Technical and Bibliographic Notes/Notes techniques et bibliographiques

The Institute has attempted to obtain the best original copy available for filming. Features of this copy which may be bibliographically unique, which may alter any of the images in the reproduction, or which may significantly change the usual method of filming, are checked below.

- Coloured covers/
Couverture de couleur
- Covers damaged/
Couverture endommagée
- Covers restored and/or laminated/
Couverture restaurée et/ou pelliculée
- Cover title missing/
Le titre de couverture manque
- Coloured maps/
Cartes géographiques en couleur
- Coloured ink (i.e. other than blue or black)/
Encre de couleur (i.e. autre que bleue ou noire)
- Coloured plates and/or illustrations/
Planches et/ou illustrations en couleur
- Bound with other material/
Relié avec d'autres documents
- Tight binding may cause shadows or distortion
along interior margin/
La reliure serrée peut causer de l'ombre ou de la
distortion le long de la marge intérieure
- Blank leaves added during restoration may
appear within the text. Whenever possible, these
have been omitted from filming/
Il se peut que certaines pages blanches ajoutées
lors d'une restauration apparaissent dans le texte,
mais, lorsque cela était possible, ces pages n'ont
pas été filmées.
- Additional comments:/
Commentaires supplémentaires:

L'Institut a microfilmé le meilleur exemplaire qu'il lui a été possible de se procurer. Les détails de cet exemplaire qui sont peut-être uniques du point de vue bibliographique, qui peuvent modifier une image reproduite, ou qui peuvent exiger une modification dans la méthode normale de filmage sont indiqués ci-dessous.

- Coloured pages/
Pages de couleur
- Pages damaged/
Pages endommagées
- Pages restored and/or laminated/
Pages restaurées et/ou pelliculées
- Pages discoloured, stained or foxed/
Pages décolorées, tachetées ou piquées
- Pages detached/

12X 16X 20X 24X 28X 32X

The copy filmed here has been reproduced thanks to the generosity of:

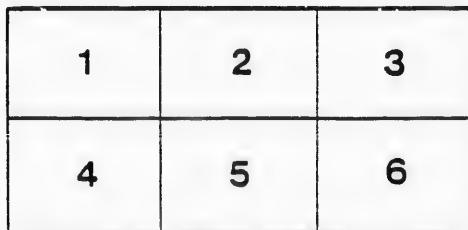

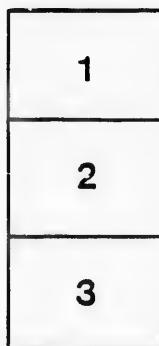

Library,
Geological Survey of Canada

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last page with a printed or illustrated impression, or the back cover when appropriate. All other original copies are filmed beginning on the first page with a printed or illustrated impression, and ending on the last page with a printed or illustrated impression.

The last recorded frame on each microfiche shall contain the symbol ➤ (meaning "CONTINUED"), or the symbol ▽ (meaning "END"), whichever applies.

Maps, plates, charts, etc., may be filmed at different reduction ratios. Those too large to be entirely included in one exposure are filmed beginning in the upper left hand corner, left to right and top to bottom, as many frames as required. The following diagrams illustrate the method:

L'exemplaire filmé fut reproduit grâce à la générosité de:

Bibliothèque,
Commission Géologique du Canada

Les images suivantes ont été reproduites avec la plus grande soin, compte tenu de la condition et de la netteté de l'exemplaire filmé, et en conformité avec les conditions du contrat de filmage.

Les exemplaires originaux dont la couverture en papier est imprimée sont filmés en commençant par le premier plat et en terminant soit par la dernière page qui comporte une empreinte d'impression ou d'illustration, soit par la seconde plat, selon le cas. Tous les autres exemplaires originaux sont filmés en commençant par la première page qui comporte une empreinte d'impression ou d'illustration et en terminant par la dernière page qui comporte une telle empreinte.

Un des symboles suivants apparaîtra sur la dernière image de chaque microtchâche, selon le cas: le symbole ➤ signifie "A SUIVRE", le symbole ▽ signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être filmés à des taux de réduction différents. Lorsque le document est trop grand pour être reproduit en un seul cliché, il est filmé à partir de l'angle supérieur gauche, de gauche à droite, et de haut en bas, en prenant le nombre d'images nécessaire. Les diagrammes suivants illustrent la méthode.

OF

METEOROLOGICAL OBSERVATIONS

MADE ON THE

ISLAND OF ST. HELEN,

IN THE RIVER ST. LAWRENCE, OPPOSITE THE CITY OF MONTREAL,

PROVINCE OF CANADA,

Situate in 45° 30' N. Lat., and 73° 22' W. Longitude, in the years 1832-40, and 1843-41.

FOR THE

NATURAL HISTORY SOCIETY OF MONTREAL,

BY THE MILITARY GUARD THERE STATIONED,

UNDER THE SUPERINTENDANCE AND DIRECTION OF

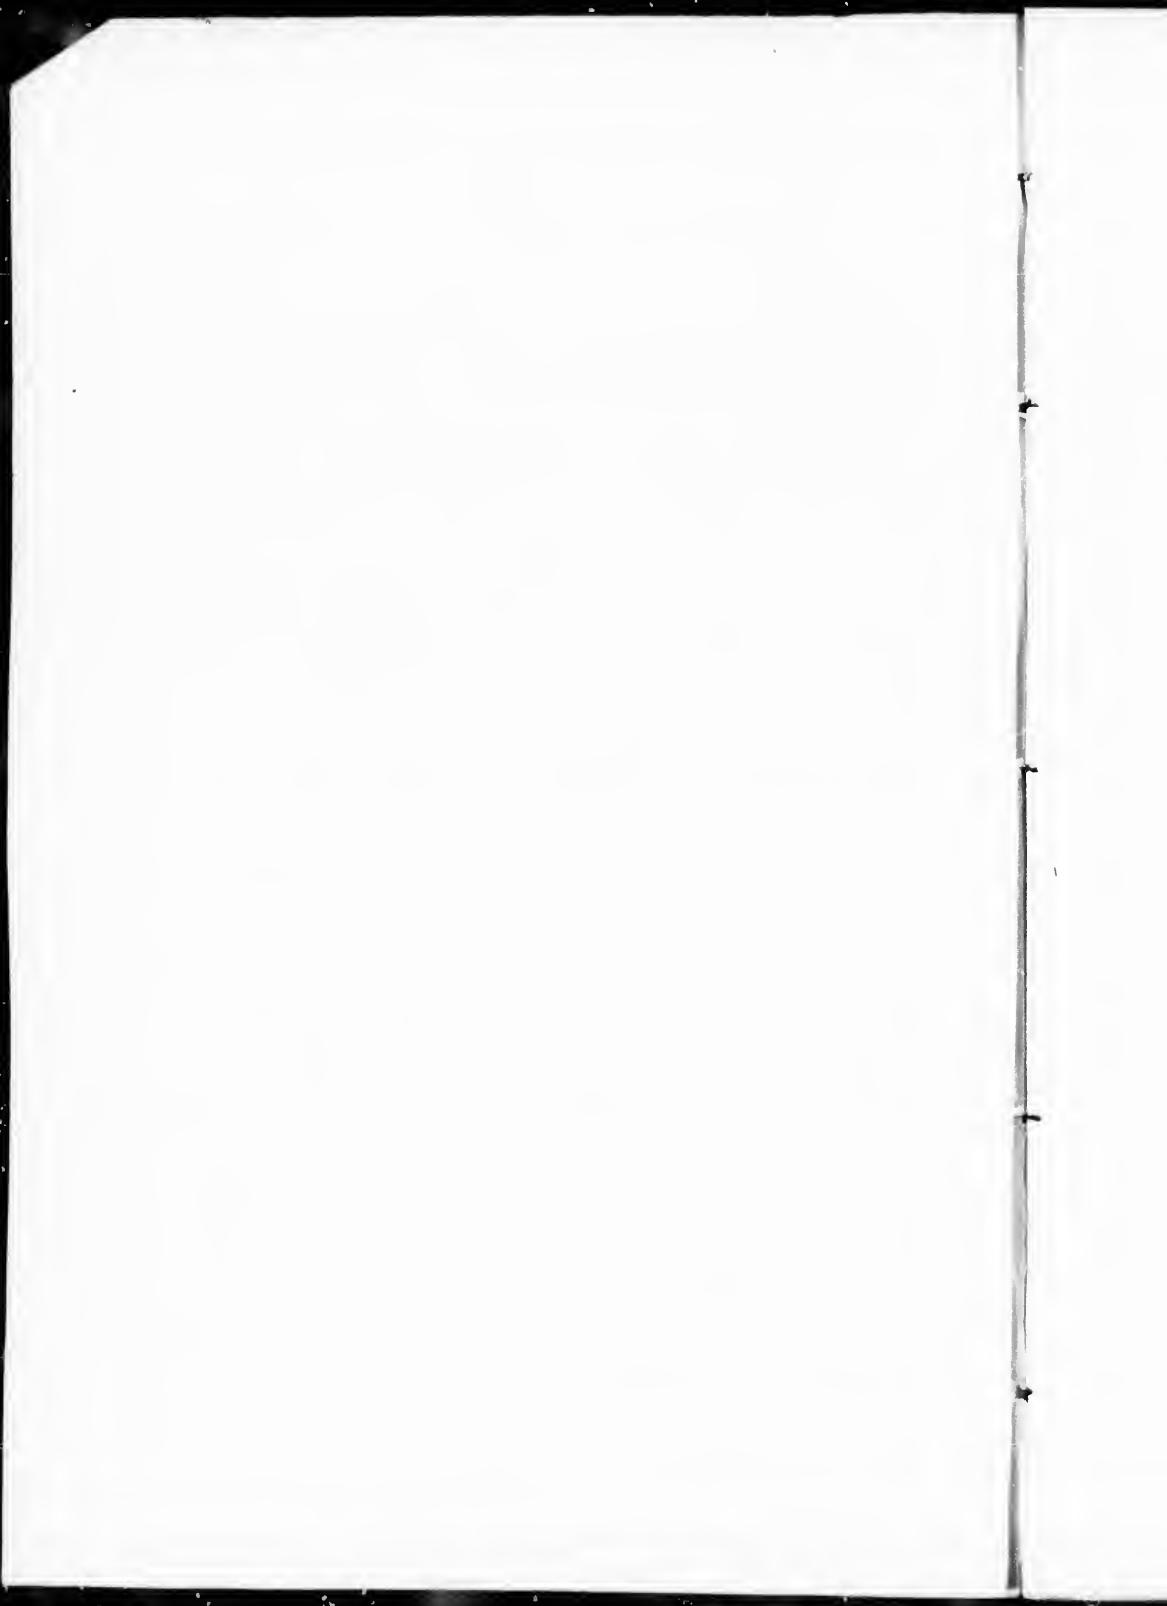

JOHN S. McCORD,

Associate Member of the London Meteorological Society, Member of the Natural History Society of Montreal, Corresponding Member of the Literary and Historical Society of Quebec, and of the Albany Institute, State of New York.

MONTREAL:

PRINTED FOR THE NATURAL HISTORY SOCIETY, BY JOHN LOVELL;

1842.

R E P O R T.

THE valuable results obtained from the Hourly Meteorological observations made in the years 1824 and 1825 at Leith, and subsequently at Plymouth, by W. S. Harris, Esq. F. R. S. &c. for the purpose of determining the laws of diurnal variation of temperature, induced me as far back as 1836, to apply on behalf of this Society to the then Commander of the Forces in Canada, His Excellency Sir John Colborne, (now Lord Seaton,) for the co-operation of the Military Guard stationed at the Island of St. Helen, opposite this city, to carry into effect a series of observations similar to those executed in Britain. With that readiness which ever distinguished His Excellency, where any public benefit was to be conferred, the requisite general order was immediately obtained, but the unfortunate troubles which broke out in 1837 and 1838, put an end for some time to the peaceful arts—and it was not therefore till July, 1839, that I was enabled to commence the present series of observations.

The general order obtained, directed the recording of *hourly* observations, but upon enquiry I found that as the relief of sentinels took place at every *second* hour, I should be compelled to trust the accuracy of the intermediate observation to the attention and punctuality of the non-commissioned officer of the guard, (a person daily changing,) without any check upon him. I therefore preferred limiting my observations to every second hour, with the certainty of these being regularly and punctually executed, rather than

require *hourly* observations, the faithfulness of which I might not be able so surely to rely on.

The first series of these observations was consequently made at the *even* hours by day and night, from the first day of August, 1839, to the thirty-first day of July, 1840. The Commanding Officer of the Royal Artillery in the Canadas, Colonel Campbell, most kindly placed at my disposal, the services of Corporal (now Serjeant) Tweedale, of that corps, to superintend the due execution of the work by the guard daily mounted. Serjeant Tweedale I found an efficient assistant, having had some experience in meteorological observations when stationed at Halifax, Nova Scotia.

For the position of my instrument, and its protection from reflected heat, &c. I selected the northern angle of the rampart surrounding the barracks at the Island of St. Helen, a spot I consider well adapted for these purposes, freely exposed to the north, and about sixty feet above the St. Lawrence, and overhanging the same. The thermometer is suspended in a cage or screen, built precisely after the one described by Mr. Harris in the Fifth Report of the British Association, placed on a single vertical pillar, in every respect conformable to that gentleman's instructions. The instrument used is one long in my possession, and carefully compared with good instruments, made by Messrs. Newman, of London, and Adie & Son, of Edinburgh, the accuracy of its graduation, especially below the zero point (Fahrenheit's scale) I can depend upon. The non-commissioned officers in command of the reliefs, enter the observations in a form prepared by me, and to them every acknowledgment is due for the care and attention bestowed upon this duty.

At the expiration of the first year of these observations, by the kindness of General Clitherow, commanding in the District of Montreal, I obtained an order that the observations for the ensuing year should be recorded at the *odd hours*, or 1, 3, 5, &c. so that now at the expiration of the second year, a complete series of hourly observations has been obtained.

When these observations were commenced, I was not aware of

the contemplated establishment of an observatory at Toronto, for the purpose of recording meteorological as well as magnetic phenomena—for in that case it might have been deemed presumption to attempt, with the means at my command, a similar undertaking, although limited to meteorology, but as the present observations were undertaken previously, and as it was found their accuracy could be depended upon, I determined to continue them, if only for the purpose of comparison, particularly as that comparison would be rendered additionally useful by the distance between the places of observation, (nearly 400 miles.)

The plan adopted in the following Tables, is the same as that of Mr. Snow Harris in his able paper, published in the Fifth Report of the Transactions of the British Association, and I have as closely as possible adhered to that gentleman's instructions throughout.

The divisions of the year into quarterly periods of Spring, Summer, Autumn and Winter, as used in Britain, cannot be strictly applied to this latitude in America. In that part of the Province of Canada, hitherto known as Lower Canada, we have, truly speaking, no Spring, and but few weeks of Autumn; in the former, the transition from snow to the intense heat of summer is almost instantaneous, and from the latter to the winter's frost, we have only a short interval of two or three weeks, and again all is winter. The quarterly division therefore, used by Mr. Harris, and adopted by me, is, with regard to this country, purely arbitrary, and useful only for the purpose of comparison with the tables made in England.

The same may be said of the divisions of summer and winter, here we have actually above seven months of winter, and less than five months of summer, but for the above mentioned reason I have followed the same subdivision of the year.

When I commenced the present task, the only observations of a similar nature undertaken in America, that I was acquainted with, were those instituted in the year 1835-'6 at Frankford arsenal, Pennsylvania, by Captain Mordicai, of the U. S. Ordnance Department, and published in the Journal of the Franklin Institute, and from the great care and attention bestowed by that gentleman in

these observations, it is only to be regretted that they were not continued beyond the first twelve months.

It will be seen in the results obtained by me, that the scale of diurnal variation of temperature, in Table XIV. for the pairs of hours, in this latitude, (with one exception which will be noticed,) corresponds perfectly with that obtained by Captain Mordecai, allowing for the difference of mean-temperature of the two places of observation.

The recent resolution of this Society to continue these observations, adding thereto a record of the Barometer, will add greatly to their interest and enable me to verify and correct, if necessary, the results now attained.

The labour thrown away, even in this Colony, in compiling Meteorological Tables, is almost incredible, from the want of system and concert in the times and manner of observation, no two observers among the mass of tables submitted to me having recorded at similar hours. In future this need not be the case, the observer may select any hour or pair of hours of the twenty-four which may suit his personal convenience, and by applying the correction set forth in the Tables XIII or XIV, obtain the true mean-temperature of the year at the place of observation.

TABLE I.—Daily and Monthly Mean Temperature from 1st August 1839,
to 31st July 1840, recorded at the even hours.

Day	1839.					1840.

	Temperature	46.19	47.15	45.67	42.98	40.90	39.22
	Deviation	+4.97	+5.93	+4.45	+1.76	-0.32	-2.00

TABLE XII. Shewing the relation of the Mean Temperature of every similar pair of alternate odd hours, to that of the whole day, or Mean Annual Temperature for 1840-41.

A. M. & P. M.	1	3	5	7	9	11
Temperature	42.06	42.07	40.93	40.33	40.56	41.31
Deviation	+1.84	+0.85	-0.29	-0.89	-0.66	+0.09

TABLE XIII. Shewing the corrections to be made for each hourly observation taken from Tables IX and XI.

Hour	1	2	3	4	5	6
Correction	-3.28	-4.22	-4.23	-4.99	-5.03	-4.52
A. M.						
Hour	7	8	9	10	11	12
Correction	-3.51	-2.26	-1.00	+0.91	+2.19	+4.28

Hour	1	2	3	4	5	6
Correction	+4.97	+5.99	+5.93	+5.63	+4.45	+3.18
P. M.						
Hour	7	8	9	10	11	12
Correction	+1.76	+0.62	-0.32	-1.32	-2.00	-2.87

From this table it will be seen that the mean annual temperature of any hour never differs more than about six degrees from the mean annual temperature of the twenty four hours. Thus the mean temperature for Montreal, may be attained from a register made at only one hour of the day, applying the correction in the table, observing its sign. Thus if the observed mean temperature of 10 A. M., taken from the observations of the whole year was 43.94, then the mean temperature of the whole twenty-four hours, for the year would be 43.94-0.91 since the mean temperature of 10 A. M. exceeds the mean temperature of the twenty-four hours, by 0.91; that is, in applying the respective corrections the signs are to be reversed.

TABLE XIV. Shewing the corrections for each pair of hours of the twenty-four, from Table X and XII.

Hour A. M. & P. M.	1	2	3	4	5	6
Correction	+1.84	+0.88	+0.85	+0.32	-0.29	-0.67
Hour A. M. & P. M.	7	8	9	10	11	12
Correction	-0.89	-0.82	-0.66	-0.21	+0.09	+0.70

From table XIV. it will appear that the greatest deviation of any similar pair of hours from the mean of the twenty-four, or mean annual temperature is less than two degrees. That the mean temperature of the six pair of hours from eleven to four inclusive, exceeds the mean temperature of the year, the greatest difference being 1.84, and the mean temperature of the six pair, from five to ten inclusive, is less than the mean temperature of the year, the greatest difference being 0.89.

From all the above results it appears that in the observations made at the odd hours, the mean of observations made at 5 A. M. and 5 P. M., and 11 A. M. and 11 P. M. approached nearest the mean temperature of the 24 hours; and that of those made at the even hours, the mean of 4 A. M. and 4 P. M., and 10 A. M. and 10 P. M. approach nearest.

Notwithstanding the close approximation of the observations made at 11 and 11, (as shewn by table XIV to the mean of the twenty-four hours, I am inclined to believe that 10 A. M. and 10 P. M. are the best hours of observation; and in this I am borne out by the results obtained at the observatory at Toronto (Canada West) where the even hours only are recorded, with which I have been most obligingly furnished since this report was in press by Lieut. Younghusband, R. A.

TABLE XV. Extracted from the results obtained at the observatory at Toronto, shewing the relation of the mean temperature of every similar pair of alternate even hours, to that of the whole day, or mean annual temperature, from 1st August, 1840, to 31st July, 1841.

A. M. & P. M.	2	4	6	8	10	12
Temperature	44.32	43.93	42.96	42.83	43.70	44.16
Deviation	+0.66	+0.27	-0.70	-0.83	+0.04	+0.50

On comparing this table with table X it will be seen how closely correspond the results attained at the two stations. The observations made at St. Helen during the current year are recorded at the odd hours, their results will determine the question of the merits of the observations at 11.

In conclusion, the mean temperature in this latitude may be *very closely* determined by two observations in the day, made throughout the year, at 4 A. M., and 4 P. M., or at 10 A. M. and 10 P. M.; or more accurately at those, or any other similar pair of hours by attending to the corrections in the manner laid down in the remarks following Table XIII. attention being paid to the respective signs.

Although in no manner affecting the correctness of the results obtained in the foregoing observations, it is nevertheless to be regretted that the mean temperature of the years '39-'40, and '40-'41 should have differed nearly 2 degrees (1-81) owing to the spring of 1841 being so much colder than that of the preceding year.

Montreal, 1842.

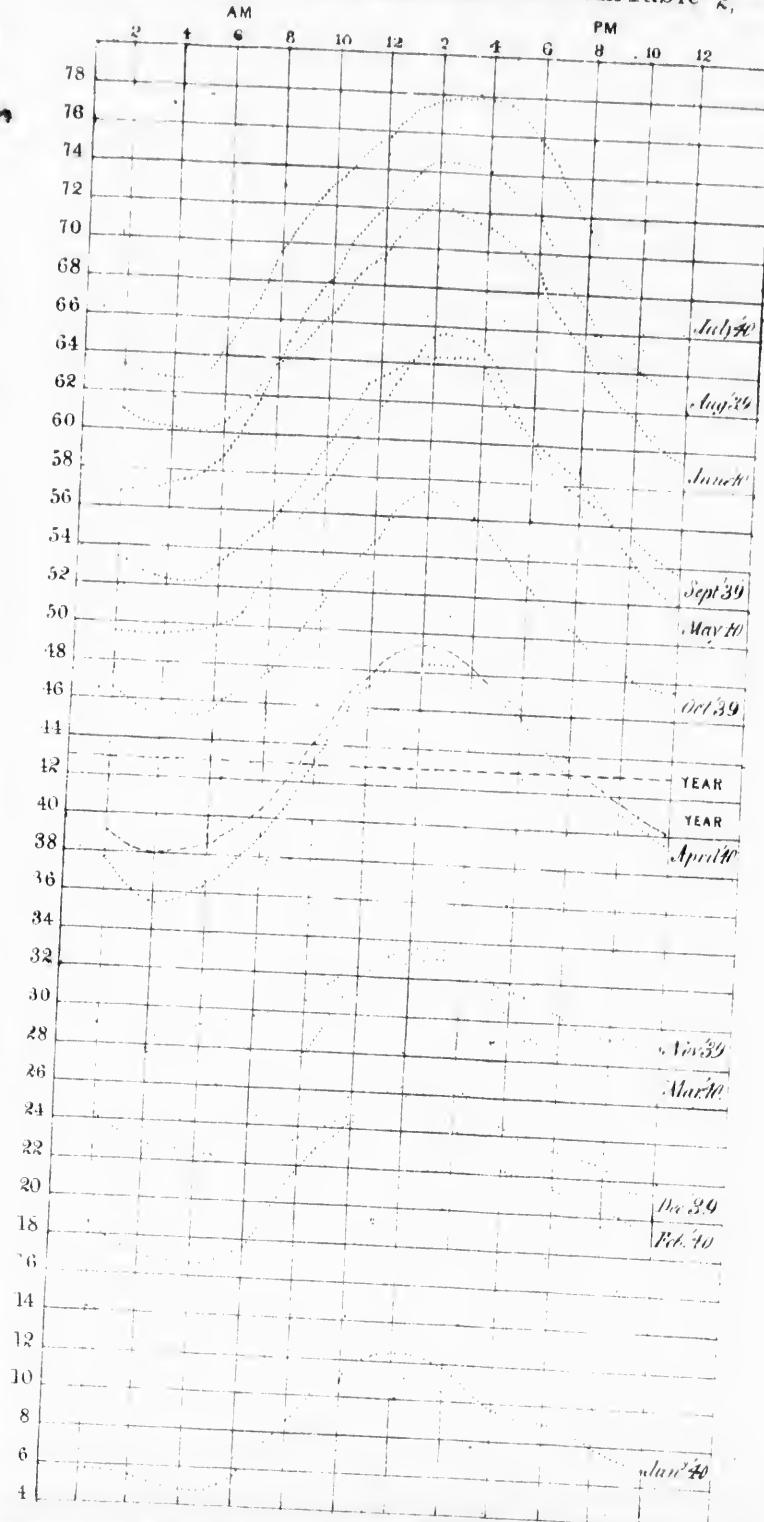

Results deducible from the foregoing Tables for the year beginning 1st August, 1839, ending 31st July, 1840.

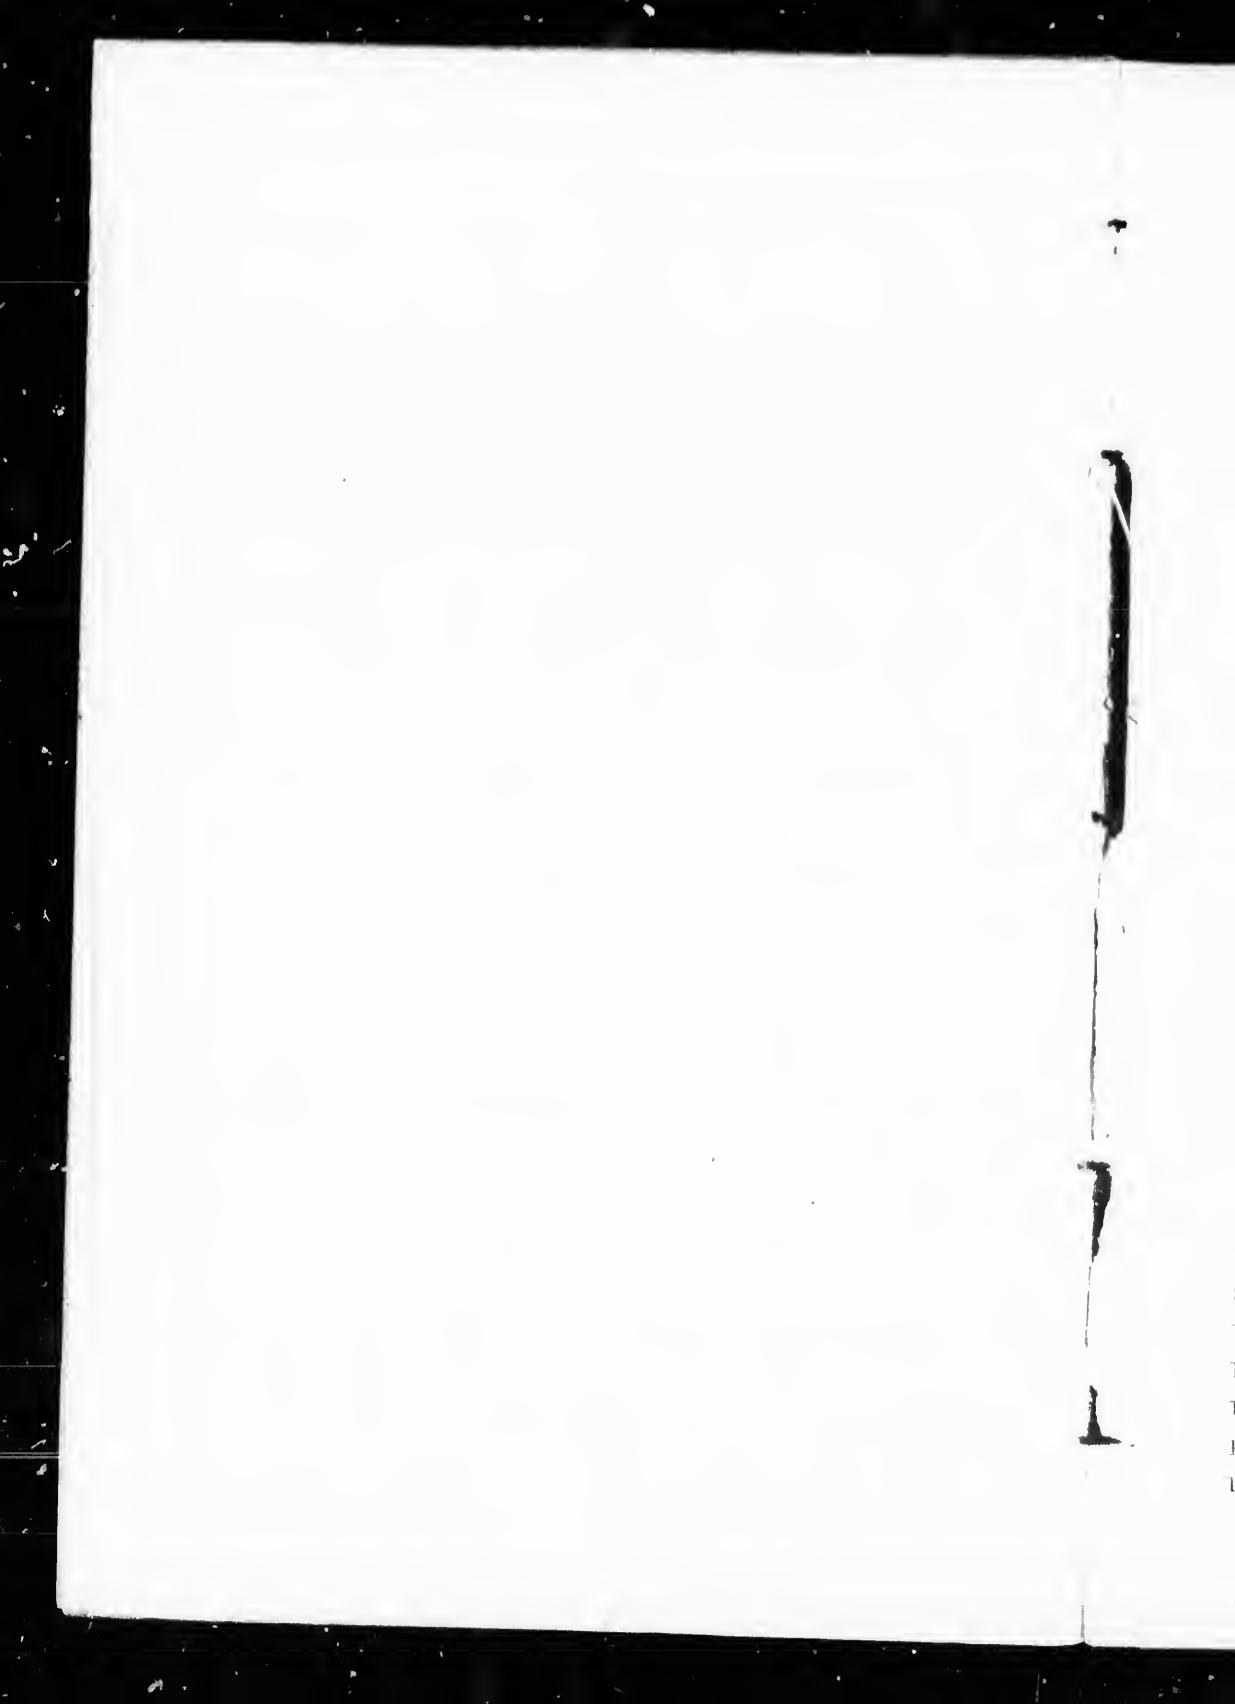

Maximum 91.5 took place on 16th July, 1840, at 2 p. m.	
Minimum -18 do 16th January, 1840, at 8 A. M.	
Mean temperature of 10 days about the summer solstice, viz. from June 15 to June 25, inclusive, 1840.	{ 63.44
