectators at those exercises, from a gallery of the palace, which looks into the meydan or royal square, where a golden cup is set up to be shot at. The candidates for the prize ride full speed, and when they are a little passed the cup, without turning their horses or stopping, they bend their bodies to the right or left, and shoot at the object, which one or other of them seldom fail to strike down.

U

Their

Their principal sport, beside those exercises, is hunting, performed not by the scent, but with large greyhounds in sight, and with falcons. They even train leopards and other wild beasts to pursue the game.

This country being very mountainous, wheel-carriages are not used in travelling. Camels serve for performing a journey, as well as for transporting merchandise from one province to another. Gentlemen, however, ride chiefly on horses, though mules and asses also are frequently used, and in some respects are preferable, being sure-footed; besides that their asses are much nimbler, and of a larger size than ours. As to ladies of rank, they are carried in a vehicle resembling a close chair, one of which is hung on each side of a camel; and so contrived, that the travellers can neither see nor be seen by any person on the road.

Merchants and people of business frequently travel in caravans, consisting of five hundred, and sometimes a thousand camels, and other beasts of burden. They usually proceed on their journey at the rate of three miles an hour, and lodge at some caravansera, or, in defect of such accommodation, they pitch their tents, and sometimes lie in the open air, in the hot season; a guard or watch being set every night, for their protection from robbers and wild beasts.

There being no established posts in this country, for the conveyance of letters, great encouragement is given to persons who travel on foot, who are generally very expeditious, and reasonable in their demands. Those men are called shatirs, and it is usual for families of rank to keep a number of them in their retinue. The common shatirs ask no more than two shillings a-day, and will travel a thousand miles in twenty days with ease, carrying with them a bottle of water, and a little bag of provisions, which will last them about two days; and by that time they commonly arrive at some place where they can replenish their store.

The Persians are esteemed men of good natural parts, and benevolent dispositions. In behaviour they are polite and engaging, exceeding hospitable, far from being deficient in bravery, and tenacious of the principles of honour. If they seem to be actuated by avarice, it is a consequence of their extreme profusion in dress and equipage, by which many of them ruin their estates. In general, they are reckoned to be fair dealers, and treat foreigners with great openness and sincerity. Their indulgence in the love of women, so far from appearing to them blameable, is justified, if not even abetted, by the principles of the religion which they profess; but an unnatural passion for boys, to which they are said to have a propensity, reflects a disgrace on their character beyond the power of extenuation.

#### C H A P. V.

##### *Of religion—festivals—pilgrimages.*

**T**HOUGH the Persians profess the religion of Mahomet no less than the Turks, they differ considerably in their principles from those of that

nation; the latter following Abubeker, Omar, and Osman, and the former the comments of Hali. Such is the antipathy between those two sects, that, not content with the most rancorous hatred, they even curse each other in their prayers. Both parties, however, call themselves musselmens, or of the number of the faithful. They have two articles of faith, namely, that there is but one God; and that Mahomet is his prophet. The commandments of their religion are, to observe corporal purifications; to pray five times a-day; to give alms; to fast in the month Ramezan; and to go on pilgrimage to Mecca. To this system the Persians add another article of faith, viz. that Hali is the vicar of God.

By the first article, that there is but one God, they mean that there is but one person in the divine essence, in opposition to the Christian doctrine of a trinity. They hold that good works are neither the cause, nor the means of salvation, but only an evidence of the favour of God, and the man's being intended for happiness. They believe that all souls were created before the world was made; and some of them even maintain the Pythagorean doctrine of transmigration.

It is their opinion, that our bodies shall not be changed in any material circumstance at the resurrection, but that they will neither be deformed, nor subject to any infirmities. Some of their doctors reprobate the notion of eternal punishment, holding that after a certain time the wicked will be annihilated; and all concur in the belief, that there will be degrees of rewards and punishments, according as men have behaved. Some of them expect a sensual paradise, and that corporeal pleasures will be the reward of the virtuous; while others interpret such promises in an allegorical sense, holding that the happiness of heaven will consist in being employed about such objects as are proper for the soul, in an increase of knowledge, and the sublime operations of the understanding; and that the body also will have pleasures suitable to its nature, but which will not consist in meat and drink, or a gratification of the animal appetites. Others maintain on the contrary, that the joys of heaven consist entirely in sensual delights, but such as are far superior to those that are the portion of this life. As to the duration of the world, they believe that it shall not be dissolved at the last day, but changed and purified, and may be the habitation of blessed souls to all eternity.

The Persians call Hali the vicar or lieutenant of God, and exalt him sometimes above Mahomet. They hold that he was of a divine nature, that God was incarnate in Hali, and that it was by him that God created the universe.

They distinguish uncleanness into two kinds, the one absolutely sinful, such as the drinking wine and eating hog's flesh; the other, as only communicating a legal incapacity to the person defiled, so as he may not perform certain acts of religion until he is purified. They look upon prayers to be criminal that are offered up with unwashed hands. Being obliged to pray five times a-day, they are generally under the necessity of washing as often; because the variety of pollutions, accord-

according to their superstition, render it almost impossible to avoid defilement, during the intervals of their duty. There are two sorts of purification, for the performing of which certain rules and ceremonials are prescribed. One kind is called *wasfon*, whereby only the washing of the face, hands, and feet, are required; and this is to be observed after sleep, a swooning, fit, and every sensible evacuation of the body. The other purification is called *gassfil*, which consists in washing the whole body, and must take place before some extraordinary acts of devotion, on a pilgrimage, or in a time of fasting. To render those lustrations meritorious, they must be performed purely upon account of religion, without any design of pleasure or convenience; and the devotees are to express themselves in the following manner, viz. *I perform this act of purification to render my devotions acceptable to God, and that I may be fit to approach him.* In performing religious rites, no assistance must be received; neither is the person to make use of water that has been warmed by the fire or the sun, or of which any animal has recently drank; nor a vessel with any painting or imagery upon it. The water is also to be lifted up with the left hand, and poured into the palm of the right. The purification, called *gassfil*, is required after matrimonial embraces, defilement by the touch of a child-bed woman, or that of a dead body.

When wine is converted into vinegar, it is esteemed pure, as it no less is, if mulled or boiled away to a third, and in that condition it may be drank. If the child of a Christian be made prisoner, it is supposed immediately to become pure, by virtue of its master; but in other cases, the Persians think themselves as much defiled by the touch of an unbeliever, as by that of a hog or dog, both which they hold in abhorrence.

In respect to the stated times of prayer, the first hour is at noon; the second, from the time the sun is forty-five degrees above the horizon, till half the disk disappears; the third, when it is so dark that colours cannot be distinguished; the fourth, when they lie down to sleep; the fifth, in the morning, any time between the disappearing of the stars and noon. If by any extraordinary accident they should be prevented from praying at the appointed time, they may perform the duty afterwards, as soon as they have an opportunity. Those avocations give the Persians a pretext for retiring from company, when they think proper, without being thought rude. They never scruple telling the reason of their departure, and nobody ever importunes a man to stay, when he says he is going to his devotions.

The mollahs or priests proclaim the hour of prayer daily from the mosques, beginning with these words, *O God most great, which they repeat, turning their faces each time to one of the cardinal points.* They then proceed in this manner: *The testimony we render to God is, that there is no other God but God; Mahomet is the apostle of God; Hali is the vicar of God.* Having repeated those words four times, they add, *Arise, say your prayers, perform that most excellent duty, which Mahomet and Hali, the most perfect of created beings, have commanded.* They afterwards sing some passages of the Alcoran, and conclude, *Omar be cursed, who is*

*the great father of the Turkish sect.* The mollahs having ended this ceremony, every one gets up and says his prayers, either in his own house or elsewhere, but does not go to the mosque. They are taught that their prayers will not be acceptable, unless they be accompanied with attention of mind, the affection of the heart, faith, modesty, reverence, hope, and purity of body, and of every thing the petitioner touches, or with which he may be surrounded. He is likewise enjoined, on those occasions, to turn his face towards Mecca, and lift up his hands, prostrating himself on the earth at the same time. He must also put off his shoes or slippers, and all ornaments, nor have on him any cloaths made of furs, or the skins of any unclean beast; taking care likewise, that his face, feet, and hands, be washed, and that there be no pictures or images in the place. He carries with him a little carpet, in which are wrapped up the Alcoran, an earthen dish, a bead-roll, a pocket-glass, and a comb. Spreading the carpet, which it would be unlawful not to use, he sets himself upon it, with his face towards Mecca. He first sits down upon his heels, and ranges his apparatus; then takes his comb and glass, and combs his beard and whiskers. If he has any money in his purse, he lays it aside, as well as his seals and rings, from an opinion that they would render his prayers ineffectual. They have usually ninety-nine beads, made of clay that is esteemed holy, and each about the size of a pea. After the thirty-third bead, which marks the number of their prayers, they repeat the words, *O God most great*; at the end of the next thirty-three, *Glory to God*; and at the conclusion of the whole, *God be praised.* The small dish they carry with them, containing a portion of the same holy earth of which the beads are made, they set upon the floor, and bow down their bodies so as to touch it with their foreheads; an essential part of their devotion consisting in this ceremony. They perform their devotions separately, whether it be at home, in the temple, or any other place; and they never assemble together, as the Turks, for the purpose of offering up their prayers, either on their sabbath or any other day of the week, holding that no person has authority to pray or read the Alcoran to a congregation in the mosque, but an Iman (one of their patriarchs) or a descendant of them.

The Persian doctors recommend prayers for the dead, but without being enjoined by their religion. They do not pray to their saints, neither to Mahomet or Hali, as mediators to intercede for them; nor do they believe that the saints know what is done in this world, only as God may reveal it to them. They consider, however, the intercession of holy men upon earth as extremely efficacious, and therefore frequently hire their saints or hermits to offer up prayers for them; of which class of impostors there is a multitude in all Mahometan countries, who subsist upon the alms of the people, or rather extort money from them. For which purpose, when the ghostly terrors they endeavour to excite prove ineffectual, they have sometimes recourse to more violent means.

There are two sorts of alms in the country; the one established by law, and the other merely voluntary.

The former consist of a kind of tythes, of corn, cattle, money, and whatever the people possess, which is applied to charitable uses under the direction of the priests, who have for their maintenance certain lands and revenues appropriated to their respective temples. The voluntary contribution is applied to the support of the faquirs or begging friars, the redeeming of slaves rigorously treated, the relief of insolvent debtors, and strangers in distress, and to works of public advantage.

What the Persians understand by a fast, is a total abstinence from all nourishment and carnal enjoyment, from the break of day till night, with an intent to please God. The principal of this kind is that which is celebrated in the month Ramezan, and may properly be called their Lent. At the first appearance of the new moon, which introduces this season, the cryers belonging to the mosques proclaim it in great numbers, and a hymn is sung upon the occasion; the street being illuminated, the horns sounding, and the people expressing their joy by loud and universal acclamations. Immediately after they proceed to the baths, where they all wash themselves previously to the entering on their devotions.

During the fast of Ramezan, the cryers proclaim every evening, from the mosques, when the people are permitted to eat, which is when half the sun's disk is below the horizon. From this time, till the same hour next evening, the puritanical part of the people abstain religiously from food; but there are many spend the whole night in revelling, regardless of decency, and the offence which they may give to those of more rigid principles. In general, they spend a great part of this month in devotion; and though they do not scruple to engage in business, yet the Christians find more difficulty in transacting it with them at this season than at other times, especially towards evening, when their long fasting has rendered them peevish.

Besides that of Ramezan, the Persians have two other festivals; one of which is the commemoration of Abraham's sacrificing his son; and the other the death or martyrdom, as they call it, of Houssein and Hassen, two of the successors of Mahomet. Those at Ispahan, who observe the feast of the sacrifice, mount their horses early in the morning, and riding out of the city, sacrifice a sheep or a goat. Then returning to their houses, they cause a great number of the same kind of animals to be killed and distributed amongst the poor. There is one general sacrifice of a camel, at which the king is present. The victim being delivered to the populace by the king's officers, they adorn him with garlands, and lead him through the city, with the music playing before them, on the first day of the feast. This ceremony is repeated daily twelve times, during which the camel is attended by crowds, to the houses of all the chief men of the city, who throw money and distribute provisions among the people. He is afterwards led out to a field at some distance, whither the king with the crown upon his head, and the whole court repair. Here the camel being caused to kneel down, with his head towards

Mecca, and some prayers offered up by the priest, he is wounded with a lance by the derage or governor of the city; who at the same time prays, that God may shower down his blessings on the king and people. The camel's head is then cut off, and presented to the king; the rest of the body being distributed to the five great wards, into which the city is divided. A particular family in each ward has the privilege of keeping the sacred flesh, which is salted up, and preserved till the next anniversary of the festival, when it is cut into small pieces, and sent to the principal inhabitants, who entertain the populace on this solemn occasion.

The festival held in commemoration of Houssein and Hassen, lasts likewise twelve days, during which time altars are erected at every corner of the streets, with arms and trophies piled upon them. All the houses are illuminated at night, and in every quarter the priests harangue the people, on the history of Houssein, exhorting them to revenge his death upon his enemies, meaning the Turkish sect. At this time, it is extremely dangerous for a Turk to appear in public, the whole nation resounding with, *Curfed be Omar* (one of the Turkish patriarchs) *the great enemy of Hali*. In the midst of those frantic exclamations, the people often beat their breasts, and cry and howl like men in the most afflicting circumstances of distress; roaring forth at intervals, *Houssein! Houssein!* till they become almost unable to speak a word. The more to incite the fury of the populace against the Turks, many mournful pageants are carried through the streets, with the wounded bodies of Houssein and his friends, till the rage and resentment of the spectators is worked up to such a pitch of enthusiasm, as if the adored object of their superstitious veneration were perishing before their eyes. During the whole festival, people of fashion send for the priests to their houses, to hear the tale of Houssein and Hassen repeated, for which they make them handsome presents. People of all ranks are extremely charitable at this time; and the king daily entertains four or five thousand persons who follow the procession.

The Mahometans consider it as a duty, to go once in their life in pilgrimage to Mecca, where their prophet was born, and to the kebba or house of God at that place. In performing this superstitious journey, they are frequently so much harassed with the exactions imposed by the Arabians, for the privilege of passing through their territories, that the Persian doctors have declared there is no necessity of making those pilgrimages in person, but that they may be performed by a deputy; since which time, numbers of people get a comfortable subsistence by that office. This method of employing a substitute is likewise by far the cheapest, especially to persons of rank. The common fare of those deputies is only about fifty pounds sterling; but such an expedition is seldom made in person under two hundred pounds, and sometimes a thousand.

When a Persian dies, who has not performed this pilgrimage by himself, or by proxy, the *cadi* (an ecclesiastical magistrate) seizes on as much of his effects, as the expence of the journey would have amounted to, and employs it in sending a person to Mecca, for the

good

good of the dead man's soul; but artificers and the lower class of the people are not required to perform the journey. The whole pilgrimage, especially if they visit the prophet's tomb at Medina, does not take up less than a year. Those who have performed it are in great honour amongst their countrymen when they return, and have the epithet *Hadji* added to their names.

Notwithstanding the extreme superstition of the Persians, they are avowed enemies to intolerance in religious matters. They treat with great humanity even the Gaur, the worshippers of fire, who were the original inhabitants of the country, and are still spread over it. This people, conformably to the principles of Zoroaster, the founder of their sect, maintain that the most meritorious actions which men can perform, are planting, sowing, and propagating their species; and to the general influence of those principles on the practice of the ancient Persians, we may ascribe the great fertility and populousness of the country in former times. The Gaur are an inoffensive people, and permitted by the Persian government to enjoy their own laws and customs, civil and religious. They acknowledge one Supreme Being, the creator and first cause of all things. It has however been said, that they profess this opinion only to keep fair with the Mahometans, it being inconsistent with an article of their belief, respecting the existence of two other beings or intelligences, one the author of all good, and the other of all evil. They also believe that the stars are animated, and have the direction of human affairs. They pay adoration to all the planets, particularly the sun and moon, and likewise to the fire, as to the representation of the deity. They believe that the sacred fire has continued burning in Persia between three and four thousand years, and pretend that it is preserved on a mountain near the city of Yezd, where their principal temple is erected. Their tradition is, that the fire was brought from heaven by Zoroaster, who they believe will return to the earth, and restore their ancient government.

Such is the account which the generality of travellers have given of the everlasting fire; but the story of its preservation is equally fabulous with that of its chimerical origin.

As the language and character of the Gaur are understood by no other people, it is difficult to obtain a perfect knowledge of their progress in speculative enquiries. We may however conclude from their manner of life, which seems to be spent entirely either in the cultivation of the lands which they occupy, or in mechanical employments, that they are totally destitute of learning; and in this situation they are likely to continue, so long as they retain not only an aversion to foreign commerce, but to mixing with people of another faith. They wear their hair and beards long, with a close vest, and hats not unlike those of Europe. They do not scruple the drinking of wine, or eating any kind of meat but beef. Every man is confined to one wife, from whom he cannot be divorced, unless she has been barren nine years; and none are permitted to keep a concubine.

No. 7.

The religion of the Armenians, who are very numerous in Persia, bears a great affinity to that of the Greek church. The exercise of it is not only tolerated, but their patriarchs, archbishops, and bishops are confirmed, and sometimes appointed by the Persian government; for which the great men who prefer them expect a handsome present.

The Armenians seem to believe the doctrine of transubstantiation, but not that of purgatory; though they believe that good men, after death, remain in a state where they know no other joy before the resurrection, but the consciousness of a well spent life, and the expectation of the rewards annexed to it. They administer extreme unction, and in baptism the trine immersion, after which the child is anointed with their holy oil. Their fasts take up one half of the year, at which times they abstain from flesh and fish, and neither clergy nor laity taste any food till the evening.

One of their most solemn festivals is the baptism of the cross, in memory of the baptism of our saviour; at which time the Mahometans as well as Christians assist in crowds, and the king is sometimes present at it. The Armenian bishops and clergy go in procession to some river or grand reservoir, with a cross carried before them; and after some prayers being read suitable to the occasion, and some anthems sung, the bishops plunge the cross into the water several times; every one endeavouring to get near enough to be sprinkled with the water, which is supposed to convey spiritual privileges equal at least to those of baptism.

There are likewise a people in Persia named St. John's Christians, whose religion is a mixture of Christianity, Judaism, and Mahometanism, and who have received their title only from their great veneration for the cross. They hold that God is material; that the angels are of both sexes; that the next state will differ from the present, only in being infinitely more perfect and agreeable; and that all of their own persuasion, after being purified from their sins, will enjoy eternal happiness. The priesthood amongst them is hereditary. Before they enter the state of matrimony, the priests and the relations of the intended bride visit the lady, and require of her an oath that she is a virgin. But not satisfied with this enquiry, the priest's wife is sent to inspect her, when, if she be declared a maid, the priest baptizes both parties, and the nuptial ceremony is performed; after which he casts lots, to know the critical hour for consummation. This likewise having taken place, the bridegroom waits on the bishop, and informs him of the tokens respecting his spouse's virginity. If the declaration of the husband coincides with the proofs which had formerly been taken, she is henceforth reputed virtuous; but if otherwise, she bears the character of a courtesan.

It is computed that there are not less than twenty thousand families of Jews in Persia, who are tolerated in the profession of their religion. They were formerly a rich people, being the principal usurers in the kingdom; but the Banians of India have succeeded them in this business, and they are at present but little regarded. Many of them are artificers, while others pretend to magic, and to tell fortunes; and their

their women, who supply the ladies of the harems with toys, frequently insinuate themselves into their favour by their predictions, and the love potions which they pretend to prepare.

#### C H A P. VI.

*Of language — sciences — arts — marriage — divorce — funerals — mourning.*

THE modern Persians being descended from the Arabs, their language bears a great resemblance to that of their ancestors. They have twenty eight letters in their alphabet, of the Arabic character, all consonants: the accents are properly their vowels, by which their consonants are founded. They use no stops, commas, or paragraphs, in their books; but begin every sentence with a large letter. The Turkish language is now spoken at court; but it is in the Arabic that the Alcoran and most of their books are written. They have not yet received the art of printing. Their paper is made of silk and cotton rag, extremely thin, and bears but on one side; and instead of goose-quills, they make their pens of reeds. They write from the right hand to the left, and entertain a superstitious reverence for the paper on which any characters are inscribed; esteeming it a crime to burn or tear any manuscript, much more to put it to any dirty use, lest the name of God, Mahomet, or some saint or patriarch, should be written upon it. Even paper on which there is no writing, they hold ought not to be defiled, being intended for recording the precepts of their religion, or for other useful purposes.

Judicial astrology continues to be a favourite study of the Persians, as well as in the times of the ancient Magi. The professors of this science at present are all natives of Bactria, the modern Chorassan, and are exceeding numerous. Some thousands of them are constantly retained in the pay of the crown, who, it is said, share amongst them annually a revenue of four hundred thousand pounds. The salary of the chief astrologer is valued at ten thousand pounds a year; and besides this establishment, the king usually makes them presents amounting to two hundred thousand pounds.

The principal men of the order always attend the king's person, to inform him of the lucky and unlucky moments when any thing is to be transacted. They are consulted not only in matters of importance, but in those of the most frivolous nature; as when it may be proper for his majesty to go abroad, or enter the women's apartment; descending even to specify the particular hour at which he ought to eat.

In delivering a prediction, it is usual for them, like the other oracles of old, to use doubtful and ambiguous expressions, by which means, whatever may be the event, they generally have the address to preserve themselves from the imputation of ignorance or falsehood. Nor is the practice of this policy a difficult matter at court. For having a great share in the administration, they are able to judge with a degree of certainty, what occurrences are likely to happen. But

exclusive of this circumstance, the superstitious regard that is paid to their predictions, is sufficient in most cases to insure the accomplishment of them; though there is reason to think that, by the princes, they are used rather as engines of state, than as persons really endowed with the spirit of prophecy. They have their offices in all the great towns in Persia, particularly the capital, where they work upon the folly and superstition of the people, whom they govern according to their own inclination, or the secret instructions of the court.

Next to judicial astrology, they affect to cultivate astronomy, arithmetic, geometry, natural and moral philosophy, and the knowledge of the Alcoran. They begin their year at the vernal equinox, when the astronomers are employed to make an exact observation of the moment at which the sun enters Aries. At this season, the great officers of state and governors wait on the king with congratulations, and wishes for a happy year; offering at the same time a handsome present, which is likewise sent by those governors who live at a distance. Their epocha begins with the hejira, or Mahomet's flight from Mecca to Medina, which happened in the year of the Christian æra 622. Their week begins on Saturday, conformably to the practice of other Mahometans, and therefore their sabbath falls on Friday. Until the Europeans furnished them with clocks and watches, they had no other measure for time than a bowl with a hole in it; which being put into a tub of water, it gradually sunk to the bottom in three hours, after which the operation was repeated.

Physicians are as much esteemed in this country as astrologers, and their fees are extravagantly large. Those two bodies of men are constantly at variance. When the physician has prescribed a medicine, the astrologer is to assign the proper hour for the patient to take it; and if it has not the desired effect, there never fails to ensue an altercation, respecting the cause of its miscarriage; the one imputing this event to an error of calculation, and the other recriminating on the medical ignorance of his rival. The physicians here pretend to understand the nature of the patient's complaint by feeling his pulse, as in China; but in the disorders of women, it is not unusual to deliver their opinion without making any enquiry on this head. If the physician, however, should think proper to insist on such an examination, a curtain must be drawn between him and the female, and her hand must be covered with a piece of crape or fine linen. They seldom bleed in a fever, which is the common disease of the country, contenting themselves with only giving emulsions of the cold seeds. They abstain from the use of clysters, as being inconsistent with modesty, but consult, as in other countries, the natural discharges of the body. The professions of physician and apothecary are centered in the same persons. For the first visit they are allowed the value of two guineas, and on every succeeding occasion, the half of that sum. Both they and the surgeons are entirely ignorant of anatomy; and in respect to those of the latter profession, they have here but little business; the tempera-

Besides fevers, to which the Persians are chiefly exposed, the cholick, dysentery, and dropsy, are diseases frequent amongst them; the latter of which is imputed to the immoderate use of a cooling regimen in febrile disorders. For the cholick they usually prescribe burning and cauterizing, and for the dysentery rice-gruel, and milk boiled with rice till it is dry. The plague seldom visits Persia, though Turkey and India, the contiguous countries on the east and west, are much exposed to its ravages. The gout, stone, and scurvy, are likewise exceeding rare, but near the Caspian Sea the yellow jaundice is very common; and the French-pox, though not so violent as in Europe, is extremely frequent in all the provinces of the kingdom.

The warm bath is here used in almost every distemper. At day-break, a servant announces, by the sound of a horn, from the roof of the bagnio, that it is ready, when immediately the men assemble, who may perhaps continue to occupy it successively till four in the afternoon. The male servants then retiring, the women come dressed as fine as possible; this being the only opportunity they have of showing their cloaths. Men of figure have baths in their own houses, as some others also have, and let them out to strangers after their own families have been accommodated.

Sculpture and painting are at present very little cultivated in Persia, though it appears from the ruins of Persepolis and other ancient buildings, that in former times the inhabitants were extremely conversant with the practice of the liberal arts. The same reason that promoted the advancement of painting in Europe, seems amongst the Persians to have proved the cause of its decline, as well as that of sculpture. They are prohibited by their religion from introducing either pictures or images into their temples; and some of their puritanical doctors preach against the forming an image or picture of any animal whatever; every such representation being, according to them, a species of idolatry.

Notwithstanding the disregard of the Persians to the arts of painting and sculpture, they are extremely attached to poetry. Every man of figure retains in his family a poet, who produces his compositions when his patron makes any entertainment; and there hardly is a place of public resort, where you may not meet with several competitors of this class, who vie with each other in exhibiting proofs of their genius. The Persians are reputed to be greater proficient in poetry than in any other branch of learning; their imagination being fruitful and lively, and their language having a softness peculiarly adapted to the harmony of versification. They are so fond of rhyme, in which they are much nicer than in their numbers, that they generally mix it with all their prose compositions, and even frequently introduce it in their conversation. Their style is for the most part highly figurative and hyperbolic, discovering all that warmth of fancy and

abruptness of transition, which distinguish the oriental manner of writing from that of the nations of Europe. As a specimen of their poetry, the following prose translation of a ghazel, or Persian ode, is submitted to the reader. The original was written by Mahomed Shemseddin, commonly called Hafes, who lived in the fourteenth century.

"Ho! come! O cup-bearer, carry round the wine, and present it; for love appeared pleasant at first, but difficulties have since happened.

"In hopes of the perfume which at length the zephyr shall diffuse from that forehead,

"From her waving musky ringlets, how much blood will flow into our hearts.

"Stain the sacred carpet with wine, if the master of the house commands thee;

"For a traveller is not ignorant of the ways and manners of houses of entertainment.

"For me what room is there for pleasure in the bowers of beauty, when every moment

"The bell proclaims, "Bind on your burdens."

"The darkness of the night and the fear of the waves and whirlpool are so dreadful,

"How can they know our situation, the bearers of light burdens on the shore?

"All my voluntary actions have tended finally to procure me a bad name;

"For how can that secret remain concealed, of which they make conversation?

"If thou desirest tranquillity, neglect not this advice, O Hafes,

"When thou shalt possess her thou lovest, bid adieu to the world, and abandon it."

Of the merit of this ode a more exact judgement may be formed, from the subsequent paraphrase; in which, without deviating from the sense or sentiment of the original, a kind of connected whole is made out of a number of apparently disjointed parts.

"Fill, fill the cup with sparkling wine,  
Deep let me drink the juice divine,

To soothe my tortur'd heart:

For love, who seem'd at first so mild,

So gently look'd, so gaily smil'd;

Here deep has plung'd his dart.

When, sweeter than the damask rose,

From Letia's locks the zephyr blows,

How glows my keen desire!

I chide the wanton gale's delay;

I'm jealous of his am'rous play,

And all my soul's on fire.

To love the flowing goblet drain,

With wine the sacred carpet stain,

If your gay host invites;

For he, who treads the mazy round

Of mighty love's enchanted ground,

Knows all his laws and rites.

But longer, 'midst the young and fair,

With happy mind and easy air,

Can I delighted roam?

When, hark! the heart-alarms bell

Proclaims aloud, with dismal knell,

Depart, thy hour is come!

The night now darkens all around,  
 Now howl the winds, the waves rebound;  
 We part to meet no more:  
 Our dreadful fate how can they know,  
 Whose tranquil hours unruffled flow  
 Secure upon the shore?  
 How many tales does slander frame,  
 And rumour whisper 'gainst my fame;  
 With malice both combine:  
 Because I wish to pass my days,  
 Despising what each snarler says,  
 With friendship, love, and wine.  
 But, Hafez, if thou wouldst enjoy,  
 Ecstatic rapture, soul-felt joy,  
 Blest as the powers above,  
 Snatch to thy arms the blooming maid,  
 Then, on her charming bosom laid,  
 Abandon all for love."

The music of the Persians is not equal to their verse. They never sing in parts, but alternately, or one after another, and generally to an instrument not unlike the lute. Singing and dancing are not looked upon as creditable employments, nor will people of fashion suffer their children to learn either; but for the most part they retain bands of music, consisting of both sexes, who make it their profession, and entertain the company at festivals, and other joyful occasions.

In all the great towns of Persia there are public schools, where boys are instructed in the Arabic, and arithmetic, whence they are removed to the medres or colleges, to acquire the sciences, as they are taught, and the principles of their religion. In some places the youth are instructed by gentlemen of distinction, discarded courtiers, and others, who perform the office gratis, with the view of recovering a lost reputation; nothing being considered as a proof of greater generosity than devoting their attention in this manner to the service of the public.

The Persians never seeing their wives till the day of marriage, an ambassadress is commissioned to take a view of the intended bride, and make a faithful report with respect to her person and circumstances. When a contract of marriage is made, it is registered before the civil magistrate, without going to the temple; and the bridegroom sends the bride a habit, with jewels and ornaments suitable to his rank and situation. Next day, towards evening, he mounts his horse richly accoutred; and attended by his friends, and a band of music, proceeds to the house of the bride's father, on the way to which he is met by her, with a similar train of attendants, but is veiled, that her face is not seen. The companies being joined, they march to the bridegroom's house with lighted flambeaux, drums, trumpets, and music playing before them. At their arrival, the bride is introduced to the apartment intended for her, to which the husband soon follows, who is now for the first time favoured with a view of her person.

The Persians are in no haste to marry their sons, but furnish them with female slaves, till advantageous matches may occur. Love is the smallest inducement

to the entering into a contract of marriage, especially among people of fashion, who are generally governed in this case by mercenary motives. According to their law, every man is permitted to have four wives by contract; but they seldom have more than one, and she is often taken for no other purpose than to be a governess to her husband's women, who are in reality her servants, though they be admitted to their master's bed, and their children are deemed as legitimate as the issue of the wife by contract. There is no such thing as a bastard; and the offspring of a concubine or slave has an equal share with any other child in the estate and effects of the father. The age of marriage in Persia, is nine years for the girls, and thirteen for the boys.

Divorces are easily obtained, where both parties are equally disposed to a separation. The chief causes on either side are a violation of the conjugal engagement, on the part of the wife by unchastity, and on that of the husband by spending his time chiefly with his concubines, or by impotency. Upon a divorce, the wife is entitled to the dower contracted for at her marriage, when it was not through any fault committed by her, that the privilege of repudiation was granted; and in this case, after her death, the estate descends to her children.

When a man appears to be dying, they set up lights, and kindle fires on the terrace of the house, as a signal to passengers and their neighbours to pray for him; and the mollah or priest being sent for, he exhorts the dying person to repent of his sins. The latter having said, *taube*, I repent, repeats after the mollah the following creed. "I believe there is but one only God, who has neither companion nor equal, and that Mahomet is his prophet. I likewise believe Haly and the other eleven Imams are the true successors of Mahomet, and as I have lived in this faith, so shall I die in it." When the person expires, the relations and friends set up a dismal howl, rend their cloaths, tear their hair, beat their breasts, and behave themselves like people in the utmost agonies of sorrow; intermingling their complaints with the most tender expressions to the dead body, as if it were sensible of their grief. The corpse is afterwards wrapped in a winding-sheet, on which are written some passages out of the Alcoran. If the burying ground is near, the body is carried thither without any coffin, preceded by the ensigns of the mosque, with the horses, turbant, and arms of the deceased. The office of bearing the corpse to the interment is not performed by any particular class of men. Every one of the company offers their service; and if a person of quality happens to meet a funeral, he will alight from his horse, to assist in carrying the bier; this being esteemed an act of piety by the Persians. They do not bury in their mosques or temples, but usually by the road-side. When a person of figure is buried, an arch is erected on that side of the tomb next Mecca, and the face of the corpse laid the same way. They imagine that the soul reanimates the body soon after it is deposited in the tomb, and is examined by an angel concerning his faith, and the actions of his life.

When a corpse is to be buried at a distance, it is put in a coffin filled with salt, lime, and perfumes, which serve instead of embalming.

Nine or ten days after the interment, the relations and friends visit the tomb, carrying with them cakes, sweet-meats, and fruits, where they again weep, and renew their addresses to the deceased, from an opinion that this expression of their grief is acceptable to the angels, who are supposed to guard the sepulchre.

During the forty days prescribed for mourning, they wear a torn and neglected dress; but never of black, which they esteem the devil's colour. When the time is expired they bathe, previous to resuming their usual habits.

## C H A P. VII.

*History of Persia.*

**D**URING many centuries the history of this country is involved in that of the first monarchy, known by the name of the Assyrian empire, of which it is agreed by all historians that Persia constituted a part. The account of the most ancient sovereigns of this empire, however, is warped with so many particulars of a doubtful and romantic nature, that the credibility of it must appear extremely questionable; and therefore, passing over the fabulous period, which includes, amongst others, the reigns of Belus, Semiramis, and Ninus, we shall begin our narrative with Sardanapalus, the last prince of the first dynasty, and who flourished about the year of the world 3237.

This weak and unwarlike monarch is said to have surpassed all his predecessors in effeminacy, luxury, and cowardice. He never went out of his palace, but spent all his time amongst women; dressed and painted like them, and employed himself like them at the distaff. He placed all his happiness and glory in the possession of immense treasures, in feasting, rioting, and indulging in all the most infamous and criminal pleasures. Falling at last a sacrifice to his voluptuousness, at his death he ordered two verses to be inscribed on his tomb, importing that he had carried with him what he had eaten, and the pleasures he had enjoyed; but left all the rest behind him; an epitaph, says Aristotle, fit for a hog.

“Hæc habeo quæ edi, quæque exaturata libido

Hauit: at illa jacent multa & præclara relicta.”

The story of his death is thus related: Arbaces, governor of Media, having found means to get into the palace, and being convinced by his own eyes of the dissolute manners of the prince, was so struck with indignation at his effeminacy, that he formed a conspiracy against him; in which he was joined by several others, among whom was Belesis, governor of Babylon. On the first rumour of the revolt, the king hid himself in the inmost part of the palace; but being afterwards driven to take the field, with some forces that had assembled in his defence, he was overcome and pursued to the gates of Nineveh; where he shut himself up, in hopes that, as the city was well stored with provisions, the rebels would not entertain the resolution of forcing a surrender of the place.

No. 8.

He was farther bouyed up in this expectation, for some time, by an ancient oracle, which had declared that Nineveh could never be taken, until the Tigris should become its enemy; an event which he considered as impossible. In the progress of the siege, however, observing that the river, by a violent inundation, had thrown down twenty stadia of the city-wall, and opened a passage to the enemy, he is said to have understood the meaning of the oracle, and abandoned all hope of success. But resolving to distinguish his effeminate life by one act of fortitude, he ordered that in his palace a pile of wood should be erected, with which he burnt his women, his eunuchs, his treasures, and himself. According to Athenæus, those treasures amounted to a thousand myriads of talents of gold, and to ten times as many talents of silver; a sum which exceeds credibility.

Nineveh, or Ninus, appears at this time to have been in a very flourishing condition. By the prophet Jonas it is called an exceeding great city, of three days journey; and, according to Diodorus, it measured in circumference four hundred and eighty stadia, or sixty miles. The walls of it are said to have been a hundred foot high, and of so considerable thickness, that three chariots might go a-breast upon them with ease. They were fortified and adorned with fifteen hundred towers, two hundred foot high. It was overthrown by the Medes, as had been foretold by the prophet Nahum. We are informed by Lucian, that not the smallest trace of it remained in his time; but this cannot be reconciled with Tacitus and Ammian, unless upon the supposition that another Ninus arose from the ruins of the old, extant in the time of the Romans.

At the death of Sardanapalus, the conspirators divided amongst them the extensive dominions which he had possessed. Arbaces usurped the government of Media and Persia, Belochus, or Phul, assumed that of Babylon and Chaldea, Ninus reigned in Nineveh and the adjacent country; and the others took possession respectively of the rest of the provinces of the Assyrian empire. But though the monarchy was thus dismembered, a mutual connexion prevailed for ages, in the history of the several provinces of which it had been composed. Of Arbaces and his immediate successors, we meet with no account in the imperfect records of those times. It appears, however, that Belochus is the same as Nabonassar, from whose reign began the famous astronomical epochs at Babylon, called from him the æra of Nabonassar; and that Ninus was likewise distinguished by the name of Tiglath Pileser.

Ahaz, king of Judah, being attacked by the kings of Syria and Israel, robbed the temple of part of its treasure, which he sent to Tiglath Pileser, king of Nineveh, to purchase his assistance against the invaders; promising at the same time to become his vassal, and pay him tribute. The king of Nineveh finding so favourable an opportunity of adding Syria and Palestine to his empire, readily accepted the proposal, and, advancing with a numerous army, defeated Rezin, king of Syria, and made himself master of Damascus. The immediate protection, however, which Ahaz derived from this resource, proved soon after injurious

Y

to

to his interest, as well as to the security of his kingdom; not only by the immense sum exacted for this service, but by bringing into this neighbourhood such powerful princes as those of Nineveh, Sabacus the Ethiopian, having made himself master of Egypt, Hofea, king of Samaria, entered into an alliance with him, in the hope of being thereby enabled to shake off the Assyrian yoke. To this end, he disclaimed all dependence on the crown of Nineveh, which had been admitted by his predecessor, and refused either to pay tribute any longer to Salmanasar, or make him the usual presents. The latter, to punish him for his presumption, marched against him with a powerful army; and after having subdued all the plain country, shut him up in Samaria, where he kept him closely besieged for three years, at the end of which time he took the city. Loading Hofea with chains, he threw him into prison for the remainder of his life, and carried his people into captivity.

Salmanasar was succeeded on the throne by his son Sennacherib, who renewed the demand of the tribute exacted by his father from Hezekiah; and in consequence of a refusal, invaded Judea with a numerous army. Hezekiah, grieved to see the devastation of his kingdom, sent ambassadors to him, to desire peace upon any terms he should prescribe. Sennacherib, apparently mollified, entered into a treaty with him, and demanded a large sum of gold and silver. After the most perfect compliance with his requisition, however, and in violation of the most solemn engagement, he continued to pursue the vanquished prince with unremitting hostilities. He was now master of all the fortified places in Judah, except Jerusalem, which likewise was reduced to great extremity, when receiving intelligence that Tirhahah, king of Ethiopia, who had joined his forces with the king of Egypt, was coming to the succour of the besieged city, he immediately marched to give them battle; previously writing to Hezekiah a letter, full of blasphemy against the God of Israel. Having defeated the Egyptians, he pursued them into their own country, and made many prisoners of war. He afterwards laid siege to Jerusalem, but losing in one night a hundred and eighty-five thousand of his army, by the sword of a destroying angel, he returned with the remnant to his own country, covered with shame and confusion. After many acts of the most barbarous cruelty and oppression, his savage temper became at length so intolerable, even to those of his own family, that his two eldest sons, uniting in conspiracy, killed him in the temple, as he lay prostrate before Nisroch his god. Those two princes, however, being obliged, after this parricide, to fly into Armenia, left the kingdom to Esarhaddon, their youngest brother. At this time, the royal family of Babylon becoming extinct, there was an inter-regnum of eight years, full of intestine commotions, of which Esarhaddon taking advantage, made himself master of Babylon, and annexing it to his former dominions, reigned over them for thirteen years. After re-uniting Syria and Palestine to the Assyrian empire, from which they had been torn in the preceding reign, he entered

the land of Israel, and made many of the inhabitants captive. He next sent a part of his army into Judea, to reduce that country likewise under his subjection. In this enterprize, his generals defeated Manasseh, and brought him prisoner to Esarhaddon, who put him in chains, and carried him in captivity to Babylon; permitting him, however, afterwards to return to Judea.

Esarhaddon, after a prosperous reign of thirty-nine years over the Assyrians, and thirteen over the Babylonians, was succeeded by his son Sardanapalus. This prince, otherwise called Nebuchadonosor, or Nebuchadnezzar, the common appellation of the kings of Babylon; and to distinguish him from others, was denominated Nebuchadonosor the First. He was succeeded by his son Saracus, against whom Nabopolassar, the general of his armies, raised a rebellion, and possessed himself of the province of Babylon, over which he reigned twenty-one years; and then entering into an alliance with Cyaxares, king of the Medes, they united their forces, and invested Nineveh. Saracus being killed during the siege, and the place entirely destroyed, the city of Babylon became the capital of the Assyrian empire, of which Nabopolassar was acknowledged sovereign. The greatness of this prince alarming the neighbouring powers, they entered into alliance against him and Cyaxares his confederate. Necho, king of Egypt, with the army of the allies, subdued Syria and Palestine; and advancing to the Euphrates, besieged and took Carchemish. On this event, Nabopolassar, now grown old, associated his son Nebuchadnezzar with him in the government, and sent him with a formidable army to oppose Necho, whom he defeated near the Euphrates, and retook Carchemish. Marching afterwards to Syria and Palestine, he reunited those provinces under his dominion; and likewise entering Judea, besieged and took Jerusalem. He caused king Jehoiakim to be put in irons, with the view of carrying him to Babylon, but being moved with his affliction, restored him to his throne. Some of the children of the royal family, however, with a great number of Jews, were carried captives to Babylon; whither all the treasures of the king's palace, and a part of the sacred vessels of the temple, were likewise transported.

From this epocha, which was the fourth year of Jehoiachim, is to be dated the memorable captivity of the Jews at Babylon; in which was involved the prophet Daniel, then eighteen years old, as was likewise soon afterwards Ezekiel. About a year from this period died Nabopolassar, king of Babylon, after a reign of twenty-one years. As soon as the news of his death had reached Nebuchadnezzar, he set out with all expedition for the capital, attended only by a small retinue, leaving the bulk of his army, with the captives, to be conducted to Babylon after him. In the fourth year of his reign he had a dream, at which he was greatly terrified, though he could not call it to mind. Requiring, therefore, of the wise men and diviners of his kingdom, that they should make known to him the substance of his dream, they answered that such a problem was beyond the reach of their art, and that the utmost they could do was to give the interpretation of

his

his dream, as soon as he should relate it. Nebuchadnezzar, imagining they dealt with him insincerely, fell into a violent rage, and condemned them all to death; Daniel and his three companions being included in the sentence, as ranked in the number of wife men. Daniel, however, obtaining at his request an audience of the king, revealed to him the substance of his dream; the consequence of which was, that Nebuchadnezzar not only acknowledged a belief in the God of the Israelites, but promoted Daniel to the highest offices in the kingdom, as well as conferred honours on his three friends.

At this time, Jehoikim revolting from the king of Babylon, the generals of the latter, that remained in Judea, marched against him, and laying waste the country, killed, as was imagined, the king in a skirmish. His son Jehonias mounting the throne, was besieged by the Assyrians in Jerusalem, till Nebuchadnezzar, soon after arriving in the camp, made himself master of the city. He plundered both the temple and the king's palace of their treasures, which he sent to Babylon; carrying away likewise a vast number of captives, amongst whom were Jehonias, his mother, and his wives, with all the great officers and principal persons of his kingdom; placing on the throne, in the room of Jehonias, his uncle Mattaniah otherwise called Zedekiah. This prince, however, entering soon afterwards into an alliance with the king of Egypt, broke the oath of fidelity which he had taken to Nebuchadnezzar, who upon the intelligence of this event, again laid siege to Jerusalem. The arrival of the king of Egypt, at the head of an army, gave the besieged some hopes of success; but after the defeat of the Egyptians and an obstinate siege, which lasted almost a twelvemonth, the city was taken by storm, and a terrible slaughter ensued. Zedekiah's two sons were, by order of the conqueror, killed before their father's face, with all the nobility and principal men of Judah; and the miserable king himself, after his eyes being put out, was loaded with chains, and carried to Babylon, where he was confined in a prison during the remainder of his life. The city and temple were burnt, and all the fortifications demolished.

Nebuchadnezzar, returning to Babylon after this unsuccessful war, ordered a golden statue to be made, sixty cubits high, which he commanded all his subjects to worship, threatening to cast those who should refuse into a burning furnace. On this occasion, the three young Hebrews, Ananias, Misael, and Azarias, who with invincible courage persisted in refusing to comply with the king's impious ordinance, were preserved in the midst of the flames, by a miraculous interposition of Providence. Nebuchadnezzar being a witness of this astonishing transaction, published an edict, by which all persons were forbid, upon pain of death, to speak any thing against the God of Ananias, Misael, and Azarias, promoting likewise those three young men to the highest honours and employments.

In the twenty-first year of his reign, and the fourth of the destruction of Jerusalem, Nebuchadnezzar marched again into Syria, and besieged Tyre, at the time when the reins of government were in the hands

of Ithobal. For thirteen years, this city resisted the most determined efforts of the whole Babylonish power; and when reduced to the last extremity, the inhabitants retired, with the greatest part of their effects, into a neighbouring island, half a mile from the shore, where they built a new city, the glory of which extinguished the remembrance of the old one, henceforward a mere village, retaining the name of *Ancient Tyre*.

Tyre was a strong and opulent city, which had never been subject to any foreign power, and was then in great repute for its commerce, by which many of the citizens were become like princes, in respect of wealth and magnificence. It was built by the Sidonians, two hundred and forty years before the temple of Jerusalem. It was celebrated for its colonies, and its purple dye. Of this city were afterwards, Porphyry, the famous antagonist of Christianity; Maximus, the Platonic philosopher; and Ulpian, the celebrated civilian.

Nebuchadnezzar, having happily finished all his wars, put the last hand to the building, or rather the embellishing of Babylon.

This metropolis, the most ancient in the world, was situated in a spacious plain on each side of the Euphrates, supposed to have stood in 44 degrees east longitude, and 32 degrees north latitude. It was built in a square form, each side measuring fifteen miles; and the whole sixty miles in circumference. The walls were three hundred and fifty foot high, and eighty-seven foot thick, made of large bricks cemented together with bitumen, a stony exudation arising from the earth in that country, and which acquires in a short time an extraordinary hardness. The walls were surrounded on the outside, with a vast ditch full of water, and faced with bricks on both sides. The river Euphrates ran through the city from north to south, and on each side of the river was a quay, and a high wall of the same thickness with the other. On every side of the city were twenty-five gates, all made of solid brass, which opened into so many streets, that ran in straight lines a hundred and fifty foot broad. By the streets on each side, intersecting one another, the city was divided into seven hundred and seventy-six squares, in which were fields and gardens that might produce provisions enough to subsist the inhabitants in a siege. Within the walls of the city stood the tower of Babel, built before the confusion of languages, and the dispersion of the people. It was a square fabric, half a mile in circumference, and as much in height, built in the form of a pyramid, consisting of eight stories, the ascent to which was by stairs, surrounding the tower in a spiral line. Over the whole was an observatory for the Babylonian astronomers, who anciently excelled all nations in their knowledge of the heavenly bodies. The principal use of the tower, however, was the worship of their gods, particularly the image of Belus, or Baal, the founder of the monarchy.

The Hanging Gardens of Babylon were esteemed the greatest curiosity of the East. They contained a square of four hundred foot on each side, and were

carried

carried up in the manner of several terrasses one above another, to a level with the top of the city-walls. The ascent was from terrass to terrass, by stairs ten foot wide. The whole pile was sustained by vast arches, one above another, and strengthened by a surrounding wall, of twenty-two foot thickness. On the top of the arches were first laid large flat stones, sixteen foot long, and four broad, covered with a layer of reeds mixed with bitumen; over which were two rows of bricks closely cemented together. The whole was covered with thick sheets of lead, on which lay the mould of the garden, so deep that the largest trees might take root in it; and with such the terrasses were covered, as well as with all other plants and flowers, that were proper for a garden of pleasure. In the upper terrass was an engine, by which water was drawn out of the river, for the use of the garden. In the spaces between the several arches on which this structure rested, were large and magnificent apartments, which had the advantage of a beautiful prospect.

We are informed in scripture, that while Nebuchadnezzar was admiring the magnificence of his palace, he was suddenly deprived of his understanding; he was driven from men, and did eat grass like oxen; his body was wet with the dew of heaven, till his hairs were grown like eagles feathers, and his nails like birds claws; but after seven years he recovered his senses, when he was restored to his throne, and became greater and more powerful than ever. Being affected with the highest gratitude, he caused a solemn edict to be published, declaring the astonishing changes which God had wrought in his person. He died soon after, and was succeeded by his son Evil Merodach, a dissolute prince, who was cut off by a conspiracy of his relations at the end of two years, his sister's husband, Neriglissar, mounting the throne in his stead. On the accession of the latter to the crown, he made great preparation for war against the Medes, which induced Cyaxares to send for Cyrus out of Persia to his assistance. His reign however proved of short duration. He was succeeded by his son Laborsadod, a prince of an odious character, who enjoyed the crown only nine months, being put to death by a conspiracy of his subjects. His successor was Labynit, or Nabonid, called in Scripture Belshazzar; in whose reign Babylon was taken, and an end put to that empire, by the united forces of Cyaxares, king of Media, called in Scripture Darius, and Cyrus, king of Persia.

This war was memorable for the defeat of the celebrated Cræsus, king of Lydia. After two engagements, his capital city of Sardis being taken by Cyrus, and himself made prisoner, he was condemned by the conqueror to be burnt alive. When a funeral pile was prepared for the purpose, and the unfortunate prince placed upon it, recollecting a conversation which he formerly had with Solon, in which the latter affirmed, that no man could be pronounced happy till his death; he cried out aloud three times, Solon! Solon! Solon! Cyrus, who was present at the spectacle, desirous to know why Cræsus repeated the name of this philosopher with so much vehemence in that extremity, being informed of the reason, was struck with compassion for

the king's misfortune, and causing him to be taken down from the pile, treated him ever afterwards with particular marks of esteem.

These two princes reigned jointly over the dominions they had conquered, for the space of two years, when Cyaxares dying, Cyrus became sovereign of Media and Persia by inheritance, as he did of the Assyrian empire by conquest; and the whole thence obtained the name of the Persian empire, of which he is considered as the founder. The empire was divided by Cyrus into a hundred and twenty provinces or governments, of all which the respective governors were obliged to give an account of their administration to three great officers of state, who always resided at court; of whom the chief was the prophet Daniel, who foretold the destruction of the Assyrian empire, and the restoration of the Jews. In the first year of the reign of Cyrus, expired the seventieth year of the Babylonish captivity, when he published the famous edict, by which the Jews were permitted to return to Jerusalem; said to be obtained by the solicitations of Daniel, who was in great credit and authority at court. Cyrus restored, at the same time, all the vessels of the temple, which Nebuchadonosor had brought from Jerusalem, and placed in the temple of his god Baal. The Jews departed for their own country soon after, under the conduct of Zerobabel.

Cyrus survived his uncle Cyaxares seven years, and at his death left two sons, Cambyfes and Tanaoxares; the former of whom succeeded to the throne, and the other inherited several considerable provinces.

In the fourth year of his reign, Cambyfes, on receiving intelligence that Amasis was endeavouring to shake off the yoke of the Assyrian empire, invaded Egypt with a numerous army, and invested Pelusium (Damiatta), situate on the eastern branch of the river Nile, of which he made himself master with very little opposition. For, driving before him a great number of cats, oxen, and other animals, adored by the Egyptians, the troops in the garrison were so tender of the sacred quadrupeds, that they would not shoot an arrow at their enemies, lest they should destroy a god. Amasis dying before the reduction of Pelusium, was succeeded by his son Pfameticus, who in a general engagement with the Assyrians was defeated and made prisoner. He was treated by the conqueror with great humanity, and restored to his throne; but endeavouring again to render himself independent, was put to death at the order of Cambyfes.

Having subjected Egypt, Cambyfes proceeded to invade Ethiopia, whence however he was obliged to retire, after losing a great part of his army by famine and various hardships; while another body of his troops, that had been sent to invade Lybia, were destroyed by a whirlwind, which raised the sands in those deserts to such a degree, that the whole army was covered and suffocated. Those different disasters appear to have extremely affected the mind of Cambyfes; for henceforward his reign was distinguished by acts of barbarity, inconsistent with the mildness of temper which he had formerly discovered. In his retreat, he plundered and demolished Thebes, with its magnificent temples and palaces. At Memphis, finding the

the Egyptians keeping a festival in honour of their adored ox, and imagining they were rejoicing at the unsuccessful issue of his enterprise, he plunged his sword into the animal, and ordered the priests to be put to death. The son of Prexaspes, his first minister, he shot through the heart with an arrow before his father's face; embittering the grief of the unhappy parent, by presenting him with the heart extracted from the body of the youth, asking the insolent question, Whether he had not a steady hand? To which Prexaspes, struck with terror, is said to have replied, Apollo could not have shot better. He became so jealous of his brother Tanaoxares or Smerdis, who attended him in the Ethiopian expedition, that he caused him to be murdered; which his sister Meroc, whom he had married, reproaching him with, he commanded her also to be murdered, and several of the officers of his court to be buried alive. Cræsus, who was yet among the number of his ministers, suggesting that such acts of cruelty must alienate the affection of his subjects, Cambyfes ordered him to be put to death; but those to whom the care of the execution was committed, observing the king to be intoxicated with liquor, and imagining that when sober he would repent of the order he had given, delayed to carry it into act. For this disobedience, however, he commanded them all to be murdered next day, notwithstanding he rejoiced greatly to know that Cræsus was alive.

In the eighth year of his reign, returning through Syria towards Babylon, he received advice that Smerdis, an impostor who pretended to be his brother, had usurped his throne. On mounting his horse, Cambyfes fell upon his own sword, which happened to be out of the scabbard, and received a mortal wound in the thigh, of which he soon after died; the Egyptians affirming that it was a judgment upon him, for wounding their god Apis in the same part.

Smerdis, the usurper, was the son of one of the Magi, governor of Babylon, and resembling the murdered brother of Cambyfes, was acknowledged by the people as their sovereign, on the death of the latter; the success of the claim being facilitated by the authority of his father. The impostor, however, being discovered by the want of his ears, which were cut off for some offence he committed in the reign of Cyrus, he was set upon by the nobility, and killed. Darius, who gave him a mortal wound, afterwards cut off his head, and exposed it to the people; the sight of which so enraged them at the Magi, that they sacrificed a great number of that body, and an annual festival was instituted in memory of their deliverance from this usurpation.

On the death of Smerdis, the tradition is, that the conspirators agreed to meet at sun-rise next morning, each mounted on horseback, when he whose horse first neighed should be acknowledged as successor to the throne; and that the lot fell on Darius, by a stratagem of his groom, who had brought a mare to the place the preceding night, and shewed her to the horse. But by whatever means Darius obtained the empire, he endeavoured to strengthen his title by marrying

No. 8.

Artossa, the sister and wife of Cambyfes, and Ariston, another of the daughters of Cyrus. It was this Darius Hystaspes (the Alaxerxes of the Scripture), who published the edict against Haman, in favour of the Jews, at the request of queen Esther, and commanded the building of the temple to be continued, at the expence of the state. Darius removing the seat of the government from Babylon, which had now been rebuilt, to Susa, or Shushan, some male-contenta took advantage of his absence, and attempted to render Babylon an independent kingdom. Collecting a body of forces, Darius laid siege to Babylon, which having invested for eighteen months, without any prospect of success, he at last reduced by a stratagem of Zopirus, one of his generals. This officer deserted to the Babylonians, and pretending to have been barbarously treated by Darius, insinuated himself so far into the favour of the citizens, as to obtain the command of their troops. He then betrayed the place into the hands of his master, who caused the walls to be demolished, and impaled three thousand of the citizens that had been most active in the revolt. His next expedition was against the Seythians, in which the greater part of his army perished in the deserts; after which, having passed over into Greece with a numerous army, in order to be revenged on the Athenians for the assistance they had given the people of Ionia, he was shamefully defeated in the memorable battle of Marathon, and obliged to repass the Hellespont with considerable loss.

Egypt revolting soon after, Darius made great preparations for invading that country and Greece at the same time, but died before his army was assembled. He was succeeded by his son Xerxes, who immediately marched into Egypt, which he reduced to subjection.

The preparations for invading Greece, which had been begun by the former king, were carried on by Xerxes with unremitting assiduity for several years; and, if we may credit the testimony of the Greek historians, the multitude which he led with him on this expedition, amounted to no less than three millions. At the head of this amazing army he marched from Sardis, the capital of the Persian dominions in Asia Minor, to the Hellespont, over which he laid a bridge of boats, that was destroyed by a tempest. Provoked at this disaster, he is said to have ordered his soldiers to lash the waves, and throw chains and fetters into the sea, to shew his dominion over that element. But whatever credit may be due to this anecdote, he caused a stronger bridge than the former to be built, over which he passed his army. When he viewed his numerous forces on this occasion, we are told that he wept, from the reflexion that of all the multitude which accompanied him, not one should survive many years. He had no sooner passed the Hellespont, than Thrace submitted to a power which seemed to bid defiance to the united opposition of Europe. The Grecians however determined to die, rather than acknowledge the Persian emperor their sovereign. In this resolution Leonidas, one of the kings of Sparta, with four thousand men, took possession of the strait

Z

of

of Thermopylæ, between Thessaly and Phocis, through which the Persians must pass; and waiting the approach of this formidable army, sustained several desperate attacks, in which the enemy lost upwards of twenty thousand men. But a native of the country showing the Persians a way up the mountain, which commanded the strait, they possessed themselves of it in the night, and the Greeks, in consequence, abandoned all hopes of success from disputing the passage any longer. Leonidas therefore gave leave to the troops he commanded to retire, while himself, with only three hundred men, determined to remain, and sell their lives as dear as they could. When they had formed this heroic resolution, he is said to have invited the three hundred to dine with him, telling them at the same time, that they must expect to sup with Pluto, on which they set up a general shout. Soon after, an attack was made by the Persians, in which Leonidas and all the three hundred were killed, except one, who escaped. This fugitive bringing advice of the action to Sparta, was punished for cowardice, in not throwing away his life with his companions.

The same day on which the action of Thermopylæ happened, Themistocles, admiral of the Grecian fleet, defeated that of the Persians, though the latter consisted of a thousand sail, and the former of no more than four hundred. Xerxes, however, continuing his march towards Athens, the inhabitants abandoned the city, and went on board their ships, sending their wives and children to Peloponnesus. The deserted capital being thus left a prey to the enemy, on their arrival they plundered and burnt it, seizing on the vast treasures that were laid up at Delphos, which consisted of offerings presented to that oracle for many years, by the neighbouring kingdoms and states.

Whilst the Persians were intent on pursuing their conquest at land, the Grecians obtained a second victory over the fleet at Salamis; and a report prevailing, that they were about to demolish the bridge over the Hellespont, and thereby preclude the invaders from the possibility of a retreat, Xerxes directed his march hither with great precipitation; where he found the bridge broke down, not by his enemies, but by a storm. He passed the Hellespont therefore in a small boat, and retired to Sardis, whither, it is presumed, great part of his army followed him, as he left only three hundred thousand men to continue the war, under the command of Mardonius. This general was defeated and killed next year at Platæa, in an action with the Athenians and Lacedæmonians, commanded by Aristides and Pausanias. Xerxes is said to have been so enraged at those repeated disasters, that he caused all the Grecian temples in Asia to be burnt, except that of Diana at Ephesus. On returning to his capital, he was murdered by Artabanus, captain of the guards, and Mithridates, one of the principal eunuchs, and was succeeded by his third son Artaxerxes, the two eldest having been murdered by the same conspirators, who were capitally punished by the new king on his advancement to the throne.

Egypt revolting from the crown of Persia about this time, Artaxerxes reduced it to his obedience. It was this prince who assisted the Jews to rebuild the walls of Jerusalem; and from the decree in their favour, in the twentieth year of his reign, is dated the commencement of the seventy weeks of Daniel; at the end of which, it was foretold that the Messiah would appear upon earth.

Under this prince, the Grecians retaliated the invasions which had been made into their country by the two preceding Persian kings; where meeting with great success, especially those under the command of the celebrated Cymon the Athenian, Artaxerxes thought fit to make peace with them, after the war had continued almost to the end of his reign. At his death, his sons, of whom he left several, contended some time for the crown, till Ochus succeeded, who assumed the name of Darius. This prince dying without performing any memorable achievement, his son Arfaces mounted the throne, who enjoyed all the paternal dominions, except the province of Asia Minor, which was given to Cyrus, the younger son. The latter imagining that he had a right to the Persian crown, on account of his being born after his father had arrived at the regal dignity, but Arfaces before that event, expressed the highest displeasure at this settlement, and attempted to assassinate his brother in the temple, at the time of the coronation. He retired, however, to his government in Asia Minor, where continuing quiet only till he had engaged a body of Grecian forces in his service, and assembled a numerous army of Persians, he began his march towards the capital of the empire, in order to depose his brother. When he came within seventy miles of Babylon, Arfaces (who on his accession to the throne took the name of Artaxerxes, and was called Mnemon by the Greeks, on account of his great memory) engaged him with an army consisting, as is said, of a million of Persians. In this battle Cyrus was killed, and his Persian troops totally routed; but the thirteen thousand Greeks in his service, in spite of the utmost efforts of the royalists, made their retreat into Greece, under the command of the celebrated Xenophon, whose elegant history of this extraordinary transaction will transmit its fame to the most distant ages of mankind.

Artaxerxes was succeeded by his son Ochus, in whose reign Egypt, which had again revolted, with Phœnicia, was rendered obedient to the Persian crown.

Besides demolishing all the fortified places in the kingdom, and plundering the temples and palaces, a multitude of the inhabitants was carried captive to Babylon; amongst whom was Bagoas, the eunuch, who became a great favourite with the king, and was advanced to the highest posts in the government. An implacable resentment, however, for the oppression of his country, and the contempt expressed by the Persian monarch for the gods and religion of Egypt, effaced in the mind of the eunuch every sentiment of gratitude and attachment, and he entered into a conspiracy against Ochus, whom he removed by poison in the

twenty-fourth year of his reign. His revenge not being satisfied by this act of treachery, he likewise poisoned Arfes, the son of his royal patron, and advanced to the throne another Ochus, who had no claim to the succession, and whom he also attempted to destroy; but the design being discovered, he was himself forced to drink the poison which he had prepared for his purpose.

This Ochus assumed the name of Darius Codrmanus, and was the prince in whose reign the Grecians, exasperated at the ravages their country had sustained from the Persian power, determined to seek revenge within the limits of that monarchy; for which purpose they made choice of Philip, king of Macedon, for their generalissimo, who being murdered, was succeeded in that station by his son Alexander, at the age of about twenty years. This youthful warrior passed the Hellespont with a body of thirty thousand foot, and five thousand horse, and landing in Asia, fought the Persians on the banks of the river Granicus; where he gained a complete victory over an army almost three times superior in number. This important battle was soon followed with the surrender of Sardis, the capital, and many other cities of the kingdom.

The next campaign, Alexander marched and possessed himself of the straits of Iffus and Cilicia, between the mountains and the Mediterranean Sea, where being attacked by Darius with a numerous army, the Persian monarch received a total defeat, aggravated by the captivity of his mother, wife, several of his children, and three hundred concubines. After this signal victory, most of the cities of Palestine and Phœnicia submitted, except Tyre, which having endured a long siege, was at length taken by storm. Two thousand of the inhabitants, who had escaped the slaughter which accompanied the furious onset of the Greeks, were reserved by Alexander to be crucified; and, to the eternal disgrace of his humanity, the barbarous sentence was soon after carried into execution, upon crosses erected along the sea-shore. So great was the terror universally spread by this act of cruelty, that the towns of Syria and Egypt immediately opened their gates to the conqueror. The rapidity of his progress, joined to the consternation every where excited by his victories, induced Darius to offer him the

surrender of all the dominions which he possessed west of the Euphrates. Alexander not accepting those terms of accommodation, a decisive battle ensued on the plains of Arbela, in which the Persians were the third time defeated. The conqueror took possession of the capital cities of Babylon, Susa, and Persepolis, the last of which, at that time the finest city in the world, he burnt to the ground, at the instigation of Thais the courtesan. Pursuing Darius to Ecbatana, the capital of Media, whither he had fled, the latter was murdered on the road by Bessus, one of the generals of his army, whom Alexander, in abhorrence of his perfidy, afterwards caused to be put to death. Thus ended the Persian monarchy, which had continued two hundred and nine years, computing from the beginning of the reign of Cyrus the Great.

At the death of Alexander, which happened a few years after that of Darius, his conquests were shared amongst his generals, under the pretext of governing them no longer than till Arideus, the natural son of Philip, and Alexander, the son of the last king by Roxana, should be capable of the administration. But the two princes being murdered in their minority, the generals assumed an independent sovereignty in the respective territories they possessed. Several of them persisting, however, in the mutual contests which succeeded, the number of the competitors was at length reduced to three; among whom, Seleucus and his posterity enjoyed great part of Asia for several hundred years, till the empire was divided into the kingdoms of Persia Proper, Parthia, Armenia, and Syria. Each of those had their respective sovereigns, and the Romans afterwards possessed Asia Minor and Syria, with most of the countries west of the Euphrates.

The next that occupied the Persian throne were the Saracens, successors of Mahomet, who made a conquest of it about the year 630; from whom it was seized by the Turks about the year of our Lord 1000. Four hundred years later it was conquered by Tamerlane, the great cham of the Tartars; and almost immediately after, passed to the family of the Sophies, or Sessies, who retained it till the usurpation of Kouli Kan, or Sha Nadir, at whose death, in 1747, a fresh contest arose about the succession to the crown of this ancient monarchy.

## C H A P. I.

*Of the situation — towns — rivers — mountains — air  
and seasons.*

ARABIA is bounded on the north by Turkey; on the east by the gulphs of Persia or Bassora, and Ormus; on the south by the Indian Ocean; and on the west by the Red Sea, and the Isthmus of Suez, which divide it from Africa. It is situate between 35 and 60 degrees of east longitude, and between 12 and 30 degrees of north latitude; extending 1300 miles in length, and 1200 in breadth. In this account, Chædea or Eyraca Arabick is not included, which will be mentioned in the description of Turkey.

Arabia is usually distinguished into three great divisions, namely, Arabia Petræa, Arabia Deserta, and Arabia Felix.

Arabia Petræa is situate at the north-west part of the country, between Egypt and Palestine, towards the isthmus that separates the Mediterranean or Levant from the Red Sea, and which is about a hundred miles in extent, the most mountainous and rocky of those territories. The chief towns are, Suez, lying at the bottom of the Arabian gulph or Red Sea, being the port where the Turkish gallees usually lie; and Tor, another port-town south-east of the former.

The second division of Arabia is that of Arabia Deserta, lying between Turkey and Arabia Felix; but neither the southern or northern limits of this province can be exactly ascertained, being bordered by vast deserts. In this quarter are very few towns, the people for the most part living in tents, and divided into a multitude of tribes, which are perpetually moving from one part of the country to another, to find water and pasture for their cattle. The chief towns here are, Medina, Mecca, Siden, Dhafar, and Eleatiff.

Medina is situate in 40 degrees 35 minutes east longitude, and 24 degrees 30 minutes north latitude, about two hundred miles north-west of Mecca. It is called Medina Talmahi, or the city of the prophet. Here Mahomet was first proclaimed king, and his tomb is also at this place; but the coffin is not supported by a load-stone in the ceiling, according to the vulgar tradition. The town is adorned with a great number of fine mosques, but that called Mofa Kibu, or the Most Holy, exceeds the rest in magnificence. It stands in the middle of the city, supported by four hundred columns, and illuminated by as many lamps. Mahomet's tomb is in a tower or chapel of this mosque. It is covered with a dome, and surrounded with a silver rail, adorned with precious stones, the gift of zealous Mahometan princes. The Hegira, or Mahometan epoch, commences from the flight of Mahomet to this city, when he was driven

from Mecca; namely, from the 16th of July, A. D. 612.

Mecca, which is the capital of all the Arabia, is situate in 21 degrees 20 minutes of north latitude, and in 43 degrees 30 minutes of east longitude; standing in a plain surrounded by mountains, about thirty miles east of the Red Sea. It consists of about two thousand houses handsomely built of brick, and most of them with flat roofs and battlements. In the middle of the city stands the kaaba, or house of God, an octagonal building, not more than twenty yards in circumference. It is ascended by six steps, and the entrance is by folding doors of solid silver. The walls are hung with red and white silk, in several parts of which are interwoven the following words: *La illa ill Alla, Mohamed Resul Alla; God is a great God, and Mahomet his prophet.* This temple is surrounded by a large piazza, supported by three rows of pillars, where the pilgrims perform their devotions, very few of them having admittance into the kaaba. The grand seignior presents annually a new set of hangings to this temple, when those of the preceding year are taken down, and cut into small pieces, which are sold to such of the pilgrims as are disposed to purchase them.

Siden or Judda is the port-town to Mecca, and situate about thirty miles westward of it. Hither the Turkish gallees bring every year vast quantities of rice and other provisions, when the pilgrims are expected to arrive, who, without those imports, would starve for want of subsistence in the deserts of Arabia.

Dhafar and Eleatiff are likewise port-towns, the former situate near the Red Sea, in 44 degrees of east longitude, and 18 degrees of north latitude, a hundred and twenty miles south of Mecca. The latter stands on the gulph of Bassora, in 49 degrees of east longitude, and in 25 degrees 50 minutes north latitude. It is capital of the province of Bahara, in the dominions of Persia, and has in its neighbourhood a fine pearl fishery.

Arabia Felix is bounded on the north by Arabia Deserta; on the east, by the gulph of Ormus; on the south, by the Indian Ocean; and on the west, by the Red Sea. The chief towns are, Sibit, Mocho, Aden, Hadramut, Caffeen, Segar, Muscat, and Jamama, the capitals of so many provinces, or subdivisions of this part of the Arabian territories.

Sibit is situate near the eastern shore of the Red Sea, in 45 degrees of east longitude, and 15 degrees of north latitude. It is the greatest mart in Asia for myrrh, frankincense, and other odoriferous gums and drugs; but there are no spices either here, or in any other part of Arabia, though the Indian spices have been frequently denominated from this country, on account of their being first brought to it by the caravans, in their passage to Egypt and the places bordering on the Levant.

Moco,

Moco, or Mocho, is situate on the east shore of the Red Sea, within the straits of Bahel Mandel, about a hundred miles south of Sibe, in 43 degrees of east longitude, and 13 degrees of north latitude. It stands in a barren sandy plain, surrounded however by the greatest plantations of coffee in the world, whence this commodity was first brought to Europe by the Turks. The town is large and populous, the houses well built with brick and stone, the roofs flat and terraced, and the shops furnished with all kinds of eastern merchandize.

Aden is likewise situated within the straits of Babel Mandel, about a hundred and twenty miles east of Moco, being a port-town on the Indian or Arabian ocean, in 46 degrees of east longitude, and 12 degrees of north latitude.

Muscat, another port-town, is situate on the western shore of the gulph of Ormus, in 38 degrees of east longitude, and 23 degrees of north latitude. It lies in a bottom, surrounded by three rocks, which secure the harbour, and render it of difficult access to strangers. This place was once possessed by the Portuguese, but is now the capital of a large territory subject to an Arabian prince, called the king of Muscat, or Oman, the only naval power on the coast of Arabia, except the Turks, who command the navigation of the Red Sea.

Hardly any country is more destitute of rivers than Arabia. The chief of those are, Chat, Fran, and Nagiran, but none of them navigable. The mountains are, Gebel, and Ared, or the great mountains in the middle of the country, with those of Sinsi and Horeb in Arabia Petraea.

Those parts of Arabia, which lie within or near the tropic of Cancer, are excessive hot, but have their monsoons and sea breezes regularly, as in other countries under the same parallels. The vernal monsoon, on the southern coast of Arabia, blows from the south-west from April to September, when it shifts, and blows from the opposite direction during the other six months. In April and May the hot winds are intolerable. The weather is almost perpetually clear and serene, and the country seldom either foreened from the sun by clouds, or refreshed with showers.

#### C H A P. II.

*Of the soil—produce—traffic—government—persons—habits—diet—divisions—method of travelling.*

THE three several divisions of Arabia are in general barren, though the southern province, on account of its comparative fertility in some places, has received the name of Felix, or Happy. But even here hardly any thing will arrive at perfection, without turning the water into the fields and gardens. The country yields very little pasture, and the grain chiefly cultivated is either rice or barley; to promote the growth of which, the inhabitants draw water out of their wells and reservoirs with oxen, and convey it by small rills into their arable lands, as in Persia.

No country produces such plenty of odoriferous gums; but they have hardly any timber or forest trees,

No. 8.

Their oranges, lemons, grapes, and peaches, come to perfection, as is usually the case in hot countries; but the fruits which yield them most profit, and are chiefly exported, are dates and coffee. The former, which candy and preserve themselves when laid in heaps, grow in almost every part of the country; but the coffee chiefly about Moco. This berry grows upon a shrub eight or ten foot high, in the richest grounds, and is watered like the rest of their plants. The natives have drank the liquor made of it between two and three hundred years; and this commodity has been imported into Britain since the year 1652. Mr. Edwards, a Turkey merchant, then brought over with him a Greek, named Pasqua, and set him up in a coffee-house in London, which was the first of the kind in England.

Arabia was once famous for gold and precious stones, especially on the borders of Chaldea, which is supposed to be the land of Havilah, mentioned by Moses. The pearl-fishery, on the gulph of Persia or Bassora, was lately esteemed the richest in Asia, and belonged formerly to Persia; but since that country has been distracted with civil wars, this branch of trade has been much neglected, and seems at present to be in the possession of the Arabs.

Arabia is hardly distinguished for any considerable manufacture, but the inhabitants carry on a trade with all Mahometan countries. Situate between Persia and India on the east, and Europe and Africa on the west, caravans of merchants, either natives or strangers, are perpetually travelling through the country; the profit of the provisions sold to which, with the toll exacted from strangers, annually amounts to a large sum. The advantage derived from the pilgrims alone, who come hither from all the Mahometan countries, from motives of interest as well as of devotion, is extremely great. Moco is the principal port used to by the Turkish gallees, which bring the coffee and other produce of Arabia to Suez, at the bottom of the Red Sea; whence it is carried to Egypt, and the ports of the Levant, where the English and other Europeans are supplied with it. The English, Dutch, and other East-India ships also resort to Moco, directly, for coffee and other goods, which they bring to Europe round the Cape of Good Hope.

The different provinces of Arabia are divided into several governments. Moco, Aden, Muscat, and other port-towns already mentioned, have large territories, the sovereigns of which are styled xeriffs, and sometimes imans; each including the office not only of king, but high-priest, which Mahomet and his successors the califfs, assumed for some hundreds of years, though they are now distinct both in Persia and Turkey. Those petty sovereigns in Arabia seem to be absolute, and their thrones hereditary. It does not appear that they have any standing forces; but the sovereign is master both of the purfes and persons of his subjects. The king of Oman or Muscat, as has been said, is the only naval power in the country. This prince has thirty ships of war, with which, like the Algerines, he makes captures of the vessels of every nation that are not too great for his force. Some of his ships

A a

are

16th of July,

the Arabias, is north latitude, longitude; Sand, about thirty miles of about built of brick, and battlements, kaaba, or house more than twenty miles, by six steps, of solid silver, silk, in several following words: God is a great temple is surrounded by three rows of their devotions, into the kaaba, a new set of the preceding pieces, which disposed to pur-

to Mecca, and c. Hither the quantities of rice is expected would starve Arabia.

port-towns, the degrees of east side, a hundred miles, the latter stands east longitude, latitude. It is dominions of pearl fishery, which by Arabia Mus; on the west, by the Mocho, Aden, Jamanna, the lions of this

the Red Sea, degrees of north for myrrh, and drugs; any other have been on account caravans, in riding on the

Moco,

are of sixty or seventy guns, but the largest of them not bigger than a fourth rate man of war, and none of them choose to engage an European vessel of any force. On this account, the Banians of India, who trade to Persia, generally load their goods on board some English or Dutch ship, when they sail from Combrion to Surat;

Though this prince, and others of the country, have great guns, they do not know how to manage them, either on board or on shore; neither will their commanders ever venture to sea but in the fair season. The Turks, who are masters of the navigation of the Red Sea, keep the adjacent port-towns in great subjection. There even are instances of the Turkish admirals hanging some of the princes on this coast, for refusing to obey their commands. The sovereigns of the inland country, however, acknowledge no dependence on the Ottoman power, unless Arabia Petrea, which is in reality a part of the Turkish dominions.

The rest of the Arabians are divided into tribes and families, consisting of a thousand or fifteen hundred persons. The head of each tribe is a monarch, called the skikel kebir; sometimes emir; and the chief of each family is styled sheik, who has very great power. Among those the government is hereditary, though they have no certain territories, but ramble perpetually from one part of the country to the other, in the manner of the hords of Tartary. Notwithstanding this ambulatory life, they demand a duty of all merchants passing through the country, which is considered by the vagrant tribes as a large undivided common. Those that lie next Turkey are sometimes looked upon as subjects of the grand seignior; but they are such that he often finds himself under the necessity of granting subsidies to their chiefs, to prevent them from making incursions into those parts of his dominions which are more immediately under his controul.

By the adventurers in the Crusades, the Arabs have been represented as men of a gigantic stature, and terrible aspect, probably with the view of extenuating the defeats received from them. They are however rather low than tall, with slender bodies and swarthy complexions. Their eyes and hair are black, as in most hot countries, and their voices shrill, but rather effeminate than strong. Among those who live in the deserts, many of the men go almost naked; but they who use any habit wear blue frocks, tied with a sash; a mantle made of the skins of beasts, with turbans, drawers, and sometimes slippers, but no stockings. The women are so wrapped up from head to foot, that no part of them can be seen.

Like other Mahometans, the Arabs eat all sorts of flesh, but that of hogs; taking care however to have the blood entirely drained from it. The meat they esteem most is camel's flesh, which they seldom fail to have at all entertainments; nor do they refuse any kinds of fish, but those without scales. Instead of bread, they use thin cakes made of flour, and baked upon the hearth immediately when they have occasion for them. But rice is used in many parts of the country, as a succedaneum to bread; and dried dates are

esteemed delicious food. Their common drink is water and sherbet made of oranges. The people in the neighbourhood of Muscat are said to abstain not only from wine, but from coffee and tea; and tobacco seems to be little used in any part of the country.

The principal diversion of the Arabs is horsemanship, in which they take great delight, and their breed of horses is excellent. In martial exercises they are likewise very expert, being at present as dexterous in the use of fire-arms, as they formerly were in that of the bow and lance.

The greater part of the country being deserts, there is hardly to be found in it any such thing as a road, and consequently there are no caravanferas, or houses of entertainment for travellers. The caravans travel over vast plains of sand, so extensive that they steer by a compass, as at sea; continuing their journey frequently by the light of the stars, but seldom in the hotter part of the day. Both merchants and pilgrims, for security, generally travel in large bodies; their caravans often consisting of three or four hundred men, and eight hundred or a thousand beasts of burden, camels, asses, and oxen, loaded with merchandize and provisions, with some saddle-horses and asses for the accommodation of travellers. A large camel will carry eight hundred or a thousand weight; and the dromedaries, which are a smaller species, about five hundred weight. Both lie down to take up their burdens, and will travel through this parched country eight or nine days without water.

Instead of caravanferas, travellers provide themselves with tents, which they pitch occasionally when the weather happens to be bad; but when the season is fine, as it commonly is, they lie down upon a carpet or matras in the open field. Part of the caravan is allotted for carrying their provisions and water, of which the latter is preferred in skins. The Arabs observe, that wherever there are trees, there seldom fails to be water. Even the camels seem to be sensible of this remark. For when they come in sight of such places, they can hardly be restrained from setting up their great trot, especially when they have had no water for some time. The natives imagine those creatures smell this fluid at a great distance.

Before the people of a caravan begin their march, they elect an officer, called the caravan basha, who is their leader, and directs all their motions. It is his business likewise of this person, to determine all disputes which may happen on the road, and to compound for the several duties demanded of the caravan, by the governors of the countries through which they pass.

The merchants who travel with the caravan, ride upon horses or mules, and sometimes upon asses, which travel fast enough for the loaded camels, who seldom go above a foot-pace. The Christians, or Franks, as they are called, are obliged to provide themselves with mules or packhorses, to carry their wine; for the camel drivers being disciples of Mahomet, will not suffer that animal to be loaded with any strong liquor, the camel being consecrated to their prophet, who strictly prohibited the use of every intoxicating beverage. The wine, as well as water, is put into goat-

skins

setna with the hair inwards, for they soon prove leaky if the hair is off.

Every merchant and his servants ride near the camels which carry their goods, to preserve them from thieves. For as they frequently travel early in the morning, and late in the evening, those pilferers sometimes cut the strings by which the camels are tied together, and lead off some of them without being perceived. To prevent the depredations of the banditti in the night, every caravan is accompanied by some poor people, who serve as watchmen when they are encamped. It is prudent for travellers in this country to dress themselves in an Arabian vest and cap, without which precaution they may be exposed to insults from the natives, and perhaps stopped at some of the towns on their way. Their boots are made of a kind of glove-leather, and they never wear spurs; the stirrup being furnished with a sharp spike, which serves to prick the horses.

### C H A P. III.

*Of the language—learning—history.*

THE language spoken by the natives of this country, or, as they are called, the Saracens, is the Arabic; but at present it is greatly degenerated from its ancient purity, the Alcoran being hardly intelligible to those who know only the common tongue.

It is agreed on all hands, that in the north-east part of Arabia, and the neighbouring states of Chaldea and Babylonia, learning flourished at an early period. To the ingenuity of the ancient Arabians the world is indebted for the valuable science of algebra; and from a period so remote as almost a thousand years ago, the physicians of this country have transmitted such documents of their medical skill and observation, particularly in the small-pox, as will perpetuate the remembrance of their industry through the latest annals of physic. Besides those sciences in particular, the Arabians were likewise distinguished for their love of general learning, and were the first that imported into Europe the literary treasures of the Greeks. But whatever acquisitions they made in former times, the cultivation of letters has totally ceased amongst them, and they are now sunk in the ignorance of every intellectual accomplishment.

The most memorable subject relative to the transactions of this country, is the history of Mahomet, the founder of the Saracen empire, as well as of the extraordinary superstition to which he has given name.

This celebrated impostor was born at Mecca, A. D. 571, in the reign of Justinian II. emperor of Constantinople. He was descended of the tribe of Korcis, one of the most honourable in Arabia; but at the time of his birth, the circumstances of his family were exceeding mean. His father dying in two years after, he was taken into the house of Abdoll Metallah, his grandfather, who not surviving above a twelvemonth, recommended him to the care of his uncle Abutaleb, a great merchant, by whom he was

instructed in the business, and afterwards sent as his factor with the caravans into Syria and Palestine, where he became acquainted both with Christians and Jews. He continued in his uncle's service till the age of twenty-five, when he became factor to a rich widow, named Cadigha, whom in three years after he married. The fortune he acquired by this match, rendered him one of the most opulent men in Mecca, and it is said that he now laid the plan of obtaining sovereign power, to which he seemed to have a claim, from the custom of the Arabs, his ancestors having been chiefs of their tribe for several generations. To recover the former rank of his family, he imagined that the readiest way was to turn reformer, and become the head of a new religion, a project which appeared the more likely to succeed, on account of the animosities prevalent at that time amongst the Christians of the East.

Setting out therefore on his political career, he affected to revive the primitive worship and purity of the ancient patriarchs; and that he might more easily avoid the opposition of every sect, he proposed to unite Christians, Jews, and Pagans in one general religion. It seemed however indispensably necessary, as he had hitherto been a Pagan, and was remarkably profligate, that he should first reform himself, or at least assume the appearance of extraordinary sanctity in his own person. For this purpose he went every morning to the cave of Hira, near Mecca, where he pretended he spent his time in prayer, fasting, and divine meditation; and it is imagined, that at those times he was employed in composing the Alcoran, in which he was assisted by some Jews and Christians, particularly a monk who constantly resided in his house. On his return to Mecca in the evenings, he used to entertain his family with a relation of the visions he had seen in the course of the day, and of his intimate conversation with the angel Gabriel; whilst the monk corroborated the truth of the detail by a solemn affirmation, wherever any of the audience appeared in the least degree incredulous; in consequence of which, his wife and a few others became converts to his persuasion.

Having acted the hermit for some years, about the age of forty he declared himself a prophet sent from God, to reclaim the Arabians from their idolatry. He taught them that there was but one God, and that those who affirm that God has any son, daughter, or companion, should be held in abhorrence; condemning by this means the doctrine of the Trinity and Incarnation. He prohibited also the worship of images, and of several female deities, which the Arabians adored as the daughters of God. He did not deny the mission of Moses, or of Jesus Christ, nor the authority of the Scriptures; but accused both Jews and Christians with corrupting them. He affirmed that the angel Gabriel was sent from God to communicate to him his will, and that he fell into a trance when the angel delivered the divine messages; an imposture the more readily credited by the vulgar, as Mahomet was naturally subject to the epilepsy. He published his pretended revelations by chapters, some of them at Mecca, and the rest at Medina. He used to dictate every new chapter to his clerk, who recited it to his disciples

eiples till they had it by heart, after which it was laid up in a chest, called the *Chest of the Apostle*.

Great opposition was made at Mecca to the doctrines of the pretended reformer, notwithstanding which he daily proceeded in making converts; and being a man of an insinuating address, he attained so much the favour of the people, that the government began to apprehend he was aiming at sovereign power. Dreading, however, that an insurrection might be the consequence of attempting to bring him to a public trial, they determined to take him off privately; when he, receiving intelligence of the design, immediately fled to Medina.

As he could not assert the reality of his mission from heaven by any power of working miracles, he was deserted by many of his disciples; in order to put a stop to which desertion, he observed to the citizens of Medina, that God had sent Moses and Jesus with the power of performing miracles, yet the world was not reclaimed by them; and that therefore the Almighty, determined to try the effects of another method, had at last sent him to reduce them to obedience by the sword. In consequence of this declaration, he commanded his disciples not to enter into disputes about religion, but maintain it by force; promising great temporal rewards to those who should take up arms in this cause, and eternal happiness to such as happened to die in defence of it.

About twelve years after he had begun to work upon the credulity of the people, he pretended that he was carried up to heaven by the angel Gabriel, who had seventy pair of wings, whiter than snow, and clearer than crystal. That he set him (Mahomet) on the back of a mule, less than a mule, which in a moment transported him to Jerusalem; where quitting the courser, he mounted by a ladder of light to heaven, and from one heaven to another, till arriving in the seventh or highest, he came to the throne of God. That the seven heavens were five hundred years journey distant from each other, and that he saw in one of them a gigantic angel, whose eyes were seventy thousand days journey asunder. He assured his disciples that this wonderful journey was performed in the tenth part of a night. For some time his followers were of opinion, that the whole was only a dream; but the doctors at length resolved that it was a real journey, and as such it is established amongst the articles of the Mahometan faith. In consequence of this decision, all his sayings have ever since been held as sacred truths brought down from heaven, and they constitute those volumes of traditions, called by the Mahometans the *Sunnah*.

Mahomet, after his arrival at Medina, married his daughter Fatima, whom he had by his wife Cadigha, to his cousin Haly, one of his disciples; from which daughter, all those derive their right who pretend to be of the family of Mahomet. Having brought over most of the people of Medina to his interest, he began to make incursions into the neighbouring states, particularly that of Mecca, intercepting their caravans that traded with Syria and Palestine, and enriching his disciples with the plunder. An employment so

profitable greatly increased the number of his converts, who justified every violence they committed, by declaring it to be done in the cause of God.

Meanwhile the citizens of Mecca finding him become extremely formidable, entered into confederacy with some of the neighbouring tribes, and marched with a powerful army to give him battle, which however he thought proper to decline. But making choice of a strong camp, he fell upon means to corrupt some of the enemy's officers, who advising a retreat, left him at liberty to evacuate a place, to which he had recourse from motives of present security alone. Having increased his army, he marched towards Mecca, and an indecisive battle being fought between that city and Sibia or Judda, a truce was concluded; in which it was agreed, that Mahomet's friends at Mecca should have leave to join him, and those in his army who desired it, might return thither.

Considering his authority as now fully established, on his arrival at Medina he caused himself to be proclaimed king, in the sixth year of the Hegira, or Mahometan era, and the year of our Lord 627. He retained however the office of high priest, in which his example was followed by his successors the caliphs, who enjoyed both the regal and sacerdotal dignity, till the 325th year of the Hegira, when the governors of the several provinces of the Saracen empire assumed an independent authority with the title of Sultans, leaving the caliphs possessed only of the ecclesiastical power. He continued to preach and pray, and perform the pontifical function as before; only instead of leaning on the stump of a palm-tree, as had been his custom before his advancement to the royal dignity, he caused a magnificent temple to be erected, and harangued the people from a pulpit.

Mahomet, regardless of the truce which he had made with the inhabitants of Mecca, privately assembled a body of ten thousand men, and surprised the city, massacring all who opposed him. Proceeding afterwards in his pretended reformation, he broke down the images in the kaaba, consecrated the place to his new religion, and enjoined his disciples to go hither in pilgrimage once in their life. Exasperated at the destruction of their favourite idols, and the insult offered to their religion, several of the tribes uniting, defeated him in a general battle, and compelled him to take refuge under the walls of Mecca. Soon afterwards, however, trying his fortune in another engagement, he obtained a complete victory, compelling the vanquished inhabitants to acknowledge him as sovereign, and recognize all the doctrines which he had delivered as a revelation from heaven. But he enjoyed not long the tranquillity which fortune had thrown into his hands. A decline of health, occasioned by poison which had been given him some time before by a Jewess, in a shoulder of mutton; now made rapid progress; he became delirious, and expired in great agony on the day, as is said, when he completed the sixty-third year of his age.

An universal consternation seized his disciples at this event, many of them entertaining an opinion that he was not subject to death. Omar, one of his generals, drawing

drawing his sword, swore he would cut any man to pieces who should say that he was dead. Abubeker demanded in reply, if they worshiped Mahomet, or the God of Mahomet. "If says he, you worship the God of Mahomet, he is immortal, but as to Mahomet he is certainly dead:" confirming his opinion of their prophet's mortality by several passages from the Alcoran, with which Omar and his party were satisfied.

Another dispute arose about the place of his burial: some proposed that he should be buried at Medina; others considered Mecca as more eligible; whilst a third party insisted that he should be laid among the prophets at Jerusalem. This controversy was decided likewise by Abubeker, who declared he had heard Mahomet say, that a prophet should be buried in the place where he died. A grave was therefore made under the bed where the body lay, in which it was interred. Over the spot a chapel was afterwards built, which stands at one of the corners of the great mosque at Medina, founded by Mahomet himself.

Mahomet took no other wife as long as Cadigha lived; but afterwards he had fifteen, some say twenty, most of them cohabiting with him at the same time. Of this number, five died before him, and he divorced six. His greatest favourite was Ayesha, the daughter of Abubeker, though she was accused of being false to his bed; but he pretended not to credit the report of her infidelity, and even added a chapter to the Alcoran, in support of her innocence. His wife Haphsa, the daughter of Omar, was the next in his good graces, and with her he trusted the chest of his apostleship, already mentioned, in which were deposited the original writings relating to his pretended revelations. He took to his bed Zaidah, the wife of one of his enfranchised slaves, at which his disciples were offended; but he composed another chapter of the Alcoran, where he introduced God approving the match.

Besides his wives, he had several concubines, particularly an Egyptian, in his old age; on which being upbraided by his wives Haphsa and Ayesha, he again had recourse to a revelation in defence of his conduct.

Such were the transactions, both public and private, of this extraordinary personage; a man in whose cha-

rafter an austere hypocrisy was joined to a licentious indulgence in pleasure; who appears to have obtained credit from the multitude, even by the extravagance of his fictions; who artfully accommodated his discordant system of religion to the interests and passions of those whom he intended to delude; and who established a veneration for his name, the most extensive, most enthusiastic, and permanent, that ever was known amongst mankind.

Mahomet by his will had appointed Hali, the husband of his eldest daughter Fatima, to be his successor; but notwithstanding this settlement, Abubeker, his father-in-law, and one of his greatest captains, assumed the title of caliph, or sovereign of the Saracens, both in spirituals and temporals. He enjoyed this rank ten years, and was succeeded by Omar, another commander of the Saracen army, who added Persia, Syria, Palestine, Mesopotamia, and Egypt, to his dominions. To him succeeded Osman, a third of Mahomet's military officers, who extended the Saracen empire over all the northern parts of Africa. But the faction of Hali prevailing against him, and being besieged in his own house, he threw himself upon his sword, and died in the eighty-seventh year of his age, and the tenth of his reign. The conqueror ascended the throne, but in less than three years was assassinated by Mahuvias, with eleven of his sons. The twelfth escaping, his posterity afterwards succeeded to the throne of Persia.

The caliphs removed the seat of their empire from Mecca to Bagdat, about the year 756, where they reigned sole sovereigns of the Saracens till the year 863, when the sultans of Egypt, Persia, &c. who were before viceroys of the caliphs of Babylon, assumed each an independent power. From this period, however, the Babylonian caliphs subsisted till the year 1255, when Mustatzem, who then held the royal and pontifical dignity at Bagdat, was starved in his castle, and his whole posterity destroyed by Allan, or Hallon the Tartar. The Saracen sultans were perpetually engaged in wars with each other, or with the Grecian emperors, until they were subdued by the Turks. Their expeditions into the southern parts of Europe will be treated of in the histories of the respective countries.

## A S I A T I C T U R K Y.

## C H A P. I.

*Of the provinces of Eyraca Arabick—Diarbeck—Curdistan—Turcomania—Georgia.*

ASIATIC Turkey is situate between 27 and 48 degrees of north latitude. It is bounded on the north by Circassia, and the Black Sea; on the east by Persia; on the south by Arabia and the Levant; and on the west by the Hellespont, and the Ægean Sea or Archipelago, which separate it from Europe.

This immense territory may be divided into three great divisions, namely, the eastern, the western, and the southern; which, for the sake of perspicuity, may be subdivided into their respective provinces.

The eastern division contains the provinces of Eyraca Arabick, Diarbeck, Curdestan, Turcomania, and Georgia; the latter comprehending Mengrelia, Imuretta, and part of Circassia.

The western division contains Natolia, or Asia Minor, divided into Natolia Proper, Asia, Aladulia, and Caramania.

The southern division contains Syria, and Palestine, or the Holy Land.

Eyraca Arabick is the ancient Chaldea, sometimes reckoned a part of Babylonia, and sometimes a province of Arabia. It lies on both sides the Euphrates and Tigris, having Persia on the east, and Arabia Deserta on the west. The chief towns are, Bagdat, and Bassora.

Bagdat, the capital, is situate in 44 degrees 21 minutes of east longitude, and in 33 degrees 10 minutes of north latitude, upon the Tigris. It was built by Mahomet II. caliph of the Saracens, on the west side of the river; and about the year 1100, another town was built on the east side of the river, and both united by a bridge. It continued the capital of the Saracen empire, till it was taken by the Tartars about the middle of the thirteenth century, when a period was put to that dominion. This city lying upon the borders of Turkey and Persia, has been an object of great contest between those powers, and taken and retaken several times. The Turks, however, have been in possession of it since the year 1689; and here the beglerbeg, or viceroy of the province, constantly resides. The town is near two miles long and one broad, defended by a wall and towers, almost of the form of bastions, with a large moat, and a strong castle upon the river. The principal buildings are, the palace of the beglerbeg; the mosques, of which there are five; the cloysters surrounding the bazars or market places; and the bagnios; all which were built by the Persians, when they were in possession of the place.

Besides the viceroy, three other great officers are constantly stationed here, over whom the former has no authority; they being rather checks to his administration, and accountable only to the divan at Constantinople. Those are, the *cadi*, who is the principal ecclesiastic, and consequently the chief judge; the *testerdar* or treasurer, and the *reis effendi* or secretary. The garrison usually consists of four or five thousand men, horse and foot.

Bassora, or Balsarra, is situate in 47 degrees of east longitude, and 30 of north latitude, three miles from the western shore of Chatal-Arab, or the united stream of the Euphrates and Tigris; with which it has a communication by a deep canal, the tide flowing up between forty and fifty miles higher than the town. The walls are twelve miles in circumference, within which are many void spaces, fields, and gardens. It is supposed to be the best situated for trade of any town in the world, and was the most ancient port-town that history takes notice of in the East. Four months in the year, the merchants from all quarters resort hither, viz. between the first of July and the end of October, when the monsoon fits fair to bring them up the gulph.

The greatest disadvantage to Bassora, is the *chamiel* or hot wind, which blows annually over the country about Midsummer, and is extremely pestilential. At the same season, another distemper is likewise epidemic, which occasions swellings in the groin, neck, and different parts of the body. It is however, not so dangerous as the former.

The customs at Bassora, arising from the merchandise, are the property of the grand seignior; but the prince who is governor of the town, and must always be an Arabian by birth, has a considerable revenue from other articles.

The country between Bagdat and Bassora, which was part of the ancient Babylonia, is one of the richest in Asiatic Turkey; abounding with the finest meadow and pasture grounds, covered with flocks and herds of cattle. But being under the dominion of the indolent Turks, it is not now so well cultivated as formerly.

Some travellers pretend to have discovered the ruins of Babylon, but they appear to have mistaken them for those of Seleucia, which was for some time called New Babylon, and peopled from the old. All that we know of certainty is, that the latter was situated upon the river Euphrates, considerably higher than the place of its junction with the Tigris. Of Seleucia nothing remains but a part of its ruins, Bagdat having been built out of the materials of the ancient city.

The province of Diarbeck, the ancient Mesopotamia, is situate north of Eyraca Arabick or Chaldea, surrounded by the rivers Euphrates and Tigris. The

chief

chief town is Diarbeck, or Caremit, situate in 42 degrees of east longitude, and 37 degrees 30 minutes of north latitude, on the river Tigris, not far from its source. It stands on an eminence, the descent from which to the river is very steep; and is surrounded by a double wall, the most outward being defended by sixty antique towers. In this city is a magnificent mosque, formerly a Christian church; and several handsome piazzas. Besides a great number of Mahometans, it is supposed to contain twenty thousand Christian inhabitants, of which two thirds are Armenians. It is the seat of the beglerbeg or viceroy, who has several fangiackships, or governments subject to him. The country in the neighbourhood is very fertile, abounding in corn, wine, cattle, wild fowl, and all sorts of provisions. The principal manufacture is that of Turkey leather, or maroquins, which employs a fourth part of the natives. The province likewise produces galls and tobacco, of which great quantities are exported.

Another considerable town in this province is Bir, a great thoroughfare to Persia, and situate on the Euphrates. It has a wall and castle for its defence, and two small rivulets run through the town. The Euphrates would be navigable so high as this city, were it not for some cataracts and rocks.

Northward of Bir stands Orfa, likewise on the Euphrates. Here the caravans, travelling from Turkey to Persia, usually rest eight or ten days. This town is surrounded by a strong wall, has a castle for its defence, and is governed by a bashaw, the garrison consisting of about a thousand janissaries and spahis. Great part of the inhabitants are Armenian Christians, who have a considerable manufacture of yellow maroquin or Turkey leather; as Diarbeck has of red, and Tocat of blue. It is supposed that Orfa is the ancient Edeffa; and likewise that in or near this place, Abraham dwelt when he removed from Ur of the Chaldees.

Monful, or Mousful, is situate on the west bank of the Tigris, opposite to the ruins of Nineveh. It is about three miles in circumference, surrounded by a stone wall, and has for its defence a castle, in which the bashaw resides. The caravans from Aleppo to Persia passing through it, and the river being navigable to Bagdat, Bassora, and the gulph of Persia, the town has a brisk trade. The inhabitants are chiefly Armenians and Christians of the Greek communion; but the Mahometan is the established religion; and the garrison consists of four thousand Turks, horse and foot. The chief produce of the adjacent country is galls.

The province of Curdistan, or Assyria Proper, is divided between the Persians and Turks. The western part, which belongs to Turkey, is the least, lying between Persia on the east, and Diarbeck on the west. The chief town is Sherafoul, or Cherazur, the houses of which are hewn out of a rock, on the side of a hill, and ascended by fifteen or twenty steps. At this place the beglerbeg or viceroy of the province resides, and has command of several fangiackships, which have bashaws for their governors.

Arbela lies on the frontiers of Persia, on the river Lycus, which runs through a fine plain, thirty or forty miles in extent. In the middle of this spacious territory is a little hill, and the ruins of a castle, where it is conjectured Darius stood to view the last fatal action between his troops and the Grecians, which terminated the Persian empire.

Betlis is situate near the south shore of the lake of Van, in 43 degrees of east longitude, and 37 degrees 30 minutes of north latitude. This town lying on the confines of the Turkish and Persian dominions, it is said that the bey or sovereign acknowledges subjection to neither power. The adjacent country is mountainous, and almost inaccessible; so that the bey, by securing the passes, could at pleasure cut off the communication between the neighbouring kingdoms. On which account, neither the Turks nor Persians think it their interest to provoke him. One whole day's march before caravans arrive at Betlis, they travel through very steep mountains. The way up to the town is cut through a rock, so narrow, that only one camel can pass at a time. It is built round a hill in the form of a sugar-loaf, that can only be ascended by a serpentine path; and in a castle, on the summit of this mountain, is the residence of the bey.

The province of Curdistan is a very mountainous country, but the hills are covered with good timber and herbage to the top. In the valleys the soil is well watered and rich; but being a frontier province, is not so well cultivated as it might be. The inhabitants chiefly lead a pastoral life, their numerous flocks and herds almost covering the face of the country.

North of Diarbeck and Curdistan, is situate the province of Turcomania, having Media or Adirbitzan on the east, and Natolia on the west. This is the ancient Armenia, and its chief towns are Erzerom and Kars.

The city of Erzerom, the capital, stands at the foot of a mountain, in 41 degrees of east longitude, and 40 degrees of north latitude. It is about two miles in circumference, surrounded by a double wall. The inhabitants consist of near twenty thousand Turks, and six thousand Armenian Christians. Most of the Turks, though only tradesmen, have the title of janissaries, which they purchase of the aga, for the sake of the privileges it confers. A janissary may insult his fellow-subjects with impunity; and for any misdemeanour, is only answerable to the aga, with whom it is always his study to keep upon good terms. Even people of figure frequently enroll themselves in this body, to prevent their being exposed to its violences. But though the janissaries are so valiant at home, they never concern themselves in any war in which the country may be engaged; neither do they receive any pay.

The Armenians and Greek Christians have here each their bishop. Those people are most of them artificers, employed in the leather and copper manufacture; the neighbouring mountains being rich in copper-ore, and some silver. Their chief commodity is furs; but they have a brisk foreign trade with the caravans which pass

pass through the city in their way to Trapezond, on the Black Sea. At Eizerom, the custom-house officers collect the grand signior's duties on all merchandize that passes through the country.

The mountains of this province are usually covered with snow till Midsummer. The air is exceeding cold in winter; and in summer in the valley is as intemperately hot. The vicissitudes of heat and cold, however, are not always so regular; for the weather frequently changes on a sudden, from scorching heat to the opposite extreme, which is the more insupportable as they have hardly any fuel in the country. There is neither tree nor bush to be seen for many miles. Their firing is cow-dung, and other stinking materials, which is said to taint the air, and spoil the food they dress with it.

Kars, or Cars, is situate on a river of the same name, about a hundred miles south of Trapezond. It is two miles in circumference, meanly built, and but thinly inhabited. It is however defended by a double wall, and a castle erected on an inaccessible rock; in which is a numerous garrison, commanded by a bashaw. The Franks, or Christian merchants, complain much of the extortion of the Turks, as they pass through this city.

The town of Van stands in 44 degrees 30 minutes of east longitude, and 38 degrees 30 minutes of north latitude; at the north end of a lake of the same name, which abounds in fish, and is about fifty miles in circumference. It is protected by a castle situate on a mountain, and a numerous garrison.

The province of Georgia is divided between the Persians and Turks, the greater part being under the dominion of the former. In Turkish Georgia are here comprehended Mengrelia, Imeretia, and the south part of Circassia; which several countries are situate between 42 and 46 degrees of east longitude, and between 40 and 45 degrees of north latitude. They lie in the form of a crescent about the east end of the Euxine Sea, having mount Caucasus on the north, the Persian Georgia on the east, and Turcomania on the south.

Georgia, particularly the northern part, is very mountainous; but the mountains are covered with forest and fruit-trees, as well as herbage, and the soil, where cultivated, produces good corn. The inhabitants, however, being generally shepherds, plough no more than is necessary for their subsistence, and they live in tents.

The mountains are generally high, and covered with snow great part of the year. In winter therefore the air is excessive cold, but temperate in the valleys, and and in the summer very hot. The country is exceeding healthful, and the inhabitants remarkable for the natural elegance of their persons, as well as the acuteness of their genius. They are of a good stature, and their features and complexion much admired. Hence the Turks and Persians replenish their harems and seraglios, by means of the Jews of Constantinople and other great towns, who with this view purchase, of their parents or masters, the most beautiful young girls in the country, and give them such an education

as may qualify them either for the royal seraglio, or the harems of bashaws and great men. Neither are the parents, as might be imagined, averse to disposing of their children in this manner; but use every art to improve the beauty of their daughters, that they may sell to the greater advantage. On this account, inoculation for the small-pox has been practised in Georgia for many ages, and hence introduced into our own country. The price paid by the merchants is not the only inducement of the parents to this kind of traffic: they flatter themselves with the expectation, that their daughters shall be advanced to a high rank, and the fortune of their families established. Those hopes are frequently not vain; for when a girl happens to be introduced into the royal harem, or becomes the wife or mistress of a bashaw, it is usual to send for her nearest relations, and promote them to some profitable post.

The youth of this country being for the most part sprightly and ingenious, young lads are likewise purchased, and educated at Constantinople or Ispahan, in such arts as may render them useful members of the state. Out of which seminary the beglerbegs, or viceroys, beys, bashaws, and governors are taken.

The southern provinces of Georgia are subject either to the Persians or Turks; but the northern appear to be independent of any foreign power. They will sometimes acknowledge subjection to Turkey, and at others, to Russia, as may happen to be most convenient; but their attachment is precarious, and the mountainous nature of the country would render it extremely difficult to secure their obedience by force.

In respect to the internal government of the northern parts, the inhabitants seem to be divided only into two ranks or orders, namely, those of lords and slaves. In each subdivision of the country is a chief or prince, to whom the former acknowledge vassalage; but the power of these princes is greatly controuled by the aristocracy. The common people have no exclusive property in the lands or goods they possess. Even their wives and children pertain to their respective lords, who may sell or dispose of them at pleasure. By some of the inhabitants the Mahometan religion is professed, but the greater part are Christians of the Greek or Armenian communion.

#### C H A P. II.

*Of Natolia, or Asia Minor.*

ASIA Minor is divided into four parts, namely, Amasia, Aladulia, Caramania, and Natolia Proper. Amasia comprehends the country known in ancient times by the name of Pontus, or Regis Pontica, so called from the Pontus Euxinus, along which it lay. This was the kingdom of the Mithridates, a succession of kings of that name, and was formerly famous for its poisons.

The first of its chief towns towards the west is Amasia, situate seventy miles south of the Euxine Sea, on the banks of the river Liris, a river famous for its long windings. It was anciently the residence of the kings of Cappadocia, sometimes of the Turkish beg-

beglerbeg or viceroys. It is pleasantly situated on an eminence, having a prospect over an extensive plain on the south. The buildings are mean, nor is it a place of much trade; but there are some magnificent ruins, where the palaces of the ancient princes had formerly stood. Amasia is supposed to be the birth-place of Strabo the geographer. The Greek Christians have here an archbishop.

Sixty miles north-east of Amasia, on the Euxine Sea, stands Themiscyra, now Leris, famous in tradition for having been the capital of the Amazons. Virgil takes notice of it on this account.

Quales Threïcias, cum flumina Thermoodontis  
Pulsant, & pictis bellantur Amazones armis.

Eight miles east of Amasia, stands Comana, a town anciently dedicated to Brillona, whose temple, we are informed by Cicero, was extremely rich, and held in great veneration.

Tocat is situate at the foot of a mountain, in 37 degrees of east longitude, and 41 degrees 3 minutes of north latitude. It is a populous city, inhabited by Turks, Armenians, Grecians, and Jews. The Armenians are mostly mechanics, working in copper and other hard ware; and the Christians here make excellent wine. There is likewise a considerable manufacture of Turkey leather. This town is a great thoroughfare of the caravans bound from Turkey to Persia, Arabia and India. The adjacent country abounds in good fruit, and produces saffron in great quantity.

Trapazond stands likewise at the foot of a mountain, on the shore of the Euxine Sea. It is a large, populous city, well built, and within the walls are groves and gardens intermixed with the houses. It was formerly defended by a strong castle founded on a rock, but now much decayed; as likewise is the harbour, which at present large vessels cannot enter, and therefore their trade is much declined. This place was subject to the Roman and Grecian emperors. About the year 1209, David Comnenus, a Frenchman, usurped the dominion of it, with the title of duke. His successor, John Comnenus, assumed that of emperor, and their descendants continued sovereigns of this town and the neighbouring country, till the year 1460, when Mahomet II. took possession of it, and put to death David, the last of those petty emperors.

Aladulia, or the beglerbelic of Marat, comprehends Cappadocia and Armenia Minor, having Armenia Major on the east, Cilicia on the south, and Galatea on the west. The river Malus or Lima passes through the south of this province, and discharges itself into the Euphrates. The rivers Halys and Iris have here also their rise, and, running northwards, fall into the Euxine Sea. The chief towns are, Cæsarea, now Caïsar, the capital when subject to the Romans; Marat, or Morofeb, situate in the south-east part of the province, near the Euphrates, and usually the seat of the beglerbeg. Another of the chief towns is Nissa, lying on the borders of Armenia.

No. 9.

Caramania, the southern division of the Less Asia; comprehends the provinces of Lycia, Pamphylia, Pisidia, Lycaonia, and Cilicia.

Lycia, now called Montrefeli, has Phrygia Major and Pamphylia on the north and east; the Mediterranean Sea on the south, and Caria on the west; surrounded on every side by mountains, except on the sea-coast. It has three towns of considerable note, one of which is Mira, or Limira, the capital, situated on a river of the same name. Another is Telmessus, one of the six towns allotted by Alexander to the city of Halicarnassus; and the last is Xanthus, which stands on a cognominal river.

Pamphylia has Pisidia on the north, Cilicia on the east, the Mediterranean Sea on the south, and Lycia on the west. The chief towns are, Attalia or Satalia, a port-town, with a castle defending the harbour, the entrance of which is very difficult; Perga, standing on the river Cestrius, remarkable for a temple anciently dedicated to Diana; and Syda or Candabra, a port-town in the east part of the province.

Pisidia is a small province, consisting of one fine plain, encompassed with mountains. Its chief towns are, Antioch, Termessus, and Sagalassus.

East of Pisidia, lies Lycaonia, likewise a small province. One of its principal towns is Lystra, where the inhabitants were about to sacrifice to Paul and Barnabas. Another is Iconium or Cogni, the capital of Lycaonia, and of the whole province of Caramania. This town is situate near a fresh-water lake, about a hundred miles north of the Mediterranean Sea, and here the beglerbeg has his residence.

Cilicia extends two hundred and fifty miles along the coast of the Mediterranean, having Syria on the east, and Pamphylia on the west. The breadth of this province from north to south is about fifty miles. The northern parts are very mountainous, between which and the sea are many difficult passes. The capital of the country is the city Tarsus, the place of St. Paul's nativity. It lies in 33 degrees of east longitude, and 37 of north latitude, on the river Cydnus, the water of which, from its excessive coldness, had almost proved fatal to Alexander, on bathing in it. Tarsus is now called Thorasse, and sometimes Hemsä. Another of the chief towns is Issus, now Ajazzo, situate on a bay of the Levant, near the river Pinarus. At this place happened the second battle between Alexander and Darius. It was taken by the former, but afterwards retaken by the latter, who cruelly put to death the Macedonians left in it. Here Cicero, as he relates, pitched his tent, on the very spot where Alexander had encamped.

Natolia Proper, or Asia Minor, comprehends the provinces of Pontus Paphlagonia, Galatia, Phrygia Major, Lydia or Mænia, Doris, Caria, Ionia, Eolis, Mysia, including Phrygia Minor, and Bithynia.

The name of Pontus anciently extended to all the provinces situated on the southern shore of the Euxine Sea. The province of Pontus Paphlagonia therefore is bounded by this sea on the north, by Cappadocia on the east, Galatea on the south, and by Bithynia on

C c

the

the west. The chief towns are Heraclea, now Penderachi, a port-town in the north-west part of the province; Claudiopolis, an inland town, south of Heraclea; and Amastris, a port-town, east of Heraclea. This town took its name from a Persian lady, the daughter of Oxyathras, brother of Darius Codomanus, and the consort of Dionysius, tyrant of Heraclea. Pliny, in a letter to Trajan, calls it an elegant and greatly ornamented city, particularly on account of a very beautiful and extensive street.

Sinope, a port-town, is situated on an isthmus formed by the Euxine Sea, in 37 degrees of east longitude, and 42 of north latitude. This city is of so great antiquity, that Strabo refers it to the Argonauts; yet it remained inconsiderable till it received a colony from the Milesians; after which it became very flourishing. It was at length taken by Pharnaces, king of Pontus, grandfather of the Mithridates conquered by the Romans, and became the royal residence. This city, which yet retains its ancient name, is memorable for having given birth to Diogenes the Cynic.

Of Galatia, which lies south of Paphlagonia, the chief towns are, Therma, remarkable for its hot baths; and Angouri or Ancyra. This city is said to have been built by Midas, king of Phrygia, and to take its name from an anchor found at the place. The neighbourhood of Ancyra was the scene of two great battles; in one of which Pompey obtained a victory over Mithridates, and in the other, Tamerlane defeated Bajazet, whom he also made prisoner, about the year 1400. The city within the walls is inhabited by Turks; the Armenian and Greek Christians live in the suburbs, not being permitted to enter the gates. It is computed that the inhabitants amount to forty-five thousand, of whom forty thousand are Turks. In the neighbourhood of this city is an extraordinary breed of wild goats, with hair as soft as silk, of which are made the finest stuffs.

Phrygia Major, the present Gormian, is an inland province, having Bithynia on the north, and Pamphylia on the south; and giving rise to the rivers Sangarius, Hermus, Murcius, and Meander. One of its chief towns is Chintania or Chontania, formerly called Cotæum, once the seat of the Turkish emperors, and now of the beglerbeg.

The next chief town is Gordium, the seat of Gordion, king of Phrygia, situated on the river Sangarius. Here anciently stood a temple of Jupiter, in which, tied with cords to a pillar, was a chariot dedicated to the sun. A tradition prevailing, that whoever could untie the knots that fastened it, should have the dominion of Asia, Alexander, after several attempts, cut the knots with his sword; saying it was no matter how they were undone, provided that the chariot was unloosed; and he thenceforward flattered himself with the conquest of Asia.

The other chief towns are, Apamea, Colossæ, and Hierapolis. Colossæ was once a considerable city, to which St. Paul directed one of his epistles. It was destroyed by an earthquake, in the time of Nero, and now lies in ruins.

Hierapolis was seated upon a portion of the Messogis, beneath the summits of the mountain. At a distance, this object appears as a white lofty cliff, composed of chalk; but on coming more near, the traveller is astonished to find it exhibit to the view an immense frozen cascade, with its surface wavy, as of water suddenly fixed. This extraordinary phenomenon is an incrustation, produced by the hot waters of Hierapolis, anciently famous for their petrifying quality.

The road up to the ruins, which appears as a wide and high causeway, is likewise a petrification; overlooking many green spots, once vineyards and gardens, separated by partitions of the same substance. The ruins are situated on a flat, to which, as travellers ascend, they pass by sepulchres with inscriptions, and behold the theatre on the right hand. Near the margin of the cliff are the remains of a huge structure, supposed to have been either baths, or a gymnasium. Beyond are the massive walls of edifices, several of them leaning from their perpendicular, and seeming every moment ready to fall; the effects of violent earthquakes, to which the country is extremely subject. In a recess of the mountain is the area of a stadium. The site has been computed about two hundred paces wide, and a mile in length. The theatre is a very large and sumptuous structure, and the most entire that is to be seen in those parts. A portion of the proscenium is standing. In the heap which lies in confusion, are many pieces of sculpture well executed in basso relievo, with fragments of architecture inscribed, but disjointed; or so immured with massive marbles, that it would be extremely difficult to obtain any information from them. The character is large and bold, with ligatures. The marble seats are still unremoved; and the numerous ranges are divided by a low semicircular wall, near mid-way, with inscriptions on the face of it, but mostly illegible. In one of those, which is short and imperfect, Apollo Archigetes, or *the leader*, is requested to be propitious. In another compartment, mention is made of the city by its name Hierapolis; and on a third is an encomium in verse, which may be thus translated: "Hail golden city Hierapolis, the spot to be preferred before any in wide Asia; revered for the rills of the nymphs; adorned with splendor!"

It may not here be improper to remark, that from the appearance of several theatres and a stadium, in this country, in which many of the seats remain in their places and entire; and from considering the height, width, and manner of arrangement, there is reason to believe that the ancient Asiatics sat at their plays and public spectacles, in the same manner as the modern, with their legs crossed and gathered under them, and probably upon carpets.

The waters of Hierapolis were peculiarly qualified for dyeing wool, giving it from roots a tincture which rivalled the purple, and were a principal source of the riches of the place. The company of dyers is mentioned in an inscription on a square building among the sepulchres. The Plutonium, or pestilential cavern, for which Hierapolis was likewise anciently noted, we

are informed yet remains. Of this city was Epictetus, the Stoic philosopher.

The province of Lydia, or Mœnia, has Phrygia on the north, and Cassia on the south. This was the kingdom of the celebrated Crœsus. The capital city Sardis was situate on the river Pactolus, about seventy miles east of Smyrna. It was once the finest city in Asia Minor, and one of the seven churches mentioned in Scripture; but being demolished by an earthquake, lies now in ruins. The site of it, which at present is named Sait, is green and flowery. Coming from the east, we have the ground-plot of the theatre on our left hand, with a small brook running before it. This structure was in a brow, which unites with the hill of the acropolis, and was called Prion. Some pieces of the vault, which supported seats, and completed the semicircle, remain. Going on, we pass by remnants of massy buildings; marble pieces sustaining heavy fragments of arches of brick; and more indistinct ruins. These are in the plain before the hill of the acropolis. On the right hand, near the road, is a portion of a large edifice. The walls are standing of two large, lofty, and very long rooms, with a space between them, as of a passage. This is conjectured to have been the house of Crœsus, once appropriated by the Sardians, as a place of retirement, to superannuated citizens. It was called the gerusia, and in it, as some Roman authors have remarked, was exemplified the extreme durability of the ancient brick. The walls in this ruin have double arches beneath, and consist chiefly of brick; with some layers of stone. The bricks are extremely fine and good, of various sizes, some flat and broad; and were united with a cement so tenacious, that it is said to be unsusceptible of decay.

The hill of the acropolis appears from the plain to be triangular. It is sandy, and the sides rough. The eminence affords a fine prospect of the country, and in the walls are two or three fragments with inscriptions. Not far from the west end is the celebrated river Pactolus, which rises in mount Tmolus, and once flowed through the middle of the agora, or market-place of Sardis, in its way to the Hermus, bringing down from the mountain bits of gold. The treasures of Crœsus and his ancestors were collected chiefly from the river, but in time the source failed. The Pactolus, after snow or rain, rushes down in a torrent. At other times the stream is shallow, the bed sandy, in colour inclining to a reddish yellow.

In ascending the acropolis, we are suddenly struck with the view of the ruin of a temple, in a retired situation, beyond the Pactolus. Five columns are standing, one without the capital, and another with the capital awry. The architrave was of two stones. It is conjectured that this was the temple dedicated to the local goddess Cybele or Cybele, and which was damaged in the conflagration of Sardis by the Milesians. It was of the Ionic order, and had eight columns in front. The shafts are fluted, and the capitals designed and carved with exquisite taste and skill. It is impossible to behold, without deep regret, this imperfect remnant of so beautiful and glorious an edifice.

Before Sardis, on the opposite side of the plain, are many barrows on an eminence. Near the lake Gygæa, which was within forty stadia, or five miles of Sardis, was the burying-place of the Lydian kings; and here the barrows are of various sizes. Four or five are distinguished by their superior magnitude. All of them are covered with green turf, and retain their conical form. One of the barrows on this eminence, near the middle, and towards Sardis, in Lydia, is inferior only to the works of the Egyptians and Babylonians. It was the monument of Halyartes, the father of Crœsus.

Not far thence is mount Sipylus, to a phenomenon extant in which, the fable of the transformation of Niobe, the daughter of Tantalus, is indebted for its origin. This phenomenon is found to be the effect of a certain portion of light and shade on a part of Sipylus, perceivable at a particular point of view.

Another of the towns of Lydia is Philadelphia, likewise one of the seven churches. It is now a poor town, called Ala-shakir, inhabited by about two thousand Christians. The most remarkable object here is the remnant of a duct, which has conveyed water of a petrifying quality. The water has incrusted some vegetable substances, which have perished, and left behind, as it were, their moulds.

The next town of Lydia is Thyatira, likewise one of the seven churches which were addressed by St. John. It is situate on the river Hermus, thirty miles north-west of Philadelphia, and is now called Ak-hissar.

Laodicea, another of the seven churches, is situate on the eastern limits of this province. It is mentioned by Cicero, as considerable for trade, but is now in ruins. The first ruin which presents itself is of an amphitheatre, in a hollow, the form oblong, and the area about a thousand foot in extent, with many seats remaining. At the west end is a wide vaulted passage, designed for the horses and chariots, about a hundred and forty foot long. The entrance from without is choked up, except a small aperture, at which a glimmering light enters; and the soil has risen above the impost of the interior arch. This has an inscription on the mouldings in large characters in Greek, which may be thus translated: "To the emperor Titus Cæsar Augustus Vespasian, son of the emperor, the god Vespasian; and to the people, Nicotratus the younger, son of Lycius, son of Nicotratus, dedicated . . . . at his own expence: Nicotratus . . . . his heir having completed what remained of the work, and Marcus Ulpus Trajanus the proconsul having consecrated it." The seventh consulate of Vespasian falls on the seventy-ninth year of the Christian æra, and the consulship of Trajan on the eighty-second. Twelve years were consumed in perfecting the structure.

Near another ruin is a pedestal with an inscription, which illustrates that on the arch. It relates to the same family, and to the two benefactors. "The senate and people have honoured Tatia, daughter of Nicotratus son of Pericles, a new heroine, on account of the magistracies, ministries, and public works of her father, and likewise on account of her great

uncle Nicostrotus, who lately, besides his benefactions, was priest of the city, and changed the stadium into an amphitheatre." The city increasing, the stadium, it should seem, was not sufficiently capacious, but Nicostrotus enlarged or lengthened it, and converted it into an amphitheatre.

On the north side of the amphitheatre, towards the east end, is the ruin of a large edifice. It consists of many piers and arches of stone, with pedestals and marble fragments. This fabric was perhaps the repository of the laws, and contained the senate-house, and public offices. At the east end of this ruin, is a mass of incrustation formed by the current, which was conveyed to it by earthen pipes; the waters of Laodicea having a petrifying quality, like those of Hierapolis.

From this ruin may be seen the odéum, which fronted the south. The seats remain on the side of the hill. The proscenium lies in a confused heap. The whole was of marble. Sculpture had been lavished on it, and the style favoured less of Grecian taste than Roman magnificence.

On the bank of the Mæander, we discover the ruin of an ancient bridge, consisting of half the central arch, with one smaller arch entire; and we may observe some stones and vestiges of a building, which is supposed to have been a temple of Menee, called Carour; a deity that was worshipped in a peculiar manner. The temple was between Caroura and Laodicea, and had once been a great seminary of physicians.

The river Mæander, which makes so many windings in this country, was anciently noted for the production of new land, occasioned by its passing through the ploughed grounds of Phrygia and Caria; whence collecting much slime, it added to the coast at its mouth. The Mæander was indistinct for removing the soil, when its margin tumbled in; and the person who recovered damages was paid from the produce of the ferries. Those downfalls of the banks were very frequent, and are supposed to be the cause of the winding so remarkable in the channel of this river. From the alterations already effected at the mouth of the Mæander, there is reason to conclude, that in a series of years the shore will protrude far into the sea, and perhaps unite the islands which at present lie at a distance.

Caria and Doris, usually laid together, compose that province now called Adinelli; having the Mediterranean Sea on the south and west. In this province stood Miletus, a city of great antiquity, said to have been built by Miletus, the companion of Bacchus. This once flourishing emporium is now a very mean place, but still called Palat or Palatia, *the palaces*. The chief relic of its former magnificence is a ruined theatre, which is visible afar off, and was a most capacious edifice, measuring in length four hundred and fifty-seven foot. The external face of this vast fabric is marble. The proscenium or front has been removed. The seats ranged, as usual, on the slope of a hill, and a few of them remain. The vaults

which supported the extremities, with the arches or avenues in the two wings, are constructed with great solidity.

The whole site of the town, to a great extent, is spread with rubbish, and over-run with thickets. The vestiges of the ancient city are pieces of wall, broken arches, and a few scattered pedestals, with inscriptions, a square marble urn, and many walls. This was the country of Thales, one of the seven wise men; and of Anaximander, his scholar and successor, the inventor of sun-dials; of Anaximenes, the philosopher; Timotheus, the celebrated musician, and other eminent persons. Among the numerous trophies of this ancient city, it was famous for its wool.

— — — — — quamvis Mileſia magno  
Vellera mutantur, Tyrios incocta rubores.

Myndus is a port-town on a bay of the sea, in a part of the division called Doris. This is the city which Diogenes, the cynic, observing to be very small, and the gates disproportionately large, called to the inhabitants to shut their gates, to prevent the escape of the town.

Priene was situate on the side of mount Mycale, near which the Ionians celebrated the Panionis, or yearly assemblies in honour of Heliconian Neptune. It was also the country of Bias, one of the seven wise men; who, when the place was taken by the enemy, and the citizens were flying with their most valuable effects, being asked, why he did not do as they did? replied, he always carried his best effects with him, meaning his philosophy and wisdom. Being a man of the strictest equity, *Justitia Priennis* became proverbial.

This city was famous for the temple of Minerva Polias, the remains of which yet evince its former elegance and grandeur. When entire, it overlooked the city, which was seated on the side of the mountain, flat beneath flat, in gradation, to the edge of the plain. The areas are levelled, and the communication preserved by steps cut in the slopes. Below the temple are broken columns, and pieces of marble, the remains of edifices of the Ionic and Doric orders. Farther down is the ground-plot of the stadium, by the city-wall. The area was narrow, and the seats ranged only on the side facing the plain. The whole circuit of the wall of the city is standing, besides several portions within it of admirable solidity and beauty.

At Ure, about twenty-two miles from Miletus, is the celebrated temple of Apollo Didymæus. It is approached by a gentle ascent, and seen afar off, the land towards the sea lying flat and level. The columns, yet entire, are so exquisitely fine, and the marble mass so vast and noble, that it is impossible perhaps to conceive greater beauty and majesty of ruin.

Halicarnassus, once a flourishing city, is now nothing more than a heap of ruins. No vestige remains of the tomb erected by Artemisia for her husband Mausoleus, though formerly esteemed one of the seven wonders. Of this city was Herodotus, called by Cicero the *Father of History*; and likewise Dionysius, not only a good historian but a critic.

Ionia

Ionia and Eolis form in conjunction a long track of land, extending from south to north, upon the coast of the Archipelago. In this territory was situate Ephesus, lying in 27 degrees 40 minutes of east longitude, and 37 degrees 5 minutes of north latitude; the most illustrious city of Ionia, and called by Pliny, the bright ornament of Asia. Here stood the celebrated temple of Diana, which Erostratus burnt to perpetuate his memory, the same night that Alexander was born. Many grand ruins are yet to be seen, of the stadium, theatre, odéum, and other buildings; and some of them supposed to be the remains of Diana's temple, there having been a second erected to the honour of that goddess, not inferior to the former. The Ephesians are now a few Greek peasants, living in extreme wretchedness, and insensibility; the representatives of an illustrious people, and inhabiting the wreck of their greatness; some the substructions of the glorious edifices which they raised; some beneath the vaults of the stadium, once the eroded scene of their diversions; and some, by the abrupt precipice, in the sepulchres which received their ashes. Of this place was Heraclitus the weeping philosopher, Hipponax the poet, and Parrhasius the celebrated painter.

On the banks of the Cayster, near Ephesus, are thick groves of tall reeds, some of which are more than twenty foot high. This extraordinary luxuriance is perhaps the reason why the river-god is represented on the Ephesian medals with this aquatic, as one of his attributes.

Myds was originally seated on a bay of the sea; but the bay being changed into a lake, became fresh; and the town was so much infested with gnats, which swarmed from the water, that the inhabitants retired to Miletus. The site of Myds is as romantic as its fortune was extraordinary; and there are here many remnants of antiquity to attract the attention. The city-wall, which was constructed with square towers, like that of Ephesus, is still standing, except on the side towards the water. We behold the theatre hewn in a branch of mount Titanus, with some mossy remnants of the wall of the proscenium; but the marble seats are removed. The principal and most conspicuous ruin is the small temple of Bacchus, is seated on an abrupt rock, with the front only, which is, towards the east, accessible. The roof is destroyed. The cell is well built of smooth stone covered with a brown crust. The portico was *in antis*. The marbles which lie scattered about, the broken columns, and mutilated statues, all witness a remote antiquity.

Without the city are the cemeteries of its early inhabitants; graves cut in the rock, suited to the human stature at all ages; with innumerable flat stones, which served as lids.

The city of Myds was allotted to Themistocles, by Artaxerxes, to furnish his table with fish, in which the lake greatly abounds.

At the head of the lake are vestiges of an ancient building, supposed to have been Thymbria. By it was a charonium or sacred cave; one of those which the ancients imagined to communicate with the infernal regions.

No. 9.

At Zillé, the ancient Claros, some ruins are to be seen, supposed to be of the temple of Apollo, who had an oracle at this place; but there seems to exist no memorial of the sacred grove of ash-trees. In the neighbourhood of Claros, stood Colophon, one of the cities which laid claim to the birth of Homer.

At Lebedus, which was anciently noted for its hot waters, are vestiges of an old wall; within which, beside rubbish, are some pieces of Doric columns. This was the great residence of stage players, and the place where people assembled from all parts of Ionia, to celebrate annual games in honour of Bacchus.

Teos, now called Bodrun, is at present almost entirely desolate. The walls appear to have been about five miles in circuit; without which are vaults of sepulchres stripped of their marble. Here are the remains of a temple of Bacchus, one of the most celebrated structures in Ionia; and a theatre is conspicuous in the side of the hill. This was the country of Anacreon the poet, Hecateus the historian, and Protagoras the philosopher. The books of the latter, as containing atheistical doctrines, were burnt by order of the Athenians; and his father Menander was so opulent, as to entertain Xerxes and his numerous attendants on his march against Greece.

In the time of Anacreon, the Teians migrated, from a love of liberty, to Thrace; but some of them returning, the city again flourished. It is now however deserted, and likely to continue in that situation. The site is a wilderness; and the low grounds, which are wet, produce the iris or flag, which was stamped on the money of Teos.

Erythræ has long been deserted, and even stripped of its ruins, except some vaults of sepulchres, and other fragments. The walls of Erythræ were erected on two semicircular rocky brows, and had square towers at regular distances. They were very thick, the stones massive and rugged, of the masonry called pseudisodomum. In the middle was a shallow purling stream, clear as crystal, which now turns a solitary mill in its way to the sea. This rivulet was anciently named Alcos, and was remarkable for producing hail on the bodies of those who drank of it. Near the mouth is a piece of ordinary mosaic pavement. By a conical hill on the north, are vestiges of an ample theatre in the mountain side. Of the celebrated temple of Hercules no traces now remain.

Passing by the site of Clazomene, of which no vestige is discoverable, we arrive at Smyrna, seated on the bottom of a fine bay, in 27 degrees of east longitude, and 37 degrees 30 minutes north latitude. The town is about four miles in circumference; the river Melus running through it, on the banks of which it is said that Homer was born. It has a large commodious harbour, commanded by a castle at the entrance, and is the principal mart of the country. Though the situation of Smyrna is exceeding pleasant, the climate, during great part of the year, is excessive hot, unhealthy, and subject to earthquakes. It was one of the seven churches addressed by St. John.

In several places may yet be discovered vestiges of the old wall, which is of a solid massive construction.

D d

It

It consists of hard cement and rubble, but has been faced with better materials. The ground-plot of the stadium is still observable, though stripped of its marble seats and decorations, and now subjected to the culture of the plough. It appears as a long dale, semicircular or rounded at the top. One side was on the slope of mount Pagus, and the other raised on a vaulted substruction, which remains.

The ladies here wear the oriental dress, consisting of large trowsers or breeches, which reach to the ancle; long vests of rich silk, or velvet, lined in winter with costly furs; and round their waist, an embroidered zone with clasps of silver or gold. Their hair is platted, and descends down the back, often in great profusion. The girls have sometimes above twenty thick tresses, besides two or three encircling the head, as a coronet, and set off with flowers and plumes of feathers, pearls, or other jewels. They commonly stain it of a chestnut colour, which is the most desired. Their apparel and carriage are alike antique. It is remarkable that the trowsers are mentioned in a fragment of Sappho, as part of the female dress.

Mysia, including Phrygia Minor, lies between the sea of Marmora or Propontis, on the north, and Lydia on the south, having the Archipelago on the west. Through this province runs the river anciently called Granicus, on the banks of which Alexander obtained his first victory over the Persians.

Pergamus is situate near the Egean Sea, in 27 degrees 30 minutes of east longitude, and 38 degrees of north latitude. This was the royal residence of Eumenes, and of the kings of the Attali; the last of whom, by his will, transferred the kingdom to the Romans. Here stood an ancient temple of Esculapius, of which no vestige remains. The ornament of Pergamus was the royal library, which contained, according to Plutarch, two hundred thousand volumes. In this city were invented the membrana pergamena, or parchment, for the use of books, and likewise tapestry. It was the birth-place of Galen, and Oribasius, and one of the seven churches threatened by St. John.

Lampacius is situate on the southern shore of the Propontis, and retains its ancient name. It was assigned by Artaxerxes to Themistocles, for furnishing his table with wine, in which the country abounded. Alexander having threatened this city with ruin, for the favour it had shewn to the Persians, it was saved by the address of Anaximenes the historian, who was sent by his fellow-citizens to deprecate the king's displeasure. The latter being informed of the design, solemnly declared he would do the very reverse of Anaximenes's request; who therefore, on his arrival, begged the king utterly to destroy Lampacius; which he could not do on account of his oath.

On the promontory, high above the sea, stands Sigéum, now Giaurkioi, a despicable village. The high hill of Giaurkioi was the acropolis or citadel of the ancient town; and a mean church on the brow at present occupies the site of the Athenæum or temple of Minerva; the remains of which, consisting of marble fragments, are scattered round. The famous Sigeian inscription lies on the right hand as we enter this

building; and on the left is part of a pedestal, of fine white marble, with sculpture in bas-relief, the subject of which is the representation of young children, with the accustomed offerings to Minerva. Within the same building was found a marble, once deposited in the precincts of the temple, and now preserved in the library of Trinity College in Cambridge. It contains a decree made by the Sigéans two hundred and seventy-eight years before the Christian æra; and enacts, amongst other articles, the erecting in the temple an equestrian statue of king Antiochus on a pedestal of white marble, with an inscription, in which his religious regard for the temple is mentioned, and he is styled the saviour of the people. The temple of Sigéum was of remote antiquity, if not coeval with the city, which is said to have been built from the ruins of Troy.

The ruins of the ancient Ilium were fought for in vain in the time of Julius Cæsar.

———— tota teguntur

Pergama dumetis: etiam periere ruinae. LUCAN.

Of the Troja Nova, which is supposed to have been built by Alexander the Great, or at least much enlarged by him and Lysimachus, there are some noble remains; but the ingenious Mr. Wood strongly contends, that this place must be at a considerable distance from the famous Ilium. This opinion he founds upon an examination of the present state of the Troad, compared with the topographical scenes, and some of the incidents in the Iliad. The present Troy, he observes, stands upon the sea; but this is not the Troy of Homer; for that was higher up, and looked towards the Hellespont, not towards the Egean. He is certain that the Scamander is considerably changed from what it was in the days of Homer. The hot spring, according to the poet, was one of the sources of this river: but it is now much lower than the present source, and has no communication with the Scamander. The fountains whence the river took its rise were, according to Homer, close by the walls of the city: but the ground about the fountain, observed by Mr. Wood, is too steep and rugged for the situation of a city. Such a situation, he observes, cannot be made to accord with the pursuit of Hector, nor with many other incidents in the poem. The distance also of the present source from the Hellespont is too great to admit of the actions of the day. For these reasons, Mr. Wood fixes the situation of the city lower down than the springs of the Scamander; and he likewise ventures to cut off some miles from our ancient map of the Trojan plain, upon a presumption, supported by the natural history of the country, that a great part of the plain, which extends to the Hellespont, has been produced since the time of Homer.

It is not to be questioned, that in the course of near three thousand years, the Troad, as well as other parts on the Ionian coast, has undergone great alterations; but it would perhaps be precipitate to determine those alterations, from the dissimilarity between the present state of this territory and the representation of it in Homer. Nothing is more probable, than that much

of the scenery in the Iliad existed only in the poet's imagination; and that this was the case, there seems additional reason to conclude, from the admired episode at the beginning of the twelfth book, intended to obviate the question, why no ruins remained of the Grecian wall. This passage being so pertinent to the subject in controversy, deserves to be quoted.

“ This flood, while Hector and Achilles rag'd,  
While sacred Troy the warring hosts engag'd;  
But when her sons were slain, her city burn'd,  
And what surviv'd of Greece to Greece return'd;  
Then Neptune and Apollo shook the shore,  
And Ida's summits pour'd their wat'ry store;  
Rhesus and Rhodius then unite their rills,  
Caresus roaring down the stony hills,  
Æsepus, Granicus, with mingled force,  
And Xanthus, foaming from his fruitful source;  
And gulphy Simois, rolling to the main  
Helmets, and shields, and godlike heroes slain:  
These turn'd by Phœbus from their wonted ways  
Delug'd the rampires nine continu'd days;  
The weight of waters saps the yielding wall,  
And to the sea the floating bulwarks fall.  
Incessant cataracts the thund'ring pours,  
And half the skies descend in sluicy show'rs;  
The god of ocean marching stern before,  
With his huge trident wounds the trembling shore,  
Vast stones and piles from their foundation heaves,  
Andwhelms the smoaky ruins in the waves.  
Now smooth'd with sand, and levell'd by the flood,  
No fragment tells where once the ruin stood.”

But whatever increase or change the plain may have received since the siege of Troy, the adjacent mountains could not easily be affected by the cause of any such alteration. We therefore find that mount Gargarus, Cotylus, and Lectum, have only changed their names; and continue to make the same conspicuous figure, which distinguished them in the Iliad. The description given by Homer of mount Ida likewise corresponds with its present state; for its numerous summits are still covered with pine-trees and it abounds with fountains.

According to Mr. Wood's computation, the ancient kingdom of Priam includes in its circumference about five hundred English miles. Of this above two hundred are a maritime tract, washed by the Propontis, Hellespont, and Ægean seas. Few spots of equal extent enjoy more natural advantages. The climate is temperate and healthful; the hills are covered with woods; and the plains, which are fertile, well watered. The country produces oil; and in ancient times some parts of it were famous for wine. There are mineral waters, and hot baths, which the natives use for several disorders; and the mountains contain mines, which probably might be wrought to advantage.

That part of the territory in which Troy stood, presents to the eye of the spectator an extensive plain, diversified with a few barrows, and divided by the Scamander. This celebrated river springs from a rock in mount Ida; and dripping in a small quantity down a romantic woody cliff, it is soon joined by another stream.

The whole length of its course, in a strait line, is computed to be about twenty-three miles; but far above this extent, if its numerous windings be included. Near Ene, a considerable village, it receives the Samois, amidst corn fields interspersed with fine mulberry trees. At the times when the Scamander has been visited by travellers, it was in its lowest state, with hardly water sufficient to support a continued current to the sea. It represented a succession of several small streams, produced from different springs; all which were absorbed in the gravelly channel, after a short and languid course. In this situation it must have been on the march of the Persians towards Greece, when we are told by Herodotus, that it was drank up by Xerxes's army.

Bithynia, called by the Turks Beefanguel, is bounded on the west by the Thracian Bosphorus, and a part of the Propontis; on the south by the river Rhyndacus and mount Olympus; on the north by the Euxine Sea; and on the east by the ancient Paphlagonia. It was so rich and fruitful a country of old, as to be distinguished by the title of *Bilbynia Divus*; but, like all the provinces of the Turkish empire, it is now less cultivated than formerly. The chief town is Prusa or Prurfa, the capital of all the Turkish dominions in Asia, situate at the foot of mount Olympus, in 29 degrees of east longitude, and 40 degrees 30 minutes of north latitude. It is about two miles in length, surrounded by an antique wall, well peopled with Turks, Jews, and Grecian and Armenian Christians. Here are thirty mosques, and several noble caravanferas, with a grand bazaar or exchange. The town is well watered with rivulets descending from mount Olympus, and almost every house has its fountain. Here is the best manufacture of silk in the Turkish dominions, the raw silk being produced in the neighbourhood. They have also a manufacture of tapestry; and a great quantity of excellent wine is made by the Christian inhabitants. The grand seignior's palace at Prusa is in a ruinous condition; but there are still the tombs of the first Turkish emperors and their sultanas, over which are erected little chapels covered with domes. Mount Olympus, in the neighbourhood, is one of the highest mountains in Asia Minor, barren towards the top, and covered with snow great part of the year; but the valleys near it are temperate, and produce great variety of fruit.

Within a mile of Prusa are the celebrated baths of Calipsa, whither people resort from the distance of several hundred miles. The apartments are all paved and lined with marble, and the baths are supplied with water of different degrees of heat. Of the city of Prusa, was the famous physician Asclepiades.

Nice, another town of this province, is situate near the lake of Aschana, or Ascu, in 30 degrees 5 minutes of east longitude, and 41 degrees of north latitude. It was anciently the metropolis of the country; and hither the emperor Constantine summoned the first general council, to consider of the doctrine of the Arians.

Chalcedon, or rather its ruins, lie nearly opposite to Constantinople. It was a flourishing city in the fourth

fourth century, at which a fourth general council was held. In ancient times, this place was called the *city of the blind*, from the answer of the oracle to the Greeks who built Byzantium, ordering to look for a settlement opposite to the country of the blind, meaning the Chalcedonians, who coming to the spot where Byzantium stands, chose a worse situation on the other side.

About eighty miles east of Chalcedon, lies Nicomedia, anciently a large city, and furnished the Beautiful. It was famous not only under its own kings, but also under the Romans; and was the royal residence of Dioclesian, and of Constantine, while Constantine was building. It is still a populous town, of considerable trade. Their chief manufactures are silk, cotton, earthen ware, and glass.

### C H A P. III.

#### *Of Syria, and Palestine, or the Holy Land.*

**S**YRIA is situate between 35 and 41 degrees of east longitude, and between 31 and 37 degrees of north latitude. It is bounded on the north by Tirocomania or Armenia, and Aladulia; on the west by the Levant Sea, and Cilicia or Caramania; on the south by Arabia; and on the east by the river Euphrates, which divides it from Diarbeck or Mésopotamia. Such are the boundaries of modern Syria; but the ancient kingdom of this name, which was governed by Seleucus and his successors, extended as far eastward as Persia.

The country is at present divided into three governments: namely, that of Aleppo, Tripoli, and Damascus or Scham; each of which is subdivided into sangaicks or inferior governments, commanded by their respective bashaws, under the governor of the province.

Of those several governments, the most northerly is the beglerbegship of Aleppo; the capital of which, bearing the same name, is situate in 37 degrees 40 minutes of east longitude, and in 36 degrees 30 minutes of north latitude, about ninety miles east of the Levant sea: this city stands on four eminences, in the middle of a spacious plain. It is of an oval figure, about three miles in circumference, surrounded by a stone wall, and having a castle in the center, on the highest eminence. The town is better built than most of those in Turkey, and contains many mosques, caravanseras, bagnios, fountains, and reservoirs of water. It is environed with fine gardens, vineyards, and orchards of apples, oranges, lemons, cherries, and other fruits. Hardly any town in the dominions of the grand seignior carries on a more flourishing trade. Here most of the maritime powers in Europe have their consuls and factors. The articles of commerce are chiefly silks, carpets, mohair yarn, shagreen, Turkey leather, cotton, and other produce of Persia and Turkey. It is computed, that in the city and suburbs, there are not less than two hundred thousand souls; of which forty thousand are Christians, who

reside in the latter. The beglerbeg of Aleppo commands all the country between the Levant and the river Euphrates; but the governor of the castle is independent of his jurisdiction.

The soil in the neighbourhood of the city produces good crops of wheat and barley. Olive-trees and capers are very frequent; but the grass being burnt up in the fair season, there is a deficiency of pasture.

The port-town to Aleppo is Scanderoon, situate on the Levant, in 37 degrees of east longitude, and 36 degrees 15 minutes of north latitude. It had anciently the name of Alexandretta, and is supposed to have been built by Alexander the Great. It is at present inhabited chiefly by seamen; the insalubrity of the air, caused by the salt-marshes in the neighbourhood, rendering it a disagreeable residence to those who are under no necessity of following an employment in the town.

When any vessel arrives at Scanderoon, the factors immediately send advice of it to Aleppo, by pigeons, bred at the latter of those towns, and which fly home in about five hours, though the distance between the two places is almost ninety miles.

Thirty miles south of Scanderoon, lie the ruins of Antioch, once the capital of Syria. Here the professors of the doctrine of Christ first received the name of Christians: hence in the middle ages it was dignified with the name of Theopolis, or the city of God.

Tripoli Asiatic is situate on the Levant, in 36 degrees 15 minutes east longitude, and 34 degrees 30 minutes north latitude, about a hundred miles south of Scanderoon. It was the capital of that part of Syria, called anciently Phœnicia, the people of which excelled so much in navigation and other arts in the earliest ages, and settled colonies in the remotest parts of Europe and Africa; and is at present the chief town of one of the divisions of Syria, and the seat of the viceroy. It is rather a road than a harbour, there being very little security for the shipping which lies here. There are however six square towers built along the shore, to protect the place from pirates; but not provided either with arms or ammunition. It stands at the foot of mount Libanus, whence a rivulet runs through the gardens, which abound in orange and mulberry trees. A considerable silk manufacture is established in the town.

Twenty miles south of Tripoli are the ruins of Botrys, said to have been built by Saturn; and twelve miles farther lie those of Byblus, famous for a temple of Apollo, who is supposed by some to have been born at this place. It was formerly a town of great extent and magnificence, but at present very inconsiderable. It is encompassed with a dry ditch, a wall, and square towers, forty yards distant from each other. Near this town is the river Adonis, called by the Turks, Ibrahim Basha, famous in the poets for the metamorphosis of a beautiful shepherd youth, the favourite of Venus, who was killed by a wild boar. Here the women annually lamented his unhappy fate, when in flood-time, the river was tinged with a red earth, a phenomenon which they imagined to be produced by an hæmorrhage from his wounds.

A little farther south is the river Licus, otherwise Canis, called by the Turks, Nahor Kelp. It is said to have received its name from an oracular image, in form of a dog, which in ancient times was here worshipped. The body of this idol is pointed out to strangers, lying with its heels upwards in the water. Not far thence, on the river Beroote, is a mosque, formerly a chapel sacred to St. George, who, according to tradition, killed the dragon at this place. The spot was anciently named Berytus, from which the idol Baal Berith is supposed to have had its name. It had afterwards many privileges conferred on it by Augustus, with the name of Julia Felix. At present, however, it retains nothing of its ancient felicity, except the situation, in which respect it is very happy.

On the same coast, about seventy miles south of Tripoli, stands Sidon, or Sayd, the mother of Tyre, and the first city that attempted a foreign trade by sea. It was famous for its manufacture of glass, and of fine linen. The Sidonians are said to have been the inventors of arithmetic and astronomy. That they were much esteemed for their ingenuity, is evident from the epithet Πολυμαθηταί, given them by Homer; and this character is confirmed by the testimony of Solomon. Moschus, the ancient atomical philosopher, who lived before the war of Troy, was a native of this city. It is at present a sangiacship, and governed by a Turkish bashaw, subject to the beglerbeg of Tripoli. The town is still well peopled, and about it are magnificent ruins, which discover its ancient grandeur.

Near Sidon is a ruined village, supposed to be the ancient Sarepta, famous for having been the habitation of the prophet Elijah. It consists of a few houses lying scattered on the top of a mountain, half a mile from the sea.

About an hour's journey farther south, we come to the ruins of Tyre, not that which was destroyed by Nebuchadnezzar, but the city built on an island adjacent to the coast, and which Alexander could not take till he had thrown up a mole or causey, to facilitate the operations of the siege. The island is covered with sand, and was formerly surrounded by a wall, standing upon the utmost boundaries of the sea. In its natural state it seems to have been of a circular figure, with an area of about forty acres. The foundations of the wall yet remain.

Twenty miles southward of Tyre is the city of Acre, lying in the neighbourhood of mount Carmel. During the Crusades, the possession of this town was long disputed by the Christians and Saracens. In the year 1191, it was taken from the latter by Richard I. king of England, and Philip king of France, who gave it to the knights of St. John of Jerusalem, in whose hands it remained a hundred years, when it was retaken by the Saracens, and almost entirely destroyed. The fate of this town is rendered memorable by an act of singular resolution, with which it was accompanied. A number of beautiful young nuns, terrified at the prospect of being exposed to the brutal lust of the licentious infidels, determined to avoid the violation of their chastity, by rendering themselves objects of averfion. With this view they cut off their noses,

No. 10.

and mangled their faces in a shocking manner. The Saracens, inflamed with resentment at a spectacle which disappointed the gratification of their appetites, immediately put them all to the sword.

Proceeding farther, we arrive at mount Hermon, remarkable for the dews which fall upon it heavily in the night; and beyond it mount Tabor, one of the most beautiful mountains in the world, both in itself, and in the prospect it affords. Seen on the east and west sides, it exactly resembles a fuger-loaf; but on the north and south sides, it appears of an oval figure, surrounded with a deep valley, that separates it from other mountains, which it overtops. To the north-east, the east, and south-east, it commands a prospect of the plain of Galilee; and to the south and south-west, that of the incomparably beautiful plain of Esdrelon. Quite round, the mountain rises equally high and steep; and appears green on every side; having on the summit an oval plain, about three miles in compass. Whether this was the high mountain on which our Saviour's transfiguration happened, though affirmed by the generality, is however questioned by some writers.

Samaria stands upon an oval mount, over-looking a fruitful valley, with a circle of hills at a distance. On the north side is a large square piazza, supposed to have been part of a church erected by St. Helen, in honour of St. John the Baptist, who was here imprisoned and beheaded.

Five miles beyond Samaria lies Naplofa, the modern name of Sychem or Sychar; situated in a narrow valley, with mount Gerizim on the south, and on the north, mount Abel. The town is well peopled, but meanly built; consisting of two streets lying parallel to each other; and is the seat of a Turkish bashaw. In the neighbourhood of this place is Jacob's well, usually visited by travellers. It is covered with an old vault, upon the mouth of which is laid a flat stone.

Jerusalem, still reckoned the capital of the Holy Land, stands on a mountain about thirty miles east of the Levant, in 36 degrees of east longitude, and 32 degrees of north latitude. Its situation is altered from what it was at the crucifixion of our Saviour: for mount Calvary then lay without the walls, and mount Sion within, near the center; but the latter is now excluded, and the former become the most central part of the city. At present this capital is not more than three miles in circumference, the buildings mean, and thinly inhabited; the chief employment of those who reside in it, being to accommodate the pilgrims who resort hither with lodging and provisions. The grandest building is the church of the sepulchre, in which almost every Christian nation has a chapel. This structure is about a hundred paces in length and sixty in breadth. It is lighted by an open dome or cupola on the middle of the roof, directly under which is the grand sepulchre. There are also in this church twelve or thirteen places, consecrated on account of some particular actions performed in them, relative to the death and resurrection of Christ; the former of which events is here annually

E e

solem-

solemnized on Good Friday, by the friars, with great superstition and ceremony. A bashaw and a good garrison is kept there by the Turks, to protect the pilgrims from the Arabs, who possess the adjacent country. The walls and fortifications are very antique, having old square towers instead of bastions; but as the Arabs are destitute of artillery, the defence proves sufficient.

When the pilgrims arrive near the gates of Jerusalem, the fathers of the Latin convent send their druggerman or interpreter, with some others, to meet them, and bring them to their cloister, where they are hospitably entertained, their feet washed, and an apartment allotted for their use. A torch is then given to each pilgrim, and they go in procession round the cloister, singing *Te Deum* for their safe arrival at the holy city.

Without the wall are some apartments hewn out of the solid rock, and called the sepulchres of the kings; but on what account they have received this name, it is difficult to determine; no kings, either of Israel or Judah, being mentioned in Scripture as interred here. They appear, however, to have been receptacles for the dead, formed at vast expence, and with infinite labour. They are approached on the east side, through an entrance, which leads into an open court about forty paces square. On the south side of the court is a portico, nine paces long, and four broad, with a kind of architrave, and ornamented with sculptures of fruits and flowers, still discernible, though injured by the ravages of years. At the end of the portico on the left hand, is the descent into the sepulchres, which consist of seven apartments, one within another, all cut out of the solid rock; each about eight yards square, except the two innermost, which are deeper, by the additional descent of six or seven steps. In all the six interior apartments, were coffins of stone, placed in niches in the sides. They had been at first carved with foliage, and covered with handsome lids; but most of them are now defaced and broken. There has been in each room a channel, for the purpose of carrying off the water, which distilled from the ceiling by the exhalation of the vapours.

To the subterraneous passages one door only remains, which is formed in the manner of wainscot, of one stone, fitted with hinges of the same material.

Between those sepulchres and the city, a dungeon is pointed out, in which the prophet Jeremiah is said to have been imprisoned.

Crossing the valley of Jehosaphat, and part of mount Olivet, we arrive in half an hour at Bethany; the first house in which village is supposed to have belonged to Lazarus; and near it is shewn the sepulchre, where he is said to have been raised from the dead. It is a small apartment, entered through one of larger dimensions, the descent to the latter of which is by twenty-five steps.

The mountain, in the desert, on which our Saviour is said to have been tempted, is approached by an intricate road, variegated, on each side, with hills and dales, and though at present extremely barren, has the appearance of

being formerly cultivated. The whole prospect is dismal, presenting nothing but rocky mountains and frightful chasms, that appear to have been the effect of some horrid convulsion of nature.

Turning into the plain of Jericho, we soon arrive at the fountain of Elisha, which that prophet purged of its brackishness, at the request of the neighbouring inhabitants. The water falls into a large basin, whence it is diffused over the fields, which it endows with great fertility. The village of Jericho is at present a wretched habitation of Arabs.

On the way towards Jordan, we pass over a plain, producing nothing but samphire and other marine plants. In many places that appear to have been once covered with water, there remain strong incrustations of salt, with which the soil seemed to be every where impregnated.

The length of the Dead Sea, which may be more properly called a lake, is twenty four leagues, and the breadth six or seven. To the east and west it is bounded by mountains of a stupendous height, covered with a sulphureous kind of stone. The tradition of birds dropping down dead in flying over this expanse of water, is entirely groundless; and from oyster and other shells on the shore, there is reason to think that it produces some fish. When the waters are low, it is said that a few relics may be discovered of those cities, which were destroyed by fire from heaven.

Passing the famous valley, where an angel destroyed in one night the best part of the army of Sennacherib, we come to a village in which it is said that no Turk can survive above two years. Whether the report be true or false, no Turk chooses to bring it to the test of experiment, and therefore the Christians enjoy the place entirely to themselves.

Farther on lies a village called St. Philip, where ascending a steep hill, we arrive at the wilderness of St. John, which, though rocky and mountainous, is well cultivated, and produces plenty of corn, grapes, and olives. After an hour's travelling, we reach the cave and fountain, where it is said that John the Baptist practised the austerities related of him. Near the cave are some old locust-trees, much revered by the pilgrims.

About six miles south of Jerusalem is situate Bethlehem, once an elegant city, but now a poor village. Hither the Christian pilgrims much resort, as the place of our Saviour's nativity. Near this place remain the pools and fountains, which stood in the gardens of Solomon, that are said to have been his delight.

Damascus or Scham, the capital of the south division of Syria, is situate in 37 degrees 20 minutes of east longitude, and in 33 degrees 15 minutes of north latitude. It stands in a fruitful extensive plain, encompassed with gardens, well watered, which stretch several miles, and surrounded by mountains at a distance. The town is about two miles in length, and the streets narrow. The houses are built of sun-burnt brick, on which account, when there is the least rain, the streets are covered with deep mud. The gates and doors, however, are beautifully inlaid with marble; the

the buildings exhibiting to the view a striking contrast of grandeur and meanness united. Each house is generally built in the form of a square court; in the middle of which are artificial fountains, decorated with marble basins. The ceilings and pannels of the apartments, after the Turkish manner, are richly painted and gilded. There are in the town a great number of magnificent mosques or temples, one of which had formerly been a Christian church, dedicated to St. John the Baptist. It is supported by lofty pillars of granite marble, and encompassed by piazzas or cloisters. The town has a brisk trade and several valuable manufactures, particularly the branching fattins, usually called damaska. Their sword-blades, and all sorts of cutlery-ware, are likewise in great reputation, the water of the place being very proper for tempering iron and steel. Nor is their traffic less considerable in raw, as well as wrought silks, wine, prunes, with other dried fruits, and soap. Near the city is a beautiful meadow, called the Ager Damascenus, of the earth of which they have a tradition that Adam was made.

The Turks of Damascus treat the Christians with great contempt, and amongst other marks of indignity, will not suffer them to ride on horseback, but upon asses. Those animals however are much more nimble than with us. A fellow runs after them, who pricks the ass with a goad, so that the traveller requires neither whip nor spur.

Jaffa, or Joppa, is situate on an eminence close to the Levant, about thirty miles west of Jerusalem. It was the only port belonging to Palestine, but the harbour is so choaked up at present, that no ship of any great burden can enter it; neither is it populous or well built.

Gaza is the most southerly town in Palestine, situate near the Levant, in 35 degrees of east longitude, and 31 degrees 20 minutes of north latitude. It was formerly a very strong place, and the possession of it much disputed by the Egyptians and Syrians; but as both those kingdoms are now under the dominion of the Turks, the fortifications, as well as the town, are in a ruinous condition.

#### C H A P. IV.

##### *Of Palmyra.*

**T**HE situation of this celebrated city is not precisely determined by geographers, some placing it in Syria, and others in Arabia; but the most general opinion is, that it was comprehended in the former. It lies in 39 degrees of east longitude, and 33 of north latitude, two hundred miles south-east of Aleppo. Its territory is enclosed for a large extent on every side by sands, but within this circular boundary it was extremely fertile in ancient times, and celebrated for the purity of its waters.

The origin of the city of Palmyra has been no less disputed than its situation. In the Arabic translation of the Chronicles, it is mentioned as subsisting before the days of Solomon; but John of Antioch, surnamed Malala, informs us that it was built by that

monarch, on the very spot where his father slew the Philistine chief, and in honour of that memorable action, Abul Farai ventures even to fix the year of its foundation. But leaving those and other accounts of the earlier state of Palmyra as fabulous, we shall proceed to what has been delivered concerning it upon more respectable authority.

We find in the ninth chapter of the first book of Kings, and the eighth of the second of Chronicles, that Solomon erected a city in the wilderness, and called it Tadmor. According to Josephus, the Greeks and Romans afterwards distinguished the place by the name of Palmyra, whilst the Syrians continued to give it the former appellation. This is confirmed by St. Jerom; and the country Arabs, even at this time, call it by the ancient name. But though Palmyra may have been originally founded by Solomon, it is probable that the ruins now existing are those of edifices which have been built at a later period. We are told by John of Antioch, that Nebuchadnezzar destroyed this city, in his march to the siege of Jerusalem. Besides, it is hardly to be imagined, that such elegant structures could be prior to the footing of the Greeks in Syria; and the improbability of such a fact being admitted, we shall not be surpris'd that Xenophon has taken no notice of it in his retreat of Cyrus the younger, though he is very exact in describing the desert; or that it is not mentioned in the account of the march of Alexander to the Euphrates. It is however extraordinary, that no mention is made of so splendid a city, even when Pompey reduced Syria to a Roman province, and when a taste for the polite arts began to be so prevalent, that architecture, painting, and sculpture, were objects not unworthy the attention of a Roman general. The name of Palmyra is not admitted to a place in history, till Appian, in the fifth book of his civil wars, speaks of Mark Antony as attempting to plunder it; though it appears, that at this time, the riches and trade of the Palmyrenes must have been of some standing. Forty years afterwards, as we find by their inscriptions, they ran into expences and luxuries which could not be supported without considerable sources of wealth.

The only ancient account of this place extant is transmitted by Pliny, who, though he has collected the most striking circumstances concerning it, yet omits to mention the buildings. "The city of Palmyra, says he, is nobly situated, the soil is rich, and it is pleasantly watered. It is on all sides surrounded by a vast sandy desert, which totally separates it from the rest of the world, and has preserved its independence between the two great empires of Rome and Parthia; their first care, when at war, being to engage it in their interest. It is distant from the Parthian Seleucia on the Tigris three hundred and thirty-seven miles; from the highest part of the Mediterranean two hundred and three; and a hundred and seventy-six from Damascus." All those circumstances, Mr. Wood observes, strongly characterize Palmyra, its situation being very fine, having a ridge of hills to the west, and to the east an extensive plain. On the hills formerly stood many sepulchral monuments, some

some of which are yet to be seen, inspiring the beholder with awe and veneration.

The soil about the town is still rich, and might be cultivated with little pains; but the streams which watered it are now lost in the sand, by not lining with stone, as formerly, the channel through which it is conveyed. Though the palm-tree, which will flourish in the dryest soil, once perhaps covered those hills and great part of the desert, none of them are now to be found here, nor more than one fig-tree; though the merchants who travelled hither in 1697, from Aleppo, saw several; and Albufedah mentions both the palm and fig as common at Palmyra.

Mr. Wood is of opinion, that among the remains of Palmyra, the ruins of two different periods of antiquity may be easily discerned; the older owing its dissolution to time, and the other bearing marks of violence. The inscriptions here, for the most part either honorary or sepulchral, are badly executed; the names are generally in Palmyrene characters, and the latest have Roman *prænomena*. From them it is evident that one of the buildings was standing before the birth of Christ; nor any of them so modern as the destruction of the city by Aurelian, except one in Latin, which mentions Dioclesian.

The information respecting the history of this place, which can be obtained from the inscriptions, cameos, intaglios, or medals found here, is very trifling. Of the latter have been found only a few Roman, in brass, of the lower empire. The most perfect piece of antiquity is a mausoleum, now almost one thousand eight hundred years old; the floors and stairs of which are still entire, though the building consists of five stories. An inscription upon it, yet legible, informs us, that it was built by Jamblicus, son of Mocius, as a burial-place for himself and his family, in the year 314. This date being relative to the æra of Seleucus, answers to the third year of the Christian epoch.

The walls which surround this city, were flanked with square towers; in many parts, particularly on the south-east nothing of them exists; and, from the best calculation that Mr. Wood could make, he imagines their circuit has not been less than three English miles. But as Palmyra, in its flourishing state, must have been of greater extent, he thinks it not improbable that the old city covered a neighbouring piece of ground, ten miles in circumference; in every spot of which, the Arabs say, that ruins are turned up in digging. For this reason, he supposes that the walls inclose only that part of Palmyra which was occupied with public buildings; and were fortified, if not erected, by Justinian, who judged this a proper place to stem the furious progress of the Saracens.

By closely inspecting this wall, it appears that two or three of the flanking towers on the north-east were formerly sepulchral monuments; which affords some proof that the walls were erected posterior to the monuments, and the works of a Christian æra; for the pagan religion would have condemned the metamorphosis as profane. Besides the Greeks and Romans always

buried without the walls of their cities; and the same custom was religiously observed over all the East.

On the top of one of the highest rocky hills, north-east of the ruins of Palmyra, is an old castle, the ascent to which is steep and rugged. It is a mean structure, not so old as the time of Justinian, and unworthy of even the Mamelukes. Round it is cut a ditch, which cannot be passed without difficulty, the draw-bridge being broken down. In the rock is a deep hole, intended perhaps for a well, but now dry.

The remains of one building at Palmyra are extremely magnificent; and this Mr. Wood supposes to have been the temple of the Sun, which being much damaged by the Roman soldiers, when Aurelian took the city, that emperor ordered, for the expense of repairing it, three hundred pounds weight of gold from the treasures of Zenobia; with one thousand eight hundred pounds weight of silver, levied upon the people, besides the jewels of the crown. The solidity and height of the walls of its court tempted the Turks to convert it into a place of strength; and therefore on the north-east, and south, they stopped up the windows, dug a ditch to the west, and demolished the portico of the grand entrance; building in its place a square tower to flank that side. The court is paved with broad stones, but so covered with rubbish as to be perceptible only in a few places. Neither are any stairs to be seen, by which it could communicate with any other part of the building.

In the desert, three or four miles south-east of the ruins of Palmyra, lies the valley of salt, whence Damascus and the neighbouring towns are supplied with that commodity. This is supposed to be the place in which David smote the Syrians. The ground, to a considerable depth, is impregnated with salt, which they obtain by forming trenches, where the rain-water lodging, dissolves the saline particles which transude from the earth.

The most remarkable figure which Palmyra makes in history, was in the reign of Gallienus, when the glory of the Roman arms was obscured in the East, under the indolent administration of that prince. At this juncture Odenathus, a native of Palmyra, collecting the remains of the vanquished Romans in Syria, led them against Sapor king of Persia, whom he routed, and advanced with his victorious army as far as Ctesiphon, the capital of the empire. On his return from this expedition, in which he not only acquired vast riches, but renown and popularity, he was unanimously declared Augustus, and copartner of the empire with Gallienus. After a series of warlike achievements, however, he was treacherously slain, as is supposed, by his kinsman Mæonius. Of his family, or the more early part of his life, history supplies us with no particulars; but is agreed that he was a man of great abilities and excellent qualifications. Libanius mentions an oration written in his praise by Longinus, which is lost; and Pollio affirms, that had he not engaged in the Roman interest, it must at that time have been entirely ruined in the East. Of his

extra-

extraordinary merit we need no other testimony, than that from a private station he obtained in marriage Zenobia, queen of Palmyra, one of the most distinguished female characters in history, either ancient or modern. She claimed her descent from the Macedonian kings of Egypt, equalled in beauty her ancestor Cleopatra, and far surpassed that princess in chastity and valour. She was esteemed the most lovely, as well as the greatest of her sex. She was of a dark complexion (for in speaking of a lady, as a celebrated writer observes, those trifles become important); her teeth were of a pearly whiteness, and her large black eyes sparkled with uncommon fire, tempered by the most attractive sweetness. Her voice was strong and harmonious. Her manly understanding was strengthened and adorned by study. She was not ignorant of the Latin tongue, but possessed in equal perfection the Greek, the Syriac, and the Egyptian languages. She had drawn up for her own use an abridgement of oriental history, and familiarly compared the beauties of Homer and Plato, under the tuition of the great Longinus. She was conversant even in the art of war; and Aurelian attributes to her the victories of her husband over the Persians.

At the death of Odonathus, this accomplished heroine assumed the reins of government, and renouncing the alliance with Rome, attacked and totally routed Heraclius the Roman general, who was sent against the Persians. This victory left her in quiet possession of Syria and Mesopotamia. Her ambition however not being gratified by this event, she asserted a hereditary right to the dominion of Egypt, as being descended from Ptolemy; and having secured a strong party there in her favour, she sent thither Zabdas, a gallant

officer, who defeating the Egyptian army, possessed himself of the province, which he left under a guard of five thousand men, and returned to Palmyra.

After this conquest, Zenobia added to her dominions the best part of Asia Minor; till the emperor Aurelian defeated her army in two battles, and forced her to take shelter within the walls of her capital.

The garrison obstinately refusing to surrender, and being reduced to great extremity, it was resolved that they should apply to their allies the Persians, in the most pressing manner, for succour. This important embassy the queen undertook to perform, and mounting a dromedary, set out for Persia; but was made prisoner by a party of Aurelian's horse, dispatched for that purpose, as she was about to cross the Euphrates. The city soon after surrendered to the emperor, who spared the inhabitants, but carried off the best part of their riches, leaving behind him a garrison of six hundred men; till, on a revolt of the citizens in a few years, the town was destroyed.

The valour and magnanimity which this celebrated queen had before discovered, appear to have entirely forsaken her under the pressure of adverse fortune, and she sacrificed to the resentment of the emperor the most faithful adherents to her cause. Among those was the renowned Longinus, who met his fate with an intrepidity that throws additional lustre round his character. After suffering the mortification to grace a Roman triumph, Zenobia married, and had children at Conche, on the road from Rome to the ancient Tibur, where the emperor assigned some lands for her maintenance; and the remains of her villa are at this day shewn to travellers.

## A F R I C A.

**Q**UITTING the continent of Asia, we arrive in that of Africa, another of the great divisions into which the terraqueous globe is distinguished, and which may naturally be considered as the second in the order of description, not only on account of its proximity to the former, but of the early period when it appears to have received its first inhabitants. This peninsular quarter of the world is bounded on the north by the Mediterranean Sea, which separates it from Europe; on the east by the Isthmus of Suez, the Red Sea, and the Indian Ocean; by the great Southern Ocean on the south; and by the Atlantic Ocean on the west. It is situate between 50 degrees of east, and 18 degrees of west longitude, and between 35 degrees of south, and 37 degrees of north latitude;

extending upwards of four thousand three hundred miles in length, and four thousand in breadth.

Africa is usually distinguished into nine divisions, viz. Egypt; Abyssinia, comprehending Nubia and the coast of Abez, with Anian, on the north-east; Zanguebar, comprehending Sofala and Terra de Natal on the south-east; Caffraria, or the country of the Hottentots, on the south; Monomotapa and Monomugi, inland countries, surrounded by Zanguebar, Caffraria, and Matamen; Benguela, Angola, Congo, and Benin, on the south-west; Guinea, Proper Negro-land, Zaara, and Biledulgerid on the west; Morocco, Algiers, Tunis, Tripoli, and Barca, usually styled the coast of Barbary; the remaining division consists of the islands of Madagascar, Balmandel, &c.

## C H A P. I.

*Of the situation—river Nile—produce—persons of the Egyptians—dress—salutations—method of travelling—houses.*

**E**GYPT, the north-east division of Africa, is bounded on the north by the Mediterranean; on the east by the Red Sea, and the isthmus of Suez; on the south by Abyssinia; and on the west by the Desarts of Barca, and the ancient Lybia. It is situate between 30 and 36 degrees of east longitude, and between 21 and 31 degrees of north latitude; being about six hundred miles long, and a hundred and fifty broad.

This country was thrown by the ancients into three grand divisions, namely, that of the Upper, the Middle, and the Lower Egypt; or the Thebais, Heptanomis, and Delta. At present, it is divided into the Higher and Lower, considered with respect to the course of the Nile.

This celebrated river is one of the most remarkable objects in Egypt, and to account for its source, and periodical overflowing, was a problem which baffled the utmost investigation of the ancients. It is now, however, found to issue from the mountains in Abyssinia, in 12 degrees of north latitude. It runs generally from south to north, through Abyssinia into Egypt,

and then continues its course in one stream, till it comes below Cairo, to the Delta, where it divides; one branch discharging itself into the Mediterranean at Damietta, and the other at Rosetta, a hundred miles farther west. Ancient writers have described the upper part of this river, as intersected by cataracts of a stupendous height; but upon more accurate enquiry, those accounts appear to have been greatly exaggerated. The channel is crossed in three places by rocks of granite, over which the Nile falling, forms three cataracts. The first is about three foot deep; the second a little lower, is about seven or eight foot; and the third is supposed to be only a few foot more. Such are the cataracts, formerly called catadopes, which have been represented as making so hideous a noise, that those who inhabited in the neighbourhood were rendered deaf by the sound.

The Nile generally begins to overflow in May or June, and the inundation increases for four or five months, during which time the waters are turbid, and of a colour either green or inclining to red. There are great rejoicings every year when the river rises to a certain height, their future harvest depending upon it. The just height of the inundation, according to Pliny, is sixteen cubits; when it rises to twelve or thirteen, a famine is expected; and when on the contrary it exceeds sixteen, the inundation is considered as dangerous. To ascertain the proper height of this annual

annual deluge, opposite to Old Cairo, stands a pillar divided into pikes, a measure about the length of two foot. Here officers appointed for the purpose constantly attend, when the waters have risen to a considerable height, who give notice two or three times in the day, of the exact degree of inundation to the cryers, by whom it is immediately published in their respective divisions. When the river is supposed to be high enough, the banks are cut, to let the water into the canals, from which it may be distributed occasionally to the fields and gardens. This expedient however is practised only in the upper part of the country, it being unnecessary in the Delta, or Lower Egypt, which on account of its level situation is sufficiently overflowed.

The cause of this annual inundation of the Nile seems to be ascribed with justice to the rains which fall periodically in the country whence it derives its source. To this end the north winds may also contribute, which beginning to blow towards the close of May, drive the clouds formed by the vapours of the Mediterranean, southward, as far as the mountains of Ethiopia; where their course being stopped, they condense, and fall down in violent rains. The same wind likewise contributes to raise the waters of the Nile, by driving forward the sea, which meeting with the river, already swollen by the new fallen rains, opposes its progress, and thus the country is soon overflowed.

In October, when the Nile usually ceases to rise, the water stagnates in the canals, and has a very noisome smell, occasioned by the filth thrown into it, as well as by the stagnation. With the vapours hence arising, even the money and plate is tarnished. To the slime which remains after the inundation, rendered putrid by the great heat of the climate, may be imputed not only the vast number of insects, which swarm near the channel of the Nile, but likewise, in part at least, the diseases incidental to the inhabitants of Egypt. Those inconveniences, however, are compensated by the prodigious fertility communicated to the lands, with little labour; and by the people being thus furnished with water, which they preserve in cisterns, and which, without this providential expedient of nature, they could not procure in a country almost totally destitute of fountains, and hardly ever visited with rain.

Amongst the different kinds of produce, for which Egypt was anciently celebrated, one was the paper, made of the bark of the papyrus; of which they likewise made sails, tackling, cloaths, coverlids, and other furniture. The country was no less remarkable for the excellence of its flax, and the peculiar dexterity with which it was manufactured. The threads were spun almost too fine for the observation of the sharpest eye. Another kind of flax here produced, was the byssus, which often received a purple dye, and the cloth made of it was held in the highest esteem. The lotus, or lote-tree, was also in great request, the berries of which were sometimes made into bread. There was another lotus in Africa, which gave its name to the Lotophagi, or Lotus Eaters, because

they lived upon the fruit of this tree, which had so delicious a taste, if Homer may be credited, as to make the eaters of it forget all the sweets of their native country. The Egyptian pulse and fruits were likewise esteemed excellent; and both the flesh and fish of the country, inferior to none of their kind. But the unrivalled wealth of Egypt arose from its corn, which, even in an almost universal famine, enabled it to support the neighbouring nations. In later ages, it was the resource and certain granary of Rome and Constantinople.

Egypt produces horses, camels, and such quadrupeds as are common in the southern climates. Amongst the reptiles of this country, the viper is much esteemed in physic. They are yellowish, of the colour of the sand in which they live, and are of two kinds. One of those is the common species, but the other has horns like a snail, and of a cartilaginous substance.

The common lizard is here also yellow. About old walls is found a very ugly one, shaped like a crocodile. The wormal is of the lizard kind, four foot long, eight inches broad, with a forked tongue, which it puts out like a serpent, and no teeth; living on flies and small lizards. It is a harmless animal, and is found only in the hottest seasons, in grottos and caverns in the mountains, on the west side of the Nile, where it sleeps during winter.

The ostrich is common on the mountains south-west of Alexandria; and the fat of it is sold very dear by the Arabs, who use it as a remedy in palsies, rheumatisms, and many other disorders.

Here is a kind of domestic large brown hawk, with a fine eye, which mostly frequents the tops of houses, where pigeons and hawks may frequently be seen standing close to each other. A beautiful bird is also common, called balsory, of the species of the ibis, which was worshipped by the ancient Egyptians. The male has a black beak and legs, and black feathers on the wings, with a large crooked bill. The legs, bill, and eyes of the female are of a fine red; and in the wings and tail are intermixed some red feathers, which, when expanded, are exceeding beautiful.

The bats are remarkably large; from the tip of one wing to that of the other, many of them measuring two foot.

The country abounds in all sorts of fowls, both wild and domestic, except pheasants; and the method of hatching eggs, is by placing them not under a hen, but in an oven, where they are exposed to a proper degree of warmth, during the usual term of incubation.

The most remarkable of the animals is the crocodile, which is a native of the Nile. This voracious creature has two long teeth in its lower jaw, which are received into the same number of holes in the upper. It is extremely quick-sighted, objects from behind being conveyed to its eyes, by means of a channel which communicates with the back of the head. The length of this animal is sometimes so enormous as to measure fifty foot. When on land, he is always seen very near the water, with his head directed

towards it; into which, upon being disturbed, he deliberately enters. The eggs of this animal resemble those of a goose. It buries them with great care in the sand, at the depth of a foot beyond the reach of the Nile's overflowing; and as soon as the young are hatched, they immediately run into the water.

It is supposed that the crocodiles are destroyed by the species of creature, named Pharaoh's rats, which is larger than a fork, and often shewn in Europe for the Ichneumon: but that the latter could creep into the mouth of the crocodile, and by eating a passage through its bowels, destroy it, there is no probability, as it must be stifled in the attempt.

The inhabitants of Egypt are distinguished into three classes, namely, the Copts, who are natives of the country and Christians, the Turks, and the Arabs. In general, they are but an ill looking people, and though many of them are fair when young, yet the heat of the sun soon makes them of a swarthy complexion.

The most simple dress of the men in Egypt probably resembles the primitive manner of cloathing. It consists only of a long shirt, with wide sleeves, tied round the middle. The common people wear over this a brown woollen shirt; but those of better condition, a long cloth coat, covered with a blue shirt hanging down to the middle of the leg. But on festivals, and all extraordinary occasions, the upper shirt is white. They wear about their necks a blue cloth, with which they defend their heads from the severity of the weather. It is also a general custom among the Arabian and Mahometan inhabitants of the country, to wear a large blanket, either white or brown, in winter, and in summer a blue and white cotton sheet thrown over the left shoulder, and brought round under the right arm, which is thus left bare, and free for action. When it is hot, and they are on horseback, they let this covering fall behind on the saddle.

The dresses of the women is not much unlike that of the men, only most of their under garments are of silk. All but the outer vest are shorter than those worn by the other sex. Their sleeves hang down to a great length, and a sort of gauze shirt under all trails the ground. Their heads are dressed with an embroidered handkerchief, and the hair plaited round under a white woollen skull-cap. The meaner sort of women wear a large linen or cotton blue garment, like a surplice; and before their faces hangs a sort of bib, which is joined to the head-dress, a space being left between for their eyes. Others who wear this garment of silk, have a large black veil that comes all over them, sometimes made of gauze. It being reckoned a great indecency for a woman to shew the whole face, they generally cover their mouth and one eye. The common women, especially the blacks, wear rings in their noses, to which they hang glass beads.

The Mahometans salute each other by inclining the head, extending the hand, and bringing it back to their breasts; or by kissing the hand, and putting it to the head, of which the latter mode is a mark of

extraordinary respect. They always wish peace to each other; a compliment which they never pay to Christians.

The salutation of the Arabs is by shaking hands and bowing the head. Amongst the Copts, a son dare not sit down in the presence of his father, especially in public company, without being several times desired; and in no place of the world do people pay greater regard to the motions of their superiors.

The present Egyptians are a slothful people, delighting much in sitting still, and attending to the rehearsal of stories; a disposition which perhaps they owe to the enervating warmth of the climate. They are likewise so slovenly, that after washing their hands, they wipe them with the sleeves of their shirts. Malice, envy, and ignorance, are predominant lineaments in their character, which is also strongly marked with cunning, falsehood, and jealousy. They are extremely credulous with respect to talismans, charms, and every species of magic. Should you praise any of their children, without blessing it, they never fail to suspect that you mean it no good, and immediately use some superstitious ceremonies to prevent the effect of the evil eye; one of which is throwing salt into the fire.

On a journey, the Egyptians generally set out early in the morning, walk their horses gently, and often stop to refresh under a shade. If they do not travel in any great state, they carry a leathern bottle of water tied to the saddle, and this they drink when thirsty. A person of condition has an attending camel laden with water. At night they have large lanterns, the bottom and top of which are of copper, tinned over, and the sides of linen, stretched upon wires, carried before them. They seldom make use of tents, but lie in the open air.

Men of quality ride on a saddled camel; and their attendants on camels loaded with carpets, beds, and other necessaries, if their journey be long. They commonly carry in their hands a double crook, to direct the beast by touching his head, and to recover their bridle, in case it should happen to drop. Some women of condition travel in litters, carried by camels; the labour of the camel that goes behind being very great, as his head lies under the vehicle. Others go in a smaller sort of litter, on the back of a camel.

Another method of conveyance is by means of a round basket with a cover, slung on each side of a camel. This contains not only the passenger, but his necessaries; and to direct the camel, a person sits before the baskets.

The best houses in Egypt, especially at Cairo, are built upon the same plan, which is usually that of a quadrangular structure, including an area of the like form. The saloon is built in the shape of a Greek cross, with a cupola in the middle. It is waincotted ten foot high, and the panels shine with mother of pearl, blue smalt, fine marble, and elegant pieces of Mosaic workmanship. Above the waincotted are inscriptions in Arabic, all round the apartment, reaching to the height of two foot, and the whole is crowned with arches of Mosaic and mother of pearl. The

room is surrounded with a sofa, furnished with rich velvet cushions, and the floor is covered with fine carpets.

The great men in general have a saloon for common use, and another for state; and as they have four wives, each of those has a different saloon, with apartments contiguous, that have no communication with the rest of the house, except the common entrance for servants, which is kept locked; and of the private entrance the master alone has the key. In the apartments of the wives, they have such machines as are used in nunneries, which receive any thing the women want to give in or out, without being seen by those with whom they communicate.

In the Delta, or Lower Egypt, the houses and villages are all situated upon eminences, natural or artificial, to defend them from the inundations of the Nile, during which time the country appears like an immense lake, interspersed with numberless islands.

#### CHAPTER II.

*Of Alexandria—Cairo—pyramids—obelisks—ruins—labyrinth—Lake Meris.*

ONE of the principal cities of Egypt is Alexandria, situate in 31 degrees of east longitude, and 30 degrees of north latitude, fourteen miles west of the most westerly branch of the Nile. The ancient city was founded by Alexander the Great, from whom it derived its name, and was reckoned one of the most considerable in Africa; but it has been so frequently exposed to the ravages of invaders, that were it not for its ports, and other monuments of antiquity, we should hardly be able to ascertain even the place on which it stood. The sea has encroached upon it in many parts, and withdrawn itself in others. Upon a little island, which once was contiguous to the port, stood the famous light-house, called Pharos.

When the city was taken by the Saracens, it contained, if we may credit the Arabian writers, four thousand palaces, four hundred spacious squares, and in it were no less than forty thousand tributary Jews. Before the discovery of the passage to the East Indies, by the Cape of Good Hope, it was undoubtedly a place of prodigious trade. At present however the old city is entirely ruined, and the materials carried away to build the new one.

The port of Alexandria, now called the Old and the New, were heretofore named the ports of Africa and Asia. The former is appropriated to the Turks, but the latter is free to all the nations of Europe. That which is used by the Turks is cleaner and deeper than the other, where they are obliged to use the expedient of fixing empty casks along the cables, to prevent their being damaged by the continual friction of a stony bottom.

The entrance of the new port is defended by two castles of a contemptible Turkish structure, that have nothing remarkable but their having succeeded to the situation of edifices that will for ever be celebrated in history.

No. 10.

The most conspicuous remains of Alexandria, are Pompey's Pillar, and the Cisterns. The latter were built under the houses, supported by two or three arches, raised on columns, to receive the water of the Nile, as they do at this day.

The pillar commonly distinguished by the name of Pompey, stands on a small eminence, about a quarter of a mile from the wells, and is surrounded by some magnificent ruins, said to be the remains of a palace of Julius Cæsar; in the center of the area of which this pillar is supposed to have been erected. It is of red granite. The capitals are of the Corinthian order, and the leaves, which are plain, not indented, seem to have been done either for bay or laurel. There are on it some marks of a Greek inscription, not legible. The height of the pillar, including the capital, pedestal, &c. is a hundred and fourteen foot; but exclusive of those parts, it is eighty-eight foot nine inches high, and nine foot in diameter.

Here is likewise an ancient obelisk, which bears the name of Cleopatra, situated almost mid-way between the city and the little pharillo in the port. Its basis, of which a part is sunk, rises twenty foot higher than the level of the sea. This obelisk consists of only one piece of granite marble. There are but two of its faces well preserved. On the two others, the hieroglyphics are hardly perceptible. This has probably belonged to the mausoleum of Cleopatra, of which two square marble fragments, covered with hieroglyphics, may be seen in the British Museum.

Between this obelisk and the port, runs a thick wall, flanked on each side of the former by a tower. The interior side of the wall is ten foot distant from the obelisk, the exterior but four or five from the sea. The front of it, far into the port, is filled with a great number of wrecks of columns, frizes, and other pieces of architecture, that must have been part of some magnificent edifice.

The huge towers, of which there are several, connected by a wall, seem to have formed the circumference of ancient Alexandria. They are not all of equal dimensions, nor of the same figure. Some are round, others square, and many are of an elliptic form. They also differ in their interior parts. Some of them have a double wall, and at the entrance a winding staircase, which mounts to the top of the building. The others are accessible only through a hole at the top, when mounted by means of a ladder. In general, the entrance of those towers is very narrow. Their different stories are so many vaults, supported in some by one column, and in others by several. The embrasures are likewise narrow, and widen inwards, not unlike those of many old castles in England.

The architecture of those towers, which are built of free stone, is very clumsy on the lowest part. Around, at certain intervals, are seen columns of different sorts of marble, so placed, as at a distance to appear like cannon pointed through the embrasure. The walls which unite the towers, and jointly with them form the circumference of the city, are not throughout of the same breadth or height, nor of a similar structure; some parts of them being twenty

G g foot

foot thick, while others either exceed, or fall short of those dimensions. — Their height is from thirty to forty foot; and within side of them is an alley, in the same taste as that in Aurelian's palace at Rome. The towers, as well as the walls are much damaged, and in some places totally ruined.

Proceeding from those ruins across an orchard of date-trees, we arrive at the canal of Cleopatra, which supplies Alexandria throughout the year with fresh water. The original design of this work, was to facilitate commerce between Alexandria and Grand Cairo. It is now, however, in a very decayed condition, almost choaked in many parts, and hardly furnishing water sufficient for the reservoirs of the city.

Contiguous to the walls and towers above-mentioned are catacombs, or sepulchral grottos, which stretch to a considerable distance along the sea shore. They are cut in the rocks, sometimes one above another, sometimes in the same line, according as the situation of the place permitted. The length of each is greater than the common standard of man; the breadth such as may hold two bodies laid beside one another; and the height is different, depending on the nature of the rock. Avarice, or the hope of finding something valuable, has opened them all, but nothing else has been found in them than human bodies, or the bird ibis, embalmed; the latter of which being regarded as sacred by the ancient Egyptians, were placed with every mark of veneration in the mansions of the dead.

We now seek in vain for any vestiges of the Pharos, reckoned one of the seven wonders of the world; which the famous architect Sostratus built by order of Ptolemy Philadelphus, who expended upon it no less than eight hundred talents. The stately edifice, likewise, furnished the Museum, where the literati used to meet, and were maintained at the public expence, is no longer discernible; and the famous library of the Egyptian Kings has perished, with the invaluable treasure it contained.

New Alexandria forms a striking contrast to the magnificence of the old, in respect both of grandeur and extent. Instead of the most superb temples, we now meet only with inconsiderable mosques; in the room of the most magnificent palaces, nothing but dwelling houses, of the meanest construction. The celebrated mart of antiquity is now decayed to a mere landing place, occupied by a few interested strangers, and a collection of wretches who live in the most fordid dependence.

The road from Alexandria to Rosetta being a sandy desert, could hardly be found, were it not marked out by pillars erected across the plain. This town, which lies at the mouth of the western channel of the river Nile, as Rosetta does at that of the eastern, is two miles long, of a circular figure, and the houses as well built as almost any in Egypt. Here is a good manufactory of coarse linens, and a brisk trade; but ships cannot come up so high as the town, on account of a bar which lies across the mouth of the river. All European commodities that pass between Alexandria and Cairo, are therefore landed here, and

put on board other vessels. For this purpose, the Europeans have their vice-consuls and factors to transact business. Letters are brought hither regularly from Alexandria by land, to be sent to Cairo by water; but in matters of great consequence, they are dispatched by special messengers across the deserts.

When Dr. Pococke was at this place, he saw two of those ideots, whom the Egyptians deem saints. One of them was a lusty elderly man, the other about the age of eighteen. They went about the streets naked, and were held in prodigious veneration. When the women visit the sepulchres, which is a common practice every Friday, they not only kiss the hands of those wretches, but also other parts, which it may not be so proper to mention; a testimony of regard from which they imagine some peculiar advantages may be derived.

Cairo, the capital of Egypt, is distinguished into two cities, the one called Grand Cairo, and the other Old Cairo, lying a little above the place where the river divides to form the Delta, on the site of the fortrefs and town of Babylon on the Nile. Grand Cairo is situate in 32 degrees 12 minutes of east longitude, and in 30 degrees 2 minutes of north latitude; in a plain at the foot of a mountain, two miles east of the bank of the river Nile, and a hundred miles south of the mouth of that river. The town is ten miles in circumference, and contains about a million of inhabitants. The streets are extremely narrow in some places, and the houses rather commodious than handsome. The lower part consists generally of stone, but the upper part of cage-work, lined with unburnt brick. They are for the most part richly furnished and adorned within.

There is here a great mixture of inhabitants; for besides the original Egyptians, the city abounds in Greeks, Jews, Armenians, Europeans, and a Molatto race, who are natives of Nubia, and have a sort of government amongst themselves. Those people supply the country with servants; and so great is their attachment to each other, that they have a common purse, out of which they support such as are sick, or out of place. Here are also some Turks, and a few remains of the Mameluke race.

Cairo is remarkable for the good regulation of its police. At the ends of almost every street, or at least of every ward, are gates, which are always shut at the approach of night, and guarded by a number of janifaries.

Here also is a grand master of the police, called huali, who has the inspection of the markets, weights, and measures. This officer has power of life and death. He walks often through the city by night, as well as by day, attended by a band of fifty licitors, who execute immediate justice on all trespassers.

Amongst many magnificent mosques, which ornament this city, that built by Sultan Hassan is the most conspicuous. The ascent to it was formerly by several steps, which are now broken down, to prevent the malecontents from taking refuge in it, as had been the practice in times of public insurrection; and for farther security, a body of janifaries keep guard in an adjoining

apartment. The building stands at the foot of the castle-hill; the top of it, which is lofty, being carved in the Turkish manner, and the entrance finely inlaid with various sorts of marble.

Another mosque, belonging to the Arabs, is likewise much admired. The body of it is sixty foot square, crowned with a beautiful dome, and waincotted to the height of eight foot; with the finest green and red porphyry. The carvings and gildings are admirable, and all round the walls are Arabic inscriptions in golden letters. The cupola likewise is beautifully painted, and the whole embellished with a number of glass lamps, and ostrich's eggs, so artfully disposed as to produce a fine effect on the eye. This grand room is said to have been built by a vizir, who requested of the sultan permission to prepare a place fit to entertain him with sherbet, on his return from Mecca.

The people of Cairo, and in general the inhabitants of Lower Egypt, are reputed to be ingenious, but it is observed, that farther up the Nile they become very heavy and stupid. The trade of the place is still great, though not so flourishing as formerly. The imports are broad cloths, tin, lead, raw silk from Indis, neat brass and iron work, and curious ornaments in silver. Their exports are coffee, flax, drugs, and various sorts of dyes, with some sugar, neither cheap nor fine, except a little which is preserved for the use of the grand seignior.

Notwithstanding the extensive trade of this city, there is amongst the Egyptians but little credit. They rarely transact business by bills, but deal all for ready money. Consuls from almost all the maritime countries of Europe have here their residence; and there is likewise a great number of foreign merchants. Those people being sociable amongst one another, live very comfortably. The morning they devote to business, and the remainder of the day to diversion. They are for the most part exceeding hospitable, and afford a kind reception to strangers, who would otherwise be very ill accommodated in the wretched inns of the Egyptians. The worst circumstance respecting Cairo, is its being so liable to the plague, from which it is rarely exempted for a longer period than three or four years at a time.

The castle of Cairo stands to the south of the city, on a rocky hill, surrounded by a wall of great height and solidity, and defended by several towers. The ascent is by a way hewn out of a rock, which loaded horses and camels get up without difficulty. What we find most worthy of observation in this fortress, is Joseph's Well, so called from a vizir of that name. The work is undoubtedly very ancient, and becoming the magnificence of the most powerful kings of Egypt. This well is cut in the solid rock, and is in depth two hundred and seventy-six foot. The dimensions of its mouth are twenty-four foot by eighteen. The water is conveyed upwards by means of two wheels, placed at different heights, and worked by oxen; for the passage of which a winding path leads down by the side of the well, in such a manner as to prevent those animals from falling out of

the tracks; and from space to space, the descent is enlightened by windows. The well at the bottom is about nine or ten foot deep, supplied from a spring, which is almost the only one in the country. The taste of the water is brackish, and it is only used in a siege, or on some other urgent occasion.

In the country adjacent to Cairo stand the celebrated pyramids, the structure and duration of which are universally the wonder of mankind. Those prodigious monuments are supposed to have been erected as burial places for the ancient kings of Egypt; but so remote is their origin, that they are anterior to the most early historians whose writings are preserved, and were regarded as of high antiquity, even at the time when the first Grecian philosophers travelled hither. The principal pyramids stand to the east-south-east of Gize, a village situated on the western bank of the Nile, not far from Cairo, and near the spot which is supposed to have been the site of the ancient Memphis. The number of them is considerable; though what particularly merit attention are four, the rest being not only less, but almost entirely demolished. Those four stand nearly in a straight line, distant one from the other about four hundred paces.

The pyramids stand at the foot of the mountains, upon a rocky plain about a Danish league in circumference, the surface of which is eighty foot of perpendicular height above the usual level of the greatest inundation of the Nile; and on this plain, which seems to be partly artificial, the marks of the chizel are yet perceptible. It is covered with sand blown from the high mountains in the neighbourhood, intermixt with which are found a number of petrified oysters, and shells. All the pyramids have square bases, which exactly front the four cardinal points.

In the most northerly pyramid, the outside is for the most part of square stones, unequal in size, but of a prismatic figure. They are not so hard as might be imagined from their having subsisted so long, but seem to owe their preservation to the natural dryness of the climate. They are however become porous in some parts, especially on the north side. The different exterior courses of stones are not joined by any cement or binding, but retain their original situation merely by their weight. It does not appear that the outside has ever been cased with marble, as some travellers have alledged. The body of the pyramid is composed of irregular stones, cemented by mortar. The entrance of this, as well as of all the other pyramids, is under the basis of the moulding, about forty-eight foot above the horizon; on the north side, but inclining a little to the east. The opening leads successively to five channels, or conduits; which, though they run in different degrees of elevation, tend all to the south, and terminate in two chambers, the one in the middle of the pyramid, the other beneath. All those channels, except the fourth, have nearly the same dimensions, viz. three foot and a half square. They are constructed alike, and covered on their four sides with white marble, so smooth that it is extremely difficult to pass through them, where they incline from the horizon.

When

When the first two channels are passed, a resting place occurs, with an opening on the right hand for another channel, where, except a second resting place, we meet with nothing but bats, which are extremely troublesome. The annoyance of those creatures is the more grievous, that after suffering it, we cannot prosecute our enquiry on account of the sand, but are obliged to return to the first mentioned resting place. The third channel leads hence to a small chamber, half filled with stones taken from the wall on the right hand, to open there another channel, which terminates in a nich not far from it. It is vaulted ridge-wise, and inlaid with granite, which is become black by the smoke of the flambeaus of its visitors. Returning by the same way, we next climb up to the fourth channel, which is also vaulted in a ridge-like form. The fifth conducs to the superior chamber, which is nineteen foot high, thirty-two foot long, and sixteen broad; in the way to which, about the middle of the channel, is a small apartment. Within the former, on the left side, is a large urn, or sarcophagus, of granite, without any ornament. The breath and depth are about three foot, and the length a little more than six. Northward of the sarcophagus, is a deep hole, apparently made since the pyramid had been finished. Nothing more is here to be seen, except two little canals, one to the north, and the other to the south, which are now stopped up with the stones that have been thrown by the curious, with the view of discovering their extent.

According to some, the height of this pyramid is five hundred and twenty-two foot, with a base of six hundred and eighty-two foot square; but by the computation of others, the height amounts to six hundred and sixteen foot, and each side of the base to seven hundred and four foot of horizontal extent. On the top, which viewed from below, seems to terminate in a point, is a platform, about sixteen or seventeen foot square; and on the outside are stones by which the pyramid is ascended.

The second pyramid is exactly similar to the former, but bears no marks of ever having been opened. The third is of the same construction, but lower by a hundred foot. It is shut, like the second, and without any covering. The fourth is a hundred foot lower than that immediately preceding, and is terminated on the summit by one great stone, which seems to have served for a pedestal.

Those four pyramids are surrounded by several others, of smaller dimensions, and mostly ruinous; in one of which is a square well about thirty foot deep.

History informs us, that in building the largest of the Egyptian pyramids, a thousand men were constantly kept in employment, who were relieved every three months by the same number. Ten years are said to have been spent in preparing the materials; and double that time in constructing the prodigious edifice. Express on the pyramid, in Egyptian characters, were the sums it had cost only in garlic, leeks, onions, and the like, for the workmen; which amounted to sixteen hundred talents of silver, or four million five hundred thousand French livres. A conjecture may hence be

formed, what the whole expence of the building must have been.

Such are the Egyptian pyramids, which by their figure as well as enormous magnitude, have triumphed over the united injuries of time and barbarians, monuments of the vanity and insolent oppression of the kings by whom they were constructed. Pliny, with great propriety, calls them a foolish and useless ostentation of the wealth of the Egyptian kings; and adds, that by a just punishment, the memory of those princes is buried in oblivion, historians not agreeing with respect to the person by whom they are said to have been founded. Other writers inform us, that the infatuated monarchs were even debarred from the sepulchres which they had raised with so much labour and expence. On account of the public hatred which they incurred, by imposing upon their subjects a work so burdensome and unnecessary, they were interred in some obscure place, to prevent their bodies from being sacrificed to the indignation and resentment of the people. It is the remark of Diodorus, that the industry of the architects of those pyramids is no less valuable and praise-worthy, than the design of the Egyptian kings contemptible and ridiculous.

Dr. Shaw, however, is of opinion, that the pyramids were not intended for the tombs of the Egyptian princes, as has been generally imagined. The chest of granite marble which is found in the upper chamber of the great pyramid, he supposes to have been rather intended for some religious use, than for the coffin of Cheops. He thinks it is more probable, that this chest was used in the mystical worship of Osiris; or that it served for one of their sacred chests, in which either the images of their deities, or their sacred vestments, or utensils, were kept; or lastly, that it might have been a cistern, such as contained the holy water, which was used in their ceremonies. He also thinks that the length of it, which is somewhat more than six foot, does not favour the received opinion of its having been designed for a coffin; and that the height and the breadth, which are each about three foot, exceeds greatly the dimensions, that were observed in works of such a kind.

Dr. Shaw farther remarks, that all the stone coffins which he had seen in Egypt, were of a quite different form from the supposed repository of Cheops, being inscribed with hieroglyphics, and made exactly in the fashion of the mummy chests, just capacious enough to receive one body. But that the chest in question is an oblong square, not ending, like the mummy chests, in a kind of pedestal, upon which it might have been erected. Neither is it adorned with any sacred characters, which from the great number of coffins that are never known to want them, seem to have been a general mark of regard and piety to the deceased.

He also observes, that this chest is placed in a manner different from what was perhaps ever the custom of the Egyptians, in depositing of their dead. For the mummies always stand upright, where time or accident has not disturbed them; but the chest in the pyramid lies flat upon the floor.

From what has been said, Dr. Shaw observes, that if this chest was not intended for a coffin (and indeed Herodotus tells us, that Cheops's tomb was in a vault below) we have a presumptive argument, that the pyramid could not thence have taken the name of a sepulchre. Nay, had even Cheops and others been buried within the precincts of this, or any of the pyramids, it was no more than what was commonly practised in other temples; and therefore would not affect the principal use or design for which they were erected. From the whole, Dr. Shaw concludes, that the pyramids were chiefly intended for places of devotion.

About three hundred paces eastward of the second pyramid, is the monstrous statue of a sphinx, cut out of the rock, representing the head of a woman, with half the breast. The head is twenty-six foot high, and measures from the ear to the chin fifteen foot. The lower part of the neck is thirty-three foot in diameter. In the top of the head is a hole, which probably is the channel by which the priests communicated their false oracles to the credulous multitude. There is an opening also in the back, through which perhaps they descended to the subterranean apartments.

Besides its pyramids, Egypt was also famous for the number and beauty of obelisks, which abounded in every part of the kingdom, and some of which form at this day the principal ornaments of Rome. Sesostris erected in the city of Heliopolis, two obelisks of granite, brought from the quarries of Syene, at the extremity of Egypt; each of which is said to have been a hundred and eighty foot high. They were afterwards transported to Rome by the order of Augustus. A third, of yet more extraordinary magnitude, which was made in the reign of Ramises, and is said to have employed twenty thousand men in the cutting of it, was likewise removed to Rome in the time of the emperor Constantius. Two of those obelisks remain, as well as another measuring a hundred and fifty foot in height, which Julius Cæsar brought from Egypt in a ship of so odd a form, that, according to Pliny, the like had never been constructed.

The design of the Egyptian obelisks seems to have been to serve as ornaments before the portals of temples, of palaces, and at the ends of colonnades. Their form, to a certain height, is quadrangular; after which they become cylindrical; then taper gradually, till they end in a pyramidal summit. They are, or at least have been made, originally of one piece. Their pedestal is a cube, which commonly does not exceed the breadth of the obelisks above three foot. This, with part of the obelisks, are for the most part sunk in the earth, and the quadrangular spaces upwards covered with hieroglyphical figures.

Two of the most beautiful obelisks extant in Egypt are at Lukoreen, which is thought to have been part of ancient Thebes. Their faces are six foot eight inches in breadth, and their height in proportion; but one is taller than the other. They both stand before a portal, or at the entrance of some superlative ruins, and their workmanship is reckoned the most admirable of any that is to be seen. Near Carnac  
No. 11.

are several others, of similar construction, amongst which, two are remarkable for the beauty of the granite. They are only about ten or eleven foot high, and are supposed to have been the pedestals of two idols.

Near the same place, which is supposed to have been the site of ancient Thebes, are two colossal figures, one representing a man, and the other a woman: They are seated, at the distance of twenty-one paces from each other, on cubical stones of fifteen foot, with pedestals five foot high, thirty-six and a half long, and upwards of nineteen wide. Both statues look towards the Nile, and in their sedent posture the altitude of each is about fifty foot, including the pedestals. They consist of several blocks of a greyish gravel stone, and seem to have been brought from the caverns, which abound in the neighbouring mountains.

Contiguous to the colossal figures are ruins, supposed to be those of the palace of Memnon. The portico of the temple alone is sufficient to give us a high opinion of Egyptian architecture. Each column has over its capital small square stones, which serve as beams for larger blocks of the same materials. Some of those masses are forty foot long, and two thick; above which are others in a transverse position, united in the manner of planks. The whole is covered with hieroglyphics, and painted in the most lively colours, in a stile which has neither shade nor gradation; but the objects are incruled as the figures of the dial-plates of watches, with this difference, that the former cannot be detached.

In respect to the architecture of this edifice, on the east and west sides is a wall, which serves for an enclosure, but on the north and south are colonades. The building was supported by three rows of columns, in each of which were twenty-one, but some are now wanting. Those in the middle are the tallest: their circumference is twenty-four Danish foot, and their height in proportion. They are without capitals, but ornamented with hieroglyphics. The floor is covered with ruins, and with sand three or four foot deep.

About fifty paces from this structure are other remains of antiquity, which seem to have been a gallery round the court, and are probably those mentioned by Philostrates, where he treats of the temple of Memnon. Here are many pilasters made of several pieces of the stone above-mentioned. Each is covered with a Term, the arms folded, and in the right hand a sort of hook. The heads are wanting, but a part of the usual head-dress of Egyptian figures remains on the shoulder. On some of the pilasters are blocks of stone, covered with hieroglyphics.

Behind the gallery is a wall in a ruinous condition. The upper part appears to have been joined to the colonade with large stones, by which means was contrived a walk sheltered from the sun. Many fragments of colossal statues are scattered, but none that can be considered as any part of the celebrated statue of Memnon.

At Medinet Habu, a town situated on part of the ruins of Thebes, is an ancient and magnificent portal,  
H h well

well preserved, and of uncommon beauty. Opposite is a kind of anti-chamber, built with large blocks of white stone, covered with hieroglyphics; to which adjoins a piece of a wall, ornamented in the same manner. The architrave of the portal has two friezes, one on the top of the other, and is highly polished. On the frontispiece may be perceived the figure of a dragon, with that sort of cartouch which was a favourite ornament amongst the Egyptians; all in basso relievo, and incrustated with colours. Behind this portal there appears to be three others in succession, so buried in rubbish, that they cannot be distinctly observed. The buildings on the right hand have also the appearance of being magnificent, but elude the enquiries of the spectator from the same cause.

Fragments of antiquities are likewise found about the village of Armeiut in Upper Egypt. This was the ancient Hermonthis, which stood on the west side of the Nile, over against Thebes. Here Jupiter and Apollo were worshipped, and the sacred ox maintained.

Higher up, on the same side of the Nile, we meet with more antiquities at the city of Esnay, which is the residence of an Arabian chief, and supposed to occupy the site of Latopolis; so called from a large fish named Latos, which was worshipped by the inhabitants. In the middle of the city is an ancient temple, closed on three sides, having in the front twenty four columns, which are well preserved. Round the top of the edifice runs a channelled border; but in the middle, which is the front of the temple, is a cartouch, or ornament similar to that on all the grand portals of Egypt. The structure is also bordered with a demi-cordon, the sides of which are covered with hieroglyphics, that seem to be of extreme remote antiquity. Stones transversely placed are supported by columns, on the former of which are fixed large flat masses of the same material, adorned with hieroglyphics. The columns are likewise covered with hieroglyphics, which in some places are very small, and much crowded.

It is observable, that in this temple not one capital of a column is similar to another in ornament, though the proportion in all be the same. The inside of the edifice is blackened by the smoke of the fire. All the other parts are distinctly seen, except the gate and the intervals of the columns in the front, which the Arabians have filled up, with the view of enclosing their cattle, it being now converted to that use.

At Edfu, once Apollinopolis, is a considerable monument of antiquity. It resembles a portal, but is used by the Turks as a citadel. A cordon runs round it in the Egyptian taste. On the top is no cornice, that part having perhaps been destroyed by the injuries of time. The structure has a simple and elegant appearance, and on the front are three rows of hieroglyphical figures, representing children. In the south side are several windows, very high, and running in an oblique direction. The portal is ornamented with a cartouch. Here are likewise the ruins of an ancient temple of Apollo, the greatest

part of which is now buried; and on the top are a few mean pigeon-houses.

Proceeding higher along the side of the river, we arrive at Tschabel-Eschfefe, which signifies the Mountain of the Chain. According to tradition, the passage of the Nile was here intercepted by a contrivance of that kind. The bed of the river is very narrow at this place. On the east side is the mountain above-mentioned, and on the west a rock. In the neighbourhood are many grottos, which have served as sepulchres, and their sides are covered with hieroglyphics. Four figures remain, in a sedent posture, in alto relievo, and of a natural size. Two of them represent men, and the other two women. The men, who are in the middle, have their arms across on their breasts, and each woman holds the man next to her under the arm. A hieroglyphical table, in basso relievo, is near, which probably contains the epitaphs of the persons interred.

Farther south, near the village of Banban, we meet with an ancient edifice raised on twenty-three columns, well executed, and covered with hieroglyphics; of which the stones that form the roof are of a prodigious size. The columns are twenty four foot in circumference.

About fifty paces hence, on the slope of a mountain, is another antique monument, above eighteen foot high. It is composed of large square blocks of whitish stone, like marble, covered with hieroglyphics. In the center of the wall is a nich, regularly squared in the middle, but larger above than below. It is conjectured that this building has been an altar, and that an idol had been placed in the nich.

In the island of Ell-sag, the ancient Elephantine, formed by the Nile, stands an edifice called the temple of the Serpent Knaphis, which seems however to have been rather a sepulchral monument. It is in the form of a cloyster, supported on two sides by several columns, but on the other two, by one only in the middle. The corners are of solid wall, covered with hieroglyphics; but they are so plastered with mud, and blackened with smoke, by the shepherds who resort hither, as to be hardly discernible. The length of the structure is about eighty Danish foot, and the breadth twenty. Near it stands a pedestal, made of large blocks of a white stone, full of Greek inscriptions. At this place, according to the Notitia Imperii, was stationed the last Roman garrison.

On the east side of the Nile, in the island of Ciesret Ell-Heist, the Philo of the ancients, is a temple of uncommon beauty, supposed to be that of Isis; and near it another, of inferior dimensions; but likewise remarkable for its elegance, conjectured to be the temple of the Hawk, which is mentioned by Strabo. Of those two beautiful edifices we can only speak in general, the barbarians who inhabit the neighbourhood precluding any accurate observation; a disappointment which those frequently experience, whom curiosity leads into the more sequestered parts of this country.

The ancient Arsinoe now lies in a heap of ruins; amongst which may be discovered several canals, with

some remains of a round brick building, partly encrusted with a petrification. It has the appearance of having once been a bagnio, and this conjecture is confirmed by common report. In the way hither we have a distant view of the famous Labyrinth which, according to Herodotus, was built at the time when Egypt was divided into twelve governments, the several kings of which had here their respective palaces, where they occasionally met to transact all matters of state and religion. Other writers differ from him, with regard to the founders of this extraordinary edifice; but all agree that it contained three thousand magnificent apartments, half under, and half above ground; that they were cut out of stone, without any wood in the structure; that no stranger could find his way through it without a clue or a guide; and that the celebrated Labyrinth of Crete was only a model of it. The whole building was covered with stone, supported by innumerable pillars, and adorned with elegant sculptures. In the lower apartments were deposited the sacred crocodiles, and the bodies of the kings who founded the building. The crocodiles were bred up tame in the neighbouring lake of Mæris, and the worship of them is said to have arisen from the life of an ancient king being saved by one of those animals. The monarch, pursued by his own dogs, was in danger of being torn in pieces by them, when plunging for safety into a lake, a crocodile opportunely presented his back, and waded the royal burthen safe to the opposite shore. The king, out of gratitude, ordained that divine honours should be paid to it; and not satisfied with giving to Arsinoë, which he then founded, the name of the City of Crocodiles, he built a pyramid and labyrinth for the interment of his aquatic deliverer.

Some authors have affirmed that the lake Mæris was the work of art, but it certainly must have existed from the beginning, though it may have been improved or deepened by the king to whom it is ascribed. What, it may be asked, became of the earth dug out of such a vast abyss, which is at present about fifty miles long, and ten broad? Could so great a work have been executed in the reign of one prince? What should prompt the Egyptians to lose the surface of so much land; and by what art could they fill this vast tract with the superfluous waters of the Nile? So many are the objections against its being artificial, that to maintain such an opinion, would not only be in the highest degree repugnant to probability, but even ridiculous.

This lake had a communication with the Nile by a great canal four leagues long, and fifty broad, which opened or shut by large sluices, as occasion required. The charge of either of those operations is said to amount to fifty talents, that is fifty thousand French crowns. The fishing of the lake brought the monarch immense sums; but its principal use related to the overflowing of the Nile. When the latter rose too high, and was like to be attended with fatal consequences, the sluices were opened, and the waters having a free passage into the lake, covered the land no longer than was necessary to enrich them. On

the contrary, when the inundation was too low, and threatened a famine, a sufficient quantity of water was supplied to the lands, by the help of drains from the lake. The waters of the lake Mæris are salt, nitrous and muddy, but less so as they approach the Nile. The banks are at first stony, then muddy, and incrustated with salt. It abounds in all sorts of fish that are natives of the Nile.

To ferry over this celebrated river, which has been so frequently mentioned, a particular kind of flat-boat is used, made of large earthen pitchers tied close together, and covered with palm-tree leaves. The man who steers, has commonly a cord hanging from his mouth, with which, as he sails, he fishes.

## C H A P. III.

*Of diseases — diversions — fortune-tellers — gypsies — the Copts.*

THE great heat of the climate exposes the inhabitants of Egypt to a variety of disorders, amongst which one of the most universal, especially in summer, is sore eyes. This complaint owes its origin chiefly to the scorching heat reflected from the sand; but it is greatly aggravated by the dust, which insinuates itself into the eyes, and, by a falsh quality it possesses, excites irritation. Disorders of the bowels are also frequent, such as a pain in the stomach, and fluxes, sometimes accompanied with dangerous fevers. A common complaint among the men is a swelling of the scrotum; and both sexes, particularly at Cairo, are much afflicted with a swelling of the legs, attended with sharp pains. At the season when the waters of the Nile begin to rise, most people are troubled with an inflammation, which affects the whole body; but this seems to proceed from some other cause than the inundation of the river, which has a salutary influence on the inhabitants, as well as increases the fertility of the soil; even the plague, a disease so frequent at Cairo, ceasing to be mortal during almost the whole of this period. The greater part of those diseases arising from irritation, they must be increased not only by the muscettos or gnats, which swarm so much, that in the hot season there is no sleeping for them at the night, but also by the sand, which insinuates itself every where, bespreading even the bed-cloaths, and is as hot as if it had been warmed with a pan of coals.

As for physicians or remedies, the Mahometans of Egypt hardly ever have recourse to any, adhering pertinaciously to their doctrine of unalterable fate; with respect to which they are so much confirmed in opinion, that when the plague is in a family, they visit their neighbours as at other times, and do not scruple to wear the cloaths of a person who died of it.

The greatest festivity known in Egypt prevails at the beginning of the annual inundation, when the dykes are thrown down, to admit the water into the canals. At Cairo, the bashaw and his beys, with a numerous retinue, assist at the ceremony, which was anciently accompanied with the horrible custom of sacrificing a virgin to the river-god. This barbarous practice, how-

however, is now happily abolished, perhaps the only mark of civilization that distinguishes the modern Egyptians. Instead of that offering, a pillar which stands at a little distance, is adorned with flowers, over which the waters rushing, carry them away; while, amidst universal shouts of joy, the populace throw into the water, nuts, melons, and other fruits; and a fire-work, consisting of only about twenty rockets, but reckoned here very considerable, is played off. The people on those occasions commit a thousand follies; dances of the most lascivious gesticulation are performed; and there is hardly a year but some lives are lost in those tumultuous rejoicings.

At other times, diversions are neither frequent nor numerous, especially in the country, and the smaller towns. The streets of Cairo are infested by jugglers, ballad-singers, and fortune-tellers. Amongst the amusements with which they wheedle the people out of money, they lead about dancing camels. Those animals are taught to dance when they are young, by being set upon a heated floor, which giving them a great deal of pain, causes them to lift up their legs alternately; and while they are in this state of motion, a person beats upon a drum. The effect is, that afterwards, whenever the creature hears the noise of a drum, he immediately renews the dancing motion.

The fortune-tellers breed up little birds, which, when any person comes to enquire concerning the success of his affairs, carry him a small scroll of paper, ready prepared, in which he finds either his good or bad fortune written; and to this imposture many of the people pay the most religious regard.

It appears upon enquiry, that the vagrants called gypsies, those pretended fortune tellers that infest most countries in Europe and Asia, were originally of Egyptian extraction. In Turkey those people are called Zingances, from their captain Zingancus, who, when the sultan Selimus made a conquest of Egypt about the year 1517, with several other Mamalukes, and as many native Egyptians as refused to submit to the Turkish yoke, retired into the deserts, where they lived by rapine, and frequently came down to the plains of Egypt, committing great outrages in the towns upon the Nile, under the dominion of the Turks. By the concurrence of idle persons, who resorted to them, with the view of participating in their plunder, they encreased at length to so formidable a body, that the Turks were glad to enter into a treaty with them; in which it was agreed, that they should lay down their arms, and be permitted the same privileges which other subjects enjoyed. The Zingances, however, having been so long accustomed to a vagabond, rapacious life, and being totally unacquainted with the arts of industry, began to have recourse to their former method of subsistence. For some time, their outrages were overlooked by the Turks, for fear of another insurrection; but proving irreclaimable, they were formally banished the kingdom, and a power was given to any man to kill a Zangance, or make him his slave, if he was found within the territories of Egypt after a limited time. Perceiving it now impossible to maintain their

liberty at home, they resolved to disperse themselves into foreign countries; and that they might be able to procure a subsistence without labour, to which they had an invincible aversion, they availed themselves of the general credulity of the times, by pretending to the art of fortune-telling. This was a science in which the people of their country were vainly imagined to be proficient, and the natural swarthiness of their complexion, by evincing their descent, contributed not a little towards the success of the imposture. Soon after this period, in the reign of Henry VIII. an act of parliament passed in England, reciting, That, whereas certain outlandish people, using no craft or merchandize to live by, but going from place to place in great companies, using subtle and crafty means to deceive the king's subjects, bearing them in hand, that they by palmistry, can tell men and women's fortunes, and so, many times subtly deceive the people of their money, and commit divers felonies and robberies: it is enacted, that all such offenders, commonly called Egyptians, who shall remain in this realm for the space of one month, shall be adjudged felons; and that every person who shall import such Egyptians, should forfeit for every offence forty pounds.

It being found, that several natives of our own country listed themselves amongst those Egyptians, and disfigured their faces that they might appear of the same extraction, using likewise an unintelligible cant, to which other people were as much strangers as to the language of Egypt, an amendment of the former act was passed in the fifth year of Elizabeth.

Such are the arts by which the modern Egyptians are distinguished; the posterity of a people renowned for their learning and wisdom, and from whom the most celebrated Grecian philosophers received their improvement in science. With the learning of ancient Egypt, has perished the knowledge of the hieroglyphical characters, for the use of which it was remarkable. Happy for the honour of those times, had no memorials existed of the extravagant and superstitious idolatry, which degraded the inhabitants of Egypt, even during their ages of greatest splendor. But history records with indelible infamy, their astonishing adoration of animals of various species; amongst which were, oxen, crocodiles, cats, &c.

Omnigenumque Deum monstra, & Iatrator Anubis.

The gospel is said to have been preached in Egypt by St. Mark, who is esteemed the first patriarch of Alexandria. During the persecution which succeeded this event, many of the new profelytes retired to the city of Coptus, whence they obtained the name of Coptis, an appellation which has ever since been bestowed on the Christians of Egypt. They continued in union with the catholic church, till Dioscores, patriarch of Alexandria, embraced in part, the opinion of Eutyches, which was conducted by the fourth general council held at Chalcedon.

When the Mahometans undertook the conquest of Egypt, they joined the party of the Coptis, who by this means prevailed against their antagonists, and their patriarch was firmly established, as he continues

to be at present. The Coptic church, in its ceremonies, considerably resembles the Greek. The liturgies are in the Coptic language, which is supposed to be a corruption of the ancient Egyptian tongue. The epistle and gospel are read both in the Arabic and Coptic languages; but the latter is understood only by a few of the priests, and not being a living tongue, is now little cultivated.

This sect spends almost all the night before festivals and holidays, in their churches; a custom that perhaps arose from their meeting to celebrate their devotions at night during the times of persecution; and which has since been continued, on account of the coolness. Their churches are always covered with matting. On entering, they take off their slippers, which it would be thought ill-breeding to wear even in their houses, and kiss the pavement. They sit for the most part on the ground, in an irreverent manner; and when obliged to stand up in any part of the service, they lean on crutches, with which they are supplied by the sexton.

The extreme ignorance of their priests affords a very good reason for their not preaching. The patriarch makes a short discourse to them once a year, and the priests read lectures out of the pulpit on great festivals. Deacons are made at eight or nine years old, who always receive the sacrament when it is administered.

The Copts observe the sabbath very strictly, and have many fast days. As abstinence from flesh cannot be a great mortification to those who seldom have any to eat, their fasts consist in not feeding upon eggs, milk, butter, oil, and such things as they commonly use; and in forbearing from those till noon or later. One of their greatest fasts is that of Lent, which begins fifty-five days before Easter; and another is that of Advent, forty-three days before Christmas. They also fast fifteen days before the Annunciation; during which time they eat no oil, and live mostly on vegetables. The fast of the Apostles begins forty days after Easter: it is observed for thirteen days by the laity, and somewhat longer by the priests. They have also three days of a rigid fast before the feast of Jonas. At the season of Good Friday, they abstain from meat for twenty-five hours.

To obtain leave of the patriarch to eat eggs in Lent, they sometimes have recourse to the following expedient. They lift him up in a chair, and ask him, if he will give them leave. On refusing it, they desire to know if he will be thrown down. When those questions have been repeated three or four times, the consent of the patriarch is granted, and both he and the people separate with mutual satisfaction.

They frequently espouse when they are seven or eight years old, and consummate the marriage at eleven or twelve; a few weeks before which time they are circumcised. The men easily procure divorces, on account of adultery, long sickness, or almost for any disagreement. At baptism, they plunge the child in the water three times, after which they confirm, and give it the sacrament; that is, the priest dips the end of his finger into the chalice, which is filled with wine, and puts it into the child's mouth.

No 11

The women keep their houses forty days after they are delivered of a boy, and twenty-four if a girl; till which time the baptism is deferred, and sometimes much longer. But if the child falls sick in the interval, it is brought to church, where only baptism can be performed, and is laid on a cloth near the font. The priest then dips his hand into the water, with which he rubs the infant all over; but if this ceremony is to be performed at a time when there is no sacrament, the child, father, and mother, must remain in the church till next day.

They give absolution, as in the Greek church, and anoint all who are sent, that the evil spirit may not enter them. Their confessions are general. They abstain from blood, and things strangled. It is their opinion, that the soul goes to heaven in forty days after leaving the body; but they pray for the dead both before and after that time.

They prostrate themselves before pictures, but have no graven image, except a crucifix. The bread which they use in their sacraments is a small white cake, made of flour and water unleavened. The people buy the corn with the money of the church, in which, after being made into flour, it is always kept. The cakes are made by the sacrificer, who chants some psalms during the work, and they are baked in an oven which is never put to any other use.

The Copts, of all the eastern people, are the most irreverent and careless in their devotions. They seem to think that religion consists only in repeating long services, and strictly observing their numerous fasts.

The more early part of the history of Egypt is lost in remote antiquity. There are reckoned above sixty princes under the denomination of Pharaohs, said to have reigned in uninterrupted succession, to the year of the world 3435, when Pharaoh Psanniticus, the second monarch of that name, was conquered by Cambyses, king of Persia, who united Egypt to that empire, under which it remained till the time of Darius, being upwards of a hundred years. Revolting from the Persian monarchy, it again became, under Amecatus, an independent kingdom; in which state it continued about fifty years. The dominion of it being again seized by Ochus, king of Persia, it remained subject to that monarchy, till the defeat of Darius, when it fell under the power of Alexander, with the other provinces of the Persian empire.

After the death of Alexander, the country became once more an independent kingdom, under Ptolemy, whose successors retained the throne and name between two and three hundred years; the last sovereign being the famous Cleopatra, with whom irrecoverably terminated the liberty and glory of Egypt. It henceforth remained a Roman province till the reign of Heraclius, the emperor of Constantinople, when the people being oppressed by their governors, called in Omer, the third caliph of the Saracens, and submitted themselves to the Mahometan power, about the year of the Christian era 640.

The caliphs of Babylon continued sovereigns of the country till about the year 870, when the Egyptians set up a caliph of their own, called the caliph of Cairo,

I i

12

to whom the Saracens of Africa and Spain were subject. But the governors of the provinces, or sultans, under the caliphs of Babylon and Cairo, soon wrested the civil power out of the hands of their caliphs or high priests, leaving them only a shadow of sovereignty.

About the year 1160, Egypt was subdued by Affareddin, or Saracon, general of Norradin, the Saracen sultan of Damascus; whose son, Saladin, reduced the kingdom of Damascus, Mesopotamia, and Palestine, under his power, and in the year 1190, took Jerusalem from the Christians. It was this prince who established in Egypt a body of troops, like the present janizaries, composed of the sons of Christians taken in war, or purchased of the Tartars. To this body he gave the name of Mamalukes, a word signifying slaves, which among the troops of the Mahometan princes, is reckoned a title of great honour, as it expresses their being implicitly devoted to the service of their sovereign; on which account they are indulged with greater privileges than other subjects. The posterity of Affareddin enjoyed the crown till the year 1242, when the Mamalukes deposed Elmutan, as they had done his father Melech Aslach, some years before, and placed one of their own officers upon the throne. The Mamaluke sultans were continually engaged in war with the Christians in Syria and Palestine, till Araphus, the sixth sultan of the race, entirely dispossessed the Christians of the Holy Land.

About the year 1501, Camfon Gaurus, the fifteenth sultan of the Mamalukes, entering into an alliance with Ismael, the sophy of Persia, against Selimus, the third emperor and tenth king of the Ottoman family, the confederates received several memorable defeats; and Tonombeus II. the successor of Camfon Gaurus, was deposed and murdered by the victorious emperor. For some time, Gazelle, one of the grandees of the Mamalukes, maintained a war against Selimus; but being at length defeated, Egypt became a province of the Ottoman empire.

The Mamaluke sultans were always chosen by a majority of Mamalukes out of their own body, who were so jealous of the kingdom's being rendered hereditary, that they hardly ever elected the son of the preceding sultan; or if the choice happened to fall on such a one, they were so apprehensive of its being made an ill precedent, that they never reited, till they deposed him.

Since the Ottoman emperors have had the dominion of this kingdom, they always governed it by a viceroy, styled the bashaw of Grand Cairo, who is accountable for his conduct only to the emperor, and is usually changed every two years. Under him are twenty-four beys or begs, whom he has the power of nominating, and who are answerable before him, as he is before the Porte. One of those attends the carats, or tribute, which are carried every year from Egypt to Constantinople; another accompanies the caravan to Mecca; and those unemployed assist at the divan or council of the bashaw. When Egypt sends her contingent, or any troops to the emperor, they are always commanded by a person of this body; and when a man has been nominated a bey, the title remains during life.

In every city is a cadiz, or judge, who decides law-suits, and his sentence is generally without appeal, though upon a complaint of any party aggrieved, it may be reversed by a majority of the divan. In religious matters, the country is governed by a mufti, and the doctors of the law.

Egypt being now esteemed the granary of Constantinople, its great importance occasions it to be governed with more lenity than any other province within the Ottoman empire; and what is a privilege enjoyed by very few of the Turkish subjects, the people have an inheritance in their lands. The taxes also are moderate; inasmuch that, except what the viceroy and his creatures may illegally extort, the whole revenue does not amount to a million of our money; two thirds of which are annually spent within the kingdom.

## A B Y S S I N I A, N U B I A, and A N I A N.

**A**BYSSINIA, or Ethiopia Superior, comprehending Nubia and the coast of Abbex, is situate between 20 and 44 degrees of east longitude, and between 6 and 25 degrees of north latitude; being upwards of one thousand three hundred miles in length, and one thousand one hundred in breadth. It is bounded on the north by Egypt and the desert of Barca; on the east by the Red Sea and the Indian Ocean; on the south by Anian and unknown parts of Africa; and on the west by other parts unknown.

Here are many high mountains of a pyramidal form, and in the middle of the country is the lake Dambca, whence issues the river Nile, which, after taking a circular sweep, runs north, and enters Egypt.

By this river, and a multitude of smaller streams, the soil of Abyssinia is so much enriched, that it yields plenty of corn, rice, fruits, cotton, sugar, and the finest flax. Gold-dust also is found in the rivulets, and mines of silver and copper are very frequent. The animals are camels, oxen, sheep, and the Arabian horses so much admired, which are bred in the pastures of this country.

The air in the valleys is excessive hot, but the mountains cool. The hottest season is when the sun is on the opposite side of the equator, and shines obliquely upon them; for when it is vertical, the clouds intercept its rays, and the rains then fall.

The Ethiopians are of a good stature. Their complexion is a deep black, and their features are much more

more agreeable than those of the negroes, having neither such thick lips, nor flat noses. They are said to have a great deal of vivacity, and to be of a docile disposition.

The better sort are clothed in veils made of silk, stuffs, or cotton, after the manner of the Franks in Turkey; but the poor people go almost naked, using only a small piece of skin, or coarse stuff, wrapped about their loins.

Their bread is thin cakes, baked upon the hearth as they are wanted. They eat all sorts of flesh almost, as the Europeans, except that of swine, and such other meats as were prohibited to the Jews. They also resemble the latter in the manner of killing their meat; and they abstain from things strangled, and from blood. The poor people live chiefly upon milk, butter, cheese, roots, and herbs.

The meat is brought to the tables of people of condition in earthen dishes; but they use no other trenchers than their bread, and are totally unacquainted with knives and forks. Their meat is generally either boiled or stewed; and persons of rank are fed by boys with spoons, they considering it as below their dignity to perform that office for themselves. The country abounding in honey, their common drink is mead or metheglin. They have also liquors made of wheat and rice, and their princes drink some wine. But in the making of this liquor they are unskilful, though they have the finest grapes in the world. On which account, you cannot make their princes a more acceptable present, than some bottles of European wine.

Notwithstanding the country affords some excellent materials for manufacture, their fabrications of this kind are extremely few and mean. Of linen they hardly make any, nor do they stand much in need of it, as they use neither table linen nor sheets. They lie on carpets or mats, as in other hot countries.

The Jews are the only weavers and smiths amongst them; and as for other handicrafts, such as carpenters, tailors, shoe-makers, every man breeds up his children to his own employment. Those several trades, like the casts or tribes in the East-Indies, live separately, and never intermix with any other.

The silk, stuffs, calicoes, linen, and carpets, used for furniture or cloathing, they receive chiefly from the Turks, who in return for their merchandize take the gold and emeralds of Abyssinia, with some fine horses. When the Portuguese first found the way to this country, the shores of the Red Sea were open; but now the Turks keep so strict a guard there, that it is difficult for any other people to have access hither.

Travellers enumerate in this country nine provinces, every one of which has a distinct sovereign, that acknowledges the king of Abyssinia as superior lord. This prince, however, has lost much of the power and prerogative which he formerly enjoyed. The throne is considered as hereditary, but primogeniture not always observed. As soon as an emperor is crowned, he orders all his collateral relations to be secured in a fortress situated on an almost inaccessible rock, where they remain in perpetual imprisonment,

to prevent them from raising any faction by which they might aspire to the crown.

According to the Portuguese, who visited Abyssinia soon after their passing the Cape of Good Hope, in the sixteenth century, the emperor was stiled Prester John, or Presbyter John, which title some imagine was given him, because he was the high priest, as well as king. By his own subjects, however, he is generally stiled Negus, or, to distinguish him from the inferior princes, who have the same title, Negafcha Negafcht, which in their language signifies king of kings.

No money being used in the country, the emperor's revenues are paid in kind. Part arises from the duties laid on merchandize brought from Turkey by the Red Sea. Exclusive of the revenue for defraying the expence of government, the farmers also pay for the maintainance of the royal household, the thirtieth part of all their produce; and every artificer, on the same account, is obliged to furnish a certain quantity of his manufacture. The king's revenue receives also a considerable accession by creating knights of St. Anthony; each of whom, on being knighted, pays a fine. This order, which is very numerous, is partly ecclesiastical, and partly military.

The religion of the Abyssinians is a mixture of Judaism and Christianity, approaching much nearer to the Greek than the Latin church. They keep both the Jewish and Christian sabbath, and each of them more in the manner of a fast than a festival. They circumcise their children on the eighth day; and it is said that the operation is performed on females as well as males, the former having in this country, as in some others of Africa, an excrescence on the genital parts, not natural to those of the sex in more temperate climates.

Circumcision is performed by an old woman, but baptism only by a priest. If it be an adult person, the priest anoints him with oil, and then going to some river or pond, by the assistance of two deacons, he plunges him three times under water, repeating the baptismal expression. The deacons then bring the person out, and he is anointed again; after which he is clothed with a white garment, and over it a red vest, denoting purity and regeneration. The person is next brought to the church, where after receiving the communion, he is presented with milk and honey, and dismissed with the priest's benediction. When an infant is baptized, it is only gently dipped, and sprinkled with water.

They acknowledge the same books of Holy Scripture with us; and, it is said, have a more correct copy of the Septuagint than is to be met with in Europe. They admit the councils of Nice, Constantinople, and Ephesus, with other provincial councils, received before that of Chalcedon; and beside the Nicene canons, have eighty-four others in the Arabic language, which the emperor Constantine sent to Jerusalem, in the year 440, and were carried thence to Rome, in 1646. This book contains the synod of the apostles, said to be written by St. Clement; the councils of Ancyra, Cæsarea, Nice, Gongra, Antiochia, Laodicea, and Sardis, with the acts of three hundred and eighteen fathers,

fathers; a treatise of the sabbath, with a decree and canon of penance; to which are annexed their general liturgy, prayers, and offices for the communion, &c.

They use the Nicene Creed, but have not that of the apostles. They believe the real presence in the sacrament, but not transubstantiation. They make general confessions only, and receive as general absolutions. They seem to think that the soul is material, yet believe in its immortality.

The emperor is supreme in all ecclesiastical, as well as civil causes; and both the clergy and laity are under the jurisdiction of the king's judges. They have however a metropolitan, consecrated by the patriarch of Alexandria, who confers orders on the clergy, amongst whom there is no order superior to priests.

The monks do not live in cloysters or convents, but every one in his hut, forming a kind of village near some church, where they perform divine service in their turns. Their principal churches were built at first after the model of the temple of Jerusalem, with a sanctuary and outward court; but they since build them in the form of a cross, like the cathedrals of other Christian nations.

At divine service the people use lighted tapers, in the manner of the Greek church. They neither sit nor kneel in their churches, but stand, though the service, on some holidays, lasts whole days and nights. They are however permitted the use of crutches, on which they sometimes lean. They pay the highest veneration to those hallowed edifices, which they never presume

to enter, without putting off their shoes. They would not spit on the pavement for any consideration; and when in travelling, they come near a church, they will dismount from their mule or horse, to walk past it on foot.

In this country, the great men are allowed as many wives as they please, but the poor are restricted to one. They bury their dead without a coffin, and have no particular funeral service. By way of mourning, the relations and friends of the deceased wear tattered cloaths for some time.

Nubia, which is contiguous to Abyssinia, and comprehended under the general name of Ethiopia, is bounded on the north by Egypt and the deserts of Barca; on the east by Abyssinia; on the south by Lower Ethiopia; and on the west by Zaara. It is said to be four hundred leagues in length, and two hundred in breadth; but writers are much divided in regard both to this and other circumstances, not only respecting Nubia, but every inland country of Africa. According to the most credible accounts, this large tract is occupied by a number of princes independent of each other; but both the country and inhabitants much resemble those of Abyssinia.

Of the country of Anian, which lies upon, or near, the Eastern Ocean and the Red Sea, we can say nothing with certainty; some travellers representing it as an uninhabitable desert, whilst others, on the contrary, affirm, that it is populous, and abounds in all the necessaries of life.

## Z A N G U E B A R.

**Z**ANGUEBAR, comprehending the countries of Magadoxa, Melinda, Mombaza, Terra de Raphael, Quiloa, Mozambique, and Zofala, is situated between 34 and 40 degrees of east longitude, and between the tropic of Capricorn and 4 degrees of north latitude; being bounded on the north by Anian; on the east by the Indian Ocean; on the south by the Terra de Natal; and on the west by Monomugi, and unknown parts of Africa.

The most northerly province is that of Magadoxa, the chief town of which, bearing the same name, is situated at the mouth of a cognominal river, in 3 degrees odd minutes of north latitude. The people here, as in most of the adjacent country, are in alliance with, or subject to the Portuguese. The territory however is very barren, affording hardly any merchandize or cattle, except a good breed of horses, which they sell to the Portuguese, who dispose of them again to the Arabs. The inhabitants are a mixture of Pagans, Mahometans, and Christians. Their complexion is black, with flat noses, and thick lips, like the rest of the negroes.

The country of Melinda lies south of the equator. The chief town is in two degrees and a half

of north latitude, on an island at the mouth of a cognominal river, and is the capital of the Portuguese dominions in this part of the world. Notwithstanding its situation in almost the center of the torrid zone, it is exceeding pleasant, fruitful, and healthy, being frequently refreshed with showers and fine sea-breezes. The city of Melinda is large and populous, well built, considering the situation, and has a good harbour, commanded by a strong citadel. The Portuguese have here seventeen churches, and nine religious houses. They have also warehouses, stocked with all sorts of European goods, which they barter with the natives for the produce of the country, viz. gold, elephants teeth, slaves, ostrich-feathers, wax, and drugs; such as senna, aloes, civet, ambergrease, and frankincense. The country likewise produces rice, millet, sugar, and fruits; and the Portuguese, beside what they use, export thither great quantities to their other settlements. According to the computation of some travellers, the inhabitants of the city of Melinda, and the little island on which it stands, do not amount to less than two hundred thousand souls, great part of them Christians. The natives have a king of their own, who is a Mahometan; but many of the people

are pagans, and all of them in some subjection to the Portuguese.

The country of Quiloa lies to the southward of Melinda; its capital city, of the same name, being in 9 degrees odd minutes south latitude. The Portuguese possessed themselves of it on their discovery of this coast, but the situation being unhealthy, they quitted it soon after. The king of the country, however, like the other princes of the coast, is tributary to them, and pays them an annual tribute in gold, amounting to the value of a hundred thousand cruzados. This part of the country produces excellent sugar-canes, but the Portuguese do not improve them, receiving every year great quantities of sugar from their countrymen at Brazil, who come hither for slaves.

South of Quiloa lies the country of Mozambique, the chief town of which is situated on an island at the mouth of a river of the same name, in 15 degrees south latitude. Here is a good harbour, defended by a citadel; the town regularly fortified; and the island on which it stands is near thirty miles in circumference, and very populous. It contains six churches, and several monasteries, the monks of which make many

profelytes in the neighbouring country. Here likewise the Portuguese barter European goods, for gold, elephants teeth, and slaves; and their shipping to and from India call for refreshments. As the country produces great herds of cattle, the Portuguese kill beef, and salt it up, either sending it to the Brazils, or selling it to European traders.

Mongale, an inland town in this country, is also garrisoned by the Portuguese; and here is their chief staple for European goods. The gold they receive in exchange from the natives, is found near the surface of the earth, or in the sands of rivers, there being no gold mines wrought in Africa.

The city of Mombaza, in the country of Mozambique, lies in 7 degrees odd minutes south latitude. Of this the Portuguese took possession when they first visited the east coast of Africa. Being forced to evacuate it afterwards, they repeated the conquest, and have here at present a considerable trade.

In Zofala, to the southward of Mozambique, the Portuguese have also some little settlements; and indeed they engross almost the whole trade of the coast, as far as the tropic of Capricorn.

### C H A P . I .

*Of the situation—air—produce.*

CAFFRARIA, or the country of the Hottentots, including the Terra de Natal, is situate between 24 and 35 degrees of south latitude, and between 15 and 35 degrees of east longitude; lying in the form of a crescent about the inland country of Monomotapa, and bounded by the Southern Ocean on the east, west, and south. It is a very uneven country, abounding in mountains, of which the three most considerable lie near the Cape; the Table Mountain, of a very great height, the top of which is always covered with a cap of clouds before a storm; the Sugar-loaf, so named from its form; and James Mountain, or the Lion's Rump.

There are no navigable rivers, but many small streams, which render the valleys exceeding fruitful. On the west, the sea forms the bay of St. Helena, with that of Soldania, and the Table-Bay; and on the east, Hermosa-Bay, and the Bay of Brasia; but we meet with no harbours, though the country has a sea-coast of upwards of a thousand miles.

The valleys would be excessive hot, were it not for the Southern Ocean, whence the wind blows almost on every side, and frequently with such violence as is seldom experienced in other seas. Hardly a week is free from these hurricanes. The Dutch sometimes lose whole fleets as they lie at anchor, and they are forced to moor their guard-ship with strong chains,

No. 11.

instead of cables. Those frequent tempests, however, render the country very healthful, and seem to be even necessary for preserving the air in a salutary state; for if there happens a calm of any considerable duration, all the people are affected with the head-ach.

The gardens belonging to the Dutch East-India Company, at Cape-Town, afford a striking proof of the favourable temperature of the climate for vegetation, and the great fertility of the soil. Here are the most delicious fruits of Asia and Europe, growing within squares of bay-hedges, so high and thick, as to prevent them from being much injured by the storms of the ocean. It appears, however, that fruit-trees are not indigenous in the climate, but have been planted here by the Dutch, who imported them either from Europe or Asia. The same may be said of the vines, which were introduced by a German, and are now so plentiful in the country, that hardly a cottage in the Cape settlement but has its vineyard, which produces wine sufficient for the family.

Fruits and plants of all sorts are observed to be both much larger and sweeter than those of Europe. The head of a cabbage, at its full growth, weighs thirty or forty pounds; and the head of a colliflower as much. A potatoe weighs from six to ten pounds. The melons, which are raised without glasses, or hot-beds, are not only larger than those of Europe, but wholesomer, and of an exceeding fine flavour.

All sorts of grain are sowed here, except oats and lentils, and they are reaped in the month of December.

K k

The

The manner in which the farmers here tread out their corn, is as follows.

They make a circular floor, about thirty, forty, or fifty foot diameter, with a composition of clay and cow-dung, which binds very hard; and round it they erect a mud-wall, about breast high. This area they cover with sheaves, beginning in the middle, and laying them in concentric circles, till they reach the outside. They then turn in about twenty or thirty horses, which a man, furnished with a long whip, drives round till the corn be trodden out, and the straw become as fine as chaff. They afterwards clean the grain, and carry it into their granaries. This method they practise with great security, as it seldom rains here from the middle of October to the middle of March.

The country adjacent to the Cape produces a great number of plants, unknown in other parts of the world, and appears to be well worthy the farther investigation of botanists.

In this country are to be found lions, tigers, and leopards, with almost every quadruped of the ravenous kind. When the first of those animals attacks a man or beast, he immediately knocks them down with his paw, and deprives them of all sensation, roaring at the same time in the most hideous manner. His shin bones, it is said, after they are dried, are as hard as flint, and are sometimes used by the natives to strike fire with.

The elephants in this part of Africa are very large: their teeth weigh from sixty to a hundred and twenty pounds, and their strength is prodigious. They are generally from twelve to fifteen foot high, but some of them, we are told, much more. The female is considerably less than the male, and has its breasts or dugs between the fore legs. Their usual food is grass, herbs, roots, and the tender twigs of trees. They pull up every thing with their trunk, which serves them as a hand; and with this they suck up water, which they afterwards empty into their mouths.

The rhinoceros is here also to be met with. This animal is less than the elephant, but of equal, if not greater strength; and with his rough prickly tongue, he licks the flesh of the bones off his prey.

Another native of the country is the elk, which is about five foot high, with a fine slender neck, and a beautiful head, not much unlike that of a deer.

The porcupine is very common. It is usually near a foot long, thick in the middle, and tapers to a point at each end. Its whole body, except the belly, is covered with stiff quills, which it immediately erects on receiving any disturbance.

The skinkbingsem, as the Dutch call it, seems to be an animal peculiar to Caffraria. It has obtained its name from the extremely offensive scent which it emits on being pursued. We are informed that even the dogs will desert the chase, rub their noses, and howl, as soon as the intolerable effluvia of this animal have reached their nostrils.

There are in this country eagles, called dung-birds, which, if they find an ox or cow laid down, will attack it in great numbers. They make a hole in its

belly with their bills and talons, and entirely scoop out the bowels!

## CHAPTER II.

*Of the persons of the Hottentots—habits—diet—hunting—swimming—artificers—traffic.*

THE men amongst the Hottentots are generally under the middle stature, but their bodies are proportionable and well made. They are seldom either too fat or too lean, and hardly ever deformed by nature. Their heads, however, as well as their eyes, are rather of the largest. They have thick lips, exceeding white teeth, and black short hair, like the negroes; whom they resemble much in colour, after they have taken great pains to darken their tawny complexion with grease and soot. The women are much less than the men, and are remarkable for a membranous flap hanging over the pudenda. Flat noses being reckoned a mark of beauty, they never fail to break and compress the cartilage of that part of an infant, soon after its birth.

In summer, the men besmear their heads with handfuls of grease and soot mixed, to which the dust adhering, a clotted covering is formed, an excellent preservative, in their opinion, from the heat of the sun. In the winter, they wear flat caps, made of the skin of cats or lambs, half dried, which they tie with a thong of the same leather under their chins. They likewise wear a krossie, or mantle of skin, over their shoulders, which reaches to the middle, and being fastened with a thong about their neck, is open before. In winter, they turn the woolly or hairy sides next their backs, and in summer the other. The same covering serves a man for his bed at night, as well as for a winding-sheet and coffin when he dies. If he be a captain of a village, or chief of his nation, instead of a sheep-skin, his mantle is made of the skin of a tyger, wild-cat, or some other that is held in greater esteem. In general those mantles reach no lower than the waist, but some tribes wear them as far down as their legs, and others so long as to touch the ground.

They wear round their bodies a girdle, from the fore part of which a square piece of skin, about two hands breadth, hangs down.

Every man also hangs about his neck a greasy pouch, in which he keeps his knife, pipe, and tobacco, with a little piece of wood burnt at both ends, as a charm against witchcraft. On his left arm he wears three large ivory rings, to which he fastens a bag of provisions when he travels. He carries in his right hand two sticks, one called his kirri, which is about three foot long, and an inch thick, blunt at both ends; the other called his raccum stick, about a foot long, and of the same thickness. This has a sharp point, and is used as a dart to throw at an enemy or wild beast. In his left hand, he has another stick, about a foot long, fastened to the tail of a fox or wild cat, which serves him as a handkerchief to wipe off the sweat. Besides those accoutrements, the men wear a kind

kind of sandals, made of the raw hide of an ox or elephant, when they are obliged to travel over stony ground. Some have also buskins to preserve their legs from bushes and briars; but usually they have no covering either on the legs or thighs.

The women wear caps, with the crowns a little raised, made also of cats-skin, and tied under their chin. This covering they for the most part wear night and day in all seasons. They use two crosses or mantles, one over the other, made of skin, sometimes bordered with a fringe of raw leather; and those garments being only fastened with a thong about their necks, their bodies appear naked down to the middle. They have an apron larger than that of the men, and a covering of the same nature behind. Round their legs they wrap thongs of half-dried skins, to about the thickness of a jack-boot, which encumber them so much, that they walk with difficulty. Women of figure, instead of sheep-skin, wear that of a tyger, or wild cat. They also have a pouch about their necks, in which they carry something to eat, whether at home or abroad, with their pipe, tobacco, and dacha; the latter, which is an herb of an intoxicating quality, like tobacco, being used in the same manner by both sexes.

The principal ornaments, both of men and women, are brass or glass beads, with little thin plates of glittering brass and mother of pearl, which they wear in their hair, or about their ears. Of each of those kinds of beads strung, they also make necklaces, bracelets for the arms, and girdles. The elegance of dress being supposed to consist in the quantity of ornaments, their arms are sometimes covered with bracelets from the wrist to the elbow.

An ornament peculiar to the men, is the bladder of any wild beast they have killed, which is blown up, and fastened to the hair, as a trophy of their valour.

Both men and women powder themselves with a dust called bachu; and the women spot their faces with a red earth or stone; a practice that adds to their beauty, in the opinion of the natives, but which, in the eyes of Europeans, renders them much more frightful and shocking than they naturally are.

All infants, soon after their birth, are laid in the sun, or by the fire, and rubbed over with fat or butter mixt with foot, to render them of a deeper complexion; and this cosmetic operation they afterwards perform almost every day in their lives.

The Hottentots are not more cleanly in their diet than in their dress. They prefer the entrails of cattle, and some wild beasts, with very little cleaning, to the rest of the flesh; and eat their meat almost raw. Their food however consists chiefly of roots, herbs, fruits, or milk; for they seldom kill any of their cattle, unless at a festival, contenting themselves at other times with such as die either of diseases or old age, or what they happen to take in hunting. In a scarcity of food, they will eat the raw leather that is wound about the womens legs, or the soles of shoes; nor is it a practice uncommon, however horrible, to feed on the vermin that breeds in their mantles, a species of insect much larger here than in Europe. Notwithstanding their

excessive indelicacy, they abstain from swine's flesh, with that of some other animals, and from fish that have no scales. They rather devour their meat than eat it, pulling it to pieces with their teeth and hands, and discovering a canine appetite.

They eat no butter, though they make a good deal of it for the purpose of anointing themselves, and selling to the Dutch, who probably use it only for their shipping. In making it, they put the milk into some skin, made in the form of a soldier's knapsack, the hairy side inwards. Two persons taking hold of it, one at each end, they whirl it round, till the milk is converted into butter. The butter-milk, without any cleansing or straining, the Hottentots drink most greedily.

Their common drink is cows milk, or water; and the women sometimes drink ewe's milk, but this the men never touch. Since the arrival of the Dutch amongst them, it appears that they are become very fond of wine, brandy, and other spirituous liquors. Gluttony and drunkenness are their favourite vices, and in these they indulge themselves as often as they have opportunity.

Like the Tartars and Arabs, they frequently remove their dwellings for the conveniency of fresh water and pasture. They encamp in a circle formed by twenty or thirty tents, and sometimes twice the number, contiguous to each other; within the area of which they keep their smaller cattle in the night, and the larger on the outside of their camp. Their tents are made with slender poles, bent like an arch, and covered with mats or skins. They are of an oval form, the longest diameter being about twelve or fourteen foot, and the shortest ten. The height in the middle is near six foot, and at each end little more than three. In the former of those parts is a shallow hole, dug in the ground, about a yard diameter, where they make their fire, and round which the whole family sit or lie night and day, in such a smoke, when it is cold, or they are dressing victuals, as to any European would be intolerable; there being seldom any other vent than by the door, which is always in one of the ends. Such a circle of tents or huts as has been described, is called by the Hottentots a kraal.

The furniture of the tents consists of little more than a few skins of wild beasts, with an earthen pot in which they boil their meat. The only domestic animals they keep are dogs, which, in respect of their species, are no less ugly than their masters, but useful in driving, as well as defending their cattle.

The few wants of the Hottentots, and their brutal indelicacy with respect to diet, by exempting them from the most powerful incentives to labour and exercise, conduce to render them the most indolent people on earth. They will almost rather starve, at least eat dried skins, or shoe-soles at home, than hunt for their food; yet when they do apply themselves to the chase, or any other exercise, no people discover more activity. Those amongst them who can overcome their natural laziness so far as to enter into the service of the Europeans, are found to be not only diligent, but remarkably faithful. In their intercourse with their own tribes,

tribes, they are reputed hospitable and generous. They hardly ever eat a piece of the venison they have caught, or drink their beloved drams alone, but call in their neighbours to partake of the entertainment as far as it will go.

When a wild beast appears in the neighbourhood, the whole kraal or village assembles, and dividing themselves into small parties, surround the place in which they suppose he is concealed. As soon as he is discovered they set up a general cry, at which the frightened animal endeavours to break through and escape them. If it prove to be a rhinoceros, an elk, or an elephant, they throw their lances at him, darts and arrows on such an occasion not being sufficient for the purpose. If the beast be not killed at the first discharge, they repeat the attack, and load him with their spears; and as he runs furiously at the persons who wound him, those in his rear follow him close, till they provoke him to return, after which he is again assailed by the party towards whom he formerly tended. Repeating their attacks thus on every side, the creature is for the most part destroyed, without any of the people having received the smallest injury.

In the attacking a lion, a leopard, or a tyger, their darts and arrows are employed; and therefore they begin their engagements at a greater distance than when they charge an elephant or a rhinoceros. The creature has generally a number of darts and arrows upon his back before he can approach the hunters, the pain occasioned by which increasing his rage, he lies at the assailants with the greatest fury; and while the person he attacks nimbly avoids the onset, the others pursue him with their spears, and complete the victory. Sometimes a lion takes to flight with many poisoned weapons in his flesh, avoiding instant slaughter only to expire by a slower death.

Elephants are frequently taken in traps or pitfalls, without any hazard. Those animals being observed to go in great companies to water, following in a file one after another, and usually taking the same road, unless disturbed; the Hottentots dig pits in their path about eight foot deep, and four or five broad, in which they fix sharp stakes pointed with iron, covering the mouth of the pit with small sticks and turf, that it may not be discernible. One or other of the animals generally falls with his fore feet into this ambush, when the stakes piercing his unwieldy body, the more he struggles to extricate himself, the more firmly he is fixed. The rest of the herd observing the misfortune of their companion, abandon him, whilst the Hottentots possess themselves of their prey. Cutting the body into pieces, they carry home the flesh, which they voraciously devour as long as it lasts. The rhinoceros and elk are frequently taken in the same manner.

The Hottentot who kills any of those animals, or a lion, leopard, or tyger, singly, has great honours and privileges conferred upon him. At his return from an exploit of this kind, the men of the kraal depute one of their seniors to congratulate him on his victory, and desire that he will honour them with his presence. The request being granted, the deputy returns to the kraal, and sets himself down upon his heels, a mat

being placed close by him, in the middle of the assembly for the reception of the expected visitor. When the latter arrives and is seated, the old deputy piles plentifully upon him, accompanying the discharge all the while with a verbal address. The hero who is the object of the ceremony, rubs the honourable tribute into his skin with great eagerness, having first scratched off the grease with his nail. A pipe of tobacco is then lighted, which is smoked successively by all the people present, till nothing remains in the bowl but ashes, which are strewed by the deputy upon the hero, who receives them with the same satisfaction that he had testified at the former mark of their esteem. The ceremony being ended, and the neighbours having congratulated him on his advancement to this high honour, they disperse, and return to their respective tents. The champion afterwards fastens the bladder of the beast which he had killed to his hair, and is henceforth universally esteemed a brave man, and a benefactor to his country. His wife, or wives, if he has more than one, are not suffered to approach him for three days after this ceremony, but are forced to ramble in the fields. At the expiration of this period they return to the tent, where they are received with great joy and tenderness. A fat sheep is killed, and their neighbours invited to the feast; during which the prowess of the hero, and the honour he has obtained, are the chief subject of their conversation.

Of all the wild beasts on which they feed, they esteem the flesh of the tyger the most delicious. When an animal of this species is killed, the whole kraal partake of the repast, and the person who furnishes it meets with a double share of praise, as he not only rids the country of an enemy, but affords them a luxurious entertainment.

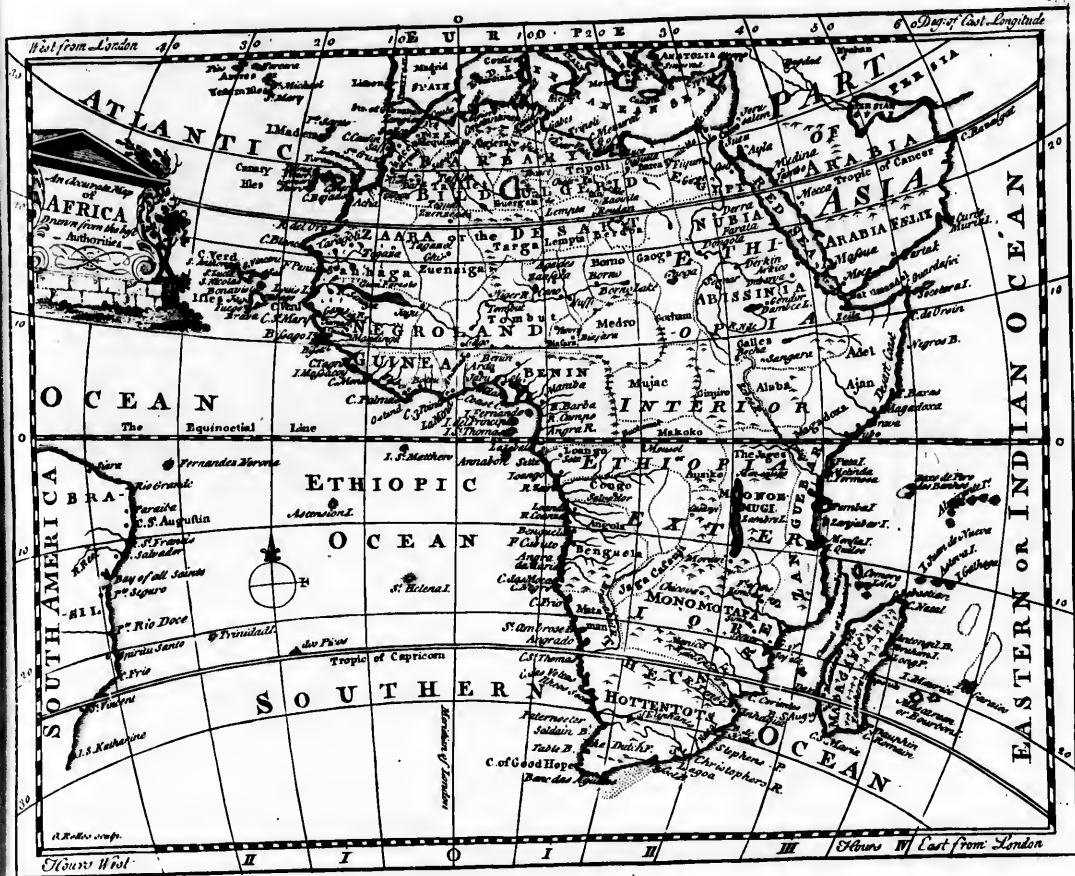

The manner in which a Hottentot swims is peculiar. He stands upright in the sea, without touching the bottom with his feet; and with his head, neck, and shoulders above water, he moves faster in that element than an European can walk.

Their smiths not only fashion their iron, but melt it from the ore. Having collected a heap of iron-stones, which are found in several parts of the country, they put them into a hole in the ground, heated and prepared for their purpose. They next make a fire over the stones, which they keep up till the iron melts. When this has happened, the melted iron runs into another hole, a little lower than the first, and after becoming cold, is broke in pieces with stones. The workmen again heat those pieces in other fires, and beat them with stones, till they are shaped into the heads of lances, darts, and such weapons as they use; for they hardly ever form any other utensils, but arms of this metal.

A people so unacquainted with luxuries, cannot be supposed to have much traffic. They barter cattle with the Hollanders, for wine, brandy, or tobacco; and such of the elephants teeth as they do not use in making ornaments for themselves, they for the most part exchange with the Portuguese and other Europeans, who touch at any part of their coast: for this commodity they sell very little to the Dutch.

C H A P.

and in the room of plates or napkins, they content themselves with the nafty corners of the mantles which they wear.

The Hottentots allow of polygamy, but seldom have more than three wives at a time. It is death amongst them to marry, or lie with a first or second cousin, or any nearer relation. A father seldom gives his son more than two or three cows, and as many sheep upon his marriage; and to a daughter, either one cow, or a couple of sheep. There being no fortunes amongst them, they match only for love; and it is not uncommon for the chiefs to intermarry with the families of the poorest men.

A widow who marries a second time, is obliged to lose a joint of one of her fingers; and a similar am-

putation to be done with decency, is such a piece can be found. Here depositing alive the innocent victim, they stop up the mouth of the den with stones or earth; or if no such cavity can be found, the infant is either tied to the lower bough of a tree, or left in some thicket to perish. Sometimes those deserted infants are found by the Dutch, who carry them home to their houses, and cause proper care to be taken of them, not omitting to imbue their minds with the principles of religion. Such however is, for the most part, the disposition of those exposed females, that on knowing their extraction, they renounce their Christianity, throw off the European habit, and running away to some Hottentot camp, assume the sheep-skin mantle, and conform themselves to all the customs of the people from whom they are descended.

C H A P.

## C H A P. III.

*Of marriages—the exposing of female infants, and of superannuated persons—burials—religion—government—war—Dutch settlements at Cape Town.*

A YOUNG Hottentot hardly ever commences a treaty of marriage without the approbation of his father. When this is obtained, those two pay a visit to the father of the intended bride, with whom having smoked, talked of indifferent things for some time, the father of the lover communicates the occasion of the interview. The person to whom the proposal is made, after consulting his wife, immediately returns an answer. If the offer be rejected, the visitors retire without more words; but if approved, the young woman is called, and told that a husband is provided for her. From this determination she has only one way to appeal, which is by preventing the bridegroom from consummating the nuptials the next night. If she should prove victorious in that encounter, the lover abandons the enterprise, but if she has been overpowered, she must submit to the match, in spite of the most invincible aversion. The day after the consummation of the marriage, the young husband kills a fat ox, or more, according to his circumstances, for the wedding dinner, to which the friends of both parties resort, with compliments of congratulation.

The entertainment being ready, the men form a circle in the area of the kraal, and the women another; the bridegroom sitting in the middle of the former, and the bride in the center of that composed of her own sex. The priest then enters the men's circle, and pisses upon the bridegroom, who joyfully rubs into his skin the descending evacuation. Going afterwards to the female circle, he confers the same favour upon the bride, till his store is exhausted; repeating all the while his best wishes for the happiness of the new married couple.

The meat is then served up in earthen pots, besmeared with grease. If any of the company have been taught the use of knives by the Europeans, they will perhaps use them on this occasion; but the greater part has recourse to their fingers; and they devour the meat as voraciously as so many dogs. Sea-shells, without handles, usually serve them instead of spoons; and in the room of plates or napkins, they content themselves with the nasty corners of the mantles which they wear.

The Hottentots allow of polygamy, but seldom have more than three wives at a time. It is death amongst them to marry, or lie with a first or second cousin, or any nearer relation. A father seldom gives his son more than two or three cows, and as many sheep upon his marriage; and to a daughter, either one cow, or a couple of sheep. There being no fortunes amongst them, they match only for love; and it is not uncommon for the chiefs to intermarry with the families of the poorest men.

A widow who marries a second time, is obliged to lose a joint of one of her fingers; and a similar am-

No. 12.

putation is performed for every new husband with whom she may contract. Either man or woman may be divorced, on shewing sufficient cause before the kraal; but the woman is not permitted to marry again, though the man is allowed that liberty.

A Hottentot never being master of a hut or tent till he marries, unless his father dies and leaves him one, the first object of a new married couple is to provide a habitation; and till that is done, they are entertained in the tents of some of their relations. The care of supporting the family rests almost entirely on the wife. She fodderes the cattle, milks them, cuts out the firs, searches every morning for roots for their food, brings them home, and dresses them, while the lazy husband lies indolently stretched in the tent, and will hardly give himself the trouble of getting up to eat what his laborious wives have provided for him; of whom the more he has, he is always proportionably the more slothful. If at any time he deigns to attend his cattle in the field, it is considered as an act of condescension, and is exceeding rare; nor is it much oftener that he will go a-hunting with the men of his kraal, to bring home a piece of venison, or a dish of fish. The wives, however, are not permitted to intermeddle in the business of buying or selling, this being the sole prerogative of the men.

When a woman is delivered of a live son, there is great rejoicing. The first thing they do with the child, is to daub it all over with cow-dung. They next lay it before the fire, or in the sun, till the dung is dried; which being rubbed off, they wash the infant with the juice of certain herbs, laying it again in the sun, or before the fire, for a little time. They afterwards anoint the child from head to foot with butter, or sheep fat melted; an operation which is repeated almost daily through life.

If the woman has twins, and they are girls, the father asks leave of the kraal, to expose one of them, either upon pretence of poverty, or that his wife has not milk for them both; and in this request the men usually indulge one another. The same barbarous custom of exposing the female infant is practised, when the twins are a boy and a girl; but they always preserve the boys, though they happen to have two at a birth. The devoted infant is carried to a distance from the kraal, to be exposed in a cave, or hole in the earth, the haunt of some wild beast, if such a place can be found. Here depositing alive the innocent victim, they stop up the mouth of the den with stones or earth; or if no such cavity can be found, the infant is either tied to the lower bough of a tree, or left in some thicket to perish. Sometimes those deserted infants are found by the Dutch, who carry them home to their houses, and cause proper care to be taken of them, not omitting to imbue their minds with the principles of religion. Such however is, for the most part, the disposition of those exposed females, that on knowing their extraction, they renounce their Christianity, throw off the European habit, and running away to some Hottentot camp, assume the sheep-skin mantle, and conform themselves to all the customs of the people from whom they are descended.

H A P.

The same inhumanity which the Hottentots so frequently discover in respect of their female infants, they likewise betray in the horrible treatment of their aged parents. When the father of a family has become superannuated, he is obliged to assign over all his effects to his eldest son, or in default of such, to his next male heir. The latter then erects a tent or hut in some unfrequented place, and having assembled the men of the kraal, acquaints them with the condition of his relation, desiring their consent to expose him in the distant hut; a request which is usually granted with great readiness. On the day appointed for the removal, the heir gives a great entertainment to all the people in the neighbourhood, who having taken a formal leave of the aged person, the latter is transported to the hut, where his fate is either to be starved or devoured by wild beasts.

When a person dies a natural death, he is immediately bundled up in his sheep-skin mantle, and thrown either into the cavity of a rock, or the den of some wild beast in the neighbourhood, the digging a grave on those occasions being a method of burial never practised. The corpse is seldom permitted to remain above ground more than six hours, and is attended to the cave by all the men and women of the kraal.

At the death of a father, the eldest son is entitled to all his possessions, the younger children depending so much upon the latter, as to be hereditarily his servants, or rather slaves, unless he pleases to enfranchise them; and even the subsistence of the mother is entirely dependent upon him.

So late as the beginning of the present century, it was questioned whether this people had any ideas of religion, but it is now generally admitted that they believe in a Supreme Being, creator of heaven and earth, whom they style Gounja Gounja, or Gounja Ticquos, God of Gods. To this supreme God, however, they pay no adoration, alleging in apology for their conduct, that their first parents grievously offended him, in consequence of which he cursed them, and all their posterity with hardness of heart. The principal object of their worship is the moon, which they hold as an inferior visible god, and a representative of the high and invisible. On the first appearance of the new and full moon, they assemble in great numbers, dancing wildly, clapping their hands, distorting their bodies, and howling in a hideous manner. Regarding this planet as the arbiters of the weather, they never fail to supplicate its favour when that is unseasonable. *Mutchi atza*, cry they, *I salute you, you are welcome: Chevagua kaka ebori oungua, Grant us pasture for our cattle, and plenty of milk.* Such invocations they frequently repeat, dancing and clapping their hands all the while, and at the end of every dance, crying, Ho, ho, ho! Those extravagant orgies are continued, with prostrations on the earth at intervals, the whole night, and part of the next day; exhibiting rather a scene of wild and fantastic diversion, than of religious ceremonies.

They likewise pay divine honours to a powerful evil spirit, whom they consider as the author of all the calamities in life. Nor are the souls of reputed saints

and heroes amongst them without their share of religious worship. To the memory of those the natives dedicate fields, mountains, woods, and rivers; and when, at any time, they happen to pass by such consecrated objects, they offer a short prayer to the genius of the place, sometimes dancing and clapping their hands, as in the adoration of the moon.

Besides the objects above-mentioned, the Hottentots worship a species of fly, about the size of a hornet. Whenever they observe this insect approach their kraal, they immediately assemble round it, singing and dancing all the while it continues amongst them, and likewise strewing over it the powder of buchu, called by botanists spiraaum. They strew the same powder on the top of their huts, and over the whole area of the kraal, in testimony of their veneration for the adored fly; to which they also sacrifice two sheep, as a thanksgiving for the favour shewn to their kraal, believing that such a visit prefigures great future prosperity. If the insect should happen to light upon a tent, they ever afterwards look upon the owner of it as the favourite of heaven, and pay him extraordinary respect. The best ox of the kraal is immediately sacrificed, to testify their gratitude to the little winged deity, and to honour the saint he has been pleased thus to distinguish. To this reverend person the entrails of the beast, in their opinion the choicest part, with the fat and the caul, is presented; and the latter being twisted as a rope, the saint ever afterwards wears it like a collar about his neck, day and night, till itrots off; anointing his body likewise with the fat of the sacrifice, as long as it lasts.

On many other occasions, they also kill sacrifices, and have festivals; as on destroying wild beasts, obtaining a victory, the recovery from a fit of sickness, and the like.

The Dutch, we are informed, have sent several divines to the Cape as missionaries, who have used every endeavour to convert this savage people from their idolatry, but hitherto without any effect.

The Hottentots are divided into several nations, each of which has its king or chief, called konquer, whose office devolves upon him by hereditary succession. He has the power of making peace or war, and presides in all their councils and courts of justice; but his authority is said to be limited, and he can determine nothing without the consent of the captains of the several kraals, who seem to be the Hottentot senate. The captain of each kraal, whose office is also hereditary, is the chief magistrate of his department in time of peace, and their leader in war. With the head of every family, he determines all civil and criminal causes within the kraal; such differences as happen between one kraal and another, and matters of general concern, being determined by the king and senate. Formerly their chief magistrates were distinguished only by finer skins, with a greater variety of beads and glittering trifes; but the Dutch, since their arrival at the Cape, have presented to the king or chief of every nation of the Hottentots in alliance with them, a brass crown, and to the captains of each kraal a brass-headed cane, which are now the badges of their respective offices.

In their councils the king sits on his heels in the center, and the captains of the kraal ranged around him in the same posture. At his accession, it is said, he promises to observe their national customs; and the same engagement is entered into by the chiefs of the kraal. Neither the sovereign nor the inferior magistrates are allowed any revenue, the respect of the people being all the distinction they enjoy.

Being entirely destitute of letters, they have no written laws, but are guided by ancient customs, from which they hardly ever deviate. Murder, adultery, and robbery, they constantly punish with death; and if a person is suspected of any of those crimes, the whole kraal join in apprehending him. A day or two after his seizure, he is brought to trial, when the people forming a ring, and sitting down upon their heels, the criminal is placed in the center, the witnesses on both sides are heard, and the party suffered to make his defence. The case being then considered, the captain collects the suffrages; and if the prisoner be condemned by a majority, he is executed on the spot. The captain first strikes him with a truncheon which he carries in his hand, and then the rest of the judges falling upon him, drub him to death; after which the corpse is buried in the usual manner.

Civil causes, also, are determined by a majority of voices, and satisfaction immediately ordered to the injured party, out of the goods of the other. From those decisions there lies no appeal to a superior court; the king and his council, as has been said, interposing only in matters of general concern.

No person possesses any private property in land, the whole country being a common, where they feed their cattle promiscuously, moving from place to place, for the sake of water or fresh pasture, as necessity requires. Each nation, however, has its respective territory, the limits of which frequently occasion war amongst those that are contiguous. But encroachments of this nature are not always the only cause of contention. Stealing each other's cattle likewise often proves the ground of fresh quarrels. For though every kraal punishes theft amongst themselves with death, yet it is considered as an act of heroism to rob those of another nation; at least the people are so backward in giving up the offender, as frequently to provoke hostilities.

One part of the armour of the Hottentots is a lance, resembling a half-pike, with the head or spear of it poisoned; which they sometimes use as a missile weapon, and at others to push with in close fight. Their bows are made of iron or olive wood, and the string, of the sinews or guts of some animal. Their arrows are bearded and poisoned likewise, when they engage either an enemy, or a wild beast not intended for food; and in the same manner they use a dart of a foot long, which they throw with remarkable dexterity. When they have spent their missile weapons, they have recourse to stones, seldom making a discharge in vain.

Every able bodied man is a soldier, and possessed of a set of such arms as has been described. They are all instantly, and neither officers nor private men have any pay. Though the country produces large elephants, they have not yet learned the art of taming them, but

they train up bulls or oxen to run upon the enemy, which those animals do with great fury.

When they march into the field, every man follows his captain, the chief of his kraal. The several companies, with horrid cries, advance to the charge at the command of their chief; and when those in the front have shot one flight of arrows, they retreat, and make room for the rear; the different files alternately relieving each other, till all their missile weapons are discharged.

The skill of the general consists chiefly in managing his bulls, which never charge each other, but spend their whole rage upon the men, whom they often gore in a dreadful manner. When the fate of the battle is determined, the tumultuous noise that accompanied the onset, is repeated by the conquerors, who often pursue their victory with great slaughter. If one battle proves not decisive, it is usual for some neighbouring power to interpose, and make up the quarrel, so that a war is seldom continued for any length of time.

The chief town at the Cape of Good Hope; belonging to the Dutch, extends from the sea-shore, along the Table Valley. It contains upwards of three hundred handsome houses, laid out in spacious streets, having courts before them, and large gardens behind, with all the regularity and neatness common to that people. The houses are built of stone, but thatched, and seldom more than one story high, on account of the extreme boisterous winds, to which they are so much exposed.

At a little distance from the town, in the same valley, the Dutch have a fort or citadel, built of stone, in form of a pentagon, for the defence of the landing-place. The garrison consists of about two hundred men, and here the governor and principal officers of the company have their respective apartments. Beyond those limits are several beautiful country seats, vineyards, and farms, extending far into the country, exclusive of two other great colonies or settlements, one called the Stellenbosch colony, and the other the Drakensteigh or Waveren colony, occupying between one hundred and two hundred miles to the northward and eastward of the Cape, but intermixed with the Hottentot nations, who still graze their cattle upon such lands as are not enclosed and cultivated by the Dutch.

The trade of the Dutch Company at the Cape is very considerable. They have here between five and six hundred officers and servants, besides slaves, who amount to near six hundred more. The country was discovered by the Portuguese, and was once in the possession of the English, who left it for St. Helena.

The country of Mataman or Matapan, which lies between the Hottentots on the south, and the Portuguese colonies, in Congo, on the north, is an uninhabited coast, where no European nation has yet found it worth their while to settle colonies, or even factories. With respect to Monomotapa and Monomugi, the inland countries between the Hottentots on the south, and the Upper Ethiopia on the north; all we know of them is, that the natives are Pagan negroes, and sometimes bring their gold and elephants teeth to the bordering nation on the coast, the inhabitants of which purchase those articles, and barter them again with the Europeans for spirits, cloathing, arms, ammunition, utensils, toys, &c.

## BENGUELA, ANGOLA, CONGO, and LOANGO.

**T**HESSE countries are situate between the equator and Cape Negro, which lies in 16 degrees south latitude; and most of them are under the dominion of the Portuguese, who have great numbers of negro princes subject to them.

The chief towns are Benguela, St. Paul de Loando, St. Salvador, and Loango. The latter of those, which is the largest, stands about five miles from the seaside, in 4 degrees 20 minutes south latitude. Most of the towns belonging to the negroes, consist of a few huts, built with clay and reeds in an irregular manner; and as every tribe has its particular king, or sovereign, his palace is usually distinguished by a spreading tree before his door, under which he sits, and converses, or administers justice to his subjects. The towns are generally in or near a grove of trees, mostly of the fruit kind; and besides being very populous, stand so close to each other, that the country has the appearance of being one continued city. In the territory of Loango, the huts are made of cane, wattled with twigs, and covered with leaves or branches of trees. They consist for the most part of two or three rooms, the innermost of which is allotted for the use of the women. Each house has usually a small yard, likewise enclosed with cane, and wattled. Those belonging to their great men, and the principal merchants have walls about ten or twelve foot high, forming a walk eight foot wide, which reaches near forty paces from the houses, but has so many windings, as to encrease the space it occupies, at least to five times that distance.

The inhabitants are as black as any of the negroes, but more civilized, especially in Congo, where the Portuguese fathers have converted many of the natives to Christianity, and introduced amongst them the European dress, on which account they now take off great quantities of imported manufactures. In other parts, the common dress of both sexes is only a piece of cloth about their waists, which is tucked in such a manner, that the corners hanging down on the left side, almost touch the ground. In the mornings and evenings, the women likewise wear a piece of cloth about their shoulders, which the men do not; and the former have about their ancles, as an ornament, a large brass ring of five or six pounds weight. This cumbersome ornament, to which however they are prodigiously attached, seems to be almost the only distinction they enjoy; for they do all the servile offices both within and without doors, as planting, reaping, carrying burdens, dressing the provisions, combing and twisting their husbands hair into various forms, and painting their bodies. When they are not engaged in these works, they usually employ themselves in making mats.

The diet of the better sort of people is mostly fowls, and stewed fish; but those of the lower class live chiefly on roots, and canky; a kind of bread made of Indian

corn, beat small, which they mix with some roots, and boil it in dumplins. They have great numbers of plantain and banana trees, as well as of palm trees; and of the latter they not only make wine, but extract oil from the fruit, which they use in diet, and for anointing their bodies. Pine apples are in great plenty, and there are some limes; but no lemons; and the oranges are generally ill tasted. The cotton trees in Loango grow to an extraordinary size.

When any of their great men, or Europeans, have occasion to travel, they are conveyed in a hammock, fastened to a long light pole, near the end. One man before, and another behind, will in this manner carry a lusty person several miles without resting; but on a long journey, six men are usually employed, who relieve each other in their turns.

The people of Loango, instead of money, use pieces of cloth made of silk grass, about the bigness of a sheet of paper. They estimate our goods by an imaginary coin, a custom which it is probable they have borrowed from the Portuguese manner of counting by rees. A piece of blue bafts is valued at a thousand, a piece of painted callico at six hundred, a small keg of powder three hundred, and so of the rest. Of the last mentioned article, with guns, anabases, brass-pans, and pewter basens, they are exceeding fond; as they likewise are of knives, small black beads, and coral, to make bracelets. Men slaves are purchased from three thousand six hundred to four thousand of their standard coin; and women, boys, and girls, in proportion.

The trade of all those countries consists chiefly in slaves, of whom they bring the greatest part eight or nine hundred miles, from the territory called by them Poamboe, which is probably the same with Ethiopia. But they frequently make excursions nearer home, in strong parties; and where they meet with any people who are not formidable by their numbers, or the strength of the government under which they live, those they drive before them, like cattle, to a trading town, and sell them for slaves. It is remarked, however, that the slaves thence obtained are far less hardy and laborious than those of Whidah, or the Gold Coast; and they are generally great lovers of brandy and tobacco.

Both in Congo and Loango there is a great number of kings, or petty sovereigns, most of them in some kind of subjection to the Portuguese, who permit them however to govern their own people, according to the custom of their country. Though those territories be situated under and near the equator, they are not so excessive hot as in higher latitudes. One reason assigned for this observation is, that their day never much exceeds twelve hours in length; and the other, that the rainy season continues four months, viz. from June to September inclusive. At this time, the rivers, particularly of Congo, overflow the level country, like

like the Nile, and render it no less fruitful than Egypt. Even of the higher lands hardly a spot is now uncultivated, owing to the agricultural improvements in which the natives have been instructed by the Portuguese, who have also introduced amongst them European corn, as well as fruits and plants.

Except in some parts of Angola, whither the English and Dutch resort for slaves, the Portuguese monopolize the foreign trade in all those countries. They bring thence elephants teeth, wax, and peltry, consisting of the skins of buffaloes, and other beasts; for which they give the natives cotton and linen cloths, or slight stuffs, tools, utensils, tobacco, brandy, and other spirituous liquors. They sometimes purchase slaves and

teeth, even with the gold which they bring from Brazil; whither, it is said, they do not send less than a hundred thousand slaves annually, from this coast, and some other settlements in Africa.

Negroes, we are informed, are purchased cheaper at Angola than in Guinea Proper; the price of young blacks, in their prime, being under three pounds a head, and that of boys and women in proportion. The treatment of those miserable creatures on the voyage, however, is shocking to humanity. They are kept upon no better food than horse beans; seven or eight hundred of them are packed in a vessel together; and during almost the whole time of the passage they are forced to lie double.

## G U I N E A.

## C H A P. I.

*Of the situation—seasons—air—negroes—molattoes—vegetable produce—minerals—animals.*

GUINEA Proper comprehends Benin and the Slave Coast, the Gold Coast, the Tooth or Ivory Coast, and the Grain or Pepper Coast. It is situate between 15 degrees west, and 15 degrees east longitude, and between 4 degrees 30 minutes and 10 degrees 30 minutes of north latitude. It is bounded on the east by unknown parts of Africa, on the south by Congo and the Atlantic Ocean, on the west by the same ocean, and on the north by Negroland.

In this country, the wet season continues for the most part from April to September inclusive, and during the other months of the year the weather is dry and hottest, though the sun is then farther from them than during the former period. Neither the commencement nor the duration of the wet season, however, are the same at all places on this coast, but between the vernal and the autumnal equinox they generally have excessive rains, attended with violent storms of wind, as well as thunder and lightning. The winds at this time blowing from the southward, and there not being any harbour upon the coast, if a vessel then happens to be in those seas, she is inevitably driven upon the coast, unless she can stand out to sea, or get into the mouth of the river Sierra de Leon before the approach of the storm. But even in the fair season, it is difficult going ashore on this coast, on account of the surf, or swelling of the sea, which constantly prevails. The most violent storms or trovadoes, are in July and August, during which time the sea rages to such a degree, as to have the appearance of fire, whence the sailors call it *the burnings*, and at this time it is almost impossible to go on shore.

During the hot season, the winds are here periodical, blowing from midnight till one or two in the afternoon, from land; after which, shifting to the southward, they blow from the sea.

No. 12.

The rivers of this country falling from high mountains not far from the coast, they form very rapid torrents, and in the wet season overflow the valleys, the consequence of which is, that the air is frequently tainted with thick stinking fogs, extremely prejudicial to the health, especially of those who have not been accustomed to the climate. The rivers being made cloudy by the rains, are not any of them navigable, from the river Sierra de Leon, in the west, to that of Benin, or Formosa, in the east; but they abound, as well as the seas, in variety of good fish.

The face of the country is agreeably diversified with mountains and valleys, woods and open fields. The hills are adorned with trees of an extraordinary height, and the interjacent plains are rich and extensive, producing corn and fruits in great abundance. Numerous villages likewise contribute to delight the eye of the beholder; but the most pleasant and fruitful part of the country is that about Fida, or Whidah.

The negroes have flat noses, thick lips, and short woolly hair; with black eyes, the white of which, as well as their teeth, form a beautiful contrast to their complexion. They are generally under, or about the middle size, and well made; many of them, however, have exomphalos, occasioned either by the violence of ignorant midwives at their birth, or by straining in their infancy to walk; for they are never taught to go upright, but creep upon a mat, on all fours, till they have strength to erect themselves; notwithstanding which, it is rare to see any of them distorted. The women, for the most part, are not near so well shaped as the men; and their breasts are remarkably pendulous.

The habit both of men and women, is a paan, or cloth, two foot broad, about the waist. Those of the better sort have another cloth of considerable length thrown over their shoulders, yet so as their arms, legs, and a good part of their bodies, appear naked. Their ornaments consist of a multitude of rings, or bracelets, of gold, ivory, or copper, according to their circumstances, worn on their arms and legs, with necklaces

M m

and

and girdles of coral, one over the other. The plaiting and adorning their hair, is a principal object of their attention; especially of the women. The hair of some of the negroes is longer than that of others, and many of them by hanging weights to it, endeavour to pull it out of the natural curl; after which they form it into different fashions, with little thin plates of gold or copper, or with beads, coral, and shells, that make a glittering appearance. Some of the women throw over their heads a veil, to screen them from the sun, and some of the men wear caps; but many of them use no covering on that part.

The negroes are reputed not to want sense, but they exercise it chiefly in studying to defraud one another; a disposition which the example of the Europeans has tended rather to confirm than eradicate. Abandoned however as they may be, in respect of morals, they are exceeded in depravity by the malattoes, who are a mixed race, the offspring of female negroes by European men. Those are of a tawny complexion, professing the religion of the Portuguese, from whom they are descended, but retaining many of the Pagan superstitions. The men are drunken, lewd, thievish, and treacherous to the last degree; and the women prostitutes to both negroes and Europeans, to the former privately, and to the latter publicly, without any shame or restraint. They are observed also to be extremely covetous, yet such masters of their temper, as to be undisturbed by any vicissitude of fortune. By a happy infensibility of mind, they will appear contented, even when they have been unexpectedly deprived of all their effects; and they will sing and dance after losing a battle, with as much apparent triumph as if they had obtained a victory.

Some parts of the country abound in rice, millet, maize, or Indian corn; but there are others so subject to floods, that the soil produces little except rice. Sugar canes grow to great perfection, but are not much cultivated. Here are also yams and potatoes, which often serve the natives instead of bread.

The palm-tree is more plentiful in Guinea than in any other country, and the cocoa-nut tree likewise very frequent. The latter, however, the natives do not put to so many uses as in the East-Indies; contenting themselves with drinking the milk of the cocoa when it is young, or eating the nuts when they are ripe.

The Guinea pepper is found on the Grain Coast. It grows on a shrub, in long, slender, red shells or pods, separated into four or five divisions. Pimento, or Spanish pepper, also grows here; as does a very strong sort of stinking tobacco, which the negroes smoke, but is so offensive that a European can hardly bear the smell of it.

The timber trees here are generally of prodigious magnitude, and of the trunks of them, hollowed, the natives form their canoes. Some kinds have a very beautiful grain, streaked red and yellow, and particularly adapted for tables and cabinets. The capotree, which bears a sort of cotton, is also in great plenty; and many other trees, not only admired for their beauty, but remarkable for the shade which they afford.

The minerals of the country are iron, copper, and silver; but of gold it does not appear that any mines are opened. In the rainy season, the water pouring in torrents from the hills, washes away the earth, and undermines pieces of rocks, which being carried down by the stream, the cavities where the gold lay concealed, are sometimes discovered, and large pieces of the mineral picked out; but much the greater quantity is washed down in little particles, no bigger than sand, the former being called rock-gold, and the other gold-dust. When the rains abate, the natives resort to all the little streams, and gathering the sand in heaps, put it afterwards into tubs, where they wash it in water from the adhering earth. The streams where the gold is found, are generally at a distance from the sea; so that the greater part of it is brought down by the negroes at the season for trading, when they expect some vessels upon the coast.

Amongst the animals of Guinea, the elephants are so numerous, that more ivory is brought from the country called the Tooth Coast, than from any other part of the world. Here are found lions, tigers, leopards, wild hogs, jackalls, wild dogs, foxes, and crocodiles; but no camels, though this species be so numerous to the northward of the river Niger. Several kinds of wild cats are frequent, one of which is the civet cat. A species of civet is here, also yielded by a mouse. No animals are more common than monkeys. Some of them are said to be near five foot high, and so bold that they have been known to attack a man. Another sort is about two foot high, perfectly black, and with white beards. In this part of Africa is also found the camelion, of which travellers affirm that it frequently changes its colour. This animal is less than a rat, but considerably larger than a mouse. Some naturalists have imagined that it can live several months, and even years, without food; but the most probable opinion is, that it subsists, as some other creatures, on flies; and that it catches them with its tongue, which is almost as long as its body.

The flesh of their neat cattle is hard and dry, and their sheep, which are covered with hair, make very indifferent food; yet both are sold at a high price. The cows yield very little milk, and that of an exceeding bad quality. The goats, hogs, and deer, are the best meats which they use. The horses are small, and used sometimes for the saddle, as well as asses; but neither they nor any of the cattle are employed in the draught, or to carry burdens; all commodities, where the conveniency of water carriage cannot be had, which is rarely obtained, being transported on porters backs, to the distance even of a hundred miles.

Here are serpents of various kinds, and some of enormous dimensions. Those of the smaller sort frequently enter the houses and bedchambers, where the negroes superstitiously cherish them with greater tenderness than they shew to their own children, paying them even divine honours.

A species of large ants is particularly troublesome to the inhabitants, who are also pestered with gnats and flies, so frequent in all the hot countries.

The country abounds in variety of sea and river-fish, which are the principal support of the Europeans, as well as of the natives on the coast, and compensate not only the bad quality, but the dearth of flesh.

## C H A P. II.

*Of the government—laws—arms—religion—marriage—diseases—physicians—funerals.*

THE government of Guinea is divided among a few sovereigns, who enjoy unlimited power, and have under them a great number of petty princes, whose tributary dominions exceed not the bounds of an English parish. Each of the great monarchs is held in the highest veneration by his respective subjects, who never appear in his presence, but either kneeling or prostrate on the ground. When they attend him in the morning, they prostrate themselves before the gate of his palace, kiss the earth three times, and clapping their hands together, use expressions significant even of adoration. He has his viceroys, governors, and other officers, as European princes have; of whom he constantly entertains four or five thousand with meat and drink. Some of those are frequently permitted to eat in his presence, but none of them either to see his majesty eat, or to know in what part of the palace he sleeps; this being an indulgence granted only to the king's wives, of whom he seldom retains a smaller number than a thousand. The duty of those ladies, however, is not restricted to the common offices either of female or domestic life. They are frequently sent on the king's embassies, and employed in executing such commands as seem more suitable to the other sex; as to punish criminals, pull down houses, and the like. When the king goes abroad, five or six hundred of them run before him, or attend him, he never having a man in his train. But he spends the greatest part of his time in his palace, administering justice to his subjects, and transacting affairs of state; or conversing with the European factors and merchants, who find him usually in a state hall of audience, richly habited in gold and silver stuffs. Though he never eats before company, it is said he will drink very plentifully both with the Europeans and his own subjects.

The chief officers under the king are the *cabicero's*, whom he consults in all affairs of importance, and by whom he administers justice to the people.

Though there be no written laws in Guinea, particular punishments are appropriated to certain crimes by custom. Murder is usually punished with death, if the person killed was a free-man; but for the murder of a slave, a fine only is exacted. Adultery is also punished with death, where it is committed with any of the king's wives, or the wife of a great man. The punishment of theft is for the most part by a heavy fine, and restitution of the stolen goods; but if the offender has nothing to pay, he either suffers death, or becomes a slave to the injured person. So likewise in cases of debt, where the party is insolvent, himself, his wife, and children, are liable to be sold for slaves.

Every able-bodied man is obliged to march into the field in defence of his country, or at the command of his prince; but there are some who make arms their only profession, and engage in the service of neighbouring nations, when their own is at peace. In the maritime parts of Guinea the use of fire-arms is now known, but in the inland country their armour consists of a bow and arrow, with a lance, sword, dart, and shield; all of them formed by the natives themselves, with no better tools than a stone for their hammer, and another for their anvil. Their shields are of an oval figure, above four foot long and three broad, made of light basket-work, usually covered with the skin of a tiger, or other animal, but sometimes with thick gilt leather, and ornamented with bosses of copper.

The natives of Guinea usually acknowledge the existence of one Supreme Being, the creator of the universe; but from an opinion that he is above noticing the state of poor mortals, they pay him no adoration, though they offer sacrifice and prayer to a multitude of inferior deities. The chief deity of the Fidaians, a considerable kingdom of Guinea, is a serpent of particular species, whose bite is not mortal. They address themselves to this animal on the most important occasions; as for seasonable weather, the preservation of the state, or whatever else concerns the public welfare. A grand temple is dedicated to this serpent in Fida, and a smaller one in almost every village, with priests and priestesses to officiate in them. The king annually makes presents and offerings to the great temple, consisting of gold, cattle, pieces of silk, European merchandize, and various kinds of meat and drink, which, on the apprehension of any public calamity, are frequently repeated.

In the great temple is kept a serpent of an enormous size, to which the people pay their devotions, whether the king formerly used to go every year on pilgrimage, but of late he deposes a certain number of his wives for this purpose.

Such is the veneration of the Fidaians for this species of snake, that they will not hear any thing spoken in derision of them; stopping their ears, and running away, if any European should laugh at the superstitious reverence which they pay to those objects. Some years ago, a hog happening to devour one of those snakes, a proclamation was immediately issued for destroying all the hogs in the country. The slaughter proceeded with great fury, till at the instance of some of their rich owners, enforced with considerable presents to the king, the decree was revoked.

The next objects of worship amongst the Fidaians, are lofty trees, to which they apply in sickness, or on any private misfortune. When the winds and waves are so tempestuous that no foreign vessel can visit their coast, which usually happens in July and August, and sometimes in other months, they offer sacrifice to the sea, another of their principal gods; throwing into it all sorts of merchandize, meat, drink, and cloathing, to appease the enraged element.

Besides those public objects of adoration, every man at Fida has a numerous set of gods, of his own choosing.

Every

Every thing they meet with on going abroad, whether animate or inanimate, they rank in this class, after it has undergone the following trial. They immediately pray to it for something they stand in need of, and if they happen by any means to obtain their desire, they ascribe their success to the influence of this new god; but if they are disappointed, they conclude that it cannot, or will not help them, and henceforth treat it with contempt.

In the kingdom of Fida, or Whidah, both priests and priestesses are treated with uncommon respect, their persons, and all that belong to them being held sacred and inviolable. The people have imperfect and confused notions of heaven and a future state; and some of them mention a local hell for the punishment of the wicked, to which, however, in their practice they seem to pay but little regard. Some of them believe that both black and white men were created by the Supreme God at the same time; whilst others ascribe the creation to a great spider, which they call Ananfia.

Every priest, or feticheer, has a different god, to which the people under his care apply on public occasions, or in time of general calamities. When they are deliberating on war and peace, they bring sacrifices, and consult the god by their priest, who sometimes performs the ceremony alone, and returns an answer to those who come to enquire of him. At other times he consults the idol in their presence, from which however they expect no vocal reply; but the priest, throwing up some nuts, or small pieces of leather, foretells success or miscarriage to the undertaking, according to the distance at which those objects fall from each other.

A solemn oath is always taken before one of those idols, the person drinking a draught after it, and praying that the god may strike him dead, or the liquor burst him, if he does not perform his engagement, or if the thing be not true which he attests. The priest however claiming a dispensing power, it is usual, upon great occasions, to make him swear, that he will not absolve the party from his oath; and to secure his observance of this promise, they require of him the most dreadful imprecations to confirm it. But perhaps the most effectual restraint against a violation of the engagement, is the opinion universally prevalent amongst them, that whoever commits such a crime, will infallibly burst or die soon after.

When the weather is unseasonable, the whole town or country consult their priest how the vengeance of heaven may be appeased; when he usually advises them to offer certain sacrifices, which is readily complied with. For the performance of those rites, every village has a sacred grove set apart, which they will not suffer to be profaned, or cut down upon any occasion.

Every person has his particular household god, before which he constantly performs his devotions on the day of the week when he was born. This they call their Bassam, as they do the day itself, and on it they drink no wine or strong liquor before sun-set. They are also then habited in white, or their skins painted

with that colour. Another day of the week is set apart for divine worship, when the poor sacrifice poultry, and the rich a sheep to their god, without the assistance of a priest. These sacrifices are eaten by the respective families; and here, as well as in Cassraria, the guts and inwards, boiled in the blood, is reckoned the most delicious repast.

What notion they entertain of the deities they worship is uncertain, any farther than that they consider them as beings of great power, who watchfully inspect their behaviour, and reward or punish them in this life according to the nature of their actions. They seem neither to have much expectation nor dread of futurity, though they generally agree that the souls of good men survive after death. A few of them speak of a paradise, not unlike the Elysian fields, intended for the spirits of those who have religiously kept their holidays, observed their oaths, and abstained from forbidden meats. Such as have been deficient in any of those particulars, it is their opinion, are drowned in a certain river, and a period put to their existence; for hardly any of them, seem to entertain a notion of eternal punishment, unless they have received it from the Christians. Some individuals amongst them believe in the doctrine of transmigration.

Though all the negroes worship some creature or other, yet they all have not images in their houses. It is said that some of the natives of the mountainous inland country pay adoration to a living man, in the manner of the Tartars; and they believe that he dooms them to happiness or misery after death, according to their deserts. It has been alledged that they also worship the devil, keeping annually to his honour a solemn festival, of eight days continuance. That a festival is kept appears to be undeniable; but we are informed by other authority, that it is observed with the view of keeping the devil out of their country.

On this occasion, seven days are spent in feasting, singing and dancing, and from the beginning to the end of those rejoicings, great liberties are taken with impunity. The eighth day in the morning, they hunt the devil out of every town and village, with horrid cries and howling; at the same time throwing dirt and stones after the invisible fugitive. When the men have continued this frolic as long as they think fit, they return home, where they find the good women employed in cleansing and scowering all their pots and utensils, from the impurity which they are imagined to have contracted by satan's residing amongst them.

Besides this festival, they have another after harvest, when they sacrifice to their gods for affording them the fruits of the earth.

In contracting marriage the consent of a woman is never asked, but she is disposed of, when a child, by her parents, with whom she lives till she arrives at years of maturity. When she is brought to her husband's house, she is allowed to dress, and live at her ease for a few days; after which she is obliged to dig, plant, and sow the ground; the men leaving to their wives the work of the field, as well as the business of the house. There seems to be very little difference in this respect between their wives and slaves. Those

that live the easiest amongst them, are the wives of the merchants, and fishermen, who have no lands to manure. Every man has one wife called his *bossim*, dedicated to his household god, who is exempted from working, and enjoys many other privileges in the lifetime of her husband. The *bossim* is usually some young beautiful slave, with whom the husband is under an obligation of spending his time on the night of his birth day, and of the day of the week appropriated to the service of their gods. There is also another wife exempted from labour, who is entrusted with the direction of all domestic affairs. Of these two wives the husband is exceeding jealous, and endeavours to keep them to himself; but with respect to the conduct of the rest, he is not so much concerned. The common people wink at their wives bestowing favours on other men, and will even promote an intrigue, provided they can make any thing by it.

The unmarried women on the coast take very great liberties, which is considered as no reproach, nor ever prevents them from getting husbands; but this is to be understood only of the inferior people. Some females are purchased by almost every township, to supply the necessities of unmarried men. These women have huts by the way-sides, where they entertain such as are willing to become their gallants, for the value of a farthing. This institution is regarded as an act of public charity, in so much that it is usual for rich negro women to bequeath a legacy at their death towards establishing such endowments.

Notwithstanding the coast of Guinea is found so unhealthy to European constitutions, the natives have very few distempers. The most fatal to them of any is the small-pox, which sweeps them away like a pestilence, as is generally the case in hot climates. The venereal distemper is likewise fatal to a great many, few escaping it amidst the number of prostitutes with which the country abounds; nor have the natives hitherto learned any method of cure. Worms are here an epidemical distemper; not such as afflict people in the stomach and bowels, but a species which lodge between the skin and the flesh, and excite intolerable pain, till they are drawn out; an operation which sometimes lasts a month, or longer.

As soon as the head of the worm has pierced the tumour, which it raises on the surface of the body, and the animal is come out a little way of itself, they endeavour to extract it by winding it about a stick a little at a time; desisting from the operation when it proceeds not with ease, and renewing it another day, till the whole is extracted. If the worm breaks, the patient suffers great pain, either from its rotting in the body, or exciting an inflammation in another part. Some of the negroes are infested with nine or ten of these worms at a time, and the Europeans are not entirely free from them. They are generally a yard in length, and sometimes double that quantity. A canine appetite is also reckoned among the diseases of the Guinea negroes, which has been imagined to proceed from drinking excessively of palm wine.

The diseases to which Europeans are chiefly subject on this coast, are fevers, dysenteries, and the cholera.

No. 12.

These disorders are ascribed not only to the excessive heat of the day, and the coldness of the night, but to the thick putrid fogs, that arise from the salt-marshes near the sea, and the mouths of the rivers where the factories are usually situated; and also to the miasma proceeding from the fish, which the natives lay to rot upon the shore. But whatever be the cause, it is certain that few Europeans, especially such as come from the temperate, or colder climates, escape a dangerous fit of sickness on their arrival in this country; and that many fall a sacrifice to the morbid quality of the air, either almost immediately, or in the space of some months.

The only physicians amongst the natives of Guinea are the priests, who we may well suppose are extremely ignorant of the medical art. When their prescriptions fail of success, they have recourse to sacrifices and charms; and should these likewise not prove effectual, so great is the confidence of the people in those men, they impute the miscarriage to any thing rather than the unskillfulness or inability of the priest.

Besides exercising the office of physician, the priests likewise act in the capacity of prophets and conjurers, professing infallible power in the use of charms and incantations, to the no small influence of their authority, as well as the increase of their emolument among the superstitious people.

When a man of figure dies, his wives, his relations, slaves, and dependents, immediately set up a dismal howl. His wives shave their heads, cover with a patched garment of rags such parts of their bodies as are usually clothed, and colour the rest with a white paint or clay; running about the streets, and bewailing themselves in the most dismal manner for several days successively.

Whilst the corpse remains unburied, all the relations, friends, and neighbours attend it, and join in the lamentations of the family. On those occasions, it is customary to bring with them presents of gold, linen, liquors, fruits, and other eatables. The corpse being richly habited, is put into a coffin, with a considerable quantity of gold, coral, and other valuable effects, suitable to the circumstances of the deceased. The body is carried to the burying-place, preceded by a great number of musketeers, who fire their guns, while some of the attendants walk behind in a disorderly manner, roaring forth their lamentations with the utmost exertion of their voice.

When the corpse is interred, most of the company return to the house of the deceased, where they feast and drink for several days.

Instead of a tomb, the negroes usually build a house, or plant a garden over the grave, and at Axim, they set images of clay upon it, which they wash every year on the anniversary of the funeral, when the expense is as great as at the time of the interment.

When a king is buried, it is customary to kill his slaves, and his *bossim*, in order to attend him in the other world. Nor is this horrible sacrifice performed with the smallest appearance of sympathy: for the wretched victims are wantonly tormented by the executioners for several hours.

## C H A P. III.

*Of games—sports—music—language—trade.*

SOME tribes of the negroes are much addicted to gaming, and will stake all they possess upon the issue. The ancient game of the natives is similar to that of draughts, but the Europeans have now taught them to play likewise at cards and dice. Their rural sports are hunting, shooting, and fishing; and so plentiful is game in some parts of the country, that a man may load himself with it in a few hours. Having no dogs to spring the game for them, nor horses to ride after it, as with us, guns, nets, and snares, are what they use on those occasions. In fishing, however, they are provided with all the necessary tackle; and this is the principal employment, as well as diversion, of those tribes that live near the coast.

Eight hundred, or perhaps a thousand of them, go out a-fishing at once. They have hooks, harping-irons, nets, and all the implements that are used by European fishermen. Every canoe, or boat, is of one piece, made out of the body of some large tree. Those of the greatest size are thirty foot long, and six broad, which the Europeans hire to carry their merchandize to and from their ships, and along the coast from one country to another, but a smaller kind is generally used in fishing. They are rowed, according to their size, by two, three, seven, nine, eleven, and sometimes fifteen watermen; there being always an odd number, when more than two are employed, as one of them steers the canoe. Instead of oars, they row with an instrument in the form of a shovel, with which they push themselves swiftly along, looking the same way that they row.

The common musical instruments are trumpets made of elephants teeth, bored through, with which they make a loud, but disagreeable noise. They have also a kind of drum, made of a wooden bowl, with a sheep-skin stretched over it, in the form of a kettle-drum, using two wooden hammers for drum-sticks, or sometimes beating them only with their hands, in concert with the trumpets. Another instrument equally harsh, and used likewise in concert with the two preceding, is a hollow iron bell, which yields a sound by being beat upon. The least shocking of any of their music is performed on an instrument in the shape of a harp. They sing and dance to their music, however, such as it is, and seem to be as much charmed with it as Europeans are with the best voices and instruments, and the finest compositions of the Italians.

The language spoken by the natives of Guinea is an extremely disagreeable and uncouth sound, nor have the Europeans ever been able to express their words in writing. It appears to be very different from that of the Hottentots, who communicate their ideas to one another, in many instances, by articulate sounds, which has been compared by some travellers to the voice of a turkey-cock. Such, however, is the diversity of dialects in the language of Guinea, that in

the space of sixty miles on the Gold Coast, there are six or seven different tribes, whose rude articulations are only intelligible to those of their respective divisions.

The four principal articles of trade on the coast of Guinea, are gold, slaves, elephants' teeth, and drugs; under the latter of which are comprehended Guinea grain and pepper, civet, cardomums, indigo, and gums of several kinds, particularly gum-tragacanth, wax, and red wood.

The European merchants never go up into the country to purchase gold, which is always brought to the forts and factories by the trading negroes, who are extremely fraudulent in their dealing. They mix copper, and other substances of less value, both with their rock-gold, and gold-dust. Some pieces they cast so artfully, that quite round, of the thickness of a shilling, the piece shall appear to be pure gold, while perhaps the inner part of the mass is filled with copper or iron. The common false mountain-gold is a mixture of silver, copper, and a proportion of gold, very high coloured, which renders the cheat not easily discernible. For being obliged to receive an infinite number of small pieces in a pound, it is almost impossible for the merchant to examine each, and the metal likewise looking so well, it is hardly suspected. The natives also tinge a powder of coral, or the filings of copper, so artificially as to make them resemble gold-dust, till in a month or two they lose their facitious lustre.

The method which the factors take to distinguish true gold from false, when in large pieces, is to cut it through, by which means the contents of the piece are ascertained. But if the gold be in dust, they put it into a basin, winnowing and blowing it, till the counterfeit metal flies away, and leaves the pure gold behind.

The value of gold, at an average, brought annually from the Guinea coast by all the European nations that trade hither, is computed to amount to the value of three hundred thousand pounds and upwards; of which the English are supposed to import one third, the Dutch another, and the French, Portuguese, and Prussians another third.

The slave-trade is carried on in much the same manner as that of the gold. The negro factors and merchants come down to the coast with their slaves, agree with the Europeans for the price of them, and likewise the value of the goods which they are to accept in exchange. It is, however, often necessary for the European merchant to pay those people the price of slaves before-hand, as the negro factors have not always stock sufficient to go to market without credit; an indulgence which they sometimes abuse, by never fulfilling their contract.

As Guinea is occupied by a multitude of petty princes, who are frequently at war with each other, the slaves are generally such as are made prisoners by either party; and it being the practice, when they invade a country, to carry all the inhabitants into captivity, the spoil consists not only of men, but of women and children. The list of those unfortunate people is much increased by the great number of such

persons as have forfeited their liberty, either on account of debt, or of some misdemeanour. Men sell even their wives and children, on receiving any offence, whilst others lessen their families from an apprehension that they shall not be able to maintain them. If a famine, or great scarcity happens, they will even sell themselves to one another for bread. Instances are known of children selling their parents when they have been weary of them, and wanted to enjoy their possessions. In times of peace, nothing likewise is more common, than for the negroes of one nation to steal those of another, and sell them to the Europeans. In those various ways is this horrible traffic carried on, to the disgrace of humanity, and of every principle which ought to actuate civilized nations.

When a ship arrives upon the coast to purchase slaves, the first business is to pay the duties, and make a present to the king or governor of that part of the country, for permission to trade. The king's slaves are to be taken off at almost what price he pleases to put upon them, before the merchant is allowed to deal with his subjects. The price being agreed upon, the European surgeon views all the slaves naked, men, women, and children. Men that are supposed to be above thirty-five years of age, are usually rejected, as are all that have any lameness, or other defect, and such as are afflicted with a distemper not easily cured. Even the loss of a tooth is sometimes urged as an objection. When the infirm are set aside, the rest are branded by the merchant with a hot iron, to distinguish them, and locked up in some prison till they can be sent on board; the Europeans having no forts or factories in many places, where they meet with the greatest number of slaves. The price of an able-bodied man may be about five pounds, the women a fifth part less, and the children in proportion to their respective ages. When they are sent on ship-board, their former masters strip them of every rag, so that the merchant receives them perfectly naked; in which state they remain till they arrive in America. Cold is however the least of the hardships which they suffer on this passage, being packed so close together, that six or seven hundred are usually stowed in a ship. The decks are so divided that they are forced to lie, or sit double on the hard boards during the whole voyage; and all the men are loaded with irons, to prevent them from attempting their escape.

Ivory may be had in small quantities along the whole Guinea coast, but it is met with chiefly in that part of the country which has obtained the name of the

Tooth Coast. It is said that there are large plains where teeth are found in great plenty, which belonged to elephants that either died naturally, or were killed by people unacquainted with the trade of those bones.

The other articles of trade are the Guinea pepper, wax, and drugs, which are chiefly procured upon the Grain Coast. What quantity of those commodities, or of teeth, is brought from Guinea every year appears not to be well ascertained. A late writer computes, that the English, Dutch, French, Danes, and Brandenburgers, export from Europe to Africa, about the value of two hundred thousand pounds in goods; bringing thence annually in gold, slaves, ivory, and drugs, to the value of three millions; and that the Portuguese, who are possessed of such vast tracts of land upon the eastern, as well as the western coast of Africa, trade for as much as all the other Europeans put together, in slaves and teeth.

The goods exported by the Europeans to Africa, are chiefly calicoes, cottons, linen, and woollen stuffs, serges, and perpetuanas, with wrought iron, pewter, and brass; such as swords, knives, hatchets, nails, hammers, pewter-dishes, plates, pots, and cups, brass-pots, kettles, and other household utensils; fire-arms, powder, shot, brass and glass toys, beads, bugles, and cowries, or blackamoor's teeth, with brandy, English spirits, and tobacco.

It was computed, that the African Company, in its flourishing condition, gained annually to England nine hundred thousand pounds. Of this sum eight hundred thousand consisted in slaves, which, in the infancy of their trade, were in great demand over all the American plantations, to supply their own wants, and carry on a clandestine commerce with the Spanish West-Indies. Barbadoes required annually a supply of four thousand negroes, Jamaica ten thousand, and the Leeward Islands six thousand; and the Company not being able to answer the demand, having imported only forty-six thousand three hundred and ninety-six slaves between the years 1680 and 1688, a number of interlopers arose, and contended for a share of the trade. From this time the Company visibly decayed; inasmuch that in the eight following years they imported to the West-Indies only seventeen thousand seven hundred and sixty slaves, while the private traders imported seventy-one thousand two hundred and sixty-eight. The original African Company was afterwards dissolved, and a new one created by act of parliament; but at present, this trade is not near so advantageous as formerly.

## NEGROLAND, ZAARA, and BILEDULGERID.

**N**EGROLAND, or Nigritia, is bounded on the south by Guinea Proper, on the west by the Atlantic Ocean, on the north by Zaara, and on the east by unknown parts of Africa. It is situate between 18 degrees of west, and 15 degrees of east longitude; and between 10 and 20 degrees of north latitude; the great river Niger running through the whole length of it, and falling by several channels into the Atlantic Ocean.

Towards the coast, the country is for the most part low and flat; but farther from the sea, it is mountainous, and covered with wood, at a little distance from the Niger, up which river the tides flow four or five hundred miles.

The rainy season usually begins before the middle of June, and continues till October, being generally most violent at the commencement and close of this period. During those four months the sea-breezes seldom blow, but instead of them easterly winds, directly down the river, which from November to March blow very fresh, especially in the day-time. The greatest heats are in May, three weeks or a month before the rainy season begins.

The inhabitants of this country, on the north side of the Niger, are not born with flat noses, as their southern neighbours; but many fantastical mothers reckoning such a shape beautiful, produce it in their children by artificial means. Broad nostrils, thick lips, and large breasts, are here in much esteem; and one breast is generally larger than the other.

During the early period of infancy, they dip their children over head and ears in cold water, three or four times in a day; and after drying, rub them with palm-oil, particularly the back-bone, small of the back, elbows, neck, knees, and hips. At first, a child is of an olive colour, and does not turn black till a month or two. When a month old, it receives its name, and its head is shaved. Children go naked till they arrive near the age of puberty, at which time all the males are circumcised, and they assume their habit, which is not uniform in different parts of the country. Some, of both sexes, wear only a piece of cloth round their waists; whilst others, of the men, use a loose covering over their shoulders, and the women over their whole body, except the arms and legs. They usually dress their hair with glittering shells and toys, and many of them wear white caps.

Their houses are little low huts, built with wooden rockades set in the ground, in a circular or square form, thatched with straw. The furniture generally consists of a mat or two to lie down upon, two or three earthen or wooden dishes, and the same number of spoons.

Almost every town has two common fields of clear ground, one for the rice, and the other for the rest of

their grain. The former is cultivated by the women, and the latter by the men; and after harvest, the whole produce is equally divided amongst the inhabitants. In some places, however, every man is entitled to the corn and rice which he sows; but none has a property in any particular part of the field, the country being considered as a common.

The people of Negroland eat crocodile's eggs, snakes, monkeys, and alligators, with almost every species of animal; but their principal food is rice, pulse, Indian corn, stinking fish, and casseon, which is flour mixed with broth. Their liquors are palm-wine, mead, brandy, and rum, when they can be procured; but their ordinary drink is water.

Every man is allowed to retain as many wives as he pleases, and some have no less than a hundred. The wife is turned off at pleasure; and, at her dissolution, is obliged to take with her all her children, unless the father chooses to keep any of them.

The people of this country are generally Mahometans, the Arabs who made a conquest of the coast of Barbary in the seventh century, having since spread themselves so far as the river Niger, and propagated their religion among the natives.

Their government, of which hardly any thing is known, it is probable resembles that of Guinea. Their principal manufacture is cotton cloth; and their arms are swords, bows and arrows, spears, and darts.

The gold of Negroland is reputed of excellent quality, and the natives bring it to the merchants on the coast, in small bars from ten to forty shillings each. They also bring slaves, sometimes to the number of two thousand in the year, most of whom they say are prisoners made in war. Those wretched captives are tied by the neck with leather thongs, about a yard distant from each other, thirty or forty in a string; having generally a bundle of corn, or an elephant's tooth on each side of their heads. They are also obliged to carry water in skin bags, to support them on their journey; having no opportunity of being supplied with any for several days, on their way through the woods and mountains.

Besides the slaves brought from distant parts, many are purchased along the river, who are either taken in war, condemned for crimes, or have been stolen, which is a practice very common amongst them. The company's servants, however, seldom buy the latter, where they entertain any suspicion of such means having been used, without sending for the alcaide, or chief men of the place, and consulting with them on the subject. Since the introduction of this trade, all punishments are changed into slavery; and great advantage being derived from those condemnations, they strain hard for crimes, in order to reap the benefit of selling the persons accused. theft, and adultery, but almost every trifling fault is punished in this manner. The slaves sold on the banks of the Niger, exclusive of those brought from the inland parts, are computed to be about a thousand, more or less, in the year.

The other articles of trade are bees-wax and elephants teeth; the latter of which are either picked up in the woods, or obtained by killing the animal. Whether the elephant ever sheds its teeth, is a point which naturalists have not yet been able fully to ascertain; but there seems to be some ground for this opinion, as teeth are frequently found in the woods, without the appearance of any part of the jaw being annexed. So large is the size of those teeth, that some of them have been known to weigh a hundred and thirty pounds. One tooth which weighs a hundred pounds is worth more than three teeth which weigh a hundred and forty pounds. Those which are broken at the point are considerably less in their value. Some are white, others yellow; but the difference in colour occasions no difference in price.

Contiguous to Negroland on the north, lies Zaara, or Sahara, beyond which, in the same direction, is situated Biledulgerid. The latter is bounded on the north by the empire of Morocco; each of them, on the east, by unknown parts of Africa; and on the west, by the Atlantic Ocean. Both of them are a barren desert, and so destitute of the necessaries of life, that when the caravans pass over it, in travelling from Morocco to Negroland, the camels are half loaded with water and provisions for the journey. There are here no towns, but some inhabitants, supposed to be the descendants of those Arabs who subdued Africa soon after the death of their prophet Mahomet. They live in tents, and being acquainted with the few springs that are in the desert, wander from one part of the country to another, where they expect to meet with subsistence for themselves and their cattle. They are of a tawny, not black complexion; their language is Arabic, and their religion Mahometanism.

## M O R O C C O.

### C H A P. I.

*Of the situation — rivers — mountains — climate — chief towns.*

**T**HE empire of Morocco is bounded on the north by the Mediterranean sea; on the east by the kingdom of Algiers; on the south by Biledulgerid; and on the west by the Atlantic Ocean. It is situated between 2 and 11 degrees of west longitude, and between 28 and 36 degrees of north latitude; being, according to the smallest computation, five hundred miles long, and four hundred and eighty broad.

It is distinguished into three great divisions, namely that of Fez in the north, Morocco Proper in the middle, and Suz in the south.

When the Saracens made a conquest of the north of Africa in the seventh century, this was much the largest kingdom they erected, containing great part of the coast of Barbary to the eastward, and part of Spain on the opposite shore. It is now, however, restricted to the three provinces above-mentioned; the most northerly of which was the Mauritania Tingitana of the Romans, so named from the port-town of Tingis or Tangier, situate on the south-west coast of the straits of Gibraltar.

The chief rivers are, the Mulvia, Suz, Rabatta, Cebu, and Lecus. The Mulvia runs from south to north, separating the kingdom of Fez from Algiers, and discharging its waters into the Mediterranean. This is a large deep river, admitting small cruising vessels, and might be made commodious for ships of greater burthen. Its sources are said to lie eight

hundred miles from the sea, within the desert or desert, and it runs almost its whole course in the same meridian.

The river Suz, which runs from east to west, through the province of that name, discharges itself into the Atlantic Ocean, close to the port-town of Santa Cruz.

The Rabatta runs almost in the same direction with the preceding, and finishes its course at the piratical port of Sallee.

The river Cebu, at the mouth of which lies Mamora, another piratical port, with the Lecus, which discharges itself at the port of Larrache, fall likewise into the Atlantic Ocean. None of these rivers are navigable for ships, and the ports at their mouths will admit only small vessels. The most commodious bays, though unsafe in some winds, are those of Tangier and Tetuan. The Spaniards are in possession of Ceuta, opposite to Gibraltar, and of Penon de Velez east of it; but those harbours are likewise not safe.

Sallee is esteemed the best port in Morocco, and is a good harbour after a ship has entered it; but there is not more than twelve foot of water on the bar at a full tide.

The mountains of Atlas run through the country from east to west, and abutting on the western ocean, gave name to that sea. It is agreed that those celebrated mountains, which, according to the fiction of the poets, supported the heavens, come not in competition either with the Alps, or the Apennines. They consist of a number of hills of four, five, or six hundred yards perpendicular height, with an easy ascent, rising as it were in ranges one above the other;

O o

inter-

interspersed with a few houses, some rocky precipices, and groves of fruit and forest trees. They are now no longer enchanted, nor meet we with any of the nocturnal flames, melodious sounds, or imaginary beings attributed to them by the ancients.

Between the mountains of Atlas and the Mediterranean, the country contains extensive fruitful plains, but very little of those species of wood distinguished by the name of timber. Notwithstanding its southerly situation, it is not so hot as the Spanish valleys, on account of its being more open, and the mountains of Atlas always cool. In general the weather is temperate and serene; but in the month of March, the north-west winds are very violent.

The chief towns in the kingdom of Fez, are Fez, Mequinez, Tetuan, Tangier, Ceuta, Arzilla, Larache, Mamora, and Sallee.

Fez, the capital of the province, and of the whole empire, is situate on the river Cebu, in 6 degrees of west longitude, and 33 degrees odd minutes north latitude. It is divided by the river into two cities, one called New Fez, and the other Old Fez. The former is three miles in circumference, adorned with upwards of fifty mosques or Mahometan temples. The houses of people of condition consist of several squares, but those of tradesmen are very mean. The streets, which are narrow and unpaved, are dirty in winter and dusty in summer. Travellers lodge in caravanseras, or houses built by the public for their entertainment; but they must buy and dress their own provision. Both cities taken together are so populous, that they can raise forty thousand men at a very short warning. They are each surrounded by antique walls and towers; but not of considerable strength. Here is always a garrison consisting of a good body of horse, who are employed in collecting the corn of the adjacent country, and laying it up in magazines erected for that purpose; and upon all the little streams in the neighbourhood there are mills for grinding it. The palaces in which the king and court formerly resided are in ruins, the imperial residence having been fixed at Mequinez for many years; but Fez has still as brisk a trade as any town in the empire.

Mequinez, where the court now resides, is situate in a pleasant plain, in 5 degrees of west longitude, and 34 degrees of north latitude. The town is divided into several quarters, or rather contains several cities united. The palace is a distinct city: the quarter of the Moors is another: the Negro town a third; and the Jews have a quarter to themselves, in which not less than fifteen thousand reside, who are governed by a shick, or magistrate, according to their own laws, and are under the king's protection. They are so necessary to the state, that the kingdom could not well subsist without them, and are the only bankers in the country. The Christian slaves are also allowed an alcaide, or governor, who is of their own religion.

There is here a monastery of Spanish Friars, endowed with a revenue of five hundred pistoles a year, for the entertainment of captives, to prevent their embracing Mahometanism. They have an infirmary

capable of accommodating a hundred persons. This endowment is also favoured with the emperor's protection, on account of the presents which the guardians annually make to him, and of their taking care of his sick slaves.

Notwithstanding the advantages of this charitable institution, there are at Mequinez a number of renegades, who have renounced Christianity, and profess the religion of the country. The people of this class are the most vicious and abandoned of the whole inhabitants, and despised both by Moors and Christians. They are generally entertained in the army, where they are only half provided either with victuals or cloaths, except such as understand engineering, or can be useful to the Moors in fitting out their piratical vessels at Sallee, who never fail of being greatly esteemed. They have their own alcaide, or governor, in the same manner as the Christians and Jews.

The city of Tetuan is situated on the ascent of a rock, about eight miles from a bay of the Mediterranean Sea, near thirty miles south of Ceuta, and fifty south-east of Tangier. The town is about a mile long, and half a mile broad; the streets narrow, unpaved, and full of dunghills in winter. It is however one of the best built towns in the country. The houses usually range about a little open square, surrounded in the front with piazzas supporting galleries; and in the middle of the square people of condition have always a fountain. The town contains about thirty thousand inhabitants, of which five thousand at least are Jews, who have here seven synagogues. Those people are the only brokers between Christians and Moors; and though all the trade of the place passes through their hands, they are said to be very poor.

It is remarkable of this city, that the people walk over the flat roofs of their houses, and thence visit one another, more than by the streets. It is surrounded by an ordinary wall, and defended by an old castle, consisting of two courts. The outward square is flanked with towers, but the walls are not cannon proof, and is commanded by adjacent hills.

On a hill above the town is a burying-place, adorned with a great number of cupolas and pyramids; but what is chiefly worth notice in Tetuan, is the bashaw's palace. Here are fine apartments for the bashaw's four wives; each apartment consisting of five rooms, namely, one large room, covered with a cupola, in the center of four smaller rooms: behind which are the bagnios of the women, and the lodgings of the female slaves. Both the doors and ceilings of the apartments are very lofty. Immediately over them are four noble terrasses, overlooking the town and a fine vale beneath it, with a river, and part of the Mediterranean Sea. At the end of each terrace is a turret with lattices, where the women sit at work, and may have a view of all that passes without being observed.

Tangier is situate on a bay of the sea, near Cape Spartel, at the entrance of the straits of Gibraltar. It was the capital of the ancient Mauritanica Tingitana, and said to have been built by Antæus, who gave it the name of Tingi or Tingis, afterwards changed

changed by the emperor Claudius for that of Traudusta Julia. It was taken from the Moors by the Portuguese, and by them transferred to Charles the Second, king of Great Britain, with the princess Catherine, infant of Portugal, in 1661. The charge of keeping up the fortifications, however, and of maintaining a numerous garrison against the continual attacks of the Moors, was so great, that the works were demolished, and the garrison withdrawn in 1683. Lying on the declivity of a hill, it is very hot in the summer, and the houses being white, it makes a tolerable appearance from the sea; but is now a place of little strength, and has hardly any trade.

Arzila, and some other port-towns on the west coast, belong still to Portugal. Those are strong fortresses, such at least as the Moors with their indifferant militia cannot take; and the same may be said of the port of Ceuta, which remains in the possession of the Spaniards.

Sallee and Mamora having been already mentioned, we proceed to the city of Morocco, the capital of the province of that name. It is situate in a large plain on the river Niffis, in 9 degrees of west longitude, and 31 of north latitude. Both the city and fortifications are now in a declining state, the seat of the empire being translated to Mequinez. The houses are said to have formerly amounted to a hundred thousand, all built with flat roofs; but at present, the city contains not above a fourth part of that number. It is surrounded by a wall and some antique fortifications, too weak to defend it against a siege.

The chief town in the province of Suz is Taradant, or Tenant, situate in a spacious plain, on the river Agus, in 10 degrees of west longitude, and 30 of north latitude. It was formerly the residence of the king, but now has little in it that requires a particular description.

## C H A P. II.

*Of the inhabitants—dresses—dwellings—entertainments—manner of life—music—marriages—funerals—religion—government—forces—trade.*

THE people of Morocco consist of three classes, who differ from each other in their way of life. Those are the Moors, the Arabs, and the inhabitants of mount Atlas. The Moors that are not exposed to the weather, have generally good complexions, and the ladies for the most part fine features, as have also the natives of the mountains; but the Arabs are tawny. All the three tribes are commonly of a good stature, and well proportioned. Their usual dress is a close-bodied frock or tunic, over which they wear a hyke, or mantle, which is a woollen blanket, generally six yards long, and near two broad. This garment serves both the Arabs and Kabyles, or inhabitants of the mountains, for a complete dress in the day, and for their bed and covering in the night. Those two classes wear no drawers, which the Moors of both sexes constantly use, especially when they go abroad or receive visits. The virgins are distinguished from the matrons in having their's made of needle-work,

striped silk or linen. When the women are at home, they lay aside their hykes, and sometimes their tunicks, wearing only a shirt; and instead of drawers, bind a towel about their loins. But when they appear in public, they always fold themselves so close in their hykes, that without the addition of a veil, which they also wear, very little is to be seen of their faces. They all affect to have their hair long, which they gather into a roll upon the hinder part of the head, binding and plaicing it afterwards with ribbands, and tying over it a triangular piece of linen, wrought into a variety of figures with the needle. Persons of better fashion wear above this a farmath, which differs not much in shape from the piece of dress last mentioned, but is made of thin flexible plates of gold or silver, variously wrought, and engraved in imitation of lace; and over all, many wear a handkerchief of crape, gauze, silk, or painted linen, bound close about the farmath, from which it falls down behind. But they never reckon themselves completely dressed, till they have tinged the hair and edges of their eye-lids with the powder of lead-ore. The sooty colour, thus communicated to the eyes, is thought to add wonderful gracefulness to persons of all complexions.

Many of the Arabs go bare-headed, binding their temples with a narrow fillet, to prevent their hair from being troublesome; but the better sort, and the Moors in general, wear caps or turbans.

The Moors, the original inhabitants, live in towns, and are the most numerous: the Arabs live in tents, removing their camps, when they want fresh pasture for their cattle: and the dwelling of the Kabyles are thatched cottages, each containing but one room, in which they also house their young cattle.

People of figure among the Moors have a variety of dishes at an entertainment, mixed up with almonds, dates, milk, honey, &c. But the Arabs and Kabyles have neither utensils nor conveniences for such luxury; two or three wooden bowls; a pot and kettle, being the whole kitchen furniture of the greatest emir or prince. All ranks of those people however eat in the same manner, first washing their hands, and then seating themselves cross-legged round a mat, or low table, upon which their dishes are placed. They use no table cloth, each person contenting himself with a share of a long towel that lies round the mat. Knives and spoons are hardly ever used; as the meat being well roasted or boiled, requires no carving. The whole company dipping the fingers of their right hand into the dish, take what portion they can conveniently for a mouthful, making it first into little balls or pellets, in the palms of their hands. Whenever a person has finished his meal, he rises up and washes himself, without paying any regard to the company, and another immediately takes his place. There being no distinction of tables, the master and servant eat at the same without ceremony. When they sit down to their meals, and before they enter on any business, they always pronounce with the greatest reverence and fervency *Bismilla*, which signifies *in the name of God*; and at the conclusion, *Albandalla*, or, *God be praised*.

The Moors rise early, constantly attending their public devotions at break of day. Every person employs himself afterwards in the exercise of his trade or occupation, till ten in the morning, the usual time of dining. Having finished their meal, they return to business till afa, the afternoon prayers, at which time all work ceases for the day, and the shops are shut up. Supper commonly follows the prayers of magreb, or sun-set; and afterwards repeating the same at the setting of the watch, when it begins to be dark, they immediately go to bed.

The Arabs follow no regular trade or employment, their life being one continued round of idleness or diversion. When no pastime calls them abroad, they do nothing all the day but loiter at home, smoke their pipe, and repose themselves under some neighbouring shade. They have not the smallest relish for domestic pleasures. What they chiefly value is their horses, in which almost their whole enjoyment consists; being seldom in good humour, except when they are hunting and riding at full speed.

People who live in such a manner can have but little taste for the recreations of music, and accordingly that of the Arabs is suitable to the rude nature of their instruments. Almost the only one in use is the bladder and string, which is sometimes accompanied with another in the form of a kettle drum, that serves as a bass in their concerts. The music of the Moors, however, is more artificial and melodious. Besides several sorts of flutes and hautboys, they have a violin of two strings, and a bass double-stringed lute, bigger than our viol, with several small guitars of different sizes, each of them tuned an octave higher than another.

Every man is allowed four wives, with as many concubines as he pleases; and marriage is celebrated here in the same manner as in other Mahometan countries. Funerals likewise are solemnized in the usual mode of those nations. Women are hired to lament and howl over the corpse, who tear off their hair, and cut themselves till they bleed. After some time the corpse is carried to the burying-place, the priests singing as they go, *Laila, il lala, Mahomet reffoul Allah: God is a great God, and Mahomet his prophet*. Having set the body upright in the tomb, with the face towards Mecca, they leave it in that posture.

With respect to their burying-places, every person, according to his quality, purchases a piece of ground, a little out of town near the highway-side; enclosing it with a wall, within which they usually plant flowers, and sometimes erect a dome or spire over the graves. The women visit the tombs of their husbands and other relations every Friday, which is their sabbath; and here they perform their devotions, being never suffered to enter a mosque, nor to receive any visits from the priests. On those occasions they carry with them, as an offering, meats and fruits, which are eat by the poor when they retire.

The Mahometans of this country are of a different sect from those of Turkey. They have a mufti or high priest of their own, who resides at Mequinez; under

whom are priests in every town, who determine all causes, civil as well as ecclesiastical, and officiate in their mosques. Besides those there are saints or marabouts, that live retired in the mountains and unfrequented places, for whom the people have so great veneration, that if a criminal can make his escape to a person of this character, the officers of justice dare not seize him, and the saint frequently procures the offender's pardon. All the marabouts, however, do not live as hermits, nor use great austerities; for some of them have large possessions, and indulge themselves in every kind of pleasure. Those orders of men are held in the greatest veneration; the people esteeming it a great favour to kiss their feet, or even the hem of their garments; deluded with an opinion of pretended sanctity, which is acquired and supported by imposture.

A protestant may enjoy greater freedom under the government of Morocco than in any popish kingdom or state; for they admit universal tolerance in matters of religion, allowing even the slaves to have their own priests and chapel in the capital of the empire.

Morocco is governed by a sovereign, who has the title of emperor, and possesses unlimited power, which he often exercises in the most cruel, brutal, and capricious manner. The magistrates under him are either cadies, who are of the ecclesiastical order, or military officers; each of whom determine all causes within their respective departments. Notwithstanding the tolerance allowed in religion, the laws in other cases are extremely severe. If a renegado, after professing himself a disciple of Mahomet, returns to Christianity, he is burnt without mercy. Murder, theft, and adultery, are also punished with death. Various modes of punishment are inflicted on those who commit crimes against the state, such as impaling, dragging the person along the streets at a mule's heels till his flesh is torn off, throwing him from a high tower upon iron hooks, hanging him upon hooks till he dies, or crucifying him; in doing which the emperor, or his eunuchs, frequently act the part of executioners. What greatly adds to the horror of those dreadful scenes, is that the accused person is denied the privilege of making any defence, and is often innocently sacrificed to malevolence, or the wantonness of uncontrolled oppression.

The forces in different parts of the empire are very numerous. It is computed that the black cavalry and infantry do not amount to less than forty thousand men, and the Moorish horse and foot to as many. The blacks are esteemed the best troops, and of those most formidable are the cavalry. The people of Morocco, however, are very ignorant in the management of great guns and bombs, leaving those chiefly to the direction of renegado Christians, of whom there are some thousands in their armies. They have a train of a hundred and fifty brass guns in the palace of Mequinez, besides several mortars, which are sometimes drawn out in times of danger.

It appeared on a late enquiry, that the whole naval force of this empire consisted but of two twenty-gun ships, the largest not above two hundred ton, and a French

French brigantine they had taken, with a few row-boats. Yet with those vessels well manned, they issue out from Sallee and Mamora, and make prize of great numbers of Christian merchant ships, the crews of which they carry into captivity. Though at peace with Britain, they make no scruple of seizing and carrying her ships into Sallee, if they find a passenger on board belonging to any country with which their nation is at war. It is however their common practice to set the ships and crews at liberty, after robbing them of some merchandize. The charge of those piratical cruizers is borne entirely by private adventurers, and the emperor retains a tenth of all the prizes they make. This sovereign is also entitled to a tenth of all corn, cattle, fruits, and produce of the soil, with a duty on whatever is exported.

Having no shipping to carry on trade by sea, the Europeans bring them whatever they want from abroad; as linen and woollen cloth, iron wrought and unwrought, arms, gun-powder, lead, and the like; taking in return, copper, wax, hides, Morocco leather, wool, gums, dates, almonds, and other fruits.

Their trade on the continent is either with Arabia or Negroland. They send to Mecca caravans, consisting of several thousand camels, horses, and mules, twice every year, partly for traffic, and partly on a religious account; great numbers of pilgrims taking those opportunities of paying their devotions to their prophet. The goods they carry to the East are woollen manufactures, Morocco skins, indigo, cochineal, and ostrich feathers; and thence they bring back muslins and drugs. By their caravans to Negroland they send salt, silk, and woollen manufactures, bringing gold and ivory in return, but chiefly negroes, for recruiting the emperor's black cavalry. The caravans are exposed to great danger, not only from the Arabs who infest the deserts, but from the burning sands, which are often blown by the violent winds in so great a quantity, as to bury the travellers alive. Such, however, is the ardour inspired by the thirst of gain, and the force of superstition, that in spite of all those disasters, the caravans never fail to undertake their journey at the usual season.

## B A R B A R Y .

**BARBARY**, in the largest acceptation of the name, includes the whole southern coast of the Mediterranean from the Atlantic Ocean to Egypt; but in a more limited sense, the kingdoms of Algiers, Tunis, and Tripoli.

The kingdom of Algiers is situate between 30 and 37 degrees north latitude; and between 1 degree of west, and 9 degrees of east longitude; being bounded on the west by the river Mulvia, which separates it from the empire of Morocco; on the north by the Mediterranean; on the east by the kingdom of Tunis; and on the south by mount Atlas. It is generally a mountainous country, computed to be about six hundred miles long, and four hundred broad. Amongst its rivers the principal are, the Mulvia, Saffran, Major, and Guadalbarbar, which run from south to north, and discharge themselves into the Mediterranean sea.

This kingdom is divided into three provinces, namely, Tlemfaut or Tremefan on the west, Titteric in the middle, and Constantina on the east.

The chief towns in the province of Tremefan are; 1. Tremefan, situate almost under the meridian of London, in 35 degrees of north latitude, about sixty miles south of the Mediterranean. This was formerly a rich and populous city, capital of a kingdom of the same name; but it is at present an inconsiderable town. 2. Oran, or Warran, a port-town on the coast of the Mediterranean; and, 3. Marsalquiver; the last two being under the dominion of Spain since the year 1732.

The chief town in the province of Titteric is Algiers, the capital of the kingdom, situate in 36 degrees 40 minutes north latitude, and 3 degrees 30 minutes

No. 13.

east longitude. It stands on the side of a hill rising gradually from the sea, near the mouth of the river Saffran; and is defended by a pier or mole, five hundred paces in length, stretching from the continent to a small island, which is fortified with a castle and large batteries of guns. The walls are three miles in circumference; the port of an oblong form, a hundred and thirty fathom long, and eighty broad, defended by several batteries of great guns. The houses are built very compact, and computed to contain a hundred thousand Mahometans, fifteen thousand Jews, and two thousand Christian slaves.

The environs of the city are beautifully diversified with country seats and gardens, whither the more opulent inhabitants retire during the summer. The villas consist of little white houses, shaded with a variety of fruit-trees and ever-greens, which afford a most delightful prospect. The gardens are well stocked with melons, fruit, and pot-herbs of all kinds; and enjoy a great command of water, from the many rivulets and fountains with which the place is supplied.

In the southern part of this province is the highest mountain in Barbary, called Jurjura, being part of the range of hills which go under the name of Atlas. It is in length about eight leagues, lying nearly in a direction from north-east to south-west, and appears to be a chain of naked rocks and precipices. By its rugged situation it secures a number of Kabyles from becoming tributary to the Algerines.

The province of Constantina is situated between the river Booberack, which separates it from Titteric on the west, and the river Zaine, which divides it from

P p

the

the kingdom of Tunis on the east. One of its chief towns is Bugia, formerly the capital of the kingdom of the same name, situate at the mouth of the river Major, about twenty leagues east of Algiers. It is a fortified town, built upon the ruins of a large city, of which a great part of the wall yet remains. Besides a castle on the hill, which commands the city, two others stand at the bottom for the security of the port; but they all were not able to defend the shipping in the river's mouth, when attacked by Sir Edward Spragg the English admiral, in 1671; for he took and destroyed nine Algerine men of war in this harbour.

Another of the chief towns is Constantina, the ancient Cirta, capital of the province. It stands on the river Rummel, upwards of ninety miles to the southward of Bugia. The greatest part of the town has been built upon a kind of peninsular promontory, inaccessible on all sides, except towards the south-west, and situated on a precipice of at least a hundred fathom perpendicular.

Barbary enjoys a wholesome temperature of air, neither too hot in summer, nor too sharp and cold in winter. The winds are generally from the sea, or from the west (by the north) to the east. Those from the east are common at Algiers from May to September, at which time the westerly winds take place, and become the most frequent. Sometimes, particularly about the equinoxes, the violence ascribed by the ancients to the Africus, or south-west wind, called by the mariners on this coast *Lalatch*, is sensibly experienced. The southerly winds, which are usually hot and boisterous, are not frequent at Algiers. In July and August, however, they sometimes blow for five or six days successively, rendering the air so extremely suffocating, that during their continuance, the inhabitants are obliged to sprinkle the floors of their houses with water.

The winds from the west, the north-west, and the north, are accompanied with fair weather in summer, and rain in the winter; but the easterly winds, as well as the southerly, are for the most part dry, though usually attended with a thick and cloudy atmosphere.

It is seldom known to rain in this climate during the summer; and in the greater part of the sahara, or desert, on the south of Algiers, particularly in the *Jereads*, they have hardly any rain at all. The first rains fall some years in September, and in others a month later; after which the Arabs break up their ground, and begin to sow wheat, and plant beans. This commonly falls out about the middle of October; but the sowing of barley, and the planting of lentils and garvancos, a species of cicer or chick-pea, is a fortnight or three weeks later, or not till the end of November.

Two bushels and a half of wheat, or barley, are judged here to be sufficient to sow as much ground as a pair of oxen will plough in one day, which is nearly equal to one of our acres. One bushel yields ordinarily from eight to twelve, though some districts afford a much greater increase; but we do not learn

that any part of Barbary affords more than one crop in the year.

In some parts of the country, where they have a command of water during the summer, the natives cultivate rice, Indian corn, and particularly a white sort of millet, which the Arabs call *drah*, and prefer it to barley for the fattening of their cattle. Oats are not cultivated by the Arabs, the horses of this country feeding altogether upon barley; neither is big, or winter-wheat, so much as known in this climate.

The Moors and Arabs continue to tread out their corn, after the primitive custom in the East. When the grain is trodden out they winnow it, by throwing it up with shovels, lodging it afterwards in mattamores or subterraneous magazines.

This country produces great numbers of palm-trees, almond-trees, apricots, plums, cherries, mulberries, apples, pears, peaches, nectarines, pomegranates, prickle-pears, olives, and walnuts; but no hazel filberts, gooseberry or currant bushes. The lemon, and sometimes the Seville orange-tree, is always in a succession of fruit and blossoms; but the China orange, which is here a foreigner, bears only towards the latter end of autumn. The grape ripens about the end of July, and is cut for the vintage in September. The wine of Algiers, before the locusts, in the years 1723 and 1724, made such vast destruction of the vineyards, was reckoned not inferior to the best *hermitage*, either in briskness of taste or flavour. But from that time it much degenerated; and we believe, has not hitherto recovered its usual qualities, though perhaps it may still dispute the superiority with the wine of Spain or Portugal.

None of the gardens here are laid out with any degree of regularity, the whole being a confused mixture of trees, with beds of cabbages, turneps, beans, garvancos, &c. nay, sometimes of wheat and barley dispersed amongst them. The soil is for the most part of such a loose and yielding nature, that an ordinary pair of oxen is sufficient to plough an acre of the stiffest sort of it in one day. The colour of it is not always the same, being in some places black, and in others inclining to red; but both kinds are equally fruitful, and impregnated with great quantities of salt and nitre.

In the salt-petre works of Tlemfan, they extract six ounces of nitre from every quintal of the common mould, which is there of a dark colour; and at Doufan, Kerwan, and some other places, they procure the like quantity from a loamy earth, and of a colour between red and yellow. The banks of several rivers, to the depth sometimes of two or three fathom, are studded in the summer with nitrous and saline particles and exudations. To this strong impregnation of salt, we may with justice attribute the great fertility for which this country has ever been held so remarkable, without any other manuring than the burning of the stubble in a few places. It is however extraordinary, that the province of Bizacium, which was formerly in so much repute for the richness of its soil, is at present the most barren and unprofitable part of those kingdoms.

The salt-pits of Arzew are enclosed with mountains, encompassing an area of about six miles. The pits appear in winter like a lake, but are dry in summer, the water being then exhaled, and the salt left behind crystallized. In digging, several different layers of this salt are discovered, some of which are an inch, and others more in thickness. The whole area consists of a succession of similar strata; and in the same manner are the saline between Carthage and the Gulletta, those of the Shott, and of other places, either bordering upon, or lying within the Sahara.

Jebbel Had-Deffa is entirely a mountain of salt, situated near the eastern extremity of the lake of Marks. The salt here is of a different quality and appearance from that of the saline, being as hard and solid as stone, and of a reddish or purple colour. Yet what is washed down from those precipices by the dews, becomes perfectly white, and loses the bitterness it originally possessed in the rock. The salt in the mountains near Lwotiah and Jibbel Minifs, is of a bluish or grey colour, and without undergoing the like accidental purification as at Had-Deffa, is very agreeable to the palate; the former of those rock-salts being sold at Algiers for a penny an ounce.

This country abounds likewise in hot and sulphurous springs. In some of those waters are little more than luke-warm, others are of a greater heat, and very proper to bathe in, whilst the Hammam-Meskouteen, and the upper spring at Mercega are much too hot for that purpose; the former boiling a large piece of mutton very tender in a quarter of an hour.

Besides the hot mineral effluvia that are constantly discharged by the Thermæ, there remains below the surface an inexhaustible fund of sulphur, nitre, and other inflammable bodies, which frequently prove the cause of local earthquakes in different parts of the country.

Lead and iron are the only metals that have hitherto been discovered in Barbary. The latter is white and good, but in small quantity; and the lead ore, which is very rich, might be obtained in large quantities, if the mines were under proper regulation.

Besides the horse, the mule, the ass, and camel, used in Barbary for riding and carrying burdens, there is another animal, called the kumrah, used for the same purposes. It is got betwixt an ass and a cow: it is single-hoofed like the ass, having the tail and head of a cow, but without horns, and the skin is more sleek than that of either of its parents.

The neat cattle of this country are generally very small, the fattest of them when brought from the stall, rarely weighing above five or six quintals, or hundred weight. Neither is their milk in proportion to their size; hardly any of them yielding a fourth part of the quantity afforded by an English cow. The Barbary cattle have likewise another imperfection, which is that they always lose their calves and their milk together.

The Arabs make their cheese principally of the milk of sheep and goats; and instead of rennet, they use, especially in summer, the flowers of the great-headed

thistle, or wild artichoke; putting the curds, thus made, into small baskets of rushes, or palmetta leaves, and afterwards pressing them. They have no other method of making butter, than by putting their cream into a goat-skin, which being suspended on a rope stretched from one side of the tent to the other, they move it backwards and forwards, till the separation is made.

The Arabs rarely kill any of their flocks, living chiefly upon the milk and butter, with what they procure in exchange for their wool.

Of cattle that are not naturally tame, these kingdoms afford large herds of the neat kind, called bekker-el-wash. This species is remarkable for having a rounder body, with a flatter face, and horns bending more towards each other than in the tame kind. They are of the size of the red deer, which they likewise resemble in colour.

Besides those animals the country produces red and fallow deer, the antelope, the bear, the ape, the fox, &c. with the rabbit, hare, and wild boar, which are every where in great numbers.

Among the wild beasts are the lion and panther, with an animal called the dubbah, about the size of the wolf, but of a flatter body, and naturally limps upon the hinder right leg. The tyger is not a native of Barbary.

As arts and sciences are now hardly known in Barbary, the people are proportionably superstitious. They hang about the children's necks the figure of an open hand, which the Turks and Moors paint upon their ships and houses, as an antidote and counter-charm to an evil eye. The number five is here reckoned extremely unlucky. Grown-up persons carry always about them some paragraph of the Koran, which, as the Jews did their phylacteries, they place upon their breast, or sew under their caps, to prevent fascination and witchcraft, and secure themselves from sickness and misfortunes. The virtue of those charms and scrolls is supposed to be so universal, that they likewise hang them upon the necks of their horses and other beasts of burthen. They repose great confidence in magicians and forcerers; and on some extraordinary occasions, particularly in a lingering distemper, they use several superstitious ceremonies in the sacrificing of a cock, a sheep, or a goat, by burying the carcass under ground, by drinking a part of the blood, or by burning or dispersing the feathers. For it is a prevailing opinion over all this country, that a great many diseases proceed from some offence given to the jennou, a sort of being placed by the Mahometans between angels and devils. Those creatures, like the fairies, are supposed to frequent shades and fountains, and to assume the bodies of toads, worms, and other little animals, which being always in our way, are liable every moment to be hurt or molested. When any person therefore is sickly or maimed, he concludes that he has injured one or other of those trans migratory spirits; on which the women who are dexterous in those ceremonies, go on a Wednesday with frankincense, and other perfumes to some neighbouring spring, and there sacrifice a hen or a cock, an ewe or a ram,

a ram, &c. according to the sex and quality of the patient, and the nature of the distemper.

The government of Algiers resides ultimately in the Turkish soldiers, who are computed to be about seven thousand; the Moors and Arabs, though more numerous, not claiming any voice in the public affairs of the state. Offensively, however, the supreme power is lodged in the hands of a sovereign prince distinguished by the title of dey, who ascends the throne not in right of succession, but by the election of the Turks. This kingdom is not subject to the grand signior, though the dey pays some regard to him as the head of their religion. The revenues of the government arise from the tribute paid by the Moors and Arabs; a detachment of the soldiers being sent into each province annually to collect it. The prizes they take at sea sometimes equal the taxes on the natives. The dey has several thousand Moors in his service, both horse and foot; and each of his boys or viceroys, in the provinces, has a body of them under his command. The naval force of the Algerines, however, has been for some years on the decline; but a friendly intercourse with them being useful, and even necessary to those nations which trade in the Mediterranean Sea, almost every maritime power of Europe has here a consul, whose chief business is to maintain a free communication between the ships of his country and this port.

The kingdom of Tunis, the ancient Africa Proper, is situate between 6 and 11 degrees of east longitude, and between 30 and 37 degrees of north latitude. It is bounded on the west by the kingdom of Algiers, on the south by mount Atlas, and on the east and north by the Mediterranean; extending in length from north to south about four hundred miles, and in breadth, where largest, two hundred and fifty miles.

The chief rivers are Guadalbarbar, the western boundary; and Megarada, which runs through the middle of it; both rising in mount Atlas, and discharging themselves into the Mediterranean Sea.

One of the chief towns is Cairoan, situated on the eastern coast; said to be the first town the Saracens built, and the residence of their sultans who had the dominion of Barbary.

On the same coast, ninety miles south-east of Tunis, is situated the town of Africa, supposed to be the Adrumatum of the ancients; and twenty-five east of Tunis, stands Sufa, the ancient Ruspina.

Tunis, at present the capital of the kingdom, is situated in 10 degrees 51 minutes of east longitude, and in 36 degrees 40 minutes of north latitude, in a fine plain, near a spacious lake. It is a large populous city, and a place of some trade.

Thirty miles north of Tunis, on a peninsula formed by two bays of the Mediterranean sea, lies Carthage, or rather the place where it stood; for it is now only a mean village. Here are still some marble ruins, and several arches of the aqueduct, which conveyed water to the city from a fountain thirty miles distant.

Byferta, the ancient Utica, which was built before Carthage, is a port-town on the Mediterranean, situate in 9 degrees of east longitude, and 37 of north latitude.

The kingdom of Tripoli, including Barca, is bounded on the west by Tunis, on the north by the Mediterranean, on the east by Egypt, and on the south by Nubia and unknown parts of Africa. The country of Tripoli Proper has a fruitful soil; but Barca is for the most part a desert, though it formerly was a considerable territory annexed to Egypt. Here stood the ancient temple of Jupiter Ammon, and the town of Cyrene, whence sprung those philosophers distinguished by the title of the Cyrenaic sect.

The governments of Tunis and Tripoli resemble that of Algiers; only in the two former the grand signior has a bashaw, who is consulted in matters of state, and collects the tribute demanded by the Porte.

In respect to the original of those piratical states, it appears that the Moors of Spain, in being expelled that country, and transported to the coast of Barbary, took every opportunity of revenging themselves on the Spaniards, by taking their merchant ships, and plundering their towns on the coast; which, being well acquainted with the country, they greatly molested. To restrain those outrages, Ferdinand V. king of Arragon, fitted out a fleet in the year 1505; in which, Peter, count of Navarre, embarking with a body of land forces, he besieged and took the town of Oran, on the coast of Barbary, then inhabited by Moors who had been driven from Granada and Valencia. He afterwards made himself master of Bugia, and several other towns upon the same coast, with the small island which lies in the bay of Algiers; by which he obstructed the navigation of the Moorish shipping in that port, and filled the town with apprehensions of being reduced under the dominion of the Spaniards.

In this extremity, Selim, then sovereign of Algiers, having heard the same of Barbarussa, the Turkish corsair, sent to desire his assistance against the Spaniards. The pirate was cruising in the Mediterranean when he received the invitation; and being flattered with the prospect of the enterprize, dispatched eighteen galleys and thirty small barks to Algiers, marching hither by land himself, with what forces he could assemble on a sudden. The Algerines receiving advice of his approach, marched out with Selim at their head, to welcome their deliverer; and having conducted him to the town, amidst the acclamations of the people, he was lodged in the prince's palace. This general joy however proved of short duration; for the pirate, who for many years had made no scruple of seizing whatever came in his way, immediately formed a plan of obtaining the sovereignty of the place. Having found means to assassinate Selim privately, he caused himself to be proclaimed king, and massacred all those who he imagined might oppose his designs. The greater part of the natives abandoned the city, leaving the usurper in the peaceable possession of his conquest; but upon his promising them protection, and the enjoyment of their former laws and liberties, they returned and acknowledged him their sovereign. Having fortified the place, however, and secured his possession, he treated them with all the severity that might be expected from a conqueror of the most cruel disposition towards those whom he had effectually subdued.

This

This revolution happened at Algiers in 1516. The son of prince Selim flying to Oran for protection, prevailed on the Spaniards the year following to fit out a strong fleet, with an army of ten thousand landmen on board, to assist him in the recovery of his dominions; promising, if he succeeded, to acknowledge the king of Spain as his sovereign. The Spanish fleet being arrived near Algiers, was dispersed or shipwrecked in a violent storm, and many of the forces that had escaped the dangers of the sea, were either cut in pieces, or made slaves by the Turks. Barbarussa, elated with this success, began to treat the Moors both in town and country with greater insolence than ever; which so far provoked the rest of the Moorish princes, that they raised a confederacy against him. Having assembled ten thousand horse, with a good body of foot, and chosen the king of Tenez their general, they immediately proceeded in order to lay siege to Algiers. Barbarussa receiving intelligence of their motions, marched out to meet them, with only a thousand Turkish musqueteers, and five hundred Moors in whom he could confide. With this force he totally routed the confederates, who being without fire-arms, were soon thrown into disorder by the musqueteers. The conqueror entering Tenez, possessed himself of the throne of one of his rivals, who fled for security to mount Atlas.

About the same time an insurrection happened in the kingdom of Tramefen, which lies to the westward; and the rebels hearing of the great success of Barbarussa, invited him to come and deliver them from the oppressions which they alleged to have suffered from their native sovereign. A message so agreeable to the ambitious Turk was received with the greatest alacrity; and sending for a reinforcement of troops, and his artillery from Algiers, he set out towards Tramefen, where by his superiority over a militia destitute of fire-arms, he soon obtained a complete victory. The king of Tramefen escaped from the field of battle, but his traitorous subjects afterwards murdered him, and sent his head to the conqueror, who entered the city of Tramefen in triumph, and was proclaimed king.

Tramefen being in the neighbourhood of Oran; he justly apprehended that the Spaniards would not long permit him to enjoy his conquests in quiet; on which account he entered into an alliance with Muley Hamet, king of Fez, the most powerful of the African princes, and who was no less an enemy to the Spanish nation than himself; not doubting but by this support he should be able to defend the extensive territories he had conquered, against all the power of the Christians. About this time, however, Charles V. coming to the possession of the crown of Spain, and being implored by the prince of Tramefen to assist him in the recovery of his father's kingdom out of the hands of Barbarussa, he sent over ten thousand men under the command of the governor of Oran, who being joined by a body of Moors and Arabs, marched towards Tramefen. Barbarussa immediately sent to the king of Fez to hasten his assistance, and marched in person, with fifteen hundred Turkish musqueteers and five hundred Moorish

horse, to watch the motions of the governor of Oran, till the succours should arrive. But being surrounded by the Spaniards, and endeavouring to break through them in the night time, he was cut in pieces with all his Turkish infantry; on which the Spanish general continuing his march to Tramefen, the young prince was restored to his throne.

The king of Fez arrived in the neighbourhood of Tramefen with an army of twenty thousand men; but hearing of the defeat of his ally, he made a precipitate retreat. The Spaniards had now a fair opportunity of making themselves masters both of Tenez and Algiers, the inhabitants of which had abandoned all thoughts of resistance; but the governor of Oran contenting himself with accomplishing the design of the expedition, sent back the forces to Spain. On this unexpected event, the Algerines proclaimed Cheredin, the brother of Barbarussa, their king; who met with no disturbance till the year 1629, when a conspiracy was formed by the Moors and Arabs, to free themselves from the Turkish yoke, and recover their ancient liberties. Cheredin conscious of his weakness to resist their united forces, especially if they should be joined by the Spaniards, whom he apprehended to be at the bottom of the design, dispatched an express to Selim, at that time the grand signior, with the view of procuring his assistance. He represented, that if the Turks should be driven from Algiers, all Africa would soon fall under the dominion of the Spaniards; and therefore urged the necessity of being supplied with a strong reinforcement of troops, promising to resign his dominions to the Porte, under whom he should be content to act in future only as bawhaw or viceroy.

The Ottoman emperor accepting Cheredin's offer, sent two thousand janisaries to his assistance; publishing a proclamation at the same time, granting to all the Turks who should resort to Algiers, the same privileges as the janisaries enjoyed at Constantinople. This resolution was no sooner known than people of desperate fortunes, and all persons whose crimes had rendered them obnoxious to the government; immediately entered themselves in the service of Cheredin Barbarussa; who with this reinforcement was soon in a condition not only to frustrate the conspiracy, but render himself absolute master of that part of Barbary. He likewise subdued the island, of which the Spaniards had possessed themselves at the mouth of the bay of Algiers; and erecting on it a fortress, he increased his piratical fleet, and so infested the coasts of Spain and Italy, that a merchant ship could not stir out of any port, without falling into the hands of his corsairs. Not content with scouring the seas, he made frequent descents upon the shore, carrying numbers of Christians into slavery; and this at the time when Charles V. then emperor of Germany and king of Spain, was in the height of his glory.

At last however Charles, incensed at the ravages committed on his subjects by those pirates, and being farther incited by pope Paul III. assembled a fleet of five hundred sail, including transports and galleys, in which he embarked with an army upwards of twenty thousand men, and sailing from Spain, arrived before

the bay of Algiers in the end of October. He had landed about two thirds of his troops, and summoned the place, which was upon the point of surrendering to him, when a sudden storm arising, great part of his fleet was shipwrecked, and all his provisions destroyed. At the same time such heavy rains fell on the shore, that his forces could no longer keep the field. Abandoning therefore the enterprise, he re-embarked his troops, one third of which had perished either by shipwreck or the sword of the enemy in his retreat. Had this expedition been undertaken more early in the season, in all probability it had succeeded, and Charles V. had added Africa to his empire, which was already extended over the best part of Europe and America.

After the death of Cheredin Barbarussa, the Ottoman princes governed the kingdom of Algiers by their bashaws till the seventeenth century. At this time the janisaries, or militia of the province, representing to the grand signior the intolerable oppression of those delegates, which could not fail, if continued any longer, of exciting the Moors to revolt, they requested the privilege of electing one of their officers, with the title of dey, to be their governor; promising not only to acknowledge the grand signior for their sovereign, but to raise supplies sufficient to maintain their forces, which would save the Porte an immense charge. The request being granted, they appointed a dey; by a succession of which elective magistrates the country has ever since been governed. In no part of the world, however, are there so frequent instances of the people's deposing and murdering their princes. Those sovereigns reign with absolute authority for a few years, months, or weeks; and sometimes a few hours put an end both to their dominion and their lives. Hardly any of them dies a natural death; affording each an example of the precarious existence of that power which is conferred by a fluctuating and capricious soldiery. At present the Algerines are entirely independent of the Ottoman court, and acknowledge the grand signior in no other capacity than as he is the head of their religion.

According to the constitution of this country, a dey ought to be elected by the Turkish militia without one dissenting voice. When the throne is vacant, the soldiery assemble at the palace, and the aga or chief officer demands who shall be their dey. Each calls out the name of the person to whom he is most attached; but when they disagree in the choice, they renew the ceremony, till they pitch upon one who is universally approved. It is not uncommon, however, for the election to be carried by violence; and in those contentions many are killed and wounded.

It may well be imagined that the janisaries, in whom the right of election resides, are sufficiently conscious of their own importance in the state. Every private soldier of this body has the title of effendi, or lord, and demands a respect from the natives not inferior to that which is usually paid to a prince. They are exempted from all taxes and duties, and seldom punished for any crimes, except those against the state. Nor is any justice to be obtained against them, where

the native Moors, Arabs, Christians, or Jews, are one of the parties concerned. All of those denominations either fly the streets, when they see a janisary coming, or stand close up to the wall in the most respectful posture, till he passes. What adds to the importance of this body, is that out of it all officers in the kingdom, whether civil or military, are chosen.

Those janisaries who are unmarried, have the greatest privileges. They are lodged in spacious houses provided at the public charge, attended by slaves, and are entitled to have their provisions one third under the market-price, exclusive of their pay, and a large allowance of bread. The married men enjoy not those advantages, but are obliged to find their own houses, and provision for their families out of their pay. One reason alledged for this distinction, is because the government is entitled to all the estate and effects of those that die, or are carried into slavery without children; but the principal is, that the married men are supposed to have more regard to the natives with whom they are connected by alliance, than the unmarried soldiers. For the same reason the sons of married janisaries are not allowed the privileges of natural Turks, or even preferred to any office under government. On account of those discouragements hardly any janisaries marry, unless the renegadoes that are admitted amongst them, who are not very numerous. They all are allowed, however, to purchase female slaves, and keep as many concubines as they please, without any restraint.

The greatest crime here next to treason, if it be not held of the same nature, is the expressing any compassion or tenderness for the natives. In several parts of the country, however, Moorish troops are employed, who assist in oppressing their fellow-subjects, and levying the tributes the dey imposes. Notwithstanding the tyranny exercised by the Turks over the Moors and Arabs, yet if any Christian power threaten an invasion, the oppressed inhabitants unite their forces with the Turks in repelling the attempt; dreading the government of Christians more than the usurpations of those of the same faith with themselves.

The Europeans trade with Tunis and Tripoli for corn, oil, wool, soap, dates, ostrich feathers, and skins of wild and tame beasts; but one of the principal branches of their commerce is slaves. The European Christians taken by their piratical ships they set very high ransoms upon, or force them to serve at sea and land in all sorts of employment and drudgery. They have also some traffic for negro slaves to the southward. Their camels they usually sell in Egypt, and their fine horses to the French. Their commerce, however, is inconsiderable in respect of their piracies, by which they are furnished with every manufacture of Europe; and for the goods thus obtained, their brokers are Jews, who are very numerous in all the towns of Barbary, and maintain a trade not only with the inland country, but with foreign nations.

The north coast of Africa was doubtless peopled from Asia, from which it is separated only by the isthmus of Suez and the Red Sea; but the Phœnicians or inhabitants of Tyre seem to have preceded all other nations

rations in sending hither colonies. The first town they built on the Barbary coast was Utica, afterwards called Dyferta; near which runs the river Bagarda or Bagradas, where we are informed that Atilius Regulus, and his whole army, attacked with warlike engines, and slew a serpent, which measured a hundred and twenty foot in length.

Carthage is supposed to have been built much later than Utica, namely, in the year of the world 3120, before the building of Rome a hundred and thirty-five years, and eight hundred and eighty-three before the birth of Christ. This celebrated city, the grand rival of Rome, is said to have been founded by Dido or Elifa, a Tyrian princess, who flying hither to avoid the rapacity of her brother Pygmalion, king of Tyre, purchased lands of the natives at this place, within three leagues of Utica, where a colony of Tyrians had already settled. At this time, it is probable, the territory of Carthage was comprehended within very narrow limits, till gradually increasing in power by the great extent of their commerce, the inhabitants stretched their dominion as far as the Atlantic Ocean.

The first war in which we find the Carthaginians engaged, was occasioned by their refusing to pay the annual tribute due to the prince of the country for the lands which they possessed. Proving unsuccessful in this contest, they were obliged to relinquish their claims, till after procuring fresh supplies and reinforcements from Tyre, they not only again asserted their independency, but enlarged their territories.

The next war of this growing republic was with the city of Cyrene, which stood between Carthage and Egypt, in that part of the country now called Barca. This war arose from a dispute about the limits of their respective territories, for determining which it was at last agreed, that two men should set out at the same hour from either city, and that the place where they happened to meet should be fixed as the boundary of the contending states. The two Carthaginians pitched upon for this service were brothers, named Phileni, who being swifter of foot than their adversaries, the Cyrenians pretended that the agreement had not been properly observed, and they would not submit to the decision, unless the two brothers would allow themselves to be buried alive in the place where the parties had met. To this proposal it is said they readily acceded; and in honour of their memory, the Carthaginians erected a pillar and two altars on the spot, on which they sacrificed to those extraordinary lovers of their country. But whatever credit may be due to an anecdote apparently improbable, and relative to a transaction so remote in antiquity, it is certain that two altars, distinguished by the name of the Phileni, were erected, and remained many years on the borders of those states. Nor was any thing more common among the ancients, than the erecting altars and sacrificing upon them at the conclusion of a treaty, or any memorable event.

The acquisitions of the Carthaginians, after this period, were not confined to the continent of Africa; they made themselves masters of Sardinia and Corsica, with the Balears, or the islands of Majorca, Minorca, and

Ivica; whence passing into Spain, they also subjected to their dominion a great part of the south coast of that country. At what precise time they stretched their conquests to Sicily, historians have not informed; but from a treaty between them and the Romans, made immediately after the institution of the consulship, it appears that they were then in possession of part of this island, as well as of Africa and Sardinia. By the same treaty, the Romans agreed not to sail farther westward than the Fair Promontory near Carthage.

About two hundred and sixty-four years after the building of Rome, and four hundred and eighty-four years before Christ, the Carthaginians entered into an alliance against Greece with Xerxes king of Persia; and while the latter marched with a prodigious army to attack the Greeks upon the continent, the former transported a large body of troops into Sicily, in expectation of reducing under their dominion the remaining Grecian cities in that island. Those forces however were defeated in a battle, which happened on the same day with the memorable engagement at Thermopylæ. In the three hundred and thirty-sixth year of Rome, they renewed their attempt on the Grecian cities in Sicily with greater success, and were upon the point of taking Syracuse, the capital of the island, when the plague broke out in their army, and destroyed the greatest part of them, while the remainder was cut in pieces by the Syracusians. The news of this disaster occasioned an insurrection in Africa, where two hundred thousand of the malecontents laid siege to Carthage; but being destitute of provisions, and disagreeing about the command, they soon dispersed.

In the year four hundred after the foundation of Rome, a treaty was concluded between the Romans and Carthaginians, for their mutual defence; about which time the latter made another attempt to reduce the Grecian cities in Sicily, but were again defeated by Timoleon, who had come to the assistance of the islanders with a body of Corinthians. Agathocles, the Syracusan general, afterwards carried the war into Africa, and in confederacy with some princes of the country, laying siege to Carthage, threatened the subversion of that state. While the Carthaginians were in this distress, an ambassador arrived from Tyre, soliciting a reinforcement of troops against Alexander the Great; but they could not manifest their attachment to their mother-city in any other manner, than by receiving the women and children from Tyre, and affording them a refuge in their country. Mean while the Carthaginians looked on the calamities that befell them as occasioned by the wrath of heaven, for some omissions in their worship, particularly in having substituted the children of slaves and poor people, in the room of a certain number of those of the best families, which their superstition required should be sacrificed annually to Saturn; when to avert the anger of that god, they sacrificed two hundred children of the first rank. Besides those who suffered in this horrible carnage, we are informed three hundred persons voluntarily made offer of their lives, to atone for the criminal neglect. Notwithstanding those oblations,

the

the affairs of the Carthaginians became still more desperate. While their enemies pressed them without, Bomilcar, their general, fomented an insurrection in the city, with the view of raising himself to the sovereign power; but being deserted by his party, he suffered a cruel and ignominious death.

The suppression of this rebellion was soon followed by the raising of the siege, in consequence of a misunderstanding between Agathocles and his allies; after which the Carthaginians recovered all the places they had lost, and again established their empire over the African princes.

Sicily, as well as Italy, being threatened with an invasion by Pyrrhus, king of Epirus, the Carthaginians renewed their confederacy with the Romans, for the preservation of their territories in that island. Pyrrhus, notwithstanding this alliance, made a descent with his forces in Sicily, and reduced all the towns belonging to the Carthaginians, except Lilybæum; but this place making a vigorous defence, and the Romans gaining some advantages over his forces in Italy, he was forced to return thither, after abandoning all his conquests in the island.

The alliance between the Carthaginians and the Romans, which had been renewed, subsisted only a short time after this epoch. It is not improbable that the latter, now become the uncontrolled sovereigns of Italy, began to think of enlarging their empire by foreign conquests; and that they had for some years cast their eyes on the fruitful island of Sicily, separated from the continent by a narrow strait. A favourable opportunity fixed their attention on this object. Some Sicilian rebels seizing on the important city of Messina, and offering to deliver it up to the Romans, they accepted the proposal, and immediately sent over a reinforcement of troops to support the insurrection. This incident occasioned the war between the Romans and Carthaginians, usually called the first Punic war, which began four hundred and eighty-eight years after the building of Rome. To this war succeeded two others, the most furious and obstinate that are recorded in history, and in the course of which it was long doubtful whether Rome or Carthage would reign the mistress of the world; till at last, the forces of the latter were totally vanquished, and the city destroyed, in the six hundred and ninth year after the building of Rome, and before the Christian æra a hundred and forty-six years.

According to the description of Carthage by ancient writers, it was situated on three hills in a peninsula, almost surrounded by the sea. It measured in circumference twenty-two miles, and contained two harbours within its works; one for men of war, and the other for merchant vessels. On the isthmus stood the citadel, called Byrsa, defended by a triple wall, and towers at proper distances. The walls were two stories high, built upon arches. In the lower arches, were kept three hundred elephants, with their provisions and warlike accoutrements; and in the upper arches were store houses and stables for four thousand horse, and barracks for twenty thousand foot. When the Romans invested the city, it contained seven hundred

thousand souls; and there was found in it four hundred and seventy thousand pound weight of silver, besides what was plundered by the private soldiers, and buried in the ruins.

The character of the Carthaginians is said to have been strongly tinged with craft, covetousness, and treachery; insomuch that Punic Faith became a proverbial phrase at Rome. It must however be acknowledged, that they had a great genius for navigation and foreign commerce; and the bravery, as well as military skill, which they displayed in the several wars with the Romans, afford evident proof that their capacity was not confined to the arts of peaceful industry alone.

The religion of the Carthaginians appears to have been the same with that of the Canaanites or Phœnicians, from whom they descended. That they worshipped a multitude of deities is obvious from the preamble of a treaty concluded between them and Philip of Macedon, reciting that the compact was made in the presence of Jupiter, Juno, and Apollo; in the presence of the demon or genius of Carthage; in the presence of Hercules, Mars, and Neptune, and all the confederate gods of Carthage; in the presence of the sun, moon, earth, rivers, meadows, &c. The gods which they chiefly invoked, however, were the moon (called Cœlestis, and sometimes Urania) and Saturn, named Moloch in sacred history. To the latter they sacrificed their children, sometimes burning them in a brazen statue of Saturn, heated for that purpose; sounding at the same time drums and trumpets, that the cries of the victims might not be heard. It was considered as a meritorious piece of heroism in their mothers to assist at those sacrifices with dry eyes, and without the least symptom of regret, the offering not being thought acceptable to Saturn, if made with any reluctance. But as the most violent superstition could not perfectly reconcile their minds to the horror of those unnatural rites, they were usually contented with making their children pass through the fire; in which their miserable offspring frequently perished. In great calamities, however, they actually burnt them, choosing for this purpose the most beautiful and noblest youths of the nation; and on those occasions, they have sacrificed children to their deity from morning till night.

The civil constitution of Carthage is now but imperfectly known. The chief magistrates in the commonwealth were the two suffles, said to resemble the Roman consuls, and sometimes styled kings. They were elected annually, but by whom is uncertain. They not only assembled the senate, and presided in it, but had sometimes the supreme command in military as well as civil affairs. At the expiration of their office, they became pretors of course, retaining henceforth the privilege of proposing new laws, and of calling both the judges and the officers of the revenue to an account. The senate consisted of men of the first quality; but whether they held their seats by election or inheritance, or what their number was, it does not appear any farther than that several hundreds enjoyed this dignity. The senate was the last resort in all appeals. Here laws were framed, ambassadors had their audience, and

and resolutions were taken either in respect of peace or war. When the senate could not agree, the matter was brought before the people, or rather their representatives; but by whom the latter were elected, we are not informed.

There was also another body of the state, called the tribunal of one hundred, though it consisted of a hundred and four persons, elected out of the senate. The members of this court were empowered to call their generals to account, whose authority had long been unlimited. Out of the complete number, five formed a kind of secret committee, who acted very arbitrarily; and those had likewise the power to fill up all vacancies that happened in the tribunal.

After the destruction of Carthage, Africa was divided into several provinces by the Romans, who maintained their acquisition till the fifth century, when the Vandals made themselves masters of all the northern parts of this continent, which remained under their dominion upwards of a hundred years. But in the reign of Justinian III. about the year 534, his general Belisarius having defeated the Vandals in several battles, reunited Africa to the Roman empire. It continued subject to the emperors of Constantinople till the year 647, when Osman, the third caliph of the Saracens, made an entire conquest of the coast of Barbary. The country was afterwards divided into many petty kingdoms and principalities, where the Christian religion, which had flourished before the invasion of the Vandals, was totally abolished, and that of Mahomet established in its room. The Turks afterwards subduing the Saracens, erected the four governments of Morocco, Algiers, Tunis, and Tripoli, which exist according to the constitutions that have been described.

Among the most celebrated men whom Africa has produced, are Tertullian, Cyprian, Julius Africanus, Arnobius, Lactantius, Victor Uticensis, and St. Austin,

all bishops of the church. The warriors of greatest fame, were Amilcar, and his three sons, Hannibal, Asdrubal, and Mago; and Terence and Apuleius the only poets whose names have descended to posterity with undisputed applause.

Besides the settlements already mentioned, several others on the coast of Africa are possessed by European powers. The Portuguese hold Cape Palmerino, Cape Lelido, Lebolo, Benguelas or Fort St. Philip. The Dutch have Tortuga, Angra de Negroes, Fort d'Elmina, and ten or twelve more, farther north. The English have a fort at Cape Coast, in 5 degrees of north latitude, and another at Anamaboe, at no great distance from the former; besides Tantumquerry, Winnebah, Accra, Prampram, and Whidah; all which are under the direction of the African Committee. The British government also has Senegal, situated at the mouth of a cognominal river in Negroland, supposed to be the north branch of the Niger, in 16 degrees of north latitude. Here the French built Fort Louis, at the mouth of the river, in 1692. The English took it from them, but it was retaken by the French the same year; and they built Fort St. Joseph, three hundred leagues up the river, on which they erected many other settlements; all which capitulated to Great Britain in 1758, and the possession of them was confirmed by the treaty of peace in 1763. The French hold the small island of Gorée, near Cape Verd, in 14 degrees 30 minutes of north latitude, about a league from the main land. It has a good bay, and is strongly fortified. This place was occupied by the Dutch in 1617; who built upon it Fort Nallau, which was taken by the French in 1677. It remained in the possession of that crown, till 1758, when it was taken by a British squadron; but restored to France by the treaty of Paris.

## OF THE PRINCIPAL ISLANDS ON THE COAST OF AFRICA.

**BEGINNING** our circuit on the south-east coast of this continent, the most considerable island which we meet with is that of Madagascar, or Laurence, situate between 43 and 51 degrees of east longitude, and between 12 and 26 degrees of south latitude. This island is about eight hundred miles in length from north to south, and generally between two and three hundred broad. It is diversified with hills, valleys, and woods, and is well watered with springs and rivers. It abounds in corn, cattle, fish, fowl, and all sorts of animals and vegetables that are found on the continent of Africa. The country is divided amongst a great many petty sovereigns; who making war on each other, sell their prisoners for slaves to the shipping which call here; taking cloaths, utensils, and other necessaries in return. This island was discovered by the Portuguese in 1492; but, though it wants not good harbours, no European nation has hitherto planted any colonies here, it producing no merchandize that will

No. 14.

bear the expence of so long a voyage, except negroes. Besides those, however, there are other inhabitants on the coast, of a tawny complexion, who seem to be descended from the Arabs, as their language and religious rites have a mixture of Mahometanism, Judaism, and Paganism; but they have no mosques or temples, nor any stated worship. European pirates frequently have their stations in the harbours of this island, and were so powerful towards the end of the last century, that five English men of war were sent thither to suppress them.

The Comorro Islands, the number of which is five, lie between the coast of Zanguebar and the north end of Madagascar. That which is the most frequented by Europeans is the island of Johanna, where ships touch for refreshments in their passage to Bombay, and the Malabar Coast. It is about thirty miles long, and fifteen broad, and produces great plenty of black cattle, goats, fowls, rice, potatoes, yams, honey,

R r

wax,

wax, bananas, tamarinds, lemons, oranges, pine-apples, and other fruits. The inhabitants are negroes, and profess the Mahometan religion. They are a plain, hospitable, inoffensive people, little covetous of wealth, and have hardly any idea of war. The women, as in other parts of Africa, cultivate the ground, and perform all laborious works, while the men indulge themselves in ease. The island contains only two small towns, which are built with stone and timber; the other houses being mean cottages scattered over the country. Amongst the superstitious notions of this people, they entertain strange apprehensions of mischief from the devil, whom they burn in effigy once a year. They also avoid, for a considerable time, the place where any person has happened to die; either from a dread of departed spirits, or because they consider the place as polluted. They seem to live under a monarchical form of government, in which women are not excluded from the sovereignty, but so far are the royal personages from assuming any state, that they converse with their subjects in the most familiar manner.

The other islands of Comorro resemble the preceding so nearly in every circumstance, that it is unnecessary to give any account of them.

Maurice, or Mauritius Island is situate in the Indian Ocean, in 56 degrees of east longitude, and 26 of south latitude. It is of an oval form, about thirty-seven miles in circumference, and abounds in woods of various kinds, particularly ebony. This island was discovered by the Portuguese, and afterwards possessed by the Dutch, who found it destitute of inhabitants, and consequently uncultivated, without any other useful animals but deer and goats. They stocked it, however, with cattle and poultry, and introduced almost all the plants of Asia and Europe. Rice, sugar-canes, and tobacco, are also raised here, but in no great quantities; nor does the soil seem favourable for the production either of corn or wine.

The island of Bourbon is situated in 20 degrees south latitude, about forty leagues south-west of Mauritius. It is thirty leagues in circumference, finely diversified not only with hills and valleys, but with wood and water. The soil is generally fruitful, except in one part of the island, which has been burnt up, and rendered barren by a volcano. The Portuguese discovered it in 1545, and stocked it with hogs and goats, as if they had intended to make a settlement, but afterwards relinquished the design. Captain Castleton, an English commander, touched here in the year 1613, and was so much pleased with the beauty of the island, that he gave it the name of the English Forest; but our East India Company did not consider it as an object worthy their regard. The French took possession of it in 1654, and gave it the name of Bourbon; but the few persons they left upon it afterwards came away in an English ship. The French, however, still claim the property, though they visit the island for no other purpose, than that of supplying their vessels, on their voyage to India, with such provisions as it affords.

7

St. Helena is situate in 6 degrees 3 minutes of west longitude, and in 16 degrees of south latitude; lying in the Atlantic Ocean, about three hundred and fifty leagues west of the coast of Africa. It consists of a congeries of rocks, near twenty miles in circumference, and to the windward utterly inaccessible. The natural soil is red, friable, and resembles ashes; from which circumstances, and the existence of sulphur in many of the cliffs, some have conjectured that it has once been the seat of a volcano. The soil is generally thin; but in some of the valleys it is now become near two foot deep, and very fertile. The inhabitants have not hitherto been able to raise wheat, though of late years they have cultivated barley with success. Their gardens produce yams, plantains, bananas, water-melons, French beans, and several kinds of wholesome herbs. The fruits of the island are oranges, lemons, apricots, peaches, pomegranates, and apples. Vines have also been introduced, that yield excellent grapes, but which have not yet been treated successfully in any of the attempts to make wine. Here is a good stock of black cattle, sheep, goats, and hogs, with a breed of spirited little horses, admirably suited to the rugged roads. There is also plenty of domestic fowl, such as turkeys, geese, ducks, &c. with pheasants, partridges, woodcocks, and a number of sea birds. The chief support of the natives, however, is derived from the fish, which are excellent and of various kinds. Here are no beasts or birds of prey, nor any venomous creatures; but the island is exceedingly infested with rats and mice. One of the principal advantages of St. Helena is, that it abounds in excellent water streaming from the rocks, and conveyed in rivulets through every part of the island. After heavy rains, indeed, the water is apt to be a little brackish, occasioned by the salt incrufted on the rocks; but by collecting the water in cisterns when the weather is mildest, this inconvenience is avoided.

The English East India Company settled this island in the last century, for the convenience of affording refreshments to their ships, especially those that are homeward-bound. The most commodious landing-place is in Chapel or James's Valley, where is a little town, consisting of between fifty and sixty houses, which with a small church, and a dwelling for the governor, were built: at the Company's expence with materials sent from England about four and twenty years ago. Most of the houses are used as places of public entertainment when the shipping arrive. In the other parts of the island the houses are generally situated in little valleys between the cliffs; and the number of families is computed to be about a hundred and fifty. All the landing-places are secured by batteries of heavy cannon, and in James's Valley is a strong fort, usually garrisoned by about three hundred men.

Ascension Island is situate in 8 degrees of south latitude, two hundred leagues north-west of St. Helena, and is about ten leagues in circumference. It is almost entirely destitute of vegetable produce; but the European vessels usually call here in their way from

India,

+ The 18<sup>th</sup> of October 1815, there was landed  
on the Island a most venomous and furious Beast,  
but too well known by the name of Napoleon.

India, to refresh themſelves with turtle, which they find on the ſhore in great plenty.

The Iſland of St. Matthew is ſituate in 2 degrees of ſouth latitude, a hundred leagues north-eaſt of Aſcenſion, and is about eight leagues in circumference. This iſland was diſcovered by the Portugueſe, who occupied it for ſome time; but afterwards withdrawing their colony, the place has ever ſince been uninhabited; and contains nothing that can invite navigators, except a ſmall lake of freſh water.

Annobon is likewiſe ſituate in 2 degrees of ſouth latitude, two hundred miles weſtward of Congo, and is nearly ten leagues in circumference. It is generally mountainous, and abounds in cattle, hogs, poultry, oranges, cocoa-nuts, and other tropical fruits, with Indian corn and rice. Moſt of the inhabitants are negroes, who either have been imported, or are the deſcendants of others formerly brought from the continent of Africa. The Portugueſe diſcovered this iſland in 1571, and have ſince continued to poſſeſs it. There is a convenient road for ſhips on the lee-ſide of the iſland.

The Iſland of St. Thomas is ſituate under the equator, in 8 degrees of eaſt longitude. It is of a round figure, about forty leagues in circumference, and was diſcovered by the Portugueſe in the ſame year with the preceding. It is well ſupplied with wood and water, and in the middle is a high mountain, the top of which is almoſt conſtantly covered with clouds. The heat and moiſture of the air render it extremely unhealthful to northern conſtitutions; but the Portugueſe, with the negroes and mulattoes, who inhabit it, are ſaid to live to a great age. Here is plenty of corn, rice, and fruits, with a good deal of ſugar-cane; and the Portugueſe have alſo introduced the cinnamon-tree. The chief town on the iſland is called St. Thomas, containing five or ſix hundred houſes, and is the ſee of a biſhop.

Princes Iſland is ſituate in 2 degrees of north latitude, about forty leagues north-eaſt of St. Thomas, and as much to the weſtward of the continent of Africa. It abounds rice, Indian corn, fruits, roots, and herbs. Cattle, hogs, and goats, are alſo in great plenty; but the chief commodity is ſugar-canes.

The Iſland of Fernando Po is ſituate 3 degrees 30 minutes of north latitude, ten leagues to the weſtward of the continent. It is about thirty miles long and twenty broad; inhabited by the ſame ſort of people, and producing the ſame commodities with the two iſlands laſt mentioned. The Dutch finding them conveniently ſituated for trade, and affording plenty of proviſions, twice attempted to drive the Portugueſe from St. Thomas, and at laſt ſucceeded in the enterprize. But almoſt all their men dying, they abandoned their conqueſt, and the Portugueſe have ſince remained in the peaceable poſſeſſion of thoſe iſlands; at one or other of which they uſually call for reſreſhments in their voyages to and from India, and in their paſſage from Brazil to Africa.

The Cape Verd Iſlands are ſituate between 23 and 27 degrees of weſt longitude, and between 13 and 19

degrees of north latitude. The number of them is ten, lying about four hundred miles weſt of Cape Verd in Africa, and ſubject to Portugal.

The Canary Iſlands, conſiſting of ſeven, are ſituate between 12 and 21 degrees of weſt longitude, and between 27 and 29 degrees of north latitude, in the Atlantic Ocean; the moſt eaſterly of them being about a hundred and fifty miles from Cape Non, on the coaſt of Biledulgerid. They were formerly called the Fortunate Iſlands, not only on account of the fertility of the ſoil, but the temperature of the air, which, notwithstanding the natural warmth of the climate, is conſtantly reſreſhed by cool breezes from the ſea. They had been diſcovered by the Carthaginians, but were afterwards unknown for many ages, till again diſcovered by the Spaniards, in 1405.

Ferro, the moſt weſterly, is about ſeven leagues in circumference. This iſland is generally mountainous; but there are ſeveral valleys abounding in paſture, corn, a variety of fruits, and ſugar-canes. It is however deſtitute both of ſprings and rivers, and the inhabitants are obliged either to bring their freſh water from the neighbouring iſlands, or preſerve it in ciſterns at the time of the rains. After the diſcovery of this iſland, it was made the firſt meridian by moſt nations, till they choſe to begin their computation from their reſpective capitals.

Palma is nearly of the ſame extent as Ferro, from which it is diſtant between thirty and forty miles north, and affords the excellent kind of wine uſually called Palm ſack.

Gomera, which is ſituated about thirty miles eaſt of Ferro, abounds in corn and fruit, but has not much wine.

Sixty miles eaſt of Ferro, lies Teneriff, computed to be in circumference a hundred and twenty miles. This iſland likewiſe abounds in corn, wine, and fruit; but ſome parts of it are rocky and mountainous. The Peak of Teneriff is eſteemed one of the higheſt mountains in the world. It is about two miles perpendicular height; riſing in the form of a ſugar-loaf, and may be ſeen at ſea more than a hundred miles diſtance. Some Engliſh gentlemen who had the curioſity to viſit this amazing mountain, inform us, that having ſet out from Oratavia, one of the principal towns in the iſland, they paſſed over ſeveral rugged hills and ſandy plains in their way to the foot of the Peak; where they found huge maſſes of rock, that ſeem to have tumbled down from the ſummit. When they had aſcended the mountain about a mile, they were obliged to quit their horſes, and climb up the hill on foot; and having traſverſed a ſteep black rock about a mile, they reached the top of it, which was perfectly flat. The air here was ſo cold, that they found it neceſſary to keep great fires all night. Next morning they proceeded to that part of the mountain called the Sugar-Loaf, which is exceeding ſteep; and the ſoil being a deep ſand, it was difficult to paſs over. On reaching near the top of the Peak, the wind was very high, and their faces were ſcorched by the conſtant breathing of a hot ſulphurous vapour which iſſued from the hill. The top of the Peak

was occupied by a large basin, or crater, above a musket-shot over, and four yards deep; the brim, on which they stood, being not above a yard broad. In this cavity were small loose stones, mixed with sulphur and sand, which sent out a hot suffocating steam. About two thirds of the way up the mountain there was a great deal of snow and ice, but none on the top; which they ascribed to the heat that issued from the crater. From the top to the foot of the mountain, they found neither shrubs nor trees, except a few pines. There is reason to conclude that this mountain has once been a volcano. For three or four miles round the bottom, the ground is almost covered with calcined rocks; and from the Peak to the south-west, almost as far as the shore, are seen the tracks of the lava, or the brimstone and melted ore that ran that way. Some of the calcined rocks resemble iron-ore; and towards the south-west are high mountains of a bluish earth, with stones which are covered with a yellow rust. There are also several streams of water, evidently impregnated with vitriol. In 1704, there happened in this island an eruption of some volcanos, accompanied with a most terrible earthquake, by which whole towns were swallowed up, and many thousands of the inhabitants perished.

The principal town of this island is St. Christopher's, the seat of the viceroy. It stands partly on the side of a hill, partly on a plain, and has two parish churches, with several convents, hospitals, and chapels. The houses of people of condition have large gardens and orchards of palms, citrons, and other fruits; and the adjacent country abounds with vineyards.

The island called the Grand Canary, or Canary Proper, lies about thirteen or fourteen leagues south-east of Teneriff, in 15 degrees 50 minutes of west longitude, and between 27 and 28 degrees of north latitude. It is about fifty leagues in circumference, and is a more level and fruitful country than the preceding. The chief town, called Palma, and by some Canaria, is situated in the north part of the island, at a little distance from the sea. It is a large, clean, pleasant town, and enjoys a serene, temperate air; being likewise the residence of the governor, and the see of a bishop. Here is a beautiful cathedral, richly adorned, besides several other churches and convents. The country abounds in corn, wine, fruits, cattle, game, fish, fowl, and fine pastures. The fields also afford a great variety of flowers, and the groves echo with the music of those birds, called from this island the Canary birds.

Fortaventura, or the Island of Good Fortune, is situated between the Grand Canary and the continent of Africa; and is sixty-five miles in length, but of a very irregular breadth. This island affords little or no wine, but abounds in corn, fruits, cattle, fish, and fowl; and chiefly in goats, which is the principal food of the inhabitants.

Lenceroa lies a little to the northward of Fortaventura, to which it is similar in respect of its produce, but much inferior in size.

On the discovery of those islands, about the year 1405, the king of Castile granted the property of three of them to John de Betancour, a French gentleman in his service, who resided there during the remainder of his life, as sovereign of the Canaries. But the posterity of Betancour resigning them to the crown of Castile, all the Canary Islands have since continued in the possession of the Spaniards. The rich wines in which they abound are the principal article of exportation; and of those, it is computed, ten thousand hogheads are annually sent to Britain in time of peace.

About a hundred leagues west of Morocco, in the Atlantic Ocean, lie the Madeiras, consisting of several small islands, the chief of which is Madeira Proper, situate in 18 degrees of west longitude; and between 32 and 33 degrees of north latitude. This island, which has the appearance of having been produced by subterraneous fire, in some remote period, is about a hundred and twenty miles in circumference, and nearly of a triangular shape. It is said to have been discovered by an English gentleman in 1344, and conquered by the Portuguese in 1432. The woods being burnt down, and the soil made fruitful by the ashes, it was afterwards planted with vines, which hitherto continue to be the chief produce of the island.

The country is agreeably diversified with little hills and valleys, which are watered by many small rivulets. The chief town is Funchal, situated on a bay of the sea on the south-east part of the island. It is the residence of a bishop, and has a cathedral, with three parish-churches, besides several chapels and convents in the city, which is the residence of the governor. This island produces incredible quantities of wine, which has the peculiar good quality; that it keeps best in the warmest weather, and the hottest climates, where other wines turn sour. The adjacent islands are small, and produce little wine; but are subject, as well as the principal one, to the crown of Portugal.

**Q**UITTING Africa, we pass over into Europe, another of the four great divisions of the terraqueous globe; a quarter distinguished not only by the temperature of its climates in general, but by the civilised state of the inhabitants, whose progress in the cultivation of the arts and sciences is unexampled in the history of mankind. Europe is bounded on the south by the Mediterranean Sea; on the west by the Atlantic Ocean; on the north by the Frozen Ocean, part of the Atlantic; and on the East by Asia, from which it is separated by the Archipelago, or Egean Sea; the Strait of the Hellespont, or Dardanelles; the Propontis, or Sea of Marmora; the Euxine, or Black Sea; the Palus Mæotis, or Sea of Afoph; the river Don or Tanais, and a line

drawn thence to the river Tobol, that joins the rivers Irtis and Oby, the united streams of which fall into the Frozen Ocean, between Europe and Asiatic Turkey. The continent of this quarter is situate between 10 degrees of west, and 65 degrees of east longitude; and between 36 and 72 degrees of north latitude; being three thousand miles in length, and two thousand five hundred in breadth. It contains the following countries, viz. Turkey in Europe, the dominions of Hungary and Bohemia, Germany, Poland, Russia, Sweden, Denmark and Norway, the Netherlands, France, Switzerland, Italy, Spain, Portugal, Great Britain, and other islands. We begin with Turkey in Europe.

## T U R K Y I N E U R O P E.

## C H A P. I.

*Of the situation—mountains—rivers—Crim Tartary—Little Tartary—Budziac Tartary—persons, dress, manner of life, and government of the Tartars.*

**T**URKY in Europe is situate between 17 and 40 degrees of east longitude, and between 34 and 49 degrees of north latitude, being about a thousand miles in length, and nine hundred in breadth. It is bounded on the north by Russia, Poland, and Sclavonia; on the east by Circassia, the Black Sea, the Propontis, Hellespont, and Archipelago; on the south by the Mediterranean; and on the west by the same sea, and the Venetian and Austrian territories. It includes the provinces of Romania, Bulgaria, Servia, Bosnia, Ragusa, Wallachia, Moldavia, Bessarabia, Budziac and Oczakow Tartary, Crim and Little Tartary, Albania, Epirus, Macedonia, Thessaly, and all the ancient Greece, with its numerous islands in the Archipelago.

The chief mountains are, 1. The Iron-gate mountains, which in part divide the Turkish provinces of Moldavia and Wallachia from Transilvania. 2. The mountains of Rhodope or Argentum, anciently sacred to Mars, because reputed to be the place of his nativity. They run almost from the Gulph of Venice

No. 14.

to the Euxine Sea, dividing Romania from Servia. 3. Mount Athos, now called Monte Santo, a promontory abutting on the Archipelago, or Egean Sea, so high that, according to Thucydides and Virgil, it throws its shadow into the island of Lemnos, forty-five miles to the east of it. 4. Chimera, a mountain in Albania. 5. The celebrated Parnassus and Helicon in Achaia, now Livadia: Pelion and Ossa in Attica.

The principal rivers are, 1. The Nieper, or Boristhenes, which rises in the middle of Muscovy, runs west by Smolensko, then running south through Poland, passes by Mohilow, beyond which it enters the Russian Ukrain, passing by Kiof and Circassia, and continues its course south-east, separating Little Tartary from Budziac Tartary, and falling into the Black Sea, near Oczakow. On this river the old Cossacs inhabit, who frequently cross the Black Sea, and plunder the maritime places on the coast of Turkey: 2. Bog, a river of Poland, which runs south-east through the province of Podolia and Budziac Tartary, falling into the Euxine Sea, between Oczakow and the mouth of the Nieper. 3. Niefter, which rises near Lemburg in Poland, and running south-east, divides Podolia in Poland from Moldavia in Turkey; and afterwards separating Bessarabia from Budziac Tartary, falls into the Black Sea near Belgorod. 4. Pruth, a river that has its source in the province

S 2

of

of Red Russia in Poland, and running south-east through Moldavia, discharges itself into the Danube.

5. Danube. This river, which is one of the finest in Europe, rises in the Black Forest in the province of Suabia, in the south-west of Germany: running north-east through Suabia, it visits Ulm, the capital; whence directing its course eastward, it runs through Bavaria and Austria, passing by Ratibon, Passau, Enz, and Vienna; then entering Hungary, it runs south-east from Presburg to Buda, and thence to Belgrade; after which it divides Bulgaria from Walachia and Moldavia, and discharges itself by several channels into the Black Sea, through the province of Bessarabia. It is so deep between Buda and Belgrade, that the neighbouring powers frequently have fleets of men of war upon it; but below the latter, the cataracts render it unnavigable to the Black Sea; and it is also obstructed by several cataracts above Buda.

6. Save, a river which rising in Carinthia, runs eastward through Carniola and Croatia, and continuing its course south-east, forms the boundary between Slavonia and Turkey, discharging itself into the Danube at Belgrade.

7. Aluta, which rising in the province of Transylvania, runs south, and forms part of the boundary between Christendom and Turkey; after which, continuing its course in the same direction through Walachia, it discharges itself into the Danube, almost opposite to Nicopolis.

8. Unna, a river of Bosnia, which running from south to north through that province, and afterwards rolling eastward between Croatia and Bosnia, falls into the Save, and forms likewise part of the boundary between Christendom and Turkey.

9. Drino, which running through Albania, falls into the Gulph of Venice.

10. Morava, a river that rising in the mountain of Rhodope or Argentum, runs north through Servia, by Nissa, and falls into the Danube at Semendria, to the eastward of Belgrade.

11. Mariza, which emerging in Bulgaria, runs south, passing by Adrianople, and falls into the Archipelago near the Dardanelles.

Crim Tartary, the ancient Taurica Chersonesus, is a peninsula lying on the north part of the Black Sea, by which it is bounded on every side, except where a narrow isthmus joins it to the continent on the north. It is situate between 33 and 37 degrees of east longitude, and between 44 and 46 degrees of north latitude.

The chief towns of this province are Bachasraï, the capital, and Kassa; the latter of which is situated in the north-east part of the peninsula, in 37 degrees of east longitude, and 44 degrees 55 minutes north latitude. It has a brisk foreign trade, and is the best built town in the country, having been many years subject to the Genoese. The Christian churches are mostly converted into mosques, or sold by the Turks to the Greek and Armenian Christians. This town gives name to the straits which lead to the Palus Mæotis.

Little Tartary is situated north of Crim Tartary, between 34 and 40 degrees of east longitude, and between 46 and 48 degrees of north latitude. It is bounded on the north by Russia, on the east by the

Palus Mæotis and the river Don, on the south by the Black Sea, and on the west by the river Nieper or Boristhenes.

The town of Precop, called by the natives Hor Capi, stands on the isthmus which unites Crim to Little Tartary. It is a wretched poor place, consisting of Tartar huts. The natives have here cast up an entrenchment across the isthmus, to defend them against the Russians; but notwithstanding this obstacle, the Russians, in the years 1738 and 1739, made two hostile irruptions into the country, which they plundered of all that they could remove.

Budziac Tartary is situated between Russia on the north; the river Nieper, which separates it from Little Tartary on the east; the Euxine or Black Sea on the south; and on the west by the river Niefter, which divides it from Bessarabia. The chief towns are Zenna and Oczakow. The latter is a sea-port, situated on the Euxine Sea, to the westward of the rivers Nieper and Bog, in 35 degrees of east longitude, and 46 degrees of north latitude.

The inhabitants of those countries are of a short square make, with their noses and faces flat. They have generally tawny complexions, and their eyes lie remarkably deep, but are very piercing. The cloaths of the common people are made of sheep-skins with the wool on; but their chiefs are clothed in furs; girt about them with a leathern girdle. The dresses of the women differs not much from that of the men, only their vests are longer, and they wear drawers which reach down to the heels. Their heads are covered with a handkerchief, and their hair hangs down upon their shoulders.

The Tartars, like the Scythians their ancestors, lead a wandering life; removing their families from place to place, in waggons, as they are prompted either by novelty, or a change of pasture for their cattle. When they fix for a considerable time, they erect mean huts of wood and turf. They seldom apply themselves to husbandry, eating very little bread; and prefer horse-flesh to all other food. They are very hospitable, and will not suffer a traveller to pay any thing for the subsistence either of himself or his horse, but they thankfully receive a small present of tobacco or spirits in return. Being of the Mahometan religion, they are allowed as many wives as the Turks, and the chief men among them have numbers of women and eunuchs in their families; but persons of inferior rank usually confine themselves to one woman.

The Tartars are governed by a cham, who is properly no more than the viceroy of the grand seignior, on whom he is entirely dependent. When the Ottoman emperor is at war, the cham is obliged to join his army with a hundred thousand troops, who are allowed no pay, but subsist by the plunder which they make in their incursions into the enemy's country. Upon the first advice they receive of a war designed against the Christians, they prepare for the field with great alacrity, and repeat a short prayer for the success of their expedition, particularly requesting, that they may take great numbers of slaves, beautiful girls and

boys,

boys, with wives newly courted, bags of flour, and mares for the use to bring him in owner in animal.

boys, with other booty; to all which petitions, their wives never fail to say amen. When they have accoutred themselves in their armour, and provided their bags of flour, they immediately mount their horses, and march to the place of rendezvous. Every person for the most part takes with him two or three horses, to bring home his slaves and plunder, or to remount him in case of necessity. If any horse dies, the owner invites his friends to feast on the flesh of the animal.

When the cham joins the Turkish army, it is usual for the commander of the latter to order some hundreds of oxen, and several thousand sheep, to be roasted for the entertainment of the Tartars; but this is the only meal with which they are treated during the whole campaign. Till such time as they can supply themselves with food by depredations on the enemy, they live upon their own talcan or bag of flour, which they carry with them, fastened behind their saddles; mixing it occasionally with mare's milk, or, if that cannot be procured, with water. To this some of them add cheese, or horse-flesh dried in the sun. The subsistence of their horses is not more expensive, or difficult to procure. In the winter, they will scratch deep in the snow, to come at the herbage underneath; and in want of other food, will eat the tender twigs of trees, or even the bark.

#### C H A P. II.

*Of the provinces of Bessarabia—Moldavia—Walachia—Bulgaria—Servia—Bonia—Dalmatia—Romania—Macedonia—Albania—Epirus—Thessaly.*

**T**HE province of Bessarabia is situated on the west side of the Euxine sea, on the mouths of the Danube, being bounded on the south by this river, and on the north by that of the Niefter. The chief towns are Belgorod, situate on the Black Sea, near the mouth of the Niefter, in 31 degrees of east longitude, and 46 degrees 30 minutes of north latitude; Bend, which stands on the same river, about a hundred miles north-west of the preceding. In their persons, and way of life, the inhabitants of this province nearly resemble the Tartars.

The province of Moldavia is situate between 25 and 29 degrees of east longitude, and between 45 and 48 degrees of north latitude. It is bounded on the east by Bessarabia; on the north-east by the river Niefter, which divides it from Poland; on the west by Walachia and Transilvania; and on the south by the Danube, which separates it from Bulgaria. It is two hundred and forty miles long, and a hundred and fifty broad. The soil is fruitful, and the country abounds in corn, wine, rich pastures, a good breed of horses, oxen and sheep, venison, game, fish, and fowl, with all sorts of European fruits. The inhabitants are Christians of the Greek church, and have been tributary to the Turks since the year 1574. The grand seignior appoints a prince to rule over them, who is usually a native of the province; the interest of which, however, he is constantly ready to

sacrifice to the will of his sovereign, by whom he is delegated to serve as an instrument of oppression. Besides the yearly tribute paid to the sultan, which is very large, they are obliged to raise a great body of troops at their own expence, when his forces take the field.

The chief towns of this province are, Jazy, the capital, situate on the river Pruth, in 28 degrees of east longitude, and 47 degrees 15 minutes north latitude; and Chotzin, situate near the frontiers of Poland, on the river Niefter.

Walachia is situate between 23 and 26 degrees of east longitude, and between 43 and 46 degrees of north latitude. It is bounded on the north-east by Moldavia; on the north-west by the Iron-gate mountains, which separate it from Transilvania; on the south-west by the Danube, which separates it from the province of Servia; and on the south-east by the same river, which divides it from Bulgaria. It is two hundred miles long, and a hundred broad. The air, as in the adjacent provinces, is temperate, and the soil fertile; producing excellent corn, wine, oil, pasture, and all kinds of European fruits, with great numbers of sheep and oxen, and a valuable breed of horses.

The chief towns are, Tergowisco, or Tarvis, the capital, situate on the river Laniza, sixty miles north of the Danube; and Buchorest, which stands on the river Dombrowecen.

The constitution of this province is the same as that of Moldavia, being governed by a native, appointed by the grand seignior, and for the most part exceedingly rapacious. The only privilege enjoyed by the inhabitants is the free exercise of their religion, which is the Christian, of the Greek communion; and to this toleration probably it is owing, that they have never revolted from the Ottoman power, and put themselves under the protection of the Austrian princes.

Bulgaria is bounded on the north by the Danube; on the east by the Black Sea; on the south by mount Hæmus or Argentinum, which separates it from Romania; and on the west by Servia. In length from east to west, it is about four hundred miles, and upwards of a hundred in breadth. This is a mountainous province, but has some fruitful valleys, which afford good crops of corn and pasture. The inhabitants are generally husbandmen, and Christians of the Greek communion, who would enjoy the fruits of their labour in tranquillity, were they not much annoyed by robbers, that possess the inaccessible parts of the mountains. The chief towns are, 1. Sophia, situate on the river Ischar, a hundred miles south of the Danube. It stands in a plain between two high mountains, on one of which the snow lies during the greater part of the summer; yet several hot baths are in the valley. It is an open town, without walls or fortifications; and was anciently called Særdica, where one of the general councils was held. 2. Silistria, or Dorestro, a large town situated on the same river, seventy miles north of Sophia. 3. Nicopolis, situated at the confluence of the rivers Danube and Ischar. This town was built by Trajan, in memory of his victory

victory over Decebalus, king of the Dacians; and here Sigismund, king of Hungary, was defeated by Bajazet, emperor of the Turks.

Servia, anciently called Mysia Superior, is bounded on the east by Bulgaria; on the south by Macedonia; on the west by Bosnia; and on the north by the rivers Save and Danube. The capital of this province is Belgrade, situated at the confluence of the Danube and the Save, in 21 degrees 2 minutes of east longitude, and 45 degrees 10 minutes of north latitude, three hundred and forty-three miles south-east of Vienna. This was lately a large beautiful city, defended by one of the strongest castles in Europe, and inhabited by Christians. It has often been the object of contending nations. It was taken by prince Eugene of Savoy, in 1717, and remained in the possession of the Austrians till 1739, when it was restored to the Turks, in whose hands it has continued ever since, with the whole province of Servia.

Other towns of note are, 1. Semandria, situated on the Danube, thirty miles south-east of Belgrade, once the capital of the province, but now in a ruinous condition. 2. Widin, or Vidin, lying on the river Danube, a hundred and twenty miles south-east of Belgrade; a town frequently taken and retaken by the Christians and Turks, but now in possession of the latter. 3. Nissa, situated on the river Morava, a hundred and thirty miles south-east of Belgrade, formerly possessed by the Imperialists, but yielded to the Turks, with the whole province of Servia, about thirty years ago. 4. Scopia, or Uscopia, likewise situated on the river Morava, near the foot of mount Rhodope, seventy miles south of Nissa; a populous city, and has a flourishing commerce.

The province of Servia is beautifully diversified with mountains and valleys, woods and open fields. The soil is fruitful, and, where cultivated, produces corn and wine; but being a frontier province, possessed alternately by the Imperialists and Turks, it is neither populous, nor well improved.

The province of Bosnia, part of the ancient Illyricum, is bounded on the east by Servia; on the south by Dalmatia; on the west by Croatia; and on the north by the river Save, which separates it from Slavonia. The chief town is Bofna Seraio, situated on the frontiers of Turkey, in 19 degrees of east longitude, and 45 degrees of north latitude, a hundred and twenty miles west of Belgrade.

The province of Dalmatia is bounded on the north by Bosnia; on the east by Servia; on the south by Albania; and on the west by the Adriatic Sea, or Gulph of Venice. The greatest part of this country is in the possession of the Turks; but the Venetians have several considerable towns on the sea-coast. The chief Turkish towns are, 1. Trebigna, situate near the Gulph of Venice, in 19 degrees of east longitude, and 42 degrees 40 minutes of north latitude; sixty miles south-east of Spalatro. 2. Narenza, situate on a bay of the Adriatic Sea, twenty-five miles north of Ragusa. 3. Antivari, a port-town, standing on a rock in the Gulph of Venice, ten miles west of Dulcigno.

This province, as well as the preceding, was part of the ancient Illyricum. The country is mountainous, but generally fruitful, and produces a considerable quantity of corn, wine, and oil.

The town of Zara was formerly the metropolis of Liburnia, or the great peninsula which runs into the sea; but is at present the capital of a more extensive province. The buildings are said to be elegant, and the inhabitants as much civilized as in any of the cities of Italy. It is confirmed by the latest travellers, that the sea is constantly gaining ground on the coast of this country; as appears from the pavements of streets observed under water, as well as from some noble fabricks discovered a few years since, in cleaning the harbour of Zara.

Of the city of Nona hardly any vestiges remain; but at San Filippo and Giacomo, may be seen the ruins of an aqueduct, either built or repaired by the emperor Trajan.

Vestiges yet remain of the walls of Asseria, the circumference of which is clearly distinguishable above ground, and measures three thousand six hundred Roman foot. They form an oblong polygon, and are built with common Dalmatian marble. The thickness is generally about eight foot, but in one of the extremities eleven. The height in some parts is thirty foot.

Near the river Kerka, the Titius of the ancients, at Suppliacerqua, are seen some old arches, supposed to have belonged to the city of Burnum, otherwise called Liburna.

In the district of Trau, which was anciently distinguished for the excellence of its marble, the most remarkable object is the pissaphaltum, or pitch that drops from a rock.

No vestiges remain of the city of Spalatro; but three miles hence lie the ruins of the ancient Epitium. The place is now called Stobrez. Near the road hither by land from Salona, are several arches of Dioclesian's aqueduct, vulgarly called *Ponte secco*, and above it is an insulated mass called *Kamen*, i. e. the stone, by way of excellence, where in former times a small fort has stood, as appears from the vestiges of the walls.

The situation of Epetium was extremely beautiful. The city stood on the sea-side, but on a plain much above the level of the water. The vestiges of its walls are still distinguishable on the banks of the small harbour of Stobrez, and appear to have been built of solid materials, but without that nice connection which is admired in the Roman fabricks. A subterraneous passage, the mouth of which remains in its primitive state, extending far under the ruins of the city, seems to have served in ancient times for an outlet to the waters. Near the parochial church, which is a quarter of a mile from the shore, appear the foundations of a tower, which flanked Epetium on that side; and the church is built on those old foundations.

On an eminence near the river Cettina, the Tiliurus of the ancients, stood the city of Equum, where vestiges of the amphitheatre are yet to be seen. The canals are still visible which served to convey the

mines of ne by th shore No

water into its area, and they were cut out of the solid rock.

From Trigl to Duare, the Cettina precipitates from rock to rock in a very romantic manner, and about a mile from the place last mentioned, forms a magnificent cascade. The vultures of those parts, near the mouth of this river, are dreadful animals, measuring above twelve foot from the tip of one wing to the other. They frequently carry away lambs, sometimes sheep, and even the children of the shepherds.

In the district called the Primorie, which is the Paratalassia of the ancients, the only town at present is Macaroca, supposed to have risen out of the ruins of the ancient Rataneum, or Retinum.

The Morlacks, a part of the inhabitants of Dalmatia, have several customs distinct from those of the other natives of the province. The obligations of friendship, among them are particularly revered. They have even made it a kind of religious point, and tie the sacred bond at the foot of the altar. The Sclavonian ritual contains a particular benediction for the solemn union of two male or two female friends, in the presence of the congregation. The male friends thus united are called *probati*, and the females *posajstrene*, which signify half brothers, and half-sisters.

The Morlacks, whether of the Roman or Greek church, have very singular ideas about religion; and the ignorance of their teachers daily augments this evil. They are firmly persuaded of the reality of fairies, nocturnal apparitions, witches, and enchantments.

When a Morlack husband mentions his wife, he always premises, by your leave, or begging your pardon; and when the husband has a bedstead the wife must sleep on the floor.

The infants here are allowed to suck their mother's milk while she has any, or till she is with child again; and though this should not happen for six years, they continue all the time to receive nourishment from the breast. The breasts of the Morlachian women are in general so large, that they can give the teat to their children over their shoulders, or under their arms.

Romania, the ancient Thrace, is bounded on the east by the Black Sea, the Bosphorus, and Propontis; on the north by the mountains of Rhodope and Argentum; on the west by Macedonia; and on the south by the Archipelago. It is about three hundred miles long, and a hundred and fifty broad.

The capital of this province, and of the Turkish empire, is Constantinople, anciently called Byzantium, but at present Stramboul by the people of that nation, and by others the Port, on account of its harbour being the finest of any in Europe. This city, which stands on the western shore of the Bosphorus, was rebuilt by the emperor Constantine, in the fourth century, who transferred hither the seat of the Roman government. Upon his death it obtained the name of Constantinople. It is situate in 29 degrees 20 minutes of east longitude, and in 41 degrees 4 minutes of north latitude. It is of a triangular shape, washed by the sea on two sides, and rising gradually from the shore, in the form of an amphitheatre. The view of

No. 14.

it from the harbour is confessedly the finest in the world, exhibiting a multitude of magnificent mosques or temples, with their domes and minarets, and the seraglio, intermixed with gardens and groves of evergreens. The expectations excited by this prospect, however, are disappointed on entering the city, where we find the streets narrow, the houses of the common people low, and built of boards, and the palaces of the great men concealed by high walls before them. The city is surrounded by a wall about twelve miles in circumference, and the suburbs are very extensive.

The royal palace or seraglio is built upon a point of the triangle, which runs out between the Propontis and the harbour, and consists of a number of apartments richly furnished, but not very commodious; many of them being detached, and at a distance from the body of the palace. The principal gate is guarded by fifty capigi or porters, and the second by the same number; who all wear high stiffened caps, but no other arms than a little staff. In the first court of the palace is an hospital, and the mint for coining money. In the second is the divan, or the supreme court of justice; with the treasury, about which runs a piazza; and in the middle of the court are fountains, surrounded by trees. Those two courts are open to the public; but no strangers are admitted beyond the second, except ambassadors with their retinues, when they come to an audience.

Of the mosques or temples, seven are exceedingly magnificent, called the royal mosques, which are surrounded by spacious areas at a distance from other buildings. The principal is that of Sophia, standing opposite to the great gate of the seraglio, upon an eminence gently declining to the sea-shore. This fabric was originally a Christian church, built by the emperor Justin, and beautified by Justinian. It is of a square figure without, three hundred and forty foot long, and two hundred and forty broad; but within, its form is circular. In the front is a portico, supported by marble columns; and part of the temple is covered by a grand cupola, thirty-six yards in diameter, sustained by four stately pillars eight fathoms in thickness. In this mosque, which receives light from twenty-four windows, there are upwards of a hundred columns, of the most curious marble, some of them porphyry and Egyptian granite; with which the whole building is likewise lined.

Besides this mosque, there are several others not much inferior in magnificence; amongst which the most remarkable are, that built by the emperor Solyman; the Validia, founded by the mother of Mahomet IV. and the new mosque built by sultan Achmet. The mosques have usually hospitals, and endowed schools, belonging to each of them. Within side those temples, the only ornaments are branches for candles, ivory balls, and large crystal globes, no painting or imagery being permitted. The floors are covered with carpets, and in each is a marble pulpit, from which the mollahs sometimes preach to the people.

Here are also several magnificent bagnios and caravanferas. The latter usually consist of spacious stone

T t build-

buildings, of a square figure, encompassing large courts, about which runs a cloyster or piazza, and a gallery over it. In some of those places, travellers are provided with a mattress and quilts to lie on, and have their entertainment gratis, at the public expence; but this is seldom accepted. Travellers usually buy their provision in the market, and dress it themselves, or send for meat dressed from the cooks shops, where they meet with it at a very reasonable price.

The Atmeidan, where horse-races were anciently run, is still used in a similar manner; for here the Turks throw the gerit or dart, riding full speed at the mark. This square retains its former dimensions, being yet four hundred paces long, and a hundred broad; but it is now destitute of the fine statues and obelisks with which it was once adorned. One grand obelisk, however, consisting of a single piece of granite marble, fifty foot high, yet remains entire, enriched with hieroglyphics which are now unintelligible. It appears from some Greek inscriptions that this pillar was thrown down by an earthquake, and after lying on the ground a considerable time, was again erected by the emperor Theodosius. This is almost the only monument of antiquity that remains entire; but fragments may yet be seen of some other pillars and obelisks.

The baskin, or exchange, where all merchandize is sold, is a very magnificent building. No tradesmens shops are in any other part of the town; nor any markets but the bazars, where provisions are exposed to sale.

In the markets for live cattle, slaves of all ages and both sexes are publicly sold, who are generally Christians. Amongst the most beautiful girls thus exposed, the Turks frequently recruit their harems, employing old women to examine, whether those whom they are inclined to purchase retain their virginity.

The suburbs of Constantinople in extent exceed greatly that of the city. The principal of those, called Galata, is on the other side of the harbour, opposite to the seraglio. The houses here are better built than those within the walls of the city, and are inhabited chiefly by foreigners, who enjoy their freedom, both in regard to their religion and other customs. Another suburb is called Cassumpasha, where are many docks, for building and repairing ships and galleys. A third suburb, near Galata, on the Asiatic side of the Bosphorus is Pera, where the ambassadors and ministers of foreign princes reside; and here are the best buildings belonging to Constantinople. The town of Scutari, likewise separated from the city by the Bosphorus, which is upwards of a mile in breadth, is usually reckoned another suburb. This is a large populous place, whither the merchants of Persia and other eastern countries resort. The sultan has here another seraglio, to which he frequently retires with his ladies.

The second city of the empire stands likewise in the province of Romania. This is Adrianople, situate in 26 degrees 27 minutes of east longitude, and in 42 degrees of north latitude, in a fine plain on the river Mariza, about a hundred and fifty miles north-west

of Constantinople. The ancient name of this city was Orestes; but being destroyed by an earthquake, it was rebuilt by the emperor Adrian, from whom it has since been denominated. It is about eight miles in circumference, and contains several grand mosques; but the private houses are built in the same mean style with those of the metropolis. The pleasantries of the place occasions it to be often visited by the grand seignior, who has here a seraglio equal in beauty, though not in extent, to that of Constantinople. This city was taken by the Turks in 1362, and became the seat of their empire, before they made a conquest of Constantinople.

The next considerable town in Romania is Philippoli, so named from king Philip, the father of Alexander the Great. It is situate in an extensive plain on the river Meriza, in 25 degrees of east longitude, and 42 degrees 20 minutes of north latitude, two hundred miles north-west of Constantinople; inhabited chiefly by Christians of the Greek communion, and is the see of one of their archbishops. Here they shew a chapel, in which, according to their tradition, St. Paul preached to the Philippians. The town is surrounded by an old wall, but is at present a place of little strength. It was taken from the Grecian emperor by the Turks in 1360.

Gallipoli is a port-town situate in 27 degrees of east longitude, and 40 degrees 30 minutes of north latitude, at the entrance of the Propontis, or sea of Marmora, twenty-five miles north-east of the Hellespont or Dardanelles, and a hundred miles south-west of Constantinople. The inhabitants, according to computation, consist of ten thousand Turks, and four thousand Christians, besides a great number of Jews. There are two harbours for galleys, but neither of them admits large vessels. This was the first town the Turks made themselves masters of Europe, in 1358.

The old castle of Romania, usually called Sestos, lies on the European side of the Hellespont, in 27 degrees of east longitude, and 40 of north latitude. This place, with Abydos on the opposite shore, are celebrated by the poets for the amours of Hero and Leander. Here it was that Xerxes laid bridges over the Hellespont, on which he passed his army when he invaded Greece; and at this place likewise the Turks take an account of all vessels bound to Constantinople.

Of Heraclia, once a great city, which stood in the midway between Constantinople and Gallipoli, little more remains at present than some ruins; within seven or eight miles of which lies Rodorto, a town of considerable trade, inhabited by a mixture of Turks, Jews, and Christians.

The province of Macedonia is bounded on the east by Romania, and part of the Archipelago; on the north by Servia; on the south by Thessaly, with the gulphs of Salonichi and Costeffa; and on the west by Epirus. The chief towns are, Costeffa, Philippoli, Amphipolis or Empoli, and Janiza.

Costeffa is situate on a bay of the Archipelago, in 25 degrees of east longitude, and 41 degrees of north latitude, about two hundred miles west of Constantinople.

nople. The bay to which it gives name, is sometimes called the Bay of Monte Santo, or the Holy Mount, from the great number of Greek monasteries upon it.

Philippi, so named from Philip the father of Alexander, is likewise situate on the confines of Thrace, in 25 degrees of east longitude, and 41 degrees of north latitude. In the plains near this city, Augustus Cæsar and Mark Anthony obtained the decisive victory over Brutus and Cassius.

Amphipolis or Empoli, situate on the river Strymon, was anciently the capital of Macedonia, but is now a poor town.

Janiza or Pella, the birth-place of Philip, and afterwards of Alexander, was the seat of the kings of Macedonia till the time of Perseus; but has no remains of its ancient-grandeur. It lies about thirty miles south west of Salonichi.

The province of Albania is bounded on the east by Macedonia; on the north by Dalmatia and Servia; on the west by the Gulph of Venice; and on the south by Epirus. In length, from north to south, it is about a hundred and fifty miles, and in breadth a hundred.

One of the chief towns is Scodra or Iscadar, situate near the river Boiano, twenty-five miles from the Gulph of Venice. It was once the capital of Illyricum, and is still a large city.

Alessio or Lissus is situate in 20 degrees of east longitude, and 42 of north latitude, near the mouth of the river Drino. It had once a capacious port, the work of Dionysius the Tyrant, who leading a colony hither, enlarged and walled the place round. In more modern times, it is celebrated for being the birth-place of George Castriot, usually called Scanderbeg, who often defeated the Turkish armies with a handful of men.

Dulcigno, a port-town, is situate on the Gulph of Venice, in 19 degrees of east longitude, and 42 of north latitude, fifty miles south-east of Ragusa.

Durazzo, the Dyrrachium of the Romans, is situate on the Gulph of Venice, in 20 degrees of east longitude, and 41 degrees 30 minutes of north latitude. Hither the Romans usually passed over from Italy to Greece. It is memorable for being the place of Cicero's banishment, and of Pompey's retreat when Cæsar had possessed himself of Rome.

Ragusa stands on the Gulph of Venice, in 21 degrees of east longitude, and 41 of north latitude. The city and territory form a Christian republic under the protection of the Turks, where the Christians enjoy greater privileges than in any other part of the Ottoman dominions.

The province of Epirus, now Canina, is bounded on the north by Albania; on the west by the sea, near the entrance of the Gulph of Venice; on the south by Achaia; and on the east by Thessaly, from which it is separated by the mountain of Mezna, the ancient Pinus. It is about a hundred miles long, and sixty broad. The chief towns are, 1. Chimæra, situate in 20 degrees 29 minutes of east longitude, and 40 de-

grees 10 minutes of north latitude; a port-town, eighty miles south of Durazzo, and twenty north of the island of Corfu. 2. Butrinto, another port-town, thirty miles south of Chimæra. 3. Arta, or Larta, sixty miles north-west of Lepanto. This was the ancient Ambracia, the residence of the kings of Epirus. 4. Hygalo, situate on a bay of the Gulph of Venice; the ancient Adium, famous for a temple of Apollo; but afterwards more famous on account of the victory obtained by Augustus over Anthony and Cleopatra, and for quinquennial games there instituted.

The province of Thessaly, now Senna, is bounded on the west by Epirus; on the north by Macedonia; on the east by the Archipelago; and on the south by Achaia. One of the chief towns is Larissa, called by the Turks Assabarda, situate in 23 degrees 30 minutes of east longitude, and in 39 degrees of north latitude; a large populous city, and the see of a Greek bishop. It stands delightfully on the river Peneus, having mount Olympus on the north, and the plains of Thessaly on the south; and is famous for being the place of Achilles's nativity.

Salonichi, or Thessalonica, is situate at the bottom of a bay of the Egean sea, to which it gives its name, lying in 24 degrees of east longitude, and 41 of north latitude. It is a populous town, has a good foreign trade, and consuls from several kingdoms and states reside here. The inhabitants are mostly Christians of the Greek communion, and have an archbishop for the government of the church.

Pharfa, situate in 23 degrees of east longitude, and 39 of north latitude, a little south of Larissa. This is supposed to be the ancient Pharalus, where Cæsar obtained the decisive victory over Pompey.

Janna, whence this province takes its modern name, is situate on a lake forty miles north of Lepanto, in 22 degrees of east longitude, and 39 of north latitude.

In this province, besides mount Olympus, which the ancients esteemed the highest mountain in the world, are those of Pelion and Ossa, mentioned likewise so often by the poets, and not much inferior in height. Between the two last mentioned mountains lay the celebrated plains of Tempe, represented by the ancients as equal to the Elysian Fields, and noted for producing fine grapes, with other fruits of a delicious flavour. According to the account delivered by Strabo and Ælian, this beautiful vale extended five miles in length, and in breadth near an acre and a half. On the right and left it was bounded by gentle convexities; the Peneus glided along the middle; and the surrounding groves were harmoniously vocal with the music of the finest birds. Livy, however, mentioning this celebrated place, informs us, that the Romans, in marching through it, were struck with a degree of horror rather than delight: for besides that the defile was difficult to pass, there were steep rocks on each hand, down which the prospect was apt to cause a dizziness; and the awfulness of the scene was heightened by the noise and depth of the interfuent Peneus.

## C H A P. III.

*Livadia.*

**T**HE province of Livadia contains that part of ancient Achaia lying north of the Morea or Peloponnesus, formerly distinguished by the names of Attica, Hellas, or Proper Greece. It is bounded on the north by Thessaly; on the east by the Egean Sea, or Archipelago; on the south by the gulph of Lepanto, which separates it from the Morea; and on the west by the Ionian Sea.

The capital of this province is Setines, the ancient Athens, situate in 24 degrees 15 minutes of east longitude, and 38 degrees 5 minutes of north latitude. It stands in the middle of a large plain, near the river Ilissus, about forty miles east of the isthmus of Corinth. This celebrated city, during its flourishing state, is said to have been upwards of twenty-four miles in circumference, but the extent of it at present is computed to be only about four. It enjoys a fine temperature, and a serene sky; and the air is clear and wholesome, though not so delicately soft as in Ionia. The town stands beneath the acropolis, or citadel, not encompassing the rock, as formerly, but spreading into the plain, chiefly on the west and north-west. The houses are mostly mean and straggling; many with large areas or courts before them. The streets are very irregular, and anciently were neither uniform nor handsome. In lanes, the high walls on each side, which are generally white-washed, reflect strongly the heat of the sun. The town is supplied with water in channels from mount Hymettus, and in the bazar or market-place, is a large fountain. The Turks have several mosques and public baths; and the Greeks have convents for men and women, with many churches, in which service is regularly performed.

The acropolis, or citadel, which was the most ancient part of Athens, is now a fortress, with a thick irregular wall, standing on the brink of precipices, and enclosing a large area, about twice as long as broad. Some portions of the ancient wall may be discovered on the outside, particularly at the two extreme angles; and in many places it is patched with pieces of columns, and with marbles taken from the ruins. The rock is lofty, abrupt, and inaccessible, except the front, which is towards the Piræus; having now, as formerly, only one entrance. It is destitute of water fit for drinking, and supplies are daily carried up to it from one of the conduits in the town. The ascent to the acropolis is by traverses and rude fortifications furnished with cannon, but without carriages, and neglected. A little beyond the second gate stand the ruins of the propylæa, which graced the entrance to the citadel.

The temple of Victory, which stood on an abrupt rock, has its back and one side unincumbered with the modern ramparts. The columns in the front being walled up, it is entered by a breach in the side, within the propylæa. It was used by the Turks as a magazine for powder, till about the year 1656; when a

sudden explosion, occasioned by lightning, carried away the roof, with a house erected on it.

The principal ornament of the acropolis was the parthenon, or great temple of Minerva, which appears from the description transmitted by antiquity to have been a most magnificent fabric. The beasts of burden, which had conveyed up the materials, were regarded as sacred, and recompensed with pastures; and one, which had voluntarily headed the train, was maintained during life, without labour, at the public expence. In the year 1676, when this temple was converted into a mosque, it was reckoned the finest in the world. In the middle of the pediment was seen a bearded Jupiter, with a majestic countenance, standing and naked. The right arm was broken. The thunder-bolt, it has been supposed, was placed in that hand, and the eagle between his feet. On his right was a figure, it is conjectured, of Victory, clothed to the mid leg; the head and arms gone. This was leaning on the horses of a car, in which sat Minerva, young and unarmed; her head-dress, instead of a helmet, resembling that of a Venus. The generous ardour visible in this pair of celestial steeds, was such, we are told, as bespoke the masterly hand of a Phidias or Praxiteles. Behind Minerva was a female figure, without a head, sitting with an infant in her lap; and in this angle of the pediment was the emperor Hadrian, with his arm round Sabina, both reclining, and seeming to regard Minerva with pleasure. On the left side of Jupiter were the mutilated figures of five or six other deities, exquisitely carved.

There yet remains much admirable sculpture about this fabric, which however is likely soon to perish, through the ignorant contempt of its present masters.

The ruin of the erékheum is of white marble, the architectural ornaments of exquisite workmanship, and uncommonly curious. The columns in the front of the temple of Neptune are standing, with the architrave; and also the skreen and portico of the temple of Minerva Polias, with a portion of the cell, retaining traces of the partition wall. The portico is now used as a powder magazine. The door-way of the vestibule is walled up, and the soil risen near to the top of the door-way of the pandrosæum, a small, but very particular building, of which no satisfactory idea can be communicated by description.

Descending from the acropolis, and making the circuit of that eminent part of ancient Athens, one of the first objects that strike our view, is a cave once sacred to Apollo and Pan, which appears to have been adorned with votive tablets.

The hill of the acropolis is more abrupt and perpendicular, as well as narrower, at the extremity opposite to the propylæa, where beneath the wall, is a cavern, the roofing place of crows and daws. Proceeding thence to the side of the acropolis next to mount Hymettus, the hill is indented with the theatre of Bacchus; beyond which begins an out-work of the fortress, standing on ancient arches, supposed to be the remains of a stoa or portico, which was connected with the theatre called the odæum. The wall of the inner front of the proscenium is still standing, very lofty,

lusty, with open arches; serving as part of an out-work of the castle; and a portion of the exterior wall of the right wing is also visible.

The venerable hill of the areopagus, celebrated for its solemn tribunal, is ascended by steps cut in the rock; and by it, is a small church of St. Dionysius, near one ruined, and a wall now choaked up, in which they pretend that St. Paul was hid on some occasion.

The temple of Theseus is of the Doric order, and in the style of its architecture greatly resembles the parthenon. It is yet entire, except the roof, which is modern and vaulted, with an aperture or two for the admission of light. It is at present a Greek church dedicated to St. George. The sculptures still extant about this temple, though much impaired, witness the hand of a master. The exploits of Theseus and Hercules were carved on the metopæ, in sixteen compartments, in alto relievo, and the following subjects are intelligible, viz. Theseus killing the sow of Crommyon; throwing Seyron from a rock into the sea; wrestling with Cereyon; destroying the Minotaur; driving the bull of Marathon to Athens; Hercules strangling the Nemean lion; with Iolaus destroying the hydra; receiving the golden apples from a nymph, one of the Hesperides.

The next object that occurs without the town, at some distance in the plain, is a marble gate, which separated the old city from Hadrianopolis, or New Athens. This gate serving as a boundary, is marked with two inscriptions. Over the arch on one side are these words in Greek, "What you see is Athens, the old city of Theseus;" and on the other front, "What you see is the city of Hadrian, and not of Theseus." Beyond it, within the region of New Athens, lies the majestic ruin of the temple of Jupiter Olympus. It consists of prodigious columns, tall and beautiful, of the Corinthian order, fluted; some single, others supporting their architraves. The columns are about six foot in diameter, and near sixty in height. The number without the cell was one hundred and sixteen or twenty. Seventeen were standing in 1676; but a few years ago, one was overturned, with much difficulty, and applied to the building a new mosque in the bazar or market-place. It is remarkable, that two stones of a step in the front had coalesced at the extremity, so that no juncture can be perceived; and the same observation has been made on a step of the parthenon. In both instances, the effect is probably owing to a concretionary fluid, which pervades the marble in the quarry.

Some stone-work of the Panathenean stadium still remains at the two extremities by the Ilissus. The area, which produces grain, measures six hundred and thirty English foot in length. On the left hand, near the top, is a subterraneous passage through the mountain, once under the seats. This was a private way by which the president of the games, the magistrates, and priests entered to take their places, after the spectators were met; and by which, it is supposed, those who contended and were unsuccessful, made their retreat. Such avenues appear to have been not uncommon in the stadiums of Greece.

No. 15.

Going on from the stadium without crossing the Ilissus, a solitary church presents itself on the left hand at a distance, and before us a temple of white marble, seated on the rock by the side of the river. This, as well as the parthenon and the temple of Theseus, has been transformed into a church, named St. Mary on the Rock. This temple, which is much impaired, is believed to have been the famous Eleusinium, belonging to Ceres and Proserpine.

Beyond the Eleusinium, in Agræ, was a temple of Diana Agræa, where the goddess was represented as bearing a bow, and named Agrotera, the huntress. In 1676 this temple was a church. It was of white marble, and the floor mosaic. The site is now occupied by another church, which is a mean structure. Beneath the Eleusinium, in a rocky dell, is also a small church with some buildings, and trees, and vestiges of the fountain Callirhæe, the same with that which obtained the name of Enneacrunus, after Pisistratus had furnished it with nine pipes.

The site of the lycæum is now marked by a well and a church, and many large stones scattered about.

Besides the ancient buildings yet remaining, innumerable fragments may be found, of statues, columns, and other pieces of architecture, which evince the magnificence of this celebrated capital in the time of its splendor.

The Turks here are in general more polite, social, and affable, than is common to their nation, and partake in some degree of the Greek character. The citizens of Athens are yet distinguished by a native quickness of apprehension, but which, not being duly cultivated, instead of producing genius, degenerates into cunning. They are reputed a most crafty, subtle, and acute race; and it has been jocosely affirmed that no Jew can live among them, because he would be continually out-witted.

The habit of the modern Athenians is a black vest, with a loose coat over it lined with furs; and their cap resembles the crown of a hat. On their legs they wear easy black boots, which fit in wrinkles; but never shoes or slippers as the Turks. The women wear coloured gowns, usually red or blue, reaching down to their feet, and over them a short vest of silk; but never appear abroad without a veil. Their hair is plaited, and hangs down low on their backs.

Provisions of every kind are here good and cheap; the frequent and severe frosts having an influence on the market. Hares, game, and fowl, may be purchased for little more than the value of the powder and shot. Oranges, lemons, and citrons, grow in the gardens: the grapes and melons are excellent, as are also the figs, which were celebrated of old. The wines are wholesome, but the pitch, infused to preserve them, communicates a taste which proves at first disagreeable to strangers. When the olives blacken, vast flocks of pigeons, thrushes, and other birds repair to the groves for food. Wild turkies are here not uncommon, and partridges very frequent. In winter, woodcocks likewise abound; descending, after snow on the mountains, into the plain, and as suddenly retreating. In the time of frost, they enter the gardens of the town in great droves, rather than cross the sea;

U u

and

and are sometimes taken with the hand. Snipes, teal, widgeon, ducks, and the like, are also found in great plenty.

The large horned owl, the favourite bird of Minerva, which the ancient Athenians placed as her companion in her temple in the acropolis, is here also to be seen. This species of bird is as ravenous as an eagle, and it pressed by hunger, will attack lambs and hares.

Frequent traces may yet be perceived of the demi or boroughs, which were anciently scattered over the territory of Athens; and several still exist, but mostly reduced to very inconsiderable villages. Many of the ancient wells also occur on Lycabettus, at the Piræus, and all over Attica. Some are seen in the vineyards and gardens nearly in their pristine state. They consist of a circular rim of marble, about a yard high, standing on a square pavement; adorned not inelegantly with wreathed flutings on the outside; or plain, with mouldings at the top and bottom. The bucket is a kettle, a jar, or the skin of a goat or kid distended; and close by is commonly a stone trough, into which they pour water for the cattle. The territory of Athens was anciently well peopled, and the city was supplied with corn from Sicily and Africa. At present Attica is thinly inhabited, and seems to produce grain sufficient for the natives; but the edicts prohibiting exportation are continually eluded, and public distress ensues almost yearly on this account.

The olive groves are now, as anciently, a principal source of the riches of Athens; and the honey of Attica continues to maintain its repute, particularly that of Hymettus.

The wild beasts, which find shelter in the mountains, greatly annoy the shepherds, who constantly guard their flocks with large fierce dogs. The person who killed a wolf, was entitled by a law of Solon to a reward; if a female, to one drachma, seven-pence half-penny; if a male, to five drachmas. Afterwards a talent, or one hundred and eighty pounds sterling, was paid for a young wolf, and double that sum for one full grown. The peasant now produces the skin in the bazar or market, and is recompensed by voluntary contribution. Parnes, the mountain towards the Cephissus, is haunted, besides wolves, by deer and foxes, as it formerly was by wild boars and bears.

In the east part of Attica, on the lofty promontory of Sunium, stood the temple of Minerva Sunias, visible from afar on the sea. This structure was of white marble, and probably erected about the same time with the great temple of Minerva called the parthenon, in the acropolis at Athens; having the same proportions, but greatly inferior in magnitude. The order is Doric, and it appears to have been a fabric of exquisite beauty. It had six columns in front. Nine columns were standing on the south-west side in the year 1676, and five on the opposite, with two antæ or pilasters at the south-end, and part of the pronaos. The number is now twelve, besides two in front, and one of the antæ.

Ten miles south-east of Athens lies the plain of Marathon, famous for the victory there obtained by the Athenians over the Persians, under the command of Miltiades. This celebrated plain is long and narrow,

and the soil reputed exceedingly fertile. The barley which it produced was anciently named Achillean, perhaps from its tallness; and at present it yields corn of the most luxuriant growth. The principal barrow, probably that of the gallant Athenians, mentioned by Pausanias, still towers above the level of the plain. It is of light fine earth, and has a bush or two growing on it. At a small distance northward, is a square basement of white marble, perhaps part of the trophy erected by the Athenians; but we now look in vain for the pillars on which the names were recorded.

About fifteen miles north-west of Athens, on the west bank of the Cephissus, near the sea-coast, lie the ruins of Eleusis, a city that contended with Athens for empire, until it was taken by Theseus. Here stood the magnificent temple of Ceres, where the Eleusinian mysteries were performed. Some marbles uncommonly massive, and some pieces of the columns remain on the spot. The breadth of the cell is about a hundred and fifty feet; the length, including the pronaos and portico, two hundred and sixteen feet; and the diameter of the columns, which are fluted, six inches from the bottom of the shafts, is six feet and a half. The temple was a decastyle, or had ten columns in the front, which was to the east. The peribolus or inclosure, which surrounded it on the north-east and on the south side, measures three hundred and eighty-seven feet in length from north to south, and three hundred and twenty-eight feet in breadth from east to west. Between the west wall of the inclosure and temple, and the wall of the citadel, was a passage forty-two feet six inches wide, which led to the summit of a high rock at the north-west angle of the inclosure, on which are visible the traces of a temple *in antis*, in length seventy-four feet six inches from north to south, and in breadth fifty four feet. It was perhaps the temple sacred to Triptolemus. This spot commands a very extensive view of the plain and bay.

At a small distance from the north end of the inclosure is a heap of marble, consisting of fragments of the Doric and Ionic orders; the remains probably of the temples of Diana, Propylæa, and of Neptunc, and of the propylæum or gate-way. Near it is the bust of a colossal statue of Ceres. She carries on her head a basket, carved on the outside, with handfuls of wheat, ears, roses, and bundles of poppies. A basin, supposed to belong to the statue, lies at a little distance from it, on the sides of which is represented the procession of Ceres, in basso relievo. A procession was made by the Athenians in commemoration of this goddess rambling about the world in search of her daughter Proserpine, stolen by Pluto, after she had lighted her torches at mount Ætna; the whole company having torches in their hands. A well yet in the village, may be that which was called Callichorus, where the women of Eleusis were accustomed to dance in honour of Ceres.

Twenty miles west of Athens lies Megara, once the capital of a considerable territory, but at present only a village consisting of low mean cottages. It retains, however, the ancient name, and is pleasantly situated on the slope of an eminence indented in the middle.

middle. Citadel; on the builder entirely demits, on the plain any of the sepulchres seems to be at this point, and

middle. On each side of this vale was an acropolis or citadel; one named Caria, the other from Alcaethous, the builder of a wall. In 1676 the city-wall was not entirely demolished, but comprehended the two summits, on which are some churches, with a portion of the plain towards the south. No vestiges remain of any of the numerous public edifices, temples, and sepulchres, which once adorned this city; a defect that seems to be justly imputed to the nature of the stone at this place, which was very white, uncommonly soft, and consisted almost entirely of cockle-shells.

Delphi, the modern Caltri, stands on the side of mount Parnassus, about half way to the top, in 22 degrees of east longitude, and 38 degrees 30 minutes of north latitude, ten miles north of the gulph of Lepanto. This celebrated place was much resorted to by the ancients, on account of the temple of Apollo, and the dark cave, whence the Pythian priestesses used to deliver her oracles sitting upon a tripod. The mountain Parnassus appears with two tops, from one of which, called Kyanpeia, the Delphians threw the famous Æsop. Between the two summits rises a spring, supposed to be the fountain of Castalia, the water of which is exceeding cold.

Not far from Parnassus, is mount Helicon, likewise consecrated to Apollo. They are both rocky hills, covered with snow during a great part of the year.

Lepanto, the ancient Naupactus, is situated near the north shore of the entrance of the gulph of Lepanto, in 23 degrees of east longitude, and 38 of north latitude. The town is surrounded by fruitful vineyards, and fields, producing corn, rice, olives, oranges, lemons, and citrons, in great plenty. The wine is esteemed the best in Greece.

Livadia, which gives name to the province, is an ancient port-town, situate on the Gulph of Lepanto. It is at present a populous trading place, consisting of Turks and Greek Christians.

Thiva, the ancient Thebes, was the capital of that subdivision of Greece called Bœotia; situated about forty miles north of the isthmus of Corinth, and thirty north-west of Athens. It was built on an eminence between two rivulets, the Imenus and Dirce. It is said to have been founded by Cadmus; and according to the ancient mythology, the walls of it were raised at the sound of Amphion's lyre. Besides Bacchus and Hercules, supposed to have been born here, this place has produced several great men, particularly Pindar, Epaminondas, and Pelopidas.

The most noted river in Livadia is the Achelous, called by Homer the prince of rivers. It rises in mount Pindus, and running southward, discharges itself into the bay of Corinth.

#### C H A P. IV.

##### *The Marca.*

AMONG the ancients, this country obtained the name of the Peloponnesus, from Pelops, the son of Tantalus, who led hither a colony. It is a peninsula situate in the Mediterranean Sea, between

21 and 24 degrees of east longitude, and between 36 and 38 degrees 30 minutes of north latitude. Its length from the isthmus of Corinth, where it joins Livadia, is about a hundred and eighty miles, and the breadth a hundred and thirty.

The chief rivers in this country being so frequently mentioned in the ancient poets, it may not be improper to enumerate them. First, therefore, of Alpheus, which, according to poetic fiction, passed under the Ionian sea, and emerged again in Sicily. This river rises in the mountain Stympthalus, whence running through Arcadia, it being joined by the rivers Celadon and Amarynth, with several rivulets, falls into the Ionian sea. 2. The Eurotas, rising in Arcadia, passes through Laconia or Lacedæmon, and discharges itself into the bay of Colochina. 3. The Inachus, a river of Argolis, running south east into the Sinus Argolicus. 4. Styx. The Styx was properly a fountain dropping a deadly water, accounted sacred, between Nonacris and Pheneus in Arcadia; but gave its name to a fictitious river in hell, so much venerated amongst the gods, that an oath of any of those by it was inviolable, and which, whoever presumed to break, was stripped of divinity, and debarred nectar for a hundred years.

The capital of the country at present is the Napoli di Romania, the ancient Naphio, situated at the bottom of a cognominal bay, formerly called Sinus Argolicus, in 23 degrees 20 minutes of east longitude, and 37 degrees 30 minutes of north latitude. It stands on a promontory, under which is a good harbour; but the passage so narrow, that no more than one ship can enter it at a time. The town is naturally strong, and likewise has a castle for its defence. It is the see of an archbishop, and is computed to contain sixty thousand Grecian inhabitants, besides Jews and Turks.

Argos stands on the river Inachus or Naio, west of Napoli. This city, which was dedicated to Juno, was the capital of the kingdom of Argos, till Perseus removed the seat of the government to Mycenæ. At the siege of this place, Pyrrhus, king of Epirus, was killed by a tile, thrown by an old woman. The town is yet of considerable extent, consisting of mud-built cottages, with churches, walls, gardens, and open areas interspersed. The devastations of time and war have effaced the old city; no vestiges now remaining of its numerous edifices, the theatre, the gymnasium, the temples, and monuments, which it once boasted, contending even with Athens in antiquity, and in favours conferred by the gods.

Corinth is situate between the bays of Lepanto and Engia, in 23 degrees of east longitude, and 37 degrees 50 minutes of north latitude. It stands on high ground beneath the acrocorinthus, with an easy descent towards the gulph of Lepanto. Except in the bazar or market-place, the houses are interspersed with cypresses, corn-fields, and gardens of lemon and orange-trees. The chief remains of antiquity are at the south-west corner of the town. Those are eleven columns supporting their architraves, of the Doric order, fluted, and wanting in height near half the common proportion to the diameter. Within them, is one taller, though not entire, which probably contributed

tributed to sustain the roof. They are of stone, not marble. This ruin is believed to be of very remote antiquity, and a portion of a fabric erected not only before the Greek city was destroyed, but before the Doric order had attained to maturity. Perhaps it is the styphléum mentioned by Strabo. Corinth was the most illustrious of all the Greek cities, and grew to great power and riches by the commodiousness of its situation. But imprudently insulting the Roman ambassadors, it was involved in a war with that nation, under the conduct of Mummius, who took and burnt the city to the ground. In this conflagration different metals running together produced a third, which was held in great esteem, and called æ Corinthium. It was afterwards restored by Cæsar to its ancient splendor, and made a Roman colony. The acrocorinthus or citadel was reckoned impregnable: whence, according to some, the proverb, *Non civis hœmisi cœtingit adire Corinthum*; which others explain of the courtesan Lais. The inhabitants of Corinth are generally Christians, and it is the see of a Greek archbishop.

The air here is reputed to be bad in summer, and in autumn exceedingly unhealthy; but the adjacent country abounds with corn, wine, and oil.

The narrowest part of the isthmus of Corinth is about six miles over; and here, on a mount called Oncius, were celebrated the Isthmian games every five years. The stadium, however, is now not visible, but some fragments remain of the ancient buildings. A few vestiges may be traced of the wall built by the Lacedæmonians across the isthmus from sea to sea, to secure the Peloponnesian peninsula from the incursions of the Athenians. Attempts to unite the two gulphs by cutting across the isthmus, were successively made, without effect, by Demetrius, Julius Cæsar, Caligula, and Nero, and afterwards by Herodes Atticus, a private person.

Olympia, now called Longinico, is situated in 22 degrees of east longitude, and 37 degrees 30 minutes of north latitude. Of this celebrated place hardly any vestiges now remain; but it will ever be held in veneration for its precious era by the chronologer and historian. Here the games were celebrated the beginning of every fifth year; a period of four years complete being called an olympiad.

Nemæa is situated twenty five miles south of Corinth, famous likewise for its games, which were celebrated every third year.

Lacedæmon, or Sparta, now called Mistra, is situate on the west side of the river Eurotas, in 23 degrees of east longitude, and 36 degrees 45 minutes of north latitude. The territory of Laconia, of which it was the capital, was much less in extent than that of Athens, however it might be equal, or even superior in power. From the constitution of this celebrated republic, which prohibited every kind of magnificence, we cannot expect to meet with any traces of ancient buildings. In its flourishing state, this place remained without walls, the bravery of the citizens, as Nepos remarks, being instead of them. At length, however, when the government fell into the hands of tyrants, who distrusted their defence by arms, a wall

was built round it, at first slight, and in a tumultuary manner, but afterwards strengthened by Nabis.

Forty miles south-east of Mistra, stands Epithrava, the ancient Epidaurus. This city had several temples, and in the acropolis or citadel, was a remarkable statue of Minerva. At present, however, no traces of the buildings, except a few fragments, remain; the site being either sown with corn, or over-run with bushes, flowering shrubs, cedars, and almond-trees. Five miles from Epidaurus was the sacred grove of Æsculapius, in which stood the temple of that deity, which was always crowded with sick persons. Beyond this building was the dormitory of the suppliants; and near it a circular edifice called the Tholus, built by Polyclethus, of white marble. The grove, besides other temples, was adorned with a portico, and a fountain, remarkable for its roof and decorations. The bath of Æsculapius was one of the benefactions of Antoninus Pius, while a Roman senator; as was also the house for the reception of pregnant women and dying persons, who were previously removed out of the enclosure, to be delivered, or to expire in the open air. The remains of those buildings are heaps of stones, pieces of brick wall, and scattered fragments of marble. The springs and wells by the ruins are now supposed to possess many excellent properties. To those and a good air, with the recreations of the theatre and of the stadium, joined to the medicinal knowledge of the priests, may be attributed both the recovery of the sick, and the reputation of Æsculapius. Since the god failed, some faints have succeeded to the business; and it is not uncommon in this country to see patients lying in bed in the churches.

The serpents of Epidaurus were sacred to Æsculapius, as were the tortoises of mount Cithæron to Pan. One species, yellower than common, was peculiar to this region, and came, perhaps from being never molested. Those reptiles, some of which are very large, and not venomous, still abound. Of this kind, probably, was the huge serpent, which, when the Romans in a time of public distress sent a solemn embassy to the Epidaurians, requesting the passage of the god, failing to the ship, coiled itself in the stern; and being taken for Æsculapius, was carried to Rome in great solemnity.

Forty miles west of Lacedæmon, stands Megalopolis, situated at the foot of a mountain on the river Alpheus. This town, once the capital of Arcadia, was built under the auspices of Epaminondas, after the battle of Leuctra, many inconsiderable towns being joined in one great city, the better to withstand the Spartans. The place is now called Leontari.

Belvidere, situated on the river Peneus, the capital of the territory of Belvidere; whence are imported those small raisins which are called by its name. This town stands on the site of the ancient Elis, the place of the nativity of the philosophers Phædo and Pyrrho.

Modon is situated on the south coast of the Morea, and is defended by one of the strongest fortresses in the country. It has a commodious harbour, and is a place of considerable trade.

## C H A P. V.

*Of the genius, dress, manners, customs, and history of the Greeks.*

HAVING finished the survey of the Grecian territories, we shall next take a view of the inhabitants, who, notwithstanding they no longer possess the spirit of liberty which distinguished their illustrious ancestors, yet retain the other features of the national character, to the almost invariable observance of the manners and customs of antiquity. The same ardor of imagination, the same vivacity of temper, and turbulence of disposition, so conspicuous in the Greeks of old, are discernible in those of the present time. Even the charge brought against the ancient Grecians, of being addicted to lying, *Græcia mendax*, may with justice be applied to the moderns. The custom continues equally familiar of confirming their assertions with an oath, which is also the same that was used by the ancients. Nothing is more common than to hear fathers and mothers swear by the lives of their children, and their own heads, or by those of other persons.

In their buildings the modern Greeks observe the same disposition as the ancients. The men and women have separate apartments, called *andronitis*, and *gynæconitis*, of which the latter, for the security of their wives, is always in the interior part of the building. There are no chimnies in the Greek houses. A brazier is placed in the middle of the room, that those who are not sufficiently warmed at a distance, may more conveniently draw near it; and this utensil, as in ancient times, is placed upon a tripod.

To defend the face from the heat and smoke of the brazier, it is covered with a tendour, or square table; over which is a carpet, with a cloth of silk, more or less magnificent. Round this apparatus, sofas or cushions are placed, for the accommodation of the company. The tendour is used chiefly by the ladies, while engaged at their embroidery, an employment which occupies the greater part of every day during the winter, the remainder being spent in receiving the visits of their friends.

The ancient custom of retaining the nurse who fostered their children, still subsists among the best families in Greece. When she has reared one child, she is thenceforward incorporated into the family, and bears the name of *paramata*, a word which signifies second mother.

The Greek ladies, conformably to the custom of the ancients, present the hand to be kissed by their daughters, their slaves, and other persons who are their inferiors. The manner in which the girls salute those of their own sex and rank, is kissing the eyes, while they mutually take hold of each others ears. This custom likewise, as appears from Theocritus, is very ancient.

The Greeks have an enthusiastic passion for black eyes; and the women still continue the custom of painting the eyebrows, and the hairs of the eye-lids,

No. 15.

of a black colour, which they perform by means of a preparation of antimony and gall-nut.

The women have different modes of dressing the head, more or less ornamented. Sometimes the hair flows in tresses on the shoulders, at other times it is formed into a roll, or negligently tied with flowers. In the last of those methods, we may recognize the practice of the Lacedæmonian ladies. The young women of Greece formerly wore their hair knotted, which is also the custom at present. Almost the only circumstance in which the dress of the modern Greek ladies differs from that of the ancient, is that they no longer follow the custom of wearing aigrettes, in their hair, because their caps are made to cover their head.

The veil worn by the Greek ladies is generally of muslin, bordered with gold; and that of the common people, of a coarser sort of plain muslin; but it is always white. When a woman prepares to go abroad, she puts up her hair, and raises her veil, which answers to the description given by Claudian of Venus rising from her toilet.

The usual female dress consists of a petticoat, and a loose robe, tied round with a girdle, so famous in the ancient poets. The latter is generally embroidered, and frequently fastened by a buckle with diamonds or emeralds, resembling that of Venus as described by Homer. On their heads, some women wear a mitra or scarf, of the same form which was anciently used.

The dress of the men is the same with that of the Turks, which will be afterwards described.

The laws of hospitality, for which the ancient Greeks are so much famed, are religiously observed by the moderns; and they still delight in feasts, pastimes, public spectacles, and luxury. Being prohibited from all exterior pomp and splendor, they compensate this restriction by their magnificence within doors. In the houses of the richest men, may be observed all the taste, disposition, and grandeur of the ancient inhabitants of Athens. The walls are elegantly painted with vases and flowers; the ceilings are carved and gilt in a superb style, and surrounded with plastered cornices of excellent workmanship.

At the marriages of the modern Greeks an epithalamium is still performed, and the celebrated torch of Hymen continues to blaze in the procession to the nuptial bed, near which it is afterwards placed, where it burns till the whole is consumed. If by any accident it should be extinguished, the most ominous presages would be drawn; on which account it is watched with as much care as the sacred fire formerly by the vestals. Various other ceremonies attending the marriages of the ancient Greeks are likewise still practised. One custom, however, is peculiar to the moderns, which is, that by their religion they are enjoined continence the first night of marriage. This injunction was formerly established in some other countries of Europe, and was introduced at the fourth council of Carthage, in the year 398. As the priests had the power of dispensation, the custom was probably the source of great emolument to that order.

The same resemblance which is apparent between the nuptial ceremonies of the ancient and modern Greeks,

X x

Greeks, subsists in those of the funeral, and is conspicuous in the custom of lamenting the deceased with all the demonstrations of sorrow, of washing the dead body, dressing it with flowers, and of the funeral feast.

At their convivial entertainments, the modern Greeks discover not only the ancient excess, and simplicity of behaviour, but also use the festal crowns, so frequently mentioned by the poets. The lyre and guitar are still their chief musical instruments.

In respect of the language of the Greeks, notwithstanding it has suffered great corruption from the ignorance of the people, and the use of Turkish expressions, yet it preserves all the richness and harmony of the ancient Greek tongue; with this difference, that the verbs of the moderns are more easily conjugated, being curtailed of the aorists; and that the use of the dual number is also discontinued. The language of love appears to be particularly emphatic amongst those people, and abounds with the warmest expressions of passion, which they lavish profusely on their mistresses. Significant, however, as is their language, it is held inadequate for displaying the vehemence of their amorous fire, and the most extravagant actions are used to demonstrate their passion for the fair.

It is the opinion of some learned men, that the Greeks descended from Javan or Ion, the son of Japhet, and grandson of Noah, and that from the name of Ion, all Greece was anciently called Ionia. But whoever were the first inhabitants, it is universally agreed that the chief cities owed their origin to colonies of the Egyptians and Phœnicians; the former of whom instructed the people in laws and polity, and the latter in writing and navigation.

The most ancient town in Greece was Sicyon, built in the year of the world 1915, 2089 before Christ, and 1313 years before the first Olympiad. It stood in the north-east part of the Peloponnesus, near the site of Napoli de Romania, and is said to have continued a thousand years.

The kingdom of Argos commenced in the year of the world 2148, and 1856 years before Christ, in the time of Abraham. It was founded by Inachus, and stood also in the north-east part of the Morea.

Besides the former colonies, the Egyptians sent several others to Greece in the time of Moses. We are informed in particular, that Cretors built twelve towns, which being afterwards united, 1556 years before Christ, became the city of Athens.

About the year 1455 before Christ, Cadmus, the Phœnician, founded Thebes in Bœotia, situated thirty miles north-east of Athens. He is said to have not only introduced letters, but to have instructed the natives in the religion of Syria.

Danaus, the brother of Sesostris king of Egypt, being accused of a conspiracy against his brother, fled into Greece, where he obtained the throne of Argos in the year of the world 2553, and before the Christian æra 1451 years.

In the year of the world 2682, Pelops, a native of Phrygia in Asia Minor, procured the sovereignty of part of Peloponnesus, and communicated his name to the whole peninsula, which is now called the Morea.

Troy is supposed to have been taken by the Greeks in the year of the world 2816, and before the Christian 1184. At this period ends that part of the Grecian history which is styled fabulous.

Lacedæmon, or Sparta, appears to have been founded about the same time as Athens. The first king of this city was Eurotus, but it was afterwards governed by the Heraclidæ, or descendants of Hercules, the son of Jupiter and Alcmena. Aristodamus, the first king of this race, left his dominions to his two sons Eriethenes and Procles, in the year of the world 2900, and before the Christian æra 1104. Those princes during their lives reigned jointly, as did likewise their posterity for almost nine hundred years, till the death of Cleomenes.

Lacedæmon has been rendered particularly famous by the institutions of Lycurgus its lawgiver. This extraordinary personage was the son of Eunomus, one of the two kings of the country, and conducted the affairs of government during the minority of his nephew Charilaus; to whom, upon coming of age, he resigned his authority, after making great alterations in the constitution of the state. He instituted twenty-eight senators, to serve as a mutual check both upon the kings and people, when either of them attempted to encroach on the privileges of the other. Succeeding princes established five other magistrates, called ephori, elected by the people, and who continued in office only one year. These were vested with a power of calling their kings to account, and even of imprisoning their persons.

By another institution of Lycurgus, the lands were equally divided among the people, with the view of abolishing every distinction, except such as might be acquired by virtue alone. For the same end he also prevailed on the inhabitants to divide their moveable goods and chattels. To banish avarice from the commonwealth, he prohibited the use of gold and silver coin, ordaining that money should be made of no other metal but iron; which was so heavy that it required a cart and oxen to draw the value of twenty pounds sterling.

He next abolished all useless arts, compelling those who professed them to remove out of the country. He also obliged the citizens to eat in public, at common tables, upon the most homely fare. Every table held fifteen persons, to which none could be admitted without the consent of the whole board. Each person was obliged to furnish every month one bushel of flour, eight measures of wine, five pounds of cheese, two pounds and a half of figs, and a small sum for dressing their viands. So indispensable was the duty of attending at meals, that when king Agis, on returning from a successful expedition, presumed to eat with his wife in private, he was fined for this transgression of the laws.

All the male children were also obliged to eat at common tables, where they were entertained with serious discourses upon government, and nothing that tended to corrupt their morals was ever permitted in conversation. An injunction particularly inculcated to the youth at those meetings was secrecy. When any of them entered the hall, the eldest man in the company

No persons were permitted to give their children a private education, but all were instructed publicly in the moral duties and in bodily exercises. They were taught to despise all foppery in dress, and to submit with patience to pain and fatigue. Such, we are told, was their constancy, that at a festival celebrated in honour of Diana, the boys would suffer themselves to be whipped to death without uttering a groan.

The Spartans spent great part of their time in the halls, where the usual subjects of conversation were the love of their country, and the public good. Besides all mechanic employments they were discharged from practising even agriculture, this business being left entirely to the helots or slaves.

They always implored the divine aid on entering upon a war, and it was an inviolable law among them never to turn their back upon an enemy, however superior in number. If any person had committed such an act of cowardice, he was condemned by the laws to go with the half of his beard shaved; and besides being treated with universal contempt, he might be beaten with impunity, by any member of the state.

The laws of Lycurgus were in some instances extremely barbarous. Of this kind were those which enjoined the exposing and taking away the lives of such infants as appeared of weakly constitutions, or were born in any measure deformed. Of the same nature was that, which, under the pretext of inspiring fortitude, ordered their bravest youths to be whipped to death, without having committed any crime. The cruel treatment of the helots was also extremely unjustifiable; nor is less censure due to the indecent custom of suffering the women to appear and dance naked in the presence of the men.

When Lycurgus had reviewed his laws, and experienced their good effects on the community, his next object was to render the obligation of them permanent. For this purpose he informed the Spartans that there yet remained one point very necessary to be considered, about which he resolved to consult the oracle of Apollo; requiring them to take an oath, that they would inviolably maintain the established form of government until his return. On his arrival at Delphos, and enquiring of the oracle, whether the laws which he had made were good, and sufficient to render the Spartans happy and virtuous, he received for answer, that nothing was wanting, and that as long as the Lacedæmonians observed those laws, they would be the most glorious and happy people in the world. Lycurgus having transmitted to Sparta the response of the oracle, voluntarily put an end to his life by fasting; an event which he considered as of the greatest advantage to the Lacedæmonians, since in virtue of their oath they would be obliged to a perpetual observance of his laws.

The first king in Attica was Cecrops, the Egyptian, who erected the court of areopagus. The members of this assembly held their sessions in the open air,

and tried causes only in the night, that their attention to the pleadings might not be diverted, nor their inclinations biased by the appearance and deportment of the pleaders. Amphictyon, the third king, formed an alliance between twelve Grecian nations, which assembled twice a year at Thermopylæ, to offer their common sacrifices, and deliberate on the affairs of the several states. This convention was called the assembly of the Amphictyons, after the name of the king by whom it was introduced.

The most remarkable reign in this period is that of Egeus, the son of Pandion, under which are placed the expedition of the Argonauts, the labours of Hercules, and the wars of Minos, the second king of Crete, with the Athenians.

The twelve cities built by Cecrops, however, were not united till the reign of Theseus, after which period they are known by the name of Athens. On the death of Codrus, who devoted himself to die for his country, the title of king was abolished by the Athenians, and his son Medon governed the city under the appellation of archon. At first this dignity was for life; but the Athenians thinking that the office bore too great a resemblance to the regal power, ordained that their archons should be elected every ten years, and afterwards changed this regulation for that of an annual appointment, the authority of the archons being at the same time greatly abridged. Great disorder, however, soon proved to be the consequence of the limitations which had been imposed on the power of the chief magistrate; to remedy which evil, the people put themselves under the direction of Draco, a man of integrity, who, in order to restrain the licentiousness which prevailed, inflicted death as the punishment of every crime. But the severity of this regulation being found to defeat its own purpose, the people chose for their archon the famous Solon, esteemed the first of the seven sages of Greece, who repealed all the laws of his predecessor, except that for the punishment of murder, and made several other important regulations.

Solon travelling to the courts of Crætus and Egypt, and returning, after ten years absence, to Athens, found the city in great confusion. Three factions were contending for the supreme authority. At the head of one of these was Pisistratus, who at length obtained sovereign power; but who, though usually styled a tyrant, reigned with great moderation thirty years. He was succeeded by his sons Hippias and Hipparchus, who, after they had reigned about eighteen years, were deposed by Hermodius and Aristogoton, two popular Athenians; and Athens recovered its democratical government in the same year that the kings were expelled from Rome.

The government of Corinth was first established in the year of the world 2628, and before the Christian epoch 1376. This city was subject to Argos, until he was dispossessed by Sisyphus, whose descendants for some time enjoyed the regal power, but were deprived of this rank by the Heraclidae, about a hundred and ten years after the siege of Troy. The government was afterwards occupied by the descendants of Barchis, under whom it was changed from a monarchy into an aristocracy.

aristocratical form. The supreme power was now lodged in a senate, which annually elected out of its own body a chief magistrate, called prytanis; but Cypselus at last, having insinuated himself into the favour of the people, usurped the sovereignty of Corinth. This prince, from the encouragement he gave to learning and learned men, was esteemed one of the sages of Greece.

Macedonia was not originally reckoned a part of Greece, but of Thrace. The first king of this country is said to have been Caranus, who began his reign 794 years before Christ, in the year of the world 3210. The Macedonians were anciently so considerable a people, that sometimes they put themselves under the protection of the Athenians, and at others, of the Thebans and Spartans, until at last, under Philip and Alexander, they not only subdued all the other states of Greece, but made an entire conquest of the Persian empire.

When the Greeks became numerous, they not only sent colonies to Asia Minor, where they founded many of the principal cities, but also sent others to Italy and Sicily; in the former of which they built Tarentum, and in the latter the city of Syracuse.

The first war that occurred among the Grecian states broke out between the Lacedæmonians and the Argives, about their title to the little country of Thyrea. When the two armies were upon the point of engaging, it was agreed, in order to spare the effusion of human blood, that their right to the territory in dispute should be decided by a combat of three hundred men on each side. Both parties fought with such resolution, that only three of the combatants survived, viz. two of the Argives, and one of the Lacedæmonians. The darkness of the night separating them, the two Argives returned to Argos, to carry the news of the victory, which they apprehended belonged to them, as they were two to one. The Lacedæmonian, however, having remained in the field of battle, the victory was also claimed by that republic; nor could the dispute be decided till both parties came to a general engagement, in which the Argives were defeated.

The next intestine war of the Grecian states was between the Lacedæmonians and Messenians, who were situated westward of Sparta. This war commenced in the year 743 before the Christian æra, when Euphaes was king of Messenia, and Polydorus and Theopompus were kings of Sparta. The Lacedæmonians, among other injuries, complained that the Messenians had ravished their daughters, when the latter were performing their devotions at a temple which stood on the confines of the two states. The Lacedæmonians laying siege to the city of Alpha took it by storm, and massacred all the inhabitants; at the same time making a vow that they would not lay down their arms, nor return to Sparta, till they had subdued all the cities of the Messenians. Two battles were afterwards fought, but neither of them proving decisive, the Messenians consulted the oracle at Delphos about the success of the war, when they were advised to appease the wrath of the gods by sacrificing a virgin of the blood royal;

and for this purpose Aristomenes, one of their princes, offered his own daughter. The Messenians were at this time so formidable, that the Spartans did not think fit to attack them again, but continued in arms during the space of seven years, from a regard to the oath which they had taken. Beginning at length to apprehend that the state would suffer by their long absence from their wives, they commissioned their friends at Sparta, who had not taken the oath, to lie with their wives, in order to increase the breed. The children that proceeded from those embraces, were afterwards esteemed infamous, and denominated the Partheniataz. Being ashamed of this opprobrious distinction, when they grew up, they transported themselves to Tarentum in Italy.

The war continuing seven years more, Aristomenes, king of the Messenians, obtained a complete victory, and even made prisoner Theopompus the Spartan king, whom, with three hundred other captives, he offered in sacrifice to Jupiter of Ithoma; and in a short time after this event, killed himself on the tomb of his daughter, who had been formerly sacrificed at his own desire, in obedience to the oracle of Delphos.

The war between those two nations revived after the death of the king, and in the end the Messenians were forced to submit to the Lacedæmonians, who obliged them to take an oath that they would become their subjects, and deliver one half of the produce of their lands annually in the market of Sparta.

The Spartans treating their new subjects with great cruelty and insolence during forty years, the latter broke out into rebellion, and were successful in several battles; but when the war had continued fourteen years, they were again obliged to submit. Some that fled transported themselves to Sicily, where they built the city of Messina; but those who remained behind were reduced to the condition of helots or slaves to the Spartans.

In the year 470 before the Christian epoch there happened in Laconia a great earthquake, which destroyed many towns, and threw the whole country into great consternation. The helots taking advantage of the disorder in which their masters were involved, broke out into rebellion, in the hope of regaining their freedom. By the late accession of the Messenians their party became so formidable, that the Spartans applied for assistance to the people of Athens, who ordered for this purpose four thousand of their troops, commanded by the celebrated Cimon. When these auxiliaries approached Lacedæmon, however, some of the Spartans suggesting that the Athenians designed to make themselves masters of the city, they refused their assistance, and would not permit them to join the Lacedæmonian army. The Athenians were so exasperated at this unprovoked outrage, that they took several cities which depended on Sparta, at the same time receiving the helots under their protection, and declaring themselves perpetual enemies to the Lacedæmonian republic.

All the states of Peloponnesus declared for Sparta, except Argos, which stood neuter; and out of Peloponnesus, Megara, Locris, Bœotia, Phocis, Ambracia, Leucadia, and Anactorium, likewise the port of Lacedæmon.

dæmon. The allies of the Athenians were Platea, the Messenians of Næupaclus, the greater part of the Acarnanians, the Cyclades, and most of the islands in the Egean Sea; with several cities of Thrace, and of Asia Minor. The Lacedæmonians being joined by their allies, marched into Attica with an army of sixty thousand men, and invested Athens. But Pericles, who commanded in the city, having previously deprived the enemy of the means of subsistence, either by destroying or securing all the provisions in the country; and the latter being likewise informed that the Athenian fleet was making descents in Peloponnesus, they abandoned the siege, and returned with precipitation to their own territories.

Next year the Spartans and their allies again assembled their forces, and marched into Attica, where the Athenians, as formerly, continued to act on the defensive. A terrible plague, however, which ravaged almost the whole continent of Asia, breaking out in the city, great numbers of the inhabitants were destroyed. In this miserable condition, they were reduced to make offers of peace to the invaders upon very disadvantageous terms, but which were not accepted by the latter.

Mean time the Spartans, finding their country perpetually harassed by the Athenian fleet, and having neither a sufficient force to guard their coasts, nor money to pay their troops, sent an embassy to Darius king of Persia, to propose an alliance with him, and request his assistance. The ambassadors, however, were made prisoners on their route, and being sent to Athens were put to death in an ignominious manner, to retaliate a similar insult which had been recently offered by the Lacedæmonians.

Never was any war carried on with greater barbarity than that which subsisted at this time between the Grecian states. The inhabitants of Lesbos being about to enter into an alliance with Sparta, the Athenians sent a fleet to subdue the island, which after they had effected, they massacred in cold blood all that had expressed their approbation of that alliance. The Spartans, on the other hand, put all the Platæans to the sword, after they had surrendered at discretion. During the first seven years of the war hostilities were exercised chiefly in mutual depredation; but in the tenth year, each of the parties being wearied with those incursions, they concluded a peace for fifty years, which continued, however, but a very little time.

A rupture happening in Sicily between the Greeks who were allies to the Athenians, and the Syracusians who were a colony of the Corinthians, allies of the Spartans; the celebrated Alcibiades persuaded the Athenians to enter into a war against Syracuse, in which proving unsuccessful, he was condemned by his countrymen to die, but made his escape to Sparta. Here he was for some time entrusted with the command of the Lacedæmonian troops, in which character he acquitted himself with applause; but not being acceptable to some of the leading men, and discovering that a design was formed against his life, he removed to the court of Tissaphernes, viceroy to the king of Persia in Asia Minor.

No 15.

The Athenian fleet and army that were employed in the siege of Syracuse being entirely defeated, their two generals, Lycias and Demosthenes, were made prisoners, and put to death by the enemy. On receiving the news of this disaster, most of the allies of Athens in Greece immediately deserted them, and entered into an alliance with Sparta; particularly the islands in the Egean Sea. By this important accession of the maritime states, the Spartan fleet, which had hitherto been very inconsiderable, became equal to that of the Athenians, whose strength was much exhausted by some battles in which they had lately been defeated. At this crisis, the Athenians imputing all their disasters to the want of a good general, invited Alcibiades into their service again, who accepting the offer, gained several victories over the Spartans; but being unsuccessful in one engagement at sea, the Athenians condemned him a second time; upon which he retired into Thrace, where he had previously secured an asylum.

Fortune seemed to abandon the Athenians with the loss of their general: for the viceroy of Asia Minor assisting the Spartans with a strong naval armament, Lyfander their admiral obtained a complete victory over the Athenian fleet, and blocked up the capital by sea; while Agis king of Sparta besieging it on the land side, compelled the city to surrender, almost at discretion, after the war had continued twenty-seven years. The victorious general putting a strong garrison into the castle, appointed for the government of the city thirty archons, who, on account of their oppression, were denominated tyrants by the Athenians. All the Grecian cities that were before subject to Athens, were restored to their liberty, and had no longer any dependence on that republic.

After this conquest, Lyfander sent to Sparta all the rich plunder and treasure that he had acquired, which is supposed to have not a little contributed to the ruin of that state. This fatal consequence was apprehended by some of the wisest men among them, and to prevent it as much as possible, they made a law, that none but iron money should pass in trade; and that all the gold and silver should be deposited in the public treasury, to be used only when the exigence of the nation required.

The Lacedæmonians had no sooner reduced Athens, than they began to tyrannize over the other Grecian states, not only oppressing those that had been their enemies, but even their most considerable allies. Attacking the Bæotians unexpectedly, they put a strong garrison into their capital city of Thebes, and governed the inhabitants in the most arbitrary manner. Having expelled some of the Theban magistrates, the citizens were so much alarmed that four hundred of the principal of them fled to Athens. There the malecontents of both cities entered into a conspiracy to expel the Lacedæmonians, and recover their liberties. The chief of this association were the celebrated Epaminondas and Pelopidas. Twelve of the conspirators going in disguise to Thebes, found means to surprize Leontides and Archias, the Spartan generals, when they were intoxicated with wine, and killed them. Immediately inviting the assistance of all that loved their country,

Y y

the

the desertion became so general both in Thebes and Athens, that the garrisons in each were compelled to surrender, and the inhabitants of the two cities resumed their ancient form of government.

The Thebans, some time after, under the command of Epaminondas and Pelopidas, engaged the Spartans in a pitched battle at Leuctra, and obtained a complete victory. Another battle was afterwards fought between the armies at Mantinea; but the two Theban generals being killed by the enemy, the glory of this republic was extinguished with them.

Athens, Sparta, and Thebes, enjoyed thus in their turns the sovereignty of the Grecian states, till at length they were all subdued by the superior power of Macedon, which before the reign of Philip had been only an inconsiderable kingdom. Two circumstances in particular contributed to raise this politic prince to the grandeur which he attained. The one was a silver mine discovered in his own territories; and the other, the divisions that he found or created among the cities of Greece. By the first of those he was not only enabled to purchase the leading men in most of the republics, but to support such an army as might be sufficient for effectuating the purpose he had in view. His policy, however, led him to proceed with caution in his design. In the sacred war, in which almost all Greece was engaged, he avoided taking a part openly on either side, but fomented the divisions of the opposite parties, as the surest way to exhaust their strength, and facilitate the conquest he intended.

The sacred war was occasioned by the people who inhabited the country in the neighbourhood of Delphos, ploughing up some lands which belonged to the temple of Apollo. This action being considered as sacrilege by the votaries of that deity, the offenders were summoned before the court of Amphictyons, which consisted of representatives from every state in Greece. The cause being heard before this tribunal, the Phocians, who were the delinquents, were condemned to pay a large fine; but they insisting that the sovereignty of Delphos belonged to them, refused to submit, and immediately had recourse to arms; engaging on their side the Lacedæmonians, and several other Grecian states.

When the several states had been considerably weakened in this war, Philip began to invade their territories; at which being alarmed, the wisest among them were of opinion, that the most prudent step was to make peace among themselves, and prepare to oppose his invasions. This measure Demosthenes recommended with great warmth to the Athenians; but they yielded not to his advice in time to adopt it with success.

Philip at length entering into an open war with the Athenians and their allies, obtained over them, at Cheronea, a complete victory, which put an end to the liberties of Greece. They submitted to acknowledge him generalissimo of all their forces against Persia, but while he was preparing for this expedition, he was assassinated by Pausanias, a young nobleman of his guards.

His son Alexander succeeded to the throne at the age of twenty years. The first object of this young prince

was to reduce such of the Grecian states as had revolted, particularly Thebes, which he entirely demolished. Assembling afterwards a body of forces, consisting of five thousand horse, and thirty thousand foot, he passed over the Hellespont into Asia. But his conquests in the East having been related in treating of Persia, the reader is referred to the account delivered in that history.

After the death of Alexander, his captains divided his dominions among themselves. Antipater, as guardian to Arideus, the natural brother of the late king, took upon him the regency of Macedon; and Alexander's widow, Roxana, being afterwards delivered of a son, the several generals pretended to govern their respective territories only in quality of regents, until the two young princes should come of age. These, however, being both murdered, and Antipater dying soon after, his son Cassander assumed the title of king, claiming not only the kingdom of Macedon, but the sovereignty of all Greece. This country being afterwards divided among many other princes and states, who were perpetually at war with each other, the Romans, under pretence of assisting their allies, and procuring the liberty of some of the Grecian states, having sent hither a considerable force, they at length made a conquest of the whole, and reduced all Greece to the form of a Roman province. In this state it continued till the division of the Roman territories, when it was comprehended in the eastern empire, till this was subdued by the Turks.

##### *Of the Greek church in the Turkish empire.*

**M**OST of the Christians in Turkey are of the Greek church, who are more numerous than the Mahometans in several parts of the empire. They are governed in spirituals by four patriarchs, viz. those of Constantinople, Alexandria, Antioch, and Jerusalem; to each of whom a particular jurisdiction is allotted. Within the province of Constantinople are included Asia Minor, Greece, and the more northerly Turkish dominions, with the islands of the Archipelago. That of Alexandria contains Egypt, Lybia, and part of Arabia. The patriarch of Antioch has the superiority of Syria, Mesopotamia, Isauria, and Cilicia. And the patriarch of Jerusalem presides over Palestine, and part of Arabia. The Armenians, Maronites, and other sects of Christians in Turkey have also their respective patriarchs; and the pope appoints a titular patriarch at Constantinople, as well as a bishop. In general, however, the Greeks and eastern Christians have an inveterate prejudice against those of the Romish church, while on the other hand the latter treat them as infidels, and are continually inciting the Turks to oppress and destroy them.

The Greek churches observe four Lenten every year; the first is coincident with ours, and continues forty-eight days: the second begins the fifteenth of November, and continues forty days: the third is observed in honour of the Virgin Mary, beginning on the first

The censur their c they b freque blood.

of August, and ending the fourteenth. The fourth fast begins on the Monday after Whit Sunday, and continues to the twenty-ninth of June. Besides all those, which are observed with great strictness, they have weekly fasts on Wednesday and Friday; and they fast on the eves of Epiphany, Pentecost, and several other great holidays.

They baptize their children at the age of eight or ten days, dipping them three times in water, which, if the weather be cold, is always warmed. They afterwards anoint the child with consecrated oil, a composition made of cassia, myrrh, storax, and a variety of other drugs, mixt with wine and oil, which is usually kept in alabaster boxes, and distributed by the bishop.

The celebration of the eucharist is performed by the priests with great ceremony. Besides being regularly given in the churches four times in the year, this sacrament is administered to infants that have been christened, when, on account of weakness or any disease, they seem to be in a dangerous situation. Before the return of those stated periods adults are obliged to confess themselves to the priests; but it is not required that they be extremely particular in this exercise, as absolution is obtained upon easy terms. They however esteem a person in a very dangerous state, who dies unabsolved; and if, at the time of death, he lay under the sentence of excommunication, his body is supposed to remain undissoluble, and to suffer great pain in the grave, until the censure of the church be removed. In the doctrine of penance, likewise, those of the Greek church coincide in opinion with the Roman Catholics, and some of them also in respect of transubstantiation; but the latter is maintained only by such as have been educated in the Italian seminaries, or learnt it from the Roman missionaries.

When a person amongst them is sick, he is anointed with oil by the priests, of whom three is the smallest number allowed to perform this ceremony. They anoint even the sick man's house with sacred oil, making the sign of the cross on the doors and door-posts.

Second marriages are not approved by the Greeks, and third and fourth marriages are esteemed wicked. The age at which the parties can contract is fourteen on the side of the man, and thirteen on that of the woman; but the marriage is void, unless ratified by the consent of the parents or guardians. Like the papists, they prohibit marriage with spiritual relations: a man therefore is prohibited from marrying the daughter or sister of his godfather, or any other that is nearly related to him. A divorce is easily obtained among them; for if it be refused, the men make no scruple of maintaining a criminal correspondence with other women.

The only creed they repeat is the Nicene. They censure the worship of images, but adore pictures in their churches, before which, and at the holy table, they burn incense. With this likewise the people are frequently perfumed; and they universally abstain from blood.

Their churches, like ours, stand east and west, and are divided into three parts. The west end is allotted to the women, who are separated by a lattice, through which they can see without being perceived. The middle of the church is occupied by the laymen, and the east end by the clergy. In their churches they neither sit nor kneel, but when fatigued with standing, they are permitted the use of crutches.

At the election of a patriarch a great sum is always demanded of him by the grand seignior, without whose confirmation, or that of the grand vizier, he cannot enter upon his office. Besides this, and large douceurs expected by the sultana and court favourites, he is obliged to pay an annual tribute, for the raising of which he imposes a tax on the bishops and inferior clergy. Every priest pays him a year's profit of his living, on his entrance upon it. He also reaps emotion by marriage licences and dispensations, as well as by perquisites in all civil causes, in which he is the only judge. His revenue, at a moderate computation, may amount to thirty or forty thousand crowns a year; but the greater part of this sum is extorted from him by the Turkish officers, who also levy on every Christian a poll tax, in consideration of the religious liberty which they are permitted to enjoy.

The revenues of the priests are very small, ten pounds a year being esteemed a good living; and out of this an annual sum is regularly paid to the bishop. They are not allowed to exercise any secular employment, and are distinguished from the laity by a black cassock, and a cap of the same colour, in the form of the crown of a hat. Notwithstanding their poverty they are held in great veneration by the people, who always behave towards them with marks of the highest respect.

#### C H A P. VII.

##### *Of the Turkish islands.*

HAVING traversed the continent of the Turkish empire, we proceed to the description of its islands, which are usually ranked either in Europe or Asia, according to their proximity to the coasts of those great divisions of the globe. We shall begin with Cyprus, as being the most easterly.

#### C Y P R U S.

Cyprus is situate between 32 and 35 degrees of east longitude, and between 34 and 36 degrees of north latitude, sixty miles south of the coast of Caramania or Cilicia, and thirty miles west of that of Syria. It is about a hundred and fifty miles long, and seventy broad. Here is one of those mountains called Olympus, but in the whole island there are no springs or rivers, except such as the rains produce; which happening to be deficient thirty years successively, in the reign of Constantine the Great, the inhabitants were obliged to abandon the place for some time. The usual produce of the island is corn, wine, oil, wool, cotton, salt,

salt, and some silk, with plenty of flesh, fish, and fowl. The merchants of Europe and Asia frequently resorting hither, Cyprus enjoys a brisk trade, but it has so much declined in fertility and populousness since it came into the hands of the Turks, that half the lands at present lie uncultivated.

This island was first peopled from Syria, and divided into several petty states; but Amasis, king of Egypt, reducing the whole, rendered it a province of that country. Many of the maritime parts, however, were afterwards separately occupied by the Phœnicians and Greeks, the latter of whom built Salamis; and the island being again divided into several governments, it was made tributary by Cyrus to the crown of Persia; but the inhabitants revolting under Darius, they joined the army of Alexander, and were of great service to that prince at the siege of Tyre. Some years after the sovereignty of the island was resumed by the king of Egypt, and remained in the possession of the Ptolemies, till it was subdued by the Romans. From this time Cyprus became a Roman province, and, with the Asiatic provinces, fell to the share of the emperor of Constantinople. About the year 641, in the reign of the second Constantine, it was taken by the Saracens, but afterwards recovered, and remained in the possession of the eastern emperor till the year 1107, when Richard I. King of England, being denied water here, he was so exasperated, that he landed his forces, and subduing the island, sold it to the Templars. It continued henceforth in the family of Guy Lusignan, the titular king of Jerusalem, until the year 1423, when it was invaded and rendered tributary by the sultan of Egypt. In this state it remained during fifty years, at which time it was transferred to the Venetians by the will of John, the last king of the island, who paid the tribute of forty thousand crowns to the sultan of Egypt. Selimus, emperor of the Turks, however, invaded the island in 1570, and his successors have ever since remained in the possession of it.

The chief towns are, 1. Nicæssa, the capital, and the seat of the beglerbeg or viceroy. It is situated in the middle of the island, and is about three miles in circumference. 2. Famagusta, the ancient Salamis, a port-town towards the east end of the island, almost opposite to Tripoli in Syria. 3. Baffo, the ancient Paphos, situated at the west end of the island. 4. Sereues, on the north side. 5. Salines, on the south. 6. Lymissa or Amathus, situated likewise on the south coast, and reckoned the best port in the island.

The ancient female inhabitants of Cyprus are represented as prostitutes, and are said to have offered themselves to all strangers who visited their coasts; which perhaps was the reason of the island being dedicated to Venus. No vestiges remain of the temple of Paphos, neither is any thing to be seen of the myrtle grove of Adonis, which once covered the promontory on the east side of the island, now called Capo di Griego.

The Christian inhabitants of this island are generally Greeks or Armenians, of whom the former have still an archbishop in the city of Nicæria.

## R H O D E S.

The island of Rhodes is situate in 28 degrees of east longitude, and between 36 and 37 degrees of north latitude, twenty miles sou h-west of Asia Minor. It is about fifty miles long, and twenty-five broad. This island, anciently sacred to the sun, had the names of Ophinta, Alæria, and Erichrea, and is said to have obtained that of Rhodes, from the plenty of roses which it produces. The climate is temperate and agreeable, and the soil abounds with fruit and wine, but yields not a sufficient quantity of corn for the use of the inhabitants, who therefore supply themselves with this article from the neighbouring continent.

The city of Rhodes, which is the capital, is situated on the north-east coast of the island, and furnished with a commodious harbour. It is about three miles in compass; the streets are wide, straight, and well paved, and in the middle of the largest is a row of white marble stones from the one end to the other. The houses are built of hard stone, and the markets well supplied with all necessaries, which are sold at an easy rate. This city, once one of the most flourishing in Asia, was granted by Emanuel, emperor of Constantinople, to the knights Hospitallers of St. John, after their expulsion from the Holy Land; and in the year 1444, they defended it gallantly against the sultan of Egypt. In 1480, they held out a siege of three months, undertaken by Mahomet II. but in 1522, the island was subdued by Soliman II. after a most obstinate defence by the knights, under the conduct of their great master, Adam. The place is defended by three walls, and the same number of moats, which render it one of the strongest fortresses in the grand seignior's dominions; and hither he usually sends prisoners of state, such as the chams of Tartary, and hospodars of Wallachia and Moldavia, when he suspects their fidelity. The inhabitants consist of Turks, Jews, and Christians, but the latter are not suffered to remain within the walls in the night-time.

At the mouth of the harbour of Rhodes, which is fifty fathoms wide, stood the famous Colossus of brass, esteemed one of the wonders of the world. This huge statue, the work of Chares the Lindian, and scholar of Lysippus, was seventy cubits in height: a foot was placed on each side of the harbour, so that ships passed between its legs. This celebrated image was overthrown by an earthquake fifty six years after its erection.

The Rhodians were the naval power next in consideration to the Phœnicians and Carthaginians. They held out long against the Greeks, but at last became their associates, till soliciting protection against the Macedonians, they submitted to receive a Roman governor. From this time the city of Rhodes was reckoned the greatest nursery for learning in the eastern part of the world. Here Cæsar studied, and hither likewise Tiberius pretended to retire for the same purpose. Upon the division of the Roman empire, this island fell to the share of the eastern emperor. In the year

fort speak Italian, which has been introduced by the Venetians, who were long in possession of the island. The established religion is the Mahometan, though the Christian is tolerated, as in other parts of the Turkish empire.

The earliest accounts of this island are involved in poetical fiction, and the mysteries of the heathen mythology. So far as we can carry our researches into the events of those remote times, it appears that Crete was anciently governed by a king of the name of Saturn, who was dethroned and expelled the country by his son Jupiter, a profligate prince, but to whom, after his death, the people paid divine honours; and this superstition gradually diffusing itself, he became in time the principal god of the whole heathen world.

One of the most memorable occurrences mentioned in the fabulous period of the Cretan history, is the amour of Pasiphaë, the wife of Minos king of the island, who was the son of Jupiter by Europa. Pasiphaë, notwithstanding she had several children by her husband, having an intrigue with one of his officers,

a channel about five hundred paces broad. The smaller Delos is of an oval figure, about six miles in circumference; and the other eighteen. The former of those islands was much celebrated in ancient times, as being the birth-place of Apollo and Diana; in honour of whom public festivals were instituted, to which all the neighbouring islands sent hither priests, sacrifices, and choirs of virgins. The number of the Cyclades, which contributed to those solemnities was at first only twelve, but they were afterwards joined by almost all the islands in the Egean Sea, and in process of time by the inhabitants of Greece, and the countries northward of it. Upon the destruction of Corinth by the Romans, the wealth and trade of that city were removed hither; the merchants being invited to this island, not only on account of the goodness of its ports, and the convenience of its situation between Europe and Asia, but chiefly because of its immunities, and exemption from customs and impositions.

1124, it was taken by the Venetians, but recovered by the emperor of the East, in 1227. About fifty-six years afterwards it was taken by the knights of St. John of Jerusalem, who bravely defended it during the space of two hundred years.

## S C A R P A N T O.

Scarpanto is situate in 27 degrees east longitude, and 36 of north latitude, twenty miles south-west of Rhodes. This is the ancient Carpathus, whence arose the proverb, Carpathius leporem, denoting an inconsiderate action which proves hurtful; hares, which were brought into the island having multiplied so fast as to destroy all the corn.

## C A N D I A.

Candia, the ancient Crete, is situate between 23 and 27 degrees east longitude, and between 35 and 36 degrees north latitude. It is about two hundred miles in length, and fifty in breadth. There is here no considerable river, but many little rivulets, of which Lethe is one of the largest. The highest of the mountains is the celebrated mount Ida, which occupies the middle of the island; the nursing-place of Jupiter, and where his tomb was visited in the time of Varro. Notwithstanding the fine descriptions of it in the ancient poets, it is only a huge barren rock, destitute of trees and herbage.

The air of this island is temperate, and the soil rich and fertile, abounding with corn, oil, wine, and fruits of various kinds. The chief commodities are, muscade wine, malmsey, sugar, sugar-candy, honey, wax, gum, olives, &c.

Crete had once a hundred cities, and was therefore called Hecatompolis. At present, however, there are only three or four, and those not considerable; but there is a number of villages, and the country is well inhabited. The common language of the natives is the modern Greek and Turkish; but most of the better sort speak Italian, which has been introduced by the Venetians, who were long in possession of the island. The established religion is the Mahometan, though the Christian is tolerated, as in other parts of the Turkish empire.

The earliest accounts of this island are involved in poetical fiction, and the mysteries of the heathen mythology. So far as we can carry our researches into the events of those remote times, it appears that Crete was anciently governed by a king of the name of Saturn, who was dethroned and expelled the country by his son Jupiter, a profligate prince, but to whom, after his death, the people paid divine honours; and this superstition gradually diffusing itself, he became in time the principal god of the whole heathen world.

One of the most memorable occurrences mentioned in the fabulous period of the Cretan history, is the amour of Pasiphaë, the wife of Minos king of the island, who was the son of Jupiter by Europa. Pasiphaë, notwithstanding she had several children by her husband, having an intrigue with one of his officers, No. 16.

whose name answered to a bull, was with child by this gallant; when the affair coming to the king's ears, he threw into prison Dædalus, a person who had been accessary to the amour. The latter, however, made his escape, and by the means of sails which he had invented, out-stripping all the boats that were sent to bring him back, he arrived in Sicily; but his son Icarus, not being sufficiently acquainted with the management of his vessel, was cast away.

This Dædalus appears to have been an ingenious man, and the author of several curious inventions. One of those was a labyrinth, into which, whoever entered far, was lost as in a wilderness. Here Minos shut up the Athenian youths whom he required to be sent to him every year, and put them to death; till Theseus, by the assistance of Ariadne, Minos's daughter, found his way out of the labyrinth, after killing those who had been employed to sacrifice the young Athenians.

After the extinction of the regal power, the Cretans formed themselves into a republic, till Q. Metellus conquering the island, made it a province of the Roman empire. It continued under the emperors of Constantinople, till about the year 823, when the Saracens surpris'd and took it, and built the city Candia, which in time gave name to the island. Being retaken by the emperor Nicephorus Phocas, Baldwin, earl of Flanders, and afterwards emperor, gave it to Boniface, marquis of Montserrat, who sold it to the Venetians for a great sum of money. The latter held it above four hundred years, when after a brave defence, it was taken from them by the Turks, in the year 1669.

## D E L O S.

Delos, the center of the islands of Cyclades, is situate in 25 degrees 50 minutes east longitude, and 37 degrees 26 minutes north latitude. There are two islands of this name, called in the plural number Zdeli, the largest of which is also known by the appellation of Rhenia. They are separated from each other by a channel about five hundred paces broad. The smaller Delos is of an oval figure, about six miles in circumference; and the other eighteen. The former of those islands was much celebrated in ancient times, as being the birth-place of Apollo and Diana; in honour of whom public festivals were instituted, to which all the neighbouring islands sent hither priests, sacrifices, and choirs of virgins. The number of the Cyclades, which contributed to those solemnities was at first only twelve, but they were afterwards joined by almost all the islands in the Egean Sea, and in process of time by the inhabitants of Greece, and the countries northward of it. Upon the destruction of Corinth by the Romans, the wealth and trade of that city were removed hither; the merchants being invited to this island, not only on account of the goodness of its ports, and the convenience of its situation between Europe and Asia, but chiefly because of its immunities, and exemption from customs and impositions.

According to the poets, Delos was once a floating island. Thucydides informs us that no dog was allowed

lowed to be on the island, nor a dead body buried in it. The *Problema Delicum* was famous among the ancient geometers. It consisted in doubling the altar of Apollo in Delos, which was a perfect cube; and was proposed to the people of Delos, for a solution, on consulting the oracle how they might be freed from a plague with which they were infested.

There are still upon this island vast heaps of marble ruins, some of which belonged to the temple of Apollo, as appears by the trunk of his statue found amongst them. This statue was four times larger than the life; for the shoulders were six foot broad, and the rest of the body proportionable. His locks hanging round his shoulders are yet to be seen, with marks in each curl, where it is probable that jewels have been set. His girdle also seems to have been richly adorned, and on the left shoulder he wore a light mantle.

On the sides of the hills, are several landing-places, admirably beautified with porticoes and other structures, as appears from the multitude of pillars, pedestals, and architraves, with many fragments of excellent marble, ranging strait and parallel to each other.

In the Greater Delos also are many magnificent ruins, among which are upwards of six score of altars. Most of them are cylindrical, adorned with festoons, interwoven with the heads of oxen or rams. They are usually about three foot and a half in height, and three foot in diameter. On one of them, below the festoons, is represented a bunch of grapes, whence this altar is supposed to have been dedicated to Bacchus. The mountains here, which are not very high, afford excellent pasturage, and the valleys, if cultivated, would produce corn and wine; but this island, as well as the other Delos, is perfectly deserted, except by the shepherds whom the people of Mycone send hither to attend their herds and flocks.

#### M Y C O N E.

The island of Mycone is situate in 25 degrees 6 minutes of east longitude, and in 37 of north latitude, three miles north-east of the Less Delos. It is about thirty miles in circumference, containing very little wood, and hardly a well in the whole country. The soil produces corn, wine, and figs, with a few olives. It is computed that there are about five hundred sea-faring men on the island, who have many of them the reputation of being rovers. The town of Mycone is supposed to contain three thousand inhabitants. Hither the rovers usually bring their plunder, and here they keep their wives and children. The women in general have a greater reputation for beauty than chastity, and their cloaths reach no farther down than a little below their knees.

The inhabitants of this island are most of them Christians of the Greek church, and have magistrates of their own religion; but a Turkish officer comes annually to collect the taxes which they pay to the Porte. Sometimes they are also visited by a *cadi*, who holds a court for determining such controversies as may be appealed from the magistrates. The island contains no less than fifty Greek churches, which have each

their papa or priests; and there is likewise a nunnery, with some monasteries.

#### N A X O S.

Naxos, or Naxia, is situate in 26 degrees east longitude, and 36 degrees 30 minutes of north latitude, sixteen miles south of Mycone. It is of an oval form, about a hundred miles in circumference. There is here but one town, which stands on the south side of the island, and about forty villages, inhabited by Greek and Latin Christians, of whom the former are most numerous. The mutual animosity of those two sects is incredible, and can only be equalled by the extravagant vanity of both. Their discourse turns almost constantly on the subject of their families and pedigree. At the conclusion of the vintage, the ladies may be seen returning from the country with a train of thirty or forty females, some mounted on asses, and others travelling a-foot; one carrying a towel, another a pair of stockings, a third a dish, and each of the rest something else; so that almost all the mistress's cloathing and the furniture of the house are exposed to view. The lady, poorly mounted, makes her entrance into the town at the head of the procession, while the children march in the middle, and the husband brings up the rear. The gentlemen of Naxia seldom visit each other, but amuse themselves chiefly with hunting either deer or other game. The villages are not very populous, the whole inhabitants of the island being computed not to exceed a thousand persons. There are however two archbishops, one of the Latin, and the other of the Greek church; the latter of whom has a handsome revenue, the islands of Paros and Antiparos being also within his jurisdiction.

The inhabitants, as in most of the other islands, elect their governors from among themselves; but are sometimes visited by a *cadi* or Mahometan judge, to whom they appeal as to the last resort. An officer comes regularly every year to collect the taxes, which amount to ten thousand crowns and upwards. Such is the servile disposition of the people, that the meanest Turkish officer who arrives in the island but occasionally, is considered, while he remains, in a manner as governor of the island, and may order whom he pleases to undergo the *bastinado*. The common people, however, both here and in the neighbouring islands pass the time almost perpetually in merriment. They derive their origin from Bacchus, and confirm their relation to that deity by the plentiful use of good wine.

#### P A R O S.

Paros is situate west of Naxia, in 25 degrees 30 minutes of east longitude, and 30 minutes of north latitude. This island is about forty miles in circumference, and produces plenty of corn and wine. The number of families here is computed at fifteen hundred. Meat of all kinds is generally good; and the mutton, which is small, and fed in the houses with fruits and bread, is particularly admired by travellers for its delicate flavour. Paros was anciently famous for its white marble,

marble, as well as for the excellent sculptors, Phidias and Praxitiles, whom it produced. It was likewise the country of Archilochus, the iambic poet. The noblest antiquity here discovered is a piece of marble, on which is engraved the most noted Greek epochs, from the reign of Cecrops, the founder of the Athenian monarchy, to Diogenes the magistrate; including a period of one thousand three hundred years. From this curious monument, which is preserved in the University of Oxford, we learn the foundation of the most famous cities in Greece, as well as the time when the several men lived who were the ornaments of that country.

The Turks repose so much confidence in the Greeks of this island, and some others, that they entrust one of their number with the administration of justice, and do not send hither a *cadi* to determine appeals. Here are several good ports, particularly that of St. Mary; but the Turks usually come to an anchor in the port of Drio, which is on the western part of the island.

#### A N T I P A R O S.

Antiparos, about a mile from Paros, is a flat rock, sixteen miles in compass, covered in some places with a stratum of earth, which produces corn sufficient for three or four score families, that inhabit a poor village about a mile from the sea. Here is little deserving notice, except a grotto about forty fathoms high, and fifty broad. The roof, which forms an arch, is embellished with variety of natural fretwork; and in some places there is the resemblance of bunches of grapes, and festoons, of a surprising length. On the right and left are formed several little closets or cabinets. Among other figures is a large pavillion, formed of parts exactly resembling the roots, branches, and heads of cauliflowerers. Those various representations are of white marble, transparent and crystalized, and many of them covered with a white crust. When struck, they give a sound resembling that which proceeds from copper. There are also several columns of marble, in the form of the trunks of trees, which undoubtedly vegetate. For not a drop of water ever falls into the place; and if it did, we can hardly suppose that a few drops, falling from a height of twenty-five or thirty fathom, would form cylindrical pieces, terminating like round caps.

#### C E R I G O.

Cerigo, or Cithera, is situate in 23 degrees 40 minutes east longitude, and 36 degrees north latitude, near the south-east part of the Morea. It is about fifty miles in circumference, a rocky mountainous country, with a barren soil, and but thinly inhabited. The chief town lies on the south side of the island, but has not a good harbour. This island was sacred to Venus, and anciently contained a temple dedicated to that goddess, in which she was represented in armour, as in Cyprus. It is also said to have been the birth-place of Leda.

#### M E L O S.

Melos, or Milo, is situate in 25 degrees of east longitude, and in 36 degrees 30 minutes of north latitude, about sixty miles east of the Morea. It is of a circular form, and about seventy miles in circumference. The island appears to be a hollow spongy rock, which the sea enters by many subterraneous passages, and mixing with the sulphur that is here found in great quantity, occasions almost continual fires. The surface of the earth being hence warmed, it produces in many places, the best grapes, figs, and melons, of any island in the Archipelago. The fields here resemble so many gardens, being separated from each other by stone walls. Hutehens meat, poultry, fish, and game, are here in great abundance; and though the air be unwholesome, and the situation dangerous, yet the inhabitants discover in their temperament the merry disposition; for which the Greeks have been always noted. They are generally sea-faring men, and serve as pilots to ships which sail in the Archipelago. The greater part are of the Greek church; the bishop of which has a good revenue, and many churches under his care; besides several monasteries: amongst the latter is one on mount Elijah, where there is a glorious prospect of several islands in the Archipelago. A rivulet runs through the gardens, and the convent is surrounded with groves of olives, oranges, and cedar trees; which render it a most agreeable solitude.

With respect to the soil of this island, Aristotle observes, that on digging the earth, the cavity naturally filled up. Of this country was Diagoras, the atheist; hence surnamed *Melius*.

#### S A N T O R I N I.

Santorini, or St. Erini, anciently called Thera and Calista, is situate in 25 degrees 35 minutes of east longitude, and 36 degrees 20 minutes of north latitude, being of the shape of a crescent, and about thirty-five miles in circumference. The island or rock of Therasia, lying between the two points, forms a large and secure harbour, at the bottom of which, as well as at each of the extremities, stands a castle. It is said by Pliny to have been raised out of the sea by a volcano; and this account is confirmed by three adjacent islands being since produced also by the means of subterraneous fire. The inhabitants amount to about ten thousand persons, all Greeks; of whom one third is of the Latin communion, and subject to a Latin bishop. A *cadi*, or itinerant judge from the Turks, visits them here annually, as in some other islands. Most of the people live in caves hewn out of the pumice-stone rocks, which are however covered with a stratum of fruitful earth.

#### T H E R M I A.

Thermia, so called from its hot-baths, lies north-east of Melos. It produces a good quantity of wine, silk, cotton, barley, honey, wax, figs, and other fruit; con-

containing about six thousand inhabitants, of the Greek communion, whose bishop resides at Thermia, the chief town of the island, which appears from the magnificence of its ruins to have been once a noble city.

## Z E A.

Zea, or Ceos, is situate about twenty miles north-west of Thermia, and nearly the same distance east of the continent of Greece. It is about fifty miles in circumference: the only town is Carthea, the residence of a Greek bishop, who has a good revenue. There are also several chapels and monasteries in the island. The soil produces corn and wine; but the chief commodity is silk, which is here manufactured. This was the country of Simonides the lyric poet, and the inhabitants were noted in ancient times for their modesty and sobriety.

## S T A N C H I O.

Stanchio, the ancient Coos, or Cos, is situate in 27 degrees 30 minutes of east longitude, and 37 degrees of north latitude, being about eighty miles in circumference. It is a pleasant and fruitful island, producing great plenty of rich wines, the turpentine tree, and other useful plants, with numerous groves of cypress trees, which are carefully preserved by the Turks. The chief town, bearing the same name with the island, is situated on the eastern coast, and fortified with a castle; having a harbour secured by a good mole, and well guarded from pirates by gallees. The ships from Egypt to Constantinople commonly touch here. This island boasted of Hippocrates and Apelles, and was likewise the country of Philetas, the elegiac poet. The *Vesit Cos*, made of silk, were anciently famous for their fineness and colour. In the suburbs of Cos stood a temple of Æsculapius, once a magnificent structure.

## S Y R A.

Syra lies about twelve miles east of Thermia, and is twenty miles in circumference. It produces corn, wine, cotton, figs, and olives, and contains about six thousand inhabitants, who are chiefly Catholics.

## A N D R O S.

Andros, now called Andro, is situated a little to the south-east of the island of Negropont, and is a hundred miles in circumference. The chief town is called *the port of the lower castle*, besides which there are on the island about forty villages. The inhabitants are computed at five thousand, who are all of the Greek communion, except two or three families. Here is not only a Greek but a Latin bishop, with several priests and chapels, and a proportionable number of monasteries. Most of the people of figure live in little castles to defend them from the rovers, who are numerous in those seas. A cadi, and aga, or colonel of the janizaries, reside here; but the people enjoy the privilege of electing their own magistrates. The

island produces great plenty of wine, oil, and barley; but the principal commodity is silk, by which article the natives make above ten thousand pounds every year. The mountains are covered with arbutus-trees, from the fruit of which they distil a spirit, as well as from the mulberries. The inhabitants live chiefly on goats' flesh; but they have also abundance of poultry, venison, partridges, and other game. It is computed, that some years they pay to the grand seignior in taxes, upwards of fifteen thousand crowns. According to Pliny, this island had a fountain, which yearly, on the nones, or fifth of January, ran with a liquor of a vinous taste.

## T E N O S.

The island of Tenos, or Tine, is situated a little south-east of Andros, and is about six miles in circumference. It produces corn, wine, and fruit, with a good quantity of silk. The inhabitants, who are very numerous considering the extent of the island, are chiefly of the Latin communion, owing to their having been many years under the government of the Venetians. This island anciently contained a large temple of Neptune, and was noted for abounding in the species of viper called *tenia*, which hence derived its name. It is said by Athenæus, that here was a fountain, the water of which would not mix with wine.

## N E G R O P O N T.

Negropont, the ancient Eubæa, is situated a little to the north-east of the coast of Livadia, from which it is separated by a narrow channel called the Euripus, or strait of Negropont. This is the largest island in the Archipelago, being ninety miles long, and about twenty broad. It abounds in corn, wine, fruits, fish, flesh, and fowl. The chief town, called Negropont, the ancient Chalcis, lies on the west side of the island, thirty miles north of Athens or Setines, where the strait is so narrow that it is joined to the continent by a bridge. The walls of the town are about two miles in circumference, but the suburbs, inhabited by the Christians, are of greater extent. On the north-east coast stands the city of Caristo, a populous town likewise, and the see of a bishop. The captain bashaw, or admiral of the Turkish fleet, is viceroy of this island and the adjacent parts of Greece, where he has a deputy, and a fleet of gallees generally lie in this port.

The most remarkable circumstance respecting this island is the tides of the Euripus, which have baffled the investigation of all natural enquirers, from Aristotle to the present time. Those tides are regular from the last three days of the old moon to the eighth of the new. The ninth day they become irregular, and continue so to the thirteenth inclusively. The fourteenth they again become regular, and observe stated periods till the one and twentieth exclusively, when they return to a variable course, in which they continue until the twenty-seventh day. When they are irregular, they flow twelve, thirteen, or fourteen times, and

ebb as often in twenty-four or twenty-five hours; at which times the water is about half an hour rising, and three quarters of an hour falling. But when the tides are regular, they observe the same rule as the tides in the ocean. In the Euripus, however, the tide never rises above a foot or little more.

## S C I R O.

Sciro, formerly Skyros, is situated about twenty miles north-east of Negropont, and is eighty miles in circumference. It is called by the Turks *Salziza Dau*, or the Island of Mastich, on account of the great quantity which it produces of that gum. The soil near the coast is very fertile, but farther up, the country is rocky and barren, yielding only pasturage for goats. The number of inhabitants is computed at one hundred thousand, four fifths of whom are Greeks, and the rest Jews, Turks, and Catholics. Their wealth consists in milk, butter, wine, and silk, of which they make annually to the amount of a hundred thousand crowns.

The city Sciro, capital of the island, lies on the sea-coast, encompassed with good walls and indifferent fortifications. The port is large, but not very safe, the bottom being so soft, that the anchors have not a sufficient hold. Five galleys are constantly stationed here, commanded by an equal number of begs, to each of whom the grand seignior allows twelve thousand crowns yearly, for the charge of the vessels. The houses of the city are built of stone, and have pyramidal roofs covered with tiles. The streets are narrow, paved with pebbles; and the bazars abound with all necessaries, supplied at an easy rate on account of the neighbourhood of *Natolia*.

The mastich of this island, being the best in the world, is entirely appropriated to the use of the grand seignior's seraglio, where the ladies chew it, in order to whiten their teeth, and render their breath more sweet. The tree which produces this gum is slender, and its branches, after bending to the ground, turn upwards: the people make incisions in different parts of the trunk, whence from the beginning of May till the end of June the gum distils upon the ground, which is therefore kept very clean to receive it.

The country produces some cotton, the manufacturing of which affords a subsistence to the poor people; and here is also a considerable quantity of excellent turpentine. Partridges are in great number, and so tame, that they feed all day in the fields like poultry, and at night return to the farmer's house on the call of a whistle.

This island was the country of king *Lycomedes*, where *Achilles*, in the habit of a girl, was educated and lay concealed, to prevent his going to the siege of *Troy*. It was also famous for the exile of *Theseus*, king of *Athens*. It was anciently inhabited by the *Delopes*, a race of robbers, expelled by *Cimon* the Athenian. *Pallas*, who was the protectress of the island, had a temple on the sea-coast, of which some columns yet remaining are supposed to have been a part.

No. 16.

## Æ N G I N A.

*Ængina*, or *Engia*, is situate in the gulph of *Engia*, to which it gives name, in 24 degrees of east longitude, and 37 degrees 45 minutes of north latitude, twenty-one miles east of *Corinth*. It is thirty miles in circumference, and in the chief town, which bears the same name, the number of houses is computed at six hundred.

On the summit of the mountain *Panhellenius* are the remains of a magnificent temple, dedicated to *Jupiter*, and visited from all parts of *Greece*. It was of the *Doric* order. Twenty-one of the exterior columns are yet standing, with two in the front of the *pronaos* and of the *proticum*, and likewise five of those which formed the ranges within the cell. The entablature, except the *architrave*, is fallen. The stone is of a light brownish colour, much eaten in many places, and bearing the marks of great antiquity. In several the junction of the parts is so exact, that they seem to consist of one piece. Digging by a column of the portico of the *naos*, a fragment of fine sculpture was lately discovered. It was the hind part of a griffin of white marble, and probably one of the ornaments which had been fixed on the *freeze*, which has in it a groove, as for their insertion. The temple was enclosed by a *peribolus* or wall, of which some traces are yet extant. The situation of this ruin on a lonely mountain, at a distance from the sea, has preserved it from total demolition amid all the changes and accidents of numerous centuries; and it has a claim to be considered as the most ancient monument of the heroic ages.

This island was the kingdom of *Æacus*, and the inhabitants were called *Myrmidones*, or a nation of ants, from their great application to agriculture. It formerly vied with *Athens* for naval power, and at the sea-fight of *Salamis* disputed the palm of victory with that republic. This rivalry induced the Athenians to an act, that was reproachful to the humanity of a people so much civilized. They passed a decree to cut off the thumbs of all such of the *Æginetæ* as were fit for sea service.

## P O R U S.

*Porus*, another island in the gulph of *Engia*, is eighteen miles in circumference, remarkable only for the banishment of *Demosthenes*, who here poisoned himself to avoid falling into the hands of *Antipater*.

## C O L U R I.

*Coluri*, the ancient *Salamis*, is situated in the same bay, seven miles south of *Athens*, and separated from the continent by a strait about a mile in breadth. This little island, not above ten miles long, and five or six broad, was the kingdom of *Ajax*, the son of *Telemon*, so famous in the history of the *Trojan* war. It was also the country of *Solon*, the celebrated law-giver of *Athens*.

A a a

S T A-

## S T A L I M E N E .

Stalimene, the ancient Lemnos, is situate in 26 degrees of east longitude, and 39 degrees 50 minutes of north latitude, almost equally distant from the coasts of Romania, Natolia, and Greece. It is about thirty miles long, is very fruitful, producing corn, wine, and other necessaries of life; but there is no wood, and hardly any springs in the island. Their trade consists chiefly in the earth called terra Lemnia, famous for its medicinal virtues. On this island, according to the poets, Vulcan fell from heaven, when he was kicked out by Juno for his deformity, and lamed by the fall. He had here a temple, of which no vestiges now remain. This island had once the name of Dipolis, from its containing two towns, into the forum of which, we are informed by Pliny, that mount Athos threw its shadow at the solstice, though distant hence forty-five miles.

## I M B R O S .

Imbros, or Limbros, is situated a little north-east of Lemnos, towards the Thracian Chersonese. It is a mountainous country covered with wood, and has some villages upon it, but produces little worthy of any notice.

## T E N E D O S .

Tenedos, called by the Turks Bosciada, lies opposite to Troas, or Phrygia Minor, about two leagues from the shore. Its situation near the mouth of the Hellespont, has rendered it important in all ages; vessels bound towards Constantinople finding shelter in its port, or safe anchorage in the road, during the Etesian or contrary winds, and in foul weather. The emperor Justinian erected here a magazine to receive the cargoes of the corn vessels from Alexandria, when detained at the island, where the grain was preserved till it could be transported to the capital. During the troubles of the eastern empire, Tenedos experienced a variety of fortune. The pirates who infested those seas, made it for many years their place of rendezvous; and Othman seizing it in 1302, procured vessels, and thence subdued the other islands in the Archipelago.

The port of Tenedos has been enclosed by a mole, of which no part now appears above water, but loose stones are piled on the foundations to break the force of the waves. The basin is encompassed by a ridge of an adjacent mountain. On the south side is a row of wind-mills and a small fort; and on the opposite, a castle by the shore. This was taken in the year 1656 by the Venetians in four days, but soon after abandoned as not tenable. The houses, which are numerous, stand at the foot, or on the slope, of an acclivity, with a flat between them and the sea, formed partly by soil washed down from above. The inhabitants are reckoned to be about six hundred Turkish families, and three hundred Greek.

Tenedos is about fifty miles in circumference; the coast is rocky, but the inland country a good soil, and deservedly famous for wine of an excellent flavour, known by the name of muscadel. The island is said to have received its name from Tennes, or Tenes, who being exposed in a coffer by his father Cygnus, the Thracian, at the instigation of his mother-in-law, was carried by fate hither, where he became king of the country, and at length was worshipped as a god, on account of his virtues. It was also famous for its earthen ware, which was made of an excellent red clay. A law being passed in this island, that persons found in the act of adultery should be put to death, it was soon after executed on the king's son. On the coins of Tenedus, therefore, according to Aristotle, there were two heads, in memorial of the king and his son, and on the reverse an ox; whence arose the proverbial expression, Tenedia Securis, to denote severity in punishment.

## M E T E L I N .

Metelin, the ancient Lesbos, is situate in 26 degrees 30 minutes of east longitude, and 38 degrees 30 minutes of north latitude. It is about sixty miles long, and twenty-five broad. The soil in some parts is rocky, but in others very fruitful, and produces excellent corn and wine. Castro, the chief town, stands on the north side, on a rocky promontory, which forms two ports, both defended by a castle on the hill, and a fort at the foot of it. The castle is well garrisoned, and is an arsenal of stores for the galleys that cruise against pirates. This was formerly a beautiful city, but at present consists only of ordinary low-built houses. It is supposed to have been the ancient Metelin. Here a cadi, or Turkish ecclesiastic, has the administration of the civil government, and an aga of the janizaries commands the soldiers. There are in the island upwards of a hundred villages.

Lesbos was famous in ancient times for the fertility of its soil, the generousness of its wines, and the beauty of its women. It was the native place of the celebrated Sappho; of Pittacus, one of the wise men; and of Arion, who is said to have charmed the Dolphin with his music. Here also Epicurus and Aristotle read lectures on philosophy.

## S C I O .

Scio, the ancient Chios, is situate in 27 degrees 39 minutes of east longitude, and in 50 degrees 20 minutes of north latitude. It is about a hundred miles in circumference. The land is hilly, and though it affords but few springs, and is very little watered with rain, it is nevertheless fruitful, producing corn, oil, honey, wine, silk, and mastic, in great quantity. The wine produced in a district of the island, called the Arvisian Field, has been famous in all ages for its delicious taste and flavour, whence Virgil gives it the name of nectar.

Vina novum fundam calathis Arvisia nectar.

The natives are remarkably gay and merry, and the women very handsome. The chief town, Scio, is pleasantly seated on the west side of the island, and had a good harbour fortified by a strong castle, but now in decay. This town was one of those which laid claim to the birth of Homer, and the inhabitants pretended to shew his school near it. The Genoese were long masters of this place, till they were dispossessed by the Turks.

## S A M O S.

Samos is situate in 27 degrees 30 minutes of east longitude, and 37 degrees 30 minutes of north latitude, on the south-east of Chios, within two leagues of the coast of Ionia. It is about eighty miles in compass, surrounded with rocks; but the inland country produces corn, wine, and fruits, in great abundance. This island was the country of Pythagoras, author of the Italic sect of philosophers. Here formerly stood a magnificent temple of Juno, of which no vestiges remain. Neither meet we now with any of the *vases Samia*, made of earthen ware, which were anciently held in so high repute.

## P A T M O S.

Patmos, now Palmosa, is situate in 27 degrees of east longitude, and in 37 degrees 20 minutes of north latitude. Being mountainous and woody it is therefore not fertile, and is most considerable for its commodious harbour, where ships arrive with provisions, which the island does not sufficiently produce. The sterility of the soil rendering it little frequented, it was used by the Romans as a place of banishment: in which situation St. John resided here, and wrote the Apocalypse.

## C H A P. VIII.

*Of the persons of the Turks—dress—diet—diversions—method of travelling—genius and character.*

HAVING finished their survey of the Turkish territories, we proceed to treat of the inhabitants. As the Turks almost always make choice of wives for their personal accomplishments and beauty, the people are generally handsome, and have in their appearance an air of dignity, which is not a little heightened by their dress, as well as by the gravity of their deportment. The men shave their heads, leaving one lock upon the crown. They wear their beards long, except the officers in the palace and military men, who leave only whiskers on their upper lip. They all wear turbans, usually white, but the family of Mahomet green. A turban contains a whole piece of linen or silk, wound about their heads to the bigness of almost half a bushel, and sometimes adorned with lace or fringe. The greater the quality of the man, the turban is proportionably large. They wear a kind of shirt without collar or wristbands, and over it a long vest tied with a sash, the sleeves close, and reaching

down to their wrists. Above the vest they usually wear a loose coat. Their breeches or drawers are close before and behind, and let down when they water, which the men do in a sedent posture, as well as the women. The stockings are of a piece with the breeches; and instead of shoes they wear yellow slippers, which they always put off in entering a house or temple, but never the turban. They carry their handkerchief, knife, and purse, in their bosoms, and a dagger or poniard in their sash. The women wear on their heads a stiffened cap, not much unlike a mitre, their hair hanging down on their shoulders. The rest of their habit is like that of the men, only they are so veiled when they go abroad, that their faces cannot be seen, and those of quality are carried in close litters or chairs. Neither sex ever alters the fashion of their cloaths, which has remained the same for many ages.

Instead of beds the Turks usually lie on a sofa, or raised floor, at the side or end of the room, on which is spread a carpet or mat, and they cover themselves with a quilt. They use no sheets, but lie in linen waistcoats and drawers, as in other eastern countries.

They generally eat as well as sleep, upon the sofa, which is about a foot and half higher than the area of the room. A small table, covered with a piece of leather, is set upon it for the purpose of holding the dishes, and a towel of blue linen is brought for the company to wipe their fingers. They sit down cross-legged at their meals, and before they eat say a short grace, as "In the name of God;" and at the conclusion of the meal, "God be praised." Their diet consists chiefly of rice, mixed with the soup or gravy of stewed meat. The latter, whether roasted or boiled, is always so much done, that they can pull it to pieces with their fingers. Their grand dish here, and in all the East, is *pilo*, which consists of mutton and fowls boiled to rags; and the rice being boiled perfectly dry, the soup made of the meat, which is very high seasoned, is poured upon it. Those who do not choose rice have cakes baked upon the hearth. Their usual liquors are water, sherbet, and coffee. The common people live much upon cucumbers, melons, roots, and other vegetables, but use the same liquors with those of better condition.

The Turks salute one another by laying their right hand on their breast, and bowing the head a little. They play at chess and drafts for diversion, but never for money, being strictly discharged from the latter by a law of their prophet. Some of them delight in the guitar, and have dancing girls to divert them, but never dance themselves. Their manly exercises are shooting at a mark on horseback and on foot, and throwing of darts, which they perform with great dexterity. They seldom go a-hunting, or use any other rural sport.

Here are no post-houses or carriages to accommodate travellers on the road; but every man rides on his own beast, or procures a firman either from court, or from the beglerbeg of the province, which may easily be had. In virtue of this passport he is provided with horses and entertainment gratis to the end

of his journey. If a person has no firman, he pays ten pence (five pence) for every three miles, but nothing for his guide. Caravanferas, or houses for the entertainment of travellers are erected in almost every village. They are built in a square form, surrounded on the inside with a piazza, beyond which are cells for lodging, as in a monastery. Those apartments are furnished with nothing more than mats or clean straw to lie on. In some of them, however, the traveller is supplied with meat as well as lodging, gratis; but provisions are so very cheap in Turkey, that few accept of this favour. As to poor travellers, they sit down with any of their countrymen whom they see furnished with victuals, without any ceremony; and so hospitable are the Turks for the most part to their own people, that they never consider this freedom as a piece of rudeness.

No regular posts are established in Turkey, but persons may be procured at an easy rate, who will carry letters by express, with care, to any part of the empire.

In general the Turks are disposed to an indolent life, passing their time chiefly either in the harams with their women, or in the shade of a spreading tree, where they solace themselves with sherbet or coffee, and with the chewing of opium, or smoking tobacco. Being prohibited from strong liquors on pain of damnation in the other world, and severe corporal punishments; if the great men sometimes indulge themselves in wine, it must be in private. Though totally destitute of liberal education, they are reputed a sagacious, thinking people; and they are seemingly obliging, without being actuated either by benevolence or gratitude. In their demeanour, they are usually sedate and moderate; but when agitated by passion, untractable and outrageous. On common occasions, however, they are capable of great dissimulation; but self-interest being their supreme good, where this object comes into competition, all other considerations must give way. Jealous and vindictive to an extreme degree, they frequently perpetuate revenge from generation to generation. Though unrestrained in the enjoyment of women, they are addicted to unnatural vice; and in matters of religion, they are tenacious, supercilious, and morose. Amidst all the gloomy features of their character, they pay regard to the laws of hospitality, and perform many charitable acts. They visit those that are confined, and discharge their debts. Where people are burnt out of their houses, which being built of wood are frequently exposed to such accidents, a public collection is made for the relief of the sufferers; and some employ their wealth in building caravanferas for the accommodation of travellers, and in erecting fountains, bagnios, and reservoirs.

The chief principle of Mahometan education is to inculcate to their children a high contempt of all other religions, teaching them from their infancy to distinguish the professors of such by the opprobrious name of *giaur*, or infidel. This habit becomes so inveterate when they arrive at manhood, that they will often follow any obnoxious person in the street, repeating all the while the epithet, and even violently pushing against him. Men of

superior rank will behave with seeming courtesy and complaisance, though more often with an air of stern superiority; but you are hardly dismissed, however civilly, when they honour you with the title of *dumus*, or hog, the animal which they hold the most detestable of the whole creation. This contempt for those of every other religion, is not the effect of prejudice alone, for they consider it as most meritorious in the eyes of God and their prophet. Against so general and violent an antipathy, which frequently breaks forth in the most unjustifiable excesses, nothing else could secure for a moment the life and property of the Christians and Jews who reside among them, than the universal advantage of those people to the country and government, which they chiefly contribute to support by their industry, in agriculture, manufactures, and commerce.

#### C H A P. IX.

*Of produce—manufactures—trade—forces—revenues—government—fraglia.*

THIS great empire extending over so many climates, abounds in variety of produce, which consists of rice, wheat, barley, raw silk, cotton, goats hair, coffee, rhubarb, turpentine, opium, fenna, emeralds, pomegranates, dates, almonds, pistachio nuts, wine, oil, figs, raisins, mother of pearl, sal ammoniac, alum, Roman vitriol, bees-wax, saffron, and gums of various kinds. The principal manufactures are carpets, silk, and leather.

The grand seignior's dominions are the best situated for trade of any country in the world. The Red Sea and the Gulph of Persia render the voyage very short to India and China; and by the Mediterranean, the Egean, and the Black Sea, the Turks might extend their commerce to almost every nation of Europe and Africa. They have timber and naval stores in their own territories sufficient to equip the largest fleets; but for want of application all those advantages are lost. They seldom or never undertake any distant voyage, and the greater part of their traffic is therefore carried on in foreign bottoms; their own vessels doing little more than transporting the produce of one province to another.

It is doubtless much more favourable to the balance of power in Europe, that those fine countries should remain in the possession of the indolent Turks, than that they should be occupied by any of the Christian princes. The trading nations of the West were so sensible of this remark, that when it seemed to be in the power of the Imperialists to drive the Turks out of Europe, as was the case under the conduct of prince Eugene, the English and Dutch interposed, and by their mediation put a stop to the Imperial arms.

The forces of the Turks are of two kinds, namely, a standing army and militia. The former of those consists of the *spahis* and *janizaries*, the one horse and the other foot; and the latter of the soldiers that are levied and paid by the gentlemen of the country, who hold their estates from the prince upon the tenure

of military service. This body of proprietors is distinguished by the name of *Zaims* or *Timarists*, according to the number of men they are obliged to bring to the field.

In time of peace, the usual number of the *spahis*, or horse, is twelve thousand; and they are divided into two bodies, viz. the *Silachtari* and the *Spahoglari*, the former of whom have yellow standards, and the latter red. Their arms were once bows, arrows, and darts, but they now use carbines and pistols. The *spahis* of Asia are usually the best mounted, but inferior in discipline to those of Europe. Their pay is from twelve to a hundred aspers a day, which is about four shillings and two pence of our money. When the grand seignior takes the field in person, he advances to the *spahis* five thousand aspers a man, to furnish them accoutrements. They manage their arms and horses very dexterously; but charge in no manner of order, though with a great deal of fury; so that if their onset be firmly opposed by the enemy, they soon retreat, and can never be induced to rally.

The *janizaries*, who are all foot, compose a more formidable body. Originally they did not exceed seven thousand, but at present the peace-establishment may amount to twenty-five thousand. More than double this number, however, purchase the name and privileges of *janizaries*, who seldom receive pay, or serve in the army. When a young *janizary* is enrolled in the service, he receives from one asper a day to seven, besides his diet. The whole body of efficient *janizaries* is usually stationed at Constantinople, where those who are unmarried live in a particular quarter of the town. They eat in common; and have their clothing provided by the government; but living idly in time of peace, they often grow mutinous, and alarm administration, which they sometimes even overturn. Their disaffection is usually discovered when they come to the divan, whither they are summoned twice a week by their *aga*, or general, and have an entertainment provided for them from the grand seignior's kitchen. If they are under the apprehension of being either oppressed or discountenanced by any minister of the court, they receive the gratuity with the utmost scorn, which they carry to such a length as to throw the dishes upon the floor. When the ministry are apprised of those marks of discontent, they endeavour to conciliate the favour of the troops, by largesses and fair promises, to prevent the disaffection from becoming general; thus maintaining present quiet by a pernicious expedient, the example of which must ever render the public tranquillity more precarious.

Among the *janizaries* marriage is a bar to preferment, on which account the greater part of them live single. They are not remarkable for discipline more than the *spahis*; and like those, their custom is to attack with impetuosity in battle, rather than maintain an obstinate engagement for any considerable time. Both *spahis* and *janizaries* are trained up in the seminaries of the *seraglio*. The former are frequently of Turkish parents, but the latter generally not. Every fifth Christian captive, under fifteen years of age, is reserved for the grand seignior's service; and out of such, after being

No. 16.

instructed in the Turkish language and religion, the body of *janizaries* is recruited. The rest of the slaves are brought up to such employments as are found most requisite for the several royal palaces. The most ingenious are educated for offices in the state; others are made smiths, carpenters, &c. and some are quartered on the estates of the nominal *janizaries* in *Narolia*, whence likewise the corps at Constantinople is frequently recruited.

Though the *spahis* and *janizaries* are the flower of the Turkish army, the militia furnished occasionally by the *Zaims* and *Timariots* are much more numerous. The quota of every *Zaim* in the empire is from four to nineteen men for the land service; and of each *Timariot* only four. They are also obliged to find men, in the same proportion, for the sea-service. Both *Zaims* and *Timariots* are liable to serve in person by land, but only the latter on board the fleet.

The number of infantry furnished by the several provinces in Europe and Asia, amounts to four hundred thousand; and of the cavalry to a hundred thousand and upwards. Besides those, a great number of volunteers serve at their own expence, in expectation of succeeding the *Zaims* and *Timariots* who may fall in battle, many of whose lands are at the disposal of the *beglerbeg* or viceroy of the province. At present, however, such is the corruption among all ranks of officers in the Turkish empire, little or no regard is paid to public services in the distribution of preferment.

The forces of the grand seignior in Egypt amount to eighty thousand men, notwithstanding which his authority is often disputed by the Egyptian princes, the descendants of the *Mamalukes*, who held the government of this kingdom during several hundred years.

Though great part of the Turkish empire be a maritime country, and it abounds in commodious harbours, yet its naval force bears no proportion to what might be expected in so extensive dominions; but should the Ottoman government increase the number and size of their ships of war, a deficiency of seamen must still be experienced, so long as they remain inattentive to the improvement of navigation and commerce.

The stated revenues of the *Porte* arise from the demesne lands, or lands of the crown; from the duties of import and export; the tribute paid by the *cham* of *Crim Tartary*, *Moldavia*, *Walachia*, and the *Grecian islands*; with the poll-tax on the *Christians*, and those who are not of the established religion. But the greater part consists of the presents and annual payments which are made by the governors and other great officers, and the confiscation of their estates when they die or are displaced. For whatever riches they have amassed during their employment fall at last to the grand seignior, who only allows their wives and families a temporary subsistence.

Besides the customary revenue, the treasures of the mosques or churches, which are very great, may be made use of, if there happen to be war with the *Christians*, or any other pressing necessity. As a reserve

in

in extraordinary cases, the emperor has also a private treasure lodged in vaults, where none but the officers of the treasury and the prime vizier ever enter. With all those resources, and a civil establishment rather profitable than expensive to the emperor, an army of five hundred thousand men, entirely supported in time of war by the provinces which furnish them, and with the incumbrance only of the household of the seraglio, the body of efficient spahis and janizaries, and an inconsiderable marine, the revenues of this potentate seem to be equal to the greatest exertions of imperial magnificence and enterprize.

The government of Turkey is vested in the sultan, a prince whose power has been generally considered as absolute, but which we find to be positively limited by religion and law. This monarch, who is likewise styled the grand seignior, or the Porte, assumes several absurd and hyperbolical titles, according to the custom of the East, viz. *The shadow of God, a god on earth, brother of the sun and moon, disposer of all earthly crowns.* As long as he is successful his subjects adore him; but if he prove unfortunate in war, he not only loses his divinity, but is treated with contempt, and frequently deposed. He is never crowned, but is carried from the palace on his accession, and inaugurated at a place called Job, near the walls of Constantinople, where stands the tomb of one of their prophets, which according to their tradition is that of Job.

Over his Christian subjects, who are almost as numerous as the Turks, the grand seignior exercises the most tyrannical authority, as also over the great officers of state, who depend upon him for all that they enjoy; but with respect to his other subjects, he is not more despotic than many Christian sovereigns, perhaps not so much as some of them. The succession to private property is unalterably fixed and regulated by the Koran, and the modes of conveying it established with as much precision as in any part of Europe; at the same time that the Turks have books which they make use of, in other cases, as authorities for their judicial decisions. The obedience of those people to the will of their sovereign seems to proceed not more from any dread of his power, than from veneration for his person and government, which is industriously impressed on their minds in their earliest years. They are taught that it is their duty to leave the world with submission and resignation, when their prince requires it; and that they may assure themselves of seats in paradise, if they make no opposition to the sentence passed upon them. The consequence of those principles is, that when an executioner is sent to bring to the grand seignior the head of any obnoxious person, he hardly ever finds in the devoted victim the smallest effort to resist or evade his fate.

The officers of state are, 1. the grand vizier, to whom the emperor for the most part commits the administration of government both civil and military. The great power and emoluments which accompany this high office render it the object of envy to all those courtiers who are actuated either by ambition or avarice; but the enjoyment of it is extremely preca-

rious, and often terminates in the disgrace, if not in the decapitation of the person who holds it. In the time of peace or war, his station is equally dangerous. During the former, he is exposed to danger from the resentment of the janizaries, ever mutinous and dissatisfied with a pacific administration, under which they consider their own importance as injuriously diminished; and in the latter he is more secretly, but not less dangerously attacked from the quarter of the seraglio, where the sultana-mother, the favourite sultanas, and the chief eunuch, are almost constantly distracting the ear of the grand seignior with their jarring intrigues; or if they happen to unite in their views, their caprice, more active through idleness, is generally directed against the minister, whom, by his possessing the confidence of his sovereign, they esteem as their rival in power. The prime vizier lives in great state, is allowed his guards, gives audience to foreign ministers, and concludes all treaties with them; though, for form's sake, they have an audience with the sultan when they arrive, and another at their departure. The salary of the office is about five thousand pounds, and the perquisites amount to an immense sum; but whatever he has amassed falls in the end to the grand seignior.

There are six viziers of the bench, who are of the prime vizier's council, as are likewise the bashaws of three tails, so called from having three horse-tails or standards carried before them, while the other bashaws have but one. The prime vizier, however, is not obliged to follow the advice of his council, but, after hearing their opinions, is at liberty to determine as he thinks proper. The mufti and civil judges are sometimes consulted in state affairs. The councils of state and the courts of justice are each of them called *divans*. The former is held every day except Friday, at the vizier's palace; and four times a week he holds a divan in the seraglio, to which he goes in great state, attended by the bashaws and great officers in town, and his Albanian guards on horseback. Upon his entering the divan, all that wait in expectation of him prostrate themselves on the ground.

The other officers are, 1. the kizar aga, or chief of the black eunuchs, and keeper of the ladies of the seraglio. 2. The capi agasi, or chief of the white eunuchs, who introduces ambassadors and others to the grand seignior. He has the privilege of wearing a white turbant, and riding on horseback in the seraglio, and attends the emperor to the door of the sultana's apartments, but no farther, the ladies being left to the care of the black eunuchs. 3. The noza de bachi, or governor of the forty pages of the bed-chamber. 4. The feras agasi, who takes care of the repairs and furniture of the royal apartment. 5. The hospodar bachi, who has the charge of the sultan's private treasure or purse. 6. The kilargi bachi, who superintends the confectioaries, kitchens, cellars, &c. 7. The dogandi bachi, or grand falconer. 8. The kokadar, who puts on the emperor's vest. 9. The kikabdar, who holds his stirrup. 10. The selistar, or sword-bearer. 11. The hummangi bachi, or keeper

of the baths. 12. The kiamica bachi, who has the care of the linen. 13. The geritbeg, who teaches the exercise of the bow and lance.

The officers without the seraglio are, 1. The caimacan, or governor of Constantinople, who is the prime vizier's representative in his absence. 2. The aga, or general of the janizaries, whose power is exceeding great. 3. The chiaux bachi, or chief of the chiauxes, who are messengers of the court, and employed sometimes to take off the head of a bashaw in any of the provinces.

In every large province or beglership are three great officers, viz. the chief priest, who is judge; the reis-effendi, in whom the offices of chancellor and secretary of state are united; and the tefedar or treasurer, who are all of the beglerbeg's council.

There being no hereditary nobility in Turkey, the governors of provinces are seldom ever succeeded in their posts by their children; nor are any of the great offices of government ever given to native Turks, but to the grand seignior's slaves, taken in war, or purchased young, and educated in the seraglio; who having no personal connections in the country, are not likely to enter into a conspiracy against their sovereign. The more effectually to preclude such an event, however, it is a maxim of the court to change their governors often, before they can have time to render themselves popular in the province. This end is yet farther answered by obliging those officers to make frequent presents to the sultan; for the refundment of which they fleece and oppress the people, rendering themselves rather odious than acceptable to those whom they govern.

Amid such general rapacity of the governors, and the inadequate resources of a nation constitutionally averse to industry, and discouraged from the prosecution of extensive commerce, the necessities of the people, it might be supposed, would often produce dangerous commotions. But the cheapness of provisions compensates in great measure the want of affluence; and the empire seems to be so firmly founded on the basis of religion, united with general enthusiasm and the vanity of individuals, that, as with all its political defects it has lasted for ages, it bids fair for stability and permanency.

All the officers of state are usually taken from among the youths who receive their education in the seraglio, the number of whom is very great. The practice in this seminary is to teach them silence; a modest behaviour, and the principles of the Mahometan religion. They are also instructed in the Turkish, Arabian, and Persian languages. Those who are intended for the army learn their military exercises, and such as are designed for public employments, are educated accordingly. We are informed that the youths in the seraglio never having the sight of a woman, frequently fall in love with one another. To this whimsical passion they give the name of Platonic love; but it is said to terminate often in an unnatural commerce, from which the severest punishments prove insufficient to restrain them.

The seraglio is supplied from time to time with young blooming beauties, taken in war, or purchased

in Georgia and Circassia, but chiefly selected by the governors of provinces in the different parts of the empire. When admitted into the seraglio, they are taught music and dancing, and whatever may render them most agreeable to the grand seignior. Amongst those ladies, an unaccountable passion for each other is said likewise to prevail.

There is always in the seraglio a number of deaf and dumb persons, some of whom constantly attend the emperor; and dwarfs that act the part of buffoons, are still retained in this court.

The pride and ostentation of the Turkish court are fully displayed in the ceremonies attending the audience of an ambassador. The first opening of the ambassador's function is to the vizier. At this interview, they both seat themselves, the ambassador on a stool, and the vizier on the corner of his sofa. Mutual civilities pass between them, without any variation in language since the empire began. The ambassador is told, "that as long as his master observes the laws of friendship with them, the grand seignior will correspond." The honours of the castan, sweet-meats, coffee, sherbet, and perfumes, are presented to him; but when he departs they clap their hands, and hiss him out of the room; while two officers who attend him, one on each side, attempt at half-way, to make him turn and salute the vizier, who never stirs off his sofa. He who forgets his character may be surprised into this compliment; but he who does not, keeps on his pace, and drives his leaders before him.

On an occasion that offered of adjusting the ceremonial with an ambassador who thought himself offended, this usage was redressed, and it is to be hoped continues no longer.

The time appointed for the ambassador to be over the water from Pera, is the morning, at the break of day. On his landing, he is received by the chiaux bachi, or marshal of the court, in a house destined for the purpose, the stairs of which are no better than a ladder, and the room exceedingly mean. It is seldom that the chiaux bachi is there at the ambassador's arrival; but the common excuse is, that he is detained in the mosque at his prayers.

When the first civilities are over, an insinuation is made to the ambassador, that he must expect the chiaux bachi will ride at his right hand. This part of the ceremony, long contested, but never given up by the Turks, except when they have been forced to relinquish it, leaves to the ambassador no other resource than that of entering a protest; insisting, however, that a gentleman of his retinue shall ride at his left. This claim, if urged with resolution, generally succeeds; though it has been productive of much altercation and disorder in the march, and sometimes almost of a suspension of the audience.

After waiting some time in a miserable chamber at the water-side, a message arrives from the vizier to let them know that he is ready to proceed to the seraglio. The cavalcade then begins, and marches in state to the vizier's door, where, whether it rains, hails, or snows, the ambassador must remain on horseback in the open street to see his pomp, and to salute his high-

ness and his whole court as they pass by. When they are near the gate of the seraglio, the ambassador's train advances slowly, and on his arrival he finds the vizier seated in the divan-chamber.

In the middle of this apartment, an old square stool is placed for the ambassador; and he is there fixed, if the stool can support him, at least for two hours, bearing the decision of causes he does not understand; though if it be pay-day for the janizaries and spahis, and such an opportunity is generally taken, he is entertained with seeing about two thousand four hundred yellow bags of money told out and distributed, which may employ them upwards of two hours more.

A new scene then succeeds, and the dinner is served. The ambassador continues to sit on his stool, and the vizier on his elevated sofa; a round table is placed between them, at each side of which is laid a handkerchief folded up to wipe the mouth and hands. Fifty dishes, succeeding each other every half minute, come in like a torrent; a principal servant stands near the ambassador with his arms bare, whose office is to tear a fowl in pieces, and to lay the choicest morsels of it before them, all which he performs with his fingers. He commends without ceasing the excellent dinner, whilst the vizier presses his guest to eat, and perhaps enters into a familiar conversation with him. To conclude the repast, one draught of sherbet is served.

The grand seignior all the while peeps through a dark window to see the whole entertainment, and as soon as it is over retires to his audience room.

The chiaux baschi enters with his talkish, or order in writing, to the vizier, to acquaint him that the monarch is on his throne. He receives it with the utmost submission, first touching his forehead with it, then kissing it, and having read it, puts it into his breast, and departs.

After his departure, the ambassador is told that he must cross the court-yard to go to the audience: he is preceded by the chiaux baschi with all his officers and attendants richly clad. He does not, however, immediately enter the audience-room, but is stopt in the court-yard, where, under a tree, by way of bench, is a single old board, on which at other times, the menial servants in the seraglio lie to sun themselves. On this, whether wet or dry, clean or dirty, he is desired to sit till he be vested with the castan. When the ceremony of vesting is over, two capigis baschis seize him by the shoulders, and conduct him to the audience. He finds the sultan in a corner of the apartment, placed on his sofa, higher by much than common, and covered with a canopy, his legs rather hanging. At his side lies a rich sword, and some regalia. He eyes the ambassador askew, and hears his harangue; a copy of which has been given before to the vizier, translated by the drugoman, or interpreter of the Porte; who, after the ambassador has done, repeats it extempore, in the Turkish language, to the grand seignior. When this is finished, the latter speaks a few words to the vizier, who advances towards the middle of the room, and answers the ambassador in their usual common-place style. This

the interpreter explains, and the ambassador is dismissed. Another ceremony, however, awaits him to render the day yet more tedious. After mounting his horse, he is stopped in the second quadrangle of the seraglio, and obliged to wait under a tree, until the vizier passes before him on his return home; after which he is permitted to depart.

## C H A P X.

### *Of the religion of the Turks.*

THE religion of the Turks is Mahometanism, but different from that which prevails in Persia. Mahomet leaving no sons, both those nations derive their spiritual as well as temporal authority from Hali, the husband of his daughter Fatima, or from Abubeker, whose daughter Mahomet married. The Persians preferring the doctrines of Hali, and the Turks those of Abubeker, and charging each other with corrupting and misrepresenting the Alcoran; those two great sects retain stronger mutual prejudices, than they do either against the Jews or Christians; and when they are at war, both nations call the war *the cause of God*, and seldom or never give quarter to one another in battle.

Among the Turks there are four sects which differ only in ceremonials. The first is called the Hannisses, who chiefly inhabit Turkey and Tartary; the second the Shaffees, of which are most of the Arabian tribes; the third the Melchees, who possess the coast of Barbary; and the fourth the Hambelles, who are a small tribe of Arabians.

All the Mahometans, except the Persians, are of one or other of those sects, which are however divided into a multitude of inferior sectaries, distinguished by the names of their respective leaders.

The Mahometans have their dervises, or friars, and convents, as well as the Christians. Those men go meanly clothed, put on a dejected look, fast, pray, and perform penances as the Roman catholics, and have strings of beads by which they number the prayers they repeat. On Tuesday every week, the superior of the convent preaches or expounds part of the Alcoran to them, at the conclusion of which the monks, having made a profound reverence to their superior, fall into a dance, turning round with great agility to the music of a flute, which has however a very doleful sound. Such as it is, this instrument is used by few, the Alcoran prohibiting all but vocal music in their devotions. For the same reason it is, that they ring no bells to call the people to prayers, but summon them from the minarets or steeples of the mosques.

Besides the ecclesiastic recluses, there are many hermits, who go naked, and suffer their hair to grow down to their waists. Those persons are in a manner adored by devout people, and in some parts of the empire take upon them to screen criminals from justice.

The high priest of the empire is the musti, who has the power of appointing all civil magistrates, their civil and ecclesiastical laws being in effect the same. The Alcoran, and the comments upon it, are the rule by

he neither salutes, converses, or takes notice of any person. No accident can divert him from his prayers; nor may he spit, cough, or rub himself; or if he has been unavoidably defiled by any of those, he must immediately wash, and return to his devotion. Until they begin to pray, they sigh and groan incessantly. The priest opens with the praises of God, all the people following him, and imitating his actions as well as repeating his words; but both prayers and praises are very short.

During the whole Ramazan, or their Lent, which continues a month every year, no person will eat, drink, or smook before sun-set; from which time till the morning, all the towns, and particularly the mosques, are illuminated. After this season they perform the pilgrimage to Mecca, which appears to be the main basis of the Mahometan religion. On this journey the caravan of Damascus, composed of the pilgrims from Europe and Asia Minor, the Arabian, and the principal one from Cairo, then set out. They all have their stated time of departure, and their regular stages. That from Cairo begins the journey thirty

No. 17.

the Mount of Forgiveness, which is about two miles in circumference. Here, according to their tradition, Adam and Eve met, after they had been separated forty years. The eve of the day of sacrifice, the three caravans, each ranged in a triangular form, environ this mountain, and spend the whole night in tumultuous rejoicings. In the morning a profound silence succeeds, they slay their sheep, and offer up their sacrifice on the mountain, with all the marks of the greatest devotion.

On a sudden a scheik, or fantone, rushes from amidst them, mounted on his camel, and ascending five steps, rendered practicable for that purpose, he addresses the people in a set harangue; on the conclusion of which the auditors salute the mountain, and depart.

The religion of the Mahometans is a complication of the basest and most infamous forgeries, with a train of superstitious degrading to the human mind, and which being substituted in the place of essential duties, are directly subversive of every virtue.

which they judge of all matters, unless in some extraordinary cases, where the temporal power thinks fit to interpose its authority. The grand seignior scarcely ever alters or reverses the sentence of the mufti; and without his *sesta*, or fiat, no important resolutions are taken, either in regard to peace or war; but if he refuses to ratify or confirm any favourite object of the ministry, he is deposed, and a more obsequious person appointed in his room.

Next to the mufti there are three other judges, of the ecclesiastical order, who have the title of *cadilif-quier*, and are appointed respectively to the provinces of Romania, Natolia, and Egypt; nor can any person be advanced to the rank of mufti, who has not passed through one or other of those offices.

There is besides in every province a *mollah cadi*, or chief judge, to whom the people may appeal from any inferior tribunal. But notwithstanding the ecclesiastics are the only legal judges, the *beglerbegs* and governors of towns and provinces take upon them to inflict punishment, and even death, without allowing the accused person any trial.

The *imams* or priests, who officiate in their mosques, are not appointed by the mufti or any ecclesiastic, nor are they subject to their controul. Any person who can read the Alcoran, and has the reputation of an honest man, may assume this office, on the recommendation of the people of the place to the governor of the town or province, when a mosque is vacant; and as the consent of the governor is necessary towards admitting one to officiate as a priest, so he likewise may dismiss him at pleasure; or the priest may leave his cure, and again become a layman, if he thinks fit. The *imam* reads some part of the Alcoran every Friday, which is their sabbath; but seldom preaches, this being the business of the sheiks, who have usually their education in the convents.

When a Mahometan enters a mosque, he puts off his shoes instead of his cap; and while he is there, he neither salutes, converses, or takes notice of any person. No accident can divert him from his prayers, nor may he spit, cough, or rub himself; or if he has been unavoidably defiled by any of those, he must immediately wash, and return to his devotion. Until they begin to pray, they sigh and groan incessantly. The priest opens with the praises of God, all the people following him, and imitating his actions as well as repeating his words; but both prayers and praises are very short.

During the whole Ramazan, or their Lent, which continues a month every year, no person will eat, drink, or smoke before sun-set; from which time till the morning, all the towns, and particularly the mosques, are illuminated. After this season they perform the pilgrimage to Mecca, which appears to be the main basis of the Mahometan religion. On this journey the caravan of Damascus, composed of the pilgrims from Europe and Asia Minor, the Arabian, and the principal one from Cairo, then set out. They all have their stated time of departure, and their regular stages. That from Cairo begins the journey thirty

No. 17.

days after Ramazan, and arrives in forty days, just before the *corban*, or great beiram of sacrifice. Five or six days previous to that festival, the three caravans, consisting of about two hundred thousand men, and three hundred thousand beasts of burden, unite and encamp at some miles from Mecca. The pilgrims form themselves into small detachments, and enter the town to perform the ceremonies preparatory to that great one of sacrifice. They pass through a street of continual ascent, until they arrive at a gate on an eminence, called the Gate of Health. From this station they behold the great mosque, which encloses the house of Abraham, and this they salute with the most profound devotion, repeating twice, *Salam Alih Irfoul Alla*, that is, "peace be with the ambassador of God." Thence, at some distance, they ascend five steps, to a large platform faced with stone, where they offer up their prayers. They next descend on the other side of it, and advance towards two similar platforms, separated a little from each other, through which they pass with great silence and devotion.

This ceremony must be performed seven times.

They afterwards proceed to the great mosque that encloses the house of Abraham, and entering it, walk seven times round the little building which it contains; saying, "This is the house of God, and of his servant Abraham." Then kissing with great reverence a black stone, said to have descended white from heaven, they proceed to the well called *Zun-Zun*, and plunge into it with all their cloaths, continually repeating, *Toba Alla, Toba Alla*, "Forgiveness God, forgiveness God." Then drinking a draught of that fetid turbid water, they depart.

The duty of bathing and drinking they are obliged to pass through once; but those who will gain paradise before the others, must perform it once a day, during the stay of the caravan.

About fifteen miles from the town of Mecca, is a hill, or small mountain, called *Ghiabal Arafata*, or the Mount of Forgiveness, which is about two miles in circumference. Here, according to their tradition, Adam and Eve met, after they had been separated forty years. The eve of the day of sacrifice, the three caravans, each ranged in a triangular form, environ this mountain, and spend the whole night in tumultuous rejoicings. In the morning a profound silence succeeds, they slay their sheep, and offer up their sacrifice on the mountain, with all the marks of the greatest devotion.

On a sudden a *scheik*, or *fantone*, rushes from amidst them, mounted on his camel, and ascending five steps, rendered practicable for that purpose, he addresses the people in a set harangue; on the conclusion of which the auditors salute the mountain, and depart.

The religion of the Mahometans is a complication of the basest and most infamous forgeries, with a train of superstitions degrading to the human mind, and which being substituted in the place of essential duties, are directly subversive of every virtue.

## C H A P. XI.

*History of the Turkish empire.*

**T**HE Turks were originally a tribe of Scythian shepherds, who led an itinerant life, wandering from place to place with their flocks and herds, but residing chiefly north of the Palus Mæotis and the Euxine Sea. In the eighth century they travelled southward, and settled in Georgia, between the Euxine and the Caspian Sea, where, after remaining about two hundred years, they removed farther south into Armenia, to which they gave the name of Turcomania. The sultan of Persia, endeavouring at this time to render himself independent of the Saracen caliph of Bagdat, solicited the aid of the Turks, who sent him a reinforcement of troops under the command of Tangrolipia, by the assistance of which he obtained a complete victory over the Saracens. The Turks afterwards made themselves masters of Bagdat, and subdued Persia, as well as the northern provinces of Arabia. At this time they were Pagans; but Tangrolipia, their leader, in order to gain the affection of his new subjects, professed himself a Mahometan, in which his example was copied by the greater part of his followers.

The Turks proceeded to invade the territories of the Grecian emperor in Asia Minor, and divested him of several cities; while the Saracens likewise prosecuted their conquests in Syria, Palestine, and Egypt. The emperor of Constantinople finding his frontiers exposed to the perpetual ravages of the confederates, implored the assistance of the powers in the west of Europe to put a stop to their progress; the Christians of Palestine, then grievously oppressed by the Mahometans, requesting likewise their protection in the strongest terms. The application of the latter was so well received by the pope and clergy of Rome, that they exerted all their influence in the several nations of Christendom, towards exciting them to rescue the Holy Land from the possession of the infidels. This gave rise to the memorable war of the Crusades, which displayed the romantic piety, but disgraced the wisdom of those times.

The chief of those who engaged in this expedition were Hugh, count of Vermandois, brother to the king of France; Robert, duke of Normandy, son of William the conqueror; Raymond, count of Toulouse; Robert, count of Flanders; Stephen, count of Blois and Chartres; Godfrey of Bouillon, duke of Lorraine, with Eustachius and Baldwin his brothers, and an infinite number of inferior nobles and gentlemen, who drew after them almost whole provinces. The disorder accompanying this tumultuous concourse of different nations was equal to the fanaticism which inspired them. Besides those who went as soldiers, old men, women, children, and ecclesiastics, all embarked in the enterprise. This immense multitude began its march in the year 1096; but having been totally improvident for their subsistence on the journey, as if they had expected the miraculous interposition of heaven in their favour, one half of them perished

through famine, fatigue, or sickness, before they had reached the eastern boundaries of Christendom. When they arrived at Constantinople, however, they yet appeared so numerous, that they put the Grecian emperor into the utmost consternation, who began to entertain greater jealousy of this prodigious emigration than he did of the infidels. Instead of joining them with his forces, therefore, he took every opportunity, underhand, to involve them in difficulty and distress; though prudence required that he should grant his assistance in transporting them over the Hellespont. When they landed on the Asiatic shore, they were found to be still near a hundred thousand horse, and almost twice that number of foot.

The first object of their operations was to lay siege to Nice in Bithynia, almost opposite Constantinople, and the usual residence of sultan Solyman. The sultan, who was then absent, marched to the relief of the town; but his troops being defeated, the place surrendered by capitulation, and was put into the possession of the Grecian emperor, in consequence of a previous agreement.

From Nice they proceeded to Antioch, the capital of Syria, when Solyman opposing their march with an army of two hundred thousand men, the Christians gained a complete victory, and at the same time became masters of his camp, which was reputed exceeding rich. Having subdued great part of the territories which the infidels had taken from the Grecian emperor in Asia Minor, and possessed themselves of Antioch, they dispatched a messenger to that monarch, requesting that he would join them with his forces, according to the articles of a treaty subsisting between them. With this demand, however, the emperor refused to comply, upon the pretext that they had not delivered Antioch into his hands; in consequence of which denial, they resolved for the future to act independently of him.

Leaving Antioch they continued their march to Jerusalem, which they immediately invested; but their number was now so diminished, that it is said they did not amount to more than fifty thousand men; a force not superior to the army which garrisoned the place. But a reinforcement arriving of English, Normans, Flemings, and Genoese, they made an assault upon the outer wall, which they carried sword in hand. In a succeeding attack, meeting with an obstinate resistance, which induced them to give way, they were animated to renew their efforts by Godfrey of Bouillon, who pretended that he had seen a horseman descend from the clouds, and assured them that heaven fought on their side. Such was the effect of this artifice on their minds, that, repeating the assault with fresh vigour, they took the city by storm. The celebrated leader, to whose zeal and activity this event had been owing, and who had distinguished himself by his conduct through the whole expedition, was by universal consent crowned king of Jerusalem. He afterwards reduced Ptolemais, Cesarea, Antipatria, Askalon, and other cities; but did not live to enjoy his prosperity more than the space of a year.

Baldwin, surnamed Brugenis, governor of Edessa, and cousin of the late king, was unanimously elected

in his room, in the year 1100. He took from the infidels the strong city of Tyre, and afterwards obtained three signal victories. He also laid siege to Damascus; but a sickness breaking forth in his army, he was obliged to raise it, and dying after a reign of thirty years, he was succeeded in the kingdom of Jerusalem by Fuik, earl of Anjou, who had married his daughter Melesinda or Margaret.

During this reign divisions happened among the Christians, of whom the different parties sometimes sought the assistance of the infidels, with the view of over-powering their rivals. The Greek emperor likewise laid siege to Antioch, which he claimed as a part of his dominions; and the confederates were obliged to consent that Raymond, earl of Poitou, the governor, should hold that city of the Greek crown. Fuik having reigned eleven years, was killed by a fall from his horse as he was hunting; and leaving two sons, Baldwin and Almerick, the former, who was the eldest, was elected by the Christian princes to succeed him on the throne. Baldwin, at his accession, being only thirteen years of age, his mother was joined with him in the administration of government. The Christians, who had now been in the possession of the Holy Land, and the adjacent countries, more than forty years, had established four considerable states, namely, that of Edessa, which comprehended the countries on the banks of the Euphrates, the district of Tripoli, the district of Antioch, and the kingdom of Jerusalem. Had the princes of those several territories continued unanimous, they might probably have bid defiance to all the power of the Mahometans; but falling out with each other, Sanguin, sultan of Aleppo, and afterwards Noradin his son, availed themselves of their disputes, and recovered most of the conquests which the Christians had made in the country. Those events induced the king of Jerusalem and the prince of Antioch to request fresh succours from Europe, which gave birth to the second crusade.

In this enterprize, which happened in the year 1147, Conrad, emperor of Germany, embarked in person, at the head of a fine army of a hundred thousand men. But the Grecian emperor having joined to oppose him, he lost great part of his troops, by famine and the sword, as well as by sickness, and returned without being able to perform any memorable achievement.

Another crusade was soon afterwards put in motion by Louis the seventh, king of France. This prince carried with him his queen Eleanor, heiress of the duchy of Aquitain; but discovering her to be guilty of some criminal amours at Antioch, he divorced her, and immediately abandoning the enterprize, returned to his own country.

Mean while Saladin, sultan of Damascus, who had made himself master of Egypt in the year 1173, observing great divisions among the Christian princes in Palestine, besieged and took Jerusalem in 1187, after it had remained in the hands of the Christians eighty-nine years. He also made himself master of Antioch; and the most of the towns which the Christians had taken were surrendered to the Turks. The flame of

the holy war, however, being not yet extinguished in Europe, Frederick, emperor of Germany, and several princes of the empire, engaged in another crusade. Arriving in Asia, they gave battle to the Turkish sultan of Iconium, and obtaining a complete victory, took that city by storm. The emperor likewise defeated the sultan in a subsequent action; but attempting to pass a river in the pursuit of the enemy, he was unfortunately drowned. His son Frederick, who, on the death of his father, was proclaimed emperor by the army, recovered the city of Antioch, and had laid siege to Acon or Ptolemais, when the plague making great havoc among his troops, and himself dying of the disease, the Christians in Palestine were again reduced to a very critical situation. In this extremity Richard I. king of England, and Philip Augustus, king of France, were prevailed upon by the pope to undertake another crusade. This expedition commenced in the year 1190, and the armies were transported by sea to the Holy Land. The two kings conducting themselves rather like jealous rivals than cordial allies, agreed only in the operation of besieging Acon or Ptolemais, of which they made themselves masters. Soon after this event the French king returned to Europe, and invaded the king of England's dominions in Normandy. The latter receiving advice of this transaction, hastened to oppose him; but in his passage through Germany, was made prisoner by the emperor, where he was seized, and detained above a year, through the intrigues of the French king, and afterwards obliged to pay a great ransom for his liberty.

The situation in which the Christians were left in Palestine by the precipitate retreat of those two princes, obliged them again to solicit the protection of Europe; and another effort was therefore made for the effectual recovery of the Holy Land. When the forces that embarked in this expedition were arrived at Constantinople, where they expected to have been joined by the eastern emperor, they found an usurper upon the throne, who opposed their passage into Asia. Irritated at this obstruction, they laid siege to Constantinople, and took the city by storm, in the year 1200. The commanders of the Christian confederates elected Baldwin (earl of Flanders and Hainault) emperor of Constantinople, by whose influence the Greek church was induced to adopt the rites and ceremonies of the Latins, and acknowledge the supremacy of the pope. The new emperor however had only part of the European provinces under his dominion, viz. the city of Constantinople and the province of Thrace. To the Venetians was allotted the island of Candia or Crete, with all the islands in the Ionian sea: the marquis of Monferrat obtained Thessaly and part of Peloponnesus, with the title of king: Godfrey of Troyes, a Frenchman, was constituted duke of Athens, and prince of Achaia: the duke of Blois likewise was nominated to a duchy; and various other adventurers obtained territories, all which however they were to hold of the emperor Baldwin, as their supreme lord. With respect to the Asiatic dominions, the family of the Greek emperors was permitted to make a partition of them.

Adria-

Adrianople, the second city of Thrace, still remaining in the possession of the Greeks, Baldwin laid siege to it. On which the Greeks inviting the Tartars to their assistance, the latter advanced to their relief, and skirmished several days with the besiegers. At length the Christians being led into an ambuscade, were entirely defeated, and Baldwin the emperor made prisoner. The enemy having inhumanly cut off his hands and feet, left him in the field to perish, where he died three days after, in the thirty-third year of his age, and before he had reigned a complete twelvemonth.

On the death of Baldwin, the confederates elected his brother Henry, emperor of Constantinople, who, with the assistance of the king of Thessaly (marquis of Monferrat), recovered all the places the Tartars had taken in Thrace, and drove them out of that province.

The most formidable of the Mahometan powers at this time, was the sultan of Egypt, who had possessed himself of great part of Palestine, as well as Jerusalem. It was therefore determined, at a council of war held in the island of Cyprus, to attack this potentate in his African dominions. In pursuance of which resolution, about sixty thousand Christians, under the command of the king of France, set sail for Egypt in the year 1249. In four days they arrived within sight of Damietta, then one of the strongest towns in Egypt, and situated at the mouth of the most eastern branch of the Nile. Here they found a great body of the infidels assembled to oppose their landings; but upon the first charge, they mostly dispersed, and the Christians effected their design with very little molestation. A rumour being spread in the Mahometan army, that the sultan was dead, the garrison retired from Damietta without waiting the approach of the enemy, and the Christians immediately took possession of that important fortress. A supply of forces arriving from France, Lewis, leaving the queen with a good garrison at Damietta, began his march towards Grand Cairo, with an army of twenty thousand horse, and forty thousand foot. The infidels avoided a general battle; but so harassed the Christians in their march, and cut off their provisions, that in the space of three months the latter had hardly been able to advance forty miles. An epidemic distemper which broke forth among the troops, likewise greatly diminished their numbers, and those who had not been seized with the contagion, were however much impaired in their health. In this situation, while the van was separated a good distance from the rear, the Mahometans fell upon them, and gave them a total defeat. The greater part of the Christian army perished in the field, and such as escaped the slaughter were made prisoners of war, among which number was the king. It was debated in the Turkish councils whether they should not massacre all the unfortunate captives, to deter the Europeans for the future from undertaking those romantic expeditions; but the prospect of emolument from the ransom of many considerable men, prevailing over their revenge, they agreed to give the king and his people their liberty, upon condition of delivering up Damietta, and paying

such a sum as the utmost resources of France could with difficulty furnish.

The miscarriage of so many successive and ruinous enterprises had not yet extinguished that ardour which animated the Christian powers, towards expelling the infidels from the Holy Land. Another crusade was undertaken in 1270, in which prince Edward (afterwards Edward I. of England) was engaged, who landed at Ptolemais in the beginning of the subsequent year. Not meeting however with the support he had expected, after remaining in Palestine a year and a half, he returned to England. Immediately on his departure, Alphis, or Elpis, sultan of Egypt, assembled a great army, and invading Syria, made himself master of Tripoli, afterwards reducing to his subjection Sidon, Bezetus, and Tyre, with all the other towns which the Christians possessed, except Ptolemais. He consented however to a truce for five years with the garrison of this city, which was not well observed by the Christians. For having received some succours from Europe, they plundered the adjacent country, then under the dominion of the sultan of Egypt, who, upon their refusing to make any satisfaction for this outrage, laid siege to the city. The sultan soon after died, but his son Araphus, continuing the warlike operations, took the place by storm, and gave the plunder of it to his soldiers. This event was succeeded by the entire expulsion of the Christians from Palestine, which they never more attempted to invade.

Cassanes the Tartar, sovereign of Persia, soon after revenged the quarrel of the Christians on the sultan of Egypt, defeating his army, and recovering most of the towns he had taken in Syria and Palestine. He even rebuilt Jerusalem, at the instance of his queen, who was a Christian and a native of Armenia; offering likewise to join the Christian princes, and establish them again in the Holy Land. But most of the latter being at that time occupied with wars in Europe, the proposal was not accepted, and Cassanes retiring into Persia, the sultan of Egypt again invaded Syria and Palestine, and recovered all he had lost. Aladin, at this time prince of the Turks, dying without issue, the Turkish lords, upon the retreat of the Tartars into Persia, divided the country among themselves; of whom Ottoman, the son of Erthogru, was the chief. During the wars between the Turks and Tartars, Theodorus, the Greek emperor of Nice, died, leaving behind him an infant son. Paleologus, an ambitious nobleman, causing the young prince's guardian to be assassinated, established himself in his room; and taking the city of Constantinople by surprise, expelled Baldwin, the last Latin emperor, in 1261. Most of the Greek cities in Europe soon after revolted, and acknowledged Paleologus their emperor.

Ottoman, the chief of the Oguzian tribe of Tartars, having possessed himself of Bythinia and Phrygia, assumed the title of sultan in the year 1300, and made Neapolis the seat of his government. At his death he was succeeded by his son Orchanes, who taking the fortress of Abydos, at the entrance of the Hellespont, on the Asian shore, transported thence an

army, and made himself master of Gallipoli, the first town which the Turks possessed in Europe. Amurath, the succeeding prince, extending the conquests of his father, took several more towns from the Grecian emperor, and among the rest Adrianople, which he made the capital of his dominions. About this time the body of janizaries was first established, Amurath ordering that every fifth captive, above fifteen years of age, should be retained in his service, and educated in the seraglio; out of whom a certain number of the best stature should be selected for the sultan's guards. Bajazet, the next sultan, proceeded to extend the Turkish empire yet farther, both in Europe and Asia, till being defeated by Tamerlane in the plains of Stella, he was made prisoner. Even in adversity, his insolent language so much provoked the conqueror, that the latter is said to have put him in an iron cage, against the bars of which he knocked out his brains in a fit of chagrin, about two years after his discomfiture.

On the death of Tamerlane, in 1404, the five sons of Bajazet contended for the dominions of their father, when, after a civil war that lasted ten years, during which all the competitors died, except Mahomet, the youngest of the brothers, this prince was acknowledged sole sovereign of the Turkish dominions. He was succeeded on the throne by his son Amurath, in whose reign the Ottoman power was kept in perpetual agitation by the brave achievements of the celebrated Scanderbeg, prince of Epirus. Mahomet, the next sultan, made himself master of Constantinople in 1453, whither, on the extinction of the Grecian empire, he removed the seat of government from Adrianople, and assumed

the title of emperor, which all succeeding sovereigns of the Turks have since retained.

The reign of this prince is memorable for one of the most extraordinary transactions that occur in history. Among the captives taken in Constantinople, was a beautiful Greek virgin, named Irene, with whom Mahomet was so enamoured, that he spent his whole time in her company for almost a year, abandoning the care of the government entirely to his ministers, and hardly ever being seen by the people. The janizaries becoming discontented at this effeminacy of the emperor, began to mutiny, when the bashaws ventured to acquaint him of the danger they dreaded of a revolution. The sultan, after reprehending the freedom of his ministers, replied, that "his subjects should see he had as great a command of his passions as any of them," and ordered that all the great officers of state should attend him in the divan next day. Meanwhile he desired that Irene should be dressed in her finest robes, and appear at the assembly. The hour being come, the emperor placed her on a raised floor, in the middle of his lords, and demanded, if they thought he deserved censure for resigning himself to so charming an object. Every one declaring it was impossible to resist so much beauty, he repeated before the assembly what he had said to the bashaws; and immediately seizing the fair Irene by the hair, struck off her head with his scimitar.

The limits of the Turkish dominions were afterwards gradually extended by conquest, through a long succession of princes, several of whom practised the barbarous expedient of murdering their brothers and nearest male relations on their advancement to the throne.

### C H A P. I.

*Of the situation—rivers—lakes—iſlands—chief towns—produce—manufactures—commerce.*

**H**UNGARY is situate between 16 and 23 degrees of east longitude, and between 45 and 49 degrees of north latitude. It is bounded on the east by Walachia and Transilvania; on the south by the river Drave, which separates it from Sclavonia; on the west by Austria and Moravia; and on the north by the Carpathian or Crapack mountains, which divide it from Poland; being upwards of three hundred miles in length, and two hundred and fifty in breadth. In the time of the Romans, this country formed part of the ancient Pannonia, but received its modern name from a tribe of Scythians, who settled here in the third century. In the whole of this extensive kingdom we hardly meet with one mountain; but it abounds in meadows, bogs, lakes, and rivers, joined to the moisture of which, the great vicissitudes of heat and cold, in the latter part of summer, render the air very

No. 17.

unhealthful. Once in three or four years it is usually visited by a pestilential fever, which occasions the country to be called the grave of the Germans, their armies having been so often destroyed by the diseases of the climate.

The chief rivers are, 1. The Danube, which runs through the whole length of the country, from Presburgh to Belgrade, in a direction from the north-west to the south-east. 2. The Drave, which runs from west to east, and falls into the Danube at Esseck. 3. The Teyſſe, which rising in the Carpathian mountains, passes by Tokay, then runs southward, and falls into the Danube opposite to Salankeman. 4. The Meriſh, which has its source in Transilvania, and running westward, falls into the Teyſſe, opposite to Segedin. 5. Gran, which issuing from the Carpathian mountains, runs south, and discharges itself into the Danube near the city of Gran. 6. The Woag, which rising in the north part of the kingdom, runs south, and falls into the Danube opposite to Komorra. 7. The Raab, which rises in Itiria, and running north-east, joins the Danube opposite to the island

D d d

Schut.

Schut. Those several rivers abound so much in fish, that they would almost subsist the inhabitants if they had no other food.

The chief lakes are, 1. The Balaton, or Platensee, about forty miles long, and twelve broad, situated almost in the middle between the Danube and the Drave. 2. The New Fidel Sea, westward of the preceding, and nearly of the same dimensions. 3. The Boker Lake, in the south-east, in the Bannat of Temeswaer.

No country abounds more in hot-baths; and there are fountains of surprising qualities, particularly a spring of vitriolic water, which turns plates of iron into copper, and others of such a nature as to kill any animal that drinks of them.

In the Danube, a little below Buda, is an island forty miles long, with a great many villages upon it. At the confluence of the Danube and the Drave, is another large island; but the largest and most fruitful is that of Schutz, near Presburg, upwards of forty miles in length, and twenty in breadth. This island was given to prince Eugene of Savoy for his services against the Turks.

This kingdom is divided by the Danube into Upper and Lower Hungary, the former of which is situated towards the north-east. The chief towns of this division are, 1. Presburg, the capital, seated on the north side of the Danube, near the confines of Austria, about forty miles east of Vienna. It is a large, populous, pleasant city, and well built. It is not a place of great strength, but has an antique castle standing on an eminence, where the regalia are kept, and the sovereigns crowned. Here likewise the states assemble, and the supreme courts of justice are held. 2. Newhaufel, situated on the river Neytre, thirty miles east of Presburg, and esteemed a strong town. 3. Leopoldstat, a fortified place situated forty miles north of Newhaufel. 4. Chremitz, standing at the foot of the Carpathian mountains, and reckoned the chief of the mine towns, of which there are many in those parts, viz. Schmitz, Newfol, Humgrunt, Eferies, and Caschaw.

Agria is situated on a river of the same name, in the middle of Hungary. It is a well fortified town, and the castle esteemed one of the strongest fortresses in Europe. Pest is a large town, seated on the north side of the Danube, opposite to Buda, with which it has communication by a moveable bridge, half a mile in length. Segedin is situated on the river Teyffe, ninety miles north of Belgrade. Tokay, celebrated for its excellent wine, stands at the confluence of the river Teyffe and Bodruck, forty miles east of Agria. The other towns of note in the Upper Hungary are, Great Waradin, about one hundred miles east of Buda; Mongatz, a strong fortress, situated near the frontiers of Poland; Zolnock, Unguar, and Temeswaer; the latter of which is the capital of the Bannat of Temeswaer, and the strongest fortress which the Austrians now possess on the frontiers of Turkey.

Lower Hungary is situated between the rivers Danube and Drave. 1. The capital of this division is Buda, which stands on the side of an eminence on the south-west bank of the Danube. It is a populous town,

and defended by a strong castle. While Buda was in the hands of the Turks, its natural baths were in great esteem, and the buildings very magnificent; but they have been much neglected since that time. 2. The city of Gran, Strigonium, is situated on the side of the Danube, thirty miles north-west of Buda. This is the see of an archbishop, who is primate of Hungary. It is a large and well built town, in which the greatest structures are the cathedral, dedicated to St. Stephen, the archbishop's palace, and the castle. 3. Komorn stands on the island of Schut, almost surrounded by the Danube and Waag. 4. Raab, a fortified town, and the see of a bishop, situate near the south branch of the Danube, opposite to the island of Schut. 5. Alba Regalis, or Stul Weissenburg, seated in the middle of a bog, on the river Zanwitz, forty miles south of Gran, where the ancient kings of Hungary were crowned.

The soil of Hungary is exceeding fruitful, and produces excellent corn. The meadows and pastures are likewise rich, and covered with herds of cattle. Game is so plentiful that none are restrained from taking it. Even the poorest people in the country eat partridges and pheasants. The grapes are large and luscious, and produce the best wine Europe; particularly that of Tokay. A vulgar error has till lately prevailed, that the Tokay wine is in so small quantity, as never to be found genuine, unless when given in presents by the court of Vienna: but the extent of ground on which it grows affords sufficient proof of the contrary. It is a common desert wine in all the great families at Vienna, and in Hungary, and is very generally drank in Poland and Russia, being used at table in those countries, like Madeira in this.

Another vulgar error is, that all the Tokay wine is the property of the empress-queen. She is not even the most considerable proprietor, nor of the best wine; so that every year she sells off her own, and purchases from the other proprietors, to supply her table, and the presents she makes of it. The greatest proprietor is the prince Trautzon, an old man, at whose death, indeed, his estate will escheat to the crown; but many others of the German and Hungarian nobility have large vineyards at Tokay. Most of the gentlemen of the neighbourhood have part of their estates there: the Jesuits College at Ungovar has a considerable share of the best wine; and besides those, many of the peasants have vineyards, which they hold of the queen, or other lords, by paying a tythe of the annual produce. There is never any red wine made at Tokay, and the vintage is always late. It commonly begins about the end of October, but sometimes not till near the middle of November. Four sorts of wine are made from the same grapes, which they distinguish at Tokay by the names of essence, aufspruch, maßsach, and the common wine.

As the Carpathian mountains afford great variety of minerals, the chief manufactures of the country are those of hard-ware, which, with their wines, are also the principal articles of their commerce; excluding the numerous herds of cattle with which they furnish the Austrians, and the inhabitants of all the adjacent territories.

## C H A . P . II.

*Of the persons of the Hungarians—dress—government—  
revenue—forces—method of travelling—bridges—  
religion.*

THE natives of Hungary are for the most part of a good size, and well proportioned. They are not so large as the Germans, but very active and hardy; and from their country having been long the scene of action between the Christians and Turks, they are inured to a military life, for which a great degree of natural courage seems peculiarly to adapt them. The men shave their faces, leaving whiskers on their upper lip. They wear a fur cap, with sometimes a feather; and a clove coat girt about them with a sash. Their upper garment is a short cloak or mantle, which reaches as low as their middle, and is buckled under one arm. The people of rank of both sexes, however, have not much of the Hungarian dress, and imitate the fashions of the French; only the women throw a veil over them when they go abroad.

This country was formerly an elective kingdom; but the house of Austria usurping the throne upwards of two hundred years ago, it has ever since continued in that family by hereditary succession, notwithstanding the frequent efforts of the Hungarians to restore their ancient constitution. At the election of a king, the custom was for the bishops, the lay-nobility, and the representatives of the several counties and cities, to assemble in the plain of Rackes, near Pest, where having agreed on a successor, who was usually the next a-kin to the deceased monarch, he was attended to Stulweissenburg (Alba Regalis) and presented to the people by the palatine, who demanded three times whether they approved of their new-elected king. Having expressed their consent, the sovereign was invested with a naked sword, which he immediately brandished. Afterwards proceeding to the cathedral, the approbation of the people was a second time asked, by the archbishop, which being granted, the prelate performed the coronation rites; while the spiritual and temporal lords, whose office it was, carried king Stephen's arms, and other parts of the regalia before the new king to the palace. King Stephen's crown is still kept at Preiburg, and is the object of great veneration. The reason of which is said to be, that this monarch having begun to propagate the Christian religion in his dominions, and sending the bishop of Coloiza to pope Benedict VII. to desire he would confirm his late election to the throne, the pope was directed by an angel to send him this crown.

The palatine is the first great officer in the kingdom, and was formerly elected by the states. Since the reins of government were assumed by the house of Austria, this officer has been appointed by the crown; but her present imperial majesty, in consideration of the services rendered to her by the Hungarians in the late wars, has promised that the inhabitants shall henceforth enjoy the ancient privilege of electing, or

at least, of nominating their own palatine. A great part of the executive power is committed to this magistrate. He assembles the states, gives audience to ambassadors, was guardian to their infant princes, and took the administration into his hands, during an inter-regnum or vacancy of the throne.

The common people here are the vassals of the respective lords on whose lands they reside; to whom they not only pay rent, but perform various services. In all cases of litigation their resort is to the courts of those proprietors, who enjoy a prescriptive right of jurisdiction within their own estates, and were the only persons who had any vote at the election of the king; the peasants being merely their slaves.

The ordinary revenue which this kingdom yields to the crown, is inconsiderable, not amounting to much more than a hundred thousand pounds a year, arising chiefly from the duties laid on minerals and cattle. It is usual, however, for the sovereign to demand of the states such sums as are necessary for the support of the government, and other uses; and as the exaction of them may be enforced, the payment is seldom refused.

The whole country is a well regulated militia, esteemed equal, if not superior to any in Europe. The horse are called hussars, and the foot heydukes. Like the Swifs, they let themselves out to any nation that will pay them, when the service of their sovereign requires not their immediate attendance.

The usual way of travelling by land is on horseback, or in an open chariot, drawn by three or four horses a-breast; but having a great many navigable rivers, they travel in summer most commonly by water, which is also the safest method. For the hussars, who have been accustomed to plunder in foreign service, often commit acts of robbery; and many parts of the kingdom are likewise infested with gypsies.

Some of the bridges over the Danube are of great extent. That of Esbeck, which stands at the confluence of the Drave and the Danube, and over the marshes adjoining to those rivers, is five miles in length, and at the distance of every quarter of a mile, is furnished with a tower. This is an important pass, where many skirmishes have happened between the Christians and the Turks. The flying-bridge of boats between Buda and Pest is half a mile in length. But the most magnificent bridge that ever was laid over the Danube, was that erected by the Romans, the ruins of which are yet visible, about eighty miles from Belgrade. It appears to have consisted of twenty piles or pillars of hewn stone, a hundred foot high. The basis of each is a square of sixty foot, and the distance between them a hundred and seventy foot. The following inscription was engraved on the most conspicuous part of the structure. *Providentia Aug. vere pontificis virtus Romana quid non domat sub jugum ecce? Raptur & Danubius.*

Most of the people of this country were disciples of John Hufs, and afterwards of Calvin, but divided into a multitude of sects, some of which entertaining very extravagant opinions, a persecution was raised

against them by the Roman Catholics. Her imperial majesty, however, has promised them a toleration of their religion; and this at present they enjoy.

**TRANSILVANIA, SCLAVONIA, CROATIA, and BOSNIA.**

All those provinces lie contiguous to Hungary, and are not only under the government of the same sovereign, but afford almost the same produce.

Transilvania is situate between 22 and 25 degrees of east longitude, and between 45 and 48 degrees of north latitude. It is bounded on the west by Hungary; on the north by Poland; on the east by Moldavia; on the south by Walachia, and the Bannat of Temeswaer. From north to south, it measures about a hundred and ninety miles, and is nearly of the same extent from east to west. It is surrounded by woods and mountains, the Carpathian mountains separating it from Poland, and the Iron-gate mountains from Turkey; besides which there are several others in the middle of the country. The valleys in summer are excessive hot. The chief rivers are, the Alauta, which in part separates the dominions of Austria from Turkey; and the Marish, which rising in the north, runs through part of Hungary, and discharges itself into the Teyffe.

This province is usually divided into four parts, namely, Sieben Burgen, Seculi, the Hungarian district, and the country of the Cingars, or Gypsies. The first of these comprehends two thirds of the country. The inhabitants, who call themselves Saxons, are supposed to be descended from the ancient Dacians. The Seculi lie north-east of the preceding, and are the posterity of the Huns. The inhabitants of the Hungarian district lie on the confines of that kingdom; and the Cingars, or Gypsies, who live in tents, pitch them upon every common, and are mostly smiths or hard-ware men.

The chief towns are, 1. Hermanstat, the capital, situated in a fine plain, on the bank of the river Cibin. This is a strong town, well built, and canals run along the middle of some of the streets. It is the see of a bishop, and the seat of the courts of justice. The chief trade of the place is in wine, mead, and woollen cloth. 2. Cronstat or Corona, a frontier town, near the borders of Moldavia, about sixty miles north-east of Hermanstat, strongly fortified, and surrounded by vineyards. 3. Claufenburg, a large populous city, standing on the river Samos, sixty miles north-west of Hermanstat. 4. Beskricia, situate near the Carpathian

mountains and the mines of Rodna. The other towns of any note are, Hogarus, Segeswaer, Megus, Alba-Julia, Huniad, Thorda, Dohoka, Zatmar, Deva, Marcozeek, Girgio, Uvarthel, Chick, Kifda, Orbay, and Schepfi.

The province of Sclavonia anciently extended almost from the Adriatic to the Euxine Sea, but is now comprehended within much narrower limits; having the river Drave on the north, the Danube on the east, the Save on the south, and the duchy of Stiria on the west. It is about three hundred miles in length, and upwards of sixty in breadth; a level country, and watered with three of the finest rivers in Hungary, besides others less considerable. 1. The chief town is Pofega, situate on the river Orana, a hundred and thirty miles west of Belgrade. 2. Walpo, forty miles north-east of the preceding. 3. Walcowar, seated near the Danube, twenty miles south of Esfeck. 4. Peterwaraden, also near the Danube, fifty miles south-east of Esfeck. 5. Salankamen, situated near the Danube, fifteen miles south-east of Peterwaraden, rendered conspicuous for the victory obtained over the Turks by prince Lewis of Baden, in 1691. 6. Carlowitz, where the peace was concluded between the Austrians and Turks, in 1699. The remaining towns of note are, Semlin, Alt Sirmium, Zagrab, and Gradiska.

The province of Croatia is bounded on the north and east by Sclavonia, on the south by Bosnia, and on the west by Carniola. The chief towns are Carlstadt, which stands on the river Culp, a hundred and forty miles south of Vienna; and Sifeg, situate on the river Save, forty-five miles east of the preceding.

The province of Bosnia lies between Croatia and Servia, and is divided between the Austrians and Turks; the former possessing the country westward of the river Unna, and the latter that on the east side. The chief town in the Austrian division is Unatz, and in the other Whitesch.

Those several provinces are generally level and open, except Transilvania, which is mountainous and woody. They are very fruitful where cultivated, and would produce plenty of corn and wine; but lying on the frontiers of Turkey, and therefore exposed frequently to be eaten up by the armies of both countries, they add but little to the revenues of the sovereign, to whom sometimes they are even chargeable. They are all subject to the empress-queen. The established religion is the Roman Catholic; but many of the inhabitants are protestants, and some of the Greek church.

## C H A P. I.

*Of the division — situation — rivers — chief towns —  
produce — manufactures.*

**T**HIS kingdom, comprehending Bohemia Proper, Silesia, and Moravia, is situate between 12 and 19 degrees of east longitude, and between 48 and 53 degrees of north latitude. It is bounded on the north by Lusatia, the electorates of Saxony and Brandenburg; on the east by Poland and Hungary; on the south by Austria and the duchy of Bavaria; and on the west by the palatinate of Bavaria, and another part of Saxony. It is in length about three hundred miles, and in breadth two hundred and fifty. The country for the most part is mountainous, and the divisions above mentioned are surrounded by high hills covered with woods, which, by obstructing the ventilation, render the air rather unhealthy. Some of the hills are barren rocks; but they abound in mines of silver, copper, lead, and iron. The chief rivers are, the Elbe, Muldaw, Eger, Bobber, the Niesse, Oder, Wesel or Vistula, Moraw, and the Theysse.

The chief towns in Bohemia Proper, which is the largest and most westerly division, are, 1. Prague, the capital of the kingdom, situate on the river Muldaw, in 14 degrees 46 minutes east longitude, and 50 degrees 6 minutes of north latitude; about a hundred and forty miles north-west of Vienna, and seventy miles south of Dresden. This city consists of three towns united, viz. Old Prague, New Prague, and Little Prague. The Old town stands on the east side of the river, and contains a university, and several monasteries. It is surrounded by the New town, from which it is separated only by a moat, having for its defence a wall, with some modern fortifications; but it is so very large as to require an army to garrison it. The Little town is separated from the others by the river, over which is a fine stone bridge. Part of it stands upon an eminence, on which is a castle, and a royal palace, where their ancient kings resided. Here likewise stands the cathedral, with the houses of the nobility. Besides those three parts, there is a suburb of Jews, who are very numerous. This city is one of the largest in Europe, and reckoned the most populous next to London, Paris, and Constantinople; but being commanded by several hills, it has greatly suffered in the late wars.

2. The second considerable city in Bohemia Proper is Egra, which stands on the river Eger, near the confines of Franconia, eighty miles west of Prague. This is a fortified town, and was several times taken and retaken during the late wars.

3. Coninggratz, situate on the river Elbe, fifty miles east of Prague. This town is the see of a bishop, No. 17.

who is suffragan to the archbishop of Prague; and near it are several rich mines, which have been wrought for almost eight hundred years.

4. Glatz situate on the west side of the mountains which divide Bohemia Proper from Silesia, a hundred miles north-east of Prague. The county of Glatz, of which this is the capital, was possessed by the king of Prussia in 1741, and confirmed to him at a subsequent treaty, by the queen of Hungary. It surrendered to the Austrians after a short siege, on the 6th of July, 1760; but was restored to the king of Prussia by the treaty of Hubertsbourg, in 1763.

5. Budweis, situate on the Muldaw, sixty miles south of Prague.

The province of Silesia, now the property of the king of Prussia, is bounded on the north by Brandenburg; on the east by Poland; on the south by the mountains of Reiffenberg, which divide it from Moravia; and on the west by Bohemia Proper. The chief towns are, 1. Breslaw, the capital, situated on the river Oder, a hundred and twenty miles north-east of Prague. It is a large populous city, but of no great strength. It has long enjoyed many considerable privileges, among which is that of being governed by its own magistrates, and of not being liable to have soldiers quartered in it. Those privileges the king of Prussia promised that the inhabitants should retain, when he took possession of the place. Here is a university, and a bishop's see; but by the treaty of Breslaw, it was agreed, that the bishop should thereafter reside at Oppelen.

2. Crossen, capital of a duchy of the same name, and situated on the river Oder, in the north part of the province.

3. Glogaw, situated likewise on the Oder, forty miles south-east of Crossen. It is a fortified town, and the capital of a duchy.

4. Lignitz, capital of a duchy, lying upwards of thirty miles north-west of Breslaw.

5. Jagendorf, situate on the river Tropaw, on the borders of Moravia, seventy miles south of Breslaw.

6. Tropaw, standing on the river of the same name, fifteen miles south-east of the preceding, and the capital of a duchy.

7. Niesse, situate on the river Niesse, forty-five miles south of Breslaw.

8. Oppelen, capital of a duchy, situate on the river Oder, thirty miles south-east of Breslaw.

The third great division of the kingdom of Bohemia, is the marquiseate of Moravia, which is bounded on the north and east by Silesia, on the south by Austria, and on the west by Bohemia Proper. The chief towns are, 1. Olmutz, capital of the province, standing on the river Moraw, seventy-five miles north of Vienna, and upwards of a hundred east of Prague. It is well

E e e

situated

situated for trade, and is the only bishop's see in this division.

2. Brin, a fortified town, situate at the confluence of two small rivers, fifty miles north of Vienna, and thirty miles south-west of Olinutz. The assembly of the states meet at this place.

3. Iglaw, seated on a river of the same name, on the confines of Bohemia Proper, sixty-eight miles south-west of Olinutz, on the road from Bohemia to Hungary.

4. Hradish, seated on an island in the river Moraw, thirty miles south of Olinutz.

In the valleys of Bohemia the soil is fruitful, and produces corn and wine sufficient for the consumption of the inhabitants; but the wine is small, and therefore unfit for exportation. The country affords great quantities of good barley and hops, of which they make so much beer, that it forms a considerable article of their trade. Flax and hemp are also very plentiful, and the Bohemians export a good deal of linen. Of this manufacture, particularly what is called Silesia lawns, England purchases a considerable quantity; but it is supposed, that a great part of what is so called is the manufacture of the French, which they carry to Hamburgh, and sell to the English merchants, as the produce of Silesia. Saffron is here a frequent commodity, and the gardens are stocked with the same fruits, herbs, roots, and flowers, as those of Britain. The country abounds in neat cattle, sheep, deer, poultry, and all other animals, wild or tame, that are to be met with in the inland parts of Europe. The horses are of a large size, fit for the draught or troop, and are bought up by the Jews for the French, when they have occasion to recruit their cavalry. The mines are rich in silver, lead, and iron; and here are many precious stones, particularly amethysts, carbuncles, rubies, jasper, and sapphires. The country, however, produces so little common salt, that they are obliged to import this article; but they have a sufficient quantity of salt-petre, and some sulphur.

#### C H A P. II.

*Of the persons of the Bohemians—character—diversions—history—government—language—religion.*

THE Bohemians are of a large stature, inclined to corpulency, robust, and have generally clear complexions. They formerly wore the habit of the eastern countries; but have many years since changed it for that of the more western Europeans. The common people are for the most part of a dull phlegmatic disposition, but those of the better sort are esteemed polite and ingenious. The latter, however, much affect a profuse and expensive way of life, which, joined with their extreme propensity to play, would render them utterly indigent, were it not that the greater part of their estates is by the custom of the country unalienable. In eating and drinking, all ranks in the nation are justly chargeable with intemperance. Feasting not only constitutes a part in every kind of diversion, but is frequently introduced where

people are assembled upon business. The common diversions are hunting, hawking, fishing, or in winter running over the ice and snow in skates and sledges. They have likewise frequent dancing, masquerades, plays, and operas; and so general is the taste of music, that there is hardly a village where the mass is not sung in concert. The houses of the nobility and gentry are built of stone, chiefly on the Italian model. They live mostly on their estates, where they generally exercise an oppressive authority over their vassals.

The annals of this nation, previous to the fourteenth century, are extremely imperfect. It appears that the country was originally divided into a great number of principalities, styled for the most part duchies. About the year 600, those detached provinces were united by Zechius, who was distinguished by the title of the great duke. The next sovereign of whom we find any mention, is Cracus, who is supposed to have reigned about the year 700. He was succeeded in the throne by his daughter Libussa; but the people being dissatisfied with a female administration, were about to depose her, when it is said she pretended to an authority from heaven, to turn a horse loose in the streets, and to take for her husband the man at whose house he should stop. The animal being accordingly let loose, stopped at the door of a peasant, named Primissaus, whom she therefore married, and reigned jointly with him till her death.

The first Christian prince of the country was Borivoius, who began his reign in 856. Some years afterwards Bolissaus restored paganism, having first murdered his own brother Uladissaus I, the preceding king; but he was compelled to admit the re-establishment of Christianity by Otho the Great, who made him also tributary to the empire. In the year 1086, Uladissaus II, was created king of Bohemia by the emperor Henry IV. The German emperors likewise advanced to the throne several succeeding kings, many of whom were deposed by the dukes, where their concurrence was not demanded.

In the reign of Randolph II, king of Bohemia and Hungary, and emperor of Germany, the protestants of the empire entered into a confederacy, called the union, or evangelical league; choosing for their general, Frederic, elector palatine, with whom the protestants of Hungary joined. They renounced their allegiance to the emperor Ferdinand, whom they had acknowledged their king, and in 1610 advanced to the throne the elector palatine, son-in-law to James I, king of Great Britain. He enjoyed his new dignity, however, but a very short time, being defeated the next year by the duke of Bavaria, the emperor's general. From this epoch the throne of Bohemia has been filled by the emperors and their heirs, or princes appointed by them. On the demise of the crown, the landed proprietors assemble, to express their consent to the succession of the person who is nominated to the throne; but they have now no constitutional power to reject or alter the appointment. The present empress-queen always convokes the

the states when money is to be raised, and they seldom refuse the sum which she demands.

The language of the Bohemians was formerly the Slavonian; but at present most of them speak the High Dutch or German language. The religion of

the kingdom is the Roman Catholic, which has been invariably professed by the inhabitants since the extinction of the sect of reformers, named Hussites, in the fifteenth century.

## G E R M A N Y.

### C H A P. I.

*Of the situation—boundaries—face of the country—rivers—air—divisions of the empire.*

**G**ERMANY is situate between 5 and 19 degrees of east longitude, and between 45 and 55 degrees of north latitude; being six hundred miles long from east to west, and five hundred miles in breadth. It is bounded on the east by Poland, Bohemia, and Hungary; on the south by Switzerland, and the Alps, which separate it from Italy; on the west by the dominions of France and the Netherlands, from which it is separated by the rivers Rhine, Moselle, and Maes; on the north by Denmark, the German Sea, and the Baltic.

In the northern part of Germany there are some rocky barren mountains, which abound with minerals; but the interior parts are interspersed with hills of a moderate height, forests, valleys, meadows, and fruitful fields, especially near the great rivers. In the north of Westphalia and Lower Saxony, bogs and morasses are frequent.

Among the rivers the chief is the Danube, anciently named the Ister, which rising in the Black Forest in the south-west part of Swabia, runs north-east through Swabia and Bavaria to Ratisbon; then almost due east to Vienna; and afterwards, dividing Hungary into two parts, runs south-east to Belgrade in Servia, whence running east through Turkey, it falls into the Euxine or Black Sea by several channels.

The rivers which discharge themselves into the Danube on the south side are, the Iller, or Iser, which joins it at Ulm; the Lech, which passes by Augsburg, and falls into the Danube near Donawert; the Iser, which passing by Munich and Landshut, falls into it opposite to Deckendorf; the Inn, which rising in Switzerland, passes by Inspruck, and terminates at Passaw; the Ens, which falls into the Danube at the town of Ens.

The rivers that discharge themselves into the Danube on the north are, the Regen, which joins it at Ratisbon; and the Nab, which runs through Bavaria, and likewise joins it near Ratisbon.

The Rhine rises in the country of the Grisons, and running north to the Lake of Constance, thence turns westward to Basil, after which it again runs north between Swabia and Alsace, then through the palatinate and electorate of Cologne, and entering the Netherlands, is divided into several branches. The

rivers that fall into the Rhine are, the Neckar, which runs from south to north through Swabia, and falls into the Rhine at Manheim, in the palatinate; the Maine, which runs from east to west, and ends its course at Mentz; the Lhon, which runs in the same direction, and falls into the Rhine below Nassau; the Roer, which also runs in the same direction through Westphalia, and falls into the Rhine at Duytsburg; and the Lippe, which runs parallel to the Roer, and falls into the Rhine at Wesel.

The Elbe, which rises in the confines of Silesia, runs north-west through Bohemia, Saxony, and Brandenburg, and then separating the king of Great Britain's German dominions from Holstein, falls into the German sea, about seventy miles below Hamburg: receiving in its passage the Muldaw, which falls into it below Prague; the Sala, which joins it below Dessau; the Havel, which unites with it at Havelsburg; and the Ilmenau, which falls into it above Harburg.

The Spree, which runs from south to north, through Saxony and Brandenburg, passing by Berlin, falls into the Havel near Potsdam.

The Oder runs from south to north, through Silesia and Brandenburg, and then passing by Stetin, divides Pomerania, and discharges itself into the Baltick, between the islands of Usedom and Wollin.

The Pene runs from west to east, dividing Swedish from Prussian Pomerania, and falls into the Baltic, opposite to Usedom.

The Weser, rising in Hesse, runs north, receiving the Aller at Ferden; then passing by Bremen, falls into the German sea below Carlstat.

The Ems, rising near Munster, and running north through Westphalia, discharges itself into the same sea below Emden.

The Moselle, rising in Lorraine, runs north-east by Toul, Mentz, and Treves, and falls into the Rhine at Coblentz.

The Saar, rising likewise in Lorraine, runs north-west, and falls into the Moselle at Triers.

In the inland parts of Germany, the air is at all times more pure, and the weather less variable than in Britain; on which account the former is colder in winter, and hotter in summer. The country is populous, and adorned with many fine cities, castles, and palaces.

Germany is divided into nine circles, viz. Upper Saxony, Lower Saxony, Westphalia, Franconia, Upper Rhine, Lower Rhine, Austria, Bavaria, and Suabia.

There was formerly a tenth circle, which consisted of the duchy of Burgundy, and the seventeen provinces of the Netherlands; but those territories have long been detached from the empire.

#### C H A P. II.

##### *Circle of Upper Saxony.*

UPPER Saxony is situate in the north-east part of Germany, and comprehends Pomerania, the marquisate of Brandenburg, the duchy of Saxony, the marquisate of Lusatia, and Misnia, with a number of other duchies and counties.

Pomerania, the most northerly division, lies along the shore of the Baltic, forming a tract of land two hundred and fifty miles in length from east to west, and from sixty to seventy-five miles in breadth. It is a flat country, well supplied with wood and water, but generally a cold barren soil. It is, however, advantageously situated for a foreign trade, and has many good harbours, particularly Stetin and Stralsund. The province is divided into two parts by the river Pene; that on the east being called Prussian or Brandenburg Pomerania, and that on the west, Swedish Pomerania, from the crowns to which they belong.

The principal rivers are, the Oder, the Pene, the Rega, the Persant, the Wiper, the Stolpt, the Recknitz, and the Barte. The Recknitz separates Pomerania from the duchy of Mecklenburg, forming a large lake near Damgarten. The Oder, on its entering Pomerania, divides into several branches, forming some large islands, and below Stetin, flows into the Damnth lake, falling afterwards into a fresh-water lake, called the Great Frichestaff, sixteen miles over, discharging itself into the Baltic by three channels, namely, the Divenow, the Swin, and the Penemund. Between the river Pene and the Swin, lies the island of Ufedom; and between the Swin and the Divenow, the island of Wallin.

The chief towns of Pomerania are Stetin and Stralsund, the former of which belongs to the king of Prussia, and the latter to Sweden. Stetin is situated on an eminence on the west side of the river Oder, in 14 degrees 58 minutes of east longitude, and 53 degrees 27 minutes of north latitude, forty miles south of the Baltic, and seventy north-east of Berlin. It is a large, populous, and trading city, regularly fortified and defended by a castle, formerly the palace of the ancient dukes of Pomerania, and esteemed an elegant piece of architecture. In the year 1713, the king of Prussia prevailed on the citizens to suffer his troops to garrison the town, under pretence of defending it against the Russians, and engaging to hold it by way of sequestration, till a peace should be concluded. The Swedes, not knowing how to recover it, ceded it, upon some consideration, to the king of Prussia, with the adjacent territory; an acquisition of the greatest importance to that prince, as he now commands the navigation of the Oder, and has a communication with the Baltic.

Stralsund is situated on the shore of the Baltic, in 9 degrees 12 minutes east longitude, and 45 degrees 5 minutes north latitude, eighty miles north-west of Swin. Standing in a morass, and well fortified, it is strong both by nature and art, and has a good harbour for vessels under two hundred tons. Opposite to this city, lies the island of Rugen, one of the largest in the Baltic. It was anciently joined to the continent, but is now separated by a channel near three miles in breadth. The island is twenty-three miles long, and fifteen broad, and is a plentiful country, abounding in corn and cattle. The chief town is Bergen.

The marquisate of Brandenburg has on the north Pomerania and Mecklenburg; on the east, Poland; on the south, Saxony Proper; and on the west, Brunsvick and Lunenburg, extending two hundred miles in length, and between fifty and a hundred in breadth. The air of this country is cold, the winters long, and the soil for the most part a barren sand; but they have large flocks of sheep, with plenty of venison and other game. Though the climate be too cold for wine, they make a sour fort, which is hardly drinkable. They have some mines of copper, and iron, but of no great value. The chief rivers are the Elbe, the Oder, the Havel, the Spree, and the Warta. Here are also canals made for the convenience of trade; by one of which they have a communication with the Havel and the Elbe, and consequently with the ocean; and by another with the Oder, which opens a communication with the Baltic. There are likewise in the country several lakes, of which one of the largest is Ukersee.

This marquisate is distinguished into three divisions, namely Altmark, Newmark, and Middlemark. The chief towns of the former are, 1. Stendal, the capital of the division, situated on the river Ucht, which falls into Angermund, at the confluence of the Anger and the Elbe.

The most fruitful part of the country is the division of Newmark, the chief town of which is Cultrin, situated on the river Oder, near the mouth of the Warta.

The division of Middlemark is situated in the centre of the marquisate, between the rivers Oder and Elbe. The chief towns are, 1. Brandenburg, lying in the middle of a bog on the river Havel, which runs through it. This town is twenty-six miles west of Berlin, and was once the capital city of the marquisate. 2. Berlin, at present the capital of the Prussian dominions, is situate in 13 degrees 37 minutes of east longitude, and in 52 degrees 53 minutes of north latitude, on the river Spree, ninety miles north of Dresden. This city has been greatly improved within these fifty or sixty years in its trade and buildings. From the river Spree canals have been cut to the Ider on the east, and to the Elbe on the west; by which means the city has a communication both with the Baltic sea and the German ocean. 3. Potsdam, situate on the river Havel, ten miles south-west of Berlin. The king of Prussia has here a palace, which is now his usual

usual residence. 4. Frankfort upon the river Oder, forty miles east of Berlin. This is a large well-built town, and enjoys a flourishing trade, having a communication with the Baltic by the Oder, and with the Spree and Havel by canals. Here the king has erected an university for Calvinists.

Berlin has been computed to be near one third as large as London, yet it contains not above one eighth part of the inhabitants, which is more, by upwards of twenty thousand, than is supposed to have been the number at the accession of the present king of Prussia. This wise monarch, by the privileges and encouragement which he has granted to manufacturers of various kinds, has induced many industrious foreigners to settle in the capital, where a considerable trade is now established. They make woollen cloth sufficient for the army, and great part of home consumption; Silesia exports linen all over Europe, and to America; and hardly any where can gold and silver lace, or wrought silks, be purchased so cheap as at Berlin.

The number of troops usually in the pay of the king of Prussia, is about a hundred and twenty thousand, two thirds of which, according to the establishment, should be composed of foreigners. This circumstance, however, joined to the small number of inhabitants in the Prussian dominions, must render it difficult to recruit the army in any war with the neighbouring nations.

The pay of a common soldier in this country is eight groch (fourteen pence) a week, besides bread; and of this sum three pence is supposed to go in washing, and materials for cleaning their arms, for which they are so much distinguished. Upon this calculation, a hundred and twenty thousand men cost only three hundred and sixty-four thousand pounds; so that if we reckon thrice the sum, in order to include their ammunition bread, the pay of officers, and cloathing, the whole will not much exceed a million sterling.

The revenues of the king of Prussia about the beginning of the last war, were estimated at one million four hundred thousand pounds; but by the improvement of commerce, and the accession of the Polish territory, they must now be much more considerable. Those revenues arise from a tax of about half the rent of the land, and near forty per cent. on all eatables, soap, candles, &c. Notwithstanding this oppressive impost, such is the regularity that runs through every branch of the government, and particularly the parsimony of the court, that the people, if not flourishing, are at least contented; and their property is guarded by a system of laws, the most plain, determinate, and equitable, of any nation in Europe.

About a mile from Berlin stands Charlottenburg, founded by the first king of Prussia, and now finished by the present in a most exquisite taste.

On an eminence in the neighbourhood is situated Sans Souci, which commands an agreeable view, and seems to have been intended as a summer-house and library to the palace of Potsdam. The apartments are for the most part on the ground-floor, and elegantly finished.

No. 18.

The king of Prussia is likewise sovereign of several other territories, particularly the duchy of Magdeburg, which is bounded on the north by Mecklenburg, on the east by a part of Brandenburg, on the south by the principalities of Anhalt and Halberstadt, and on the west by Brunswick. It is sixty miles long, and thirty broad, and has the river Elbe running through it. The revenues of this duchy are computed at a hundred thousand pounds *per annum*. The capital city is Magdeburg, anciently Parthenopolis, situated on the Elbe, seventy miles west of Berlin. Before the Reformation it was an archbishoprick, independent of any ecclesiastical superior but the pope; on which account this prelate was styled primate of all Germany. The cathedral is a grand edifice of Gothic architecture, and contained forty-nine magnificent altars. The high altar, yet remaining, is a table of jasper stone, eighteen foot long, eight broad, and two inches thick, valued at two tons of gold. Among other relics are shewn, a piece of the watering-pots, in which, they tell us, Christ converted the water into wine; a wooden slipper of the Virgin Mary, and the basin in which Pilate washed his hands. Here Luther had his education, in the convent of St. Aofin.

This city was once remarkable for the tilts and tournaments instituted by the emperor Henry, surnamed the Fowler, in the year 638; to which none but the ancient nobility were admitted, nor even those without some restrictions. With so much emulation were those exercises celebrated, that at one tournament, in 1473, seventeen gentlemen of Franconia, and nine of Hesse, were killed in the field, besides great numbers lamed and wounded. On account of similar mischiefs, of which the tilts and tournaments were frequently productive, they were at length abolished.

In the religious wars of Germany between the protestants and papists, count Tilly, the catholic or imperial general, took the city of Magdeburg by storm, and massacred all the inhabitants that were Lutherans, to the number of forty thousand; demolishing at the same time all the houses and public buildings, except the cathedral.

The adjacent duchy of Halberstadt is also subject to the Prussian crown. This country is bounded on the north by the duchies of Magdeburg and Brunswick, on the east by Saxony Proper, on the south by the principality of Anhalt, and on the west by the bishoprick of Hildersheim; being thirty-six miles long, and twenty-five broad. The chief town, Halberstadt, stands on the rivulet of Hotheim, thirty miles south-west of Magdeburg. This duchy is one of the most fruitful parts of the king of Prussia's dominions.

The fourth division of this circle comprehends chiefly the dominions of the elector of Saxony, viz. the duchy of Saxony, the marquissates of Misnia or Missin, and Voightland, with the territories of the other princes of the house of Saxony, the principality of Anhalt, and the county of Barbay.

The capital of the duchy of Saxony is Wittenburg, situate on the river Elbe, fifty-five miles north of Dresden. Bautzen, capital of the marquissate of Lusatia, stands on the river Spree, thirty-five miles north-

F f f

east

east of Dresden; and Gorlitz, in the same marquisate, stands on the river Niessa, fifty miles east of Dresden.

Dresden, capital of the marquisate of Misnia and of the electorate of Saxony, is situate in 13 degrees 40 minutes east longitude, and in 51 degrees 12 minutes of north latitude, on the river Elbe, seventy-five miles north-west of Prague, and eighty-five south of Berlin. It is divided by the Elbe into the old and new towns, which are joined by a fine stone bridge, consisting of eighteen arches. The city stands on a plain, surrounded with high sandy hills, which have been converted into vineyards, but the fruit is not much commended. It is well fortified, and the buildings elegant, but the streets are generally narrow. The elector's palace is a magnificent structure, and abounds in many valuable curiosities both of nature and art. The collection of pictures is reckoned one of the finest in the world, and is valued at five hundred thousand pounds.

Above seven hundred men are here constantly employed in the porcelain manufacture, the annual expence of which is estimated at no more than eighty thousand crowns; and the manufacture yields to the king two hundred thousand crowns yearly, besides the magnificent presents which he occasionally makes, and the large quantity reserved for the use of his household.

The other most considerable article of trade is silver, of which the mines near Fridburg produce every fifteen days near the value of twenty thousand dollars. The metal is brought into the city in ingots, where it is immediately coined, and delivered to the proprietors.

The court of Dresden is one of the most remarkable in Europe for splendor and profusion. Six thousand five hundred ducats are yearly allowed for comfits, and such articles, which is near twice as much as the king of Prussia allows for the whole expence of his table. The revenues of the elector are estimated at about one million five hundred and seventy-six thousand pounds, which arise from the taxes on lands, and a capitation of six dollars on all males, as soon as they commence an apprenticeship, or begin to work. People of a higher rank are taxed according to their class, and are liable to be called to account, if they assume not an exterior appearance correspondent to the extent of their fortune. Every foreigner pays capitation, after residing six months in the country. Jews are taxed at fifty, their wives at thirty, and their children at twenty dollars. There is also an excise on all eatables and liquors; and ten per cent. is levied out of the incomes of the people.

Leipzig is situated in 12 degrees 55 minutes east longitude, and in 51 degrees 20 minutes of north latitude, on the river Pleiss, forty-two miles north-west of Dresden. The city is small, but the buildings are lofty and elegant. The streets are clean and commodious, and the market-places two squares of considerable extent. The town is surrounded with numerous gardens, which are in general laid out in good taste. The wealth of this city consists chiefly in wool; besides which the inhabitants have several profitable manufactures, particularly painted cloths in imitation of tapestry. It is one of the most trading towns in

Germany, and proportionably populous. It is also the seat of a flourishing university, and the Lutheran is here the established religion, as well as at Dresden.

The territory of Misnia includes many other towns of considerable note, where the inhabitants are employed on the general manufactures of the province, which are chiefly linen, lace, and porcelain.

The duchy of Saxony, to which the electorate is annexed is a small territory, bounded on the north by Brandenburg, on the east by Lusatia, on the south by Misnia, and on the west by Anhalt. It is by nature the richest country in Germany, if not in Europe. It contains two hundred and ten walled towns, sixty-one market towns, and near three thousand villages. The annual revenue is computed at upwards of one million three hundred and fifty thousand pounds sterling. The chief town is Wittenburg, on the Elbe, fifty-five miles north of Dresden; but the latter is the residence of the electoral family. The elector of Saxony is great marshal of the empire of Germany, and is supposed capable of bringing into the field twenty-five thousand men.

To the elector of Saxony belong likewise the marquisate of Lusatia, and Voightland, with that of Misnia or Meissen. The latter is a fruitful country, producing corn and wine, and is well supplied with wood and water, having also in the hills rich mines. The capital city is Dresden.

The landgrate of Thuringia is bounded on the north by the duchy of Brunswick and the principality of Anhalt, on the east by Misnia, on the south by Franconia, and on the west by Hesse. It is about seventy-five miles in length, and as much in breadth; fertile, abounding with fruits and woods, and well watered with rivers. It is subject to the elector of Mentz, and several other petty sovereigns. The chief town is Erford.

### C H A P. III.

#### *Circle of Lower Saxony.*

**T**HE circle of Lower Saxony is bounded on the north by Denmark, the German sea, and the Baltic; on the east and south by Upper Saxony; and on the west by Westphalia; comprehending the duchies of Holstein, Mecklenburg, Lawenburg, Bremen, Verden, Brunswick-Lunenbourg, Brunswick-Wolfenbüttele, the bishoprick of Hildesheim, and the duchies of Magdeburg and Halberstadt, of which the two latter have been already mentioned.

The duchy of Holstein is bounded on the north by Kewic; on the east by the Baltic sea, and the duchy of Sax-Lawenburg; on the south by the river Elbe, which separates it from Bremen and Lunenburg; and on the west by the German sea. It is about a hundred miles long, and fifty broad; a pleasant fruitful country, and extremely well situated for trade. The king of Denmark, and the duke of Holstein Gottorp, have a joint dominion in great part of it; and of some towns and territories, each is respectively the sole sovereign. There are also some imperial cities and sovereign states, which are governed by their own magistrates.

The chief of the latter is Hamburg, situate in 10 degrees of east longitude, and 53 degrees 41 minutes of north latitude. It stands on the north side of the Elbe, partly on islands, and partly on the continent, seventy miles north-east of the German ocean. The tide flows through the channels that separate the islands; and the town lies so low, that in spring tides they receive great damage in their houses. The streets are spacious, and the houses, which are built of brick, are very high, and have a magnificent appearance. The city is naturally strong, and likewise industriously fortified. It is exceeding populous, merchants from all parts of Europe resorting hither; whence their goods are sent into the middle of the empire by the Elbe. All sorts of provisions are here in great plenty; and their beer has such a reputation, that the export of it is very considerable. Ships come up to the doors to deliver and take in their lading; the tide flows sixteen miles above the town. The territory is small, but contains some beautiful villas and gardens. There are also several considerable islands which belong to Hamburg. The magistrates consist of four burgomasters or mayors, twenty scjeps or aldermen, twelve common-council-men or senators; and upon extraordinary occasions sixty more of the principal citizens are assembled, in whom is the last resort. It is a free imperial city, subject only to the general laws of the empire; but of late years the people have sometimes disputed the authority of the senate, and the emperor has interposed. The king of Denmark, as duke of Holstein, sometimes lays claim to the dominion of this city, and extorts money from the inhabitants; for being possessed of the fortress of Gluckstadt, near the mouth of the river, it is greatly in his power to distress their commerce. The established religion is Lutheranism, and they will tolerate no other, whether popish or protestant, except in the chapels of foreign ministers.

The city of Lubec is situate in 10 degrees 51 minutes of east longitude, and in 54 degrees of north latitude; on the river Trave, ten miles south-west of the Baltic, and forty miles north-east of Hamburg. It is one of the hanse-towns, and is a rich, populous city, pleasant and well built, containing twenty parochial churches, besides the cathedral, which is a piece of fine architecture, dedicated to the Virgin Mary. The government of Lubec is properly aristocratical, none having any share in it but the nobility and persons of fortune. Their territories, which lie round the city, are about sixty miles in circumference, containing several towns and villages.

In the flourishing state of the hanse-towns, Lubec was the chief of the confederacy, and its inhabitants were not only the greatest traders, but the most formidable naval power in Europe; being able to equip two hundred men of war. They have still a great foreign trade; but ships of burden come up no higher than the town of Travemund, at the mouth of the river Trave, twelve miles north-east of Lubec.

The lands of the bishop have been enjoyed by protestant princes since the year 1561, when the Lutheran religion was established here. They devolve

as an appendage, or inheritance, on a younger son of the duke of Holstein-Gottorp, who is styled duke of Holstein-Eutin, from the place where he usually resides, which is at the distance of four miles from the city.

The duchy of Mecklenburg is bounded on the north by the Baltic; on the east by Pomerania; on the south by Brandenburg; and on the west by the duchies of Holstein, Lunenburg, and Lawenburg; being about a hundred miles long, and sixty broad. The air is unhealthy, and in the winter cold; but the country is fruitful, well watered, and advantageously situated for a foreign trade. It was anciently inhabited by the Vandals. This duchy is subject to two branches of the house of Mecklenburg, namely, Strelitz, and Schwerin, the later of whom possesses the part of the country called Mecklenburg Proper.

The chief towns are, 1. Gultrow, a fortified city, which became subject to the duke of Mecklenburg-Schwerin, upon the extinction of the line of Gultrow, in 1695. 2. Rostock, situate on a bay of the Baltic, twenty-six miles east of Wismar. This is an imperial city, or sovereign state, and took its name of Rostock from a red pillar, anciently worshipped by the inhabitants. 3. Grabou, situated twenty miles south of Schwerin.

Wismar is situated on a bay of the Baltic, twelve miles north of Schwerin. It was formerly one of the chief hanse-towns, being the station of their men of war; but the Swedes making themselves masters of the place, during the civil wars of Germany, it was confirmed to them by the treaty of Westphalia. Being afterwards taken by the Danes and their allies, it was restored to Sweden by the peace of 1720; with provision that the fortifications should be demolished.

Schwerin, the capital of the duchy, is situated on an extensive lake, called the Schwerin sea, twenty-two miles south of the Baltic. It was formerly a bishop's see, but secularized by the treaty of Westphalia, and being converted into a principality, was allotted to Adolph Frederic, duke of Mecklenburg.

The duchy of Lunenburg, including Zell, is bounded on the north by the river Elbe, which separates it from Holstein and Lawenburg; on the east by the marquisate of Brandenburg; on the south by the duchy of Brunswick; and on the west by Bremen and Westphalia; extending in length about a hundred miles, and in breadth seventy. Part of it is a barren territory, full of bogs and morasses, and part of it is covered with forests; but near the banks of the rivers the land is in many places fertile. As it abounds in wild hogs, deer, and other venison, the German nobility resort hither to hunt in the season. The duchies of Lunenburg and Zell, on the death of George William, the last duke, in 1705, devolved on the electress of Hanover, his only daughter, and are now descended to his present majesty.

The chief towns are Lunenburg, Zell, and Harburg. Lunenburg is situate in 10 degrees 40 minutes of east longitude, and in 53 degrees 38 minutes north latitude; on the river Ilmenow, forty-five miles north of Zell, and thirty-five south-east of Hamburg. The figure

figure of the town is oblong, and the circumference about two miles; the streets broad, and the houses pretty well built. Near the city are salt springs, where great quantities of salt are made; and this manufacture not only affords employment to many of the inhabitants, but a considerable revenue to the sovereign.

Zell is situate at the confluence of the rivers Aller and Fuhse, forty-seven miles south-west of Lunenburg. This was the usual residence of the late duke of Zell, and the courts of justice for both those duchies are commonly held in this city.

Harburg is a port-town, on the south side of the river Elbe, opposite to Hamburg, and thirty-seven miles north-west of Lunenburg. It is well situated for trade, but on account of the vicinity of Hamburg, is far less considerable than it otherwise might be.

The duchies of Bremen and Ferden, or Verden, have the Elbe on the north, Lunenburg on the south-east, and the German sea and the Weser on the north-west; extending about sixty miles in length, and forty in breadth. This country was formerly subject to Sweden, but conquered by Denmark, and transferred by that crown to the elector of Hanover, for a valuable consideration, in 1716. The chief towns are, Bremen, Ferden, Stade, Boxthude, and Rottenburg.

Bremen is situate on the river Weser, seventy miles north-west of Zell, and the same distance south-west of Hamburg. It is well fortified; and what renders it almost inaccessible to an enemy, is, that the adjacent country may be laid under water. It is a port-town, the most considerable for trade of any in Germany, next to Hamburg. But large vessels are obliged to unload six miles below it, on account of the sands in the river. It was one of the hanse-towns, and is still an imperial city or sovereign state, governed by its own magistrates.

Ferden, or Verden, is situate on the river Aller, twenty-six miles south-east of Bremen. It is but a little town, and has a very small territory about it. This, as well as Bremen, was the see of a bishop, before it was secularized in 1648.

Stade lies on the south side of the Elbe, with which it has a communication, twenty-two miles west of Hamburg. It is defended by a fort at the confluence of the Zuenga and Elbe, which form a good harbour for large ships; and so advantageous is its situation for trade, that in time it may rival the most flourishing city in Germany.

Boxthude stands near the banks of the Elbe, in a fruitful country, fifteen miles west of Hamburg, which it supplies with great part of its provisions.

The duchy of Hanover or Calemburg, including Grubenhagen, is bounded on the north by the duchy of Zell; on the east by Brunswick Proper, and the bishoprick of Hildesheim; and on the south and west by the landgrate of Hesse, and Westphalia; being about eighty miles in length, and near forty in breadth, in the south of Grubenhagen; but Hanover, in the north, is not more than twelve miles broad. The country is much over-run with wood, and the soil

not fruitful; on which account, notwithstanding its favourable situation for commerce, it enjoys not a flourishing trade. The chief articles are, timber, cattle, hogs, and some minerals, viz. a little silver, copper, lead, iron, vitriol, brimstone, quicksilver, and coppers; with mum, beer, and bacon. Hanover, the capital of the duchy, is situate in 9 degrees 45 minutes of east longitude, and in 52 degrees 32 minutes of north latitude; on the river Leyna, sixteen miles west of Brunswick. It is surrounded by a wall and other works of no great strength, and the buildings are generally mean. The best edifice is the Roman Catholic church, which was assigned to the papists, on the advancement of the family of Hanover to an electorate of the empire. The elector also agreed to admit in his dominions an apostolical vicar from the pope. The palace, though not magnificent, is commodious, and the appearance of a court is constantly kept, as if the sovereign were present. A French comedy is performed three times a week, to which the public is admitted gratis; and frequently there are concerts, balls, and assemblies. The situation of the town is agreeable, and there are several pleasant seats in the neighbourhood.

The usual residence of his late majesty was at the palace of Herenhausen, a short way distant from the capital. The gardens at this place are much admired, and the waterworks considered as equal, if not superior, to any thing of the kind in Europe.

Another of the chief towns in the electorate is Gottingen, situated also on the Leyna, in the province of Grubenhagen, about fifty miles south of the capital. King George II. erected here an university, which in a few years became so flourishing, under the royal patronage, as to rival every institution of that kind in the empire, and continues to be in great reputation for the study of the sciences.

The elector is absolute here, as in his other German dominions. His revenues are computed at four hundred thousand pounds a year, and he is able to raise thirty thousand men in all his territories, which, besides Hanover, consist of the duchies of Lunenburg and Zell, Bremen and Verden, with the duchy of Lawenberg; the elector of Hanover is hereditary arch-treasurer of the empire, and is usually styled sovereign of Brunswick-Lunenburg.

The duchy of Brunswick-Wolfenbuttle is bounded on the north by Zell, on the east by Magdeburg and Halberstadt, on the south by Hesse-Cassel, and on the west by Hildesheim and Hanover; being about forty miles in length, and nearly the same in breadth. The chief towns are Brunswick, Wolfenbuttle, Helmstat, and Bienenberg.

Brunswick, the capital of the duchy, is situate on the river Ocker, thirty-five miles east of Hanover, and thirty miles south of Zell. It was formerly one of the hanse-towns, and an imperial city, governed by its own magistrates; but now the duke of Brunswick is an absolute sovereign. The town is of a square form, about two miles in circumference; the private houses well built, and the duke's palace and the stadthouse magnificent. The city is rich and populous, enjoy-

mi

enjoying a considerable trade; and the goods they export are chiefly hides, butter, and mum.

Wolfenbüttele is also situated on the Ocker, ten miles south of Brunswick. Being surrounded by bogs and morasses, it is strong by nature as well as art. The duke's palace here is a noble building, and has a library which contains near a hundred and thirty thousand volumes.

Helmstadt is situate four miles east of Wolfenbüttele, and fifteen miles south-east of Brunswick. Here is an university, founded and endowed by Julius, duke of Brunswick-Wolfenbüttele, the rector of which has the title of count palatine.

The revenues of the duke of Brunswick-Wolfenbüttele are computed to amount to three hundred thousand pounds a year. He is able to raise several thousand men, and is of the Lutheran religion.

The bishoprick of Hildesheim is surrounded by the territories of Hanover and Brunswick-Wolfenbüttele, being thirty miles in length, and almost as much in breadth. The capital, which bears the same name, lies seventeen miles south-east of Hanover. It is an imperial city governed by its own magistrates, the bishop having little temporal authority either here, or in the territories belonging to it. The inhabitants consist both of Lutherans and Papists.

#### C H A P. IV.

##### *Circle of Westphalia.*

THE circle of Westphalia is bounded on the north by the German ocean; on the east by the circle of Lower Saxony; on the south by the landgraveate of Hesse, the palatinate of the Rhine, and the electorate of Triers; and on the west by the Netherlands; being two hundred miles in length, and from a hundred and fifty to two hundred miles in breadth. The north part of the circle is generally an open level country, either a dry, barren sand, or consists of lakes and morasses, which, with its northern situation, render it excessively cold in the winter; but in the southern parts, the air is much milder, and the soil more fertile. The chief rivers are, the Rhine, the Maes, the Weser, the Ems, the Roer, the Lippe, another Roer, the Aa, and the Hunt.

The divisions or provinces comprehended in the circle of Westphalia are, the bishopricks of Liege, Munster, Paderborn, and Osnaburg; the duchies of Westphalia, Cleves, Juliers and Berg; the counties of Minden, Mark, Ravenburg, Schawenburg, Hays, Diepholt, Oldenburg, Delmonhurst, Embden, Beutheim, Tecklenburg, Lippe, Pymont, Lingen, and Steinfort; Corbey Abbey, and the imperial towns, which are so many sovereign states.

The bishoprick of Liege is bounded on the west and north by Brabant; on the east by the duchy of Limburg, from which it is separated by the river Maes; and on the south by the duchy of Luxemburg, and Namur. It is seventy miles in length from north to south, and its breadth between twenty-five and fifty miles. The air is temperate and healthful, and the

No 18.

soil fertile, abounding in corn-fields, meadows, and pasture grounds. There are also some mines of lead and iron, and quarries of marble; but it is most considerable for the great quantities of brimstone and vitriol which it produces, as well as mineral waters, particularly near the Spa. It is computed that there are in the bishoprick twenty-four walled towns, and four hundred villages, besides a great number of abbeys and convents. The bishop, who is sovereign, is one of the most considerable ecclesiastical princes in Germany. His yearly revenue amounts to three hundred thousand ducats, or nobles; and he is able to maintain a body of eight thousand men, without oppressing his subjects, who are generally Roman Catholics.

The chief towns are, Liege, Tongers, Huy, Dinant, Bouillon, and Spa.

Liege, the capital, is situate in 5 degrees 40 minutes of east longitude, and in 50 degrees 36 minutes of north latitude; on the river Maes, twelve miles south of Maestricht. It is a populous and rich city, about four miles in circumference. Two branches of the Maes, and other rivulets or canals run through several of the streets, and form little islands. No city in Germany can equal it in fine churches and convents. Of the former there is not less than a hundred; and a multitude of monasteries, which are so pleasantly situated, and have such endowments, that the city is sometimes called the paradise of ecclesiastics. Here is an university of great fame; and among the religious houses one of English nuns. The fortifications of the town are not strong, and are commanded by the neighbouring hills; but the citadel is capable of making a good defence. The magistrates of Liege pretend that it is an imperial city, or sovereign state; but this claim is not acknowledged by the bishop, who exercises absolute power here, as well as in the adjacent territory. He is elected by the sixty major canons, who are generally of noble extraction. The trade of this city is chiefly with Holland, whither they export, down the Maes, great quantities of iron, stone, chalk, &c. bringing in return, herrings, cheese, butter, and all sorts of grocery.

The common women here are employed in the most laborious services; they draw the boats up the river instead of horses; they dig, saw, and carry all kinds of heavy burdens, and are for the most part naked.

Tongers lies on the river Jecker, ten miles north-west of Liege. This was a noted town in the time of the Romans. It was made a bishoprick at an early period; and when taken by Attila, the Hun, it contained a hundred churches, which he destroyed. Upon its decline, the see was removed to Maestricht, and afterwards to Liege.

Huy, or Hugum, is situate on the east side of the Maes, fifteen miles south west of Liege. In ancient times it also was a place of great note, and at present a strong fortress.

Dinant is situate on the river Maese, twelve miles south of Namur.

Bouillon lies on the river Semoy, thirty miles south of Dinant. It is a fortified town, and with a small territory annexed to it, gives the title of duke to the

G g g bishop

bishop of Liege. One of the dukes of this place was the famous Godfrey, who for his conduct and courage in the crusade, in the eleventh century, was made the first Christian king of Jerusalem.

Spa, or Spaw, is situate seventeen miles south-east of Liege, in a bottom surrounded with hills. This place has been celebrated for its mineral waters since the time of the Romans, and company resorts hither from every nation in Europe, both for health and pleasure.

Besides the towns already mentioned, Franchemont, Borchloen, St. Tron, and Meyrick, are also places of some note.

The duchy of Westphalia is situate between the bishoprick of Paderborn on the north, and the territory of Wateravia on the south. It is much encumbered with mountains and forests, and has been annexed, by purchase, to the archbishoprick of Cologne. One of the chief towns is Arensburg, pleasantly situated on the Roer, fifty miles north-east of Cologne. Near it is a fine castle, where the elector of Cologne frequently resides. The town of Werle stands between the Roer and the Lippe; and here the supreme courts of justice are held. Another of the most considerable is Geleek, a fortified town, situated twenty-five miles north-east of Arensburg.

The bishoprick of Munster, lying on both sides of the river Ems, is bounded on the north by the counties of Bentheim and Steinfurt; on the east by the bishopricks of Osnaburg and Paderborn; on the south by the county of Mark; and on the west by the duchies of Cleve and Zutphen; being a hundred and twenty miles long, and eighty broad. It is a barren country, producing hardly corn enough for the subsistence of the inhabitants, but abounds with the best bacon in Europe.

The city of Munster, the capital of the bishoprick, and of the circle of Westphalia, is situate in 7 degrees 50 minutes of east longitude, and in 52 degrees north latitude; on the river Aa, in the most fruitful part of the country, seventy miles north-east of Cologne, and thirty-five south-west of Osnaburg. The town is well built of free stone. Here was concluded the treaty, in 1648, which put an end to the religious wars of Germany, and settled the pretensions of many princes both in the empire and other parts of Europe; sometimes called the treaty of Munster, from the city, and sometimes that of Westphalia, from the province in which it was concluded. In the year 1533, John of Leyden, a taylor by profession, and a fanatic, drove away the bishop and magistrates, and made himself master of the city; but it was taken from him in 1536, after a siege of fourteen months, and he was tortured to death.

Munster was an imperial city, or sovereign state, till the year 1661, when it was subdued by the bishop, under the jurisdiction of whose successors it has since remained, with an annual revenue amounting nearly to a hundred and fifty thousand pounds.

The bishoprick of Paderborn is bounded on the north by the county of Lippe, on the east by the circle of Lower Saxony, on the south by that of the

Upper Rhine, and on the west by the duchy of Westphalia; being about forty miles long, and twenty broad. This is a barren province, remarkable chiefly for its salt springs and other waters, as well as its iron and lead mines. One of those springs disappears twice in twenty-four hours, and returns with such violence that it moves several mills near its source. The other principal commodities of the country are bacon and venison.

Paderborn, the chief town of the bishoprick, is situated thirty miles north-west of Cassel, and fifty south-east of Munster. It is a populous town, of considerable extent, well built and fortified. This was anciently an imperial city, or sovereign state; but is now subject to its bishop both in spirituals and temporals; and the established religion is the Roman Catholic.

The territory of Corbey Abbey lies between the river Weser on the east, and the bishoprick of Paderborn on the west; being about sixteen miles long, and eight broad. The chief town is Corbey, where the abbey stands; besides which, here is Hoxter, a handsome town, situate on the bank of the Weser, five miles south of the abbey. This territory is subject to the abbot, who is a prince of the empire.

The bishoprick of Osnaburg is bounded on the north by the territory of Diepholt; on the east by the county of Minden; and on the south and west by the counties of Steinfurt and Bentheim; being about forty miles long, and thirty broad, and one of the most fruitful countries in the circle of Westphalia. This bishoprick, with the territories belonging to it, is held alternately by a protestant and papist, the nomination of the protestant bishop being vested in the family of Hanover. The present bishop is his royal highness prince Frederick, second son of his majesty, who derives from the bishoprick a considerable revenue. This was the first bishoprick founded by Charlemagne, who dedicated the cathedral to St. Peter and the two martyrs Crispin and Crispianus, exempting the see from all service and homage to the emperor, or any other prince or state.

Osnaburg, the capital, is situate on the river Ouse, in a fine plain. In it are some grand buildings; and the churches are divided between the protestants and papists, the latter being possessed of the cathedral, and the church and monastery of the Dominicans. Both protestants and papists have votes at the election of their magistrates. This town is said to produce the best beer and bread in Westphalia. The chief manufacture is the lincens called Osnaburgs, a great deal of which is exported, as well as Westphalia hams.

The other towns of note in this bishoprick are, Iburg, Quakenburg, Vorde, Faulsenade, Whitlag, and Me'lo.

The duchy of Juliers is bounded on the north by the duchies of Cleve and Gelder; on the east by Cologne; on the south by the palatinate; and on the west by the Netherlands. It is sixty miles long, and thirty broad, abounding in corn and pasture grounds, with good neat cattle, and an excellent breed of horses. It produces also great quantities of wood, for dying.

This duchy is subject to the elector palatine. The chief town Juliers stands on the Roer, twenty-seven miles east of Maestricht, and as many west of Cologne. It is a small fortified town, defended by a castle, in which was the palace of the ancient dukes. This place was anciently called Juliacum, and according to tradition, built by Julius Cæsar.

Aix-la-Chapelle, or Aken, is situated in a low valley, encompassed with hills of a gradual ascent, twenty-two miles north-east of Liege, and thirty miles west of Cologne. It is an imperial city, or sovereign state, and is said to have been founded in the year 53, by Severus Granus, a Roman prince, brother to the emperors Nero and Agrippa; who being banished Rome, chose this place for his residence, on account of the hot springs. It was also the favourite residence of Charlemagne, who built in it the magnificent church of St. Mary, or Notre Dame, being of an octagonal figure, but usually called the rotundo. He afterwards furnished it with the most valuable relics that could be procured in the Holy Land; calling himself a canon of it, and ordaining that all future emperors should likewise be invested with the same office. The memory of this prince is held in great veneration by the inhabitants of Aix, and in honour of him they celebrate an annual festival on the 14th of January, which is called the feast of St. Charles, when they carry his image about the town, in solemn procession, for the people to adore.

The relics that were purchased by Charlemagne are deposited in a part of the church, allotted for that purpose. On high festivals the priests exhibit sometimes one, and sometimes another of them; but once in seven years all the relics are carried up to the tower, and thence displayed to the people for fifteen days successively, beginning on the 10th of July. On this occasion many thousands of bigotted persons resort hither from all parts of Germany, and the spectators universally kneel while the relics are exhibiting.

This city is governed by its own magistrates, of whom there are fifteen, who annually choose out of their body eight echevins by ballot, the latter electing likewise from among themselves two burgomasters. The burgomasters of the preceding year sit in court, and act in conjunction with those in office. There is likewise a town-bailiff or mayor, who has cognizance in military affairs, passes, &c. and who is named by the elector Palatine, as duke of Juliers.

The street containing the baths is very regular and handsome, with trees planted before the houses. The great pump is placed under a piazza, behind which are several walks for the company. The royal baths are within a court, on the opposite side of the same street; and there are also cold baths adjoining. Several houses have been erected for the accommodation of the company; and they have rooms for assemblies, gaming tables, &c. in the manner of those at Bath, but much inferior in elegance.

The trade of Aix is very inconsiderable, the inhabitants, as in most towns of pleasure, being more addicted to dissipation than industry. There are, how-

ever, a few dealers in cloth, gloves, and stockings; but the greatest manufacture is that of needles, in which branch no less than five hundred persons are constantly employed.

Several kings of the Romans, and many emperors have been crowned at Aix-la-Chapelle, at which solemnity the relics above-mentioned were exposed to view; as they likewise are at the coronation of an emperor, wherever the ceremony is performed. The elector of Mentz, as chancellor of the empire, sends a summons to the magistrates of Aix to appear in person, or by their deputies, and bring those relics with them to Francfort, or any other place he appoints for the coronation.

Duren is situate on the Roer, ten miles south of Juliers. This is a small town, well built, with canals or rivulets running through the streets. Among the relics in the church of St. Martin, they shew the head of St. Anne, mother of the Virgin Mary, to which great numbers of pilgrims used to resort. This was formerly an independent state, but is now subject to the elector palatine. The other towns in this duchy are, Munster-Eifel, Emkirchen, Nidec, Boisslar, Linnich, Dalen, Wefenbergl, Sltard, Tudder, and Safteren.

The duchy of Berg is bounded on the north by the county of Mark; on the east by the duchy of Westphalia; and on the south and west by the Rhine, which separates it from the electorate of Cologne; extending along the eastern bank of the Rhine above forty miles, but is not in any part twenty miles broad. It consists chiefly of rocky barren hills, and is neither fruitful nor populous.

The principal town of this duchy is Dusseldorp, pleasantly seated near the Rhine, twenty-five miles north of Cologne, and six south of Keyserwaert; receiving its name from its situation near the confluence of the Rhine, with the little river Dussel. The town is of considerable extent, well built, and fortified; and the elector palatine, who is sovereign of the duchy, has here a palace, in which he frequently resides. The chief trade of the place consists in transporting from Holland corn and several commodities, to Cologne, and other towns in Germany.

The town of Essen, lying fifteen miles north-east of Dusseldorp, is noted for a magnificent nunnery, inhabited by noble ladies, who are allowed to marry, and leave the convent when they please. The other most considerable towns in this country are, Bensberg, Solingen, and Wipperford.

The duchy of Cleves is bounded on the east by the territories of Munster; on the south by Juliers; and on the north and west, by Zutphen and Brabant; being about forty miles long, and twenty-five broad. It is a mountainous woody country, and the soil generally barren; but there are some fertile valleys. It was the Clivia of the Romans, who gave it this name from the steep rocks and mountains with which it abounds.

Cleves, the capital of the duchy, stands near the west bank of the Rhine, ten miles distant from Nimeguen, towards the same quarter. It is a small, but popu-

populous city, defended by a castle, which is however not considerable for strength. The other towns in this duchy are Embrick, Gunnepe, Wesel, Rees, Roertort, Duisberg, Griët, Gortz, Culcar, Santen, Buric, Alphen, Orfoi, and Dinstaken. The inhabitants consist chiefly of Papists and Calvinists; and the king of Prussia, as duke of Cleves, is absolute sovereign of the country.

The county of Mark is situated between the rivers Roer and Lippe. It is about forty miles long, and twenty broad, and is one of the most fruitful countries in the circle of Westphalia, likewise subject to the king of Prussia. The capital of the county is Ham, lying on the river Lippe, twenty-two miles south of Munster. Another of the towns is Saest, twenty-six miles south of Munster; an imperial city, and one of the largest in Westphalia. Besides those, the remaining towns of note are, *ina*, Altena, and Werden.

The county of Ravensburg is situated between the county of Lippe on the east, and the bishoprick of Munster on the west. It is a mountainous barren country, and also subject to the king of Prussia. The chief town is Bilevelt, seven miles from which stands Herfurt, or Hervorden, pleasantly situated at the confluence of the Aa and the Wehre. In this town is a magnificent nunnery, the abbess of which is a princess of the empire, and sends her deputy to the diet or assembly of the states. Since the king of Prussia has become sovereign of this country, those nuns have professed themselves protestants of the sect of Calvin.

The duchy of Minden is situated between the counties of Hoy and Lippe, extending about twenty-five miles in length, and twenty in breadth, for the most part arable land, and abounding in corn.

Minden, the capital city, was a bishoprick before the reformation, but is now secularized; and, with the territory belonging to it, is subject to the king of Prussia. Near this place, the French were defeated by the allied army, under prince Ferdinand of Brunswick, on the 1st of August, 1759.

The county of Hoy is situate between Minden on the south, and the duchy of Bremen on the north. It was subject to its own counts till the death of Otho, the last count, in 1582, when it descended to the houses of Hanover and Lüneburg. The greater part now belongs to his Britannic majesty, and the remainder is the property of the count of Bentheim. The chief town of the Hanoverian division is Hoy, situate on the east side of the Weser. The other towns of any note are, Stolzenow, Nyenburgh, Ucht, Frendenburg, Frenburg, Sierk, Shegerburg, Depenaw, Burenburg, Lavenhaw, and Bruckhausen.

Diepholt is a small county, south of Delmenhurst, subject also to his Britannic majesty, as elector of Hanover. The chief town, Diepholt, lies on the Dummerlake, twenty-five miles west of Hoy.

The county of Lippe, belonging to the count of that name, is situated between the territories of Hanover, and the duchy of Westphalia, being about thirty miles long, and ten broad. The chief town is Diethmold, twelve miles north-east of Paderborn. Another of

the towns is Lippe, situated on the river of the same name, twenty miles west of Paderborn. Here is a considerable trade in timber and planks for ship-building. The town of Hern is supposed to be the place where the Romans under Varus received a signal defeat, and were driven over the Rhine and Danube, which were for some hundred years afterwards considered as the boundaries of the Roman empire. Between Lemgow and Hertfurt, lies the town of Uffen, where are salt springs which afford a great manufacture of that commodity.

Pyrmont county is annexed to the county of Lippe. The chief town is Pyrmont, celebrated for its excellent mineral waters. The county of Riburg is also annexed to that of Lippe. The chief town, which bears the same name, is situate near the head of the river Ems, ten miles west of Lippe.

The county of Schawenburg is bounded on three sides by the territories of Hanover, and on the west by the duchy of Minden. It is about thirty miles long, and sixteen broad; consisting both of good arable and pasture grounds, well watered by the Weser and other streams, and a great lake named the Steinhadersee. It produces salt, timber, coals, alum, chalk, and free-stone. Part of this territory is subject to the count de Lippe, and part to the landgrave of Hesse. The most conspicuous place is the old fortrefs of Schawenburg, standing on a high hill on the east side of the Weser. The others of greatest note are, Buckholt, Stathagen, Oldendorf, and Saxonhagen.

South-west of Osnaburg, lies Tecklenburg, about sixteen miles long, and eight broad, subject to the count of Bentheim. The capital, which bears the same name, is a town of considerable extent.

The county of Steinfort lies north of Munster. It is about twelve miles long, and six broad. The chief town, Steinfort, is situated on the river Aa, fifteen miles north-west of Munster. This territory is now subject to the count of Bentheim.

The county of Linguen is situated between Osnaburg on the east, and Bentheim on the west; being about fifteen miles long, and ten broad. The chief town is Linguen, standing on the river Ems, forty miles north of Munster. The bishop of Munster is sovereign of the county, but the king of Prussia has claimed the town.

The county of Bentheim, which lies north of Steinfort, is about forty miles long, and ten broad; having for its capital a town of the same name, situated in the middle of a forest, thirty miles north-west of Munster. This is the property of the count of Bentheim.

The county of Embden, frequently denominated East Friesland, lies on the German ocean, with the county of Oldenburg on the east, and Groningen, one of the United Provinces, on the west; being part of the country of the ancient Frizons. A great part of it is covered with lakes and morasses; and hardly any either well cultivated, or fruitful. Its situation, however, is remarkably advantageous for foreign traffic; on which account, it was claimed by the king of Prussia, who, in order to increase his maritime power,

took

took possession of it on the death of the former proprietor.

Embsen, the capital, is situate on the Dollart Bay, near the mouth of the river Ems, twenty-five miles east of Groningen, and sixty west of Bremen. This was formerly considered as an imperial city, or fove-reign state, under the protection of the Dutch, who used to station a guard-ship at the mouth of the Dollart Bay; but since it was seized by the king of Prussia, the Hollanders have been obliged to relinquish this mark of prerogative. Here is a good harbour, and the place has acquired a considerable trade under the auspices of the Prussian monarch.

#### C H A P. V.

##### *Circle of the Upper Rhine.*

THE countries which constituted the circle of the Upper Rhine, being now under the dominion of the French, except Hesse, only this comes properly within a description of the empire.

Hesse, comprehending the landgravates of Hesse-Cassel, Hesse-Marpurg, Hesse-Darmstadt, Hesse-Rhinefeld, and Wetteravia, is bounded on the north by Paderborn and the territories of Hanover; on the south-east by Franconia; and on the south-west by the bishopricks of Mentz and Triers, and the palatinate of the Rhine. It is about a hundred miles in length, and almost as much in breadth. The most considerable tract of this country, especially towards the north, is the property of the landgrave of Hesse-Cassel. A great part of it is not very fruitful, and much of it under forest. The plains, however, are covered with flocks of sheep, the wool of which is reputed very fine; and in the mountains are mines of lead and copper.

Cassel, the capital of the landgrave, is situate in 9 degrees 20 minutes of east longitude, and in 51 degrees 20 minutes of north latitude; in a spacious plain, on the river Fulde, forty-five miles north-east of Marburg. The houses of this city are built of wood, but the streets are wide, and the market-places extensive. It contains four churches, and has a brisk trade for wool and woollen manufactures. The castle or palace of the landgrave stands without the town, and is strongly fortified.

Darmstadt, the capital of the division called Hesse-Darmstadt, is situate ten miles east of the Rhine, and is a well built town, though not of considerable extent. The landgrave's palace, in particular, is a magnificent edifice. Marburg, another of the most eminent towns in this circle, is pleasantly situate on the river Lhon, forty miles south-west of Cassel. It is a fortified town, defended by a castle, and here is also one of the best universities in Germany. The sovereign of the place is the landgrave of Hesse-Cassel.

Catzenebogen is a small town, capital of a county of the same name, and lies on the bank of the Rhine, twenty miles north-west of Mentz. The property of it was long disputed by the houses of Hesse and Nassau; but at length was ceded to the former.

No. 18.

Smalcald is situate fifty miles south-east of Cassel. It is a well built town, and has a good trade, especially in hard-ware, having iron mines in the neighbourhood. At this place the protestant princes and states of Germany entered into a league for their defence, and compelled the catholics to consent to a toleration of the reformed religion.

Schwalback is situate ten miles north of Mentz, and is famous for its baths, to which there is annually a great resort of company in the season. In one of the springs the water seems to boil, though so cold as to be used by the people in the neighbourhood for allaying the warmth of their wines.

The other most conspicuous towns are, Rottenburg, Hamburg, and Alsfeld.

The county of Waldeck is bounded on the north by the bishoprick of Paderborn, and on the west by the territories of Cologne; being twenty-four miles long, and nearly as much in breadth, subject to the count of that name. The chief town, Waldeck, is situate on a high hill, twenty miles south-west of Hesse-Cassel.

The territory of the abbey of Hirschfeld lies south of Cassel, and is about twelve miles in length, and nearly as much in breadth. The convent, which gives name to the town, was esteemed an elegant building; but this, with the annexed territory, has been converted into a lay fee; and the landgrave of Hesse-Cassel is both sovereign and proprietor of it.

Southward of Hirschfeld is situate the abbey of Fuld, the territories of which are about thirty miles in length, and more than half as much in breadth. This abbey is endowed with great privileges, the abbot being not only a prince of the empire, but primate of the abbeys in Germany, depending immediately on the pope. The great church here, dedicated to St. Boniface, is a magnificent structure.

Proceeding to Wetteravia, in the southern part of Hesse, we come to the county of Solms, lying south-west of the territories of Marburg. The chief town is Solms; but the count usually resides at the castle of Brunswiek, about fifteen miles to the southward.

Wetzlar, an imperial city, stands on the river Lhon, twenty-eight miles north of Frankfort. It is a fove-reign state, governed by its own magistrates; and the imperial chamber was removed hither from Spire in the year 1698.

Fifteen miles south of Wetzlar, lies Friedburg, also an imperial city. It is a rich trading place, and has been the residence of some of the German emperors.

The county of Hanau is bounded on the north by the territories of Hesse-Cassel; on the east by those of the abbey of Fuld; on the south by the river Maine, and the territories of Mentz; and on the west by the county of Nassau; being about forty miles in length, and fifteen in breadth, subject to its count, who is at present landgrave of Hesse-Cassel. The chief town, Hanau, is pleasantly situated on the river Cantz, thirteen miles east of Frankfort. The town is well built and fortified, and has a brisk trade.

H h h

Budin-

Budingen, capital of a small county, situate twenty miles north-east of Frankfort, is a large city, and has a fine castle belonging to it.

Gelnhausen is an imperial city, lying twelve miles north-east of Hanau.

The county of Nassau is bounded on the north by Westphalia, on the east by the county of Solms, on the south by the territories of Mentz, and on the west by the electorate of Treves or Triers. The capital bears the same name, and stands on the river Lhon, twenty-nine miles north-west of Mentz.

Dietz is situate also on the river Lhon, and in the same county, twenty miles north of Mentz, and is subject to the prince of Nassau-Dillenburg.

Hadamar stands twenty miles north of Mentz, and gives title to another branch of the house of Nassau.

Wisbaden, situated five miles north of Mentz, is distinguished for its excellent baths.

Frankfort stands on both sides of the river Maine, eighteen miles east of Mentz, and fifteen west of Hanau. It is a large populous city of no great strength, but has a brisk trade, being advantageously situated near the confluence of the Maine and the Rhine. The streets are spacious, and the houses built of a red stone. It is an imperial city, governed by its own magistrates; and here the emperor is usually elected and crowned. In the state-house, where the electors assemble on the choice of an emperor, is kept the golden bull, or statute, containing the rights and privileges of the princes, and other subjects of the empire, which the emperor swears to observe on his accession.

There are here some convents, and the cathedral is in the hands of the Roman Catholics; but they are not permitted to make any processions through the town, the magistrates and most of the inhabitants being Lutherans. Many protestants fled hither from England, during the persecution raised against them in the reign of queen Mary.

Rhinefeld is situate sixteen miles north-west of Mentz, and is subject to the landgrave of Hesse-Rhinefeld, of which territory it is the capital.

The other towns of any note in this circle are Wildenburg, Corbach, Eyenburg, Hamelburg, Bruckennau, Huneld, Hazfeld, Fritzlär, Frankenburg, &c.

#### C H A P. VI.

##### *Circle of the Lower Rhine.*

**T**HE circle of the Lower Rhine comprehends the three archbishopricks and electorates of Mentz, Triers, and Cologne, with the Palatinate of the Rhine, the bishopricks of Spire and Worms, and several imperial cities, with their respective territories.

The electorate of Mentz is bounded on the north by Wetteravia; on the east by Hesse-Darmstadt; on the south by the palatinate of the Rhine; and on the west by the electorate of Triers; being about fifty miles long, and twenty broad. Mentz, or Mayence, the capital city, stands at the confluence of the rivers Rhine and Maine, twenty miles west of Frankfort, and twenty-five north of Worms. It is large and

populous, but not a place of strength, and said to have been built by Drusus, there being here the ruins of a trophy erected to his memory. The streets are narrow, and the private houses mean; but the public buildings are magnificent. The university was founded by Charlemagne, in the year 800. This city claims the discovery of gun-powder and the invention of printing; but both have been disputed.

Bingen is situate at the confluence of the Rhine and Nahe, sixteen miles west of Mentz, and was anciently a Roman fortress.

The Rhinegaw, which is a narrow tract of land, extending twenty miles along the bank of the Rhine, contains so great a number of towns, intermixt with gardens and vineyards, as to have the appearance of one continued city. At the town of Erbach is a grand monastery, where are the tombs of the old counts of Nassau, and of the archbishops of Mentz; and Rodenstein is remarkable for some of the best vines upon the Rhine. Hachot is situate on the river Maine, at which place the custom-house officers, belonging to the elector, receive the duties of all goods that are carried up or down that river.

Besides Mentz, the elector has other extensive territories in Thuringia, Wetteravia, the palatinate, and county of Waldeck. His revenues are computed at upwards of a hundred thousand prunds a year.

The electorate of Triers is bounded on the north by the electorate of Cologne, and the duchy of Juliers; on the east by the territories of Mentz and Wetteravia; on the south by the palatinate of the Rhine and Lorraine; and on the west by the Netherlands. It is about a hundred miles long, and from twenty to fifty broad. The south and western parts of the country are mountainous and woody; but near the rivers Rhine and Moselle it is pleasant and fruitful, abounding in corn and wine, and exceeding populous.

Triers, the capital city, stands on the Moselle, sixty miles south of Cologne, and as many west of Mentz. Having been much exposed to the ravages of war, it is neither large nor populous, but is one of the most ancient cities in the empire, and has been the residence of several emperors. It was the Augusta Trevirorum of the Romans.

Coblentz is the second city in the electorate, and stands at the confluence of the Rhine and Moselle, fifty miles north-east of Triers. It is of a triangular figure, one side washed by the Rhine, another by the Moselle, and the third, towards the land, defended by a wall and out-works. The streets are regular, and the houses well built. The principal edifice is the elector's palace, which stands on the bank of the Rhine, and upon the hill above it, is a castle. The city is populous, and has a flourishing trade, particularly in corn, wine, wood, and iron.

Fifteen miles westward of Coblentz, on the Moselle, stands the town of Meyn, which is defended by a wall and castle, and communicates its name to a large territory. At Berncastle, situate on the Moselle, great quantities of wine are made; as are likewise at Cell, which is situate on the same river, thirty miles north-

east of Triers. The other most considerable towns are Engers, Oberwesal, Sarbrug, Montroyal, Cochem, Saffich, Bopart, Ulmin, St. Maxamin, Phalis, Wittlich, and Prum.

The electorate of Cologne, which is the most northerly division of this circle, is a long narrow territory, lying on the western bank of the Rhine, near fifty miles in length, and about ten in breadth. It is bounded on the north by the duchy of Cleves; on the east by the Rhine, which separates it from the duchy of Berg; on the south by Triers; and on the west by the duchy of Juliers, and the Netherlands. It abounds in most of the necessaries of life, particularly corn, cattle, and wine; but the latter is not so good as in the more southern countries.

The capital of the electorate is Cologne, situated on the Rhine, sixty-two miles north of Triers, and forty-five east of Maestricht. This is one of the largest and most elegant cities of Germany, and carries on an extensive trade. It is also an imperial city, but partly subject to the jurisdiction of the elector, who has the appointment of some of the magistrates, as well as the chief justice in criminal causes; and his concurrence is necessary in the enacting of all laws. The elector, however, can levy no taxes on the citizens without their consent. Most of the inhabitants are Roman Catholics; but some of the principal merchants and tradesmen are Lutherans, and allowed a church. This privilege is denied to the Calvinists, who have no place of worship nearer than Mulheim, which is distant two miles. Here are eleven collegiate, nineteen parish churches, besides the cathedral, thirty chapels, twelve monasteries, and twenty nunneries. In the cathedral are three tombs, said to contain the skulls of three kings, who came from the East, to worship Christ in his infancy, usually called the three kings of Cologne. They are said to have been first brought to Constantinople by Helen, the mother of Constantine; and being removed to Milan, were transported hither in 1164, when the emperor Frederick Barbarossa possessed himself of that place.

In the church of St. Ursula is shewn the tomb of that saint, who, according to tradition, came over from Britain, to convert the infidel Germans, accompanied by eleven thousand virgins, who all suffered martyrdom. From the great number of churches and convents, and the multitude of relics here preserved, Cologne has obtained the name of the Holy City. The endowments of the cathedral and collegiate churches are so considerable, that many princes and noblemen become canons and prebends of them, and reside in sumptuous palaces surrounded with gardens and vineyards.

The city of Bon is situated on the river Rhine, twelve miles above Cologne. The place is beautiful and well fortified, and here the elector usually resides. The other most noted towns in the electorate are Andernach, Reyserswaert, Dettingen, Broel, Lintz, Nuys, Zous, Rhinebergh, Meurs, and Kempen.

The elector of Cologne is arch-chancellor of the empire for Italy, and has a right with the elector of

Mentz to consecrate the emperor. His revenues are computed to amount to a hundred and thirty thousand pounds a year.

The next division of the circle of the Lower Rhine, is the Palatinate, bounded on the north by the archbishopsricks of Triers and Mentz, on the east by Franconia, on the south by Suabia, and on the west by the territories of France and the Netherlands. It is about a hundred miles long, and sixty broad, denominated the Palatinate of the Rhine, to distinguish it from that of Bavaria. In the temperature of the climate, and the fertility of the soil, this country exceeds any in the empire. It abounds in corn, wine, cattle, fish, and game; and by the rivers Rhine and Neckar, the inhabitants can maintain a traffic with most parts of Germany and the Netherlands.

The capital of the Palatinate is Heidelberg, situated on the Neckar, forty-five miles south of Frankfort. It consists chiefly of one spacious street, and a commodious market-place, of a quadrangular form. On every side except the west, the town is surrounded with hills, whence there is a delightful prospect. On the ascent of those hills stood the elector's palace, a grand edifice, which was mostly consumed by fire in 1764; near which is a fort, called the Star Fort, one of the completest fortifications in Germany. Near the palace lies the celebrated vessel, of so prodigious a size, as to contain eight hundred hogheads. It is said to have been generally kept full of Rhenish wine, which all were obliged to taste of, that visited the late elector's court. Here is an university, and the elector had formed one of the most valuable libraries in Europe; but it was destroyed, or removed to the Vatican, and the emperor's library at Vienna, when the elector was driven from his dominions in 1622. The greater part of the inhabitants of this city consists of protestants; but the elector is a Roman Catholic.

Manheim is situated at the confluence of the Rhine and the Neckar, ten miles north-west of Heidelberg. It is beautifully built, and as well fortified as any town in Germany. On account of a religious difference with some of his subjects at Heidelberg, the elector built here a fine palace, to which he removed his court.

Philippsburg stands on the east bank of the Rhine, eighteen miles south-west of Heidelberg. It is a strong town, surrounded by a morass, and has been frequently besieged by the French, when they invade the palatinate, as being the key of Germany on that side.

Spire is situated on the west side of the Rhine, about fifteen miles from Heidelberg. It is an imperial city, or sovereign state, governed by its own magistrates. Before it was destroyed by the French in 1688, one of the supreme courts of the empire was held here, but afterwards removed to Wetzlar, in the district of Wetteravia. This city is the see of a bishop, suffragan to the archbishop of Mentz.

Worms is situated also on the west side of the Rhine, twenty-five miles north-west of Heidelberg, and the same distance south of Mentz. This is an ancient and imperial city, governed by its own magistrates.

Ita

Its territories are about eight miles in length, and two in breadth, very fertile, and producing a great quantity of wine.

Zweilbruggen, or Deuxponts, so named from the bridges over two little rivers on which it stands, is situate forty miles south-west of Worms. The surrounding territory, about forty miles in length, and twenty in breadth, was subject to the crown of Sweden till the death of Charles XII. in 1718, when it fell to a prince of the palatine family. This duchy of Deuxponts contains the bailiwicks of Zweilbruggen, Meisheim, Lichtemberg, Neufchatel, Landsparg, with part of Guttenberg and Bischweiler.

Simerin, capital of the duchy of Simerin, is situate thirty-five miles east of Triers; having a considerable territory about it, subject to its own prince.

The other most remarkable towns in the Palatinate are Birkenfeld, Oppenheim, Traarbach, Oberstein, Altheim, Keislarlaatern, Simtheim, Spirebach, Bruckfal, Weibstadt, Altrip, Newstadt, Batharach, Eberinberg, Ladenberg, Lauterach, Leningen, Rhinegrave-stain, Veldentz, and Reipolizkirk.

The elector palatine is sovereign of the greater part of the Palatinate; of the duchies of Newburg, Juliers, and Berg; the city of Dusseldorp, and lordship of Ravenstein. He is director of three circles, viz. the Lower Rhine, jointly with the elector of Mentz; the Upper Rhine, as prince of Simmeren, with the bishop of Worms; and of Westphalia, as duke of Juliers, alternately with the king of Prussia, who is duke of Cleves. The revenues of the Palatinate arise by a toll on all vessels going along the Rhine, Neckar, and other rivers; and from the duties on corn, wine, and other provisions; the whole being estimated at three hundred thousand pounds a year. The elector usually keeps a body of six or seven thousand men in time of peace; and in the late wars, maintained twelve thousand regular forces many years.

##### *Circle of Franconia.*

**T**HE circle of Franconia is bounded on the north by Hesse and the circle of Upper Saxony; on the east by Bohemia; on the south by Bavaria and Suabia; and on the west by the Palatinate of the Rhine, and the elector of Mentz. It is about a hundred and thirty miles in length, and almost as much in breadth. The country is intermixed with hills, valleys, forests, and champaign; and produces corn and wine, but not in great plenty. It comprehends the bishopricks of Wurtzburg, Bamberg, and Aichstadt; the duchy of Coburg; the marquises of Cullenbach and Anspach; the territories of the master of the Teutonic order; the districts of Bareith, Schwartzenburg, Hennerburg, Wertheim, and Hoenlach or Hoenlac, with several imperial cities.

The western part of this circle is the bishoprick of Wurtzburg, the territories of which are upwards of two hundred miles in circumference, and the richest

of the whole division. Wurtzburg, the capital of the bishoprick, and of all Franconia, is situate in 10 degrees 5 minutes of east longitude, and in 49 degrees 46 minutes of north latitude; on both sides of the river Maine, sixty miles east of Frankfort. Several branches of the Maine and other rivulets run through the principal streets. The bishop's palace is on a hill above the town, and commands a most delightful prospect of the country. It is computed, that there are, at least, four hundred towns and villages in his dominions.

The bishoprick of Bamberg is sixty miles long, and forty broad. Its capital, which bears the same name, is situated on the river Regnitz, forty-five miles north-east of Wurtzburg. There are several other good towns in the bishoprick; and the bishop has castles, royalties, and manors, in other parts of Germany, where the sovereign of Bohemia, and the electors of Brandenburg and Bavaria hold territories of him.

The bishoprick of Aichstadt is situated towards the southern parts of the circle, and is about thirty miles long, and twelve broad. Aichstadt, the capital, stands on the river Altmul, ten miles north of Neuburg, and fourteen north-west of Ingoldstadt.

Those three bishops are princes of the empire, and members of the diet, or assembly of the states.

The territories of the master of the Teutonic order are but small. His chief town is Mergentheim, or Mariendal, a small city, standing on the river Tauber, where the master has a palace. The Teutonic knights were a Dutch order, who undertook to defend the Christian pilgrims in the Holy Land, and assist in recovering Jerusalem from the Saracens. When they were driven from Palestine, and returned to Europe, the pope, according to the authority which he exercised in those times, gave them the territories of Prussia, as the inhabitants of the country were then heathens. The duke of Prussia continued grand-master till the Reformation; but becoming protestant, another was appointed in his room, who is now the elector of Cologne. The knights have estates in almost every popish country. Before any person can be admitted into this order, he is obliged to prove his nobility by father and mother for fifteen descents.

The marquise of Cullenbach lies in the north-east part of the circle, about thirty-four miles long, and thirty broad. The capital is of the same name, situate on the river Maine, twenty-five miles east of Bamberg. The marquis is joint-director of the circle of Franconia with the bishop of Bamberg.

Bareith territory is situated south-east of Cullenbach; being about forty miles long, and ten broad. The capital bears the same name, and lies fifteen miles from Cullenbach. Those two countries are subject to two branches of the house of Brandenburg, who are each of them princes of the empire.

The marquise of Anspach lies towards the south-west of the circle, and is about fifty miles long, and twenty broad. The capital, Anspach, is at the distance of twenty-five miles south-west of Nuremberg. This

of them adorned with fountains. The river Regnitz runs through the middle of it, and turns a great number of iron, corn, and paper-mills within the town. This city was the Noricorum Mons, so named from a castle near it, built on a hill by the Nerici, to defend themselves from the Huns, by whom they had been expelled from Austria. Nuremberg is an imperial city, governed by its own magistrates, the legislative authority is lodged in four hundred of the principal inhabitants; and the burgomaster, or chief magistrate, is changed every month. Here are kept the regalia used at the coronation of the emperor, particularly, Charlemagne's crown, mantle, globe, sword, scepter, and imperial cloak. Nuremberg is exceeding populous, and has the best inland trade of any town in Europe. Their clock-work, and manufactures in iron, steel, ivory, wood, and alabaster, are much admired, and afforded exceeding cheap. Thence are exported most of those commodities called Dutch toys.

Besides Nuremberg, there are some other imperial cities within the limits of Franconia, viz. Rottemberg, Ewinstadt, Weinfelsheim, and Weissenberg.

No. 19.

The margravate of Baden lies along the eastern bank of the Rhine, opposite to Alsatia. Baden, the capital, is situate on a hill, five miles from the Rhine, twenty-five miles south of Heidelberg, and twenty north of Strasburg. This place is celebrated for its numerous baths, which are remarkably hot, and strongly impregnated for the most part with alum and sulphur.

Dourlach lies fifteen miles north of the city of Baden, and is subject to the prince of Baden-Dourlach, a Lutheran, whose palace here is a magnificent structure.

Baden-Weisler is situate twelve miles north of Basil, and gives title to a branch of the house of Baden. Here also are hot baths, but not equal to those last mentioned.

The territory of the Brisgaw, which lies along the east bank of the Rhine, between Furstenburg and Alsace, is subject to the house of Austria. The chief town is Friburg, situate at the entrance of the Black Forest, and, being a frontier town, is strongly fortified.

Ten miles west of Friburg, on the east bank of the Rhine, lies Brisac, another frontier town, well fortified. It is usually called Old Brisac, to distinguish it

from

C H A P. VII.

*Circle of Franconia.*

**T**HE circle of Franconia is bounded on the north by Hesse and the circle of Upper Saxony; on the east by Bohemia; on the south by Bavaria and Suabia; and on the west by the Palatinate of the Rhine, and the electorate of Mentz. It is about a hundred and thirty miles in length, and almost as much in breadth. The country is intermixed with hills, valleys, forests, and champaign; and produces corn and wine, but not in great plenty. It comprehends the bishopricks of Würzburg, Bamberg, and Archfladt; the duchy of Coberg; the marquisates of Cullenbach and Anspach; the territories of the master of the Teutonic order; the districts of Bareith, Schwartzenburg, Hennerburg, Wertheim, and Hoelnach or Hoelnac, with several imperial cities.

The western part of this circle is the bishoprick of Würzburg, the territories of which are upwards of two hundred miles in circumference, and the richest

reformation, but becoming popish, must be appointed in his room, who is now the elector of Cologne. The knights have estates in almost every popish country. Before any person can be admitted into this order, he is obliged to prove his nobility by father and mother for fifteen descents.

The marquisate of Cullenbach lies in the north-east part of the circle, about thirty-four miles long, and thirty broad. The capital is of the same name, situate on the river Main, twenty-five miles east of Bamberg. The marquis is joint-director of the circle of Franconia with the bishop of Bamberg.

Bareith territory is situated south-east of Cullenbach; being about forty miles long, and ten broad. The capital bears the same name, and lies fifteen miles from Cullenbach. Those two countries are subject to two branches of the house of Brandenburg, who are each of them princes of the empire.

The marquisate of Anspach lies towards the south-west of the circle, and is about fifty miles long, and twenty broad. The capital, Anspach, is at the distance of twenty-five miles south-west of Nuremberg. This

N

marquifate is fubject to another branch of the houfe of Brandenburg.

The county of Holach, or Hoenlac, which is fituated weftward of Anfpach, is about twenty-five miles long, and fifteen broad, and takes its name from a cattle, the ufual refidence of the count to whom it is fubject.

Henneburg county is fituate between the circle of Upper Saxony on the eaft, and the territories of Fuld on the weft, having the bifhoprick of Wurtzburg on the fouth. The chief town is Henneburg, thirty-four miles north-weft of Bamberg, and fubject to the count.

The county of Wertheim lies weftward of the bifhoprick of Wurtzburg, and is twenty-fix miles long, and twelve broad. The capital, Wertheim, ftands at the confluence of the rivers Main and Tauber, and is alfo fubject to its count.

The duchy of Corburg lies between Upper Saxony on the north, and the bifhoprick of Bamberg on the fouth; its capital, Corburg, being fituated feventeen miles north of the latter. In the caftle of this town, Luther the Reformer was imprifoned fome time, for infulting his fuperiors.

Schwartzenburg is a fmall territory, eaft of Wurtzburg, fubject to its own count.

The territory of Nuremberg has the bifhoprick of Bamberg on the north, with Aichftadt and Anfpach on the fouth. It is about thirty miles long, and twenty broad; one of the moft barren countries in Germany, but greatly enriched by the manufactures of the capital. The city of Nuremberg ftands near the confluence of the rivers Regnitz and Pegnitz, fifty-five miles north-weft of Ratifbon, and forty miles fouth of Bamberg. It is about feven miles in circumference, furrounded by a wall and fome antique works, with a caftle near it; but neither the town nor caftle is of great ftrength. The ftreets, fquares, and market-places are fpacious and well built, and many of them adorned with fountains. The river Regnitz runs through the middle of it, and turns a great number of iron, corn, and paper-mills within the town. This city was the Noricum Mons, fo named from a caftle near it, built on a hill by the Nerici, to defend themfelves from the Huns, by whom they had been expelled from Atria. Nuremberg is an imperial city, governed by its own magiftrates, the legiflative authority is lodged in four hundred of the principal inhabitants; and the burgoafter, or chief magiftrate, is changed every month. Here are kept the regalia ufed at the coronation of the emperor, particularly, Charlemagne's crown, mantle, globe, fword, fcepter, and imperial cloak. Nuremberg is exceeding populous, and has the beft inland trade of any town in Europe. Their clock-work, and manufactures in iron, fteel, ivory, wood, and alabafter, are much admired, and afforded exceeding cheap. Thence are exported moft of thofe commodities called Dutch toys.

Befides Nuremberg, there are fome other imperial cities within the limits of Franconia, viz. Rotemburg, Swinfurt, Weinfcheim, and Weiffenberg.

No. 19.

## C H A P. VIII.

### Circle of Suabia.

THE circle of Suabia is bounded on the north by Franconia, and the palatinate of the Rhine; on the eaft by Bavaria; on the fouth by Switzerland; and on the weft by the Rhine, which feparates it from Alface: it is a hundred and thirty miles long, and a hundred and ten broad; containing the duchy of Wirtemberg, the margravate of Baden, the principalities of Howen-Zollern, Oßringen, and Mindelheim, the bifhopricks of Augfburg, Conftance, and Coire, with feveral abbeys, and free towns.

The duchy of Wirtemberg is fituate in the northern part of the circle, fixty-five miles long, and almoft as much in breadth. It is fubject to the duke of Wirtemberg, whofe ufual refidence is at the capital, Stutgard, where he has an elegant palace. This town ftands on the river Neckar, forty-five miles north-weft of Ulm, and forty miles eaft of Baden; and is much reforted to, on account of its baths.

Tubingen is fituate on the river Neckar, twenty miles fouth of Stutgard; as is likewife the city of Hailbron, twenty-eight miles north of Stutgard, and twenty-five fouth-eaft of Heidelberg. It is an imperial city, and famous for its excellent baths.

The duchy of Wirtemberg enjoys a temperate air, and a fruitful foil, abounding in corn, wine, cattle, rich mines, and plenty of game in the forefts. It is computed that there are in this territory fixty cities, a hundred and fifty towns, almoft feven hundred villages, and fourteen abbeys. The duke is ftandard-bearer of the empire, and great huntsman. This family had embraced the reformed religion, but is lately become Roman Catholic. The other branches of it are Wirtemberg-Neuftadt, Wirtemberg-Æls in Silefia, and Wirtemberg-Bernftadt.

The margravate of Baden lies along the eaftern bank of the Rhine, oppofite to Alface. Baden, the capital, is fituate on a hill, five miles from the Rhine, twenty-five miles fouth of Heidelberg, and twenty north of Straßburg. This place is celebrated for its numerous baths, which are remarkably hot, and ftroingly impregnated for the moft part with alum and fulphur.

Durlach lies fifteen miles north of the city of Baden, and is fubject to the prince of Baden-Durlach, a Lutheran, whofe palace here is a magnificent ftructure.

Baden-Weifer is fituate twelve miles north of Bafil, and gives title to a branch of the houfe of Baden. Here alfo are hot baths, but not equal to thofe laft mentioned.

The territory of the Brißgaw, which lies along the eaft bank of the Rhine, between Furtfenburg and Alface, is fubject to the houfe of Atria. The chief town is Friburg, fituate at the entrance of the Black Foreft; and, being a frontier town, is ftroingly fortified. Ten miles weft of Friburg, on the eaft bank of the Rhine, lies Brißac, another frontier town, well fortified. It is ufually called Old Brißac, to diftinguifh it

I i i

from

from a town which the French have erected in Alsace, on the opposite side of the Rhine.

Besides those, the house of Austria possesses four forest towns on the frontiers of Switzerland, viz. Rhinefeld, Seckingen, Lautenburg, and Waldshut, with the territory of Constance. Constance, the capital of the latter, stands on the south-west of a lake of the same name, eight miles east of Uberlingen, and twelve west of Bucaw. The town is pleasantly situated, and though not large, is populous, and a place of good trade, the inhabitants exporting their merchandize by the lake and the Rhine, both south and north. The bishop of Constance is a prince of the empire, and one of the directors of the circle of Suabia. At this place a council was called by the emperor Sigismund, in 1414, to prevent a schism in the church; there being three popes who pretended to the chair at the same time. They were all deposed, and Martin V. elected. This council continued sitting four years, and was attended by four patriarchs, twenty-nine cardinals, three hundred and forty-six archbishops and bishops, four hundred and sixty-four abbots and doctors, and ten thousand secular princes and noblemen. It condemned Wickliffe's doctrines as heretical, ordering likewise his bones to be dug up and burnt, forty years after he was dead. It also burnt John Hus and Jerom of Prague for hereticks, though they had the emperor's safe-conduct for their protection.

On the same lake stand Buchorn and Ratelzel, subject likewise to the house of Austria; with the city of Uberlingen, a rich trading place, and celebrated for its mineral waters.

The margravate of Burgaw, on the frontiers of Bavaria, is also subject to the house of Austria. It is thirty miles long, and nearly the same broad. The principal towns are Burgaw, standing on the river Mindel, twenty miles west of Augsburg; and Guntzburg, situate on the Danube, eight miles north-west of Burgaw.

The house of Austria likewise possesses the landgravate of Nellenburg, lying north-west of the lake of Constance. This territory is twenty-seven miles long, and twelve broad; its chief town being Nellenburg, twelve miles north-west of Uberlingen.

To the same house pertains the county of Hohemburg, or Hohenzollern, lying to the eastward of Furstenburg; twenty-four miles long, and twenty broad. The chief towns are Hohenburg, Rottenburg, and Willengen. The county also contains the three imperial cities or sovereign states of Offenburg, or Offingen, Zell, and Gongenbach.

The county of Furstenburg lies on both sides of the Danube, near its source, and is about seventy miles long, but not above a third so much in breadth. The chief town, Furstenburg, is situated on the south side of the Danube, twenty miles north of Schaffhausen. In this county lies the village of Tone-Effingen, in which is one of the fountains of the Danube. The whole territory is subject to the count, who is a prince of the empire.

Sultz, Ems, and Montfort, are three small counties lying on the eastern frontier of Switzerland, having

capitals of the same names, and subject to their respective counts.

Waldburg county lies north-east of the lake of Constance. It is twenty miles long, and about eighteen broad, taking its name from the castle of Weldburg, and is subject to its count.

Koningzeck county lies westward of the preceding, and is subject to the count, who is of the family of the Guelphs.

Kirkburg stands upon the river Iser, south of the territories of Ulm. It is eighteen miles long, and eight broad, and is subject to its count.

The principality of Mindelheim is situate between the bishoprick of Augsburg and the abbacy of Kempfen; being twenty miles long, and sixteen broad. It was conferred on the great duke of Marlborough by the emperor Leopold; but the duke leaving no male issue, it reverted to the emperor at his death.

The principality of Odingen is situated on the frontiers of Franconia. It is about thirty miles long, and eighteen broad. The chief towns are Odingen, Nordlingen, Hochstet, and Blenheim; the two latter of which are celebrated for the victories obtained by the allied army over the French.

Graveneck county is situate between Hohenzollern on the west, and the territories of Ulm on the east, and is subject to the count, who is a prince of the empire. The chief towns are Graveneck and Eglingen.

The county of Lowenstein lies upon the banks of the Neckar, and is subject to its count, who is of the palatine family, and a prince of the empire.

Augsburg stands near the frontiers of Bavaria, at the confluence of the rivers Lech and Wardour, in 10 degrees 58 minutes of east longitude, and in 48 degrees 24 minutes of north latitude. It was called Augusta Vindelicorum, from Augustus Cæsar, in whose reign the Romans planted a colony here. It is a large, populous, well built city, adorned with fountains, and brazen statues of emperors and ancient heroes, and other valuable monuments of antiquity. The cathedral is a grand building, and the hospitals exceed any thing of the kind, both in accommodation and endowments. That which was erected by the family of the Fuggars, lords of the neighbouring country, contains a hundred and six houses, ranged in four streets that meet in the center, and are inhabited by poor people, who have pensions settled upon them. Augsburg is an imperial city, or sovereign state, the senate which possesses the executive power, consists of twenty-three Papists and twenty-two Protestants; and the common-council, which, with the senate, has the legislative authority, of a hundred and fifty of each persuasion. The people likewise consist chiefly of Lutherans and Papists; but the former are most numerous. There is no place where a greater variety of habits may be seen, which are so regulated by the government, that every person's quality, trade, or profession, is known by his dress. The citizens are esteemed excellent mechanicks, especially the goldsmiths and hardware-men. It was in this city that the protestant princes presented their confession of faith

faith to the year 1530 of twenty or absent was agree enjoy the Ulm, v stands at Iller, thi miles sou the gover aldermen. faith to the emperor Charles V. at a diet held in the year 1530; which occasioned a civil war in the empire, of twenty years continuance. At a subsequent diet, or assembly of the states, in this city, in 1555, it was agreed that the protestants in the empire should enjoy the free exercise of their religion.

Ulm, which may be reckoned the capital of Suabia, stands at the confluence of the rivers Danube and Iller, thirty-six miles west of Augsburg, and ninety miles south-west of Ratibon. It is an imperial city, the government of which is lodged in one and forty aldermen, elected out of the principal inhabitants. Two bailiffs, who preside in their councils, are chosen annually, and the magistrates are all Lutherans, as are most of the inhabitants. It is a place of great trade, and the mechanics are reputed excellent, especially in clock-work. By the Danube the people export to Bavaria and Austria, their own produce, consisting of linen, cotton-cloth, and hard-ware; and receive in return, corn, salt, and iron.

Bibrac, an imperial city, stands on the river Rufs, twenty-miles south of Ulm, in a pleasant fertile country, and much frequented for its hot-bath. The magistracy is divided between the Protestants and Papists, and the people are likewise a mixture of both persuasions.

Bucaw, another imperial city, lies ten miles south-west of Bibrac. Here is a nunnery, the nuns of which are all of noble families, and are at liberty to leave the cloyster and marry when they please. The abbess is a princess of the empire, and her deputy has a vote in the diet.

Memmingen is a large city, seventeen miles south-east of Bibrac.

Leutkirk is another imperial city, twelve miles south-west of Memmingen, in the road from Italy to Germany.

Kempton, also an imperial city, lies fifteen miles south of Memmingen, on the same road.

Eisna is situate twelve miles south of Kempton.

Lindau stands on an island in the lake of Constance, in which is a nunnery, of the same constitution with that at Bucaw; and the abbess, who is sovereign of the territories about it, is a princess of the empire.

Bergentz is situate on the lake of Constance, five miles south-east of Lindau, and is capital of the county in which it stands.

Ravensprug, which lies twenty miles west of Leutkirk, and as many south of Bucaw, is an imperial city, and well built. In the middle of the city stands a tower, with an inscription, importing that the old tower being blown down by a whirlwind, the watchman, who stood on the top of it to give notice of the time of night every three hours, by a trumpet, as is the custom in some German towns, received no hurt by the fall; but that his wife and son were both killed.

Altorf is an ancient town two miles from Ravensprug, subject now to the house of Austria, but formerly to its count; from whom descended the ancient dukes of Bavaria, and the present dukes of Brunswick. This was the burying-place of the Guelphian family; and

here stood the ancient monastery and chapel of St. Ofwald.

Wangen is an imperial city, ten miles east of Lindau.

### C H A P. IX.

#### *Circle of Bavaria.*

THE circle of Bavaria is bounded on the north by Franconia, Saxony, and Bohemia; on the east by Austria; on the south by Tyrol; and on the west by Suabia. The palatinate of Bavaria lies north of the Danube; having Bohemia on the east, and Franconia on the west. It extends about seventy miles in length, and thirty in breadth. The duchy of Bavaria, which lies south of the Danube, is about a hundred and twenty miles in length, and almost as much in breadth.

The capital of the electorate and duchy of Bavaria is Munich, situate in 11 degrees 40 minutes of east longitude, and in 48 degrees of latitude; on the river Weiser, sixty miles south-west of Ratibon. It is a large beautiful city, with spacious streets, and canals running through many of them. The elector's palace was reputed the most magnificent in Germany; and the churches and cloysters are also very grand. The city is surrounded with a wall and fortifications, but not of great strength.

Ingoldstadt stands upon the Danube, in a level fruitful country, forty-five miles north of Munich, and thirty west of Ratibon. It is a fortified town, and well built.

Donawert stands also on the Danube, forty miles north-east of Ulm, and twenty-five west of Ingoldstadt.

Amberg, the capital of the Bavarian palatinate, is a fortified town, lying on the river IIs, thirty miles north of Ratibon.

Newmark is situate in a mountainous rocky country, thirty miles north of Ingoldstadt. The neighbouring mountains being rich in iron mines, the town has a considerable trade in hard-ware.

Sultzbach, capital of the county of the same name, is situate five miles north-west of Amberg, subject to the elector palatine.

Neuburg, capital of a duchy, is situate on the south side of the Danube, fifteen miles west of Ingoldstadt, and subject also to the elector palatine. The town has a good trade, especially in wine.

Ratibon, or Regensburg, stands at the confluence of the rivers Danube and Regen, sixty-two miles north-east of Munich. It is pleasantly situated, large, well built, and populous. It is an imperial city, surrounded with a double wall and other fortifications, but too large to be defended without a considerable army. Here the diet, or assembly of the states of the empire usually meets. The place of convention is a large upper room, hung with tapestry. The imperial throne and seats are covered with gold and silver tissue and velvet. The established religion here is the Lutheran, only the popish bishop has the liberty of saying mass in the cathedral once a week. The city is plentifully supplied with provisions from its own territories,

teries, which afford corn, cattle, and excellent wine; and in time of peace it has a brisk trade, as it lies upon the finest navigable river in Europe.

The city of Passau is situate about sixty-two miles south-east of Ratibon, at the confluence of the Danube, Inn, and Ill, which dividing it into three parts, that are united by bridges, and form one beautiful town. The territory belonging to it lies chiefly on the north side of the Danube, between the palatinate of Bavaria and the Upper Austria. The sovereign of the country is the bishop.

Landshut stands on the river Iser, thirty miles south of Ratibon. It is a beautiful city, pleasantly situated, and here the ancient dukes of Bavaria had their residence.

Freisingen stands on the river Iser, twenty miles north of Munich. It is a large city, and the see of a bishop, who is sovereign of the town, and surrounding territory.

The archbishoprick of Salzburg has the duchy of Bavaria on the north; Stiria and the Upper Austria on the east; and Carinthia and Tyrol on the south and west. It is about seventy miles in length, and sixty in breadth. The capital town, Salzburg, is situate on the river Saltz, seventy miles east of Munich. This is esteemed one of the finest cities in Germany, and has a good trade, especially for salt, which is produced in the neighbourhood. Here also are some rich mines of silver, copper, and iron. The archbishop is sovereign both of the city and territory; and lately persecuted his protestant subjects with extreme rigour.

Eight miles south of Salzburg, on the same river, stands the town of Hall, where the salt-works employ a great number of people. It is said that in the year 1573, a human body was found here in the rock-salt, some hundred fathoms deep, with the flesh, hair, and cloaths entire, which from its antique dress was supposed to have remained in that situation several ages.

Waldeck stands about fifty miles south-east of Munich, and a hundred south-west of Salzburg.

The elector of Bavaria is an absolute sovereign, and has a large revenue, arising not only from his demesne lands, but the tolls on the rivers, particularly the Danube; and from monopolies of salt, corn, and beer, which the subjects are obliged to purchase of his agents. Though the country be in general fertile, those oppressive monopolies render the inhabitants very poor.

#### C H A P. X.

##### *Circle of Austria.*

THE circle of Austria is bounded on the north by Bohemia and Moravia; on the east by Hungary, Slavonia, and Croatia; on the south by the territories of Venice; and on the west by Bavaria. It comprehends the provinces of Austria Proper, Styria, Carinthia, and Carniola. It formerly included the county of Tyrol, and the bishopricks of Trent and Brixen; but those are now detached from it. This country once formed a part of the great duchy or kingdom of Bavaria; but the emperor Otto erected

it into a distinct landgravate, and created his son Albert the first archduke of Austria.

Vienna, the capital of the circle of Austria, and of the German empire, is situate in 16 degrees 20 minutes of east longitude, and in 48 degrees 20 minutes of north latitude. It stands on the river Danube, a little above the confluence of the Wien. The city, which is well fortified, is not, within the walls, more than three miles in circumference; but the suburbs are of much greater extent. It is built of stone, and the houses are five or six stories high with flat roofs. The imperial family has here two large palaces, in which are several grand apartments; but the buildings are neither uniform nor elegant, nor the furniture so rich as might be expected. The houses of the nobility and great officers of state are magnificent structures. The palace of the late prince Eugene, particularly, is much admired, not only for the edifice and the conveniency of the apartments, but for its superb furniture. Several of the convents are also very elegant, especially that of the Austin-Friars, the model of which was taken from the Holy House at Loreto. The colleges which formerly belonged to the Jesuits were likewise fine buildings. In the front of one of them stands a column of copper, with a statue of the Virgin Mary on the top of it; and there are inscriptions on the pillar, importing, that Austria is dedicated to her patronage. The cathedral of St. Stephen is particularly grand, and it has a steeple four hundred and sixty-five foot in height. In this church, which is however too dark, are several grand tombs and monuments, of their princes and great men, and near one of the doors, they shew a stone in the wall, which, according to their tradition, is one of those with which St. Stephen was stoned. The finest suburb is that called Leopoldstadt, separated from the city by a branch of the river, where the houses of the nobility mostly stand. The city has six gates, eighty streets, twenty-nine churches, eight chapels, and eighteen market-places. The university here is equal to any in Europe, in respect to the number of students and their accommodations. The students are divided into four classes, namely, that of Austria, the Rhine, the Hungarians, and the Saxons. Under one or other of those, the students of every nation are comprehended. The imperial library contains upwards of eighty thousand volumes; in which are some curious ancient manuscripts, besides a noble museum. This city was not very considerable till towards the end of the twelfth century, when it was enlarged and beautified by the margrave of Austria; the expence of which is said to be defrayed by the money he got for the ransom of Richard I. king of England, whom he imprisoned in his return from the Holy Land.

Though this city be so far within land, yet the breadth and depth of the Danube give it the air of a port-town. Trading vessels are constantly building and repairing; and here ships of war, of fifty guns, are sometimes fitted out, to serve on the river against the Turks.

Provisions of all kinds are here in great plenty, and perhaps no people indulge the luxury of the table more

than the inhabitants of Vienna. Persons of quality will have eighteen or twenty different sorts of wine upon the sideboard, with a list of their names laid before every guest at the table. Their freedom in the use of those liquors is equal to the variety which they keep; and it is difficult for a stranger to rise from a meal without a degree of intoxication. Besides drinking, the pastimes at Vienna consist in dancing, fencing, and gaming. In the winter, when the branches of the Danube are frozen, and the ground covered with snow, which is usually the case for two or three months in the year, the ladies ride over the snow and ice in sledges of different forms, resembling swans, scollop-shells, tygers, or griffins. The lady sits on the sledge dressed in velvet lined with furs, and adorned with jewels, wearing on her head a velvet cap. She is drawn by a horse richly caparisoned, with plumes of feathers, ribbands, and bells. As this diversion is chiefly in the night, a groom rides before the sledge with a torch, and a gentleman usually sits behind the lady, and guides the horse.

The furniture of the houses in Vienna is generally magnificent; and, in the winter, it is the common practice of the inhabitants to cover themselves with a feather bed, instead of blankets. A person of the first distinction, and the meanest tradesman, will sometimes occupy different floors of the same house. This city is the usual residence of the emperor, and is likewise an archbishoprick.

Baden lies about seventeen miles to the southward of Vienna, and is famous for its hot-baths in the cure of many chronic diseases.

Haynburg is situated thirty miles east of Vienna, on the frontiers of Hungary. It was formerly the residence of the dukes of Austria, and a place of good trade; but by the removal of the court, and the frequent incursions of the Hungarian malecontents, it is greatly declined.

Krems stands on a river of the same name, which joins the Danube on the north side, about forty miles west of Vienna. It is a large town, and has a flourishing trade; being particularly crowded at two annual fairs, by merchants from Poland, Hungary, and various parts of the continent.

Lintz, the capital of Upper Austria, is situate on the south side of the Danube, a hundred miles west of Vienna, in a pleasant, fruitful country, to which the court frequently resorts in summer; there being here a palace on the north side of the river, which communicates with the city by a bridge.

Enns, situate on the river of the same name, near its confluence with the Danube, ninety miles nearly west of Vienna. This place is supposed to be the ancient Lauriacum, where the Roman emperors resided for some time. The other towns of most note in Austria are Frieftadt, Stain, Everding, Steyr, Wells, Ips, Neustadt, Tuln, Saxemburg, and Starremburg.

The duchy of Stiria, or Steyrmarch, is bounded on the north by Austria, on the east by Hungary, on the south by Carinthia, and on the west by Seltzburg; being a hundred and twenty miles long, and sixty broad. The capital is Gratz, situate in a pleasant

No. 19.

fruitful country, on the river Muer, eighteen miles south of Vienna. It is a fortified town, well built, and has a castle on an adjacent hill for its defence. The present empress-queen has here also a palace, to which she sometimes retires.

Rakenburg is another strong fortress, on the river Muer, twenty-eight miles east of Gratz.

On the same river, in a fertile country, stands Luttenburg, where the empress also has a palace, fifty miles westward of Gratz.

Eysenartz stands on the little river Seltza, twenty-four miles north-west of Luttenburg. At this place are exceeding rich mines of iron.

Upper Stiria is a mountainous country, abounding chiefly in sheep: but Lower Stiria produces corn, wine, fruit, venison and fish; and the plains are covered with herds of neat cattle. This province, however, is often visited by the Hungarian putrid fever; and the poorer sort of the inhabitants, who live on a low diet, are extremely subject to strumous swellings in the glands of the neck.

The duchy of Carinthia is bounded on the north by Stiria, on the east by Slavonia, on the south by Carniola, and on the west by Seltzburg. It is about a hundred and forty miles long, and fifty broad. The chief towns are Clagenfurt, situated about a hundred and twenty miles south-west of Vienna; and Lavemund, on the river Levant, in a pleasant valley, fifty miles east of Clagenfurt. In the county of Cilley, which lies between the rivers Drave and Save, the chief town is Cilley, or Celia, tolerably well fortified.

The duchy of Carniola, with Windesmark, or the margravate of Windes, is bounded on the north by Carinthia, on the east by Croatia, and on the south and west by Istria and other territories of the Venetians. The capital is Laubach, situate on a river of the same name, forty miles north of Trieste and the Gulph of Venice; a populous, well built city, and the see of a bishop. The town of Zirknitz is remarkable only for a lake in its neighbourhood, sixty miles in length, which totally subsides every year in the month of June, when the bottom of it yields good pasture; but in the end of September the water returns with great violence, spouting up to a considerable height through the fissures of the earth, till the lake becomes several fathoms deep.

Oberlawbach stands sixteen miles south-west of Laubach, and has a flourishing trade with the produce of Italy, which it disperses to all parts of Germany.

Metling, the capital of Windesmark, stands on the frontiers of Croatia, thirty-five miles south-east of Cilley.

Goritz, capital of the district of Gorizia, is situate in Friuli, fifty miles west of Laubach. This place is supposed to be the Naricia of the Romans. The rest of Friuli is subject to the Venetians.

In the province of Istria, a territory belonging to the Venetians, the house of Austria has two sea-ports, namely, Trieste, and St. Vîct, or Fiume, where they have been long endeavouring to establish a foreign trade with the several countries bordering on the Mediterranean. The

K k k

late

late emperor, Charles VI. was at great expence to enlarge the port of the former of those towns, and make it a station for men of war; but on his losing Naples and Sicily, this project was laid aside.

The province of Carniola is a mountainous country, interspersed with fruitful valleys, which furnish plenty of corn and wine. The inhabitants, being a mixture of Germans, Italians, and Slavonians, speak both High Dutch and Italian,

Windesmark is a mountainous barren country, inhabited by the posterity of the Veneti, a branch of the Slavonian nation, as appears by their language.

In the circle of Austria lie likewise the county of Tirol, and the bishoprick of Trent, the latter of which was anciently considered as a part of Italy.

The county of Tirol, including the bishoprick of Brixen, is bounded on the north by Bavaria and Suabia, on the east by Carinthia and Friuli, on the south by the country of the Grisons and the bishoprick of Trent, and on the west by Switzerland; being a hundred and twenty miles long, and upwards of fifty broad. The chief rivers are the Inn, which falls into the Danube; and the Adige, which runs southward into Italy, and discharges itself into the gulph of Venice. It is generally a mountainous, barren country, but has some fruitful valleys, with several mines of silver, copper, and iron. The chief town is Inspruck, situate on the river Inn, sixty-two miles south of Munich, and seventy north of Trent. The town of Hall, or Impthal, stands likewise on the same river, ten miles north-east of Inspruck. Tirol is at present a ruinous castle, and only mentioned for its giving name to the county. Brixen, capital of the bishoprick is situated on the river Eysack, thirty miles south-east of Inspruck. The territories of the bishoprick extend forty miles in length, and thirty in breadth. It is for the most part mountainous, but has some fruitful valleys, with mines of silver, copper, and iron, mineral-waters, and salt springs. The bishop, who is invested with temporal jurisdiction, is a prince of the empire.

The bishoprick of Trent is situated upon the Alps, which separate Germany from Italy, and has sometimes been reckoned a part of either of those countries. It is bounded on the north by Tirol, on the east and south by the territories of Venice, and on the west by the country of the Grisons; being about seventy miles long, and fifty broad, and having the river Adige running through it. This country produces very little corn, but is not deficient in wine, oil, fruits of different kinds, and cattle. The chief town is Trent, situate in 11 degrees of east longitude, and 46 degrees 5 minutes of north latitude, sixty-seven miles south-west of Venice. It stands in a pleasant valley on the bank of the Adige, but encompassed by three steep mountains, which render it excessive hot in summer, and cold in winter. It is a small city, built of a kind of red and white marble, dug out of the rock on which it stands, and is surrounded by a single wall. The bishop is suffragan to the Venetian patriarch of Aquileia, but a prince of the empire, and sovereign of the adjacent country. In this city, pope Paul III. assembled that great council, which with

some intermissions continued from the year 1545 to 1563, in which the authority of the pope over the church was established, and the Roman Catholic doctrines confirmed. This council consisted of seven cardinals, three patriarchs, thirty-three archbishops, two hundred and thirty-five bishops, seven vicars-general, and a hundred and forty-six doctors and dignified clergy.

Pozen, or Bolsano, is situate on the river Adige, twenty-five miles north of Trent, and is considerable for its four annual fairs, to which the merchants of Italy and Germany resort.

#### C H A P. XI.

*Of the Germans—government—forces—election of the emperor—king of the Romans—archbishopricks and—bishopricks—universities—coins—religion—marriage—history of the empire.*

**T**HE natives of Germany are for the most part of a good stature, rather inclining to corpulency, and their complexions generally clear. Their hair grows to a great length, which the men wear plaited; and in several provinces they wear also mustaches on the upper lip. They are reputed an honest, sagacious, sedate people, brave in war, and their application indefatigable in the pursuit of any favourite object. They are however rather morose than sociable, and haughty rather than complaisant; much addicted to intemperance in eating and drinking, and the men likewise to the smoking of tobacco, for which they use pipes of a great length.

There are in Germany upwards of three hundred sovereign princes and states, most of them arbitrary in their respective territories, but universally subject to the general laws of the empire, the legislative diet of which consists of the emperor, the nine electors, the ecclesiastic and secular princes, and the deputies of the towns. This assembly is convened by the emperor's summons; and the members are obliged by their allegiance to appear at the day and place appointed, either by themselves or their proxies, unless they will run the risk of incurring the ban of the empire, and forfeiting their privileges. As half the diet usually consists of deputies, who vote according to the instructions which they receive from their principals, whom they must consult on every matter of importance, its proceedings are generally slow. This great convention is held for the most part at Ratisbon, but it may be summoned to meet at any city within the limits of the empire.

The power of every member of the diet is not uniformly the same; the concurrence of the citizens and burgeses not being necessary to the making of laws, though they are permitted to debate, and give their opinion when any law is proposed.

The emperor, or the person he appoints to supply his place, proposes every thing that is to be deliberated in the diet, and adjourns the debates when he pleases.

There are in the empire two supreme courts of justice, namely, the Aulic council, held at Vienna, and

and the chamber of Spire, now removed to Wetzlar in Wetteravia. The judges in each of those courts were formerly sixteen, but now increased to fifty. The emperor names the president, and four more: every elector nominates one; and the rest are appointed by the several circles of the empire. Some of the judges are Protestants, but the greater part Roman Catholics. To those two tribunals lies an appeal from all inferior courts in the empire. If any of the German princes oppress their subjects, or encroach upon each other's territories, a decree of those supreme courts will compel them to do justice to the injured. The judges are generally governed by the civil law and the acts of the diet; but in some cases they are directed by the golden bull, a charter so called from the seal annexed to it being of gold. It was framed by Charles IV. with consent of the princes and states of the empire, and contains the laws relating to the election of the emperor, the privileges of the electors, the rules to be observed at all public solemnities, and the appointing vicars during an inter-regnum. Those laws were pronounced to be irrevocable; but one of them has been violated, in increasing the number of electors from seven to nine.

The emperor has hardly any lands or revenues which properly belong to the empire; but he is at no charge in the administration of the government, or maintaining forces, all expences, whether fixed or contingent, being defrayed by the vassals of the empire. He cannot either make or suspend laws, declare peace or war, nor raise taxes, without the consent of the states. The power however with which he is invested of conferring all honours, and of appointing the generals of their armies, joined to the numerous posts of consequence at his disposal in the hereditary dominions, render his influence in the diet exceeding great. He is entitled to the reversion of all fiefs, in default of heirs, and to all fines, forfeitures, and confiscations of criminals.

The charge of the civil government is defrayed by a tax called Roman months, to which all the princes and states contribute a certain proportion; and their names are matriculated in a register kept by the elector of Mentz, who is chancellor of the empire, specifying the annual sum which each is obliged to pay, as well as the number of forces which they respectively maintain in time of war.

There are one or more directors in every circle of the empire, who are generals of the forces of the respective circles, and execute the decrees and sentences of the diets and supreme councils. They also assemble the princes and states of the circle, to deliberate what measures are to be taken on any extraordinary emergency.

The states of each circle, besides a general, who is usually their director, elect five lieutenants to assist him, or supply his place in his absence. They also appoint for the service of the circle, a treasurer, a receiver, and a secretary. Upper Saxony usually assembles at Leipfick; Franconia at Nuremberg; and the circle of Susbia at Ulm. They treat of the regu-

lation of their coin, magazines, fortifications, and commerce; putting also into execution the decrees of the empire, appointing judges for the imperial chamber at Wetzlar, and the Aulic council at Vienna, and enacting such provincial laws as are not inconsistent with the constitution of the empire.

With respect to the forces which the several princes of the empire may furnish and maintain for the general interest, the following list appears to be a moderate computation, viz.

The elector of Mentz	- -	6000
The elector of Triers	- -	6000

		<u>379500</u>

At the demise of an emperor, if no king of the Romans has been previously elected, the elector of Mentz, as high chancellor of the empire, and dean of the electoral college, sends a summons to the other electors to appear at Frankfort on a certain day, for the purpose of choosing a successor to the imperial dignity. At the time appointed the electors march in great state on horseback, from the stadthouse to St. Bartholomew's church, and having taken their seats in the choir, their several sword-bearers standing before them with their drawn swords on their shoulders, divine service begins. On singing the hymn of Veni Creator,

Creator, however, the protestant electors withdraw till mass is over. From the choir the electors proceed to a gallery in the church, where the election is made by a majority of voices. The new emperor being then conducted to the altar, takes an oath to maintain the laws and constitution of the empire inviolable. The emperor must be a prince of German extraction, and at least twenty-eight years of age; but whether a protestant prince can be elected, is a matter not determined by any precedent in the history of the empire, so great a majority of the electors being of the Roman Catholic religion. When the day appointed for the coronation is arrived, the electors, or their proxies, attend the emperor from his palace to the church, where the election had been made; the elector Palatine carrying the crown, the elector of Bavaria the globe, the elector of Brandenburg the sceptre, the elector of Saxony the sword, and the elector of Hanover the standard. With respect to the king of Bohemia, the other secular elector, he has been son of the deceased emperor, and consequently the person elected, for several generations before the year 1740.

Being arrived at the door of the church, the emperor is received at his entrance by the three ecclesiastical electors, who conduct him to the altar, where the archbishop who officiates, anoints his head, breast, neck, and back, between the shoulders and the right arm. He is then conducted to another altar, where being crowned, and clothed with the ancient imperial robes, he is seated on the throne, and *Te Deum* is sung with great solemnity.

A king of the Romans has been frequently elected in the life of the reigning emperor, which is one of the expedients practised by the house of Austria to keep the empire in their family. This dignity, however, is accompanied with very little power, except that in the absence of the emperor the person who enjoys it is entrusted with the administration.

There are in Germany six archbishopricks and thirty-nine bishopricks, of which many have been secularized since the Reformation, and some converted into duchies. The number of universities is twenty-seven. No people applies more closely to study than the Germans; nor is there in any country a greater number of authors. No man can be a graduate in their universities, who has not published one disputation at least; the consequences of which is, that the nation abounds in polemical writings, which rather perplex than enlighten the understanding. Among the dead languages the Hebrew is much cultivated; and next to civil jurisprudence, the science of medicine has here received extraordinary improvement.

Besides the sun and moon, to which the ancient Germans paid adoration, they acknowledged several other deities, namely, Teutch, Woden, Thor, and Freia, with others of inferior rank; and from those were the names of so many days in the week transplanted by the Saxons into Britain. The German pagans assembled for religious worship and sacrificed in groves, where they erected arbours of oak and beechen branches. Their sacrifices consisted generally of beasts; but malefactors were also devoted to the altar, as were likewise slaves, and those who had been made prisoners in war. If we may credit the Roman writers, they sometimes sacrificed their children. The women were admitted to the priestly office as well as the men, and both were of families of distinction. They believed in the doctrine of transmigration, and of endless existence in a future state.

Some are of opinion that Christianity was introduced here in the time of the apostles; others that it was not received till the second century, and then only in such provinces as were within the pale of the Roman empire. It appears that several missionaries arrived here from England in the eighth century, who converted the inhabitants that dwelt between the Rhine and the Weser; but the Saxons in the north were not converted, until they were subdued by Charlemagne in the succeeding age.

Popery was the established religion in Germany till about the year 1517, when Martin Luther began to expose the errors of that church. The archbishop of Mentz being required to advance more money to the pope than he was able to raise, obtained leave of his

huli-

holiness to sell pardons and indulgences to the people for all sins, past, present, and to come. This scandalous profanation of the papal authority excited the abhorrence of Luther, who declaimed against this practice in the warmest terms at Wittemberg and Leipsic, where, meeting with the support of the elector of Saxony, he propagated his doctrines in Brunswick-Lunenburg, Mecklenburg, Pomerania, the marquisate of Brandenburg, and the landgrate of Hesse, as well as in most of the imperial cities. The followers of the reformer drew up a protestation, containing the points in which they differed from the church of Rome; which they presented to the imperial chamber at Spire, in 1529, and thence received the denomination of Protestants. Next year they delivered a confession of their faith to the diet at Augsburg, called the Augsburg Confession; and refusing to recede from the doctrines avowed in this declaration, a civil war ensued, in which the emperor Charles V. took the part of the catholicks. This war continued till the year 1552, when the emperor thought fit to grant the Protestants a toleration at Passau, which was confirmed at Augsburg in 1555. On the promulgation of the doctrines of Zuinglius and Calvin, which happened immediately after, much animosity broke forth between the disciples of Luther and those of the other new sect, which so far obstructed the progress of the Reformation, that the greater part of the empire still adheres to the Romish church.

If a prince, or person of distinction in Germany, marries his inferior, she has no title to be endowed, nor can her children inherit till they obtain an act of the diet to qualify them to succeed their father.

The foundation of this empire was laid in the eighth century, by Charlemagne, who was an absolute prince, and constituted governors over the several provinces for years or for life. Under his successors some of those were rendered hereditary, and others assuming the same distinction, asserted an almost total independency on the imperial crown. Many of the great towns purchased the privilege of electing their own magistrates, and being governed by peculiar jurisdiction, subject however to the general laws of the empire.

In the year 888, the emperor Charles III. was deposed by his subjects, who placed on the throne Arnolph, the natural son of the duke of Bavaria, after which the government was no longer hereditary in the family of Charlemagne, but descended for two generations to the posterity of Arnolph.

Conrade, duke of Franconia, was next advanced

to the imperial throne by the German nobility, who appointed Henry, son of Otho, duke of Saxony, to succeed him; and afterwards Otho II. the son of the preceding emperor. This prince obliged the king of Denmark to acknowledge his dependance on the empire, and admit Christianity into his dominions. He also subdued the king of Bohemia, and planted Christianity in that country. His enterprizes, however, were not confined to the propagation of the doctrines of the church. He deposed pope John XII. and advanced Leo VIII. to the papal chair; decreeing also that future popes should be appointed by the emperor.

This emperor was likewise succeeded by his son Otho III. who is said to have first reduced the number of electors to seven. He reigned eighteen years, when he was poisoned by a pair of gloves which were given him by his concubine, for refusing to marry her, as he had promised.

After a succession of four emperors, of the name of Henry, who maintained an almost perpetual contest with the papal authority, the emperor Barbarossa was so much distressed by the pope, that he submitted to the indignity of letting his holiness tread upon his neck. During those contests between the popes and emperors, arose the two famous factions, distinguished by the names of the Guelphs and Gibellines, under the one or the other of which all the princes of Europe were engaged, the former adhering to the popes, and the other to the emperors.

On the death of Frederick II. there was an interregnum of twenty years, six princes contending for the empire, among whom was Richard, earl of Cornwall, brother to Henry III. king of England. The election was carried however by Rodolph, earl of Hapsburg, who first aggrandized the Austrian family, by creating his son Albert archduke of Austria, who afterwards raised his son Rodolph to the rank of king of Bohemia.

Albert was succeeded in the imperial dignity by the earl of Luxemburg, who was poisoned by a monk at the sacrament, with the consecrated elements.

In the year 1411, Sigismund, king of Hungary and Bohemia, was unanimously elected emperor; since which time the imperial dignity continued without interruption in the house of Austria, till the elector of Bavaria was advanced to the throne in 1740; at whose death the imperial crown was conferred on the then grand-duke of Tuscany, formerly duke of Lorraine, the father of the present emperor.

## P O L A N D.

## C H A P. I.

*Of the situation—rivers—air—provinces—chief towns.*

**I**N describing this country we shall treat of its limits and constitution, as they existed previous to the late violent partition of the kingdom between the emperor of Germany, the empress of Russia, and the king of Prussia, mentioning afterwards the particular territories which have been seized by each of those powers.

Poland is situate between 16 and 34 degrees of east longitude, and between 46 and 57 degrees of north latitude; being bounded on the north by the Baltic sea, Livonia, and Russia; on the east by Russia, and Budziac Tartary; on the south by Bessarabia, Moldavia, Transilvania, and Hungary; and on the west by Pomerania, Brandenburg, and Silesia. It is nearly of a square figure, extending either way about seven hundred miles; a level, fruitful country, well watered by lakes and rivers. On that part of it which is washed by the Baltic, are several spacious bays, which form commodious harbours, the principal of which are Dantzick and Koningsburg.

The chief rivers are, 1. The Weisfel, or Vistula, which rising in Silesia, runs eastward into Poland, and having visited Cracow, turns north towards Warsaw, discharging itself into the Baltic at Dantzick. 2. The Warta, which running from east to west, crosses the province of Great Poland, falls into the river Oder in Brandenburg. 3. The Dwina, which separates Poland from Livonia, and falls into the Baltic at Riga. 4. The Nieper, or Boristhenes, which rising in Russia, runs west into Poland, and then turning to the south-east, passes by Kiof, discharging itself into the Euxine sea at Oczacow. 5. The Niester, which rising in Red Russia, and running towards the south-east by Bender in Turkey, falls into the Euxine sea to the northward of the Danube. 6. The Bog, which having its source in Padolia, runs to the south-east, and falls into the Nieper near its mouth. 7. The Bug, which rises in Red Russia, and running north-west, discharges itself into the Weisfel above Plaefkow. 8. The river Niemen, which rising in the middle of Russia, runs northward by Grodno, and assuming the name of the Ruffe, after its confluence with the Wilia, falls into a bay of the Baltic sea, called the Cur-haff.

This being chiefly an inland country, the air is usually clear; and which account the winters are colder, and the summers more hot, than in maritime regions that are situated in parallel latitudes; and in the former of these seasons, the ground is annually covered with snow during several months.

Poland comprehends twelve great provinces, namely, Great Poland, Prussia Regal and Ducal, Samogitia, Courland, Lithuania, Warsovia, Palachia, Polesia, Little Poland, Red Russia, Volhinia, and Podolia.

Great Poland is the most westerly province of the kingdom, and adjoins to Silesia. The chief towns are, 1. Pofna, or Pofin, situate on the river Warta, a hundred and fifty miles west of Warsaw. It is a beautiful little city, standing in a plain surrounded with hills, and is the capital of a palatinate. 2. Gnesna, lying near thirty miles east of Pofna; the see of an archbishop, who is primate of Poland, and viceroys during the vacancy of the throne. This was the first town built in Poland; the inhabitants living always in tents before that time, and removing from place to place with their flocks and herds, in the manner of the Scythians or Tartar nations. In the cathedral of Gnesna is the tomb of St. Adelbert, held in great veneration by the Poles, who make rich presents annually to his shrine, almost equal, we are told, to those offered to the Virgin Mary at Loreto. 3. Kalish, the capital of a palatinate, lying forty miles south-east of Pofna. 4. Siradia, likewise the capital of a palatinate, seated on the river Warta in the south part of the province. The other most considerable towns in this division are Rava, D. Scia, Sreble, and Inowloez, each the capital of a distinct palatinate, to which they respectively give name.

Prussia is divided into the Regal and the Ducal; the former of which, subject to the kingdom of Poland, contains the western part of this division. The chief town is Dantzick, situate in 19 degrees 5 minutes of east longitude, and in 54 degrees 22 minutes of north latitude, on the west bank of the Vistula, which falls into the Baltic sea a little below the town. Dantzick is a large city, encompassed with a wall and fortifications of great extent. The houses are well built of stone or brick, six or seven stories high. The granaries containing vast magazines of corn and naval stores, are yet higher, to which the shipping lie close, and take in their lading. It is an excellent harbour, and has the best foreign trade of any port within the Baltic. The Dutch annually import thither many thousand tuns of corn, timber, and naval stores, and other nations some; but the former have the greatest share of this trade, paying for their merchandise with pickled herrings, spices, sugars, brandy, and other produce of the southern countries; while England and other nations pay chiefly with money for the commodities which they purchase at this place. This is one of the hanse-towns, and the number of inhabitants is computed at two hundred thousand. The magistracy consists of thirty senators, who continue for life; four of whom are burgo-masters.

Besides

Besides the the burgo appoint the From the consuls an the republ a burgo-r person in be signed burgeses of govern and this has the The estab Calvinists diction of They ma coin mon the city-

The the riv the east on the thirty reckor their c They the Po

Besides those there are thirteen consuls, who elect the burgo-masters out of their own body, and likewise appoint the judges, and all other officers of the city. From the decisions of the judges, an appeal lies to the consuls and burgo-masters, and from this tribunal to the republic of Poland. The king annually nominates a burgo-master out of the consuls to represent his person in the senate; and all sentences of death must be signed by the deputy in the king's name. A hundred burgeses are elected to inspect the administration of government, and defend the people's privileges; and this body, with the concurrence of the senate, has the disposal of vacant benefices in the church. The established religion is the Lutheran; but Papists, Calvinists, and Anabaptists are tolerated. The jurisdiction of the town extends forty miles round the city. They maintain a garrison at their own expence, and coin money with the effigy of the king on one side, and the city-arms on the other.

The city of Culm is situated on an eminence near the Vistula, sixty miles south of Dantzick, and is the capital of a palatinate. On the same river, thirty miles south of Culm, stands Thorn, the best built city in Regal Prussia; the stadthouse of which is reckoned little inferior to that of Amsterdam. Marienburg, the capital likewise of a palatinate, lies on the west side of the Vistula, ten miles south of Dantzick, and was anciently the chief city of the Teutonic knights. Elbing is situated near a bay of the sea, called Frischaff, thirty miles east of Dantzick. The other towns of note in Regal Prussia are, Hailburg, Frauenburg, and Brawnsburg.

Ducal Prussia lies east of the river Vistula, opposite to Regal Prussia, and gives the title of king to the elector of Brandenburg. The chief town of this province is Koningsburg, situate at the mouth of the river Pragal, in 21 degrees 35 minutes of east longitude, and in 54 degrees 42 minutes of north latitude. This is one of the most considerable port-towns on the Baltic, and has a commodious harbour. Here is an university, and a magnificent palace, and the town is the see of a bishop. Memel is seated on that bay of the sea called the Cur, or Curishaff, eighty miles north of Koningsburg, and has a convenient harbour, almost surrounded by lakes and marshes. The town of Pilau, which is situated at the entrance of the Frischaff, has likewise a good harbour; and opposite to it, on the same bay, stands the town of Heligpiel.

The province of Samogitia lies north of Ducal Prussia. The chief towns are Rostenne, seated on the river Dubissa, sixty miles south of Mittau; and Midnick, lying on the river Wernita, twenty miles north-west of Rostenne.

The duchy of Courland is bounded on the north by the river Dwina, which separates it from Livonia; on the east by Lithuania; on the south by Samogitia; and on the west by the Baltic; being about a hundred and thirty miles long, and thirty broad. This is usually reckoned a province of Poland, but the Courlanders elect their own princes, and are governed by their own laws. They are influenced however in their choice either by the Poles or Russians; and of late years chiefly by the

latter. The capital of the duchy, and the usual residence of the dukes of Courland, is Mittau, situate on the river Massa, upwards of thirty miles south of Riga. The town of Goldingen stands on the river Wetaw, about twenty miles south-east of the Baltic.

The province of Warsovia lies eastward of Great Poland, and south of Prussia. The chief town of this province, and the capital of the kingdom, is Warsaw, situate in 21 degrees 5 minutes of east longitude, and in 52 degrees 15 minutes of north latitude; on the river Vistula, a hundred and fifty miles north of Cracow, and a hundred and forty south of Dantzick. Though a place of little or no trade, it is a large populous city, ornamented with several magnificent royal palaces, and here the diet or states of the empire assemble. A plain adjoining to the city was hitherto the scene where the kings of Poland were elected. Czarkow, capital of a palatinate of the same name, is situate on the Vistula, about thirty miles south of Warsaw.

The province of Polachia is situate about the middle of Poland, between Warsovia and Lithuania. The chief town is Bielsk, the capital of a palatinate, near a hundred miles east of Warsaw.

The province of Polesia lies between Lithuania and Volhinia. The chief town is Brest or Brestsch, capital of a palatinate of the same name, situated on the river Bug, a hundred miles east of Warsaw.

The great duchy of Lithuania occupies the north-east division of the country, and is in extent near two hundred and fifty miles either way. It may in some respects be considered as an independent state in alliance with Poland; being governed by its own laws and magistrates, though united under one sovereign, who is the titular head of both nations. The capital of this duchy is Wilna, lying two hundred and twenty miles north-east of Warsaw. The other towns of note are Braslaw, Polocksko, Witstask, Trochi, Minsk, Meislaw, Novogradeck, Wilcomitz, and Grodno, at the latter of which the diet sometimes used to assemble.

The province of Little Poland has Hungary on the south, and Silesia and Moravia on the west. The chief town is Cracow, situate in a fine plain, near the banks of the Vistula, in 19 degrees 55 minutes east longitude, and in 50 degrees 10 minutes of north latitude, a hundred and fifty miles south of Warsaw. This is sometimes reckoned the capital of Poland; but it is at least the best built town in the kingdom. Here the supreme courts of justice are held, and the regalia are kept in the castle; it being the place where the kings were usually crowned, and buried. It is also the see of a bishop, and the seat of an university. In the same province lies Sandomir, capital of a palatinate, pleasantly situated at the confluence of the rivers Vistula and Sanus, seventy miles east of Cracow; and also Lublin, capital of a palatinate, a hundred and thirty miles north-east of Cracow. This is a town of considerable trade, whither foreign merchants resort in great numbers, at three fairs which are held every year.

The province of Red Russia lies eastward of the preceding, and is separated from Hungary on the south

by the Carpathian mountains. The chief towns are, Chelm, Belz, and Lemberg, or Leopold. This is the see of an archbishop, and enjoys a flourishing trade.

The province of Podolia is situate on the east of Red Ruffia, and is divided into the Upper and Lower, the latter of which lies south-east of the former. The capital of the province is Kamineck, seated on the river Smartzick, almost the only fortified town of Poland on the frontiers of Turkey.

The province of Volhinia is situated on the river Nieper, eastward of Little Poland, and is also distinguished into the Upper and Lower Volhinia. The chief town in the former is Lufuc, or Luckow, a place of great trade, and a bishop's see. The Lower Volhinia is inhabited by the Cossacs, who are most of them subject to Ruffia.

## C H A P. II.

*Of the produce—animals—trade—natives—dress—diet—diversions—way of travelling—language—religion—money—government—history.*

**P**OLAND being well watered by lakes and rivers, produces vast quantities of wheat, rye, and oats, which are annually exported to the southern countries of Europe. Nor is this kingdom less remarkable for its numerous herds of neat cattle, which the inhabitants sell to the people of Brandenburg, Pomerania, and the other contiguous territories. The froits of the country are the same with ours, and their grapes also will not make wine. Here is a fine breed of horses, fit either for riding or the draught; and the forests abound in deer, elks, hares, and other game. The wild beasts are bears, wolves, foxes, wild bulls, and wild asses; and in Volhinia, about the Nieper, there are wild sheep and horses. The waters of Poland abound in fish, and they have all sorts of wild fowl. Vast quantities of honey are produced by the bees in the forests. In the northern provinces, the partridges, hares, and some other animals, turn white in the winter, as they do in Sweden and Norway. The country also produces mines of silver, copper, lead, and iron; but the salt-pits are the most considerable, and some of them three or four hundred yards deep.

The exportations of Poland consist in grain, cattle, hemp, flax, linen, hops, hides, tallow, leather, furs, honey, wax, pot-ashes, pitch, tar, masts, yards, plants, salt, beer, vitriol, nitre, lead, iron, copper, glass, coals, earthen ware, and wool. The goods which they import are, woollen cloth, silks, tapestry, jewels, wines, spices, salted and dried fish, raisins, figs, sugars, and tin; the balance of trade being very much against them in most countries.

Neither the habits of the Polish nation, nor the laws of the country, are favourable to manufactures or commerce. No person who follows either of those employments is at liberty to purchase any landed estate, or to acquire any real property in the kingdom; and such is the pride of the nobility and the ecclesiastical order, that they hold those useful members of the com-

munity in the greatest contempt. On this account the manufactures here remain in an unimproved state, and all the inland commerce is carried on by Jews and foreigners, who take every opportunity of imposing upon the natives with whom they traffic.

The Poles are generally above the middle size, and inclined to corpulency. They have good features, with a healthy complexion, and hair for the most part of a light colour. This they wear short, and shave their beards, reserving only whiskers on their upper lip.

The habit of a gentleman is a vest, and over it a loose coat, lined with furs, and girt with a sash, the sleeves fitting close like those of a waistcoat. Under the vest they wear a shirt, which has neither collar nor wristbands. Their breeches are wide, and of a piece with their stockings. Instead of shoes they wear boots of Turkey leather. Their dress is not complete without a poll-ax, and a sabre or broad sword. The sabre hangs by a leather strap, with the handkerchief, knife, and a small stone set in silver, for the purpose of whetting the knife. When they go abroad they wear a short cloak, covered with furs on each side.

The old Polish dress of the women is not much unlike that of the other sex; but at present they generally follow the French mode.

The Poles are very profuse both in their dress and the furniture of their houses. Some of them think they are not well provided, if they have not forty suits of cloaths, and those exceeding rich.

Except in Dantzick, and the trading towns in the north, where the buildings are five or six stories high, the houses for the most part consist of no more than a ground floor; but some are built higher, and after the model of those in Italy. In gentlemen's houses in the country, the apartments are usually ranged in the form of a square. Opposite to the gate of the court stands the body of the house, on one side of which ranges the kitchen, with the offices belonging to it; and on the other, the stables, and lodgings for the men servants. The rooms are for the most part hung with tapestry, and all the furniture rich and elegant. In every house there are stoves, and in all great houses also bagnios, which are much used by the inhabitants. For the accommodation of the public, every town is supplied with a convenience of this kind.

The principal gentry have their horse and foot-guards, who do duty at their houses, and precede their coaches in the streets. When they appear at the diets, or assemblies of the states, some of them are attended by five hundred, and others by a thousand of those retainers. At their meals they are attended by bands of music, and their domestics serve them with the most profound respect. Having little relish for mutton, they usually eat beef or veal, with venison, river-fish, tame and wild fowl, and other game. Bacon and peas, with pig, are favourite dishes; and they are also fond of mushrooms. They season their meat high with spice, and use likewise a great deal of saffron. Their drink is mead and strong beer; and they have all sorts of liquors that are used in other countries of Europe.

*Habit of a Woman of Wotiac in Siberia, in 1768.*

*from L'Abbe Chappe.*

*The Wotiac Men and Women are in General, a few inches more than four feet high; their head-dress is very remarkable, something like that of the English Ladies in 1773. They first wrap up their heads, says L'Abbe Chappe, with a towel, over which they fasten a kind of Helmet, made of the bark of a tree, covered with thread, &c. and fringed. The head-dress is a bare foot high.*

As soon as the company sit down to table, the gate of the court is shut, and the several guests produce their own knives, forks, and spoons; those implements not being furnished by the family, on account of the servants and inferior people being much addicted to theft. For the same reason, a strict account is taken of the plate, after the entertainment is over.

Their diversions within doors are music and dancing; and without, hunting and riding. They generally travel on horseback, but sometimes in a chaise and pair; and will hardly walk the length of a street. There are not many inns to be met with on the road, but empty boarded houses, in which a traveller is accommodated with no other convenience than lodging, and clean straw. Those who travel in a chaise, in winter, place their feet in a box lined with furs, and horsemen have generally their boots supplied with the same means of warmth.

The Poles usually study their own language, and the Latin, with great application, but seldom any other. With the latter of those tongues even the women and the common people are acquainted. The better sort of the inhabitants of Poland are reputed an honest, generous people, and hospitable to strangers. Their ruling foible is the love of pomp and grandeur; to maintain which they too often exercise an oppressive authority over their vassals and inferiors.

The established religion of Poland is the Roman Catholic; but in the north, the subjects of the king of Prussia, with those of Dantzick and several other cities, are protestants; and in conjunction with such inhabitants of the country as follow the Greek church, are denominated Dissidents. The people of this class have been for many years cruelly persecuted by the catholic party, contrary to the faith of several treaties; but the same epoch which put a period to the ancient constitution of the Polish government, has terminated their religious disputes.

There are here two archbishopsricks, viz. Gnesna and Leopold. The incumbent of the former, who is always a cardinal, is primate of the kingdom; and during an inter-regnum, or in the king's absence, he is regent. The bishopsricks are those of Pofna, Wilna, Cracow, Culm, Karnoflaw, Window, Mednic, Plafko, Lesko, Calmenfee, Fauconburg, Premiflaw, and Camineck.

Poland abounds in Jews, said to be of the tribe of Benjamin. They are however in appearance extremely despicable, but by their acuteness and industry they have obtained an establishment, which it is for the advantage of the nation to support; as the trade which they carry on enables them to pay an interest of ten per cent. for large sums.

Polish coin falls from one to two per cent. advance. The exchange is usually from 280 to 290 grosch per pound Flemish pennies. Koningburg draws in current money, one per mil. according to custom, being deducted. Accounts in Poland are kept in guilders, grosch, and phenningen.

Poland, before the late dismemberment of the kingdom, and the alteration in its government, was in reality an aggregate of confederated states. Every palatinate or county had the power of making provincial laws, which were however to be consistent with the general statutes of the republic. The government was divided into two branches, namely, the legislative and executive power; the former of which was lodged in the diet or assembly of the states, and the latter in the senate, of which the king was president. The senate consisted of the archbishops, bishops, palatines, castellans, and great officers of state; and the diet was composed of the senate and the deputies or representatives of every palatinate (county) and city. They usually met every two years, and oftener upon extraordinary occasions, if summoned by the king, or in his absence, by the primate, the archbishop of Gnesna. The longest term of a session was six weeks, and the assembly often broke up in a tumult in a much shorter time. For one dissenting voice prevented their passing any law, or coming to any resolution on what was proposed to them from the throne. The regal power was contracted within very narrow limits. By the *pacta conventa*, or the instrument which the king signed at his accession, he engaged not to introduce any forces within the bounds of the republic, and to prefer no person to any civil office, except a native of the province in which the department existed. Though he appointed the officers of state, they were only accountable to the republic. To displace any officer he had no legal authority, and the public treasure he was not permitted to touch. He could not make war or peace, nor marry, without the consent of the states; and neither king nor queen could profess any other religion than that of the catholic church.

The king was usually elected in the plain adjoining to Warsaw, by the clergy and men of landed property in the several provinces, who assembled in armour on horseback. The choice was not held to be valid unless they were unanimous; and when they happened to be divided, as was frequently the case, the majority drew their sabres, and compelled the other party to submit. But though this expedient suppressed any opposition for the present, the tranquillity of the nation remained always precarious, and seldom proved of long duration.

\* M m m among

among a turbulent aristocracy, whose natural haughtiness incited revolt against the constrained acknowledgement of an unpopular sovereign, and whose numbers were such that they could hardly be conciliated by the utmost influence of the crown.

No fixed revenue was established in Poland for the support of the government, but supplies were occasionally granted by the diets, according to the exigence of the state. The fund allotted for the maintenance of the royal household arose formerly from certain lands vested in the crown, from the produce of the salt-works, and from the different custom-houses in the kingdom, the whole of which never exceeded two hundred thousand pounds a year, and sometimes did not amount to the half of that sum. Since the kingdom has been divided, the salt-works and some of the crown lands have been seized by the empress-queen of Hungary, the produce of part of the custom-houses by the king of Prussia, and another part of the crown-lands, with part of the customs of Mohilow by the empress of Russia.

Before the partition of Poland, the army of the republic usually consisted of thirty-six thousand men, who were divided into two corps, independent of each other. The Polish corps was fixed at twenty-four thousand men, and that of Lithuania at twelve thousand, of which two thirds were cavalry. Those troops were respectively commanded by two generals, who were vested with absolute authority over the men, and though always nominated by the crown, were accountable for their operations to the republic only.

The furniture of the Polish cavalry is extremely magnificent, but the infantry is badly armed, as well as ill clothed, and often without uniforms. Neither the horse nor the foot is remarkable for discipline: they commonly make a furious onset, but if they be repulsed they retreat with great precipitation, and will never return to the charge.

The greater part of Poland is now divided between the empress-queen of Hungary, the king of Prussia, and the empress of Russia. The first of those powers has taken possession of almost all the south-eastern parts of the kingdom, and the rich salt-works of the crown; the second has occupied Polish Prussia, with some districts bordering upon Brandenburg; and the third has assumed a large district of country about Mohilow, upon the banks of the Dnieper. Since this division has taken place, there is not any regular form of government in Poland; those three great powers directing every thing according to their pleasure, while the king, the senate, and the diet, are at present only the instruments of their administra-

tion. Hardly, however, can the despotism of any of those sovereigns prove more intolerable to the people than the former oppression of the aristocracy, which exercised its dominion with a degree of rigour repugnant to every principle of civil liberty.

The Poles, like the other northern nations, were anciently a tribe of Scythians, who led an itinerant life, till Lechus, the first of their sovereigns mentioned in history, taught them to establish a permanent residence. Under the direction of this prince, who assumed the title of duke, they built the city of Gnesna about the year 550. Lechus is said to have been succeeded by his posterity for a hundred and fifty years, when the family becoming extinct, the government was divided between twelve palatines, or vaivods, who were sovereigns of their respective provinces, and independent of each other. About the year 700, one Cracus, either by force or intrigue, became sovereign of the whole, and built the city of Cracow, which he called after his own name. He left two sons, Cracus and Lechus, with a daughter named Venda, Lechus murdering his elder brother, was excluded from the succession by the people, who advanced Venda to the throne; but this family becoming likewise extinct, the country again adopted the government of the twelve vaivods, who in the year 760 elected Lescus their sovereign, with the title of duke, as formerly. In the year 999, Boleslaus Croby first assumed the title of king. About this time Christianity appears to have been first established in Poland. The monarchy was absolute until the reign of Lewis, in 1370, when the prerogative was greatly restricted; but the lineal succession to the crown suffered no alteration. A few years afterwards the representatives of the several palatinates or provinces were first summoned to sit in the assembly of the states; the great officers of the crown and the dignified clergy only having hitherto enjoyed this privilege. But so important an extension of the legislative authority, though it served to diffuse a more equal share of power among the aristocratical part of the nation, proved the means of frequently impeding the operations of government; and whilst it farther diminished the influence of the crown, which had already been abridged of all its most formidable prerogatives, it added nothing to the general happiness or freedom of the people. Henceforward turbulence and dissension took place of regularity and concord; and the succession being contested at the demise of almost every king, there ensued a scene of universal anarchy and civil war, which often never totally subsided during the whole succeeding reign.

*Of the situation—air—seas—lakes—rivers—provinces  
—chief towns.*

**T**HE empire of Russia, sometimes called Muscovy, including its European and Asiatic dominions, extends from 24 to 130 degrees of east longitude, and between 45 and 72 degrees of north latitude. But its territories in Europe, with which alone we are now engaged, stretch from 24 to 65 degrees of eastern longitude, being about fifteen hundred miles long, and near as much in breadth. It is bounded on the north by the Frozen Ocean, on the east by Siberia, on the south by Turkey, and on the west by Poland, the Baltic Sea, and the territories of Sweden. As this country lies under so many degrees of north latitude, the temperature of the air is very different in different parts of the empire, and towards the north is exceedingly cold. At the winter solstice the sun is six weeks or two months below the horizon, and in summer above it an equal time. At Petersburg, the navigation of the Nieva seldom opens before the end of April, and it is sometimes the first of June before the fields have acquired a verdure; but after this season the weather is frequently very hot for upwards of two months. On this account, and the earth being fertilized by the great quantity of nitre contained in the snow, vegetation proceeds extremely fast.

The seas of Russia are, the Frozen Ocean, the sea of Weygats or Nova Zembla, the White Sea, the Baltic, and the Gulph of Finland. It is observable of the Baltic Sea, that a current always sets out of it, through the Sound into the ocean; for which reason, and the numerous rivers that fall into it, its waters are not so salt as other seas. There are no tides in it, and it is often frozen three or four months in the winter.

Here also are several lakes of considerable extent, viz. Ladoga, Onega, the White Lake, the Ilmen Lake, and those of Wursero and Pepus. By means of those lakes, joined to the flatness of the country, and the large rivers, as well as canals, with which it is plentifully supplied, a free navigation is maintained in the summer almost through the whole empire.

The chief rivers are, 1. The Tobol, which rising in Bulgar, runs northward, and uniting with the Irtis and Oby, falls into the Frozen Ocean; forming the eastern boundary of European Russia. 2. Mangasia. 3. Petzora. 4. Upper Dwina. Those three rivers run from south to north, and fall into the northern seas. 5. The Wolga, which rises in Belozero, and running south-east through European Russia, receives

the rivers Mologo, Mosco, Kisma, Ocka, and Kamar.

Continuing its course in the same direction, it runs through Asiatic Russia, and discharges itself by several channels into the Caspian Sea, seventy miles below Astracan. This river, which flows through a tract of three thousand miles, is of great use to the Russians, not only in point of trade, but as it has enabled them to reduce under their government several tribes of Tartars, who inhabit its banks towards the East. The vast number of waters which the Wolga receives in its course, and the torrents that descend from the hills at certain seasons, occasion it to rise considerably.

The commencement of the inundation is usually about the end of March, when the snow begins to melt. It continues to increase during April and May, and does not subside till the end of June. It is raised again in September by the autumnal rains; but this is neither so constant nor considerable as the flood in the spring. The height of the inundation varies at different places.

At Astracan it seldom rises above seven or eight foot, unless its discharge into the Caspian should be obstructed by south winds. At Zaritzen, which is four hundred wersts higher, it rises twenty foot, and at Casan twelve hundred and fifty wersts; but farther up the stream, the rise is yet more considerable. The banks and sands are altered almost every year by the force of the current, and the navigation is very difficult for vessels drawing more than five foot water, except in the time of the flood, when the largest flat-bottomed vessels have sufficient water. At those times vessels may be seen on the river carrying six hundred tons, and in some seasons there are barks of greater burden. Prodigious quantities of fish are taken in this river, which are sent either salted or frozen to the most distant parts of the empire. Here is also a great trade in caviar (the roes of sturgeons) so much esteemed in all the countries of Europe. 6. The river Don or Tanais, which rises in the middle of Russia, and having received the Woronetz, runs south-east to Kamisinka, where turning south-west, it falls into the Palus Mæotis, or sea of Asoph.

7. The Nieper, or Boristhenes, rises in the province of Moscow, and running south-west through part of Poland, afterwards changes its course to the south-east, in which direction again entering Poland, and passing by Kiof, it proceeds through the Ukrain, and falls into the Euxine Sea at Oczakow. 8. The Lower Dwina rises in the province of Moscow, and running west through Poland, falls into the Baltic below Ripa, by a canal which Peter the Great made between the river Woronte and the Wolga.

Russia contains thirty-one provinces, viz. in the north, Lapland, Samoieda, Bella Morenskoï, Mescen, Dwina, Syrianes, Perma, Robininkî: in the middle, Rezan, Belozera, Wologda, Jereftaf, Tweer, Mosco, Belgorod: on the east, Bulgar, Cassan, Czremiff,

Little Novogrod, the territory of the Cossacs on the river Don; on the west, Great Novogrod, Russian Finland, Kexholm, Carelia, Ingria, Livonia, Smolensko, Zerniugof, Seefsk, and the Ukrain, or country of the Old Cossacs on the Nieper.

Petersburg, or St. Petersburg, the capital of the Russian empire, is situate in 30 degrees 23 minutes of east longitude, and in 59 degrees 57 minutes of north latitude. It stands on an island in the middle of the river Nieva, in the provinces of Carelia and Ingria, between the gulph of Finland and the lake Ladoga, occupying at present a prodigious extent of ground; but as the houses in many parts are not contiguous, and great spaces are left unbuild, it is hard to ascertain its real magnitude. It extends about six miles every way, and, being situated on a flat, is greatly exposed to inundations. When this city was founded, in the year 1703, the houses were generally built of timber but since the Russians have become acquainted with the manufacture of bricks, it makes a far more noble appearance. Canals run through several of the streets, which are here and there adorned with the palaces of the sovereign, and some of the principal nobility. The river Nieva at Petersburg is about half a mile in breadth, and is very deep and rapid; but the sands at the mouth of it preventing ships from coming up, they are obliged to take in their lading four or five miles lower. The Thames, however, is not comparable to this noble river in beauty; and as the stream sets constantly out of the lake of Ladoga into the gulph of Finland, it is always full, clear, and perfectly clean. The walk along its banks is one of the finest in the world: it consists of a parade running a mile in length, the buildings of which are hardly to be exceeded in elegance. There are at Petersburg, besides other public buildings, twenty Russian churches, and four Lutheran, exclusive of the Calvinists, Dutch, English, and Catholics, all religions being tolerated. The inhabitants are computed at about a hundred thousand, a number not inferior to which is said to have perished by the various hardships sustained in the building of this metropolis. The palace of Peterhoff, at which the present empress mostly resides, is a magnificent structure. It stands on an eminence in the midst of extensive gardens, which lie along the shore of the gulph of Finland, and are washed by its waters. It was begun by Peter I. but has received many additions and improvements from his successors, and is now become very large. In the front is a canal some hundred yards in length, that joins the gulph, and whence three jets d'eau are supplied, which do not, like those of Versailles, play only on great festivals, but constantly throughout the year. The apartments of the palace are very splendid, and adorned with valuable paintings.

The country round Petersburg is a barren morass, where the inhabitants could hardly subsist if they were not supplied with provisions from Novogrod, Pleskow, and Casan; the last of which is distant about a thousand miles from the capital. Innumerable sledges, however, are employed in the winter in carrying hither from those fertile provinces all the necessaries of life; and in

summer the produce is transported by vessels, to which the multitude of rivers and canals almost every where afford convenient access.

About eleven or twelve miles below Petersburg, lies the island of Retusari, where the czar Peter observing a commodious harbour, built a town and fortress for its defence, to which he gave the name of Cronslot or Crown-Castle; as both the town and island are now called. This he proposed to make the station for the royal navy before he was master of Revel and Riga. Here are still his principal magazines of naval stores, and the greatest dock-yard in the empire. This island is about fifteen miles round, and opposite to it, on the shore of the gulph of Finland, are the seats of many of the nobility, which make a fine appearance; the land rising gradually to the height of sixty or seventy foot all the way from Cronslot to the capital.

Moscow, capital of the province of that name, and lately of the whole empire, is situate in 39 degrees of east longitude, and in 55 degrees 45 minutes of north latitude, on the river Moscovia, five hundred miles south-east of Petersburg. It stands in a fine plain, and is about six miles in length, and four in breadth. Some years ago this city suffered greatly by fire, to which the numerous timber buildings render it extremely liable. The very streets of the town are laid with square beams of fir, instead of pavement; and in place of walls, the houses of the great men had timber enclosures. Before the conflagration there are said to have been in this city upwards of a thousand churches. Here are still several palaces, but not comparable to those about Petersburg. One however is remarkable for its thirty chapels, and its hanging gardens. The river Moscovia running through the city in a winding course, and having several groves and gardens on its banks, affords a pleasant prospect; but the many vacant spaces where houses once stood, present at the same time a striking picture of the desolation which the fires have occasioned. That which happened in the year 1752 destroyed thirteen thousand houses, which is not half the number that have been burnt within the present age. Since those calamities, wooden houses are permitted to be built only in the remote streets; an order having been issued for rebuilding the rest with brick and stone. As this city stands in the middle of European Russia, in an healthful air, and was formerly the capital of the empire, many of the nobility who are not obliged to attend the court, reside here; as well as the principal manufacturers and merchants. For the ancient Russian families look with contempt upon Petersburg, as being a modern town, inhabited by a mixture of people of different nations, and of mean extraction.

Archangel, the capital of the province of Dwina, is situate in 40 degrees 22 minutes of east longitude, and in 64 degrees 30 minutes of north latitude. It stands about four hundred miles north-east of Petersburg, on the Upper Dwina, which discharges itself into the White Sea five or six miles below the town. The trade of this place has greatly suffered since the building of Petersburg, but it is still a considerable town.

town. Timber and naval stores being here in great plenty, and labour likewise being cheap, many of the Russian ships of war are fitted out at this port. Great quantities of fresh meat, fish, and wild fowl, are sent from this place to Petersburg, with which in winter the sledges will travel in two days. The inhabitants of Archangel have plenty of good liquor, as well as food of all sorts.

Riga, the capital of Livonia, is situate in 24 degrees 25 minutes of east longitude, and 57 degrees of north latitude, not far from the mouth of the Lower Dwina, near four hundred miles south-west of Petersburg. Two miles below the town, at the mouth of the Dwina, stands Dunamunder fort, which commands the entrance of the river. Mr. Hanway, who was here in the middle of May, observed that the weather was then as hot as in Portugal.

The Lower Dwina is generally frozen by the end of November, and not open again till the middle of March. When the ice breaks, it floats to the sea in masses of so vast a weight, as to bear down every thing before it; on which account there is no bridge over the river, but they pass it on a raft or float of timber. Three hundred vessels may lie conveniently, and take in their lading, in nine foot water; but larger ships take in their goods at a little distance, where they have seven fathom water. The merchandize at this port consists of hemp, flax, masts, and timber. Of hemp they export annually about six thousand tons, which is brought down the river: the flax comes from Lithuania, and the timber from the south of Poland; great part of which is fit for masts.

The streets at Riga are very narrow, and the houses seldom built above two stories high, with the roofs very steep, to carry off the water at the melting of the snow.

Dorpt is another city of Livonia, on the road from Riga to Narva, about fifteen miles south of the lake Piebus. It stands in a plain on the river Embeck, and on the side next Riga makes a very beautiful appearance. The trade consists chiefly in corn and flax, of which great quantities are sent to Riga.

Narva is a port-town, situate in 28 degrees 35 minutes east longitude, and in 59 degrees of north latitude. It stands on a river of the same name, about a hundred miles south-west of Petersburg. It trades chiefly in flax and timber. Of the former they export about four thousand tons to England and other countries. The Dutch purchase most part of their timber, and the British some of the largest. They import of tobacco about fifteen thousand pound weight, and of salt above a hundred tons. There not being here a depth of water for ships above a hundred and fifty tons, larger vessels are obliged to lie in an open road.

Revel is situate in 25 degrees 7 minutes of east longitude, and in 59 degrees 23 minutes of north latitude; at the entrance of the gulph of Finland, a hundred and forty miles north of Riga, and a hundred and ten west of Narva. One part of the town stands on the side of a hill, and the other in a fine plain. It has at present no great trade, but the cathedral and the houses of the nobility are elegant buildings.

No. 20.

Novogorod, the capital of the province of Great Novogorod, lies in 34 degrees of east longitude, and in 59 degrees of north latitude, on the river Wolcass, a little north of the lake Ilmen. It is the see of an archbishop, and contains near two hundred churches and monasteries; and here is one of the best manufactories of Russia leather. The province of Novogorod being one of the most plentiful in Russia, abounding in corn, flax, hemp, wax, honey, and all kinds of provisions, supplies Petersburg with them by the river Wolcass, and the lakes to the northward.

Pleskow, capital of the duchy of the same name, lies in 28 degrees 45 minutes of east longitude, and in 57 degrees 34 minutes of north latitude, on the river Muldow; a hundred and thirty miles east of Riga. It is a large populous city, and well situated for trade.

Wologda, capital of the province of that name, is situate in 41 degrees 50 minutes east longitude, and in 59 degrees 10 minutes of north latitude, on a cognominal river, which a little below falls into the Upper Dwina. This city, which is also very populous, lies on both sides of the river, extending four miles along its banks, and contains about eighty churches; one half of which are built of stone, with cupolas over them, covered with tin; the rest are of wood.

Tweer, the capital of the province of the same name, is situated on a cognominal river a hundred miles north of Moscow. This river has not generally two foot depth of water, but on the melting of the snow in April and May, it rises to eleven foot; at which time large flat-bottomed vessels usually pass to and from Astracan, when great numbers of merchants resort hither, who trade with the towns on the banks of the Wolga. The merchandize consists mostly in corn, meal, grocery, rock-salt, caviar, and fish.

Smolensko, capital of the province of the same name, stands on the river Nieper, about two hundred miles west of Moscow. This province was anciently reckoned a part of Poland, but being taken by the Russians, was confirmed to that empire, by treaty, in 1686.

Casan is situate in 53 degrees 25 minutes of east longitude, and in 55 degrees 38 minutes of north latitude, at the confluence of the rivers Wolga and Casan, about three hundred and fifty miles east of Moscow. This was once the metropolis of a powerful kingdom, to which Russia was tributary, and is still the capital of the province of its name. The caravans of this city trade as far as China by land, whence they bring tea, gold-dust, and rich silks. They also trade with Persia by water, down the Wolga and the Caspian Sea, and have a considerable trade with Petersburg. The timber used for the Russian navy is cut in this province; the conveyance of which to Petersburg, by water, usually takes up two summers. Next to Moscow and Petersburg, this is the greatest magazine in Russia for all kinds of merchandize. The inhabitants had formerly a considerable trade to Bucharra, Khieva, and other parts of Ubec Tartary; but this commerce has been disused some time, on account of

N n n

the

the depredations committed on the caravans by the tribes of Tartars, through whom they were obliged to pass.

On both sides of the river Don, towards its mouth, as far as the Palus Mæotis, is the country of the Don Cossacks, the chief town of which is Adar, situate on the river Donetz; about two hundred miles south of Woronez. There are few towns in this country, the Cossacks living in slight huts or tents, which they remove occasionally as the necessities of their cattle require.

The Old Cossacks live in the Ukraïn, towards the mouth of the river Nieper, or Boristhenes. Their chief town is Kiof or Kiow, seated on the Nieper, in 31 degrees of east longitude, and in 51 degrees of north latitude. It stands in the most agreeable climate and fruitful soil in Russia, which has induced the court of Petersburg to reside here sometimes, though it lies upwards of five hundred miles north of Moscow.

Besides the cities that have been mentioned, there are many other considerable towns in this extensive empire, viz. Rostof, Perislaw, Sufdal, Wolodimir, Troitzta, Columnia, Wyburg, Parna, Stiria, Belosero, &c. But in Samoiéda, and some other of the northern provinces, we hardly meet with any towns, or even inhabitants, except the Laplanders, who live great part of the year in caves under the snow.

So much of this extensive empire is covered with wood, that perhaps not a twentieth part of it has yet been cultivated. It is extremely well watered with large navigable rivers; and if there were a communication between them, which might easily be effected, this country would be admirably adapted for internal commerce. The Dnieper and the Don, or Tanais, are navigable between two and three hundred leagues; the Wolga about twice that extent; the Dwina two hundred leagues; and the Irtysh and Oby also near twice as much. Peter the Great formed the vast project of making a communication by water from Petersburg to the Caspian Sea; and it is said that the present empress is about to carry it into execution.

The territories which compose the Russian empire, from Finland to the borders of China, have been united at different times. The first inhabitants of this country were Scythians, Scelavonians, Celts, and Huns, to whom may be added Cossacks, Calmucks, and various hords of Tartars.

## C H A P. II.

*Of the products—natives—dress—character—food—bathing—diversion—method of travelling—revenue—forces—trade—coin—religion—nobility—constitution—history.*

THE snow which Russia is annually covered in the winter, fertilizes the ground in so great a degree, that it yields large crops without the trouble and expence of manure. The seed-time for rye, in the middle of Russia, is before the winter begins, but for wheat or other grain, in April or May, after the

snow is melted; and the harvest for both is in August. The snow has no sooner disappeared than warm weather succeeds in the southern provinces, when tulips, lilies, roses, and a great variety of fine flowers and herbs, spring up without culture; and the best asparagus grows so thick that it may be mowed. The grass in the meadows is as high as a horse's belly; and all kinds of fruit abound, without the assistance of the gardener. Notwithstanding the natural luxuriance of those provinces, they are so much infested by the depredations of the Coban Tartars, that they are very thinly inhabited.

In the southern parts of the empire there is plenty of oak, elm, and other good timber, but towards the north scarce any other trees than fir or birch. European Russia affords no vineyards, but produces the same kinds of fruit-trees as the climate of Britain. They have also the same kinds of cattle, and in some places, camels and buffaloes. Their horses are not so large as in Germany, but very hardy, and able to endure great fatigue. They have no hounds; nor, if they had any, is the country proper for hunting by the scent in the winter, on account of the snow. With respect to wild beasts, Russia abounds in wolves, bears, foxes, elks, and rein-deer. In some of the deserts there are wild hurses and wild sheep. Here are also martins, fables, ermins, and white hares. Some bears are likewise of this colour, and some of the foxes black; but more of them are white, though the latter assume the common brown colour as the summer advances. The wild beasts here are said not to be so mischievous as in other countries. It is not unusual for many Russians to make their fortunes by bees, which are here in remarkable plenty. The method is to cut down a great number of trees in the forests, which they afterwards bore hollow, and stop up the apertures, so that nothing larger than a bee can find admittance. Here the bees enter, and make their combs, which become the property of those who have bestowed their labour towards the obtaining of this produce.

Few serpents or scorpions are found in Russia, but in summer it abounds with insects, particularly flies and gnats, which are exceeding troublesome. The rivers and lakes abound with excellent fish; and both tame and wild fowls are in great plenty. Many of the birds which visit us annually are natives of the northern provinces of Russia; and in those during winter, the partridges become white. Here are great varieties of hawks and birds of prey; but few singing birds were ever seen about Petersburg before the reign of Peter the Great, who caused some thousands of them to be purchased in the southern provinces, and let fly in the latitude of the capital; since which time it is said they have greatly multiplied, notwithstanding the severity of the climate. The country likewise abounds in mines of copper, silver, and iron, especially in Siberia.

Amidst so great a variety of people as are contained in this extensive dominion, the persons of the natives differ much from each other in the opposite extremities of the empire. The Laplanders and Samoiéds, in the north, are of low stature, with flat faces, small eyes, and

and a tawny hue; while the natives in the southern provinces are of a moderate stature, endowed not only with agreeable features, but with clear and lively complexions.

The usual dress of the common people, both men and women, is a long coat made of sheep-skins, with the wool inwards, and tied about the loins with a sash. Their feet and legs they swaddle up in coarse cloth; and they wear caps lined with furs, which come so far down as to cover the neck. They also wear double gloves, one pair of woollen and another of leather, which have no divisions for the fingers, but only a place for the thumb. The dress of the people of condition, except a great coat lined with fur, is according to the mode of the western countries of Europe, since the time of Peter the Great, who introduced this alteration, and also prohibited his subjects from wearing long beards, which had formerly been the general practice. With respect to the Laplanders and Samoieds, they clothe themselves with skins and furs from head to foot, and usually sew two skins together, with the furs on each side.

Till the accession of the czar Peter, the Russians were chiefly distinguished for indolence and drunkenness. An ambassador was obliged to swallow a pint of their country spirits drawn from the rye, before he was allowed to address the emperor; and merchants expected the same from foreigners before they would enter upon business. Since that period, however, the national character has undergone a considerable alteration. Arts and manufactures have been introduced amongst them; and the habits which were the concomitants of sloth and ignorance, have gradually yielded to the progress of civilization and industry; though intemperance in drinking may yet be considered as a prevalent vice among the people. The excessive abuse of intoxicating liquors, which prevailed so much in Russia before the beginning of the present century, rendered the natives not only averse to every useful occupation, but almost totally unsusceptible of social amusement. They are, however, for the most part hardy, and patient of labour in a great degree.

Animal food of all kinds is here in great plenty; besides which the people make great use of melons, cucumbers, onions, and garlick, and they pickle vast quantities of mushrooms to serve in the time of their long fasts.

The practice of bathing is so common in Russia, that accommodations for this purpose are established in every town of any note. Among the people of inferior condition, both sexes use them promiscuously; and it is the general custom to plunge into the cold bath immediately after coming out of the warm.

Among the winter diversions in Russia, one which seems to be peculiar to the nation, is that of sliding down a hill. They make a track on the side of a steep hill, down which they descend with astonishing velocity, in a machine resembling a butcher's tray. The Russians are so fond of this diversion, that at Petersburg, having no hills, they raise artificial mounts on the ice on the river Nieva, whither the people of

all ages and ranks resort in great numbers for the sake of sliding. The late empress Elizabeth, who was much addicted to this diversion, had a theatre erected for the purpose. It consisted of five mounts of unequal height. The first and highest is thirty foot perpendicular altitude. The momentum acquired in descending this, carries a person over the second, which is about five or six foot lower, and so to the last, when the slider is conveyed by a gentle descent, with nearly the same velocity, over a piece of water into a little island. Those slides, which are about a furlong and a half in length, are made of wood, that they may be used in summer as well as in winter. In traversing them, two or four persons usually sit in a little carriage, and one stands behind; for, according to the weight, the velocity of the motion is proportionably greater. The carriage runs on castors, and in grooves, to keep it in a right direction, and it descends with prodigious rapidity. At the bottom is a machine worked by horses, for drawing the carriages back again, with the company in them.

The method of travelling here in sledges during frosty weather is very expeditious. When the empress makes an excursion in this way from Petersburg to Moscow, which is distant about four hundred and ninety miles, she usually performs the journey in the space of three days and three nights. Her voiture on those occasions is a machine which contains a bed, a table, and other conveniences; where four persons may lodge, and be furnished with all necessary accommodations. This machine is set on a sledge, drawn by twenty-four post horses, which are relieved at regular stages; and to illuminate the road, great piles of wood are placed at certain distances, to be set on fire, if she happens to pass in the night.

When Peter the Great ascended the throne, the whole revenue of the Russian empire did not amount to six millions of roubles; but before the death of that prince, the public revenues, including the tribute of the Tartars which was paid in money, independently of all those taxes that were levied in kind, were increased to near fifteen millions of roubles. In the year 1767, after the present empress had annexed the church-lands to the domains of the crown, the public revenues amounted to twenty-five millions of roubles; and in 1770, after some additional taxes had been imposed, they amounted to full twenty-eight millions, clear of all incumbrances.

This rapid increase of the revenue was owing not to any improvements made in the agriculture or manufactures of the empire, but to the gaining so many ports for foreign trade in the Baltic Sea. A great balance of trade in favour of Russia, has brought a considerable sum of money to circulate in the empire, which enables the inhabitants to pay a great tax upon all kinds of foreign merchandize that is imported. The custom-houses of Petersburg, Riga, Narva, and Revel, produce an immense revenue. Some years past it amounted to above eight millions of roubles; and the mines of gold and silver in Siberia have been worked by the crown to a very great advantage.

A considerable part of the revenue of the empire arises from a capitation-tax, with the monopoly of salt, shubarb, and pot-ash; so that, the whole included, the imperial treasury is more than sufficient to answer all the public charges of the state.

In the beginning of the reign of Peter the First, the maritime force of Russia consisted only of a few row-gallies, but at present the empress has at least sixty ships of the line, and between thirty and forty frigates. Besides those, there are about a hundred and fifty row-gallies, which are useful in many parts of the Baltic, where it would be dangerous for any large ships to enter. These gallies generally carry two pieces of cannon, and from fifty to a hundred men, who attack with small arms. The Russians have likewise a naval force in the Black and Caspian seas, which is composed of a number of small frigates, sloops of war, and row-gallies.

The regular troops at present in the service of Russia, exclusive of the Cossacks and Tartars, are full three hundred and fifty thousand men. So great, however, is the extent of their territories, and such the number of fortresses which they have to support from Peterburg to the borders of China, that it is with difficulty they can bring into the field a hundred and fifty thousand men.

The common Russian soldiers, from a principle of superstition, are taught to despise life, and are therefore extremely bold in an engagement; but their intrepidity is rendered in a great measure ineffectual through the ignorance of the commanding officers, who are for the most part men of very little experience in their profession. Those are generally chosen, not by their merit, but in consequence of their family connections, out of the officers of the Russian guards, a body of troops which at present amounts to about ten thousand men, over whom their influence is so great, as to render them formidable even to the sovereign.

There is a great number of fortified places in the Russian empire, many of which are very strong, particularly those in the provinces conquered from the Swedes by Peter the First. They have a chain of forts passing through Siberia and Great Tartary, as far as the frontiers of China. There are also many strong fortresses in the kingdoms of Casan and Astracan, as well as in the Ukraine, and upon the frontiers of the Turkish dominions.

The Russian dominions are at present nearly as extensive as all the other European states; yet, according to a just calculation, they do not contain much above eighteen millions of people, there being very extensive tracts of land, even in the most fertile and populous provinces, which remain uncultivated and full of woods. In the kingdoms of Casan and Astracan there are whole provinces that have only inhabitants sufficient to conduct the cattle and the sheep to their pasture; and the Ukraine alone might support two millions of inhabitants by the produce of agriculture, more than at present are able to subsist in the country. This unprosperous state of the empire is owing to the

despotism of the government, which is particularly oppressive to the peasants, who besides being loaded with a heavy capitation-tax, are obliged to furnish recruits for the army and navy; and are also, under the sanction of the legislature, most cruelly treated by the proprietors of the siefs.

Notwithstanding those disadvantages, the trade of Russia, both interior and foreign, is now become very considerable, though its aggrandizement be greatly counteracted by the slavery of the people, and some injudicious regulations. Exchange, which is the means of transporting money from one country to another, and without which the best established commerce cannot be supported, is prohibited by the laws of Russia, under very severe penalties; and no person can quit the empire without a passport. Russia, however, being able to furnish iron, hemp, flax, with most of the materials for ship-building, and almost all the natural productions of the North, will continue to have some balance of trade in her favour with the maritime powers, particularly England and Holland.

The staple manufactures of the country are linens and leather, to which may be added hard-ware, which has of late been greatly cultivated. They also cast great guns, mortars, bombs, and anchors, and make vast quantities of small arms.

The coins of Russia are, the silver rouble, valued at four shillings and six pence, and the half and quarter rouble, with the cossick or yenny. The charvonitz, usually called a ducat by foreigners, is a gold coin of the value of nine shillings and six pence.

The religion of the Russians is that of the Greek church. They had a patriarch at Moscow, until Peter I. laid him aside, and seizing on the lands and revenues of the patriarchate, declared himself apostolical head of the empire. They still however have five metropolitan districts, fourteen archbishopsricks, and six bishopsricks, all well endowed. The secular priests have neither glebe nor tithes, but depend upon the perquisites which arise from their office, and seldom preach but in Lent. They deny the pope's supremacy, and abhor the worship of images; but have in their churches many pictures of saints, to which as mediators they often address their prayers. They have four Lents, which take up near half the year, and they observe their fasts with great strictness. There are many monasteries and nunneries, but by a regulation of Peter I. no woman is permitted to take the vow until she be fifty years of age, nor admitted till then into a cloyster. The priests are allowed to marry, but not the bishops. The doctrine of transubstantiation prevails in the Greek church; and they believe that the Holy Ghost does not proceed from the Son.

The ancient nobility of Russia were styled knez or knazey, boyars and vaivods. The first were dukes or sovereign princes, on the subjection of whom the duke of Russia distinguished himself by the title of Great Duke. The boyars were the nobility of the several duchies, and the vaivods were governors of

provinces. The honours of knez or boyars are at present seldom conferred on any subject; having given place to the more modern titles of princes, counts, and margraves, as in Germany. The estates of those proprietors are divided equally among their sons, the younger enjoying the same title as their elder brother.

Every master may punish his servant with the batogs or knoute, in the inflicting which punishment the offender is stretched on the ground naked, and beaten with sticks by two fellows till he is almost ready to expire. Even officers of rank in the state are sometimes thus punished by their superiors.

The parental authority is greater in this empire than in any other part of Europe. A father has an absolute power over his children; and neither age nor sex can exempt a son or daughter from obedience to his jurisdiction. This right they found upon the principle that parents have nothing but the happiness of their children in view, and consequently that they ought not to be accountable to any person for their conduct towards them.

The right of husbands over their wives is here also unlimited. The husband is the proprietor of his wife, and considers her as part of his goods, which he may dispose of as he pleases. In the northern and eastern parts of the empire, the wives of the common people reckon it a singular honour to be beaten by their husbands.

The power which the proprietors of fiefs have usurped over their slaves is almost absolute. Formerly a master might have killed his slave without any reserve; but this practice is now prohibited, though the master may yet, with impunity, beat him in so terrible a manner that he shall die of the bruises or wounds.

The ordinary charge of law-suits is very moderate in Russia, but the judges are extremely corrupt, and the lawyers in general remarkably ignorant in their profession.

There are in Russia four universities, viz. those of Moscow, Kiow, Chernikow, and Harkow; with two academies, one at Moscow, and the other at Petersburg. Every day the progress of learning becomes here more perceptible; and the fine arts as well as the sciences begin to be successfully cultivated under the patronage of the empress.

The government of Russia pays particular attention to those salutary regulations which concern the health of the people. Every surgeon is obliged in difficult cases to call for the advice of some regular physician or senior surgeon, whether the case be internal, or purely surgical; nor dare a surgeon perform any operation without previously having had the advice or concurrence of such, if possible to be got. If the patient should die, or be treated unsuccessfully where this precaution has been neglected, the surgeon would not escape punishment. The same obligation of calling assistance, when it can be procured, extends to the body of physicians. At every eminent apothecary's shop, a good surgeon is

No. 20.

appointed, with a sufficient salary, to attend daily two hours, forenoon and afternoon, to give advice to the poor; and if such are not able to pay for the medicines, they are furnished by the apothecary at the expence of the empress. If any person, not having a licence from the medicine chancery, should presume to dispense medicines to patients, the penalty is no less than to suffer the knute, to be sent to the gallees during pleasure, and to have all his effects confiscated, one half to the empress, and the other to the informer.

The constitution of Russia is that of an absolute government, and the crown hereditary; but instances have frequently occurred in which the senate and great lords have determined the right of succession even to the prejudice of proximity of blood.

The empire of Russia formerly consisted of a multitude of petty sovereigns, usually stiled dukes, till after the beginning of the seventeenth century, when the various provinces were reduced under the subjection of one sovereign, who assumed the name of the Great Duke, and was sometimes called Czar or Cæsar. Michael, the first sovereign of the whole empire, was succeeded by his son Alexis Michaelowitz, in the year 1645, after whose death his son Theodore Alexowitz ascended the throne, who dying without issue, in 1682, appointed John his brother by the same mother, and Peter his half brother, to reign jointly, as they did till the year 1696, when czar John died, leaving three daughters, viz. the princess Anne, married to the duke of Courland, Catherine, married to the duke of Mecklenburg Schwerin, and Proscovia, who died unmarried.

Czar Peter, who was the son of Alexis Michaelowitz, by his second wife, married the princess Ottokefa Federowna, a subject of Russia, by whom he had issue the czarowitz Alexis, born in 1690; but was divorced from her in 1692. The czarowitz married Charlotta Christina Sophia, daughter of Lewis Adolphus, duke of Brunswick-Wolfenbuttle, and died in prison in 1721, while under sentence of death for a conspiracy against his father Peter the Great. The latter next married the lady Catherine Alexowna, in 1711, with whom he had cohabited some time before, and had issue by her the princess Anne, and the princess Elizabeth, the former of whom was married to the duke of Holstein. On the death of Peter the Great in 1724, the czarina Catherine ascended the throne, and dying in 1727, appointed for her successor prince Peter, son of the late czarowitz, and grandson of Peter the Great; but this prince dying soon after, the crown devolved on the princess Anne, duchess dowager of Courland. On the demise of this empress in 1740, she was succeeded by prince John, an infant six months old, son of the duke of Brunswick-Wolfenbuttle, and of Anne his wife, daughter of the duke of Mecklenburg, and of the princess Catherine, eldest daughter of late czar John. But by a sudden revolution next year, the princess Elizabeth, second daughter of Peter the Great, was advanced to the throne. This empress

adopted

adopted for her heir the duke of Holstein, who was defended from her eldest sister; causing him afterwards to be stiled grand duke of Russia. He married the princess Catherine Alexowna, daughter of the prince of Anhalt Zerbst who on the death of her husband in 1764, succeeded to the throne, and is at present empress of Russia.

So late as the beginning of the present century the empire of Russia continued to be involved in a state of barbarism, till by the extraordinary genius, and in indefatigable exertion of the czar Peter, who has justly obtained the name of Great, it has already made such progress in civilization, as bids fair to rival the most polished nations in Europe.

## S W E D E N.

**T**HE kingdom of Sweden is bounded on the north by Norwegian Lapland, on the east by the territories of Russia, on the south by the Baltic Sea, and on the west by Norway; being situated between 10 and 30 degrees of east longitude, and between 56 and 69 degrees of north latitude, extending upwards of eight hundred miles in length from north to south, and in breadth five hundred. This country has a very rugged surface, incumbered with barren rocks and mountains; nor is it less diversified by dreary forests, extensive marshes, and great lakes. Of the latter the principal are the Meller, the Wener, and the Weter, on the south-west, with those of Cajania and Jende in Finland. The chief hills are the Dofrine, which separate the kingdom from Norway. Here are numerous torrents which fall precipitately from the mountains, but not many navigable rivers. The most considerable are those of Torne, Kimi, Lula, and Uma in Swedish Lapland, which discharge themselves into the north part of the Bothnic Gulf; that of Dalicaria, which rising in the Dofrine hills, runs from west to east, and falls likewise into the Gulf of Bothnia; and that of Kymen in Finland, which runs from the lake of Jende southward, and falls into the Gulf of Finland. The air is almost constantly clear and healthful, but in winter excessive cold. This season is usually followed by four months during which the heat of the climate is equally intense. In no place is the constitution of the atmosphere temperate, and in many the ground is covered with snow during the greater part of the year. The extreme length of the days about Midsummer renders the flies so numerous, that they will sometimes cover a dish of meat in the time of a meal. In winter, though the sun is not more than four or five hours above the horizon, the inhabitants have so long a twilight, and so much of the moon, that they travel almost as well in the night as the day, the whiteness of the snow contributing much to the light; and sometimes the Aurora Borealis, which is here very frequent, shines with far greater lustre than in the southern climates. Those phenomena are visible chiefly in the beginning of the year, and about the new and full moon.

Sweden is usually distinguished into six great divisions, viz. Lapland, Sweden Proper, Gothland, Finland, the German dominions, and the Swedish islands.

Lapland lies in the north part of the kingdom, and is subdivided into Tornea, Lapmark, Kimi-Lapmark,

Lula-Lapmark, Pithia-Lapmark, with East and West Bothnia. The chief town of this division is Torne, situate at the bottom of the Bothnic Gulf, on an island in the mouth of the river Tornea, in 24 degrees of east longitude, and in 65 degrees 31 minutes of north latitude, about four hundred miles north of Stockholm. In this part of the country are several copper and iron mines, the working of which affords employment to a great number of people; but the banks of the river Tornea, for a hundred miles northward of the town, are mostly inhabited by fishermen, who traffic with their southern neighbours, exchanging salted and dried fish, furs, and skins, for cloathing and provisions, as the soil of Lapland produces hardly any corn or vegetables. Instead of bread the natives generally grind the inner bark of a fir tree, which, being made into a paste and baked, they eat with the flesh of their rein-deer, or fish dried upon the rocks.

Sweden Proper lies in the middle of the kingdom, and is divided into ten provinces, viz. Uplandia, Sudermania, Westmania, Nericia, Gestricia, Helsingia, Dalicaria, Medelpedia, Jemptia, and Angermania. The chief town is Stockholm, the metropolis of the kingdom, situate in 19 degrees 30 minutes of east longitude, and in 60 degrees of north latitude. It stands on seven small islands or rocks, that part which is properly called the city not being more than a mile and a half in circumference, but the suburbs extending on the main land to a considerable distance north and south. Almost all the streets are steep and inconvenient for carriages, but the houses are lofty and handsome. In the midst of the capital stands the royal palace, a square building, on a steep hill, which commands an extensive prospect of the neighbouring country. Here are nine churches, the chief of which is that of St. Nicholas, supported by marble pillars. The roof is covered with copper, as are most other of the considerable edifices in this city. Stockholm is naturally so well defended by its insular situation, that it has never been fortified. The harbour, where it is entered, is spacious and secure; but the passage being extremely difficult, on account not only of the number of islands, but the variety of the winds necessary for the navigation, and the deficiency of tides, the station of the royal navy is at Carlesroon. The houses in the city of Stockholm are built of brick or stone, but many of those in the suburbs are of timber.

Upal

Upfal is situate in 12 degrees 15 minutes of east longitude, and in 59 degrees 53 minutes of north latitude, in the middle of a spacious plain upon the river Sala, about forty miles north of Stockholm.

This city was anciently the residence of the kings of Sweden, and is much older than the present metropolis.

The houses are mostly of wood, nor is there one public or private edifice of stone. Here is an university containing about fifteen hundred students, who in general are miserably accommodated in wretched hovels amidst dirt and penury. The adjacent country, and indeed almost the whole province, is chiefly a horrid desert, covered with huge stones, or impenetrable woods, incapable of cultivation, and destitute of inhabitants. The quantity of land employed in tillage will hardly bear the proportion of one to twenty. Those barren wastes, however, are enriched with inexhaustible mines of copper, iron, and silver.

Nykopping, the capital of Sudermania, is situate on a bay of the Baltic sea, about fifty miles south-west of Stockholm; and Hedmura, capital of Dalicaria, lies sixty miles north west of Upfal.

Gothland is the most southerly of the grand divisions of Sweden, and contains the following subdivisions, viz. East-Gothland, West-Gothland, and South-Gothland; each of which is again distinguished into different provinces. East-Gothland comprehends East-Gothland Proper and Smalland; West-Gothland is divided into West-Gothland Proper, Wermeland, and Dalia; and South-Gothland includes Schonen, Blekin, and Halland. The capital of all the Gothlands is Gottenburg, a port-town, situate in 12 degrees 15 minutes of east longitude, and in 57 degrees 45 minutes of north latitude. It lies on the coast of the Schaggerer Sea without the Sound, and is the most commodious for trade of any town in Sweden. Lindkopping, the capital of East-Gothland, stands on the river Motala, a hundred and twenty miles east of Gottenburg. Carelsroon, which is the station of the Swedish navy, is situate on the coast of the Baltic, in 15 degrees 5 minutes of east longitude, and 56 degrees 15 minutes of north latitude. Lund, or Lunden, the capital of Schonen, lies about thirty miles east of Copenhagen; besides which the province contains the two port-towns of Malmac and Helsingburg, the former opposite to the isle of Zealand, and the latter to Helsingora. Helmsstadt, capital of the province of Halland, is another port-town near the entrance of the Sound, ninety miles south of Gottenburg.

The vast forests which overspread this extensive country afford excellent timber for building ships. The oak furnishes them with planks, and their pine-trees and firs with masts and yards. Out of the latter also they extract pitch and tar; and their plantations of hemp supply them with cordage and sails. Their inexhaustible woods are likewise of great advantage in their iron and copper forges, and plentifully supply them with fuel for every domestic use. The most fertile part of Sweden is the middle of the country, where the valleys produce pasture and corn; but with the latter article the people must continue to supply

themselves annually from Poland, till they become more animated with the spirit of agriculture than they have hitherto been.

The cattle here are not large, but hardy, and the horses will endure great labour. The rein-deer are peculiar to Lapland, and will not live in a warmer climate. Such as are most wild run towards the north as the sun approaches them every year. These animals resemble the other species of deer in shape and colour, but have a flatter foot, and are stronger built, serving the inhabitants for draught and carriage, as well as food. The twigs and barks of trees are the subsistence in which they chiefly delight, but when those cannot be procured, they will dig a yard deep through the snow to come at the moss and weeds.

The Swedes are in general a well-made, strong and active people, and can sustain the greatest hardships. The common women, besides their domestic busiesses, perform all the ordinary works of labour without doors as well as the men. They till the ground, carry burdens, and even row upon the water. Such as practise those occupations are almost as tawny as the Laplanders, but the women that keep within doors have complexions as fair as the British, and like the other northern nations, for the most part distinguished by golden locks.

The usual dress differs little from that of the Germans. In winter, the better sort wrap themselves up in double furs, and the rest make use of sheep-skins with the wool on.

The Swedes, though well qualified by nature for action, are far from being industrious, and their indolence is accompanied with a degree of reserve, which assumes the appearance of pride. Even the lower orders of the gentry would think themselves degraded by following a liberal profession, or exercising any kind of traffick. There being few who apply to any particular trade, it is usual among the common people for every man to make his own cloaths, and instruments of husbandry, which is however performed for the most part in a very bungling manner. Intemperance in drinking is common to the Swedes with the other nations of the North. The first thing presented to a stranger that visits them is a bowl of wine or spirits; and they are apt to be offended if he rise from the table perfectly sober. There is a profusion of dishes at their entertainments, but no taste in the arrangement or disposition of them. The table groans beneath a number of covers, which are all brought in at once, and then left to cool during a ceremonious meal of at least two hours. But before they sit down to dinner the company eat bread and butter, which they wash down with a glass of brandy.

The diversions are chiefly hunting, and in the winter running races with sledges, which is also the most usual way of travelling in that season. With respect to the high-ways, they are much better than might be expected in so rugged a country; but the inns are in general extremely bad, and in some parts the inhabitants are so few that one may travel many miles without seeing so much as a hut.

The

The dominions of Sweden are almost as extensive as those of France, yet, according to a computation made in 1770, they do not contain more than two millions three hundred and fifty thousand inhabitants; a number not sufficient to cultivate the earth, notwithstanding the people are employing all possible methods to introduce manufactures into their country. That Sweden, however, was much more populous in former times, is apparent not only from the number of ruined old houses to be seen in different parts of the kingdom, but also from the exportation of corn in those days; while on the contrary, at present they are obliged to import a great part of the necessaries of life. The plague and sweating sickness, which raged here in the end of the last and the beginning of the present century, carried off several hundred thousand persons; besides which, about the former of those periods, great numbers perished of famine in the different provinces.

So little encouragement has been given to agriculture in this kingdom, for two hundred years past, that in the most fertile provinces, very extensive tracts of land remain uncultivated, though at present the inhabitants do not grow a sufficient quantity of grain for their own consumption. On this account, much is imported every year from Russia, Courland, and Pomerania; and other kinds of provision, such as butter, cheese, salt meat, rice, beer, &c. are annually brought from Britain and Ireland, notwithstanding some of the Swedish provinces abound in pasture.

Iron alone constitutes near three fourths of the Swedish exports, and this, besides several other articles, is entirely monopolized by foreigners, to the great detriment of the commercial interest of the country. The other most considerable exports are, copper, wood, brass-wire, tar, pitch, pipe-staves, herrings, dried cod-fish, and train-oil. It is computed that their exports, at an average, amount annually to 12,845,762 dollars, silver mint; and their import trade, which consists of grain, materials for manufacture, sugar, coffee, hemp, flax, and sundry other articles, amount to 13,409,666 dollars silver mint; a coin nearly equal in value to an English shilling. According to this computation, Sweden must soon be exhausted of all the little wealth she has, were she not supported by the money spent by foreigners in her different provinces, and what she receives in subsidies from other courts.

It is no small part of the pernicious policy of the Swedish government to keep the farmers in a distressed state. Every person in this class is prohibited by law to retain more than one servant to assist him in the cultivation of his land, if he has ever so great a quantity. He is also forbidden to make a division of his farm, and thereby to multiply the number of labourers. Whoever attempts to cultivate small parcels of lands are declared, every year from the pulpit, to be vagabonds, and are forced into the military service, from which they never can be released except they are maimed or disabled. This order of men is also prohibited from purchasing any of the free estates in the kingdom; and whatever lands they can legally obtain

must be burdened with the maintenance of soldiers. The more to increase their oppression, this tax is never levied on the free lands of the nobility, who in this kingdom amount to ten thousand nine hundred.

Sweden is not a little impoverished, and the industry of the inhabitants checked, by the premature introduction of manufactures, before the country was sufficiently peopled, and the land as much cultivated as to supply the fruits of the earth at a moderate price, without the necessity of importation. When Sweden has a bad harvest, as she has no magazines, and cannot speedily get assistance from foreign countries, especially in the winter, at which time her ports are frozen up, many persons are constrained to quit the kingdom. This is also the case when a single province labours under the same disadvantage, there being no internal communication between the several parts of the country. Hence it frequently happens that the inhabitants of one province labour under a great want, while those of another abound with a superfluity, for which they can find no vent but under great difficulties.

The standing revenues of Sweden arise from the crown-lands, the customs and excises; the capitation-tax, the silver and copper mines, and other less considerable particulars. It is computed that the whole amounts annually to about 10,104,406 dollars silver mint, which in the year 1769, when the pound sterling was worth fifty-one copper dollars, was about 594,180 l. Of this sum the crown-lands produce near one third, and the customs another. The capitation-tax is levied only upon the farmers, each of whom between the ages of sixteen and sixty, pay yearly about an English shilling, or something more. Almost one third of all the revenues of the kingdom is appropriated to the support of the royal family, and the remainder to that of the civil and military establishments.

Sweden at present labours under a debt of five millions sterling, a sum which in so poor a country can never be paid, and must remain a great load not only on the springs of government, but the commercial interest of the nation.

The military establishment consists of the militia of Sweden and Finland, amounting to near thirty-eight thousand men, with about four thousand regular troops in Pomerania, and the regiment of foot-guards containing two thousand men. Above the ordinary pay, the government has annexed to each regiment several supernumerary farms, to answer any extraordinary accidents, and to furnish a subsistence for such officers as are past service. For the common soldiers who are rendered unfit for military duty, there is one general hospital, which has a good fund.

The maritime force of Sweden is at present in a very weak state, consisting of about twenty old ships of the line, the half of which is rotten and unfit for sea, with ten or eleven frigates or sloops of war, almost in the same situation.

The established religion in Sweden is Lutheranism. The church is governed by an archbishop and ten bishops, whose revenues are very moderate,

that of the former not being more than four hundred pounds a year, . . . others considerably less. Under those are seven . . . hundred superintendants, who enjoy the same power . . . as the bishops; and to every ten churches is a provost or dean, invested with some authority over the inferior clergy. The number of the latter in Sweden and Finland is computed at two thousand, which, with the addition of chaplains and curates, may make the whole body of ecclesiastics amount to near four thousand.

For many years the government of Sweden had been that of a limited monarchy, in which however, till lately, the ancient power of the crown was almost totally annihilated by the usurpation of the states. This body is composed of four orders, the nobility, clergy, citizens, and farmers. The first of those have a hereditary right to vote in the diet; and this privilege is likewise granted to the colonel, lieutenant-colonel, major, and one captain of each regiment. They keep their seats according to the antiquity of their family, and not according to their rank or functions. They assemble at Stockholm, or send hither their deputies, and elect their speaker, who has the title of land-marshal, and is entitled to a gratuity of about five thousand pounds at the end of the diet.

The right of creating a nobleman was vested in the crown; but it depended upon the assembly of the nobles to receive the object of royal favour into their body, and permit him to have a seat in their house.

Persons of this order enjoy very great and important immunities; such as being alone entitled to the high offices under the crown, and all the principal posts in the army. They are also exempted from the land and capitation-tax. The citizen is legally capacitated to purchase a nobleman's estate; but since the nobles have been exposed to a diminution of their finances, on account of the subdivision of their estates among their families, they frequently dispense with this privilege. A nobleman's daughter also, by marrying below the rank of nobility, not only enjoys the privilege of nobility herself, but transfers the same right to her husband and children, so far as concerns the possession of their estates.

The order of the clergy is composed of the archbishop of Upsal, who is generally their speaker, the bishop of each diocese, a member from each chapter, with a person elected out of every ten parishes. The number of the whole is about a hundred and seventy. Their expences during the diet are defrayed by a subscription of the clergy; and both they and their children have the privilege of purchasing the estates of noblemen.

The representatives of the citizens are chosen by the magistrates and common-council of each corporation; of which Stockholm sends four, other cities two, and some one; there being some small corporations where two join together to send one representative. This order consists of about a hundred and fifty members. They are maintained during the diet at the expence of their fellow-citizens, and their speaker is generally one of the burgomasters of Stockholm.

No. 21.

Every district sends a member from among the farmers who are in possession of the crown lands, no other having any right to sit in the diet. This order comprises about a hundred and eighty, and their expences are defrayed by their fellow-farmers.

The first meeting of the diet, when it assembles at Stockholm, is in a large room of the castle, called the hall of the kingdom, where the king being seated on a throne, and the senate at some distance, the president of the chancery makes the diet a compliment in the king's name, and then a secretary reads to them his majesty's proposals, acquainting them with the state of affairs since their recess, and the present occasion of their advice and assistance. To this the marshal of the nobility first returns an answer, and kisses the king's hand; after which the same ceremony is performed by each of the other orders.

The states then resolve themselves into different committees, the principal of which is the secret committee, where the journals of the senate and the accounts of the exchequer are revised, and where the foreign, as well as the most secret affairs of the kingdom, are examined. This committee consists of forty members, who are chosen out of the four orders of the states in pleno, as it is termed. The plenum is summoned by the land-marshal on any important emergency. Every resolution must have the sanction at least of three orders before it can be received as a law.

Such was the government of Sweden at the death of the late king, when the states entertained the design of abolishing so far all the essential prerogatives of the sovereign, as to render him little more than the president of the senate; but by a sudden revolution, well planned, and conducted with great dexterity, the present king, in the year 1772, emancipated the crown from the severe restrictions which the usurpation of former diets had imposed upon it; and since this period the Swedish sovereign enjoys almost absolute power.

No certain account is transmitted of the government of Sweden before the thirteenth century, at which time the crown was elective, and its prerogatives greatly limited. The king had not the power to make either peace or war, much less to raise any money or levy any troops without the consent of the states. He was not even permitted to build any new fortifications, nor to give the government of any of the castles but to a native Swede; and he would infallibly be exposed to a general revolt had he attempted to bring any foreign troops into the kingdom. The king was only considered as captain-general of the army during the time of war, and in peace as president of the senate. This body, which was usually composed of twelve of the principal persons in the state, had almost the whole authority. The archbishop of Upsal, primate of Sweden, was always a senator by his episcopal dignity; but the six bishops, though vested with great power, had no right to be senators but by the nomination of the king, or by the choice of the senate during an inter-regnum. The place of senator was not hereditary, but conferred by the crown.

P p p

The

The senate which, by its institution, was only established as the king's privy-council, extended its authority so far as even to scrutinize the conduct of the prince; and the senator assumed the right of advising the sovereign when he exceeded the limits of his power.

The clergy possessed more property than the king and all the other orders of the state together. For besides the lands annexed to the bishopricks, which consisted in large manors and fiefs, they were become masters in their respective dioceses of the succession of all ecclesiasticks who died intestate; and this source, in process of time, had greatly increased their revenue. They also enjoyed the fines and confiscations within their respective dioceses, and had insensibly acquired by foundations and pious legacies many fiefs of the crown. While the revenues of the clergy were thus continually augmenting, they could diminish neither by sales or alienations, both which were expressly forbidden by the laws. Those haughty prelates, proud of their riches and the number of their vassals, became so many petty sovereigns. They fortified their castles, and constantly kept garrisons in them; nor did they ever take any journey without being accompanied by a strong party of armed men, whom they retained in the quality of guards.

The early ages of the Swedish history appear to have been little more than a continued scene of seditions, ravages, and revolts. About the year 1364, the sovereign of the country was Magnus Smeck. This prince had, by the daughter of the count of Namur two sons; the eldest of whom being dead, the inhabitants of Norway elected for their king the second son Haquin, who was married to Margaret, daughter of Valdomar king of Denmark. Magnus being assured of the Norwegians, and fortified by the alliance of the king of Denmark, attempted to abolish the senate of Sweden and render himself absolute master of the kingdom. The people however discovering his design, took up arms, and the country became the theatre of a bloody war. The king of Denmark sent a considerable force to the assistance of his ally, as did likewise the king of Norway; but the Swedes gaining the victory in several battles, drove Magnus out of the kingdom, and elected, in his room, his nephew, prince Albert of Mecklenburg. The new king pursuing the measures of his predecessor, became also in a short time so obnoxious to his subjects, that they made an offer of the crown to Margaret above mentioned, at this time queen both of Denmark and Norway. She readily embraced the proposal, and uniting her troops with those of the Swedes, they expelled Albert the kingdom.

During the reign of this queen, she obtained Henry of Pomerania, grandson of her eldest sister, to be elected successor to the three kingdoms after her demise; and his name was changed to that of Eric. This prince, however, proving no less ambitious than the former kings, soon met with the same fate, and the crown was conferred on Canute son, great marshal of the kingdom. Canute son, at his death, recom-

mended Steno Sture, his nephew, to succeed in quality of administrator of Sweden, fearing to excite the jealousy of the great lords and bishops by a more elevated title. Christian the First of Denmark used every expedient to abolish this dignity, and to obtain the re-establishment of the Union of Calmar, by which it had been ordained that the three crowns of Sweden, Denmark, and Norway, should be enjoyed by the same person. He attempted to effectuate his purpose sometimes by negotiation, and sometimes by force of arms. During four and forty years this prince and his son reigned in Sweden, alternately with the administrators Steno and Suanto Sture; the two former, and the two latter being at the same time masters of different provinces in Sweden, according as their respective parties happened to prevail.

Such was the state of this country, continually rent by foreign and domestic factions, when a great revolution laid the foundation of the Swedish monarchy, through the means of Gustavus Vasa, the first king of the family which now possesses the throne.

This prince was descended from the ancient kings of Sweden, but had been reduced so low that he was obliged to work in the copper mines of Dalicaria for subsistence. In this situation he prevailed with the miners, and the neighbouring peasants, to assist him in an attempt to throw off the Danish yoke, under which the nation then groaned. For this purpose having assembled a considerable force, he surprised several posts that were occupied by the Danes, and drove them entirely out of the kingdom. This event was immediately followed by his election to the vacant crown, which he received at Upsal in the year 1528.

As the bishops and popish clergy had appeared his greatest enemies, he introduced the Lutheran doctrine, and seized the revenues of the church, by appropriating the greater part of which to the service of the state, he was enabled to ease the people of their taxes; an expedient which rendered him very popular. His reign, however, was frequently disturbed by the intrigues of the clergy, as well as the invasions of the Danes, who attempted to recover the kingdom; but proving successful over all his enemies, and marrying the princess Katherine, daughter of Magnus duke of Sax-Lawenburg, his eldest son by this marriage, Eric Augustus, was declared his successor, and the crown made hereditary by the states in 1546. At the same time the catholic religion was abolished by authority; and the sovereigns of Sweden have ever since taken an oath, at their accession, to maintain the doctrines of Luther.

Eric mounted the throne in 1559, and reigned nine years, five of which he kept his brother John in prison, on suspicion of forming a design to supplant him. Though at this time the king's apprehensions seem to have been entirely groundless, they were afterwards realized, but not until by several cruel and dishonourable actions he had lost the favour of his subjects, by whom he was deposed, and condemned to perpetual imprisonment, in which he ended his life.

His

His brother John assuming the reins of government with the consent of the people, endeavoured to restore the Roman Catholic religion, but dying in 1592, he was succeeded by his son Sigmund, then upon the throne of Poland. This prince persisting to violate the laws of the kingdom in several instances, the States, in 1604, conferred the crown on his uncle Charles, in whose family they settled the succession, to the exclusion of the issue of Sigmund.

The new king dying in 1611, he was succeeded by his son, the celebrated Gustavus Adolphus, then only nineteen years of age, but already distinguished by his courage and military talents. This prince finding the kingdom engaged in an unfortunate war with the Danes and Russians, purchased peace of the former, at the price of a million of crowns, and maintained the war against the latter, over whom he proved victorious in several battles, forcing them in the end to cede the territories of Hexholm and Ingermania to the Swedes. The truce which had been made with Poland being expired, he invaded Livonia, and made himself master of the whole province; whence marching into Prussia, he took Elbing, Marienburg, and several other towns, which were confirmed to Sweden by a subsequent treaty.

Gustavus being afterwards induced to carry the war into Germany, his arms were attended in this quarter also with extraordinary success, till he was treacherously killed at the battle of Lutzen, in an engagement with the imperial troops.

By this event the crown descended to his daughter Christina, then only five years of age, in whose favour Gustavus Adolphus had gained the states of the kingdom to alter the act which limited the succession to the male line. During her minority the war in Germany was prosecuted with great advantage to Sweden, which, at the treaty of Munster, obtained the dukedoms of Pomerania, Bremen and Verden, with the city of Wismar, besides the sum of five millions of crowns, and a right of session to vote in the diet of the empire, and circle of Lower Saxony.

When this queen, who was not less distinguished by her rank than her extraordinary talents, arrived at years of reflection, she resolved to quit the crown, and accordingly in 1654, resigned it in favour of her nephew Charles Gustavus, reserving only a portion for the support of her dignity. She afterwards professed herself a Roman Catholic, and retired to a convent in Rome, where she passed the remainder of her life, signalized as much by her virtues as she had formerly been by her excellent conduct in the administration of her kingdom.

The war still continuing between Sweden and Poland, the new king immediately marched into the latter, where his arms at first were accompanied with extraordinary success. In less than three months he not only obliged Casimir, the Polish king, to take refuge in Silesia, but also made himself master of a great part of the kingdom, the subjects of which, in many places, acknowledged him as their sovereign, and took an oath of allegiance. This rapid success however proved of short duration; for marching into

Silesia, not only the Poles revolted, but several of the northern powers united to oppose him. Leaving his brother therefore governor of Prussia, he marched immediately to chastise the Danes, whom he reduced to the necessity of surrendering the provinces of Schoëer, Halland, and Bleaking, with the island of Bornholm. This treaty was concluded at Roschild in the year 1658; but the Danes soon after repenting of the concession they had made, the war broke out again in a few months. In consequence of this rupture, the Swedish king landed an army the following summer in Zealand, where he took the castle of Cronenburg, which commands the entrance of the Sound, and besieged Copenhagen. From the gallant defence of the inhabitants, however, and the assistance which they received from Holland, the siege was turned into a blockade, and continued so for some time; till Charles Gustavus having by his enterprising spirit drawn upon himself the enmity of almost all Europe, was carried off by a fever, and left the crown to his son Charles the Eleventh, then a minor, whose ministers obtained peace from Poland, Muscovy, the emperor, Brandenburg, Holland, and Denmark, upon honourable terms.

On the commencement of the war in 1674, the Swedes broke the alliance into which they had entered a little before with England and Holland, and forming a league with France, invaded Brandenburg. Their forces however were defeated by that elector, who made himself master of most of their territories in Pomerania, while the duke of Zell entered Bremen and Verden, and the Danes recovered several towns in Schonen. But the latter being afterwards defeated in several battles, were compelled to make a separate peace with Sweden at St. Germain. This transaction was succeeded by the treaty of Nimwegen in 1678, by which the Swedes obtained restitution of all the territories that had been taken from them during the war, and Charles married the princess Ulrica Eleanora, sister to the king of Denmark.

The states of Sweden soon after resigned their share in the government entirely into the hands of the king, declaring that he received his crown from God, and was not accountable for his actions to any human power. This unlimited complaisance, so favourable to his ambition, Charles failed not to improve. He therefore resumed all the grants which his predecessors had made of the crown-lands; erecting at the same time a court to enquire into such misdemeanors as had been committed by the great lords, or others of his wealthy subjects, from whom he extorted large fines. He also lowered the coin, and obliged the creditors of government to be content with half the money that was due to them. The king however lived not long to enjoy the fruits of his despotism, but died in the year 1697, in the forty-second year of his age, leaving the crown to his son Charles XII. at that time not more than fifteen years of age.

Soon after the young king's accession, a hostile design was formed against him by three great powers, viz. the king of Denmark, the elector of Saxony, likewise king of Poland, and Peter the czar of Muscovy. Notwithstanding so formidable a confederacy,

this

this martial young prince, who seemed to rival the most celebrated heroes of ancient times, pursued the war with an ardour which never before had been exceeded, till after many astonishing acts of valour, and a variety of fortune, he was, at last killed at the siege of Frederichshal, a Danish city on the frontiers of Norway, in the thirty-sixth year of his age.

By the last will of Charles, the young duke of Holstein was appointed his successor; but the Swedes apprehensive of the calamity in which he might involve the kingdom, by pursuing the measure of their late sovereign, conferred the crown on Ulrica Eleonora, sister to the late king, and who had married the prince of Hesse-Cassel. In the year 1720, this prince was,

with the consent of the queen and the senate, raised to the throne; but the prerogative, which had in the two late reigns been extended to absolute power, was now restrained within such narrow limits, as had never been prescribed even by the ancient constitution of the kingdom.

The queen of Sweden dying without issue in 1744, prince Adolphus Frederick, administrator of Holstein, and bishop of Lubeck, was elected to the throne. From this period the Swedish sovereigns enjoyed only a nominal power, till the present king, as has been already observed, produced a revolution in favour of the royal authority.

## D E N M A R K.

### C H A P. I.

#### *Of its situation and provinces.*

**DENMARK** is situate between 8 and 13 degrees of east longitude, and between 54 and 58 degrees of north latitude. It is bounded on the north by the sea called the Categate or Schaggerach, which separates it from Norway; on the east by the same sea, and the straits called the Sound, which divide it from Sweden; on the south by the Baltic sea and part of Germany; and on the west by the German ocean. What is now properly called Denmark consists of the peninsula of Jutland, with the islands of Zealand and Funen, and the smaller islands adjacent.

This kingdom consists of several islands, as well as part of the continent of Europe. The principal of those is Zealand, situated between Sweden on the east, and the island of Funen on the west, being about two hundred miles in circumference. The metropolis of this island, and of the Danish dominions, is Copenhagen, situate in 13 degrees 2 minutes of east longitude, and in 55 degrees 51 minutes of north latitude, on the eastern shore of the island, upon the borders of the Sound. Its harbour, which is capacious and safe, is regularly fortified, and the mouth of it so strait, that two ships cannot enter it at the same time. The city is about five miles in circumference, and stands in the middle of a bog, on which account it can be approached on the land side only in the time of a hard frost. It is ornamented with several grand edifices, particularly the royal palace, which is one of the most elegant in the northern parts of Europe. Another of the most remarkable objects is the round tower, built by Christian IV. under whom flourished the celebrated astronomer Tycho Brahe, who designed it for an observatory. The ascent is by a spiral road, without steps, near fourteen foot broad from the bottom to the summit.

Some leagues towards the north, the little arm of the sea which washes the walls of Copenhagen, and is here about three leagues over, is gradually contracted by Zealand, and the territories of Sweden, till it forms what is called the passage of the Sound.

Elsenor is a small town, situated upon the border of this canal, and defended by the castle of Cronenburg; before which all the trading ships that pass this way must lower their sails, and pay a tribute to the crown of Denmark, in proportion to the value of their cargoes. The passage here is not quite a league over.

Fredericburg is situated in the north part of the island, and is the seat of a royal palace.

Zealand, though in general a sandy soil, is rather fertile in grain and pasturage, and is agreeably diversified with woods and lakes.

The second of the Danish islands, considered with respect to extent, but the first for the goodness of the soil, is Fioni. It is higher ground than Zealand, from which it is separated by an arm of the sea, commonly called the Great Belt; another arm, named the Little Belt, dividing it from Jutland on the opposite side. All sorts of grain and common fruits grow in this island in great plenty, and it likewise affords excellent pasture. The capital is the town of Odensee, situated in the middle of the island, eighty miles west of Copenhagen.

The islands of Laland and Falster, though much inferior in extent, are not less fertile than Fioni. Both those islands are remarkable for the fine wheat which they produce; and the latter also abounds in fruit.

In the neighbourhood of those two islands, are several others of small extent, which however are fertile, and support a considerable number of inhabitants.

One of the largest and most fertile of the provinces of this kingdom is Jutland, forming the head of that long

long peninsula which is bounded on the west by the ocean; on the north and east by the gulph called the Categate; and on the south by Holstein, and part of the Baltic sea. This province is rich in grain and pasturage, not only supplying Norway, but affording numerous herds of small cattle, which are transported into Holstein, to be fed for the use of Hamburg, Lubeck, and Amsterdam.

Norway, which at present is united to the crown of Denmark, is situate between 4 and 30 degrees of east longitude, and between 58 and 72 degrees of north latitude; bounded on the west and north by the Atlantic Ocean; on the east by the territories of Sweden; and on the south by the Categate, or Schaggerac, which separates it from Denmark. The interior parts of this extensive country are full of rocky mountains, which afford nothing but wood; but on the sea-coasts there are considerable tracts of fertile ground that produce grain and herbage. Even the mountainous parts of this province are valuable, on account of the vast quantities of fine oak and fir timber which they produce, besides tar, pitch, turpentine, with mines of iron, copper, and silver. On the west coast there is a great cod and herring fishery, which not only supplies the inhabitants of the country, but furnishes a great store for exportation. The chief towns are, Wardhuys, where the Danes have a small fortress and garrison; Dronheim, situated on a bay of the North sea, in 64 degrees of latitude, where is a commodious harbour, and a brisk trade; Bergen, lying on the same sea, in 60 degrees of latitude, the most trading town in Norway. Besides these are the towns of Christians, Ansl. Fredericstadt, and Fredericshal, at the latter of which Charles XII. of Sweden was killed in 1718.

The duchy of Holstein, now united to Denmark, forms a considerable part of the dominions and riches of the crown. This province is bordered on the west by the ocean and the Elbe; on the north by Jutland; on the east by the Baltic sea; and on the south by part of the territories which belong to the electorate of Hanover. It is a populous and fertile country, and furnishes more excellent fat cattle, and other provisions, in proportion to its extent, than perhaps any other province in Europe. Here are many rich towns, and commodious ports, particularly on the Elbe and the Baltic.

The climate of Holstein is temperate and agreeable, but in all the northern provinces of Denmark the winters are extremely severe, and the air thick and foggy, occasioned by the numerous lakes, and the seas with which almost each of them is surrounded.

Under the dominions of Denmark, may be included Iceland, an island situated between 10 and 26 degrees of west longitude, and between 63 and 68 degrees of north latitude; being almost four hundred miles long, and two hundred broad. Notwithstanding this great extent, it is computed that the inhabitants at present do not exceed a hundred thousand, though they appear to have been more numerous before they were visited by the disease called the black plague, which greatly ravaged the northern countries in the fourteenth cen-

tu. y. There is not any town in the island; but the inhabitants are dispersed along the sea-coasts within forty miles from the shore. The soil in those parts is tolerably good for pasture, enabling the inhabitants to export a considerable quantity of salted provisions, particularly beef and mutton, which, with fish, oil, &c. they exchange for grain and other necessaries.

The inhabitants of Iceland are generally tall and well made, but the features, especially of the men, are said to be not agreeable. The common covering of both sexes is the skin of the sea-calf with the hair turned outward, and for linen they use coarse packing-cloth. Their food consists chiefly of a sort of stock-fish, with very bad butter and cheese; and their drink is water, milk, or whey. They lie under the same roofs with their cattle, in caverns hewn under the rocks, or in cottages built either with wood or fish-bones, and covered with turf. The whole family lie in their cloaths upon a common bed of hay, and cover themselves with an additional quantity of skins. Notwithstanding the coarseness of their diet, and the extreme cold of the climate, they usually live to a great age.

The cattle which happen to die by chance in the field, or to be smothered in the snow, are held in great esteem, and considered in some degree even as sacred. If any of the inhabitants procure wine or strong liquors, they invite all their friends to partake of them, and the company never stir till the whole is consumed. During the entertainment, they enliven each other with rude songs, setting forth the achievements of their ancestors; never rising from the table, even to make water, which they would reckon a breach of good manners; but a utensil for this purpose is handed round the company by some of the young women who are constantly in waiting at those cauals. They are great players at chess, inasmuch that every peasant is an adept at the game; and in the workmanship of the tables, as well as of the rooks, bishops, &c. they are said to be very dexterous.

When the young girls have attained a proper age, they are prostituted by their parents for the most trifling consideration, to such strangers as happen to come among them. If any offspring should be the consequence of such an amour, the young woman is henceforth held in great esteem, and the child is received by the person whom she marries, as a valuable part of her dowery.

This country is well watered, but many of the springs are unwholesome; some of them being also intensely cold, and others strongly impregnated with sulphur, in which the island remarkably abounds.

Near the east side of Iceland is the mountain of Hecla, a volcano, from which great eruptions often happen. The inhabitants believe this mountain to be the receptacle of the damned, who they suppose are alternately tortured with heat and cold, between the flames of Hecla, and the floas of ice near the adjacent shore. The latter being driven violently against the rocks, by the winds, produce a howling noise, which is considerably augmented by the many echoes of the neighbouring caverns; and this dismal

found the natives imagine to proceed from the lamentations of departed souls.

The ancient inhabitants of this country were pagans, and offered to their gods human sacrifices; but the established religion at present is Lutheranism, which appears to have been introduced towards the end of the tenth century, about which time Iceland fell under the dominion of the Danish crown.

#### C H A P. II.

##### *Of the Danes.*

THE natives of Denmark are generally personable and strong built, but clumsy; they have for the most part fair complexions, but their features are rather disagreeable. The enterprising spirit which actuated their ancestors, seems now to be entirely extinguished, the character of the modern Danes being a disposition to indolence and pusillanimity, accompanied, however, with an extreme attachment to parade, and frivolous distinctions. Their chief pleasures are drinking and smoking tobacco, the latter of which may prove useful in counteracting the noxious effects of their cold and moist atmosphere. They are remarkably dirty in their persons and houses. It is common for a merchant who would appear decent in public, to put clean sleeves and collars over those of a shirt which they have wore for two or three weeks.

The number of nobility that have privileged fiefs in the kingdom, is very small, and the ranks are only those of count and baron. Of the former there are in Denmark but fourteen, besides two in Norway; and of the latter, fifteen. The body of titular nobility, however, is extremely numerous. For the sons of counts are all barons; and there are other families which have the title of count as a personal dignity, independent of the land, and which is also transmitted indifferently to all their male offspring.

Neither the food of the Danes, nor their manner of dressing it, deserves much to be admired. Their butcher's meat is lean, and their tame fowls bad; but the bacon and fresh-water fish are of superior quality. They drink chiefly Rhenish wine or brandy. Before the meat is laid upon the table, the guests are always presented with a glass of the latter, which it would be considered as extremely rude to refuse. During the entertainment, whenever the master of the house drinks a glass of wine, every person at the table must do the same. After meals, their discourse consists chiefly of double entendres, or downright obscenity, in which the ladies never scruple to bear a share, nor decline calling every thing by its proper name. Their principal diversion is hunting, and in the winter riding on sledges. Besides this vehicle, which is likewise often used for performing a journey, they travel either in waggons or on horseback. If a gentleman obtains a warrant from court for horses or carriages, the farmers in every province are obliged to supply him with them. On most of the roads there are tolerable inns, but hardly, any except a person of distinction, is favoured

with a room to himself, the rest being accommodated with little cabins, ranged round a great apartment, as in Holland. Their beds however are generally good, and their linen clean.

The insular situation of the Danish provinces, with the materials which they afford for ship-building, the expertness of their seamen, and the number of excellent harbours, joined to the several kinds of produce which the country supplies for exportation, might render this kingdom extremely commercial and flourishing; but her trade is so discouraged by the despotism of the government, and the corruption of the ministers, that Denmark is at present one of the most indigent and distressed states in Europe. Nor will this appear surprising, when the constitution of the country is considered. The farmers here are so much oppressed by the landed interest, that they are almost in a state of servitude; and such is the corruption which prevails in the courts of justice, that they can expect no redress by appealing to the laws of the kingdom. For should the grievance sustained by the plaintiff be so evident, that the judges could have no pretence to decide against him, it is easy for the wealthier party to obtain either an order from the king to stop the judicial process, or a dispensation from observing particular laws.

The kingdom of Norway is at present in a better situation than that of Denmark. The number of nobility is but small, and even those have very little authority over their farmers, who are now become proprietors of their farms, by paying only a small rent to their landlords. The farm descends from the father to the eldest son, without being divided; but the heir is obliged to pay a yearly stipend to each of his brothers and sisters.

In all the great towns in Denmark and Norway, there is a number of men chosen by the magistrates from among the citizens, to watch over the education of children, and inspect the conduct of guardians.

Every wholesale merchant here is obliged by the laws to regulate his accounts with his creditors at least every two years; and every retail merchant is obliged to do the same every year; under the penalty of being debarred from bringing any action for their debts.

According to a late regulation, when bastards are acknowledged by their respective fathers in a court of law, they are entitled to half the portion of the legitimate children.

The trade which the Danes carry on in the East Indies is greatly against them, as they pay for all their imports in specie, not having any produce, or manufactured goods, fit for those markets. Their small islands in the West Indies, on the contrary, have been advantageous to the state, and are now in a very flourishing condition. Those supply them with sugar, coffee, and cocoa, for their own consumption, and a small surplus which they send to Sweden. Norway furnishes them with wood, tar, pitch, fish, and iron, with some silver; and Iceland with fish-oil, and dried fish, which they export to Germany, France, Great Britain, Ireland, and all the southern parts of Europe. Their commerce with France, Spain, Portugal, and

the

the Mediterranean states, is also against them; the former taking no great quantity of their materials for ship-building, but supplying them with wines, spirituous liquors, fruits, silk, salt, and a great variety of manufactured goods. In return for their fish and oil, Germany furnishes them with different sorts of linens, grain, and some common woollen stuffs. But Britain and Holland, by taking the greater part of the productions of Norway for ship-building, and the latter the provisions of Holstein, supply them with specie, without which they must be reduced to great distress. The great number of foreign ships which pass through the Sound, make Elsinore a kind of market for all the manufactured goods in Europe.

Various regulations and companies have been established at Copenhagen for promoting the manufactures and commerce of the kingdom, such as the Insurance Company, the Iceland Company, the Bank, the African Company, and the General Company, which was instituted with the view of rendering that city the magazine for all the Baltic sea. But from the smallness of the capitals employed in those undertakings, with the despotism of the government, joined to the corruption and bad conduct of the ministers, those several commercial companies are at present at the lowest ebb.

The revenues of the king of Denmark arise partly from the crown-lands, and partly from taxes. All who cultivate the land, if they are not particularly privileged, are subject to a variety of imposts, which tends greatly to the discouragement of agriculture; and all others pay a capitation-tax. On this account, the king's officers, and those who live upon privileged manors, or such as are exempted from the taxes on husbandry, pay eight shillings English each person, besides so much for their wives and children, and four shillings a year for every stable where horses are kept. Clergymen pay for their wives and children at the rate of five shillings and six pence a year each person, and four shillings for their horses, but are themselves exempted from this tax, in consideration of their making out an exact list annually of all that are taxable in their respective parishes. The day-labourers pay four shillings every year, and their wives two shillings. Tradesmen who work in the country, and only make such utensils as are necessary for farming, are exempt from this tax; but those who follow other trades pay for themselves eight shillings each, with as much for their wives, and for every person in their family; so that a poor tradesman or manufacturer pays as much to the capitation-tax, as the first of the nobility.

Another principal branch of the Danish revenue is the duty laid upon all goods that are either exported or imported into the kingdom. In general the duties upon the importation of merchandize are about ten per cent, but some not quite so high, and others higher. All such articles as are used in the manufactures are exempted from this tax; but the merchants are obliged to leave them at the custom-house, or in the king's warehouses, till they are bought up by the manufacturers, by which the former are subject

to great inconveniences, and often to losses. Such foreign merchandize, however, as is brought into the kingdom in Danish vessels, pays a much less duty than that which is imported by foreign ships. This tax is farmed in every part of the Danish dominions, except at Copenhagen, and the contract is renewed every three years.

A third considerable branch of the revenue is the excise, which is laid, as in Holland, upon every necessary of life. This oppressive tax is likewise farmed. Though the grain has before paid a tax in the country, it is liable to another at the mill.

But the most oppressive tax, as well as the most impolitic, is that which is laid upon marriages, especially as the inhabitants of the kingdom are not very numerous. Every person who holds any employment, or who bears any title that gives him a rank in the state, pays for a marriage licence ten pounds sterling. Those of the nobility who have no employment pay four pounds; the clergy, the citizens, the stewards of the nobility, and the free farmers, sixteen shillings; journeymen who work at trades, eight shillings; and the servants and day-labourers in the towns, four shillings.

Another heavy charge laid upon the inhabitants of the towns, is that which they pay to be exempt from the quartering of soldiers. This tax is laid upon all the houses in proportion to their size and situation, and is regulated by the magistrates, in conjunction with some of the principal citizens.

Besides the taxes paid by the inhabitants of towns for the support of government, they are subject to others imposed for the benefit of the town. One of these is a ground-rent, which every house pays in proportion to its extent, and the other is a kind of capitation-tax; both which are regulated by a certain number of principal citizens.

There is also a heavy tax upon all the stamped paper which is used in this kingdom. Bonds, and other obligations, for the sum of twenty pounds sterling, may be written upon a stamped paper of two shillings English in value; from twenty to a hundred and sixty pounds, the paper is four shillings; from two hundred to eight hundred pounds, it is twelve shillings; from that to a thousand pounds, it is rated at the value of three pounds four shillings; when from one thousand eight hundred to two thousand pounds, the obligation is written upon paper which costs eight pounds sterling; and for more than the last mentioned sum, the paper pays a tax of ten pounds sterling.

All kinds of receipts must likewise be written upon stamped paper; the smallest stamp for this purpose being of the value of two pence English, and that of the highest, two pounds eight shillings.

Every foreign ship which passes the Sound, pays a duty in proportion to her size and the value of her cargo; and it is computed that this tax, at an average, amounts to about sixty-five thousand pounds a year.

In Norway, the revenue arises from the tithes of timber, tar, fish, and oil, with a duty upon mines, exclusive of the taxes usual in Denmark, to which the inhabitants of this country are also subject.

The

The whole revenues of Denmark, at present, are valued at about six millions of rik-dollars, or one million two hundred thousand pounds sterling.

The Danish army is composed of regular troops and militia; the former consisting of eleven regiments of dragoons, and sixteen regiments of infantry. Every regiment, when completed, has two battalions, each containing six companies of a hundred men. There are also three regiments employed in the service of the artillery; one of which is stationed in Denmark, another in Norway, and the third in Hülstein. Since the last reduction of the regular troops in this kingdom, the horse and dragoons amount to about ten thousand men; and the infantry, including the artillery, to about thirty thousand.

Every person in the kingdom who possesses three hundred and sixty acres of land, is obliged to furnish one man for the militia, and pay the expence of a man for the corps de reserve. The national troops are formed out of this militia, and are clothed in uniforms; but the corps de reserve is not, nor is it ever called out but in a great emergency. Four regiments of militia are raised in Denmark, each regiment containing twelve companies of one hundred and fifty men, exclusive of officers.

In the duchies of Holstein and Sleswic, the county of Rantzau, and the lordship of Pinneberg, the militia consists of one thousand eight hundred and thirty-two men, formed into two regiments; no regulation being yet established in that part of the great duchy of Holstein which was lately ceded to Denmark, in exchange for the counties of Oldenburg and Delmonhorst.

The greater part of the Danish troops is furnished by Norway, the militia of this country consisting of thirteen regiments, each of which contains twelve companies of a hundred men, and four companies of Landvorn of a hundred and fifty men each, besides officers. Here are likewise eight companies of light troops, called in their language Skielobere, which by their activity in running over the mountains, and ice, have been extremely useful in the country.

The pay of the captains, both in the horse and foot, amounts to no more than five pounds a month each, and that of the other officers and private men in proportion. The captains, however, are generally permitted to dispense with the service of a certain number of soldiers, who are for the most part artisans, so that they may work at their respective trades, while their pay is partly enjoyed by the captains, and partly allotted for the expence of recruits; the king allowing for this article no more than fifty-two pounds a year in the cavalry, and thirty pounds in the infantry.

The Danish fleet is composed of thirty ships of the line, and fifteen or sixteen frigates; but many of the ships being old, and wanting great repairs, the most that they can furnish, fit for service upon any emergency, is twenty ships. This fleet is usually stationed at Copenhagen, where are the dock-yards, store-houses, and all the materials necessary for the marine. This harbour is defended by two or three batteries of cannon, and by the difficulty which there is to enter it

without the assistance of good pilots; but by a squadron well acquainted with the coasts and the soundings, Copenhagen might be bombarded by sea, and all the dock-yards destroyed.

The seamen destined for the service of the fleet consist of two classes. The first is composed of those who are bred up in the merchant service, or who apply themselves to fishing, amounting sometimes to thirty thousand. They cannot quit the kingdom without a permission from their superior, and are obliged to present themselves when required. They receive according to their abilities from six to twelve shillings sterling every year to pay their excise; and such of them as live in the country villages are exempted from the capitation-tax.

The second class is composed of four divisions, each consisting of a chief, and ten companies of a hundred and eighteen men. This body, which is recruited out of the former, is in constant pay, and is always ready not only to man the ships of war, but likewise to furnish workmen for the dock-yards, they all being taught the art of ship-building. When they are at land, they receive about nine shillings sterling every month, and as much provisions as will supply their families, if not very numerous. Many of them are likewise furnished with lodgings at the king's expence. When at sea, they are paid according to their capacity, some receiving twenty, some twelve, and others only ten shillings a month.

The captains of the men of war have a fixed salary of sixty pounds a year, and the privilege of dispensing with the service of ten men in every company, whose wages they receive for their own use. They are, however, obliged to defray the expence of bringing recruits from the different parts of the kingdom, his Danish majesty allowing only forty pounds a year for this purpose. The captain of every ship, when at sea, has also a certain sum for his table, to which he is obliged to admit all the officers under his command. The pay of the lieutenants is in proportion; and all the officers of both classes enjoy the same respective salaries in peace and war.

For the last hundred and eighteen years Denmark has been an absolute monarchy. The king is the only interpreter of his laws, supreme judge and president of the high court of justice, when he pleases to sit there; and whether present or absent, the advocates always address themselves to the throne.

The established religion in Denmark is that of the Lutheran church. The revenues of the ecclesiasticks are proportioned to their rank, each having a decent maintenance, but no superfluity. The widows of all the parochial clergy are authorized by the law to receive one eighth part of the stipend which their husbands enjoyed. Besides, in every diocese, the clergy have a fund for the benefit of the widows, who receive thence a year's revenue, proportionable to the sums that had been paid into the fund by their husbands. The lands of every person convicted of becoming a papist are forfeited to the next heir, and the apostate is banished the Danish territories. All Jews are forbid to enter the kingdom without the royal licence; and

whoever discovers such an offender is entitled to a reward of fifty crowns.

The only university of the kingdom is that of Copenhagen. Here are several hundred students, who are maintained upon an establishment made by the former kings, at a time when all the necessaries of life were very cheap; but these being much increased of late years, the fund is so inadequate to the design, that the students live in great misery; nor is any class of the people held in so much contempt.

Besides these there is a great variety of copper coins of small value.

The Danes are one of those nations which, under the names of Teutones and Cimbri, invaded the Roman empire a hundred years before the Christian epoch; the ancient Cimbrria appearing to have comprehended Jutland, Sleswic, Hulslein, and some parts of Lower Germany. Schiold, the first king of Denmark, is said to have lived about sixty years before the above-mentioned period. According to the Danish chronicles, he was succeeded by eighteen kings, to the time of Regner, surnamed Logbrag, whose accession is placed in the year 750. In the ninth century the Danes became exceeding formidable, and not only committed great depredations on the coasts of England and Scot-

land for many years, but actually established their sovereigns on the throne of the former kingdom, of which they maintained possession upwards of twenty years.

On the death of Olaus, without issue, in 1387, queen Margaret, his mother, was elected queen of Denmark and Norway, who having associated in the government her nephew Erick, subdued the kingdom of Sweden; and it was enacted by the states, that those three kingdoms should be united for the future under one prince. On the death of Margaret, Erick became sovereign of the whole; but being deposed, on pretence of mal-administration, he retired into Pomerania, where he died.

For more than a hundred years from this epoch no king of Denmark ever left any male heirs, but the three crowns of Denmark, Norway, and Sweden, were jointly conferred on the same person by the states of the respective kingdoms, till the year 1439, when Christian, earl of Oldenburg, being elected to the sovereignty of the Danish dominions, the Swedes refused to concur in the nomination, and renouncing the union of Calmar, which had been observed from the time of queen Margaret, elected a king to themselves. From this period the Danish and Swedish crowns have ever been detached from each other; and thenceforth, likewise, the senate of Denmark arrogated to themselves the right of disposing of the sovereignty of the nation, the states being only now and then consulted out of form. The power of this oppressive aristocracy continued till the year 1660, when it was abolished by Frederick the Third, who changed the constitution of the government from a limited and elective to an absolute monarchy, and established the succession in his own descendants, by whom it has ever since been maintained.

*Of the situation—rivers—dykes—air—province of Holland—chief towns.*

THE Netherlands, or Low Countries, so denominated from their low situation at the mouths of several great rivers, viz. the Rhine, the Maese, the Scheld, &c. are situate between 2 and 7 degrees of east longitude, and between 50 and 53 degrees 30 minutes of north latitude. They are bounded on the north by the German sea, on the east by Germany, on the south by the territories of France, and on the west by part of France and the British seas; extending in length from north to south about three hundred miles, and in breadth two hundred. They

No. 21.

anciently formed part of Gallia Belgica, and were afterwards comprehend in the circle of Burgundy. At present they consist of seventeen provinces; of which the seven northern revolting from the Spaniards, and entering into a treaty of union for their mutual defence, obtained the name of the United Provinces. The greater part of the other ten being subject to the house of Austria, is called the Austrian Netherlands.

The seven United Provinces are situate between 3 and 7 degrees of east longitude, and between 51 and 54 degrees of north latitude; bounded on the west and north by the British and German seas, on the east by Westphalia, and on the south by the Austrian Netherlands. They contain the following provinces, viz. Holland Proper, Zealand, Friesland, Groningen, Overijssel, Guelderland, and Utrecht; which, from the

R r r

chief

chief province, are usually comprehended under the general denomination of Holland.

This country is perfectly flat, without the intervention of a single hill, but abounds in bogs and morasses. It is divided almost into two parts by the Zuider Sea, a large shallow bay; and the Dollart Bay separates Groningen from East Friesland. In Holland and West Friesland there are several lakes, of which Haerlem Meer is the chief. One half of the country may be called a lake in the winter, on account of the annual inundation, but in summer it affords rich pastures.

The principal rivers are, 1. the Rhine, which on its entrance into this country divides into three branches, called the Waal, the Lech, and the Yssel. The two former run westward, and, uniting their waters with the Maese, discharge themselves into the German or British seas; while the latter running northward, falls into the Zuider Sea. 2. The Scheld; entering the country below Antwerp, divides it into two branches, one running north, called the Oosterscheld, and the other due west, named the Westerscheld; both which fall into the same sea with the Rhine. 3. The Vecht runs from east to west through the province of Overijssel, and falls into the Zuider Sea. 4. The Eems rises in the province of Utrecht, and running north by Amersfort, discharges itself into the Zuider Sea. 5. The Hunse has its source in the province of Overijssel, and running north falls into a bay of the sea between Friesland and Groningen.

It is conjectured by some that great part of the United Provinces has been gained out of the sea, by casting up banks and draining them; while others are of opinion that much of them has been lost by inundations of the sea and tempestuous weather. Both of those opinions may be well founded, in respect to different places. For in many parts, the seas and rivers appear to be above the land at high water, and are kept out only by prodigious banks of earth, called dykes; nor are instances wanting, where large tracts of land have been laid irretrievably under water. The tops of steeples, and other high buildings, where towns and villages formerly stood, have been seen near the coast at low water. As the Zuider Sea has never been mentioned by any Roman writer, Sir William Temple conjectures, with probability, that it has been formed by some great inundation breaking in between the Texel, and other islands which lie near in a line, and seem to be the shattered remainders of a continued coast. This opinion, he thinks, is confirmed from the shallowness of the sea, and the flatness of the sands along its whole extent.

The Zuider Sea is enclosed almost on every side. On the north, it has the islands of Schelling, Ameland, &c. on the east the provinces of Friesland and Groningen; on the south, Utrecht and part of Holland; and on the west, another part of Holland, with the islands of the Texel and the Ulic; being about seventy miles in length, and half as much in breadth, exceeding shallow, and full of sands. The entrance of it at the Texel, and the passage over it, are reputed extremely dangerous to navigators. Here the violence

of the waves is such, that when the wind blows a storm at north-west, if it happens to be a spring-tide, the strongest dykes sometimes give way, and threaten destruction to all the maritime provinces.

The dykes are generally seventeen ells thick at bottom, and seven ells high, fortified to the landward in the strongest manner with wood and stone; and towards the water, covered with mats, rushes, and sea-weed, and sometimes with sail-cloth. Notwithstanding these bulwarks, in the year 1530, the sea broke in and overflowed great part of Zealand; and in 1568, it rose to that height, that it covered some of the islands of Zealand, and laid under water great part of the coast of Holland, and almost all Friesland, swallowing up seventy-two villages, and destroying twenty thousand people in Friesland only. Another inundation happened in 1655, and a much greater in 1665, when the sea broke in with such violence between the Texel and the Helder, that it carried away part of the village of Haydunem, laid all the country under water between Wiring and Zyp, broke the dyke of Hern at two places, and came up to the gates of Medenblick, overwhelming many villages, and turning a considerable tract of land into a continued sea, by which numbers of people and cattle were destroyed. The dyke of Maydenburgh was also broken down, and all the country round Naerden, Myden, and Wesop, as far as Loren in Goyland, and Balicorn in the province of Utrecht, was laid under water. The gates and fortifications of Naerden were destroyed; and the strong rampart of stone, called the ass's back, swept away from the foundation, leaving a hole where it stood, thirty-six foot deep. In Amsterdam the Newen dyke, with the street upon it, and the adjoining marketplace, was overflowed. The dyke betwixt Amsterdam and Haerlem broke in the middle thirty or forty rods, and a great part of Waterland was entirely swallowed up. Other inundations happened in the years 1682 and 1717, which are said to have done as much damage as those above mentioned.

The banks of the river are also broken down sometimes by shoals of ice and land-floods; as happened in 1638, when the Ise dyke near Utrecht giving way, most part of Holland was laid under water.

The method of removing the inundation on those occasions is by wind-mills, of which there are great numbers, for the purpose of carrying off the winters rains and melted snow, which in the spring overflow the country; at which time it appears like a sea, intersected by the towns and villages built upon the rising grounds, and which are like so many islands.

Though Holland be so much celebrated for its commerce and the number of its shipping, there is hardly a good harbour on the coast. The best are those of Flushing, Helvoetsluis, and Rotterdam. With respect to Amsterdam, there cannot be a more incommo- dious haven, being seated in so shallow a water that ordinary ships cannot come near it unless in high tides, nor vessels of burden without unloading.

The country is intersected with numerous canals, which lead to every town and village, and almost to every farm house.

The air of Holland could not fail of being extremely unwholesome, were it not purified by the sharpness of the frosts, which visit them with every east wind for about four months in the year, and are much more severe than in Britain. In winter, their harbours are frequently shut up two or three months together by the ice, especially those in the Zuider Sea. The spring is much shorter and less agreeable in the United Provinces than in England, and some part of the summer far more hot; nor is it uncommon for great heat and cold to succeed each other without any intermediate temperature. There is so much moisture in the air that it causes metals to rust, and wood to mould faster than in other places. It has probably been to obviate this disposition of the atmosphere, that the inhabitants were first induced to maintain that cleanliness so remarkable in their houses and streets, without which they must have been greatly exposed to infectious disorders; and with all their precaution they hardly escape three summers successively being seized with diseases of this kind. In the neighbourhood of the sea, they not only have unwholesome weather in spring and autumn, but the cold winds blast most of the fruit; and in the latter of those seasons, great part of the unripe fruit is blown down by furious storms.

The endemic diseases of the country are chiefly the gout and scurvy; but in hot summers they are visited by malignant fevers, especially at Amsterdam and Leyden. The people seldom live to a great age, both men and women beginning to decay very early, particularly at the former of those places. It is remarked by sir William Temple as something extraordinary, that he had seen at the Hague, which is the best air in Holland, two men above seventy. Perhaps this may proceed from their diet and want of exercise, as much as from the badness of the air. For their usual food is dried and salted flesh and fish; and brandy and Geneva are very commonly drank. They have hardly any idea of rural sports, and seldom travel about business either on horseback or a-foot, but are drawn along in a covered boat upon a smooth canal, by a horse, a method of conveyance little calculated to afford the smallest motion to the body.

The province of Holland is bounded on the west and north by the German sea; on the east by the Zuider Sea, which separates it from West Friesland, Overysel, and Guelderland; and on the south by Zeeland and Utrecht; being about a hundred miles in length from north to south, and near thirty in breadth. In point of strength and riches it is equal to the six other United Provinces, though it has hardly any staple commodities or produce of its own, except some rich pastures which furnish them with plenty of butter and cheese; and their seas and rivers which supply them with fish.

The capital of this province, and of the whole United States, is Amsterdam, situate in 4 degrees 30 minutes of east longitude, and in 52 degrees 25 minutes of north latitude. It lies in the form of a crescent on the river Amstel, and an arm of the sea called the Wye, a little to the eastward of the Zuider Sea. This

is justly reckoned the greatest port in the world, notwithstanding the access be so difficult, that it is hardly possible for a loaded ship, or man of war, to enter the harbour. The foundations of the city are laid upon several thousand vast piles, driven down with infinite labour and prodigious expence. A strong wall with bastions and out-works, defend it on the land-side, and the Wye secures it towards the sea. The principal streets are of great breadth, having canals planted with trees running through them; but the rest are too narrow. They are so careful of the pavement, that all goods and merchandize are drawn upon sledges, and no other wheel-carriages are suffered but gentlemen's coaches, who pay a tax for this privilege. Hired coaches are set on sledges, and drawn by one horse.

There are various accounts of the dimensions of this city, and the number of inhabitants, but according to the most general computation, it is one third as large as London, and contains between three and four hundred thousand inhabitants. The private houses are well built of brick, but their beauty is diminished by their benching in according to the height of the stories, which was done with a view of lessening the weight, as they are founded on a morass. Their churches are handsome buildings, but not comparable to those in popish countries; neither are they built in the same form, with isles, chancels, and steeples, or situate east and west as with us, but constructed upon various plans, as convenience may require, or the taste of the architect direct; except some old churches which were formerly built by the papists. No churches, chapels, or oratories however are allowed bells, except those of the Calvinists.

The chief buildings in Amsterdam next to their churches are, the stad-house, the exchange, the India-house, and their great bridge.

The exchange is two hundred and fifty foot long, two hundred and thirty-two broad, and a hundred and sixteen foot in height. Over the middle of the building is a lofty cupola. In this building are held the courts of justice; and here are the apartments of most of the officers of state. The vast treasures of the republic are also lodged here in the bank, which is supposed to be the richest in the world, and is guarded every night by a body of the burghers, whom they consider as more interested in its safety than mercenary soldiers. The whole building excites the idea of great solidity and strength, but is destitute of that elegance and symmetry which we might expect to find in the principal edifice of so flourishing a city and nation.

The place which contains this great treasure is a vault under the stad-house, strongly fortified with iron bars, and all the apparatus of security. Here is certainly the appearance of immense riches, in bars of gold and silver, besides plate and innumerable bags, supposed to contain those precious metals. In fact there ought to be in this bank all the treasure which it has received since its institution, as it gives out nothing but its credit. This however is a point that has lately been much disputed; and many affirm, though it does not pay

pay in specie, but only by a transfer of credit upon its books, orders drawn upon it, that great sums of money are thence taken out for other purposes.

The security of this bank rests not only upon the treasure it contains, which upon a moderate computation amounts to sixteen or eighteen millions sterling, but upon the credit of the whole city of Amsterdam, the inhabitants of which are bound to make good all the monies that are paid into it. This system of treasure is properly a general deposit, where every man lodges his money, because he considers it as more safe than if it lay in his own coffers: and so far is the bank from paying any interest for the cash deposited, that the owner, if he does not choose to have his name entered upon the bank books so, so much credit, may receive again the identical bags which he delivered, on paying a certain consideration in proportion to the time during which they had lain in safety. But when a person chooses to have his name entered for so much credit, the bank money is worth more in payment than the current coin of the state, it generally bearing a premium of four or five per cent.

The large sums lent to the Dutch government are entirely independent of the bank, the revenues of the respective provinces being mortgaged as a security for the payment of such sums, for which the provinces give bond.

The East India house is another magnificent structure, divided into a great number of apartments and warehouses, where the fine spices are deposited in great quantities. The admiralty and arsenal, or magazine of arms and warlike stores, are also justly admired; as is likewise the bridge over the Amstel, which is six hundred and sixty foot long, and seventy broad.

The city of Haerlem is situate four miles east of the sea, and ten miles west of Amsterdam, with which it has a communication by a canal. This city is surrounded only by a slight wall. The principal building is the great church, formerly the cathedral, the largest and most elegant church in Holland. Here are considerable manufactures of silk and velvet; but the place is most remarkable for that of linen, called Holland, or rather for their bleaching and whitening of it, a great part of this linen being wove in Germany.

Leyden, the Lugdunum Batavorum of the ancients, is situate four miles east of the sea, and eighteen south of Amsterdam, with which it also has a communication by a navigable canal. It is esteemed one of the neatest and pleasantest towns in Holland, but one of the most unhealthful, on account of the marshes and stagnant waters in the neighbourhood. This place is much better fortified than Haerlem; but what renders it most secure, is the power of overflowing the country on any hostile attack. The canals of this city are so numerous, that no less than thirty islands are formed by them; and over the canals are laid thirty-five bridges. Here is the most considerable university in the United Provinces, founded by the states in 1575. The schools are in a large building, three stories high, in the uppermost of which were Elzivir's printing rooms. There are only two colleges for the students,

who wear no distinguishing habits, nor are obliged to reside in any particular part of the town. Of those who resort hither for their improvement, it is computed that there are sometimes near two thousand, including foreigners. The rector of the university is elected annually out of three presented to the states. The number of professors is twelve, amongst whom those in the medical departments have been chiefly celebrated for many years. The anatomical theatre is held to exceed any thing of the kind. The environs of the city are embellished with fine gardens, the various produce of which is much admired.

About three leagues south-west of Leyden stands the Hague, at the distance of two miles from the sea. It is encompassed with fine meadows and groves, but no walls, and therefore esteemed only a village; but from its extent, the grandeur of the buildings, and the number of beautiful walks, it may be deemed equal, if not superior, to any of their cities. It is governed by its own magistrates, and enjoys all the privileges of cities, except the sending a representative to the assembly of the states. Here however the states-general, as well as the states of the province of Holland, assemble; being the residence not only of the stadholder, but of all foreign ministers and other persons of distinction. Here are but two churches, one of which, called the new church, is of a singular form without pillars.

A fine shady walk stretches from the Hague to the village of Scheveling, which lies on the sea-shore at the distance of two miles. This was once a great town, but was destroyed by a tempestuous ocean continually beating upon it.

Houssaerdyke, a palace that belonged to king William, stands about ten miles south-west of the Hague, and is much admired for its fine gardens, statues, and furniture; some of which, it is said, were removed hither from the British palaces after the Revolution. Within two miles of the Hague stands another palace of the princes of Orange in the village of Ryfwick, where the peace was negotiated in 1697, between the allies and France.

Delft is pleasantly situated in the meadows, six miles south-east of the Hague. It is about two miles in circumference, and canals planted with trees run through the streets. This town is remarkable for its fine earthen ware, but otherwise has no great trade. There are here only two churches, in one of which is the tomb of William I. prince of Orange, with his statue in marble, and near it another of brass, on which is the motto, *Te vindice tuta libertas*. He was shot in this city by Balthazer Gerrard, a popish bigot, as he sat at supper. At the foot of the statue is the figure of a dog that, according to tradition, died of grief for the loss of his master.

Rotterdam, the second city of Holland in respect of wealth and treasure, is situate on the north side of the river Mae'e, upwards of thirty miles south of Amsterdam, than which it has a much more commodious harbour; that of the former being usually open in winter, when others are frozen up, and allowing ships of burthen to come to the merchants doors.

It is a large, well built, populous city, and contains four churches, besides those of foreigners. Many British families are settled at this place, on account of its convenient situation for trade. The chief buildings, besides the churches, are the *Stadt-houfe*, the exchange, the admiralty office, and the East-India house. No country in the world is more populous than that in the neighbourhood of this city.

Dort is situated on the river *Merne*, forty miles south of Amsterdam, and fourteen south-east of Rotterdam. The territory on which this city stands was formed into an island, in the year 1421, by a tempest, which demolished the banks of the *Maefe* and *Merne*, and laid a great tract of land under water, between Dort and *Brabant*, in which fourscore villages and upwards of twenty thousand persons were destroyed. Dort being situated between the rivers *Maefe* and *Merne*, and the lake of *Bielbos*, where the country may be laid under water, it is almost impossible for an enemy to approach it. The streets are wide, the houses well built, and contain a great number of inhabitants. This is the chief mart for British cloth. Here was held that famous synod, in 1619, where the Calvinists condemned the Armenians, and established the Presbyterian sect, which has ever since had the sole power in the government of the United Provinces; all other denominations of Christians being excluded from the magistracy.

*Gertrudenburg* is situated within the territory of Dort, twelve miles south-east of that city.

*Goude*, or *Tergow*, the sixth city in dignity of those that constitute the states of Holland, is a strong town twelve miles north east of Rotterdam, at the confluence of the rivers *Gow* and *Iffel*.

*Naerden* is situated in a morass, near the south end of the *Zuider sea*, twelve miles east of Amsterdam, and is one of the strongest towns in Holland.

*Williamstadt*, built by William I. prince of Orange, stands on the *Roo Vaert*, a river which separates the island of *Voorn* from the continent. This town is subject to the prince of Orange; and here the British usually embark and disembark their troops.

All the towns above mentioned are in that part of the province of Holland called *South Holland*; and there are some others situated in the islands of *South Holland*. Those islands are, *Voorn*, *Iselmond*, *Goree*, and *Overflackee*. The chief town is *Briel*, which stands on north-west coast of the island of *Voorn*, and has the advantage of a pretty good harbour. It is a strong town, and was ceded to queen Elizabeth by the Dutch, as a security for the payment of the money which she lent them, to defend themselves against the Spanish tyranny.

On the island of *Voorn* stands likewise *Helvoetsluis*, a port-town, about five miles south of *Briel*. This is one of the best harbours in Holland: a first rate man of war may lie close to the keys in the middle of the town; and this is therefore the usual station for their largest ships. Here likewise the English packet has its regular passage.

*Somerdyke* is the chief town on the island of *Overflackee*. Of *Iselmond* the chief town bears the same name, and stands almost opposite to Rotterdam.

No. 22.

The chief towns in North Holland are, 1. *Sardam*, or *Samerdam*, situate on that arm of the sea called the *Wys*, about seven miles north-west of Amsterdam. On the opposite shore is the greatest magazine of timber and naval stores in Europe. Here are many hundred saw-mills constantly employed in sawing plank and timber for shipping, the stock of which is prodigious.

2. *Hoorn*, a sea-port, pleasantly situate on the *Zuider Sea*, twenty miles north of Amsterdam.

3. *Enchuyfen*, situate on the same sea, ten miles north-east of *Hoorn*.

4. *Medemblich*, situate on the *Zuider Sea* ten miles north of *Hoorn*. Here are the strongest dykes or banks to defend the country against the waves, which bear with violence on those shores when the winds blow from the north. The pasture grounds in this part of the country are exceeding rich.

5. *Alemaer*, situate about eighteen miles north of *Haerlem*. It is one of the best built towns of North Holland, and surrounded by gardens, groves, and rich pasture grounds, producing great quantities of butter and cheese.

6. *Edam*, a port-town on the *Zuider Sea*, ten miles south of *Hoorn*, most considerable for its dock-yards.

7. *Purmer*, a small fortified town five miles west of *Edam*. The country about this town and *Edam* was formerly a lake, and being drained, now affords rich pasture, as is the case of several other parts of North Holland.

The islands of North Holland, which is a barrier, to break the violence of the sea, are, the *Texel*, *Ulic* island, *Schelling*, and *Wieringen*.

The *Texel* is a fruitful island a little to the northward of the continent, about six miles long, and five broad. The strait between the island and the continent is the principal passage from the ocean to the *Zuider Sea*, through which most ships sail that are bound to Amsterdam. There is a harbour in the *Texel*, and another in the *Ulic*, and when the homeward-bound vessels can reach either of these ports, they ride secure from enemies as well as storms.

## C H A P. II.

*Of the provinces of Zealand—Friesland—Groningen—Overysseel—Guelderland—Utrecht.*

THE province of *Zealand* consists of eight islands, which lie in the mouth of the river *Scheld*. They are bounded on the north by the province of *Holland*, from which they are separated by a narrow channel; on the east by *Brabant*; on the south by *Flanders*, from which they are divided by one of the branches of the *Scheld*; and on the west by the *German sea*. Those islands are, *Walcheren*, *South Beveland*, *North Beveland*, *Wolterdyke*, *Schowen*, *Duivilland*, *Tolon*, and *Oresand*.

*Walcheren*, the principal island, lies at the mouth of the *Scheld*, and is about nine miles long, and eight broad. The chief town of the island and of the whole province is *Middleburg*, situate in 3 degrees

S 3 5

43 mi-

43 minutes of east longitude, and in 51 degrees 30 minutes of north latitude, fifty miles south-west of Rotterdam, and thirty north-east of Bruges. It is a large, rich and populous city, and has a communication with the sea by a deep canal, through which merchant ships are brought into the middle of the town. It contains twenty churches, of which that called the new church, of a octagonal form, is much admired for its beauty. The *stadt-houfe* is likewise a magnificent structure. The town is surrounded by a wall and bastions, with a moat and other modern fortifications.

Ramekins, or Zouburg, situate three miles south-east of Middleburg, was formerly a considerable port-town, and one of those that were ceded by the Dutch to queen Elizabeth, for the security of the money which she advanced to the states; but it is now a poor village.

Flushing is a port-town five miles south of Middleburg, and has a harbour well defended by forts and batteries. This was another of the cautionary towns ceded to queen Elizabeth.

Tervere is a fortified town and harbour, three miles north of Middleburg; of which and Flushing the princes of Orange are sovereigns.

Armuyden is a port-town two miles east of Middleburg, but the harbour is now choked up, and of little use.

South Beveland, the largest of the islands of Zealand, is about fifteen miles long, and seven broad, and was much larger, till part of it was carried away by an inundation in the year 1532. The only considerable town is Ter Goes, situate on the north part of the island, about twelve miles east of Middleburg, and fifteen west of Bergen-op-Zoom. There are several gentlemen's seats, and about thirty villages in the island.

North Beveland is situate a little northward of the preceding, and is at present five miles long, and two broad, but was much more extensive till part of it was swallowed up by the sea.

Wolferdyke is yet a smaller island, lying between the two last mentioned. Part of it likewise has been carried away by an inundation.

Schowen lies north of the Bevelands. It is about fifteen miles long, and six broad, and has suffered much by inundations. The chief town is Zuricksee, situate on the channel. Brewerhaven stands five miles north of Zuricksee; and Bommence two miles east of Brewerhaven, strongly fortified.

The island of Duvelland lies east of Schowen, from which it is separated by a very narrow channel. It contains several villages, but no considerable town.

The island of Tolen lies eastward of the province of Brabant, and is separated from it by a narrow strait. It is about six miles long, and five broad; the chief town Tolen is strongly fortified, lying about five miles north-west of Bergen-op-Zoom.

The province of Friesland Proper is bounded on the north by the ocean; on the east by Groningen and Overysseel; on the south by Overysseel and the Zuider Sea; and on the west by the ocean. It is conjectured

that it was once contiguous to North Holland, and divided from it by an inundation which formed the Zuider Sea. This province is about forty miles long, and twenty-five broad, and subdivided into the territories of Ostergo, Westergo, and Sevenwolden. The first is situate in the north-east part of the province; the second in the west; and the third in the south-east.

The chief town of Ostergo and of the whole province is Lewarden, about seventy miles north-west of Amsterdam. This city is admired for its elegant buildings, spacious streets, fine bridges, and the gardens which surround it.

Franeker is a small city, situate eight miles east of Lewarden, and four miles east of the Zuider Sea. Here is an university, founded by the states in 1585, and endowed with part of the abbey-lands, which were sequestered a little before that time.

Harlingen is situate on the coast of the Zuider Sea a little west of Franeker. It is strongly fortified, and the avenues to it may be laid under water on the approach of an enemy.

Doccum is a fortified town, situate ten miles north-east of Lewarden, in a fruitful country, and remarkable for a bridge so lofty, that vessels may pass under it with their sails standing.

Stavem is situate on the south-west point of Friesland, on the coast of the Zuider Sea. It was one of the hanse-towns, and anciently the capital of the kings of the Frikons. The harbour however is now choked up, and its trade removed to other ports.

Several islands lie northward of this province, which are subject to it, and have only a few villages upon them.

The province of Groningen is bounded on the north by the German ocean; on the east by the Dollart bay, which separates it from Embden or East Friesland; on the south by the province of Overysseel; and on the west by the province of West Friesland. It is about thirty miles long and twenty broad, and may be divided into the districts of Groningen Proper and the Omlands.

Groningen, the chief town and formerly one of the hanse-towns, stands at the confluence of the two rivers Aha and Hunefus, thirty miles east of Lewarden, and twenty south-west of Embden. It is about two miles in circumference, well fortified, and has a communication with the river Ems and the ocean by navigable canals, which enables it to maintain a great trade with Germany.

Dam, the capital of the Omlands is situate on the canal called Damster Diep, three miles west of the river Ems, and is a large well built town, but without walls.

Winfchoven is a fortress near the Dollart bay, situate in a morass, and commands a pass out of East Friesland into the United Provinces. The Dutch have several other forts on this frontier towards East Friesland, and were till lately esteemed masters of that province; but the king of Prussia has obliged them to abandon the country, and taken possession of it himself.

The province of Overysseel is bounded on the north by Groningen; on the east by Westphalia; on the south

south by Zutphen; and on the west by Guelderland, the Zuider Sea, and Friesland. It is about sixty mile long and forty broad.

The chief towns are, 1. Deventer, situate on the river Iffel, on the confines of Guelderland, thirty miles east of Amersfort. It was formerly one of the hanse-towns, and is still a place of good trade, and inhabited by people of distinction.

2. Zwoll, situate twenty miles north of Deventer, is a fortified town; the ramparts are planted with trees, and the buildings elegant.

3. Campen, situate on the river Yffel, near the Zuider Sea, twelve miles west of Zwoll, is a handsome well built city, and had formerly a great trade before the mouth of the Yffel was blocked up.

4. Coverden, situate on the confines of Germany, thirty miles east of Zwoll, is strongly fortified, and stands in an impassable morass.

The province of Guelderland, comprehending the Dutch and Prussian Guelderland, is bounded on the north by the Zuider Sea and the province of Overysfel; on the east by Westphalia; on the south by Brabant; and on the west by the province of Utrecht.

Dutch Guelderland is subdivided into three districts, namely, the Veluwe, the Betew, the ancient Batavia; and the county of Zutphen.

The Veluwe is the north west division, lies between the Zuider Sea, and the rivers Lech and Yffel. The chief towns are, Arnhem, Wageningen, Hattem, Harderwick, and Elberg.

The Betew is almost encompassed by the rivers Rhine, Lech, Maese, and Meruwe. The chief towns are Nimeguen, Tiel, Skenkenfeans, Bommel, Burel, and Culemburg.

The county of Zutphen is bounded on the north by Overysfel; on the east by Munster; on the south by the duchy of Cleve; and on the west by the Veluwe. The chief towns are Zutphen, Dueburg, Groll, and Brevoort.

The city of Arnhem is pleasantly situated on the river Lech, ten miles north of Nimeguen, on firm ground, and in a healthy air, which occasions it to be inhabited by people of distinction. At Dieren, ten miles north-west of this city, the princes of Orange have a palace; and twenty miles north of Arnhem, in the middle of the Veluwe, is the palace of Leo, where the late king William frequently resided in the hunting season. This is esteemed one of the most elegant palaces belonging to the house of Orange.

Hardwick is situate on the coast of the Zuider Sea, and has an university which was founded in 1638.

Nimeguen is pleasantly seated on the river Waal, ten miles south of Arnhem, and eight north of Grave, and is a large, populous, well built city. The castle was anciently reckoned a place of great strength, and commands a fine view of the adjacent country. Here was concluded the treaty between the allies and France in 1679.

Skenkenfeans is a fortress situate on the frontiers of Germany, where the Rhine divides into two branches, called the Waal and Lech, and commands both rivers.

Bommel stands on an island formed by the Maese and Waal, called the Bommel-Waart, twenty-five miles west of Nimeguen. On the same island is the castle of Lovistein, with the fort of St. Andrew and Voorn, or Nassau, which command the rivers Waal and Maese.

Zutphen, capital of the territory of the same name, is situate on the river Yffel, fifteen miles north-east of Arnhem. It is a good town, and inhabited by opulent people. Near this place Sir Philip Sidney was killed, in the war between the Spaniards and the Dutch.

Doeburg stands on the Yffel eight miles south of Zutphen. It is naturally strong, having the river on one side, and a morass on the other; but was taken by the French, as well as Zutphen, in 1672, and restored at the peace.

Groll is situate twenty-six miles east of Doeburg, and commands an important pass between the Netherlands and Germany. This was also taken by the bishop of Munster, an ally of France, in 1672, but restored with the rest of the Dutch towns two years after.

Prussian (formerly Spanish) Guelderland is separated from the Dutch Guelderland by the territories of Cleve. It is bounded on the north by this duchy; on the east by the electorate of Cologne; on the south by the duchy of Juliers; and on the west by the bishoprick of Liege; being about thirty miles long, and twenty broad. By the treaty of Rastadt, in 1714, his imperial majesty ceded to the king of Prussia all that part of the Upper Guelderland which he then possessed, viz. the city of Guelder and its bailiwick, with its dependencies, to be enjoyed in the same manner as they were formerly held by the kings of Spain.

Guelder, the capital of Prussian Guelderland, is a strong little town, situate in a morass, twenty-five miles south-east of Nimeguen.

Ruremond is a large populous town, well built and fortified, fifteen miles south of Venlo. This city, with the rest of Spanish Guelderland, was seized by Lewis XIV. for his grandson the duke of Anjou, on the death of Charles II. king of Spain, in the year 1700, but was recovered by the allies in 1702, and is now in possession of the empress-queen, as heirs of the Austrian dominions.

Venlo stands on the river Maese, about twelve miles south of Guelder, and is in possession of the Dutch.

Stevensmaert is a fortress on the river Maese, eight miles south of Ruremond. This is also in the possession of the Dutch.

Watchtendonk is a strong fortress south of Guelder, occupied by the king of Prussia.

The province of Utrecht is bounded on the north by the Zuider Sea and part of Holland; on the east by Guelderland; on the south by the Rhine; and on the west by another part of Holland; being about twenty-five miles long, and as many broad. This is one of the most pleasant and healthful provinces in the United Netherlands, containing very little bog and morass.

The chief town, Utrecht, formerly Antonina, is situate on the ancient channel of the Rhine, twenty-five miles south-east of Amsterdam. It is a large

popu-

populous city, and well built. Over the two principal canals, which run the whole length of the city, are laid thirty-five bridges. Several spacious streets meet in the market-place, in the center of the town; and without the gates are beautiful walks of trees. From the church of St. Martin, which is ascended by four hundred and sixty steps, there is a fine prospect of the adjacent country, and no less than fifty walled towns. Here is a great university founded by the states in 1636; and here the peace was concluded between the allies and France in 1713.

Amersfort stands on the river Ems, fifteen miles north-east of Utrecht, in a country abounding in corn and good pasture. It is a well built, populous city, about three miles in circumference. Four miles to the northward lies the palaces of Sueddyke, one of king William's hunting seats, situate in the middle of a forest which abounds with game.

Wyck de Duesterde, called by the Romans Durostadium Batavorum, stands at the confluence of the Lech, and the middle channel of the Rhine, twenty miles south of Amersfort.

Montfort is a little elegant town, capital of a small territory, situate eight miles west of Utrecht.

The towns in the United Provinces are generally well built of brick, but the houses are not equal to those of the trading towns in England; neither are the houses of the ministers and great men comparable to those of the British nobility. But such of the towns as have canals running through the streets, the banks of which are planted with trees, are vastly pleasant, especially in summer, as they are kept very neat and clean. The pavement is so sloped, that every shower washes away the little dirt they have, into the canal; and as all goods are drawn upon sledges, or carried by water, the pavement is seldom broken.

### C H A P. III.

*Of the soil—produce—animals—manufactures—traffic—natives—dress—character—houses—diet—diversions—music—houses—way of travelling—forces—coins—religion—marriages.*

**T**HE soil of the United Provinces is for the most part in extremes, being either very good or very bad. Great part of it consists of barren sands, bogs, and marshes, but no where in Europe are the pasture grounds of richer quality. There is some good arable land, where wheat, rye, barley, oats, pease, and beans, thrive well, but do not afford what is sufficient for the subsistence of the natives. Other portions of ground produce excellent flax. The sides of the canals, and roads, with the avenues to country houses, are planted with forest-trees; but there is little or no timber of any value. There is great variety of fruit-trees, and flowers, of the latter of which the people are fond, almost to a degree of adoration.

The country produces no minerals, and almost their only fossil is a bituminous earth, out of which they dig peat for fuel, being destitute of wood for that

purpose, and having no other coals but what they import from Britain.

The neat cattle and horses of the Netherlands are the largest in Europe; the cows give incredible quantities of milk, and their horses for the draught and army are hardly to be matched for their bulk; but in speed and activity they are far inferior to the English. They have numerous flocks of sheep, but those are likewise not equal to the breed of this country, in respect either of flesh or wool. They have the same domestic animals as in Britain, with some to which we are strangers, particularly wolves and wild hogs. Deer are not in great plenty. The country abounds in fresh-water fish, and they have all kinds of sea-fish except oysters and herrings, both which they take on the British coast.

Among the birds of passage that visit the Netherlands are the storks, which build and hatch their young on the chimneys in the cities as well as villages. The inhabitants have so superstitious a veneration for those birds, that they will not suffer them to be killed on any account. They come every year about the end of February, and fly away with their brood in the beginning of August. Quails also come over to Holland from Africa in the summer, as in England, and return thither in the winter. All kinds of tame and wild fowl are here in great plenty.

In the spirit of manufacture and industry the Dutch confessedly excel all the nations in the world. They will not suffer an idle person among them. They set even the lame and blind to work, as well as old people and children; and find a proper employment for every species of cripples. The profession of the greatest advantage to this, as to every maritime country, is that of seamen, for the breeding of whom they give particular encouragement to fisheries. This branch of industry affords them an inexhaustible fund of riches, purchasing with its produce the merchandize of every other country. The preparing of vessels, nets, boats, and other utensils for those fisheries, employs a multitude of their poor on shore, who would otherwise be a burden to the country.

The ship and house-carpenters are another numerous profession, who furnish many other countries with plank, though they have hardly any timber of their own growth. The vessels constructed by those mechanicks, however, are not comparable to the English, either in strength, beauty, or expedition, but are heavy, bulky, and ill-shaped. They appear to be under a necessity of following this model: for the entrance of their harbour being generally so shallow, as to admit only of flat-bottomed vessels, they must make up in breadth for what they are deficient in depth.

The Dutch excel in dying, sugar-baking, and bleaching of linen. That which is denominated Holland, with their manufacture of paper and sail-cloth, exceed every thing of the kind. They have also manufactures of silk, velvet, wool, and every other with which we are acquainted.

This country, however, is far from being famous for her manufactures, producing not the third of what is sufficient for the consumption of the inhabitants.

The

The fine cloth of Leyden and Utrecht has always supported its character; but lately, from the high price of labour in those towns, this cloth is become dearer, in proportion to its breadth, than the English superfine cloth. The greater part of it is exported to foreign markets, while all the common people, and most of the troops, are clothed with the English manufactures from Yorkshire, or those of Aix la Chapelle and Vervier.

The high price of provisions, and of all the necessaries of life, will prevent this people from ever succeeding in any great or extensive manufactures, though the country be over stocked with inhabitants. It is computed that the United Provinces contain about two millions of people; but there not being provisions enough raised in the country to supply the fourth part of this number, the remainder must be imported from other states, and sometimes at great expence, exclusive of the duties and excises. The consumer must pay between fifty and sixty per cent. upon the prime cost, for all the grain which is imported into this country to make bread. Beef and mutton cannot be eaten in any part of the United Provinces before the consumer pays between one penny and three halfpence per pound to the excise; and every other necessary of life is taxed in proportion.

The trade and riches of this state have been considerably increased by the herring and Greenland fisheries, which not only employ a multitude of seamen, but furnish them with articles of commerce that are demanded in almost all the markets of Europe. They pickle and preserve their herrings in a manner infinitely superior to the Danes, Swedes, or Norwegians, and they are always sure of finding a market for them in the North, in preference to those of any other state. What is also not less beneficial, they have the cod and turbot fishery upon the coasts of England and Scotland. All the inhabitants upon the sea-coasts of Holland and Zealand are more or less concerned in this trade.

The exclusive commerce which the Dutch have of the East-India spices, must likewise be a perpetual source of riches to this republic. Having no great colonies or settlements in the West-Indies, they have very politically established a free port in those seas, not only as a magazine to smuggle all sorts of European goods into the English, French, and Spanish settlements, but also for receiving the superfluous produce of those colonies. The low-priced coffee, cocoa, cotton, and in fact all the productions of the West-India islands, as well as of Surinam, find their way into Amsterdam and Rotterdam, whence they are sent into Westphalia, and all the western parts of Germany, where they are sold to great advantage.

Their trade to Turkey and the Levant seems at first sight to be considerably against them; but when we consider that they export hither a great quantity of their fine Leyden cloth, thence importing chiefly the rough materials for European manufactures, and very little for their own consumption, this branch of trade will also be found much to their advantage.

No. 22.

Another great source of riches to the inhabitants of Holland is the exchange and banking business. So convenient is the situation of Amsterdam, and so great its credit and correspondence, that three quarters of all the monies remitted from one state to another in Europe, as well in mercantile as in other affairs, pass through this city, and of course entitle her merchants to receive commissions on them; which, as those remittances are for immense sums, must amount to a considerable sum annually.

Besides the great quantities of different sorts of goods which the merchants of Amsterdam and Rotterdam send to all the western parts of Germany, by the Rhine and the Maese, on their own account, all the merchandize which the people in those parts import directly from, or export to foreign countries, must pass through one or other of the above mentioned cities, where they must pay the duties of import and export to the state, and likewise a commission to some of their merchants for expedition; so that in fact the Hollanders, from their situation, lay a tax upon all the foreign trade of those parts.

Though Holland produces hardly any thing except butter and cheese, the country is the most commercial, and its merchants the richest in the world. They import a thousand ship-loads of timber every year from the Baltic, which, by the advantage of their saw-mills, they cut out and prepare at an easy expence, for building ships and houses, and sell to their neighbours to great advantage. They also import many hundred ship-loads of corn, which they sell to such nations as happen to have had bad crops; often buying up the British grain when it is cheap, and selling it to us again when the price is advanced. But they gain much more by the monopoly of the fine spices, and their fisheries, than by all the other branches of their trade. As they obtained the former by means the most unjustifiable, so they forcibly also broke into the latter, and in a manner monopolized the herring and whale fisheries, those inexhaustible funds of wealth, in which they surpass every other nation.

The natives of the United Provinces are of a good stature, and inclined to be corpulent, but are remarkable in general for a heavy awkward mien. Their features however are regular, and the complexions of such as are not exposed to the weather, sufficiently fair. Their young women are exceeding handsome, and make a good appearance in a coach, or sitting posture; but their motion is extremely slow. Before they attain the age of twenty-five, their faces become red and bloated, and they cease to be amiable. This change is probably owing to too great an indulgence in the use of spirituous liquors. It is not unlikely that the fumes which they place under their petticoats in winter, have also a pernicious influence on their health; and some have imagined this practice to be the reason why they do not breed so long as other women.

The better sort of people imitate the French fashions in their dress, but those who are stamped with the genuine character of their native country, never fail to load themselves with an enormous incumbrance of

T t

cloaths.

cloaths. Both men and women wear at least two waistcoats, with as many coats; and the former likewise cover their limbs with double breeches and trowsers: the women's petticoats are so very short, that they discover half the leg; and the men's coats are usually as ill-shaped as their bodies, having no plaits, but long pockets, almost as high as their arms. The women tie up their hair in a roll, and adorn it with two or three black knots. They use little other covering for their heads in the house, but wear a hood when they go abroad. The girls which ply at their music-houses, or brothels, are dressed in a coat and jacket, not unlike the riding-habit, which suits but ill with the Dutch shape.

Sir William Temple, whose long residence among the Dutch afforded him an opportunity of observing their character, distinguishes the people of this country into five classes, namely, the peasants and farmers, sea-faring men, merchants and tradesmen; those that live upon their estates, or the interest of their money; and the military officers.

The peasants, he observed, were industrious people, but exceeding stupid, little affected by passionate words, but easily managed by fair language, and readily yielding to reason, if you give them time to understand it. Of sea-faring men he remarked, that they were a plain, but a much rougher people, seldom using more words than are necessary about their business, and in respect of valour rather passive than active.

As to the trading people in general, whether merchants or mechanics, their wits are something sharper than those of either the former classes, being improved by the conversation of foreigners; but even those are much better at imitation than invention, sometimes succeeding so far as to excel the original by dint of unwearied application. They exert all their skill to take advantage of the folly or ignorance of those with whom they have any dealing; and are great extortioners when there is no law to restrain them; but in other cases they are the plainest and best dealers in the world.

Those who live on their patrimonial estates in great cities, resemble the merchants and tradesmen in the modesty of their dress and their parsimonious way of living; but between the education and manners of those classes there is a very wide difference. The former, after they come from school, are sent to the universities of Leyden or Utrecht, where they go through the common studies of those places, but apply themselves chiefly to the civil law, by which the jurisprudence of their country is in a great measure governed. When young gentlemen have finished their education at home, if their relations be wealthy, they are sent abroad, to England or France, for the sake of improvement, the whole design of their education being to qualify them for the magistracy in the towns and provinces, which however is more honourable than lucrative in this country.

The gentry or nobility are not numerous, especially in Holland, many of those families having been extinguished in the war with Spain. Those that remain

are usually employed in the military service, and sometimes in the civil department in their respective provinces. They are apt to value themselves more upon their nobility than men do in other countries, where it is more common; looking upon it dishonourable to marry below their rank, and hardly ever condescending to make an alliance, even to extricate an involved fortune. They imitate the French in their dress, their mien, their talk, their diet, and their gallantry; but their imitation is generally awkward. They are however an honest, good-humoured, gentleman-like sort of men, and usually acquire themselves with honour in the service of their country. The officers of the army follow the fashions and customs of the gentry, as do many of the rich merchants' sons. Some customs and dispositions however seem general to all the classes in the nation. The most conspicuous characteristic is a great frugality and order in their expences. What they can spare from their domestic charges is laid out in the ornament and furniture of their houses, rather than keeping great tables, fine cloaths or equipages. Their charity is rather national, and regulated by the orders of the state, than moved by the common objects of compassion. Avarice excepted, all appetites and passions are less violent here than in any other country. Quarrels are very rare, revenge seldom heard of, and jealousy hardly known. Their tempers are too phlegmatic for merriment, and too cool for the ardour of love. The same insensibility, however, which renders them indifferent to pleasure, disposes them to uncommon assiduity and constant application in the pursuit of such objects as are to be attained more by the efforts of labour than genius; and upon the whole, the air of this country may be considered as the Bœotian climate of modern times.

The people are utter strangers to freedom of thought, and notwithstanding their government is in some degree popular, very few persons venture to speak their sentiments on public affairs.

The natives of those provinces, particularly Holland and Zealand, are generally not so long lived as in other parts of Europe. Both sexes begin to decay at least ten years sooner than in Britain or France. The prevailing diseases of the climate are stubborn intermitting and remitting fevers, the rheumatism, gout, and scurvy; and when the summers are very hot, they produce putrid fevers of the most dangerous kind.

No poor people are to be seen in the streets or public places of this state, the government having made provision for their support, and there being hospitals for the aged as well as diseased of all denominations; but the laws of the country are very severe against vagabonds and idle people.

The lower part of the houses in Holland is lined with white Dutch tiles, and their kitchen furniture of copper, pewter, and iron, are kept so exceeding bright, that it affords a strong proof of their cleanliness. Their beds and tables are covered with the best and finest linen; their rooms are adorned with pictures, and their yards and gardens with flowers. They heat their rooms with stoves, placed either

underneath or round the apartments, which render the heat equal on all sides. Mechanics will work in them stripped to the shirt in the coldest season. The women have little stoves or pans of lighted peat, which they put into a small square box, and lay under their feet. People of condition have those carried with them upon visits, and even to church, where they have not the convenience of the other sort of stoves.

The diet of the Dutch boors or farmers is usually mean, consisting mostly of roots, herbs, sour milk, and pulse; but in the towns the common people live something better. All ranks in the nation are much addicted to the use of butter, and those of the inferior classes seldom take a journey without a butter-box in their pocket. Here is not only good beer, but wine and brandy in great plenty, which are almost as cheap as beer; and the Geneva is also cheap and good.

The diversions of the Hollanders are bowls, billiards, chess, and tennis, as with us; but they do not seem to be so much addicted to the games of chance, unless that of verheeven, or trick-track reversed. Shooting wild geese and ducks in winter, and angling in summer, make another part of their pastime. In the most rigorous season of the year, sledges and skates are a great diversion. Both women and men use them alike, to carry their goods to the market, as well as for pleasure. The sledge is drawn by a horse, or pushed along by a man in skates. When the snow is upon the ground, and the streets frozen, young gentlemen and ladies appear abroad in the most magnificent sledges. The person drives his horse himself, which is covered with a rich skin or caparison, and a fine tuft of feathers; and the gentleman or lady is wrapped up in furs, or a fine Indian quilt. The sledges are of various shapes, finely painted, gilt, and varnished, and the horses harness is rich and splendid.

Bandy is another play much used when the country is covered with ice and snow, and at this they are very dexterous. They seldom play for any thing but drink, which hardly ever fails to conclude the diversions of the day.

In summer, it is common to see multitudes of people walking out on the banks of the fine canals, well planted with trees, or by the sea shore, or perhaps in the public gardens. Almost all those excursions end in the tavern, where they meet with a variety of little amusements and agreeable entertainment, at a cheap rate. Even common labourers indulge themselves in such recreations. The same distinctions are not maintained in Holland between the wealthy traders and mechanics as in other countries. They converse pretty much upon a level; neither is it easy to know the man from the master, or the maid from her mistress. Among other entertainments, drinking of tea has here long been universal among all ranks of people.

The Hollanders have music-houses licensed by authority, for which a tax is paid; and the master of such a house may keep as many wenches as he pleases. The girls also pay a tax to the government on their being admitted into those receptacles of pleasure. Hither the people openly resort, and when a sufficient

company is assembled, they sup together in a common room, where good entertainment is provided for them. The supper is succeeded by a ball, whence any couple is at liberty to retire to a private room.

There are several sorts of those houses of pleasure, some for the gentry, and others for the seamen and common people, which are tolerated by the government with the view of preventing greater evils.

Their usual way of travelling is in treckschutes, or covered boats, drawn by a horse at the rate of three miles an hour, for which the fare does not amount to a penny a mile. A passenger in such a vehicle has the conveniency of carrying a portmanteau, or provisions, so that he need not be at any expence in a public house by the way. As to the inns and public houses on the road, they generally afford a soft bed and clean linen; but it is difficult to procure any other bed chamber than one of the little cabins which are ranged round a great room, where people of different ranks lie promiscuously, and disturb one another the whole night. The bedsteads in those cabins are likewise placed so high, as to be not only inconvenient, but even dangerous.

There is no disputing with a Dutch inn-keeper, either about the reckoning or any other particular; for he will enhance the bill if you find fault with it, and procure a magistrate to levy his demand by force.

The revenue of this republic consists in the ordinary funds which the seven provinces provide annually, according to their respective proportions, upon the petition of the council of state, and the computation of the public charges for the ensuing year, delivered by them to the states general; as well as what is levied in the conquered towns and country of Brabant, Flanders, and the Rhine. The whole of this revenue generally amounts to about twenty-five millions of guilders a year.

The principal funds out of which this revenue is raised, are the different excises, the customs, and the land-tax. The excises are so very high in general, that they are not to be paralleled in any part of Europe. Hardly one article of the necessaries of life is exempted from this heavy tax. The customs however are moderate, as is likewise the land-tax, on account of the great expence incurred by the land-holders in supporting their dykes and wind-mills, and in keeping the country dry.

All the excises and taxes laid upon landed property and immoveable possessions, are collected by the magistrates of the respective districts; but those which arise from uncertain consumptions, are generally farmed out to the persons who bid most for them; some for three months, some for six, and others for a year. The collection, receipt, and payment of all the public money, are made without any fee to officers, who receive fixed salaries from the state, which they dare not increase by any private practices or extortions.

The military establishment of the United Provinces, at present, supposing all their regiments to be complete, amounts to thirty-two thousand men. This body is composed of the troops of several German princes, of Scots.

Scots, Swifs, Walloons, and of deserters from almost every country in Europe; there being very few natives in the army, except the officers. Those troops are paid differently, according to the contracts made with the respective states from which they are hired.

The admiralties in the several provinces maintain about five or six and thirty ships of war of different burthens, for protecting their trade, and for any sudden accidents of the state.

The estimates for the yearly expences of the army, and for the repairs of fortresses, magazines, &c. amount to about seven hundred and twenty thousand pounds a year; and those of the admiralties, for the maintenance of this fleet and for the building of ships, to about five hundred and fifty thousand pounds.

The coins of Holland are, first, a *doit*, three of which make one *stiver* or penny, which is something more than an English penny. Fifty *stivers* make a *rix-dollar*; sixty-three *stivers* make a *ducatoon*. Fifteen *guldens* or *florins* make a gold *ducatoon*; and five *florins* five *stivers* a gold *ducat*. The coin called a *schilling*, which goes for six *stivers*, is base metal, scarce a third part of six pence in real value.

The established religion of this country is Calvinism, which is embraced by the bulk of the people. The clergy have neither lands nor tithes, but are paid by the state certain fixed salaries, from six or seven hundred to two thousand *guldens* a year. In some provinces, if they are married and have children, they are allowed a hundred *guldens* a year for each child. In all the great towns, the service of the church is performed in the English, French, and German languages, as well as in that of the country. All the other sects of the reformed religion are tolerated and protected; and the Jews likewise have their synagogues in Amsterdam and Rotterdam.

The Dutch seem to look upon a contract of marriage made before friends to amount to a marriage in law, and allow the parties to consummate before the nuptial ceremony. It is a common thing to see pregnant women come to church to be married, and the children thus gotten are deemed legitimate.

#### C H A P. IV.

##### *Of the government of the United Provinces.*

THE United Provinces are a confederacy of many independent states; for not only every province is sovereign and independent of the states-general, but contains several inferior republicks independent of the province and of each other. The latter are not bound by the decrees or acts of the states of the province, until such acts are ratified by each particular city or republic, which sends deputies or representatives to the provincial assembly.

As the states-general can neither make war or peace, enter into alliances, or raise money, without the consent of every province, so neither can the states-provincial determine those matters without the consent of every city or republic, which, by the constitution of the province has a voice in the assembly. In some

civil cases, indeed, there lies an appeal from the courts of justice in cities to the provincial courts of justice; but in criminal matters there lies no appeal. Nor can the states of the province exercise any jurisdiction, punish an offender, pardon an offence, or execute any general law, within any of the cities or republics of the province, but by the courts and officers of the place where it is to be put in execution.

The states of Holland are composed of the deputies or representatives of the nobility, and of eighteen cities or great towns, making in all nineteen voices, of which the nobility and gentry have only the first. The cities entitled to vote were at first but six, viz. Dort, Haerlem, Delft, Leyden, Amsterdam, and Ter-gow; to which prince William of Nassau, their first stadtholder, added twelve, namely, Rotterdam, Gorcum, Scheidam, Sconhoven, Briel, Alcmear, Hoorn, Enchuyfen, Edam, Moninckdam, Medenblick, and Permeren.

The nobility, who are not numerous in Holland, are represented by eight or nine of their own number; but those have altogether but one voice, equal to the smallest of the above mentioned towns. Persons of this class, however, are very considerable in the government, possessing many of the best posts both civil and military, and having the direction of the ecclesiastical revenues which were confiscated by the state, upon the alteration of religion. As the nobility vote first in those assemblies, they influence, in a great measure, the deputies of the cities. Their vote is delivered by the pensioner of Holland, who sits with them, and assists in all their deliberations previous to the general assembly. He is always a person of great credit, and seldom removed, though by the constitution he ought to continue in that post but five years. This officer is in reality but the servant of the province, yet enjoys the good fortune to lead, or at least to influence his masters. He proposes all matters to be debated by the states, collects their opinions, and digests their resolutions, and sometimes assumes a power of postponing the most important affairs. He is always constituted one of their deputies or representatives to the states-general.

The representatives of the cities are elected out of the magistracy and senate of each town, and there is more or less, according to the pleasure of their constituents. Whatever be their number, they have but one voice, and enjoy a salary from the places for which they are appointed. The states of Holland generally assemble at the Hague, four times a year, viz. in the months of February, June, September, and November.

Upon extraordinary occasions they are summoned by the council of state of the province, consisting of several deputies or representatives, viz. one from the nobility, one from each of the chief towns, and one from three of the smaller towns; each of those choosing a representative by turns. This council sits constantly at the Hague, proposes to the states of the province at their extraordinary assemblies the matters proper for their deliberation, and executes their resolutions. One negative voice in the assembly of the

states

states of the province hinders them from coming to a resolution. When they are all agreed, they send some of their number to the respective towns which they represent, to obtain their concurrence. If it be a matter of any intricacy, and may take up time in debating in the several cities, the states usually adjourn till the deputies may have transacted their business.

There is also a chamber of accounts which manages the revenues of the province, and has the absolute disposal of the lands belonging to the states. The revenue arising from these lands is seldom applied to the use of the public, except upon urgent occasions, but is usually distributed among magistrates, and officers grown old in the service.

The government of the province of Friesland is very different from that of Holland, being composed of four members, viz. the quarter of Oftergo, the quarter of Westergo, with that of Seven-Wolden, and those of the towns of the province. The quarter of Oftergo consists of eleven baillages; the quarter of Westergo of nine, and the quarter of Seven-Wolden of ten; each baillage comprehending about twelve or fifteen villages. The towns of the province which send deputies are eleven. The four members above mentioned choose their respective representatives, viz. two out of every baillage, and two out of every town, which compose the assembly of the states-provincial, who deliberate and conclude all matters relating to the government of the province, without having recourse to their constituents, either for instruction or consent.

In Friesland likewise every baillie or greetman summons all persons possessed of a certain quantity of land within his baillage, a majority of whom choose the two representatives to be sent to the provincial assembly. The baillie also and his assessors compose a court of justice for civil matters, from which there lies no appeal to the court of justice of the province.

In the province of Groningen the deputies or representatives elected to serve in the assembly of the states of the province, are chosen, as in Friesland, by freeholders, or persons possessed of a certain portion of land. And in Overysel, all the nobility and gentry who have manors, are qualified to be members of the states of that province.

The constitution of the government in the provinces of Guelderland, Zealand, and Utrecht, resembles nearly that of Holland; the states of each province being composed of the deputies or representatives of the nobility and cities. There are however some trifling differences between them. For instance, in Guelderland, all the nobility and gentry possessing sinecure lands, have a seat, and vote in the assembly of the states of the province. Such members compose one half of the states, as the representatives of the towns do the other half; and though certain persons of their number are deputed to the states-general, yet any of the nobility of Guelderland are entitled to a seat in that court, if they will attend at their own charges.

The nobility of Zealand having been almost extinguished in the wars with Spain, and the prince of

Orange being proprietor of the marquisates of Flushing and Terveer, this prince alone represents that part of the states of the province, under the title of the first, or sole noble of Zealand, by virtue of which his deputy has the first place and voice in the assembly of the states of Zealand; as he has likewise in their council of state, and chamber of accounts, as sovereign of Flushing and Terveer. He also appoints the magistrates, and consequently disposes of the votes of those two towns, as well as the votes of the nobility; and there are but six towns which send deputies to the assembly of the province of Zealand.

The council of state consists of representatives of the several provinces, of which the province of Holland sends three, the provinces of Guelderland, Zealand, and Utrecht, two each; and the other three provinces one a-piece. The council of state for all the United Provinces therefore consists of twelve members, who do not vote by provinces, as in the assembly of the states-general, but by general voices. Every deputy presides by turns, and in this council, the stadtholder or governor of the United Provinces has a voice, and the casting vote. The treasurer-general has a seat here, and may give his opinion, but has no vote, though his place be for life; as is that of the deputy sent by the nobility of Holland, and the deputies of the province of Zealand. The other deputies are appointed only for two, three, or four years. This council of state executes the resolutions of the states-general, proposes the number of troops requisite for the ensuing year, with the method of raising them, and of levying money for the exigencies of the government. They also superintend the militia, fortifications, and contributions levied on the enemy in time of war, with the revenues and government of the conquered places acquired since the Union, which being obtained by the common arms of the state, depend on the states-general, and not on any particular province.

The authority of the stadtholder enters deeply into the government of this country, and though the states have more than once endeavoured to suppress it, their attempts for this purpose have always proved ineffectual, and sometimes dangerous to the public liberty.

This great office commenced immediately after the union of Utrecht, in the person of William prince of Orange, in whose family it has mostly continued ever since, and is now made hereditary by a law of the states. The stadtholder is vested with the command of all the forces both by sea and land; and he has the disposal of all the military employments, governments of towns, &c. He likewise enjoys the power of pardoning crimes. As the states-general represent the sovereignty of the state, so does the stadtholder its dignity, by public guards and the attendance of all the military officers, as well as by the splendor of his court.

At the end of every year the council presents to the states-general an estimate of the expences which are judged necessary for the ensuing year, that they may demand of the states-provincial their respective proportions. In every hundred pound sterling each province raises the following sums, by such ways

U u u and

and means as they respectively judge to be the most proper.

The chamber of accounts takes nff part of the trouble from the council of state. The business of the former is to examine and state all accounts of the several receivers, and to controul and register the orders of the council of state, which disposes of the revenue. This chamber is composed of two deputies sent from each province, who are changed every three years.

The next great office is the court of admiralty, which, after the states-general, by the advice of the council of state, have concluded on the number and force of the fleet to be fitted out, has the absolute disposal of all marine affairs, as well in the choice and equipment of the several ships, as in issuing the money allotted for that service.

In Amsterdam the sovereign power is lodged in thirty-six senators, who hold their places for life. When any of them dies, the remaining senators elect another in his room, the people not being permitted to have any share in the nomination. The senate has the choice of the deputies to be sent to the states of Holland, and appoints the chief magistrates of the city, namely, the burgo-masters and eschevins. The number of burgo-masters is four, of whom three are chosen annually, one of them remaining in office; but the three last chosen are styled the reigning burgo-masters for the year, and after the first three months preside by turns. They are elected by a majority of such persons in the senate as have been burgo-masters or eschevins, and they have the disposal of all inferior offices that fall vacant during their administration. They likewise issue money out of the treasury for the public service, and are in a manner vested with the whole executive power of the state. Those offices however are attended with little profit, the salary not exceeding five hundred gilders or fifty pounds a year; but the persons who hold them are liable to no extraordinary charge, either for equipage or entertainments; and when they have acquitted themselves with reputation, they are generally preferred to more lucrative places.

In every town there is a court of justice, consisting of the eschevins, or aldermen, who are sole judges in all criminal cases; but in civil, there lies an appeal to the court of justice of the province, if the matter in dispute be of importance. They never pronounce sentence of death, without first communicating the case to the burgo-masters; but this is only a matter

of form, the latter having no power to controul or suspend the judgment.

The countries lying between the Scyue and Rhine, and united to the Roman empire by Julius Cæsar, were anciently named Gallia Belgica. On the decline of that empire, the Franks in Germany erected a kingdom in Gaul, under the denomination of Frankland or France, of which the territory of Gallia Belgica was esteemed a part. When Germany became separated from France, most of this country fell to the share of the former; but being so much wasted by frequent depredations, it was almost abandoned by the natives, and for want of cultivation, either overrun with forests, or covered with bogs and marshes. The Franks and northern nations divided it into seventeen provinces, over which they placed as many governors or sovereigns, with limited powers, who transacted nothing of consequence without the consent of the states, consisting of the nobility and clergy. The governors or sovereigns of Brabant, Limburg, Luxemburg, and Guelderland, were styled dukes; those of Flanders, Artois, Hainault, Holland, Zealand, Namur, and Zutphen, had the title of counts or earls; while those of Friesland, Mechlin, Utrecht, Overyffel, and Groningen, enjoyed the dignity of barons; and the governor of Antwerp was distinguished with the rank of marquis.

About the year 1430, all those different governments were, by marriages, conquest, or contracts, united in the house of Burgundy, of which Charles, surnamed the Warlike, being killed in a battle with the Switzers, the princess Mary, his only daughter and heiress, married Maximilian of Austria, son of the emperor Frederick, whom he succeeded in the empire, in 1482. The archduke Philip, the issue of this alliance, married Joanna, the daughter and heiress of Ferdinand and Isabella, king and queen of Spain, whose son, Charles V. became entitled to the Netherlands, then under the dominion of Spain, and afterwards denominated the Austrian Netherlands, on their descending to the heir of that house. This prince constituted the provinces and territories of Burgundy one of the circles of the empire, by the name of the circle of Burgundy.

After the erection of the different governments in the Netherlands, those provinces enjoyed great privileges and an extensive commerce for many years. No laws were made, nor taxes imposed, without the consent of the respective states of each province; neither were any foreigners suffered to hold a post in the administration, or any foreign troops introduced, till Charles the Warlike, being at war with France, invaded those ancient regulations, which occasioned some discontent. The emperor Charles V. quartered upon the provinces still greater bodies of troops, consisting of Spaniards, Italians, and Germans; but this prince being beloved by the people, they submitted without murmuring to those exertions of the royal authority, till their liberties continuing to be infringed, under the government of his son Philip II. an unpopular sovereign, a revolt was excited in the Netherlands, which terminated in the

the

the subversion of the Spanish power in those seven divisions of the country, afterwards called the United Provinces. Since that time the several provinces have maintained a strict confederacy, and possessed themselves of important settlements in various quarters of the globe. But though the professed enemies of regal government, they have at length vested the executive power in a stadtholder, whose authority differs little more than in name, from that of a limited monarch.

#### AUSTRIAN NETHERLANDS.

**T**HE Austrian Netherlands are bounded on the north by the United Provinces; on the east by Germany; on the south by France; and on the west by part of France, and the English channel. They consist of ten provinces, namely, Brabant, Antwerp, Malines or Mechlin, Limburg, Luxembourg, Namur, Hainault, Cambresis, Artois, and Flanders; extending in length about two hundred miles, and in breadth a hundred and thirty. The province of Flanders is one continued flat; but in others there is a mixture of hills and valleys, interspersed with woods, enclosures, and champain. South of Brussels lies the forest of Soignies, and farther southward that of Ardenne, being each a remainder of the great Hyrcynian Forest. The air is much better here than in the United Provinces; except on the coast of Flanders and Brabant, which are as unhealthy as Holland.

The chief rivers are, 1. The Maese, which rising in Burgundy, runs northward through Lorraine and Champain into the Netherlands, passing by Verdun, Sedan, and Dinant, and receiving the Sambre at Namur, proceeds north-west by Liege, Maefricht, Venlo, and Grave; whence, having joined the Waal, it runs towards the west, and discharges itself in the British sea. 2. The Scheld, which rises on the confines of Picardy, and runs north-east by Cambray, Valenciennes, Conde, Tournay, and Oudenard, uniting its waters with the Lis at Ghent, and thence running through Antwerp, continues its course north into the United Provinces: one branch of it, called the Ofter-Scheld, runs north, and the other, called the Western-Scheld, runs almost due west into the sea. The other most considerable rivers are, the Demer, Dyle, Ruppel, Nethe, Gut, Senna, Scarpe, Deule, and Donder; besides which are several noble canals, particularly those of Brussels, Ghent, Bruges, Ostend, and Dunkirk. The chief ports in Flanders are, Gravelin, Dunkirk, Newport, Ostend, and Sluys. The principal of these is Ostend, the others hardly admitting ships of burthen. Antwerp in Brabant, near the mouth of the Scheld, is an excellent harbour, but the Dutch have in a manner cut off all communication with the sea, by the forts which they have built at the mouth of the river. Sluys, in Dutch Flanders, is also a pretty good port.

The duchy of Brabant, including the marquisate of Antwerp, and the lordship of Malines or Mechlin, lies contiguous to the United Provinces on the south.

It is divided into four parts, namely, the quarter of Louvain, Antwerp, Brussels, and Boisleeve.

The city of Louvain stands on the river Dyle, fifteen miles north-east of Brussels, and is about seven miles in circumference, but a place of no great strength. It was formerly very considerable for its manufactures, containing at one time no less than four thousand master weavers; but it is now much declined, though it still has a trade in fine linen. Its great ornament at present is the university, founded about the year 926, but first endowed by John IV. duke of Brabant, in 1525. The situation and buildings of this university are much admired, as well as its noble endowments. The other towns in this quarter are, Tienen or Tilmont, St. Truen, or St. Tron, Lewe, Dieft, Gembleurs, Halen, Sicken, Judoigne, Hannue, Landen, and Ramillies.

In the quarter of Antwerp the chief towns are, Antwerp, Breda, Lillo, Lier, Herentals, and Hoogstraten.

Antwerp, capital of the marquisate of Antwerp, is situate on the east bank of the Scheld, in 4 degrees 15 minutes of east longitude, and in 51 degrees 15 minutes of north latitude, twenty-five miles north of Brussels, and thirty west of Louvain. It lies in a low fenny ground, and is built in the form of a crescent. The Scheld here being twenty foot deep, and the tide rising twelve foot more, ships of burthen may unload at the keys. Eight canals also are cut from the river for the convenience of carrying vessels into the town, some of which will contain a hundred sail. This circumstance rendered it one of the most safe and commodious harbours in Europe, till the Dutch cut off the communication with the sea, by their forts towards the mouth of the Scheld, and thus diverted the trade to their own ports. The city is about seven miles in circumference, and surrounded by a beautiful wall and bastions faced with stone. The top of the wall is not less than a hundred foot broad, and well planted with trees. There are thirteen noble gates, of which eight front the river, and have near them their several keys, where vessels are laden and unladen. The streets of the city are broad and regular, and the buildings magnificent.

The citadel, which stands on the south side of the city, on the bank of the Scheld, is a pentagon of five royal bastions, about a mile in compass. Here are large repositories for ammunition, and provision, with convenient accommodation for three thousand soldiers. This fort, which was erected during the government of the duke of Alva, gave the first check to the trade and greatness of Antwerp.

The trade of the English was once so great at this place, that they had an exchange to themselves. There is another common to all nations, built after the model of that of London, but supported by forty-three pillars of white marble, and standing in the centre of four large streets. The commerce of Antwerp was at its greatest height about the middle of the sixteenth century, when it was supposed to contain two hundred thousand inhabitants. But the Dutch forming their state

state a little after, and making themselves masters of the islands of Zealand, which lie at the mouth of the Scheld, diverted the current of trade to Amsterdam, and other cities of Holland. This event was not a little promoted by the oppressive government of the king of Spain. To which we may add, queen Elizabeth's being at war with that crown, and consequently favouring the derivation of the trade from the Spanish dominions towards the United Provinces.

The city of Breda, the capital of Dutch Brabant, is situate in 4 degrees 45 minutes of east longitude, and in 51 degrees 35 minutes of north latitude, in a flat country on the bank of the river Merk, thirty miles north-east of Antwerp, and as many to the southward of Rotterdam. It is a large, populous, well built city, regularly fortified, and has usually a numerous garrison of the troops of the states. It was taken from the Spaniards in the year 1637, by the prince of Orange, in whose family the property and civil government of the place still remains.

Bergen-op-zoom stands on an eminence in the middle of a morass, half a league from the eastern branch of the Scheld, with which it has a communication by a navigable canal. It lies about twenty miles north of Antwerp, and as many to the westward of Breda. This place, which is strongly fortified by nature as well as art, is of great importance, not only by securing the communication between Holland and Zealand, but opening to the Dutch a way into Austrian Brabant.

The chief towns in the quarter of Brussels are, Brussels, Nivelles, Senef, and Vilvorden.

Brussels, the capital of the province of Brabant, and of all the Austrian Netherlands, is situate in 4 degrees 8 minutes of east longitude, and 50 degrees 51 minutes of north latitude. It stands on the side of a hill on the little river Senne, twenty-two miles south of Antwerp, and twenty-six south-east of Ghent. It is surrounded by a wall and other fortifications; but being six miles in circumference, they would require an army to defend them. In this city are many noble abbeys and monasteries. The river Senne running through it, and joining the Kuppel, which falls into the Scheld by a fine navigable canal, near twenty miles in length, this place has a free communication with Antwerp and other cities. The country round it is well planted with fruit and forest trees, and watered with fountains, canals, and rivulets.

Nivelles stands near fifteen miles south of Brussels, near the head of the river Senne, and is one of the most pleasant towns in the Netherlands, but has no other fortifications than a single wall. This town enjoys great privileges, and is considerable for a linen manufacture equal to that of Cambray. Here also is a nunnery of noble ladies, who enjoy all manner of innocent freedoms, and are not confined to their cloyster, as in other places. Their governess, styled Madame de Nivelles, is chosen by themselves, with the consent of the sovereign and the pope.

Senef is a town five miles to the southward of Nivelles, memorable for a battle fought near it in 1671, between

the French and Dutch; and Vilvorden is situated on the river Senne, between Mechlin and Brussels, two leagues distant from each.

In the quarter of Bois-le-Duc, the chief towns are, Bois-le-Duc, Helmont, Eindhoven, Mege, Ravenstein, Grave, Maestricht, Crevecœur, and Hoxtal.

Bois-le-Duc is situate in 6 degrees 16 minutes of east longitude, and in 31 degrees 45 minutes of north latitude, on the river Dommet, twenty-three miles north-east of Breda, and seventeen miles west of Grave. It stands on a rising ground, in the middle of a large morass, and during great part of the year can be approached only by causeys, on which are built forts and redoubts for its defence. The town is about four or five miles in circumference, regularly fortified, and is one of the strongest upon the Dutch frontiers. Through it run several navigable canals, over which lie fifty stone bridges. Ten of the principal streets center in a spacious market-place, surrounded with good buildings.

Maestricht stands on the west bank of the river Maese, fifteen miles north of Liege, and thirty-five east of Louvain. It is about four miles in circumference, and strongly fortified. The streets are large, the old buildings of wood, and the new of brick. The stadthouse is built after the model of that of Amsterdam. On the west side the city has a suburb, called the Wyck, of which the bishop of Liege has the civil government, though both this and the city be within the dominions of the Dutch.

The little province of Mechlin, or Malines, is about ten miles long, and five broad. Its capital, which bears the same name, stands on the river Dyle, about twelve miles north-east of Brussels, eleven miles north-west of Louvain, and thirteen south-east of Antwerp. It is a large well built city, and fortified, but of no great strength; consisting of several islands, made either by the branches of the Dyle or artificial canals, over which are a great many bridges. The tanners and weavers trade flourished much here formerly, and are still considerable. The town is also famous for casting bells and great guns; but the manufacture for which it is now most distinguished is that of lace, considered as the finest in the Low Countries.

On the border of this province stands the little town of Arschot, erected into a duchy by Charles V. It is seated on the river Demer, twelve miles to the eastward of Mechlin, and has a small territory belonging to it, the inheritance of the ancient family of Croys.

The province of Limburg is bounded on the north and east by the duchy of Juliers; on the south by Luxemburg, and on the west by the bishoprick of Liege; being about thirty miles long, and twenty broad. It consists of good arable and pasture lands, with plenty of wood, and some of the best iron mines in the Netherlands. The chief towns are, Limburg, Dalem, Baldock, and Valkenburg, or Fauquemont. The town of Limburg stands on a steep rock twenty miles south-east of Liege, and about twelve south-west of Aix-la-Chapelle, and is a little fortified town, but not of great strength.

*Habit of a Lady of Quality in Syria.*

*This Lady's Head-dress is a high Bonnet covered with Velvet, and adorned with a Gold Thread put on in Squares; from the top of this Bonnet hangs a thin Veil curiously wrought with Needle-work, which falls over the Shoulders. The under Garment is close; the Sleeves long and narrow: Over this Garment is worn another of Amasine, and over that another with an embroidered Edge: They wear Chains of Gold and Jewels hang loose round their Necks, and paint themselves immoderately with white & red.*

The province of Luxemburg is bounded on the north by the bishoprick of Liege and duchy of Limburg; on the east by the river Moselle, which divides it from Trier; on the south by the duchy of Lorraine; and on the west by the river Maese, which separates it from the counties of Champaign, Hainault, and Namur; being about seventy miles long and sixty broad. The north part of it is a fruitful soil, but the south is incumbered with the mountains, and the forest of Ardenne. The north division, which is much the largest, is subject to Austria, and the southern to France. The chief towns are, Luxemburg, Thionville, Montmedy, Damvillers, Yvoix, La Forêt, Aftensy, Morville, Rode Macheren, Konings Macheren, Sirick, Maseres, Durly, La Roche, St. Vita, Viande, Eich-Ternach, Baifoigne, Neufchattel, and Virton.

Luxemburg, the capital of the Austrian division of this province, stands on the river Else or Aistat, a hundred miles south-east of Brussels, seated on a rock, and strongly fortified, but not large. Its ancient name was Luciburgum, and it is supposed to have been built in honour of the sun.

Thionville, capital of the French division of this province, is situate fourteen miles south of Luxemburg, and is a well built, fortified town.

The province of Namur is bounded on the north by Brabant; on the east and south by the bishoprick of Liege; and on the west by the province of Hainault; extending about thirty miles in length, and twenty in breadth. It is a fruitful country, and has good mines of lead and iron. The chief towns are, Namur, Bouvines, Waicourt, Charleroy, and Charlemont.

The city of Namur stands at the confluence of the Sambre and the Maese, thirty miles south-east of Brussels. It is defended by a castle situated on a rock, and esteemed one of the strongest fortresses in the Netherlands. It is the see of a bishop, suffragan to the archbishop of Cambray.

Charleroy stands on a hill near the river Sambre, twenty miles west of Namur, and is also reckoned a very strong fortress.

The province of Hainault is bounded on the north by Brabant and Flanders; on the east by Namur and Liege; on the south by Cambresis, Picardy, and Champaign; and on the west by Artois, and another part of Flanders. The north part of it is subject to Austria, and the south to France. The chief towns in the French division are, Valenciennes, Bouchain, Conde, Bavay, Maubeuge, Le Quesnoy, Avesnes, Zandrecy, Philipville, and Marienburg; and of the Austrian division, Mons, Aeth, Brain le Compte, St. Gillian, Enghien, Bincha, Halle, Laînes, Roches, Soignes, and Beaumont.

Valenciennes, the capital of the French Hainault, is situate on the river Scheld, fifteen miles south of Tournay, and seventeen south-west of Mons. It is a large well built town, strongly fortified and defended by a citadel; and as it stands in a flat country, abounding with rivulets, its environs may be laid under water upon any emergency. The inhabitants had

No. 23.

formerly a brisk trade in cloth and French wines, but the chief manufactures at present are those of silk and linen.

Mons, capital of the Austrian Hainault, stands on a hill, twenty-six miles south-west of Brussels, and twelve miles south-east of Tournay, near the confluence of the rivers Haine and Trouille. It was formerly a strong place, but the works were demolished by the treaty of Aix-la-Chapelle. It is a bishop's see, and there the states of the province assemble.

The Cambresis, or province of Cambray, is situated in the south-west part of the Netherlands, and is a fruitful country, about twenty-five miles long and ten broad. The chief towns are Cambray, Chateau, Cambresis, and Crevecoeur.

Cambray is situate on the river Scheld, near its source, fourteen miles south-west of Valenciennes, and fifteen south-east of Douay. It is a large well built city, regularly fortified and defended by two citadels; and as the adjacent country may also be overflowed, it is considered as one of the strongest towns in the Netherlands. The principal manufacture is that of fine linen, thence called Cambric.

The province of Artois lies between Flanders and Picardy, and is about sixty miles long, and twenty-five broad. It was confirmed to France by the Pyrenean treaty in 1659; and having been so long in the possession of that crown, the natives are perfectly assimilated with the French in the other provinces of the kingdom. The chief towns are, Arras, St. Omer, Aire, Bethune, St. Venant, Bassaume, Hefden, Terrouen, Lens, Averno de Compte, St. Paul, and Munt St. Eloy.

Arras, the capital of the province, is situate in 2 degrees 50 minutes of east longitude, and in 50 degrees 20 minutes of north latitude; standing on the river Scarpe, twelve miles south-west of Douay, and twenty-two miles north-west of Cambray. It is a large fortified town, with considerable manufactures both of linen and woollen; but it is chiefly distinguished for that tapestry, whence its name is derived. It is also the see of a bishop, who is suffragan to the archbishop of Cambray. The cathedral, dedicated to the Virgin Mary, is a magnificent structure. In a chapel here the priests show a wax taper burning, which they pretend does not consume, and was sent to them from heaven. They have also a pot of manna, said to have been obtained in the same way; and this they expose in a dry season, when prayers are put up for rain. The town of Arras is generally well built, the streets broad, and the market-place spacious. Its ancient name was Atrabatum, and it was the capital of the Atrabates in the time of Cæsar.

St. Omer stands on the river Aa, twenty miles south of Dunkirk, and eighteen miles south-east of Calais. It is a large trading town, having a communication with the sea by a navigable canal, which extends thence to Graveline. It has been famous for an English seminary of Jesuits, and is the see of a bishop, suffragan to the archbishop of Cambray.

X x x

The

The province of Flanders is bounded on the north by the German ocean, and the United Provinces; on the east by the Brabant; on the south by Hainault and Artois; and on the west by another part of Artois, and the German ocean; being about sixty miles long and fifty broad. It is divided between the Austrians, the French, and the Dutch. This province is one continued flat, watered with innumerable rivers and canals, and not only exceeding fruitful, but commodiously situated for trade, and has some of the finest cities in Europe, with above a thousand other towns and villages. The produce of the country is chiefly fine lace, linen, and tapestry.

In the Dutch division, which lies in the north-east part of the province, the principal towns are, Sluys, Ardenburg, Middleburg, Sas-van-Ghent, Hulst, Axel, Liefkens, Terneus, Philippin, Biervliet, Isendick, Obburg, with Cadfant-fort and island.

Sluys, the most commodious port of Flanders, is situated about ten miles north-east of Bruges, which city can have no communication with the sea, by the way of the Scheld, when the Dutch are disposed to obstruct the passage.

Sas-van-Ghent, or the port of Ghent, lies about twelve miles to the northward of that city, and is a small but strong fortress, situate in a morass; by the possession of which the Dutch may at their pleasure cut off all communication between Ghent and the sea.

Cadfant island is situate at the mouth of the Scheld, over against the island of Walkeren. It is about nine miles in length and four in breadth, containing a fort of the same name, by which the Dutch secure their communication between Flanders and the islands of Zealand.

The chief towns of the Austrian division, which is the largest, are, Ghent, Bruges, Damme, Ostend, Plafendal, Newport, Dayns, Dendermont, Rupelmond, Alost, Ninove, Oudenard, Harlebeck, Courtray, Menin, Comines, Warwick, Warneton, Tournay, Ypres, Fort Knoque, Dixmuyde, and Furnes.

Ghent, the capital of Flanders, is situate in 4 degrees of east longitude, and in 51 degrees 24 minutes of north latitude, on four navigable rivers, viz. the Scheld, the Lys, the Licue, and the Mourwater. It is about twelve miles in circumference, defended with walls and other fortifications, besides a castle; notwithstanding which it is a place of no great strength, on account of its extent being disproportioned to any moderate garrison. More than half the ground within the walls consists of fields and gardens. It is divided into twenty-six islands, by the rivers and canals which run through it; over which are laid three hundred bridges. On the Bridge called Dogabrack, are two brazen statues representing a son beheading his father. The tradition is, that both being condemned to die, a pardon was offered to him who should execute the other; and the father having prevailed with the son to take the office upon him, as he was ready to strike, the blade of the sword broke in his hand, which being looked upon as miraculous, the pardon was extended

to both. The stadthouze and cathedral here are handsome structures. Besides the latter there are seven parish churches, with fifty-five monasteries and nunneries, among which is an English nunnery. Here the silk and woollen manufactures, as well as that of linen, greatly flourish, and the city has likewise a brisk trade in corn. It is a bishop's see, under the archbishop of Mechlin; and likewise the seat of the provincial court, from which there lies an appeal to that of Mechlin.

Bruges lies twenty-four miles north-west of Ghent, and eight miles east of Ostend, on the grand canal which reaches between those cities. It is about four or five miles in circumference, surrounded by a wall and other fortifications, but not able to sustain a brisk siege. The town is populous, well built, and has a spacious market-place, in which six of the principal streets terminate. It contains seven parish churches besides the cathedral, with sixty monasteries and nunneries, among which is one for English nuns. Before the revolt of the United Provinces, or rather before Antwerp arrived to its grandeur, this was the most commercial town in Europe. Having a communication with the sea by means of the new canal to Ostend, it is still a place of good trade. The chief manufactures are those of woollen cloth and stuffs, linen and tapestry.

Ostend is situated ten miles west of Bruges, on a morass, almost surrounded by wide trenches filled with sea water, and has the best harbour in Flanders, next to that of Sluys. The town is not large, but the houses are generally well built, and the streets not only regular but well paved. It is environed with modern fortifications, which, with its boggy situation renders it one of the strongest towns in Flanders.

Newport, another of the five ports of Flanders, lies near the sea-shore, eight miles south-west of Ostend, and fifteen west of Bruges, at the mouth of a small river. The town is fortified, but not very considerable either for its buildings or trade.

Dendermond stands twelve miles to the eastward of Ghent, at the confluence of the Dender and Scheld. It is a strong fortress surrounded by meadows, and can only be approached by causeys, when the citizens think proper to lay the country round them under water.

Oudenard lies fourteen miles south of Ghent, and is situated on the river Scheld, which divides it into two parts. It is almost surrounded by meadows, except that there is a hill which commands it on the south side. The streets are wide and handsome, and there are several fine churches and monasteries. The town carries on a flourishing trade, consisting chiefly of linen and tapestry.

Courtray stands on the river Lys, twenty-six miles south-west of Ghent, and twelve miles north-east of Lisle, strong by nature as well as art, and also defended by a good citadel. It is a populous place, and has a brisk trade both in the linen and woollen manufactures.

Tournay is situate on the river Scheld, thirteen miles east of Lisle, and twenty-one west of Mons.

It is a large elegant town, containing seventeen parishes, and has a good linen manufacture.

Ypres, or Ipres, is situate in a flat country, on the river Ipre, about ten miles westward of Menin, and eighteen northward of Lille. It is a large town, regularly fortified, and by its sluices can lay the neighbouring country under water. The streets are broad, and the market-place the most capacious of any in Flanders; surrounded by a piazza; but the houses are built of timber.

The chief towns in French Flanders are, Lille, Duokirk, Mardyke, Gravelin, Berg St. Winock, Doway, Orchies, Armentiers, La Bassé, L'Eoluse, St. Amand, Lanoy, and Bourbourg.

Lille, or Ryffel, is situate on the river Deule, twenty-five miles north of Arras, and fourteen west of Tou nay. It had formerly stood in a lake, on which account it received its name; but the waters are now drained off. The silk manufacture, with that of fine linen and cambric, are here in great perfection; and their camblots are much admired. It is the capital of French Flanders; and from the elegance of its buildings, and its flourishing trade, usually styled Petit Paris.

Dunkirk is situate on the British channel, at the mouth of the river Coln, twenty miles east of Calais, twenty-two south-west of Ostend, and fifty east of Dover. The fortifications of this port cost France an incredible sum of money. The place was taken from the Spaniards by the united forces of Britain and France, and was put into the hands of the former nation in 1658, but afterwards sold to the latter in the reign of Charles II. The French much improved the fortifications, and in the succeeding wars it was the station of their privateers, which greatly molested the English trade. At the treaty of Utrecht, therefore, Britain insisted on the harbour and fortifications being demolished, which was accordingly done; but in the late war the French attempted to rebuild the works, but were again obliged to demolish them by the peace of 1763.

Douay stands on the river Scarpe, fifteen miles south of Lille. It is a large populous town, and strongly fortified. The principal manufacture is worsted camblots. Here is a considerable seminary of English Roman Catholics, founded by Philip II. king of Spain, about the year 1569.

The Austrian Netherlands are subject to the empress-queen, who assembles the states of each province by her viceroy, when money is wanted for the support of the government, or when any alteration in their laws is deemed to be expedient. The states consist of the bishops, abbots, and dignified clergy; with the nobility and gentry, and representatives of the several towns. They all meet at Brussels, except those of Luxemburg, who assemble in the capital of their own province. Besides the viceroy or governor-general, there is in each province an inferior governor. Every province also has its own court of justice, from which there lies an appeal to the supreme court at Malines. Their judges are usually governed in these determinations by the civil and canon laws, and the particular customs of each province.

As the Netherlands lie between France and Holland, the inhabitants frequently speak both French and Dutch, and have also a language, called Flemish, which is a barbarous mixture of the two. In their manners and customs, they for the most part resemble the people of the country to which they are most near. In Dutch Flanders and Brabant they are Calvinists, as in Holland; in the other parts, generally Roman Catholics, but far from being bigots; and the Inquisition prevails not here any more than in France.

In those provinces there are two archbishopricks, viz. Cambrai and Malines, and nine bishopricks, namely, Ghent, Bruges, Antwerp, Arras, Ypres, Tournay, St. Omer's, Namur, and Ruremond. The universities are those of Louvain, Douay, and St. Omer's. The coins of Germany and France are current here.

## F R A N C E.

### C H A P. I.

*Of the situation — air — mountains — rivers — provinces — chief towns*

**T**HE kingdom of France is situated between 5 degrees of west, and 8 degrees of east longitude, and between 42 and 51 degrees of north latitude. It is bounded on the north by the British channel and the Austrian Netherlands; on the east by Germany, Switzerland, Savoy, and Piedmont; on the south by the Mediterranean Sea, and the Pyrenean mountains, which separate it from Spain; and on the west by the

Bay of Biscay. It is almost a square of six hundred miles on each side, except that the province of Brittany makes it irregular, by extending near a hundred miles farther to the westward than any other part.

The temperature of the air in this country is perhaps the most healthful of any in Europe, and towards the north, the soil produces corn, wine, oil, and flax, in great abundance.

The chief mountains are, the Alps, which divide France from Italy; the Pyrenees, which separate it from Spain; the Vauge, which divides Lorraine from Burgundy and Alsace; Mount Jura, which separates

Dau-

Dauphine from Switzerland; the Cevennes, in the province of Languedoc; and mount Dor; in the province of Auvergne.

The principal rivers are; the Rhone, which rises in Switzerland, and is joined at Lyons by the Soane; after which, dividing Dauphine and Provence from Languedoc, it falls into the Mediterranean below Arles, receiving also in its passage the rivers Isere and Durance. The Garonne rises in the Pyrenees, and running north-west, falls into the Bay of Biscay, below Bourdeaux; after receiving the rivers Lot and Dordonne. The Charente rises in Limosin, and running westward, falls into the Bay of Biscay below Rochort. The Loire rises in the Cevennes, whence running northward, and afterwards to the west by Orleans, it falls into the Bay of Biscay below Nantz, receiving in its passage the Aller, the Cher, Vienne, the Little Loire, the Sarre, and the Mayenne. The Seine rises in Burgundy, and running north-west by Paris and Rouen, falls into the British channel at Havre de Grace, after being joined by the Yonne, the Aube, the Marne, and Ouse. The Rhine rises in Switzerland, and running north-west, divides Alsace from Suabia, being the boundary between the territories of France and Germany towards the east. Continuing its course north through the Netherlands, it there divides itself into three streams, receiving in its passage the Moselle and the Sarre. The Maese or Meuse rises in Champaign, and running north through Lorraine and the Netherlands, falls into the German sea below the Briel, after receiving the Sambre at Namur. The Scheld rises in the confines of Picardy, and running north-east through the Netherlands, turns westward, and falls into the German sea at the island of Walcheren, receiving the Lis at Ghent, and the Scarpe at Conde. The Somme running north-west through Picardy, falls into the British channel below Abbeville. The Var rises in the Alps, and running south, divides France from Italy, falling afterwards into the Mediterranean west of Nice. The Adour runs from east to west through Gascony, and falls into the Bay of Biscay below Bayonne.

France is divided into fifteen large provinces, viz. Picardy, Isle of France, Champaign, Normandy, Brittany, Orleanois, Lionois, Provence, Languedoc, Guienne, Gascony, Dauphine, Burgundy, Lorraine, and Alsace.

The province of Picardy is bounded on the north and east by the French Netherlands and the Straits of Dover; on the south by the Isle of France; and on the west by the British Channel, and the province of Normandy; being about a hundred and fifty miles long, and from twenty to forty broad. It is for the most part a plain open country, without woods or mountains producing corn, pasture, and fruits, but no wine.

The chief towns are, 1. Amiens, capital of the province, situate in 2 degrees and 30 minutes of east longitude, and in 49 degrees 34 minutes of north latitude, on the river Somme, sixty-five miles south of Calais, and eighty north of Paris. It is a large beautiful town, and has some manufactures of woollen

and linen, being also the see of a bishop, under the archbishop of Rheims.

2. Calais is situate on the coast of the English channel, twenty-one miles south-east of Dover, and a hundred and fifty-two north of Paris. It is well fortified, and has a citadel, which commands both town and country; but its greatest strength consists in its situation among the marshes, and in the power of overflowing the environs upon the approach of an enemy. A navigable canal runs from it to St. Omer's, Graveline, Dunkirk, Bergues, and Ypres. The inhabitants are computed at four thousand. This place was taken by Edward III. king of England, in 1347, and lost in the reign of queen Mary, in 1557. It was anciently a good harbour, but is now so choked up, as not to admit any vessels of burden.

3. Creffy is situate forty-four miles south of Calais, and memorable for the victory obtained in its neighbourhood over the French, by Edward III. of England, in 1346.

4. Abbeville stands fifteen miles east of the British channel, and is considerable for its woollen manufacture.

5. Boulogne is situate on the British channel, at the mouth of the river Laine, sixteen miles south-west of Calais. This town was taken by Henry VIII. king of England, but restored to France, in consideration of receiving three hundred thousand crowns.

The Isle of France is bounded on the north by Picardy, on the east by Champaign, on the south by Orleanois, and on the west by Normandy. The capital of this province, and of the whole kingdom is Paris, situate in a degree 25 minutes of east longitude, and in 48 degrees 50 minutes of north latitude. This city is usually divided into three parts; the largest of which, called the town, stands on the north side of the river Seine; the city, which is the most ancient part, consists of three small islands in the middle of the river; and the other part, or the university, is seated on the south side of the Seine, having in it several little hills. The whole town is of a circular form, and about eighteen miles in circumference; but though, according to this computation, it occupies more ground than London, it is not near so populous, the inhabitants of Paris not amounting to more than seven hundred thousand, whereas those of the former are supposed to exceed this number, in the proportion of almost a third part. The houses of Paris are built of white hewn stone, five, six, or seven stories high; and there are a great many palaces, with beautiful gardens, belonging to the nobility; but being shut up from the streets by high dead walls, they rather increase the bulk, than add to the embellishment of the city. The streets are generally narrow, without pavement for foot passengers, and in the night are illuminated by lamps suspended on ropes placed across. By the computation of a late French writer, there are here fifty thousand houses, with a family in almost every story; fifty-two parishes, and a hundred and twenty churches, parochial, chapter, or collegiate, including chapels. There are about thirty bridges, but none of them very considerable, except the Pont Neuf,

Neuf, and the Pont Royal. The Louve, and the other royal palaces, where the kings used to reside, are now decayed buildings. The university of Paris is very ancient, having been founded by Charlemagne in the year 790. The college for divinity, named the Sorbonne, and from which the university is sometimes denominated, is one of the finest in Europe, but now upon the decline. Among the public institutions are, the academy of sciences, that for improving the French language, and others for the improvement of painting, sculpture, and architecture, as well as that of mechanic arts and manufactures, such as works of iron, steel, copper, brass, wrought plate, tapestry, &c. The chief manufactures are those of gold and silver stuffs, wrought silks, velvet, gold and silver lace, ribbons, tapestry, linen, and glass. Paris is the see of an archbishop, and Notre Dame the metropolitan church. The city is well supplied with provisions of all kinds, which are generally sold at a cheap rate. In the day, the public safety is protected by a corps-de-garde, and at night, by a horse and foot patrol.

About twelve miles south-west of Paris stands Versailles, situated on an eminence in the midst of a fine sporting country, encompassed with hills. It consisted originally of a castle built by Lewis XIII. as a hunting seat, which was afterwards converted into a magnificent palace, by Lewis XIV. who also annexed to it a handsome town. The avenue leading to the palace divides the town into two parts; one of which is called Old Versailles, and the other the New Town. On the side towards Paris this avenue forms three vistas, that in the middle being sixty foot wide, and the others thirty foot each, all planted with elms.

The great court of the palace is four hundred and eighty foot long, with a large pavilion at each corner. It is inclosed with an iron balustrade, and two large buildings, that form the wings on each side, which have balconies supported by columns, and adorned with fine statues. These wings, with pavilions, serve for offices, and have behind them others for the same purpose.

From this court is an ascent of three marble steps into a large landing place, and thence by five more, into a little court paved with black and white marble; in the middle of which is a marble fountain and basin, with statues of gilt copper. The front and wings are of brick and free stone, adorned with marble busts and brackets; and before this front is a balcony, supported by eight marble columns of the Doric order, with red and white spots like jasper, and their bases and capitals of white marble. In the two angles of the wings in the front are hanging pedestals, which support two closets, encompassed with gilt iron cases; and underneath are two basins of white marble in the form of shells, where young Tritons spout water. The middle building has three gilt iron doors in the porch, with apartments on the right and left.

On quitting the great court, through an open porch, we ascend by a stair-case eighty-one foot long, and thirty broad. From the porch an entrance leads to two painted halls. The ceiling of one of them is

supported by eight marble columns of the Doric order, with red and white veins. The capitals and bases are of a greenish colour; and the columns, of which there are four on each side, divide the hall into three parts. On the sides opposite to each column are pilasters of the same marble, that support a cornice under a platform; and fronting the windows are niches with statues.

The other hall is supported by twelve columns of the Ionic order, which have behind them marble pilasters, with red, black, purple, and yellow veins; their capitals and bases being of white marble. From this we enter a third hall of the same dimensions, the ceiling of which is an octagon, with twelve double pedestals of fine marble, on which are placed emblematical figures of the twelve months, in gilt copper. All the parts not hung with tapestry are lined with marble.

The royal apartments are extremely magnificent, and richly ornamented with sculptures and paintings. Their furniture, even to the bedsteads, balustrades, and rails, consist chiefly of massy plate.

The gardens are no less magnificent than the palace, and particularly abound with curious water-works. The labyrinth, which is a fine grove, is admirably executed; and the orangery, or green-house, is a master-piece of its kind.

In the park of Versailles is another palace, called Trianon, which is also very magnificent; and in a contiguous park, is a third royal seat, named Marly, particularly beautiful.

Fontainebleau is situated thirty-five miles south-east of Paris, in a country that is likewise well adapted to hunting. The town is mean, but the palace, though not uniform, and though built at different times in a confused manner, is however very commodious, and has an air of grandeur.

The province of Champagne is bounded on the north by Picardy, on the east by Lorraine, on the south by Burgundy, and on the west by the Isle of France. The chief town is Troyes, situate on the river Seine, ninety miles south-east of Paris. It is a large fortified place, computed to contain fifteen thousand inhabitants, and has a flourishing linen manufacture. The other most considerable towns are, Sens, Langres, Provins, St. Dizier, Chalons, Joinville, and Rheims. The last of these is situated eighty-five miles north-east of Paris, and is one of the most elegant cities in the kingdom. Here is kept the holy oil used at the consecration of the French kings, which, according to their tradition, was brought from heaven by a dove. The archbishop of this see has the right of consecrating the kings, and is a duke and peer of France.

The province of Normandy is bounded on the north by the British channel; on the east by Picardy and the Isle of France; on the south by Orleans; and on the west by Britany, and another part of the British channel; being near two hundred miles in length from east to west, and about a hundred in breadth. It is agreeably diversified with hills and valleys, and is one of the most fruitful provinces in France, except

in wine. It was anciently called Neustria, or West France, till the tenth century, when the Normans and Danes made a conquest of it under Rollo, their first duke. It became afterwards united to the crown of England in the person of William the Conqueror, in which condition it remained till the time of king John.

The chief town is Rouen, situate in 1 degree 10 minutes of east longitude, and in 49 degrees 26 minutes of north latitude, on the north side of the river Seine, seventy miles north-west of Paris, and forty-five south-east of the British channel. The city is about seven miles in circumference, and computed to contain sixty thousand inhabitants. One of the most remarkable objects here is the bridge over the Seine, two hundred and seventy paces in length, supported by boats; whence it becomes higher or lower according to the tide. Rouen is the see of an archbishop, and the seat of a parliament; having also a mint, a college, an academy, two abbeys, and a castle. It is advantageously situated for trade, and is the centre of commerce in the northern parts of France. The other chief towns of this province are, Caudebeck, Eyreux, Gouray, Lisieux, Bajoux, Coutance, Avranches, Seco, Alençon, and Caen. The latter is situated on the river Orne, seventy-five miles west of Rouen, and seven miles south of the British channel, with which it has a communication. It is a place of considerable trade, and contains about forty thousand inhabitants; being likewise the see of a bishop, and having an university. Here William I. king of England, was buried, in the abbey of St. Stephen, which he had founded.

Britany is encompassed on the north, west, and south, by the British channel and the Bay of Biscay; and bounded on the east by the province of Orleanois. The chief towns are, 1. Rennes, the capital, situate on the river Villaine, fifty-eight miles north of Nantz. 2. Nantz, seated on the river Loire, thirty miles east of the ocean. It is a large populous city, and has a very extensive trade, though ships of burden cannot reach it, but are obliged to unload at Pambouf, near the mouth of the river. Here was promulgated, by Henry IV. the famous edict, thence called the edict of Nantz, which was afterwards revoked in 1685. 3. St. Malo, seated on a rock in the English channel, surrounded by the sea, but joined to the continent by a causeway; lying thirty-eight miles north-west of Rennes, and ten miles north of Dinant. The harbour is one of the best on the coast, but of difficult access, and will not admit of large vessels. The town, which is indifferently built, is inhabited chiefly by sea-faring men, and in the time of a war with Britain, fits out a great number of privateers. 4. Brest, situate on Cameret Bay, in the Atlantic Ocean, a hundred and fifty miles north-west of Nantz, and three hundred miles west of Paris. This is one of the principal ports in France for the navy. 5. Port L'Orient, seated at the mouth of the river Blavet, on the north side, seventy-eight miles north-west of Nantz. It is guarded by a fortress, and obtained its name from being the station of the French East-India ships. 6. Port Louis,

seated on the south side of the river Blavet, opposite to Port L'Orient. It has a good harbour, and is a station for part of the royal navy, as well as for the ships of the French East-India Company.

The province of Orleanois is bounded on the north by Normandy and the Isle of France, on the east by Champaign and Burgundy, on the south by Lionois and Guienne, and on the west by Britany and the bay of Biscay. The chief towns of this province are, 1. Orleans, the capital, situated on the river Loire, seventy miles south of Paris. This is a place of great trade, considering that it is an inland town, having a communication with the south-west parts of France, by the river Loire; and with the northern by the canal of Orleans. It is about four miles in circumference, a bishop's see, and the seat of an university. The French language is spoken here with the greatest purity. The inhabitants yet commemorate the famous heroine, Joan of Arc, who by her address retrieved the French affairs after the conquest of the kingdom by Henry V. of England. A statue of her, in complete armour, is placed on the great bridge. 2. Blois, seated on the north side of the Loire, thirty-two miles south-west of Orleans. This is an elegant town, and here the kings have a palace. 3. Tours, situated also on the Loire, sixty miles south-west of Orleans. It is built with a fine white stone, and laid out in spacious streets, adorned with public fountains. Here also is a royal palace, where the states of the nation assembled in the reign of several of their princes. The town is the see of an archbishop. 4. Angers, situate at the confluence of the Little Loire and the Sarthe, a hundred and sixty miles south-west of Paris, and forty-two miles east of Nantz. Part of the town stands on the side of a hill, and the rest in the plain. It is surrounded by a wall with antique fortifications, and commanded by a castle which stands upon a steep rock. The town contains about nine thousand houses, and thirty thousand inhabitants. The cathedral is an elegant structure. It is the see of a bishop under the archbishop of Tours. Here is an university, chiefly for the study of law; with an academy erected by Louis XIV. on the same footing with the royal academy at Paris. 5. Poitiers, situated on an eminence near the little river Clain, seventy miles north-east of Rochelle. This is also the see of a bishop, and seat of an university. Near this city, Edward the Black Prince, son of Edward III. king of England, obtained a complete victory over the French in 1356, making prisoners John, king of France, and his son Philip, whom the conqueror brought over to England. 6. Rochelle, situate on the Bay of Biscay, seventy miles south-west of Poitiers. 7. Rochfort, seated near the mouth of the river Charante, twenty-three miles south of Rochelle. It is a large town, built by Louis XIV. and is one of the stations of the royal navy. Besides those, the other towns of greatest eminence are, Beaufort, Nivers, Nugent, Chartres, Lucen, Angouleme, Bourges, and Montargis.

The province of Lionois is bounded on the north by Orleanois and Burgundy, on the east by the river Rhone, on the south by Languedoc and Guienne, and

on the west by another part of Orleanois. The chief town is Lyons, situated at the confluence of the rivers Rhone and Soane, in 4 degrees 55 minutes of east longitude, and in 45 degrees 50 minutes of north latitude. This is a town of great antiquity, and was the seat of the Roman government in Gaul. The ruins of some of the Roman palaces are here yet visible. It is one of the places of greatest trade in the kingdom, and is computed to contain a hundred and fifty thousand inhabitants. The other towns of eminence are, Beaujeu, Feurs, Clermont, St. Flour, Bourbon Archibaut, and Gueret.

Provence is bounded on the north by Dauphine, on the east by Piedmont and the Mediterranean Sea, on the south by the same sea, and on the west by the river Rhone, which separates it from Languedoc. Towards the north and east it is mountainous, but in the other parts level, producing plenty of wine, oil, and fruit. In this province are great manufactures of silk, with those of gold and silver lace, and linen. The chief towns are, 1. Aix, the capital of the province, sixteen miles north of Marseilles. 2. Jenez, lying forty-six miles north-east of the preceding. 3. Arles, situated on the east bank of the Rhone, thirty-five miles north-west of Marseilles. This place was made the seat of the Roman empire in Gaul, under Constantine; and there are still large remains of a Roman amphitheatre and other antiquities. Several councils have here been held, particularly one, which condemned the opinion of the Donatists, in the year 314. It is at present a large town, and the see of an archbishop. 4. Marseilles, situate in 4 degrees 27 minutes of east longitude, and in 43 degrees 18 minutes of north latitude, on a fine bay in the Mediterranean, four hundred and twenty-two miles south-east of Paris. This is a fortified place, and has a spacious harbour, the station of the French galleys, but which will not admit of any large men of war. The town is said to contain a hundred thousand inhabitants. It has a good silk manufacture, and a great foreign trade, with warlike magazines, supposed to be equal to any in Europe. It is also the see of a bishop, and the seat of an university, or rather an academy. 5. Toulon, situated on a bay of the Mediterranean, thirty miles south-east of Marseilles. This has the most secure and spacious harbour of any port in France, Here the largest ships in the navy are built and stationed. Here are also schools for the marine guards, where they are taught navigation; with a foundery for cannon and mortars. 6. Avignon, situate on the east side of the river Rhone, thirty-seven miles north-west of Aix, and twelve miles south of Orange. This town is the see of an archbishop, and, with the adjacent territory, was subject to the pope; but in 1762, the French took possession of the city, and have obliged the inhabitants to swear allegiance to their king. Seven popes successively resided here, viz. from the year 1307 to 1377; but to prevent the future removal of the seat of the papal hierarchy from Rome, the Italians have ever since taken care to have a majority of the cardinals of that nation, and an Italian is now always chosen to succeed to the papal

chair. Here is the only court of inquisition within the dominions of France. Near this city lies Vaucluse, celebrated for the residence of the poet Petrarch. Its situation is extremely romantic, being a little valley, enclosed in the form of a horse-shoe, by a barrier of rocks, which are bold, high, and grotesque. The valley is divided by a river, along the banks of which are extended meadows and pastures of a perpetual verdure. A path, which is on the left side of the river, leads in gentle windings to the head of this vast amphitheatre, where, at the foot of an enormous rock, is a prodigious cavern, in which arises the spring, which has been immortalized by the Italian bard. The other principal towns of this division are, Reiz, Digne, Frejus, Gracé, Vence, Glan-deve, Sisteron, Apt, Forcalquir, Carpentras, and Orange.

The province of Languedoc is bounded on the north by Lionois; on the east by the Rhone, which separates it from Dauphine and Provence; on the south by the Mediterranean and Pyrenees; and on the west by Gascony and Guienne.

The capital city is Toulouse, situated in 1 degree 31 minutes of east longitude, and in 42 degrees 36 minutes of north latitude, on the river Garonne, three hundred and seventy-five miles S. by E. of Paris. This is a city of great antiquity, and in the time of the Romans, was one of the most flourishing in Gaul. Here are yet the ruins of a Roman amphitheatre. It afterwards became the capital of the kingdom of the Visigoths, and in later times, of that of Aquitain. It is at present one of the largest cities in France, but neither rich nor populous, and computed to contain no more than nineteen thousand families. It is the see of an archbishop; and here are, a parliament, a mint, an university, and an academy of Belles Lettres.

Montpellier is situate in 3 degree 58 minutes of east longitude, and in 43 degrees 57 minutes of north latitude, on the small river Lez, near the Bay of Maguelon and the Mediterranean Sea, a hundred and eighty miles S. by W. of Paris. The salubrity of the air at this place draws hither valetudinarians from every quarter. It is computed that the inhabitants are between two and three thousand, among whom is a great number of physicians and apothecaries. Here is also an university, intended chiefly for the study of physic; with a royal academy of sciences, a mint, and a citadel. The churches and convents were here very numerous before the civil wars in the sixteenth century; when they were all demolished, except three, the principal of which is that of Notre Dame, remarkable for its high steeple, altar, and chapel of the Virgin Mary. This is also the see of a bishop.

The other towns of eminence are, Alby, Foix, Perpignan, Lauregais, Narbonne, Beziers, Nîmes, Mende, Viviers, and Puy.

The province of Guienne is bounded on the north by Orleanois; on the east by Languedoc; on the south by Gascony, from which it is separated by the river Garonne; and on the west by the Bay of Biscay. The capital of this province is Bourdeaux, situate in 39 minutes

minutes east longitude, and in 44 degrees 50 minutes north latitude; on the river Garonne, three hundred and twenty-five miles south-west of Paris, and eighty-seven miles south of Rochelle. This is one of the largest and richest cities in France, containing about forty thousand inhabitants. It has a great foreign trade, especially in wine. The town is fortified after the modern way, and, with the see of a bishop, has also an university. Here are yet the remains of an amphitheatre, and other Roman antiquities; and here Edward the Black Prince having resided some years, his son, afterwards Richard II. king of England, was born. The other principal towns are, Bazis, Agen, Rhodes, Saïates, Periguex, Limoges, and Cahors.

The province of Gascony is bounded on the north by Guienne; on the east by Languedoc; on the south by the Pyrenees, which separate it from Spain; and on the west by the Bay of Biscay. The chief towns are, 1. Aux, or Augh, situate in 20 minutes of east longitude, and in 43 degrees 40 minutes north latitude, on the side of a mountain, near the river Gers; eighty miles south-east of Bourdeaux, thirty-five miles west of Toulouze, and three hundred and twenty south-west of Paris. It is only a small town, but is the see of an archbishop, one of the richest in France. 2. Bayonne, situate near the mouth of the river Adour, which forms a good harbour, eighty-five miles south of Bourdeaux. 3. Aire, situate on the river Adour, fifty-five miles south of Bourdeaux. The other most considerable towns are, Albert, Condom, Verdun, Mirande, Lombez, St. Palais, Maulcon, Pais, Tarbe, and St. Lizier.

The province of Dauphine is bounded on the north by Burgundy, on the east by Piedmont, on the south by Provence, and on the west by Languedoc and Lioinois. From this province the presumptive heir of France derives the title of Dauphin. The chief towns are, 1. Vienne, situate on the Rhone, fifteen miles south of Lyons, and the see of an archbishop. 2. Valence, seated at the confluence of the rivers Rhone and Isere, forty-eight miles south of Lyons: it is the see of a bishop, and has an university, with an abbey of Augustine canons. 3. Grenoble, situate on the river Isere, forty-five miles south-east of Lyons. The other considerable towns are, Gap, Embrun, Die, Buis, St. Paul, and Briançon.

The province of Burgundy is bounded on the north by Champagne; on the east by Switzerland; on the south by Dauphine, and part of Lioinois; and on the west by Orleanois. The capital of this province is Dijon, situate on the river Ouche, a hundred and forty miles south-east of Paris. It is defended by a citadel, and is the see of a bishop. Here also a parliament assemble, and there is a mint, an university, an academy of sciences, and an abbey. The other chief towns are, Autun, Chalons, Semur, Auxerre, Charollis, Macon, Chatillon, Dole, Besançon, Vesoul, Salino, Poligny, St. Claude, Bourg, Belley, Gax, Trevoux, and Montbelliard.

The province of Lorraine is bounded on the north by the duchy of Luxemburg; on the east by Alsace, the duchy of Deuxponts, and the palatinate of the

Rhine; on the south by Burgundy or French Comte; and on the west by Champagne. It is nearly of a circular form, and about a hundred miles in extent either way. This province anciently pertained to its own duke, who was a sovereign prince, but since the death of king Stanislaus, of Poland, in 1766, it has become entirely subject to France. The chief town is Nancy, situate in 6 degrees 17 minutes east longitude, and in 48 degrees 41 minutes of north latitude, a hundred and fifty miles east of Paris. The other places of note are, Minécourt, Vaulrevaux, Bar-le-duc, Michael, Pontamoufon, Clermont, Metz, Toul, and Verdun.

The province of Alsace is bounded on the north by the palatinate of the Rhine; on the east by the river Rhine; on the south by Switzerland, and on the west by Lorraine. This was a province of Germany till the year 1681, when it was treacherously taken by the French, who have ever since kept possession of it. The capital of this territory is Straßburg, situate in 7 degrees 35 minutes east longitude, and in 48 degrees 38 minutes of north latitude, near the west bank of the Rhine, sixty miles east of Nancy. It is a large city, elegantly built; and the cathedral, which is esteemed one of the greatest ornaments of Germany, has a tower near five hundred foot high. The other towns are, Hagenau, Fort Lewis, Weissemburg, Landau, Colmar, Schlestar, Munster, Murbach, Forette, Mulhausen, Betort, and Hunningen.

## C H A P. II.

*Of the soil—produce—manufactures—natives—character—way of life—nobility—returiers—parliaments—taxes—military forces—marine—religion—learning—history.*

ALMOST the whole of France, except the parts towards the north-west, are exceeding fruitful, and even those, if properly cultivated, might be rendered far more beneficial to the nation, than they have been for many years. Before the persecution and civil wars broke forth in this kingdom, the inhabitants were computed at nineteen millions, but it is supposed, that at present they do not exceed three fourths of that number. With the diminution of the people, the riches of the state have also declined; but of late, a more vigorous spirit of agriculture and commerce, seems to have diffused itself over the nation. The country produces corn, wine, oil, and flax, in great abundance; and their manufactures of linen, woollen, silk, and lace, are very considerable. The country is particularly well situated for trade, as it is washed by the ocean, the British channel, and the Mediterranean Sea, and not only well watered by many navigable rivers, but intersected by numerous canals.

The French are generally not of a large stature, but for the most part, of an acute understanding, and remarkable vivacity. In the arts of politeness it is admitted that they excel every nation in Europe; but their assiduities seem to be prompted more by motives

of vanity than benevolent affection, and amidst the warmest professions of attachment, they are frequently insincere. Their natural levity of temper disposes them to frequent innovations in point of dress; and though in this they be extremely fantastic, their most capricious modes never fail of being immediately adopted by the neighbouring nations. Their tongue is likewise become as universal as the influence of their taste; and in every civilized country, it is now considered as the fashionable language of the court.

One of the chief qualifications of the French is that of temperance, both in eating and drinking. Their diet consists mostly of soups and the lighter sort of meats, which are also dressed in a manner peculiar to themselves. At table, both sexes take their seats alternately, and their meals are long protracted. Neither wine nor spirituous liquors are drank after dinner, as with us, but the repast concludes with a dish of coffee.

A disposition to gallantry being a general characteristic of the nation, the inhabitants of the metropolis especially are much addicted to all kinds of fashionable entertainment. During the representation of theatrical performances, it is the custom for spectators to stand; and a tragic catastrophe is always transacted behind the scenes.

As the French include all their gentry under the title of nobility or noblesse, this rank consists of four classes, namely, the princes of the blood, the higher nobility, the ordinary nobility, and those who are lately made. Few of the nobility here have a right to sit in parliament, though in other respects they enjoy the privileges of their rank.

The ordinary nobility are divided into those who have been such for time immemorial, and have been created by patent. If their families have enjoyed that honour a hundred years, it is sufficient to give them the privileges of the noblesse, as they are called, and exempt them from the tailles, and some other taxes.

That degree of nobility which is obtained by being members of parliament, or of the superior courts, is but personal, and does not descend to their posterity, unless the grandfather and father have enjoyed such offices successively, and exercised them twenty years, or died possessed of them. The crown has also granted the privileges of nobility to the magistrates of some cities.

The rank of nobility is forfeited by exercising any mechanic art, or the farming of lands; and until the time of Lewis XIV. the forfeiture extended to all who engaged in foreign commerce. But such forfeitures are only temporary, and the rank of nobility may be resumed, on renouncing any of those occupations which are esteemed inconsistent with it.

With respect to the other class of the people, or the roturiers, which comprehends all the tradesmen and yeomanry, they are liable to the land-tax, and many others, from which the nobility and gentry are exempted, as well as to the quartering of soldiers. This order of the community lives in a state of miserable subjection to those of superior rank. If a peasant,

or a tradesman, sees a gentleman upon the road, he gets out of his way as fast as possible, making a thousand cringes as he passes by, without paying which mark of respect, he runs the hazard of being drubbed.

Till within these two hundred years the kingdom of France was a limited monarchy, but ever since that time, it has been under an absolute government; though an appearance of liberty be still preserved in the form of their ancient constitution. There are yet in the country fifteen parliaments, viz. those of Paris, Thoulouse, Rouen, Grenoble, Bourdeaux, Dijon, Aix, Rennes of Vannes, Pau, Besançon, Metz, Douay, Perpignan or Roussillon, Arras, with that of Alsace, held at Colmar, and Strafsburg. These assemblies consist of a certain number of inferior judges and presidents, who purchase their places either of the crown, or of those who are in possession of them. They enjoy their posts for life, unless they be convicted of some notorious malversation in the exercise of their office. The parliament of Paris is much the most considerable in the kingdom. Hither the king frequently comes in person, and here his royal edicts are recorded and promulged, before they can have the force of laws. But to this act of ratification, the assembly is frequently compelled by the crown, even without being permitted the privilege of deliberating on the subject. The parliament of Paris is also held in the highest esteem of all the assemblies in the nation; being composed of the princes of the blood, dukes and peers of France, as well as the ordinary judges; and its authority extending over all offences committed by peers, where the court does not interpose, and issue a special commission for that end. This parliament had anciently under its jurisdiction the duchies of Burgundy, Normandy, Guienne, and Brittany, with those of Flanders and Thoulouse; but at present its authority is confined to the Isle of France, la Beauce, Sologne, Berry, Auvergne, Lionois, le Forets and Beaugolois, Nivernois, Bourbonnois, Anjou, Anjumois, Picardy, Champagne, la Brice, Marne, Perche, Tourain, Poictou, Aunis, and Rochelois. The princes of the blood have a seat and voice in this parliament at the age of fifteen, and the peers of France at twenty-five.

The other parliaments of the kingdom have their respective districts, and are divided into chambers or houses, among which the several branches of business are distributed; but they are excluded from taking cognizance of any causes which relate to the crown; this privilege pertaining only to the parliament of Paris. In those provincial parliaments, the king's edicts are also registered, before they have the force of laws in their respective districts; but with regard to this act of power, the members are at least as much under the influence of the crown, as those of the parliament of Paris.

France is at present divided into thirty general governments, over every one of which is placed an officer, called an intendant, appointed by the king, and who seems to be vested with the power of controuling the governor, and all other officers of justice.

By the Salique law the succession to the crown of France is limited to the heirs male; and though the royal power be now rendered absolute, the private property of the subjects is nevertheless guarded by inviolable barriers against the encroachments of the sovereign.

The taxes usually levied in France are the *taille*, or land-tax, the *tailion*, the subsistence money, the *aides*, and the *gabelle*. From the first of these taxes the clergy and all the orders of nobility are exempted, with the *bourgeois* of Paris, and some other cities. With respect to the proportion of this tax, when the king has determined what sum he will raise, an order is issued to every intendant, ascertaining what part of it shall be levied in each of the thirty generalities or governments. The number of parishes in those several districts are thirty-eight thousand five hundred and two, in which are comprehended near one million five hundred and ninety thousand families liable to pay the *taille*.

The *tailion*, which was introduced for the purpose of augmenting the soldiers pay, is payable by the same persons as the preceding, and usually amounts to about a third of that tax.

The subsistence is a tax which was first levied by Lewis XIV. for the support of his army in their winter quarters, and is paid in the same manner as the *taille*.

By *aides* are understood all duties and customs on goods and merchandize, except salt; the duty levied on this article being distinguished by the name of *gabelle*.

Other taxes are the capitation, or poll-tax, and the fiftieth penny, from the latter of which neither the clergy nor nobility are exempted, though many representations have been made to the crown on this subject. One of the most considerable imposts is the tenths, or free gifts of the clergy, who are for the most part allowed to tax themselves. Besides those, a great revenue arises from crown-lands and woods, *fee-farms*, forfeitures, fines, &c. and from the duties laid upon all provisions brought to Paris. The annual amount of the whole is computed at fifteen millions sterling. But those are not the only resources of which the crown is possessed. It is supposed, that some years, the king makes as much by raising the value of the coin, and other oppressive ways and means.

A militia is established in France, under the title of the *ban*, or *arrear ban*, which enjoys many privileges on account of being always in readiness to prevent a descent from a foreign enemy. During peace, the army of the French king consists frequently of two hundred thousand men, but in time of war they are sometimes double that number; among which are foreigners from almost every nation in Europe.

The marine force of France is far from being so considerable as in the time of Lewis XIV. It was computed, that in 1769, the whole navy amounted to no more than sixty-four ships of the line (including those of fifty guns) twenty-five frigates, and some smaller vessels.

In every port where the king has a magazine, there is an intendant of the marine, who takes cognizance of civil and criminal causes, and the revenues relating to the sea-service, and who has the charge of furnishing the magazines with all kinds of stores.

The galleys may be reckoned a considerable part of the French marine. Of these there are thirty in the port of *Marzeilles*, and ten more in other ports of the kingdom. The commander of those vessels, who is styled general of the galleys, and lieutenant-general of the *Levant Seas*, is independent of the admiral, and has under him a lieutenant-general, and five commanders of squadrons. The principal galley is called the *Real*, on account of the royal standard which it carries, and on this the general twists his flag; the second being called the *Patron*, and commanded by the lieutenant-general. Both these vessels are larger than the rest, and have three hundred slaves on board each, while the other galleys have but two hundred. Besides the crew, every galley has a company of foot, consisting of sixty men, commanded by the officers of the galleys. There is also belonging to the galleys a company of young gentlemen, called the guards of the standard, who are instructed in navigation at the king's charge; as are those of the guards marine, belonging to the royal navy. Besides those the galleys are furnished with an intendant, inspector, comptroller, commissary, secretary-general, and two treasurers-general.

The established religion of France is Roman Catholic, but they seem to be less devoted to the pope than any other nation of that communion, and have never yet admitted the inquisition among them. In the whole kingdom there are seventeen archbishops, a hundred and thirteen bishops, seven hundred and seventy abbeys for men, three hundred and seventeen abbeys and priories for women, besides a great number of inferior convents, and two hundred and fifty commandaries of the order of Malta. Many of the abbeys however have been lately suppressed, and their revenues seized by the king. The ecclesiastics of various denominations are computed at near two hundred thousand, and their revenues at about six millions sterling. The number of universities is also very considerable, and the nation has long been distinguished for producing geniuses of the first rank, in every department of polite learning.

The Gauls, the ancient inhabitants of this country, appear to have been under the dominion of the Romans, during the space of near five hundred years. In the reign of the emperor Honorius, the Goths, after ravaging Italy extended their conquests to Gaul; of which they remained masters, till they were subdued or expelled by the Franks, a nation of Germany, who gave to their new acquired territory the name of France, which it has ever since retained. According to the most probable accounts, this monarchy was founded by Clovis, about the year 486. This prince dying in 511, left his dominions to his four sons. Childbert became king of Paris, Clodomir of Orleans, Clotaire of Soissons, and Thierry the eldest of Austraria or East France, lying between the rivers Rhine and

Maese;

Maese; the latter also possessing the territories of the Franks in Germany, which lay east of the Rhine.

Those several kingdoms, with the addition of Burgundy, were again united in the person of Dagobert, who dying in 638, followed the example of Clovis, by dividing the kingdom between his two sons; bestowing on one the kingdom of Neustria, with Burgundy, and on the other that of Austraria. After being a third time united in the person of Childerick, in 663, the kingdom was once more divided between Charlemagne and Carloman, the two sons of Pepin, who died in 768. The former of those princes assuming the government of the whole kingdom on the decease of his brother, transmitted it, at his death, to his son Lewis in 814; who again parcelled out the regal dominions among his children, in which he was imitated by his son Lewis. In the year 884,

the royal territories were re-united, under Charles the Gros, who, like his ancestor Charlemagne, was also emperor of Germany, and sovereign of Italy and part of Spain; but it was not till the reign of Lothaire, in 954, that the kingdom was successively conveyed entire to the eldest son, without any partition of the provinces amongst the younger children.

On the death of Lewis, the son of Lothaire, the throne was usurped by Hugh Capet, the first of the Capetine line of kings, from whom, the present royal family is descended. For many ages after this period France remained a limited monarchy, till the foundation of despotism was laid by cardinal Richlieu, the minister of Lewis XIII. who died in 1643; since which time the freedom of the ancient constitution has never been restored.

### C H A P. I.

*Of the situation—seasons—rivers—produce—cantons—chief towns.*

**SWITZERLAND**, or Swisserland, the ancient Helvetia, is surrounded by the territories of France, Germany, and Italy, being bounded on the north by the Suntgow, the Black Forest, and other parts of Suabia; on the east by the Lake of Constance, Tirol, and Trent; on the south by the duchies of Savoy, Milan, and the provinces of Italy; and on the west by the French provinces of Burgundy and Dauphine; extending in length about two hundred and sixty miles, and in breadth upwards of a hundred. The Alps and other high mountains that surround this country, and which are covered with snow great part of the year, render the air much sharper than might be expected between the latitudes of 45 and 48 degrees. It is observed, that the seasons here are very different according to the local situation. If a field lies on the south side of a mountain, the snow melts early in the spring, and their seed-time commences proportionably; while on the north side, the winter declines slowly, and the operations of agriculture are long retarded. So great is the difference arising from those circumstances, that sometimes when it is seed-time on the north of the mountain, they are preparing for the harvest on the other side.

The sources of some of the most considerable rivers in Europe are found in this country, viz. the Rhine, Rhone, the Inn, the Adda, the Aar, and the Rufs. The chief lakes are those of Constance and Geneva, the latter of which is sixty miles long, and twelve broad; and the former thirty miles long and eight or ten broad. There is also one at the top of almost every

mountain, in consequence of which few inland countries are so well supplied with water. Nor is it less copiously furnished in respect of wood; both hills and valleys affording excellent timber, particularly oak, elm, pine, and fir.

The country produces some wine, which however is neither of good quality, nor sufficient in quantity for the consumption of the inhabitants, who supply themselves with this article from France; as they do also from Germany both with wine and corn. The storms of hail and rain, which frequently happen here in autumn, sometimes destroy the vintage and harvest, as well as the other fruits of the earth; on which account they erect magazines of corn against a time of scarcity.

Switzerland is divided into thirteen cantons or republics, viz. Bern, Friburg, Basil, Lucern, Soloturn or Solure, Zurick, Appenzel, Schaffhausen, Zug, Swisse, Glaris, Uri, and Underwald.

As Switzerland is separated from the circumjacent countries by mountains, so almost every canton is divided from the other by a ridge of hills, which are covered with snow in the winter, but in summer afford good pasture intermixt with corn-fields. In some parts, the corn may be seen growing on a precipice where it is difficult to walk; but in others, the country is plain and open. Two thirds of the canton of Bern in particular, abound with corn-fields which lie pretty much upon a level. The cantons of Zurick, Solure, Friburg, Basil, and Schaffhausen also produce corn; though they have for the most part a rocky soil, and it is with great pains that the inhabitants procure a plentiful crop.

The country abounds in horses and neat-cattle, both which the natives exchange with their neighbours for the produce of the respective territories. The

horfica

herbes are frequently purchased by the French to remount their cavalry. Here is also plenty of tame and wild fowl, with venison, wild hogs, and goats of several kinds; particularly the chamois goat, of the skin of which is made the fine chamois leather, that is so much esteemed. The rivers and lakes afford such plenty of fish that they supply the neighbouring countries with this article.

Several mines have been discovered of silver, copper, and iron, but they are not much wrought. Their quarries of black marble with white veins, and the crystal on the tops of the mountains, and the sides of the rocks, are much admired. Of the latter there are two sorts, one clear and transparent, and the other pale and cloudy.

The canton of Basle is bounded on the north and east by Germany, on the south by the canton of Soleure, and on the west by part of Alsace; being about twenty miles long and eighteen broad. The chief towns are Basle, Valtenburg, and Homburg.

The city of Basle is situate in 7 degrees 36 minutes east longitude, and in 47 degrees 40 minutes of north latitude, the river Rhine dividing it into two parts, which are united by a bridge. The town is fortified, being a frontier against France and Germany, and is the capital of the canton in which it stands. The art of making paper is said to have been first practised in this city. Here is a flourishing university, where Erasmus founded a college, and spent the latter part of his life.

The canton of Soleure, or Solothurn, is bounded on the north by Basle and Alsace, on the east by the canton of Zurich, on the south by the canton of Bern, and on the west by the bishopric of Basle; being thirty-five miles long from north to south, and twenty-five broad. The chief town is Soleure, situated on the river Aar, fifteen miles north of Bern.

The canton of Schaffhausen is bounded on the north and west by part of Germany and Basle, on the east by the territory of Constance, and on the south by Zurich; being twenty miles long and twelve broad. The chief towns are, Schaffhausen, Herblingen, Newkilch, and Halaw.

The city of Schaffhausen is esteemed the finest town in Switzerland next to Basle, and is situated on the Rhine, twenty-five miles north of Zurich, and as many west of Constance. It is a town of good trade; all vessels being obliged to unload here, on account of the cataracls in the Rhine, which are in its neighbourhood.

The canton of Zurich is bounded on the north by the canton of Schaffhausen; on the east by Thurgaw, and the county of Tockenbourg; on the south by Zug and Switz; and on the west by Lucern. The chief town is Zurich, pleasantly situated at the north end of the lake of the same name, in 8 degrees 45 minutes of east longitude, and in 47 degrees 28 minutes north latitude, thirty-seven miles south-west of Constance. It is a small fortified town, supposed to have been the capital of the Tigurini, one of the four Helvetian tribes. The inhabitants apply themselves much to trade, the chief manufacture being that of crape,

which they export by the lake and the river Rhine. The other towns are, Kiburg, Gruningen, Laffen, Rusty, Wadisfchweil, Adelfinger, Griffurce, Ktingenew, Eg-liso, Regensburg, and Staffen.

The canton of Appenzel is bounded on the north by the territories of Thurgow, on the east by the Rhintal, on the south by the country of the Grisons, and on the west by the territory of Tockenbourg. It consists of one large barren valley, twenty miles long, and almost as broad. The inhabitants are esteemed the most unpolished of any in Switzerland. The chief village is named Appenzel, there being no town in the canton.

The canton of Glaris is bounded on the north by Zurich, on the east by the Grisons, on the south by Uri, and on the west by the canton of Swisse. It also consists only of one valley, nearly of the same extent with the preceding canton. The chief town is Glaris, situated thirty-five miles south-east of Zurich.

The canton of Switz, or Swisse, is bounded on the north by Zurich and Zug, on the east by Glaris, on the south by Uri, and on the west by Underwald, from which it is separated by the lake Lucern. It is about twenty miles long and eighteen broad. The chief town bears the same name as the canton, and is situated on the east side of the lake Lucern, sixteen miles east of the city of that name.

The canton of Uri is bounded on the north by Swisse, on the east by Glaris and the county of the Grisons, on the south by the canton of Bern, and on the west by Underwald; being about thirty miles long and twelve broad. The chief town is Altorf, situated on the lake Lucern, near the mouth of the river Ruis, twenty miles south-east of the city of Lucern.

The canton of Underwald is bounded on the north by Switz and Lucern, on the east by Uri, on the south by the mountains of Brunic, which separate it from the canton of Bern, and on the west by another part of Lucern. It is about twenty-five miles long, and seventeen broad, a mountainous and barren country, containing only eight poor villages.

The canton of Zug is bounded on the north by Zurich, on the east and south by Switz, and on the west by Lucern. It is about eighteen miles long and seven broad, producing corn and wine sufficient for the use of the inhabitants. The chief town is Zug, pleasantly situated on a lake of the same name.

The canton of Lucern is bounded on the north by Soleure and Zurich, on the east by Zug, and on the south and west by the canton of Bern. It is about fifty miles long, and thirty broad. The chief town is also Lucern, situated on the lake of the same name, thirty miles south-west of Zurich, and thirty-five miles east of Bern. It is an elegant fortified town, and stands in a plain almost encompassed with mountains.

The canton of Bern is bounded on the north by Basle and Soleure, on the east by Lucern and Underwald, on the south by the lake of Geneva, and on the west by Neufchatel and Burgundy. This is much the largest and most fruitful of the Swisse cantons, being a hundred and twenty miles long and sixty broad.

The chief town is Bern, situate in 7 degrees 15 minutes east longitude, and in 47 degrees north latitude, on the bank of the river Aar, sixty-five miles north-east of Geneva. It consists of three spacious streets, chiefly built of hewn stone, and many of the houses having a piazza in the front.

Another of the most considerable towns in this canton is Lausanne, situated on the north side of the lake of Geneva, forty miles south-west of Bern. Before the Reformation this place was the see of a bishop, and here is still an university. The other chief towns are, Thun, Arberg, Vangen, Lansburg, Erlach, La Serre, Bruck, Nyon, Sana, Aubon, Briento, Walen, and Yverden.

The canton of Friburg is almost surrounded by that of Bern, extending about twenty-five miles in length, and twenty in breadth. The chief towns are Friburg, Estavay, and Griens. The first of those, which is the capital, is situated eighteen miles south-west of Bern. It stands upon almost inaccessible rocks and precipices, to which, in several places, there is no other ascent than by means of stairs and ladders.

#### C H A P. II.

*Of the government of the Switzers, and their religion.*

**I**N some of the Swiss cantons the government is aristocratical, and in others of a democratical nature. Those under the former description are the cantons of Zurich, Bern, Lucern, Basil, Friburg, Soleure, and Schaffhausen; in the capital cities of three of which, however, namely, Zurich, Basil, and Schaffhausen, the magistracy is democratical. In each of them the ordinary tradesmen, who are divided into tribes, have their share in the government, and may be elected into the sovereign council; whereas in the cities of the other four aristocratical cantons, the less council, consisting of twenty-seven members, joined to a smaller number of the great council, have the sole right of filling up vacancies in the sovereign council; and those always preferring their friends and relations, the common citizens have no share in the administration. In the canton of Bern, which is far the most considerable, the legislative authority is lodged in the great council, consisting, when complete, of two hundred and ninety-nine persons; but as about ninety odd are usually absent on their respective governments, or other avocations, it is generally styled the council of two hundred. Out of the members of this council is elected another, called the senate, or less council, consisting of twenty-seven members, with their two avoyers, who preside in both councils annually by turns. The two youngest members of this assembly, who have the title of secret counsellors, resemble the Roman tribunes, and summon the great council, upon every emergency, or when they apprehend any design to be formed prejudicial to the liberties of the people. This senate possesses the executive power, and meets every day except Sunday. The great council assembles only twice a week, unless upon extraordinary occasions. This body is vested with full

No. 24.

power in every thing that relates to peace or war, alliances, or the public treasure; and all civil employments of importance are in its disposal: but all those of an ecclesiastical nature, with some inferior civil offices, are in the gift of the senate. When the great council meets, the senate constitutes a part of it, or rather is lost in the great council, having no existence during the continuance of that assembly. The vacancies in the great council are filled up by the senate, and sixteen members of the former, called *seizeniers*, from their number, who are chosen out of the old bailiffs, that is, such as have enjoyed a government or bailiage for the term of six years.

The six democratical cantons are those of Switz, Underwald, Uri, Zug, Glaris, and Appenzel. Each of those cantons is divided into districts according to their extent, some four, some six, and others twelve; which appear to be in some respects independent sovereignties, having both civil and criminal jurisdiction, in which the rest of the canton cannot interpose, and whence there lies no appeal. In the management of public affairs, however, every district having a deputy or representative, they assemble at some place appointed, and form a standing council of the canton. Where the object of deliberation is of great importance, they send each of them two or three representatives. The authority of this council nevertheless is limited, the supreme legislative power residing in the disjunctive body of the people, every male in the country, servant as well as master, having an equal share in the sovereignty. Those assemblies seldom meet more than once or twice a year to choose their magistrates, and the representatives to the general diets, though they may be convoked at other times, as occasion may occur, to give their consent to such acts as require their ratification. The first officer in those cantons is called *land-aman*, and is chosen in a full assembly of the people, who always express their consent by holding up their hands. His office resembles that of an avoyer or burgher-master, but is changed in some of those cantons every year, and in others every two years. He is president both of their standing council and general assemblies, and has the chief direction of all public affairs with the advice of the council. When the *land-aman* is elected, the people choose for him a deputy, who is called *stat-halter*, and acts in the absence of the former. They next choose treasurers, secretaries, and other officers of state, who continue in their posts a longer or shorter time, according to the custom of the respective canton.

But though every member of the canton is equally entitled to a share in the government, the greater part are usually influenced in their determinations by the gentry, to whom they pay a particular regard. On the other hand, if they imagine that they have been led by designing men into measures destructive to their country, they never fail to punish the authors of such advice with the utmost severity.

The general diet, or assembly of the states, consists of two representatives sent from each canton; to which likewise the abbot of St. Gall, with the cities of St. Gall and Bienne, send their representatives, as allies.

4 A

The

The diet is for the most part held annually at Baden, on the Feast of St. John Baptist, the first representative of the canton of Zurich acting as president of the assembly; this canton having also the privilege of convoking the diet by circular letters.

The objects brought under the consideration of a general diet are, either the accounts of the governors of their common bailliages, or appeals from the sentences of such governors in civil and criminal cases, the redressing the grievances of their common subjects, or composing the differences which may have arisen between any cantons, with whatever else may contribute to their general interest. To this diet, the ministers of foreign princes usually apply themselves, either by way of audience or memorial. The French ambassador in particular never fails to give his attendance, though he had nothing more than compliment to offer.

Besides this diet, which meets regularly, any one canton may summon a diet upon an extraordinary occasion, as may the minister of a foreign prince, if he apprehends that the affairs of his master require such a measure, and he will defray the charges of the deputies. In this way seldom a year passes without one extraordinary diet, and sometimes more.

There are also particular diets for the consideration of religious matters, that of the Protestants being held at Arraw, and the Roman Catholics at Lucern, which are summoned occasionally.

The inhabitants of Switzerland are distinguished into Protestants and Papists, who are each of them exceeding zealous in their different persuasions, and of whom the former are rigid Calvinists, according to the doctrines contained in the Helvetic confession. Both religions are tolerated in their common bailliages or governments, but there is no toleration in the cantons themselves, every person who professes not the established religion being banished the country. Even Lutherans and every other denomination of Protestants are liable to the same pains and disabilities as Papists, in the protestant cantons. The Swiss clergy in some of the cities have great influence over the people, and frequently intermix politics with their religious discourses; but in the canton of Bern they are not indulged in this latitude, and the government keeps them in an entire dependence on the state. The protestant cantons are those of Zurich, Bern, Basli, Schaffhausen, with two thirds of the canton of Glaris, and more than half of Appenzel. The rest are Roman Catholics.

### C H A P. III.

*Of the subjects of the Switzers, and their allies.*

**T**HE territories subject to the Switzers, are such places as belong to them all, or to several of them in common, having been conquered by their united arms. The common bailliages are nine, viz. the county of Baden, the free villages, the counties of Turgovy, Sargantz, and Rhintal, with the four Italian bailliages of Lugano, Locarno, Mendrisio, and Valmadia; to which may be added the three cities without

territories, viz. Bremgarten, Meilingen, and Rappersweil.

The county of Baden is bounded on the north and west by the Rhine, and on the east and south by the canton of Zurich. It is as large as some of the little cantons, and of a much more fruitful soil. It formerly belonged to the house of Austria, but was conquered by the Swiss confederates in the year 1415. Baden, the capital city, so named from its baths, is situated on the river Limath, about fourteen miles north-west of Zurich, and six to the southward of the Rhine. It is one of the most ancient towns in Switzerland, and the place of their general diet; usually called Upper Baden, to distinguish it from Lower Baden in Germany.

The four bailliages of Lugano, Locarno, Mendrisio, and Valmadia, are situate on the Italian side of the Alps, and formerly composed part of the duchy of Milan; but were disunited from it by duke Maximilian Sforza, and given to the Switzers in the year 1513, for the service which they had rendered him in his wars. They belong to twelve of the cantons, Appenzel having no share in them, as not being received into the alliance of the cantons at the time of this acquisition.

These four bailliages extend several leagues into the climate of Italy, but the country is mountainous. The chief towns are Lugano, Locarno, Scona, and Brifago.

Lugano is situate in 9 degrees of east longitude, and 46 of north latitude, on the north side of a lake of the same name, about eight miles from the frontiers of Milan. The governor of this place has also the command of the other bailliages.

Locarno stands on the west side of the lake Major, ten miles north-west of Lugano, and was formerly a considerable place, but is now in a ruinous condition.

The natives of all those four bailliages are Roman Catholics, and so bigotted, that when a protestant canton sends in its turn a governor, he is not allowed the exercise of his religion in his own house.

Turgovy, Sargantz, and Rhintal, are governed by their respective bailiffs, elected out of the several cantons, which appoint them by turns. In some bailliages those officers are changed every five, and in others every six years. They are not accountable to the particular canton which elected them, but to the general diet.

The most considerable of the Swiss allies are the Grisons. The country occupied by this people is bounded on the north by Tirol and part of Switzerland, on the east by Tirol and Trent, on the south by Italy, and on the west by the Swiss cantons. This was part of the ancient Rhetia, and consists of three independent states, united for their common defence. With the contiguous territories which they have conquered, viz. the Valtelina, Chiavenna, and Borno, their dominions extend about a hundred miles in length and sixty in breadth.

The Valtelina consists of one great valley about ten leagues in length, abounding in corn, wine, oil,

and

and the most delicious fruits. The two other countries of Chiavenna and Bormio are also fruitful, though in a less degree than the preceding, which is also of the greater importance on account of being a pass between Germany and Italy.

The territories of the Grisons are divided into three parts, namely, the Grison, or Grey League, the League of the House of God, and the League of the ten Jurisdictions. The capital of the whole is Coire, situate near the banks of the Rhine, fifty-five miles south of the lake of Constance.

With respect to the government of this country, every male in each division has a voice in electing their representatives, who meet in their particular diets. These diets elect some of their numbers to represent them in a general diet, the members of which are so limited by their instructions, that they cannot act definitively, without referring to the communities from which they were deputed, to have their resolutions confirmed.

Two thirds of the Grison Leagues are protestants of the sect of Calvin, and the rest Roman Catholics. But every thing being determined by a majority of voices, and the Grisons being only allied to the protestant cantons of Zurich and Bern, this is usually reckoned a protestant state. In the Valteline and the countries of Bormio and Chiavenna, which were anciently part of the duchy of Milan, the Roman Catholic religion was confirmed by the terms of the cession to the Grisons.

The bailliages in the Valteline, as well as those in Chiavenna and Bormio, are in the disposal of each community of the Grisons by turns, and sold to the best bidder, who, in order to reimburse himself, is generally guilty of great exactions on the people. The stated revenues of the Grison Leagues are very inconsiderable; and therefore, upon a war breaking out, or any other emergency, they tax themselves in proportion to their abilities, and the necessity of the service. The revenues consist chiefly of the duties on goods carried through the country. The Grisons may justly be reckoned the refuse of Switzerland. What renders them most considerable is the passes through their country, between Germany and Italy, by four of which only their territory is accessible, and even those may be defended by a very small force. The first is by the lake Como, which preserves their communication with Italy; the second by the valley of Camonica, which gives them an entrance into the territories of Venice; the third by the valley of the Inn, which affords them a passage into Tirol; and the fourth by a bridge over the Rhine near Coire, which opens a communication with Suabia and the cantons of Switzerland.

The adjacent counties of Neuchâtel and Vellengin are also allies of the Switzers. These territories are bounded on the north by the bishoprick of Basil, on the east by the lake of Neuchâtel, on the south by the canton of Bern, and on the west by the province of Burgundy in France, being about forty miles long and twenty broad. The air of this country near the lake is temperate, but in the mountainous

parts very sharp. The soil is strong, but produces the best wine in Switzerland; by the sale of which the natives make considerable profit.

The chief town of either of those counties bears the same name respectively with its adjoining territory. Neuchâtel is situate in 6 degrees 35 minutes of east longitude, and in 47 degrees 10 minutes of north latitude, at the north-east end of the lake of Neuchâtel, twenty miles north-west of Bern. The town is well built, and adorned with several handsome fountains. It is governed by a grand and little council; the former consisting of forty members, with two masters of the keys; and the other of twenty-four, including the mayor, who is president. These two councils assemble every month, as do also the ecclesiastics, to settle the affairs of the church.

The inhabitants of those territories are in a manner a free independent people, notwithstanding they have had always a prince for their head. Nothing is determined without the concurrence of the three estates. To which add, that they have the privilege of choosing their own magistrates and standard-bearer, and are subject to no taxes but what they impose upon themselves. Among other privileges it is not the least considerable, that they are free denizens of the canton of Bern, which is not only their protector, but the umpire of all the differences between them and their sovereign.

Upon the death of the duchess of Nemours, the last countess of Neuchâtel, as heiress of the house of Longueville, the states of the country were inclined to submit themselves to the late king of Prussia, as heir by his mother to the house of Orange, which derived its title to Neuchâtel from the marriage of one of its princes with the heiress of the house of Chalons, the direct sovereign of those two counties. Several competitors arose at the same time, who claimed as heirs in blood to the house of Longueville. The states however determining the right in favour of the heirs of the house of Chalons, the king of Prussia accordingly took possession of the territories. The whole country is of the reformed religion, except two Roman Catholic villages. The common language is French; and the natives, in their temperament as well as their manners and customs, resemble more that nation than the Germans.

Other allies of the Switzers are the abbot and city of St. Gall, lying between the canton of Zurich and the lake of Constance; as also of the county of Treheuburg, contiguous to it; extending about thirty-six miles in length, and twelve in breadth. He assumes the title of a prince of the empire, but has not the privilege either of vote or session in it. He was also formerly sovereign of the city of St. Gall, and of good part of the canton of Appenzel; but both of them purchased their liberty, and at present have no dependence on him.

The city of St. Gall is situated in the Turgow, about five miles south-west of the lake of Constance, and ten north-west of Appenzel, forming at present a little commonwealth, without any territory belonging to it. The government is of an aristocratical

kind,

kind, and consists of a great and little council, as in the other cities of Switzerland. Both the abbot and town of St. Gall have the privilege of sending deputies to the general diets of the Swiss cantons, at which however they are entitled to no vote. The town is one of the most commercial in the country, and particularly remarkable for its linen manufacture, which affords employment to many of the inhabitants. It is computed that they make annually forty thousand pieces of linen, of two hundred ells to the piece; which they send into Italy, Germany, and the adjacent countries, in packs carried by mules. By this traffick the natives are so much enriched, that there is hardly any place of equal extent which affords a greater number of wealthy burghers, and so few poor people. St. Gall is reckoned to contain about ten thousand inhabitants. Neither the buildings of the town, the abbey, or the abbey-church, are very magnificent. The established religion of the city is Protestant, which occasions continual differences between the inhabitants and the adjoining abbey.

Another ally of the Switzers is the republic of Valais, which takes its name from a valley inhabited by the subjects of this commonwealth, and extends from the lake of Geneva to the mountain called la Fourche, where the Rhone has its source. It is divided into two parts by this river, which runs through the middle of it, and frequently overflows great part of the valley. This country is bounded by Switzerland on the north and east, by the Milanese and duchy of Aoust on the south, and on the west by Savoy; being near a hundred miles in length, and from ten to twenty in breadth, encompassed on every side with high mountains, of which those that separate it from the canton of Bern and Savoy, are of a prodigious height, and always covered with snow. The country is usually distinguished into the Upper and Lower Valais; the former being subdivided into seven independent communities, resembling those of the Grisons, and the latter into six. The mountains afford pasture for numerous herds of cattle in the summer, and the valley produces corn and wine, with a great variety of delicious fruits. This fertility however is in great measure owing to the industry of the inhabitants, who with incredible labour convey the water from the rocks and mountains by wooden troughs or channels, for two miles together in some places. In one day's journey here we experience a great variety of seasons. Winter and summer prevail respectively on different sides of the same mountain, while the spring appears in a third place with its intermediate temperature and beauty. The harvest, in different parts, continues from May to October, being sooner or later according to the situation of the spot. The inhabitants of this country were anciently allied to the canton of Bern, but they are now much more closely connected with the papish cantons, being themselves of that persuasion. The chief towns are, Syon, the capital, Martinach, and St. Maurice.

Syon, the Sedunum of the ancients, is situate in 7 degrees 10 minutes of east longitude, and in 46 degrees 10 minutes north latitude, upon the the river

Site, near its confluence with the Rhone, about fifty miles to the southward of Bern, and sixty eastward of Geneva. It is the seat of the bishop, who is a prince of the empire, and was formerly sovereign of great part of the country; but his power is of late much diminished, and the government changed into a republic; though the prelate still presides in their councils, and has a considerable influence on their affairs. The seven communities of the Upper Valais (to which the Lower is subject) send deputies to their diets, in the same manner as the Grisons, between whose government and the constitution of this commonwealth, there is hardly any difference.

The next ally of the Switzers is the city of Geneva, situate in 6 degrees 15 minutes east longitude, and in 46 degrees 13 minutes north latitude, on the river Rhone, at the west end of the lake Lemman, or Geneva, seventy miles south-west of Bern. The town is surrounded by a wall and other fortifications, about two miles in circumference; but it is not very strong; considering its proximity to so formidable neighbours as those of France and Sardinia, against which its chief defence rests upon its allies, the cantons of Bern and Zurich. The river Rhone divides it into two parts, the most southerly of which is the larger, and stands upon a hill; but the other, called Gervais, and which belongs to the country of Gex in France, is situated on a flat. A communication subsists between those parts by means of three wooden bridges. The houses lately built are generally of hewn stone; and among the public edifices the most remarkable are, the church of St. Peter, formerly the cathedral, the town-house, and the library. But that for which the place is chiefly distinguished is its beautiful situation, with the fine walks and prospects that surround it. The adjoining lake is sixty miles long, and twelve broad, and affords great plenty of the best fish. The number of inhabitants is computed to amount to thirty thousand, who maintain a brisk foreign trade; their manufactures being chiefly gold and silver lace, silks, and chamoy leather. Here is an university, but no salaries settled on the professors or fellows, whose subsistence depends upon the contributions of their pupils. The language of the common people is the Savoyard, or a very bad dialect of the French tongue; but persons of condition speak in greater purity.

This city is the great resort of Calvinists from France and other nations, for education; it having been the place of Calvin's residence, and ever since in the possession of people of that sect. It was anciently under the dominion of the Romans, and afterwards of the Burgundians. It was once also an imperial city, and the dukes of Savoy have had the sovereignty of it. The counts and bishops of Geneva seem for some time to have divided the jurisdiction of it between them; but at the Reformation, the bishop was their sovereign both in temporal and spiritual matters. In the year 1533, the hierarchy was abolished, and the people substituted a republican government in its room. The legislative authority was vested in a council of two hundred, and a senate of

twenty-five members; none but the principal citizens being permitted to have any share, either in the administration of the government or the election of the magistrates; but of late the common people have compelled their superiors to relinquish this monopoly of power.

The church is presbyterian, governed by the city clergy, the burgher-master of reformation, and six others elected out of the great council. The clergy have neither glebe nor tythes, but are allowed fifty pounds a year each, by the states. The use of cards, drinking in public houses, and dancing, are strictly prohibited; but in the manner of keeping the sabbath they are not equally rigid, not only exercising their militia on that day, but playing at bowls, and other manly diversions, after divine service.

The inhabitants of the lower rank are extremely clownish, spending their time chiefly among their cattle. They drive them up the mountains about the middle of May, living in huts, and managing the business of the dairy till the winter, when they return to town.

The ground about Geneva is not unfruitful, consisting of gardens, vineyards, meadows, and rich pastures on the neighbouring hills; but their territories are very small. On three sides, respectively, they are hemmed in by the lake, and the dominions of France and Savoy; and on the fourth, their lands hardly extend four miles. This republic was anciently allied to the Catholic as well as Protestant cantons, but since the Reformation, their alliance is only with the latter.

About five miles from Nion are seen the ruins of Cæsar's wall, which extended eighteen miles in length from mount Jura to the banks of the lake of Geneva, as described by Cæsar in the first book of his Commentaries.

#### C H A P. IV.

##### *Of the revenues — forces — history.*

THE revenues of Switzerland are small, compared with those of other countries; yet, considered in regard to the expences of the state, they seem to be sufficient for the ordinary demands of the public service. The little popular cantons have hardly any fixed revenues, but tax themselves voluntarily, according to the exigence of their affairs. In general, the revenues of the protestant cantons exceed those of the catholic, the church-lands, which the former seized at the Reformation, being appropriated to the use of the government, except a small part reserved for the maintenance of the clergy. The two wealthiest cantons are those of Zurich and Bern. Zurich, by the advantage of its trade, is richer in proportion to the extent of its territories; but Bern is so much larger, that the revenues of this canton are far superior to those of the preceding.

Since the first institution of those republics, the people have been averse to standing forces, but in no

No. 24.

country of Europe do we meet with a better regulated militia. Every male from sixteen to sixty is enrolled, and about one third of them regimented under the title of fuziliers and electionaries; and out of the other two thirds those are from time to time recruited. The fuziliers are all unmarried men, of a good size, and in the flower of their age, always ready to march at an hour's warning. The electionaries, on the other hand, are married, but of an age and size fit for service. Every regiment of fuziliers consists of ten companies, and the electionaries of twelve, exclusive of staff officers. In each company of the fuziliers there are a hundred and ten men, and in those of the electionaries two hundred and eighteen, including the officers of every rank. Every soldier provides his own arms, but all are of one make. Of late they have also introduced an uniformity of cloathing, the colour of which is grey, with different facings, to distinguish the regiments.

Finding that horse are of little service in this mountainous country, they have converted their cavalry into dragoons, except in the canton of Bern, where there is one regiment of cuirassiers, maintained at the expence of their vassals. Every regiment of dragoons consists of ten troops, of sixty men each, and the horses as well as arms are provided by the soldiers; none being admitted into this corps but substantial farmers, who are always furnished with horses for their husbandry. Neither horse nor foot receive any pay while they remain at home. The state provides tents, kettles, and hatchets for their soldiers, and those implements are laid up in the arsenal, when the service is over.

In the magazine of Bern, there is always an entire new set of arms for all the militia of the canton, besides those that are in common use. There is another set for the militia of every bailliage, kept in the castle, where the bailiff or governor resides; in which place is also laid up a sum, amounting to three months pay, for the whole militia of the bailliage. In the capital of this canton a fine train of artillery is likewise constantly kept, besides a great number of cannon in the castles where their bailiffs reside.

Every community is taxed to furnish the necessary horses and waggons for the use of the train and army. There belongs to the train a hundred and twenty men of several trades, as carpenters, smiths, wheel-wrights, &c. to whom is added a company of guides, actually enlisted, with their captain, lieutenant, and other officers, who have a perfect knowledge of the country. They have no general or commander in chief in time of peace; nor do they fill up the posts of secretary of war, commissioners of victualling, treasurer, quartermasters, provost, and others, till the army is ready to take the field. When a general is appointed for any expedition, several deputies, chosen out of the statesmen of greatest rank and experience, are nominated to accompany him, and be a check upon him; without whose consent he is not at liberty to undertake any affair of importance. The soldiers are exercised every Sunday and holiday, after divine service; and on

4 B

certain

certain days of the year they meet to shoot at a mark, the cannoners likewise doing the same with their great guns and mortars.

For the readier assembly of their militia, there are, in the most conspicuous places of every bailliage, signals, which consist of wood and straw, to which they set fire upon any alarm. At every one of those signals a corporal is stationed, with a guard of six men. What number of forces the Swifs can raise, it is difficult to determine; but in the late war between the protestant and popish cantons, the canton of Bern had forty thousand men in the field, and that of Zurich twenty thousand.

The Helverians remained subject to the Romans till the destruction of that empire, when new kingdoms and states being formed out of its ruins, Switzerland was comprehended in that of Burgundy, and upon the extinction of this kingdom, which happened about a hundred years after, was united to the crown of France, to which it continued to be annexed till the beginning of the ninth century. About the year 870, two new kingdoms of Burgundy were erected, called Burgundia Cisjurana and Burgundia Transjurana; but the former was united to the latter about the year 926, and of this kingdom of Burgundia Transjurana Switzerland continued a part, till 1032, when Rodolph, the third and last king of Burgundy, dying without issue, transferred the kingdom to the emperor Conrad II. called the Salick, whose successors enjoyed it almost two hundred years, the territory being neglected by the emperors, several petty sovereignties were formed out of it. In the thirteenth century the counts of Hapsburg, ancestors of the house of Austria, to whom several fiefs in this country had been granted by the emperor Barbarossa, began to take upon them the government of the people, particularly the cities, on their immediate request. The inhabitants were induced to this measure with the view of shaking off the yoke of the nobility, by whom they were intolerably oppressed. They agreed therefore that Rodolph, the count of Hapsburg, should send governors amongst them, with power of administering judgment in criminal causes, but with an express reservation of their rights and liberties. The count however being so much engaged in other places, could not afford the cities the protection they expected; upon which the latter, unable to endure any longer the oppression of the nobility, had recourse to arms, demolished the castles of the lords, and after a war which lasted twelve years, compelled many of them to abandon the country.

Rodolph being now advanced to the imperial dignity, was solicited by the exiled nobles to afford them protection against the commons of Switzerland, whom they charged with rebellion; but the latter having heard the contending parties, declared himself in favour of the people, to whom he not only confirmed their ancient privileges, but also added others which they had not hitherto enjoyed. Upon the death of this emperor, however, his son, the emperor Albert, adopted very opposite measures. Desirous of rendering himself master of Switzerland, he first attempted

to accomplish his purpose by the arts of persuasion, but finding these means ineffectual, he at length had recourse to violent measures. He appointed over the people new governors, to whom he gave positive orders to reduce them to obedience, either by corrupting their leading men, or, if that should fail, by force of arms. The former alternative proving unsuccessful, those delegates openly invaded the privileges of the states. To complain of such proceeding the people resolved on sending a deputation to the emperor, who instead of redressing their grievances, threatened them with more sanguinary measures, if they should refuse an absolute submission to his pleasure. Exasperated by repeated acts of the most intolerable oppression, from which the application to their sovereign had afforded no prospect of relief, the people entered into the design of bravely asserting their ancient rights in opposition to every illegal power. The three principal men who formed this resolution were, Arnold Molchdal of Underwald, Werner Stouffacher of Switz, and Walter Furst of Uri, who were rather substantial yeomen than gentlemen. These three were soon joined by nine of their friends, the whole party binding themselves by the most solemn oaths not to discover the design. The first of January 1308 being the day appointed for the insurrection, an accident happened, that had like to have precipitated the measures of the conspirators, by the fresh provocation to revolt, which it universally diffused among the people. Amidst other insolent acts of whimsical tyranny, Griesler, governor of the canton of Uri, had ordered his cap to be set upon a post in the market-place of Altorf, the capital of the canton; requiring every person who passed by to pull off his hat to it on pain of death. Many, terrified at the rigid character of the deputy, submitted to this ridiculous ceremonial, till William Tell, a man of determined courage, and one of the conspirators, took an opportunity of frequently passing by without testifying any mark of respect. Being observed by the guards that were placed to see the order put in execution, he was arrested and brought before the governor, who, by way of punishment, commanded him to set an apple on his son's head, and shoot at it with an arrow, declaring, that if he missed, he should be hanged. The father, rather than run the hazard of being accessory to his son's death, desired that they would take away his own life without farther ceremony; but the inflexible Griesler declaring, that if he refused to shoot at the apple immediately, he would hang up his son before his face, and himself afterwards, the unfortunate delinquent agreed to make the attempt. The scene which he fixed for the experiment was the market-place, in presence of the deputy; imagining, it is probable, that his fellow-conspirators would assemble and rescue him from the hands of so arbitrary and capricious an oppressor. No marks of any tumult appearing, at his arrival on the spot, he took out of his quiver two arrows, and applying one of them to the bow, which he drew with a steadiness hardly ever before discovered in so violent an agitation of mind, he providentially struck the apple off his son's head, without giving him the least wound.

wound. The joy of the spectators at this unexpected good fortune was testified by a general shout, to the great mortification of the governor, who proceeding to enquire of Tell what he meant by taking two arrows out of his quiver, the latter boldly answered, that the second arrow was designed for the tyrant, in case he had been so unfortunate as to have killed his son. The implacable Griesler ordered him to be put in irons, and carried on board a vessel to be transported to the castle of Cassenach, on the lake Lucern, where he was destined to perpetual imprisonment; the governor also going on board himself to see the sentence carried into execution. On reaching the middle of the lake, a violent storm arising suddenly, the vessel was ready to sink; when the governor's servant knowing the prisoner to be an excellent pilot, proposed the taking off his chains, and letting him manage the helm, as the only means of saving their lives. This expedient being approved, Tell with great difficulty steered the boat into smooth water under the shore; when jumping out upon a rock he made his escape, and Griesler despairing of ever taking him, sailed on to the next town, called Brunen, whence he proposed to go by land to the castle of Cassenach. Tell receiving intelligence of his route, concealed himself in a wood on the side of the way, and shot him through the heart with an arrow. In memory of those incidents, a chapel was built upon the spot where the governor lost his life, and another on the rock whence Tell made his escape, which are yet to be seen.

On new-year's-day 1308, the time fixed by the conspirators for a general insurrection, some of the most resolute of them resorted to the castle where the governor and commanders of the imperial troops resided, under pretence of carrying the usual presents. Having concealed arms beneath their cloaths, they fell upon the guards as they entered the gates; and in this manner reduced every fortress in the country which they attempted. The governor of Landenburg and his troops were in so great consternation, that they fled without making any resistance; but were afterwards made prisoners by the country people, who only requiring of them an oath that they never would return, granted them the liberty to retire wherever they pleased. The people commemorate these events

by an annual festival, at which the company is entertained with songs containing the history of their deliverance from Austrian tyranny.

The emperor Albert receiving advice of this defection, was about assembling an army to reduce the people to obedience; but being killed soon after, as he passed the river Rufs, the cantons had a favourable opportunity of establishing their new government, while the empire remained in confusion. About seven years after, archduke Leopold, the son of Albert, marched into the canton of Switz, with twenty thousand men, threatening utter destruction to the confederated provinces. The inhabitants made little resistance till the Austrians were advanced to a narrow valley, between two mountains, near Morgarten, where rolling large stones from the tops of the hills, they threw the enemy's cavalry into confusion. At the same time attacking them in front with fifteen hundred men, they obtained a complete victory, which they pursued with so much diligence, that they drove the invaders entirely out of the country. Upon this defeat of the Austrians, the three cantons of Underwald, Switz, and Uri, entered into a perpetual league, which had at first been made for ten years only, and took an oath for the due observance of it; whence they were called Eydgnossen, a German word signifying parties to the same oath. The battle being fought in the canton of Switz, the name of this little province was communicated to the rest, which entered into the confederacy, and even to their allies. The house of Austria made several attempts afterwards to reduce the cantons of Switz, Underwald, and Uri, to subjection; but were so far from succeeding in this design, that they lost several more of their provinces, which from time to time acceded to the association. In all the attempts of the house of Austria for the recovery of those provinces, its forces were usually assisted by the Swiss nobility, till the latter being at length either expelled the country, or reduced to acknowledge the sovereignty of the cantons, the Switzers were declared a free people, independent of the empire and the house of Austria, by the treaty of Munster, in the year 1648, at the same time that the United Provinces were declared independent of Spain.

## I T A L Y.

## C H A P. I.

*Of the situation—mountains—seas—rivers—air—produce.*

ITALY is situate between 7 and 19 degrees of east longitude, and between 38 and 47 degrees of north latitude. It is bounded on the north by Switzerland and the Alps, which separate it from Ger-

many; on the east by another part of Germany and the Gulph of Venice; on the south by the Mediterranean; and on the west by the same sea and the Alps, which divide it from France. But if we include Savoy, which lies on the west side of those mountains, the boundaries of Italy in this quarter must be extended to one degree more. The shape of this country is said to resemble a boot, and, according to the limits here specified, its length, from the north-west

to

to the south-east, is upwards of six hundred miles. Its breadth is various in different parts: in the north it is four hundred miles; in the middle about a hundred and twenty; and towards the south eighty miles. In ancient times, the boundaries of Italy on the west extended no farther than a line drawn from the river Arnus, which runs into the Tuscan Sea, to the Rubicon, which discharges itself into the Adriatic; the whole of that part lying between this line and the Alps being denominated Gallia Cisalpina. The most southern part of the country was also considered as distinct from Italia Propria, and bore the name of Magna Græcia; but Augustus Cæsar, abolishing the names of Gallia and Magna Græcia, gave the common name of Italia to the whole country comprehended within the limits which we have ascribed to Modern Italy.

In the north part of Italy lie the Alps, the highest mountains in Europe. They begin at the Mediterranean, and stretching northward, separate Piedmont and Savoy from the adjacent countries; whence directing their course to the east, they form the boundary between Switzerland and Italy, and terminate near the extremity of the Adriatic Sea, north-east of Venice. Over the western part of those mountains, towards Piedmont, Hannibal forced his passage into Italy; which he is said to have effected by pouring vinegar on the rocks, that had been previously heated by fires made with great piles of wood. The prospect, from many parts of this enormous range of mountains is extremely romantic, especially towards the north-west. One of the most celebrated is the Grande Chartreuse, where is a monastery founded by St. Bruno, about the year 1084. From Echelles, a little village in the mountains of Savoy, to the top of the Chartreuse, the distance is six miles. Along this course, the road runs winding up, for the most part not six foot broad. On one hand is the rock, with woods of pine-trees hanging over head; on the other a prodigious precipice, almost perpendicular, at the bottom of which rolls a torrent, that sometimes tumbling among the fragments of stone which have fallen from on high, and sometimes precipitating itself down vast descents with a noise like thunder, rendered yet more tremendous by the echo from the mountains on each side, concurs to form one of the most solemn, the most romantic, and most astonishing scenes in nature. To this description may be added the strange views made by the craggs and cliffs, and the numerous cascades which throw themselves from the very summit down into the vale. On the top of the mountain is the convent of St. Bruno, which is the superior of the whole order. The inhabitants consist of a hundred fathers, with three hundred servants, who grind their corn, press their wine, and perform every domestic office, even to the making of their cloaths. In the Album of the fathers is admired an Alcaic ode, written by the late ingenious Mr. Gray, when he visited the Chartreuse, and which has since been published among his works.

The Glaciers of Savoy are also justly reckoned among the most stupendous works of nature. These are immense masses of ice, lodged upon the gentler

declivities amidst the Alps, and exhibiting representations beyond conception fantastic and picturesque. In the extraordinary narrative of Mr. Bourrit's journey hither we meet with the following account of the Prientré, in the valley of Chamouni. We had, says he, the magnificent prospect of a chain of mountains, equally inaccessible, and covered with ice; and above the rest that of Mount Blanc, whose top seemed to reach, and even pierce the highest region of the clouds. The chain upon which this mountain looks down like a giant, is composed of masses of rocks, which terminate in pikes, or spires, called the Needles, and which are ranged like tents in a camp. Their sides appear lighter, and more airy, from the ornament of several hollow breaks and furrows fretted in the rock itself, as well as from the different streaks and panes of ice and snow, which without changing the general character of their form, or the majesty of their appearance, give them a picturesque variety. Lower down, the eye surveys with ravishment the gills of ice, and the several glaciers, extending almost into the plain, whilst this appears like an artificial garden, embellished with the mixture of a variety of colours. We have a picturesque opposition to this chain, which is formed by innumerable mountains at the distance of near fifty leagues, between whose tops we have a glimpse of those several plains which they environ.

M. De Saussure, who had visited those mountains about two months before M. Bourrit, felt himself naturally electrified in this place. This extraordinary phenomenon seems not to have been experienced by the latter or his company; but they heard a long continued rumbling noise, like that of thunder, which was rendered more awful by the silence of the place where they stood. This noise proceeded from the subsequent causes, viz. the avalanches of snow, which separated from the tops of the mountains, and rolled down to the bottom; considerable fragments of the rocks which followed them, overturning others in their fall; and massy blocks of ice, which precipitated from the summits.

The valley of Montanvert appears to be peculiarly romantic. Here, says M. Bourrit, we beheld a spacious icy plain entirely level. Upon this there rose a mountain all of ice, with steps ascending to the top, which seemed the throne of some divinity. It likewise took the form of a grand cascade, whose figure was beyond conception beautiful, and the sun, which shone upon it, gave a sparkling brilliance to the whole. The valley on our right hand was ornamented with prodigious glaciers, that shooting up to an immeasurable height between the mountains, blend their colours with the skies, which they appear to reach.

Amidst those sequestered regions is found the chamois, which seems to hold a middle place between the goat and the deer, and to exceed in strength and agility almost any other animal of its size. It is astonishing to see with what swiftness they bound along the steepest slopes upon the edge of precipices, to elude pursuit. The hunters carry with them a pocket telescope, and having gained an eminence, run over the most elevated pastures with their glass to

dis-

discover the game. This they endeavour to take by surprize; but the least noise is sufficient to give the animal an alarm. The skill of the hunter is shewn in driving it upon such narrow ledges, as lay the creature under the necessity either of leaping down a precipice, or of presenting itself trembling before him. In this situation, it sometimes turns short on a sudden, and endeavours to dart past him; in which case the hunter is in no little danger of being precipitated down the steep; if he has not time to slip aside, or cling close to the rock.

The gun used by the chamois-hunters is of a peculiar construction, consisting of a single-rifled barrel with two locks, one before the other. It receives two charges of powder and ball at the same time; the bullet of the first charge being either screwed down, or rammed so tight, as to serve for a breech-pin to the second charge, and prevent the communication of the fire to it, upon pulling down the cock nearest the muzzle. The difficulty of pursuing those animals over the heights of the mountains, renders it necessary to have the piece as light as possible, consistent with the advantage of a double charge.

The Apennine mountains are a ridge running through the middle of Italy, from north-west to south-east, in the form of a crescent. This mountain is greatly short of the height of the Alps, but occasions a considerable difference in the climate on its opposite sides.

The sea which washes the coast of Italy is the Mediterranean, that part of it lying on the east being usually styled the Adriatic, or Gulf of Venice. It is remarkable of the tides in this branch of the sea, that they now flow to places considerably above what they had reached in former times; as is evident by a comparison of the mean heights, from the year 1751 to 1755, and from the year 1760 to 1769. The mean height in the former period is found to have been  $23\frac{1}{2}$  inches, and in the latter  $25\frac{1}{2}$ . This increase of the modern tides has such an effect on the city of Venice, that the inhabitants are obliged to raise the streets to keep them dry, and also the large cisterns for the reception of rain water, to preserve them from any mixture of the encroaching sea waters. The heights of the tides at Venice are the greatest that are observed in all the Adriatic; the waters being pushed against, and accumulated in the bottom of the gulph about the Venetian coast; for towards the Mediterranean the tides gradually abate; so as to be hardly perceptible, except in the narrow creeks and gulfs.

It is also observed with respect to the Adriatic Sea, that the waters have constantly a circular course. Entering by the mouth of the gulf, they flow northward along the east coast, whence sweeping round the Gulf of Venice, they return southward by the Ecclesiastical and Neapolitan coasts. In consequence of this motion ships follow the same course in navigating to and from Venice.

The principal lakes are those of Maggior, Lugano, Como, Iseo, and Garda, in the north; with Perugia or Trasimene, Bracciano, Tarni, and Celano, in the middle of Italy.

No. 24.

The chief rivers are as follows: viz. the Po, which rises in the Alps, and running northward, passes by Turin and Chivas, whence directing its course to the east, through Piedmont, Montserrat, the Milanese, and the territories of Venice, it discharges itself into the Adriatic by several channels; receiving in its course the two Dorias, the Sura, Sessia, Tessino, Olana, Adda, Oglio, and Mincio, on the north side; and on the south, the Tenaro, Trebia, Taro, Secchia, and Parma. This great river, formerly called Padus, but more anciently Eridanus, divided Cisalpine Gaul into Cispadana and Transpadana, and is famous in mythology from the story of Phaeton.

The Var divides Italy from Provence, and falls into the sea near Nice. The Adige rises in Tyrol, whence running south by Trent, it bends to the east at Verona, and discharges itself into the Adriatic a little north of the Po. The Toghamenta, Piava, and Brenta, rise in the Alps, and running south-east through the territories of Venice, fall likewise into the Adriatic.

The Arno rises in the Apennine Mountains, and running west by Florence, through one of the finest vales in Italy, discharges itself into the sea of Tuscany below Pisa. The Rubicon rising in the same mountains, proceeds eastward, and falls into the Adriatic near Rimini. Here likewise is the source of the celebrated river Tiber, which running south-west by Rome, falls into the sea at Ostia, about twelve miles below the city. The Volturno rises also in those mountains, and running west through Naples, falls into the sea below Capua.

The air of this country is generally temperate and healthful, though in the mountains and some of the valleys respectively, it tends to opposite extremes. A considerable difference in the climate may be perceived between the territories on the north, and those on the south side of the Apennine, the former being much the more temperate. This country, so much the boast of the ancient Romans, under the various names of Italia, Latium, Saturnia Tellus, and Hesperia, is with great justice denominated the Garden of Europe. It produces all sorts of fruit that are indigenous to a warm climate, with oil, and wine, in great plenty. Silk also is one of its capital commodities, with rock-cryстал, alabaster, fine marble, and Venetian steel. The manufactures are chiefly gold and silver stuffs and velvets.

## C H A P. II.

*Of Savoy—Piedmont—the Milanese—Genoa—Parma—Mantua—Venice.*

ITALY may be subdivided into three parts or districts, viz. the north, the middle, and the south. The first comprehends the duchies of Savoy, Piedmont, and Montserrat, with the territories of Genoa, the duchies of Milan, Mantua, Parma, Modena, and the territories of Venice; the second division comprehends the duchy of Tuscany, the pope's dominions, and the state of Lucca; and the third the kingdom of Naples.

The duchy of Savoy is bounded on the north by the lake and territories of Geneva, on the east by Switzerland and Piedmont, on the south by Dauphiné and another part of Piedmont, and on the west by Dauphiné and Franche Comté; being about eighty miles in length, and seventy in breadth. The country is generally barren and encumbered with the cold high mountains of the Alps; but there are some pleasant fruitful valleys, producing corn, wine, and fruit. It abounds in cattle, game, venison, and wild fowl; and the lakes and rivers afford fish in great plenty. The chief town is Chambery, situate in 5 degrees 50 minutes of east longitude, and in 45 degrees 35 minutes north latitude, eighty miles north-west of Turin, and forty south of Geneva. The other principal towns are, Montmelian, Annecy, Tonon, Aoste, Moutiers, Maurienne, and Bonneville.

The duchy of Savoy is subject to the king of Sardinia. The greatest disadvantage attending its situation is that of being exposed to the incursions of the French, by whom it is frequently ravaged in every war between the two nations.

The principality of Piedmont, so named from its lying at the foot of the Alps, is bounded on the north by those mountains, which separate it from Savoy; on the east by the duchies of Milan and Montferrat; on the south by the territories of Genoa, and the county of Nice; and on the west by France, from which it is divided by the river Var and the Alps; extending about a hundred and forty miles in length, and near a hundred in breadth. This country enjoys not only a most delightful climate, but also a fertile soil, abounding in corn, rice, wine, fruits, cattle, silk, hemp, and flax. Hardly any dominion of equal extent yields the sovereign so great a revenue. It is however exposed to the same inconvenience as the duchy of Savoy, and the crops are sometimes destroyed by storms of hail, called the plague of Piedmont. This country was formerly a part of Lombardy, but is now subject to the king of Sardinia, who is an absolute prince, sovereign of the island of Sardinia, Piedmont, Montferrat, and Savoy, with the counties of Nice, Tende, and Boglio or Buel, with the provinces of Oneglia, the Alexandrin, Vigavano, and Lomelin. The administration of the government in these provinces is committed to a council of state, a council of finances, and other boards, all of which are subject to the controul of his Sardinian majesty.

The city of Turin, the capital of Piedmont, and of the king of Sardinia's dominions, is situate in 7 degrees 16 minutes of east longitude, and in 44 degrees 50 minutes north latitude, at the confluence of the rivers Po and Doria, seventy miles south-west of Milan, and sixty-two south-east of Lyons, and a hundred north-west of Genoa. The town is of a quadrangular figure, about three miles in circumference, containing several spacious streets and squares, with lofty and magnificent buildings, and is fortified as well as the situation of the place will admit. The royal palace is much admired, no less on account of the grandeur of the edifice, than of the many valuable paintings with which it is furnished. Here is one of

the most celebrated Egyptian antiques in all Italy, known by the name of the table Isiaque. It is a slab of copper covered with hieroglyphics. The principal figure is an Isis sitting: she has a kind of hawk on her head, and the horns of a bull. Various are the conjectures formed by the learned in regard to the meaning of the emblematical figures upon this table. Some have imagined that the slab was intended for a compass; others, a perpetual calendar; while not a few pretend to discover in it principles of philosophy and politics; and others affirm that it contains a complete system of theology. But whatever may be the mystery conveyed in this celebrated antique, the figures are obviously the representation of men, women, birds, and other animals, confusedly grouped together, and rudely delineated, with silver incrustated into copper.

The other most conspicuous towns in the principality of Piedmont are, Susa, situated on the river Doria, on the confines of France, thirty miles north-west of Turin; Saluzz, an episcopal city, seventeen miles south of Turin; Nice, situated at the mouth of the river Var, eighty miles south-by-west of Turin; a well fortified town, the see of a bishop; Oneglia, lying in the territories of Genoa, but subject to the king of Sardinia. It is situated fifty miles north-east of Nice, and is a town of considerable trade.

The duchy of Montferrat contains about two hundred small towns and castles, and is a pleasant fruitful country, lying northward of the territories of Genoa. This duchy was formerly divided between the dukes of Savoy and Mantua; but upon the death of the latter without issue, in 1708, the house of Austria ceded the duke of Mantua's part to the then duke of Savoy, the ancestor of the present king of Sardinia, in whose family it has continued since that time.

It is difficult to ascertain the revenues of the king of Sardinia with any degree of precision. They seem however to be sufficient for all the public charges of the state, and for maintaining the dignity of the sovereign with regal splendor. Though in possession of some port-towns on the Mediterranean, as well as of an insular kingdom, his Sardinian majesty can hardly be ranked among the maritime powers; but he frequently has on foot a land army of upwards of twenty thousand men, who may rival, in point of discipline, the troops of any nation.

Savoy was anciently possessed by the Allobroges, who were reduced to the obedience of Rome in the time of Augustus. After the fall of that empire, and the decline of the Gothic nations by whom it was overturned, this country was annexed to the dominion of the Burgundian kings, on the extinction of which, it was conferred on Berold, the son of Hugh, duke of Saxony, in 999, by the emperor Otho III. his uncle, in whose family it still continues. Amadeus was created duke of Savoy and prince of Piedmont, by the emperor Sigismund, in 1391.

Victor Amadeus II. being made king of Sardinia, abdicated his throne, in 1730, in favour of his son Charles Emanuel; but afterwards repenting of this measure, and endeavouring to resume the reins of

govern-

government, he was confined by his successor, and died in prison in the sixty-sixth year of his age.

The Milanese, or duchy of Milan, is bounded on the north by Switzerland; on the east by the territories of Venice, with the duchies of Mantua and Parma; on the south by the Apennine mountains, which separate it from Genoa; and on the west by Piedmont. It is about a hundred and fifty miles in length, and eighty in breadth, well watered with lakes and rivers, and abounding with corn, wine, and delicious fruits. It contains also many fine towns and villages, and is subject to the house of Austria. The capital of the country is the city of Milan, situated on the rivers Olona and Lambro, two hundred and fifty miles south-west of Rome, and a hundred north-east of Turin. It is of a round figure, ten miles in circumference, surrounded by a wall and other fortifications, of which the extent is too great to be defended by an ordinary garrison. The citadel however is one of the strongest fortresses in Italy. The town, which is elegantly built, consists of many spacious streets and squares, and is supposed to contain about thirty thousand inhabitants. The chief manufactures here are silk, brocade, and other rich stuffs. The works of steel and crystal are also much admired; and so great is the reputation of the Milanese artificers, in various branches, that they have monopolised almost the whole trade of this part of Italy. The city of Milan is the see of an archbishop, and is adorned with a prodigious number of churches and religious houses. The cathedral is a most magnificent structure, and contains, amongst innumerable ornaments, no less than six hundred statues. In the college of St. Ambrose are sixteen professors, who read lectures every day. The gallery of this building is celebrated for a noble collection of paintings, and the library contains upwards of forty-five thousand printed books, besides a great number of valuable manuscripts.

This duchy is subject to the house of Austria, whose vicar-general, or viceroy, resides in Milan. The city is governed by a senate under the controul of this officer, who exercises the same jurisdiction in the other towns and districts of the country. The revenues of the Milanese are computed to amount to three hundred thousand pounds a year.

The territories of the republic of Genoa lie in the form of a crescent on the Mediterranean Sea, from the town of Ventimiglia on the west, to the territories of the republic of Lucca eastward. It measures in length about a hundred and fifty miles, extending no where twenty miles from the sea, and in some parts not ten. It is properly called the Riviere, or coast of Genoa. On the land side it is covered by the Apennine mountains, which separate it from the county of Nice, Piedmont, the Milanese, and Parma. The tops of those mountains produce neither trees nor herbage; but towards the bottom they are well planted with olives, vines, and other fruit. The Genoese dominions however hardly yield any corn, and their seas not many fish.

The city of Genoa, the capital of the republic, is situate in 8 degrees 57 minutes east longitude, and in 44 degrees 25 minutes north latitude, part of it along

the shore of a circular bay, and part rising gradually backwards in the form of a great amphitheatre. The harbour is large and deep, but exposed to the south-west wind; against which however there is a mole for the security of their galleys and small vessels. The houses are well built, five or six stories high. The principal street is formed by a range of palaces, exceeding elegant, the fronts of several of which consist entirely of marble. The city is surrounded by a wall and other works, six miles in circumference; beyond which, at a little distance, is a second wall, enclosing the hills that command the place. The city contains fifty-seven churches, with seventeen convents, and is the see of an archbishop. The legislative authority is lodged in the great senate, consisting of the signiory, and four hundred principal citizens, elected annually out of the freemen. The signiory is composed of the doge and twelve other members, who hold their places two years. To this body, assisted by some other councils, is committed the administration of government; four parts in five of the senate being necessary to constitute a majority. While the doge continues in office, he resides in the palace erected by the public for his accommodation, and is attended by guards, in the manner of a sovereign prince. He is clothed in robes of crimson velvet, and addressed with the title of most serene; the senators being styled their excellencies, and the nobility illustrious. Those of the latter class derive their titles from the lands which they possess in Naples, Milan, and other countries, a privilege that has been justly considered as a fault in the constitution of the republic, the subjects of which, by being permitted to purchase honours and estates abroad, become thereby dependent on a foreign jurisdiction, repugnant to the interest of their country.

The forces of the republic are usually four or five thousand men, but sometimes they have been increased to the number of twenty thousand. The ordinary revenue is computed at two hundred thousand pounds a year. There is here a bank, which has part of the public duties for its fund. The crown of Spain is much indebted to this republic for money lent during the reign of Philip II. and other sums since that time; the interest of which, or part of it, being regularly paid, but none of the principal ever discharged.

The territories of Genoa not being fruitful, the magistrates usually keep two or three years provisions of corn, wine, oil, and other necessaries in their magazine, which they sell out at reasonable prices to the public in times of scarcity. The chief manufactures of this place are rich silks, velvets, and brocades, of which they export a great quantity, as well as of wine, oil, fruits, anchovies, sweet-meats, and several sorts of drugs.

The territory of Genoa formed part of the ancient Liguria, which, with the rest of Italy, fell under the dominion of the Romans. Upon the destruction of that empire, it was invaded by the Goths, and afterwards made part of the kingdom of the Lombards. It next became subject to the German empire, and during the wars between the pope and the emperor, asserted its independency. Various forms of govern-

ment

ment being adopted after this revolution, the people were sometimes subject to the nobility, and at others to one sovereign, who were successively the archbishop of Milan, the king of France, the marquis of Montserrat, the duke of Milan, and again the French king. The present constitution of the republic was settled by Andrew Doria, in 1518, who relieved his country from the foreign yoke under which it had formerly been held.

This republic once rivalled the Venetians in traffic, and the dominion of the Mediterranean Sea. They also possessed several towns on the coast of Greece, and the Euxine Seas, with some of the Grecian islands in the Archipelago, and took the island of Corsica from the Saracens. Their foreign possessions however have been lost, with the declension of their maritime power. They have now only some armed galleys, and are usually under the influence of Spain and Naples, the greater part of their estates being situated within the latter kingdom.

The duchy of Parma is bounded on the north by the river Po, which separates it from the Milanese; by the duchy of Modena on the south-east; on the south-west by the territories of Genoa; and on the west by another part of the Milanese, being about sixty miles long and fifty broad. It is a fertile country, abounding in corn, rice, wine, oil, and fruits, with rich pastures and cattle. Here are also mines of copper and silver. Parma, the capital, is pleasantly situated on a river of the same name, in 11 degrees of east longitude, and 44 degrees 50 minutes north latitude, sixty miles north-east of Genoa, and sixty-five south-east of Milan. The town is of a circular form, about three miles in circumference, defended by a citadel, and other modern works, which are esteemed very strong. Here is an university, and the see of a bishop. The dome of the church of St. John is adorned with excellent paintings, the work of the celebrated Coreggio, who was a native of this place.

The duchy of Parma is subdivided into Parma and Placentia; the latter of which has for its capital the town of the same name, situated thirty miles north-west of Parma. It stands about half a mile south of the river Po, in a fruitful plain, well watered with rivulets. The town is upwards of three miles in circumference, fortified, and defended by a citadel.

The duchy of Parma has been successively subject to the western emperors, the pope, the Venetians, the Milanese, and the French. In 1545, pope Julius reduced it again under the power of the Roman see; and pope Paul III. created his natural son, Peter Lewis Farnese, duke of Parma. In 1736, after the death of the preceding duke of Parma, the duchy was assigned to the house of Austria, by a treaty concluded between the late emperor Charles VI. and France, and possession was taken of it accordingly: but the pope, who claimed it as a fief of the holy see, protested against this settlement. By the treaty of Aix-la-Chapelle, it was conferred on the infant Don Philip of Spain, who has since been duke of Parma, Placentia, and Guastalla, a town in the duchy of Mantua, also ceded by the same treaty.

The duchy of Mantua is bounded on the north by the Brescian and Veronese; on the east by another part of the Venetian territories; on the south by the duchies of Modena and Mirandola; and on the west by the Milanese; being about fifty miles long, and from ten to fifty broad. The country abounds in corn, wine, silk, flax, pasture, and excellent fruits. The chief town is Mantua, situate in 10 degrees 47 minutes east longitude, and in 45 degrees 10 minutes north latitude, in the middle of a lake formed by the river Mincio, eighty miles south-west of Venice, and seventy west of Milan. It has a communication with the Continent by three causeways defended by forts, and is about five miles in circumference. The streets and squares are spacious and elegantly built. The number of inhabitants is computed at upwards of four hundred thousand. Here is an excellent manufacture of silk, hence called Mantuan silk. The town is the see of an archbishop, who is immediately subject to the pope, and has no other superior. At this place was born the poet Tasso; and the village of Andes, about two miles from it, is celebrated for the nativity of Virgil.

Mantua mufarum domus, atque ad sidera cantu  
Evecta Andino, & Smyrnæis æmula pletris.

SIL. ITAL.

Mantua formerly constituted part of the kingdom of Lombardy, but was conquered by Charlemagne about the year 800, from which time it continued a province of the German empire until the wars between the pope and the emperor, when the inhabitants erected a republic. This form of government however was overturned by some of the principal citizens, who assumed the sovereignty of the state, and reigned successively under the denomination of tyrants. In 1328, the last of those usurpers was deposed by Lewis de Gonzaga, who obtained the sovereignty as the emperor's vicar; his successors enjoying the title of lords of Mantua till 1435, when the emperor conferred on the family the title of marquis, and afterwards that of duke. In 1703, however, the duke adhering to the French interest against the house of Austria, the latter seized upon the duchy as a forfeited fief, and has ever since kept possession of it. The revenues of the duchy are computed to amount to three hundred thousand pounds a year.

The republic of Venice is bounded on the north by the country of the Grisons, Trent, and Tirol; on the east by Carniola and the Gulf of Venice; on the south by Romania and the duchy of Mantua; and on the west by the duchy of Milan; being a hundred and eighty miles long, and a hundred broad. The country is level and the soil fruitful, producing corn, wine, silk, rich pasture, and plenty of cattle of all kinds. The capital of the Venetian dominions is Venice, situate in 12 degrees 2 minutes of east longitude, and in 45 degrees 25 minutes north latitude; two hundred and twenty miles north of Rome, and a hundred and forty east of Milan. This city is said to derive its origin from the fishermen of Padua, who here built their huts on the lagunes, or marshy grounds, whither

and the inhabitants computed to amount to two hundred thousand.

The sovereign power of Venice is lodged in the descendants of the ancient families, of whom there are at present about fifteen hundred, styled noble Venetians, and who constitute the grand council or assembly of the state; having a right to enter on their senatorian office at the age of twenty-five. The doge or duke of Venice, though vested with all the external marks of executive power, has in reality but very little share in the administration of government; but he enjoys his dignity for life. As the Venetians claim the sole navigation of the Adriatic Sea, this magistrate, attended by the senators, and a great number of gondolas or vessels richly adorned, sails into the gulf annually on Ascension-Day, and throwing a ring into the Adriatic, espouses her, as proxy of the state.

Besides the great council, or legislative body of the republic, there are several others to which is committed the charge of public affairs. One of those in particular has the power of imprisoning and putting to death the greatest nobleman, even the doge himself, upon the bare suspicion of any treasonable design, and

the architect. Verona is yet distinguished by a university, and is the see of a bishop.

Aquileia, capital of Friuli, is situated twenty-two miles west of Trieste, and fifty-seven north-east of Venice. This was anciently a city of great eminence, but now much decayed. It is at present subject to the house of Austria, though its patriarch be one of those of the Venetian republic.

The inhabitants of the Venetian territories are allowed no share in the government of the state, nor is any respect paid in the capital to the ancient nobility on the continent.

The annual revenues of the republic are estimated at one million two hundred thousand pounds. The number of their land forces is about twenty-four thousand. Their marine, it is computed, may sometimes consist of thirty men of war, a hundred galleys, and ten galleasses; but they seldom engage the Turks at sea without foreign assistance. Their fleet is always commanded by a noble Venetian; but for the land-service they make choice of some foreign general, who is accompanied by several senators, without whose concurrence he cannot act. For the most part, they also employ foreign troops in their wars, that the

adorned with excellent paintings, the work of the celebrated Coreggio, who was a native of this place.

The duchy of Parma is subdivided into Parma and Placentia; the latter of which has for its capital the town of the same name, situated thirty miles north-west of Parma. It stands about half a mile south of the river Po, in a fruitful plain, well watered with rivulets. The town is upwards of three miles in circumference, fortified, and defended by a citadel.

The duchy of Parma has been successively subject to the western emperors, the pope, the Venetians, the Milanese, and the French. In 1545, pope Julius reduced it again under the power of the Roman see; and pope Paul III. created his natural son, Peter Lewis Farnese, duke of Parma. In 1736, after the death of the preceding duke of Parma, the duchy was assigned to the house of Austria, by a treaty concluded between the late emperor Charles VI. and France, and possession was taken of it accordingly: but the pope, who claimed it as a fief of the holy see, protested against this settlement. By the treaty of Aix-la-Chapelle, it was conferred on the infant Don Philip of Spain, who has since been duke of Parma, Placentia, and Guastella, a town in the duchy of Mantua, also ceded by the same treaty.

Gonzaga, who obtained the sovereignty as the emperor's vicar; his successors enjoying the title of lords of Mantua till 1435, when the emperor conferred on the family the title of marquis, and afterwards that of duke. In 1703, however, the duke adhering to the French interest against the house of Austria, the latter seized upon the duchy as a forfeited fief, and has ever since kept possession of it. The revenues of the duchy are computed to amount to three hundred thousand pounds a year.

The republic of Venice is bounded on the north by the country of the Grisons, Trent, and Tirul; on the east by Carniola and the Gulf of Venice; on the south by Romania and the duchy of Mantua; and on the west by the duchy of Milan; being a hundred and eighty miles long, and a hundred broad. The country is level and the soil fruitful, producing corn, wine, silk, rich pasture, and plenty of cattle of all kinds. The capital of the Venetian dominions is Venice, situate in 12 degrees 2 minutes of east longitude, and in 45 degrees 25 minutes north latitude; two hundred and twenty miles north of Rome, and a hundred and forty east of Milan. This city is said to derive its origin from the fishermen of Padua, who here built their huts on the lagunes, or marshy grounds, whither

several

several considerable families of Padua and Aquileia likewise retired, in the fifth century, to save themselves from falling into the hands of the Goths, who then invaded Italy. At that time the foundation of Venise was laid on seventy-two small islands, but it now stands on a much greater number. Such is the natural advantage of its situation, and so difficult the access either by land or sea, that no power has ever attempted to besiege this city, though it has now stood upwards of twelve hundred years. The prospect of Venice, on approaching it either from the continent or the sea, is extremely beautiful, nor is the idea of its uncommon grandeur diminished on arriving in the city. The piazza of St. Mark is hardly to be equalled for the magnificence of its buildings; and on the grand canal the houses are for the most part elegant structures with marble fronts, and adorned with pillars of the various orders of architecture. The canals are so numerous that they are dispersed in every quarter of the town; and over them are four hundred and fifty bridges, the principal of which, called the Rialto, lies over the great canal, and is composed of one arch ninety foot wide, making one third part of a circle. Along the sides of some of the canals, there are keys on which the people walk, but others are destitute of this convenience, and in some parts extend from one side of the street to the opposite.

The rooms are usually hung with gilt leather or tapestry, and the bedsteads are of iron, for the purpose of securing them against vermin, to which the warmth and moisture of the climate might expose them. The low and maritime situation of Venice, however, is attended with several disadvantages. The canals in the heat of summer afford a very offensive smell; all the water is bad, except what is brought from the continent; and they have no good cellars for their wine. The circumference of the city is about six miles, and the inhabitants computed to amount to two hundred thousand.

The sovereign power of Venice is lodged in the descendants of the ancient families, of whom there are at present about fifteen hundred, styled noble Venetians, and who constitute the grand council or assembly of the state; having a right to enter on their senatorian office at the age of twenty-five. The doge or duke of Venice, though vested with all the external marks of executive power, has in reality but very little share in the administration of government; but he enjoys his dignity for life. As the Venetians claim the sole navigation of the Adriatic Sea, this magistrature, attended by the senators, and a great number of gondolas or vessels richly adorned, sails into the gulf annually on Ascension-Day, and throwing a ring into the Adriatic, espouses her, as proxy of the state.

Besides the great council, or legislative body of the republic, there are several others to which is committed the charge of public affairs. One of those in particular has the power of imprisoning and putting to death the greatest nobleman, even the doge himself, upon the bare suspicion of any treasonable design, and

No. 25.

that without bringing him to an open trial, or allowing him the privilege of making his own defence.

The territories of Venice are subdivided into a number of districts, distinguished by their chief towns, which are, Padua, Verona, Aquileia, &c.

Padua is situated twenty-two miles west of Venice, in a fine plain, watered by the rivers Brentae and Bachiaglione. The form of the city is circular, and about seven miles in compass; but the ground within the walls is at present not half built, and many of the houses are in a ruinous condition. This city was anciently one of the most flourishing in Italy. In the time of the Romans, the inhabitants amounted to a hundred thousand, but at present hardly to a third part of that number; and its celebrated university is now reduced to one college. Here is still however a manufacture of woollen cloth; but the people are generally miserable through the oppression of the Venetian republic. According to tradition, this city was founded by Antenor, and a colony of Trojans; and here is shown an image of the Blessed Virgin, which, upon the same oral authority, flew thither from Constantinople, when the city was taken by the Turks.

Verona, capital of the Veronese subdivision, is situated on the river Adige, twenty-four miles north of Mantua. It is six miles in circumference, well fortified, and containing several noble buildings. Among other antiquities is a Roman amphitheatre, with the seats yet entire, and capable of accommodating twenty-five thousand spectators. The longest diameter of the area is two hundred and thirty-three foot, and the shortest a hundred and thirty-six. Here is also the remains of a triumphal arch, and a magnificent temple dedicated to Jupiter. At this place were born the two Pliny's, the elder and younger, and Vitruvius the architect. Verona is yet distinguished by an university, and is the see of a bishop.

Aquileia, capital of Friuli, is situated twenty-two miles west of Trieste, and fifty-seven north-east of Venice. This was anciently a city of great eminence, but now much decayed. It is at present subject to the house of Austria, though its patriarch be one of those of the Venetian republic.

The inhabitants of the Venetian territories are allowed no share in the government of the state, nor is any respect paid in the capital to the ancient nobility on the continent.

The annual revenues of the republic are estimated at one million two hundred thousand pounds. The number of their land forces is about twenty-four thousand. Their marine, it is computed, may sometimes consist of thirty men of war, a hundred galleys, and ten galleasses; but they seldom engage the Turks at sea without foreign assistance. Their fleet is always commanded by a noble Venetian; but for the land-service they make choice of some foreign general, who is accompanied by several senators, without whose concurrence he cannot act. For the most part, they also employ foreign troops in their wars, that the

subjects of the state may not be interrupted in their application to manufactures and commerce, which are the support of the republic.

Their exports consist chiefly of wine, oil, fruit, Venetian steel, copper, glass, &c. with wrought silks of various kinds, brocades, gold and silver stuffs, damasks, and velvets.

Though the Venetians, like the other states of Italy, profess the catholic religion, the authority of the pope is here extremely inconsiderable. Their church has two patriarchs, the one of Aquileia and the other of Venice, who are entirely subject to the temporal power, and regarded as little more than cyphers; considering likewise as such the Roman pontiff in his ecclesiastical capacity. A kind of inquisition indeed is here tolerated, but the court can put none of their decrees in execution without the leave of the state. In proportion to the small authority of the ecclesiastics, religious prejudices are rarely found among the Venetians, nor is even public decency required in those of the clerical function. Monks and priests may not only enjoy the diversion of masquerading during the carnival, but may keep concubines, sing upon the stage, and take what liberties they please, provided that they do not interfere in the affairs of government. The dissoluteness of the nuns is equal to that of the clergy, and they openly violate the coercive regulations of the patriarch towards restraining their immoralities.

The Venetians, considered as a trading people, are perhaps more addicted to pleasure than the inhabitants of any other nation, and seem not even to possess the virtues of frugality and temperance, which are usually found to prevail the most in republican governments. The custom for the ladies to have their cavaliers servants, or cicisbeo, is here universal. A person under this denomination enjoys so intimate a familiarity with the lady to whom he is attached, that he may be regarded in every respect as her husband, more properly than the nominal partner whose wife she is reputed, in consequence of a marriage by which her parents had sacrificed her affection to considerations of interest.

Here are many small houses, named casinos, consisting of one or two rooms on a floor, neatly fitted up; intended for the reception of coteries, where the company play at cards, and generally sup together.

The Venetians were formerly much richer and more powerful than at present, possessing the whole trade of the Levant, and not only masters of a great part of Italy north of the Po, but also of the Morea, and the numerous islands in the Archipelago. Upon the Portuguese discovering the way to India by the Cape of Good Hope, however, the Venetians lost a valuable branch of their commerce, with the ruin of which their wealth and power began to decline. They have since been obliged to abandon their territorial acquisitions in Greece, as well as almost all the islands in the adjacent seas; and their continental possessions are now restricted to their territories in Italy, with Istria, Morlachia, and some towns on the coast of Dalmatia, north of the Gulf of Venice.

## C H A P. III.

*Of Modena—Lucca—Tuscany—deminions of the pope—  
Naples—Italians—character—history.*

THE duchy of Modena is bounded on the north by Mantua; on the east by Romania; on the south by Tuscany and Lucca; on the west by Parma and the territories of Genoa. It is about fifty miles long, and forty broad, a pleasant fertile country, abounding in corn, wine, silk, rich pastures, and excellent fruits. The capital is Modena, situate in 11 degrees 20 minutes of east longitude, and in 44 degrees 34 minutes north latitude, forty miles south of Mantua. The houses in the city are not well built, but it contains some handsome structures, among which are, the cathedral, several churches, and some of the monasteries. This is the ancient Mutina, where Brutus being besieged by Anthony, was relieved by the consuls Hirtius and Panfa.

The duchy is subject to its own duke, who resides in a magnificent palace in the capital, and enjoys a revenue of about a hundred thousand pounds a year. On the fall of the Roman empire this country became subject to the Goths, the Lombards, and the German emperors successively. It was afterwards annexed to the marquisate of Ferrara, and possessed alternately by the pope and the family of D'Este, till the duke and the pope agreed to divide it between them; since which time the former has held the duchies of Modena, Rhegio, and Mirandola; and the latter the marquisate of Ferrara.

The territories of the republic of Lucca are bounded on the north by Modena; on the east and south by Tuscany; and on the west by the Tuscan Sea and the territories of Genoa; extending twenty-five miles in length, and in breadth about twenty. Lucca, the capital, is situate in 11 degrees 36 minutes of east longitude, and in 43 degrees 50 minutes north latitude, near the river Serchio, twelve miles east of the Tuscan Sea. The town is elegantly built, about three miles in circumference, surrounded by a wall and other modern fortifications.

The legislative authority of this republic is lodged in a senate of two hundred and the principal inhabitants; and the executive power administered by the gonfalonier, or standard-bearer, the chief officer of the state, assisted by a council of nine members, who are changed every two months. All elections of officers are made by balloting in the senate. By the diligence of the natives this town has obtained the name of Lucca the Industrious. The principal manufactures are those of silk, and gold and silver stuffs. The inhabitants oblige all travellers to leave their arms at the gate, and will not suffer any person to wear a sword in the city. This place is the see of a bishop, immediately subject to the pope, and he officiates in the robes of an archbishop. The olive oil produced in the territory of Lucca is in great esteem. Of corn they have only a small quantity, but abundance of wine.

wine. The ordinary revenues of the state are estimated at thirty thousand pounds a year, which enables them to raise on any emergency a body of ten thousand men. This republic usually shared the fortunes of the rest of Italy, till they purchased their independency of the emperor Rodolph, for ten thousand crowns, in 1279; since which time they have remained a free state, but greatly declined in respect of traffic, and naval power in the Mediterranean, for which they once were conspicuous.

The duchy of Tuscany is bounded by the territories of Lucca and Modena on the north-west; by those of the pope on the north-east and south; and by the Tuscan Sea on the south-west; being a hundred and fifty miles long, and about a hundred broad. This country being almost encompassed on the land side by the Apennine mountains, the air in those parts is generally cold, and the soil barren; but in others the climate is agreeably temperate, and there are several fine valleys, of great extent, as well as uncommon fertility. One in particular, which runs across this country, from Arezzo to the Tuscan Sea, abounds in corn, wine, oil, oranges, figs, citrons, and other excellent fruits. No country affords greater plenty of mulberry-trees, on which account the natives are enabled to make the richest silks.

Tuscany is subdivided into three districts, viz. the Florentine, Sianese, and Pisan. The capital of the first, and of all Tuscany, is Florence, situate in 11 degrees 24 minutes of east longitude, and in 43 degrees 46 minutes north latitude, on the river Arno, a hundred and twenty-five miles north of Rome, and forty-five east of Leghorn. This town, which on account of its beauty is distinguished by the name of Florence the Fair, is defended by a wall and other modern works, with three citadels, the extent of the whole in circumference being about six miles. The private buildings are lofty, the squares spacious, the noblemen's palaces equal to any in Italy, and the churches little inferior to those of Rome. Almost all the streets are adorned with statues and fountains; but the valuable antique statues, curiosities, and paintings, in the great duke's palace, are unrivalled by any in the world. This elegant city is supposed to contain seventy thousand inhabitants. It has nineteen gates, seventeen large squares, twenty-two hospitals, eighty-nine convents, and a hundred and fifty-two churches. Here is also an university, and the seat of an archbishop.

The chief town of the Sianese subdivision is Sienna, situated thirty-six miles south of Florence, on an eminence, in a pleasant and fruitful valley. This town is likewise elegantly built, about four miles in circumference, encompassed with a ruinous antique wall, and defended by a citadel. The cathedral is esteemed one of the finest pieces of Gothic architecture in Italy. An archbishoprick and university are also distinctions of this place. Sienna was formerly a powerful republic, and often contended with the Florentines for superiority in war. The magistracy consists of a governor and senate, which has however been subject to the grand duke of Tuscany since the year 1555;

a period whence may be dated the decline of its ancient prosperity.

The capital of the other district is Pisa, situated on the river Arno, forty-two miles west of Florence, and four miles east of the sea. In the same subdivision of the country stands the port-town of Leghorn. This city has a secure harbour, but so liable to be choaked up with sands, that the great duke's slaves are continually employed in clearing it. With the sand thus collected, they fill up the marshes about the place, by which means the town is rendered more healthy than it formerly had been. Leghorn being a free port, the merchants of all nations resort hither, and the place is rich and populous. The inland duties however are very high, nothing going in or out of the city but what is greatly taxed to the inhabitants. Britain imports from Leghorn a great quantity of silk, wine, and oil.

Tuscany was anciently known by the names of Umbria, Tyrrhenia, and Etruria, and was divided into twelve states or principalities, till about four hundred and fifty-five years before Christ, when it fell under the dominion of the Romans. From many remaining antiquities, it appears that the inhabitants of Etruria cultivated the arts at a very remote period, though even the characters of their language are now entirely unknown. After experiencing the dominion of the Goths, and the kings of Lombardy, it was annexed by Charlemagne to the western empire. The viceroy or governor was sometimes styled marquis, and at others duke of Tuscany. This officer rendering himself independent of the emperor, at the instigation of the pope, who made offer of his protection, the influence of the latter became at length so considerable, that he took upon him to transfer the dominions of Tuscany to the sovereigns of Naples, the dukes of Anjou, and other princes who possessed the greatest share of his favour. During the wars between the pope and emperor, in which the partizans of the former were distinguished by the name of Guelphs, and the latter by that of Gibellines, Florence, Pisa, Sienna, and several other considerable cities in Italy, with their territories, withdrew themselves from the subjection to either power, and erected such governments as suited their own inclination. They seldom however continued long under any one form, but altered their constitutions as the nobility or people prevailed, till John de Medicis was invested by the Florentines with the executive power of the state. But neither he nor his descendants were absolute for many years after, the advances which they made towards despotism being slow and cautious. In 1570, pope Pius V. conferred the title of grand duke on Cosmo de Medicis, and crowned him at Rome with his own hands. From this time the holy see has considered the dukes of Tuscany as its vassals, while the emperor on the other hand has claimed it as a chief of the empire, and asserted the right of disposing of it on the failure of issue of the Medicæan family; as was done some years ago in favour of Don Carlos, son of the queen of Spain, against which the pope protested.

This

This prince however relinquishing his right to his new dominions, in consideration of the Sicilies being conferred upon him, the late emperor obtained this duchy, in lieu of Lorraine which he ceded to France; and his second son, archduke Leopold, is at present sovereign of Tuscany.

Some places in Tuscany however are under the dominion of other sovereigns, as the city of Lucca with its territories; the State del Presidii, or the garrisons on the sea coast, which is occupied by the Spaniards; the principality of Piombino, the domain of the house of Cibo, and the marquise de Fos de Nuovo.

The great duke of Tuscany is an absolute prince, and his revenues are computed to amount to five hundred thousand pounds. They arise from the tenths of the yearly value of every house; the tenth of all estates that are sold; the ground-rents of the houses in Leghorn, and other cities; with eight per cent. out of the portions of all women when they marry; five shillings a head on cattle when they are sold, and almost a general excise on provisions. The forces of this prince, exclusive of the ordinary militia, consist only of his guards, and some armed galleys at sea. In case of a war, he usually hires foreign troops, who are for the most part from Switzerland.

The dominions of the pope are bounded on the north by the Venetian territories; on the north-east by the Gulf of Venice; on the south-east by Naples; on the south-west by the Tuscan Sea; and on the north-west by the duchy of Tuscany, which they almost encompass on the land side. They extend in length two hundred and forty miles, and in breadth from twenty to two hundred and twenty. The soil of the pope's territories is generally fertile, producing corn, wine, oil, silk, and excellent fruits, but might yield them in much greater quantity, were it as well cultivated as in the time of the Romans. The country is subdivided into the following districts, viz. Romania, the Bolognese, the Ferrarese, Urbino, Ancona, Spoleto, Campania, St. Peter's Patrimony.

Romania, including the Bolognese and Ferrarese, is bounded on the north by the territories of Venice; on the east by the Gulf of Venice; on the south by the duchy of Tuscany, and the province of Urbino; and on the west by Modena and Mantua, extending about eighty miles in length, and almost as much in breadth. The country is in general fruitful and pleasant, but the Ferrarese is unhealthy.

The chief town of Romania is Ravenna, situate in 12 degrees 15 minutes of east longitude, and in 44 degrees 22 minutes north latitude, three miles west of the Gulf of Venice. It anciently stood on several islands, like the city of Venice, and was then esteemed one of the best harbours the Romans had; but the sea is now retired about three miles from it, and what formerly lay under water, is at present a fruitful field. In the lower age this city was the seat of the Ostrogoths for seventy-two years; but being recovered by Narfes, Justinian's general, it became the residence of the exarchs, or viceroys, sent by the emperor from Constantinople, for a hundred and seventy-five years, when it was taken by the Longobards. On being

seized by Pepin, the king of France, it was given by the conqueror, with the adjacent territory, to the pope, in whose possession it has since remained. The city is still the see of an archbishop, but is at present not very considerable. The soil of the country round it, however, is so well suited to vines, that they grow here to an incredible size. Another town of this province is Rimini, situated on the Gulf of Venice, twenty miles south-east of the preceding. This is the see of a bishop, and here is a celebrated bridge, built in the time of Augustus.

Ferrara is situated on the river Po de Valona, twenty-five miles north-east of Bologna; being the seat of an university and the see of an archbishop.

Bologna stands fifty miles north of Florence, a few miles north-west of the Appenine mountains, and in one of the most fruitful plains of Italy. It is washed by several little rivulets, and a navigable canal. The city is about five miles in circumference, remarkable for its magnificent churches and monasteries, with the riches and fine paintings which they contain. The number of inhabitants is computed at eighty thousand. It is the see of an archbishop, and one of the most considerable universities in Europe.

The province of Urbino is bounded on the north by Romania and the Gulf of Venice; on the east by the marquise of Ancona; on the south by Umbria and Perugia; and on the west by Tuscany; being fifty-five miles long, and from twenty to fifty broad. The chief town is Urbino, situate in 13 degrees of east longitude, and in 42 degrees 26 minutes north latitude, sixty miles north-west of Ancona. It is a small city, but well built and populous, and the place of nativity of the celebrated painter Raphael.

On a mountain twenty miles north of Urbino, stands the city of St. Marino, capital of the territory of the same name. This had formerly been a little commonwealth, independent of the pope, till a faction of the citizens resigned the sovereignty into his hands; but it appears that his holiness has since restored the ancient liberties of the state.

The marquise of Ancona extends along the Gulf of Venice, east of Spoleto. The capital of the province is Ancona, a port-town, situated in 15 degrees 5 minutes of east longitude, and in 43 degrees 5 minutes north latitude, a hundred and sixteen miles north-east of Rome. This was a Greek city, built by the Syracusians, who fled from the tyranny of Dionysius, and had once a noble harbour, erected by the emperor Trajan.

In the same territory stands the celebrated city of Loreto, three miles west of the Gulf of Venice, and fifteen miles south of Ancona. It is a small fortified town, consisting only of one street within the gate, and another without. According to the catholic tradition, here is the chamber of the blessed Virgin, in which she was born, was saluted by the angel, and where she brought up her son Jesus till he was twelve years of age. This sacred habitation is said to have been transported by angels into Dalmatia, on the east side of the Gulf of Venice, in the year 1291; but the people of that country not expressing a due veneration

for the favour, it was about three years after carried over into Italy by the same means, where having suffered various removals, it was at length fixed at Loreto, its present station, under the cupola of the magnificent cathedral, which was built for the purpose. The chamber is thirty-one foot nine inches long, thirteen foot three inches broad, and eighteen foot nine inches high; is surrounded by a case of the whitest Carrara marble, half a foot distant from it on every side. In the interior chamber is an image of the blessed Virgin, with a little Jesus in her arms, and a triple crown on her head; her person almost covered with diamonds and pearls. Round the figure is a kind of rainbow, of precious stones of various colours; all the ornaments, altars, and utensils of the place being inexpressibly rich. The gallery in which the treasures are lodged is full of gold and jewels; the votive donations, of emperors, kings, popes, and princes, for many hundred years past. This holy house was formerly visited every year by near two hundred thousand pilgrims; but the number of annual visitants is now greatly diminished. The time of the greatest concourse is from the beginning of May, till the middle of July, and afterwards in September; the eighth of that month being kept as the birth-day of the Virgin Mary. On those occasions, every pilgrim contributes something to increase the treasure. Loreto was constituted a city and bishoprick by pope Sixtus V. and by all true catholics it is esteemed the most sacred place under heaven.

The province of Spoleto, or Umbria, is situated westward of Ancona, and has for its capital a town of its own name. This place is the see of a bishop, and was formerly very considerable; but suffered greatly by an earthquake in 1703.

The Campania of Rome extends upwards of sixty miles along the coast of the Mediterranean, in a direction south-east from the city, as far as the frontiers of Naples. This country has for many years been unhealthy, especially in the latter end of the summer, on account of the many lakes and stagnant waters, which in the time of the ancient Romans had been drained off. The metropolis of it, and the whole papal dominions, is Rome, once the mistress of the world. This celebrated city stands in 13 degrees of east longitude, and in 41 degrees 54 minutes north latitude, on the river Tyber, about sixteen miles north-east of the Tuscan Sea. The walls, as in the time of the Romans, are about twelve miles in circumference, but not a third part of the ground within them is at present occupied with buildings, the rest being almost entirely taken up with vineyards and gardens. Modern Rome stands fourteen or fifteen foot higher than the old city, on the ruins of which it is built; and a great part of the hills being washed down into the valleys, it is also become more level. The Tarpeian rock, whence malefactors were anciently thrown, and which was then so terrible a precipice, is at present not more than twenty foot high. In general the streets are spacious, and the houses magnificently built. There are three hundred fine churches, besides a vast number of palaces and convents. The church of St. Peter, which is said to be the largest in Christen-

No. 25.

dom, is incrufted, within and without, with marble. But the greatest curiosities in Rome are the ancient theatres and amphitheatres, pagan temples, obelisks, triumphal arches, statues, &c. minute descriptions of which might fill many volumes.

One of the most perfect remains of Roman magnificence is the amphitheatre built by Vespasian. It is five hundred and fifty foot long, four hundred and seventy broad, and one hundred and sixty high; sufficient to contain eighty thousand persons seated, and twenty thousand standing. The stone with which it is built is the same that was used in many of the ancient edifices of Rome, an incrustation of the aqua albucina; between Rome and Tivoli; and the orders of architecture that adorn the building, are the Doric, Ionic, Corinthian, and Composite. The entrance to the amphitheatre is by eighty arcades, seventy-six of which were for the people, two for the gladiators and the wild beasts, and two for the emperor and his suite, who came all the way under cover from the royal apartments. The vivaria of Domitian are still to be seen.

The prison which was built by Tullus Hostilius, and afterwards enlarged by Ancus Martius, yet remains, under the name of Il Carcera Mamentino. The most ancient part of it is a dungeon, to which the descent is by a few steps. The walls are exceedingly solid, and are made to slope inwards pyramidically, whilst the roof is left nearly flat, in order to counterbalance the lateral pressure. In this prison they shew the mark of St. Peter's head against the wall, and the miraculous fountain which sprung up for the baptism of the prisoners. This is also the place of which Juvenal speaks in his third Satire, and Sallust in his Conspiracy of Cataline.

There are five bridges over the river, twenty-eight gates, and three hundred antique towers still remaining. The castle of St. Angelo, whither the pope retires on any apprehension of danger, is a modern fortification, but of no great strength, and serves rather to keep the city in awe, than to defend it against a foreign enemy.

The pope's palace, named the Vatican, is extremely magnificent, situated on an eminence, one of the seven hills on which the ancient city was built. It is said to consist of five hundred and sixty rooms. The parts most admired are the grand stair-case, and the pope's apartment; but chiefly the Vatican library, the richest in the world, both in printed books and manuscripts.

The city is well supplied not only with water, by their noble aqueducts and fountains, but with all sorts of provisions, and those of the best kinds. The inhabitants are extremely obliging to strangers, and are computed to amount to a hundred and fifty thousand.

Twenty miles east of Rome stands the city of Tivoli, the ancient Tibur, situated on the river Anio, now called the Teverone. From the high situation, and its being the resort of all the great, it had anciently the epithet of Superbum. The hill, on the side of which it stands, is covered with olive-trees for five or six miles, and adorned with beautiful houses of the nobility, whence there is a delightful prospect of the

4 E

Cam-

Campania, as far as Rome. The palace of the family of Esté, dukes of Modena, is much admired for its architecture, sculpture, and paintings, as well as its gardens and water-works. Tivoli was the retreat of many of the most eminent of the ancient Romans, in the hot season. Here Horace had his favourite villa, and hither Augustus also frequently resorted, on account of the pleasant situation, and the salubrity of the air.

At the mouth of the Tyber, on the south side, twelve miles south of Rome, stands Ostia, formerly the port-town to the city, but the harbour is now choked up, and the place lies in ruins.

The town of Albano, famous for its excellent wine, and beautiful prospects, is situated fifteen miles south-east of Rome, supposed to be near the place where formerly stood Alba Longa.

The division of the pope's dominions, distinguished by the name of St. Peter's Patrimony, is bounded on the north and east by Tuscany and Umbria; on the north-east by Sabina; on the south-east by the Campania of Rome; and on the west by the Tuscan Sea. The chief town of this province is Viterbo, situate twenty-five miles north of Rome. Here likewise stands Civita Vecchia, thirty-five miles north-west of Rome, on a bay of the Tuscan Sea. This place, which is the station of the pope's galleys, is defended by a fortress, and a few years since declared by his holiness a free port. The other eminent towns are, Bracciano, Castro Orvito, and Aquapendente.

The pope possesses over his dominions the power of an absolute sovereign, the consistory of cardinals, who are his council in ecclesiastical affairs, having no authority to intermeddle in the civil government of the state. The Campania of Rome, on account of its vicinity, is usually subject to his own immediate superintendance; but the other provinces are governed by officers whom he appoints, under the title of legates, or vice-legates. He also nominates to the command of the forces in all the provinces and cities; but in the latter, the podestats, or judges, and other inferior officers, are elected by their respective inhabitants. His prime-minister is the cardinal patron, for the most part his nephew, who seldom fails to amass an enormous estate, if his uncle's pontificate proves of considerable duration.

The pope ingrosses all the corn in his dominions, the farmers being obliged to sell the produce to his agents at the price he sets upon it, and the latter again retail it to the people at an advanced price, which is such however as is generally allowed to be moderate. Some have computed the papal revenue to amount to a million sterling, or upwards; but this must far exceed the sum that arises from his territorial possessions. In former times, the pope's contingent profits alone were much superior even to this valuation; but those casualties are now greatly diminished by the suppression of the order of Jesuits, from whom he drew vast supplies; as well as in consequence of the measures taken by the several popish powers, for preventing the great ecclesiastical issues of money to Rome. According to the best accounts, the taxes upon the provisions and

lodgings, furnished to foreigners, who spend immense sums in visiting his dominions, form at present the most considerable part of his accidental revenues.

The pope, like other temporal princes, has his guards, or *birri*, to whom is entrusted not only the care of his person, but the peace of the city, under proper magistrates, both ecclesiastical and civil. He usually maintains an army of twenty thousand men, stationed in different parts of his territories, and has also a fleet of galleys.

With respect to the pope's ecclesiastical dominion, it is extended over all the countries where the catholic religion prevails, the people of every nation esteeming allegiance to their respective sovereigns no longer a duty, when it comes in competition with that which they owe to the papal chair. Of late years, indeed, many temporal princes, as well as their lay subjects, have disputed the pope's supremacy; but the monks and regular clergy of the Romish church remain universally attached to the holy see. The number of those partizans, it is computed, may amount to two million; a formidable body, by their intrigues, when we consider that they are in every great family in the catholic countries, and have an almost unbounded influence over the minds of the people.

The successor to the papal chair is elected by the cardinals, who are seventy in number, when complete, and are appointed by the pope upon a vacancy. There is always a majority of Italians in the conclave, who take care that no foreigner is advanced to the holy see, since the fourteenth century, when seven popes resided successively at Avignon, in France, to the prejudice of the Romish capital. The pope is held by the catholics in the highest veneration: they regard him as infallible, and his authority superior to all human controul. The greatest princes have thought themselves honoured by the permission to kiss his toe, and he is addressed by the title of his holiness.

The papal territories were held many years under the sovereign jurisdiction of the emperor, who was styled the patron and defender of the church, until the reign of the emperor Henry IV. when the popes, weary of subjection to a race of princes, who sometimes refused to confirm their election, and at others displaced them, endeavoured to excite insurrections both in Germany and Italy against the imperial power. When the above named emperor asserted his right of investing bishops in their sees, pope Gregory VII. excommunicated him, and compelled him by the dint of the papal anathema to relinquish that part of his prerogative. He even assumed a temporal authority over the proscribed monarch, not only summoning him to answer the complaints of his subjects, but declaring that he had forfeited his right to the empire. The same ambitious motives continuing to influence the papal councils, the successors of Gregory arrogated a jurisdiction over all the Christian princes, which they were long enabled to maintain, by means of the unlimited spiritual authority ascribed to the Roman pontiff, in the times of superstition and ignorance. In consequence of the Reformation, however, the ancient bounds of the papal sovereignty were greatly

restricted; and by the gradual progress of philosophical enquiry and knowledge, the mitre has been almost entirely divested of those rays which had been accustomed to dazzle the Christian world in the ages of darkness.

The kingdom of Naples, which occupies the south-east part of Italy, is situate between 14 and 19 degrees of east longitude, and between 38 and 43 degrees of north latitude. It is bounded on the north-east by the Gulf of Venice, on the south-east by the Mediterranean Sea, on the south-west by Sicily and the Tuscany Sea, and on the north-west by the territories of the pope; being about two hundred and seventy-five miles long, and a hundred broad. This country is divided into four provinces, viz. Terra di Lavoro, Abruzzo, Apulia, and Calabria, which are also subdivided into districts.

The first of those provinces is situated in the north-west part of the kingdom, and is remarkable for the wholesomeness and delightful temperature of the air, as well as for the fertility of the soil, which abounds with all the fruits that grow in the climates of Italy.

The capital of the kingdom is Naples, situate in 15 degrees 12 minutes of east longitude, and in 41 degrees 6 minutes of north latitude, a hundred and forty miles south-east of Rome. This city is fifteen miles in circumference within the walls, but including the suburbs, it may be nearly double this extent. It stands on an eminence rising gradually from the sea, on a fine bay about thirty miles in diameter; the islands which are before it forming a secure and commodious harbour. The buildings are mostly magnificent, which occasions it to occupy so large a space of ground, and the number of inhabitants is computed at three hundred thousand.

This city is ornamented with a great number of elegant fountains, but in many of them the water is very indifferent. The harbour is very spacious, and has a grand light-house, with a mole near five hundred paces in length, which separates the main harbour from the basin. For the defence of the city, and at the same time to keep it in subjection, are five castles, which consist of very strong walls. The Castello Nuovo has a communication by a covert way with the king's palace; and one side of it is contiguous to the sea. At its entrance stands a triumphal arch of very curious sculpture, near which is a brass gate, decorated with fine basso-reliefs, representing some of the achievements of the kings of Arragon. The church of the castle is beautifully decorated with gilding and stucco-work, and a picture, in a room adjoining to it, is greatly admired.

The Castello del Uovo, so called from its oval form, stands on a rock in the sea, and is joined to the continent by a bridge, two hundred and twenty paces in length. It is supplied with fresh water by means of a stone conduit, which is embellished with various figures of animals, and conveys the water under the bridge to the castle, where are two reservoirs.

The castle of St. Elmo, or St. Eramo, is situated on an eminence towards the west, and is in the form of a star with six rays. The subterraneous works,

which are very spacious, are hewn out of the rock to such a depth as to be bomb-proof, on which account a great quantity of military stores is kept here. This castle may be supplied with provisions from Castello Nuovo, by means of a subterraneous communication: In the upper part of it are seven cisterns for water, which is drawn up by buckets; and under the vaults and mines is a reservoir large enough for two galleys to sail on. The other two castles are of little note.

The cathedral in this city is dedicated to the Assumption of the Virgin Mary, and, though a Gothic structure, is very noble. On the high altar is the Assumption of the Virgin Mary, by Pietro Perugino, who was Raphael's master. Fronting the altar are two pillars of red jasper, twelve foot high, without the pedestals, which are of verde antico. The pavement is inlaid with verde antico, jasper, giallo antico, and porphyry. The remains of St. Januarius have been removed from the church dedicated to that saint, without the walls, to this subterraneous chapel. The late emperor offered at his shrine twelve silver eagles, in the heads of which are twelve lamps kept continually burning; a hundred feudi a-year being appropriated for supplying them with oil.

The chapel called Il Tesoro, in this cathedral, is of beautiful architecture. Behind the high altar, which consists entirely of red porphyry, is the shrine with silver doors, where they pretend to keep St. Januarius's head, with some of his blood, contained in two crystal phials. The chapel is of a round figure, and ornamented with the statues of St. Peter and St. Paul, finely executed by Finelli, with two pillars of black marble most beautifully spotted. It likewise contains seven altars of the finest marble, and forty-two pillars of broccatello. Round the upper part of the wall stand twenty-one large bronze images of saints, each valued at four thousand feudi; under which are sixty silver busts of so many other saints.

About five Italian miles from the city of Naples stand the celebrated Mount Vesuvius. This mountain, like Parnassus, has two summits; but at present only that on the right hand as you come from Naples is a volcano. The valley between these hills is about a mile long, and extremely fertile. The height of the burning summit is computed to be eleven hundred fathoms above the level of the sea. The declivity towards the sea is every where planted with vines and fruit-trees; but the south and west sides of the mountain are covered with black cinders and stones. The great crater of Vesuvius is of a circular form, and between three and four hundred yards in diameter. This vast hollow is generally filled with smoke; and round the sides, which are stained with various colours, there project several rocks, that have the appearance of brimstone.

Near Vesuvius lies the village of Portici, the royal palace lately built at which place contains one of the noblest collections of antiques that are any where to be found. At a small distance hence anciently stood the city of Heraclia or Herculaneum; the greater part of which was destroyed by an earthquake in the reign of Nero, and the remainder overwhelmed soon after the accession of Titus, by an eruption of mount Vesuvius. Upon digging

digging into these parts in the years 1689 and 1711, several vestiges of this unfortunate city were discovered; but farther searches having been made, at a considerable expence, within these forty years, many valuable antiquities of various kinds have been found.

At the distance of eight miles from Naples is Puzzuolo, the ancient Puteoli, which in the time of the Romans was a considerable city, but is at present only a small town.

The Lucrine Lake, so famous among the Romans for its fine oysters, and other fish, lies near the shore, and is now greatly reduced in extent, having been for the most part dried up by a new mountain, which rose instantaneously in the night between the nineteenth and twentieth of September 1538, during an earthquake which caused a terrible devastation in the neighbourhood. The subterraneous fire ejected, by a wide chafm, such a quantity of stones, ashes, sulphur, and sand, as within twenty-four hours formed this mountain, the perpendicular height of which is not less than four hundred rods, and the circumference three Italian miles.

The lake of Averno lies in a narrow valley, and is about an Italian mile in circumference; but its water has not the quality ascribed to it by Virgil, and other writers, who represent its poisonous exhalations as almost instantaneously killing the birds that attempted to fly over it. At present, fowls are observed not only to harbour about, but even to swim upon it. It is stocked with fish, and is in some places a hundred and eighty foot deep. The adjacent land produces excellent fruit and wine; and near the edge of the lake are some old walls, supposed to be the remains of a temple of Apollo.

In the same valley is the entrance to the grotto of the sibyl Cumana, which is hewn in the rock. The mouth for a little way is low and narrow; but afterwards becomes ten foot broad, twelve high, and is several hundred paces in length.

The grotto of Pausilippo is a subterraneous passage under a vast rock, about half a mile long, and near twenty foot wide; near which is shewn the tomb of Virgil. The grotto del Cani is about twelve foot long, five broad, and six high, and is famous for the poisonous vapours that exhale from it.

It is the opinion of Sir William Hamilton, who has examined the soil about Naples with great care and attention, that the spot on which the city stands, as well as the greater part of Italy, if not the whole, has been produced by subterraneous fire. A *tufa*, exactly resembling a specimen taken from the inside of the theatre of Herculaneum, layers of pumice intermixed with those of good soil, resembling what is found at Pompeii, and lavas like those of Vesuvius, compose the whole soil of the adjacent country.

Fifteen miles north-east of the city of Naples, and six miles east of the sea, lies the city of Capua. It is situated in a fine plain, on the river Volturno, but is now in a declining state, though yet the see of an archbishop. It was built in the year 856; and in 869 was made the first archbishoprick in the kingdom of Naples. The ancient celebrated city of Capua, which

vied in magnificence with Rome and Carthage, stood two Italian miles from the present town; and out of its ruins was built the market-town of St. Maria, in the neighbourhood of which are still seen the remains of palaces, temples, and other buildings, particularly a beautiful amphitheatre of free-stone.

Gaieta is situated on the sea-coast, thirty-five miles north-west of Naples. It is at present a strong town, and was anciently named Cajeta, from Æneas's nurse.

Aquila lies ninety miles east of Rome, and thirty-five miles west of the Gulf of Venice. This was formerly a large city, but great part of it was destroyed by an earthquake in 1703.

Benevento is situated at the confluence of the rivers Salato and Colore, which here form the river Volturo, thirty miles north-east of Naples. The greater part of this city was destroyed by an earthquake in 1688, and the archbishop, afterwards pope Benedict XIII. dug out of the ruins alive, who rebuilt it at his own expence, on his advancement to the papal chair. Benevento was formerly under the jurisdiction of the pope, but in the year 1768, the troops of the king of Naples took possession of it in the name of their master, expelled the ecclesiastical governor, and obliged the inhabitants to swear allegiance to that monarch.

Taranto is situated near a bay of the Mediterranean, in the south-east part of Naples. This was formerly a strong city, and of great antiquity, adorned with a temple of Neptune, who was worshipped here with peculiar veneration. Of this place were, Archytas, the famous geometrician; Aristoxenas, the musician; Iccus, the physician, mentioned by Plato; and Rinthon, the inventor of tragic-comedy.

Brindisi stands at the entrance of the Gulf of Venice, in 18 degrees 5 minutes of east longitude, and in 40 degrees 52 minutes north latitude. This is the ancient Brundisium, whence, having an excellent harbour, the Romans usually took their passage to Greece; and here ended the Via Appia.

Otranto stands in the south-east extremity of Italy, forty-three miles east of Taranto. In the territory adjoining to this town is found the spider called tarantula, which has been fabulously said to infect with a poison, that could be cured only by music.

The part of Naples in which the towns last mentioned lie, was anciently denominated Magna Græcia, a name ascribed to the vanity of the Greeks, who sent hither colonies at an early period.

The other towns of note in this kingdom are, Salerno, Cerenza, Cofenza, Rhegio, St. Severino, Aquila, Chieta, Manfredonia, and Barri; among which we must not omit to mention Baia or Baiæ, situated on the sea-coast twelve miles west of the city of Naples. This place was anciently famous for its hot baths and elegant palaces; and here are still shewn the ruins of buildings, said to be the houses of Cæsar, Pompey, Cicero, and other Romans of distinction. The little spot called the Elysian Fields, lies about a mile from Baia, but at present contains no remarkable traces of its former beauty.

Naples was anciently divided into a great number of states, of which the Greeks were the most numerous.

It

It was afterwards subdued by the Romans, on the decline of whose empire, it fell successively under the dominion of the Goths and Lombards, till being conquered by Charlemagne, it was divided between the Western and Grecian emperors.

In the ninth and tenth centuries, the Saracens possessed part of Naples, and the Greeks the rest; the former of whom were expelled in the eleventh and twelfth centuries by the pope, with the assistance of Christian volunteers, especially the Normans. Tancred, the Norman, and his twelve sons, for their services on this occasion, had considerable territories there assigned them. His son Robert was created duke of Apulia and Calabria by the emperor; and Roger, the son of Robert, was afterwards proclaimed king of the *Two Sicilies*. Under this title were included Naples and the island of Sicily, the former having been anciently distinguished by the same name with the latter. The family of Tancred enjoyed the crown till the year 1166, at which time the pope introduced the earl of Anjou, and the French, who held the dominion of the *Two Sicilies* until the year 1282, when the Sicilians massacred all the French in the island of Sicily; a transaction to which they gave the name of the Sicilian Vespers; because the tolling of the bells on Easter Eve was the signal for the natives to make the attack. From this period the Spaniards began to contend with the French for the kingdom of Naples, and they possessed it alternately during several hundred years; till at length the latter were entirely expelled about the year 1504, and the Spaniards retained possession of Naples, Sicily, and Sardinia, till 1700; when the duke of Anjou, afterwards king of Spain, mounted the throne, but was driven from the *Two Sicilies* by the Austrians, in 1707. By the treaty of Utrecht, in 1713, Naples and Sardinia were confirmed to the house of Austria, and the island of Sicily allotted to Amadeus, duke of Savoy. In 1717, the Spaniards reduced Sardinia, and a great part of Sicily next year; but relinquishing both by treaty soon afterwards, Sicily was transferred to the house of Austria, and Sardinia to the duke of Savoy, with the title of king of that island.

The French, Spaniards, and Sardinians, invading the Austrian dominions in Italy, in 1733, the Austrians were driven out of almost all their Italian dominions; and by a subsequent peace, Naples and Sicily were settled on Don Carlos, eldest son of the king of Spain, by his last wife, the princess of Parma. The present king of the *Two Sicilies* is Ferdinand IV. third son of the king of Spain, who succeeded to the throne by the appointment of his father, soon after his accession to the Spanish crown, in 1759; on the express condition, that the dominions of Spain, and those of Sicily and Naples, should never be united in one person. The pope insisting that Naples is a fee of the ecclesiastical state, on account of the share which his predecessors had in recovering it from the Saracens, the king pays annually to the holy see, the usual acknowledgement of a Spanish jennet, and seven thousand ducats, on St. Peter's Eve, for his investiture.

The dignified clergy and nobility of this kingdom are very numerous. In the catalogue of the fairs,

No. 25.

we meet with no less than twenty-five archbishops, and a hundred and twenty-five bishops; and in that of the latter, about three hundred princes, dukes, marquises, and earls. A great part of this class is composed of Genoese, and other foreigners, who have purchased titles in the kingdom. It is computed that one third of the dominions of Naples, belongs to the clergy; and the remainder to the crown, the nobility, and gentry respectively. Every lord or gentleman who is proprietor of an estate, is sovereign of the people who live upon it, and may be said to have the absolute disposal of all their effects. While they plough his lands, and plant his vineyards and olive-yards, they are hardly allowed provisions sufficient for enabling them to undergo the toil; and the more to increase their dependence, they are amenable to the courts of their respective lords in every case that is not capital. The consequence of this great oppression is, that though the country abounds in silks, the manufacture is very inconsiderable. They send most of it abroad unwrought, and that in such a manner as is highly disadvantageous to the traffic of the nation. For having few ships of their own, as well as being destitute of the spirit of commerce, the proprietors of the lands sell the produce of their estates to foreigners, who usually export them in vessels belonging to their own country.

As the nobility and gentry hold their lands by military tenures, the militia of the kingdom is numerous. This body however seems not to enjoy the confidence of the crown, and is seldom called out; the king usually maintaining fifteen thousand regular troops in time of peace, and being able, upon any emergency, to raise double that number. The government retains constantly a fleet of armed galleys, and has lately begun to build some ships of war.

The king's ordinary revenues are computed at a million a year, arising from a composition with the nobility and gentry for certain sums, in lieu of their personal services, from a duty on houses, and an almost general excise. The crown also claims a power of laying additional taxes on the landed interest, according to the necessities of the state. The clergy are subject to no imposts, but grant a free gift, which however is for the most part proportionable to the taxes on the laity.

Before the alarming insurrection of the populace, which was headed by Masinello, the necessities of life had been taxed by the government at Naples to an exorbitant degree; but since that event, the ministers of the crown have been far more reserved in whatever relates to taxation. The king however is an absolute sovereign, independent of all constitutional restraint, and subject to no other restrictions than those of discretion and prudence, which the competition of the house of Austria may long continue to render necessary.

The Italians are generally of a middle stature, and few of them are corpulent. Most of them have black hair, as well as eyes, and many use cosmetics to correct the darkness of their complexion. In their dress, they follow the Spanish fashion, especially in the territories

stories which were once subject to that crown, as in the Milanese and Naples, where they usually wear black, to the no small detriment of their silk manufacture. They are a people of lively imagination, and excel in the fine arts of music, painting, sculpture, and architecture. Uniting in their temper a happy mixture of vivacity and sedateness, their character is equally distant from the frivolous levity of the French, and the haughty reserve of the Spaniards. Though possessing great variety of delicious wines, they are temperate in drinking; and may be said to be rather luxurious than immoderate in the pleasures of the table. Their virtues, however, are sullied by vices of the most detestable kind, and they are jealous of their women in a degree beyond what may be thought compatible with their indifference towards the sex.

In almost every town there are societies of virtuosi, who frequently meet for their mutual improvement in arts and sciences, and can maintain an agreeable conversation without the aid of any extraneous liquor. The nobility and gentry affect great pomp in the furniture of their houses and equipages, though at the same time it is not uncommon for a nobleman, in some places, to retail wine, with his own hands, to those who are inclined to purchase it.

At the most distant period, to which the historical accounts of Italy ascend, the country appears to have been divided into a great number of kingdoms or states, which emerged from obscurity only as they became connected with the Roman power; though there be reason to conclude, from the monuments of the Etruscans particularly, that the arts had flourished among this people for ages previous to the foundation of Rome. The first kings of Italy are said to have been Janus, Saturn, Picus, Faunus, and Latinus, the latter of whom entertained Æneas at his arrival from Troy, and bestowed upon him his daughter Lavinia in marriage. In virtue of this alliance, Æneas succeeded to the crown, on the death of his father-in-law, and was himself succeeded by Ascanius, his son by a former wife, who removed the seat of government to Alba Longa. This prince dying, the people advanced to the throne Silvius, the son of Æneas and Lavinia, setting aside Julius, the son of the former king, and, according to tradition, the ancestor of the Julian family; on whom however they conferred the honourable office of high-priest. Silvius was succeeded by eleven kings in lineal descent, the last of whom, named Anulius, deposing his elder brother Numitor, usurped his throne; but was afterwards killed by Romulus and Remus, the grandsons of the latter, who restored the reins of government to the rightful king.

Those two brothers, leaving their grandfather in possession of Alba Longa, laid the foundation of another city on the Tyber, which from Romulus obtained the name of Rome. This event is supposed to have happened towards the end of the third year of the sixth olympiad, about four hundred and thirty years after the taking of Troy, and seven hundred and fifty-three years before the Christian æra.

Remus being killed in a quarrel with his elder brother, the latter succeeded to the sole government of the new

erected city, which he soon augmented by affording a reception to the banditti, and committing depredations on the neighbouring states. After a reign of thirty-eight years, he was succeeded by Numa Pompilius, whose wise institutions greatly reformed the inhabitants. On the death of this prince, the throne was successively occupied by Tullus Hostilius, Ancus Martius, Tarquinius Priscus, Servius Tullius, and Tarquin, surnamed the Proud. Sextus, the son of the latter, committing a rape on Lucretia, the wife of Collatinus a senator, the king was banished by an insurrection of the people, and consular government established. Under this republican constitution, the Romans increased in power and grandeur for upwards of four hundred and fifty years, till the civil war breaking forth between Cæsar and Pompey, an end was put to the liberty of the state, which was henceforth governed by a series of absolute princes, who had the title of emperors of Rome. Italy having continued subject to the imperial government, during a space almost equal to the duration of the consular form, was at length over-run by the northern nations, at the period from which we commenced the history of its several kingdoms and states.

#### ISLANDS on the Coast of ITALY.

**B**EGINNING our maritime survey from the north-east extremity of the Adriatic, we meet, in our progress southward, with several islands subject to the Venetians.

The principal of these are Cherso and Osero, which lie almost close to each other, and have therefore been considered as one island. It is situated between the coast of Istria and Dalmatia, extending in length from north to south about sixty miles, with a very unequal breadth. This island has often changed its name, but was known almost three thousand years ago by that of Apfirtides, Apfirtus, and Apfirtius. It is mentioned in the poem of Orpheus upon the expedition of the Argonauts. In the heat of summer, the air of Osero is extremely unwholesome, on account of the noxious vapour arising from some pieces of stagnant water; but this was not the case formerly, and might be easily remedied.

The most considerable town is Cherso, situated at the bottom of a large harbour. It contains at present above three thousand inhabitants; but from the many ruins of houses yet visible, it appears to have been formerly more populous. Both parts of the island are mountainous and stony, but peculiarly adapted for producing trees, if the inhabitants were sufficiently industrious. Oil is the most valuable produce in Cherso, and is reckoned the best of any made in the Venetian state. The islanders compute that they make of it annually from three thousand to three thousand five hundred barrels.

In Cherso and Osero, as well as in other parts, are found many of those fossil bones, which have so much exercised the ingenuity of naturalists, and for which it is so difficult to account.

The principal of the other islands in the Dalmatic Sea is *Lissa*, which is mentioned with particular marks of distinction both by the Greek and Latin geographers. It is, however, only thirty miles in circumference, and is mountainous, though not without plains that are capable of cultivation. The temperature of the air is delightful, and the island has no other inconvenience than a scarcity of fresh water. This island was anciently celebrated for its wine, which is not at present of the best quality. The honey, however, is still reputed excellent, but the bees do not make much, on account, as is supposed, of the scarcity of fresh water. The principal substance in the bowels of *Lissa* is marble, and a whitish calcareous stone, in which fossil bones are frequently found.

The island of *Pelagosa*, with several rocks that appear above water near it, seem to be the remains of an ancient volcano. The face of the island is extremely rugged, and it is chiefly formed of a lava resembling that of *Vesuvius*.

*Lefina* is about forty-four miles long, and eight in the broadest part. Here has been collected a variety of marbles, with yellow, green, and red slints, all penetrated by a pyritical denormorphous fluor. In the small brook of *Borovaz* there are also heaps of fossil bones. This island, though stoney and barren in the highest parts, contains good land, fit to bear not only fruit-trees, but likewise corn.

*Brazza* is in length about thirty-two miles, and of unequal breadth, but no where exceeding nine. Being remarkably mountainous and rocky, it is ill adapted to cultivation; and the scarcity of fresh water often subjects it to fatal droughts. This island was anciently noted for the excellence of its kids, which, as well as the lambs, continue to be highly valued for the delicate taste of their flesh; and on account of the fine pasture, the cheese of *Brazza* is by far the best in *Dalmatia*.

The island of *Arbe* is about thirty miles in circumference; and though wholly uncultivated in the higher parts, has an exceeding pleasant appearance. The climate, however, is none of the happiest, the winter being for the most part very tempestuous, especially during the prevalence of the north winds. The most remarkable circumstance relative to the natural history of this island is, that on the heights are found large tracts of sand, mixed with an iron ochreous earth, deposited in regular strata, like those that are formed in some other countries by the inundation of great rivers. On examining this sand with a microscope, it is found to consist of quartz, and has been evidently produced by the trituration of matter separated from mineral mountains.

The island of *Corfu* is situated about four miles west of the coast of *Epirus*, and is about thirty-five miles long, and ten broad. With near a hundred villages, it contains the two cities of *Corfu* and *Calliope*, of which the former is the see of an archbishop. This is the island known to the ancients by the different names of *Corcyra*, *Pheacia*, and *Drepane*, famous for the shipwreck of *Ulysses*, and the gardens of *Alcinous*.

*Ithaca* is a small island, about eight miles in circumference, now called *Iathaco*; a rugged barren territory, though so much celebrated as being the kingdom of *Ulysses*.

*Cephalonia*, anciently *Cephalenia*, lies about eight miles west of the gulf of *Lepanto*. It is near fifty miles in circumference, having for its principal towns, *Cephalonia*, *St. Nicholas*, *Catania*, and *Alfo*.

*Zante* lies twelve miles south of *Cephalonia*, and is about twenty-four miles long, and near half as much in breadth. The chief town is *Zante*, situated in the east part of the island, well fortified and defended by a caille, which is the residence of the governor. This island is the ancient *Zacynthus*, and constituted the most valuable part of the *Laertia* regna.

The produce of these several islands is oil, wax, oranges, grapes, and a variety of other fruits natural to a warm climate; but *Zante* is particularly celebrated for the fruit called currants, which affords the Venetians a considerable article of trade.

The inhabitants of these islands are chiefly Greek Christians; but the Venetians have also introduced the Roman Catholic religion among them.

Proceeding westward over the Mediterranean, we arrive at the island of *Sicily*, which is separated from the southernmost point of the Italian continent only by the strait of *Meſina*. This island, anciently called *Trinacria*, from its triangular figure, is situated between 12 and 16 degrees of east longitude, and between 37 and 39 degrees of north latitude; being about a hundred and eighty miles long, and a hundred and twelve broad. The refreshing breezes from the sea and the mountains render the temperature of the island both pleasant and healthful, and the fertility of the soil, which is watered by numerous rivulets, might yet correspond to the genial nature of the climate; but it is not now so much cultivated as in those times when it was called the granary of *Rome*.

The chief mountains are those of *Ætna*, or mount *Gibello*, *Madoni* and *Aldonis*. The best harbours are those of *Messina* and *Syracuse*, on the east; *Melazza* and *Palermo* on the north; and *Trapano* on the west. Though the country abounds in springs and rivulets, few of the rivers are navigable beyond their mouths, as their course from the mountains is precipitate.

Mount *Ætna* is divided into three distinct regions, called *la Regione Culta*, or *Piedmontese*, the fertile region; *il Regione Sylvoſa*, or *Nemorosa*, the wood region; and *il Regione Deferta*, or *Scoperta*, the barren region. Those three regions, though contiguous, are yet, in respect both of climate and productions, totally different from each other. The *Regione Culta*, or *Piedmontese*, forms a zone round the mountain, a hundred and eighty-three miles in circumference. This region is well watered, and abounds with vines and other fruit-trees. Towns, villages, and inhabitants, are also very numerous, notwithstanding the danger of the situation, *Catania*, so often destroyed by eruptions, and totally overthrown by an earthquake, contains, as is supposed, thirty-five thousand inhabitants. This region is likewise covered with a number of little conical or spherical mountains,

beau =

beautifully diversified both in colour and form. On the south and south-east, it is bounded by the sea, and on the other sides by the rivers Semetus and Alcantara, which almost surround it.

In about four hours of gradual ascent from the verge of the mountain, we arrive at a little convent of Benedictine monks, called St. Nicolo dell Arena, near the volcano whence issued the great eruption in the year 1669. On this occasion, the lava burst out of a vineyard within a mile of St. Nicolo, and by frequent explosions of stones and ashes, raised there a mountain, which is supposed to be not less than half a mile perpendicular in height, and in circumference at the base three miles. At the foot of this mountain is a hole, through which, by means of a rope, we descend into several subterraneous caverns, branching out to a great extent. The cold in those regions is said to be excessive, and frequently a violent wind extinguishes the torches. Many cavities of this kind are found also in other parts of *Ætna*, some of which are used as magazines of snow; the whole island of Sicily and Malta being thence supplied with this article, so indispensably requisite in a hot climate.

The Regione Sylvosa, or the second division of the mountain, which likewise surrounds it on all sides, is incomparably beautiful, abounding in little mountains that have been thrown up by the different explosions of *Ætna*. They are all more or less covered, even within their craters, as well as the rich valleys between them, with the largest oak, chestnut, and fir-trees that perhaps are any where to be seen. It is chiefly thence that his Sicilian majesty's dock-yards are supplied with timber; for which this part of *Ætna* was famous even in the time of the tyrants of Syracuse. Though the trees in this quarter, especially the chestnuts, be of an extraordinary size, they are far inferior to some which grow on another part of the Regione Sylvosa, called Carpinetto. In the place last mentioned, one tree of this species, called *la castagna di cento cavalli*, is said to measure in circumference upwards of twenty-eight Neapolitan canes, or fifty-nine yards and a half. This amazing tree is hollow from age; but another stands near it, almost as large, and which is found.

In this part of the mountain are the finest horned cattle in Sicily. They are of the common size, but it may be remarked, that the horns of the Sicilian cattle in general are almost twice as large as those in other countries.

Proceeding upwards through the Regione Sylvosa, we arrive at the third division, or the Regione Deserta, likewise called *La Netta*, or *Scoparta*. In approaching this district, we perceive a gradual decrease of vegetation, passing from large timber-trees to the smaller shrubs and plants of northern climates. The air here is exceeding cold, and the region is marked by a circle of snow and ice, which extends on all sides to the distance of about eight miles. In many places the snow is covered with a bed of ashes, thrown out of the great crater, which rears its burning head in the center of this division. The great crater is about two miles and a half in circumference; the inside,

which is incrustated with salts and sulphurs, is in the form of an inverted hollow cone, and is supposed to be about a quarter of a mile in depth.

Sir William Hamilton informs us, that the smোক of *Ætna*, though very sulphureous, did not appear to him so fœtid as that of Vesuvius; but this circumstance varies in both those mountains, according to the quality of the matter which happens to be in motion. The air is so very keen in the whole upper region of *Ætna*, particularly in the most elevated parts of it, that respiration is rendered very difficult, independently of the sulphureous vapour.

The inquisitive naturalist above mentioned farther informs us, that when he and his company made their first observation at the foot of Mount *Ætna*, on the 24th of June, 1769, the quicksilver in the barometer stood at twenty-seven degrees four lines; and on the 26th, at the most elevated part of the volcano, it was at eighteen degrees ten lines.

The thermometer, on the first observation at the foot of the mountain, was at eighty-four degrees, and on the second at the crater at fifty-six. The weather had not changed in any respect those two days, and was equally fine and clear. It was found difficult to manage the barometer in the extreme cold and high wind on the top of *Ætna*; but from the most exact observation that could be made in such circumstances, the result was as has been specified.

According to observation made by Mr. Brydone, about three hundred yards below the summit of the mountain, on a spot where there was no snow, and a comfortable vapour issued, the mercury stood at nineteen degrees and a half. The thermometer was fallen three degrees below the point of coagulation; and before they left the summit of *Ætna*, it fell two degrees more, viz. to twenty-seven.

The beautiful and extensive prospect from the summit of *Ætna* is such as exceeds all description. The whiteness of the milky way appears like a pure flame shot across the heavens; and the number of the stars seems not only to be infinitely increased, but their light much greater than usual. No imagination, says Mr. Brydone, has dared to form an idea of so glorious and so magnificent a scene. Neither is there on the surface of this globe, any one point that unites so many awful and sublime objects. The circumference of the visible horizon on the top of *Ætna* is supposed to be not less than two thousand miles; but the most beautiful part of the scene is certainly the mountain itself, the island of Sicily, and the numerous islands lying round it. All these seem as if they were brought close round the skirts of *Ætna*, the distances appearing reduced to nothing; occasioned, perhaps, by the rays of light passing from a rarer medium into one more dense. The perpendicular height of the mountain is said to be more than three Italian miles.

About a mile distant from the summit of *Ætna* are some remains of the foundation of an ancient building. It is of brick, and seems to have been ornamented with white marble, many fragments of which are scattered about. It is called the Philosopher's Tower, and said to have been inhabited by Empedocles. the ancients used to sacrifice to the celestial gods on the top of *Ætna*, it is probably the ruin of a temple which has served for that purpose.

Sir William Hamilton, on his way back to Catania, was shewn a little hill covered with vines, which, as is well attested, was undermined by the lava in the year 1669, and transported half a mile from the place where it stood, without having damaged the vines.

Till the year 252 of the Christian era, the chronological accounts of the eruptions of mount *Ætna* are very imperfect; but as the veil of St. Agatha was in that year first opposed to check the torrents of lava, and has ever since been produced at the time of great eruptions, the miracles attributed to its influence having been carefully recorded by the priests, have at least preserved the dates of the eruptions. It appears from those, that *Ætna* is as irregular and uncertain in its operations as *Vesuvius*.

Sicily is commonly divided into three provinces, viz. Val Demona on the east; Val de Noto on the south-east; and Val de Mazara on the west.

The chief town in the province of Val Demona is Messina, anciently *Messana*, situate on the strait or faros of Messina, opposite to Reggio in Calabria. Here is a commodious harbour defended by a castle; but the city itself is not strong. It is large and populous, however, and the place of greatest trade in the island; on which account most of the nations of Europe have here their consuls and factors. The other towns in this province are Melazzo, Tindaro, Patti, St. Marco, Cefalidi, Nicosia, Catania, and Taormina.

The chief town of the Val de Noto is Syracuse, anciently the capital of the island. It is situate on a fine bay on the east coast of the island, in 15 degrees 25 minutes east longitude, and in 37 degrees 5 minutes of north latitude; sixty-five miles south of Messina.

This city was anciently twenty-two miles in compass; but is now greatly reduced, though it is still one of the most considerable places in the island, and is reputed to contain about fourteen thousand inhabitants. It forms only one of the five parts into which it was anciently divided; extending no farther than the division formerly called the *Insula*. Its walls, which are strong and high, are washed on every side by the sea; and the port is extremely commodious. At the entrance is a strong castle, which has a communication with the city by a wooden bridge. Within this fortress is the famous fountain anciently named *Arethusa*, which supplies it plentifully with water.

Castro Giovanni, the ancient Enna, is situated near the middle of Sicily, upon a hill near the lake of Pergusa, forty-five miles south-west of Catania. In its neighbourhood is a spacious plain, adorned with flowers and rivulets, where likewise is a cavern, whence Pluto is said to have come with his car, and carried off the goddess *Proserpine*.

The other towns in this province are, Augusta, situate on the coast, a little north of Syracuse; and Noto, lying twenty miles south of the same city, on a mountain surrounded by rocks.

No. 26.

The capital of Val de Mazara, and at present of the whole island, is Palermo, situate in 33 degrees 40 minutes east longitude, and 38 degrees 10 minutes north latitude, on the north coast, and a hundred and ten miles west of Messina. This is a well built city, surrounded by a wall and other fortifications, but not of great strength. It was formerly the seat of the kings, and is now the usual residence of the viceroy and the archbishop. Having a good harbour, the trade here is considerable, but not equal to that of Messina. The inhabitants are computed at a hundred and twenty thousand.

Mazara lies on the south-west coast of the island, fifty miles distant from Palermo. It has also a tolerable good harbour, and is the see of a bishop.

Gergente is situate on the same coast, near fifty miles south-east of Mazara. This is the ancient *Agrigentum*, which, in its flourishing state, was ten miles in circumference. It was famous for the tyrant Phalaris, in whose reign Perillus invented the brazen bull, and was himself the first who was tortured to death in it. The inhabitants were luxurious in their tables, and magnificent in their dwellings; Empedocles observing of them, that they lived to day . . . they were to die to-morrow, and built as if they were to live for ever. The country round the city was laid out in vine and olive yards, in the produce of which they maintained a great trade with Carthage.

Marsala, the ancient *Lilybæum*, is situated twenty miles north-west of Mazara. Here the Carthaginians used to embark their troops when they were in possession of this island.

Trepano, or Drepanum, is another port-town situated at the west end of the island, fortified by Hamilcar, the father of Hanibal, who made it a place of arms, in his wars with the Romans.

The produce of Sicily is chiefly corn, wine, oil, silk, and fruits, of which their exports are very great.

The Lipari Islands, of which there are seven, are situated in the Mediterranean about forty miles north of Sicily, and subject to the king of Naples. They were anciently called *Æolie* and *Vulcaniæ* from *Æolus* and *Vulcan*; whom the poets feigned to have here their residence. Lipari, the largest, is about twenty miles in circumference. The two named *Strumbolo* and *Hiera* are volcanos.

At the west end of Sicily lie the small islands of Levanzo, Maritime, and Favignana, also subject to the same sovereign.

The first inhabitants of Sicily and the adjacent islands, according to tradition, were the Cyclops or *Levrigones*, a savage race of gigantic stature and appearance. Afterwards the Siculi from Italy, and the Phœnicians from Tyre, successively, sent hither colonies, which were possessed by the Greeks. The Carthaginians next made themselves masters of a considerable part of Sicily; but both they and the Greeks being vanquished by the Romans, it remained a province of that empire till the invasion of the Goths; from which time it usually followed the fate of Naples, until the massacre of the French by the natives, in

1282. The country was afterwards occupied by the Spaniards, who retained it till the year 1707, when it was rendered subject to the Imperialists. At the peace of Utrecht it was allotted to the duke of Savoy. The Spaniards, however, invading it in 1718, it was by a subsequent treaty resigned to the emperor, who remained in possession of it eighteen years, when the French, Spaniards, and Sardinians, forming an alliance, the crown of Sicily and Naples was confirmed to Don Carlos, the king of Spain's eldest son by his second queen.

The island of Capri, or Caprea, is situate at the entrance of the gulf of Naples, three miles westward of the continent, and twenty south of the city of Naples. It is about four miles long and one broad, composed of a rock, which is in many places covered with a fruitful soil, and produces corn and a variety of delicious fruits, as figs, almonds, olives, oranges, and vines. It is almost unequalled in a delightful temperature of the air, being warm in winter, and refreshed in summer by sea-breezes. The town of Caprea is situated on the westward of the island, where the rock is extremely high. The natural beauty, and happy climate of this island rendered it the favourite retreat of several Roman emperors, particularly Tiberius, who made it the scene of his infamous pleasures. The imperial palace stood chiefly on a rising-ground in the middle of the island; but the most considerable ruin which remains stands at the eastern extremity, where may be seen some lofty apartments, arched over, supposed to have been baths. There were formerly also many subterraneous retirements, which were demolished by the Romans after the death of Tiberius, in detestation of his memory. The city of Caprea is at present the see of a bishop.

The island of Sardinia is situate in the Mediterranean sea, between 8 and 10 degrees of east longitude, and between 39 and 41 degrees of north latitude. Its length from north to south is about a hundred and sixty miles, and its breadth eighty. Towards the north the island is mountainous, but in the other parts it is agreeably diversified with hills and valleys, as well as with woods and champain fields. The chief rivers are, the Sacer, which falls into the bay of Oristagni, on the west side of the island; the Coquines, which runs towards its northern extremity; and the Lepro, which running in the opposite direction, discharges itself into the bay of Cagliari, in the south-east part of the island.

The air of this country is hot and unhealthful in summer; but the soil, when cultivated, is fruitful, producing corn, wine, and oil. A spirit of indolence, however, occasioned by a long course of oppression, is so predominant among the natives, that they never apply themselves either to agriculture or commerce, any farther than is necessary to procure immediate subsistence.

The capital of Sardinia is Cagliari, situate on a bay in the south part of the island, in 9 degrees 14 minutes east longitude, and 39 degrees 12 minutes north latitude. The harbour is tolerably good, and the trade the greatest of any of the port-towns. A uni-

versity is here established, and the place is also the see of a bishop, and the residence of the viceroy. The other towns are, Oristagni, Villa d'Iglesia, Sassari, Castella Arragonese, Algari, and Bosa.

Sardinia is thinly inhabited, and the natives are an unpolished people. It appears to have received its first colonies from the Phœnicians. The Greeks afterwards possessed part of the country, and erected in it several little states; but the Carthaginians were the first that occupied the whole island, which next fell under the dominion of the Romans upon the commencement of the Punic war. In the eighth century it was conquered by the Saracens, who kept possession of it several hundred years. The Genoese and Pisans afterwards reduced it to subjection; but the popes, who assumed an authority of disposing of such countries as were recovered from the infidels, made a grant of the island to James II. king of Arragon, who expelling the former invaders, united it to the crown of Spain; of which monarchy it continued an appendage, till the British fleet put the Austrians in possession of it, in the year 1708. The conquest was confirmed to the Austrians by the peace of Utrecht; but Sicily being allotted to the emperor by a subsequent treaty, Sardinia was, in 1720, resigned to the duke of Savoy, to whom it gives the title of king. It is computed that the revenues of this island do not amount to more than five thousand pounds a year.

Corfica is situated north of Sardinia, from which it is separated by the strait of Bonifacio, between 8 and 10 degrees of east longitude, and between 41 and 43 degrees of north latitude; being about a hundred miles long and forty broad. This island, which is almost surrounded by rocks, is of difficult access. It is generally mountainous, but there are valleys which produce plenty of corn; nor are they deficient in wine or oil. Sheep and neat cattle are in great numbers; and the breed of horses, though not large, are esteemed for their handsome shape. The country is well watered with springs and rivulets, but hardly affords any navigable river. Mines of iron, alum, and salt, are met with in different parts of the island. The inhabitants along the coast are chiefly fishermen, whose ancestors were so much addicted to piracy, that thence the rovers in the Mediterranean have obtained the name of Corsairs.

The chief town is Bastia, situate in 9 degrees 42 minutes east longitude, and 42 degrees 35 minutes north latitude, in the north-east part of the island. The place is defended by a castle, and is the see of a bishop. The other towns are, Porto Vecchia, Bonifacio, Ajazza, Mariana, Accia, Alaria, Corte, Jagone, Calvi, Nebis, and Fiorenza.

Corfica, like the other islands in the Mediterranean, was planted by colonies from Phœnicia and Greece; after which the Carthaginians, Romans, and Saracens, successively held possession of it. The Saracens being expelled by the Pisans and Genoese, the latter of these invaders retained their conquest for many years, till the natives commenced an insurrection for the recovery of their freedom. To suppress this revolt, the Genoese had recourse to the assistance of the Austrians, and after-

afterwards of the French; but the allies last mentioned proving victorious over the Corsicans, who were commanded by the brave Paoli, the island was reduced, in 1769, under obedience to the French crown to which it has since continued subject. During the struggle of the Corsicans for their liberty, they elected for their king a private person named Theodore; but being deserted by those who had set him up, he left the island, and retired to Eugland, where he remained several years a prisoner for debt; till being dismissed upon an act of insolvency, he died in great distress in the year 1755.

Malta is situate in 15 degrees of east longitude, and 36 of north latitude, about sixty miles south of Cape Passaro in Sicily. This island is twenty miles long and ten broad. It consists of a white soft rock, covered with vegetable earth, which produces corn and wine, but not enough for the consumption of the natives, who are supplied with those articles from Sicily. This deficiency of corn, however, is not owing to any barrenness of the soil, which well deserves the epithet of *Fruitful Malta* formerly bestowed upon it; but by the cultivation of other produce, that is found more profitable. The kitchen gardens are well stocked with herbs and roots of various kinds; and here are plantations of olives, figs, oranges, lemons, cotton, and indigo. The mutton and lamb are reputed particularly good; fowls, both wild and tame, are in great plenty, as is also game of all kinds. Here are no forest-trees nor rivers, but many good springs and fountains.

The capital of the island is the city of Malta, or Valetta, consisting of three towns, separated by channels, which form so many peninsular rocks, and defended by the castles of St. Elmo, St. Angelo, Civita Vecchia, and Il Bochero. The streets of the town are spacious, and the houses well built of hewn stone, flat roofed, and surrounded with balustrades. Those of the grand master, and the other chiefs, are elegant palaces. The great church of St. John is a magnificent building, inferior to few in Italy. Here are the tombs of the grand masters; and among other relics is shewn the right hand of St. John the Baptist. The other public buildings are the treasury, the hospital, and the magazine, in which are arms for thirty thousand men. The island contains between thirty and forty villages, and about fifty thousand inhabitants, the half of which number are military men, and unmarried.

Malta was first planted by the Phœnicians, and has almost uniformly been subject to the same masters as Sicily, till the year 1530, when Charles V. conferred it on the knights of St. John of Jerusalem, after their expulsion from the island of Rhodes by the Turks,

The knights of Malta derive their origin from the period immediately succeeding the commencement of the crusades, or holy war, when some pious people built an hospital for the entertainment of pilgrims. On the taking of Jerusalem by Godfrey of Bouillon, the order became military, and, instead of hospitallers, assumed the title of knights hospitallers. Having assisted in the defence of Palestine till the year 1290, when they were expelled that country, they received the protection of John king of Cyprus, with whom they remained till 1310, when, under the conduct of their grand master, Foulkes de Villaret, a native of France, they took the island of Rhodes from the Saracens; after which they were styled knights of Rhodes. They maintained the possession of their new conquest against all the power of the Saracens and Turks upwards of two hundred years, when abandoning it, they retired to the isle of Candia, or Crete, and afterwards to Sicily, till being presented by the emperor with Malta, they fixed their residence in this island.

At first this order of knights consisted of eight different nations, but the English withdrawing themselves at the Reformation, they have since been reduced to seven. Each of those has a distinct convent, the head of which is distinguished by the title of grand-prior of his respective nation. Every knight, on his admission, must prove his legitimacy, and his nobility by father and mother for four descents, except the natural sons of kings and sovereign princes. The grand-priors, or, as they are also called, grand-crosses, have commandaries, or estates, in the respective nations to which they belong, and they alone are permitted to be candidates for the office of grand-master.

Beside the grand-priors or crosses, there are demi-crosses, who are indulged with the privilege of marrying. The grand-master is elected by the grand-priors, and is subject in spirituals to the pope alone; but the knights have a dependence on the several princes in whose territories their lands are situated. The grand-master wears a long cloak on festivals, and on the left side, a white cross with eight points. The knights give him the title of eminence, and his subjects that of highness. The knights of Malta are obliged by their vows to suppress pirates, and to wage perpetual war with all Mahometan princes. They also come under the same solemn obligation to observe celibacy, chastity, and other virtues; but though they do not violate the first of those restraints, they entertain great numbers of Grecian women, who serve them in quality of concubines.

*Of the situation—face of the country—produce—air—  
mountains—rivers—bays—capes.*

THE kingdom of Spain is a peninsula, bounded on the north by the Bay of Biscay, and the Pyrenean mountains; on the east and south by the Mediterranean; and on the west by Portugal and the Atlantic Ocean. It lies between 10 degrees of west and 3 degrees of east longitude, and between 36 and 44 degrees of north latitude; extending about seven hundred miles in length from east and west, and near five hundred in breadth.

This country is much incumbered with mountains, the chief of which are the Pyrenees, that divide it from France, and form a range of two hundred miles from the Bay of Biscay to the Mediterranean Sea. Towards the north, the Cantabrian mountains stretch from the Pyrenees to the Atlantic; besides which, in the more interior parts, are the mountains of Sierra Molina and Tablada, Sierra Morene, and Sierra Nevada; and in the southern extremity, mount Calpe, opposite to mount Abila in Africa, which were denominated by the ancients the pillars of Hercules. The Spanish mountains however generally produce timber and herbage to the very top, and the valleys between them, if sufficiently cultivated, might prove exceeding fruitful. The wheat of this country is inferior to none of the kind; and though hardly any oats, here is plenty of barley, with which they feed their horses and mules. The pasturage being almost continually in verdure, there is not the same necessity for hay as in colder countries.

With variety of excellent wines, and the common European fruits, Spain abounds in oranges, lemons, citrons, raisins, pines, figs, almonds, pomegranates, olives, chestnuts, and capers. The oil, wax, and honey, are reputed to be of the finest quality, and the soil produces spontaneously many medicinal and odoriferous herbs and flowers, which seldom arrive at perfection, even with the utmost care, in more northerly climates. Sugar, saffron, cotton, flax, hemp, pitch, rosin, &c. are also produced in great plenty; and silk abounds so much that it may be reckoned the staple commodity of the nation.

With respect to animals, the Spanish horses have always been held in reputation for swiftness, as are the mules for being strong and sure-footed; on which account the latter, being well adapted to a mountainous country, are preferred by the inhabitants for travelling. But they want not good horses for draught. The wool of their sheep, no less than the flesh, is universally esteemed for its excellence, and the hogs and bacon reckoned equal to those of Westphalia. Goats,

deer, rabbits, hares, fowls, and all kinds of game, are plentiful, especially in the mountains and forests, while the seas, which almost surround the country, are well supplied with fish; but of this the rivers are not plentiful.

The state of the air is various in different parts of country. Towards the north it is temperate; but in the southern provinces, about the summer solstice, the heat in the valleys is excessive. The mountains, however, which are always cool, afford an agreeable retreat in the hottest season; and those parts that lie near the coast are generally refreshed with qualifying breezes from the sea. It seldom rains in this country, except about the vernal and autumnal equinox, which are almost the only times that the sun is obscured by cloudy weather. In the hot season most of the small rivers are dried up, and the roads so dusty as to render travelling disagreeable. But though the valleys be parched in the day, the nights are generally cool, to such a degree, however, as not to prove dangerous to the health, which the climate, upon the whole, is calculated rather to preserve than impair.

Notwithstanding all its natural advantages, Spain is now but poor and thinly peopled. Various reasons may be assigned for this situation, namely, the celibacy of the clergy, and the great number of both sexes secluded in the monasteries; the expulsion of such a multitude of Moors and Jews, as happened upwards of two hundred years ago; the wars which the inhabitants maintained during so many years with most of the powers of Europe, as well as with Africa and America; and the perpetual drain which is made to supply their American plantations with men, in the numerous offices to which only natives of Spain are admitted. To those various causes may be added, the pride and indolence of the people, which, by restraining them from laborious employments, diminishes the means of subsistence, and consequently the incitement to marriage.

Spain is divided into fourteen provinces, viz. Galicia, Asturia, Biscay, Navarre, Arragon, Catalonia, Valencia, Murcia, Granada, Andalusia, Estremadura, Old Castile, New Castile, and Leon.

The chief rivers are, 1. The Douro, anciently Durius, which rising in the eastern part of Old Castile, runs westward through that province, and Leon, and, crossing Portugal, falls into the Atlantic Ocean below Oporto. 2. Ebro, the ancient Iberus, rises likewise in Old Castile, and running south-east through Arragon, falls into the Mediterranean below Tortosa. 3. Guadalaviar, or Turis, runs from Arragon south-west, and discharges itself into the Mediterranean at the city of Valencia. 4. Guadalquivir, anciently Bætis, runs south-west through Andalusia, and falls into the Atlantic at St. Lucar. 5. Guadiana, formerly the

Anas,

Anas, runs in the same direction through New Castile and Estremadura, and falls into the Atlantic Ocean at Ayamont. 6. Limea runs also in the same direction from Galicia, and discharges itself into a bay of the Atlantic. 7. Minho runs in a parallel course with the preceding, through Galicia, and falls likewise into the Atlantic Ocean. 8. Segura runs east through Murcia and part of Valencia, and falls into the Mediterranean, between Carthage and Alicant. 9. Zucar runs eastward cross Valencia, and falls into the Mediterranean near Gandia. 10. Tajo, formerly the Tagus, runs westward through New Castile and Estremadura, and falls into the Atlantic below Lisbon.

The chief bays are, the Bay of Biscay, in the north; the Groyne, in the north-west; the Vigo, in the west; those of Cadiz and Gibraltar, in the south-west; the bay of Carthage, in the south; and in the east, the bays of Alicant, Altea, Valencia, and Roses.

The chief capes are, the cape of Ortegale, the most northern promontory of Spain; Finisterre, the most westerly; Trafalgar, at the entrance of the strait of Gibraltar; de Gat, on the south-east coast of Granada; Palos, on the coast of Murcia; St. Martin, on the coast of Valencia; with those of Palafogah and Creus, on the east coast of Catalonia.

#### C H A P. II.

##### *Of the provinces and chief towns.*

**T**HE province of Galicia is bounded on the west and north by the Atlantic Ocean, on the east by the province of Leon, and on the south by Portugal. The capital of this province is Compostella, or St. Iago de Compostella, situate in 7 degrees 17 minutes of west longitude, and in 42 degrees 54 minutes of north latitude, two hundred and seventy-five miles north-west of Madrid, and forty seven miles east of cape Finisterre. It stands in a fine plain, encompassed with hills at some distance, and contains upwards of two thousand houses. This place is celebrated for the tomb of St. James the apostle, who is said to have planted Christianity here, and to have been the first martyr in the kingdom. Hither pilgrims resort in great numbers, from all parts of Europe, especially in the year of Jubilee, this instance of devotion being considered as very meritorious. From this city the knights of St. Iago or St. James derive their origin. They are reckoned the richest order in the kingdom, possessing no less than eighty-seven commandaries or estates, the revenues of which amount to a hundred and seventy-two thousand ducats or nobles a year. No person can be admitted into this order, without proving his nobility for two generations, descended from the race of old Gothic Christians, and that their blood has never been polluted with any mixture of that of the new Christians, or converted Jews and Moors. Compostella is the see of an archbishop, whose revenues amount to seventy thousand crowns a year, and those of the chapter to as much. The town is

No. 26.

one of the most elegant in Spain, and enjoys a flourishing trade.

Corunna, or the Groyne, is a port-town in the same province, situated on a fine bay of the Atlantic, thirty-seven miles north-east of Compostella. Hither the British packet-boat always sails in time of peace.

Ferrol is another port-town of this province, situated also on a bay of the Atlantic, twenty miles north-east of the Groyne. Here is a good harbour, where the Spanish Squadron is frequently stationed in time of war, and whither their privateers carry many of their prizes.

Vigo stands on a bay of the Atlantic, fifty miles south of Compostella. Here is a capacious harbour, which is likewise often a station of the Spanish navy.

The other towns of note in this province are, Mondonedo, Lugo, Ortense, Tuy, Betanoso, and Rivadavia. At Padron is shewn a hollow stone, in the form of a boat, in which they pretend that St. James sailed hither from Palestine, when he came to preach the gospel in Spain.

Asturia is bounded on the north by the bay of Biscay, on the east by the province of Biscay, on the south by that of Leon, and on the west by Galicia. The capital of this province is Oviedo, situate on the river Asta, fifty miles north of Leon. The town is the see of a bishop, and also the seat of an university. The other most considerable towns are, Santillane, Aviles, and St. Vincent.

The province of Biscay is bounded on the north by the bay of Biscay, on the east by Navarre, on the south by Old Castile, and on the west by Asturia. The chief town is Bilbao, situated at the mouth of the river Ibaibabal, which forms a good harbour a little below the town. This is one of the best and most frequented ports on the north coast of Spain. The exportations hence consist chiefly of wool, sword-blades, which are much admired, and other manufactures of iron and steel. The remaining towns of note are, Tolosa, Vittoria, Fontarabia, St. Andero, Laredo, Ordonna, Placentia, St. Sebastian, and Port Passage; the two latter of which, being good ports, are frequently the station of the Spanish men of war and cruisers.

The province of Navarre is bounded on the north-east by the French Navarre, on the south-east by Arragon, on the south-west by Old Castile, and by a part of the province of Biscay on the north-west. This province is the coldest of any in Spain, consisting chiefly in pasturage and timber, with some iron mines. The chief towns are, Olita, Tudela, Estella, and Sanguesa.

Arragon is bounded on the north by Navarre and the Pyrenean mountains, on the east by Catalonia, on the south by Valencia, and on the west by Old Castile. The capital of this province is Saragossa, situated at the confluence of the rivers Ebro, Gallego, and Guerva. This city is said to have been founded by the Phœnicians. The town is large and well built, and the streets are spacious. Here are many fine churches and convents; but that which is most

4 H

cele-

celebrated is the church of *our Lady of the Pillar*, not so much on account of its magnificence, as of the chapel beneath it. This chapel is a subterraneous building, thirty-six foot long, and twenty-six broad, enlightened with lamps and flambeaux. Within is the image of the Virgin Mary standing on a pillar, with little Jesus in her arms. The sculpture is enriched with a profusion of precious stones, round which is represented, in solid silver, a number of angels, holding flambeau: in their hands. Besides those, there are about fifty lamps of the same metal, intermixed with a multitude of figures of legs, arms, heads, and hearts, erected in acknowledgement of the miraculous cures wrought by the Blessed Virgin, all which are also decorated with gold and precious stones. Hither pilgrims resort in great numbers to perform their devotion. The tradition is, that on a fine jasper pillar on this spot the Virgin appeared to St. James, while he was endeavouring the conversion of the Spaniards, and encouraged him in his labours. Saragossa is the see of an archbishop, and has an university. Here also, in the palace of the ancient kings, is held the tribunal of the inquisition. The town is surrounded by an old wall, and other antique fortifications.

The other towns in this province are, Jaca, Huesca, Balbastro, Tarazona, Albarazin, Tervel, Ainsa, Catalagud, and Boria.

Catalonia is bounded on the north by the Pyrenean mountains, on the east and south by the Mediterranean, and on the west by the provinces of Arragon and Valencia. The capital of this province is Barcelona, situate in 2 degrees 3 minutes of east longitude, and in 41 degrees 26 minutes of north latitude, in a large plain on the shore of the Mediterranean, two hundred and fifty miles east of Madrid. It is of an oblong form, surrounded by a wall and other modern fortifications, and defended by the castle of Montjoy, standing on a rock about a mile north-east of the city. A harbour is formed for galleys and small vessels by a mole which projects into the sea; but the situation is not commodious for large ships. Barcelona is divided into the New and Old Town, the former surrounding the latter, and separated from it by a wall and ditch. The streets are spacious, well built, and neatly paved; and there are several beautiful squares, in the chief of which, or that of St. Michael, all the principal streets have a termination. The most remarkable public buildings are the cathedral, the church of our Lady Delpino, the palaces of the viceroy and bishop, and that where the states of the province assemble. It is computed that there are in the city about fifteen thousand houses. The inhabitants are generally polite, and maintain a great trade in the silk and woollen manufactures, but particularly in those of iron and steel. A great quantity of wine, the produce of the neighbouring country, is also exported from this place; and it is the seat of an university.

About seven or eight miles north-west of Barcelona is the situation of Montserrat, which commands a prospect of the whole adjacent country, as far as the sea. On this mountain is a chapel dedicated

to the Blessed Virgin, of whom here is an image, which, according to tradition, was found in a cave by some shepherds about the year 880. Over this image, Guthred, earl of Barcelona, caused a monastery and chapel to be erected; but after remaining in this receptacle upwards of seven hundred years, Philip II. and Philip III. invested it with a magnificent church, instead of the former covering. The image, holding in its hand a little Jesus, is now placed upon an altar in this church, which is illuminated with ninety silver lamps; and in the treasury is shewn a crown of the Blessed Virgin's, valued at a million of florins. The convent is inhabited by monks of every nation, who amount to three hundred persons, including their servants. All strangers who come hither, out of devotion or curiosity, are entertained gratis for three days; nor is there any place, except Rome or Loretto, to which pilgrims resort in greater numbers. Over the church, towards the top of the mountain, are the cells of thirteen hermits, hewn out of the rock. These men are generally persons of quality, who being weary of the world, have retired hither to spend their time in solitude and devotion. Adjoining to the cells each hermit has a chapel, a garden, and a fountain springing out of the rock. Over those caves is a leaning rock, to which they have fixed three crosses, where they say mass every day, to implore the Blessed Virgin, that she will not suffer it to fall upon the church or cloyster; part of it having tumbled down in the sixteenth century, and done considerable damage. The place undoubtedly affords a delightful solitude, presenting the eye with one of the finest prospects in the world, and charming the ear with the soft notes of birds, or the murmuring of springs and rivulets, which fall down the rocks on every side.

The other towns of note in the province of Catalonia are, Urgel, Balaguer, Lerida, Tortosa, Gironne, Roses, Vic, Cardonna, Solsona, Puiceda, and Mameca.

The province of Valencia is bounded on the north by Arragon and Catalonia, on the east and south by the Mediterranean, and on the west by New Castile and Murcia. The capital is Valencia, situate in 35 minutes west longitude, and in 39 degrees 30 minutes of north latitude, in a fine plain on the river Guadalquivir, about two miles from the sea coast. This city, within the walls, contains about twelve thousand houses, elegantly built; and the suburbs are nearly of the same extent. Besides a fine river, over which there are five stone bridges, it is watered by a great number of fountains, and abounds with all kinds of provisions. The inhabitants are remarked to be more gay and sociable than in other parts of Spain, and the women much addicted to gallantry. The most considerable public buildings are the cathedral, the viceroy's palace, and that of Cinto, with the monastery of St. Jerome, the exchange, and the arsenal. This city was once a Roman colony, under the name of Colonia Julia Valencia; and there may yet be seen several remains of antiquity, both in the town and neighbourhood. It was afterwards the residence of the

the Moorish kings. At present, it is the see of an archbishop, and has an university. So mild and genial is the temperature of the air in this province, that the country, for twenty miles round, looks like a continued garden, Intermixed with numerous towns and villages, in which may be seen crowds of women and children before the houses, employed in spinning silk.

Near Valencia, about a mile from the coast, stands Morvedro, a town which arose from the ruins of the ancient Saguntum. This city was famous for its clay, of which fine cups were made; and yet more celebrated for its memorable defence against Hannibal, who, contrary to the faith of treaty, had invested it with his troops; the inhabitants choosing rather to throw themselves and their most valuable effects into the flames, than either to forfeit their fidelity to the Romans, or fall a prey into the hands of the enemy. This transaction occasioned the second Punic war, and gave rise to the expression of *Saguntina famis*, and *Saguntina rabies*, to denote famine and rage in the extreme.

Alicant is a small port-town seventy-five miles south of Valencia. It is defended by a castle which is built upon a high, and almost inaccessible rock. The place enjoys a great foreign trade in fruit and wine. The other towns of note are, Villahermosa, Origuella, Segorbe, Xativa, Donia, Gandia, Villareal, Aleira, and Altea.

The province of Murcia is bounded on the north by New Castile, on the east by Valencia and the Mediterranean Sea, on the south by the same sea, and on the west by Granada and Andalusia. This province affords a great quantity of sulphur, and so much salt, that it is able to supply all Spain with that commodity. Murcia, the capital, is situate in 1 degree of west longitude, and in 38 degrees of north latitude, on the river Segura. The town is of considerable extent, and is the see of a bishop.

Carthagen is situated twenty-five miles south of Murcia, and enjoys one of the most spacious and commodious harbours in the Mediterranean. This city is said to have been founded or improved by Hannibal, who gave it the name of Carthago Nova, and made it the capital of the Carthaginian dominions in Spain. Having been almost destroyed by the Goths and Vandals, Philip II. rebuilt it, since which time it has been strongly fortified, as a place of great importance to the nation.

The other considerable towns in the province are, Lorca, Caravaca, and Mula.

The province of Granada is bounded on the north by Andalusia, on the east by Murcia and the Mediterranean sea, on the south by the same sea, and on the west by Andalusia. The chief town Grenada is situate in 2 degrees 49 minutes west longitude, and in 37 degrees of north latitude; two hundred and twenty-five miles south of Madrid. It stands at the confluence of the rivers Daro and Xenil, and at the foot of Sierra Novada, or the Snowy Mountain. Here are several spacious streets and squares, magnificently built, and inhabited by persons of distinction; many of whom have fine gardens and fountains belonging to their

houses. The ancient palace of the Moorish kings is a large building, said to contain accommodation for four thousand persons. On the out-side it has the appearance of an old castle, but within is extremely magnificent. The walls are lined with jasper, porphyry, and other beautiful marbles, which forms a kind of Mosaic work, containing many inscriptions in Arabic characters; and the ceilings are painted and gilded. In the middle is a spacious court paved with marble, surrounded with a noble piazza, over which is a magnificent gallery. At the four corners of the court are several marble fountains, and in the middle one of an uncommon size, adorned with groups of figures, whence the water was conveyed to the baths in the palace, which are grand apartments lined with alabaster, and elegantly vaulted in the roof. Adjoining to the palace is a fine park and gardens, well supplied with fountains, rivulets, and shady groves, which contribute to render the place a most delightful retreat in the summer.

The city of Granada is now the see of an archbishop, and endowed with an university, which however is one of the most inconsiderable in Spain. The temperature of the air is so remarkably salubrious, that many valetudinarians resort hither for the purpose of recovering their health. The Moors were so charmed with the situation of the place, that they imagined paradise to be in the part of the heavens which is over it.

Malaga is situated on the coast of the Mediterranean, sixty-six miles north-east of Gibraltar, at the foot of a steep mountain. It is strongly fortified by a double wall and two castles; and though neither large nor well built, yet is very considerable on account of its trade, to which a most commodious harbour renders it peculiarly adapted. Great numbers of foreign ships resort hither in autumn every year, particularly from England and Holland, to load with fruits of various kinds, as raisins, almonds, figs, oranges, capers, &c. Hence also is exported a great quantity of wine, the produce of the neighbouring country, but which has obtained the name of Malaga, from being put on board at this place. The town of Malaga is the see of a bishop, suffragan of Granada; and the cathedral an elegant building, richly furnished and adorned.

Near Velez Malaga lie the mountains of Alpuxarras, of considerable extent, and inhabited by the descendants of the Moors, who, though they now profess the Christian religion, retain their ancient customs and habits, and owe by their application to agriculture rendered this mountainous tract one of the most fruitful parts of the country.

The other most considerable towns in this province are, Almeria, Guadix, Ronda, Antiquera, Baza, and Loya.

The province of Andalusia is bounded on the north by Estremadura and New Castile, on the east by Murcia, on the south by Granada, the Straits of Gibraltar, and the Atlantic Ocean, and on the west by Portugal. The capital is Seville, situate in 6 degrees west longitude, and in 37 degrees of north latitude, on the river Guadalquivir, upwards of two hundred miles south-west

west of Madrid. This city is said to have been founded by the Phœnicians, who gave it the name of Hyspali. It is of a circular form, about eight miles in circumference. The cathedral, once a Mahometan mosque, and built by the Moors in the tenth century, is a very magnificent structure. It measures four hundred foot in length, two hundred foot in breadth, and a hundred and twenty-eight in height; containing no less than fourscore chapels and altars, where mass is said every day. Besides this there are in the city many other fine churches and monasteries. The town is surrounded with an old wall and antique towers, and the streets narrow, but well built. It is the largest city in Spain, except Madrid, and computed to contain three hundred thousand inhabitants. On the south side of the town stands the royal palace; called Alcazar, the finest part of which was built by the Moors. It is adorned on every front with the imperial eagle, under which is Charles the Fifth's motto, *Plus Ultra*. The gardens belonging to this palace are exceeding beautiful. The other public buildings in the city are, the palace of the inquisition, the exchange, the India-house, the mint, and the colleges belonging to the university, which at present however enjoys not the reputation it formerly had. Here is a noble aqueduct, which brings water to the city from Carmona, at the distance of eighteen miles. The number of hospitals of all kinds is said to amount to a hundred and twenty, some of which are very large and beautiful.

In the last century, while Seville monopolized the trade with Potosi and America, its commerce was extremely flourishing; but Cadiz and other sea-ports have since made a great derivation from it. The traffic however is still considerable, and the situation of the place is by the Spaniards esteemed the most delightful in the world. The climate is doubtless the most agreeable that can be imagined, and the air is perfumed with a variety of sweet flowers and blossoms, which nature produces spontaneously in almost every season. The olives here are the best in Europe, and grow in the greatest quantity; there being not far from the city a wood of them near twenty miles in circumference.

Seventy-five miles north-east of Seville, on the bank of the river Guadalquivir, stands Cordoua, the ancient Corduba. It is computed to contain fourteen thousand families, and has a flourishing trade in wine, silk, and leather. Here is an university, and the see of a bishop. This was the seat of the first Roman colony sent into those parts, and was surnamed Patricia; supposed to have been founded by the first Marcellus. It was famous of old for its rich produce in oil; nor is it less celebrated for the birth of the two Senecas, of Lucan, of Martial.

The port of Cadiz, anciently Gader, is situated at the north-west end of the island of Leon, opposite to port St. Mary's on the continent, in 6 degrees 46 minutes of west longitude, and in 36 degrees 25 minutes of north latitude. The island on which it stands is about eighteen miles long, and from nine to two broad; having a communication with the continent by a bridge called Ponte Sanora. The island with the

opposite continent form a bay four leagues long, and in most places two in breadth; but about the middle are two points of land, one on the continent, and the other on the island, so closely situated, that the forts upon them, called the Puntal and Matagorda, command the passage. Within those points is the harbour, which it is impossible for an enemy to enter without previously being master of the forts. Cadiz is supposed to contain about five thousand houses. It has an extensive foreign trade; the galleons annually taking in their lading here, and returning hither with the treasures of America, and other rich merchandize.

The Phœnicians first possessed themselves of this island, and erected on it a temple to Hercules. The Carthaginians and Romans were afterwards successively masters of it; and so great was the trade which it enjoyed in those times, that no less than five hundred Roman knights resided in it at once.

The port-town of Gibraltar is situated on the strait between the Atlantic Ocean and the Mediterranean, in 4 degrees 53 minutes west longitude, and 36 degrees 13 minutes of north latitude. It stands on a rock in a peninsula, at the foot of the celebrated Mount Calpe, which covers it towards the land. On this side it can only be approached by a very narrow passage between the mountain and the sea, across which the Spaniards have drawn a line, to prevent the garrison from having any communication with the country. This place was taken by the confederate fleet under the command of Sir George Rook, in 1704; since which time the Spaniards have repeatedly attempted to recover it, but without success. The garrison of Gibraltar is cooped up within very narrow limits, the ground which they occupy affording hardly any of the necessaries of life; on which account, in time of war, they are obliged to be supplied with provisions either from England or the coast of Barbary. As this fort commands the entrance to the Mediterranean, the possession of it is of the greatest importance to our trade in those parts. It is usually garrisoned by six regiments, and the governorship is reckoned a place of considerable profit.

The strait to which the town gives name, is about twenty-four miles long, and fifteen broad. A strong current, which requires a brisk gale to stem, constantly sets through it from the ocean.

The other towns of note in this province are, Jaen, Medina Sidonia, Port St. Mary, Ezia, Baeza, Osuna, St. Lucar, Anduxar, Carmona, Alcala-real, Lucena, Arcos, Marchena, Ayamont, Ubeda, and Moguer.

The province of New Castile is bounded on the north by Old Castile, on the east by Valencia, on the south by Andalusia and Murcia, and on the west by Portugal. The capital of the province, and of the whole kingdom, is Madrid, situate in 4 degrees 15 minutes west longitude, and in 40 degrees 30 minutes of north latitude. It stands almost in the midst of a large sandy plain, surrounded with high mountains at the distance of about eight or ten miles. The city is about seven miles in circumference, without either walls or fortifications. The streets are long and spacious, but ill paved with small flints. There are in it some noble squares, the most magnificent of which

which is the *Placa Mayer*, in the middle of the town. This square contains a hundred and thirty-six grand houses, five stories high, uniformly built, with balconies at every story, and the whole sustained by arches and pilasters. This quarter is inhabited by substantial tradesmen, mercers, drapers, goldsmiths, &c. The great market is held in the middle of the square; and here are the bull-fights upon days of rejoicing. The houses are built of brick, and the apartments commodious and magnificent; but the lattice windows considerably diminish their elegance. The materials of their houses being brought from distant provinces, and no navigable rivers to import them, occasions building here to be very expensive. There are neither courts nor great gates before the nobleman's houses as at Paris, the front of every house forming a line with the street. The first floor of every house in Madrid belongs to the king, unless the builder purchase it of his majesty, which he generally does. People of distinction have a variety of apartments suited to the different seasons of the year, and richly furnished. Their hangings are of velvet, silk, or tapestry, trimmed with gold and silver lace, or fringe, and adorned with busts, pictures, glasses, and japan cabinets, with a vast profusion of plate and jewels, rich carpets and cushions to sit upon; but no chairs or tables are seen in the ladies apartments.

Here are three grand edifices belonging to the crown, viz. the Palace Royal, the Casa del Campo, and the Buen Retiro. The first of these, which is the usual residence of the court is situate on an eminence at the end of the town, commanding an extensive prospect over the adjacent country. Some of the rooms in this building have no light but what they receive from the doors; and the rest, having only small windows, are very dark.

The Casa del Campo stands opposite to the preceding. Between them runs the river Mancaneres, which forms a large stream when the snows on the neighbouring mountains are melted, but is hardly visible in the hot season. A grand bridge however is erected over its channel.

The palace of Buen Retiro is situated at the other extremity of the town, on the side of a hill, near the Pardo, a park about three miles in circumference, in which are several detached pavilions, where the officers of the court reside when the king comes to divert himself in the hot season. The groves, parterres, grottos, and cascades, render this a delightful abode in summer; and it is also supplied with a great number of fountains, one of which is so large that the king sails upon it in a yacht.

The nobility have a great many palaces in Madrid, inferior only in respect of dimensions to those of the king. Several fine churches and convents contribute also to the ornament of this capital. Amongst the former, that which is dedicated to the Blessed Virgin, called our *Lady of Atocha*, or the Grove, is the most magnificent. Here is an image of the Virgin, with the infant Jesus in her arms, to which many miracles are ascribed. She is clothed in a widow's habit, except

No. 26.

on grand festivals, when she is almost covered with jewels. To this church the king comes to sing *Tedeum* on any signal victory. Here are also several hospitals, two of which in particular afford each accommodation to fifteen hundred persons.

The numerous towers and large buildings in this capital give it a magnificent appearance, and provisions of all kinds are cheap; but being destitute of common sewers, it is extremely offensive, especially in summer; and having neither taverns nor coffee-houses, it is little calculated to afford an agreeable reception to strangers.

Besides the royal palaces in Madrid, there are several others in the province. One of those called the Prado, is about two leagues distant from the capital; that of Sarfuala a little farther, and the Escorial about six leagues and a half. This palace being dedicated to St. Laurence, who is said to have been broiled alive on a gridiron, is built in the form of that culinary instrument, the bars of which form several courts, and the handle is the royal apartments. The whole consists of a palace, a church, a convent, and a burial-place for the sovereigns of Spain. The representations of a gridiron are met with in every part of the building, either sculptured, painted, formed of iron, marble, wood, or stucco. This is doubtless the largest palace in Europe, though not the most elegant. The Doric order is that which prevails: it is four stories high, wholly built of a grey stone, resembling granite, but not so hard. The extent of the principal fronts is six hundred and fifty-seven foot, and of the others, four hundred and ninety-four. At each of the corners stands a square tower two hundred foot high. It is said, that in the whole building, there are four thousand windows, and eight thousand doors. There are three doors in the principal front. Over the grand entrance are the arms of Spain, carved in stone; and a little higher, in a nich, a statue of St. Laurence in a deacon's habit, a gilt gridiron in his right hand, and a book in his left. Directly over the door is a basso relievo of two enormous gridirons in stone. Notwithstanding the great extent of this palace, the royal apartments contain nothing worthy of notice. We are told, however, that in the whole, there are upwards of one thousand six hundred pictures in oil colours, exclusive of the paintings in fresco, which are also very numerous. This palace was begun by Philip II. in 1557, and completed in twenty-two years.

The great church resembles that of St. Peter's at Rome, and is the repository of an infinite number of relics, which are held in great veneration. Under this edifice is the Pantheon, so called from its being built after the model of the Pantheon at Rome, of a round form, and vaulted like a cupola. This is the mausoleum of the Spanish kings of the Austrian family.

In this province are two other royal palaces, viz. Ildophonso and Aranguez; the latter of which has a great resemblance of Potsdam, and is as much admired for the beauty of its gardens, as the Escorial for the magnificence of its buildings. The water-works at this place are called the wonders of Spain, and thought

by the natives to be unequalled. Here are brazen and marble statues, as at Versailles, spouting up water in different forms, which falls into basins adorned with groups of figures of excellent workmanship. Most of the fictions of the ancient poets are here represented; and there are artificial trees, from every branch and twig of which the water spouts, in the form of a shower of rain.

About forty miles to the southward of Madrid stands Toledo, formerly the capital of Spain, and the seat of the ancient Gothic and Moorish kings. It is situated on a steep rock, at the foot of which runs the Tagus, encompassing it on three sides. The rest is defended by an old wall and towers, which are however commanded by several hills. Here are many grand houses occupied by people of distinction. This place was once very considerable for its manufactures of silk and wool, and still maintains a great trade in the article of twyl-blades. The cathedral here is one of the largest Gothic buildings in Europe, and is honoured with the distinction of always having the pope and the king of Spain as its canons. On Christmas, before the first vespers, the names of those personages are called aloud at the door of the choir; when for not appearing, as they never do, they are mulcted in two thousand maravedis each, a sum nearly equivalent to sixteen shillings and nine pence. This building stands in the middle of the city, and has before it a grand court, from which it is entered by eight beautiful brazen doors, through a grand portico. The church is three hundred and eighty foot long, a hundred and ninety-one broad, and a hundred and seven high. It is supplied with a number of chapels, which are richly furnished. In that of our lady of Sagrana, is an image of the Virgin, of solid silver, as large as the life, with a golden crown, enriched with diamonds and pearls of an extraordinary size. The treasury contains a group of figures, all of solid gold, where the Virgin, sitting on a rock of precious stones, is presenting her son to St. John Baptist. One of the diamonds that form the rock is as large as a pigeon's egg. The lands allotted for the repair of this cathedral afford the yearly rent of a hundred thousand crowns. The archbishop of Toledo is primate of Spain, and great-chancellor of Castile, and is proprietor of seventeen towns, besides a great number of villages. His revenue is computed at three hundred and fifty thousand crowns a year.

In the southern part of this province lies the country of La Mancha, which Cervantes has rendered celebrated, by making it the scene of Don Quixote's Adventures.

The remaining towns of note in New Castile are, Cuenca, Ciudad Real, Alcalá de Henares, Almanza, Guadalajara, Brihuega, Calatrava, Valena, and Requena.

The province of Old Castile is bounded on the north by Asturia and Biscay, on the east by Arragon, on the south by New Castile, and on the west by Leon. The chief town is Burgos, situated a hundred and seventeen miles north of Madrid. The other

places of note are, Logronno, Calahorra, Sarra, Ofma, Valladolid, Avila, Signenza, Roa, Aranda, Calzada, Nagora, St. Domingo, and Segovia.

At the last of these towns is the famous aqueduct, the building of which has been attributed to the Goths, to Hercules, the emperor Trajan, &c. It consists of a range of one hundred and eighteen arches, over forty-three of which stands an equal number of others. The greatest height of the building is one hundred and two foot. The whole is composed of stones about three foot long and two foot thick, without any mortar or cement; but those on the top are joined by cramp-irons. It is doubtless one of the noblest and most perfect monuments of antiquity now existing.

Near the city stands the Alcanor, or royal palace, situated on a rock, detached by a deep dry ditch from the town, with which it communicates by a strong stone bridge. It was erected by the Moors in the eighth century; was afterwards inhabited by the kings of Castile, and is now used for a state prison. From the center of the building, which consists of white stone, a lofty tower rises, environed with many turrets; and the roof of the whole is covered with lead. In the royal saloon, round the wall, are fifty-two statues of painted wood, representing a series of the kings and queens of Spain, sitting on thrones, and of other eminent persons, all as large as the life, with an inscription underneath. The ceiling of this apartment, and of several others, is so well gilt, that though it probably was done seven centuries ago, it appears quite fresh and new. Here is shewn the cabinet where Alphonso X. furnished the Impious and the Wise, composed his astronomical tables, in 1260. He was here struck by lightning, the marks of which yet appear in the wall.

The province of Leon is bounded on the north by Asturia, on the east by Old Castile, on the south by New Castile, and on the west by Galicia. The chief town is Leon, situated on the river Esla, a hundred and sixty-five miles north-west of Madrid. This was the capital of the first Christian kings of Spain, seven of whom are here interred. It is at present a large city, and the see of a bishop. The cathedral is esteemed one of the most elegant buildings of the kind in Spain.

Salamanca is situated on the river Tormes, eighty-eight miles north-west of Madrid. This place, also the see of a bishop, is famous for its university, in which are twenty-four colleges, four thousand students, and eighty professors, who have each a salary of a thousand crowns a year.

The other most considerable towns are, Palencia or Placencia, Toro, Zamora, Astorgo, Alva, and Ciudad Rodrigo.

The province of Estremadura is bounded on the north by Leon, on the east by New Castile, on the south by Andalusia, and on the west by Portugal. This province is now generally reckoned a part of New Castile. The chief towns are, Merida, Badajoz, Placencia, Corra, Truxillo, Lerene, or Ellerene, Alcantara, and Medelin.

## C H A P. III.

*Of the persons of the Spaniards—habit—character—diet—visits—diversions—founding hospitals—way of travelling.*

**I**N respect of their persons, the Spaniards are moderately tall and thin, their complexion on the olive cast, their hair black, their features regular, their eyes lively, and for the most part likewise black. They shave their beards, but leave mustachios on the upper lip. The women are generally slender, and habituate themselves early to acquire and preserve a genteel shape. In particular, they reckon it a beauty to have little feet, and take much pains to prevent the growth of their breasts, by keeping them compressed with plates of lead.

Of late years, the habit of the Spaniards has undergone a great alteration. They have laid aside the short cloak, as also their spectacles, ruffs, and long swords; and the only mark of their former gravity consists in the deep brown colour of the habits of the common people.

The Spanish ladies make no secret of using paint, which they lay very thick not only on their faces and hands, but a great way down their backs; and indeed without this artifice, their tawny shoulders, which, by wearing their stays so low behind, are much exposed to view, would make a very indifferent appearance. They wear several garments under their gown, and their coats are of so great length, that they always trail on the ground. On the top of the stays, ladies of rank have a breast-plate of diamonds, to which they hang a chain of pearl, or other precious jewels. They use many bracelets round their arms, as well as rings upon their fingers, and such weighty pendants in their ears, as stretch them to an unreasonable length.

The Spaniards are still remarkable for that gravity of deportment, which has so long been the characteristic of the nation. Their most peculiar endowments appear to be taciturnity and composure, the latter of which is evident in almost every action of their life. A pensive kind of dignity uniformly marks their mien and air; and their pace is so extremely slow, that at a little distance, it is not easy to discern whether they move at all. They are however reputed liberal, sincere, delicate in point of honour, and temperate in the pleasures of the table. But their understanding, which in other things appears not to be defective, is greatly tarnished by the grossest superstition and bigotry. They hold their priests in so much veneration, that they kiss the very hem of their garment, and pay them a degree of respect little short of idolatry. Their regard for the female sex is almost equally enthusiastic. It is common for a well-bred man to approach a lady with his knees bended, kissing her hands instead of her lips; and if she does him the favour to commend any thing he has, as a watch, a ring, a jewel, or other toy, it would be reckoned extremely unpolite not to present her with it. This attachment to the sex, however, is accompanied with such jealousy on the side of the husbands, as frequently excites them to a behaviour

the most unjustifiable and extravagant. Among the follies and vices of the Spaniards, may be ranked their unreasonableness of contempt of other nations, their pride and vanity, their indolence, avarice, libidinous passions, and insatiable thirst of revenge. Upon the whole, they are more a grotesque than a pleasing people, and ridiculous rather than respectable. It is their great misfortune that they converse so little with the rest of the world, and that their ignorance is industriously encouraged by their priests, whose influence over them is unbounded.

Immediately after getting out of bed, it is usual for persons of condition to drink a glass of water cooled with ice or snow, and afterwards chocolate, which is now become the morning beverage of almost all ranks. At dinner the master of the family sits down to table in a chair; but the women and children sit cross-legged on a carpet, after the manner of the Moors. Their meals consist commonly of light food, such as a pigeon or a partridge, an olio or ragou, high seasoned with garlic and pepper, which is succeeded by a desert of delicious fruits. They seldom eat butter or cheese, of which they have neither in perfection; but instead of butter in their sauces, they make use of oil. The ladies drink only water, and the gentlemen but very little wine. After dinner they usually sleep two or three hours, during which time the shops in Madrid are shut up, and few persons, except foreigners, are to be met with in the streets. Their supper is also light, and seldom consists of any thing more than a little hash, a ragou, or a tart. This meal as well as their breakfast, they frequently take in bed.

The usual time for their visits, as in other hot countries, is the evening. At this time the men meet abroad in public places of resort, and the ladies visit each other at their houses, where the floors of the apartments are covered with rich carpets and cushions of silk or velvet; they yet retaining the custom of the Moors of sitting on the floor. They never address one another by any distinguishing title; as, your highness, your grace, &c. but the title of donna is given to ladies of every rank. Those of distinction, however, pay their visits in great state. They are carried in a chair by four men, of whom the two foremost are uncovered. Two others attend as a guard, and a seventh carries a lantern. A coach drawn by mules immediately follows, containing her women, and another the gentlemen of her household, several menial servants walking after. The whole procession is very slow, conformably to the gravity of the people. Few coaches, except the king's, are drawn by horses, though hardly any country affords a finer breed for the purpose.

The usual phrase in the Spanish language on parting with a person is, *Yaya V. S. con Dios*, 'May your worship go along with God.' For, 'I thank you,' they say, *Viva V. S. mil anos*. 'May your worship live a thousand years;' to which the answer sometimes is, *Poca mas o menos*, 'a little more or less.'

There are two play-houses at Madrid, but the entertainments so execrable, that they hardly deserve the name. When the ave-bell rings, as it constantly does

at six in the evening, all the actors, as well as the audience, fall down upon their knees, in which attitude they remain a few minutes. The Spaniards also use masquerading, both on horseback and foot. They have a peculiar attachment to the game of chess, at which they play with great slowness, it being not unusual for a game begun by parents to be determined by their children; and it is sometimes carried on by letters between persons at a distance. In most of the capital towns there is likewise a great number of billiard-tables, at a kind of which, called *truces*, and furnished with twenty pockets, they play with very large balls, which are to pass through an iron arch fixed in a certain part of the table.

Of all the Spanish diversions, however, the most remarkable is their bull feasts. On the spot where any of those are exhibited, scaffolds are previously erected for the spectators, and the beasts are shut up in stalls made as dark as possible, to render them the fiercer on the day of battle. The following description of a late bull-feast may serve to give an idea of this entertainment.

Every thing being ready, the bulls remained to be driven across the area from the stables in which they were confined, to a smaller behind the amphitheatre, where they were to be kept apart from each other. The first stable was not far from the amphitheatre, and a wall of boards six foot high was put up on each side of the way by which the bulls were to pass. At a quarter past four ten bulls were let into the area, in order to be put into the stables at the opposite door; a man on foot leading before them a tame ox, which had been bred with bulls, to decoy them into those receptacles. Three combatants on horseback placed themselves at some distance, one on each side of, and the other opposite to the door at which the bull was to enter. A trumpet was then sounded, as a signal to let in a bull, and the man who opened the door got behind it immediately.

During a quarter of an hour preceding this period, the bulls had been teased by pricking them in the backs. This is done by persons placed on the ceiling of the stables, which was low, and constructed in such a manner as to afford convenience for the operation. The bulls were distinguished by a small knot of ribbon fixed to their shoulders.
