CIHM/ICMH Collection de microfiches.

Canadian Institute for Historical Microreproductions / Institut canadien de microreproductions historiques

## Technical and Bibliographic Notes/Notes techniques et bibliographiques

The Institute has attempted to obtain the best original copy available for filming. Features of this copy which may be bibliographically unique, which may alter any of the images in the reproduction, or which may significantly change the usual method of filming, are checked below. L'Institut a microfilmé le meilleur exemplaire qu'il lui a été possible de se procurer. Les détails de cet exemplaire qui sont peut-être uniques du point de vue bibliographique, qui peuvent modifier une image reproduite, ou qui peuvent exiger une modification dans la méthode normale de filmage sont indiqués ci-dessous.

rrata o

pelure, nà The copy filmad here has been reproduced thanks to the ganarosity of:

D. B. Weldon Library University of Western Ontario (Regional History Room)

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last paga with a printed or illustratad impression, or the back cover when appropriete. All other original copies are filmed beginning on the first page with e printed or illustreted impression, and ending on the last page with a printed or illustrated imprassion.

The last recorded frame on eech microfiche shall contain the symbol → (meaning "CON-TINUED"), or the symbol ▼ (meaning "END"), whichever applias.

Meps, plates, charts, etc., may be filmed at different reduction ratios. Those too large to be entirely included in one exposure are filmed beginning in the upper left nand corner, left to right and top to bottom, as many frames as required. The following diagrams illustrate the method:

1	2	3

L'examplaire filmé fut reproduit grâce à la générosité de:

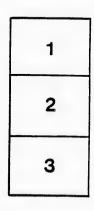

D. B. Weldon Library University of Western Ontario (Regional History Room)

Les images suivantes ont été reproduitas avec le plus grand soin, compta tanu de la condition at de la netteté de l'exemplaira filmé, et an conformité avec les conditions du contrat de filmage.

Les exemplaires originaux dont la couverture an papier est imprimée sont filmés en commençant par le premier plat et an tarminent soit par la dernière pege qui comporte une amprainte d'Impression ou d'Illustration, soit par le sacond plat, selon le cas. Tous les autres exemplaires originaux sont filmés en commençant par la pramière page qui comporta une empreinta d'Impression ou d'Illustretion at en tarminent par la dernière pege qui comporte une talle empreinta.

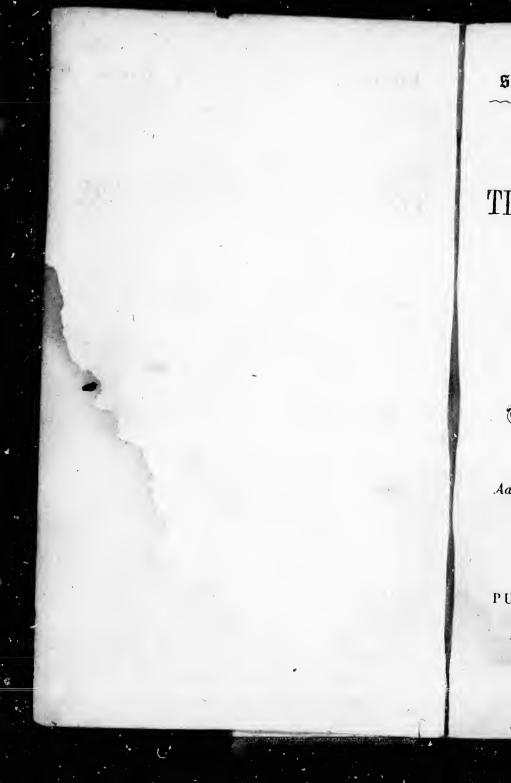

Un des symboles suivents apperaîtra sur la dernière image de chequa microfiche, selon le cas: le symbole  $\longrightarrow$  signifie "A SUIVRE", la symbole  $\nabla$  signifie "FIN".

Las cartes, planchas, tablaeux, etc., peuvent être filmés à des taux de réduction différants. Lorsque le document est trop grand pour être reproduit en un seul cliché, il ast filmé à partir de l'angle supérieur gaucha, de gauche à droita, et de haut en bes, an pranant le nombre d'imeges nécessaire. Las diagrammes suivants illustrent la méthode.

# TREATISE ON ARITHMETIC,

IN

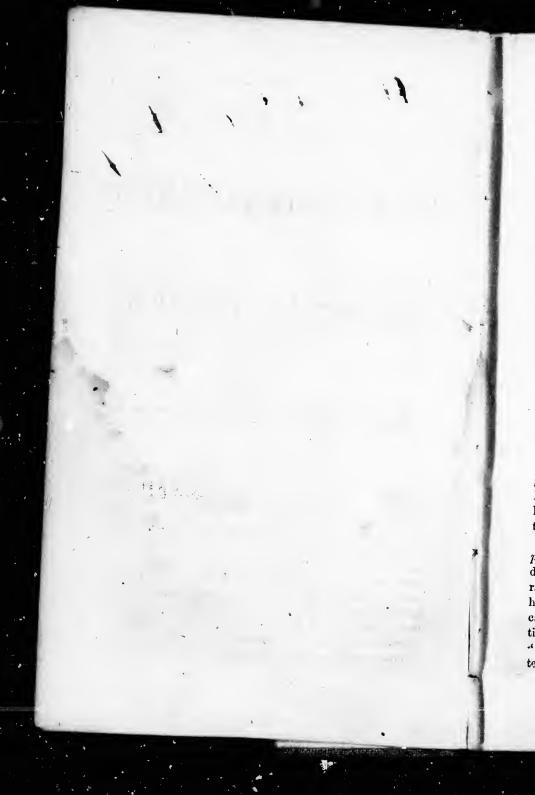

# THEORY AND PRACIICE.

FOR

The Use of Schools.

Aathorized by the Council of Public Instruction for Upper Canada.

TORONTO: PUBLISHED BY ROBERT MCPHAIL, 65, King Street East. 1860.

PREFACE

Abount Hope

Sect

Is the present edition a vast number of exercises have been added, that no rule, however trifing, might be left without so many illustrations as should serve to make it sufficiently familiar to the pupil. And when it was feared that the application of any rule to a particular class of eases might not at once suggest itself, some question ealeulated to remove, or diminish the difficulty has been introduced among the examples.

A considerable space is devoted to the "nature of num bers," and "the principles of notation and numeration:" for the teacher may rest assured, that the facility, and even the success, with which subsequent parts of his instructior. will be sonveyed to the mind of the learner, depends, in a great degree, upon an adequate acquaintance with them. Hence, to proceed without securing a perfect and practical knowledge of this part of the subject, is to retard, rather than to accelerate improvement.

The pupil, from the very commencement, must be made perfectly familiar with the terms and signs which are introduced. Of the great utility of technical language (accurately understood) it is almost superfluous to say anything here: we cannot, however, forbear, upon this oceasion, recalling to remembrance what is so admirably and so effectively inculcated in the "Easy Lessons on Reasoning." "Even in the common mechanical arts, something of a technical language is found needful for those who are learning or exercising them. It would be a very great in convenience, even to a common carpenter, not to have a precise, well understood name for each of the several operations he performs, such as chiselling, sawing, planing, &c., and for the several tools [or instruments] he works with. And if we had not such words as addition, subtraction, multiplication, division, &c., employed in an exactly defined sense, and also fixed rules for conducting these and other arithmetical processes, it would be a tedious and uncertain work to go through even such simple calculations as a child very soon learns to perform with perfect case. And after all there would be a fresh difficulty in making other persons understand clearly the correctness of the calculations made.

"You are to observe, however, that technical language and rules, if you would make them really useful, must be not only distinctly understood, but also learned and remembered as familiarly as the alphabet, and employed constantly, and with scruppious exactness; otherwise, technical language will prove an encumbrance instead of an advantage, just as a suit of clothes would be if, instead of putting them on and wearing them, you, were to carry them about in your hand." Page 11.

What is said of *technical language* is, at least, equally true of the signs and characters by which we still further facilitate the conveyance of our ideas on such matters as form the subject of the present work. It is much more simple to put down a character which expresses a process, than to write the name, or description of the latter, in *full*. Besides, in glancing over a mathematical investigation, the mind is able, with greater ease, to connect, and understand its different portions when they are briefly expressed by familiar signs, than when they are indicated by words which havo nothing particularly calculated to *catch the eye*, and which cannot even be clearly understood without considerable attention. But it must be borne in mind, that, while such a treatise as the present, will seem easy and intelligible

### PREFACE

enough if the signs, which it contains in almost every page, are as familiar as they should bc, it must necessarily appear more or less obscure to those who have not been habituated to the use of them. They are, however, so few and so simple, that there is no excuse for their not being perfectly understood—particularly by the teacher of arithmetic.

Should peculiar circumstances render a different arrangement of the rules preferable, or make the omission of any of them, for the present at least, advisable, the judicious master will never be at loss now to act-there may be instances in which the shortness of the time, or the limited intelligence of the pupil, will render it necessary to confine his instruction to the more important branches. The teacher should, if possible, make it an inviolable rule to receive no answer unless accompanied by its explanation, and its reason. The references which have been subjoined to the different questions, and which indicate the paragraphs where the answers are chiefly to be obtained, and also those references which are scattered through the work, will, be found of considerable assistance; for, as the most intelligent pupil will occasionally forget something he has learned, he may not at once see that a certain principle is applicable to a particular case, nor even remember where he has seen it explained.

Decimals have been treated of at the same time as integers, because, since both of them follow precisely the same laws, when the rules relating to integers are fully understood, there is nothing new to be learned on the subject—particularly if what has been said with reference to numeration and notation is earefully borne in mind. Should it, however, in any case, be preferred, what relates to them can be omitted until the learner shall have made some further advance.

The most useful portions of *mental arithmetic* have been introduced into "Practice" and the other rules with which they seemed more immediately connected.

The different rules should be very carefully impressed on the mind of the learner, and when he is found to have been

reat in have a loperang, &c., s with. raction, defined l other eertain a child d after er perlations

be not be not ered as /, and ge will t as a on and iand."

### PREFACE.

guilty of any inaccuracy, he should be made to correct him self by repeating each part of the appropriate rule, and exemplifying it, until he perceives his error. It should be continually kept in view that, in a work on such a subject as arithmetic, any portion must seem difficult and obscure without a knowledge of what precedes it.

The table of logarithms and article on the subject, also the table of squares and cubes, square roots and cube roots of numbers, which have been introduced at the end of the work, will, it is expected, prove very acceptable to the more advanced arithmetician.

## PART I.

## TABLES.

## MULTIPLICATION TABLE.

1		are 4 1 a - 8 2 -	$\begin{array}{c ccccccccccccccccccccccccccccccccccc$	imes     7 times       re     6     1 are       7     12     2       12     2     14       18     3     21       -24     4     28       -30     5     35       -36     6     42       -42     7     49       -48     8     56       -54     9     63       -60     10     70
$\begin{array}{c ccccccccccccccccccccccccccccccccccc$	$\begin{array}{c c c c c c c c c c c c c c c c c c c $	$\begin{array}{c c c c c c c c c c c c c c c c c c c $	$ \begin{array}{c ccccccccccccccccccccccccccccccccccc$	$\begin{array}{c c c c c c c c c c c c c c c c c c c $

It appears from this table, that the multiplication of the same two numbers, in whatever order taken, produces the

## SIGNS USED IN THIS TREATISE.

+ the sign of addition; as 5+7, or 5 to be addee to 7.

- the sign of subtraction; as 4-3, or 3 to be subtracted from 4.

 $\times$  the sign of multiplication; as  $8 \times 9$ , or 8 to be multiplied by 9.

 $\div$  the sign of division ; as  $18 \div 6$ , or 18 to be divided by 6.

- the vinculum, which is used to show that all the quantities united by it are to be considered as but Thus  $\overline{4+3-7\times 6}$  means 4 to be added to 3, 7 one. to be taken from the sum, and 6 to be multiplied into the remainder-the latter is equivalent to the whole quantity under the vinculum.

= the sign of equality; as 5+6=11, or 5 added to 6, is equal to 11.

 $\frac{3}{4} > \frac{1}{2}$ , and  $\frac{2}{3} < \frac{3}{5}$ , mean that  $\frac{3}{4}$  is greater than  $\frac{1}{4}$ , and that  $\frac{2}{3}$  is less than  $\frac{8}{9}$ .

: is the sign of ratio or relation; thus 5:6, means the ratio of 5 to 6, and is read 5 is to 6.

:: indicates the equality of ratios; thus, 5:6::7:8, means that there is the same relation between 5 and 6 as between 7 and 8; and is read 5 is to 6 as 7 is to 8.

 $\checkmark$  the radical sign. By itself, it is the sign of the square root; as  $\sqrt{5}$ , which is the same as  $5^{\frac{1}{2}}$ , the square root of 5.  $\sqrt[3]{6}$ , is the cube root of 3, or  $3^{\frac{1}{2}}$ .  $\sqrt[3]{4}$ , is the 7th root of 4, or 4<sup>†</sup>, &c.

EXAMPLE.  $\sqrt{8-3}$   $+7 \times 4 \div 6 + 31 \times \sqrt[3]{9} \div 10^{\frac{1}{2}} \times 5^{\frac{3}{2}} =$ 641.31, &c. may be read thus: take 3 from 8, add 7 to the difference, multiply the sum by 4, divide the product by 6 take the square root of the quotient and to it add 31, then multiply the sum by the cube root of 9, divide the product by the square root of 10, multiply the quotient by the square of 5, and the produce will be equal to 641.31, &c.

These signs are fully explained in their proper places.

1	1234567890	tin	- 1 - 2 - 3 - 4 - 4 - 5 - 6 - 7 - 7	7418529330
11 112345678901	2 2 t	- 1	77 84 12 24 36 48 60 72 84 96 08 20 32	

ion of tha duces the

#### MULTIPLICATION TABLE.

same result; thus i times 6, and 6 times 5 are 30:—the reason will be explained when we treat of multiplication. There are, therefore, several repetitions, which, although many persons conceive them unnecessary, are not, perhaps, quite unprofitable. The following is free from such an objection :—

Twice 2 are	4 5 times 7 are 85 6 , 8 - 40 8 , 9 - 45	10 times 8 are 80 ,, 9 - 90 ,, 10 - 100
··· 5	$\begin{array}{c c} 0 \\ 2 \\ 4 \\ 4 \\ 7 \\ 7 \\ -42 \end{array}$	", $11 - 110$ 11 times $2 - 22$
" <u>9 — 1</u>	$\begin{array}{c ccccccccccccccccccccccccccccccccccc$	$\begin{array}{c ccccccccccccccccccccccccccccccccccc$
$\frac{5}{3}, \frac{5}{6}, \frac{-1}{-1}$		$\begin{array}{cccccccccccccccccccccccccccccccccccc$
$\frac{8}{9} = \frac{2}{2}$	4 8 times 8 - 64	12 times $2 - 24$ , $3 - 36$
4 times 4 $-1$ ,, 5 $-2$ ,, 6 $-2$		$\begin{array}{c ccccccccccccccccccccccccccccccccccc$
$   \begin{array}{c}                                     $	2 ,, 3 - 30	$\begin{array}{c ccccccccccccccccccccccccccccccccccc$
5 times 5 $-2$ ,, 6 $-3$	5 ,, 76 - 60	$\begin{array}{c ccccccccccccccccccccccccccccccccccc$

"Ten," or "eleven times," in the above, scarcely requires to be committed to memory; since we perceive, that to multiply a number by 10, we have merely to add a cypher to the right hand side of it:—thus, 10 times 8 are 80; and to multiply it by 11 we have only to set it down twice:—thus, 11 times 2 are 23.

## TABLE OF MONEY.

The following tables are required for reduction, the compound rules, &c., and may be committed to memory as convenience suggests.

#### TABLE OF MONEY.

		smallest coin	genera		this nools.
Country, Farthings	it is represe	ented by .	•	• • • .	4
2.	] . halfpence	• •	. mak	e 1 halfpenny	, <u>1</u>
4 or	2	pence	•	1 penny,	đ.
48	24_ or	12		1 shilling,	8,
960 1,008	480 504	240 or 252 or	20 21	1 pound, 1 guinea,	£ g.

The symbols of pounds, shillings, and pence, are placed over the numbers which express them. Thus, 3 ,, 14 ,, 6, means, three pounds, fourteen shillings, and sixpence. Sometimes only the symbol for pounds is used, and is placed before the whole quantity; thus,  $\pounds 3$ , 14, 6.  $39\frac{1}{3}$  means

three shillings and ninepence halfpenny. 2s. 63d. means two shillings and sixpence three farthings, &c.

When learning the above and following tables, the pupil should be required, at first, to commit to memory only those partions which are over the thick angular lines; thus, in the one just given :- 2 farthings make one halfpenny; 2 halfponce one penny; 12 pence one shilling; 20 shillings one pound; and 21 shillings one guinea.

 $\frac{1}{4}, \frac{1}{2}, \frac{3}{4}$ , really mean the quarter, half, and three quarters of a penny. d. is used as a symbol, because it is the first letter of "denarius," the Latin word signifying a penny; s. was adopted for a similar reason-"solidus," meaning, in the same language, a shilling; and £ also-" Libra," signifying a pound.

#### WEIGHTS.

## AVOIRDUPOISE WEIGHT.

Its name is derived from French—and ultimately from Latin words signifying "to have weight." It is used in weighing heavy articles

16							-	SI	mbole
10	ounces	•	•	•	•	make	1	ounce,	0Z.
256 or	16	pounds	•	•	•		1	pound,	lb.
7,168	448 or	28	÷,	•	•		1	quarter,	q.
28,672	1,792	112 or	quar 4				1	hundred	,cw <b>t.</b>
673,440	14 lbs.,	and in a	80 n	r	ndreds 20 1bs., :	make	11	ton, stone.	t
	20 stone	8	•				1	barrel.	

#### TROY WEIGHT.

It is so called from Troyes, a city in France, where it was first employed; it is used in philosophy, in weighing gold, &c.

Grains				S	mbols.
24	• •	•	minles	1	grs.
	] pennyweights	•	make	1 pennyweight,	wt.
480 or	20			1 ounce,	02.
5,760	240 or	ounces		1 nound	

A grain was originally the weight of a grain of corn, taken from the middle of the ear; a pennyweight, that of the silver penny formerly in use.

## APOTHECARIES WEIGHT.

In mixing medicines, apothecaries use Troy weight, but subdivide it as follows:----

20		•	, •	•	make 1 scrupla,
60 or	seruples 3			•	. 1 dram, 3
480	24 or	drams 8	, · .		1 ounce, 3
5,760	288	96 or	ounces 12		1 pound. 1b.

The "Carat," which is equal to four grains, is used in weighing diamonds. The term carat is also applied in extinations the fineness of gold; the latter, when perfectly

#### MEASURES.

pure, is said to be "24 carats fine." If there are 23 parts gold, and one part some other material, the mixture is said to be "23 carats fine;" if 22 parts out of the 24 are gold, it is "22 carats fine," &c. ;—the whole mass is, in all cases, supposed to be divided into 24 parts, of which the number consisting of gold is specified. Our gold coin is 22 carats fine; pure gold being very soft would too soon wear out. The degree of fineness of gold articles is marked upon them at the Goldsmith's Hall; thus we generally perceive "18" on the eases of gold watches; this indicates that they are "18 carats fine"—the lowest degree of purity which is stamped.

A Troy ounce contains	480
An avoirdupoise ounce	4371
A Troy pound .	5,760
An avoirdupoise pound	 7,000

A Troy pound is equal to 372.965 French grammes.

175 Troy pounds are equal to 144 avoirdupoise; 175 Troy are equal to 192 avoirdupoise ounces.

#### MEASURE3

Three miles make one league.  $69_{15}$  Euglish miles make 60 nautical, or geographical miles; which are equal to one degree, or the three hundred and sixtieth part of the circumference of the globe—as measured on the equator.

4 inches mak 3 inches	te 1 hand (used in measuring horses). 1 palm.
3 palms 18 inches 5 feet	1 span. 1 cubit
6 feet 120 fathoms	1 pace. 1 fathom. 1 cable's length.

100 links, 4 English perches (or poles), 22 yards, 66 feet, or 792 inches, make one chain. Each link, therefore, is ectal to  $7\frac{92}{100}$  inches. 11 Irish are equal to 14 English milet. The Paris foot is equal to 12.792 English inches; the Roman foot to 11.604; and the French metre to 39.383.

## MEASURE OF SURFACES.

A surface is called a square when it has four equal sides and four equal angles. A square inch, therefore, is a surface one inch long and one inch wide; a square foot, a surface one foot long and one foot wide, &c. Square inches

1,296 0	square f	eet	•	•	. nak	e 1 sq. foot.
39,204	2721 01	aq. yard	is	•	•	1 square yard.

#### MEASURES.

#### MEASURE OF SOLIDS.

The teacher will explain that a cube is a solid having six equal square surfaces; and will illustrate this by models or examples—the more familiar the better. A cubic inch is a solid, each of whose six sides or faces is a square inch; a cubic foot a solid cach of whose six sides is a square foot, &c.

Cubic inches 1,728

The pint dry measure contains about  $34\frac{2}{3}$  cubic inches;  $277\frac{1}{4}$  cubic inches was made the standard gallon for both liquid and dry goods, by an Act of Parliament which came into operation in 1826.

Coals are now sold by weight; 140 pounds make one bag; 16 bags one ton.

The following will exemplify the use of the above symbols :--The solar year consists of 365 d. 5 h. 48' 45" 30"; read "three hundred and sixty-five days, five hours, forty-eight minutes. forty-five seconds, and thirty thirds.

The number of days in each of the twelve calendar months will be easily remembered by means of the well known lines, "Thirty days hath September, April, June, and November, February twenty-eight alone And all the rest thirty-one." The following table will enable us to find how many days there are from any day in one month

there are from any day in one month to any day in another.

1

To find by this table the distance between any two days in two different months :

RULE.—Look along that vertical row of figures at the head of which stands the first of the given months; and also along the horizontal row which contains the second; the number of days from any day in the one month to the same day in the other, will be found where these two rows intersect each other. If the given day in the latter month is carlier than that in the former, find by how much, and *subtract* the amount from the number obtained by the table. If, on the contrary, it is later, ascertain by how much, and *add* the amount.

When February is included in the given time, and it is a leap year, add one day to the result.

EXAMPLE 1.—How many days are there between the fifteenth of March and the fourth of October ? Looking down the vertical row of figures, at the head of which March is placed, and at the same time, along the horizontal row at the left hand side of which is October, we perceive in their intersection the number 214:—so many days, therefore, intervene between the fifteenth of March and the fifteenth of October. But the fourth of October is eleven days earlier than the fifteenth; we therefore subtract 11 from 214, and obtain 203, the number required.

EXAMPLE 2.—How many days are there between the third of January and the unneteenth of May? Looking as before in the table, we find that 120 days intervene between the third of January and the third of May; but as the nine-to-onth is sixteen days later than the third, we add 16 to 120 and obtain 136, the number required.

Since February is in this case included, if it were a leap year, as that month would then contain 29 days, we should add one to the 136, and 137 would be the answer.

During the lapse of time, the calendar became inaccucate : it was corrected by Pope Gregory. To understand now this became necessary, it must be borne in mind that the Julian Calendar, formerly in use, added one day every fourth year to the month of February ; but this being somewhat too much, the days of the months were thrown out of their proper places, and to such an extent, that each had become ten days too much in advance. Pope Gregory, to remedy this, ordained that what, according

## n any two

figures at n months; ntains the n the one und where given day the former, from the ontrary, it mount. time, and

ween the Looking eh March tal row at e in their refore, inteenth of 78 earlier 214, and

veen the oking as between the ninel6 to 120

re a leap e should

inaccuerstand ind that y every being thrown it, that Pope cording to the Julian style, would have been the 5th of October 1582, should be considered as the 15th; and to prevent the recurrence of such a mistake, he desired that, in place of the last year of every century being, as hitherto. a leap year, only the last year of every fourth century should be deemed such.

The "New Style," as it is called, was not introduced into England until 1752, when the error had become eleven days. The Gregorian Calendar itself is slightly inaccurate.

To find if any given year be a leap year. If net the last year of a century:

RULE.—Divide the number which represents the given year by 4, and if there be no remainder, it is a leap year. If there be a remainder, it expresses how long the given year is after the preceding leap year.

EXAMPLE 1.—1840 was a leap year, because 1840 divided by 4 leaves no remainder.

EXAMPLE 2.—1722 was the second year after a leap year, because 1722 divided by 4 leaves 2 as remainder.

If the given year be the last of a century :

RULE.—Divide the number expressing the centuries by 4, and if there be no remainder, the given one is a leap year; if there be a remainder, it indicates the number of centuries between the given and preceding last year of a century which was a leap year.

EXAMPLE 1.—1600 was a leap year, because 16, being divided by 4, leaves nothing.

EXAMPLE 2.—1800 was two centuries after that last year of a century which was a leap year, because, divided by 4, it leaves 2.

#### DEFINITIONS.

fore, the circle, the greater or less each of these will be. The following will exemplify the applications of the symbols :—  $60^{\circ} 5' 4'' 6'''$ ; which means sixty degrees, five minutes, four seconds, and six thirds.

### DEFINITIONS.

1. Arithmetic may be considered either as a science or as an art. As a science, it teaches the properties of numbers; as an art, it enables us to apply this knowledge to practical purposes; the former may be called theoretical, the latter practical arithmetic.

• 2. A Unit, or as it is also called, Unity, is one of the individuals under consideration, and may include many units of another kind or denomination; thus a unit of the order called "tens" consists of ten simple units. Or it may consist of one or more parts of a unit of a higher denomination; thus five units of the order of "tens" are five parts of one of the denomination called "hundreds;" three units of the denomination called "tenths" are three parts of a unit, which we shall presently term "the " unit of comparison."

3. Number is constituted of two or more units; strictly speaking, therefore, unity itself eannot be considered as a number.

4. Abstract Numbers are those the properties of which are contemplated without reference to their application to any particular purpose—as five, seven, &c.; abstraction being a process of the mind, by which it separately considers those qualities which cannot in reality exist by themselves; thus, for example, when we attend only to the length of anything, we are said to abstract from its breadth, thickness, colour, &c., although these are necessarily found associated with it. There is nothing inaccurate in this abstraction, since, although length cannot exist without breadth, thickness, &c., it has properties independent of them. In the same way, five, seven, &c., can be considered only by an abstraction of the mind, as not applied to indicate some particular things. 5. Applicate Numbers are exactly the reverse of

12

#### DEFINITIONS.

a science roperties of this knowy be called

s one of the elude many s a unit of e units. Or of a higher "tens" are hundreds;" areths" are ly term "the

operties of their applieven, &c.; ich it sepat in reality n we attend to abstract ough these e is nothing ugh length it has profive, seven, tion of the alar things. abstract, being applied to indicate particular objectsas five men, six houses.

6. The Unit of Comparison. In every number there is some unit or individual which is used as a standard : this we shall henceforward call -the " unit of comparison." It is by no means necessary that it should always be the same; for at one time we may speak of four objects of one species, at another of four objects of another species, at a third, of four dozen, or four scores of objects; in all these cases four is the number contemplated, though in each of them the idea conveyed to the mind is different-this difference arising from the different standard of comparison, or unity assumed. In the first case, the " unit of comparison" was a single object; in the second, it was also a single object, but not of the same kind ; in the third, it became a dozen ; and in the fourth, a score of objects. Increasing the "unit of comparison" evidently increases the quantity indicated by a given number; while decreasing it has a contrary effect. It will be necessary to bear all this carefully in mind.

7. Odd Numbers. One, and every succeeding alternate number, are termed odd ; thus, three, five, seven, &c.

8. Even Numbers. Two, and every succeeding alternate number, are said to be even; thus, four, six, eight, &c. It is scarcely necessary to remark, that after taking away the odd numbers, all those which remain are even, and after taking away the even, all those which remain are odd.

We shall introduce many other definitions when treating of those matters to which they relate. A clear idea of what is proposed for consideration is of the greatest importance; this must be derived from the definition by which it is explained.

Since nothing assists both the understanding and the memory more than accurately dividing the subject of instruction, we shall take this opportunity of remarking to both teacher and pupil, that we attach much importance to the divisions which in future shall actually be made, or shall be implied by the order in which the different heads will be examined.

в2

# SECTION I.

### ON NOTATION AND NUMERATION.

1. To avail ourselves of the properties of numbers, we must be able both to form an idea of them ourselves, and to eonvey this idea to others by spoken and by written language ;—that is, by the voice, and by characters.

The expression of number by characters, is called notation, the reading of these, numeration. Notation, therefore, and numeration, bear the same relation to each other as writing and reading, and though often confounded, they are in reality perfectly distinct.

2. It is obvious that, for the purposes of Arithmetic, we require the power of designating all possible numbers; it is equally obvious that we cannot give a different name or character to each, as their variety is boundless. We must, therefore, by some means or another, make a limited system of words and signs suffice to express an unlimited amount of numerical quantities:—with what beautiful simplicity and clearness this is effected, we shall better understand presently.

3. Two modes of attaining such an object present themselves; the one, that of *combining* words or characters already in use, to indicate new quantities; the other, that of representing a variety of different quantities by a *single* word or character, the danger of mistake at the same time being prevented. The Romans simplified their system of notation by adopting the principle of *combination*; but the still greater perfection of ours is due also to the expression of many numbers by the *same* character.

ľ

6

t

Ŀ

tl

Ь

4. It will be useful, and not at all difficult, to explain to the pupil the mode by which, as we may suppose, an idea of considerable numbers was originally acquired, and of which, mdeed, although unconsciously, we still avail ourselves; we shall see, at the same time, how methods of simplifying both numeration and notation were naturally suggested.

1.o.' us suppose no system of numbers to be as yet constructed, and that a heap, for example, of publies, is placed before us that we may discover their amount. If this is considerable, we cannot ascertain it by looking at them all together, nor even by separately inspecting them; we must, therefore, have recourse to that contrivance which the mind always uses when it desires to grasp what, taken as a whole, is too great for its powers. If we examine an extensive landscape, as the eye cannot take it all in at one view, we look successively at its different portions, and form our judgment upon them in detail. We must act similarly with reference to large numbers; since we cannot comprehend them at a single glance, we must divide them into a sufficient number of parts, and, examining these in succession, acquire an indirect, but accurate idea of the entire. This process becomes by habit so rapid, that it seems, if carelessly observed, but one act, though it is made up of many : it is indispensable, whenever we desire to have a clear idea of numbers-which is not, however, every time they are mentioned.

5. Had we, then, to form for ourselves a numerical system, we would naturally divide the individuals to be reckoned into equal groups, each group consisting of some number quite within the limit of our comprehension; if the groups were few, our object would be attained without any further effort, since we should have acquired

urate knowledge of the number of groups, and of mber of individuals in each group, and therefore actory, although indirect estimate of the whole.

we ought to remark, that different persons have very different limits to their perfect comprehension of number; the intelligent can conceive with ease a comparatively large one; there are savages so rude as to be incapable of forming an idea of one that is extremely small.

6. Let us call the *number* of individuals that we choose to constitute a group, the *ratio*; it is evident that the larger the ratio, the smaller the number of groups, and the smaller the ratio, the larger the number of groups – but the smaller the number of groups the better.

N.

of numbers, m ourselves, id by written aracters.

t, to explain suppose, an ly acquired, usly, we still time, how and notation

7. If the groups into which we have divided the objects to be reckoned exceed in amount that number of which we have a perfect idea, we must continue the process, and considering the groups themselves as individuals, must form with them new groups of a higher order. We must thus proceed until the number of our highest group is sufficiently small.

8. The *ratio* used for groups of the second and higher orders, would naturally, but not necessarily, be the same as that adopted for the lowest; that is, if seven individuals constitute a group of the first order, we would probably make seven groups of the first order constitute a group of the second also; and so on.

9. It might, and very likely would happen, that we should not have so many objects as would exactly form a certain number of groups of the highest order some of the next lower might be left. The same might occur in forming one or more of the other groups. Wo might, for example, in reekoning a heap of pebbles, have two groups of the fourth order, three of the third, none of the second, five of the first, and seven individuals or "units of comparison."

10. If we had made each of the first order of groups consist of ten pebbles, and each of the second order consist of ten of the first, each group of the third of ten of the second, and so on with the rest, we had selected the decimal system, or that which is not only used at present, but which was adopted by the Hebrews, Greeks, Romans, &c. It is remarkable that the language of every civilized nation gives names to the different groups of this, but not to those of any other numerical system; its very general diffusion, even among rudo and barbarous people, has most probably arisen from the habit of counting on the fingers, which is not altogether abandoned, even by us.

11. It was not indispensable that we should have ased the same *ratio* for the groups of all the different orders; we might, for example, have made four pebbles form a group of the first order, twelve groups of the first order a group of the second, and twenty groups of the second a group of the third order :—in such a

e divided the that number t continue the selves as indis of a higher number of our

nd and higher , be the same if seven indider, we would der constitute

ppen, that we exactly form thest order is same might groups. We p of pebbles, of the third, d seven indi-

der of groups second order e third of ten had selected only used at rews, Greeks, language of the different among rudo arisen from which is not

should have the different four pebbles roups of the venty groups :----in such a case we had adopted a system exactly like that to be found in the table of money (page 3), in which four farthings make a group of the order *pence*, twelve pence a group of the order *shillings*, twenty shillings a group of the order *pounds*. While it must be admitted that the use of the same system for applicate, as for abstract numbers, would greatly simplify our arithmetical processes—as will be very evident hereafter, a glance at the tables given already, and those set down in treating of exchange, will show that a great variety of systems have actually been constructed.

12. When we use the same ratio for the groups of all the orders, we term it a common ratio. There appears to have been no particular reason why ten should have been selected as a "common ratio" in the system of numbers ordinarily used, except that it was suggested, as already remarked, by the mode of counting on the fingers; and that it is neither so low as unnecessarily to increase the number of orders of groups, nor so high as to exceed the conception of any one for whom the system was intended.

13. A system in which ten is the "common ratio" is called *decimal*, from "decem," which in Latin signifies ten :--ours is, therefore, a "decimal system" of numbers. If the common ratio were sixty, it would be a *sexagesimal* system; such a one was formerly used, and is still retained—as will be perceived by the tables already given for the measurement of ares and angles, and of time. A quinary system would have five for its "common ratio;" a *duodecimal*, twelve; a *vigesimal*, twenty, &c.

14. A little reflection will show that it was useless to give different names and characters to any numbers except to those which are less than that which constitutes the lowest group, and to the *different orders* of groups; because all possible numbers must consist of individuals, or of groups, or of both individuals and groups :—in uci'aer case would it be required to specify more than the number of individuals, and the number of cach species of group, none of which numbers—as is evident—can be greater than the common ratio. This J

is just what we have done in our numerical system, except that we have formed the names of some of the groups by combination of those already used; thus, " tens of thousands," the group next higher than thousands, is designated by a combination of words already applied to express other groups-which tends yet further to simplification.

16. The characters which express the nine first numbers are the only ones used; they are called *digits*, from the custom of counting them on the fingers, already noticed-" digitus" meaning in Latin a finger ; they are also called significant figures, to distinguish them from the cypher, or 0, which is used merely to give the digits their proper position with reference to the decimal point. The pupil will distinctly remember that the place where the " units of comparison" are to be found is that immediately to the left hand of this point, which, if not expressed, is supposed to stand to the right hand side of all the digits-thus, in 468.76 the 8 expresses " units of comparison," being to the left of the decimal point; in 49 the 9 expresses " units of comparison," the deeimal point being understood to the right of it.

17. We find by the table just given, that after the nine first numbers, the same digit is constantly repeated, its position with reference to the decidal point being, however, changed :---that is, to indicate each succeeding group it is moved, by means of a cypher, one place farther to the left. Any of the digits may be used to

nine first numled *digits*, from ingers, already nger; they are ish them from give the digits *e decimal point*. he place where d is that immeieh, if not ext hand side of presses " units decimal point; son," the deci-

that after the antly repeated, a point being, ach succeeding her, one place ay be used to express its respective number of any of the groups :-thus 8 would be eight "units of comparison;" 80, eight groups of the first order, or eight "tens" of simple units; 800, eight groups of the second, or units of the third order; and so on. We might use any of the digits with the different groups; thus, for example, 5 for groups of the third order, 3 for those of the second, 7 for those of the first, and 8 for the "units of comparison;" then the whole set down in full would be 5000, 300, 70, 8, or for brevity sake, 5378—for we never use the cypher when we can supply its place by a significant figure, and it is evident that in 5378 the 378 keeps the 5 four places from the decimal point (understood), just as well as cyphers would have done; also the 78 keeps the 3 in the third, and the 8 keeps the 7 in the second place.

18. It is important to remember that each digit has two values, an *absolute* and a *relative*; the absolute value is the number of units it expresses, whatever these units may be, and is unchangeable; thus 6 always means six, sometimes, indeed, six tens, at other times six hundred, &c. The relative value depends on the order of units indicated, and on the nature of the " unit of comparison."

19. What has been said on this very important subject, is intended principally for the teacher, though an ordinary amount of industry and intelligence will be quite sufficient for the purpose of explaining it, even to a child, particularly if each point is illustrated by an appropriate example; the pupil may be made, for instance, to arrange a number of pebbles in groups, sometimes of one, sometimes of another, and sometimes of several orders, and then be desired to express them by figures-the "unit of comparison" being occasionally changed from individuals, suppose to tens, or hundreds, or to scores, or dozens, &c. Indeed the pupils must be well acquainted with these introductory matters, otherwise they will contract the habit of answering without any very definite ideas of many things they will be called upon to explain, and which they should be expected perfectly to understand. Any trouble bestowed by the teacher at this period will be well repaid by the case

N.

and rapidity with which the scholar will afterwards advance; to be assured of this, he has only to recollect that most of his future reasonings will be derived from, and his explanations grounded on the very principles we have endeavoured to unfold. It may be taken as an important truth, that what a child learns without understanding, he will acquire with disgust, and will toon cease to remember; for it is with children as with persons of more advanced years, when we appeal successfully to their understanding, the pride and pleasure they feel in the attainment of knowledge, cause the labour and the weariness which it costs to be undervalued, or forgotten.

20. Pebbles will answer well for examples; indeed, their use in computing has given rise to the term calculation, "calculus" being, in Latin, a pebble : but while the teacher illustrates what he says by groups of particular objects, he must take care to notice that his remarks would be equally true of any others. He must also point out the difference between a group and its equivalent unit, which, from their perfect equality, are generally confounded. Thus he may show, that a penny, while equal to, is not identical with four farthings. This seemingly unimportant remark will be better appreciated hereafter; at the same time, without inaccuracy of result, we may, if we please, consider any group *either* as a unit of the order to which it belongs, or so many of the next lower as are equivalent.

21. Roman Notation.—Our ordinary numerical characters have not been always, nor every where used te express numbers; the letters of the alphabet naturally presented themselves for the purpose, as being already familiar, and, accordingly, were very generally adopted for example, by the Hebrews, Greeks, Romans, &c., each, of course, using their own alphabet. The pupil should be acquainted with the Roman notation on account of its beautiful simplicity, and its being still employed in inscriptions, &c.: it is found in the following table :—

 $\mathbf{20}$

One hundred thousand, &c 22. Thus we find that the Romans used very few characters-fewer, indeed, than we do, although our system is still more simple and effective, from our applying the principle of "position," unknown to them.

They expressed all numbers by the following symbols, or combinations of them : I. V. X. L. C. D. or Ig. M., or CLO. In constructing their system, they evidently had a quinary in view; that is, as we have said, one in which five would be the common ratio; for we find that they changed their character, not only at ten, ten times

ten, &c., but also at five, ten times five, &c. :-- a purely decimal system would suggest a change only at ten, ten times ten, &c.; a purely quinary, only at five, five times five, &c. As far as notation was concerned, what they adopted was neither a decimal nor a quinary system, nor even a combination of both; they appear to have supposed *two* primary groups, one of five, the other of ten "units of comparison;" and to have formed all the other groups from these, by using ten as the common ratio of each resulting series.

23. They anticipated a change of character; one unit before it would naturally occur—that is, not one "unit of comparison," but one of the units under consideration. In this point of view, four is one unit before five; forty, one unit before fifty—tens being now the units under consideration; four hundred, one unit before five hundred—hundreds having become the units contemplated.

24. When a lower character is placed before a higher its value is to be subtracted from, when placed after it, to be added to the value of the higher; thus, IV. means one less than five, or four; VI., one more than five, or six.

25. To express a number by the Roman method of notation :---

RULE.—Find the highest number within the given one, that is expressed by a single character, or the "anticipation" of one [21]; set down that character, or anticipation—as the case may be, and take its value from the given number. Find what highest number less than the remainder is expressed by a single character, or "anticipation;" put that character or "anticipation" to the right hand of what is already written, and take its value from the last remainder : proceed thus until nothing is left.

EXAMPLE.—Set down the present year, eighteen hundred and forty-four, in Roman characters. One thousard, expressed by M., is the highest number within the givon one, indicated by one character, or by an anticipation; we put down M.

and take one thousand from the given number, which leaves

23

te. :—a purely nly at ten, ten five, five times ed, what they iinary system, opear to have , the other of formed all the as the common

aracter; one at is, not one s under consine unit before eing now the ne unit before he units con-

when placed igher; thus, I., one more

n method of

in the given acter, or the at character, take its value chest number ingle characor "anticipawritten, and proceed thus

teen hundred thousand, exthe given one, ; we put down

which leaves

eight hundred and forty-four. Five hundred  $\rightarrow$  the highest number within the last remainder (e A/2 hundred and forty-four) expressed by one character,  $c_r$  an "anticipation;" we set down D to the right hand of M,

#### MD,

and take its value from eight hundred and forty-four, which leaves three hundred and forty-four. In this the highest number expressed by a single character, or an "anticipation," is one hundred, indicated by C; which we set down; and for the same reason two other Cs.

#### MDCCC.

This leaves only forty-four, the highest number within which, expressed by a single character, or an "anticipation," is forty, XL—an anticipation; we set this down also,

### MDCCCXL.

Four, expressed by IV., still remains; which, being alse added, the whole is as follows:-

### MDCCCXLIV.

26. Position.—The same character may have different values, according to the place it holds with reference to the decimal point, or, perhaps, more strictly, to the "unit of comparison." This is the principle of position.

27. The places occupied by the units of the different orders, according to the Arabie, or ordinary notation [15], may be described as follows :—units of comparison, one place to the left of the deeimal point, expressed, or understood; tens, two places; hundreds, three places, &c. The pupil should be made so familiar with these, as to be able, at once, to name the "place" of any order of units, or the "units" of any place.

28. When, therefore, we are desired to write any number, we have merely to put down the digits expressing the amounts of the different units in their proper places, according to the order to which each belongs. If, in the given number, there is any order of which there are no units to be expressed, a eypher must be set down in the place belonging to it; the object of which is, to keep the significant figures in their own positions. A cypher produces no effect when it is not between significant figures and the decimal point; thus 0536, 536.0, and 536 would mean the same thing—the

second is, however, the correct form. 536 and 5360 are different; in the latter case the cypher affects the value, because it alters the position of the digits.

EXAMPLE .- Let it be re uired to set down six hundred and two. The six must be in the third, and the two in the first place; for this purpose we are to put a cypher between the 6 and 2-thus, 602: without the cypher, the six would be in the second place-thus, 62; and would mean not six hundreds, but six tens.

29. In numerating, we begin with the digits of the highest order and proceed downwards, stating the number which belongs to each order.

To facilitate notation and numeration, it is usual to divide the places occupied by the different orders of units into periods; for a certain distance the English and French methods of division agree; the English billion is, however, a thousand times greater than the French. This discrepancy is not of much importance, since we are rarely obliged to use so high a number,-we shall prefer the French method. To give some idea of the amount of a billion, it is only necessary to remark, that according to the English method of notation, there has not been one billion of seconds since the birth of Christ. Indeed, to reckon even a million, counting on an average three per second for eight hours a day, would require nearly 12 days. The following are the two methods.

	ENGLISH	METHOD.
Trillions. 000.000	Billions.	Milli
000-000	000.000	000 •

#### lions. Millions. 0.0000 $000 \cdot 000$

#### FRENCH METHOD.

Billions. Condreds. Tens. Units.	Millions. Hund ens. Units.	Thousands.	Units.
0 0 0	0 0 0	Hund. Tens. Units.	Hund. Tens, Units.

30. Use of Periods .- Let it be required to read off the following number, 576934. We put the first point to the left of the hundreds' place, and find that there are exactly two periods-576,934; this does not always occur, as the highest period is often imperfect, consisting only of one or two digits. Dividing the number thus

and 5360 are cts the value,

n six hundred the two in the pher between the six would mean not six

digits of the ng the num-

t is usual to at orders of English and aglish billion the French. ce, since we r,—we shall idea of the remark, that ation, there he birth of counting on ours a day, ing are the

Units. 000.000

Units. und. Tens. Units. 0 0 0

to read off first point it there are not always , consisting unber thus into parts, shows at once that 5 is in the third place of the second period, and of course in the sixth place to the left hand of the decimal point (understood); and, therefore, that it expresses hundreds of thousands. The 7 being in the fifth place, indicates tens of thousands; the 6 in the fourth, thousands; the 9 in the third, hundreds; the 3 in the second, tens; and the 4 in the first, units (of " comparison"). The whole, therefore, is five hundreds of thousands, seven tens of thousands, six thousands, nine hundreds, three tens, and four units, or more briefly, five hundred and seventy-six thousand, nine hundred and thirty-four.

31. To prevent the separating point, or that which divides into periods, from being mistaken for the decimal point, the former should be a comma (,)—the latter a full stop  $(\cdot)$  Without this distinction, two numbers which are very different might be confounded : thus, 498,763 and 498,763,—one of which is a thousand times greater than the other. After a while, we may dispense with the separating point, though it is convenient to use it with considerable numbers, as they are then read with greater ease.

32. It will facilitate the reading of large numbers not separated into periods, if we begin with the units of comparison, and proceed onwards to the left, saying at the first digit "units," at the second "tens," at the third "hundreds," &c., marking in our mind the denomination of the highest digit, or that at which we *stop*. We then commence with the highest, express its number and denomination, and proceed in the same way with each, until we come to the last to the right hand.

EXAMPLE.—Let it be required to read off 6402. Looking at the 2 (or pointing to it), we say "units;" at the 0, "tens;" at the 4, "hundreds;" and at the 6, "thousands." The latter, therefore, being six thousands, the next digit is four hundreds, &c. Consequently, six thousands, four hundreds, no tens, and two units; or, briefly, six thousand four hundred and two, is the reading of the given number.

33. Periods may be used to facilitate notation. The pupil will first write down a number of periods of cyphers

to represent the places to be occupied by the various orders of units. He will then put the digits expressing the different denominations of the given number, under, or instead of those cyphers which are in corresponding positions, with reference to the decimal point beginning with the highest.

EXAMPLE.—Write down three thousand tix hundred and fifty-four. The highest denomination being thousands, will occupy the fourth place to the time into the decimal point. It will be enough, therefore, to prodown four cyphers, and under them the corresponding digits—that expressing the thousands under the fourth cypher, the hundreds under the third, the tens under the second, and the units under the first; thus

#### 0,000 3,654

A cypher is to be placed under any denomination in which there is no significant figure.

EXAMPLE.—Set down five hundred and seven thousand, and sixty-three.

### 000,000 507,063

After a little practice the periods of cyphers will become unnecessary, and the number may be rapidly put down at once.

34. The units of comparison are, as we have said, always found in the first place to the left of the decimal point; the digits to the left hand progressively increase in a tenfold degree-those occupying the first place to the left of the units of comparison being ten times greater than the units of comparison ; those occupying the second place, ten times greater than those which occupy the first, and one hundred times greater than the units of comparison themselves; and so on. Moving a digit one place to the left multiplies it by ten, that is, makes it ten times greater; moving it two places multiplies it by one hundred, or makes it one hundred times greater; and sc of the rest. If all the digits of a quantity be moved one, two, &c., places to the left, the whole is increased ten, one hundred, &c., times-as the case may be. On the other hand, moving

the various gits expressven number, re in corresmal point—

hundred and ousands, will hal point. It cyphers, and pressing the ds under the ts under the

# mination in

en thousand,

# yphers will be rapidly

have said, eft of the ogressively ng the first being ten those occuthan those ies greater und so on. plies it by ving it two kes it one If all the places to dred, &c., nd, moving

a digit, or a quantity one place to the right, divides it by ten, that is, makes it ten times smaller than before; moving it two places, divides it by one hundred, or makes it one hundred times smaller, &c.

35. We possess this power of easily increasing, or diminishing any number in a tenfold, &c. degree, whether the digits are all at the right, or all at the left of the decimal point; or partly at the right, and partly at the left. Though we have not hitherto considered quantities to the left of the decimal point, their relative value will be very easily understood from what we have already said. For the pupil is now aware that in the decimal system the quantities increase in a tenfold degree to the left, and decrease in the same degree to the right; but there is nothing to prevent this decrease to the right from proceeding beyond the units of comparison, and the decimal point ;--on the contrary, from the very nature of notation, we ought to put quantities ten times less than units of comparison one place to the right of them, just as we put those which are ten times less than hundreds, &c., one place to the right of hundreds, &c We accordingly do this, and so continue the notation not only upwards, but downwards, calling quantities te the left of the decimal point integers, because none of them is less than a whole "unit of comparison;" and those to the right of it decimals. When there are decimals in a given number, the decimal point is actually expressed, and is always found at the right hand side of the units of comparison.

36. The quantities equally distant from the unit of comparison bear a very close relation to each other which is indicated even by the similarity of their names; those which are one place to the *left* of the units of comparison are called "tens," being each identical with, or equivalent to ten units of comparison; those which are one place to the *right* of the units of comparison are called "tenths," each being the tenth part of, that is, ten times as small as a unit of comparison are called "hundreds," being one hundred times greater; and those two places to the *right*, "hundredths," being one

hundred times less than the units of comparison; and so of all the others to the right and left. This will be more evident on inspecting the following table :---

Ascending Series, or Integers. One Unit 1 Ten 10 Hundred 100 Thousand 10,000 Hundred thousand 100,000 &c.	·01 Hundredth. ·001, Thousandth.
---	-------------------------------------

We have seen that when we divide integers into periods [29], the first separating point must be put to the right of the thousands; in dividing decimals, the first point must be put to the right of the thousandths.

37. Care must be taken not to confound what we now call "decimals," with what we shall hereafter designate "decimal fractions;" for they express equal, but not identically the same quantities—the decimals being what shall be termed the "quotients" of the corresponding decimal fractions. This remark is made here to anticipate any inaccurate idea on the subject, in those who already know something of Arithmetic.

38. There is no reason for treating integers and decimals by different rules, and at different times, since they follow precisely the same laws, and constitute parts of the very same series of numbers Besides, any quantity may, as far as the decimal point is concerned, be expressed in different ways; for this purpose we have merely to change the unit of comparison. Thus, let it be required to set down a number indicating five lumdred and seventy-four men. If the "unit of comparison" be one man, the quantity would stand as follows, If a band of ten men, it would become 57.4-for, 574.as each man would then constitute only the tenth part of the "unit of comparison," four men would be only four-tenths, or 0.4; and, since ten men would form but one unit, seventy men would be merely seven units of comparison, or 7; &c. Again, if it were a band of one hundred men, the number must be written 5.74; and lastly, if a band of a thousand men, it would be 0.574

son; and so will be more

, or Decimals.

th. lth.

sandth.

thousandth.

into periods to the right first point

d what we after desigequal, but mals being the corresade here to t, in those

and decisince they e parts of y quantity ed, be exwe have hus, let it five huncomparis follows, 57.4---for, enth part l be only form but units of nd of one '74; and be 0.574

Should the "unit" be a band of a dozen, or a score men, the change would be still more complicated; as, not only the position of the decimal point, but the very digits also, would be altered.

39. It is not necessary to remark, that moving the decimal point so many places to the left, or the digits an equal number of places to the right, amount to the same thing.

Sometimes, in changing the decimal point, one or more cyphers are to be added; thus, when we move 42.6three places to the left, it becomes 42600; when we move 27 five places to the right, it is .00027, &c.

40. It follows, from what we have said, that a decimal, though less than what constitutes the unit of comparison, may itself consist of not only one, but several individuals. Of course it will often be necessary to indicate the "unit of comparison,"-as 3 scores, 5 dozen, 6 men, 7 companies, 8 regiments, &c. ; but its nature does not affect the abstract properties of numbers; for it is true to say that seven and five, when added together, make twelve, whatever the unit of comparison may be :--provided, however, that the same standard be applied to both ; thus 7 men and 5 men are 12 men ; but 7 men and 5 horses are neither 12 men nor 12 horses.; 7 men and 5 dozen men are neither 12 men nor 12 dozen men. When, therefore, numbers are compared, &c., they must have the same unit of comparison, or-without altering their value-they must be reduced to those which have. Thus we may consider 5 tens of men to become 50 individual men-the unit of comparison being altered from ten men to one man, without the value of the quantity being changed. This principle must be kept in mind from the very commencement, but its utility will become more obvious hereafter.

### NOTATION AND NUMERATION.

21. The diameter of Saturn is 78,730 miles, and his distance from the sim 907,089,032 miles.

22. The length of a pendulum which would vibrate seconds at the equator, is 39.011,684 inches; in the latitude of 45 degrees, it is 39.116,820 inches; and in the latitude of 90 degrees, 39.221,956 inches.

23. It has been calculated that the distance from the earth to the nearest fixed star is 40,000 times the diameter of the earth's orbit, or annual path in the heavens; that is, about 7,600,000,000,000 miles. Now suppose a cannon ball to fly from the earth to this star, with a uniform velocity equal to that with which it first leaves the mouth of the gun—say 2,500 feet in a second—it would take nearly 1,000 years to reach its destination.

24. A piece of gold equal in bulk to an ounce of water, would weigh 19.258 ounces; a piece of iron of exactly the same size, 7.788 ounces; of copper, 8.788 ounces; of lead, 11.352 ounces; and of silver, 10.474 ounces.

Note.—The examples in notation may be made to answer for numeration; and the reverse.

# QUESTIONS IN NOTATION AND NUMERATION.

[The references at the end of the questions show in what paragraphs of the preceding section the respective answers are principally to be found.]

1. What is notation ? [1].

2. What is numeration? [1].

3. How are we able to express an infinite variety of numbers by a few names and characters? [3].

4. How may we suppose ideas of numbers to have been originally acquired? [4, &c.].

5. What is meant by the common ratio of a system of numbers? [12].

6. Is any particular number better adapted than another for the common ratio? [12].

7. Are there systems of numbers without a common ratio? [11].

8. What is meant by quinary, decimal, duodecimal, vigesimal, and sexagesimal systems? [13].

9. Explain the Arabic system of notation? [15].

10. What are digits? [16].

11. How are they made to express all numbers ? [17].

12. What is meant by their absolute and relative values? [18].

13. Are a digit of a higher, and the equivalent numor of units of a lower order precisely the same thing? (20].

14. Have the characters we use, always and every where been employed to express numbers? [21].

15. Explain the Roman method of notation ? [22, &c.].

16. What is the decimal point, and the position of the different orders of units with reference to it? [26 and 27].

17. When and how do cyphers affect significant figures? [28].

18. What is the difference between the English and French methods of dividing numbers into periods? [29].

19. What is the difference between integers and decimals? [35].

20. What is meant by the ascending and descending series of numbers; and how are they related to each other? [36].

21. Show that in expressing the same quantity, we must place the decimal point differently, according to the unit of comparison we adopt? [38].

22. What effect is produced on a digit, or a quantity by removing it a number of *places* to the right, or left. or similarly removing the decimal point? [34 and 39]

# SECTION II.

# THE SIMPLE RULES.

### SIMPLE ADDITION.

1. If numbers are changed by any arithmetical process, they are either increased or diminished; if increased, the effect belongs to Addition; if diminished, to Subtraction. Hence all the rules of Arithmetic are ultimately resolvable into either of these, or combinations of both.

2. When any number of quantities, either different, or repetitions of the same, are united together so as to form but one, we term the process, simply, "Addition." When the quantities to be added are the same, but we may have as many of them as we please, it is called "Multiplication;" when they are not only the same, but their number is indicated by one of them, the process belongs to "Involution." That is, addition restricts us neither as to the kind, nor the number of the quantities to be added; multiplication restricts us as to the kind, but not the number; involution restricts us both as to the kind and number:—all, however, are really comprehended nnder the same rule—addition.

3. Simple Addition is the addition of abstract numbers; or of applicate numbers, containing but one denomination.

The quantities to be added are called the *addends*; the result of the addition is termed the *sum*.

4. The process of addition is expressed by +, called the plus, or positive sign; thus 8+6, read 8 plus 6, means, that 6 is to be added to 8. When no sign is prefixed, the positive is understood.

The equality of two quantities is indicated by =, thus 9+7=16, means that the sum of 9 and 7 is equal to 16.

Quantities connected by the sign of addition, or that of equality, may be read in any order; thus if 7+9=16, it is true, also, that 9+7=16, and that 16=7+9, or 9+7.

5. Sometimes a single horizontal line, called a vinculum, from the Latin word signifying a bond or tie, is placed over several numbers; and shows that all the quantities under it are to be considered, and treated as but one; thus in 4+7=11, 4+7 is supposed to form but a single term. However, a vinculum is of little consequence in addition, since putting it over, or removing it from an additive quantity—that is, one which has the sign of addition prefixed, or understood—does not in any way alter its value. Sometimes a parenthesis () is used in place of the vinculum; thus 5+6 and (5+6)mean the same thing.

6. The pupil should be made *perfectly* familiar with these symbols, and others which we shall introduce as we proceed; or, so far from being, as they ought, a great advantage, they will serve only to embarrass him. There can be no doubt that the expression of quantities by characters, and not by words written in full, tends to brevity and clearness; the same is equally true of the processes which are to be performed—the more concisely they are indicated the better.

7. Arithmetical rules arc, naturally, divided into two parts; the one relates to the setting down of the quantitics, the other to the operations to be described. We shall generally distinguish these by a line.

### To add Numbers.

RULE.—I. Set down the addends under cach other, so that digits of the same order may stand in the same vertical column—units, for instance, under units, tens under tens, &c.

II. Draw a line to separate the addends from their sum.

III. Add the units of the same denomination together, beginning at the right hand side.

IV. If the sum of any column be less than ten, set it down under that column; but if it be greater, for every

on, or that of 7+9=16, it +9, or 9+7. called a vinbond or tie, that all the d treated as osed to form a is of little or, or removthe which has d-does not enthesis () is and (5+6)

amiliar with introduce as bey ought, a barrass him. of quantities a full, tends y true of the more con-

led into two of the quancribed. We

e each other, in the same c units, tens

s from their

ion together,

an ten, set it er. for every teu it contains, carry one to the next column, and put down only what remains after deducting the tens; if Nothing remains, put down a cypher.

V. Set down the sum of the last column in full.

8. EXAMPLE .- Find the sum of 542+375+984-

### 1901 sum.

We have placed 2, 5, and 4, which belong to the order "units," in one column; 4, 7, and 8, which are "tens," in another; and 5, 3, and 9, which are "hundreds," in another. 4 and 5 units are 9 units, and 2 are 11 units—equivalent to one ten and one unit; we add, or as it is called, "carry" the ten to the other tens found in the next column, and set down the unit, in the units' place of the "sum."

The pupil, having learned notation, can easily find how many tens there are in a given number; since all the digits that express it, except one to the right hand side, will indicate the number of "tens" it contains; thus in 14 there are 1 ten, and 4 units; in 32, 3 tens, and 2 units; in 143, 14 tens, and 3 units, &c.

The ten obtained from the sum of the units, along with 8, 7, and 4 tens, makes 20 tens; this, by the method just mentioned, is found to consist of 2 tens (of tens), that is, two of the next denomination, or hundreds, to be carried, and no units (of tens) to be set down. We "earry," 2 to the hundreds, and write down a eypher in the tens' place of the "sum."

The two hundreds to be "carried," added to 9, 3, and 5, hundreds, make 19 hundreds; which are equal to 1 ten (of hundreds); or one of the next denomination, and 9 units (of hundreds); the former we "carry" to the tens of hundreds, or thousands, and the latter we set down in the hundreds' place of the "sum."

As there are no thousands in the next column—that is, nothing to which we can "carry" the thousand obtained by adding the hundreds, we put it down in the thousands' place of the "sum;" in other words, we set down the sum of the last column in full.

9. REASON OF I. (the first part of the rule) .- We put units of the same denomination in the same vertical column,

that we may easily find those quantities which are to be added together; and that the value of each digit may be more clear from its being of the same denomination as those which are under, and over it.

REASON OF II.—We use the separating line to prevent the sum from being mistaken for an addend.

REASON OF III.—We obtain a correct result only by adding units of the same denomination together [Sec. I. 40]:—hundreds, for instance, added to tens, would give neither hundreds nor tens as their sum.

We begin at the right hand side to avoid the necessity of more than one addition; for, beginning at the left, the process would be as follows—

542 375 984	
1,700 190 11	
1,000 800 100 1	
1,901	

The first column to the *left* produces, by addition, 17 hundred, or 1 thousand and 7 hundred; the next column 19 tens, or 1 hundred and 9 tens; and the next 11 units, or 1 ten and 1 unit. But these quantities are still to be added :--beginning again, therefore, at the *left* hand side, we obtain 1000, 800, 100, and 1, as the respective sums. These being added, give 1,901 as the *total* sum. Beginning at the right hand rendered the successive additions unnecessary.

REASON OF IV.—Our object is to obtain the sum, expressed in the highest orders, since these, only, enable us to represent any quantity with the lowest numbers; we therefore consider ten of one denomination as a unit of the next, and add it to those of the next which we already have.

After taking the "tens" from the sums of the different columns, we must set down the remainders, since they are parts of the *entire* sum; and they are to be put under the columns that produced them, since they have not ceased to belong to the denominations in these columns.

REASON OF V.—It follows, that the sum of the last column is to be set down in full; for (in the above example, for instance,) there is nothing to be added to the tens (of lundreds) it contains.

10. Proof of Addition.—Cut off the upper addend, by a separating line; and add the sum of the quantities

re to be added be more clear ose which are

o prevent the

nly by adding I. 40]:—hunther hnndreds

e necessity of ft, the process

tion, 17 hunhumn 19 tens, or 1 ten and :--beginning 000, 800, 100, ed, give 1,901 rendered the

to represent fore consider and add it to

the different nce they are ut under the not ceased to

e last column mple, for inof hundreds)

per addend, o quantities under, to what is above this line. If all the additions have been correctly performed, the latter sum will be equal to the result obtained by the rule : thus-

5,673	
4,632 8,697 2,543	/
21,545	sum of all the addends.
15.872	sum of all the addends, but

5,673 upper addend.

21,545 same as sum to be proved.

This mode of proof depends on the fact that the whole is equal to the sum of its parts, in whatever order they are taken; but it is liable to the objection, that any error committed in the first addition, is not unlikely to be repeated in the second, and the two errors would then conceal each other.

To prove addition, therefore, it is better to go through the process again, beginning at the top, and proceeding downwards. From the principle on which the last mode of proof is founded, the result of both additions—the direct and reversed—ought to be the same.

It should be remembered that these, and other proofs of the same kind, afford merely a high degree of probability, since it is not in any case quite certain, that two errors calculated to conceal each other, have not been committed.

11. To add Quantities containing Decimals.—From what has been said on the subject of notation (Sec. I. 35), it appears that decimals, or quantities to the right hand side of the decimal point, are merely the continuation, downwards, of a series of numbers, all of which follow the same laws; and that the decimal point is intended, not to show that there is a difference in the nature of quantities at opposite sides of it, but to mark where the "unit of comparison" is placed. Hence the rule for addition, already given, copplies at whatever side all, or any of the digits in the addends may be found It is necessary to remember that the decimal point in the sum, should stand precisely under the decimal points of the addends; since the digits of the sum must be, from the very nature of the process [9], of exactly the same value;, respectively, as the digits of the addends under

62

one.

which they are ; and if set down as they should be, their denominations are ascertained, not only by their position with reference to their own decimal point, but also by their position with reference to the digits of the addends above them.

### EXAMPLE. 263 • 785 460 • 502 637 • 008 526 • 3

### 1887 · 595

It is not necessary to fill up the columns, by adding cyphers to the last addend; for it is sufficiently plain that we are not to notice any of its digits, until we come to the *third* column.

12. It follows from the nature of notation [Sec. I. 40], that however we may alter the decimal points of the addends—provided they are all in the same vertical column—the digits of the sum will continue unchanged; thus in the following :—

4785	$478 \cdot 5$	$47 \cdot 85 \\ 32 \cdot 57 \\ 65 \cdot 46$	•4785	•004785

87. A merchant owes to A. £1500; to B. £408; to C. £1310; to D. £50; and to E. £1900; what is the sum of all his debts? Ans. £5168.

88. A merchant has received the following sums:  $\pounds 200, \pounds 315, \pounds 317, \pounds 10, \pounds 172, \pounds 513$  and  $\pounds 9$ ; what is the amount of all ? Ans.  $\pounds 1536$ .

89. A merchant bought 7 easks of merchandize. No. 1 weighed 310 fb; No. 2, 420 fb; No. 3, 338 fb; No. 4, 335 fb; No. 5, 400 fb; No. 6, 412 fb; and No. 7 429 fb: what is the weight of the entire?

Ans. 2644 lb.

91. A merchant paid the following sums :--£5000, £2040, £1320, £1100, and £9070; how much was the amount of all the payments? Ans. £18530.

92. A linen draper sold 10 pieces of cloth, the first contained 34 yards; the second, third, fourth, and fifth, each 36 yards; the sixth, seventh, and eighth, each 33 yards; and the ninth and tenth each 35 yards; how many yards were there in all? Ans. 347.

93. A cashier received six bags of money, the first held £1034; the second, £1025; the third, £2008; the fourth, £7013; the fifth, £5075; and the sixth, £89: how much was the whole sum? Ans. £16244.

94. A vintner buys 6 pipes of brandy, containing as follows :—126, 118, 125, 121, 127, and 119 gallons; how many gallons in the whole ? Ans. 736 gals. 95. What is the total weight of 7 easks, No. 1, con-

taining, 960 lb ; No. 2, 725 lb ; No. 3, 830 lb ; No. 4, 798 1b; No. 5, 697 1b; No. 6, 569 1b; and No. 7, Ans. 5566 1b.

96. A merehant bought 3 tons of butter, at £90 per ton; and 7 tons of tallow, at £40 per ton; how much is the price of both butter and tallow?

Ans. £550. 97. If a ton of mcrchandize cost £39, what will 20 tous come to ? Ans. £780.

98. How much are five hundred and seventy-three; eight hundred and ninety-seven; five thousand six hundred and eighty-two; two thousand seven hundred and twenty-one ; fifty-six thousand seven hundred and seventyone? Ans. 66644.

99. Add eight hundred and fifty-six thousand, nine hundred and thirty-three; one million nine hundred and seventy-six thousand, eight hundred and fifty-nine ; two hundred and three millions, eight hundred and ninetyfive thousand, seven hundred and fifty-two.

# Ans. 206729544.

100. Add three millions and seventy-one thousand; four millions and eighty-six thousand ; two millions and fifty-one thousand; one million; twenty-five millions and six ; seventeen millions and one ; ten millions and two ; twelve millions and twenty-three; four hundred and seventy-two thousand, nine hundred and twenty-three; one hundred and forty-three thousand; one hundred and forty-three millions. Ans. 217823955.

101. Add one hundred and thirty-three thousand; seven hundred and seventy thousand ; thirty-seven thousand; eight hundred and forty-seven thousand; thirtythree thousand ; eight hundred and seventy-six thousand ; four hundred and ninety-one thousand. Ans. 3187000.

102. Add together one hundred and sixty-seven thousand ; three hundred and sixty-seven thousand ; nine hundred and six thousand; two hundred and forty-seven thousand ; ten thousand ; seven hundred thousand ; nine hundred and seventy-six thousand; one hundred and ninety-five thousand ; ninety-seven thousand.

# Ans. 3665000.

103. Add three ten-thousandths; forty-four, five tenths ; five hundredths ; six thousandths, eight ten-thou-

30 lb; No. 4, and No. 7, Ans. 5566 fb. r, at £90 per 1; how much Ans. £550. what will 20 Ans. £780. eventy-three; and six hunhundred and and seventy-Ans. 66644. ousand, nine hundred and y-nine; two and ninety-

104. Add one thousand ; one ten-thousandth ; five hundredths ; fourteen hundred and forty ; two tenths, three ten-thousandths ; five, four tenths, four thousandths.

Ans. 2445.6544.

105. The circulation of promissory notes for the four weeks ending February 3, 1844, was as follows :-Bank of England, about £21,228,000; private banks of England and Wales, £4,980,000; Joint Stock Banks of England and Wales, £3,446,000; all the banks of Seotland, £2,791,000; Bank of Ireland, £3,581,000; all the other banks of Ireland, £2,429,000: what was the total circulation? Ans. £38,455,000.

106. Chronologers have stated that the creation of the world occurred 4004 years before Christ; the deluge, 2348; the call of Abraham, 1921; the departure of the Israelites, from Egypt, 1491; the foundation of Solomon's temple, 1012; the end of the captivity, 536. This being the year 1844, how long is it since each of these events? Ans. From the creation, 5848 years; from the deluge, 4192; from the call of Abraham, 3765; from the departure of the Israelites, 3335; from the foundation of the temple, 2856; and from the end of the captivity, 2380

107. The deluge, according to this calculation, occurred 1656 years after the creation; the call of Abraham 427 after the deluge; the departure of the Israelites, 430 after the call of Abraham; the foundation of the temple, 479 after the departure of the Israelites; and the end of the captivity, 476 after the foundation of the temple. How many years from the first to the last?

Ans. 3468 years.

108. Adam lived 930 years; Seth, 912; Enos, 905; Cainan, 910; Mahalaleel, 895; Jared, 962; Enoch, 365; Methuselah, 969; Lamech, 777; Noah, 950; Shem, 600; Arphaxad, 438; Salah, 433; Heber, 464; Peleg, 239; Reu, 239; Serug, 230; Nahor, 148; Terah, 205; Abraham, 175; Isaac, 180; Jacob, 147. What is the sum of all their ages? . Ans. 12073 years

13. The pupil should not be allowed to leave addition,

until he can, with great rapidity, continually add any of the nine digits to a given quantity; thus, beginning with 9, to add 6, he should say:—9, 15, 21, 27, 33, &c., without hesitation, or further mention of the numbers. For instance, he should not be allowed to proceed thus: 9 and 6 are 15; 15 and 6 are 21; &c.; nor even 9 and 6 are 15; and 6 are 21; &c. He should be able, ultimately, to add the following—

# 5638 4756 9342 19736

in this manner: -2, 8 ... 16 (the sum of the column; of which 1 is to be carried, and 6 to be set down); 5, 10 ... 13; 4, 11 ... 17; 10, 14 ... 19.

# QUESTIONS TO BE ANSWERED BY THE PUPIL.

### SUBTRACTION.

# SIMPLE SUBTRACTION.

14. Simple subtraction is confined to abstract numbers, and applicate which consist of but one denomination.

Subtraction enables us to take one number called the subtrahend, from another called the minuend. If anything s left, it is called the excess; in commercial coneerns, it is termed the remainder; and in the mathematical sciences, the difference.

15. Subtraction is indicated by —, called the minus, or negative sign. Thus 5-4=1, read five minus four equal to one, indicates that if 4 is substracted from 5, unity is left.

Quantities connected by the negative sign cannot be taken, indifferently, in any order; because, for example, 5-4 is not the same as 4-5. In the former case the positive quantity is the greater, and 1 (which means +1[4]) is left; in the latter, the negative quantity is the greater, and -1, or one to be subtracted, still remains. To illustrate yet further the use and nature of the signs, let us suppose that we have five pounds, and owe four ;- the five pounds we have will be represented by 5, and our debt by -4; taking the 4 from the 5, we shall have 1 pound (+1) remaining. Next let us suppose that we have only four pounds and owe five; if we take the 5 from the 4--that is, if we pay a: far as we can-a debt of one pound, represented by -1, will still remain ;-- consequently 5-4=1; but 4-5=-1.

16. A vinculum placed over a subtractive quantity, or one having the negative sign prefixed, alters its value, unless we change all the signs but the first: thus 5—3+2, and 5—3+2, are not the same thing; for 5—3+2=4; but 5—3+2 (3+2 being considered now as but one quantity) =0; for 3+2=5;—therefore -3+2 is the same as 5—5, which leaves nothing; or, in other words, it is equal to 0. If, however, we change all the signs, except the first, the value of the quantity is

uot altered by the vinculum ;—thus 5-3+2=4; and 5-3-2, also, is equal to 4.

27 - 4 + 7 - 3 = 19.

But 27-4-7+3 (changing all the signs of the original quantities, but the first) =27.

The following example will show how the vinculum affects numbers, according as we make it include an additive or a subtractive quantity :---

48 + 7 - 3 - 8 + 7 - 2 = 49.

48+7-3-8-7-2=49; what is under the vinculum being additive, it is not necessary to change any signs.

 $\begin{array}{c} 48 + 7 - \overline{3 + 8 - 7 + 2} = 49 \\ 48 + 7 - 3 - 8 - 7 + 2 = 49; \end{array} it is now necessary to change all the signs under the vinculum. \\ 48 + 7 - 3 - 8 - 7 + 2 = 49; it is necessary in this case, also, to change the signs. \\ 48 + 7 - 3 - 8 + 7 - 2 = 49; it is not necessary in this case. \end{array}$ 

ŧ

*t*1

re

si;

an

W (

tio

In the above, we have sometimes put an additive, and sometimes a subtractive quantity, under the vinculum; in the former case, we were obliged to change the signs of all the terms connected by the vinculum, except the first—that is, to change all the signs *under* the vinculum; in the latter. to preserve the original value of the quantity, it was not necessary to change any sign.

# To Subtract Numbers.

II: Put a line under the subtrahend, to separate it from the remainder.

III. Subtract each digit of the subtrahend from the one over it in the minuend, beginning at the right hand side.

IV. If any order of the minuend be smaller than the quantity to be subtracted from it, increase it by ten; and either consider the next order of the minuend as lessened by unity, or the next order of the subtrahend as inereased by it.

V. After subtracting any denomination of the sub-

+2=4; and

the first) }=27.

subtrahend minuend—

separate it

l from the right hand

er than the y ten; and as lessened end as in-

f the sub-

trahend from the corresponding part of the minuend, set down what is left, if any thing, in the place which belongs to the same denomination of the "remainder."

VI. But if there is nothing left, put down a cypher--provided any digit of the "remainder" will be more distant from the decimal point, and at the same side of it.

18. EXAMPLE 1.-Subtract 427 from 792.

792 minnend. 427 snbtrnhend.

365 remainder, difference, or excess.

We cannot take 7 units from 2 units; but "borrowing," as it is called, one of the 9 tens in the minuend, and considering it as ten units, we add it to the 2 units, and then have 12 units; taking 7 from 12 units, 5 are left:--we put 5 in the units' place of the "remainder." We may consider the 9 tens of the minuend (one having been taken away, or borrowed) as 8 tens; or, which is the same thing, may suppose the 9 tens to remain as they were, but the 2 tens of the subtrahend to have become 3; then, 2 tens from 8 tens, or 3 tens from 9 tens, and 6 tens are left:--we put 6 in the tens' place of the "remainder." 4 hundreds, of the subtrahend, taken from the 7 hundreds of the minuend, leave 3 hundreds--which we put in the hundreds' place of the "remainder."

EXAMPLE 2.-Tuke 564 from 768.

 $\frac{768}{564}$ 

# $\overline{204}$

When 6 tens are taken from 6 tens, nothing is left: we therefore put a cypher in the tens' place of the "remainder." EXAMPLE 3.—Take 537 from 594.

594
537
-
57 -

When 5 hundreds are taken from 5 hundreds, nothing remains; but we do not here set down a cypher, since no significant figure in the remainder is at the same side of, and farther from the decimal point, than the place which would be occupied by this cypher.

19. REASON OF I .- We put digits of the same denominations in the same vertical column, that the different parts

of the subtrahend may be near those of the minuend from which they are to be taken; we are then sure that the corresponding portions of the subtrahend and minueud may be easily found. By this arrangement, also, we remove any doubt as to the denominations to which the digits of the subtrahend belong—their values being rendered more certain, by their position with reference to the digits of the minuend.

REASON OF II.—The separating line, though convenient, is not of such importance as in addition [9]; since the "remainder" can hardly be mistaken for another quantity.

REASON OF III.—When the numbers are considerable, the subtraction cannot be effected at once, from the limited powers of the mind; we therefore divide the given quantities into parts; and it is clear that the sum of the differences of the corresponding parts, is equal to the difference between the sums of the parts:—thus, 578-327 is evidently equal to 500-300+70-20+8-7, as can be shown to the child by pebbles, &c. We begin at the right hand side, because it may be necessary to alter some of the digits of the minuend, so as to make it possible to subtract from them the corresponding ones of the subtrahend; but, unless we begin at the right hand side, we cannot know what alterations may be required.

REASON OF IV.—If any digit of the minuend be smaller than the corresponding digit of the subtrahend, we can proceed in either of two ways. First, we may increase that denomination of the minuend which is too small, by borrowing one from the next higher, (considered as *ten* of the lower denomination, or that which is to be increased,) and adding it to those of the lower, already in the minuend. In this case we alter the form, but not the value of the minuend; which, in the example given above, would become—

Hundreds.	tens.	units.
7	8	12 = 792, the minuend.
4	2	7 = 427, the subtrahend.
3	6	5 = 365, the difference.

Or, secondly, we may add equal quantities to both minuend and subtrahend, which will not alter the difference; then we would have

I

n si b

V

d

01

01

Va

Hundreds. 7 4	tens. 9 2 + 1	2 + 10 7	=======================================	792 427	++	- 10, the minuend $+$ 10. - 10, the subtrahend $+$ 10.	
3	6	5	==	365	+	- 0, the same difference.	

In this mode of proceeding we do not use the given minuend and subtrahend, but others which produce the same remainder.

REASON OF V.—The remainders obtained by subtracting, successively, the different denominations of the subtrahend from those which correspond in the minnend are the parts of

minuend from that the corresinueud may be we remove any gits of the subnore certain, by minuend.

1 convenient, 18 e the "remaintity.

e considerable, com the limited iven quantities e differences of erence between evidently equal o the child by because it may minuend, so as corresponding the right hand equired.

rence.

both minuend ence; then we

id + 10. 1 + 10.

fference.

ven minuend no remainder.

subtracting, e subtrahend the parts of

the total remainder. They are to be set down under the denominations which produced them, since they belong to these denominations.

REASON OF VI.-Unless there is a significant figure at the same side of the decimal point, and more distant from it thar. the cypher, the latter-not being between the decimal point and a significant figure-will be useless [Sec. I. 28], and may therefore be omitted.

20. Proof of Subtraction .- Add together the remainder and subtrahend; and the sum should be equal to the minuend. For, the remainder expresses by how much the subtrahend is smaller than the minuend; adding, therefore, the remainder to the subtrahend, should make it equal to the minuend; thus

8754 minuend. 5839 subtrahend. ) 2915

difference.

Sum of difference and subtrahend, 8754=minuend.

Or; subtract the remainder from the minuend, and what is left should be equal to the subtrahend. For the remainder is the excess of the minuend above the subtrahend; therefore, taking away this excess, should leave both equal; thus

S634 minuend. 7985 subtrahend.

PROOF: 8634 minuend. 649 remainder.

649 remainder. New remainder, 7985=subtrahend.

In practice, it is sufficient to set down the quantities once; thus

> 8634 minuend. 7985 subtrahend. 649 remainder.

Difference between remainder and minuend, 7985=subtrahend.

21. To Subtract, when the quantities contain Decimals .- The rule just given is applicable, at whatever side of the decimal point all or any of the digits may be found ;---this follows, as in addition [11], from the very nature of notation. It is necessary to put the decimal point of the remainder under the decimal points of the minuend and subtrahend; otherwise the digits of the remainder will not, as they ought, have the same value as the digits from which they have been derived.

## SUBTRACTION.

EXAMPLE.—Subtract 427.85 from 563.04.

# $563.04 \\ 427.85$

## $135 \cdot 19$

Since the digit to the right of the decimal point in the remainder, indicates what is left after the subtraction of the tenths, it expresses so many tenths; and since the digit to the left of the decimal point indicates what remains after the subtraction of the units, it expresses so many units; all this is shown by the position of the decimal point.

22. It follows, from the principles of notation [Sec. I. 40], that however we may alter the decimal points of the minuend and subtrahend, as long as they stand in the same vertical column, the digits of the difference are not changed; thus, in the following examples, the same digits are found in all the remainders :--

| 4362<br>8547 | $436 \cdot 2 \\ 354 \cdot 7$ | 43 • 62<br>35 • 47 | •4362<br>•3547 |          |

75. A merchant bought 564 hides, weighing 16800 lb, and sold of them 260 hides, weighing 7809 lb; how many hides had he unsold, and what was their weight ? Ans. 304 hides, weighing 8991 lb.

76. A gentleman who had 1756 acres of land, gives 250 acres to his eldest, and 230 to his second son; how many acres did he retain in his possession? Ans. 1276.

77. A merchant owes to A. £800; to B. £90; to C. £750; to D. £600. To meet these debts, he has but £971; how much is he deficient? Ans. £1269.

78. Paris is about 225 English miles distant from London; Rome, 950; Madrid, 860; Vienna, 820; Copenhagen, 610; Geneva, 460; Moscow, 1660; Gibraltar, 1160; and Constantinople, 1600. How much more distant is Constantinople than Paris; Rome than Madrid; and Vienna than Copenhagen. And how much less distant is Geneva than Moscow; and Paris than Madrid ? Ans. Constantinople is 1375 miles more distant than Paris; Rome, 90 more than Madrid; and Vienna, 210 more than Copenhagen. Geneva is 1200 miles less distant than Moscow; and Paris, 635 less than Madrid.

79. How much was the Jewish greater than the English mile ; allowing the former to have been 1.3817 miles English ? Ans. 0.3817.

80. How much is the English greater than the Roman mile; allowing the latter to have been 0.915719 of a mile English ? Ans. 0.084281

81. What is the value of 6-3+15-4? Ans. 14 82. Of 43+7-3-14? Ans. 33

83. Of 47.6 - 2 + 1 - 24 + 16 - 34? Ans. 52.94 84. What is the difference between 15+13-6-81+62, and 15+13-6-81+62? Ans. 38.

23. Before leaving this rule, the pupil should be able

to take any of the nine digits continually from a given number, without stopping or hesitating. Thus, subtracting 7 from 94, he should say, 94, 87, 80, &c.; and should proceed, for instance, with the following example

# 5376 4298

# 1078

# QUESTIONS TO BE ANSWERED BY THE PUPIL.

1. What is subtraction? [14].

2. What are the names of the terms used in subtraction ? [14].

3. What is the sign of subtraction ? [15].

4. How is the vinculum used, with a subtractive quantity? [16].

5. What is the rule for subtraction? [17].

6. What are the reasons of its different parts? [19].

7. Does it apply, when there are decimals ? [21].

8. How is subtraction proved, and why? [20].

9. Exemplify a brief mode of performing subtraction? [23].

# SIMPLE MULTIPLICATION.

24. Simple multiplication is confined to abstract numbers, and applicate which contain but one denomination.

Multiplication enables us to add a quantity, called the multiplicand, a number of times indicated by the multiplier. The multiplicand, therefore, is the number multiplied; the multiplier is that by which we multiply: the result of the multiplication is called the *product*. It follows, that what, in addition, would be called an "addend," in multiplication, is termed the "multiplicand;" and what, in the former, would be called the "sum," in the latter, is designated the "product." The quantities which, when multiplied together, give the

ce it 10901 Ans. 1192. , containing 1680 galmaining? 79 gallons. ning 16800 09 fb;how eir weight? ıg 8991 fb. land, gives l son; how Ans. 1276. C90; to C. he has but ns. £1269. stant from ana, 820; 660; Giblow much Rome than how much Paris than more disdrid; and a is 1200 635 less

l be able

product, are called also *factors*, and, when they are integers, *submultiples*. There may be more than two factors; in that case, the multiplicand, multiplier, or both, will consist of more than one of them. Thus, if 5 6, and 7, be the factors, either 5 times 6 may be considered as the multiplicand, and 7 as the multiplier—or 5 as the multiplicand, and 6 times 7 as the multiplier.

25. Quantities not formed by the continued addition of any number, but unity—that is, which are not the products of any two numbers, unless unity is taken as one of them—are called *prime* numbers : all others are termed *composite*. Thus 3 and 5 are prime, but 9 and 14 are composite numbers; because, only *three*, multiplied by *one*, will produce "three," and only *five*, nultiplied by *one*, will produce "five,"—but, *three* multiplied by *three* will produce "fourteen."

26. Any quantity contained in another, some number of times, expressed by an *integer*—or, in other words, that can be subtracted from it without leaving a remainder—is said to be a *measure*, or *aliquot part* of that other. Thus 5 is a measure of 15, because it is contained in it three times *exactly*—or can be subtracted from it a number of times, expressed by 3, an integer, without leaving a remainder; but 5 is not a measure of 14, because, taking it as often as possible from 14, 4 will still be left;—thus, 15—5=10, 10—5= 5, 5—5=0, but 14—5=9, and 9—5=4. Measure, submultiple, and aliquot part, are synonymous.

27. The common measure of two or more quantities is a number that will measure each of them: it is a measure common to them. Numbers which have no common measure but unity, are said to be prime to each other; all others are composite to each other. Thus 7 and 5 are prime to each other, for unity alone will measure both; 9 and 12 are composite to each other, because 3 will measure either. It is evident that two prime numbers must be prime to each other; thus 3 and 7; for 3 cannot measure seven, nor 7 three, and except unity—there is no other number that will measure either of them.

S

### MULTIPLICATION.

Two numbers may be composite to each other, and yet one of them may be a prime number; thus 5 and 25 are both measured by 5, still the former is prime.

Two numbers may be composite, and yet prime to each other; thus 9 and 14 are both composite numbers, yet they have no common measure but unity.

28. The greatest common measure of two or more numbers, is the greatest number which is their common measure; thus 30 and 60 are measured by 5, 10, 15, and 30; therefore each of these is their common measure;—but 30 is their greatest common measure. When a product is formed by factors which are integers, it is measured by each of them.

29. One number is the *multiple* of another, if it contain the latter a number of times expressed by an integer. Thus 27 is a multiple of 9, because it contains it a number of times expressed by 3, an integer. Any quantity is the multiple of its measure, and the measure of its multiple.

30. The common multiple of two or more quantities, is a number that is the multiple of each, by an integer; thus 40 is the common multiple of 8 and 5; since it is a multiple of 8 by 5, an integer, and of 5 by 8, an integer.

The least common multiple of two or more quantities, is the least number which is their common multiple; thus 30 is a common multiple of 3 and 5; but 15 is their least common multiple; for no number smaller than 15 contains each of them exactly.

31. The equimultiples of two or more numbers, are their products, when multiplied by the same number; thus 27, 12. and 18, are equimultiples of 9, 4, and 6; because, multiplying 9 by three, gives 27, multiplying 4 by three, gives 12, and multiplying 6 by three, gives 18.

32. Multiplication greatly abbreviates the process of addition ;—for example, to add 68965 to itself 7000 times by "addition," would be a work of great labour, and consume much time; but by "multiplication," as we shall find presently, it can be done with ease, in less than a minute.

33. At first it may seem inaccurate, to have stated [2] that multiplication is a species of addition; since we can know the product of two quantities without having

recourse to that rule, if they are found in the multiplication table. But it must not be forgotten that the multiplication table is actually the result of additions, long since made; without its assistance, to multiply so simple a number as 4 by so small a one as five, we should be obliged to proceed as follows,

performing the addition, as with any other addends.

The multiplication table is due to Pythagoras, a celebrated Greek philosopher, who was born 590 years before Christ.

34. We express multiplication by  $\times$ ; thus  $5 \times 7 =$  35, means that 5 multiplied by 7 are equal to 35, or that the product of 5 and 7, or of 5 by 7, is equal to 35.

When a quantity under the vinculum is to be multiplied by any number, each of its parts must be multiplied—for, to multiply the whole, we must multiply each of its parts:—thus,  $3 \times 7 + 8 - 3 = 3 \times 7 + 3 \times 8 - 3 \times 3$ ; and  $4+5 \times 8+3-6$ , means that each of the terms under the *latter* vinculum, is to be multiplied by each of those under the *former*.

35. Quantities connected by the sign of multiplication may be read in any order; thus  $5 \times 6 = 6 \times 5$ . This will be evident from the following illustration, by which it appears that the very same number may be considered either as  $5 \times 6$ , or  $6 \times 5$ , according to the view we take of it :---

Quantities connected by the sign of multiplication,

he multiplihat the mulditions, long ly so simple e should be

plication,

#### MULTIPLICATION.

are multiplied if we multiply one of the factors; thus  $6 \times 7 \times 3$  multiplied by  $4 = 6 \times 7$  multiplied by  $3 \times 4$ .

36. To prepare him for multiplication, the pupil should be made, on seeing any two digits, to name their product, without mentioning the digits themselves. Thus, a large number having been set down, he may begin with the product of the first and second digits; and then proceed with that of the second and third, &c. Taking

#### 587634925867

for an example, he should say:-40 (the product of 5 and 8); 56 (the product of 8 and 7); 42; 18; &c., as rapidly as he could read 5, 8, 7, &c.

## To Multiply Numbers.

37. When neither multiplicand, nor multiplier ex-

RULE.—Find the product of the given numbers by the multiplication table, page 1.

The pupil should be perfectly familiar with this table. EXAMPLE.—What is the product of 5 and 7? The multiplication table shows that  $5 \times 7=35$ , (5 times 7 are 35).

38. This rule is applicable, whatever may be the *relative* values of the multiplicand and multiplier; that is [Sec. I. 18 and 40], whatever may be the *kind* of units expressed—provided their *absolute* values do not exceed 12. Thus, for instance,  $1200 \times 90$ , would come under it, as well as  $12 \times 9$ ; also  $0009 \times 0.8$ , as well as  $9 \times 8$ . We shall reserve what is to be said of the management of cyphers, and decimals for the next rule; it will be equally true, however, in all cases of multiplication.

39. When the multiplicand does, but the multiplier does not exceed 12-

RULE.-I. Place the multiplier under that denomination of the multiplicand to which it belongs.

II. Put a line under the multiplier, to separate it from the product.

III. Multiply each denomination of the multiplicand by the multiplier-beginning at the right hand side.

IV. If the product of the multiplier and any digit of the multiplicand is less than ten, set it down under that digit; but if it be greater, for every ten it contains carry one to the next produce, and put down only what remains, after deducting the tens; if nothing remains, put down a cypher.

V. Set down the last product in full.

# 40. EXAMPLE. 1.-What is the product of 897351×4?

# 897351 multiplicand.

4 multiplier.

# 3589404 product.

4 times one unit are 4 units; since 4 is less than ten, it gives nothing to be "carried," we, therefore, set it down in the units' place of the product. 4 times 5 are twenty (tens); which are equal to 2 tens of tens, or hundreds to be carried, and no units of tens to be set down in the tens' place of the product-in which, therefore, we put a cypher. 4 times 3 are 12 (hundreds), which, with the 2 hundreds to be earried from the tens, make 14 hundreds; these are equal to one thousand to be carried, and 4 to be set down in the thousands' place of the product. 4 times 7 are 28 (thou-sands), and 1 thousand to be earried, are 29 thousands; or 2 to be carried to the next product, and 9 to be set down 4 times 9 are 36, and 2 are 38; or 3 to be carried, and 8 to be set down. 4 times 8 are 32, and 3 to be carried are 35; which is to be set down, since there is nothing in the next denomination of the multiplicand.

EXAMPLE 2.—Multiply 80073 by 2.

80073

#### 160146

Twice 3 units are 6 units; 6 being less than *ten*, gives nothing to be carried, hence we put it down in the units' place of the quotient. Twice 7 tens are 14 tens; or 1 hundred to be earried, and 4 tens to be set down. As there are no hundreds in the multiplicand, we can have none in the product, except that which is derived from the multiplication of the tens; we accordingly put the 1, to be carried, in the hundreds' place of the product. Since there are no thousands in the multiplicand, nor any to be earried, we put a cypher in that denomination of the product, to keep any significant figures that follow, in their proper places. any digit own under t contains only what remains,

 $1 \times 4?$ 

ian ten, it down in ty (tens); 3 carried, place of pher. -4 reds to be are equal n in the 28 (thousands; or set down and 8 to l are 35; the next

ten, gives he units' hundred re are no the proplication d, in the no thouve put a eep any

#### MULTIPLICATION.

41. REASON OF I.—The multiplier is to be placed under that denomination of the multiplicand to which it belongs; sincethere is then no doubt of its value. Sometimes it is necessary to add cyphers in putting down the multiplier; thus,

EXAMPLE 1.-478 multiplied by 2 hundred-

478 multiplicand. 200 multiplier.

EXAMPLE 2.-559 multiplied by 3 ten-thousandths-539 · multiplicand. 0.0003 multiplier.

REASON OF II.-It is similar to that given for the separating line in subtraction [19].

REASON OF III.—When the multiplicand exceeds a certain amount, the powers of the mind are too limited to allow us to multiply it at once; we therefore multiply its parts, in succession, and add the results as we proceed. It is clear that the sum of the products of the parts by the multiplier, is equal to the product of the sum of the parts by the same multiplier:—thus, 537 ×8 is evidently equal to  $500 \times 8 + 30 \times 8 + 7 \times 8$ For multiplying all the parts, is multiplying the whole; since the whole is equal to the sum of all its parts.

We begin at the right hand side to avoid the necessity of *afterwards* adding together the subordinate products. Thus, taking the example given above; were we to begin at the left hand, the process would be—

| 4         |                  |
|-----------|------------------|
| 3200000=8 |                  |
| 360000 =  | $90000 \times 4$ |
|           | $7000 \times 4$  |
| 1200 =    | $300 \times 4$   |
| 200 =     | $50 \times 4$    |
| 4 =       | $1 \times 4$     |

897351

# 3589404=sum of products.

**REASON OF IV.**—It is the same as that of the fourth part of the rule for addition [9]; the *product* of the multiplier and any denomination of the multiplicand, being equivalent to the sum of a column in addition. It is easy to change the given example to an exercise in addition; for  $807351 \times 4$ , is the same thing as

| 897351  |
|---------|
| 897351  |
| 897351  |
| 897351  |
| 3589404 |

REASON OF V.—It follows, that the last product is to be set down in full; for the tens it contains will not be increased: they may, therefore, be set down at once.

This rule includes all cases in which the *absolute* value of the digits in the multiplier does not exceed 12. Their relative value is not material; for it is as easy to multiply by 2 thousands as by 2 units.

42. To prove multiplication, when the multiplier does not exceed 12. Multiply the multiplicand by the multiplier, minus one; and add the multiplicand to the product. The sum should be the same as the product of the multiplicand and multiplier.

# EXAMPLE.—Multiply 6432 by 7, and prove the roult. 6432 multiplicand.

6=7 (the multiplier) -1

6432 - 38592 multiplicand×6.

7(=6+1) 6432 multiplicand  $\times 1$ .

45024 = 45024 multiplicand multiplied by  $\overline{6}$ ,  $\overline{1}$ =7.

We have multiplied by 6, and by 1, and added the results; but six times the multiplicand, plus once the multiplicand, is equal to seven times the multiplicand. What we obtain from the two processes should be the same, for we have mercly used two methods of doing one thing.

#### MULTIPLICATION.

43. To Multiply when the Quantities contain Cyphers. or Decimals.—The rules already given are applicable: those which follow are consequences of them.

When there are cyphers at the end of the multiplicand (cyphers in the middle of it,' have been already noticed [40])—

RULE.—Multiply as if there were none, and add to the product as many cyphers as have been neglected. For The greater the quantity multiplied, the greater ought to

be the product.

EXAMPLE. — Multiply 56000 by 4.

#### 56000 4

#### 224000

4 times 6 units in the fourth place from the decimal point, are evidently 24 units in the same place;—that is, 2 in the *fifth* place, to be carried, and 4 in the *fourth*, to be set down. That we may leave no doubt of the 4 being in the fourth place of the product, we put three eyphers to the right hand. 4 times 5 are 20, and the 2 to be carried, make 22.

44. If the multiplier contains cyphers—

RULE.—Multiply as if there were none, and add to the product as many cyphers as have been neglected.

The greater the multiplier, the greater the number of times the multiplicand is added to itself; and, therefore, the greater the product.

EXAMPLE.—Multiply 567 by 200.

 $\frac{567}{200}$ 

#### 113400

From what we have said [35], it follows that  $200 \times 7$  is the same as  $7 \times 200$ ; but 7 times 2 hundred are 14 hundred; and, consequently, 200 times 7 are 14 hundred;—that is, 1 in the *fourth* place, to be carried, and 4 in the *third*, to be set down. We add two cyphers, to show that the 4 is in the third place.

45. If both multiplicand and multiplier contain cyphers-

RULE.—Multiply as if there were none in either, and add to the product as many cyphers as are found in both.

Each of the quantities to be multiplied adds cyphers to the product [43 and 44].

#### EXAMPLE.---Multiply 46000 by 800.

# 46000 800

#### 36800000

8 times 6 thousand would be 48 thousand; but 8 hundred times six thousand ought to produce a number 100 times greater—or 48 hundred thousand;—that is, 4 in the seventh place from the decimal point, to be carried, and 8 in the sixth place, to be set down. But, 5 cyphers are required, to keep the 8 in the sixth place. After ascertaining the position of the first digit in the p.oduet—from what the pupil already knows—there can be no difficulty with the other digits.

46. When there are decimal places in the multiplicand—

RULE.—Multiply as if there were none, and remove the product (by means of the decimal point) so many places to the right as there have been decimals neglected.

The smaller the quantity multiplied, the less the product

EXAMPLE.—Multiply 5.67 by 4.

 $5\cdot 67$ 

#### 22.68

4 times 7 hundredths are 28 hundreths; --or 2 tenths, to be carried, a.d.8 hundredths---or 8 in the second place, to the right of the decimal point, to be set down. 4 times 6 tenths are 24 tenths, which, with the 2 tenths to be carried, make 26 tenths; --or 2 units to be earried, and 6 tenths to be set down. To show that the 6 represents tenths, we put the decimal point to the left of it. 4 times 5 units are 20 units, which, with the 2 to be carried, make 22 units.

47. When there are decimals in the multiplier-

RULE.—Multiply as if there were none, and remove the product so many places to the right as there are decimals in the multiplier.

The smaller the quantity by which we multiply, the less must be the result.

product

2 tenths, to d place, to 4 times 6 be carried, 3 tenths to ths, we put nits are 20 nits.

ier nd remove there are

y, the less

#### MULTIPLICATION.

#### Example.—Multiply 563 by .07 563

#### 0.07

#### 39.41

3 multiplied by 7 hundredths, is the same [35] as 7 hundredths multiplied by 3; which is equal to 21 hundredths ;--or 2 tenths to be carried, and 1 hundredth-or 1 in the second place to the right of the decimal point, to be set down. Of course the 4, derived from the next product, must be one place from the decimal point, s.c.

48. When there are decimals in both multiplicand and multiplier-

RULE.—Multiply as if there were none, and move the product so many places to the right as there are decimals in both.

In this case the product is diminished, by the smallness of both multiplicand and multiplier.

EXAMPLE 1.—Multiply 56.3 by .08.

56.3  $\cdot 08$ 

# 4.504

8 times 3 tenths are 2.4 [46]; consequently a quantity one hundred times less than 8-or .08, multiplied by threetenths, will give a quantity one hundred times less than 2.4--or 024; that is, 4 in the third place from the decimal point, to be set down, and 2 in the second place, to be carried.

EXAMPLE 2.---Multiply 5.63 by 0.00005.

#### 5.630.00005

# 0.0002815

49. When there are decimals in the multiplicand, and cyphers in the multiplier ; or the contrary-

RULE .--- Multiply as if there were neither cyphers nor decimals ; then, if the decimals exceed the cyphers, move the product so many places to the right as will be equal to the excess; but if the cyphers exceed the decimals, move it so many places to the left as will be equal to the excess.

The cyphers move the product to the left, the decimals to the right; the effect of both together, therefore, will be equal to the difference of their separate effects.

In the last example we are obliged to add cyphers to the product, to make up the required number of decimal places.

50. When both multiplicand and multiplier exceed 12-

RULE.--I. Place the digits of the multiplier under those denominations of the multiplicand to which they belong.

II. Put a line under the multiplier, to separate it from the product.

III. Multiply the multiplicand, and each part of the multiplier (by the preceding rule [39]), beginning with the digit at the right hand, and taking care to move the product of the multiplicand and each successive digit of the multiplier, so many places more to the left, than the preceding product, as the digit of the multiplier which produces it is more to the left than the significant figure by which we have last multiplied.

IV. Add together all the products; and their sum will be the product of the multiplicand and multiplier.

51. EXAMPLE.-Multiply 5634 by 8073.

| 5634               |      |
|--------------------|------|
| 8073               |      |

30000

(24) 86000 5000

 $(28) \\ 0.0007$ 

7 tens times 4, or [35] 4 times 7 tens are 28 tens :-2 hundreds, to be carried, and 8 tens (8 in the second place from the decimal point) to be set down, &c. 8000 times 4, or 4 times 8000, are 32 thousand :--or 3 tens of thousands to be carried, and 2 thousands (2 in the *fourth* place) to be set down, &c. It is unnecessary to add cyphers, to show the values of the first digits of the different products; as they are sufficiently indicated by the digits above. The products by 3, by 70, and by 8000, are added together in the ordinary way.

52. REASONS OF I. and II.—They are the same as those given for corresponding parts of the preceding rule [41].

REASON OF III.—We are obliged to multiply successively by the parts of the multiplier; since we cannot multiply by the whole at once.

REASON OF IV.—The sum of the products of the multiplicand by the parts of the multiplier, is evidently equal to the product of the multiplieand by the whole multiplier; for, in the example just given,  $5634 \times 8073 = 5634 \times 8000 + 70 + 3 =$ [34]  $5634 \times 8000 + 5634 \times 70 + 5634 \times 3$ . Besides [35], we may consider the multiplicand as multiplier, and the multiplier as multiplicand; then, observing the rule would be the same thing as multiplying the new multiplier into the different parts of the new multiplicand; which, we have already seen [41], is the same as multiplying the whole multiplieand by the multiplier. The example, just given, would become  $8078 \times 5634$ .

> 8073 new multiplicand 5634 new multiplier.

We are to multiply 3, the first digit of the multiplicand, by 5634, the multiplier; then to multiply 7 (tens), the second digit of the multiplicand, by the multiplier; &c. When the multiplier was small, we could add the different producte as we proceeded; but we now require a *separate* addition,—which, however, does not affect the nature, nor the reasons of the process.

53. To prove multiplication, when the multiplier exceeds 12—

RULE.—Multiply the multiplier by the multiplicand; and the product ought to be the same as that of the multiplicand by the multiplier [35]. It is evident, that we could not avail ourselves of this mode of proof, in the last rule [42]; as it would have supposed the pupil to be then able to multiply by a quantity greater than 12 Tal J bc

plicand, by the second When the products as n,—which, ons of the

tiplier ex-

tiplicand; lat of the dent, that oof, in the e pupil to than 12 54. We may prove multiplication by what is called "casting out the nines."

RULE.—Cast the nines from the sum of the digits of the multiplicand and multiplier; multiply the remainders, and cast the nines from the product :—what is now left should be the same as what is obtained, by casting the nines, out of the sum of the digits of the product of the multiplicand by the multiplier.

EXAMPLE 1.-Let the quantities multiplied be 9426 and 3785.

Taking the nines from 9426, we get 3 as remainder. And from 3785, we get 5.

| $\begin{array}{r} 47130\\75408\end{array}$ | 2 2 5 15                  | £   |                     | 0 |
|--|---------------------------|-----|---------------------|---|
| 65982<br>28278                             | 3×5 <del>=</del> 15,<br>● | bei | ng take<br>re left. |   |

Taking the nines from 35677410, 6 are left.

The remainders being equal, we are to presume the multiplication is correct. The same result, however, would have been obtained, even if we had misplaced digits, added or omitted cyphers, or faller, into errors which had counteracted each other :—with ordinary care, however, none of these is likely to occur.

EXAMPLE 2.—Let the numbers be 76542 and 8436.

Taking the nines from 76542, the remainder is 6. Taking them from 8436, it is 3.

> 459252 229626 6×3=18, the 306168 remainder from which is 0. 612336

Taking the nines from 645708312 also, the remainder is 0.

The remainders being the same, the multiplication may be considered right.

EXAMPLE 3.-Let the numbers be 463 and 54.

From 463, the remainder is 4.

From 54, it is 0.

1852  $4\times$  0==0 from which the remainder is 0. 2315

From 25002 the remainder is 0.

The remainder being in each case 0, we are to suppose that the multiplication is correctly performed.

This proof applies whatever be the position of the decimal point in either of the given numbers.

55. To understand this rule, it must be known that "a number, from which 9 is taken as often as possible, will leave the same remainder as will be obtained if 9 be taken as often as possible from the sum of its digits."

Since the pupil is not supposed, as yet, to have learned division, he cannot use that rule for the purpose of casting out the nines;— nevertheless, he can easily effect this object.

Let the given number be 563. The sum of its digits is 5+6+3, while the number itself is 500+60+3.

First, to take 9 as often as possible from the sum of its digits. 5 and 6 are 11; from which, 9 being taken, 2 are left. 2 and 3 are 5, which, not containing 9, is to be set down as the *remainder*.

Next, to take 9 as often as possible from the number itself.  $563 = 500 + 60 + 3 = 5 \times 100 + 6 \times 10 + 3 = 5 \times 99 + 1 + 6 \times 94 + 1 + 3$ ,= (if we remove the vinculum [34]),  $5 \times 99 + 5 + 6 \times 9 + 6 + 3$ . But any number of nines, will be found to be the product of the same number of ones by 9:—thus 999=111 \times 9; 99=11 \times 9; and 9=1 \times 9. Hence  $5 \times 99$  expresses a certain number of nines—being  $5 \times 11 \times 9$ ; it may, therefore, be cast out; and for a similar reason,  $6 \times 9$ ; after which, there will then be left 5 + 6 + 3—from which the nines are still to be rejected; but, as this is the sum of the digits, we must, in easting the nines out of it, obtain the same remainder whether we east the nines out of the number itself, or out of the sum of its digits."

Neither the above, nor the following reasoning can offer any difficulty to the pupil who has made himself as familiar with the use of the signs as he ought: they will both, on the contrary, serve to show how much simplicity, is derived from the use of characters expressing, not only quantities; but processes; for, by means of such characters, a long series of argumentation may be seen, as it were, at a single glance.

56. "Casting the nines from the factors, multiplying the resulting remainders, and easting the nines from this product,

to suppose

ion of the

nown that s possible, ained if 9 its digits." ve learned urpose of can easily

s digits is

sum of its ken, 2 are to be set

mber itself.  $+1+6 \times$   $\times 99+5+$ und to be hus 999=expresses ay, thereter which, nines are digits, we digits, we remainder remainder

ying the product, will leave the same remainder, as if the nines were cast from the product of the factors,"—provided the multiplication has been rightly performed.

To show this, set down the quantities, and take away the nines, as before. Let the factors be  $573 \times 464$ .

Casting the nines from 5+7+3 (which we have just seen is the same as casting the nines from 573), we obtain 6 as *remainder*. Casting the nines from 4+6+4, we get 5 as *remainder*. Multiplying 6 and 5 we obtain 30 as product; which, being equal to  $3\times10=3\times9+1=3\times9+3$ , will, when the nines are taken away, give 3 as *remainder*.

We can show that 3 will be the remainder, also, if we cast the nines from the product of the factors;—which is effected by setting down this product; and taking, in succession, quantities that are equal to it—as follows,

| $573 \times 464$ (the product of t                  |                   |
|---|-------------------|
| $5 \times 100 + 7 \times 10 + 3 \times 4 \times 10$ | $00+6\times10+4=$ |
|   |                   |

| $5 \times 99 + 1 + 7 \times 9 + 1 + 3$ | Х | $4 \times 99 + 1 + 6 \times 9 + 1 + 4 =$ |
|--|---|--|
| $5 \times 99 + 5 + 7 \times 9 + 7 + 3$ | × | $4 \times 99 + 4 + 6 \times 9 + 6 + 4$   |

 $5 \times 99$ , as we have seen [55], expresses a number of nines; it will continue to do so, when multiplied by all the quantities under the second vinculum, and is, therefore, to be cast out; and, for the same reason,  $7 \times 9$ .  $4 \times 99$  expresses a number of nines; it will continue to do so when multiplied by the quantities under the first vinculum, and is, therefore, to be east out; and, for the same reason,  $6 \times 9$ . There will then be left, only  $5+7+3 \times 4+6+4$ ,—from which the nines are still to be cast out, the *remainders* to be multiplied together, and the nines to be east from their product;—but we have done all this already, and obtained 3, as the remainder.

# Contractions in Multiplication.

58. When it is not necessary to have as many decimal places in the product, as are in both multiplicand and multiplier—

RULE.—Reverse the multiplier, putting its units' place under the place of that denomination in the multiplicand, which is the lowest of the required product.

Multiply by cach digit of the multiplier, beginning with the denomination over it in the multiplicand; but adding what would have been obtained, on multiplying the preceding digit of the multiplicand—unity, if the number obtained would be between 5 and 15; 2, if between 15 and 25; 3, if between 25 and 35; &c.

Let the lowest denominations of the products, arising from the different digits of the multiplicand, stand in the same vertical column.

Add up all the products for the total product; from which cut off the required number of decimal places.

59. EXAMPLE 1.—Multiply 5.6784 by 9.7324, so as to have four decimals in the product.

| at                     |                  |

so as to od.

5

9 in the multiplier, expresses units; it is therefore put ander the *fourth* decimal place of the multiplicand—that being the place of the lowest decimal required in the product.

In multiplying by each succeeding digit of the multiplier, we neglect an additional digit of the multiplicand; because, as the multiplier decreases, the number multiplied must increase-to keep the lowest denomination of the different products, the same as the lowest denomination required in the total product. In the example given, 7 (the second digit of the multiplier) multiplied by 8 (the second digit of the multiplicand), will evidently produce the same denomination as 9 (one denomination higher than the 7), multiplied by 4 (one denomination lower than the 8). Were we to multiply the lowest denomination of the multiplicand by 7, we should get [46] a result in the fifth place to the right of the decimal point ; which is a denomination supposed to be, in the present instance, too inconsiderable for notice-since we are to have only four decimals in the product. But we add unity for every ten that would arise, from the multipl cation of an add'tional digit of the multiplicand; since every such ten constitutes one, in the lowest denomination of the required product. When the multiplication of an additional digit of the multiplicand would give more than 5, and less than 15; it is nearer to the truth, to suppose we have 10, than either 0, or 20; and therefore it is more correct to add 1, than either 0, or 2. When it would give more than 15, and less than 25, it is nearer to the truth to suppose we have 20, than either 10, or 30; and, therefore it is more correct to add 2, than 1, or 3; &c. We may consider 5 either as 0, or 10; 15 either as 10, or 20; &c.

On inspecting the results obtained by the abridged, and ordinary methods, the difference is perceived to be inconsiderable. When greater accuracy is desired, we should proceed, as if we intended to have more decimals in the product, and afterwards reject those which are unnecessary.

EXAMPLE 2.—Multiply 8.76534 by 5764, so as to have 3 decimal places.

| 8.76532<br>4675   |
|---|
| $   \begin{array}{r}     4383 \\     613 \\     52 \\     3   \end{array} $ |
| 5.051   |

There are no units in the multiplier; but, as the rule directs, we put its units' *place* under the third decimal place of the multiplicand. In multiplying by 4, since there is no digit over it in the multiplicand, we merely set down what would have resulted from multiplying the preceding denomination of the multiplicand.

| $284220 \\ 33159 \\ 1421 \\ 47$ |
| ·318847                         |

We have put the units' *place* of the multiplier under the sith decimal *place* of the multiplicand, adding a cypher, or supposing it to be added.

EXAMPLE 4.—Multiply 84.6732 by .0056, sc as to have four decimal places.

| 4234<br>508 |
|-------------|
| •4742       |

EXAMPLE 5.—Multiply 23257 by 243, so as to have four decimal places. 23257

 $\begin{array}{r}
 342 \\
 \overline{\phantom{0}405} \\
 93 \\
 7 \\
 \overline{\phantom{0}505} \\
 \overline{\phantom{0}505} \\
 \end{array}$ 

We are obliged to place a cypher in the product, to make up the required number of decimals.

60. To multiply by a Composite Number-RULE.-Multiply, successively, by its factors.

s the rule imal place there is no own what ling deno-

to have 6

under the sypher, or

s to have

have four

to make

EXAMPLE.—Multiply 732 by 96.  $96 = 8 \times 12^{\circ}$  therefore  $732 \times 9 = 732 \times 8 \times 12$ . [35].

132 8

5856, product by 8. 12

## 70272, product by $8 \times 12$ , or 96.

If we multiply by 8 only, we multiply by a quantity 12 times too small; and, therefore, the product will be 12 times less than it should. We rectify this, by making the product 12 times greater—that is, we multiply it by 12.

61. When the multiplier is not exactly a Composite Number—

RULE.—Multiply by the factors of the nearest composite; and add to, or subtract from the last product, so many times the multiplice 1, as the assumed composite is less or greater than the given multiplier

EXAMPLE 1.—Multiply 927 by 87.

 $87 = 7 \times 12 + 3$ ; therefore  $927 \times 87 = 927 \times 7 \times 12 + 3 = 927 \times 7 \times 12 + 927 \times 3$ . [34].

$$\begin{array}{r} 527\\ \hline 7\\ \hline 6489 = 927 \times 7.\\ \hline 12\\ \hline 77868 = 927 \times 7 \times 12.\\ 2781 = 927 \times 3\end{array}$$

 $80649 = 927 \times 7 \times 12 + 927 \times 3$ , or  $927 \times 87$ .

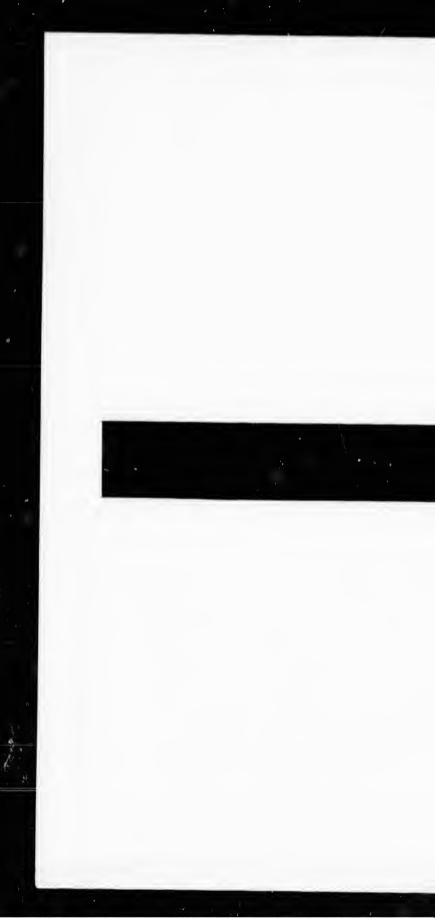

If we multiply only by 84  $(7 \times 12)$ , we take the number to be multiplied 3 times less than we ought; this is rectified, by adding 3 times the multiplicand.

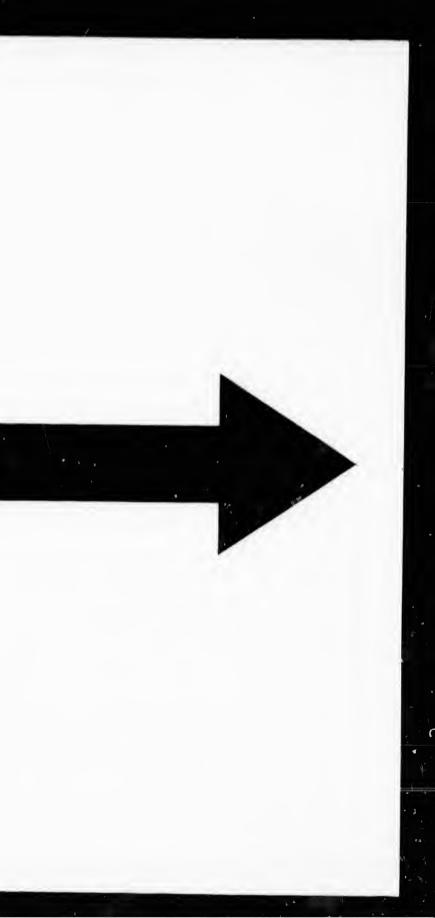

EXAMPLE 2.—Multiply 432 by 79.  $79 = 81 - 2 = 9 \times 9 - 2$ ; therefore  $432 \times 79 = 432 \times 9 \times 9 - 2 = 432 \times 9 \times 9 - 432 \times 2$ . 4329

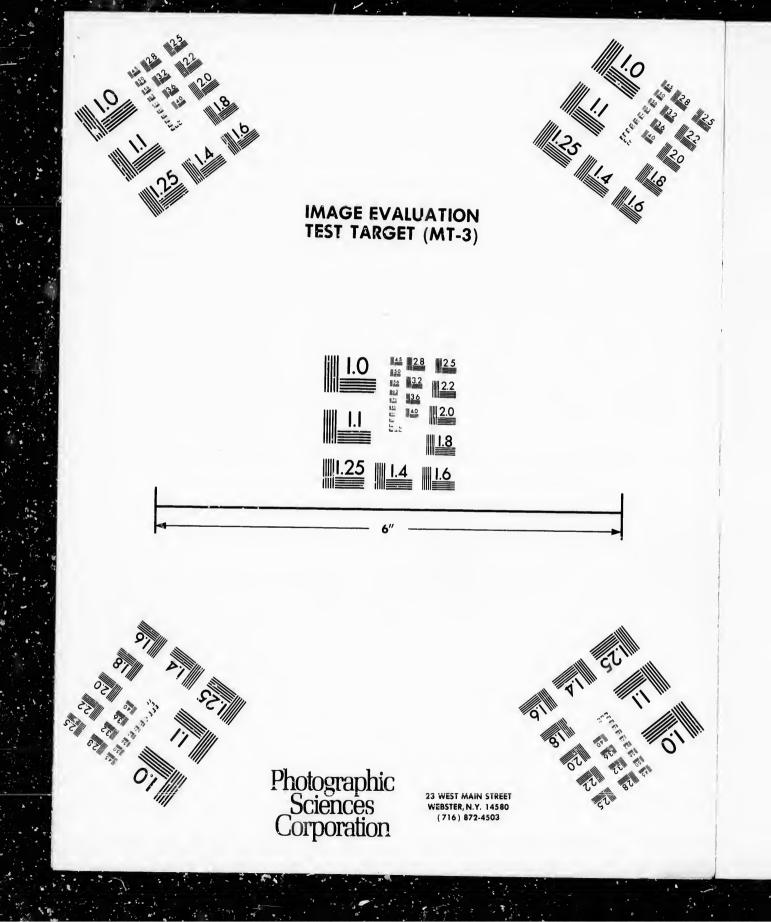

> $3888 = 432 \times 9.$ 9  $34392 = 432 \times 9 \times 9.$

 $864 = 432 \times 2.$ 

 $34128 = 432 \times 9 \times 9 - 432 \times 2$ , or  $432 \times 79$ .

In multiplying by 81, the composite number, we have taken the number to be multiplied twice too often; but the inaccuracy is rectified by subtracting twice the multiplicand from the product.

56

57 58

59

62. This method is particularly convenient, when the multiplier consists of nines.

To Multiply by any Number of Nines,-

RULE.—Remove the decimal point of the multiplicand so many places to the right (by adding cyphers if necessary) as there are nines in the multiplier; and subtract the multiplicand from the result.

. EXAMPLE.--Multiply 7347 by 999.

 $7347 \times 999 = 7347000 - 7347 = 7339653.$ 

We, in such a case, merely multiply by the next higher convenient composite number, and subtract the multiplicand so many times as we have taken it too often; thus, in the example just given—

 $7247 \times 999 = 7347 \times 1000 - 1 = 7347000 - 7347 = 7339653.$ 

63. We may sometimes abridge multiplication by considering a part or parts of the multiplier as produced by multiplication of one or more other parts.

EXAMPLE.—Multiply 57839268 by 62421648. The multiplier may be divided as follows :—6, 24, 216, and 48.

| 6 = 6               |   |
|---------------------|---|
| $24 = 6 \times 4$   |   |
| $216 = 24 \times 9$ | ) |
| $48 = 24 \times 2$  | 2 |

| 2610 100 10705004 | product by 48.            |

3610422427673664 product by 62421648.

The product by 6 when multiplied by 4 will give the product by 24; the product by 24, multiplied by 9, will give the product by 216—and, multiplied by 2, the product by 48.

64. There can be no difficulty in finding the places of the first digits of the different products. For when there are neither cyphers nor decimals in the multiplicand and *during* multiplication, we may suppose that there are neither [48, &c.]—the lowest denomination of each pro-

duct, will be the same as the lowest denomination of the multiplier that produced it ;—thus 12 units multiplied by 4 units will give 48 units ; 14 units multiplied by 4 tens will give 56 tens ; 124 units multiplied by 35 units will be 4340 units, &c. ; and, therefore, the beginning of each product—if a significant figure—must stand under the lowest digit of the multiplier from which it arises. When the process is finished, cyphers or decimals, if necessary, may be added, according to the rules already given.

The vertical dotted lines show that the places of the lowest digits of the respective multipliers, or those parts into which the whole multiplier has been divided, and the lowest digits of their resulting products are—as they ought to be—of the same denomination.

48 being of the denomination units, when multiplied into 8 units, will produce units; the first digit, therefore, of the product by 48 is in the units' place. 216, being of the denomination hundreds when multiplied into units will give hundreds; hence the first digit of the product by 216 will be in the hundreds' place, &c. The parts into which the multiplier is divided are, in reality,

 $\left. \begin{array}{c} 60000000\\ 2400000\\ \cdot 21600 \end{array} \right\} = 69$ 

 $21600 \\ 48 \end{bmatrix} = 62421648$ , the whole multiplier.

We shall give other contractions in multiplication hereafter, at the proper time.

65 When the pupil is familiar with multiplication, in working, for instance, the following example,

897351, multiplicand.

4, multiplier.

# 3589404, product.

He should say:—4 (the product of 4 and 1), 20 (the product of 4 and 5), 14 (the product of 4 and 3 plus 2, to be carried), 29, 38, 35; at the same time putting down the units, and carrying the tens of each.

# QUESTIONS TO BE ANSWERED BY THE PUPIL.

1. What is multiplication ? [24].

2. What are the multiplicand, multiplier, and product? [24].

3. What are factors, and submultiples ? [24].

4. What is the difference between prime and composite numbers [25]; and between those which are prime and those which are composite to *each other*? [27].

5. What is the measure, aliquot part, or submultiple of a quantity? [26].

6. What is a multiple ? [29].

7. What is a common measure ? [27].

8. What is meant by the greatest common measure? [28].

9. What is a common multiple ? [30].

10. What is meant by the *least* common multiple? [30].

11. What are equimultiples ? [31].

12. Does the use of the multiplication table prevent multiplication from being a species of addition ? [33].

13. Who first constructed this table ? [33].

14. What is the sign used for multiplication? [34].

15. How are quantities under the vinculum affected by the sign of multiplication ? [34].

16. Show that quantities connected by the sign of multiplication may be read in any order ? [35].

17. What is the rule for multiplication, when neither multiplicand nor multiplier exceeds 12? [37].

18. What is the rule, when only the multiplicand exceeds 12? [39].

19. What is the rule when both multiplicand and multiplier exceed 12 ? [50].

20. What are the rules when the multiplicand, multiplier, or both, contain cyphers, or decimals ? [43, &c.]: and what are the reasons of these, and the preceding rules? [41, 43, &c., 52].

 How is multiplication proved ? [42 and 53].
 Explain the method of proving multiplication, by " casting out the nines [54];" and show that we can cast the nines out of any number, without supposing a knowledge of division. [55].

23. How do we' multiply so as to have a required number of decimal places ? [58].

24. How do we multiply by a composite number [60]; or by one that is a little more, or less than a composite number ? [61].

25. How may we multiply by any number of mines? 62.

26. How is multiplication very briefly performed ? [65].

# SIMPLE DIVISION.

tl

is

**a**4

W.

vi

tie

Wi

25

div

66. Simple Division is the division of abstract numbers, or of those which are applicate, but contain only onc denomination.

Division enables us to find out how often one number, called the divisor, is contained in, or can be taken from another, termed the dividend ;---the number expressing how often is called the quotient. Division also enables us to tell, if a quantity be divided into a certain number of equal parts, what will be the amount of each.

When the divisor is not contained in the dividend any number of times exactly, a quantity, called the remainder, is left after the division.

67. It will help us to understand how greatly division abbreviates subtraction, if we consider how long a process would be required to discover-by actually suben neither

ltiplicand

cand and

und, mul-43, &c.]: preceding

53]. plication; t we can posing a

required

cr [60]; omposite

nines ?

formed ?

ct numun orly

en from pressing enables number

ividend ed the

y divilong a lv subtracting it—how often 7 is contained in 8563495724, while, as we shall find, the same thing can be effected by *division*, in less than a minute.

68. Division is expressed by  $\div$ , placed between the dividend and divisor; or by putting the divisor under the dividend, with a separating line between :---thus  $6\div 3=2$ , or  $\frac{6}{3}=2$  (read 6 divided by 3 is equal to 2)

means, that if 6 is divided by 3, the quotient will be 2.

69. When a quantity under the vinculum is to be divided, we must, on removing the vinculum, put the divisor under each of the terms connected by the sign of addition, or subtraction, otherwise the value of what was to be divided will be changed;—thus 5+6-7; 3= $\frac{5}{3}+\frac{6}{3}-\frac{7}{3}$ ; for we do not divide the whole unless

we divide all its parts.

The line placed between the dividend and divisor occasionally assumes the place of a vinculum; and therefore, when the quantity to be divided is subtractive, it will sometimes be necessary to change the signs—as already directed [16]:—thus  $\frac{6}{2} + \frac{13 - 3}{2} = \frac{6 + 13 - 3}{2}$ ; but  $\frac{27}{3} - \frac{15 - 6 + 9}{3} = \frac{27 - 15 + 6 - 9}{3}$ . For when, as in these cases, all the terms are put under the vinculum, the effect—as far as the subtractive signs are concerned is the same as if the vinculum were removed altogether; and then the signs should be changed back again to what they must be considered to have been before the vinculum was affixed [16].

When quantities connected by the sign of multiplication are to be divided, dividing any one of the factors, will be the same as dividing the product; thus,  $5 \times 10 \times$  $25 \div 5 = \frac{5}{5} \times 10 \times 25$ ; for each is equal to 250.

# To Divide Quantities.

70. When the divisor does not exceed 12, nor the dividend 12 times the divisor

#### DIVISION.

RULE.—I. Find by the multiplication table the greatest number which, multiplied by the divisor, will give a product that does not exceed the dividend : this will be the quotient required.

II. Subtract from the dividend the product of this number and the divisor; setting down the remainder, if any, with the divisor under it, and a line between them.

EXAMPLE.—Find how often 6 is contained in 58; or, in other words, what is the quotient of 58 divided by 6.

We learn 'rom the multiplication table that 10 times 6 are 60. Bz' is greater than 58; the latter, therefore, does not contain 6 10 times. We find, by the same table, that 9 times 6 are 54, which is less than 58:— consequently 6 is contained 9, but not 10 times in 58; hence 9 is the quotient; and 4—the difference between 9 times 6 and the given number—is the *remainder*.

The total quotient is  $9 + \frac{4}{6}$ , or  $9\frac{4}{6}$ ; that is,  $\frac{58}{6} = 9\frac{4}{6}$ .

If we desire to carry the division farther, we can effect it by a method to be explained presently.

71. REASON OF I.—Our object is to find the greatest number of times the divisor can be taken from the dividend; that is, the greatest multiple of 6 which will not exceed the number to be divided. The multiplication table shows the products of any two numbers, neither of which exceeds 12; and therefore it enables us to obtain the product we require; this must not exceed the dividend, nor, being subtracted from it, leave a number equal to, or greater than, the divisor. It is hardly necessary to remark, that the divisor would not have been subtracted as often as possible from the dividend if a number equal to or greater than it were left; nor would the quotient answer the question, how often the divisor eould be taken from the dividend.

REASON OF II.—We subtract the product of the divisor and quotient from the dividend, to learn, if there be any remainder, what it is. When there is a remainder, we in reality suppose the dividend divided into two parts; one of these is equal to the product of the divisor and quotient—and this we actually divide; the other is the difference between that product and the given dividend—this we express, by the notation already explained, as still to be divided. In the example given,  $\frac{58}{6} = \frac{54+4}{6} = \frac{54}{6} + \frac{4}{6} = 9 + \frac{4}{6}$ .

but the

RULE.—I. Set down the dividend with a line under it to separate it from the future quotient: and put the divisor to the left hand side of the dividend, with a line between them.

II. Divide the divisor into all the denominations of the dividend, beginning with the highest.

III. Put the resulting quotients under those denominations of the dividend which produced them.

IV. If there be a remainder, after subtracting the product of the divisor and any denomination of the quotient from the corresponding denomination of the dividend, consider it ten times as many of the next lower denomination, and add to it the next digit of the dividend.

V. If any denomination of the dividend (the preceding remainder, when there is one, included) does not contain the divisor, consider it ten times as many of the next lower, and add to it the next digit of the dividend—putting a cypher in the quotient, under the digit of the dividend thus reduced to a lower denomination, unless there are no significant figures in the quotient at the same side of, and farther removed from the decimal point.

VI. If there be a remainder, after dividing the "units of comparison," set it down—as already directed [70]—with the divisor under it, and a separating line between them; or, writing the decimal point in the quotient, proceed with the division, and consider each vemainder ten times as many of the next lower denonination; proceed thus until there is no remainder, or antil it is so triffing that it may be neglected without inconvenience.

# 73. EXAMPLE.—What is the quotient of 64456÷7? Divisor 7)64456 dividend. 9208 quotient.

6 tens of thousands do not contain 7, even once ten thousand times; for ten thousand times 7 are 70 thousand, which is greater than 60 thousand; there is, therefore, no digit to be put in the ten-thousands' place of the quotient—we do not, however, put a cypier in that place, since no digit

#### DIVISION.

of the quotient can be further removed from the decimal point than this cypher; for it would, in such a case, produce no effect [See. I. 28]. Considering the 6 tens of thousands as 60 thousands, and adding to these the 4 thousands already in the dividend, we have 64 thousands. 7 will "go" into (that is, 7 can be taken from) 64 thousand, 9 thousand times; for 7 times 9 thousand are 63 thousand-which is less than 64 thousand, and therefore is not too large; it does not leave a remainder equal to the divisor-and therefore it is not too small :- 9 is to be set down in the thousands' place of the quotient; and the 4 already in the dividend being added to ono thousand (the difference between 64 and 63 thousand) considered as ten times so many hundreds, we have 14 hundreds. 7 will go 2 hundred times into 14 hundreds, and leave no remainder; for 7 times 2 hundreds are exactly 14 hundreds :-- 2 is, therefore, to be put in the hundreds' place of the quotient, and there is nothing to be earried. 7 will not go into 5 tens, even once ten times; since 10 times 7 are 7 tens, which is more than 5 tens. But considering the 5 tens as 50 units, and adding to them the other 6 units of the dividend, we have 50 nnits. 7 will go into 56, 8 times, leaving no remainder. As the 5 tens gave no digit in the tens' place of the quotient, and there are significant figures further removed from the decimal point than this denomination of the dividend, we have been obliged to use a cypher. The division being finished, and no remainder left, the required

quotient is found to be 9208 exactly; that is,  $\frac{64456}{7} = 9208$ .

74. EXAMPLE 2.—What is the quotient of 73268, divided by 6?

#### 6)73268

# 122112

We may set down the 2 units, which remain after the units of the quotient are found, as represented; or we may proceed with the division as follows—

#### 6)73268

# 12211·333, &c.

Considering the 2 units, left from the units of the dividend, as 20 tenths, we perceive that 6 will go into them three tenths times, and leave 2 tenths—since 3 tenths times 6 (=6 times 3 tenths [35]) are 18 tenths:—we pat 3 in the tenths' place of the quotient, and consider the 2 tenths remaining, as 20 hundredths. For similar reasons, 6 win go into 20 hundredths 3 hundredths times, and leave 2 hunt e tl

tl

#### DIVISION.

dredths. Considering these 2 hundredths as 20 thousandths, they will give 3 thousandths as quotient, and 2 thousandths as remainder, &c. The same remainder, constantly recurring, will evidently produce the same digit in the successive denominations of the quotient; we may, therefore, at once put down in the quotient as many threes as will leave the final remainder so small, that it may be neglected.

# 75. EXAMPLE 3 .- Divide 47365 by 12.

#### 12)47365

# · 3947.08, &c.

In this example, the one unit left (after obtaining the 7 in the quotient) even when considered as 10 tenths, does not contain 12:—there is, therefore, nothing to be set down in the tenths' place of the quotient—except a cypher, to keep the following digits in their proper places. The 10 tenths are by consequence to be considered as 100 hundredths, 12 will go into 100 hundredths 8 hundredths times, &c.

This may be applied to the last rule [70], when we desire to continue the division.

EXAMPLE .-- Divide 8 by 5.

 $8 \div 5 = 1_{\$}^{3}$ , or 1.37, &c.

76. When the pupil fully understands the real denominations of the dividend and quotient, he may proceed, for example, with the following

#### 5)46325

In this manner :--5 will not go into 4. 5 into 46, 9 times and 1 over (the 46 being of the denomination to which 6 belongs [thousands], the first digit of the quotient is to be put under the 6---that is, under the denomination which produced it). 5 into 13, twice and 3 over. 5 into 32, 6 times and 2 over. 5 into 25, 5 times and no remainder.

When the divisor does not exceed 12, the process is called *short* division.

77. REASON OF I.—In this arrangement of the quantities which is merely a matter of convenience—the values of the digits of the quotient are ascertained, both by their position with reference to the digits of the dividend, and to their own decimal point. The separating lines prevent the dividend, divisor, or quotient from being in any way mistaken.

REASON OF II.—We divide the divisor successively into all the parts of the dividend, because we cannot divide it at once into the whole:—the sum of the numbers of times it can be subtracted from these parts is evidently equal to the number of times it can be subtracted from their sum. Thus, if 5 goes into 500, 100 times, into 50, 10 times, and into 5, once; it will go into 500+50+5 (=555), 100+10+1 (=111) times.

The pupil perceives by the examples given above, that, in dividing the divisor successively into the parts of the dividend, each, or any of these parts does not necessarily consist of one or more digits of the dividend. Thus, in finding, for example, the quotient 64456 + 7, we are not obliged to consider the parts as 60000, 4000, 400, 50, and 6 :- on the contrary, to render the dividend suited to the process of division, we alter its form, while, at the same time, we leave its value unchanged; it becomes

Thousands. Hundreds. Tens. Units. 63 14 0 Each part being divided by 7, the different portions of the 56 (=64456). dividend, with their respective quotients, will b

| Thousands.<br>7 63 | Hundreds.   | Tens. | Units<br>56 |  |        |  |
|--------------------|-------------|-------|-------------|--|--------|--|
| 9                  | 2           | 0     |             | and the second s | 64456. |  |
| havin at 41.       | - 1 - 0 - 1 |       | ð           | 2002   | 9208.  |  |

We begin at the left hand side, because what remains of the higher denomination, may still give a quotient in a lower; and the question is, how often the divisor will go into the dividend-its different denominations being taken in any convenient way. We cannot know how many of the higher we shall have to add to the lower denominations, unless we begin

REASON OF III .- Each digit of the quotient is put under that denomination of the dividend which produced it, because it belongs to that denomination; for it expresses what number of times (indicated by a digit of that denomination) the divisor tan be taken from the corresponding part of the dividend :---thus the tens of the quotient express how many tens of times the divisor can be taken from the tens of the dividend; the bundreds of the quotient, how many hundreds of times it can be taken from the hundreds, &c.

REASON OF IV .-- Since what is left belongs to the total remainder, it must be added to it; but unless considered as of a lower denomination, it will give nothing further in the quotient.

REASON OF V .- We are to look upon the remainder as of the highest denomination capable of giving a quotient; and though it may not contain the divisor a number of times expresse. by a digit of one denomination, it may contain it some number of times expressed by one that is lower.

The true remainder, after subtracting each product, is the whole remainder of the dividend; but we "bring down" only to much of it as is necessary for our present object. Thus, in looking for a digit in the hundreds' place of the quotient, it will not be necessary to take into account the tens, or units of the dividend; since they cannot add to the number of hundreds of times the divisor may be taken from the dividend.

b, is the n'' only Thus, in tient, it or units of hunnd.

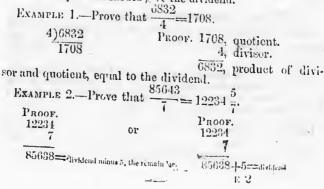

REASON OF VI.—We may continue the process of division, if we please, as long as it is possible to obtain quotients of any denomination. Quotients will be produced although there are no longer any significant figures in the dividend, to which we can add the successive remainders.

78. The smaller the divisor the larger the quotient for, the smaller the parts of a given quantity, the greater their number will be; but 0 is the least possible divisor, and therefore any quantity divided by 0 will give the largest possible quotient—which is *infinity*. Hence, though any quantity multiplied by 0 is equal to 0, any number divided by 0 is equal to an infinite number.

It appears strange, but yet it is true, that  $\frac{5}{0} = \frac{1}{0}$ ; for each is equal to the greatest possible number, and one, therefore, cannot be greater than another—the apparent contradiction arises from our being unable to form a true conception of an *infinite* quantity. It is necessary to bear in mind also that 0, in this case, indicates a quantity infinitely small, rather than absolutely nothing.

79. To prove Division.—Multiply the quotient by the divisor; the product should be equal to the dividend, minus the remainder, if there is one.

For, the dividend, exclusive of the remainder, contains the divisor a number of times indicated by the quotient; if, therefore, the divisor, is taken that number of times, a quantity equal to the dividend, minus the remainder, will be produced. It follows, that adding the remainder to the product of the divisor and quotient should E we the dividend.

DIVISION.

When the dividend, divisor, or both contain 80. cyphers or decimals .- The rules already given are applicable : those which follow are consequences of them.

When the dividend contains cyphers-

RULE.-Divide as if there were none, and remove the quotient so many places to the left as there havo been cyphers neglected.

The greater the dividend, the greater ought to be the quotient; since it expresses the number of times the divisor can be subtracted from the dividend. Hence, if 8 will go into 58 7 times, it will go into 5600 (a quantity 100 tin.s greater than 56) 100 times more than 7 times-or 700 times.

EXAMPLE 1.—What is the quotient of 568000 + 4 ?  $\frac{568}{4}$  == 142; therefore  $\frac{568000}{4}$  = 142000.

EXAMPLE 2.—What is the quotient of  $4060000 \div 5$ ?  $\frac{406}{5}$ =81.2; therefore  $\frac{4060000}{5}$ =812000 [Sec. I. 39.].

81. When the divisor contains cyphers-

RULE .- Divide as if there were none, and move the quotient so many places to the right as there are cyphers in the divisor.

n

vi

qı

The greater the divisor, the smaller the number of times it can be subtracted from the dividend. If, for example, 6 can be taken from a quantity any number of times, 100 times 6 can be taken from it 100 times less often.

**EXAMPLE.**—What is the quotient of  $\frac{56}{800}$ ?  $\frac{56}{8} = 7$ ; therefore  $\frac{56}{800} = 07$ .

#### DIVISION.

82. If both dividend and divisor contain cyphers-

RULE.—Divide as if there were none, and move the quotient a number of places equal to the difference between the numbers of cyphers in the two given quantities:—if the cyphers in the dividend exceed those in the divisor, move to the left; if the cyphers in the divisor exceed those in the dividend, move to the right.

We have seen that the effect of cyphers in the dividend is to move the quotient to the left and of cyphers in the divisor, to move it to the right; when, therefore, both causes act together, their effect must be equal to the difference between their separate effects.

#### EXAMPLES.

| $7)63 \over 9$ | $7)6300 \\ 900$ | $70)63 \\ \hline 0.9$ | $(4) \\ 70)6300 \\ 90$ | (5)<br>700 <u>)630</u> | (6)<br>700 <u>)6300</u> |  |
|----------------|-----------------|-----------------------|------------------------|------------------------|-------------------------|--|
| -              |                 | 00                    | 30                     | 0.9                    | Q                       |  |

In the sixth example, the *difference* between the numbers of cyphers being = 0, the quotient is moved neither to the right nor the left.

83. If there are decimals in the dividend-

RULE.—Divide as if there were none, and move the quotient so many places to the right as there are decimals.

The smaller the dividend, the less the quotient.

**EXAMPLE.**—What is the quotient of  $048 \div 8$ ?

 $\frac{48}{8} = 6$ , therefore  $\frac{.048}{8} = .006$ .

84. If there are decimals in the divisor-

RULE.—Divide as if there were none, and move the quotient so many places to the left as there are decimals.

The smaller the divisor, the greater the quotient.

EXAMPLE.—What is the quotient of  $54 \div 006$ ?

$$\frac{54}{6} = 9$$
, therefore  $\frac{54}{.006} = 9000$ .

85. If there are decimals in oth dividend and di-

RULE.—Divide as if there were none, and move the quotient a number of places equal to the difference

#### DIVISION.

between the numbers of decimals in the two given quantities:—if the decimals in the dividend exceed those in the divisor, move to the right; if the decimals in the divisor exceed those in the dividend, move to the left.

We have seen that decimals in the dividend move the quotient to the right, and that decimals in the divisor move it to the left; when, therefore, both causes act together, the effect must be equal to the difference between their separate effects.

#### EXAMPLES.

| (1)<br>5)45<br>$\overline{9}$ | $(2)$ $5) \cdot 45$ $\cdot 09$ | (8)<br>•05)45<br>900 | $(4)$ $\cdot 5) \cdot 045$ $\overline{\cdot 09}$ | (5)<br>•005) 450<br>90000 | (6)<br>$\cdot 05) \cdot 45$<br>$\overline{9 \cdot 00}$ |
|-------------------------------|--------------------------------|----------------------|--|---------------------------|--|
|                               |                                |                      |  | 00000                     | 00.00  |

86. If there are cyphers in the dividend, and decimals in the divisor-

RULE.—Divide as if there were neither, and move the quotient a number of places to the left, equal to the number of both cyphers and decimals.

Both the cyphers in the dividend, and the decimals in the divisor increase the quotient.

EXAMPLE.—What is the quotient of  $270 \div \cdot 03$ ;  $\frac{27}{3} = 9$ , therefore,  $270 \div \cdot 03 = 9000$ .

87. If there are decimals in the dividend, and cyphers in the divisor-

RULE.—Divide as if there were neither, and move the quotient a number of places to the right equal to the number of both cyphers and decimals.

Both the decimals in the dividend, and the cyphers in the divisor diminish the quotient.

# EXAMPLE.—What is the quotient of $\cdot 18 \div 20$ ? $\frac{18}{2} = 9$ , therefore $\frac{\cdot 18}{20} = \cdot 009$ .

The rules which relate to the management of cyphers and decimals, in multiplication and in division—though numerous—will be very easily remembered, if the pupil merely considers what *ought* to be the effect of either

88. When the divisor exceeds 12-

8

The process used is called long division; that is, we perform the multiplications, subtractions, &c., in full, and not, as before, merely in the mind. This will be understood better, by applying the method of long division to an example in which-the divisor not being gr ater than 12-it is unnecessary.

| Short Division :<br>)5763472 | the same by | Long Division.         |
|------------------------------|-------------|------------------------|

|                              |             | 16                     |
|                              |             | 34                     |
|                              |             | 32                     |
|                              |             | 27                     |
|                              |             | 24                     |
|                              |             | 32                     |
|                              |             | 32                     |

In the second method, we multiply the divisor by the different parts of the quotient, and in each case set down

#### DIVISION

the product, subtract it from the corresponding portion of the dividend, write the remainder, and bring down the required digits of the dividend. All this must be done when the divisor becomes large, or the memory would be too heavily burdened.

89. RULE-I. Put the divisor to the left of the dividend, with a separating line.

II. Mark off, by a separating line, a place for the quotient, to the right of the dividend.

III. Find the smallest number of digits at the left hand side of the dividend, which expresses a quantity not less than the divisor.

IV. Put under these, and subtract from them, the greatest multiple of the divisor which they contain; and set down, underneath, the remainder, if there is any. The digit by which we have multiplied the divisor is to be placed in the quotient.

V. To the remainder just mentioned add, or, as it is said, "bring down" so many of the next digits (or cyphers, as the case may be) of the dividend, as are required to make a quantity not less than the divisor; and for every digit or cypher of the dividend thus brought down, except one, add a cypher after the digit last placed in the quotient.

VI. Find out, and set down in the quotient, the *number* of times the divisor is contained in this quantity; and then subtract from the latter the product of the divisor and the digit of the quotient just set down. Proceed with the resulting remainder, and with all that succeed, as with the last.

VII. If there is a remainder, after the units of the dividend have been "brought down" and divided, either place it into the quotient with the divisor under it, and a separating line between them [70]; or, putting the decimal point in the quotient—and adding to the remainder as many cyphers as will make it at least equal to the divisor, and to the quotient as many cyphers minus one as there have been cyphers added to the remainder—proceed with the division.

90. EXAMPLE 1.-Divide 78325826 by 82. 82)78325826(955193

| 738               |  |
|-------------------|--|
| 452<br>410        |  |
| 425<br>410        |  |
| 158<br>82         |  |
| 762<br>738        |  |
| $\frac{246}{246}$ |  |

82 will not go into 7; nor into 78; but it will go 9 times into 783 :- 9 is to be put in the quotient.

The values of the higher denominations in the quotient will be sufficiently marked by the digits which succeed them-it will, however, sometimes be proper to ascertain, if the pupil, as he proceeds, is acquainted with the orders of units to which they belong.

9 times 82 are 738, which, being put under 783, and subtracted from it, leaves 45 as remainder; since this is less than the divisor, the digit put into the quotient is-as it ought to be [71]-the largest possible. 2, the next digit of the dividend, being brought down, we have 452, into which 83 goes 5 times ;- 5 being put in the quotient, we subtract 5 times the divisor from 452, which leaves 42 as remainder. 42, with 5, the next digit of the dividend, makes 425, into which 82 goes 5 times, leaving 15 as remainder ;-we put another 5 in the quotient. The last remainder, 15, with 8 the next digit of the dividend, makes 158, into which 82 goes once, leaving 76 as remainder ;—1 is to be put in the quotient. 2, the next digit of the dividend, along with 76, makes 762, into which the divisor goes 9 times, and leaves 24 as remainder ;-9 is to be put in the quotient. The next digit being brought down, we have 246, into which 82 goes 3 times exactly;-3 is to be put in the quotient. This 3 indicates 3 units, as the last digit brought down expressed units. 78325826 Therefore 82

# $\frac{1284}{1284}$

642 goes once into 642, and leaves no remainder. Bringing down the next digit of the dividend gives no digit in the quotient, in which, therefore, we put a cypher after the 1. The next digit of the dividend, in the same way, gives no digit in the quotient, in which, consequently, we put another cypher; and, for similar reasons, another in bringing down the next; but the next digit makes the quantity brought down 1284, which contains the divisor twice, and gives no remainder:—we put 2 in the quotient. 91. When there is a next 2 in the quotient.

91. When there is a remainder, we may continue the division, adding decimal places to the quotient, as follows--

EXAMPLE 3.—Divide 796347 by 847.

| 847 | )796347(940) | 19, &c. |
|-----|--------------|---------|
| •   | 7623         | ,       |

|     | 8230         |         |
|     | 7623         |         |

92. The learner, after a little practice, will guess pretty accurately what, in each case, should be the next digit of the quotient. He has only to multiply in his mind the last digit of the divisor, adding to the product what he would probably have to carry from the multiplication of the second last:—if this sum can be taken from the corresponding part of what is to be the minuend, leaving little, or nothing, the assumed number is likely to answer for the next digit of the quotient.

93. REASON OF 1.—This arrangement is merely a matter of convenience; some put the divisor to the right of the dividend, and immediately over the quotient—believing that it is more convenient to have two quantities which are to be multiplied together as near to each other as possible. Thus, in dividing 5425 by 54—

ler. Bringno digit in her ador the way, gives tly, we put in bringing the quantity twice, and

ontinue the s follows--

ill guess the next his mind uct what ultiplicaken from ninuend, is likely

natter of dividend, is more ultiplied dividing DIVISION.

 $\begin{array}{c} 6425\\ 54\\ 102\\ 54\\ 485\\ 432\\ 53, \&c \end{array}$ 

REASON OF II.—This, also, is only a matter of convenience REASON OF III.—A smaller part of the dividend would give no digit in the quotient, and a larger would give more than one.

REASON OF IV.—Since the numbers to be multiplied, and the products to be subtracted, are considerable, it is not so convenient as in short division, to perform the multiplications and subtractions mentally. The rule directs us to set down each multiplier in the quotient, because the latter is the sum of the multipliers.

REASON OF V.—One digit of the dividend brought down would make the quantity to be divided one denomination lower than the preceding, and the resulting digit of the quotient also one denomination lower. But if we are obliged to bring down two digits, the quantity to be divided is two denominations lower, and consequently the resulting digit of the quotient is two denominations lower than the preceding—which, from the principles of notation [Sec. I. 28], is expressed by using a cypher. In the same way, bringing down three figures of the dividend reduces the denomination three places, and makes the new digit of the quotient three denominations lower than the last—two eyphers must then be used. The same reasoning holds for any number of eharaeters, whether significant or otherwise, brought down to any remainder.

REASON OF VI.—We subtract the products of the different parts of the quotient and the divisor (these different parts of the quotient being put down successively according as they are found), that we may discover what the remainder is from which we are to expect the next portion of the quotient. From what we have already said [77], it is evident that, if there are no decimals in the divisor, the quotient figure will always be of the same denomination as the lowest in the quantity from which we subtract the product of it and the divisor.

REASON OF VII.---The reason of this is the same as what was given for the sixth part of the preceding rule [77].

It is proper to put a dot over each digit of the dividend, as we bring it down; this will prevent our forgetting any one, or bringing it down twice.

94. When there are cyphers, decimals, or both, the rules already given [3), &c.] are applicable.

95. To prove the Division.—Multiply the quotient by the divisor; the product should be equal to the dividend, minus the remainder, if there is any [79].

To prove it by the method of "casting out the

RULE.—Cast the nines out of the divisor, and the quotient; multiply the remainders, and cast the nines from their product:—that which is now left ought to be the same as what is obtained by casting the nines out of the dividend minus the remainder obtained from the process of division.

EXAMPLE.—Prove that  $\frac{63776}{54} = 1181_{34}^2$ .

Considered as a question in multiplication, this becomes  $1181 \times 54 = 63776 - 2 = 63774$ . To try if this be true,

Casting the nines from 1181, the remainder is 2. "," from 54, " is 0.  $2 \times 0 = 0$ Casting the nines from 63774, the remainder is . . . 0

The two remainders are equal, both being 0; hence the multiplication is to be presumed right, and, consequently, the process of division which supposes it.

 $\mathbf{t}$ 

ri q

0

f ut

 $\mathbf{2}!$ 

61

The division involves an example of multiplication; since the product of the divisor and quotient ought to be equal to the dividend minus the remainder [79]. Hence, in proving the multiplication (supposed), as already explained [54], we indirectly prove the division.

DIVISION.

In example 40-and some of those which follow-after obtaining as many decimal places in the quotient as are deemed necessary, it will be more accurate to consider the remainder as equal to the divisor (since it is more than one half of it), and add unity to the last digit of the quotient.

### CONTRACTIONS IN DIVISION.

96. We may abbreviate the process of division when there are many decimals, by cutting off a digit to the right hand of the divisor, at each new digit of the quotient; remembering to carry what would have been obtained by the multiplication of the figure neglectedunity if this multiplication would have produced more than 5, or less than 15; 2 if more than 15, or less than 25, &c. [59].

# Example.—Divide 754.337385 by 61.347.

| Ordinary Method.   | Contracted Method.       |
|--|--------------------------|
| 61·347)754·337385(12·296   | 61.347)754.337385(12.296 |
| 61347  | 61347                    |
| 14086 7  | 14086                    |
| 12269 4  | 12260                    |
| $1817 \begin{array}{c} 33 \\ 1226 \begin{array}{c} 94 \end{array}$ | 1817<br>1227             |
| 590 398  | 590                      |
| 552 123  | 552                      |
| 38 2755  | 38                       |
| 36 808 <b>2</b>  | 37                       |
| 1 46730  | 1                        |

#### DIVISION.

According as the denominations of the quotient become small, their products by the lower denomination of the divisor become inconsiderable, and may be neglected, and, consequently, the portions of the dividend from which they would have been subtracted. What should have been carried from the multiplication of the digit neglected—since it belongs to a higher denomination than what is neglected, should still be retained [59].

97. We may avail ourselves, in division, of contrivances very similar to those used in multiplication [60].

To divide by a composite number— Rule.—Divide successively by its factors.

EXAMPLE. - Divide 98 by 49.  $49 = 7 \times 7$ . 7)98 7)14  $2 = 98 \div 7 \times 7$ , or 49.

Dividing only by 7 we divide by a quantity 7 times too small, for we are to divide by 7 times 7; the result is, therefore, 7 times too great :--this is corrected if we divide again by 7

98. If the divisor is not a composite number, we cannot, as in multiplication, abbreviate the process, except it is a quantity which is but little less than a number expressed by unity and one or more cyphers. When this is the case—

RULE.—Divide by the nearest higher number, expressed by unity and one or more cyphers; add to remainder so many times the quotient as the assumed exceeds the given divisor, and divide the sum by the preceding divisor. Proceed thus, adding to the remainder in each case so many times the foregoing quotient as the assumed exceeds the given divisor until the exact, or a sufficiently near approximation to the exact quotient is obtained—the *last* divisor must be the given, and not the assumed one. The last remainder will be the true one; and the sum of all the quotients will be the true quotient.

#### DIVISION.

EXAMPLE. — Divide 987663425 by 998. 987663\_425=987663425  $\div$  1000. 1975\_751=987663 $\times$ 2+425  $\div$  1000. 4\_701=1975 $\times$ 2+751  $\div$  1000. 0.7\_8090=4 $\times$ 2+701  $\div$  1000. 0.01 $\wedge$ 040=.7 $\times$ 2+9  $\div$  1000. 0.000\_420=.01\times2+4 $\div$ 1000. 0.0004\_0208=.01 $\times$ 2+4 $\div$ 998

that is, the last quotient is 0.0004, and 0.0208 is the last remainder.

| all the quotients are | $ \left\{\begin{array}{c} 987663 \\ 1975 \\ 4 \\ 0.7 \\ 0.7 \end{array}\right. $ |
|-----------------------|--|
| 201. a. t.            | $\begin{bmatrix} 0.01 \\ 0.0004 \end{bmatrix}$                                   |

The true quotient is 989642.7104, or the sum of the quotients. And the true remainder 0.0208, or the last remainder

Unless we add twice the preceding quotient to each successive remainder; we shall have subtracted from the dividend, or the part of it just divided, 1000, and not 998 times the quotient—in which case the remainder would be too small to the amount of twice the quotient.—We have used (A) to separate the quotients from the remainder3.

There can be no difficulty when the learner, by this process, comes to the decimals of the quotient. Thus in the third line, 4701 gives, when divided by 1000, 4 units as quotient, and 701 units still to be divided—that is, 701 as remainder. 4.701 would express 4701 actually divided by 1000. A number occupying four places, all to the left of the decimal point, when divided by 1000, gives units as quotient; but if, as in 709.0 (in the next line), one is a decimal place, the quotient must be of a lower denomination than before—that is, of the order tenths; and in 010.40 (next line), since two out of the four places are decimals, the quotient must be hundredths, &e.

In adding the necessary quantities, we must carefully bear in mind to what denominations the quotient multiplied, and the remainder to which the product is to be added, belong

69. If £7500 were to be divided between 5 persons, how much ought each person to receive ? Ans. £1500. 70. Divide 7560 acres of land between 15 persons.

26

1.6 0,

be

ro

Ans. Each will have 504 acres. 71. Divide £2880 between 60 persons.

Ans. Each will receive £48. 72. What is the ninth of £972? Ans. £108.

73. What is each man's part if £972 be divided among 108 men? Ans. £9.

74. Divide a legacy of £8526 between 294 persons. Ans. Each will have £29.

75. Divide 340480 punces of bread between 1792 persons. Ans. Each person's share will be 190 ounces.

76. There are said to be seven bells at Pekin, each of which weighs 120,000 pounds; if they were melted up, how many such as great Tom of Lincoln, weighing 9894 pounds, or as the great bell of St. Paul's, in London, weighing 8400 pounds, could be made from them ? Ans. 84 like great Tom of Lincoln, with 8904 pounds left; and 100 like the great bell of St. Paul's.

77. Mexico produced from the year 1790 to 1830 a

quantity of gold which was worth £6,436,443, or 6,178,985,280 farthings. How many dollars, at 207 farthings each, are in that sum? An 2007

farthings each, are in that snm? Ans. 29850170 nearly 78. A single pound of cotton has been spun into a thread 76 miles in length, and a pound of wool into a thread 95 miles long; how many pounds of each would be required for threads 5854 miles in length? Ans. 77.0263 pounds of cotton, and 61.621 pounds of wool.

79. The earth travels round its orbit, a space equalto 567,019,740 miles, in about 365 days, 8765 honrs, 525948 minutes, 31556925 seconds, and 1893415530 thirds; supposing its motion uniform, how much would it travel per day, hour, minute, second, and third? Aus. About 1553480 miles a day, 64691 an hour, 1078 a minute, 18 a second, and 0.3 a third.

80. All the iron produced in Great Britain in the year 1740 was 17,000 tons from 59 furnaces; and in 1827, 690,000 from 284. What may be considered as the produce of each furnace in 1740, one with another; 2429.5775 in 1827. Ans. 288.1356 in 1740; and

81. In 1834, 16,000 steam engines in Great Britain saved the labour of 450,000 horses, or 2 millions and a half of men; to how many horses, and how many men, may each steam engine be supposed equivalent, one with another? Ans. About 28 horses; and 156 men.

99. Before the pupil-leaves division, he should be able to carry on the process as follows :---

Example.—Divide 84380848 by 87532. 87532)84380848(964

### 560204

#### 350128

He will say (at first aloud) 4 (the digit of the dividend to be brought down). 18 (9 times 2); 0 (the remainder after and fracting the right hand digit of 18 from 8 in the dividend). 28 (9 times 3 + the 1 to be carried from the 18); 2 (the remainder after subtracting the right hand digit of 28 from 0, or rather 10 in the dividend). 48 (9 times 5 + the 2 to be carried from 28, and 1 to compensate for what we borrowed when we considered 0 in the dividend as 10); 0 (the

persons, . £1500. ersons. 04 acres.

ive £48. 8. divided

persons. ve £29. en 1792 ounces. in, each e melted veighing aul's, in de from th 8904 Paul's. 1830 a remainder when we subtract the right hand digit of 48 from 8 in the dividend). 67 (9 times 7 + the 4 to be carried from the 48); 6 (the remainder after subtracting the right hand digit of 67 from 3, or rather 13 in the dividend). 79 (9 times 8 + the 6 to be carried from \*the 67 + the 1, for what we borrowed to make 3 in the dividend become 13); 5 (the remainder after subtracting 79 from 84 in the dividend).

As the parts in the parentheses are merely explanatory, and not to be repeated, the whole process would be,

First part, 4. 18; 0. 28; 2. 48; 0 67; 6. 79; 5. Second part, 8. 12; 2. 19; 1 32; 0. 45; 5. 53; 3. Third part, 8; 0. 12; 0. 21; 0. 30; 0. 35; 0. The remainders in this case being cyphers, are omitted.

All this will be very easy to the pupil who has practised what has been recommended [13, 23, and 65]. The chief exercise of the memory will consist in recollecting to add to the products of the different parts of the divisor by the digit of the quotient under consideration, what is to be carried from the preceding product, and unity besides—when the preceding digit of the dividend has been increased by 10; then to subtract the right hand digit of this sum from the proper digit of the dividend (increased by 10 if necessary).

# QUESTIONS FOR THE PUPIL.

1. What is division? [66].

2. What are the dividend, divisor, quotient, and remainder ? [66].

3. What is the sign of division ? [68].

4. How are quantities under the vinculum, or united by the sign of multiplication, divided ? [69].

5. What is the rule when the divisor does not exceed 12, nor the dividend 12 times the divisor? [70].

6. Give the rule, and the reasons of its different parts, when the divisor does not exceed 12, but the dividend is more than 12 times the divisor? [72 and 77].

7. How is division proved ? [79 and 95].

8 What are the rules when the dividend, divisor, or both contain cyphers or decimals? [80].

9. What is the rule, and what are the reasons of its different parts, when the divisor exceeds 12? [89 and 93].

11. How is division proved by casting out the nines? [95].

12. How may division be abbreviated, when there are decimals? [96].

13. How is division performed, when the divisor is a composite number ? [97].

14. How is the division performed, when the divisor is but little less than a number which may be expressed by unity and eyphers? [98].

15. Exemplify a very brief mode of performing division. [99].

# THE GREATEST, COMMON MEASURE OF NUMBERS.

100. To find the greatest common measure of two quantities-

RULE.—Divide the larger by the smaller; then the divisor by the remainder; next the preceding divisor by the new remainder:—continue this process until nothing remains, and the last divisor will be the greatest common measure. If this be unity, the given numbers are prime to each other.

EXAMPLE -Find, the greatest common measure of 3252 and 4248.

| 3252   | 2.4                         |
|--|-----------------------------|
| 996)3252(3<br>2988                                       |                             |
| <b>264</b> )99<br>79                                     | 6(3<br>2                    |
| 20-  | 4)264(1<br>204              |
| - ,  | <sup>60</sup> )204(3<br>180 |
| - *  | 24)60(2<br>48               |

| 1. 11 A  | 2 T                         |

996, the first remainder, becomes the second divisor 264, the second remainder, becomes the third divisor, &c. 12 the last divisor, is the required greatest common measure.

101. REASON OF THE RULE .- Before we prove the correctness of the rule, it will be necessary for the pupil to be satistied that "if any quantity measures another, it will measure any multiple of that other;" thus if 6 go into 30, 5 times, it will evidently go into 9 times 30, 9 times 5 times. Also, that "if a quantity measure two others, it will measure

their sum, and their difference." First, it will measure their sum, for if 6 go into 24, 4 times, and into 36, 6 times, it will evi-

dently go into 24+36, 4+6 times :--that is, if  $\frac{24}{6}$ =4, and  $\frac{36}{6}$ = 6,  $\frac{24}{6}$ + $\frac{36}{6}$ =4+6.

Secondly, if 6 goes into 36 oftener than it goes into 24, it is because of the difference between 36 and 24; for as the difference between the numbers of times it will go into them is due to this difference, 6 must be contained in it some number of times :—that is, since  $\frac{36}{6}$ =6, and  $\frac{24}{6}$ =4,  $\frac{36}{6}$  =  $\frac{24}{6}$  (or  $\frac{36-24}{6}$ ) =6-4=2, a whole number [26]—or, the difference between the quantities is measured by 6, their measure.

This reasoning would be found equally correct with any other similar numbers.

102. Next; to prove the rule from the given example, it is necessary to prove that 12 is a common measure; and that it is the greatest common measure.

It is a common measure. Beginning at the end of the process, we find that 12 measures 24, its multiple; and 48, because it is a multiple of 24; and their sum, 24+48 (because it measures each of them) or 60; and 180, because it is a multiple of 60; and 180-4-24 (we have also just seen that it measures each of these) or 204; and 204+60 or 264; and 792, because a multiple of 264; and 792-204 or 996; and 2988, a multiple of 996; and 2988+264 or 3252 (one of the given numbers) and 3252+996 or 4248 (the other given number). Therefore it measures each of the given numbers, and is their common measure.

103. It is also their greatest common measure. If not, let some other be greater; then (beginning now at the top of the process) measuring 4248 and 3252 (this is the supposition), it measures their difference, 996; and 2988, because a multiple of 996; and, because it measures 3252, and 2988, it measures their difference, 264; and 792, because a multiple of 264; and the difference between 996 and 792 or 204; and the difference between 264 and 204 or 60; and 180 because a multiple of 60; and the difference between 204 and 180 or 24; and 48, because a multiple of 24; and the difference between 60 and 48 or 12. But measuring 12, it cannot be greater than 12.

# GREATEST COMMON MEASURE.

In the same way it could be shown, that any other common measure of the given numbers must be less than 12—and consequently that 12 is their greatest common measure. As the rule might be proved from any other example equally well, it is true in all cases.

104. We may here remark, that the measure of two or more quantities can sometimes be found by inspection •

Any quantity, the digit of whose lowest denomination is an even number, is divisible by 2 at least.

Any number ending in 5 is divisible by 5 at least.

Any number ending in a cypher is divisible by 10 at least.

Any number which leaves nothing when the threes are cast out of the sum of its digits, is divisible by 3 at least; or leaves nothing when the nines are cast out of the sum of its digits, is divisible by 9 at least.

#### EXERCISES.

1. What is the greatest common measure of 464320 and 18945? Ans. 5.

2. Of 638296 and 33888? Ans. 8.

3. Of 18996 and 29932 ? Ans. 4.

4. Of 260424 and 54423? Ans. 9.

5. Of 143168 and 2064888 ? Ans. 8.

6. Of 1141874 and 19823208? Ans. 2.

105. To find the greatest common measure of more than two numbers-

RULE.—Find the greatest common measure of two of them; then of this common measure and a third; next, of this last common measure and a fourth, &c. The last common measure found, will be the greatest common measure of all the given numbers.

EXAMPLE 1.—Find the greatest common measure of 679, 5901, and 6734.

By the last rule we learn that 7 is the greatest common measure of 679 and 5901; and by the same rule, that it, the greatest common measure of 7 and 6734 (the remaining number), for  $6734 \div 7 = 962$ , with no remainder. Therefore 7 is the required number.

EXAMPLE 2.—Find the greatest common measure of 936, 736, and 142.

visor 264, r, &c. 12, measure.

he correctto be satisill measure 5 times, it

106. REASON OF THE RULE. —It may be shown to be correct in the same way as the last; except that in proving the number found to be a *common* measure, we are to begin at the end of *all* the processes, and go through all of them in succession; and in proving that it is the *greatest* common measure, we are to begin at the commencement of the first process, or that used to find the common measure of the two first numbers, and proceed successively through *all*.

#### EXERCISES.

7. Find the greatest common measure of 29472, 176832, and 1074. Ans. 6.

8. Of 648485, 10810, 3672835, and 473580. Ans. 5. 9. Of 16264, 14816, 8600, 75288, and 8472. Ans 8.

# THE LEAST COMMON MULTIPLE OF NUMBERS.

107. To find the least common multiple of two quantities-

RULE.—Divide their product by their greatest common measure. Or; divide one of them by their greatest common measure, and multiply the quotient by the other—the result of either method will be the required least common multiple.

EXAMPLE.—Find the least common multiple of 72 and 84. 12 is their greatest common measure.

m

th

oť

la

m

 $\frac{9}{\bar{3}}$ 

 $\frac{72}{12} = 6$ , and  $6 \times 84 = 504$ , the number sought.

108. REASON OF THE RULE.—It is evident that if we multiply the given numbers together, their product will be a nultiple of each by the other [30]. It will be easy to find the smallest part of this product, which will still be their tommon multiple.—Thus, to learn if, for example, its nincteenth part is such.

From what we have already seen [69], each of the factors of any productivided by any number and multiplied by the product of the other factors, is equal to the product of all the factors divided by the same number. Hence, 72 and 84 being the same numbers.

# LEAST COMMON MULTIPLE.

and 84.

we mulill be a to find be their ts nine-

factors by the all the being  $\frac{2 \times 84}{19}$  (the nineteenth part of their product)  $= \frac{72}{19} \times 84$ , or  $72 \times \frac{84}{19}$ . Now if  $\frac{72}{19}$  and  $\frac{84}{19}$  be equivalent to integers,  $\frac{72}{19} \times 84$  will be a multiple of 84, and  $\frac{84}{19} \times 72$ , will be a multiple of 72 [29]; and  $\frac{72 \times 84}{19}$ ,  $\frac{72}{19} \times 84$ , and  $72 \times \frac{84}{19}$  will each be the common multiple of 72 and 84 [30]. But unless 19 is a common measure of 72 and 84,  $\frac{72}{19}$  and  $\frac{84}{19}$  cannot be both equivalent to integers. Therefore the quantity by which we divide the product of the given numbers, or one of them, before we multiply it by the other to obtain a new, and less multiple of them, must be the common measure of both. And the multiple we obtain will, evidently, be the least, when the divisor we select is the greatest quantity we can use for the purpose—that is, the greatest common measure of the given numbers

It follows, that the least common multiple of two numbers, prime to each other, is their product.

#### EXERCISES,

1. Find the least common multiple of 78 and 93. Ans. 2418.

2. Of 19 and 72. Ans. 1368.

3. Of 464320 and 18945. Ans. 1759308480.

4. Of 638296 and 33888. Ans. 2703821856.

5. Of 18996 and 29932. Ans. 142147068.

6. Of 260424 and 54423. Ans. 1574783928.

109. To find the least common multiple of three or more numbers-

RULE.—Find the least common multiple of two of them; then of this common multiple, and a third; next of this last common multiple and a fourth, &c. The last common multiple found, will be the least common multiple sought.

EXAMPLE.—Find the least common multiple of 9, 3, and 27. 3 is the greatest common measure of 9 and 3; therefore

 $\frac{3}{3} \times 3$ , or 9 is the least common multiple of 9 and 3.

9 is the greatest common measure of 9 and 27; therefore  $\frac{27}{5} \times 9$ , or 27 is the required least common multiple.

### LEAST COMMON MULTIPLE.

110. REASON OF THE RULE .- By the last rule it is evident that 27 is the least common multiple of 9 and 27. But since 9 is a multiple of 3, 27, which is a multiple of 9, must also be a multiple of 3; 27, therefore, is a multiple of each of the given numbers, or their common multiple.

It is likewise their least common multiple, because none that is smaller can be common, also, to both 9 and 27, since they were found to have 27 as their least common multiple.

#### EXERCISES.

7. Find the least common multiple of 18, 17, and 43. Ans. 13158.

8. Of 19, 78, 84, and 61. Ans. 1265628.

9. Of 51, 176832, 29472, and 5862. Ans. 2937002688. 10. Of 537842, 16819, 4367, and 2473.

# SECTION III.

#### **REDUCTION AND THE COMPOUND RULES.**

The pupil should now be made familiar with most of the tables given at the commencement of this treatise.

#### REDUCTION.

1. Reduction enables us to change quantities from one denomination to another without altering their value. Taken in its more extended sense, we have often practised it already :---thus we have changed units into tens, and tens into units, &c.; but, considered as a separate rule, it is restricted to applicate numbers, and is not confined to a change from one denomination to the *next* higher, or lower

2. Reduction is either descending, or ascending. It is reduction descending when the quantities are changed from a higher to a lower denomination; and reduction ascending when from a lower to a higher.

#### Reduction Descending.

3. RULE.—Multiply the highest given denomination by that quantity which expresses the number of the next lower contained in one of its units; and add to the product that number of the next lower denomination which is found in the quantity to be reduced.

Proceed in the same way with the result; and continue the process until the required denomination is obtained.

EXAMPLE.—Reduce £6 16s.  $0_4^1d$ , to farthings.

| $\pounds$ s. d.   |
|---|
| $\begin{array}{c} 6 \\ 20 \end{array}$ , 16 , 0 <sup>1</sup> / <sub>4</sub> |
| $\frac{\overline{136} \text{ shillings}}{12} = \pounds 6 ,, 16.$            |
| $\overline{\frac{1632}{4}}$ pence = £6 ,, 16 ,, 0.                          |
| 6529 farthings = £6 16 01   |

We multiply the pounds by 20, and at the same time add the shillings. Since multiplying by 2 tens (20) can give no units in the product, there can be no units of shillings in it except those derived from the 6 of the 16s. —we at once, therefore, put down 6 in the shillings' place. Twice (2 tens' times) 6 are 12 (tens of shillings), and one (ten shillings), to be added from the 16s., are 13 (tens of shillings)—which we put down.  $\pounds$ 6 16s. are, consequently, equal to 136s.

12 times 6d. are 72d. :--since there are no pence in the given quantity, there are none to be added to the 72d.--we put down 2 and carry 7. 12 times 3 are 36, and 7 are 43. 12 times 1 are 12, and 4 are 16.  $\pounds$ 6 16s. are, therefore, equal to 1632 pence.

4 times 2 are 8, and  $\frac{1}{4}$  (in the quantity to be reduced) to be carried are 9, to be set down. 4 times 3 are 12. 4 times 6 are 24, and 1 are 25. 4 times 1 are 4, and 2 are 6. Hence £6 16s. 0 $\frac{1}{4}d$ . are equal to 6529 farthings.

4. REASONS OF THE RULE.—One pound is equal to 20s.; therefore any number of pounds is equal to 20 times as many shillings; and any number of pounds and shillings is equal to 20 times as many shillings as there are pounds, plus the shillings.

It is easy to multiply by 20, and add the shillings at the same time; and it shortens the process.

Shillings are equal to 12 times as many pence; pence to 4 times as many farthings; hundreds to 4 times as many quarters; quarters to 28 times as many pounds, &c.

#### EXERCISES.

1. How many farthings in 23328 pence? Ans. 93312.

2. How many shillings in £348? Ans. 6960.

3. How many pence in £38 10s. ? Ans. 9240.

4. How many pence in £58 13s. ? Ans. 14076.

5. How many farthings in £58 13s. ? Ans. 56304.

6. How many farthings in £59 13s. 6<sup>3</sup>/<sub>4</sub>d.? Ans. 57291.

7. How many pence in £63 0s. 9d. ? Ans. 15129.

8. How many pounds in 16 cwt., 2 qrs., 16 lb.? Ans. 1864.

9. How many pounds in 14 cwt., 3 qrs., 16 lb.? Ans. 1668.

10. How many grains in 3 lb., 5 oz., 12 dwt., 16 grains? Ans. 19984.

11. How many grains in 7 lb., 11 oz., 15 dwt., 14 grains? Ans. 45974.

12. How many hours in 20 (common) years? Ans. 175200.

13. How many feet in 1 English mile ? Ans. 5280.

14. How many feet in 1 Irish mile? Ans. 6720.

15. How many gallons in 65 tuns? Ans. 16380.

16. How many minutes in 46 years, 21 days, 8 hours, 56 minutes (not taking leap years into account)? Ans. 24208376.

17. How many square yards in 74 square English perches? Ans. 2238.5 (2238 and one half).

18. How many square inches in 97 square Irish perchcs? Ans. 6159888.

19. How many square yards in 46 English acres, 3 roods, 12 perches? Ans. 226633.

20. How many square aeres in 767 square English miles? Ans. 490880.

21. How many cubic inches in 767 cubic feet? Ans. 1325376.

22. How many quarts in 767 peeks? Ans. 6136. 23. How many pottles in 797 peeks? Ans. 3188.

# Reduction Ascending.

5. RULE.—Divide the given quantity by that number of its units which is required to make one of the next higher denomination—the remainder, if any, will be of the denomination to be reduced. Proceed in the same manner until the index required denomination is obtained.

EXAMPLE.—Reduce 854 4)856347 12)2140863 20)17840, 63 63

892 , 0 ,, 63=856347 farthings.

4 divided into 856347 farthings, gives 214086 pence and 3 farthings. 12 divided into 214086 pence, gives 17840 shillings and 6 pence. 20 divided into 17840 shillings, gives  $\pounds 802$  and no shillings; there is, therefore, nothing in the shillings' place of the result.

6. REASONS OF THE RULE.—It is evident that every 4 farthings are equivalent to one penny, and every 12 pence to one shilling, &c.; and that what is left after taking away 4 farthings as often as possible from the farthings, must be farthings, what remains after taking away 12 pence as often as possible from the pence, must be pence, &c.

7. To prove Reduction.-Reduction ascending and descending prove each other.

EXAMPLE.— $\pounds 20$  17s.  $2_1^{1}d$ .=20025 farthings; and 20025 farthings= $\pounds 20$  17s.  $2_1^{1}d$ .

|             | $\begin{bmatrix} \pounds & s. \\ .20 & ,, & 17 \\ .20 & . \end{bmatrix}$ | , $\frac{d.}{2\frac{1}{4}}$<br>Reduction | $\begin{cases} \text{farthings.} \\ 4)20025 \\ 12)50061 \end{cases}$ |         |

19. How are degrees (of the circle) reduced to thirds, or thirds to degrees, &c. ?

# THE COMPOUND RULES.

8. The Compound Rules, are those which relate to applicate numbers of more than one denomination.

If the tables of money, weights, and measures, were constructed according to the decimal system, only the rules for Simple Addition, &c., would be required. This would be a considerable advantage, and greatly tend to simplify mercantile transactions.—If 10 farthings were one penny, 10 pence one shilling, and 10 shillings one pound, the addition, for example, of £1  $9s. \mathfrak{L}_4^*d$ . to £6  $8s. 6\frac{1}{2}d$ . (a point being used to separate a pound, then the " unit of comparison," from its parts, and 0.005 to express  $\frac{1}{2}$  or 5 tenths of a penny), would be as follows—

#### £ 1·983 6·865

#### Sum, 8.848

The addition might be performed by the ordinary rules, and the sum read off as follows—" eight pounds, eight shillings, four pence, and eight farthings." But even with the present arrangement of mouey, weights, and measures, the rules already given for addition, subtraction, &c., might easily have been made to include the addition, subtraction, &c., of applicate numbers consisting of more than one denomination; since the

# COMPOUND ADDITION.

principles of both simple and compound rules are precisely the same—the only thing necessary to bear carefully in mind, being the number of any one denomination necessary to constitute a unit of the next higher.

# COMPOUND ADDITION.

9. RULE.—I. Set down the addends so that quantities of the same denomination may stand in the same vertical column—units of pence, for instance, under units of pence, tens of pence under tens of pence, units of shillings under units of shillings, &e.

II. Draw a separating line under the addends.

III. Add those quantities which are of the same denomination together—farthings to farthings, pence to pence, &c., beginning with the lowest.

IV. If the sum of any column be less than the number of that denomination which makes one of the next higher, set it down under that column; if not, for each time it contains that number of its own denomination which makes one of the next higher, carry one to the latter and set down the remainder, if any, under the column which produced it. If in any denomination there is no remainder, put a cypher under it in the sum.

10. EXAMPLE.--Add together £52 17s.  $3\frac{3}{4}d.$ , £47 5s.  $6\frac{1}{2}d.$ , and £66 14s.  $2\frac{1}{4}d.$ 

| £<br>52<br>47<br>66 | s.<br>17<br>5<br>14 | $\left.\begin{array}{c} d.\\ 3\frac{3}{4}\\ 6\frac{1}{2}\\ 2\frac{1}{4} \end{array}\right\} \text{ addends.}$ |
|---------------------|---------------------|---|
| 166                 | 17                  | 01  |

 $\frac{1}{4}$  and  $\frac{1}{2}$  make 3 farthings, which, with  $\frac{3}{4}$ , make 6 farthings; these are equivalent to one of the next denomination, or that of pence, to be carried, and two of the present, or one half-penny, to be set down. 1 penny (to be carried) and 2 are 3, and 6 are 9, and 3 are 12 pence—equal to one a d leas whi forv put left to t examples

r

e.

COMPOUND ADDITION.

ules are presary to bear any one deof the next

that quantiin the same ance, under pence, units

ends.

f the same gs, pence to

n the numof the next ot, for each nomination one to the under the nomination it in the

47 5s. 61d.,

ike 6 fardenominaie present, e carried) ual to one of the next denomination, or that of shillings, to be carried, and no pence to be set down; we therefore put a cypher in the pence' place of the sum. 1 shilling (to be carried) and 14 are 15, and 5 are 20, and 17 are 37 shillings—equal to one of the next denomination, or that of pounds, to be carried, and 17 of the present, or that of shillings, to be set down. 1 pound and 6 are 7, and 7 are 14, and 2 are 16 pounds—equal to 6 units of pounds, to be set down, and 1 ten of pounds to be carried; 1 ten and 6 are 7 and 4 are 11 and 5 are 16 tens of pounds, to be set down.

11. This rule, and the reasons of it, are the same as those already given [Sec. II. 7 and 9]. It is evidently not so necessary to put a cypher where there is no remainder, as in Simple Addition.

12. When the addends are very numerous, we may divide them into parts by horizontal lines, and, adding each part separately, may afterwards find the amount of all the sums.

EXAMPLE:

£ d. S. 57 14 2) 32164 19 17= 151 76 9 11) 2 8 14 9] 32 $\mathbf{5}$ *d*.  $\begin{array}{c}
6 \\
17 \\
3 \\
4 \\
2 \\
4 \\
2
\end{array}$ 47 11 10. 3256= 25327 3 11 5237

13. Or, in adding each column, we may put down a dot as often as we come to a quantity which is at least equal to that number of the denomination added which is required to make one of the next—carrying forward what is above this number, if anything, and putting the last remainder, or—when there is nothing left at the end—a cypher under the column :—we carry to the next column one for every dot. Using the same example—

| COMPO | UND | RULES. |
|-------|-----|--------|
|-------|-----|--------|

| £ 57<br>32<br>19<br>8<br>32<br>47<br>32<br>56<br>27<br>52 | s.<br>$\cdot 14$<br>16<br>$\cdot 17$<br>$\cdot 14$<br>5<br>$\cdot 6$<br>17<br>$\cdot 3$<br>4<br>4 | $\begin{array}{c} d. \\ 2 \\ 4 \\ \cdot 6 \\ 2 \\ \cdot 9 \\ 4 \\ 2 \\ \cdot 9 \\ 2 \\ 4 \end{array}$ |
|---|---|---|
| 37  | 8   | $\frac{4}{2}$   |
| 04  | 11  | 10  |

2 pence and 4 are 6, and 2 are 8, and 9 are 17 penceequal to 1 shilling and 5 pence; we put down a dot and carry 5. 5 and 2 are 7, and 4 are 11, and 9 are 20 pence-equal to 1 shilling and 8 pence; we put down a dot and carry 8. 8 and 2 are 10 and 6 are 16 pence-equal to 1 shilling and 4 pence; we put down a dot and carry 4. 4 and 4 are 8 and 2 are 10-which, being less than 1 shilling, we set down under the column of pence, to which it belongs, &c. We find, on adding them up, that there are three dots; we therefore earry 3 to the column of shillings. 3 shillings and 8 are 11, and 4 are 15, and 4 are 19, and 3 are 22 shillings-equal to 1 pound and 2 shillings; we put down a dot and carry 1. 1 and 17 are 18, &c.

Care is necessary, lest the dots, not being distinctly marked, may be considered as either too few, or too many. This method, though now but little used, seems a convenient one.

14. Or, lastly, set down the sums of the farthings, shillings, &c., under their respective columns; divide the farthings by 4, put the quotient under the sum of the pence, and the remainder, if any, in a place set apart for it in the sum—under the column of farthings; add together the quotient obtained from the farthings and the sum of the pence, and placing the amount under the pence, divide it by 12; put the quotient under the sum of the shillings, and the remainder, if any, in a place allotted to it in the sum—under the column of pence; add the last quotient and the sum of the shillings, and putting under them their sum, divide the latter by 20, set down the quotient under the sum of

#### COMPOUND ADDITION.

the pounds, and put the remainder, if any, in the sumunder the column of shillings; add the last quotient and the sum of the pounds, and put the result under the pounds. Using the following example—

| £    | <i>s</i> . | d.             |            |
|------|------------|----------------|------------|
| 47   | - 9        | $2\frac{1}{2}$ |            |
| 362  | 4          | 11Į            |            |
|      | 16         | $2\frac{3}{4}$ |            |
| 97   | 4          | $2\frac{3}{4}$ |            |
| 541  | 13         | $2^{3}_{c}$    |            |
|      | 6          | 4              |            |
| 6    | 11         | 111            |            |
| 72   | 19         | 93             |            |
| 1071 | () =       | *              |            |
| 1651 | 82         | 47 13          | farthings. |
| 4    | 4          | 3              |            |
|      | 86         | 50             |            |
| 1655 | 6          | 2!             |            |

The sum of the farthings is 13, which, divided by 4, gives 3 as quotient (to be put down under the pence), and one farthing as remainder (to be put in the sum total-under the farthings). 3d. (the quotient from the farthings) and 47 (the sum of the pence) are 50 pence, which, being put down and divided by 12, gives 4 shillings (to be set down under the shillings), and 2 pence (to be set down in the sum total-under the pence). 4s. (the quotient from the pence) and 82 (the sum of the shillings) are 86 shillings, which, being set down and divided by 20, gives 4 pounds (to be set down under the pounds), and 6 shillings (to be set down in the sum total-under the shillings). £4 (the quotient from the shillings) and 1651 (the sum of the pounds) are 1655 pounds (to be set down in the sum totalunder the pounds). The sum of the addends is, therefore, found to be £1655 6s.  $2^{1}_{1}d$ .

15. In proving the compound rules, we can generally avail ourselves of the methods used with the sinple rules [Sec. II. 10, &c.]

17 pence t and carry nce—equal ad earry 8. hilling and t are 8 and set down . We find, e therefore d 8 are 11, —equal to ad carry 1.

ly marked, ny. This mient one.

farthings, s; divide um of the set apart ngs; add ings and nt under under the eny, in a blumn of the shilvide the sum of

61. What is the sum of the following :---three hundred and ninety-six pounds four shillings and two pence; five hundred and seventy-three pounds and four pence halfpenny; twenty-two pounds and three halfpence; four thousand and five pounds six shillings and three farthings? Ans. £4996 103. 834d.

62. A owes to B £567 16s. 71d.; to C £47 16s.; and to D £56 1d. How much does he owe in all? Ans. £671 12s. 81d.

63. A man has owing to him the following sums :---£3 10s. 7d.; £46 71d.; and £52 14s. 6d. How much is the entire? Ans. £102 5s. 81d.

64. A merchant sends off the following quantities of butter :---47 cwt., 2 qrs., 7 lb; 38 cwt., 3 qrs., 8 lb; and 16 cwt., 2 qrs., 20 fb. How much did he send off in all ? Ans. 103 cwt., 71b.

65. A merchant receives the following quantities of tallow, viz., 13 cwt., 1 qr., 6 fb; 10 cwt., 3 qrs., 10 fb; and 9 cwt., 1 qr., 15 fb. How much has he received in all ? Ans. 33 cwt., 2 qrs., 3 fb.

66. A silversmith has 7 fb, 8 oz., 16 dwt. ; 9 fb, 7 oz., 3 dwt.; and 4 lb, 1 dwt. What quantity has he? Ans. 21 fb, 4 oz.

67. A merchant sells to A 76 yards, 3 quarters, 2 nails; to B, 90 yards, 3 quarters, 3 nails; and to C, 190 yards, 1 nail. How much has he sold in all? Ans. 357 yards, 3 quarters, 2 nails.

68. A wine merchant receives from his correspondent 4 tuns, 2 hogsheads; 5 tuns, 3 hogsheads; and 7 tuns, 1 hogshead. How much is the entire? Ans. 17 tuns, 2 hogsheads.

.69. A man has three farms, the first contains 120 acres, 2 roods, 7 perches; the second, 150 acres, 3 roods, 20 perches; and the third, 200 acres. How much land does he possess in all? Ans. 471 acres, 1 rood, 27 perches.

70. A servant has had three masters; with the first he lived 2 years and 9 months; with the second, 7 years and 6 months; and with the third, 4 years and 3 months. What was the servant's age on leaving his last master, supposing he was 20 years old on going to the first, and that he went directly from one to the other? Ans. 34 years and 6 months.

71. How many days from the 3rd of March to the 23rd of June? Ans. 112 days.

72. Add together 7 tons, the weight which a piece of fir 2 inches in diameter is capable of supporting; 3 tons, what a piece of iron one-third of an inch in diameter will bear; and 1000 lb, which will be sustained by a hempen rope of the same size. Ans. 10 tons, 8 ewt., 3 quarters, 20 lb.

73. Add together the following: -2d., about the value of the Roman sestertius;  $7\frac{1}{2}d$ ., that of the denarius;  $1\frac{1}{2}d$ ., a Greek obolus; 9d., a drachma; £3 15s. a mina; £225, a talent; 1s. 7d., the Jewish shekel; and £342 3s. 9d., the Jewish talent. Ans. £571 2s.

74. Add together 2 dwt. 16 grains, the Greek drachma; 1 lb, 1 oz., 10 dwt., the mina; 67 lb, 7 oz., 5 dwt., the talent. Ans. 68 lb, 8 oz., 17 dwt., 16 grains.

### QUESTIONS FOR THE PUPIL.

1. What is the difference between the simple and compound rules? [8].

2. Might the simple rules have been constructed so as to answer also for applicate numbers of different denominations? [8].

3. What is the rule for compound addition? [9].

4. How is compound addition proved ? [15].

5. How are we to act when the addends are numerous? [12, &c.]

### COMPOUND SUBTRACTION.

## COMPOUND SUFTRACTION.

16. RULE—I. Place the digits of the subtrahend under those of the same denomination in the minuend farthings under farthings, units of pence under units of pence, tens of pence under tens of pence, &c.

II. Draw a separating line.

III. Subtract each denomination of the subtrahend from that which corresponds to it in the minuend beginning with the lowest.

IV. If any denomination of the minuend is less than that of the subtrahend, which is to be taken from it, add to it one of the next higher—eonsidered as an equivalent number of the denomination to be increased; and, either suppose unity to be added to the next denomination of the subtrahend, or to be subtracted from the next of the minuend.

V. If there is a remainder after subtracting any denomination of the subtrahend from the corresponding one of the minuend, put it under the column which produced it.

VI. If in any denomination there is no remainder, put a cypher under it—unless nothing is left from any higher denomination.

17. EXAMPLE.—Subtract £56 13s. 4<sup>3</sup>/<sub>4</sub>d., from £96 7s. 6<sup>1</sup>/<sub>4</sub>d.

| £  | <i>s</i> . | d.                    |
|----|------------|-----------------------|
| 96 | 7          | $6_4^1$ , minuend.    |
| 56 | 13         | $4_4^3$ , subtrahend. |

# 39 14 $1\frac{1}{2}$ , difference.

We eannot take  $\frac{3}{4}$  from  $\frac{1}{4}$ , but—borrowing one of the pence, or 4 farthings, we add it to the  $\frac{1}{4}$ , and then say 3 farthings from 5, and 2 farthings, or one halfpenny, remains: we set down  $\frac{1}{2}$  under the farthings. 4 pence from 5 (we have borrowed one of the 6 pence), and one penny remains: we set down 1 under the pence  $(1\frac{1}{2}d.$  is read "three halfpence"). 13 shillings eannot be taken from 7, but (borrowing one from the pounds, or 20 shillings) 13 shillings from 27, and 14 remain: we set down 14 in the shillings' place of the remainder. 6 pounds cannot be taken from 5 (we have borrowed one of the 6 pounds in the minuend)

ains 120 acres, 3 ow much reod, 27

# COMPOUND SUBTRACTION.

but 6 from 15, and 9 remain: we put 9 under the units of pounds. 5 tens of pounds from 8 tens (we have borrowed one of the 9), and 3 remain: we put 3 in the tens of pounds' place of the remainder.

18. This rule and the reasons of it are substantially the same as those already given for Simple Subtraction [Sec. II. 17, &c.] It is evidently not so necessary to put down cyphers where there is nothing in a denomination of the remainder.

33. A shopkceper bought a piece of cloth containing 42 yards for £22 10s., of which he sells 27 yards for £15 15s.; how many yards has he left, and what have they cost him? Ans. 15 yards; and they cost him £6 15s.

34 A merchant bought 234 tons, 17 cwt., 1 quarter, 23 lb, and sold 147 tons, 18 cwt., 2 quarters, 24 lb; how much remained unsold? Ans. 86 tons, 18 cwt., 2 qrs. 27 lb.

35. If from a piece of cloth containing 496 yards, 3 quarters, and 3 nails, I cut 247 yards, 2 quarters, 2 nails, what is the length of the remainder? Ans. 249 yards, 1 quarter, 1 nail.

36. A field contains 769 acres, 3 roods, and 20 perches, of which 576 acres, 2 roods, 23 perches are tilled; how much remains untilled? Ans. 193 acres, 37 perches.

37. I owed my friend a bill of £76 16s.  $9\frac{1}{2}d.$ , out of which I paid £59 17s.  $10\frac{3}{4}d.$ ; how much remained due > Ans. £16 18s.  $10\frac{3}{4}d.$ 

G

38. A merchant bought 600 salt ox hides, weighing 561 cwt., 2 lb; of which he sold 250 hides, weighing 239 cwt., 3 qrs., 25 lb. How many hides had he left, and what did they weigh i Ans. 350 hides, weighing 321 cwt., 5 lb.

39. A merchant has 209 casks of butter, weighing 400 ewt., 2 qrs., 14 lb; and ships off 173 casks, weighing 213 ewt., 2 qrs., 27 lb. How many casks has he left; and what is their weight? Ans. 36 casks, weighing 186 cwt., 3 qrs., 15 lb.

40. What is the difference between 47 English miles, the length of the Claudia, a Roman aqueduct, and 1000 feet, the length of that across the Dee and Vale of Llangollen? Ars. 247160 feet, or 46 miles, 4280 feet.

41. What is the difference between 980 feet, the width of the single arch of a wooden bridge erected at St. Petersburg, and that over the Schuylkill, at Philadelphia, 113 yards and 1 foot in span? Ans. 640 feet

# QUESTIONS FOR THE PUPIL.

What is the rule for compound subtraction ? [16].
 How is compound subtraction proved ? [19].

## COMPOUND MULTIPLICATION.

20. Since we cannot multiply pounds, &c., by pounds, &c., the multiplier must, in compound multiplication, be an abstract number.

21. When the multiplier does not exceed 12-

RULE-I. Place the multiplier to the right hand side of the multiplicand, and beneath it.

II. Put a separating line under both.

III. Multiply each denomination of the multiplicand by the multiplier, beginning at the right hand side.

IV. For every time the number required to make one of the next denomination is contained in any product of the multiplier and a denomination of the multiplicand, carry one to the next product, and set down the remainder (if there is any, after subtracting the number equivalent to what is carried) under the denomination

weighing weighing he left, weighing

h miles, nd 1000 Vale of 280 feet. Teet, the ected at t Phila-40 feet

? [16]. ].

pounds, lication,

t hand

iplicand e. D make ny promultiown the number ination to which it belongs; but should there be no remainder, out a cypher in that denomination of the product.

22. EXAMPLE. - Multiply £62 17s. 10d. by 6.

#### 62 s. d. 62 17 10, multiplicand. 6, multiplier.

### 377 7 0, product.

Six times 10 pence are 60 pence; these are equal to 5 shillings (5 times 12 pence) to be carried, and no pence to be set down in the product—we therefore write a cypher in the pence place of the product. 6 times 7 are 42 shillings, and the 5 to be carried are 47 shillings—we put down 7 in the units' place of shillings, and carry 4 tens of shillings. 6 times 1 (ten shillings) are 6 (tens of shillings), and 4 (tens of shillings) to be carried, are 10 (tens of shillings), or 5 pounds (5 times 2 tens of shillings) to be carried, and nothing, (no ten of shillings) to be set down. 6 times 2 pounds are 12, and 5 to be carried are 17 pounds—or 1 (ten pounds) to be carried, and 7 (units of pounds) to be set down. 6 times 6 (tens of pounds) are 36, and 1 to be carried are 37 (tens of pounds).

23. The reasons of the rule will be very easily understood from what we have already said [Sec. II. 41]. But since, in compound multiplication, the value of the multiplier has no connexion with its position in reference to the multiplicand, where we set it down is a mere matter of convenience; neither is it so necessary to put cyphers in the product in those denominations in which there are no significant figures, as it is in simple multiplication.

24. Compound multiplication may be proved by reducing the product to its lowest denomination, dividing by the multiplier, and then reducing the quotient

EXAMPLE. - Multiply £4 3s. 8d. by 7.

|            | s.<br>3 | <i>d</i> .<br>8 | .*         | 29                             | 100)<br>5 |                      |
|------------|---------|-----------------|------------|--------------------------------|-----------|----------------------|
| <b>2</b> 9 | 5       | 8,              | product.   | $\frac{20}{585}$ 12            |           |                      |
|            |         |                 |            | $7)\overline{7028}$<br>12)1004 | pr        | oduct reduced.       |
|            | •       | quo             | tient redu | 20)83                          | 3         | 8<br>8=multiplicand. |

£2.) 55. 8d. are 7 times the multiplicand; if, therefore, the process has been rightly performed, the seventh part of this should be equal to the multiplicand.

The quantities are to be "reduced," before the division by 7, since the learner is not supposed to be able as yet to divide £29 5s. 8d.

18s. 54d.

14. If gallons at 13s. 9d.  $\Phi$ , will cost £ 15. 12 lb at £1 3s. 4d.  $\Phi$ , will cost £14.

25. When the multiplier exceeds 12, and is a composite number-

RULE .---- Multiply successively by its factors

| EXAMPLE 1Multiply £47 13s. 4d. by 56.                         |
|---|
| $\begin{array}{cccccccccccccccccccccccccccccccccccc$          |
| $56 = 7 \times 8 \xrightarrow[333]{13} 4 = 47 13 4 \times 7.$ |
| 2669 6 8=47 13 $4 \times 7 \times 8$ , or 56.                 |
| EXAMPLE 2Multiply 14s. 2d. by 100.                            |
| s. d. 14 2 10   |
| $100=10\times10 \xrightarrow{10} s. d.$                       |
| £70 16 8=14 $2 \times 10 \times 10$ , or 100.                 |

т 2 nur F E

TI[Sec the juult

Example 3.-Multiply £8 2s. 4d. by 700. £ 8 *s*. d, 2 -4 10 £ s. d. 81 3 4 = 82 4×10. 10 811 13 4 =8 4×10×10, or 100.  $\mathbf{2}$ 

5681 13 4 =8 2  $4 \times 10 \times 10 \times 7$ , or 700. The reason of this rule has been already given [Sec. II. 60]. 26 When the multiplice is the second

26. When the multiplier is the sum of composite numbers-

RULE.-Multiply by each, and add the results.

EXAMPLE.-Multiply £3 14s. 6d. by 430.

| 3   | s.<br>14<br>5 | $\begin{array}{c} 6\\ 10\\ \hline 0 \end{array}$ | £<br>×3=111             | s.<br>15 | <i>d</i> .<br>0, or | £3 | s.<br>14 | <i>d.</i><br>6×30.              |
|-----|---------------|--|-------------------------|----------|---------------------|----|----------|---------------------------------|
| 372 | 10            | $\frac{10}{0}$                                   | <4 <u>-1490</u><br>1601 |          |                     |    |          | $6 \times 400.$ $6 \times 430.$ |

The reason of the rule is the same as that already given [Sec. II. 52]. The sum of the products of the multiplicand by the parts of the multiplier, being equal to the product of the multiplicand by the whole multiplier.

40. What is the difference between the price of 743 ounces of gold at £3 17s.  $10\frac{1}{2}d$ . per oz. Troy, and that of the same weight of silver at 62d. per oz. ? Ans. £2701 2s.  $3\frac{1}{2}d$ .

41. In the time of King John (money being then more valuable than at present) the price, per day, of a cart with three horses was fixed at 1s. 2d.; what would be the hire of such a cart for 272 days? Ans. £15 17s. 4d.

42. Veils have been made of the silk of caterpillars, a square yard of which would weigh about 4 grains; what would be the weight of so many square yards of this texture as would cover a square English mile? Ans. 2151 lb, 1 oz., 6 dwt., 1C grs., Troy.

QUESTIONS TO BE ANSWERED BY THE PUPIL.

1. Can the multiplier be an applicate number ? [20].

2. What is the rule for compound multiplication when the multiplier does not exceed 12? [21].

3. What is the rule when it exceeds 12, and is a composite number? [25].

132

4. When it is the sum of composite numbers? [26].
5. When it exceeds 12, and not a composite number?
[27].

6. How is compound multiplication proved ? [24].

# COMPOUND DIVISION.

29. Compound Division enables us, if we divide an applicate number into any number of equal parts, to ascertain what each of them will be; or to find out how many times one applicate number is contained in another.

If the divisor be an applicate, the quotient will be an abstract number—for the quotient, when multiplied by the divisor, must give the dividend [Sec. II. 79]; but two applicate numbers cannot be multiplied together [20]. If the divisor be abstract, the quotient will be applicate—for, multiplied by the quotient, it must give the dividend—an applicate number. Therefore, either divisor or quotient must be abstract.

30. When the divisor is abstract, and does not ex-

RULE-I. Set down the dividend, divisor, and separating line-as directed in simple division [Sec. II. 72].

II. Divide the divisor, successively, into all the denominations of the dividend, beginning with the highest.

III. Put the number expressing how often the divisor is contained in each denomination of the dividend under that denomination—and in the quotient.

IV. If the divisor is not contained in a denomination of the dividend, multiply that denomination by the number which expresses how many of the next lower denomination is contained in one of its units, and add the product to that next lower in the dividend.

V. "Reduce" each succeeding remainder in the same way, and add the product to the next lower denomination in the dividend.

VI. If any thing is left after the quotient from the lowest denomination of the dividend is obtained, put it do be th qu

lea lea wi aro fan wh th wh

un

go wi ov de: fan be san

wł

be gre one to a div

cat

ph [S

de

down, with the divisor under it, and a separating line between:—or omit it, and if it is not less than half the divisor, add unity to the lowest denomination of the quotient.

# 31. EXAMPLE 1.-Divide £72 6s. 91d. by 5.

| £<br>5)72 | s.<br>6 | $d. 9\frac{1}{2}$ |
|-----------|---------|-------------------|
| 14        | 9       | 41                |

5 will go into 7 (tens of pounds) once (ten times), and leave 2 tens. 5 will go into 22 (units of pounds) 4 times, and leave two pounds or 40s. 40s. and 6s. are 46s., into which 5 will go 9 times, and leave one shilling, or 12d. 12d. and 9d. are 21d., into which 5 will go 4 times, and leave 1d., or 4 farthings. 4 farthings and 2 farthings are 6 farthings, into which 5 will go once, and leave 1 farthing—still to be divided; this would give  $\frac{1}{5}$ , or the fifth part of a farthing as quotient, which, being less than half the divisor, may be neglected.

A knowledge of fractions will hereafter enable us to understand better the nature of these remainders.

EXAMPLE 2.—Divide £52 4s.  $1\frac{3}{4}d$ . by 7.

One shilling or 12d. are left after dividing the shillings, which, with the 1d. already in the dividend, make 13d. 7 goes into 13 onee, and leaves 6d., or 24 farthings, which, with  $\frac{3}{4}$ , make 27 farthings. 7 goes into 27 3 times and 6 over; but as 6 is more than the half of 7, it may be considered, with but little inaccuracy, as 7—which will add one farthing to the quotient, making it 4 farthings, or one to be added to the pence.

32. This rule, and the reasons of it, are substantially the same as those already given [Sec. II. 72 and 77]. The remainder, after dividing the farthings, may, from its insignificance, be neglected, if it is not greater than half the divisor. If it is greater, it is evidently more accurate to consider it as giving one farthing to the quotient, than 0, and therefore it is proper to add a farthing to the quotient. If it is exactly half the divisor, we may consider it as equal either to the divisor, or 0.

33. Compound division may be proved by multiplication—since the product of the quotient and divisor, plus the remainder, ought to be equal to the dividend [Sec. II. 79].

35. When the divisor exceeds 12, and is not a com-

RULE.—Proceed by the method of long division; but in performing the multiplication of the remainders by the numbers which make them respectively a denomination lower, and adding to the products of that next lower denomination whatever is already in the dividend, set down the multipliers, &c. obtained. Place the quotient as directed in long division [Sec. II. S9].

62 goes into £87 once (that is, it gives £1 in the quotienc), and leaves £25. £25 are equal to  $500s. (25 \times 20)$ , which, with 16s. in the dividend, make 516s. 62 goes into 516s. 8 times (that is, it gives 8s. in the quotient), and leaves 20s., or 240d. (20×12) as remainder. 62 goes into 240, &e.

Were we to put  $\frac{3}{4}$  in the quotient, the remainder would be 46, which is more than half the divisor; we consider the quotient, therefore, as 4 farthings, that is, we add one penny to (3) the pence supposed to be already in the quotient. £1 8s. 4d. is nearer to the true quotient than £1 8s.  $3\frac{3}{4}d$ .[32].

This is the same in principle as the rule given above [30] but since the numbers are large, it is more convenient actually to set down the sums of the different denominations of the dividend and the preceding remainders (reduced), the products of the divisor and quotients, and the numbers by which we multiply for the necessary reductions: this prevents the memory from being too much burdened [Sec. II. 93].

36. When the divisor and dividend are both applicate numbers of one and the same denomination, and no reduction is required—

RULE.—Proceed as already directed [Sec. II 70, 72, or 89].

com-

posite

ion ; ders enonext end, 100-

EXAMPLE.-Divide £45 by £5.

That is £5 is the ninth part of £45.

37. When the divisor and dividend are applicate, but not of the same denomination; or more than one denomination is found in either, or both—

RULE.—Reduce both divisor and dividend to the low est denomination contained in either [3], and then proceed with the division.

| EXAMPLE. Divide £37 5s. $9^{1}_{4}d$ . by 3s. $6^{1}_{2}d$ .   |
|--|
| $\mathfrak{L}^{\mathfrak{s}}$ $\mathfrak{L}^{\mathfrak{s}}$ $\mathfrak{L}^{\mathfrak{s}}$ $\mathfrak{L}^{\mathfrak{s}}$                  |

31. A cubic foot of distilled water weighs 1000 ounces what will be the weight of one cubic inch? Ans 253.1829 grains, nearly.

32. How many Sabbath days' journeys (each 1155 yards) in the Jewish days' journey, which was equal to 33 miles and 2 furlongs English? Ans. 50.66, &c.

33. How many pounds of butter at  $11\frac{3}{4}d$ . per fb would purchase a cow, the price of which is £14 15s.? Ans. 301.2766.

### QUESTIONS FOR THE PUPIL.

1. What is the use of compound division ? [29].

2. What kind is the quotient when the divisor is an abstract, and what kind is it when the divisor is an applicate number? [29].

3. What are the rules when the divisor is abstract, and does not exceed 12? [30];

4. When it exceeds 12, and is composite ? [34];

5. When it exceeds 12, and is not composite ? [35];

6. And when the divisor is an applicate number ? [36 and 37].

# SECTION IV.

# FRACTIONS.

1. If one or more inits are divided into equal parts, and one or more of these parts are taken, we have what is called a *fraction*.

Any example in division—before the process has been performed—may be considered as affording a fraction : thus  $\frac{3}{6}$  (which means 5 to be divided by 6 [Sec. II. 68]) is a fraction of 5—its sixth part; that is, 5 being divided into six equal parts,  $\frac{5}{6}$  will express one of them; or (as we shall see presently), if unity is divided into six equal parts, five of them will be represented by  $\frac{5}{6}$ .

2. When the dividend and divisor constitute a fraction, they change their names—the former being then termed the numerator, and the latter the denominator; for while the denominator tells the denomination or kind of parts into which the unit is supposed to be divided, the numerator numerates them, or indicates the number of them which is taken. Thus  $\frac{2}{3}$  (read threesevenths) means that the parts are "sevenths," and that "three" of them are represented. The numerator and denominator are called the terms of the fractions.

3. The greater the numerator, the greater the value of the fraction—because the quotient obtained when we divide the numerator by the denominator is its real value; and the greater the dividend the larger the quotient. On the contrary, the greater the denominator the less the fraction—since the larger the divisor the smaller the quotient [Sec. II. 78]:—hence  $\frac{3}{7}$  is greater than  $\frac{5}{7}$ —which is expressed thus,  $\frac{6}{7} > \frac{5}{7}$ ; but  $\frac{5}{8}$ 4. Since the fraction because the second by  $\frac{5}{8} < \frac{5}{7}$ .

4. Since the fraction is equal to the quotient of its numerator divided by its denominator, as long as this quotient is unchanged, the value of the fraction is the

o wo can

ne Y

to increase or diminish both the dividend and divisor which does not affect the quotient.

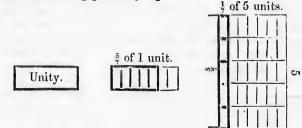

5. The following will rc, resent unity, seven-sevenths, and five-sevenths.

The very faint lines indicate what  $\frac{4}{7}$  wants to make it equal to unity, and identical with  $\frac{4}{7}$ . In the diagrams which are to follow, we shall, in this manner, generally subjoin the difference between the fraction and unity.

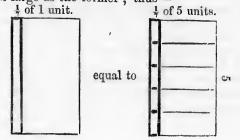

The teacher should impress on the mind of the pupil that he might have chosen any *other* unity to exemplify the nature of a fraction.

6. The following will show that  $\frac{5}{4}$  may be considered as either the  $\frac{5}{4}$  of 1, or the  $\frac{1}{4}$  of 5, both—though not identical—being perfectly equal.

In the one case we may suppose that the five parts belong to but one unit; in the other, that each of the five belongs to different units of the same kind.

Lastly,  $\frac{5}{7}$  may be considered as the  $\frac{1}{7}$  of one unit five times as large as the former; thus—

real

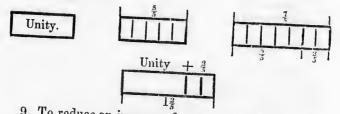

his he an ne Y

its

7. If its numerator is equal to, or greater than its denominator, the fraction is said to be *improper*; because, although it has the fractional form, it is equal to, or greater than an integer. Thus  $\frac{7}{4}$  is an improper fraction, and means that each of its seven parts is equal to one of those obtained from a unit divided into five equal parts. When the numerator of a proper fraction is divided by its denominator, the quotient will be expressed by decimals; but when the numerator of an improper fraction is divided by its denominator, part, at least, of the quotient will be an integer.

It is not inaccurate to consider 7 as a fraction, since it consists of "parts" of an integer. It would not, however, be true to call it *part* of an integer; but this is not required by the definition of a fraction—which, as we have said, consists of "part," or "parts" of a unit [1].

8. A mixed number is one that contains an integer and a fraction; thus  $1\frac{2}{5}$ —which is equivalent to, but not identical with the improper fraction  $\frac{7}{5}$ . The following will exemplify the improper fraction, and its equivalent mixed number—

9. To reduce an improper fraction to a mixed number An improper fraction is reduced to a mixed number if we divide the numerator by the denominator, and, after the units in the quotient have been obtained, set down the remainder with the divisor under it, for denominator; thus  $\frac{7}{5}$  is evidently equal to  $1\frac{2}{5}$ —as we have already noticed when we treated of division [Sec. II. 71].

tł

fc

ti

fr

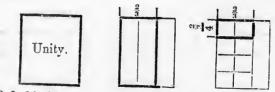

th m tie

10. A simple fraction has reference to one or more integers; thus  $\frac{5}{4}$ —which means, as we have seen [6], the five-sevenths of one unit, or the one-seventh of five units.

11. A compound fraction supposes one fraction to refer to another; thus  $\frac{4}{3}$  of  $\frac{3}{4}$ —represented also by  $\frac{3}{4} \times \frac{4}{3}$ (three-fourths multiplied by four-ninths), means not the four-ninths of unity, but the four-ninths of the three-fourths of unity:—that is, unity being divided into four parts, three of these are to be divided into nine parts, and then four of these nine are to be taken; thus—

12. A complex fraction has a fraction, or a mixed number in its numerator, denominator, or both; thus  $\frac{3}{4}$ , which means that we are to take the fourth part, not of unity, but of the  $\frac{3}{4}$  of unity. This will be exemplified by—

 $\frac{8}{\frac{2}{5}}, \frac{1}{\frac{3}{5}}, \frac{1}{\frac{1}{2}}, \frac{1}{\frac{2}{5}}, \frac{1}{\frac{5}{5}}, \text{ are complex fractions, and will be better}$ 

understood when we treat of the division of fractions.

13. Fractions are also distinguished by the nature of their denominators. When the denominator is unity, followed by one or more cyphers, it is a decimal fraction—thus,  $\frac{1}{10}$ ,  $\frac{1}{1000}$ , &c.; all other fractions are vulgar —thus,  $\frac{4}{9}$ ,  $\frac{5}{6}$ ,  $\frac{2}{300}$ , &c.

Arithmetical processes may often be performed with fractions, without actually dividing the numerators by the denominators. Since a fraction, like an integer, may be increased or diminished, it is capable of addition, subtraction, &c.

14. To reduce an integer to a fraction of any denomination.

An integer may be considered as a fraction if we make unity its denominator:—thus  $\frac{5}{1}$  may be taken for 5; since  $\frac{1}{5}=5$ .

We may give an integer any denominator we please if we previously multiply it by that denominator;

thus,  $5 = \frac{25}{5}$ , or  $\frac{30}{6}$ , or  $\frac{35}{7}$ , &e., for  $\frac{25}{5} = \frac{5 \times 5}{1 \times 5} = \frac{5}{1} = 5$ ; and  $\frac{30}{6} = \frac{5 \times 6}{1 \times 6} = \frac{5}{1} = 5$ , &e.

#### EXERCISES.

1. Reduce 7 to a fraction, having 4 as denominator

2. Reduce 13 to a fraction, having 16 as denominator. Ans.  $\frac{208}{16}$ .

3.  $4 = \frac{23}{7}$ . 4.  $19 = \frac{57}{3}$ . 5.  $42 = \frac{504}{12}$ . 6.  $71 = \frac{6574}{54}$ . 15. To reduce fractions to lower terms.

Before the addition, &c., of fractions, it will be often convenient to reduce their terms as much as possible. For this purpose—

RULE.-Divide each term by the greatest common measure of both.

EXAMPLE.  $-\frac{40}{72} = \frac{5}{9}$ . For  $\frac{40}{72} = \frac{40 \div 8}{72 \div 8} = \frac{5}{9}$ .

We have already seen that we do not alter the quotient which is the real value of the fraction [4]—if we multiply or divide the numerator and denominator by the same number.

What has been said, Sec. II. 104, will be usefully remembered here.

#### EXERCISES.

Reduce the following to their lowest terms.

| $\begin{array}{c} 1. & \frac{574}{1080} = \frac{287}{540}.\\ 8. & \frac{410}{10} = 41 \\ \end{array}$ | 13. $\frac{63}{72} = \frac{7}{8}$ .<br>14 144 12          | $19. \ \frac{100400}{370300} - \frac{1004}{3003}.$   |
|---|---|--|
| 9. $\frac{976}{743}$ $\frac{976}{743}$ .  | 15. $\frac{156}{93} = \frac{13}{31}$ .                    | $\begin{array}{c} 20. & \frac{1}{7400} = \frac{1}{2}. \\ 21. & \frac{5000}{7555} = \frac{1120}{1120}. \end{array}$ |
| $10. \frac{7143}{2381}$ $11. \frac{240}{322} \frac{130}{161}$   | 16. $\frac{43}{60}$ $\frac{4}{5}$ .<br>17. $\frac{60}{5}$ | 22. $\frac{425}{755}$ $\frac{85}{151}$ .   |
| 12. $\frac{125}{162} = \frac{1}{9}$ .   | 18. $\frac{72-6}{112}=\frac{7}{8}$ .                      | $\begin{array}{c} 20. & \frac{1}{466} \\ 24. & \frac{512}{614} \\ \hline \\ 307. \end{array}$                      |

 16. To find the value of a fraction in terms of a lower denomination-

RULE.—Reduce the numerator by the rule already given [Sec. III. 3], and place the denominator under it.

EXAMPLE.—What is the value, in shillings, of  $\frac{3}{4}$  of a pound ? £3 reduced to shillings=60s.; therefore  $\frac{2}{4}$  reduced to shillings= $\frac{60}{10}s$ .

The reason of the rule is the same as that already given [Sec. III. 4]. The  $\frac{2}{3}$  of a pound becomes 20 times as much if the "unit of comparison" is changed from a pound to a shilling.

We may, if we please, obtain the value of the resulting fraction by actually performing the division [9]; thus  $\frac{e_0}{4}s.=15s.$ :—hence  $\pounds_4^3=15s.$ 

#### EXERCISES.

|---|--|---|--|

17. To express one quantity as the fraction of another-

RULE.—Reduce both quantities to the lowest denomination contained in either—if they are not already of the same denomination; and then put that which is to be the fraction of the other as numerator, and the remaining quantity as denominator.

EXAMPLE.—What fraction of a pound is  $2\frac{1}{4}d$ ?  $\pounds 1=960$  farthings, and  $2\frac{1}{4}d$ .=9 furthings; therefore  $\frac{9}{560}$  is the required fraction, that is,  $2\frac{1}{4}d$ .= $\pounds \frac{9}{560}$ .

REASON OF THE RULE.—One pound, for example, contains 960 farthings, therefore one farthing is  $\pounds_{\frac{1}{960}}$  (the 960th part of a pound), and 9 times this, or  $2\frac{1}{4}$ , is  $\pounds 9 \times \frac{1}{560} = \frac{9}{960}$ .

#### EXERCISES.

31. What fraction of a pound is 14s. 6d.? Ans. 29

32. What fraction of £100 is 17s. 4d.? Ans. 1500.

33. What fraction of £100 is £32 10s.? Ans. 13.

34. What fraction of 9 yards, 2 quarters is 7 yards, 3 quarters ? Ans.  $\frac{31}{38}$ .

35. What part of an Irish is an English mile ? Ans. 14.

36. What fraction of 6s. 8d. is 2s. 1d. ? Ans.  $\frac{1}{16}$ . 37. What part of a pound avoirdupoise is a pound Troy? Ans.  $\frac{144}{14}$ .

### QUESTIONS.

1. What is a fraction ? [1].

2. When the divisor and dividend are made to constitute a fraction, what do their names become ? [2].

3. What are the effects of increasing or diminishing the numerator, or denominator? [3].

4. Why may the numerator and denominator be multiplied or divided by the same number without altering the value of the fraction? [4].

5. What is an improper fraction ? [7].

6. What is a mixed number ? [8].

7. Show that a mixed number is not identical with the equivalent improper fraction ? [8].

8. How is an improper fraction reduced to a mixed number ? [9].

9. What is the difference between a simple, a compound, and a complex fraction ? [10, 11, and 12];

10. Between a vulgar and decimal fraction ? [13].

11. How is an integer reduced to a fraction of any denomination ? [14].

12. How is a fraction reduced to a lower term? [15].

13. How is the value of a fraction found in terms of a lower denomination ? [16].

14. How do we express one quantity as the fraction of another ? [17].

# VULGAR FRACTIONS.

### ADDITION.

18. If the fractions to be added have a common denominator\_\_\_

RULE .-- Add all the numerators, and place the common denominator under their sum.

EXAMPLE.  $-\frac{5}{7} + \frac{6}{7} = \frac{11}{7}$ .

REASON OF THE RULE. -- If we add together 5 and 6 of any kind of individuals, their sum must be 11 of the same kind of individuals-since the process of addition has not changed th ins Ac

of th

for in the q and s 2 + 3 +7

their nature. But the units to be added were, in the present instance, sevenths; therefore their sum consists of sevenths. Addition may be illustrated as follows :---

19. If the fractions to be added have not a common denominator, and all the denominators are prime to each other—

RULE.—Multiply the numerator and denominator of each fraction by the product of the denominators of all the others, and then add the resulting fractions—by the last rule.

EXAMPLE.—What is the sum of  $\frac{2}{3} + \frac{3}{4} + \frac{4}{7}$ ?

| $\frac{2}{3} + \frac{3}{4} + \frac{4}{7} = \frac{2 \times 4 \times 7}{3 \times 4 \times 7} + \frac{3 \times 3 \times 7}{4 \times 3 \times 4} + \frac{4 \times 3 \times 4}{56} + \frac{56}{63} + \frac{63}{48} + \frac{48}{167}$ |
|---|
|   |
| Having found the denominator of one fraction, we may at<br>once put it as the common donominator we may at  |
| once put it as the common denominator of one fraction, we may at<br>factors (the given denominator) much the same   |
| factors (the given denominators) must necessarily produce<br>the same product.  |
| the same product. must necessarily produce  |

20. REASON OF THE RULE.—To bring the fractions to a common denominator we have merely multiplied the numerator and denominator of each by the same number, which [4] does not alter the fraction. It is necessary to find a common denominator; for if we add the fractions without so doing, we cannot put the denominator of any one of them as the denominator of their sum;—thus  $\frac{2+3+4}{3}$  for instance, would not be correct—since it would suppose all the quantities to be thirds, while some of them are fourths and sevenths, which are *less* than thirds; neither would  $\frac{2+3+4}{7}$  be correct—since it would suppose all of them to be

[2]. ninishing

to con-

10. er. 3

a com-]; [13]. of any

term?

rms of

raction

mmon

com-

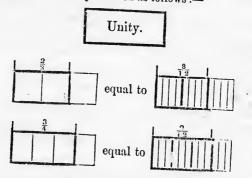

f any kind

sevenths, although some of them are thirds and fourths, which are greater than sevenths.

21. In altering the denominators, we have only changed the parts into which the unit is supposed to be divided, to an equivalent number of others which are smaller. It is necessary to diminish the size of these parts, or each fraction would not be *exactly* equal to some number of them. This will be more evident if we take only two of the above fractions. Thus, to add  $\frac{3}{2}$  and  $\frac{5}{4}$ ,

$$\frac{2}{3} + \frac{3}{4} = \frac{2 \times 4}{3 \times 4} + \frac{3 \times 3}{4 \times 3} = \frac{8}{12} + \frac{9}{12} = \frac{17}{12}$$

These fractions, before and after they receive a common denominator, will be represented as follows :---

We have increased the number of the parts just as much as we have diminished their size; if we had taken parts larger than twelfths, we could not have found any numbers of them exactly equivalent, respectively, to both  $\frac{3}{4}$  and  $\frac{3}{4}$ .

| 200 200 288 288  | + 288 +-                   | 288 -288                                     | $+\frac{12}{288}+\frac{12}{288}$ | =         |                    |

23. REASON OF THE RULE. -- We have multiplied each numerator and denominator by the same number (the least common multiple of the denominators [4])-since  $b \times 288 \div 32$ 

(for 288

instance) =  $\frac{5 \times 288}{32 + 288}$ . For we obtain the same quotient, whether

we multiply the divisor or divide the dividend by the same number-as in both cases we to the very same amount, diminish the number of times the one can be subtracted from

When the denominators are not prime to each other the fractions we obtain have lower terms if we make the least common multiple of the denominators, rather than the product of the denominators, the common denominator. In the present instance, had we proceeded according to the last rule [19], we would have found 5 8 3 17280 18432 4608  $\overline{32} + \overline{48} + \overline{72} = 1\overline{10592} + 1\overline{10592} + 1\overline{10592} = 1$ 40320 : but  $\frac{40320}{110592}$  is evidently a fraction containing larger 110592 terms than 81 288

24. To reduce a mixed number to an improper fraction\_\_\_

RULE .- Change the integral part into a fraction, having the same denominator as the fractional part [14], and add it to the fractional part.

EXAMPLE.—What fraction is equal to  $4\frac{5}{9}$ ?  $4\frac{5}{9} = \frac{4}{1} + \frac{5}{9} =$ 86+5-41.

14"

25. REASON OF THE RULE.-We have already seen that an integer may be expressed as a fraction having any denominator we please :- the reduction of a mixed number, therefore, is really the addition of fractions, previously reduced to

| 38. 161 - 113                       | EXERCISES.              |
|-------------------------------------|-------------------------|
| 39. 185 149                         | 44. 99 1 1090           |
| 40. 791_633                         | 45. $12^{11}_{-145}$    |
|                                     | 46. $151^{2}-91^{12}$ . |
| 41. $47_{\frac{1}{4}} = 189$ .      | 47, 465 373             |
| 42. $74\frac{1}{9}=6\frac{6}{9}7$ . | 48, 133-180             |
| 43. $95\frac{1}{5}=4\frac{7}{5}6$ . | 49 9715 447             |
| 6 11                                | 10. 41 18 18.           |

26. To add mixed numbers-

RULE .- Add together the fractional parts; then, if the sum is an improper fraction, reduce it to a mixed number [9], and to its integral part add the integers in the given addends ; if it is not an improper fraction, set It down along with the sum of the given integers.

EXAMPLE 1.—What is the sum of  $4\frac{5}{8} + 18\frac{7}{8}$ ?

 $\frac{1}{8} + \frac{5}{8} = \frac{12}{8} = 1\frac{4}{8}$ sum 234

5 eighths and 7 eighths are 12 eighths; but, as 8 eighths make one unit, 12 eighths are equal to one unit and 4 eighths-that is, one to be carried, and <sup>4</sup>/<sub>8</sub> to be set down. 1 and 18 are 19, and 4 are 23.

EXAMPLE 2 .- Add 125 and 2911.

11.

| $+\frac{5}{6} = \frac{47}{30} = 1, \frac{17}{30}$ | $\begin{array}{c}125 \\ 125 \\ 2911 \\ 3 \\ 2911 \\ 5 \\ 293 \\ 3 \\ 5 \\ 6 \\ 7 \\ 5 \\ 7 \\ 7 \\ 7 \\ 7 \\ 7 \\ 7 \\ 7 \\ 7$ |
|---|--|
|   |  |

sum  $42\frac{17}{30}$ In this case it is necessary, before performing the addition [19 and 22], to reduce the fractional parts to a common

27. REASON OF THE RULE .- The addition of mixed numbers is performed on the same principle as simple addition but, in the first example, for instance, eight of one denomination is equal to one of the next-while in simple addition [Sec. II. 3], ten of one denomination is equal to one of the next.

#### QUESTIONS.

1. What is the rule for adding fractions which have a common denominator? [18].

2. How are fractions brought to a common denominator? [19 and 22].

3. What is the rule for addition when the fractions have different denominators, all prime to each other? [19].

4. What is the rule when the denominators are not the same, but are not all prime to each other? [22].

5. How is a mixed number reduced to an improper fraction? [24].

6. How are mixed numbers added? [26].

### SUBTRACTION.

28. To subtract fractions, when they have a common lenominator-

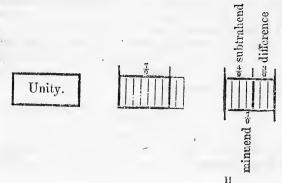

RULE.—Subtract the numerator of the subtrahend from that of the minuend, and place the common denominator under the difference.

EXAMPLE .- Subtract & from 7.

· ·, ( ).

$$\frac{7}{9} - \frac{4}{9} = \frac{7 - 4}{9} = \frac{3}{9}$$

29. REASON OF THE RULE.—If we take 4 individuals of any kind, from 7 of the same kind, three of them will remain. In the example, we take 4 (ninths) from 7 (ninths), and 3 are left which must be ninths, since the process of subtraction cannot have changed their nature. The following will exemplify the subtraction of fractions :—

|---|---|
| $\begin{array}{c} 0, \ \frac{4}{22} - \frac{7}{22} = \frac{7}{11}, \\ 0, \ 1 \in \mathcal{O} \end{array}$   | <br>10. $\frac{1}{27} - \frac{1}{27} = \frac{1}{3}$ .   |

30. If the subtrahend and minuend have not a common denominator-

RULE.-Reduce them to a common denominator [19 and 22]; then proceed as directed by the last rule.

EXAMPLE .- Subtract 5 from 7.

$$\frac{1}{8} - \frac{5}{9} = \frac{63}{72} - \frac{40}{72} = \frac{23}{72}$$

81. REASON OF THE RULE .- It is similar to that already given [20] for reducing fractions to a common denominator,

EXERCISES.

| 14 14 128. 2  | $17. \frac{53}{48} - \frac{55}{48} - \frac{4038}{5}$   |
| 14. $\frac{14}{13} - \frac{12}{13} - \frac{2}{105}$ . | 18 756 81 28   |
| 0   | 10. 381 - 223  |

32. To subtract mixed numbers, or fractions from mixed numbers.

If the fractional parts have a common denominator-RULE-I. Subtract the fractional part of the subtrahend from that of the minuend, and set down the difference with the common denominator under it: then subtract the integral part of the subtrahend from the integral part of the minuend.

II. If the fractional part of the minuend is less than that of the subtrahend, increase it by adding the common denominator to its numerator, and decrease the integral part of the minuend by unity.

EXAMPLE 1.-4 $\frac{3}{8}$  from 9 $\frac{5}{8}$ .

95 minuend.

43 subtrahend.

$$5\frac{1}{4}$$
 difference.

3 eighths from 5 eighths and 2 eighths  $(=_{4}^{1})$  remain. 4 from 9 and 5 remain.

151

EXAMPLE 2.-Subtract 12<sup>3</sup> from 18<sup>1</sup>.

 $18\frac{1}{4}$  minuend.  $12\frac{3}{4}$  subtrahend.

### 51 difference.

3 fourths cannot be taken from 1 fourth; but (borrowing one from the next denomination, considering it as 4 fourths, and adding it to the 1 fourth) 3 fourths from 5 fourths and 2 fourths  $(=\frac{1}{2})$  remain. 12 from 17, and 5 remain.

If the minuend is an integer, it may be considered as a mixed number, and brought under the rule.

EXAMPLE 3.—Subtract 34 from 17.

17 may be supposed equal to  $17\frac{6}{5}$ ; therefore  $17-3\frac{4}{5}=17\frac{6}{5}-3\frac{4}{5}$ . But, by the rule,  $17\frac{6}{3}-3\frac{4}{5}=16\frac{5}{5}-3\frac{4}{5}=13\frac{1}{5}$ .

33. REASON OF THE RULE.—The principle of this rule is the same as that already given for simple subtraction [Sec II. 19]:—but in example 3, for instance, *five* of one denomination make *one* of the next, while in simple subtraction *ten* of one, make *one* of the next denomination.

34. If the fractional parts have not a common denominator-

RULE.—Bring them to a common denominator, and then proceed as directed in the last rule.

EXAMPLE 1.—Subtract  $42\frac{1}{4}$  from  $56\frac{1}{3}$ .

 $\begin{array}{c} 56\frac{1}{3} = 56\frac{4}{12}, \text{ minuend.} \\ 42\frac{1}{4} = 42\frac{3}{12}, \text{ subtrahend.} \\ \hline 14\frac{1}{12}, \text{ difference.} \end{array}$ 

25. REASON OF THE RULE.—We are to subtract the different denominations of the subtrahend from those which correspond in the minuend [Sec. II. 19]—but we cannot subtract fractions unless they have a common denominator [30].

4

we

too

ha

to

by

ing

20.

21.

 $\frac{22}{23}$ .

2. What is the rule, when they have not a common denominator? [30].

3. How are mixed numbers, or fractions, subtracted from mixed numbers, or integers? [32 and 34].

# MULTIPLICATION.

36. To multiply a fraction by a whole number; or the contrary-

RULE.—Multiply the numerator by the whole number, and put the denominator of the fraction under the product.

EXAMPLE.—Multiply  $\frac{4}{7}$  by 5.  $\frac{4}{7} \times 5 = \frac{29}{7}$ .

37. REASON OF THE RULE.—To multiply by any number, we are to add the multiplicand [Scc. II. 33] so many times as are indicated by the multiplier; but to add fractions having a common denominator we must add the numerators [18], and put the common denominator under the product. Hence—

$$\frac{4}{7} \times 5 = \frac{4}{7} + \frac{4}{7} + \frac{4}{7} + \frac{4}{7} + \frac{4}{7} = \frac{4+4+4+4+4}{7} = \frac{4\times5}{7} = \frac{20}{7}$$

We increase the number of those "parts" of the integer which constitute the fraction, to an amount expressed by the multiplier—their size being unchanged. It would evidently be the same thing to increase their size to an equal extent without altering their number—this would be effected by dividing the denominator by the given multiplier; thus  $\frac{1}{15} \times 5 = \frac{4}{3}$ . This will become still more evident if we reduce the fractions resulting from both methods to others having a common denominator—for  $\frac{20}{15} \left(=\frac{4 \times 5}{15}\right)$ , and  $\frac{4}{3} \left(=\frac{4}{15 \div 5}\right)$ will then be found equal.

As, very frequently, the multiplier is not contained in the denominator any number of times expressed by an integer, the method given in the *rule* is more generally applicable.

The rule will evidently apply if an integer is to be multiplied by a fraction—since the same product is obtained in whatever order the factors are taken [Sec. II. 35].

38. The integral quantity which is to form one of the factors may consist of more than one denomination

EXAMPLE. - What is the <sup>2</sup>/<sub>3</sub> of £5 2s. 9d. ?

| £ | 8. | d.                      | £  | 5. | d.           | £  | s. | d. |  |
|---|----|-------------------------|----|----|--------------|----|----|----|--|
| 5 | 2  | $\frac{d}{9\times_3^2}$ | _5 | 2  | $9 \times 2$ | -3 | 8  | 6  |  |
|   | -  | - 113                   |    |    | 3            |    | 0  | 0. |  |

|   | EXERCISES.                                   |   |
|---|--|---|
| 1. $\frac{4}{5} \times 2 = 1\frac{3}{5}$ .  | 6. $27 \times 4 = 12$ .                      | 11. $\frac{17}{18} \times 86 = 34$ .  |
| 2. $4 \times 8 = 6\frac{3}{7}$ .            | 7. $\frac{3}{14} \times 18 = 3\frac{6}{7}$ . | 12. $\frac{19}{20} \times 20 = 19$ .  |
| 3. $+\times 12 = 104$ .                     | 8. $\frac{13}{10} \times 8 = 7\frac{1}{2}$ . | 13. $22 \times \frac{3}{9} = 4\frac{3}{6}$ .  |
| 4. $\frac{1}{6} \times 12 = 9\frac{1}{3}$ . | 9. $21 \times 3 = 9$ .                       | 14 - 17-11  |
| 5. $\frac{7}{10} \times 30 = 14.$           | 10. $15 \times \frac{1}{5} = 3$ .            | 14. $\frac{1}{16} \times 17 = 1_{16}$<br>15. $143 \times \frac{3}{7} = 61\frac{3}{7}$ |
| 16 How much                                 | in 83 of 96 comen                            | 0   |

10. How much is  $\frac{8}{100}$  of 26 acres 2 roods? Ans 20 acres 3 roods.

17. How much is  $\frac{14}{45}$  of 24 hours 30 minutes? Ans 7 hours.

18. How much is  $\frac{870}{2219}$  of 19 cwt., 3 qrs., 7 lb? Ans 7 cwt., 3 qrs., 2 lb.

19. How much is  $\frac{13}{42}$  of £29? Ans.  $\pounds_{\frac{377}{42}}^{377} = \pounds 8$  19s  $6\frac{1}{4}d$ .

39. To multiply one fraction by another-

RULE.—Multiply the numerators together, and under their product place the product of the denominators.

EXAMPLE .- Multiply # by #.

| 4.5                             | $4 \times 5$                 | 20 |
|---------------------------------|------------------------------|----|
| $\bar{9}^{\bar{6}} \bar{6}^{=}$ | $=\frac{4\times5}{9\times6}$ | 54 |

40. REASON OF THE RULE.—If, in the example given, we were to multiply  $\frac{4}{9}$  by 5, the product  $\binom{20}{6}$  would be 6 times too great—since it was by the *sixth* part of 5  $\binom{5}{6}$ , we should have multiplied.—But the product will become what it ought to be (that is, 6 times smaller), if we multiply its denominator by 6, and thus cause the *size* of the parts to become 6 times less.

We have already illustrated this subject when explaining the nature of a compound fraction [11].

|   | EXERCISES.   |  |  |
|---|--|--|--|
| $\begin{array}{cccccccccccccccccccccccccccccccccccc$                      | $\begin{array}{c} 24. \frac{13}{14} \times \frac{74}{75} \underbrace{=} \frac{481}{525} \\ 25. \frac{7}{8} \times \frac{5}{6} \times \frac{7}{16} \underbrace{=} \frac{245}{768} \\ \end{array}$ | 28. $\frac{19}{20} \times \frac{30}{57} = \frac{1}{3}$ . |  |
| 21. $\frac{14}{15} \times \frac{5}{5} = \frac{7}{12}$ .                   | $25.7 \times 5 \times 7 = 245$   | 29. $1 \times 1 = 1$                                     |  |
| 22. $\frac{1}{8} \times \frac{4}{1} \times \frac{3}{4} = 2^{5}_{8}$ .     | $26.\frac{5}{8} \times \frac{4}{5} = \frac{1}{2}$  | $30. \frac{4}{4} \times \frac{5}{5} \frac{1}{1}$         |  |
| 23. $\frac{1}{4} \times \frac{1}{3} = \frac{1}{3}$ .                      | $\begin{array}{c} 26. \frac{5}{8} \times \frac{4}{5} = \frac{1}{2}, \\ 27. \frac{314}{453} \times \frac{177}{312} = \frac{9263}{23556} \end{array}$  | $31. \frac{3}{12} \times 6 = 3$                          |  |

41. When we multiply one proper fraction by another, we obtain a product smaller than either of the factors .-----Nevertheless such multiplication is a species of addition; for when we add a fraction once, (that is, when we take the whole of it,) we get the fraction itself as result ; but when we add it less than once, (that is, take so much of it as is indicated by the fractional multiplier,) we must necessarily get a result which is less than when we took the whole of it. Besides, the multiplication of a fraction by a fraction supposes multiplication by one number-the numerator of the multiplier, and (which will be seen presently) division by another-the denominator of the multiplier. Hence, when the division exceeds the multiplication-which is the case when the multiplier is a proper fraction-the result is, in reality, that of division; and the number said to be multiplied must be made less than before.

42. To multiply a fraction, or a mixed number by a mixed number.

RULE.—Reduce mixed numbers to improper fractions [24], and then proceed according to the last rule.

EXAMPLE 1.-Multiply 3 by 45.

 $4_{5}^{5}=4_{9}^{4_{1}}$ ; therefore  $\frac{3}{4}\times 4_{9}^{5}=\frac{3}{4}\times 4_{9}^{4_{1}}=\frac{123}{36}$ . Example 2.—Multiply  $5_{7}^{7}$  by  $6_{3}^{2}$ .

 $5_8^7 = \frac{47}{8}$ , and  $6_3^2 = \frac{32}{3}$ ; therefore  $5_8^7 \times 6_3^2 = \frac{47}{8} \times \frac{32}{3} = \frac{1504}{40}$ .

43. REASON OF THE RULE.—We merely put the mixed numbers into a more convenient form, without altering their value.

To obtain the required product, we might multiply each part of the multiplicand by each part of the multiplier.—Thus, taking the first example.

$$^{4}_{4} \times ^{4}_{6} = ^{3}_{4} \times ^{4}_{4} + ^{3}_{4} \times ^{5}_{6} = ^{1}_{4} + ^{1}_{36} = ^{1}_{36} + ^{1}_{36} = ^{1}_{26} - ^{1}_{26}$$

EXERCISES.

| $\begin{array}{c} 34. \ 6_{3}^{3} \times \frac{1}{3} = 7\frac{21}{2}, \\ 35. \ 5\frac{-6}{15} \times \frac{3}{3} = 2\frac{1}{3}\frac{1}{3}, \\ 26. \ 1\frac{1}{5} \times \frac{7}{3} = 2\frac{1}{3}\frac{1}{3}, \\ \end{array}$ | $\begin{array}{c} 39. \ 3\frac{2}{11} \times 19\frac{1}{5} \times \frac{5}{6} = 50\frac{10}{11}. \end{array}$   |

 $\mathbf{t}$ 

Ans. 20. 45 What is the 1 bid of 5?

45. What is the product of  $\frac{2}{5}$  of  $\frac{3}{5}$ , and  $\frac{5}{5}$  of  $3\frac{3}{7}$ ?

154

24 02. .

155

44. If we perceive the numerator of one fraction to be the same as the denominator of the other, we may, to perform the multiplication, omit the number which is common. Thus  $\frac{5}{6} \times \frac{6}{9} = \frac{5}{9}$ .

This is the same as dividing both the numerator and denominator of the product by the same number-and therefore does not alter its value; since

| 5  | 6 | $5 \times 6$     | $\frac{5\times6\div6}{6\times9\div6} =$ | 5            |
|----|---|------------------|---|--------------|
| ē' | 9 | $6 \times 9^{=}$ | $6 \times 9 \div 6$                     | - <u>9</u> . |

45. Sometimes, before performing the multiplication, we can reduce the numerator of one fraction and the denominator of another to lower terms, by dividing both by the same number :—thus, to multiply  $\frac{3}{4}$  by  $\frac{4}{7}$ .

Dividing both 3 and 4, by 4, we get in their places, 2 and 1; and the fractions then are  $\frac{3}{2}$  and  $\frac{1}{7}$ , which, multiplied together, become  $\frac{3}{2} \times \frac{1}{7} = \frac{3}{14}$ .

This is the same as dividing the numerator and denominator of the product by the same number; for

$$\frac{3}{8} \times \frac{4}{7} = \frac{3 \times 4 \div 4}{8 \times 7 \div 4} = \frac{3 \times 1}{2 \times 7} \left( = \frac{3}{2} \times \frac{1}{7} \right) = \frac{3}{14}.$$

#### QUESTIONS.

1. How is a fraction multiplied by a whole number or the contrary? [36].

2. Is it necessary that the integer which constitutes one of the factors should consist of a single denomination? [38].

3. What is the rule for multiplying one fraction by another? [39].

4. Explain how it is that the product of two proper fractions is less than either? [41].

5. What is the rule for multiplying a fraction or a mixed number by a mixed number? [42].

6. How may fractions sometimes be reduced, before they are multiplied? [44 and 45].

### DIVISION.

46. To divide a vulgar fraction by a whole number-RULE .- Multiply the denominator of the fraction by the whole number, and put the product under its numerator.

EXAMPLE. 
$$-\frac{2}{3} \div 4 = \frac{2}{3 \times 4} = \frac{2}{12}$$
.

47. REASON OF THE RULE .- To divide a quantity by 8, for instance, is to make it 3 times smaller than before. But it is evident that if, while we leave the number of the parts the same, we make their size 3 times less, we make the fraction itself 3 times less--hence to multiply the denominator by 3, is to divide the fraction by the same number.

A similar effect will be produced if we divide the numerator by 3; since the fraction is made 3 times smaller, if, while we leave the size of the parts the same, we make their number 3 times less; thus  $\frac{0}{0}$  $\div 4 = \frac{8 \div 4}{9} = \frac{2}{9}.$ But since the numerator is not always exactly divisible by the divisor, the method given in the rule is more generally applicable.

The division of a fraction by a whole number has been already illustrated, when we explained the nature of a complex fraction [12].

EXERCISES.

| $\begin{array}{c} 1. \frac{8}{9} \div 2 = \frac{4}{9}, \\ 2. \frac{14}{2} \div 8 = \frac{7}{60}, \\ 3. \frac{19}{20} \div 19 = \frac{1}{20}, \\ 4. \frac{1}{3} \div 9 = \frac{1}{53}. \end{array}$ | $ \begin{bmatrix} 5 & \frac{11}{12} \div 3 = \frac{11}{36} \\ 6 & \frac{7}{6} \div 8 = \frac{7}{64} \\ 7 & \frac{7}{19} \div 14 = \frac{1}{36} \\ \end{bmatrix} $ | $ \begin{array}{ c c c c c c c c c c c c c c c c c c c$   |
|--|---|---|
| 4. $\frac{1}{3} \div 9 = \frac{1}{63}$ .   | 7. $\frac{7}{19} \div 14 = \frac{1}{38}$ .<br>8. $\frac{9}{11} \div 3 = \frac{3}{11}$ .   | $\begin{array}{c} 11. \ \tau 44 \div 42 = 1 \\ 12. \ \tau 44 \div 14 = 1 \\ 14 = 1 \end{array}$ |

48 It follows from what we have said of the unultiplication and division of a fraction by an integer, that, when we multiply or divide its numerator and denominator by the same number, we do not alter its valuesince we then, at the same time, equally increase and

t

d d t gin

49. To divide a fraction by a fraction-

RULE .- Invert the divisor (or suppose it to be inverted), and then proceed as if the fractions were to be

Example .- Divide \$ by 3.

 $\frac{5}{7} \div \frac{3}{4} = \frac{5}{7} \times \frac{4}{3} = \frac{5 \times 4}{7 \times 3} = \frac{20}{21}.$ 

**REASON OF THE RULE.** —If, for instance, in the example just given, we divide  $\frac{5}{7}$  by 3 (the numerator of the divisor), we use a quantity 4 times too great, since it is not by 3, but the fourth part of 3 ( $\frac{3}{4}$ ) we are to divide, and the quotient ( $\frac{5}{21}$ ) is 4 times too small.—It is, however, made what it ought to be, if we multiply its numerator by 4—when it becomes  $\frac{20}{21}$ , which was the result obtained by the rule.

50. The division of one fraction by another may be illustrated as follows—

The quotient of  $\frac{5}{7} \div \frac{3}{4}$  must be some quantity, which, taken three-fourth times (that is, multiplied by  $\frac{3}{4}$ ), will be equal to  $\frac{5}{7}$  of unity. For since the quotient multiplied by the divisor ought to be equal to the dividend [See. II. 79],  $\frac{5}{7}$  is  $\frac{3}{4}$  of the quotient. Hence, if we divide the five-sevenths of unity into three equal parts, each of these will be *one*-fourth of the quotient—that is, precisely what the dividend wants to make it four-fourths of the quotient, or the quotient itself.

51. When we divide one proper fraction by another, the quotient is greater than the dividend. Nevertheless such division is a species of subtraction. For the quotient expresses how often the divisor can be taken from the dividend; but were the fraction to be divided by unity, the dividend itself would express how often the divisor could be taken from it; when, therefore, the divisor is less than unity, the number of times it can be taken from the dividend must be expressed by a quantity greater than the dividend [See. II. 78]. Besides, dividing one fraction by another supposes the multiplication of the dividend by one number and the division of it by another—but when the multiplication is by a greater

umberaction by r its nu-

ty by 3, ore. But parts the fraction for by 3,

number than the division, the result is, in reality, that of multiplication, and the quantity said to be divided must be increased.

#### EXERCISES.

| $\begin{array}{c ccccccccccccccccccccccccccccccccccc$ | • |
|---|---|
|---|---|

whole number by a fraction-

RULE .- Multiply the whole number by the denominator of the fraction, and make its numerator the denominator of the product.

EXAMPLE .--- Divide 5 by 3

158

$$5 \frac{3}{7} = \frac{5 \times 7}{3} = \frac{35}{3}$$
.

This rule is a consequence of the last; for every whole number may be considered as a fraction having unity for denominator [14]; hence  $5 \div \frac{3}{7} = \frac{5}{1} \div \frac{3}{7} = \frac{5}{1} \times \frac{7}{3} = \frac{3}{3} 5$ .

It is not necessary that the whole number should consist of but one denomination [38]. EXAMPLE - Divide 17

$$17_{\circ}$$
 211 218. 31d. by 3.

17s.  $3\frac{1}{4}d$ .  $\div \frac{3}{5} = 17s$ .  $3\frac{1}{4}d$ .  $\times \frac{5}{5} = \pounds 1$  8s.  $9\frac{1}{5}d$ .

### EXERCISES.

22.  $3 \div \frac{4}{2} = 6\frac{3}{2}$ . 25.  $5 \div \frac{15}{18} = 5\frac{1}{4}$ . 28.  $8 \div \frac{14}{15} = 8\frac{4}{7}$ . 23.  $11 \div \frac{5}{9} = 194$ . 26.  $19 \div \frac{19}{20} = 20.$ 29.  $14 \div \frac{7}{10} = 38.$ 24.  $42 \div \frac{7}{144} = 864.$  27.  $9 \div \frac{1}{7} = 63.$  $30. 16 \div = 32.$ 31. Divide £7 16s. 2d. by  $\frac{4}{9}$ . Ans. £17 11s.  $4\frac{1}{2}d$ 32. Divide £8 13s. 4d. by 5. Ans. £10 8s. 33. Divide £5 0s. 1d. by  $\frac{1}{12}$ : Ans. £5 9s.  $2\frac{1}{4}d$ .

53. To divide a mixed number by a whole number or a fraction-

RULE .- Divide each part of the mixed number according to the rules already given [46 and 49], and add the quotients. Or reduce the mixed number to an improper fraction [24], and then divide, as already directed [46 and 49].

EXAMPLE 1.-Divide 93 by 3.

 $9_7^3 \div 3 = 9 \div 3 + \frac{3}{7} \div 3 = 3 + \frac{1}{7} = 3\frac{1}{7}$ 

EXAMPLE 2.—Divide  $14\frac{3}{11}$  by 7.

 $\frac{14_{\frac{3}{11}}=\frac{157}{11}}{11}; \text{ therefore } 14_{\frac{3}{11}} \div \frac{7}{8}=\frac{157}{11} \div \frac{7}{8}=\frac{157}{11} \times \frac{3}{7}=\frac{1250}{77$ .624

54. REASON OF THE RULE.—In the first example we have divided each part of the dividend by the divisor and added the results—which [Sec. II. 77] is the same as dividing the whole dividend by the divisor.

In the second example we have put the mixed number into a more convenient form, without altering its value.

#### EXERCISES.

| 34. $8_{4}^{3} \div 17 = \frac{35}{85}$ . 1 39                       | 4325 415 6450   |

| $\begin{array}{c ccccccccccccccccccccccccccccccccccc$                | $\begin{array}{c} 4\frac{3}{3}\frac{2}{2}\frac{5}{7} \div \frac{4}{4}\frac{1}{5} = 5\frac{6}{3}\frac{4}{3}\frac{5}{0}\frac{6}{3}\frac{4}{3}\frac{5}{0}\frac{6}{3}\frac{1}{3}\frac{6}{3}\frac{1}{3}\frac$ |
|  |   |
| 27 102 . 41 429 20. 41.  | $18_{\overline{3}\overline{15}} - \frac{43}{27} = 19_{\overline{9}\overline{3}\overline{1}}^{\overline{7}\overline{1}}$   |
| $\begin{array}{cccccccccccccccccccccccccccccccccccc$                 | $18\frac{{}^{6}1}{3}\frac{1}{75} \div \frac{25}{2}\frac{1}{7} = 19\frac{5}{9}\frac{772}{3}\frac{7}{75}.$<br>$106\frac{3}{2}\frac{3}{1} \div \frac{3}{15} = 198\frac{251}{2}\frac{5}{1}.$<br>$18\frac{4}{9} \div 11 = 1\frac{67}{9}.$  |
| $38. 10 \frac{100}{151} \div \frac{48}{40} = 17 \frac{17}{1570}$ 43. | 184 11 167  |

55. To divide an integer by a mixed number--

RULE.—Reduce the mixed number to an improper fraction [24]; and then proceed as already directed [52].

# EXAMPLE.—Divide 8 by $4\frac{3}{5}$ .

 $4\frac{3}{3}=\frac{23}{5}$ , therefore  $8\div 4\frac{3}{3}=8\div \frac{23}{5}=8\times \frac{5}{23}=1\frac{12}{23}$ . REASON OF THE RULE.—It is evident that the improper fraction which is equal to the divisor, is contained in the dividend the same number of times as the divisor itself.

#### EXERCISES.

| 44.<br>45. | $\begin{array}{c} 5 \div 3 \overset{*}{_{7}} = 1 \overset{2}{_{5}} \\ 16 \div 11 \overset{1}{_{2}} \overset{2}{_{9}} = 1 \overset{1}{_{3}} \overset{3}{_{3}} \overset{3}{_{1}} \end{array}$ | 46<br>47 | $\begin{array}{c} 14 \div 1\frac{3}{9} = 7\frac{7}{1.7}, \\ 21 \div 14\frac{4}{1.1} = 1\frac{7.3}{1.58}. \end{array}$ |
|------------|---|----------|---|
|            |   |          | 1.1 100   |

48. Divide £7 16s. 7d. by 31. Ans. £2 6s. 113d.

49. Divide £3 3s. 3d. by  $4\frac{1}{2}$ . Ans. 14s.  $0\frac{3}{4}d$ .

56. To divide a fraction, or a mixed number, by a mixed number-

BULE. – Reduce mixed numbers to improper fractions [24]; and then proceed as already directed [49].

EXAMPLE 1.-Divide 3 by 57.

 $5_{\overline{9}}^{7} = \frac{5^{2}}{9}$ , therefore  $\frac{3}{4} \div 5_{\overline{9}}^{7} = \frac{3}{4} \div \frac{5^{2}}{9} = \frac{3}{4} \times \frac{9}{5^{2}} = \frac{27}{208}$ .

EXAMPLE 2.—Divide  $8\frac{9}{11}$  by  $7\frac{5}{8}$ .

 $\begin{array}{c} 8\frac{9}{11} = \frac{97}{11}, \text{ and } 7\frac{5}{6} = \frac{47}{6}, \text{ therefore } 8\frac{9}{11} \div 7\frac{5}{6} := \frac{97}{11} \div \frac{47}{6} = \frac{97}{11} \times \frac{47}{6} = \frac{97}{11} \times \frac{47}{6} = \frac{97}{11} \times \frac{97}$ 

47 REASON OF THE RULE.-We (as in the last rule) merely change the mixed numbers into others more conveniently divided-without, however, altering their value

ality, that e divided

MISCELLANEOUS EXERCISES IN VULGAR FRACTIONS.

1. How much is  $\frac{1}{9}$  of 186 acres, 3 roods? Ans. 20 acres, 3 roods.

2. How much is  $\frac{4}{9}$  of 15 hours, 45 minutes? Ans. 7 hours.

3. How much is  $\frac{870}{2219}$  of 19 cwt., 3 qrs., 7 lb? Ans. 7 cwt., 3 crs., 2 lb.

4. How much is 729 of £100? Ans. £36 9s.

5. If one farm contains 20 acres, 3 roods, and another 26 acres, 2 roods, what fraction of the former is the latter? Ans.  $\frac{3}{100}$ .

6. What is the simplest form of a fraction expressing the comparative magnitude of two vessels—the one containing 4 tuns, 3 hhds., and the other 5 tuns, 2 hhds.  $Ans. \frac{19}{22}$ .

7. What is the sum of  $\frac{2}{3}$  of a pound, and  $\frac{5}{4}$  of a shilling? Ans. 13s.  $10\frac{2}{3}d$ .

8. What is the sum of  $\frac{2}{5}s$ , and  $\frac{4}{15}d$ ? Ans.  $7\frac{7}{15}d$ .

9. What is the sum of  $\pounds_{7}^{1}$ ,  $\frac{2}{9}s.$ , and  $\frac{5}{12}d.$ ? Ans  $3s. 1\frac{3}{9}\frac{1}{4}d.$ 

10. Suppose I have  $\frac{3}{2}$  of a ship, and that I buy  $\frac{5}{16}$  more; what is my entire share  $\frac{1}{2}$  Ans.  $\frac{11}{16}$ .

11. A boy divided his marbles in the following manner: he gave to A  $\frac{1}{3}$  of them, to B  $\frac{1}{7\sigma}$ , to C  $\frac{1}{3}$ , and to D  $\frac{1}{6}$ , keeping the rest to hiuself; how much did he give away, and how much did he keep? Ans. He gave away  $\frac{37}{12\sigma}$  of them, and kept  $\frac{33\sigma}{12\sigma}$ .

12. What is the sum of  $\frac{1}{7}$  of a yard,  $\frac{1}{7}$  of a foot, and  $\frac{1}{7}$  of an inch? Ans. 7 inches.

13. What is the difference between the  $\frac{3}{4}$  of a pound and  $5\frac{1}{4}d$ . Ans. 11s.  $6\frac{3}{4}d$ .

14. If an acre of potatoes yield about 82 barrels of 20 stone each, and an acre of wheat 4 quarters of 460 lb—but the wheat gives three times as much nourishment as the potatoes; what will express the subsistence given by each, in terms of the other? Ans. The potatoes will give  $4\frac{1}{6}\frac{1}{9}$  times as much as the wheat; and the wheat the  $\frac{10}{29.7}$  part of what is given by the potatoes.

15. In Fahrenheit's thermometer there are 'S0 degrees between the boiling and freezing points, in that

 $= 3_{6069}^{853}, \\ -4_{42005}^{5356}, \\ \div 3_{8}^{1} = 7_{100}^{7}$

16. The average fall of rain in the United Kingdom is about 34 inches in depth during the year in the plains; but in the hilly countries about 50 inches; what fraction of the latter expresses the former? Ans.  $\frac{1}{27}$ .

17. Taking Chimborazo as 21,000 feet high, and Purgeool, in the Himalayas, as 22,480; what fraction of the height of Purgeool expresses that of Chimborazo?  $Ans. \frac{5}{2}\frac{25}{2}$ .

18. Taking 4200 feet as the depth of a fissure or crevice at Cutaco, in the Andes, and 5000 feet as the depth of that at Chota, in the same range of mountains; how will the depth of the former be expressed as a fraction of the latter? Ans.  $\frac{2}{2}\frac{1}{5}$ .

# DECIMAL FRACTIONS.

59. A decimal fraction, as already remarked [13], has unity with one, or more cyphers to the right hand, for its denominator; thus,  $-\frac{5}{1000}$  is a decimal fraction. Since the division of the numerator of a decimal fraction by its denominator—from the very nature of notation [Sec. I. 34]—is performed by moving the decimal point, the quotient of a decimal fraction—the equivalent decimal—is obtained with the greatest facility. Thus  $-\frac{5}{1000}$ =:005; for to divide any quantity by a thousand, we have only to move the decimal point three places to the right.

60. It is as inaccurate to confound a decimal fraction with the corresponding decimal, as to confound a vulgar fraction with its quotient.—For if 75 is the *quotient* of  ${}^{3}\frac{0}{4}$ , or of  ${}^{7}\frac{5}{100}$ , and is distinct from either; so also is  $\cdot 75$  the quotient of  $\frac{3}{4}$  or of  ${}^{7}\frac{5}{100}$ , and equally distinct from either.

13. Reduce 12s. 6d. to the decimal of a pound. Ans 625.

14. Reduce 15s. to the decimal of a pound. Ans. '75

15. Reduce 3 quarters, 2 nails, to the decimal of a yard. Ans. 875.

16. Reduce 3 cwt., 1 qr., 7 lbs, to the decimal of a ton. Ans. 165625

64. To reduce a decimal to a lower denomination-RULE.—Reduce it by the rule already given [Sec. III. 3] for the reduction of integers.

EXAMPLE 1.-Express £.6237 in terms of a shilling.

 $6237 \\ 20$ 

AIO

Answer, 12-4740 shillings=£-6237

DECIMALS.

EXAMPLE 2.-Reduce £.9734 to shillings, &c. ·9734

Answer, £.9734=198. 5 1d.

65. This rule is founded on the same reasons as were given for the mode of reducing integers [Sec. III. 4].

Multiplying the decimal of a pound by 20, reduces it to shillings and the decimal of a shilling. Multiplying the decimal of a shilling by 12, reduces it to pence and the decimal of a penny. Multiplying the decimal of a penny by 4, reduces it to farthings and the decimal of a farthing.

#### EXERCISES

23. What is the value of £.86875? Ans. 17s. 41d

24. What is the value of £.5375? Ans. 10s. 9d.

25. How much is 875 of a yard? Ans. 3 qrs., 2 nails.

26. How much is 165625 of a ton? Ans. 3 cwt., 1 qr., 7 fb.

27. What is the value of  $\pounds.05$ ? Ans. 1s.

28. How much is 9375 of a cwt.? Ans. 3 qrs., 21 fb.

29. What is the value of  $\pounds.95$ ? Ans. 19s.

30. How much is '95 of an oz. Troy ? Ans. 19 dwt.

31. How much is 875 of a gallon ? Ans. 7 pints.

32. How much is 3945 of a day? Ans. 9 hours, 28', 4', 48"".

33. How much is 09375 of an acre? Ans. 15 perches.

66. The following will be found useful, and-being intimately connected with the doctrine of fractionsmay be advantageously introduced here :

To find at once what decimal of a pound is equivalent to any number of shillings, pence, &c.

When there is an even number of shillings-

RULE .- Consider them to be half as many tenths of a pound.

#### DECIMALS.

EXAMPLE.— $16s.=\pounds \cdot 8$ .

Every two shillings are equal to one-tenth of a pound; therefore 8 times 2s. are equal to 8 tenths.

67. When the number of shillings is odd--

RULE.—Consider half the next lower even number, as so many tenths of a pound, and with these set down 5 hundredths.

EXAMPLE.-15s.=£.75.

For, 15s.=14s.+1s.; but by the last rule  $14s.=\pounds7$ ; and since 2s.=1 tenth—or, as is evident, 10 hundredths of a pound—1s.=5 hundredths.

68. When there are pence and farthings-

RULE.—If, when reduced to farthings, they exceed 24, add 1 to the number, and put the sum in the second and third decimal places. After taking 25 from the number of farthings, divide the remainder by 3, and put the nearest quantity to the true quotient, in the fourth decimal place.

If, when reduced to farthings, they are less than 25, set down the number in the third, or in the second and third decimal places; and put what is nearest to onethird of them in the fourth.

EXAMPLE 1.—What decimal of a pound is equal to  $8_4^3d$ .?

 $8_4^2$ =35 farthings. Since 35 contains 25, we add one tc the number of farthings, which makes it 36—we put 36 in the second and third decimal places. The number nearest to the third of 10 (35-25 farthings) is 3—we put 3 in the fourth decimal place. Therefore,  $8_4^2$ =£.0363.

EXAMPLE 2.—What decimal of a pound is equal to  $1\frac{3}{4}d$ .?

 $1_{3}^{3}$  = 7 furthings; and the nearest number to the third of 7 is 2. Therefore  $1_{3}^{3}d$  = £.0072.

EXAMPLE 3.—What decimal of a pound is equal to  $5\frac{1}{4}d$ .?  $5\frac{1}{4}d$ .=21 farthings; and the third of 21 is 7. Therefore  $3\frac{1}{4}d$ .=£.0217.

69 REASON OF THE RULE.--We consider 10 farthings as the one hundredth, and one farthing as the one thousandth of a pound—because a pound consists of nearly one thousand farthings. This, however, in 1000 farthings (taken as so many thousandths of a pound) leads to a mistake of about 40 since  $\pounds 1$ =(not 1000, but) 1000-40 farthings. Hence, to a thousand farthings (considered as thousandths of a pound),

### were given

forty, or one in 25, must be added; that is, about the enethirtieth of the number of farthings. It is evident that, as those above 25 have not been allowed for when we added one to the farthings, one-thirtieth of their number, also, must be added-or, which is the same thing, one-third of their number, in the fourth or next lower decimal place.

If the farthings are less than 25, it is evident that the correction should still be about the thirtieth of their number, or one-third of it, in the fourth decimal place.

|---|--|

70. To find at once the number of shillings, pence, &c., in any decimal of a pound-

RULE.-Double the number of tenths for shillingsto which, if the hundredths are not less than 5, add one. Consider the digit in the second place (after subtracting 5, if it is not less than 5), as tens, and that in the third as units of farthings; and subtract unity from the result if it exceeds 25.

EXAMPLE. - £. 6874=13s. 9d.

6 tenths are equal to twelve shillings; as the hundredths are not less than 5, there is an additional shilling-which makes 13s. Subtracting 5 from the hundredths and adding the remainder (reduced to thousandths) to the thousandths, we have 37 thousandths from which-since they exceed 25, we subtract unity; this leaves 36 as the number of farthings.  $\pounds$ .6874, therefore, is equal to 13s. and 36

This rule follows from the last three-being the reverse of them.

# CIRCULATING DECIMALS.

71. We cannot, as already noticed [Sec. II. 72], always obtain an exact quotient, when we divide one number by another :--- in such a case, what is called an in-terminate or (because the same digit, or digits, constantly recur, or circulate) a recurring, or circulating

#### CIRCULATING DECIMALS.

it the eneat that, as added one o, must be r number,

t that the r number,

. 7. 42·577.

, pence,

llingsdd one. tracting te third result

which which adding thouthouthey umber and 36

rse of

72], one l an conting decimal is produced.—The decimal is said to be terminate if there is an exact quotient—or one which leaves no remainder.

72. An interminate defined, in which only a single figure is repeated, is called a *repetend*; if two or more fligits constantly rectry, they form a *periodical* being it. Thus '77, &c., is a repetend; but '597597, ... is a periodical. For the sake of brevity, the repeated digit, or period is set down but once, and may be marked as follows, '5' (='555, &c.) or '493' (= 193493493, &c.)

The ordinary method of marking the period is somewhat different—what is here given, however, seems preferable, and can searcely be mistaken, even by those in the habit of using the other.

When the decimal contains only an *infinite* partthat is, only the repeated digit, or period—it is a *pure* repetend, or a *pure*\_periodical. 'But when there is *both* a finite and an infinite part, it is a *mixed* repetend or *mixed* circulate. Thus

3' (= 333, &c.) is a pure repetend.

578' (= 57888, &c.) is a mixed repetend.

'397' (= 397397597, &c.) is a pure circulate.

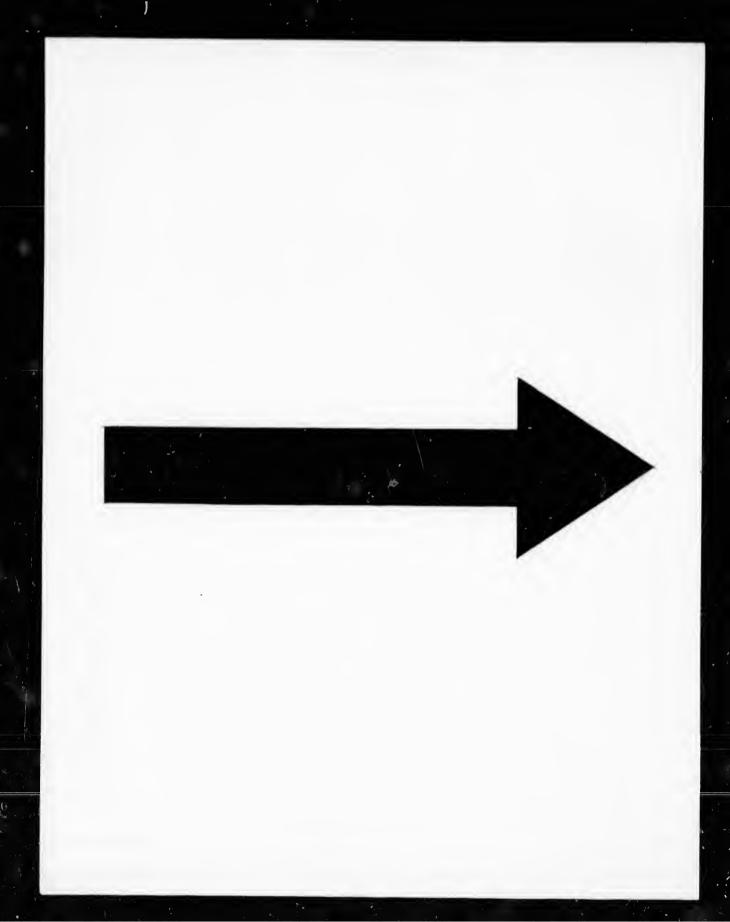

865\64271'(=865642716427164271,&c) is a mixed circulate

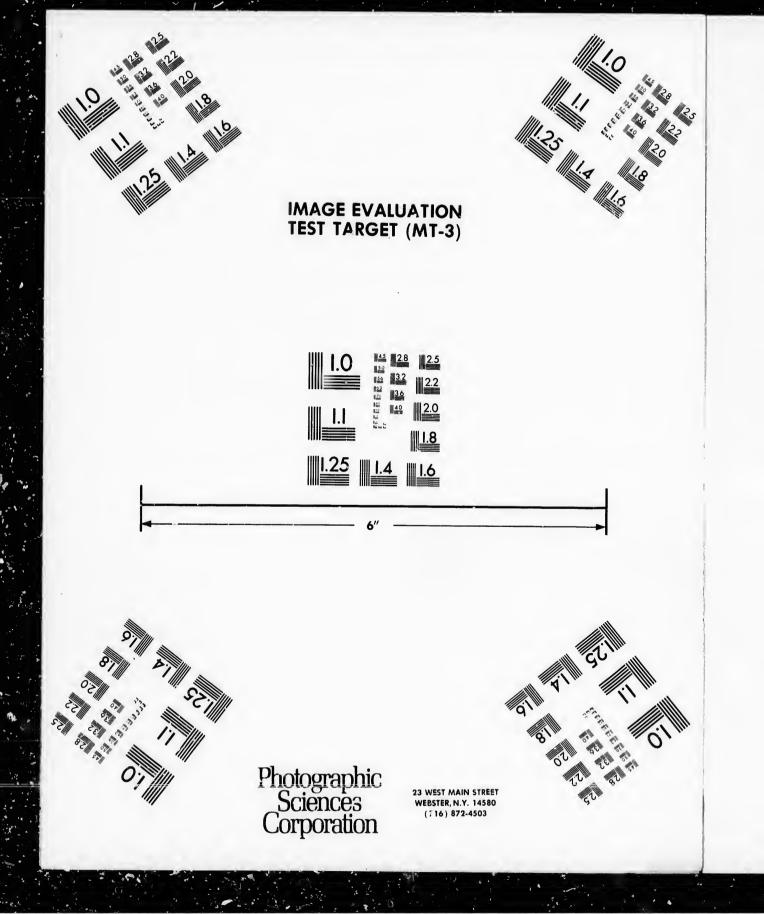

73. The number of digits in a period must always be less than the divisor. For, different digits in the period suppose different remainders during the division; but the number of remainders can never exceed--nor even be equal to the divisor. Thus, let the latter be seven: the only remainders possible are 1, 2, 3, 4, 5, and 6; any other than one of these would contain the divisor at least once-which would indicate [Sec. II. 71] that the quotient figure is not sufficiently large.

74. It is sometimes useful to change a decimal into its equivalent vulgar fraction—as, for instance, when in adding, &e., those which eirculate, we desire to obtain an exact result. For this purpose—

RULE-I. If the decinal is a *pure repetend*, put the repeated digit for numerator, and 9 for denominator.

II. If it is a *pure periodical*, put the period for numerator, and so many nines as there are digits in the period, for denominator.

EXAMPLE 1.-What vulgar fraction is equivalent to .3' ? Ans. 3.

EXAMPLE 2.-What vulgar fraction is equivalent to .7854'? Ans. 7854.

75. REASON OF I.  $-\frac{1}{9}$  will be found equal to .111, &c. -or ·1'; therefore  $\frac{3}{9}$  (=8× $\frac{1}{9}$ )=·333, &c.=(3×111, &c.) For if we multiply two equal quantities by the same, or by equal quantities, the products will still be equal.

In the same way it could be shown that any other digit divided by 9 would give that other digit as a repetend.—And, consequently, a repetend of any digit will be equal to a vulgar fraction having the same digit for numerator, and 9 for denominator.

REASON OF if.  $-\frac{1}{99}$  will give 0101, &c. -or '01' as quotient. For before unity can be divided by 99, it must be considered as 100 hundredihs; and the quotient [Sec. II. 77] will be one hundredth, or 01. One hundredth, the remainder, must be made 100 ten thousandths before it will contain 99; and the quotient will be one ten thousandth, or 0001. One ten thousandth, the remainder, must, in the same way, be considered as ten millioneths; and the next quotient will be one millioneth, or 000001and so on with the other quotients, which, taken together, will be 01+0001+000001+&c., or 010101, &c.-represented

quotient. Thus

| 010101,<br>37 | & |
|---------------|---|
|               |   |

#### 70707 30303

373737, &c.=37×.01'.

In the same way it could be sho n that any other two digits divided by 99 would give those other digits as the period of a circulate .- And, consequently, a circulate having any two digits as a period, will be equal to a vulgar fraction having the same digits for numerator, and 2 nines for denominator.

For similar reasons  $\frac{1}{505}$  will give 001001, &c., or 001' as quotient. But 001001, &c.,  $\times$  (for instance) 563=563563, &c 001001001, &c.

563

#### 3003003003 6006006006 5005005005

563563563563, &c.=563×.001 In the same way it could be shown that any other three digits divided by 999 would give a circulating decimal having these alent to .3'?

quivalent to

111, &c.-or &c.) For if or by equal

y other digit etend.-And, l to a vulgar 19 for deno-

as quotient. e considered will be one ust be made the quotient isaudth, the ten millionr ·000001u together, represented

two digits period of a any two aving the or. r ...001' as 33563, &c

ree digits ng these

gits as a period.-And, consequently, a circulating decimal having any three digits as period will be equal to a vulgar traction having the same digits for numerator, and 3 nines for denominator.

We might, in a similar way, show that any number of digits divided by an equal number of nines must give a circulate, each period of which would consist of those digits .- And, consequently, a circulate whose periods would consist of any figits must be equal to a vulgar fraction having one of i's periods for numerator, and a number of nines equal to the number of digits in the period, for denominator.

76. If the decimal is a mixed repetend or a mixed circulate-

RULE.-Subtract the finite part from the whole, and set down the difference for numerator; put for denominator so many cyphers as there are digits in the *finite* part, and to the left of the cyphers so many nines as there are digits in the *infinite* part.

EXAMPLE.-What is the vulgar fraction equivalent to ·97\8734' ?

There are 2 digits in 97, the finite part, and 4 in 8734, the infinite part. Therefore 978784--97 978637

999900 = 999900, is the required vulgar fraction.

77. REASON OF THE RULE.-If, for example, we multiply 978734' by 100, the product is 978734=97+8734. This (by the last rule) is equal to  $97 + \frac{8731}{9090}$ , which (as we multiplied by 100) is one hundred times greater than the original quantity--but if we divide it by 100 we obtain  $\frac{97}{100} + \frac{9734}{9909334}$ , which is equal the original quantity. To perform the addition of  $\frac{97}{10}$ , and 38734 , we must [19 and 22] reduce them to a common denominator-when they become

97×995400, 873400 97×9999, 8734

| 999900    | 00 99990000           | 999900 | -999900 = (since       | 9999 == |
|-----------|-----------------------|--------|------------------------|---------|
| 10000 - 1 | $97 \times 10000 - 1$ | 8734   | $97 \times 10000 - 97$ | 8784    |
| 10000-1)  | 999900                | 999900 | 999900 +               | 999900  |

970000---97 8734978734 - 97978637 -999900, which is exactly the 999900 + 999900 - \$29900 result obtained by the rule. The same reasoning would hold with any other example.

# CIRCULATING DECIMALS.

78. Except where great accuracy is required, it is not necessary to reduce circulating decimals to their equivalent vulgar fractions, and we may add, and subtract them, &c., like other decimals—mercly taking care to put down so many of them as will secure sufficient 70. It we have

79. It may be here remarked, that no vulgar fraction will give a *finite* decimal if, when reduced to its lowest terms, the denominator contains any prime factors (factors that are prime numbers—and all the factors, can be reduced to such) except *twos* or *fives*. For neither 10, 100, 1000, &c., nor any multiples of these—as 30, 400, 5000, &c., nor the sum of any of their multiples—as 6420 (5000 + 400 + 20), &c., will exactly contain any prime numbers, but 2 or 5. Thus  $\frac{3}{5}$  (considered as  $\frac{30 \text{ tenths}}{5}$ ) will give an exact quotient; so also will  $\frac{7}{2}$  (considered as  $\frac{70 \text{ tenths}}{2}$ ). But  $\frac{1}{4}$  will not give one; for  $\frac{1}{4}$  (considered as  $\frac{10 \text{ tenths}}{7}$ , or  $\frac{100 \text{ hundredths}}{7}$ &c.) does not contain 7 exactly.

For a similar reason  $\frac{4}{7}$  will not give an exact quo tient; since  $\frac{4}{7}$  (considered as  $\frac{40 \text{ tenths}}{7}$  or  $\frac{400 \text{ hundredths}}{7}$ &c.) does not exactly contain 7.

80. A finite decimal must have so many decimal places as will be equal to the greatest number of twos, or fives, contained as factors in the denominator of the original vulgar fraction, reduced to its lowest terms.

Thus  $\frac{1}{2}$  will give one decimal place; for 2 (found once in its denominator) is contained in 10 (5×2); and therefore  $\frac{10 \text{ tenths}}{2}$  (= $\frac{1}{2}$ ) will give some digit (in the tenths' place [Sec. II. 77]), that is, one decimal as quotient.

 $\frac{3}{2 \times 2}$  will give two decimal places; because 2 being found twice as a factor in its denominator, it will not be enough to consider the numerator as so

#### CIRCULATING DECIMALS.

ator, \$ 50 many tenths; for  $\frac{30 \text{ tenths}}{4} (=\frac{3}{4})$  cannot give an exact quotient—30 being equal to  $3 \times 2 \times 5$ , which contains 2, but not  $2 \times 2$ . It will, however, be sufficient to reduce 300 hundredths the numerator to hundredths; because will give an exact quotient—for 300 is equal to  $3 \times 2 \times$  $2 \times 5 \times 5$ , and consequently contains  $2 \times 2$ . But 300 hundredths divided by an integer will give hundredths-

or two decimals as quotient. Hence, when there are two

twos found as factors in the denominator of the vulgar fraction, there are also two decimal places in the quotient.  $\frac{6}{40} \left( = \frac{6}{2 \times 2 \times 2 \times 5} \right)$  contains 2 repeated three times as a factor, in its denominator, and will give three decimal places. For though 10 tenths-and therefore  $6 \times 10$  tenths—contains 5, one of the factors of 40, if does not contain  $2 \times 2 \times 2$ , the others; consequently it will not give an exact quotient.-Nor, for the same reason, will  $6 \times 100$  hundredths.  $6 \times 1000$  thousandths  $6 \times 1000$  thousand ths will give one-that is,- $(=\frac{6}{40})$  will 40 leave no remainder; for  $6 \times 1000 \ (= 6 \times 2 \times 2 \times 2 \times 5 \times 5 \times 1000)$  $5 \times 5$ ) contains  $2 \times 2 \times 2 \times 5$ . But  $6 \times 1000$  thousand ths divided by an integer will give thousandths-or three decimals as quotient. Hence, when there are three twos found as factors in the denominator of the vulgar fraction, there are also three decimal places in the quotient.

S1. Were the fives to constitute the larger number of factors—as, for instance, in  $\frac{4}{50}$ ,  $\frac{5}{500}$ , &c., the same reason ing would show that the number of decimal places would be equal to the number of *fives*.

It might also be proved, in the same way, that were the greatest number of twos or fives, in the denominator of the vulgar fraction, any other than one of those numbers given above, there would be an equal number of decimal places in the quotient.

82. A pure circulate will have so many digits in its period as will be equal to the least number of nines, which would represent a quantity measured by the denomina-

tor of the original vulgar fraction, reduced to its lowest terms. For we have seen [74] that such a circulate will be equal to a fraction having some period for its numerator, and some number of nines for its denominatorthat is, it will be equal to some fraction, the numerator of which (the period of the circulate) will be as many times the numerator of the given vulgar fraction, as the quantity represented by the nines is of its denominator. For if a fraction having a given denominator is equal to another which has a larger, it is because the numerator of the latter is to the same amount larger than that of the former-in which case the increased size of the nu. merator counteracts the effect of the increased size of the Thus  $\frac{5}{6} = \frac{25}{30}$ ; because, if the numerator of  $\frac{2}{3}\frac{5}{9}$  is 5 times greater than that of  $\frac{5}{9}$ , the denominator of  $\frac{2}{3}\frac{5}{6}$ , also, is five times greater than that of  $\frac{5}{6}$ .

Let the given fraction be  $\frac{5}{13}$ . Since  $\frac{5}{13}$  ... '384615'; and  $384615' = \frac{3}{9} \frac{3}{9} \frac{4}{9} \frac{5}{9} \frac{1}{9} \frac{5}{9} \frac{5}{9} \frac{5}{9} \frac{1}{9} \frac{5}{9} \frac{1}{9} \frac{1}{9$ and, therefore, whatever multiple 384615 is of 5, 999999 is the same of 13.-But 999993 is the least multiple of 13, consisting of nines. If not, let some other be less. Then take for numerator, such a multiple of 5, as that lesser number of nines is of 13--and put that lesser number of nines for its denominator. The numerator of this new fraction will [75] form the period of a circulate equal to the original fraction. But as this new period is different from 384615 (the former one), the circulate of which it is an element, is also different from the former circulate; there are, therefore, two different circulates equal to  $\frac{5}{13}$ —that is two different values, or contients is absurd to suppose that any less number of nines is a

83. The periodical obtained does not contain a finite part, when neither 2 nor 5 is found in the denominator of the vulgar fraction—reduced to its lowest terms.

For [76] a finite part would add cyphers to the right hand of the nines in the denominator of the vulgar fraction, obtained from the circulate. But cyphers would suppose the denominator of the original fraction to contain twos, or fives—since no other prime factors to its lowest eirenlate will or its numenominator e numerator be as many tion, as the enominator. is equal to numerator an that of of the nu. size of the numerator enominator.

`384615'; 84615; -5,9999999ultiple of r be less. 5, as that nat lesser erator of eirculate period is culate of le former irculates otients .ence it nes is a

a finite ominator is. he right vulgar s would tion to factors could give cyphers in their multiple—the denominator of the vulgar fraction obtained from the circulate.

84. If there is a finite part in the decimal, it will contain as many digits as there are units in the greatest number of twos or fives found in the denominator of the original vulgar fraction, reduced to its lowest terms.

• Let the original fraction be  $\frac{1}{56}$ . Since  $56=2\times 2\times 2\times 2\times 7$ , the equivalent fraction must have as many nines as will just contain the 7 (cyphers would not *cause* a number of nines to be a multiple of 7), multiplied by as many tens as form a product which will just contain the twos as factors. But we have seen [80] that one ten (which adds one cypher to the nines) contains one *two*, or *five*; that the product of two tens (which add two cyphers to the nines), contains the product of two *twos* or *fives*; that the product of three tens (which add three cyphers to the nines), contains the product of three *twos* or *fives*; that the product of three tens (which add three cyphers to the nines), contains the product of three *twos* or *fives*, &c. That is, there will be so many cyphers in the denominator as will be equal to the greatest number of twos or fives, found among the factors in the denominator of the original vulgar fraction.

But as the digits of the finite part of the decimal add an equal number of eyphers to the denominator of the new vulgar fraction [76], the cyphers in the denominator, on the other hand, evidently suppose an equal number of places in the finite part of a circulate :—there will therefore be in the finite part of a circulate so many digits as will be equal to the greatest number of *twos* or *fives* found among the factors in the denominator of a vulgar fraction containing, also, *other* factors than 2 or 5.

85. It follows from what has been said, that there is no number which is not *exactly* contained in some quantity expressed by one or more nines. or by one or more nines followed by cyphers, or by unity followed by cyphers.

CONTRACTIONS IN MULTIPLICATION AND DIVISION (derived from the properties of fractions.)

86. To multiply any number by 5-

RULE.—Remove it one place to the left hand, and divide the result by 2

# CONTRACTIONS,

EXAMPLE. - 736×5-7360=3680.

REASON.  $-5 = \frac{12}{3}$ ; therefore  $736 \times 5 = 736 \times \frac{12}{2} = \frac{7536}{3} = 3680$ . 87. To multiply by 25-

RULE .-- Remove the quantity two places to the left, and divide by 4.

EXAMPLE.  $-6732 \times 25 = \frac{973200}{5} = 168300.$ 

 $R_{EASON} = 25 = \frac{100}{4}$ ; therefore  $6732 \times 25 = 6732 \times \frac{100}{4}$ .

88. To multiply by 125-

RULE .--- Remove the quantity three places to the left, and divide the result by 8.

EXAMPLE.  $-7865 \times 125 = 7865000 = (83125)$ .

REASON.  $-125 = \frac{1000}{8}$ ; therefore  $7365 \times 125 = 7865 = 1000$ .

89. To multiply by 75-

RULE .- Remove the quantity two places to the left, then multiply the result by 3, and divide the product by 4.

EXAMPLE.  $-685 \times 75 = \frac{98500}{4} \times 3 = \frac{205500}{4} = 51375.$ REASON.  $-75 = \frac{300}{4} = 100 \times \frac{3}{4}$ ; therefore  $685 \times 75 = 685 \times$ 100×3.

90. To multiply by 35-

RULE .- To the multiplicand removed two places to the left and divided by 4, add the multiplicand removed one

EXAMPLE 1.  $-67896 \times 35 = {}^{6739600} + 678960 = 1697400$ +678960 = 2376360.

REASON.  $-35 = \frac{100}{4} + 10$ ; therefore  $67896 \times 35 = 67896 \times 100$ 100+10.

Many similar abbreviations will easily suggest themselves to both pupil and teacher.

91. To divide by any one of the multipliers-

RULE .- Multiply by the equivalent fraction, inverted.

Example. Divide 847 by 5. 847 ÷ 5=847 ÷ 10=847 ×  $r_{10}^2 = 169.4.$ 

REASON .- We divide by any number when we divide by the fraction equivalent to it; but we divide by a fraction when we invert it, and then consider it as a multiplier [49].

92. Sometimes what is convenient as a multiplier will not be equally so as a divisor; thus 35. For it is not so easy to divide, as to multiply by 100 + 10, its equivalent

#### DECIMALS.

### QUESTIONS FOR THE PUPIL.

1 Show that a decimal fraction, and the corresponding decimal are not identical [59].

2. How is a decimal changed into a decimal fraction? [61].

3. Are the methods of adding, &c., vulgar and decimal fractions different? [62].

4. How is a vulgar reduced to a decimal fraction ? [63].

5. How is a decimal reduced to a lower denomination? [64].

6. How are pounds, shillings, and pence changed, at once, into the corresponding decimal of a pound? [66, 67, and 68].

7. How is the decimal of a pound changed, at once, into shillings, pence, &c. ? [70].

8. What are terminate and circulating decimals? [71].

9. What are a repetend and a periolical, a puro and a mixed circulate? [72].

10. Why cannot the number of digits in a period be equal to the number of units contained in the divisor? [73].

11. How is a pure circulate or pure repetend changed into an equivalent vulgar fraction ? [74].

12. How is a mixed repetend or mixed circulate reduced to an equivalent vulgar fraction? [76].

13. What kind of vulgar fraction can produce no equivalent *finite* decimal? [79].

14. What number of decimal places must necessarily be found in a finite decimal ? [80].

15. How many digits must be found in the periods of a *pure* circulate? [82].

16. When is no finite part found in a repetend, or circulate? [83].

17. How many digits must be found in the finite part of a *mixed* circulate? [84].

18. On what principal can we use the properties of fractions as a means of abbreviating the processes of multiplication and division ? [86, &c.]

# SECTION V.

# PROPORTION.

1. The rule of Proportion is called also the golden rule, from its extensive utility; in some cases it is termed the rule of three-because, by means of it, when three numbers are given, a fourth, which is unknown, may be found.

2. The rule of proportion is divided into the simple, and the compound. Sometimes also it is divided into the direct, and inverse-which is not accurate, as was shown by Hatton, in his arith netic published nearly one hundred years ago.

3. The pupil to have accurate ideas of the rule of proportion, must be acquainted with a few simple but important pri ciples, connected with the nature of ratios, and the doc' rine of proportion.

The following truths are self-evident :---

If the same, or equal quantities are added to equal quantities, the sums are equal. Thus, if we add the same quantity, 4 for instance, to  $5 \times 6$  and  $3 \times 10$ , which are equal, we shall have  $5 \times 6 + 4 = 3 \times 10 + 4$ .

Or if we add equal quantities to those which are equal, the sums will be equal. Thus, since

5×6=3×10, and 2+2=4  $5 \times 6 + 2 \times 2 = 3 \times 10 + 4.$ 

4. If the same, or equal quantities are subtracted, from others which are equal, the remainders will be equal. Thus, if we subtract 3 from each of the equal quantities 7, and 5+2, we shall have

7 - 3 = 5 + 2 - 3.

And since 8=6+2, and 4=3+1.

# 8 - 4 = 6 + 2 - 3 + 1.

5. If equal quantities are multiplied by the same, or by equal quantities, the products will be equal. Thus

if we multiply the equals 5+6, and 10+1 by 3, we shall have

And since 4+9=13, and  $3\times6=18$ .  $\overline{4+9}\times3\times6=13\times18$ .

6. If equal quantities are *divided* by the same, or by equal quantities, the quotients will be equal. Thus if we divide the equals 8 and 4+4 by 2, we shall have

 $\frac{8}{2} = \frac{4+4}{2}$ 

And since 20 = 17 + 3, and  $10 = 2 \times 5$ .

 $\frac{20}{10} = \frac{17 + 3}{2 \times 5}.$ 

7. Ratio is the relation which exists between two quantities, and is expressed by two dots (:) placed between them—thus 5:7 (read, 5 is to 7); which means that 5 has a certain relation to 7. The former quantity is called the *antecedent*, and the latter the *consequent*.

S. If we invert the terms of a ratio, we shall have their *inverse ratio*; thus 7:5 is the inverse of 5:7.

9. The relation between two quantities may consist in one being greater or less than the other—then the ratio is termed arithmetical; or in one being some multiple or part of the other—and then it is geometrical.

If two quantities are equal, the ratio between them is said to be that of equality; if they are unequal it is a ratio of greater inequality when the antecedent is greater than the consequent, and of lesser inequality when it is less.

10. As the *arithmetical* ratio between two quantities is measured by their *difference*, so long as this difference is not altered, the ratio is unchanged. Thus the ratio of 7:5 is equal to that 15:13—for 2 is, in each ease, the difference between the antecedent and consequent.

Hence we may *add* the same quantity to both the antecedent and consequent of an arithmetical ratio, or may *subtract* it from them, without changing the ratio. Thus 7:5, 7+3:5+3, and 7-2:5-2, are equal arithmetical ratios.

But we cannot multiply or divide the terms of an arith-

o the *golden* s it is termed when three wn, may be

the simple, livided into ate, as was nearly one

the rule of simple but e of ratios,

d to equai d the same which are

which are

subtracted, s will be the equal

same, or Thus

metical ratio by the same number. Thus  $12 \times 2: 10 \times 2$ ,  $12 \div 2: 10 \div 2$ , and 12: 10 are not equal arithmetical ratios; for  $12 \times 2 - 10 \times 2 = 4$ ,  $12 \div 2 - 10 \div 2 = 1$ , and 12 - 10 = 2.

11. A geometrical ratio is measured by the quotient obtained if we divide its antecedent by its consequent ; therefore, so long as this quotient is unaltered the ratio is not changed. Hence ratios expressed by equal fractions are equal; thus 10:5=12:6, for  $\frac{1}{5}=\frac{1}{5}^2$ .—Hence, also, we may multiply or divide both terms of a geometrical ratio by the same number without altering the ratio; thus  $7 \times 2:14 \times 2=7:14$ —because  $\frac{7 \times 2}{7}$ 

But we cannot add the same quantity to both terms of a geometrical ratio, nor subtract it from them, without altering the ratio.

12. When the pupil [Sec. IV. 17] was taught how to express one quantity as the fraction of another, he in reality learned how to discover the geometrical ratio between the two quantities. Thus, to repeat the question formerly given, "What fraction of a pound is  $2\frac{1}{4}d$ .?"—which in reality means, "What relation is there between  $2\frac{1}{4}d$ . and a pound ;" or "What must we consider  $2\frac{1}{4}d$ , if we consider a pound as unity ;" " or," in fine, "What is the value of  $2\frac{1}{4}$  : 1"—

We have seen [See. I. 40] that the relation between quantities cannot be ascertained, unless they are made to have the same " unit of comparison :" but a farthing is the only unit of comparison which can be applied to both 24d. and £1; we must therefore reduce them to farthings—when the ratio of one to the other will become that of 9: 960. But we have also seen that a geometrical ratio is not altered, if we divide both its terms by the same number; therefore 9: 960 is the same ratio as  $\overline{\varphi}_{\theta \sigma}^{\theta}$ ;  $\overline{\varphi}_{\theta \sigma}^{\theta}$ , or  $\overline{\varphi}_{\theta \sigma}^{\theta}$ ; 1.—That is, the ratio between 24d. and £1 may be expressed by 24d. : £1, or 9: 960, or  $\overline{\varphi}_{\theta \sigma}^{\theta}$ ; 1; or, the pound being considered as unity, the farthing will be represented by  $\overline{\varphi}_{\theta \sigma}^{\theta}$ .

13. The geometrical ratio between two numbers is the same as that which exists between the quotient of the fraction which represents their ratio, and unity. Thus,

 $\times 2: 10 \times 2,$ arithmetical  $\div 2=1,$  and

14

both terms them, with-

taught how mother, he trical ratio t the quespound is relation is at must we ;" " or,"

n between are made a farthing upplied to be them to will been that a both its the same between 9:960, unity, tho

ers is the at of the Tbus,

in the last example 9:960 and  $\frac{2}{960}$ : 1 are equal ratios. It is not necessary that we should be able to express by integers, nor even by a finite decimal, what part or multiple one of the terms is of the other; for a geometrical ratio may be considered to exist between any two quantitics. Thus, if the ratio is 10:2, 5 ( 2) is the quantity by which we must multiply one term to make it equal to the other; if 1:2, it is  $0.5(\frac{1}{2})$ , a finite decimal; but if 3 : 7, it is '428571' (3), an infinite decimal-in which case we obtain only an approximation to the value of the ratio. But though the measure of the ratio is expressed by an infinite decimal, when there is no quantity which will exactly serve as the multiplier, or divisor of one quantity so as to make it equal to the other-since we may obtain as near an approximation as we pleasethere is no inconvenience in supposing that any one number is some part or multiple of any other; that is, that any number may be expressed in terms of anotheror may form one term of a geometrical ratio, unity being the other.

14. Proportion, or analogy, consists in the equality of ratios, and is indicated by putting  $\doteq$ , or ::, between the equal ratios; thus  $5:7 \doteq 9:11$ , or 5:7:9:11 (read, 5 is to 7 as 9:11), means that the two ratios 5:7 and 9:11 are equal; or that 5 bears the same relation to 7 that 9 does to 11. Sometimes we express the equality of more than two ratios; thus 4:8::6:12::18:36, (read, 4 is to 8, as 6 is to 12, as 18 is to 36), means there is the same relation between 4 and 8, as between 6 and 12; and between 18 and 36, as between either 4 and 8, or 6 and 12—it follows that 4:8::18:36—for two ratios which are equal to the same, are equal to each other. When the equal ratios are arithmetical, the constitute an arithmetical proportion; when geometri eal, a geometrical proportion

15. The quantities which form the proportion are ealled *proportionals*; and a quantity that, along with three others, constitutes a proportion, is called a *fourth proportional* to those others. In a proportion, the two outside terms are called the *extremes*, and the two middle terms the *means*; thus in 5:6::7:S, 5 and 8 are the

an 7-

extremes, 6 and 7 the means. When the same quantity e is found in *both* means, it is called *the* mean of the restremes; thus, since 5:6:.6:7, 6 is *the mean* of 5 and 7. When the proportion is arithmetical, *the mean* of two quantities is called their *arithmetical* mean; when the proportion is geometrical, it is termed their geometrical mean. Thus 7 is the arithmetical mean of 4 and 10; for, since 7-4=10-7, 4:7::7:10. And 8 is the geometrical mean of 2 and 32; for, since  $\frac{2}{3}=\frac{8}{32}$ , 2:8::8:32.

17. This equation (as it is called), or the equality which exists between the sum of the means and the sum of the extremes, is the *test* of an arithmetical proportion :---that is, it shows us whether, or not, four given quantities constitute an arithmetical proportion. It also enables us to find a fourth arithmetical proportional to three given numbers—since any mean is evidently the difference between the sum of the extremes and the other mean; and any extreme, the difference between the sum of the means and the other extreme—

For if 4:7::8:11 be the arithmetical proportion, 4+11=.7+8 [16]; and, subtracting 4 from the equals, we have 11 (ene of the extremes) =.7+8-4 (the sum of the means, minus the other extreme); and, subtracting 7, we have 4+11-7 (the sum of the extremes minus one of the means) ==8 (the other mean). We might in the same way find the remaining extreme, or the remaining mean. Any other arithmetical proportion would have

180

181

answered just as well—hence what we have said is true in all cases.

18. EXAMPLE.—Find a fourth proportional to 7, 8, 5.

Making the required number one of the extremes, and putting the note of interrogation in the place of it, we have 7:8::5:?; then 7:8::5:8+5-7 (the sum of the means minus the given extreme, =6); and the proportion completed will be

Making the required number one of the means, we shall have 7 : 8 :: ? : 5, then 7 : 8 :: 7+5-8 (the sum of the extremes minus the given mean, =4) : 5; and the proportion completed will be

7:8::4:5.

As the sum of the means will be found equal to the sum of the extremes, we have, in each case, completed the proportion.

19. The arithmetical mean of two quantities is half the sum of the extremes. For the sum of the means is equal to the sum of the extremes; or—since the means are equal—twice one of the means is equal to the sum of the extremes; consequently, half the sum of the means—or one of them, will be equal to half the sum of the extremes. Thus the arithmetical mean of 19 and 27 is  $\frac{19+27}{2}$  (=23); and the proportion completed is

219: 23: 23: 27, for 19+2i=23+23.

20. If with any four quantities the sum of the means is equal to the sum of the extremes, these quantities are in arithmetical proportion. Let the quantities be

6 7 5

As the sum of the means is equal to the sum of the extremes

### 8+5=6+7.

Subtracting 6 from each of the equal quantities, we have 8+5-6=6+7-6; and subtracting 5 from each of these, we have 8+5-6-5=6+7-6-5. But 8+5-6-5 is equal to 8-6, since 5 to be added and 5 to be subtracted are =0; and +6+7-6-5=7-5, since 6 to be added and 6 to be subtracted =0;

therefore 8+5-6-5=6+7-6-5 is the same as 8-6=7-5; but if 8-6=7-5, 8:6 and 7:5, are two equal arithmetical ratios; and if they are two equal arithmetical ratios, they constitute an arithmetical proportion. It might in the same way be proved that any other four quantities are in arithmetical proportion, if the sum of the means is equal to the sum of the same set.

21. In a geometrical proportion, "the product of he means is equal to the product of the extremes." Thus, since 14:7:: i6:8 is a geometrical proportion,  $\frac{14}{4} = \frac{16}{8} [11]$ ; but, multiplying each of the equal quantiies by 7, we have  $(\frac{14}{4} \times 7) = \frac{16}{5} \times 7$ ; and multiplying such of these by 8, we have  $14 \times 8 = 16 \times 7(\frac{16}{5} \times 7 \times 8)$ : out  $14 \times 8$  is the product of the extremes; and  $16 \times 7$ is the product of the means. The same reasoning would nold with any other geometrical proportion, and thereiore it is true in all cases.

22. This equation (as it is called), or the equality of the product of the means and the product of the extremes, is the test of a geometrical proportion: that is, it shows us whether or not four given quantities constitute a geometrical proportion. It also enables us to find a fourth geometrical proportional to three given quantities—which is the object of the rule of three; since any mean is, evidently, the quotient of the product of the extremes divided by the other mean; and any extreme, is the quotient of the product of the means divided by the other extreme.

For if 7: 14:: 11: 22 be the geometrical proportion, 7×22=14×11; and, dividing the equals by 7, we have 22 (one of the extremes)  $=\frac{14\times11}{11}$  (the product of the means divided by the other extreme); and, dividing these by 11, we have  $\frac{7\times22}{11}$  (the product of the extremes divided by one mean)=14 (the other mean). We might in the same way find the remaining mean or the remaining extreme. Any other proportion would have answered just as well—and therefore what we have said is true in every case.

24. If with any four quantities the product of the means is equal to the product of the extremes, these quantities are in geometrical proportion. Let the quantities be

#### 5 20 6 24,

As the product of the means is equal to the prod. et of the extremes,

#### $5 \times 24 = 20 \times 6$ .

 $5 \times 24$  $20 \times 6$ Dividing the equals by 24, we have 24 24;  $5 \times 24$  $20 \times 6$ and, dividing these by 20, we have  $\overline{20 \times 24} = \overline{20 \times 24}$ .  $5 \times 24$ 6 5  $20 \times 6$ 6 But  $20 \times 24^{-20}$ ; and  $20 \times 24^{-24}$ ; therefore  $20^{-24}$ ; consequently the geometrical relation between 5 and 20 is the same as that between 6 and 24; hence there are two equal geometrical ratios-or a geometrical propor-

tion. It might, in the same way, be proved that any other four quantities are in geometrical proportion, if the product of the means is equal to the product of the

25. When the first term is unity, to find a fourth proportional-

RULE.—Find the product of the second and third.

EXAMPLE.-What is the fourth proportional to 1, 12, and 27 2

# $1: 12:: 27: 12 \times 27 = 324$

We are to divide the product of the means by the given extreme; but we may neglect the divisor when it is unitysince dividing a number by unity does not alter it.

26. When either the second, or third term is unity-RULE .- Divide that one of them which is not unity, by the first.

EXAMPLE.—Find a fourth proportional to 8, 1, and 5.

# $8:1::5:\frac{5}{8}$ .

We are to divide the product of the means by the given extreme; but one of the means may be considered as the product of both, when the other is unity. For, since multiplication by unity produces no effect, it may be omitted.

duct

5.

any , if the of the extremes is equal to the mean multiplied by itself. Hence, to discover the geometrical mean of two quantities, we have only to find some number which, multiplied by itself, will be equal to their product—that is,

tities, we have only to find some number which, multiplied by itself, will be equal to their product—that is, to find, what we shall term hereafter, the square root of their product. Thus 6 is the geometrical mean of 3 and 12; for  $6 \times 6 = 3 \times 12$ . And 3: 6:: 6: 12.

28. It will be useful to make the pupil acquainted with the following properties of a geometrical proportion-

We may consider the same quantity either as a mean, or an extreme. Thus, if 5:10::15:30 be a geometrical proportion, so also will 10:5::30:15; for we obtain the same equal products in both cases—in the former,  $5 \times$  $30 = 10 \times 15$ ; and in the latter,  $10 \times 15 = 5 \times 30$ —which are the same thing. This change in the proportion is called *inversion*.

29. The product of the means will continue equal to the product of the extremes—or, in other words, the proportion will remain unchanged—

If we allernate the terms; that is, if we say, "the first is to the third, as the second is to the fourth"-

If we "multiply, or divide the first and second, or the first and third terms, by the same quantity"---

If we " read the proportion backwards"\_\_\_\_

If we say "the first term plus the second is to the second, as the third plus the fourth is to the fourth"— If we say "the first term plus the second is to the first, as the third plus the fourth is to the third"—&e.

# RULE OF SIMPLE PROPORTION.

30. This rule, as we have said, enables us, when three quantities are given, to find a fourth proportional.

The only difficulty consists in *stating* the question; when this is done, the required term is easily found.

In the rule of *simple* proportion, *two* ratios are given, the one perfect, and the other imperfect.

31. RULE-I. Put that given quantity which belongs to the *imperfect* ratio in the third place.

: II. If it appears from the nature of the question that the required quantity must be greater than the other,

# RULE OF PROPORTION.

or given term of the same ratio, put the larger term of the *perfect* ratio in the second, and the smaller in the first place. But if it appears that the required quantity must be less, put the larger term of the *perfect* ratio in the first, and the smaller in the second place.

III. Multiply the second and third terms tegether, and divide the preduct by the first. The answer will be of the same kind as the third term.

32. EXAMPLE 1.--If 5 men build 10 yards of a wall in one day, how many yards would 21 men build in the same time ?

It will facilitate the stating, if the pupil puts down the question briefly, as follows—using a note of interrogation to represent the required quantity—

|   | 5 men.    |  |
|---|-----------|--|
|   | 10 yards. |  |
|   | 21 men.   |  |
| , | 7         |  |
|   | ? yards.  |  |

10 yards is the given term of the imperfect ratio—it must, therefore, be put in the third place.

5 men, and 21 men are the quantities which form the perfect ratio; and, as 21 will build a greater number of yards than 5 men, the required number of yards will be greater than the given number—hence, in this case, we put the larger term of the perfect ratio in the second, and the smaller in

# 5:21::10:?

And, completing the proportion,

5 : 21 :: 10 :  $\frac{21 \times 10}{5}$  42, the required number.

Therefore, if 5 men build 10 yards in a day, 21 men will build 42 yards in the same time.

33. EXAMPLE 2.—If a certain quantity of bread is sufficient to last 3 men for 2 days; for how long a time ought it to last 5 men? This is set down briefly as follows:

| 3 men.<br>2 days. |  |
|-------------------|--|
| 5 men.            |  |
| ? days.           |  |

2 days is the given term of the imperfect ratio—it must, therefore, be put in the third place.

The larger the number of men, the shorter the time a given quantity of bread will last them; but this *shorter* time is the

required the

A

34 be t

It deno the

85 quai extr dere

Ri the stan but inace the eat; shal

W fect reve rule of th meti ral i rule ther

R and [22] T neit chan

186

required quantity—hence, in this case, the greater term of the perfect ratio is to be put in the first, and the smaller in the second place—

#### 5:3::2:?

And, completing the proportion,

5:3::2: $\frac{3\times 2}{5}=1\frac{1}{5}$ , the required term.

34. EXAMPLE 3.—If 25 tons of coal cost  $\pounds$ 21, what will be the price of 1 ton ?

25:1::21:
$$\frac{1\times 21}{25}$$
 pounds  $\pounds \frac{21}{25} = 16s. 9\frac{1}{2}d.$ 

It is necessary in this case to reduce the pounds to lower denominations, in order to divide them by 25; this causes the answer, also, to be of *different* denominations.

35. REASON OF I.—It is convenient to make the required quantity the fourth term of the proportion—that is, one of the extremes. It could, however, be found equally well, if considered as a mean [23].

**REASON** OF II.—It is also convenient to make quantities of the same kind the terms of the same ratio; because, for instance, we can compare men with man, and days with days but we cannot compare men with days. Still there is nothing inaccurate in comparing the number of one, with the number of the other; nor in comparing the number of men with the quantity of work they perform, or with the number of loaves they eat; for these things are proportioned to each other. Hence we shall obtain the same result whether we state example 2, thus

> 5 : 3 :: 2 : ? or thus 5 : 2 :: 3 : ?

When diminishing the kind of quantity which is in the perfect ratio increases that kind which is in the imperfect—or the reverse—the question is sometimes said to belong to the *inverse* rule of three; and different methods are given for the solution of the two species of questions. But llatton, in his Arithmetic, (third edition, London, 1753.) suggests the above general mode of solution. It is not accurate to say "the *inverse* rule of three" or "*inverse* rule of proportion;" since, although there is an inverse ratio, there is no inverse proportion:

REASON OF III.—We multiply the second and third terms, and divide their product by the first, for reasons already given [22].

The answer is of the same kind as the third term, since neither the multiplication, nor the division of this term has changed its nature;—20s. the payment of 5 days divided by 5

2

If the fourth term were not of the same kind as the third, it would not complete the imperfect ratio, and therefore it would not be the required fourth proportional.

36. It will often be convenient to divide the first and second, or first and third terms, by their greatest common measure, when these terms are composite to each other [29].

EXAMPLE.-If 36 cwt. cost £24, what will 27 cwt. cost ? 36:27::24:?Dividing the first and second by 9 we have

4:3::24:?

And, dividing the first and third by 4,

# $1:3::6:3 \times 6 = \pounds 18.$

# EXERCISES FOR THE PUPIL.

Find a fourth proportional to

1. 5 pieces of cloth : 50 pieces :: £27.

2. 1 cwt. : 215 cwt. :: 50s. Ans. 10750s. Ans. £270

3. 10 1b : 150 1b :: 5s. Ans. 75s.

4. 6 yards : 1 yard :: 27s. Ans. 4s. 6d.

5. 9 yards : 36 yards :: 18s. Ans. 72s.

6. 5 lb : 1 lb :: 15s. Ans. 3s.

7. 4 yards : 18 yards :: 1s. Ans. 4s. 6d.

8. What will 17 tons of tallow come to at £25 per ton? Ans. £425.

9 If one piece of cloth cost £27, how much will 50 pieces cost? Ans. £1350.

10. If a certain quantity of provisions would last 40 men for 10 months, how long would they suffice for 32 : Ans. 121 months.

11. What will 215 cwt. of madder cost at 50s. per cwt. ? Ans. 10750s.

12. I desire to have 30 yards of cloth 2 yards wide, with baize 3 yards in breadth to line it, how much of the latter shall I require ? Ans. 20 yards.

14. At 5s. per 1b, what will be the price of 150 lb of tea? Ans. 750s.

15. A merchant agreed with a carrier to bring 12 cwt. of goods 70 miles for 13 crowns, but his waggon being heavily laden, he was obliged 'to unload 2 cwt.; how far should he carry the remainder for the same money? Ans. 84 miles.

16. What will 150 cwt. of butter cost at £3 per cwt. ? Ans. £450.

17. If I lend a person £400 for 7 months, how much ought he to lend me for 12? Ans. £233 6s. 8d.

18. How much will a person walk in 70 days at the rate of 30 miles per day? Ans. 2100.

19. If I spend £4 in one week, how much will I spend in 52? Ans. £208.

20. There are provisions in a town sufficient to support 4000 soldiers for 3 months, how many must be sent away to make them last 8 months? Ans. 2500.

21. What is the rent of 167 acres at £2 per acre? Ans. £334.

22. If a person travelling 13 hours per day would finish a journey in 8 days, in what time will he accomplish it at the rate of 15 hours per day? Ans.  $6\frac{14}{15}$  days.

23. What is the cost of 256 gallons of brandy at 12s. per gallon? Ans. 3072s.

24. What will 156 yards of eloth come to, at £2 per yard? Ans. £312.

25. If one pound of sugar cost 8d., what will 112 pounds come to? Ans. 896d.

26. If 136 masons can build a fort in 28 days, how many men would be required to finish it in 8 days? Ans. 476.

27. If one yard of ealico cost 6d., what will 56 yards come to? Ans. 336d.

28. What will be the price of 256 yards of tape at 2d. per yard? Ans. 512d.

29. If £100. produces me £6 interest in 365 days, what would bring the same amount in 30 days? Ans £1216 13s. 4d.

30. What shall I receive for 157 pair of gloves, at 10d. per pair? Ans. 1570d.

31. What would 29 pair of shoes come to, at 9s. per pair? Ans. 261s.

32. If a farmer lend his neighbour a cart horse which draws 15 cwt. for 30 days, how long should he have a horse in return which draws 20 cwt. ? Ans.  $22\frac{1}{2}$  days.

33. What sum put to interest at £6 per cent. would give £6 in one month ? Ans. £1200.

34. If I lend £400 for 12 months, how long ought £150 be lent to me, to return the kindness? Ans. 32 months.

35. Provisions in a garrison are found sufficient to last 10,000 soldiers for 6 months, but it is resolved to add as many men as would cause them to be consumed in 2 months; what number of men must be sent in ? Ans. 20,000.

bety

will

F

Ί

4

3 q:

36. If 8 horses subsist on a certain quantity of hay for 2 months, how long will it last 12 horses? Ans  $1\frac{1}{3}$  months.

37. A shopkeeper is so dishonest as to use a weight of 14 for one of 16 oz.; how many pounds of just will be equal to 120 of unjust weight? Ans. 105 fb.

38. A meadow was to be mowed by 40 men in 10 days; in how many would it be finished by 30 men? Ans.  $13\frac{1}{3}$  days.

37. When the first and second terms of the proportion are not of the same denomination; or one, or both of them contain different denominations—

RULE.—Reduce both to the lowest denomination contained in either, and then divide the product of the second and third by the first term.

EXAMPLE 1.—If three ounces of tea cost 15d. what will 87 pounds cost?

The lowest denomination contained in either is ownees.

oz. ib d.  $1302 \times 15 \ d.$  $3: 87: : 15: \frac{1302 \times 15}{3} = 6960 = \pounds 29.$ 

1392 ounces.

There is evidently the same ratio between 3 oz and 87 lb as between 5 oz. and 1392 oz. (the equal of 87 lb).

EXAMPLE 2.—If 3 yards of any thing cost 4s.  $9\frac{3}{4}d$ , what can be bought for  $\pounds 2$ ?

The lowest denomination in either is farthings.

| *   | $\begin{array}{ccc} s. & d. \\ 4 & 9_4^3 \\ 12 \end{array}$ | :     | £<br>2::<br>20 | $3:\frac{1920}{23}$ | $\frac{3}{3}$ yds. q<br>=24 3 | nls.<br>3.     |
|-----|---|-------|----------------|---------------------|-------------------------------|----------------|
|     | 57 pence<br>4   |       | 40 shi<br>12   | illings. 🦂          | 1.21                          |                |
|     | 231 farth   | ings. | 480 per        | nce., ; .           |                               | њ <sub>а</sub> |
| 1.9 |   | j     | .920 fai       | things.             | · .                           |                |

There is evidently the same ratio between 4s.  $9\frac{4}{3}d$ . and  $\pounds 2$ , as between the numbers of farthings they contain, respectively. For there is the same ratio between any two quantities, as between two others which are equal to them.

EXAMPLE 3.—If 4 cwt., 3 qrs., 17 ib, cost £19, how much will 7 cwt. 2 qrs. cost ?

The lowest denomination in either is pounds.

56. At 15s. per cwt., what can I have for £615 15s.? Ans. 821 cwt.

57. How much beef can be bought for £760 12s., at 32s. per cwt. Ans. 475 cwt., 1 qr., 14 lb.

58. If 12 lb, 6 oz., 4 dwt., cost £150, what will 3 lb, 1 oz., 11 dwt., cost? Ans. £37 10s.

59. If 10 yards cost 17s., what will 3 yards, 2 qrs. cost? Ans. 5s. 111d.

60. If 12 cwt. 22 lb cost £19, what will 2 cwt. 3 qrs. cost? Ans. £4 5s. 8<sup>1</sup>d.

61. If 15 oz., 12 dwt., 16 grs., cost 19s., what will 13 oz. 14 grs. cost? Ans. 15s. 10d.

38. If the third term consists of more than ove deno-

RULE.—Reduce it to the lowest denomination which it contains, then multiply it by the second, and divide the product by the first term.—The answer will be of that denomination to which the third has been reduced and may sometimes be changed to a higher [Sec. 1.1.5].

t £18 per ill be the at £5 per ill be the to, at 3s. ome to, at t 7d. per 6d. per will 110 7s: 21d. uch will 01d. 1. 15 155. ? 12s., at will 3 fb, it di s, 2 qrs. 2 cwt. 3 hat will e denon which

divide ll be of educed [Scc. EXAMPLE 1.-If 3 yards cost 9s. 21d., what will 327 yards

$$\begin{array}{c} 12 \\ 12 \\ 110 \text{ pence.} \\ 4 \\ \hline 441 \text{ farthings.} \end{array}$$

EXAMPLE 2.—If 2 yards 3 qrs. cost 111d., what will 27 yards, 2 qrs., 2 nails, cost?

The lowest denomination in the first and second is nails, and in the third farthings.

| yds. (<br>2<br>4 | qr.<br>3 : | yds.<br>27<br>4 | qr. n.<br>2 2 | $\begin{array}{c} d.\\ \vdots 11 \\ 4 \end{array}$ | : 4  | 42×4<br>44 | 5 <sup>,</sup><br>-farthings=9s. | 5d. |
|------------------|------------|-----------------|---------------|--|------|------------|----------------------------------|-----|
| 11 q<br>4        | r          | 110 q<br>4      | Įr.           | 45 f   | arth | ings.      |                                  |     |
| 44 n             | ails .     | 442 -           | naila         |  |      |            |                                  |     |

Reducing the third term generally enables us to perform the required multiplication and division with more facility.--It is

sometimes, however, unnecessary.

EXAMPLE.—If 3 lb cost £3 11s.  $4\frac{3}{4}d$ ., what will 96 lb cost? Ib lb £ s. d. £ s. d. £ s. d. £ s. d. 3:96::3 11  $4\frac{3}{4}$ :  $\frac{3}{3}$  11  $4\frac{3}{4} \times 96$ 3 = 3 11  $4\frac{3}{4} \times 32$ —114 4 8

87. If the shilling loaf weigh 3 fb 6 cz., when flour sells at £1 13s. 6d. per cwt., what should be its weight when flour sells at £1 7s. 6d ? Ans. 4 lb 143 oz.

88. If 100 lb of anything cost £25 6s. 3d., what will be the price of 625 fb? Ans. £158 4s. 03d.

89. If 1 lb of spice cost 10s. Sd., what is half an oz. worth ? Ans. 4d.

90. Bought 3 hhds. of brandy containing, respectively, 61 gals.; 62 gals., and 62 gals. 2 qts., at 6s. 8d. per gallon; what is their cost? Ans. £61 16s. 8d.

39. If fractions, or mixed numbers are found in one or more of the terms--

RULE .- Having reduced them to improper fractions, if they are complex fractions, compound fractions, or mixed numbers-multiply the second and third terms together, and divide the product by the first-according to the rules already given [Sec. IV. 36, &c., and 46, &c.] for the management of fractions.

EXAMPLE.—If 12 men build  $3\frac{5}{7}$  yards of wall in  $\frac{3}{4}$  of a week, how long will they require to build 47 yards ?

 $3\frac{5}{7}$  yards= $\frac{26}{7}$  yards, therefore  $\frac{26}{7}$ : 47 ::  $\frac{3}{4}$  :  $\frac{\frac{3}{4} \times 47}{\frac{26}{2}} = 9\frac{1}{2}$  weeks, nearly.

40.-If all the terms are fractions-

RULE .- Invert the first, and then multiply all the terms together.

EXAMPLE.—If  $\frac{3}{4}$  of a regiment consume  $\frac{11}{12}$  of 40 tons of flour in \$ of a year, how long will \$ of the same regiment take to consume it ?

# $\frac{5}{4}$ : $\frac{3}{4}$ :: $\frac{4}{5}$ : $\frac{3}{4} \times \frac{4}{5} \div \frac{5}{6} = \frac{3}{4} \times \frac{4}{5} \times \frac{6}{5} = \frac{72}{100} = 262.8$ days.

This rule follows from that which was given for the division of one fraction by another [Sec. IV. 49].

41. If the first and second, or the first and third terms, are fractions.

RULE.-Reduce them to a common denominator (should they not have one already), and then omit the denominators

1b :: £73 2 qrs., 18 prs., 11 lb. 1 1 . t. t. wt. cost ? come to? t 14s. 6d. t 2s. 81d. h, at 16s. vill 18 1b Irs. come

l be the 81d. ...

1 1b :: £87

EXAMPLE.—If  $\frac{2}{3}$  of 1 cwt. of rice costs £2, what will  $\frac{9}{10}$  of a cwt. cost?

 $\frac{2}{3}:\frac{9}{10}::2:?$ Reducing the fractions to a common denominator, we have

 $\frac{20}{36}:\frac{27}{36}::2:?$ 

And omitting the denominator,

# $20:27::2:\frac{27\times 2}{20}=\pounds 2.7=\pounds 2.14s.$

This is merely multiplying the first and second, or the first and third terms by the common denominator—which [30] does not alter the proportion.

#### EXERCISES.

91. What will  $\frac{3}{4}$  of a yard cost, if 1 yard costs 13s 6d. ? Ans. 10s.  $1\frac{1}{2}d$ .

92. If 1 Hb of spice costs  $\frac{3}{4}s$ ., what will 1 Hb 14 oz. cost? Ans: 1s.  $4\frac{7}{4}d$ .

93. If 1 oz. of silver costs  $5\frac{2}{3}s$ , what will  $\frac{3}{4}$  oz. cost? Ans. 4s. 3d.

94. How much will  $\frac{1}{4}$  yard come to if  $\frac{7}{5}$  cost  $\frac{5}{5}s$ .

95. If  $2\frac{1}{2}$  yards of flannel cost  $3\frac{1}{5}s$ , what is the price of  $4\frac{3}{4}$  yards? Ans. 6s. 4d.

96. What will  $3\frac{3}{8}$  oz. of silver cost at  $6\frac{1}{2}s$ . per oz. ? Ans. £1 1s.  $4\frac{1}{2}d$ .

97. If  $\frac{3}{16}$  of a ship costs £273 $\frac{1}{8}$ , what is  $\frac{5}{32}$  of her worth? Ans. £227 12s. 1d.

98. If 1 fb of silk costs  $16\frac{3}{3}s.$ , how many pounds can I have for  $37\frac{1}{2}s.$ ? Ans.  $2\frac{1}{4}$  fb.

99. What is the price of  $49\frac{3}{11}$  yards of cloth, if  $7\frac{5}{2}$  cost £7 18s. 4d. ? Ans. £51 3s.  $1\frac{5}{5}\frac{3}{13}d$ .

100. If £100 of stock is worth £987, what will £362 8s.  $7\frac{1}{2}d$ . be worth? Ans. £358 7s. 1d.

101. If  $9\frac{1}{7}s$ , is paid for  $4\frac{5}{6}$  yards, how much can be bought for  $\pounds 2\frac{3}{17}$ ? Ans. 24 yards, nearly.

# MISCELLANEOUS EXERCISES IN SIMPLE PROPORTION.

## $15\frac{1}{4}d$ . Answer.

104. Received 4 pipes of oil containing 480 gallons which cost 5s.  $5\frac{1}{2}d$ . per gallon; paid for freight 4s. per pipe; for duty, 6d. per gallon; for porterage, 1s. per pipe. What did the whole cost; and what does it stand me in per gallon? Ans. It cost £144, or 6s. per gallon

105. Bought three sorts of brandy, and an equal quantity of each sort: one sort at 5s.; another at 6s.; and the third at 7s. What is the cost of the whole—one gallon with another? Ans. 6s.

106. Bought three kinds of vinegar, and an equal quantity of each kind: one at  $3\frac{1}{2}d$ ; another at 4d; and another at  $4\frac{1}{2}d$ . per quart. Having mixed them I wish to know what the mixture cost me per quart? Ans. 4d.

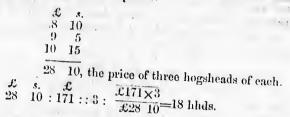

107. Bought 4 kinds of salt, 100 barrels of each; and the prices were 14s., 16s., 17s., and 19s. per barrel. If I mix them together, what will the mixture have cost me per barrel? Ans. 16s. 6d.

108. How many reams of paper at 9s. 9d., and 12s. 3d. per ream shall I have, if I buy £55 worth of both, but an equal quantity of each? Ans. 50 reams of each.

109. A vintner paid £171 for three kinds of wine: one kind was £8 10s.; another £9 5s.; and the third

K

£10–15s, per hhd. He had of each an equal quantity, the amount of which is required.

110. Bought three kinds of salt, and of each an equal quantity; one was 14s., another 16s., and the third 19s. the barrel; and the whole price was  $\pounds 490$ . How many barrels had I of each? Ans. 200.

111. A merchant bought certain goods for £1450, with an agreement to deduct £1 per cent for prompt payment. What has he to pay? Ans. £1435 10s.

112. A captain of a ship is provided with 24000 fb of bread for 200 men, of which each man gets 4 fb per week. How long will it last? Ans. 30 weeks.

113. How long would 3150 lb of beef last 25 men, if they get 12 oz. each three times per week? Ans. 56 weeks.

114. A fortress containing 700 men who consume each 10 fb per week, is provided with 184000 fb of provisions. How long will they last? Ans. 26 weeks and 2 days.

115. In the copy of a work containing 327 pages, a remarkable passage commences at the end of the 156th page. At what page may it be expected to begin in a copy containing 400 pages? Ans. In the 191st page.

116. Suppose 100 cwt., 2 qrs., 14 the 191st page. ship's use were to be cut up in pieces of 4 lb, 3 lb, 2 lb, 1 lb, and  $\frac{1}{2}$  lb—there being an equal number of each. How many pieces would there be in all? Ans. 1073;

117. Suppose that a greyhound makes 27 springs while a hare makes 25, and that their springs are of equal length. In how many springs will the hare be overtaken, if she is 50 springs before the hound?

al quantity,

ds of each.

h an equal third 19s. How many

or £1450, or prompt 5 10s. 24000 H s 4 lb per s. 25 men, if Ans. 56

consume 00 fb of 26 weeks

pages, a he 156th gin in a page. beef for lb, 2 lb, of each. . 1073;

springs, are of are be The time taken by the greyhound for one spring is to that required by the hare, as 25 : 27, as  $1 : \frac{27}{25}$ , or us  $1 : 1\frac{2}{25}$  [12]. The greyhound, therefore, gains  $\frac{2}{25}$  of a spring during every spring of the hare. Therefore

 $\frac{1}{25}$ : 50 :: 1 spring : 50  $\div \frac{3}{25}$  = 675, the number of springs the hare will make, before it is overtaken.

118. If a ton of tallow costs £35, and is sold at the rate of 10 per cent. profit, what is the selling price? Ans. £38 10s.

119. If a ton of tallow costs  $\pounds$ 37 10s., at what rate must it be sold to gain by 15 tons the price of 1 ton ? Ans.  $\pounds$ 40.

120. Bought 45 barrels of beef at 21s. per barrel; among them are 16 barrels, 4 of which would be worth only 3 of the rest. How much must I pay? Ans.  $\pounds$ 43 1s.

121. If 840 eggs are bought at the rate of 10 for a penny, and 246 more at 8 for a penny, do I lose or gain if I sell all at 18 for 2d. ? Ans. I gain 6d.

122. Suppose that 4 men do as much work as 5 women, and that 27 men reap a quantity of corn in 13 days. In how many days would 21 women do it? Ans.

The work of 4 men=that of 5 women. Therefore (dividing each of the equal quantities by 4, they will remain equal),  $\frac{4 \text{ men's work}}{4}$  (one man's work)= $\frac{4 \text{ men's work}}{4}$ . Consequently 1<sup>1</sup> times the work of one woman=1 man's work: that is, the work of one man, in terms of a woman's work; is 1<sup>1</sup>/<sub>4</sub>; or a woman's work is to a man's work :: 1 : 1<sup>1</sup>/<sub>4</sub>. Hence 27 men's work =  $27 \times 1^{1}_{4}$  women's work; then, in place of saying—

21 women : 27 men :: 13 days : ? say the work of 21 women : the work of  $27 \times 1\frac{1}{4}$  (=33<sup>3</sup>/<sub>4</sub>) women :: 13.:  $\frac{33^3_4 \times 13}{21}$ =20<sup>35</sup>/<sub>28</sub> days.

123. The ratio of the diameter of a circle to its circumference being that of 1:3.14159, what is the circumference of a circle whose diameter is 47.36 feet? Ans. 148.78618 feet.

124. If a pound (Troy weight) of silver is worth 66s.,

what is the value of a pound avoirdupoise? Ans. £4 0s. 21d.

125. A merchant failing, owes £40881871 to his creditors; and has property to the amount of £12577517 10s. 11d. How much per cent. can he pay? Ans. £30

126. If the digging of an English mile of canal costs £1347 7s. 6d., what will be the cost of an Irish mile? Ans. £1714 16s. 93d.

127. If the rent of 46 acres, 3 roods, and 14 perches, is £100, what will be the rent of 35 acres, 2 roods, and 10 perches? Ans. £75 18s. 63d.

128. When A has travelled 68 days at the rate of 12 miles a day, B, who had travelled 48 days, overtook him. How many miles a day did B travel, allowing both to have started from the same place ? Ans. 17.

129. If the value of a pound avoirdupoise weight be £4 0s.  $2\frac{1}{2}d$ , how many shillings may be had for one pound Troy? Ans. 66s.

130. A landlord abates  $\frac{1}{3}$  in a shilling to his tenant; and the whole abatement amounts to £76 3s.  $4\frac{1}{3}d$ . What is the rent? Ans. £228 10s. 1d.

131. If the third and tenth of a garden comes to £4 10s., what is the worth of the whole garden? Ans. £10 7s. 81d.

132. A can prepare a piece of work in  $4\frac{1}{2}$  days; B in 61 days; and C in 81 days. In what time would all three do it ? Ans.  $2_{1\frac{1}{447}}$ .

 $4\frac{1}{2}$  days : 1 day :: 1 whole of the work :  $\frac{2}{9}$  part of the wholeor what A would do in a day.

 $6\frac{1}{3}$  days : 1 day :: 1 whole of the work :  $\frac{3}{19}$  part of the wholeor what B would do in a day.

 $8\frac{1}{2}$  days : 1 day :: 1 whole of the work :  $\frac{9}{17}$  part of the whole-

or what C would do in a day.

Then the  $\frac{1447}{1967}$  part of the work : 1 whole of the work :: 1 day (the time all would require to execute  $\frac{1447}{2967}$  of the work):  $2_{\overline{1447}}^{13}$  days, the time all would take to do the whole of it.

133. A can trench a garden in 81 days; B in 51 days; but when A, B, and C work together, it will be finished in 11 days. In how many days would C be able to do it by himself? Ans. 219 days.

? Ans. £4

1871 to his £12577517 Ans. £30

canal costs Irish mile?

14 perches, 2 roods, and

the wholeb in a day. the wholeb in a day. e wholeb in a day. in a day. work :: 1 the work) : f it. B in 51 will be

d C be

A, B, and C's work in one day= $\frac{3}{4}$  of the whole= $\frac{107}{1428}$ Subtracting  $\begin{cases} A's \text{ work in 1 day=}\frac{3}{17}\\ B's \text{ work in 1 day=}\frac{4}{21} \end{cases} = \frac{110}{357} \text{ of the whole=}\frac{440}{1428}$ 

C's work in one day remains equal to  $..._{\frac{631}{1428}}$ Then  $\frac{631}{1428}$  (C's work in one day): 1 whole of the work :: 1 day:  $2\frac{166}{531}$ , the time required.

134. A ton of coals yield about 9000 cubic feet of gas; a street lamp consumes about 5, and an argand purner (one in which the air passes through the centre of the flame) 4 cubic feet in an hour. How many tons of coal would be required to keep 17493 street lamps, and 192724 argand burners in shops, &c., lighted for 1000 hours? Ans.  $95373\frac{4}{9}$ .

135. The gas consumed in London requires about 50,000 tons of coal per annum. For how long a time would the gas this quantity may be supposed to produce (at the rate of 9000 cubic feet per ton), keep one argand light (consuming 4 cubic feet per hour) constantly burning? Ans. 12842 years and 170 days.

136. It requires about 14,000 millions of silk worms to produce the silk consumed in the United Kingdom annually. Supposing that every pound requires 3500 worms, and that one-fifth is wasted in throwing, how many pounds of manufactured silk may these worms be supposed to produce ? Ans. 1488 tons, 1 cwt., 3 qrs., 17 lb.

137. If one fibre of silk will sustain 50 grains, how many would be required to support 97 lb? Ans 13580.

138. One fibre of silk a mile long weighs but 12 grains; how many miles would 4 millions of pounds, annually consumed in England, reach?

Ans.  $2333333333_{\frac{1}{3}}$  miles. 139. A leaden shot of  $4\frac{1}{2}$  inches in diameter weighs 17 lb; but the size of a shot 4 inches in diameter, is to that of one  $4\frac{1}{2}$  inches in diameter, as 64000:91125:what is the weight of a leaden ball 4 inches in diameter? Ans. 11.9396.

140. The sloth does not advance more than 100 yards in a day. How long would it take to crawl from Dublin to Cork, allowing the distance to be 160 English miles? Ans. 2816 days; or 8 years, nearly.

141. English race horses have been known to go at the rate of 58 miles an hour. In what time, at this velocity, might the distance from Dublin to Cork be travelled over? Ans. 2 hours, 45' 31'' 2''

142. An acre of coals 2 feet thick yields 3000 tons; and one 5 feet thick 8000. How many acres of 5 feet thick would give the same quantity as 48 of 2 feet thick? Ans. 18.

143. The hair-spring of a watch weighs about the tenth of a grain; and is sold, it is said, for about ten shillings. How much would be the price of a pound of crude iron, costing one halfpenny, made into steel, and then into hair-springs—supposing that, after deducting waste, there are obtained from the iron about 7000 grains of steel? Ans. £35000.

# COMPOUND PROPORTION.

42. Compound proportion enables us, although two or more proportions are contained in the question, to obtain the required answer by a single stating. In compound proportion there are three or more ratios, one of them imperfect, and the rest perfect.

43. RULE-I. Place the quantity belonging to the imperfect ratio as the third term of the proportion.

II. Put down the terms of each of the proportion. in the first and second places—in such a way that the antecedents may form one column, and the consequents another. In setting down each ratio, consider what effect it has upon the answer—if to increase it, set down the larger term as consequent, and the smaller as antecedent; if to diminish it, set down the smaller term as consequent, and the larger term as

consequent, and the larger as antecedent. III. Multiply the quantity in the third term by the product of all the quantities in the second, and divide the result by the product of all there in the second.

the result by the product of all those in the first. 44. EXAMPLE 1.—If 5 men build 16 yards of a wall in 20 days, in how many days would 17 men build 27

days, in how many days would 17 men build 37 yards? The question briefly put down [32], will be as follows :

n to go at ne, at this o Cork be

3000 tons; of 5 feet of 2 feet

about the about ten pound of steel, and leducting out 7000

igh two stion, to ng. In ios, one

y the livide

in 20

'S : ....

b men<br/>16 yardsconditions which give 20 days.20 daysimperfect ratio.

? days, the number sought.

17 men 37 yards conditions which give the required number of days.

The imperfect ratio consists of days—therefore we are to put 20, the given number of days, in the third place. Two ratios remain to be set down—that of numbers of *men*, and that of numbers of *yards*. Taking the former first, we ask ourselves how it affects the answer, and find that the more men there are, the smaller the *required* number will be—since the greater the number of men, the shorter the time required to do the work. We, therefore, set down 17 as antecedent, and 5 as consequent. Next, considering the ratio consisting of yards, we find that the larger the number of yards, the longer the time; before they are built—therefore increasing their number increases the quantity required. Hence we put 37 as consequent, and 16 as antecedent; and the whole will be as follows :—

And  $17: 5:: 20: \frac{20 \times 5 \times 37}{17 \times 16} = 13.6$  days, nearly.

45. The result obtained by the rule is the same as would be found by taking, in succession, the two proportions supposed by the question. Thus

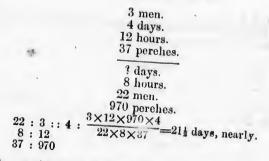

.1 5 men would build 16 yards in 20 days, in how many 's would they build 37 yards ?

 $\dot{\sigma}: 37:: 20: \frac{37 \times 20}{16}$  = number of days which 5 men would require, to build 37 yards.

If 5 men would build 37 yards in  $\frac{20 \times 37}{16}$  days, in how many days would 17 men build them ?

17 : 5 ::  $\frac{20 \times 37}{16}$  :  $\frac{20 \times 37}{16} \times 5 \div 17 = \frac{20 \times 5 \times 37}{17 \times 16}$ , the number of days found by the rule.

46. EXAMPLE 2.—If 3 men in 4 days of 12 working hours cach build 37 perches, in how many days of 8 working hours ought 22 men to build 970 perches?

The number of days is the quantity sought; therefore 4 days constitutes the imperfect ratio, and is put in the third place. The more men the fewer the days necessary to perform the work; therefore, 22 is put first, and 3 second. The smaller the number of working hours in the day, the larger the number of days; hence 8 is put first, and 12 second. The greater the number of perches, the greater the number of days required to build them; consequently 17 is to be put first, and 970 second.

47. The process may often be abbreviated, by dividing one term in the first, and one in the second place; or one in the first, and one in the third place, by the same number.

EXAMPLE 1.—If the carriage of 32 cwt. for 5 miles costs 8s., how much will the carriage of 160 cwt. 20 miles cost?

fi n

d si ti

ta

 $\frac{32:160::8:\frac{160\times20\times8}{32\times5}=160}{32\times5}$ 

Dividing 32 and 160 by 32 we have 1 and 5 as quotients. Dividing 5 and 20 by 5 we have 1 and 4; and the proportion will be—

 $1:5::8:5 \times 4 \times 8 = 160$ 1:4

48. We are to continue this kind of division as long as possible—that is, so long as any one number will measure a quantity in the first, and another in the second place; or one in the first and another in the third place This will in some instances change most of the quantities into unity—which of course may be omitted.

EXAMPLE 2.—If 28 loads of stone of 15 cwt. each, build a wall 20 feet long and 7 feet high, how many loads of 19 cwt. will build one 323 feet long and 9 feet high ?

 $\begin{array}{c} 19 : 15 :: 28 : \frac{15 \times 323 \times 9 \times 28}{20 : 323} \\ 7 : 9 \end{array} = 459.$ 

Dividing 7 and 28 by 7, we obtain 1 and 4.—Substituting these, we have

19:15::4:? 20:323 1:9

Dividing 20 and 15 by 5, the quotients are 4 and 3 :

| 19 | : | 3 : | : 4 | : |
|----|---|-----|-----|---|
|    |   | 323 |     |   |
|    |   | 9   |     |   |
|    |   | 9   |     |   |

Dividing 4 and 4 by 4, the quotients are 1 and 1 :

| 19 | : | 3 :: | 1 | : |
|----|---|------|---|---|
| 1  | : | 323  |   |   |
| 1  | : | 9    |   |   |

Dividing 19 and 323 by 19, the quotients are 1 and 17:

 $1:3::1:3\times 17\times 9=459. \\1:17$ 

## 1:9 In this process we merely divide the first and second, or st and third torms, by the same number—which [29] does

first and third torms, by the same number—which [29] does not alter the proportion. Or we divide the numerator and denominator of the fraction, found as the *fourth term*, by the same number—which [Sec. IV. 15] does not alter the quotient.

#### EXERCISES IN COMPOUND PROPORTION.

1. If £240 in 16 months gains £64, how much will £60 gain in 6 months? Ans. £6.

2. With how many pounds sterling could I gain £5 per annum, if with £450 I gain £30 in 16 months ? Ans. £100.

3. A merchant agrees with a carrier to bring 15 cwt of goods 40 miles for 10 crowns. How much ought he to pay, in proportion, to have 6 cwt. carried 32 miles i Ans. 16s.

4. If 20 cwt. are carried the distance of 50 miles for  $\pounds 5$ , how much will 40 ewt. cost, if carried 100 miles 2.

5. If 200 lb of merchandise are carried 40 miles for 3s., how many pounds might be earried 60 miles for £22 14s. 6d. Ans. 20200 lb.

6. If 286 lb of merchandiso are carried 20 miles for 3s., how many miles might 4 cwt. 3 qrs. be carried for £32 6s. 8d. ? Ans. 2317 627.

7. If a wall of 28 feet high were built in 15 days by 68 men, how many men would build a wall 32 feet high in 8 days? Ans. 146 nearly.

8. If 1 lb of thread make 3 yards of linen of 14 yards wide, how many pounds of thread would be required to make a piece of linen of 45 yards long and 1 yard wide 2 Ans. 12 lb.

9. If 3 lb of worsted make 10 yards of stuff of  $1\frac{1}{2}$  yards broad, how many pounds would make a piece 100 yards long and  $1\frac{1}{2}$  broad? Ans. 25 lb.

10. S0000 cwt. of ammunition are to be removed from a fortress in 9 days; and it is found that in 6 days 18 horses have earried away 4500 ewt. How many horses would be required to carry away the remainder in 3 days? Ans. 604.

11. 3 masters who have each 8 apprentices carn £36 in 5 weeks—each consisting of 6 working days. How much would 5 masters, each having 10 apprentices, earn in 8 weeks, working  $5\frac{1}{2}$  days per week—the wages being in both cases the same ? Ans. £110.

12. If 6 shoemakers, in 4 weeks, make 36 pair of men's, and 24 pair of women's shoes, how many pair of each kind would 18 shoemakers make in 5 weeks? Ans. 135 pair of men's, and 90 pair of women's shoes.

13. A wall is to be built of the height of 27 feet; and 9 feet high of it are built by 12 men in 6 days. How many men must be employed to finish the remainder in 4 days? Ans. 36.

14. If 12 horses in 5 days draw 44 tons of stones, how many horses would draw 132 tons the same distance in 18 days? Ans. 10 horses.

15. If 27s. are the wages of 4 men for 7 days,

what will be the wages of 14 men for 10 days? Ans. £6 15s.

16. If 120 bushels of corn last 14 horses 56 days, how many days will 90 bushels last 6 horses? Ans. 98 days.

17. If a footman travels 130 miles in 3 days when the days are 14 hours long, in how many days of 7 hours each will he travel 390 miles? Ans. 18.

18. If the price of 10 oz. of bread, when the corn is 4s. 2d, per bushel, be 5d., what must be paid for 3 the 12 oz., when the corn is 5s. 5d. per bushel? Ans. 3s. 3d.

19. 5 compositors in 16 days of 14 hours long can compose 20 sheets of 24 pages in each sheet, 50 lines in a page, and 40 letters in a line. In how many days of 7 hours long may 10 compositors compose a volume to be printed in the same letter, containing 40 sheets, 16 pages in a sheet, 60 lines in a page, and 50 letters in a line? Ans. 32 days.

20. It has been calculated that a square degree (about  $69 \times 69$  square miles) of water gives off by evaporation 33 millions of tons of water per day. How much may be supposed to rise from a square mile in a week? Ans.  $48519 \cdot 2187$  tons.

21. When the mercury in the barometer stands at a height of 30 inches, the pressure of the air on every square inch of surface is 15 fb. What will be the pressure on the human body—supposing its whole surface to be 14 square feet; and that the barometer stands at 31 inches? Ans. 13 tons 19 cwt.

# QUESTIONS IN RATIOS AND PROPORTION.

1. What is the rule of proportion; and is it ever called by any other name? [1].

2. What is the difference between simple and compound proportion? [30 and 42].

3. What is a ratio? [7].

4. What are the antecedent and consequent? [7].

5. What is an inverse ratio? [8].

6. What is the difference between an arithmetical and a geometrical ratio? [9].

7. flow can we know whether or not an arithmetical or geometrical ratio, is altered in value? [10 and 11].

8. How is one quantity expressed in terms of an other? [12].

9. What is a proportion, or analogy? [14].

10. What are means, and extremes ? [15].

11. What is the arithmetical, or geometrical mean of two quantities? [19 and 27].

12. How is it known that four quantities are in arithmetical proportion? [16].

13. How is it known that four quantities are in gcometrical proportion? [21].

14. How is a fourth proportional to three quantities found? [17 and 22].

15. Mention the principal changes which may be made in a geometrical proportion, without destroying it? [29].

# ARITHMETIC.

## PART II.

# SECTION VI.

## PRACTICE.

1. Practice is so called from its being the method of calculation practised by mercantile men: it is an abridged mode of performing processes dependent on the rule of three-particularly when one of the terms is unity. The statement of a question in practice, in general terms, would be, "one quantity of goods is to another, as the price of the former is to the price of the latter."

The simplification of the rule of three by means of practice, is principally effected, either by dividing the given qu. tity into " parts," and finding the sum of the prices of these parts; or by dividing the price into "parts," and finding the sum of the prices at each of these parts : in either case, as is evident, we obtain the required price.

2 Parts are of two kinds, "aliquot" and "aliquant." The aliquant parts of a number, are those which do not measure it-that is, which cannot be multiplied by any integer so as to produce it; the aliquot parts are, as we have seen [See. II. 26], those which measure it.

3. To find the aliquot parts of any number-

RULE .- Divide it by its least divisor, and the resulting quotient by its least divisor :- proceed thus until the last quotient is unity. All the divisors are the prime aliquot parts; and the product of every two, every three, Sc., of them, are the compound aliquot parts of the given number.

4. EXAMPLE.—What are the prime, and compound aliquot parts of 84? 2)84

> $2)\overline{42}$  $3)\overline{21}$  $\overline{7})\overline{7}$

| The p | rime | aliquot | parts | are | 2, | 3, | and | 7; | and | l |
|-------|------|---------|-------|-----|----|----|-----|----|-----|---|
|-------|------|---------|-------|-----|----|----|-----|----|-----|---|

| $2 \times 2 = 4$  |   |
|-------------------|---|
| $2 \times 3 = 6$  |   |
| $2 \times 7 = 14$ |   |
| $3 \times 7 = 21$ | ļ |
| $2 \times 3 - 12$ |   |

 $\times 7=21$  are the compound aliquot parts.

 $2\times2\times3=12$  $2\times2\times7=28$ 

 $2 \times 3 \times 7 = 42$ 

All the aliquot parts, placed in order, are 2, 3, 4, 6, 7, 12, 14, 21, 28, and 42.

5. We may apply this rule to *applicate* numbers.—Let it be required to find the aliquot parts of a pound, in shillings and pence.  $240d.=\pounds1$ .

| 2)240              |
|--------------------|
| $2)\overline{120}$ |
| 2)60               |
| $2)\overline{30}$  |
| $3)\overline{15}$  |
| 5)5                |
| 7                  |

The prime aliquot parts of a pound are, therefore. 2d., 3d., and 5d.: and the compound,

| L -/   |    |
|--|----|
| <i>d</i> .                                       |    |
|  |    |
| $2 \times 2 = 4$                                 |    |
| $2 \times 3 = 6$                                 |    |
| $2 \times 5 = 10$                                |    |
|  |    |
| $2 \times 2 \times 2 = 8$ s.                     | d. |
| $2 \times 2 \times 3 = 12 = 1$                   | 0  |
|  | ~  |
| $2 \times 2 \times 5 = 20 = 1$                   | 8  |
| $2 \times 3 \times 5 = 30 = 2$                   | 6  |
| $2 \times 2 \times 2 \times 2 = 16 = 1$          | 4  |
|  |    |
| $2 \times 2 \times 2 \times 3 = 24 = 2$          | 0  |
| $2 \times 2 \times 2 \times 5 = 40 = 3$          | 4  |
| $2 \times 2 \times 3 \times 5 = 60 = 5$          | -  |
|  | 0  |
| $\times 2 \times 2 \times 2 \times 3 = 48 = 4$   | 0  |
| $\times 2 \times 2 \times 2 \times 5 = 80 = 6$   | 8  |
|  |    |

Aliquot parts of avoirdupoise weight-

Aliquot parts of a ton. | Aliquot parts of a cwt. |Aliquot parts of a quartor ton cwt. qr. cwt. lb Ťb qr.  $\frac{1}{40} = \frac{1}{2} = 2$  $\frac{1}{56} = 2$ = 2 $\frac{1}{20} = 1 = 4$  $\frac{1}{28} = 4$ = 4  $\frac{1}{16} = 1 = 5$  $\frac{1}{16} = 7$ 7  $\frac{1}{10} = 2 = 8$  $T_4 = 8$  $\frac{1}{2} = 2\frac{1}{2} = 10$ =14 $\frac{1}{5} = 4 = 16$ =16l = 5 = 20-28 =10 =40**1**=56

Aliquot parts may, in the same manner, be easily obtained by the pupil from the other tables of weights and measures, page 3, &c.

6. To find the price of a quantity of one denomination-the price of a "higher" being given.

RULE .- Divide the price by that number which expresses how many times we must take the lower to make the amount equal to one of the higher denomination.

EXAMPLE .--- What is the price of 14 lb of butter at 72s. per cwt. ?

We must take 14 lb, or 1 stone 8 times, to make 1 cwt. Therefore the price of 1 cwt. divided by 8, or  $72s. \div 8=9s.$ , is the price of 14 lb.

The table of aliquot parts of avoirdupoise weight shows that 14 lb is the  $\frac{1}{8}$  of a cwt. Therefore its price is the  $\frac{1}{4}$  of the price of 1 cwt.

- 1. 1 cwt., at 29s. 6d. per cwt. ? Ans. 7s. 41d.
- 2. 1 a yard of cloth at 3s. 6d. per yard? Ans. 4s. 3d
- 3. 14 15 of sugar, at 45s. 6d. per cwt. ? Ans. 5s. 81 d
- 4. What is the price of 3 cwt., at 50s. per cwt.?

## £ s. d.

## 50s = 2 10 0

qrs. cwt. £ s. The price of  $2=\frac{1}{2}$  is  $1 5 0 = 2 10 \div 2$ of  $1 = \frac{1}{2} \div 2$  is 0 12 6=1 5 ÷ 2

Therefore the price of  $\overline{2+1}$  qrs. ( $=\frac{3}{4}$  cwt.) is 1 17 6

 $\frac{3}{4}$  owt., or 3 qrs.=2+1 qrs. But 2 qrs.= $\frac{1}{2}$  cwt.; and its price is half that of a cwt. 1 qr.= $\frac{1}{2}$  cwt.  $\div$  2; and its price is half the price of 2 qrs. Therefore the price of  $\frac{3}{4}$  cwt. is half the price of 1 cwt. plus the half of half the price of one owt.

# What is the price of

5.  $\frac{1}{2}$  oz. of cloves, at 9s. 4d. per lb? Ans.  $3\frac{1}{2}d$ .

6. I nail of lace, at 15s. 4d. per yard? Ans. 1112d.

7. 1/2 lb, at 23s. 4d. per cwt. ? Ans. 11/4.

8.  $\frac{3}{4}$  lb, at 18s. 8d. per cwt.? Ans.  $1\frac{1}{2}d$ .

7. When the price of more than one "lower" denomination is required-

RULE .- Find the price of each denomination by the last rule; and the sum of the prices obtained will be the required quantity.

EXAMPLE.-What is the price of 2 qrs. 14 lb of sugar, at 45s. per owt. ?

d.

| .45  | 0 price of 1 cwt.   |
|--|---|
| $\begin{array}{c} \text{cwt.} & \text{And } 22\\ 2 \text{ qrs.} = \frac{1}{2} & 5 \end{array}$ | 6, or $45s \div 2$ , is the price of 2 qrs.,  |
| $14^{1}$ $1b = \frac{1}{8}$ , or $\frac{1}{4}$ of 2 qrs.                                       | $7\frac{1}{2}$ , or $45s. \div 8=22s. 6d. \div 4$ , is the price of 14 ib, the $\frac{1}{8}$ of 1 cwt., |
| And 28   | on the $\frac{1}{4}$ of 2 qrs.<br>$1\frac{1}{2}$ is the price of 2 qrs. 14 lb.                          |

 $2 \operatorname{qrs}_{=\frac{1}{2}} \operatorname{of} 1 \operatorname{cwt}_{\cdot}$  Therefore 45s. (the price of 1 cwt.)  $\div 2$ , or 26s. 6d., is the price of 2 qrs.

14 lb is the  $\frac{1}{8}$  of 1 cwt., or the  $\frac{1}{4}$  of 2 qrs. Therefore  $45s. \div 8$ , or 22s.  $6d. \div 4=5s. 7\frac{1}{2}d.$ , is the price of 14 lb. And 22s.  $6d. \pm 5s. 7\frac{1}{2}d.$ , or the price of 2 qrs. plus the price of 14 lb, is the price of 2 qrs. 14 lb.

#### EXERCISES.

# What is the price of

9. 1 qr., 14 fb at 46s. 6d. per cwt. ? Ans. 17s.  $5\frac{1}{4}d$ . 10. 3 qrs. 2 nails, at 17s. 6d. per yard ? Ans. 15s.  $3\frac{3}{4}d$ .

11. 5 roods 14 perches, at 3s. 10d. per acre? Ans. 5s.  $1\frac{1}{2}d$ .

12. 16 dwt. 14 grs., at £4 4s. 9d. per, oz. ? Ans. £3 10s.  $3\frac{1}{4}d$ .

13. 14 lb 5 oz., at 25s. 4d. per cwt.? Ans. 3s. 2<sup>3</sup>/<sub>4</sub>d.
8. When the price of one "higher" denomination is required—

RULE.—Find what number of times the lower denomination must be taken, to make a quantity equal to one of the given denomination; and multiply the price by that number. (This is the reverse of the rule given above [6]).

EXAMPLE.—What is the price of 2 tons of sugar, at 50s. per cwt. ?

1 cwt. is the  $\frac{1}{40}$  of 2 tons; hence the price of 2 tons will be 40 times the price of 1 cwt.—or  $50s. \times 40 = \pounds 100$ .

50s. the price of 1 cwt. multiplied

by 40 the number of hundreds in 2 tons, gives 2000s.

or £100 as the price of 40 cwt., or 2 tons.

#### EXERCISES.

## What is the price of

14. 47 cwt., at 1s. Sd. per lb ? Ans. £438 13s. 4d

15. 36 yards, at 4d. per nail? Ans. £9 12s.

16. 14 acres, at 5s. per perch? Ans. £560.

17. 12 lb, at 1<sup>3</sup>/<sub>4</sub>d. per grain? Ans. £504.

18. 19 hhds., at 3d. per gallon ? Ans. £14 19s. 3d.

9. When the price of more than one "higher" denomination is required—

s.  $4\frac{1}{2}d$ . Ans. 4s. 3d lns. 5s.  $8\frac{1}{4}d$ r cwt. ? d. 0  $\pounds$  s. 0=2 10 ÷ 2 6=1 5 ÷ 2

6

wt.; and its nd its price of  $\frac{3}{4}$  cwt. is he price of

 $3\frac{1}{2}d.$ ns.  $11\frac{1}{2}d.$ 

er" deno-

on by the d will be

of sugar,

of 1 cwt. e of 2 qrs., ÷ 4, is the of 1 cwt.,

14 lb. 2wt.)÷2,

RULE.—Find the price of each by the last, and add the results together. (This is the reverse of the rule given above [7]).

EXAMPLE. - What is the price of 2 cwt. 1 qr. of flour, at 2s. per stone ?

1 stone is the  $\frac{1}{16}$  of 2 cwt. Therefore

2s., the price of one stone, ~ multiplied by 16, the number of stones in 2 cwt.,

gives 32s., is rice of 16 stones, or 2 cwt.

There are 2 stones i.e., ; therefore 2s. (the price of 1 stone)  $\times 2 = 4s$ . is the price of 1 qr. And 32s + 4s = 36s =£1 16s., is the price of 2 cwt. 1 qr.

#### EXERCISES.

# What is the price of

19. 5 yards, 3 qrs., 4 nails, at 4d. per nail? Ans. £1 12s.

20. 6 cwt. 14 lb, at 3d. per lb? Ans. £8 11s. 6d.

21. 3 fb 5 oz., at  $2\frac{1}{4}d$ . per oz. ? Ans. 9s.  $11\frac{1}{4}d$ .

22. 9 oz., 3 dwt., 14 grs., at  $\frac{3}{4}d$ . per gr. Ans. £13 15s.  $4\frac{1}{2}d$ .

23. 3 acres, 2 roods, 3 perches, at 5s. per perch? Ans. £140 15s.

10. When the price of one denomination is given, to find the price of any number of another—

RULE.—Find the price of one of that other denomination, and multiply it by the given number of the latter.

EXAMPLE.—What is the price of 13 stones at 25s. per cwt.?

 $1 \text{ stone} = \frac{1}{8} \text{ cwt.}$  Therefore

8)25s., the price of 1 cwt. divided by 8,

gives  $3 1\frac{1}{2}$ , the price of 1 stone, or  $\frac{1}{6}$  of 1 cwt. Multiplying this by 13, the number of stones,

we obtain £2 0  $7\frac{1}{2}$  as the price of 13 stones.

1 stone is the  $\frac{1}{3}$  of 1 cwt. Hence  $25s \div 8 = 3s$ .  $1\frac{1}{4}d$ ., is the price of one stone; and 3s.  $1\frac{1}{2}d \times 13$ , the price of 13 stones.

24. 19 fb, at 2d. per oz.? Ans. £2 10s. 8d.
25. 13 oz., at 1s. 4d. per fb? Ans. 1s. 1d.
26. 14 fb, at 2s. 6d. per dwt.? Ans. £420.
27. 15 acres, at 18s. per perch? Ans. £42160.
28. 8 yards, at 4d. per nail? Ans. £2 2s. 8d.
29. 12 hhds., at 5d. per pint? Ans. £126.
30. 3 quarts, at 91s. per hhd.? Ans. 1s. 1d.

11. When the price of a given denomination is the aliquot part of a shilling, to find the price of any number of that denomination—

RULE.—Divide the amount of the given denomination by the number expressing what aliquot part the given price is of a shilling, and the quotient will be the required price in shillings, &c.

EXAMPLE.—What is the price of 831 articles at 4d. per ?

#### 3)831

 $277s = \pounds 13 \ 17s$ , is the required price.

4d. is the  $\frac{1}{3}$  of a shilling. Hence the price at 4d. is  $\frac{1}{3}$  of what it would be at 1s. per article. But the price at 1s. per article would be 831s.:—therefore the price at 4d. is 831s.:—3 or 277s.

#### EXERCISES.

#### What is the price of

31. 379 lb of sugar, at 6d. per lb? Ans. £9 9s. 6d. 32. 5014 yards of calico, at 3d. per yard? Ans. £62 13s. 6d.

33. 258 yards of tape, at 2d. per yard? Ans. £2 3s.

12. When the price of a given denomination is the aliquot part of a pound, to find the price of any number of that denomination—

RULE.—Divide the quantity whose price is sought by that number which expresses what aliquot part the given price is of a pound. The quotient will be the required price in pounds, &c.

EXAMPLE.-What is the price of 1732 lb of tea, at 5s per ib?

5s. is the  $\frac{1}{4}$  of £1; therefore the price of 1732 lb is the 1 of what it would be at £1 per 1b. But at £1 per 1b it would be £1732; therefore at 5s. per lb it is £1732:4=

#### EXERCISES.

# What is the price of

fin

th

pe

8

tl

a

35. 13 oz., at 4s. per oz.? Ans. £2 12s.

36. 19 stones, at 2s. 6d. per stone? Ans. £2 7s. 6d.

37. 83 lb, at 1s. 4d. per lb? Ans. £5 10s. 8d.

38. 115 grs., at 8d. per gr. ? Ans. £3 16s. 8d.

39. 976 fb, at 10s. per fb? Ans. £488.

40. 112 lb, at 5d. per lb? Ans. £2 6s. 8d.

41. 563 yards, at 10d. per yard? Ans. £23 9s. 2d.

42. 112 lb, at 5s. per lb ? Ans. £28.

43. 795 lb, at 1s. 8d. per lb? Ans. £66 5s.

44. 1000 fb, at 3s. 4d. per lb? Ans. £166 13s. 4d.

13. The complement of the price is what it wants of a pound or a shilling.

When the complement of the price is the aliquot part or parts of a pound or shilling, but the price is not-

RULE.-Find the price at £1, or 1s.-as the case may be-and deduct the price of the quantity calculated at the complement. J.

EXAMPLE.-What is the price of 1470 yards, at 13s. 4d. per yard ?

6s. 8d. (the complement of 13s. 4d.) is  $\frac{1}{3}$  of £1.

From £1470, the price at £1 per yard,

subtract 490, the price at 6s. 8d. (the complement) and the difference, 980, will be the price at 13s. 4d. per yard.

1470 yards at 13s. 4d., plus 1470 at 6s. 8d., are equal to 1470 at 13s. 4d.+6s. 8d., or at £1 per yard. Hence the price of 1470 at 13s. 4d.=the price of 1470 at £1, minus the price of 1470 at 6s. 8d. per yard.

#### EXERCISES.

#### What is the price of

| 45. | 51 lb, at 17s. 6d. per lb? Ans. £44 12s. 6a |  |
|-----|---|--|
| 46. | 39 oz., at 7d. per oz.? Ans. £1 2s. 9d.     |  |
| 47. | 91 fb, at 10d. per lb? Ans. £3 15s. 10d.    |  |
|     | 432 cwt., at 16s. per cwt. ? Ans. £345 12s. |  |

14. When neither the price nor its complement is the aliquot part or parts of a pound or shilling-

RULE 1.—Divide the price into pounds (if there are any), and aliquot parts of a pound or shilling; then find the price at each of these (by preceding rules) : the sum of the prices will be what is required.

**EXAMPLE.**—What is the price of 822 lb, at £5 19s.  $3_4^3d$ . per lb ? £5 19s.  $3_4^3d$ .=£5+19s.  $3_4^3d$ .

| <i>s</i> .                | d. L  |
|---------------------------|---|
| r 10                      | $0 = \frac{1}{2}$   |
| 6                         | $8 = \frac{1}{2}$   |
| But 19s. $3^3d.= \{ 2 \}$ | $6 = \frac{1}{2}$   |
| 0                         | $1_{\frac{1}{2}} = \frac{1}{8} \div 20 = \frac{1}{160}$ , or $\frac{1}{20}$ of the last |
| lo                        | $\begin{array}{cccccccccccccccccccccccccccccccccccc$                                    |

Hence the price at £5 19s.  $3_4^3d$ . is equal to

| £  | £          | s. d.                  |  | £ s. |                   |
|--|------------|------------------------|--|------|-------------------|
| 822×5  | =4110      | 0 0, the               | price at   | 5 0  | 0 per lb.         |
| 822  | = 411      | 0 0                    | $\therefore$ $\pounds_{\frac{1}{2}}$ or  | 0 10 | 0 ,,              |
| 822  | = 274      | 0 0                    | . £1 or  | 0 6  | 8 ,,              |
| 823  | = 102      | 15 0                   | $\mathcal{L}_{\mathbf{k}}$ or  | 0 2  | 6 ,,              |
| 822(823·20)  | = 5        | 29                     | $f_{1,0} = f_{1,0} = f_{1$ | 0 0  | 13 ,,             |
| $\begin{array}{c} & & & & & & \\ 8 & & & & & \\ 8 & & & & &$ | = 0        | $17 1\frac{1}{3}$      | , £ 100 or   | 6 0  | $0\frac{1}{4}$ ,, |
|  |            |                        |  |      |                   |
| And  | $\pm 4903$ | 14 10 <sup>±</sup> is: | the price at £   | 5 19 | 37 11             |

The price at the whole, is evidently equal to the sum of the prices at each of the parts.

If the price were £5 19s.  $3\frac{1}{4}d$ . per lb, we should subtract, and not add the price at  $\frac{1}{4}d$ . per lb; and we then would have £4902 0s.  $7\frac{1}{2}d$ . as the answer.

15. RULE 2.-Find the price at a pound, a shilling, a penny and a farthing; then multiply each by their .

tea, at 5s

2 1b is the 1 per, 1b it 1732:4=

| 4)3   | 0  | 0 (the price at 1.1.)   | 2 10   | 10 | 6     | "     | 198.      |
|       | 17 | 11(the price at 4d.)×   | 3 = 2  | 11 | 41    | **    | 3d<br>Ad. |
|       |    | mine at OF 10 and   |        |    |       | ,,    | 4000      |

And the price at £5 19s. 34d. is £4903 14 101

16. RULE 3.-Find the price at the next number of the highest denomination; and deduct the price at the difference between the assumed and given price.

Using still the same example-

 $\pounds 6$  is next to  $\pounds 5$ —the highest denomination in the given prico.

| From the pri     | ico at CR (   |                   |    |    | đ.  |    | £    |   |    |
|------------------|---------------|-------------------|----|----|-----|----|------|---|----|
| Deduct the price | (the price    | ot 8.7            | 07 | •  | · · | or | 4932 | 0 | 0  |
| at 84d.          | , ene price , | at 8d.==<br>4d.== | 0  | 17 |     | or | 28   | 5 | 13 |

The difference will be the price at £5 19s. 34 or £4903 14 10 $\frac{1}{2}$ 17. RULE 4.-Find the price at the next higher aliquot part of a pound, or shilling ; and deduct the price at the difference between the assumed, and given price

EXAMPLE.-What is the price of 84 lb, at 6s. per lb ?

 $6s.=6s. 8d. \text{ minus } 8d.=\frac{1}{3} \text{ minus } \frac{1}{3} \div 10.$ £ £ S. d.

Therefore  $84 \div 3 = 28$ 0 0 is the price at 6s. 8d. per lb. Deducting  $\frac{1}{10}$  of this=2 16 0 the price at 8d.,

we have  $\pounds 25$  4 0, the price at 6s.

#### EXERCISES.

# What is the price of

49. 73 lb, at 13s. per lb? Ans. £47 9s.

50. 97 cwt., at 15s. 9d. per cwt. ? Ans. £76 7s. 9d.

51. 43 fb, at 3s. 2d. per fb? Ans. £6 16s. 2d.

52. 13 acres, at £4 5s. 11d. per acre? Ans. £55 : os. 11d.

53. 27 yards, at 7s. 53d. per yard? Ans. £10 1s.  $11\frac{1}{4}d$ .

18. When the price is an even number of shillings, and less than 20.

RULE .- Multiply the number of articles by half the number of shillings; and consider the tens of the product as pounds, and the units doubled, as shillings.

EXAMPLE.-What is the price of 646 lb, at 16s. per lb ?

## 646 8 51618 2

## £516 16s.

2s. being the tenth of a pound, there are, in the price, half as many tenths as shillings. Therefore half the number of shillings, multiplied by the number of articles, will express the number of tenths of a pound in the price of the entire. The tens of these tenths will be the number of pounds; and the units (being tenths of a pound) will be half the required number of shillings-or, multiplied by 2-the required number of shillings.

In the example, 10s., or £.8, is the price of each article. Therefore, since there are 646 articles, 646×£.8=£516.8 is the price of them. But 8 tenths of a pound (the units in the product obtained), are twice as many shillings; and hence we are to multiply the units in the product by 2.

#### EXERCISES.

## What is the price of

54. 3215 ells, at 6s. per ell? Ans. £964 10s.

55. 7563 lb, at 8s. per lb? Ans. £3025 4s.

56. 269 cwt., at 16s. per cwi.? Ans. £215-4s.

57. 27 oz., at 4s. per oz.? Ans. 20 8s.

58. 84 gallons, at 14s. per gallon ? Ans. £58 16s.

19. When the price is an odd number of shillings, and less than 20--

RULE .- Find the amount at the next lower even number of shillings; and add the price at one shilling.

EXAMPLE.-What is the price of 275 lb, at 17s. per lb ?

| The price at 16s. (by the last rule) is $220 \ 0$<br>The price at 1s. is $275s = 13 \ 15$ |  |      | 0   |

63. 96 gallons, at 7s. per gallon? Ans. £33 12s.

20. When the quantity is represented by a mixed number---

RULE .- Find the price of the integral part. Then multiply the given price by the numerator of the fraction, and divide the product by its denominator-the quotient will be the price of the fractional part. The sum of these prices will be the price of the whole quantity.

EXAMPLE.—What is the price of  $8\frac{3}{4}$  lb of tea, at 5s. per 15 2

> The price of 8 lb is  $8 \times 5s = 2$  0 0 The price of  $\frac{3}{4}$  lb is  $\frac{3 \times 5s}{4} = 0$  3

#### And the price of $8\frac{3}{4}$ lb is . 2 3 9

The price of  $\frac{3}{4}$  of a pound, is evidently  $\frac{3}{4}$  of the price of a pound.

#### EXERCISES.

# What is the price of

64.  $5\frac{1}{2}$  dozen, at 3s. 3d. per dozen? Ans. 17s.  $10\frac{1}{2}d$ .

65. 2731 1b, at 2s. 6d. per 1b? Ans. £34 3s. 112d.

66. 5303 lb, at 14s. per lb? Ans. 371 10s. 6d.

67. 1783 ewt., at 17s. per ewt.? Ans. £151 12s  $4\frac{1}{2}d.$ 

68. 7523 cwt., at £1 12s. 6d. per cwt. ? Ans. £1239 4s. 6%.

69. 8173 ewt., at £3 7s. 4d. per cwt.? Ans. £2751 11s. 61d.

Ans.

21. The rules for finding the price of several denominations, that of one being given [7 and 9], may be abbreviated by those which follow—

Avoirdupoise Weight.-Given the price per ewt., to find the price of hundreds, quarters, &c.-

RULE.—Having brought the tons, if any, to cwt., multiply 1 by the number of hundreds, and consider the product as pounds sterling; 5 by the number of quarters, and consider the product as shillings; 2<sup>1</sup>/<sub>4</sub>, the number of pounds, and consider the product as pence : the sum of all the products will be the price at £1 per cwt. From this find the price, at the given number of pounds, shillings, &c.

EXAMPLE.—What is the price of 472 ewt., 3 qrs., 16 lb, at £5 9s. 6d. per cwt.?

|             | t   | S. | a. |
|-------------|-----|----|----|
|             | 1   | 5  | 24 |
| Multipliers | 472 | 3  | 16 |

 $\frac{472 \ 17 \ 10^{1}_{1}}{5} \text{ is the price at } \mathcal{L}1 \text{ per cwt.}$ 

| $2364 \\ 212 \\ 11$ | 16 | 31<br>03<br>51<br>54 | the price, at £5 per cwt.<br>the price, at 9s. $(\pounds_{\frac{1}{20}} \times 9.)$<br>the price, at 6d. $(\pounds_{\frac{1}{20}}^{\pm} \div 2.)$ |
|---------------------|----|----------------------|---|
| 2589                | 1  | 91                   | the price, at £5 9s. Ed.  |

At £1 per ewt., there will be £1 for every cwt. We multiply the qrs. by 5, for shillings; because, if one cwt. costs £1, the fourth of 1 cwt., or one quarter, will cost the fourth of a pound, or 5s.—and there will be as many times 5s. as there are quarters. The pounds are multiplied by  $2\frac{1}{7}$ ; because if the quarter costs 5s., the 28th part of a quarter, or 1 lb, must cost the 28th part of 5s., or  $2\frac{1}{7}d$ .—and there will be as many times  $2\frac{1}{7}d$ . as there are pounds.

#### EXERCISES.

## What is the price of

70. 499 cwt., 3 qrs., 25 lb, at 25s. 11d. per cwt. ? Ans. £647 17s.  $\frac{7}{2}d$ .

71. 106 cwt., 3 qrs., 14 lb, at 18s. 9d. per cwt.? Ans. £100 3s. 10<sup>3</sup><sub>4</sub>d.

L

72. 2061 cwt., 2 qrs., 7 lb, at 16s. 6d., per cwt.? Ans. £1700 15s.  $9\frac{1}{4}d$ .

73. 106 cwt., 3 qrs., 14 lb, at 9s. 4d. per cwt. ? Ans. £49 17s. 6d.

74. 26 cwt., 3 qrs., 7 lb, at 15s. 9d. per cwt. ? Ans. £21 2s. 34d.

75. 432 cwt., 2 qrs., 22 lb, at 18s. 6d. per cwt.? Ans. £400 4s. 10<sup>1</sup>/<sub>2</sub>d.

76. 109 cwt., 0 qrs., 15 fb, at 19s. 9d. per cwt.? Ans. £107 15s. 4<sup>3</sup>/<sub>4</sub>d.

77. 753 cwt., 1 qr., 25 lb, at 15s. 2d. per cwt.? Ans. £571 7s. 8d.

78. 19 tons, 19 cwt., 3 qrs.,  $27\frac{1}{2}$ lb, at £19 19s.  $11\frac{3}{4}d$ . per ton? Ans. £399 19s. 6d.

22. To find the price of cwt., qrs., &c., the price of a pound being given-

RULE.—Having reduced the tons, if any, to cwt., multiply 9s. 4d. by the number of pence contained in the price of one pound :—this will be the price of one cwt. Divide the price of one cwt. by 4, and the quotient will be the price of one quarter, &c.

Multiply the price of 1 cwt. by the number of cwt.; the price of a quarter by the number of quarters; the price of a pound by the number of pounds; and the sum of the products will be the price of the given quantity.

EXAMPLE.—What is the price of 4 cwt., 3 qrs., 7 lb, at 8d. per lb.?

4)74 8 the price of 1 cwt. ×4, will give 208 8 the price of 4 cwt.28)18 8 the price of 1 qr.×3, will give 56 0 the price of 3 qrs.8 the price of 1 lb×7, will give 4 8 the price of 7 lb.20)359 4

And the price of the whole will be £17 19 4

At 1*d*. per lb the price of 1 cwt. would be 112*d*. or 9*s*. 4*d*. :therefore the price per cwt. will be as many times 9*s*. 4*d*. as there are pence in the price of a pound. The price of a quarter is  $\frac{1}{4}$  the price of 1 cwt.; and there will be as many times the price of a quarter, as there are quarters, &c. 79. 80. 12s. 4 81. 2s. 9d 82. 10s. 5 83. £261 23. Ru

79. 1 cwt., at 6d. per 1b? Ans. £2 16s.

80. 3 cwt., 2 qrs., 5 lb, at 4d. per lb? Ans. £6 12s. 4d.

81. 51 cwt., 3 qrs., 21 lb, at 9d. per lb? Ans. £218 2s. 9d.

82. 42 cwt., 0 qrs., 5 fb, at 25d. per fb? Ans. £490 10s. 5d.

83. 10 cwt., 3 qrs., 27 lb, at 51d. per lb? Ans. £261 11s. 9d.

23. Given the price of a pound, to find that of a ton-RULE.—Multiply £9 6s. 8d. by the number of pence contained in the price of a pound.

EXAMPLE.—What is the price of a ton, at 7d. per lb ?

# $\begin{array}{c} \pounds \quad s. \quad d. \\ 9 \quad 6 \quad 8 \\ & 7 \\ \hline \end{array}$

65 6 8 is the price of 1 ton.

If one pound cost 1*d*., a ton will cost 2240*d*., or £9 68. 8*d*. Hence there will be as many times £9 68. 8*d*. in the price of a ton, as there are pence in the price of a pound.

#### EXERCISES.

What is the price of 84. 1 ton, at 3d. per lb? Ans. £28. 85. 1 ton, at 9d. per lb? Ans. £84. 86. 1 ton, at 10d. per lb? Ans. £93 6s. 8d. 87. 1 ton, at 4d. per lb? Ans. £37 6s. 8d.

The price of any *number* of tons will be found, if we multiply the price of 1 ton by that number.

24. Troy Weight.—Given the price of an ounce—to find that of ounces, pennyweights, &c.—

RULE.—Having reduced the pounds, if any, to ounces, set down the ounces as pounds sterling; the dwt. as shillings; and the grs. as halfpence:—this will give the price at £1 per ounce. Take the same part, or parts, &c., of this, as the price per ounce is of a pound.

EXAMPLE 1.—What is the price of 538 oz., 18 dwt, 14 grs., at 11s. 6d. per oz.?

| 11s. 6d. | $=\frac{\pounds 1}{2}+\frac{\pounds \frac{1}{2}}{10}+$ | $+\frac{\pounds_{\frac{1}{2}}}{10}\div 2.$ |
|----------|--|--|
|----------|--|--|

£ s. d.

2)538 18 7 is the price, at  $\pounds 1$  per ounce. 10)269 9 31 is the price, at 10s. per ounce. 2) 26 18 111 is the price, at 1s. per ounce. 13 9 53 is the price, at 6d. per ounce.

And 309 17  $8\frac{1}{2}$  is the price, at 11s. 6d. per ounce. 14 halfpence are set down as 7 pence.

If one ounce, or 20 dwt. cost £1, 1 dwt. or the 20th part of an ounce will cost the 20th part of £1—or 1s.; and the 24th part of 1 dwt., or 1 gr. will cost the 24th part of 1s.—or  $\frac{1}{2}d$ .

EXAMPLE 2.—What is the price of 8 oz. 20 grs., at £3 2s. 6d. per oz. ?

 $\begin{array}{cccc} \mathcal{L} & s. & d. \\ 8 & 0 & 10 \text{ is the price, at } \mathcal{L}1 \text{ per ounce.} \\ 3 \end{array}$ 

Price at  $\pounds 1 \div 10 = 0$  16 1 is the price, at  $\pounds 3$  per ounce. Price at  $\pounds 1 \div 10 = 0$  16 1 is the price, at 2s. per ounce. Price at  $2s \div 4 = 0$  4  $0_4^4$  is the price, at 6d. per ounce.

And  $\pounds 25$  2 7<sup>1</sup>/<sub>4</sub> is the price, at  $\pounds 3$  2s. 6d. per oz.

#### EXERCISES.

25. Cloth Measure .- Given the price per yard-to find the price of yards, quarters, &c .--

RULE.-Multiply £1 by the number of yards; 5s. by the number of quarters; 1s. 3d. by the number of nails; and add these together for the price of the quantity at £1 per yard ? Take the same part, or parts, &c., of this, as the price is of £1.

EXAMPLE 1.-What is the price of 97 yards, 3 qrs., 2 nails, at 8s. per yard?

5s. 1s. 3d. £1 Multipliers 97 - 3

2)97 17 6 is the price, at £1 per yard.

5)48 18 9 is the price, at 10s. per yard. From this subtract 9 15 9 the price, at 2s. per yard.

And the remainder 39 3 0 is the price, at 8s. (10s.-2s.) If a yard costs £1, a quarter of a yard must cost 5s.; and a nail, or the 4th of a yard, will cost the 4th part of 5s. or 1s. 3d.

EXAMPLE 2.-What is the price of 17 yards, 3 qrs., 2 nails, at £2 5s. 9d. per yard ?

£1 5s. 1s. 3d. Multipliers 17 3 -2

17 17 6 is the price, at £1 per yard

35 15 0 is the price, at £2 per yard. The price at  $\pounds 1 \div 4 = 4$  9  $4\frac{1}{2}$  is the price, at 5s. The price at  $5s \div 10 = 0$  8  $11\frac{1}{4}$  is the price, at 6d.

The price at  $6d \div 2=0$  4  $5\frac{1}{3}$  is the price, at 3d.

And £40 17  $9\frac{1}{4}$  is the price, at £2 5s. 9d.

#### EXERCISES.

What is the price of

94. 176 yards, 2 qrs., 2 nails, a 15s. per yard? Ans. £132 9s. 41d.

95. 37 yards, 3 qrs., at £1 5s. per yard? Ans. £47 3s. 9d.

96. 49 yards, 3 qrs., 2 nails, at £1 10s. per yard? Ans. £74 16s. 3d.

97. 98 yards, 3 qrs., 1 nail, at £1 15s. per yard? Ans. £172 18s. 51d.

98. 3 yards, 1 qr., at 17s. 6d. per yard? Ans  $\pounds 2$ 16s.  $10\frac{1}{2}d$ .

99. 4 yards, 2 qra., 3 nails, at £1 2s. 4d. per yard? Ans. £5 4s. 84d.

26. Land Measure.—RULE.—Multiply £1 by the number of acres; 5s. by the number of roods; and  $1\frac{1}{2}d$ . by the number of perches :—the sum of the products will be the price at £1 per acre. From this find the price, at the given sum.

EXAMPLE.—What is the rent of 7 acres, 3 roods, 16 perches, at  $\pounds$ 3 8s. per acre ?

|             | £ | <i>s</i> . | d.                  |  |
|-------------|---|------------|---------------------|--|
|             | 1 | 5          | 11                  |  |
| Multipliers | 7 | 3          | $16^{\frac{11}{2}}$ |  |
|             |   |            |                     |  |

226

Sum of the products 7 17 0, or the price at  $\pounds 1$  per acre.

23 11 0 the price at £3 per acre. 3 18 6 the price at 10s. per acre.

27 9 6 the price at £3 10s. per acre. Subtract 0 15  $8\frac{1}{2}$  the price at 2s. per acre.

And 26 13  $S_{\frac{1}{2}}$  is the price at £3 8s.

If one acre costs £1, a quarter of an acre, or one rood, must cost 5s.; and the 40th part of u quarter, or one perch, must cost the 40th part of 5s.—or  $1\frac{1}{2}d$ .

#### EXERCISES.

What is the rent of

100. 176 acres, 2 roods, 17 perches, at £5 6s. per acre? Ans. £936 0s. 3d.

101. 256 acres, 3 roods, 16 perches, at  $\pounds 6$  6s. 6d. per acre? Ans.  $\pounds 1624$  11s.  $6\frac{1}{4}d$ .

102. 144 acres, 1 rocd, 14 perches, at £5 6s. 8d. per acre? Ans. £769 16s

103. 344 acres, 3 roods, 15 perches, at £4 1s. 1d. per acre? Ans. £1398 1s. 1d.

27. Wine Measure.—To find the price of a hogshead, when the price of a quart is given—

RULE.—For each hogshead, reckon as many pounds, and shillings as there are pence per quart. Si the j ting:

s. 8d. per

4 1s. 1d.

f a hogs-

y pounds,

**LEAMTLE.**—What is the price of a hogshead at 9d. per quart? Ans. £9 9s.

One hogshead at 1*d*. per quart would be  $63 \times 4$ , since there are 4 quarts in one gallon, and 63 gallons in one hhd. But  $63 \times 4d$ .=252*d*.=£1 1s.; and, therefore, the price, at 9*d*. per quart, will be nine times as much—or  $9 \times \pounds 1$  1s.=£9 9s.

#### EXERCISES.

What is the price of

104. 1 hhd. at 18d. per quart? Ans. £18 18s. 105. 1 hhd. at 19d. per quart? Ans. £19 19s.

106. 1 hhd. at 20d. per quart? Ans. £21.

107. 1 hhd. at 2s. per quart? Ans. £25 4s.

108. 1 hhd. at 2s. 6d. per quart? Ans. £31 10s.

When the price of a pint is given, of course we know that of a quart.

28. Given the price of a quart, to find that of a tun-RULE.—Take 4 times as many pounds, and 4 times as many shillings as there are pence per quart.

EXAMPLE.—What is the price of a tun at 11d. per quart?  $\pounds$  s. 11 11

4

## 46 4 is the price of a tun.

Since a tun contains 4 hogsheads, its price must be 4 times the price of a hhd.: that is, 4 times as many pounds and shiltings, as pence per quart [27].

#### EXERCISES.

#### What is the price of

109. 1 tun, at 19d. per quart? Ans. £79 16s.

110. 1 tun, at 20d. per quart? Ans. £84.

111. 1 tun, at 2s. per quart? Ans. £100 16s.

112. 1 tun, at 2s. 6d. per quart? Ans. £126.

113. 1 tun, at 2s 8d. per quart? Ans. £134 8s.

29. A number of Articles.—Given the price of 1 article in pence, to find that of any number—

RULE.-Divide the number by 12, for shillings and

pence; and multiply the quotient by the number of pence in the price.

EXAMPLE. --- What is the price of 438 articles, at 7d. each?

12)438

36s. 6d., the price at 1d. each.

#### QUESTIONS IN PRACTICE.

1. What is practice ? [1].

2. Why is it so called ? [1].

3. What is the difference between aliquot, and aliquant parts ? [2].

4. How are the aliquot parts of abstract, and of applicate numbers found? [3].

5. What is the difference between prime, and compound aliquot parts ? [3].

6. How is the price of any denomination found, that of another being given ? [6 and 8].

7. How is the prize of two or more denominations found, that of one being given ? [7 and 9].

8. The price of one denomination being given, how do we find that of any number of another ? [10].

9. When the price of any denomination is the aliquot part of a shilling, how is the price of any number of that denomination found? [11].

10. When the price of any denomination is the aliquot part of a pound, how is the price of any number of that denomination found ? [12].

11. What is meant by the complement of the price r [13].

12. When the complement of the price of any denomination is the aliquot part of a pound or shilling, but the price is not so, how is the price of any number of that denomination found? [13].

13. When neither the price of a given denomination, nor its complement, is the aliquot part of a pound or shilling, how do we find the price of any number of that denomination? [14, 15, 16, and 17].

14. How do we find the price of any number of articles, when the price of each is an even or odd number of shillings, and less than 20? [18 and 19].

15. How is the price of a quantity, represented by a mixed number, found ? [20].

16. How do we find the price of cwt., qrs., and lb, when the price of 1 cwt. is given ? [21].

17. How do we find the price of cwt., qrs., and Ib, when the price of 1 Ib is given ? [22].

18. 11. w is the price of a ton found, when the price of 1 In is given ? [23].

19. How do we find the price of oz., dwt., and grs. when the price of an ounce is given ? [24].

20. How do we find the price of yards, qrs., and nails, when the price of a yard is given ? [25].

21. How do we find the price of acres, roods, and perches? [26].

22. How may the price of a hhd. or a tun be found, when the price of a quart is given ? [27 and 28].

23. How may the price of any number of articles be found, the price of each in pence being given ? [29].

24. How are wages per year found, those [f: day being given ? [30]

#### TARE AND TRET.

3!. The gross weight is the weight both of the goods, and of the bag, &c., in which they are.

Ture is an allowance for the bag, &c., which contains the article.

Suttle is the weight which remains, after deducting the tare.

Tree is, usually, an allowance of 4 lb in every 104 lb, or  $\frac{1}{2^{2}\theta}$  of the weight of goods liable to waste, after the tare has been deducted.

Claff' is an allowance of 2 lb in every 3 ewt., after both tare and tret have been deducted.

What remains after making all deductions is called the *net*, or *neat* weight.

Different allowances are made in different places, and for different goods; but the mode of proceeding is in -all cases very simple, and may be understood from the following—

#### EXERCISES.

1. Bought 100 earcasses of beef at 18s. 6d. per ewt.; gross weight 450 ewt., 2 qrs., 23 lb; tret 8 lb per earcass. What is to be paid for them?

|       | cwt. | qrs. | lb. |                      | 100 carcasses.   |
|-------|------|------|-----|----------------------|------------------|
| Gross | 450  | 2    | 23  |                      | 8 lb per carcass |
| Tret  | 7    | 0    | 16  |                      | ewt. grs. lb     |

## SECTION VII.

#### INTEREST, &c.

1. Interest is the price which is allowed for the use of money; it depends on the plenty or searcity of the latter, and the risk which is run in lending it.

Interest is either simple or compound. It is simple when the interest due is not added to the sum lent, so as to bear interest.

It is compound when, after certain periods, it is made to bear interest—being added to the sum, and considered as a part of it.

The money lent is called the *principal*. The sum allowed for each hundred pounds "per annum" (for a year) is called the "*rate* per cent."—(per £100.) The *amount* is the sum of the principal and the interest due.

#### SIMPLE INTEREST.

2. To find the interest, at any rate per cent., on any sum, for one year-

RULE I.—Multiply the sum by the rate per cent., and divide the product by 100.

EXAMPLE.—What is the interest of £672 14s. 3d. for one year, at 6 per cent. (£6 for every £100.)

We have divided by 100, by merely altering the decimal point [Sec. I. 34].

238

If the interest were 1 per cent., it would be the hundredth part of the principal—or the principal multiplied by  $\frac{1}{160}$ ; but being 6 per cent., it is 6 times as nuch—or the principal nultiplied by  $\frac{1}{160}$ .

3. RULE II.—Divide the interest into parts of £100; and take corresponding parts of the principal.

EXAMPLE.—What is the interest of £32 4s. 2d., at 6 per cent.?

 $\pounds 6 = \pounds 5 + \pounds 1$ , or  $\pounds \frac{100}{20}$  plus  $\pounds \frac{100}{20} \div 5$ . Therefore the in-

terest is the  $\frac{1}{20}$  of the principal, plus the  $\frac{1}{5}$  of the  $\frac{1}{20}$ .

|   | £  | <b>s</b> . | d,             |        |           |      |           |  |
|---|--|------------|----------------|--------|-----------|------|-----------|--|
|   | 20)32  |            |                |        |           |      |           |  |
|   | 5)1  | 12         | 21             | is the | interest, | at 5 | per cent. |  |
| - | 0  | 6          | $5\frac{1}{4}$ | is the | interest, | at 1 | per cent. |  |
|   | and the second sec |            | _              |        |           |      | *         |  |

And 1 18  $7\frac{3}{4}$  is the interest, at 6 (5+1) per cent.

#### EXERCISES.

1. What is the interest of £344 17s. 6d. for one year, at 6 per cent. ? Ans. £20 13s.  $10\frac{1}{5}d$ .

2. What is the interest of £600 for one year, at 5 per cent. ? Ans. £30.

3. What is the interest of £480 15s. for one year, at 7 per cent. ? Ans. £33 13s.  $0\frac{3}{5}d$ .

4. What is the interest of £240 10s. for one year, at 4 per cent. ? Ans. £9 12s.  $4\frac{4}{5}d$ .

4. To find the interest when the rate per cent. consists of more than one denomination---

RULE.—Find the interest at the highest denomination; and take parts of this, for those which are lower. The sum of the results will be the interest, at the given rate.

EXAMPLE.—What is the interest of  $\pounds 97$  8s. 4d., for one year, at  $\pounds 5$  10s. per annum ?

 $\pounds 5 = \pounds \frac{100}{20}$ ; and  $10s = \pounds \frac{5}{10}$ .

20)97 8 4

10)4 17 5 is the interest, at 5 per cent.

0 9 9 is the interest, at 10s. per cent.

And 5 7 2 is the interest, at .£5+10s. per cent.

A 10s. fore,

5.

year 6. year 7. at £ 8. £5 5. year

Ru ber c Ex

9.

per e 10 10s. 11 years 6. mont Re alrea of on

the r

At 5 per cent. the interest is the  $\frac{1}{26}$  of the principal; at 10s. per cent. it is the  $\frac{1}{16}$  of what it is at 5 per cent. Therefore, at £5 10s. per cent., it is the sum of both.

#### EXERCISES.

5. What is the interest of £371 19s.  $7\frac{1}{2}d$ . for one year, at £3 15s. per cent.? Ans. £13 18s.  $11\frac{3}{2}d$ .

6. What is the interest of  $\pounds 84$  11s.  $10\frac{1}{2}d$ . for one year, at  $\pounds 4$  5s. per cent. ? Ans.  $\pounds 3$  11s.  $10\frac{3}{4}d$ .

7. What is the interest of  $\pounds 91$  0s.  $3\frac{3}{4}d$ . for one year, at  $\pounds 6$  12s. 9d. per cent. ? Ans.  $\pounds 6$  0s.  $10\frac{1}{4}d$ .

8. What is the interest of £968 5s. for one year, at £5 14s. 6d. per cent.? Ans. £55 8s. 8d.

5. To find the interest of any sum, for several years-

RULE.—Multiply the interest of one year by the number of years.

EXAMPLE.—What is the interest of  $\pounds 32$  14s. 2d. for 7 years, at 5 per cent. ?

#### £ s. d. 20)32 14 2

#### 1 12 01

1 12  $8\frac{1}{2}$  is the interest for one year, at 5 per cent.

And 11 8  $11_{\frac{1}{2}}$  is the interest for 7 years, at 5 per cent. This rule requires no explanation.

#### EXERCISES.

9. What is the interest of £14 2s. for 3 years, at 6 per cent. ? Ans. £2 10s. 9d.

10. What is the interest of £72 for 13 years, at £6 10s. per cent. ? Ans. £60 16s.  $9 \frac{4}{3}d$ .

11. What is the interest of £353 0s.  $6\frac{1}{2}d$ . for 11 years, at £4 12s. per cent.? Ans. £431 12s.  $7\frac{3}{4}d$ .

6. To find the interest of a given sum for years, months, &c.--

RULE.—Having found the interest for the years, as already directed [2, &c.], take *parts* of the interest of one year, for that of the months, &c.; and then add the results.

#### EXERCISES.

12. What is the interest of £211 5s. for 1 year and 6 months, at 6 per cent. ? Ans. £19 0s. 3d.

13. What is the interest of £514 for 1 year and  $7\frac{1}{2}$  months, at 8 per cent.? Ans. £66 16s.  $4\frac{4}{5}d$ 

14. What is the interest of £1090 for 1 year and 5 months, at 6 per cent.? Ans. £92 13s.

15. What is the interest of £175 10s. 6d. for 1 year and 7 months, at 6 per cent. ? Ans. £16 13s.  $5\frac{97}{100}d$ .

<sup>1</sup>6. What is the interest of £571 15s. for 4 years and 8 months, at 6 per cent. ? Ans. £160 1s.  $9\frac{3}{5}d$ .

17. What is the interest of £500 for 2 years and 10 months, at 7 per cent. ? Ans. £99 3s. 4d.

18. What is the interest of £93 17s. 4d. for 7 years and 11 months, at 6 per cent. ? Ans. £44 11s.  $7\frac{1}{2}d$ .

19. What is the interest of £84 9s. 2d. for 8 years and 8 months, at 5 per cent. ? Ans. £36 11s.  $11\frac{1}{4}d$ .

7. To find the interest of any sum, for any time, at 5, or 6, &c., per cent.

At 5 per cent.-

RULE.—Consider the years as shillings, and the months as pence; and find what aliquot part or parts of a pound these are. Then take the same part or parts of the principal.

To find the interest at 6 per cent., find the interest at 5 per cent., and to it all its fifth part, &c.

The interest at 4 per cent. will be the interest at 5 per cent minus its fifth part, &c.

8. EXAMPLE 1.—What is the interest of £427 5s. 9d. for 6 years and 4 months, at 5 per cent.?

6 years and 4 months are represented by 6s. 4d.; but 6s.  $4d.=5s.+1s.+4d.=\frac{1}{4}+\frac{1}{20}$  of a pound + the  $\frac{1}{3}$  of the  $\frac{1}{20}$ .

And 135 6  $1\frac{3}{4}$  is the required interest.

The interest of  $\pounds 1$  for 1 year, at 5 per cent., would be 1s. for 1 month 1d.; for any number of years, the same number of shillings; for any number of months, the same number of pence; and for years *and* months, a corresponding number of shillings *and* pence. But whatever part, or parts, these shillings, and pence are of a pound, the interest of any other sum, for the same time and rate, must be the same part or parts of that other sum—since the interest of any sum is proportional to the interest of  $\pounds 1$ .

EXAMPLE 2.—What is the interest of  $\pounds 14$  2s. 2d. for 6 years and 8 months, at 6 per cent. ?

6s. 8d. is the  $\frac{1}{3}$  of a pound.

·)1+ 4 4

5)4 14  $0\frac{3}{14}$  is the interest, at 5 per cent.

0 18  $9\frac{3}{4}$  is the interest, at 1 per cent.

5 12  $10\frac{1}{2}$  is the interest, at 6 (5+1) per cent.

#### EXERCISES.

20. Find the interest of £1090 17s. 6d. for 1 year and 8 months, at 5 per cent. ? Ans. £90 18s.  $1\frac{1}{2}d$ .

21. Find the interest of £976 14s. 7d. for 2 years and 6 months, at 5 per cent. ? Ans. £122 1s.  $9\frac{\pi}{8}d$ .

22. Find the interest of £780 17s. 6d. for 3 years and 4 months, at 6 per cent. ? Ans. £156 3s. 6d.

23. What is the interest of £197 11s. for 2 years and 6 months, at 5 per cent. ? Ans. £24 13s. 101d.

24. What is the interest of £279 11s. for  $7\frac{1}{2}$  months, at 4 per cent. ? Ans. £6 19s.  $9\frac{3}{10}d$ .

25. What is the interest of £790 16s. for 6 year and 8 months, at 5 per cent. ? Ans. £263 12s.

26. What is the interest of £124 2s. 9d. for 3 years and 3 months, at 5 per cent. ? Ans. £20 3s. 53d.

27. What is the interest of £1837 4s. 2d. for 3 years and 10 months, at 8 per cent.? Ans. £563 Ss. 3d.

9. When the rate, or number of years, or both of them, are expressed by a mixed number-

RULE .- Find the interest for 1 year, at 1 per cent., and multiply this by the number of pounds and the fraction of a pound (if there is one) per cent. ; the sum of these products, or one of them, if there is but one, will give the interest for one year. Multiply this by the number of years, and by the fraction of a year (if there is one); and the sum of these products, or one of them, if there is but one, will be the required interest.

EXAMPLE 1.—Find the interest of £21 2s. 6d. for  $3\frac{3}{4}$  years at 5 per cent. ?

£21 2s. 6d.  $\div$  100=4s.  $2_4^3$ d. Therefore

£ 8. d.

0 4  $2\frac{3}{4}$  is the interest for 1 year, at 1 per cent.

#### EXERCISES.

28. What is the interest of £379 2s. 6d. for 41 years, at 55 per cent.? Ans. £91 5s. 5d.

29. What is the interest of £640 10s. 6d. for  $2\frac{1}{2}$  years, at  $4\frac{1}{2}$  per cent. ? Ans. £72 1s.  $2\frac{1}{40}d$ .

30. What is the interest of  $\pounds 600$  10s. 6d. for  $3\frac{1}{3}$  years, at  $5\frac{3}{4}$  per cent. Ans.  $\pounds 115$  2s.  $0\frac{3}{20}d$ .

31. What is the interest of £212 8s.  $1\frac{1}{2}d$ . for  $6\frac{2}{3}$  years, at  $5\frac{3}{4}$  per cent. ? Ans. £81 8s.  $5\frac{3}{4}d$ .

10. To find the interest for days, at 5 per cent.-

RULE.---Multiply the principal by the number of days, and divide the product by 7300.

EXAMPLE.-What is the interst of £26 4s. 2d. for 8 days ?

|                  | £<br>26          | s.<br>4 | d.<br>2      |
|------------------|------------------|---------|--------------|
|                  | $\frac{209}{20}$ | 13      | 8            |
| 4                | $\frac{193}{12}$ |         |              |
| 7300)503<br>•438 | 320(<br>300      | 632     | $^{6}_{3}d.$ |

6520

The required interest is 63365, or 7*d*.—since the remainder is greater than half the divisor.

The interest of £1 for 1 year is  $\pounds_{26}^1$ , and for 1 day  $\frac{1}{26} \div 365 =$ 

 $\overline{20\times365} = 7300$ ; that is, the 7300th part of the principal. Therefore the interest of any other sum for one day, is the 7300th part of that sum; and for any number of days, it is that number, multiplied by the 7300th part of the principal or, which is the same thing, the principal multiplied by the number of days, and divided by 7300.

#### EXERCISES.

32. Find the interest of £140 10s. for 76 days, at 5 per cent. Ans. £1 9s.  $3\frac{2}{340}\frac{1}{5}d$ .

11. To find the interest for days, at any other rate-RULE .- Find the interest at 5 per cent., and take parts of this for the remainder.

EXAMPLE.-What is the interest of £3324 6s. 2d. for 11 days, at £6 10s. per cent. ?

£3324 6s.  $2d \times 11 \div 7300 = £5$  0s.  $2^{1}_{4}d$ . Therefore s. d.

5)5 0

244

 $2_1^1$  is the interest for 11 days, at 5 per cent.

2)1 0  $0\frac{1}{2}$  is the interest for 11 days, at 1 per cent.

0 10 0° is the interest for 11 days, at 10s. per cent.

And 6 10  $2\frac{3}{4}$  is the interest for 11 days, at £6 10s. (£5+  $\pm 1+10s.)$ 

This rule requires no explanation.

#### EXERCISES.

35. What is the interest of £200 from the 7th May to the 26th September, at 8 per cent. ? Ans. £6 4s.  $5\frac{6}{1}\frac{3}{2}d.$ 

36. What is the interest of £150 15s. 6d. for 53 days, at 7 per cent. ? Ans. £1 10s.  $7\frac{3}{4}d$ .

37. What is the interest of £371 for 1 year and 213 days, at 6 per cent. ? Ans. £35 5s. 0d.

38. What is the interest of £240 for 1 year and 135 days, at 7 per cent. ? Ans. £23 0s.  $3\frac{2}{7}\frac{1}{3}d$ .

Sometimes the number of days is the aliquot part of a year; in which case the process is rendered more easy.

EXAMPLE.—What is the interest of £175 for 1 year and 73 days, at 8 per cent. ?

1 year and 73 days= $1\frac{1}{5}$  year. Hence the required interest is the interest for I year+its fifth part. But the interest of £175 for 1 year, at the given rate is £14. Therefore its interest for the given time is  $\pounds 14 + \pounds_{5}^{14} = \pounds 14 + \pounds 2$  16s.= £16 16s.

12. To find the interest for months, at 6 per cent-

RULE .--- If the number expressing the months is even, multiply the principal by half the number of months and divide by 100. But if it is odd, multiply by the half of one less than the number of months; divide the result by 100; and add to the quotient what will be obtained if we divide it by one less than the number of months.

12 : 8  $100 \times 12$  = (dividing both numerator and denominator by 6 [Sec. IV. 4] .  $\pounds 72$  6s. 4d.  $\times 8 \times 6 \div 6 \cdot \pounds 72$  6s. 4d.  $\times 8$ 

 $\frac{100 \times 12 \div 6}{100 \times 2} = \frac{100 \times 2}{100 \times 2} = \text{(dividing both})$ numerator and denominator by 2)  $\frac{\pounds 72}{100 \times 2 \div 2} = \pounds 72 \text{ Gs. } 4d. \times 4$ 

100

-that is, the required interest is equal to the given sum, multiplied by half the number which expresses the months, and divided by 100.

EXAMPLE 2.-What is the interest of £84 6s. 2d. for 11 months, at 6 per cent. ? 11 = 10 + 1 $10 \div 2 = 5.$ £ s. d. 84  $\mathbf{2}$ 6 5 One less than the given number of months=10. £4.21 10 10 20£ s. d. 4.30s. 10)4 4 33 is the interest for 10 months, at 6 per cent. 12  $0 = 8 = 5\frac{1}{3}$  is the interest for 1 month, at same rate. 3.70d. And 4 12 9 is the interest for 11 (10-1-1) months, at 6 ... 4  $2 \cdot 80 f_{a} = \frac{3}{4} d_{a}$  nearly. The interest for 11 months is evidently the interest of 11 - 1 month, plus the interest of 11 - 1 month  $\div 11 - 1$ .

M

#### EXERCISES.

39. What is the interest of £250 17s. 6d. for 8 months, at 6 per ce.it. ? Ans. £10 0s. 8<sup>2</sup>/<sub>8</sub>d.

40. What is the interest of £571 15s. for 8 months, at 6 per cent.? Ans. £22 17s. 44d.

41. What is the interest of £840 for 6 months, at 6 per cent. ? Ans. £25 4s.

42. What is the interest of £3790 for 4 months, at 6 per cent.? Ans. £75 16s.

43. What is the interest of £900 for 10 months, at 6 per cent. ? Ans. £45.

44. What is the interest of £43 2s. 2d. for 9 months, at 6 per cent. ? Ans. £1 18s.  $9\frac{1}{2}d$ .

13. To find the interest of monry, left after one or more payments-

RULE.—If the interest is paid by *days*, multiply the sum by the number of days which have elapsed before any payment was made. Subtract the first payment, and multiply the remainder by the number of days which passed between the first and second payments. Subtract the second payment, and multiply this remainder by the number of days which passed between the second and third payments. Subtract the third payment, &c. Add all the products together, and find the interest of their sum, for 1 day.

If the interest is to be paid by the week or month, substitute weeks or months for days, in the above rule.

EXAMPLE.—A person borrows  $\pounds$ 117 for 94 days, at 8 per cent., promising the principal in parts at his convenience, and interest corresponding to the money left unpaid, up to the different periods. In 6 days he pays  $\pounds$ 17: in 7 days more  $\pounds$ 20; in 15 more  $\pounds$ 32; and at the end of the 94 days, all the money then due. What does the interest come to?

 $\begin{array}{c} \pounds & \text{days.} & \pounds & \text{day.} \\ 117 \times & 6 = & 702 \times 1 \\ 100 \times & 7 = & 700 \times 1 \\ 80 \times 15 = & 1200 \times 1 \\ 48 \times 66 = & 3168 \times 1 \end{array} \right\} = \pounds 5770.$ 

The interest on 5770 for 1 day, at 5 per cent., is 15s.  $9_4^3d$ . Therefore A

If the s due : &c. prod

 $9_{1}^{3}d$ 

0 6 4 is the interest, at 2 per cent.

And 1 5 3<sup>3</sup>/<sub>4</sub> is the interest, at 8 per cent., for the given sums and times.

If the entire sum were 6 days unpaid, the interest would be the same as that of 6 times as much, for 1 day. Next, £100 due for 7 days, should produce as much as £700, for 1 day, &c. And all the sums due for the different periods should produce as much as the sum of their equivalents, in 1 day.

#### EXERCISES.

45. A merchant borrows £250 at 8 per cent. for 2 years, with condition to pay before that time as much of the principal as he pleases. At the expiration of 9 months he pays £80, and 6 months after £70—leaving the remainder for the entire term of 2 years. How much interest and principal has he to pay, at the end of that time? Ans. £127 16s.

46. I borrow  $\pounds$ 300 at 6 per cent. for 18 months, with condition to pay as much of the principal before the time as I please. In 3 months I pay  $\pounds$ 60; 4 months after  $\pounds$ 100; and 5 months after that  $\pounds$ 75. How much principal and interest am I to pay, at the end of 18 months? Ans.  $\pounds$ 79 15s.

47. A gives to B at interest on the 1st November, 1804, £6000, at  $4\frac{1}{2}$  per cent. B is to repay him with interest, at the expiration of 2 years—having liberty to pay before that time as much of the principal as he pleases. Now B pays

|                          |  | de   |
|--------------------------|--|------|

| The 17th August,         |  | 800  |
| The 12th February, 1806, |  | 1048 |

How much principal and interest is he to pay on the 1st November, 1806? Ans. £1642 9s. 215428d.

48. Lent at interest £600 the 13th May, 1833, for

1 year, at 5 per cent.—with condition that the receiver may discharge as much of the principal before the time as he pleases. Now he pays the 9th July £200; and the 17th September £150. How much principal and interest is he to pay at the expiration of the year? Ans. £266 13s.  $5\eta_{\overline{3}}^{2}d$ .

14. It is hoped that the pupil, from what he has learned of the properties of proportion, will easily understand the modes in which the following rules are proved to be correct.

Of the principal, amount, time, and rate-given any three, to find the fourth.

Given the amount, rate of interest, and time; to find the principal—

RULE.—Say as £100, plus the interest of it, for the given time, and at the given rate, is to £100; so is the given amount to the principal sought.

EXAMPLE.-What will produce £862 in 8 years, at 5 per cent. ?

 $\pounds 40 \ (=\pounds 5 \times 8)$  is the interest for  $\pounds 100$  in 8 years at the given rate. Therefore

 $\pounds 140 : \pounds 100 :: \pounds 862 : \frac{862 \times 100}{140} = \pounds 615 \ 14s. \ 3\frac{1}{2}d.$ 

When the time and rate are given-

 $\pounds 100$ : any other sum :: interest of  $\pounds 100$ : interest of that other sum.

By alteration [Sec. V. 29], this becomes-

 $\pounds 100$ : interest of  $\pounds 100$ : : any other sum : interest of that sum.

And, saying "the first + the second : the second," &c. [Sec. V. 29] we have—

 $\pounds 100 + \text{its interest}$  :  $\pounds 100 ::$  any other sum + its interest : that sum—which is exactly the rule.

#### EXERCISES.

49. What principal put to interest for 5 years will amount to £402 10s., at 3 per cent. per annum? Ans. £350.

50. What principal put to interest for 9 years, at 4 per cent., will amount to £734 Ss.? Ans. £540.

51. The amount of a certain principal, bearing interest for 7 years, at 5 per cent., is  $\pounds 334$  16s. What is the principal? Ans.  $\pounds 248$ .

15. Given the time, rate of interest, and principalto find the amount-

RULE.—Say, as £100 is to £100 plus its interest for the given time, and at the given rate, so is the given sum to the amount required.

EXAMPLE.—What will £272 come to, in 5 years, at 5 per cent. ?

 $\pounds 125 (=\pounds 100 + \pounds 5 \times 5)$  is the principal and interest of  $\pounds 100$  for 5 years; then—

 $\pounds 100 : \pounds 125 : \pounds 272 : \frac{272 \times 125}{100} = \pounds 340$ , the required amount.

We found by the last rule that

 $\pounds_{100+its interest}$ :  $\pounds_{100}$ :: any other sum +its interest : that sum.

Inversion [Sec. V. 29] changes this into,

 $\pounds 100 : \pounds 100 + its interest :: any other sum : that other sum+its interest-which is the present rule.$ 

#### EXERCISES.

52. What will £350 amount to, in 5 years, at 3 per cent. per annum? Ans. £402 10s.

53. What will £540 amount to, in 9 years, at 4 per cent. per annum? Ans. £734 8s.

54. What will £248 amount to, in 7 years, at 5 per cent. per annum? Ans. £334 16s.

55. What will £973 4s. 2d. amount to, in 4 years and 8 months, at 6 per cent. ? Ans. £1245 14s. 13d.

56. What will  $\pounds 42$  3s.  $9\frac{1}{2}d$ . amount to, in 5 years and 3 months, at 7 per cent. ? Ans.  $\pounds 57$  13s.  $10\frac{1}{2}d$ .

16. Given the amount, principal, and rate-to find the time-

RULE.—Say, as the interest of the given sum for 1 year is to the given interest, so is 1 year to the rejuired time.

EXAMPLE. -- When would £281 13s. 4d. become £338, at 5 per cent. ?

£14 1s. 8d. (the interest of £281 13s. 4d. for 1 year [2]): £56 6s. 8d. (the given interest) :: 1:  $\frac{\pounds 56}{\pounds 14}$  1s. 8d. =4, the required number of years.

17. Thence briefly, to find the time-Divide the interest of the given principal for 1 year, into the entire interest, and the quotient will be the time.

It is evident, the principal, and rate being given, the interest is proportional to the time; the longer the time, the more the interest, and the reverse. That is—

The interest for one time : the interest for another : : the former time : the latter.

Hence, the interest of the given sum for one year (the interest for one time) : the given interest (the interest of the same sum for another time) :: 1 year (the time which produced the former) : the time sought (that which produced the latter)—which is the rule.

#### EXERCISES.

57. In what time would £300 amount to £372, at 6 per cent. ? Ans. 4 years.

58. In what time would £211 5s. amount to £230 5s. 3d., at 6 per cent.? Ans. In 1 year and 6 months.

59. When would £561 15s. become £719 0s. 92d., at 6 per cent. ? Ans. In 4 years and 8 months.

60. When would £500 become £599 3s. 4d., at 7 per cent. ? Ans. In 2 years and 10 months.

61. When will  $\pounds$ 436 9s. 4d. become  $\pounds$ 571 8s. 14d., at 7 per cent. ? Ans. In 4 years and 5 months.

18. Given the amount, principal, and time-to find the rate-

RULE.—Say, as the principal is to £100, so is the given interest, to the interest of £100—which will give the interest of £100, at the same rate, and for the same time. Divide this by the time, and the quotient will be the rate. in t

tere

The V £1( of th T

А 100 В

whi or, i

 $\begin{array}{c} 6\\ \pounds 37\\ 6\\ \pounds 37\\ 6\\ and\\ 0\\ teres\\ 6\\ 1s. \\ 6\\ 7\frac{3}{4}d.\\ 6^{7}\\ 4\frac{1}{4}d. \end{array}$ 

68 in 12

19 amou R payn

EXAMPLE.—At what rate will £350 amount to £402 10s in 5 years ?

£350 : £100 : : £52 10s. :  $\frac{\pounds 52}{350}$  10s. ×100  $\pm$ £15, the in terest of £100 for the same time, and at the same rate

Then  $\frac{15}{5}$ =3, is the required number of years.

We have seen [14] that the time and rate being the same,  $\pounds 100$ : any other sum :: the interest of  $\pounds 100$ : interest of the other sum.

This becomes, by inversion [Sec. V. 29]-

Any sum :  $\pounds 100$  :: interest of the former : interest of 100 (for same number of years).

But the interest of £100 divided by the number of years which produced it, gives the interest of £100 for 1 year—or, in other words, the *rate*.

#### EXERCISES.

62. At what rate will £300 amount in 4 years to £372? Ans. 6 per cent.

63. At what rate will £248 amount in 7 years to £334 16s. ? Ans. 5 per cent.

64. At what rate will £976 14s. 7d. amount in 2 years and 6 months to £1098 16s.  $4\frac{3}{4}d$ .? Ans. 5 per cent.

Deducting the 5th part of the interest, will give the interest of £976 14s. 7d. for 2 years.

65. At what rate will £780 17s. 6d. become £937 1s. in 3 years and 4 months? Ans. 6 per cent.

66. At what rate will  $\pounds$ 843 5s. 9d. become  $\pounds$ 1047 1s.  $7\frac{3}{4}d.$ , in 4 years and 10 months? Ans. At 5 per cent.

67. At what rate will  $\pounds 43$  2s.  $4\frac{1}{2}d$ . become  $\pounds 60$  7s  $4\frac{1}{2}d$ ., in 6 years and 8 months? Ans. At 6 per cent.

68. At what rate will £473 become £900 13s.  $6\frac{1}{4}d$ in 12 years and 11 months? Ans. At 7 per cent.

#### COMPOUND INTEREST.

19. Given the principal, rate, and time-to find the amount and interest-

RULE I.—Find the interest due at the first time of payment, and add it to the principal. Find the interest

38, at [2]) : , the

the

, the

er : :

(the st of hich pro-

at 6

230 d 6

3d.,

per

łd.,

find

the give me be

of that sum, considered as a new principal, and add it to what it would produce at the next payment. Consider that new sum as a principal, and proceed as before. Continue this process through all the times of payment.

EXAMPLE.—What is the compound interest of £97, for 4 years, at 4 per cent. half-yearly ?

 $\begin{array}{cccc} \pounds & s. & d. \\ 97 & 0 & 0 \end{array}$ 

2 17 7

3 17  $7\frac{1}{4}$  is the interest, at the end of 1st half-year.

100 17  $7_1^1$  is the amount, at end of 1st half-year. 4 0 8 is the interest, at the end of 1st year.

 $4 \quad 0 \quad 8\frac{1}{2}$  is the interest, at the end of 1st year.

10.1 18 33 is the amount, at the end of 1st year.

4 3  $11_{4}^{i}$  is the interest, at the end of 3rd half-year.

109 2 3 is the amount, at the end of 3rd half-year. 4  $7_1$   $3\frac{1}{2}$  is the interest, at the end of 2nd year.

113 9 61 is the amount, at the end of 2nd year.

4 10  $9\frac{1}{3}$  is the interest, at the end of 5th half-year.

118 0 4 is the amount, at the end of 5th half-year. 4 14 5 is the interest, at the end of 3rd year.

122 14 9 is the amount, at the end of 3rd year. 4 18 2! is the interest, at the end of 7th half y

4 18  $2_4^1$  is the interest, at the end of 7th half-year.

127 12 11<sup>1</sup>/<sub>4</sub> is the amount, at the end of 7th half-year. 5 2  $1\frac{1}{2}$  is the interest, at the end of 4th year.

132 15  $0_4^3$  is the amount, at the end of 4th year.

 $97 \quad 0 \quad 0$  is the principal.

And 35 15  $0_4^3$  is the compound interest of £97, in 4 years.

20. This is a tedious mode of proceeding, particularly when the times of payment are numerous; it is, therefore, better to use the following rules, which will be found to produce the same result—

RULE II.—Find the interest of  $\pounds 1$  for one of the payments at the given rate. Find the product of so many factors (each of them  $\pounds 1$ +its interest for one payment) as there are times of payment; multiply this product by the given principal; and the result will be the principal, plus its compound interest for the given E rest The amo

we

tim

der

Зуе

and to b

1.0€ 1.0€

T

E

£

252

time. From this subtract the principal, and the remainder will be its compound interest.

EXAMPLE 1.—What is the compound interest of £237 for 3 years, at 6 per cent. ?

 $\pounds 06$  is the interest of  $\pounds 1$  for 1 year, at the given rate; and there are 3 payments. Therefore  $\pounds 1.06$  ( $\pounds 1 + \pounds 0.3$ ) is to be taken 3 times to form a product. Hence  $1.06 \times 1.06 \times 1.0$ 

The following is the process in full-

£

1.06 the amount of  $\pounds 1$ , in one year.

1.06 the multiplier.

1.1236 the amount of  $\pounds 1$ , in two years 1.06 the multiplier.

1.191016 the amount of  $\pounds 1$ , in three years Multiplying by 237, the principal,

we find that  $282 \cdot 270792 = 282 \cdot 5$  is the amount  $\cdot$ and subtracting 237 0 0, the principal,

we obtain 45.5 5 as the compound interest.

EXAMPLE 2.—What are the amount and compound interest of  $\pounds79$  for 6 years, at 5 per cent. ?

The amount of  $\pounds 1$  for 1 year, at this rate would be  $\pounds 1.05$ . Therefore  $\pounds 1.05 \times 1.05 \times 1.05 \times 1.05 \times 1.05 \times 1.05 \times 79$  is the amount, &c. And the process in full will be—

|     | 1.05    |  |
|-----|---------|--|
|     | 1.05    | · · · ·  |
|     | 1 1005  | 11   |

 $\frac{121842}{27} \text{ fb amount of } \mathcal{L}1, \text{ in four years.}$   $\frac{27}{\mathcal{L}32\cdot89734=32} \quad \mathcal{L} \quad s. \quad d.$ 

 $27 \quad 0 \quad 0$ 

## And 5 17 11; is the required interest.

21. RULE III.—Find by the interest table (at the end of the treatise) the amount of £1 at the given rate, and for the given number of payments; multiply this by the given principal, and the product will be the required amount. From this product subtract the principal, and the remainder will be the required compound interest.

EXAMPLE.--What is the amount and compound interest of  $\pounds 47$  10s. for 6 years, at 3 per cent., half-yearly ?

£47 10s.=£47.5.

We find by the table that

 $\pounds$ 1.42576 is the amount of  $\pounds$ 1, for the given time and rate. 47.5 is the multiplier.

£ s. d.

67.7236 = 67 14  $5\frac{3}{4}$  is the required amount. 47 10 0

11 10 0

And 20 4  $5\frac{3}{4}$  is the required interest.

22. Rule L requires no explanation.

REASON OF RULE II.—When the time and rate are the same, two principals are proportional to their corresponding amounts. Therefore

£1 (one principal) : £1 03 (its corresponding amount) : £1.06 (another principal) : £1.06  $\times$  1.06 (its corresponding amount).

Henor the for one Aga

Hence or the £1 for The ments. The the am the pr the am Rule

23. proceed We we re multip them duct of produ equal 1.1025

£91 f 0s. 11 pound 2. £142 £227 compe 3. £63 f £90 comp 4. £44

2:14

Hence the amount of £1 for two years, is  $\pounds 1.06 \times 1.06 \rightarrow$  or the product of two factors, each of them the amount of £1 for one year.

Again, for similar reasons,

 $\pounds 1 : \pounds 1.06 :: \pounds 1.06 \times 1.06 : \pounds 1.06 \times 1.06 \times 1.06$ 

Hence the amount of  $\pounds 1$  for three years, is  $\pounds 1.06 \times 1.06 \times 1.06 =$  or the product of three factors, each of them the amount of  $\pounds 1$  for one year.

The same reasoning would answer for any number of payments.

The amount of any principal will be as much greater than the amount of  $\pounds 1$ , at the same rate, and for the same time, as the principal itself is greater than  $\pounds 1$ . Hence we multiply the amount of  $\pounds 1$ , by the given principal.

Rule III. requires no explanation.

23. When the decimals become numerous, we may proceed as already directed [Sec. II. 58].

We may also shorten the process, in many cases, if we remember that the product of two of the factors multiplied by itself, is equal to the product of four of them; that the product of four multiplied by the product of two is equal to the product of six; and that the product of four multiplied by the product of four, is equal to the product of eight, &c. Thus, in example 2,  $1.1025 (= 1.05 \times 1.05) \times 1.1025 = 1.05 \times 1.05 \times 1.05 \times 1.05$ .

#### EXERCISES.

1. What are the amount and compound interest of £91 for 7 years, at 5 per cent. per annum? Ans. £128 Os. 11d. is the amount; and £37 Os. 11d., the compound interest.

2. What are the amount and compound interest of  $\pounds 142$  for 8 years, at 3 per cent. half-yearly? Ans.  $\pounds 227$  17s.  $4\frac{1}{2}d$ . is the amount; and  $\pounds 85$  17s.  $4\frac{1}{2}d$ ., the compound interest.

3. What are the amount and compound interest of  $\pounds 63 5s$ . for  $\Im$  years, at 4 per cent. per annum? Ans.  $\pounds 90 0s$ .  $5\frac{3}{4}d$ . is the amount; and  $\pounds 26 15s$ .  $5\frac{3}{4}d$ ., the compound interest.

4. What are the amount and compound interest of  $\pounds$ 44 5s. 9d. for 11 years, at 6 per cent. per annum?

nterest

l rate.

e the

nt) : onding

Ans. £84 1s. 5d. is the amount; and £39 15s. 8d., the compound interest.

5. What are the amount and compound interest of  $\pounds 32 \ 4s. \ 9\frac{3}{4}d$ . for 3 years, at  $\pounds 2 \ 10s$ . per cent. half-yearly? Ans.  $\pounds 37 \ 7s. \ 8\frac{1}{2}d$ . is the amount; and  $\pounds 5 \ 2s. \ 10\frac{1}{2}d$ ., the compound interest.

6. What are the amount and compound interest of £971 0s.  $2\frac{1}{4}d$ . for 13 years, at 4 per cent. per amnum? Ans. £1616 15s.  $11\frac{3}{4}d$ . is the amount; and £645 15s  $9\frac{1}{2}d$ ., the compound interest.

24. Given the amount, time, and rate—to find the principal; that is, to find the present worth of any sum to be due hereafter—a certain rate of interest being allowed for the money now paid.

RULE.—Find the product of as many factors as there are times of payment—each\_of the factors being the amount of £1 for a single payment; and divide this product into the given amount.

EXAMPLE.—What sum would produce £834 in 5 years, at 5 per cent. compound interest?

The amount of  $\pounds 1$  for 1 year at the given rate is  $\pounds 1.05$ ; and the product of this taken 5 times as a factor  $1.05 \times 1.05 \times 1.05 \times 1.05 \times 1.05$ , which (according to the table) is 1.27628. Then

 $\pounds 834 \div 1 \cdot 27628 = \pounds 653$  9s.  $2_4^3d$ , the required principal.

25. REASON OF THE RULE.—We have seen [21] that the *amount* of any sum is equal to the amount of £1 (for the sama time, and at the same rate) multiplied by the principal; that is,

The amount of the given principal=the given principal× the amount of  $\pounds 1$ .

If we divide each of these equal quantities by the same number [Sec. V. 6], the quotients will be equal. Therefore—

The amount of f e given principal  $\div$  the amount of  $\pounds 1$ =the given principal  $\times$  the amount of  $\pounds 1 \div$  the amount of  $\pounds 1$ . That is, the amount of the given principal (the given amount) divided by the amount of  $\pounds 1$ , is equal to the principal, or quantity required—which is the rule.

#### EXERCISES.

7. What ready money ought to be paid for a debt of  $\pounds 629$  17s.  $1\frac{1}{2}\frac{1}{s}d$ , to be due 3 years hence, allowing 8 per cent. compound interest? Ans.  $\pounds 500$ .

9. What sum would produce £742 19s. 111d. in 14 years, at 6 per cent. per annum? Ans. £328 12s. 7d.

10. What is  $\pounds 495$  19s. 11 $\frac{3}{4}d$ , to be due in 18 years, at 3 per cent. half-yearly, worth at present. Ans.  $\pounds 171$  2s.  $\$^{3}_{4}d$ .

26. Given the principal, rate, and amount-to find

RULE I.—Divide the amount by the principal; and into the quotient divide the amount of £1 for one payment (at the given rate) as often as possible—the number of times the amount of £1 has been used as a divisor, will be the required number of payments.

EXAMPLE.—In what time will  $\pounds 92$  amount to  $\pounds 106$  13s.  $0_4^3d.$ , at 3 per cent. half-yearly ?

£106 13s.  $0_3^2 d.$ ; £92=1·15927. The amount of £1 for one payment is £1·03. But 1·15927 ÷ 1·03 = 1·1255; 1·1255 ÷ 1·03 = 1·09272; 1·09272 ÷ 1·03 = 1·0609; and 1·0609 ÷ 1·03 = 1·03; 1·03 ÷ 1·03=1. We have used 1·03 as a divisor 5 times; therefore the time is 5 payments or 2½ years. Sometimes there will be a remainder after dividing by 1·03, &c., as often as possible.

In explaining the method of finding the powers and roots of a given quantity, we shall, hereafter, notice a shorter method of ascertaining how often the amount of one pound can be used as a divisor.

27. RULE II.—Divide the given principal by the given amount, and ascertain by the interest table in how many payments  $\pounds 1$  would be equal to a quantity nearest to the quotient—considered as pounds : this will be the required time.

EXAMPLE.—In what time will £50 become £100, at 6 per cent. per annum compound interest ?

#### $\pounds 100 \div 50 = 2.$

We find by the tables that in 11 years  $\pounds 1$  will become  $\pounds 1.8983$ , which is less; and in 12 years that it will become  $\pounds 2.0122$ , which is greater than 2. The answer nearest to the truth, therefore, is 12 years.

28. REASON OF RULE I.—The given amount is [20] equal to the given principal, multiplied by a product which contains as many factors as there are times of payment—each factor being the amount of  $\mathcal{L}1$ , for one payment. Hence it is evident, that if we divide the given amount by the given principal, we must have the product of these factors; and that, if we divide this product, and the successive quotients by one of the factors, we shall ascertain their *number*.

REASON OF RULE II.—We can find the required number of factors (each the amount of  $\pounds 1$ ), by ascertaining how often the amount of  $\pounds 1$  may be considered as a factor, without forming a product *much* greater or less than the quotient obtained when we divide the given amount by the given principal. Instead, however, of calculating *for ourselves*, we may have recourse to tables constructed by those who have already made the necessary multiplications—which saves much trouble.

29. When the quotient [27] is greater than any amount of £1, at the given rate, in the table, divide it by the greatest found in the table; and, if necessary, divide the resulting quotient in the same way. Continue the process until the quotient obtained is not greater than the largest *amount* in the table. Ascertain what *number of payments* corresponds to the last quotient, and add to it so many times the largest *number of payments* in the table, as the largest *amount* in the table has been used for a divisor

EXAMPLE.—When would  $\pounds 22$  become  $\pounds 535$  12s.  $0_4^3 d.$ , at 3 per cent. per aunum ?

£535 12s.  $0_1^3d. \div 22=24.34560$ , which is greater than any amount of £1, at the given rate, contained in the table.  $24.34560 \div 4.3839$  (the greatest amount of £1, at 3 per cent., found in the table)=5.55339; but this latter, also, is greater than any amount of £1 at the given rate in the tables.  $5.55339 \div 4.3839=1.26677$ , which is found to be the amount of £1, at 3 per cent. per payment, in 8 payments. We have divided by the highest amount for £1 in the tables, or that corresponding to fifty payments, twice. Therefore, the required time, is 50+50+8 payments, or 108 years.

#### EXERCISES.

## QUESTIONS.

1. What is interest? [1].

2. What is the difference between simple and compound interest? [1].

3. What are the principal, rate, and amount? [1].

4. How is the simple interest of any sum, for 1 year, found ? [2 &c.].

5. How is the simple interest of any sum, for several years, found ? [5].

6. How is the interest found, when the rate consists of more than one denomination ? [4].

7. How is the simple interest of any sum, for years, months, &c., found ? [6].

8. How is the simple interest of any sum, for any time, at 5 or 6, &c. per cent. found ? [7].

9. How is the simple interest found, when the rate, number of years, or both are expressed by a mixed number? [9].

10. How is the simple interest for days, at 5 per cent., found ? [10].

11. How is the simple interest for days, at any other rate, found ? [11].

12. How is the simple interest of any sum, for months at 6 per cent., found? [12].

13. How is the interest of money, left after one or more payments, found ? [13].

14. How is the principal found, when the amount, rate, and time are given ? [14].

15. How is the amount found, when the time, rate, and principal are given? [15].

#### DISCOUNT.

16. How is the time found, when the amount, prin cipal, and rate are given ? [16].

17. How is the rate found, when the amount, princi pal, and time are given ? [18].

18. How are the amount, and compound interest found, when the principal, rate, and time are given ? [19].

19. How is the present worth of any sum, at compound interest for any time, at any rate, found ? [24].

20. How is the time found, when the principal, rate of compound interest, and amount are given ? [26].

## DISCOUNT.

30. Discount is money allowed for a sum paid before it is due, and should be such as would be produced by what is paid, were it put to interest from the time the payment is, until the time it ought to be made.

The present worth of any sum, is that which would, at the rate allowed as discount, produce it, if put to interest until the sum becomes due.

31. A bill is not payable until three days after the time mentioned in it; these are called *days of grace*. Thus, if the time expires on the 11th of the month, the bill will not be payable until the 14th—except the latter falls on a Sunday, in which case it becomes payable on the preceding Saturday. A bill at 91 days will not be due until the 94th day after date.

32. When goods are purchased, a certain discount is often allowed for *prompt* (immediate) payment.

The discount generally taken is larger than is supposed. Thus, let what is allowed for paying money one year before it is due be 5 per cent.; in ordinary circumstances  $\pounds 95$  would be the payment for  $\pounds 100$ . But  $\pounds 95$  would not in one year, at 5 per cent., produce more than  $\pounds 99$  15s., which is less than  $\pounds 100$ ; the error, however, is inconsiderable when the time or sum is small Hence to find the discount and present worth at any rate, we may generally use the followingat dec rec alle rat is 2 £0 wo

tin pro to

> 10: 7

all

one in in Ar

me per

> to dis du

> > 11

#### DISCOUNT.

33. RULE.—Find the interest for the sum to be paid, at the discount allowed; consider this as discount, and deduct it from what is due; the remainder will be the required present worth.

EXAMPLE.— $\pounds$ 6? will 1 due in 3 months; what should be allowed on immediate payment, the discount being at the rate of 6 per cent. per annum?

The interest on £62 for 1 year at 6 per cent. per annum is £3 1<sup>1</sup>, 4<sup>3</sup><sub>4</sub>d.; and for 3 months it is 18s. 7<sup>4</sup><sub>4</sub>d. Therefore £62 minus 18s. 7<sup>4</sup><sub>4</sub>d.=£61 1s. 4<sup>3</sup><sub>4</sub>d., is the required present worth.

34. To find the present worth accurately-

RULE.—Say, as  $\pounds 100$  plus its interest for the given time, is to  $\pounds 100$ , so is the given sum to the required present worth.

EXAMPLE.—What would, at present pay a debt of :6142 to be due in 6 months, 5 per cent. per annum discount being allowed ?

| 102.5 | ££<br>(100+2 | s.<br>10) | £<br>: 100 | $\begin{array}{c} \mathfrak{L}\\ :: 142 \end{array}$ | : | $\frac{100 \times 142}{102.5}$ | £<br>138 | <br>10 | <i>d</i> .<br>8 |
|-------|--------------|-----------|------------|--|---|--------------------------------|----------|--------|-----------------|
|-------|--------------|-----------|------------|--|---|--------------------------------|----------|--------|-----------------|

This is merely a question in a rule already given [14].

## EXERCISES.

1. What is the present worth of £850 15s., payable in one year, at 6 per cent. discount? Ans. £802 11s. 10<sup>3</sup><sub>4</sub>d

2. What is the present worth of £240 10s., payable in one year, at 4 per cent. discount? Ans. £231 5s.

3. What is the present worth of £550 10s., payable in 5 years and 9 months, at 6 per cent. per an. discount? Ans. £409 5s.  $10\frac{1}{2}d$ .

4. A debt of £1090 will be due in 1 year and 5 months, what is its present worth, allowing 6 per cent. per an. discount? Ans. £1004 12s. 2d.

5. What sum will discharge a debt of  $\pounds 250$  17s. 6d., to be due in 8 months, allowing 6 per cent. per an. discount? Ans.  $\pounds 241$  4s.  $6\frac{1}{2}d$ .

6. What sum will discharge a debt of  $\pounds$ 840, to be due in 6 months, allowing 6 per cent. per an. discount? Ans.  $\pounds$ 815 10s.  $8\frac{1}{4}d$

8. What ready money now will pay for £1000, to be due in 130 days, allowing 6 per cent. per an. discount? Ans. £979 1s. 7d.

9. A bill of £150 10s. will become due in 70 days, what ready money will now pay it, allowing 5 per cent. per an. discount? Ans. £149 1s. 5d.

10. A bill of £140 10s. will be due in 76 days, what ready money will now pay it, allowing 5 per cent. per an. discount? Ans. £139 1s.  $0\frac{1}{2}\sqrt{2}$ .

11. A bill of £300 will be due in 91 days, what will now pay it, allowing 5 per cent. per an. discount? Ans. £296 6s.  $1\frac{1}{2}d$ .

12. A bill of £39 5s. will become due on the first of September, what ready money will pay it on the preceding 3rd of July, allowing 6 per cent. per an.? Ans. £38 18s.  $7\frac{1}{4}d$ .

13. A bill of £218 3s.  $8\frac{1}{4}d$ . is drawn of the 14th August at 4 months, and discounted on the 3rd of Oct.; what is then its worth, allowing 4 per cent. per an. discount? Ans. £216 8s.  $1\frac{1}{4}d$ .

14. A bill of £486 18s. 8d. is drawn of the 25th March at 10 months, and discounted on the 19th June, what then is its worth, allowing 5 per cent. per an. discount? Ans. £472 9s.  $11\frac{3}{4}d$ .

15. What is the present worth of £700, to be due in 9 months, discount being 5 per cent. per an.? Ans.  $\pounds 674 \ 13s. \ 11\frac{1}{2}d.$ 

16. What is the present worth of £315 12s.  $4\frac{1}{5}d.$ , payable in 4 years, at 6 per cent. per an. discount? Ans. £254 10s.  $7\frac{1}{4}d.$ 

17. What is the present worth and discount of £550 10s. for 9 months, at 5 per cent. per an. ? Ans. £530 12s.  $0\frac{1}{2}d$ . is the present worth; and £19 17s.  $11\frac{1}{2}d$ . s the discount.

18. Bought goods to the value of £35 13s. 8d. to be baid in 294 days; what ready money are they now worth, 6 per cent. per an. discount being allowed? Ans. £34 0s.  $9\frac{1}{4}d$ .

## COMMISSION.

19. If a legacy of  $\pounds$ 600 is left to me on the 3rd of May, to be paid on Christmas day following, what must I receive as present payment, allowing 5 per cent. per an. discount? Ans.  $\pounds$ 581 4s.  $2\frac{1}{4}d$ .

20. What is the discount of  $\pounds756$ , the one half payable in 6, and the remainder in 12 months, 7 per cent. per au. being allowed ? Ans.  $\pounds37$  14s.  $2\frac{1}{2}d$ .

21. A merchant owes £110, payable in 20 months, and £224, payable in 24 months; the first he pays in 5 months, and the second in one month after that. What did he pay, allowing 8 per cent. per an.? Ans. £300.

#### QUESTIONS FOR THE PUPIL.

1. What is discount? [30].

2. What is the present worth of any sun? [30].

3. What are days of grace? [31].

4. How is discount ordinarily calculated ? [33]

5. How is it accurately calculated ? [34].

## COMMISSION, &c

35. Commission is an allowance per cent. made to a person called an *agent*, who is employed to sell goods.

Insurance is so much per cent. paid to a person who undertakes that if certain goods are injured or destroyed, he will give a stated sum of money to the owner.

Brokerage is a small allowance, made to a kind of agent called a broker, for assisting in the disposal of goods, negotiating bills, &c.

36. To compute commission, &c.-

RULE.—Say, as £100 is to the rate of commission, so is the given sum to the corresponding commission.

EXAMPLE.—What will be the commission on goods worth £437 5s. 2d., at 4 per cent. ?

 $\pounds 100 : \pounds 4 :: \pounds 437 5s. 2d. : \frac{4 \times \pounds 437 5s. 2d.}{100} = \pounds 17 9s.$ 

 $\theta_4^3 d$ ., the required commission.

- 37. To find what insurance must be paid so that, if the goods are lost, both their value and the insurance paid may be recovered—

of £200, er cent.

0, to be scount?

70 days, er cent.

ns, what

hat will ? Ans.

he first on the ar an.?

e 14th f Oct. ; per an.

e 25th June, per an.

due in Ans.

 $4\frac{1}{5}d.,$ 

£550 £530 11<u>1</u>d.

to be now owed?

#### COMMISSION

RULE.—Say, as  $\pounds 100$  minus the rate per cent. is to  $\pounds 100$ , so is the value of the goods insured, to the required insurance.

EXAMPLE.—What sum must I insure that if goods worth  $\pounds 400$  are lost, I may receive both their value and the insurance paid, the latter being at the rate of 5 per cent.?

 $\pounds 95$  :  $\pounds 100$  ::  $\pounds 400$  :  $\frac{\pounds 100 \times 400}{95} = \pounds 421$  1s.  $0_4^3 d$ .

If £100 were insured, only £95 would be actually received, since £5 was paid for the £100. In the example, £421 1s.  $0\frac{1}{2}d$ . are received; but deducting £21 1s.  $0\frac{3}{2}d$ ., the insurance, £400 remains.

#### EXERCISES.

1. What premium must be paid for insuring goods to the amount of £900 15s., at  $2\frac{1}{2}$  per cent.? Ans. £22 10s.  $4\frac{1}{4}d$ .

2. What premium must be paid for insuring goods to the amount of £7000, at 5 per cent. ? Ans. £350.

3. What is the brokerage on £976 17s. 6d., at 5s. per cent. ? Ans. £2  $8s \cdot 10\frac{1}{8}d$ .

4. What is the premium of insurance on goods worth  $\pounds 2000$ , at  $7\frac{1}{2}$  per cent. ? Ans.  $\pounds 150$ .

5. What is the commission on £767 14s. 7d., at  $2\frac{1}{2}$  per cent. ? Ans. £19 3s.  $10\frac{3}{8}d$ .

6. How much is the commission on goods worth  $\pounds 971 \ 14s. \ 7d.$ , at 5s. per cent. ? Ans.  $\pounds 2 \ 8s. \ 7_{\overline{6}} \ 0 \ d.$ 

7. What is the brokerage on £3000, at 2s. 6d. per cent. ? Ans. £3 15s.

8 How much is to be insured at 5 per cent. on goods worth £900, so that, in case of loss, not only the value of the goods, but the premium of insurance also, may be repaid? Ans. £947 7s.  $4\frac{1}{15}d$ .

9. Shipped off for Trinidad goods worth £2000, how much must be insured on them at 10 per cent., that in ease of loss the premium of insurance, as well as their value, may be recovered? Ans. £2222 4s.  $5\frac{1}{3}d$ .

## QUESTIONS FOR THE PUPIL.

5. How is insurance calculated, so that both the insurance and value of the goods may be received, if the latter are lost? [37].

## PURCHASE OF STOCK.

33. Stock is money borrowed by Government from individuals, or contributed by merchants, &c., for the purpose of trade, and bearing interest at a fixed, or variable rate. It is transferable either entirely, or in part, according to the pleasure of the owner.

If the price per cent. is more than £100, the stock in question is said to be above, if less than £100, below "par."

Sometimes the shares of trading companies are only gradually paid up; and in many cases the whole price of the share is not demanded at all—they may be  $\pounds 50$ ,  $\pounds 100$ , &c., shares, while only  $\pounds 5$ ,  $\pounds 10$ , &c., may have been paid on each. One person may have many shares When the intesest per cent. on the money paid is considerable, stock often sells for more than what it originally cost; on the other hand, when money becomes more valuable, or the trade for which the stock was contributed is not prosperous, it sells for less.

39. To find the value of any amount of stock, at any rate per cent.---

RULE.—Multiply the amount by the value per cent., and divide the product by 100.

EXAMPLE.—When  $\pounds 69\frac{1}{8}$  will purchase  $\pounds 100$  of stock, what will purchase  $\pounds 642$ ?

 $\frac{\pounds 642 \times 69\frac{1}{8}}{100} = \pounds 443 \ 15s. \ 7\frac{3}{4}d.$ 

It is evident that  $\pounds 100$  of stock is to any other amount of it, as the price of the former is to that of the latter. Thus

$$\pounds 100 : \pounds 642 :: \pounds 69\frac{1}{3} : \frac{\pounds 642 \times 69\frac{1}{3}}{100}$$

#### EXERCISES.

1. What must be given for £750 16s. in the 3 per 5 cent. annuities, when £64<sup>1</sup>/<sub>3</sub> will purchase £100? Ans. £481 9s.  $0\frac{3}{3\pi}d$ .

## EQUATION OF PAYMENTS.

2. What must be given for £1756 7s. 6d. India stock, when £1964 will purchase £100? Ans. £3446 17s.  $\$\frac{5}{2}d$ .

3. What is the purchase of £9757 bank stock, an  $\pounds 125\frac{5}{2}$  per cent. ? Ans. £12257 4s.  $7\frac{1}{2}d$ .

## QUESTIONS.

1. What is stock ? [38].

2. When is it above, and when below " par"? [38].

3. How is the value of any amount of stock, at any rate per cent., found ? [39].

## EQUATION OF PAYMENTS.

40. This is a process by which we discover a time, when several debts to be due at *different* periods may be paid, *at once*, without loss either to debtor or creditor.

RULE.—Multiply each payment by the time which should elapse before it would become due; then, add the products together, and divide their sum by the sum of the debts.

EXAMPLE 1.—A person owes another  $\pounds 20$ , payable in 6 months;  $\pounds 50$ , payable in 8 months; and  $\pounds 90$ , payable in 12 months. At what time may all be paid together, without loss or gain to either party ?

| 25          |        | £    |
|-------------|--------|------|
| $20 \times$ | 6 = -  | 120  |
| $50 \times$ | 8=     | 400  |
| 90×         | 12 = 1 | 1080 |

160 160)1600(10 the required number of mon''s. 160

EXAMPLE 2.—A debt of £450 is to be paid thus: £100 immediately, £300 in four, and the rest in six months. When should it be paid altogether ?

| nu anogemer :          |
|------------------------|
| £ £                    |
| $100 \times 0 = 0$     |
| $300 \times 4 = 1200$  |
| $50 \times 6 = 300$    |
| 450 450)1500(31 months |
| 1350                   |
| 150                    |
| 150                    |
| 450                    |
| 100                    |

## EQUATION OF PAYMENTS,

41. We have (according to a principle formerly used [13]) reduced each debt to a sum which would bring the same interest, in one month. For 6 times £20, to be due in 1 month, should evidently produce the same as £20, to be due in 6 months—and so of the other debts. And the interest of £1600 for the smaller time, will just be equal to the interest of the smaller sum for the larger time.

#### EXERCISES.

1. A owes B £600, of which £200 is payable in 3 months, £150 in 4 months, and the rest in 6 months; but it is agreed that the whole sum shall be paid at once. When should the payment be made? Ans. In  $4\frac{1}{2}$  months.

2. A debt is to be discharged in the following manner:  $\frac{1}{4}$  at present, and  $\frac{1}{4}$  every three months after until all is paid. What is the equated time? Ans.  $4\frac{1}{2}$  months.

3. A debt of £120 will be due as follows: £50 in 2 months, £40 in 5, and the rest in 7 months. When may the whole be paid together ? Ans. In  $4\frac{1}{4}$  months.

4. A owes B £110, of which £50 is to be paid at the end of 2 years, £40 at the end of  $3\frac{1}{2}$ , and £20 at the end of  $4\frac{1}{2}$  years. When should B receive all at once? Ans. In 3 years.

5. A debt is to be discharged by paying  $\frac{1}{2}$  in 3 months,  $\frac{1}{2}$  in 5 months, and the rest in 6 months. What is the equated time for the whole? Ans.  $4\frac{1}{6}$  months.

#### QUESTIONS.

1. What is meant by the equation of payments? [40].

2. What is the rule for discovering when money, to be due at different times, may be paid at once? [40].

# SECTION VIII.

## EXCHANGE, &c.

1. Exchange enables us to find what amount of the money of one country is equal to a given amount of the money of another.

Moncy is of two kinds, *real*—or coin, and *imaginary*—or money of exchange, for which there is no coin; as, for example "one *pound* sterling."

The par of exchange is that amount of the money of one country actually equal to a given sum of the money of another; taking into account the value of the metals they contain. The course of exchange is that sum which, in point of faet, would be allowed for it.

2. When the course of exchange with any place is above "par," the balance of trade is against that place. Thus if Hamburgh receives merchandise from London to the amount of  $\pounds 100,000$ , and ships off, in return, goods to the amount of but  $\pounds 50,000$ , it can pay only half what it owes by bills of exchange, and for the remainder must obtain bills of exchange from some place else, giving for them a premium—which is so much lost. But the exchange cannot be much above par, since, if the premium to be paid for bills of exchange is high, the merchant will export goods at less profit; or he will pay the expense of transmitting and insuring coin, or bullion.

3. The nominal value of commodities in these countries was from four to fourteen times less formerly than at present; that is, the same amount of money would then buy much more than now. We may estimate the value of money, at any particular period, from the amount of corn it would purchase at that time. The value of money fluctuates from the mature of the crops, the state of trade, &c. In Lone coun A betw or ba Th famil

Har "Lub for the Wo sterlin

In exchange, a variable is given for a fixed sum; thus London receives different values for £1 from different countries.

Agio is the difference which there is in some places between the current or cash money, and the exchange or bank money-which is finer.

The following tables of foreign coins are to be made familiar to the pupil.

#### RUSSIAN MONEY.

make 1 ruble.

#### EAST INDIAN MONEY.

Cowries 2560 Rupees 100,000 10,000,000

Copecs

100

make 1 rupee.

1 lac.

1 crore.

The cowrie is a small shell found at the Maldives, and near Angola : in Africa about 5000 of them pass for a pound.

The rupeg has different values : at Calcutta it is 1s. 114d. the Sicca rupee is 2s. 04d. ; and the current rupee 2s .- if we divide any number of these by 10, we change them to pounds of our money; the Bombay rupee is 2s. 3d., &c. A sum of Indian money is expressed as follows ; 5.88220, which means 5 lacs and 98220 rupees.

4. To reduce bank to current money-

RULE .- Say, as £100 is to £100 + the agio, so is the given amount of bank to the required amount of current money.

EXAMPLE.-How many guilders, current money, are equal to 463 guilders, 3 stivers, and 1364 pennings banco, agio being 45?

| 100<br>7                    | : | $rac{1045}{7}$ | :: 463<br>20 | 3 g. 3 st. | 1364 p. | : ? |
|-----------------------------|---|-----------------|--------------|------------|---------|-----|
| $\overline{\frac{700}{65}}$ |   | 733             | 9268<br>10   | stivers.   |         |     |
| 45500                       |   |                 | 148221       | penning    | 78.     |     |

Multiplying by 65, and adding 64 to the product, will give 9634429

Multiplying by 733

and dividing by 45500)7062036457

will give 155209 pennings.

16)155209

20)9700 9

And  $485 \text{ g. } 0 \text{ st. } 9_{\frac{2}{5}\frac{5}{5}\frac{5}{6}\frac{5}{6}}^{\frac{5}{6}} \text{ p. is the amount sought.}$ 5. We multiply the first and second terms by 7, and add the numerator of the fraction to one of the products. This is the same thing as reducing these terms to fractions having 7 for their denominator, and then multiplying them by 7 [Sec. V. 29].

For the same reason, and in the same way, we multiply the first and third terms by 65, to banish the fraction, without destroying the proportion.

6.

R

The remainder of the process is according to the rule of proportion [Sec. V. 31]. We reduce the answer to pennings, stivers, and guilders.

## EXERCISES.

1. Reduce 374 guilders, 12 stivers, bank money, to current money, agio being  $4\frac{5}{7}$  per cent. ? Ans. 392 g., 5 st.,  $3\frac{19}{175}$  p.

2. Reduce 4378 guilders, 9 stivers, bank money, to current money, agio being  $4\frac{\pi}{2}$  per cent. ? Ans. 4577 g., 17 st.  $3\frac{\pi}{2}\frac{\pi}{2}\frac{\pi}{3}$  p.

3. Reduce S73 guilders, 11 stivers, bank money, to current money, agio being  $4\frac{7}{4}$  per cent.? Ans. 916 g., 2 st.,  $11\frac{1}{29}$  p.

4. Reduce 1642 guilders, bank money, to current money, agio being  $4\frac{1}{12}$  per cent. ? Ans. 1722 g., 14st.,  $10\frac{2}{15}$  p.

6. To reduce current to bank money-

RULE.—Say, as £100-+ the agio is to £100, so is the given amount of current to the required amount of bank money.

EXAMPLE.—How much bank money is there in 485 guilders and  $9\frac{20057}{42500}$  pennings, agio being  $4\frac{5}{7}$ ?

| $   \frac{1045}{7} $ | 7                         | 20                                | st.<br>0 | p.<br>9 <u>35957</u><br>9 <u>35500</u> | : ?       |

#### EXERCISES.

5. Reduce 58734 guilders, 9 stivers, 11 pennings, current money, to bank money, agio being  $4\frac{5}{6}$  per cent.? Ans. 56026 g., 10 st.,  $11\frac{1}{6}\frac{6}{24}$  p.

6. Reduce 4326 guilders, 15 pennings, current money, to bank money, agio being  $4\frac{9}{7}$  per cent.? Ans. 4125 g., 13 st.,  $2\frac{1}{3}\frac{6}{7}$  p.

7. Reduce 1186 guilders, 4 stivers, 8 pennings, current, to bank money, agio being  $4\frac{3}{2}$  per cent.? Ans 1136 g., 10 st.,  $0\frac{16}{16}\frac{9}{2}$  p.

8. Reduce 8560 guilders, 8 stivers, 10 pennings, current, to bank money, agio being  $4\frac{3}{5}$  per cent. . Ans. 8183 g., 19 st.,  $5\frac{5}{5}\frac{1}{2}\frac{3}{3}$  p.

7. To reduce foreign money to British, &c.-

RULE.—Put the amount of British money considered in the rate of exchange as third term of the proportion, ita value in foreign money as first, and the foreign money to be reduced as second term.

EXAMPLE 1.—Flemish Money.—How much British money is equal to 1054 guilders, 7 stivers, the exchange being 33s. 4d. Flemish to £1 British ?

400 pence. 21087 stivers.

400)42174 Flemish pence.

 $\pounds 105.435 = \pounds 105 8s. 8\frac{1}{2}d.$ 

£1, the amount of British money considered in the rate, is put in the third term, 33s. 4d., its value in foreign money, in the first; and 1054 g. 7 st., the money to be reduced, in the second.

9. How many pounds sterling in 1680 guilders, at 33s. 3d. Flemish per pound sterling? Ans. £168 8s.  $6\frac{7}{133}d$ .

10. Reduce 6648 guilders, to British money, at 33s. 11d. Flemish per pound British? Ans. £594 7s. 112134d.

11. Reduce 2048 guilders, 15 stivers, to British money, at 34s. 5d. Flemish per pound sterling? Ans £198 8s. 6114d.

12. stiver Ans.

> money Ans.

18.

12. How many pounds sterling in 1000 guilders, 10 stivers, exchange being at 33s. 4d. per pound sterling? Ans. £100 1s.

EXAMPLE 2.— Hamburgh Money.— How much British money is equivalent to 476 marks, 9 skillings, the exchange being 33s. 6d. Flemish per pound British?

| 12<br>402 g |         | _ | $\frac{32}{15232}$ | 2          |   |    |   |   |  |
|-------------|---------|---|--------------------|------------|---|----|---|---|--|
| s.<br>33    | d.<br>5 | : | m.<br>476          | s.<br>93:: | : | £1 | : | ş |  |

402 grotes.  $15232+19\frac{1}{3}=15251\frac{1}{3}$  grotes.  $402)15251\frac{1}{3}$ 

£37.9386=£37 18s. 9d.

Multiplying the schillings by 2, and the marks by 32, reduces both to pence.

13. How much British money is equivalent\_to 3083 marks, 12<sup>a</sup>/<sub>3</sub> schillings Hambro', at 32s. 4d. Flemish per pound sterling? Ans. £254 6s. 8d.

14. How much English money is equal to 5127 marks, 5 schillings, Hambro' exchange, at 36s. 2d. Flemish per pound sterling? Ans. £378 1s.

15. How many pounds sterling in 2443 marks, 91 schillings, Hambro', at 32s. 6d. Flemish per pound sterling? Ans. £200 10s.

16. Reduce 7854 marks, 7 schillings Hambro', to British money, exchange at 34s. 11d. Flemish per pound sterling, and agio at 21 per cent. ? Ans. £495 15s.  $0\frac{3}{4}d$ 

EXAMPLE 3.—French Money.—Reduce 8654 francs, 42 centimes, to British money, the exchange being 23f., 50c., per £1 British.

f. c. f. c. 8654.42

23 50 : 8654 42 : : 1 :  $-\frac{1}{23\cdot 50}$  £368 5s.  $5\frac{1}{2}d$ .

42 centimes are 0.42 of a franc, since 100 centimes make 1 franc.

17. Reduce 17969 francs, 85 centimes, to British money, at 23 franc-, 49 centimes per pound sterling Ans. £765.

18. Reduce 7672 francs, 50 centimes, to British money, at 23 francs, 25 centimes per pound sterling? Ans. £330.

ennings, r cent.?

t money, 4125 g.,

ennings, cent. .

nsidered portion, foreign

n money eing 33s.

į

the rate, a money, reduced,

ders, at 168–8s.

at 33s. 594 7s.

British Ans

19. Reduce 15647 francs, 36 centimes, to British money, at 23 francs, 15 centimes per pound sterling? Ans. £675 18s. 2<sup>3</sup>/<sub>4</sub>d.

20. Reduce 450 francs,  $58\frac{1}{2}$  centimes, to British money, at 25 francs, 5 centimes per pound sterling? Ans. £176 14s.

EXAMPLE 4. — Portuguese Money.—How much British money is equal to 540 milrees, 420 rees, exchange being at 58. 6d. per milree?

m. m. r. s. d. 1:540.420::5  $6:540.420 \times 5s.$  6d.=£148 12s.  $3\frac{3}{4}d.$ 

In this case the British money is the variable quantity, and 5s: 6d. is that amount of it which is considered in the rate.

The rees are changed into the decimal of a milree by putting them to the right hand side of the decimal point, since one ree is the thousandth of a milree.

21. In 850 milrees, 500 rees, how much British money, at 5s. 4d. per milree ? Ans. £226 16s.

22. Reduce 2060 milrees, 380 rees, to English money, at 5s.  $6\frac{3}{4}d$ . per milree ? Ans. £573 0s.  $10\frac{1}{4}d$ .

23. In 1785 milrees, 581 rees, how many pounds sterling, exchange at  $64\frac{1}{2}$  per milree? Ans. £479 17s. 6d.

24. In 2000 milrees, at 5s.  $8\frac{1}{2}d$ . per milree, how many pounds sterling? Ans. £570 16s. 8d.

EXAMPLE 5.—Spanish Money.—Reduce 84 piastres, 6 reals, 19 maravedi, to British money, the exchange being 49d. the piastre.

| р.<br>1<br>8        | p. r. m. d.<br>84 6 19 :: 49 : ?<br>8 |

#### EXERCISES.

25. Reduce 2448 piastres to British money, exchange at 50*d*. sterling per piastre? Ans. £510.

26. Reduce 30000 piastres to British money, at 40d. per piastre? Ans. £5000.

27. Reduce  $1\sqrt{25}$  piastres, 6 reals,  $22\frac{15}{137}$  maravedi, to . British money, at  $39\frac{1}{4}d$ . per piastre ? Ans. £167 15s. 4d.

EXAMPLE 6.—American Money.—Reduce 3765 dollars to British money, at 4s. per dollar.  $4s = \pounds_{\frac{1}{2}}$ ; therefore 5)3765 dol. dol. s.  $\pounds$ 

753 is the required sum. Or 1 : 3765 :: 4 : 753

28. Reduce £292 3s. 2<sup>2</sup>/<sub>4</sub>d. American, to British money, at 66 per cent. ? Ans. £176.

29. Reduce 5611 dollars, 42 cents., to British money, at 4s.  $5\frac{1}{2}d$ . per dollar? Ans. £1250 17s. 7d.

30. Reduce 2746 dollars, 30 cents., to British money, at 4s.  $3\frac{1}{2}d$ . per dollar? Ans. £589 6s.  $2\frac{1}{2}d$ .

From these examples the pupil will very easily understand how any other kind of foreign, may be changed to British money.

8. To reduce British to foreign money-

RULE.—Put that amount of foreign money which is considered in the rate of exchange as the third term, its value in British money as the first, and the British money to be reduced as the second term.

EXAMPLE 1.—Flemis't Money.—How many guilders, &c., in £236 143. 2d. British, the exchange being 34s. 2d. Flemish to £1 British ?

| €<br>1 :<br>20 | £<br>236<br>20  | s. d.<br>142: | s.<br>: 34<br>12 | d.<br>2 : ? |   |    |

55. Reduce £437 British to American money, at 78 per cent. ? Ans. £777 17s.  $2\frac{1}{2}d$ .

9. To reduce florins, &c., to pounds, &c., Flemish-

RULE.—Divide the florins by 6 for pounds, and adding the remainder (reduced to stivers) to the stivers —divide the sum by 6, for skillings, and double the remainder, for grotes.

EXAMPLE.—How many pounds, skillings, and grotes, in 165 florins 19 stivers?

## f. st. 6)165 19

£27 13s. 2d., the required sum.

6 will go into 165, 27 times—leaving 3 florins, or 60 stivers, which, with 19, make 79 stivers; 6 will go into 79, 13 times—leaving 1; twice 1 are 2.

10. REASON OF THE RULE.—There are 6 times as many florins as pounds; for we find by the table that 240 grotes make £1, and that 40  $\binom{240}{9}$  grotes make I florin. There are 6 times as many stivers as skillings; since 96 pennings make 1 skilling, and 16  $\binom{96}{9}$  pfennings make one stiver. Also, since 2 grotes make one stiver, the remaining stivers are equal to twice as many grotes.

Multiplying by 20 and 2 would reduce the florins to grotes; and dividing the grotes by 12 and 20 would reduce them to pounds. Thus, using the same example—

| . f.                   | st.  |      |    |         |       |        |      |
|------------------------|------|------|----|---------|-------|--------|------|
| 165                    | 19   |      |    |         | *     |        |      |
| 20                     |      |      |    |         |       |        |      |
| 3319                   |      |      |    |         |       |        |      |
| 2                      | •    |      |    |         |       |        |      |
| $12)\overline{6638}$ . |      |      |    |         |       |        |      |

### EXERCISES.

56. In 142 florins 17 stivers, how many pounds, &c., Ans. £23 16s. 2d.

57. In 72 florins 14 stivers, how many pounds, &c., Ans. £12 2s. 4d.

58. In 180 florins, how many pounds, &c. ? Ans. £30

11. To reduce pounds, &c., to florins, &c.-

RULE.—Multiply the stivers by 6; add to the product half the number of grotes, then for every 20 contained in the sum carry 1, and set down what remains above the twenties as stivers. Multiply the pounds by 6, and, adding to the product what is to be carried from the stivers, consider the sum as florins.

EXAMPLE.—How many florins and stivers in 27 pounds, 13 skillings, and 2 grotes ?

| £  | s. | d. |  |
|----|----|----|--|
| 27 | 13 | 2  |  |
|    | 6  |    |  |

## 165fl. 19st., the required sum.

6 times 13 are 78, which, with half the number  $(\frac{3}{2})$  of grotes, make 79 stivers—or 3 florins and 19 stivers (3 twenties, and 19); putting down 19 we carry 3. 6 times 27 are 162, and the 3 to be carried are 165 florins.

This rule is merely the converse of the last. It is evident that multiplying by 20 and 12, and dividing the product by 2 and 20, would give the same result. Thus

d.

| £ s.<br>27 13<br>20 |

7. How is current reduced to bank meney? [6].

8. How is foreign reduced to British money? [7].

9. How is British reduced to foreign money ? [8].

10. How are florins, &c., reduced to pounds Flemish, &c.? [9].

11. How are pounds Flemish, &c., reduced to florins, &c.? [11].

## ARBITRATION OF EXCHANGES.

12. In the rule of exchange only two places are concerned; it may sometimes, however, be more beneficial to the merehant to draw through one or more other places. The mode of estimating the value of the money of any place, not drawn directly, but through one or more other places, is called the arbitration of exchanges, and is either simple or compound. It is "simple" when there is only one intermediate place, "compound" when there are more than one.

All questions in this rule may be solved by one or more proportions.

13. Simple Arbitration of Exchanges.—Given the course of exchange between each of two places and a third, to find the par of exchange between the former.

RULE.—Make the given sums of money belonging to the third place the first and second terms of the proportion; and put, as third term, the equivalent of what is in the first. The fourth proportional will be the value of what is in the second term, in the kind of money contained in the third term.

# ARBITRATION OF EXCHANGES.

EXAMPLE.—If Loudon e-changes with Paris at 10*d*. per franc, and with Amsterdam at 34*s*. 8*d*. per £1 sterling, what ought to be the course of exchange, between Paris and Amsterdam, that a merchant may without loss remit-from London to Amsterdam through Paris ?

 $\pounds 1$ : 10d.:: 34s. 8d. (the equivalent, in Flemish money, of  $\pounds 1$ ): ? the equivalent of 10d. British (or of a frame) in Flemish money.

Or 240 : 10 :: 34s. 8d. :  $\frac{34s. 8d. \times 10}{240} = 17\frac{1}{3}d.$ , the re-

quired value of 10*d*. British, or of a franc, in Flemish money.  $\pounds 1$  and 10*d*. are the two given sums of English money, or that which belongs to the *third* place; and 34*s*. 8*d*. is the given equivalent of  $\pounds 1$ .

It is evident that,  $17\frac{1}{3}d$ . (Flemish) being the value of 10d., the equivalent in British money of a franc, when more than  $17\frac{1}{3}d$ . Flemish is given for a franc, the merchant will gain it he remits through Paris, since he will thus indirectly receive more than  $17\frac{1}{3}d$ . for 10d. sterling—that is, more than its equivalent, in Flemish money, at the given course of exchange between London and Amsterdam. On the other hand, if less than  $17\frac{1}{3}d$ . Flemish is allowed for a franc, he will lose by remitting though Paris; since he will receive a franc for 10d. (British); but he will not receive  $17\frac{1}{3}d$ . for the franc:—while, had he remitted 10d., the value of the franc, to Amsterdam directly, he would have been allowed  $17\frac{1}{3}d$ .

### EXERCISES.

1. If the exchange between London and Amsterdam is 33s. 9d. per pound sterling and the exchange between London and Paris  $9\frac{1}{2}d$ . per franc, what is the *par* of exchange between Amsterdam and Paris? Ans. Nearly 16d. Flemish per franc.

2. London is indebted to Petersburgh 5000 rubles; while the exchange between Petersburgh and London is at 50*d*. per ruble, but between Petersburgh and Holland it is at 90*d*. Flemish per ruble, and Holland and England at 36*s*. 4*d*. Flemish per pound sterling. Which will be the more advantageous method for London to be drawn upon—the direct or the indirect? Ans. London will gain £9 11*s*.  $1\frac{6.3}{1.6\frac{3}{7.0\frac{1}{2}}d}$ . if it makes payments by way of Holland.

5000 rubles=£1041 13s. 4d. British. or £1875 Flemish, but £1875 Flemish=£1032 2s.  $2\frac{40}{100}d$ . British.

ients nish,

14. Compound Arbitration of Exchanges.-To find what should be the course of exchange between two places, through two or more others, that it may be on a par with the course of exchange between the same two places, directly-

RULE .- Having reduced monies of the same kind to the same denomination, consider each course of exchange as a ratio; set down the different ratios in a vertical column, so that the antecedent of the second shall be of the same kind as the consequent of the first, and the antceedent of the third, of the same kind as the conscquent of the second-putting down a note of interrogation for the unknown term of the imperfect ratio. Then divide the product of the consequents by the product of the antecedents, and the quotient will be the value of the given sum if remitted through the intermediate places.

Compare with this its value as remitted by the direct exchange.

15. EXAMPLE .- £824 Flemish being due to me at Amsterdam, it is remitted to France at 16d. Flemish per frane; from France to Venice at 300 francs per 60 ducats: from Venice to Hamburgh at 100d. per ducat; from Hamburgh to Lisbon at 50*d*. per 400 rees; and from Lisbon to England at 5s. 8*d*. sterling per milree. Shall I gain or lose, and how much, the exchange between England and Amsterdam being 34s. 4d. per £1 sterling ?

15d. : 1 frane.

300 francs.: 60 ducats.

1 ducat : 100 pence Flemish.

50 pence Flemish : 400 rees.

1000 rees : 68 pence British.

? : £824 Flemish.

 $1 \times 60 \times 100 \times 400 \times 68 \times 824$  $16 \times 300 \times 1 \times 50 \times 1000$  =(if we reduce the terms

 $[Sec. V. 47]) \frac{17 \times 824}{25} = \pounds 560 \ 6s. \ 4\frac{4}{3}d.$ 

But the exchange between England and Amsterdam for £824 Flemish is £480 sterling.

Since 34s. 4d. :  $\pounds 824$  ::  $\pounds 1$  :  $\pounds 824$  ::  $\pounds 1$  :  $\pounds 824$ 

I gain therefore by the circular exchange £560 6s. 44d. minus £480==£80 6s. 4td.

If commission is charged in any of the places, it must be deducted from the value of the sum which can be obtained in that place.

The process given for the compound arbitration of exchange may be proved to be correct, by putting down the different proportions, and solving them in succession. Thus, if 16d. are equal to 1 frane, what will 300 frames (=60 duents) be worth. If the quantity last found is the value of 60 duents, what will be that of one ducat (=100d.), &c. ?

## EXERCISES.

3. If London would remit £1000 sterling to Spain, the direct exchange being  $42\frac{1}{4}d$ . per piastre of 272 maravedis; it is asked whether it will be more profitable to remit directly, or to remit first to Holland at 35s. per pound; thenee to France at  $19\frac{1}{4}d$ . per franc; thence to Venice at 300 frances per 60 ducats; and thence to Spain at 360 maravedis per ducat? Ans. The circular exchange is more advantageous by 103 piastres, 3 reals,  $19\frac{2}{4}$  maravedis.

4. A merchant at London has credit for 680 piastres at Leghorn, for which he can draw directly at 50d. per piastre; but choosing to try the circular way, they are by his orders remitted first to Venice at 94 piastres per 100 ducats; thence to Cadiz at 320 maravedis per ducat; thence to Lisbon at 630 rees per piastre of 272 maravedis; thence to Amsterdam at 50d. per crusade of 400 rees; thence to Paris at  $18\frac{2}{3}d$ . per frane; and thence to London at  $10\frac{1}{2}d$ . per frane; how much is tho eircular remittance better than the direct draft, reekoning  $\frac{1}{2}$  per cent. for commission? Ans. £14 12s. 74d

16. To estimate the gain or loss per cent.-

RULE.—Say, as the par of exchange is to the course of exchange, so is £100 to a fourth proportional. From this subtract £100.

EXAMPLE.—The par of exchange is found to be 18<sup>1</sup>/<sub>d</sub>. Flemish, but the course of exchange is 19d. per franc; what is the gain per cent. ?

181d. : 16 l. ::  $\pounds 100$  :  $\frac{\pounds 19 \times 100}{18\frac{1}{3}} = \pounds 104$  7s. 11d.

Thus ( £4 7s. 1) If in paid, it is

5. The but the event. ? 6. The course is  $6s. 11\frac{1}{2}d$ 7. The course of Ans. £1

1. W 2. W pound an 3. W 4. W 5. Ho any plac 6. Ho

gain or l certain j Given gain or l Rule and at th or loss o

0.17. 1

EXAMP 6d., and The to The to The to

Thus the gain per cent.= $\pounds 104$  7s. 11d. minus  $\pounds 100=$  $\pounds 4$  7s. 11d. if the merchant remits through Paris.

If in remitting through Paris commission must be paid, it is to be deducted from the gain.

#### EXERCISES.

5. The par of exchange is found to be  $18\frac{3}{4}d$ . Flemish, but the course of exchange is  $19\frac{1}{3}d$ , what is the gain per cent. ? Ans. £4 18s.  $2\frac{1}{4}d$ .

6. The par of exchange is  $17\frac{3}{2}d$ . Flemish, but the course is  $18\frac{3}{3}d$ ., what is the gain per cent.? Ans. £4 6s.  $11\frac{1}{2}d$ .

7. The par of exchange is  $18\frac{1}{4}d$ . Flemish, but the course of exchange is  $17\frac{2}{2}\frac{2}{3}d$ , what is the loss per cent. ? Ans. £1 16s. 2d.

## QUESTIONS.

1. What is meant by arbitration of exchanges? [12].

2. What is the difference between simple and compound arbitration? [12].

3. What is the rule for simple arbitration ? [13].

4. What is the rule for compound arbitration ? [14].

5. How are we to act if commission is charged in any place? [15].

6. How is the gain or loss per cent. estimated ? [16].

## PROFIT AND LOSS.

17. This rule enables us to discover how much we gain or lose in mercantile transactions, when we sell at certain prices.

Given the prime cost and selling price, to find the gain or loss in a certain quantity.

RULE.—Find the price of the goods at prime cost and at the selling price; the difference will be the gain or loss on a given quantity.

EXAMPLE.—What do I gain, if I buy 460 lb of butter at 6d, and sell it at 7d. per lb ?

The total prime cost is  $460d. \times 6=2760d$ . The total selling price is  $460d. \times 7=3220d$ . The total gain is 3220d. minus  $2760d.=460d.=\pounds1$  18s. 4d.

1. Bought 140 fb of butter. at 10d. per lb, and sold it at 14d. per fb; what was gained? Ans. 22 6s. 8d.

2. Bought 5 cwt., 3 qrs., 14 lb of cheese, at £2 12s. per cwt., and sold it for £2 18s. per cwt. What was the gain upon the whole? Ans. £1 15s. 3a.

3. Bought 5 cwt., 3 qrs., 14 fb of bacon, at 34s. per cwt., and sold it at 36s. 4d. per cwt. What was the gain on the whole? Ans. 13s.  $8\frac{1}{2}d$ .

4. If a chest of tea, containing 144 lb is bought for 6s. Sd. per lb, what is the gain, the price received for the whole being £57 10s. ? Ans. £9 10s.

18. To find the gain or loss per cent.-

RULE.—Say, as the cost is to the selling price, so is £100 to the required sum. The fourth proportionalminus £100 will be the gain per cent.

EXAMPLE 1.—What do I gain per cent. if I buy 1460 lb of beef at 3d, and sell it at  $3\frac{1}{3}d$ . per lb ?

 $3d \times 1460 = 4380d$ , is the cost price.

And  $3\frac{1}{2}d \times 1460 = 5110d$ , is the selling price.  $5110 \times 100$ 

Then  $4380 : 5110 :: 100 : \frac{110}{4380} = \pounds 116$  13s. 4d. Ans. £116 13s. 4d. minus £100 (=£16 13s. 4d.) is the gain per cent.

REASON OF THE RULE.—The price is to the price plus the gain in one case, as the price (£100) is to the price plus the gain (£100+the gain on £100) in another.

Or, the price is to the price plus the gain, as any multiple or part of the former (£100 for instance) is to an equimultiple of the latter (£100+the gain on £100).

EXAMPLE 2.—A person sells a horse for  $\pounds 40$ , and loses 9 per cent., while he should have made 20 per cent. What is his entire loss ?

£100 minus the loss, per cent., is to £100 as £40 (what the horse cost, minus what he lost by it) is to what it cost. 91 : 100 :: 40 :  $\frac{100 \times 40}{91}$  =£43 19s.  $1\frac{1}{2}d$ , what the horse cost.

But the person should have gained 20 per cent., or  $\frac{1}{5}$  of the price; therefore his profit should have been £43 19s.  $1\frac{1}{3}d$ .

 $-\frac{1}{5} = \mathcal{L}8 \ 15s. \ 9^{3}_{4}d.$  And

#### EXERCISES.

5. Bought beef at 6d. per 1b, and sold it at 8d. What what was the gain per cent.? Ans.  $33\frac{1}{3}$ .

6. Bought tea for 5s. per lb, and sold it for 3s. What was the loss per cent.? Ans. 40.

7. If a pound of tea is bought for 6s. 6d., and sold for 7s. 4d., what is the gain per cent.? Ans.  $12\frac{32}{34}$ .

8. If 5 cwt., 3 qrs., 26 lb, are bought for £9 8s., and sold for £11 18s. 11*d*., how much is gained per cent.? Ans.  $27\frac{47}{564}$ .

9. When wine is bought at 17s. 6d. per gallon, and, sold for 27s. 6d., what is the gain per cent.? Ans. 574. 10. Bought a quantity of goods for £60, and sold them for £75; what was the gain per cent.? Ans. 25.

11. Bought a tun of wine for £50, ready money, and sold it for £54 10s., payable in 8 months. How much per cent. per anaum is gained by that rate ? Ans.  $13\frac{1}{2}$ .

12. Having sold 2 yards of cloth for 11s. 6d., 1 gained at the rate of 15 per cent. What would I have gained if I had sold it for 12s.? Ans. 20 per cent.

13. If when I sell cloth at 7s. per yard, I gain 10 per cent.; what will I gain per cent. when it is sold for 8s. 6d.? Ans. £33 11s.  $5\frac{1}{4}d.$ 

7s. : 8s. 6d. :: £110 : £133 11s. 51d. And £133 11s. 51d.  $\pm 233$  11s. 51d.  $\pm 233$  11s. 51d., is the required gain.

19. Given the cost price and gain, to find the selling price-

RULE.—Say, as £100 is to £100 plus the gain per cent., so is the cost price to the required selling price.

EXAMPLE.—At what price per yard must I sell 427 yards of cloth which I bought for 19s. per yard, so that I may gain 8 per cent.?

100 : 108 :: 19s. : 
$$\frac{108 \times 19s}{100} = \mathcal{L}1$$
 0s. 64d.

This result may be proved by the last rule.

#### EXERCISES.

14. Bought velvet at 4s. 8d. per yard; at what price must I sell it, so as to gain  $12\frac{1}{2}$  per cent.? Ans. At 5s. 3d.

15. Bought muslin at 5s. per yard; how must it be sold, that I may lose 10 per cent.? Ans. At 4s. 6d.

16. If a tun of brandy costs £40, how must it be sold, to gain  $6\frac{1}{4}$  per cent.? Ans. For £42 10s.

17. Bought hops at £4 16s. per cwt.; at what rate must they be sold, to lose 15 per cent.? Ans. For £4 1s.  $7\frac{1}{5}d$ .

18. A merchant receives 180 easks of raisins, which stand him in 16s. each, and trucks them against other merchandize at 28s. per cwt., by which he finds he has gained 25 per cent.; for what, on an average, did he sell each cask? Ans. 80 lb, nearly.

20. Given the gain, or loss per cent., and the selling price, to find the cost price—

RULE.—Say, as £100 plus the gain (or as £100 minus the loss) is to £100, so is the selling to the cost price.

EXAMPLE 1.—If I sell 72 lb of tea at 6s. per lb, and gain 9 per cent., what did it cost per lb?

109 : 100 :: 6 :  $\frac{\pounds 100 \times 6}{109}$  = 5s. 6d.

What produces  $\pounds 109$  cost  $\pounds 100$ ; therefore what produces 6s. must, at the same rate, cost 5s. 6d.

EXAMPLE 2.—A merchant buys 97 easks of butter at 30s. each, and selling the butter at  $\pounds 4$  per ewt., makes 20 per cent.; for how much did he buy it per cwt.?

 $30s. \times 97 = 2910s.$ , is the total price.

Then 100 : 120 :: 2910 :  $\frac{2910s}{100} = 3492s$ , the selling price. And  $\frac{3492s}{80s} = \frac{3492s}{\pounds} = 43.65$ , is the number of ewt. ; and  $\frac{43.65}{97} = 50\frac{194}{55}$  b, is the average weight of each cask.

Then  $50_{485}^{194}: 112:: 30: \frac{112 \times 3}{50_{485}^{194}} = 66s. 8d. = £3 6s.$ 8d., the required cost price, per cwt. 19. 1 and lost 22s. 23 20. 1 and gain 18s. 27 21. 1 gained a Ans. 8s 22. 1 sold fon  $8s. 1\frac{1}{2}d$ 23. 1 sold for £23 13

19. Having sold 12 yards of cloth at 20s. per yard, and lost 10 per cent., what was the prime cost? Ans.  $22s. 2\frac{3}{2}d.$ 

20. Having sold 12 yards of cloth at 20s. per yard, and gained 10 per cent., what was the prime cost? Ans. 18s.  $2\frac{2}{11}d$ .

21. Having sold 12 yards of cloth for £5 14s., and gained 8 per cent., what was the prime cost per yard? Ans. 8s.  $9\frac{5}{2}d$ .

22. For what did I buy 3 cwt. of sugar, which I sold for  $\pounds 6$  3s., and lost 4 per cent.? Ans. For  $\pounds 6$  8s.  $1\frac{1}{2}d$ .

23. For what did I buy 53 yards of cloth, which I sold for £25, and gained £5 10s. per cent.? Ans. For £23 13s.  $11\frac{1}{4}d$ .

#### QUESTIONS.

1. What is the object of the rule? [17].

2. Given the prime cost and selling price, how is the profit or loss found? [17].

3. How do we find the profit or loss per cent? [18].

4. Given the prime cost and gain, how is the selling price found? [19]. -

5. Given the gain or loss per cent. and selling price, how do we find the cost price? [20].

## FELLOWSHIP.

21. This rule enables us, when two or more persons are joined in partnership, to estimate the amount of profit or loss which belongs to the share of each.

Fellowship is either *single* (simple) or *double* (compound). It is single, or simple fellowship, when the different stocks have been in trade for the *same* time. It is double, or compound fellowship, when the different stocks have been employed for *different* times.

This rule also enables us to estimate how much of a bankrupt's stock is to be given to each creditor.

price s. At

it be 6d. it be

t rate or £4

which other he has he sell

selling

minus ice.'

1 gain

at pro-

at 30s. 20 per

s., the

of each

£3 6s. .

22. Single Fellowship.—RULE.—Say, as the whole stock is to the whole gain or loss, so is each person's contribution to the gain or loss which belongs to him.

EXAMPLE.—A put  $\pounds$ 720 into trade, B  $\pounds$ 340, and C  $\pounds$ 960; and they gained  $\pounds$ 47 by the traffic. What is B's share of it?

| t   |
|-----|
| 720 |
| 340 |
| 960 |

|      |   |     |    |      |   | $\pm 47 \times 340$   |  |
|------|---|-----|----|------|---|---|--|
| 2020 | : | £47 | :: | £340 | : | $\frac{\pounds 47 \times 340}{2020} = \pounds 7 \ 18s. \ 2\frac{1}{2}d$ |  |

Each person's gain or loss must evidently be proportional to his contribution.

## EXERCISES.

1. B and C buy certain merchandizes, amounting to £80, of which B pays £30, and C £50; and they gain £20. How is it to be divided? Ans. B £7 10s., and C £12 10s.

2. B and C gain by trade £182; B put in £300, and C £400. What is the gain of each? Ans. B £78, and C £104.

3. 2 persons are to share £100 in the proportions of 2 to B and 1 to C. What is the share of each? Ans. B  $\pounds 66\frac{2}{3}$ , C  $\pounds 33\frac{1}{3}$ .

4. A merchant failing, owes to B £500, and to C £900; but has only £1100 to meet these demands. How much should each creditor receive? Ans. B £392 $\frac{6}{7}$ , and C £707 $\frac{1}{7}$ .

5. Three merchants load a ship with butter; B gives 200 casks, C 300, and D 400; but when they are at sea it is found necessary to throw 180 casks overboard. How much of this loss should fall to the share of each merchant? Ans. B should lose 40 casks, C 60, and D 80.

6. Three persons are to pay a tax of £100 according to their estates. B's yearly property is £800, C's £600, and D's £400. How much is each person's share ? Aus. B's is £44 $\frac{4}{9}$ , C's £33 $\frac{1}{3}$ , and D's £92 $\frac{5}{9}$ .

7. Divide 120 into three such parts as shall be to each other as 1, 2, and 3? Ans. 20, 40, and 60.

A ship worth £900 is entirely lost; 1 of it belonged to B, 1 to C, and the rest to D. What should be the loss of each, £540 being received as insurance ? Ans. B £45, C £90, and D £225.

9. Three persons have gained £1320; if B were to take £6, C ought to take £4, and D £2. What is each person's share? Ans. B's £660, C's £440. and D's £220.

10. B and C have gained £600; of this B is to have 10 per cent. more than C. How much will each receive ? Ans. B £3142, and C £2855.

11. Three merchants form a company; B puts in £150, and C £260; D's share of £62, which they gained, comes to £16. How much of the gain belongs to B, and how much to C; and what is D's share of the stock ? Ans. B's profit is £16 16s. 771d., C's £29 3s. 44 d.; and D put in £142 12s. 22 d.

12. Three persons join; B and C put in a certain stock, and D puts in £1090; they gain £110, of which B takes £35, and C £29. How much did B and C put in; and what is D's share of the gain? Ans. B put in £829 6s. 11113. C £687 3s. 517.d.; and D's part of the profit is £46.

13. Three farmers hold a farm in common; one pays £97 for his portion, another £79, and the third £100. The county cess on the farm amounts to £34; what is each person's share of it? Ans. £11 18s. 1119. c.; £9 14s.  $7\frac{15}{23}d$ .; and £12 6s.  $4\frac{12}{23}d$ .

23. Compound Fellowship.-Rule.-Multiply each person's stock by the time during which it has been in trade; and say, as the sum of the products is to the whole gain or loss, so is each person's product to his share of the gain or loss.

EXAMPLE.-A contributes £30 for 6 months, B £84 for 11 months, and C £96 for 8 months; and they lose £14. What is C's share of this loss ?

 $30 \times 6 = 180$  for one month.  $84 \times 11 = 924$  for one month.  $= \pounds 1872$  for one month.  $96 \times 8 = 768$  for one month.

 $1872: \pounds 14::\pounds 768: \frac{\pounds 14 \times 768}{1970} = \pounds 6$  1s. 4<sup>1</sup>d., C's share 1872

24. REASON OF THE RULE — It is clear that £30 contributed for 6 months are, as far as the gain or the loss to be derived from it is concerned, the same as 6 times £30 - or £180 contributed for 1 month. Hence A's; contribution may be taken as £180 for 1 month; and, for the same reason, B's as £924 for the same time; and C's as £768 also for the same time This reduces the question to one in simple fellowship [22].

## EXERCISES.

14. Three merchants enter into partnership; B puts in £89 5s. for 5 months, C £92 15s. for 7 months, and D £38 10s. for 11 months; and they gain £86 16s. What should be each person's share of it? Ans. B's £25 10s., C's £37 2s., and D's £24 4s.

15. B, C, and D pay £40 as the year's rent of a farm. B puts 40 cows on it for 6 months, C 30 for 5 months, and D 50 for the rest of the time. How much of the rent should each person pay? Ans. B £21 $\frac{9}{11}$ , C £13 $\frac{7}{11}$ , and D £4 $\frac{6}{11}$ .

16. Three dealers, A, B, and C, enter into partnership, and in a certain time make £291 13s. 4d. A's stock, £150, was in trade 6 months; B's, £200, 3 months; and C's, £125, 16 months. What is each person's share of the gain? Ans. A's is £75, B's £50, and C's £166 13s. 4d.

17. Three persons have received £665 interest; B had put in £4000 for 12 months, C £3000 for 15 months, and D £5000 for 8 months; how much is each person's part of the interest? Ans. B's £240, C's £225, and D's £200.

18. X, Y, and Z form a company. X's stock is in trade 3 months, and he claims  $\frac{1}{12}$  of the gain; Y's stock is 9 months in trade; and Z advanced £756 for 4 months, and claims half the profit. How much did X and Y contribute? Ans. X £168, and Y £280.

It follows that Y's gain was  $\frac{5}{12}$ . Then  $\frac{1}{2}$ :  $\frac{1}{12}$ :: £756×4: 504=X's product, which, being divided by his number of months, will give £168, as his contribution. Y's share of the stock may be found in the same way.

19. Three troops of horse rent a field, for which they pay £80; the first sent into it 56 horses for 12 days, the

second What 10s., t 20. the fir a sum for a t receiv and C Ans.

£800; and C A is What B's £4

1. 2. fellows names 3. ship?

second 64 for 15 days, and the third 80 for 18 days. What must each pay? Ans. The first must pay £17 10s., the second £25, and the third £37 10s.

20. Three merchants are concerned in a steam vessel; the first, A, puts in £240 for 6 months; the second, B, a sum unknown for 12 months; and the third, C, £160, for a time not known when the accounts were settled. A received £300 for his stock and profit, B £600 for his, and C £260 for his; what was B's stock, and C's time? Ans. B's stock was £400; and C's time was 15 months.

If £300 arise from £240 in 6 months, £600 (B's stock and profit) will be found to arise from £400 (B's stock) in 12 months.

Then £400 : £160 :: £200 (the profit on £400 in 12 months): £80 (the profit on £160 in 12 months). And £160+ 80 (£160 with its profit for 12 months) : £260 (£160 with its profit for some other time) :: 12 (the number of months in the one case) :  $\frac{260 \times 12}{160+80}$  (the number of months in the other case)==13, the number of months required to produce the difference between £160, C's stock, and the £260, which he received.

21. In the foregoing question A's gain was £60 during 6 months, B's £200 during 12 months, and C's £100 during 13 months; and the sum of the products of their stocks and times is 8320. What were their stocks? Ans. A's was £240, B's £400, and C's £160.

22. In the same question the sum of the stocks is  $\pounds 800$ ; A' stock was in trade 6 months, B's 12 months, and C's 15 months; and at the settling of accounts, A is paid £60 of the gain, B £200, and C £100. What was each person's stock? Ans. A's was £240, B's £400, and C's £160.

#### QUESTIONS.

## BARTER.

#### BARTER.

25. Barter enables the merchant to exchange one commodity for another, without either loss or gain.

RULE.—Find the price of the given quantity of one kind of merchandise to be bartered; and then ascertain how much of the other kind this price ought to purchase.

EXAMPLE 1.—How much tea, at 8s. per lb, ought to be given for 3 ewt. of tallow, at  $\pounds 1$  16s. 8d. per cwt. ?

5 10 0 is the price of 3 cwt. of tallow.

And £5 10s.  $\div$  8s.  $=13\frac{6}{8}$ , is the number of pounds of tea which £5 10s., the price of the tallow, would purchase.

There must be so many pounds of tea, as will be equal to the number of times that 8s. is contained in the price of the tallow.

EXAMPLE 2.—I desire to barter 96 fb of sugar, which cost me 8d. per 1b, but which I sell at 13d., giving 9 months' credit, for calico which another merchant sells for 17d. per yard, giving 6 months' credit. How much calico ought I to receive ?

I first find at what price I could sell my sugar, were I to give the same credit as he does—

If 9 months give me 5d. profit, what ought 6 months to give ?

$$9:6::5:\frac{6\times 5}{9}=\frac{30}{9}=3\frac{1}{3}d.$$

Hence, were I to give 6 months' credit, I should charge  $11\frac{1}{3}d$ . per ib. Next—

As my selling price is to my buying price, so ought his selling to be to his buying price, both giving the same credit.

$$11_{\frac{1}{3}}: 8:: 17: \frac{8 \times 17}{11_{\frac{1}{3}}} = 12d.$$

The price of my sugar, therefore, is  $96 \times 8d$ ., or 768d.; and of his calico, 12d. per yard.

Hence  $\frac{763}{12} = 64$ , is the required number of yards.

#### BARTER

#### EXERCISES.

1. A merchant has 1200 stones of tallow, at 2s.  $3\frac{1}{4}d$ . the stone; B has 110 tanned hides, weight 3994 lb, at  $5\frac{3}{4}d$ . the lb; and they barter at these rates. How much money is A to receive of B, along with the hides? Ans.  $\pounds 40$  11s.  $2\frac{1}{2}d$ .

2. A has silk at 14s. per lb; B has cloth at 12s. 6d. which cost only 10s. the yard. How much must A charge for his silk, to make his profit equal to that of B? Ans. 17s. 6d.

3. A has coffee which he barters at 10*d*. the lb more than it cost him, against tea which stands B in 10*s*., but which he rates at 12*s*. 6*d*. per lb. How much did the coffee cost at first? Ans. 3*s*. 4*d*.

4. K and L barter. K has cloth worth Ss. the yard, which he barters at 9s. 3d. with L, for linen cloth at 3s. per yard, which is worth only 2s. 7d. Who has the advantage; and how much linen does L give to K, for 70 yards of his cloth? Ans. L gives K  $215\frac{5}{6}$  yards; and L has the advantage.

5. B has five tons of butter, at £25 10s. per ton, and  $10\frac{1}{2}$  tons of tallow, at £33 15s. per ton, which he barters with C; agreeing to receive £150 1s. 6d. in ready money, and the rest in beef, at 21s. per barrel. How many barrels is he to receive? Ans. 316.

6. I have eloth at Sd. the yard, and in barter charge for it at 13d., and give 9 months' time for payment; and hant has goods which cost him 12d. per b, an hich he gives 6 months' time for payment. How hich he charge his goods to make an equal barter is and. At 17d.

7. I barter goods which cost Sd. per lb, but for which I charge 13d., giving 9 months' time, for goods which are charged at 17d., and with which 6 months' time are given. Required the cost of what I receive? Ans. 12d.

8. Two persons barter; Λ has sugar at Sd. per lb, charges it at 13d., and gives 9 months time; B has at 12d. per lb, and charges it at 17d. per lb. How time must B give, to make the barter equal? 6 months.

## QUESTIONS.

1. What is barter ? [25].

2. What is the rule for barter ? [25].

# ALLIGATION.

.26. This rule enables us to find what mixture will be produced by the union of certain ingredients—and then it is called alligation *medial*; or what ingredients will be required to produce a certain mixture—when it is termed alligation *alternate*; further division of the subject is unnecessary:—it is evident that any change in the amount of one ingredient of a given mixture must produce a proportional change in the amounts of the others, and of the entire quantity.

27. Alligation Medial.—Given the rates or kinds and quantities of certain ingredients, to find the mixture they will produce—

RULE.—Multiply the rate or kind of each ingredient by its amount; divide the sum of the products by the number of the lowest denomination contained in the whole quantity, and the quotient will be the rate or kind of that denomination of the mixture. From this may be found the rate or kind of any other denomination.

EXAMPLE 1.—What ought to be the price per 1b, of a mixture containing 98 lb of sugar at 9d. per 1b, 87 lb at 5d., and 34 lb at 6d.

| d.<br>9×98<br>5×87<br>6×34 | 11 11 11 | $d. \\ 882 \\ 435 \\ 204$ |
|----------------------------|----------|---------------------------|
| 219                        | -        | 1521                      |

# Ans. 7d. per Ib, nearly.

The price of each sugar, is the number of pence per pound multiplied by the number of pounds; and the price of the whole is the sum of the prices. But if 219 lb of sugar have cost 1521*d*., one lb, or the 219th part of this, must cost the 219th part of 1521*d*., or  $\frac{152}{219}$  *d*. ==7*d*., nearly.

Ex conta per it

And In treduce ounce, -Exa and 2 mixtur In tr sented

gallon, gallons Ans. 1 2. 1 at 9½ much 1 3. 1 fine, 12 wish to Ans. 2 28. mixture amount RUL given n

1. .

EXAMPLE 2.—What will be the price per lb of a mixture containing 9 lb 6 oz. of tea at 5s. 6d. per lb, 18 lb at 6s. per lb, and 46 lb 3 oz. at  $9s. 4\frac{1}{2}d.$  per lb?

| $\frac{9}{18}$ | 6 at 5<br>0 6 | $\begin{array}{cccccccccccccccccccccccccccccccccccc$ |  |
|----------------|---------------|--|--|
| 73<br>16       | 9             | $\frac{1177)29}{Ans. 6d.} \text{ per oz. nearly.}$   |  |

1177 ounces.

And  $6d. \times 16 = 8s.$ , is the price per pound.

In this case, the lowest denomination being ounces, we reduce the whole to ounces; and having found the price of an ounce, we multiply it by 16, to find that of a pound.

EXAMPLE 3.—A goldsmith has 3 lb of gold 22 carats fine, and 2 lb 21 carats fine. What will be the fineness of the mixture?

In this case the value of each kind of ingredient is represented by a number of carats—

## 1bs3 × 22 = 662 × 21 = 42 $\overline{5} 5)108$

# The mixture is 213 carats fine.

## EXERCISES.

1. A vintner mixed 2 gallons of wine, at 14s. per gallon, with 1 gallon at 12s., 2 gallons at 9s., and 4 gallons at 8s. What is one gallon of the mixture worth? Ans. 10s.

2. 17 gallons of ale, at 9*d*. per gallon, 14 at  $7\frac{1}{2}d$ ., 5 at  $9\frac{1}{2}d$ ., and 21 at  $4\frac{1}{2}d$ ., are mixed together. How much per gallon is the mixture worth ? Ans.  $7\frac{1}{5}d$ . 3. Having melted together 7 oz. of gold 22 carats

3. Having melted together 7 oz. of gold 22 carats fine,  $12\frac{1}{2}$  oz. 21 carats fine, and 17 oz. 19 carats fine, I wish to know the fineness of each ounce of the mixture ? Ans.  $20\frac{1}{79}$  carats.

28. Alligation Alternate.—Given the nature of the mixture, and of the ingredients, to find the relative amounts of the latter—

RULE.—Put down the quantities greater than the given mean (each of them connected with the difference

then then s will it is the hange xture ounts

kinds kture

lient the the c or this tion.

of a b at

ind the ive the

between it and the mean, by the sign -) in one column; put the differences between the remaining quantities and the mean (connected with the quantities to which they belong, by the sign +) in a column to the right hand of the former. Unite, by a line, each *plus* with some *minus* difference; and then each difference will express how much of the quantity, with whose difference it is connected, should be taken to form the required mixture.

If any difference is connected with more than one other difference, it is to be considered as repeated for each of the differences with which it is connected; and the sum of the differences with which it is connected is to be taken as the required amount of the quantity whose difference it is.

EXAMPLE 1.—How many pounds of tea, at 5s. and 8s. per ib, would form a mixture worth 7s. per ib ?

# Price. Differences. Price. $s. \quad s. \quad s. \quad s. \quad s.$ The mean=8 - 1 - - 2 + 5 =the mean.

1 is connected with 2s., the difference between the mean and 5s.; hence there must be 1 lb at 5s. 2 is connected with 1, the difference between 8s. and the mean; hence there must be 2 lb at 8s. Then 1 lb of tea at 5s. and 2 lb at 8s. per lb, will form a mixture worth 7s. per lb—as may be proved by the last rule.

It is evident that any equimultiples of these quantities would answer equally well; hence a great number of answers may be given to such a question.

EXAMPLE 2.—How much sugar at 9d., 7d., 5d., and 10d., will produce sugar at 8d. per lb?

## Prices. Differences. Prices.

The mean=  $\begin{cases} d. \ d. \ d. \ d. \ d. \\ 9-1-1+7\\ 10-2-3+5 \end{cases}$  = the mean.

1 is connected with 1, the difference between 7d. and the mean; hence there is to be 1 lb of sugar at 7d. per lb. 2 is connected with 3, the difference between 5d. and the mean; hence there is to be 2 lb at 5d. 1 is connected with 1, the difference between 9d. and the mean; hence there is to be 1 lb at 9d. And 3 is connected with 2, the difference between 10d. and the mean; hence there are to be 3 lb at 10d. per lb.

Conse 1 lb at ( these wi

'Exami 9s. per fi

Т

Exami 8s., 9s., 6s. per 1

1 ib at ib at 5s., form the

29. Re above th wants of at 5s. per 2s. excess In exac gives an of 1d. ex Again, worth ju &verago

Consequently we are to take 1 lb at 7d., and 2 lb at 5d., 1 lb at 9d., and 3 lb at 10d. If we examine what mixture these will give [27], we shall find it to be the given mean.

EXAMPLE 3.—What quantities of tea at 4s., 6s., 8s., and 9s. per lb, will produce a mixture worth 5s.?

13, 1, and 4 are connected with 1s., the differece between 4s. and the mean; therefore we are to take 3 1b + 1 1b + 41b of tea, at 4s. per 1b. 1 is connected with 3s., 1s., and 4s., the differences between 8s., 6s., and 9s., and the mean; therefore we are to take 1 1b of tea at 8s., 1 1b of tea at 6s., and 1 1b of tea at 9s. per 1b.

We find in this example that 8s., 6s., and 9s. are all connected with the same 1; this shows that 1 lb of each will be required. 4s. is connected with 3, 1, and 4; there must be, therefore, 3+1+4 lb of tea at 4s.

EXAMPLE 4.—How much of anything, at 3s., 4s., 5s., 7s., 8s., 9s., 11s., and 12s. per 1b, would form a mixture worth 6s. per 1b?

Prices. Differences. Prices.

1 lb at 3s., 2 lb at 4s., 3 lb at 7s., 2 lb at 8s., 3+5+6 (14) lb at 5s., 1 lb at 9s., 1 lb at 11s., and 1 lb at 12s. per lb, will form the required mixture.

29. REASON OF THE RULE.—The excess of one ingredient above the mean is made to counterbalance what the other wants of being equal to the mean. Thus in example 1, 1 lb at 5s. per lb gives a *deficiency* of 2s. : but this is corrected by 2s. excess in the 2 lb at 8s. per lb.

In example 2, 1 lb at 7d. gives a *deficiency* of 1d., 1 lb at 9d. gives an *excess* of 1d.; but the excess of 1d. and the deficiency of 1d. exactly neutralize each other.

Again, it is evident that 2 lb at 5d. and 3 lb at 10d. are worth just as much as 5 lb at 8d.—that is, 8d. will be the average price if we mix 2 lb at 5d. with 3 lb at 10d.

#### EXERCISES.

4. How much wine at 8s. 6d. and 9s. per gallon will make a mixture worth 8s. 10d. per gallon? Ans. 2 gallons at 8s. 6d., and 4 gallons at 9s. per gallon.

5. How much tea at 6s. and at 3s. 8d. per lb, will make a mixture worth 4s. 4d. per lb? Ans. 8 lb at 6s., and 20 lb at 3s. 8d. per lb.

6. A merchant has sugar at 5*d*., 10*d*., and 12*d*. per tb. How much of each kind, mixed together, will be worth 8*d*. per tb? Ans. 6 tb at 5*d*., 3 lb at 10*d*., and 3 lb at 12*d*.

7. A merchant has sugar at 5d., 10d., 12d., and 16d per lb. How many lb of each will form a mixture worth 11d. per lb? Ans. 5 lb at 5d., 1 lb at 10d., 1 lb at 12d., and 6 lb at 16d.

8. A grocer has sugar at 5d., 7d., 12d., and 13d., per fb., How much of each kind will form a mixture worth 10d. per fb? Ans. 3 lb at 5d., 2 lb at 7d., 3 lb at 12d., and 5 lb at 13d.

30. When a given amount of the mixture is required, to find the corresponding amounts of the ingredients-

RULE.—Find the amount of each ingredient by the last rule. Then add the amounts together, and say, as their sum is to the amount of any one of them, so is the required quantity of the mixture to the corresponding amount of that one.

EXAMPLE 1.—What must be the amount of tea at 4s. per 1b, in 736 lb of a mixture worth 5s. per lb, and containing tea at 6s., 8s., and 9s. per lb ?

To produce a mixture worth 5s. per lb, we require 8 lb at 4s., 1 at 8s., 1 at 6s., and 1 at 9s. per lb. [28]. But all of these, added together, will make 11 lb, in which there are 8 lb at 4s. Therefore

| 1b | 1b  | ťb    | 1b<br>8×736 | 1b   | OZ.               | the_ required |          |
|----|-----|-------|-------------|------|-------------------|---------------|----------|
| 11 | :8: | : 736 | : 11=       | =526 | $4\frac{4}{11}$ , | the_ required | quantity |

of tea at 4s.

That is, in 736 lb of the mixture there will be 536 lb  $4_{11}^{**}$  oz. at is, per lb. The amount of each of the other ingredients may be found in the same way.

EXAMPLE 2 .-- Hiero, king of Syracuse, gave a certain quantity of gold to form a crown; but when he received it, suspecting that the goldsmith had taken some of the gold, and supplied its place by a baser metal, he commissioned Archimedes, the celebrated mathematician of Syracuse, to ascertain if his suspicion was well founded, and to what extent. Archimedes was for some time unsuccessful in his researches, until one day, going into a bath, he remarked that he displaced a quantity of water equal to his own bulk. Seeing at once that the same weight of different bodies would, if immersed in water, displace very different quantities of the fluid, he exclaimed with delight that he had found the desired solution of the problem. Taking a mass of gold equal in weight to what was given to the goldsmith, he found that it displaced less water than the crown ; which, therefore, was made of a lighter, because a more bulky metal-and, consequently, was an alloy of gold.

Now supposing copper to have been the substance with which the crown was adulterated, to find its amount—

Let the gold given by Hiero have weighed 1 lb, this would displace about 052 lb of water; 1 lb of copper would displace about 1124 lb of water; but let the crown have displaced only 072 lb. Then

> Gold differs from  $\cdot 072$ , the mean, by  $- \cdot 020$ . Copper differs from it by  $\cdot - + \cdot 0404$ .

Hence, the mean = 1124 - 0404 - 020 + 052 = the mean.

Therefore  $\cdot 020$  lb of copper and  $\cdot 0404$  lb of gold would produce the alloy in the crown.

But the crown was supposed to weigh 1 lb; therefore 0604 lb  $(\cdot 020 + \cdot 0404)$ :  $\cdot 0404$  lb :: 1 lb :  $\frac{0404 + 1}{\cdot 0604}$ = 669 lb, the quantity of gold. And 1--669=331 lb is the quantity of copper.

#### EXERCISES.

9. A druggist is desirous of producing, from medicine at 5s., 6s., 8s., and 9s. per 1b,  $1\frac{1}{2}$  cwt. of a mixture worth 7s. per 1b. How much of each kind must he use for the purpose? Ans. 28 lb at 5s., 56 lb at 6s., 56 lb at 8s., and 28 lb at 9s. per lb.

11. How much sugar, at 4*d*., 6*d*., and 8*d*. per lb, must there be in 1 cwt. of a mixture worth 7*d*. per lb? Ans.  $18\frac{2}{3}$  lb at 4*d*.,  $18\frac{2}{3}$  lb at 6*d*., and  $74\frac{2}{3}$  lb at 8*d*. per lb.

12. How much brandy at 12s., 13s., 14s., and 14s. 6d. per gallon, must there be in one hogshead of a mixture worth 13s. 6d. per gallon? Ans. 18 gals. at 12s., 9 gals. at 13s., 9 gals. at 14s., and 27 gals. at 14s. 6d. per gallon.

31. When the amount of one ingredient is given, to find that of any other—

RULE.—Say, as the amount of one ingredient (found by the rule) is to the *given* amount of the same ingredient, so is the amount of any other ingredient (found by the rule)<sup>1</sup> to the *required* quantity of that other.

EXAMPLE 1.—29 lb of tea at 4s. per lb is to be mixed with teas at 6s., 8s., and 9s. per lb, so as to produce what will be worth 5s. per lb. What quantities must be used?

8 *b* of tea at 4s., and 1 *b* at 6s., 1 *b* at 8s., and 1 *b* at 9s., will make a mixture worth 5s. per 1b [27]. Therefore 8 *b* (the quantity of tea at 4s. per *b*, as found by the rule). 29 *b* (the given quantity of the same tea) :: 1 *b* (the  $1 \ge 20$  *b*)

quantity of tea at 6s. per lb, as found by the rule):  $\frac{1 \times 29}{9}$  lb

(the quantity of tea at 6s., which corresponds with 29 lb at 4s. per lb)= $3\frac{5}{8}$  lb.

We may in the same manner find what quantities of tea at 8s. and 9s. per lb correspond with 29 lb—or the given amount of tea at 4s. per lb.

EXAMPLE 2.—A refiner has 10 oz. of gold 20 carats fine and melts it with 16 oz. 18 carats fine. What must be added to make the mixture 22 carats fine ?

10 oz. of 20 carats fine= $10 \times 20 = 200$  carats.

16 oz. of 18 carats fine= $16 \times 18 = 288$ 

 $26:1::488:18\frac{10}{13}$  carats, the

fineness of the mixture.

24 - 22 = 2 carats baser metal, in a mixture 22 carats fine.  $24 - 18\frac{10}{13} = 5\frac{3}{13}$  carats baser metal, in a mixture  $18\frac{10}{13}$  carats fine.

Then 2 carats : 22 carats ::  $5\frac{3}{13}$  :  $57\frac{7}{13}$  carats of pure

# SECTION IX.

## INVOLUTION AND EVOLUTION, &c.

1. INVOLUTION.—A quantity which is the product of two or more factors, each of them the same number, is termed a power of that number; and the number, multiplied by itself, is said to be involved. Thus  $5 \times 5 \times 5$ (=125) is a " power of 5;" and 125, is 5 " involved." A power obtains its denomination from the number of times the root (or quantity involved) is taken as a factor. Thus 25 ( $\pm 5 \times 5$ ) is the second power of 5.—The second power of any number is also called its square; because a square surface, one of whose sides is expressed by the given number, will have its area indicated by the second power of that number; thus a square, 5 inches every way, will contain 25 (the square of 5) square inches; a square 5 feet every way, will contain 25 square feet, &c. 216  $(6 \times 6 \times 6)$  is the third power of 6.—The third power of any number is also termed its cube; because a cube, the length of one of whose sides is expressed by the given number, will have its solid contents indicated by the third power of that number. Thus a cube 5 inches every way, will contain 125 (the cube of 5) cubie, or solid inches; a cube 5 feet every way, will contain 125 cubic feet, &c.

2. In place of setting down all the factors, we put down only one of them, and mark how often they are supposed to be set down by a small figure, which, since it points out the number of the factors, is called the index, or exponent. Thus  $5^2$  is the abbreviation for  $5 \times 5$ :—and 2 is the index.  $5^5$  means  $5 \times 5 \times 5 \times 5 \times 5$ , or 5 in the fifth power  $3^4$  means  $3 \times 3 \times 3 \times 3$ , or 3 in the fourth power.  $5^7$  means  $8 \times 8 \times 8 \times 8 \times 8 \times 8 \times 8$ , or 8 in the seventh power, &c.

3. Sometimes the vinculum [Sec. II. 5] is used in conjunction with the index; thus  $5+8^2$  means that the sum of 5 and 8 is to be raised to the second power—this is very of the squa is only & 4. In as a spe how ofte 187×5 187+18 often 18 an abbre is, the "ind

5. To Rule index of factors b

EXAMP To inv multiply its numer number of

## INVOLUTION.

is very different from  $5^2 + 8^2$ , which means the sum of the squares of 5 and 8:  $5+8^2$  being 169; while  $5^2+8^2$  is only 89.

4. In multiplication the multiplier may be considered as a species of index. Thus in  $187 \times 5$ , 5 points out how often 187 should be set down as an *addend*; and  $187 \times 5$  is merely an abbreviation for 187 + 187 + 187 + 187 + 187 [Sec. II. 41]. In  $187^5$ , 5 points out how often 187 should be set down as a *factor*; and  $187^5$  is an abbreviation for  $187 \times 187 \times 187 \times 187 \times 187 = 187$ is, the "multiplier" tells the number of the *addends*, and the "index" or "exponent," the number of the *factors*.

RULE.—Find the product of so many factors as the index of the proposed power contains units—each of the factors being the number which is to be involved.

EXAMPLE 1.—What is the 5th power of 7?  $7^5 = 7 \times 7 \times 7 \times 7 \times 7 = 16807.$ 

EXAMPLE 2.—What is the amount of £1 at compound interest, for 6 years, allowing 6 per cent. per annum?

The amount of £1 for 6 years, at 6 per cent. is-

 $\frac{1.06 \times 1.06 \times 1.06 \times 1.06 \times 1.06 \times 1.06}{1.06^6 = 1.41852}$ , or

We, as already mentioned [Sec. VII. 23], may abridge the process, by using one or more of the products, already obtained, as factors.

#### EXERCISES.

1.  $3^{5}=243$ .

2.  $20^{10} = 1024000000000$ .

3. 37=2187.

4. 105<sup>6</sup>=1340095640625.

5.  $105^6 = 1.340095640625$ .

45. To raise a fraction to any power-

RULE.—Raise both numerator and denominator to that power.

EXAMPLE.  $-(\frac{3}{4})^3 = \frac{3}{4} \times \frac{3}{4} \times \frac{3}{4} = \frac{5}{6} \frac{7}{4}.$ 

To involve a fraction is to multiply it by itself. But to multiply it by itself any number of times, we must multiply its numerator by itself, and also its denominator by itself, that number of times [Sec. IV. 29].

| EXERCISES  |      |

| a ninnhay to an  | 37 . |

7. To raise a mixed number to any power-RULE.-Reduce it to an improper fraction [Sec. IV 24; and then proceed as directed by the last rule.

EXAMPLE.  $(2\frac{1}{2})^4 = (\frac{5}{2})^4 = \frac{625}{10}$ .

EXERCISES.

10.  $(11^2_{2})^3 = 12^{5} 10^3_{2}$ . 11.  $(3^2_{3})^5 = 643^{1} 3^{1} 3^3_{3}$ . 12.  $(5^4_{3})^6 = 2^{2} 1643^{1} 3^{1}_{3}$ . 13.  $(4^5_{7})^7 = 4^{2} 6^{11} 6^{11}_{3} 4^{1}_{4} 2^{9}_{7} 7^7$ .

8. Evolution is a process exactly opposite to involution; since, by means of it, we find what number, raised to a given power, would produce a given quantity-the number so found is termed a root. Thus we "evolve" 25 when we take, for instance, its square root; that is, when we find what number, multiplied by itself, will produce 25. Roots, also, are expressed by exponents-but as these exponents are fractions, the roots are called "fractional powers." Thus  $4^{\frac{1}{2}}$  means the square root of 4;  $4^{\frac{1}{2}}$  the cube root of 4; and  $4^{\frac{5}{7}}$  the seventh root of the fifth power of 4. Roots are also expressed by  $\sqrt{}$ , called the radical sign. When used alone, it means the square root-thus  $\sqrt{3}$ , is the square root of 3; but other roots are indicated by a small figure placed within it-thus 3/5; which means the cube root of 5.  $\sqrt[3]{7^2}$   $(7^{\frac{2}{3}})$ , is the cube root of the square of 7.

9. The fractional exponent, and radical sign are sometimes used in conjunction with the vinculum. Thus  $4-3^{\frac{1}{2}}$ , is the square root of the difference between 4 and 3;  $\sqrt[3]{5+7}$ , or  $\overline{5+7^{\dagger}}$ , is the cube root of the sum of 5 and 7.

10. To find the square root of any number-

RULE-I. Point off the digits in pairs, by dots ; putting one dot over the units' place, and then another dot over every second digit both to the right and left of the units' place--if there are digits at both sides of the decimal point.

II. J will no that wl the firs square conside

III. into tw dered produc and th after t from tl IV.

> anothe process near a 11. 1

22 is does n or 16 f period, We we can 33, wh We root) 25, theWe the ro The its squ 12.1square

II. Find the highest number the square of which will not exceed the amount of the highest period, or that which is at the extreme left—this number will be the first digit in the required square root. Subtract its square from the highest period, and to the remainder, considered as hundreds, add the next period.

III. Find the highest digit, which being multiplied into twice the part of the root already found (considered as so many tens), and into itself, the sum of the products will not exceed the sum of the last remainder and the period added to it. Put this digit in the root after the one last found, and subtract the former sum from the latter.

IV. To, the remainder, last obtained, bring down another period, and proceed as before. Continue this process until the exact square root, or a sufficiently near approximation to it is obtained.

11. EXAMPLE.-What is the square root of 22420225 2

22420225(4735, is the required root.

 $\begin{array}{r} 16\\ 87\overline{)642}\\ 609\\ 943\overline{)3302}\\ 2829\\ 9465\overline{)47325}\\ 47325\end{array}$ 

22 is the highest period; and  $4^2$  is the highest square which does not exceed it—we put 4 in the root, and subtract  $4^2$ , or 16 from 22. This leaves 6, which, along with 42, the next period, makes 642.

We subtract 87 (twice 4 tens+7, the highest digit which we can now put in the root)  $\times$  7 from 642. This leaves 33, which, along with 02, the next period, makes 3302.

We subtract 943 (twice 47 tens  $\pm$ 3, the next digit of the root)  $\times 3$  from 3302. This leaves 473, which, along with 25, the only remaining period, makes 47325.

We subtract 9465 (twice 473 tens 4.5, the next digit of the root) ×5. This leaves 20 remainder,

The given number, therefore, is exactly a square; and its square root is 4735.

12. REASON OF I.-We point off "ne digits of the given square in pairs, and consider the number of dots as indicating

ition; to a num-" 25 when oduce these tiona**l** <sup>1</sup> the ower ıdica**l** -thus cated which e root some-

IV

e.

Thus cen 4 sum

putr dot ft of f the e fatter a

the number of digits in the root, since neither one nor two digits in the square can give more or less than one in the root; neither three nor four digits in the square can give more or less than two in the root, &c.-which the pupil may easily ascertain by experiment. Thus 1, the smallest single digit, will give one digit as its square root; and 99, the largest pair of digits, can give only one-since 81, or the square of 9, is the greatest square which does not exceed 99.

Pointing off the digits in pairs shows how many should be brought down successively, to obtain the successive digits of the root-since it will be necessary to bring down one period for each new digit; but more than one will not be required.

REASON OF II .- We subtract from the highest period of the given number the highest square which does not exceed it, and consider the root of this square as the first or highest digit of the required root; because, if we separate any number into the parts indicated by its digits (563, for instance, into 500, 60, and 3), its square will be found to contain the square of each of its parts.

REASON OF III .--- We divide twice the quantity already in the root (considered as expressing tens of the next denomination) into what is left after the preceding subtraction, &c., to obtain a new digit of the root; because the square of any quantity contains (besides the square of each of its parts) twice the product of each part multiplied by each of the other parts. Thus if 14 is divided into 1 ten and 4 units, its square will contain not only 10<sup>2</sup> and 4<sup>2</sup>, but also twice the product of 10 and 4.-We subtract the square of the digit last put in the root, at the same time that we subtract twice the product obtained on multiplying it by the part of the root which precedes it. Thus in the example which illustrates the rule, when we subtract  $87 \times 7$ , we really subtract  $2 \times 40 \times 7 + 7^2$ .

It will be easily to show, that the square of any quantity contains the squares of the parts, along with twice the product of every two parts. Thus

| 4000 <sup>2</sup>                                | $22420225 = 4735^2 = 4000 + 700 + 30 + 5^2$ .<br>16000000 |
|--|---|
| <sup>2</sup> ×4000×700+700 <sup>2</sup> =        | 6420225<br>6090000  |
| <sup>2</sup> ×4000×30+2×700×30+30 <sup>2</sup> = | 330225<br>282900  |
| 1000 1 1 2 2 2 2 2 2 2 2 2 2 2 2 2 2 2 2         | 47325   |

2×4000×5+2×700×5+2×30×5+52=47325

REASON OF IV .- Dividing twice the quantity already in the root (considered as expressing tens of the next denomination) into the remainder of the given number, &c., gives the next digit; because the square contains the sum of twice the products (or, what is the same thing, the product

of twi multip 4735, 6 700 + twice 7 of its I them ( the su found t If w not be time, n

13. If a in the

. ntity pro-

5<sup>2</sup>.

y in omisives of duct of twice the sum) of the parts of the root already found, multiplied by the new digit. Thus 22420225, the square of 4735, contains  $4000^2 + 700^2 + 30^2 + 5^2$ ; and *also* twice  $4000 \times$ 700 + twice  $4000 \times 30 +$  twice  $4000 \times 5$ ; plus twice  $700 \times 30 +$ twice  $700 \times 5$ ; plus twice  $30 \times 5$ :—that is, the square of each of its parts, with the sum of twice the product of every two of them (which is the same as each of them multiplied by twice the sum of all the rest). This would, on examination, be found the case with the square of any other number.

If we examine the example given, we shall find that it will not be necessary to bring down more than one period at a time, nor to add cyphers to the quantities subtracted.

13. When the given square contains decimals-

If any of the periods consist of decimals, the digits in the root obtained on bringing down these periods to the remainders will also be decimals. Thus, taking the example just given, but altering the decimal point, we shall have  $\sqrt{224202\cdot25} = 473\cdot5$ ;  $\sqrt{2242\cdot0225} = 47\cdot35$ ;  $\sqrt{22\cdot420225} = 4\cdot735$ ;  $\sqrt{\cdot22420225} = \cdot4735$ ; and  $\sqrt{\cdot0022420225} = \cdot04735$ , &c.: this is obvious. If there is an odd number of decimal places in the power, it must be made even by the addition of a cypher. Using the same figures,  $\sqrt{2242022\cdot5} = 1497\cdot338$ , &c.

 $\begin{array}{r} 2242022\cdot 50\ (1497\cdot 338,\,\&c\\ 1\\ 24\overline{)124}\\ 06\\ 289\overline{)2820}\\ 2001\\ 2987\overline{)21922}\\ 20909\\ 29948\overline{)101850}\\ 89829\\ 29946\overline{3}\overline{)1152100}\\ 898389\\ 29946\overline{3}\overline{)25371100}\\ 23957344\end{array}$ 

## 1413756

In this case the highest period consists but of a single digit and the given number is not a perfect square.

There must be an even number of decimal places; since no number of decimals in the root will produce an odd number in the square [Sec. II. 48]—as may be proved by experiment

14. To extract the square root of a fraction-

RULE.—Having reduced the fraction to its lowest terms, make the square root of its numerator the numerator, and the square root of its denominator the denominator of the required root.

## EXAMPLE. $\sqrt{\frac{4}{9}} = \frac{2}{3}$ .

312

15. REASON OF THE RULE.—The square root of any quantity must be such a number as multiplied by itself, will produce that quantity. Therefore  $\frac{2}{3}$  is the square root of  $\frac{4}{5}$ ; for  $\frac{2}{3} \times \frac{2}{3} = \frac{4}{5}$ . The same might be shown by any other example.

Besides, to square a fraction, we must multiply its numerator by itself, and its denominator by itself [6]; therefore, to take its square root—that is, to bring back both numerator and denominator to what they were before—we must take the square root of each.

16. Or, when the numerator and denominator are not squares—

RULE.—Multiply the numerator and denominator together; then make the square root of the product the numerator of the requirel root, and the given denominator its denominator; or make the square root of the product the denominator of the required root, and the given numerator its numerator.

EXAMPLE.—What is the square root of  $\frac{4}{5}$ ?  $(\frac{4}{5})^{\frac{1}{2}} = \sqrt{\frac{4\times5}{5}}$  or  $\sqrt{\frac{4}{5\times4}} = 4.472136 \div 5 = .894427$ .

17. We, in this case, only multiply the numerator and denominator by the same number, and then extract the square root of each product. For  $\frac{4}{5} = \frac{4 \times 5}{5 \times 5}$ , or  $\frac{4 \times 4}{5 \times 4}$ . Therefore  $\begin{pmatrix} 4\\ 5 \end{pmatrix}^{\frac{1}{2}} = \begin{pmatrix} \frac{4 \times 5}{5 \times 5} \end{pmatrix}^{\frac{1}{2}} = \sqrt{\frac{4 \times 5}{5}}$ , or  $\begin{pmatrix} \frac{4 \times 4}{5 \times 4} \end{pmatrix}^{\frac{1}{2}} = \frac{4}{\sqrt{5 \times 4}}$ .

EXAMPLE.-What is the cube root of 179597069288?

|  | 179597069288(5642, the<br>125   | required root. |
|--|---|----------------|
| $\begin{array}{c c} 300 \times 5^{2} \times 6 \\ 30 \times 5 \times 6^{3} \\ 6^{2} \times 6 \\ 300 \times 56^{2} \times 4 \\ 30 \times 56 \times 4^{2} \\ 4^{3} \times 4 \\ 300 \times 564^{2} \times 2 \\ 30 \times 564 \times 2^{2} \\ 2^{2} \times 2 \end{array}$ | $= \frac{54597}{50616}$ $= \frac{3981069}{3790144}$ $= \frac{3790144}{190925288}$ $= 190925288$ |                |

We find (by trial) that 5 is the first, 6 the second, 4 the third, and 2 the last digit of the root. And the given number is exactly a cube.

21. REASON OF I.—We point off the digits in threes, for a reason similar to that which caused us to point them off in twos, when extracting the square root [12].

REASON OF II.—Each cube will be found to contain the cube of each part of its cube root.

REASON OF III.—The cube of a number divided into any two parts, will be found to contain, besides the sum of the cubes of its parts, the sum of 3 times the product of each part by the other part, and 3 times the product of each part by the square of the other part. This will appear from the following:—

179597069288

| 5000 <sup>3</sup> ==  | 125000000000               |
|---|----------------------------|
| 3×5000 <sup>3</sup> ×600+3×5000×600 <sup>3</sup> +600 <sup>3</sup> =            | 54597069288<br>50616000000 |
| $3 \times 5600^{3} \times 40 + 3 \times 5600 \times 40^{2} + 40^{3} =$          | 3981069288<br>3790144000   |
| $3 \times 5640^{\circ} \times 2 + 3 \times 5640 \times 2^{\circ} + 2^{\circ} =$ | 190925288<br>190925288     |

Hence, to find the second digit of the root, we must find by trial some number which—being multiplied by 3 times the square of the part of the root already found—its square being

multiplied by 3 times the part of the root already found-and being multiplied by the square of itself—the sum of the products will not exceed what remains of the given number.

Instead of considering the part of the root already found as so many tens [12] of the denomination next following (us it really is), which would add one cypher to it, and two cyphers to its square, we consider it as so many units, and multiply it, not by 3, but by 30, and its square, not by 3, but by 300. For  $300 \times 5^2 \times 6 + 30 \times 5 \times 6^2 + 6^2 \times 6$  is the same thing as  $8 \times 50^2 \times 6 + 30 \times 6^2 + 6^2 \times 6$ ; since we only change the position of the factors 100 and 10, which does not alter the product [Sect. II. 35].

It is evidently unnecessary to bring<sup>\*</sup> down more than one period at a time; or to add cyphers to the subtrahends.

REASON OF IV.—The portion of the root already found may be treated as if it were a single digit. Since into whatever two parts we divide any number, its cube root will contain the cube of each part, with 3 times the square of each multiplied into the other.

22. When there are decimals in the given cube-

If any of the periods consist of decimals, it is evident that the digits found on bringing down these periods must be decimals. Thus 3/179597.069288=56.42, &c.

When the decimals do not form complete periods, the periods are to be completed by the addition of cyphers. EXAMPLE.—What is the cube root of  $\cdot 3$ ?

$$\begin{array}{c} 0.800(.669, \&c. \\ 216 \\ 84000 \\ 80\times6\times6^{2} \\ 6\times6^{3} \\ 800\times66^{2}\times9 \\ 30\times66\times9^{2} \\ 9\times9^{2} \end{array} \right\} \xrightarrow{84000}_{=71496} \\ =71496 \\ 12504000 \\ =11922309 \\ 581691, \&c. \end{array}$$

 $3/\cdot 3 = \cdot 669$ , &c. And  $\cdot 3$  is not exactly a cube.

It is necessary, in this case, to add cyphers; since one decimal in the root will give 3 decimal places in the cube; two decimal places in the root will give six in the cube, &c. [Sec. II. 48.]

23. To extract the cube root of a fraction-

RULE.—Having reduced the given fraction to its lowest terms, make the cube root of its numerator the numerator of the required fraction, and the cube root of its denominator, the denominator.

EXAMPLE. 
$$-3\sqrt{\frac{5}{125}} = \frac{3/8}{3\sqrt{125}} = \frac{3}{3}$$
.

24. REASON OF THE RULE.—The cube root of any number must be such as that, taken three times as a factor, it will produce that number. Therefore  $\frac{2}{5}$  is the cube root of  $\frac{3}{125}$ ; for  $\frac{2}{5} \times \frac{2}{5} \times \frac{2}{5} = \frac{8}{125}$ .—The same thing might be shown by any other example.

Besides, to cube a fraction, we must cube both numerator and denominator; therefore, to take its cube root—that is to reduce it to what it was before—we must take the cube root of both.

25. Or, when the numerator and denominator are not cubes--

RULE.—Multiply the numerator by the square of the denominator; and then divide the cube root of the product by the given denominator; or divide the given numerator by the cube root of the product of the given denominator multiplied by the square of the given numerator.

EXAMPLE.—What is the cube root of  $\frac{3}{7}$ ?

$$\binom{3}{7}^{\frac{3}{2}} = \sqrt[3]{\frac{3\times7^2}{7}}$$
 or  $\sqrt[3]{\frac{3}{7\times3^2}} = 5\cdot277632 \div 7 = \cdot753947.$ 

This rule depends on a principle already explained [16].

26. Or, lastly-

RULE.—Reduce the given fraction to a decimal [See. IV. 63], and extract its cube root [22].

## EXERCISES.

28. To extract any root whatever—

RULE.—When the index of the root is some power of 2, extract the square root, when it is some power of 3, extract the cube root of the given number so many times, successively, as that power of 2, or 3 contains unity.

EXAMPLE 1.—The 8th root of  $65536 = \sqrt{\sqrt{65536}} = 4$ . Since 8 is the *third* power of 2, we are to extract the square root *three* times, successively.

Example 2.-134217728 - 3/ 3/134217728-8.

Since 9 is the second power of 3, we are to extract the cube root twice, successively.

29. In other cases we may use the following (Hutton Mathemat. Diet. vol. i. p. 135).

RULE .- Find, by trial, some number which, raised to the power indicated by the index of the given root, will not be far from the given number. Then say, as one less than the index of the root, multiplied by the given number-plus one more than the index of the root, multiplied by the assumed number raised to the power expressed by the index of the root : one more than the index of the root, multiplied by the given numberplus one less than the index of the root, multiplied by the assumed number raised to the power indicated by the index of the root, :: the assumed root : a still nearer approximation. Treat the fourth proportional thus obtained in the same way as the assumed number was treated, and a still nearer approximation will be found. Proceed thus until an approximation as near as desirable is discovered.

EXAMPLE.—What is the 13th root of 923?

Let 2 be the assumed root, and the proportion will be

 $12 \times 923 + 14 \times 2^{13}$  :  $14 \times 923 + 12 \times 2^{13}$  :: 2 : a nearer approximation. Substituting this nearer approximation for 2, in the above proportion, we get another approximation, which we may treat in the same way.

30. To find the squares and cubes, the square and cube roots of numbers, by means of the table at the end of the treatise—

This table contains the squares and cubes, the square and cube roots of all numbers which do not exceed 1000 but it will be found of considerable utility even when very high numbers are concerned—provided the pupil bears in mind that [12] the square of any number is equal to the sum of the squares of its parts (which may be found by the table) plus twice the product of each part by the sum of all the others; and that [21] the cube of a number divided into any two parts is equal to the sum of the eubes of its parts (which may be found by the table) plus three times the product of each part multiplied by the square (found by means of the table) of the other. One or two illustrations will render this sufficiently elear.

EXAMPLE 1.—Find the square of 873456.

873456 may be divided into two parts, 873 (thousand) and 456 (units). But we find by the table that  $\overline{873}^2$ =762129 and  $\overline{456}^2$ =207936.

Therefore 762129000000=873000<sup>2</sup> 796176000=873000×twice 456 207936=456<sup>2</sup>

# And 762925383936=873456'

EXAMPLE 2.—Find the cube of 864379. Dividing this into 864 (thousand) and 379 (units), we find  $\overline{864}^{2}$ =644972544  $\overline{864}^{2}$ =746496,  $\overline{379}^{3}$ =54439939, and  $\overline{379}^{2}$ =143641

Therefore  $64497254400000000 = 804000^3$   $848765952000000 = 3 \times 864000^3 \times 379$   $372317472000 = 3 \times 864000 \times 379^3$  $54439939 = 379^3$ 

And 645821682323911939-864379

31 In finding the square and cube roots of larger numbers, we obtain their three highest digits at once, if we look in the table for the highest cube or square, the highest period of which (the required cyphers being added) does not exceed the highest period of the given number. The remainder of the process, also, may often be greatly abbreviated by means of the table.

## QUESTIONS.

1. What are involution and evolution? [1].

2. What are a power, index, and exponent? [1 & 2].

3. What is the meaning of square and cube, of the square and cube roots ? [1 and 8].

4. What is the difference between an integral and a fractional index ? [2 and 8].

5. How is a number raised to any power? [5].

6. What is the rule for finding the square root ? [10].

7. What is the rule for finding the cube root? [20].

8. How is the square or cube root of a fraction or

of a mixed number found ? [14, &c., 19, 23, &c., 27].

9. How is any root found? [28 and 29].

10. How are the squares and cubes, the square roots and cube roots, of numbers found, by the table ? [30].

## LOGARTIHMS.

32. Logarithms are a set of *artificial* numbers, which represent the ordinary or *natural* numbers. Taken along with what is called the *base* of the system to which they belong, they are the *equals* of the corresponding natural numbers, but without it, they are merely their *representatives*. Since the base is unchangeable, it is not written along with the logarithm. The logarithm of any number is that power of the base which is equal to it. Thus 10<sup>2</sup> is *equal* to 100; 10 is the *base*, 2 (the index) is the *logarithm*, and 100 is the corresponding natural number.—Logarithms, therefore, are merely the *indices* which designate certain powers of some base.

33. Logarithms afford peculiar facilities for calculation. For, as we shall see presently, the multiplication of numbers is performed by the addition of their

e and e end

6988

20

puare 000 very bears al to ound y the of a sum y the nultia) of

) and 9 and

• this

s into 2544

logarithms; one number is divided by another if we subtract the logarithm of the divisor from that of the dividend; numbers are involved if we multiply their logarithms by the index of the proposed power; and evolved if we divide their logarithms by the index of the proposed root.—But it is evident that addition and subtraction are much easier than multiplication and division; and that multiplication and division (particularly when the multipliers and divisors are very small) are much easier than involution and evolution.

34. To use the properties of logarithms, they must be exponents of the same base-that is, the quantities raised to those powers which they indicate must be the same. Thus  $10^4 \times 12^3$  is neither  $10^7$  nor  $12^7$ , the former being too small, the latter too great. If, therefore, we desire to multiply 104 and 123 by means of indices, we must find some power of 10 which will be equal to 123, or some power of 12 which will be equal to 104, or finally, two powers of some other number which will be equal respectively to 104 and 123, and then, adding these powers of the same number, we shall have that power of it which will represent the product of 104 and 123. This explains the necessity for a table of logarithmswe are obliged to find the powers of some one base which will be either equal to all possible numbers, or so nearly equal that the inaccuracy is not deserving of notice. The base of the ordinary system is 19; but it is clear that there may be as many different systems of logarithms as there are different bases, that is, as there are different numbers.

35. In the ordinary system—which has been calculated with great care, and with enormous labour, 1 is the logarithm of 10; 2 that of 100; 3 that of 1000, &c. And, since to divide numbers by means of these logarithms (as we shall find presently), we are to subtract the logarithm of the divisor from that of the dividend, 0 is the logarithm of 1, for  $1=\frac{10}{10}=10^{1-1}=10^{\circ}$ ; -1 is the logarithm of '1, for  $1=\frac{1}{10}=\frac{10^{\circ}-1}{10^{\circ}}=10^{\circ-1}=10^{-1}$ ; and for the same reason, -2 is the logarithm of '01; -3 that of '001, &c.

36.must\* some ( and 1 is, uni numbe mal; The d 37. tive le than t ber, a numbe it is 1 corres part) .99440 0.9944integer &c. :have is the logarit 4.7624 38. table-The may be Wh found decima in the If t 1000, and th the col If t them fourth in die the gi

36. The logarithms of numbers between 1 and 10, must be more than 0 and less than 1; that is, must be some decimal. The logarithms of numbers between 10 and 100 must be more than 1, and less than 2; that is, unity with some decimal, &c.; and the logarithms of numbers between 1 and 01 must be -1 and some decimal; between 01 and 001, -2 and some decimal, &c. The decimal part of a logarithm is always positive.

37. As the integral part or characteristic of a positive logarithm is so easily found-being [35] one less than the number of integers in its corresponding number, and of a negative logarithm one more than the number of cyphers prefixed in its natural number, it is not set down in the tables. Thus the logarithm corresponding to the digits 9872 (that is, its decimal part) is 994405; hence, the logarithm of 9872 is 3 '994405; that of 987.2 is 2.994405; that of 9.872 is 0.994405; that of .9872 is -1.994405 (since there is no integer, nor prefixed cypher); of '009872-3'994405, &c. :- The same digits, whatever may be their value, have the same decimals in their logarithms; since it is the integral part, only, which changes. Thus the logarithm of 57864000 is 7.762408; that of 57864, is 4.762408; and that of 0000057864, is-6.762408. 38. To find the logarithm of a given number, by the table-

The integral part, or characteristic, of the logarithm may be found at once, from what has been just said [37]-

When the number is not greater than 100, it will be found in the column at the top of which is N, and the decimal part of its logarithm immediately opposite to it in the next column to the right hand.

If the number is greater than 100, and less than 1000, it will also be found in the column marked N, and the decimal part of its logarithm opposite to it, in the column at the top of which is 0.

If the number contains 4 digits, the first three of them will be found in the column under N, and the fourth at the top of the page; and then its logarithm in the same horizontal line as the three first digits of the given number, and in the same column as its fourth

if we of the their ; and lex of on and n and articusmall)

ust be raised same. being desire must 23, or nally, equal these power 123. mswhich learly The that ithms ferent

aleu-1 is , &c. logaotract lend, -1 is and

-3

If the number contains more than 4 digits, find the logarithm of its first four, and also the difference between that and the logarithm of the next higher number, in the table; multiply this difference by the remaining digits, and cutting off from the product so many digits as were in the multiplier (but at the same time adding unity if the highest cut off is not less than 5), add it to the logarithm corresponding to the four first digits.

**EXAMPLE 1.**—The logarithm of 59 is 1.770852 (the characteristic being positive, and *one less* than the number of *integers*).

# EXAMPLE 2.—The logarithm of 338 is 2.528917.

EXAMPLE 3.—The logarithm of  $\cdot 0004587$  is  $-4 \cdot 661529$  (the characteristic being negative, and one more than the number of prefixed cyphers).

# EXAMPLE 4.—The logarithm of 28434 is 4.453838.

For, the difference between 453777 the logarithm of 2843, the four first digits of the given number, and 453930 the logarithm of 2844, the next number, is 153; which, multiplied by 4, the remaining digit of the given number, produces 612; then cutting off one digit from this (since we have multiplied by only one digit) it becomes 61, which being added to 453777 (the logarithm of 2844) makes 453838, and, with the characteristic, 4.453838, the required logarithm.

# EXAMPLE 5.—The logarithm of 873457 is 5.941242.

For, the difference between the logarithms of 8734 and 8735 is 50, which, being multiplied by 57, the remaining digits of the given number, makes 2850; from this we cut off *two* digits to the right (since we have multiplied by *two* digits), when it becomes 28; but as the highest digit cut off is 5, we add unity, which makes 29. Then 5.941213 (the logarithm of 8734)-429=5.941242, is the required logarithm.

39. Except when the logarithms increase very rapidly—that is, at the commencement of the table—the differences may be taken from the right hand column (and opposite the three first digits of the given number) where the *mean* differences will be found.

Instead of multiplying the mean difference by the remaining digits (the fifth, &c., to the right) of the given number, and cutting off so many places from the product as are equal to the number of digits in the multiplier, to obtain the *proportional part*—or what is to be added to the the promaining land sid division given n Exam The (

Opposite we find 5, 20. 924570

quotient We s another

/ from th 42. '

Rut. cred as

to the logarithm of the first four digits, we may take the proportional part corresponding to each of the remaining digits from that part of the column at the left hand side of the page, which is in the same horizontal division as that in which the first three digits of the given number have been found.

EXAMPLE.-What is the logarithm of 839785?

The (decimal part of the) logarithm of 839700 is 924124. Opposite to 8, in the same horizontal division of the page, we find 42, or rather, (since it is 80) 420, and opposite to 5, 26. Hence the required logarithm is 924124+420+26=924570; and, with the characteristic,  $5 \cdot 924570$ .

40. The method given for finding the *proportional part*—or what is to be added to the next lower logarithm, in the table arises from the difference of numbers being proportional to the difference of their logarithms. Hence, using the last example,

100: 85:: 52 (924176, the logarithm of 839800-924124, the logarithm of 839700):  $\frac{52 \times 85}{100}$ , or the difference (the mean difference may generally be used)  $\times$  by the *remaining* digits of the given number  $\div$  100 (the division being performed by eutting off *two* digits to the right). It is evident that the number of digits to be eut off depends on the number of digits in the multiplier. The logarithm found is not *exactly* correct, because numbers are not *exactly* proportional to the differences of their logarithms.

The *proportional parts* set down in the left hand column, have been ealculated by making the necessary multiplications and divisions.

41. To find the logarithm of a fraction-

RULE.—Find the logarithms of both numerator and denominator, and then subtract the former from the latter; this will give the logarithm of the quotient.

EXAMPLE.—Log.  $\frac{47}{57}$  is 1.672098 - 1.748187 = - 1.923910. We find that 2 is to be subtracted from 1 (the characteristic of the numerator); but 2 from 1 leaves 1 still to be subtracted, or [Sect. II. 15] - 1, the characteristic of the quotient.

We shall find presently that to divide one quantity by another, we have merely to subtract the logarithm of the latter from that of the former.

42. To find the logarithm of a mixed number-

RULE.—Reduce it to an improper fraction, and pro cool as directed by the last rule.

the beimainany ime add gits.

racers).

the

843, the ultiprowe eing, and, m.

and ning eut two cut (the thm.

ra--the umn ber)

the iven duct lier, ided

43. To find the number which corresponds to a given logarithm—

If the logarithm itself is found in the table—

RULE.—Take from the table the number which corresponds to it, and place the decimal point so that there may be the requisite number of integral, or decimal places—according to the characteristic [37].

EXAMPLE.—What number corresponds to the logarithm 4.214314 ?

We find 21 opposite the natural number 163; and looki-g along the horizontal line, we find the rest of the logarithm under the figure 8 at the top of the page; therefore the digits of the required number are 1638. But as the characteristic is 4, there must in it be 5 places of integers. Hence the required number is 16380.

44. If the given logarithm is not found in the table— RULE.—Find that logarithm in the table which is next lower than the given one, and its digits will be the highest digits of the required number; find the difference between this logarithm and the given one, annex to it a cypher, and then divide it by that difference in the table, which corresponds to the four highest digits of the required number—the quotient will be the next digit; add another cypher, divide again by the tabular difference, and the quotient will be the next digit. Continue this process as long as necessary.

EXAMPLE.—What number corresponds to the logarithm 5.654329?

654273, which corresponds with the natural number 4511, is the logarithm next less than the given one; therefore the first four digits of the required number are 4511. Adding a cypher to 56, the difference between 654273 and the given logarithm, it becomes 560, which, being divided by 96, the tabular difference corresponding with 4511, gives 5 as quotient, and 80 as remainder. Therefore, the first five digits of the required number are 45115. Adding a cypher to 80, it becomes 800; and, dividing this by 96, we obtain 8 as the next digit of the required number, and 32 as remainder. The integers of the required number (one more than 5, the characteristic) are, therefore, 451158. We may obtain the decimals, by continuing the addition of cyphers to the remainders, and the division by 96. 45. from •t the ner oxceed hand s sion w continu nothin

45. We arrive at the same result, by subtracting from the difference between the given logarithm and the next less in the table, the highest (which does not exceed it) of those proportional parts found at the right hand side of the page and in the same horizontal division with the first three digits of the given numbercontinuing the process by the addition of cyphers, until nothing, or almost nothing, remains.

EXAMPLE .--- Using the last, 4511 is the natural number corresponding to the logarithm 654273, which differs from the given logarithm by 56. The proportional parts, in the same horizontal division as 4511, are 10, 19, 29, 38, 48, 58, 67, 77, and 86. The highest of these, contained in 56, is 48, which we find opposite to, and therefore corresponding with, the natural number 5; hence 5 is the next of the required digits. 48 subtracted from 56, leaves 8; this, when a cypher is added, becomes 80, which contains 77 (corresponding to the natural number 8); therefore 8 is the next of the required digits. 77, subtracted from 80, leaves 3; this, when a cypher is added, becomes 30, &c. The integers, therefore, of the required number, are found to be 451158, the same as those obtained by the other method.

The rules for finding the numbers corresponding to given logarithms are merely the converse of those used for finding the logarithms of given numbers.

# Use of Logarithms in Arithmetic.

46. To multiply numbers, by means of their logarithms---

RULE.-Add the logarithms of the factors ; and the natural number corresponding to the result will be the required product.

EXAMPLE.  $-87 \times 24 = 1.939519$  (the log. of 87) + 1.380211(the log. of 24)=3.319730; which is found to correspond with the natural number, 2088. Therefore 87×24=2088.

REASON OF THE RULE .--- This mode of multiplication arises from the very nature of indices. Thus  $5^4 \times 5^8 = 5 \times 5 \times 5 \times 5$ multiplied  $5 \times 5 \times 5 \times 5 \times 5 \times 5 \times 5 \times 5$ ; and the abbreviation for this [2] is  $5^{12}$ . But 12 is equal to the sum of the indices (logarithms). The rule might, in the same way, be proved correct by any other example.

47. When the characteristics of the logarithms to be added are both positive, it is evident that their sum will be positive. When they are both negative, their sum (diminished by what is to be carried from the sum of the positive [36] decimal parts) will be negative. When one is negative, and the other positive, subtract the less from the greater, and prefix to the difference the sign belonging to the greater—bearing in mind what has been already said [Sec. II. 15] with reference to the subtraction of a greater from a less quantity.

48. To divide numbers, by means of their logarithms— RULE.—Subtract the logarithm of the divisor from that of the dividend; and the natural number, corresponding to the result, will be the required quotient.

EXAMPLE.—1134  $\div$  42=3.054613 (the log. of 1134)— 1.623249 (the log. of 42) = 1.431364, which is found to correspond with the natural number, 27. Therefore 1134 $\div$ 42=27.

49. In subtracting the logarithm of the divisor, if it is negative, change the sign of its characteristic or integral part, and then proceed as if this were to be added to the characteristic of the dividend; but before making the characteristic of the divisor positive, subtract what was borrowed (if any thing), in subtracting its decimal part. For, since the decimal part of a logarithm is positive, what is *borrowed*, in order to make it possible to subtract the decimal part of the logarithm of the divisor from that of the dividend, must be so much taken away from what is positive, or added to what 's negative in the remainder.

We change the sign of the negative characteristic, and then *udd* it; for, adding a positive, is the same as taking away a negative quantity. 50. it- log Run the ine respon

Ex. The the m of 7. RE. the n numb a factor equal 53 R. the c

# LOGARITHMS.

50. To vaise a quantity to any power, by means of its logarithm-

RULE.—Multiply the logarithm of the quanity by the index of the power; and the natural number corresponding to the result will be the required power.

EXAMPLE.-Raise 5 to the 5th power.

The logarithm of 5 is 0.69897, which, multiplied by 5, gives 3.49485, the logarithm of 3125. Therefore, the 5th power of  $5^2$  is 3125.

REASON OF THE RULE.—This rule also follows from the navare of indices. 5<sup>2</sup> raised to the 5th power is  $5 \times 5$  multiplied by  $5 \times 5$ , or  $5 \times 5 \times 5$ , the abbreviation for which is [2] 5<sup>10</sup>. But 10 is equal to 2, the index (logarithm) of the quantity, multiplied by 5, that of the power. The rule might, in the same way, be proved correct by any other 6x ample.

51. It follows from what has been said [47] that when a negative characteristic is to be multiplied, the product is negative; and that what is to be earried from the multiplication of the decimal part (always positive) is to be *subtracted* from this negative result.

52. To evolve any quantity, by means of its loga-

RULE.—Divide the logarithm of the given quantity by that number which expresses the root to be taken; and the natural number corresponding to the result will be the required root.

Ex. PLE.-What is the 4th root of 2401.

The logarithm of 2401 is 3.380392, which, divided by 4, the number expressing the root, gives .845098, the logarithm of 7. Therefore, the fourth root of 2401 is 7.

REASON OF THE RULE.—This rule follows, likewise, from the nature of indices. Thus the 5th root of  $16^{10}$  is such a number as, raised to the 5th power—that is, taken 5 times as a factor—would produce  $16^{10}$ . But  $16\frac{15}{5}$ , takeu 5 times as a factor, would produce  $16^{10}$ . The rule might be proved correct, equally well, by any other example.

53. When a negative characteristic is to be divided-

RULE I.—If the characteristic is *exactly* divisible by the divisor, divide in the ordinary way, but make the characteristic of the quotient negative.

o be will sum n of Then less sign has the

rom res-

t) d to 34÷

from -4×

) of , in

if it nteided king what mal is ible the uch t 's

and

# LOGARITHMS.

II.—If the negative characteristic is not exactly divisible, add what will make it so, both to it and to the decimal part of the logarithm. Then proceed with the division.

EXAMPLE.—Divide the logarithm -4.837564 by 5. <u>4 wants 1 of being divisible by 5; then  $-4.837564 \div 5 =$ </u> <u>5.1.837564</u> ÷ 5=1.367513, the required logarithm.

REASON OF I.—The quotient multiplied by the divisor must give the dividend; but [51] a negative quotient multiplied by a positive divisor will give a negative dividend.

REASON OF II.—In example 2, we have merely added + 1 and - 1 to the same quantity—which, of course, does not alter it.

### QUESTIONS.

1. What are logarithms? [32].

2. How do they facilitate calculation ? [33].

3. Why is a table of logarithms necessary? [34].

4. What is the characteristic of a logarithm; and how is it found ? [37].

5. How is the logarithm of a number found by the table? [38].

6. How are the "differences," given in the table used ? [39].

7. What is the use of "proportional parts ?" [39].

S. How is the logarithm of a fraction found ? [41].

9. How do we find the logarithm of a mixed number? [42].

10. How is the number corresponding to a given logarithm found? [43].

11. How is a number found when its corresponding logarithm is not in the table ? [44].

12. How are multiplication, division, involution and evolution effected, by means of logarithms? [46, 48, 50, and 52].

13. When negative characteristics are added, what is the sign of their sum? [47].

14. What is the process for division, when the characteristic of the divisor is negative? [49].

15. How is a negative characteristic multiplied ? [51].

16. How is a negative charactoristic divided ? [53]

# SECTION X.

# PROGRESSION, &c.

1. A progression consists of a number of quantities increasing, or decreasing by a certain law, and forming what are called *continued proportionals*. When the terms of the series constantly increase, it is said to be an *ascending*, but when they decrease (increase to the *left*), a *descending series*.

2. In an equidifferent or arithmetical progression, the quantities increase, or decrease by a common difference. Thus 5, 7, 9, 11, &c., is an ascending, and 15, 12, 9, 6, &c., is a descending arithmetical series or progression. The common difference in the former is 2, and in the latter 3. A continued proportion may be formed out of such a series. Thus—

5:7::7:9:11, &c.; and 15:12:12:9:129:6, &c. Or we may say 5:7::9:11:: &c.; and 15:12::9:6:: &c.

3. In a geometrical or equivaliant progression, the quantities increase by a common ratio or multiplier. Thus 5, 10, 20, 40, &c.; and 10000, 1000, 100, 10, &c., are geometrical series. The common ratio in the former case is 2, and the quantities increase to the right; in the latter it is 10, and the quantities increase to the right; in the latter it is 10, and the quantities increase to the left. A continued proportion may be formed out of such a series. Thus—

4. The first and last terms of a progression are called its *extremes*, and all the intermediate terms its *means*.

5. Arithmetical Progression.—To find the sum of a series of terms in arithmetical progression—

RULE.-Multiply the sum of the extremes by half the number of terms.

EXAMPLE.—What is the sum of a series of 10 terms, the first being 2, and last 20? Ans.  $2+20\times \frac{19}{2}=110$ .

6. REASON OF THE RULE.—This rule can be easily proved. For this purpose, set down the progression twice over—but in such a way as that the last term of one shall be under the first term of the other series.

Then, 24+21+18+15+12+9 ==the sum. 9+12+15+18+21+24 ==the sum. And,

adding the equals, 33+33+33+33+33+33=twice the sum.

That is, *twice* the sum of the series will be equal to the sum of as many quantities as there are terms in the series—cach of the quantities being equal to the sum of the extremes. And the sum of the series itself will be equal to half as much, or to the sum of the extremes taken half as many times as there are terms in the series. The rule might be proved correct by any other example, and, therefore, is general.

# EXERCISES.

1. One extreme is 3, the other 15, and the number of terms is 7. What is the sum of the series? Ans. 63.

2. One extreme is 5, the other 93, and the number of terms is 49. What is the sum? Ans. 2401.

3. One extreme is 147, the other  $\frac{3}{4}$ , and the number of terms is 97. What is the sum? Ans. 7165.875.

4. One extreme is  $4\frac{3}{6}$ , the other 143, and the num ber of terms is 42. What is the sum? Ans. 3094.875

7. Given the extremes, and number of terms—to find the common difference—

RULE.—Find the difference between the given extremes, and divide it by one less than the number of terms. The quotient will be the common difference.

EXAMPLE.—In an arithmetical series, the extremes are 21 and 3, and the number of terms is 7. What is the common difference ?

 $21 - 3 \div 7 - 1 = 18 \div 6 = 3$ , the required number.

8. REASON OF THE RULE.—The difference between the greater and lesser extreme arises from the common difference being added to the lesser extreme once for every term, except the lowest; that is, the greater contains the lesser extreme plus the common difference taken once less than the number of terms. Therefore, if we subtract the lesser from the greater extreme, the difference obtained will be equal to the common difference additional by one less than the number of terms. And if we divide the difference by one less than the number of terms we will have the common difference.

5. Th and 497, common 6. Th and  $9\frac{1}{7}$ , common 7. Th and  $\frac{3}{4}$ , a common

# EXERCISES.

5. The extremes of an arithmetical series are 21 and 497, and the number of terms is 41. What is the common difference? Ans. 11.9.

6. The extremes of an arithmetical series are  $127\frac{25}{2}$ and  $9\frac{1}{7}$ , and the number of terms is 26. What is the common difference? Ans.  $4\frac{3}{4}$ .

7. The extremes of an arithmetical series are  $77\frac{2}{3}\frac{3}{3}$ and  $\frac{3}{4}$ , and the number of terms is 84. What is the common difference? Ans.  $\frac{13}{14}$ .

9. To find any number of arithmetical means between two given numbers-

RULE.—Find the common difference [7]; and, according as it is an ascending or a descending series, add it to, or subtract it from the first, to form the second term; add it to, or subtract it from the second, to form the third. Proceed in the same way with the remaining terms.

We must remember that one less than the number of terms is one more than the number of means.

EXAMPLE 1.—Find 4 arithmetical means between 6 and 21. 21-6=15.  $\frac{15}{4+1}=3$ , the common difference. And the series is—

EXAMPLE 2.—Find 4 arithmetical means between 30 and 10. 30-10=20.  $\frac{20}{4+1}=4$ , the common difference. And the series is—

30 . 26 . 22 . 18 . 14 . 10 This rule is evident.

# EXERCISES.

8. Find 11 arithmetical means between 2 and 26 Ans. 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, and 24.

9. Find 7 arithmetical means between 8 and 32 Ans. 11, 14, 17, 20, 23, 26, 29.

10 Find 5 arithmetical means between  $4\frac{1}{2}$ , and  $13\frac{1}{2}$ Ans. 6,  $7\frac{1}{2}$ , 9,  $10\frac{1}{2}$ , 12.

nber 5. um 875 find

ex-

e 21 mon

the enco exemo iber iter non ems.

10. Given the extremes, and the number of terms to find any term of an arithmetical progression—

RULE.—Find the common difference by the last rule, and if it is an ascending series, the required term will be the lesser extreme *plus*—if a descending series, the greater extreme *minus* the common difference multiplied by one less than the number of the term.

EXAMPLE 1.—What is the 5th term of a series containing 9 torms, the first being 4, and the last 28 ?

 $\frac{28-4}{8}$  = 3, is the common difference. And  $4+3\times5-1$  =

16, is the required term.

EXAMPLE 2.—What is the 7th term of a series of 10 terms, the extremes being 20 and 2 ?

20 - 2

# $\frac{-1}{9}$ = 2, is the common difference. $20 - 2 \times 7 - 1 = 8$ , is the required term.

11. REASON OF THE RULE.—In an ascending series the required term is greater than the given lesser extreme to the amount of all the differences found in it. But the number of differences it contains is equal only to the number of terms which precede it—since the common difference is not found in the first term.

In a descending series the required term is less than the given greater extreme, to the amount of the differences subtracted from the greater extreme—but one has been subtracted from it, for each of the terms which *precede* the required term.

# EXERCISES.

11. In an arithmetical progression the extremes are 14 and 86, and the number of terms is 19. What is the 11th term? Ans. 54.

12. In an arithmetical series the extremes are 22 and 4, and the number of terms is 7. What is the 4th term? Ans. 13.

13. In an arithmetical series 49 and  $\frac{3}{4}$  are the extremes, and 106 is the number of terms. What is the 94th term? Ans. 6.2643.

12. Given the extremes, and common difference-to find the number of terms-

RULE.—Divide the difference between the given extremes by the *common* difference, and the quotient plus unity will be the number of terms.  $\begin{array}{r} -\text{Examp}\\ \text{which th}\\ \text{ence } 3 ?\\ \underline{26 -}\\ 3 \end{array}$

EXAMPLE.—How many terms in an arithmetical series of which the extremes are 5 and 26, and the common differ ence 3?

 $\frac{26-5}{3}$  =7. And 7+1=8, is the number of terms.

13. REASON OF THE RULE.—The greater differs from the lesser extreme to the aniount of the differences found in all the terms. But the common difference is found in all the terms except the lesser extreme. Therefore the difference between the extremes contains the common difference once less than will be expressed by the number of terms.

### EXERCISES.

14. In an arithmetical series, the extremes are 96 and 12, and the common difference is 6. What is the number of terms? Ans. 15.

15. In an arithmetical series, the extremes are 14 and 32, and the common difference is 3. What is the number of terms? Ans. 7.

16. In an arithmetical series, the common difference is  $\frac{5}{9}$ , and the extremes are  $14\frac{8}{9}$  and 11. What is the number of terms? Ans. 8.

14. Given the sum of the series, the number of terms, and one extreme—to find the other—

RULE.—Divide twice the sum by the number of terms, and take the given extreme from the quotient The difference will be the required extreme.

EXAMPLE.—One extreme of an arithmetical series is 10 the number of terms is 6, and the sum of the series is 42 What is the other extreme ?

 $\frac{2 \times 42}{6} - 10 = 4$ , is the required extreme.

15. REASON OF THE RULE.—We have seen [5] that  $2 \times$  the sum = sum of the extremes  $\times$  the number of terms. But if we divide each of these equal quantities by the number of terms, we shall have

 $\frac{2 \times \text{the sum}}{\text{the number of terms}} \frac{\text{sum of extremes } \times \text{the number of terms}}{\text{the number of terms}}$   $2 \times \text{the sum}$ 

Or the number of terms = sum of the extremes. And subtracting the same extreme from each of these equals, we shall have

Or the number of terms minus one extreme == the other exreme.

### EXERCISES.

17. One extreme is 4, the number of terms is 17, and the sum of the series is 884. What is the other extreme? Ans. 100.

18. One extreme is 3, the number of terms is 63, and the sum of the series is 252. What is the other extreme? Ans. 5.

19. One extreme is 27, the number of terms is 26, and the sum of the series is 1924. What is the other extreme? Ans. 121.

16. Geometrical Progression.—Given the extremes and common ratio—to find the sum of the series—

RULE.—Subtract the lesser extreme from the product of the greater and the common ratio; and divide the difference by one less than the common ratio.

EXAMPLE.—In a geometrical progression, 4 and 312 are the extremes, and the common ratio is 2. What is the sum of the series.

 $\frac{312 \times 2 - 4}{2 - 1} = 620$ , the required number.

17. REASON OF THE RULE.—The rule may be proved by setting down the series, and placing over it (but in a reverse order) the product of each of the terms and the common ratio. Then

And, subtracting the lower from the upper line, we shall have  $Sum \times common ratio - Sum = 624 - 4$ . Or

 $Common ratio - 1 \times Sum = 624 - 4.$ 

And, dividing each of the equal quantities by the common ratio minus 1

 $Sum = \frac{642 \text{ (last term } \times \text{ common ratio)} - 4 \text{ (the first term)}}{\text{common ratio} - 1}$ Which is the rule, 20. The 2, and th Ans. 682. 21. The 175692, an Ans. 1932 22. The are  $\frac{1}{15}$  and the sum? Since the

#### EXERCISES.

20. The extremes of a geometrical series are 512 and 2, and the common ratio is 4. What is the sum  $\stackrel{?}{:}$  Ans. 682.

21. The extremes of a geometrical series are 12 and 175692, and the common ratio is 11. What is the sum? Ans. 193260.

22. The extremes of an infinite geometrical series are  $\frac{1}{10}$  and 0, and  $\frac{1}{10}$  is the common ratio. What is the sum? Ans.  $\frac{1}{10}$ . [Sec. IV. 74.]

Since the series is infinite, the lesser extreme=0.

23. The extremes of a geometrical series are 3 and 937.5, and the common ratio is 5. What is the sum? Ans. 1171.875.

18. Given the extremes, and number of terms in a geometrical series—to find the common ratio—

RULE.—Divide the greater of the given extremes by the lesser; and take that root of the quotient which is indicated by the number of terms minus 1. This will be the required number.

EXAMPLE. -- 5 and 80 are the extremes of a geometrical progression, in which there are 5 terms. What is the common ratio?

 $\frac{80}{5}$ =16. And 3/16=2, the required common ratio.

19. RDASON OT THE RULE.—The greater extreme is equal to the lesser multiplied by a product which has for its factors the common ratio taken once less than the number of terms since the common ratio is not found in the *first* term. That is, the greater extreme contains the common ratio raised to a power indicated by 1 less than the number of terms, and multiplied by the lesser extreme. Consequently if, after dividing by the lesser extreme, we take that root of the quotient, which is indicated by one less than the number of terms, we shall obtain the common ratio itself.

#### EXERCISES

24. The extremes of a geometrical series are 49152and 3, and the number of terms is 8. What is the common ratio? Ans. 4.

25. The extremes of a geometrical series are 1 and

15625, and the number of terms is 7 What is the common ratio? Ans. 5.

26. The extremes of a geometrical series are 201768035 and 5, and the number of terms is 10 What is the common ratio? Ans. 7.

20. To find any number of geometrical means be tween two quantities—

RULE.—Find the common ratio (by the last rule), and—according as the series is ascending, or descending—multiply or divide it into the first term to obtain the second; multiply or divide it into the second to obtain the third; and so on with the remaining terms.

We must remember that one *less* than the number of terms is one *more* than the number of means.

EXAMPLE 1.—Find 3 geometrical means between 1 and 81.

 $\sqrt[4]{1}$  =3, the common ratio. And 3, 9, 27, are the required means.

EXAMPLE 2.—Find 3 geometrical means between 125? and 2.

 $4\sqrt{\frac{1250}{2}}$ =5. And  $\frac{1250}{5}$   $\frac{1250}{5\times5}$   $\frac{1250}{5\times5\times5}$ , or 250, 50, 1% are the required means.

This rule requires no explanation.

# EXERCISES.

27. Find 7 geometrical means between 3 and 19683 : Ans. 9, 27, 81, 243, 729, 2187, 6561.

28. Find 8 geometrical means between 4096 and 8 iAns. 2048, 1024, 512, 256, 128, 64, 32, and 16.

29. Find 7 geometrical means between 14 and 23514624? Ans. 84, 504, 3024, 18144, 108864, 653184, and 3919104.

21. Given the first and last term, and the number of terms—to find *any* term of a geometrical series—

RULE.—If it be an ascending series, multiply, if a descending series, divide the first term by that power of the common ratio which is indicated by the number of the term minus 1.

 $\frac{\text{Exam}}{\frac{256}{2}}$ 

The e the gre number

**EXAMPLE 1.**— Find the 3rd term of a geometrical series, of which the first term is 6, the last 1458, and the number of terms 6.

The common ratio is  $\sqrt[3]{\frac{1458}{6}}=3$ . Therefore the required term is  $6 \times 3^2 = 54$ .

EXAMPLE 2.—Find the 5th term of a series, of which the extremes are 524288 and 2, and the number of terms is 10.

The common ratio  $2\sqrt{\frac{524288}{2}} = 4$ . And  $\frac{524288}{4^4} = 2048$ , is the required term.

22. REASON OF THE RULE.—In an ascending series, any term is the product of the first and the common ratio taken as a factor so many times as there are *preceding* terms--since it is not found in the *first* term.

In a decending series, any term is equal to the first term, divided by a product containing the common ratio as a factor so many times as there are preceding terms—since every term but that which is required adds it once to the factors which constitute the divisor.

### EXERCISES.

30. What is the 6th term of a series having 3 and 5859375 as extremes, and containing 10 terms? Ans. 9375.

31. Given 39366 and 2 as the extremes of a series having 10 terms. What is the 8th term? Ans. 18.

32. Given 1959552 and 7 as the extremes of a series having 8 terms. What is the 6th term? Ans. 252.

23. Given the extremes and common ratio—to find the number of terms—

RULE.—Divide the greater by the lesser extreme, and one more than the number expressing what power of common ratio is equal to the quotient, will be the required quantity.

EXAMPLE.—How many terms in a series of which the extremes are 2 and 256, and the common ratio is 2 !

 $\frac{256}{2}$ =128. But 2<sup>\*</sup>=128. There are, therefore, 8 terms.

The common ratio is found as a factor (in the quotient of , the greater divided by the lesser extreme) once less than the number of terms.

# EXERCISES.

33. How many terms in a series of which the first is 78732 and the last 12, and the common ratio is 9? Ans. 5.

34. How many terms in a series of which the extremes and common ratio are 4, 470596, and 7? Ans. 7.

35. How many terms in a series of which the extremes and common ratio, are 196608, 6, and 8? Ans. 6.

24. Given the common ratio, number of terms, and one extreme—to find the other—

RULE.—If the lesser extreme is given, multiply, if the greater, divide it by the common ratio raised to a power indicated by one less than the number of terms.

EXAMPLE 1.—In a geometrical series, the lesser extreme is 8, the number of terms is 5, and the common ratio is 6; what is the other extreme ? Ans.  $8 \times 6^{\delta-1} = 10368$ .

EXAMPLE 2.—In a geometrical series, the greater extreme is 6561, the number of terms is 7, and the common ratio is 3; what is the other extreme ? Ans.  $6561 \div 3^{2-1}=9$ .

This rule does not require any explanation.

# EXERCISES.

36. The common ration is 3; the number of terms is 7, and one extreme is 9; what is the other? Ans. 6561.

37. The common ratio is 4, the number of terms is 6, and one extreme is 1000; what is the other ? Ans. 1024000.

38. The common ratio is 8, the number of terms is 10, and one extreme is 402653184; what is the other? Ans. 3.

In progression, as in many other rules, the application of algebra to the reasoning would greatly simplify it.

MISCELLANEOUS EXERCISES IN PROGRESSION.

1. The clocks in Venice, and some other places strike the 24 hours, not beginning again, as ours do, after 12. How many strokes do they give in a day? Ans. 300.

2 A butcher bought 100 sheep; for the first he gave 1s, and for the last £9 19s. What did he pay for

all, supp Ans. £5 3. A yard he price of a 4. A the first on, until did he tr 5. A that the and that year. E 6. Fi Ans.  $\frac{1}{2}$ . 7. Of 8. W payment being £ common the ratio 9. W thing fo second, shoe? 10. A queathe gave £ next, 11 was the of the 1 ceived J

1. W series? 2. W trical pr names? 3. W ratio?

all, supposing their prices to form an arithmetical series? Ans.  $\pounds 500.$ 

3. A person bought 17 yards of cloth; for the first yard he gave 2s, and for the last 10s. What was the price of all? Ans. £5 2s.

4. A person travelling into the country went 3 miles the first day, 8 miles the second, 13 the third, and so on, until he went 58 miles in one day. How many days did he travel? Ans. 12.

5. A man being asked how many sons he had, said that the youngest was 4 years old, and the eldest 32, and that he had added one to his family every fourth year. How many had he? Ans. 8.

6. Find the sum of an infinite series,  $\frac{1}{2}$ ,  $\frac{1}{9}$ ,  $\frac{1}{27}$ , &c. Ans.  $\frac{1}{2}$ .

7. Of what value is the decimal '463'? Ans. 453.

8. What debt can be discharged in a year by monthly payments in geometrical progression, the first term being  $\pounds 1$ , and the last  $\pounds 2048$ ; and what will be the common ratio? Ans. The debt will be  $\pounds 4095$ ; and the ratio 2.

9. What will be the price of a horse sold for 1 farthing for the first nail in his shoes, 2 farthings for the second, 4 for the third, &c., allowing 8 nails in each shoe? Ans. £4473924 5s.  $3\frac{3}{4}d$ .

10. A nobleman dying left 11 sons, to whom he bequeathed his property as follows; to the youngest he gave £1024; to the next, as much and a half; to the next,  $1\frac{1}{2}$  of the preceding son's share; and so on. What was the eldest son's fortune; and what was the amount of the nobleman's property? Ans. The eldest son received £59049, and the father was worth £175099.

# QUESTIONS.

1. What is meant by ascending and descending series? [1].

2. What is meant by an arithmetical and geometrical progression; and are they designated by any other names? [2 and 3].

# ANNUITIES

4 Show that a continued proportion may be formed from a series of either kind? [2 and 3].

b. What are means and extremes? [4].

6. Now is the sum of an arithmetical or a geometrical series found? [5 and 16].

7. How is the common difference or common ratio found? [7 and 18].

8. How is any number of arithmetical or geometrical means found? [9 and 20].

9. How is any particular arithmetical or geometrical mean found? [10 and 21].

10. How is the number of terms in an arithmetical or geometrical series found? [12 and 23].

11. How is one extreme of an arithmetical or geometrical series found? [14 and 24].

# ANNUITIES.

25. An annuity is an income to be paid at stated times, yearly, half-yearly, &c. It is either *in possession*, that is, entered upon already, or to be entered upon immediately; or it is *in reversion*, that is, not to commence until after some period, or after something has occurred. An annuity is *certain* when its commencement and termination are assigned to definite periods, *contingent* when its beginning, or end, or both are uncertain; is *in arrears* when one, or more payments are retained after they have become due. The *amount* of an annuity is the sum of the payments forborne (in arrears), and the interest due upon them.

When an annuity is paid off at once, the price given for it is called its *present worth*, or *value*—which ought to be such as would—if left at compound interest until the annuity ceases—produce a sum equal to what would be due from the annuity left unpaid until that time. This value is said to be so many *years' purchase*; that is, so many annual payments of the income as would be just equivalent to it.

26. To find the amount of a certain number of payments in arrears, and the interest due on themRot.E. the sum of be the requ

EXAMPLE 1 .- What will be the amount of £1 per annum, unpaid for 6 years, 5 per cent. simple interest being allowed ?

The last, and preceding payments, with the interest due on them, form the arithmetical series  $\pounds 1 + \pounds 05 \times 5$ .  $\pounds 1 + \pounds 05 \times 5$ 4... $\pounds 1 \times \pounds 05$  £1. And its sum is  $\pounds 1 + \pounds 1 + \pounds 05 \times 5 \times 5$ 

EXAMPLE 2.-If the rent of a farm worth £60 per annum is unpaid for 19 years, how much does it amount to, at 5 per cent. per an. compound interest ?

In this case the series is geometrical ; and the last payment with its interest is the amount of  $\mathcal{L}1$  for 18 (19-1) years multiplied by the given annuity, the preceding payment with its interest is the amount of  $\mathcal{L}1$  for 17 years multiplied by the given annuity, &c.

The amount of  $\mathcal{L}1$  (as we find by the table at the end of the treatise) for 18 years is £2.40662. Then the sum of the series is---

 $\pm 2.40662 \times 1.05 \times 60 - 60$ [16]=1-32.4, the required amount. 1.05 - 1

The amount of £1 for 18 years multiplied by 1 05 is the same as the amount of £1 for 19, or the given number of years, which is found to be  $\pounds 2.527$ . And 1.05 - 1, the divisor, is equal to the amount of  $\pounds 1$  for one payment minus  $\mathcal{L}1$ ; that is, to the interest of  $\mathcal{L}1$  for one payment. Hence the required sum will be  $\frac{\pounds 2.527 \times 60 - 60}{67}$ 

 $- = \pounds 1832.4.$ 

It would evidently be the same thing to consider the annuity as £1, and then multiply the result by 60. Thus

 $\frac{2 \cdot 527 - 1}{.05} \times 60 = \pounds 1832.4$ . For an annuity of  $\pounds 60$  ought

to be 60 times as productive as one of only  $\pounds 1$ .

Hence, briefly, to find the amount of any number of payments in arrears, and the compound interest due on them--

Subtract £1 from the amount of £1 for the given number of payments, and divide the difference by the interest of £1 for one payment ; then multiply the quotient by the given sum.

Q

# ANNUITIES.

27. REASON OF THE RULE.—Each payment, with its interest, evidently constitute a separate amount; and the sum dae must be the sum of these amounts—which form a decreasing series, because of the decreasing interest, arising from the decreasing number of times of payment.

When simple interest is allowed, it is evident that what is due will be the sum of an *arithmetical* series, one extreme of which is the first payment plus the interest due upon it at the time of the last, the other the last payment; and its common difference the interest on one payment due at the next.

But when compound interest is allowed, what is due will be the sum of a geometrical series, one extreme of which is the first payment plus the interest due on it at the last, the other the last payment; and its common ratio £1 plus its interest for the interval between two payments. And in each case the interest due on the first payment at the time of the last will be the interest due for one less than the number of payments, since interest is not due on the first until the time of the second payment.

# EXERCISES.

1. What is the amount of £37 per annum unpaid for 11 years, at 5 per cent. per an. simple interest? Ans. £508 15s.

2. What is the amount of an annuity of £100, to continue 5 years at 6 per cent. per an. compound interest? Ans. £563 14s.  $2\frac{1}{4}d$ .

3. What is the amount of an annuity of £356, to continue 9 years, at 6 per cent. per an. simple interest? Ans. £3972 19s.  $2\frac{1}{2}d$ .

4. What is the amount of £49 per annum unpaid for 7 years, 6 per cent. compound interest being allowed? Ans. £411 5s.  $11\frac{1}{2}d$ .

28. To find the present value of an annuity-

RULE.—Find (by the last rule) the amount of the given annuity if not paid up to the time it will cease. Then ascertain how often this sum contains the amount of £1 up to the same time, at the interest allowed.

EXAMPLE.—What is the present worth of an annuity of  $\pounds 12$  per annum, to be paid for 18 years, 5 per cent. compound interest being allowed ?

An annuity of £12 unpaid for 18 years would amount to  $\pounds 28.13238 \times 12 = \pounds 2337.58856$ .

Bu woul

The as we time.

> 8. its p rest i 9.

# ANNUITIES.

But  $\mathcal{L}1$  put to interest for 18 years at the same rate would amount to  $\mathcal{L}2$  40662. Therefore

£337.58856

 $2:40662 = \pounds140$  5s. 6d. is the required value.

The sum to be paid for the annuity should evidently be such as would produce the same as the annuity itself, in the same time.

# EXERCISES.

5. What is the present worth of an annuity of  $\pounds 27$ , to be paid for 13 years, 5 per cent. compound interest being allowed? Ans.  $\pounds 253$  12s.  $6\frac{1}{4}d$ .

6. What is the present worth of an annuity of  $\pounds$ 324, to be paid for 12 years, 5 per cent. compound interest being allowed? Ans.  $\pounds$ 2871 13s. 10<sup>1</sup>d.

7. What is the present worth of an annuity of  $\pounds 22$ , to be paid for 21 years, 4 per cent. compound interest being allowed? Ans.  $\pounds 308$  12s. 10d.

29. To find the present value, when the annuity is in perpetuity—

RULE.—Divide the interest which £1 would produce in perpetuity into £1, and the quotient will be the sum required to produce an annuity of £1 per annum in perpetuity. Multiply the quotient by the number of pounds in the given annuity, and the product will be the required present worth.

EXAMPLE.—What is the value of an income of £17 for ever !

Let us suppose that £100 would produce £5 per cent. per an. for ever:—then £1 would produce £05. Therefore, to produce £1, we require as many pounds as will be equal to the number of times £05 is contained in £1. Eut  $\frac{\pounds}{.05}$  = £20, therefore £20 would produce an annuity of £1 for ever. And 17 times as much, or £20×17=340, which would produce an annuity of £17 for ever, is the required present value.

# EXERCISES.

S. A small estate brings £25 per annum; what is its present worth, allowing 4 per cent. per annum interest? Ans. £625.

in perpetuity, allowing 6 per cent. interest? Ans £5783 6s. 8d.

10. What is the value of a perpetual annuity of £46, allowing 5 per cent. interest? Ans. £920.

30. To find the present value of an annuity in rever-

RULE.—Find the amount of the annuity as if it were forborne until it should eease. Then fr.d. what sum, put to interest now, would at that time produce the same amount.

EXAMPLE.—What is the value of an annuity of £10 per annum, to continue for 6, but not to commence for 12 years, 5 per cent. compound interest being allowed ?

An annuity of £10 for 6 years if left unpaid, would be worth £68.0191; and £1 would, in 18 years. be worth £11.68959. Therefore £68.0191

 $11.68959 = \pounds 28$  5s. 3d., is the required present worth.

# EXERCISES

11. what is the present worth of £75 per annum, which is not to commence for 10 years, but will continue 7 years after, at 6 per cent. compound interest? Ans. £155 9s.  $7\frac{2}{4}d$ .

12. The reversion of an annuity of £175 per annum, to continue 11 years, and commence 9 years hence, is to be sold; what is its present worth, allowing 6 per cent. per annum compound interest? Ans. £430 7s. 1d.

13. What is the present worth of a rent of £45 per annum, to commence in 8, and last for 12 years, 6 per cent. compound interest, payable half-yearly, being allowed? Ans. £117 2s.  $8\frac{1}{2}d$ .

31 When the annuity is contingent, its value depends on the probability of the contingent circumstance, or circumstances.

A life annuity is equal to its amount multiplied by ' the value of an annuity of  $\pounds 1$  (found by tables) for the given age. The tables used for the purpose are calculated on principles derived from the doctrine of chances, observations on the duration of life in different eircumstances, the rates of compound interest, &c. 1. 2. What is an annuity in possession—in reversion certain—contingent—or in arrears ? [25].

3. What is meant by the present worth of an annuity? [25].

4. How is the amount of any number of payments in arrears found, the interest allowed being simple or compound? [26].

5. How is the present value of an annuity in possession found ? [28].

6. How is the present value of an annuity in perpetuity found? [29].

7. How is the present value of an annuity in reversion found? [30].

# POSITION.

32. Position, called also the "rule of false," is a rule which, by the use of one or more assumed, but *false* numbers, enables us to find the true one. By means of it we can obtain the answers to certain questions, which we could not resolve by the ordinary direct rules.

When the results are really proportional to the supposition—as, for instance, when the number sought is to be *multiplied* or *divided* by some proposed number; or is to be increased or diminished by *itself*, or by some given multiple or part of itself-and when the question contains only one proposition, we use what is called single position, assuming only one number; and the quantity found is *exactly* that which is required. Otherwise-as, for instance, when the number sought is to be increased or diminished by some absolute number, which is not a known multiple, or part of it-or when two propositions, neither of which can be banished, are contained in the problem, we use *double* position, assuming two numbers. If the number sought is, during the process indicated by the question, to be involved or evolved, we obtain only an approximation to the quantity required.

33. Single Position.—RULE. Assume a number, and perform with it the operations described in the question; then say, as the result obtained is to the number used, so is the true or given result to the number required.

EXAMPLE.—What number is that which, being multiplied by 5, by 7, and by 9, the sum of the results shall be 231?

Let us assume 4 as the quantity sought.  $4 \times 5 + 4 \times 7 + 4 \times 9 = 84$ . And  $84 : 4 :: 231 : \frac{4 \times 231}{84} = 11$ , the required number.

34. REASON OF THE RULE.—It is evident that two numbers, multiplied or divided by the same, should produce proportionate results.—It is otherwise, however, when the same quantity is added to, or subtracted from them. Thus let the given question be changed into the following. What number is that which being multiplied by 5, by 7, and by 9, the sum of the products, plus 8, shall be equal to 239?

Assuming 4, the result will be 92. Then we cannot say

92(84+8): 4:: 239(231+8): 11.

For though 84 : 4 :: 231 : 11, it does not follow that 84+8 : 4 :: 231+8 : 11. Since, while [Sec. V. 29] we may *multiply* or *divide* the first and third terms of a geometrical proportion by the same number, we cannot, without destroying the proportion, *add* the same number to, or *subtract* it from them. The question in this latter form belongs to the rule of *double* position.

# EXERCISES.

1. A teacher being asked how many pupils he had, replied, if you add  $\frac{1}{3}$ ,  $\frac{1}{4}$ , and  $\frac{1}{6}$  of the number together, the sum will be 18; what was their number? Ans. 24.

2. What number is it, which, being increased by  $\frac{1}{2}$ ,  $\frac{1}{3}$ , and  $\frac{1}{4}$  of itself, shall be 125? Ans. 60.

3. A gentleman distributed 78 pence among a number of poor persons, consisting of men, women, and children; to each man he gave 6d., to each woman, 4d., and to each child, 2d.; there were twice as many women as men, and three times as many children as women. How many were there of each? Ans. 3 men, 6 women, and 18 children.

4. A person bought a chaise, horse, and harness, for  $\pounds 60$ ; the horse came to twice the price of the harness, and the chaise to twice the price of the horse and har-

aess. What did he give for each? Ans. He gave for the harness,  $\pounds 6$  13s. 4d.; for the horse,  $\pounds 13$  6s. 8d.; and for the chaise,  $\pounds 40$ .

5. A's age is double that of B's; B's is treble that of C's; and the sum of all their ages is 140. What is the age of each? Ans. A's is 84, B's 42, and C's 14.

6. After paying away  $\frac{1}{4}$  of my money, and then  $\frac{1}{4}$  of the remainder, I had 72 guineas left. What had I at first? Ans. 120 guineas.

7. A can do a piece of work in 7 days; B can do the same in 5 days; and C in 6 days. In what time will all of them execute it? Ans. in  $1\frac{1}{10.3}$  days.

8. A and B can do a piece of work in 10 days; A by himself can do it in 15 days. In what time will B do it? Ans. In 30 days.

9. A cistern has three cocks; when the first is opened all the water runs out in one hour; when the second is opened, it runs out in two hours; and when the third is opened, in three hours. In what time will it run out, if all the cocks are kept open together? Ans. In  $\frac{1}{10}$  hours.

10. What is that number whose  $\frac{1}{3}$ ,  $\frac{1}{6}$ , and  $\frac{1}{7}$  parts, taken together, make 27? Ans. 42.

11. There are 5 mills; the first grinds 7 bushels of corn in 1 hour, the second 5 in the same time, the third 4, the fourth 3, and the fifth 1. In what time will the five grind 500 bushels, if they work together? Ans. In 25 hours.

12. There is a eistern which can be filled by a cock in 12 hours; it has another cock in the bottom, by which it can be emptied in 18 hours. In what time will it be filled, if both are left open? Ans. In 36 hours.

35. Double Position.--RULE I. Assume two convenient numbers, and perform upon them the processes supposed by the question, marking the error derived from each with + or -, according as it is an error of excess, or of defect. Multiply each assumed number into the error which belongs to the other; and, if the errors are both plus, or both minus, divide the difference of the products by the difference of the errors. But, if one is a plus, and the other is a minus error, divide the sum of

Assuming numbers which give two errors of excess-First, let 28 be one of them,

Multiply by 4

# 112 Add 10

From 122, the result obtained, subtract 100, the result required,

and the remainder, +22, is an error of excess. Multiply by 31, the other assumed number

and 682 will be the product.

Next<sub>7</sub> let the assumed number be 31 Multiply by 4

# 124

# Add 10

From 134, the result obtained, subtract 100, the result required,

and the remainder, +34, is an error of excess. Multiply by 28, the other assumed num.

and 952 will be the product. From this subtract 682, the product found above,

# divide by 12)270

and the required quantity is 22.5=£22 10s.

Difference of errors= $34-2\times =12$ , the number by which we have divided.

36. REASON OF THE RULE. - When in example 1, we multiply 28 and 31 by 4, we multiply the error belonging to each by 4. Hence 122 and 134 are, respectively, equal to the true result, plus 4 times one of the errors. Subtracting 100, the true result, from each of them, we obtain 22 (4 times the error in 28) and 34 (4 times the error in 31).

But, as numbers are proportional to their equinaltiples the error in 28: the error in 31::22 (a multiple of the former): 34 (an equimultiple of the latter).

And from the nature of proportion [Sec. V. 21]-

The error in  $28 \times 34$  = the error in  $31 \times 22$ .

But 682=the error in 31+the required number  $\times 22$ .

And 952=the error in 28+the required number ×34.

Or, since to multiply quantities under the vinculum [Sec [I. 34], we are to multiply each of them-

682=22 times the error in 31+22 times the required number. 952-34 times the error in 28-34 times the required number.

Subtracting the upper from the lower line, we shall have 952-682=34 times the error in 28-22 times the error in 31+34 times the required number-22 times the required number.

But, as we have seen above, 34 times the error in 28=22 times the error in 31. Therefore, 34 times the error in 28-22 times the error in 31=0; that is, the two quantities cancel each other, and may be omitted. We shall then have

952-682=34 times the required number-22 times the required number; or 270=34-22 (=12) times the required number. And, [See. V. 6] dividing both the equal quantities by 12,

 $\frac{270}{12}(22.5) = \frac{34-22}{12}$  times (once) the required number.

37. EXAMPLE 2.-Using the same example, and assuming numbers which give two errors of defect.

| Let | them | be | 14, | and | 16 |

| 364 1               | Difference of errors $= 34 - 26 = 8$ . |  |
|                     |  |  |

8)180

 $22.5 = \pounds 22$  10s., is the required quantity.

In this example 34=four times the error (of defect) in 14; and 26 =four times the error (of defect) in 16. And, since aumbers are proportional to their equimultiples,

The error in 14 : the error in 16 :: 34 : 26. Therefore The error in  $11 \times 26$  = the error in  $16 \times 34$ .

But 544=the required number-the error in 16×34 And 364=the required number-the error in 14×26 02

casa roxi

210 is

um,

ove,

iich

nuleach truo the ror

les for.

If we subtract the lower from the upper line, we shall have 544-364=(removing the vinculum, and changing the sign [Sec. II. 16]) 34 times the required number-26 times the required number-34 times the error in 16+26 times the error in 14.

But we found above that 34 times the error in 16=26 times the error in 14. Therefore-34 times the error in 16, and+26 times the error in 14=0, and may be omitted. We will then have 544--364=34 times the required number--26 times the required number; or 180=8 times the required number; and, dividing both these equal quantities by 8,

 $\frac{180}{8}$  (22.5)  $=\frac{8}{8}$  times (once) the required number.

38. EXAMPLE 3.-Using still the same example, and assuming numbers which will give an error of excess, and an error of defect.

| Let them be 15, and 23                                |  |
|---|--|
| 15  | 23   |
| 4   | · <b>1</b>   |
| 60  | 92   |
| 10  | 10   |
| 70, the result obtained.<br>100, the result required. | 102, the result obtained.<br>100, the result required. |
| $-\frac{30}{23}$ , an error of <i>defect</i> .        | $+\frac{12}{15}$ , an error of excess.                 |
| 690   | 30   |
| 30 Sum of c   | errors = 30 + 2 = 32.                                  |
| 2)720   |  |

 $22.5 = \pounds 22$  10s., the required quantity.

In this example 30 is 4 times the error (of defect) in 15; and 2, 4 times the error (of excess) in 23. And, since numbers are proportioned to the equimultiples,

The error in 23 : the error in 15 :: 2 : 30. Therefore The error in  $23 \times 30$  = the error in  $15 \times 2$ .

But 690=the required number+the error in  $23 \times 30$ .

And 30=the required number-the error in  $15 \times 2$ .

If we add these two lines together, we shall have 690+30== (removing the vinculam) 30 times the required number+twice the required number + 30 times the error in 23 - twice the error in 15.

But we found above that 30×the error in 23=2×the error in 15. Therefore 30×the error in  $23-2\times$ the error in 15=0.

and 1 quire times quan

> Th to si Fe or fo it co not

> > 3 4 ti

n tl  $\mathbf{n}$ tl 8

and may be omitted. We shall then have 690+30=the required number  $\times 30$  + the required number  $\times 2$ ; or 720=32 times the required number. And dividing each of these equal quantities by 32.

 $\frac{720}{32}(22.5) = \frac{32}{32}$  times (once) the required number.

The given questions might be changed into one belonging to single position, thus-

Four times the price of my horse is equal to  $\pounds 100 - \pounds 10$ ; or four times the price of my horse is equal to  $\pounds 90$ . What did it cost? This change, however, supposes an effort of the mind not required when the question is solved by double position.

39. EXAMPLE 4.—What is that number which is equal to 4 times its square root +21?

| Assume 64 and 81<br>$\sqrt{64=8}$<br>4<br>32<br>21<br>53, result obtained.<br>64, result required. | $\sqrt{81} = 9$ $\frac{4}{36}$ $21$ $\overline{57}, \text{ result obtained}$ $81, \text{ result required}$ $-24$ |
|--|--|
| $\frac{-11}{81}$   | $ \begin{array}{r} 64 \\ \overline{1536} \\ 891 \end{array} $  |
|  | 13)645   |

# The first approximation is 49.6154

It is evident that 11 and 24 are not the errors in the assumed numbers multiplied or divided by the same quantity, and therefore, as the reason upon which the rule is founded, does not apply, we obtain only an approximation. Substituting this, however, for one of the assumed numbers, we obtain a still nearer approximation.

40. RULE—II. Find the errors by the last rule; then divide their difference (if they are both of the same kind), or their sum (if they are of different kinds), into the product of the difference of the numbers and one of the errors. The quotient will be the correction of that error which has been used as multiplier.

have sign the error

error 5==0 EXAMPLE.—Taking the same as in the last rule, and w suming 19 and 25 as the required number.

| 19 $4$                   | $\frac{25}{4}$                             |     |
|--------------------------|--|-----|
|                          | 100  |     |
| 76<br>10                 | $\begin{array}{c} 100 \\ 10 \end{array}$ . |     |
| 86 the result obtained.  | 110 the result obtain                      | ed. |
| 100 the result required. | 100 the result require                     |     |
| -14, is error of defect. | +10, is error of excess                    |     |

The errors are of *different* kinds; and their sum is 14+10=24; and the difference of the assumed numbers is 25-19=6. Therefore

14 one of the errors,

is multiplied by 6, by the difference of the numbers. Then

# divide by 24)84

and 3.5 is the correction for 19, the number which gave an error of 14.

19+(the error being one of *defect*, the correction is to be added) 3.5=22.5=£22 10s. is the required quantity.

41. REASON OF THE RULE.—The difference of the results arising from the use of the different assumed numbers (the difference of the errors) : the difference between the result obtained by using one of the assumed numbers and that obtained by using the true number (one of the errors) : the difference between the numbers in the former case (the difference between the assumed numbers) : the difference between the numbers in the latter case (the difference between the true number, and that assumed number which produced the error placed in the third term—that is the correction required by that assumed number).

It is clear that the difference between the numbers used produces a proportional difference in the results. For the results are different, only because the difference between the assumed numbers has been multiplied, or divided, or both in accordance with the conditions of the question. Thus, in the present instance, 25 produces a greater result than 19, because 6, the difference between 19 and 25, has been multiplied by 4. For  $25 \times 4 \Rightarrow 19 \times 4 + 6 \times 4$ . And it is this  $6 \times 4$ which makes up 24, the *real* difference of the errors.—The difference between a negative and positive result being the sum of the differences between each of them and no result. Thus, if I gain 10s., I am richer to the amount of 24s, than if I lose 14s.

# $\sqrt[3]{512}$ = 8, is the required number.

We multiply the alternate error by the cube of the supposed number, because the errors belong to the  ${}^{3}_{64}$ th part of the cube of the assumed numbers, and not to the numbers themselves; for, in reality, it is the cube of some number that is required —since, 8 being assumed, according to the question we have  $\frac{8}{2} \times \frac{8}{4} \times \frac{3 \times 8}{8} = 24$ , or  $\frac{3}{64} \times 8^{3} = 24$ .

22. What number is it whose  $\frac{1}{2}$ ,  $\frac{1}{4}$ ,  $\frac{1}{5}$ , and  $\frac{1}{6}$ , multiplied together, will produce  $6998\frac{2}{5}$ ? Ans. 36.

23. A said to B, give me one of your shillings, and I shall have twice as many as you will have left. B answered, if you give me 1s., I shall have as many as you. How many had each  $\stackrel{?}{\underset{}}$  Ans. A 7, and B 5.

24. There are two numbers which, when added together, make 30; but the  $\frac{1}{4}$ ,  $\frac{1}{3}$ , and  $\frac{1}{4}$ , of the greater are equal to  $\frac{1}{2}$ ,  $\frac{3}{4}$ , and  $\frac{1}{4}$ , of the lesser. What are they? Ans. 12 and 18.

2° A gentleman has 2 horses and a saddle worth  $\pounds$ 50. The saddle, if set in the back of the first horse, will make his value double that of the second; but if set on the back of the second horse, it will make his value treble that of the first. What is the value of each horse?  $2 \le \pounds$ 30 and  $\pounds$ 40.

26. A gentleman finding several beggars at his door, gave to each 4d, and had 6d, left, but if he had given 6d, to each, he would have had 12d, too little. How many beggars were there? Ans. 9.

It is so likely that those and are desirous of studying this subject further will be acquainted with the method of treating algebraic equations—which in many cases affords a so much simpler and easier mode of solving questions belonging to position—that we do not deem it necessary to enter further into it.

#### QUESTIONS.

1. What is the difference between single and double position? [32].

2. In what cases may we expect an exact answer by these rules  $\geq \lceil 32 \rceil$ .

3. What is the rule for single position ? [33].

4. What are the rules for double position? [35 and 40].

# MISCELLANEOUS EXERCISES.

1. A father being asked by his son how old he was; replied, your age is now  $\frac{1}{3}$  of mine; but 4 years ago it was only  $\frac{1}{4}$  of what mine is now; what is the age of each? Ans. 70 and 14.

2. Find two numbers, the difference of which is 30, and the relation between them as  $7\frac{1}{4}$  is to  $3\frac{1}{2}$ ? Ans. 58 and 28.

3. Find two numbers whose sum and product are equal, neither of them being  $2 \stackrel{?}{=} Ans$ . 10 and  $1\frac{1}{2}$ .

#### EXERCISES.

4. A person being asked the hour of the day, answered, It is between 5 and 6, and both the hour and minute hands are together. Required what it was? Ans.  $27_{T^3T}$  minutes past 5.

5. What is the sum of the series  $\frac{1}{2}$ ,  $\frac{1}{4}$ ,  $\frac{1}{8}$ , &c.? Ans. 1.

6. What is the sum of the series  $\frac{2}{5}$ ,  $\frac{4}{15}$ ,  $\frac{8}{15}$ ,  $\frac{16}{135}$ , &c. ? Ans.  $1\frac{1}{5}$ .

7. A person had a salary of £75 a year, and let it remain unpaid for 17 years. How much had he to receive at the end of that time, allowing 6 per cent. per aunum compound interest, payable half-yearly? Ans. £204 17s.  $10\frac{1}{4}d$ .

8. Divide 20 into two such parts as that, when the greater is divided by the less, and the less by the greater, and the greater quotient is multiplied by 4, and the less by 64, the products shall be equal? Ans. 4 and 16.

9. Divide 21 into two such parts, as that when the less is divided by the greater, and the greater by the loss, and the greater quotient is multiplied by 5, and the less by 125, the products shall be equal? Ans.  $3\frac{1}{2}$  and  $17\frac{1}{2}$ .

1. A, B, and C, can finish a piece of work in 10 days; B and C will do it in 16 days. In what time will A do it by himself? Ans.  $26\frac{2}{3}$  days.

1. A can trench a garden in 10 days, B in 12, and C in 14. In what time will it be done by the three if they work together? Ans. In  $3\frac{9}{107}$  days.

12. What number is it which, divided by 16, will leave 3; but which, divided by 9, will leave 4? Ans. 67

13. What number is it which, divided by 7, will leave 4; but divided by 4, will leave 2? Ans. 18.

14. If £100, put to interest at a certain rate, will, at the end of 3 years, be augmented to £115.7625 (compound interest being allowed), what principal and interest will be due at the end of the first year? Ans. £105.

15. An elderly person in trade, desirous of a little respite, proposes to admit a sober, and industrious young person to a share in the business; and to encourage him, he offers, that if his circumstances allow him to

advance £100, his salary shall be £40 a year; that if he is able to advance £200, he shall have £55; but that if he can advance £300, he shall receive £70 annually. In this proposal, what was allowed for his attendance simply? Ans. £25 a year.

16. If 6 apples and 7 pears cost 33 pence, and 10 apples and 8 pears 44 pence, what is the price of one apple and one pear ? Ans. 2d. is the price of an apple, and 3d, of a pear.

17. Find three such numbers as that the first and  $\frac{1}{4}$  the sum of the other two, the second and  $\frac{1}{3}$  the sum of the other two, the third and  $\frac{1}{4}$  the sum of the other two will make 34? Ans. 10, 22, 26.

18. Find a number, to which, if you add 1, the sum will be divisible by 3; but if you add 3, the sum will be divisible by 4? Ans. 17.

19. A market woman bought a certain number of eggs, at two a penny, and as many more at 3 a penny; and having sold them all at the rate of five for 2d, she found she had lost fourpenee. How many eggs did she buy? Ans. 240.

20. A person was desirous of giving 3d. a piece to some beggars, but found he had 8d. too little; he therefore gave each of them 2d., and had then 3d. remaining. Required the number of beggars? Ans. 11.

21. A servant agreed to live with his master for  $\pounds$ S a year, and a suit of elothes. But being turned out at the end of 7 months, he received only  $\pounds$ 2 13s. 4d. and the suit of elothes; what was its value? Ans.  $\pounds$ 4 16s.

22. There is a number, consisting of two places of figures, which is equal to four times the sum of its digits, and if 18 be added to it, its digits will be inverted. What is the number? Ans. 24.

23. Divide the number 10 into three such parts, that if the first is multiplied by 2, the second by 3, and the third by 4, the three products will be equal? Ans.  $4\frac{1}{32}, 3\frac{1}{33}, 2\frac{1}{33}$ .

24. Divide the number 90 into four such parts that, if the first is increased by 2, the second diminished by 2, the third multiplied by 2, and the fourth divided by

ittle ung rage 1 to 2, the sum, difference, product, and quotient will be equal: Ans. 18, 22, 10, 40.

25. What fraction is that, to the numerator of which, if 1 is added, its value will be  $\frac{1}{3}$ ; but if 1 be added to the denominator, its value will be  $\frac{1}{4}$ ? Ans.  $\frac{4}{15}$ .

26. 21 gallons were drawn out of a cask of wine, which had leaked away a third part, and the cask being then guaged, was found to be half full. How much did it hold? Ans. 126 gallons.

27. There is a number,  $\frac{1}{2}$  of which, being divided by 6,  $\frac{1}{3}$  of it by 4, and  $\frac{1}{4}$  of it by 3, each quotient will be 9? Ans. 108.

28. Having counted my books, I found that when I multiplied together  $\frac{1}{2}$ ,  $\frac{1}{4}$ , and  $\frac{3}{4}$  of their number, the product was 162000. How many had I? Ans. 120.

29. Find the sum of the series  $1+\frac{1}{2}+\frac{1}{4}+\frac{1}{8}$ , &c.? Ans. 2.

30. A can build a wall in 12 days, by getting 2 days' assistance from B; and B can build it in 8 days, by getting 4 days' assistance from A. In what time will both together build it? Ans. In  $6\frac{2}{7}$  days.

31. A and B can perform a piece of work in 8 days, when the days are 12 hours long; A, by himself, can do it in 12 days, of 16 hours each. In how many days of 14 hours long will B do it? Ans.  $13\frac{5}{7}$ .

32. In a mixture of spirits and water,  $\frac{1}{2}$  of the whole plus 25 gallons was spirits, but  $\frac{1}{3}$  of the whole minus 5. gallons was water. How many gallons were there of each? Ans. 85 of spirits, and 35 of water.

33. A person passed  $\frac{1}{2}$  of his age in childhood,  $\frac{1}{12}$  of it in youth,  $\frac{1}{4}$  of it +5 years in matrimony; he had then a son whom he survived 4 years, and who reached only  $\frac{1}{2}$  the age of his father. At what age did this person die? Ans. At the age of 84.

34. What number is that whose  $\frac{1}{3}$  exceeds its  $\frac{1}{3}$  by 72? Ans. 540.

35. A vintner has a vessel of wine containing 500 gallons; drawing 50 gallons, he then fills up the cask with water. After doing this five times, how much wine and how much water are in the cask? Ans  $295\frac{49}{250}$  gallons of wine, and  $204\frac{1}{250}$  gallons of water.

# EXERCISES.

6. A mother and two daughters working together and spin 3 lb of flax in one day; the mother, by herself, can do it in  $2\frac{1}{2}$  days; and the eldest daughter in  $2\frac{1}{4}$ days. In what time can the youngest do it? Ans. In  $6\frac{3}{4}$  days.

37. A merchant loads two vessels, A and B; into A he puts 150 hogsheads of wine, and into B 240 hogsheads. The ships, having to pay toll, A gives 1 hogshead, and receives 12s.; B gives 1 hogshead and 36s. besides. At how much was each hogshead valued? Ans. £4 12s.

38. Three merchants traffic in company, and their stock is £400; the money of A continued in trade 5 months, that of B six months, and that of C nine months; and they gained £375, which they divided equally. What stock did each put in? Ans. A £167<sup>1</sup>/<sub>4</sub>, B £139<sup>2</sup>/<sub>4</sub>, and C £93<sup>1</sup>/<sub>4</sub>.

39. A fountain has 4 cocks, A, B, C, and D, and under it stands a cistern, which can be filled by A in 6, by B in 8, by C in 10, and by D in 12 hours; the cistern has 4 cocks, E, F, G, and H; and can be emptied by E in 6, by F in 5, by G in 4, and by H in 3 hours. Suppose the cistern is full of water, and that the 8 cocks are all open, in what time will it be emptied? Ans. In  $2\frac{2}{10}$  hours.

40. What is the value of 2'97'? Ans. 11.

41. What is the value of 5416'? Ans.  $\frac{13}{24}$ .

42. What is the value of '0'76923'? Ans.  $\frac{1}{13}$ .

43. There are three fishermen, A, B, and C, who have each caught a certain number of fish; when A's fish and B's are put together, they make 110; when B's and C's are put together, they make 130; and when A's and C's are put together, they make 120. If the fish is divided equally among them, what will be each man's share; and how many fish did each of them catch? Ans. Each man had 60 for his share; A caught 50, B 60, and C 70.

44. There is a golden cup valued at 70 crowns, and two heaps of crowns. The cup and first heap, are worth 4 times the value of the second heap; but the cup and second heap, are worth double the value of the first

500 cask nuch Ans ter. heap. How many crowns are there in each heap? Ans 50 in one, and 30 in another.

45. A certain number of horse and foot soldiers are to be ferried over a river; and they agree to pay  $2\frac{1}{2}d$ . for two horse, and  $3\frac{1}{2}d$ . for seven foot soldiers; seven foot always followed two horse soldiers; and when they were all over, the ferryman received £25. How many horse and foot soldiers were there? Ans. 2000 horse, and 7000 foot.

46. The hour and minute hands of a watch are together at 12; when will they be together again? Ans. at  $5\frac{5}{11}$  minutes past 1 o'clock.

47. A and B are at opposite sides of a wood 135 fathoms in compass. They begin to go round it, in the same direction, and at the same time; A goes at the rate of 11 fathoms in 2 minutes, and B at that of 17 in 3 minutes. How many rounds will each make, before one overtakes the other? Ans. A will go 17, and B  $16\frac{1}{2}$ .

48. A, B, and C, start at the same time, from the same point, and in the same direction, round an island 73 miles in circumference; A goes at the rate of 6, B at the rate of 10, and C at the rate of 16 miles per day. In what time will they be all together again? Ans. in  $36\frac{1}{4}$  days
