MARCH 2 1934

"The Master Won't Dine Without  
Lea & Perrins' Worcestershire Sauce"

"He says that it gives an appetizing relish to Soups, Stews and Ragouts."

"Of course, he uses it principally on Roasts, Chops and Cutlets, although he says that Fish, Fowl and Game are always at their best with Lea & Perrins."

"O, no! Master won't have any but Lea & Perrins'. That's the original Worcestershire!"

COMMISSIONER'S REPORT  
PARTIZAN AND UNFAIR,  
DECLARES DR. PUGSLEY

OTTAWA, Ont., April 12.—The findings of the commission appointed by the Conservative government of New Brunswick to inquire into the relations between the late government of the province and the New Brunswick Railway and Coal Company are partizan and unfair and not justified by the evidence in the ground which will be taken by Dr. Pugsley in the statement which he will make in the House of Commons tomorrow.

Dr. Pugsley is satisfied, after a close examination of the findings before Judge Landry, Mr. Tweedie and Mr. McDougall, the commissioners appointed by the New Brunswick government to look into the affairs of the New Brunswick Coal and Railway Company, which not printed, was pretty fully reported by the New Brunswick press while the investigation was going on. Anyone that followed the evidence, as the people of New Brunswick followed it during the time that the last Dominion election was in progress are bound to come to the conclusion that the evidence contains no justification for the findings which the commission has made that there was company or misappropriation of funds by the management and executive.

With regard to Mr. Tweedie and Mr. McDougall, the commissioners in their report observe us for not having looked sufficiently well after the interests of the province as ex-officio directors of the Coal and Railway Company, whose bonds were guaranteed by the province, they do not pretend to find that either of us in any way profited through the transaction. The commission will conclude that the allegation that Mr. Tweedie profited through the sale of some bonds of the company, however, the trouble to read the evidence in regard to this transaction will convince the commissioners have gone very far indeed out of their way to find something upon which to pass condemnation.

Palpitation of the Heart.

One of the first danger signals that announce something wrong with the heart is the irregular beat or violent throbb. Often there is only a fluttering sensation, or an "all gone" sinking feeling; or again, there may be a most violent beating, with flushings of the skin and visible pulsations of the arteries. The person may experience a smothering sensation, gasp for breath and feel as though about to die. In such cases the action of Milburn's Heart and Nerve Pills in quieting the heart, restoring its normal beat and imparting tone to the nerve centers, is beyond all question, marvelous. They give such prompt relief that no one need suffer.

Mr. Sylvester Smith, Hampton, N.B., writes:—"I was troubled with palpitation of the heart and tried doctor's medicines, but they only gave me temporary relief. I heard of your Heart and Nerve Pills and bought two boxes and before I had used them I was completely cured and would recommend them to all similarly affected."

Price, 80 cents per box, or 3 boxes for \$1.95 at all dealers or mailed direct on receipt of price by The T. Milburn Co., Limited, Toronto, Ont.

Another Part  
"Another proof of this partizan feeling is found in the fact that although by the terms of the commission the commissioners were limited to inquire into the affairs of the company only since 1931, when the province guaranteed the bonds of the company, the commissioners made in 1937, twenty-two years ago, and thereby seek to attack the reputation of the late Premier G. Elias; at that time the leader of the New Brunswick government. Another instance of the same sort is found in a reference which the commissioners made in their report to an alleged payment to myself in 1935, conveying the impression that I was at that time a member of the New Brunswick government, though I was then not even in politics, but acting as solicitor to parties interested in the undertakings of the Central Railway."

DISEASES OF FOODS DISCUSSED

BY RENE FACHE  
Diseases of foods have recently been the subject of an investigation at the hands of science. They are many and various, and some of them, such as the cholera, typhoid, and other frequent instances cause considerable loss to producers. What is commonly known as "ropy milk" is a disease that at least for awhile has practically destroyed the business of many dairymen.

These diseases are caused by two different kinds of vegetable germs: bacteria, and the spores of fungi. Bacteria, as everybody knows, are microscopic plants which are in the air and everywhere. Most of them are entirely harmless, but a few species are dangerous. The fungi in question are of the kind known as molds and mildews, and their spores, corresponding to the seeds of higher plants, which are so tiny as to be invisible to the naked eye, are omnipresent.

As a rule, moulds, spread by the housewife and made ready for the oven, is likely to contain a great many bacteria and perhaps fungus germs as well. But the heat of the oven kills all these spores and microbes, and certainly the baker's loaf when it comes out is absolutely sterile; that is to say, germ-free. No kind of food could possibly be safer to eat. Possibly there may have been typhoid germs in the water used for making the bread; but if so, they are destroyed.

THE FOND OF BREAD.  
But what happens then? Well, under ordinary circumstances, the loaf is not so sterile as it seems. The bacteria or fungus spores floating about in the atmosphere find their way into the crumb. Microbes and germs of moulds are as fond of bread as human beings are, and they are ready to get upon it, multiplying with great rapidity.

ON OLD SHOES AND RYE BREAD.  
One of the commonest kinds of mould is that which makes it so that it is a to a familiar case of disease in bread. The preventive in this case, too, is cold, dry air. Microbes, especially fungi, cannot get along without warmth and moisture. The latter is so far requisite, indeed, that in certain desert regions, as in Arizona, where the climate is

(e) Natural. Your Furs?

very hot, nothing decays. Animals that perish simply dry up and turn into mummies.

In some moist regions there is a disease of rye bread that is very dangerous to human beings. A rust fungus, or mildew, known to science as Fusarium roseum, grows on grain in fields, and when it is made into bread the latter is poisonous. There are districts in Russia where this bread disease, popularly known as "drunken bread," appears every year, though it is worst in rainy seasons. People who eat the bread are attacked a few hours later by violent headaches, giddiness, vomiting and usually more or less disturbance of vision, the symptoms lasting perhaps for several days and often terminating in death.

One of the worst bread diseases is "ropy bread," called, which is the most common. It is caused by a bacterium, the Bacillus panis (literally translated, "bread bacterium," which originates in the flour. Unlike all other species of microbes that occur in dough, this bacterium is able to withstand the heat of the oven. Thus, in the baked loaf, it quickly pervades the entire body of the crumb. As soon as it comes to the surface, it forms threadlike strings, and the crumb attacked by it becomes so elastic that a finger is pressed into it and withdrawn, the substance of the bread is pulled out in long filaments.

Bread attacked by this disease has a smell so disagreeable as to be positively stifling, the odor somewhat resembling that of rotting rye. Its flavor is most disagreeable. When eaten, it produces violent diarrhoea. Until recently the cause of the trouble was a mystery; but the bacillus, at length identified, was finally traced to the bran husks. It is especially likely to develop the ropy disease. It is recommended that, when making bread, the entire crust of flour on hand, whether in household or bakery, be carefully examined, the spread portions, which is easily recognized, being thrown away.

THE BLEEDING HOST.  
During the Middle Ages great religious enthusiasm was aroused by the appearance of a phenomenon, attributed to miracle, commonly spoken of as the Bleeding Host. These visions of its verity, and a suspicion of fraud would have been entirely unjust. The consecrated bread was broken up and portions were given to the faithful in a white cloth spotted and streaked with what looked like blood. It was declared to be blood, and many flocked in multitudes to witness the marvel, incidentally paying for privilege.

Nevertheless, as is now known, the stains on the bread were not those of blood at all, but were due to the presence of certain micro-organisms, which, feeding on the crumb, secreted a red, sticky material, called a rosy milk, that made the bread unpalatable and dangerous to eat.

Both butter and cheese are subject to disease, due, however, to microbes on the food material, give them a bad smell and flavor. Such products as butter and cheese, when made, are often attacked and spoiled by moulds. It is to keep out such germs that a thin coat of paraffin is applied to the surface of the butter. In the case of cheese, the cheese is covered with a thin layer of paraffin. If they get at the contents, they will not only make them unpalatable to the eye, but will destroy their flavor. It is, therefore, to keep preserves, also butter and cheese, in a dry and cool place, where micro-organisms are least plentiful.

Said to be the key-note of good form at all times. Undoubtedly at all times the key-note of cold storage for furs. When the summer months came the original wearers of your furs went to colder climates. It was natural. For the same cost as you would pay for a service which amounts to nothing, you can have your furhanded in the natural way, subject to your occasional personal inspection and always at your disposal for temporary use. Phone Main 1024.

The New Brunswick Cold Storage Co. LIMITED

minutes in boiling water for three minutes, and to fill the large cans with boiling water for the same length of time. This means that the milk is, of course, carefully scalded for the purpose of killing the bacteria which may be in it. It is well to remember that in every domestic establishment.

DANGER IN CANNED FRUITS.  
Canned foods are likewise subject to disease. The filled cans, after being sealed, are subjected to high heat, in order to kill any germs they may contain; but if a few microbes remain, they are likely to multiply in great numbers, feeding on the food substance, and incidentally developing a gas that causes the cans to bulge, a most undesirable and dangerous symptom.

When it comes to fruits, it is a fact obvious enough that they are particularly liable to disease. In the ordinary course of nature an apple or a banana ought to dry up, and not decay. Now and then this is what does actually happen; but in most instances bacteria or fungus germs attack them, obtaining entrance through breaks in the skin, and, feeding on the vegetable tissue, cause rot. This so-called "rot" of apples, which gives them an extremely bitter taste, is attributable to a fungus. One important reason for spraying trees in the orchard with germicidal solutions is to prevent the development of such microbes. Often they attack fruits while the latter are still unripe and hanging on trees.

Friday Night's Events SHOULD BE INTERESTING  
The Mohawks All St. John sports in the Queen's Park on Friday evening are attracting great attention among local athletes. The entry list is already large and the help of a programme of events has been arranged.
