Charles I. was a man of slender person, of the middle size, and of a grave and somewhat melancholy cast of countenance. He had not a gracious manner, but possessed considerable dignity. He was sincerely attached to the Church of England, for which he might be considered as a martyr, and he was able to reason very acutely in favour of the divine origin of Episcopacy. The general opinion of modern times respecting his political conduct is unfavourable; though few deny that his death was a most disgraceful as well as imprudent act, on the part of those who brought it about. The worst point of his character was his insincerity; he was prone to using equivocations, with a view to deceive his opponents, and therefore no enemy could depend upon him in negotiation. In private life he was a virtuous man, and he is entitled to much credit for the taste which he displayed in the encouragement of the fine arts. He left three sons—Charles, Prince of Wales; James, Duke of York, afterwards James II.; and Henry, Duke of Gloucester, who died in early life. He also left several daughters, one of whom, named Elizabeth, was treated with much harshness by the new government, and died not long after him in prison.

In the reign of Charles I., the chief literary men were Ben Johnson and Philip Massinger, dramatists, and Samuel Daniel, Michael Drayton, and William Drummond, poets. The most eminent philosophical character was Dr. William Harvey, who discovered the circulation of the blood. Elegant architecture was now for the first time introduced into private buildings. The king patronized the Dutch artists, Rubens and Vandyke, and collected many fine pictures, which were afterwards sold by his enemies. The excise and the tax upon landed property were introduced by the Parliament, in order to support the war against the king. When the Parliamentary party became triumphant, it suppressed the theatre, which was not again set up till the restoration of monarchy.

THE COMMONWEALTH—SUBJUGATION OF IRELAND AND SCOTLAND.

Though the execution of the king produced a considerable reaction in favour of royalty, the small remaining part of the House of Commons, which got the ridiculous nickname of the *Rump*, now established a republic, under the title of the Commonwealth, the executive being trusted, under great limitations, to a council of forty-one members, while in reality Cromwell possessed the chief influence. The House of Peers was voted a grievance, and abolished, and the people were declared to be the legitimate source of all power. Soon after the king's death, the Duke of Hamilton, and a few other of his chief adherents, were executed.

During the progress of the civil war, Ireland had been the scene of almost ceaseless contention among the various parties of the King, the English House of Commons, and the Catholics, none of which could effectually suppress the rest. The most remarkable event was a secret agreement which Charles made, in 1646, with the Earl of Glamorgan, to establish the Catholic religion in Ireland, on condition that its partisans should assist him in putting down his enemies in England and Scotland; a transaction which ultimately injured his reputation, without leading to any solid advantage. At the time of his execution, the Royalists were in considerable strength under the Duke of Ormond, while Hugh O'Neill was at the head of a large party of Catholics, who were not indisposed to join the other party, provided they could be assured of the establishment of their religion. While the two parties in union could have easily rescued the country from the English connection, Cromwell landed (August 1649) with 12,000 horse and foot, and, in a series of victories over the scattered forces of his various opponents, succeeded without any great difficulty in asserting the sway of the Commonwealth. One of his most important actions was the capture of Drogheda, where he put the garrison and a number of Catholic priests to the sword, in order to strike terror into the nation.

The people of Scotland, who had had scarcely any other object in the civil war than the establishment of their favourite form of worship, and were sincere friends to a limited monarchy, heard of the death of the king with the greatest indignation, and immediately proclaimed his eldest son Charles. Early in 1650, the young monarch, who had taken refuge in Holland, sent Montrose with a small force to attempt a Cavalier insurrection in Scotland; but this nobleman being taken and put to death, Charles found it necessary to accede to the views of the Scots respecting the Presbyterian religion, and he was accordingly brought over and put at the head of a considerable army, though under great restrictions. Cromwell, who had now nearly completed the conquest of Ireland, lost no time in returning to London, and organizing an army for the suppression of this new attempt against the Commonwealth.

On the 19th of July he crossed the Tweed, and advanced through a deserted country to Edinburgh, where the Scottish army lay in a fortified camp. Sickness in the army, and the want of provisions, soon after compelled him to retreat; and the Scottish army, following upon his rear, brought him into a straitened position near Dunbar, where he would soon have been under the necessity of surrendering. In the midst of his perplexities (September 3), he beheld the Scots advancing from the neighbouring heights to give him battle, and in a transport of joy, exclaimed, "The Lord hath delivered them into our hands!" This movement was solely the result of interference on the part of the clergy who followed the Scottish camp: the better sense of General Leslie would have waited for the voluntary surrender of his enemy. In the fight which ensued, the veteran troops of Cromwell soon proved victorious. The Scots fled in a panic, and were cut down in thousands by their pursuers. This gained for Cromwell the possession of the capital and of all the south-east provinces; but the Covenanters still made a strong appearance at Stirling.

Cromwell spent a whole year in the country, vainly endeavouring to bring on another action. During the interval (January 1, 1651), the Scots crowned the young king at Scone, part of the ceremony consisting in his acceptance of the Solemn League and Covenant. In the ensuing summer, Cromwell at length contrived to outflank the position of the Scottish army; but the result was, that Charles led his troops into England without opposition, and made a very threatening advance upon the capital. Ere the Royalists had time to rally around him, Cromwell overtook the king at Worcester, where after a stoutly contested fight (September 3, 1651), he proved completely victorious. Charles, with great difficulty, escaped abroad, and Scotland, no longer possessed of a military force to defend itself, submitted to the conqueror. All the courts of the Scottish church were suppressed, and the ministers were left no privilege but that of preaching to their flocks. The country was kept in check by a small army under General Monk, and in a short time was declared by proclamation to be united with England. Thus was the Independent party, or rather Cromwell, left without a single armed enemy. All the efforts of the people during twelve years to obtain limitations upon the monarchy, had ended in a military despotism.

THE PROTECTORATE.

After the country and its dependencies had been thoroughly settled under the new government, the republican leaders resolved upon commencing hostilities against Holland, which, during the civil war, had manifested a decided leaning towards the king, and had recently treated the triumphant party with marked disrespect. In the summer of 1652, the Dutch fleet, under its famous commanders, Van Tromp, De Ruyter, and De Witt, had several encounters with the English ships, under Admirals Blake and Ayscue, without any decided success on either side. But, in the ensuing spring, an action was fought between Blake and Van Tromp, in which the latter lost eleven ships. The Dutch then sued for peace, which the Rump Parliament, for various reasons, were little inclined to grant. Their principal motive for prosecuting the war, was a conviction that it tended to restrict the power of Cromwell, to whom they now paid by no means a willing obedience. Cromwell, perceiving their design, proceeded with 300 soldiers to the house (April, 1653), and entering with marks of the most violent indignation, loaded the members with reproaches for their robbery and oppression of the public; then, stamping with his foot, he gave signal for the soldiers to enter, and, addressing himself to the members, "For shame!" said he; "get you gone! give place to honester men! I tell you you are no longer a Parliament; the Lord hath done with you!" He then commanded "that bauble," meaning the mace, to be taken away, turned out the members, and, locking the door, returned to Whitehall with the key in his pocket.

Being still willing to keep up the appearance of a representative government, Cromwell summoned one hundred and forty-four persons in England, Ireland, and Scotland, to assemble as a parliament. These individuals, chiefly remarkable for fanaticism and ignorance, were denominated the *Barebones Parliament*, from the name of one of the members, a leather-seller, whose assumed name, by a ridiculous usage of the age, was Praise-God Barebones. As the assembly obtained no public respect, Cromwell took an early opportunity of dismissing it. His officers then constituted him PROTECTOR of the Com

monwealth of Great Britain and Ireland, with most of the prerogatives of the late king.

The war against Holland was still carried on with great spirit. In the summer of 1653, two naval actions, in which both parties fought with the utmost bravery, terminated in the triumph of the English, and the complete humiliation of the Dutch, who obtained peace on the condition of paying homage to the English flag, expelling the young king from their dominions, and paying a compensation for certain losses to the East India Company. In a war which he subsequently made against Spain, the fleets of the protector performed some exploits of not less importance. The respect which he thus gained for the English name throughout Europe, is one of the brightest points in his singular history. But while generally successful abroad, he experienced unceasing difficulties in the management of affairs at home. Of the various parliaments which he summoned, no one was found so carefully composed of his own creatures as to yield readily to his will: he was obliged to dissolve them all in succession, after a short trial. He also experienced great difficulty in raising money, and sometimes applied for loans in the city without success. His own officers could scarcely be kept in subordination, but were constantly plotting a reduction of his authority. The Royalists, on the other hand, never ceased to conspire for his destruction; one, named Colonel Titus, went so far as to recommend his assassination in a pamphlet entitled "Killing no Murder," after reading which he was never seen again to smile.

The last Parliament called by Cromwell was in January, 1656; when, besides the commons, he summoned the few remaining peers, and endeavoured, by ennobling some of his officers, to make up a kind of Upper House. This assembly proved as intractable as its predecessors, and he contracted such a disgust at the very nature of a representative legislature, as to resolve, like Charles I., never to call another. His health finally sank under the effects of his ill-gotten power, and he died on the 3d September, 1658, a day which was thought to be propitious to him, as it was the anniversary of several of his victories. His eldest son Richard, a weak young man, succeeded him as protector, and was at first treated with all imaginable respect; but he could not long maintain a rule which even his father had ultimately failed in asserting. He quietly slunk out of public view, leaving the supreme authority in the hands of the Rump, which had taken the opportunity to re-assemble.

THE RESTORATION.—DUTCH WAR.

This remnant of an old Parliament continued in power till the autumn of 1659, when it gave way to a council of the officers who had been in command under Cromwell. The latter government, in its turn, yielded to the Rump, which sat down once more in December. The people, finding themselves made the sport of a few ambitious adventurers, began to long for some more fixed and respectable kind of government. At this crisis, General Monk, commander of the forces in Scotland, conceived the design of settling the nation. He left Scotland (January 2, 1660), with a considerable army; and though he kept his thoughts scrupulously to himself, all men bent their eyes upon him, as a person destined to realize their hopes. He reached London (February 3), and was received with feigned respect by the Rump. Some resistance was attempted by Lambert, one of Cromwell's officers, but in vain. Ere long, Monk was able to procure the restoration of the members who had been excluded from Parliament by Cromwell; who, being a majority, gave an immediate ascendency to anti-republican views. As soon as this was effected, an act was passed for calling a new and freely elected Parliament; after which, the existing assembly immediately dissolved itself.

The new Parliament proved to be chiefly composed of Cavaliers and Presbyterians, men agreeing in their attachment to monarchy, though differing in many other views. After some cautious procedure, in which the fears inspired by the late military tyranny were conspicuous, they agreed to invite the king from his retirement in Holland, and to restore him to the throne lost by his father. They were so glad to escape from the existing disorders, that they never thought of making any preliminary arrangement with the king as to the extent of his prerogative. On the 29th of May, being his thirtieth birthday, Charles II. entered London amidst such frantic demonstrations of joy, that he could not help thinking it his own fault, as he said, that he had been so long separated from his people.

One of the first measures of the new monarch was the passing of a bill of indemnity, by which all persons concerned in the late popular movements were pardoned, excepting a few who had been prominently concerned in bringing the king to the block: Harrison, Scrope, and a few other regicides, were tried and executed; and the bodies of Cromwell, Ireton, and Bradshaw, were raised from the grave and exhibited upon gibbets. In Scotland only three persons suffered—the Marquis of Argyle, Johnston of Warriston, and Mr. Guthry, a clergyman: it was considered remarkable, that the marquis had placed the crown upon the king's head at Scone in the year 1651. Excepting in these acts, the king showed no desire of revenging the death of his father, or his own exclusion from the throne. The Parliament which called him home was constituted a legal one by his own ratification of an act for that purpose. In the settlement of other matters, it seemed the prevailing wish that all the institutions of the country should be made as nearly what they were before the civil war as possible. Thus the Episcopal Church was established both in England and Scotland, though not without causing about a third of the clergy in both countries to resign their charges. The stern and enthusiastic piety which prevailed during the civil war, was now treated with ridicule, and the most of the people vied with each other in that licentious riot and drunkenness which is condemned by all systems of faith. The nation, in fact, seemed intoxicated with the safety which they supposed themselves to have at length gained in a restoration to the imperfect freedom they enjoyed before the civil war.

Ireland, which, during the Protectorate, had been managed by Henry, a younger son of Cromwell, acceded to the Restoration with as much readiness as any other part of the British dominions. An act was passed for settling property, by which the Catholics obtained some slight benefits, but which, in its main effects, confirmed the rights of the settlers introduced by Cromwell.

Though Charles had been restored with the approbation of a very large portion of his subjects, his most zealous friends were the Royalists and Episcopalians; hence he almost immediately subsided into the character of a party ruler. It was deemed necessary that he should maintain an armed force for the protection of his person, and to keep down popular disturbances. He therefore caused several horse regiments to be imbodied under the name of Life Guards, being chiefly composed of Royalist gentlemen upon whom a perfect dependence could be placed; and he afterwards added two or three foot regiments, the whole amounting to about five thousand men. The king paid these troops chiefly out of the money allowed for his own support, for Parliament did not sanction his keeping up such a force, and the nation generally beheld it with suspicion. This was the commencement of a *standing army* in England.

Personally indolent, dissolute, and deficient in conscientiousness, and surrounded almost exclusively by ministers of the basest pleasures, Charles was not qualified to retain the sincere respect of a people whose

tual character is grave and virtuous. His extravagant expenditure soon cooled the affections of his Parliament, and he began to find considerable difficulties in obtaining money. To relieve himself from this embarrassment, he accepted £40,000 from the French king for Dunkirk, a French port which had been acquired by Cromwell. For the same purpose, he married a Portuguese princess of the Catholic religion, who possessed a dowry of half a million. He also commenced (1664) a war against Holland, for apparently no better reason than that, in applying the Parliamentary subsidies necessary for keeping up hostilities, he might have an opportunity of converting part of the money to his own personal use.

The Dutch war was chiefly conducted by sea. On the 3d of June, 1665, an English fleet of 114 sail met a Dutch one which numbered just one ship less, near Lowestoffe, and after an obstinate fight gained a complete victory, depriving the enemy of eighteen vessels, and compelling the rest to take refuge on their own coast. The commander on this occasion was the Duke of York, the king's younger brother; a man of greater application and more steady principles, but who soon after became unpopular, in consequence of his avowing himself a Catholic.

Some other well-contested actions took place at sea, and the English, upon the whole, confirmed their naval supremacy. Owing, however, to a failure of the supplies, the king was obliged to lay up his best vessels in ordinary, and to send only an inferior force to sea. The Dutch took advantage of this occurrence to send a fleet up the Thames (June 10, 1667), which, meeting with no adequate resistance, threatened to lay the capital in ruins and destroy its shipping. Fortunately, the Dutch admiral did not think it expedient to make this attempt, but retired with the ebb of the tide, after having sunk and burnt nearly twenty vessels, and done much other damage. The king, finding himself rather impoverished than enriched by the war, soon after concluded a peace.

PLAGUE AND FIRE OF LONDON.—PERSECUTION IN SCOTLAND.

In the mean time, two extraordinary calamities had befallen the metropolis. In the summer of 1665, London was visited by a plague, which swept off about 100,000 people, and did not experience any abatement till the approach of cold weather. On this occasion the city presented a wide and heart-rending scene of misery and desolation. Rows of houses stood tenantless, and open to the winds; the chief thoroughfares were overgrown with grass. The few individuals who ventured abroad, walked in the middle of the streets, and, when they met, declined on opposite sides, to avoid the contact of each other. At one moment were heard the ravings of delirium, or the wail of sorrow, from the infected dwelling; at another, the merry song or careless laugh from the tavern, where men were seeking to drown in debauchery all sense of their awful situation. Since 1665, the plague has not again occurred in London, or in any other part of the kingdom.

The second calamity was a conflagration, which commenced on the night of Sunday the 2d of September, 1666, in the eastern and more crowded part of the city. The direction and violence of the wind, the combustible nature of the houses, and the defective arrangements of that age for extinguishing fires, combined to favour the progress of the flames, which raged during the whole of the week, and burnt all that part of the city which lies between the Tower and the Temple. By this calamity, 13,200 houses and 89 churches, covering in all 430 acres of ground, were destroyed. The flame at one time formed a column a mile in diameter, and seemed to mingle with the clouds. It rendered the night as clear as day for ten miles around the city, and is said to have produced an effect upon the sky which was observed on the borders of Scotland. It had one good effect, in causing the streets to be formed much wider than before, by which the city was rendered more healthy. By the populace, this fire was believed to have been the work of the Catholics, and a tall pillar, with an inscription to that effect, was reared in the city, as a monument of the calamity. This pillar with its inscription still exists; but the fire is now believed to have been occasioned purely by accident.

Meanwhile, in Scotland great dissatisfaction had been occasioned by the imposition of Episcopacy upon the church, and advantage had been taken of various acts of resistance on the part of the clergy and people, to visit both with measures of considerable severity. Heavy fines were imposed upon such as failed to attend the ministrations of the established clergy, on the suspicion that, when not at church, they were hearing the ejected clergymen in some private place. A small standing army was kept up to enforce the fines, and, till these were paid, free quarters were exacted for the soldiers. Tired of suffering, a few of the peasantry of Galloway rose in rebellion (November, 1666), and, advancing through the disaffected districts of Ayrshire and Lanarkshire, gradually assumed a threatening appearance. An unfortunate movement towards Edinburgh, where they expected accessions, thinned their numbers, and they were overpowered by General Dalyell at the Pentland Hills. Thirty-four of the prisoners were executed as rebels, chiefly at the instigation of Sharpe, Archbishop of St. Andrews, who, with the other prelates, was peculiarly zealous in behalf of the government. Besides these sufferers, fifty persons, including fifteen clergymen, forfeited lands and goods.

Some attempts were now made, at the desire of the king, to induce the ejected clergy to connect themselves with the church; but very few took advantage of a leniency which they believed would have been extended also to Catholics, and which involved their acknowledgment of the king's supremacy in spiritual affairs. About the year 1670, some divines began to hold conventicles in secluded parts of the country, to which the country people used to come with arms. At these places, a far warmer kind of devotion was felt, than could be experienced under tamer circumstances; and, as may be supposed, such meetings were not calculated to diffuse or foster a sentiment of loyalty. Sensible of this, the government obtained an act, imposing very severe fines on all who should preach or listen at conventicles; but without producing any effect. The penalties with which they were threatened seemed only to make the people more attached to their peculiar modes of worship and church government.

THE TRIPLE ALLIANCE.—THE FRENCH ALLIANCE.

The kingdom of France was at this period, under Louis XIV., rising into a degree of power and wealth which it had never before known. Louis had some claims through his wife upon the Netherlands (since called Belgium), which were then part of the Spanish dominions. He accordingly endeavoured to possess himself of that country by force of arms. A jealousy of his increasing power, and of the Catholic religion, professed by his people, induced the English to wish that his aggressions should be restrained. To gratify them, Charles entered into an alliance with Holland and Sweden, for the purpose of checking the progress of the French king. In this object he was completely successful, and consequently he became very popular. The Parliament, however, having disappointed him of supplies, he soon after entirely changed his policy, and, with the assistance of five abandoned ministers, Clifford, Ashley, Buckingham, Arlington, and Lauderdale, who were called the CABAL, from the initials of their names forming that word, resolved to render himself, if possible, independent of Parliament; in other words, an absolute

prince. In consideration of a large bribe from Louis, he agreed to join France in a war against Holland, with a view of putting an end to that example of a Protestant republic.

War was accordingly declared in May, 1672, and the naval force of England was employed in meeting that of the Dutch by sea; while Louis led a powerful army across the Rhine, and in a very short time had nearly reduced the whole of the Seven Provinces. In this emergency, the Dutch could only save themselves from absolute ruin by laying a great part of their country under water. The English, who had not entered heartily into this war, soon began to be alarmed for the fate of Holland, which was almost their only support against the dread of Popery; and though forbidden under severe penalties to censure the government measures, they soon contrived to exhibit so much dissatisfaction, as to render a change of policy unavoidable.

The king found it necessary to assemble his Parliament (February, 1673), and it was no sooner met, than it passed some acts highly unfavourable to his designs. Among these was the famous Test Act, so called because it enacted the imposition of a religious oath upon all persons about to enter the public service, the design being to exclude the Catholics from office. Above all things the House of Commons declared that it would grant no more supplies for the Dutch war. The king resolved to prorogue the assembly; but before he could do so, they voted the alliance with France, and several of his ministers, to be *grievances*. Charles, who, in wishing to be absolute, had been inspired by no other motive than a desire of ease, now saw that there was a better chance of his favourite indulgence in giving way to his subjects than in any other course; and he at once abandoned all his former measures, and concluded a separate peace with Holland. This country was now beginning, under the conduct of the Prince of Orange, to make a good defence against the French, which it was the better enabled to do by obtaining the friendship of Germany and Spain. In the year 1678, after a war, which, without any decisive victories, will ever reflect lustre upon Holland, a peace was concluded. The Prince of Orange, in the previous year, had married the Princess Mary, eldest daughter of the Duke of York, and educated in the reformed faith—an alliance which pleased the English, from its strengthening the Protestant interest, and which was destined, some years after, to bring about important results.

During the whole of this reign the corruptness of the court was very great; but it was, in some measure, the protection of the public. Charles spent vast sums in debauchery, and thus made himself more dependent on his Commons than he would otherwise have been. Many of the Commons were exceedingly corrupt, and all kinds of evil methods were adopted to render them more so. Bribes were distributed among them, and they were frequently *closeted;* that is, brought into the presence of the king individually, and personally solicited for votes. Still a large party maintained its purity and independence, and long kept a majority against the court.

THE POPISH PLOT.

For a century past, one of the grand moving-springs of the public conduct had been a strong detestation and dread of the adherents of the Romish church. This sentiment did not arise from any fear of the numbers or political strength of the Catholics, for they were but a small minority of the nation, but from a belief, generally entertained, that the Catholics scrupled at no treachery or cruelty which might seem favourable to the re-establishment of their religion. The popular notions, newly inflamed by the avowed Catholicism of the Duke of York, heir-presumptive to the crown, and by the late intrigues of the king with France, were encouraged by party who wished to impose restrictions upon the royal prerogative, and to exclude the duke from the succession. In 1678, an account of a plot, supposed to have been formed by the Papists for burning London, massacring the Protestants, and destroying the king and the Protestant religion, was circulated by one Kirby, a chemist, Tong, a weak, credulous person; and Titus Oates, one of the most abandoned miscreants that ever appeared in history. The circumstances attending this pretended discovery were so unlike reality, that, if the nation had not been in a state of hallucination at the time, they never could have been for a moment listened to.

Nevertheless, the Popish Plot, as it was called, was not only generally believed by the people, but also by the Parliament and the court; and such was the extent of the excitement, that a general massacre of the Catholics was apprehended. Even the king, though incredulous, was obliged to give way to the prevailing delusion. Meanwhile, letters were seized, which discovered that the Duke of York carried on a correspondence with France, in opposition to the religion and interests of his country. A correspondence of the king's minister, Danby, which involved the king in the disgrace of similar machinations, was detected; and, to crown the whole, Sir Edmondsbury Godfrey, the magistrate who first gave publicity to the plot, was found in the fields dead, with his own sword stuck through his body. For two years this horrible delusion reigned over the public mind, and under its influence many innocent Catholics were condemned to death. At length the execution of a venerable nobleman, the Viscount Stafford, excited a general sensation of pity, and the people gradually saw and repented of the excesses which they had committed.

THE HABEAS CORPUS ACT—THE EXCLUSION BILL.

At this period, the House of Commons appears for the first time formally separated into the two parties who have ever since been recognised in it. The appellation Tory, applied to the friends of the Court, was originally brought from Ireland, where the word *Torre* (give me), used by a Cavalier banditti, had gradually been extended to the whole of the Cavalier or Royalist party. The term *Whig*, which fell to the lot of the Opposition, is said to have originated in Scotland, being first applied to the sterner portion of the Presbyterian party in the western counties.

The Parliament having impeached Danby, the king dissolved it, and called another. The new assembly, which met in October, 1679, proved equally uncontrollable as the last. It passed, by a majority of seventy-nine, a bill excluding the Duke of York from the succession; declared the king's guards and standing army illegal; and passed the *Habeas Corpus* act, which, limiting the time between the apprehension of a supposed criminal and his trial, rendered it impossible for this or any future sovereign to keep individuals in prison at his pleasure, as had formerly been done. The last measure is still justly looked upon as the great bulwark of personal liberty in Britain. Though the bill for excluding the Duke of York was thrown out by the Upper House, that prince found it necessary to evade the popular odium, first by retiring to Brussels, and afterwards to Scotland. At the same time, the Duke of Monmouth, eldest natural son of the king, and believed by many to be legitimate, began to be regarded by the Presbyterians and liberal party in general as a preferable heir to the crown. In these agitations, the populace of London was particularly active; and it was at this period that the term *mob* was first used. The word was an abbreviation of *mobile vulgus*, a phrase signifying "the unsteady vulgar," which the court contemptuously applied to the crowds which daily assembled.

PERSECUTION IN SCOTLAND.

The persecution in Scotland for field-meetings was so severe, that, before the year 1678, it was supposed that 17,000 persons had suffered by it, in fine, imprisonment, and death. A bond was attempted to be imposed upon the people, in which conventicles were renounced; and, to enforce it in the west country, an army of 10,000 Highlanders was permitted to range there at free quarters. Nothing, it was found, could break the resolution of the people to adhere to their favourite modes of worship; on the contrary, all these severe measures inspired a deep resentment against the government, as well as the prelates. On the 2d of May, 1679, as Archbishop Sharpe was going in his coach to St Andrews, he was beset by a body of desperate men, among whom were Balfour of Burleigh, and Hackstoun of Rathillet, who cruelly slew him. An insurrection of the west country conventiclers immediately followed, and a party of dragoons sent against them, under Captain Graham, of Claverhouse, was gallantly repulsed at Loudon Hill. In a brief space, about five thousand men were found in arms against the state, among whom were many of the lesser gentry, the command being assumed by a gentleman named Hamilton. The rebellion was considered so formidable, that the Duke of Monmouth was sent down to head the troops for its suppression. He found them posted advantageously at Bothwell Bridge (June 22); but divisions on certain religious and political points unfitted them for making a good resistance. After defending the bridge for a while, they turned in a panic, and fled. Three hundred were killed in the pursuit, and twelve hundred taken prisoners.

This unfortunate insurrection, being followed up by fresh severities, effectually subdued all disposition to resistance, except in a small party of the nonconformists, whose principles were of an unusually enthusiastic kind. Twenty armed men, professing these principles, were assailed by a detachment of dragoons, in Airsmoss (1680), when their leader, Cameron, a clergyman, and several others, were killed, after a desperate resistance. Cargill, another preacher of this extreme sect, soon after held a conventicle at Torwood, near Stirling, where he formally excommunicated the king, his brother, and ministers. These proceedings had a highly injurious effect, in as far as they gave occasion for fresh severities against the whole party; but they originated in such pure and pious motives, and brought down such calamities upon the unshrinking heads of those concerned in them, that they have ever since been regarded in Scotland with great respect.

The more uncompromising party soon after arranged themselves into what they called a Secret Society, and (12th January, 1682) openly appeared at Lanark, where they published a declaration of their principles, among which a renunciation of all allegiance to Charles II. was the most remarkable. The dispute between the government and its subjects had now arrived at such an extremity, that individuals were shot in the fields by military law, if they merely refused to acknowledge the royal authority. The most of the people, unable or unwilling to resist, were therefore obliged to give an external reverence to the church established among them, or at least to the irregular clergy, who, by submissions odious to the community, had received what was called an *indulgence* or permission to preach. A great disposition prevailed to emigrate to the American colonies, as the only means of escaping the oppressive restraints which prevailed at home.

THE KING BECOMES ABSOLUTE.

In the mean time, an extraordinary revolution took place in England. About the time that popular feeling was recovering from the mania respecting the Popish Plot, the House of Commons had shown stronger symptoms than ever of a determination to seek the exclusion of the Duke of York from the throne. The time was unfortunate, for men were beginning to suspect that they had been deceived in many of their surmises about danger from the Catholics. The object, moreover, touched upon a principle which many men in that age deemed sacred—that of hereditary succession; nor was it possible to blame the king for opposing a measure so unfavourable to the interests of his nearest blood relation. In fact, the Whig party pushed their favourite measure to such a point as to cause a reaction of the public mind against their views.

The king called a new Parliament to meet at Oxford, resolved, in the event of he not proving more tractable, to take advantage of the popular feeling, dissolve the assembly, and never call another. It met on the 21st of March, 1681, and the Whigs soon showed that the Exclusion Bill was still uppermost in their minds. The king permitted one of his ministers to propose, that, at his death, the Princess of Orange should reign as regent, and the new king be for ever banished five hundred miles from his dominions. To this concession, which now seems much greater than could have reasonably been expected, they would not listen for a moment. Charles then dissolved the Parliament as utterly intractable, and, as he expected, he was generally applauded for the act. Popular feeling had now taken a turn in favour of royalty; and the representative branch of the legislature, long regarded with veneration by the English, was once more permitted to go down without a struggle. The king henceforth ruled entirely without control, being secretly supplied with money by France, in consideration of his non-interference with the conquests of that country.

THE RYE-HOUSE PLOT.—DEATH OF CHARLES II.

A fit of slavishness now befell the English nation, as remarkable in its extent as the late fury against the court and the Catholics. Supported by this mood of the people, Charles caused all the corporations in the kingdom to give up their old charters, and accept of new ones, by which he became all-powerful over the elections of magistrates, and, consequently, over those of parliamentary representatives, should ever another election of that kind take place. The leaders of the late majority in Parliament, comprising the Duke of Monmouth, Lord Russell (son of the Earl of Bedford), the Earl of Essex, Lord Howard, the famous Algernon Sydney, and John Hampden, grandson of the patriot who first resisted Charles I., being reduced to absolute despair, formed a project for raising an insurrection in London, to be supported by one in the west of England, and another under the Earl of Argyle in Scotland, and the object of which should be confined to a melioration of the government. They were betrayed by an associate named Rumsay, and implicated, by a train of unfortunate circumstances, in a plot for assassinating the king (styled the Rye-house plot), of which they were perfectly innocent. By the execution of Russell and Sydney, and some other severities, the triumph of the king might be considered as completed. After having been an absolute sovereign for nearly four years, he died (February 6, 1685), professing himself at the last to be a Catholic, and was succeeded by the Duke of York.

Charles II. was a prince of a gay and cheerful disposition, and so noted a sayer of witty things, and so addicted to humorous amusements, that he was called "the merry monarch." His wit, shrewdness, and good humour, form the best side of his character. On the other side, we find a deficiency of almost every active virtue and of all steady principle. He never allowed any duty of his station, or any claim upon his justice

or clemency, to interfere with his own interests, or even to disturb him in his indolent and vicious pleasures. Neglecting his wife, who never had any children, he spent most of his time with his various mistresses, who openly lived at court, and were even received by the queen. Of these ladies, the most remarkable were Louisa Querouaile, whom he created Duchess of Portsmouth, and Barbara Villiers, whom he made Duchess of Cleveland. Six sons of the king by his mistresses were made dukes, and five of these were the progenitors of families in the English nobility.

During the reign of Charles ..., the nation advanced considerably in the arts of navigation and commerce; and the manufactures of brass, glass, silk, hats, and paper, were established. The post-office, set up during the Commonwealth as a means of raising money, was advanced in this reign, and the penny post was now begun in London by a private person. Roads were greatly improved, and stage-coach travelling was commenced, though not carried to any great extent. During this reign, tea, coffee, and chocolate, which have had a great effect in improving and softening manners, were first introduced. In 1660, the Royal Society was established in London, for the cultivation of natural science, mathematics, and all useful knowledge. The science of astronomy was greatly advanced by the investigations of Flamstead and Halley. But the greatest contribution to science was made by Sir Isaac Newton, whose Principles of Natural Philosophy were published in 1683; in this work, the true theory of planetary motions was first explained, in reference to the principle of gravitation. Amongst the literary men of the period, the first place is to be assigned to John Milton, author of the Paradise Lost and other poems: Samuel Butler shines as a humorous and satirical poet, and Edmund Waller as a lyrist. Amongst divines, the highest names connected with the church are those of Jeremy Taylor and Isaac Barrow; while the highest among the nonconformists are those of Richard Baxter and John Bunyan. The theatre, which had been suppressed during the Commonwealth, was revived in this reign; but the drama exhibited less talent and more licentiousness than it did in the previous reigns. Female characters, which had formerly been acted by men, were now for the first time performed by females.

JAMES II.—EXPEDITION OF MONMOUTH.

Charles II., with all his faults, had conducted himself towards his subjects with so much personal cordiality, and had so well calculated his ground before making any aggressions upon popular liberty, that he might probably have pursued his arbitrary career for many years longer. But his brother James, though much more respectable as a man, more industrious, and more sincere, wanted entirely the easiness of carriage, pleasantry, and penetration, which were the grounds of the late king's popularity and success. He was, moreover, an avowed Catholic, and inspired by an ardent desire of reforming the nation back into that faith. He began his reign by declaring before the privy council his intention to govern solely by the laws, and to maintain the existing church; and such was the confidence in his sincerity, that he soon became very popular. Addresses poured in upon him from all quarters, professing the most abject devotion to his person. The parliament called by him voted an ample revenue, and expressed the greatest servility towards him in all things. The doctrines of passive obedience, and the divine right of the sovereign, were now openly preached. The University of Oxford promulgated an elaborate declaration of passive obedience to rulers, which they declare to be "clear, absolute, and without any exception of any state or order of men."

The remains of the Whig party still existed, though in exile, and there were some districts of the country where they were supposed to have considerable influence. The Duke of Monmouth and the Earl of Argyle (the latter of whom had been condemned to death in Scotland, for adding a qualification to the test-oath, but had escaped) met in Holland, and projected two separate invasions, for the purpose of expelling King James. The former soon after landed in the west of England, with a small retinue, and quickly found himself at the head of 5000 persons, though irregularly armed. At several places he caused himself to be proclaimed king, which offended many of his principal adherents, as inconsistent with his previous engagements. Upon the whole, his conduct was not energetic enough for the management of such an enterprise. Being attacked by the king's troops near Bridgewater, his infantry fought with some spirit, but, being deserted by the cavalry, and by the duke himself, were obliged to give way. Monmouth was taken and executed. Many of his followers were hanged without form of trial by the royal troops, and others were afterwards put to death, with hardly any more formality, by the celebrated Chief-Justice Jefferies, whom the king sent down with a commission to try the offenders. The butchery of several hundred men of low condition, who were unable of themselves to do any harm to the government, was looked upon as a most unjustifiable piece of cruelty, even if it had been legally done; and the principal blame was popularly ascribed to the king.

The Earl of Argyle sailed in May with a corresponding expedition, and landed in that part of the West Highlands which owned his authority. Unfortunately for him, the government had received warning, and seized all the gentlemen of his clan, upon whom he had chiefly depended. He nevertheless raised between two and three thousand men, and made a timid advance to Glasgow, in the expectation of being joined by the persecuted Presbyterians of that part of the country. Being surrounded on the march by various parties of troops, he dispersed his army, and sought to escape in disguise, but was taken, brought to Edinburgh, and executed. Thus terminated the last effort made by the Whig party to ameliorate the despotic sway of the Stuarts.

ARBITRARY MEASURES OF THE KING.

Encouraged by his successes, James conceived that he might safely begin the process of changing the established religion of the country. On the plea of his supremacy over the church, he took the liberty of dispensing with the test-oath in favour of some Catholic officers, and thus broke an act which was looked upon, under existing circumstances, as the chief safeguard of the Protestant faith. His Parliament, servile as it was in temporal matters, took the alarm at this spiritual danger, and gave the king so effectual a resistance that he resorted to a dissolution. Transactions exactly similar took place in Scotland.

Heedless of these symptoms, he proclaimed an universal toleration, for the purpose of relieving the Catholics, and thus assumed the unconstitutional right of dispensing with acts of Parliament. The nation was thrown by this measure, and by the numerous promotions of Roman Catholics, into a state of great alarm; even the clergy, who had been so eager to preach an implicit obedience to the royal will, began to see that it might be productive of much danger. When James commanded that his proclamation of toleration should be read in every pulpit in the country, only two hundred of the clergy obeyed. Six of the bishops joined in a respectful petition against the order; but the king declared that document to be a seditious libel, and threw the petitioners into the Tower. In June, 1688, they were tried in Westminster Hall, and, to the infinite joy of the nation, acquitted.

Blinded by religious zeal, the king proceeded on his fatal course. In defiance of the law, he held open intercourse with the Pope, for the restoration of Britain to the bosom of the Romish church. He called Catholic lords to the privy council, and even placed some in the cabinet. Chapels, by his instigation, were everywhere built, and monks and priests went openly about his palace. A court of high commission—a cruel instrument of power under Charles I.—was erected, and before this every clerical person who gave any offence to the king was summoned. He also excited great indignation, by violently thrusting a Catholic upon Magdalen College, at Oxford, as its head, and expelling the members for their resistance to his will. Public feeling was wound to the highest pitch of excitement by the queen being delivered (June 10, 1688), of a son, who might be expected to perpetuate the Catholic religion in the country, and whom many suspected to be a supposititious child, brought forward solely for that purpose.

The disaffection produced by these circumstances extended to every class of the king's subjects, except the small body of Roman Catholics, many of whom could not help regarding the royal measures as imprudent. The Tories were enraged at the ruin threatened to the Church of England, which they regarded as the grand support of conservative principles in the empire. The Whigs, who had already made many strenuous efforts to exclude or expel the king, were now more inflamed against him than ever. The clergy, a popular and influential body, were indignant at the injuries inflicted upon their church; and even the dissenters, though comprehended in the general toleration, saw too clearly through its motive, and were too well convinced of the illegality of its manner, and of the danger of its object, as affecting the Protestant faith, to be exempted from the general sentiment. But for the birth of the Prince of Wales, the people at large might have been contented to wait for the relief which was to be expected, after the death of the king, from the succession of the Princess of Orange, who was a Protestant, and united to the chief military defender of that interest in Europe. But this hope was now shut out, and it was necessary to resolve upon some decisive measures for the safety of the national religion.

THE REVOLUTION.

In this crisis, some of the principal nobility and gentry, with a few clergymen, united in a secret address to the Prince of Orange, calling upon him to come over with an armed force, and aid them in protecting their faith and liberties. This prince, who feared that England would soon be joined to France against the few remaining Protestant powers, and also that his prospects of the succession in that country, as nephew and son-in-law of the king,* were endangered, listened readily to this call, and immediately collected a large fleet and army, comprising many individuals, natives of both Scotland and England, who had fled from the severe government of the Stuart princes. The preparations for the expedition were conducted with great secrecy, and James was partly blinded to them, by a rumour that their only object was to frighten him into a closer connection with France, in order to make him odious to his subjects. When he was at length assured by his minister in Holland that he might immediately expect a formidable invasion, he grew pale, and dropped the letter from his hands. He immediately ordered a fleet and large army to be collected, and, that he might regain the affections of his subjects, he called a parliament, and undid many of his late measures. The people justly suspected his concessions to be insincere, and were confirmed in their belief, when, on a rumour of the Prince of Orange being put back by a storm, he recalled the writs for assembling Parliament.

On the 19th of October, the Prince of Orange set sail with 50 ships of war, 25 frigates, 25 fire-ships, and 500 transports, containing 15,000 land troops. A storm occasioned some damage and delay; but he soon put to sea again, and proceeded with a fair wind along the British Channel, exhibiting from his own vessel a flag, on which were inscribed the words, "THE PROTESTANT RELIGION AND THE LIBERTIES OF ENGLAND," with the opposite motto of his family, "*Je Maintiendrai*"—I will maintain. As he passed between Dover and Calais, his armament was visible to crowds of spectators on both shores, whose feelings were much excited at once by its appearance and its well-known purpose. The English fleet being detained at Harwich by the same wind which was so favourable to the prince, he landed (November 5) without opposition at Torbay, and immediately proceeded to circulate a manifesto, declaring the grievances of the kingdom and promising, with the support of the people, to redress them.

At the first it seemed some reason to fear that the prince would not meet with adequate support. On his march to Exeter, and for eight days after arriving there, he was joined by not any person of consequence. The nation, however, soon became alive to the necessity of giving him support. The gentry of Devon and Somersetshires formed an association in his behalf. The Earls of Bedford and Abingdon, with other persons of distinction, repaired to his quarters at Exeter. Lord Delamere took arms in Cheshire; the city of York was seized by the Earl of Danby; the Earl of Bath, governor of Plymouth, declared for the prince; and the Earl of Devonshire made a like declaration in Derby. Every day discovered some new instance of that general confederacy into which the nation had entered against the measures of the king. But the most dangerous symptom, and that which rendered his affairs desperate, was the spirit which he found to prevail in his army. On his advancing at its head to Salisbury, he learned that some of the principal officers had gone over to the Prince of Orange. Lord Churchill (afterwards famous as Duke of Marlborough), Lord Trelawney, and his son-in-law, George, Prince of Denmark, successively followed this example. Even his daughter, the Princess Anne, deserted him. In great perplexity, he summoned a council of peers, by whose advice writs were issued for a new Parliament, and commissioners despatched to treat with the prince. A kind of infatuation now took possession of the king; and, having sent the queen and infant prince privately to France, he quitted the capital at midnight, almost unattended, for the purpose of following them, leaving orders to recall the writs and disband the army. By this procedure, the peace of the country was imminently endangered; but it only served to hasten the complete triumph of the Prince of Orange, who had now advanced to Windsor. The supreme authority seemed on the point of falling into his hands, when, to his great disappointment, the king, having been discovered at Feversham, in Kent, was brought back to London, not without some marks of popular sympathy and affection. There was no alternative but to request the unfortunate monarch to retire to a country house, where he might await the settlement of affairs. James, finding his palaces taken possession of by Dutch guards, and dreading assassination, took the opportunity to renew his attempt to leave the kingdom. He proceeded on board a vessel in the Medway, and, after some obstructions, arrived safely in France, where Louis readily afforded him an asylum.

The same day that the king left Whitehall for the last time, his nephew and son-in-law arrived at St. James's

* The mother of the prince was Mary Stuart, eldest daughter of Charles I., and sister of James II. Failing the infant Prince of Wales, his own wife, and the Princess Anne, the two daughters of the king, he was the heir of the British crown.

The public bodies immediately waited on him, to express their zeal for his cause; and such of the members of the late Parliaments, as happened to be in town, having met by his invitation, requested him to issue writs for a convention, in order to settle the nation. He was in the same manner, and for the same purpose, requested to call a convention in Scotland. The English convention met on the 22d of January, 1689, and during its debates the prince maintained a magnanimous silence and neutrality. The Tory party, though it had joined in calling him over, displayed some scruples respecting the alteration of the succession, and seemed at first inclined to settle the crown on the princess, while William should have only the office of regent; but when this was mentioned to the prince, he calmly replied, that in that event, he should immediately return to Holland. A bill was then passed, declaring that "James II., having endeavoured to subvert the constitution, by breaking the *original contract* between the king and people, and having withdrawn himself from the kingdom, has *abdicated* the government; and that the throne is thereby become *vacant*." To the bill was added what was called a *Declaration of Rights*, namely, an enumeration of the various laws by which the royal prerogative and the popular liberties had formerly been settled, but which had been violated and evaded by the Stuart sovereigns. WILLIAM and MARY, having expressed their willingness to ratify this declaration, were proclaimed king and queen jointly—the administration to rest in William; and the convention was then converted into a Parliament.

In Scotland, where the Presbyterians had resumed an ascendency, the convention came to a less timid decision. It declared that James, by the abuse of his power, had *forfeited* all right to the crown—a decision also affecting his posterity; and William and Mary were immediately after proclaimed. By a bill passed in the English Parliament, the succession was settled upon the survivor of the existing royal pair; next upon the Princess Anne and her children; and, finally, upon the children of William by any other consort—an arrangement in which no hereditary principle was overlooked, except that which would have given a preference to James and his infant son.

By the Revolution, as this great event was styled, it might be considered as finally decided that the monarchy was not a divine institution, superior to human challenge, as the late kings had represented it, but one dependent on the people, and established and maintained for their benefit. Many advantages, of smaller importance, though of more direct and practical utility, resulted from the change. The Episcopal Church, which in Scotland had occasioned incessant discontent and disturbance for the last twenty-eight years, was abolished in that kingdom, and the favourite Presbyterian forms were established, to the almost universal satisfaction of the nation. By an act passed in the English parliament, the dissenters from the Church in England were freed from the severities to which they had been exposed during the last two reigns. The royal revenue, which had formerly been fixed at the beginning of each reign, was now settled annually by the House of Commons, so that the king was more under the control of his people than formerly. The independence and impartiality of the judges were now secured by their being appointed for life, or during good behaviour, instead of being removable at the royal pleasure as heretofore. William is said to have wished to grant some further concessions in favour of the Dissenters, but was prevented by the powerful opposition which the Tory party presented in Parliament.

RESISTANCE IN SCOTLAND AND IRELAND.

The new government was at first extremely popular in Scotland; but one portion of the people was much opposed to it. This consisted of the Highland clans—a primitive race, unable to appreciate the rights which had been gained, prepossessed in favour of direct hereditary succession, and of such warlike habits, that though a minority, they were able to give no small trouble to the peaceful Lowlanders. When the Scottish convention was about to settle the crown on William and Mary, Viscount Dundee, formerly Graham of Claverhouse, and celebrated for his severity upon the recusant Presbyterians, raised an insurrection in the Highlands in favour of King James, while the Duke of Gordon, a Catholic, still held out Edinburgh Castle in the same interest. It was with no small difficulty that the new government could obtain the means of reducing these opponents. The castle, after a protracted siege, was given up in June (1689). General Mackay was despatched by William, with a few troops, to join with such forces as he could obtain in Scotland, and endeavour to suppress the insurrection in the Highlands. He encountered Dundee at Killiecrankie (July 27), and, though his troops were greatly superior in number and discipline, experienced a complete defeat. Dundee, however, fell by a musket-shot in the moment of victory, and his army was unable to follow up its advantage. In a short time the Highland clans were induced to yield a nominal obedience to William and Mary.

In Ireland, a much more formidable resistance was offered to the revolution settlement. Since the accession of James, the Romish faith might be described as virtually predominant in that kingdom. The laws against Catholics had been suspended by the royal authority, all public offices were filled by them, and, though the established clergy were not deprived of their benefices, very little tithe was paid to them. The vice-regal office was held by the Earl of Tyrconnel, a violent and ambitious young man, disposed to second the king in all his imprudent measures, and resolved, in the event of their failing, to throw the country into the hands of the French. The people at large, being chiefly Catholics, were warmly attached to the late sovereign, whose cause they regarded as their own.

Early in the spring of 1689, James proceeded from France to Ireland, where he was soon at the head of a large though ill-disciplined army. He immediately ratified an act of the Irish Parliament for annulling that settlement of the Protestants upon the lands of Catholics, which had taken place in the time of Cromwell, and another for attainting two thousand persons of the Protestant faith. The Protestants, finding themselves thus dispossessed of what they considered their property, and exposed to the vengeance of a majority over whom they had long ruled, fled to Londonderry, Inniskillen, and other fortified towns, where they made a desperate resistance, in the hope of being speedily succoured by King William. That sovereign now led over a large army to Ireland, and (July 1) attacked the native forces under his father-in-law at the fords of the Boyne, near the village of Dunore, where he gained a complete victory.

James was needlessly dispirited by this disaster, and lost no time in sailing again to France. In reality, the Irish made a better appearance, and fought more vigorously, after the battle of the Boyne, than before it. The Duke of Berwick, a natural son of James, and the Earl of Tyrconnel, still kept the field with a large body of cavalry, and the infantry were in the mean time effectually protected in the town of Limerick. William invested this town, and, in one assault upon it, lost two thousand men, which so disheartened him, that he went back to England, leaving his officers to prosecute the war. The Irish army afterwards fought a regular battle at Aghrim, when, partly owing to the loss of their brave leader, St. Ruth, they were totally routed. The remains of the Catholic forces took refuge in Limerick, where they finally submitted in terms of a treaty which seemed

to secure the Catholic population in all desirable rights and privileges. It was agreed that they should receive a general pardon; that their estates should be restored, their attainders annulled, and their outlawries reversed; that Roman Catholics should enjoy the same toleration as in the days of Charles II., and not be disturbed in the exercise of their religion; that they should be restored to all the privileges of subjects, on simply swearing allegiance to the king and queen; and that such as chose to follow the fortunes of James (of whom there was a vast number), should be conveyed to the Continent at the expense of government.

King William, whose disposition was tolerant, promised to procure a ratification of this treaty by Parliament, but he was thwarted in his design. An act was passed in England, making it necessary for all members of the Irish Parliament, and all persons filling civil, military, and ecclesiastical offices in Ireland, to take an oath abjuring the most important doctrines of the Catholic faith. After this had taken effect, in the filling of the Irish Parliament with Protestants, an act was passed by that assembly, professing to be a confirmation of the treaty of Limerick, but in reality putting the Catholics into a worse condition than before.

REIGN OF WILLIAM III.

Though all military opposition was thus overcome, William soon found difficulties of another kind in the management of the state. The Tories, though glad to save the established church by calling in his interference, had submitted with no good grace to the necessity of making him king; and no sooner was the danger past, than their usual principles of hereditary right were in a great measure revived. From the name of the exiled monarch, they now began to be known by the appellation of *Jacobites*. James's hopes of a restoration were thus for a long time kept alive, and the peace of William's mind was so much embittered, as to make his sovereignty appear a dear purchase. Perhaps the only circumstance which reconciled the king to his situation, was the great additional force he could now bring against the ambitious designs of Louis XIV. Almost from his accession he entered heartily into the combination of European powers for checking this warlike prince, and conducted military operations against him every summer in person. The necessity of having supplies for that purpose rendered him unfit, even if he had been willing, to resist any liberal measures proposed to him in Parliament, and hence his passing of the famous Triennial Act in 1694, by which it was appointed that a new Parliament should be called every third year. In this year died Queen Mary, without offspring; after which William reigned as sole monarch.

While William was treated in England with less than justice, he lost all his popularity in Scotland, in consequence of two separate acts, characterized by great cruelty and injustice. An order had been issued, commanding all the Highland chiefs, under pain of fire and sword, to give in their submission before the last day of the year 1691. One individual—Macdonald of Glencoe—was prevented by accident from observing the day, and letters of fire and sword, signed by the king, were accordingly issued against him. The military party intrusted with this duty, instead of boldly advancing to the task, came among the clan as friends, partook of their hospitality and amusements, and never indicated their intentions till the morning of the 13th of February (1692), when they attacked the unsuspecting people in their beds, and mercilessly slew all that came in their way. Thirty-eight persons, including the chief and his wife, were slaughtered, and many others died in the snow, as they vainly tried to escape. A more atrocious action does not stain modern history, though the barbarous circumstances of the slaughter were more owing to feelings of private revenge on the part of some of the officials of government in Scotland, than to the intentions of William.

Two or three years after, the Scottish people began to turn their attention to commerce, by which they saw great advantages gained by neighbouring states, and they planned a colony on the Isthmus of Darien, which they thought might become an emporium for American and Indian produce. They subscribed among themselves, for this purpose, no less than £400,000; to which was added more than as much again by merchants in London and Holland. The jealousy of other trading companies, and the remonstrances of the Spaniards, who apprehended some interference with their colonies, induced the king to withdraw his countenance from the scheme, after he had sanctioned it by act of Parliament; but, nevertheless (1698), a gallant expedition was sent out by the Scots, who founded a town called New Edinburgh, about midway between Portobello and Carthagena, and under the ninth degree of latitude. During the winter months, every thing seemed likely to answer the expectations of the colonists; but summer brought disease, and, on their provisions running low, they found, to their infinite consternation, that they could get no supplies, the Spanish and British colonists of the neighbouring countries being forbidden to deal with them. In May and September, 1699, ere intelligence of these circumstances could reach home, two other expeditions had sailed, containing 1800 men, who were involved on their arrival in the same disasters. After disease had swept off many hundreds, the remainder were attacked by the Spaniards, who pretended a right to the country; and to these haughty enemies, who were countenanced in their proceedings by the British sovereign, the unfortunate colony was obliged to surrender. Very few ever regained their native country, and the large sums vested in the undertaking were irrecoverably lost. The massacre of Glencoe, and the Darien expedition, excited the most bitter feelings against the king in the breasts of the Scottish nation, among whom the Jacobite party thenceforward began to assume a formidable appearance.

The peace of Ryswick, concluded in 1697, by which the French power was confined to due limits, permitted William to spend the concluding years of his reign in peace. In 1700, in consideration that he and his sister-in-law Anne had no children, the famous Act of Succession was passed, by which the crown, failing these two individuals, was settled upon the next Protestant heir, Sophia, Duchess of Hanover, daughter of Elizabeth, the eldest daughter of James I.

About this time, the causes of a new war took their rise in certain disputes respecting the succession to the crown of Spain. The title to that sovereignty, in the event of the death of the existing king without heirs, was claimed by the King of France, the Elector of Bavaria, and the Emperor of Germany, through various female lines of descent. A treaty, to which England was a party, was entered into for preventing the whole from falling into the hands of the reigning family of France, whose possessions would then have been so great as to be inconsistent, it was thought, with the independence and safety of the neighbouring states. At the death of the King of Spain, a will was produced, in which it appeared that he had appointed the Duke of Anjou, second son of the Dauphin, to be his successor. The French king lost no time in enforcing the pretensions of his grandson, who, under the title of Philip V., became the founder of the Bourbon dynasty in Spain.

About the same time (September, 1701), James, the exiled English king, died at St. Germains, leaving his pretensions to his son, James, Prince of Wales, now a boy of thirteen years of age, and henceforth generally recognised in Britain by the epithet of the *Pretender*

Without regard to the treaty of Ryswick, Louis XIV. acknowledged this young person as JAMES III., King of Great Britain, by which he added greatly to the hostile feeling which his other proceedings had already created in the British king and people. A war was accordingly in preparation, when King William died (March 2, 1702), in consequence of a fall from his horse.

William was a prince of commanding ability, particularly in military affairs. His ruling sentiment was a wish to reduce the power of the King of France, which he was able in no small degree to effect. His person was thin and feeble, and his ordinary demeanour cold, silent, and somewhat repulsive. It was only in battle that he ever became animated or easy. He was a conscientious man, of sober domestic habits, and sincerely attached to toleration in religion. But for the questionable act of expelling his uncle and father-in-law from the throne, and his concern in the affairs of Glencoe and Darien, no serious blot of any kind would have rested upon his name, either as a public or private person.

The reign of King William is remarkable for the first legal support of a standing army, and for the commencement of the national debt. It is also distinguished by the first establishment of regular banks for the deposit of money, and the issue of a paper currency. Formerly, the business of banking, as far as necessary, was transacted by goldsmiths, or through the medium of the public Exchequer, by which plans the public was not sufficiently insured against loss. In 1695, the first public establishment for the purpose, *the Bank of England*, was established by one William Paterson, a scheming Scotsman; and next year the Bank of Scotland was set on foot by one Holland, an English merchant; the capital in the one case being only £1,200,000, and in the other the tenth part of that sum.

In the reign of King William flourished Sir William Temple, an eminent political and philosophical writer, to whom is usually assigned the honour of first composing the English language in the fluent and measured manner which afterwards became general. The most profound philosophical writer of the age was John Locke, author of an Essay on the Human Understanding, an Essay on Toleration, and other works. Bishop Tillotson stands high as a writer of elegant sermons. The greatest name in polite literature is that of John Dryden, remarkable for his energetic style of poetry, and his translations of Virgil and Juvenal.

QUEEN ANNE.—MARLBOROUGH'S CAMPAIGNS.

William was succeeded by his sister-in-law ANNE, second daughter of the late James II.; a princess now thirty-eight years of age, and chiefly remarkable for her zealous attachment to the Church of England. The movement against the King of France had not been confined to Great Britain; it was a combination of that power with the Emperor of Germany and the States of Holland. Queen Anne found it necessary to maintain her place in the Grand Alliance, as it was termed; and the Duke of Marlborough was sent over to the Continent with a large army to prosecute the war in conjunction with the allies. Now commenced that career of military glory which has rendered the reign of Anne and the name of Marlborough so famous. In Germany and Flanders, under this commander, the British army gained some signal successes, particularly those of Blenheim and Ramillies: in Spain, a smaller army, under the chivalrously brave Earl of Peterborough, performed other services of an important kind. The war, however, was one in which Britain had no real interest—for it has been seen that Spain has continued under a branch of the House of Bourbon, without greatly endangering other states.

A party, consisting chiefly of Tories, endeavoured, in 1706, to put an end to the war: and France was so much reduced in strength as to concede all the objects for which the contest had been commenced. But the people were so strongly inspired with a desire of humiliating France, which in commerce and religion they considered their natural enemy, that some ambitious statesmen of a contrary line of politics were enabled to mar the design of a treaty. Among these was the Duke of Marlborough, who, being permitted to profit, not only by his pay but by perquisites attached to his command, wished the war to be protracted, merely that he might make his enormous wealth a little greater. It was in consequence of these unnecessary interferences with continental politics, urged chiefly by the people, and by a popular class of statesmen, that the first large sums of the national debt were contracted.

UNION OF ENGLAND AND SCOTLAND.

Since their religious enthusiasm had been laid at rest by the Revolution Settlement, the Scottish people had been chiefly animated by a desire of participating in the commerce of England. The treatment of their expedition to Darien had now inspired them with a bitter feeling against their southern neighbours, and they resolved to show their power of counter-annoyance, by holding up threats of dissenting from England in the matter of the succession. In 1703, their Parliament passed the famous *Act of Security*, by which it was ordained that the successor of her Majesty in Scotland should not be the same with the individual adopted by the English Parliament, unless there should be a free communication of trade between the countries, and the affairs of Scotland thoroughly secured from English influence. Another act was at the same time passed, for putting the nation under arms. The English ministers then saw that an incorporating union would be necessary to prevent the Pretender from gaining the Scottish crown, and to protect England from the attacks of a hostile nation. For this purpose they exerted themselves so effectually in the Scottish Parliament, as to obtain an act, enabling the queen to nominate commissioners for the arrangement of a union. The men appointed, thirty on each side, were, with hardly an exception, the friends of the Court and of the Revolution Settlement; and the treaty accordingly was framed without difficulty.

In October, 1706, this document was submitted to the Scottish Parliament, and was found to contain the following principal points:—that the two nations were to be indissolubly united in one government and legislature, each, however, retaining its own civil and criminal law; the crown to [illegible] House of Hanover; the Scottish Presbyterian church to be guarantied; forty-five members to be sent by the Scottish counties and burghs to the House of Commons, and sixteen elective peers to be sent to the Upper House by the nobles; the taxes to be equalized, but, in consideration of the elevation of the Scotch imposts to the level of the English (for the latter people already owed sixteen millions), an equivalent was to be given to Scotland, amounting to nearly four hundred thousand pounds, which was to aid in renewing the coin, and other objects. These terms were regarded in Scotland as miserably inadequate; and the very idea of the loss of an independent legislature and a place among governments raised their utmost indignation. Nevertheless, by dint of bribery, the union was carried through Parliament; and, from the 1st of May, 1707, the two countries formed one state, under the title of the Kingdom of Great Britain.

HIGH CHURCH ENTHUSIASM.

Since the Revolution, the Whigs might be considered as the predominant party in England. They almost exclusively constituted the ministries, and a large majority in the Parliaments, of King William. The sentiments of the queen were of a different cast from theirs. She

disrespected the Revolution Settlement, by which she reigned; and was more zealously attached than they to the Church of England, in all its doctrines, practices, and privileges. As the remembrance of the errors of King James faded from the public recollection, or were put out of view by more recent grievances, the people began to partake more generally of the Tory spirit. The Parliament which they returned at the beginning of the new reign, contained a much larger admixture of that party than the former one. The Tory feeling of both people and Parliament chiefly took the direction of a strong attachment to the Church of England, which they wished to maintain in uncompromising supremacy, and in all its privileges; while the Whig party, in general, were favourable to the toleration called for by the dissenters. The distinction of High Church and Low Church now became conspicuous, the one phrase implying the ecclesiastical views of the Tories, while the other referred to those of the Whigs. In this Parliament, the House of Commons passed a bill against *occasional conformity*, by which penalties were imposed on all persons in office who should attend dissenting places of worship; but it was thrown out by the Upper House, in which the bishops created by William voted against it.

An imprudent act of the ministry raised the High Church enthusiasm to an extraordinary height. A divine of inferior note, named Henry Sacheverell, had preached a violent sermon, in which he seemed to call upon the people to take up arms in defence of their endangered church. The ministers were so weak as to give this man a solemn trial, during which the people rose so tumultuously in his favour, that, though declared guilty, it was found impossible to inflict upon him more than a nominal punishment. After the trial, he received more marks of public reverence and honour than were ever bestowed on the greatest national benefactor. In proportion to the popularity of Dr. Sacheverell, was the loss of public favour experienced by the Whig party. About the same time, through some court intrigues, they forfeited all remaining favour with their royal mistress. Mrs. Masham, a lady of the court, and favourite of the queen, had contrived to introduce into the cabinet two Tory statesmen, Mr. Robert Harley, afterwards Earl of Oxford, and Mr. Henry St. John, afterwards Lord Bolingbroke. These gentlemen having attempted to set up a party for themselves, their superior, Lord Godolphin, dismissed them, to the great displeasure of Queen Anne, who now resolved to get quit of the Whig party at the first opportunity. In August, 1710, Harley and St. John came into power at the head of a decidedly Tory ministry, which, though of brief duration, was destined to make an important figure in the national history. The queen at the same time called a new Parliament, which proved to be almost wholly composed of the Tory party.

PEACE OF UTRECHT.—DEATH OF QUEEN ANNE.

The members of the new cabinet immediately applied themselves, though very secretly, to the business of bringing about a peace. When their plans were matured, the consent of the House of Commons was easily gained; but the Lords having shown some reluctance, it was found necessary to create twelve new peers, in order to overpower the sense of that part of the legislature. After a tedious course of negotiation, Britain and Holland concluded a peace at Utrecht (1713), leaving the Emperor of Germany still at war. By this arrangement, Philip V. was permitted to retain Spain and the Indies, but no other part of the dominions which his ambitious grandfather had endeavoured to secure for him; and it was provided that he and his descendants should never inherit the kingdom of France, nor any future King of France accede to the crown of Spain. Britain obtained nothing tangible by all her exertions, except the possession of Gibraltar and Minorca, and the privilege of being exclusively employed to carry slaves to the Spanish American colonies. It has justly been considered a stain upon the nation, that it should have concluded a separate peace under such clandestine circumstances, as the interests of the other belligerent parties were thereby greatly injured. For the gratification of their High Church supporters, the ministers obtained an act for preventing dissenters from keeping schools, and another for establishing church patronage in Scotland, the former of which was repealed in the following reign.

It is believed that Queen Anne and her Tory ministers were in secret willing to promote the restoration of the main line of the Stuart family, and Harley and St. John are now known to have intrigued for that purpose. But before any plan could be formed, the queen took suddenly ill and died (August 1, 1714), when the ministers had no alternative but to proceed according to the Act of Settlement. The Electress Sophia being recently dead, her son, the elector, was proclaimed under the title of GEORGE I.

The reign of Queen Anne is not more distinguished by the wonderful series of victories gained by Marlborough, than by the brilliant list of literary men who now flourished, and who have caused this to be styled the Augustan age of English literature, as resembling that of the Roman Emperor Augustus. Alexander Pope stands unrivalled in polished verse on moral subjects. Jonathan Swift is a miscellaneous writer of singular vigour and an extraordinary kind of humour. Joseph Addison wrote on familiar life and on moral and critical subjects with a degree of elegance before unknown. Sir Richard Steele was a lively writer of miscellaneous essays. This last author, with assistance from Addison and others, set on foot the Tatler, Spectator, and Guardian, the earliest examples of small periodical papers in England, and which continue to this day to be regarded as standard works. Cibber, Congreve, Vanburgh, and Farquahar, were distinguished writers of comedy; and Prior, Philips, and Rowe, were pleasing poets. In graver literature, this age is not less eminent. Dr. Berkeley shines as a metaphysician; Drs. Sherlock, Atterbury, and Clark as divines; and Bentley as a critic of the Roman classics.

ACCESSION OF THE HOUSE OF HANOVER.—REBELLION OF 1715–16.

The new sovereign lost no time in coming over to Britain, and fixing himself in that heritage which his family has ever since retained. He was fifty-four years of age, of a good though not brilliant understanding, and very firm in his principles. Knowing well that the Whigs were his only true friends, he at once called them into the administration. It was the custom of that period for every party, on getting into power, to try to annihilate their opponents. Not only were the whole Tory party insulted by the king, but a committee of the House of Commons was appointed to prepare articles of impeachment against Oxford, Bolingbroke, the Duke of Ormond, and the Earl of Stratford. Bolingbroke, perceiving his life to be in danger, fled to the Continent; and his attainder was in consequence moved and carried by his rival Walpole. Ormond suffered a similar fate. Oxford, after a protracted trial, was only saved in consequence of a difference between the Lords and Commons.

During the first year of King George, the Tories kept up very threatening popular disturbances in favour of High Church principles: but the Whigs, gaining a majority in the new House of Commons, were able to check this a little by the celebrated enactment called the *Riot Act*, which permits military force to be used in dispersing a crowd, after a certain space of time has been allowed. Disappointed in their hopes of office and power and stung by the treatment of their leaders, the Tories

resolved to attempt bringing in the Pretender by force of arms. With an eager hopefulness, which for a long time was characteristic of the party, they believed that all England and Scotland were ready to take up arms for the Pretender, when in reality there was but a limited portion of the people so inclined, and that portion unwilling to move, if they saw the least risk. Blind to these circumstances, and without design or concert, they commenced the unfortunate civil war of 1715

The Earl of Mar, who had been a secretary of state in the late administration, raised his standard in Braemar (September 6), without any commission from the Pretender, and was soon joined by Highland clans to the amount of 10,000 men, who rendered him master of all Scotland north of the Forth. There, however, he weakly permitted himself to be cooped up by the Duke of Argyle, who, with a far less numerous force, had posted himself at Stirling. Mar expected to be supported by an invasion of England by the Duke of Ormond, and a rising of the people of that country. But the duke completely failed in his design, and no rising took place, except in Northumberland. There Mr. Foster, one of the members of Parliament for the county, and the Earl of Derwentwater, with some other noblemen, appeared in arms, but unsupported by any considerable portion of the people. Mar detached a party of 1800 foot, under Mackintosh of Borlum, to join the Northumbrian insurgents, who complained that they had no infantry. The junction was managed with great address; and at the same time some noblemen and gentlemen of the south of Scotland attached themselves to the southern army. The government was ill provided with troops; but it nevertheless sent such a force against Mr. Foster, as obliged him to retire with his men into the town of Preston, in Lancashire, where, after an obstinate defence, the whole party (November 13) surrendered themselves prisoners at the king's mercy. On the same day, the Earl of Mar met the Duke of Argyle at Sheriffmuir, near Dunblane, where a battle was fought, in which, after the manner of the battles in the civil war, the right wing of each army was successful, but neither altogether victorious. The duke withdrew in the face of his enemy to Stirling, and the earl retired to Perth, resolved to wait for the news of an invasion from France, and for the arrival of the Pretender, whom he had invited to Scotland.

Mar did not for some time become aware how little reason he had to expect support from France. Louis XIV., upon whom the hopes of the party greatly rested, had died in September, leaving the government to the Regent Orleans, who had strong personal reasons for wishing to cultivate the good will of the British monarch, and of course declined to assist in the present enterprise. The Pretender, nevertheless, sailed for Scotland, and, on the 22d of December, arrived incognito at Peterhead, bringing nothing but his own person to aid his adherents. Mar, who had already attempted to negotiate a submission to the government, brought him forward to Perth, where he was amused for some time with preparations for his coronation. But before he had been many days there, the Duke of Argyle found himself in a condition to advance against the insurgent force; and, on the 30th of January, 1716, this unfortunate prince commenced a retreat to the north, along with his dispirited army. On the 4th of February, he and the Earl of Mar provided for their own safety by going on board a vessel at Montrose, and setting sail for France; the army dispersed itself into the Highlands. For this unhappy appearance in arms, the Earl of Derwentwater, Viscount Kenmure, and about twenty inferior persons, were executed; forty Scottish families of the first rank lost their estates, and many excellent members of society became exiles for the remainder of their lives.

CHARACTER OF THE GOVERNMENT UNDER GEORGE I.

The suppression of this insurrection, and the ruin of so many Tory leaders, tended to increase the power of the Whig party, and the stability of the Hanoverian dynasty. The government, nevertheless, acted under considerable difficulties, as they were opposed by the majority of the clergy and country gentry, as well as by the whole of the mob feeling, except in the large commercial towns. To avoid the hazard of too often appealing to the people, they carried, in 1716, a bill for repealing King William's Triennial Act, and protracting the present and all future Parliaments to a duration of seven years. The chief popular support of the government was in the Dissenters, and the middle classes of the community.

From the peace of Utrecht, Britain remained free from foreign war for nearly thirty years, excepting that, in 1719, the ministry was called on to interfere for the repression of an attempt on the part of Spain to regain her Italian territories. A Scotsman, named Law, who had become comptroller-general of France, and amused that country with financial schemes, which at first promised to enrich, but finally almost ruined the country, was the means, in 1720, of inspiriting the British people with a similar visionary project, called the South Sea Scheme. This might be described as a joint-stock company, professedly trading in the South Seas, but chiefly engaged in a scheme for managing the national debt. It seemed for a time to prosper, and many realized large fortunes by selling their shares at a premium to others; but in a short time its unsoundness was discovered, the price of shares fell, and thousands were utterly ruined. With great difficulty, and by an extremely complicated adjustment, the House of Commons equalized as nearly as possible the state of gain and loss among the innocent parties, and credit was restored. Sir Robert Walpole, who was chiefly concerned in effecting this arrangement, became Premier and Chancellor of the Exchequer, and for upwards of twenty years, from that period (April, 1721), he must be looked on as the prime manager of the public affairs.

At the beginning of the reign of George I., the national debt amounted to fifty-three millions, and, owing to there having been no war, it was rather less at the time of the king's death. The annual expenditure of the state was about seven millions, or scarcely a seventh part of what it now is. The commerce and manufactures of England continued to advance steadily during this reign; but Scotland and Ireland remained in an unimproved state. Roads were now for the first time made in the Highlands. The chief literary men were the same as those who had come into repute in the time of Queen Anne: in addition to them John Gay is to be reckoned among the poets, and Waterland and Lardner among the divines. This was also more particularly the age of Daniel Defoe, a dexterous writer of pamphlets on the nonconformist side, but far more noted in later times on account of his admirable tale of Robinson Crusoe.

GEORGE II.—WAR WITH SPAIN AND FRANCE.

George I., at his death in 1727, was succeeded by his son, GEORGE II., a prince of moderate abilities, but conscientious, and free from all gross faults. In the early part of his reign, Walpole effected some useful measures, and upon the whole was a vigorous and enlightened administrator of public affairs, though nothing can justify the extensive system of bribery by which alone he pretended to manage the House of Commons. After a peace of extraordinary duration, he was urged, much against his will, into a contest with Spain, on account of some efforts made by that country to check an illicit trade carried on by British merchants in its American

colonies. In searching vessels for the prevention of this traffic, the Spaniards had made some trifling aggressions; and British spirit took fire at the indignity of being liable to a search by any neighbouring state, even for the prevention of a notorious breach of treaty. The community therefore demanded a war, and the minister, with great reluctance, was obliged to comply. One fleet, under Admiral Haddock, was sent to cruise off the coast of Spain, and another, under Admiral Vernon, was sent against the American colonies. The latter gained lustre by taking the important town of Portobello. Another and larger expedition, with 10,000 soldiers, was then sent to reinforce Vernon; but, owing to disputes between him and the commander of the troops, no further triumphs were gained. A timid, ill-concerted, and ill-conducted attack upon the fortifications of Carthagena, lost Britain about 20,000 men. Meantime, a third fleet, under Anson, sailed to the eastern coast of Spanish America, in order to co-operate with Vernon; but only one of the vessels reached its destination. Anson, thus reduced in naval force, took several prizes off Chili, and plundered the town of Puita, but could venture upon no more hazardous enterprise. He cruised across the Pacific, in the hope of meeting one of the Spanish galleons, which usually contained great quantities of bullion; but did not succeed, till, on his return from refitting at Canton, he took the Manilla transport, with treasure to the amount of three hundred thousand pounds. Though he had failed in all the proper objects of his expedition, the money he brought to the public treasury caused him to be very well received by the people; while the flagrant mismanagement at Carthagena was the subject of general execration.

The Spanish war now languished for some time, while the attention of Britain was attracted to the proceedings of France. After the death of the Emperor Charles VI. of Germany, his dominions fell by inheritance to his daughter, the celebrated Maria Theresa, Queen of Hungary. She was opposed in this succession by the sovereigns of France, Saxony, and Bavaria, all of whom pretended to have some claims on her dominions. A war was commenced against her; the Elector of Bavaria was crowned emperor, under the title of Charles VII.; and such was the success of the French arms, that she was soon reduced to the greatest distress. With this quarrel Britain had little reason for interfering; but the king thought his dominions in Germany endangered, and the people were animated by their usual hostility to the French. Walpole, being conscientiously opposed to the war, allowed himself to be driven from office (February, 1742), though he still continued to enjoy the respect of the king.

The ministry was recruited by the most popular men of the late minority, among whom the most conspicuous were Lord Carteret and the Earl of Bath. To the surprise of the nation, this set of statesmen opposed, now they were in power, all the improvements they had lately professed to clamour for, and seemed even more willing than their predecessors to carry out the policy which was suggested by the king's anxiety on account of his foreign dominions. About the time when Great Britain entered into this struggle, the affairs of the Hungarian queen took a surprising turn, and her armies, under her husband the Grand Duke of Tuscany, Prince Charles of Lorraine, and other eminent commanders, began to drive her enemies from her dominions. France, having lost 100,000 men in the contest, sued for peace; but this the queen haughtily refused, in the hope of gaining still greater triumphs by means of Britain. The aid of that power, as it turned out, was of little service to the queen. The Earl of Stair had permitted his army to get into a position of great difficulty at Aschaffenburg, on the Upper Maine, and, but for a blunder of the French, it would probably have been starved into a surrender, along with the king and prime minister (Carteret), both of whom had recently joined it. The blunder consisted in an attack made by the Duke of Grammont, with 30,000 troops, upon the British and Hanoverian infantry, upon a plain near the village of Dettingen (June 16, 1743). The infantry, cheered by the presence of the king, who rode between the lines with his sword drawn, received the charge of the French cavalry with great firmness, and compelled them to retreat—a movement which communicated a panic to the whole French army, and might have been attended with the most disastrous consequences, if the British monarch would have permitted his advantage to be followed up. This was the last occasion of a king of Great Britain appearing on the field of battle.

The death of the Emperor, Charles VII., for whom this great European contest appeared to have taken its rise, might have now given an opportunity for the cessation of hostilities; but the French thought the war still necessary, in order to prevent the husband of Maria Theresa from being elected emperor, and the British were still animated by their usual antipathy to the French. A campaign was therefore opened in Flanders, the troops of the French nation being commanded by Count Saxe, distinguished for military genius and experience; while the British and Hanoverian army was under the charge of the young Duke of Cumberland, second son to the king. To animate the French troops, their sovereign (Louis XV.) and the dauphin attended the camp. The French having invested Tournay, it was resolved by the English to hazard a battle, in order to save that strong city.

The rencontre took place (May, 1745) at Fontenoy, near the bridge of Colonne. The British infantry advanced under Cumberland, and, notwithstanding a tremendous fire, which swept them off in whole ranks, attacked the centre of the position of the French army, which they beat back in so furious a style, that Saxe advised the king to retire for the safety of his person Louis bravely refused to stir, being apprehensive that a retrograde motion on his part would decide the day against his army. Ashamed to desert their sovereign, the French returned to the charge; the cavalry renewed their efforts; and other circumstances conspired to give a turn to the battle. The British cavalry were prevented by a mistake from giving their support to the infantry; and the Dutch and Austrian part of the army was found totally ineffective. Assailed on all sides, fatigued with their great exertions, and galled by the French batteries, the infantry was obliged to retire, with a loss of 7000 men, after having beaten every regiment in the French army. The Duke of Cumberland, though able to withdraw in good order, did not venture after this disaster to face the enemy during the whole campaign. Nevertheless, the Queen of Hungary at this time gained the summit of her wishes, by the election of her husband to the imperial throne.

REBELLION OF 1745.

The Pretender had married, in 1719, the Princess Clementina Sobieski of Poland, and was now the father of two sons in the bloom of youth, the elder of whom has been distinguished in history by the title of Prince Charles Stuart. The misfortunes of the British arms on the Continent, and the dissensions which prevailed among the people and the Parliament, encouraged this prince to make an attempt to recover the throne of his ancestors. In 1744, he had been furnished by France with a large fleet and ample stores to invade the British dominions, but had been driven back by a storm, and prevented from again setting sail by a superior fleet under Sir John Norris. The object of France in this enterprise was to produce a diversion in favour of her own army in the Netherlands. At present, in conse-

ence of the victory of Fontenoy, such an enterprise as no longer necessary; but though the French monarch would not grant him any further supply, Charles resolved to make the proposed attempt, trusting solely to the generosity and valour of his friends in Britain. He therefore landed from a single vessel, with only seven attendants, on the coast of Inverness-shire, where the clans most attached to his family chiefly resided. By merely working upon the ardent feelings of the Highland chiefs, he soon induced several of them to take up arms, among whom were Locheil, Clanranald, Glengary, and Keppoch.

On the 19th of August, he raised his standard at Glenfinnan, within a few miles of the government station of Fort William, and found himself surrounded by about 1500 men. The government was at first inclined to disbelieve the intelligence of these proceedings, but was soon obliged to take steps for its own defence. A reward of thirty thousand pounds was offered for the head of the young prince, who, with all his family, was under attainder by act of Parliament; and Sir John Cope, commander of the forces in Scotland, was ordered to advance with what troops he had into the Highlands, and suppress the insurrection. Cope proceeded on this mission with about 1400 infantry; but on finding the Highlanders in possession of a strong post near Fort Augustus, he thought it necessary to go aside to Inverness. Charles, taking advantage of this ill-judged movement, immediately poured his clans down into the Lowlands, gaining accessions everywhere as he advanced; and, there being no adequate force to oppose him, he took possession successively of Perth and Edinburgh.

Cope now transported his troops back to Lothian by sea, and, on the 21st September, a rencontre took place between him and Charles, at Prestonpans. Seized with a panic, the royal troops fled disgracefully from the field, leaving the prince a complete victory. With the lustre thus acquired by his arms, he might have now, with four or five thousand men, made a formidable inroad into England. Before he could collect such a force, six weeks had passed away, and when at length (November 1) he entered England, a large body of troops had been collected to oppose him. After a bold advance to Derby, he was obliged by his friends to turn back. At Stirling he was joined by considerable reinforcements, and on the 17th of January, 1745, a battle took place at Falkirk between him and General Hawley, each numbering about 8000 troops. Here Charles was again successful; but he was unable to make any use of his victory, and soon after found it necessary to withdraw his forces to the neighbourhood of Inverness, where he spent the remainder of the winter. The Duke of Cumberland now put himself at the head of the royal troops, which had been augmented by 6000 auxiliaries under the Prince of Hesse. During the months of February and March, the Highland army was cooped up within its own territory, by the Hessians at Perth, and the royal troops at Aberdeen. At length, April 16, Prince Charles met the English army in an open moor at Culloden, near Inverness, and experienced a total overthrow. He had himself the greatest difficulty in escaping from the country, and the Highlands were subjected for several months to the horrors of military violence in all its worst forms.

To complete the subjugation of this primitive people, the hereditary jurisdictions under which they and the rest of the people of Scotland still lived, and by which the nobles and gentry were enabled to administer justice at their own discretion, were abolished by act of Parliament. Another act put an end to the tenure of ward-holdings, by which the land-proprietors were enabled to command the personal services, in peace and war, of those who lived on their estates. A third act prohibited the use of tartan and the ancient Highland fashion of clothes, which were supposed to have the effect of keeping alive the warlike spirit of the mountaineers. The two former of these measures, in connection with the suppression of the Stuart cause, and some other circumstances, produced a marked improvement in the social state of the Scottish people. The government, it must be remarked, had hitherto acted towards Scotland in a harsh and partial spirit. Suspected and hated by the ruling faction, the Highlanders had every temptation to continue in adherence to the exiled family. But when the government began to treat them in a milder spirit, and admitted them to the army and other branches of the public service, their naturally generous and loyal feelings were turned as zealously in favour of the new dynasty as they ever had been in favour of the old. The middle of the eighteenth century may be described as the time when Scotland, after a long period of sloth and poverty, first began to make advances towards that equality with England, in respect of comfort and prosperity, which it has since attained.

PEACE OF AIX-LA-CHAPELLE.

During the remainder of the war in which Britain and other powers were now engaged with France, the latter was generally successful by land, and unfortunate at sea, the contrary being the case with Britain. In 1748, the two countries found, after nine years of contention, that their losses were equal, though in different departments of their strength. Thirty millions had been added to the national debt of Britain, and France had expended an equal sum. They therefore agreed, by a treaty formed at Aix-la-Chapelle, mutually to restore their respective conquests, and to go back to exactly the same condition in which they stood before the war. A more signal illustration could have scarcely been held forth of the important truth—that war is to the parties in general only a means of waste and loss, and can do no good to any man except at the expense of his neighbour.

COLONIES AND DEPENDENCIES OF BRITAIN.—THE SEVEN YEARS' WAR.

For several years after this period the national resources underwent rapid improvement. The most respectable minister who immediately followed Walpole, was the Honourable Henry Pelham, First Lord of the Treasury and Chancellor of the Exchequer, whose commercial and financial schemes were usually very successful. Since the reign of Elizabeth, the British had been active in planting and rearing colonies; of which a considerable number now existed in the West Indies and in North America. The East India Company had also obtained large possessions in Hindostan, which proved the source of great wealth to Britain. The exclusive spirit in which Britain managed the commerce of those territories, provoked the cupidity of the French, who commenced a system of aggression both in India and North America. They, in particular, drew a line of forts along the back settlements of the whole range of the American colonies, from the Gulf of St. Lawrence to the Mississippi, so as to prevent the settlers from advancing beyond the Appalachian mountains.

For two or three years the British government suffered these aggressions, and even insults of a more decided nature, to pass unresented; but at length it was determined, in 1756, to proclaim war. A campaign of a novel and difficult character was opened in North America, for the purpose of driving the French from their forts. The first movements were attended with defeat and disaster. The French had gained the exclusive affection of the native Indians, who proved a dangerous and barbarous enemy to the British. Several of the forts were attacked, but without success; in the assault upon Ticonderoga, 2000 men were killed. A

South, on the accession of Mr. William Pitt (afterwards Earl of Chatham) to the office of Secretary of State, a more auspicious era commenced. The British troops and provincials became more experienced in the nature of the service. One after another, the principal forts fell into their hands; and a diversion was created by an attack upon Canada. In September, 1759, General Wolfe reduced the town and fort of Quebec, though at the expense of his own life; and the whole colony soon after submitted to the British arms. Meanwhile, Colonel Clive had been equally successful in the East Indies. He had destroyed the French settlement at Pondicherry, thereby securing to his country the whole coast of Coromandel; and by his famous victory at Plassey (June 26, 1756), over a combination of French and native forces, he laid the foundation of the great territorial power which the British have since gained in Hindostan. Thus the French, instead of gaining the colonies of other nations, ended by losing some of their own.

While Britain was thus successful in two remote quarters of the world, she experienced a different fortune in Europe. Austria, Russia, and Poland, had combined with France against the new and rising power of Prussia, which was at present directed by Frederick II., commonly called Frederick the Great. Britain on this occasion became the ally of the Prussian monarch, not from any regard to her own interests, but in order that the king might be able to protect his Hanoverian dominions. Immense sums of money were raised for the purpose of paying the troops of those countries which the king was anxious to defend; and the Duke of Cumberland was appointed their commander. This prince was so unfortunate (September, 1757) as to bring an army of 40,000 men into an angular piece of country, from which there was no escaping, so that the whole were obliged to lay down their arms to the French, who then became masters of Hanover. Notwithstanding this failure on the part of his ally, Frederick was able, by his extraordinary military genius, and by British subsidies, to defend his dominions for several years against all the forces that Austria, France, and Russia, could bring against him. In the midst of this war (October 25, 1760), George II. died suddenly, in the seventy-seventh year of his age, and was succeeded by his grandson GEORGE III., then only in his twenty-third year.

MISCELLANEOUS CIRCUMSTANCES CONNECTED WITH THE REIGN OF GEORGE II.

The chief domestic event of the reign of George II. was the rise of the religious sect called Methodists. The church had for a considerable time been in a languid state; amongst the community there was little religious feeling of a fervid character; and at no previous time were there so many conspicuous writers against the main doctrines of Christianity. John Wesley, a clergyman of the established church, and several other individuals of an enthusiastic turn of mind, were prompted by these circumstances to attempt to rouse a more zealous piety amongst the people; and in this object they were surprisingly successful. Another clergyman, named Whitefield, gifted with oratorical powers which gave him great command over the feelings of an audience, proved of much service as an itinerant preacher in working this reformation. The consequence of these exertions was the organization of a new religious body, generally called Methodists, comprehending a vast number of congregations in all parts of the kingdom, as well as in the American colonies.

Newspapers first acquired political importance in this reign. They originated in the time of the Commonwealth, but none of a regular periodical nature appeared till after the Restoration, when a busy writer named Roger L'Estrange established in London a weekly one called *The Intelligencer*. Till the Revolution, such small and unimportant newspapers as existed, were trammelled by a licensing power and censorship. When these restrictions were removed, newspapers increased in number, till, in 1709, they were again restricted by the imposition of a penny stamp. In those days newspapers were chiefly conducted by a set of mean and poor writers, to whom the term "Grub Street authors" was generally applied, from many of them living in that wretched part of London. The influence which newspapers were calculated to have over the public mind, was first recognised by Sir Robert Walpole, who, while he never thought of giving the least encouragement to literature on its own account, liberally pensioned various editors who supported his government. About the beginning of this reign, there were, in London, one daily paper, fifteen three times a week, and one twice a week, besides a few country papers. A monthly pamphlet, begun in 1731 by Edward Cave, a London bookseller, under the name of the *Gentleman's Magazine*, was composed of the best articles from the newspapers; and thus originated the periodical works termed magazines, which are now conspicuous as vehicles of light literature and political discussion.

The peculiar literary genius of the age was shown in the fictitious prose writings of Fielding, Smollett, and Sterne, and in the pictures of Hogarth, all of which represent the national character in its greatest breadth. The novels of Richardson are equally accurate as descriptions of manners, but contain no trace of the same humour. Next in distinction to these writings, must be placed the essays of John Hawkesworth and Samuel Johnson, the latter of whom did a great service to literature in compiling a dictionary of the English language. James Thomson, William Collins, and Thomas Gray, rank high as poets. Carte and Echard were respectable historical writers; and philosophy was cultivated by Francis Hutcheson and David Hartley. Drs. Conyers Middleton, Joseph Butler, and Isaac Watts, were the principal writers on religious subjects.

GEORGE III.—BUTE ADMINISTRATION—PEACE OF 1763.

Soon after his accession, George III. espoused the Princess Charlotte of Mecklenburg-Strelitz, by whom he had a large family. One of his earliest political measures was to confer one of the state secretaryships upon the Earl of Bute, a Scottish nobleman of Tory or Jacobite predilections, who had been his preceptor, and possessed a great influence over his mind. This, with other alterations, infused a peaceful disposition into his majesty's counsels, which was not much relished by Mr. Pitt. That minister, having secretly discovered that Spain was about to join France against Britain, and being thwarted in the line of policy which he consequently thought it necessary to assume, retired with a pension, and a peerage to his wife; after which the ministry was rendered still less of a warlike temper. A negotiation for peace was entered into with France, which offered, for that end, to give up almost all her colonial possessions. The demands of the British were, however, rather more exorbitant than France expected, and not only was the treaty broken off, but Spain commenced those hostilities which Mr. Pitt had foretold. Nevertheless, Britain continued that splendid career of conquest, which, except at the beginning, had been her fortune during the whole of this war. In a very few months, Spain lost Havana, Manilla, and all the Philippine Isles. The Spanish forces were also driven out of Portugal, which they had unjustly invaded. At sea the British fleets reigned everywhere triumphant, and at no former period was the country in so proud a situation. The ministry, however, were sensible that war, even with all this good fortune, was a losing game; and they therefore, much against the will of the nation, concluded a peace in February, 1763.

By this treaty, Great Britain gave up certain parts

of her conquests, in exchange for others which had been wrested from her; but she was nevertheless a gainer to an immense amount. She acquired from the French, Canada, that part of Louisiana east of the Mississippi, Cape Breton, Senegal, the islands of Grenada, Dominica, St. Vincent's, and Tobago, with all the acquisitions which the French had made upon the Coromandel coast in the East Indies since 1749. From Spain she acquired Minorca, East and West Florida, with certain privileges of value. The continental states in alliance with Great Britain were also left as they had been. These advantages on the part of Great Britain had been purchased at the expense of an addition of sixty millions to the national debt, which now amounted in all to £133,959,270.

We now direct our attention to Ireland, where some important transactions had occurred since the early part of the century.

FROM THE PEACE OF 1763 TILL THE YEAR 1840.

TRANSACTIONS IN IRELAND.

Since the pacification at Limerick, Ireland had been ruled exclusively by the Protestant party, who, under the influence of feelings arising from local and religious antipathies, had visited the Catholics with many severities. These measures naturally rendered the Catholics discontented subjects, and led to much turbulence. The common people of that persuasion, being denied all access to justice, took it into their own hands, and acquired those lawless habits for which they have since been remarkable. Treachery, cruelty, and all the lower passions, were called into vigorous exercise. The passing of a bill in 1719 by the English Parliament, declaring its power to legislate for Ireland, occasioned general dissatisfaction, and caused the rise of a patriotic party in the Parliament and people of Ireland, who professed to look to the advantage of the country, as distinguished from that of Great Britain. The discontent of the Tory party mingled with this spirit; and the celebrated Swift, in 1724, blew it into a flame by his severe pamphlets, called the *Drapier's Letters*, which professedly decried a new coinage of halfpence, but were in reality aimed at the English ministry.

The discontents of the Catholics continued unabated, and the contentions of the patriotic party with the adherents of the English ministry were carried on with the utmost keenness in Parliament, when the rebellion in Scotland (1745) alarmed the government for the loyalty of Ireland. The Earl of Chesterfield, celebrated for his literary productions, was, in this exigency, sent for a short time as lord-lieutenant, and allowed to hold forth all possible encouragement to the Catholics and patriotic party. By discountenancing party distinctions, and giving the Catholics the full protection of the laws, he so effectually soothed and tranquillized the country, that, while the neighbouring Protestant kingdoms exhibited an army seeking the restoration of a Catholic prince, Ireland, though full of Christians of that persuasion, and bound to the Jacobite cause by many endeared associations, remained perfectly faithful to the Hanover dynasty. When the danger was past, the earl was recalled, and the former system resumed. The struggles of the patriots with the English ministerial party were continued with unabated violence down to the death of George II., without producing any marked benefit to Ireland, although at one time the former party gained an ascendency in the native Parliament.

CASE OF MR. WILKES.

Ever since the accession of the Brunswick family in 1714, the government had been chiefly conducted by the Whig party, who formed a very powerful portion of the aristocracy of England. Walpole, Pelham, Newcastle, and Pitt, had all ruled chiefly through the strength of this great body, who, till a period subsequent to the rebellion of 1745, seem to have had the support of the more influential portion of the people. After that period, when the Stuart claims ceased to have any effect in keeping the crown in check, a division appears to have grown up between the government and the people, which was manifested in various forms even before the demise of George II., but broke out in a very violent manner during the early years of his successor. George III., who had imbibed high notions of the royal prerogative from the Earl of Bute, showed, from the beginning of his reign, an anxious desire to extend the power of the crown, to shake off the influence of the great Whig families, and keep popular force of all kinds within strict limits.

A stranger, with no connection in the country, a favourite, and moreover a man of unprepossessing manners, the Earl of Bute had neither the support of the aristocracy nor of the people. He was assailed in Parliament, and through the newspapers, with the most violent abuse, the unpopular peace furnishing a powerful topic against him. To this storm he at length yielded, by retiring (April 8, 1763).

Among the public writers who assailed the ministry, none was more virulent than Mr. John Wilkes, member for Ailesbury, and editor of a paper entitled the *North Briton*. Mr. George Grenville, who succeeded Bute, commenced his career by prosecuting Wilkes for a libel, contained in the forty-fifth number of his paper, in which he had directly accused his majesty of falsehood. The king's messenger, being provided with a general warrant against the editor, printers, and publishers of the *North Briton*, entered the house of Mr. Wilkes, and apprehended him. After being examined before the secretaries of state, he was committed to the Tower, and his papers were seized and sealed up. A few days after, he was brought to Westminster Hall by *habeas corpus*, and released by Chief Justice Pratt, in consideration of his being a member of Parliament. The Parliament ordered the seditious paper to be burnt by the hands of the common hangman—an operation that produced a riot, not in itself dangerous, but serving to discover the angry spirit of the populace. Mr. Wilkes was soon after expelled from the House of Commons, and found it convenient to retire to the continent. One result of his case was favourable to the popular cause: a prosecution which he instituted against the secretary of state, on the plea that his seizure was illegal, terminated in a verdict of damages, and a declaration by Chief Justice Pratt, that general warrants were inconsistent with the laws of England.

AMERICAN STAMP ACT.

The administration of Mr. Grenville is memorable for the first attempt to tax the American colonies. An act, passed under his influence (March 1765) for imposing stamps on those countries, appeared to the colonists as a step extremely dangerous to their liberties, considering that they had no share in the representation. They therefore combined almost universally to resist the introduction of the stamped paper by which the tax was to be raised. Resolutions were passed in the various assemblies of the states, protesting against the assumed right of the British legislature to tax them. Partly by popular violence, and partly by the declarations issued by the local legislative assemblies, the object of the act was completely defeated.

The home government were then induced to agree to the repeal of the act, but with the reservation of a right to impose taxes on the colonies. Between the Stamp Act and its repeal, a change had taken place in the administration: the latter measure was the act of a Whig ministry under the Marquis of Rockingham, which, how

ever, did not long continue in power, being supplanted by one in which Mr. Pitt, now created Earl of Chatham, held a conspicuous place. The second Pitt administration was less popular than the first; the Earl of Chesterfield, reflecting on the title given to the minister, at the same time that he sunk in general esteem, called his rise a *fall up stairs*. All the ministries of this period laboured under a popular suspicion, probably not well founded, that they only obeyed the will of the king, while the Earl of Bute, as a secret adviser behind the throne, was the real though irresponsible minister.

At the suggestion of Mr. Charles Townsend, a member of the Earl of Chatham's cabinet, it was resolved, in 1767, to impose taxes on the Americans in a new shape, namely, upon British goods imported into the colonies, for which there was some show of precedent. An act for imposing duties on tea, glass, and colours, was accordingly passed with little opposition. Soon after this, Mr. Townsend died, and the Earl of Chatham, who had been prevented by illness from taking any share in the business, resigned. The Americans met the new burdens with the same violent opposition as formerly.

THE WILKES TUMULTS.

Early in 1768, a new administration was formed under the Duke of Grafton, a pupil of Chatham, and soon after a new Parliament was called. At the general election, Mr. Wilkes re-appeared in England, though a sentence of outlawry still stood against him. He even ventured to become candidate for the county of Middlesex, where he was returned by a large majority. Having previously surrendered to the jurisdiction of the King's Bench, his outlawry was reversed; but by virtue of the verdicts which two courts had given against him, he was subjected to a fine and two years' imprisonment. On his arrest, Mr. Wilkes quietly committed himself to the officers of justice, but was forcibly rescued by the populace; and in a riot subsequent to this violence, a young man, who had no participation in the tumult, was killed. During his imprisonment, Mr. Wilkes was formally expelled the House, on the pretext that, by the vote of censure passed by the preceding Parliament, he was for ever disqualified from being a representative of the people. This decision incensed a great portion of the community, and the case became identified in their estimation with the liberties of the nation itself. Four times did the county of Middlesex return Mr. Wilkes; but the rival candidate, Colonel Luttrell, with only a fourth of the votes, was accepted by the House.

These proceedings occasioned many keen debates in the House of Commons, where an opposition of much talent and ardour of purpose now took up every popular question. Tumults of a dangerous character were constantly taking place; the cry of "Wilkes and Liberty" resounded everywhere, excepting only in Scotland, his scurrility against the Scotch having rendered him generally detested in that country. Even the municipal bodies and corporations, though usually not easily moved by popular objects, became zealous partisans of Mr. Wilkes, and thought it their duty to remonstrate with the king on the high hand with which his government was conducted. At this agitated time (1769), an unknown writer, styling himself Junius, commenced a series of letters in a newspaper, animadverting in the most virulent manner on both the men and measures of the government. These compositions were the more remarkable, as, from the force and elegance of their style, they were evidently the production of some person, not only far above the usual character of newspaper writers, but fitted to rank with the first intellects of his day. The publisher of the newspaper was prosecuted for publishing them; but the author remained concealed, and his name, though still an object of curiosity, has never been discovered.

MINISTRY OF LORD NORTH—THE CITY OF LONDON'S REMONSTRANCE.

At the opening of Parliament in January, 1770, it was expected that the conspicuous topic in the king's speech would be the Middlesex election. The surprise was general when it was found that the king did not make the least reference to the troubles respecting Mr. Wilkes. The opposition were enraged at this oversight, and moved, as an amendment to the address, that an inquiry ought to be made into the causes of the prevailing discontents; on which occasion, Charles James Fox, afterwards so celebrated as a political leader, made his first speech in Parliament. The amendment was negatived by 254 against 138, which showed that the king was quite secure of the support of the House of Commons.

At this time, the Duke of Grafton retired from the cabinet, and his place was supplied by Lord North, son of the Earl of Guilford. The new ministry was tenth which had existed during as many years, but the first in which the king might be considered as completely free of the great Whig families, who, by their Parliamentary influence, had possessed the chief power since the Revolution. This was the beginning of a series of Tory administrations, which, with few and short intervals, conducted the affairs of the nation down to the close of the reign of George IV

The supposed injury which the cause of free election had sustained from the decision of the House of Commons, still for a time agitated the public mind. Forty-eight peers, including all the great Whig chiefs (Devonshire, Rockingham, rosvenor, Fitzwilliam, Tankerville, King, &c.), besides the Earl of Chatham, made a public declaration that they should not cease their efforts till they had obtained full justice to the electors of Britain. The city of London, and some other corporations of note, presented remonstrances to the king on the same subject. The policy of the king and cabinet was to wear ou the public fervour by dignified silence. No notice as therefore taken of these remonstrances. Under the policy of the king, the Wilkes agitations in time subsided.

THE AMERICAN WAR OF INDEPENDENCE.

Meanwhile, the remonstrances of the American colonists had induced the ministry to give up all the new taxes, excepting only that on tea, which it was determined to keep up, as an assertion of the right of Parliament to tax the colonies. In America, this last remaining tax continued to excite as much discontent as the whole had formerly done, for it was the principle of a right to impose taxes which they found fault with, and not the amount of the tax itself. The discontent with the mother country was found to affect trade considerably and the British merchants were anxious to bring the dispute to a close. The government was then induced to grant such a drawback from the British duty on tea, as enabled the East India Company to offer the article in America at a lower rate than formerly, so that the American duty, which was only threepence a pound, did not affect the price. It was never doubted that this expedient would satisfy the colonists, and large shipments of tea were accordingly sent out from the British ports. But the principle of the right to tax still lurked under the concession, and the result only showed how little the sentiments of the Americans were understood.

The approach of the tea cargoes excited them in a manner totally unlooked for in Britain. At New York and Philadelphia, the cargoes were forbidden to land. In Charlestown, where they were permitted to land, they were put into stores, and prohibited from being sold. At Boston, a ship-load, which had been introduced into the

harbour, was seized by a lawless mob, and tossed into the sea. This last act of violence was resented by the passing of a bill in Parliament for interdicting all commercial intercourse with the port of Boston, and another for taking away the legislative assembly of the state of Massachusetts. The former measure was easily obviated by local arrangements; and in reference to the latter, a Congress of representatives from the various states met at Philadelphia, in September, 1774, when it was asserted that the exclusive power of legislation, in all cases of taxation and internal policy, resided in the provincial legislatures. The same assembly denounced other grievances, which have not here been particularly adverted to, especially an act of the British legislature for trying Americans, for treasonable practices, in England. The Congress also framed a covenant of non-intercourse, by which the whole utility of the colonies to the mother country, as objects of trading speculation, was at once laid prostrate. The colonists still avowed a desire to be reconciled, on the condition of a repeal of the obnoxious statutes. But the government had now resolved to attempt the reduction of the colonists by force of arms. Henceforth, every proposal from America was treated with a proud silence on the part of the British monarch and his advisers.

The war opened in summer, 1775, by skirmishes between the British troops and armed provincials, for the possession of certain magazines. At the beginning there seemed no hope of the contest being protracted beyond one campaign. The population of the colonies was at this time under three millions, and they were greatly inferior in discipline and appointments to the British troops. They possessed, however, an indomitable zeal in the cause they had agreed to defend, and fought with the advantage of being in the country of their friends. At Bunker's Hill, near Boston (June 17, 1775), they had the superiority in a well-contested fight with the British troops, of whom between two and three hundred were killed. At the end of one year the British government was surprised to find that no progress had been made towards a reduction of the Americans, and sent out an offer of pardon to the colonists, on condition that they would lay down their arms. The proposal only met with ridicule.

On the 4th of July, 1776, the American Congress took the decisive step of a declaration of their independence, imbodying their sentiment in a document remarkable for its pathos and solemnity. During the next two campaigns, the slender forces of the new republic were hardly able anywhere to face the large and well-appointed armies of Great Britain. Much misery was endured by this hardy people in resisting the British arms. Notwithstanding every disadvantage and many defeats, America remained unsubdued.

The first serious alarm for the success of the contest in America, was communicated in December, 1777, by intelligence of the surrender of an army under General Burgoyne at Saratoga. In the House of Commons, the ministers acknowledged this defeat with marks of deep dejection, but still professed to entertain sanguine hopes, from the vigour with which the large towns throughout Britain were now raising men at their own expense for the service of the government. Mr. Fox, the leader of the opposition, made a motion for the discontinuance of the war, which was lost by 165 to 259, a much narrower majority than any which the ministry had before reckoned in the Lower House.

In proportion to the dejection of the government, was the elation of the American Congress. Little more than two years before, the British sovereign and ministers had treated the petitions of the colonists with silent contempt; but such had been the current of events, that, in 1778, they found it necessary, in order to appease the popular discontent to send out commissioners, almost for the purpose of begging a peace. As if to avenge themselves for the indignities of 1775, the Americans received these commissioners with the like haughtiness; and, being convinced that they could secure their independence, would listen to no proposals in which the acknowledgment of that independence, and the withdrawal of the British troops, did not occupy the first place. The ministers, unwilling to submit to such terms, resolved to prosecute the war, holding forth to the public, as the best defence of their conduct, the necessity of curbing the spirit of insubordination, both in America and at home, which they described as threatening the overturn of the most sacred of the nations' institutions.

The rise of Great Britain during the seventeenth and eighteenth centuries, in wealth and military and naval power, had been observed by many of the surrounding states with no small degree of jealousy. France, in particular, had not yet forgiven the triumphant peace which Britain had dictated in 1763. The Americans, therefore, by their emissary, the celebrated Benjamin Franklin, found no great difficulty in forming an alliance with France, in which the latter power acknowledged the independence of the colonists, and promised to send them large auxiliary forces. Viewing the distressed state to which Britain was reduced by the contest, and concluding that the time had arrived to strike a decisive blow for her humiliation, Spain soon after declared war against her; and in 1780, Holland was added to the number of her enemies. Russia then put herself at the head of what was called an Armed Neutrality, embracing Sweden and Denmark, the object of which was indirectly hostile to Britain. So tremendous was the force reared against Britain in 1779, even before all these powers had entered into hostilities, that it required about three hundred thousand armed men, three hundred armed vessels, and twenty millions of money annually, merely to protect herself from her enemies. Even her wonted superiority at sea seemed to have deserted her; and for some time the people beheld the unwonted spectacle of a hostile fleet riding in the Channel, which there was no adequate means of opposing.

It was now obvious to the whole nation, that this contest, upon whatever grounds it commenced, was a great national misfortune; and the Opposition in Parliament began to gain considerably in strength. After some votes, in which the ministerial majorities appeared to be gradually lessening, Mr. Dunning, on the 6th of April, 1780, carried, by a majority of eighteen, a motion, "that the influence of the crown had increased, was increasing, and ought to be diminished." This was looked upon as a severe censure of the government, considering that the House of Commons was not altogether a popular body, but included many who had seats there only through the influence of the crown, or by the favour of the nobility and gentry.

In the year 1778, an act had been passed, relieving the Roman Catholics in England from some of the severe penal statutes formerly enacted against them. The apprehension of a similar act for Scotland caused the people of that country to form an immense number of associations, with a view to opposing it; and, in the early part of 1779, the popular spirit broke out at Edinburgh and Glasgow in several alarming riots, during which one or two Catholic chapels, and some houses belonging to Catholics, were pillaged and burnt. An extensive Protestant Association was also formed in England, to endeavour to procure the repeal of the English act. This body was chiefly led by Lord George Gordon, a son of the late Duke of Gordon, and member of the House of Commons. In June, 1780, an immense mob assembled in London to accompany Lord George to the House of Commons, where he was to present a

petition against the act, signed by 120,000 persons. His motion for the repeal of the act being rejected by a vast majority, he came out to the lobby and harangued the crowd in violent terms, suggesting to them similar acts to those which had taken place in Scotland. The mob accordingly proceeded to demolish the chapels of the foreign ambassadors. Meeting with no effectual resistance, for the magistrates of the city were afraid to take decisive measures against them, they attacked Newgate, released the prisoners, and set the prison on fire. The new prison at Clerkenwell, the King's Bench and Fleet Prisons, and the New Bridewell, were treated in like manner. At one time, thirty-six fires were seen throughout the city. The mob had uncontrolled possession of the streets for five days, pillaging, burning, and demolishing; until the king in council determined to authorize the military to put them down by force of arms. Tranquillity was then restored, but not before upwards of 400 persons were killed and wounded. Many of the ringleaders were convicted and executed. Lord George Gordon was tried for high treason, but acquitted on a plea of insanity, which his subsequent life showed to be well founded. Similar outrages were attempted in other cities, but prevented by the vigour of the magistrates. The chief sufferers from these riots were the party who aimed at political reforms. On the other hand, the king obtained increased respect, in consequence of the firmness he had shown in taking measures for the suppression of the riots.

The states of North and South Carolina, which contained a larger proportion of persons friendly to the British crown than any of the northern states, had submitted, in 1780, to a British army under General Clinton. Next year, the greater part of the troops which had been left in those states were conducted northward by Lord Cornwallis, in the hope of making further conquests; but the consequence was that General Greene, after a series of conflicts in which he greatly distressed various parties of the British troops, regained both Carolinas, while Lord Cornwallis took up a position at Yorktown in Virginia. At this time, General Washington, the American commander-in-chief, to whose extraordinary sagacity and purity of motives the colonists chiefly owed their independence, was threatening General Clinton's army at New York. Clinton tamely saw him retire to the southward, believing that he only meant to make a feint, in order to draw away the British from New York, when he in reality meant to attack Cornwallis. On the 29th of September (1781), Yorktown was invested by this and other corps of Americans and French; and in three weeks more, the British batteries being completely silenced, Lord Cornwallis surrendered, with his whole army. With this event, though some posts were still kept up by British troops, hostilities might be said to have been concluded.

At the next opening of Parliament, many of those who had formerly supported the war, began to adopt opposite views; and, early in 1782, a motion, made by General Conway, for the conclusion of the war, was carried by a majority of nineteen. The necessary consequence was, that, on the 20th of March, Lord North and his colleagues resigned office, after twelve years of continued misfortune, during which the prosperity of the country had been retarded, a hundred millions added to the national debt, and three millions of people separated from the parent state.

As usual in such cases, a new administration was formed out of the Opposition. The Marquis of Rockingham was made prime minister, and Mr. Fox one of the secretaries of state. The new ministers lost no time in taking measures for the restoration of peace. Unfortunately for their credit with the nation, Sir George Rodney gained an important victory over the French fleet off the island of Dominica, April 12, 1782, after the ministers had despatched another officer to supersede him in the command. On this occasion, thirty-seven British vessels encountered thirty-four French, and, chiefly by the dexterous manœuvre of a breach of the enemy's line, gained one of the most complete victories recorded in modern warfare. The triumph was eminently necessary, to recover in some measure the national honour, and enable the ministers to conclude the war upon tolerable terms. In November, provisional articles for a peace with the United States of America, now acknowledged as an independent power, were signed at Paris, and the treaty was concluded in the ensuing February. When the American ambassador was afterwards, for the first time, introduced at the British levee, the king received him kindly, and said, with a manly frankness, that though he had been the last man in his dominions to desire that the independence of America should be acknowledged, he should also be the last to wish that that acknowledgment should be withdrawn. War was soon after concluded with France, Spain, and Holland, but not without some considerable concessions of colonial territory on the part of Great Britain.

The conclusion of this war is memorable as a period of great suffering, arising from the exhaustion of the national resources, the depression of commerce, and the accident of a bad harvest. The principles of prosperity were after all found to be so firmly rooted in the country, that, immediately after the first distresses had passed away, every department of the state resumed its wonted vigour; and, during the ensuing ten years of peace, a great advance was made in national wealth.

On the unexpected death of the Marquis of Rockingham, in July, 1782, the king chose as his successor the Earl of Shelburne, who, though nominally a Whig, was not sufficiently inclined to the general measures of that party to be agreeable to Mr. Fox and other leading members of the cabinet. On their consequent resignation, the vacancies were filled up by the friends of Shelburne, among whom was Mr. William Pitt, a younger son of the Earl of Chatham. This young statesman, to whom was assigned the office of chancellor of the exchequer, had already distinguished himself by the part he took in the popular proceedings for a reform of the House of Commons—an object which the opposition and their supporters had for some years advocated with great zeal, but which soon after fell in a great measure out of public notice.

COALITION MINISTRY.

The present ministry was opposed by two parties of very different principles, namely, the adherents of the North administration, and the friends of those Whigs who had lately retired from the cabinet. These two parties, notwithstanding that they had been opposed to each other throughout all the late war, coalesced for factious or ambitious purposes; and, being triumphant over the ministry, forced themselves upon the king's counsels. Then was formed (April 2, 1783) what was called the Coalition Ministry, in which Lord North and Mr. Fox acted together as secretaries of state, though two years had hardly elapsed since the latter had breathed the most violent threats in Parliament against his present associate. A coalition, in which political principle was supposed to be abandoned for the sake of office, could not be agreeable to the nation, while it was evidently embarrassing to the sovereign. Mr. Fox had prepared and carried through the Lower House his famous bill for the regulation of the East India Company, by which all authority was to devolve on seven directors chosen by the House of Commons; in other words, by which the immense patronage of this offshoot of the empire was to fall into the hands of the ministry. The India bill, as it was called, was generally supposed to aim at fixing the ministry in power beyond the control of both king and

people, and it accordingly roused much indignation. His majesty, therefore, fully confident of support from the people, used his personal influence, in no covert way, to induce the House of Lords to reject the bill, and (December 18) sent a messenger to demand the seals of office from his over-ambitious ministers, appointing Mr. Pitt to be the prime minister and chancellor of the exchequer of a new cabinet, consisting chiefly of his majesty's friends.

The various departments of the state were now thrown into a relative position, which had never been known before, and has never recurred. The king and his ministers, backed by a decided majority of the public, were opposed by two powerful aristocratic factions in the House of Commons, who defeated every measure that was introduced, refused the usual supplies, and voted again and again resolutions against the continuance of the present men in office, which they denounced as unconstitutional. But in the course of a few weeks, the influence of the opposition was sensibly reduced; the public sentiment and the power of the court began to take effect even on this intractable body; and when at length their majority had been worn down to *one*, which happened on a motion by Mr. Fox, the king dissolved the Parliament—a measure which, whatever it might promise to him, he did not previously think justifiable. So far were the votes of the coalition from being based on popular support, that in the new election, no fewer than one hundred and sixty members lost their seats. The new House of Commons was so favourable towards the king and ministry, as to enable the public service to go on without further interruption.

LEGISLATIVE MEASURES IN IRELAND.

From the end of the reign of George I., a patriotic party in Ireland, composed of a mixture of Catholics and Protestants, had been exerting itself to reduce the influence of the English ministry in their country. The resistance of the American colonists gave a powerful stimulus to this body; and, on some alarm of an invasion of the French, they found a pretext for taking up arms, apparently for the protection of the country, but in reality to render themselves formidable to England. Encouraged by Parliament, and headed by the principal men in the country, the Volunteer Corps, as they were called, held meetings and passed resolutions, in which they openly avowed their determination, at the hazard of life and fortune, to achieve the independence of the native legislature, and a complete participation in the commercial rights of the British. The government, being then too feeble to resist, bowed to their demands. Poyning's law, and others which had given the English Parliament a right to interfere with Ireland, were repealed; and acts were passed for the right of *habeas corpus* and the independence of the judges. In November, 1783, the volunteers held a grand convention in Dublin, and proposed to urge the question of Parliamentary reform; but the government now began to regain strength, and in a short time, by skilful measures, it prevailed upon the corps to dissolve.

MINISTRY OF MR. PITT—FROM 1784 TO THE COMMENCEMENT OF THE FRENCH REVOLUTION.

Though the favourite minister of a sovereign decidedly opposed to all popular innovations, Mr. Pitt continued to profess his former zeal for a reform in the House of Commons; but, as might be expected, was unable to bring the power of the government to bear upon the subject. In April, 1785, he asked leave of the House to bring in a bill for this object; but it was refused by a large majority. The desire of Parliamentary reform nevertheless continued to animate a large portion of the community. In 1784, a regular society had been instituted in Scotland, for the purpose of obtaining such a measure; and in the succeeding year, forty-nine out of the sixty six boroughs had declared in favour of it. There were also numerous associations of a similar character in England.

In 1786, Mr. Pitt established his celebrated but fallacious scheme for redeeming the national debt, by what was called a Sinking Fund. The revenue was at this time above fifteen millions, being about one million more than was required for the public service. This excess he proposed to lay aside annually, to lie at compound interest; by which means he calculated that each million would be quadrupled at the end of twenty-eight years, and thus go a great way towards the object he had in view. To this scheme Mr. Fox added the infinitely more absurd amendment, that, when the government required to borrow more money, one million of every six so obtained should be laid aside for the same purpose. The scheme was so well received as to increase the popularity of the minister, and it was not till 1813 that its fallacy was proved.

In the same year commenced the Parliamentary proceedings against Mr. Warren Hastings, for alleged cruelty and robbery exercised upon the natives of India during his governorship of that dependency of Great Britain. These proceedings were urged by Mr. Burke and other members of the Whig party, and excited so much public indignation against Mr. Hastings, that the ministry was obliged, though unwillingly, to lend their countenance to his trial, which took place before Parliament in the most solemn manner, and occupied one hundred and forty-nine days, extending over a space of several years. The result was the acquittal of Mr. Hastings.

The king and the queen had, in the mean time, become the parents of a numerous family of sons and daughters. The eldest son, George, Prince of Wales, had now for several years been of age, and exempted from the control of his father. He had no sooner been set up in an establishment of his own, than he plunged into a career of prodigality, forming the most striking contrast with the chastened simplicity and decorum of the paternal abode. He also attached himself to the party of the Opposition, though rather apparently from a principle of contradiction to his father, than a sincere approbation of their political objects. The result was the complete alienation of the Prince of Wales from the affections of the king.

In November, 1788, an aberration of intellect, resulting from an illness of some duration, was observed in the king, and it became necessary to provide some species of substitute for the exercise of the royal functions. To have invested the Prince of Wales with the regency, appeared the most obvious course; but this would have thrown out the ministry, as it was to be supposed that his royal highness would call the chiefs of his own party to his councils. Mr. Fox contended that the hereditary nature of the monarchy pointed out an unconditional right in the prince to assume the supreme power under such circumstances; but Mr. Pitt asserted the right of Parliament to give or withhold such an office, and proposed to assign certain limits to the authority of the intended regent, which would have placed the existing ministry beyond his reach. The Irish Parliament voted the unconditional regency to the prince; but that of Great Britain was about to adopt the modified plan proposed by Mr. Pitt, when, March, 1789, the king suddenly recovered, and put an end to the difficulty. The debates on the regency question show ... very strong light how statesmen will sometimes abandon their most favourite and strongest principles on the call of their own immediate interests.

MISCELLANEOUS CIRCUMSTANCES FROM 1760 TO 179[illegible].

At the beginning of the reign of George III., both the commerce and the manufactures of the country might be

considered as in a highly flourishing condition. Scotland was not now, as formerly, exempt from the general prosperity. In that country, since the year 1746, great improvements of various kinds had taken place: the linen manufacture had been much advanced; a trade with the colonies had sprung up; agriculture was undergoing great changes for the better; the Highlands were now peaceful, and throughout the whole country were seen conspicuous symptoms of increasing wealth, and its natural consequence, refinement of manners.

During the first ten years of the reign of George III., some discoveries and inventions were made, by which the prosperity of the whole empire received a new impulse. By the improvements effected in the steam-engine by Mr. James Watt, a superior mechanic power was obtained for the driving of machinery and other purposes. Mr. James Hargreaves of Blackburn invented the *spinning-jenny*, a contrivance for abridging the use of hand-labour in the cotton manufacture. Upon this an improvement was afterwards made by Mr. Richard Arkwright, who invented what was called the *spinning-frame*, by which a vast number of threads of the utmost fineness were spun with very little aid from hand-labour. A third invention, called the *mule-jenny*, by Mr. Crompton of Bolton, came into use some years later; and, finally, the *power-loom* was invented, for superseding hand-labour in weaving. By these means, the cotton manufacture was brought to a pitch of prosperity in Britain, such as no particular branch of manufacture had ever experienced before in any country. The immense wealth produced by it is allowed to have been what chiefly enabled the nation to sustain the great contest in which it was afterwards involved with France. Considering these results, the original condition of the principal persons concerned in improving the manufacture is remarkable. Mr. Watt, who gave it a mechanic force in the steam-engine, was an artisan in his early days: Mr. Hargreaves was a carpenter; and Mr. Arkwright a dresser of hair. The last, who was knighted by George III., left, at his death, nearly a million sterling, realized by the profits of his invention.

The early part of the reign of George III. was distinguished by the discoveries of Captain Cook in the Pacific Ocean, by the formation of many canals for internal navigation, and by the foundation of the Royal Academy for the Promotion of the Fine Arts. This period derives lustre from the admirable paintings of Barry, Blake, Hoppner, and Reynolds. Astronomy was cultivated by Dr. William Herschel, who in 1781 discovered the planet Uranus. Chemistry was improved by Dr. Joseph Black and Mr. Cavendish. The science of medicine was advanced by Dr. Cullen of Edinburgh; and natural history by Sir Joseph Banks. In literature, the chief place is due to Dr. Samuel Johnson, who had flourished also in the preceding reign. Oliver Goldsmith, Mark Akenside, and William Cowper, were the most eminent poets. History was written in a masterly manner by William Robertson and David Hume; Henry Home, David Hume, and Adam Smith, figure as philosophical writers; Sir William Blackstone wrote on English law; and among divines, the most eminent were Bishops Warburton, Jortin, and Hurd.

FRENCH REVOLUTION, AND CONSEQUENT WAR WITH FRANCE.

The country had for several years experienced the utmost prosperity and peace, when it was roused by a series of events which took place in France. The proceedings of the French nation for redressing the political grievances under which they had long laboured, commenced in 1789, and were at first very generally applauded in Britain, as likely to raise that nation to a rational degree of freedom. Ere long, the violence shown at the destruction of the Bastile, the abolition of hereditary privileges, the open disrespect for religion, and other symptoms of an extravagant spirit, manifested by the French, produced a considerable change in the sentiments of the British people. The proceedings of the French were still justified by the principal leaders of Opposition in Parliament, and by a large class of the community; but they inspired the government, and the propertied and privileged classes generally, with great alarm and distrust.

When at length the coalition of Austria and Prussia with the fugitive noblesse had excited the spirit of the French people to a species of frenzy, and led to the establishment of a republic and the death of the king, the British government and its supporters were effectually roused to a sense of the danger which hung over all ancient institutions, and a pretext was found (January, 1793) for declaring war against France. A comparatively small body of the people were opposed to this step, which was also loudly deprecated in Parliament by Messrs. Fox and Sheridan; but all these remonstrances were drowned in the general voice of the nation. At such a crisis, to speak of political reforms in England seemed the height of imprudence, as tending to encourage the French. All, therefore, who continued to make open demonstrations for that cause, were now branded as enemies to religion and civil order. In Scotland, Mr. Thomas Muir, a barrister, and Mr. Palmer, an Unitarian clergyman, were tried for sedition, and sentenced to various terms of banishment. Citizens named Skirving, Gerald, and Margarot, were treated in like manner by the Scottish criminal judges, for offences which could only be said to derive the character ascribed to them from the temporary and accidental circumstances of the nation. An attempt to inflict similar punishments upon the English reformers, was defeated by the acquittal of a shoemaker named Hardy; but the party was nevertheless subjected, with the apparent concurrence of a large and influential portion of the people, to many minor severities.

After alliances had been formed with the other powers hostile to France, the British ministers despatched an army to the Netherlands, under the command of the king's second son, the Duke of York, to co-operate in reducing the fortresses in possession of the French, while the town of Toulon, being inclined to remain under the authority of the royal family, put itself into the hands of a British naval commander. At first, the French seemed to fail somewhat in their defences; but on a more ardently republican party acceding to power under the direction of the famous Robespierre, the national energies were much increased, and the Duke of Brunswick experienced a series of disgraceful reverses. The Prussian government, having adopted new views of the condition of France, now began to withdraw its troops, on the pretext of being unable to pay them; and though Britain gave nearly a million and a quarter sterling to induce this power to remain nine months longer upon the field, its co-operation was of no further service, and was soon altogether lost. On the 1st of June, 1794, the French Brest fleet sustained a severe defeat from Lord Howe, with the loss of six ships; but the republican troops not only drove the combined armies out of the Netherlands, but, taking advantage of an unusually hard frost, invaded Holland by the ice which covered the Rhine, and reduced that country to a republic under their own control. The successes of the British were limited to the above naval victory, the temporary possession of Corsica and Toulon, the capture of several of the French colonies in the West Indies, and the spoliation of a great quantity of the commercial shipping of France; against which were to be reckoned the expulsion of an army from the Netherlands, the loss of 10,000 men and 60,000 stand of arms in an unsuccessful descent upon the west coast of France, some considerable losses of shipping,

and an increase of annual expenditure from about fourteen to nearly forty millions.

In the course of the year 1795, the lower portions of the community began to appear violently discontented with the progress of the war, and to renew their demands for reform in the state. As the king was passing (October 29) to open the session of Parliament, a stone was thrown into his coach, and the interference of the horse guards was required to protect his person from an infuriated mob. The ministers consequently obtained acts for more effectually repressing sedition, and for the dispersion of political meetings. They were at the same time compelled to make a show of yielding to the popular clamours for peace; and commenced a negotiation with the French Directory, which was broken off by the refusal of France to restore Belgium to Austria. In the ensuing year, so far from any advance being made towards the subjugation of France, the northern states of Italy were overrun by its armies, and formed into what was called the Cisalpine Republic. The celebrated Napoleon Bonaparte made his first conspicuous appearance as the leader of this expedition, which terminated in Austria submitting to a humiliating peace. At the close of 1796, a French fleet sailed for Ireland, with the design of revolutionizing that country, and detaching it from Britain; but its object was defeated by stress of weather. At this crisis, a new attempt was made to negotiate with the French Republic; but as the events of the year had been decidedly favourable to France, a renewed demand of the British for the surrender of Belgium was looked upon as a proof that they were not sincere in their proposals, and their agent was insultingly ordered to leave the French territory. To add to the distresses of Britain, while Austria was withdrawn from the number of her allies, Spain, by a declaration of war in 1797, increased in no inconsiderable degree the immense force with which she had to contend.

THREATENED INVASION—SUBSEQUENT EVENTS.

For some time an invasion of Britain had been threatened by France; and, sacred as the land had been for centuries from the touch of a foreign enemy, the successes of the republicans had hitherto so greatly exceeded all previous calculation, that the execution of their design did not appear improbable. Just as the interference of the neighbouring powers had, in 1792, roused the energies of the French, so did this proposed invasion stimulate the spirit of the British people. The clamours of reformers, and of those who were friendly to France, were now lost in an almost universal zeal for the defence of the country; and not only were volunteer corps everywhere formed, but the desire of prosecuting the war became nearly the ruling sentiment of the nation. The ministers, perceiving the advantage which was to be derived from the tendency of the national spirit, appeared seriously to dread an invasion, and thus produced an unexpected and very distressing result. The credit of the Bank of England was shaken; a *run* was made upon it for gold in exchange for its notes, which it could not meet. On the 25th of February, 1797, therefore, the bank was obliged, with the sanction of the privy-council, to suspend cash payments, that is, to refuse giving coin on demand for the paper money which had been issued. This step led to a great depreciation in the value of Bank of England notes, and a very serious derangement of the currency ensued for a number of years.

In April, a new alarm arose from the proceedings of the seamen on board the Channel fleet, who mutinied for an advance of pay, and the redress of some alleged grievances. A convention of delegates from the various ships met in Lord Howe's cabin, and drew up petitions to the House of Commons and the Board of Admiralty. Upon these being yielded to, order was restored; but the seamen on board the fleet at the Nore soon after broke out in a much more alarming revolt; and, on the refusal of their demands, moored their vessels across the Thames, threatening to cut off all communication between London and the open sea. The reduction of this mutiny appeared at one time as if it could only be effected by much bloodshed; but by the firmness of the government, and some skilful dealings with the seamen, a loyal party was formed, by whom the more turbulent men were secured, and the vessels restored to their officers. The ringleaders, the chief of whom was a young man named Richard Parker, were tried and executed.

The same year was remarkable for several victories gained by the British fleets. A Spanish fleet of twenty-seven ships was attacked by fifteen vessels under Admiral Jervis (February 14), off Cape St. Vincent, and completely beaten, with the loss of four large vessels. A fleet under Admiral Harvey, with a military force under Sir Ralph Abercromby, captured the island of Trinidad, a Spanish colony. In October, a Dutch fleet, under Admiral De Winter, was attacked off the village of Camperdown, upon their own coast, by Admiral Duncan, who, after a desperate battle, captured nine of the enemy's vessels. These naval successes compensated in some measure for the many land victories of the French, and served to sustain the spirit of the British nation under this unfortunate contest.

In 1798, the French overran and added to their dominions the ancient republic of Switzerland, which gave them a frontier contiguous to Austria, and enabled them eventually to act with increased readiness and force upon that country. In this year, the directors of the French republic, beginning to be afraid of the ambition of their general, Bonaparte, sent him at the head of an expedition to reduce and colonize Egypt, intending from that country to act against the British empire in the East Indies. The expedition was successful in its first object; but the fleet which had conveyed it was attacked in Aboukir Bay, by Admiral Nelson (August 1), and almost totally destroyed or captured. While so much of the strength of the French army was thus secluded in a distant country, the eastern powers of Europe thought they might safely recommence war with the republic. Austria, Naples and Russia formed a confederacy for this purpose; and Britain, to supply the necessary funds, submitted to the grievance of an income tax, amounting in general to ten per cent., in addition to all her previous burdens.

The new confederacy was so successful in 1799, as to redeem the greater part of Italy. A Russian army, under the famous Suwaroff, acted a prominent part in the campaign, but, in the end, attempting to expel the French from Switzerland, this large force was nearly cut to pieces in one of the defiles of that mountainous country. In August of the same year, Great Britain made a corresponding attempt to expel the French from Holland. Thirty-five thousand men, under the Duke of York, formed the military part of the expedition. The fleet was successful at the first in taking the Dutch ships; but the army, having landed under stress of weather at an unfavourable place for their operations, was obliged, after an abortive series of skirmishes, to make an agreement with the French, purchasing permission to go back to their country by the surrender of 8000 prisoners from England.

The reverses which France experienced in 1799 were generally attributed to the weakness of the Directory—a council of five, to which the executive had been intrusted. Bonaparte suddenly returned from his army in Egypt, and, by a skilful management of his popularity, overturned the Directory, and caused himself to be appointed the sole depositary of the executive power of the state, under the denomination of First Consul. He immediately wrote a letter to King George, making

overtures of peace, but was answered, by the British secretary, that no dependence could be placed by Great Britain on any treaty with France, unless her government were again consolidated under the Bourbons. Bonaparte, having much reason to wish for peace, made a reply to this note, vindicating France from the charge brought against her, of having commenced a system of aggression inconsistent with the in[illegible]ts of other states, and asserting her right to choos[illegible]wn government—a point, he said, that could not de[illegible]ay be contested by the minister of a crown which was held by no other tenure. But the British government was at this time too much elated by the expulsion of the French army from Italy, and the late changes in the executive, which, in their estimation, betokened weakness, to be immediately anxious for peace.

The events of 1800 were of a very different nature from what had been calculated upon in England. Sir Sidney Smith, who commanded the British forces in Syria, had made a treaty with the French army after it had been left by Bonaparte, whereby it was agreed that the French should abandon Egypt, and retire unmolested to their own country. The British government, in its present temper, refused to ratify this arrangement; and the consequence was a continuance of hostilities. The French overthrew a large Turkish army at Grand Cairo, and made themselves more effectually than ever the masters of the country, so that Britain was obliged to send an army next year, under Sir Ralph Abercromby, to accomplish, at an immense expense and a great waste of human life, what the French had formerly agreed to do. In Europe the presence of Bonaparte produced equally disastrous results. By one of his most dexterous movements, he eluded the Austrians, led an army over the Alps by the Great St. Bernard into the Milanese, and, having gained a decisive victory at Marengo (June 14), at once restored the greater part of Italy to French domination. Contemporaneously with Napoleon's movements, Moreau led another army directly into Germany, overthrew the Austrians in several battles, and advanced to within seventeen leagues of Vienna. These reverses obliged Austria next year to make a peace, by which France became mistress of all Europe west of the Rhine and south of the Adige.

REBELLION IN IRELAND—UNION WITH GREAT BRITAIN.

Although the government had been able, in 1783, to procure a dissolution of the volunteer corps, the bulk of the Irish people continued to express the most anxious desire for such a reform in their parliament as might render it a more just representation of the popular voice. Unable to yield to them on this point, Mr. Pitt endeavoured to appease them by extending their commercial privileges; but his wishes were frustrated, chiefly by the jealousy of the British merchants. A strong feeling of discontent, not only with the government, but with the British connection, was thus engendered in Ireland.

The commencement of the revolutionary proceedings in France excited the wildest hopes of the Irish. Towards the close of the year 1791, they formed an association, under the title of the United Irishmen, comprehending persons of all religions, and designed to obtain "a complete reform of the legislature, founded on the principles of civil, political, and religious liberty." The government from the first suspected this association of meditating an overturn of the state, and took strong measures for keeping it in check. Acts were passed for putting down its meetings, and the secretary, Mr. Hamilton Rowan, was tried, and sentenced to a fine and two years' imprisonment for what was termed a seditious libel. At the same time, some concessions to the popular spirit were deemed indispensable, and the Irish parliament accordingly passed acts enabling Catholics to intermarry with Protestants, to practise at the bar, and to educate their own children.

On discovering that a treasonable correspondence had been carried on with France by some leading persons in the society of United Irishmen, the government was so much alarmed as to send (1794) a Whig lord-lieutenant (Earl Fitzwilliam) to grant further concessions; but, ere any thing had been done, the ministers were persuaded by the Protestant party to return to their former policy. The patriotic party now despaired of effecting any improvement by peaceable means, and an extensive conspiracy was entered into for delivering up Ireland to the French republic. The scheme was managed by a directory of five persons, and though half a million of men were concerned in it, the most strict secrecy was preserved. In December, 1796, a portion of the fleet which had been fitted out by the French to cooperate with the Irish patriots, landed at Bantry Bay; but measures for a rising of the people not being yet ripe, it was obliged to return. Next year, the losses at Camperdown crippled the naval resources of France, and prevented a renewal of the expedition. Losing all hope of French assistance, the conspirators resolved to act without it; but their designs were betrayed by one Reynolds; and three other members of the directory, Emmet, Macnevin, and Bond, were seized. Notwithstanding the precautionary measures which the government was thus enabled to take, the Union persisted in the design of rising on a fixed day. Lord Edward Fitzgerald, another of its leaders, was then arrested, and, being wounded in a scuffle with his captors, soon after died in prison. On the 21st of May, 1798, Lord Castlereagh, secretary to the lord-lieutenant, disclosed the whole plan of insurrection, which had been fixed to commence on the 23d.

Though thus thwarted in their designs, and deprived of their best leaders, the conspirators appeared in arms in various parts of the country. Parties attacked Naas and Carlow, but were repulsed with loss. A large party, under a priest named Murphy, appeared in the county of Wexford, and took the city of that name. Slight insurrections about the same time broke out in the northern counties of Antrim and Down, but were easily suppressed. In Wexford alone did the insurgents appear in formidable strength. Under a priest named Roche, a large party of them met and defeated a portion of the government troops; but, on a second occasion, though they fought with resolution for four hours, they were compelled to retreat. Another defeat at New Ross exasperated them greatly, and some monstrous cruelties were consequently practised upon their prisoners. On the 20th of June, their whole force was collected upon Vinegar Hill, near Enniscorthy, where an army of 13,000 men, with a proportionate train of artillery, was brought against them by General Lake. They were completely overthrown and dispersed. From this time the rebellion languished, and in July it had so far ceased to be formidable, that an act of amnesty was passed in favour of all who had been engaged in it, except the leaders.

On the 22d of August, when the rebellion had been completely extinguished, 900 French, under General Humbert, were landed at Killala, in the opposite extremity of the country from that in which the insurgents had shown the greatest strength. Though too late to be of any decisive effect, they gave some trouble to the government. A much larger body of British troops, under General Lake, met them at Castlebar, but retreated in a panic. They then advanced to the centre of the country, while the lord-lieutenant confessed the formidable reputation which their countrymen had acquired, by concentrating an immensely disproportioned force against them. On the 8th of September, they

were met at Carrick-on-Shannon by this large army, to which they yielded themselves prisoners of war.

During the ensuing two years, the British ministers exerted themselves to bring about an incorporating union of Ireland with Great Britain; a measure to which the Irish were almost universally opposed, but which, by the use of bribes and a government patronage liberally employed amongst the members of the Irish legislature, was at length effected. From the 1st of January, 1801, the kingdom of Ireland formed an essential part of the empire, on which was now conferred the name of the United Kingdom of Great Britain and Ireland. The act of union secured to the Irish most of the commercial privileges which they had so long sought. Upon a comparison of the aggregate exports and imports of the two countries, Ireland was to raise two parts of revenue for every fifteen raised by Great Britain, during the first twenty years of the union, after which new regulations were to be made by Parliament. One hundred commoners were to be sent by Ireland to the British (now called the Imperial) Parliament, namely, two for each county, two for each of the cities of Dublin and Cork, one for the university, and one for each of the thirty-one most considerable towns. Four lords spiritual, by rotation of sessions, and twenty-eight lords temporal, elected for life by the Peers of Ireland, were to sit in the House of Lords.

The Union, though upon the whole effected in a spirit of fairness towards Ireland, increased the discontent of the people, which broke out in 1803 in a new insurrection. Under Robert Emmett and Thomas Russell, a conspiracy was formed for seizing the seat of the vice-government, and for this purpose a great multitude of peasantry from the county of Kildare assembled (July 23) in Dublin. Disappointed in their attempt upon the castle, they could only raise a tumult in the streets, in the course of which Lord Kilwarden, a judge, and his nephew, Mr. Wolfe, were dragged from a carriage and killed. The mob was dispersed by soldiery, and Emmett and Russell, being seized, were tried and executed.

CHANGE OF MINISTRY, AND PEACE OF AMIENS, 1801.

At the commencement of 1801, Britain had not only to lament this unexpected turn of fortune, but to reckon among her enemies the whole of the northern states of Europe, which had found it necessary to place themselves on a friendly footing with Bonaparte, and, though they did not declare war against Britain, yet acted in such a manner as to render hostilities unavoidable. Nelson sailed in March, with a large fleet, for Copenhagen, and proved so successful against the Danish fleet, as to reduce that country to a state of neutrality. The death of the Russian Emperor Paul, which took place at the same time, and the accession of Alexander, who was friendly to Britain, completely broke up the northern confederacy. Yet the great achievements of France on the continent, joined to the distresses of a famine which at this time bore hard on the British people, produced a desire for that peace which, a year before, might have been gained upon better terms. With a view, apparently, to save the honour of Mr. Pitt and his friends, a new ministry was appointed under Mr. Addington, by whom a peace was at length, in the end of the year (1801), concluded with France, which was left in the state of aggrandizement which has just been described.

The war of the French Revolution placed Great Britain in possession of a considerable number of islands and colonies in the East and West Indies and elsewhere; and while only two war ships had been lost on her part, she had taken or destroyed 80 sail of the line, 181 frigates, and 224 smaller ships belonging to the enemy, together with 743 privateers, 15 Dutch, and 76 Spanish ships. The triumphs of the British fleets were indeed numerous and splendid, and had the effect of keeping the national commerce almost inviolate during the whole of the war, while that of France was nearly destroyed. There was, however, hardly the most trifling instance of success by land; and the expenses of the contest had been enormous. Previously to 1793, the supplies usually voted by the House of Commons were £14,000,000; but those for 1801 were £42,197,000, being double the amount of the whole land-rent of the country.

WAR RENEWED WITH FRANCE, 1803.—SUBSEQUENT EVENTS.

It was only one of the results of the war against French independence, that France was led by the course of events to place herself under the control of her chief military genius, Napoleon Bonaparte; a man singularly qualified for concentrating and directing the energies of a country in the existing condition of France, but animated more by personal ambition than by any extended views of the good of his species. It was soon manifest that Bonaparte did not relish peace. By taking undue advantage of several points left loose in the treaty, he provoked Great Britain to retaliate by retaining possession of Malta; and the war was accordingly recommenced in May, 1803. Britain immediately employed her superior naval force to seize the French West India colonies; while France took possession of Hanover, and excluded British commerce from Hamburgh. Bonaparte collected an immense flotilla at Boulogne, for the avowed purpose of invading England; but so vigorous were the preparations made by the whole British population, and so formidable the fleet under Lord Nelson, that he never found it possible to put his design in execution. In the year 1804, he was elevated to the dignity of Emperor of the French; and France once more exhibited the formalities of a court, though not of the kind which the European sovereigns wished to see established. In April of the same year, the Addington administration was exchanged for one constructed by Mr. Pitt, and of which he formed the chief.

In 1805, under the fostering influence of Great Britain, a new coalition of European powers, consisting of Russia, Sweden, Austria, and Naples, was formed against Napoleon. He, on the other hand, had drawn Spain upon his side, and was making great exertions for contesting with Britain the empire of the sea. A fleet of thirty-three sail, partly French and partly Spanish, met a British fleet of twenty-seven, under Nelson, off Cape Trafalgar, October 25, 1805, and was completely beaten, though at the expense of the life of the British commander. Britain thus fixed permanently her dominion over the seas and coasts of the civilized world. At this time, however, Napoleon was asserting with equal success his supremacy over continental Europe. By a sudden, rapid, and unexpected movement, he conducted an army into Germany, where the Austrians were already making aggressions upon neutral territory. On the 17th October, he took the fortress of Ulm, with its artillery, magazines, and garrison of 30,000 men; a month after, he entered Vienna without resistance. He then pursued the royal family, and the allied armies of Russia and Austria, into Moravia; and, on the 2d of December, he gained the decisive victory of Austerlitz, which put an end to the coalition, and rendered him the dictator of the continent.

This series of events caused much gloom in the British councils, and with several other painful circumstances, among which was the impeachment of his colleague Lord Melville, for malpractices in the Admiralty, proved a death-blow to Mr. Pitt, who expired on the 23d of January, 1806, completely worn out with state business, at the early age of forty-seven, half of which time he had spent in the public service. Mr. Pitt is universally allowed the praise of high talent and patriotism. But his policy has been a subject of dispute between the

two great parties into which British society is divided. By the Tories it is firmly believed, that his entering into the war against the French republic was the means of saving the country from anarchy and ruin; by the Whigs, that this step only tended to postpone the settlement of the affairs of France, and loaded Britain with an enormous debt. Of the absence of all selfish views in Mr. Pitt, there can be no doubt; for, so far from accumulating a fortune out of the public funds, he left some debts, which Parliament gratefully paid.

Mr. Pitt's ministry was succeeded by one composed of Lord Grenville, Mr. Fox, and their friends; it was comprehensively called Whig, although Lord Grenville was in every respect a Tory, except in his advocacy of the claims of the Catholics for emancipation. In the course of 1806, the new cabinet made an attempt to obtain a peace from France, which now threatened to bring the whole world to its feet. But the Grenville administration encountered serious difficulties from the king, who never could be induced to look with the least favour on the Catholic claims, or those who advocated them. Exhausted by his useless labours, Mr. Fox died, September 13, 1806. Few names are more endeared to the British people than his, for, though the leader of the Whigs, he never excited any rancour in his opponents. He was remarkable for his frankness and simplicity. His abilities as a parliamentary orator and statesman were of the first order, and he was invariably the consistent and sincere friend of popular rights.

A new coalition, excluding Austria, but involving Prussia, had been subsidized by Britain, and was now preparing to act. With his usual decision, Napoleon led what he called his "Grand Army" by forced marches into Prussia; gained, on the 14th of October, the battles of Jena and Averstadt, which at once deprived that country of her army, her capital, and her fortresses; and then proclaimed the famous "Berlin Decree," by which he declared Great Britain in a state of blockade, and shut the ports of Europe against her merchandise. The King of Prussia, Frederick William III., took refuge with his court in Russia, which now was the only continental power of any importance that remained unsubdued by France.

Towards that country Napoleon soon bent his steps, taking, as he went, assistance from Poland, which he promised to restore to independence. After a series of skirmishes and battles of lesser importance, he met the Russian army in great strength (June 14, 1807), at Friedland, and gave it a total overthrow. He might now have easily reduced the whole country, as he had done Austria and Prussia; but he contented himself with forming a treaty (called the treaty of Tilsit, from the place where it was entered into), by which Russia agreed to become an ally of France, and entered into his views for the embarrassment of Britain by the exclusion of her commerce from the continental ports. France had thus, in the course of a few years, disarmed the whole of Europe, excepting Great Britain, an amount of military triumph for which there was no precedent in ancient or modern history.

The Grenville administration was displaced in spring 1807, in consequence of the difference between its members and the king on the subject of the Catholic claims, which had long been urged by the Whig party, with little support from the people. The next ministry was headed by the Duke of Portland, and included Lords Hawkesbury and Castlereagh (afterwards Earl of Liverpool and Marquis of Londonderry), and Mr. Canning, as secretaries; Mr. Spencer Perceval being chancellor of the exchequer. After being accustomed to the services of such men as Pitt and Fox, the people regarded this cabinet as one possessing comparatively little ability. One of its first acts was the despatch of a naval armament to Copenhagen, to seize and bring away the Danish shipping, which was expected to be immediately employed in subserviency to the designs of France, and for the injury of Britain. The end of the expedient was easily gained but it was the means of lowering the honour of Britain in the eyes of foreign states.

FIRST PENINSULAR CAMPAIGN.—SUBSEQUENT EVENTS.

The retaliation of France, for the interferences of other powers with its revolution, even supposing such retaliation justifiable, was now more than completed. Further measures could only appear as dictated by a desire of aggrandizement. But France was now given up to the direction of a military genius, who had other ends to serve than the defence of the country against foreign aggression or interference. The amazing successes of Napoleon had inspired him with the idea of universal empire; and so great was the influence he had acquired over the French, and so high their military spirit, that the attainment of his object seemed by no means impossible. There was a difference, however, between the opposition which he met with before this period, and that which he subsequently encountered. In the earlier periods of the war, the military operations of the European powers were chiefly dictated by views concerning the interests of governments, and in which the people at large felt little sympathy. Henceforth a more patriotic spirit rose everywhere against Napoleon: he was looked upon in England and elsewhere as the common enemy of humanity and of freedom; and every exertion made for the humiliation of France was animated by a sentiment of desperation, in which the governors and governed alike participated.

The Spanish peninsula was the first part of the prostrated continent where the people could be said to have taken a decidedly hostile part against Napoleon. He had there gone so far as to dethrone the reigning family, and give the crown to his elder brother Joseph. A sense of wrong and insult, mingled with religious fanaticism, raised the Spanish people in revolt against the French troops: and though their conduct was everywhere barbarous in the extreme, it was hailed in Britain as capable of being turned to account. In terms of a treaty entered into with a provisional government in Spain, a small army was landed, August 8, 1808, in Portugal, which had been recently taken possession of by the French. Sir Arthur Wellesley, who afterwards became so famous as Duke of Wellington, was the leader of this force. In an engagement at Vimeira, on the 21st, he repulsed the French, under Junot, who soon after agreed, by what was called the Convention of Cintra, to evacuate the country. Sir Arthur being recalled, the British army was led into Spain under the command of Sir John Moore; but this officer found the reinforcements poured in by Napoleon too great to be withstood, and accordingly, in the end of December, he commenced a disastrous though well-conducted retreat towards the port of Corunna, whither he was closely pursued by Marshal Soult. The British army suffered, on this occasion, the severest hardships and losses, but did not experience a check in battle, or lose a single standard. In a battle which took place at Corunna, January 16, 1809, for the purpose of protecting the embarkation of the troops, Sir John Moore was killed.

Much of the public attention was about this time engrossed by circumstances in the private life of the eldest son of the king. The Prince of Wales had been tempted, in 1796, by the prospect of having his large debts paid by the nation, to marry the Princess Caroline of Brunswick, for whom he entertained no affection. Almost ever since the marriage, he had shown the most marked disrespect for his consort, who, consequently, lived separate from him, and was herself considered by many as deficient in her conduct as a matron.

In 1809, Austria was induced once more to commence

war with France. Upwards of half a million of men were brought into the field, under the command of the Archduke Charles. Bonaparte, leaving Spain comparatively open to attack, moved rapidly forward into Germany, and, by the victory of Echmuhl, opened up the way to Vienna, which surrendered to him. After gaining a slight advantage at Essling, the archduke came to a second decisive encounter at Wagram, where the strength of Austria was completely broken to pieces. The peace which succeeded was sealed by the marriage of Napoleon to Maria Louisa, daughter of the Emperor of Austria, for which purpose he divorced his former wife Josephine.

In the autumn of 1809, the British government despatched an armament of 100,000 men, for the purpose of securing a station which should command the navigation of the Scheldt. The expedition was placed under the command of the Earl of Chatham, elder brother of Mr. Pitt, a nobleman totally unacquainted with military affairs on such a scale. The army, having disembarked on the insalubrious island of Walcheren, was swept off in thousands by disease. The survivors returned in December without having done any thing towards the object for which they set out. This tragical affair became the subject of inquiry in the House of Commons, which by a majority of 272 against 232, vindicated the manner in which the expedition had been managed.

SUCCESSES OF WELLINGTON IN SPAIN.

A new expedition in Spain was attended with better success. Taking advantage of the absence of Napoleon in Austria, a considerable army was landed, April 23, 1809, under the command of Sir Arthur Wellesley, who immediately drove Soult out of Portugal, and then made a rapid move upon Madrid. King Joseph advanced with a considerable force under the command of Marshal Victor; and, on the 28th of July, attacked the British and Spanish troops in a strong position at Talavera. The contest was obstinate and sanguinary; and though the French did not retreat, the advantage lay with the British. As this was almost the first success which Britain experienced by land in the course of the war, Sir Arthur Wellesley became the theme of universal praise, and he was elevated to a peerage, under the title of Viscount Wellington of Talavera. He was obliged immediately to fall back upon Portugal, where he occupied a strong position near Santarem.

Early in 1810, Napoleon reinforced the army in Spain, and gave orders to Massena to "drive the British out of the peninsula." Wellington posted his troops on the heights of Busaco—eighty thousand in number, including Portuguese—and there, on the 27th of September, was attacked by an equal number of French. Both British and Portuguese behaved well: the French were repulsed with great loss, and, for the first time in the war, conceived a respectful notion of the British troops. Wellington now retired to the lines of Torres Vedras, causing the whole country to be desolated as he went, for the purpose of embarrassing the French. When Massena observed the strength of the British position, he hesitated; and finally, in the spring of 1811, performed a disastrous and harassed retreat into Spain

It now became an object of importance with Wellington to obtain possession of the Spanish fortresses which had been seized by the French. On the 22d of April, he reconnoitered Badajos, and soon after laid siege to Almeida. Massena, advancing to raise the siege, was met on fair terms at Fuentes d'Onoro, May 5, and repulsed. Almeida consequently fell into the hands of the British. General Beresford, at the head of another body of British forces, gained the bloody battle of Albuera over Soult, and thereby protected the siege of Badajos, which, however, was soon after abandoned. During the same season, General Graham, in command of a third body of troops, gained the battle of Barossa. At the end of a campaign, in which the French were upon the whole unsuccessful, Wellington retired once more into Portugal.

SIR F. BURDETT.—THE REGENCY.

The exclusion of strangers from the House of Commons during the inquiries into the Walcheren expedition, had been made a subject of discussion in a debating club, the president of which was therefore committed to Newgate for a breach of privilege. Sir Francis Burdett, member for Westminster, made this proceeding the subject of some acrimonious remarks in a letter to his constituents, denying the right of the House of Commons to imprison without trial, and describing that body as "a part of our fellow-subjects, collected together by means which it is not necessary for me to describe." The letter was voted a libel on the house, and a warrant was issued by the speaker for committing Sir Francis to the Tower. Sir Francis, denying the legality of the warrant, resisted its execution by remaining in his own house, where he was protected from the officers by immense crowds of people. After suffering a kind of siege for two days, he was forcibly taken by a large train of soldiers, and lodged in the Tower. By these proceedings, the capital was convulsed for several days; and in the course of the tumults which took place, a number of lives were lost.

The intellect of the king, which had experienced several temporary aberrations, gave way at the close of the year 1810, and rendered the appointment of a regent unavoidable. Accordingly, in December, the Parliament imposed that duty upon the Prince of Wales, though under certain restrictions as to the appointment of officers and other branches of the royal prerogative. The Tory party had not now the same reason to dread the accession of the prince which they had in 1789. His sentiments on the Catholic claims, originally favourable, had in 1804 experienced a decided change, which proved the means of alienating him from the Whigs, with whom Catholic emancipation was a leading principle. Though he did not at first show any disinclination to take his old friends into the ministry, he contrived, when the first year of restriction had elapsed, to let them remain in their wonted state of opposition without seeming to have desired it.

EVENTS OF 1811, 1812, AND 1813.

The year 1811 was regarded as the period of greatest depression and distress which the British empire had known for several ages. At this time, with the exception of an uncertain footing gained in Spain, the influence of England was unknown on the continent. Bonaparte seemed as firmly seated on the throne of France as any of her former monarchs, while every other civilized European kingdom either owned a monarch of his express appointment, or was in some other way subservient to him. By the Berlin and Milan decrees, he had shut the ports of the continent against British goods, so that they could only be smuggled into the usual markets. By British orders in council, which, though intended to be retaliatory, only increased the evil, no vessel belonging to a neutral power—such, for instance, as the United States—was permitted to carry goods to those ports, unless they should previously land and pay a duty in Britain. Thus the nation at once suffered from the short-sighted despotism of the French emperor, and from its own narrow and imperfect views of commerce; for, by embarrassing America, it only deprived itself of one of its best and almost sole remaining customers.

The power of Bonaparte, though sudden in its rise, might have been permanent, if managed with discretion. It was used, however, in such a way as to produce a powerful reaction throughout Europe in favour of those

ancient institutions, which, twenty years before, had been threatened with ruin. The exclusion of British goods—a measure which he had dictated in resentment against England—proved the source of great distress, oppression, and hardship throughout the continent, and was greatly instrumental in exciting a spirit of hostility against him. The very circumstance of a foreign power domineering over their native princes, raised a feeling in favour of those personages, which being identified with the cause of national independence, acted as a very powerful stimulant. On the other hand, a sense of the grasping ambition of Napoleon—of his hostility to real freedom—of his unscrupulousness in throwing away the lives of his subjects for his own personal aggrandizement—had for some time been gaining ground in France itself.

In 1812, when the transactions in Spain had already somewhat impaired Napoleon's reputation, Alexander, Emperor of Russia, ventured upon a defiance of his decrees against British merchandise, and provoked him to a renewal of the war. With upwards of half a million of troops, appointed in the best manner, he set out for that remote country, determined to reduce it into perfect subjection. An unexpected accident defeated all his plans. The city of Moscow, after being possessed by the French troops in September, was destroyed by incendiaries, so that no shelter remained for them during the ensuing winter. Napoleon was obliged to retreat; but, overtaken by the direst inclemency of the season, his men perished by thousands in the snow. Of his splendid army, a mere skeleton regained central Europe. Returning almost alone to Paris, he contrived with great exertions to reinforce his army, though there was no replacing the veterans lost in Russia.

Early in 1813, he opened a campaign in northern Germany, where the Emperor of Russia, now joined by the King of Prussia, and various minor powers, appeared in the open field against him. After various successes on both sides, an armistice was agreed to on the 1st of June, and Bonaparte was offered peace on condition of restoring only that part of his dominions which he had acquired since 1805. Inspired with an overweening confidence in his resources and military genius, he refused these terms, and lost all. In August, when the armistice was at an end, his father-in-law, the Emperor of Austria, joined the allies, whose forces now numbered 500,000 men, while an army of 300,000 was the largest which Napoleon could at present bring into the field. Henceforth he might be considered as overpowered by numbers. By steady though cautious movements, the allies advanced to France, driving him reluctantly before them, and increasing their own force as the various states became emancipated by their presence. At the close of 1813, they rested upon the frontiers of France, while Lord Wellington, after two successful campaigns in Spain, had advanced in like manner to the Pyrenees.

HOME AFFAIRS.—WAR WITH AMERICA.

Some changes had in the mean time taken place in the British administration. On the 11th of May, 1812, the premier, Mr. Perceval, was shot in the lobby of the House of Commons, by a man named Bellingham, whom some private losses had rendered insane. Lords Liverpool and Castlereagh then became the ministerial leaders in the two Houses of Parliament, but were quickly voted down by a majority of four, upon a motion made by Mr. Stuart Wortley, afterwards Lord Wharncliffe. The ministry was finally rendered satisfactory to Parliament by the admission of Earl Harrowby as president of the council. Mr. Vansittart as chancellor of the exchequer, and Lord Sidmouth (formerly premier while Mr. Addington) as secretary for the home department; Lord Liverpool continuing as premier, and Lord Castlereagh as foreign and war secretary.

Notwithstanding the successes which were at this period brightening the prospects of Britain, the regent and his ministers did not enjoy much popularity. The regent himself did not possess those domestic virtues which are esteemed by the British people, and he had excited much disapprobation by the steps which he took for fixing a criminal charge upon his consort. The general discontents were increased by the effects of the orders in council, for prohibiting the commerce of neutral states. Vast multitudes of working people were thrown idle by the stagnation of manufactures, and manifested their feelings in commotion and riot. The middle classes expressed their dissatisfaction by clamours for Parliamentary reform.

At this unhappy crisis, provoked by the orders in council, as well as by a right assumed by British warvessels to search for and impress English sailors on board the commercial shipping of the United States, that country (June 1812) declared war against Britain. Before the news had reached London, the orders had been revoked by the influence of Lord Liverpool; but the Americans, nevertheless, were too much incensed to retrace their steps. During the summer and autumn, several encounters took place between single American and British ships, in which the former were successful. It was not till June 1, 1813, when the Shannon and Chesapeake met on equal terms, that the British experienced any naval triumph in this war with a kindred people. On land, the Americans endeavoured to annoy the British by assaults upon Canada, but met with no decisive success. The British landed several expeditions on the coast of the States; and were successful at Washington, at Alexandria, and at one or two other points, but experienced a bloody and disastrous repulse at New Orleans. The war ended, December, 1814, without settling any of the principles for which the Americans had taken up arms. But, while thus simply useless to America, it was seriously calamitous to Britain. The commerce with the States, which amounted in 1807 to twelve millions, was interrupted and nearly ruined by the orders in council, and the hostilities which they occasioned: and henceforth America endeavoured to render herself commercially independent of Britain, by the encouragement of native manufactures—a policy not immediately advantageous, perhaps, to herself, but decidedly injurious to Great Britain. The fatal effects of the Berlin and Milan decrees to Napoleon, and of the orders in council to the interests of Britain, show how extremely dangerous it is for any government to interfere violently with the large commercial systems upon which the immediate interests of their subjects depend.

PEACE OF 1814.—SUBSEQUENT EVENTS.

At the close of 1813, it was evident that Bonaparte could hardly defend himself against the vast armaments collected on all hands against him. Early in 1814, having impressed almost every youth capable of bearing arms, he opposed the allies on the frontiers with a force much less numerous and worse disciplined. Even now he was offered peace, on condition that he should only retain France as it existed before the Revolution. But this proposition was too humiliating to his spirit to be accepted; and he entertained a hope that, at the worst, his father-in-law, the Emperor of Austria, would not permit him to be dethroned. Two months were spent in almost incessant conflict with the advancing allies, who, on the 30th of March, entered Paris in triumph; and in the course of a few days, ratified a treaty with Napoleon, by which he agreed to resign the government of France, and live for the future as only sovereign of Elba, a small island in the Mediterranean.

In the measures for settling France, Great Britain concurred by her representative Lord Castlereagh, who attended the allies during the campaign of 1814; and

peace was proclaimed in London on the 20th of June. France was deprived of all the acquisitions gained both under the republic and the empire, and restored to the rule of the ancient royal family in the person of Louis XVIII. The Emperor of Russia and the King of Prussia visited England in June, and were received with all the honours due to men who were considered as the liberators of Europe. Wellington, now created a duke, received a grant of £400,000 from the House of Commons, in addition to one of £100,000 previously voted; and had the honour to receive in person the thanks of the house for his services. Representatives from the European powers concerned in the war met at Vienna, October 2, in order to settle the disturbed limits of the various countries, and provide against a renewal of a period of war so disastrous. Throughout the whole arrangements, Great Britain acted with a disinterested magnanimity, which, after her great sufferings and expenses, could hardly have been looked for, but was highly worthy of the eminent name which she bore amidst European nations.

In March, 1815, the proceedings of the congress were interrupted by intelligence that Napoleon had landed in France, and was advancing in triumph to the capital. He had been encouraged by various favourable circumstances to attempt the recovery of his throne; and so unpopular had the new government already become, that, though he landed with only a few men, he was everywhere received with affection, and on the 20th of March, was reinstated in his capital, which had that morning been left by Louis XVIII. The latter sovereign had granted a charter to his people, by which he and his successors were bound to rule under certain restrictions, and with a legislature composed of two chambers, somewhat resembling the British Houses of Parliament. Bonaparte now came under similar engagements, and even submitted to take the votes of the nation for his restoration, on which occasion he had a million and a half of affirmative, against less than half a million of negative voices, the voting being performed by ballot. His exertions to reorganize an army were successful to a degree which showed his extraordinary influence over the French nation. On the 1st of June, he had 559,000 effective men under arms, of whom 217,000 were ready to take the field.

A Prussian army of more than 100,000 men, under Blucher, and one of about 80,000 British, Germans, and Belgians, under Wellington, were quickly rendezvoused in the Netherlands, while still larger armies of Austrians and Russians, making the whole force above a million, were rapidly approaching. These professed to make war, not on France, but against Bonaparte alone, whom they denounced as having, by his breach of the treaty, "placed himself out of the pale of civil and social relations, and incurred the penalty of summary execution." Napoleon, knowing that his enemies would accumulate faster in proportion than his own troops, crossed the frontier on the 14th June, with 120,000 men, resolved to fight Blucher and Wellington separately, if possible. The rapidity of his movements prevented that concert between the Prussian and English generals which it was their interest to establish. On the 16th, he beat Blucher at Ligny, and compelled him to retire. He had, at the same time, intrusted to Marshal Ney the duty of cutting off all connection between the two hostile armies. His policy, though not fully acted up to by his marshals, were so far successful, that Blucher retired upon a point nearly a day's march from Wellington.

After some further fighting next day, Napoleon brought his whole force to bear, on the 18th, against Wellington alone, who had drawn up his troops across the road to Brussels, near a place called Waterloo. The battle consisted of a constant succession of attacks by the French upon the British lines. These assaults were attended with great bloodshed, but nevertheless resisted with the utmost fortitude, till the evening, when Blucher came up on the left flank of the British, and turned the scale against the French, who had now to operate laterally, as well as in front. The failure of a final charge by Napoleon's reserve to produce any impression on the two armies, decided the day against him: his baffled and broken host retired before a furious charge of Prussian cavalry, who cut them down unmercifully. On his return to Paris, Napoleon made an effort to restore the confidence of his chief counsellors, but in vain. After a fruitless abdication in favour of his son, he retired on board a small vessel at Rochfort, with the intention of proceeding to America; but being captured by a British ship of war, he was condemned by his triumphant enemies to a perpetual confinement on the island of St. Helena, in the Atlantic, where he died in 1821.

Louis XVIII. was now restored, and the arrangements of the Congress of Vienna were completed. The expenses of Great Britain during this last year of hostilities exceeded seventy millions; and the national debt, which in 1793 had been £230,000,000, now amounted to £860,000,000.

During the latter years of Napoleon, a reaction had taken place throughout Europe against the innovatory doctrines, which, by producing the French Revolution, had been the cause, innocent or guilty, of so much ruinous warfare. Encouraged by this sentiment, the sovereigns of Austria, Prussia, and Russia, had no sooner settled the new government of France, than they entered, September 26, 1815, into a personal league or bond for assisting each other on all occasions when any commotion should take place among their respective subjects. This treaty was composed in somewhat obscure terms, and from its professing religion to be the sole proper guide "in the councels of princes, in consolidating human institutions, and remedying their imperfections," it obtained the name of the Holy Alliance. It was published at the end of the year, and communicated to the Prince Regent of England, who approved of, but did not accede to it.

The reaction had also its effect in Great Britain, in fixing the power of the aristocracy, which, by composing the whole of the Upper House, and influencing the election of a major part of the Lower, might be said to constitute the government. The security of this predominating power was indicated by several acts in which their peculiar interests were consulted. In the preceding year, an act had been passed for prohibiting the importation of grain from the continent, when the price in this country should be less than eighty shillings per quarter. An attempt to continue the income and property taxes, which pressed with the greatest severity on the wealthy and landed classes, was also negatived.

THE PRINCESS CHARLOTTE.—POPULAR TUMULTS.

In May, 1816, the Princess Charlotte, only child of the Prince Regent, was married to Prince Leopold of Saxe-Coburg, a young officer who had gained her affections when attending the allied sovereigns at the British court. In November, 1817, to the inexpressible grief of the whole nation, the young princess died, immediately after having given birth to a dead son.

In August, 1816, a British armament under Lord Exmouth bombarded Algiers, and reduced that piratical state to certain desirable conditions respecting the treatment of Christian prisoners.

The year 1816, and the four following years, will always be memorable as an epoch of extraordinary distress, affecting almost every class of the community. The liberation of European commerce at the end of the war, produced a proportionate diminution of that trade which England had previously enjoyed through her exclusive possession of the seas. While all public bur

tene continued at their former nominal amount, the prices of every kind of produce, and of every kind of goods, had fallen far below the unnatural level to which a state of [illegible] and of paper money had raised them; and hence the expenses of the late contest, which had never been felt in the fictitious prosperity then prevalent, came to press with great severity upon the national resources, at a time when there was much less ability to bear the burden. To complete the misery of the country, the crop of 1816 fell far short of the usual quantity, and the price of bread was increased to an amount more than double what has since been the average rate.

Tumultuary proceedings took place in various parts of the country; and a desire for a reform in the House of Commons, which was supposed to be the only means of reducing the public expenditure, began to take deep root among the lower orders, and produced tumultuary excesses in the metropolis. The government then adopted expedients for counteracting the force of the popular spirit. They endeavoured to make it appear that an extensive conspiracy had been formed for the overthrow of the government. Of the four rioters charged with high treason, a conviction was obtained only against one. Such unanimity, however, prevailed between the ministry and the Parliament, that, at the close of February (1817), an act was passed for the suspension of the Habeas Corpus Act. Many persons were imprisoned and detained for some time at the will of the ministers.

A temporary revival of prosperity occurred in 1818, but was quickly followed by renewed distress. In the autumn of 1819, the misery of the working classes had reached its greatest height, and still parliamentary reform was demanded as the only measure which could permanently improve their prospects. On the 12th of July, at a public meeting in the unrepresented town of Birmingham, an attorney was elected to proceed to Westminster, and openly claim to be received as a member of Parliament. On the 16th of August, a vast body of operatives assembled at Manchester, in an open space of ground called St. Peter's Field, for a similar purpose, though professedly to petition for parliamentary reform. As they came in regular array, bearing banners with inscriptions, the magistrates professed to consider the meeting as dangerous to the public peace, and accordingly, ere the proceedings were far advanced, a body of troops, consisting chiefly of yeomanry, dashed into the mass, trampling down many persons of both sexes under the horses' feet, and killing and wounding others with their sabres. The meeting was dispersed by these means, and Messrs. Hunt and Johnston, the principal orators, were apprehended. The tragic nature of this event, and its appearing as an invasion of the popular right of meeting for redress of grievances, produced some marks of public resentment; but the magistrates who conducted the attack received the immediate and cordial thanks of the government.

When Parliament reassembled in November, there was an evident increase of attachment to the ministry; and in addition to the strong measures already taken for suppressing popular discontent, acts were passed to suppress unstamped political publications, to prevent secret training to arms, and to restrict the right of calling a public meeting to magistrates.

The year 1819 was remarkable, among other things, for the provision made, by act of Parliament, for the resumption of cash payments at the bank.

On the 20th of January, 1820, George III. died at Windsor, in his eighty-second year, without having experienced any lucid interval since 1810. The Prince Regent was immediately proclaimed as GEORGE IV.; but there was no other change to mark the commencement of a new reign. A few days after the decease of George III, the Duke of Kent, his fourth son, died suddenly, leaving an infant daughter, Victoria, with a very near prospect to the throne.

MISCELLANEOUS CIRCUMSTANCES FROM 1790 TO 1820.

Owing to the superiority of Britain at sea, she was able to preserve her commerce during the war, while that of France was comparatively ruined. This circumstance, combined with the remarkable effects of machinery in various manufactures, and the great improvements effected in agriculture, maintained the prosperity of the country during a contest which otherwise must have sunk her as low as it did Austria and Prussia. The value of the exports, which had been fifteen millions in 1760, and had only advanced to twenty in 1790, was, in 1802, *forty-six millions*.

This period is above all things memorable for the introduction of the use of steam in navigation. A model vessel, with a small steam-engine on board, was tried in 1788 by Mr. Patrick Miller of Dalswinton in Dumfriesshire. Soon after, a vessel on a larger scale was exhibited in perfect action on the Forth and Clyde Canal. The idea fell asleep for a few years, but was revived by Mr. Fulton, an American, who, in 1807, set agoing a steam-vessel on the Hudson river, the first in the world which was regularly employed in conveying passengers. In 1812, Mr. Henry Bell, of Helensburg, launched a similar vessel on the Clyde, being the first seen in Europe; and from that period steam-vessels quickly became numerous. Their superiority, in propelling vessels without regard to wind or tide, was in time universally acknowledged; and ultimately they have been used in voyages across large oceans.

In this period, considerable efforts were made for the more general education of the people. Sunday-schools, first suggested by Mr. Raikes of Gloucester, overspread the whole country, and proved the means of instructing many children who otherwise would have remained altogether ignorant. A plan of teaching great numbers of children, by employing the best pupils as monitors or assistants, was originated by Dr. Bell and Mr. Joseph Lancaster, and widely introduced. Two great societies were formed for the purpose of setting up and supporting schools in the districts where they were most needed. This period also beheld the rise of various societies, whose object it was to send missionaries to convert the heathen in distant lands, and to disseminate Bibles both at home and abroad. Great efforts were at the same time made in Britain to put an end to slavery in the West India colonies.

The latter part of the reign of George III. was also distinguished by great improvements in the dress and social condition of the people. Old fashions gradually disappeared, and the more simple and agreeable costume of the present day came into use. In the year 1750, cocked hats, wigs, swords, and buckles, were generally worn, and all gentlemen used hair powder. From the year 1790 to about 1800, these and many other oddities completely disappeared. Speedy travelling by stage-coaches, and the rapid transmission of letters by mail-carriages, became at the same time general in all parts of the United Kingdom.

At no period did a more brilliant class of literary men exist. Poetry assumed new and attractive forms in the works of Campbell, Moore, Southey, Wordsworth, Byron, and Scott. The novel or fictitious tale was advanced to a dignity it had never known before, in consequence of the production, by Sir Walter Scott, of a series of such compositions, in the highest degree dramatic and entertaining. In the Edinburgh and Quarterly Reviews, periodical criticism acquired an importance it never before possessed. At the same time, the more grave walks of divinity, history, and travels, were filled by a respectable body of writers. The name of Sir Humphry Davy stands pre-eminent in science, which has also cultivated

with distinguished success by Wollaston, Leslie, Playfair, and Robison. In philosophical literature, the names of Dugald Stewart and Thomas Brown ask for peculiar respect.

REIGN OF GEORGE IV.

At the time when George IV. commenced his reign, the Manchester affair and the recent proceedings of the ministry, had inspired a small band of desperate men with the design of assassinating the ministers at a cabinet dinner, and thereafter attempting to set themselves up as a provisional government. On the 23d of February, 1820, they were surprised by the police in their place of meeting, and, after a desperate resistance, five were seized, among whom one Thistlewood was the chief. These wretched men were tried for high treason, and executed. Nearly about the same time, an attempt was made by the workmen in the west of Scotland to bring about some alteration in the state; and two men were executed.

On the accession of the king, his consort's name had been omitted from the liturgy. This and other indignities induced her to return from a voluntary exile in Italy, June, 1820, to the great embarrassment of the king and his ministers. Her majesty, who had long been befriended by the Opposition, was received by the people with the warmest expressions of sympathy. Whatever had been blamable in her conduct was overlooked on account of the greater licentiousness of life ascribed to her husband, and the persecutions which she had suffered for twenty-four years. The king, who had established a system of observation round her majesty during her absence from the country, caused a bill of pains and penalties against her to be brought (July 6) into the House of Lords, which thus became a court for her trial. Messrs. Brougham and Denman, who afterwards attained high judicial stations, acted as counsel for her majesty, and displayed great dexterity and eloquence in her defence. The examination of witnesses occupied several weeks; and nothing was left undone which might promise to confirm her majesty's guilt. But no evidence of criminality could soften the indignation with which almost all classes of the community regarded this prosecution. Though the bill was read a second time by a majority of 28 in a house of 218, and a third time by 108 against 99, the government considered it expedient to abandon it, leaving the queen and her partisans triumphant.

In July, 1821, the coronation of George IV. took place under circumstances of great splendour. On this occasion, the queen made an attempt to enter Westminster Abbey, for the purpose of witnessing the ceremony, but was repelled by the military officers who guarded the door; an insult which gave such a shock to her health, as to cause her death in a few days. During the month of August, the king paid a visit to Ireland, where he was received with much cordiality by all classes of that excitable people, notwithstanding his known hostility to the Catholic claims. In September, he paid a visit to the kingdom of Hanover. In August of the ensuing year, he completed this series of visits by a voyage to Scotland, where, owing to the novelty of the occasion, and the historical associations which it was the means of awakening, he was also received with extreme kindness. During his absence in Scotland, his leading minister, the Marquis of Londonderry (formerly Lord Castlereagh) put an end to his own life, in consequence of a morbid sense of the difficulty of his position in regard to continental affairs. The successor of the Marquis of Londonderry in the direction of foreign affairs was Mr. George Canning, who had quitted the cabinet two years before on account of the prosecution of the queen, and was at this time preparing to leave the country as governor-general of India. Mr. Canning was a statesman of enlightened and humane spirit, and, among other popular qualities, possessed a rich and classical style of parliamentary eloquence.

JOINT-STOCK MANIA.—COMMERCIAL EMBARRASSMENTS.

The two ensuing years were characterized by an extraordinary activity in almost all departments of trade and commerce. Mr. Huskisson, an able commercial minister introduced by Mr. Canning, originated several measures highly important; especially the repeal of all duties on goods passing between Great Britain and Ireland—an alteration in the duties affecting the silk manufacture—the repeal of the combination laws, and of the law against the emigration of artisans; while the executive formed commercial treaties, on the reciprocity system, with various countries of Europe, and, acknowledging the independence of the revolted Spanish colonies in America, drew them as additional customers into the British market.

Capital now so far exceeded the ordinary means of its employment, that many joint-stock companies were formed, as a means of giving it a wider range than that to which it was usually limited. Some of these associations professed objects which were by long-established usage the proper business of individuals alone, and others involved hazardous and visionary projects, which were to be carried into effect in remote countries. The depressed state of trade in 1821 and 1822, had led to a diminished importation and production of goods, and been succeeded by an advance of prices in 1823. The consequence was a sudden and unusually active demand, and a powerful reaction of supply, which did not cease till production had far exceeded the bounds of moderation. Through the facilities afforded by large issues of paper-money, the delusion was kept up longer than it would otherwise have been. The first symptom of something being wrong, was the turning of the exchange against England. A diminution of issues at the bank followed. Merchants began to feel a difficulty in answering pecuniary obligations. Then took place a run upon the banks, some of which, both in London and in the country, were obliged to stop payment. Between October, 1825, and February, 1826, fifty-nine commissions of bankruptcy were issued against English country banks, and four times the number of private compositions were calculated to take place during the same period. While the merchant and manufacturer were without credit, their inferiors were without employment, and distress reached almost every class of the community. Some liberal pecuniary measures on the part of the Bank of England, helped, in a short time, rather by inspiring confidence than by actual disbursement of money, to retrieve, in some measure, the embarrassed circumstances of the country.

MR. CANNING'S ADMINISTRATION.—CATHOLIC EMANCIPATION.

In spring, 1827, the illness of Lord Liverpool (followed soon after by his death) opened the way for Mr. Canning's promotion to the first place in the administration; on which occasion, for various reasons of a personal as well as political character, the more uncompromising class of Tories resigned their places, leaving the reins of government in the hands of a comparatively popular party. Mr. Canning, however, sank under the new load imposed upon him, and died in the ensuing August. His friend Lord Goderich succeeded as premier; but resigned in January, 1828, when the Duke of Wellington was appointed in his place, with Mr. (afterwards Sir) Robert Peel as secretary for the home department.

From the year 1805, the Catholic claims had been a prominent subject of parliamentary discussion, and since 1821 they had been sanctioned by a majority in

the House of Commons. Almost despairing of their cause, while left to the progress of mere opinion in the English aristocracy, the Irish Catholics had in 1824 united themselves in an association with the scarcely concealed purpose of forcing their emancipation by means of a terrifying exhibition of their physical strength. An act was quickly passed for the suppression of this powerful body; but it immediately reappeared in a new shape. In fact, the impatience of the Catholic population of Ireland under the disabilities and degradation to which they were subjected on account of religion, was evidently becoming so very great that there could be little hope of either peace or public order in that country till their demands were conceded. Though the English public lent little weight to the agitation, and the king was decidedly hostile to its object, Catholic emancipation rapidly acquired importance with all classes, and in all parts of the empire. In spring, 1828, a kind of preparation was made for the concession, by the repeal of the test and corporation oaths, which had been imposed in the reign of Charles II.

The ministry soon after received an alarming proof of the growing force of the question. Mr. Vesey Fitzgerald had vacated his seat for the county of Clare, on becoming president of the board of trade. He was a friend to emancipation, and possessed great influence in the county; but he was also a member of an anti-Catholic administration. As an expedient for annoying the ministry, the Catholic Association, and all the local influences on that side, were set in motion to procure the return of Mr. Daniel O'Connell, the most distinguished orator of the Catholic party. To the surprise of the nation, Mr. O'Connell was returned by a great majority. It was even surmised that the laws for the exclusion of Catholics from Parliament would be unable to prevent him from taking his seat. The Duke of Wellington now began to see the necessity of taking steps towards a settlement of this agitating question; and the first, and most difficult, was to overcome the scruples of the sovereign. At the opening of the session of 1829, in consequence of a recommendation from the throne, bills were introduced by ministers for removing the civil disabilities of Catholics, and putting down the Catholic Association in Ireland; and, notwithstanding a great popular opposition, as well as the most powerful exertions of the older and more rigid class of Tories, this measure was carried by a majority of 353 against 180 in the House of Commons, and 217 to 112 in the House of Lords.

REIGN OF WILLIAM IV.

The agitations respecting the Catholic Relief Bill had in some measure subsided, when, June 26, 1830, George IV. died of ossification of the vital organs, and was succeeded by his next brother, the Duke of Clarence, under the title of WILLIAM IV. About a month after, a great sensation was produced in Britain by a revolution which took place in France, the main line of the Bourbon family being expelled, and the crown conferred upon Louis-Philippe, Duke of Orleans. By this event, a great impulse was given to the reforming spirit in Britain, and the demands for an improvement in the parliamentary representation became very strong. The consequence was the retirement of the Wellington administration in November, and the formation of a Whig cabinet, headed by Earl Grey. The agitations of the time were much increased by a system of nocturnal fire-raising, which spread through the south of England, and caused the destruction of a vast quantity of agricultural produce and machinery.

The Whig ministry came into power upon an understanding that they were to introduce bills for parliamentary reform, with reference to the three divisions of the United Kingdom. These, when presented in March, 1831, were found to propose very extensive changes, particularly the disfranchisement of boroughs of small population, for which the members were usually returned by private influence, and the extension of the right of voting in both boroughs and counties to the middle classes of society. The bills accordingly met with strong opposition from the Tory, now called the Conservative party. By a dissolution of Parliament, the ministry found such an accession of supporters as enabled them to carry the measure through the House of Commons with large majorities; but it encountered great difficulties in the House of Lords, and it was not till after a temporary resignation of the ministry, and some strong expressions of popular anxiety respecting reform, that the bills were allowed to become law.

During the few years which followed the passing of the Reform Bills, the attention of Parliament was chiefly occupied by a series of measures which a large portion of the public deemed necessary for improving the institutions of the country, and for other beneficial purposes. The most important of these, in a moral point of view, was the abolition of slavery in the colonies, the sum of twenty millions being paid to the owners of the negroes, as a compensation for resigning a right of property which had long been a disgrace to humanity. By this act, eight hundred thousand slaves were (August 1, 1834) placed in the condition of freemen, but subject to an apprenticeship to their masters for a few years.

In the same year, an act was passed for amending the laws for the support of the poor in England, which had long been a subject of general complaint. One of the chief provisions of the new enactment established a government commission for the superintendence of the local boards of management, which had latterly been ill-conducted, and were now proposed to be reformed. The able-bodied poor were also deprived of the right which had been conferred upon them at the end of the eighteenth century, to compel parishes to support them, either by employment at a certain rate, or pecuniary aid to the same amount: they were now left no resource, failing employment, but that of entering poor-houses, where they were separated from their families. The contemplated results of this measure, were a reduction of the enormous burden of the poor-rates which had latterly exceeded seven millions annually, and a check to the degradation which indiscriminate support was found to produce in the character of the labouring classes.

On the renewal of the charter of the East India Company in 1834, the government deprived it of its mercantile privileges, and extended the right of trading with China to the community at large. The ancient policy of not allowing Europeans to settle in Hindostan was also departed from, under some restrictions of inferior importance. Some reforms, equally advantageous to the public, were effected in the administration of the law and in the privileges held by the Bank of England.

In 1833, a reform took place in the mode of electing the councils and magistracies of the Scottish boroughs. Instead of regulations which took their rise in an early age, and had been found productive of mismanagement, the parliamentary constituencies were empowered, in all except a few cases, to choose the requisite number of councillors, to whom then belonged the duty of appointing the requisite number out of their own body to act as magistrates. In 1835, the English municipal corporations were reformed, upon a principle similar to that applied to Scotland, except that the rate-payers and freemen were designed to form the electoral bodies, and that the councils in most cases were to consist of a greater number of members. A modified reform of the same kind took place in Ireland, by virtue of an act passed in 1840.

During the summer of 1834, the ministry endeavoured

to carry through Parliament a bill to enable them to take unusual measures for restraining turbulence in Ireland. In consequence of a difficulty experienced in passing the measure, Lord Althorp and Earl Grey resigned their situations. The earl, who had now passed his seventieth year, was anxious for other reasons to retire from more active life, in order to spend the remainder of his days in the bosom of his family. He withdrew with the admiration of all parties, his whole career having been marked by consistency and sincerity. His place was supplied by Viscount Melbourne, and Lord Althorp was induced to resume office. The Irish Coercion Bill, with certain alterations, was then passed. On the 10th of October in this year, the two Houses of Parliament were burnt by accident.

In November, the death of Earl Spencer caused the advancement of his son Lord Althorp to the House of Peers, and the ministry was then left without a leader in the House of Commons. The king, who had for some time inclined to the Conservative party, took advantage of this circumstance to dissolve the cabinet. The Duke of Wellington was again called into office, and a messenger was despatched to Italy to bring Sir Robert Peel home from that country, in order to accept the premiership. Sir Robert hastened to London, and on the 10th of December, the new ministry was constructed, chiefly of the individuals who lost office in 1830. Sir Robert, though sensible of the difficulty of conducting public affairs at such a time, resolved to do the utmost to conciliate popular favour, by entering upon reforming measures. In a new House of Commons, his party was strengthened by nearly a hundred new votes; but he was still in a minority. After bringing forward a variety of measures of a reforming character, being defeated on the question of devoting some part of the Irish church revenues to education, he was compelled to resign (April 8, 1835), and allow the Melbourne ministry to be replaced.

In the session of 1836, the ministry were defeated, by majorities in the House of Lords, in attempts to carry several important measures of reform, but succeeded in passing an act for commuting tithes in England into a corn-rent charge payable in money; also in an act for enabling dissenters in England to be married otherwise than by the established clergy; and another for a general registry of births, deaths, and marriages. They likewise reduced the stamp-duty on newspapers to one penny, by which the circulation of that class of publications was very largely increased. From this time, there was a marked diminution in the zeal which had for some years been manifested for changes in the national institutions. Early in 1837, the ministry again introduced into the House of Commons a bill for settling the Irish tithe question; but before this or any other measure of importance had been carried, the king died of ossification of the vital organs (June 20), in the seventy-third year of his age, and seventh of his reign, being succeeded by his niece, the Princess Victoria, who had just completed her eighteenth year. The deceased monarch is allowed to have been a conscientious and amiable man, not remarkable for ability, but at the same time free from all gross faults.

COMMENCEMENT OF THE REIGN OF QUEEN VICTORIA.

The commencement of the reign of Queen Victoria has been marked by no signal events, and may as yet [February, 1841] be rather considered as a period of promise than of performance. Meanwhile, her majesty appears to have given unmixed satisfaction to her people by her marriage to Prince Albert of Saxe-Cobourg, and the birth of a princess-royal.

MISCELLANEOUS CIRCUMSTANCES FROM 1820 TO 1840.

This period is remarkable for the great efforts which were made to diffuse knowledge more generally among the people. *Mechanics' Institutions* were formed in most considerable towns, for the purpose of instructing that class of the community in mechanical and natural science. Various periodical works were also set a-going, for the purpose of communicating science and other branches of instruction, in such forms as to be intelligible to the less educated classes. At the same time considerable efforts were made to still farther extend education by means of ordinary schools. Among the individuals who sought to promote these objects, the most conspicuous was Lord Brougham, who filled the office of lord chancellor in the Grey administration.

In this period, the national energies were chiefly turned towards the arts of peace, and accordingly the prosperity of the country made, upon the whole, great advances. Though agricultural produce had ceased to bring the high prices it realized during the war, the farmers paid rents nearly equally high; and this they were enabled to do in consequence of the soil having been so much improved as to produce much larger crops. During this period steam navigation was immensely increased; ordinary roads were greatly improved by the mode of paving invented by Mr. Macadam; and railways began to overspread all parts of the country, for the conveyance of goods and passengers by means of steam locomotive carriages, the common speed of which is about thirty miles an hour. These circumstances form the fair side of the picture; on the other, we behold discontents pervading large sections of the working population, on account of the low wages of labour, and other real or imaginary grievances.

CONSTITUTION AND RESOURCES OF THE BRITISH EMPIRE.

The British Empire consists of the United Kingdom of Great Britain and Ireland (including a number of minor islands around their shores), and colonies and other dependencies in different quarters of the world. The most remarkable peculiarity in the political condition of the British empire, is the high degree of civil and religious liberty which all classes of subjects practically enjoy. Slavery exists in no quarter of the British dominions: personal freedom, with liberty to come and go, unquestioned and unimpeded, is assured to all, without respect of birth, rank, language, colour, or religion.

Britain, while in population and some other respects surpassed by several other nations, possesses a degree of wealth and political influence which may be said to place her at the head of all nations. This unprecedented [illegible] and power appears to have taken its rise in a fortunate concurrence of favouring circumstances, some of a physical and others of a moral character.

The first of the physical causes in importance is unquestionably the insular situation, at once protecting the country from the destructive invasions which have so much depressed and retarded many continental states, and furnishing opportunities for a ready commerce with all the shores of the civilized world. The second of these causes is to be found in the natural fertility of a large portion of the United Kingdom, and the temperate climate enjoyed by it, favouring the production of the food necessary for a large population. A third cause is the large amount of the mineral wealth of England, furnishing her with the means of prosecuting manufactures to an extent beyond all which the world has ever before had experience of. Thus Britain has been naturally qualified to become the seat of a great agricultural, manufacturing, and commercial nation, and must always, from the nature of things, have tended to assume that character. Moral causes, it is true, might have been unfavourable. Had a branch of the Ethiopian or Mongolian races possessed the country, its natural advantages would probably have remained unused. But the stock of the British population chances to have sprung from the Teutonic branch of the Caucasian variety, a race who have in many countries proved the superiority of their intellectual and moral organization. The idea of trial by jury, and of arranging public affairs by a representative body, hit upon at an early period by this race, show that it possesses a natural aptitude for forming improved political institutions. Its concern in the most important modern inventions shows its ingenuity in the arts. Its maritime enterprise and mercantile intrepidity were testified at a time when other nations were engaged only in feudal broils. Planted in England in the fifth century, and probably in Scotland many centuries before, we see this people making a continual advance ever since in political institutions and in the arts of peace. Historians point out the accidents which effected conspicuous changes; but, while the feebleness and wickedness of a John may have been the immediate cause of the Magna Charta, and the passion of Henry VIII. for a beautiful woman the proximate cause of the reformation of religion, there must have also been something in the people pressing them irresistibly towards liberty of person and of conscience, and enabling them to overcome all obstacles to the accomplishment of those objects. It was in the nature of the people to establish free institutions—and they were established. A people so active and so ingenious could not fail to take advantage of the natural facilities which they enjoyed for manufactures and commerce. They made the best of blades in the days of Cœur de Lion, and in the time of Elizabeth their sails whitened every neighbouring sea. Arts, driven out of other countries by ruthless bigotry, found refuge and flourished among a people who eagerly grasp at every kind of employment which promises to be useful. It is to their persevering industry, exercised by favour of so many natural circumstances, and constantly protected by free institutions, that we are mainly and most immediately to look for the source of the greatness of the British empire.

FORM OF THE BRITISH GOVERNMENT.

The government of the United Kingdom is constitutional, or possesses a regular form, in which the civil rights of all classes are acknowledged and guaranteed. The constitution is a monarchy, in which the sovereign accepts of his dignity under an express agreement to abide by certain prescribed forms of government according to the laws of the realm, and to maintain inviolate the Protestant religion, with all the rights and privileges of the church. The sovereign is the head or directing power in the executive of government, the fountain of all honours, and the watchful guardian of the interests of the state: he is held to be incapable of doing wrong; and if an unlawful act is done, the minister instrumental in that act is alone obnoxious to punishment. The legislative part of the government is composed of two deliberating bodies—the House of Lords and the House of Commons—both of which consist of individuals belonging to the United Kingdom only, the colonial dependencies of the empire having no share in the general management.

House of Lords.—The persons who compose the House of Lords form a separate class or rank, which is called collectively the Peerage, whose members enjoy certain exclusive privileges and honours. The members of the House of Lords are either lords spiritual or temporal. The spiritual lords are archbishops and bishops, and hold their seats for life in virtue of their ecclesiastical office; the temporal lords enjoy their seats from hereditary right, or in virtue of being elevated to the peerage. In 1837, at the meeting of the first Parliament of Queen Victoria, the number of members of the House of Lords was 641; namely, 3 princes of the blood royal, 2 English archbishops, 21 dukes, 19 marquises, 112 earls, 19 viscounts, 24 English bishops, 6 Irish prelates, 193 barons, 16 representative peers of Scotland, and 28 representative peers of Ireland. The House of Lords is liable at all times to an increase of number by the elevation of commoners to the peerage; but this prerogative of the crown is sparingly used.

The House of Commons.—This body consists of 658 members; of whom 253 are chosen by counties, 6 by universities, and 399 by cities, boroughs, and towns. England returns 471, Wales 29, Ireland 105, and Scotland 53. The number of persons entitled to vote in the election of these members is probably about a million; of whom about 600,000 vote for county members, 5000 for representatives of universities, and 400,000 for members for cities, boroughs, and towns. The great bulk of the voters, as settled by the Reform Acts of 1832, is

composed of the agricultural tenantry and the occupants of houses of £10 of yearly rent; in other words, the middle classes. The operative classes, from their not in general inhabiting houses of such value, possess little direct influence in the election of members of the House of Commons. A House of Commons cannot legally exist for more than seven years; but, in reality, it rarely exists so long, the death of the sovereign, change of ministry, and other circumstances, causing a renewal on an average every three or four years. Reckoning from 1802 till November 15, 1837, there were thirteen Houses of Commons; as the thirteenth still exists (January, 1841), we have an average of three years for each; those of longest duration were the fourth, from 1807 to 1812, and the fifth, from 1812 to 1818.

The Houses of Lords and Commons compose the *Parliament*. The Parliaments of England and Scotland were united in 1707, and then called the British Parliament. In 1800, the Irish Parliament merged in the British Parliament. The three kingdoms were first represented in one Parliament in 1801. Since that period it has been called the *Imperial Parliament*, and is always convened at Westminster.

The two houses, with the sovereign, compose the three estates of the realm, or legislative body. The sovereign takes no personal concern in the proceedings of Parliament, further than opening or proroguing the sessions; but the interests of the crown in Parliament are intrusted to members of the cabinet council or ministry, and by them are defended and explained. The two houses, with the sovereign, have the power to pass laws, impose taxes, borrow money, make inquiries into the management of the public revenues, or the transactions of the great officers of government, and even to bring the latter to trial, if necessary. Members of either house inquire into the manner in which all great public institutions or boards of management are conducted, such as those for education, for purposes of charity, for the erection of lighthouses on the coast, for the construction of harbours, and generally, indeed, into all the business which is intrusted to the executive part of the government; they cannot direct what is to be done, but may always make scrutiny into it afterwards, if any error or mismanagement has taken place. The discussions on these subjects are often very warm and eager, and bring to light facts of great public importance. No act of the two deliberative bodies becomes valid as a law, without the assent of the sovereign; and all propositions relating to money to be raised for the public service, must originate with the House of Commons, the Lords merely giving their assent as a matter of form, without being allowed to alter any thing. This circumstance gives a much larger share of influence to the Commons than is possessed by the Lords; the former having it in their power, whenever they are dissatisfied with the measures of government, to stop the supplies of money, and bring the whole machinery to a stand.

Each of the two houses has one presiding member, whose duty it is to preserve order and see that the regulations of the assembly are attended to by the members; he is also the person through whom any communication passes between the house and the queen, he alone having the privilege of addressing her majesty in name of the house. Hence, in the House of Commons, this officer is called the *Speaker*; in the House of Lords he is commonly known as the *Lord Chancellor*, from another office which he holds; but the duties of the latter are quite the same as those of the Speaker of the Commons. There are numerous forms established for the regularity of business in Parliament, but of these there are only a few which need be mentioned here. Any proposal which is laid before either of the houses, in order to pass into a law, must be made out by its promoter *in the form* of an act of Parliament, but is only known by the name of a *bill* while under discussion; permission must first be obtained to introduce the bill, and it must then be read and considered by the house three several times, besides being once scrutinized more closely by a committee or select number of the members, and, if a public bill, by the whole house sitting as a committee, when each member is permitted to speak as frequently as he sees occasion, whereas in the regular sittings of the house no one is allowed to speak more than once, except to explain where his first statements have been misunderstood. If it is not rejected in any of these three readings, or given up in the committee, the bill is said to have passed. It must then go through the same process in the other house, where it is sometimes adopted, sometimes rejected; but if any alterations are made on it here, they must be reported to the house where it first originated. If the two cannot agree on the changes proposed, the bill falls to the ground; but some modification is generally contrived which satisfies both parties. It still remains to obtain the sanction of the sovereign, which is hardly ever refused, when the *bill* becomes an *act of Parliament* or *law*.

The members of both houses have certain personal privileges, which are deemed necessary for enabling them properly to attend to their public duties. In Parliament, they enjoy absolute freedom of speech, and cannot be questioned out of the house for any thing said in the debates; they and their servants are exempted from arrest (except in criminal cases) during their attendance in Parliament.

The Executive, as already stated, is reposed in the hands of a sovereign. The dignity of the sovereign is hereditary in the family of Brunswick, now on the throne, and in the person of either a male or female. A queen reigning, therefore, enjoys the same privileges as a king. Besides enforcing the laws of the realm, through the medium of courts of justice, and a variety of functionaries, the sovereign is charged with the office of levying taxes granted for the public service, and of defending the empire at home or abroad against foreign enemies. He, or she (with reference to our present sovereign), also conducts all intercourse with the rulers of other nations, forming treaties and alliances, declaring war or concluding peace. She has the duty of protecting the persons and trade of British subjects in foreign countries. For this purpose, she has the sole appointment of the officers who perform these duties; of judges in the several courts of law; of officers in the army and navy; of public ambassadors, and of consuls at foreign ports for the safety of trade; and of the officers who levy the taxes. She has also large forces, both naval and military, at her disposal, which are stationed in different parts of the empire where she or her advisers think that they are wanted for the time. The task of managing all these extensive concerns, which would fall into confusion in the hands of one person, is deputed by the queen to a number of persons, who are denominated her *Ministers*, and sometimes the *Cabinet*. These are nominally selected and appointed by the queen herself; but as her choice would be in vain if it were to fall on men who were disagreeable to Parliament (which might in that case refuse to grant supplies for national business), the ministry is generally chosen from among such men as enjoy a considerable share of public confidence. They have all some high state office. The chief is the *First Lord of the Treasury*, whose nominal duty is the receiving and issuing of the public money, while his actual station is that of leader of the administration; he is the first who is appointed in any ministry, and generally selects all the other members, according to his own views of their abilities, or of the influence they possess in the country or in Parliament; and any changes afterwards made are generally at his suggestion, or at least with his full assent. Next is the *Lord High Chancellor*, who

presides in the highest law court of the kingdom, and is Speaker of the House of Lords; he is chief adviser of the sovereign in all that relates to the laws of the country, and has the disposal of a great number of clerical and law offices. After him are the principal secretaries of state, who are five in number, each having a separate charge; the first is Secretary for the Home Department, after whom are the Secretaries for Foreign Affairs and for the Colonies, the Secretary at War, and the Secretary for Ireland. These, with the *Chancellor of the Exchequer*, and several others of the high officers of state, form what is called the *Ministry*, the *Cabinet Council*, or briefly the *Cabinet;* and all the measures of the executive government are settled by their deliberations.

The regular division of labour which is established in the British government, is one of its chief excellences; because every secretary, or other officer of state, having a particular department assigned to him, the responsibility for any error or mismanagement is established at once, and may be either rectified or punished. Parliament itself has its duties; and when these are not performed to the satisfaction of the electors, the members can be dismissed at next election, to make way for others who deserve better.

The British constitution, thus slightly sketched, may be generally described as an anomaly in political science, being both professedly and in reality a mixture of all the three kinds of government—monarchical, aristocratical, and democratical. Such a government would probably be found totally inapplicable in other societies; but in Britain it answers well, having grown up in conformity with the views and character of the people, and enjoying, in consequence of that conformity and of its long existence, the respect required to enable any system to work. Upon the whole, notwithstanding the Reform Acts, the aristocratic principle predominates, yet fully as much from the spirit of the people themselves, as from any forms of the constitution. An unprejudiced foreigner would probably remark, that the greatest drawback from its happy working now is, the position in which it places the labouring portion of the community.

FINANCES.

Revenue.—The revenue of the British empire has varied exceedingly of late years; from 1761 to 1774, which was a period of peace, it increased from £8,800,000 to £10,285,673; and since that time, from the various wars in which the country was engaged, the immediate expenses, and the interest of public debts, it has continued to augment till within these last ten or twelve years. From 1775 to 1783, which was the period of the American war, it rose from ten millions to twelve millions; and during the peace which followed till 1793, it was increased to seventeen and a half millions a year.

After this period the French revolutionary war commenced. That war was by no means unpopular with the nation; and it was besides gilded by the many splendid victories which continued to be obtained by British seamen as long as the enemy had a fleet to appear at sea. Heavy taxes for defraying the expenses of this war were therefore submitted to without remonstrance, and the public revenue rose accordingly to a very large amount. From 1794 to the peace of Amiens in 1801, which only lasted two years, the revenue was increased from seventeen and a half millions to twenty-eight millions: and from 1803 till 1816, the year after the final conclusion of peace, it had risen to £76,834,494, which was the largest sum raised by taxes in one year.

The sums thus raised in taxes, large as they were, did not, however, meet the expenditure of the country during these periods of war. In order to defray the great charges which arose, it became necessary also to borrow to a great amount. The following table will show the sums raised by the taxes, the sums borrowed, and the total expenditure for each of the years specified.

Year.	Raised in Taxes.	Borrowed.	Total Expenditure.
1794	£17,674,395	£5,079,971	£22,751,366
1801	28,085,829	33,532,159	61,617,988
1803	38,401,738	23,972,742	62,373,480
1806	53,698,124	22,358,672	76,056,796
1810	66,029,319	22,763,202	88,792,551
1814	70,926,215	52,309,445	122,235,660
1816	76,834,494	54,471,464	130,305,958

These sums will appear altogether enormous, and must give the most extraordinary idea of the resources of a government, which, while it raised such a large yearly amount in taxes, had yet credit to borrow the immense additional sums which were wanted. The whole sum which was expended in the wars of the revolution, from 1794 to 1816, amounted to 1700 millions of pounds sterling—a sum so far beyond all ordinary dealings, that we can have little conception of its amount or value. All the mines that are at present wrought in Europe and America would not furnish gold and silver equal to it in less than 310 years.

The debt formed by borrowing money at different rates of interest to conduct the warlike operations of the country, has risen from small beginnings towards the conclusion of the seventeenth century, to an unparalleled amount. At the revolution of 1688, the national debt amounted to only £664,263; at the accession of Queen Anne, £16,394,702; of George I., £54,145,363; of George II., £52,092,235; at the end of the Spanish war in 1748, £78,293,312; at the commencement of war in 1755, £74,571,840; at the conclusion of peace in 1762, £146,682,844; at commencement of American war in 1776, £135,943,051; at conclusion of peace in 1783, £238,484,870; at commencement of French revolutionary war, £233,733,609; at peace of Amiens in 1801 £582,839,277; at peace of (Feb. 1) 1816, £864,822,461; on the 5th of January, 1832, £782,667,224—interest, £28,341,416. Since 1832, the debt has increased, chiefly by the funding of exchequer bills (adding floating obligations to funded stock), and in 1839, the amount was £841,000,000, with an interest of £29,000,000.

The revenue which it is necessary to raise for the purpose of paying the interest of the debt, and conducting the business of the country, is derived from taxation upon a great variety of different articles, which are all, however, reduced to the following heads:

1. *The Customs.*—These are taxes levied upon the foreign commerce of the country, being the duties paid upon articles imported from abroad, such as tea, sugar, coffee, spirits, wines, tobacco, &c. They include also a few on some goods exported, such as coals, wool, and skins. Their whole amount, in the year ending October 10, 1840, was £20,152,739.

2. *The Excise.*—The excise taxes are those which are levied on goods of British manufacture, such as glass, malt, paper, &c. The duty is paid back again to the maker, if the commodity is to be exported to foreign countries. This class of taxes yielded, in the above year, £11,985,467.

3. *Stamp Duties.*—These consist of the prices affixed to stamp papers, upon which the law makes it imperative that every document for the transfer of property, or other obligation, shall be written. Deeds, settlements, and bills, bills of exchange, receipts (above a certain small amount), and a great variety of other instruments of business, are required to be stamped in this manner; and the prices affixed to the stamps, which are often high, bring a large revenue. Under the head of stamps, are also included newspaper stamps, indentures, dice, duties on plate, and other anomalous items. The whole amounted in the above year to £6,726,31[illegible]

4. *Direct Taxes.*—These are duties levied on land, on windows (eight or upwards), male servants, riding horses, dogs, use of armorial bearings, hair powder, &c. This class of taxes, which are levied by surveyors and collectors, amounted in the above year to £3,744,372. The principal items are the land and window taxes, each of which was above a million.

5. *Post-Office.*—In the year ending October, 1839, the revenue derived from the tax on letters passing through the post-office was £2,390,764. But, by the reduction of postage to one penny per letter (if under half an ounce) at the beginning of 1840, the amount of revenue derived from this source in the year ending January, 1840, was only £441,000. The great advantage derived by the country from cheap postage more than compensates the deficiency.

6. The income derived from rentals of *crown property*, and the sale of timber, bark, &c., from the crown lands (with other incidents), yielded a revenue, in the year ending October, 1840, of £167,500.

7. *Miscellaneous.*—These include duties on hackney-coaches, hawkers' licenses, offices, pensions, &c.; and amounted to £84,479.

8. Some *incidental revenues* are derived from matters connected with the regular taxes; such as duties collected at the Isle of Man, fines, and goods seized for taxes; these, with a number of other casual receipts, amounted, in the above year, to £454,784. Besides this, there was a sum entitled *Repayments of Advances*, amounting to £656,140.

The total of the income for the year ending October, 1840, was £44,665,798; and it will be observed that of that sum fully thirty-two millions were raised from customs and excise, or duties on foreign and British manufactures, and nearly seven millions on stamps. Thus, the great bulk of taxation is indirect, and the really direct taxes are a mere trifle in comparison. The chief burden of the taxes evidently falls on the consumers of tea, coffee, sugar, tobacco, soap, spirits, and wines, and these consumers are the great body of the people. As the land-tax amounts to no more than £1,300,000 annually, proprietors of lands contribute but a small direct aid to the public income. The customs duties are levied on nearly 1700 articles imported into the country, but a few leading articles raise nineteen-twentieths of the entire amount, and the insignificant sum raised from the remainder acts merely as a prohibition on foreign commerce. The following were the duties levied on ten articles in the year ending January 5, 1840:—

1. Sugars and molasses,	£4,826,917
2. Tea,	3,658,763
3. Spirits,	2,615,413
4. Wine,	1,849,308
5. Tobacco,	3,495,686
6. Coffee and cocoa,	794,818
7. Fruits of all kinds,	462,002
8. Timber and dye-woods,	1,668,584
9. Corn, grain, meal, and rice,	1,131,075
10. Provisions (including bacon, hams, butter, eggs, &c.),	368,560
Total amount,	£20,871,126

On the following six articles, the duties levied in the year ending January 5, 1840, were as follows:—

1. Seeds of all kinds,	£145,712
2. Oils of all kinds,	69,964
3. Spices of all kinds,	98,261
4. Hides and skins,	94,987
5. Tallow,	181,999
6. Wool (cotton and sheep's),	556,225
	£1,147,148
Which added to the duties levied on the ten articles in the preceding list, namely,	20,871,126
Gives a grand total on sixteen unmanufactured articles of	£22,018,274
Balance received on 1136 minor articles,	944,326
Total net revenue,	£22,962,600

Therefore the duty levied on all the remaining 514 articles, including all raw materials and manufactured goods, is £55,674 less than one million. The revenue levied on manufactured articles was as follows:—

	Duty.	
Brass manufactures,	30 per cent.	£1,710
Boxes of all kinds,	20 ...	2,769
Bugles,	1s. per lb.	2,140
Earthenware, china, &c.,	15 to 20 per cent.	5,622
Clocks and watches,	25 ...	9,628
Copper, manufactures of	30 ...	731
Cotton, manufactures of 10, and made up	20 ...	6,584
Embroidery and needlework,	30 ...	8,875
Flowers, artificial (not of silk),	25 ...	5,299
Glass bottles, and all other sorts of glass,	30 to 120 ...	27,304
Hair and goat's wool, manufactures of	30 ...	3,097
Hats of chip and straw	20s. per dozen	1,729
Leather gloves,	20 to 40 per cent.	18,506
Manufactures of leather, including shoes and boots,	30 ...	6,095
Paper and paper-hangings, 3d. per lb., and 1s. per square yard, and hangings,		1,579
Plaiting of chip and straw, 17s. to 20s. the lb.		19,637
Silk manufactures, various duties,	20 to 40 per cent.	247,361
Toys,	20 ...	3,793
Cologne water, 1s. per flask, or 30s. the gallon,		5,009
Woollen manufactures, 15 per cent. and made up 20 per cent.		25,111
Total duty levied,		£402,576
On manufactures, except so much as is included in the £80,760 received from the remaining enumerated tariff and non-enumerated articles; say one-half on manufactures,		40,380
Total on manufactures,		£412,956
Duty levied on raw materials, exclusive of cotton and wool, dye-woods, oils, tallow, seeds, hides, and skins,		500,271
Total duties levied on manufactures and minor raw materials,		£913,227

The whole question of import duties, with reference to an improvement in the mode of levying them, has lately been considered by a committee of the House of Commons; and it is likely that a very great alteration will speedily be adopted, for it appears that the prohibitive duties act injuriously on British manufactures, and induce foreigners, by way of retaliation, to exclude our goods from their markets.

Expenditure.—The total annual revenue, as above mentioned, is at present between forty-four and forty-five millions, and we have now to see how this large sum is spent. The first great item in the expenditure is in the form of interest on the national debt: in the account rendered of the expenditure during the year ending October, 1840, the following statements are made:—Amount applied to consolidated fund, £31,836,088; amount applied as advances, and to pay off exchequer bills issued as advances, £559,592; amount paid as part of ways and means of year, £12,270,118. It is difficult to obtain an exact idea of this complicated statement; but we may be certain of the general fact, that about £31,000,000 are paid annually as interest of debts due, or partial liquidation of debts, and that the whole business of the con-

uy—civil, military, and naval, including charges for royal household—is conducted for the sum of £13,000,000. The debt has been latterly increasing; in other words, the revenue is falling short of the expenditure.

Miscellaneous.—Every year, there are various charges under the head of *miscellaneous*, which consist of payments made by grants of Parliament for a great number of purposes. The following are these payments for 1836:

Public buildings, including National Gallery and temporary houses of Parliament,	£149,035
Roads, canals, harbours, lighthouses, and surveys,	144,355
Expenses attending the two houses of Parliament,	57,418
Salaries in public departments not otherwise defrayed by fees or by deductions from the revenue in its progress to the exchequer,	193,570
Superannuation allowances in public departments,	49,692
Contingent expenses in public departments,	55,234
Parliamentary and other commissions, revising barristers, and the like expenses,	262,811
Civil and ecclesiastical establishments in colonies,	95,902
Special justices in West India colonies,	49,469
Establishing steam-navigation to India,	5,726
Indian department in Canada, instruction of emancipated negroes, and support of captured negroes,	64,112
Expense of convicts, police, and criminal prosecutions,	282,069
Consular services,	83,229
Scientific and literary objects,	47,267
Charitable institutions and objects,	68,950
Educational purposes,	71,546
Printing and stationery,	176,665
Law charges,	24,000
Civil contingencies, miscellaneous services—Scotland,	120,175
Claims of merchants arising out of war with Denmark,	96,442
Secret services,	29,650
Loss sustained by re-coinage of silver and gold,	46,889
Compensation to individuals,	6,641
Charges formerly paid out of county rates,	69,000
Nonconforming ministers,	29,463
	£2,279,310

Civil List.—The expense incurred for the personal support of the sovereign and royal family and household, is but a small item in the general expenditure of the nation. Formerly, the crown possessed private revenues from lands, duties, &c., but all such are now abandoned to the country (chiefly under management of the Board of Woods and Forests), and the sovereign in requital is voted a civil list, or certain fixed sums, by Parliament. On the accession of William IV., the civil list was voted under five different classes, amounting in the aggregate to £510,000 per annum, as follows:—

Class 1. For the king's privy purse, £60,000; for the queen, £50,000,	£110,000
" 2. Salaries of the royal household,	130,300
" 3. Expenses of the household,	171,500
" 4. Special and home secret services,	23,200
" 5. Pensions,	75,000
	£510,000

On the accession of Queen Victoria, a civil list in six classes was voted, amounting in the aggregate to £385,000, with a power to the crown to grant pensions to an amount not exceeding £1200 in any one year.

Salaries in Civil Departments.—The number of persons employed in the various civil departments of government was reduced to 3787, causing a saving of £976,822, between 1815 and 1835. In 1835, the following statement was given of the number of persons employed in the chief departments of government, with amount of salaries

DEPARTMENTS.	No. of Persons.	Amount of Salaries.
Treasury, including Commissariat and Solicitor,	92	£56,346
Exchequer Offices,	14	7,005
Paymaster of Civil Services,	20	7,529
Privy Council Office,	18	9,058
" " " for Trade,	29	11 331
Secretary of State—		
" Home Department,	30	19,678
" Foreign,	39	21,584
" Colonial,	31	20,487
India Board,	38	21,300
Privy Seal Office,	1	2,000
Alien Office,	7	1,161
Register of Colonial Slaves' Office,	4	1,21[illegible]
State-Paper Office,	6	1,573
Commander-in-Chief's Office,	21	7,167
Adjutant-General's Office,	22	3,870
Quartermaster-General's Office,	19	2,210
War Office, including Office for Military Boards,	64	32,042
Judge-Advocate-General's Office,	7	3,460
Army Medical Board Office,	5	2,850
Chaplain-General's Office,	2	276
Army Pay Office,	51	17,614
Ordnance Department,	996	159,128
Chelsea Hospital, including Secretary's Agents and Treasurer's Office,	157	23,999
Royal Military College,	80	...
Royal Military Asylum,	67	3,699
Admiralty and Naval Departments,	821	227,971
Customs Department, including Coast Guard,	11,602	940,762
Excise Department,	6,072	722,456
Stamps and Taxes ditto,	660	106,347
Post-Office,	1,774	124,439
Mint Office,	30	10,110
Audit Office, and other Offices transferred to that Department,	130	39,050
National Debt Office,	31	8,717
Exchequer Bill Office,	11	3,610
Woods, Forests, Land-Revenue, and Public Works Office,	60	18,445
Stationery Office,	34	5,076
Alienation Office,	7	806
Lottery Office,	...	...
Exchequer and other Departments in Scotland,	296	94,782
IRELAND.		
Chief Secretary's Office,	38	14,536
Chief Secretary's office in London,	8	2,410
Privy Council Office,	7	2,575
Vice-Treasurer's Office, late Irish Treasury, &c.,	13	4,964
Tellers' Office, Exchequer,	5	1,680
Privy-Seal Office,	2	100
Office of Public Works,	19	5,096
Office of Lieutenant-General Commanding,	6	1,066
Army Medical Office,	3	1,044
Quartermaster-General's Office,	6	664
Deputy Judge-Advocate-General's Office,	1	597
Provost Marshal-General's Office,	1	168
Adjutant-General's Office,	9	1,018
Commissariat Department,	12	2,246
Royal Hospital, Kilmainham,	54	3,138
Board of Charitable Donations,	1	184
Board of Education,	25	4,756
	23,578	£2,786,278

The expenses incurred for the colonies were lately £2,606,483 per annum, but this included the outlay in the military and naval departments; and the annual expenses for ambassadors and consuls in foreign countries was £264,616, and for courts of justice nearly £800,000. Altogether, the *civil* management of the United Kingdom costs about £4,000,000, or but a tenth of the entire expenditure.

THE ARMY AND NAVY.

The Army.—According to the terms of the constitution, a permanent or standing army is not held to be legal. It is understood that the civil power, as exerted by magistrates, constables, and police, is competent to preserve order, and that the creation of a military force is only a matter of temporary necessity. An army, however, being constantly required both to assist the civil authority, and to protect the foreign possessions of the empire, an act of parliament, called the Mutiny Act, is passed annually, to maintain a large body of troops in regular service. Whether from this provision in the constitution or otherwise, it happens that education in military tactics is conducted on a very limited scale; the privates in the army are enlisted by small bounties from the lowest classes of the community, and very rarely, if ever, are promoted to the rank of commissioned officers. The commissioned officers, in general, belong to the aristocracy or landed gentry, and in most instances purchase their commission according to a scale of prices. Although both privates and officers are alike ill-prepared, by previous instruction, for performing the duties of their profession, such are the effects of discipline, the excellence of equipment, and other advantages, but, above all, a high tone of honour and spirit of valour, that the British army is found able to compete with forces recruited under far more favourable circumstances.

The army at present (1841) consists of the following numbers and descriptions of force:—

	Horses.	Men.	Officers and non-commissioned officers.	Expense, pay, clothing, &c.
Cavalry.				
Guards, 3 regts.	922	1,053	258	£87,102
Line, 23 regts.	7,696	8,578	1,578	466,372
Infantry.				
Guards, 3 regts.	..	4,640	613	192,079
Line, 99 regts.	200	81,407	10,948	2,781,365
	8,718	95,678	13,397	£3,526,918

To the account of expense mentioned above, there is to be added £466,237 for recruiting, for depôts of regiments at Chatham, Maidstone, &c., and for other charges. There is also what is called the civil department of the army, or the army management, consisting of the salary of the secretary-at-war and his office, the commander-in-chief and his office, the medical departments, &c. By an act passed in the reign of George IV., a sum of £60,000 is paid into the exchequer by the East India Company, on account of the charge for retiring pay and pensions, and other expenses of that nature, arising in respect of the forces serving in India. This sum is applied towards the general expenses of the state. The pay of a private in the horse guards varies from 1s. 9½d. to 2s. 0½d. per day; in the cavalry of the line, 1s. 4d.; in the foot guards, 1s. 2d.; and in the infantry of the line, 1s. 1d. When at home and in barracks, 6d. a day is deducted from this, for which the soldier receives three quarters of a pound of meat and one pound of bread. The principal part of his clothes and accoutrements is furnished at the public expense; his pay, however, is subject to a deduction of 2s. 7½d. a week, in the case of privates serving in the cavalry; 1s. 1d. a week from privates in the foot guards, and 1s. 6d. from all other privates, on account of these articles.

Besides the cavalry and foot regiments, there is another description of force called the ordnance, which includes artillery, engineers, miners, &c. They have the management of fortifications, with their guns, stores, &c., the making of rockets, and different kinds of shot for great guns. There are 827 officers and gentlemen cadets employed in this service, and 7458 men. These, with equipments, cost about £1,300,000 annually. Of the British army, 69,351 are employed at home and in the colonies, and 20,467 in the East Indies. The troops at home are chiefly lodged in barracks, as a police, near the large towns.

The statements which we have made above relate entirely to the effective force of the army, which is either on active duty or ready to be so employed. But there are a great number of persons attached to the army who do no duty, though receiving pay like others. Some of these are pensioners, who have either been long in service, or have suffered by wounds, &c.

The Navy.—Great Britain has long been renowned as a first-rate naval power: by command of its war vessels it protects its commerce, and exerts its authority in the most remote quarters of the globe. It is usual to say that Britain possesses the "dominion of the seas;" but this is only a figure of speech. The nation possesses no acquired or vested sovereignty over the ocean, acknowledged by other powers, although at times it may forcibly compel submission. The British royal navy is recruited in much the same manner as the army; but the constitution, by a singular anomaly, sanctions the forcible abduction of men from their private homes to serve on board of war vessels. This species of impressment, however, is only resorted to in cases of urgent necessity, as for instance during the heat of war. The sailors who enlist are generally young men who have served an apprenticeship on board merchant vessels; and with this preparation, they form seamen of the highest qualifications; their courage, integrity, and kind-heartedness, are a lasting theme of national gratulation. The following statement affords an idea of the present extent of, and expenditure upon, the royal navy:—

Wages of 34,465 sailors and marines,	£1,030,088
Victuals for do.,	546,628
Dockyards for building and repairing ships, including naval stores,	1,016,669
Wages to artificers in the establishments at home and abroad,	485,449
Establishments at home and abroad,	141,0[illegible]
Miscellaneous,	9[illegible],363
Admiralty office,	113,994
	£3,492,130

Besides the above, there is another expense charged in the navy accounts, such as the conveyance of troops, half-pay to officers, pensions, &c., and which amounts to £1,488,221.

The average pay of a sailor is £2 7s. per month, with victuals, which are estimated at about £1 4s. additional. Much complaint is made of the high salaries paid to people about the dock-yards; the master-workmen receiving £250 per annum, and the artificers from 5s. to 12s. 6d. per day. During the war with France, Great Britain had upwards of 1000 ships, manned by 184,000 seamen.

In 1835 there were in commission 1 first-rate (three-decker), a ship whose war complement exceeds 1000 men; 3 second-rate, war complement above 700; 8 third-rate, war complement above 600; 8 fourth-rate, war complement above 400; 6 fifth-rate, war complement above 250; 13 sixth-rate, complement below 250; and 136 smaller vessels. In ordinary, 14 first-rate; 16 second-rate; 50 third-rate; 14 fourth-rate; 75 fifth-rate; 13 sixth-rate; and 89 small vessels; in all, 443 vessels. This does not include smaller vessels, such as yachts, cutters, transports, &c., which amount to between 200 and 300 more. We give the list of 1835 in preference to that for 1840, as the navy in the latter year was much greater than it is probable it will continue at. At present there are 234 of all kinds of vessels in commission, and 43,000 sailors and marines employed in the navy service.

The ships in ordinary are vessels which are dismo

wed, and put aside in a harbour, with only a few persons on board to take care of them. A ship in service, or even thus taken care of, will waste and rot, it is said, in fourteen or sixteen years; but a plan has lately been devised by which those not in service may be hauled up out of the water, and placed under a dry shed, which it is expected will make them last much longer.

The cost of building a first-rate ship of war differs according to the price of wood, stores, &c. One of 120 guns, and 2602 tons burden, requires 5880 loads of timber, 20,101 yards of canvas, and 30,250 fathoms of rope, for hull, masts, yards, &c., and costs £100,394.

There are six marine arsenals or dockyards—Deptford, Woolwich, Chatham, Sheerness, Portsmouth, and Plymouth. The principal foreign stations for the navy are Gibraltar and Malta in the Mediterranean; Halifax and Quebec in North America; Jamaica and Antigua in the West Indies; and Trincomalee and Bombay in the East Indies.

RELIGION AND THE CHURCH.

The United Kingdom is a Protestant state, but all religions (not offensive to public or private morals) may be professed, and their different forms of worship practised, without interference from any quarter whatever. All denominations of Christians have their own churches, employ whom they please as their pastors, and are equally under the protection of the law. The empire contains several established or predominant churches, which are supported by special acts of the legislature. In England and Ireland, there is one church, denominated the *United Church of England and Ireland* (separate before the union of the two countries in 1800), being a Protestant Episcopacy. In Scotland, the established religion is Protestant Presbyterian. According to the constitution, the religion of the English church, and also the law of England, are established in every colony by the simple act of adding the territory to the crown, unless there be a special provision to the contrary. Thus the church of England prevails in all the great colonial dependencies, except Lower Canada, which is guarantied a Roman Catholic hierarchy; the Cape of Good Hope, which has been guarantied Protestant Presbyterianism; Malta, which is Roman Catholic; and so on with some minor colonial possessions.

Church of England.—The affairs of the church are managed by archbishops and bishops, but no step of any importance, out of the ordinary routine, can be taken without an act of Parliament, and therefore the church may be said to be governed by the legislature of the country. The sovereign is the head of the church, which is thus in intimate union with the state. The laity, except through their representatives in the House of Commons, possess no right to interfere in any shape whatever with the doctrines or practice of the church. The doctrines defined by law are contained in the Thirty-nine Articles, and the form of worship is the Book of Common Prayer. (See HISTORY OF THE CHURCH.) Ecclesiastically, the country is divided into *dioceses*, each of which is under the care of a bishop or archbishop; the dioceses are classed under two *provinces*, each of which is under the charge of an archbishop. At the end of 1839, the dioceses were as follow:—*Province of Canterbury*—Canterbury, London, Winchester, Litchfield and Coventry, Lincoln, Ely, Salisbury, Exeter, Bath and Wells, Chichester, Norwich, Worcester, Hereford, Rochester, Oxford, Peterborough, Gloucester and Bristol, Llandaff, St. Davids, St. Asaph, and Bangor. *Province of York*—York, Durham, Carlisle, Chester, Sodor and Man, and Ripon. Gloucester and Bristol were separate till lately. It is designed to unite the diocese of Sodor and Man to that of Chester, and the diocese of St Asaph to that of Bangor. Ripon is a new bishopric; and a bishopric of Manchester is also to be erected, its see being the county of Lancaster, which has hitherto formed part of the bishopric of Chester. The Archbishop of York is styled "Primate of England;" and the Archbishop of Canterbury, who ranks next to the royal family, is styled "Primate of all England." The other dignitaries of the church are archdeacons, deans, and prebendaries; the inferior clergy are rectors, vicars, and curates. Strictly there are only three grades, bishops, priests, and deacons, all clergymen belonging to one of these. The bishops are entitled to be addressed as "my lord," being legally spiritual peers. The revenues exigible by law for the support of the church are most unequally distributed, and the dioceses are of very unequal proportions. The same may be said of the working clergy, some of whom have wealthy and others very poor benefices; and some enjoy several benefices, while curates or assistants are paid on the meanest scale. The following table, extracted from a parliamentary paper, shows the number of benefices or livings, parishes, churches and chapels, with the population, in 1831:—

DIOCESE.	Number of Benefices.	Number of Parishes.	Churches and Chapels.	Population.
St. Asaph, - -	160	139	143	191,156
Bangor, - - -	131	179	192	103,712
Bath and Wells,	440	479	493	403,705
Bristol, - - -	255	298	306	232,036
Canterbury, - -	343	369	374	405,272
Carlisle, - - -	128	100	129	135,002
Chester, - - -	616	530	631	1,883,958
Chichester, - -	266	289	302	254,460
St. David, - - -	451	525	561	358,451
Durham, - - -	175	140	241	460,023
Ely, - - - - -	156	158	160	133,722
Exeter, - - -	607	681	711	705,416
Gloucester, - -	283	296	330	315,512
Hereford, - - -	226	346	360	200,327
Llandaff, - - -	194	221	228	181,244
Litchfield and Coventry, - - -	623	650	655	1,045,451
Lincoln, - - -	1,273	1,370	1,377	899,468
London, - - -	577	650	689	1,722,685
Norwich - - -	1,076	1,178	1,210	690,139
Oxford, - - -	208	207	237	140,700
Peterborough, -	305	335	338	194,330
Rochester, - -	93	107	111	191,875
Salisbury, - -	408	451	474	384,683
Winchester, - -	389	408	404	729,007
Worcester, - -	222	230	260	271,687
York, - - - -	828	741	870	1,496,538
Total, - - -	10,533	11,077	11,825	13,807,187

In 1831, on an average of the previous three years, the revenues of the archbishops and bishops amounted in the aggregate to £160,292 per annum, and are now believed to be about £150,000. The largest incomes were those of the Archbishop of Canterbury, £19,182; Bishop of Durham, £19,066; Archbishop of York, £12,629; Bishop of London, £13,929; Bishop of Winchester, £11,151; and Bishop of Ely, £11,105: the others were from about £1500 to £5000. The greater part of these revenues are derived from lands, or rents for grounds let on leases, and for which fines are taken at entry. The chapters of cathedrals, composed of deans, canons, and prebends, possess also large revenues; the dean of Durham, for instance, having £4800 a year, and other members of the chapter, £32,160. In 1834, the gross revenues of the deans and chapters amounted to upwards of £235,000. The revenues of the inferior or parochial clergy are derived from tithes commuted into money payments, and also fees at celebrating marriages, baptisms, and funerals. With respect to the parochial branch of church emoluments, we extract the following from Mr. M'Culloch's Statistical Account, 1837:—

"It appears that of 10,478 benefices, from which returns have been received, 297 are under £50 a year; 1629 are between £50 and £100 a year; and 1602 are between £100 and £150; so that there are 1926 benefices under £100 a year, and 3528, or more than a third of

all the benefices in the country, under £150 a year. On many of these benefices there are no glebe houses, nor do they possess the means of erecting any. Were the spiritual duties of the poorest of these livings not performed by the clergymen of the neighbouring parishes, it is difficult to see how they could be performed at all." Curates are paid by the rectors or vicars, whose servants they are; by law their salary cannot be under £80—the average is £81.

The total revenues of the church may be stated in general terms as follow:—

Archbishops and bishops, - -	£150,000
Cathedral and collegiate churches, -	250,000
Deans and other functionaries -	60,000
10,540 parochial benefices, - - -	3,100,000
Curates of resident clergy, - - -	87,000
Curates of non-resident clergy, - -	337,000
	£3,984,000

A proposal to introduce a greater equality into ecclesiastical salaries has for some time engaged the consideration of ecclesiastical commissioners; and lately an act of Parliament was passed appropriating revenues from certain sinecure offices in cathedrals, as they become vacant, to increase the incomes of the poorer classes of parochial incumbents.

The appointment of the clergy to benefices is as follow:—Presented by the crown, 952: by archbishops and bishops, 1248; by deans, chapters, and ecclesiastical corporations, 2638; by universities, colleges, and hospitals, 721; by private individuals, 5096; and by municipal corporations, 53. This, says M'Culloch, is not exactly correct, there being upwards of 200 omitted in the returns.

In 1831, the total number of congregations belonging to the established church was 11,825. At the same time there were the following number of congregations of dissenters:—Roman Catholics, 416; Presbyterians, 197; Independents, 1840; Baptists, 1201; Calvinistic Methodists, 427; Wesleyan Methodists, 2818; other Methodists, 666; Quakers, 396; Home Missionary congregations, 453; total of dissenting congregations (exclusive of Jews), 8414. It is considered probable that this number includes as many actual worshippers as the 11,825 congregations of the establishment, or about 4,000,000. Thus, reckoning dissenters and members of the established church at 8,000,000, about 6,000,000 remain who cannot be said distinctly to attend any place of public worship, though in most instances nominally belonging to the established church.

Church of Ireland.—In Ireland, the established religion is the Protestant Episcopacy, of which another branch is established in England. Thus the same doctrines, ritual, and forms of ecclesiastical government exist in these two countries, the hierarchies only being different with respect to their political status. At present, considerable alterations are in the course of being carried into effect with regard to the higher orders of the Irish clergy and their dioceses. Hitherto there have been four archbishoprics—Armagh, Dublin, Cashel, and Tuam, with thirty-two dioceses consolidated under eighteen bishops. When the new arrangement is carried fully into effect, by the demise of certain functionaries, there will be only two archbishops, those of Armagh and Dublin, and ten bishops. The Archbishop of Armagh is styled "Primate and Metropolitan of all Ireland;" and the Archbishop of Dublin is styled "Primate and Metropolitan of Ireland." There have hitherto been 33 deans and 30 chapters of cathedrals. The number of parishes, including perpetual curacies, is (or was lately) 2405, but many have no church, and the number of incumbents for the whole is 1385. According to the proposed arrangements, the money saved by the extinction of higher offices is to be appropriated to sustain churches and glebe-houses in parishes, and to execute other necessary purposes.

The revenues of the archbishops and bishops, in 1831, amounted to £151,128 annually; and the total income of the church, including value of glebe-lands and tithes, was £865,535. (*Parliamentary paper.*) The tithes of most parishes have since been compounded for. Mr. M'Culloch estimates the amount of composition for all the parishes at £704,313, 15s.

The Roman Catholic church in Ireland consists of four archbishoprics and twenty-three bishoprics, with parochial divisions and a body of clergy similar to the plan of the establishment; to it also belongs a considerable number of monasteries. After the Roman Catholic body the chief dissenting communion is that of the Presbyterians, in the northern parts of the country. The following table, drawn up by properly appointed commissioners, shows the state of religious parties in Ireland in 1834:—

PROVINCES.	Members Estab. Church.	Roman Catholics.	Presbyterians.	Other Protest. Dissent.	Total of all sects.
Armagh, -	517,722	1,055,123	638,073	15,823	3,126,741
Dublin, -	177,930	1,063,681	2,517	3,162	1,247,290
Cashel, -	111,813	2,220,340	966	2,454	2,335,573
Tuam,	44,599	1,188,569	800	369	1,234,337
Total,	852,064	6,427,712	642,356	21,808	7,943,940

According to law, two days throughout the year, exclusive of Sundays, are set apart as holidays, or sacred from labour, in England and Ireland, namely, Christmas and Good Friday.

Church of Scotland.—Protestant Presbyterianism, according to a polity introduced from Geneva, by Knox, was established in Scotland, by act of Parliament, in 1560, a few years after the previous Roman Catholic church had been completely dismembered and suppressed. The history of the country describes the struggles of this form of church government with Episcopacy during the greater part of the seventeenth century. Shortly after the revolution, an act of Parliament of William and Mary, in 1690, re-established Presbytery on the model of a statute of 1592. According to the plan thus established, and never afterwards materially altered, the clergy of the Church of Scotland are all equal in rank, and are officially ministers of parishes. To the church belongs a body of lay functionaries called elders, each church having several, who assist the clergyman at the communion, visit the sick, and generally act as a vigilant ecclesiastical police. This incorporation of laity with the church has given it a remarkably secure footing in the affections of the people. The ecclesiastical community is governed by a series of courts—the lowest being the kirk-session in every parish, composed of the minister and elders; the next is a court composed of the clergy of a division, called a presbytery, and an elder from each parish; the next is a synodal court, composed of functionaries from an aggregation of presbyteries; and the highest is the General Assembly, composed of delegates from the presbyteries, and which meets annually at Edinburgh. Constant residence in their parishes is obligatory on the clergy.

A few years ago, before recent alterations of doubtful legality, there were in Scotland 80 presbyteries, 1025 parishes, and 1050 ministers, some churches having two clergymen. The church has lately included ministers of chapels of ease in its judicatories; and if this be ultimately sanctioned as lawful, the above number of clergymen will be considerably increased. Nearly the entire body of clergy (ministers of chapels of ease, of *quoad sacra* parishes, not included) are appointed by lay patrons, or by the crown, in virtue of an act of Parliament in 1711–12, reviving ancient rights. The General Assembly, in 1834, passed an act, usually called the

Act, giving male communicants, heads of families, the right of objecting to the appointments by patrons; but this has been declared illegal by the civil courts, as interfering with the private property of patrons (the advowsons being saleable), and the question remains in a doubtful and precarious state (January, 1841).

The parochial clergy are supported by money stipends levied from the heritors or landowners, on the principle of commuted tithes or teinds. The amount of stipends yearly, depends on the average market value of corn, the averages being called *fiars*, which are struck annually by a jury in every county. Each minister being entitled to a certain quantity of grain, the value of the quantity, according to the fiars, is paid in money. If the teinds in the hands of the heritors be not all uplifted, the stipend is liable to be increased at the end of every twenty years. In 1838, the gross amount of teinds, paid to the clergy annually, was £146,942, and the amount left unappropriated in the hands of private individuals was £138,186. It is not stated by any authority we have consulted, what unappropriated teinds are in the hands of the crown; but it appears that there are bishops' teinds (formerly revenues of bishops), amounting to £15,741 annually, of which a portion is drawn by the crown, and £10,182 unappropriated. The total income of the church, including value of glebes and manses, is calculated at £274,620, being on an average of £256 each. In some parishes the exigible stipend is so small, that it is made up to a minimum of £150 by government. Among the largest stipends are those paid to the eighteen parish ministers of Edinburgh, who receive about £500 each, levied by a peculiar law as a money-tax from the inhabitants. The expense incurred for building and maintaining the fabrics of the churches and manses is defrayed by the heritors along with the stipends.

In Scotland, no secular days, such as Christmas and Good Friday, are legally set apart as holidays, the Scottish church recognising no saint's days or holidays whatsoever. But in each parish there are one or two fast days in the year, previous to the celebration of the communion.

Scotland abounds in dissenters, the bulk of whom are only separatists from the church, and, under various names, possess the same doctrines and formula. Besides these dissenters, there is a considerable body of Protestant Episcopalians, in communion with the Church of England; also Roman Catholics and Independents. The number of congregations belonging to the Established Church, and various dissenting bodies, may be summed up as follows:—Established Church, 1060; United Associate Synod, or Secession Church, and other Presbyterians, 550; Independents, 100; Episcopalians, 80; other Protestant sects, 40; Roman Catholics, 60; total, 1880.

EDUCATION.

England.—England is almost the only country in Europe in which there is no public or general system of elementary education. For the instruction of her clergy and gentry, she has several great public classical schools, among which are those of Winchester, Westminster, and Eton, and also two great universities, Oxford and Cambridge, but she has no national establishment, like those which exist in Prussia, Holland, and other countries. Elementary instruction is given to the children of the poorer classes by endowed and charity schools, and the children of the middle classes are chiefly educated at schools of private teachers.* In 1818, there were in England 4167 endowed schools, 14,282 unendowed schools, and 5162 Sunday-schools, educating 644,000, or one-sixteenth of the entire population, instead of the sixth, which Prussia has shown to be the proper amount of school-attenders. Thus England was shown to enjoy little more than a third part of the proper amount of education, even supposing the education she did enjoy to be good. Of the 11,000 parishes, 3500 were, in 1820, without a school.

Between 1818 and 1833, considerable advances were made in the establishment of infant and ordinary day schools; and in the last-mentioned year, the statement of schools throughout England and Wales, according to a parliamentary paper, was as follows:—

	Schools.	Scholars
Infant schools,	2,985	89,005
Daily schools,	35,986	1,187,942
Total,	38,971	1,276,947
Maintenance of infant and daily schools:—		
By endowment,	4,106	153,764
By subscription,	2,820	178,517
By payments from scholars,	29,141	732,449
By subscription and payment from scholars,	2,895	212,217
Sunday-schools,	16,822	1,543,890
Maintenance of Sunday-schools:—		
By endowment,	571	39,533
By subscription,	15,244	1,423,377
By payments from scholars,	101	5,718
By subscriptions and payments from scholars,	912	80,262
Schools established by Dissenters:—		
Infant and daily schools,	925	51,822
Sunday-schools,	6,247	750,107
Increase of schools between 1818 and 1833:—		
Infant and daily schools,	19,645	671,243
Sunday-schools,	11,285	1,123,397
Schools to which lending libraries are attached,	2,464	

In 1833, when this statement was compiled, the population of England and Wales was estimated at 15,000,000; the total number of scholars, therefore, as above enumerated at 1,276,947, gives the ratio of about 1 in 15 of the population at school. Since 1833, additional schools have been opened, particularly in connection with factories, mechanics' institutions, and by subscription. At present, a considerable proportion of the humbler order of schools are in connection with two great rival societies—the British and Foreign, and the National, both of whose head establishments are in London. Recently, an annual grant of £30,000 has been made by Parliament, to enable the privy-council to encourage elementary instruction in such schools as will submit to the supervision of an inspector. Religious sectarian differences have as yet frustrated every other step towards the establishment of a national system of education.

Ireland.—The chief educational establishment in Ireland is Trinity College in Dublin; and latterly a collegiate institution for conferring the higher branches of instruction has been established in Belfast. Elementary education has in recent times made great advances in this part of the United Kingdom. In 1831, there was established by act of Parliament a national system of education, the main feature of which is an arrangement by which the children are separated at certain times, and taught religion by their respective pastors—the necessary funds being provided by the state. By this means it was hoped that the great body of the people, and more particularly the children of the poorer class of Catholics, would at length be brought within the pale of education. We need not say how differently the plan has been regarded by various parties, both in Ireland and in Britain. The national board consists of nine commissioners chosen from both the Roman Catholic and Protestant bodies—the Roman Catholic and Protestant archbishops of Dublin being among the number. The commissioners receive from the public purse, and expend annually, the sum of £50,000: their estimate for the year ending March 31, 1840, was £50,357, which they proposed to

* It is believed that, at this moment, the incomes of the estates and other property left for educational purposes, would amount, if properly managed, to £400,000 a year.—*M'Culloch*, 1841. It may be added, that, besides the misappropriation of this sum, much of that which is actually expended on the antiquated education of the grammar schools is little better than thrown away. The abuse of educational endowments in England is a great national evil, requiring speedy correction.

lay out as follows:—On training of teachers, £2220; model schools, £390; grants towards building and establishing new schools, £12,000; salaries and gratuities to teachers, £23,000; infant schools, £220; agricultural schools, £150; inspection, £4975; books and school requisites, £4250; and general expenditure, £3152. The fee paid by each scholar is 1d. per week. In March, 1838, the number of national schools was 1384, attended by 160,548 children; but 195 new schools were soon to be opened, and it was expected that they would be attended by 40,106 pupils, making a total of 209,654. Reckoning, however, the schools said to be in actual operation in March, 1838, there were then upwards of 169,000 children receiving a regular elementary education, at an annual cost to the state of £50,000.

Besides this great national system of elementary instruction, the country possesses several religious or charitable associations for promoting education among the poorer classes: of these the principal are the Kildare Place Society, which lately supported 1097 schools, attended by 81,178 scholars, and the Church Education Society. The Roman Catholic body also supports a considerable number of schools.

Scotland possesses five colleges or universities for the higher branches of instruction, being those of Glasgow, St. Andrews, King's College and Mareschal College Aberdeen, and Edinburgh. Education at these institutions is generally conferred on a more liberal and less expensive scale than at the universities of England. Scotland has been long distinguished for its parochial institutions for elementary instruction, and also for its grammar-schools or academies in the chief towns, which serve as preparatory gymnasia for the universities. Each parish (some parishes in towns excepted) is provided with a school at the expense of certain landowners or heritors, in virtue of an act of Parliament passed in 1696, re-establishing statutes formerly in existence. Another act was passed (43 Geo. III. c. 54) in 1803, amending existing provisions on the subject, and ordaining "that the salary of each parochial schoolmaster shall not be under £16, 13s. 4d., nor above £22, 4s. 5½d.," except in particular cases mentioned; and provision is further made for augmenting this minimum and maximum at the end of every twenty-five years. An increase accordingly took place in 1828, raising the minimum to £25, 13s. 3⅓d., and the maximum to £34, 4s. 4½d. These payments are made according to the liberality of the heritors; and they besides must provide a small house for the schoolmaster, with a garden, as well as schoolhouse. The teacher is entitled to take small fees in addition, the more common fee is 2s. or 2s. 3d. per quarter for instruction in reading, with 6d. for writing. Altogether, this class of men are slenderly remunerated for their extremely valuable services. Within the last thirty years, the parish schools have been almost superseded in some quarters by the establishment of voluntarily supported institutions, better suited to the wants of the age.

In a report to Parliament in 1834, the number of schools in Scotland was stated as follows:—Parochial schools, 1047; pupils attending them, 68,293; total emoluments of teachers, £53,339. Voluntarily supported schools, 3995; pupils attending them, 154,160. It appears from this that there were 222,453 children receiving instruction (not including the attendance at Sunday-schools), and that of these only 68,293, or little more than one-fourth, were educated at the parochial schools. There were 5042 schools, and of these only 1047, or about one-fifth, were parochial establishments. The publication of this report caused considerable surprise, for it was generally believed that the great bulk of the juvenile population were instructed in the parish schools. The total emoluments of the parish teachers are stated at £53,339, or on an average, nearly £51, each; but of this sum only £29,642 is stated as salary there being collected in school fees, £20,717, and from other sources, £4975. The average annual expense of educating each child at the parochial schools, on the above data, appears to be 15s. 7½d. A great difference was found between the attendance of males and females. Taking the entire attendance on schools, there were 132,489 males, and 89,964 females. The result of the Inquiry seems to be, that about 1 in 9 of the population in Scotland attends school.

The generally imperfect instruction among the humbler orders of society in all parts of the United Kingdom is strikingly manifested in the returns of criminal commitments. On this interesting topic we extract the following results of an inquiry instituted with respect to education and crime, and lately imbodied in a pamphlet read before the Statistical Society of London, by Rawson W. Rawson, Esq.

"1st, That only 10 in 100 of the criminal offenders committed for trial in England and Wales are able to read and write well, and of these only 4 in 1000 have received such an amount of instruction as may be entitled to the name of education; and that these proportions are greatly below the average standard of instruction among the general population.

"2d, That these proportions are considerably higher in Scotland, and lower in Ireland; and the evidence appears to establish that the degree of instruction possessed by criminal offenders is an indication of that possessed by the general population in the same districts.

"3d, That above one-third of the adult male population of England cannot sign their own names, and that from one-fifth to one-fourth can neither read nor write.

"4th, That these proportions are much more favourable than in France or Belgium, where one-half of the youths at the age of eighteen could neither read nor write. The proportion of wholly ignorant criminals in those countries is correspondingly greater than in England.

"5th, That in England, instruction is twice as prevalent among male as among female criminals, and one-half more prevalent among males in the general population than among females. That in Scotland and Ireland it is three times as prevalent among the male criminals.

"6th, That this unfavourable condition of females in these two countries is further confirmed by the fact, that the proportion of female to male criminals is greater than in England; and it may be traced to the circumstance of the number of girls at school in those two countries being very small in comparison with the number at school in England. In comparing the three countries, the number of female criminals is found to be exactly in the inverse ratio to the proportion of females at school.

"7th, That education has a greater influence among females than among males in restraining them from the commission of crime.

"8th, That instruction prevails, upon an average, to a greater extent among the agricultural than among the manufacturing counties of England; but that the agricultural counties in the east, east-midland, and south-east, are greatly below the average."

DISPENSATION OF LAWS.

Justice, civil and criminal, is administered in England and Ireland according to laws and forms which took their rise in the former country, and were in time extended to the latter. The English law, as it is comprehensively termed, is of two kinds—written or statute law, consisting of the laws established by acts of Parliament, and consuetudinary law, consisting of customs which have existed from time immemorial, and have received the

function of the judges. Consuetudinary law is again divided into common law and equity; the former is administered by courts which profess to adhere strictly to the old laws of England, except in as far as they are altered by statute; the latter was founded upon the principle that the king, in cases of hardship, was entitled to give relief from the strictness of the common law. Equity, though thus originated, has now become also a fixed kind of law, and is administered in courts which decide according to established rules.

The principal court for civil suits is the Court of Common Pleas. The Court of King's (or Queen's) Bench, which was at first only a criminal tribunal, and the Court of Exchequer, which was designed only to decide in cases concerning the revenue, have become civil courts by means of fictions in their respective modes of procedure. The Court of Chancery, presided over by the Lord Chancellor, administers the law of equity. Courts under these designations sit both in Westminster and in Dublin: there are also courts of assize, which, in England, perform six provincial circuits, in some instances once, and in others twice a year. Minor cases, criminal as well as civil, are judged by bodies of provincial magistracy, who meet in every county once every quarter of a year. Besides the civil and criminal tribunals, there are ecclesiastical courts, which have jurisdiction in matters connected with marriage, wills, &c., and adopt the principles of the old canon law. There are also courts of admiralty, which decide questions between persons of different nations, according to the code of civil law recognised throughout Europe.

Guernsey, Jersey, Alderney, and other small islands in the British Channel, which politically belong to the United Kingdom, possess a variety of peculiar privileges and legal usages. The Isle of Man, situated in the sea between England and Ireland, likewise possesses certain peculiar privileges.

In Scotland, laws peculiar to itself, founded upon the principles of the Roman and the Feudal law, are administered by a supreme civil tribunal, denominated the Court of Session, which remains fixed at Edinburgh, and by a criminal tribunal, named the Court of Justiciary, which not only sits in the same city, but makes circuits through the provinces. Minor civil and criminal cases are also judged in Scotland by the sheriffs of the various counties, and the magistrates of the boroughs.

Scotland possesses the advantage of public prosecution of offences, the injured party being only a complainer to the public prosecutor. The chief public prosecutor is the Lord Advocate; the inferior public prosecutors, in connection with the various minor courts, are termed procuratore-fiscal. The whole expense of prosecution is defrayed by the national exchequer.

The peculiar boast of the criminal law of the British empire, is the *Jury*. In England and Ireland, where the principle of the criminal law requires the injured party or his representative to prosecute, he can only do so by permission of a jury of accusation, called the Grand Jury; another jury sits for the purpose of deciding if the evidence against the accused has established the guilt. These juries consist in England and Ireland of twelve men, whose verdict must be unanimous; in Scotland, the jury upon the charge consists of fifteen men, who decide by a plurality of votes. The jury is an institution of Scandinavian origin, transmitted to Britain through the Saxons, and it is justly considered as a most efficient protection of the subject from the vindictiveness of power. Civil cases, turning upon matters of fact, are also decided in all parts of the United Kingdom by juries.

The House of Lords, as the great council of the sovereign, acts as a court of last appeal from the civil tribunals of Britain and Ireland. Practically, the business of hearing these appeals is undertaken by some law lord, such as the Lord Chancellor, who, as there must be three persons present, is usually accompanied by a temporal peer and a bishop. Before deciding, the House sometimes demands the opinions of the English judges.

The laws and judicial usages of England are extended to most of the colonial possessions, along with all the rights and privileges which are common to British subjects. Hence, the inhabitants of the most distant part of the empire, whatever be their origin, rank, or colour, are entitled by the constitution to enjoy the same [illegible]ree of civil and religious liberty, and the same careful [illegible]ction of life and property, as their fellow-subjects in the mother country. This is an invaluable boon, for in no nation do the people practically enjoy greater liberty of speech or action (without licentiousness), and in none is the press more unshackled. Next in point of value to the privilege of trial by jury, the British subject places the *right of petition* to the House of Parliament, either for an improvement in the laws or a redress of grievances. As this involves the right of assembling publicly in a peaceful manner, or of *meeting constitutionally*, to discuss measures of government and legislation, it is allowed to form the impregnable bulwark of British political freedom.

COLONIAL POSSESSIONS.

The foreign possessions of the United Kingdom are infinitely more extensive and populous than the home country. They are about thirty in number, reckoning all classes of foreign stations and possessions, and lie in every quarter of the globe. The oldest existing colonies are the West Indies, chiefly consisting of a series of islands stretching across the great bay which nearly divides North from South America. Britain is mistress of Canada, New Brunswick, and Nova Scotia, on the mainland of North America, with Cape Breton, Prince Edward Island, and Newfoundland, on the coast. On the mainland of South America she possesses British Guiana. In the southern ocean she has appropriated the vast continent of Australia, containing the colonies of New South Wales and South and West Australia, also near its coast the island of Van Diemen's Land. In an easterly direction from these she possesses the New Zealand Islands; and near Cape Horn she possesses the Falkland Islands. In Asia she occupies a large part of Hindostan, and near its shores the large and beautiful island of Ceylon. In the Indian Ocean she possesses the Mauritius, and in the Atlantic the islands of Bermuda, Ascension, and St. Helena. On the continent of Africa, the principal British colony is the Cape of Good Hope, which is at present among the most thriving of our foreign possessions, and is almost the only spot in Africa in which civilization has been successfully planted. On the western coast of Africa lie the British colonies and military and naval stations of Sierra Leone, Gambia, and Fernando Po. In the Mediterranean, Britain has under her protection the Ionian Islands, and possesses Malta and Gibraltar, the latter being merely a military post at the southern extremity of Spain. In the German Ocean she holds the small island of Heligoland.

All are free crown colonies, except Hindostan, which is governed by and under tribute to the East India Company; the company, however, being in some measure controlled by the supreme government and the high functionaries whom it appoints. With the religion and law of England have been generally introduced the English language, usages and manners. The colonies possess little or no independent power. They are locally managed by governors and other functionaries appointed by the crown, and are subject to numerous regulations imposed by the imperial Parliament or by the colonial secretary. Canada, Nova Scotia, New Brunswick, Newfoundland, Jamaica, and other West Indian possessions, and the Cape of Good Hope, individually possess local legislatures, or parliaments, by which various interna concerns, such as making roads, education, imposition of

dues on shipping, &c., to defray expenses, are managed. The colonies are not taxed to support the home government, it being a principle in the constitution that there can be no taxation without representation; but they are subjected to various custom-house duties and restrictions, that greatly limit their capacity for improvement. All the raw produce they can export, such as sugar, coffee, timber, &c., is permitted to enter British ports at a duty much lower than the same kind of produce from foreign countries. This preference is in one respect advantageous to them; however, they are at the same time restricted in the purchase of various articles, except from Britain and its possessions. They are also prevented from manufacturing certain kinds of produce; for example, the inhabitants of Jamaica cannot refine their own sugar, but are compelled to send that article to England to be refined, and then buy it back again. By these arrangements, the colonies are, generally speaking, in a state of tutelage, and cannot, without a very great change in their affairs, start forward in a course of prosperity; while we at home, by being compelled to pay for their protection, and to buy their high-priced produce, receive no adequate benefit from their possession. The ostensible object of maintaining a connection with the colonies, is to find an outlet for British manufactures, and to employ shipping in the transport of goods. It is, however, extremely doubtful whether the expense incurred in supporting them is not much greater than all the profit derived from commercial intercourse. In a return to Parliament lately published, the following statement of the expenditure of the United Kingdom on the colonies, was given for the year ending March 1, 1836:—

Military charges, net,	£2,030,050
Civil charges, net,	480,154
Naval expenditure,	39,304
St. Helena (not classified),	90,883
	£2,646,410
Deduct repayments out of colonial revenues, &c.,	39,928
	£2,606,482

The expenditure for each colony, neglecting fractional parts of a pound, is as follows:—

MILITARY AND MARITIME STATIONS.

	Total Expenditure incurred by Great Britain.
Gibraltar,	£130,830
Malta,	110,818
Cape of Good Hope,	242,907
Mauritius,	78,284
Bermuda,	91,446
Fernando Po,	510
Ascension,	4,907
Heligoland,	1,016
Ionian Islands,	118,955
St. Helena,	87,559

PLANTATIONS AND SETTLEMENTS.

Jamaica, Bahamas, Honduras,	232,429
Barbadoes, Grenada, St. Vincent, Tobago, Antigua, Montserrat, St. Christopher's, Nevis, Anguilla, Virgin Islands, Dominica, St. Lucia, Trinidad, British Guiana,	373,342
Lower Canada, Upper Canada,	221,441
Nova Scotia, New Brunswick, Prince Edward Island, Newfoundland,	161,294
Sierra Leone, Gambia,	38,347
Ceylon,	133,805
Western Australia,	12,745

PENAL SETTLEMENTS.

New South Wales, Van Diemen's Land,	533,501
General charges,	23,449
	£2,606,483

The total value of exports to the above dependencies in 1838 (see statement of exports in another page), was about ten millions, the profit on which would be 10 per cent.; but the above sum incurred for protection is equal to 25 per cent. on the ten millions, and therefore there is a clear loss of 15 per cent. on colonial commerce. We have not seen any statement of what benefit is derived by British shipping from the colonial connection; but whatever it is, there can be no doubt that the same number of ships would be employed in the export and import trade, if the colonial connection was dissevered. It appears to us, that the only real advantage derived by Britain from her colonies, is the ready means afforded for sending large masses of her population as emigrants to these vast and fertile territories, where their settlements become the nurseries of future independent and civilized nations. In this respect, the colonial system of Britain is of immense importance to the cause of Christianity and civilization; and it is only matter of deep regret that, by proper management and the abolition of all restrictions, the colonies are not rendered more valuable and less expensive to the mother country. Reckoning the expense of military, naval, and civil protection, along with the heavy loss incurred by our obligation to buy their dear produce, it is calculated that in ordinary times the people of Great Britain lose between five and six millions annually by the colonies.

India is not, strictly speaking, a colony or possession of Britain. Politically it belongs to the Honourable East India Company, an association of British merchants, by whose servants it has been conquered, and is now locally governed, under the control and approval, however, of the crown, and a charter granted by the legislature. In virtue of an act of Parliament, passed in 1833, the East India Company is guarantied the government of the British territories in India until April, 1854; the company is not to carry on any trade; commerce to be open to British merchants; natural-born subjects of England may proceed to, settle, and buy lands in India; and natives of India, of whatever colour or religion, are to be eligible to office. India affords no direct revenue or tribute to England, as conquered countries are in general supposed to do. The only advantages which we derive from our occupation of these immense countries, are the undisputed possession of their trade, and the fortunes (sometimes very large) saved out of their salaries by British subjects who are appointed to discharge the duties of government. It is to the trade of the country, however, that we must look for any considerable and permanent advantage; and as this can only be made to increase by the cultivation of peace and order through the country, the interest of Britain becomes directly involved in maintaining henceforth the peace of India. The improvement which a few years of peace effects in these fertile countries, is astonishing: the population of a certain portion is supposed to have nearly doubled in the period of comparative peace from 1811 to 1830, being in the former year only forty five, and in the latter almost ninety, millions. Till she came under British rule, India never enjoyed twenty years of peace and orderly government in all her former history. Many faults and oppressions are laid to the charge of the English in India, from which it is impossible to defend them. The taxes (which fall chiefly upon the *land* and the poor peasantry) are very oppressive, and are rendered more so by the unprincipled conduct of the natives who are employed to collect them. Justice also is administered in a foreign language (Persic), and the courts are so few, that districts which are larger than Scotland have hardly one to each. Notwithstanding all this, the preservation of public order and of peace has conferred advantages on the country of the most inestimable kind. Latterly, considerable improvements have been effected by the establishment of schools, and by Christian missionaries of various persuasions.

The territorial extent of the British possessions in India is 514,190 square miles; the population, as far as it has been ascertained, 89,577,206; to which may be added eleven millions more for districts not included in the census. There are several states which are under British *protection*, though not directly governed by our establishments; these have an area of 614,610 square miles, and a population estimated at forty millions. The goods ex

ported from Britain in 1836 to the East Indies, including Ceylon, were valued at £3,876,196. As India, by the taxes which it pays to the Company, clears the cost of its own protection, and all its other public expenses, it may be considered as the only foreign possession of Britain whose trade affords an unburdened profit to the home country. The forces employed by the Company, partly composed of British regular troops, and partly of native levies, amounted in 1830 to 224,444 men.* In 1833–4, its annual revenue was £13,680,165, an enormous sum to be raised in a semi-barbarous country, yet no more than sufficient to discharge the annual expenses. The Company at that time was in debt to the amount of £35,463,483. (See article EAST INDIES.)

MANUFACTURING AND COMMERCIAL INDUSTRY.

Manufactures.—The manufactures of Great Britain surpass in extent and variety those of any other country; and from the superior character of its machinery, the economizing of time, and the refined skill of its workmen, the manufactures are generally produced at a lower rate, and of better quality, than in countries more favourably situated with respect to the production of raw materials.

The Cotton Manufacture is the most extensive of the whole, both with respect to the capital which it involves, and the number of people to whom it gives employment; it is supposed to form one-fourth part of the total industry of Britain. The number of work-people in its various departments (reckoning spinners, weavers, bleachers, &c.; engineers, smiths, and others engaged in the works) is estimated at 1,500,000. The capital invested in this large branch of manufacture at present is reckoned at about £30,000,000, and the total value of the goods annually produced is believed to be between £30,000,000 and £34,000,000. The raw material, or cotton wool, is brought chiefly from America, and a part also from the East Indies and Egypt. The chief seats of the manufacture are Manchester, Glasgow, and Paisley; and the magnificent apparatus of factories, machinery, and warehouses, with which these cities are filled, for this sole business, are the astonishment of all visiters. According to papers published a few years ago by the Board of Trade, there were in the empire at large 1262 cotton factories at work, and 42 empty, since the period of which estimate many more have been erected. It has been calculated that there are at least 10,000,000 of spindles and 100,000 power-looms in the United Kingdom. The cotton manufacture has latterly been greatly impeded in its tendency to increase by the establishment of cotton factories in Germany, Switzerland, and the United States, in the two first of which countries labour or food is cheaper than in Britain, and consequently goods are there produced at a somewhat cheaper rate.

The Woollen Manufacture.—This manufacture was the earliest established in England; it gives employment to above half a million of people, who receive on an average, men, women, and children, about £16 per annum. The goods manufactured are valued at twenty millions; the finer qualities of the raw material are imported from Germany, or from her colonies in Australia; the coarser are produced at home: the value of the whole is estimated at £6,000,000. This manufacture, particularly the finer kinds, is chiefly carried on in the west and north of England; both fine and coarse fabrics are now made at Galashiels in Scotland; and Kilmarnock and Stirling drive a thriving trade in carpets, bonnets, &c. In the finest kind of broadcloths, the Prussians are said still to excel the English.

The Silk Manufacture has been carried on in this country for a long period, having been first introduced in the fifteenth century by emigrants from France. It was for many years confined chiefly to Spitalfields in London, and to Coventry. There were then prohibitory duties on all foreign silks, but this, instead of fostering the manufacture, as was intended, only encouraged its proprietors in indolence, as they knew that they had the home market to themselves. These prohibitions have been partly removed since 1824; and those regulations which confined the manufacture to some particular spots, are also done away with; so that the trade has been roused from its inactivity, and a great deal more business is done than formerly. The quantity of silk for working imported in 1823 (the year before removing the restrictions) was two and a half millions of lbs.; the average quantity of the same material imported since, has been three and a half millions. The consumption of silk goods at home has increased more than a half. The annual produce of the manufacture is now estimated at £10,000,000; and it is supposed to give employment to about 300,000 work-people. Its chief seats are Spitalfields in London, Coventry, and latterly Manchester, Paisley, and Glasgow, where some of the most beautiful fabrics are now made.

The Leather Manufacture is of considerable importance. The value of the different articles of which it forms the material, is estimated at £15,000,000; this includes gloves, saddlery, boots and shoes, &c. The increase of this trade in late years has been very great; *hides* are imported from all quarters of the world, and the quantity has doubled within a few years. The number of lamb and kid *skins* imported, in 1830, was about three millions.

Iron, Cutlery and Hardware.—This is one of the manufactures in which Britain particularly excels. The abundance of her mines of iron, copper, tin, lead, and coal, and the easy access which can be had to them at all points by sea, river, or canal, give facilities which are possessed by no other country. The annual value of the manufactured goods is estimated to be above £17,000,000, and employment is given to 320,000 men in the working of copper, brass, pewter, steel, tin, and other metals. The chief seat of the manufacture of the finer and more skilled articles, is Birmingham, Sheffield, and the immediate vicinity; and from these districts metal goods of all descriptions, implements of war, and the most elegant ornaments of peace, are despatched to all parts of the world. For heavy cast-iron goods, cannon, parts of machinery, &c., Carron, in Scotland, has been long celebrated.

The Earthenware, China, and Glass Manufactures, rank next to those we have mentioned. The number of people employed cannot be easily estimated; but as no money has to be sent abroad to purchase any part of the material of these works, the whole proceeds of the goods go to pay wages at home. The annual value of the glass manufactured is about two and a half millions, and that of the pottery and earthenware about three and a half. It is believed that the trade in glass might be doubled, if relieved of the burdensome excise duties and regulations which prevent improvement.

The whole value of the manufactures of all kinds produced annually in Great Britain, is reckoned to be about £150,000,000.

Commerce.—Since the middle of the last century, the rapid progress of improvement in manufactures has continued to afford new materials and goods for exportation, and the increase of trade has been in proportion. Since 1800, the import and export trade have prodigiously increased. The late and present extent of the import and export trade of the United Kingdom is as follows:—In the year ending January 5, 1840, the official value of imports was £62,004,000; official value of exports of British produce and manufactures, £97,402,726; official value of exports of foreign and colonial merchandise, £12,795,990; total exports £110,198,716.

Quantities of the Principal Articles of Foreign and Colonial Merchandise entered for Home Consumption, in the Years ending January 5, 1839 and 1840.

Declared Value of British and Irish Produce and Manufactures Exported from the United Kingdom to different Countries in 1838.

British Possessions.—East India Company's territories and Ceylon, £3,876,196; British West Indies, £3,393,441; British America, £1,992,457; Australia, £1,336,662; Gibraltar, £894,006; Cape of Good Hope, £623,321; Mauritius, £467,342; Channel Islands and Man, £343,854; West Coast of Africa, £413,354; Malta, £226,040; St. Helena, &c., £15,065; total, £13,581,830.

Foreign States.—Russia, £1,063,241; Sweden, £102,647; Norway, £77,485; Denmark, £181,404; Prussia, £155,223; Germany, £4,066,906; Holland, £3,540,429; Belgium, £1,0[illegible]; France, £2,314,141; Portugal, £1,165,395; Azores, £[illegible]; Madeira, £34,917; Spain, £243,869; Canaries, £47,693; Italy and Italian Islands, £3,076,211; Ionian Islands, £96,160; Turkey and Greece, £1,767,907; Syria, £188,440; Egypt, £242,[illegible]; Barbary, £74,013; East Coast of Africa, £10,765; Cape Verd Islands, £1392; Arabia, £167; China, £1,204,356; Sumatra and Java, £505,302; Philippine Islands, £31,780; New Zealand, &c., £1095; Hayti, £200,139; other Foreign West Indies, £1,026,392; United States, £7,585,760; Mexico, £439,776; Columbia, £174,338; Brazil, £2,605,604; States of La Plata, £680,345; Chili, £413,647; Peru, £412,196; total, £21,479,130.

In all, £50,060,970; of which Europe, £21,171,504; Africa, £1,647,759; Asia, £6,689,866; Australasia, £1,337,757; North America, £9,578,217; West Indies, £4,708,972; Mexico and South America, £4,726,906.

It will be observed from these statements, that the best customer of Great Britain is the United States of North America, the trade with which has prodigiously increased since the colonial connection was dissolved. The exports to Brazil are likewise considerable, being at present about £4,000,000. There is reason, however, to fear that both these countries contemplate the exclusion of British goods, in consequence of our high prohibitory duties on their produce. For a further notice of British manufactures and commerce, we refer to the article COMMERCE, and also to the articles on the various branches of manufactures.

SHIPPING.

The following statements embrace a view of the number of ships belonging to and engaged in the commerce of the British empire:—

Account of the Registered Shipping belonging to the Empire on the 31st of December, 1839, and Ships built during the previous year.

	Ships Registered.		Ships Built.	
	1839.		1839.	
	Tons.	Men.	Ships.	Tons.
England,	1,983,522	114,593	951	144,500

Account of Shipping employed in the Coasting Trade in the Year ended January 5, 1840, stated exclusively of Ships in Ballast.

	Entered Inwards.		Cleared Outwards.	
	1839.		1839.	
	Ships.	Tons.	Ships.	Tons.
Employed in intercourse between Britain and Ireland,	9,221	1,176,893	17,335	1,70[illegible]
Other Coasting Ships,	121,033	9,433,511	125,560	9,[illegible]
Totals,	130,254	10,610,404	142,895	11,[illegible]

The following is the list of Steam-vessels belonging to the British Empire in 1836:—

	Vessels.	Tonnage.
England,	268	34,314
Scotland,	93	11,589
Ireland,	71	13,460
Guernsey, Jersey, and Man,	7	914
British plantations,	30	7,693
Total,	600	67,966

This is very nearly double since 1829. Now (1841) the list might be vastly increased by the addition of the Atlantic steamers, and others of great power.

None of the above accounts include the great number of canal or fishing-boats with which many parts of the coast are swarming.

PUBLIC WORKS, CANALS, RAILROADS, DOCKS, &c.

Connected with our manufactures, are the great works of the civil-engineer—canals, roads, docks, bridges, piers, &c.—works which attest, more obviously than any others, the activity, power, and resources of the country. It is to the facility of internal communication afforded by these works, that the heaviest goods, though manufactured in the interior of the country, can be carried to sea-ports for exportation, without any burdensome addition to their price; and materials for their different manufactures can be carried to inland towns from sea-ports, by canals or railroads, with the same advantage.

The length of the *Turnpike Roads* in 1829 (the latest authentic account) was 24,541 miles; annual income, £1,314,716; debt, £5,200,000. The income, of course, was from tolls, and was intended for repairing the roads and paying the interest of the money borrowed for constructing them. The total length of the canals, in the same year, was 2880 miles; the income on these canals amounted to £13,205,116, which, besides keeping them in repair, afforded an average profit to the proprietors of 5¼ per cent. on their capital.

The *Bridges, Aqueducts, and Tunnels*, which have been erected in connection with roads and canals, are more magnificent and numerous than those of any other country in the world. To estimate their number would be difficult; but we may mention, that, in London, the Waterloo and London bridges alone cost very nearly two and a half millions of money. The iron bridges which have been erected in different places are the admiration of all foreigners. Their arches are constructed of a number of strong ribs of metal, standing apart from each other like the joists of a house, and on these the floor or roadway is formed. Bridges of suspension are now also common, in which the roadway is suspended by iron bars, from strong chains which are fixed in the earth, and then hung over high pillars at each end of the bridge; by this means bridges can be constructed over deep and broad waters, where it would have been altogether impossible to stretch an arch of any other kind. On a well-frequented road, bridges costing £14,000 or £18,000 are often constructed merely to shorten the distance by a mile or two, or to avoid an inconvenient ascent in the old track. Were it possible to estimate the amount of capital laid out on this kind of improvement alone, it would be almost incredible.

The number of *Railway Companies* incorporated by act of Parliament up till January, 1839, in Great Britain and Ireland, was 107, and the capital which they were allowed to raise by shares was £41,610,814; they were besides allowed to raise by loan £16,177,630. A considerable number of these railways being jobbing, or at least crude speculations, have never commenced, and the number of railways actually begun to be prepared or finished at the beginning of 1840, in the United Kingdom, was only about fifty. The principal lines are—the Liverpool and Manchester Railway, about thirty-two miles long, and uniting these populous towns; the London and Birmingham Railway, about one hundred and twelve miles long, connecting the metropolis with the centre of England; the Grand Junction Railway, continuing the London and Birmingham line to that of Liverpool and Manchester, and also to a railway proceeding northward to Lancaster, and thus forming a most important thoroughfare obliquely across the country; the Midland Counties, North Midland, and Great North of England Railways, connecting the great seats of trade in Northumberland, Durham, Yorkshire, and Derbyshire, with the London and Birmingham line; the Newcastle and Carlisle Railway, connecting these towns; the Great Western Railway, about one hundred and seventeen miles long, connecting London with Bristol, and with smaller tributary lines opening up the west of England; the South-Western Railway, about seventy-seven miles long, connecting London with Southampton; the Manchester and Leeds Railway, connecting these populous towns. In Scotland, the Edinburgh and Glasgow Railway, and the Glasgow and Ayr Railway, are the principal lines. The most prosperous of all the lines is that of the London and Birmingham, the weekly revenue of which is upwards of £16,000: the weekly revenue of the Grand Junction, which joins it, is £9000.*

Docks, Piers, and Lighthouses.—Docks are artificial basins built of stone for the reception of ships: they are of two kinds, wet and dry. A dry dock is a receptacle where vessels are built or repaired; after which the tide is admitted by flood-gates, and they are floated out to sea. Wet docks are constructed for the use of ships when loading and unloading, it being found that when they are allowed to settle down unequally on the mud or sand of rivers and harbours, their timbers are strained, and the vessels considerably damaged; in the wet docks they are kept always afloat. The capital expended by some of the dock companies in London is immense. The capital expended by the London Dock Company in purchasing ground (chiefly the sites of houses and streets) was more than one million; and the whole cost of the works was £3,938,310.

The docks at Liverpool have an area of water of about 91 acres, and the quay space is nearly eight miles in total length. The business transacted may be conjectured from the fact, that the dues paid by vessels entering the docks in 1840, was £497,477, 18s. 6d. Few of the large sea-ports are without the accommodation which docks yield to commerce; those at Leith contain ten acres of water-room, and have cost £285,108. It would be idle to attempt a description or even enumeration of the immense number of piers and harbours which have been constructed at the different sea-ports. At every place where the profits of trade seemed to authorize such erections, capital was seldom deficient to complete them.

The *Lighthouses* of Britain are perhaps the most remarkable part of the nautical apparatus of the islands. The capital expended upon them has been large, and the skill with which some of them, such as the Bell-Rock and Eddystone lighthouses, are constructed for durability in the midst of a tempestuous sea, could only have been exhibited in a country where mechanical science existed in its highest perfection; and there is hardly a dangerous or doubtful point along the coast where the mariner is not guided by a light on some headland or rock. There is, however, much complaint concerning the dues levied from ships for lighthouse expenses; some of them are held as profitable tolls by private families, and in others the money levied is applied to purposes quite unconnected with lighting.

SOCIAL STATISTICS.

The population of the United Kingdom consists of various classes of persons, among whom, with respect to

* See article ROADS, CANALS, and RAILWAYS, for further information.

wealth, education, and general condition, even more than the usual differences are to be found. Notwithstanding great improvements in agriculture of late years, the country cannot produce wheat, oats, and other cereal grains, in sufficient abundance to meet the demands of a daily increasing and hard-labouring population, and what is deficient is excluded, except at high duties, which render the price of bread higher than it is elsewhere in Europe.* Without entering minutely into this great and much debated question, it may be mentioned as a general result, that the difficulty of purchasing food leads to a corresponding depression of circumstances in the humbler orders of the community, and either causes an extensive dependence on poor-rates for support, or produces debased and dangerous habits of living. The poor of England are entitled by law to support in workhouses, according to the provisions of an act of Parliament passed in 1834; in 1839, the money expended on paupers in England was £4,406,907, being only about two-thirds of what had, during some years, been expended under a somewhat different system, and a less careful administration of funds. In Ireland, a similar poor-law has lately been introduced, and is likely to prove of great service to that part of the empire. In Scotland, none but the impotent or very aged poor can legally claim relief from the parish funds: these are very inadequately supplied. The humbler classes are accordingly, in many places, in a very miserable condition. The entire outlay for the parochial poor in Scotland was lately no more than £140,000.

The present condition of society throughout the United Kingdom exhibits the spectacle of great and valuable efforts at improvement among the more enlightened classes. Within the last ten years, the utility of the press has been immensely increased, and works of instruction and entertainment have been circulated in departments of society where formerly nothing of the kind was heard of. The establishment of mechanics' institutions, lyceums, exhibitions of works of art, reading societies, and other means of intellectual improvement, forms another distinguishing feature of modern society. At the same time, great masses of the people, for lack of education, and from other unfortunate circumstances, are evidently gravitating into a lower condition. From these reasons, and others connected with the development of our manufacturing and commercial system, convictions for crime have been latterly increasing. In 1837, there were 17,090 convictions for crime in England. The late establishment of an improved prison system in Scotland, independently of other advantageous circumstances, is expected to greatly lessen the number of offenders in that part of the empire.

England is now provided with a law for enforcing the registration of births, marriages, and deaths; but in other parts of the empire, Scotland in particular, the arrangements for these useful objects are very imperfect. During the year ending June 30, 1839, the number of births, marriages, and deaths, in England and Wales, was as follows:—births, 480,540; marriages, 121,083; deaths, 331,007. This enumeration, compared with the previous year, shows, for births, an increase of 80,828; for deaths, a decrease of 4949; and for marriages, an increase of 9602. At the celebration of marriage, parties are required to sign their names; and it appears that, on an average, 33 in the 100 of males, and 49 in the 100 of females, sign with a mark, being unable to write. The average age of men in England at marriage is about 27 years, and of women, 25 years and a few months.

An account of the population of the empire has been taken at intervals of ten years from 1801; and the following table will show the gradual increase which has occurred during these intervals.

	1801.	1811.	1821.	1831.
England and Wales,	8,872,980	10,163,876	11,978,875	13,894,569
Scotland, - - -	1,599,068	1,805,688	2,093,456	2,365,807
Ireland, - - - -	—	4,500,000	6,802,093	7,734,368
Army and Navy, -	470,500	640,500	319,300	277,017
Totals,	10,942,548	17,109,964	21,193,724	24,271,759

The increase of population has been greatest in the manufacturing districts, where, in some instances, it has been double of those which are merely agricultural; as, for example, the increase in the manufacturing counties of England, from 1821 to 1831, was 22 per cent., while in the agricultural counties it was only 10½. It has been ascertained, that, in 1831, there were of the classes belonging to the aristocracy in Great Britain, from 3000 to 4000 families; of squires and gentlemen, who are landproprietors, stockholders, money-lenders, &c., from 50,000 to 60,000 families; of learned professions—36,000 clergy of all denominations, about 30,000 lawyers, and 50,000 physicians, surgeons, apothecaries—making 116,000 families, with half as many more dependents; of farming tenants, about 250,000 families, and of their labourers, 400,000 families; of merchants, shopkeepers, and general traders, 900,000 families; of artisans, 200,000 families; of manufacturers in all lines, 500,000 families, of labourers, porters, and servants, 600,000 families; and of destitute paupers, soldiers, &c., 800,000 families.

The statement of the aggregate population of the British islands, affords no idea of the force which is actually employed in agriculture and manufactures. The effective labourers (men) are estimated to amount to no more than 7,000,000, whereas, reckoning the powers exerted in productive industry by animals, mills, steam-engines, and mechanism of various kinds, the force is equal to the strength of more than *sixty millions* of working men.

An estimate was formed a few years ago of the total annual income of all classes of people in the United Kingdom, with the aggregate value of the articles of use and luxury which each produces, and from this we make the following extract:—

Value of agricultural and dairy produce, -	£236,000,000
... Mines and minerals, - - - -	21,400,000
... Inland and foreign trade, - - - -	57,773,000
... Manufactures, - - - - - -	148,050,000
Total of produce and property annually created in Great Britain, - -	£503,223,000

An estimate was also formed of the value of the whole property, public and private, which has been created and accumulated by the people of this country, and which they now actually possess. This value, when the sum is expressed by figures, is so immense, that it eludes the imagination to conceive it.

Value of productive private property, -	£2,995,000,000
... unproductive, or dead stock, - -	540,700,000
... public property of all kinds, - -	103,300,000
Total public and private property, - -	£3,679,000,000

The wealth of the empire is distributed in the following proportions between the three countries:

	Productive private property.	Unproductive private property.	Public property.
England, -	£2,054,600,000	£374,300,000	£42,000,000
Scotland, - -	316,100,000	51,100,000	3,000,000
Ireland, - -	622,100,000	116,400,000	11,900,000

The proportion which these values bear to the population in each country is not suggested by the table; but in England (taking productive and unproductive property together) the ratio is £186 to each person; in Scotland, £160; and in Ireland, £96.

The following is the latest statement of the extent and population of the empire:—

*The annual consumption of all kinds of grain in the United Kingdom was, a few years ago, estimated at 52,000,000 quarters, about a twelfth part of which would require to be imported. All ordinary kinds of animal food, or foreign produce, are entirely excluded.

	Population.	Sq. Miles.
British Islands,	24,371,758	90,948
British dependencies in Europe,	247,701	
North America, Canada, &c.	1,066,208	1,930,000
West Indies,	884,050	
Australian Colonies,	39,685	1,406,000
Islands of Ceylon and Mauritius,	1,034,736	21,000
British possessions in Africa,	154,046	91,000
East India Empire,	89,577,206	826,650
Total,	117,375,390	4,457,598

Since the preceding details were collected, the returns of the census of Great Britain for 1841 have been published. It appears from these, that on the night of the 6th of June, 1841, the population was as follows:—

England,	14,995,508
Wales,	911,321
Persons travelling on railways and canals,	4,896
	15,911,725
Scotland,	2,628,957
Man, Jersey, and other islands in British Seas,	124,079
Total of Great Britain,	18,664,761

If to this we add 8,205,382 for Ireland, which, however, we have only on newspaper authority, the total population of the United Kingdom, on the night of June 6, was 26,870,143. The returns include only such part of the army, navy, and merchant seamen, as were at the time of the census within the kingdom on shore.

The increase of the population, as compared with the returns of 1831, is at the rate of 14·5 per cent. for England; 13 per cent. for Wales; for Scotland, 11·1; for the islands in the British Seas, 19·6: making the increase for the whole of Great Britain 14 per cent., being less than that of the ten years ending 1831, which was 15 per cent.

The number of houses in England is—Inhabited, 2,753,295; uninhabited, 162,756; building, 25,882. The number in Wales, inhabited, 188,196; uninhabited, 10,133; building, 1,769. In Scotland, inhabited, 503,357; uninhabited, 24,307; building, 2,760. In the islands of the British Seas, 19,159 inhabited; 865 uninhabited; and 220 building. Grand totals for the whole of Great Britain, 3,464,007 inhabited, 198,061 uninhabited, 30,631 building—altogether, 3,692,679 houses.

DESCRIPTION OF ENGLAND.

The ancient kingdom of England, inclusive of Wales, forming geographically the principal division of the island of Great Britain, and politically the chief division of the United Kingdom—the country in which, it is no boast to say, the arts and institutions of social life have made the greatest advance they have ever done in any part of the world—enjoys a situation which has unquestionably tended much to make the country what it is, both politically and socially. The island of which it is the southern and larger portion, is protected from neighbouring countries by a sea of sufficient breadth in most parts, and sufficiently uncertain in its condition, to throw almost insuperable difficulty in the way of an invading force. Placed in a medium latitude, it is further saved by the surrounding ocean from those extremes of heat, cold, and aridity, to which continental countries in both higher and lower parallels are often subject. While there are some districts, chiefly in the west and north, in which an uneven surface prevails, the country may be generally described as of a level and fertile character. Almost everywhere, the eye rests upon the evidences of a long-enduring cultivation, in rich corn-fields and meadows, surrounded by well-grown hedges and rows of trees; the elm-surrounded Gothic parish church, the clean honey-suckled village, and the well-wooded park connected with the residence of the noble and gentleman, being other notable features in the landscape. When we turn from merely rural scenes, we see not less striking evidences of an advanced civilization, in frequent brick towns and "towered cities," generally overhung by clouds of smoke resulting from the coal everywhere used for domestic, if not also for manufacturing purposes. The peculiar features of some of these cities—Liverpool, Hull, and Bristol, vast depôts of mercantile shipping; Manchester and Birmingham, sites of extensive manufactures; London, in itself a superb port, the seat of the government and the residence of a class of unprecedented wealth and splendour—will be more particularly adverted to in the sequel.

England is situated between 50° and 55° 45′ north latitude, and 6° west and 1° 50′ east longitude, from Greenwich Observatory. On the north, the only direction in which it is not surrounded by the sea, it is divided from Scotland by a series of rivers and a chain of mountains. The greatest length, from Lizard Point in Cornwall to Berwick-upon-Tweed, is 400 miles; and the greatest breadth, from St. David's Head in Pembrokeshire to the east of Essex, is 300 miles. The area has been variously estimated at 50,387 and 57,960 square miles; it has also been estimated at 37,784,400 acres, of which only about a fourth part is said to be uncultivated.

England is divided into fifty-two counties, forty of which form England Proper, while twelve belong to Wales. They may be thus enumerated:—*Southern Counties*—Cornwall, Devon, Somerset, Dorset, Wilts,

Hampshire, Berkshire, Sussex, Surrey, and Kent. *Midland Southern Counties*—Middlesex, Hertfordshire, Bedfordshire, Buckinghamshire, Oxfordshire, Gloucestershire, Cambridgeshire, Huntingdonshire, Northamptonshire, Warwickshire, and Worcestershire. *Midland Northern Counties*—Rutlandshire, Leicestershire, Staffordshire, Nottinghamshire, and Derbyshire. *Eastern Counties*—Essex, Suffolk, Norfolk, and Lincolnshire. *Counties bordering on Wales*—Monmouth, Herefordshire, Shropshire, and Cheshire. *Northern Counties*—Lancashire, Westmoreland, Cumberland, York, Durham, and Northumberland. *Counties in South Wales*—Glamorganshire, Brecknockshire, Caermarthenshire, Pembrokeshire, Cardiganshire, and Radnorshire. *Counties in North Wales*—Montgomeryshire, Merionethshire, Flintshire, Denbighshire, Caernarvonshire, and Anglesea. The capital city is LONDON, which is also the metropolis of the United Kingdom. The counties are subdivided into hundreds, wapentakes, tithings, &c., the whole containing 25 cities (inclusive of London), and 172 boroughs. For ecclesiastical purposes, the country is divided into 11,077 parishes; the largest number in any county being 475, in Somersetshire, and the smallest 32, in the county of Westmoreland.

Owing to the limited extent and insular position of England, it contains no rivers comparable in magnitude to those of various continental countries. There are, nevertheless, some fine navigable streams, as the Thames, Medway, Humber, and Tyne, on the east side of the island, and the Mersey and Severn on the west side. The Trent, Ouse, Tees, Wear, Dee, Avon, and Derwent, are minor, but not inconsiderable rivers, besides which there are many of inferior importance. England contains no large lakes; but those of Cumberland, Westmoreland, and Lancashire, though of small size, are celebrated for the picturesque scenery by which they are surrounded.

Wales and the west side of England generally are mountainous. The chief ranges of mountains in this district have been classed under three heads—the *Devonian Range*, stretching from Somersetshire, through Devon, into Cornwall, and terminating with the promontory of the Land's End; the *Cambrian Range*, extending from the Bristol Channel through Wales; and the *Northern* or *Cumbrian Range*, stretching from Derbyshire, through Cumberland, and passing into Scotland. None of the individual hills exceed 3000 feet in height, except a few in Wales; the highest being Snowdon in Caernarvonshire (3571 feet). In the central and eastern parts of England (south of Yorkshire), there are a few ill-defined ranges of swelling eminences, but none which reach the altitude of 1000 feet. Besides Snowdon, the principal eminences in England are David (3427 feet), and Llewellen (3469), both in Wales; Skafell (3166), Skiddaw (3022), and Saddleback (2787), in Cumberland; and Helvellyn (3055), in Westmoreland. The loftiest points in the Devonian range are not more than from 1000 to 1200 feet in height.

GEOLOGICAL STRUCTURE.—SOIL.—CLIMATE.

The surface of England includes specimens of the whole extent of the series of rocks, from the primary, which are found in the ranges of mountains on the west, to the lowest of the tertiary, which compose several districts in the south-east; strata intermediate to these divisions being found in succession, in proceeding from the west and north towards the east and south.

In Cornwall and Devonshire, eminences of granite, serpentine, and felspar porphyry, occur, while the slopes resting on them are composed of different kinds of slate. The granite of this district is extensively used for paving in London, though considered less hard and durable than that brought from Scotland. The Welsh mountains are composed chiefly of varieties of slate, with some intermixture of volcanic rocks, as basalt and trap; while a rich coal-field, one hundred miles in length and from five to ten in breadth, rests upon their southern verge, extending from Glamorgan into Pembrokeshire, being the largest coal-field in Great Britain. The northern range of mountains is also chiefly composed of slate rocks, there being only one mountain of granite near Shap in Westmoreland.

Between these ranges of mountains and a line drawn from Exmouth, through Bath, Gloucester, Leicester, Nottingham, and Tadcaster, to Stockton-upon-Tees, the surface is composed of the lower secondary strata, including rich beds of coal, the existence of which in this situation is mainly what has enabled England to become the first manufacturing country in the world. The eastern parts of the counties of Durham and Northumberland, from the Tees northward to Berwick, form a peculiarly valuable coal-field, of numerous beds, from which the metropolis and other cities in the east of England and elsewhere are supplied with this important mineral. Another coal-field of great value, and that upon which the manufactures of Manchester depend, extends northwards from Macclesfield to Oldham, and thence westwards to Prescot near Liverpool. A coal-field near Wolverhampton, in Staffordshire, is the most valuable in the centre of England: upon it depend the extensive metallic manufactures of Birmingham.

To the east of the line drawn from Exmouth to Bath and thence by Gloucester, Leicester, and Tadcaster, to Stockton-upon-Tees, we find the upper rocks of the secondary formation, presenting in succession red sandstone and red marl, lias limestone and clay, oolitic limestone, green sand with clay, and finally chalk. Connected with the red marl, great strata of rock-salt are found; these are extensively dug in Cheshire and Worcestershire for domestic use. Lias, which extends from Lyme in Dorsetshire to Whitby in Yorkshire, is remarkable for the remains which it presents of the large saurian reptiles. Beds of oolite limestone, so called from the small egg-like globules contained in it, cover the southern part of Gloucestershire, and a great part of Oxfordshire, Northamptonshire, Rutlandshire, and the eastern side of Lincolnshire. The Portland stone, so extensively used for building, and which is quarried in the Isle of Portland, belongs to this class of rocks. The chalk exists everywhere to the south-east of a line commencing near Dorchester on the south coast, and passing through Wilts, Berks, Norfolk, and so on to Flamborough Head—excepting in Sussex and Kent, where it has been carried off by denudation, exposing a peculiar formation called the *wealden*, and in the bed of the Thames near London, and one or two other places, where tertiary beds of clay occur.

Tin-ore, containing about three parts metal out of four, is found in thick veins or vertical beds in the granite of Cornwall, where it has been wrought since before the conquest of the country by the Romans. Copper-ore is also found extensively in that district, generally in continuation of veins, which, in the upper parts, have been composed of tin-ore; and in several of the same veins, lead, zinc, and antimony are found. A mountain of copper-ore, named Parys Mountain, has long been wrought in the Isle of Anglesea, but is now supposed to be nearly exhausted. Next in importance to coal, as a mineral product, is iron, which is extensively diffused throughout England, though chiefly wrought in the neighbourhood of coal, on account of that fuel being required for smelting it. In 1839, this valuable metal was produced in South Wales to the amount of 380,000 tons. The chief other districts where it is wrought are Staffordshire, Worcestershire, and Yorkshire; the entire produce in that year being a million of tons. In an account of the mineral productions of England, it would be improper to overlook its clay, so extensively used in

the manufacture of pottery (chiefly in Staffordshire), and in making bricks and tiles for building.

The great south-east division of England, in which a comparatively level surface prevails, exhibits a soil which is either chiefly chalky, or chiefly clayey, according to the character of the substratum. Interspersed are a few sandy tracts, of which Bagshot Heath may be cited as an example. In the mountainous districts, the usual light soil resulting from the early rocks prevails, excepting where, in the north, there has been a peaty admixture. Upon the whole, England may be said to possess a large proportion of good and productive soil. Probably not above one-ninth of the entire surface (Wales being included) is unsoceptible of tillage.

The climate of England is, as already mentioned, remarkable for its exemption from extremes of heat and cold. It displays an uncommon amount of variation within a narrow range. The average temperature in winter is about 42° of Fahrenheit; in summer, the day temperature is generally about 62°. It is only on rare occasions that the thermometer reaches 80°, or sinks below 20°. The neighbourhood of the sea, which partly accounts for this moderation, is also the cause why the climate of England is more humid than is usual in continental countries of similar latitude. Being inclined to cold and damp, it is more favourable to the growth than to the ripening of vegetable productions. It is certainly not unfavourable to either the physical or moral condition of the people. Perhaps even its uncertainty has been the subject of too much grumbling. On this point we may adduce the cheerful opinion of Charles II., as recorded by Sir William Temple. "I must needs," says Sir William, "add one thing more in favour of our climate, which I heard the king say, and I thought new and right, and truly like a king of England that loved and esteemed his own country: it was in reply to some of the company that were reviling our climate, and extolling those of Italy and Spain, or at least of France. He said he thought that was the best climate where he could be abroad in the air with pleasure, or at least without trouble and inconvenience, the most days of the year, and the most hours of the day; and *this he thought he could be in England more than in any other country in Europe.*" Devonshire and some adjacent districts on the southern coast enjoy a temperature which in winter is, at an average, two, three, four, and even in some instances five degrees above the rest; and these districts are therefore recommended for the residence of persons affected by pulmonary disease.

VEGETABLE PRODUCTIONS.—ANIMALS.

The most conspicuous feature in the botany of England is the fresh and luxuriant herbage, resulting from the humidity of the climate, and which, though apt to be overlooked by the natives from familiarity, never fails to strike the minds of foreigners with surprise.

Much of the surface was formerly under wood; but this has for ages been chiefly confined to particular forests, to the neighbourhood of great mansions, and the enclosures of fields. Several large royal forests still exist in England, the most considerable being New Forest in Hampshire (66,942 acres), and Dean Forest in Gloucestershire (23,015 acres). That of Windsor, though famed from its situation and the poetry of Pope, is much smaller, being only 4402 acres. These were anciently the scenes of courtly sport, but are now in part reduced to cultivation, or reserved for the production of timber to be used for the public service. The *parks* around the seats of the nobility and gentry are a peculiar and most inviting feature of the English landscape. A mixture of green open glades with masses of old well-grown timber, they are scenes of great sylvan beauty; while the existence of so much pleasure-reserved ground in a country where nearly every acre would be profitable under tillage, conveys a strong impression of the opulence of England. The principal trees are the oak, elm, beech, ash, chestnut, sycamore, poplar, and willow. The vine was at one time extensively cultivated in southern England, but is now seen only in a few detached places.

The leading grain in England is wheat; barley, oats, and rye, being in a great measure local to the less favoured districts. The turnip and potato are almost everywhere cultivated; and peas, beans, and clover, are extensively diffused. Hops are produced in the counties of Surrey, Worcester, and Hereford. Hemp, flax, and some other useful productions of the soil, are less conspicuous. The principal fruit-trees are the apple, pear, cherry, and plum; but many others are cultivated under particularly careful circumstances. The English garden produces a great variety of pot-herbs, most of which have been introduced from the continent within the last three centuries.

Of the useful animals, England possesses a considerable variety. Her draught-horses are remarkable for their bulk, generally fine condition, and great strength. The race and riding-horse have been improved by the best blood of Arabia and Barbary. There are excellent breeds of both sheep and cattle; and the pig is also an animal in prime condition, and extensively reared. Some of the ancient wild animals, as the wolf, boar, and beaver, are now extinct; and other, as the stag and wild-ox, are very rare. The hare, partridge, and pheasant, are the chief game animals, grouse being only found, and that in small amount, in some of the northern wolds. Most of the smaller quadrupeds, birds, insects, &c., common in the same latitude, are found in England. The nightingale is said to be not heard farther north than Yorkshire. The rivers present trout, perch, &c., and the adjacent seas abound in herring, mackerel, sole, pilchard, and other edible fishes.

Agriculture is, in England, in a progressive state but is yet not nearly so far advanced as in the better parts of Scotland. Previous to the eighteenth century, no advance had been made from the most simple modes of tillage and husbandry. The chief improvements since then are thus enumerated in a popular work:—"The gradual introduction of a better system of rotation, since the publication of Tull's *Horseheeing Husbandry*, and other agricultural works, from 1700 to 1750; the improvement of live-stock, commenced by Bakewell about 1760; the raised-drill system of growing turnips, the use of lime, and the convertible husbandry, by Pringle, and more especially by Dawson, about 1765; the improved swing-plough, by Small, about 1790, and the improved threshing-machine, by Mickle, about 1795. The field culture of the potato, shortly after 1750; the introduction of the Swedish turnip, about 1790; of spring wheat, about 1795; of summer wheat, about 1800; and of mangel-wurzel more recently, have, with the introduction of other improved field-plants and improved breeds of animals, contributed to increase the products of agriculture; as the enclosing of common field lands and wastes, and the improvements of mosses and marshes, have contributed to increase the produce and salubrity of the general surface of the country."

Mr. M'Culloch calculates that twelve millions of acres are cultivated in England as follows:—

	Acres
Wheat,	3,800,000
Barley and rye,	900,000
Oats and beans,	3,000,000
Clover,	1,200,000
Roots (turnips, potatoes, &c.),	1,300,000
Hops and garden products,	150,000
Fallow,	1,650,000
	12,000,000

The value of the crops is estimated by the same writer

at £72,000,000. He also calculates 17,000,000 acres of pasture-land as producing £69,000,000.

The chief defects of the agricultural system of England are in the modes of tillage. Cumbrous machinery is employed to do what might be better done by a lighter and cheaper kind: thus, five horses, and even more, are sometimes seen at one plough, while the heaviest lands in Scotland require only two. The virtue of draining is scarcely dreamt of in many districts of England, while in Scotland it is in some places doubling the produce, besides improving the salubrity of the climate. English farmers are too little educated to be ready to adopt improved modes of agriculture; and, amongst the class of landlords, these have hitherto been too much overlooked.* It seems surprising, yet is quite true, that in one district of the island of Great Britain, expensive and unproductive modes, scarcely in the least better than those which prevailed during the wars of the Roses, will be followed, without the least suspicion that they are wrong, although other districts, which might be reached by a day's journey, present appearances of a reflecting skill and dexterity, the general diffusion of which would be attended with incalculable benefit to both landlords and tenants. It is gratifying, however, to know that this state of things is not likely to last much longer. The English nobility and gentry are now supporting an agricultural association, which is to proceed after the manner of the eminently useful Highland Society of Scotland, in promoting improvements in this important branch of the national industry. We may therefore hope, in another generation, to see the splendid soil of England turned to its full account.

THE PEOPLE—THEIR CHARACTER.

The constituent elements of the English population are to be traced in the history of the country. The first inhabitants were Britons, probably a mixed Celtic race, and who, during the time of the possession of the country by the Romans, must have been slightly changed by the admixture of that race. Upon a scattered population of Romanized Britons came the great wave of the Saxon invasion, in the fifth and sixth centuries. The Britons are usually said to have been driven to the west; but probably this was not so much the case as has been generally thought, for it is rarely that any invasion expels the mass of a people from the ground they have long occupied. After this, however, the predominant element of English society was undoubtedly Saxon, the Norman conquest only adding to it a French aristocracy, which little affected the great bulk of the population. The English, therefore, exclusive of the Welsh, who are Britons almost unchanged, may be regarded as in the main a Teutonic people, an admixture of British or Celtic entering into the composition always in less and less measure as we advance from Wales towards the eastern coasts, where the people are nearly pure Saxon.

According to an acute writer, "the Saxon Englishman is distinguished from other races by a stature rather low, owing chiefly to the neck and limbs being short, by the trunk and vital system being large, and the complexion, irides,† and hair light; and by the face being broad, the forehead large, and the upper and back part of the head round, and rather small. In his walk, the Englishman [understanding by this name the Saxon Englishman] rolls, as it were, on his centre. This is caused by the breadth of the trunk, and the comparative weakness of the limbs. The broader muscles, therefore, of the former, aid progression by a sort of rolling motion, throwing forward first one side and then another. . . . The mental faculties of the Englishman are not absolutely of the highest order; but the absence of passion gives them relatively a great increase, and leaves a mental character equally remarkable for its simplicity and its practical worth. The most striking of those points in English character, which may be called fundamental, are *cool observation, unparalleled single-mindedness*, and *patient perseverance*. This character is remarkably homogeneous.

"The cool observation of the Englishman is the foundation of some other subordinate, but yet important points in his character. One of the most remarkable of these, is that real curiosity, but absence of wonder, which makes the *nil admirari* a maxim of English society. It is greatly associated, also, with that reserve for which the English are not less remarkable.

"The single-mindedness of the Englishman is the foundation of that sincerity and bluntness which are perhaps his chief characteristics; which fit him so well for the business of life, and on which his commercial character depends; which make him hate (if he can hate any thing) all crookedness of procedure, and which alarm him even at the insincerities and compliances of politeness.

"The perseverance of the Englishman is the foundation of that habitude which guides so many of his own actions, and that custom in which he participates with all his neighbours. It is this which makes universal cant, as it has been profanely termed,* not reasoning, the basis of his morals; and precedent, not justice, the basis of his jurisprudence. But it is this also which, when his rights are outraged, produces that grumbling which, when distinctly heard, effectually protects them, and it is this which creates that public spirit, to which on great emergencies, he rises with all his fellow-countrymen, and in which he persists until its results astonish even the nations around him.

"Now, a little reflection will show, that of the three fundamental qualities I have mentioned, the first seeming may easily be less amiable than the final result shall be useful. To a stranger of differently constructed mind, the cold observation, and, in particular, the slowness and reserve which must accompany it, may seem unsociable; but they are inseparable from such a construction of mind, and they indicate not pride, but that respect for his feelings which the possessor thinks them entitled to, and which he would not violate in others. The dignity, therefore, which in this case the Englishman feels, is not *hauteur*; and he is as rarely insolent to those who are below, as timid to those who are above him.

"In regard to the absence of passion from the English mind, it is this which forbids one to be charmed with music, to laugh at comedy, to cry at tragedy, to show any symptom of joy or sorrow in the accidents of real life; which has no accurate notion of grief or wretchedness, and cannot attach any sort of meaning to the word ecstacy; and which, for all these reasons, has a perfect perception of whatever is ridiculous. Hence it is, that in his domestic, his social, and his public relations, it is perhaps less affection than duty that guides the conduct of an Englishman; and, if any one question the moral grandeur which this sentiment may attain, let him call to mind the example of it, which, just before the victory of Trafalgar, was given by Nelson in the simple and sublime communication to his fleet—'England expects every man to do his *duty!*' Which is the instance that equals this even in the forged records of Roman glory? Happily, too, the excess of hatred is as little known

* We have been assured that, in some districts, where the stranger is surprised to see the flail still in operation, the farmers and landlords are not unaware of the superiority of the thrashing-machine; but, having only the alternative of supporting the labouring class by this means, or in the condition of paupers, they prefer the former. It is needless to remark, that this is only a misapplication of the powers of the labouring class, which can only tend to increase poverty, and which we may hope to see in time abandoned.

† Plural of iris, the coloured part of the eye, surrounding the pupil.

* The word must not here be understood as implying hypocrisy, of which the Saxon temperament is very innocent.

the Englishman as excess of love; and revenge is abhorrent to his nature. Even in the pugiliatic combat he shakes hands with his antagonist before he begins; he scorns to strike him when he is down; and, whether vanquished or victor, he leaves his antagonist neither cast down nor triumphant.

"The extraordinary value of such a character is obvious enough. British liberty and British commerce are its results: neither the Scottish nor Irish mind would have attained them."*

In this sketch, though clever and forcible, some conspicuous features of the social character of the English are overlooked. The domesticity of the Englishman's mode of life is very remarkable, when taken in contrast with the lounging, open-air existence of continental nations. The Englishman delights in his home, and spends much of his time in it—a result to which the nature of the climate undoubtedly contributes. He appreciates his home very highly, calls his house his castle, and prides himself on its being inviolable even by the emissaries of the law. The members of his family, his wife, his sons and daughters, are taken along by him in most of his recreations and pleasures. The conjugal tie is deemed peculiarly sacred, insomuch that the slightest dishonour offered to it is universally resented. It cannot be said, however, that the affections of kindred are much recognised in England beyond the nearest class of relations.

The strong sense of rectitude which animates the Englishman is conspicuous in his love of what he calls *fair play*, which he carries even into those coarse amusements, boxing, cock-fighting, dog-fighting, &c., a love of which (now fast declining) forms one of the less amiable traits of the national character. His benevolence shines in the liberality of the legal provision for the poor, and in the numberless charitable institutions of all kinds which are supported in the country, as well as in the readiness which the nation has always displayed to hold out a hand of succour to distress in other quarters of the world. Cleanliness of person and household, and a love of comfort both in food and in domestic accommodation, distinguish the people at large. In all personal and domestic circumstances, the substantial is kept strongly in view, even while the ostensible object is ornament. The aristocratic institutions of the country have mixed, with the sturdy independence of the English character, a considerable reverence for external and accidental distinctions, and created a disposition, pervading almost all classes, to hold forth appearances rather above than below their means. For the same reason, as well as that abstract truths are not readily apprehended by the English intellect, there is a strong and general disposition to cling to ancient practices and forms in both government and law. The rural tenantry and the tradesmen of the smaller towns are generally subservient to the landed classes; and it is chiefly in large towns that new political dogmas find any warm advocacy.

Horse-racing and field-sports are the chief amusements of the nobility and gentry, and are practised upon a scale so extensive, and with apparatus so perfect in all its parts, including a breed of horses of the highest excellence, that they would probably be considered by a foreigner as amongst the most remarkable features of English life. Amongst the upper and middle classes generally, the pleasures of the table are much, perhaps too much, cultivated; dinner, in particular, being generally followed by an abundance of the wines of Portugal, Madeira, and Germany. The lower classes also live, in general, on substantial fare; their favourite beverages are ale and porter; while quoits, cricket, and ninepins, may be described as their most common amusements.

* Blackwood's Magazine, 1829.

PROGRESS OF POPULATION.—HEALTH AND LONGEVITY.

The population of England in the time of the Plantagenet sovereigns, is believed to have been little more than two millions. It has been estimated at 5,500,000 in 1696. The progress during the greater part of the eighteenth century was slow; the amount in 1760 is supposed to have been about 6,500,000. In 1801, for the first time, a regular census was taken; and this has been repeated once in ten years ever since, giving the following results:—

1801,	-	8,872,980	1821,	-	11,978,875
1811,	-	10,150,015	1831,	-	13,894,569

The census to be taken during he year in which this sheet is published, will probably give not less than 16,000,000, being nearly a doubling since the beginning of the present century. The rapid advance of our population is placed in a striking light, when we consider that, for the United Kingdom, it is nearly a thousand per day. Within the last ten years, emigration has been proceeding on a scale of unprecedented magnitude; yet, even in the years during which it has been most active, it has not been sufficient to drain the country at one-third of the rate at which its population has been increased by new births. This rapid increase of numbers clearly shows that, whatever partial evils there may be in the condition of the people, the country must upon the whole have enjoyed for forty years a high degree of prosperity; for it is quite insupposable that, with stationary resources, so many new mouths could have been fed, unless there had been, what certainly there has *not* been, a large and general deterioration in the style of living. It is to be remarked, however, that an immigration to a great extent from Ireland has been going on for about twenty years, and that generally the Irish settlers continue in England to live in a style little superior to that which they followed in their own country.

The increased population has chiefly taken place in the manufacturing towns. It was calculated by Mr. M'Culloch, in 1831, that nearly a third of the people live in towns of above 10,000 inhabitants. Most of the large cities have experienced a rapid advance of population within the last twenty years. These circumstances serve to show that it is the development of the manufacturing, and not of the agricultural energies of the country, which has mainly tended to increase the population. In 1831, it was ascertained that the total number of persons, above twenty years of age, engaged in any kind of business or professional employment, was 3,394,690. Of these, 1,075,912 were engaged in agriculture; 1,327,727 in trade and manufactures; and 991,051 in other pursuits. Of the last number, 185,187 were capitalists, bankers, and professional and other educated men. In this part of the account we also find the army and navy, and male servants. "It may thus be seen," says an intelligent writer, "how very small is the number of persons arrived at maturity, who are not employed in some one or other of the occupations whereby the sum of the national wealth or convenience is advanced."

With regard to the rate of mortality in England, no certain conclusions were in the hands of the public till the commencement of a general registry of births, marriages, and deaths, in 1836–7. In the first year of the operation of this system, the burials were 335,956, which, if we suppose the population to have then been fifteen millions and a half, would give 1 in 46 per annum as the rate of mortality for the whole country, being considerably more than previous imperfect calculations had made it. There are considerable local variations in the rate of mortality, in accordance with peculiar circumstances. In the last half of the year 1837, the deaths out of 3,553,161 persons, living in large cities, were 47,953; and out of 3,500,751 persons living chiefly in rural situations, only 34,074, or as nearly 34 to 47 For

this so much greater mortality in cities, we must look, first to that custom which prevails of retiring in old age and sickness from country to town, and, secondly, to the filth, deficient ventilation, destitution, and vicious habits of life, which prevail in large towns. It is remarkable that London is healthier than most of the other large towns. The proportion who died at 70 out of 1000 persons, was in London 104; but in Birmingham it was 81, in Leeds 79, and in Liverpool and Manchester only 63.

Out of 1000 deaths in the counties of Dorset, Devon, and Wilts, and in Wales, 180 are of children under one year; but in Leeds and its neighbourhood, in the mining districts of Staffordshire and Shropshire, and in the fenny lowlands of Lincoln, Cambridge, and Huntingdonshire, the number was 270, giving token of a great local discrepancy in the sanitory condition of the English population. After deducting the diseases of infancy, the most fatal maladies in England are consumption, fever, and dysentery. One-eighth of the whole deaths, subject to the above deductions, are ascribed to the first of these diseases.

REMARKABLE NATURAL SCENERY—NATURAL CURIOSITIES.

The natural scenery of England is generally of a pleasing rather than a grand or picturesque character; yet there are some portions of the country which are considered attractive on account of their romantic beauty. We shall notice the chief of these.

The Cumberland Lake Scenery.—The south-west part of the county of Cumberland and the north-west part of Westmoreland, comprehend a range of lofty mountains—Skiddaw, Saddleback, Helvellyn, and some others of scarcely less note—amidst which lie the lakes for which this district of England has long been celebrated. The largest of these are Ullswater, Thirlmere, Derwentwater, and Bassenthwaite; but some of less size, as Buttermere, Crummockwater, Loweswater, Ennerdale, Wastwater, and Devock-lake, are scarcely less admired. The vales or passes amongst the hills likewise contain much beautiful scenery of a wild character, although perhaps only traversed by a brawling mountain rill.

The combination of alpine wildness and grandeur, with the soft scenery which reposes in clothed slope and mirror-like lake at the bottoms of the hills, is what gives the Cumberland scenery its principal charm. Ullswater, which extends into Westmoreland, is thought to possess the greatest beauty: it is about nine miles in length, but nowhere more than one in breadth. Derwentwater (often termed Keswick Lake, from its vicinity to the town of Keswick), which measures three miles in length by one

Derwentwater or Keswick Lake.

and a half in breadth, is only inferior to Ullswater. Mrs. Radcliffe, the eminent novelist, describes it as having peculiar charms, both from beauty and wildness. "The whole is seen at one glance, expanding within an amphitheatre of mountains, rocky but not vast, broken into many fantastic shapes. The precipices seldom overhang the water, but are ranged at some distance; and the shores swell with woody eminences, or sink into green pastoral margins. The bosom of the lake is spotted by several small but well-wooded islands."

Amongst the *passes*, that of Borrowdale is the most remarkable: It is a narrow chasm opening from the centre of the amphitheatre which terminates the expanse of Derwentwater, and traversed by the vehement little stream of the same name. Near the entrance of the pass is a detached mountain called Castle-Crag, with a peaceful village reposing at its foot; and opposite to Castle-Crag is the *Bowderstone*, a huge mass of rock, which has apparently fallen from the neighbouring cliffs, and round whose base the road is made to wind. It is computed that this enormous boulder is not less than 1800 tons in weight.

The lake scenery of Cumberland has by its beauty attracted a great number of permanent residents, whose villas enter pleasingly into its landscapes, and amongst whom the present age has seen several eminent literary men—Southey, Wordsworth, &c. It also attracts an immense number of tourists from all parts of the kingdom.

The district usually called *the Lakes* may be said also to comprehend a small northern and nearly detached portion of Lancashire, where Windermere and Coniston Water are sheets rivalling in extent and beauty those of Cumberland.

The Derbyshire Peak Scenery.—The termination of the great northern range in the north of Derbyshire, presents, in that district, a collection of rugged hills and narrow valleys, amidst which some of the most romantic scenery in England is to be found. A particular portion of it, near the village of Castleton, is termed the Peak Scenery, from a particular eminence or peak which attracts more than usual attention.

The *Peak* is approached through a rude and savage pass, named *Winyats* (*q. d.* gates of the winds), flanked with precipices 1000 feet high. It is a limestone mountain, and perforated, as mountains of that kind of rock often are, with an immense cave. On the top are perched the remains of a castle, once the residence of a family descended from William Peveril, a natural son of the Conqueror. In the precipice below, above 600 feet from the top, is the entrance of the cave, a flattish Gothic arch,

Entrance to the Peak Cavern.

120 feet wide and 46 in height. Within this arch the cavern recedes about 90 feet. Here a company of twine-makers pursue their humble trade. At the extremity of the first cave, which alone enjoys any of the light of day, a low and narrow arch leads into a spacious opening, called "the Bell-house," whence a path leads to the "First Water." This is a lake 42 feet in breadth, passing below a massive arch of rocks, in some places not more than 20 inches above the surface of the water. Laying himself flat along the bottom of a small canoe, the visiter with his guide shoots through below the depending rocks into an opening 220 feet in length, 200 in breadth, and 121 in height. At the further extremity of this spacious cavern, the stream which flows along the

bottom forms itself into what is called "the Second Water," near the end of which is a pile of rocks subjected to a perpetual copious dripping from the roof, and called "Roger Rain's House." Other passages and expansions succeed, till the cave ceases to be passable at the distance of 2300 feet from the opening. On returning from his torch-lit adventure to the mouth of the cave, the visiter usually experiences a singular impression of novelty and delight from beholding again the surface of the daylight world.

The scenery adjacent to the neighbouring town of Buxton is also much celebrated. One of the most noted objects is *Elden's Hole*, a perpendicular opening, down which a line has been dropped to the extent of 2652 feet without finding the bottom. *Poole's Hole* is a cave remarkable for its magnificent stalactites. A succession of beautiful valleys, situated amidst rugged mountains, leads to the romantic one of *Matlock*, where the banks of the Derwent are bordered by extensive woods, interspersed with the boldest and most varied forms of rock. Of a wilder character is the celebrated *Dovedale*, where the River Dove traverses a pass of two miles in length, and of the most striking character. The sides of this short valley are chiefly composed of rocks of gray limestone, which, in their abrupt and towering ascent, assume innumerable fantastic forms—spires, pyramids, &c.—and are clothed with yew-trees, the mountain-ash, and numerous mosses and lichens.

The Isle of Wight.—This island, situated off the coast of Hampshire, and measuring twenty-three miles by about thirteen, is celebrated both for its mild climate and its beautiful scenery. From the high open downs formed by a range of chalk hills in its centre, some delightful views, mingling the bold objects of the coast line with the sail-studded English Channel, are obtained. The south shore is the most noted for its romantic objects, the most remarkable of which is at *Undercliff*. Here a great chalk cliff has at one time been presented to the sea; but, afterwards undermined by the action of the waves, a large portion of it has fallen forward in vast fragments, leaving a new cliff at the distance of about half a mile from the shore. In the interval between the beach and the cliff, the fragments are scattered in confusion, many of them forming eminences of the most picturesque forms, while the intermediate spaces afford room for cottages and villas, and even at one place for a small rising town, nestling amidst the most beautiful shrubbery, natural and artificial. This district, when viewed from the sea, appears a series of gigantic steps rising from the beach towards a great perpendicular wall. The cliff in several places opens in vast ravines, locally termed *chines*, which are usually clothed with a picturesque vegetation, and the most admired of which are those of Shanklin and Blackgang. Newport, the capital, is situated in a beautiful valley in the interior, adjoining the picturesque old castle of Carisbrooke. At the western extremity of the island are the celebrated *Needles*, a cluster of chalk rocks rising like pillars above the waves.

The Scenery of Wales.—Wales has already been described as a mountainous region, the chief peaks of which somewhat exceed 3000 feet in height. It is visited by tourists from all parts of the kingdom, on account of the picturesque scenery with which it abounds, particularly in the northern district, or *North Wales*. Its hollows or vales contain none of those beautiful expanses of water which mix such softness with the grandeur of the Cumbrian scenery, but are traversed by impetuous rivers and torrents, according with the precipitous and savage character of the landscape. The vales of North Wales are deeper and narrower than those of South Wales; these expand in many instances into broad plains, affording scope for the operations of the agriculturist, and for the building of towns and villages.

A range of hills, of which *Snowdon* is the highest (3570 feet), traverses North Wales from south to north, terminating at Beaumaris Bay in the tremendous steep of *Penmanmawr*, whose hanging fragments threaten to bury him who travels by the difficult path which has been formed along its almost perpendicular sides. This hilly district comprehends a few *tarns*, or mountain lakelets, full of delicious fish. The general bleakness is delightfully relieved by the intervening vales, the largest of which is that of Clywd in Denbighshire, twenty miles long by about four or five in breadth, and presenting a brilliant picture of fertility. Among the lesser vales, the most famed for beauty is that of *Llangollen*, "where the Dee, winding through cultivated and pastoral scenes, presents at every step a varying landscape." *Festiniog*, in which a number of streams unite to form a little river, amidst verdant and wooded scenes, is also celebrated by tourists.

Cheese Wring and Logging Stones of Cornwall.—Upon a hill north of Liskeard, the slopes of which are strewed with granite boulders, stands the curious pile called the *Cheese Wring*, composed of five flat round pieces of the same rock, laid one above another, the largest towards the top, so that the whole forms a kind of inverted cone, to the height of fifteen feet. Dr. Macculloch, the eminent geologist, explains the formation of this strange object as solely owing to natural causes. *Logging Stones*, of which there are several in the same county, are in like manner explained. The largest is one situated upon a cliffy promonotory near the Land's End. It is a mass 17 feet in length, of irregular form, and believed to be about 90 tons in weight, resting by a slight protuberance upon the upper surface of the cliff, and so nicely poised, that a push from the hand, or even the force of the wind, causes it to vibrate. It appears that these logging stones are simply prismatic masses of the rock, which have chanced to be left in their present situation after adjoining masses of a similar character had been removed.

ANTIQUITIES.

Perhaps the earliest objects of antiquity in England are the barrows or *tumuli* with which the Britons, like so many other uncivilized nations, were accustomed to cover the remains of the dead. Several specimens of these still exist.

Druidical Remains rank perhaps next in point of antiquity. The most simple of these are *Cromlechs*, of which an unusual number is found in the island of Anglesea, once the chief seat of the Druids, who were the priests of British heathenism. A cromlech consists of a large slab of stone, placed flatwise, or in a sloping position upon two upright ones. It seems to have formed an altar for human sacrifices. *Druidical circles* are more complicated. They usually consist of circles of huge stones placed on end, with in some instances connected lines or rows of similar stones, the whole forming objects at once rude and imposing. It is believed that they were the temples of the Druids. The most remarkable Druidical circle is that of *Abury*, six miles from Marlborough, in Wiltshire: there is an outer circle, 1400 feet in diameter, composed of stones generally about 16 feet in height, with a distance of 27 between every two. There are small concentric circles within the large one, and in the centre of all is a cromlech or altar for human sacrifices, composed of one long flat stone, supported by two upright ones. Two straight avenues of approach, about a mile in length, were composed of similar blocks, and on the outside of the outermost circle there was a *vallum* or bank, the inner slope of which was perhaps a place for spectators. From the encroachments and carelessness of the neighbouring inhabitants during a long course of ages, this curious relic of the British people is much dilapidated. Another Druidical circle of great note is that of *Stonehenge*, upon Salisbury Plain, a district also presenting many tumuli and other vestiges of the Bri

Remains of Stonehenge.

tons. The Stonehenge temple, in its perfection, consisted of 140 stones, arranged in two concentric circles, the outermost 108 feet in diameter, with similar stones laid flatwise along the tops of the upright stones. The blocks which remain are from eighteen to twenty feet high, and about seven feet broad. Within the inner circle are two oval ranges, supposed to have formed the *admytum* or vell, and which consist of stones about thirty feet in height. The remains of this stupendous temple, ruined and shattered as they are, still produce a sensation of awe upon the mind of the beholder.

Roman Remains are now rare and nearly obliterated. The roads formed by this people have in some instances been changed into our present comparatively broad and well-formed ways; in other cases, slight traces of their original pavement, which generally consisted of large stones forming a causeway, are to be found. Between Newcastle and Carlisle are the remains of the two walls built respectively by the Emperors Adrian and Severus, in 120 and 210, to keep out the northern barbarians: the first being a high mound of earth, and the second a rampart of stone, 68½ miles long, running parallel to the first, on the outside. Remains of Roman camps, bridges, villas, baths, &c., also exist in various parts of England. All the towns, the names of which terminate in *chester* or *ceater*, are considered as having been originally Roman stations. Near St. Albans are the remains of the walls which once surrounded the Roman town of *Verulamium*, the site of the town itself having long been subjected to the plough.

Several of the small churches built soon after the introduction of Christianity still exist, and continue to be used as parish churches. The larger churches connected with monastic establishments, and the cathedrals, which were the seats of bishops, took their rise at a later period, chiefly during the twelfth and thirteenth centuries. This was a time when an enthusiasm existed for founding and endowing monasteries and churches. To it we are indebted for many superb minsters, the solemn beauty

Glastonbury Abbey.

of which continues to be a proud possession of our land. Westminster Abbey, York Minster, and the cathedrals of Winchester, Lincoln, Gloucester, Canterbury, Lichfield, and Salisbury, may be instanced as particularly august specimens of the Gothic style in which all ecclesiastical structures were then built. There are also many ruinous remains of the great abbacies of the middle ages: those of Tintern, near Monmouth, Glastonbury, near Wells, and Bury St. Edmund's, are of famed beauty. A kindred class of antique structures exist in what are called *crosses*, which consist generally of an elegant tapering Gothic erection, with a small shrine below, and were in most instances erected to hallow the spot on which the remains of venerated persons rested on their way to the tomb.

Caernarvon Castle.

Of the huge castles built by the Norman nobility and by the sovereigns during the first few centuries after the conquest, many specimens still exist, but few which are not in ruins. The Tower of London, built by the Conqueror himself, is an entire and most superb example of this class of structures. Conway and Caernarvon Castles, which, with several others, were raised to overawe the then independent principality of Wales, are also noble specimens. Others may be found in the north, as Lancaster, Carlisle, Newcastle, and Rnghy. They usually consist of a great square tower, with ronges of lesser towers, and the whole surrounded by thick and lofty walls, beneath which there was generally a moat or wet ditch. Dover Castle, placed on the top of a lofty cliff overlooking the English Channel, and still kept in good order, is a peculiarly interesting specimen of the Norman fortress.

MANSIONS.

England abounds in mansions in various styles, the seats of her nobility and gentry. Some of these reach a high degree of splendour, both in architecture and internal furnishing, not to speak of the delightful sylvan domains by which they are generally surrounded.

A certain class of English mansions may be described as engrafted upon the fortresses of the middle ages, or upon the priories and abbeys disused at the Reformation. *Warwick Castle*, the seat of the Earl of Warwick, situated upon a rock forty feet above the River Avon, and *Alnwick Castle*, in Northumberland, the seat of the Duke of Northumberland, are splendid examples of the first class of edifices. The area of the latter building is divided into three courts, entered through gateways formed in lofty towers. The keep, or citadel, is of vast magnitude, and acquires some peculiar points of architectural beauty from 'fair semicircular towers,' which protect and adorn it on every side." *Newstead Abbey*, in Nottinghamshire, the seat of the late Lord Byron and of his ancestors, may be instanced as a beautiful and impressive example of the domestic mansion founded upon the remains of a monastic building.

There is a class of old mansions which appear to be peculiar to England, and are usually called *Halls*. They date in many instances from the sixteenth century, and may be supposed to have been the favourite form of domestic architecture in the days of the first Tudors. *Haddon Hall*, near Derby, belonging to the Duke of Rutland

is an unusually handsome specimen of the class. They generally present a front, of irregular form, advancing into prominent bows with many windows, and constructed of brick upon a fantastically shaped framework of timber, the exterior of which is left exposed and painted. A variety of angular projections break the line of the roof, and give occasion to much carved wood-work. In the interior there is always a goodly hall of oak, with a diced floor, a huge set of oaken tables, and a spacious fire-place. Mr. Nash has published a beautiful work, containing views and descriptions of the most remarkable of these charming old mansions, so rich in old-world associations.

Another large class of English mansions are of a style which prevailed in the seventeenth century, and which comprehends many substantial as well as decorative features. Elegant fronts of polished stone, with traces of turreting, ornamented square windows, and tall angular chimney-stalks, strike an untechnical spectator as the principal features of this style, usually called Elizabethan. *Holland House*, Kensington, and *Theobalds*, the seat of the celebrated Secretary Cecil, present apt examples.

The houses built in the last century were chiefly in the Grecian style, more or less pure. Some of the productions of Mr. Adam present beautiful examples—for instance, *Keddlestone House*, the residence of Lord Scarsdale, near Derby, the front of which is a line of 360 feet, comprehending a central and two lateral masses connected by low corridors, and universally admired for its classic purity and grace. *Chatsworth*, the seat of the Duke of Devonshire, near Derby, is another magnificent mansion of this class.

Within the last fifty years, houses have been built in various styles, imitative of modes long ago fashionable. The castellated, the Elizabethan, and the Grecian, have all had their admirers. It is also common now-a-days to build houses from the foundation in the manner of those Gothic priories and abbeys which were originally designed for purposes so different.

Eaton Hall, the seat of the Marquis of Westminster, situated near Chester, may be considered as a prime example of the modern Gothic. It comprises, besides other apartments, an entrance-hall, paved with variegated marbles, a music-gallery, adorned with two fine pictures by West, a saloon, decorated with some beautiful specimens of stained glass, and a library. This magnificent mansion is much visited by strangers on account of its architectural beauty, its splendid furniture, and the vast number of interesting objects assembled in it.

CITIES, TOWNS, &c.

It has already been seen that a large part of the population of England is collected in cities and towns of considerable size. Some of these may be classed under the separate heads of manufacturing and commercial towns, while others are either university towns, naval stations, cathedral towns, or towns for summer recreation or the residence of persons in independent circumstances. The cities and towns of England are of great number, and, though often of plain exterior, include an immense amount of wealth. The prevalence of brick in domestic buildings, and of the smoke arising from coal fires, gives a peculiar character to English towns. In all, however, there are numerous churches and other public edifices, and in some there are many streets built of stone.

For an account of the capital of England, which unites the manufacturing, commercial, educational, and leisurely characters in one, we must refer to a separate sheet, following the present.

Manufacturing Towns.

At the head of these stands *Manchester*, the chief seat of the principal manufacture of England—that of cotton. This town is situated on the river Irwell, in the south-east district of Lancashire, at the distance of 182 miles from London. Inclusive of Salford, a separate municipality on the other side of the Irwell, and also comprehending a few connected villages, Manchester contained in 1831 a population of 270,398, now probably increased to 350,000. The ground on which it stands is a perfect level, and, from whatever side it is approached, its crowd of spires, towers, manufactories, and warehouses, appears mingling with the smoke that hangs over it. The older part of the town clusters round the collegiate church, an elegant and spacious structure of the time of Henry VII., or extends in ancient street called Deansgate. The busiest commercial street is Market Street, and the most elegant is Mosley Street. The town contains most of the usual public buildings to be found in one of its size—a town-hall, infirmary, prison, exchange, &c., besides several institutions of a literary and scientific character; and several of these buildings, particularly the two first, are of remarkable elegance. A botanic garden, about a mile from the outskirts of the town, is a great ornament, and forms a most delightful as well as instructive place of recreation. There is also a zoological garden.

The factories of Manchester exceed a hundred and twenty in number: they employ between thirty and forty thousand persons, and steam enginery equal in power to five thousand horses. About four-fifths of the cotton manufacture of the kingdom centres in Lancashire, and of this a large proportion is confined to Manchester. The woollen, linen, and silk trade, particularly the last, and many smaller manufactures, as of hats, pins, umbrellas, &c., are also carried on to a large extent in this town. It may be added, that the making of machinery has of late years become a thriving trade in Manchester.

Manchester is connected with its port, Liverpool, by a railway, and by means of the Irwell and numerous canals, it transports and receives goods to and from other parts of the kingdom. (See article CANALS AND RAILWAYS.)

The above may be considered as an outline of this great seat of manufacturing and commercial industry Fully to describe the bustle of wagons and human beings on its streets, to detail the vast mercantile transactions in which it is engaged, or describe its numerous factories and workshops of various kinds, would require a separate volume. In the way of details, we can only afford room for a description of two or three working establishments, which we find in a neat local volume, entitled *Manchester as it is*:—

"Many of the mills are immense buildings, raised to the height of six, seven, and eight stories, erected at an expense of many thousands of pounds, and filled with machinery costing as many more. The capital sunk in a single mill will sometimes be £50,000, and frequently is as much as £100,000. Some of the mills contain nearly 2000 hands. A visit to one of the largest mills, if an introduction can be procured, is a gratifying treat. The rooms are kept in the most perfect state of cleanliness, and the strictest order and regularity prevail. Every operation is performed by rule, and the subdivision of labour is carried out in the most minute manner. The mills and factories are of various sorts, namely, cotton spinning-mills, silk spinning-mills, woollen spinning-mills and factories, small-ware factories, and power-loom weaving factories.

"Among the cotton mills, one of extraordinary extent, belonging to Messrs. Birley & Co., is situated in the suburb called Chorlton-upon-Medlock. It consists of a group of buildings, upon which, including machinery, several hundred thousand pounds have been sunk. The number of hands employed by this firm is 1600, whose wages annually amount to the sum of £40,000. The amount of moving power is equivalent to the labour of 397 horses. The number of spindles in the mills is

about 80,000. The annual consumption of raw cotton is about 4,000,000 lbs. weight! The annual consumption of coal is 8000 tons. It will perhaps excite surprise in a person unacquainted with the nature of machinery, when informed that the annual consumption of oil, for the purpose of oiling the machinery, is about 5000 gallons; and the consumption of tallow, for the same purpose, 50 cwt. The annual cost of gas is £600. One room alone, belonging to this firm, contains upwards of 600 power-looms. Besides the hands engaged in the cotton department, the following description of mechanics are employed in this mill:—Millwrights, mechanics, joiners, bricklayers, plumbers, painters, moulders, turners, and smiths.

"The establishment in which the fabric is manufactured for waterproof clothing, such as '*Mackintosh Cloaks*,' belongs to Messrs. Birley & Co., and is a part of their concern. The number of hands employed in this business varies from 200 to 600. The immense amount of 250,000 lbs. weight of Indian rubber is annually consumed in the process of manufacture, to dissolve which 100,000 gallons of spirits are employed.

"In the establishments called small-ware mills, of which there are several in Manchester, the articles of cotton, worsted, and silk tapes, are very extensively manufactured. To trace the various processes a piece of tape passes through, and the various employments it affords, before it comes into the market, is a very curious and interesting occupation. Beginning, then, with the first commercial operations—The cotton used in the manufacture of tapes, having been warehoused in Liverpool, is sold on account of the importer, and bought to the order of the manufacturer by cotton brokers. It is conveyed by canal or railway to Manchester; and when delivered at the works of the purchaser, is weighed, assorted, mixed, and spread, with a view to obtain equality in the staple. It is then taken to the willowing-machine to be opened and rendered floculent. Thence it is transferred to the blowing-machine, which cleanses it from dust and makes it feathery. Attached to the blower is a lapping apparatus, by which the cotton is taken up and laid in a continuous fleece upon a roller, in order that it may be conveniently carried to the carding-engine, there to be made into a fleece of the most equable texture possible; thence it is handed to the drawing-frame, where it is blended with the production of all the carding-engines connected with the particular set or system to which it belongs. It is next passed through the slubbing-frame, afterwards through the jack or roving-frame, and then through the throstle or spinning-frame, upon which it is made into yarn or twist. From the throstle, the yarn, if intended for warp, is forwarded to the winding-frame, but if intended for weft, to the reeler; afterwards, that which is wound is delivered to the warper, that which is reeled, to the pin-winder. The weaver next operates upon it, passes it through the loom, rubs up the tape, and consigns it to the taker-in, who examines the fabric, and transfers it to the putter-out, who sends it to the bleacher. When bleached, it is handed to the scraper, whose business it is to take out the creases, and open the tape, by running it under and over iron-scrapers. This having been done, the piece is put through the callender, when it is pressed between hot bowls, and rendered smooth and glossy. It is next taken to the lapping department, where it is neatly folded by young women, after which the maker-up forms the pieces into parcels, containing the required quantity, and places them in a powerful press to make them compact. He next papers them, and sends them to the warehouse for sale.

"Some idea of the extent to which this manufacture is carried on in Manchester, may be formed from the fact, that, at the works of Messrs. Wood and Westheads, upwards of 1,240,000 yards of goods, not exceeding three inches in width, and composed partly or entirely of cotton, linen, silk, or worsted, are woven in *one week* or upwards of 35,227 *miles* in *one year*.

"One of the principal establishments in the department of steam-engine making and engineering, is that belonging to William Fairbairn, Esq., situate in Canal street, Great Ancoats street. To persons unacquainted with the nature of working in iron, an admission into these works affords perhaps the most gratifying spectacle which the town can present of its manufactures in this metal. Consequently, almost every person of distinction visiting the town, contrives to procure an introduction to the proprietor before leaving it. In this establishment the *heaviest* description of machinery is manufactured, including steam-engines, water-wheels, locomotive engines, and mill-gearing. There are from 550 to 600 hands employed in the various departments; and a walk through the extensive premises, in which this great number of men are busily at work, affords a specimen of industry, and an example of practical science, which can scarcely be surpassed. In every direction of the works the utmost *system* prevails, and each mechanic appears to have his peculiar description of work assigned, with the utmost economical subdivision of labour. All is activity, yet without confusion. Smiths, strikers, moulders, millwrights, mechanics, boiler-makers, pattern-makers, appear to attend to their respective employments with as much regularity as the working of the machinery they assist to construct.

"In one department mechanics are employed in building those mighty machines which have augmented so immensely the manufacturing interests of Great Britain, namely steam-engines. All sizes and dimensions are frequently under hand, from the diminutive size of 8 horses' power, to the enormous magnitude of 400 horses power. One of this latter size contains the vast amount of 200 tons or upwards of metal, and is worth, in round numbers, from £5000 to £6000.

"The process of casting metal is conducted here on a very large scale. Castings of 12 tons weight are by no means uncommon: the beam of a 300 horses' power steam-engine weighs that amount. Fly-wheels for engines, and water-wheels, though not cast entire, are immense specimens of heavy castings. A fly-wheel, for an engine of 100 horses' power, measures in diameter 26 feet, and weighs about 35 tons. In this establishment some of the largest water-wheels ever manufactured, and the heaviest mill-gearing, have been constructed; one water-wheel, for instance, measuring 62 feet in diameter. The average weekly consumption of metal in these works, in the process of manufacturing, owing to the quantity of wrought-iron used, and the immense bulk of the castings, is 60 tons or upwards, or 3120 tons annually.

"This extensive concern forwards its manufactures to all parts of the world. The stranger is told, on inquiry, that *this* article is for Calcutta, *that* for the West Indies; this for St. Petersburgh, that for New South Wales: and there are, besides, men belonging to it *located* in various parts of Europe, who are employed, under the direction of Mr. Fairbairn, in superintending the erection of work manufactured on these premises."

Leeds, the chief town for the manufacture of cloths, is situated in the West Riding of Yorkshire, on a slope gently rising from the river Aire, at a distance of 191 miles from London. It contains a few streets of handsome houses, but as in many other English manufacturing towns, utility appears to be more in contemplation than ornament or elegance. The population in 1831 was 123,393. There are some goodly public structures, as a court-house, commercial buildings, theatre, &c., and the town enjoys the benefits of a literary and philosophical society, an institution for the promotion of the fine arts, and several public libraries.

Leeds is the centre of a large district devoted to the

mixing of mixed and white cloths. Cloths of light fabrics, and blankets and carpets, are also made here in considerable quantity; but the mixed and white cloths form the staple of the business of the district. The mode in which these are sold in Leeds, gives occasion for the existence of two public buildings of a most peculiar nature. They are called respectively the Mixed Cloth Hall and the White Cloth Hall. A description of the former, from a popular work, will convey an idea of both. "The Mixed Cloth Hall was erected in 1758, at the general expense of the merchants. It is a quadrangular edifice, surrounding a large open area, from which it receives the light abundantly, by a great number of lofty windows; it is 128 yards in length and 66 in breadth, divided in the interior into six departments, or covered streets, each including two rows of stands, amounting in number to 1800, held as freehold property by various manufacturers, every stand being marked with the name of the proprietor. This hall is exclusively appropriated to the use of persons who have served regular apprenticeship to the trade or mystery of making coloured cloths. The markets are held on Tuesdays and Saturdays, and only for an hour and a half each day, at which period alone sales can take place. The market-bell rings at six o'clock in the morning in summer, and at seven in winter, when the markets are speedily filled, the benches covered with cloths, and the proprietors respectively take their stands: the bell ceasing, the buyers enter, and proceed with secrecy, silence, and expedition, to bargain for the cloth they may require; and business is thus summarily transacted, often involving an exchange of property to a vast amount. When the time for selling is terminated, the bell again rings, and any merchant staying in the hall, after it has ceased, becomes liable to a penalty. The hall is under the management of fifteen trustees, who hold their meetings in an octagonal building, erected near the entrance to this hall."

Huddersfield, *Wakefield*, *Saddleworth*, *Halifax* and *Bradford*, all in Yorkshire, and *Rochdale* in Lancashire, are other towns noted for their concern in the cloth manufacture, but of inferior population, and not distinguished by any remarkable features. *Axminster*, *Kidderminster*, *Ashton*, and *Wilton*, are the chief seats of the carpet manufacture. *Bradford*, in Wiltshire, is distinguished for superfine cloths.

Birmingham, the chief town in the kingdom engaged in metallic manufactures, is situated in Warwickshire, at the distance of 109 miles from London. The lower part of the town consists chiefly of old buildings, is crowded with workshops and warehouses, and is inhabited principally by manufacturers; but the upper part has a superior appearance, consisting of new and regular streets, and containing a number of elegant buildings. Among the public buildings, the town-hall calls for particular notice, being a magnificent structure of the Corinthian order, in the proportions of the temple of Jupiter Stator at Rome. The population of Birmingham in 1831 was 146,986, being all, except a small fraction, engaged in trade and manufactures.

Among the principal manufactures are buttons, in immense variety, buckles, cloak-pins, and snuff-boxes; toys, trinkets, and jewellery; polished steel watch-chains, corkscrews, &c.; plated goods for the dining and tea-table, now in the way of being superseded by similar goods of mixed metal; japanned and enamelled articles; brass work of every description; swords and fire-arms; medals and coins of various kinds; copying machines and pneumatic apparatus; grates, fire-irons, gas-light burners, nails, and steel-pens. Besides almost every metallic article which can be considered as curious, useful, or ornamental, cut crystal is produced to a large extent, while certain branches of the cotton trade connected with hardware, as the making of the cloth for umbrellas, braces, girths, &c., have also fixed themselves here, in order to facilitate the preparation of those articles.

The operations of the Birmingham manufactures are carried on chiefly by means of foundries, rolling mills, die-stamping machines, and turning-lathes. From the foundries proceed all heavy iron goods, and even a considerable quantity of small wares, though the work required in trimming these articles after they leave the sand causes a constant tendency towards the use of the die-stamp in preference. By the latter machine, not only are buttons and other small articles produced, but likewise complicated decorative articles of many various kinds, to which it might be supposed that the process was inapplicable. The rolling mill is a ponderous engine, for pressing out ingots of metal into sheets of requisite thinness. The lathe, a conspicuous machine in the workshops of Birmingham, is used for the preparation of articles of correctly circular, and also of oval form. It is usually driven by steam; and in many instances this power is not generated in the premises of those who use it, but is obtained for a rent from some engine kept by a different individual in the neighbourhood.

To give an idea of the extent of some branches of trade, and the activity of some kinds of machinery at Birmingham, it may be stated that, at the pin-works, some years ago, 12,000 pins could be cut and pointed, and 50,000 pin-heads made from the wire, in an hour; that there is a coining-mill which produces between thirty and forty thousand pieces of coin in the same time; and that, from 1805 to 1818, 5,000,000 stands of arms were made for public and private service. The making of steel-pens, which, before 1821, was scarcely known, is now a great manufacture. Probably not less than 10,000,000 are made annually. There is one individual in the trade who employs 250 persons, and consumes every year upwards of forty tons of metal. The article was originally sold at the rate of one shilling each pen; and now, from improvements and facilities in the manufacture, 144 are sold at the same money.

Sheffield, in the West Riding of Yorkshire, ranks only second to Birmingham as a seat of metallic manufactures. It is a town of above 100,000 inhabitants, great part of whom are engaged in the business for which Sheffield is remarkable. The situation of the town, upon a swelling piece of ground near the confluence of the Sheaf and Don, gives it health and cleanliness, but only the newer streets and suburban villas are neat, and the town is constantly involved in the smoke arising from the manufactories. A music hall, post-office, and medical hall, together with a building called the cutler's hall, in which the members of that trade meet for an annual banquet, are the chief public buildings boasting of any elegance of exterior.

Sheffield was famous in the middle ages for producing knives and arrow heads. From such small beginnings, it advanced in the course of ages to its present distinction. An immense quantity of knives, scissors, implements of husbandry, and surgical and mathematical instruments, is now made in it. The manufacture of plate, and of goods in imitation of it, as also of carpenters' tools, printing types, hair-cloth, and many other articles, is carried on to an immense extent. The manufactures of Sheffield have the peculiarity of being chiefly in the hands of men of moderate capital and limited business, though there are also a few houses which engross a vast quantity of the principal trade. The establishments for the grinding and polishing of cutlery are among the most striking objects of curiosity to a stranger; and the show-room of the Messrs. Rogers, cutlers to the late king, is a splendid museum, where all the local manufactures may be seen, of the best quality, and in the finest order

Coventry, an ancient city in Warwickshire, 91 miles from London, is a great seat of the manufacture of ribbons, and also of watches. Some other manufactures, carried on to a great extent in the last century, including gauzes and calimancoes, have declined, leaving these alone flourishing. The population in 1831 was 27,070, all except a small portion being engaged in trade and manufactures.

Coventry is an ancient town of note, and contains, besides some good modern public buildings, an old church of remarkable beauty as a specimen of Gothic architecture, and a very curious old hall (St. Mary's Hall), used for festive purposes, having a grotesquely carved oak roof, and a piece of tapestry, wrought in 1450, measuring 30 feet by 10, and containing 80 figures. The town was remarkable in early ages for the performance of the grotesque religious dramas called Mysteries, and for the shows and pageants which took place in celebration of the visits of royal personages. One pageant of an extraordinary character has been performed annually ever since the reign of Charles II. It is designed to commemorate a real or imaginary incident, which is thus related: Leofric, Earl of Mercia, who possessed the property of the tolls and services of Coventry, exacted his dues so rigidly, that the inhabitants were greatly aggrieved, and at length Godiva, his pious wife, became their advocate. The earl, wearied by her solicitations, promised to grant her request, if she would ride naked through the town at mid-day. His terms, according to the legend, were accepted, and the countess rode through the town with no covering but her flowing tresses. It is added, that she had modestly commanded every person to keep within doors and away from the windows, on pain of death, but that one person could not forbear taking a glance, and lost his life for his curiosity. The procession commemorative of this occurrence includes the whole of the officials of the corporation, besides a female of easy purchase, who rides in a dress of linen closely fitted to her limbs and coloured like them. The curious person who stole the glance is called *Peeping Tom*, and a wooden image of him is to be seen on a house in the city.

Derby, the capital of Derbyshire, is an ancient but now considerably modernized town, situated on a pleasant slope and irregular ground, on the south side of the vale of the Derwent, a river tributary to the Trent, pursuing a winding course through the county, and of great value in moving mill-machinery. Derby is the centre of one of the most productive and industrious districts in England, particularly as respects the manufacture of iron and other minerals. In the town and its neighbourhood there are large manufactories of lace, galloons, broad silks, silk hosiery, china, marble, jewellery, &c.; several extensive mills and manufactories have been built within these few years, and the machinery is equal to that of any other part of the kingdom. The town is irregularly built, and excepting some new erections in the corn-market, an infirmary, and an old church, with an elegant and conspicuous tower, it owns no public building worthy of remark. Though placed in the midst of a stone district, the houses are as usual built of brick. Within these two years, Derby has come prominently into notice by being on the line of the extended series of railways from Durham and Yorkshire to London, and the station here is of magnificent proportions: the distance from London, 126 miles, is performed by railway in about seven hours. In 1840, the town received from Mr. Joseph Strutt the munificent gift of a pleasure-ground, eleven acres in extent, and called by him the Arboretum. It is replenished with walks, seats, and every way fitted up for promenading and recreation; it is opened freely two days in the week to all classes, and on other days is accessible upon payment of a small fee. The population of Derby, in 1831, amounted to 23,627.

Carlisle, which in early times was distinguished as a bulwark against the invasions of the Scottish armies, and as a cathedral city, has latterly acquired some note as a seat of manufactures, particularly in the department of cotton-spinning, calico-printing, and the weaving of ginghams, &c. The establishment of a railway communication with Newcastle has within the last few years added to its mercantile prosperity, by rendering it an entrepôt for produce passing from the west coast and from Ireland to the populous counties of Durham and Northumberland. Population, 20,006.

Commercial Towns.

At the head of this class stands *Liverpool*, next to London the greatest port in the empire. It is situated in Lancashire, on the east bank of the estuary of the Mersey, at the distance of 30 miles from Manchester, and 204 from London. The town extends for about three miles along the Mersey, and rather more than one mile inland, the situation enjoying a slight slope towards the river. On the side next the country, the town extends into numerous suburban districts, comprehending many villas, the residences of the more wealthy citizens. Liverpool, in 1831, contained 165,175 inhabitants; but, inclusive of the immediate environs, and the persons engaged in navigation, the whole number in 1835 was believed to be not less than 220,000. Its rise has been surprisingly rapid. In the reign of Elizabeth, it was only a small village; in 1700, there were about 5000 inhabitants; in 1760, 26,000; and, in 1801, 77,653.

Liverpool is the grand medium through which the trade of England with Ireland and America is carried on; and a vast quantity of business is transacted by its merchants with the ports of the Mediterranean, East Indies and other parts of the world. The leading article of import is the cotton so extensively used in the manufactures of Lancashire, of which, in 1830, out of 793,695 bales imported into England, 703,200 were brought into Liverpool. The rural produce of Ireland, cattle, bacon, poultry, eggs, &c., forms the import next in amount, the value in 1832 being about four and a half millions sterling. The duties paid at the custom-house of Liverpool, in 1837, were £4,351,496, being about a fifth of those paid throughout the whole kingdom. In the same year, the vessels entered inwards exclusive of those concerned in the fisheries and coasting trade, were—British, 1685, foreign, 985; in all, 2670. Those entered outwards were—British, 1735; foreign, 1012; in all, 2747. But when the fisheries and coasting trade are included, the number of British vessels entering Liverpool that year reaches the amazing number of 10,281, each being upon an average of 200 tons. Liverpool is the great outlet for the goods manufactured in Lancashire and Yorkshire for sale in America. It is stated that one mercantile house in the American trade, has in one year shipped and received goods to the amount of a million. In connection with the commerce carried on with the United States, there is a large transit of passengers. This was formerly carried on by means of a periodical series of well-appointed and quick-sailing vessels, usually termed *liners*; but for three years past, it has been conducted by means of steam-vessels. There are also steam vessels conveying passengers, daily, to and from Dublin, Glasgow, and several Welsh ports, and only a little less frequently to other Irish harbours, and to several ports in the south-west division of England.

The town, thus so extensively concerned in that commerce from which England derives its chief glory, presents many external features not unworthy of its mercantile character. Of these the chief is the *Docks*, a magnificent series of deep-water harbours, extending along the whole front of the town. They are eleven in number, with an aggregate superficies of 111 acres, and

eight miles of quays! In the year ending June 24, 1840, the dues paid by vessels entering and leaving them was £197,477, 18s. 6d. The sight of these docks, bristling with numberless masts, and a scene of constant bustle from loading and unloading, fills a stranger with astonishment.

The town contains several handsome streets, the chief being Castle street and Dale street. The Town-hall and Exchange buildings form an elegant and impressive assemblage of objects, having a bronze group in the intermediate court, commemorative of the death of Lord Nelson. The Custom-house is, as might be expected, a conspicuous edifice, but in a heavy style of architecture. The other public buildings—the Corn-Exchange, Lyceum, Athenæum, Wellington Rooms, Infirmary, &c., are goodly structures. There are upwards of twenty churches belonging to the establishment, many of them of much architectural beauty; a greater number of chapels belonging to various denominations of dissenters; with four Roman Catholic chapels, a meeting-house for quakers, and a Jews' synagogue. The charitable institutions are numerous and well conducted. About 1500 patients are admitted annually into the Infirmary. The Blue-Coat Hospital maintains and educates about 200 boys and girls. The school for the blind is on a most extensive scale. A handsome and spacious theatre, and a circus, are open during great part of the year. At the Royal Liverpool Institution, public lectures are given; and attached to it is a philosophical apparatus and a museum of natural curiosities. A botanic garden was established in 1801, at an expense of about £10,000. There is also a mechanics' institution of unusual extent and elegance, having been erected at an expense of £11,000. It includes schools for the young, as well as for the adolescent; and in the amount of its funds, and variety of the branches of knowledge taught, the establishment may be described as a kind of university for the middle and working classes of Liverpool. Among the remarkable objects connected with the town, the ornamental Cemetery of St. James's, formed out of an old stone quarry, is worthy of particular notice. It contains a statue of Mr. Huskisson, who was interred in it. The Manchester and Liverpool Railway is noticed elsewhere.

Bristol, a large sea-port town, is situated partly in the county of Somerset, and partly in that of Gloucester, at the junction of the rivers Avon and Frome, and about ten miles from the junction of the former (which is navigable) with the Bristol Channel. It is one of a few English towns which possess the dubiously acknowledged privilege of being counties in themselves, and it is also the cathedral city for the diocese of Bristol. Bristol is an ancient town, and has long enjoyed distinction as a sea-port. Previous to the rise of Liverpool, to which it is now greatly inferior, it was the chief port of the west of England. It still possesses considerable trade, and has further of late years become the seat of some active and thriving manufactures. In 1837, 386 ships, of 76,957 tons burden, entered the harbour from foreign ports, besides 632 from Ireland; and in the same year, the customs duties collected were £1,153,109. Sugar, rum, and tea, are the chief foreign imports, while the chief exports are the native manufactures, and cotton, woollen, and linen goods. The chief native manufactures are soap, glass bottles, various metallic wares, drugs, dyes, and soda. It is honourable to Bristol that, as in its ancient days of supereminency as a port, it sent out the first English vessel across the Atlantic (that of Cabot, which discovered North America), so, in these days, it was the first to establish a communication by steam with the same continent. This was done in 1838, when the Great Western performed its first voyage. The population of Bristol, in 1831, was 117,016.

Bristol is a well-built town, containing many spacious streets and squares, and extending into several beautiful suburban villages, as Clifton, Kingsdown, and St. Michael's, where the residences of the wealthiest citizens are placed. The city contains many public structures of an interesting character. The cathedral is a fine old specimen of the Gothic architecture, and the Church of St. Mary Redcliffe is considered one of the most beautiful in England. The "floating harbour," formed out of the ancient beds of the two rivers, and surrounded by an immense extent of quay, is a most impressive object: the cost of its construction was not much less than £700,000. The Guildhall, Jail, Commercial Rooms, and Institution (which contains a library, hall for lectures, &c.), are other public buildings of an elegant appearance. Clifton, being the site of a well-known hot well, contains a suit of baths and pump-rooms.

Newcastle-on-Tyne.—This ancient and prosperous seat of commerce occupies a somewhat incommodious situation on the left or north bank of the Tyne, at the distance of about ten miles from the sea. It is locally in the county of Northumberland, and by means of a bridge across the Tyne is connected with the populous borough of Gateshead, in the county of Durham. It owes the

Newcastle-on-Tyne.

origin of its name to Robert, the eldest son of William the Conqueror, who erected a fortress on the high bluff which here overhangs the river, and gave it the name of Newcastle. For ages the town was surrounded by strong walls, as a protection against invading Scottish armies: these, however, have disappeared, and in modern times the town has spread over the irregular acclivities and upland which border the river. The old fort or castle still exists, also the ancient Gothic Church of St. Nicholas, whose elegant turret is conspicuous at a considerable distance. The main cause of the increasing importance of Newcastle is its fortunate situation in the midst of the great coal-field of Northumberland and Durham, the produce of which finds a ready outlet by the Tyne. The plentifulness of coal has led to the establishment of numerous manufactures, among which are numbered cast and wrought iron, machinery, lead, glass, chemical productions, pottery, soap, and glue. The number of vessels, British and foreign, which entered the port in 1838, was 1835, with a burden of 242,004 tons. The gross receipts at the custom-house for the same year were £379,360. The older parts of the town near the river exhibit a busy scene of industry; here are crowded together ship and boat-building yards, wharfs for vessels, iron founderies and machine manufactories, and all the usual works connected with a great sea-port. The streets in this quarter are dirty and smoky, but other parts of the town are of great elegance. Since 1834, by the extraordinary energy and taste of Mr. Richard Grainger, a speculating architect, a large portion of the town has been taken down and rebuilt with handsome stone houses, amidst which are various public buildings, including a theatre, an exchange, extensive markets, &c. Newcastle must be considered the metropolis of a rich and populous district, including Tynemouth, North and South Shields (all at the mouth of the Tyne), Sunderland, Durham, and Gateshead; and with these it is intimately connected by means of the river, railways as

otherwise. At Shields and Sunderland are the great depôts of shipping in the coal and other trades. Besides its remarkable manufacturing and commercial industry, Newcastle is distinguished for its philosophical and literary institutions, no other town of its kind possessing so many inhabitants of cultivated taste. In 1831, including the population of Gateshead, which was 15,177, Newcastle and its suburbs had a population of 68,790; but at present it is estimated at 100,000.

Hull (properly Kingston-upon-Hull) is situated at the confluence of the River Hull with the estuary of the Humber, in the East Riding of Yorkshire, of which district it is the principal town. It commands an extraordinary amount of inland navigation, not only by means of the Trent, Ouse, Derwent, and other branches of the Humber, but by means of canals connecting with those streams, and penetrating to the very heart of England. It is the principal outlet for the manufactures of York and Lancashire towards the continent of Europe, the chief seat of the northern whale fishery, and one of the most important stations for steam-navigation in the island, having packets of that kind voyaging not only to London, Newcastle, Leith, and Aberdeen, besides many inland places in its own district, but to Rotterdam, Hamburgh, and occasionally to some of the ports in what is more particularly called the north of Europe. Hull was a noted port so early as the reign of Edward I.; and in the seventeenth century it was a great state depôt for arms, on which account the possession of it in the time of the civil war became an object of much importance. The refusal of its governor, Sir John Hotham, to give it up at that time to Charles I., or even to admit his majesty within the gates, is a conspicuous incident in English history. For some years, owing to various circumstances, some branches of the commerce of the port have experienced a decline rather than an advance; but it is still a town of large trade. In 1829, 579 vessels, of 72,248 aggregate tonnage, belonged to Hull. For the accommodation of the shipping there is a splendid range of docks, presenting an amount of quayage said to measure 60,000 square yards, and with all the suitable accommodations for storing a vast quantity of merchandise. The population of the town is about 50,000.

Chester is one of the less important and less populous of the commercial towns of England. Such importance, however, as it possesses as a commercial town, is enhanced by its being a county town and cathedral city, and the residence of a considerable number of persons in independent circumstances. It is also remarkable for its antiquity and its historical associations, as well as for some local features of an unusual kind.

It is situated within a bend of the Dee, a few miles from the point where that river joins an estuary branching from the Irish Channel. The two principal streets cross each other at right-angles, and the town is still surrounded by the massive walls which were originally designed to protect it from warlike aggression, but are now only useful as an agreeable promenade, from which some pleasant views of the surrounding country may be obtained. The streets are formed in hollows dug out of rock, so that the lowest floor of each house is under the level of the ground behind, though looking out upon the carriage-way in front. The paths for passengers are not here, as is usually the case, formed in lateral lines along the streets, but in a piazza running along the front of what in England is called the *first*, and in Scotland more correctly the *second* floor, of the houses. These piazzas, called in Chester *the Rows*, are accessible from the street by stairs at convenient distances. There are numerous shops entered from them, and they in some places still retain the massive wooden balustrades with which all were originally furnished, but for which, in other places, light iron railings have been substituted. Where the houses and balustrades are old the effect is very curious and striking, and apt to awaken ideas of ancient usages and habits long passed away. The Cathedral of Chester contains some curious ancient architecture. The Castle is a splendid modern building, on the site of the powerful fortress which was once of such importance as a check upon the Welsh: it contains the county court-house, jail, &c. The principal other buildings are the Halls built by the merchants to serve as marts, of which there are three, besides the Exchange. The bridge across the Dee is a remarkable object, being of one arch, with a span of 200 feet: it cost £40,000.

Chester was an important station of the Romans, from whom it derived the cross form of its two principal streets, and of whom many relics have from time to time been dug up. It retained its importance during Saxon and Norman times, and in the thirteenth and fourteenth centuries was a flourishing city, with a large maritime trade. It then declined, in consequence of natural obstructions to the navigation of the river. From the year 1328 downwards, it was remarkable for the annual performance of a peculiar class of theatrical representations, similar to those performed at Coventry, and termed Mysteries. To modern taste these would seem the most gross burlesque of sacred subjects; but so convinced were the clergy of those days of their edifying qualities, that a thousand days of pardon from the pope, and forty from the Bishop of Chester, were granted to all who attended them. After a long period of declension, the trade of Chester was revived by the cutting of a new channel for the river, whereby vessels of 600 tons burden were enabled to come to the quays near the town. The commerce, with the exception of a few ships which visit Spain, Portugal, the Mediterranean, and the Baltic, is chiefly confined to Ireland, whence an immense quantity of linen, hemp, flax, skins, and provisions, is imported. The exports of Chester are cheese (the staple production of the county), lead, coal, calamine, copper-plates, and cast-iron. Ship-building is carried on to a considerable extent, and there are some manufactures of inferior consequence. The population of Chester in 1831 was 21,363.

Southampton is an ancient but considerably modernized town, the capital of Hampshire, and, next to Portsmouth and Plymouth, may be considered the chief outport on the south coast. It enjoys a situation at once pleasant and convenient, in a vale adjoining to the bay bearing its own name. In modern times, the town has been greatly improved and increased by the erection of lines of handsome streets in the environs, the residence of a respectable and leisurely population. Among the attractions of the neighbourhood, are those of the New Forest, which almost adjoins the town, and a beach forming a pleasant bathing-place in summer: few sea-side towns are more salubrious or agreeable. With the Isle of Wight, at a few miles' distance, there is a constant communication by steamboats. The South-Western Railway, which terminates near the shore of the bay, has greatly advanced the interests of the town, by making it a depôt of traffic in connection with the metropolis; and there are now constructing, at a great cost, large wet-docks and wharfs for shipping. A considerable trade is already carried on with foreign countries, and the port is a main point of communication between England and Guernsey, Jersey, and Havre, in which, and some other respects, it is a rising rival of the neighbouring town of Portsmouth. The population in 1831 was 19,324.

University Cities.

Oxford, the chief of this limited class of cities, is the principal town in Oxfordshire, and is situated in a valley at the confluence of the Isis and Cherwell, at the distance of 58 miles from London. Besides being the seat of the celebrated university named from it, it is the seat of an episcopal see. Containing twenty colleges and five

"halls," a cathedral, and thirteen elegant parish churches, besides the Radcliffe Library, the University Theatre, and several other elegant public buildings, all condensed into a small space, amidst streets, some of which are straight and elegant, while none except a few of an obscure character are mean, Oxford appears to a stranger as beautiful externally as its historic character renders it venerable. The High Street, in which several colleges are situated, is generally acknowledged to be one of the finest streets in the world. The origin of the university is usually attributed, but upon no certain authority, to King Alfred. Oxford has certainly, however, been a famed seat of learning since the twelfth century. Each college and hall has its own students and teachers, revenues and regulations; yet they are all united under the government of one university. The officers by whom the university is immediately governed, are the chancellor, high steward, vice-chancellor, and two proctors. In addition to the private officers in each college and hall, who see that due order and discipline are preserved, and all the liberal sciences taught, there are twenty-three public professors of the several arts and sciences. In 1829, there were 5009 members on the books, one-third of whom, in their capacities as fellows, &c., were maintained by the revenues. The students wear a peculiar dress, varied according to their status in the college. They all live within the precincts of their respective colleges.

Cambridge is the chief town in Cambridgeshire, and is situated on the Cam, at the distance of 50 miles from London. It is also an elegant city, though less so than Oxford. The university has no certain date before 1229: it comprehends seventeen colleges, which in most respects are similar to those of Oxford. King's College Chapel, built in the reign of Henry VI., is considered the most beautiful structure in either of the two university towns.

Naval Stations.

Portsmouth, the principal rendezvous of the British navy, is situated on the west side of the Isle of Portsea in Hampshire. To the west of the island is the bay called Portsmouth Harbour, excelling every other on the coast of England for its spaciousness, depth, and security. The obvious utility of this harbour in such a situation, caused it to be used at an early period as a station for shipping, and hence the rise of the town of Portsmouth on the narrow inlet by which it communicates with the English Channel. It is also to be observed, that the strait between the mouth of this harbour and the Isle of Wight, forms the celebrated roadstead of Spithead, which is capable of containing a thousand sail at anchor in the greatest security. The original or old town of Portsmouth, surrounded by ancient walls; the modern suburban towns of Portsea and Southsea, respectively situated to the north and south of the original town; and the town of Gosport, on the opposite side of the inlet to the harbour, may all be said to form one cluster of population, probably numboring not less than 40,000. The beach opposite Southsea being well adapted for sea-bathing, has caused that suburb or village to become a watering-place of some note.

The docks, arsenal, building-yards, and all the various other establishments concerned in the fitting out and safe keeping of the national shipping, render Portsmouth an object of wonder to all who see it for the first time. The Dockyard includes the great area of 100 acres. The Smithery is a vast building, where anchors are wrought, weighing from seventy to ninety hundredweight each. On the Anchor-Wharf hundreds of these useful implements are piled up, ready for immediate service. The Ropery, where the cordage for the vessels is prepared, is three stories high, 54 feet broad, and 1094 feet long. The Gun-Wharf is an immense arsenal, consisting of various ranges of buildings for the reception of naval and military stores, artillery, &c. The Small Armoury is capable of containing 25,000 stand of arms. There is a naval college, where a hundred scholars, in time of war, and seventy in time of peace, are taught; thirty, who are the children of officers, being maintained and educated at the public expense. During war, the number of persons employed in the various establishments connected with the public service at Portsmouth, has amounted to 5000. The principal buildings connected with the arsenal and dockyards, are the commissioner's house, the government house, the victualling office, the port-admiral's house, and the naval and military barracks. The promenade along the fortifications forms one of the most agreeable features of the town. Among objects of curiosity, we may specify the Victory, Nelson's flag-ship at Trafalgar; the Semapore Telegraph; and the house (No. 110, High street) in which the Duke of Buckingham was temporarily residing, when, in front of it, he was stabbed to death by Lieutenant Felton, in 1628. The church of Portsmouth is a spacious Gothic structure, with a comparatively modern tower, useful as a landmark to seamen. There are various charitable, literary, and scientific institutions connected with the town.

Plymouth is another important naval station, besides being a thriving commercial town. It is situated at the head of the spacious haven of Plymouth Sound, in Devonshire, on the east side of a tongue of land formed by the estuaries of the rivers Plym and Tamar, which here empty themselves into the sea. Essentially connected with Plymouth is *Devonport*, situated in the immediate neighbourhood, and properly an appendage of Plymouth, though of late years distinguished by a separate name. The united population, in 1831, was 75,534. Plymouth having gradually risen from the condition of a small fishing-town to its present size, most of the streets are irregular, and by no means elegant or commodious, but the new parts of the town are handsome, and are spreading rapidly.

Plymouth carries on a considerable trade in timber with North America and the Baltic, and a intercourse has been established with the West Indies. The coasting trade is chiefly with London, Newcastle, Newport, (in Wales), and Bristol. The chief imports are coal, culm, corn, wine, and timber.

It is as a naval and military station that the town is chiefly distinguished. Situated upon a capacious and secure nntural harbour, near the mouth of the English Channel, it is well adapted for this purpose, fleets having a ready exit from it upon any expedition towards the Mediterranean, the Indies, or America. The dock, which is situated at Devonport (formerly on that account called Plymouth Dock), extends along the bank of the Tamar, in a curve 3500 feet in length, with a width at the middle, where it is greatest, of 1600 feet, and at each extremity 1000, thus including an area of 96 acres. Of the fortifications connected with Plymouth, the most remarkable is the citadel, which was erected in the reign of Charles II. It is placed in a most commanding situation on the east end of the height called the *Hoe*, which shelters the town from the sea. It is exceedingly well fortified, and is constantly garrisoned. It contains the residence of the Governor of Plymouth, and barracks for five or six hundred troops. The Victualling Office, an important establishment, containing storehouses, granaries, baking-houses, and cellars for supplying the meat, bread, and liquors required to provision the vessels of the Royal Navy, occupies a splendid building in the adjacent township of East Stonehouse. The port of Plymouth is distinguished for its capacity, and the security which it affords in its several parts. It is capable of containing 2000 sail, and is one of the finest harbours in the world. It consists of three divisions or harbours—Sutton Pool,

immediately adjoining the town; Catwater, an extensive sheet, formed by the estuary of the Plym; and the harbour or bay of Hamoaze. At the mouth of these harbours, the great bay of Plymouth Sound forms an excellent roadstead, which is now completely secure by the erection of the breakwater across its entrance. This work is an insulated mole, or vast heap of stones, stretching across the entrance of the sound so far as to leave a passage for vessels at either end, and opposing a barrier to the heavy swell rolling in from the Atlantic. Its length is 1700 yards, the eastern extremity being about 60 fathoms to the eastward of St. Carlos's Rocks, and the western, 300 west of the Shovel Rock. The middle part is continued in a straight line 1,000 yards, and the two extremities incline towards the northern side of the straight part in an angle of about 120 degrees. This great work was begun, August 12, 1812. During its progress convincing proofs of its efficacy and utility were afforded. The expense of erecting the breakwater is estimated at £1,171,100. The Eddystone Lighthouse is an important appendage to the harbour, the entrance of which would, without this beacon, be extremely dangerous.

The public buildings of Plymouth are, the Customhouse, the Exchange, the Athenæum, the Public Library, the Theatre, the Classical and Mathematical School, the Mechanics' Institute, &c. Of the two parish churches, the most ancient is that of St. Andrew, built previously to 1291, a handsome building of the Gothic order; Charles's Church is also a Gothic structure. Among the charitable institutions, which are about thirty, are a workhouse, a public dispensary, an eye-infirmary, a lying-in charity, a public subscription school, almshouses, Bible societies, &c.

Towns of Residence and Recreation.

Bath.—This is reckoned the best built town in England, and is a favourite residence of the higher classes, either for recreation or in pursuit of health. It is situated in Somersetshire, at the distance of about 108 miles west from London, and lies in a valley divided by the River Avon. Though of great antiquity, the place came into notice and rose to importance in comparatively modern times, in consequence of possessing certain hot mineral springs, considered to be efficacious in the cure of different complaints. The water issues from the ground at a temperature of from 109° to 117° of Fahrenheit, and the quantity discharged daily from the various outlets is 184,320 gallons. The water has been analyzed, and is found to contain sulphate of lime, with considerably lesser proportions of muriate of soda, sulphate of soda, carbonic acid, and carbonate of lime, also a minute portion of silica and oxide of iron. It is stimulating in its properties, and is said to be most successful in cases of palsy, rheumatism, gout, and cutaneous diseases. Over the springs there are elegant pump-rooms and baths. The modern parts of the town are built as streets, crescents, and squares, the houses being of polished sandstone, and in some instances constructed with much taste. Living is expensive in the town during the fashionable season. The population in 1831 was 38,063.

Cheltenham competes with Bath as a fashionable resort for valetudinarians, real or imaginary. It is situated in Gloucestershire, 88 miles west from London, and 39½ north-east of Bath. The situation is exceedingly delightful, being remarkably well sheltered by the range of Cotteswold Hills on the north-east, and having an exposure to the south and west; it is on this account preferred to all other towns in England by persons from India and other hot climates. Besides being attractive from the salubrity and mildness of its climate, Cheltenham, like Bath, possesses mineral springs reckoned of value for medical purposes, but particularly for invalids with diseased livers. There are several springs, some of which are chalybeate, but their properties and strength are liable to variation. Cheltenham is laid out, in a very ornamental manner, with walks and pleasure-grounds, and may be described as perhaps the prettiest town of a small size in England. As in Bath, the expense of living is very great. The population of the parish in 1831 was 22,942, about one-half of whom belonged to the town.

Brighton, on the coast of Sussex, has risen into importance within the last sixty years, partly in consequence of a beach remarkably well adapted for sea-bathing, and partly from its attracting the regard of George Prince of Wales, who reared a marine palace here, in a Chinese style. The population in 1831 was 40,634. Brighton is an elegant and airy town, with much to render it agreeable as a place of residence for persons in affluent circumstances. The Steyne, a spacious and beautiful lawn, nearly surrounded by houses, the Marine Parade, and several terraces overlooking the sea, furnish delightful walks; while the Baths, Theatre, Assembly Rooms, &c., form additional attractions. There is a regular intercourse with Dieppe by steam-vessels. The Chain-Pier is a remarkable object: it was erected in 1823 at an expense of £30,000, and is 1134 feet long.

Among other towns of this class, we can only notice *Herne Bay*, *Margate* and *Ramsgate*, situated on the coast of Kent, and which may be considered as the chief places of summer recreation for the inhabitants of London, to and from which steamers ply daily. Herne Bay is a place of recent date, rising into notice, and possessing a pleasant open beach, with space for promenading. Margate is a town of a much earlier date, situated in an open part of a bold line of chalky cliffs, and consists of a confused cluster of streets, with some lines of building of a more airy description in the environs. The town is well supplied with shops, bazaars, and places of amusement during the bathing-season; it also possesses numerous respectable boarding-houses, where, on moderate terms, a person may reside for a short time in a very agreeable manner. At these houses, parties of pleasure are made up for the day, the expense of cars and refreshments during the excursion being defrayed by general contribution. Within a mile or two along the coast is another summer retreat called *Broadstairs*; and beyond it, at an equal distance, is Ramsgate. The chalk cliffs here, which are bold and precipitous, afford a high and salubrious position for the chief part of the town, and beneath there is a fine tract of sandy beach for the use of bathers. The harbour at Ramsgate is one of the best in England, and affords shelter to all kinds of vessels in the Downs.

Cathedral Towns.

Of this class of towns, besides those which have been already noticed under other heads, we can here only advert to three of more than usual importance.

Canterbury, the capital of Kent, is a city of great antiquity, having formed the seat of an ecclesiastical establishment to St. Augustine, the apostle of Christianity to Britain in the sixth century. In the tenth and eleventh centuries, the town derived great importance from the erection or extension of a cathedral, on a most extensive scale, and of the purest Gothic architecture. In 1162, the archiepiscopal see was bestowed on the famous Becket, who enjoyed it eight years, till the period of his murder in 1170, when his shrine became an object of extraordinary reverence, and brought pilgrims in thousands from all parts of the kingdom. The cathedral, which thus became celebrated, still exists, in a slightly altered and improved condition. Its form is that of a cross, with a central tower of unrivalled workmanship, reaching to a height of 236 feet. The size of the building is immense: the length inside, from east to west, being 514 feet; height of the vaulted roof, 80 feet; breadth of the nave and side aisles, 71 feet; and breadth of the

cross aisles, from north to south, 124 feet. The interior exhibits a number of interesting monuments of distinguished individuals. Altogether, the cathedral is a work of exceeding grandeur, and, with exquisite beauty of form, possesses a profound historical interest. The town of Canterbury is old, and, like most cathedral towns, is a dull and formal place of residence, with a proportion of genteel inhabitants. It is, however, neat and clean, and is surrounded by a fertile and pleasant tract of country. It has a number of large hotels and posting-houses, to accommodate the numerous travellers passing between the metropolis and Dover, the chief out-port for France. The distance from London is 56 miles, and from Dover 16. A railway which is now preparing between London and Dover, and which does not touch Canterbury, will, in all likelihood, completely ruin it as a posting-station. The only object of attraction in the town, besides the cathedral, is a pleasure-ground called the Danejohn, a corruption of the word donjon, such a building having once occupied the spot, in connection with the city walls. The area of the field is laid out with an avenue of trees, and is principally otherwise a grassy esplanade, open freely to all the inhabitants. In 1790, the field was presented by Mr. Alderman James Simmonds for the use and recreation of the inhabitants in all time coming, an act of generosity deserving the highest commendation. The population of Canterbury in 1831 was 14,463.

York.—This ancient city, considered as the second in the kingdom in dignity—the chief town of the county, and the cathedral city of the archiepiscopal diocese bearing its name—is situated at the confluence of the Rivers Foss and Ouse, in one of the richest and most extensive plains in England. Its population in 1831 was 25,359. York, whatever its first rise might be, was a city of the Romans, and occupied by Roman citizens as a *colony*. It was successively the seat of Adrain, Severus, and other emperors: Severus died here in the year 210. At the time of the Norman conquest, it was a city of considerable consequence. This eminence it retained for several centuries, but latterly it has sunk into a mere county and cathedral town, that is to say, a place where a considerable number of legal and ecclesiastical functionaries reside, and from which articles of necessity and luxury are diffused over a neighbouring rural district.

It is entered by four principal gates or bars, has six bridges, a cathedral, twenty-three churches, besides places of worship for various dissenting bodies; a guild-hall, county-hall, and other public buildings. The most remarkable object by many degrees is the Cathedral, or Minster, a most superb specimen of the Gothic architecture, measuring in length 524½ feet; in breadth across the transepts, 222 feet: the nave being in height 99, and the grand tower 213 feet. The various parts were built at different times between 1227 and 1377. The parts most admired are the east window and the screen dividing the choir from the body of the church. This window consists of upwards of 200 compartments of stained glass, containing representations of the Supreme Being, saints, and events recorded in Scripture. The screen is a piece of carved wood-work in a highly ornamental style. The chapter-house is also much admired: it is a magnificent structure, of an octagonal form, 63 feet in diameter and 68 feet in height. York Minster has, within the last few years, twice suffered severely from fire. The damage produced on the first occasion, namely, the destruction of the wooden work in the choir, was completely and successfully repaired; that which took place on the second occasion, and which consisted of the destruction of the interior of one of the smaller towers and the roof of the nave, is in the course of being also repaired.

York was at one time a commercial town of some importance, conducting trade by means of the River Ouse, which is navigable for vessels of 120 tons burden. It still possesses a few small manufactures.

Winchester, a town of great antiquity in Hampshire, at the distance of 62 miles from London, is situated in the bottom of a rich grassy vale, through which flows the Itchin, a small river which issues into the sea at Southampton. There was a town here before the Christian era, and it afterwards became the principal city of the Danish, Saxon, and Norman dynasties. It was the scene of Alfred and Canute's glories; and here, with innumerable princes, bishops, and abbots, they lie interred. Till the revolution, it continued a chief place of residence of the royal family; a palace built by the Stuarts is now used as a barrack for soldiers. In the reign of Edward III. (1366), Winchester became the episcopal see of the celebrated William of Wykeham, who greatly improved the cathedral, and instituted a college for the education of youth. The cathedral has undergone various mutations; but being lately repaired and cleaned, is now one of the finest structures of the kind in Britain. The splendid mausoleum of William of Wykeham, in one of its aisles, is an object of great interest. At a short distance from the cathedral are placed the venerable buildings composing the College of Wykeham, at which a number of young gentlemen are educated and prepared for the university. Another highly interesting object of antiquity is the Hospital of St. Cross, situated about a mile down the Itchin. Founded by Henry de Blois, Bishop of Winchester, and brother of King Stephen, in 1136, at St. Cross, is the most perfect specimen remaining in England of the conventual establishments of the middle ages, and affords a residence and means of subsistence to thirteen indigent old men. Winchester is composed of a variety of old streets, and seems among the least improved towns in England. Latterly it has been inspired with a little animation, by becoming a station on the line of the London and Southampton Railway. Population in 1831, 9212.

LONDON:

A DESCRIPTION OF AND GUIDE TO THE BRITISH METROPOLIS.

London, the capital of England and metropolis of the British empire, is situated on the banks of the Thames, in the counties of Middlesex and Surrey, and within a day's journey of the southern shore of Britain.* On the spot now occupied by the city, or more ancient part of the metropolis, which is on the left or northern bank of the Thames, a town had been built and possessed by the Romans eighteen centuries ago, and from that period it has constantly been the seat of an increasing and busy population. Its chief increase and improvement, however, have been since the great fire in 1666, which destroyed a large number of the old streets and public edifices.

The original city was fortified by a wall, which has long since been removed, to allow of an expansion into the adjacent fields; and as the number of houses and streets without the old line of wall has at length greatly exceeded those within, *the city*, as it is still named, is like a mere kernel in the mass. The extending city has in time formed a connection with various clusters of population in the neighbourhood, including Westminster on the west, and by means of bridges, Southwark and Lambeth on the south. The whole metropolis, reckoning by continuous lines of houses, extends to a length of nearly eight miles, by a breadth of from six to seven; and it is computed that the whole includes at least thirty-five square miles.

The following is the list of districts included within what is usually described as London, with their population in 1831:—London within the walls, 57,695; London without the walls, 67,878; city of Westminster, 202,080; out parishes within the bills of mortality, 761,348; parishes not within the bills of mortality, 293,567; Southwark, 91,501; total, 1,474,069. London within the walls contains ninety-eight parishes, most of which are very small in size, but at one time were very populous. The practice of living out of town, and of using the dwellings of the city for warehouses, has greatly lessened the population in latter times. Without the walls, there are eleven parishes, independently of the parishes in Westminster and Southwark. The largest and most populous of the suburban parishes is Marylebone. Adjoining the suburban though really town parishes, there are various country parishes, as Greenwich, Deptford, Camberwell, Clapham, Westham and Stratford, Hammersmith, Hampstead, &c., containing an aggregate population of 129,480; and adding this number to the above 1,474,069, there was within a compass of about eight miles round London, in 1831, a population of 1,584,042, which is probably now increased to nearly two millions. Within the last fifty years, London has doubled in extent, and at present is rapidly increasing on all sides, particularly on the north, west, and south. In no town in Great Britain are there to be seen so few empty houses. The total assessed rental of the metropolis in 1830 was £5,143,340, but the real rental was supposed not to be less than £7,000,000.

The increase of London to its present enormous size, has been promoted by certain highly favourable circumstances. First, it has for ages been the capital of England, and seat of the legislature and court; and, since the union with Scotland and Ireland, it has become a centre also for these parts of the United Kingdom. Being, therefore, a point of attraction for the nobility, landed gentry, and other families of opulence from all quarters, a vast increase of population to minister to the tastes and wants of these classes has been the result. While deriving immense advantages from this centralizing principle, London has been equally, if not yet more, indebted to its excellent situation on the banks of a great navigable river, and in a fine part of the country. As already mentioned, London proper, or the greater part of the town, stands on the left bank of the Thames, on ground rising very gently towards the north; and so even and regular in outline, that among the streets, with few exceptions, the ground is almost flat. On the south bank of the river, the ground is quite level, rather too much so; and on all sides the country appears very little diversified with hills, or any thing to interrupt the extension of the buildings. The Thames, that great source of wealth to the metropolis, is an object which generally excites a lively interest among strangers. It is a placid majestic stream, rising in the interior of the country at the distance of 138 miles above London, and entering the sea on the east coast about sixty miles below it. It comes flowing between low, fertile and village-clad banks, out of a richly ornamented country on the west, and arriving at the outmost houses of the metropolis, a short way above Westminster Abbey, it pursues a winding course between banks thickly clad with dwelling-houses, warehouses, manufactories, and wharfs, for a space of eight or nine miles, its breadth being here from a third to a quarter of a mile. The tides affect it for fifteen or sixteen miles above the city; but the salt water comes no farther than Gravesend, or thirty miles below it. However, such is the volume and depth of water, that vessels of seven or eight hundred tons reach the city on its eastern quarter at Wapping. Most unfortunately, the beauty of this noble stream is much hid from the spectator, there being no quays or promenades along its banks. With the exception of the summit of St. Paul's, the only good points for viewing the river are the bridges, which cross it at convenient distances, and by their length convey an accurate idea of the breadth of the channel. During fine weather, the river is covered with numerous barges or boats of fanciful and light fabric, suitable for quick rowing; and by means of these pleasant conveyances, as well as small steamboats, the Thames forms one of the chief thoroughfares.

*In latitude 51° 30′ 47″ north. The name London is traced to a Celtic or British origin, though some doubts are entertained respecting its exact signification. The more common opinion is, that it originates in the words *Llin*, a pool or lake, and *din*, a town or harbour for ships. As the Thames at one time spread into a lake on the Surrey side, this signification is sufficiently descriptive of the local position of the metropolis.

London is fortunate in a particularly salubrious situation, whether as respects its relation to the river or its subsoil. A large portion of the entire city is built on gravel, or on a species of clay resting on sand; and by means of capacious underground sewers in all directions, emptying themselves into the Thames, the whole town (with some discreditable exceptions in the humbler and more remote class of streets) is well drained and cleared from superficial impurities. On account of the want of stone here, as in many other places in England, brick is the only material employed in building. London is therefore a *brick-built town*. To a stranger, it appears to consist of an interminable series of streets of moderate width, composed of dingy red brick houses, which are commonly four stories in height, and seldom less than three. The greater proportion of the dwellings are small. They are mere slips of buildings, containing, in most instances, only two small rooms on the floor, one behind the other, often with a wide door of communication between, and a wooden stair, with balustrades, from bottom to top of the house. It is only in the more fashionable districts of the town that the houses have sunk areas with railings; in all the business parts, they stand close upon the pavements, so that trade may be conducted with the utmost facility and convenience. Every street possesses a smooth flagged pavement at the sides for foot passengers; while the central parts of the thoroughfares are causewayed with square hard stones, or paved in some other way equally suited to endure the prodigious tear and wear created by the horses and vehicles passing along them.

In the central and many other principal streets of London, the ground stories of the houses are generally used as shops or warehouses. When the object is retail traffic, the whole range of front is usually formed into door and window, so as to show goods to the best advantage to the passengers. The exhibition of goods in the London shop windows is one of the greatest wonders of the place. Every thing which the appetite can desire, or the fancy imagine, would appear there to be congregated. In every other city there is an evident meagreness in the quantity and assortments; but here there is the most remarkable abundance, and that not in isolated spots, but along the sides of thoroughfares miles in length. In whatever way the eye is turned, this extraordinary amount of mercantile wealth is strikingly observable; even in what appear obscure alleys or courts, the abundance of goods is found to be on a greater scale than in any provincial town.

The flowing of the Thames from west to east through the metropolis, has given a general direction to the lines of streets; the principal thoroughfares are in some measure parallel to the river, with the inferior, or at least shorter, streets branching from them. Intersecting the town lengthwise, or from east to west, are two great leading thoroughfares at a short distance from each other, but gradually diverging at their western extremity. One of these routes begins in the eastern environs, near Blackwall, proceeds along Whitechapel, Leadenhall Street, Cornhill, Cheapside, Newgate street, Skinner Street, Holborn, and Oxford street. The other may be considered as starting at London Bridge, and passing up King William street into Cheapside, at the end of which it makes a bend round St. Paul's Churchyard, thence proceeds down Ludgate Hill, along Fleet street and the Strand to Charing Cross, where it sends a branch off to the left to Whitehall, and another to the right, called Cockspur Street, which leads forward into Pall-Mall, and sends a shoot up Regent street into Piccadilly, which proceeds westward to Hyde Park Corner. These are the main lines in the metropolis, and are among the first traversed by strangers. It will be observed that the main channels unite in Cheapside, which therefore becomes an excessively crowded thoroughfare, particularly in the early part of the day. The main cross branches in the metropolis are—Farringdon street, leading from the opening to Blackfriars Bridge, at the foot of Ludgate Hill, to Holborn; the Haymarket, leading from Cockspur street; and Regent street, already mentioned. There are several large streets leading northwards from the Holborn and Oxford street line. The principal one, in the east, is St. Martin le Grand and Aldersgate street, which communicates with the great north road. It is a matter of general complaint, that there are so few great channels of communication through London both lengthwise and crosswise; for the inferior streets, independently of their complex bearings, are much too narrow for regular traffic. According to the accounts last taken, the entire metropolis contained 13,936 separate streets, squares, courts, alleys, &c., each with a distinct name. Oxford street, the longest in London, is 2304 yards in length, and numbers 225 houses on each side.

Without particular reference to municipal distinctions, London may be divided into four principal portions—the city, which is the centre, and where the greatest part of the business is conducted; the east end, in which is the port for shipping; the west end, or Westminster, in which are the palaces of the queen and royal family, the houses of Parliament, Westminster Abbey, and the residences of the nobility and gentry; the Surrey division, lying on the south side of the Thames, and containing many manufacturing establishments and dwellings of private families. Besides these, the northern suburbs, which include the once detached villages of Stoke Newington, Islington, Hoxton, St. Pancras, Pentonville, Somer's Town, and Paddington, and consists chiefly of private dwellings for the mercantile and higher classes, may be considered a peculiar and distinct division. It is, however, nowhere possible to say exactly where any one division begins or ends. Throughout the vast compass of the city and suburbs, there is a blending of one division with those contiguous to it. In the business parts there are lines or clusters of neat dwellings, and in the parts devoted to retirement there are seen indications of business. The outskirts on all sides comprise long rows or groups of detached villas, with ornamental flower-plots; and houses of this attractive kind proceed in some directions so far out of town, that there seems no getting beyond them into the country. From the Surrey division there extend southward and westward a great number of these streets of neat private houses, as, for instance, towards Walworth, Kennington, Clapham, Brixton, &c.; and in these directions lie some of the most pleasant spots in the environs of the metropolis. The suburban streets are only macadamized, and possess gravel side paths.

PLACES ON THE THAMES, BELOW LONDON.

The places on the Thames, below London, which are most worthy of the visits of strangers, are Deptford, Greenwich, and Woolwich, the latter being the farthest from town.

Woolwich is a village in Kent, on the south bank of the Thames, eight miles from London by land, and ten following the course of the river. Here, in the reign of Henry VIII., a dockyard for the construction of vessels of the royal navy was established; and, ever since, the place has been distinguished as an arsenal for naval and military stores. From the river a view is obtained of the dockyard and arsenal, now greatly improved. The ground, for nearly a mile in length, is bounded by a stone quay, and surrounded on the land side with various storehouses and workshops. Among these is included a laboratory for the preparation of cartridges, bombs, grenades, and shot. Adjoining are barracks for artillery and marines, military hospitals, &c.: on the upper part of Woolwich Common is situated a royal military academy for the education of young gentlemen designed

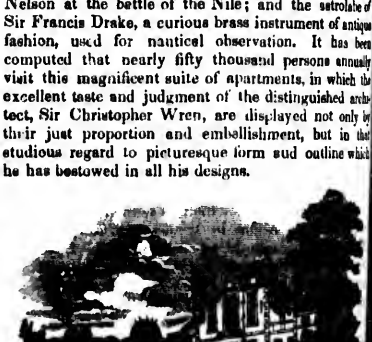
for the army. Strangers are not admitted to the dockyard and arsenal without an order from an officer of the Board of Ordnance. About two miles farther up the Thames, at the head of the reach, is *Blackwall*, on the north bank, with its noble quay for steam-ships. The river now bends sharply to the south, and again returning northwards, encloses like a peninsula, on the north side, a large flat piece of marshy ground called the *Isle of Dogs*. At the southern extremity of this bend of the river stands Greenwich.

Greenwich is a small town, lying on the south bank of the Thames, about six miles below London Bridge, following the windings of the river, but only about four miles by land. To those who do not reach it from Woolwich or any other part down the river, but proceed to it on purpose from London, the most convenient route is by railway from the terminus near the south end of London Bridge, the journey being performed in fifteen or twenty minutes. Small steamers also sail to it from the north end of the bridge every half hour. As a town, Greenwich is of no moment; its hospital and parks are the only objects of attraction to visitors. As you enter its streets, you perceive that it exhibits a seafaring look, and does not resemble the inland places of population in the environs of the capital. Towards its eastern extremity stands the hospital, which faces the Thames, and has a perfect command of all that passes on the river. This superb hospital consists of four edifices, unconnected with each other, but apparently forming an entire structure, lining three sides of an open square, that side on which there is no building being next the water. The whole is built of fine stone, in the best possible style; and along nearly the greater part are lofty colonnades, with handsome pillars, and covered overhead, to protect those underneath from the weather. The square interval in the centre, which is 273 feet wide, is paved also with smooth stone, and ornamented in the middle with a statue of George II., by Rysbrach. Beyond the edifices, on the south, rises the splendid park of Greenwich, dotted with luxuriant tall trees, and crowned at the top with the Royal Observatory buildings.

A portion of these beautiful buildings was originally a palace of Queen Elizabeth, since whose time various renovations and additions have been made, but chiefly in the reign of William and Mary, who, in the year 1694, here established an hospital for invalid seamen, to which purpose the buildings are still exclusively devoted. By the last accounts it contains 2710 pensioners, 168 nurses, with a variety of officers for the government of the house; and gives support to 32,000 out-pensioners. The institution is supported by a payment of sixpence per month from every sailor in the royal navy, by certain dues and donations, and other means. The number of individuals who reside within the walls is nearly 3500. The inmates have a strikingly antique air. They are all old sailors, with countenances well browned by tropical suns, and bleached by the tempests of the ocean; some hobbling on a wooden leg, others with an empty sleeve, a few with only one eye. Their clothes are all of a dark blue colour, of an antiquated fashion. A number wear cocked hats, which add greatly to their supposed antiquity; the boatswains, or other warrant officers, are allowed a yellow trimming or lace to their garments.

There is an air of much contentment, comfort, and peacefulness, in this well-regulated establishment. An abundance of food is allowed, the clothing is warm and comfortable, the accommodations in the house are good, and each man, according to his rank, has from a shilling to half a crown a week, as an allowance for pocket-money. The outer gateway, and the interior parts of this establishment are under the care of the pensioners themselves, who show the utmost attention to strangers, manifesting a politeness and good nature characteristic of the profession of the sailor. Small sums are taken for exhibiting the different places worth seeing, but the money goes to the general fund, or for the board and education of the children of seamen; and the amount tendered by visiters is instantly transferred to the box for its reception.

The chief *lion* of the establishment is the painted hall, which is in the west wing. It consists of a great room and one smaller but equally lofty, leading from its upper end by a flight of steps. A vestibule and flight of steps are between the outer doorway and large room. The appearance of the whole interior on entering is very imposing, the high roof being covered with paintings, as also the farther extremity fronting the entrance; and although these paintings, from exhibiting a mixture of fantastic heathen gods and goddesses with royal and other portraits, are not individually in good taste or of any value, they serve to give a good general effect to the noble apartments they adorn. Along the walls are hung a collection of pictures, partly portraits of celebrated navigators and admirals, and partly depicting distinguished naval victories, each being a present to the institution by some benefactor. A good portrait of Captain Cook, by Dance, presented by Sir Joseph Banks, adorns the vestibule. A number of portraits, by Sir Peter Lely, Dahl, Sir Godfrey Kneller, and others, have been presented by George IV. There are also several by Sir Joshua Reynolds. A little garrulous old sailor, with a single sparkling eye, and a wonderful warmth of devotion to the excellence of the institution, points out the beauties of the various artists, and descants on the extraordinary deception in the perspective of the figures, which he again and again assures the beholder do not stand out from the walls or from the plaster, but are quite flat, and "all as smooth as glass." The painted ceiling of the great room was executed by Sir James Thornhill in 1703, and several subsequent years: from a miscalculation as to the time required for the work, the remuneration fell far short of what it ought to have been. It is related that, in consequence of the length of time he had to lie on his back painting the ceiling, the artist could never afterwards sit upright. In the smaller apartment are shown several models of ships of war, admirably executed in wood; the coat worn by Nelson at the battle of the Nile; and the astrolabe of Sir Francis Drake, a curious brass instrument of antique fashion, used for nautical observation. It has been computed that nearly fifty thousand persons annually visit this magnificent suite of apartments, in which the excellent taste and judgment of the distinguished architect, Sir Christopher Wren, are displayed not only by their just proportion and embellishment, but in that studious regard to picturesque form and outline which he has bestowed in all his designs.



Greenwich Observatory.

The park extending behind the hospital—ever open to the public—comprehends a considerable space

ground, of great natural and artificial beauty. A pathway amidst lines of tall trees leads to a piece of rising ground or mount—quite a hill to a I [illegible]—which, on holidays, generally exhibits a mirthful s[illegible]lads and asses of the humbler classes considering it as a feat to run down the slope without falling or making a stop. On the summit is the Royal Observatory, founded by George III. for the promotion of astronomical science, and the scene of the labours of some men of distinguished ability. An astronomer-royal, supported by the bounty of the crown, constantly resides and pursues investigations in the Observatory. It is scarcely necessary to remind the reader that, from this spot, British geographers measure the longitude in their maps and charts.

Deptford adjoins Greenwich on the west, being only separated from it by a muddy river called Ravensbourne, the mouth of which forms an estuary known as Deptford Creek. Like Woolwich, this place is celebrated for its royal dockyard, commenced also in the reign of Henry VIII. The dockyard, with the victualling department and offices, covers above thirty acres. While Woolwich is now devoted to the preparation and custody of naval and military stores, Deptford is chiefly used for the building of ships; and it possesses wet and dry docks, mast houses, smiths' shops, with about twenty forges for making anchors. From 1000 to 1500 men are usually employed here. The principal depôt, however, for large vessels of war laid up in ordinary, is at Sheerness, near the mouth of the Thames. Peter the Great of Russia, in 1698, studied the art of ship-building at Deptford. In the Thames, near Deptford, may be seen moored the hull of a ninety-eight gun ship, called the Dreadnought, which was dedicated by George III. as a seaman's hospital, and, as is indicated by the inscription on its side, it is open to the reception of sick or disabled seamen of any nation. This noble charity is supported by voluntary contributions.

We now proceed to notice the chief public buildings and objects and places of attraction in and about London, beginning with the Port and places of importance on the Middlesex side of the river.

PUBLIC BUILDINGS, &c., IN LONDON.

The Port.—That part of the river between London Bridge and Blackwall, an interval of several miles, but more particularly the part immediately below the bridge, constitutes the Port, and here are constantly seen lying at anchor great numbers of vessels. As a relief to the river, and for other reasons, there are several very large docks; the lower, and most important, being the East India Docks, which consist of two spacious basins. The next are the West India Docks, the entrances to which are at Blackwall: in these large depôts of shipping connected with the West India trade may at all times be seen some hundreds of vessels, loading or unloading in connection with the warehouses around. The largest of these docks contains thirty acres of water, and is [illegible] feet deep. Farther up the river, and near the [illegible] in the district called Wapping, are the London Docks and St. Katharine's Docks. The London Docks consist of one grand enclosure to the extent of twenty acres, and another of smaller dimensions. These are surrounded by warehouses for the reception of bonded goods, and beneath the warehouses are vaults for bonded liquors. The principal warehouse, entirely devoted to the keeping of tobacco in bond, till it is purchased and the duties are paid, is situated close beside a dock of above an acre in extent, called the Tobacco Dock. The Tobacco Warehouse is the largest covered building in the world; it occupies no less than five acres of ground, and has accommodation for 24,000 hogsheads of tobacco. The sight of this extraordinary warehouse, and of the wine vaults, is calculated to convey the most magnificent conceptions of British commerce. The vaults are arched with brick, and extend in one direction in a continuous line about a mile in length, with diverging lines also of great length, the whole being like the streets of a town under ground. Along the sides are ranged pipes of wine to an amount apparently without limit. There is accommodation for 65,000 pipes. These cellars being dark, all who enter and go through them carry lights. Admission may be had by procuring an order from a wine-merchant to taste and examine any pipes he may have in bond: a cooper accompanies the visiter to pierce the casks. Besides this large vault, which principally contains port, there are other vaults for French wines, &c. The various docks are the property of joint-stock companies, who receive rents and dues of various kinds for their use. At the side of the river adjacent to St. Katharine's Docks, lie large steam-vessels, which sail to and from Edinburgh and other distant ports. Passing the Tower, there is a continuous series of wharfs for shipping and steam-vessels for about a mile to London Bridge, the traffic of the Port being here most dense, and the river at this place being called the Pool. In this chosen seat of commerce, and at a short distance from the bridge, close upon the river, is situated the *Custom-house*. This is an immensely large stone building, which was built in 1814, on the spot occupied by a former custom-house destroyed by fire. The north front, in which is the entrance, is towards a narrow and dirty alley called Lower Thames street. There is nothing worth a moment's notice in or about the building, excepting the long room, in which the chief part of the business is transacted; it measures 190 feet long, 66 feet wide, and 55 feet high. The number of clerks, searchers, and other officers of the establishment, is about two thousand. At wharfs between the Custom-house and the bridge, lie those numerous steam-vessels which ply to Gravesend, Margate, and other places of resort down the Thames, also steamers for continental ports. London, as has been observed, possesses no line of quays on the river. The trade with the ships is carried on at wharfs jutting upon the water. The Thames is placed under strict police regulations with respect to trade; certain places are assigned to different classes of vessels, including those which arrive from Newcastle with coal, and all coasters. The number of ships which arrived from foreign ports in 1837 was 5625, having a burden of 1,064,923 tons; and the number of coasters, including [illegible] vessels, which arrived the same year, was 21,3[illegible] with a burden of 2,911,736 tons. The customs duty collected at the Port in 1834, amounted to the enormous sum of £9,576,972. Of the amount of imports by canals, railways, and roads, there can be no just estimate.

The trade connected with the Port is carried on in the closely constructed part of the town adjacent to the Thames, and backwards to the centre of the city. Almost the whole of this district consists of narrow streets, environed by warehouses and offices, making no external show, but in which an incalculable amount of trade is going on. The offices of many bankers, shipping and insurance companies, are situated hereabouts. Opposite this quarter, on the Surrey side of the river, in equally dense masses, are numerous shipping wharfs, warehouses, porter breweries, and manufactories.

The Tower.—The Tower of London, which forms one of the principal sights of the metropolis, is a cluster of houses, towers, and prison-like edifices, situated in a low and obscure locality, on the north bank of the Thames, and separated from the crowded narrow streets of the city by an open space of ground called Tower-hill. The Tower was founded by William the Conqueror, to secure his authority over the inhabitants of London: but the original fort which he established on the spot was greatly extended by subsequent monarchs; and in the twelfth century it was surrounded by a wet ditch, which

was improved, as it is now seen, in the reign of Charles II. Within the outer wall the ground measures upwards of twelve acres. Next the river there is a broad quay, and on this side also there is a channel by which boats may pass into the main body of the place. This water entrance is known by the name of Traitor's Gate, being that by which state-prisoners are conveyed out in boats to proceed for trial at Westminster. The interior of the Tower is an irregular assemblage of short streets and court-yards, with barracks, houses of keepers, &c. The chief buildings are—the White Tower for prisoners, an ancient chapel, the Ordnance-Office, the Record-Office, the Jewel-Office, the Horse Armoury, the Grand Storehouse, and the Small Armoury. Strangers, on applying at an office at the entrance from Tower-hill, are conducted through the public establishments. The principal objects of curiosity are the immense store of fire-arms, sufficient to equip 150,000 men, and beautifully arranged for show; a collection of cannon, being trophies of war; the horse armoury, being a most interesting collection of suits of mail, on figures; and the crown and other insignia of royalty. Fee for seeing the armoury, 6d.; the regalia, 2s. 6d.

On Tower-hill, facing the Tower, are placed two public establishments—the *Trinity House*, being the office of a corporation whose duty consists in superintending the interests of British shipping; and the *Royal Mint*. The large and elegant building pointed out as the Mint, contains the offices of clerks and other functionaries of the establishment. The buildings in which the coining is performed are situated in the courts behind, and are a series of neat workshops, containing a large steam-engine, as a moving power, melting pots, and machinery for striking the coins. This machinery is exceedingly interesting, and the whole is a model of exactness. Strangers can only be admitted by an order from a superior officer connected with the establishment.

Thames Tunnel.—With the view of affecting a ready communication for wagons and other carriages, and foot passengers, between the Surrey and Middlesex sides of the river, at a point where, from the constant passage of shipping, it would be inconvenient to rear a bridge, a tunnel or free passage beneath was designed and carried into execution by a joint-stock company, which, however, has been largely assisted by government. The tunnel, from a plan of Mr. Brunel, was begun in 1822, at a point about two miles below London Bridge, entering on the southern shore at Rotherhithe, and issuing near the London Docks on the other. After encountering numerous difficulties, including several inundations from above, the work has been brought nearly to a close (January, 1841). The tunnel consists of two distinct avenues or arched vaults, but connected by openings with each other; each avenue being of such height and breadth as to afford a wagon road and footpath. All carriages and passengers going from south to north will take one avenue, and those going the opposite direction will take the other. In its incomplete state, the tunnel is open to visiters, who descend to it by a spiral stair on the Rotherhithe side. When completed, it will be entered by an inclined road at each end.

The Monument.—This is a stone column situated in a small space of ground adjoining the southern extremity of King William street, on the descent to Lower Thames street. It was erected (1677) in commemoration of the great fire of London, which began at the distance of 202 feet eastward from the spot, in 1666; and its height has on that account been made 202 feet. It is a handsome fluted column, designed by Sir Christopher Wren, with a gilt spicular ball on the summit. Visiters are allowed to ascend by a stair to the top, on paying 6d. each. The fabric is now infirm, and its removal has been proposed.

Bridges.—*Old London Bridge* crossed the Thames a little way below the new erection, and was built in 1176, having a considerable rise in the middle, and twenty narrow arches. The new bridge, which is a remarkably fine stone structure, was designed by the late John Rennie, Esq., and opened in 1831; it consists of five arches, that in the middle being 150 feet span, and with a spacious level roadway, connected with the beautiful new thoroughfare, King William street, at the north end, and with the main street of the Borough on the south. The old bridge was removed after the new one was built. On one of the days in August, 1840, it was found, on a careful inquiry, that there passed along King William street, from eight in the morning till eight in the evening, 11,010 carriages, or an average of 970 an hour, or 15 in every minute. On a day of September, in the same year, it was found that there passed during the same space of time, 53,503 foot passengers, averaging 74 per minute.

Southwark Bridge is the next above London Bridge. Its piers are of stone, supporting three arches of immense width; the span of the central arch is 240 feet, or the widest in the world. There are 5308 tons of iron in this bridge. It is the property of a company, who exact a toll from passengers; and from this cause, as well as from having a bad entrance, there is remarkably little traffic upon it.

Blackfriars Bridge, the next in order, was finished in 1769, and consists of nine elliptical arches; the centre one being 100 feet in span, and the entire length 995 feet; the breadth of the carriage-way is 28 feet, with 7 feet of pathway on each side. This bridge rises in the old-fashioned manner; and has been so badly constructed, as recently to require an almost entire renewal of piers; it is now much improved. It is connected with Fleet street, at the foot of Ludgate Hill, by the intermediate thoroughfare called Bridge street, and at its southern extremity it has the long and wide thoroughfare, Blackfriars Road. The river and St. Paul's are best seen from this bridge.

Waterloo Bridge, which is the next above, crosses the river opposite the central part of the Strand. It was finished in 1817, having taken only six years to build. The design was furnished by Mr. G. Dodd, and exceeds in elegance any similar work of art. It consists of nine arches, each of 120 feet span, the whole, including the parapet, built of granite. The roadway at each end is also brought to a level by seconded arches. The length of the bridge, within the abutments, is 1242 feet; width of carriage-road 28 feet, and of each side-path 7 feet. The whole being perfectly level, the bridge may be considered by far the finest in the world. Waterloo Bridge is the property of a company, who exact a toll of 1d. from each passenger; on this account, it is little used as a public thoroughfare.

Westminster Bridge, which crosses the river at a point immediately adjoining Westminster Hall, to Lambeth, is of an old-fashioned structure, with a considerable rise from both ends; it was finished in 1750; extends a length of 1223 feet; is 44 feet wide; and has thirteen large and two smaller arches, of the semi-circular figure; width of middle arch, 76 feet. At the side of the pathways, and rising above the piers, there are recesses, twelve of which are partially covered with cupolas, and these prominent objects give the bridge a peculiar appearance.

Vauxhall Bridge is the most westerly in the series, and crosses the river from a point above Millbank to the thoroughfare adjoining Vauxhall Gardens and Kennington. It consists of nine cast-iron arches resting on stone piers. Standing very much aloof from the lines of general intercourse, and being the property of a company who exact a toll from passengers, it is comparatively little used. In consequence of a considerable bending in the Thames, Vauxhall, Kennington, and other places in that neighbourhood, can be reached by much shorter routes from the centre of the metropolis, by crossing at London or Blackfriars Bridges, than at either the bridges of Westminster or Vauxhall.

Proceeding with our description of public buildings and places of importance in the city, the first we come to in going westward, is the

India House.—This is a large building on the south side of Leadenhall street, erected in 1799, and containing accommodation for the home government of the East Indies. Here there is a grand court-room for the directors of the company, large sale rooms for the disposal of tea and other goods, and offices of various kinds. The chief places of attraction in the establishment are the library and museum, both containing many objects of curiosity from the East. The principal warehouses, which are of immense extent, are in Bishopsgate street. The museum of the India House is open only on Saturday from ten to twelve, *gratis*, all the year except September.

Corn Exchange.—In Mark Lane, a thoroughfare going southwards from Leadenhall street, near the India House, is the Corn Exchange, a large plain building, in which the greater part of the sales of corn take place. Monday is the market-day, on which the greatest bustle prevails.

Royal Exchange.—This building, erected in 1566, and consisting of a handsome quadrangular structure, situated on the north side of Cornhill, was burnt down a few years ago, and upon its site a new Exchange is in course of erection.

Bank of England.—Standing in some measure behind the site of the Royal Exchange, facing Threadneedle street, are seen the extensive series of stone buildings containing the Bank of England. The principal front, seen from the corner of Cornhill, consists of a long line of wall, ornamented with handsome fluted pillars, cornices, and other devices; the windows being blank, the aspect is dead and not by any means pleasing. In the centre is the principal entrance, which conducts to an inner open court, and thence the main building, in which is the telling-office, is reached. Thus far the house is freely open to visiters. The whole buildings and courts include an area of about eight acres, and were completed in 1788. The telling-room shows a scene of extraordinary activity—clerks counting and weighing gold coins, porters going to and fro, and crowds of tradesmen and others negotiating business at the counters. The other and more private parts of the Bank can be seen only by an order from a director. The most interesting departments are the bullion office, in a vaulted chamber beneath, entering from a back court, the treasury, and the apartments in which the notes of the bank are printed. In this latter department there is a large steam-engine, which moves two printing machines, twelve plate presses, and other mechanism—the whole being in the most beautiful order, and forming a most interesting sight. In 1832, there were employed in the Bank, 820 clerks and porters, and 38 printers and engravers; there were besides 193 pensioners. The salaries and pensions amounted to £218,003, the house expenses to £39,187, and the allowance to directors £8000. In a spacious circular chamber, called the Rotunda, which is near the telling-office, a considerable business in the sale of government stock is negotiated. The three per cent. consols office, and dividend office, are fine large apartments adjoining. The hours at which the Bank is open are from nine in the morning till five in the afternoon, holidays excepted.

The most striking view in the interior of the city is at the open central space whence Threadneedle street, Cornhill, King William street, and Cheapside, radiate in different directions. While the corner of the Bank of England bounds this space on the north, it is environed on the south by the

Mansion-House.—This is a tall square mass of dark stone building, with a portico of six Corinthian columns in front, resting on a low rustic basement—the design being heavy and inelegant. This edifice, which projects a considerable length behind, is the official residence of the Lord-mayor of London, provided by the city corporation. Besides an extensive suite of domestic apartments, it contains a number of state-rooms, in which company is received and entertained. The chief of these rooms are the Egyptian Hall, and the ball-room, which have a grand appearance. The annual allowance to the lord-mayor is £8000, and in the Mansion-House he has the use of a superb collection of plate; he is likewise allowed the use of a state coach, &c.

Cheapside.—This great central thoroughfare, which is closely lined with shops of drapers and other tradesmen, is one of the oldest and most respectable streets of the city. On each side narrow streets diverge into the dense mass behind—Ironmonger Lane, King street, Milk street, and Wood street on the north; and among others, Queen street, Bow Lane, and Old 'Change on the south. The greater part of those back streets, with lanes adjoining, are occupied by the offices or warehouses of wholesale dealers in cloths, silks, Manchester goods, articles of Scotch manufacture, paper, &c., and are resorted to by country shopkeepers for supplies. Across the bottom of King street stands

Guildhall, or the townhall of London, where are held meetings of the livery to elect members of parliament, lord-mayor, sheriffs, and others, and where the principal city entertainments are given. The building is old, but received a new Gothic front in 1789. The interior of the grand hall is 153 feet long, 48 feet broad, and 55 feet high; it is one of the largest rooms in London, and can accommodate about 3500 persons at dinner. Two clumsy figures called Gog and Magog, interesting to vulgar curiosity, are placed at the west end of the hall. The apartment is decorated with several historical pictures and monuments. Adjoining are various offices for city courts.

Bow Church, or, more correctly, the church of St. Mary-le-Bow, occupies a conspicuous situation on the south side of Cheapside, and possesses a spire of great elegance, designed by the famous architect, Sir Christopher Wren. The clock projects over the street from the lower part of the tower. Standing in the centre of the city, those who are born within the sound of its bells are jocularly called *Cockneys*, a name equivalent to genuine citizens. The consecration of the bishops of London takes place in Bow Church.

At the western extremity of Cheapside is a dense clump of building, in which is Paternoster Row; on the right or north is St. Martin le Grand, a street in which is the Post-Office; and on the left is St. Paul's Churchyard.

Post-Office.—This is the grandest of all the public buildings of London, not reckoning those of an ecclesiastical order. In comparison with its lofty central portico, all other columnar structures in the metropolis seem insignificant. The whole edifice is of stone, and measures 389 feet in length; and the three porticoes with which it is adorned are of the Ionic order. Beneath the central portico is the entrance to a spacious hall (80 feet long, 60 feet wide, and 53 feet high), having also an entrance at the opposite extremity; and on both sides are the various windows or wickets for receiving letters designed for the foreign, inland, or town post, &c. The upper stories in the building contain sleeping apartments for numerous clerks belonging to the foreign post-office, and servants. The building is enclosed by railing, and at the north end is a courtyard in which mail-coaches range up and depart with their load of bags every evening at eight o'clock. From six to seven o'clock in the evening a prodigious bustle prevails in putting letters into the Post-Office; and on Saturday evening, when the Sunday newspapers are posted, it exceeds all description. The spectacle afforded at that time is one of the most interesting sights of London. Immediately behind the Post-Office stands Goldsmiths' Hall, a new and very elegant building

of Grecian architecture, and of large dimensions, but lost to view in this unhappily confined situation.

St. Paul's.—St. Paul's Church, the most prominent object in London, and whose lofty dome towers in majesty over the mean rows of brick houses which environ it, stands in the centre of an enclosed churchyard of limited dimensions, at the head of Ludgate Hill street. A church was planted here four hundred years before the Norman Conquest, and, under various shapes and extensions, it remained till destroyed by the great fire in London, in 1666. An entirely new edifice was then erected in its stead, the important work being committed to Sir Christopher Wren. It is built in the form of a Greek cross, and measures 514 feet in length, 286 in breadth, and 370 in height, to the topmost pinnacle. Outwardly, the walls, which have a dark sooty appearance, except where bleached with the rains, exhibit a double range of windows. There are three porticoes at as many entrances, on the north, west, and south. That on the west is the principal, with twelve lofty Corinthian pillars below, and the angles above crowned with handsome bell towers, the size of ordinary church towers or steeples. But this entrance, which fronts the street called Ludgate Hill, is apparently disused, and the common entrance is by the north portico and flight of steps. On entering, the impression produced by the vastness of the internal space is very great, although the walls entirely want those decorations which give St. Peter's and many less remarkable continental churches so much beauty and interest. The only objects designed to please in detail are the statues and sepulchral monuments ranged along the sides of the aisles. The revenues of St. Paul's are considerable, and support several prebendaries and other functionaries, the institution being a collegiate church. Prayers are read every morning and afternoon. Through some fine open screenwork, a view is obtained of the place where the usual services are performed, and which is highly decorated with dark oaken carved work. If the stranger pleases, he may mount by means of stairs and ladders to the top of the cupola; and though he be taxed in a small sum at the different stages, he will be amply repaid by the extensive view from the balcony or gallery, which comprehends the whole of London, with the country beyond its outskirts, and the Thames rolling placidly in its winding course through the dense mass of houses. Altogether, St. Paul's is a magnificent structure, and though it cost a million and a half of money in the erection—and that was a great sum in the seventeenth century—the price was well spent by the nation on so worthy an object. The clock-work and great bell of St. Paul's always attracts the notice of visiters. The pendulum measures fourteen feet in length, while the mass at its extremity is one hundred-weight. The great bell, which is only rung when a member of the royal family dies, is placed in the southern turret above the western portico, and weighs four and a half tons, and is ten feet in diameter. The fine deep tones of this mighty bell, on which the hours are struck, sweep solemnly in a quiet evening across the metropolis, and are heard distinctly by families at their firesides, several miles distant. In the immediate vicinity of St. Paul's, the town has a retired, cloistered appearance, the names of the very streets and lanes giving token of their former connection with the religious structure and its clerical attendants. The enclosed churchyard is surrounded by a street, not of the broadest dimensions, closely hemmed in with houses, now chiefly dedicated to trade, the lower stories being, as usual, shops. An open arched passage on the south side of the churchyard leads to Doctors' Commons, or the offices connected with the ecclesiastical courts. St. Paul's is open each week-day from 9 to 11, and from 3 to 4; and on Sunday from 10 to 12, and from 3 to 5. An authorized tariff of fees is exhibited at the door.

Paternoster Row is a continuation of Cheapside, but is not used as a thoroughfare, though it communicates by transverse alleys or courts with the Churchyard, and, at its western extremity, by means of another cross alley, called Ave-Maria Lane, leads into Ludgate Hill. Paternoster Row, or "the Row," as it is familiarly termed, is a dull street, hardly wide enough to permit two carriages to pass each other, with a narrow pavement for a single rank and file on each side, and a gutter in the middle. The houses are tall and sombre in their aspect, and the shops below have a dead look, in comparison with those in the more animated streets. From a very remote period, this alley has been the seat of booksellers and publishers, who, till the present day, continue in such numbers as to leave little room for other tradesmen. At the western extremity of Paternoster Row, a passage leads from Amen Corner to Stationers' Court, in which is situated Stationer's Hall, and also several publishing houses.

Christ Church Hospital, or the *Blue Coat School*, as it is commonly called from the colour of the boys' dress, is situated within an enclosure on the north side of Newgate street, and is one of the most splendid among the charitable foundations of London. The buildings stand on the site of a monastery of Grayfriars, which was granted by Henry VIII. to the city for the use of the poor; and his son and successor Edward VI. greatly extended the value of the gift, by signing a charter for its foundation as a charity school, and at the same time endowing it with sundry benefactions. The hospital was opened for the reception and education of boys in 1552. Charles II. added an endowment for a mathematical class, and with various augmentations of endowment, the annual revenue is, we believe, about £40,000. This income supports and educates nearly 1200 children, 500 of whom, including females, are boarded at the town of Hertford for the sake of country air. The management of the institution is vested in a body of governors, composed of the lord-mayor and aldermen, twelve common-councilmen chosen by lot, and all benefactors to the amount of £400 and upwards. The children are admitted without reference to the city privileges of parents; about one hundred and fifty are entered annually. After instruction in the elementary branches of education, the greater number leave the seminary at the age of fifteen, those only remaining longer who intend to proceed to the university, or to go to sea after completing a course of mathematics. There are seven presentations at Cambridge, and one at Oxford, open to the scholars. The buildings of the institution embrace several structures of large dimensions, chiefly ranged round open courts, with cloisters beneath, and a church, which also serves as a parochial place of worship. The only part of the establishment worth examining for its architecture or size is the great hall, occupying the first floor of a building of modern date, and in the Gothic style. It measures 187 feet long, 51 feet broad, and 47 feet high, and possesses a small gallery at each end. In this magnificent apartment, the boys breakfast, dine, and sup, under the direction of female *governantes*. Before meals, one of the elder inmates, from a pulpit, says a long grace or prayer, at the commencement of which the whole of the boys, in lines at their respective tables, fall on their knees, and present a striking spectacle. Each boy is dressed in the pauper costume of Edward VI.'s reign; the garment consisting of a long dark-blue coat, breeches, and yellow worsted stockings. They are also provided with woollen caps, but these are so small and flat as to be rather for show than use.

Newgate.—At the western extremity of Newgate street, and fronting the Old Bailey, a street which crosses to Ludgate Hill, stands Newgate, the general criminal prison for the city and county. The exterior presents high dark stone walls, without windows, save with entrances from the side next to the Old Bailey, a

ons ! which public executions take place. The earliest prison here was in the portal of the *new gate* of the city, as early as the thirteenth century, and hence the name. The present modern edifice was in course of erection in 1780, when it was partially destroyed by the riots of that year; and it has since been greatly extended, one of its improvements being the exclusion of debtors, who are now confined in a jail in Whitecross street, and a still greater improvement being the classification of prisoners in wards. The establishment is kept in the cleanest possible condition, and is otherwise managed with great care and humanity. The cells for condemned prisoners are at the north-east corner, next to Newgate street. Strangers are admitted to inspect the prisons by an order from one of the sheriffs or other competent city authorities. In buildings adjoining the prison are held the Central and other criminal courts. At the head of Snow Hill, and nearly opposite Newgate, stands St. Sepulchre's Church, the sounding of whose bell has admonished many an unhappy wretch of the approaching hour of execution.

Temple-Bar, &c.—The boundary of the city, at the western termination of Fleet street, is marked by Temple-Bar, consisting of a wide central archway, and a smaller archway at each side for foot passengers. There are doors in the main passage which can be shut at pleasure, but practically they are never closed except on the occasion of some state ceremonial, when the lord-mayor affects an act of grace in opening them to royalty. The structure, which was designed by Sir Christopher Wren, and erected in 1672, must now be considered as a serious obstruction to the living stream passing below. The neighbourhood of Temple-Bar, on the city side, is much occupied by offices, halls, and residences of lawyers and law-students. In or near Chancery Lane, northward from Fleet street, are situated Serjeant's Inn, Lincoln's Inn, Clifford's Inn, &c., while Gray's Inn and Furnival's Inn are situated on the north side of Holborn. These and other *Inns of Court*, as they are termed, are large establishments, with apartments for the residence of law students, who, however, do not attend classes, but only rent rooms and pay for their dinners. After residing and paying at an ordinary for a certain length of time in these places, young men are considered qualified to be called to the bar. At the foot of a lane near Temple-Bar, on the south side of Fleet street, is a most extensive series of buildings, composing several squares and rows, called the Temple, and being the place of residence of the members of two societies, the Inner and Middle Temple, consisting of benchers, barristers, and students. The establishments possess a neatly trimmed garden, adjoining the river. In the cluster of buildings lying east from the Temple, once existed the sanctuary of Whitefriars, or *Alsatia*, as it was sometimes called, a description of which is given by Scott in the "Fortunes of Nigel." The streets here are still narrow and of an inferior order, but all appearance of Alsatians and their pranks is gone.

Strand.—The Strand is the long but somewhat irregularly built street in continuation westward from Temple-Bar, the thoroughfare being greatly incommoded by two churches, which, at a distance from each other, stand in the very middle of the way. In the seventeenth century, the Strand was a species of country road, connecting the city with Westminster, and on its southern side stood a number of noblemen's residences, with gardens towards the river. The grandest of these mansions was a palace, which had been erected in 1549 by the Duke of Somerset, Protector during a part of the minority of Edward VI.; on whose attainder it became crown property and a royal residence. The edifice was entirely removed in the reign of George III., and on the spot was erected, from designs of Sir William Chambers, about the year 1780, that magnificent quadrangular structure called *Somerset House*, which is devoted to the accommodation of various government offices. This noble stone building has its main front towards the Strand, while on the rear it presents an almost equally elegant façade to the Thames, which it closely overhangs. In the middle of the Strand front is the principal entrance, consisting of three open archways, leading into a spacious quadrangular court in the centre. The lines of buildings around as may be observed from inscriptions over the doorways contain the Navy Pay-Office, Stamp-Office, &c.; and in a brick building behind, at the north-western angle, is the office of the Poor-Law Commission. In the central part of the north line of building, near the river, is the suite of apartments devoted to various matters connected with the royal navy, and including a museum of models of ships, &c. Adjoining Somerset House on the east, and entering by a passage from the Strand, is a range of rather plain but massive brick buildings, lately erected for the accommodation of *King's College*. The Strand contains no other public structure of importance, but has some elegant stuccoed buildings at the western extremity, on the northern side; opposite, and overlooking Charing Cross, is the large mansion of the Duke of Northumberland, distinguished by the figure of a lion, the family crest, on the summit.

Charing Cross.—The open space called Charing Cross is marked by a figure on horseback of Charles I., and the name of the locality is derived from the ancient village of Charing, which once stood upon the spot. On the north side is an open quadrangular space, formed by the clearing away of buildings, now called Trafalgar Square, and in the centre of which a pillar is erecting in commemoration of Lord Nelson. At the north-east angle stands *St. Martin's Church*, whose portico, by James Gibbs (1721), is reckoned the most elegant of its kind in the metropolis, or perhaps in the world. Adjacent, closing the northern side of the square, has been lately erected, at an expense of £62,000 voted by Parliament, a building containing the *National Gallery* of Pictures. Mr. Wilkins was the architect. It is in the Grecian style, but so long and so deficient in height or grandeur, as to be contemptible as a work of art. The National Gallery, which is freely open to the public, consists chiefly of a collection of pictures, purchased for £50,000 from the heirs of the late Mr. Angerstein. The Royal Academy has apartments in the eastern division of the building, for its exhibitions of pictures. The National Gallery is open on Monday, Tuesday, Wednesday, and Thursday, and the whole of Easter and Whitsun weeks, except Saturday, from ten till five; but is closed for six weeks from the end of the second week in September.

Whitehall.—Whitehall street, which runs in a southern direction from Charing Cross, is a long and spacious thoroughfare leading to Parliament street, which terminates in Palace Yard, where the Houses of Parliament are situated. On the western side of Whitehall street, and nearly throughout its length, stands a series of large buildings, in various styles of architecture, and used as government offices. The first in the series, on our right going southward, is the Admiralty, which may be known by the telegraph on its roof; next is the Horse Guards, where the business of the army is transacted, and which is outwardly distinguished by two mounted guards at the gateway, and an entrance leading to St. James's Park behind; next is the Treasury; and, lastly, the Board of Trade, and office of the Privy-Council. A short street or place, leading from the corner of the building, and called Downing street, contains the official residences of the first lord of the treasury, the chancellor of the exchequer, the offices of the foreign and colonial secretaries of state, &c. On the eastern side of Whitehall street, and opposite the Horse Guards, stands a tall square massive edifice, of handsome architecture, designed by Inigo Jones, and built, at the order of James I., to serve as a ban

queting house to his adjoining palace of Whitehall. The palace, which reached to the river, was accidentally burnt down in 1695, when St. James's Palace, in St. James's Park, was erected, leaving the Banqueting House to remain as an edifice for any public purpose. The great hall is now used as a chapel; its roof is ornamented by a painting by Rubens, representing the apotheosis of James I. The Banqueting House derives a melancholy interest, from having been the scene of the execution of Charles I., who, on the 30th of January, 1648-9, passed from an open window to a scaffold in front, where he was beheaded in the presence of an immense concourse of spectators.

Westminster Hall—Houses of Parliament.—On the south side of Palace Yard, stands a somewhat confused cluster of buildings of ancient and modern date, comprising a central and beautiful old Gothic fabric, called Westminster Hall, some parasitic edifices devoted as offices for courts of law, and other structures, being the re-edified wrecks of the houses of Parliament, burnt down a few years ago. Westminster Hall, which has its end exposed to Palace Yard, was built by William Rufus, in the years 1097-8, and may be said to resemble the body of a church; the interior is of extraordinary dimensions, being 270 feet long, 74 broad, and 90 high; and the roof, consisting of ancient oak-work, has an air of solemn grandeur. The floor is open, for the free walking to and fro of lawyers, members of the House of Commons, and others. The present House of Commons and House of Lords are neat and commodious; but being only for temporary use, till a splendid edifice is erected for their accommodation nearer to the river, nothing further need be said of their appearance. Strangers will find admittance to the gallery of the House of Commons during the sittings, either by an order from a member, or by paying a fee of half-a-crown to the door-keeper in attendance. Admission to a space without the bar of the House of Lords may be procured in a similar manner. During the recess, admission is had to all parts of the two houses, by applying to the porters in attendance.

Westminster Abbey.—Nearly opposite the houses of Parliament stands Westminster Abbey, open to inspection on the north and east, but much crowded upon by paltry dwelling-houses on the west. In very early times, this spot of ground was a small insular tract, surrounded by the waters of the Thames, and called Thorney Island. Here a monastic institution was founded on the introduction of Christianity into Britain. Under Edward the Confessor, an abbey was raised upon the site of the ruined monastic building. The ground plan, as usual, bore the form of the cross; rights and endowments were granted, and the edifice assumed a great degree of architectural grandeur. It had become the place for the inauguration of the English monarchs, and William the Conqueror was crowned here with great pomp and solemnity, in 1066. Henry III. enlarged the abbey, and the building continued in the state in which he left it until Henry VII. added a chapel, built in the florid Gothic style, on which the greatest skill of the architect and the sculptor was displayed; exhibiting the most splendid structure of the age, and so highly esteemed, that it was enjoined that the remains of royalty alone should be interred within its walls. During the reign of Henry VIII. the abbey was considerably defaced, but on the surrender of its revenues, Henry raised Westminster to the dignity of a city, and its abbey was constituted a cathedral. It was, however, afterwards reunited to London in 1550. Westminster Abbey, during the reign of William and Mary, was thoroughly repaired, and the towers added at the western entrance, under the direction of the celebrated Sir Christopher Wren, to whom London owes so much of its architectural grandeur.

Westminster Abbey.

The length of the abbey is 416 feet; breadth at the transept, 203 feet; nave, 102 feet; height of the west towers, 226 feet. The exterior measurement, including Henry VII.'s Chapel, is 530 feet.

On entering at the great western door between the towers, the magnificence of the abbey at once strikes the beholder with reverential awe: nearly the whole of the interior appears in grand masses of towering Gothic columns of gray marble, connecting the pavement with the roof, and separating the nave from the side aisles. A screen divides the nave from the choir, which is surmounted by a noble organ, while beyond, the eye soars amid graceful columns, tracery, and decorated windows, to the summit of the eastern arch that overlooks the adjacent chapels. The walls on either side display a great profusion of sepulchral monuments, among which are many finely executed pieces of sculpture, and touching memorials of those whose exploits or exertions deserved the notice of posterity.

Above the line of tombs there are chambers and galleries, once occupied by nuns, but now solemn and dreary in their antiquity, though relieved by the sunbeam glancing across the misty height of the nave. The northern window is richly ornamented with stained glass, representing the Holy Scriptures surrounded by a band of cherubim, in the centre; on the sides, the Saviour, the Evangelists, and Apostles, appear in recumbent attitudes. From this window proceeds a calm ray of light, very advantageous to the display of the beautiful sculpture on which it falls. There are numerous tombs and monuments of noble persons, exquisitely imagined and executed, in emblematical groups or in faithful portraiture, presenting to the spectator subject for deep reflection.

The Chapel of Edward the Confessor is at the eastern end of the choir, and contains the shrine of St. Edward; that it was an exquisite piece of workmanship is evident even in its decay. Here also is the coronation-chair, under which is placed the celebrated stone brought from Scone in Scotland by Edward I., in 1297. The Chapel of Henry VII. is also at the eastern end of Westminster Abbey; and among the ashes of many whose brows were decorated with diadems, are those of Mary and Elizabeth. The ascent to this splendid piece of Gothic art, which has been extolled as the wonder of the world, is by steps of black marble beneath a stately portico. The entrance gates display workmanship of extraordinary richness in brass. The effect produced on entering the chapel is solemn and elevating: the lofty ceiling is wrought in stone into an astonishing variety of figures and devices; the stalls are of oak, having the deep tone of age, with Gothic canopies, all elaborately carved. Here are installed the knights of the most honourable Order of the Bath. In their stalls are placed brass plates of their arms, and above are suspended their banners, swords, and helmets; beneath the stalls are seats for the esquires. The pavement is composed of black

and white marble, beneath which is the royal vault. The magnificent tomb of Henry VII. and Elizabeth his queen, stands in the body of this chapel, in a curious chantry of cast brass, most admirably executed, and interspersed with effigies, armorial bearings, and devices, alluding to the union of the red and white roses.

Westminster Abbey is a collegiate church, with a dean and chapter, who possesses a considerable authority over the adjoining district. The abbey may be considered as subdivided into nine chapels; but in the present day divine service is performed only in a space enclosed with wood, near the eastern extremity of the building. It takes place daily at ten in the morning and three in the afternoon, though sometimes none are present but the officials. The public worship of the parish is conducted in the adjacent church of St. Margaret.

The abbey is usually entered by a side door at Poet's corner, which is nearly opposite the House of Lords. Here strangers will find admittance daily, and be conducted through the building on payment of certain fees.

Penitentiary.—Beyond Westminster Abbey in a southerly direction, there is no public building or institution requiring notice, except the Penitentiary at Millbank, near the extremity of Vauxhall Bridge. This great establishment for the confinement and reformation of offenders of secondary turpitude, occupies a very low situation near the Thames, and the external wall includes eighteen acres of ground. The plan of the building, or buildings, is that of a hexagon, with six interior courts, and a building in the centre. The cost of building it was between £400,000 and £500,000, and it is calculated to accommodate 400 male and 400 female convicts. Latterly, the silent and separate system have been adopted in the prison, under particular regulations.

THE PARKS, ROYAL PALACES, &c.

The Parks, which form one of the most beautiful features of the metropolis, are situated chiefly in a series from the back of Whitehall street, in a westerly and southerly direction, and are thus blended with the fashionable end of the town. The most ancient of these open grounds is

St. James's Park, so called from St. James's Palace, which partly bounds it on the north. Originally these grounds were a marshy waste, which was drained and otherwise improved by Henry VIII., who also took down an ancient hospital dedicated to St. James, and built on the site the palace now called St. James's. Charles II. improved the grounds by planting the avenues of lime-trees on the north and south sides of the park, and forming the Mall, which was a hallowed, smooth, gravelled space, half a mile long, skirted with a wooden border, for playing at balls. The southern avenue was appropriated to aviaries: hence it derived the appellation Birdcage Walk. The centre of the park was occupied by canals and ponds for aquatic birds. William III. threw the park open to the public for their recreation. It is nearly a mile and a half in circumference, and the avenues form delightful **shady promenades**. In the centre is a fine piece of water, interspersed with islands, and covered with swans and various water-fowl. On each side are spacious lawns, dotted with lofty trees and flowering shrubs. The lawns are separated from the avenues by iron railings, and at each entrance is a keeper's lodge. There are seven or eight entrances to the park, the king's guard doing duty at each, day and night. At the east side of St. James's Park is a large gravelled space called the Parade, on which, about ten o'clock every morning, the body-guards required for the day are mustered—about seven or eight hundred men; and here the regimental bands perform every morning between ten and eleven o'clock. At the south side of the parade is placed a huge mortar, brought from Spain; and at the north end is a piece of Turkish ordnance, of great length, brought from Alexandria, in Egypt. A little farther north from the parade, is a broad flight of steps, giving entrance to the park from Waterloo Place, constructed by order of William IV.; these steps are surmounted by a lofty column, commemorative of the late Duke of York, which occupies the spot where lately stood Carlton Palace, the favourite residence of George IV. while Prince Regent. The buildings near this, which overlook the park, are lofty and elegant. Farther along the Mall, or avenue, is St. James's Palace, an irregular brick structure, having its front towards Pall-Mall. The interior consists of several spacious levée and drawing rooms, besides other state and domestic apartments. This palace is only used occasionally by the queen, the principal royal residence being now

Buckingham Palace.—This edifice stands at the west end of the Mall in St. James's Park, in a situation much too low in reference to the adjacent grounds on the north. The site was chosen by George IV., and the structure rose under the care of Mr. Nash, architect; when completed, after various capricious alterations, about 1831–2, it is said to have cost about £700,000. The edifice is of stone, with a grand centre, and a wing of similar architecture projecting on each side, forming an open court in front; on the extremities are colonnades, giving a noble expanse to the building. The basement is of the Doric, and the superior part of the building of the Corinthian order; the summits are adorned with statues. The interior contains many beautiful and magnificent apartments, both for state and domestic purposes; but so ill has the plan been conceived, that in a number of the passages lamps require to be kept lighted during the day. In the front of the palace is the Waterloo triumphal arch, which forms an entry to the palace.

The Green Park rises with a gentle slope to the north of Buckingham Palace, and is bounded on the east side by many fine mansions of the nobility. In a north-westerly direction from the palace is a broad road called Constitution Hill, connecting St. James's Park with Hyde Park Corner. On the north is the line of terrace-like street, forming the western extremity of Piccadilly. The whole of the Green Park is surrounded by iron railings, and is interesting from its unequal grassy surface, which rises considerably on the north side. From the highest ground there is a pleasing prospect of Buckingham Palace, and of St. James's Park with its ornamental grounds and avenues of tall trees, over which Westminster Abbey majestically rises, accompanied by the Gothic turrets of other buildings. At the north-west angle of the park, and head of Constitution Hill, where Piccadilly terminates, there is a triumphal arch of the reign of George IV., elaborately decorated, but possessing little general effect. Across the way is the handsome entrance to Hyde Park: and here in the after part of the day in fine weather, may be seen an extraordinary concourse of foot passengers, vehicles, and gentlemen on horseback, going to and returning from Hyde Park; also the general traffic between Piccadilly and Kensington, Brompton, and other places in a westerly direction.

Hyde Park is part of the ancient manor of Hida, which belonged to the monastery of St. Peter, at Westminster, till Henry VIII. appropriated it differently. Its extent is about 400 acres, part of which is considerably elevated. The whole is intersected with noble roads, lawns with luxuriant trees, planted singly or in groups, presenting beautiful examples of diversified prospects. At the south-east corner, the entrance from Piccadilly, on an elevated pedestal, stands a colossal and dark statue of Achilles, cast from the cannon taken at the battles of Salamanca and Waterloo, weighing thirty tons, and "erected to the Duke of Wellington and his companions in arms, by their countrywomen."

The long sheet of water called the Serpentine River enriches the scenery of Hyde Park. At its western ex

tremity is a stone bridge of five large and two smaller arches, erected in 1826, giving access to the gardens of Kensington Palace. On the level space of Hyde Park, troops of the line are occasionally reviewed. The great road through the Park to Kensington is denominated Rotten Row, and is a fashionable resort for equestrians wherein to show off their high-bred horses. Other roads display countless elegant equipages of the nobility, gentry, and others; while the footpaths, which are railed off from the roads, are crowded with the well-dressed inhabitants of London, enjoying the salubrity of the air and the gayety of the scene, more particularly between two and five on a Sunday afternoon. There are five entrances open from early morning till nine at night. No stage or hackney coaches are permitted within the gates of Hyde Park.

Kensington Gardens.—At the western extremity of Hyde Park lie Kensington Gardens, a large piece of ground laid out in the ornamental park style, interspersed with walks, and ornamented with rows and clumps of tall trees. Besides an entrance from Hyde Park, there is an entrance from the Knightsbridge road, or continuation of Piccadilly. The grounds are open daily to all respectably dressed persons. Near the west end of the grounds stands Kensington Palace, a large red brick building, and which serves as a residence for members of the royal family. It was purchased from Lord Chancellor Finch, and greatly improved, by William III., since whose time the gardens adjoining have been considerably extended, so that they now measure about two and a half miles in circumference. These grounds form a most delightful public lounge during fine weather.

Regent's Park is situated considerably apart from the other parks, in a northerly direction from the preceding grounds, and consists of a circular enclosure of about 450 acres, which are laid out on the most approved principles of what is called landscape gardening; its centre is enriched with lakes, plantations, shrubberies, and eight beautiful villas. The park is surrounded by extensive ranges of buildings, forming splendid terraces, variously designated, and all decorated with sculpture in agreement with their respective orders of architecture; producing an effect of beauty and grandeur rarely witnessed. At the south end of the park, the *Colosseum* stands conspicuous, with its immense Doric portico and circular roof, rising from a polygon of sixteen faces, occupying an area of 400 feet The main design of this large structure is to exhibit a panel of panoramic view of London, and this is accomplished with surprising fidelity and effect. The representation is exhibited as seen from the top of St. Paul's, and to gain this imaginary height, the visiter mounts a central tower. Besides this view of London, there are several conservatories and other sights connected with the Colosseum, all of which are exceedingly worthy of being visited. On the border of the Park is the celebrated exhibition called the *Diorama*, which consists of painted representations of landscapes or buildings; on particular parts of the scene, illuminations of different hues are so judiciously cast, as to produce a perfect resemblance to nature.

Zoological Gardens.—At the northern extremity of the Regent's Park are the Zoological Gardens, the property of the Zoological Society, and established in 1826. These gardens are very extensive, and being removed from the dingy atmosphere, noise, and bustle, of London, they present an agreeable and truly country-like aspect. The grounds have been disposed in the style of landscape-gardening—here a clump of shrubby trees and border of flowers, indigenous and exotic; there a pretty miniature lake; and at proper intervals is seen a neat rustic cot, with its straw-thatched roof and honeysuckled porch. Much of the ground, also, is occupied as green meadows, either subdivided into small parks for deer and other quadrupeds, or dotted with movable trellis houses, the abodes of different kinds of birds which require the refreshing exercise of walking on the green turf. Throughout the whole, neat gravel walks wind their serpentine course, and conduct the visiter to the bear-pit, monkey-house, aviaries, and other departments of the establishment. The gardens are open every week-day for the admission of visiters, who must previously procure an order from a member of the society, and likewise pay a shilling each at the gate.

The West End.—Returning up Whitehall street to Charing Cross, the stranger may pursue his tour through Cockspur street to Pall-Mall, and thence proceed up Regent street. As he enters this new line of route, he will perceive that the buildings assume an exceedingly imposing aspect. They are for the most part covered with a composition to resemble stone, and being in some instances painted, they have a light and cheerful appearance. At the foot of Regent street is the short broad thoroughfare of Waterloo Place, lined with noble mansions, and leading southwards to St. James's Park. Here stands the elegant column dedicated to the late Duke of York. From this point, for about a mile in a northerly direction, is the line of Waterloo Place and Regent street, forming the handsomest street in London. At a point a short way up, we cross Piccadilly, and enter a curve in the thoroughfare, called the Quadrant; the fronts of the houses are here lined with arcades and pillars, so as to form a covered path on each side of the way. At the corners of the Quadrant, and also in Upper Regent street, there are now some of the most splendid shops in London, several being decorated in a style of extraordinary magnificence. Regent street, during the busy season in May and June, and during the day from one till four o'clock, exhibits an extraordinary concourse of fashionable vehicles, gentlemen on horseback, and foot passengers; while groups of carriages are drawn up at the doors of the more elegant shops. Towards its upper extremity, Regent street crosses Oxford street: and the mass of streets west from it, throughout its entire length, may be said to include the residences of the greater part of the nobility and other high classes of London. In this quarter are Old and New Bond streets, Hanover, Berkeley, Grosvenor, Cavendish, and Portman squares (the two latter north of Oxford street); and in connection with these squares there are long quiet streets, lined with houses suited for an affluent order of inhabitants. In and north from Oxford street, and in its eastern continuation, Holborn, there are few public buildings deserving particular attention: the only institution of general importance north from Holborn is the

British Museum.—This is a great national establishment (the property of the public), containing a vast collection of books, prints, antiquities, and natural curiosities. It occupies a most extensive suite of buildings in Great Russel street, Bloomsbury. Since its commencement in 1755, the collection has been prodigiously increased by gifts, bequests, and purchases, and now it is perhaps the largest of the kind in the world. The library is open only to persons who proceed thither for study or for consulting authorities, no general inspection by strangers being allowed. The portions open to ordinary visiters consist of an extensive series of large apartments on the ground and upper floors, each devoted to the exhibition of a distinct class of objects. Among others are the following:—Room 1, Terracottas; 2, 3, 4, and 5, Greek and Roman sculptures; 5, Roman sepulchral antiquities, and Sir T. Lawrence's collection of casts; 7, British antiquities; 8, Egyptian antiquities; 9, Portland Vase; and several saloons containing the Elgin Marbles, and massive Egyptian antiquities. The rooms containing objects in natural history and artificial curiosities, are handsomely fitted up with glass-cases on the walls and counters. The most deeply interesting collec-

tion in the whole establishment is that of Egyptian antiquities—consisting of smaller objects, including mummies in cases, on the upper floor, and huge remains in stone in the saloons below. Days may be spent in examining this vast assemblage of objects; and to assist in the inspection, catalogues for the entire museum may be purchased at the door.

The British Museum is open from October to April on Mondays, Wednesdays, and Fridays, and the whole of Easter and Whitsun weeks, except Saturday, from 10 till 4; from May to September, 10 till 7. It is closed on the first week in January, May, and September, and on Christmas-day, Good Friday, and Ash Wednesday. No fee whatever is payable.

PLACES OF INTEREST NEAR LONDON.

The chief places of an interesting kind near London are Woolwich, Greenwich, and Deptford, already mentioned, on the east; Dulwich on the south; and Chelsea, Richmond, Hampton Court, and Windsor, on the south-west.

Dulwich is a pretty village, lying within the extended suburbs of the metropolis, in Surry, in a southerly direction from London Bridge. Here Edward Alleyn, or Allen, a distinguished actor in the reign of James I., founded and endowed an hospital or college, for the residence and support of poor persons, under certain limitations. The foundor bequeathed some pictures to the Institution, and the collection was vastly increased by the addition of a large number bequeathed in 1810, by Sir Francis Bourgeois. A splendid new gallery was opened in 1817; and this now forms a most attractive sight to all who delight in the fine arts. The gallery is open every forenoon, except on Fridays and Sundays. Tickets to view it may be had *gratis* from Colnaghi, Pall Mall, and other printsellers.

Chelsea.—Chelsea is a village on the west of the Metropolis. It is only eminent for its hospital for retired invalid soldiers, an institution similar in all respects to the asylum for decayed sailors at Greenwich. The hospital, which is situated on a flat stretch of ground between the village and the Thames, and was planned by Sir Christopher Wren, consists chiefly of one large edifice of red brick, several stories in height, forming a centre and two wings, or three sides of a square, with the open side towards the bank of the Thames. On the north, in which is the main entrance, the style of architecture is simple, being ornamented with only a plain portico. The inner part of the centre building is more decorated, there being here a piazza of good proportions, forming a sheltered walk for the veteran inmates. In the centre of the open square interval stands a statue of Charles II., in whose time the hospital took its rise. The only parts of the house considered worthy to be shown to strangers are the chapel and old dining hall, both in the central building. The chapel is neat and plain in appearance, the rows of benches being furnished with prayer-books and hassocks, and the floor being paved with marble in alternate black and white squares. Above the communion-table there is a painting of the Ascension, containing some good figures. The dining-hall is equally spacious, but is now disused as a refectory, though the tables stand ready covered for use.

The usual number of in-pensioners is about 476, and of out-pensioners not fewer than 80,000, who reside in all parts of the United Kingdom. The former are provided with all the necessaries, and the latter have each pensions varying from £7, 12s. to £54, 15s. yearly. The inmates wear an antique garb of red cloth, in which they may be seen loitering about the village.

Near Sloane Square, Chelsea, is situated a large building forming the *Royal Military Asylum*, for the support and education of about 500 poor children, whose parents were non-commissioned officers and privates in the army. Each regiment contributes annually one day's pay, to aid in supporting the institution.

Richmond.—Richmond is a village situated on the south bank of the Thames, at about nine miles by land from Hyde Park Corner, and sixteen miles by following the windings of the river. The most pleasant mode of conveyance to it is by one of the small steamboats from Hungerford Stairs, for then an opportunity is afforded of seeing numerous beautiful and interesting spots on both banks of the river. In passing upwards, we have on our right, Chelsea; Fulham, at which is the residence of the Bishop of London; and the pretty village of Chiswick; on the left, Battersea, Putney, Mortlake, the royal residence of Kew and its gardens, next which is Richmond. The village of Richmond stands on a slope overhanging the river, and possesses no point of attraction. Opposite the village is a stone bridge crossing the Thames, which is here very much narrowed, and further than this steam-vessels do not go. Richmond is only interesting from its exceedingly beautiful environs. South from the village, a pretty steep bank ascends to the green and bushy eminence called Richmond Hill, and from the walks on its prominent front, a view is obtained of the beautifully wooded country on the opposite side of the river. Among numerous villas, ornamental grounds, and other attractive objects, may be seen Twickenham, situated in the immediate vicinity, on the west bank of the Thames. In the house for which the present was erected as a substitute, lived Pope, the poet, and his body is entombed in the church. Close by Twickenham is Strawberry Hill, once the seat of Horace Walpole, and now belonging to Lord Waldegrave. Moving onwards along the brow of the eminence, and passing the well-known hotel called the Star and Garter, we enter the famous Richmond Park, which is eight miles in circumference, and ornamented with many magnificent large trees. These extensive grounds were at one time connected with a royal palace, but there is now no such edifice—one or two hunting lodges excepted, and these are not used by royalty; but the park is still a domain of the crown, and freely open to the public. From Richmond, it is but a short excursion to

Hampton Court.—Hampton is about thirteen miles from London by land, and twenty-four by water, on account of the windings of the Thames. The village is unimportant, and the chief object of attraction is Hampton Court Palace, which is now open daily, *gratis*. The palace, which is situated within an enclosed garden near the west, or perhaps more correctly the north bank of the Thames, was originally built by Cardinal Wolsey, and a portion of the structure which he reared is still extant in the northern quadranglo. Here was the scene of the humiliation and forfeiture of that favourite of Henry VIII., who at this place often held his court, and made it the scene of his Christmas festivities; here Edward VI. was born; here were held the masques, mummeries, and tournaments of Philip and Mary, and Elizabeth; here James I. held his court and famous meeting of controversialists; here Charles I. was immured as a state prisoner, and took leave of his children; here was celebrated the marriage of Cromwell's daughter and Lord Falconberg; here Charles II. had occasionally his impure residence; here lived William and Mary after the revolution of 1688; and here, till the reign of George II., royal courts were sometimes held. The palace, in external appearance, is a lofty and magnificent structure of red brick, ornamented with pale free-stone cornices and edgings to the doors and windows. Altogether, the edifice consists of three quadrangles. Entering by the grand staircase, the visiter is conducted through a suite of lofty and large apartments, furnished in an old-fashioned style, and decorated with pictures. The guard-room, which is first in order, contains, besides a series of English admirals by Kneller and Dahl, a variety

of ancient warlike instruments. In the next apartment are seen portraits of various beauties of the court of England, painted by Kneller, who has here depicted several lovely countenances, though a sameness runs through the whole, and none are so striking as to leave any impression. In the third room is seen what is generally esteemed as the finest painting in the house—a portrait of Charles I. on horseback, by Vandyke—and which ought to be seen, in order to have a just appreciation of that great master's admirable style. There is also an excellent painting of Bandinelli in his studio, by Correggio. The third room, or audience-chamber, has also some good pictures; among others, a painting of the family of Louis Cornaro, a person celebrated for his extraordinary temperance. The picture, which is from an original, by Titian, shows Cornaro and three generations of descendants, who appear in the act of adoration at a shrine. There are likewise portraits of Titian and his uncle, done by Titian himself, and a spirited battle-piece by Julio Romano.

The fourth apartment, or queen's drawing-room, is enriched with an exceedingly fine painting of Charles I., a whole length, by Vandyke, esteemed the best likeness we have of that monarch. There is a well-known and most beautiful print from it by Sir Robert Strange, the prince of English line engravers. In the next room, or state bed-chamber, the visiter will see a beautiful portrait of Anne Hyde, daughter of Hyde, Earl of Clarendon, and mother of the successive queens, Mary and Anne. The queen's dressing-room and writing-closet, and Queen Mary's state bed-chamber, which follow, contain many fine pictures, by Holbein, Sir Peter Lely, Sebastian del Piombo, Louis da Vinci, Albert Durer, and others. After having traversed these stately and silent halls, the visiter is led out through a long, dreary, ill-lighted apartment, the walls of which are ornamented with what at first sight he may suppose very wretched daubs, but which prove to be some of the famous cartoons of Raphael—productions whose praises have resounded over the whole civilized world.

On the opposite side of the public road from the palace gardens, is *Bushy Park*, a royal domain, embellished with an avenue of splendid horse-chestnut trees, and open to the inspection of the public.

Windsor is situated in the county of Berks, at the distance of 22 miles west from London by the road through Brentford, but may now be reached in less than an hour by the Great Western Railway from Paddington. Windsor occupies a rising ground on the south bank of the Thames, and is only interesting for its ancient and most extensive castle, the chief country residence of the queen. The gates of the castle are close upon the main street of the town, and lead to enclosures containing a number

Windsor Castle.

of mansions, barracks, and other structures. The principal portion of the castle occupies two courts, an upper and lower, of spacious dimensions, and having between them a large round tower in which the governor resides. In the lower court is St. George's Chapel, an elegant Gothic edifice, in which service is performed on Sundays in presence of the royal residents. Besides the chapel, the only parts of the castle attractive to strangers are the state apartments in the upper or northern quarter, and which may be seen by paying a fee of a shilling each person to one of the keepers. Behind these buildings, facing the north, is the famed terrace of the castle, from which a view is obtained over a most beautiful piece of country.

CLUB-HOUSES, HOTELS, &c. IN LONDON.

During the last thirty years, or little more, new habits among the upper classes have led to the establishment of a variety of club-houses—places of resort unknown to our ancestors. A London club-house is either the property of a private person who engages to furnish subscribers with certain conveniences, on paying a certain sum as entrance-money, and a specified annual subscription, or of a society of gentlemen who associate for the purpose. Of the first class, the most noted are Brooke's, White's, and Boodle's, in St. James's Street; also Crockford's, but it superadds the character of a gaming-house. The second class of clubs is most numerous; and the principal are the Carlton, Reform, Athenæum, Clarence, Traveller's, United University, United Service, and Junior United Service. The houses belonging to these clubs, respectively, are among the finest in the west end of London, and may easily be distinguished in and about Pall-Mall and Waterloo Place. No one sleeps in the houses: the accommodations extend the length of furnishing all kinds of refreshments, use of a library, and an ample supply of newspapers and periodicals in the reading-room. The real object of the institutions is to furnish an agreeable lounge to a select number of gentlemen. The Athenæum Club (corner of Pall-Mall), which consists chiefly of scientific and literary gentlemen, is one of the most important. It has 1300 members, each of whom pays twenty guineas of entrance-money, and six guineas of yearly subscription: as in all other clubs, members are admitted only by ballot. The expense of the house in building was £35,000, and £5000 for furnishing; the plate, linen, and glass, cost £2500; library, £4000; and the stock of wine in cellar is worth about £4000. The yearly revenue is £9000. From these items an idea may be obtained of the nature of the London club-houses.

It is calculated that at all times there are 120,000 strangers residing for a few days only in the metropolis, and to accommodate this numerous transient population, there is a vast number of lodging and boarding-houses, hotels, and other places of accommodation. A few years ago, the metropolis possessed 396 hotels, inns, and taverns; 3780 public-houses of licensed victuallers; and 130 beer-shops. The fashionable hotels are situated west of Charing Cross—as, for instance, Mivart's, in Brook street, Grosvenor Square, and Dunn street, Berkeley Square; Warren's, in Regent street; Frenton's, St. James's street; Lemmer's, George street, Hanover Square; the Clarendon, in New Bond street; the Burlington, in Old Burlington street; Wright's, in Dover street, Piccadilly; Morley's, Trafalgar Square, &c. At all the fashionable and family hotels in the "west end" the charges are very high, and the majority of the respectable middle classes lodge at hotels or boarding-houses east of the Strand. In and about Covent Garden there are several highly respectable hotels for single gentlemen; among others, the Cavendish, the New and Old Hummums, and the Tavistock. Another class of hotels or inns are those to which stage-coaches run, and which are resorted to by commercial and other gentlemen; as, for example, the Golden Cross, near Charing Cross; the Bolt-in-Tun, Fleet street; the White Horse, Fetter Lane; the Bell and Crown, Holborn; the Saracen's Head, Snow Hill; the Swan with two Necks,

Lad Lane; the Spread Eagle, Gracechurch street; the Belle Sauvage, Ludgate Hill; and the Bull-in-Mouth, opposite the General Post-office, in St. Martin le Grand. To these we may add three large inn and tavern establishments at the outskirts of the town—the Angel at Islington (northern environs); the Elephant and Castle, Newington Causeway; and the Horns, Kennington Common (both southern environs).

In and about the city there are various large and respectable taverns, at each of which gentlemen are lodged in a comfortable manner; but they are principally designed for accommodating dinner and festive parties. Among these may be mentioned, the London and City of London Taverns, both in Bishopsgate street; the Albion, in Aldersgate street; the Crown and Anchor, Strand; the Thatched House, St. James's street; Freemason's Tavern, Lincoln's Inn Fields; the British Coffee-house and Tavern, Cockspur street; and the London Coffee-house and Tavern, Ludgate Hill. There is, besides, a class of coffee-houses or taverns, whose chief business is supplying small refreshments and dinners, also the accommodation of newspapers, and which are resorted to only by gentlemen. Each of these has a distinct character. Garraway's and Lloyd's, at the Royal Exchange, are associated with marine intelligence, stockjobbing, and auctions; and in Cornhill, opposite, the North and South American Coffee-house supplies American newspapers, and here also are to be seen the captains of vessels who are preparing to sail to different ports in the western continent and islands. At Jerusalem and East India Coffee-house, Cowper's Court, Cornhill, information relating to East India shipping and captains may be obtained from the waiter at the bar. The Chapter Coffee-house, in Paternoster Row, is the resort chiefly of literary and clerical gentlemen, and is a place of grave aspect. Peel's Coffee House, in Fleet street, is celebrated for keeping files of newspapers, which may be consulted; but this accommodation, as respects London papers, may also be had at the Chapter. A small fee is payable to the waiter for examining files at these houses.

The next class of houses of this nature are chop or dining-houses, but also doing the business of taverns, and resorted to only by gentlemen—as Dolly's Chop-house, in Paternoster Row; Dr. Johnson's Tavern, in Bolt Court (a few doors from Farringdon street), in Fleet street; also the Mitre, in Fleet street. Latterly, there has sprung up a very numerous class of coffee-houses, of a much more humble though perhaps more useful nature, at which cups of ready-made coffee and tea, with slices of dressed meat, may be obtained at very moderate prices. In most of these establishments the charge is (or was lately) three halfpence for half a pint of coffee; half a pint of tea, twopence; two slices of bread buttered, twopence; eggs and meat proportionably cheap. While these establishments are chiefly resorted to for breakfast or for refreshment in the evening, there is a far more numerous class of eating-houses, resorted to for dinners by the shopkeeping and working classes. We have room to mention a few great houses—Morton's Excise Dining-rooms, in Bishopsgate street, where about nine hundred dine daily; the famous Boiled-Beef House, Old Bailey (near Ludgate Hill); the Chancery Dining-rooms, in Chancery Lane; and Hancock's Dining-rooms, in Rupert street (a short distance from the head of Haymarket). An excellent dinner may be had at any of these houses for about 1s. 3d., or even less.

Throughout the town there are now many splendid dram-shops called gin-palaces; but of these haunts of intemperance nothing need be said.

PUBLIC RECREATION AND AMUSEMENT.

The chief places of resort during the day, for the recreation and amusement of strangers, may be summed up as follows:—The Parks; the Zoological Gardens in the Regent's Park; another Zoological Garden in Surrey; the British Museum; the National Gallery, the Exhibitions of the Royal Academy, of the Society of British Artists, and of the Society of Painters in Water Colours; the Diorama and the Colosseum, Regent's Park; Sir John Soane's Museum in Lincoln's Inn Fields, open Thursday and Friday during April, May, and June, from 10 till 4 (tickets must be previously applied for); the exhibition of interesting objects of science and arts, Adelaide Gallery, Lowther Arcade, Strand; a similar exhibition at the Polytechnic Institution, Regent street. Several noblemen permit inspection of their picture-galleries: it is admitted that the most extensive and valuable is that of the Duke of Sutherland, Cleveland House, St. James's Place. Besides the regular places of recreation, there are always temporary exhibitions of things interesting to strangers, at the Egyptian Hall, Piccadilly, places in the Strand, &c. Public meetings frequently occur at Exeter Hall, Strand.

The places of evening entertainment are various; and first may be mentioned the theatres, of which there are upwards of twenty in the metropolis. The principal are the Queen's Theatre, or Italian Opera House, foot of Haymarket; Drury Lane and Covent Garden Theatres, being the two licensed for the legitimate drama, and open in the winter season; the Haymarket Theatre, for legitimate drama also, but only open in summer; the Adelphi, in the Strand; the Surrey Theatre, Blackfriars Road; and Astley's Royal Amphitheatre, Westminster Bridge. Latterly, Drury Lane Theatre has abandoned theatricals, and is now opened for cheap evening concerts. Vauxhall Gardens, long a place of evening resort, have been finally closed, having latterly proved ruinous to its lessees. Nearly all the theatres are in a languishing condition, and a large and respectable part of the community now prefer attending Lyceums and Literary Institutions, which combine occasional lectures, a reading-room, and library. One of these establishments is in Aldersgate street, in the city, and another is in Leicester Square, for the western part of the town. Strangers are introduced by members.

CIVIC GOVERNMENT, POLICE, &c.

With respect to civic jurisdiction, the city of London is governed in a peculiar manner. In virtue of ancient charters and privileges, the city is a species of independent community, governed by its own laws and functionaries. While all other boroughs have been reformed in their constitution, London has been suffered to remain, as yet, in the enjoyment of all its old usages. The city is civilly divided into twenty-five wards, each of which has an alderman who is chosen for life, and acts as magistrate within his division. The freemen of the various wards elect representatives annually to the common council, to the number of 236 members. The lord mayor, aldermen, and common council, compose the legislative body for the city. The lord mayor is chosen by a numerous and respectable body of men, called *the livery*, or liverymen; these are certain qualified members of trading corporations, who, except as appointing the lord mayor, sheriffs, members of parliament, &c., do not actively interfere in city management. The revenue of the city corporation, which is derived from sundry dues, rents, interest of bequests, fines for leases, &c., amounted in 1832 to £186,929, 10s. 10d., and the expenditure was nearly the same. The magistracy, police, and prisons, cost about forty thousand pounds annually, but this is exclusive of large sums disbursed by the court of aldermen. The trading companies at present existing are eighty-nine in number, eight which formerly existed being now extinct.

The lord mayor is elected annually, on the 29th of September, from among the body of aldermen. The

livery send a list of two candidates to the court of aldermen, and one of these, generally the senior member, is chosen by them. He enters office, with much pomp, on the 9th of November, which is hence called Lord Mayor's Day. The advocate and legal adviser of the corporation is an official with the title of recorder. The lord mayor and corporation exercise a jurisdiction over Southwark and other precincts. Westminster, which is not connected in civic matters with London proper, is under the jurisdiction of a high bailiff. The county of Middlesex is represented in parliament by two members, chosen by the freeholders; the city of London by four, chosen by the liverymen; Westminster, two, chosen by the rate-paying householders; Marylebone, two; Tower Hamlets (eastern precincts), two; Finsbury (northern precincts), two; Southwark, two; and Lambeth, two. Thus the metropolis, with its immediate neighbourhood, including about two millions of souls, returns eighteen members to the House of Commons, without reckoning those who are sent by the county of Surrey.

Police.—In 1829 the old mode of watching was abolished, in all parts of the metropolis except the city, and a new police force established by act of Parliament. This has been a highly successful and beneficial improvement. The new police is under the management of two commissioners, who are in direct communication with the secretary of state for the home department; under the commissioners are 17 superintendents, 70 inspectors, 342 sergeants, and 2968 constables. The district under their care includes the whole metropolis and environs, with the exception of the city. The constables wear a blue uniform, and may be seen on the street on duty at all times of the day and night. The expense of this most efficient police force in 1837 was £209,754, 11s. 11d. Three-fourths of the expenses are paid out of the parish rates, but limited to an assessment of 8d. per pound on the rental; the remainder is contributed from the public purse. Latterly, the lord mayor and aldermen have established a police force for the city on the model of that above mentioned. It consists of 1 superintendent, 12 inspectors, 50 sergeants, and 638 constables. In addition to these two police bodies, there are nine police offices, in Bow street, Queen Square, Hatton Garden, &c., each with a small body of active officers; and there is likewise a river police, consisting of 22 surveyors and 70 constables. In 1836 a horse patrol was added to the Bow street establishment, consisting of 4 inspectors and 66 patrols, whose sphere of action is the less frequented roads around the metropolis. With all these means of preserving the peace and preventing crime, the metropolis is now one of the most orderly towns in the world; and provided strangers do not seek the haunts of vice, but pursue their way steadily, they run no risk of molestation.

Fires.—In 1833, by an arrangement among the fire assurance offices, there was established a regular fire-suppression police, consisting of a superintendent, 5 foremen, 10 engineers, 9 sub-engineers, and 72 firemen; 33 engines are in constant readiness at twenty different stations, and one-third of the men are constantly on duty, day and night. About 500 fires occur annually, but by the activity of the fire police, not more than from 20 to 30 houses are wholly burnt.

Prisons.—Including Newgate, and the Penitentiary, Millbank, already noticed, there are eleven prisons in the metropolis for the reception of criminals and debtors. The two great debtors' jails are the Fleet Prison in Farringdon street (once called Fleet Market), and the Queen's Bench Prison. The latter is a very large establishment, resembling a kind of small town, within high brick walls; it is situated in the Borough Road, and may be freely entered by strangers. The streets around it are within the "Rules of the Bench," and debtors are permitted to live there in lodgings, on paying to the governor a certain fee, regulated by the amount of the debt.

Lighting.—The whole metropolis is now well lighted with gas, all the public lights being paid for from the parish rates, and by the corporation within the city. In 1840, it was stated that for lighting London and its suburbs there were eighteen gas-works, the property of twelve companies, who consumed 180,000 tons of coal, and derived a yearly revenue of £450,000.

MARKETS—CONSUMPTION.

London contains sixteen flesh-markets, and twenty-five markets for corn, coal, hay, vegetables, fish, or other principal articles of consumption. The flesh-markets are of various kinds, some for live animals, others for carcasses in bulk, and others for the retail of meat; some, also, are for pork, and others principally for fowls. The great cattle-market is Smithfield, situated a short way north from Newgate street. It is a large open space surrounded by buildings, within the city, covered with pens, in numerous subdivisions, to contain cattle for the convenience of the dealers during examination and purchase. The north-west end is appropriated to sheep and calves, the north-east end to hogs, and the centre to bullocks. Calves are conveyed to market in caravans; hogs are driven during the night to their stations. Monday is the principal market-day, but much business is done on Friday, when there is a market for horses. The annual value of the animals sold in Smithfield market is estimated at £8,000,000.

Leadenhall Market is a depôt for meat and poultry killed out of town, and also for the sale of skins. Newgate Market, in a confined situation off Newgate street, is also a great depôt for country-killed meat in bulk, and likewise for supplying by retail. It is from the markets of Smithfield, Leadenhall street, and Newgate, that nearly all the butchers in London and its vicinity are supplied. At Whitechapel, there is a very considerable flesh-market, principally for the retail of meat in that populous district. A few years ago, a flesh-market was established in Farringdon street, and another at Hungerford Stairs, near Charing Cross, both on a commodious plan.

Billingsgate, the principal fish-market of London, is situated on the side of the Thames below the Custom-house. The fish arriving in smacks and boats from the coast, or more distant places, are generally consigned to salesmen, who, during the early market hours, transact extensive business with fishmongers or respectable retailers residing in different parts of the metropolis; the inferior fish are disposed of to costermongers, or those who hawk fish about the streets in baskets. When particular fish are in a prime state, or very scarce, there are individuals who will pay enormously for the rarity; hence a struggle between the boats to reach the market in time. At times, so many boats come laden with the same kind of fish, as to produce a glut, and instead of being sold at a high price, as is usually the case, the fish are retailed for a mere trifle. Throughout the town, there are many fishmongers, at whose shops oysters and other fish, when in season, may be obtained in prime order. The finest oysters are called *natives*, and are sold in small quantities to those who wish to eat them on the spot.

Covent Garden market (connected by Southampton street with the Strand) is the great vegetable-market for the metropolis. The spot, which is exceedingly central to the metropolis, was once the garden to the abbot and convent of Westminster. At the suppression of the religious houses in Henry VIII.'s reign, it devolved to the crown. Edward VI. gave it to the Duke of Somerset; on his attainder it was granted to the Earl of Bedford, in which family it has remained. From a design of Inigo Jones, it was intended to have surrounded the

space with a piazza, but the north and east sides only were completed The west side is occupied by the parish church of St. Paul's, celebrated for its expansive roof, sustained by the exterior walls. The election of members to serve in Parliament for the city of Westminster is held in front of this church; the places for receiving the votes are temporary buildings. The south side is occupied by a row of brick dwellings. Within this square, fruit and vegetables of the best quality are exposed for sale. A large paved space, surrounding the interior square, is occupied by the market gardeners, who, as early as four or five in the morning, have carted the produce of their grounds, and wait to dispose of it to green-grocers, or dealers in fruit and vegetables, residing in different parts of London; any remainder is disposed of to persons who have standings in the market, and they retail it to such individuals as choose to attend to purchase in smaller quantities. Within this paved space, rows of shops are conveniently and elegantly constructed for the display of the choicest fruits and vegetables of the season: the productions of the forcing-house, and the results of horticultural perfection, appear in all their beauty. There are also conservatories, in which every splendour of the garden may be obtained, from the rare exotic to the simplest native flower.

The cultivation of vegetables in the open ground within ten miles surrounding London, has arrived at great perfection; and so certain is the demand, that the whole is regularly conveyed by land or water to the metropolis, so that persons residing in the neighbourhood of those well-arranged gardens have no supply of vegetables but from their own resources. The annual produce of the garden grounds cultivated to supply the London markets with fruit and vegetables, amounts to £1,045,000.

The greater part of the corn used for bread and other purposes in the metropolis, is sold by corn-factors at Mark Lane; but much also arrives in the form of flour. In 1838, the consumption of wheat was 525,407 quarters, and of flour, 515,005 sacks. The annual consumption of butter is 11,000 tons; of cheese, 13,000 tons. The quantity of poultry annually consumed amounts to £80,000, independent of game. The annual consumption of milk is said to amount to £646,000.

In 1837, it was found that the malt used in brewing in London amounted to 5,692,360 bushels; and that there were sent out of stock for consumption 1,270,931 gallons of foreign spirits, 5,354,388 gallons of British spirits, 3,636,362 lbs. of tobacco, and 1,181,723 lbs. of snuff. A certain portion of these supplies would doubtless be drawn by families in the country.

The water used in the metropolis is chiefly supplied by the Thames, and an artificial canal called the New River. The water is naturally good and soft, but far from pure, notwithstanding the filtration to which it is subjected. The spots at which it is raised from the Thames are within the bounds of the metropolis, at no great distance from the mouths of common sewers; this forms one of a number of evils to which the inhabitants submit with a remarkable degree of indifference. The water supplied by the New River Company is more pure, but is charged at a high rate. Eight companies are concerned in the supply of water, and the total quantity distributed daily amounts to 20,829,555 imperial gallons.

The metropolis is supplied with coal principally from the neighbourhood of Newcastle, and partly from Wales, and certain inland counties; the import from the latter being by canals. Newcastle coal is preferred. It arrives in vessels devoted exclusively to the trade, and though the charge for freight is small, so many and so excessive are the duties and profits affecting the article, that a ton of coal, which can be purchased at Newcastle for about 5s., costs, to a consumer in London, upwards of 30s. The quantity of coal imported in 1838 was 2,581,085 tons.

It has been calculated that the money spent annually in London, on articles of consumption and luxury, amounts to £70,000,000; being more than a third of what is spent for such purposes in the whole United Kingdom.

MISCELLANEOUS INFORMATION.

The metropolis contains 500 places of public worship, and attached to these there are not fewer than 600 clergymen. Exclusive of the places of worship of the Jews and various small sects, the number of dissenting chapels in London was lately 200, as follows:—Chapels of Independents, 66; Wesleyan Methodists, 36; Baptists, 32; Calvinistic Methodists, 30; Presbyterians, 16; Roman Catholics, 14; Quakers, 6. The chapels of dissenters are principally in the eastern suburbs of London. The largest of the Roman Catholic chapels is in this quarter, near Finsbury Square. The original Tabernacle, erected by Whitfield, is in Tottenham Court Road. The chapel of the late Rev. Rowland Hill, which can contain 5000 persons, is in Blackfriars Road. Each of the established churches is surrounded with a small burying-ground, and many churches have vaults beneath for sepulture. The odious practice of burying in these confined situations is now gradually going out of use; and many interments take place in new cemeteries in the environs. These cemeteries, which are respectively the property of joint-stock companies, are laid out in a neat manner, and are well worthy of a visit from strangers. The oldest established is that at Kensal Green, in the north-western environs, on the road to Harrow Others are at Norwood in the south, Highgate in the north, and Stoke Newington in the north-eastern environs, and several are in course of establishment. The annual number of deaths in London is about 30,000.

London abounds in charitable institutions of various kinds. The charities connected with the corporation of London are Christ's Hospital, for boarding and educating youth, already mentioned; Bethlehem Hospital, for insane patients; St. Thomas's Hospital, Southwark, for poor patients diseased and hurt; and Bartholomew's Hospital, West Smithfield, for the same purpose. The trades' companies likewise support a number of beneficiary institutions. The following hospitals have been founded and are supported by private benevolence:—Guy's Hospital, Southwark; London Hospital, Whitechapel Road; Westminster Hospital; St. George's Hospital, Hyde Park Corner; Middlesex Hospital, Charles street, Oxford street; the University College Hospital; St. Luke's Hospital, City Road; Small-Pox Hospital, and London Fever Hospital, St. Pancras; and Lock Hospital, Pimlico. Besides these, there are four lying-in hospitals; a floating hospital; various ophthalmic hospitals, and numerous dispensaries and infirmaries for particular diseases. Institutions for relief of indigent persons, deaf and dumb asylums, blind asylums, and orphan asylums, are far too numerous to be specified.

Under the orders of the Poor-Law Commissioners, the metropolis is divided into 26 districts or unions, which, in 1838, absorbed an expenditure on the poor of £401,952. By the active management of the guardians, the annual expenditure is much less than it was under the old wasteful parochial system, while the poor are allowed to be now better employed and more comfortable. Begging is followed as a profession in the metropolis, and there are many persons who subsist by tricks of imposture; nevertheless, although, as has been alleged, there are 15,000 regular beggars of various kinds, it is certain that fewer signs of absolute mendicancy and misery meet the eye in London than in other large towns. As an instance of the growth of provident habits in the humbler orders, it has been stated that in 1837, about 97,000 persons resident in the metropolis had accounts at the different Savings' Banks, and that

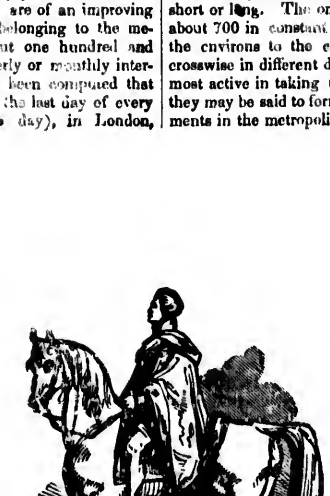
the sum standing at the credit of their accounts was about £2,450,000.

The principal educational establishments in the metropolis are the University College (northern environs); King's College, Strand; and University of London, Somerset House. There are also some important schools, one of which is that of Westminster; but they are more interesting from their antiquity than their usefulness. The National Society for the Education of the Poor, and the British and Foreign School Society, have each large model schools in the metropolis. That of the British and Foreign, Borough Road, is worthy of inspection for its great extent and its well-planned routine of elementary instruction. The metropolis forms the seat of from forty to fifty societies connected with science, literature, and the arts, which may be deemed of national importance. Among these are the Royal Society, Societies of Antiquaries, Linnean Society, Geological Society, Society for Diffusion of Useful Knowledge, Horticultural Society, Royal Geographical Society, Sion College, &c. For a notice of the weekly meetings of these societies, we refer to the Athenæum, a literary periodical.

Lately there were eleven newspapers published daily in London—six in the morning and five in the evening. There were also twenty-four weekly newspapers, and thirty-eight which appeared at other intervals. There were besides about fifty small literary publications issued weekly, the greater part of which are of an improving tendency. Of larger periodicals belonging to the metropolis, there are altogether about one hundred and twenty, which are issued at quarterly or monthly intervals, but chiefly monthly. It has been computed that the number of such works sold on the last day of every month (locally termed magazine day), in London, amounts to half a million of copies, occasioning an expenditure to the public of £25,000.

In recent times, great improvements have taken place in the vehicular conveyance of the metropolis and its neighbourhood. By the trains of the London and Birmingham Railway, terminus at Euston Square; of the South-Western Railway, terminus at Nine Elms, Vauxhall; of the Croydon Railway, terminus same as the Greenwich Railway, at London Bridge; of the Eastern Counties Railway, terminus at Shoreditch; and of the Great Western Railway, terminus at Paddington—trips out of town may now be performed, in different directions, in a very short space of time, and at a small expense.

Within the metropolis, hackney coaches, cabriolets, or cabs, and omnibuses, are exceedingly plentiful. The fare charged for hackney coaches is 1s. per mile, and for cabs 8d. per mile. The cabs, which mostly resemble small chaises, are limited to carry only two passengers. The fare by omnibuses is only 6d. for the ride, whether short or long. The omnibuses, of which there are now about 700 in constant operation, run from all parts of the environs to the central part of London, and also crosswise in different directions; and as their drivers are most active in taking up and setting down passengers, they may be said to form the greatest of modern improvements in the metropolis.



DESCRIPTION OF SCOTLAND.

Scotland occupies the northern part of the island of Great Britain, and, divided from England by a series of hills and rivers, is externally distinguished from that country by many peculiar features. Mountain chains of primitive or at least early rock, and in many instances uncovered by vegetation, form a large portion of the surface, giving occasion for many deep inlets of the sea, which peninsulate several districts, and render the general outline extremely irregular. Lakes embosomed in the hills, and clear, copious, and rapid rivers pouring along the vales, help to complete that picture which a native poet has expressed in the well-known apostrophe—

> "Land of the mountain and the flood,
> Land of brown heath and shaggy wood"

The arable ground, which is not above a third of the whole surface, chiefly lies in tracts sloping to the seacoast, and in the lower parts of the vales. The less precipitous hilly districts are chiefly occupied as pastoral ground for sheep and cattle. Wood, which once covered a large portion of the surface, is now chiefly confined to the neighbourhood of gentlemen's seats, and to plantations which have been raised within the last fifty years for the protection of arable lands from the cold winds.

The mainland of Scotland is situated between 54° 38′ and 58° 40′ north latitude, and 1° 47′ and 5° 45′ west longitude. It is bounded on the east by the German Ocean, on the north by the Northern Ocean, on the west by the Atlantic, and on the south by England. The greatest length is 287 miles, and the greatest breadth 147 miles. The entire surface, including the islands, contains 30,000 square miles, or nearly 20,000,000 of English statute acres.

To the north of a southward curving line, stretching between Glasgow and Aberdeen, the country is more mountainous than elsewhere, and therefore bears the general appellation of the *Highlands*. This is a district full of romantic scenery—savage precipitous mountains, lakes, rushing streams, and wild hanging natural woods. Its population, numbering about 400,000, or a sixth of the entire population of the country, is of Celtic (and in a less degree Scandinavian) descent, and exhibits many peculiar features, in language, dress, and manners, which are, however, rapidly becoming obliterated. The remainder of the country is termed the *Lowlands*, as containing less ground of an elevated and irregular character, though here also there are several considerable ranges of mountains. The inhabitants of this district, who are more peculiarly entitled to be considered as *the Scotch*, are, like the English, a Teutonic people, but with probably a mixture of Celtic blood; and their language may be considered as only a variety of English.

Connected with Scotland are two large groups of islands; namely, the *Northern Islands*, including the Orkney and Shetland Isles, situated in the Northern Ocean; and the *Hebrides* or *Western Islands*, situated in the Atlantic Ocean.

Scotland and its islands contain thirty-three counties, which may be thus classed:—*Border Counties* (so called because forming the border adjacent to England)—Berwick, Roxburgh, and Dumfries. *South-Western Counties*—Kirkcudbright and Wigton. *Western Counties*—Ayr, Lanark, Renfrew, Bute, and Argyll. *Central Counties*—Peebles, Selkirk, Haddington, Edinburgh, Linlithgow, Stirling, Dunbarton, Clackmannan, Kinross, Fife, and Perth. *North-Eastern Counties*—Forfar (or Angus), Kincardine (or the Mearns), Aberdeen, Banff, Elgin (or Moray), and Nairn. *Northern Counties*—Inverness, Ross, Cromarty, Sutherland, Caithness, and Orkney.

For ecclesiastical purposes, the country is divided into parishes (which are also civil divisions), presbyteries, and synods. (See Constitution and Resources of the British Empire.)

The principal rivers are Tweed, Annan, Nith, Dee (Kirkcudbright), Ayr, Clyde, Beauly, Ness, Findhorn, Spey, Deveron, Ythan, Don, Dee (Aberdeenshire), Tay, Forth, Carron, Leith, and Tyne. The Tay is the most copious, and the Spey the most rapid. Scarcely any of these rivers are navigable to a considerable distance from the sea.

The mountains of Scotland are generally in groups or ranges. The Highlands may be considered as one great cluster of hills; but those bordering on the Lowlands, and extending between Stirlingshire and Aberdeenshire, are more particularly distinguished as the *Grampian Mountains*. The other principal ranges are the *Sidlaws* in Forfarshire; the *Campsie Hills* in Stirlingshire; the *Pentlands* in Edinburghshire; the *Lammermoors*, extending between Berwick and Haddingtonshire; the *Cheviot Hills* on the Border; and a great range, of no general name, extending throughout the counties of Selkirk, Peebles, Dumfries, Lanark, Ayr, and Kirkcudbright. The most noted of the Highland mountains are Ben Nevis (4370 feet, being the highest in the United Kingdom), Ben Mac Dhui (4327), Cairngorm (4095), Ben More (3870), Ben Wyvis (3720), and Ben Lomond (3262). The highest of the Pentland range is Carnethy (1880). Amongst the southern hills, few exceed 2500 feet.

Geological Structure.—Soil.—Climate.

In the Highlands, the rocks are generally of the primary kind—granite, gneiss, mica-slate, &c.; the granite generally rising into lofty peaks, on which, in many instances, gneiss and other non-fossiliferous rocks abut or rest. In the Lowlands, the rocks are generally of the transition kind (grawacke, &c.), covered in many parts

with coal-measures, trap, and red sandstone. Rocks superior to the red sandstone occur only in a few detached places, and in very small quantity.

The coal-field of Scotland extends, with slight interruptions, across the central part of Scotland, from the eastern extremity of Fife to Girvan in Ayrshire; the principal beds being near Dysart and Alloa, in the vale of the Esk near Edinburgh, near the line of the Forth and Clyde Canal, at Paisley in Renfrewshire, and at Dalry, Kilmarnock, and Girvan, in Ayrshire. The Scottish coal is chiefly of a hard and lumpy kind, calculated to burn briskly, and therefore well adapted for manufacturing as well as for domestic purposes.

Granite is dug in the neighbourhood of Aberdeen, and at Kirkcudbright, for building purposes. The city of Aberdeen itself is chiefly constructed of it; and great quantities of it are transported to London, Liverpool, and other places, to be employed in building bridges, docks, and other structures in which unusual durability is required. Slates of excellent quality for roofing are quarried at Easdale and Ballahulish in Argyllshire, and in other places. Sandstone slabs for paving are quarried in Caithness, and at Arbroath in Forfarshire. A fine kind of sandstone is dug in many places, and is the primary cause of the architectural elegance of many of the public and private buildings in the principal towns. Owing to the abundance of both sandstone and trap, both of which are excellently adapted for building, little brick is used in Scotland.

The chief metals worked in Scotland are lead and iron. Lead is extensively wrought in the hills near the junction of Lanark and Dumfries shires, and silver was formerly obtained in considerable quantities in the same district. Iron has latterly been worked on a great scale in the northern district of Lanarkshire, and in the counties of Renfrew and Ayr. Agates, topazes, cornelians, and some other precious stones are found in the highlands of Aberdeenshire. Mineral waters, useful for various maladies, exist at Dunse, Moffat, Innerleithen, Airthrey, Bridge of Earn, Peterhead, and Strathpeffer.

The soil of Scotland is of an extremely diversified character. On the comparatively level tracts, much is composed of loam resting on the great clay bed, or diluvium, or of alluvial clay washed down from the hills. Much level as well as hilly ground is also covered by peat bog, the dissolved forests of ancient times. On the trap hills, a light and useful soil, composed of the material below, is generally found. A considerable quantity of the arable soil throughout, being composed of reclaimed bog, contains a peaty material. Out of the thirty thousand square miles comprehended in Scotland, about thirteen thousand are totally incapable of improvement, nine thousand are wastes believed to be capable of improvement, and the remainder are pretty equally divided between arable and pasture land.

The climate, as compared with that of England, is cold, cloudy, and wet; yet the temperature is not liable to such great extremes as that of either England or France, seldom falling below 25° Fahrenheit, or rising above 65°, the annual average being from 45° to 47°. The summer is uncertain, and often comprehends many consecutive weeks of ungenial weather; but, on the other hand, the winters are rarely severe, and often include many agreeable days and even weeks. The backwardness of spring is perhaps the worst feature of the meteorological character of the country.

ANIMAL AND VEGETABLE PRODUCTIONS.—AGRICULTURE.

The country, as already mentioned, was originally covered in great part by wood; and this feature is believed to have been expressed in its ancient name, Caledonia (*choille dun*, Gaelic, a wooded hilly country). The natural wood has been allowed in the course of ages to go into decay, in all except a few remote districts, of which we may particularize the high country at the junction of Aberdeen, Banff, Moray, and Inverness shires. In the last century, Scotland had become nearly bare of wood, the only patches being around gentlemen's seats. Within the last fifty years, this state of things has been greatly changed. Extensive plantations have been formed in most districts, as a protection to the cultivated lands. Those of the Duke of Athole in Perthshire are remarkable, above all, for the vast territory which they occupy. Scottish plantations consist chiefly of larch and fir; but the country also produces oak, ash, and elm, in great abundance. It is calculated that about a million of acres in Scotland are now under wood.

Scotland formerly abounded in wild animals, particularly the wild-boar, the wild-ox, and the wolf. The wild-boar has been for many ages extinct; and the wolf has been so since the latter part of the seventeenth century. Of the primitive white wild cattle of the country, there is now only a specimen herd, preserved from curiosity in the parks near Hamilton Palace. Birds of prey, the eagle, falcon, and owl, are still found in the Highlands and Western Islands, where also deer and game birds are abundant. Aquatic birds haunt the more precipitous shores in vast quantities. Hares and rabbits everywhere abound, and foxes are not scarce. The rivers of Scotland produce salmon and trout, and herrings, haddocks, cod, and flounders, exist in great abundance in the neighbouring seas.

Husbandry was in a very backward state in Scotland till the middle of the eighteenth century. The Highlands produced herds of the native small black cattle; in the low countries, the higher grounds were occupied, as now, by flocks of sheep; but there was little arable land, and that little was ill cultivated and comparatively unproductive. Since then, under the care of a set of patriotic and enlightened individuals, Scotland may be said to have been one great experimental farm for the advancement of husbandry in all its forms. The rearing of turnips for the winter support of cattle has been in itself a most remarkable improvement. A proper rotation of crops has been studied, and has been attended with the best effects. Old, cumbrous, and expensive modes of tillage have been banished, and the light plough and cart substituted in their place. Draining has improved not only the soil but the climate. Lime, and latterly bone manure, have been extensively introduced. The productiveness of the soil has consequently increased in an immense ratio. Oats, a hardy plant, calculated for most soils and climates, is still the chief grain raised in Scotland, and its meal is still the principal food of the peasantry, of working people in general, and of the children of all classes of the community: it is said to cover 1,260,000 acres, or a fourth of the whole in cultivation. Barley, which forms a conspicuous article in the food of the common people, and is also used in distillation, occupies 280,000 acres. Wheat is believed to occupy only about 140,000 acres; yet it is remarkable that this grain is exported in considerable quantity from Scotland, while the above two grains are in not less quantity imported from England and Ireland, testifying that the ancient frugal habits of the people with respect to food change less rapidly than the improvement of the soil advances. Potatoes are extensively raised in open fields in Scotland, and now constitute an important article of food to the working classes. The southern hills continue as formerly to be covered by extensive flocks, and sheep-farming has also been extensively introduced in the Highlands. The latter change has necessarily caused the extinction of a kind of cottier system, which came down from the old days of feudalism; yet it is believed that black cattle are as extensively reared in the Highlands as ever, and it is certain that

the population, so far from being diminished by the suppression of small farms, increased about one-seventh during the first thirty years of the present century.

THE PEOPLE—THEIR CHARACTER.

The Scotch, as already mentioned, are, like the English, a Teutonic people, with only a few distinctive varieties of character, perhaps partly original, and partly the effect of local and political circumstances. It may be remarked, that, though in the main Teutonic, the Scotch do not descend from the same branch of that race as the English. From language and other circumstances, it appears likely that the original colonizers of North Britain were from Scandinavia, Denmark, and Zealand.

The Scotch (taking as usual the general characteristics of the people) may be described as a tall, large-boned, and muscular race. Even the women appear to a southern eye remarkable for the robustness of their figures, though this is a point which the natives are of course apt to overlook or to be unconscious of. The Scotch figure is not so round and soft as the English. The face, in particular, is long and angular, with broad cheek bones. The cranium is also said to be somewhat larger, and tending more to a lengthy shape than that of the English. A fair complexion and light colour of hair abound in Scotland, though there are also many instances of every other variety of tint.

The Scottish character exhibits a considerable share of both energy and perseverance. It may safely be said, that a country with so many physical disadvantages could never have been brought into such a condition as respects rural husbandry, nor, with all the advantage of the English connection, been made so prosperous a seat of both manufactures and commerce, if the people had not been gifted in a high degree with those qualities. A disposition to a frugal and careful use of means is also abundantly conspicuous in the Scotch. The poorest poor, at least in rural districts, are in few instances of such improvident habits as to exhibit that destitution of furniture, clothing, and tolerable house accommodation, which meets the eye almost everywhere in Ireland. Caution, foresight, and reflection, may be said to enter largely into the Scottish character. Under the influence of these qualities, they are slow and sometimes cold in speech, and are therefore apt to appear as deficient in frankness and generosity. These, however, are in a great measure only appearances. That *pervidum ingenium*, or fiery genius, attributed to them by Buchanan, is still a deep-seated characteristic of the people. On subjects which they regard as important, they sometimes manifest this excitability in a very striking manner; as, for instance, in their almost universal rising against Charles I. in defence of their favourite modes of worship and ecclesiastical polity. Generous affections, in which, as compared with the English, the Scotch might appear deficient, perhaps only take, in their case, somewhat different directions. They cherish, more than most people, a feeling of attachment for their native country, and even the particular district and spot of their birth, for their remote as well as immediate kindred, and for every thing which reminds them of what is honourable in the doings of those who went before them. A strong sense of religion is a conspicuous feature in the Scottish national character; clear, however, from all regard to external and what appear to them unimportant things connected with it. There is no country where a more decent attention is paid to the Sabbath than in Scotland. It may at the same time be remarked, that their religion is more doctrinal than directly practical or sentimental—a peculiarity which may be traced in the plainness of their forms of worship, as either its cause or its effect. There is a considerable tendency in the Scottish intellect to argumentative reasoning, and this shows itself in the service in their churches as well as in their philosophical literature. The domestic virtues flourish in much the same degree in Scotland as in England; but the humbler classes in North Britain are not nearly so remarkable for cleanliness as the lower English, and they have suffered of late years from the extensive use of ardent spirits. The rural labouring classes are remarkable for their steady industry and decent conduct; and it is only, perhaps, among the lower orders, in large towns, that much moral deterioration has taken place. For centuries, the wandering disposition of the Scotch has been remarkable. An immense number of young persons every year leave their native country to push their fortunes in the busier English cities, in public employment in India, in the colonies, or in other parts of the world. These persons have generally a tolerable education in proportion to their rank and prospects; and being found possessed of steadiness, fidelity, and perseverance, they rarely fail to improve their circumstances. We are here reminded of the advantage which Scotland has long enjoyed in the possession of a universally diffused means of elementary instruction. This, though in some respects over-estimated, has at least insured that nearly every person reared in Scotland is not without some tincture of literature.

PROGRESS OF POPULATION.

The population of Scotland, at the end of the seventeenth century, did not probably exceed a million. In 1755, when an attempt was first made to ascertain it, it appears to have been about 1,265,380. From that time, the country made a start in manufacturing and commercial prosperity, as well as in improved modes of rural husbandry, and the population experienced accordingly a considerable increase, though not so great in proportion as the increase of wealth. The various census, since 1801, inclusive, give the following results:—

1801, - -	1,599,068	1821, - - -	2,093,456
1811, - -	1,805,688	1831, - - -	2,365,114

The increase has taken place chiefly in large towns, a result of the progress of manufactures and commerce. It was ascertained that, of the total families in 1821, 130,679 were employed in agriculture, and 150,264 in trade, manufactures, and handicrafts; leaving a remainder of 126,997 subsisting otherwise. Since then, the proportion of the second class has probably experienced a large increase. The progress of population in Scotland has, according to Mr. M'Culloch, "been less than its progress during the same period in England and Ireland; while there are good grounds for thinking that the wealth of Scotland has increased more rapidly than that of either of these two countries. This desirable result," our author adds, "seems to have been owing principally to the consolidation of small farms in the low country, the introduction of sheep-farming into the Highlands, and the obstacles imposed, by the law of Scotland, as to leases and the operation of the poor-laws, against the subdivision of land and the building of superfluous cottages. These circumstances, combined with the moral and religious habits of the people, and the general diffusion of education, have made marriages be deferred to a later period than in other parts of the empire, and have also led to a very extensive emigration. * * In consequence, the Scotch have advanced more rapidly than the English or Irish in wealth, and the command of the necessaries and conveniencies of life. Their progress in this respect has, indeed, been quite astonishing. The habits, diet, dress, and other accommodations of the people, have been signally improved."*

It has been shown, on the other hand, that the comforts of the people have not everywhere improved in the ratio of the general advance of wealth. That operation

* Statistica. Account of the British Empire.

of the limited poor-laws of Scotland which Mr. M'Culloch eulogizes, has been shown by Profess r Alison of Edinburgh to send annually great numbers of superannuated labourers and others into the large towns, where they form a dense population, living in semi-destitution, and in other circumstances unfavourable to health, and are thus exposed to fevers and other contagious maladies, which periodically sweep them off in large numbers. It is contended by the same writer, that the low condition in which the scanty provision for pauperism compels many to live, gives them reckless habits, and tends materially to increase a mean, squalid, and dangerous population. There is certainly much truth in these views. The sanitory condition of Glas[illegible]ow is a startling illustration of them. During five years, from 1835 to 1839 inclusive, the number of fever cases treated at the public expense in that city was 56,049, or about 11,000 per annum, and the deaths in the same period were 4788. The population of Glasgow has risen from 151,540 in 1822, to 272,000 in 1840, and in that period the rate of mortality has been rapidly advancing. In 1822, the mortality was 3408, or one in about 44¼ of the population; in 1825, it was 4571, or as one in about 36¼. In 1828, the mortality increased to 5534, which, at the then amount of the population, was one in 33—a proportion alarmingly high. Since then, however, the inhabitants of this great city have suffered still more severely. In the year of the Asiatic cholera, 1832, when the population was 209,230, the mortality reached the enormous amount of 9654, or one in about 21½; and again, in a year of severe fever (1837), when the population was estimated at 263,000, it reached 10,270, or one in about 24½. It would appear as if, after such disastrous periods, the mortality becomes for some time lessened. After 1832, it rebounded to one in 36, and after 1837 to one in 37, or thereabouts. Probably this is in some measure owing to the effect of severe epidemics in carrying off so many of the least healthy of the people. It is to be remarked that in these results no account is taken of still-born children, who, in the eighteen years before 1840, amounted to 8763. The proportion of the still-born is startlingly high, being, in 1830, 471 out of 6868, or about a fourteenth. In this fact alone, we cannot help thinking we behold a strong proof of the amount of misery and unfavourable modes of living prevailing in Glasgow.

The average annual mortality in Glasgow was, for the period between 1822 and 1830, both inclusive, one in 38¼; for the period between 1831 and 1839, also both inclusive, one in nearly 32. At the latter date, if it were habitual, Glasgow would stand forth as one of the cities most fatal to human life in Europe. Another fact is most remarkable, that of the deaths during these eighteen years, 43 per cent., *or not much short of the one-half, are of children under five years of age, and* 18 *per cent. under one year of age.* It further appears, from minute evidence, that in the years of unusually great mortality, there is a larger proportion of deaths amongst the adult population, *showing how fatal the epidemics are to heads of families.* From one-fourth to one-fifth of the funerals in Glasgow are at the public expense—an impressive fact, seeing how it *connects poverty with mortality.*

REMARKABLE NATURAL SCENERY.—NATURAL CURIOSITIES.

The comparatively irregular surface of Scotland, or, as a geologist would remark, its being more generally formed of the primitive and early rocks, has caused the existence of much picturesque and romantic scenery, the attractions of which have been greatly heightened of late years by the works of the native poets and novelists, particularly Sir Walter Scott. The Highlands may be said to form one wide tract of such scenery, though some parts are considerably more beautiful than others. Fine scenery in Scotland generally lies along the beds of lakes or the vales of rivers. The chief tracts are the following:—

Lower Perthshire.

The Trosachs and Loch Katrine.—This is a beautiful district, situated at the distance of little more than twenty-five miles from Stirling, and remarkable as the scenery of Scott's *Lady of the Lake.* It may be said to commence at the large lowland village of Callander, which is only sixteen miles from Stirling. This village lies in the bosom of the valley of the Teith, with lofty hills on all sides except the east, and apparently occupying the last patch of level ground before the traveller enters the Highlands. The surrounding scenery is worthy of being explored; two places, in particular, should be visited. The first is the *Fall of Bracklin*, situated among the hills, at the distance of a mile and a half in a north-easterly direction from the village. It consists of a series of cascades formed by the impetuous rushing of a mountain stream, termed the Keltie, down a rugged rocky ravine. Each cascade is from eight to ten feet in depth, and altogether, the falls may measure upwards of a hundred feet, before they finally settle in a profound receptacle at the bottom. Above the chasm there is thrown a rustic footbridge, from which the view of the falls, when the water is large, is particularly grand. This spot is worthy of being visited by geologists, on account of the singular masses of rifted rock over and among which the water impetuously dashes.

The other place to which we would draw attention is the *Pass of Leny.* This is a narrow opening, about a mile to the north-west of the village, which affords access, as its name imports, from the low country into the wild recesses of the Highlands. While the vale of the Teith continues towards the west, the road to the Pass of Leny strikes off in a north-westerly direction. Skirted with waving woods and bound in by lofty mountains this is a scene of great sublimity. A rapid river, which issues from the mountain lake denominated Loch Lubnaig, hurries through the narrow vale over a series of little cascades, yielding a music harsh and wild, in strict keeping with the ruggedness of the scene. The road leads along the brink of Loch Lubnaig, to the small parish village of Balquidder, where, in the churchyard, the grave of the celebrated freebooter Rob Roy is still pointed out.

The road towards the Trosachs pursues a tortuous line along the base of a mountain range, skirting the north side of the valley. In the bottom of the vale, lie in succession two long stripes of water, or lakes, called Loch Vennachar and Loch Achray. Immediately before approaching the eastern extremity of the last of these lakes, which is by much the smallest, a road leads off to the right, into the vale of *Glenfinlas*—a tract of ten miles in extent, formerly a royal hunting-forest, destitute of the smallest symptom of habitation or of cultivation, and which any one who wishes to have a complete idea of an Ossianic desert, in all its sterile and lonely wildness, may be recommended to traverse. The bridge crossing the stream which descends from that vale, is called the Bridge of Turk, on account of a wild boar, which had done much mischief in the neighbourhood, having been slain at the place in times long bygone.

On coming to the head of Loch Achray you approach the Trosachs. At this point is situated an inn, having a strange Gaelic name, sounding something like Ardrecrockran. This is the last human habitation on the route, and here travellers usually quit their vehicles, in order to walk the remainder of the distance; the road, however, will accommodate a chaise to the verge of Loch Katrine. The Trosachs is simply a concluding portion of the vale, about a mile in extent, and adjoining to the bottom of Loch Katrine. From the tumultuous confu-

sion of little rocky eminences, of all the most fantastic and extraordinary forms, which lie throughout the bottom of the vale, and are everywhere shagged with trees and shrubs, nature here wears an aspect of roughness and wildness, of tangled and inextricable boskiness, totally unexampled. The valley being contracted, hills, moreover, rise on each side to a great height, which, being entirely covered by birches, hazels, oaks, hawthorns, and mountain ashes, contribute greatly to the general effect. The meaning of the word *Trosachs* in some measure describes the scene—a rough or *bristled* piece of territory. The author of the *Lady of the Lake* has described it as "a wildering scene of mountains, rocks, and woods, thrown together in disorderly groups."

At the termination of the Trosachs, Loch Katrine commences: it measures about ten miles in length, and is justly reckoned one of the most beautiful in Scotland. Its principal charm consists in the singular rugged wildness of its mountainous sides, and its pretty rocky islets, rising to a considerable height out of the water, and tufted over with trees and shrubs. Near the eastern extremity of the lake, there is precisely such an island as that which is described in the poem as the residence of the outlawed Douglas and his family. To fulfil the rules of the imagination—if such a phrase may be used—Lady Willoughby D'Eresby, the proprietrix of the ground, has erected upon the island a sort of tower or cottage, such as that which the said family occupied; and he must be a traveller of more than ordinary churlishness who could refrain from indulging in the pleasing deception thus created.

The view of the lake, on approaching it on the east, is rather confined, but from the top of the rocky and woody mount above, the prospect is more extensive and of that singular beauty which the author of the *Lady of the Lake* has described in the following passage:—

> ——"Gleaming with the setting sun,
> One burnish'd sheet of living gold,
> Loch Katrine lay beneath him roll'd,
> In all her length far-winding lay,
> With promontory, creek, and bay,
> And islands that, empurpled bright,
> Floated amid the liveliest light.
> And mountains that like giants stand,
> To sentinel enchanted land.
> High on the south, huge Ben-venue
> Down on the lake its masses threw—
> Crags, knolls, and mounds, confusedly hurl'd,
> The fragments of an earlier world;
> A wildering forest feather'd o'er,
> His ruin'd sides and summit hoar;
> While on the north, through middle air,
> Ben-an heaved high his forehead bare."

Loch Earn.—The beautiful scenery connected with this lake may be said to commence at Comrie, a village about twenty miles to the west of Perth, and remarkable as the place of all others in the United Kingdom where earthquakes take place most frequently. The vale of the Earn is here, and even lower down, full of natural and acquired beauty. Passing upwards towards the lake, the scenery becomes more interesting at every step. At that part of the vale which adjoins to the bottom of the lake, its character is similar to that of the Trosachs, at the corresponding extremity of Loch Katrine, though less minutely rugged and picturesque. Passing through the extensive grove at the bottom of the valley, now within sight and hearing of the ever-glancing and ever-murmuring Earn, and then beyond both, as the road approaches and recedes from the water-side, the traveller gets frequent broken glimpses of the grand and wildly serrated tops of the neighbouring mountains, whose sides present a strange piebald mixture, by no means deficient in effect, of alternate bare crag and incumbent verdure—a beautiful confusion, indeed, of gray and green—relieved occasionally by the darker branches of the birch and weeping-ash.

Loch Earn extends nine miles in length, and generally about one mile in breadth. It is thus described by Dr. M'Culloch:—"Limited as are the dimensions of Loch Earn, it is exceeded in beauty by few of our lakes, as far as it is possible for many beauties to exist in so small a space. I will not say that it presents a great number of distinct landscapes adapted for the pencil; but such as it does possess, are remarkable for their consistency of character and for a combination of sweetness and simplicity, with a grandeur of manner, scarcely to be expected within such narrow bounds. Its style is that of a lake of far greater dimensions; the hills which bound it being lofty, and bold, and rugged, with a variety of character not found in many of even far greater magnitude and extent. It is a miniature and model of scenery that might well occupy ten times the space. Yet the eye does not feel this. There is nothing trifling or small in the details; nothing to diminish its grandeur of style, and tell us we are contemplating a reduced copy. On the contrary, there is a perpetual contest between our impressions and our reasonings; we know that a few short miles comprehend the whole, and yet we feel as if it were a landscape of many miles—a lake to be ranked among those of first order and dimensions. While its mountains thus rise in majestic simplicity to the sky, terminating in bold, and various, and rocky outlines, the surfaces of the declivities are equally bold and various; enriched with precipices and masses of protruding rock, with deep hollows and ravines, and with the courses of innumerable torrents which pour from above, and, as they descend, become skirted with trees till they lose themselves in the waters of the lake. Wild woods also ascend along their surface, in all that irregularity of distribution so peculiar to these rocky mountains; less solid and continuous than at Loch Lomond; less scattered and romantic than at Loch Katrine, but, from these very causes, aiding to confer upon Loch Earn a character entirely its own." In passing along Loch Earn, it is recommended to go by the road on the south side. The house of Ardvoirdlich (Stewart, Esq.) occurs about mid-way; its name recalls the memory of Stewart of Ardvoirdlich, a partisan of Montrose, who killed his friend Lord Kilpont in the royalist camp at Collace, September 5, 1644—the incident on which Scott founded his *Legend of Montrose*. The woody promontories which here project into the lake are remarkably beautiful. About a mile and a half from the west end of the lake, occur the castle and falls of Edinample, a scene of distinguished loveliness, such as people, in the spirit of compliment, say, might give occasion to a volume, and which, rather strange to tell, has actually done so.

The upper extremity of this beautiful lake, where the general merits of the scenery may be said in some measure to be altogether condensed and combined, is enlivened by the little village and inn of Loch Earn Head.

Middle Perthshire.

Dunkeld.—This small town, so celebrated for the fine scenery in its neighbourhood, is situated on the north bank of the Tay, at the distance of fifteen miles from Perth, and twenty-four from Kenmore. Nestling beneath steep and woody mountains, with a noble river running in front, across which there is an elegant bridge, the first view of Dunkeld, in approaching it from the south, is very striking. The village consists of two small streets, in which are two excellent inns, affording extensive accommodation for the tourists who flock hither in summer. At Dunkeld, attention is called to the venerable remains of a cathedral, and the Duke of Athole's mansion, styled Dunkeld House; but our present business is with the natural scenery. Most of this is in the pleasure-grounds connected with the mansion.

Craig-y-Barns, a lofty hill, wooded to the top, which rises behind the house, is a resort of tourists for the sake of the magnificent view which it commands. They are also conducted by guides to the scenery of the *Braan*,

which joins the Tay on its opposite bank near the village of Inver—the birthplace and usual residence, it may be mentioned, of the late Neil Gow, so famous wherever Scottish music is known, at once for his performance on the violin and his excellent compositions. Near this place the tourist is conducted into a tasteful hermitage or summer-house, named Ossian's Hall, where he sees before him a picture representing the aged Ossian singing to some females the tales "of the days that are past," while his dog, his hunting-spear, and bow and arrows, lie at his side. On a sudden, this picture slips aside, and discloses to the view of the surprised stranger a splendid cataract, which dashes down the rocks immediately opposite to the building, and the waters of which are reflected from a range of mirrors disposed around the hall. To use the words of Dr. Clarke, "The whole cataract foams at once before you, roaring with the noise of thunder. It is hardly possible to conceive a spectacle more striking. If it be objected that machinery contrivance of this sort wears too much the appearance of scenic representation, I should reply, that as scenic representation I admire it, and as the finest specimen of that species of exhibition; which, doubtless, without the aid of such a deception, would have been destitute of half the effect it is now calculated to produce. A little below this edifice, a simple but pleasing arch is thrown across the narrow chasm of the rocks, through which the river flows with vast rapidity. About a mile higher up the Bran, is the *Rumbling Bridge*, thrown across a chasm of granite, about fifteen feet wide. The bed of the river, for several hundred feet above the arch, is copiously charged with massive fragments of rock, over which the river foams and roars like the waters of Ivy Bridge in Devonshire. Approaching the bridge, it precipitates itself with great fury through the chasm, casting a thick cloud of spray or vapour high above the bridge, and agitating by its fury even the prodigious masses which form the surrounding rocks. Few objects will more amply repay the traveller for his trouble of visiting them, than the woody precipices, the long, winding, shady groves, the ruins, and cataracts of Dunkeld."

In the angle formed by the junction of the Bran and Tay rises *Craig Vinean*, a broad shadowy mass of firs, reared against the sky. A neighbouring eminence obtains the name of the *King's Seat*, in consequence of King William the Lion having been in the habit of stationing himself upon it, in order to shoot at the droves of deer which his attendants caused to pass through the adjacent hollows. It is related that Queen Mary also practised the same sport at this place, and on one occasion narrowly escaped destruction from an infuriated stag.

Aberfeldy, Kenmore, and *Killin.*—Tourists frequently proceed from Dunkeld along the bank of the Tay, in order to comprehend the tract of scenery here indicated. *Aberfeldy*, a village not in itself remarkable, is celebrated for the fine cataract, formed by a small tributary of the Tay, in its neighbourhood, and near the house of Moness. The tourist is conducted by a guide along the thickly wooded banks of this rivulet, till, about a mile from the village, he reaches the first of the celebrated waterfalls of Moness. A little sub-tributary rill here pours, in a series of cascades, down the side of the glen, amidst a natural scene of the greatest beauty. A little farther up the main dell, the rivulet pours along a steep natural staircase, of a hundred feet in perpendicular descent, the sides of which rise abruptly and ruggedly, clothed with the most beautiful natural plants. This scene is described by Burns in one of his songs:—

"The braes ascend like lofty wa's,
The foaming stream deep roaring fa's,
O'erhung wi' fragrant spreading shaws,
The birks of Aberfeldy.
The hoary cliffs are crown'd wi' flowers;
White o'er the linn the burnie pours,
And, rising, weets wi' misty showers,
The birks of Aberfeldy."

At a third cataract, higher up, the pathway crosses the stream, and descends on the other side of the dell. Pennant describes the Moness Falls as "an epitome of every thing that can be admired in the curiosity of waterfalls."

A ride of six miles along the Tay brings the traveller to *Kenmore*, a village of famed Perthshire, situated at the east end of Loch Tay, at the place where the river issues from that sheet of water. This is one of the chief stages, or *points*, in the tour of Perthshire, and it is provided, accordingly, with a good inn. Lofty hills ascend on each side; on one hand there is a noble lake; on the other, towards Aberfeldy, stretch the splendid grounds around Taymouth Castle, the seat of the Marquis of Breadalbane. This magnificent house—truly worthy of the great chief and land-proprietor who owns it—is about a mile to the east of Kenmore, the exterior gateway of the park opening from the street of the village. It is a dark gray castellated edifice, of modern aspect, situated in the low ground beside the river, with a beautiful backing of woody hills rising behind it. This princely place and its adjuncts made a deep impression on the mind of Burns, who visited it in 1787, and thus described it:—

"The outstretching lake, embosom'd 'mong the hills,
The eye with wonder and amazement fills;
The Tay, meandering sweet, in infant pride;
The palace rising by his verdant side;
The lawns, wood-fringed, in nature's native taste;
The hillocks dropp'd in nature's careless haste;
The arches striding o'er the new-born stream;
The village glittering in the noon-tide beam."

A guide is required to introduce a stranger to all the beauties of the Taymouth Park, among which the most remarkable is the *Berceau Walk*, a grand avenue of four hundred and fifty yards in length, which reminds one of some lofty cathedral, "casting a dim religious light."

Loch Tay is a fine sheet of water, fifteen miles in length, lying between two ranges of hills. In the centre of the north-west side rises *Ben Lawers*, to the height of 4015 feet. An island near Kenmore formerly contained a priory of Augustines, founded by Alexander I., in the year 1122. Here his queen, Sybilla, daughter of Henry I., of England, was buried. Loch Tay is remarkable, like some other Scottish lakes, for having been, on several occasions, greatly agitated at the moment of the occurrence of earthquakes in distant parts of the world. It is from fifteen to a hundred fathoms deep. There is a road on each side to Killin, the distance being sixteen miles. Both abound alike in fine scenery, though by pursuing that along the south side, a view will be obtained of the lofty Ben Lawers, which will scarcely be seen in such perfection on the opposite side. The mixture of wood, rock, and cultivated field, which the traveller finds skirting Loch Tay, will surprise him with its happy effect. The old system of minute farms prevails here in all its pristine vigour, and a prodigious number of rude and picturesque cottages necessarily enter into the composition of the landscape.

Killin, a straggling little village, situated in the low vale at the head of the loch, is celebrated for the varied beauty of its scenery. Here two rivers, the Dochart and the Lochy, come down out of different glens, and join their waters with each other and with the lake. The vale of the latter is peculiarly beautiful; but that of the Dochart, extending up to Tyndrum, upon the great west road, is only stern and wild. On arriving at the town, the Dochart breaks over a strange expanse of table rock in a thousand little cascades, so that the traveller, who crosses a bridge just at the place, is bewildered, as he looks around, with the flashing and sparkling water which everywhere meets his eye.

"Killin," says Dr. M'Culloch, "is the most extraordinary collection of extraordinary scenery in Scotland, unlike every thing else in the country, and perhaps on earth, and a perfect picture-gallery in itself, since you cannot move three yards without meeting a new landscape. A

easy artist might here draw a month, and not exhaust it. It is indeed scarcely possible to conceive so many distinct and marked objects collected within so small a space, and all so adapted to each other as always to preserve one character, and, at the same time, to produce so endless a number of distinct and beautiful landscapes. To find, however, all that Killin has to give of this nature, it is necessary to try about into corners, like a cat; as the separate scenes are produced by very slight changes of position, and are often found in very unexpected places. Fir-trees, rocks, torrents, mills, bridges, houses—these produce the great bulk of the middle landscape, under endless combinations; while the distances more constantly are found in the surrounding hills, in the varied woods, in the bright expanse of the lake, and the minute ornaments of the distant valley, in the rocky and bold summit of Craig Caillench, and in the lofty vision of Ben Lawers, which towers like a huge giant to the clouds, the monarch of the scene."

On the north-west shore of Loch Tay, near Killin, stands the mouldering ruin of Finlarig Castle, built by Sir Colin Campbell of Glenurchy between 1513 and 1523, and the seat of the family before their removal to Balloch or Taymouth. "We observe also," says a traveller, writing in 1802, "situated on a plain at the west end of the lake, a neat but small mansion (Kinnel), belonging to Mr. M'Nab, the chieftain of that name. The family burial-ground, *Inish-Mhui*, close by the house, is pointed out to the stranger as a place of singular beauty. It undoubtedly is such, and is highly calculated to raise ideas of tenderness and sorrow; as an insulated grove of tall pines, whose solemn aspect and deep silence are in fine harmony with the waters around it, the blue expanse of the lake calm and unruffled, and the sublime height of the mountains that rise from its margin are objects well suited to correspond with the belief that Fingal sleeps here in the dust."

Dunbartonshire.

A tract of beautiful scenery extends through this county, from the banks of the Clyde along those of the Leven, and including the magnificent Loch Lomond, the largest and probably most beautiful of our British lakes.

At the starting point, in an angle formed by the confluence of the Leven and Clyde, is a basaltic mass shooting up to the height of 560 feet above an alluvial plain. This affords a site for the celebrated *Dunbarton Castle*, a romantic fortress, noted in Scottish history, and one of four kept in repair in terms of the Act of Union. Passing the town of Dunbarton, the tourist proceeds upwards along the vale of the Leven, a scene of singular beauty, filled with thriving villages and elegant mansions. The road, at the distance of two miles from the town, passes the old mansion-house of Dalquharn, in which, in the year 1721, the author of Roderick Random first saw the light. Archibald Smollett, the father of the novelist, was the fourth son of Sir James Smollett of Bonhill, and, having married against his father's will, was residing here, in possession of one of the farms of the family property, at the time of the birth of his illustrious child. In a field on the opposite or west side of the road, there is an obelisk to the memory of the novelist, erected and inscribed by his cousin-german, James Smollett of Bonhill. Immediately beyond, the road passes through the populous modern village of Renton, occupied by persons engaged in the neighbouring bleachfields, and taking its name from that of a lady married into the Smollett family. This, and another similar village named Alexandria, a little farther on, together with the appearance of various works on a large scale scattered over the landscape, testify that industry of a different kind from that which becomes "embrowned with toil," has taken possession of the limpid waters of the Leven, to which, therefore the beautiful ode of Smollett is no longer strictly applicable. Bonhill, the ancient seat of the novelist's family is opposite to Alexandria. Several other mansions of handsome appearance enliven the road before it arrives at *Balloch* (town at the foot of the lake), a small village and inn at the southern extremity of Loch Lomond, four and a quarter miles from Dunbarton. From this place a steamer, on earth at least "yclept Euphrosyne," starts every morning to conduct tourists along the lake.

Loch Lomond measures twenty-three miles in length from north to south; its breadth, where greatest, at the southern extremity, is five miles, from which it gradually grows narrower between the enclosing hills, till it terminates in a mountain streamlet. The whole aqueous surface is calculated at 31¼ square miles, or 20,000 English acres, and it is studded by above thirty isles, mostly at the southern extremity. These islands, together with the shores of the lake, are in general clothed with dark wood, which gave occasion to a distinction very judiciously drawn a few years ago by a Swiss tourist between Lausanne and Loch Lomond: "Our lake," he said, "is the fair beauty—yours the black." The first isle that occurs is a long narrow one named *Inch Murrin*, at the southern extremity of which there is an old ruined fortalice, called Lennox Castle, said to have formerly been a residence of the Earls of Lennox. This isle is now the property of the Duke of Montrose, who employs it for the keeping of deer. In succession from Inch Murrin, towards the north-east, occur *Inch Cro* (the isle of cattle), *Torr Inch* (the wood isle), and *Inch Caillach* (the island of women, having been the site of a nunnery). On the south side of Inch Caillach, is *Clar Inch* (flat island), a very little member of the archipelago; at the north end the ruins of a castle are to be seen under water, testifying that the surface of the lake must have risen in the course of ages. Inch Caillach, which formerly gave name to the parish of Buchanan, and was the burial-place of the Macgregors, has on its north side *Inch Fadd* (long island), which bears grain and pasture, and near which is *Ellendarroch* (the small rugged island). Another group, to the northward, stretch between the peninsula of Rossdoe, on the west side of the lake, and Strathcashel Point, on the east: *Inch Tavanagh*, the first in this group, and which derives its name from having once been the residence of a monk, contains 150 acres, partly covered with wood; it is the highest island in the lake. At a little distance to the south, the ruins of Galbraith Castle, once the residence of a family of that name, start up from the water. To the east of Inch Tavanagh are *Inch Conagan*, covered with oak and fir, and *Inch Moan*, a low isle correctly described by its name, which signifies the island of moss. Still farther to the east are *Inch Cruin*, on which is an asylum for insane persons, and *Buc-inch* (goat island). North from these lies *Inch Lonaig*, 150 acres in extent, and bearing many old yews, formerly of great use in furnishing the materials of bows and arrows. Of the whole thirty islands, the remainder are unimportant. South of Luss, the depth of the lake is rarely more than 20 fathoms: in the northern and narrower part it ranges from 60 to 100 fathoms; and in the places where deepest never freezes. In ancient times, Loch Lomond was famed for three wonders—"waves without winds, fish without fins, and a floating island." The first phenomenon is attributed to a peculiar atmospheric effect, not easily described, but which has also been observed on the Cumberland lakes; vipers swimming from island to island account for the second; the floating island is supposed to have been a detached fragment of moss, or a matted mass of aquatic plants, which ultimately fixed itself near the west side of Inch Conagan. The lake abounds in delicious fish.

Loch Lomond is skirted on the west side by the road

from Dunbarton to Inverary. Less than a mile from the lower end of the lake, this road passes Cameron House, long the seat of the Smolletts of Bonhill, and described as such in the novel of *Humphry Clinker*, where we have many panegyrics upon its scenery. A little farther on, the fine modern mansion of Belretiro overhangs the road upon the left. Here, through a fine vista, appears the polished expanse of Loch Lomond, its large islands, and the soft hills in the distance—a view that never fails to arrest the attention of the traveller. The objects that crowd into this scene are so finely diversified in form, in situation, and in colour, as to compose a picture at once beautiful and impressive. At the seventh mile-stone, upon the left, is Arden, the property of H. Buchanan, Esq., environed with woods, and placed at the bottom of a lofty hill, called *Dunfion*, or the hill of Fingal, tradition reporting it to have been one of the hunting seats of that hero. Somewhat farther on, and passing Nether Ross upon the left, the traveller crosses a small river called the Water of Fruin, which falls into the lake. It rises in *Glenfruin*, or Vale of Lamentation, so called, it is said, from a dreadful slaughter of the Colquhouns by the Macgregors, in 1602, and on account of which the Macgregors were, for nearly two centuries, unceasingly persecuted by government. The promontory of *Rossdoe*, which forms a beautiful situation for the mansion of the same name (Colquhoun of Luss, Bart.), is then passed; after which a scene of uninterrupted beauty continues all the way to Luss, twelve miles from Dunbarton.

Luss, a delightful little village, on a promontory which juts into the lake, is much resorted to in summer, on account of its being a convenient station for tourists in search of the picturesque. One of the finest points for enjoying the scenery of Loch Lomond and the environs of Luss, is Stronehill, to the north of the village. At this point, about one-third of the way up a lofty hill, the whole breadth of the lake is spanned by the eye, including

> ——"all the fairy crowds
> Of islands which together lie,
> As quietly as spots of sky
> Among the evening clouds."

From this point, the isles appear distinctly separated from each other, but not so much so as to give the idea of a map or bird-eye view, which a higher point of view would undoubtedly present. The prospect is bounded on the south by the distant hills which intervene between Loch Lomond and the Clyde, and which here appear, in comparison with the mountains around, to be only gentle swells; the Leven, its vale, the rock of Dunbarton, and even the surface of the Clyde, are in the same direction conspicuous. Towards the east, the vale of the Endrick, its principal seats, the obelisk erected to the memory of Buchanan at Killearn, and the Lennox hills, are also distinctly visible. Turning to the north, the lake is seen to wind far away among the mountains.

At *Inveruglas*, three and a half miles beyond Luss, there is a ferry to Rowardennan Inn, the usual starting-point for those who desire to ascend to the top of *Ben Lomond*. This mountain, situated in the county of Stirling, is 3240 feet above the level of the lake, which is 22 above the level of the sea. At Rowardennan, when looking northward, it almost completely fills up the view. It consists in three great stages, each rising above the other; these again are divided into a number of lesser swelling knolls, some of which are covered with heath and crags, while others are verdant and smooth. The distance from the inn to the top of the mountain is six miles of a continued ascent, which, in general, requires about three hours. From the summit, a varied and most extensive prospect opens upon the eye in every direction. The lake, lately contemplated with so much pleasure, now appears a small pool, and its rich and diversified islands as so many specks upon its surface. Beyond it, and to the left, appear the vale of the Endrick, the distant county of Lanark, its towns, and the mountain of Tinto; directly south, the outlet of the lake, the river Leven, its winding and rich banks, the Castle of Dunbarton, and the counties of Renfrew and Ayr; nearly in the same direction, the Firth of Clyde, the rock of Ailsa, the islands of Arran and Bute, with the more distant Atlantic. The coasts of Ireland and the Isle of Man are, when the atmosphere is clear, within the boundary of the view. To the east are seen the counties of Stirling and the Lothians, with the windings of the Forth, and the Castles of Stirling and Edinburgh. The prospect to the north is marked by grandeur alone. Immense mountains, piled as it were above each other, and extending from the borders of Stirlingshire to the western ocean, with the indentations of the coast on one side and the lakes of Perthshire on the other, form altogether a scene which may be conceived, but cannot be properly described.

Ben Lomond has this remarkable advantage as a hill, that it is not overcrowned or crowded up with surrounding hills. It seems to be sole monarch of a vast undisputed territory. Nowhere, therefore, is there a better idea to be obtained of the Highland country than on its summit. The mountain itself, besides, affords a great variety of scenery. To the south it stretches out into a slope of a very gentle declivity. The north side is awfully abrupt, and presents a concave precipice of many hundred yards in depth. He must possess firm nerves who can approach the brink and look down unmoved. The rock is said to be 2000 feet in sheer descent.

About four and a half miles to the north of Inveruglas, the Dunbarton and Inverary road reaches the lonely but comfortable inn of Tarbert, where there is also a ferry by which Ben Lomond may be approached. At this inn the road leaves the shore of the lake, and proceeds to the westward by the head of Loch Long, and so into Argyllshire. At Inversnaid Mill, there is a little cataract, the scene alluded to by Wordsworth in his address to a Highland girl—

> "Sweet Highland girl! a very shower
> Of beauty is thy earthly dower."

On the heights above, beside the way to Lock Katrine are the remains of Inversnaid Fort, erected by the government in 1713 to check the turbulence of the Macgregors: near it is a little burial-ground, in which the garrison had interred their dead, and containing one or two monuments, which have long forgot to tell the familiar tale confided to them. The fort was taken by Rob Roy in 1716, but afterwards regained and re-established. It is said that the amiable General Wolfe at one time resided in it.*

Firth of Clyde.—Argyllshire.

This is a tract of scenery much admired and visited, on account of its presenting a fine combination of inland seas with islands of varied surface and chains of rugged mountains.

* "On the east shore of Loch Lomond, and the west side of Ben Lomond, or what is called *Craigrostan*, a narrow alpine road conducts through scenery of gigantic features. Here tradition, countenanced by Barbour, has assigned to Robert Bruce a cave, in which he sojourned a night when passing from Strathfillan after the nearly fatal combat with Macdougal of Lorn. Here too, a steep shelving rock is pointed out as what is called '*Rob Roy's Prison*,' where that Highland laird is reported to have stowed such of his vassals as he had adjudged to durance. One of his tenants had not paid his rent when it became due. Rob, suspending him on a rope by the shoulders, let him down into the fastness. Having drawn him up at the end of twenty-four hours, he told him that, if he failed to pay by a particular time, he should draw him up by the neck. North of Craigrostan is what is said to have been used by him as his cave. It is a wide subterraneous recess, formed by a huge avalanche of the mountain. Here, according to tradition, he rendezvoused with his followers."—*Stirling's edition of Nimmo's Stirlingshire.*

The Clyde expands into an estuary a little way below Dunbarton. There, while the comparatively low hills of Renfrewshire, with the thriving towns of Port-Glasgow and Greenock, are seen on the left, attention is called on the right to the towering alps of Argyllshire, sometimes ironically called the Duke of Argyll's Bowling-Green. The Argyllshire shores are here decorated with a long succession of villas, the favourite summer residences of the more affluent citizens of Glasgow. This mountainous region is penetrated by several inlets of the sea, one of which, named Loch Long, is twenty-four miles long. Another named the Holy Loch, is shorter, but surrounded by equally picturesque ground. There is also an inland lake, Loch Eck, which presents very beautiful scenery.

Separated from this rugged district by only a narrow strait, is the island of *Bute*, displaying features only a little less highland, and remarkable for the amenity of its climate, on which account it is much resorted to by persons affected with pulmonary ailments. It measures fourteen miles in length by about four in breadth, and contains some beautiful strips of level territory, in one of which is situated the mansion of the Marquis of Bute. The beautiful town of Rothesay, a favourite sea-bathing station, occupies a fine situation on the north-east extremity of the island. Here are the ruins of a palace which formed the ordinary residence of the earliest sovereigns of the house of Stuart. The *Kyles of Bute*, as the strait above mentioned is named, is remarkable for the fine vistas of alpine scenery which it opens up to the view of the tourist.

To the south of Bute lies the island of *Arran*, twenty-two miles long, and which entirely consists of a range of rocky mountains, the serrated outline of which, as seen from the neighbouring seas and shores, is extremely grand. The loftiest summit, Goat-fell (called by the natives *Goath-bhein*, the hill of storms), is 2800 feet high. Arran bears great value in the eyes of the geologist, on account of its presenting, within a narrow space, an epitome of the whole geological structure of Scotland. Its pathless glens and picturesque hills commend it equally to visiters who do not inquire into the mysteries of stratification and volcanic agency. The whole island, excepting a few small farms, belongs to the Duke of Hamilton, whose ancestor, James first Lord Hamilton, obtained it from the crown on his marrying Mary, the eldest daughter of James II., in the year 1474. There are now a number of large farms enclosed, subdivided, and well cultivated, having fine stocks of cattle and comfortable farm-steadings, where formerly there were numerous huts without chimneys or windows, and ridges running in all directions without a single enclosure or subdivision. At the north end of the island, under the lofty and isolated summit called the Cock of Arran, a small bay, denominated Loch Ranza, serves as a natural harbour, in which capacity it is turned to great advantage in the herring fishery. On the shore of the bay there are a few scattered houses, an inn, an ancient castle in ruins, and a preaching station. A road sweeping round the east shore of the island leads to Brodick Bay, at the bottom of which there is a beautiful tract of low and sloping ground, ornamented with some fine wood, containing a hamlet, which forms a favourite resort for sea-bathing. On the adjacent height, amidst ancient woods, is the ancient chateau of Brodick, a mansion of the Duke of Hamilton. From this place a road strikes across the island, and opens up some magnificent scenery. Two or three miles to the southward of Brodick, the shore forms the more spacious recess of Lamlash Bay, at the bottom of which is a village of the same name, while it is landlocked in front by Holy Island, a small isle which formerly contained a monastery. Lamlash Bay is of great importance to the navigation of the Clyde and Irish Channel, as an unfailing retreat for distressed vessels.

Loch Fyne, a long narrow estuary, having the ridgy promontory of Kintyre on the one side and the district of Cowal on the other, opens up much fine scenery. In sailing up the loch, the first remarkable place is Tarbert, a fishing village situated at the bottom of a beautiful small bay, with a ruined fortalice of the Argyll family perched on a rock by its side. Farther up the loch is Inverary, the beautifully situated, village-like county town, chiefly forming a mere dependency of the neighbouring Inverary Castle, the principal seat of the ancient and illustrious house of Argyll. The rugged sylvan scenery around this mansion, with its views of seas, mountains, and distant islands, excite general admiration. Between Inverary and the inn of Tarbert on Loch Lomond, a road opens up a splendid tract of mountain scenery, the most striking being comprehended in the valley of Glencroe. Another road, proceeding in a northerly direction, leads to Loch Awe, an inland lake possessing many fine features, and upon which stands the ruined castle of Kilchurn, once the chief stronghold of the Breadalbane family. The loch is overhung by Ben Cruachan, a mountain 3390 feet in height, on the skirts of which King Robert Bruce gained a victory over his powerful enemy, the Lord of Lorn.

The northern portion of Argyllshire, where it is bounded by the western ocean and its many inlets, contains much fine scenery. In a sheltered situation on the west coast, stands the neat and cheerful town of Oban, a point of rendezvous for the numerous steamers permeating these seas, and a kind of entrepôt for the rural produce of the wide district around it. In front is the isle of Kerrera, where Alexander II. died in the course of an expedition to the western islands. On the coast, a little to the north of Oban, is Dunolly Castle, the mansion of the Macdougals of Lorn, and a little way farther north is Dunstaffnage, an ancient seat of the Caledonian kings, occupying a commanding site on the top of a rock overlooking the sea.

Loch Linnhe, opening between Lorn and Morven, and the commencement of the chain of salt and fresh water lakes formed into the Caledonian Canal, presents on both sides scenery of a most romantic character—a mixture of bold rocky forelands, on many of which are perched the eyrie-like fortresses of the rude chiefs of the olden time, and green smiling hollows, within bays, where the elegant habitations of a modern gentry have been placed. The long island of Lismore, in the mouth of this estuary, was the ancient appanage of the bishops of Argyll, and temporarily the site of a college for Catholic priests, after the French seminaries were closed by the Revolution; but is now only remarkable for the great quantity of limestone exported from it. Opposite to its upper extremity, Loch Creran, a sub-estuary, branches off into the land of Lorn, opening up much beautiful scenery. On the south shore of Loch Linnhe, to the north of the opening of Loch Creran, is the district of Appin, previous to 1765 the property of a race of Stewarts, descended from a natural son of the last Lord Lorn, and for four centuries conspicuous in Highland history. In this district, the first mansion which occurs to the north of Loch Creran is Airds, the seat of Sir John Campbell. Next is the ruin of Castle Stalker, an ancient massive building. Appin House, the seat of Mr. Downie of Appin, next occurs; and after that, at the mouth of Loch Leven, Ardshiel (Stewart, Esq.). From Ballahulish Ferry on Loch Leven, noted for its great quarry of slate, the west Highland road penetrates the savage vale of Glencoe.

Glencoe opens a little to the north of a solitary inn called the King's House, and extends about ten miles in a north-westerly direction to Ballahulish. It may be described as a narrow strip of rugged territory, along which hurries the wild stream of Cona, celebrated by Ossian, who is said to have been born on its banks. Ga

each side of the narrow banks of this river, a range of stupendous hills shoots perpendicularly up to the height of at least 2000 feet, casting a horrid gloom over the vale, and impressing the lonely traveller with feelings of awe and wonder. The military road sweeps along the right side of the glen. From the sides of the hills an immense number of torrents descend, sometimes sweeping over and spoiling the road, which is always, therefore, in a very precarious state. From the one end of the vale to the other, only one human habitation is to be seen; and as it is not a road of much currency, the traveller may pass through it without meeting a single human being. The goats scrambling among the rocks, and the wild eagle hovering about the tops of the wall-like hills, are usually the only living objects within sight; and, as may be conceived, these rather increase than diminish the wildness and desolation of the scene. The place where the famous massacre of Glencoe happened, is at the north-west end of the vale.

Inverness-shire.—The Great Glen.

Between Loch Linnhe on the west coast and a point on the Moray Firth near Inverness, there is a remarkable natural phenomenon, in the form of a glen or hollow, passing in a perfectly straight line for sixty miles through a mountainous region, and the bottom of which is nowhere more than ninety feet elevated above the level of the sea. It is called by the Highlanders *Glenmore-nan-Albin* (the Great Glen of Scotland). A chain of lakes extending along this extraordinary hollow suggested the formation of a canal which should admit of navigation between the seas on the two sides of the island, and save the dangerous passage round by the Pentland Firth, and this, under the name of the *Caledonian Canal*, was formed between 1803 and 1822, under the care of Mr. Telford, at an expense of £800,000. This line of communication has not proved so useful as was contemplated; but, by admitting of a line of steamers between Inverness and Glasgow, it has been the means of allowing a vast number of persons to enjoy the magnificent scenery through which it passes.

The canal commences at Clachnaharry, in the outskirts of the town of Inverness, and, after six miles, enters the first of the chain of lakes, *Loch Ness*, a grand piece of water, twenty-three miles long, situated amidst stupendous and sterile mountains. The waters of Loch Ness never freeze, but they are often agitated simultaneously with the occurrence of earthquakes in distant parts of the world. On an elevated rock projected into the north-east margin of Loch Ness, are situated the remains of Urquhart Castle, consisting of a great square keep and several exterior walls of defence. It was besieged in 1303 by the officers of Edward I., and with great difficulty taken; it afterwards was a royal fortress; and, finally, in 1509, it became the property of Grant of Grant, ancestor of the Earl of Seafield, to whom it now belongs. Glen Urquhart, which recedes behind Urquhart Castle, is a beautiful Highland vale, sometimes likened to Tempe, and containing many gentlemen's seats and a good inn. The conspicuous mountain, *Mealfourvonie* (hill of the cold moor), upwards of 3000 feet in height, here begins to raise its huge bulk above the banks of the loch. About 500 feet from the summit, there is a lake about a mile long, which cannot be much less than 3000 feet above the level of Loch Ness. On the top of the hill there is a cairn, the accumulation of which must have been a work of great labour. Mealfourvonie stands so prominently above the neighbouring herd of hills, that it is not only singled out by the eye at Inverness, but is the first landmark seen on entering the Moray Firth, at the distance of a hundred miles.

The road along the south side of Loch Ness, though it presents numberless fine views, is enlivened by few traces of man's presence. The paucity of houses gives a sort of distinction to the inn named General's Hut, nearly eighteen miles from Inverness, originally the residence of General Wade, while superintending the formation of his roads. Little more than a mile farther on, a recess or chasm in the hill by the side of the lake contains the celebrated *Fall of Fyers*. At the bottom of the recess there is a smooth little plain, descending upon the lake, ornamented by the house and shrubberies of Fyers, and where the steamers usually disembark such passengers as may desire to behold the waterfall. A path accessible to carriages, winds backwards and forwards, up the face of the hill, till the height of the public road is reached; and then there is a pathway leading down the face of the crags, towards a projecting rock, on which visiters usually stand to see the fall. The Fyers is not a very copious stream, except in rainy weather; consequently there are great variations in the aspect of the cascade. In its medium fullness, it pours through a narrow gullet in the rock, in a round unbroken stream, which gradually whitens, as it descends, till it falls into a half-seen profound, usually described as two hundred and forty feet below the point of descent, though this is supposed to be an exaggeration. A dense mist is constantly seen rising from the broken water, like the heavenward aspirations of an afflicted and tortured spirit. The noise is usually very loud. About a quarter of a mile farther up the ravine, there is another cascade, usually called the Upper Fall—a fearful gulf, down which the water descends by three leaps, and over which a bridge has been thrown, by way of station for a sight of the cataract. All this stupendous ravine is covered by birches, on whose every leaf a pearl of vapoury dew is constantly hanging.

A few miles farther on, *Glenmorrison* opens upon the north-west bank of Loch Ness. It is a valley full of romantic scenery, and belongs to a branch of the family of Grant. While the steam-borne traveller necessarily pursues the route by the lake, the traveller by the south road, after passing Fyers, leaves the brink of that piece of water, and advances into *Stratherrick*, a long valley behind the line of hills which overlook Loch Ness. A secluded valley, called Killean, opening upon this part of the road near Whitebridge, is spoken of as a singularly secluded and romantic piece of scenery. At the distance of thirty-two miles from Inverness, the road descends upon Fort Augustus and the little village of Killicumming, so called as the burying-place of the Cummings, lords of Badenoch.

Fort Augustus, situated in a pleasant opening amongst the hills, at the termination of Loch Ness, was erected in 1730, as an addition to the means previously existing for the control of the turbulent children of the mountains. Its purposes being long since accomplished, it has for many years been only occupied by two or three artillerymen. From Fort Augustus, the cut of the canal is resumed, and several locks are ascended; a very few miles brings it to *Loch Oich*, the smallest of the chain of lakes. The scenery is here finer than at any other part of the Great Glen. On the north-west bank of the loch is Invergarry, till a recent period the residence of the chief of Glengarry, a handsome modern building, in the immediate neighbourhood of an older mansion, which has been in ruins since burnt down by the king's troops in 1746, in consequence of the part taken by the chief in the rebellion.

The next and last loch is *Loch Lochy*, the hills environing which are the most hopelessly wild and stupendous of all in the glen. The summit level of the canal between Loch Oich and Loch Lochy, being ninety feet above the ordinary high-water mark at Fort William, and ninety-four above that at Inverness—a difference to be accounted for by the pressure of the Atlantic on the west shores of Scotland. The lonely little inn of Letter

Findlay is the only house at first seen on Loch Lochy; but when the west end is nearly reached, the traveller discovers, in a recess on the right side, the house of Auchnacarrie, which was the residence of the gallant and unfortunate Locheil, before he entered upon the fatal campaign of 1745. The canal, after leaving this loch, descends in a precipitous series of locks, called *Neptune's Staircase*, into Loch Eil, a continuation of Loch Linnhe, the arm of the sea formerly mentioned.

At this point the glen is more spacious than anywhere else. It is, however, the spaciousness of a moor. The River Lochy, which issues from the lake of the same name, pours its voluminous and impetuous flood towards Loch Eil on the left; and beyond it Ben Nevis is seen to rear his enormous head, with the vale of Glen Nevis withdrawing from his mighty side into the solitudes of Lochaber. At the distance of little more than a mile is the town of Fort William, so called from a fortress of the same name built for the repression of Highland turbulence, and now nearly disused.

A cluster of glens to the south of the Great Glen, is remarkable for a natural phenomenon, usually called the Parallel Roads of *Glenroy*, such being the name of the vale in which the wonder is most conspicuously marked. It consists of a set of terraces, in most places three in number, extending along both sides of these vales for many miles, the uppermost 82 feet above the second, which, again, is 212 feet above the first. The common people represent these terraces as roads formed at the command of Fingal, an early hero, for his convenience in hunting; but they are in reality ancient beaches of inland seas, raised into their present position by successive upheavals of the land—phenomena with which modern geologists are familiar.

Western Islands.

The Western Islands are generally bleak and rugged in surface, and occupied by a very poor class of tenantry. In some of them, particularly in Skye and Eigg, the scenery attains to a savage grandeur. It is not possible here to present a particular description of any besides the Isle of *Staffa*, so remarkable for its basaltic structure. It is about a mile and a half in circumference, and bears no human habitation, its only useful tenants being a small herd of black cattle. At the point of greatest elevation, towards the south-west, this island is 144 feet high. On the north-east it presents a face of somewhat less height, composed of basaltic columns, and penetrated by several caves of various sizes, into which the sea occasionally breaks with the report of thunder. This face, according to Dr. Macculloch, is formed of three distinct beds of rock, of unequal thickness, inclined towards the east in an angle of about nine degrees: the lowest is a rude trap tufa; the middle one is divided into columns placed vertically to the planes of the lowest bed; and the uppermost is an irregular mixture of small columns and shapeless rock—the whole being partially covered by a fine verdure. The central columnar part having in some places given way, is the occasion of the numerous caves by which the island seems perforated.

At the north-east point of the island, the dipping of the rocks is so low as to afford a safe landing-place at any time of the tide. Proceeding thence, the visiter is conducted along the north-east face, and is introduced to the *Clam-shell* (Scallop) *Cave*, where a curious confusion in the columnar structure is observable. The columns on one side are bent, so as to form a series of ribs not unlike the inside view of the timbers of a ship; while the opposite wall is formed by the ends of columns, bearing a general resemblance to the surface of a honeycomb. This cave is 30 feet in height, and 16 or 18 feet in breadth at the entrance; its length being 130 feet, and the breadth contracting to the termination. Next occurs the noted rock, *Buachaille* (the herdsman), a conoidal pile of columns, about 30 feet high, lying on a bed of curved horizontal ones, visible only at low water There is here an extensive surface, resembling that of the Giant's Causeway, and composed of the broken ends of pillars once continuous to the top of the cliff. The colonnade is now for some distance upright and very grand, till the visitor reaches the *Uaimh Binn* (Musical Cave), usually called *Fingal's Cave*, by far the most impressive and interesting object in the island. It opens from the sea with a breadth of 42 feet, a height of 66 feet above the water at mean tide, the pillar on one side being 36 feet high, and that on the other 18. The depth of the recess is 227 feet, and the breadth at the inner termination 22. The sides within are columnar throughout; the columns being broken and grouped in many different ways, so as to catch a variety of direct and reflected tints, mixed with secondary shadows and deep invisible recesses. As the sea never ebbs entirely out, the only floor of this beautiful cave is the fine green water, reflecting from its white bottom tints which vary and harmonize the darker tones of the rock, and often throwing on the columns flickering lights, which its undulations catch from the rays of the sun without.

Fingal's Cave, Isle of Staffa.

ANTIQUITIES.

There are in Scotland, and particularly in the district between the Firth of Tay and Moray Firth, numerous mounds, upright slab stones, and carved stones, which are supposed to have been raised as monuments over slain warriors, by the early inhabitants of the country, or by the Danes or other northern nations who occasionally invaded it in remote times. The most remarkable examples of mounds are two at Dunnipace on the Carron, in Stirlingshire, and one at Fettercairn, in Kincardineshire.

A distinct class of mounds, called *moot* or *moat hills*, are common in the south-western and several other districts. They are generally of a square form, with a flat top. It is believed that they served as places for the administration of justice in rude ages.

Of the carved stones, a remarkable example exists at Forres. It contains figures of men and animals, in various compartments. There is another very entire and curious specimen at Aberlemno in Forfarshire. A third at Meigle is remarkable as containing a representation of one of the war-chariots used by the original inhabitants of the country.

In the north of Scotland, and in Orkney, there are some surviving examples of a very remarkable class of early buildings, to which the common people now give the name of *Picts' Houses*, as supposing them to have been built by the Picts. They are generally round buildings, of no great height, with round vaulted tops, altogether built of courses of dressed stone without mortar

and containing for the most part one central chamber, and several long narrow recesses in the thickness of the wall.

Circular mounds, the remains of British and Danish camps, are common on the tops of the Scottish hills, having probably been the places to which the early people retired with their flocks in times of danger. On several hills, particularly in Perthshire and Inverness-shire, there are remains of walls, presenting appearances as if the stony materials had been artificially vitrified. It is not yet clearly ascertained whether these *vitrified forts*, as they are called, were works of our Caledonian ancestors, or the effect of accident, though the former is certainly the more likely supposition.

The weapons used by the aboriginal people are often found, consisting of stone axes, arrow-heads of flint, &c. Necklaces, bracelets, and other ornaments used by them, barbarous in style, but generally of gold, are also often found. In various districts, Druidical circles still exist in a tolerably entire state; but none on so large or regular a scale as those of Stonehenge and Abury.

There are remains of roads and camps formed by the Romans in their hesitating and imperfect attempts to subdue North Britain; and of the wall built under the Emperor Antoninus, between the Firths of Forth and Clyde, with forts at regular intervals, it is still possible to discern a few traces.

The next class of antique objects are the remains of the Gothic fanes, reared on account of religion during the period when the Romish church was triumphant. These are everywhere very numerous, but in few cases tolerably entire. Excepting two cathedrals, those of Glasgow and Kirkwall (in Orkney), all of that class of structures are in ruins. The abbeys, priories, and other conventual and collegiate establishments, are in every instance gone to decay. Melrose Abbey, the Cathedral of Elgin, and the Collegiate Church of Roslin, are the most beautiful of these ruinous buildings.

Melrose Abbey.

Numerous specimens of the towers and castles occupied by men of note in the middle ages, still exist, though mostly in a decayed state. Those which indicate the greatest strength and consequence are—*Lochmaben Castle*, the residence of the Bruces, Lords of Annandale; *Hermitage* (Roxburghshire), which belonged to a powerful noble named Lord Soulis; *Douglas*, the residence of the Earls of Douglas; *Turnberry* (Ayrshire), the residence of the Earls of Carrick; *Bothwell*, another stronghold of the Douglases; *Tantallon* (Haddingtonshire), the residence of the Earls of Angus, a branch of the Douglas family; *Dunnottar* (Kincardineshire), the seat of the Earls Mareschal; and *Doune* (Perthshire), the stronghold of Robert Earl of Fife, brother of Robert III., and governor of Scotland. Four places of strength, *Edinburgh*, *Stirling*, *Dunbarton*, and *Blackness Castles*, are still kept in repair at the public expense, and serve as barracks for foot soldiers.

MANSIONS.

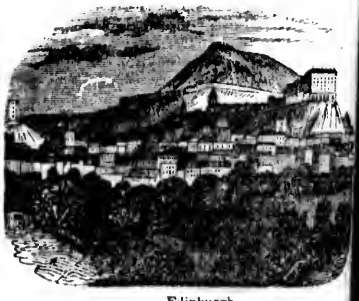
The mansions of the nobility and gentry of Scotland do not differ in any important respect from similar classes of structures in England. The "hall" is, however, completely wanting in Scotland, and there are comparatively few specimens of the Elizabethan style. Turbulent times being more recent in Scottish than in English history, the chief mansions of an unfortified character in the northern kingdom are not of earlier date than the reign of Charles II., and most of them are much later. In many instances, the whole or part of the original castellated buildings which stood on the same site are retained.

Before the reign of James III. (1460–1488), there seems to have been no mansion besides the regular tower, with its surrounding inferior buildings, and external wall or barmkyne. In that, and one or two of the ensuing reigns, a few mansions were built, in an ornamental style, having, for instance, an elegant front looking inwards to a quadrangular court; yet, in these instances, the outside of the building was still a plain and almost dead wall, calculated for defence. *Crichton Castle* (Edinburghshire), and *Linlithgow Palace*, are examples. In the reign of James VI., the favourite style was the tall square tower; but this was now rendered somewhat more ornamental by means of sundry flourishes, such as minor towers projecting like pepper-boxes from the corners. *Glammis Castle* (Forfarshire) is a superb specimen of this class of mansions.

In the reign of Charles II., mansions were for the first time built in any thing like pure Grecian taste. This was introduced by Sir William Bruce of Kinross, Bart., an architect of considerable skill, and of whose works the modern Holyrood Palace, and his own house of Kinross, are examples. During the last century, the mansions built in Scotland have partaken of all the changes of taste passing through England, from the heavy barrack-like structures of Sir John Vanburgh, to the light and elegant Grecian style of Adam. We have new chateaux in the style of the middle ages (*Gordon Castle*, Banffshire, and *Colzean* in Ayrshire); Grecian structures by Adam (*Hopetoun House*, Linlithgowshire); mansions in the Doric and more sombre Grecian style since introduced (*Hamilton Palace*, a superb example); and, very lately, a few specimens in the priory and Elizabethan styles.

CHIEF TOWNS.

Edinburgh, the capital, is situated in the county of the same name, on a cluster of eminences, distant between one and a half and three miles from the Firth of Forth.



Edinburgh.

The city is composed of two principal parts, the Old and New Towns, the former being built on a long narrow

eminence gently rising towards the west, where it terminates in a lofty and abrupt rock, on which the Castle is situated, while the latter occupies lower ground towards the north. The town is universally built of a fair sandstone, which retains its original colour in the newer parts of the town and in the best public buildings, and forms one of the most important features of Edinburgh. The New Town is laid out on a regular plan of rectangular streets and squares, exhibiting in general much architectural elegance. Between the Old and New Towns, and between various sections of the New Town itself, as well as in the centres of the principal squares, there are gardens laid out in the modern landscape style, forming delightful places of recreation. It is chiefly owing to the unequal ground on which Edinburgh is situated, the massive elegance and regularity of its buildings, the intermixture of ornamental pleasure-ground, and the picturesque hills immediately adjacent, whence distant and extensive prospects are commanded, that this city makes so great an impression on most strangers.

Formerly the seat of the government of the country, Edinburgh is still that of the supreme law-courts and of a flourishing university. It is also to a great extent a city of residence, not only for affluent persons connected with the country, but for strangers desirous of enjoying a society of moderate habits, and the benefits of education for their children. Its leading classes are thus composed of legal practitioners, learned persons, and families in independent circumstances. It is only in a small degree a manufacturing town, the principal trades being the brewing of ale (for which the town is celebrated), coachmaking, the weaving of shawls, and the printing and issuing of literary productions. The leading periodical publications are the well-known Edinburgh Review, Blackwood's and Tait's Magazines, and a Philosophical and Medical Journal, besides which there are a number of smaller size. The town is distinguished for its numerous banking institutions, which exert an influence on the general trade of the country. Within a few miles of the city, on the Esk River, there are various paper-mills, at which vast quantities of paper are made, both for the home trade and for exportation to London. A railway in course of execution to Glasgow is expected to prove of great benefit to both cities.

Amongst the remarkable objects in the city, the most striking is the Castle, a large fortress romantically situated on the summit of a mass of igneous rock, between two and three hundred feet in sheer height. It contains, besides various batteries and other fortifications, an ancient palace, in which Queen Mary was delivered of her son James I. of Great Britain, and a modern barrack, in which a foot regiment is usually quartered. In a well-protected room, are shown the crown, sceptre, mace, and sword, which formed the regalia of the Scottish line of princes. The Courts of Law are situated in the centre of the Old Town, and are composed of a great hall, formerly the meeting-place of the Scottish Parliament, rooms for the two various divisions of the civil court and for the Jeals ordinary, a room for the High Court of Justiciary (supreme criminal court), and other accommodations. The extensive libraries belonging respectively to the Advocates (barristers) and Writers to the Signet (solicitors), are adjacent; the former being a collection of about 18,000 volumes. Holyrood-house, the palace of the Scottish kings, is situated at the lower extremity of the principal street of the Old Town. The oldest part is a mass of building erected by James V., containing the presence-chamber, bed-room, and other apartments, used by Queen Mary, with some of the original furniture; as also a gallery, furnished with (generally imaginary) portraits of the kings of Scotland. The apartments of the queen are to be regarded with no ordinary interest, both as furnishing a curious and faithful memorial of the domestic accommodations of a princess of the sixteenth century, and on account of that extraordinary incident, the murder of David Rizzio, which took place within them. Another part of the building, erected in the reign of Charles II., contains the apartments used by George IV. for his levee in 1822, and a suite of rooms which furnished accommodation to Charles X. of France and his family, during the years 1831–2–3. Closely adjoining to the palace, are the ruins of a Gothic church, originally that of the Abbey of Holyrood, and latterly a chapel-royal.

The College is a large modern quadrangular building, in the southern quarter of the city. It contains class-rooms for the professors (33 in number), a library of splendid proportions and decoration, and an extensive museum of natural history. The university is chiefly distinguished as a school of medicine; but it is also the means of preparing a great number of the native youth for the profession of law and divinity. The Register House is a beautiful building, planned by Adam, in a conspicuous part of the New Town: it contains the records connected with the legal business of the country. The Royal Institution is the general appellation of an elegant building facing the centre of Princes street, and containing halls for various public bodies, as the Royal Society of Edinburgh, the Antiquarian Society of Scotland, the Scottish Academy of Painting and Sculpture, and an academy for instruction in drawing. Of places of worship, the most remarkable are St. Giles' Church in the Old Town (once the cathedral), a Gothic building of the fifteenth century, lately renovated; the Trinity College Church, also a Gothic building, founded by the queen of James II. of Scotland; St. George's, St. Stephen's, and St. Andrew's, modern churches of the establishment; and St. Paul's and St. John's elegant Gothic chapels of the Episcopalian body. There are two Roman Catholic chapels, and many dissenting places of worship. Of the other public buildings, the most remarkable are the Infirmary; the hospitals for the maintenance and education of poor children, of which Heriot's is the most elegant; the Surgeons's and Physicians' Halls; and the offices of the Bank of Scotland and Royal Bank. On the Calton Hill are situated some other public structures, as the County Jail and Bridewell, monuments to Nelson, Dugald Stewart, and Professor Playfair, an astronomical observatory, and a small portion of a building designed as a national monument to the Scotsmen who perished in the last war, but which will probably never be completed. The population of Edinburgh in 1831 was 136,301.

Leith, the sea-port of Edinburgh, and recently constituted an independent parliamentary burgh, is situated at the efflux of the rivulet of the same name, which originally constituted its harbour. The older part of the town is crowded and mean, but in the outskirts there are some good streets. The town is connected with Edinburgh by a broad and beautiful road, above a mile in length, denominated Leith Walk. Besides the quays skirting the embouchure of the river, there is a range of wet-docks; but the harbour, after vast efforts to improve it, continues to labour under several strong natural disqualifications. During spring tides, the utmost depth of water on the bar at the mouth of the river is seventeen feet—during neap tides, fourteen feet; and it is rarely that vessel of 400 tons can gain admission. The want of deep water at Leith is partly supplied by a harbour at Newhaven, a stone-pier at Granton, and a chain-pier at Trinity, which serve as places of embarkation and debarkation for steamers and other vessels devoted chiefly to passengers. The chief foreign trade of Leith is with the ports in the Baltic and north of Europe; next to this in importance ranks its intercourse with the West Indies. But the imports of Leith are chiefly for local consumption, and bear little reference to the great manufacturing

business of the country. For the coasting trade there are various companies, each of which has several vessels in employment. Amongst the ports with which regular intercourse is carried on by steam, may be mentioned London, Hull, Newcastle, Aberdeen, and Rotterdam. The tonnage belonging to Leith is on the decline: it was, in 1826, 25,674; in 1832, 23,094; in 1835, 22,073. The amount of tonnage which entered the harbour in 1835 was 340,540. The gross amount of custom-house duties in 1834 was £386,905. In Leith there are several breweries, a sugar-refining establishment, and several manufactories of soap, candles, ropes, and glass. The Custom-house, an elegant modern building, is the seat of the Board of Customs for Scotland. In 1831 the population of Leith was 25,855. The town, in union with Newhaven, Portobello, and Musselburgh, returns a member to Parliament.

Glasgow, the most populous city in Scotland, occupies a highly advantageous situation on the banks of the Clyde, in Lanarkshire, a few miles from the place where the river expands into an estuary, 42 miles from Edinburgh, 397 from London, and 196 from Dublin. The external appearance of this great city is elegant and impressive. The streets are regular in arrangement, and substantially built of smooth stone. The public buildings are in general handsome, and, in most instances, disposed in such a manner as to be seen to advantage. The more ancient part of the city extends along the line of the High street, between the Cathedral and the river; the more modern and elegant part stretches towards the north-west. On the left bank of the river, and connected by three bridges, is situated the populous barony of Gorbals, bearing the same reference to Glasgow which Southwark bears to London. Westward from the lowest of the bridges, both sides of the river are formed into quays, which, owing to recent operations for deepening the channel, are now approached by vessels drawing about fourteen or fifteen feet water. The quay on the right or north bank is denominated the *Broomielaw*: it has recently been extended to 3340 feet in length, while that on the south bank is 1260 feet.

Glasgow took its rise as a dependency of the cathedral of the bishops (latterly archbishops) of the see bearing its name. It was not, however, till long after the Reformation, that it became a seat of considerable population. About the middle of the eighteenth century, it had acquired a considerable share of the import colonial trade, which it still retains; but, during the last seventy years, it has chiefly been distinguished as a seat of manufactures. The weaving of lawns, cambrics, and similar articles, commenced in Glasgow in 1725. The advantages enjoyed by the city for the importation of cotton, in time gave a great impulse to that species of manufacture. In 1834, out of 134 cotton-factories existing in Scotland, 100 belonged to Glasgow, and the importation of cotton into that port amounted to 95,703 bales. In the weaving of this material, upwards of 15,000 power-looms, and 32,000 hand-loom weavers, were at the same time employed by the manufacturers of Glasgow. Of calico-printing establishments there are upwards of forty. It would be vain to attempt an exact enumeration of the less prominent features of the business carried on in Glasgow. The chief articles of importation, besides cotton, are sugar, rum, tea, tobacco, and timber. The chief articles manufactured or prepared, besides cotton goods, are sugar, soap, glass, iron, ropes, leather, chemical stuffs, and machinery. There were recently seven native banks, and several branches of other banks. During a year extending from a certain period in 1839, to a certain period in 1840, 5484 vessels, of 296,302 tonnage, arrived at the Glasgow harbour; the custom-house revenue of 1839 was £468,975, and the harbour dues of the twelvemonth ending August 31 of that year were £45,826. It is worthy of remark, that the Clyde was the first river in the elder hemisphere on which steam navigation was exemplified. A steam-vessel of three horse power was set afloat on the river in January, 1812, by Mr. Henry Bell of Helensburgh; and there were twenty such vessels on the Clyde before one had disturbed the waters of the Thames. In 1835 there were sixty-seven steam-vessels, of 6691 aggregate tonnage, connected with Glasgow, eighteen of which plied to Liverpool, Belfast, Dublin, and Londonderry. Within the last few years, the city has become a great centre of the iron trade, this metal being produced in the neighbourhood to an annual amount of not less than 200,000 tons. As a necessary consequence of the commerce and manufactures which flourish in Glasgow, the city has a vast retail trade in all the articles of luxury and necessity which are used by human beings. But no circumstance connected with Glasgow could give so impressive an idea of the height to which business has been carried in it, as the rapid advance and present great amount of its population. By the census of 1791, the inhabitants were 66,578; and by the first government census in 1801, they were 77,385. But these numbers have been increased in 1811, 1821, and 1831, respectively, to 110,749, 147,043, and 202,426. As the increase is about 7000 per annum, the present amount (1841) is supposed to be fully 285,000—a mass of population which, at the time of the Union, could not have been dreamt of as likely ever to exist in any Scottish city.

The Cathedral, or High Church, is situated in the northern outskirts of the city, near the upper extremity of the High street. The bulk of the existing building was constructed at the close of the twelfth century, in place of another which had been consecrated in 1136, but was destroyed by fire. It consists of a long nave and choir, a chapter-house projecting from the north-east angle, a tower and spire in the centre, and a crypt extending beneath the choir or eastern portion of the building. In the nave, termed the Outer High Kirk, was held the celebrated General Assembly of the Church, November, 1638, by which Episcopacy was abolished and pure Presbytery replaced—the first great movement in the civil war.

The elevated ground, near the east end of the Cathedral, has been formed into an ornamental place of sepulture, under the appellation of the Necropolis. Since 1831, the Society of Merchants, its proprietors, have expended the sum of £6000 in laying out about twenty-four acres of ground in walks and shrubberies, and in connecting the spot with the opposite slope by means of a bridge across the intermediate rivulet. The taste manifested in the whole scheme and in its execution, is extremely creditable to the city. The walks, several miles in extent, command an extensive view of the neighbouring country. They are skirted by numberless sepulchral plots and excavations, where already affection has been busy in erecting its "frail memorials," all of which, it may be mentioned, are fashioned according to certain regulations, with a view to general keeping and effect.

The College buildings are situated on the east side of the High street, about half-way between the Cathedral and the Trongate. They consist in a sort of double court; the front which adjoins to the street being 300 feet in length, and three stories in height. The whole edifice has a dignified and venerable appearance. A large piece of ground behind the College is formed into a park or green, interspersed with trees and hedges, and always kept in grass, to be used by the students as a place of exercise or amusement. In the College there are appointed professors or teachers of about thirty branches of science, theology, and polite literature. At the back of the interior court stands the modern Gothic building which contains the Hunterian Museum. This is a large collection of singular natural objects, coins, medals, rare manuscripts, paintings, and relics of antiquity, originally formed by Dr. William Hunter, the cele-

brated anatomist, and bequeathed by him to this university, at which he received his education. While the College confers professional education, popular instruction is attainable, under unusually advantageous circumstances, through the medium of the Andersonian Institution, an extensive school of science founded at the close of the last century, and connected with which there is a general museum, containing many curious objects, and constantly open to the public.

The most attractive modern building in Glasgow is the Royal Exchange in Queen street, a most superb structure, erected in 1829, as a point of assemblage for the merchants in the western part of the city. The principal room is a large hall, supported by a double row of columns, and used as a reading-room. The front of the Exchange consists of a magnificent portico, surmounted by a cupola; and, as the building is isolated, the other sides are also of decorative architecture. Altogether, this building, supported by a set of very elegant domestic structures of similarly august proportions, impresses the mind of a stranger as something signally worthy of a great city.

Since the Reform Act of 1832, Glasgow has the privilege of returning two members to Parliament. The places of worship, charitable institutions, and associations of various kinds for public objects, are very numerous. A laudable zeal for the improvement of education marks the city; and a normal school, or seminary for the rearing of teachers—the first in the empire—has been erected under the auspices of a private society.

The means of communication in connection with Glasgow, are suitable to the character of the city as one of the greatest emporia of commerce and manufacture in the world. Besides a river, navigable by vessels drawing fifteen feet of water, and which gives the means of a ready communication with the western shores of Britain, with Ireland, and with America, the Forth and Clyde Canal, of which a branch comes to Port-Dundas, in the northern suburbs, serves to convey goods and passengers to the eastern shores of the island, while canals of less note connect the city with Paisley and Johnstone in one direction, and with the great coal-fields of Monkland in the other. There is also a railway, which traverses the same great coal-field, by Garnkirk and Wishaw, and conveys passengers as well as coal and goods. Another railway, connecting the city with Kilmarnock, Ayr, and the port of Ardrossan, was opened in 1840. During the year in which this sheet makes its appearance, a third railway, passing by Falkirk and Linlithgow to Edinburgh, will be opened. Others are projected. The steam communication between Glasgow and Liverpool, Dublin, and other Irish ports, is conducted on a scale which may be called grand. The vessels are superb in magnitude, decoration, and power; and they sail frequently and rapidly. The steam intercourse between Glasgow and various places in Scotland, both for passengers and objects of traffic, is also conducted on a great scale: among the places touched at in the Clyde and to the south are Greenock, Dunbarton, Dunoon, Rothesay, Arran, Gourock, Troon, and Ayr. Among the places to the north, to which vessels sail regularly, are Inverary, Campbelton, Oban, Staffa, and Iona, Mull, Arisaig, Skye, Stornoway, and Inverness. In opening up markets for West Highland produce, and introducing luxuries in return, these vessels have also been of marked service, insomuch that the value of property in those hitherto secluded districts has experienced a considerable rise.

The country around Glasgow, particularly towards the south, abounds in busy towns and villages, of the former of which the most remarkable is *Paisley*, situated in Renfrewshire, on the banks of the small river Cart, seven miles from the city above described. The external appearance of this town is pleasing, and the streets are in general composed of substantial buildings. It originated from an abbey founded in 1160 by Walter, the first of the Stewarts, and of which considerable remains still exist. Paisley is a noted seat of the manufacture of shawls, and also of cotton thread, gauzes, and velvets. In the town and Abbey parish, exclusive of the large village of Johnstone, there were lately three cotton spinning-mills, and seven or eight thread-mills: two steam-loom factories, six flour-mills; a calico-printing work; many bleaching works and dye-houses; three breweries and two distilleries; several timber yards; and several iron and brass founderies; an alum and copperas work, a soap work and a tan-yard. An idea of the present extent of manufactures, in comparison with what it was in the last age, may be obtained from the fact, that, while the whole of the manufactures in 1760 amounted to £15,000, the annual computed value of the goods made in and around the town a few years ago, was a million and a half sterling.

Paisley has been changed by the Reform Acts from a burgh of barony into a parliamentary burgh of the first class, returning one member, divided into wards for municipal purposes, and managed by sixteen councillors, including a provost, four baillies, and a treasurer. Being, though not the county town, the seat of the sheriff court, it is adorned by a large modern castellated building, containing a jail, bridewell, and series of court-rooms; but unfortunately the edifice is placed in a low situation, without reference to salubrity or external influences. Devoted as the inhabitants of Paisley are to the pursuits of business, they have long been honourably remarkable for a spirit of inquiry and a desire for intellectual improvement. The population of Paisley, like that of Glasgow, has experienced a very rapid advance; the inhabitants of the town and surrounding parochial district, in 1821, amounted to 47,003; in 1831, to 57,466.

Notwithstanding the inland situation of Paisley, its means of communication are unusually facile and ample. The White Cart, navigable from its efflux into the Clyde to the Sneddon in the outskirts of Paisley, presents all the advantages of a canal. A canal leaves the suburbs of Glasgow, and, passing Paisley, terminates at Johnstone. Paisley is also benefited by the Glasgow and Ayr Railway, which passes it.

In Renfrewshire, also, is situated *Greenock*, the greatest sea-port of the kingdom, as far as custom-house receipts form a criterion, these having been, in 1834, £482,138 in gross amount. This town occupies a strip of sloping ground facing towards the Firth of Clyde, at the distance of twenty-four miles from Glasgow. In the seventeenth century it was a mere hamlet; now it is a handsome town of about 30,000 inhabitants, containing harbours and quays of 2200 feet in extent, to which belonged, in 1828, 219 vessels, of 31,929 aggregate tonnage, and employing 2210 men. It is now, moreover, by virtue of the recent Reform Acts, a parliamentary burgh of the first class, returning one member of Parliament. The principal branches of commerce conducted in Greenock have reference to the East and West Indies, the United States, and British America, to which last it yearly sends out great numbers of emigrants. Sugar-baking and ship-building are other branches of industry carried on here to a great extent. The Custom-house, fronting to the Firth of Clyde, is a beautiful Grecian building, erected in 1818, at an expense of £30,000. The Tontine Hotel, situated in one of the principal streets, and containing a large public room, twelve sitting-rooms, and thirty bed-rooms, was built, in 1801, by 400 subscribers of £25 each, the whole expense being thus £10,000. There is also an elegant building, in the character of an exchange, which cost £7000, and contains, besides two spacious assembly rooms, a reading room, to which strangers are admitted gratuitously for six weeks. In Greenock there are two native banks, besides branches of several others.

James Watt, the improver of the steam-engine, was born in Greenock in 1736; and an institution for literary and scientific purposes, designed to serve as a monument to him, and termed the Watt Institution, has been recently completed. The situation of the town, on the shore of a land-locked basin of the Firth of Clyde, with the mountains of Argyllshire and Dumbartonshire rising on the opposite side, is very fine.

Among Scottish towns, *Aberdeen* ranks next to Edinburgh and Glasgow. It is situated in the county named from it, on a level piece of ground between the efflux of the rivers Dee and Don, 110 miles from Edinburgh. Its external appearance produces a favourable impression; the principal streets are straight and regular, and the buildings at once substantial and elegant, the chief material used in constructing them being a gray granite found here in great abundance. New Aberdeen, or what is now generally called Aberdeen, is close to the efflux of the Dee, the mouth of which forms its harbour; and Old Aberdeen, where the ancient Cathedral and King's College are situated, is a comparatively small town, about a mile distant, on the bank of the Don. The entire population is about 60,000.

Aberdeen is a city of great antiquity. It became the seat of a university by the erection of King's College, in Old Aberdeen, in 1495; Mareschal College, in New Aberdeen, was added in 1593. By the recent Reform Acts, it is a royal burgh of the first class, divided into districts for municipal purposes, and returning one member to Parliament. Aberdeen is at once a seat of manufactures and a sea-port. There are four great houses engaged in the cotton manufacture, two in the woollen trade, and three in flax-spinning and the weaving of linen. Ship-building, iron-founding, comb-making, rope-making, and paper-making, are also carried on to a great extent. The fisheries of the river Dee, and the export of granite, are sources of considerable income. Of the exports for the year 1836, we may notice, as indicating at once the extent and nature of the agricultural and manufacturing products of the district, the following items:—Flax manufactures, 30,482 barrel bulk; cotton manufactures, 16,336 do.; woollen manufactures, 20,043 do.; oats, 29,239 quarters; meal 13,375 bolls; sheep and lambs, 1407; pigs, 3034; butter, 9261 cwts.; eggs, 9120 barrel bulk; pork, 6006 cwts.; salmon, 7757 do.; granite stones, 1738 tons. The chief imports are, coal, of which there was unloaded, during the same year, 371,914 bolls; lime, cotton, flax, wool, wood, wheat, flour, salt, iron, whale-blubber, and miscellaneous goods, consisting of groceries, &c. There were, in 1836, belonging to the port of Aberdeen, 360 vessels, tonnage 42,080, employing 3110 men.

Aberdeen is entered from the south by Union street, an elegant double line of buildings, a mile in length and seventy feet wide, in the centre of which a ravine pervaded by a rivulet is crossed by a noble arch of one hundred and thirty-two feet in span, upon a rise of twenty-two. King street, which opens up the city from the north, is sixty feet wide, and contains many splendid edifices. Besides these two main streets, there is a considerable number of modern squares and terraces. The public buildings are much scattered, but are generally of an elegant appearance. The Public Rooms, erected by the gentlemen of the counties of Banff, Aberdeen, Kincardine, and Forfar, for meetings, dancing assemblies, &c., and partly occupied as a reading-room, constitute a handsome Grecian structure, fronting to Union street. On the north side of Castle street, stands the Town-House, and in the centre is the Cross, a curious structure re-erected in 1822, and containing sculptures of eight Scottish sovereigns between James I. and James VII. Mareschal College, formerly a plain old structure, has lately been re-edified in handsome style, chiefly at the expense of the nation. King's College consists of a handsome but ill-assorted quadrangle, surmounted by a fine tower and spire. The two colleges are attended by about five hundred students, nearly equally divided between them. In Old Aberdeen are also to be seen the remains of the Cathedral, consisting of the nave of the original building, with two towers at the west end. The ceiling is composed of oak, cut out into forty-eight compartments, each displaying in strong colours the armorial bearings of some eminent person, whose name is given below, in Latin, and in the old Gothic character.

Dundee, situated in Forfarshire, on the shore of the Firth of Tay, may be considered as the fourth town in Scotland, whether in population, or in the importance conferred by wealth. It is a busy sea-port, and the chief seat of the linen manufacture in Scotland, and, indeed, in Great Britain. A series of docks, the erection of which cost £365,000, extend along the shore, where, a century ago, there was only a small quay in the form of a crooked wall. The dues collected for the harbour were, in 1839, £16,996; the tonnage belonging to it, in 1839, was 44,882. In the year ending May 31, 1836, the quantity of hemp and flax imported was 32,462 tons, and the number of pieces of sheeting, bagging, sailcloth, sacking, and dowlas exported, was 717,070, the value of which was about £1,500,000, being considerably greater than the entire exports from Ireland. In 1839, the number of spinning-mills was 41, and of flax-mills (that is, mills for weaving), 47; besides which there are several machine-factories, candle-factories, sugar-refineries, and establishments for rope-making and ship-building. This great hive of industry contained, in 1831, a population of 45,355, to which it is probable that 15,000 have since been added. The town is represented in Parliament by one member.

Dundee contains one handsome *place*, denominated the High Street, in the centre of the town, and several other good streets; but the most elegant and commodious private dwellings take the form of suburban villas. There is a handsome modern building, serving the purposes of an exchange and reading-room, besides which the most conspicuous public buildings are the Town-House and a building comprehensively called the Seminaries, containing an academy and grammar-school. The High Church of Dundee was an interesting building of the thirteenth century, with a massive tower 156 feet high; but the whole structure, excepting the steeple, was destroyed by fire in January, 1841. Dundee is connected by railways with Arbroath and Brechin on the one hand, and Newtyle on the other. It carries on a regular steam intercourse with London.

Perth, the chief town of the county of the same name, is celebrated on account of its elegant appearance and the beautiful situation which it enjoys on the banks of the Tay, here a broad and majestic stream. Umbrella cloths, ginghams, handkerchiefs, and shawls, are manufactured in Perth in considerable quantities, the number of weavers employed being 1600; and there are a flax spinning-mill and an extensive bleachfield. The river being navigable to this place for small vessels, there is a harbour, chiefly for coasting trade. The salmon fishery on the river are a source of considerable income: the fish are sent to London, in boxes, the number of which, in 1835, was 5000, amounting to 250 tons. Perth had, in 1831, a population of 20,010, and it is represented by one member in Parliament.

The streets of Perth are generally rectangular, and well built of stone. The river is spanned by a substantial bridge, connecting the town with a small suburb on the other side, and forming part of the great north road. The town contains most of the public buildings found in places of similar character and magnitude: the new Church of St. John, an elegant suite of county buildings, an academy, and town-hall, are those most entitled to notice within the town. In the environs, besides a

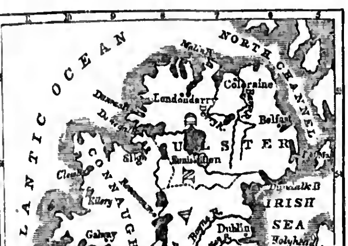
asylum, there is a structure designed, when finished, to serve as a national reformatory for criminals. The beauty and salubrity of Perth are much enhanced by two beautiful pieces of adjacent public ground, respectively entitled the North Inch and South Inch. In the midst of a highly cultivated vale, pervaded by a great river, and with lofty mountains in the distance, Perth, especially when its own neat appearance is considered, may be said eminently to deserve its appellation of "the fair city."

Dumfries, the principal town of Dumfriesshire (71 miles from Edinburgh and 34 from Carlisle), enjoys a beautiful situation on the Nith, which is navigable to nearly this point for small vessels. Inclusive of a large suburb on the opposite side of the river, the population is about 14,000. Dumfries has a few small manufactures, but its chief importance rests in its character as a kind of provincial capital and seat of the county courts, and as an entrepôt for the transmission of cattle and pork to the English market. Eighty-four vessels belong to the port, with an aggregate tonnage of 5783; and steam-vessels sail regularly to Liverpool. The town has a neat and clean appearance, has some handsome public buildings, and is the seat of considerable refinement. In St. Michael's Churchyard repose the remains of Robert Burns, over which his admirers have reared a handsome mausoleum.

Inverness (155 miles from Edinburgh) is the principal seat of population in the northern counties of Scotland. It is an ancient royal burgh, a seaport for the export and import trade of the district, and the seat of the county courts. The situation on the river Ness, near its junction with the sea, with some picturesque eminences in the neighbourhood, is one of great beauty, and the town itself is well built and remarkably clean. Inverness is often called the Highland capital, being within the line of the Grampians, and the residence of many persons connected with that district. The population of the town and parish, in 1831, was 14,324. Among objects of interest may be enumerated—the remains of a fort built by Cromwell; Craig-Phadric, an eminence crowned by a vitrified fort; and the moor of Culloden (distant five miles), the scene of the fatal battle which extinguished the hopes of the house of Stuart.

The principal towns in Scotland, next to those above enumerated, are—in Ayrshire, *Kilmarnock*, a prosperous seat of the coarser woollen manufacture—population about 20,000; *Ayr*, the capital of the county, a thriving market-town, and in a small degree a sea-port—population (including dependencies) about 17,000; in Stirlingshire, *Stirling*, the county town, remarkable chiefly for its castle, a favourite seat of the Scottish monarchs, and from which the most splendid views are commanded; *Falkirk*, a busy market-town, and the centre of a district remarkable for its iron founderies, particularly the celebrated one of Carron—population about 7000; in Fifeshire, *Dunfermline*, the principal seat of the manufacture of damasks, diapers, and similar fabrics—population about 18,000, *Cupar*, the county town; *Kircaldy*, a busy manufacturing and sea-port town; *St. Andrews*, the seat of an ancient university; in Forfarshire, *Montrose* and *Arbroath*, active seats of the linen trade, and likewise seaports; in Morayshire, *Elgin*, an ancient royal burgh and county town.

DESCRIPTION OF IRELAND.



This large and important section of the United Kingdom is geographically described as an island situated to the west of Great Britain, from which it is divided by a strait, called at different places St. George's Channel, the Irish Sea, and North Channel, the Atlantic forming the boundary on the other sides. Of a more compact form than Great Britain, it is nevertheless penetrated by a considerable number of deep bays and estuaries, which give it an outline upon the whole irregular. Besides enjoying this advantage for internal navigation, it may be considered as more favourably situated for foreign commerce than either England or Scotland. It lies between 51° 19′ and 55° 23′ north latitude, and 5° 19′ and 10° 28′ of west longitude from Greenwich; but the greatest length, from Brow Head in the county of Cork, to Fair Head in the county of Antrim, is 306 miles, and the longest transverse line, between similar points in the counties of Mayo and Down, 182 miles. The entire area appears, from the latest and best measurement, to include 31,874 square miles, or 20,399,608 English statute acres.

Ireland is divided into four provinces, namely Leinster, on the east; Munster, on the south; Ulster, on the north; and Connaught, on the west: these are subdivided into 32 counties, 252 baronies, and 2348 parishes. For an account of the ecclesiastical divisions and civil polity, we refer to the Constitution and Resources of the British Empire.

In superficial character, Ireland may be called a hilly or mountainous country, since there are few spots where the view is not terminated by lofty hills or mountain scenery. Generally speaking, the mountains stand in groups, and are more or less detached from each other, but in some districts they form ridges of great extent. The Mourne range, in the county of Down, lies west and east, ending with *Sliere Donard*, which rises 2809

feet above the level of the sea, and is the highest of the northern mountains. The *Slieve Bloom* mountains, placed in nearly the centre of the island, run north and south, intersecting the King and Queen's Counties: in this range, sometimes called the *Ard na Erin*, or Heights of Ireland, the rivers Nore, Barrow, and Suir, commonly called by the country people the Three Sisters, take their rise. In Connaught there is a fine range, of which the *Twelve Pins* form a part; and in Munster, a ridge of varied height extends from Dungarvon, in the county of Waterford, across the kingdom, into the county of Kerry. It may be here observed, that wherever the Irish term *slieve* is applied to a mountain, it expresses that that mountain forms part of a range. The highest mountain in Ireland is *Carran Tual*, at Killarney, being 3410 feet above the level of the sea. *Mount Nephin* and *Croagh Patrick*, two conspicuous mountains in Mayo, are respectively 2639 and 2499 feet high. Some, however, of the counties, though possessing a very varied surface, can only boast of hills, as Armagh, Monaghan, Cavan, and Louth, while others are in general very level: Meath, Kildare, Longford, and Galway, are of the latter character. A distinguishing peculiarity of the country, whether in its hilly or more level districts, is its generally green appearance, a circumstance arising from its fertile soil and moist and temperate climate, and which has led to its receiving the appellations of the "Emerald Isle" and "Green Isle of the Ocean"—names sung by its poets, and repeated with affection by its natives in all quarters of the world.

In the lower and less reclaimed portions of the country, there are various extensive bogs or morasses, which disfigure the beauty of the scenery, and are only serviceable in supplying fuel to the adjacent inhabitants. The chief of these morasses is the Bog of Allen, which stretches in a vast plain, across the centre of the island, or over a large portion of Kildare, Carlow, and the King and Queen's Counties. In this bog, the beautiful River Boyne takes its rise, flowing thence north-eastward to the sea at Drogheda, on the borders of the county of Louth: much of this bog has been drained and brought into tillage, and there is good reason to think that in time the whole of it will be reclaimed. Along the banks of the River Inny, which is rising in Lough Iron, in the county of Westmeath, crosses Longford and falls into the Shannon, are large tracts of deep wet bog, only exceeded in dreariness by that which for miles skirts the Shannon, in its course through Longford, Roscommon, and the King's County. All these bogs might be easily reclaimed, could they be drained; but that cannot be accomplished, as the Inny and the Shannon are kept up to their present level by the numerous eel-weirs which at present interrupt their course. There are also many tracts of bog in the western counties, and many detached bogs both in Ulster and Munster; but none of such great size as those above mentioned. It is remarkable, that notwithstanding the quantity of water contained in these extensive bogs, there arises from them no miasma injurious to health. This is attributable to the large portion of tannin they contain, which possesses so strong an antiseptic quality, that bodies plunged into a deep bog remain undecayed, the flesh becoming like that of an Egyptian mummy. It sometimes happens that a bog, overcharged with water during a rainy season, breaks through the obstruction which the drained and more solid part affords, and, rushing forward, overflows large portions of good land. This occurred in the year 1821, when the Bog of Clara, in the county of Westmeath, suddenly burst into the valley of the River Brusna, and totally destroyed many hundred acres of excellent land: a similar occurrence took place, to a large extent, a very few years since, in the county of Antrim.

Ireland is described as a thickly-wooded country, not only by her early native writers, but by all those English authors who have given any account of the country from the days of Giraldus Cambrensis, about A. D. 1185. Morrison (1596) and Davis (1605) mention the forests in which the poor Irish took refuge; and all the scenery of Spenser's *Fairy Queen* is drawn from the River Bandon, which he celebrates as the "pleasant Bandon, wood y-crowned," as it is to this day. Boate, in his Natural History, mentions the great extent of wood then standing; but not long did it so stand, for wherever Cromwell's army came, the forests were felled, and the country laid bare. In most cases, the bogs give ample testimony to the truth of these statements, some supplying large quantities of *fir*, which burns with a pleasant aromatic smell, and a flame so brilliant that it is often used in the place of candles. In other bogs, only oak is dug up, and sometimes sallow, and yew of a great size, which takes a fine polish and is used for cabinet-work. There are still, in a few favoured spots, some remains of the ancient oak and ash woods, as at Killarney, at Glengariffe near Bantry, in Connemara, in some spots of the county of Wicklow, and in Donegal, near the beautiful but little Lough Van, where a few red deer are still to be seen. Near the mouth of the Suir, at the foot of the Knockmeledan Mountains, is a wood of the pine species, commonly called Scotch fir, of such size and hardness, that Mr. Nimmo, the engineer, pronounced it to be equal to the best Memel timber, and used it in constructing the pier at Dunmore. Many noblemen and gentlemen have planted largely and with great success, their flourishing plantations giving promise that the country in a few years will again be furnished with trees.

Ireland possesses many large and remarkably fine rivers, several of which form lakes at certain points in their course, and fall into the sea at the head of spacious bays every way suitable for navigation. The principal rivers are the *Foyle* and the *Bann*, which flow into the Northern Ocean: the *Boyne*, the *Liffey*, and the *Slaney*, which empties themselves into the Irish Channel; the *Barrow* and the *Nore*, which, falling into the *Suir*, pour their united streams into the Bay of Waterford; the *Blackwater* and the *Lee*, which run southward, their embouchures being at Youghal and Cork; the *Shannon*, the *Gweebarra*, the *Erne*, the *May*, the *Mang*, and the *Lane*, which flow into the Atlantic. Among inland lakes or loughs, the largest is *Lough Neagh* in Ulster, which exceeds in size any lake in the United Kingdom, its length being twenty miles by a breadth of from ten to twelve: its waters are discharged by the Bann.

GEOLOGICAL STRUCTURE.—MINERALOGY.

Ireland stretches westward into the Atlantic, and is indented, as has been stated, by deep bays, protected by jutting promontories, which have hitherto withstood the force of the boisterous ocean to which they are exposed. The rock which forms the bed or bottom of these bays is generally composed of the secondary or carboniferous limestone, while the projecting promontories to the north and south of each, are composed, for the most part, of primary or transition rocks, and particularly of greenstone, mica-slate, quartz rock, grawacke, and old red sandstone conglomerate. In Ireland, the coast is mostly mountainous, and the interior flat. Thus, we find the mountains of Antrim on the east; of Derry and Donegal on the north-west coasts; those of Sligo and Kerry west and south-west. The slate districts of Cork and Waterford form the south and south-east, while the mountains of Wicklow, and those still higher ones of Louth and Down, are situated on the eastern coast. The interior of the island is, generally speaking, composed of flat or gently-swelling grounds, covered with rich and fruitful soil. This peculiar conformation of the surface has been the origin of the great number of rivers with which the Irish coast abounds. They have their sources in the neighbouring mountains, whence they flow directly to

the sea. The flatness of the interior of Ireland has been the probable cause of those vast accumulations of alluvial matter called *escars*. They possibly originated at a period when the country was at least partially submerged, from eddies formed by undulations on the surface. The origin of the great tracts of bog for[illegible] generally in the flat country, may be attributed to the water pent up, as we even now find it, above the level of the dry country, by gravel hills, which form a continuous ridge, though not of equal height, round the edge of the bog. The central district of Ireland contains upwards of one million of acres of bog, comprehended between Wicklow Head and Galway, Houth Head and Sligo.

A vast tract of limestone extends in an almost unbroken line from the north of Cork to the south of Fermanagh, with an intermixture towards the eastern coast of clayslate, grawacke, and grawacke-slate, with veins of granite interspersed, as is the case in the counties of Down, Armagh, and Wicklow. The southern coast is composed of limestone and old conglomerate, with red, purple, and gray clayslate, which may be distinctly seen along the shores of Cork and Waterford. In the south-western coasts are large tracts of coal formation; while the western are formed of granite, carboniferous limestone, including the lower limestone, calp or black shale series, and the upper limestone, with a tract of the coal formation. There are also in Galway, Mayo, and Sligo, tracts of mica-slate, quartz rock, yellow sandstone, and conglomerate. The northern division, consisting of the counties of Donegal and Derry, is chiefly mica-slate, with an intermixture, in the northern part of Donegal, of granite, quartz rock, and primary limestone; while the county of Antrim is composed of tubular trap. The counties in which coal is worked are Carlow, Kilkenny, Donegal, Limerick, Tyrone, and part of Tipperary. Ireland is rich in minerals, and contains gold and silver, though not in large veins, as well as copper, lead, coal, and sulphur. Her quarries also produce a variety of beautiful marbles, as the black marble of Kilkenny, the green of Galway, and the many-coloured of Fermanagh. The quarries of Killaloe and of Valentia, in the county of Kerry, afford large-sized excellent slates, now coming extensively into use. Nor should the inexhaustible supply of extremely fine building-stone which the hills south of Dublin afford, be left unmentioned. Of this granite, the particular vein which is worked at the coast village of Bullock, has been found to withstand the wash of the sea better than any other kind of stone, and is exclusively reserved for the building of the lower stories of those lighthouses which are exposed to violent sea-wash. The stones are cut on the spot, and shipped ready fitted to their places.

CLIMATE.

There is but a small part of Ireland more than fifty miles from the sea, a circumstance which fully accounts for the mildness of the climate, its equability, and its humidity. The temperate atmosphere of Ireland was held in high estimation, and strong testimony to its goodness is borne by the older historians. At the beginning of this century (1804), Dr. Hamilton, in his account of Antrim, mentions the equable distribution of heat throughout the island, and the perpetual verdure of the fields, unimpaired by either solstice. This equability of temperature is clearly proved by the fact, that delicate plants thrive in the county of Donegal, close upon the Northern Ocean. Arbutus and laurestinus there grow healthily, and myrtles so luxuriantly, as to cover the walls of houses up to the second story. On the shore of Lough Swilley, near Ramelton, the agapanthus and the fuchsia abide in winter in the open ground; and flower extremely well in summer.

The southern part of Ireland is considerably warmer than Ulster. The snow seldom lies for any considerable time. The spring is earlier, fruit ripens a fortnight sooner, and the harvest is fit for the sickle a month before that of the northern, and about a fortnight before that of the midland districts. In the counties of Cork and Kerry, tender shrubs, such as bay, verbena, fuchsia, &c., grow with extraordinary luxuriance; and the native arbutus enriches the wild scenery of Killarney and Glengariffe. The moisture of the climate is its greatest defect; but this varies remarkably in degree. The atmosphere of the western side of Ireland is naturally much more humid than that of the eastern, exposed as it is to the influence of the moist vapours of the great Atlantic, which, attracted by the mountains, rest upon their heads and pour down rain into the valleys. Thus, the greatest quantity of rain which has been known to fall—forty-two inches—was near Colooney in the county of Sligo, while the smallest quantity is at Armagh, which, though a very hilly, is comparatively an inland district. In a paper lately read at the Royal Irish Academy, it appeared, f[illegible]mparative registers carefully kept, that, in the yea[illegible] th[illegible]had been, at Monks Eleigh, which is about forty [illegible] the sea-coast of Suffolk, 21.796 inches of rai[illegible]n Tuomavara, in the county of Tipperary [illegible] forty miles from the western coast, there fell [illegible] or very nearly double the quantity ; but duri[illegible] year, only 21.7 fell at Armagh —a curious in[illegible]he differences arising from local circumstances. Again, the county of Dublin is wetter than that of Wicklow, because the clouds charged with rain pass over Dublin towards the channel, free from every obstacle, while those which cross Wicklow, striking upon the mountains and hills, deposit their moisture upon their western slopes, leaving the eastern sides of the country between them and the sea dry and in sunshine.

VEGETABLE PRODUCTIONS.—ANIMALS.

The botany and zoology of Ireland generally resemble those of the neighbouring island. The cultivated plants and useful animals are identical. There are, however, some peculiar to Ireland.

The more remarkable plants which are indigenous and peculiar to Ireland, are—the *arbutus unedo*, or strawberry-tree, found at Killarney, particularly beautiful from its abundance of red fruit; the *rosa Hibernica*, Irish rose, found near Belfast; the *ulex strieta*, Irish furze, found sparingly in the county of Down, distinguished from common furze by its upright mode of growth and softer texture; the *taxus Hibernica*, frequently called Florencecourt yew, from having been first observed in Lord Enniskillen's demesne in the county of Fermanagh —its growth is upright, resembling that of the cypress, and its foliage dark green; the *menziesia polyfolia*, Irish menziesia, a very beautiful plant, whose large purple heath-like bells decorate the wild districts of Galway; the *erica Mediterranea*, discovered by Mr. Mackay at Connemara in 1829, a distinct variety of the Corsican heath, very ornamental in the flowering season; the *erica Mackayana*, many-branched, cross-leaved heath, sent to Mr. Mackay from Connemara, and named after him by Sir William Hooker, Professor of Botany, Glasgow (the three last species of heaths are also natives of the Pyrenees); the *saxifraga geum*, kidney-leaved saxifrage; *s. hirsuta*, hairy saxifrage; *s. elegans*, small round-leaved saxifrage; *s. umbrosa*, variety serratula, saw-leaved saxifrage, or London pride. The above four species and varieties, new to Britain and Ireland, were discovered by Mr. Mackay, in the mountains near Killarney, in 1805. They all resemble the London pride of the gardens, which also grows wild on the mountains of Galway, Mayo, Sligo, and Donegal.*

* For the above account of Irish plants, the writer is indebted to Mr. Mackay, Curator of Trinity College Botanic Gardens, and author of the *Flora Hibernica*.

With respect to the animal kingdom, there were formerly several races of cattle considered as exclusively Irish, of which two kinds are still extant—the *Kerry breed*, which is black, very small, and beautifully proportioned, the limbs and horns being most delicately made; they are excellent milkers, both for quantity and quality, and are remarkable for their gentle and affectionate disposition: they are to be had only in the remote barony of Iveragh, in the county of Kerry. The other species, which is always called the *old Irish breed*, is usually of a bright red, the back hollow, the *pin* bones high, the head very small, a fine eye; the horns growing upright, and remarkably slender, as are the legs. They are very deficient in beauty, but are valuable for the dairy. The *red deer*, though now extremely scarce, are still to be found at Killarney, in some of the wild mountain districts of Kerry, and the adjoining part of the county of Cork; at Shanbally in the county of Tipperary, and in Donegal. The *wolf-dog*, now almost extinct, is still occasionally to be seen in Ireland; the *curly-haired, liver-coloured water-dog*, which is considered quite an Irish breed; the large *black and tan* breed of terriers, peculiar to the county of Kerry. Squirrels are common in some places. The *gillaroo-trout* is peculiar to Lough Neagh; and the *pollen*, or fresh-water trout, was long considered so, but has lately been found in the Scottish lakes. The *dorchar* is also peculiar to Lough Neagh; it is of a darker colour than trouts usually are. It is generally supposed that Ireland possesses no reptiles, but this is a vulgar error. The toad and frog are common.

THE PEOPLE—THEIR CHARACTER AND CIRCUMSTANCES.

The bulk of the Irish people are a branch of the Celtic race, who were probably the first settlers in the island. The peasantry, throughout nearly the whole country, are of this origin, and in many parts they still speak the Celtic (here termed the Irish) language. The chief exception from this rule is in the north, where a great number of the humbler, as well as middle classes, are descended from comparatively recent settlers of Scottish extraction. Another rather conspicuous exception is found in Connaught, particularly in Galway, where a considerable number of the people seem to be of Spanish descent. Families of English extraction are comparatively rare among the labouring class in Ireland.

The Irish labouring classes, and a large portion of the middle classes, being thus generally of Celtic origin, are marked by many peculiar features. Their character includes much quickness of apprehension and ingenuity, considerable natural eloquence and wit, and affections much warmer than those of most European nations, but is generally acknowledged to be deficient in reflection and foresight, and liable to a peculiar irascibility, which often attaches to a mercurial and upon the whole amiable character. The upper, and a large portion of the middle classes, being of Saxon descent, are not much different from the same classes in Great Britain; but, in as far as any difference exists, it may be said to consist in a tincture of the Celtic, or genuine Irish character, as just described. This admixture is perhaps that which gives the educated Irish so much artistic talent, whether to be exhibited in literature or the arts, while some of the more peculiarly English characteristics are less conspicuous.

Limiting the consideration of the social state of Ireland to what is peculiar to it, we may first advert to a conspicuous practice of the landowners—*absenteeism*. By absentees are not meant those noblemen, who, being Englishmen, have also large possessions in this country, and whose estates (with some glaring exceptions) are usually well and justly managed; but those sons of Erin who prefer living in any other country to remaining in their own, although it is at home only that a man receives his just meed of respect. This system of absenteeism has led to that of *middlemen*, who hold large tracts of land from the head landlord, and relet this land at a much increased rent to farmers; these, again, let to a third set of under-tenants at rack-rents; and this lowest grade of tenantry divide their small farms among their sons, thus creating a race of farming poor, who are unable to till their holdings properly, and miserably increasing a population raised but a step above the pauper. There is perhaps no more thriving person than the *farming landholder*, who, contented with his condition, rises with his labourers, holds his own plough, and superintends the management of his farm; but the state of the *cottier* is often far from being a happy one. The discomfort of this class may be said to arise chiefly from three causes—low wages, high rents, and, most of all, from the want of steady employment. The too great subdivision of land, as will be shown, in treating of the condition of the peasantry in the provinces, is another cause of the general poverty and want of comfort of the cottier. Under the excitement of war prices and the free trade in corn with Great Britain, agriculture advanced rapidly, and, consequently, so did the demand for labour; land rose in value, lessees were tempted to realize profit-rents by subletting their farms; and thus a class of middlemen was created, by whom the land was let in still smaller divisions, and at extreme rents. This system was an absolute bar to the encouragement which might have been given to the tenantry by the proprietors of estates. The occupying landlord pays a higher rent to the middleman than does the middleman to the proprietor, because the middleman exacts as much as he can get, without any reference to the future situation of the tenant: but the landlord has different feelings—he looks forward, and considers the reversionary interest which he has in keeping his tenant in prosperity, and his land in a state to yield a remunerating profit.

The habits of getting credit frequently at an advance of 50 per cent., of resorting to pawnbrokers, and of forming early marriages, contribute to the impoverishment of the labouring classes in Ireland. The poorer the individuals are, the more eager are they for wedlock; even the very beggars intermarry. It must, however, be admitted as some excuse, that early marriage is much encouraged by the Romish priesthood; and in fairness it must be added, that this practice contributes exceedingly to the morality of the lower classes. The superstitious regard to *wakes* and funerals, which has been handed down from ancient times, is often a deplorable drain on the slender resources of the peasant.

In considering the character of the Irish peasantry in general, it is refreshing to see some noble traits standing out in full relief against the darker shades. The Irish people are of acknowledged bravery, proverbial hospitality, affectionate to their parents and aged relatives, charitable to the mendicant, and evincing in many places, even under extreme distress, a decency of feeling, which renders them averse to soliciting eleemosynary assistance. The women, generally speaking, are modest and irreproachable in their conduct; and it must be added, that, notwithstanding the crime and wretchedness which oppress the country, the poor Irish are free from many species of vice which are but too common in other countries. During the hay and corn harvests of England and Scotland, the services of the Irish labourers are very important. They are generally sober, well-conducted and inoffensive; labouring hard and living hard, that they may bring their earnings home to pay the rent of their little farm or dwelling. A *spalpeen*, or harvest-man, carries home from four to eight or ten pounds; to do which, he is contented, while away, almost to starve himself. There is reason, therefore, to hope, that under a better state of things, the national character will rise to a standard much higher than it has yet attained.

no improvement may reasonably be expected from the happy change wrought of late years by the temperance societies, and especially by the Roman Catholic clergyman, the Rev T. Mathew, of which evidence was given in the Ballinasloe Fair of 1840, where, instead of twelve hogsheads, the quantity usually disposed of, it is believed that there were only eight gallons of whisky consumed.

The last, but by no means most miserable class in Ireland, is that of the common *vagrant*. Of these, some are beggars by profession; some are obliged, from loss of employment, to become what are called *walkers*; and others are mendicants for a time only, as when their husbands are reaping the harvests in England, at which time it is customary to lock up the house, and the wife and children *walk the world* until the traveller returns with his little hoard of hard-earned money. It may be asserted, that in every district of Ireland, excepting some peculiarly circumstanced portions of Ulster, there is a feeling of respect towards mendicancy, which tends to support and perpetuate it. The poor tenants of the cabins receive the wanderers, whether single or in groups; and carrying, as these do, their bedding along with them, a warm corner is allowed them, even in the only room possessed. "It is the humblest sort," say they, "that are really good to us." The vagrants that frequent fairs, markets, patrons, holy wells, and other places of religious or pleasurable resort, are better off than the other poor. A respectable evidence declared to the commissioners on the Poor-Law Inquiry in the county of Meath, that the beggars at fairs were "as jolly a set as ever he saw in his life;" and in more places than one, it was stated to the commissioners that the beggars were better off than the tradesmen or labourers.

Hitherto, the usual methods of supporting the pauper poor have been congregational collections, subscriptions, very extensive private charity, and of late years the application of the resources of the Mendicity Association; but the inefficiency of these means have ultimately led to the establishment of a *Poor-Law*, the general object of which is to relieve the destitution of the country. Under this system, assistance is proposed to be afforded to persons only in the workhouses of their respective parochial unions, which are now erecting throughout Ireland. It is calculated that a hundred workhouses, placed in the centre of so many unions, and capable of containing each from four to eight hundred persons, will be sufficient to accommodate all who are likely to apply for admission. For the better regulation of the system, it was enacted, that a board of guardians should be annually elected in each union, in number according as the commissioners shall see fit, the same guardians being eligible for the subsequent year. It appears that, so far as the poor-law system is as yet brought into operation, it is imperfect, and has not relieved the districts in which it has been carried into effect from the annoyance of mendicity, inasmuch as there is no compulsory law for retaining vagrants in the poorhouses; they therefore leave them at pleasure, to follow the more agreeable course of begging in the streets. Until such enactment be passed, Ireland, it would seem, will be subject to a severe taxation in support of the poor-law system, while at the same time it is not relieved of the evils of mendicancy. So far as the poorhouses are yet in operation, they seem to be well conducted; arrangements are made for the instruction of the younger portion of the inmates, and the details of food, clothing, and lodging, appear to be generally considered satisfactory.

POPULATION.

The population of Ireland was estimated by an acute statesman of the reign of Charles II. as being then about 1,100,000. Another estimate, formed in 1731, but upon data not perfectly to be relied on, made the population 2,010,221. This last number seems to have been doubled before 1788, till which time Ireland was almost exclusively a pastoral country. Since then, agriculture and commerce have borne more conspicuous parts in the national industry; but circumstances unfavourable to national happiness and wealth have also been strongly operative, and the progress of the people was, till a very late date, upon the whole, downward. In proportion to the unfavourable circumstances, and most of all where the circumstances have been the most unfavourable, the population has increased. It was, at the first regular census in 1821, 6,801,827; and at that of 1831, 7,767,401. What strikingly illustrates the principle here alluded to, is, that in Leinster, which contains populous towns and is a comparatively prosperous province, the increase in the ten years between these two census, was at the rate of 9 per cent.; while in Connaught, where there are few towns, but a numerous peasantry in a very depressed condition, the increase was 22 per cent. It is a recent discovery, but a very important one, that, below a certain point in comfort of life, population is apt to experience a rapid increase, to the aggravation of all existing evils. And it is to this evil, more particularly, that a well-regulated poor-law may be considered as addressed.

ANTIQUITIES.

The antiquities of Ireland may be classed under the heads of the *Cromleac*, the *Cairn*, the *Circle*, the *Pillar-Stone*, the *Barrow*, the *Dun*, the *Lis*, the *Rath*, the ancient *Stone-roofed Buildings*, and the lofty and beautifully built *Round Towers*. The name *Cromleac* is compounded of *Crom*, which signifies Fate or Providence, and *leac*, a stone, literally "the stone or altar of God;" and to what god they were dedicated sufficiently appears by the name retained by so many of these altars. They vary in size and form, and in most instances consist of three upright supporters, two at the lower and one at the upper end, upon which the alter-stone was balanced; underneath this, and between the uprights, a hollow is usually found, which is thought to have been for the purpose of facilitating the passage of cattle and children under the sacred fire—a custom which seems to be alluded to in the Scriptures, when the Israelites are reproached with passing their sons and daughters through the fire to Moloch, one of the names given to the sun.

Of the *Cairn* there were two kinds, the burying and the simple cairn, or high place made of stones flattened on the top. These artificial high places were usually situated on an eminence; and here, on festival days, especially the 1st of May and the 1st of November, the fires of Bel were wont to be lighted. At these times all household fires were extinguished, to be rekindled by a brand from the sacred flame—a practice which continued till the time of St. Patrick, who succeeded in putting an end to it. Tumuli of this description abound in all parts of the kingdom.

Closely connected with the cairn, are the circles of upright stones, usually called *Druidic Circles*. They frequently surround a cairn, as that of New Grange, in the county of Meath, where the stones are placed about one third of the whole height above the base: frequently they encircle a pillar-stone.

The *Pillar-Stone* is so frequently joined with the circle cairn, cromleac, and sacred grove, that it cannot be passed over in silence. Numerous instances might be pointed out of lofty upright stones in many parts of the kingdom, standing sometimes singly, but most commonly in conjunction with one or more of the above-mentioned relics of pagan times. Tradition says, that formerly the people collected round such stones for worship, which is confirmed by the common expression in Irish of "going

to the stone," for going to church or chapel. These stones are conceived by many to have given rise to the carved stone cross found in various churchyards, and of which one of the finest specimens is to be seen at Monasterboyce, in the county of Louth.

There are several kinds of tumuli remaining, of which the Irish names declare the original object. The *Lios* or *Lis*, which signifies a fortified house, was an artificial hill, sometimes approaching in shape to an ellipse, with a flat top, and an earthen breastwork or rampart thrown round the little plain on the summit, where was placed the dwelling, usually protected by a strong wattled paling, as is now customary among the Circassians. The *Duns* or *Doons* were places of strength, always perched on a rocky bold situation, and fenced by a broad wall of extremely large stones, which wall forms one of the distinctions between the dun and the lis. The *Rath* signifies a village or settlement: these abound in all parts of the island, and are of various sizes, standing sometimes singly, sometimes so as to form a chain of posts; and frequently may be seen a large head rath, where the chieftain lived, and its smaller dependent raths, on which his retainers dwelt.

Among the earliest and peculiar antiquities of Ireland, are the low *Stone-roofed Buildings*, with high wedge-shaped roofs: of these, a few instances still exist at Kells, Kildare, Ardmore, and Killaloe. The most remarkable relics of the olden times of Ireland are the lofty *Round Towers*, of which, perfect and imperfect, one hundred and eighteen have been enumerated in various parts of the kingdom. They are built with a wonderful uniformity of plan. They are all circular, of small diameter, and great altitude. In most of them the door is at some height from the ground; small loop-hole windows, at distances in the sides, give light to the spaces where the different floors once were; and generally there were four larger-sized windows round the top, immediately below the roof, which is high and cone-shaped. There are, however, two or three towers, in which it does not appear that there ever were any windows round the top. Of the excellence of the masonry, a proof was given some years ago by the tower of Mahera, which, in consequence of having been undermined, was blown down, and lay, at length and entire upon the ground, like a huge gun, without breaking to pieces, so wonderfully hard and binding was the cement with which it had been constructed. Various theories have been offered as to the purpose for which these mysterious buildings were erected; the only clear point seems to be that they were religious, as they are always placed near churches. They vary in height from 35 to 120 feet; the internal diameter from 10 to 16 feet, and the outer circumference from 46 to 56 feet. Their tapering shape forms one of their most marked characteristics.

Ancient weapons and golden ornaments are from time to time dug up in all parts of Ireland, as bronze swords, exactly like those discovered at Carthage and on the field of Marathon. Multitudes, also, of spear-heads of all sizes, made of the same mixed metal, and curiously shaped bronze rings, have from time to time been discovered, the use of which had long been a desideratum to antiquaries, when a recent event unexpectedly threw light upon the subject, and confirmed the conjecture of Sir William Betham as to their having been current money. A variety of golden articles have been discovered in many parts of the country, such as semilunar shaped disks, formed of thin plates of pure gold; torques, or large twisted collars for the neck; armlets, brooches, rings, pieces of gold, bell-shaped, but solid and fastened together, the use of which has not been made out; and some rings of the same shape as those of bronze, which have been proved by Sir William Betham to have been used as money.

Ecclesiastical Antiquities.—Under this head rank those buildings which may be considered as the most ancient after the Pagan remains, and which bear a peculiar character, differing from that of any extant elsewhere. Of these but few are now in existence. The stone-roofed church of St. Doulagh's, near Dublin, belongs to the earliest date; its plan and style are equally uncommon. The latter seems to have been a rude approach to the oldest Norman; it is low, and of great strength; the church, divided by a low-browed arch, seems to have had a small choir and a somewhat larger nave. There are also strangely disposed, at various heights, small chambers, apparently for the residence of the clergy. A part of the building is used as the parish church; and the old tower has borne the addition of a belfry, so excellent was the mason work. The beautiful and curious ruin at Cashel, called *Cormack's Chapel*, is Norman in character, and was probably the cathedral of that diocese previous to the English invasion. It is considered to have been built in the tenth century by Cormac, who was both king and archbishop. He died about A. D. 990. It is to be observed, that both here and at St. Doulagh's are crypts placed *over* the churches—a peculiarity known in Ireland only; the crypts in all other countries being underneath. In this very marked Irish-Norman style, there exist a few remains at Aghadoe near Killarney, at Clonathen in the county of Wexford, and near Bannow in the same county, in an ancient town, which having been, time out of mind, overwhelmed by the blowing sand from the coast, has only within a few years been discovered, but, protected by the sand, is in a high state of preservation. The peculiar character which marks these buildings, proves them to be examples of the Irish style subsequent to the age of the towers, and previous to that brought in by the British invaders. Ireland cannot boast of any ecclesiastical buildings of great richness or beauty; but there are some of respectable appearance. The two cathedrals of the capital, St. Patrick's and Christ-church, are at least elegant in the interior. The large cathedral of Galway, and that of Limerick, are both handsome buildings, as is the cathedral of Kilkenny. These are all in good order, and in daily use. There are numberless ruins of monasteries, abbeys, knights' preceptories, and churches, of which the chief are—*Kilconnel Abbey*, in the county of Galway; *Corcomroe*, in Clare, the finest ruin in Ireland; *Holy Cross*, in Tipperary; the *Old Cathedral*, on the Rock of Cashel; *Dunbrody* and *Tintern Abbeys*, in Wexford; *Jerpoint*, in Kilkenny; and *Lusk*, in the county of Dublin. Kilconnel and Lusk are remarkable for rude bas-reliefs in stone, which bear a degree of resemblance to the Egyptian hieroglyphics. Many of these still retain fragments of their former ornaments of frotted stone-work—Holy Cross in particular.

Military Antiquities.—The traveller in Ireland must be struck with the vast numbers of small castles, which stud the whole country. They chiefly bear date since the reign of Elizabeth, by whose orders they were raised as strongholds to overawe the wild Irish. They are usually high and square, with towers at each corner. Besides these fortalices, there are ruins of very large castles, so customarily attributed to King John, as to show that they were built in the early times. Of these the extensive ruin at Trim, in the county of Meath, affords a fair example, as being one of the largest, and also formerly the residence of the viceroy or chief governor. Parliaments were held within its walls, and money minted there and sent into circulation. A few of the ancient castles belonging to the old nobility still continue to be inhabited, as *Malahide*, Lord Talbot's at Malahide, and *Howth*, the Earl of Howth's, both in the county of Dublin; *Shane's Castle*, the residence of Earl O'Neil; *Portumna Castle*, on the Shannon, that of Lord Clanrickard; and *Kilkenny Castle*, the seat of the Marquis of Ormond.

LEINSTER.

T is is the largest province of Ireland, and contains the twelve counties of *Louth, Meath, Dublin, Wicklow, Wexford, Carlow, Kilkenny, Kildare, Queen's County, King's County, Westmeath,* and *Longford,* the whole forming a large tract of country on the east side of the island, and having Dublin at a central point on the coast. The scenery of Leinster is much varied. The county most remarkable for picturesque beauty is that of Wicklow, a short way south of Dublin; the hills, glens, and valleys are here rich in natural wood, and, bounded by an extensive prospect of the ocean, can hardly be exceeded in beauty. The principal points of attraction for tourists are Lough Bray, a woody ravine called the Dargle, and the Vale of Avoca, which is one continuous piece of sylvan pleasure-ground. Wexford, still farther south, may also, to a considerable extent, be described as a picturesque and fertile country; and, though the county of Meath is for the most part flat and tame, except along the banks of the Boyne and Blackwater, it can boast there of some spots of redeeming beauty, as an example of which, *Beau Parc,* the beautiful demesne of Gustavus Lambert, Esq., may well be mentioned; and in a large portion of the county the quantity of wood and the rich hedgerows give an almost English character to the landscape. Westmeath is remarkable for expansive lakes, and for the dry gravelly hills which give variety to its surface. The Queen's County, though a good deal disfigured by bog, yet boasts, at Abbeleix and Dunmore, of a great stretch of magnificent natural oak wood. The remaining part of Leinster cannot be considered interesting or peculiar in its general features. The King's County contains the greatest portion of the flat flow-bog, on the eastern side of the Shannon; towards Roscrea, where the Slieve Bloom Mountains terminate, there is some fine scenery, especially about the ancient castle of Leap.

Leinster may be considered as much superior to the other provinces with respect to agriculture; and some parts of Carlow, Kildare, and Wexford, are cultivated in a manner approaching in skill to that of the agricultural districts of England and Scotland. In stock, implements, rotation of crops, and the industry with which manure is collected and composts manufactured, there is a great and increasing improvement. Farming societies, ploughing-matches, and premiums for new and better breeds of cattle, have greatly tended to this increasing prosperity; and they only who have witnessed what these districts were previous to the Union, can appreciate the amelioration which has since taken place.

In Kilkenny and its vicinity, the blanket trade was carried on to some extent, but latterly it has been in a very declining state. Near Dublin are some extensive paper manufactories, and in the county of Meath is a large flax-mill. Generally speaking, however, there are but few manufactures in Leinster. There is from its chief towns a considerable export of agricultural produce.

The counties of Wicklow and Wexford contain an industrious and thriving population; and because industrious, the people are able to pay, from soils not superior to those of other districts, rents which would be intolerable in other parts of Ireland. The Wicklow peasantry are reckoned the finest in the world, and are proverbial for their handsome features and fine Roman profiles, and still more so as being a respectful, quiet, and well-conducted people. The county of Meath is remarkably fertile; but being less subdivided, is therefore less populous than any other part of Ireland, considering the richness of its soil. The same prosperity as that in Wicklow and Wexford, though perhaps, in a smaller degree, prevails in Kildare, Carlow, and the Queen's County. One of the chief causes of this prosperity is, that a large portion of the population receive money payments for their daily labour, and another, that the *cottier* and *con* or *corn acre* systems are here less resorted to. The wages of Leinster are usually a shilling a day in summer, and in winter from eightpence to tenpence, without diet. The average rent for arable land is from £1 to £1, 10s., and for pasture-land from £2 to £3 per acre. The general diet of the peasantry is potoes, milk, stirrabout, eggs, butter, bacon, and herrings. Their dwellings are confessedly superior to those of Munster or Connaught. The resident gentry are more numerous, and take a great interest in the well-being of their tenantry. Leinster, therefore, may altogether be pronounced a much improved part of the country.

As the woollen and silk manufactures are still carried on in Dublin and other parts of Leinster, a slight sketch of their history may not be out of place in the account of that province. So early as the reign of Henry III., Irish woollen manufactures were imported from Ireland to England, duty free; and so excellent was their quality, that, from 1327 to 1357, they were exported to Italy, at a time when the woollen fabrics of the latter country had attained a high degree of excellence. The prosperity of the trade is noticed in an act of Elizabeth: and so flourishing was it in the time of Sir William Temple, that he became apprehensive lest it should interfere with that of the English. In 1688, the woollen manufacture was established to a considerable extent in the liberties of Dublin. But this prosperity was soon interrupted by the English presenting a petition for the imposition of such heavy duties on the exportation of wool, as greatly injured the trade. It never, however, became extinct in the liberties, though it now extends only to the manufacture of coarse fabrics. In 1773, the Dublin Society, anxious for its revival, procured an order that the army should be clothed with Irish cloth. This employment, however, became soon monopolized by one or two great houses which had Parliamentary interest: one of these failed in 1810, and the failure was followed by the bankruptcy of almost the entire woollen trade of Dublin; for the general credit was so much affected, that the banks refused to discount the bills of the manufacturers, and consequently the crash became general. The trade is now almost confined to the city of Dublin, where good hearth-rugs and carpeting are made; and favourable auguries are held forth of the factory of Mr. Willans, in particular, from the competition which he is able to stand against the cloth markets of the United Kingdom.

The *silk* trade was introduced by the French refugees, and about 1693, fully established by them in the liberties of Dublin. In 1774 an act was passed, placing it under the direction of the Dublin Society, for the extent of two miles and a half round the castle; and that society was empowered to make regulations for its management, which it accordingly did, and also opened a silk warehouse, and paid a premium of five per cent. on all sales made therein. But this warehouse was ruined by an act passed about the year 1786, prohibiting any of the funds of the Dublin Society from being applied to support any house selling Irish goods either wholesale or retail. This act gave to the manufacture a check by which hundreds of people were thrown out of employment. According to a return made in 1809, there were still 3760 hands engaged in it, who, after the passing of this cruel act, struggled to support the trade; but when the protecting duties were taken off in 1821, and steam communication opened with England, the Irish market was inundated with goods at a smaller price than that at which her native fabric could be produced, and thus the ruin of the trade was completed. The tabinet fabric of silk and worsted, for which Dublin has long been famous, is the only branch of the silk business which has not materially suffered from these discourage-

ments At present, silk tabareas of great beauty, and rich silk velvets, equal to those of France, are manufactured in Dublin.

Chief Towns.

The chief towns in Leinster are *Dublin, Kilkenny, Drogheda, Wexford, Maryboro, Mullingar,* and *Trim.*

Dublin, the principal town in Leinster, and the capital of Ireland, is situated at the margin of a beautiful bay, on a generally flat piece of country, through which flows the River Liffey, and is, therefore, agreeably placed both for commerce and the accommodation of a large population. In point of size, Dublin occupies a place between Edinburgh and London, and its appearance never fails to surprise and delight the stranger. In external aspect, it is essentially an English town, being built of brick in a neat and regular manner, but abounding in a class of elegant public structures of stone, which resemble the more substantial embellishments of Paris and other continental cities. The river, flowing from west to east, divides the city into two nearly equal portions, and is a striking feature in the general plan. The leading thoroughfares of the city are easily comprehended. First, from east to west, there is the double line of houses and quays bordering upon the river, the lower part of which forms a harbour, and is crowded with vessels. Crossing this line at right angles, is the great line formed by Sackville, Westmoreland, and Grafton streets, the first and second of which are connected by Carlisle Bridge, the lowest in a range of eight or nine which span the river at various distances from each other. Parallel to the quays, on the south side of the river, there is a shorter arterial line of great importance, formed by College Green, Dame street, Castle street, and Thomas street, being terminated to the east by the buildings of the University. Though the ancient part of the city occupies the south bank of the river, there is a portion of the mean and elegant on both sides; the streets and squares of the wealthy being here, contrary to the usual rule, in the north-east and south-east districts. All the great lines are formed by houses of lofty and elegant proportions, chiefly devoted to commerce; and perhaps no city can present a more splendid series of shops and warehouses. Sackville street, a hundred perches in length and six in width, with a noble monumental pillar in the centre, and some of the finest public buildings in the world lending it their effect, must impress every one as something worthy of a great city. The spaciousness of several of the squares in the aristocratic districts is equally impressive. Merrion Square is half, and St. Stephen's Green nearly a whole mile, in circumference, the latter containing seventeen acres of pleasure-ground in the centre.

Dublin.

On first walking into the streets of Dublin, the stranger is apt to see, in the throng of carriages and foot-passengers, nothing more than what he expects to find in all large cities. He soon observes, however, that, besides the usurious class who occupy the better kind of vehicles, and the busy well-dressed crowd who move along the foot-ways, there is a great multitude of mean and mendicant figures, such as are only to be found in a small proportion in other cities. This is the very first peculiar feature which the stranger detects in Dublin, and it is an unfortunate one. It is explained when we learn, that, of the large population of Dublin—supposed to approach three hundred thousand—fully three-fourths are beneath what is recognised in Britain as the middle rank. Thus the most respectable streets in Dublin, and the most elegant figures which appear in them, seem isolated in the midst of penury and meanness.

The public buildings of Dublin boast an elegance much above what might be expected from the general character of the city. In sailing up the river, the eye is first attracted by the Custom-house, a large and splendid edifice in the well-known taste of the Adams, surmounted by a dome, and very happily situated upon the north quay. The Post-Office, in Sackville street, is in that graver form of the Grecian style which has more recently come into favour, extending above two hundred feet in front, with a noble portico surmounted by a pediment. The simultaneous starting of the mail-coaches at a certain hour every evening from the court of this building, is one of the sights of Dublin. Opposite to it is a pillar in honour of Nelson, surmounted by a figure of that hero. At the upper extremity of Sackville street is the Lying-in Hospital, a beautiful building, with which is closely connected the more celebrated Rotunda, together with an extensive plot of ornamental ground. The Four Courts —also a most superb structure—overlooks the river at a point considerably removed to the west, and completes the list of remarkable buildings in the northern division of the city. To the south of the river, the objects worthy of especial notice are more numerous. The buildings of the University (founded by Queen Elizabeth in 1592) occupy a conspicuous situation on the great transverse line of streets which has already been mentioned. Beneath an elegant Grecian front three hundred feet in length, an archway gives admission to a succession of spacious squares, chiefly composed of brick domestic buildings, and containing a theatre for examinations, a museum, a chapel, a refectory, a library, and other apartments necessary for the business of the institution. In the museum is preserved an ancient harp, generally represented as that of Brian Boroimhe, a famous Irish king of the tenth century. There are usually about two thousand students in attendance at the University. Divided from this building only by the breadth of a street, is the Bank of Ireland—formerly the place of assembly of the Irish Houses of Parliament. The deep colonnaded front of this building is one of the most beautiful pieces of architecture, not only in the British dominions, but in the world: it carries a charm like a fine picture. The hall where once the Commons of Ireland assembled —where the eloquence of a Grattan, a Curran, and a Flood, was once heard—is now altered to suit the purposes of a telling-room; but the House of Peers remains exactly as it was left by that assembly, being only occasionally used for meetings of the Bank directorate. The latter is a small but handsome hall, adorned with tapestry representing transactions in the subjugation of Ireland by King William—the battle of the Boyne, the breaking of the boom, and so forth, as also a few appropriate inscriptions.

In Kildare street, at no great distance from the College and Bank, the halls of the Royal Society of Dublin present a powerful claim to the attention of strangers, in the great variety of curiosities, pictures, and models, with which they are filled. In a perambulation of the city, the Castle is the next object worthy of notice. This ancient seat of the viceregal government, to which rumours of plots and insurrections have been so often brought by terror-struck spies or remorseful particistors

is placed on slightly elevated ground, in the midst of the old or southern division of the city. It consists of two courts, containing certain public offices, and the apartments of state used by the Lord-Lieutenant. In the lower court is the Castle Chapel, a beautifully constructed and beautifully furnished modern Gothic place of worship, the whole materials of which are of Irish production, and which cost above £40,000. The service performed here every Sunday forenoon, graced as it is by the finest vocal and instrumental music, while a rich "religious light" streams through stained windows, and is reflected from the gorgeous stalls of civil and ecclesiastical dignitaries, is one of the most attractive things in Dublin. The state-apartments of the viceroy are in the taste of the middle of the last century, and are elegant, but not remarkable for grandeur. In one is a bust of Chesterfield, who was Lord-Lieutenant in 1745. The most remarkable room is the ball-room, denominated St. Patrick's Hall, which is spacious and lofty, and among other attractions has a ceiling ornamented with pictures, representing transactions in the history of Ireland.

In Ireland, old ecclesiastical structures are usually more curious for their antiquity than their beauty. Accordingly, the exterior of St. Patrick's and Christchurch, the two cathedrals of Dublin, is apt to appear ungainly to an eye fresh from Westminster or Melrose. In the former building, nevertheless, the interior of the choir, in which service is usually performed, will impress every mind by its lofty proportions, its pompous monuments, and the dark stalls and niches, surmounted with the helmets and banners of the knights of the order of St. Patrick. In visiting this ancient church, the predominant thought is—SWIFT. We look for his dwelling as we approach, and for his tomb when we enter—such is the power which genius has of fixing the feelings of men for all time upon every external thing connected with it! The deanery still exists in St. Kevin street, containing the portrait of Swift from which all the engraved likenesses have been derived. The streets immediately surrounding St. Patrick's Cathedral are the meanest and vilest in the city. The houses have a ruinous and forlorn look, and the pavements are crowded with a population of the most wretched order. These streets are filled with shops, but the trades to which they are devoted serve rather to betray the misery than to manifest the comfort of the people. Dealers in old clothes, pawnbrokers, spirit-dealers, and persons trading in offals, almost the only kinds of unimul food indulged in by the lower orders of the people, abound.

At the western extremity of Dublin, on the north side of the river, is the celebrated public promenade denominated the Phœnix Park, said to consist of about a thousand acres. Not only does this park greatly exceed those of London in extent, but it is questionable if even the Regent's Park, after all the expense incurred in ornamenting it, will ever match this domain in beauty. The ground is of an undulating character, and is covered with groups of fine old timber and shrubbery, amidst which are the domestic residences of the Lord-Lieutenant and his principal officers, besides some other public buildings, and a tall obelisk in honour of the Duke of Wellington's victories. A zoological garden has lately been added to the other attractions of the Park.

Dublin was formerly a busy literary mart, in consequence of the state of the copyright law, which allowed of cheap reprints of British books being here issued. After a long interval, the activity of its publishers has lately revived, and there are now several houses which afford considerable encouragement to native talent; among others, those of Mr. Tims and Mr. Milliken in Grafton street, and that of Messrs. W. Curry, Jun., and Co., in Sackville street. The latter has had the merit of for the first time establishing a respectable periodical work in Ireland, the *Dublin University Magazine*, which has been carried on with increasing success for a number of years.

Dublin possesses a number of beneficiary institutions, conducted on a scale of great liberality; also several religious and educational societies, whose operations are extended over the whole kingdom. The trade carried on in the town refers chiefly to home consumption; and, excepting tabinets or poplins, it is not distinguished as the seat of any manufacture. There is very little foreign export from Dublin. Its principal imports are—timber from the Baltic; tallow, hemp, and tar, from Russia wine and fruits, from France, Spain, and Portugal, tobacco, bark, and spices, from Holland; and sugar, from the West India islands.

The most important branch of its commerce is that carried on with England, chiefly in connection with Liverpool, to whose market there are now large exports of native produce. Though the Liffey forms the harbour of the port, vessels of large burden, and steamboats, have an opportunity of preferring the harbour at Kingston (formerly called Dunleary,) at the mouth of the bay, on its southern side. This harbour, which is constructed on a magnificent scale, with the neat town adjacent, may at all times be readily reached by a railway from Dublin, which proves a great convenience to the inhabitants. At the opposite side of the bay from Kingston, is Howth, whose celebrated "hill" forms a distinguishing land-mark.

The number of light private vehicles in Dublin is one of its most remarkable distinctive features. These are generally of the kind called cars, drawn by one horse, and having a seat on each side, admitting of two or more persons sitting with their faces outwards. To keep a car is one of the highest aims of the ambition of a Dublin tradesman. "Previous to the Union," says an intelligent writer, who has been consulted with advantage, "Dublin was the constant residence of 271 temporal and spiritual peers, and 300 members of the House of Commons. At present about half a dozen peers, and fifteen or twenty members of the House of Commons, have a settled dwelling within its precincts. Other persons of this exalted class of society, whom business or amusement may draw to the capital occasionally, take up their residence at the hotels, which are numerous in the city. The resident gentry of Dublin now amount to about 2000 families, including clergymen and physicians, besides nearly an equal number of lawyers and attorneys, who occasionally reside there. The families engaged in trade and commerce are calculated at about 5000, and the whole may yield a population of 60,000 or 70,000 in the higher and middle ranks of society. The change which has taken place, though injurious to commercial prosperity, has perhaps in an equal proportion proved beneficial to public morals; the general character of the inhabitants, which was once gay and dissipated, has now become more serious and religious, and those sums formerly lavished on expensive pleasures, are now happily converted to purposes of a more exalted nature. Formerly there were seven theatres well supported; at present the only one which remains is frequently thinly attended. Club-houses and gaming-tables are nearly deserted; and even among the lower classes, vice of every kind has visibly diminished." In 1831 the population of Dublin was 204,155.

Kilkenny, the capital of the county of the same name, situated on the River Nore, was formerly a town of great consequence, as its ancient castle, the ruins of its embattled walls, and churches testify. Till lately it carried on a considerable trade in the manufacture of woollen cloths and blankets; but these branches have in a great degree fallen off, and the business is now confined to the retail of necessaries for its inhabitants, and the sale of the agricultural produce of the district. The city contains seve-

ral good streets, which are respectably inhabited, both by private families and tradesmen; but the suburbs are miserable. The most conspicuous ornament of the city is the fine baronial castle of the Marquis of Ormond, full of historical associations, rising boldly over the Nore. The Cathedral of St. Canice, built in 1202, is not excelled by any of the ancient ecclesiastical buildings in the kingdom, except St. Patrick's and Christ Church in Dublin. The town possesses a number of respectable schools, and various asylums and other beneficiary institutions. Near the town there is a marble quarry of considerable local importance. Population in 1831, 23,741.

Drogheda, in the county of Louth, and situated on the Boyne, in the line of road from Dublin to Belfast, is a town of respectable appearance, and the seat of an industrious population. From the time the English settled in Ireland, this town was called *Tredagh*, and considered of such importance that Parliaments were formerly held in it. In 1649, it was stormed by Cromwell, and the inhabitants put to the sword, except a few who were transported to America. Five steamers ply regularly between Drogheda and Liverpool or Glasgow, carrying out corn, cattle, sheep, pigs, and fowl, and bringing back cotton cloth, timber, leather, tobacco, salt, and iron. Drogheda contains three Episcopal churches—St. Peter's, St. Mary's, and St. Mark's, which is a chapel of ease to St. Peter's; four Roman Catholic chapels, two convents, and a friary. The chief civic buildings are a handsome tholsel, custom-house, mayoralty-house, jail, and linen-hall. The town does not bear a literary character: it has, however, four tolerably good booksellers' shops and a reading-room: there is also a mechanic's society in Drogheda. Its principal manufactories are a flax-mill, two founderies, salt works, a distillery, three breweries, one of which, belonging to Mr. Cairns, is celebrated for the superior quality of its ale, which is in constant demand in the English and foreign markets. There are, besides, several large flour-mills, and a soap and candle manufactory. There is a salmon-fishery on the Boyne, close to the town; and cod, haddock, plaice, soles, and gurnet, are abundantly caught along the coast. The linen trade is still carried on in Drogheda, though it is at present in a very depressed condition. The time of its greatest prosperity was from 1814 to 1820, during which period 4000 pieces of linen were averaged to be the weekly product. There was also a temporary revival of the cotton trade in this town; but in the commercial panic of 1825–6, many of the Drogheda weavers passed over to Manchester and Oldham, others went to France, and a large body emigrated to America, in consequence of which the cotton business ceased. The population in 1831 was 17,366.

MUNSTER.

Munster contains six counties, *Clare*, *Cork*, *Kerry*, *Limerick*, *Tipperary*, and *Waterford*, and may be considered as that part of Ireland in which the national character, and the national habits of all kinds, are maintained in their greatest purity. Some of the largest seats of population in the island, as the cities of Cork, Waterford, and Limerick, are situated in Munster. The province contains many tracts of beautiful scenery, and one in particular, which is allowed to be unequalled in the kingdom—the celebrated lake district at Killarney.

The *lakes of Killarney* are situated in the bosom of the mountainous county of Kerry, and are annually visited by travellers from all parts of the island, as well as from neighbouring countries. They are three in number, of unequal size, and considerably varied with respect to surrounding scenery, though that may be described as generally of a mountainous character. Lough Lane, or the Lower Lake, by far the largest of the three, is skirted on one side by the level and well-cultivated country surrounding the pleasant village of Killarney; on the other side rise the Glena and Tomies Mountains. In this lake there are a number of wooded islands, one of which contains the ruins of an abbey, and another the remains of an ancient castle. On the shore, towards the east, is the beautiful ruin of Muckross Abbey. Divided from the Lower Lake by the fine wooded promontory of Muckross, but accessible by two channels of level water, is the Middle Lake, called also Turk Lake, from the name of the mountain at whose foot it reposes. Over and above the islands which stud the surface, the beauty of these two sheets of water may be said to consist in the irregular promontories and slopes, generally wooded, by which they are surrounded, and above which the mountains tower in sterile grandeur. In many nooks of the scenery, elegant mansions look out upon the lakes; in others the mountain streams are seen descending in glittering cascades. The Upper Lake, the third of the series, is three miles apart from the middle one, on a nigher level, and totally embosomed amidst the hills. A stream descending from the one to the other can be passed in a boat; and, at a particular place on the passage, it is common for tourists to have a bugle played, in order to enjoy the oft-repeating echoes which it awakes in the neighbouring hills. The Upper Lake, having the wooded heights of Dericunighy on one side, the round-headed Purple Mountains on the other, and, at the head, the bare many-coloured ridge of Macgillicuddy's Reeks, while the surface is broken by a variety of sylvan islets, presents a landscape of enchanting loveliness. In connection with the lakes, there is a narrow rugged vale, named Dunloe, which is usually taken in by a tourist in a survey of this fine scenery.

Among other beautiful places in Munster, we can only particularize Glengarriff, a rugged and most picturesque vale near the head of Bantry Bay; the banks of the Blackwater, between Lismore and Youghal; the River Lee, below Cork, and the fine natural harbour (the *Cove of Cork*) in which it terminates; and the lofty iron-bound coasts of Clare, amidst which are some scenes of uncommon grandeur.

The soil in the southern parts of Limerick and Tipperary is perhaps not inferior in fertility to any portion of Europe. The Corkass lands of the former, and the Golden Vale of the latter, are celebrated for their extraordinary richness. These districts are chiefly appropriated to the feeding of black cattle. Wheat husbandry is cultivated throughout the limestone districts of Tipperary, Clare, and Limerick, while dairy farming is followed in the mountain districts of Kerry and Waterford. The potato culture necessary to supply the wants of an overdense population, is eagerly pursued throughout the whole province; and it is a deplorable fact, that a large portion of that population have no other food during the greater part of the year. The grass farms let in large divisions of from 150 to 400 acres, at from 40s. to £3 per acre. In the dairies of the county of Cork, the great butter country of Munster, it is no uncommon thing to have from one to two hundred cows in profit; the advantage of which is, that a cask is filled at once by butter, all of the same churning. The sweet thick cream only is churned, and that every morning. The pastures of these dairy-farms are highly manured, and are never broken up for tillage, experience having taught the dairy farmers that the older the sward the richer is the milk. Some of these grass lands have not been ploughed for a hundred and fifty years.

Daily labourers are usually paid from 8d. to 10d. per day; or, if engaged by the year, from 6d. to 8d. In the latter case, it is supposed that the labourer has a house and grass for a cow, at what is called a moderate rent, and which, in the estimation of the labourer, is equivalent to additional wages. The food of a great part of the Munster peasantry consists of potatoes; to this is usually added milk, and, if they live near the sea, hake or herrings. In Cork, but few of the labouring poor have

cows, because milk can be had in abundance at a moderate price at the dairies. It is, however, very customary to have ewes, which not only supply a tolerable quantity of milk, but furnish clothing. The women spin and dye the fleeces, and have them woven into thick frieze, and fulled at the village fulling-mill: from this practice, the southern Munster men are remarkably well clothed. The cottages, or rather cabins, are, generally speaking, wretched; but it may be stated, that in the dwellings and furniture of the people there is a growing improvement. The character of the Munster peasantry may be considered as of mixed good and evil—the evil arising from a total want of restraint in early childhood, bad education, or, as frequently happens, none at all. Female education is peculiarly neglected; and it is deplorable to see marriages contracted when the wife has few capabilities for managing a family, and rendering her husband comfortable, or his house a happy home.

Generally speaking, the trade of Munster consists in the export of provisions and agricultural produce, as wheat, oats, and potatoes, to a large amount.

There is on the Shannon an active fishery for trout, herrings, &c., and abundance of excellent fish are sent into Limerick, Ennis, Kilrush, and to the county of Kerry. Along the coast of Cork there is a fishery for pilchards, herrings, and other kinds of fish, which are caught in great quantities, so that frequently the farmers manure the fields with sprats.

Chief Towns.

The leading towns of Munster are *Cork*, *Limerick*, and *Waterford*. The name *Cork* is derived from the Irish word *Corcah*, which signifies a marsh. This city, which ranks as the second in Ireland with respect to population and commercial importance, stands on the River Lee, which, through several channels, pours its waters into the harbour, from whence the tide flows to some distance above the town. The streets are built along the river channels, which, being all quayed, give the city somewhat of a Venetian character: of late years, however, the narrower have been arched over, and only the main streams, in which the merchant vessels lie, left open.

The Episcopal ecclesiastical buildings of Cork consist of seven parish churches, the Cathedral of St. Fin Barry, St. Luke's Chapel of Ease and Free Church, the Chapel of the Foundling Hospital, and the Church of St. Michael's at Blackrock: two other churches are in progress. There are four Roman Catholic chapels, three new ones nearly completed, and four friaries. There are numerous dissenting chapels—two meeting-houses for Wesleyan Methodists, one for the Primitive Wesleyans, one for Anabaptists, two for Presbyterians, one for the Society of Friends, and two for two other small bodies of dissenters. A new Scotch church is in progress. The principal public buildings are, the Bishop's Palace, which stands on a height overlooking the town; a new jail, a little to the west of the city; the Custom-house, large and handsome barracks, the City Library, the Reading-Rooms, the infirmaries, the Chamber of Commerce, the Steam-Packet Office, and a well-built and spacious court-house, having in front a pediment supported on six Corinthian columns and surmounted by an emblematic group of colossal figures. There is now in progress a new savings' bank, an extensive and ornamental building, but not more than half erected; also a new banking-house of cut stone for a branch Bank of Ireland; a new and showy corn-market house; and an extensive workhouse for the Poor-Law Union, about three-quarters of a mile from the city.

Cork boasts of many schools—the Blue-Coat Hospital, for twenty-two sons of reduced Protestants; the Green-Coat Hospital, for twenty children of each sex, to be brought up Protestants; the Cove Street Infant, Diocesan, Lancastrian, and Female Orphan Schools; the diocesan schools for the united diocese of Cork and Ross, and a free school founded by Archdeacon Pomeroy.

Among the charitable institutions in the city are—Bertridge's Charity, where are maintained seven old Protestant soldiers; Skiddy's Almshouse, where twelve aged women receive £29 yearly; Deane's Schools, where forty poor children are clothed and taught gratis. There is, besides, a masonic female orphan asylum, and several almshouses. Indeed, in proportion to its size and wealth, the city of Cork bears a peculiarly high character for benevolence.

There are five societies here, whose objects are almost entirely scientific—the Royal Cork Institution, the Cuvierian, the Scientific and Literary Societies, the Mechanics' Institute, and the School and Library in Cook street; one public subscription, and several circulating libraries; eighteen Protestant societies, devoted to religious purposes; four benevolent societies, for the relief of the distressed; five philanthropic societies, two lunatic asylums, and a school for instructing the deaf and dumb poor in George's street.

The chief exports of Cork are grain, butter, cattle, and provisions; its chief imports, wine, tea, sugar, and coals. From the parliamentary returns, it appears that, during the five years ending 1834, the average annual number of vessels entering the port of Cork, was—British, 135, tonnage, 26,438; and foreign, 29, tonnage, 3384. Steam-vessels communicate between Cork and Dublin, Bristol and Liverpool; and steamboats also ply daily between Cork and Cove. The population of Cork, according to the census of 1831, was 107,016.

Limerick, the chief city of the west of Ireland, is situated on the Shannon, near the place where that noble river expands into an estuary. It consists of the Old and New Town, respectively situated on the north and south sides of the river, and connected by an elegant modern bridge. The new city contains many good streets, filled with handsome shops; but the old town is confined, dirty, decayed, and inhabited by a very miserable population. Limerick contains a handsome cathedral of some antiquity, situated in the old part of the city, six Episcopal churches and a chapel of ease, meeting-houses belonging to the Presbyterians, Independents, and the Society of Friends, with five Roman Catholic chapels, three friaries, and one nunnery. The principal public buildings are the Exchange, the City Court-house, the City and County Jail, the Police Barrack, the Custom-house, the Commercial Buildings, the Linen-Hall, the Market, and two banks. Though Limerick is not a particularly literary city, it has an excellent library, and some very good booksellers' shops. The principal school at Limerick is the Diocesan, but there are many private day and boarding schools. There are many charitable institutions, as the County Hospital; the House of Industry for the aged and infirm, widows, orphans, young females, and deserted children; the Corporation Almshouse; Dr. Hall's and Mrs. Villiers's Almshouses.

With regard to the trade of Limerick, it has been observed, that though it has increased with the extension of the city, it has done so by no means in an adequate proportion, when its peculiar advantages are considered; the Shannon, which connects it with Clare, Kerry, Waterford, and Tipperary, affording it innumerable commercial facilities. The quays of Limerick are nevertheless a scene of considerable bustle, though chiefly frequented by vessels for the export of the native produce. Provisions to the amount of 75,000 tons are here shipped annually. The population of Limerick, in 1831, was estimated to be 66,555.

Waterford, the chief town of the county bearing its name, and a large sea-port, is situated on the Suir, a few miles from its junction with the sea. Native produce, to the value of £2,000,000, is annually exported from this city; but the imports are comparatively unimportant.

There is here a fine cathedral, founded by the Ostmen, and endowed with lands by King John, and several churches, meeting-houses for the Presbyterians and the Society of Friends, a French church for the Huguenots, and several abbeys and friaries. The principal buildings are the Bishop's Palace, the Exchange, and the City Jail. Among its schools are the Latin Free-school, and the Blue Boys' Free-school, in which seventy-five are instructed and partly clothed gratis, and the boys apprenticed to different trades. The population in 1831 was 28,820.

ULSTER.

The most northerly of the provinces is ULSTER, containing the counties of *Antrim*, *Armagh*, *Cavan*, *Donegal*, *Down*, *Fermanagh*, *Derry*, *Monaghan*, and *Tyrone*. The province of Ulster is hilly. The scenery is in general picturesque, especially in the vicinity of its chief towns, Derry, Belfast, and Armagh. In the county of Antrim, the country from Glenarm to Bengore Head presents a succession of striking and romantic views. The most remarkable feature of this scenery is the peculiar conformation of the basaltic columns with which it abounds, and of which the arrangement is strikingly displayed in Fair Head and the *Giant's Causeway*. Bengore, one of the promontories of the causeway, lies about seven miles west of the little town of Ballycastle: though generally described as a single headland, it is composed of many small capes and bays, each bearing its own proper name, and of these capes the most perfect is *Pleaskin*. The summit of Pleaskin is covered with a thin grassy sod, which lies upon the rock, the surface of which is cracked and shivered. About ten or twelve feet from the top, the rock begins to assume a columnar character, and standing perpendicularly to the horizon, presents the appearance of a magnificent colonnade, supported on a foundation of rock nearly sixty feet in height. About eight miles from Pleaskin is *Fair Head*, the easternmost head of the causeway, which presents a huge mass of columnar stones, of coarse texture, but many of them more than two hundred feet in height. Some of these gigantic stones seem to have fallen from the top, and now present to the eye of the spectator the appearance of groups of artificial ruins. The part which may more properly be called the *Giant's Causeway* is a kind of quay, projecting from the base of a steep promontory some hundred feet into the sea: it is composed of the heads of pillars of basalt, which are placed in close contact with each other, forming a sort of polygonal pavement, somewhat like the appearance of a solid honeycomb. The pillars are jointed, and their articulation curiously exact, the convex termination of one joint always fitting with precision into a concave socket in the next. Within about two miles of the Giant's Causeway stands Dunluce Castle, situated on the summit of a rock whose base is washed by the ocean, by the ravages of which great part of the building was suddenly swept from its foundation. The mansion and offices stand upon the mainland, divided from the fortress by a deep cut which separates the rock on which the castle is placed. Over this chasm lies the only approach to the building, along what was one of the walls of the drawbridge: should the passenger miss his footing on this narrow path, there is not the slightest protection on either side to save him from the abyss beneath.

The soil of Ulster varies much. In the counties of Armagh, Down, Antrim, Derry, and Monaghan, it passes from a deep rich fertile clay to a dry sandy or gravelly loam; while in Donegal, Tyrone, Fermanagh, and Cavan, a great proportion of it is cold, wet, and spongy. Tillage is, in general, in an improved state throughout this province; and, though the old Irish plough and the slide car are still occasionally used in the remoter parts, many of the modern implements of husbandry have been introduced, especially in Down and Londonderry. The English spade has nearly displaced the long or one-sided spade; the angular harrow and the thrashing-machine are much in use, and the Scotch plough has almost superseded the heavy Irish one. The corn crops most general are oats, bere, barley, and a small proportion of wheat. Barley is in Derry said to pay the summer's rent, and flax the winter's. Potatoes are largely planted by rich and poor, and gentlemen-farmers cultivate turnips and mangel-wurzel. Lime and peat are the most usual ingredients of the manure employed in the inland districts; while in the maritime counties, sea-sand, sea-weed of different sorts, and various kinds of shells pulverized, are used in addition. From the wetness of the soil, in some of the northern parts of Monaghan, the manure is usually carried to the fields in baskets, called *bardocks*, which are slung over asses' backs or the shoulders of the poor women. A small but hardy race of horses is reared in the island of Rathlin or Raghery; and the old Irish sheep still prevails in and near Carey, in the county of Antrim. Pigs, goats, and donkeys, are numerous, the latter being much used in the counties of Cavan and Monaghan. A good deal of butter is sent to the markets of Belfast, Antrim, and Derry, from the various dairies scattered through Ulster.

Whatever were the manufactures of Ireland before the time of James I., they were swept away in the long series of wars between government and the local chieftains in the days of the Tudors; and the Scottish settlers in the north of Ireland, and those English whom Boyle, Earl of Cork, brought into Munster, may be considered the introducers of nearly all the manufactures that now exist in Ireland. During the reigns of Charles I. and II. much attention was paid to them; and the exertions of Lord Strafford, Sir William Temple, and the Duke of Ormond, caused the establishment of the linen trade to be attributed successively to each. The Duke of Ormond not only procured several acts for its encouragement, but sent Irishmen to Flanders to be instructed in the details of the flax manufacture; and also established a linen factory both at Chapelizod, near Dublin, and at Carrick-on-Suir. In the reign of William III., the linen business rose to still greater importance, from the compact between the English and Irish merchants to discourage the woollen and promote the linen trade; for which purpose they procured a statute to be passed, levying additional duty on Irish woollen goods, from a jealous fear that the prosperity of the Irish woollen trade was inconsistent with the welfare of that of England. Another impetus was given to the linen trade by the emigration of the French manufacturers, after the edict of Nantes, of whom a large number took refuge in Ireland; and Mr. Louis Cromelin, a leading manufacturer, obtained a patent for improving and carrying it on, and his efforts were crowned with considerable success. In the 9th year of Queen Anne, a board of linen and hempen manufactures was established, and linen allowed to be exported duty free. In the 8th of George I., a grant was given to build a linen-hall, and another to encourage the growth of flax and hemp. Previous to 1778, bleached linen was sold in the fairs, the manufacturer being the bleacher; but when the manufacture extended, bleaching became a separate business. Considerable sums had been from time to time voted by parliament for its support; and during the eighteenth century the trade continued to advance, until the check it received during the American war. On the re-establishment of peace it revived, and was at its greatest height from 1792 to 1796. Since this period it has considerably increased, and, though deprived of all artificial props in the form of bounties, is now a flourishing department of industry. Belfast is the great centre to which the linens, not only of Ulster but also of the weaving districts in the west of Ireland, are sent for sale; and from hence large quantities are exported to

foreign countries. The linen trade prospers at Castlewellan, Rathfriland, and Banbridge, in the county of Down, and also at Lurgan in the county of Armagh, where the weavers are at once weavers and manufacturers. At Dungannon, in the county of Tyrone, it has greatly declined, and is in Donegal chiefly confined to those who work for farmers or market sale.

The province of Ulster was also the seat of the first cotton manufactory introduced into Ireland. In 1777 the manufactures were in the lowest state of depression. To give them some stimulus, Mr. Joy conceived the plan of introducing cotton machinery from Scotland; and a firm for this charitable purpose was formed, of Joy, M'Cabe, and M'Craken; and a mill for spinning twist by water was erected by them at Belfast in 1784, at which time the manufacture may be said to have been established; and so rapidly did it spread, that, in 1800, in a circuit of ten miles, comprehending Belfast and Lisburn, it gave employment to 27,000 individuals. But, from want of assistance at home to protect it, and the embargo laid on American goods, which inundated Ireland with English manufactures, the trade has declined, and the cotton manufacture is now almost altogether confined to the county of Antrim. Through the early part of the present century, it was carried on to a considerable extent in Drogheda, Collon, Strafford, Mountmellick, Limerick, and Bandon. Belfast was, however, the place where most skill and capital were expended; as the trade increased there, it declined in other parts of the kingdom; and, though large manufactories have formerly been established at Clonmel, Portland, and Limerick, it may for all practical purposes be considered as extinct in the other parts of Ireland.

No returns have been given since the year 1825, when the total number of pounds of cotton wool imported into Ireland was 4,065,930; and of cotton yarn imported thither from Great Britain in the same year, 41,953,156.

Wherever the linen trade is in operation, the people have constant employment, in consequence of being able to fall back upon their looms when agricultural work is not in demand. They may be said, in common years, to enjoy a competency; that is, a sufficiency of food, raiment, and fuel. But in the western parts of Ulster, as, for example, the mountainous districts of Tyrone, Donegal, and Derry, where the linen manufacture does not exist to any extent, the labouring classes are not much better off than in the three other provinces. However, speaking of Ulster generally, it may be said the lower classes have more self-respect, more industry, more desire for advancement in life, than in other parts of Ireland. In fact, they are a better educated, and therefore more improving people. As may be expected, their taste for comfort operates in the economy of their houses and farms; and, except in the mountainous districts above alluded to, where old habits still maintain their ground, the Ulster peasantry may be considered as a respectable class in society. The average rent of arable land is from £2 to £3 per acre, usually rising in the immediate neighbourhood of towns to £5 or £6. The wages in Ulster vary from 6d. to 9d. a-day in winter, and in summer from 10d. to 1s. a-day, without diet. The food of the peasantry is chiefly potatoes, oatmeal porridge, oaten bread, milk, and fish, which those who live near the sea vary with that species of sea-weed called the edible *alga*.

The salt-water fisheries of Ireland cannot be said to have ever thriven. Under the former system of the Irish Parliament, of giving bounties, large sums were at different times voted for their encouragement; but by this there was no real strength given, and on the withdrawal of these bounties, things fell below their natural level, and the sea-fisheries became altogether inefficient for any purpose but that of supplying the localities surrounding the fisherman's dwelling. The fishery laws are now enforced with regard to both the sea and river fishing, and therefore there is reason to believe that this branch of industry is on the increase, and, if properly managed, will become one of the chief means of benefiting the island. The river fisheries, though less productive than under better management they might have been, yet form in several parts of Ulster a lucrative source of property. The lakes and rivers abound with trout, pike, perch, eels, and char, and on the Bann, the Foyle, and the Ballyshannon in Donegal, are established very successful salmon fisheries. Formerly, whales were not unfrequently, and still are, though but seldom, taken at the coast fisheries in this province. The salmon-fisheries of the Foyle and the Bann were early celebrated. In Phillips's MS., they are stated to have been let from 1609 to 1612, at £666, 13s. 4d. a year, for three years at £800, for eleven years at £1060, and for twelve years, ending at Easter 1639, at £800. The right of fishing the river Foyle, so far as Lifford, is vested in the Irish Society by the charter of Londonderry, granted by James I. in 1613. The increase of the quantity of fish taken since the introduction of stake-nets, is very considerable. The salmon for exportation to London and to Liverpool are packed with ice in boxes, 15 salmon, weighing together about 90 lbs., being put into each case. In a report made to Sir William Petty about 1682, it is stated that the fishing for salmon in the Bann river, and so in all the salmon fisheries, begins with the 1st of May and ends on the last of July. But by the present law, the season now begins the 1st of February and ends on the 1st of September, seven months being open and five close. The Bann fishery has of late years been much neglected; but, under the spirited and judicious management of Charles Atkinson, Esq., it has been much improved during the last year.

Chief Towns.

The chief towns in Ulster are *Belfast* and *Antrim*, in the county of Antrim; *Londonderry* or *Derry*, and *Coleraine*, in the county of Londonderry; *Donegal*, in the county of the same name; *Strabane*, in Tyrone; *Armagh*, in Armagh; and *Newry*, *Lisburn*, and *Downpatrick*, in the counties of Antrim or Down. Without reference to counties, Belfast, Lisburn, Newry, Armagh, and some places of smaller note, may be said to form a cluster of towns chiefly devoted to the linen manufacture, and all occupied by a population who, for generations, have been noted for their industry and peaceful habits.

Belfast is esteemed the principal town and sea-port in this province of Ireland. It is advantageously situated on the west side of the Lagan, where that river swells into an estuary called the Bay of Belfast; distance from Dublin 85 miles. The ground on which the town stands is flat, while the beautiful and fertile environs on the western side of the vale are bounded by a picturesque range of mountains. Within the town, the opposite shore of the Lagan is reached by a long stone bridge, which also forms the egress from Belfast towards Donaghadee. Although this portion of Ireland is inhabited chiefly by Scotch, or their descendants, Belfast, like Dublin, is essentially an English town in external aspect, being built of brick, and having throughout a neat and regular appearance, with many handsome shops. The prosperity of Belfast is dated from the revolution of 1688, when religious and political tranquillity settled upon that part of Ireland. Belfast is in Ireland what Glasgow is to Scotland and Liverpool to England. In manufactures, it is now the great depôt of the linen business, and the seat of the cotton trade, having within itself all the various branches necessary for producing and finishing these fabrics, from the finest cambric to the coarsest canvas. There are in Belfast and its suburbs fifteen steam power mills, for the spinning of linen yarns. Among

these, the factory of Mulholland and Company, employing 800 persons, spins 720 tons of flax annually, the yarn of which is worth £80,000. The hand-spun yarn sold on commission in the linen-hall (a cluster of buildings devoted to the use of linen factors), produces about £100,000 a year. The cotton trade is declining, several of the mills being employed in spinning flax; and there are now only six cotton-mills in the town. There are also extensive corn-mills, breweries, distilleries, and tan-yards, with manufactories of machinery, cordage, glass, iron, soap, candles, tobacco, &c., for home use and exportation. In commerce, its exports and imports are extensive; the amount of duties paid at the custom-house of late years averaging nearly £400,000. The number of vessels lately belonging to the port was 293, the aggregate burden of which was 32,585 tons. Latterly, great improvements have been effected for the accommodation of the shipping, by deepening and contracting the harbour, and furnishing handsome and substantial quays, wharfs, and docks. The port usually exhibits a busy scene of industry, by the daily sailing and arrival of ships and steam-vessels. Ten steamers sail regularly—four to Glasgow, three to Liverpool, two to London, and one to Dublin. In the retail trade, the numerous branches are carried on in a spirited and tradesman-like manner; and the various markets for the sale of the rural produce, which is brought in large quantities to town, are well conducted; in a word, the whole system of trade and industry is on an efficient scale, and equals that of any town of similar size in England or Scotland. The prosperity of the town is likely to be augmented by a railway lately opened, which is designed to proceed to Armagh.*

Belfast abounds in Presbyterian and other Dissenters. The Episcopal places of worship are only two (some authorities say three) in number; but there are ten Presbyterian meeting-houses; there are also two meeting-houses of Independents; the Methodists, four; the Society of Friends, one; and the Roman Catholics, two. The town possesses some excellent charitable and humane institutions: the principal are—a poor-house for the aged and infirm, a house of industry, a lunatic asylum, an institution for the blind and for deaf mutes. This institution is on the same plan as that of Liverpool. The blind are employed in weaving and basket-making, and lately, by the introduction of raised letters, they have been instructed in reading. In 1824, there were in the town and parish sixty-three schools of all kinds, at which 2152 males and 1666 females were educated, exclusive of the Royal Academical Institution, which in 1825 contained 462 boys in its various classes. This institution originated in 1807, in a voluntary subscription of the inhabitants, by whom a fund was raised of above £25,000, to which the late Marquis of Hastings added £5000 for its erection and the endowment of its teachers and professors. It consists of two departments, one elementary, the other for the higher branches of science and literature. This establishment is directed by a president, four vice-presidents, twenty managers, and eight visiters, chosen by the proprietory. The chairs in the collegiate department are eight, embracing Divinity, Moral and Natural Philosophy, Logic, Mathematics, Greek, Latin, Hebrew, and a lectureship on Irish. The object of this academy was to give cheap home education to those who had heretofore frequented the Scottish colleges. The Synod of Ulster receives the general certificate of this institution as a qualification for ordination, and it may be now considered the great seminary for the Presbyterian Church in Ireland. The Belfast Academy had been founded some time previously by private subscription.

Of literary societies, Belfast possesses the Society for Promoting Knowledge, founded 1786; the Literary Society for Improvement in Literature, Science, and Antiquities, founded 1801; and the Natural History Society, founded 1821. The town has lately received the valuable addition of a botanic garden, on a large scale, and laid out in an exceedingly tasteful manner. It was established, and is wholly supported by the inhabitants of Belfast, and affords a pleasing proof of their spirit and liberality. The population in 1831 was 53,287, but this number is now considerably increased.

Londonderry ranks next to Belfast. Besides being a sea-port of considerable importance, it is the seat of a bishop's see. It is situated on the west bank of the Foyle, a few miles above the point where that river spreads into the harbour of Loch Foyle, and is distant 146 miles from Dublin. The original town built by Sir Henry Dowera about 1603–4, was burned by Sir Cahir O'Dogherty in 1608; and the present city may be considered as deriving its origin from the London plantation, which was the immediate result of that catastrophe. The walls of Derry are described by Pynnar as "excellently made, and neatly wrought; the circuit thereof about 24 perches, and in every place the wall being 24 feet high and 6 in thickness;" and, after a lapse of more than two centuries, these fortifications retain their original form and character. The north-west bastion was demolished in 1824, to make room for a market; and in 1826 the central western bastion was modified for the reception of Walker's Testimonial; but the guns used during the celebrated siege are still preserved in their original places. The total number of cannon remaining in the city and suburbs is about fifty; and in the court-house yard stands *Roaring Meg*, so called from the loudness of her report during the siege. This cannon is 4 feet 6 inches round at the thickest part, and 11 feet long, and is thus inscribed—"Fishmongers, London, 1642."

The chief of the ecclesiastical buildings is the Cathedral. For nearly twenty years after its plantation, Derry was without a proper place of worship, part of the ruined church of Saint Augustine being employed for that purpose. At length a royal commission of inquiry was appointed, which, in 1628, reported that the corporation of London had begun to build a fair church in Derry, and in 1633 its erection was completed. This event is recorded in a tablet, which was originally placed over the door of the porch of the old cathedral, but is now over that of the belfry, bearing the following couplet:—

"If stones could speak, then London's praise should sound,
Who built this church and city from the ground.—A. D. 1633."

The other principal places of worship are—a chapel of ease, a free church, two Presbyterian meeting-houses, a Wesleyan chapel, a Primitive Wesleyan Methodist chapel, also Reformed Presbyterian, Seceding, and Independent chapels, and a Roman Catholic chapel, which can accommodate 2000 persons. The principal buildings in the city are the Bishop's Palace, the Public Library and News-room, the Lunatic Asylum, the Jail, and Corporation Hall. Of its various manufactories, the chief are two great distilleries, and two corn-mills, one worked by a steam-engine of eighteen, the other by one of twenty horse-power. The public schools in Derry are, the Diocesan, the Parochial, the Presbyterian, the Meeting-house, St. Columb's, the Barracks, the Infant School; and besides these are many others, public and private. There is here a branch of the London Bible Society, the Londonderry Literary Society, and one for promoting religious, moral, and historical knowledge. There are also the Londonderry Farmers' Society and the Mechanics' Institution. The port carries on a considerable traffic, both with respect to imports of foreign and British produce, and exports. The estimated value of the exports of Irish produce is above a million ster

* We have been indebted for a number of these particulars to "The Tourist's Guide to Ireland," a work of great merit, published by Messrs. W. Curry, Jun. and Co., Dublin.

ing per annum. The population of Londonderry in 1831 was 10,130.

The city of *Armagh*, situated in an inland part of the country, is of considerable local importance. It is placed in the midst of a rich and beautiful district, the face of which is singularly varied by detached hills, some of which are more than a thousand feet in height. This character of country stretches from Lough Neagh in the north, to the north-western part of the county of Meath in the south, and is well watered by lakes and streams, and, generally speaking, richly furnished with wood. The city stands on a hill, which is crowned by the old cathedral, around which the town has gradually arisen. Within these few years, several handsome buildings have been erected, with cut stone fronts—the Court-house, the Jail, the Presbyterian Church, Primate Stewart's Free School, founded and liberally endowed by him, and well carried on; the National School, and the Savings' Bank. The Cathedral has been re-edified within these five years, at an expense exceeding £30,000, in the pointed Gothic style, for the most part in very good taste; the organ is a remarkably fine one, and the choir excellent. The roads, in all directions, are admirable; and in the laying out of the new ones, they are carried round instead of over the hills. There is water-carriage from both Belfast and Newry by lake and canal, to within four miles of the city; the streets have flagged footways, and are well lighted with gas. About forty years since, the population was only 1000. It now amounts to 13,000. The Archbishop of Armagh, Primate of all Ireland, resides close to the town, as do also a large number of clergymen attached to the Cathedral, as well as many respectable gentry. Near Armagh stands the Observatory, built and endowed by Primate Robinson, whose munificence greatly contributed to the advance of science and improvement of the whole diocese. This noble institution is at present conducted by the Rev. Dr. Robinson, Professor of Astronomy.

CONNAUGHT.

CONNAUGHT, the smallest of the four provinces, contains but five counties, those of *Leitrim*, *Roscommon*, *Mayo*, *Sligo*, and *Galway*. There are in this province large tracts of mountainous and sterile land, especially in the western parts of the counties of Galway and Mayo. The peninsula formed by the western part of the first of these counties is named *Connemara*, and is famed for its scenery, which somewhat resembles that of Argyllshire. It may be described as a vast tract of mingled bog, lake, rocky moorland, and mountain, bounded and partially penetrated by deep inlets of the sea, resembling the fiords of Norway. The principal lake is Lough Corrib, which is twenty miles long, full of islands, and surrounded by an extensive rocky desert, bearing no small resemblance to those of Arabia. Between this lake and the western extremity of Connemara, there is a range of tall swelling green hills, called the Twelve Pins of Bunabola, and to the north of these is an estuary famed for its wild scenery, named the Killery, many miles in length, and connected with the Atlantic by a passage only thirty feet wide. Connemara contains a small, scattered, and primitive population, unusually full of superstitious and old feudal feelings. Besides Clifden, a modern fishing-village on the west coast, there is scarcely any such seat of population in the district. There are, however, a few homely inns for the accommodation of the numerous tourists who flock thither in summer.

From the high grounds near Westport, is obtained a view of Clew Bay, a magnificent sheet of almost enclosed water, full of islands, and bounded by lofty mountains, among which the most conspicuous are Croagh, Patrick, and Nephin. The islands of Clare and Achill bound the scene towards the west. In some states of the weather, and particularly when a summer sun is calmly descending on Clare, the view of Clew Bay is one of extraordinary beauty. The islands are said by the common people to be as numerous as the days in a year, but in reality are only about a hundred. Croagh Patrick is regarded with superstitious feelings by the peasantry, as the spot where their tutelary saint was accustomed to preach.

Amidst the great tracts of wild ground in Connaught, there are a few other spots of an unusually attractive character. The scenery round Lough Allen, out of which the Shannon flows, is extremely pretty, as is also that near Boyle, at the foot of the Curlew Mountains. At Lough Gill, near Sligo, a lake bearing a strong resemblance to the upper lake of Killarney, and the little bay of Ardnaglass, into which falls the cataract of Ballysedare, are scenes of peculiar beauty. Much of the surface of Galway is flat, showing, for twenty miles together, a succession of narrow limestone rocks, like parapet walls of three feet high, placed in parallels to each other, at distances of from three to ten feet; the intermediate spaces, though apparently but a waste of rock and stone, supply the finest sheep pasture in the kingdom.

The great central limestone district of Ireland occupies the southern portion of this province, which, to the eye, forms an exception to the general character of limestone countries, appearing so exceedingly barren, that, in passing over tracts of Galway and Mayo, the traveller almost doubts whether he is not journeying over a great cemetery covered with tombstones, rather than over places where the sheep could find pasture or the peasant plant potatoes. There are, however, some exceptions to this prevailing sterility, for nowhere are finer sheep-walks found than in some parts even of the southern counties of Connaught. The tillage of this province is principally confined to oats and potatoes, as best suited to the shallow mountain bog-soil, which so largely prevails in the western baronies. The extreme moisture of the climate is so inimical to the growth of wheat, that, except in a few parts of Galway, Connaught cannot be said to grow its own bread corn. There is a great export of oats and potatoes from the ports of Galway, Westport, and Sligo. With regard to husbandry, though it certainly is improving, it is yet much inferior to that of the other provinces. The landholders pride themselves on the breed of long-woolled sheep, their great source of wealth; and the celebrated Fair of Ballinasloe, where from 80,000 to 100,000 are usually sold, year after year exhibits an improvement in this branch of rural economy. Horned cattle, and horses, especially hunters, are also bred extensively in Galway. What has been said of Munster applies in a still more aggravated degree to Connaught. The property of an absentee landlord is usually divided into portions ruinously small; and if the proprietors do not quickly interfere, deplorable consequences must result from the subdivision system. The grazing farms are let in large portions, which it is the policy of the farmer not to diminish. Rents vary from £1 to £1, 10s. an acre, except in the vicinity of towns, where they rise to £2 and £3; and wages are from 10d. to 1s. a day in summer, and from 8d. to 10d. in winter.

There have been many attempts to introduce the linen manufacture into Connaught, and markets for its sale were established in Sligo, Castlebar, Westport, and Galway; but though it thrives to an extent sufficient to supply the rural population, there is reason to believe that little if any linen is exported from the province. There is, from the ports above mentioned, a pretty large export of oats, whisky, and potatoes.

The peasantry in Connaught are as poor as poverty can be without amounting to destitution; and, except in the mountain districts, their situation is daily becoming worse—so much so, that poverty, in times of scarcity, which on an average occur about once in seven years,

increases to destitution, and appeals to the richer members of the empire to save the labouring classes from actual starvation, become unavoidable. The food of those who are the best off is generally dry potatoes, with occasionally a herring or an egg. In Connaught, the indigent peasant is reduced to a state of greater poverty, by grasping at the temporary relief afforded by the system called by the Irish name of *gambeen* (exchange), of which the principle is to furnish provisions to the poor, allowing time for payment, but generally charging an exorbitant interest. This system has led to the most deplorable results.

There is a good salmon-fishery near the town of Galway, and one for cod, hask, and haddock, which, from the poverty of those engaged in it, which prevents them from providing sufficient tackling for their boats, is less productive than it might be. In some years the sun-fish, or basking-shark, are abundant off the shores of Galway, and much excellent oil is produced; but this fish is so capricious, that the fishery cannot be looked to with any certainty. The salmon of Ballinahinch are regularly sealed up in tin cases by the gentleman who farms this fishery from Mr. Martin, the principal proprietor of the country. There is a very productive salmon-fishery below the thriving town of Ballina, on the river Moy, from which large quantities of salmon are sent to the London market.

Chief Towns.

Galway, reckoned the capital of the west, and in point of population the fifth town in the kingdom, is situated in a valley lying between the bay which bears its name and Lough Corrib. The town is of considerable antiquity, and consists of streets and lanes huddled together without any regard to comfort or convenience. The whole partakes of the appearance of a Spanish town, the result probably of its early intercourse with Spain; and a small open space near the quay retains the name of *Spanish Parade*. The principal ecclesiastical buildings are the Parish Church of St. Nicholas, founded in 1320, a Presbyterian meeting-house, and the Roman Catholic chapel. The Franciscans, Augustines, and Dominicans, have monasteries here. The chief public buildings are—the County Court House, a handsome cut-stone edifice, erected in 1815, with a portico of four Doric columns; and the Tholsel, built during the civil wars of 1641. The schools in Galway are mostly under the superintendence of the Roman Catholic religious orders. There is also one on the foundation of Erasmus Smith, one belonging to the National Board, and about sixteen parish schools. Galway possesses a house of industry, an asylum for widows and orphans, a Protestant poorhouse, and a Magdalen asylum, which is supported by two benevolent Roman Catholic ladies.

The chief manufacture of Galway is flour. There are a bleach-mill and green on one of the islands, an extensive paper-mill, and several breweries and distilleries in the town. The exports consist principally of grain, kelp, marble, wool, and provisions; the imports, of timber, wine, coal, salt, hemp, tallow, and iron. In 1835, the vessels entered inwards numbered 135, of an aggregate burden of 12,915 tons; while the vessels cleared outwards amounted to 145, with a tonnage of 15,531. In 1840, a splendid dock was opened, from which great expectations are formed of the increase of trade. A steamer in this bay is highly necessary, for towing out vessels in adverse winds. In 1831, the population of Galway was 33,120.

Across the country in a northern direction, and also situated at the head of a bay bearing its name, stands *Sligo*, a town of a much smaller population than Galway, but more important as respects its commerce. It has carried on for several years a considerable trade, both export and import, and is still increasing, notwithstanding the bad state of its harbour. The exports are wholly limited to agricultural produce. The retail trade is extensive, articles of every description in demand being supplied to a large and populous district. The streets in the older part of the town are narrow, dirty, and ill-paved, and badly suited to the bustle of an export trade. But convenient markets have been erected, and the extension of the town by regularly built wide streets, is expected to remedy the inconvenience and irregularity of the older parts. Some good public buildings embellish the prominent points in and about the town, and the river Garwogue, which bears the surplus waters of Lough Gill to the bay, and turns several large flour-mills in its course, is a fine feature in the scene. The suburbs are beautiful and picturesque. In 1831, the population was 15,152.

TRADE BETWEEN GREAT BRITAIN AND IRELAND.

The trade and general intercourse between Great Britain and Ireland have been greatly increased since the Union in 1800, and more particularly since the establishment of steam navigation on a large scale. The following statements on this branch of our subject are given by Mr. Porter in his lately published work, "The Progress of the Nation."

The value of produce and merchandise that have been the objects of trade between Great Britain and Ireland, in various years since the Union, has been stated in papers laid before Parliament, as follows:—

	Imports into Ireland from Great Britain.	Exports from Ireland to Great Britain.
1801, - - - -	£3,270,350	£3,537,725
1805, - - - -	4.007,717	4,288,167
1809, - - - -	5.316,557	4,588,305
1813, - - - -	6,746,353	5,410,326
1817, - - - -	4.722,766	5,696,612
1821, - - - -	5.338,898	7,117,452
1825, - - - -	7,948,936	8,531,355

No account of this trade can be given for any year subsequent to 1825, the commercial intercourse between Great Britain and Ireland having at the end of that year been assimilated by law to the coasting traffic carried on between the different ports of England; and, with the exception of the single article of grain (as to which it was considered desirable by the legislature to continue the record), we have now no official register of the quantity or value of goods or produce received from or sent to Ireland. That this traffic has greatly increased in all its branches there can be no doubt; and this increase may partly be attributed to the abolition of the restrictions that existed up to 1825, but probably still more to the employment of steam-vessels upon an extensive scale. To show the extent to which the traffic has been carried by this means, a statement was furnished to a committee of the House of Commons by the manager of a company trading with steam-vessels between Ireland and Liverpool, of the quantity and value of agricultural produce imported into that one port from Ireland in 1831 and 1832. From this statement it appears that the annual value of the trade was about four millions and a half sterling, which was in great part made up of articles that could not have been so profitably brought to England by any previously existing mode of conveyance—such as live cattle, horses, sheep, and pigs; the value of which amounted in 1831 to £1,760,000, and in 1832 to £1,430,000. During the same two years the value of Irish agricultural produce brought to the port of Bristol averaged about one million sterling. The whole number of cattle, horses, sheep, and pigs, sent from Ireland to the various ports of England and Scotland, in different years from 1801 to 1825, was as follows:—

	1801.	1805.	1809.	1813.	1817.	1821.	1825.
Cattle, -	31,543	21,809	17,917	9,973	45,301	26,725	63,619
Horses,	669	4,114	3,264	3,904	848	2,392	3,130
Sheep, -	2,879	10,038	7,572	7,509	29,460	25,310	72,161
Pigs, - -	1,908	6,383	4,719	14,521	24,193	104,501	85,919

The numbers sent to Liverpool and Bristol alone, in 1831 and 1832, were—

	Liverpool.		Bristol.	
	1831.	1832.	1831.	1832.
Cattle, - - -	91,911	71,318	6,078	4,077
Horses and Mules,	539	708	159	190
Sheep, - - -	156,427	98,337	11,640	4,446
Pigs, - - -	150,001	149,090	84,107	85,619

The statement above mentioned of the imports into Liverpool occasioned considerable surprise at the time it was made, from the greatness of its amount; but it would appear that this branch of trade has since gone on increasing in a most extraordinary degree, as will be seen from the following account of the number and value of live animals brought from Ireland to Liverpool in the year 1837:—

94,710 Black Cattle, at	£16	each, - - -	£1,365,360
316 Calves,	45s.	" - - - -	711
225,050 Sheep,	40s.	" - - - -	450,100
24,669 Lambs,	18s.	" - - - -	22,202
595,422 Pigs,	50s.	" - - - -	1,488,555
2,414 Horses,	£20	" - - - -	68,280
319 Mules,	£8	" - - - -	2,552
Total value,		- - - -	£3,397,760

The average value here assigned to the several kinds of animals, is given on the authority of an intelligent gentleman resident at Liverpool, and who is practically acquainted with the trade.

The value in money, of one seemingly unimportant article, eggs, taken in the course of the year to the above two ports from Ireland, amounts to at least £100,000. The progress of this trade affords a curious illustration of the advantage of commercial facilities in stimulating production and equalizing prices. Before the establishment of steam-vessels, the market at Cork was most irregularly supplied with eggs from the surrounding district; at certain seasons they were exceedingly abundant and cheap, but these seasons were sure to be followed by periods of scarcity and high prices, and at times it is said to have been difficult to purchase eggs at any price in the market. At the first opening of the improved channel for conveyance to England, the residents at Cork had to complain of the constant high price of this and other articles of farm-produce; but as a more extensive market was now permanently open to them, the farmers gave their attention to the rearing and keeping of poultry, and, at the present time, eggs are procurable at all seasons in the market at Cork, not, it is true, at the extremely low rate at which they could formerly be sometimes bought, but still at much less than the average price of the year: a like result has followed the introduction of this great improvement in regard to the supply and cost of various other articles of produce. In the apparently unimportant article feathers, it may be stated, on the respectable authority above quoted, that the yearly importation into England from Ireland reaches the amount of £500,000.

When, some years ago, it was determined to cease keeping any official record of the commercial intercourse between Great Britain and Ireland, an exception was made as regards grain and flour, that trade being of great personal interest to our legislators. The following statement exhibits the quantities of those kinds of produce sent to Britain from Ireland in each year from 1815 to 1836:—

Years.	Wheat and Wheat Flour.	Barley and Barley Meal.	Oats and Oatmeal.	Total, including Rye, Beans, Peas, &c.
	Qrs.	Qrs.	Qrs.	Qrs.
1815	139,544	27,108	567,537	931,192
1816	121,631	62,254	683,714	873,865
1817	59,025	26,766	611,117	699,809
1818	108,230	25,387	1,069,385	1,207,851
1819	154,031	20,311	799,613	967,951
1820	404,747	87,065	916,250	1,417,120
1821	569,700	82,894	1,162,949	1,823,816
1822	462,004	29,532	589,337	1,083,089
1823	400,069	19,274	1,102,427	1,528,153
1824	356,408	45,572	1,225,085	1,634,094
1825	396,018	105,082	1,629,856	2,203,902
1826	314,851	64,885	1,303,734	1,692,180
1827	405,955	67,791	1,343,207	1,829,743
1828	652,584	84,204	2,075,631	2,826,135
1829	519,493	97,140	1,673,628	2,305,806
1830	529,717	189,745	1,471,252	2,217,729
1831	557,520	185,409	1,655,934	2,417,643
1832	572,586	123,068	1,890,321	2,605,734
1833	644,201	107,519	1,762,519	2,736,281
1834	779,504	217,568	1,713,971	2,733,046
1835	661,773	156,176	1,813,161	2,659,345
1836	598,756	182,887	2,126,693	2,929,329

In the absence of all further custom-house records, the following table of the number and tonnage of vessels in which the trading intercourse with Ireland has been carried on during each year of the present century, will afford a pretty correct view of its amount and progress. If we compare the tonnage employed in 1801 with that of 1836, we shall find that they bear the proportion of 257 to 100, showing an increase of 157 per cent. It will further be seen that this increase has been much more rapid during the last ten years in which steam-vessels have been so much brought into use, than it was in the preceding years of the series. Up to 1826, the increase from 1801 was no more than 62 per cent., showing a mean annual increase of 2¾ per cent.; whereas, in the ten years following 1826, the increase has been 95 per cent., or 9½ per cent. annually.

Years.	Inwards.		Outwards.	
	Ships.	Tons.	Ships.	Tons.
1801	5,300	456,026	6,816	582,033
1802	5,820	461,328	5,540	449,350
1803	5,796	504,884	5,656	502,279
1804	5,643	490,456	6,149	557,279
1805	6,306	566,790	6,875	598,720
1806	6,907	578,297	7,032	586,728
1807	No returns can be procured for this year.			
1808	8,477	768,264	7,566	696,473
1809	7,041	600,898	7,011	589,587

1837	10,299	1,202,104	10,347	1,585,694

EMIGRATION TO CANADA, AND OTHER BRITISH AMERICAN POSSESSIONS.

From one cause or another, emigration is a subject of considerable interest to the British public, and for some years has been practised upon a large scale. It is not necessary here to discuss these causes, but it may be allowable to present an account of the various countries chiefly resorted to by British emigrants, such as may be useful to persons contemplating a change of country, and at the same time convey to those who remain some knowledge of the regions to which so many of their friends and fellow-countrymen have removed. In drawing up these accounts, we are animated by an extreme desire to be correct and faithful, so that no one shall be unduly persuaded or dissuaded with respect to so important a step as that of emigration. If, therefore, any error should find its way into our pages, it must be attributed to unfaithfulness in the original reporters, or to our imperfect handling of the subject, and to no other cause.

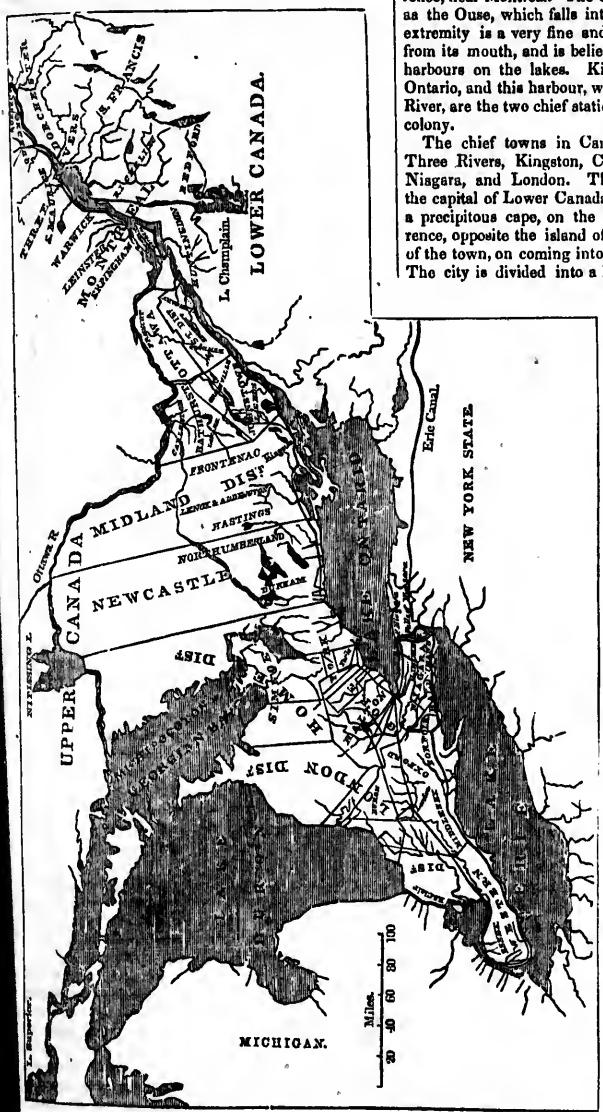
There are three regions of the earth to which the attention of emigrants is chiefly directed, namely, Canada and the other British possessions in North America; the United States, which many prefer, and which hold out similar advantages; and the British colonies in Australia, Van Diemen's Land, and New Zealand. At present our attention will be confined to Canada and the other British American possessions.

CANADA.—GENERAL DESCRIPTION.

North America, of which Canada is a part, lies at the distance of 3000 miles west from Great Britain, on the opposite shore of the Atlantic Ocean. This vast continent is much larger than Europe, measuring 4376 miles in length from north to south, and 3000 miles across from east to west. As yet, only a portion of the territory, measuring a few hundred miles back from the coast of the Atlantic, has been settled by people of European descent. Excepting in a few districts, the remainder of the continent is possessed only by a thin and scattered population of Aborigines. The southern and tropical part of North America is composed of the republics of Guatemala and Mexico; the most temperate portion (from the 30th parallel of latitude to about the 43d) forms the republic of the United States. The more northerly part, with some islands, is in the possession of Great Britain, and comprehends the provinces of Canada, New Brunswick, Nova Scotia, Newfoundland, Cape Breton, St. John's or Prince Edward Island, &c. The line of division betwixt the British possessions and the United States is either the River St. Lawrence and the lakes from whence it proceeds, or an ideal and mutually arranged boundary. Canada is bounded on the east by the Gulf of St. Lawrence and Labrador; on the north by the territories of Hudson's Bay; on the west by the Pacific Ocean; on the south by Indian countries, parts of the United States, and New Brunswick. Canada, until a recent period, was divided into two provinces, the Upper and Lower, each of which had its own local government; but by a recent act of the Imperial Parliament, the two provinces are united under one general Legislative Council and House of Assembly, two bodies respectively resembling the Houses of Peers and Commons in the mother country, and whose measures require the consent of the governor, as the acts of the home Parliament require that of the sovereign. The affairs of this, as of all other colonies, are subject to an ultimate control vested immediately in a colonial minister, but finally in the British legislature. In Lower or Eastern Canada, the greater part of the population is of French descent (this having originally been a French colony); the laws resemble those of France, and the French language is generally spoken. Upper or Western Canada lies to the west and south-west of the lower province. Its inhabitants are of British descent, and a very great number of them are from Scotland, both Lowlands and Highlands. The English law and church are here established; but there is the most perfect liberty of conscience, and as great a security of life and property as even in Scotland or England. Western Canada is divided into districts, counties, ridings, townships, special tracts, and allotments, together with blocks of land reserved for the clergy and the crown, and lands appropriated to the Indians. A district contains one, two, or three counties, and each county contains from four to thirty townships. There are 18 districts, 26 counties, and 6 ridings, comprising together 273 townships. The line of division betwixt Western and Eastern Canada is in one part the Ottawa or Grand River. Nearly all the other lines of division in the provinces are straight; without regard to physical distinction, such as hills and rivers; and this peculiarity is common over the whole of North America. The entire area of Upper Canada has been estimated at 64,000,000 acres. Of this extent of territory, the portion laid out in townships, and open for settlement, amounts to nearly 17,000,000 acres, the size of each township averaging 61,600 acres. Deducting the quantities granted to different classes of settlers, and otherwise disposed of by the crown, there yet remains within the townships, at the disposal of government, about 3,000,000 acres. This tract of country, chiefly bordering the north shore of the River St. Lawrence, and of the Lakes Ontario, Erie, and St. Clair, and of the rivers or straits communicating between these lakes up to Lake Huron, a distance in all little short of 700 miles, and stretching northward from the water to a depth varying from 50 to 80 miles, is composed of a soil which, for productive richness, variety, and applicability to the highest purposes of agriculture, may challenge competition with the choicest tracts of land in the New World.

Western Canada is chiefly a flat country, and is for the greater part covered with timber, but possesses a number of chains or ridges of high lands, running in different directions, and separating the sources and channels of innumerable rivers and brooks. The higher and less districts are called Table Lands. The grand feature of the country is, its water-courses. By looking at the map, it will be perceived that there is a series of large lakes, communicating with each other; these are unequalled by any inland sheets of water in the world, and are entitled to the appellation of fresh-water seas, for they are not only of great extent, but are liable to be affected by storms like the ocean itself. The uppermost called Lake Superior, is 381 miles long, and 161 broad; Huron, 218 miles long, and from 60 to 180 broad; Erie, 231 miles long, and about 70 in breadth; Ontario, 171 miles in length, and 60 in breadth. The waters of Lake Erie, on issuing from its lower extremity, form a river above 30 miles in length, and varying from three miles to a quarter of a mile in breadth, which in its course precipitated over a precipice to a depth of 165 feet,

making the famed cataract or Falls of Niagara. The river is, at the distance of a few miles below, received by Lake Ontario, whence issues the River St. Lawrence, one of the largest streams in the world, and which, after a course of above 2000 miles from its head waters above Lake Superior, falls into the Atlantic. This majestic river, which is 90 miles wide at its mouth, and for some distance inwards, varying from 60 to 24 miles, is navigable for ships of the line for 400 miles from the ocean. In its upper parts above Montreal, which, next to Quebec, is the chief port for ocean vessels, its navigation is impeded by *rapids*, or the rushing of the stream down an inclined plane. But these impediments are obviated by means of canals recently cut; wherefore there is now a continued water communication for vessels from the Atlantic up into the interior, so far as the foot of Lake Superior, where a series of rapids impede the entrance into that lake, and only requiring a short canal of about half a mile to complete the vast chain of inland navigation. The Welland Canal, a magnificent undertaking, connects Lakes Erie and Ontario, and affords a passage for vessels of large size. Lake Erie is also connected by a canal with the Hudson, a river of the United States which also falls into the Atlantic. The River Ottawa is next to the St. Lawrence in point of size, and is tributary to it. It falls into the north side of the St. Lawrence, near Montreal. The Grand River, formerly known as the Ouse, which falls into Lake Erie near its lower extremity is a very fine and deep stream for some miles from its mouth, and is believed to afford one of the best harbours on the lakes. Kingston, at the foot of Lake Ontario, and this harbour, within the mouth of the Grand River, are the two chief stations for the naval forces of the colony.



The chief towns in Canada are Quebec, Montreal Three Rivers, Kingston, Cobourg, Toronto, Hamilton, Niagara, and London. The city of Quebec, formerly the capital of Lower Canada, stands on the extremity of a precipitous cape, on the north bank of the St. Lawrence, opposite the island of Orleans. The appearance of the town, on coming into view, is particularly striking. The city is divided into a lower and upper town; the lower being of ancient date, and adopted as the seat of commerce, and the upper being the residence of the higher and more affluent classes. There are a number of fine public edifices; among the rest, the old Parliament House of the province, a stately building of hown stone; the Roman Catholic and Protestant cathedrals; the barracks, hospitals; the Quebec bank and a handsome monumen to Wolfe and Montcalm The institutions are, in many instances, of French character, and the language of the inhabitants is French and English.

Montreal, now the capital of United Canada, is a city of an entirely different appearance. It is agreeably situated on a beautiful island of the same name in the St. Lawrence, which measures thirty-two miles long by ten and a half broad, and lies at the confluence of the Ottawa River and the St. Lawrence. The island of Montreal is nearly level, and is scarcely excelled in fertility. The city stands on the south side of the island, and is reckoned the first in the province in respect of situations, local advantages, and mildness of climate. The houses in the modern parts of the city are well built, and the streets commodious. There are also

some has some public buildings. The literary and scholastic institutions in Montreal are numerous, and are of great benefit to the province. There is a line of substantial stone wharfs along the bank of the river, in front of the town, where there is deep water. Mr. Macgregor mentions, in his work on British America, that there is much activity observable among all classes connected with trade. "The position of Montreal," says he, "at the head of the ship navigation, and near the confluence of the St. Lawrence with the Ottawa, and its subsequent communication with Upper Canada, the Genessee country, and other parts of the United States, will always constitute it one of the greatest commercial emporiums in America, which must increase in magnitude and importance along with the rapid improvement and increasing population of the upper and surrounding countries. In winter, the trade of Montreal is not suspended like that of Quebec. Hundreds of sledges may be seen coming in from all directions with agricultural produce, and frozen carcasses of beef and pork, firewood, and other articles. Manufactured goods of all kinds are continually selling off in packages by the merchants or the auctioneers to the shopkeepers and country dealers, who again retail them to the townsfolk or country people; and flour, wheat, potatoes, &c., are continually coming in, and filling the stores or warehouses. The markets of Montreal are abundantly supplied at all seasons of the year."

CHARACTER OF DISTRICTS IN CANADA.

The various writers on Canada each recommend particular districts for the settlement of the emigrant; but it is hardly to be expected that persons in this country can make a perfectly judicious choice, a personal inspection of the lands, or at least information near the spot, being in almost every case requisite. The most elaborate details are given by Bouchette, in his large work on British America, regarding the different parts of the province; and as what he mentions may be of use in furnishing emigrants with an idea of the nature of the lands, we take the liberty of offering a few of his observations.

"*The Eastern Section*, including Ottawa, Johnstoun, Midland, and Bathurst districts.—Situated between two broad and navigable rivers, the Ottawa and the St. Lawrence, and centrally traversed in a diagonal course by an extensive and splendid sloop canal, connecting the navigation with the waters of Ontario, this section of country evidently enjoys important geographical and local advantages. Its surface presents, almost unexceptionably, a table-level of moderate elevation, with a very gentle and scarcely-perceptible depression, as it approaches the margin of the magnificent streams by which it is bounded to the northward and south-east. The soil, though sometimes too moist and marshy, is extremely rich and fertile, and chiefly consists of a brown clay and yellow loam. This section is intersected by numerous rivers, remarkable for the multitude of their branches and minor ramifications. There are also a number of good public roads both along the St. Lawrence and Ottawa, and into the interior. Great industry and attention to improvement are displayed upon most of the lands throughout this tract. The town of Kingston, which, next to Toronto, is the largest and most populous of the upper province, is very advantageously seated on the north side of the St. Lawrence, or rather at the eastern extremity of Lake Ontario. The streets are regular and well planned, and the population may be estimated at about 9000. The town has considerable mercantile importance: the harbour is well sheltered and convenient.

"The thriving village of Perth is situated in the township of Drummond, on a branch of the Rideau, and occupies a central position between the Ottawa River and the St. Lawrence, communicating by tolerably good roads with Kingston to the south and Bytown to the northward, at the opposite extremities of the Canal. The first establishment, fostered by government, was made in 1815 by British emigrants, chiefly from Scotland, many of whom are now at the head of excellent farms, possess comfortable habitations, and reap the fruits of their perseverance and industry.

"Ascending along the shores of Lake Chaudiere, the objects of note first presenting themselves are the rising colonies in front of the townships of March and Tarbolton; they are chiefly composed of families of high respectability, possessed in general of adequate means to avail themselves of the advantages that are incident to a newly-opened country. High up, on the bold and abrupt shore of the *Chats*, the Highland chief Macnab has erected a romantic edifice, Kinell Lodge, which he has succeeded, through the most unshaken perseverance, in rendering exceedingly comfortable.

"*The Central Section* of the province (continues the accurate Bouchette) embraces the districts of Home and Newcastle, which occupy a grant of about one hundred and twenty miles upon Lake Ontario, extending from the head of the bay of Quinté westward to the line between Toronto and Trafalgar. Although less populous than the tract of country composing the first part of the division which we have adopted, this portion of the province does not yield to it in fertility, and is equally well watered by numerous lakes, broad and beautiful rivers, and innumerable streams and brooks. The rivers in general abound with excellent fish, and especially salmon, great quantities of which are annually speared in the River Credit, for the supply of the western country. In front of Newcastle district, on the borders of Lake Ontario, the soil consists of a rich black earth; but in the district of Home, the shores of the lake are of an inferior quality. The lands upon Yonge street [roads are frequently called streets in Canada], which connects Toronto with Lake Simcoe, are exceedingly fertile, but so destitute of stones (for building and other purposes), as to create some inconvenience to the settlers. A sandy plain of some extent exists some distance north of Ontario, towards Rice Lake; but, saving this, and probably one or two more comparatively insignificant exceptions, the soil of this tract of country is extremely fertile, well adapted for agriculture, and yields luxuriant crops of wheat, rye, maize or Indian corn, peas, barley, oats, buckwheat, &c. The fronts of all the townships from Kingston to Toronto are, with few exceptions, well settled; roads lead through them, from which, in many places, others branch off to the interior. At intervals, rather distant indeed from each other, there are a few small villages. On the lands that are occupied, great progress has been made in agriculture: the horses, generally speaking, are strong and well-built; and the inhabitants appear to be possessed of all the necessaries, as well as most of the comforts, that a life of industry usually bestows." In this division is the town of Toronto. Our authority next proceeds to notice

The Western Section, which includes Gore, Niagara, London, and Western Districts. "With the aid of a little fancy," says Bouchette, "this tract of country may be shaped into a vast equilateral triangular peninsula, whose base, extending from Fort Erie to Cape Hurd on Lake Huron, measures 216 miles, and whose perpendicular, striking the Detroit River at Amherstburgh, is about 195 miles. It is bounded on the north and west by Lake Huron, River and Lake St. Clair, and Detroit River; south by Lake Erie; and east by Niagara River, Lake Ontario, and the western limits of the district of Home. The surface it exhibits is uniformly level, or slightly undulating, if we except a very few solitary eminences, and those parts of the districts of Gore and Niagara traversed by the ridge of elevated land. The variety of soils, and the diversity of their combinations observable in these four districts, are by no means so

great as might be expected in so extended a region. The whole tract is alluvial in its formation, and chiefly consists of a stratum of black, and sometimes yellow loam, above which is deposited, when in a state of nature, a rich and deep vegetable mould, the substratum beneath the bed of loam being generally a tenacious gray or blue clay, which in some parts appears at the surface, and, intermixed with sand, constitutes the super-soil. There are numerous and extensive quarries of limestone to be found in these districts, that supply the farmers with excellent materials for building. Freestone is also found, but in small quantities, and generally along the shores of the lakes. The Thames River, in this section, rises far in the interior, and, after pursuing a serpentine course of about 150 miles, in a direction nearly south-west, discharges itself into Lake St. Clair." This portion of the province seems to us to be that most worthy of the attention of the emigrant: the climate is pleasant, the land excellent, the rivers numerous and useful; roads are opening up in all directions for the benefit of the inhabitants; and although at a great distance inland, the communication with the ocean is conveniently kept up by means of the lakes and canals. Were we about to emigrate, we would have little hesitation in directing our steps towards this portion of Upper Canada, so tempting from the prodigious vastness of its waters, the exuberant fertility of its extensive plains, its luxuriant orchards, and its busy scenes of rural industry.

It may here be remarked, that the general salubrity of the climate improves as you recede from the banks of the lakes and great rivers where these happen to be low-lying, and the land adjoining wet and swampy, although such situations possess, as a counterpoise, a greater facility of disposing of surplus produce. The prevailing maladies on the low-lying shores of the lakes and large rivers are fevers and the ague, which, although a most annoying complaint, is very seldom fatal. By great care being given to regularity of the bowels, observing temperate habits, keeping the feet dry, and avoiding unnecessary exposure to the night air, it may generally be averted. We cannot sufficiently impress on the minds of emigrants the necessity they will be under of adhering to temperate habits. In the Canadas, whisky is much cheaper than in Britain; hence this advice becomes of double importance.

Mr. Fergusson, in his "Practical Notes," made during a tour in Canada in 1831, furnishes his readers with a number of valuable illustrations of the state and appearance of the Upper Province along the route he pursued: indeed, all intending emigrants who can afford it should purchase his very instructive volume. Speaking of that part of the territory adjacent to Lower Canada, he says—"Returning to the St. Lawrence, we enter the Upper Province, the Ottawa here forming the boundary line. As we ascend the river, we find numerous settlers and thousands of acres well adapted for the farmer. One of the first settlements we meet with is the Glengarry district, an extensive tract of good land, enjoying the advantages of water carriage. The language, the customs, and the native courage of their Celtic sires, still distinguish the clan, though at the same time, we are afraid, accompanied by some of those less profitable traits which stamp the Highlander as more at home in wielding the claymore, or extracting mountain dew, than in guiding the ploughshare to slow but certain results. The farms are but indifferently improved, considering the advantages they have enjoyed; and much valuable time is expended in the depths of the forest, in a demi-savage life, cutting and preparing timber for the lumber merchant, which, if steadily devoted to the cultivation of the land, would certainly be attended with infinitely greater benefit both in a physical and moral point of view.

"To go minutely into the statistics of even the banks of the river, would far exceed the limits to which I must necessarily restrict myself. Suffice it to say, that a constant succession of eligible situations present themselves for estates and farms. I was much pleased with the Matilda district, and consider it capable of great improvement. The soil is a fine mellow sandy loam, sometimes perhaps rather light, but admirably adapted for turnip husbandry and fine-woolled sheep, with numerous beautiful situations of residences, the noble St. Lawrence ever forming a prominent feature—its surface varied by lovely wooded islands, similar to those we so justly admire on many of our British lakes. In approaching Kingston, or the east end of Lake Ontario, the River Guananogue falls into the St. Lawrence, and at its mouth is the establishment of Messrs. M'Donnell, two brothers who came about eight years ago to the colony, and who, by steady enterprise, without original capital, have realized considerable wealth, while, along with it, they have secured the respect and esteem of all who know them. They have here what is called in America a valuable water privilege, or fall, and have erected flour and saw mills to a large extent.

"Having received very encouraging accounts at Kingston of the country along the Bay of Quinté, a deep inlet of Lake Ontario formed by a peninsula called Prince Edward Island, I made an excursion into that district. The scenery was pleasing, in many places very fine; and settlements are forming on every hand. The soil is partly clay, partly loam and sand, sufficiently rich to yield fifteen crops of good wheat, with impunity, in a period of twenty years. Granite, limestone, and schistus, or clay-slate, are successively met with. Whenever a stream or creek of any importance falls into the lake, there we find a mill-seat and a village growing up, the embryo, in many cases, of considerable towns.

"To the patriot or philanthropist, it is highly gratifying to remark, how the wants of the farmer and the interests of the trader or mechanic co-operate in the rapid progress of general improvement and civilization. Holywell, Sophiaburg, and Belville, are all thriving villages of this description; and many individuals are to be met with in each who, from the humble situations of merchants' clerks, &c., have rapidly risen to independence.

"Toronto (he says in another place) is a very desirable station for a settler to choose as head-quarters, in looking about for a purchase. He is sure at this place to meet with numerous offers of farms, regarding which he will do well to act with caution. The *rich* and *heavy* land of Upper Canada is not to be found in general upon the immediate banks of the lakes and rivers. It lies for the most part from twelve to twenty miles back, and thus compensates the enterprising settler for plunging into the forest."

The shores of the lakes of Upper Canada present many superior stations for emigrants, the soil being of the very best quality, and the climate not so severe as it is in Lower Canada nearer the sea. These districts are rapidly becoming peopled, through the exertions of government and the enterprise of private individuals. Even in the settled districts of both Lower and Upper Canada there is still abundance of good land to be disposed of; and from the desire of many of the older settlers to dispose of their farms in order to procure a larger extent of uncleared or forest land for their rising families, comfortable and well-cultivated farms are constantly to be met with, and to be had frequently cheap and upon easy terms in every district.

The climate of Canada presents very opposite extremes of heat and cold, and the transition from the one to the other is much more sudden than in Great Britain. Notwithstanding this, however, it is healthy; all accounts which we have seen, both those of travellers and the letters of private individuals, agreeing in this respect. The

spring in Canada generally commences about the end of April, and the fields are well covered with vegetation by the beginning of May. The thermometer ranges during summer from about 80° to 84°; in some instances it has reached 102°; but such extreme heat is very rarely felt. Spring, summer, and autumn extend from the end of April to October. Winter commences in November, when thick fogs and snow-storms are frequent. By the middle of December the ground is generally covered with snow, and the frost, especially in Lower Canada, becomes sometimes very intense. The depth of the snow in Upper Canada varies according to seasons, from a few inches to several feet; the average depth, taking one season with another, has been estimated to be between eighteen inches and two feet. The winter in the Upper or western part of the province is much milder than in the Lower or eastern part, and new settlers generally are pleasantly disappointed in not experiencing the rigours which, from exaggerated rumours at home, they had expected to find. January has generally a week or more of open, and sometimes mild weather; and it not unfrequently happens that it is only in February that the weather may be said to be very severe and the frost intense.

In Lower Canada, where winter is most severe, the thermometer ranges from 25° above to 25° below zero. The sky of a Canadian winter is generally almost cloudless, the air bracing, and, from the absence of wind, in spite of the low temperature, the cold is not felt to be disagreeable. From Quebec to Montreal and upwards, the St. Lawrence and other rivers, and also the lakes, cease to be navigable; but the firm icy surface serves as a road for the sleighs and carrioles; and although the entire face of nature is now changed—the varied and pleasing tints of autumn in the forest, and the busy and enlivening signs of commerce upon the lakes and rivers, having given place to one dead and drear-like scene, seemingly destitute of variety; yet the snows and frosts of Canada are hailed as ushering in a season which brings with it no small amount of social enjoyment.

While the external weather is guarded against by warm clothing when out of doors, the habitations of the Canadians are kept comfortably warm, the apartments being heated with stoves, which keep the temperature at a higher and more uniform rate than can be effected by English fireplaces.

The heated air produced by the stoves being considered to be rather unhealthy, the farmers, especially in Upper Canada, in many instances use the large open fireplace, and fearing no scarcity of wood, the substantial billets or huge Christmas-looking logs blaze merrily and warmly on the pair of massy gridirons, conjuring up scenes of the halls of England in the olden time. Winter in Canada is indeed the season of joy and pleasure: all classes and ranks indulge in a general carnival, as some amends for the more enervating toil undergone during the summer months. The double-seated sleigh, with its mettled pair of horses, or single-horse *cutter* of the Upper Canadian, or the carriole of the humble *habitan*, or proud *seigneur* of Lower Canada, is got ready all over the country. Riding abroad on business or pleasure commences; visiting is in active play between friends, neighbours, and relatives; regular city and town balls, and irregular picnic country parties, are quite the rage.

Travelling over frozen rivers or lakes is not unattended with danger, for it sometimes happens that the sleigh, its horses, and passengers, are engulfed and sucked beneath the ice. Fortunately, the thin or weak parts of the ice are in general of no great extent, and in most instances the passengers are able to leap from the vehicle to a part sufficiently firm to bear them. The Canadians have a curious contrivance for saving the horse on these occasions. A rope, with a running noose round the neck of the animal, is on occasions part of the furniture of the carriage. As soon as he sinks in the ice, the driver pulls this rope till he strangles him, or at least so far deprives him of sensation that he can no longer struggle. The poor horse is thus, by a severe process, prevented from doing that which would sink him deeper in the broken ice; and when the passengers are safe, he is pulled upon the firm ice, the rope is loosened, respiration recommences, and generally, in a few minutes, he is carrioling away again as well as ever. A necessity of this kind, however, is believed to be of rare occurrence.

The other British possessions in North America are Nova Scotia, New Brunswick, Prince Edward Island, Cape Breton, and Newfoundland; the last, however, is an island in the Gulf of St. Lawrence, and unsuitable for the settlement of emigrants. The whole lie within the 41st and 51st degrees of north latitude, and from about the 54th to the 68th degree of west longitude. These countries are not so warm or genial as Upper Canada; they are what Scotland is to England—more rugged and mountainous, and more unpromising in their outlines; but they are not less healthy and pleasant; and they possess the advantage of being the nearest colonial possessions of Great Britain, with the likelihood of remaining longest under its paternal government.

NOVA SCOTIA.

Nova Scotia is a peninsula connected with the mainland by a narrow isthmus. It measures about three hundred miles in length, but is of unequal breadth; altogether, it contains 15,017 square miles, or nearly ten millions of acres. One-third of this superficies is occupied by lakes of various shapes and sizes, spread in all directions over the face of the peninsula. There is no part of the land thirty miles distant from navigable water, and in all parts there are fine streams and rivers. The southern margin of Nova Scotia is broken and rugged, with very prominent features, deep inlets, and craggy islands. The features of the northern coast are soft, and free from rocks. It is bounded on the north by part of the Gulf of St. Lawrence, which separates it from Prince Edward Island; on the north-east by the Gut of Canso, which separates it from the island of Cape Breton; on the west by the Bay of Fundy, which separates it from New Brunswick; and on the south and south-east by the Atlantic Ocean. Nova Scotia was first settled by the French in 1603, and till 1712 it was alternately possessed by the French and English, when the latter became its permanent possessors. By the French it was called Acadia.

The soil of a country of such extent and such varied features as Nova Scotia must necessarily be various. If an imaginary line be drawn, dividing the province in the exact centre, from east to west, the north-western half will be found to contain by far the greatest portion of good land. On the side towards the Bay of Fundy, the soil is very rich, and free from stones, and contains many thousand acres of dyked marsh land. This is alluvial land, and is made by the deposit of the tides—a sediment composed of the finer particles of soil, brought away by the rivers and torrents in their course to the Bay of Fundy, of putrescent matter, salt, &c. This land, called marsh, after it has attained a suitable height, is dyked, and the waters of the rivers excluded. Nothing can exceed its fertility. In many places, particularly about Windsor and Truro, it yields three tons of hay per acre, and has continued to do so without manure for fifty years past. There is a difference in its quality. Where the water which overflows it is not much enriched by a long course through the country, it is thin and of an inferior quality. The quantity of land enclosed in this manner is very great. At the head of the Bay of Fundy, there are seventy thousand acres in one connected body. There is one marsh in Cumberland containing nearly as much land as Romney Marsh in Kent, and of a quality

vastly superior. There is something peculiarly agreeable to cattle in the grass growing upon these marshes, which has a wonderful tendency to fatten them. This land is found in great quantities in Cumberland, Macan, Nspan, Londonderry, Truro, Onslow, Shubenacadie, Noel, Kennetcook, Newport, Windsor, Falmouth, Horton, Cornwallis, Granville, Annapolis, &c. The next best quality of land is called by a term peculiar to America, *intervale*, an alluvial soil made by the overflowing of large fresh-water brooks and rivers in the spring and autumn. The quantity of intervale is incalculable. It is to be met with in every part of the province, and is frequently found covered with a long natural grass, several feet in length, and is sometimes called wild meadow. The quality varies according to the size of the brook or river by which it is made, but in general it is very fertile and rich. The upland varies so much, that it is difficult to give a general description of it; but one tract deserves notice from its extent and quality. It commences at Cape Blomidon in Cornwallis, and runs in one continuous ridge of high land for upwards of one hundred miles in the direction of Digby, and varies from three to seven miles in breadth. This is a very strong soil, and, with little exception, of a most excellent quality throughout, producing wheat and other grains in abundance.

The mineral products of this part of America are valuable; but none is so much worthy of consideration as coal, which is found at Pictou, and also at Sidney in Cape Breton; and there can be no doubt that the possession of this mineral will constitute one of the chief advantages of these provinces over every other. Limestone, freestone, and slate abound, of the best qualities, and there is plenty of fine clay for bricks. Iron ore has also been discovered in several places. The province has no animals of a troublesome nature. There are foxes, mice, squirrels, and rats. Among the feathered tribe there are a number of birds of the same kind as in Britain, including those called game in this country, all of which may be shot and used as food without any restriction. The only troublesome insects are the mosquitoes and black flies during hot weather. The rivers abound with the finest fish, among which are salmon and trout; and the shores yield large supplies of white and shell-fish of different kinds.

The climate of Nova Scotia, like that of the adjoining districts, is salubrious and pleasant, but is in a peculiar degree exposed to the extreme of summer heat and winter cold. The ground is generally covered with snow from the 25th of December till the 5th of March, in which respect it nearly resembles Upper Canada; and during this period the farmers draw upon sledges their wood and poles from the forest, and carry their produce to market. It is difficult to say when spring commences, as it is rather late and irregular in its approaches. When vegetation does begin, it is very rapid, and two or three days make a perceptible change in the amount of the foliage. The summer may be said to be short and powerful, and during the time it lasts, it exerts a much greater influence on vegetation than is observable in Britain. During this period the inhabitants go very lightly dressed. Altogether, the climate of Nova Scotia is as good as that of Scotland, if not superior; nor are there any of those local or epidemical disorders with which other countries are frequently afflicted. Although the winters are intensely cold, they are not so disagreeable as the raw changeable winters of this country, nor nearly so fatal to human life. Besides, if the settlers work during three-quarters of a year, they have ample provision for the remaining quarter, and are enabled to look forward to winter as their season of holiday enjoyment and relaxation. We have been informed by a Nova Scotian, that the improvement of the country is greatly retarded by the inactive habits of the settlers. The employment most popular is fishing, and agriculture remains so backward, that large importations of flour from the United States are constantly required, the payment of which drains the country of specie. The farmers, it seems, are in the habit of ceasing to exert themselves after attaining a moderate means of subsistence, and their sons spend the time in riding and other frivolous pursuits, which should be devoted to the improvement of the paternal acres. These half-idle habits, and also an indulgence in spirituous liquors, are described as the true cause of the backward state of the colony as respects its territorial improvement.

Few parts of the world are so well watered as Nova Scotia. The rivers, brooks, springs, and streams of different kinds are very numerous. Some of the lakes are extremely beautiful, containing in general one or more small islands, which are covered with a luxuriant growth of wood, and vary in every imaginable shape. The land in the neighbourhood of them is often undulated in the most romantic manner. These lakes will in time be of great service to the province. In several instances they nearly intersect the peninsula, offering scope for inland navigation. Already a canal has been formed to a certain length.

The fruits produced in the country are numerous. Besides a great variety of wild fruits, gooseberries, strawberries, cherries, and raspberries, there are pears of various kinds, all the varieties of English plums, apples of a very superior quality, and some finer fruits. The other vegetable products are cucumbers, potatoes, artichokes, cauliflowers, cabbages, beans, and peas. Hops are an invariable and sure crop, and may be raised in great abundance. Pumpkins and Indian corn are cultivated to a great extent. Carrots, onions, parsnips, beet, celery, and most other kitchen herbs, are produced with ease. The grains cultivated by the farmers are summer and winter wheat, rye, buckwheat, barley, and oats. The natural forests are elm, cherry, white, black, yellow, and gray birch, red oak, beech, white and yellow pine, white, red, and black spruce, maples, &c.

Nova Scotia is divided into ten counties, including Cape Breton. The chief towns are Halifax, Truro, Londonderry, Onslow, &c. The capital, Halifax, is pleasantly situated on the slope of a rising ground, facing a fine spacious bay or natural harbour in front, on the eastern or more accessible side of the peninsula. It contains about 25,000 inhabitants, and is a central point for the foreign commerce and fishing-trade of the colony. Although possessing considerable wealth and trade, and the seat of an intelligent population, it is behind English towns of the same size and inferior capabilities. Here, as elsewhere in the colonies, a dependence on the arrangements of the home government deadens public spirit, and retards that natural tendency to advance which is observable in the towns of the United States.

Cape Breton is a romantic and mountainous island, lying close to Nova Scotia on the east, and only divided from it by a narrow strait, called the Gut of Canso. On the western side is the Gulf of St. Lawrence. The island measures upwards of a hundred miles in length by about sixty in breadth, including the numerous bays which indent the land. The natural productions of this island resemble those of Nova Scotia, though wheat is less generally grown, and oats and potatoes are raised to a considerable extent. There are large tracts of good land in the lower parts, and the expense of clearing it of timber is estimated at £3 an acre. The minerals of the island are valuable. Cape Breton is politically annexed to Nova Scotia, of which it forms a county.

NEW BRUNSWICK.

The province of New Brunswick, lying on the main land of North America, contiguous to the United States and Lower Canada, consists of an extensive tract, comprising nearly 28,000 square miles, the greater part of which is still covered with dense forests. The land,

nowever, is generally fertile, and excellently adapted for the settlement of emigrants. Besides being recommended by the fertility of its soil, it possesses innumerable rivers and streams in all directions, suitable for purposes of trade or manufacture. The climate is salubrious; the natural products numerous and valuable; wild animals are plentiful; and the rivers and lakes abound in fish; while along the coasts, cod, haddocks, salmon, and other fish, are yielded in plenty to the enterprising fisher. The resources of the province are thus inexhaustible, and, according to Macgregor, suitable to the maintenance of at least three millions of inhabitants. As yet, New Brunswick has a small population, and the principal settlements are along the River St. John and its lakes. On the northern side of the entrance to this large river from the Bay of Fundy, stands the town of St. John, the largest in the province, and the seat of an extensive trade. Fredericton, which claims to be the metropolis of the colony, is situated nearly ninety miles above St. John, on the same river; it is still a village in appearance. The chief buildings are the government house and a college.

The province of New Brunswick presents an extensive line of coast to the Gulf of St. Lawrence on the east, while on the north it has part of Lower Canada, which separates it from the River St. Lawrence upwards. Its latent capabilities for carrying on trade with the interior are thus very considerable. Miramichi is the chief river after the St. John. It falls into the Gulf of St. Lawrence, and is navigable for large vessels for about forty miles. Along its banks, here and there, are seen the huts and houses of settlers, who have not made great advances in cultivation. The cutting and export of timber form the main trade of the district. About twenty miles up, on the south bank, is seen the village of Chatham, where many of the ships load, and where several of the merchants are settled, who have erected stores and wharfs. Four miles further up stands the village of Newcastle. The Miramichi River divides into two great branches. "On coming down the south-west branch (says Mr. Macgregor) in the autumn of 1828, from where the road from the River St. John joins the Miramichi, about eighty miles above Chatham, I was astonished at the unexpected progress made during so short a period in the cultivation of the soil. Near where the road parts off for Fredericton, an American possessing a full share of the adventurous activity of the citizens of the United States, has established himself. He told me that when he planted himself there, seven years before, he was not worth a shilling. He has now (1829) more than three hundred acres under cultivation, an immense flock of sheep, horses, several yokes of oxen, milch cows, swine, and poultry. He has a large dwelling-house, conveniently furnished, in which he lives with his family and a numerous train of labourers; one or two other houses, a forge, with a powerful trip-hammer worked by water-power, fulling-mill, grist-mill, and two saw-mills—all turned by water. Near these he showed me a building which he said he erected for the double purpose of a school and chapel, the floor of which was laid, and on which benches were arranged so as to resemble the pit of one of our theatres. He said that all preachers who came in the way were welcome to the use of it. An English parson, a Catholic priest, a Presbyterian minister, or a Methodist preacher, should each, he said, get something to eat at his house, and have the use of the chapel, with equal satisfaction to him. He then showed me his barn, and in one place a heap, containing about ninety bushels of Indian corn, that grew on a spot (scarcely an acre) which he pointed out to me. This man could do little more than read and write. His manners were quite unpolished, but not rude; yet he had wonderful readiness of address; and, as far as related to his own pursuits, quick powers of invention and application. He raised large crops, ground his own corn, manufactured the flax he cultivated and the wool of his sheep into coarse cloths; sold the provisions which his farm produced, and rum and British goods, to the lumberers kept a tavern; employed lumberers in the woods, and received also timber in payment for whatever he sold. He made the axes and other tools required by the lumberers at his forge; he ate, gambled, and associated with his own labourers, and with the lumberers, and all others who made his house a kind of rallying point. He appeared, however, to be a sober man, and a person who had in view an object of gain in every thing he engaged in. He talked much in praise of the rich interior country, and how rapidly it would be settled and cultivated if possessed by the Americans."

PRINCE EDWARD ISLAND.

This rich and productive island is situated in the Gulf of St. Lawrence, between Cape Breton on the east and New Brunswick on the west, and is separated from Nova Scotia on the south by a strait of about nine miles in breadth. It measures 140 miles in length, and is 34 at its greatest breadth. The general appearance of this island from the sea is level, but, on landing, the scenery is varied with gentle undulations. It abounds with streams and lakes, and in many places it is indented with bays, no part being more than eight miles from the sea. The soil is in general fertile, yielding good crops of wheat and other grains; and parsnips, turnips, carrots, potatoes, and almost all the common culinary vegetables, succeed well. This island has been recommended to such emigrants as possess a knowledge of agriculture with that of the curing of fish. The climate of Prince Edward Island is in some respects similar to that of the neighbouring countries. The winter is said to be shorter than in Lower Canada, and the atmosphere is noted for being free of fogs. Agricultural operations commence about the beginning of May, and the harvest is generally over by the end of October. The chief disadvantage this colony labours under, and which is equally applicable to the others near it, is the great length of the winter, which obliges the farmer to lay up a very large stock of hay for supporting his live-stock. The sudden manner, also, in which spring comes on, abridges the period for sowing and planting, thus leaving the agriculturist comparatively idle at one season, and obliging him to work severely at another. The inhabitants are chiefly from Great Britain and Ireland, with a few Dutch and Germans. Mr. Macgregor characterizes them as hospitable, kind, obliging, and as, generally speaking, a moral people. The island is governed by a lieutenant-governor, council, and house of assembly consisting of eighteen members, who are elected by the people. Charlotte Town, the capital, is situated on the north bank of the river Hillsborough, on the east side of the island. The town stands on ground which rises in gentle heights from the banks of the river, and its harbour is considered one of the best in the Gulf of St. Lawrence. A small group of islands called the Magdalens have been recently annexed to Prince Edward Island, chiefly as fishing establishments.

Little requires to be said respecting the trade of Canada, or of British America generally. To Halifax, Quebec, Montreal, St. John, and other ports, shipments of English manufactured goods and foreign produce are regularly made, chiefly in spring and autumn, and the produce returned is wood, fish, oil, potashes, salted beef and pork, some butter and cheese, and of late, a not inconsiderable supply of wheat and flour. The total of our exports annually to British America was, in 1833, under £2,000,000, while the military and civil expenditure incurred by the mother country in 1836 was £382,735, thus showing that, as regards commerce, Britain loses a considerable sum yearly by maintaining

these colonies. British America is highly favoured by being permitted to send its produce at comparatively low duties to the home country; but from lack of capital or enterprise, this does not appear to have so important an effect as might be expected on the prosperity of the colonies. The comparatively independent, easy, and comfortable circumstances, with light taxes, experienced by colonial farmers, may perhaps account most naturally for the absence of ambition or enterprise among a scantily-educated and plain-living people. Agricultural societies and periodicals, in conjunction with the recently more encouraging terms on which colonial produce is admitted into the British market, have, of late, however, exercised considerable influence in Canada, and with the increasing supply of bread-stuffs and salted provisions from the colony, the circumstances of its farmers, and its condition and prospects generally, are understood to be steadily and cheerfully improving. The duty on wheat imported into this country from Canada and other British possessions in North America, is 5s. a quarter when the average price of wheat in this country is less than 55s. a quarter; 4s. when 55s. and under 56s.; 3s. when 56s. and under 57s.; 2s. when 57s. and under 58s.; and 1s. when 58s. and upwards. Wheat, when imported from foreign countries, when the price is 58s. a quarter in this country, pays a duty of 14s. a quarter. The duties on the importation of salted provisions are similarly favourable to the colonies. Hams and bacon, which pay a duty of 14s. a cwt. when imported from foreign countries, are admitted from the colonies on paying a duty of 3s. 6d. a cwt. Foreign butter and cheese pay respectively 20s. and 10s. 6d. a cwt., while colonial are admitted for 5s. and 2s. 6d. a cwt.

PERSONS WHO OUGHT TO EMIGRATE.

"The persons who may be inclined to emigrate to Upper Canada," says Howison, "are of three different descriptions; namely, the poor peasant or day-labourer; the man of small income and increasing family; the man possessing some capital, and wishing to employ it to advantage. Persons of the first class never would repent if they emigrated to Upper Canada, for they could hardly fail to improve their circumstances and condition. The poorest individual, if he acts prudently, and is industrious, and has a common share of good fortune, will be able to acquire an independence in the space of four or five years. He will then have plenty to eat and drink, a warm house to reside in, and light taxes to pay; and this state of things surely forms a delightful contrast with those hardships and privations which are at present the lot of the labouring population of Great Britain.

"It is evident that some descriptions of emigrants will succeed better in Upper Canada than others. Those who have been accustomed to a country life and to country labour, are of course more fitted to cultivate land, and endure the hardships at first attendant upon a residence in the woods, than artisans or manufacturers, whose constitutions and habits of life are somewhat unfavourable to the successful pursuit of agriculture. But every individual, who to youth and health joins perseverance and industry, will eventually prosper. Mechanics cannot fail to do well in Upper Canada; for when not employed in clearing lands, they will find it easy to gain a little money by working at their professions; and they likewise have the advantage of being able to improve their dwelling-houses and repair their farming utensils at no expense. Weavers, being ignorant of country affairs, and unaccustomed to bodily exertion, make but indifferent settlers at first, and their trade is of no use to them whatever in the woods. Married persons are always more comfortable, and succeed sooner in Canada than single men; for a wife and family, so far from being a burden there, always prove sources of wealth. The wife of a new settler has many domestic duties to perform; and children, if at all grown up, are useful in various ways."

Every candid traveller in Canada concurs in these views; and it may be observed that they are equally applicable to the other districts noticed in this sheet. "Of this, I think," says Fergusson, "there can be no doubt, that either the moderate capitalist, or the frugal, sober, and industrious labourer or artisan, cannot fail of success. *Fortunes* will not be rapidly or even readily acquired; but it must be the settler's own fault if he does not enjoy, in large abundance, every solid comfort and enjoyment of life, and rear around his table even a *forest* of 'olive plants,' without one anxious thought regarding their future destination or provision."

PASSAGE.

There are two ways of proceeding to Canada—by the St. Lawrence, Quebec, and Montreal; and by New York and the Erie Canal. The passage by the St. Lawrence is tedious and troublesome, and we recommend all who can conveniently do so to take shipping direct to New York; from that city they will at once go on by a steamboat on the Hudson River to Albany, and from Albany be conveyed in a track-boat on the Erie Canal, or by railway, to Lake Erie, where they will find steamboats ready to convey them in all directions. For those who prefer the passage by Quebec, the following information is given by an official pamphlet:—"Passages to Quebec may either be engaged inclusive of provisions, or exclusive of provisions, in which case the shipowner finds nothing but water, fuel, and bed-places, without bedding. Children under fourteen years of age are charged one-half, and under seven years of age one-third, of the full price; and for children under twelve months old no charge is made. Upon these conditions the price of passage from London, or from places on the east coast of Great Britain, has generally been £6 with provisions, or £3 without. From Liverpool, Greenock, and the principal ports of Ireland, as the chances of delay are fewer, the charge is somewhat lower [we would here strongly advise emigrants to sail, if possible, from a port on the west coast, as being a great saving of time, trouble, and expense]; this year the charge will probably be from £2 to £2, 10s. without provisions, or from £4 to £5 including provisions. [Emigrants intending to settle in New Brunswick, Cape Breton, or Prince Edward Island, will generally obtain a passage in the vessels bound for Canada; and ships for Halifax or Pictou in Nova Scotia are constantly sailing from the British ports.] In ships sailing from Scotland or Ireland, it has mostly been the custom for passengers to find their own provisions; but this practice has not been so general in London; and some shipowners, sensible of the dangerous mistakes which may be made in this matter through ignorance, are very averse to receive passengers who will not agree to be victualled by the ship. Those who do resolve to supply their own provisions should at least be careful not to lay in an insufficient stock. Fifty days is the shortest period for which it is safe to provide; and from London the passage is sometimes prolonged to seventy-five days." Having wound up his affairs in this country, and otherwise prepared himself and family for proceeding to the land of their adoption, it is recommended that the emigrant should be exceedingly cautious how he disposes of any portion of his funds previous to setting out. An ordinarily good stock of clothing he may safely direct his attention to procure; and for the purpose of insuring greater comfort, such clothing would better be had lighter in fabric for summer, and heavier for winter, than is usually worn in this country. Strong linen jackets and trousers are frequently worn during summer, and flannel under-clothing is generally used both during summer and winter; cotton in preference to

linen shirts are generally worn. Pilot, beaver, and tweed cloths are commonly used for winter wear; and among working-people, not unfrequently stout moleskin and the domestic cloth of the country, exactly similar to that which was used, and in some instances is still worn, in our own rural districts. Fur caps during winter, and straw hats in summer, are in common use. The intending settler in Canada need, however, give himself no concern about laying in any large stock of clothing, as all sorts, and perhaps better suited to the climate and habits of the country, may be had at reasonable prices in almost every part of Canada. Many settlers have had reason to repent their having incautiously laid out a great portion of their funds before embarking, which, they afterwards experienced to their loss, would have been much more valuable to them in the colony than any purchases of articles for use or speculation they had made or could have made at home. American coarse boots and shoes, for instance, are to be had as cheap, if not cheaper, in Canada than they can be had in this country; and American axes, saws, and edge-tools are usually preferred in Canada before the English-made articles, as, although higher in price, more attention is believed to be bestowed in the selection of the metal, and in the tempering of the tool, and the pattern or shape is better adapted to its peculiar purposes in the colony. Furniture may be purchased very reasonably in almost every part of Canada, from the plainest to the most costly description.* Medicines are invariably provided upon the voyage by the captains of vessels, and dispensed without charge to passengers. Great attention should be paid, both during the voyage and upon landing, to preserve the bowels in regularity. When this cannot be effected by diet, a dose of simple medicine should be resorted to. Provisions, and what articles the intending voyager determines to take with him, should be conveniently packed in substantial handy trunks. Potatoes may perhaps be best carried and preserved during the voyage in a good barrel, having the top secured by hinges and a padlock.

Scotch families usually and very judiciously provide themselves with a sufficient quantity of oatmeal, eggs well packed, some tea and sugar, besides other provisions. A few cooking utensils are indispensable; and tin dishes, for eating out of when the sea is running high, and the vessel heaving, would be an advantage. Milk boiled with loaf-sugar, in the proportion of one pound of sugar to a quart of milk, and bottled when cool, will keep sweet all the voyage.

The following we quote from the letter of a Scotch emigrant:—"Upon the voyage out, your provision-store should consist mostly of oat-meal, plenty of potatoes, eggs, hams; a good supply of porter and ale you will find to be very useful. Tea will not be much used; coffee will. Bring along with you some rice, with every other article to make a rice-pudding; and particularly bring plenty of red herrings; you will find these very useful indeed; a few dried fruits, &c. Be sure to bring provisions for three months at least; and if you do not require them all on the voyage, you will find them of great use to you afterwards."

A Scotch emigrant in Upper Canada, in a letter published in the Counsel for Emigrants, gives the following list of provisions to be taken to sea for four persons as steerage passengers:—"16 or 18 pecks of potatoes in a barrel with a lock on it; 40 lbs. of good beef, well salted in brine; 16 lbs. of butter; 3 lbs. of coffee; 3 or 4 dozen of *old* bottled beer, which has less chance of flying than if new; some dozens of eggs packed in salt; half a dozen cod-fish, cut in pieces for boiling; some dozens of Buckie haddocks, well dried for keeping. Milk does not keep well; no sweetmeats are relished at sea. A few oranges, which at times taste very pleasant to the parched palate; some cheese; 8 lbs. of treacle in a flagon; 1 stone of barley; a good deal of pepper and mustard; plenty of carrots, turnips, and onions, for broth—they will keep all the voyage; 28 lbs. of fine ship bread; 8 or 10 quartern loaves, baked hard; 1 boll of oatmeal, 6 pecks baked into bannocks and cakes, very well fired, and flat for packing; some white puddings; some suet for dumplings; a few candles, and a white-iron lantern with horn; 1 bottle of vinegar, to use in water on shipboard; 1 bottle of castor-oil; 2 or 3 dozens of colocynth and rhubarb pills; 6 lbs. of epsom salts, and 1 lb. of senna—these medicines are very dear here; tin pan to fit the stove of the ship—and it is convenient to have one for hooking on the ribs of the grate when the top of the fire is occupied; kettle for making coffee, &c. Use no crockery, but instead, jugs and bowls of tin; broth-pot, frying-pan, and tin-kettle."

The best months for leaving England are certainly March and April: the period during which the greatest number of vessels sail is between the 1st and 15th April. The names of the vessels to sail are generally advertised in the newspapers. The conveyance of passengers to the British possessions in North America is regulated by an act of parliament (5 and 6 Vic. cap. 107), of which the following are the principal provisions:—Ships are not allowed to carry passengers to these colonies unless they be of the height of six feet between decks, and they must not carry more than three passengers for every five tons of the registered burden; there must be on board at least fifty gallons of pure water, and seventy pounds of bread, biscuit, oatmeal, or rice, for each passenger.* Masters of vessels who land passengers, unless with their own consent, at a place different from that originally agreed upon, are subject to a penalty of £20, recoverable by summary process before two justices of the peace in any of the North American colonies. The enforcement of this law rests chiefly with the officers of her majesty's customs; and persons having complaints to make of its infraction, should address themselves to the nearest custom-house or government emigration agent. These officers act under the instructions of the Government Emigration Commissioners in London (a board constituted to superintend emigration and the diffusion of information regarding the colonies, and who have their office in Park street, Westminster.) The agents of these commissioners, who are all officers of the royal navy, are stationed at most of the chief ports; namely, London, Liverpool, Glasgow, Greenock, Dublin, Belfast, and two or three other Irish ports. Their duties are to afford information as to the facilities for emigration from their respective ports, such as the sailing of ships, means of accommodation, and that the provisions of the passengers' act be strictly complied with, as in regard to the sea-worthiness of vessels, their having a sufficiency of provisions, water, medicines, &c., on board, and that they sail with punctuality. Agreements or receipts for passage-money require to be furnished according to a particular form by the captain, shipowner, or *properly authorized or licensed* agent, so that no undue advantage may be taken of passengers. Expenses may be summarily obtained from the captain or owners of the ship for each day persons may be detained beyond the time fixed for sailing, except when the cause of detention is unfavourable wind or weather. The passengers' act applies to all vessels leaving British ports, and carrying steerage passengers: the benefits of the act are not extended to cabin passengers.

LANDING.

Previous to disembarkation, arrange your baggage in a

* Steerage passengers require to prov de themselves with a mattress and bedding.

* One half of this supply of provisions is allowed by the act to be furnished in potatoes, five pounds of potatoes being computed to be equal to one pound of bread.

small compass, the fewer packages the better, but have them well secured—old dirty clothing, large boxes, and other useless articles, are not worth the carriage. If you have any provisions left, such as oatmeal, potatoes, &c., you can sell them at Quebec, and avoid the expense of transport, and you can purchase bakers' bread, butter, tea, sugar, and other necessaries more suited for your journey. All sorts of provisions may be bought cheaper, and generally of a better quality, in Montreal and Upper Canada than at Quebec. Dress yourself in light clean clothing. Females frequently bring on sickness by being too warmly clothed. Cut your hair short, and wash daily and thoroughly. Avoid drinking ardent spirits of any kind, and when heated, do not drink cold water. Eat moderately of watery food. Avoid night dews. By attending to the preceding directions, sickness will be prevented, with other serious inconveniences. When every thing is ready for disembarkation, and if the ship is lying at anchor in the river, take care in passing from the ship to the boat. Avoid all haste, and see that your baggage is in the same conveyance with yourself, or left under the charge of some friend, with your name on it. If the ship hauls to the wharf to disembark, do not be in a hurry, but await the proper time of tide, when the ship's deck will be on a line with the quay or wharf. Passengers are entitled by law to the privilege of remaining on board ship forty-eight hours after arrival; and it is unlawful for the captain to deprive his passengers of any of their usual accommodations for cooking or otherwise; you may therefore avoid the expense of lodgings, and make all your arrangements for prosecuting your journey. If, previous to disembarkation, sickness should overtake you, proceed immediately, or be removed, to the Emigrant Hospital, in St. John's Suburbs, where you will be taken care of, and provided with every thing needful until restored to health. Medicine and medical advice can also be had at the dispensary attached to the Quebec Charitable Emigrant Society. This society will grant relief to all destitute emigrants. In Montreal there is a similar institution for the relief of emigrants. It is particularly recommended to emigrants not to loiter their valuable time at the port of landing, but to proceed to obtain settlement or employment. Emigrants not unfrequently find employment in the city of Quebec and its vicinity, as also in and about Montreal. Single men, in particular, are advised to embrace offers of this kind; but emigrants with large families had better proceed without delay to Upper Canada, as hereafter directed, or to situations in Lower Canada, particularly the eastern townships; and if they have sons and daughters grown up, they will very probably find a demand for their services. Artificers and mechanics of all denominations, and farming labourers, if sober and industrious, and good workmen, may be sure of doing well. Blacksmiths, particularly those acquainted with steam-engine work, also good millwrights and sawyers by machinery, have an excellent field for improving their circumstances in Canada. The current rate of wages lately paid to carpenters, masons, and other artificers, was from 3s. 6d. to 6s. or 7s. per day, according to circumstances; farm-labourers were paid at a lower rate. There is little demand for persons skilled in the ornamental professions, or for the preparation of articles such as are usually imported from England. Emigrants with families, and who are possessed of from £20 to £25, are advised to push immediately into the interior in the vicinity of old settlements, where they can obtain provisions for their spare labour. The most vexing circumstance connected with money matters, is that the currency of the whole of British America is different from that which prevails in the United Kingdom; in other words, a shilling in England is different from a shilling in Canada. The money of Canada is locally of higher nominal value than what we understand by the term *sterling*, and is called Halifax currency. The difference varies; but it may be stated in general terms, that an English sovereign is reckoned to be worth 24s. 6d. currency; or an English shilling is equal to about 1s. 2¼d. or 1s. 3d. currency. All wages are, of course, reckoned in currency. Therefore, when it is said you will receive 4s. a day of wages, the actual value of this 4s. is only 3s. sterling. This distinction between currency and sterling will soon be learned, and is on the whole of less consequence than the practice of paying wages in goods. We have heard very serious complaints on this subject. From all we can learn, it is not uncommon for an employer to pay his workmen by an order for goods on a store, corresponding to the amount bargained for; and such is the high price at which articles are usually sold when such orders are presented, that sometimes a workman, instead of getting 4s. a day, does not in reality get more goods than he could buy for 1s. 6d. in England. Thus an apparently high wage dwindles down to a trifle. Perhaps such practices are not resorted to by respectable employers, or may only prevail in parts of the country where a circulating medium is scarce; but we have considered it proper to mention the circumstance, in order to put emigrants on their guard. Always ascertain whether you are to be paid in cash or in goods, and act accordingly.

Having arranged all your business at Quebec, you will proceed without loss of time to Montreal, by steamboat, on your route to Upper Canada. Several steamboats ply daily to Montreal, 180 miles up the St. Lawrence, which is performed in from 24 to 30 hours. The fares on board the steamboats were lately as follow (but all may now be a little altered):—Deck passengers, adults, one dollar each; that is, 5s. currency, or about 4s. sterling; children under twelve years of age, half-price; and under seven, one-third. The routes and fares to the principal places were lately as follow:—

Quebec to Montreal, by steamboats, - - -	4s.
Montreal to Kingston, by steam, - - - - -	12s.
Kingston to Toronto, by steam, - - - - - -	12s.
(Touching at Coburg and Port Hope.)	
Toronto to Hamilton, by steam, - - - -	4s.

Steamboats also ply from Kingston, Toronto, and Hamilton, to Niagara and Queenston. From Queenston, on the river Niagara, a few miles below the famous Falls, the traveller may proceed to Buffalo, or to a port on the Canada side of Lake Erie, and take a steamboat for Port Stanley, in the London district, Amherstburgh, on the river Detroit, Sarnia, on the river St. Clair, or Goderich, on Lake Huron. Stage-coaches or wagons are to be had from all the chief places on the lake or river coast, to all the principal settlements in the interior; the cost of travelling by stage is usually from 2½d. to 3d. per mile for each passenger. The hire of a wagon, with a pair of horses, is generally three dollars, or about 12s. sterling, a day. A comfortable wagon upon springs, and with good horses, should be selected. At most of the towns in Canada government agents are stationed, to afford gratuitous information and advice to emigrants.

Persons proceeding to the thriving settlements in the Newcastle district, disembark at Coburg or Port Hope, on Lake Ontario. Those going to the townships of Seymour may proceed from Kingston, by the beautiful Bay of Quinté, to the mouth of the Trent river, from whence a road, distance 18 miles, brings you to Seymour. If proceeding to the Home district, disembark at Toronto, the capital of Upper Canada. If for the London district, proceed either by the Niagara frontier to Lake Erie, or take the stage-coach direct from Hamilton to London. The distance is between 80 and 90 miles, and the road is now reported to be one of the best in Canada. A similarly good road, all well planked, takes the traveller from London westward to Chatham. Stage-coaches run every day. Stages run twice or thrice a week from London to Goderich, Sarnia, and Port Stanley; and also from Hamilton to Dundas, Galt, Guelph, and Goderich. If for Bytown, Grenville,

Horton, or other situations on the Ottawa river, proceed from Montreal and Lachine by the usual conveyances. Such are the directions that were a short time since suitable; but as there are continual changes, emigrants may find it necessary, on their arrival, to act more by local information than any thing we can say on the subject.

We think it important to mention, for the benefit of the poorer class of emigrants, that there has existed for some years in Montreal a benevolent society of great local importance, called the Canada Immigration Association. This body of individuals, actuated by humane motives, and desirous of forwarding labourers to places where their services are required, affords ready assistance to poor emigrants on their arrival at Montreal. It appears that, from the 11th of June, 1840, to the close of the navigation by frost a few months later, the society relieved 322 natives of England, 8778 natives of Ireland, 397 natives of Scotland, and 10 from Germany; total, 9507. Of this number, 201 were above sixty years of age, and 587 were infants. The relief consisted in furnishing provisions and a humble kind of lodging in sheds, also medical attendance, and payment of passage of individuals and families to places in the interior. The emigrants were greatly benefited by being sent off without loss of time, as they were thereby not only saved from the danger to their health and morals, which would have been incurred by remaining any length of time idle in a large city, but their time was economized, which is the most important consideration of all when the necessity of making preparations for the rigours of a Canadian winter is considered. Such was the desire of the society's committee to expedite emigrants, that in some instances they were sent off from Montreal, and actually on their route to Upper Canada, within thirty-six hours of their arrival in Quebec, and in all instances delay was as far as possible avoided.

SALE OF LANDS.—SETTLEMENT.

The mode of selling crown lands in the British North American possessions was, until recently, far from satisfactory, the principle formerly pursued being to have periodical auctions of lands at upset prices; and the emigrant, after waiting perhaps for a very inconvenient period, would find himself outbidden in price. The crown lands in all the North American colonies now, are understood to be offered at fixed prices, varying from about 2s. 6d. to 14s. an acre for wild lands generally. In the cases of town and pasture lots, the prices which from time to time are fixed upon such may range most frequently from £4 to £8 an acre, and in some instances much higher. With regard to the prices and modes of sale of lands in Canada, we are enabled to supply the most recent information from a lately published work, "Views of Canada and its Colonists, by a Four Years' Resident," (Edinburgh, 1844)—a work we can confidently recommend for the fulness and trustworthy character of its details.

"Lands in Canada (proceeds this authority) may be purchased either from government, incorporated companies, or private individuals. The lands under the control of the government are classified into crown lands, clergy-reserves, school-reserves, and Indian reserves, and are scattered over every district of the colony. The incorporated land companies in Canada are two, the British American Land Company, and the Canada Company. The lands possessed by the former are situated in Lower Canada; and the Canada Company's lands in the Upper or Western division of the province. This latter company, which was incorporated in 1826, possesses scattered lands in every district, and almost every township of Upper Canada, besides large territories or tracts in the Wellington and Huron districts, the latter consisting of a million of acres. The lands held by private individuals for sale are situated in every part of the colony, and consist of tracts and scattered lots which have been purchased for speculation, or acquired in payment of debts, chiefly by merchants, and lots of from 100 to 1000 acres in the occupation of the proprietors, and partly cultivated. Dividing the description of lands in Canada into the two classes of waste or wild lands, and lands partly cultivated or cleared, some information respecting them is subjoined.

"*Wild Lands.*—The crown lands, by an act of the colonial legislature, are to be sold at a price to be from time to time fixed by the governor in council. The present fixed price for such lands in Upper Canada is 8s. currency, or 6s. 7d. sterling per acre. This price does not apply to lands reserved by government for non-payment of the conditions of settlement on which they were granted under a former system now abolished, nor to lands called Indian reserves, and clergy-reserves, which three classes are, as well as town and village lots, subject to special valuation.' The Government Gazette publishes respecting the crown lands, which are to be had for 8s. currency, that the lots are to be taken at the contents in acres marked in the public documents, without guarantee as to the actual quantity; that no purchase-money will be received by instalments, but that the whole, either in money or 'land scrip,' must be paid at the time of sale. On the payment of the purchase-money, the purchaser will receive a receipt which will entitle him to enter upon the land purchased, and arrangements will be made for issuing to him the patent deed without delay. [The 'land scrip' mentioned above is paper issued by the colonial government in satisfaction of U. E., or other claims for lands adjusted by this means, and which paper, bearing a certain value attached by government, and taken as payment for lands, is frequently to be purchased much under the nominal value from the holders for ready cash.]

"For public convenience, government agents are appointed in each municipal district, 'with full powers to sell to the first applicant any of the advertised lands, which, by the returns open to public inspection, may be vacant within the district.'

"In addition to the crown lands offered for sale at 6s. 7d. sterling per acre, the colonial government has set apart settlements in both Upper and Lower Canada, in which individuals of twenty-one years of age and upwards, who have never obtained a grant of land from government, may receive a farm lot of 50 acres without purchase, upon certain conditions. The settlements in Lower Canada are upon the Lambton and Kennebec roads, the former leading from the village of St. Francis, through Tring, to the townships of Forsythe and Lambton; and the latter being a continuation of the Kennebec road from Aubert de Lisle to the Province Line. The settlement in Upper Canada is upon a road which commenced opening in 1842 at the expense of government, through the crown land from the north-west angle of the township of Garrafraxa, in the Wellington district, to Owen Sound upon Lake Huron. The road which opens up this important new territory terminates at Lake Ontario, from which Owen Sound is distant somewhat over a hundred miles. The chief conditions to be observed by settlers are—

"They are to make application to the commissioner of crown lands, or to the agent on the ground, wherever they shall be ready to become resident on the tract to be granted. Upon giving a satisfactory account of their means of providing for themselves until a crop can be raised from the ground, they will receive a ticket from the commissioner at the crown land's office, entitling them to locate the land. Upon application to the agent in the first place, he will forward a statement to the crown land's office of the applicant's age, family and means of settlement, upon which, if approved, authority for location will issue. Settlers will be required

to clear and place once under crop one-third of the land located, and to reside on the land until this settlement duty is performed; and after one-third of the grant shall have been cleared and under crop, the settler shall be entitled to his patent free of expense. The settlement duty is required to be done within four years from the date of the ticket.'

"The class of lands known as clergy-reserves are subject to the disposal of the commissioner for crown lands and his agents in each district. The amount of these lands to be disposed of in any one year in Canada is limited to one hundred thousand acres, except with the written approbation of one of her majesty's principal secretaries of state. The lands are reported upon and valued by inspectors appointed by the crown land's commissioner, and returns upon oath are made by the inspectors of the extent, nature, and other particulars, including the value of such lands; and upon the returns being approved of by the governor in council, the same shall be communicated to the commissioner of crown lands, and the lands contained in such returns shall be considered open for sale, and the price stated in such returns as confirmed, including the value of improvements, to the first person who shall apply for, and pay for the same.'

"The sale of clergy-reserves are subject to the following terms:—'Two-sixths of the purchase-money to be paid in hand, and the remaining four-sixths in four equal annual instalments, payable on the first day of January in each year, with interest, at the rate of six per cent. per annum—the first of the instalments to fall due and be payable on the first day of January next ensuing after any such sale.'

"The lands of the British American Land Company in Canada are situated in a district of country in Lower Canada, known as the Eastern Townships, and amount to about 700,000 acres. The price of the new or wild land of this company, according to their published papers, is 6s. to 8s., and near towns, 12s. an acre.

"The Canada Company, whose lands are in Upper or Western Canada, have for a number of years been concerned in selling properties to settlers on liberal terms, likewise in giving leases to those who are indisposed to buy lands, with the option of afterwards becoming purchasers of what they have been paying a rent for. It is very easy gaining information on all these points in the colony. New printed lists of land (which may be seen in every post-office and store in Canada West), and any particulars, may be obtained, free of charge, upon application, if by letter post-paid, to the company's office at Goderich, or Toronto. In order to afford every assistance to industrious and provident settlers, the Commissioners of the Canada Company in the province will receive any sum, no matter how small the amount may be, for which their lessee settlers may not have immediate want, on deposit, allowing interest at the rate of four per cent. per annum for the same, when remaining in their hands for ninety days or upwards; but it is clearly understood that the full amount, with interest accrued, shall at all times be at the disposal of the settler without notice. For this purpose the company have opened an account, which is termed 'Settlers' Provident or Savings' Bank Account,' thus affording to the provident settler every facility for accumulating sufficient money to purchase the freehold of the land which he leases, whenever he chooses to do so, within the term of ten years. But should bad harvests, or any unforeseen misfortunes visit him, he has always the amount deposited, with interest accrued, at his disposal to meet them.

"*Improved Farms.*—It is, as will be conceived, difficult to state the precise prices at which improved farms can be purchased, the locality, amount of improvements, and particular circumstances of persons wishing to sell, having all to be taken into account. It may be generally remarked, however, that such farms, say usually about 200 acres, with 40 acres, or less or more, under cultivation, and having dwelling-house, farm-buildings, and sometimes implements and stock, are frequently to be bought under real value. The number of farms in the market of this description rises, in many cases, from the possessor wishing to purchase a large extent of wild or waste land for the purpose of sharing such with his grown-up family. In the greater number of instances, perhaps, farms partly cultivated are to be had for about £3, 10s. to £5 an acre. Good bargains are frequently to be had when purchasers are able to pay ready money. An instance I am able to mention of an Englishman who arrived in the London district in the spring of 1843, and who purchased a farm of 100 acres, one half cleared, with a dwelling-house upon it, though not very good, a frame barn, and also some stock, for £350 currency, or about £286 sterling, ready money. This farm is about four or five miles from the town of London, and was considered to be a cheap purchase. Another instance I know of is of a farm about the same distance from the town, and the same size as the above, but understood to possess a better soil, having had an offer of a purchaser for £600 currency, or £493 sterling; and the bargain, though not concluded when I heard of it, was expected to be. Like the other farm purchased for £350 currency, this one had also 50 acres cleared, with a frame barn and dwelling-house, though the latter of a rather poor description. There are mostly always advertisements of farms for sale to be found in the various newspapers throughout the country, and many bargains are had in this way; but it is ever a great drawback that, with few exceptions, the price is not stated.

"Wild or waste lands near towns frequently bring a price apparently disproportionate to their value, compared with the low price of cleared farms. This is chiefly owing to the timber in such situations being valuable for fuel. A lot of 150 acres of woodland, within two and a half miles of London, was lately sold for £500 currency, or about £411 sterling, and shortly afterwards easily resold for the same amount.

"The least quantity of farm land sold by government is 50 acres, and the least quantity disposed of by the Canada Company is 100 acres. The usual size of farms in Canada is 200 acres; 100 acres, however, is considered a fair size for persons of moderate means. With respect to the important matter of ascertaining the validity of titles in cases of purchases from private individuals, it may be mentioned that each county has a register-office, in which titles to lands are recorded. The charge for a search is 1s. 6d."

In making a selection and purchase, we would advise the emigrant to keep in mind the following points:—See that there is a tolerable road to the property; that it is not too far distant from a town; that it is not environed with clergy-reserve lands, which, being uncleared, and without roads, except you assist to make them, are a nuisance; that you will have decent neighbours (English or Scotch, if possible); and that the neighbourhood possesses a place of public worship, and school, or will shortly have them.

The difficulties at first in fixing and settling upon a farm are very great—much greater than one in ten has any idea of; but by prudent and diligent management no one need despair, and in the end a state of comfort will unquestionably be attained. Having acquired a property, the first thing you have to do is to select a favourable spot for your log-house, which should be near a spring of water or running stream, and where a *cellar to keep your potatoes in winter can be dug under the house*. Carefully clear the timber and brush to a distance from your dwelling and out-buildings, or, in the event of fire in the woods, great risk is incurred of

their being destroyed. If you proceed to build houses and clear lands on a large scale on first arrival, it rarely succeeds so well; for the price of labour is so high, and the difficulty of getting persons to work, added to the great expense of providing food for increased numbers, until produced from your own land, ought in every instance to induce caution in laying out money; but a crop of potatoes, with fodder for a cow, is the first object, and this may be accomplished the first year, if you arrive early. The second you will be enabled to supply your family with the necessaries of life from your own grounds; and the third year you may find yourself possessed of a yoke of oxen, a cow or two, and a year-old calf, a couple of pigs, poultry, &c., abundance of provisions for your family, and fodder for your cattle. The Irish and Scotch peasantry know well how to value the economy of a milch cow; every new settler ought to strive to obtain one as soon as possible, taking care to provide a sufficiency of fodder for the long winter. Cattle require a little salt in the Canadas. It is not considered necessary to go farther into the details of the first settlement, as on all these points you will be guided by your own observations on the spot, and the advice you will get from the local agents and superintendents.

ACCOUNTS GIVEN OF THESE COUNTRIES BY SETTLERS.

We quote the following letter from Upper Canada, from the United Service Journal:—

"Dear ——, You wish me to give you some account of Canada, and I will endeavour to do so; and if the little that I have to say on the subject does not tend to instruct, it will, I hope, serve to amuse you, and enable you to form correct ideas of this remote but interesting corner of the world. I may not possess extensive information upon every subject connected with Canadian affairs, nor do I wish to tire you with lengthened or studied details. Having resided many years in Upper Canada, and circumstances having obliged me to consider it my adopted country and home, I have grown imperceptibly attached to the rough life of a woodsman; but I will endeavour to divest myself of prejudice, and hope to be able to present you with a plain unembellished account.

"Emigrants coming to Canada generally entertain very erroneous opinions; their information having been collected from the writings of people who have little knowledge of the country, or are governed by interested motives: they come full of romantic whimsical notions, but perfectly ignorant of the country they are about to inhabit, and of the trials that await them. On their arrival, they ought to abstain from eating new potatoes, green peas, unripe fruit, &c., or use them in moderation; for many, on their first arrival, are afflicted with dysentery, which, I am confident, is occasioned by the greediness with which they devour vegetables of every kind, after being confined for a few weeks to the use of salt provisions. Fever and ague are common complaints all over America [in low and swampy localities, not in high and well-drained grounds], but seldom prove fatal. They generally make their appearance in new settlements in four or five years after we have commenced clearing land, rage for one or two years, and then almost wholly disappear. They are probably to be attributed to the foul vapours arising from the decayed stumps and roots of trees and other vegetable substances. Intermittent and other fevers are common in the neighbourhood of large marshes and stagnant ponds. Emigrants ought to avoid such places.

"About sixteen years ago a number of families came from Glasgow and its neighbourhood. They were assisted by government, and settled in the district of Bathurst. They were moral and industrious, and an acquisition to the country; but such was the bad quality of the land selected for them, that many of them, after struggling for years, abandoned their farms, and removed to other places. Clearing land is laborious work. The first thing we do is to underbrush it; that is, cut the young trees and bushes close to the ground, and put them together in large heaps. The best time for underbrushing is when the leaves are on, or before the snow falls; for when the snow is on the ground, we cannot conveniently cut the bushes low; we then cut the trees down. The small branches are thrown upon the brush heaps, and the trunks are cut into logs of about twelve feet each: good straight logs of oak, ash, cedar, and some other kinds, are reserved to be converted into rails. The cutting of the timber is called chopping, and is mostly performed in the winter, as we have then most leisure: when the brush heaps are sufficiently dry, they are set on fire. Logging next commences.

"Wolves are numerous, and are very destructive to sheep, and occasionally to young cattle. I have heard of their attacking travellers; but upon inquiring into these reports, have always found them mere fabrications, though I know two instances when travellers on horseback have seen wolves in the middle of the road, and after trying in vain to frighten them away, or urge their horses forward, have been obliged to turn back. I have met them when travelling alone and unarmed through the woods, but never was even menaced by them. In winter, when oppressed with hunger, they are most dangerous. The wild-cat, or cat-a-mount, in figure bears a strong resemblance to the domestic cat, except in its tail, which is not above two inches in length, and tipped with black, as are also the ears; it is of the same colour as the wolf, and appears to be quite as large and powerful, though shorter in the legs: they climb to the tops of the tallest trees with facility, and are said to be very fierce: they destroy sheep and other domestic animals. We have also beavers, racoons, martens, and many other animals. Our woods abound with deer, hares, partridges, pigeons, and many other kinds of game. There are a great variety of ducks in our rivers and marshes; and here, in the western district, we have wild turkeys and quails; our rivers and lakes are equally well supplied with fish."

This letter goes on to describe a number of snakes which are found in Canada, such as the water-snakes which some suppose to be venomous; two kinds of rattlesnakes, which are both very dangerous: there are also garter snakes, copper-head snakes, and blowing adders. These reptiles are only to be found in particular districts, and with common precautions little danger may be expected from them.

The following letters are from a gentleman who settled about a hundred miles west from Toronto. He says—"I am installed in about 800 acres of clergy reserves and Canada Company's lands contiguous, and am in treaty for 800 more from private individuals, which, one with another, will cost fifteen shillings currency per acre. The land, besides being bounded by the River Thames, is watered at every half mile by streams running into it, the springs giving the purest water; the land slopes down to the south; and, altogether, is calculated to create satisfaction. I have set people to work, to chop, clear, burn, and fit the land in every respect for sowing, for eleven dollars an acre, or £2, 15s. The fencing will cost me at the outside two dollars more per acre, and sowing one dollar and a half, making in all £3, 12s. 6d. My log-house, 34 by 22, and two stories, will give me six good rooms at least for roughing in, and will cost me at the outside, to make it comfortable, not more than £50. In this my friend and I will live during the winter, and until I get things prepared for building. We have every thing as comfortable and good to eat as the most reasonable man could wish; and barring pawter spoons for silver, horn-handled knives for

ivory, our table would not blush to stand alongside one at home. I have made three trips to Toronto since our location, and bought a load of things each time. I must make three trips more, most likely before winter, to complete stores, pick up labourers, and arrange for land. Well, with the whole of this hard work, much hard desling, thought, and calculation, I grow more and more enthusiastic in favour of the country. Our climate is delightful, and our neighbourhood excellent and obliging. *I would not for twenty thousand pounds return to Scotland.* I want not money, but to lead a useful life. Now, Alexander, if you want to buy land for your boys, do it immediately." Here the writer enters into private details, so we pass on to his next letter. After giving some further account of his operations, he thus proceeds to speak of his toils:—"Riding fourteen miles to get lumber or sawn timber drawn, to ride to measure every cart-load myself, and to do at least one-half of what one at home would find people trustworthy enough to do for him, you will not wonder that the toils of a beginning are as numerous as they are weighty. However, I like the life amazingly. I find at all events some scope for my mind; and if there be difficulties to surmount, there is no little pleasure in overcoming them, and still greater in feeling one's self equal to it. I have just been buying a hundred bushels of oats at 11½d. a bushel, so you know what oats may be had for; excellent apples 7½d. per bushel; wheat is high this year—that is, a dollar a bushel; and butcher meat for 2½d. and 3d. per lb.; potatoes the same price as oats."

In another letter he says—"Since my last, I have removed to my new residence; and although, as I said before, I have to break my neck to get a view of the heavens overhead, get the cramp in my fingers from milking the cow in these cold mornings, follow the trail of my oxen when they stray, and be alternately plasterer, glazier, slater, delver, and chopper, so that my hands have become as hard as elm, and their shape like bullock's lights, with Bologna sausages for fingers—I am, for all this, as pleased as Punch, and even get fat on it. Indeed, I may say, I have been indefatigable since my adoption of my new calling; so that, if I don't succeed in establishing some degree of order, and management, and evidence of prosperity, 'twill neither be for want of activity, decision, good humour, nor system." It is clear that this is the sort of person for a Canadian life. Again, in January, 1834, he says—"I rise every morning at five o'clock, and awake the household; and while the servants are managing the breakfast, so as to get all comfortably over by daylight, I light the fire in our room, for I exact no service not absolutely necessary. I don't mean what you call *necessary* at home, but things of far lower estimate. My shoes, for instance, which are somewhat of the thickest, are well greased twice a week, instead of being blackened, which is very well for walking the streets, but of wondrous little use here. I have cut down twenty acres since my last, and am continuing the good work. We muster in all seven axes, and get through about an acre a day; but as other matters interfere to take off my hands, I find I cannot average more than about twelve acres a month. I see by my account with the bank that they have credited me with———; and as money currency goes as far here as money sterling does in England, I calculate I am a gainer of rather more than a fifth by the transfer. That, with the high rate of interest, the cheapness of living, and exemption from taxes, makes me at least three times as rich a man as I was at home."

By the next letter, we find the writer equally pleased with the country both as to soil and climate, and also for its healthiness. He had now a good deal cleared, and was burning off his timber from twenty-five acres for spring crop. He had rented all that he had cleared to a farmer from Scotland for a third of the crop, and was gradually acquiring the means of a lasting independence, along with all the attributes of rural wealth and comfort It has been said that gentlemen should not emigrate to Canada—that it is a country only for working people but this idea is quite fallacious. The present is but one of many hundreds of gentlemen who, during all their lives before, had never soiled their fingers with labour and yet we see what is the result. We venture to say that Mr. R. is as active, and puts his hands to as much dirty and hard work, as would be the case with a person bred to rough country labour; while his education and intelligence lead him into the most advantageous course of operations.

Those who cannot immediately purchase land in Canada, sometimes put in grain along with that of any neighbouring farmer, and receive a share of the crop. "This being the case with me this year," says a writer of a letter dated January, 1834, "one of my neighbours puts in two fields with me—one of rye, of which he does all the work except half the harvesting, affords half the seed, and gets half the crop: another of peas, of which he does all the work, affords all the seed, and gets two-thirds of the crop."

We quote the following from a letter written by a settler in the township of Nichol, Upper Canada, to a friend in Scotland, and which appeared in the Aberdeen Herald:—

"From the experience of myself and friends, I give my plain candid opinion on this matter, when I say to the emigrant newly come among us, beware of attempting to clear more than you have a rational prospect of finishing in time for the season of sowing or planting Two acres well cleared are worth five acres indifferently finished; and if you can set about it by the first or second week in July, you may get two acres nearly ready to receive fall wheat. Should you attempt seven acres, unless you have a strong force and plenty of dollars, it is ten to one but you will fail of being ready in time; and if the spring be as backward as I have seen it, you would be too late for cropping them. Now, if you can get two or two and a half acres sown with fall wheat the first autumn you are in the woods, and get half an acre cleared for potatoes by the 15th or 20th of May, which may be quite practicable, and perhaps another half acre cleared for turnips by the 20th of June, I maintain there is a rational prospect of your eating the produce of your own farm during the second year of your settlement, and have as much as bring you to the next crop; but bear in mind, that during the first year you must buy in your provisions, or work for them. Go on clearing for fall wheat during the summer, and perhaps you may get four or five acres ready by the second autumn; and if you can get the stubble burned off when your first crop of fall wheat grows, by the 20th or 25th of May next year you may get in a crop of barley without ploughing, and timothy-grass seed grown along with it, to give you a crop of hay during the third year. If you can get another acre or so cleared for potatoes, you will have some of them to dispose of after supplying yourself; and where turnips and potatoes grew the previous year, you may get spring wheat or oats sown the next. This may be a rational prospect of the fruits of your industry at the end of your third autumn or second harvest, and thus you may begin to feel yourself in a thriving way. This, however, brings me to speak upon the next matter for the emigrant's consideration—live-stock. If he can possibly afford it, he must endeavour to procure a cow to begin the world with. During the summer months a cow gets her meat in the forest without costing the owner a farthing for keep; and for the other six months straw and turnips will be advantageous; but tops of trees, felled down for the purpose, seem to be the food they are instinctively inclined to prefer. The last of course costs the farmer the trouble of chopping them down; but as

he may be engaged doing so for the purpose of clearing, he thus 'kills two dogs with one bone.' Clearing can scarcely be carried on without the assistance of a yoke of oxen; but unless the emigrant can buy food for them, I would not recommend him to purchase these during the first autumn, but rather hire a man and a yoke to assist him when and where necessary; and he may have some more encouragement to buy a yoke during the following year, with the prospect of having some food growing for them. You will understand that I have been writing about the *bush farming*, as it is called, and taking it for granted that I am addressing an intending emigrant who is possessed of a moderate supply of money. In fact, supposing he had a considerable amount with him, still he will be nothing the worse for adopting the plan I have laid down. Were it possible to get a small cleared farm to commence upon, it would perhaps be more advantageous to the emigrant.

"I now finish my letter by giving my opinion on the subject as a whole. If a man have firmness, patience, and fortitude, combined with perseverance and prudence, he will in the course of a few years be quite comfortable—I might say independent—even supposing he set himself down in the bush at a considerable distance from neighbours; but if he could get the chance of a farm with four or five acres cleared upon it, I would recommend him to fix upon such in preference to one completely wild, unless he is careless of what sort of neighbours he may be likely to have about him."

Another letter, dated from Fort Erie, says—"Wheat is selling here for 5s. per bushel; oats, 1s. 3d. per bushel; butter, 6d. per lb.; eggs, 6d. per dozen; beef, 2½d. to 3d. per lb. Servant's wages, £2 to £2, 10s. per month, with board. Tea, 3s. per lb.; green tea, 4s. 6d. Potatoes are selling at 1s. per bushel; 350 bushels constitute an average crop per acre.

"A farmer can settle here in style with £500, and keep as good a table as any of our lairds; but of course must attend to his business and keep at home, as servants here are much less to be depended on than they are in Scotland. I have seen a few persons in the ague, but they seem to think little about it; those on Lake Erie are more liable to it than those on the lower lake."

Extract from a letter dated Sandwich, Western District, Upper Canada, which appeared in the Inverness Courier:—

"In this district, after mature consideration, I have finally settled. Having at a very early period been colonized by the French, and since that time vastly improved by numerous proprietary, it has all the commercial advantages of the mother country, with infinitely greater capabilities of supplying the raw materials. The fertility of our soil is even here proverbial, and our produce superior in quality; so much so, that our wheat is uniformly a shilling ahead of any other. Along the sides of the isthmus on which we are planted (for, with the Lake St. Clair on the one hand, and Erie on the other, it almost is such) there is ready and cheap conveyance by steam; while the Thames, a noble and majestic stream that intersects the interior, opens up the inland parts. Not even a tree is felled in the remotest parts of the country but may be conveyed by water to market. That of Detroit, on the American side, is flocked to from all parts of the Union and of the British possessions; and, both from the numbers that attend, and the quality of the articles produced, is among the best in the country. There is abundance of woodcocks, snipes, and deer, in the district.

"But what chiefly fixed my determination was the salubrity of the climate, which, compared with that of Lower Canada, and most parts of Upper, is immeasurably superior.

"We have abundance of room for settlers. Were you to sail down the Thames, for instance, and see the country along its banks studded with cultivated farms and closely shaded behind with the 'tall trees of nature's growth,' waving their majestic foliage to the breeze of heaven, and seeming to court the hand of man to remove them from the situations in which they have so long flourished untouched; were you to meet the steamboats as they ply their course upwards—their decks crowded with emigrants, driven perhaps from the land of their fathers, and now come to seek a home 'beyond the western wave,' you would, as I have often done, heave a sigh for the wretchedness in other climes that here might be relieved—for the starving inmates of many a hovel that here might have 'plenty and to spare.'"

Extract of a letter from a mill-wright who left Aberdeen for Zorra, Upper Canada, in 1832, to his friends in Scotland:—"This is a salubrious climate: nothing beyond some trifling ailments has, ever since we came here, been the matter with any of us. This is a mercy for which we ought to feel thankful, for many of the first settlers were deeply afflicted with fever and ague for nine, ten, or twelve months, during which time they were unable to do any thing for themselves. I have purchased a farm of about 100 acres, and have got some little stock upon it: we have got two cows, a yoke of oxen, and a year-old steer, three sheep, and a nog. Our cows have been very useful, the one gives us milk in summer, the other supplies us pretty well in winter: our oxen, with a wagon, we got the other day. With such a stock on a farm of 100 acres, with about thirty acres cleared, we get on very comfortably. In a new settlement as this is, far removed from market, it is no easy matter to raise money; but in this respect there is a prospect of improvement. Now, as to the important question, shall I advise you to follow us? Were I to consult merely my own feelings and comfort, I should say without hesitation—*come, come every one of you*—come as soon as possible. Here, with hard labour and industry, after three or four years, you might find yourself in possession of a piece of land, at least fifty acres, which you could call your own; also a yoke of oxen, and cows, &c. upon it, besides other property. Judge if such can be the case where you are. But it cannot be concealed that there are difficulties to encounter, and privations to be endured, which every one has not resolution to face or patience to bear; *these especially occur to those who have little or nothing to commence with.* Our winter has as yet been just such as yours—very moderate. For some time we had the frost perhaps rather more intense than you ever have it, but it has had no durability; it has been, however, easier than usual, and the former was as much severer. The heat of the last summer was fully greater and of longer continuance than usual; and I may say that I have felt neither the heat of summer nor the cold of winter at all insufferable; nay, though both have been stronger than in Scotland, I have felt both more disagreeable there, however it may be accounted for. We have had several slight storms, but none of them has lasted above a week or two. Our cattle here live in summer by ranging the woods; in winter, if scarce of fodder, we can bring them through by chopping down the maple, on the tops of which they seem to fare sumptuously. Making sugar from the maple-tree is here a principal source of gain to the settler. The sugar season begins generally about the middle of March, and lasts about a month. Some will make from ten to twelve cwt. in a season, which can be sold for about £2 per cwt—a good deal of which, however, must generally be taken in goods. Two months hence, we expect to be able to tell you more about it, as we intend to make the most we can of it. It would be desirable if you could send or bring some seeds—an English pint of good potato oats, barley, a few seeds of the best kinds of potato, some yellow turnip-seeds, early carrots, onions, caraway seed, some greens and cabbage seeds, and a few roots of

strawberries. We have wild gooseberries in the woods, but no garden gooseberries. Some of them you could bring if you come yourself, the others could be packed in a small box."

Extract of a letter from a gardener who left Aberdeenshire in 1834, to a friend there:—"I got into a very good situation as soon as I arrived in Montreal. I am engaged for one year. My wages are not so high as I expect they will be when I become better acquainted with the climate of the country. Just now I have £40 per annum, and bed, board, and washing. I have three acres of a garden, along with ten acres of apple orchard, to take charge of, and am assisted by two labourers who are constantly with me. The garden is surrounded by high brick walls, covered with peach and nectarine trees. The peaches here grow to a great size, and ripen excellently in the open air. The grapes bear well on trellises in the garden. I had a fine crop of these, superior to any I ever saw in the houses at home; and the melons are also surpassingly fine. I cut 300 of very fine melons from a small piece of ground not more than 20 feet by 12. Some of them weighed 15 lbs., and most of them from 6 to 7 lbs. They require no attention here whatever. Just sow the seed in the open garden, and keep them clear of weeds, and this is all you have to do. We do not think it worth while to give cucumbers garden-room; we sow them about the ditch-sides in the fields, and they produce most abundantly. Gourds come to a great size, some of them weighing 50 lbs. You will not be surprised that we can grow all these things in the open air, when I inform you what degree of heat we have for three months here during the summer. The thermometer stood for three months at 99 degrees all day in the shade, and 86 all night. I thought I would be roasted alive, being obliged to take my bed out of the house, and lie in an open shed, with nothing on but a single sheet; and after all I perspired very freely. The weather is cooler now, and they tell me that winter will soon be on, and continue for six months, during which all outdoor work will be suspended. Wheaten bread is very cheap: you can buy a loaf that will weigh 6 lbs. for 8d. Vegetables sell very high in the market: a good cauliflower will bring 8d.; a cabbage 4d. Potatoes, 2s. 6d. per bushel. Barley, 3s. 6d. per bushel. Beef sells at 5d. per lb. Pork, 6d. per lb. Mutton, 3½d. per lb. Eggs, 5d. per dozen. We can grow no rye-grass here. Our hay is all made of timothy-grass. We cut it in the morning, and it is ready to be put into the barn in the afternoon.

"I would advise no person to come here but such as are able and willing to work; for I can assure you this is no place for idlers. Labouring men's wages in this town are 2s. 6d. currency per day; joiners, 5s. per day; masons, the same; tailors, 7s. 6d. per day; blacksmiths, 5s. 6d. per day. Clothes are remarkably high here. Thirty shillings is charged for making and mounting a dress coat; six shillings for making a pair of trousers. Shoes much about the same price as in Scotland, but not so good."

Extract of a letter from a farmer who left the parish of St. Fergus in the summer of 1834, and settled in the township of Whitby, Upper Canada:—"With the advice of Mr. D—— and Mr. S——, I bought my present farm, which I shall now give you some account of. I have ninety acres of good land, seventy of which are cleared; and on thirty acres of this there never was any stone, and but few stumps to clear off—perhaps not above forty on each acre. About twenty acres are altogether clear of them, and I think I will have the whole cleared this season. I have a good orchard, containing about 200 trees, one-half of which are in full bearing, and the other half planted last year. The barn is good, but the dwelling-house rather indifferent. There are three log-houses on the place, two of which let at £6 each per annum. I have bought a pair of oxen, which cost me 70 dollars, and two cows, one of which cost £3, 10s., and the other £4, 10s. currency. The cattle here are very good: I never expected that I should see such in America. The horses are excellent, and although of the blood kind, can endure a great deal of fatigue. I had almost forgotten to tell you the price of my farm. It cost me £400 sterling. You may think this a very high price, but you cannot get woodland here under 8 dollars an acre, and it costs 12 dollars to clear and fence it. If a man can buy a cleared farm at £5 per acre, or £5, 10s., he is much better, if he has the money, than to go into the woods. I have ten acres of summer fallow ready to sow down with wheat; four acres of potato land; four acres where there was Indian corn, which I think I shall have ready to sow down in the course of ten days. I will sow the rest with spring crop, say oats and peas. I fear nothing in this country save the heat in summer; but I have been told, if I stand out this summer, I need not be afraid, as the oldest man in the place does not recollect such a warm season. We are at the same distance from church as we were at Cairnhill, and have two schools within two hundred yards of the door. A blacksmith and wright, a saw-mill and brick-work, are all about the same distance. A person here can have every thing as in the old country, if he has money. Wheat is very cheap. The best does not bring more than 3s. 6d. per bushel; but it is expected to rise very soon. The crop of it was excellent this year, as was also the Indian corn. If any of my old neighbours think of coming here, they need not fear of getting a farm, as there are always plenty to sell."

CONCLUSION.

Very little remains now to be said regarding these colonies. In our opinion, the question of emigration is one of a very simple nature, and may easily be solved by every thinking person. We have proved beyond the possibility of doubt, that British America is a country placed in infinitely better circumstances at the present moment than any part of Great Britain and Ireland. We have shown that, in most places, the climate is delightful, and the lands fertile. It is not denied that in many portions of the colonies agues and other local diseases prevail; but it admits of demonstration, that on the whole they are as healthy as these islands. If the inhabitants of the low uncleared lands in North America be liable to agues and fevers, those of this country are, on the other hand, continually liable to colds and consumptions to a degree fully as dangerous; indeed the *colds* of the island of Great Britain seem to rank as the most destructive of the diseases which affect mankind. Besides, every year the continent of America, as it becomes cleared, is becoming more salubrious, and it certainly possesses extensive tracts of land already fully as healthy and pleasant as any part of England. If it be established that British America is that fertile and promising territory which it is represented to be, the whole of the question of emigration resolves itself into this: are men who are in difficulties in this country willing to undergo the trouble of removing thither, and of exerting themselves for a few years after they arrive? As for the notion which obtains as to the pain of parting with early friends and the place of our birth, that we take to be entirely fallacious. It is the duty of every man to go where his mental and physical properties can be most advantageously exercised. It is a fundamental law of human nature, that mankind must disperse themselves over the whole earth, to seek out the best means of subsistence and the most agreeable spot for their residence. Had intending emigrants to proceed to a land of barbarians, where neither human nor divine laws were understood or acted upon, and where they had to settle on sterile deserts or burning

wildernesses, we might excuse their hesitation to depart from their native country; but the case is quite different. To emigrate to Canada, or any other British colony, is simply to remove, as it were, to another part of Great Britain. Distance is nothing; for the removal of a family from the north of Scotland to the south of England would be attended with nearly the same trouble and expense; and in each case the family would find itself surrounded with neighbours equally strange. But to emigrate to Upper Canada with the means of purchasing a tract of land, holds out a much better prospect than to remove from one part of Great Britain to another. In this country it now requires a very great mental and physical effort to obtain a comfortable subsistence. Nearly the whole of the lands and manufactures in the United Kingdom are passing into the hands of capitalists. The rich are becoming very rich, and the poor are sinking deeper and deeper into poverty and wretchedness. The small farmers and tradesmen of England, Scotland, and Ireland, are now placed in that peculiar condition, when emigration to a country less occupied and overdone than their own, is almost imperative; for, looking around on all sides, they see little chance of rising into better circumstances, or of rearing their families in that comfortable and reputable manner which their feelings dictate. To such, therefore, British America offers a fair field for removal and settlement. In these countries lands can be had in full possession at an expense of from fifteen to twenty times less than what is paid here by way of annual rent; and it is seen that in a space of from three to five years, the whole cost may be realized by the amount of the produce. In these colonies, moreover, there are no taxes; at least they are so very trifling, that they are not worthy of being classed as taxes. There are also no poor-rates, and no tithes, both of which imposts are severely felt in England. The emigrant will likewise have nothing to annoy him in a political sense; for in Canada he continues to be a British subject, and can claim all the prerogatives of such a distinction.

In short, it appears to us that, excepting the drawbacks attending the *first difficulties*, there is no substantial obstacle to a very considerable improvement of circumstances. But we entreat all who have any confidence in our advice, not to imagine that these difficulties will be trifling. They will be, on the contrary, of a very serious nature. Let all remember, that they will see a country consisting of extensive dreary forests, interspersed with settlements on the rudest scale; that the roads are generally in a very bad condition; that the cold of winter far exceeds what is generally experienced in Britain; that many of the conveniences of civilized life can with great difficulty be obtained; and, above all, that every one *must work hard with his own hands*. We tell all most distinctly, that these things will be seen and experienced; and that a great deal will in all likelihood be suffered for some years. Having, however, by patience and enterprise, got over the early difficulties, the settler will unquestionably possess a competence, along with the blessing of mental tranquillity, and be relieved of all fears respecting the rearing of his family in a state of decent independence.

EMIGRATION TO THE UNITED STATES.

The United States now occupy the largest portion of the North American continent, and offer a boundless field for the settlement of emigrants. Originally confined to the territory along the shore of the Atlantic, this great republic has extended its influence and power over nearly the whole of the regions spreading westward to the Pacific. This vast territory, surpassing in internal resources, and nearly in dimensions, any of the empires of the Old World, extends from the 25th to the 49th degree of north latitude, and from the 67th to the 124th degree of west longitude. It measures in extreme length, from the Pacific Ocean to the Atlantic, 2780 miles, and its greatest breadth is estimated at 1300 miles.

The United States consist of three great natural divisions—the slope from the range of the Alleghany mountains to the Atlantic, comprehending the oldest settlements; the valley of the Mississippi, now in the middle of settlement; and the slope from the Rocky or Chippewa Mountains towards the Pacific, which is still in a wild wilderness condition, and inhabited by Indians. The great wonder of this immense country is the valley of the Mississippi, which is considered the largest division of the globe over which the waters pass into one estuary. The Atlantic slope contains 390,000 square miles, the Pacific slope about 300,000; but this great central valley contains at least 1,300,000 square miles, or four times as much land as the whole of England. The valley of the Mississippi, into which the flood of emigration to the states is chiefly directed, is divided into two portions, the upper and lower valley, distinguished by particular features, and separated by an imaginary intersecting line at the place where the Ohio pours its waters into the Mississippi. This large river has many tributaries of considerate proportions besides the Ohio. The chief is the Missouri, which, indeed, is the main stream, for it is not only longer and larger, but drains a great extent of country. Its length is computed at 1870 miles, and its particular course 3000 miles. In its appearance it is turbid, violent, and rapid, while the Mississippi, above

junction with the Missouri, is clear, with a gentle current. At St. Charles, twenty miles from its entrance into the Mississippi, the Missouri measures from five to six hundred yards across, though its depth is only a few fathoms.

The Mississippi-proper takes its rise in Cedar Lake, in the 47th degree of north latitude. From this to the Falls of St. Anthony, a distance of five hundred miles, it runs in a devious course, first south-east, then south-west, and, finally, south-east again; which last it continues, without much deviation, till it reaches the Missouri, the waters of which strike it at right angles, and throw the current of the Mississippi entirely upon the eastern side. The prominent branch of the Upper Mississippi is the St. Peter's, which rises in the great prairies in the north-west, and enters the parent stream a little below the Falls of St. Anthony. The Kaskaskia next joins it, after a course of 200 miles. In the 36th degree of north latitude, the Ohio (formed by the junction of the Alleghany and Monongahela) pours in its tribute, after pursuing a course of 750 miles, and draining about 200,000 square miles of country. A little below the 34th degree, the White River enters, after a course of more than 1000 miles. Thirty miles below that, the Arkansas, bringing in its tribute from the confines of Mexico, pours in its waters. Its last great tributary is Red River, a stream taking its rise in the Mexican dominions, and flowing a course of more than 2000 miles.

Hitherto the waters in the wide regions of the west have been congregating to one point. The Mississippi is now upwards of a mile in width, and several fathoms deep. During its annual floods, it overflows its banks below the mouth of the Ohio, and sometimes extends thirty and forty miles into the interior, laying the prairies, bottoms, swamps, and other low grounds, under water for a season. After receiving Red River, this large stream is unable to continue in one channel; it parts into separate courses, and finds its way to the ocean or the Gulf of Mexico, at different and distant points below New Orleans.

The capabilities of the Mississippi for purposes of trade are almost beyond calculation, and are hardly yet developed. For thousands of years this magnificent American river rolled its placid and undisturbed waters amidst widely spreading forests, rich green prairies, and swelling mountain scenery, ornamented with the ever-varying tints of nature in its wildest mood, unnoticed save by the wandering savage of the west, or the animals which browse upon its banks. At length it came under the observation of civilized men, and now has begun to contribute to their wants and wishes. Every part of the vast region, irrigated by the main stream and its tributaries, can be penetrated by steamboats and other water craft; nor is there a spot in all this wide territory, excepting a small district in the plains of Upper Missouri, that is more than one hundred miles from some navigable water. A boat may take in its lading on the banks of the Chataqua Lake, in the state of New York, within a short distance of the eastern shore of Lake Erie—another may receive its cargo in the interior of Virginia—a third may start from the Rice Lakes at the head of the Mississippi—and a fourth may come laden with furs from the Chippewa Mountains, 2800 miles up the Missouri—and all meet at the mouth of the Ohio, and proceed in company to the ocean.

Those whom we are now addressing probably inhabit the island of Great Britain, where the traffic of every sea-port, every branch of inland navigation, has been pushed to its utmost limits, where every art is overdone, and where the heart of the ingenious almost sinks within them for want of scope for their enterprise. But here, in this wide-spread ramification of navigable streams, there is an endless, a boundless field for agricultural and mercantile adventure Within the last twenty-four years, the Mississippi, with the Ohio, and its other large tributaries, have been covered with steamboats and barges of every kind, and populous cities have sprung up on their banks. There are now *sea*-ports at the centre of the American continent—trading towns, each already doing more business than some half-dozen celebrated ports in the Old World, with all the protection which restrictive enactments and traditional importance can confer upon them. The valley of the Mississippi, one of the greatest natural wonders of the world, will one day possess and comfortably sustain a population nearly as great as that of all Europe.

Such are the great natural divisions of the United States. Usually the country is divided into what are termed the Northern and Southern, or Free and Slave-holding States, in which the climate and habits of the people differ very considerably. It is chiefly, and almost entirely, to the northern or free states that the attention of emigrants should be directed, because such persons will there have at once a temperate climate, more agreeable to their constitutions, and a greater scope for their industry in agricultural and mechanical employments. The Southern or Slave states afford no place for any except those who have capital to purchase both land and slaves; and the soil and temperature, besides, are adapted chiefly to the culture of tobacco, cotton, indigo, rice, and other tropical productions, in raising and preparing which the people of this country have no experience. Texas, a country on the south of the States, in which slavery is tolerated, lately forming part of Mexico, possesses also, we fear, too tropical a climate for the comfortable settlement of emigrants from Britain.*

EMIGRATION.

When the determination is once taken to emigrate, the next step is to make arrangements with a ship-owner, or captain, for the voyage. A passage may be taken either to Philadelphia, Baltimore, or New York, with almost equal advantage: Philadelphia or New York are perhaps preferable. The charge for passage from Leith to New York, in the steerage, is £3, 10s. to £4; children from 7 to 14 years, one-half; under 7, one-third; under 12 months, no charge: passengers find their own provisions. The ship lays in water, firewood, or coals, cooking apparatus, and fits up sleeping berths. One-third of the freight to be paid before the passage be secured, and the remaining two-thirds on sailing. Cabin passage, £14 to £15; children, £10. The line of packet ships which sail at stated periods from Liverpool and Greenock for New York, Philadelphia, and other ports in America, are as desirable vessels as could be wished for taking a passage in. They are of large tonnage; and being fitted up for carrying both passengers and goods, emigrants may expect greater comfort than in common sailing vessels.

Supposing the emigrant landed at Philadelphia, New York, or Baltimore, his next step, if a tradesman, is to consider where he is most likely to find work. Except shipwrights and one or two other trades, it is perhaps better to proceed to some of the considerable inland towns, where wages are generally higher and the cost of living less. On this subject, the emigrant will find ready information from people of his own business in whatever city he may land: they are seldom unwilling to put strangers in the way of finding employment. There is an emigrant society in Philadelphia, which has done a great deal for this purpose.

If the emigrant wishes to purchase land, and has fixed on the district where he intends to settle, he ought to take his passage accordingly to the port which is nearest to his intended destination. If he means to purchase a farm in the settled districts of New York, such as those in the valley of the Hudson, or about the lakes of the

* For a complete account of the United States we refer to the article on the subject.

River Mohawk, Genessee, &c., he should sail immediately for New York. The same port is the fittest for those who mean to proceed to Michigan; but these may also go by Montreal, whence the Rideau Canal, now opened, affords an easy passage to Kingston, instead of a disagreeable route by the rapids of the St. Lawrence, formerly followed, and which made emigrants generally prefer going, even to our own settlements, by New York, instead of Montreal. The passage by the canal, now opened, from that place to Kingston, costs 9s. 4d., with one trunk; other luggage must be paid for. Supposing the emigrant at Kingston, he will find a direct passage to Michigan by proceeding up Lake Ontario, and then through the Welland Canal, whence he will go up Lake Erie to Detroit. If he goes by New York, he proceeds up the River Hudson, thence along the Erie Canal to Buffalo, and next to Detroit by the Lake. By New York, the expense of the whole passage may be reckoned: passage to New York (in the steerage), £3, 15s.; to Albany on the Hudson, 9s. 6d.; to Buffalo, £2, 2s.; to Detroit, 9s.; the whole amounting to £6, 15s. 6d. If there be considerable luggage, it will, of course, add to the expense; but £7, 10s. will cover it in general. By Montreal, and the facility now afforded by the Rideau Canal, the expense will be somewhat less. The numerous railroads now existing in America leave the emigrant a choice of the means of conveyance. From all the large towns in the States he will find railroads proceeding either into the interior, where they meet other railroads or canals, or to some town on the banks of the large rivers, from whence steamboats are constantly sailing.

We have not received intelligence of the completion and opening of the canal which is in progress from Lake Erie by Columbus and Chillicothe to Portsmouth in Indiana, so that it will be necessary for travellers who think of proceeding to any of the western countries, to journey partly by road, and partly by canal, to Pittsburg, and thence down the Ohio. This they can do either from Baltimore or Philadelphia.

Emigrants who intend to settle in the highlands of Pennsylvania, had better take passage immediately to Philadelphia, which will be the cheapest; but if that be impossible, as ships are not always to be found for the desired port, the journey either from New York or Baltimore to that place is short, and not expensive. Readers may see it mentioned in our notice concerning the Expenses of Travelling.

After landing, emigrants ought to make no delay in lingering about the sea-ports, either from curiosity or the persuasion of fellow-passengers. Let them immediately proceed to business. If in search of land in Ohio or Michigan, let them instantly set out thither; they will find a land-office in every principal town of the districts, where they may look at the surveys, learn what townships or lots remain unsold, and get such information as the surveyor possesses concerning their qualities. But in every case let the settler examine and search for himself; no one else can or will judge for him. The surveys are made out, delineating the lines of the most considerable rivers and hills; and they are covered over with a number of small squares, like checks, which represent the different townships of six miles square, sections of one mile, and quarter sections. There are some principal lines marking larger squares; these are the meridians and base lines, by which the positions of the smaller portions are fixed, according to their distance from each. No smaller quantity is sold than 80 acres; and the price of government land is everywhere the same, that is, one dollar and a quarter per acre, or 5s. 9d.—though emigrants cannot always reckon on getting a situation to fit them at that price; perhaps four to eight dollars may procure a choice.

Should the settler wish to have land in Pennsylvania or New York states, it is to be bought there from individuals, the government having no land for sale in these states. The price here varies according as the land is improved or not; and on this subject the reader will find information under the head Prices of Land. If the emigrant should not, immediately on landing, find any one who has land to sell, an advertisement inserted in any of the papers will bring some of the owners or their agents to wait on him, and to direct him concerning purchases to be examined. His family should remain in New York or Philadelphia till he sees the land and fixes on a situation.

Emigrants, on landing, are advised to lodge their money in some of the banks. If they have any considerable sum in gold, they can generally dispose of it to advantage to the brokers; but it is better, in the meanwhile, to place it in bank as a *special deposit*, taking a receipt from the cashier, bearing that he will return *the same* to you or your order. The proceeds, after exchanging your gold, may be left in the bank, from which you will receive a book giving you credit for your deposit; and you may then draw upon the bank as you need the money.

To those who wish full information on the subject of America, we would recommend the splendid work lately published by J. Howard Hinton, Esq., which contains every thing relating to the history, natural capabilities, and statistics of the country. The recent work of our countryman, Mr. Stuart of Dunearn, is well worthy of attention, from its accuracy and impartiality. The volume of Mr. Fergusson of Woodhill is full of interest to agricultural emigrants. Other works may be perused with advantage—Flint's Letters from America, Duncan's Travels, Shirreff's Tour in North America, &c.

DISTRICTS FOR EMIGRANTS.

Three districts are pointed out as highly worthy of consideration by emigrants. These are—1st, The highlands of Pennsylvania; 2d, The countries in the valley of the Mississippi; and 3d, The district of Michigan.

Pennsylvania.—The highlands of Pennsylvania form a fertile and healthy country, situated to the north-west, between Philadelphia and Pittsburg. It lies in the middle of the settled districts, and has hitherto never been occupied by a population, from the circumstance that there were no roads or channels of carriage open between it and the large towns and rivers; so that the settlers, whatever might be their produce, had no means of sending it to market. From the mountainous nature of the ground, it was long before lines of communication to the requisite extent could be carried through it; this has now, however, been effected, so that the whole resources of the district are at length laid open to cultivation and industry. Coals, lime, and iron-ore, are here found abundantly, and canals or railroads have been formed to the mines. The lands in the valleys and sides of the lower ranges of hills are of great fertility; and from the mildness of the climate, some of the mountains admit of cultivation to their very summit. The meadows are in the highest degree luxuriant, and the hills are covered with abundance of pasture for cattle, sheep, hogs, deer, and goats. The timber found on the land in their wild state is different, according to their quality (a circumstance which the intending settler should observe carefully): that on the best lands being walnut and chestnut; the next best, maple, beech, oak, and hickory; the third quality, pine, spruce, and hemlock (a kind of fir-tree); and the poorest lands are encumbered with shrubs, brambles, and bushes. When the lands are brought under cultivation, their produce, in Indian corn, wheat, buckwheat, potatoes, &c., equals that of any of the eastern sections of the Union; and the soil, especially in the hilly parts of the north, is well adapted for grazing. Mr. Flint mentions that produce

in this district may be stated at from twenty to twenty-five bushels of wheat, and from twenty-five to thirty bushels Indian corn. These, he adds, are raised under slovenly management, and without much labour. A farmer expressed his contentment with the crop under existing circumstances. "A dollar a bushel for wheat," he said, "made a fair price, where he has neither rent nor taxes to pay. His own farm paid about four or five dollars a year for the support of the state and county officers." The expense of taking cattle from these inland parts, where they are easily fed, to the market at Philadelphia (where they always command cash), is about 5s. 9d. a head. The great roads from Philadelphia and New York, to Pittsburg, on the Ohio, pass through part of the district. There is also a canal between Philadelphia and Pittsburg, which intersects the southern parts of it, and affords means for transporting the produce of the country to markets on both sides.

In a letter written by a Mr. Emerson, in Philadelphia, published in the *Morning Post* newspaper (Feb. 1841), which has been brought under our notice by a respectable authority, a peninsula, lying between the River Delaware and Chesapeake Bay, is represented as exceedingly favourable for the settlement of agriculturists. The lands are described as level and of good soil, but exhausted in some degree by incessant cropping without manure. In consequence of this deficiency, many of the farms are abandoned, or nearly so, and the emigrant who has a small capital is recommended "to purchase or lease one of these reduced farms, which, by applying to it some of the agricultural skill of Europe, will not fail to yield him a rich reward for his labours. How much better," continues the writer, "is such a place for the European emigrant, than going out into the wild woods, where the state of society is often extremely rude, the country undrained, and consequently more or less unhealthy; the roads almost impassable, and the difficulties attendant upon raising and getting crops to market, almost tenfold of what they are on the shores of our great bays. I have made long visits to new settlements, and therefore am prepared to speak of them from actual observation. Suppose the emigrant pays for wild land in Ohio, Illinois, or elsewhere, the customary price of one dollar twenty-five cents per acre, the expenses of clearing off the trees, or getting it into cultivation, will make it cost more than the cleared farms in Delaware, Maryland, and Virginia, with the addition of all the expenses required to bring them into a high state of productiveness. In the west, the settler may get 37½ cents per bushel for his wheat, and 12½ cents for his Indian corn. In the old settlements just named, he gets 1 dollar to 1 dollar 50 cents for his wheat, and from 50 to 75 cents per bushel for his Indian corn. In the new settlements, potatoes, oats, fruits, &c., are of no further profit than as they furnish supplies to the immediate family or farm stock. The same may be said of his poultry, pigs, &c. In conclusion, I can assert that, of the many good and industrious European farmers whom I have known to settle on the peninsula, every one has in a few years either become independent or acquired considerable property, although the means of several have at first been very limited." Whether these statements are to be fully depended on we are unable to say; but they may easily be verified by the emigrant making inquiries on the spot, before determining on a place of settlement. We recommend him, however, by all means, to see the land himself, before concluding a bargain: this caution cannot be too often repeated. It is not to be expected that every desirable object should be united on one property; but many inconveniences can be observed by a man's own eye, which no one will point out to him. It must in general be borne in mind, that the best carse lands, or the rich bottoms of valleys, are not the most healthy; and a situation near marshes, or pools of shallow water, is always to be avoided even in the healthiest districts.

Mr. Shirreff mentions, that in the neighbourhood of Philadelphia, land of fine quality and in high condition may be had at from 100 to 120 dollars per acre; uncleared land will of course be had for much less. Mr. Shirreff compares the country around Philadelphia to the finest parts of the south of England. Many of the fences consist of well-kept thorn hedges; and the crops were in general excellent, although the land was not highly cultivated. He says, "Men assisting at farm work in the neighbourhood of Philadelphia get from ten to twelve dollars, with maintenance, per month, and they are not easily obtained to attend regularly at work."

The Countries in the valley of the Mississippi.—The climate of this extensive region is not unsuited to European constitutions, though perhaps requiring greater caution on a first arrival than in the old states; because, being an inland country, the heat of summer and the cold of winter are not softened by those breezes from the ocean which moderate the temperature of islands and sea-coasts. In marshy situations, and close by the banks of rivers, especially if the woods in the neighbourhood have been left uncleared, agues and fevers are not uncommon during autumn; but these, with due caution, are seldom fatal, and are looked on by the inhabitants with little apprehension. None of the large towns have been set down in unhealthy situations; and the settlers, in selecting lands, can at present have their choice of fine upland grounds, which are not liable to any disease.

With this drawback, which it was necessary to state at the outset, the region we have now mentioned presents a scene of promise to the industrious settler which is hardly to be equalled. The greater part of the land is a fine black mould; in some parts, particularly the river sides, where the grass continues rank all the year, it is covered with heavy timber; in others, where burning of the dry grass in summer prevented the growth of trees, it lies in fine meadows, called here *prairies*: and in the hilly, or rather *knolly* districts (for the land is generally flat), there is a growth of shrubs and underwood. The soil of the last portion is lighter than the others, but still it is excellent, and in that fine climate produces every kind of crop abundantly. These situations, too, are often the healthiest, in a degree which compensates for their inferiority in point of richness to the carse and meadow lands: it is even said that they are the best lands for growing wheat. The natural productions of the country are in the principal matters the same as those of the other states—Indian corn, wheat, oats, barley, buckwheat, potatoes, sweet potatoes, and rye. Of these, oats, barley, and buckwheat, are, we believe, hardly natural to the climate, and do not thrive so well; but, to make amends, there are tobacco, cotton, hemp, the grape vine, the papaw tree, the tomato, and other productions, which are not cultivated in the north of America or in Britain. Wheat produces a good and sure crop of about 30 to 35 bushels of 60 lbs. per acre: it is not uncommon to have it weighing 66 lbs. Of this country Mr. Shirreff says—"All the rivers of magnitude in the valley of the Mississippi seem to have occupied, at a remote period higher elevations and wider channels, than they now do, called first and second banks; and the flat space on the margins of their present channels passes by the name of *bottom*, which generally consists of alluvial depositions, annually augmented by the overflowing of the waters at the melting of the snow." This valley, he says, was indescribably rich, the soil of considerable tenacity, and some Indian corn he estimated at twenty feet high. Mr. Shirreff, however, differs from Mr. Flint in his opinion of the prairie grounds, he con

sidering them as by no means so fitted for cultivation as the same kind of land in Illinois. Most travellers agree in describing the countries of the Mississippi as peculiarly suited for agricultural pursuits.

Mr. Flint mentions, as a proof of what can be done in this country by industry, that he met a settler who had that year raised nine hundred bushels Indian corn and wheat, by his own individual exertions. Mr. Flint had previously heard of a negro, settled on the prairies near Vincennes, who had the same year raised one thousand bushels. The soil is well adapted for growing the European vegetables; as a proof of which, we find it mentioned that cabbages grow to the size of 13 and 17½ feet in circumference: those of nine feet round in the head are common. Parsnips, carrots, and beets, are remarkable for their size and flavour; peas excellent, and very prolific; onions are raised with no other trouble than sowing the seed, and keeping the ground clear of weeds. The following extract from the memorandum of a naturalist in that country, will give an idea of the periods of the seasons:—April 1st, Peach-trees in blossom. 2d, Asparagus in blossom. 3d, Peas, beans, and onions, planted. 10th, Spring had completely opened, and the prairies were green. 18th, Lilac and strawberries in bloom. 27th, Lettuce and radishes fit for use. 30th, Roses and honeysuckles in full bloom. It is mentioned, also, that turnips, sown on the 10th September, will grow to a very large size before winter. Besides its capability for rearing grain, &c., it is one of the best cattle-feeding countries in the world. "A farmer," it is said, "calls himself poor with a hundred head of horned cattle around him." Hogs, from the abundance of all kinds of vegetables, are reared and fattened in great numbers; and the demand at New Orleans affords a ready market for all. Nothing is more common than for an Illinois farmer to go among his stock, shoot down and dress a fine "beef" (as they call the ox), whenever fresh meat is wanted. This is often divided out among the neighbours, who in turn kill and share likewise. It is common at "camp meetings" (*teat preachings*) to kill a "beef" and three or four hogs, for the subsistence of friends from a distance. A three-year-old heifer is fed to about 423 lbs. (whole carcass), and sells for 5½ dollars, or 24s. 6d. By the 1st of June or middle of May, the young cattle on the prairies are fit for the market. Common cows, if suffered to lose their milk in August, become fit for table use by October. Every farmer, besides his own land, has the range of the meadows around him, both for his cattle, hogs, turkeys, and poultry, so that they are reared in immense numbers, and at small expense. They are purchased readily, both, as mentioned formerly, for the New Orleans market, and by drovers, who take them to the east coast, Philadelphia, &c. This district affords, indeed, the chief supply of live-stock for the Union. Altogether, the fertility of the country, and the abundance of its natural productions, are such, that the inhabitants are afraid of not being believed in mentioning them to the other Americans. These statements may appear somewhat overdrawn, but all the favourable impressions which had been made concerning this country, by the reports of former visiters, have been confirmed, in the most satisfactory manner, by Mr. Stuart of Dunearn, who passed through the whole territory in 1832, and conversed with the most intelligent of its inhabitants and public men. His account agrees in every thing with what we had previously heard of the great fertility and growing importance of the country.

The influx of emigrants into Ohio and the neighbouring states, has continued for these twenty years in multitudes, and without intermission. They can now travel by canal and by railroad; but in the absence of these, the poorest emigrants still urge forward, over every difficulty, to the western land of promise. "It is truly interesting," says Mr. Flint, "to see people of different countries, and of different dresses, coming forward in the mail-coach, on horseback, and on foot. At first view, this great migration leads to the conclusion, that oppression, and the fear of want, are in extensive operation somewhere to the eastward." "On Sidelong Hill," he says in another place, "we came up with a singular party of emigrants—a man, with his wife and ten children. They were removing from New Jersey to Pittsburgh, a land journey of 340 miles. The eldest of the progeny had the youngest tied on his back, and the father pushed before him a wheelbarrow, containing the movables of the family. Abrupt edges of rocks, higher than the wheel, occasionally interrupt the passage: their humble carriage must be lifted over these. A little farther onward, we passed a young woman carrying a sucking child in her arms, and leading a very little one by the hand. We could scarcely look before or behind without seeing some emigrants travelling. No pilgrims were ever so diversified or interesting as these."

Mr. Flint seems to have been surprised at the numbers whom he saw on the roads, all moving in one direction. His description reminds one of the multitudes seen streaming on in pilgrimage towards the Indian temple of Juggernaut; but the pilgrims of the Old World are generally going to seek a relief from their misery in superstitions or death; here they appear to have been led on by much more comfortable anticipations, at least if the next extract may be trusted.

"We arrived at a tavern. The bread was not prepared; but the people were obliging, and made it ready for us in a short time. The landlord was a farmer. He told us that Indian corn sells here at 13½d. per bushel, and that he could procure 20,000 bushels of it within three miles of his own house. Wheat sells at 3s. 4½d. per bushel."

The principal districts in the western country are Ohio, Indiana, and Illinois. There are considerable towns settled in each of these, the most advantageous situations those likely to become important in the commerce of the country, having been immediately pitched upon for the purpose. Some of these have hardly been longer in existence than fifteen years; few of them, except those on the river Ohio, longer than thirty; yet, from the influx of new settlers, and the facility these find in maintaining themselves and their families, such places are already populous and thriving. The country is generally flat, so that the towns do not, as in some of the western states, owe their origin to favourable situations for water-power. Manufactures, grist-mills, &c., if ever established here, must derive their power from steam; for which, indeed, the abundance of coal offers great facilities, while the smooth course of the numerous rivers makes the means available over the whole district.

Cincinnati, a town situated on the Ohio, on the confines of the two states, Indiana and Ohio, is a place of great trade. In 1800, it contained only 750 people, in 1805, only 960; it was then surrounded by a wild country, occupied by the Indians. The country around is now cultivated, and the number of inhabitants in the town is about 35,000, composed of people from all parts of Europe and the United States, who have been attracted by the advantages of the place. On the opposite side of the Ohio, in the state of Kentucky, there is another town, which is divided into two by the river Licking; these two parts are laid out on the same regular plan as Cincinnati, so that the whole appears one city. There are many great manufactoring works here—steam-mills, glass and iron-works, &c., and the bustle of the place gives the farmers an excellent market for their produce. This advantage is further increased by the trade of the numerous large steam-boats which here take in cargoes of beef, pork, flour, &c., for their voyage down the Ohio and Mississippi to New Orleans. Formerly, they were

not easily ascend the river, on account of rapids which occur farther down at Louisville; but these have been now overcome by a canal two miles in length, cut through the rock at that place. Louisville itself is situated in Kentucky, and is a place of considerable trade.

Other large towns in this tract of country are Pittsburg, Wheeling, Steubenville, Marietta, and Chilicothe. They afford a considerable market for agricultural produce; and the free navigation to New Orleans, as well as the facilities now afforded by a canal cut to intersect the country from the Ohio, at Portsmouth to Cleveland, on Lake Erie, secure a constant and steady demand for grain, salted beef, pork at the mall, &c. The Americans look forward to this district, and the vast countries surround. , as the future pivot of their national grandeur.

The countries in the valley of the Mississippi include Illinois, Indiana, and Missouri, to which we shall now advert.

Illinois and Indiana.—The tide of emigration has for some time back been setting towards the west countries, and among these Illinois is conspicuous for its great extent, and the general fertility of its soil. This state is 382 miles long and 154 broad, with an area of 58,900 square miles. It is bounded on the north by the Wisconsin or north-west territory, on the east by Lake Michigan and Indiana, on the south by the Ohio, and on the west by the Mississippi. The whole country is described as a very gently inclined plain, very level—no height reaching above 600 feet. It is nearly all prairie, with a few groves of timber widely separated from each other, and deeply indented with ravines whose sides slope into low round hills. Illinois is favourably situated with regard to water communication. On one side it has the Mississippi as its boundary, on another side the Ohio and Wabash; to the north it is washed by Lake Michigan. The Illinois, from which the state receives its name, connects Lake Michigan with the Mississippi; Rock and Kaskaskia are also navigable rivers; and besides these there are numerous boatable streams.

The soil of this state resembles that of Ohio, but with less irreclaimable land. On this subject Mr. Shirreff says—"The soil of Illinois is variable, and the different habitations of the varieties of the sunflower, and other tall-growing plants, often distinctly marked changes of soil on the prairie. The prevailing soil between Chicago and Springfield was black sandy loam, and occasionally considerable tracts of clay or heavy loam intervened. In this distance of nearly 200 miles, I did not pass over in all ten miles of bad soil, which was light-coloured sand. The surface, which is forest, oak openings, or prairie, has no relation to quality of soil, all of which abound with soils of every description." These prairies are covered with grass three or four feet high, which is burned annually, either being set on fire wilfully or igniting from natural causes. No danger is apprehended from this burning, the ploughing of the ground around a dwelling being sufficient to prevent the fire from spreading so far, and the grass, being perennial, comes up again in the spring.

The productions of Illinois are Indian corn, wheat, potatoes, cotton, hemp, flax, &c. Fruits, such as the grape, apples, peaches, gooseberries, &c., arrive at great perfection, and the silk-worm has been found to succeed well. In the wooded parts, the trees exhibit a luxuriant growth, and are often seen of an enormous size. The mineral productions are of great value, consisting of lead, coal, copper, and lime, and good building stone. The lead-mines, which were opened in 1821, are situated in the north-west corner of the state, at a place called Galena, on the Fever River. Salt is also manufactured extensively at Shawnectown in Gallatin county; and other salt springs have been discovered in different parts of the country. The climate of Illinois does not differ very materially from that of the other states in the same latitude; from its lower situation it is perhaps generally milder. In the southern parts the winter is said seldom to exceed six weeks; in the northern parts, again, it is sometimes very severe, but not of long duration. Settlers on their first arrival are apt to be attacked by bilious fever, but with proper care as to clothing and diet this may be avoided. A disease called the *milk sickness* frequently attacks the cows in this country, and has even proved fatal to man, from drinking the milk of the diseased animals. It is supposed to be caused by the cows eating the leaves of a poisonous grape, which might be easily prevented by rooting out the plant from around a farm.

Mr. Shirreff speaks very highly of this country as a field for emigration; being of opinion that there is no country in the world where a farmer can commence operations with so small an outlay of money, and so soon obtain a return. This arises from the cheapness of land, and the facility with which it may be cultivated, there being little or no forest land to clear. Mr. Shirreff makes a statement of the expense of purchasing 200 acres of land, fencing forty acres, ploughing and sowing eighty, harvesting, building houses, and maintaining family, which he estimates at 1604 dollars, equal to £340, 17s. With this expenditure is obtained the dairy produce of four cows, the improvement of eight cattle grazing on the prairie, and 3200 bushels of Indian corn, besides vegetables, and the improvement of pigs and poultry. Next year, the settler might plough eighty acres more; and in eighteen months after settling, would have expended £484, 4s., and reaped 6400 bushels of Indian corn, and 1600 bushels of wheat, besides abundance of vegetables, dairy produce, beef, pork and poultry. In this statement, Mr. Shirreff has stated the produce at 22½ bushels per acre, which is lower than what he was told land in Illinois generally yields. He supposes, also, that the farmer and family only attend to the cattle; the ploughing, &c., being performed by contract. In the case where the farmer himself works, he estimates the purchasing, fencing, ploughing, sowing, &c., of eighty acres at 609 dollars, or £130 sterling; and for this the farmer reaps 2400 bushels of Indian corn, 675 bushels of wheat, and receives the dairy produce of one cow, pigs, and poultry, besides abundance of vegetables.

Grazing is extensively carried on in the prairies of Illinois, the cattle being sent to New Orleans in great numbers. "With an unlimited range of pasturage for the rearing of cattle," says Mr. Shirreff, "and Indian corn at 15 cents, or 7½d. per bushel, the farmer might comfortably live by stock, without cultivating any portion of land."

The capital of Illinois is Vandalia, which is situated on a high bank of the river Kaskaskia, in the midst of a rich and thriving country. There are also several other towns rapidly rising into importance, such as Edwardsville, Carlisle, Kaskaskia, &c. The state of Indiana resembles Illinois, but contains a greater portion of waste land. The land is mostly all prairie, and the country is well watered by numerous rivers.

Missouri.—The state of Missouri is separated from Illinois by the river Mississippi, which flows along its east and north-east sides. It contains considerable diversity of soil, being in one part hilly, and in others marshy; but for the most part it is good prairie land. Its means of internal commerce are great, from the Missouri and other rivers flowing through it. Mr. Flint says of its soil—"This state possesses lands already fit for the plough, sufficient to produce wheat enough for the whole of the United States. Prairies of hundreds of thousands of acres of first-rate wheat lands—covered with grass, and perfectly free from shrubs and bushes—invite the plough; and if the country were cultivated to a proper extent, it might become the granary of the world." The climate

of this state is changeable; the winters are sometimes very severe, and the summers extremely warm. In several parts of this state the climate is unhealthy, owing to swamps and lakes; but in the mountainous tracts the inhabitants enjoy good health. The staple agricultural productions are wheat and Indian corn, with the usual fruits of warm countries. Cotton is cultivated in the south-east section, along with tobacco; and hemp and flax are becoming important articles of produce. This state has been long celebrated for the immense deposits of lead ore found among the hills. There is one district, extending over nearly one hundred miles, which is particularly distinguished for its lead mines. The ore is found imbedded in masses, and appears evidently to be a deposit. Coal is also found in several parts of Missouri, as also iron ore, manganese, zinc, &c. The chief town in Missouri is St. Louis, pleasantly situated on an elevation close to the Mississippi. It is a thriving place, rapidly rising to importance, being the port at which all vessels arrive from New Orleans, &c.

The Count Marbois thus speaks of the states in the valley of the Mississippi:—"At the junction of the Mississippi and Missouri, the lands lying towards the north-west are of admirable fertility; and these districts, though remote from the sea, will one day be as densely populated as any portion of the world. The Mississippi, the Missouri, the Arkansas, the Red River, and their tributaries, water 200,000 square leagues within the space of country called the valley of the Mississippi. This internal navigation, prepared by nature, has already been greatly extended and improved by canals, and steam-boats ascend and descend against wind and tide with great speed. Wood and coal, indispensable agents in this navigation, abound on the shores of the rivers, supplying steam-ships with the means of traversing this magnificent stream."

These states, from the facility of communication, may be reached from any of the great ports of the Union. The route by New Orleans is recommended as the cheapest, from the number of steam-ships which are constantly plying between that port and St. Louis on the Missouri. The cabin passage from Liverpool to New Orleans is £35, and the passage from New Orleans to St. Louis £5, 6s., including provisions; the steerage passage is from £4 to £5 to New Orleans, and £1, 14s. to St. Louis, exclusive of provisions.

Michigan.—The reader will observe on the map a tongue of land, situated between the two lakes, Huron and Michigan; this tract, with another which lies on the west, between Lake Michigan and the Mississippi, has been lately begun to be settled by emigrants from the old states of America. The two together possess great recommendations to agricultural emigrants. The capital is Detroit, a town situated on the river which connects Lake Huron with Lake Erie, and containing 2500 inhabitants. Those lakes, with their rivers and canals, give the district access to the markets of New York, New Orleans, and Montreal.

The climate is temperate and healthy: winter sets in generally about the middle of November, and continues till about the middle of March. At Detroit, in 1818, the mean heat of January was 24°; and in 1820, the mean heat of July was 69°, of December, 27°. The country is situated upon limestone rock, rather hilly, and possesses what the Americans call good water privileges—that is, numerous falls of water for mills, &c. It is better watered than any other in the United States, being finely diversified with lakes and brooks, rising in most parts from copious springs.

The soil is in general a good fertile loam, upon limestone: in some places a calcareous earth is turned up, mixed with the common soil; in others, the loam is mixed with a little sand; both are extremely productive. The country is, in some districts, under heavy timber, and in others an open prairie, where the settler has nothing to do but start his plough. Horses here cost from £18 to £22, 10s.; oxen from £15 to £18 a pair. The produce of the land runs from 25 to 50 bushels of wheat, after one bushel of seed. The cotton plant, the grape vine, the sweet potato of Carolina, the tomato and egg plant, have all been successfully cultivated. Rye, barley, oats, peas, beans, and potatoes, as well as all kinds of vegetables usually cultivated in the same latitude, produce here in great abundance. Peaches and pears have been tried, and both produce delicious fruit: near towns, pears sell at from 2s. to 4s. per bushel; apples vary from 6d. to 2s. per bushel; currants, blackberries, raspberries, and strawberries, thrive exceedingly. Indian corn is less luxuriant than in the valley of the Ohio, the climate being somewhat colder. This country, on the whole, seems more congenial to European constitutions and habits than the other western settlements.

The richest and perhaps most beautiful part of the territory, is generally thought to be that adjacent to the St. Joseph's River, on which twelve new counties are formed. The soil is excellent, and there are numerous falls of water, for mills, &c.

At any of the government land-offices (which are established, wherever there is land to sell, in all the states), a settler may provide himself with a farm, at the usual rate of 5s. 7½d. per acre. No quantity smaller than 80 acres is sold by government. Should he chance to fancy one in some favoured spot (most of which are already secured along the great public road for 300 miles through the country), he will have little difficulty in procuring it for 12s. or 15s. an acre. An extensive tract of country upon the river and bay of Saginaw (on the west side of Lake Huron) is spoken of in terms of high admiration for the richness of the soil and beauty of the natural scenery, and also as presenting uncommon inducements to enterprising and industrious farmers and mechanics, from its central and advantageous position for business. The river Saginaw is navigable for boats, twenty miles from the head of the bay, and a road is made to Detroit. Fox River, on the west side of Lake Michigan, is also specially noticed as highly desirable for settlers, in regard to quality of soil, beauty, and local advantages; a canal is projected to connect this river and the lake with the Mississippi.

Mr. Fergusson, to whom we are indebted for the above particulars, gives an estimate, from the experience of persons acquainted with the district, of a purchase in Michigan, and of its returns:—

Price of 160 acres, at 1¼ dollars per acre,	£45	0	0
Seed, labour, and rail-fence, at 6 dollars, for, say, 150 acres, - - - - -	202	10	0
Harvesting, at 2 dollars, - - - -	67	10	0
Dwelling-house, stables, &c., - - - -	180	0	0
Returns.	£495	0	0
Produce of 150 acres, at 20 bushels per acre, at 1 dollar per bushel, - -	675	0	0
Profit,	£180	0	0

No allowance is here made for maintenance; but it is to be recollected, that the wheat crop may be repeated for three or four years without manure, and in the succeeding years the charge for purchase disappears, so that the advantages of the latter are obvious. These are properly appreciated by the Americans, the number of emigrants flocking to Michigan being immense. Its population in 1831 was estimated at 32,000.

Detroit, the capital of Michigan, is the embryo Constantinople of the inland seas of North America. It is situated in a narrow channel, which connects the two lower lakes, Ontario and Erie, with the three upper, Huron, Michigan, and Superior. Having access in every

direction to countries of more fertile soil than those of Greece or Asia, and possessed of an equally favourable climate, it begins its career with political institutions far more propitious to human welfare than were possessed by the celebrated city we have mentioned; and it promises one day to be the abode of a more numerous as well as happier population.

Other Districts.—The three districts we have mentioned are those in which the greatest quantities of land are yet unoccupied, and where it is to be had cheapest; but there are others in which settlers may locate themselves with advantage. Among these is the district of Genessee, in New York state; and, indeed, the whole valley of the River Hudson presents at intervals spots on which good land may be purchased, especially by those who would rather sit down in a place partly cultivated, and near markets, than in the heart of the forest.

DIFFERENT CLASSES OF EMIGRANTS.

Men with Capital.—There are three different classes of emigrants, each of whom will be guided by different motives in their choice of a situation. The first is composed of persons who are possessed of capital to some amount, and who have been accustomed to move among the wealthier classes of society in this country. If these individuals intend to devote themselves to agriculture in the country to which they are bound, every circumstance leads us to believe, that unless they are prepared to submit to very great sacrifices of personal comfort, and that for no inconsiderable time, they ought to purchase land partly improved, and as near some of the towns as they can find it. The hardships of a new settlement to persons who have not been accustomed to labour, are hardly such as can be anticipated by description; while the total change of habits—labouring in the woods, living in log-huts, and the want of regular food—often induces disease, of which such persons may feel the effects during the whole of their after lives. Abundance of half-improved properties may be found (as we have mentioned under the title Purchasing of Land), upon which moderate labour, and the exertion of some skill and attention, will secure excellent returns. These may be heard of at any of the large towns, but chiefly at New York, or at Albany, Genessee, Rochester, Geneva, &c., in that state. In Philadelphia, also, in the state of Pennsylvania, most eligible purchases of this kind may be made; and at Pittsburg, a very busy manufacturing town in the same state, on the river Ohio, there are many properties on sale which must rise in value every day with the increasing commercial importance of the place. There are immense beds of coal, iron ore, and limestone, in the vicinity of the town, and the navigation of the Ohio is uninterrupted (though there are some inconsiderable rapids) the whole way to its junction with the Mississippi. Communications by canal and railroad are also now completed, to connect the Ohio at this place with Baltimore and Philadelphia, so that the town of Pittsburg is already of great wealth, and promises rapidly to increase. The land in the neighbourhood is of uncommon fertility, and may be obtained now at prices lower than can be expected in a few years, when a greater number of settlers shall have arrived to occupy it. Properties within twenty miles of the town already sell very high—say fifty dollars or more. Almost the same observations may be made with regard to Louisville, Cincinnati, and Jeffersonville, which are situated in the states of Ohio, Kentucky, and Indiana; these places already possess great trade, and from the abundance of minerals, coal, lime, iron, salt, and lead, which are found in the neighbourhood, they must continue to increase. Farms, therefore, purchased in their vicinity, are certain to rise in value, and, with attentive cultivation, will, in the mean time, pay the cultivator abundantly for his labour and capital. Cincinnati particularly is a place of great activity and persons who settle in its neighbourhood will easily find society to their liking; it presents, indeed, though so remote from European cities, no difference nor any inferiority in this respect. It is right to mention, however, that the whole of the western country, and, indeed, of all the countries which are in progress of settlement, are overrun with a swarm of speculators in land, and in projected establishments, new cities, manufactories, &c., of all which the moneyed emigrant ought to avoid as a set of locusts. Americans may deal in those matters, and may, perhaps, profit by them; but emigrants never can do any thing but involve themselves in difficulties by such schemes. Let them look to *certainties exclusively*: the quality of the land, the healthiness of the site, the neighbourhood of a market already established—these are the only considerations that should weigh with them, and no other. In short, to those who have capital, we would say, without hesitation, choose your abode near some of the principal towns; it is almost indifferent which. The soil of the western countries on the Ohio is the richer, and its produce more varied and luxuriant, but the prices of agricultural produce are lower than in the old states, and labour dearer. This is the sole and essential difference, except, indeed, to those who wish to speculate in buying land, by adding to its improvements, and then selling it at a higher rate, when their own labour, and the increasing density of the busy population around them, shall have added to its value. To persons who wish to make money in this way, the vicinity of the rising towns in the western states is certainly a field of high promise, and many have already realized large sums there by proper management in that manner.

Mechanics, Farm-Servants, and Labourers.—Mechanics and labourers, in looking for a situation where they may settle, will be guided by very different views from those of persons possessed of capital. The latter, if they wish to buy land, will prefer to have it in a place where labour is cheap, and farm produce sells dear. The man who lives by his wages, on the other hand, would have labour high, and all manner of provisions cheap. We have advised those possessed of capital to look for settlements as near the large towns as possible, where markets and labour are most easily procured. In regard to the places to be chosen for settling by mechanics, farm labourers, and others who look for work, we believe, that to those who possess funds sufficient to carry them forward to the western or inland states, there can be no doubt but these afford the preferable field for them, both in respect to wages, and cheapness of living. The towns on the Ohio are all gaining rapidly in population and importance, from the richness of the country with which they are surrounded; and many considerations make it probable that if manufactures be ever largely established anywhere in America, it will be here. The carriage of foreign manufactured goods is very expensive to a country so remotely inland, and to which they have to be carried through so many canals, rivers, or railroads; and the district itself produces cotton, silk (if cultivated), iron, lead, coals, &c.; so that there is here a *bonus* for manufacturing on the spot which hardly any other country possesses. The consequence begins to be already felt: manufacturing establishments are begun, wages are high, and the price of living is withal exceeding low. To mechanics and labourers, therefore, who have money to defray the expenses of the journey, we cannot but say that the western states present by far the most favourable opportunities. The following extract of a letter is from Cincinnati, on the Ohio:—

"The improvements in Cincinnati are rapidly increasing: the communications opened by means of the canal and the new roads give an impetus to trade. Whatever number of artisans, mechanics, and labourers come out,

they will find abundant occupation. The soil is excellent. Engineers are in great demand. Engravers, particularly those who will work in general work, as maps, names, &c.; card-manufacturers; tinmen and braziers; bell-hangers, with a knowledge of casting or directing in that department; baking, brewing, and malting; are good trades. Glovers, stocking-weavers, first-rate planemakers, turners in steel, iron, brass, and wood, are much wanted. Carpenters, joiners, builders, plasterers, bricklayers, stone-masons, plumbers, all who are good at their business, and labourers, can get plenty of work at 3s. or 4s. per day. Gardeners and mechanics average 4s. 6d. to 9s. per day, curriers, 9s per day, journeymen's wages. Tailors get 20s. for making a coat. Hatters do well."

On the subject of wages, Mr. Shirreff says—"An industrious and sober man must rapidly accumulate wealth by working for hire, and many perhaps err by purchasing land instead of continuing to work under the direction of others. On leaving New York, a gardener, who was working at Haddington when I left Scotland, gave me ten pounds sterling, which he had saved since his arrival in America, to enable his wife and family to reach him. A young man whom I had often employed at spade work at 1s. 6d. a day, was earning by sawing stones at Cincinnati 4s. 3d. a day, with board."

Let it be recollected, that, with these wages, flour is at 9s. per 112 lbs.; mutton at 2d. per lb.; sugar 4d. to 5d. per lb.; coals 5d. per bushel.

It may now be asked, what additional expense will be required to take a mechanic to Cincinnati, after he has reached New York or Philadelphia? To this we find it answered, that the journey from New York to Wheeling (a town on the Ohio) costs 25 dollars, or £5, 12s. 6d.; and from Wheeling to Cincinnati, by steamboat on the Ohio, the fare is 10 dollars, or £2, 5s. The whole expenses, therefore, from New York to Cincinnati, are £7, 17s. 6d. The journey may now be made, by the canals and steamboats, to Buffalo, on Lake Erie; thence to Cleveland; and from that place, by the canal, to Cincinnati. This will reduce the expense somewhat. The same letter from which we have quoted above, mentions, that a family of respectable persons had arrived at Cincinnati from England, and that the whole expense of their journey (with 2500 lbs. luggage) was £75. But there is no occasion for going even so far as Cincinnati—Wheeling itself, or Pittsburg, which, though still on the Ohio, is much nearer New York, present quite the same inducements to mechanics of all descriptions.

Labour is in the greatest demand everywhere. The people are not able to avail themselves of the riches of the country which they inhabit without assistance. Mr. Flint, who travelled on foot, was stopped by the farmers asking him anxiously if he "*knew of any traveller who would rest himself, and thrash for a few days;*" and Mr. Stuart of Dunearn, after telling one of the Ohio settlers the work usually done by farm-servants in Scotland, was charged, on departing, not to neglect sending some of them to America, if possible.

It is not in one or two districts of the Union that this demand for work-people exists, but everywhere. The towns immediately on the coast are generally better supplied with tradesmen, labourers, &c., than those inland, because emigrants first land there, and often apply for employment as soon as they go on shore; but in all that we have heard on the subject, we find no instance of a person who was willing to work, and who did not find employment.

Persons who wish to buy small lots of land.—Besides emigrants possessed of good capitals, there are often men who are acquainted with farming business, and with that only, but who have not money to buy improved land, and who wish, therefore, to depend on their own industry for clearing ground for themselves. Many such men, after persevering for years, with their families, in unrequited labour in this country, have gone to America, and become proprietors of well-improved and rich farms. We could quote numerous examples of this kind; the following is from Mr. Flint's interesting publications:—"J. M., a man from the county of Edinburgh, arrived here (near Pittsburg), and had settled with his family, seven sons, two daughters, and a son-in-law, about ten months before I met him. He has purchased 480 acres of land; built two log-houses and a small stable; cleared and enclosed about twenty-two acres, which are nearly all under crop; deadened the timber of about eighty acres more; and planted an orchard. In addition to these improvements, his sons have wrought for a neighbour to the amount of a hundred days' work. He has a horse, a cow, a few hogs, and some poultry. I inquired if he felt himself happy in a strange land. He replied, that he would not return to Scotland, though the property of which he formerly rented a part were given him for nothing."

This instance—and hundreds of others might be quoted—will show that people from this country, with a stock of from £50 to £100, may establish themselves well in America. Smaller sums than these will hardly suffice to land with, if the settler intends to buy land immediately; because eighty acres of land (which is the least quantity sold by government) costs £22, 10s.; and though something were done to raise a crop the first season, the other expenses of a log-house, &c., would absorb every thing. The price of government land is required to be paid immediately.

The following quotation affords a graphic description of the situation and life of cultivators in the woods:—"The settlers in the woods appear to be the most contented and independent people, in their way, I ever met with: perhaps with only a log-house, unplastered, containing two rooms, one above and one below, sometimes only one below, with a large open fire-place, and a log-fire. The chimney back and hearth built of stone, picked up about the farm; a boarded floor unplaned, perhaps hewed only, if too far from a saw-mill; one or two small glass sash windows, and sometimes at first none; doors and gates with wooden hooks and hinges. A few articles of common household use; two spinning-wheels, one for flax and one for wool, with reaves of spun-yarn hung round the inside of the house on wooden pegs, driven into the logs; an upright churn; a rifle-gun; a dog or two; an oven out of doors, at a little distance from the house, built sometimes of clay, sometimes of brick or stones, often placed on the stump of a tree near the house, and with a shed covered with tree bark to keep it dry; a yoke of oxen, some young steers, two or three cows, eight or ten sheep; perhaps a horse, or a span (yoke); a sleigh wagon, a plough and harrow, the last perhaps with wooden teeth; these form all their riches except their land, and on this they often raise one hundred or two hundred bushels of wheat, eighty or one hundred of Indian corn, some oats, peas, and perhaps buckwheat and a patch of flax: and fatten three or four hogs and a cow, or a yoke of oxen in a season, besides seven or eight more store pigs, and a sow or two. Those who brought a little money with them, or were fortunate in having a family of industrious sons, get perhaps a good frame house, or, at all events, a good frame barn, eighty or one hundred acres of land cleared; grow four hundred or six hundred bushels of wheat; other things in proportion; with two or three yoke of oxen, twelve to thirty fat hogs, two to five horses, &c., half of them or more brood mares."

The following is a ruder picture of industry:—"In Maquapin county (Illinois) one of our frontier men settled himself on government land three or four years since, with four or five sows for breeders, worth as mu-

dollars. In 1829, he drove forty-two fat hogs to market, which he sold for 135 dollars (£30, 7s. 6d.) The amount of corn given to the whole before he drove them, did not exceed one bushel. They lived on the *range*, and grew fat on *mast*, that is, beech-nuts, walnuts, acorns, &c.; had they been fed on corn they would have sold higher. Of the proceeds, 100 dollars (£22, 10s.) were applied to pay for eighty acres of land on which he had settled; the remainder served to pay some small debts, and to purchase his salt, iron, and groceries for the year. This is not an extraordinary occurrence, but one common in that country."

PURCHASING LANDS.

It was, until recently, the practice of the American government to sell the public lands on credit, receiving payment by instalments; but this plan was found so mischievous that it has been abandoned, and the public lands are now sold for cash only. While the credit system was in operation, many people were induced to become proprietors of large tracts of land which they had not the means of cultivating, and in the course of a few years the land again fell into the hands of government. The farmer was thus left in a worse state than when he first settled in the country; his capital was expended without having yielded him any suitable return. Most travellers concur in representing the cash system as much superior to the former practice of giving credit, for by it, although any person should be foolish enough to purchase land without having the means of cultivating it, his capital is not lost, as he may always get the price he paid for it again. In the United States there are public land-offices in the chief towns, at which maps of the sold and unsold lands are kept for inspection. Lands are first offered for sale by public auction, and are put up at from a dollar and a quarter to two dollars per acre. If no one offers these prices, they are exhibited on the land-office map, and may be obtained at any subsequent period. On the maps, sections of a square mile, and quarter sections of 160 acres, are laid down; six miles square constitute a township. The fifteenth section of each township is reserved for the support of a school. The deed which confers the right of property in the States is very simple. It is printed on a piece of parchment of the quarto size; the date, the locality of the purchase, and the purchaser's name, being inserted in writing, and the instrument subscribed by the President of the United States, and the agent of the general land-office. It is delivered to the buyer free of all expense, and may be transferred by him to another person without the intervention of stamped paper, law practitioners, or those absurd feudal usages which continue to disgrace the transfer of landed property in Great Britain. Emigrants in going into the woods to make a selection of lands, will do well to take with them an extract from the land-office map applying to the part of the country they intend to visit, and by this they will discover entered from unentered lands.

The public land is, of course, totally uncleared, and untouched by the plough; some of it is more heavily timbered than other portions, and it is of very various quality, that on the banks of rivers and alluvial grounds being exceedingly fertile, and other parts being either rocky or marshy, so as to be either too unhealthy or too unprofitable to be cultivated. The settler, however, has his choice, and, by going out into the woods, he may fix upon a lot to his own mind. An enterprising cultivator, particularly if he be a stout man, with a family of sons, may do very well upon such lands, because the original price is small; and after clearing them to some extent, and erecting one or two log-houses and barns, he can either extend his cultivation (which is easy after crops are got for the first three seasons), or he may sell at a considerable advance as population begins to increase around him, and as settlers arri who are not inclined to make first beginnings in th woods for themselves.

When lots are advertised for sale, there are persons who make it their business to go out to survey the whole tract before any one else has examined it; and by remaining in the woods for months, sleeping often in the open fields, and undergoing great hardships, they get acquainted with all the natural advantages of the land, the spots where there are water-power, minerals (such as salt springs, &c.), healthy, open, or fertile grounds, and select such of these as they choose, in order to sell them again at a profit. This practice raises the price of the best lands, and it is one which can only be followed by natives well acquainted with the face of the country; but it cannot be said to have much effect in retarding settlements, as the persons who follow it seldom have very large capitals, and are soon willing to dispose of their purchase at a reasonable advance to those who intend really to avail themselves of the natural advantages which the former have been at the trouble to search out.

In 1838, 12,251,966 acres of land were offered for sale, of which quantity 1,388,733 acres were sold; the price paid being 1,749,401 dollars, or about 1¼ dollar, (5s. 7½d.) per acre. At the commencement of 1832, the quantity of land unsold, and to which the Indian title had been extinguished, in the states of Ohio, Indiana, Illinois, Missouri, Mississippi, Alabama, Louisiana, and Michigan, and in the territories of Arkansas and Florida, was estimated at 227,293,884 acres. The quantity in the same states and territories held at that period by the Indians was estimated at 113,577,869 acres. The quantity beyond these states and territories was estimated at 750,000,000 acres; making the whole of the public lands at the commencement of 1832, 1,090,871,750 acres.

These are the public lands, but there are vast quantities of ground in the hands of individuals which have not yet been cleared, or only partially so; and the prices at which this is to be had vary according to the quality of the land, its situation with regard to roads and markets, or the work which has been already done upon it. Large quantities of this description of lands are to be had in the north-western districts of Pennsylvania, at from two to four dollars per acre; many portions of it are fertile, situated on healthy mountain sides, and in a climate more nearly resembling that of Britain than is to be expected in the low though rich valleys of the western states, where the public lands are chiefly situated. In the other old-settled states there is not so much of this kind of unoccupied land; though, certainly, when it comes to be in America as it is here, where every inch of ground is wanted for raising food, an immense quantity of what is now despised, will, by the operations of draining, trenching, and reclaiming, be brought into productive cultivation. In these states, particularly New York, there is, however, always abundance of properties in the market, parts of which have been long farmed, and which have houses and offices erected on them, for extending the cultivation of their remaining acres. These are offered at various prices, according to their advantages: and to gentlemen who have skill and enterprise to introduce better and more careful modes of farming, they offer admirable capabilities. The profit which has been hitherto realized in America, has been by merely breaking up the woods and prairies into corn land in the roughest and most unskilful manner; but a new field of enterprise and wealth remains to those who shall introduce in the settled states better breeds of cattle and more scientific modes of agriculture. In general, the American farmers entirely neglect the use of manures; they very often shovel the refuse of their stable-yard into the nearest

river; and one farmer is mentioned, who, rather than remove a dunghill which had gathered in his court, choose to build a new set of barns.* The national habits lead them continually to think of breaking up new land, and they always choose to do this rather than manure the old. They prefer, in short, taking their crop off a large field carelessly and unexpensively cultivated, to getting the same returns from a smaller piece of ground skilfully prepared. This is obviously a want of thrift as well as of science, and it is for this reason that we say that good farmers, with some capital, might take advantage of the half-improved lands which are on sale in the settled states,† and by buying them at the very moderate prices at which they are offered, enrich both themselves and the country, by the introduction of more business-like modes of farming. An attention to dairy produce, an improvement of the breeds of cattle, and the introduction of kinds which would produce fat of better quality, and with less expense or trouble than the kinds now known, would be of essential benefit.

The prices at which cultivated and half-reclaimed lands are offered in the district of Genessee (a very fertile one), are from twenty to forty dollars per acre. Mr. Fergusson mentions several farms which he saw on sale: one near Geneva was of 250 acres, "consisting of good loam, and some indifferent clay, well watered, but without any mill power. The wheat and Indian corn were excellent; the hedges thriving and in good order, with a double rail fence; the mansion-house and offices were very respectable. The price asked was 25 dollars per acre, or £1406, 5s. for the whole farm."

Mr. Fergusson mentions the prices at which some other farms were offered; we subjoin an abstract of the notices:—

"1. Captain Davenport's farm, on the east bank of the Hudson. It contains 350 acres, 100 of which are in wood: the soil is partly clay, partly sandy loam, and a large portion is a rich holm on the river side, of the finest quality. The price demanded is £7, 10s. per acre, and it was sold at somewhat more than that sum soon after. The returns might reasonably be expected to reach £112, 10s. *clear of expenses*, from the flat land; and £70 from the profit on a sheep stock on the upper portion of the farm; in whole £182, 10s. The price given was £2000, and £1000 more was required for building, fences, and drains—in all, £3000; for which there is a return of £180. An industrious Scots farmer, in Mr. Fergusson's opinion, would not fail to realize £200, clear of all the expenses of subsistence, &c.

"2. Next to this farm was that of Mr. Knickerbocker, containing 275 acres. There is a fine holm on this farm, and the upland seemed fully better than No. 1. It was let in shares last year, and the owner received £63. The price asked was £4 per acre, or £1100; and £200 more would be requisite for houses, fences, &c. There was no more timber than seemed requisite for the use of the estate.

"3. Mr. Cherney's farm, 106 acres, with wood sufficient for the use of the property—about 40 acres of very fine holm, capable of yielding, I was assured, forty or fifty bushels of oats, or other grain in proportion. This farm could be had for £530, and would certainly return £45 or £50 clear.

"4. Mr. Veley's farm, 118 acres; 40 acres of most superior holm; the upland good; with a stream running through it. The houses appeared to be new. This farm could be had for £400, and the return could not be less than from £35 to £40, clear of all charges.

"5. A farm of 300 acres, occupied by Colonel Grent, at a rent of 300 dollars (£67, 10s.) The soil is good loam; nine parts of it are clay: a new dwelling-house, and good barn, with a valuable wood lot. It might be bought for £1500.

"The whole of these properties were evidently susceptible of great improvement, though in foul and bad condition. The local situation is good, the Champlain canal passing within half a mile, though separated by the river.* The roads are tolerable."

The account given of these properties by an intelligent observer and agriculturist, will serve to convey an idea of the prices of land, and the returns of the capital and industry employed in American agriculture. In all cases we believe it to have been well proved, that no person should buy more land, however cheaply offered, than he can immediately cultivate with advantage. The capital expended in buying superfluous ground is completely locked up from use; and that circumstance, in a country where every disposable dollar can be employed with certain profit, is a downright and pitiable loss. There are some persons, indeed, who, as has been already mentioned, speculate in land, buying large quantities in order to sell it again, as it becomes more valuable by the increase of population; but such adventurers require to have well studied the natural advantages of the district, and it is not a speculation for emigrants.

To conclude, then, on this subject: Land in new districts, chiefly in the western states, may be had for a dollar and a quarter per acre; in places partially settled, unreclaimed land fetches from two to four dollars; in very favourable situations, perhaps a little more. Ground partially opened, and cleared of trees, is offered at all manner of prices, according to the labour bestowed on it, from four dollars to forty.

RENTING LAND.

There is little of what is called renting land in any part of the States; but where there is, the produce is generally divided into certain proportions between the owner and tenant. Sometimes each receives an equal share; sometimes the owner gets a third according to the improvements on the land, and its quality; sometimes tenants take land "*on shares*," with the landlord, on condition that he furnishes them with seed-corn and fire-wood; and then he receives one-half of the crop. In the western country of Illinois, &c., it is not uncommon for the owner to give a man "team, tools, and board, besides one-third of the crop," for labouring a farm. Mr. Pickering mentions that, in the neighbourhood of Baltimore, he was asked a rent of 18s. per acre for a lot of fifty acres, only half-cleared; for another lot of very rich land, the rent asked was twelve dollars, or £2, 14s. per acre.*

These lands had the recommendation of being situated near the markets of Baltimore; and it must be recollected also, in explanation of the high sums demanded, that the rent of land in America by no means bears the same proportion to its price as it does in England. With us, it brings twenty-five years' purchase of the rent. In America, it is freely sold at sixteen and seventeen years' purchase. This must be owing to the many profitable ways in which ready money can be employed in that country.

---

* Flint's Letters from America.

† The experiments of Mr. Cobbett, while residing on Long Island, are an illustration of this remark. His mode of cultivating and preserving *ruta-baga*, turnips, and other green crops; his less expensive method of feeding hogs; his sheltering of poultry during winter, to procure eggs and chickens early in the spring; are all examples which were much needed in America.

* The rents asked in America are certainly higher than might be expected from *our* ideas of the relative proportions of the price of land and its rents in this country. But as Mr. Pickering, on whose authority we state the above facts, did not really take the land, and only inquired concerning it to gratify his curiosity, we are disposed to think a real bidder might have heard a lower price. In another place, Mr. Pickering says he was asked three guineas per acre of rent—a sum quite incredible *to be paid*.

CHOICE OF LAND FOR SETTLING WITH RESPECT TO HEALTH AND NEIGHBOURHOOD.

It is of the greatest consequence that the land which is selected be in a healthy situation, in whatever district it be chosen; and for ascertaining this, the emigrant must examine the spot himself. Let him trust the report of no other person; land-dealers and others naturally commend tracts of ground which they have an interest to sell. The people of the neighbourhood are also to be distrusted, because they are all anxious to have settlers near them, from the additional value an increasing population gives to their property. There can, however, be little difficulty in making the choice. In the first place, the neighbourhood of all marshes is to be avoided, as well as of rivers, which, from their sluggish course and low banks, appear to overflow and stagnate in time of floods. Such situations are almost always liable to agues and fevers. The same may be said of low moist prairies (meadows), whose great fertility should never tempt any settler from this country to establish himself in them. An elevated spot, where the air circulates freely from all points of the compass, is most desirable. If circumstances should induce the settler to fix himself near any of the great rivers, it is asserted that a residence chosen as near as convenient to the margin of the stream will be more healthy than those situated a few hundred yards' distance, in what is called the "interior of the bottom." Along the Mississippi and Missouri, the banks are generally higher than the ground a little distance inward; and from the porous nature of the soil, this interior land absorbs moisture from the river, and remains always damp. So much is this the case with regard to the Missouri, that all the waters which it receives from its tributaries do not increase the stream, which is, therefore, as large 1000 miles from its mouth as it is where it falls into the Mississippi, after having received more than a hundred rivers in its course. This circumstance is attributed chiefly to the water being absorbed by the porous soil, whence it is partially evaporated in the surrounding air. This peculiarity renders the immediate vicinity of the rivers (except where they have a rocky channel) unfavourable to the health of persons lately arrived in the country, and whose constitutions have not been yet accustomed to the climate and atmosphere.

To emigrants from Britain, we would say, that the country of Michigan and the Highlands of Pennsylvania are likely to be least injurious to their constitutions, and that more caution is required in selecting a situation in Ohio, Indiana, and Illinois—the whole western country indeed—than in the former places. That country, from the number of years it has now been settled, however, has been thoroughly explored, and all its healthy and unhealthy situations ascertained; so that a settler will seldom be at a loss, in the neighbouring towns, to find some clue by which to guide himself.

In whatever place a settlement be chosen, it is of the utmost consequence that the *house* be on a dry and airy spot, and that it have a spring, or clear running stream of good water, close by, for household purposes: some, to secure this object, pitch on the banks of a pool or small lake as an eligible situation, which is the worst place possible, both because the water is often stagnant and unwholesome, from the dead leaves and vegetables lying in it, and because the effluvia from such water is apt to generate disease in those who are constantly near it. The floor of the house should, if possible, be laid with some hard dry substance; and a little fire should be kept in the evenings, even when the weather hardly seems to require it, because this serves to maintain a wholesome circulation of air, and to dry more quickly the green logs of which settlers' houses are first constructed. With regard to clothing, it is of consequence that those who enter upon this new life should make themselves somewhat comfortable in this respect; and though they must for a time submit to hardships, by no means to imitate the savage affectation of many of their neighbours, who think that, as they are in the woods, they ought to take a pride in living like Indians. These people often neglect all cleanliness and comfort, both in their persons and dwellings, and are vain of telling how much they expose themselves to the weather, both in sun and dew, and how well they have stood it for years. Let none of these vain-glorious boastings have any influence with the new settler: he ought, in every point, to maintain habits as little removed from his former way of life as is consistent with his situation; keep his clothes and house as snug and comfortable as he finds it possible at the present time to make them; and expose himself neither to the weather nor fatigue, except where there is some useful purpose to be gained by it; never at least to do so for the mere sake of bragadocio, or to imitate the ostentatious hardiness of some of his neighbours. He will find the Scots proverb, "hooly and fairly gangs far," as true in the backwoods of America as at home. Steady and cautious perseverance in clearing his lands and securing his harvests, with patience and good humour under such privations as are unavoidable, are chiefly essential to the success of the emigrant.

As a farther advice to settlers entering into the woods or new lands, we would say, that if two or three can go together, it assists them materially: a family with several stout sons has a very great advantage in this respect. A few acquaintances joining together, and taking a piece of land to divide among them, can assist one another in clearing it, or in getting in their harvest; and if any accident happens in one of their families, the good offices of the rest serve greatly to relieve its inconveniences. It may happen, for instance, that some of them gets a hurt, or is laid by for a week with sickness; and if this were to occur during harvest, or in seed-time, every thing would be lost, without the assistance of the rest of the company If such partnerships cannot be formed before leaving home (which, when the emigrants are not from the same neighbourhood, cannot be expected), they may be and often are arranged to much advantage during the passage; and intending settlers will often find it advisable to sacrifice some of their own views as to the district in which they mean to settle, in order to have the assistance of steady companions elsewhere. Should no prospect of this kind occur, and should the emigrant resolve to choose a spot and settle for himself, his next object ought by all means to be to study the dispositions and characters of his nearest neighbours, and accommodate himself to them with cheerfulness and good humour. In return, he will almost always find them obliging, and ready to afford him information and assistance. Both after he is settled, and whilst on the voyage, he ought to avoid all bargain-making people, many of whom he will find, who have continually something to sell or to exchange, of the very best kind, as they say. These insidious bustling characters ought to be specially marked, and emigrants ought never to buy any thing but what they have already determined on, or see to be absolutely necessary.

AGRICULTURE, SOIL, AND NATURAL PRODUCTIONS.

In North America, oats do not produce nearly so heavy a crop as in Scotland; and wheat, though of excellent quality, is not quite so productive as it is here. Part of these deficiencies may be attributable to the careless cultivation of the Americans, but part also is undoubtedly owing to the difference of climate.

The grains usually cultivated are wheat and Indian corn. The former, with such cultivation as the Americans bestow on it, produces about 30 bushels per acre. The Indian corn yields 50 bushels per acre; this vegetable is cultivated in rows or drills, which are placed four feet apart, and hoed much in the same way as turnips

are here; the stalk grows to a great height, and affords in the leaves a kind of grass, which cattle eat with greediness. The corn is used as food for man in a great variety of ways—as bread, as porridge (when it is called *mush*), and in puddings. When unripe, and in the green pod, it is not unlike green peas, and in that state is sold as a vegetable. Horses, cattle, and poultry are all fond of this grain, and thrive well on it.

Potatoes are also cultivated, and yield very profitable returns—good land producing 300 bushels per acre. Wheat, however, is the most valuable crop; and though the produce is generally smaller than in Britain, the flour is of excellent quality. This crop usually succeeds maize, and is followed in succession by barley and oats, sown down with grass—although this rotation is as frequently inverted; and as maize is a culmiferous plant itself, it is not thought by observers from this country so useful in preparing the ground for wheat as our green crops are. With good management, oats yield from 40 to 50 bushels, and barley about one-fifth less. Rye and buckwheat are more generally cultivated than in Britain. Buckwheat cakes are one of the standing dainties of an American breakfast. The process of manuring is much neglected, both as regards the use of ordinary stable manure, and of lime and gypsum. The Americans say that the labour required in the application of manure would be so expensive, from the high wages of all their servants, that the returns would not be profitable. But the truth seems to be, that they are more familiar with the process of breaking up new land, of which they have abundance generally within reach, and that they have never yet given manure and scientific agriculture a fair trial. Mr. Stuart of Duncarn calculates, that under their present system of management (the slovenliness of which is universally remarked), the average crops of all sorts of grain, maize excepted, are nearly a half less than in Britain. The climate is favourable for the making of hay, which yields a good return. Turnips, ruta-baga, peas, lucerne, are all cultivated to advantage.

The author of the "Stranger in America" thus speaks of the farmers in the state of New York:—"The American farmer generally owns the land he cultivates, in fee simple; what he gains is his. He is intelligent, thinks, and knows how to converse on his affairs. I have never received from one a stupid answer. He loves his country, yet has no especial attachment to the peculiar spot of his birth, which, however, I believe nowhere exists in any great degree, except where the farmer cannot move. If he sees before him a noble country, where he can buy for a dollar and a quarter an acre of ground, yielding abundant crops, and affording him the greatest pleasure a farmer knows, that of seeing a fine soil answer to his labours, it would be strange indeed were he to remain on a jealous earth, which seems to grudge the husbandman his well-earned reward. A proof of this may be found in the emigration by thousands and thousands of European peasants. On the whole, the American farmers are a hardy and well-disposed race. That you should not seek for refined and minute husbandry among the farmers in the west, who have to plough between the stumps, because the labour to dig them out would cost more than would be gained from the spots thus obtained, is evident; and that, moreover, the facility with which a farmer can here obtain land, sometimes induces him to commit the common fault of farmers, of husbanding too much land, and thereby scattering his means, you may easily imagine. It is necessary to travel but a short distance towards the west, to be convinced how erroneous the frequent assertion is, that the Americans are more a commercial nation than any thing else; they are, on the contrary, thus far essentially agricultural, that not only the vastly greater part of them are farmers, but also that their disposition is fitted for the farmer's life. Every American loves farming. In this the Americans resemble the ancient Romans and the English, not the Greeks, who never were famous farmers. If I say you should not seek for refined and minute husbandry here, I speak of the west alone. In some parts of the same state of New York, which have been settled for a long time, and where the price of the land is not so exceedingly low, it compared to the price of labour, farms are found which are managed with minute care, in all the different branches of husbandry; so that the farmer does not only compete with the cultivator of the soil in other countries, as to his chief article, wheat, but even butter is exported in considerable quantity from the farms along the Hudson, or near it. Some of the best butter, called Goshen butter, is exported to Malta and other places of the Mediterranean, where the best kind brings as much as a halfpenny per pound more than the best English or Irish butter. This I have been told by a gentleman who had long resided in various ports of that sea. So we go—American butter sent to the shores of antiquity!

"In the west of New York, probably, nine farms out of ten are owned in fee-simple, though many (perhaps as much as a third) are subject to mortgage. A lease is seldom for more than ten years, and for a rent in kind, or money, or wheat alone. The proportion of produce given as rent is, with few exceptions (I speak here always of the western part of New York), one-third of the grain and one-half of the hay. This proportion is delivered to the lessee, ready for market, on or near the premises. On fine wheat land it amounts to about two dollars and a half per acre, for all the farm not in timber. Many recent leases are at about two dollars per acre for the cleared land. One-third or fourth of a farm is generally reserved in timber. One hundred acres is the magnitude of fair farms. Those persons who occupy less, carry on, besides, some trade, or take jobs and work on larger farms; few farms exceed five hundred acres. Many consider the largest farmers the best cultivators: and the character of the cultivation is here, of course, as everywhere else, governed by the relation between price of labour and price of land, as I said before. Throughout the United States, as compared with Europe, labour is dear and land cheap; and it is this which causes difference in American cultivation and agricultural improvements, and not, as is not unfrequently supposed, a want of industry or capacity for business in the agricultural population. It is very obvious that a farmer upon one of the western prairies, who gives one dollar and twenty-five cents per acre for his land, seventy-five cents per day to his labourers, and gets for his corn from ten to twenty cents per bushel, must adopt a different mode of agriculture from the European cultivator, who pays for his land many pounds per acre, a few pence per day to his labourers, and who gets for his products from ten to twenty times as much as the western farmer. Reverse the case, and let the English farmer pursue the American mode of cultivation, and *vice versa*, and one would be ruined about as soon as the other. Each must adapt himself to the given circumstances, and only thus can prosper. At least nine in ten of farm-labourers in the west of New York, purchase or lease farms by the time they are twenty-five years of age. A majority of them go to the west, after having accumulated from 200 to 500 dollars, and purchase government lands."

The following notice of the produce of some *well-cultivated* land, in the northern part of the state of New York, will give an idea of American agriculture:—

10	acres of	orchard ground	produced	25 tons hay.
20	"	maize	"	1580 bushels.
4	"	wheat	"	140 "
1	"	flax	"	600 "
8	"	oats	"	560 "
1	"	barley	"	60 "
2	"	potatoes	"	1000 "
2	"	vegetables fattened		100 chickens.

Much of the industry of the American farmers is exercised in rearing cattle, hogs, and poultry, for the market of the towns. The hogs are fed a good deal on Indian corn, and the abundance of that kind of grain often makes it be given to them, when they might be fattened on much cheaper stuff. The rearing and feeding of cattle is carried on very systematically, and to a great extent; there being drovers, as in this country, who purchase the beasts from the farmers, and often drive them as far as 600 miles to be sold. New York consumes about 700 oxen per week; these weigh on an average 55 stones of 14 lbs.; and the butcher pays for them from £12 to £14 per head. Men employed as drovers receive 4s. 6d. a day, with food for themselves and cattle. It is allowed that a great deal might be done in all the states to improve the breeds of fat cattle, who, though always in good condition, often take more care and more feeding to bring them into that state than some of the profitable English kinds would do.

The horses of America are highly praised by good judges. Mr. Fergusson of Woodhill says (speaking of those in New York state), that he seldom passed a farmer's door without noticing horses, which, for their action and figure, were worthy of being transferred to any gentleman's stud. They are, he adds, kindly treated, well fed, and *remarkably* docile. They are in general about 15 or 15½ hands high. Those of settlers in the less improved parts of the country are, of course, a smaller and inferior breed, but hardy, tractable, and easily fed and stabled.

The sheep of New York state are Saxon and Merino, and the wool brings 2s. 8½d. per lb. in good years; in others, only 2s. 1d. They raise fine crops of turnips (where this management is attended to), and rear many sheep, the prices fluctuating: a ewe fetched in 1831, 9s.; the year before, only 4s. 6d. Some farmers brought a sheep-doctor from England, and gave him 27s. each 100 sheep, for his attendance to this kind of stock only.

The prices at which farm produce sells vary exceedingly in different places, according to the demand and the distance from markets. In New York state, wheat brought 1 dollar to 1½ dollars per bushel; maize, 2s. to 2s. 6d.; oats, 1s. 2d. to 1s. 6d.; barley, 2s. 8d.; potatoes, 1s. 3d. Good ordinary horses, £20 to £25. Oxen, per pair, with yoke and chain, £20 to £30. Cows, £4, 10s. to £6. Merino sheep, 9s. to 18s.; Saxony, 13s. 6d. to 43s.; common sheep, a sort of coarse small Leicesters, 4s. 6d. to 9s., after shearing. Brood sow, £2, 5s. to £3, 10s Hogs, 1d. to 1½d. per lb. on live weight. Geese, 2s. 10d. a pair. Turkeys, 2s. 1d. each. Fowls, 6½d.—*Utensils* cost—Farm-wagon, £13, 10s.; ox-cart, £10; ploughs, £1, 10s. to £1, 16s.; good double harness, £18.

Dairy articles, from the labour and attention they require, are high in proportion to other things; and, from the same cause they do not pay the farmer so well, nor are they so much attended to.

Orchards are a matter of considerable attention in America, and apples, peaches, and cherries, thrive in the greatest beauty and luxuriance. The orchard itself is a considerable ornament to a farm-house, and its fruit can be disposed of to advantage, either fresh or preserved, if near a town: and if not, it yields a luxury to the farmer and his family, which their whole earnings could hardly purchase in this country. Little attention is paid to the appearance of gardens, which are in general ploughed, labour being too dear to admit of spade husbandry; the Americans, indeed, scarcely know how to handle this instrument.

Many parts of the Union are highly propitious for the growth of flax and hemp, the hemp of Kentucky being found not inferior to that of Riga. Hops thrive well in New England. The rearing of the silk-worm is a profitable occupation in Connecticut. Cotton, tobacco, rice, indigo, and sugar, may be said to form the staple products of the more southerly states. The vine, which seems to be indigenous to America, and is found in the forests has within these few years been successfully cultivated in Indiana, and in many other parts of the western states, the first cultivators being a body of Swiss settlers. Of one of these vineyards, Mr. Flint thus speaks:—

"We have witnessed nothing in our country, in the department of gardening and cultivation, which can compare with the richness of this vineyard in the autumn, when the clusters are ripe. Words feebly paint such a spectacle. The horn of plenty seems to have been emptied in the production of this rich fruit. We principally remarked the blue or Cape grape, and the Madeira grape. The wine of the former has been preferred to the claret of Bordeaux."

In the northern states, farmers make sugar from the maple tree; and as the produce is of excellent quality, and cheaply procured, this becomes a branch of industry well worth attending to, at least for domestic consumption.

There are some fruits cultivated in the United States which are not known in this country. Among these is the papaw-tree, which is not uncommon in the bottoms which stretch along the rivers of the middle states, but is most plentiful in Kentucky and the western parts of Tennessee. It attains the height of twenty feet, and about four inches in thickness. The fruit resembles a cucumber, and, when ripe, is of a rich yellow: the pulp resembles egg-custard in consistence and appearance; it has the same creamy feeling in the mouth, and unites the taste of eggs, cream, sugar, and spice. It is exceedingly nutritious, and in its native woods was a great resource for food to the Indians. So many tastes are compounded in it, that it is said no person at first eats it without being tempted to laugh at the unexpected and whimsical combination. The *persimon* is another fruit not known in this country, which grows to considerable perfection near New York: the ripe fruit is about as large as the thumb, of a reddish complexion, round, fleshy, and furnished with six or eight stones; but it requires to be mellowed by the first frost before it be eaten, when it becomes very palatable. The fruit is produced in amazing abundance, and is used either for eating from the tree, for making a kind of beer, or for distillation. The tree, however, is not, upon the whole, more advantageous than the apple and peach.

There are few persons established on farms in the States who have not access to some stream in their neighbourhood for fishing, if they are fond of that pursuit, either for amusement, or as a means of providing food for their families. Every one has the privilege to avail himself of all the treasures of the waters, without let or hindrance; and they are worth taking advantage of. The shad and the salmon, of excellent kinds, abound in the rivers of the eastern states, and beautiful trout are taken in those of the north. Among the fish of the western waters are noticed the perch, one of which, the buffalo-perch, is a fine fish for the table, weighing from ten to thirty pounds. The pike, the perch, and other fish of the Illinois, and the rivers connected with it, are represented as excellent: a line called a trot-line, drawn across the mouth of the Illinois, with hooks at regular distances, took five hundred pounds in one night. The whole of the fish of the Mississippi are not, however, of equal quality for eating; the kinds which are chiefly admired are the trout, the small yellow cat-fish, the pike, the bar-fish, and the perch.

In recounting the privileges of the farmer, it would be improper to pass over the game, which is abundant in the American woods, and which may sometimes afford amusement, sometimes an agreeable variety of food. The mallard, or common wild-duck, is found in every fresh-water lake and river of the United States. The canvas-back duck is an American species, altogether

unknown in Europe; they are found in the rivers Hudson and Delaware, but principally frequent the waters of the Chesapeake, where they feed on the roots of a certain grass-like plant abundant in these streams: they float about in shoals, but are exceedingly shy, and difficult to be shot. The delicacy of their flesh, and the high price they bring in towns, render them an object of lucrative pursuit to numbers. In general, however, with regard to game of all kinds, though plentiful and excellent, it is no object with the colonist, who does not care to waste his time in following it. Mr. Fergusson of Woodhill met in Canada with a young Scotsman who had been a poacher in Scotland, but was now settled and thriving well on a farm of one hundred acres in his new country. Mr. Fergusson said to him, "You will need neither certificate nor qualification here: what do you principally shoot?"

"Indeed, sir," said he, "if you'll believe me, I scarce ever think about it, for there's naebody here seeks to hinder us." A herd of deer, only two days before, had wandered past him while at the plough, yet Walter felt no inclination to run for his rifle, though it stood loaded in the house.

WAGES OF LABOUR, AND COST OF LIVING.

The price of articles varies in different places, so that no general average can be stated either of wages or of the cost of living: both are different in different circumstances. But we have selected, from the best authorities, such lists, for several of the chief towns and districts, as will enable the reader to judge for himself.

Albany.—For Albany, on the river Hudson, we have, from good authority, the following statement:—

Wages.—Men for general farm work—Summer, £2, 5s. per month; winter, £1, 7s. per month. Harvest work, cradling wheat, 4s. 6d. per day. A cradle scythe is said to cut four acres a day, and requires one man to find to each cradler. Hay cutting, 2s. 7d. per day. Board found besides to all these. A steady active farm overseer or bailiff has about £45 money wages, a capital house, a cow, and some other advantages. A man gets 8 guineas (or 21 dollars) for three weeks' work drying hops. Good cooks, 18s. to 27s. per month; chambermaids, 13s. 6d. to 18s. per month; washerwomen, 4s. per day; servant girls, 18s. to 24s. per month.

Provisions.—Wheat, 6s. 9d. per bushel; beef, per quarter, 18s. to 23s.; per lb., 2d. to 4d.; mutton, 1½d. to 2d.; veal, the same; pork, 22s. to 27s. per cwt.; butter, 5d. per lb.; cheese, 2d. to 4d. per lb.; eggs, 4d. to 5d. per dozen. Brandy (French), 4s. 6d. per gallon; gin, 3s. per ditto; whisky, 1s. to 1s. 1d. per ditto; excellent table beer, 4s. 6d. per barrel of 32 gallons. Firewood, 13s. 6d., country price; 22s. to 27s., town price, per cord of 128 cubic feet, delivered four feet long, and cost 2s. per cord to cut to lengths required for use.

"The American farmers," says Mr. Fergusson, "live comfortably, and at a very moderate expense. Candles and soap are generally manufactured from kitchen refuse. A good housewife assured me that the butcher-meat for her family, fifteen in number, did not exceed, *in whole*, 1s. per day (three meals), except when she allowed them turkeys and other poultry, when she reckoned the expense at 2s. 6d. The flour consumed did not exceed 4s. 6d. per week. They have fruit, both fresh and preserved, in the utmost profusion; and the cider barrel is always ready broached. A good many articles of clothing are spun and woven at home; and the geese are subjected to periodical contributions, towards the bedding of the household, or the feathers are sold at a good price."

Baltimore.—Mr. Pickering, who went to this town to look for a situation as overseer of a farm, mentions the following prices as current there:—

His own lodgings and board, at a respectable shipcarpenter's (including washing and mending), 13s. 6d. per week.* In the markets, beef, 2d. to 3½d. per lb., the best cuts, 4½d.; pork from 2d. to 3½d. per lb., and sometimes lower; veal and mutton, by the quarter, 1s. 2d. to 2s. 3d.; good lamb, 4d. per lb. Turkeys, 1s. 2d. to 2s. 3d. each; fowls, 6½d. to 9d. each. Cabbages (drumheads), 1d. to 2d. each; potatoes and turnips, 10d. to 14d. per bushel. Wild-ducks, 3½d. to 5d. each; the canvas-back duck, a large bird, and esteemed a great delicacy, 13d. to 18d. each; partridges, 4d. to 7d. each; quails, 1d. to 2½d. each; hares and rabbits (small), from 6d. to 1s. each; shad (a fine fish like a herring, but ten times the weight), 13d. to 18d. a pair. Apples, very fine, 13d. to 2s. 3d. per bushel; green peas, 1s. to 1s. 8d. a peck.

Ship-carpenters' wages from 7s. to 9s. per day, which was higher than the usual rate, on account of a great demand for hands at the time. A young man, bound apprentice to a shipwright, had 13s. 6d. per week, wages for first year, and 22s. 6d. per week second year, to board himself.

Philadelphia.—In the "Price Current" of Philadelphia we find the following rates given on wholesale articles:—Mess beef, per barrel of 196 lbs., 45s. to 47s. 2d.; butter, per lb., 4½d. to 5d. (best quality); biscuit, best, per lb., 2d.; mould candles, per lb., 5½d.; dipped candles, 4½d.; cheese, in casks, 3d. to 4d.; coffee, 5½d. Brown shirting, 3d. to 4½ per yard. Flour, superfine, per barrel of 196 lbs., 20s. 1d.; Indian corn meal, per 196 lbs., 15s. 1d.; hams, 5d. to 5½d. per lb.; honey, per gallon, 2s. 1d.; loaf sugar, per lb., 6½d. to 8d.; brown sugar, 3½d. per lb.; brandy, per gallon, 7s. 2d.; Virginia tobacco, 1½d. per lb.; Cuba tobacco, 5½d. per lb.; wine, Madeira, per gallon, 5s. 2d. to 13s. 6d.; Port wine, per gallon, 4s. 6d. to 5s. 9d.

These are the wholesale prices; articles of provision are furnished in the markets as follows:—The best beef from 3½d. to 6½d. per lb., according to what part of the animal is selected; fat mutton, of excellent quality, 3d.; chickens about 2s. 1d. a pair; turkeys from 3s. 6d. to 7s. a pair. Butter varies, according to the time of the year, from 6½d. to 18¾d. per lb., averaging about 12½d. Superfine wheat-flour, 19s. 8d. per barrel of 196 lbs., kidney beans, 1s. 1½d. per peck; cherries (good), 2½d. per lb.; good rye whisky, 1s. to 1s. 2d. per gallon; corn ditto, less.

As to the prices of labour in Philadelphia, and the surrounding country, we find it stated, that a labouring man gets from 3s. 2d. to 4s. 6d. per day, in the cities; and at farm-work, in the country, he receives from £1, 16s. to £2, 14s. per month, besides board and lodging. An attentive, handy servant-girl is readily engaged at 4s. 6d. per week (besides her board, of course).

New York.—The provision market here seems to be cheaper than that of Philadelphia, as we find the best beef quoted at 2d. per lb. Journeymen mechanics are hired at 6s. per day, and some that work by the piece earn 8s. per day. House carpenters, bricklayers, and brick-makers, find ready employment (except in the dead of winter), at 4s. 6d. to 7s. or 8s. per day; and shoemakers, tailors, and persons well acquainted with any common or useful trade, easily find work, according to these rates. It must be remarked, that tradesmen in America work long hours, that is, from sunrise to sunset. Mr. Stuart of Dunearn says of this circumstance, that he does not think the employer gets any additional work done by it, the people being much more disposed to loiter than when the hours are shorter. It may be remarked, also, that the long summer day at New York is about an hour and a half shorter than that of London.

* The living was—a roast turkey once or twice a week, fowls, beefsteaks, ham, sausages, and a kind of pudding; pies, soup, fish, &c. A variety of the above was placed on the table at every meal, and generally three kinds of vegetables with coffee or tea at breakfast and supper.

Farm-labourers in New York get from ten to twelve dollars a month, with bed and board, including washing. A married man receives from 95 to 120 dollars a year instead of board, and he pays about 20 dollars for a house and garden.

With regard to prices generally, it deserves to be mentioned, that those of imported articles, such as tea, sugar, coffee, &c., are higher in places at a distance from the sea and the great towns, and that articles of home provision are cheaper there. This arises from the expense of carriage in both cases, what is produced and sold at home having always less charges on it than what is brought from a distance. Clothing is rather dear in the States, especially woollen; worsted stockings and worsted mits, for instance, are considerably higher than in England.

These notices will serve to convey an idea of the cost of living and of wages in most parts of the eastern states, where emigrants first land. They will be found to vary, as we have already mentioned, in different places, and according to circumstances; but it appears generally that there is full employment for labour, with wages according to the kind of business, from 3s. 6d. per day, with board, to 9s. per day without board, the most laborious or most ingenious trades receiving the highest remuneration. The cost of living may be inferred from the prices of beef and wheat—the former varying from 3½d. to 4d. per lb., according to the quality or the demand, the latter generally about 4s. 6d. per bushel, or 18s. per boll.

Western States.—We find the following list given for the prices at Cincinnati, on the Ohio, which may be reckoned the capital of the west, and is the point to which emigants first direct their steps in that quarter.

Flour, 9s. per cwt. of 112 lbs.; Indian corn, from 6½d. to 8d. per bushel; mutton, 2d. per lb.; cider, 4s. 6d. per barrel; bacon, 2d. and 2½d. per lb.; shoulders, 1½d. per lb.; hams, 2½d. per lb.; freesold butter, 2½d. and 3d. per lb.; mould candles, 5½d. and 6d. per lb.; dip candles, 4½d.; coals, 4d. and 4½d. per bushel afloat, 5d. and 6d. in the yard; coffee, 8d. and 9d. per lb.; teas, 1s. 6d. to 2s. per lb.; sugar, 4d. to 5d. per lb.; copper sheeting, 18d. per lb.; old copper, 9d. per lb.; cigars, 20s. per 1000.

EXPENSES OF TRAVELLING.

Mr. Pickering, to whom we have formerly referred, travelled in search of a situation as land steward, and has been particular in noticing the expenses of his journey. The following are some of his notes:—From Philadelphia, via Brunswick, N. J., to New York, partly by steamboat, and partly by coach, 96 miles, 11s. 3d., luggage included; dinner on board, 3s. 4½d.—the fare, fish, flesh, fowl, puddings, pies, tarts, brandy, &c. On landing at New York, he got lodgings, after some search, at a tavern, where he paid for lodging 6½d. per night, and 13½ for each meal; five beds in the room he slept in. Went on board the steam tug-boat for Albany; the fare 4s. 6d., one trunk included, and paying 1s. 1d. for the other. In the steamboat the fare is higher; the distance is 145 miles: he took provisions with him for 24 hours, as did the rest of the passengers. From Albany he took passage in the canal to Lockport, near Lake Erie, distance 360 miles—fare, a little more than one penny per mile for himself and one trunk, paying 3s. 4½d. for the other, which weighed 75 lbs. Passed over a ferry on the Niagara river, to Canada—charge, 13½d. This was in the year 1826.

Mr. Fergusson of Woodhill travelled the same route from New York to Albany, some years later (1831). The charges of freight were then considerably lower: he went in the cabin of the North America, a magnificent steamboat, and paid only 9s. fare for the whole 145 miles, with a very moderate charge for meals—being 2s. 3d. for dinner, including brandy, whisky, and Hollands, placed on the tables at the discretion of the passengers He returned from Canada by the Erie Canal to Rochester: the fare from Buffalo to Rochester, 94 miles, 15s. 9d., three capital meals included—the boats good, the cabins amply supplied with books and pamphlets, and the tables with good cheer. Travelled by hired coach from Geneva to Albany, 170 miles, £1, 11s. 6d. No extra charges given to coachmen or other persons.

Mr. Fergusson afterwards went from New York to Washington, and found the charges as follows:—From New York to Philadelphia, by Bordentown (where Joseph Bonaparte lived), by steam, with 30 miles of land-carriage, 18s., including breakfast and dinner; went in the William Penn steamboat from Philadelphia to Baltimore, 120 miles (going through the Delaware and Chesapeake Canal, 14 miles), fare 18s.—breakfast and dinner, both excellent, were charged 2s. 3d. each. From Baltimore to Washington in the stage-coach, 38 miles, fare 13s. 6d.: got a neat light coach, a pair of sleek well-fed horses, and a black driver to go to Mount Vernon (the former residence of General Washington), a distance of about 12 miles—fare, 13s. 6d.

In the account of travelling expenses, it must be noticed, that passengers may always carry their own provisions when in steamboats, or canal boats, and by that means reduce the amount very considerably.

MANNERS OF THE PEOPLE, AND THEIR CONDUCT TOWARDS STRANGERS.

We have now presented a fair and impartial view of the United States of America, as regards their suitability for the purposes of intending emigrants. As the preceding information has been very carefully drawn from every accessible source, and rendered as complete as possible, nothing remains to be mentioned which can concern the interests of emigrants, unless it be a few observations on the manners of the people they have an intention of residing amongst.

Few persons know or care about those little peculiarities of speech or manner in which the people of one county or district differ from those of another; as, for instance, in what the dialect of the natives of Yorkshire differs from those of London, or that of the people of the south of England from the same class in the north of Scotland. These matters are of very slight importance to the comfort of a stranger going to reside among them; but it is of some consequence for him to know if the new people with whom he is going to pass his life are kind and hospitable to those who come among them, or if they are jealous and intolerant in their manners, and disposed to repel the advances of strangers. There are many such people who look on all new comers as intruders, and take every means to make them feel that the country they have come to belongs to others. Is this the case with regard to America? may be naturally asked by emigrants who think of proceeding thither. On this subject we might appeal to the many invitations which are daily circulated by the Americans and their friends, calling on all who are destitute of employment and subsistence in Europe, to come freely to that country, where they are assured of cordial welcome and abundance. But the following extracts from the journal of Mr. Fergusson may show how our wealthy travellers are received there; and we shall then subjoin a similar specimen of what the poor are to expect.

"I could say much," says Mr. Fergusson, "were it proper, of the hospitality of New York, and of the unostentatious kindness with which my letters of introduction were received. The style of living is elegant and comfortable, and the domestic circles which I had the pleasure of joining seemed truly unaffected and happy. The quiet, modest, and amiable tone of female society particularly pleased me."

We give a second extract from the same traveller. "I learned also, from a Scotchman in Mr. Thorburn's employment, whose family had suffered heavily from sickness last winter, that flowers and parties by no means engross the sole attention of the ladies of New York. He assured me, that within his own observation, it was quite wonderful what they continued to do, in visiting, clothing, and attending to the poor. This man left Glasgow in great destitution about a year ago. He is now in comfortable circumstances, and his family provided for; but the first fortnight which honest Saunders Lee spent in New York, a total stranger, without money or engagement, he described with a shudder, as '*perfectly awful.*'"

The following extract is from the letter of a female emigrant, whose husband had fallen sick on his arrival:—"We hired a room, and my husband bought a saw, and went sawing wood, and doing any thing; and we thought we should get through the winter pretty well; but after about three weeks, he was taken ill, and it proved to be a typhus fever. We had no parish to apply to for relief; but you would be astonished at the friends we have found; for people that were quite strangers have called to know *if the sick Englishman lived here;* one kind gentleman sent for a doctor, and another good old Methodist gave me leave to go to the grocer's for any thing in his name; and others were equally kind. I never thought I should meet with such friends among strangers. Husband is now mending fast."

Mr. Flint says—"To-day a vessel from Dumfries arrived; and a few minutes after she was moored, one of the brothers Messrs. Ronaldson went aboard, making inquiries after the views and circumstances of the poorer classes of emigrants. He employed one of them, pointed out where several others would find work, and gave advice to the rest. This is not a new or rare instance of benevolence on the part of these gentlemen."—"Every day numbers of European emigrants are to be seen in the streets [of Philadelphia]; I have never heard of another feeling than good wishes to them."

It is frequently mentioned, that difference of rank or of wealth is not so much thought of in America as in this country, and that the industrious labouring man stands more nearly on an equality with his employer than with us. The following extracts relate to this subject.

Extract of a letter from a labourer:—"A person must not think of coming here without working, and they despise drunkards; but if a person keeps steady, he is respected much more than in England; he is admitted at table with the farmer."

The following extract is illustrative of American manners in various respects. It is from Mr. Stuart:—"When they meet us walking, they, whether acquainted with us or not, frequently stop their vehicles, and very civilly offer us a ride with them, and will hardly believe us to be serious when we decline to avail ourselves of their kindly meant invitations, and tell them we prefer to walk. There are few more striking points of difference between this country and Britain, than in the numbers of people who ride and walk on the public roads. It absolutely seems disgraceful to be seen walking. The circumstance, no doubt, proves the easy circumstances of the mass of the people, as well as the value of time to a mechanic, whose wages may be from one to two dollars a day, and who can better afford to pay for a conveyance and spend less time, than to walk and spend more."—"We have not hitherto," he adds in another place, "seen any thing like a poor man's house, or a beggar, or any one who did not seem well clothed and well fed."

Such are some of the traits of character of the inhabitants of North America, who, although speaking the English language, and living under institutions strictly English in their character, differ, as may be supposed, in several respects in their manners from the people of this country. They do not lay claim to that artificiality and polish which distinguishes what is called "good society" in Great Britain; they are more downright and frank in their behaviour, less ceremonious, and are in every way a more independent people in their thoughts and actions than the generality of English and Scotch. From all that we can understand of their character, they seem to possess less of the quality which produces "cringing" than any people on the surface of the earth. It may be conceived, from the extraordinary mixture of classes of persons from most European countries, and the wide field offered for adventure and enterprise, that the Americans have little of that staidness of disposition and subdued tone of mind which are characteristic of the British nation. Society, in the partially settled districts, is therefore still in a loose condition; and emigrants will require to be more alert in regard to their interests, and much more on their guard against deception, than in this old-established country. It is deeply to be regretted, that, for a number of years, there has been a class of writers in Great Britain, and a few travellers, whose deeply-rooted object it has been to vilify the American nation in the gross, and to hold up not only their institutions and usages, but all that belongs to the country, whether in nature or art, as fit subjects of ridicule and contempt. The unworthy calumnies which have been industriously circulated by these splenetic writers, need not in the smallest degree produce hesitation among emigrants in reference to settling in the United States. The citizens of the North American Union are essentially British in their origin and character. Their other peculiarities have naturally arisen from the fortunate circumstances under which they are placed; and in which peculiarities we would equally partake, had we fewer public burdens, fewer causes to be careworn, as well as a greater scope for the profitable exercise of our industry. In comparing Canada with the States, every intelligent traveller allows, that the citizens of the Union are infinitely more active than the subjects of Great Britain. Within the colonial territories, all public works, and most of the settlements, proceed slowly, the system seeming to be rather inert; while on the States' side of the boundary, every species of work proceeds with the most astonishing rapidity—canals being cut, railways formed, and towns built, in an inconceivably brief space of time. As Upper Canada has nearly the same natural advantages as the States, and as the people, it may be presumed, are as well educated and as generally intelligent, it would seem that the true cause of the difference we specify is in the mode of conducting public affairs. It may be conceded, that the provinces are as well managed as they could possibly be; but it must also be allowed, that it is not in the nature of things that a country, with its seat of government three thousand miles distant, can be so advantageously conducted as another country where the government is not only on the spot, but consists of the people themselves. It is not, however, our object here to draw any comparison between the political condition of the colonies and States. Both have free institutions, and both possess those capabilities which can yield comfort to settlers. The honest, the industrious, and the enterprising, will do well in either, and will command respect and ascendency wherever they may fix their place of settlement.

EMIGRATION TO AUSTRALIA.

AUSTRALIA is an island of extraordinary magnitude, forming the chief of a group lying off the southern coast of Asia, and collectively termed Australasia. Next to the great continents composing the four "quarters" of the world, it is the largest mass of land of which we have any certain acquaintance, being in length from east to west 2000 miles, and in breadth from north to south 1700. It lies between 9° and 38° of south latitude, and 112° and 153° east longitude. Australia was discovered by the Dutch in 1616, and from them it received the name of New Holland, which is now generally disused. The Dutch having done little more than merely point out the island, it was afterwards visited and more carefully examined by several English navigators, and among those by the celebrated Captain Cook, who bestowed upon its eastern coast the name of New South Wales. Its distance from Great Britain is 16,000 miles by ship's course. Australia has a few small islands near its shores; and one of larger dimensions on the south, called Van Diemen's Land, from which it is separated by a channel named Bass's Straits.

The physical geography of Australia is in some respects peculiar. The country, taken as a whole, and as far as it has been explored, exhibits less hill and dale, with less compact vegetation, than most other parts of the world. At different places there are extensive ranges of mountains, between which and the sea there are generally some fertile valleys; other parts of the coast are flat and sandy; while the greater part of the interior is said to consist of extensive plains, with rising terrace-like land, and low ridges of hills, with open forest. Nowhere are there any dense forests like those of North America; the timber is for the most part thinly scattered, and the scenery has in numberless places been compared to that of a gentleman's park in England. The herbage in nearly all quarters, except the fertile valleys, is thin, and what in England would be called scanty; yet there are spots in which the vegetation is exceedingly beautiful. Australia has a variety of rivers, great and small, as the Hunter, the Hawkesbury, the Macquarrie, Lachlan, Murumbidgee, &c., but they all less or more possess the peculiarity of being subject to great flooding at certain seasons, and being very low at others; consequently, none can be said to be navigable for any great length. Some of the rivers are liable to be so greatly dried up in summer, that they cease to flow, and their course is only known by a series of pools, from which alone water is to be obtained. A natural result of this general deficiency of irrigation, is the scanty herbage already noticed, and the adaptation of the land more to pasturing than to agriculture. It is to be remarked, however, that the coarse scanty grasses are extremely nutritious; those named cat-grass and kangaroo-grass are distinguished for their fattening qualities for horses, cattle and sheep.

In a late expedition into the interior, from the eastern coast, Captain Sturt advanced towards the north beyond the 145th meridian, and on the south beyond the 140th, and found "that the country preserved, as far as he was able to see from some hills, the same uniform appearance of an immense level plain. This extensive country resembles as little the plains of South America, covered with abundant grass, as the African Sahara, with its moving sands: it seems to approach in character to the wide steppes which surround the lake of Aral, and extend to the Caspian Sea and the Ural Mountains. But we are inclined to think that they are somewhat better adapted to sustain inhabitants than the steppes of Asia. These plains of Australia are, in many parts, extremely level; in others, they are slightly undulating; and here and there, but at great distances, sometimes of more than a hundred miles, a sandy eminence rises, which hardly deserves to be called a hill: the loftiest of these eminences are not above 300 feet higher than the plain on which they stand.

"All over this extent of country the soil presents only two varieties: it is either a red sandy loam or a white coarse sand. In some places it is entirely destitute of vegetation, in others it nourishes only salsolaceous plants, without a blade of grass between them. Others, again, are covered with polygonum, a gloomy and leafless bramble; and in a few tracts patches of ground are discovered, which appear to be moist, and in which the calystemma is abundant. Such patches probably form quicksands in the rainy season. Those parts of the plains which seem to have the best soil, produce stunted gum-trees and cypresses. Large tracts of country are covered with shells and the claws of cray-fish, and this soil, although on alluvial deposit, is superficially sandy They bear the appearance not only of being frequently inundated, but also of the floods having subsided upon them. On their surface no accumulation of rubbish is observed, so as to indicate a rush of waters to any one point; but numerous minor channels are traced, which evidently distribute the floods equally and generally over every part of the area which is subject to them.

"My impression," says Captain Sturt, "when travelling in the country to the west and north-west of the marshes of the Macquarrie, was, that I was traversing a country of comparatively recent formation. The sandy nature of the soil, the great want of vegetable decay, the salsolaceous character of the plants, the appearance of its isolated hills and flooded tracts, and its trifling elevation above the sea, severally contributed to strengthen these impressions on my mind."*

The conjecture of Captain Sturt, that Australia is of a more recent formation than the rest of the globe, is by no means singular, but how far it is correct it is here unnecessary to inquire. It is at least remarkable, that nature has, in several instances, put on very different forms in Australia from what are customary elsewhere. Among the animal tribes, the chief are of the pouched kind, and move forward by springing. The kangaroo is the principal animal of this description, and there are different kinds of it; some are from four to five feet in height, when sitting on their hind legs. They will, in some cases, leap twenty feet at a single bound, by which odd species of movement they are able to outstrip a horse at full gallop. This interesting and pacific class of animals is fast diminishing in numbers; they are now seldom seen in the settled parts of the country. Opossums are numerous. There is an animal half-bird, half-beast, or possessing the bill and feet of a duck, and the body of a mole or rat (ornithorhyncus paradoxus). Wild savage animals are unknown, the native dog excepted, which has been pretty well hunted in some quarters. Of birds there are some singular varieties, both large and small. There are, in particular, a great variety of parrots, parroquets, and cockatoos, all with exceedingly beautiful plu-

* Penny Cyclopædia.

mage—green, red, purple, and white. The doves are equally splendid in their feathery coverings. There are several kinds of native bees, "which are without stings, and produce a great deal of delicious honey."—(*Martin.*) Of snakes there are several varieties, some of them poisonous. Musquitoes prevail in the uncleared districts, as they do in all warm uncultivated regions where there are marshes and trees to harbour them; but we do not see it anywhere mentioned that they form that horrid nuisance which they are in almost every part of North America. In some places, fleas are described as forming a serious nuisance. The rivers abound with fish, some with cod of a large size; and of aquatic birds the usual kinds are seen, including swans of a dark colour. Shrimps, mussels, and oysters, are plentiful; the oysters, though small, are of a very superior quality, and abound on some parts of the coast to an extent quite unprecedented in any other quarter of the globe. The seal and whale fishery on the coasts of Australia offer boundless scope for profitable adventure to those acquainted with this branch of industry, and who have capital to risk.

The mineral riches of Australia are also of great amount. "Coal and iron, the most valuable of minerals, are met with in inexhaustible abundance, the latter being not infrequently found in the state of native iron in large detached masses on the surface of the ground. Limestone is still more abundant, and in some parts of the territory, as in Argyle county, New South Wales, it passes into marble, of which beautiful specimens have already been cut and polished by a skilful artisan from London, now established in Sydney."—(*Lang.*) The colony also possesses clay fit for pottery. A manufactory of brown and glazed earthenware, of the best quality, has lately been commenced on a large scale at Irrawang, near the confluence of the rivers William and Hunter, by that enterprising and scientific settler Mr. King, the well-known discoverer of the superior quality of Sydney sand for the manufacture of glass.

Vast as are the latent resources of Australia with respect to its fruitage, mining, and fisheries, it is not to these departments of industry that the country at present looks for its advancement. Its grand resource consists in an "illimitable extent of pasture-land, which it presents to the sheep-farmer or the proprietor of cattle in every direction."—(*Lang.*) No country on the face of the earth seems to be so admirably adapted for the feeding of sheep and produce of fine wool. America, as is well known, is not a sheep-feeding or wool-growing country. In Canada and other northern parts, sheep require to be housed and fed by artificial means for several long winter months; while on the fine prairies of the States, the sheep which are left at large throughout the year do not yield wool of a valuable quality. Australia, on the other hand, resembles Spain in its qualities for pasturage in all seasons; and its climate produces equally fine, if not superior wool. At the present moment, Australian wool enjoys the highest reputation in England and America—it takes the lead in the market—and so readily and so profitably is it disposed of, that the cost of transport of sixteen thousand miles goes almost for nothing in the grower's calculation of profits. Most of those beautiful and soft woollen fabrics which go by the names of Indianas, Merinoes, and Challis, and are in so great request by ladies, in the shops of our haberdashers, are chiefly manufactured from this fine Australian wool; and it is obvious, from the growing taste and demand for these articles, which are so well suited to our climate, that (barring fiscal interference) the production and sale of this species of wool must soon become one of the first trades connected with British commerce.

The aborigines or natives of New South Wales are now very inconsiderable in numbers. They lead the usual wandering life of savages, roaming throughout the interior in small tribes, each claiming as head-quarters a respective territory. They are jet black in complexion, and in general tall and thin in their persons, with large heads, large lips, and wide mouths, and are altogether the reverse of beautiful, according to our ideas of that quality. They have been considered, although the opinion is not completely borne out by experience, as among the lowest of all known savages in the scale of intellect. There is certainly less mechanical genius among them—fewer contrivances to improve the original condition of man, than are to be found among the natives of any other quarter of the globe. Their only arms are a rude spear or rather pointed pole, which, however, they throw with great force and precision; and a short club, called by themselves a *waddie*. Their huts are of the poorest description, and they wear no sort of covering whatever on their bodies. All attempts to civilize them, and to induce them to abandon their wandering life, have hitherto been nearly ineffectual; and with the exception of a few in the neighbourhood of Sydney, and some other of the colonial towns, who . . . is contiguity has, in some degree, forced into a half-domesticated state, they still wander in roving tribes throughout the interior. From the latest accounts, it does not appear that the white settlers are now suffering much from these miserable beings; indeed, it seems that any person may command their good will by the slightest efforts of kindness and conciliation.

The climate of Australia, confining ourselves of course to the settled portion of the country, although varying considerably in different districts, is altogether highly agreeable and salubrious. According to Mr. Cunningham, who was a surgeon in the colony of New South Wales, exposure produces no bad effect, from the dryness of the atmosphere; and it has been recommended to consumptive patients. The summer commences in December and extends to February, during which period the heat is considerable. Dr. Lang states that the thermometer seldom rises above 75° in Sydney, except when the hot winds blow from the west. Another writer mentions having walked two miles to church, with the thermometer at 146° in the sun, and 95° in the shade, yet felt no inconvenience, the air being dry and pure. In the lower districts, the air is tempered by a cool and delightful sea-breeze, which blows steadily and regularly through the day, and is succeeded at night by an equally steady and grateful breeze from the land. The average temperature at Sydney during winter is 55°, and there is only one instance on record of snow having fallen in the town, which was on the 17th June, 1836. In the higher districts, of course, the cold is greater; the thermometer at Paramatta sometimes falling so low as 27°, and in the district of Bathurst snow lies for a short time in winter.

A peculiarity in the climate of Australia is the prevalence of hot winds during the summer. These blow from the north-west, and resemble a strong current of air from a heated furnace, raising the thermometer to 100° in the shade, and 125° when exposed to their influence. They seldom occur more than four or five times every summer, and last only a few days. It has been supposed that these winds derive their extreme heat from passing over a great extent of arid and heated country, which deprives them of all moisture. Breton, in his tour in New South Wales, says—"I rode fifty miles a day, in the hot wind, without feeling more inconvenience than in a hot day in England; and at night I have slept in the open air, my saddle for a pillow—the breeze balmy, the firmament studded with innumerable bright stars shining sweetly through the deep blue of that cloudless sky, and never yet experienced any ill effects from it; indeed, in a climate like that of New South Wales, I question if any thing is to be feared from night exposure."

Regarding the mortality in Australia, no certain tables have as yet been formed. Dr. Lang says—"I am inclined to believe that the probabilities of life for any

number of children born in the colony are higher than for a similar number born in England." Several instances of longevity are mentioned—one of a woman who had reached 125 years, and was able to perform her daily work. Mr. Butler says he has seen several persons upwards of a hundred years old, which is confirmed by Dr. Lang and others. At Moreton Bay, a penal settlement, only one man was in the hospital, out of 1200 convicts and soldiers, in six months. In Bathurst district, which is upwards of 2100 feet above the level of the sea, only two persons are said to have died in twelve years. All writers agree upon the salubrity of the climate, however much they may differ regarding the capabilities of the country.

Australia being situated in the southern hemisphere, the seasons are the reverse of those in Britain—January being the middle of summer, and July of winter. The spring months are September, October, and November; those of summer are December, January, and February; autumn includes March, April, and May; and the winter months are June, July, and August. March, April, and August, are generally considered the rainy months. The average temperature of spring is 65°; summer, 72°; autumn, 66°; and winter, 55°. As a matter of course, while it is day in Britain it is night in Australia, a circumstance of no consequence to the inhabitants.

Australia, though originally discovered by the Dutch, has long been considered as a possession of the British crown. In 1778, the British government planted a settlement at Botany Bay, in consequence of the recommendation of Captain Cook, designing it to serve chiefly as a place for the reception of transported convicts. This was soon after removed to Sydney, on Port Jackson, and, notwithstanding the unfavourable circumstances attending convict labour, was found to prosper very considerably. In 1803, a second settlement was formed on Van Diemen's Land, to which convicts were also sent. The transportation of convicts to these two colonies has been continued till a recent period, and has had of course a certain moral effect on the population. A large portion of the inhabitants are either convicts, or the descendants of convicts. The more recent settlements in Australia, namely, West Australia (1829), South Australia (1836), Port Philip, and Port Essington, have not received convicts. Hence the classification of the Australian colonies into penal and non-penal; a distinction, however, which we may hope to see always less and less marked, as time and the usual moral influences work their effect on the masses of settlers.

With these general remarks, we proceed to specific notices of the colonies, beginning with the oldest and most extensive,

NEW SOUTH WALES.

This colony includes a large portion of the east side of Australia, or from Cape York on the north to Bass's Straits on the south. Its general appearance from the sea is far from being inviting, presenting immediately on the coast a continuous front of bold cliffs and mural precipices, unbroken for many miles together; behind these, again, and running generally parallel with them, at an average distance of about forty miles, rises a chain of rocky, precipitous, and almost impassable mountains, extending along the whole eastern coast. These are called the Blue Mountains. The unpromising appearance of the shores of New South Wales is not removed upon landing. For five or six miles interiorly, the land continues barren and rocky, presenting few other signs of vegetation besides some thinly scattered, stunted shrubs and dwarf underwood. At this distance inward a marked change begins to take place; the soil improves, and begins now to be encumbered with tall and stately trees, which soon again thicken into a dense but magnificent forest, indicating, indeed, a more luxuriant soil than that passed, but scarcely less discouraging to the settler. Advancing inwards, however, from six to nine miles farther, another change takes place. You have cleared the forest, and the promised land lies before you, improving with every step you advance; now presenting an endless variety of hill and dale, covered with the most luxuriant vegetation; now extensive plains, resembling the finest parks in England—a resemblance which is made the more striking from their being similarly interspersed with magnificent trees, just numerous enough to add beauty to the land without encumbering it.

Such is, with few exceptions, the whole of the eastern coast of Australia. The colony is, or was lately, divided into the following counties:—Ayr, Argyle, Bathurst, Bligh, Brisbane, Camden, Cook, Cumberland, Cambridge, Durham, Georgiana, Gloster, Hunter, King, Liverpool, Macquarrie, Murray, Northumberland, Phillip, Roxburgh, St. Vincent, Wellington, Westmoreland, and Melbourne. To these, additions are constantly taking place, and we therefore do not pledge ourselves for the accuracy of the list.

Ayr.—This county is remarkable for the vast proportion of high, rocky, barren, and mountainous land which it presents; it is also, in general, so thickly timbered as to give the greater part of it the appearance of one immense forest. The quantity of land capable of cultivation in this district is, therefore, comparatively small; and though there are some good tracts occasionally to be met with, it is not, on the whole, by any means a desirable quarter of the colony to settle in. The climate, too, has been found to be highly unfavourable to wheat; and the hills are bleak, poor, and brushy, and not well adapted for grazing. Port Macquarrie, one of the penal settlements of the colony, is in this county.

Durham.—There is but a small portion of this county located, as it is called, that is, possessed by settlers; and its general appearance, so far as it has been explored, like the greater number of the other districts, is exceedingly varied, often presenting the most beautiful scenery, and equally often the reverse: on the whole, it does not seem to be by any means rich in suitable localities for the agricultural emigrant. Notwithstanding, however, this unfavourable character when generally spoken of, it contains some of the finest lands in New South Wales; these are to be found in the neighbourhood of the Hunter and Patterson rivers, on the south and south-east side of the county, as laid down in the maps. The fertile valleys and soft green undulating hills of this part of the country, are spoken of rapturously by all who have seen them; they are, however, of course, all already located, and not an acre worth taking can here be had except by purchase from the present proprietors. In this district is situated the large and commodious harbour of Port Stephen, and the township of Maitland, the capital of the district. Maitland is one of the most considerable towns in the colony, and now daily steam communication with Sydney. The next district, pursuing the line of coast, is

Northumberland—lying between Port Hunter and Broken Bay, a distance of about fifty-five miles, and extending inland about eighty miles. This county possesses the usual proportions of grazing land, and barren and fertile tracts. The best lands, though there are many other beautiful and desirable localities, are to be found in the neighbourhood of Patterson river, which divides it from the county of Durham. Within this county is situated the town of Newcastle, so called from the abundant supply of coal which it affords; the whole surrounding country, as well as a line of coast extending from sixty to seventy miles on either side of it, presenting evidence of its abounding with that valuable mineral. The coal is of a very good quality, though rather small, and makes a brisk fire. The Australian Agricul-

ture! company have a lease of the mines from government, and they supply coal at the pit for 8s. a ton to the dealers, who supply Sydney and other places at from 20s. to 30s. per ton, this great increase to the price being caused by the high rate of wages. The company have a powerful engine to work the coal and load vessels.

Cumberland.—Following out the line of coast, as originally proposed, we now come to the county of Cumberland, which has a coast line, stretching southward, of about fifty-six miles, namely, from Broken Bay to Coal Cliffs, about eighteen miles south of Port Hacking, and running inland about forty miles. This county, though one of the smallest, and in point of fertility of soil one of the worst in New South Wales, is nevertheless the most important of the whole, from its containing the principal towns in the colony, and among these Sydney, the capital. In this county, also, is situated the celebrated Botany Bay. The towns and ports in this district are Sydney, the capital, Paramatta, Windsor, Liverpool, Campbeltown, and Darling Harbour. By a reference to the map, it will be observed that the coast here is opened up by spacious inlets of the sea, all of which form excellent harbours; into the head of one of these harbours flows the Hawkesbury river, whose banks present a stretch of fine alluvial lands, to the extent of a few thousand acres.

Sydney is situated about seven miles inwards from the head of Port Jackson, which is considered to be one of the finest natural harbours in the world. It is built upon two necks of land, with an inlet between, called Sydney Cove, possessing a depth of water which enables vessels of the greatest burden to come close to the land. Half a century ago, the ground on which Sydney stands was a barren, desolate wild, covered with wood, and tenanted only by savages and the kangaroo. In the year 1800, its population, consisting of free settlers and convicts, amounted to about 4000, and now it is reckoned to be upwards of 30,000. Sydney is in general a handsomely built town, and here are to be found more than all the conveniences and luxuries of a British town of the same extent—regular and handsome markets, public seminaries, banks, flour-mills, warehouses, hotels, distilleries, breweries, steam-engines, stage-coaches for different parts of the colony, five newspapers—the Sydney Herald, the Sydney Monitor, the Sydney Gazette, the Australian, and the Colonist, besides the Government Gazette, equally respectably-looking periodicals with any published in this country. Being the seat of government, here centres the colonial business; and the shipping to and from England and other parts of the world is on an extensive scale.

The wharfs and warehouses in Sydney are of surprising extent, and the fine secure harbour in front, so advantageously adapted for general traffic, as well as the reception of vessels employed in the sperm-whale fishery of the southern ocean, is a grand feature in the scene. From all we can learn of Sydney, it appears that the industry and enterprise of its inhabitants, acting on the great resources around them for inland and external trade, promise to raise this chosen seat of population to a high pitch of prosperity; and we may expect that in a few years Sydney will be by far the most important British city in the colonies. The environs of the town are said to be very charming, and include a botanic garden, laid out with handsome walks and rides.

Next to Sydney in importance, though much inferior to it, is Paramatta, situated at the head of the narrow inlet of the sea in which Port Jackson terminates above Sydney. Between the latter place and the former, a distance of about sixteen miles, there is frequent and regular communication both by land and water, two coaches, one morning and evening, and two passage-boats, daily plying between the two places, the fare of the former 4s. inside, and 2s. outside. Nothing can exceed the beauty of the scenery which presents itself on all sides as you proceed to Paramatta by water; the sea generally smooth as glass, or but gently rippled by a slight breeze; innumerable little promontories covered with wood to the water's edge, stretching into the sea, and forming a corresponding number of beautiful little bays and inlets, in endless succession and variety. Paramatta contains upwards of 5000 inhabitants. The greater part of the houses here are built of brick or white freestone, and being for the most part unconnected with each other, cover a greater extent of ground altogether than its population would seem to warrant. The situation of Paramatta is exceedingly delightful. It lies in a spacious hollow, covered with the richest verdure, and surrounded by hills of a moderate height. Here too, are churches, hotels, taverns, seminaries, &c., and all the other appendages of a considerable country town, with a military and convict barracks, jail, government house, and the female factory, an establishment for the reception of incorrigible female convicts. Many of the private houses are of elegant construction, with parks and gardens attached; the place altogether thus forming rather an assemblage of cottages than a town: the streets, however, are regularly laid out, running north and south, east and west.

Pursuing an inland course for about twenty-one miles, the traveller next arrives at Windsor, containing a population of about 2000. From Paramatta to this little town a coach runs three times a week. Windsor, which, in the description of its buildings, much resembles Paramatta, is built upon a hill close by the River Hawkesbury, which forms the north and north-western boundary of the country, and which, after a circuitous route of about 140 miles, discharges itself into Broken Bay Windsor also contains a handsome government house, with extensive gardens, &c.; two churches, a jail, court-house, military and convict barracks, taverns, inns, shops, &c. The lands in the neighbourhood of Windsor are exceedingly fertile, but this advantage is more than counterbalanced by its extreme liability to inundation from the Hawkesbury (in consequence of its vicinity to the Blue Mountains), which has been known to rise to the almost incredible height of 93 feet above its ordinary level. Inundations of 70 and 80 feet are of frequent occurrence, and the consequence to settlers within its reach are often fatal, and always ruinous to their settlements. The town itself, which is built on an eminence of about 100 feet above the level of the river, has hitherto escaped these tremendous overflowings; but as its elevation above the highest known floods is only a few feet, it cannot be considered as free from danger. Next to Windsor in importance is Liverpool, at the distance of about eighteen or twenty miles from Sydney, in a south-west direction. Between these two places a stage-coach runs several times a week. Liverpool is situated on the banks of George's river, which discharges itself into Botany Bay. It possesses a church, two or three good inns, stores, court-house, jail, and the usual accompaniments of a town in New South Wales—a convict and military barracks. The soil around Liverpool is of a very indifferent quality; but as the town occupies a central situation between Sydney and some fertile districts in the counties south and west of it, it is, notwithstanding, a place of considerable bustle, and of rising importance. George's river, on which it is situated, and which is about half the size of the Hawkesbury, is navigable for boats of about twenty tons burden as high up as the town. Recurring again to the coast line, we come to the county of

Camden—extending south from Coal Cliffs to Shoa Haven, a distance of from thirty-five to forty miles, and stretching interiorly north about sixty miles, with an average breadth of about twenty miles. There are no

yet any towns in this county. It possesses, however, an average quantity of fertile land, but is greatly deficient in water; the very limited supply which it possesses chiefly proceeding from branches of the Cow Pasture and other rivers. This defect operates, as might be expected, greatly against the prosperity of the district, since, without that important element, its fertile plains can have no temptation for the settler. Nor is there merely a short supply for the irrigation of the soil; we are assured that water can scarcely be obtained even for the common purposes of life. Mr. P. Cunningham relates, that he "once travelled for twelve miles along one of the main roads (in this county) in the height of summer, yet could only obtain one drink of hot muddy water throughout all that distance." Camden, though not remarkable for its extent of cultivable land, possesses, perhaps, a larger proportion of pasture land than any in the colony, and this of acknowledged superior quality. The most flourishing local district in this county is the Illawarra, situated at the foot of a mountain of that name, a few miles inland from the seacoast, and one of the most beautiful and fertile localities in the whole colony. Continuing the coast line, we have

St. Vincent.—This county is of considerable length, and possesses several good harbours, particularly Shoal Haven, Jervis Bay, and Bateman Bay. It is well watered by a number of streams, one of which, called the Clyde, runs nearly parallel to the sea for a considerable distance. The lands generally in this county are described as large rich open plains, watered by copious, never-failing streams. There are many parts on the Shoal Haven river which are admirably adapted for agricultural operations, and the same may be said of those on the Clyde.

Argyle.—This county is about sixty miles in length, and of an average breadth of from twenty-five to thirty. About the one-half of it is indented, as it were, between the county of Camden on the coast, or eastern side, and the county of Westmoreland interiorly. It is one of the finest districts in New South Wales, producing wheat and other agricultural commodities of the first quality, and in the greatest abundance. Large tracts, too, of the best pasture-land are everywhere to be met with; and, from its geographical position, its climate is of the most delightful kind, highly favourable not only to the rearing of every description of cattle, but rendering it capable of producing, in great perfection, all the fruits and vegetables of Europe.

Westmoreland—stretching from north to south about eighty miles, and averaging in breadth about forty. This is the most mountainous district in the settled portion of New South Wales; and although none of these are of any great height (the highest not much exceeding 3000 feet), yet they are so numerous, extensive, and withal so barren, that but a very small portion of cultivable land is left. It is not, however, without some fertile spots, and some excellent grazing districts. Among the best of these is an extensive flat called Emu Plains; but the general character of the country is highly unfavourable to the agriculturist. There being little more deserving of particular notice in this county, we proceed to the adjoining county of

Georgiana—situated behind the Blue Mountains, and bounded on the north and east by the counties of Westmoreland and Roxburgh, and thence stretching south and west interiorly, but without any definite limits being yet assigned to it in that direction. This county presents an irregular and varied surface. It is, however, comparatively lightly timbered, and generally easily accessible; but, although particularly adapted for grazing, it presents only a small portion for the plough, and that consisting merely of occasional patches on the banks of rivers and streams. As a grazing district, however, it is not inferior to the best in the colony, and, in this point of view, is an exceedingly desirable place for the settler.

Roxburgh is separated from the sea by the counties of Northumberland and Durham, and lies beyond the Blue Mountains. It contains a large proportion of hilly and barren country, but possesses some tracts of good arable land, and is well adapted for grazing.

Bathurst.—This county at one time formed a portion of Roxburgh. It consists of extensive plains of remarkable beauty and fertility, and contains many thousand acres of the finest pasturage. These are now covered with the flocks and herds of settlers to an immense amount, this territory alone furnishing the greater proportion of the whole quantity of wool exported from the colony. It has also acquired great reputation for its dairy produce, and is considered, with regard to its cheese, as the Cheshire of New South Wales. Settlers here, however, labour under the same disadvantage with all those in the interior districts, namely, the being far distant from any market. This, however, materially affects the agriculturist only, and not the grazier, whose property can transfer itself. The rich territory of Bathurst Plains was discovered only a few years since, and was then considered, as it still is, a discovery of the highest importance to the colony. Nearly the whole of the available lands in the counties next the sea, occupying the space between the barren range of mountains and the coast, having been already located, or in the possession of settlers, there was none left for the thousands that were yearly arriving in the colony. On the discovery of these fertile plains, therefore, the superabundant emigrant population, which had been pent up, as it were, on the narrow strip between the mountains and the sea, left that territory, and, crossing the mountains with their flocks and herds, poured down upon this new land of promise, spreading themselves and their flocks far and wide over its rich pastures.

The climate at Bathurst, from its great height above the level of the sea (about 2000 feet), is considerably colder than in the eastern districts near the coast, and on this account, none of the tropical productions, which thrive so well in the latter, can be raised there to any perfection. In the midst of these fine lands is a thriving town of the same name, namely, Bathurst Town. Here there are several institutions, bespeaking the wealth and intelligence of the surrounding settlers. Among these are an academy, literary society, and public library. Proceeding still northwards, we arrive at the county of

Cambridge, which is separated from the sea by the county of Ayr. The land is in general good for grazing, but it is said sometimes to be inundated with water from the mountains. It formerly contained some valuable flat land, which now forms part of the county of

Liverpool.—This county contains a tract of valuable land called Liverpool Plains, lying behind a range of mountains which run east and west. Although of a very inferior description of land to Bathurst Plains, these are, notwithstanding, well adapted for grazing cattle and horses; but from their being subject to inundation in the rainy season, the best portion of them being under water during that period, they are neither adapted for agricultural purposes nor for the rearing of sheep. The Liverpool Plains extend about forty miles in every direction. There are few settlements in this county besides those on the plains just named, although it possesses some very eligible lands; but they are remote, and of limited extent.

COLONIAL GOVERNMENT—SOCIETY—TRADE, &c.

The government of New South Wales is conducted by a governor and a legislative and executive council; both of the two last, as well as the governor, are appointed by the ministry at home. The legislative coun

oil is composed principally of persons holding official situations, and these chiefly residing in the government towns. The executive council, again, is composed of persons filling the highest government appointments. There are, besides, a class of functionaries called police magistrates, distributed throughout the colony, and who take especial cognisance of offences committed by convicts, whom they have a power to punish by flogging or condemning to work in irons.

Sydney is the chief seat of the colonial government, comprehending the supreme court, and the heads of all the civil and military establishments of the country. Being a colony of Great Britain, the laws by which New South Wales is governed are the same in their leading features with those of England, differing only in instances where such difference was found necessary to adapt them to the peculiarities of the country. The colonies of South and Western Australia have governors appointed by the government at home. They have also councils much the same as New South Wales.

The external and domestic trade of Australia has scarcely yet emerged from a state of infancy; but it is fast gaining strength; and if no unforeseen circumstances should arise to check its prosperity, Australia will one day become, if it is not so even now, by far the most important of all the British settlements abroad. Its leading export articles are wool, and seal and whale oils; a great part of the latter is of that valuable kind called sperm-oil, produced by a description of whale found in the South Seas only, and which generally brings double the price of the common whale oil. In the article of oil, which has only very lately become an object of serious consideration to the colonists, the improvement has been remarkably rapid, there being now upwards of 40 vessels, averaging a tonnage of nearly 10,000, belonging to and sailing out of Port Jackson alone, exclusively engaged in the whale fishing. A striking evidence of the increasing prosperity of the colony, is the circumstance of its having, in four years, in some instances nearly, and in others more than doubled, the amount of its property in cattle and sheep, and the extent of its cultivated land.

The revenue of New South Wales had advanced in 1837 to £226,900, 3s. 10d., independently of the revenue from the sale of land, which was upwards of £127,000. The principal source of the colonial revenue is the duties exigible on liquors, and for licenses to dealers—a fact in itself distressing, for it argues a state of debasing intemperance. The land-revenue is a most important item; but from all we can learn, it has latterly been devoted to a liquidation of expenses incurred for jails and police, instead of paying for the import of free labourers. There is, therefore, on this point, great room for amendment; and such is the increasing attention paid to the subject by the colonists, that it may be expected to be arranged on a satisfactory footing.

We need not particularize the great and miscellaneous import and export trade of the colony, but confine ourselves to a few leading facts as an evidence of general prosperity. The imports, which amounted to £280,000 in 1826, had increased to £1,251,969 in 1839; while the exports from the colony, including the produce of the fisheries, had increased from £106,600 in the former year, to £948,776 in the latter. In 1824, the exports of wool amounted to 275,560 lbs.; in 1837, they were 4,606,915 lbs. In the Savings' Bank of New South Wales, the deposits increased from £24,469 in December, 1835, to £127,000 in August, 1840. The interest paid for deposited money in the ordinary colonial banks is, we believe, at the rate of from 6 to 8 per cent.; and at these banks bills on London will be discounted on favourable terms to emigrants bringing money in this form. Parties emigrating should exchange their cash for bills at respectable and old-established banks before leaving home, this being in every respect the safest mode of transfer. The currency of all the colonies is reckoned in pounds, shillings, and pence, as in England.

A large and profitable trade cannot fail to be ultimately established in wine, from vines which have been introduced as exotics. Some vines of a fine quality, presented by Louis Philippe, King of the French, to the late King William IV., have been sent to New South Wales, whose clarets may by and by rival those of France. Already, from grapes grown in the vineyards of the colony, excellent wine might be produced, if any thing like good management were exercised. From the peaches of New South Wales the finest brandy is distilled: so superior is this article, that, if it were allowed to be imported into Great Britain, it would speedily supersede the use of the brandies of France and other high-priced spirits. Silk (from the abundance of the mulberry) and dried fruits, with other useful and valuable articles, as opium and indigo, for the growth of which the climate is favourable, will doubtless by degrees be produced. At a short distance from Sydney, a large orange grove has been formed, from which upwards of 100,000 dozens of oranges have been sent into the market there in a year; and an immense quantity of fine grapes are sent by a steamer from Hunter's river every day in the season, to the Sydney market. The only articles of food in general use not produced in the colony, are tea and sugar; but these are largely imported, and sold at perhaps not the third of their price in this country. In the advertisements in the Sydney newspapers, we see the same kinds of articles announced for sale by tradesmen as are seen everywhere in the wealthiest establishments in Britain.

The production of wool has for some time back been a primary consideration with the settlers, and they have of late begun to pay more attention to the quality than they did formerly, quantity alone having been at one time all they aimed at. From the improvement which has taken place in the breed of sheep, as well as in the mode of preparing the wool for the market, Australian wool has now become an object of much interest to the dealers and woollen manufacturers in England, where it is greatly prized for the peculiar softness of the cloth produced from it, and which, if combined with a little higher degree of fineness—a result that must soon follow the care and attention that is now bestowed on it—would place it on a level with the best growths of other countries, and consequently direct an inexhaustible stream of wealth into the colony; and there are two important considerations at this moment operating to produce this effect. The first of these is the readiness of the market, and the fair remunerating price which the settler obtains for his wool; the next, the necessity which the distance of the extensive interior settlements from towns imposes on their occupants, of directing their whole attention to the rearing of cattle and sheep in preference to agricultural productions.

The state of society in New South Wales has been to a considerable extent affected by the transportation thither of convicts from the United Kingdom, and on that account is less agreeable than that of colonies free from this moral stain. The plan which has been usually followed by government on transmitting convicts need not be particularly described, as no new assignment is to take place. Convicts now deported are, we believe, sent to Norfolk Island, which may be called a penitentiary on a great and improved scale.

The most unhappy circumstance connected with the state of general society is, that the emancipated convicts and their descendants, however well behaved, are held as a degraded or inferior class by the free settlers; and thus two factions have sprung up in the colony, who virulently persecute each other, and cause dispeace in what would be otherwise an agreeable condition of affairs. As the settlement of convicts as labourers

abandoned as a practice unworthy of an enlightened government, it is to be hoped that the line of distinction between the two classes of inhabitants will gradually disappear. In Sydney, where society both bad and good equally flourishes, there are many hundreds of families of the highest respectability, enjoying all the elegancies of refined life, exchanging its courtesies, and cultivating its amusements and pleasures; splendid equipages are to be seen rolling along its streets; its public dancing and assembly rooms blazing with light, and filled, as our newspapers would say, with "beauty and fashion;" music parties and theatricals filling up the measure of the happiness of a Sydney life. Next to Sydney, Bathurst has probably the highest pretensions to a superiority in the general character of its society. Besides its literary institutions, it boasts an association called the Bathurst Hunt, composed of all the sporting gentlemen who reside in the district; these wear a uniform, and are, as a body, no way inferior to any similar society in England.

The convict system only extended to New South Wales and Van Diemen's Land, the other colonies being entirely free from convicts, except such as have obtained their freedom, and are of course allowed to emigrate whither they please. The colonies of Port Philip, South Australia, and Western Australia, are altogether peopled by free emigrants, who seem by the latest accounts to be taking active steps to establish societies for advancing knowledge. A mechanics' institute has been established at Melbourne, and agricultural and horticultural societies at Adelaide. In New South Wales there are six infant schools and thirty-three parochial schools; and also two government schools, one at Sydney and the other at Paramatta. An orphan hospital has been established at Sydney, capable of rearing and educating 125 children. The male children of this institution are apprenticed out as they come of age, and the females receive a small sum when married. The Australian College was established in 1831, and is now in a flourishing condition. By means of a large and regular import of English literature, the tone of feeling and general intellect of the colony cannot fail to advance in a yearly increasing ratio.

With respect to the means adopted for sustaining religious and moral culture, we may mention that there is no lack of churches and chapels where they are required. On this subject, Dr. Lang remarks:—"The colonial churches are, the Church of England, the Church of Scotland, and the Church of Rome. Besides these establishments, there are several congregations of dissenters. Whenever a hundred adults shall attach themselves to the ministrations of any pastor, duly recognised and sent forth by one or other of the colonial churches, and shall contribute a comparatively small amount for the erection of a church and manse, the government guarantee a salary of £100 per annum for such pastor, and advance at least £300 from the public treasury to assist in erecting his church and manse; and, to stimulate the exertions of the pastor, his government salary is to be augmented to £150 or even to £200 per annum, as soon as he rallies around him a congregation of two or five hundred adults.

"The practical operation of the new ecclesiastical system to which the colonists of New South Wales and Van Diemen's Land are now subjected, I am happy to state, promises to be attended with the happiest results. It has already infused something like life and vigour into the withered and shrivelled arm of colonial Episcopacy; it has proved as life from the dead to the Presbyterian communion. By the Episcopalian laity of all classes, it has not only been acquiesced in as a measure of urgent necessity, on the score of justice to others, but received as a measure of real benefit to themselves. Local committees for the raising of the funds requisite for the erection and endowment of additional churches of that communion, in all parts of the colony, were formed immediately after the announcement of the new system." In parts which have been settled by emigrants from the Highlands of Scotland, there are preachers who use the Gaelic tongue.

PORT PHILIP DISTRICT.

The southern portion of New South Wales, opposite to Van Diemen's Land, obtained this name from an inlet called Port Philip, which, within a few years past, has become the seat of a flourishing settlement. The same district was named Australia Felix, by its first explorer, Major Mitchell, from a consideration of its uncommon natural beauties and advantages. Hitherto, the settlement has been a dependency of New South Wales; but it is now contemplated to erect it into a distinct crown colony, with a governor in direct communication with the home country. Port Philip was known in the early days of the New South Wales colony, and was named after the first Australian governor, Philips. A settlement was attempted in it by Governor King, but it failed from want of sufficient means and of a knowledge of the country, as well as from the accident of its being pitched upon the sandy barren side, where no good water was found. The failure led to the settlement on the Derwent river in Van Diemen's Land, and it is rather singular that the first settlers in the renewed effort were from that island: these settlers, having crossed the sea (Bass's Straits) to pasture their flocks on the Australian continent, brought the capacities of Port Philip into notice, and led to those investigations which have terminated in making it a flourishing colony. Major Mitchell describes the interior "as of vast resources, of the most various and fascinating description, more extensive than Great Britain, equally rich in point of soil, and ready for the plough." The land is well clothed with grass, and requires no clearing, the trees being few. The prevailing plants are forest oaks, honeysuckles, and what are called wattles, which belong to the mimosa tribe. The face of the country is diversified by gentle slopes, plains, and vales, of great fertility, and well watered by numerous springs. There are few hills; but these are beautifully wooded, and with little labour might be rendered excellent grazing lands. From the private information we have received, it appears that a very large portion of the interior consists of the usual flat and extensive plains in which Australia abounds. These plains are more or less covered with herbage suitable for sheep pasture, and are here and there refreshed with the shade of trees and water-courses.

The capital of Port Philip district is Melbourne, a rising town situated at the falls of the River Yarra-Yarra, a few miles from the harbour. From its situation, the town can always be supplied with fresh water from above the falls, while immediately below, ships of 200 tons can be discharged. Port Philip itself is a large bay, about forty miles long and thirty-five broad, with an entrance from Bass's Straits, of three-quarters of a mile in breadth. It is of such a depth, that a vessel of any tonnage may enter and find shelter behind the various creeks with which it abounds. Being situated opposite Launceston in Van Diemen's Land, a ready intercourse may be carried on betwixt the two ports. The country around Melbourne is thickly studded with trees, chiefly what the natives call the *yarra*, and from which the river has received its name.

The following is an extract of a published letter from a gentleman residing at Sydney, referring to this rising settlement:—"I am quite delighted with this beautiful Melbourne. Enthusiastic as I was regarding the extraordinary advantages of this favoured province, I almost upon my approaching it had some misgivings that the reality would, as, alas! is too frequently the case, involve the bitterness of disappointment. The reality, however, in this instance, far surpassed my most sanguine expectations,

an I every day's experience confirms me in my favourable opinion of this Australia Felix. The appearance of Melbourne is positively wonderful; a foreigner unacquainted with the enterprising, determined, bstacle-surmounting character of our countrymen, could never believe that it was the creation of eighteen months' industry. The wand of the magician could not have effected a change more wondrous. If all the towns on the road from Sydney to Yass were put together—Liverpool, Campbelltown, Goulburn, and Yass, they would not make so respectable a town as Melbourne now is The commercial importance of Melbourne is evident from the activity of its inhabitants, and the number of ships and vessels that visit its port (*i. e.* Port Philip). A powerful steam-ship, to trade between this and the neighbouring settlements, is pressingly required, and would pay her owners a very handsome profit. I have just returned from a delightful boat excursion on the beautiful Yarra-Yarra, the scenery on the banks of which is most attractive. * * * You are at liberty to make any use you please of these remarks; their correctness may be depended on. We feel perfectly convinced, that the country around or connected with Port Philip, is a finer tract than any of a similar extent in Australia, and better situated, in point of locality. It is destined to become one of the most flourishing provinces of this continent."

Mr. Russell, in his tour in the Australian colonies, says of Port Philip—"This is a portion of the Australian territory which has in less than two years gathered a community of about 3500 souls, who have been attracted to the place by its good harbour and superiority of soil. Being more to the south than either Sydney, Adelaide, or Swan river, its geographical position gives it every advantage both in climate and productions. Private enterprise has already raised it to an important colony, through the shipments of its wool to the mother country, besides the flocks of superior sheep sent to South Australia, &c., and even mutton to Van Diemen's Land, thereby returning to that fertile island their own sheep, after being fattened on the soil of Australia Felix." From tables in Mr. Russell's work, it appears that, in 1837, 56,326 acres of land were sold in this district, for which the sum of £69,099 was obtained, and that chiefly from individuals well acquainted with the capabilities of an Australian soil. The first settlers came from Van Diemen's Land and New South Wales to Port Philip, preferring it to the older settlements; and these being in almost all cases young men, a spirit of enterprise was at once set agoing, which has been since of the greatest benefit to the colony.

Besides Port Philip, Australia Felix also possesses an excellent station for a town, in Portland Bay. This bay is rather exposed to a heavy swell during four months of the year, which renders landing in it dangerous; but during the remaining eight months the winds blow off the land, when it is perfectly safe. The interior, for seventy miles back, according to Mr. James and others, exhibits one of the richest and most desirable countries in the world, fit either for grazing or for the plough. Mr. James thus speaks of Portland Bay:—"To the north-east of Portland Bay are fine sheep and cattle runs, until you come to the lakes; and here may be seen large flocks of Van Diemen's Land sheep depasturing all the way up to Mount Macedon and down to Geelong. The country about Cape Otway is rocky and mountainous. This cape is opposite Bass's Straits, which are only forty miles broad at this part; and at the back of the highlands of the cape the grass is good, though the fresh water is not so abundant as in the rear of Portland Bay." This district is about 700 miles overland from Sydney, and the road is good and well marked.

SOUTH AUSTRALIA.

South Australia is a large district of country, lying on southern shore of the Australian continent, between the Swan River settlement on Western Australia on the west, and New South Wales on the east. It is contained within the 26th and 36th degrees of south latitude, and forms a territory of nearly 300,000 square miles, or 192,000,000 acres, being nearly double the dimensions of the British Isles. It is penetrated from the sea by Spencer's Gulf and Gulf St. Vincent, at the entrance of which lies Kangaroo Island. The country from the eastern side of Gulf St. Vincent is very picturesque; being in general well wooded, with considerable spaces of open country. This renders it admirably adapted for sheep farming, and in many places the land is ready for the plough.

About ten or twelve miles inland runs a range of hills, most of which are good soil to the top, and afford abundance of food for cattle. The highest of these is Mount Lofty, which is 2400 feet above the level of the sea. The country between these hills and the sea is diversified, being in some parts undulating and in others level.

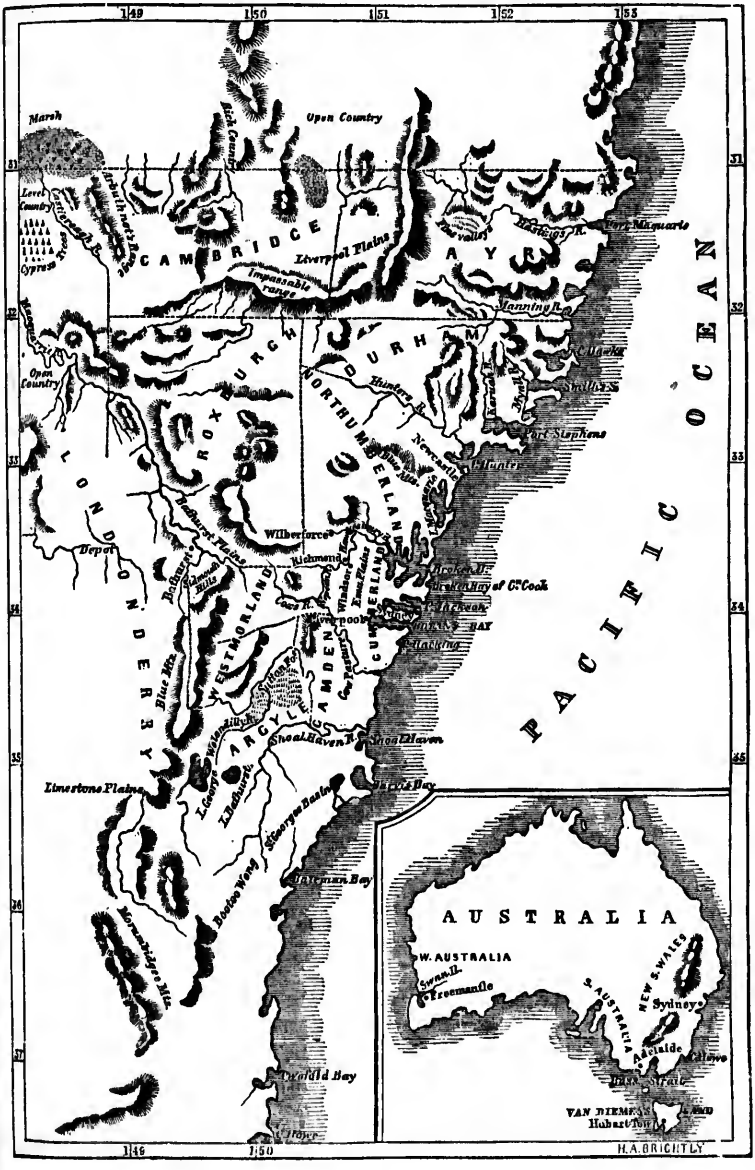
Gulf St. Vincent is described as without an island, rock, reef, or sand-bank, and almost any part of it is perfectly safe anchorage all the year round. Spencer's Gulf runs nearly 300 miles into the interior, becoming quite narrow and shallow at the top. It abounds with flat fish; but the country around is deficient in fresh water, and but a small portion of the soil is capable of cultivation. The great want of this colony is rivers, by which an intercourse with the interior could be effected. The largest river is the Murray, which is described by Mr. James as being, for the last 200 miles of its course, nearly as broad as the Thames at London Bridge. On the banks of this river are several fine alluvial flats, at present covered with reeds, but which are capable of being made to yield abundant crops of grain. These flats are nearly on a level with the river, and could be irrigated at any season. The Murray delivers its waters into Lake Alexandrina, which also receives the waters of the Hindmarsh, and from thence to the sea the river is broad and deep. The next river is the Torrens, on the banks of which stands the town of Adelaide, the capital of the colony. The site of the town is well chosen as to the healthiness of the situation, but labours under the disadvantage of being six miles from the harbour, betwixt which and the town the carriage of goods is very expensive. The harbour is perfectly safe for shipping, but there is a bar at the entrance which prevents very large ships from entering. The great objection to the site of the town is the want of good water, which can only be obtained by boring to the depth of about forty feet, or taking it from the Torrens, which degenerates into almost stagnant pools in the dry season. The town of Adelaide has several good stone and brick houses, and the churches and public offices are described as handsome buildings. The River Glenelg, at the eastern boundary of the colony, is of considerable size during the winter months, but is almost dry in summer. Lake Victoria is a sheet of water about twenty miles long and seven broad, communicating with the Murray river by a stream called the Rufus. Its banks abound with good pasturage, and the country around being flat, it might be made an admirable agricultural station. Lake Bonney is smaller than Lake Victoria, but the land around it possesses equal advantages with regard to soil.

Much has been written upon the soil of South Australia. On the one hand, it has been lauded as the finest spot in the world, and on the other decried as not worth the trouble of cultivation. From the best authorities we have been able to consult, there appears to be very little of what can be called really barren land. The principal part of it is fit for grazing sheep and cattle, and there are many parts which would yield an abundant return of grain if subjected to the plough. On this subject Mr. James, who is known not to be very favourable to the colony, says, "In short, there is more good soil than will be required for many years to come; it is generally cov-

posed of a rich loam, averaging about nine inches thick, on a substratum of coarse calcareous rock, and, through the whole extent of the plains round the settlement, gives evidence of having been at no very remote period covered by the sea, every stone you pick up being a part of the rock, and exhibiting a congeries of little shells. Over the hills the soil and vegetation are still finer; and the author visited a tract of country between the mountains and the mouth of the Murray, that seemed to contain nearly 100,000 acres of excellent rich soil, in many places ready for the plough."

From the want of mountains, the country is very free from rains, and even the rivers become comparatively dry during the summer. These deficiencies are in fact the grand drawbacks upon this otherwise fine colony. With respect to the condition of the colony up to a late period, we present the following extract from a speech of the governor (Gawler) to his legislative council, April 3

MAP OF NEW SOUTH WALES.



1840:—"The establishment of the colony has cost a large sum; but it is probable that no British province has ever attained to the same condition, at, to say the least, a smaller price. However great the expenditure may be, the results are great also.

"Three years and a half ago, the spot on which we are now standing was a desert unknown to Europeans. Now we are surrounded by a populous, and, to a considerable extent, handsome city. Our principal streets are lined with well-filled warehouses and shops, and crowded by all the attendants of active traffic; handsome and substantial buildings are to be seen on every side, and are rapidly increasing. Our port, which, a few years since, was an unknown salt-water creek, covered only by water-fowl, and enclosed in a mangrove swamp, is now filled with large shipping, from Europe, India, and the neighbouring colonies. The swamp is traversed by a substantial road, and handsome wharfs and warehouses are rising on its borders. A steam-tug is promised by the commissioners, and with such conveniences there will not be a finer harbour for vessels drawing under sixteen feet water. Ships of larger dimensions may discharge their cargoes from the gulf, which is in itself a secure roadstead. The neighbourhood of the capital is studded with numerous and populous suburbs and villages; while the more distant country, whether to the north, the east, or the south, is rapidly assuming, in population, that healthy and natural proportion which it ought to bear to the metropolis.

"Farming establishments are in active formation on every side; and it is now a matter not merely of hope but of sober expectation, that our magnificent agricultural valleys will soon be filled with produce sufficient for home-consumption. Flocks and herds of cattle from New South Wales, following each other in countless succession, already cover a tract of two hundred miles in length; and their enterprising proprietors are even now seriously contemplating [illegible] attempt at geographical discovery, which bids fair to make this province the great entrepôt of South Australia. Our institutions are assuming a condition of stability. Our public departments have attained to a high degree of system and order. The aborigines have been kept under humane control; and considerable, though I regret to say, as yet unsatisfactory, efforts have been made towards their civilization. Property and private rights enjoy as much protection as in any country in the world; and peace, union, and good understanding, reign throughout the community.

"Land has been surveyed, to an extent capable of containing three times the present amount of population; and the most promising arrangements are in active operation, for completing, in a comparatively short space of time, the survey of those rich and beautiful districts already discovered, which would enable us to increase it from ten to twenty fold."

We add the following from articles in the South Australian Register, July, 1840:—"In the last general notice of the progress of South Australia, published in August, 1839, the population of the colony was stated at 8500. This amount, we have since ascertained, was almost exactly correct. The arrivals since that period have increased the number to nearly 13,250, of which about 6700 are located in Adelaide and the villages in its immediate environs, and the remainder distributed throughout the agricultural and pastoral districts. On the 30th June, 1839, the stock in the province was as follows:—Sheep, 58,500; bullocks, cows, &c., 6250; horses, 520; pigs, 1000; goats, 130. On the 30th June, 1840, the colony possessed 186,000 sheep; 14,800 head of cows, &c.; 1250 horses; 3600 pigs; and 350 goats—showing, at the close of one year, an *increase*, after satisfying the large consumption of the population, of 27,000 sheep 8550 cows, heifers, and bullocks, 730 horses, 2660 pigs, and 170 goats. In the above number of sheep we have included 13,000 which have arrived overland from New South Wales during the present week. From advices just received, we learn that upwards of 40,000 sheep, 8000 head of cattle, and 500 horses, are now on their route overland, and may be expected within the ensuing three months.

"The prices at the present moment may be quoted as under:—

Sheep,	£1, 6s. to £2, 2s.
Cows and heifers,	9, 0s. to 18 0s.
Bullocks and steers,	10, 0s. to 21, 0s.
Horses,	35, 0s. to 120, 0s
Pigs,	1, 5s. to 7, 7s
Goats,	2, 0s. to 8, 8s.

"One of the most frequent, and, at the same time, most unjust and inconsiderate subjects of reproach, is, that we 'grow nothing'—that we 'produce nothing' Now, whatever may be the faults or errors of the colonists, we must deny, in the most unequivocal manner, that there is any thing of the *festina lente* in their character or proceedings. The first handful of settlers, in 1837 and 1838, could not fairly be expected to grow an ample supply of grain for themselves and for the thousands of emigrants that were pouring in upon them. During the two first seasons of the settlement of South Australia, it must not be forgotten, they *had no land surveyed and appropriated, whereon they could proceed with their farming operations.* In point of fact, last year was the first in which it was practicable to commence grain-growing. Nearly 500 acres were then fenced in and cultivated. At the present time, according to the most careful estimate we have been able to make, the number of acres, in wheat alone, exceeds 1600; and before the middle of November, we expect that there will be, in maize and other crops, throughout the province, considerably upwards of 2000 acres. Judging from the activity with which fencing is proceeding in all directions, we may safely state the amount of land which will be cultivated in 1841, at 12,000 acres. It is thus most gratifying to prove, that so far from our colonists being obnoxious to the charge of 'doing nothing,' they have been most actively engaged in turning the unlimited agricultural capabilities of the colony to good account. We are fully warranted in asserting, that the harvest of 1842 will see South Australia entirely independent of our neighbours for supplies of grain. A few years more, and the probability is we shall be able to supply them."

From a statistical return, June, 1840, we copy the following particulars:—

"*Stock.*—Sheep, 160,000; cattle, 15,000; horses, 1500; pigs, 3600; goats, 400.

"*Shipping.*—Ships arrived in the port, 104; tonnage, 19,399; ships from Europe, 18; ships in harbour, 12; tonnage, 3059.

"*Rural lands—number of acres selected.*—District A, 43,086; district B, 21,058; district C, 16,000; district D, 1040; district E, 7536; district F, 480. Total number of acres surveyed, 359,975. Special surveys of 4000 acres each, 36.

"*Houses in Adelaide.*—Brick or stone, 816; wooden, 1588; churches and meeting-houses, 8.

"*Wages.*—Carpenters, 12s. to 15s.; masons and bricklayers, 12s. to 14s.; labourers, 6s. to 7s. per diem. Men-servants, £25 to £60; women-servants, £12 to £25 per annum.

"*Price of stock.*—Sheep, 25s. to 40s.; cows, £12 to £18; oxen, £12 to £20; horses, £30 to £150; pigs, £2 to £6; goats, £3 to £6.

"*Imports.*—[These we omit, as they are such as might be expected.]

"On comparing this return with the one compiled to the end of 1839, it appears that the increase, during the

first six months of the past year, was as follows:—Population, 2000. Sheep, 93,604; cattle, 7000; horses, 800; pigs, 600; goats, 100. Number of acres selected in district A, 786; district B, 1920; district C, 5760; district D, 1040; district E, 1626; district F, 160. Total number of acres surveyed during this period, 199,739. Houses built, brick and stone, 403; wooden, 648. While sheep have fallen about 20s. and cattle above £4 each, wages remain the same."

WESTERN AUSTRALIA.

This colony, which is entirely distinct from New South Wales, includes the settlements at Swan river and King George's Sound. Swan river settlement takes its name, as is obvious, from the river in whose vicinity it is. This river is situated on the south-west coast of Australia, a little way north of the most extreme southern point, on the west side of the island. Its neighbourhood was first proposed as a place of settlement in the year 1828, when Captain Stirling was appointed lieutenant-governor. The latest accounts of the progress of this little colony are upon the whole favourable, although they do not certainly hold out any very great inducements for any one to go thither.

The soil appears, and really is, until you have gone about fifteen or twenty miles inland, extremely poor and barren. At this distance from the coast, however, it greatly improves, exhibiting many beautiful and fertile tracts, and bearing some of the most magnificent trees in the world. Here, also, is the same profusion of those gorgeous flowers which form so remarkable a feature of the natural vegetable productions of New South Wales and Van Diemen's Land. Its animal productions are entirely similar to those of the two former colonies, and it is equally free from any that are dangerous to man. The heat, however, would appear to be more oppressive than in either of the places just named. Whether this arises from a greater intensity in the sun's rays, or from a lighter or more irregular visitation of those cooling breezes which prevail in both New South Wales and Van Diemen's Land, is not explained; but the complaints by the settlers here of the warmth of the climate are frequent, while there are none in this particular from either of the former. The climate, however, is exceedingly salubrious. Not only have no complaints of any kind whatever, attributable to the country, appeared among the colonists, but they are enabled to bear exposures with impunity, which, in most other climates, might be attended with the most serious consequences.

The best land, indeed the only land, yet discovered sufficiently near the settlement worth cultivating, is on the banks of the Swan river, and on those of an adjoining river called the Canning; but even there it rarely extends on either side more than two miles from the stream, and not often so far, and all this land has been already located. There is, however, reason to believe that good tracts of country are to be found in the interior; indeed some have been found: but the young colony has not yet had time to devote to expeditions of discovery, or been able to avail itself of those that have been made. The pressure of emigration, however, and more leisure on the part of those already there, will no doubt very soon extend the dependencies of the settlement, and lead to some valuable acquisitions of country. The land already under cultivation has been found to be very productive, bearing crops of wheat and other grain equal to the best of any other country, but not yet in sufficient abundance to supply the wants of the colony. For grain, and many other articles of agricultural produce, it is still indebted to New South Wales, Van Diemen's Land, and the Cape of Good Hope; but the progress which it has made, and continues to make, bids fair to leave it at no distant date wholly independent of foreign aid.

There are already several thriving little towns in the colony, amongst these Freemantle and Perth; the former the port, being built at the mouth of the Swan river, and the latter the capital. The site of Perth is represented as happily chosen. It is situated on a picturesque spot on the north bank of the river, about twelve or fifteen miles above Freemantle. A government house is about to be built here, and there are many others, substantially built of both brick and stone, fast rising on all sides. Colonel Hanson, who has lately published an interesting account of the Swan river settlement, speaking of this infant capital, says—"The society of the place is hospitality personified; for though their means are somewhat limited, yet they share them with the kindest good will." The intending emigrant to that quarter, therefore, may look forward to at least a kind reception from his countrymen who are already there; and this is no small matter to a man who has just arrived a stranger in a foreign land, in which he is in all probability to spend the remainder of his life, and where he is just about to engage in an arduous struggle for the support of himself and his family.

KING GEORGE'S SOUND SETTLEMENT.

There is little in this settlement that can be considered peculiar to itself, as all its natural properties and characteristics are the same with those of Swan river. It adjoins to and is a dependency of the latter, and is situated on the south side of that point or projection of land which places Swan river on the west coast of New Holland. Farmers, labourers, mechanics, and whale fishermen, are greatly wanted here, and are offered the following encouragement, by authority of Governor Sterling, to emigrate thither:—A guarantee will be given, if desired, to such as wish to secure employment before leaving home, of certain wages proportioned to their abilities and industry, and regulated by their different trades; these wages assured to be about one-half more than what is given in this country. They will be also ensured of a supply of provisions at a rate not exceeding a fourth more than the prices of this country. To those who prefer devoting themselves to agricultural pursuits, a grant of land, at the rate of one hundred acres to each family, will be made, free of all charge, with the advantage of fixing the prices of stock, provisions, &c., before starting; thus enabling the emigrant to form a correct idea of the amount of capital which he would require before leaving his native land—a piece of information which is often much too long of coming, sometimes not until it is too late. It is recommended that all who go thither should be married persons, and that they should be accompanied by their wives.

SALE OF LANDS.

With respect to the sale of lands in these colonies, we cannot do better than give the official answer to a letter which we sent to the Colonial Office for information:—

"Colonial Land and Emigration Office,
9, Park street, Westminster,
1st December, 1840.

"Gentlemen—I am directed by the Commissioners of Land and Emigration to acknowledge the receipt of your letter of the 12th instant, referred to them by direction of Lord John Russell: and, in compliance with your request, that you may be furnished with the latest government regulations for the sale of crown lands in the colonies, mode of sale, and other particulars, I am desired to transmit to you the under-mentioned papers, which have been printed under the authority of the commissioners. [Here certain papers are mentioned.]

"It will be seen by the papers referred to, that in the Port Philip district of New South Wales, and in Western Australia, the public lands will be sold at one

fixed price, which is for the present established at £1 per acre.

"In Lower Canada, the public lands are also henceforward to be sold at a fixed price. In the county of Ottawa, and the county on the south bank of the St. Lawrence as far as the Kennebo road, the price is for the present fixed at 6s. per acre, and for the remainder of the province at 4s.

"In the following colonies, sales are made at auction, and take place at stated periods, the land being offered at the respective upset prices named in the under-mentioned list:—

Sydney district of New South Wales, comprising at present all parts exclusive of the Port Philip district,	12s. 0d. per acre.
Van Diemen's Land,	12s. 0d. ...
Ceylon,	5s. 0d. ...
New Brunswick,	2s. 6d. ...

"In Nova Scotia, the upset price is at the discretion of the governor in council; but by a local act, it is in no case to be less than 1s. per acre.

"In Upper Canada lands continue to be sold by public auction, at an upset price to be fixed from time to time by the lieutenant-governor in council. This price varies according to the locality, but the average price of land in 1836, 1837, and 1838, was 6s. per acre.

"In the Port Philip district, and in Western Australia, it is intended, as you will perceive by the enclosed printed papers, to divide the land into lots of 320 acres, or half a square mile. In Canada the lot has generally been 200 acres; in Ceylon, 100 acres. In Van Diemen's Land, and the Sydney district of New South Wales, the size of the lot is one square mile, except under special circumstances.

"The several prices above mentioned will, of course, be subject at any time to revision by the proper authorities. For additional particulars, I am directed to refer you to the parliamentary paper ordered to be printed by the House of Commons, on the motion of Mr. O'Brien, on the 18th of July last. I have the honour to be, gentlemen, your obedient servant,

S. WALCOTT, Secretary."

Here follow two of the chief papers referred to:—

"*Notice to Persons desirous of purchasing Land at Sydney or Port Philip.*

"1. With a view to promoting settlement in the Australian colonies, the following measures have been adopted, under the sanction of her majesty's government:—

"2. It has been determined that, for all purposes connected with the disposal of land, that portion of the territory of New South Wales which lies to the south of the counties of Murray and St. Vincent, and of the Rivers Murrumbidgee and Murray, as far as the eastern boundary of South Australia, shall be separated from the rest of New South Wales, and be distinguished by the title of the Southern or Port Philip district.

"3. Within the Port Philip district, land will henceforth be sold at the fixed uniform price of £1 per acre, in sections of one-half of a square mile, or 320 acres each.

"4. Towns already laid out, and in which any land has actually been sold, will be exempt from the operation of the foregoing rule, and town lots in them continue to be sold by auction; and the government will also have the power, should it be deemed expedient, to reserve any sites of towns likely to become the seats of local administration, or any sites eminently adapted for commercial sea-ports. The formation of all other towns and villages, including therefore every inland town, except where the residence of a government may be established, will be left to the enterprise and judgment of individuals.

"5. Certain lands, to be properly marked out in maps exhibited at the land-office in the colony, will be set apart for roads and other public purposes, and will be regarded as inalienable public property. But it is not intended, unless in very special and rare cases, to make any reservation of minerals, and all deeds of grant, therefore, will convey to the purchaser every thing above and every thing below the surface.

"6. Purchasers in the colony must buy their land at the office for crown lands in the district of Port Philip.

"7. Purchasers in England will have to deposit their purchase-money with Mr. Barnard, the crown agent for the colony, No. 2, Parliament street, from whom they will obtain a receipt, on production of which at the office of the Colonial Land and Emigration Commissioners, No. 9, Park street, Westminster, they will be furnished with an order, stating the number of acres which they have purchased, and directing that this quantity shall be granted to them upon their naming in the colony the spot of unappropriated land which they shall select.

"8. The charts and registers to be kept in the land-office at Melbourne are intended to furnish full and authentic information of all appropriations of land, and of all surveyed lands not appropriated, and of all portions of land reserved for public purposes. And each purchaser will be allowed to select his land in the order of his application at that office.

"9. Any one who shall pay in this country, or in the colony, the price for eight square miles, or £5120, will not be confined to districts already surveyed and open for sale, but will have the privilege of demanding a special survey of the land he is desirous to acquire. This land, however, must be taken in one block, of which only the outer boundaries, therefore, will be surveyed. It will also be subject to all regulations which may be established in the colony, respecting the proportion of front to depth, water-frontage, reserves for roads, and other conditions of similar nature.

"10. Every purchaser will be entitled to name a number of persons of the labouring class for a free passage to the colony, in proportion to the amount of purchase-money which he has paid in this country: viz., for every £20, one adult person of fourteen years and upwards, or two children between seven and fourteen, or three children under seven. The whole must be subject to the approval of the commissioners, and fall within their general regulations on this subject, of which a copy will be furnished to any person requiring them.

"11. Persons who may wish to avail themselves of the above advantage, will be required to send into this office lists of the names and descriptions of the people they propose for a free passage within six months of the date of their purchase, after which time no further claim to any nomination for a free passage will be admitted. Purchasers of special surveys, however, will be allowed eighteen months.

"12. In the older parts of New South Wales, constituting what will henceforward be called the Sydney district, land continues to be sold by auction at an upset price of 12s. per acre, in lots of 640 acres, or one square mile.

"13. Should any person, intending to purchase land in this portion of New South Wales, think proper to deposit money in this country, in the mode above mentioned, he will receive from the Land and Emigration Commissioners an order entitling him to credit for a corresponding sum in the acquisition of land at the public sales in the colony, and he will be allowed to nominate emigrants for conveyance to Sydney, under the same rules and regulations as above referred to for the district of Port Philip.—By order of the board,

S. WALCOTT, Secretary."

Regulations for granting free passages, alluded to in the above paper:—

"1. The emigrants must belong to the class of mechanics and handicraftsmen, agricultural labourers, or useful domestic servants. All the adults must be capable of labour, and emigrate with the intention of working for wages after their arrival.

"2. Persons, therefore, who are proceeding to the colony to buy land, or invest a small capital in trade, are not eligible for a free passage.

"3. The classes most in demand may be described as follows:—shepherds and farm-servants; the trades employed in building, such as carpenters, joiners, plasterers, bricklayers and stone-masons, quarrymen and brickmakers; country blacksmiths, who can shoe horses; wheelwrights, and a moderate number of tailors and shoemakers.

"4. The emigrants are required to consist principally of married people and their families.

"5. Single women without their parents, are only admissible if they are emigrating under the immediate care of some married relatives, or else attached as domestic servants to ladies going out as cabin passengers in the same ship.

"The most useful of this class may be said to be domestic servants, as just alluded to, sempstresses, and young women accustomed to farm or dairy work.

"6. Single men cannot be allowed, except in a number not exceeding that of the single women in the same ship. If named by a land purchaser, they can only be accepted in case the same party has named an equal number of single women who conform to regulation 5.

"7. The age of persons accepted as adults is not to be less than fifteen, nor, generally speaking, more than thirty-five. But the latter rule will admit of being relaxed in favour of the parents of sons and daughters, of useful ages, going by the same ship.

"8. Good character is indispensable, and decisive certificates will be required both to this point and also to competence in the professed trade or calling of the proposed emigrant.

"9. All applications, therefore, must be made in the form hereto annexed for the purpose, duly filled up and attested, as explained in the form itself, and then forwarded to this office.*

"10. For the present, the limited amount of funds does not admit of giving free passages except to emigrants named by parties who have made purchases in this country of colonial land. No others, therefore, need apply, as it will be impossible to comply with their applications.

"11. Purchasers must make their applications within the first six months, after which the right of nomination ceases. Purchasers of special surveys, however, are allowed eighteen months. The nomination will be subject to the approval of the commissioners, whose answer must be received before the emigrants are led to make any preparation.

"12. An early answer will be given. If approved of, the emigrants will be registered in this office as accepted for a free passage, and accommodation be found for them at the first suitable opportunity. But due notice will be given, and they should not in the meanwhile withdraw from their employment.

"13. The emigrants must pay their own journey to the port of embarkation.

14. Provisions, mattresses and bolsters, and cooking utensils, will be found for them. But blankets, sheets, and coverlets, are not supplied, and they must provide a sufficient stock for themselves and their families. They should also bring their own towels, and their own knives and forks, with tin or pewter plates, spoons, and drinking mugs.

"15. The emigrants must bring their own clothing, and cannot be allowed to proceed unless they provide themselves with a sufficient supply for their health during the voyage. The lowest quantity that can be admitted, would consist of two complete suits of *exterior* clothing (including two pairs of shoes), and of six changes of shirts and stockings; but, as a general rule, it may be stated that the more abundant the stock of clothing the better for health and comfort during the passage. I should be observed, that the usual length of the voyage to New South Wales is about four months, and that, at whatever season of the year it may be made, the emigrants have to pass through both very hot and very cold weather, and should therefore be prepared for each.

"16. Each family should furnish itself with two canvas clothes-bags, as the heavy boxes and chests will be put away in the hold, and there will only be access to them once in every three or four weeks.

"17. It is desirable that emigrants should take out with them the necessary tools of their trades: bulky agricultural implements, however, cannot be admitted, on account of their inconvenient size and weight; neither can furniture be received on board—mattresses especially, and feather beds, are strictly prohibited.

"18. The whole quantity of baggage allowed for each adult emigrant is as much as will measure twenty cubic feet, and not exceed half a ton weight. It should be divided, as far as possible, into two or three boxes of not more than two and a half or three feet long, by about twenty inches wide and eighteen inches high. People should not crowd the ship with boxes only half filled, and must pack their effects close.

"19. Only the luggage really belonging to each family of passengers is intended to be taken under the foregoing allowance. If any one should attempt to impose on the commissioners, by letting the baggage of other persons, not members of his family, go under his name, he will forfeit his passage, and not be suffered to proceed.

"Letters and applications should be addressed (post-paid) to Stephen Walcott, Esquire, Secretary to the Board of Emigration, No. 9, Park street, Westminster.—By order of the Board,

"Stephen Walcott, Secretary."

EMIGRATION AND MISCELLANEOUS INFORMATION.

From the above accounts of the various settlements in Australia, it will appear that they are in a condition to receive, employ, and comfortably sustain, an immense population. At present the whole country is only in its infancy, and it is perhaps not too much to say, that fifty thousand families could be accommodated from Great Britain annually, for a century to come. Two or three points are peculiar in the adaptation of Australia to settlers. Some parts are well suited for carrying on agriculture and gardening; but from the dry nature of the climate, the grand object of pursuit must be sheep-farming, and it may be recollected that America and England will take any quantity of wool that can be sent, and for which food, clothing, and all desirable articles, will be given in return. Hence, to become a pastoral farmer may be considered the prime intention of the emigrant who possesses a sufficiency of capital; and to employ themselves as shepherds or to work as mechanics, is what all labourers without capital will naturally turn to.

The rapid extension of pastoral farming in all the settlements, particularly New South Wales, Port Philip district, and South Australia, and the increasing size of towns, along with the stoppage of convict assignment, have caused a most extraordinary demand for labourers, and wages are very high. In a letter from a gentleman at Melbourne (Port Philip), dated July 23, 1840, to his father in this country, and which has been obligingly

* [Applicants, we believe, can procure these blank schedules from shippers of emigrants, who will also show how they are to be filled up.]

shews to us, we find the following passages:—"Melbourne is spreading out daily to a great extent. Labour is the cry. We have had three ships from Mr. Marshall of London, during the last three weeks, each vessel bringing at least 200 emigrants; yet the wages are 12s. per day for mechanics, 8s. per day for labourers, and shepherds £35 per annum, with rations; female house-servants, £20, and female cooks, £25 to £30 per annum, with board and lodging. These are the wages now, and no prospect of a fall. No sooner does an emigrant ship arrive in the bay, than numbers go down and engage servants, and before a week has passed they are all taken up." It is true, the expense of living is higher at Melbourne than it is in this country, but we should suppose not more than a fourth can be reasonably deducted from the rate of wages on this account; and it is very certain that no man or woman of honest character, who is willing to work, need lack the means of a comfortable mode of life, besides the prospect of still greater advantages.

So great is the demand for labourers, that government, as we have seen, hold out the inducement of a free passage to young persons of both sexes, and a portion of all the money laid out in land is set aside as a fund wherewith to accomplish this desirable object. Persons in humble life, therefore, who are of the age, and belong to any of the professions named, can now get a free passage by applying to the proper authorities; and as there are shippers who negotiate these free passages in every principal sea-port, very little trouble need be encountered on the subject. They will be supported for ten days after landing, but it is not probable they will be ten hours without getting into work.

Others who do not come under the class for free passages, or who prefer selecting their own mode of transit, can be at no loss whatever to find vessels fitted for their reception. About the months of March and April of each year, emigrant vessels sail in great numbers to Australia. The same expense, we believe, is incurred for a passage to Sydney, Port Philip, or Adelaide. The common price of passage, including provisions, is, for a single man in the steerage, about £23, and in the cabin, from £55 to £60; for a married couple, somewhat less than the double; and for single females the charge is about £3 less in the steerage, and £5 in the cabin. Children are rated according to their ages from sixteen, at three-fourths of the above rates down to six at one-fourth; when under twelve months old, no charge is made. Each passenger is allowed half a ton of luggage. They furnish their own bedding, and, in the case of steerage passengers, their own spoons, knives, forks, &c. When the passage money, however, is found to be lower than that stated above, it would be well for the intending voyager to see that the difference is not made up by a deficiency in the quantity or quality of his provisions, or that it is not perhaps much more than compensated by some such arrangement, probably, as putting three grown-up persons into one bed, when there are no ordinary ship beds that can with any degree of comfort accommodate more than two.

The usual length of a voyage from England to Australia is from four to five months. The course pursued is across the Atlantic in a diagonal direction to the coast of Brazil, and thence along the Atlantic again farther southward to the Cape of Good Hope. From that southern promontory of Africa, the course is pretty directly east or south-east to the Australian coast. The voyage is almost invariably good, the line pursued being free of any dangerous navigation. The reason for crossing to Brazil, is to catch the winds which blow to and from that part of the American continent, as well as to keep aloof from the coast of Africa. In the course of the voyage, vessels usually touch or go near Madeira, and cross the equinoctial line, after which the voyager is in the southern hemisphere. As noticed in the emigration regulations, the emigrant must necessarily pass through both extremes of temperature, and should therefore be prepared for such.

Emigrants should take no fine clothes with them. All articles of dress should be plain and substantial: an old patched coat in some parts of the country will do equally well with a new one. On this subject, a writer in the Sydney Monitor observes—

"Strangers coming to New South Wales should bring clothes to as many persons as they can, provided they be men of character. But let them not expect any thing more from the people here than a kindly feeling towards them. This they will receive. If they meet with hospitality, it will be likely to do them harm. It will tend to raise in them expectations of rank and expense, which will retard their success, and probably ruin them, by inducing them to borrow money on mortgage, &c. &c.

"However respectable men may have been at home, they should have firmness enough to lay all rank aside when they come here. Let them, for this purpose, sell all their blue coats and yellow buttons, and silk stockings, and enter the colony in a barragon shooting-jacket, waistcoat and trousers, their wives and children wearing dark stuffs, for cheapness in washing, and for durability; and however they may be rallied and tempted by their new friends here to put on better attire, let them turn a deaf ear to such allurements. Let them buy nothing in the way of furniture but rush-bottom chairs and the commonest tables, and bedsteads without posts, which are sold here at 10s. each; and, in short, let them endure the constant reproach of being mean and stingy, until their wool, salted beef, butter and cheese, shall have enabled them to dress and furnish their houses according to their taste. By that time, however, they will have learned to see the folly of attempting any thing in New South Wales, but to be warm, dry, and well fed. And in lieu of improving their external appearance, they will learn the wisdom of laying out their profits in building barns and stables, in fencing in more paddocks, in buying more milch cows and fine woolled ewes, and in buying and renting more land in the distant interior to keep them."

The question may be put to us—"To which of the Australian colonies should we go?" To this it is impossible to give a decided answer. We candidly state it as our belief, that in either one or the other, a sober, industrious, and enterprising person, who will submit for a time to privations, will do well. Let the workman but vow to be *steady* and *sober*, and really be so under all temptations, and we are certain he will gain all the comforts of life, and attain a degree of opulence that he could scarcely have reckoned upon in Britain. Gentlemen from Australia, with whom we have conversed, have assured us, that by avoiding intemperance, every working man may safely calculate on prosperity. Such is the fineness of the climate, that nothing is to be apprehended on the score of health, provided reasonable care be taken. In short, we earnestly recommend the emigration of sober and industrious men and women to Australia. As to which colony they should select, that ought to depend on circumstances coming immediately under their notice. Were we ourselves to emigrate, we should prefer going either to Sydney or Melbourne.

With respect to those who emigrate with capital, sheep pasturing, as already mentioned, will form the more suitable means of existence. The persons to succeed best in this line of business are those who are already acquainted with country affairs. If accustomed to a life of comparative refinement, the settler will be required to forego much that he has hitherto looked upon as essential to comfort. "Can I drive a cart—saddle a horse—kill a sheep—milk a cow—lie on a truss of straw under a tree—cook my own dinner—linger all day long beside a flock of ewes?" are some

ding like the questions which a man should put to himself, and answer satisfactorily, before plunging into the business of an Australian sheep-farmer. Consenting to submit to difficulties and privations, nothing more alarming may intimidate the proposing emigrant. All accounts coincide in representing the business of sheep-farming, or, properly speaking, wool-growing, as most lucrative, and professionally less difficult than it is in Britain. To go into this business, a man should possess a capital of at least £2000, only a portion of which is to be laid out at first, and the remainder as it may appear afterwards advisable. We should recommend young men who have but a moderate capital and little experience, to employ themselves for a time as assistants to the store-farmers. By doing so, there is a plan not unusual, of buying a quantity of ewes and getting permission to rear them with the employer's flock—he, the employer, having a third of the wool and a third of the lambs as remuneration for the keep. A few extracts from letters of settlers will convey more precise information than any thing we can say from our own knowledge.

In a letter from a settler in South Australia, dated April 9, 1839, and published in the *South Australian*, a London newspaper, the following details are given:—"With respect to sheep-farming, there is only one opinion, that it is a certain fortune if a man has sufficient capital to start with, and goes into the country and attends to it. I think this a very good country for persons having £2000 or upwards, and also for the lower class; but young men with a few hundred pounds, and *not able to work*, are sadly mistaken in coming here. I have purchased 600 ewes at 33s. each, and 300 at 35s., and intend getting about 300 more, so as to make two flocks of 600 each. It is usual to have a shepherd and a hutman for each flock of 600—the former at 20s., and the latter at 15s. a week, with rations, which consist of 12 lbs. of flour, 9 lbs. of pork, a quarter of a pound of tea, and 1 lb. of sugar. I shall, however, employ an overseer instead of one of the hutmen, as I find I must be a great deal in town, and have agreed to give him part of the increase of the flock in lieu of wages. I intend sending my sheep to a station about twenty-five miles north from Adelaide: there are some good sheep runs about fifty miles from hence, which is at present thought a great distance, but within a short time it will be thought nothing of."

The following account of the increase of sheep stock is from the *Sydney Herald*:—"Early in April, 1838, Mr. Robert R. Leake, a young gentleman well instructed in pastoral affairs, and formerly employed by the South Australian Company, landed in the province 390 ewes and 10 rams. The dropping of lambs unfortunately commenced immediately after landing, and while the ewes were suffering from the effects of the voyage, so that a considerable number were lost. The produce, however, of the flock, on the 1st June, amounted to 351 lambs. On the 1st of January following, the same ewes lambed the second time, and the produce was 306 lambs, making the increase of Mr. Leake's flock as under:—May 1, original flock, ewes and rams, 400; June 1, increase lambs, 351; January 2, increase lambs, 306; actual increase within seven months, 657; total flock, 13th January, 1057. The lambs of the first dropping will produce in August next, along with the imported ewes, and Mr. Leake calculates that his increase of lambs upon the whole flock during that month will amount to 510, which added to the present flock of 1057, shows an increase upon the original importation of 400, of 1197 within little more than sixteen months."

These statements are fully corroborated by tables annexed to Captain Sturt's Expedition into Australia, who proposes that, with a flock originally amounting to 670, the increase at the end of the first year would be 595, and in five years, the flocks of all ages would be 5464. The cost of 670 sheep is estimated at £1005; the expense of management in the first year, £80, and in the fifth year, £365. For the wool in the first year the settler would receive £213, 9s.; in the fifth year, £922, which, after deducting the cost of management (£365), would leave him an income of £557. The value of the flock is estimated, at the end of the fifth year, at £5851, 15s. Mr. Gouger, in similar calculations, states the increase of stock at 80 per cent., and the loss from deaths at 5 per cent.; the latter, we understand, is rather above than below the mark on an average of seasons.

In the small work, "Three Years of a Settler's Life," we find a letter communicating advice designed for a young emigrant who possessed only a small capital, and from it we take the following extract:—"In the first place, I must acquaint you that £300 is but a drop in the bucket to commence settling with, even if he understood how to make the best of it; however, I think, if he could not employ himself profitably in Sydney, it would do him a service to see the country. But, before he turns settler, he must know how to work. By the by, I will explain how he may invest his capital profitably while he is seasoning his fingers. He must not be above soiling them—he must think it no degradation to load a cart and drive a team of bullocks; in fact, he must be a perfect farmer, and he should and must learn, if he wishes to prosper in this country, to be industrious; he must plough his own ground, sow, and reap, and afterwards not be above grinding it. When he can do all this, and be content that God has given him bodily strength sufficient for it, then he will become a rich man. In seven years' time, with his capital judiciously managed, he will be worth £1500 per annum.

"Let him purchase 300 good sound ewes, and give them out to some honest man on the usual conditions, namely, thirds of increase and wool. [By this is meant, as already said, that the farmer who keeps the ewes is to receive a third of the young lambs and a third of the wool from the flock annually, leaving the two-thirds of increase in both cases as the property of the owner of the ewes.] In three years' time he may begin for himself; he will by that time, if ever, be acquainted with the customs of the country, and probably the management of his own establishment. His accounts will most likely be as follow:—1834, 300 ewes; 1835, 270 lambs, less 90 of thirds; 1836, 270 lambs, less 90 of thirds; 1837, 350 lambs, less 117 of thirds. Total, 1190, less 297, leaving a balance of 893 sheep. The wool account will be—

Nov. 1835.	297 fleeces, at 3 lb. per fleece.		
	891 lbs. wool, at 1s. - - - -	£44	11 0
	270 lambs, 1½ lb.—405, at 1s. - - -	20	5 0
1836.	560 full fleeces, 3 lb.—1680, - -	84	0 0
	270 lambs, 1½ lb.—405, - - - -	20	5 0
1837.	820 full fleeces, 3 lb.—2460, - - -	123	0 0
	350 lambs, 1½ lb.—525, - - - -	26	5 0
		£318	6 0
Deduct one-third for their keep, -	£106 2 0		
Ditto wool bags, - - - - -	20 0 0		
		126	2 0
	Balance, - - -	£192	4 0

Thus, in three years from November, 1834, which we will say is the time he will purchase, he will have 893 sheep, and £192, 4s. returned to him for his £300. This is a moderate calculation, and is most likely to be exceeded; but you will not be able to trace it, as I have cut off for deaths, casualties, odd numbers, &c."

The following are extracts from letters written by two young men, brothers, who left Leith for Port Philip in April, 1839, giving a description of their voyage and settlement. They both possessed a small patrimony which they carried with them as a capital to adventure in sheep-farming, or any other suitable line of business. The vessel in which they sailed reached the Cape on the

30th of July, and Port Philip on the 18th of September, making the voyage in five months. In the first letter, written at sea, after describing the early part of the voyage, and a visit to Bahia, on the coast of Brazil, the writer proceeds—"From Bahia, we got two new passengers who had come from England, and had been forced to put into this port, in consequence of the bad state of the vessel, which was here condemned, and they were waiting for an opportunity of getting forward to Australia. Both are Englishmen, and uncommonly agreeable; and we have got a great deal of information from one of them regarding the Australian colonies, in which he was long resident. He confirms all the ideas I had formed of the country of Australia, and considers that two or three individuals going to the bush and getting some sheep, is the safest and best way for investing a small capital, as a concern of that kind is managed at very little expense, and, with economy, will no doubt pay. When stating my fears of an inexperienced person not being able to go about the matter properly, he said that in three or four months one would acquire all the knowledge necessary; and he kindly said, that, if we chose, we might go to his farm in Van Diemen's Land for six or twelve months, and he would be very glad of our assistance, as the shearing time will be approaching when we arrive, but would not recommend settling there, as he considered Port Philip the best situation. We are, from this and other circumstances, resolved, on arriving at Port Philip, and while the vessel lies there, to take a turn into the country; and should matters be at all as they say, and if we can get our bills cashed at a reasonable rate, we intend remaining there.

"On the 11th we came in sight of land, and by three o'clock afternoon were pretty close in shore, which put me in mind of the Yorkshire coast, precipitous and rocky to the water's edge. The land was covered with brushwood, and looked wild and pretty; and I did not feel at all disappointed with our first view of Australia Felix, though some of our passengers did. The wind continued unfavourable for four days, during which we tacked out and in, making little progress to the eastward [what a want of a steam-tug here!]; but the appearance of the country improved much, being now clothed with forest down to the shore, and we frequently distinguished fires which the natives raised as signals. The land we made first was between Portland Bay and Cape Otway. On the 17th, we entered Port Philip Bay by a very narrow entrance, not more than half a mile broad; but on getting through what are called the 'Heads,' the bay opens up into a fine sheet of water, somewhere about thirty miles long and twenty broad. The country on each side is richly wooded, and rather high. We sailed up in the afternoon, the bay being as calm as a loch, with the sun shining clear and beautiful, and making us pleased with the new country. We got ashore in the morning, and found that we had to walk two miles to Melbourne. The appearance of that town, the capital of the Port Philip district, was strange to us—a great many brick houses and tents being scattered about here and there. The price of provisions is astonishingly high, but is more than compensated by proportionately high wages. All the mechanics on board were engaged the first day at 12s. per day, and people waiting and coming on board to get them. We had our bills discounted—the thirty days' ones at 2 per cent. premium, and we got 5 per cent. interest from the banks for deposits for money lent, the common rate is 15 per cent. The price of sheep is high, from 30s. to 40s., but after the clipping time they will fall, and so also will the other provisions, as there is promise of an excellent crop. This is really an astonishing place, for two years ago there was nothing but a few mud huts and tents, and now it is assuming the appearance of a regular town. Already, the port is supplying other places with cattle and sheep; there are now four square-rigged vessels lying here, one of them waiting for a cargo of wool for London, besides various small craft engaged in the coasting trade. We will go into the country, and should we not meet with any thing to suit us in the way of a situation (for we will not lay out our money till we acquire a knowledge to do so advantageously), we will return to town, and have no doubt of getting employment."

Our next extract is from a letter dated January, 1840. "When I wrote on arrival, I did not think it would be advantageous to buy sheep, from the highness of their price. I could have got a situation in a merchant's office in Melbourne, with a salary of £130, but, after all, did not like taking to the pen again. Having been introduced to Mr. ——, we visited his station, about seventy miles from Melbourne, and there we bought 500 ewes. We lived there nearly two months, and got a good deal of insight into the business of sheep-farming. were it such a science as it is at home, I would feel a little afraid of succeeding, but there is really no mystery about it. We left that station the day after Christmas, and proceeded with our sheep about twenty-five miles further up the country, where we are now settled, and have got our hut erected. It would be impossible to give you an outline of all the adventures we have encountered up to this time, and I am so hurried as to be able to write only in snatches. You will have heard that we are settled in company with Mr. —— and Mr. —— [two acquaintances], which is for the purpose of avoiding the expense which a small number of sheep take." Here we stop to say, that in a letter from the other brother, it is explained that they had procured a license from government to graze and pasture in a certain district, thus avoiding the necessity of buying land; and the following account is given of the sheep-purchase and plan of settlement:—"We have, after many doubts and fears, fairly commenced sheep-farming, having purchased 1080 full-monthed ewes at £1, 2s. each, merely as a sort of beginning. There are four of us concerned in the undertaking. We have begun on a very economical system, managing the sheep ourselves, one of us going out with them for a week alternately, while the others are doing any thing about the place. We run the whole in one flock, till the lambing, which takes place about the middle of March, when we will require to take another man. We have one man-servant already, who drives and looks after our bullocks, besides making himself generally useful. The sheep require the utmost care and attention possible. One has to take them out at sunrise, so as to get the dew, and remain with them the whole day, bringing them back at sundown. They require to be always watched, both in consequence of the natives and wild dogs; the dogs are most to be feared, as they often rush into the flocks by day, and sneak into the pens at night. We have as yet escaped both evils, but I have seen as many as six killed in a flock in one night by the wild dog. The sheep here are very subject to a disease called scab, but it just requires care in looking after to be kept under. I think, if wool keep the same price, we will get about 1s. 5d. per pound, the produce averaging 3 lbs. per sheep, washed. I hardly think the wool will clear our expenses this year, but then we have the increase always coming on; and although the way we live is far from comfortable, in a wretched turf hut, shut out in a manner from all the world and every sort of society, still I have no doubt the thing will pay."

Speaking of the appearance of the country, one of the writers observes—"The aspect of the country, as we are aware, is flat, and appearing at a distance as thickly wooded; but when you enter this woody district, you find generally the trees a good deal separated from one another, with sward among them. This

considered the best ground for sheep, as it affords good shelter from the cold, and shade from the sun. There are really many beautiful parts, and more like the park scenery around a nobleman's seat than a wilderness. But there are other places which look as wild and bleak as you can conceive—immense plains with nothing but short grass on them—no water—and stretching away to the horizon. You cannot see a tree or any thing on them; and they are only inhabited by wild dogs, turkeys, and snakes. The grass in most part of these plains affords excellent pasturage for sheep, but, from the want of wood and water, they are useless. You must be near some river or water-holes, in order that the sheep may drink every day; this they will always do when there is no rain and the weather has been dry for some time, when the grass becomes so dry, that if you take a little you can rub it in your hands till it is like snuff. Our place is very pretty, being on a creek or water-holes, which are connected with a river, of which we do not know the name. These water-holes [or series of pools] run during winter, but become dry in the summer, except the very deep holes. Adjacent are some large gum-trees, some fallen into the water, and some half buried, but still flourishing, with the grass long and luxuriant, and forming excellent feeding for our bullocks. Our hut is placed a few yards from these holes, with the sheep yard immediately behind; on one side we have a woody country, going back nobody knows how far, affording shelter to the natives, kangaroos, and emus."

From other passages in these letters, we learn that the writers are far from being satisfied with their situation—the miseries of living in a turf-built hut—the swarms of fleas—the dreadful solitude they are compelled to endure, being twenty miles from any other settlement—their half-savage mode of life—their recollections of home—all tend to inspire distaste of their lot. We believe that such sensations are common to all young emigrants who have abruptly left refined society and plunged all at once into the novel career of sheep-farming in the wilderness. It is of importance to observe, that no one in such circumstances can reasonably expect to avoid experiencing such sensations. Take any man from a counter or desk, much more from a respectable drawing-room, and oblige him to attend to the drudgeries of sheep-farming even in Lincolnshire or Roxburghshire, and he would in all likelihood feel precisely the same disgust. But such disagreeables must only have a temporary operation. After a little while, the man's nature will become in some measure accommodated to them: they will be in themselves diminished, and other circumstances will arise to palliate and compensate for them. All, then, that the emigrant has to contemplate at the beginning is, how he is to get over the first shock. That passed, it is to be hoped that, with a fair share of vigour and perseverance, he will begin to find pleasures he did not contemplate in a simple rural life.

The last letter of our two young friends, dated June, 1840, tends to support these views. It is written in a much more cheerful spirit than those previously sent, things having begun to improve in appearance. The lambing season had passed, leaving fully a thousand young lambs, and another dropping equally good was expected in November; "but," says the writer, "there has been a great outlay, and there will be little return till the third year; the wool should then pay all expenses, the increase of flock being the profit. The first stock we will have to sell will be wethers, which are at present selling for 20s. each." The party had also begun to cultivate a few acres of land, for the purpose of raising wheat, which is excessively expensive in the colony, also to lay out a garden, and to rear fowls. The only drawback, it is added, is the *want of labourers*, and this keeps every thing behind. The writer now rather laughs than laments over "the domestic arrangements" of the hut: one of his companions had commissioned a wife from Scotland, and sent for two nephews to assist in the farm, while all were looking forward to a course of moderate prosperity and comfort.

EMIGRATION TO VAN DIEMEN'S LAND AND NEW ZEALAND.

VAN DIEMEN'S LAND.

GEOGRAPHICAL POSITION AND GENERAL HISTORY.

Van Diemen's Land is an island lying off the southern extremity of the mainland of Australia, from which it is separated by a channel 120 miles broad, called Bass's Strait. Its situation is between latitude 41° and 44° south, and between longitude 144° 40′ and 148° 20′ east of Greenwich. The length of the island is about 210 miles, and its breadth 150. It was first discovered in the year 1642, by Abel Jansen Tasman, a celebrated Dutch navigator, and was by him called Van Diemen's Land, in honour of Anthony Van Diemen, at that time governor-general of the Dutch possessions in the East Indies. Nothing, however, immediately resulted from this discovery, and for upwards of a hundred years the island was lost sight of. In 1773, it was visited by Captain Furneau, the first English navigator who had ever touched at it; after this it was visited from time to time by several celebrated navigators, and among these by Captain Cook, in the year 1777. It was not, however, until 1803 that any settlement was made upon the island; in that year it was formally taken possession of by Lieutenant Bowers, as a receptacle for convicts, with a party from Port Jackson, in New South Wales, where a penal establishment had been already fixed; and to this purpose Van Diemen's Land was exclusively devoted until the year 1819, when it was thrown open to free settlers. It is thus only since the very recent period just named that it has exhibited the character of a colony. Its progress, however, has been since then extremely rapid. Van Diemen's Land is sometimes called Tasmania by its inhabitants, in honour of Tasman its discoverer.

The continent of Australia and Van Diemen's Land are totally different in character, the one being flat and ill-watered, so as to be suitable chiefly for pasturing while the other is mountainous, and more resembling Ireland or Scotland. The appearance of Van Diemen's Land from the sea is exceedingly picturesque, presenting an endless succession of lofty mountains, covered to their summits with wood; while tall rocks and precipices, glens and hills, contribute to increase the interest of this

romantic island. Nor does a nearer inspection materially alter this general character of the scene.

On traversing the island, it is found to present a constant alternation of hill and dale, with occasional flats or plains; but these are comparatively few in number, though some of them are of great extent, consisting in several instances of not less than from 8000 to 10,000 acres, and one in particular is said to be six miles in length, and from two to three in breadth. These plains are in general exceedingly fertile, and being often but thinly interspersed with trees, present a most delightful appearance. There are some of them, again, very poor, presenting a cold thin soil, of little value. Van Diemen's Land, though it cannot be called a well-watered country, is yet much superior in that respect to New South Wales. Besides several extensive lakes scattered throughout the interior, it possesses a considerable number of rivers; and in almost every district of the island water is to be found. The names of the two largest rivers are the Derwent and the Tamar.

In another important particular, this island is peculiarly fortunate, that is, in the number and capacity of its harbours, no place of similar extent in the world probably being equal to it in this respect. The principal harbours are—the Derwent on its southern side, Port Davey and Macquarrie Harbour on the western, Port Sorrel and Port Dalrymple on the northern, and Oyster Bay and Great Swan Port on the eastern coast. Besides these, there are many other harbours, bays, and creeks, distributed along its shores. The coast is in general high and rocky, particularly on the south, east, and western sides of the island: on the north, however, it presents a line of low alternate sandy beaches, on which the surf rolls with great impetuosity during the prevalence of northerly winds. From the extremely hilly nature of the country, there is but a comparatively small proportion of it adapted for the plough, though presenting abundance of excellent pasturage. The extent of really available land throughout the known part of the island, has been estimated at one-third of the whole, and this is again divided into four parts, giving one for the plough and the other three for pasture: thus, out of 1000 acres of land, about 100 will be found fit for cultivation, and from 300 to 400 for grazing. This is, of course, a rough estimate, and may be found not to be correct in many instances, but in general we believe it will not be far from the truth.

DIVISION—DISTRICTS, &c.

Van Diemen's Land was originally divided into two counties, Buckingham and Cornwall; the former occupying the northern, and the latter the southern portion of the island. These counties have been again subdivided into the following districts:—Hobart Town, New Norfolk, Richmond, Clyde, Oatlands, Oyster Bay, Campbelltown, Norfolk Plains, and Launceston.

Hobart Town District, though the smallest in extent of any in the island, is yet the most important in the colony, as well from the circumstance of its including Hobart Town, the capital of the island, as from its possessing many superior local advantages; and, among these, that of its being accessible by water on three different sides—by the Huon river, which forms its southern boundary, by the Derwent on the north and east, and by the sea on the east. The whole district, including the island of Bruny, which lies off the mouth of the Huon river, and forms part of it, comprises 400 square miles, or about 25,000 acres. The country in this district, however, is in general so hilly, that out of these 25,000 acres there are not above 1600 under tillage; and it is said that the first cost of clearing and preparing these lands for the plough greatly exceeds what they would now bring altogether if put up to public sale. The best and principal farms here are situated on the banks of the Derwent, and south of Hobart Town in the direction of Fairlie's Cove; behind this, interiorly, there are but few locations, nor does the appearance of the country tend much to invite future settlers, the soil being in general so thin, and so heavily encumbered with trees, that even its vicinity to the capital is scarcely an inducement sufficient to any one to attempt its cultivation.

In this district, Hobart Town, the capital of the colony, as we have already said, is situated. Hobart Town is built on the left bank of the River Derwent, at the head of a beautiful cove or bay, distant about twenty miles from its junction with the sea. The town is pleasantly situated on a gently rising ground, which, gradually retiring, terminates ultimately in hills of considerable height, covered with wood, and presenting a most romantic appearance. These, again, are overlooked by one of still greater altitude, called Mount Wellington, which rises to the height of 4000 feet above the level of the sea. Hobart Town is thus happily placed between highly picturesque hills on the one hand, and a beautiful bay or arm of the sea on the other; for, though the Derwent be here called a river, it can so be called only in a very extended sense, the water being still salt, and of considerable width. The town itself covers somewhat more than a square mile of ground; the houses are principally constructed of wood, though many of them are of brick and freestone. The streets are regularly laid out, and those of them that have been completed are macadamized, and present on either side long rows of large and handsome shops. The town derives a peculiar and highly pleasing character, too, from the circumstance of the houses in general standing apart from each other, each having a small plot of ground, from a quarter to a half an acre in extent, attached to it. Its public buildings are numerous, and many of them would be considered handsome even in Britain. The town contains breweries, tanneries, distilleries, flour-mills, two or three banks, hospitals, churches, schools, charitable and stipendiary, inns, taverns, hotels, and grog-shops *ad infinitum*, and every thing else which bespeaks a thriving, bustling, industrious, and civilized community. Nor are they behind in the department of literature: two or three newspapers are here published weekly, besides a yearly almanac, containing a great deal of statistical and other interesting information regarding the colony, and an official gazette.

New Norfolk District lies immediately behind the former, and is entirely inland, no part of it approaching the sea: its extent from east to west is about fifty miles, and from north to south about thirty—thus comprising 1500 square miles, or 900,000 acres. This district is in general much more fertile than that of Hobart Town, returning on an average from six to eight bushels of wheat per acre more than the latter. The farms, too, are of much larger extent, many of them amounting to 2000 acres, some of which are delightfully situated on the banks of the Rivers Derwent and Jordan, the latter of which streams, after passing through an exceedingly beautiful tract of country, ultimately falls into the former at a place called Herdsman's Cove. In this district there is also a large proportion of rich sheep pasture. New Norfolk is intersected, in a north-westerly direction, by a chain of lofty mountains, covered with the most magnificent timber, and exhibiting snow on their summits throughout the greater part of the year. From its vicinity to Hobart Town, and the advantage of water carriage which the lower part of the district possesses, there is a greater proportion of agricultural produce raised in it than in many of the other districts. It is remarkable, however, that, with all its superiority of soil, its crop of potatoes is about one-seventh less than that of the Hobart Town district. Here is a pleasantly situated little town or village, bearing the name of the district, and distant

from Hobart Town about twenty-two miles. A coach and van, the former with four horses, and the latter with two, run daily between it and Hobart Town; besides these, there is a steamboat plying on the Derwent between the two places.

Richmond District extends on the sea-coast, from Prosser's River to Tasman's Peninsula, a tract of uninterrupted sterility, being rocky, mountainous, and barren to the last degree. The ridge of bleak and unproductive hills which run through this whole length are heavily timbered, and never can be made in any way available to the purposes of man. On the side next the Derwent, however, which bounds it on the south, though still hilly, there are a number of beautiful and fertile valleys; and around Pitt Water, a salt-water lake of six miles in length and three in breadth, there is a considerable portion of comparatively level land of the first description, and well adapted for agricultural purposes. In this district there are two towns or villages, Richmond and Serrel; the first fourteen, and the second twenty-two miles distant from Hobart Town. In the latter there are several good inns, a parsonage-house, church, jail, &c.; the former is not so well furnished with inns, but there are several respectable private houses. Serrel is situated in the fertile locality of Pitt Water, and is surrounded on all sides with rich and highly cultivated farms. This district contains altogether about 672,000 acres, or about 4050 square miles.

Oatlands District is separated from the sea by part of the Oyster Bay district, and bounded interiorly, or on the west, by the district of Clyde, and on the north by that of Campbeltown. This district is comparatively but of small extent, and forms a square of about thirty miles on each side, containing 900 square miles, or about 576,000 acres. Though one of the smallest subdivisions of the land, Oatlands is one of the best, possessing, perhaps, a greater proportional extent of cultivatable and grazing land, and that of the finest quality, than any other locality of similar bounds in the island; its beautiful open and extensive downs afford the richest pasturage, and its arable lands are equally fertile and productive with the best in the colony. It is besides most advantageously situated, occupying a central position between Hobart Town and Launceston, the next town in the island in extent and importance to the former. The advantages which this district presents have been duly appreciated, and a greater proportion of it, taking its limited extent into account, has been located than of any other district in the colony. Coal is found here, but in too remote a situation to afford any profit in the working. Within this district are situated what are called the Salt-pans Plains, a beautiful level tract of fertile country, of many miles in extent, terminated in the distance by lofty ranges of the most magnificent hills. These plains derive their somewhat singular name from three small lakes, or ponds, which are so strongly impregnated with salt, that they yield by a natural process many tons of that essential article of life annually. This salt is not equal in quality to English salt, but nevertheless, brings 10s. a hundredweight in the colony. The town of Oatlands, situated in this district, fifty-one miles from Hobart Town, contains a military barracks, a jail, an inn, several large stores, and a number of well-built houses.

Clyde District comprises about 1700 square miles, or 1,088,000 acres. This district is in general hilly, but affords excellent and extensive pasturage. Its remoteness from Hobart Town, and the difficulty of transporting agricultural produce to that market, from want of good roads, has tended to keep it almost exclusively a pastoral district. The proportion of cultivated land here is exceedingly small. Some of the best grazing-farms, however, in the island, are to be found in this district, many of them covered with the immense flocks and herds of the various settlers. This district has the advantage of many of the others in the colony in the essential article of water, no less than five different rivers running through its bounds; these are the Ouse, Shannon, Clyde, and Jordan. From its elevated situation, the climate here is considerably colder than in the districts nearer the sea; and even in summer, slight hoar-frosts are not unusual at a very early hour in the morning. This circumstance has particularly affected the crops of potatoes which have been attempted to be raised here, and which in consequence exhibit such a poor return as almost amounts to a total failure. The principal township in the district is Bothwell, distant forty-five miles from Hobart Town: there is an excellent inn here, a court-house, church, and a considerable number of respectable private houses.

Oyster Bay District is bounded by Richmond on the south, Oatlands and Campbeltown on the west, and the sea on the east. Oyster Bay district takes its name from a beautiful bay situated within its limits, and which affords excellent anchorage for ships, and is reckoned altogether one of the finest harbours in the island. It is separated from the adjoining districts by a lofty range of mountains, which run from north to south throughout its whole length on its interior side. This district is about the same extent with that of Oatlands, comprising 900 square miles, or about 576,000 acres. It does not exhibit any general traits of character differing from the others. In common with these, it possesses large tracts of fine pasture-lands, but there is little yet under the plough. A great portion of the wealth of this district is derived from whale-fishing, a considerable number of these animals being every year taken in Oyster Bay.

Campbeltown District lies between Oyster Bay district on the east, and Norfork Plains on the west, and comprises about 1260 square miles, or 85,000 acres. This is one of the finest districts in the whole island, and is every day increasing in prosperity and importance. The peculiar richness of its herbage adapts it in an especial manner for the rearing of cattle; and this is so well known and so universally acknowledged in the colony, that the butchers of Hobart Town come hither to make their purchases of fat stock, though at the distance of seventy miles, in preference to drawing them from the more immediate districts of less celebrity in this particular. Among other delightful tracts of grazing-land which this district presents, there is one of superior fertility formerly called the Ross Reserve, from its having been kept possession of by the crown for its own purposes. When this reserve was exposed to sale by the government, in lots of 4000 acres each—the whole tract comprising about 32,000 acres—it brought readily from 16s. to 20s. per acre. One lot sold as high as 29s. per acre. Each of these lots has a frontage to the Macquarrie River, from which they run backwards about six miles. At Ross there is an annual cattle-market, and a yearly display of horse-racing. The agricultural produce of this fine district is equally remarkable with its pasturage; and for barley especially it seems to be singularly well adapted, the average return of that crop being not less than forty bushels per acre. The chief town of this district is Campbeltown, which contains many well-built houses, stores, inns, &c.

Norfolk Plains District.—By including this district, we have now crossed the island from north to south, and arrived at the shores of Bass's Strait, which separates Van Diemen's Land from New South Wales. Norfolk Plains district comprises 2250 square miles, or about 1,500,000 acres. This division of the island presents a very different aspect from that of which we have just been speaking, being generally mountainous and barren; and when it is not absolutely either, the soil is often poor, thin, and comparatively unproductive.

Launceston District completes the catalogue of the

political divisions of Van Diemen's Land, and is the largest of them all. It occupies the north-eastern corner of the island, ending at Cape Portland, having Bass's Strait on the north-east, and the Pacific Ocean on the east, with a coast-line on the former of about seventy miles, and on the latter of about fifty-five. It is estimated to contain 3800 square miles, or about 2,500,000 acres. The greater part of this extensive district is wholly useless for any of the purposes of man, being barren, sandy, rocky, and mountainous, and in many places altogether inaccessible. Notwithstanding of this, however, it is considered the next in importance to the Hobart Town district, from the circumstance of its possessing the second largest town in the island, namely Launceston, situated at the junction of the North and South Esk, at the head of the navigable portion of the River Tamar, which discharges itself into Bass's Strait, about forty-five miles below the town. The town presents a very business-like appearance, with its shipping, wharfs, stores, and public buildings, all calculated to impress the stranger, even on a cursory glance, with a favourable idea of its rising importance. The court-houses, soldiers' barracks, female factory, &c., stand near to the junction, in a very fine situation. The male prisoners' barracks lie near to the North Esk. There are two finely-built churches here, the Episcopalian and the Scottish Presbyterian, with numerous and highly respectable congregations. There are, besides, meeting-houses of various other sects, all of whom receive pecuniary support from government, in proportion to the number of members who attend them; also several societies of a benevolent and useful character, deriving their chief support from the liberality of the inhabitants. The exchange or reading-room, which would not disgrace some of the more populous towns of Britain, contains an excellent selection of papers from the other colonies, as well as from the mother-country. There are several banking-houses, inns, warehouses, and shops of a superior kind, having almost every necessary and luxury used in civilized life, and which are obtained at very moderate rates. The private residences of the inhabitants are elegant and substantial, and prove that both the architect and the tradesman are to be found in this colony. From the favourable nature of its situation for commercial purposes, the river being navigable for vessels of 500 tons burden up to the town, the trade of Launceston is very considerable, and is every day increasing. The chief exports are wheat, bark, wool, and whale-oil. In connection with the post-office, custom-house, and commercial establishments, a telegraph has been erected on an eminence called the Windmill Hill. This is of great consequence to the merchants, who ascertain, by a code of signals devised for each mercantile house, when a vessel either enters or clears the heads of George Town; the vessel being scarcely at the cove, when the owner or consignee, thirty miles distant, is put in possession of the fact, through this excellent medium of communication, where steamboats or stage-coaches are yet awanting. There is a strong probability, however, from the enterprise hitherto displayed by the inhabitants, that this want will not have to be long complained of.

Mr. Russell, a young Scotchman, made a tour in the Australian colonies in 1839, during which he paid a visit to Launceston district in Van Diemen's Land; and from his remarks on the country we offer the following extract:—

"The banks of the river Tamar are of the most romantic description, rather thickly timbered, with here and there a comfortable-looking residence, having the land cleared in its neighbourhood: the fields produce excellent crops. Several flour-mills, &c., are here also, these having great facility in conveying produce by boats to any place either up or down the river

"The appearance of Launceston harbour, from its natural advantages combined with a class of very enterprising merchants, would lead one to suppose that they were entering a port in old England. The shipping of this place has increased very much of late, both in tonnage and in number. Where vessels of 150 tons burden were formerly brought up with difficulty, others of 500 tons now fill their place easily, many of those at present here conveying immense quantities of wheat, flour, and hay, to Sydney, Adelaide, and Port Philip, the late drought having caused a scarcity in these colonies, while this part of the island, from its geographical position and richer soil (though limited), grew crops sufficient to prove its superiority as an agricultural district. Any one visiting the farms on the banks of the Tamar, North Esk, or Norfolk Plains, will cease to wonder at the shipments of grain and other produce. It has formerly been termed the granary of New Holland, and now fully realizes the title. Farmers usually get convict labourers assigned to them by government, which is of much consequence, where free labour is yet scarce. Extensive establishments are provided with one or more mechanics; they being of greater value, are estimated as worth two or three labourers, and assigned accordingly. Female convicts are also assigned; the parties binding themselves to furnish all such servants with rations and clothing, agreeably to a government-scale furnished them.

"There are some fine thriving country towns in this northern district, among them Campbelltown, Longford, Evandale, and Perth, which is beautifully situated on the banks of the Esk. Two bridges of considerable dimensions are in process of building across this river, the churches, mills, &c., forming a most picturesque scene. There are also stores for merchandise, and inns for accommodation—two very necessary appendages in country settlements.

"The roads in Van Diemen's Land are rather superior, from the quantity of metal always to be had, and the numerous chain-gang parties constantly employed in making and repairing them. Tolls are yet unknown here. In general, the drays used for conveying all kinds of material, are drawn by teams of bullocks, consisting of from two to eight in number, as the occasion requires. The traffic along the different roads with vehicles of all sorts is very great, including mails, stage-coaches, tandems, &c., up to the rolling carriage with liveried servant; some the result of unsurpassed industry, and some through means more equivocal. There are many singular instances in the changes of fortune these colonies have produced on the persons and in the circumstances of individuals sent out here for punishment originally.

"The road between Launceston and George Town is at present but a bush one, every one striking off the different turnings as their fancy of saving distance leads them, always converging to the common track at some place or other. At present, however, there are some gangs at work, forming an excellent road, which will soon be in use. I had a good opportunity of seeing the fertility of soil on the banks of the Tamar, when on a visit to a family, and of being still more strongly convinced, that here, as everywhere else, farming requires considerable attention in taking the advantage of seasons. During the past season, notwithstanding the drought, this industrious class have had excellent returns from their crops. The growth of vegetables, &c., at this farm, particularly attracted my attention beyond any thing I had ever seen in Europe.

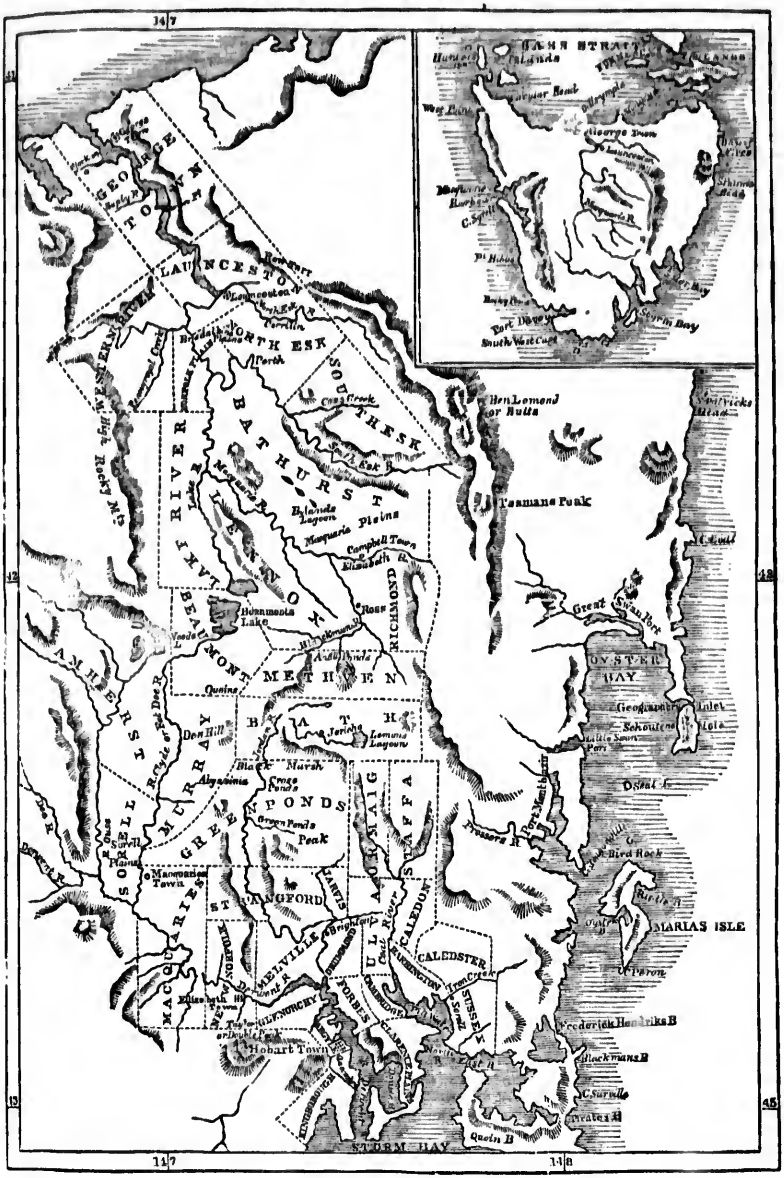
"Among the many instances of individual enterprise that could be given, is one, where a bridge connecting the north and south banks of the North Esk, was erected through the spirited exertions of a merchant, who is a native, and an honour to the colony which gave him birth. This erection is a fine light structure, and suited for all

purposes. I understand that government afterwards compensated this gentleman by some grants of land.

On Norfolk Plains are some extensive and fertile farms, having very excellent steadings. The houses are principally built of brick, having the roofs shingled, that is, covered with pieces of wood similar in size and shape to the common slate.

It has been remarked by almost every one who has visited this island, that cattle and horses thrive remarkably well upon it. The horses used in harness struck me as being much finer than those across the straits, where they exhibit a more relaxed appearance. Here, from the climate being rather cooler, the richness of food grown, and moderate labour, they exhibit plumpness and action at the same time, superior to what I saw in South Australia. Shortly before my arrival in Launceston, there was said to have been a fine display of saddle-horses at the annual races, which took place on the

MAP OF VAN DIEMEN'S LAND.



course, a flat piece of ground on the bank of the North Esk, well laid off, and having high land in its neighbourhood, apparently very suitable for such a purpose. There is also sport of another kind to be had with the kangaroo and opossum, which are very plentiful on this island. The skins of these animals are converted into many purposes, such as shoes, rugs, &c.

"The land on the North Esk, and that which runs in the line of road to Hobart Town through Perth, Ross, and Campbeltown, as far as Oatlands, is tolerably well cleared of timber, and many extensive fields of corn, &c., are to be seen. This latter place lies about the centre of the island. The country from thence towards Hobart Town becomes very hilly, with here and there a few farms in the valleys; the bush, of course, having sheep, horses, and cattle in abundance depasturing on its soil. The harvest of Van Diemen's Land generally commences in February. Around the capital are said to be some fine spots. The government gardens, about three miles distant, are considered worthy of a visit, from the many exotics and fruits grown there—apples, pears, and all other English fruits, growing to great perfection. The grapes raised against the wall are as large as those of Spain or Portugal; but a friend who has spent much time in all these places considers this Tasmanian crop deficient. As in the other colonies, many of the settlers here have been officers in the army and navy, grants of land being given them on retiring from active service, which has, no doubt, tended much to the formation of an excellent community. Many civilians who ventured their future happiness by emigrating to this island, have been very prosperous, principally by dint of determined perseverance."

CLIMATE, SOIL, NATURAL PRODUCTIONS, &c.

The climate of Van Diemen's Land is exceedingly pleasant and salubrious, and is especially adapted to the constitutions of the natives of Great Britain; the heat in summer is not so intense as that of Australia, not often much surpassing that of London or the southern parts of England; while the mornings and evenings, even at the hottest periods of the year, are always cool and agreeable. The cold in winter, however, though mild when compared to what we experience at that season, is more intense and of longer duration than that of Australia, snow lying frequently on the higher mountains throughout the greater part of the year; but in the valleys and lower districts it seldom remains more than a few hours. There have not yet appeared any diseases which can be said to be peculiar either to the climate or to the island; and, on the whole, the chances of life are estimated to be considerably more in favour of Van Diemen's Land than of Britain or any other of the most healthy parts of Europe. Colds are sometimes caught in winter, but never prove fatal unless neglected. It is not subject to any extremes of heat or cold: the seasons are regular, mild, and agreeable; the atmosphere constantly pure and elastic; and the sky clear, unclouded, and brilliant. The average number of days on which rain falls throughout the year, is from fifty to sixty. The island possesses a considerable variety of trees and shrubs. The gum-tree is the largest; and there are numerous others well adapted for ship and house building. The trees are all tall and straight, branching only at the top, and they are nearly all evergreens. The bark of the trees is in general of so white a complexion as to give them the appearance of having been peeled, and their leaves are long, narrow, and pointed. All the vegetables and fruits known are cultivated in England and Scotland, are raised without difficulty—apples, pears, plums, gooseberries, &c., to which the warmer temperature of Australia is unfavourable, are produced here in great abundance and of excellent quality. Both the climate and the soil are sufficiently favourable to the production of most descriptions of grain; wheat is found to thrive remarkably well; potatoes are in general a good crop, and of excellent quality. The island is altogether, in short, fit for all the purposes of agriculture aimed at in this country, being neither more nor less favourable to them, but in all respects nearly the same; its climate being ours, only somewhat modified, and its soil in general not materially differing in quality. Its animal productions are nearly the same with those of Australia, consisting of the kangaroo, opossum, squirrel, &c. The native dog, however, so well known in the former country, is not to be found here; but in its place there is an animal of the panther tribe, which, though it flies from man with the timidity of a hare, is yet extremely destructive to the flocks of the settlers, among which it frequently commits the most dreadful havoc. This animal attains considerable size, having been found in many instances to measure six feet from the snout to the extremity of the tail. The birds of Van Diemen's Land are the emu, or Australian ostrich, parrot, cockatoos, herons, swans, pelicans, &c. There are here, too, a considerable number and variety of poisonous reptiles; but these, on the whole, are neither so numerous nor so venomous as in the sister colony.

The seas around Van Diemen's Land abound with whales, dolphins, and seals, and its shores with shell-fish, particularly the mussel, these last literally covering the rocks on its coast, and in its bays, creeks, and harbours. Oysters were once plentiful, but they have become almost extinct.

The leading if not almost the only misfortune under which Van Diemen's Land labours, is a deficiency of good roads. This prevents all communication on a profitable or convenient scale, except in the few cases in which proper thoroughfares have been made. Mr. Dixon, a late writer on the country, observes, that the cost of transporting farm-produce a distance of thirty miles, is as great as is the cost of bringing the same quantity of articles from Great Britain; in other words, a barrel of beef can be sent from London to Hobart Town for the same price as it could be sent from thirty miles inland to Hobart Town. If this be true, it is a fact most disgraceful to the local authorities; for without good roads it is utterly impossible to carry on agricultural operations with advantage.* The statistical accounts of the island mention, that latterly great improvements have been made in this respect, there being now upwards of 100 miles of macadamized roads in the colony, also several bridges, and good cross-roads; but we fear that much still remains to be done to extend the means of communication.

GOVERNMENT.

Van Diemen's Land is now an independent British colony. Till the year 1825, it was a dependency of the colony of New South Wales, but in that year it received a government of its own. The internal policy of the island is now conducted by a lieutenant-governor, and an executive and legislative council. There are also here a chief-justice, attorney-general, and all the other appendages of a supreme court of judicature, courts of requests, attorneys, barristers, solicitors, proctors, sheriffs, justices of the peace, and the whole of the paraphernalia of civil and criminal jurisprudence known in this country. There are, besides, as in New South Wales, a number of police magistrates, each having a separate and distinct district under his judicial authority; these are, as in the former case, stipendiary. The laws here are the same with those in England, in so far as the circumstances of the colony will admit. The members of all the civil institutions are appointed by the crown, consisting, in the

* Mr. Dixon's observations on the state of the roads are completely at variance with those which we have quoted from Mr. Russell. Perhaps the roads are good in one or two lines of route, but indifferent in others.

executive council, of four in number, including the governor, and in the legislative of fifteen, also including that officer. The expense of the judicial department amounts to about £13,000 per annum, and the ecclesiastical to about £6500. The military and convict establishment are paid by the mother country. The governor's situation is reckoned worth £5000 per annum, although his net salary is only £2500; the difference is made up by taking into account various items, such as furnished houses, gardens, farms, servants, horses, cattle, sheep, pigs, poultry, fish, &c.

Society in Van Diemen's Land, like that of New South Wales, is made up of free settlers who have emigrated from this country, and of convicts. Society is so much alike in both countries, that it is unnecessary for us to say any thing regarding it in this article. The convicts in Van Diemen's Land are in all respects treated the same as in New South Wales, to which article we refer for particulars. There are no aborigines now in Van Diemen's Land, these having been lately conveyed to an island in Bass's Strait, and an ordinance has been issued by the home government for their removal to Port Philip district, New South Wales. Regarding the bush-rangers, or runaway convicts, from the effective police force kept up, their depredations are confined to the less populated districts, and even there they seldom exist long without being captured. We understand, that while we are now writing, measures are in the course of adoption for entirely altering the mode of convict management and labour, and leaving the colonists to be more dependent on the assistance of free labourers than formerly. Correct information may be obtained on this point on arrival in the colony.

We gather the following information respecting the condition of Van Diemen's Land from an official return, drawn up by the Colonial Secretary to the government for the years 1836–7–8, and published in the Hobart Town Courier, 1839. It appears that the fixed revenue of the colony has increased from £91,320 in 1835 to £98,081 in 1838, although in the interval there has been a decrease of £18,000 on the annual revenue from spirit duties. The number of licenses granted to publicans and wholesale dealers in spirits has been considerably diminished. The annual expenditure of the colony has correspondingly increased from £103,027 in 1835 to £133,681 in 1838: much of this increase, however, is caused by the colony now bearing the cost of the police establishment, formerly paid by the home government. The number of vessels cleared inwards in 1835 was 229, with a tonnage of 55,853; in 1838 the number of vessels had increased to 370, with a tonnage of 64,454. The number of vessels cleared outwards in 1835 was 225, with a tonnage of 53,560; in 1838 the number was 369, and the tonnage 63,392. The number of vessels belonging to the colony had increased in three years 40 per cent. In 1835 five vessels were built in the colony, with a tonnage amounting to 382, while in 1838 the number built was ten, tonnage 1267.

It also appears that the number of acres in crop had increased from 87,283 to 108,000, or nearly 24 per cent. The number of horses had increased at the rate of 49 per cent, and that of sheep from 824,256 to 1,214,485. Manufactories and trades are progressively increasing in almost every branch. In 1835 the number of mills driven by water or wind was 47; in 1838, 51; and in place of one formerly driven by steam-power, there are now two.

PASSAGE.

Van Diemen's Land is sooner reached than New South Wales (the distance from Hobart Town to Sydney being about 800 miles); on which account the charge for passage to Hobart Town is in general several pounds less than to Sydney. For a single man in the cabin, including provisions, it is about £50 to the former, and £55 to the latter; and in the steerage about £21 and £23: the difference, in short, is about £5 in the case of a cabin passenger, and from £2 to £3 in that of a steerage passenger—in both, the passage-money for a married couple is somewhat less than double. Each passenger is allowed a certain quantity of luggage freight free, generally about half a ton, although in this particular there is a considerable difference with different ships, some giving more, but a greater number less.

SUITABLE OCCUPATIONS.

We have no doubt that in time Van Diemen's Land will form a beautifully cultured and large food-producing country, perhaps as much so in proportion to its size as England. The present preventives of this desirable result are not natural but artificial. Nature has done much; man has done little. The greater part of the country is suitable for agriculture and cattle and sheep feeding. The nature of the choice between Australia and Van Diemen's Land seems to be this:—By going to Australia (almost any part of it), there is a wide scope for sheep and wool farming to capitalists: but those who engage in it have to proceed hundreds of miles into desolate wildernesses, and in a great measure bid adieu to society. Besides, the want of water is an evil of no mean character. Still, by enduring all this, money may be made. In other words, at great personal misery (to some) a fortune may be realized. In Van Diemen's Land, on the other hand, there is less scope for large sheep-farms than in Australia, and from the badness of the roads and deficiency of labourers, there is even at present little scope for agriculture. But then, Van Diemen's Land is more pleasant; it is more like what people have been accustomed to at home; labourers will by and by find their way to it; roads will surely be made some time or other; and if so, we cannot see why agriculture may not be pursued as advantageously as in Britain. Into all, the climate is unexceptionable, droughts being of comparatively rare occurrence. To persons of moderate views, and possessing a family, Van Diemen's Land is decidedly preferable. It is at all events worth remembering, that emigrants may have an opportunity of landing at and examining this colony on their way to Port Philip or Sydney, and if displeased with the prospect, they can easily find their way to a locality more suitable to their wants.

Supposing that emigrants settle here, the following is a sketch of rural operations and prospects. The greatest difficulty which the new settler will have to encounter in preparing his land, is from the trees with which he will find it encumbered. To free the land from these is an expensive, tedious, and exceedingly laborious process, but as it of course must be done, it had best be set about with cheerfulness, and kept at with unremitting perseverance. The settler must now cast his coat, and set fairly to work with his assistants. A great many settlers have contented themselves with cutting the trees a little way above the ground, leaving the stumps and roots to decay of themselves, without grubbing them out entirely, as they ought to be. This is a saving of labour and expense in the first instance, but it will not be found so in the long-run. These stumps take ten or twelve years to decay; and even in the state of decomposition to which they are then reduced, they still require to be taken up; and not having the tree to act as a lever in tearing them from the earth, they are often found more troublesome to root out than the whole tree itself would have been. While in the ground, too, they interfere sadly with the operations of both plough and harrow, deform the ridges interfere with proper draining, rendering it more expensive by making it more circuitous; and as neat and regular husbandry is always the more profitable, and as a crowd of blackened stumps sticking up in a field must entail the reverse, so must the farmer's profits be propo-

tionally lessened, to say nothing of the ungainly appearance which they must present in a cultivated field. Besides forest land, however, the emigrant may obtain abundance of open pasture-ground, upon which he may either depasture sheep and cattle, or plough it up for the growth of grain.

Oxen are commonly employed in the plough, this animal being thought safer than the horse, where many roots encumber the ground; but it is much slower, and costs more to feed than the horse does. Potatoes are eagerly cultivated in Van Diemen's Land, and it is said that they are equal to those produced in any other country in the world. They are exported in considerable quantities, along with grain, to the Australian colonies, to New Zealand, and also to Rio Janeiro, and are preferred to those grown in the above countries. In spite of the inhabitants being able to export grain, it still maintains a very high price in the island. The Hobart Town prices current states wheat to be from 10s. to 11s. per bushel; oats, 6s.; hay from £5 to £7 per ton; potatoes from £7 to £7, 10s. per ton.

The management of sheep and wool is much the same in Van Diemen's Land as in Australia, and a description of it need not here be repeated. To show the progress which this branch of industry is making in the country, it may be stated, that the amount of wool exported in 1836 was 1,983,786 lbs., and in 1837 this had increased to 2,453,610. From all we can learn, the increase of stock in Van Diemen's Land is much the same as in New South Wales, namely, 80 per cent., and the loss from deaths, &c., about 5 per cent.

Besides the growing of wool, there is another exceedingly promising source of wealth open to the settler—this is the dairy, which seems to be strangely neglected in the colony, although the demand for this species of produce is great, and the prices even extravagantly high; butter readily bringing 2s. 6d. to 3s. per pound, and colonial cheese 1s. to 1s. 3d. per pound. Yet, with all its vast extent of rich pasturage, and its innumerable flocks and herds, Van Diemen's Land imports both of these articles from New South Wales and the Cape of Good Hope. Indeed in the former country, there is more than one person who, wisely devoting themselves to this profitable branch of farm-produce, are rapidly realizing fortunes. Any person, therefore, going out with a thorough knowledge of dairy matters, would assuredly find his account in it. The cattle in Van Diemen's Land are certainly much inferior in general to what they are in this country, and therefore a similar return as to quantity could not be expected, but still that return would be amply sufficient to realize a very handsome yearly profit to the dairyman. The person going out there, or indeed any other who intends grazing cattle, would do well to take with him a quantity of English grass-seeds of various kinds, and particularly Dutch clover, which, when once settled, he should always carry about with him, sprinkling it here and there as he goes over his pasture-lands, as the sameness of the grasses in Van Diemen's Land, notwithstanding their richness, has been found pernicious to the health of the cattle. On reaching his destination, he will learn that a little salt also, placed in situations where it may be at once kept dry and be within the reach of his cattle, will be exceedingly beneficial to them.

The manner of feeding and rearing cattle is in every respect exactly the same in Van Diemen's Land as in England and Scotland, and their farming is also nearly the same, differing only in so far as a greater degree of heat in summer requires that it should. There is an idea gone abroad, that all the good land in the island is already in the possession of settlers; but this report is incorrect: there are many millions of acres of fertile country still to dispose of. Probably by much the greater part of the best situated lands, in so far as a contiguity to market or to points of embarkation is concerned, is already in the possession of private persons; but there is much valuable ground in the interior unoccupied, particularly a fine newly-discovered tract at the back of Mount Wellington, which will alone afford excellent locations to all who may seek them for some years to come.

A recent writer in the Colonial Magazine, Mr. David Burd, a settler in Van Diemen's Land, says, that the spots occupied form a mere belt along the valley of the Derwent, and that there is abundance of land in other parts which has not been even surveyed. "There is much land, too, which has been despised for its sandy surface, but a stiff clay generally lies beneath, and it is well known what trenching such ground effects. There are other spots, covered with large surface stones, almost approaching to rocks, that, from the grievous want of labour, it becomes almost impossible to convert to a fitness for agricultural purposes, although, when so converted, they have yielded a most liberal return." Land is sold in Van Diemen's Land by public auction, in lots of one square mile, or 640 acres, at an upset price of 12s. per acre.

The demand for mechanics is equally great in Van Diemen's Land as in Australia, and the encouragement the same. The description of mechanics most in demand here are coopers, ship and house carpenters, cabinet-makers, joiners, wheelwrights, brickmakers, sawyers, quarriers, stone-cutters, and masons. The wages which these receive vary from 5s. to 8s. per day, according to the ability of the workman. Living is said to be higher here than in New South Wales, but from all the information we have been able to procure, articles do not appear to be dearer in the one place than in the other. Beef sells at from 5d. to 8d. per lb.; mutton, 5½d. to 6d.; veal, 8d.; ham, 10d. to 1s.; bread, 1s. 6d. per 4 lb. loaf; oatmeal, 6d. per lb.

Farm-servants and labourers are also greatly wanted in the colony, and readily obtain employment on good terms. Shepherds and good ploughmen receive from £15 to £25 per annum, with ample provisions, providing they be trustworthy, and well acquainted with their professions. Common labourers generally receive about 1s. per day with provisions.

Both the mechanic and labourer should be informed, also, that the colonists pay as little in money to any of their workmen as they possibly can, always stipulating for a portion of their wages being taken in produce. This does not apply so much to their principal towns, such as Sydney, Hobart Town, Launceston, &c.; but in the country it is the universal practice. Money, in short, is an exceedingly scarce commodity in the colony, and its place is as far as possible supplied with the produce of the soil.

The following announcement, relative to the conveyance of free emigrants from Britain to Van Diemen's Land, has recently been issued by the Colonial Secretary:—"1. That the sum of £40 be paid towards defraying the passage of a man and his wife (and children under three years of age), provided the ages of the married couple do not exceed on embarkation thirty-five years respectively. 2. That the sum of £19 be paid towards defraying the passage of each female emigrant above eighteen years of age, and not exceeding thirty-five years, on arrival. 3. That the sum of £18 be paid towards defraying the passage of each female domestic above the age of seventeen years, and not exceeding thirty-five years, on arrival. 4. That the sum of £7 be paid for the passage of each child from three to ten years of age, and of £12 for lads between the ages of ten and eighteen, and females between ten and seventeen, respectively, for whose parents or parent the rate of fourty specified in No. 1. may be allowed. 5. That there be allowed to the master of each vessel bringing out

grants under the terms of this notice, a gratuity of 7s., to the chief mate 3s., and to the second mate 1s. 6d., for each person above one year of age, provided their conduct to such emigrants during the voyage prove satisfactory to the lieutenant-governor. 6. That parties applying for servants under the terms of this notice be required, before receiving the bounty, to enter into an engagement to maintain them for the term of the agreement hereinafter alluded to, unless parted with by mutual consent, or discharged by due course of law. 7. That persons requiring servants under the bounties thus offered, be allowed to choose their own ships; but it is recommended that regular traders to and from the ports of Hobart Town and Launceston be selected. 8. That no emigrant brought out under the foregoing regulations be engaged for a less period than three years, under a written agreement, according to a form hereafter to be published, and to date from the day that such agreement is entered into in Great Britain or Ireland. 9. That these respective bounties be allowed for emigrants of the following description only:—agricultural labourers, shepherds, masons, bricklayers, blacksmiths, wheelwrights, shipwrights, and all other descriptions of mechanics, and male and female domestic servants."

SEASONS.

The seasons of the year in these colonies being very different from what they are in this country, we beg to offer the following observations on the proper periods and mode of planting in the kitchen garden, abridged from the Appendix to the work of W. C. Wentworth. The observations apply to New South Wales in particular, but may with a reasonable allowance be also useful as regards Van Diemen's Land:—

Potatoes, for a general winter crop in field or garden, should be planted from the end of January to the end of February, or even the beginning of March, rather than lose the planting; and they will come into use in winter, when cabbage and other vegetables run to seed. The ground should, if possible, be prepared a month before the planting, and a preference given by the country gardener to new ground, or dry wheat stubble, where the soil is light. The town gardener should keep his ground in a good state by frequent light manuring. In July the ground should be prepared for the summer crop, at which time the winter crop will be fit for digging; and in this process ca e must be taken to prevent the potatoes being bruised. If possible, they should be dug in cloudy weather, to avoid exposure to the sun, which would rot them; whereas, if carefully preserved, they will keep sound for a length of time—a result the more desirable, as at this season vegetables are generally scarce and dear. The planting should take place in August, or even in September, if necessary; and at the end of the latter month, or in October, they will require to be hilled and earthed, and well cleansed from weeds, which must also now and then be done as weeds make their appearance. In the choice of seed for this crop, a middle-sized potato should be preferred, without any objection to their being cut, as is the customary mode of planting. In October you may also plant potatoes for a later crop; and this, though perhaps less abundant than that sown in August or the beginning of September, will nevertheless be sufficiently productive to pay well the expense and labour of planting. The potato is so essential and desirable an article of food, that too much care cannot be bestowed in its culture and preservation; for should other crops fall short, this will afford the grower a certain means of supporting his family.

Carrots and parsnips, for a general crop, may be be t sown in December and January. The ground should be dug deep, and broken up very fine. If the soil be light, the seed should be sown on a calm day, and trod in. Carrots and parsnips may also be planted in July, and also in November. They thrive best in an open situation, on a light sandy soil; and after they come up should be thinned and set out with a small two-inch garden hoe.

Cabbages, for a constant supply, may be sown in January, April, May, July, August, October, and early in November, at a time when the ground is in a moist state. The plants sown in April will not run to seed. Care should be taken to set out the plants in a richer and stronger ground than the bed they are taken from, otherwise the crop will be poor. Their first bed should now and then be weeded with the hand in dry weather, and the freshest and strongest plants removed first.

The ground for turnips should be prepared in February, and at the latter end of the month some may be planted, for which purpose gentle showery weather is most favourable. Turnips for a general crop should be sown early in March, and they will be ready for food for sheep in the beginning of May. During their growth they require hoeing once or twice, to thin and keep them clean, if the land be foul. Turnips for table use may be sown at any time between March and September, or the beginning of November, when absolutely necessary.

The seed of cauliflower may be sown at any time between November and February, but best in December. Some sow about the middle of May for a summer crop, and this practice is found to answer.

In March prepare the ground for onions, by breaking it up well, and richly manuring it. At the end of the month, and beginning of April, sow a light crop of onions for immediate use. In April prepare for a general crop, which should be sown at the latter end of the month, or beginning of May, to keep them from going to seed. When they grow to a proper size, which will be from the latter end of October to the beginning of November, they should be carefully laid down, so as not to break the tops; for should the tops be broken, and the wet penetrate, the onions will inevitably spoil. When fit to draw, they should be gathered on a fine dry day, and laid under cover, so as not to be at all exposed to the sun.

The ground should be prepared in March for peas and beans of all kinds, by well working and manuring; and at the end of the month, and in April, they may be sown for a spring crop. Some sow from the beginning of March till the middle of June, as occasion may require. Prepare in August for a later crop: French beans may be as well sown in October as at any other time.

In Van Diemen's Land, the farmer sows his grain in July, August, and September, which are the spring months; in October he prepares the land for Swedish turnips; in November he gets in his potato and turnip crops; December is the height of his hay harvest; at about the middle of January his wheat harvest commences, and continues through February; in March he pays attention to his fallowing and husbandry; in April he gathers his second crop of potatoes; in May he lays down his English grasses; and in June he continues his ploughing and harrowing. Thus he has a continual round of pleasurable occupation in his fields.

NEW ZEALAND

New Zealand consists mainly of two large islands, called the Middle Island and the North Island, separated by a passage called Cook's Straits, with numerous smaller isles scattered around their shores. They lie in the great southern ocean in an easterly direction from Australia, and although at a distance of about 1200 miles from that continent, may be considered as belonging to the same division of the globe The New Zea-

and islands lie between the 34th and 48th degrees of south latitude, and the 166th and 179th of east longitude. The southern or Middle Island is about 500 miles long, and from 100 to 120 broad. The northern island is the smaller, being about 400 miles long, and from 5 to 30 broad; both being estimated to contain nearly 95,000 square miles, of which two-thirds are fit for cultivation. New Zealand was first discovered in 1642 by Tasman, who, however, did not land, supposing it to form a part of the southern continent. Captain Cook first sailed round the islands, and surveyed their shores with so much accuracy, that his charts are depended upon even to the present day.

The distance of New Zealand from Great Britain is rather more than to New South Wales, or about 16,000 miles, but is reached by the same line of voyage round the Cape of Good Hope, the return being by Cape Horn. Vessels reach New Zealand from Sydney in ten or twelve days.

New Zealand is evidently of volcanic origin, there being many extinct and a few active volcanoes in the interior of the islands. According to Mr. Darwin, a naturalist who visited the islands in the ship Beagle, "the soil is volcanic; in several parts we passed over slaggy and vesicular lavas, and the form of a crater could clearly be distinguished in several of the neighbouring hills." Hot springs have also been found, some of which are described as higher than boiling heat, and some of them "of a sufficient temperature to cook any kind of native food. There is one spring of a very remarkable quality; it is to the touch as soft as oil, and, without the use of soap or any alkali except what the water itself contains, will cleanse the dirtiest garments, removing every particle of grease, however sullied they may be with it." A chain of mountains runs through the whole of the southern and a considerable part of the northern island. Some of these mountains are as high as 14,000 feet above the level of the sea, their tops being covered with perpetual snow, and their sides with forest-trees and luxuriant ferns. Besides this chain of mountains, there are other subordinate ranges, which, for the most part, are covered with vegetation to the top. From their volcanic origin, these mountains are studded with large caves; the diameter of whose openings was ascertained in some cases to be above thirty feet. The mountains are all abrupt, and highly picturesque in appearance, the perpetual snow on the tops forming a fine contrast to the agreeable climate and rich vegetation of the valleys below.

There are numbers of fine streams and rivers scattered throughout the country, which have their origin in these mountains. Several of the rivers are navigable to a considerable extent, and possess waterfalls which afford the means of establishing mills in most parts of the country. From the shape of the islands, and the mountains which intersect them, the rivers do not run to any great length, from 100 to 200 miles being the average. In 1838, the ship Pelorus entered a river in the southern island falling into Cook's Straits, and sailed up nearly forty miles, and her boats continued the navigation for twenty miles farther. The river Hokianga, in the northern island, situated almost opposite the Bay of Islands, has been navigated thirty miles by vessels of 500 tons burden. Another river, the Haritoua, which falls into Port Nicholson, is said to be navigable for nearly 100 miles. Besides these, there are numerous streams which cross and intersect the country in all directions, affording abundant means for irrigation where this is necessary.

The bays and harbours of New Zealand are not surpassed either in number or advantages by those of any country in the world. Beginning with the North Island, we have first the harbour of Wangaroa, the entrance to which is narrow, but inside the harbour is spacious and well sheltered. The Bay of Islands is about twenty-five miles south of Wangaroa, and is the harbour which has been hitherto most frequented by Europeans. The entrance to the bay is eleven miles broad, and perfectly safe, there being no bar. Inside, the bay is studded with a number of rocky islands; the water is deep close to the shore, and the anchorage is excellent. This bay has been long visited by whaling vessels for supplies, and a considerable part of the surrounding country is in the possession of Europeans. To the south of the Bay of Islands is the Frith of the Thames, which contains several well-protected harbours. The tide flows in this frith to the height of from eight to ten feet, and at all times there is plenty of water for ships of almost any tonnage. The Bay of Plenty, on the north-east coast, is formed by the island becoming much broader in a curved direction. This bay is very large, and possesses an excellent harbour called Tauranga, which is much frequented for the shipment of flax, &c. Poverty Bay is the place where Captain Cook landed, and, according to him, it affords good anchorage. Hawke's Bay is very extensive and deep, the soundings showing from six to twenty-seven fathoms water. The most important harbour in the northern island is Port Nicholson, situated in Cook's Straits. This is the port fixed upon by government as the future capital of the country, and numerous settlements are now being formed on its shores. The bay is about twelve miles long and three broad, perfectly sheltered, and ships may enter or leave with any wind. The depth of water is from seven to eleven fathoms, and the whole bay is described as of sufficient capacity to hold a navy. The river Haritoua falls into this port, the banks of which are high and well wooded. Port Nicholson has the disadvantage of being upon a lee shore, but this objection can only have weight with regard to the navigation of Cook's Straits, not to vessels lying in the port itself. On the west coast of the North Island the harbours have generally a bar at the entrance, which render their navigation more dangerous than those on the east coast. The best harbour on the west coast is that of Hokianga, which is said to run nearly thirty miles inland. It receives the river of the same name, and a number of smaller streams; and from all accounts it seems to be a valuable district for settlement. There is a bar at the entrance, with three fathoms water at low ebb; but the tide rises twelve feet, and inside the harbour deepens to seventeen fathoms. To the south of Hokianga occure the harbour of Kaipara, which is thirty miles long, and receives the waters of three considerable streams. The entrance is obstructed by two sand-banks, but between these the passage is deep, and inside the harbour is safe and commodious.

In the southern island, within Cook's Straits, is the fine harbour of Queen Charlotte's Sound, which is nearly thirty miles long. Ship Cove, within this sound, is a very fine harbour, to which European vessels have long repaired, in consequence of its having been described by Captain Cook. The harbour is perfectly sheltered, and the soundings show ten fathoms a cable's length from the shore. At the north-western extremity of this island is Cloudy Bay, which runs fifteen miles inland, and is about four miles broad. This bay is thought the best station for the black whale fishery, and, in consequence, several Europeans have already settled on its shores. Besides these two harbours, there are many others in the island, such as Lookers-on Bay, visited by Captain Cook, Port Gore, Blind Bay, Admiralty Bay, and others which have not yet been properly surveyed.

CLIMATE.

From the position of New Zealand being north and south, it presents great variety of climate considering the size of the country. All accounts agree, however, in describing it as highly salubrious, and very congenial

to European constitutions. Spring commences in the middle of August; summer in December; autumn in March; and winter in July. During winter the temperature ranges from 40° to 50° in some parts, and in others the average is higher. According to Captain Cook, while lying in Queen Charlotte's Sound, the thermometer never sunk below 48° in June, which corresponds to our December. "The trees at that time retained their verdure as if in the summer season; so that I believe their foliage is never shed till pushed by the succeeding leaves in spring." In summer the thermometer ranges from 64° to 80°, which is the highest number given. In Queen Charlotte's Sound, Captain Cook says it did not rise higher than 66°, and in the Bay of Islands, in the northern island, a thermometer kept by one of the missionaries "never rose higher than 73° or 74°, nor went below 64°." Mr. Yate, in his Account of New Zealand, speaking of the climate, says—"Those who come here sickly are soon restored to health; the healthy become robust, and the robust fat. North of the Thames snows are unknown; and frosts are off the ground by nine o'clock in the morning. The country, during six months in the year, is subject to heavy gales from the east and north-east, which generally last for three days, and are accompanied with tremendous falls of rain. These gales usually commence in the east, and gradually haul round to the north-west, where they terminate in a violent gust almost approaching to a hurricane; the clouds then pass away, and the westerly wind blows again with some violence. In the winter season the moon rarely either changes or wanes without raising one of these tempestuous gales; and during the whole year the wind is sure to blow, though it may be only for a few hours, from the east, every full and change of the moon.

"The spring and autumn are delightfully temperate, but subject to showers from the west-south-west. Indeed, however fine the summer may be, we are frequently visited by refreshing rains, which give a peculiar richness to the vegetation and fertility of the land. The prevailing winds are from the south-west and north-west, which, within this range, blow upwards of nine months in the year; more frequently the wind is due west. During five months sea-breezes set in from either coast, and meet each other half-way across the island."

Colonel Wakefield compares the climate to that of the north of Portugal; and another writer, Mr. Ward, to "that of the land lying between the south of Portugal and the north of France—pervading but without exceeding the most favoured part of the temperate region; and numerous witnesses, of ample experience, concur in describing the extremes of cold in winter, and heat in summer, as being within peculiarly narrow limits; which is to describe the climate as one of the most equable in the world." Mr. Watkins, in his examination before the Committee of the House of Lords, on being asked if the vicissitudes appeared great as compared with European climates, said—"Not any thing like our climate. The frost was there at one time a very gentle frost indeed—the ice was not entirely over a small pool of water: they told me that they saw ice sometimes in the bay the thickness of a shilling, but I did not see any near that thickness. I have slept out frequently in the bush. The fern grows in great abundance. I found myself very comfortable and warm in my great-coat and a bed of fern, rather than sleeping in the houses which are very unlike English people."

The climate of New Zealand has one great advantage over that of Australia, in not being subject to the severe droughts which so often destroy the hopes of the farmer in that country. Its insular position, and the lofty mountains which intersect the country, ensure it a constant supply of rain. This circumstance gives it a decided superiority over Australia in an agricultural point of view, rendering it more suitable for the growth of grain though we are not aware of its being greatly superior to Van Diemen's Land.

It does not appear that there are any diseases peculiar to the climate of New Zealand; all accounts agree in describing the inhabitants as a robust and healthy-looking people. Captain Cook says he never saw a single person among them who appeared to have any bodily complaint; and their wounds healed with astonishing rapidity. "A further proof that human nature is here untainted with disease, is the great number of old men we saw; many of whom, by the loss of their hair and teeth, appeared to be very ancient, yet none of them were decrepid, and though not equal to the young in muscular strength, were not a whit behind them in cheerfulness and vivacity." From their intercourse with Europeans, however, many diseases have spread among the native inhabitants; the consequence of which is, that in some parts their numbers appear to be on the decline.

SOIL AND PRODUCTIONS.—NATIVES.

The soil of New Zealand appears in almost every part to be excellent, well adapted for cultivating all sorts of grain, and indeed most European vegetables. Around the mountains the soil is volcanic, composed of pumice-stone, somewhat resembling that of some parts of Italy. In other parts it appears to be a fine stiff loam and vegetable mould, very productive. Captain Cook, describing the valleys, says—"The soil in these valleys and in the plains, of which there are many that are not overgrown with wood, is in general light but fertile; and in the opinion of Mr. Banks and Dr. Solander, as well as of every other gentleman on board, every kind of European grain, plant, and fruit, would flourish here in the utmost luxuriance. From the vegetables that we found here, there is reason to conclude that the winters are milder than those in England; and we found the summer not hotter, though it was more equally warm; so that if this country should be settled by people from Europe, they would, with a little industry, be very soon supplied, not only with the necessaries but the luxuries of life in great abundance."

The natives cultivate the potato in considerable quantities, which yields them a good crop without much trouble. There is also plenty of fine open land, consisting of alluvial soil deposited from the mountains, which would yield abundant crops of wheat, maize, barley, and other grains. In other parts, the soil consists of a deep, stiff, vegetable mould on a marly subsoil, capable of being slaked with the ashes of the fern. Mr. Yate says—"All the English grasses flourish well, but the white clover never seeds; and where the fern has been destroyed, a strong native grass, something of the nature of the Canary grass, grows in its place, and effectually prevents the fern from springing up again. Every diversity of European fruit and vegetable flourishes in New Zealand." The farms of the missionaries are perhaps the best criterion by which to judge of the capabilities of the soil of New Zealand; and from the accounts of all travellers, these appear to be particularly good. Captain Fitzroy, in his evidence before the House of Lords, says—"They are very fertile indeed. The wheat I saw there grown on the islands was as fine-looking wheat as I ever saw; and the missionaries told me it was considered better than the wheat grown in Australia, near Sydney."

The potato seems to be the only vegetable which the natives bestow much care upon in the cultivation. Of this root they have four kinds—the common potato, the white man's potato, an indigenous species, and the sweet potato. The root of the fern-tree, which is said to be almost equal to flour, furnishes them with the

principal part of their food, and this plant grows in great abundance all over the islands.

The forest-trees grow to a very great size, many of them being larger than those of America or any country in the world—a sure proof of the fertility of the soil. The largest tree is that called the *kauri*, or *cowdie*, belonging to the pine tribe. It grows in some cases to the height of eighty or ninety feet without branching, and the branches themselves may be compared to ordinary trees. The trunk is of immense girth, and the wood tough and light, being admirably adapted for ship-building or almost any other purpose. "It will scarcely be believed," says Mr. Yate, "that I have measured a kauri-tree whose circumference was forty feet eleven inches, perfectly sound throughout, the gum oozing out of it, when the bark was wounded, as though it were a plant of only a few years' growth." This gum is chewed by the natives on account of its fragrance, and a peculiar taste which it leaves on the tongue. The wood of this tree is very valuable, from its beautiful grain, smoothness durability, and the ease with which it can be wrought. "I have measured some of these trees," says Mr. M'Donnell, "upwards of thirty feet in circumference; recollect I go out of my way to do this—here are numerous single sticks, as straight as an arrow, and fit for masting any three-decker in the navy." The roots of the kauri do not sink deep into the ground, rather spreading along the surface, which is an advantage for those engaged in uprooting them from the soil. This tree is now regularly imported into this country for masting ships of war, it having been found from experiment to be stronger and more flexible than the wood of the Norway pine.

Another tree called the *totara* reaches a height of from fifty to sixty feet, and a circumference of twenty feet. Its wood is very hard, of a red colour, works easily, and from its size and strength may be applied to many useful purposes. This tree is said to resemble the yew in appearance, the foliage growing in a tuft at the top.

The *puriri* or New Zealand oak is a tree of great hardness and durability, the wood being of a dark-brown colour, and capable of taking on a beautiful polish. It has been known to remain twenty years under ground, in a wet soil, without rotting. It is, however, perforated with the holes of a worm peculiar to the tree, which prevents its being used for many purposes for which it would be otherwise very suitable.

The *farairi*, a tree of the laurel tribe, reaches the great height of from fifty to seventy feet, while its diameter is not more than three feet. It has a very beautiful appearance, and is one of the chief ornaments of the woods, but does not appear to be applied to any useful purpose. Besides these, there are many other trees in New Zealand, especially the pines, which are said to afford very superior timber for ship and house building, and also furniture-making.

The flax is another important vegetable production of New Zealand, and which is likely to form an article of considerable export. It is said to resemble the garden iris in appearance, having a green thick leaf from six to ten feet long, and growing in the greatest luxuriance throughout the country. The fibres of the leaf of this plant are used for making ropes, and many competent judges state that it is better adapted for this purpose than the European flax. From having been improperly prepared at first, a prejudice exists against the New Zealand flax. Mr. M'Donnell says regarding it—"All the standing and part of the running rigging of the Sir George Murray, a ship of 485 tons, belonging to myself, was laid up from New Zealand flax: it had been over the mast-heads for nearly three years. I can state that better rope never crossed a ship's mast-head. I have experienced some very heavy gales in the Sir George Murray, consequently the rigging had been well tried, when lifted and examined it was found (except where slightly chafed) as good as when first put over; the running rigging wore uncommonly well. Her spars, one and all, were of New Zealand pine—they were faultless. Cordage and fishing lines made from good New Zealand flax, have been proved to be far more durable than any made from European hemp."

The vegetables of Europe have been found to flourish in New Zealand; seeds which were sown by Captain Cook are said to have propagated themselves over a considerable part of the country. "Large quantities of Indian corn are now raised," says Mr. Ward, "and there is no lack of cabbages, greens, turnips, a particularly fine species of the yam, with other esculent roots. Peaches are plentiful in the season at Hokianga; figs, grapes, oranges, melons, and the Cape gooseberry, thrive uncommonly well. There are several species of the native fruits very pleasant and grateful to the taste. Strawberries and raspberries grow in abundance." A species of spinach is indigenous to the country, also a spruce-tree from which Captain Cook made beer; and a tea-tree which is said to be a good substitute for that of China.

Mr. Ward sums up his account of the vegetable productions of the country in the following words:—"New Zealand is fitted by nature for the production in abundance of those three articles which have always been regarded as the especial signs of the plenty, wealth, and luxury of a country—corn, wine, and oil. Its fertile plains adapt it to the easy cultivation of grain, for the surplus production of which it will possess a ready market, from its vicinity to New South Wales and Van Diemen's Land, where, from the high profits of wool-growing, grain from foreign countries will always find a ready demand. And the New Zealand harvests may be safely anticipated to be free from the influence of those destructive droughts which must ever be ruinous to the prospects of agriculture in Australia. The vine has been already found to thrive luxuriantly in the islands, and the possibility of its successful cultivation, both for home consumption and commerce, admits of no doubt. We have previously cited the proof of a strong resemblance to the volcanic soil of Italy in the northern island; and there is good reason to believe that the wines not only of Italy, but of Spain, Portugal, and the south of France, might be brought to as great perfection as in those countries."

The very circumstance of New Zealand being suited for the cultivation of grain, renders it unfit for ever becoming an extensive grazing country, at least for the growth of the fine wools of Australia. The following remarks from the Sydney Herald newspaper, were written by a person who had visited New Zealand on seven different occasions:—"New Zealand is fitted by nature to become the garden of New South Wales: the fertility of the soil, the excellence of the climate, and, above all, the regularity of the seasons, eminently combine to fit it for an agricultural country. But it is only as an agricultural settlement that New Zealand can flourish; as a pastoral country it can never compete with New South Wales. The experiment has again and again been tried, and the result has invariably been the same. The climate is too moist for sheep pastures: and the fine wool for which New South Wales is so remarkable speedily deteriorates in quality on the transportation of the sheep to New Zealand. The new colony consequently, can never come into any hurtful competition with New South Wales; on the contrary, the settlement of the former must be highly conducive to the advancement of the latter."

Mr. Ward gives the following suggestions for the conveyance of seeds and plants to these colonies, which may not be out of place here:—"The chief articles of food

duce to be first thought of are such as—1st, call for little labour; 2d, are not bulky for exportation; 3d, suitable for consumption in the colony; 4th, affording a quick return. Fruit-trees have the first requisite. If an emigrant takes out a few bushels of almonds (which we now import from Sicily) they will soon be bearing trees, and either the fruit or the oil is a good article of export. From a hundredweight of raisins of the sun (from the seeds of which a good vine has been known to be raised) he might sow several acres; it would be needful only to plant out the seedlings at the end of the year, and then let them stay till they had borne fruit enough to judge of; perhaps one in a hundred will be worth keeping, and the rest being rooted up, their places might be supplied with cuttings from the good sorts, and in a few years there would be a flourishing vineyard. Or from any of the wine countries, the marc might be procured in a dry state (it is for fuel they keep it), which contains all the grape stones. Of walnuts, the same may be said as of almonds. The kumera or sweet potato, which is well known in New Zealand, has been found in America to make beer exactly like malt: five bushels being equivalent to three. The olive, when once established, may be propagated quickly by cuttings, as also the fig. Plants to be transported by sea should be covered over with a glass hermetically sealed, and never uncovered till they arrive."

Little is known of the mineral productions of New Zealand, no geological survey of the islands having ever been made. Iron and coal are found in abundance, along with bitumen, freestone, marble, and sulphur. A blue pigment made use of by the natives is said to be manganese, and there is a valuable green stone found exclusively in the southern island. There is also abundance of clay fit for brick-making.

There are no native quadrupeds in New Zealand, those at present existing having been left by Captain Cook and other Europeans during their visits to the islands. Pigs are numerous, having spread very rapidly throughout the country. They are said to grow to an enormous size, and are highly valued by the natives. Dogs abound, especially about the Bay of Islands; and cats are also plentiful, and are eaten by the natives. The cattle which have been introduced by the missionaries are said to thrive well. Sheep have also been tried, and in some open parts succeeded; but New Zealand, as already stated, is more of an agricultural than a pastoral country. The only reptile yet seen in the islands is a small species of lizard.

Birds are very numerous, and are described by all travellers as beautiful songsters. Captain Cook says of them—"The ship lay at the distance of somewhat less than a quarter of a mile from the shore in Queen Charlotte's Sound, and in the morning we were awakened by the singing of the birds; the number was incredible, and they seemed to strain their throats in emulation of each other. This wild melody was infinitely superior to any that we had ever heard of the same kind; it seemed to be like small bells most exquisitely tuned; and perhaps the distance and the water between might be no small advantage to the sound. Upon inquiry we found that the birds here always began to sing about two hours after midnight, and continuing their music till sunrise, were, like our nightingales, silent the rest of the day."

Amongst the feathered tribe may be mentioned ducks, geese, woodcocks, snipes, curlews, and wood-pigeons, as affording food to man. These are very numerous, and the wood-pigeons especially are highly valued for the delicacy of their flesh. They are much larger than the pigeons of this country, and are extremely beautiful in plumage—green, purple, and gold, being the prevailing colours. Some of the birds are very remarkable. One, called by the natives the *tui*, has the power of imitating the notes of all the other birds with great exactness, and may be taught to repeat sentences or imitate the sounds of quadrupeds. Another, called the *kiwi*, is about the size of a young turkey, and its plumage resembles that of the Australian emu, being long, straight, and coarse. It has neither wings nor tail, but runs with great swiftness along the ground, and can only be caught by dogs. The natives prize it highly, and make garments of its skin.

Fish are very abundant all round the coast, and are of most excellent quality. "We have," says Mr. Yate, "a rich supply of salt-water fish; but nothing more than eels in any of the fresh-water streams or lakes in New Zealand. Those most plentiful and of greatest note are soles, mackerel, codfish, a species of salmon, whiting, snapper, mullet, beam-skate, gurnards, and a few smaller kinds, some not so large as a sprat; with an abundance of cray-fish, oysters, shrimps, prawns, mussels, and cockles. An immensely large mussel, measuring from eleven to thirteen inches, is found in great abundance at Kaipara, a harbour on the western coast, and some few of this fish are picked up in the Bay of Islands. These inhabitants of the deep form a never-failing resource for the supply of native food; but fishing is not now much regarded, except in the mackerel season, when several tribes go together to the little creeks which these fish frequent, and always succeed in capturing some hundreds of thousands before they return, the greater part of which they preserve for winter stock. They always catch these fish in the darkest nights, when they are able to see the direction the shoal takes from the phosphorescent appearance which their motion causes upon the water. They surround them with their nets, which are several hundred yards long, and drag them in vast numbers to the shore, where the contents are regularly divided among the people to whom the net belonged."

Whales frequent the coasts of New Zealand for the purpose of calving, and are caught in large numbers. This trade alone is very considerable, and would no doubt be greatly extended were settlements more numerous in the country.

The aboriginal natives of New Zealand were formerly savage and dangerous, but are now partially improved, and harmless in disposition. From all accounts, they are susceptible of much greater improvement than the natives of Australia, being ready in apprehension and tractable. They generally dwell in small villages. In their intercourse with Europeans, the New Zealanders have on all occasions manifested a desire to learn, and great aptitude in acquiring civilized customs. They are very curious to know the use of every thing they see, not being content with a mere childish admiration of it. They make excellent steersmen in ships, and one, in particular, rose to be mate of a colonial vessel. Although occasional instances of theft have been known amongst these people, yet upon the whole, their moral faculties seem to be of a high order.

The missionaries have acquired considerable influence over the natives, and have in all cases exercised it for their benefit. At their suggestion, roads have been formed, bridges erected, and ships of several hundred tons' burden built. Mr. Darwin, the naturalist to the surveying expedition of the Beagle, gives a delightful picture of a farm establishment which he visited. Fields of corn, potatoes, and clover, were seen growing, and large gardens with every fruit and vegetable which England produces. The water of a small rill on the grounds had been collected into a pool, and a flour-mill erected. "The house has been built, the windows framed, the fields ploughed, and even the trees grafted, by the New Zealander. At the mill a New Zealander may be seen powdered white with flour, like his brother miller in England."

Regarding the amount of the native population of

New Zealand, it can only be guessed at. It appears to be very small considering the extent of country—not more than five natives to three square miles. The Rev. Mr. Williams, of the Church Missionary Society, estimated the population of the northern island at 106,000. According to Mr. Polack, who allows five persons to three square miles, and taking the whole extent of both islands at 95,000 square miles, the entire population of New Zealand will be about 158,300.

HISTORY OF THE COLONIZATION OF NEW ZEALAND.

The first attempt to colonize New Zealand was made in 1825, by a company under the auspices of the Earl of Durham. Two vessels were despatched to the country by this company, and some land was acquired at Herd's Point on the Hokianga river, but the idea of settling it was soon after abandoned. The missionaries have acquired considerable tracts of land in different parts of the islands, and have introduced many farming improvements, along with the religious instruction which they have bestowed upon the natives. The Church Missionary Society has ten stations in the northern island, with fifty-four schools, and scholars amounting to 1431. There are also five Wesleyan Missionary stations, where teachers are engaged instructing the people and superintending farming operations. A company, called the New Zealand Association, was started in 1837; and another, under the name of the New Zealand Colonization Company, in 1838. These companies may be said to have merged in a New Zealand Company which was established in May, 1839, and is now engaged in carrying out plans for the settlement of the country.

When this company started into existence, the minds of many individuals of all orders were ripe for affording it encouragement; and to this circumstance, in some measure, we may attribute the remarkable success it met with. From the Colonization Company, merged in it, it inherited an extensive territory adjoining the Kaipara and Hokianga harbours in the northern island; which territory had been recently purchased by the Colonization Company, but not surveyed. While as yet the new company had formed no other connection whatever with New Zealand, but entirely upon the faith of being able to purchase land and effect settlements, it issued proposals to sell, to intending colonists, what it might be said as yet not to possess, namely, 990 sections of land in what was to be the principal settlement of the company, wherever that might be pitched, each section to consist of 100 acres of country land, and one acre of town land; 110 similar sections being reserved for the use of native settlers. Thus, the first principal settlement was to consist of 1100 sections in all, or 111,100 acres. Let the reader mark, these sections had as yet no geographical situation; the whole settlement was as yet, we might say, in the clouds. Nevertheless, within seven weeks from the issue of the proposals, purchasers had come forward for all the disposable sections, and the company had in its treasury, as the purchase-money, £99,990. Of this sum, however, they professed to have a right to only a fourth part. The remainder, £74,992, 10s., was reserved to be employed in carrying out labourers to the settlement, according to what we may call the *Wakefield plan of colonization*, already followed in South Australia. It is important to add, that priority in the choice of sections was determined by lot.

This company had to contend at its outset with one great difficulty. The British government refused to afford its plan of settlement any countenance, so that no provision for maintaining order in the new colony could be had, besides what was afforded by a gentleman who possessed an old commission as a justice of peace in New Zealand, derived from General Macquarrie, governor of New South Wales. The company, nevertheless, proceeded with their scheme, and the government soon after found it advisable to send out a lieutenant-governor of New Zealand.

The whole procedure of the company, and of those dealing with it, forms a singular and striking example of that confidence between parties which is only to be exp[illegible]ed in even its simplest forms amidst a community considerably advanced in civilization. Not only was the ground of the first settlement *paid for* before it had a cognisable existence, but, before its existence was yet known in Britain, *nine ships, containing* 1125 *emigrants*, had been despatched to it. There was first the Tory, of 382 tons, which sailed on the 5th of May, 1839, with only six emigrants, but containing Colonel Wakefield, the company's principal agent for the arrangement of settlements, and a great store of articles designed to be employed in bartering for land with the native chiefs. Colonel Wakefield, it may be remarked, had distinguished himself in the Spanish service, and is brother of the author of the well-known plan of colonization followed on this occasion. On August 1st, followed the Cuba of 373 tons, with eight first-class emigrants and twenty-two labourers, and containing also the surveying staff, under Captain W. M. Smith of the royal artillery. In the middle of September, the Oriental, Aurora, and Adelaide, respectively of 506, 550, and 640 tons, proceeded on the same voyage, with a large body of emigrants of both classes. All of these were from London. On October 5th, the Duke of Roxburghe sailed from Plymouth with 167 settlers. Three other vessels, one of which was from Glasgow, and two from London, sailed before the end of the year. Besides these, there were three ships containing stores, designed to guard against the possibility of any deficiency of necessaries being felt during the early days of the settlement.

The voyage of the Tory was prosperous, and uncommonly quick. In ninety-six days from Plymouth, namely, on the 16th of August, she hove in sight of Cape Farewell, the northern point of the southern island, and which forms one side of the opening, named Cook's Straits, between the two islands. She lost no time in standing through the straits, and on the 18th she anchored in Ship Cove, as nearly as possible in the same spot that Captain Cook occupied in his three visits to the island. Colonel Wakefield, in his journal, describes the southern island as forbidding in its appearance at a distance—"a succession of apparently barren mountains stretching away from the coast till they reach those covered with snow in the interior." But, "on nearing the land, you find that the whole is covered to the very highest points with timber and brushwood, which not till then betray their perpetual verdure." Ship Cove, in the northern island, was a beautiful place. "The water, tranquil as an inland lake, has ten fathoms' depth within a ship's length of the shore, which is covered to the water's edge with an evergreen forest, consisting of every variety of indigenous tree and shrub, so thick as to be scarcely penetrable, and presenting to the eye an undulating carpet of verdure reaching to the summit of the surrounding mountains, the highest of which is from 1200 to 1500 feet. The birds, as in the time of the immortal English navigator, fill the air with their notes, the mingling of which he has aptly likened to the tinkling of small bells; and the sea teems with fish, of which we caught enough with hooks and lines for the whole ship before we dropped anchor. These consisted of hauk, cole-fish, spotted dog-fish, gurnet, flounder, and joe-fish, all of which are eatable."

Colonel Wakefield found no difficulty in communicating with the native chiefs; but it was not so easy to acquire lands, not owing to any disinclination of the natives to sell them at a moderate price, but because it was difficult to ascertain who were the proper owners, or the owners who could convey a sound title. The general feeling of the natives is in favour of British sub-

Jements. They have tasted the benefits of civilization sufficiently, to be very anxious for increased intercourse with the English, and for this reason they appeared to Colonel Wakefield as if they would have willingly allowed the soil to be appropriated to a large extent, without looking for any remuneration. But the company was anxious that a reasonable, and, considering the circumstances, a liberal price, should be given for lands; and the main difficulty, as just stated, was to discover the parties who were entitled to part with the soil. An immense quantity of land had already been appropriated by private persons or by the missionary societies, without much ceremony.

Colonel Wakefield sent home a journal brought down to the 2d of September, and not long after he despatched another section of it, containing not less interesting intelligence. The second section of his journal commences on the 6th of September with a description of the trade carried on in Queen Charlotte's Sound and other bays connected with Cook's Straits. He describes whalers in the pay of Sydney capitalists as being the chief followers of this hazardous but profitable commerce. It is estimated that the whale-fishery produces 1200 tons of oil per annum, and that the number of British who compose "shore-parties" in Cook's Straits and the stations on Banks's Peninsula, are about 500. They are a lawless set of people, quarrelling with the natives and among themselves. There are, however, some respectable persons among them.

Learning that the church missionaries were endeavouring to frustrate their views respecting Port Nicholson, a fine harbour and country in the northern island, about the centre of Cook's Straits, Colonel Wakefield now made haste thither. He met with a very hearty reception from the chiefs. "Epuri, an old chief, eagerly inquired the motives of our visit, and betrayed the most lively satisfaction at being informed that we wished to buy the place, and bring white men to it. He was followed by Wareporl, his nephew, who is about thirty-five years old, and has for some years superseded the older chiefs in influence, by his prowess in war, and skill in the rude arts cultivated by these people." Colonel Wakefield ascended the principal river which falls into the bay, and was well satisfied with the capabilities of the district. The soil is a rich black loam; the timber excellent in quality and of various descriptions; and the navigation of the river, which was obstructed by heaps of stones and trees thrown across, susceptible of great improvement at slight expense.

Colonel Wakefield determined to fix upon this part of the island for the first and principal settlement of the company; and he lost no time in coming to terms with the natives. He thus describes his purchase:—

"I found a territory of forty or fifty miles in length by twenty-five or thirty in breadth, containing a noble harbour, accessible at all times, and in the very highway between New Holland and the Western world, and land exceeding in fertility any I have seen in these islands, and equalling that of an English garden. I found a race of people of warlike habits, and but little used to intercourse with Europeans, just emerging from their barbarism, and inclined to cultivate the arts and intimacy with Great Britain; appreciating the protection from their hostile and still savage enemies that British settlers would afford, and anxiously desiring to assist them in their first efforts in a new country. Under these circumstances, without swerving out the spirit of my instructions, I determined to act in the most liberal manner in the transaction. Moreover, I was most anxious to distinguish this bargain from all others that have been made in New Zealand, and to put none of the haggling and petty trading which usually takes place between Europeans and the natives of this country, should enter into any operations between the natives and the company's agents; and that the value of this property should not be regulated by what has hitherto been considered the standard of exchange in similar transactions."

The amount paid, of course, is not published; but the natives were highly pleased with their bargain, and eager to sell more of their land. The chiefs carefully examined the articles given in barter, and then signed a formal deed, alienating the land for ever. The war-dance, the hoisting of the New Zealand flag, and the formal ceremony of taking possession of the territory, are vividly described. Colonel Wakefield left a person in charge of his newly-acquired territory.

This important business being settled, the Tory proceeded along the coast of the northern island towards the north, and on the 16th October came to an anchor off Kapiti, near Evans's Island. A smart battle had just then taken place between the two chief tribes in those parts, the Ngatirocowas, and Ngatiawas, the latter of whom, a comparatively civilized and pacific race, had acted on the defensive, and been victorious. Colonel Wakefield had some intercourse with Raupero, a corrupt chief of the Kafia tribe, who had aided and instigated the Ngatirocowas, and with Hiho, an amiable young chief of the Ngatiawas; and after some deliberations, and one somewhat wild scene, purchased the extensive tracts of land on both sides of Cook's Straits, forming "the commanding portions of the two islands." The goods given in exchange were upon the same liberal scale as in the case of Port Nicholson, and ultimately all the natives expressed themselves as quite satisfied. With regard to some portions of the ground purchased, it was known that there were other tribes, now dispossessed, who had claims upon them; but from these parties Colonel Wakefield apprehended no trouble of any consequence. In all cases he took care to have deeds of cession formally executed on the spot—a precaution the more necessary, as already speculators were sending emissaries from Sydney to buy up land in New Zealand, on a supposition of its soon acquiring a marketable value. For the next two or three weeks, Colonel Wakefield employed himself in sailing to different points in Cook's Straits, in order to buy up the claims of as many parties as possible. In concluding his survey of both sides of these straits, he gives a table of the native population of the principal districts, which he estimates as amounting in all to 6650.

Colonel Wakefield now proceeded to Hokianga, a deep inlet near the farther extremity of the northern island, leaving Mr. Barrett, a whaling merchant, to arrange with the natives for the purchase of the lands more immediately to the north of Cook's Straits. He reached Hokianga on the 2d December, and entered into negotiations for the purchase of lands there and in the Bay of Islands, on the opposite or east side of the country. The natives are not here so fine a people, physically or morally, as in the south, and not so ready to sell their lands. Colonel Wakefield obtained possession of a tract at Herd's Point, being the land purchased by Captain Herd, in 1826, for the old company —reserved by the natives since that time—and now scrupulously made over to their successors. This done, he left Hokianga on the 13th December for Kaipara, another important inlet, a little farther to the south. At this point, he completed his third despatch.

According to subsequent despatches, the Tory struck upon a (supposed) newly-formed sand-bank in going into Kaipara bay or harbour, and, though got off in twenty-four hours, sustained such damage that Colonel Wakefield judged it prudent to leave her for repairs, and proceed with his land-buying operations. Having therefore secured all important papers, he walked across the continent to the Bay of Islands, and there chartered a small brig to go to Kaipara, to take charge of the cargo and passengers. He likewise engaged another small

vessel to take him to Port Hardy in D'Urville's Island (Cook's Straits), the place of rendezvous for the emigrant ships. He reached Port Hardy on the 11th January; but finding none of the emigrant vessels arrived, he judged it best to cross the straits to Port Nicholson, which he did in a whale boat, leaving an Englishman to direct these vessels to follow him thither. Port Nicholson was the place of all others which he thought suitable for the first settlement, and he was now anxious to prepare matters as far as possible for the arrival of the settlers. These now began to arrive in the successive vessels, of which all that had been despatched in 1839 arrived before March 7, 1840.

Meanwhile the government had deemed it necessary to take some step regarding the colonization of New Zealand. In August, 1839, it despatched Captain Hobson, R. N., as Lieutenant-Governor of New Zealand. He arrived at the Bay of Islands on the 30th of January, and on that day issued a proclamation, intimating that the queen did not deem it expedient for the interests either of her British subjects resorting to New Zealand, or for those of the native tribes, to recognise as valid any titles to land not derived from or confirmed by her majesty; but yet, "to dispel any apprehension that it was designed to dispossess the owners of land acquired on equitable conditions, and not in extent or otherwise prejudicial to the present or prospective interests of the community," declaring "that her majesty had been pleased to direct that a commission should be appointed, with certain powers to be derived from a governor and Legislative Council of New South Wales, to inquire into and to report on all claims to such lands;" and further intimating that "purchases of land in any part of New Zealand which may be made from any of the chiefs or native tribes after the date of these presents [January 30, 1840], will be considered as null and void, and will not be confirmed, or in any way recognised, by her majesty."

In terms of this proclamation, it will be necessary for all who have purchased land in New Zealand to prove their rights before the commission. Captain Hobson left the Bay of Islands on the 17th February, declaring it an unfit place to be the seat of government for New Zealand, being distant from the more fertile parts of the country, and cut off from all easy communication with the southward. He had previously had some conferences with the native chiefs relative to the acquisitions of land by the missionaries. A paralytic shock brought his measures to an abrupt conclusion, which, however, was only temporary, as he soon so far recovered as to resume his functions.

Other companies besides that represented by Colonel Wakefield have in the mean time been taking steps for promoting the colonization of New Zealand. One of these, the *Plymouth Company of New Zealand*, advertised on the 18th July that it had secured an extensive purchase of land, and had sent out orders for the selection of a settlement. A thousand sections of town and rural land were in the way of being engaged, on the understanding that, out of the £70 of purchase-money of each section, £40 was to be expended in carrying out labourers. The *New Zealand Manakou and Waitemata Company* acquired valuable tracts on those harbours (in the northern island) in 1838, and sent out a clever young officer, Captain W. C. Symonds, H. M. S., to survey the same and report, before taking any further step. A report from Captain Symonds, dated in February, 1840, and of a highly favourable nature, was received in July, and the company then proceeded to receive applications for 200 sections, of 1 town-acre and 100 country acres each, at £101 each, 65 per cent. of the purchase-money to be expended in taking out labourers. In July, 1840, the *Paisley New Zealand Emigration Society* was formed in connection with the London Company, for the purpose of promoting an extensive emigration of hand-loom weavers from the west of Scotland to New Zealand.

While these proceedings were going on on the part of the British, a French expedition sailed for the same country, designing to appropriate land for a settlement, but chiefly to all appearance with a view to the whale fishery. Disputes between France and England respecting the sovereignty of New Zealand, have been foreboded; but we have no fear that any thing of the kind, to an extent at all troublesome, will take place.

The following has been issued by the colonial secretary, respecting the plan of government to be adopted in New Zealand:—

The colony is to be entirely separate from and independent of New South Wales. A local legislature, to be composed for the present of the chief officers of the local government, and some of the chief inhabitants, is to be constituted, to make laws for the peace, order, and good government of the colony.

With respect to all lands acquired in the colony under any other than that of grants made in the name and on behalf of her majesty, it is proposed that the titles of the claimants should be subjected to the investigation of a commission to be constituted for the purpose. The basis of that inquiry will be the assertion on the part of the crown of a title to all lands situate in New Zealand, which have heretofore been granted by the chiefs of those islands according to the customs of the country, and in return for some adequate consideration.

An account of all the just and moderate expenses of the company hitherto incurred in forwarding the colonization of New Zealand to be made out, and the crown to grant the company as many acres of land as shall be equal to four times the number of pounds sterling which they shall be found to have expended in the manner stated. The lands to be taken by the company in the neighbourhood of their respective settlements at Port Nicholson and New Plymouth.

The company to forego all claim to any lands purchased or acquired by them in New Zealand, other than the lands so to be granted to them, and other than such lands which they may hereafter acquire from the crown or other persons deriving their title from the crown.

It is proposed to apply to all other British subjects the rule to which the New Zealand Company will be subject in respect of the lands claimed by them within the colony. This advantage, however, will be offered only to those whose lands were acquired before the 5th day of January, 1840, the date of proclamation issued by Sir George Gipps on the subject.

The governor of New Zealand will be instructed to recommend to the local legislature the enactment of a law to incorporate, as a municipal body, settlers who have, at the charge of the company, resorted to Port Nicholson, and settled themselves there or in that vicinity. For the present, her majesty's government engage that all sums of money which shall be paid by the company for the purchase of land in New Zealand, shall, whatever such money shall be paid in this country, be laid out in the removal of emigrants to New Zealand, it being left to the company, from time to time, to determine whether such money shall be so laid out by the Commissioners of Colonial Lands and Emigration or by the company themselves, under the superintendence and with the concurrence and sanction of those commissioners. The native reserves made by the company to be sanctioned by the crown.

A charter to be granted for forty years, but to contain provisions enabling the crown to resume the charter and purchase the lands and other property of the company on just and equitable terms, in case the public interest should require such resumption and purchase.

A township has been marked out on the shores of Port Nicholson, and named Wellington, which is

thought will be the capital of the colony. It is also proposed to build a town at the harbour of Hokianga, to be called Churchill; another at the Bay of Islands, to be called Russell; and a fourth at the Frith of Thames, to be called Auckland.

Up till the period we write (April, 1841), so little information of a substantial nature has been made known respecting the settlement of New Zealand, that we are unable to say distinctly how the colony is advancing, though, from floating intelligence, there is the greatest prospect of success; ships with emigrants, both capitalists and labourers, and also large stocks of provision and merchandise, are regularly sailing, and the country must soon present the spectacle of general industry and comfort.

SUBJECT OF EMIGRATION CONCLUDED.

In the present and preceding three sheets, we have presented, to the best of our ability, a practical view of the subject of emigration to Canada and other British American possessions, to the United States of America, to the different colonies on the mainland of Australia, and to Van Diemen's Land and New Zealand. These do not comprehend all the fields for emigration, but they are the principal, and those which seem most commonly available. The places of which we have not formally treated, are the Cape of Good Hope, the British West Indies, and Ceylon, all of which are crown colonies, and open to settlers. Ceylon, being situated within a few degrees of the line, and altogether tropical in character, is not to be mentioned as suitable for British emigrants; and the same thing may almost be said of the West Indies. The Cape of Good Hope, consisting of a large portion of South Africa, from all we can understand, is now in a thriving condition, and to many it forms a tempting field of settlement. The climate is agreeable, the government is settled and liberal in character, and there are large tracts of land open to settlers on easy terms. Farms abandoned by Dutch proprietors who have emigrated to more remote districts, can always be obtained at a cheap price; and as respects pastoral qualities, the territory is equal, if not superior, to many portions of Australia. As, however, we have no official papers on the subject before us, we pass to a general consideration of those fields of emigration which have been separately described.

The readers of these sheets will have observed, that each country or district referred to possesses a certain peculiarity of character, or, as we may say, has good and bad points in a greater or lesser ratio, which it will behove the intending emigrant to consider.

Canada possesses a most fertile soil, but it has very indifferent roads, is slow in improving, and labours under the drawback of a long and extremely cold winter. It seems best adapted for small capitalists who wish to pursue agricultural pursuits, or field labourers and artisans of a common kind. It has also the great advantage of being speedily and cheaply reached; yet, to a person with a few pounds to spare, such an advantage should go for nothing. In taking the step of emigration, it is of importance that it should be done well, and once for all.

The United States offer a far more agreeable scene for agricultural labour, because, while the soil is equally fertile with that of Canada, the winters are shorter. Some of the fine prairie-lands of the western states possess attractions which cannot be surpassed. As it is easy to reach these districts from Canada, many spirited emigrants will push on thither if they find such a step advisable. The United States possess a prodigious superiority over Canada in one particular—the sale of lands. In Canada, the abominable plan of selling lands by suction to the highest bidder, at periodic intervals, still continues, and, by disheartening emigrants and wearing out their means, sends shoals onwards to the states, where the land pitched upon has its exact price, and a purchase can be at once effected. If emigrants to Canada, therefore, cannot buy half-cleared lots on the instant, which perhaps they will find no difficulty in doing, we recommend them to proceed immediately into Michigan, Illinois, or some other western state of the Union. They will find so many persons on the road, that the exact route need not here be defined. Were the British government to institute a plan of colonising Canada, on a great scale, with an humble order of settlers, and at the same time permit the free importation of corn from that part of the empire, we might expect to find the country in a state of rapid progression in a very short period of time; but neither of these arrangements is at present likely to be carried into effect. It is proper to mention, that although the United States possess that degree of civil and religious liberty, which leaves nothing to be wished for on that score, the country labours under a universal derangement in money matters, and we fear that the settler must lay his account with a clumsy and unprofitable system of barter in relation to most products of his industry.

Australia is much better adapted for the emigration of capitalists than any part of America. We never hear of any one making a fortune in either Canada or the United States, but many in New South Wales. It would almost appear that, whatever be the sum of money a man expends on land in America, he seldom rises above the condition of a drudge—a circumstance arising from two causes, lack of cheap labour and lack of outlet for produce. Provided a course of industry and sobriety be pursued, he will unquestionably attain a state of competency and tranquillity, and will see his family rising around him with the prospects of respectable settlement, but we fear that, unless some great change take place in Canadian affairs, he stands a slender chance of ever getting above the condition of a small farmer; consequently there is no temptation for persons of comparative wealth to encounter the early and annoying difficulties of settlement in that rude country. In Australia, the emigrant will also experience personal discomfort and deterioration of habits. But a time comes when he can sit down with a degree of ease, calmly reposing on the advantages he has earned—he can reasonably look forward to indulgence in refinements such as wealth purchases in Britain; and with this pleasing hope, any species of immediate toil is of trifling consideration. Besides, to the person who loves a fine climate, where on earth could a more delightful country be found than Australia? Cold seldom or never sinks to that pitch which produces snow, and the heat, also, is by no means extreme. As respects climate and natural products, we should consider some parts of New South Wales equal to Asia Minor and adjacent countries; and that British subjects are at liberty to proceed to such an agreeable field of industry, and there possess all the privileges which our laws and constitution bestow, may be held to be a boon of which we cannot be too thankful. There is one material drawback to Australia—the want of regular and frequent rains. This leads occasionally to extreme droughts, which parch the ground, and in many parts render the business of the agriculturist very precarious. On that account Australia is better fitted for pasturage than agriculture. Van Diemen's Land, and also New Zealand, on the other hand, seem to be more agricultural than pastoral. Grain and flax, two grand staples in human affairs, will most likely become the permanent products of these fertile islands. In point of national economy, it is of no consequence what a country produces, provided it produce something which can be sold in the general market of the world. Let the mainland of Australia, therefore, attain prosperity by its wool, and perhaps its wines and fine fruits, and let Van Diemen's

Land and New Zealand grow in wealth from their grain, flax, timber, and perhaps their whale-fisheries. In both New South Wales and Van Diemen's Land, the sales of land are by auction, as in Canada—an evil of serious consequence, from which the Port Phillip district and South Australia are fortunately exempt.

It is gratifying to reflect, that every year settlement in any of the colonies is becoming less precarious, and promises a higher measure of success. Those who have gone before, instead of absorbing all that is good, are only preparers of the way for others. There is not the least chance of any one going too late, go when he will. There is ample room for all. The more who go, indeed, the greater is the likelihood of general prosperity. The fundamental evil, a lack of labourers, is daily lessening by the free and purchased passages of the young and industrious classes, and in proportion as this stream of emigration is sustained, so may we expect the various fields of emigration to be more suitable for the resort of capital and intelligent enterprise.

DESCRIPTION OF THE UNITED STATES.

HISTORICAL NOTICE.

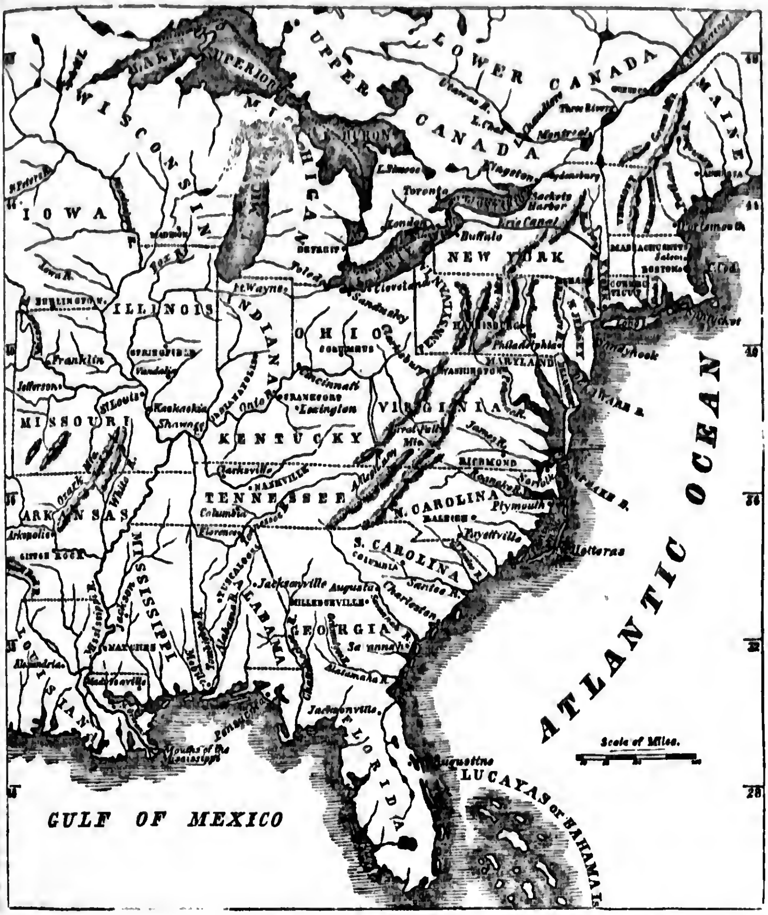
The continent of America, with all its islands, and the people who originally inhabited them, were unknown to the inhabitants of Europe till the end of the fifteenth century. They were discovered in the year 1492 by Christopher Columbus, while in search of a route by sea to the East Indies; and when he first saw them, he believed that they were part of China, or Japan; so little idea had the Europeans of those days of the existence of the vast countries which have since exercised so powerful an influence on the fate of their descendants.

The rude state of the native inhabitants, and the superior military knowledge of the Europeans, which they used with very little regard to right, enabled them soon to seize on all such parts of the country as they preferred, and to drive away, or reduce to subjection, the original possessors. In this way the southern part of the continent was subjugated, and partly colonized, by the Spaniards and Portuguese; while the northern portions fell into the hands of the other maritime nations of Europe—the English, French, Dutch, and Swedes—who formed colonies at different points along the coast. The whole of these, however, soon fell into the possession of the English and French alone. Under these two powers, the American colonies continued to afford a refuge to people of the European countries who considered themselves oppressed or aggrieved at home. During the seventeenth century, when extensive emigration first began to take place, it was not so much the want of employment, or of subsistence, which induced men to seek for a change of residence, as the wish of escaping from persecution on account of religion, or from the civil wars of the time. This was the case particularly in England, during that period when religious and political animosities greatly disturbed the country. Troubles of other kinds, and latterly the necessities of an overcrowded population, continued to afford a motive for the people resorting to America: and during great part of the eighteenth century, it is reckoned that from 5000 to 3000 persons yearly removed to these countries from Europe.

Some disputes arose, about 1755, between the French and English, who were now the sole possessors of North America; these at last led to a war, which terminated in the total destruction of the French power in that country, and in the transference to the English of all their colonies there, except some thinly peopled regions on the Mississippi. This result took place in 1763; but though it gave to Britain a large addition of new territory, and relieved her old possessions from an enemy, it left her burdened with large debts. In order to avoid unpopularity at home, the ministry of the day projected the scheme of throwing part of the burden of these upon the colonies; alleging as a reason, that the war had been undertaken for their benefit, and in order to deliver them from an enemy who continually hung on their frontiers. The first tax proposed for this purpose was a stamp-duty (1765); but the colonies firmly refused to submit to it, saying that they were perfectly willing to pay the expense of their own governments, but that they would not endure to be taxed by a foreign body like the British Parliament, which was situated at the distance of 3000 miles, and in whose deliberations they had no voice, while it might employ the money obtained from them for purposes hostile to their own freedom or welfare. This feeling was universal among the people of the colonies; for these being generally the descendants of men who had left Europe in disgust at some real or fancied oppression, had not those habits of deference to the commands of persons in high station, which often tend to secure obedience and quiet in other countries.

In consequence of this determination on the part of the colonies, and of the obstinacy of the English ministry in adhering to their demands, a great many irritating occurrences took place. The Americans refused to import or to use British manufactures; riots took place in almost all the towns, but chiefly in Boston; and the taxed articles which were sent out were destroyed. A meeting of delegates from the several colonies or districts was held in 1765, to petition and remonstrate against what they considered an injustice. Still the British government persevered. And though there was at one time an apparent disposition to recede from some of the propositions which had caused most irritation, the right of taxing the colonies was vigorously maintained. New taxes were soon after imposed (1767) on tea, glass, and paints. The pertinacity of both parties led to frequent violence, and at length to actual demonstrations of war on the part of the Americans. This war lasted for about seven years, from 1775 to 1782, and concluded at last, as might have been anticipated, by the British being compelled to relinquish a country of which every inhabitant was their enemy. The war was conducted on the part of the Americans by General George Washington, to whose talents and perseverance its speedy termination was greatly owing, and whose moderation in using the influence which success had given him over his countrymen, has been too seldom imitated by conquerors. The councils of the Americans, and the negotiations with other powers, were mainly directed during these transactions by Benjamin Franklin, a man who was equally distinguished as a philosopher and a lover of his country.

At the conclusion of peace between Great Britain and America, the following thirteen states formed the republic of the United States:—New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, South Carolina, and Georgia. To these have been added, from time to time, Maine, Vermont, Columbia, Alabama, Louisiana (purchased from the French in 1803), Ohio, Michigan, Indiana, Illinois, Missouri, Kentucky, Tennessee, and Mississippi. Besides these, may be mentioned the territories of Florida, Wisconsin, and Iowa, which are governed by officers appointed by the American government.



FORM [illegible]

Each of the [illegible] settled in America, had ha[illegible] assigned it for maintaining the [illegible]. This consisted generally of a house of [illegible] chosen by the people, with governor, judges, and other officers, appointed by the king, but paid out of taxes levied by the representatives. On acquiring independence after their war with the mother country, the different colonies, now called states, made such alterations, each in its own constitution, as they believed to be suited to their circumstances; and a general government, framed and appointed by the consent of the whole, was formed to take charge of such national affairs as the states could not manage separately. The states have each a senate and house of representatives; the members of the former are fewer in number than those of the latter, and a part of them only is chosen at each election, so that they remain in office for several years, generally four: the house of representatives is elected anew every year. The resolutions agreed to by these two bodies for the government of the state, are afterwards submitted to a president or governor, whose sanction constitutes them part of the law. Both senators and representatives are paid for their attendance on the public business, generally at the rate of two dollars (or nine shillings sterling) per day, besides an allowance for travelling expenses. The right of election resides in the people under certain limitations: in some states the possession of a certain property (about £50) is required in the electors: in others, the regular payment of certain taxes: in all, a residence in the state, varying from two years to six months, is requisite. But there are only eight of the states in which black people

are allowed to give votes. The judges and other magistrates are in some states elected by the people; in others, by the governor, subject to the approval of the two houses: and their tenure of office is in some for a term of years; in others, during good behaviour; and in several, till the holder attain a certain age (about 70).

The general government of the United States is, like that of the states individually, a representative democracy, in which the people intrust the administration of affairs to executive and legislative officers of their own choice. At the head of the executive is a President, who, with a Vice-President, is elected every four years, and must be a native-born citizen of the States. The legislative body consists of two houses—the Senate and House of Representatives. The members of both houses receive 36s. per day, with travelling expenses. The Senate consists of forty-eight members, two from each state; sixteen of these are elected every two years, so that the whole may be renewed in six years. The members are required to be at least thirty years of age, to have lived nine years in the United States, and to be at the time of election residents in the state by which they are returned. The Senate exercises most of the functions of the British House of Lords. The House of Representatives is chosen annually, and the members are required to be at least twenty-four years of age, to have resided three or four years in the state for which they are chosen, and, in one or two of the districts, to possess a certain property. There is one representative nearly for every 40,000 persons, five black men being reckoned in this enumeration equal to three white. The House of Representatives perform the duties allotted by the British constitution to the Commons' House of Parliament, and have the right, like them, of originating all bills for raising revenue; while the Senate, on the other hand, like our House of Lords, is intrusted with the exclusive power of impeaching any officer of state for public misdemeanor. Bills which have passed the two houses have not the sanction of law till they are signed by the President, or, on his refusal, are voted a second time by two-thirds of each of the houses. The President, Senate, and House of Representatives, are called the Congress of the United States, and their powers in making regulations concerning the public affairs are defined and limited by the original articles of the Constitution. Congress is prohibited by these from making any law concerning the establishment or free exercise of religion, the liberty of the press, and freedom of speech, or the privilege of public meetings to express their opinions peaceably on the measures of government. The people are secured in the right of bearing arms, of fair trial, and in the possession of their property, against all aggressors, either public or private. Of these rights, no act of Congress, or other authority, can deprive them; and if they are invaded, the sufferer can have redress by applying to the courts of justice.

The judicial power is vested in one supreme court, and in such inferior courts as Congress may from time to time establish. The present judicial establishment consists of a supreme court, thirty-one district courts, and seven circuit courts. The Supreme Court consists of a chief-justice and six associate justices, who hold a court in the city of Washington annually; besides which, each judge attends in certain districts to hold circuit courts with the local justices. The processes of law are in general simple and direct, and are not made difficult of access to the poor by any burdensome expenses.

According to the Constitution, all men are equal, none possessing any hereditary rank over the other; but this universal and broadly defined principle of democracy is impaired by the circumstance of there being upwards of two millions of blacks forcibly detained in the condition of slaves, besides upwards of 300,000 of a free coloured population, who are shunned as an inferior race, and denied various social advantages; in point of fact, the whites form an aristocracy in all parts of the states. The constitution is further defective in practice, by being evidently incapable of restraining popular violence; for it is an incontestible fact, that mobs frequently defeat the operation of the law, when distasteful to their feelings, and commit flagrant acts of severity upon individuals. Perhaps a better state of education may remedy this great grievance; meanwhile, it is too important a feature in the political condition of the people, to be passed over in silence. Generally speaking, it may be said that popular opinion is the absolute governing power in the States, and cannot be withstood by any species of opposition. Popular opinion, whether right or wrong, enforces uniformity in external behaviour and profession of belief, to a degree which would be called despotic if exercised in a monarchical country. On this account, the maintenance of opinions with respect to politics and religion is practically less free in America than in England, where, if a man pay all demands upon him, and commit no overt act of sedition or other gross impropriety, he may profess what opinions he pleases, and live any way that suits his fancy.

The expense at which the entire government of the States is conducted, including the military and naval departments, is on a singularly economical scale. The President receives of annual salary £5625, the Vice-President £1125, and the Secretary of State the same. Each of seven ambassadors is paid £2025. In 1837, the general expenses were summed up as follow:—

Civil list, foreign intercourse, and miscellaneous,	$5,521,[illegible]
Military service, including fortifications, Indian affairs, militia, improvements of harbours and rivers; constructing roads and building arsenals, &c.,	19,417,[illegible]
Naval service, including expeditions, &c.,	6,52[illegible]
Public debt,	21,[illegible]
Total expenses of general government,	$31,515,[illegible]

The annual charge of the public debt is to be deducted from the above sum, as the whole has now been very nearly discharged. But in estimating the whole cost of the government, it is necessary also to take into account the sums required for the expenses of the different states. We do not find any direct notice of the amount of these, but as Captain Hall states that each person pays to the state government 3s., and to the general government about 9s. 4½d. per annum, this proportion would make the amount of the expenses of the different states about £2,087,029; and the whole cost of government is therefore £7,722,009, amounting, according to Captain Hall's estimate, to about 12s. 4½d. for each person. The national debt having been now nearly paid off, the yearly sum paid in taxes, by each person, may be estimated at 8s. The only taxes are those on articles imported from foreign places, none whatever being levied on the manufactures or produce of the country itself; and there are no direct taxes, like the house or window taxes in this country. Part of the revenue is derived from the sale of public lands; and this amounted in 1828 to £290,821.

ARMY AND NAVY.

The regular army of the United States amounts upwards of twelve thousand men: it consists of 7[illegible] commissioned officers, and 11,804 non-commissioned officers and privates; in all, 12,539 men. The militia is estimated at 1,350,805 men. In this body the men require a certain knowledge of military exercises, but admit very little to subordination.

There is a military academy for educating young men as officers; the number under tuition is limited to [illegible], and the instruction given is well fitted for training the minds to knowledge and gentlemanly feelings: the course consists of natural and experimental philosophy, mathematics, engineering, ethics, drawing, and the use

military exercises. The young men educated here are received into the army as cadets, and their promotion is afterwards regulated strictly by seniority, except in extraordinary cases.

The navy consists of 8 ships of the line, and 3 others building; 10 frigates of 44 guns, 2 of 36 guns, and 5 building; 29 sloops of war and smaller vessels, and 1 armed steamship. The number of captains is 55; commanders 54; and lieutenants 285. There are seven navy-yards, of which the principal are on Long Island, near New York, at Philadelphia, and at Washington. Recent events may have caused an alteration in this summary of the military and naval force.

Notwithstanding the free genius of the American constitution, and the little attention paid to wealth or difference of rank in common life, discipline is enforced with great strictness in the naval service, and with the more jealousy, perhaps, because there is always a danger of the seamen and inferior officers falling into the independent habits of their countrymen, which would be inconsistent with the authority of a commander at sea. Captain Hall tells a story of a young officer who announced his intention of appealing to the people on having been reprimanded by his captain. This being reported at head-quarters, an order came down to say, that the officer was perfectly at liberty to appeal as he proposed; and in order that he might do so without inconvenience, his discharge from the navy was enclosed. Great care is taken in the selection of persons wishing to enter the naval service; and these gentlemen are also exposed, afterwards, to frequent and rigorous examinations, by which means incompetent persons are excluded.

The ships of the American navy are generally well built, and good sailers: they are constructed in great part of a wood called the *live oak*, or *evergreen oak*, which grows in the salt marshes of Florida, and which is almost incorruptible. Large plantations of this valuable tree are formed, and carefully attended to by the government, the only instance in which forest trees are at all cared for in America.

MANUFACTURES.

The vast extent of culturable and prolific land in the United States, and the constant demand for large supplies for food, forms a reason why the nation should resort more to agricultural than manufacturing industry as a staple employment. The Americans, nevertheless, from a strong desire to be independent of foreign countries for a supply of articles of clothing, have thrown themselves energetically into a course of manufacturing, in relation both to soft and hard goods. Doubtless, they could be supplied with the articles cheaper from England than they could make them; but this seems a matter of indifference, and as the English think fit to exclude American grain from their market, the Americans in return exclude English goods. At present, they are engaged in a kind of rivalry with Britain, and it is certain that they are fast overtaking it, both in the excellence and cheapness of their products.

The manufactures which are followed with most advantage in America, and without fear of English rivalry, are those which produce articles too bulky or too heavy, in proportion to their value, to bear the expense of a long carriage, or of which the materials are found in the country, and can be wrought up there at less expense than by carrying them to cheaper tradesmen at a distance. Some of these branches may be mentioned—such as the making of soap, candles, and hats; tanning and working in leather, particularly bulky articles; building of carriages; making of all kinds of agricultural implements; carpentry, sawing, and turning of most descriptions; building of ships and steamboats; constructing and putting up of millwork and machinery; distilling: the employments of goldsmiths, tinsmiths, and printers. There are several businesses, however, whose prospects depend chiefly on prohibiting the cheaper manufactures of England, and which of course are liable to be deranged by any alteration in the tariff laws: these are the making of glass and earthenware; spinning and weaving most kinds of cotton goods; making of woollens, carpets, &c.; most of the finer kinds of hardware, iron, steel, and brass; hempen goods and silk goods.

Within the last few years the manufacture of cotton has been conducted on a great scale, by means of factories on the same plan as those in England. The cotton manufacture was introduced only in 1790, and in 1832 it was found that the number of mills in twelve states was 795, of spindles 1,246,503, of power looms 33,506; of males employed in the manufacture 18,539, females 38,027—total employed, 57,466. The amount of capital now invested in this thriving branch of trade, is estimated at 45,000,000 dollars, equal to £9,375,000 sterling, being about a fourth part of the capital invested in the cotton manufacture in Great Britain. By procuring the cotton cheaper than can be done in England, the Americans have an important advantage; wages, however, are higher. The principal cotton manufacturing districts are in Massachusetts, Maine, and other states on the coast. The chief seat of the manufacture is Lowell, in Massachusetts, and it may be termed the Manchester of America. Besides containing at least a dozen factories for cotton and woollen fabrics, Lowell possesses large machine-making establishments, which employ many hundreds of workmen. All the improvements in mechanism in England speedily find their way to this spot.

Household manufactures of woollen, linen, and cotton, are made to a great extent. Many families spin, weave, and make up their own clothing, sheeting, table-linen, &c. They purchase cotton, and mix it up in the yarn with their linen and woollen stuffs; blankets, quilts, coverlids, stockings, mits, &c., are made chiefly in the family. These are perhaps neither so fine nor made so expeditiously as those of regular tradesmen; but they are produced for domestic use at times when there is no other employment, and in this manner may be said to cost nothing except the material of which they are made. It is supposed that nearly two-thirds of the domestic clothing is so made in country places, many families, as in Canada, having a loom in the house. It is the same with soap, candles, and maple-sugar, all of which are manufactured by the farmers at home. The articles made by families in the state of New York for their own use, were, in 1831, reckoned at £1,045,360, in value. Attempts have recently been made, with great success, to introduce the manufacture of silk; the mulberry-tree grows spontaneously in the middle states, and the light, easy labour which the collecting of the silk requires, would afford employment to old people and females, enabling them to add to the income of their families, when they could not otherwise be able to do any thing.

The native American manufactures, limited as they are in some respects, are sufficient to give employment to every one who wishes to work; and there is still a continual call for new hands. Capital also finds abundant remuneration in the existing state of things, so that there seems to be no necessity for the Americans troubling themselves to establish new manufactures, all their spare hands and spare money being already occupied to advantage. English workmen, who are skilful and steady, are almost certain of finding employment with good wages, in one or other of the manufacturing towns; but it is here necessary to state, that the American manufacturers make serious complaints against operatives from British factories, whom they describe as arrogant, intemperate, and unsettled in habits. The chief ground of complaint is their intemperance, a circumstance partly

arising from the cheapness and abundance of intoxicating liquors, but also from a want of due personal control. We mention this as a warning; for no intemperately disposed workmen need think of leaving their employment in Britain to find an asylum in American factories.

In the southern states there is little manufacturing; the inhabitants there depend on the northern states or on foreign countries for their supplies, and their exports are cotton, sugar, and other raw materials.

COMMERCE.

The wealthiest class in the United States is generally the merchants of large sea-port towns. Commerce may be considered as forming the aristocracy of that country, and is regarded everywhere as highly honourable. Young people are educated for it with as much care as for the army, or for any of the learned professions; and they acquire a knowledge of the languages of the foreign countries with which they propose to be connected, their modes of transacting business, &c., instead of learning dead languages, and the manners of extinct nations, as with us. The manufactures and markets of foreign states—the quality, value, and profits of every commercial article—form the objects of their study, and prepare them for engaging in business with system and advantage. The same energy of character which has brought English commerce to the highest pitch, is carrying forward the United States in a similar career, but perhaps with undue speed. The chief fault of the American commercial character is an over-haste to be rich. This "go-ahead" policy leads to wild speculations, on an extensive scale, which produce most disastrous results on the currency and finances of the nation.* At an interval of every few years, the banks suspend payments of their notes in cash; debts due to foreign merchants and others cannot be liquidated, and money is scarcely to be had—all which mischiefs directly arise from a spirit of over-trading, instead of pursuing the path to wealth by a course of patient and accumulative industry.

The tonnage employed in the foreign and internal trade of the States, in 1838, was 1,741,391 tons of shipping, and about 140,000 seamen—numbers little less than those of Britain. In the papers presented to Congress, we have the following statement of the amount of exports and imports in the year 1838:—

EXPORTS.

Produce of the Forests,	$5,200,490
Fisheries, &c.	3,175,576
Agricultural produce—	
Cotton,	61,556,811
Tobacco,	7,302,029
Vegetable food,	6,781,064
Products of animals (skins, &c.),	2,340,850
Other agricultural products,	140,093
Manufactures—	
Cotton goods,	3,758,755
Other manufactures,	5,704,544
	$96,033,821

IMPORTS.

Articles free of duty,	$60,990,005
Articles paying a specific duty,	25,726,919
Articles paying duty according to their value,	27,000,480
	$113,717,404

Tables are given of the different countries with which this trade is carried on. The following abstract will give an idea of the extent of transactions with each in 1838:—

	Imports.	Exports
Russia,	$1,898,396	$1,043,[illegible]
Germany, Holland, and Belgium,	4,301,812	7,943,[illegible]
Sweden, Norway, Denmark,	881,880	400,[illegible]
Britain,	44,861,688	52,170,610
Spain and Portugal,	1,399,400	505,407
France,	17,771,797	15,783,516
Mediterranean,	1,936,402	1,629,173
Gibraltar,	25,024	762,[illegible]
Africa and Islands,	1,520,033	834,709
West Indies generally,	18,614,583	13,[illegible],449
Hayti,	1,275,762	910,233
British America,	1,555,570	2,723,494
Mexico,	3,500,709	[illegible],664,097
Brazil,	3,191,238	[illegible],657,194
South America generally,	8,042,361	6,252,288
East Indies and Asia,	1,494,556	1,291,661
China,	4,764,536	1,516,649
South Seas,	55,561	82,857

The annual amount of American commerce is about twenty-eight millions sterling imports, and twenty-four millions exports. This excess of the imports over the exports has continued since the year 1831, but the difference is now considerably less than it was at that time. It appears that these sums form about half the amount of the British foreign trade. The American shipping, however, is nearly equal in tonnage to that of Britain. This apparent inconsistency is accounted for in two ways: first, a great deal of the trade to Britain is carried on in American bottoms, and not equally in ships of the two countries; and, secondly, there is a larger quantity of tonnage occupied by the Americans in the coasting or internal trade of the country than there is in Britain. It is, in fact, the traffic between the different parts of the Union, which gives its chief activity to American commerce.

The immense number of navigable rivers which run through the country in every direction, and discharge themselves into the ocean or the lakes, afford the means of a great internal trade. These facilities have been increased at many important points by canals, connecting the different rivers at points where they approach each other, or where they flow away in opposite directions from sources lying in the same neighbourhood. Between the southern and eastern states there is a constant interchange of commodities along the coast, and a similar trade goes on from the western states to the south, by the Ohio and its branches, down the Mississippi. New Orleans is the great entrepôt for the goods of the latter branch of internal commerce. The north-eastern states furnish rum, molasses, cordials, dried fish, European goods of all descriptions, and articles of small value, quaintly styled *notions*: and they take in return corn, grain, cotton, and tobacco, from the south; while from the western states are received hams, beef, lard, flour, &c., either for use or for exportation to the West Indies and the other parts of Southern America. To show the extent to which this traffic is carried, we may mention that there are two hundred large steamboats on the Mississippi, making the voyage up and down in twenty-four days. The cargo of one of these is given as follows:—501 barrels of pork, 9 hogsheads of hams, 2138 kegs of lard, 3147 barrels of flour, 30 barrels gin, 92 barrels beef, 50 boxes merchandise, 32 barrels porter 224 barrels eggs, 50 horses, 32 cabin passengers, 15 deck do., 31 way do., and this was the usual cargo every trip. The traffic from north to south along the coast is greater than might be inferred, even from this specimen of internal trade by the rivers; because the productions of the northern and southern districts on the sea-coast are as different from each other as those inland, while the states in that part of the country have been longer and more densely peopled. This active intercourse by rivers, canals, railroads, and sea-coast, increases the value of land and of industry everywhere: the produce of the agricultural countries can always be sent easily to the towns, and that of manufacturing places to those which are more exclusively agricultural. The United States have too lately commenced industrial operations, to pos

* The standard currency of the States is in dollars silver coins worth about 4s. 3d. sterling each; each dollar is equal to 100 small copper coins called cents.

ness either the wealth or available resources of such an old-settled and industrious country as England, and therefore both the currency and means of defence are upon a comparatively meagre scale. The bulk of the money, for instance, employed on great public works, and borrowed by the different states, has been lent by British capitalists; of the stock of the United States Bank, five-sevenths were understood to belong to England. So stupendous, however, are the natural resources of the States, and so readily may they be developed, that with peace, and by following those pursuits of industry which are appropriate to the country, the nation at large cannot remain long a debtor to foreign powers.

CANALS, RAILWAYS, AND PUBLIC WORKS.

When America was first settled, the people chose lands in the vicinity of the sea or navigable rivers, so as to have the means of free communication to all parts by water; and lands even of inferior quality were found more valuable in such districts than richer soils in places where the produce could not be brought to market. All the available ground, however, in these favourable situations, was soon occupied, and people who wished to settle were forced to cultivate lands very inconveniently placed for carriage and communication with markets. These lands, however rich, afforded no more than the means of subsistence to their occupants, who, as they could send little or nothing to the great towns, could buy nothing from thence; they contributed, therefore, very little to the general trading prosperity of the country. It was not until after the last war with Great Britain that the Americans saw what advantages might be afforded to such districts by the establishment of railways and canals, and immense efforts were made to set such works on foot. Their enterprise has been successful. The canals and railways of that country are now hardly to be equalled in the world, and these channels have opened the tide of population and prosperity into inland districts and rich lands, which must otherwise have lain waste and lost, except to a few slovenly and ignorant persons. One of the states alone (Pennsylvania) has, since 1826, devoted no less than £5,800,000 to this object. New York has been even more liberal; and there is no part of the country (always excepting the slave states, which in this respect, as in all others, are greatly behind) where such means are not taken to afford the occupiers of land means of bringing their produce to the market of cities. This is a matter which very nearly concerns the settler everywhere; because, however good the soil of his farm, or however unremitting his own industry may be, every advantage would be thrown away, if he could not get the produce disposed of. Some of the settlers in Canada, at the head of Lake Erie, were so badly off in this respect, till the opening of the Erie canal, that their surplus wheat and cattle were worth nothing: money was not given for farm-produce in that quarter. Wherever there is a good canal or navigable river, on the other hand, the prices of farm-produce rise, and land which was unsaleable becomes in request, and is covered with a throng of settlers from Europe, or of the restless speculators of America.

The Erie canal was planned by an American patriot, Mr. De Witt Clinton, and was carried into effect at the expense of the state of New York. It extends three hundred and sixty miles along a rich and fertile country, which had formerly no communication with markets, but which can now send its produce to the sea in two directions. It is forty feet wide at top, twenty-eight at bottom, and four feet deep. It was finished in five years, at an expense of 9,027,456 dollars. The waters of Lake Champlain are connected with the Erie canal by another sixty-three miles long, which was executed at an expense of 1,179,871 dollars. The amount of tolls collected on these canals, in 1822, was 44,486 dollars, and in 1834 this had increased to 1,313,155 dollars.

Houses, villages, and towns, are starting up along the whole line of the Erie canal, with unexampled rapidity. Lockport, for example, is a place where the canal is carried by locks up a steep rock of seventy feet. This spot has been suddenly transformed from a wilderness into a thriving village of two thousand inhabitants. Rochester is another example of the benefits the canal has conferred on the country: at that place there was abundance of most fertile land, and there were also certain falls on the river Genessee, which were admirably adapted for giving water-power to mills and other machinery; but all these advantages existed to little purpose without good roads and markets. The opening of the canal has supplied these; and the consequence has been, that Rochester has all at once started up from a desert into a populous city, and presents, says Mr. Fergusson, a remarkable instance of what may be done in the way of transition, exhibiting in its streets a perfect sample of the progress from stumps to steeples. It is not long ago since its most crowded streets were a forest. The first settlers cut down the trees, leaving the stumps standing till they had more leisure; and this place now presents as elegant buildings as any in Europe, with churches whose steeples might do credit to London or Edinburgh.

This canal terminates in Lake Erie, and forms a channel by which the trade of the large inland seas, Lake Erie, Lake Huron, and Lake Michigan, may find access to markets in the populous cities of western America and Europe. The fertile shores of these lakes will therefore be rapidly settled, and all their natural advantages soon be brought into operation for the profit of mankind.

There are a number of other large and useful canals in this state, such as the Oswego canal, the Cayuga and Seneca canal, besides several others which are in progress. The whole extent of canals in the state of New York, in 1833, was 535 miles. A number of the great rivers of America have been connected by canals. Thus, a canal stretches from the Delaware to the Hudson; from the Delaware to the Chesapeake; and from the Chesapeake to the Ohio. The rivers Potomac and Shenandoah, which were formerly obstructed by rapids, have been rendered completely navigable by the construction of canals and lockage at each of the rapids.

It would be idle in us to attempt here an enumeration of even a small proportion of the undertakings of this nature which have been executed in America. Wherever the navigation of a river has been impeded by rapids, or the occasional shallowness of its bed, the obstacle has been overcome, if there were either useful minerals or fertile land to be made accessible. Along the banks of some rivers of this kind, canals have been carried for 100 miles; as, for instance, the canalling of the Lehigh and Schuylkill, in Pennsylvania. Wherever two navigable streams, flowing to different seas, are separated by a ridge which it is possible to penetrate by a canal, the work is attempted, and the communication made complete from sea to sea. Examples of this are found in the Champlain canal, which is completed, and connects the Hudson and St. Lawrence; and in canals between the Miami and the Wabash, the Fox river and the Ouisconsin, which are both likely to be effected. It is not that the Americans are more generous or more patriotic than other people, that they undertake these works; it seems rather to arise from a spirit of restless enterprise, which cannot be satisfied with turning to advantage the land within their reach, but must be always hurrying away to secure the resources of some new region which is supposed to be more fertile than any yet discovered. Another reason for the manner in which the Americans

outstrip the British in this species of undertaking, ought to be mentioned. All great improvements in this country are impeded by powerful factions of men who thrive upon ancient systems, however absurd; whereas in America all classes seem to strive to improve the country on general principles of utility, without regard to antiquated usages. Whatever may be the cause, it has had the effect of opening up to the over-crowded population of Europe rich and inexhaustible countries, to which they may emigrate for ages without filling them, but which would have been of little advantage without the channels of communication now opening by the Americans.

Although it is only since the year 1824 that railroads have been used for general traffic in the United States, yet that country has a greater extent of railroads than any country in Europe. Some of these are of great magnitude, and others have been constructed in places where the difficulties might have been thought almost insurmountable. The Camden and Amboy railroad is sixty-one miles in length, and brings the cities of New York and Philadelphia within a few hours' journey of each other. The Philadelphia and Columbia road, with the portage-road over the Alleghany mountains, constitute part of the great inland communication between the Delaware and Lake Erie. The railroad over the mountains is thirty-six miles long, and in this distance overcomes a rise and fall of 2570 feet. In one part of it there is a tunnel 900 feet long cut through the solid rock, and it has ten stationary steam engines and ten inclined planes. This stupendous work cost about 1,750,000 dollars.

In South Carolina a railroad extends from Charleston to Hamburgh, a distance of one hundred and thirty-five miles. It is altogether built upon piles of wood, and may be considered as one continuous bridge. The whole expense of this road was 1,336,615 dollars. A railway has also been projected, and is now partly opened, from Baltimore to Pittsburg, a distance of three hundred and thirty miles. The railroads in America are so numerous, that it would be almost impossible to enumerate them all. There are now upwards of three thousand miles of railroads in the United States. The capital expended in the construction of these has been estimated at 60,000,000 dollars (about £15,000,000 sterling), or at an average of 20,000 dollars per mile. Passengers pay about 5 cents per mile, and goods are charged 7½ cents per ton per mile. The average speed is from twelve to fifteen miles an hour, stoppages included.

SEA-COAST, LAKES, AND NAVIGABLE RIVERS.

Bays and Harbours on the Sea-Coast.—There are some countries which are deprived of the advantage of bays, harbours, and good protection for shipping. France, for instance, with a long line of sea-coast, has but few of these natural advantages; and a more remarkable instance still is afforded by the coast of Coromandel in India, which has not one good harbour or bay where vessels might take shelter, along its whole extent. America is very differently situated in this respect: from north to south along the whole coast which fronts the Atlantic, the country is deeply indented with large navigable bays, which afford ready protection to her shipping, and give points of rendezvous to the trade of numerous rivers which fall into them. It would be needless to mention the whole of these: the smallest of them, on the coast of India, where ships are exposed to all the hazards of an open sea, and lie off, delivering their cargoes by means of rafts or lighters sent backwards and forwards to the shore, would be reckoned sufficient to give wealth and importance to a large city. They are so numerous on the coast of America, that the commercial facilities of half of them cannot be taken advantage of. Among the principal is the Bay of Chesapeake, where the mouths (or firths) of several large rivers, the Susquehannah, the Potomac, the James, the Rappahannoc, &c., meet together, and concentrate the commerce of a large tract of country belonging to each. There is hardly another bay in the world which, by the rivers that fall into it, gives access to inland places so remote from each other. North from this is the Bay of Delaware, very little inferior to it in the facilities it affords for trade, and the communication its rivers (the Delaware, Lehigh, Schuylkill, &c.) afford with the interior. North from these is the Bay of New York, which affords an entrance to the large river Hudson, besides several others; and which, by means of canals, has now a communication with the St. Lawrence, the lakes of Canada, and the whole fertile country lying on the banks of these, forming an extent of inland navigable waters larger than any other which is known.

The coast north from New York has the Bays of Providence, Barnstable, Boston Harbour, Penobscot, &c., all of the greatest utility for shipping, and enabling the people to bring all the natural advantages of the country into operation for commerce.

To the south of the Chesapeake, in the slave countries, there are also many noble harbours, bays, and rivers, which, under circumstances more favourable to the moral and commercial improvement of the people, would give to the trade of this part of the Union all the facilities which have contributed so powerfully to the prosperity of the north.

Lakes.—The American states are bounded to the north by a chain of the largest fresh-water lakes on the globe, which are all connected together by one continuous river, called, after it leaves them at its lower portion or outlet, the St. Lawrence. These lakes lie along the summit of a range of elevated ground, which stretches nearly across the continent, occupying certain deep cavities hollowed out on this summit level, and they receive the waters of all those small rivers which are formed on the flat region lying around them. The principal lakes are four in number, and are called (beginning from the eastward) Lakes Ontario, Erie, Huron, Michigan, and Superior; the navigation from Lake Ontario to Lake Erie is interrupted by the Falls of Niagara, where that river (the same which is called the St. Lawrence after it quits the lakes) is precipitated over a rock of 160 feet high. From Erie to Huron, vessels of large size pass uninterrupted, but the communication is impeded in the channel which connects Lakes Michigan and Superior with Lake Huron, by the straits of St. Mary. At Niagara, a canal, called the Welland Canal, has been formed by the British government on the Canada side of the river, which enables vessels to pass from Ontario to Erie without impediment; and the like will no doubt be performed by one or other of the governments for the straits of St. Mary, whenever the commerce upon these more remote lakes shall justify the expense of such an undertaking. The whole chain of those inland seas will then be navigable from one end to the other; and as their shores are all of great fertility, the region lying around them may be expected at some future time to be one of the busiest and richest on the globe. At present, as they extend along the northern limits of the United States, they afford to that inland boundary nearly the same commercial advantages as those possessed by a sea-coast, and give a sensible stimulus to the industry of all the districts connected with them. The following is a summary of particulars connected with the extent, depth, &c., of the lakes:—

Name.	Length. Miles.	Width. Miles.	Depth. Feet.	Elevation above the Sea—Feet.
Ontario,	180	40	500	231
Erie,	270	80	200	565½
Huron,	250	100	900	618
Michigan,	400	50	unknown.	618
Superior,	480	109	900	641

None of the navigable rivers of the United States fall into the lakes, and there is no river that flows out of them over which that country has command, so that it would appear that the advantages it can derive from them are but limited. To remedy this inconvenience, which the Americans soon perceived and regretted, they have led canals from the most of their inland districts to the upper portion of the lakes; while from their lower shore (or that which is next the sea) they have conducted others, to give them an outlet to the ocean within their own territory. The navigation is thus rendered complete, from the shores of the sea at New York, by a canal, to Lake Erie; thence to Huron and Michigan; and from thence by other canals to the inland states of the west.

Navigable Rivers.—The navigable rivers on the eastern side of America are numerous and important. We may first mention the Connecticut, a large stream flowing into the Atlantic near the north-east end of Long Island: the Hudson, a river navigable for steamboats of the largest class for one hundred and sixty miles above its mouth, and the channel which has enabled New York to extend its commerce by a canal to the lakes: the Delaware, flowing past Philadelphia, and affording communication by itself or its tributaries with a country three hundred miles in length, and of nearly equal breadth: the Susquehannah, the Potomac, the James River, and others flowing into the Bay of Chesapeake, which, by the help of canals, afford entrance to vessels of one kind or other into the deepest valleys and recesses of the eastern country. Southward are the Roanoke, flowing into Albemarle Sound, and the Pamlico river, affording channels for the commerce of North Carolina; while South Carolina and Georgia are canalled in the most complete manner (if we may use the expression) by the rivers Pedee, Santee, Savannah, Ogeechee, Alatamaha, &c.; and East Florida enjoys the same convenience in the River St. John's and its branches.

But the eastern rivers, useful as they are (and they have certainly as yet been the chief seats of commerce in the country), are by the Americans themselves entirely lost sight of in the enthusiasm of their admiration for the immense streams which water the western and inland states. These great rivers are certainly not to be equalled in any other country, at least in any country which has had such skill, or such a form of government, as have enabled its people to turn the commercial facilities of their inland waters to proper advantage. The rivers to which we allude are the Mississippi, and the large tributaries which arrive from the east and west to fall into the channel of that great stream.

The number of steamboats on the western rivers in 1834 was about 230, measuring 39,000 tons. Besides these, there are 4000 flat-bottomed and keel boats, with a tonnage amounting to 160,000. Only a few of these vessels, however, are fit to go to sea, being only suited for river navigation.

MINERALS.

There is a great variety of useful minerals distributed through different parts of the states. Coal may be mentioned among the first: it exists through all the country, lying north of a line drawn from Philadelphia to the mouth of the Ohio, and is particularly abundant on the upper waters of the Susquehannah, as well as on the Alleghany and the Monongahela. At Pittsburg there is a hill principally composed of coal, and it is found at many places in this district within a few feet of the surface. There are extensive coal mines also on the Roanoke and Appomatox, in Virginia.

The country on the Ohio is particularly rich in mineral productions. The whole district is bottomed on limestone, on which rests the wide and valuable coal formation mentioned above, extending from the head waters of the Ohio, in Pennsylvania, to the River Tombigbee. Iron ore is found abundantly in the same district, principally towards the upper part of the Ohio; bog ore is found in the valleys of the Alleghany chain; and various kinds of ores, of the same metal, are met with in the New England states: at one place, carbonate of iron is found, which, on being reduced, produces steel, and is called *steel ore*. Black lead, in beds of from five to six feet wide, traverses the states of New York, Jersey, Virginia, Carolina, &c. Copper ore is found in Virginia, in Connecticut, and in New Jersey: it exists also in the neighbourhood of the lakes; and a piece of pure malleable copper, weighing three pounds, was found in Illinois.

Gold mines have been traced extending through a large tract of country in the western parts of Virginia, North and South Carolina, and Georgia: they are wrought to a considerable extent, 20,000 men being employed at the different workings: the miners, who are people of all countries, say that the produce is richer than that of any other mines on the globe: one piece of pure gold was found weighing twenty-eight pounds. The annual produce is about one million sterling; but we have not heard what proportion of this is expended in the work, or what actual profit has been realized. One singular fact is remarked concerning these mines, which is, the indubitable evidences found that they have been wrought at some period before America was known to the Europeans. Many pieces of machinery which were used for this purpose have been discovered in the workings, among which were several crucibles of earthenware, which are far better than those now in use.

Silver and its ores are not of frequent or extensive occurrence. Mercury has been found native in Kentucky, but it occurs plentifully in the ore as bituminous cinnabar, through the Ohio and Michigan territory. It is found in the soil as a black or red sand, sometimes as a fine red powder, and at other times in iron clay. There are lead mines of vast extent on the Missouri; they are said to occupy a surface of six hundred miles in length, and two hundred in breadth. One miner will raise about two thousand pounds per day, which sell for forty-five dollars, and yield twelve hundred pounds of pure lead.

Epsom Salts, Glauber salts, and nitre, are found in Ohio and Indiana; the two latter in caves, the former in a thin layer on rocky surfaces. Salt, which in countries far removed from the sea is an article of great expense, is produced from salt springs, or from borings in different parts of the western country. Mineral waters of valuable medicinal qualities occur at several places; the springs principally frequented are those of Saratoga, in New York. Oil of vitriol, or sulphuric acid, is got almost pure from the earth, in Genessee, near the town of Byron. It oozes out from the soil of a low hummock, and may be collected by digging holes in the ground. There are several places where inflammable gas issues from the earth: one is a small lake called Sodom, the bottom of which is formed of grass-green slate, the sides of white shell-marl, and the brim of black mould; the water is uncommonly transparent, so that the basin looks like an immense porcelain bowl; the water is of the quality of that of Harrowgate; the gas issues from it abundantly, and, when kindled, burns along the surface with a bright red flame by daylight.

GEOLOGICAL PECULIARITIES.

In examining the geological structure of the American continent, some singularities have been observed, which are believed not to correspond with the theories formed in Europe on this subject. We shall mention a few of those which appear to be most interesting. There is no

chalk found anywhere in the states, neither is there any roestone (or oolite, as it is called by geologists), though the localities where both might be expected are sufficiently marked. Mr. Maclure states, that some shells of the recent alluvial formations in New Jersey are identical with species found in the secondary rocks. There have been discovered in naked limestone of the elder secondary formation, the prints of human feet; the marks are those of a man of ordinary size standing erect, with his heels drawn in, and his toes turned outward; the toes are much spread, and the feet flattened, like those of people not accustomed to shoes; the impressions are strikingly faithful, exhibiting every muscular swell and depression with accuracy. Every thing seems to warrant the conclusion, that these marks were made at a time when the rock was soft, and received them by pressure, which geology dates at a period very long indeed before the general flood. They were examined by Governor Cass and Mr. Schoolcraft, at St. Louis and Herculaneum, on the Mississippi, and they exist also at the Cumberland mountains, always in the same kind of limestone. Other singular facts (unconnected, however, with the above) have been observed in this district. At Pickaway plains, on the Ohio, a human skeleton was found seventeen feet below the surface, in a bed of pebbles and shells deposited by water, and having nine feet of earth over them. At Cincinnati, in digging a well, an arrow-head was found ninety feet below the surface; and in Illinois, fragments of antique pottery and jars of coarse earthenware have been found at a depth of eighty feet below ground. In forming the Erie canal, the workmen, when digging this ridge of gravel, found several hundred living shellfish at a depth of forty-two feet. They were chiefly of two kinds of *mya*, a salt-water mussel, of which several species exist in Britain: one, called *smurstin*, is used for food in Zetland, and another is eaten about Cork, where it is called *sugar loons*; we do not know if the species which were dug out of the gravel are found among the present American shellfish. *Living toads* have been found in America, as here, in solid rock, of what has been called the millstone-grit.

PECULIARITIES OF DIFFERENT DISTRICTS.

America is generally considered and spoken of as one country, its people as forming a single nation, and the remarks which are made with regard to one part of it are supposed to be equally applicable to all. No idea, however, can be more fallacious. The region which we term the United States is composed of sections of country as remote from each other as London is from Constantinople, or Madrid from Berlin: they lie under different climates, and the different circumstances under which their inhabitants are placed form in each a totally different set of manners. The English language is common to all, and they all profess the Christian religion; but in most other respects the difference between them is as great as between any two European nations. The great divisions under which the country ought to be viewed are the north-eastern or New England states, in which for the present may be included Pennsylvania; 2d, The southern or slave states, to which section also we may refer Kentucky and Tennessee; and, 3d, The new states of the west, which are in progress of settlement. The manners of the New England states are formed on the model of those of our own country, and there are few circumstances in the nature of the climate which tend to produce any material alteration; it is among them only that due provision is made for the education of the people or for religious instruction. The productions of the soil—the modes of agriculture—the arts and occupations to which these give rise—the alternations of season—and many other things, have all a resemblance to those of our own country. They cultivate wheat and the other European grains; their garden vegetables, potatoes, turnips, carrots, cabbages, &c., are the same as ours; they employ the same domestic animals; and they use, of course, the same agricultural implements, the same grist-mills, &c., requiring also the same tradesmen to prepare and work them.

Even in these great divisions which we have pointed out, there are portions which differ exceedingly from each other. New Orleans, for instance, which belongs to the slave states, has a completely different set of manners from Charleston in South Carolina. The former is a city of immense trade, situated at the mouth of the great river Mississippi; it contains a mixed population of blacks of all shades, and of white men from every nation in Europe. Its streets are crowded and speckled with people of every colour; its quays with ships of every country; and its wharfs are loaded with bales of goods from all quarters of the earth, some coming from Europe or from China, to be carried for three thousand miles up the inland rivers of America; others sent down these rivers some months' voyage, to be carried to the West Indies or the Mediterranean. The air of the place is unwholesome, and it is a mart where people hurry to make money before they be overtaken with disease and death. Such are the influences under which the manners and character of the people of New Orleans are formed. Charleston, on the other hand, is the capital of a wealthy agricultural state; the pursuits of the people are not decidedly commercial; the town is the resort of numerous country gentlemen, who pride themselves rather on the oldness and respectability of their families, and the extent of their property, than on the activity of their business habits. The gentry strive to keep up, between themselves and their slaves, an exterior resemblance to the feudal relations of Europe; coats of arms are fashionable, as are liveries for servants: there is a general air of elegance and splendour in the buildings of the town: some of the houses "are real palazzos, surrounded with orange trees, magnolias, and other trees of an almost tropical climate." There is much taste for the fine arts among the higher classes, and among the lower an absence of all that bustle and variety of language and dress which mark a great commercial city. It is obvious, therefore, that the manners of these two places can have very little in common.

If we glance at the northern states, we shall find a difference of a similar kind existing between New York and Philadelphia. The former city is the great thoroughfare of all emigrants and commercial agents who arrive from Europe; the people passing through it daily are sometimes estimated at 15,000 or 20,000; it lies at a central point, having communication, by rivers, canals, and railroads, with the whole northern parts of the American continent. Grain, provisions, lumber, and manufactures, are brought from countries a thousand miles inland, for exportation, or for the use of places along the coast which have not the same facility of conveyance. People arriving there are secure of finding a passage to every other city inland or coastways; hence the streets and quays are constantly crowded with travellers and their luggage. The extent of its commercial transactions gives a facility to those who wish to engage in any kind of speculation, because here they can always learn the prices or the demand for every article of American produce; hence there is a restlessness, bustle, and continual spirit of change among its population, or a great part of it, which it would be vain to seek elsewhere in Europe or in America. Philadelphia, on the other hand, though also a place of very extensive commerce, has fewer channels of communication with the distant inland countries, and has of course a smaller variety of produce either raw or manufactured: hence there is less speculation; business proceeds with more steadiness, but less apparent bustle; there is in the streets an air of quiet regularity

where every one seems to go easily and leisurely about his business: and the transit of strangers through the place is but inconsiderable. The prevailing religion, which is Quakerism, has also a manifest influence in producing these effects. The influence of circumstances upon the manners of a people is nowhere more remarkable than it is here in the case of the negroes. Slavery is not permitted in this state; and the inhabitants do not countenance in all its severity that feeling of contempt with which black people are regarded in other parts of the Union; hence the Africans reside here in freedom and comfort, while they see their countrymen, a few miles to the southward, poor degraded slaves; and they are generally in consequence a contented, cheerful, and industrious caste.

Again, if we look at the western states, we shall find that, though there is a certain uniformity of manners over the whole, they are here also differently modified, according to circumstances. Pittsburg, for instance, with the neighbouring towns, Wheeling and Steubenville, are in the centre of a country which is rich in various kinds of minerals—coal, iron, lime, &c.; they are therefore filled with a manufacturing population, and the pursuits, appearance, and manners of their inhabitants, differ from those of the country around them, as those of Birmingham may be supposed to do from other places in the centre of England. The town of Cincinnati, again, which is situated on the Ohio, as these places also are, is a great inland depôt for merchandise to be exported or imported. Its inhabitants are merchants, attendants in counting-houses and warerooms, owners of river steamboats, and a population attracted by the general trade of the place, while there is also a large number who are occupied in the very peculiar business of killing and preserving for exportation the immense quantities of live-stock reared in the country.

CLIMATE, SOIL, AND NATURAL PRODUCTIONS.

The state of Maine, which is the farthest north of the Union, reaches to latitude 48°: Florida, on the south, extends to within 25° of the equator. Between these two points there is a great variety of climate, and the differences of temperature are increased by the flat or sheltered situation of some districts, and the mountainous features of others. The New England states and Pennsylvania, lying between 40° and 48° north, approach nearest to the climate of England; but, owing to causes which are not yet perfectly understood, the whole Atlantic coast is warmer in summer and colder in winter, by about 10 degrees, than the same latitudes in Europe. Some of the plants of this country, such as the holly, and the common *whin* or furze, when transplanted thither, fade equally under the heats of summer and the frosts of the cold season, and cannot be preserved except in greenhouses. In winter the rivers are frozen, so as to bear horses and wagons. The air is in general drier than in this country, and wet showery weather much less frequent; so that farm work is conducted with more regularity and more security than with us. Winter does not set in till the middle of December; after which frosts continue with more or less severity till March, with frequent and great changes from mild weather to intense cold. In April, the season becomes again fine, sunny, and dry.

In the states south of the Potomac, the climate is much warmer; the winters, which indeed are hardly to be called winters in our sense of the word, are short and mild, frost being little felt except during the night. The heat of the warm season is like that of tropical countries; but this is felt chiefly on the sea-coast, which is in general low, flat, and far from healthy. The inland parts being more elevated and hilly, the climate there is more temperate. The whole coast from north to south is subject to tremendous hurricanes, which sometimes do much mischief.

The climate of the western states, forming what is called the Basin of the Ohio, is different both from that of New England and from the southern districts in the same latitudes. The *average temperature of the year* is nearly the same at corresponding points on both; but there are fewer inequalities in the west, neither the heat nor cold reaching the same extremes. The thermometer seldom falls more than ten or twelve degrees below the freezing-point. Frost does not become permanent till near the close of December, when standing water and small rills are frozen from three to fifteen days. Many plants, such as the cotton, the catalpa, sassafras, the Illinois nut, flourish in the western states, in latitudes where they would not thrive on the sea-coast. The air is more moist, fogs and heavy dews more common.

Soil.—That portion of the New England states which lies east of the river Hudson, is broken and hilly; the soil in general thin, unproductive, and better adapted for pasture than tillage. From New York, all along the sea-coast southward to the Mississippi, there is a tract of flat sandy soil extending inland from thirty to one hundred miles; it produces nothing but shrubs and pine-trees, except on the banks of rivers and marshy places, where rice is grown. Backward from this line to the foot of the Alleghany Mountains, there is a tract of coarse land of variable breadth, but of great fertility. The Alleghanies themselves are not cultivated, but the valleys between their ridges are rich and useful lands. The district inland from these is the Basin of the Mississippi, a region of vast extent; it is generally bottomed on limestone, well watered, and inexhaustibly productive.

Agricultural Productions.—Oats, rye, and barley, are raised in all the northern states, and also in the hilly districts of the south. Of barley, two crops in a season are obtained in favourable situations. Maize is common to every part of the Union, but thrives best in the middle states; it is a vegetable adapted to a greater variety of soil and climate than wheat, and yields a much larger produce. The sugar maple grows everywhere, but thrives best in the good maize districts. Wheat is also cultivated through the whole Union; but it is only a profitable crop to the north of the Potomac, or in the hilly districts of the south; in these situations it yields large returns, and of excellent quality; in the low warm districts it is not cultivated; these are more favourable to the rice crop. In general, it is remarked that the late wheat countries are favourable to the European constitution, and that in rice countries, which are warm and moist, the African population has a great advantage in respect to health and longevity over whites.

The cultivation of tobacco begins in Maryland, in latitude 39°; it is raised to a greater extent in that state and in Virginia than in any others of the Union; but it thrives also in all the western states. Cotton does not succeed well farther north than the latitude of 37°, though some of the districts raise it for domestic use; it forms the staple of all the districts south of the river Roanoke. The best kinds grow in South Carolina and Georgia, in dry situations, upon the sea-coast. The cultivation of rice occupies nearly the same region as that of cotton: it is a very unhealthy occupation for the slaves who are engaged in it. The climate which is favourable to sugar does not extend beyond the latitude of 32°; it is raised in the states chiefly for domestic use, and is not an article of export to any extent. The crop is rather precarious, from the frosts which sometimes occur even in the most southerly districts. Indigo has been tried in America, but could not come into competition with that of Bengal.

The vine grows spontaneously in most of the southern and western states, and is cultivated as a fruit about Phi-

ladelphia. The mulberry tree, hops, and hemp, all succeed well in the middle and western states.

The timber trees of the states are of numerous kinds, and many of them of the best quality. There are twenty-six kinds of oak, of which eleven or twelve species are in request; the best for common purposes is the *white oak*, a tree which is found plentifully over the whole country: the *live oak* grows in marshy places near the sea, and has a hard, heavy, and durable timber, much used for ship-building. There are eighteen kinds of pine, cedar, and larch; seven kinds of maple, three or four of which furnish sugar—the best is called the sugar maple; ten kinds of walnut trees; four kinds of birch, the bark of one of which furnishes the Indians with canoes; six kinds of ash (the ash of this country is not of the number); besides many other trees, of very useful qualities. There are one hundred and thirty kinds which rise to a height of more than thirty feet; while in France there are only thirty-seven of that size. The flowering shrubs, *kalmia* and *rhododendron*, which are cultivated here with so much attention for their splendid flowers, grow wild on the sides of the American hills to the height of fifteen or twenty feet.

Even in the most thickly peopled states, there are still remaining large tracts of uncleared woodlands, which give the country a wild appearance, and form an aspect on the whole very different from any thing seen in Europe, where forests have long been too valuable to be allowed to remain uncut.

RATES OF PROFIT, WAGES, AND STYLE OF LIVING.

There is abundance of fertile land in the United States, which needs only to be broken up and cleared of woods to yield large returns for a slight outlay. There are none of those obstacles to the cultivation of solitary districts which exist in the lawless or unimproved condition of some other countries. Property is secure everywhere, and there is hardly any spot, however remote, which has not ready communication by rivers, canals, or roads, with one or other of the large cities. Hence, fertile lands which are of easy access are to be found by every one who is at a loss for employment, or who thinks his present occupation less profitable than he would wish. On such soils, the accumulation of capital in agriculture is much more rapid than has ever been exhibited in any other nation. The valuations of 1799 and 1814 furnish interesting information on this head. From these it appears, that, in the fifteen years between these periods, the value of lands and houses (not reckoning slaves) in the seventeen states, had, on an average, increased one hundred and sixty per cent., or from a hundred to two hundred and sixty. The rate of increase for the whole is about 6¼ per cent., and the original capital is doubled in about eleven years. At this rate, capital accumulates more than twice as fast as population; or in other words, the increase of the people is always met by a double increase of the means for employing and maintaining them. These remarks are derived from the condition of the agricultural population; but they apply equally to the whole, the rate of profit being the same in all occupations. No man will submit to take small wages, or to carry on business with slender profits, where he can betake himself to farming, with the certainty of acquiring, in a few years, an independent property, especially where agriculture requires as yet no particular skill or apprenticeship to secure adequate success. The legal rate of interest is seven per cent.; and when money is lent for commercial speculations in the western states, ten per cent. is reckoned favourable terms. The average price of labour was reckoned in 1815 at 80 cents, or 3s. 4d. per day; wheat at 1½ dollar, or 6s. 9d. per bushel (27s. per boll); and at these prices, it has been computed that a labourer can earn as much in one day as will maintain himself, his wife, and four children, for three days nearly. Hence the style of living among all classes is full and liberal; there is less perhaps of that princely but unfeeling magnificence, which, in the palaces of Europe, is so often beheld surrounded and besieged with the importunity of beggars; but there is an equal distribution of comfort everywhere. The houses of the middle classes are well and conveniently furnished. As a specimen of the way in which they live, we may mention, that a man who pays 13s. 6d. per week for board, lodging, and washing, dines at the family table, where there is a roast turkey once or twice a week, fowls, beefsteaks, ham, sausages, pudding, pies, soup, fish, &c.; a variety of these are given at every meal, and generally three kinds of vegetables, with coffee or tea at breakfast and supper.

A beggar is scarcely to be seen; but there are persons in all countries, who, from age or bodily infirmities, are unable to support themselves. In America, these are reckoned on the sea-coast at one to two hundred and thirty of the population; in the interior at one to three hundred and fifty, most of them foreigners or worn-out negroes. In England, the proportion is one to six or seven of the population.

POPULATION OF THE STATES.

The rapid increase of population in the United States is one of the most interesting circumstances connected with their history. When the general style of living among any people is comfortable, and they continue at the same time to add rapidly to their numbers, it is a proof that their country affords abundant resources for subsistence, and that they have industry and skill to turn these to good account. England doubles the number of her people in about one hundred years, Scotland in one hundred and fifty: in America they are doubled in about twenty-five years, and it is reckoned, that, by the end of a century from this date, if the same increase continues, the American population will be more than two hundred millions—a number greater than that of any nation at present speaking one language on the face of the earth. From the rapidity with which successive generations come forward, it is generally remarked that the number of aged persons in any neighbourhood appears small compared with the multitudes of young people by whom they are surrounded; and from the same reason the number of individuals below sixteen, who in other countries form hardly a third of the population, are in America fully one-half of the whole. In Carolina and Kentucky, the number above sixteen was considerably less than that of those under it.

The population at successive periods has been given as follows from the official census:—

	White People.	Blacks.
Population in 1790,	3,929,328	697,697
... 1800.	5,309,758	896,849
... 1810,	7,239,903	1,191,364
... 1820,	9,638,166	1,538,061
... 1830,	12,856,177	2,010,436

These returns show an average increase of thirty-three per cent. in ten years; a rate incomparably greater than has ever been witnessed in any other country. The number of persons who come from Europe to settle in the states is estimated variously, from 8000 to 20,000 yearly; the most accurate accounts incline to the former statement. The number of foreigners not naturalized who were residing in the states in 1830 was 53,687; and as these persons cannot be naturalized till they have been five years in the country, this amount, with a little deduction, may represent the arrivals during the last five years, which will therefore be about ten thousand per annum.

The census for 1830 gives the number of persons

who have attained the age of one hundred and upwards, as follows:—

White men above one hundred,	297
Ditto women,	234
Black people—men,	1099
Ditto women,	1011
	2641

The proportion of black people who live to a great age appears therefore to be much higher than that of the whites. This advantage the African race seem to possess chiefly in the southern districts. In ten of the states south of the Ohio and Potomac, the whole number of white inhabitants was five and a half millions, the number of blacks one million and a half (nearly); yet of the former only three hundred are above one hundred years of age, while of the latter there are 1780—a circumstance which shows that the climate of the south is better fitted for the negro constitution than for that of white people. Of the latter, only one in nineteen thousand arrive at the age of one hundred; while of the Africans one in every nine hundred reaches that age. On the subject of longevity we may mention, that, in August, 1817, within a circle of twelve miles in diameter, in North Carolina, there were living sixteen persons between eighty and ninety years of age, twelve from seventy to eighty, and twelve from sixty to seventy. A child was lately born there whose father was eighty-four and mother fifty-seven years at the time of birth (*Warden's United States—Walsh's Register*). In Cumberland county (Virginia), seven persons died between the ages of ninety and one hundred and twelve years, within a short time of each other. In South Carolina it is remarked, that all who could be found above eighty (1808) were emigrants from Europe, and living in the upper billy country.

THE COLOURED POPULATION.

Slaves.—The states which continue to support slavery are those which lie south of Pennsylvania and the river Ohio, with the new districts to the westward of the Mississippi; in all the others it is abolished. The whole number of slaves in 1830 was two millions. The condition of these poor people is everywhere very low; the field slaves are fed, lodged, and attended to, exactly on the same principle as that on which farmers in this country take care of their oxen and horses; a planter is sorry to see them dying or diseased, because he loses their labour, but they meet with no farther regard. It is frequently profitable to cultivate rice in very marshy grounds, or in fields artificially overflowed, where the negroes must work up to their knees in water in the heat of the day. Numbers of them take sick and die in this unhealthy occupation; but the planter only calculates whether the profits of his crops will pay for the number of new negroes which he is obliged to buy; he never thinks of the distress of these poor people, and even takes credit to himself in being liberal in sacrificing his blacks, in order to keep those rich grounds in cultivation which otherwise must be lost to the country. Mr. Stuart of Dunearn mentions, that even where the slaves were well fed and attended to (as it is the interest of every proprietor to do with his cattle), he found them, in respect to knowledge and feeling, little removed from brutes, while all declared themselves unhappy and miserable in their situation. When their tasks are found deficient, they are whipped, put in the stocks, or forced to wear irons. One person was in the habit of punishing his slaves by fixing them down in coffins, and some of them had died under that treatment. The cruel owner might have been punished by law had there been sufficient evidence of the facts; but as he took care to have no one present but slaves, whose testimony is not admitted in the courts, nothing could be done.

The gangs of slaves on large estates are in general tolerably well fed and clothed; but there is a numerous class of slaves belonging to very poor, and often very improvident, white people, and these are exceedingly wretched, toiling hard, with little subsistence and the harshest treatment. In all cases, the slaves live together with little more feeling of the decencies of life than the brutes that perish. Even when they are employed as waiters in the large inns and hotels of cities, they are not furnished with beds, all lying like dogs in the passages of the house. There are laws by which every one who shall teach a slave to read, or permit him to be taught, may be imprisoned for twelve months. The advantage of having labour performed by slaves, is to the proprietor very considerable: they are maintained at an annual expense of about thirty-five dollars each; while the interest on their original cost, at ten per cent., may be forty dollars; the amount is seventy-five dollars, or about £17 per annum. Now, the wages of a white labourer are here three times as great as in Europe, and cannot be reckoned at less than five hundred or six hundred dollars, from £120 to £150. It is no wonder, therefore, that the proprietors of slaves in America are jealous of any attempts to instruct or emancipate them.

Free Blacks and Coloured People.—From the black people having been first introduced into America as slaves, they are regarded everywhere with great contempt, whether free or in bondage. In the states where slavery remains in force, the free negroes or mulattoes are treated with the greatest contumely; every impediment is thrown in the way of their obtaining education; and the senate of Virginia even voted that the increase of schools for coloured people was a nuisance which ought to be put down: by laws in the several states, any one who may instigate them to resent this ignominious treatment, or in any way to diminish the respect which is commanded to free people of colour for the whites, may be punished by fine and imprisonment. Clergymen in their pulpits, and judges on the bench, are not exempted from this regulation. But even in the free states, though laws of this kind are not in existence, people of colour are subjected to every mortification: they are not allowed to eat at the same table with white men, to attend at the same public meetings, or even to enter the same churches. From being thus always exhibited in a kind of degraded light among the more powerful class, they have not the same respect for themselves which they ought to entertain. Of the persons who are punished for crimes, a larger proportion are people of colour than whites. They have a greater difficulty in getting proper remuneration for their industry or talents than that favoured class; and their exertions are discouraged in all the higher lines of life. Numbers of them, however, notwithstanding all these difficulties, rise to great wealth, and live in a style of much elegance. They have churches and schools for themselves, with ministers and teachers of their own people. Great exertions are making by the Quakers, and other benevolent persons in the free states, to establish and maintain respectable schools for the education of black children. As the memory of their former slavery wears away, they will come to be regarded in a more favourable view. The whole number of free coloured persons in the states is about 300,000.

The Indians.—The number of Indians now remaining within the territory of the states, is estimated to be somewhere between 400,000 and 600,000; of these, about 75,000, consisting of tribes called Cherokees, Creeks, Chickasaws, and Choctaws, are in possession of tracts of land lying contiguous to each other in Georgia, Alabama, and Tennessee. There have been some disputes concerning their territory, and some of the adjoining states have used very despotic means to have them ejected from it: they still, however, retain possession

and as any violence done to them directly would excite much odium both in Europe and among well-thinking people in the states, they are likely now to remain undisturbed. They have quite renounced the character of savages, and are all more or less in progress towards civilization; they cultivate wheat, maize, pumpkins; rear cattle and horses; manufacture cloth, oil, leather, &c. The tribe which has made the greatest advances is the Cherokees, whose population, in 1824, was 15,560; in 1810, it was 12,400, so that they are not falling off in number like the other Indians. They possess a fine, well-watered, and arable country of five millions of acres; agriculture is well understood; apple and peach orchards are common; butter and cheese are procured of good quality; they have slaves, good horses, and about 22,000 head of cattle. Several of them are good tradesmen, as blacksmiths, weavers, millers; and they have saw-mills, grist-mills, wagons, and other furniture of an improving community. They have a newspaper edited by one of their own people, in their own language. Numerous and flourishing villages are seen in every section of the country. They are remarkably clean and neat in their persons, and practise bathing universally. A young man solicited the hand of a young Cherokee woman: she refused his offer, and gave as a principal reason that he was not clean in his appearance; that he did not, as the Cherokees do, bathe himself in the river. They consider bathing and cleanliness in the light of a moral virtue.

The Choctaws, Chickasaws, and Creeks, have not been so much noticed as the Cherokees; but they, too, are in a satisfactory progress towards civilization. They have good orchards and corn-fields, and some of them are the owners of inns or hotels on the roads through their country, which are found, we believe, to be very comfortable places of entertainment to travellers. There are a few books in the Choctaw language; and the Creeks produce very neat articles of pottery, jars, vases, &c., and pipe-heads of black marble. Their ploughs, spinning-wheels, &c., are a further proof of their thriving condition, and the growth of economical habits.

The Indians in the northern part of the states, and along the lakes, retain much more of the idle unsettled habits of their ancestors than the southern tribes; and those of them who remain near the white settlers are little superior in appearance or character to the gipsies of Europe. Reserves of land have been set apart for them out of their former hunting-grounds, and in many cases these have been entirely surrounded by the farms and settlements of the whites, the Indians still remaining in their original patch of forest. In this state, they appear to be like animals of prey under confinement; their natural occupation is taken from them, and they seem to have no powers for any other. Their numbers are found to be smaller upon every enumeration; and their idle, uncomfortable way of living, with the disrespect which is everywhere shown them by the whites, tend greatly to prevent any spirit of union among them, or any steps to prosperity. Some few of them have settled into agricultural communities, and have built houses, churches, &c.; others have submitted for a time to the instruction of missionaries. But as this adds nothing to their respectability among their own people, who prefer a good hunter to a good mechanic, they have seldom the steadiness to persevere.

Treaty stipulations, as they are called, have been entered into between the American government and most of the Indian tribes, for the removal of the latter from the east to the west side of the Mississippi. This has been partly carried into effect, and it seems likely that the Indians will soon be removed altogether out of the states. In 1838, 25,139 Indians emigrated beyond the Mississippi, and by this the American government acquired 18,250,000 acres of land, for which was paid 3,738,000 dollars in money or in lands.

"With regard to those Indians who refuse to emigrate, it has not been deemed expedient for the government, by its own act, to partition out to them the land necessary for their support, or to decide upon the consideration to be allowed for the residue, and to direct its appropriation. This, so far as regards the general government, has been, and continues to be, the subject of conventional arrangement, in which the parties, by mutual discussion and compromise of opinion, arrive at a satisfactory result. In these arrangements, where the parties desire it, adequate tracts of land in fee, with temporary and wholesome restraints upon the right to sell, are secured to all who desire to remain."

When the Indians remove from any district, it is stipulated that the ceded territory shall be surveyed and sold, and the whole proceeds, deducting only the actual expenses, applied to the various objects connected with the removal, temporary subsistence, and permanent establishment of these Indians. No pecuniary benefit ever results to the United States from such treaties; the advantages to be derived from these arrangements are limited to the removal of the Indians from their present unsuitable residences, and to their establishment in a region where they may be prosperous, contented, and improving.

GENERAL REMARKS ON AMERICAN MANNERS.

There are perhaps some national traits which may be stated of the American generally, and which pervade all the districts: one of these is that among white people there is not that deference to rank or wealth which is reckoned their due, or at least is claimed for them as such in Europe. The demand for work-people is always so great that they are glad to get them at whatever price; and on the other hand, the men themselves feel much greater independence of their employers; while the employer, on the other hand, is much at a loss if at any time he offend the workmen. This circumstance modifies the whole intercourse between man and man, among the white inhabitants of America. Labourers, very generally sit at meat with their masters; and in families the whole establishment, masters and domestics, eat at the same table. The American working people seldom, however, bring up any of their children as house servants, which among them is reckoned a degrading employment; and if any of them submit to act in that capacity, they will still not allow themselves to be called servants, but are denominated *helps*. The name "*master*" is also disliked; and an employer is generally called *boss* in preference. In consequence of this unpleasant kind of feeling, which imposes a sense of degradation on one party, and of constraint on the other, white people are as seldom as possible sought for as house servants; these are generally blacks or mulattoes, who are not allowed anywhere in the states to eat with white men, and who therefore never think of it, nor feel hurt about it, when in service. The difficulty of getting servants, and the high rate of wages, leads every one, as far as possible, to do his own work. A gentleman of considerable property goes to market, and brings home a turkey for dinner; if he even mend his own shoes, it is not thought anywise strange. Judge Marshall (Chief-Justice) used to carry home his dinner in his hand, and no one appeared to think it unbecoming.

In their domestic manners, there are some peculiarities which may be mentioned. They live a great deal in large boarding-houses, or hotels, instead of having homes of their own; and travellers passing through the country, in stopping at any town, have frequently the opportunity of dining at the inn with a great part of the respectable persons of the place. Work-people adopt very generally the same mode of living; and there are houses in the different towns where as many as forty or fifty board and lodge together, paying at a certain rate per week a

month. Even young married people frequently live in this way for some years, not troubling themselves with a separate establishment till it be absolutely necessary for their family. Marriages are generally a great deal more early with them than in this country; a circumstance which contributes to this practice of boarding, as young people, though they have always abundant employment and subsistence, cannot till after some time accumulate sufficient for furnishing a comfortable home. We have Mr. Cobbett's authority for stating that long courtships receive no countenance from young ladies in America; females of every rank very quickly dismiss a lover who requires time to make up his mind. It may be noticed here that women everywhere receive the greatest attention, both in their families and when they have occasion to go abroad. Captain Hall, who seems at one time to doubt concerning this circumstance, says in another, "it is a rule which we saw universally attended to in America, never to think how men shall fare, till every female has been fully accommodated." As a proof that the same feeling exists among the working classes, we may mention, that in farming establishments the females are never asked to do any work out of doors.

On American manners, Mr. Shirreff, in his Tour in North America, has the following remarks. "On reaching the United States, the plainness of the people's manners appeared remarkable. In all classes there was a total absence of grimace and corporeal token of respect, with corresponding sounds of address and expression of obligation or thankfulness seldom heard. But on the other hand, vulgarity, rudeness, and impudence, is almost never met with in the humblest walks of life. A general propriety of deportment and softness of manner pervades the lower classes. In America every individual seems possessed of self-respect, and, in the intercourse of life, arrogance is seldom assumed and never submitted to. The civility of all classes in the United States is so universal, that, during my intercourse with the inhabitants, I scarcely experience an indication of insolence, and never observed that democratic sauciness which I was taught to expect amongst the lower orders."

There are certain laws in the United States which have a peculiar influence on the manners of the country. It is not, for instance, allowed for a rich proprietor to leave the whole of his wealth to any one of his children; the laws direct that it shall be divided equally, or nearly so, among the whole. Hence large properties are broken down, and the aristocracy of landholders, the most important class in all other countries, have no existence in the states. As it is this class which in Europe gives the tone to a great many of the observances and even feelings of society, the want of it in America has a powerful influence in forming a set of manners different from ours; the farmers there are almost universally the proprietors of the land which they occupy, and it is seldom very extensive. They have no rents to pay, and they cultivate only the best soils; hence they have always large returns on their outlay; and though few of them acquire great fortunes, the majority are in easy circumstances. Some of the southern planters, who are the richest *class* in the United States, have incomes as high as £18,000 or £20,000 per annum; many have from £3000 to £5000, but the incomes of the majority do not probably exceed from £700 to £1500 per annum. The next class to the planters, in point of wealth, are the great merchants in the commercial cities, some of whom possess fortunes of £250,000; these, however, are not numerous. As none of these sums are, however, equal to the large fortunes which are inherited in Europe by the accumulations of several generations in one person, it is evident that there cannot exist in America those clubs of enormously wealthy individuals, who have such a powerful influence in all the affairs of the older countries. Extensive concerns and great establishments, which in other countries are supported by single individuals, are here carried on by joint-stock companies: not only is this the case with banks and canals, but with mills, steamboats, woollen, cotton, and iron manufactories. The shares in the stocks of these companies are generally small, and thus afford a ready means for mechanics, labourers, and persons of all classes, investing their savings with advantage.

From the comfortable circumstances in which people of the middling classes generally find themselves, there are not the same restraints upon their moving from place to place, to improve their circumstances, as there are in Europe. Young persons have never the apprehension, for instance, of leaving their parents destitute, or dependent upon others, which often keep them at home with us. Married people, again, with a growing family, have generally a sufficient stock to enable them to move away with all their children, and take a long journey in whatever direction they may see a prospect of thriving. In England, where they have hardly a sufficiency from one day to another, this would be impossible; and hence the small number of working people in this country who are able to transport themselves to take advantage of the higher wages and better living of America. The journey by canal, river, and lake, to some of the back settlements there from the coast, is more expensive than that of an English family would be to Halifax, and the improvement of circumstances hardly so great; yet how few in this country, to whom this improvement would be the greatest, are able to take advantage of it! This power of shifting their place, and seeking to better themselves, has had a more peculiar effect upon the character of the Americans than any other circumstance. They have less of that superstitious attachment to one spot than is found in poorer countries, where the people cannot leave it: families think little of a journey of some hundreds, or even thousands of miles; and the numbers who are continually moving with their luggage, has made the opening of new canals and railroads to distant parts more profitable than it could have been in any other country.

RELIGION.

All forms of religion are equally favoured by the state in America, and the members of all have equal privileges. None of the clergy are paid by government, or out of public property, in any shape; they depend for their salaries entirely upon the congregations for which they officiate, and by which they are elected. The bishops, ministers, elders, or other officers, are chosen by the members of each persuasion, according to their several forms of church government, without the intervention of any other party. There are a great number of different denominations of Christians in America; the principal are the same as in this country, consisting of Catholics, Protestant Episcopalians, Presbyterians, Quakers, and the various classes of Independents. In some of the states there are certain denominations more prevalent than others. New England, for instance, was settled by the Puritans in Cromwell's time, and its religious condition bears the impress of that origin. Maryland was colonized by Roman Catholics, who are still numerous there: Pennsylvania by the Quakers or Friends; while Episcopacy prevailed in Virginia, the Carolinas, and Georgia. The first Presbyterians came from England, Scotland, and Ireland, and settled in Delaware and New Jersey. If the whole population of the states were divided into twelve parts, three of them would be Calvinists, chiefly of the Independent and Presbyterian sects; two Baptists; two Methodists; one Episcopalians and Lutherans. The rest include persons of many various forms of belief, and a considerable number who follow no religious profession.

WEBSTER, N.Y. 14580
(716) 872-4503

There are about sixty colleges and seminaries for the education of young men devoted to the church, of all the different sects. In New York, it is found that there is one clergyman to every 1384 of the population; in Pennsylvania there is one to every 1123; in Kentucky, one to every 1377 of the white inhabitants. In Great Britain, the proportion is one to every 800 or 900—in Europe generally, one to every 1000. It must be recollected, however, that in America this whole number are actually employed in the ministry; there are none of them who are merely dignitaries, or who hold offices without labouring for the instruction of the people: this renders the proportion of actual religious teachers greater than at first sight it appears, when compared with the number of clergymen in European countries.

These remarks apply chiefly to the old-settled states of the east and north; and on this subject we beg to give the following extract from the work of a recent traveller of our own country, Mr. Fergusson of Woodhill:—

"The religion of the states is marked by some peculiar features. It has been too frequently disgraced by wild and extravagant fanatics, and Unitarianism has in many places made dreadful strides. Still, the conclusion to which I have come is favourable to the growth of pure and vital Christianity in the populous and civilized portion of the states. I observed, in public and in private, a decent observance of the Sabbath. The official papers of the government uniformly recognise the superintending care of a beneficent God. No shops were to be seen open on the day of sacred rest, still less were the theatres or places of public amusement; public travelling was not in general use, and the transmission of the mail on that day had been debated in the preceding session of Congress, when the question was lost, chiefly on the ground that the constitution forbade any interference by government with matters of conscience. There can be no doubt, however, that Sabbath profanation is practised in some quarters to a great extent. As regards the fruits of religion, there can be little question, that, taking them as a people, the citizens of America are virtuous and exemplary. Conjugal infidelity is extremely rare, and in more than one of the states is visited by fine and imprisonment. In the large cities, at least of the middle and northern states, vice does not stalk abroad in that disgusting form which may be said to deprive respectable females in European towns of the free enjoyment of our public spectacles and walks."

We give one more extract on this subject; it is from Mr. Stuart of Dunearn:—

"We went to attend divine service at Mr. Stebbings's church. He had gone from home, and was unavoidably detained; and the person who had promised to officiate for him failed to appear, in consequence of the morning being stormy. The congregation assembled—a pause ensued: at length Dr. Smith, one of the elders, rose, and said, that they ought not to separate without discharging those religious duties which had led them to assemble on the first day of the week. He then gave out a psalm from his own seat, and afterwards prayed. In the mean time, he had sent home one of his daughters for a volume of sermons, one of which he read. A second psalm was given out by him and sung, after which the service was concluded by a prayer from Mr. Lister, a farmer in the neighbourhood, and one of the elders—the whole without any appearance of bustle or exertion." There are a great number of religious newspapers in America, which is a further proof of the serious habits of a large part of the population.

The remarks we have here made apply exclusively to the New England states, and to the older settled districts of the east; they may also perhaps be extended to the *towns* of the newly-formed western states, in which much attention is given to religion. In the slave countries, however, this condition is altogether reversed. North Carolina, with a population of 600,000, has hardly fifty clergymen; and South Carolina, with 420,000 inhabitants, has not more than forty. In Georgia there were only ten in 1818. In Virginia, the population is about one million; the number of clergymen not one hundred. The situation of Maryland is similar.

In the countries on the Ohio, Michigan, &c., which are in progress of settlement, there are no regular churches except in towns; the only opportunity the colonists have of attending sacred ordinances being at field-meetings, or *tent-preachings*, as they would be called in Scotland, which are held in the forests, and are sometimes continued for several days. The first settlers in these districts are generally rude men, and little heedful of religious matters; but these meetings serve to keep alive among them a feeling of what is due to their character in this respect, and, as the population becomes more dense, gradually lead to the establishment of regular pastors and churches.

MEANS OF EDUCATION.

The state of the people in respect to education is very different in different parts of the states. In the old settled districts, the proportion of well-informed and well-educated people is greater than in most countries of Europe. In the slave states of the south, and in the western districts, which are as yet only occupied by a thinly-scattered population, the number who can read and write is very small in proportion to the population. Some idea of these different conditions in respect to education, may be formed from the following account of the number of students at college in the different districts in proportion to the whole inhabitants of each:—

In the eastern or free states,	1	student to	1231	inhabitants
" middle slave states.	1	"	3465	"
" southern slave states.	1	"	7232	"
" western or new states.	1	"	6060	"

There are at present ninety-five colleges in the United States, under the direction of the various religious sects.

In the New England states, it appears, by the number of young men who are thus receiving a liberal education, that there is care taken to provide instructors for the rising generation, as well as to secure respectable attainments in those who are to exercise the professions of clergymen, lawyers, medical men, engineers, &c. In the slave states there is a lamentable deficiency of all this. In the newly-settled districts it cannot of course be expected that people so thinly scattered over the wild should have regular means of education.

In the New England states the means of instruction provided for the children of the labouring classes are in general such as to put the knowledge of reading, writing, and arithmetic, within the reach of all. Every state has a public fund set apart for paying the salaries of teachers; and if this is not sufficient to provide for each township, the inhabitants are expected to make themselves to make up the deficiency. They generally elect school committees, who build school-houses, choose teachers, and apportion funds, according to the necessities of each parish. Children are entitled to attend all the seminaries without any charge but that of paying for the books which they use. In order further to secure the education of young people who may be obliged to go early to *service*, it is common in these states to stipulate *schooling as part of their wages*. This was in former times a regular condition in respect to young farm-servants in Scotland, only that here they were generally taught by the master or mistress themselves, whereas in America they are sent to school for that purpose. The result of all this is, that the number of people of the working classes who can read and write is more fully greater than in any country of Europe, not even excepting Scotland or Switzerland. The means of education are also

awanting, while the wages of the labouring classes enable them to provide books, and to maintain their children at school for a longer period than can be easily done in Europe, where their services are soon required to assist in maintaining the family. It is remarked, that, "though the number of learned and scientific characters is much smaller than in France or England, the mass of the population are better informed than in either of these countries. Reading the journals universally, and knowing a little of what is doing at home and the world generally, they betray none of that awkwardness which springs from conscious ignorance."

It must not be supposed, however, that this general account of the state of education applies equally to every district. It relates, indeed, chiefly to the great towns, and to the thickly peopled places in their neighbourhood. The remote townships, which in a country so lately occupied form a large proportion of the whole area, are frequently as much deficient in the means of instruction as in regard to religious edification; and they have indeed little anxiety to improve themselves. Many of them pay no attention to the regulations for establishing schools, and, were it left to themselves, would allow their people to remain as they are, without either reading or writing. In America, however, as in most other free countries, the well-informed portion of the community is the most active, and, like the little leaven which leavens the whole lump, it is continually at work to stir up a desire for information and light in all the dark places around it. The operations of benevolent societies have the same effect in the remote districts of America which with us they have produced in the Highlands of Scotland and elsewhere; and they are ultimately more successful, because, whenever a desire for information has been excited, the comfortable circumstances of the people enable them to go on educating themselves. In all the newly settled states, lands have been allotted for the erection of academies, and the establishment of regular district or parochial schools, according as the population increases; six hundred and forty acres are generally set apart in each township for this purpose, beside one or two entire townships in each state for university funds.

LEARNING AND THE ARTS.

America has produced several names of the highest celebrity, both in learning and the arts. Classical studies, which used to be looked on as the great test of learning, are not very extensively cultivated; but in general philology, or acquaintance with the principles of language, this country possesses several very eminent scholars—among whom we may mention Mr. Duponceau, a native of France, but naturalized in America, and celebrated for his researches into the history and affinities of the different Indian tongues. Mr. Wheaton, also, who is well known for his acquaintance with the languages and history of the north of Europe, deserves to be mentioned; and a Dictionary of the *English Language* has been published by an American scholar, Dr. Webster, which was reprinted in England, and is highly esteemed. Many American writers of the present day have attained very high fame, and their works stand side by side with the best English authors. To mention those only which are well known in Europe—there are Dr. Channing and Jonathan Edwards in divinity; Irving, celebrated both as an historian and a novelist; Bryant, a poet of high power and elegance; Cooper, whose fictitious narratives have attained a fame hardly inferior to those of Scott, and which exhibit a set of manners completely original to Europeans. It is questionable, indeed, whether there are not as great a proportion of living American writers who have attained celebrity in England, as there are of English authors of the present day whose works are read on the other side of the Atlantic. The American reviews, which often give publicity to the opinions of men of talent in that country, as ours do to those of philosophers and statesmen here, produce frequently as deep an impression as any European publications of a similar kind; and the selections which appear now and then in this country from the American periodical literature, give evidence of as high talent in the writers, and of as cultivated taste in the readers for whom it is prepared, as any thing of the same description among ourselves.

"There is in this country no class of men who can be styled authors by profession. Almost all the works which have issued from the American press have been written by men who have been engaged in some laborious profession or employment. These works have not been written under the shelter of academic bowers, or in the vicinity of large and well-furnished libraries, but under circumstances of inconvenience and embarrassment. It would therefore be unreasonable to expect that they should indicate that degree of erudition and literary culture which might be looked for under more favourable circumstances. Dr. Franklin, the greatest American philosopher, followed during most of his life the profession of a printer; and Dr. Bowditch, the most eminent American mathematician and astronomer, was, during his whole life, devoted to business relating to navigation and commerce, or finance. The most distinguished American theologians, as for example, Mather, Edwards, and Dwight, were devoted to laborious professional duties.

"Since the beginning of the present century there has been a vast increase of persons who have written for the press, and also of the number of works published." The American Almanac, from which the above is quoted, gives a list of 776 names of American writers. The same authority estimates the number of copies of newspapers circulated in the United States at 100,000,000.

In science, the reputation of Europe is so compacted of what her philosophers of former times have done, and of what is now doing by those who continue their researches, that it would be absurd to institute a comparison in this respect. It may be remarked, however, in regard to America, that she possesses men who keep pace with all the discoveries and improvements of the sciences, and who are able to canvass and examine every thing which any new train of investigation may bring to light in other countries: if we add, farther, that one of the most splendid of these original trains of investigation was devised and traced to its result—the identity of the electric fluid with lightning—by the American philosopher Franklin, we shall have said as much for the scientific fame of America, as can be arrogated to itself by any European country. Of the American journals of science, that of Dr. Silliman is well known in Europe, where it enjoys a high and well-merited celebrity. The recent growth of every thing in America has not given time as yet for the formation of those extensive museums and libraries which so much facilitate the researches of learned men in the old countries of Europe; and as the legislature has not power to vote money for these objects, it may be a considerable time before any thing is witnessed there like the splendid national collections of Paris, London, and Rome. There are, however, several museums: as, for instance, those at Salem, Boston, and Philadelphia, whose fame will gradually accelerate their own increase, and may at last attract national attention to the subject. There is no public astronomical observatory in the states, and the expense would be too great for any private means.

In mechanical science, which is the absorbing pursuit of the present day, the Americans have been no whit behind other nations in devising means for facilitating and abridging such processes of labour as are carried on in their own country. Steam navigation, though certainly first discovered in Scotland by Mr. Taylor, was as certainly first brought to a useful and

practical result in America by Mr. Fulton. The machine which was contrived by an American for separating cotton from the seed—that for distilling salt water, or procuring sweet water at sea, by separating it from the salt—some contrivances for abridging the manufacture of iron-work—and many others adapted to the peculiar circumstances of their country—show the Americans to be equally ingenious, and equally acquainted with the resources of mechanical invention, as the English or any other nation.

The science of the Americans, as we have seen, has also been displayed in a very remarkable and useful manner, in the construction of several large canals and railways, some of which are hardly to be equalled in any other country. The same skill is exhibited in improving the navigation of their rivers, in constructing bridges, in architecture, and in ship-building.

FUTURE PROSPECTS OF THE UNITED STATES.

From the rapidity with which the population of the states has hitherto increased, and is diffusing itself over the wide and fertile continent of which it is in possession, the most magnificent anticipations are formed by the Americans of the future greatness of their nation. "Let us assume," say they, "what appears highly probable, that the people of the United States will ultimately spread themselves over the whole North American continent west of the Mississippi, between the parallels 30° and 49°, as far as the Pacific Ocean. This will be found to add 1,800,000 square miles to the territory east of the Mississippi, and, putting both together, the area of the United States, thus enlarged, will be 2,700,000 square miles. A surface of such extent, if peopled to the density of Massachusetts, would contain two hundred millions; or if peopled to the density of Great Britain and Ireland, four hundred and thirty millions. If the population of the United States continue to multiply in the same proportion as hitherto, it is demonstrable that the two hundred millions, necessary to people this vast territory, will be produced within a century." These are indeed magnificent anticipations, and we know no reason why they should not be realized. But we must remark, that, whatever they may add to the national greatness of the American name, they are by no means likely to be favourable in the same degree to the individual comfort of the members of its population. It cannot be doubted but that the high rates of wages and profits, and the rapidity with which capital now accumulates in that country, are partly owing to the large tracts of fertile and easily accessible land, which are always at the disposal of its inhabitants. Were the government weak, ignorant, or partial, these unoccupied territories might exist, as they do in many other countries of the world, without being of advantage to any one. In America, the qualities of the government render them easily available, as long as they last; but nothing can renew the same advantage after it has once been expended. As those splendid prospects, in which the Americans are fond of indulging, approach to realization, the quantities of new land will be daily growing less—the rapidity with which capital now accumulates will be diminishing in the same proportion—the wages of industry will gradually fall off—and as the nation becomes greater and more powerful, in the same degree will the resources of its individual population be lessened. But the truth is, these fancies concerning the rapid increase of population, and the filling of the whole American continent with a nation of unparalleled power, "greater than the sands of the sea in multitude," are mere playthings of the imagination. Too little is known of the real numerical progress of population to enable us to say any thing on the subject; and certainly it is not the circumstance that their immense and fertile country *will one day be fully occupied*, which ought to be a subject of satisfaction or pride to the Americans, however powerful the nation might then be, but rather that their gigantic population has rich fields and abundant pasture in which to carry on its increase for many ages. During this time, it may set an example of equal government and peaceful industry to the rest of the world, which, unhappily, has been hitherto wanting; and by the reception of just principles on the influential part of the old continent, the new nations of the west may be the means of redeeming it from many oppressions. When these are removed, it will be seen, that, in our world too, there is not wanting abundance of unoccupied and rich land; whole kingdoms and provinces of Europe, Asia, and Africa, are at present shut up from industry by one kind of barbarism or other, and the example of America may yet enable mankind to enjoy the advantages of their fertility.

DESCRIPTION OF SOUTH AMERICA.

The southern portion of the American continent is a peninsula of a triangular form, extending from north latitude 12° to south latitude 52° 30′, or, including the Archipelago of Terra del Fuego, to 56°, the small island called Cape Horn, situated in that parallel, being generally reckoned as the most southerly point of South America. In longitude, it extends from 35° to 80° west from Greenwich. It is connected with North America by the Isthmus of Panama. On the south and west it is washed by the Pacific Ocean, on the north by the North Atlantic, and on the east by the South Atlantic Ocean. Its greatest length, from north to south, is 4600 miles; its greatest breadth, from Cape St. Roque in Brazil, to Cape Blanco in Peru, latitude 4° south, is 3500 miles; and it has a superficial area of about 7,000,000 square English miles. As mentioned in the article MARITIME DISCOVERY, the West India Islands were discovered by Columbus in 1492, and the adjacent continent of South America in 1498. In the following year the coast of Brazil was discovered; after which [illegible] various parts of the continent were visited by different navigators, and the discovery of the whole maritime territory was effected in about five and twenty years.

GENERAL ASPECT.

South America may be said to be separated into two portions by the hand of nature, which has raised the huge chain of mountains, *or cordilleras*—the Andes—which run from the Straits of Magellan to the Isthmus of Darien, parallel to the shores of the Pacific. Nature may also be said to have separated it into five distinct regions:—1. The low flat country lying between the foot of the Andes and the Pacific Ocean, averaging from thirty to a hundred and fifty miles in breadth. 2. The valley of the Orinoco, enclosed by the Andes and their branches, consisting of huge plains, or steppes

called by the natives *llanos*. The heat is so intense in these plains during the summer, that the ground is split into great rents or fissures. 3. The basin of the Amazon, or Maranon, which embraces nearly a third of the whole continent, or above 2,000,000 of square miles, and the soil of which is everywhere densely covered with vegetation. 4. The great plain of the Rio de la Plata and its tributaries, consisting of numerous varieties of soil and climate. 5. The elevated country of Brazil, very woody towards the Atlantic, and opening into fertile plains in the interior.

Every thing in South America is upon a grand scale. The mountains, the rivers, the forests, the plains—every feature of nature, in short, is characterized by magnificence and sublimity, and calculated to excite alternately admiration and wonder. In one point are seen mountain-summits above the clouds, white with snows that never melt, while their bases rear the banana and pine-apple. In other places are to be seen ever-living volcanoes, throwing out flames, smoke, ashes, and stones. Then, again, we have vast and dark forests, which never yet rang to the woodman's axe, where vegetation prevails in its most gigantic forms. "In the interior of the new continent," says Humboldt, "we almost accustomed ourselves to regard men as not being essential to the order of nature. The earth is loaded with plants, and nothing impedes their development. An immense layer of free mould manifests the uninterrupted action of organic powers. The crocodiles and the boas are masters of the river; the jaguar, the *peccari*, the *dante*, and the monkeys, traverse the forest without fear and without danger; there they dwell as in an ancient inheritance. This aspect of animated nature, in which man is nothing, has something in it strange and sad. To this we reconcile ourselves with difficulty on the ocean, and amid the sands of Africa; though in these scenes, where nothing recalls to mind our fields, our woods, and our streams, we are less astonished at the vast solitude through which we pass. Here, in a fertile country, adorned with eternal verdure, we seek in vain the traces of the power of man; we seem to be transported into a world different from that which gave us birth."

The Andes derive their name from the Peruvian word *anti*, signifying copper. They stretch, as we have said, throughout the entire length of South America and the Isthmus of Darien, and are, indeed, prolonged into North America, traversing Mexico and the United States as far as the shores of the Polar Sea. The southern Andes vary very much in breadth. Near Potosi and lake Titicaca (in Bolivia) the chain is 180 miles broad. The loftiest, which are near Quito, under the equator, were, until the height of the Himalaya was ascertained, always accounted the loftiest in the globe. The Pico de Illimani, first peak, is 24,450 feet in height; the second peak of the same 24,200 feet; Sorata 25,000 feet; Chimborazo 21,440 feet; Cotopaxi 18,890 feet; and Potosi 16,000 feet above the ocean level. All these are in Peru and Bolivia, and they are the loftiest mountains in South America. When Humboldt crossed the Andes, he passed through a deep forest, which took him about twelve days to traverse, during all which time not the slightest trace of man was to be seen. The pass over the ridge was not more than from one to two feet broad, and resembled a hollow gallery open to the sky. The Quebradas are immense rents, dividing the mass of the Andes, and breaking the continuity of the chain which they traverse. Mountains of great size might be swallowed up in those almost fathomless ravines, at the bottom of which only the astonished traveller can judge of the awful magnificence of the mountains

In no one respect is South America more distinguished than in the number and magnitude of her rivers, some of which might with propriety be described as *running oceans*. Of these the Amazon, or Maranon, claims the first rank. For a space of 22°, in a direct meridional distance, not a single stream descends the eastern side of the Andes, but what contributes to swell the ocean-flood of this river, which, for length of course and volume of water, has no parallel in the world. The main trunk is composed of several very large streams, its chief effluents being derived from the south. First is the Huallaga, whose source may be traced to the neighbourhood of Lima, not far from those of the Maranon itself. The next is the Ucayale, a river not inferior to the Maranon at its junction, and sometimes held to be the true Maranon. The Purus, or Cuchivara, is also a river of the first class; but the most celebrated of these tributaries is the Madera, formed from the Beni, the Marmore, and the Itenes. The Rio Negro, which comes in from the north, is likewise a very large stream. Having said this, we must refer the reader to the map for a description of its onward course to the ocean. The total navigable course of the Maranon is calculated at upwards of 3000 miles in a direct line; but the length of its course is estimated at 4095 miles. Ships of 500 tons burden might ascend it for 2500 miles, while many of its tributaries are equally navigable almost to their source. More than one-half, indeed, of this vast continent might enjoy a maritime shore from these numberless streams, any of which would spread commerce and civilization through a widely extended empire. The territory watered by the chief stream and its branches is at least equal in extent to continental Europe, and may be stated at 2,177,000 English miles. There are no sand-banks, nor shelving rocks, nor ice at any time of the year, to impede navigation; and so strong an easterly wind blows constantly from the Atlantic, as to carry up vessels against the tide. Yet, notwithstanding all these advantages, the mighty Maranon rolls on its course through regions unknown to industry or civilization. Throughout its whole course it is studded with large and fertile islands, from five, ten, twenty, to a hundred leagues in circumference. The waters of this mighty stream, and those of its tributaries, are stored with an infinite variety of fish of the most delicious kinds.

The La Plata, Plate, or Silver River, is next in magnitude to the Amazon. It is composed of three principal streams, the Parana, the Paraguay, and the Uruguay, and receives all the waters that flow from the eastern declivity of the Chilian Andes, and from the southern, south-western, and western faces of the Brazilian mountains. The three principal streams, with their tributaries, offer facilities for inland navigation little inferior to the Amazon itself. The estuary of the La Plata is broader than the British Channel. The length of its course is estimated at 2430 miles, and the area of its basin at 1,240,000 miles.

The Orinoco is the third largest river in South America, but much inferior to the two above mentioned Through a direct course of about 1200 British miles, it receives all the streams that water the Caraccas and New Granada, with the exception of the coast rivers. It was only about fifty years ago that there was discovered a communication between this river and the Amazon, by means of the Rio Negro. Humboldt, who has since explored these rivers, has accurately laid down the previous courses and junction of the Rio Negro and the Orinoco. In one part of their course they flow along a level plateau, which has little or no declivity; their branching waters meet and mingle in a sort of basin; and when thus united, they form what is called the natural canal of Cassiquiare. There are several cataracts and rapids on the Orinoco, described by Humboldt as splendid in the extreme. There are some other very large streams in South America, particularly in Brazil; these will be noticed when we treat of the individual countries in which they occur. There are likewise some large lakes, which will be described in the same manner

CLIMATE AND VEGETATION.

A country embracing so many degrees of latitude and elevation, possesses of course equally diversified degrees of climate. "The three zones of temperature which originate in America," says Malte Brun, "and form the enormous difference of level between the various regions, cannot by any means be compared with the zones which result from a difference of latitude. The agreeable, the salutary vicissitudes of the seasons, are wanting in those regions that are here distinguished by the denominations of *frigid*, *temperate*, *hot*, or *torrid*. In the frigid zone it is not the intensity but the continuance of the cold—the absence of all vivid heat—the constant humidity of a foggy atmosphere—that arrests the growth of the great vegetable productions, and, in man, perpetuates those diseases that arise from checked perspiration. The hot zone of these places does not experience excessive heat; but it is a continuance of the heat, together with exhalations from a marshy soil, and the miasmata of an immense mass of vegetable putrefaction, added to the effects of an extreme humidity, that produces fevers of a more or less destructive nature, and spreads through the whole animal and vegetable world the agitation of an exuberant but deranged vital principle. The temperate zone, by possessing only a moderate and constant warmth, like that of a hot-house, excludes from its limits both the animals and vegetables that delight in the extremes of heat and cold, and produces its own peculiar plants, which can neither grow above its limits, nor descend below them. Its temperature, which does not brace the constitution of its constant inhabitants, acts like spring on the diseases of hot regions, and like summer on those of the frozen regions. Accordingly, a mere journey from the summit of the Andes to the level of the sea, or *vice versâ*, proves an important medical agent, which is sufficient to produce the most astonishing changes in the human body. But living constantly in either one or the other of these zones, must enervate both the mind and the body by its monotonous tranquillity. The summer, the spring, and the winter, are here seated on three distinct thrones, which they never quit, and are constantly surrounded by the attributes of their power. Vegetation presents a greater number of gradations, of which it becomes necessary to point out the principal.

"In the region of the palms, next the sea, the natives cultivate the banana, jatropha, maize, and cocoa. Europeans have introduced the sugar-cane and indigo plant. After passing the level of 3100 feet, all these plants become rare, and only prosper in particular situations. It is thus that the sugar-cane grows even at the height of 7500 feet. Coffee and cotton extend across both of these regions. The cultivation of wheat commences at 3000 feet; but its growth is not completely established lower than 1500 feet above this line. Barley is the most vigorous, from a height of 4800 to 6000 feet. One year with another, it produces 25 or 30 grains for 1. Above 5400 feet, the fruit of the banana does not easily ripen; but the plant is still met with, although in a feeble condition, 2400 feet higher. The region comprehended between 4920 and 5160 feet is also the one which principally abounds with the cocoa, or *Erythoxylum Peruvianum*, a few leaves of which, mixed with quicklime, support the Peruvian Indian in his longest journeys through the Cordillera. It is at the elevation of 6000 and 9000 feet, that the *Chenopodium quinoa* and the various grains of Europe are principally cultivated: their cultivation is greatly favoured by the extensive plateaus that exist in the Cordillera of the Andes, the soil of which being of smooth surface, and requiring little labour, resembles the bottom of ancient lakes. At the height of 9600 or 10,200 feet, frost and hail often destroy the crops of wheat. Indian corn is scarcely any longer cultivated above the elevation of 7200 feet; 1000 feet higher and the potato is produced; but it ceases at 12,600 feet. At about 10,200 feet barley no longer grows, and rye only is sown, although even this grain suffers from a want of heat. Above 11,040 feet all culture and garden ing cease; and man dwells in the midst of numerous flocks of lamas, sheep, and oxen, which, wandering from each other, are sometimes lost in the region of perpetual snow."

ANIMAL KINGDOM.

The multitude and diversity of its zoological riches harmonizes with the other magnificent characteristics of South America. Among the quadruped beasts of prey, the jaguars are the most formidable, being of enormous size. They generally frequent the impenetrable jungles that skirt the banks of the larger streams; and Humboldt, who explored the Orinoco and many of its tributaries, had many narrow escapes from them. The natives, however, attack them fearlessly, receiving them, when they spring, upon the point of a pike; a manœuvre in which they seldom fail. Pumas, a small species of lion, ocelots, and long-tailed tiger-cats, are common. Bears appear to be unknown, and the largest wild animals appear to be the tapira. Deers and antelopes are sparingly scattered; in which respect South America offers a singular contrast to the opposite continent of Africa. Monkeys, squirrels, and some other inferior quadrupeds abound. Of domestic animals the list is scanty. The horse and mule, originally brought by the Spaniards from the old world, are the most universally used in the new, where they have multiplied prodigiously. The immense herds of wild oxen which swarm over the pampas of Buenos Ayres, are well known; these are also of European descent. The guanaco, llama, alpaco, and vicuna, animals closely allied to the camel of Africa, are found in abundance on the Andes of Peru, Bolivia, and Chili. These were the only ruminating animals found in America on its discovery by the Spaniards. They are not only valuable as beasts of burden, but on account of their rich fleeces. The ornithology of South America is celebrated for its variety and splendour, but we cannot enter into details. Nor is it necessary to occupy space with descriptions of its reptiles, insects, and fishes. The forests abound with the two former, and the rivers and seas with the latter.

EARTHQUAKES AND VOLCANOES.

Of the whole of the active volcanoes known to exist in the world, by far the greater number are scattered along that range of mountains which has been described as extending, under the name of the Andes, from the south to the north extremity of South America, and thence passing along the Isthmus of Panama into North America, everywhere keeping near the shore of the Pacific Ocean. South America is therefore eminently a volcanic region. From the 46th degree of latitude, northward to the 27th, there is an uninterrupted line of active volcanoes; farther to the north, in Peru and Quito, they are less numerous, but very lofty and conspicuous. The volcanoes of Chili rise through granitic mountains; that of Villarica, which is so high as to be distinguished at the distance of 150 miles, burns without intermission. In Quito there are some above 16,000 feet in height, as Antisana, Cotopaxi, and Tunguragua, all of which frequently emit flames. As a necessary consequence of so much volcanic action, the region of the Andes is remarkable for frequent earthquakes. In Peru, scarcely a week passes without some slight tremor of the surface being felt. In Chili, it is seldom that a year is unmarked by some considerable shock. About once a century, or oftener, a tremendous earthquake shakes the greater part of the Andean region, destroying cities and towns, and producing extensive changes of the earth's surface. One of the most destructive in modern times was that which

occurred at Caraccas in 1812, when about 20,000 people in the city and surrounding district (16,000 of whom belonged to the city alone) were destroyed, being swallowed up by the rending of the earth, or buried beneath the ruins occasioned by the shock. One remarkable result of these great convulsions is an elevation of the land. In consequence of the great earthquake in Chili in 1821, the land was raised several feet along a space of a thousand miles, the sea receding from it accordingly, and leaving dry an extensive tract formerly covered by the ocean. Similar raised beaches are to be traced at various elevations along the slope between the sea and the Andes, showing that phenomena of the same kind must have taken place at different distances of time. Indeed, it is now the belief of geologists that the whole of the continent of South America has been raised out of the sea at a comparatively recent period; and it is ascertained that a sinking of it to the extent of only five hundred feet would again submerge the greater part. Humboldt is of opinion that the Andean volcanoes are but the spiracles of an immense *volcanic vault*, extending under the surface of this part of the globe, and part of which is covered by the bed of the Pacific. The connection of the volcanoes of Pasto in New Grenada with the volcanoes of Quito, was strikingly displayed in 1797. A column of black smoke had continued for several months to issue from the former, but it suddenly disappeared on the 4th February of the same year, at the precise moment when, at sixty-five leagues from the city of Pasto, the city of Riobamba, near Tunguragua, was swallowed up by an earthquake. This eruption was of a very extraordinary nature. An enormous area of ground rolled backwards and forwards, like the sea, for four minutes, during which time every town on its undulating surface was levelled with the ground, and the cities of Riobamba and Quero were buried under the ruins of the impending mountains. Tunguragua was rent asunder and vomited a sea of mud, covering the valleys to the depth of 600 feet.

NATIVES.

The question respecting the origin of the native population of both continents of America, seems to have been settled by the discovery of Behring's Straits, and there is now scarcely a doubt entertained of their descent being Asiatic. There are, throughout most parts of the interior of South America, innumerable hordes of Indians still living in a savage and primitive state. Of the general features of these people it would be in vain to attempt an enumeration here, as they are divided into thousands of small tribes, or *nations* as they call themselves, all distinguished by their own peculiar characteristics. Many of them, such as the Chilians and Peruvians—and of the former, the Araucanians more especially—were certainly marked, from the earliest period of their discovery by Europeans, by many of the finest and noblest traits of human nature while in an unenlightened state—hospitable, faithful, social, peaceful, and affectionate; while those in other parts of the immense continent were conspicuous, as many of them indeed still are, for all the cruel, deceitful, bloody, and barbarous features displayed by the most savage nations.

SUBJUGATION OF THE COUNTRY BY EUROPEANS.

After the discovery of Brazil by the Portuguese in 1499, the country was taken possession of in the name of the sovereign of Portugal. In 1531, it was divided into captaincies, and granted to such persons as were willing to undertake their settlement. But these lords possessors abused their powers, and a governor-general was appointed, with full authority, civil and criminal. The first individual selected for this high office entered upon the duties of it in the year 1549. The Pacific Ocean was discovered in 1512 by Nunez de Balboa, governor of Darien, which a few years before had been colonized by the Spaniards. In 1524, the famous, or infamous, Francisco Pizarro landed in Peru, which he found in a partially civilized state, and governed by a race of princes named incas. In a few years he completely subjugated this simple, and, in many respects, amiable people. The treachery, cruelty, and perfidy, by which he effected his object, have rendered his name odious to mankind; but into details we cannot enter. An army was despatched from Peru for the conquest of Chili, but this proved a very difficult undertaking, on account of the indomitable courage of the natives. Of all the aboriginal nations of America, the Promaucian and Araucanian tribes of Chili possessed the highest degree of intelligence, energy of character, and warlike prowess. To keep even a partial possession of Chili cost the Spaniards more blood and treasure than all their other settlements put together. The Araucanians, indeed, maintained their independence for three centuries, in spite of all the efforts of Spain to subdue them. Only a part of the country submitted to the Spaniards, and cities were there erected and local governors appointed, but still frequent hostilities mark the history of this portion of South America, down to the period when, along with the rest of the continent, it achieved its independence.

That large tract of country situated at the north-east base of the continent, and which for some time bore the name of Colombia, was explored at a very early period, and settled by the Spaniards. The natives, however, showed something of the spirit of the Chilenos, and were only subdued with difficulty. The territory of New Granada was formed into a government in 1547, and Venezuela in 1550. Quito depended on the government of Peru till 1564, when it was constituted a presidency. These three territories underwent repeated changes, but finally became known under the names of the captain generalship of Caraccas (Venezuela), the viceroyalty of New Granada, and the presidency of Quito. Guiana was settled in 1550 by some French Protestants, who had fled thither as to an asylum from the persecution of the League. The Dutch settled Berbice in 1626; Essequibo in 1698; and Demerara somewhat later. The history of the ill-fated colony of Darien, established by the Scotch at the close of the seventeenth century, is well known. The country situated on the shores of the Rio de la Plata remains to be noticed. A considerable part of the river having been explored by Sebastian Cabot in 1526, the region was taken possession of for the Spanish crown. Buenos Ayres (*good airs*) was founded in 1535, but soon after destroyed by the natives. It was rebuilt, but a second time reduced to ruins by the savages; and not until 1580 did the Spaniards succeed in their object of erecting a city on this spot. In the meanwhile Paraguay had been colonized, and the country conquered as far as Potosi. The permanent settlement of the Spaniards here was greatly facilitated by the Jesuits, who founded those celebrated communities called *reductions*, or missions, in which they made strenuous efforts to civilize the natives, and bring them within the pale of Christianity.

CONDITION OF SOUTH AMERICA UNDER THE SPANIARDS

The power of Spain and Portugal having been firmly established over the greater part of the South American continent, such methods of government were adopted as seemed best calculated to secure the allegiance of these territories to the mother countries. That the measures to which the Europeans had recourse for this purpose were tyrannical and most oppressive to the natives, may be taken for granted. We shall, in the first place, treat of the Spanish dominions, leaving Brazil to be noticed afterwards. The whole of the Spanish possessions in the new world were originally divided into two immense governments, one subject to the viceroy of Mexico, and

the other to the viceroy of Peru. But these were of too unwieldy a size to be properly managed; so that about the middle of the eighteenth century, they were distributed into nine distinct governments, all constructed on the same plan, and independent of one another. Five of these belonged to South America; three of the first rank being viceroyalties; namely, Peru, La Plata, and New Granada; and two being captain-generalships, Chili, and Venezuela, or Caraccas. By this arrangement, Quito was incorporated with New Granada; but, as has already been noticed, it assumed a distinct and independent form, which it maintained until the revolution. The government was vested in the viceroy or captain-general, who was held to represent the king, with all the prerogatives attached to the regal character. The royal *audiencas*, or supreme courts, consisting of Spaniards nominated by the crown, enjoyed extensive judicial powers—as also did the municipalities and corporations:—but perhaps the clergy possessed more influence than any. All these contributed to modify the otherwise unlimited powers of the head of the government. Considerable security and many privileges were enjoyed by all classes, excepting the miserable Indians, who were treated little better than beasts of burden. They were at first slaves, paying a capitation tax to the crown; and although modifications took place in the system, they were never released from vassalage till the period of the Revolution. For, although laws were made by the home government from time to time for their protection, they were never acted upon; and as the only object of the government was to raise a large revenue from the colonists (whom they taxed to the uttermost), no notice was ever taken of this disregard of the laws. The Creole, or American-born Spaniards, were excluded from all public offices, from the highest to the lowest, all of which were bestowed on the natives of Spain. These functionaries, whose sole object was to make money, acted the part of true despots towards the other classes; plundering, taxing, and exacting, without the slightest regard to mercy or justice. Men rose to affluence in offices without salaries, and the priests rivalled the laymen in the art of extracting money from the natives. In a word, the Creoles were little better situated than the miserable Indians. All books of general knowledge or information were prohibited from being imported; schools of every kind discouraged; while the priests filled the minds of the natives with the most childish superstitions and religious terrors. Even to visit foreign countries was generally forbidden to the people.

Amongst other deeds of darkness which were brought to light by that remarkable document, the manifesto put forth by the congress of Buenos Ayres, at the time of the revolution, we find it stated that "every thing was disposed on the part of Spain, in America, to effect the degradation of her sons. It did not suit the policy of Spain that sages should rise up amongst us; fearful lest men of genius should remind them of advancing the condition of their country, and of improving the morals and excellent capacities with which its sons have been gifted by their Creator. It was her policy incessantly to diminish and depress our population, lest one day we should imagine aught against her dominion, guarded by a force too contemptible for keeping in subjection regions so various and vast. Commerce was exclusively confined to herself, from a mean suspicion that opulence would make us proud, and render us capable of aspiring to free ourselves from so many vexations. The growth of industry was checked, in order that the means of escaping from our wretchedness and poverty might be denied us; and we were excluded from all participation in public employments, in order that the natives of the peninsula might have entire influence over the country, so as to form the inclinations and habits necessary for retaining us in a state of dependence, that would no longer permit us to think nor act but in conformity to the modes dictated by the Spaniards."

We must here find a place for the description of two distinct features of the tyranny exercised over the aborigines of Peru. These were the *mita* and *repartimiento*. The former was a civil conscription, by which the population of every district was compelled to furnish annually a certain number of labourers for the service of the proprietors of the lands or mines. Under the most favourable circumstances, we are told, scarcely one Indian out of five survived the first year of his unwholesome and exhausting labours in the mines, to which he had been dragged from home and kindred, it might be many hundred miles away. It is asserted by several Spanish authorities, and surely they are to be credited, that the effect of working in the mines was to reduce the population of some districts to one-half, and of others to one-third, of what it was in 1581. It is computed that upwards of 8,000,000 of men perished in the mines of Peru alone. This estimate is very probably exaggerated, for there were several other causes which contributed to thin the population, such as small-pox, and other diseases, and the intemperate use of ardent spirits, the mortality arising from which might be ascribed to the operation of the *mita*. But such a statement being made by the Spaniards themselves is a sufficient proof of the horrible nature of this conscription. The other grievance, called the *repartimiento*, was a privilege originally granted to the corregidors or governors of districts, empowering them to furnish to the Indians, at a fair price, articles of necessary consumption. In course of time, this privilege degenerated into a compulsory and oppressive exaction. Not only were the Indians compelled to purchase the most worthless commodities at an enormous price, but articles for which they had no use were forced upon them. For instance, razors for men without beards; furs and velvets for people who lived within the tropics; silk stockings for Indians who went barefoot at all seasons; and spectacles for those whose strength of vision was proverbial. Even luxuries, the very use of which was unknown to them, formed part of the supplies which they were compelled to purchase. Such is a brief outline of the system by which Spain continued for three centuries to sacrifice the interests and degrade the nature of many millions of human beings.

Long before the great revolt of the American provinces of Spain, partial attempts to shake off her oppressive yoke were made in several of the provinces; and we have seen that it was never very securely imposed upon the warlike natives of Chili. The most remarkable of these efforts to achieve independence was that made by Tupac Amaru, in the year 1780. He claimed to be a descendant of the last inca of Peru, who was beheaded in 1562; and to give eclat to the cause, he assumed not only the name of his ancestor (which means *the highly endowed*), but the style and pomp of the incas. The immediate cause of the revolt was the shameful avarice of the corregidors of some districts, who imposed upon the Indians more repartimientos than the law gave the authorities power to inflict on them. At first it wore a very serious aspect, but was ultimately suppressed, after one-third of the whole population of Peru had perished by violence. An attempt at revolution was made in Venezuela in 1797, and another in 1806, both without success. But events were taking place on the continent of Europe, which, singularly enough, were completely to change the destinies of South America.

THE WAR OF INDEPENDENCE.

It is a remarkable fact, that the first revolutionary movement originated not in a spirit of resistance to the powers by which America was oppressed, but in a spirit of enthusiastic loyalty to the imbecile Ferdinand, the

sovereign ruler of Spain and the Indies. When this monarch was deposed and imprisoned by Napoleon, and the conqueror's brother Joseph was placed on the throne, orders were despatched to the colonies to demand their submission to the new dynasty. But they refused to transfer their allegiance from Ferdinand "the beloved" to a usurper, although he was the brother of Napoleon, who had then just reached the zenith of his power. In this the Americans showed a great and commendable spirit of independence—it was a good omen of what should soon take place. On the 15th of July, 1808, the people of Caraccas took the lead in proclaiming Ferdinand VII., the captain-general and audiencia being compelled to give way to popular feeling, and a solemn oath of allegiance to the legitimate monarch was taken by acclamation. By an ancient decree it was provided, that, in cases of emergency, the convocation of cortes or general juntas, in the respective kingdoms of Spanish America, might take place. Here, then, was an emergency as momentous as any that could possibly occur. They were about to be transferred from their legitimate monarch to the ruler of France, as if they had no voice in the matter whatever, and this they would not tolerate. The exercise of the right legally and constitutionally vested in these juntas seemed the best means of saving the colonies from the yoke of France. Yet such was the singular state of affairs at the time, that this demonstration of attachment to the lawful sovereign proved the signal for the declaration of hostilities by Spain, and the commencement of a war of extermination. But how could it be otherwise? Napoleon was now omnipotent in the mother country, and the loss of any of her colonies, which their standing out for Ferdinand must have virtually been, was not likely to be tolerated. So that instructions to the powers in the colonies to suppress any demonstration of the kind, followed as a necessary consequence of the position of the Spanish crown, and the affairs in the peninsula at the time. But a flame was kindled which was not to be quenched even at the fiat of a Napoleon. We are far, however, from thinking that ardent attachment to legitimacy was the sole or even the leading motive which determined the simultaneous movement which took place throughout the whole of Spanish America. It was the ostensible ground for the formation of juntas, but entire independence was clearly the ultimate aim of thousands, who were content at first to mask their operations with this disguise. In Caraccas, the supreme junta assembled on the 19th of April, 1809, and one of its first acts was to banish the captain-general and the members of the audiencia. Juntas of government were convened at La Paz, in Upper Peru, on the 15th of July in the same year; at Quito, on the 19th of August following; at Santa Fe de Bogota on the 25th of May, 1810; at Buenos Ayres on the same day; and at Santiago of Chili on the 18th September.

Buenos Ayres has been called the cradle of South American independence; yet at the period of the first British invasion of that city, Spain had nowhere more loyal subjects. But many of the inhabitants had grown rich by trade, and enlightened views had become disseminated among them, so that, although they displayed equal zeal with the other colonies in the cause of Ferdinand, they did not long conceal their design of ultimately erecting the standard of independence. Attempts were made to foist upon them a lopped-off scion of the royal stock of Portugal, but this scheme proved abortive. After some political squabbling, Cisneros, the viceroy, was deposed, and banished from the country along with the oidores. The junta, consisting of nine individuals, among whom were some very able men, now made no secret of their intentions. The people acquiesced, and thus, without bloodshed, a complete revolution was effected in Buenos Ayres. The city soon felt itself powerful enough to proselytize in the distant provinces of the viceroyalty, where some royalist generals had collected bodies of troops, declared against the revolution, and taken measures for putting the question to the arbitration of the sword. The army of the republic was intrusted to Balcarce, and its first campaign proved completely successful. Cordova, a city of the interior, attempted to change the course of events, but all opposition in this quarter was speedily suppressed. On the 27th of October and 7th of November, 1810, the royalists were defeated at two different places on the distant frontiers of the viceroyalty. These successes gave Balcarce possession of the country as far as the Bridge of the Incas, near the great lake of Titicaca; and on the 25th of May, 1811, the first anniversary of independence was celebrated on its shores, amid the ruins of the ancient incarial palace, 2000 miles distant from Buenos Ayres. Meanwhile Castelli, a man of great talents, but most reckless temper, had joined Balcarce, having been sent to act in concert with him, and to assume the governorship of Upper Peru. But while the cruelties of this chief struck terror and dismay to the hearts of the Spaniards, his dissoluteness and want of attention to the affairs of the provinces, alienated the affections of the inhabitants of Upper Peru from their deliverers, and the common cause of both. This gave opportunity for Abascal, viceroy of Peru, striking a powerful blow in the cause of royalty. An army of 4000 men was speedily organized, and placed under the command of General Goyeneche. An armistice had been concluded between the contending armies; but in violation of this transaction (by no means an uncommon feature of the war of independence), the Spanish commander attacked the patriots at Husqui on the 20th of June, 1811. They were equally matched in point of numbers; but Balcarce was completely defeated, and compelled to retreat 700 miles from the scene of action. Great cruelties were perpetrated by the Spanish general in Upper Peru, in spite of much resistance on the part of the patriots, who assembled in considerable numbers, and sought an asylum among the neighbouring mountains. The history of Buenos Ayres becomes now closely interwoven with that of Upper Peru. Indeed, the transactions which took place throughout the whole of the governments, are intimately blended with one another. A principle of mutual assistance was acted upon, and armies successful in one place marched many hundred miles to the assistance of their fellow-patriots, who were hardly pressed by the Spaniards in another. Thus the troops of different provinces, or republics, as they soon were designated, became mixed together, and Buenos Ayreans, Chilinos, Bolivians, Peruvians, and Colombians, fought side by side on the same field. This friendly co-operation among the republicans greatly contributed to their success; the struggle might otherwise have been protracted in many places, till a period long subsequent to that when the Spaniards were finally expelled from South America.

We have already had occasion to notice the valour and patriotism of the natives of Chili, so that the reader is probably prepared for a speedy overthrow of the Spanish power in that quarter; but events often take a very different course from what they at first promise, and from what is anticipated. The first revolutionary movements, indeed, were here accomplished without difficulty or violence, being greatly facilitated by a commissioner sent from Buenos Ayres. The Spanish governor was deposed; a junta was formed on the 18th September, 1810, still, however, acknowledging the supremacy of Spain; and in spite of attempts to upset the new government, a congress met in June, 1811, when many wise measures were adopted. Reforms in civil and ecclesiastical establishments were projected; freedom of commerce and of the press was declared; and this was the first legislature in South America which adopted efficient

measures for the extinction of slavery. But the smiling aspect which affairs began to assume was soon overcast by the ambition of three brothers named Carera, who succeeded in forming a new government, and dividing the interests of the country just at the very moment when union was almost indispensable to the existence of the new system of things. The Spaniards in Peru took advantage of the crisis, landed an army in Chili, and seized the city of Conception and some other places. This occurred early in 1813. The Chilinos were not long in making head against the foe, and a bloody battle was fought, in which the patriots were victorious, the Spaniards retreating to a town which they strongly fortified. But various engagements took place, in which the royalists were generally successful, and by the end of 1814, the principal Chilinos leaders were forced to seek refuge beyond the Andes, which divide Chili from the plains of La Plata. Once more, then, the Spanish power became dominant in Chili, but its ascendency was of short duration, for the celebrated general, San Martin, who makes such a figure in the subsequent history of South America, was at this period busily employed in organizing an army for the liberation of his country, and with which he in no long time achieved it.

In New Granada and Venezuela the struggle was more bloody, variable, and protracted, than in any other part of South America. This portion of the dominions of Spain being comparatively easy of access, and, from its central position, to a certain extent a key to the whole, she made proportionate attempts to retain possession of it. Within the course of one year, no less than 10,000 troops were landed in it. To attempt any thing like a detail of the military operations would carry us far beyond our limits, the vicissitudes of the war being so numerous and extraordinary, from 1809, when juntas were established in Caraccas and Quito, to the surrender of Porto Cabello in 1823. It was here that the famous Simon Bolivar first made his appearance, and also the celebrated General Miranda, one of the earliest martyrs to South American independence. It was he who made the heroic attempt to raise the country in 1806; and now that a more favourable opportunity presented itself of achieving his favourite object, he reappeared on the scene of his former discomfiture. In July, 1811, Venezuela declared its independence of Spain and all other nations; a constitution was drawn up, a congress assembled early in 1812, and every thing seemed to promise a speedy termination to the struggle in this quarter. But the whole aspect of affairs was changed by an earthquake, which overwhelmed the city of Caracccas, burying many thousands of the inhabitants under the ruins. It is not new for the superstitious inhabitants of the peninsula to attribute calamities produced by natural causes to the direct interference of the Almighty with the affairs of men. Thus the earthquake which destroyed the city of Lisbon, was by many attributed to the Jesuits, who were supposed to have drawn down the vengeance of Heaven! And such was the pernicious influence of the clergy over the minds of the people on the present occasion, that the dreadful casualty came to be generally regarded as a work of divine vengeance for their adopting the new order of things. The consequence was a great change for the worse in public opinion, which the Spaniards were not slow to take advantage of. Monteverde, a royalist general, marched against Caraccas, and soon effected its resubjugation, Bolivar himself escaping to Curacoa. In 1813, he returned; and being intrusted with an army by the confederation of Granada, he again effected the liberation of Venezuela. Finding the necessity of intrusting their affairs to the guidance of some one energetic mind, the Venezuelans named him dictator; and by his exertions, a union between the republics of Granada and Venezuela was for the first time effected in 1819, Quito being at this time under the dominion of the Spaniards. This was the first confederation, styled the *Republic of Colombia*. At the congress which ensued, a republican constitution was established, Bolivar being elected president, and Santander vice-president. The former immediately returned to the seat of war; and after two years' campaign, the details of which it is impossible to give here, succeeded in completely overthrowing the Spanish power in Colombia.

The most decisive battle of the whole war was fought on the 7th of August, 1819, at the bridge of Boyaca, where the royalists were completely ruined, nearly their whole army being taken prisoners. This triumph decided the fate of New Granada, giving the patriots an ascendency which they never afterwards lost. It is a coincidence not unworthy of being noticed, that the last battle in which the liberties of the ancient inhabitants of the country were stricken down by the Spaniards, was fought on the same spot. The balance was now restored by the fortune of war.

We left General Balcarce with the army of Buenos Ayres retiring before the royalists of Upper Peru. He was superseded by General Belgrano, who, after one or two victories, was totally defeated on the 14th of November, 1813; the patriot cause was thus brought to a low ebb in the interior. Buenos Ayres had early turned its attention to the important province of Paraguay, where, after various changes of fortune, a new government was finally erected, with the celebrated Dr. Francia at its head, as dictator. The career of this individual has been more extraordinary than that of any one which the revolutionary struggle brought upon the theatre of action. The government which he established was as completely despotic as any that mankind were ever doomed to suffer under; and this iron ruler succeeded most effectually in cutting off Paraguay not only from the neighbouring republics, but even from the rest of the world. It is impossible to follow all the changes which the government of Buenos Ayres underwent, and all the civil dissensions by which the country continued to be torn. Monte Video, which had long held out for the mother country, capitulated in June, 1814. This important fortress was afterwards taken possession of by Artigas, a famous gaucho chieftain, who for some time ruled the whole of the pampas from the Andes to Brazil. The congress of Buenos Ayres having determined on holding its sessions in that city, issued a declaration of the causes which led the vice-royalty to shake off the yoke of Spain, and assume the title of the United Provinces of South America. In May, 1819, a constitution was published by congress. It was on the model of that of the United States, and secured personal freedom and equality, liberty of conscience and of the press, the right of suffrage, and other privileges. Although afflicted with internal dissensions, Buenos Ayres was ever ready to aid the cause of independence in other quarters, and rendered efficient service to the Chilinos, who, under San Martin, were mustering their strength upon the frontiers. Early in 1817, this able commander led his small army of 5000 men through the passes of the Andes into the plains of Chili, where the royalists, twice as strong, were taken by surprise and utterly defeated. In repeated engagements they suffered the same casualty, and their power rapidly declined. Before the end of the year, several important places fell into the hands of the patriots, and San Martin was elected supreme director of Chili, but declining the honour, it was conferred on O'Higgins, another distinguished general. The great struggle, however, was yet to take place. The royalists received a strong reinforcement from Peru, and the patriots another from Buenos Ayres, so that, early in 1818, both armies took the field with a considerable accession of strength. On the 5th of April was fought the battle

at Maypu, in which the royalists were totally routed, and after which the patriots never again lost the ascendency. In order to clear the Pacific of Spanish ships of war, the naval force of Chili was augmented, and ultimately came to be commanded by the celebrated Lord Cochrane, who lent to this remote American state the naval glory which had belonged almost alone to Britain. Peru had from the first been the stronghold of the royalists, and as from her ports expeditions had repeatedly issued to aid the royalists in other quarters, it was considered that, as long as Spain was enabled to do this with impunity, the cause of independence would stand on a precarious footing in Chili. Accordingly, San Martin resolved on carrying the war into the heart of the enemy's country. He landed with a considerable body of troops, succeeded in capturing Lima, and was soon afterwards declared protector of the new republic, with supreme power, civil and military. San Martin then drew up a constitution upon very free principles; but the views of the people had become so democratic that nothing would satisfy them. The plan was disapproved of, and the protector retired.

Meanwhile, these dissensions gave courage to the royalists, who collected in great force under General Canterac, and advanced upon Lima, of which they obtained possession. The proceedings of the new patriot government were marked by feebleness and discord. Some reverses in the field followed, and the cause of independence seemed hanging by a thread which it required little exertion to break, when the celebrated Bolivar made his appearance in the country on the 1st of September, 1823. He was received with the greatest enthusiasm, and immediately invested with supreme authority, military and political. Great activity was now infused into the measures of government. Congress was dissolved and an army levied, with which Bolivar sallied from the capital early in November. But fresh misfortunes overtook the cause of the patriots. The city of Lima, and its port Callao, once more fell into the hands of the royalists, and, but for the firmness and decision of Bolivar, the consequences might have been disastrous to Peruvian independence. The dictator, however, proved equal to the crisis. There was a charm in the name of Bolivar, and he was looked up to as the only man capable of saving the republic. He did not disappoint general expectation; for in less than a year from that time, South American independence was finally established. After a series of marches and manœuvres, the liberating army and the royalists met on the plain of Ayacucho, where a battle was fought, "the most brilliant," as General Miller says, "ever fought in South America." The Spanish army was all but annihilated; and this may be considered as the last regular engagement, although not the last struggle, in which Spain was engaged for the recovery of her revolted colonies. It was fought upon the 9th of December, 1824.

In Bolivia, or Upper Peru, the royalists still retained an ascendency, but now that the victory of Ayacucho enabled the patriots to pour additional troops into the country, under Sucre, a general alike distinguished for his valour and ability, the cause of royalty rapidly declined. Olaneta, the Spanish commander, was killed in an affray with some of his own revolted troops in March, 1825, and from this time all serious opposition in the field was at an end. But General Rodil still held out the strong port of Callao against the patriots. It was a gallant but a hopeless defence. For thirteen months he sustained, unaided, bombardments both by sea and land, but at length capitulated on the 19th of January, 1826. Almost contemporaneously with this event, the island of Chiloe was captured by a patriot force, and the Spanish flag ceased to wave on the territory of Chili.

We shall now present a view of the various republics which arose out of the ruins of the Spanish dominions in South America; though without pledging ourselves for the accuracy of all our details, as the state of information on the ever-shifting political condition and general statistics of the different states is exceedingly defective. Brazil, the largest and most important state of this continent, was all along totally unconnected with the others; and belonging to another order of things, was reserved for a different destiny. The republic in which the revolt may be said to have originated, and from which it drew the vital strength that ensured ultimate success, was

BUENOS AYRES, OR THE UNITED PROVINCES OF THE RIO DE LA PLATA.

The united provinces of La Plata, or the Argentine Republic, comprises the whole of that vast space extending from the cordillera of Chili and Peru to Brazil, with the exception of Paraguay and the Banda Oriental, which are independent states. It extends from the 22d to the 41st degree of south latitude, and from 55 degrees 36 minutes to 71 degrees of west longitude, comprising an area of 720,000 square miles English, and divided into thirteen provinces, which, to a certain extent, govern themselves independently of each other, but for all general or national purposes, are confederated by conventional agreements. For want of a more defined national executive, the provincial government of Buenos Ayres is temporarily charged with carrying on the business of the union with foreign powers, and with the management of all matters appertaining to the republic in common. The executive power of that government, as constituted in 1821, is vested in the governor or captain-general, as he is styled, aided by a council of ministers appointed by himself, responsible to the junta, or legislative assembly of the province by which he is elected. The junta itself consists of forty-four deputies, one-half of whom are annually renewed by popular election. It was at first attempted to establish a system of federalism, by which Buenos Ayres should exercise immediate control over the other provinces; but from various causes the plan proved quite abortive. The national organization of this state is now limited to the slender bonds of voluntary confederation, not only with each other, but with the old metropolis, Buenos Ayres. The whole territory is an almost uniformly level plain of great fertility, watered by the large rivers La Plata, Parana, Paraguay, and Uruguay, and several others of smaller dimensions; the Talado, Pileomayo, Vermijo, Nuevo, and that which empties itself into the lake Solatos, being the most important. There are likewise a number of lakes, the waters of which are brackish. There are almost no natural trees in the province, but there are numerous plantations, or rather orchards, of peach trees, which the natives cultivate for firewood—the fruit being applied to feeding the swine and poultry. Immense forests of thistles spring up at certain seasons of the year, of ten and twelve feet in height. Deer are plentiful in the wilder parts, but little prized where there is so much fine beef. The climate is extremely salubrious, and, singularly enough, is almost entirely governed by the winds, which, generally speaking, are northerly.

One of the distinguishing characteristics of La Plata, are the vast plains called *pampas*, one portion of which extends from the banks of the Paraguay westward to the frontiers of Los Charcas, and northward to the mountains of Chiquitos—another immense plain, 300 miles in length from east to west, and 1500 miles from north to south, as far as Patagonia. These plains present one uniform expanse of waving grass, uninterrupted by either wood or eminence, although in some places parched and barren, and perfectly uninhabited, unless by innumerable herds of wild oxen, horses, ostriches, and other animals. Over these pampas lies the only route

by land from Buenos Ayres to Chili, which journey was formerly performed by large companies, as the plains were infested by hordes of roving Indians, who went here to hunt, catch wild horses, and plunder. From the absence of all permanent land-marks, the travellers over these immense plains shaped their course by the compass, and their caravans were in reality movable houses, solid and defensible. Of late years, regular post-houses have been established along the whole line of road between Santiago (the capital of Chili) and Buenos Ayres —a distance of nearly 1400 miles—and a regular communication is kept up between the two republics by means of couriers, who perform their journeys with uncommon speed.

The city of Buenos Ayres is situated on the southern margin of the river Plata, where the latter is formed by the confluence of the Parana, Uruguay, and Negro rivers. It is thus, as it were, the key to all the internal navigation. The length of the Plata, from its formation to the ocean, is upwards of 700 miles. The city occupies a large extent of ground, being about two miles long, and a mile and a half broad, all the streets crossing at right angles. There are a university, several educational establishments, and a number of churches. The prosperity of Buenos Ayres and the other provinces is greatly impeded by the defective navigation of the river Plata, which is filled with shoals and sandbanks, and therefore dangerous to large vessels, otherwise the city of Buenos Ayres would become one of the largest emporiums of commerce in the world. The rivers Parana and Uruguay are each navigable for vessels of from 200 to 300 tons, 1500 miles into the interior; the former running through Paraguay into the centre of Bolivia. In 1806, Buenos Ayres was taken by a small English expedition, under Admiral Popham and General Beresford; but the inhabitants, recovering from their surprise, soon afterwards drove their assailants from the town. In the following year, General Whitelock arrived with reinforcements; the troops were quietly permitted to enter the town, when they were repulsed with great slaughter, and ultimately compelled to evacuate the La Plata. There were no fortifications at the time the city was attacked by the British troops, and it was indebted for its strength solely to the peculiar structure of its buildings.

The estimated population of the provinces of the Rio de la Plata, in 1836–7, was from 600,000 to 675,000, exclusive of independent Indians within the territory laid claim to by the republic. Of this number of inhabitants, from 180,000 to 200,000 were reckoned as belonging to Buenos Ayres. Into details of trade we cannot enter; indeed, it is impossible to obtain correct information regarding the interior provinces, their commerce being mostly of a domestic or internal nature. Buenos Ayres is of course the great centre of foreign trade. In 1837, the imports from Great Britain amounted to £696,104; the total imports into the republic being valued at 7,000,000 dollars. The exports during the same year amounted to 5,837,138 dollars, consisting chiefly of ox hides, gold and silver, sheeps' wool, jerk beef, horse hair, tallow, sheep-skins, and other products of the country. Of late years, the imports into Buenos Ayres have decreased, whilst those of Monte Video have increased.

PARAGUAY.

The republic of Paraguay, formerly one of the united provinces of the vice-royalty of Buenos Ayres, is situated between the rivers Parana (on the east and south) and Paraguay (on the west). It is divided by a desert tract from Brazil on the north. It comprises an area of about 50,000 square miles, with a population of about 250,000, seven-tenths of which are Creoles.

The climate of Paraguay is mild and healthy, although moist, being low and level. All sorts of tropical fruits, corn, vines, sugar-cane, rice, maize, tobacco, *indigo*, and a number of valuable medicinal plants, abound in profusion. There is a particular plant peculiar to Paraguay, called *yerba*, and, when decocted, *matte*, which greatly resembles the tea of China, and is by many preferred to the latter. It is universally used in South America. Of late years it has been cultivated in Brazil with great success. Immense herds of cattle roam over the vast plains, whose hides and tallow form an article of commerce.

From shortly after the declaration of independence in 1811, until 1838, this beautiful and prolific region was governed in a despotic manner by Doctor Francia, a man of considerable talent, but it is believed partly crazed in mind, who had the address, like Cromwell, to dissolve the temporary government established by the revolutionary party, and to appoint himself sole and perpetual dictator of the state. All things were now managed by him; he planned roads, bridges, and other public works, organized the army, and interfered in the most minute arrangements. His rule was supported by excessive cruelty, and he lived in constant fear of assassination. This extraordinary despot died, in his eighty-second year, in 1838; but what has been the political condition of the state since we have not heard. Some writers are disposed to think that, upon the whole, Francia's dictatorship was beneficial for the country, as he carried on various objects of utility, and procured respect and tranquillity for his people.

URUGUAY, OR BANDA ORIENTAL.

This comparatively small state, which occasioned a long and bloody contention between the united provinces and the Brazilian government, is situated between the river Uruguay and the Atlantic from south to north, and between the rivers Plata and Parana from east to west. From its position, between the Spanish and Portuguese settlements, it soon became an object of contention; but it would be a waste of time to follow the course of the struggle. Suffice it to say, that after much blood had been shed on both sides, in a war of more than half a century's duration, during which the disputed territory, by being the common battle-field, was devastated by both, the contending parties at last drew stakes, and it was erected into an independent state in 1829. It is equally distinguished for fertility of soil, salubrity of climate, natural beauty, and geographical position. It abounds in excellent pastures, which are fertilized by an unusually large number of streams, in which respect it is greatly superior to the rival provinces on the opposite banks of the Rio de la Plata. The city of Monte Video, the capital of the republic, is situated on the northern bank of the great river just named, near its mouth, 130 miles north-east from Buenos Ayres, in latitude 34° 50′ south, and longitude 56° 20′ west. The importance of this city has greatly increased since the erection of the country into an independent republic. A lowering of the duties on import trade, whilst those of Buenos Ayres remained high, brought foreign goods to it, so that it has in some measure supplanted its rival, and become an entrepôt for the supply of the neighbouring provinces. This is the cause of the diminution in the amount of imports into Buenos Ayres, to which allusion has already been made. In 1836, the importations of foreign goods into Monte Video amounted to 3,500,000 dollars, whilst the exports were nearly equal in value, and now constitute an important proportion of the returns in the general account of the trade with the river Plata. The population of the Banda Oriental is estimated by Sir Woodbine Parish (1839) to be from 100,000 to 120,000 souls, and is rapidly increasing.

CHILI.

Chili is bounded on the north by La Plata, on the east and south by Patagonia, from which it is separ-

by the Andes, and on the west by the Pacific Ocean, along the shores of which it stretches from 21° to 43° of south latitude. It is 1300 miles long, and from 30 to 190 broad. The ground ascends gradually from the ocean to the Andes, but is intersected by their projecting branches, some of which run almost down to the sea-shore. There is no deficiency of rivers in Chili, but in general they are small, and running from the Cordillera to the Pacific, they have necessarily short courses. These streams are indispensable to the existence of agriculture, in a country where it rains very seldom, and to a very limited extent. The fertility of the soil of Chili has in many respects been much overrated. It presents great diversities. In some parts where irrigation is deficient, it is barren and unproductive; in others quite the reverse; and amid splendid woodlands, the finest crops of wheat, barley, rye, and other species of grain, are raised, with scarcely any trouble to the cultivator beyond scattering the seed. Cotton, sugar-cane, vines, &c., are also extensively cultivated. The country is perfectly free of all noxious reptiles, the climate salubrious, and the weather serene. The want of navigable

MAP OF SOUTH AMERICA.

rivers is unfavourable to commerce; and although there are many rich mines of gold, silver, and copper, in the northern provinces, the sterility of the country around them prevents many of them from being wrought.

In 1827, the directorship of Chili was changed into a presidency, in imitation of the United States. The established religion is the Roman Catholic, the priesthood not being numerous, as was the case prior to the revolution. The constitution of Chili is that of a federal republic, consisting of three states, namely, Coquimbo, Santiago, and Conception, and one district, Chiloe, each having a provincial assembly, and all four a common congress, or executive power, which holds its sittings at Santiago.

Chili is divided into eight provinces, which contain a population of about 600,000. The principal towns are Santiago, with 65,675 inhabitants; Valparaiso, with 26,000; Conception, with 10,500; and there are, besides, Penco, Coquimbo, Copiapo, and others of inferior note. In 1836, the outlay of the state was reckoned at 1,840,204 dollars, the receipts being above 300,000 dollars more, which served to pay the interest of the English loan, or, at all events, a part of it; for their affairs are in great confusion, and their debts are so mixed up with those of Peru, that it is difficult to determine how they stand. By allowing the interest of their loan to remain for years unpaid, the debt has accumulated in such a manner as to have destroyed national credit. The perpetual broils with Peru have materially contributed to retard the advancement of this country, which has certainly very considerable resources, and an enterprising and intelligent population. To enter into particulars regarding this long-standing quarrel, is not compatible with our limits. It originated in a loan which Chili gave to Peru, to assist her in the period of her distress, and which the latter has not been grateful or honest enough to refund. Peace and war have more than once been proclaimed between the two states within these few years, and so late as 1839 the army of Peru was, through treachery, it is said, nearly extirpated by the troops of Chili.—See PERU.

During the year 1834, there was exported from Chili, gold, silver, and copper, to the amount of 3,158,143 dollars. The other chief articles of export are hides, timber, wheat, flour, fruits, Cortex Peruvianus, indigo, tin, and seal-skins. The imports into Chili from Great Britain, chiefly of manufactured goods, amounted in 1835 to £606,176. The native manufactures of Chili are insignificant. A great number of islands stretch along the coast, and belong to this republic, but they are too small and unimportant to require special notice in this place. Valparaiso is the great port of Chili into which all foreign goods enter. In 1835, about 400 vessels here delivered their cargoes.

PERU.

Ever since the declaration of independence, Peru has been a scene of political squabbling and change, into the details of which we need not enter. In 1836, the country was divided into North Peru and South Peru, the chief power being vested in a supreme protector, and a close intimacy was then entered into with the neighbouring republic of Bolivia. The constitution, established by a congress of the three confederated states of North and South Peru, and Bolivia, is modelled upon that of the United States of North America. Each of the three republics was to have its own distinct congress, and, collectively, they may be said to have formed a federal republic, united to one another for mutual support and protection. The head of the confederation was chosen by the general congress, out of six candidates proposed by the three republics. The first person appointed to the protectorship of the Peruvio-Bolivian confederation was General Santa Cruz, who then virtually became the head of three independent states. He was elected for ten years. With regard to the constitution of each republic, little appears to have been agreed to besides the general principle that the government of the countries should be intrusted to a senate and house of representatives.

We have already alluded to the declarations of war which have passed between Peru and Chili. Hostilities do not appear to have yet terminated, and these infant states, instead of bending their energies to the development of the resources of the country, are tearing each other to pieces by the bloody and ever-losing game of war. A squadron from Chili took the city of Lima, in August, 1838, after an action in which 2000 men were killed. Santa Cruz immediately advanced upon the city, but in the mean time the Chilinos had evacuated it, and penetrated farther into the country. They were followed by the Bolivian chief with a considerable army, but, in January, 1839, he allowed himself to be surprised, when nearly his whole troops were either killed or taken prisoners. Santa Cruz soon after published a proclamation, by which he abdicated the protectoral authority over Peru; and, by another decree, he resigned the presidency of Bolivia. It were vain to speculate how matters will terminate; but in all likelihood Bolivia will remain a separate state, and North and South Peru will again amalgamate and form one republic.

The boundaries of North and South Peru are as yet so imperfectly defined, that in our description of this region, we shall consider them as forming one whole. Indeed, it is very probable, as we have said, that they will soon again be united as formerly. Peru extends from 3 degrees 34 minutes to about 22 degrees of south latitude, and from 62 degrees to 82 degrees of west longitude. Its length is computed at 1500 miles, but its coast line on the Pacific Ocean cannot be less than 2100, reckoning the bendings of the shore. According to Humboldt's estimate, Peru comprises an area of 45,500 square leagues. The surface of this vast territory is of the boldest and most varied description. It is naturally divided into three regions, Western Peru, situated to the west of the Andes; Eastern Peru, situated to the east of that mountain chain; and Peru of the Andes, which comprises the mountainous districts. Western Peru is a belt or zone of sand nearly 2000 miles in length, and having an average breadth of thirty or forty miles. No rain falls throughout the whole of this desolate Sahara of the west, and vegetation only springs up on the banks of the rivers which run from the Andes to the Pacific. The habitable parts of Western Peru, therefore, are merely a series of oases "islanded amid the waste of sand," like those of Africa. Yet here are situated the city of Lima and several other large towns, the only seaports of the republic. Peru of the Andes, as might be inferred from its varied elevation above the level of the sea, presents a great diversity of soil, climate, and vegetation. Suffice it to say that in different parts it exhibits every species of production, from the dwarf plants of Lapland, which clothe the lofty mountain tops, to the aromatic species of Sumatra, which shed their odours at its base. This portion of Peru contains the sources of those vast rivers which traverse the whole continent of South America, and are the greatest on the face of the globe. But by far the largest, most beautiful, and most valuable part of the Peruvian territory, lies to the east of the Andes, commencing on the eastern declivity of the second chain, and stretching to the confines of Brazil. In this vast region, a thousand sources of wealth lie buried, for the greater part of it may be said to be yet unknown, although the riches which it contains are immense. In fertility, luxuriance, and variety of vegetation, it rivals Brazil, and the world does not present us with any higher standard of comparison. Every sort of production which springs from the ground may be

metal in one part of Peru or another in the amplest abundance. Its mineral treasures are gold, silver, platina, tin, copper, lead, quicksilver, precious stones, salt, alum, saltpetre, coal, sulphur, and others. The most valuable of these are in great plenty.

Peru carries on considerable trade with Great Britain, the United States, France, the kindred republics of South America, and other places. A treaty of amity, commerce, and navigation, with Great Britain, was signed at Lima on the 5th of June, 1837; by which perpetual freedom of trade was established with the countries of the Peruvio-Bolivian confederation. The chief articles of export are gold and silver, Peruvian bark, hides, nitre, sugar (unrefined), cotton, and sheeps' wool, tin, molasses, pot and pearl ashes, &c. The imports into Peru from Great Britain, chiefly of manufactured goods, amounted, in 1833, to £387,524. In 1834, the imports fell, on account of political agitations, but they have since risen, and on an average of years are steadily increasing. In 1835, they amounted to £441,324. The exports to the United States, in 1835, amounted to 1,118,278 dollars; those to France and other places were likewise considerable. The present revenue of Peru has been estimated at £1,250,000; the expenditure at a little less than that sum; and the national debt at £6,000,000. But precise information on these points is not to be obtained. There is a standing army of 3000 men maintained in Peru, and 2000 in Bolivia, according to the articles of confederation. The religion of the republic is the Roman Catholic, no other being tolerated. Slavery has been long abolished here; but the state of the country in regard to education and morals, is still very low. The total population of Peru in 1838, was estimated at 1,700,000, consisting of three original castes—Spaniards, Indians, and Negroes, and all their possible combinations. Lima, the capital, which was formerly the grand entrepôt for the trade of all the west coast of South America, contains a population of 70,000. All the trade is carried on at Callao, which, although six miles distant, is the port of Lima. The next most important place is Cuzco, the chief town of the interior, and the ancient capital of the incas. Here are some magnificent remains of the former riches and splendour of Peru, particularly a Temple of the Sun, the wealth of which, when first spoiled by the Spaniards, was almost incalculable. The remembrance of the ancient heathen worship is still preserved by an honorary institution, called the "Order of the Sun." Besides Lima and Cuzco, the next largest town is the maritime port of Arequipa, which has been six times destroyed by eruptions from a neighbouring mountain, and yet possessed a population of 40,000, previous to the revolution. There are also a great many other towns of minor importance. Earthquakes are frequent in Peru. The city of Lima has been three times almost entirely destroyed by these visitations—in 1687, 1746, and 1828.

BOLIVIA.

After independence was established in 1825, this portion of the ancient vice-royalty of Buenos Ayres received the name which it now bears, conferred in honour of the liberator, General Bolivar. A constitution, drawn up chiefly by Bolivar, and called the Bolivian Code, was immediately introduced, and for two years the republic was tranquil under the presidency of General Sucre. But when the great *libertador* became unpopular in his own country, and those troubles arose which darkened the close of his career, his constitution was rejected from Bolivia, the president was deposed, and Santa Cruz was elevated to the dignity. The present position of this republic we have already spoken of under Peru.

Bolivia is bounded on the north by Peru and Brazil, on the east by Brazil, on the south by the Buenos Ayrean provinces and Chili, and on the west by the Pacific Ocean and Peru. It comprehends a space of 480,000 square miles, and the population is estimated at 1,200,000, of whom probably two-thirds are Indians. This republic includes five of the provinces which were formerly under the Buenos Ayrean vice-royalty, but has been divided by the new government into six departments, namely, Potosi, Chuquisaca, La Paz, Santa Cruz, Cochabamba, and Oruro. The greater part of Bolivia is situated at a very high elevation, but towards the east it stretches down in extensive plains towards Brazil. The climate, therefore, is extremely various. On the high parts, snow-storms and hurricanes frequently prevail, and the plains, from the rigour of the weather, are nearly destitute of vegetation. The climate of Potosi, at an average elevation of 13,400 feet, is so changeable, that it frequently exhibits in one day all the vicissitudes of the four seasons of the year. Thence descending through the regions of Oruro, at an elevation of 12,400 feet, La Paz at 12,100, Chuquisaca at 9300, Cochabamba at 8400, down to the plains of Majos and Chiquitos, all the known degrees of temperature, from extreme cold to extreme heat, are experienced. This elevated region is enriched with the most valuable mines of gold and silver, which, with other precious metals, form the only articles of Bolivian commerce. The mountain of Illumini, in La Paz, which is supposed to contain rich veins of gold ore, is 24,000 feet above the level of the sea. From the great difficulty of working the mines, and the expense of extracting the ore, the greater part of the gold of Bolivia is obtained from the *lavaderos*, or gold washings in the beds of rivulets, where it is found in the shape of grains. The most productive of these *lavaderos* are those of Tipuani, in the province of Larecaja. Silver, however, is the great staple metallic production of Bolivia; and the famous mountain of Potosi is ranked next in importance to the mines of Guanaxuata in Mexico. On account of the inconsiderable nature of the rivers flowing from Bolivia to the Pacific, and the badness of the roads, it is impossible this country can enjoy much commerce with the Pacific; but towards the east, several large streams communicate with the great navigable rivers that flow into the Atlantic Ocean. The river Paro, or Beni, which rises near La Paz, and the Guapey, which rises near Cochabamba, after a long sweep, unite with the Mamori, and, flowing to the north-east, mingle with the waters of the Maranon or Amazon. The Picomayo, again, which rises near Potosi and Chuquisaca, and the Vermejo, which rises in the valley of Tarija, flow to the south-east, and mingle with the Paraguay, the upper part of the mighty Rio de la Plata. All these rivers are navigable almost to their source, and, with steam navigation, would open up a direct communication between these rich districts and the nations of Europe.

The table land of Titicaca is the most elevated on the globe, with the exception of that of Thibet; but while the latter only presents pastures and flocks of sheep, the former exhibits towns and populous cities, and is covered with fine crops of wheat, barley, rye, &c. The lake of Titicaca is 12,700 feet above the level of the sea, and is twenty times the size of the lake of Geneva. It contains several islands, the largest of which, named Titicaca, is the place whence Manco Capac, and his wife Manco Oello Huaco, were represented by Peruvian tradition to have come forth to found the empire of the incas, and spread civilization, industry, and good government through the nations. A magnificent and gorgeous Temple of the Sun was afterwards erected here, the whole ornaments and wealth of which are said to have been thrown into the lake, to prevent their falling into the hands of the Spaniards.

COLOMBIA, OR THE REPUBLICS OF VENEZUELA, NEW GRANADA, AND QUITO.

For three years after the establishment of Independence in Colombia, the country remained tranquil, Santander being vice-president, and exercising executive power in Bolivar's absence. The Peruvians had elected the latter president for life, and adopted his celebrated code; but as he belonged to Colombia, and as symptoms of rebellion had become apparent in that country, he resolved on relinquishing all the honours which the Peruvians were desirous of conferring on him, and returning to his native country. He arrived towards the close of 1826, from which period till his death in 1830, Colombia was a scene of turmoil and bloodshed. The person who played the most conspicuous part in this tumultuous drama, besides Bolivar himself, was General Paez, who had been appointed to the command of Venezuela. He gave great offence by his arbitrary conduct, was impeached, but refused to make his appearance. Immediately thereafter, he placed himself at the head of a strong party opposed to the central system, and desirous of a separation from New Granada. Bolivar succeeded in quelling this insurrection of the north-eastern provinces, but the violence of parties again broke forth in 1828. The events which followed finally resulted in Bolivar's assuming absolute authority; from which period his popularity declined. Plots were formed to assassinate him, but all these attempts ended in the destruction of the projectors, and in Bolivar's exercising, probably to an unwarrantable extent, the absolute power which had been intrusted to him. In 1829, war was declared against Colombia by Peru. The causes of this are partly to be attributed to personal animosity, partly to national jealousy, partly to a desire to get possession of Guayaquil, one of the principal ports of the Colombian territory. The armies met at Tarqui, in Quito, when a sanguinary conflict took place, in which the Peruvians were defeated; and this, along with other circumstances, for a time raised the hopes of Bolivar and his friends. The great cause of difference between the dictator and the people was the Bolivian code or constitution, which did not, it was asserted, allow enough of liberty to the subject, the country being eminently republican and democratic in its views. The fact is, the people had become intoxicated with their freedom, and nothing short of licentiousness would satisfy them. But a civil war was prevented by the death of Bolivar, which took place on the 17th of December, 1830. As soon as this event became known, the three component states of Colombia peaceably agreed to become independent of one another. The limits of these states are nearly the same as they were when each was a separate province subject to Spain. Their constitutions are based on the most liberal republican principles, and they are leagued together for mutual support against foreign aggression. The national debt of Colombia was equally divided among the three states in December, 1834; slavery was for ever abolished in all of them; and, upon the whole, they are likely to go on much more peaceably and rationally apart, than if they were united under one head. We shall give a brief description of each state.

NEW GRANADA.

This republic is bounded on the north by the Caribbean Sea and Guatemala; on the east by Venezuela and Guiana; on the south by the Amazon and Quito; and on the west by the Pacific Ocean. The great chain of the Andes traverses this country, and the mountains are extremely rich in gold and silver; and there are also mines of platina, copper, lead, and emeralds. The value of gold and silver produced annually is stated at £650,000. It is divided into five districts and thirteen provinces, the united population of which, according to the census of 1835, amounts to 1,687,109; or, on account of errors, 1,700,000. Santa Fe de Bogota is the capital of the republic; it has a population of above 40,000. Here a national academy was opened in 1833. In 1835, the income amounted to 3,337,836 dollers, and the expenditure to 2,211,554 dollars; leaving a balance of 126,282 dollars for payment of the interest of the national debt. The share which belongs to New Granada was above £3,000,000. The principal articles of export are cocoa, indigo, tobacco, coffee, hides, and cattle. The imports are manufactured goods of almost every description. What the value of these may be, it is impossible to say, for the contraband trade has been here carried on to an almost unparalleled extent.

VENEZUELA.

This state extends from the republic of Quito or the Equator to 12 degrees of north latitude, and from 60 degrees to 71 degrees 36 minutes of west longitude. On the north and east it is washed by the Atlantic Ocean, and has a number of good ports. The most remarkable feature of the country is the great river Orinoco. It is also traversed by the Andes; and the great lakes of Maracaybo and Valencia belong to its territory. The northern part is mountainous; but in the south, on the banks of the Orinoco, are immense plains, called *llanos*, the climate of which is hot, and in some parts unhealthy. The year is completely divided into the rainy and the dry seasons; the former commencing in November and ending in April. The productions are sugar, coffee, indigo, cotton, and tobacco. The plains on the Orinoco furnish extensive pastures, which support numerous herds of cattle. Venezuela is partitioned into four departments, and further divided into twelve provinces, which contain in all a population of 829,000. The budget for 1838 was estimated at 1,763,649 piastres. According to the division of the national debt already noticed, £1,941,705 fell to the share of Venezuela. The patronage of the church has been taken from the archbishop of Caraccas, and is now in the hands of the president. Tithes are abolished, the clergy being paid by the state. Monastic institutions and missions have been done away with, their income and possessions being applied to the uses of the National College established at Maracaybo for public instruction. The principal town of Venezuela are Caraccas, with a population of probably 40,000; Cumana, a sea-port, with 25,000 inhabitants; Varinas, with 12,000; and Maracaybo, situated on the margin of the great lake of the same name, which has 25,000 inhabitants. The cultivation of the soil and the rearing of cattle are the great objects of industry in this republic. With the overplus of these, the inhabitants obtain the manufactures of Europe. The chief articles of export are cocoa, coffee, sugar, tobacco, cotton, hides, dye-woods, sarsaparilla, Peruvian bark, balsam, indigo, furs, &c. The imports are for the most part the fabrics of England and France. It is difficult to state with certainty what the exports and imports may amount to respectively, but the former may be estimated at 2,000,000, and the latter at 4,000,000 of piastres. (A piastre is equal to 4s. 3½d. sterling.)

EQUATOR, OR QUITO.

The territory of the Equator comprehends the ancient presidency of Quito, extending from 2 degrees of north to 6 degrees of south latitude, and from 75 degrees 30 minutes to 80 degrees 40 minutes of west longitude. On the south it borders on Peru and Brazil, the latter country forming also its eastern boundary; on the north its limits are New Granada, and it is washed by the Pacific Ocean on the west. This republic is intersected by both chains of the Andes, and consequently presents great diversity of surface and climate.

The high valleys enjoy a temperate climate, although situated immediately under the equator, a consequence of their great elevation. They are extremely fruitful, and would be the most charming places in the world, were it not for the destructive earthquakes and volcanic eruptions with which they are not unfrequently visited. There are sixteen active volcanoes in Quito; and some of the most frightful earthquakes on record have taken place in this country. The valley in which the city of Quito is situated is allowed to be the finest table-land in America, and all travellers speak in glowing terms of its surpassing loveliness. The fertility of some parts almost exceeds belief. Every thing of vegetable kind is produced in the greatest abundance. Gold and silver are comprised in the metallic riches of the mountain territory.

This republic is divided into eight provinces, the population of which is estimated at 550,000, more than the half of whom are Indians, who dwell in the mountains. The capital of the country is Quito, one of the largest and finest cities in the New World. It stands at an elevation of 9000 feet above the ocean level, but being nearly under the equator, has a bland and genial climate. Quito has two universities, and it has always enjoyed celebrity for the great number of students by which they are attended. The population is estimated at 75,000. The great port of this republic, and indeed of the whole three republics formerly constituting Colombia, is Guayaquil. In the year 1835, there entered inwards 123 vessels of 21,430 tons burden in all, and with cargoes valued at £221,680. The same number cleared outwards, and the value of their cargoes was £210,429. The imports consist chiefly of British manufactures, flour, wine, and other necessaries; the exports of cocoa, timber, and the various other vegetable products of the country. With regard to the income and expenditure, little correct information is to be obtained. The former has been reckoned at 800,000 piastres, and the latter at about as much; but by the most recent intelligence, the minister of finance estimates the outlay as low as 171,086 piastres. By the treaty regarding the national debt, £1,464,795 fell to the lot of the republic of Equator. On the 1st of May, 1835, the congress of the nation, consisting of forty-five members, agreed to draw up a plan of a constitution for the country; but it does not appear that they have yet come to a complete understanding as to the details.

It is worthy of being mentioned, that the independence of all the republics of America, which formerly were Spanish provinces, was regularly recognised by Spain on the 5th of December, 1836.

BRAZIL.

Brazil is by far the largest and most important state in the New World. The climate is more generally salubrious and agreeable than that of any other tropical country, and every part of the soil is rich, fertile, and exuberant of vegetation. It is in a manner encircled by Banda Oriental, Paraguay, Bolivia, Peru, Colombia, and Guiana; bounded on the east and north-east by the Atlantic, and possessing the immense range of coast from beyond the Rio Grande South (about half way between Rio Janeiro and La Plata) and the Amazon. The territory within these limits has been estimated by some at 2,500,000, and by others at 3,000,000 square miles. Brazil, indeed, is nearly as large as Europe. But more than one-half of it is in possession of independent Indians, who are not included in the account of the population.

Brazil was governed in much the same way as the Spanish colonies, until the year 1808, when King Joam fled from Portugal to escape the power of Bonaparte, who had taken a fancy to his dominions. He was warmly received by the Brazilians nor was their joy misplaced, for he immediately set about freeing the territory from all the marks of colonial dependence. The press was made free, newspapers established, and the ports thrown open to traders of every nation; and every thing done to promote education and industry. In 1815, also, Brazil was created an independent state, although annexed to the crown of Portugal. In 1817, some democratic insurrections broke out in Pernambuco; and although suppressed, discontent still continued, until in 1821 it was announced that the Portuguese constitution was to be conferred on Brazil. Before this, however, King Joam had sailed for Portugal, promising at his departure increased pay to all his officers and soldiers. But when he was gone, it was found he had carried off every farthing that was in the treasury, having also raised immense sums by means of treasury bills. The public indignation at this discovery, together with the suspicion that he intended again to reduce Brazil to the condition of a vice-royalty, occasioned a general call for his son Don Pedro, who had been left as regent, to become the head of the government as an independent state. This he readily complied with. In 1822, he was proclaimed emperor; and in 1825, his title and the independence of Brazil were acknowledged by his father. Then followed the war with Buenos Ayres respecting the Banda Oriental, which, at its termination in 1828, left the country destitute of all currency but paper. This excited much discontent. About the same time, the abolition of the Portuguese constitution by Miguel excited the suspicions of the Brazilians that that event was only the prelude to a similar occurrence in Brazil; nor did the language and deportment of Pedro tend at all to allay their fears. In April, 1830, the nation had become divided into constitutionalists (Brazilians) and absolutists (Portuguese); but an attempt having failed to induce the troops to declare the emperor absolute, he to all appearance joined the constitutionalists. His measures and conduct, however, continued so equivocal, that, in March, 1831, manifestations of popular excitement broke out. The extreme rigour he exercised on this occasion, and his subsequent vacillation, increased and incensed his enemies more and more; and in the April following, disturbances broke out in which many persons were killed. Pedro immediately announced a change of ministry; the public remonstrated against this, but he remained resolute; an insurrection, in which the troops joined, was the consequence; and next morning Pedro abdicated in favour of his infant son, Pedro II., and embarked from Rio Janeiro, on board an English ship of war, carrying with him an immense treasure in diamonds and jewels. A permanent regency was appointed to manage the government during the minority of the emperor; but political storms have not ceased to "lower upon this house." Insurrections are by no means uncommon in Brazil; some recent inroads of the Indian tribes have been attended with much loss of life and property. The city of Para was taken in 1836, but afterwards evacuated. Bahia was likewise captured by a rebel army of Indians and others, but wrested from them by the imperial troops with a great loss on both sides. This event occurred so late as March, 1838. A serious insurrection has recently broken out in the province of Rio Grande. The imperial troops were repeatedly defeated, and that portion of the country has declared its independence. That this will be maintained, is quite uncertain.

To describe minutely the physical characteristics of so vast a region as that of Brazil, would carry us far beyond our limits. Generally speaking, there is not on the globe a finer country, one blessed with a more genial climate, or a more fertile soil; more happily diversified with wood and water, or with abundance of navigable rivers; or more famed for its produce of gold and diamonds. Nearly the whole of the most highly valued productions of the earth are raised within its territory. The land rises by

gentle gradations from the shore to the interior, to the height of from three to six thousand feet above the level of the sea. At this elevation within the tropics, the climate is temperate, and European fruits and grains are raised in abundance. The intervening valleys have a warmer temperature, and consequently are extremely favourable to the growth of sugar, coffee, cotton, and every description of tropical produce. Magnificent forests overspread a great part of the interior. The trees are closely interwoven with brushwood and shrubs, and covered with creeping plants adorned with the most resplendent flowers, thus imparting a peculiar and rich appearance to the scenery. These forests abound in valuable woods, adapted for every purpose to which art can apply them. They are also the abodes of numerous wild animals, and of an infinite variety of the feathered tribes. The climate in the neighbourhood of the Amazon, and in the northern parts, is hot, but ameliorated by the humidity of the atmosphere; in the southern regions it is temperate, and in general healthy. The principal rivers are the Amazon, Madeira, Topayas, Xingu, Tocantins, Negro, St. Francisco, Paraguay, Parana, and the Uruguay.

Brazil is rich in mineral treasures, especially in gold and diamonds. Gold is found in the beds of most of the rivers that rise in the interior, and almost all the towns were founded by men searching for gold. Next to gold, diamonds form the staple of Brazilian mineral riches. They were first accidentally discovered about 1730. There are several large mines of nitre and iron, but no silver is found. Salt is extremely abundant, but being a government monopoly, it is always kept very high in price; a most absurd regulation in a country where it is so much required, not only for the use of man, but of cattle, poultry, sheep, and other animals, and for salting meat. The commerce of Brazil is very extensive, especially with Great Britain. Though labouring under the curse of being a slave-holding state—a condition of things incompatible with sound institutions—Brazil is yearly improving in circumstances, and exhibits very satisfactory symptoms of commercial prosperity. All that it requires, exteriorly, is liberty to trade on equitable terms with Great Britain, where its vast produce of coffee and sugar would find a market. At present it raises 60,000 tons of coffee annually, and this could be greatly increased. Brazil is well known as being the best South American customer of Britain, particularly for cotton goods. At present its imports from the United Kingdom amount to about £4,000,000 annually, and between 50,000 and 60,000 tons of British shipping are engaged in the trade, chiefly in connection with Liverpool. On Brazil coffee a duty of 1s. 3d. per lb. is now (1841) charged on admission to our market, while West India coffee is allowed to enter at 6d. per lb. This preposterous preference greatly injures our trade with Brazil, and forms a serious tax on the consumer. Brazil sugar is practically excluded, from a similar cause. The trade with France, the United States, and other countries, being on the increase, it is not unlikely that Britain may soon almost lose Brazil as a customer for her cotton and other manufactures. The imports into Brazil from the United States during the year 1835 amounted to 2,608,656 dollars, being chiefly flour; from France, to the extent of £907,330. The whole imports into Brazil may be estimated at £6,500,000. The exports, consisting of sugar, cotton, hides, coffee, tobacco, rice, leather, drugs, dye-woods, India-rubber, gold, diamonds, are estimated at £5,500,000, of which about £1,500,000 comes to Great Britain. According to the report of the finance minister, the income for the year 1838 was 13,663,289 dollars, the expenditure 13,622,000 dollars, leaving a balance of 41,289 dollars. There is a national debt of above £6,000,000. Brazil is divided into nineteen provinces, the population of which is stated to be 5,216,666 souls, of whom 2,086,666 are slaves. The form of government is that of a constitutional and representative monarchy, the imperial crown being hereditary in the male line. Four political powers are recognised—the legislative, which resides in a general assembly, consisting of a senate appointed by the emperor, and a chamber of deputies elected by the people; the executive, the managing, and the judicial, are the other three powers. In 1835, it was decreed that a legislative provincial assembly should be introduced into each of the nineteen provinces, the duration of each session to be two years. The local powers of these bodies are very considerable, approaching to those of the individual states of the North American Union. The religion of the state is the Roman Catholic, but the exercise of all others is permitted, though none are allowed to build churches or perform divine service in public. There are a great number of monasteries and nunneries in Brazil, and the clergy is numerous. Much has been done for public instruction in Brazil, a national system of education having been introduced. The press is free, but, as yet, there are few printing establishments in the country. A succession of tranquil years, it is hoped, will enable the Brazilians to make advances in literature and the useful arts.

The capital city of Brazil is Rio Janeiro, of which the population is estimated at nearly 200,000. The harbour is one of the finest in the world. The entrance to it is a narrow opening in a ledge of rocks, about half a mile wide, at the mouth of which is an island, upon which a strong fort is erected. After passing through this strait, the mariner finds himself in a magnificent gulf 100 miles in compass, encircled by lofty mountains, and enclosing a number of islands. Vessels of all dimensions may enter and anchor in perfect security. The city is on the north-east side of the bay; the streets in one part are narrow, and the whole appearance of the lower city is somewhat mean. It is, however, now greatly improved by the erection of public and private buildings. The greatest portion of the mercantile inhabitants are Portuguese. One of the most striking features of Rio, is the immense number of churches with which it is provided.

Bahia, or St. Salvador, the ancient capital, is situated on the east side of the magnificent bay of All-Saints, which extends a whole degree from north to west, branching inland in every direction, and capable of holding all the shipping in the world. The population is estimated at 120,000, so that it is the second city in Brazil. From its central situation, the commerce is very extensive. Pernambuco is the next city in size and importance, and is increasing so rapidly that new houses are built wherever space can be found, while the commerce is increasing in proportion. It is perhaps the handsomest city in Brazil, with broad paved streets, fine houses, an episcopal palace, handsome churches, convents, hospitals, theatre, &c. The population is about 62,325. Maranham is a sea-port of considerable size and trade, with a population of 27,000. Besides these are Villa Rica, Para, Rio Negro, and about twenty others of lesser importance.

PATAGONIA.

The land of Megalhaens is of great extent, occupying the whole southern portion of South America, beyond about the 40th parallel of south latitude. Its length, including Cape Horn, is above 1000 miles; but its breadth at the widest is not much more than one-third of that space, and it gradually narrows to a point at the southern extremity, where the land bends in a curve to the north. The interior of this large territory is but little known, but the more that is ascertained of it, the less does it appear likely ever to become the seat of a thriving people. It appears to be almost entirely destitute of

useful production, and quite unfitted for the residence of civilised men. Terra del Fuego is divided into three islands by two channels, and is altogether a desolate place. The inhabitants of Patagonia, so long proverbial for their gigantic stature, are now known to be little above the European standard in height, and are few in number; they possess no towns, but lead an unsettled life, somewhat resembling that of the Tartars.

To the east of Patagonia lie the Falkland Islands, the possession of which at one time nearly occasioned a war between England and Spain. They are now held by Britain, and may possibly be opened for colonial settlement. Still farther south, are the South Shetland Isles, containing not a vestige of vegetation, and covered with eternal snows. To the north-east of these is a large island, Georgia, which may be termed the throne of the southern winter, presenting nothing but rocks of ice and mountains of snow.

GUIANA.

This territory is divided into British, Dutch, and French Guiana. It is situated north of Brazil, between Cape North and Essequibo, inclusive. As British Guiana is usually comprehended under the West Indies, we shall not enter into a description of these settlements in this place. The whole district is about 600 miles in length, and has an average breadth of 250 miles.

The settlement of Cayenne, or French Guiana, was first formed about 1630, by a colony from Caen, in Normandy, after which it is called. It did not succeed. From that period down to the peace of 1814, it passed alternately into the hands of the Dutch, British, Portuguese and French, but was then finally restored to France. There are two settlements, one on the mainland, another on the island of the same name, separated from the former by the river Cayenne. The mainland is low and marshy, and the Indians in the surrounding territories are so troublesome that the settlers attend to little else than the rearing of cattle. It is on the island that all the articles of merchandise are raised, consisting of coffee, sugar, cotton, cocoa, indigo, Cayenne pepper, &c. The island is eighteen miles long, and ten broad. At the north point is the town of Cayenne, the capital of the colony, with a fine convenient harbour, and containing about 200 houses. The population of the whole colony does not exceed 25,000; and altogether it is a settlement of very little importance.

Dutch Guiana, until 1814, comprehended Surinam, Berbice, Demerara, and Essequibo; the three last were then transferred to Britain. The remaining province of Surinam is about 210 miles long along the coast, and as much broad. The soil is low, rich, and fertile, and produces sugar, rum, cotton, and coffee, for exportation. In 1831, the imports into the United Kingdom amounted only to £899, while there were no exports in return. In 1815, the population was calculated at 49,000, of whom 2000 were whites, 3000 free coloured persons, 31,000 slaves, and 13,000 free Indians and Maroons. The population at present is certainly above 60,000. Paramaribo is the capital, situated on the river of that name, with a population of from 18,000 to 20,000.

GENERAL CHARACTERISTICS—POPULATION, CHARACTER, RELIGION, CUSTOMS, &c.

Whatever may be advanced against the ritual of the Romish church, the experience of history would seem to show that it is of all the forms of Christianity the best fitted to captivate a people involved in the errors, and addicted to the superstitious observances, of heathenism, from the strong power which it exercises over the imagination. We find, accordingly, it was through the influence of the Jesuits that a compromise or friendly understanding was first effected between the American Indians and their conquerors. This union has continued to grow gradually firmer from the intercourse of their descendants, by which the physical characteristics of the two races have been amalgamated in the present brown, or rather olive-coloured population, who now constitute the great body of the Christianized inhabitants of South America. The events of the last half century have contributed powerfully to annihilate that invidious distinction of *castes*, which in other European colonies has been the constant source of mutual jealousy, envy, and heart-burning—displaying themselves in discontent and insurrection on the one hand, and oppression on the other. This gradual extinction of the observance of *caste* has naturally generated a more benevolent sympathy towards the unfortunate African negroes than is anywhere else exhibited; and, accordingly, it was one of the first objects of the patriots who threw off the Spanish yoke, to grant them their freedom. In some provinces—as those, for example, of Colombia—immediate emancipation was declared; in others, more gradually. In some parts, as in the Brazils and Guiana, slavery still exists; but the spirit of all the various governments is favourable to manumission, and universal freedom seems to be a matter neither improbable nor distant. The uniform establishment of the Roman Catholic religion throughout all the states, has also, no doubt, contributed much to produce a community of feeling and sentiment among all classes of the population, all being alike—negro as well as white—members of the church. The events of the revolution were naturally accompanied with feelings of jealousy respecting all the original institutions introduced by the Spaniards, religious as well as civil; but in the matter of religion, the odium seems to have fallen not on the church, but on the priesthood. This was more especially the case in the commercial cities, in almost all of which as complete an overturn and spoliation took place among the rich and indolent establishments of monks and friars, as during the period of the reformation in Scotland.

Generally speaking, the natives of South America are a much more active and industrious race of men than the creoles of other tropical countries. The Spanish custom of the *siesta*, or noon-sleep, is universally prevalent; but both before and after that period of repose, they are actively engaged either in transacting business, or in giving and receiving visits, attending public exhibitions, promenading, making short journeys of pleasure, &c. As among the whites in the West Indies, universal hospitality prevails, every man's house being a home to the traveller; and this is the more necessary from the scarcity and bad provisions of the inns. The manners of the inn-keepers and their servants resemble those in the United States, where both sit down at table, and converse familiarly with their customers. The staple dish throughout South America, both at inns and in private houses, is the *olla*, consisting of boiled or stewed beef, covered with *friolas* and other vegetables. In these places of refreshment, too, travellers of all ranks and characters dine at the same board, and take their siesta in the same room, upon mats spread down for the purpose. Travellers of respectability generally endeavour, however, to stop at the houses of proprietors near the wayside, who live in a style of wealthy ease and luxury.

The Spanish amusement of bull-baiting is pursued with great avidity by the South Americans. But perhaps a more demoralizing and pernicious amusement is the besetting vice of gamoling, in which all classes in the town indulge to a great extent. The method of catching the wild cattle that rove in immense herds over the *pampas*, is a practice altogether peculiar to the South Americans. The instrument used is called a lasso, from the Spanish *lazo*, signifying slip-knot or noose, and the operation of using it is called lassoing. It consists of a rope made of strips of untanned hide, varying in

length from fifteen to twenty yards, and is about as thick as the little finger. It has a noose or running-knot at one end, the other extremity being fastened by an eye and button to a ring in a strong hide-belt or surcingle, bound tightly round the horse. The coil is grasped by the horseman's left hand, while the noose, which is held in the right, trails along the ground, except when in use, and then it is whirled round the head with considerable velocity, during which, by a peculiar turn of the wrist, it is made to assume a circular form; so that, when delivered from the hand, the noose preserves itself open till it falls over the object at which it has been aimed.

Wild horses are captured with what is called, in the language of the Gaucho, "las bolas," or balls—a most formidable weapon in the hands of him who knows how to use it. It consists of three thongs or cords of hide, each more than a yard long, having balls attached to the extremities. The "bolesdor," or he who is going to fling the balls, takes one ball in his hand, and swinging the others rapidly round his head, throws "las bolas" with all his might, and unerring certainty, round the hind legs of his victim, which immediately comes to the ground.

Spanish is of course the language spoken in all the republican states of South America. At Panama, however, Captain Hall was surprised to hear the whole inhabitants, white, brown, and black, talking good English. This arises from the constant commercial intercourse kept up with Jamaica across the isthmus.

COMMERCE OF SOUTH AMERICA.

It is impossible for us to give any probable estimate of the present state of South American commerce. The capabilities of this vast continent for a trading intercourse with foreign nations are perfectly incalculable as to value and extent. Having, therefore, briefly stated, in our notice of the various provinces, the principal articles of import and export from each, we will here give the published official report of the entire commerce between South America and Great Britain, for the year ending January, 1831, and from it a guess must be made at the entire traffic of the former with foreign nations:—

OFFICIAL REPORT of the ENTIRE COMMERCE between SOUTH AMERICA and GREAT BRITAIN for the year ending January, 1831.

	Official value of imports into the United Kingdom.	Official value of Exports from the United Kingdom.		Declared value of British and Irish produce & manufactures exported from the United Kingdom.

MINES AND MINERALS.

Having under the various heads alluded to the mines and minerals peculiar to each district, we reckon it unnecessary to do more here than to show at one view the quantity of the precious metals which have been extracted from the mines of Spanish America and Brazil. The estimate is made by Humboldt, from the registries of the various mints, and making allowance for the contraband traffic:—

Spanish America.	*Dollars.*	*Pounds sterling*
Produce of the Mexican mines, to 1800,	2,107,270,511	£474,135,866 0 0
Produce of the mines of New Granada, to 1803,	275,000,000	61,875,000 0 0
Produce of the mines of Chili, to 1803,	138,000,000	31,050,000 0 0
Produce of the Peruvian mines, to 1800,	891,358,595	200,555,684 0 0
Produce of the mines of Potosi (Bolivia), to 1803,	1,476,372,174	332,183,739 7 6
Total produce, registered and unregistered, of Spanish America,	4,888,001,280	£1,099,800,289 7 6
Portuguese America.		
Produce of the Brazilian mines from 1695 to 1803, registered & unregistered,	855,000,000	192,375,000 0 0
Total produce of the American mines to 1803 and 1806,	5,743,001,280	£1,292,175,289 7 6

So much has the mineral produce of the Mexican mines diminished, consequent on the destructive intestine warfare which so long afflicted that unfortunate country, that it does not now exceed 10,000,000 dollars, instead of £27,000,000, as in 1805. From 181[illegible] to 1826, the collective produce was only 168,297,400 dollars. The coinage of the Mexican mint, for 1827 and 1828, amounted to 5,700,853, and that of the four provincial mints, for these same years, 6,001,74[illegible] dollars. Total produce in eighteen years, from 1811 to 1828, 179,999,990 dollars, or 10,000,000 annually. According to an official document, the coinage of all the mints in 1834 was 12,040,811 dollars; but it is calculated that gold and silver were shipped from Mexico during the same year to the extent of £5,000,000, which shows a considerable rise. The Chilian mines, which produced annually 2,060,000 dollars, registered and contraband, prior to the revolution, and which even in 1817 produced a coinage of 1,161,283 dollars at the mint of St. Jago, fell in 1824 to 193,000 dollars, or only one-sixth of the coinage of 1817. But it has since risen even above its old standard. During the year 1831, there was shipped from the ports of Chili, gold, silver, and copper, to the amount of 2,379,539 dollars. The quantity of gold produced by the mines is, besides, stated to be much greater than appears from official documents. According to parliamentary returns, the gold coined at the mints of Lima and Cuzco, from 1820 to 1833, amounted to 2,138,870 dollars, and of silver to 27,825,286 dollars. At the different smelting-houses throughout the republic of Peru, the silver reduced to bars in 1833 amounted to 2,562,242 dollars, or about half a million sterling, and the gold to about £30,000 sterling. Still later returns show that the working of the silver mines in that country is at length proceeding with increased spirit, activity, and success. The Quicksilver mine of Guancavelica in Peru, the only one of this kind in the New World, and which formerly yielded about 8000 quintals of mercury annually, is now very nearly exhausted. The silver mines of Potosi, now included in the territory of Bolivia, have yielded since their discovery in 1545 upwards of 1300 millions of dollars. These are still considered the richest in South America, but great ignorance of mining operations is displayed in working them. Indeed, this remark is applicable to the whole mining business of South America, or was till very lately. What Potosi may now produce yearly, it is difficult to state with any degree of accuracy. When Temple visited the depart

sent in 1828, the mines were only wrought to the extent of £125,000 annually; other accounts say double that sum, and they must certainly have at least risen to half a million since then. The mines of New Granada, which formerly yielded 3,000,000 of dollars annually, are now much fallen off.

The gold and diamond mines of Brazil are not the profitable speculation which they once were. The process of procuring diamonds may rather be termed washing than mining. They are found in the beds of rivers among the mud, which is placed in a range of troughs into which a stream of water is introduced.

In concluding our sketch of the South American continent, it is impossible to avoid expressing a regret that such an extensive and productive region of the earth should have had the misfortune to fall under the domination of Spain, and other unimproving nations of Europe. From this cause, bigotry, sloth, vice in all its most hideous aspects, and an enmity to human improvement, have been engrafted on the social condition of the people, no matter what be their form of government, and ages must elapse before they can compete, in civilization and its innumerable advantages, with their more fortunate and enlightened brethren in the northern continent.

DESCRIPTION OF THE WEST INDIES.

The name of the *West Indies* is given to a huge belt of islands, stretching in the form of a curve between the continents of North and South America. They may be, in general terms, described as running in a south-east direction, from the coast of Florida on the former continent to the Gulf of Paria on the most north-eastern point of the latter, presenting a sort of convex breastwork to the Atlantic Ocean. They are *nautically* classed by the British under two great denominations—*Windward* and *Leeward*. The former are the more northern of the group, the latter the more eastern and southern, and include those properly termed the Carribean Isles. The latter, again, are themselves divided into *Leeward* and *Windward*, as will be seen by the map annexed to this article. St. Domingo (or Hayti) is the most southern of the Windward Islands; Porto Rico the most northern of the Leeward. Looking at the map, it would seem that these two divisions had derived their distinctive appellations from their relative position to Jamaica. Thus, in returning to Europe from that island, the navigator either holds at first a southerly course across the Carribean Sea, and through the cluster of isles so called, until, having attained the proper degree of southerly latitude, he changes his tack, and slants right across the Atlantic with a side wind, when he catches the western breeze off the coast of Newfoundland, which enables him to run down upon any desired point of the continent of Europe; or he at once beats direct up to the eastward against the trade-wind, by short tacks, the line of the latter course subtending (to speak mathematically) the angle described by that of the former. These two courses of navigation are respectively termed the *leeward* and *windward* passages. It must be observed, however, that the French and Spaniards affix different meanings from the British to these terms, and apply them respectively to the relative position of the various islands.

That portion of the ocean which is thus in a manner separated from the main body of the Atlantic by this huge chain of islands, and contained between them and the respective shores of North and South America (which are connected by the narrow Isthmus of Darien), is also divided into three great basins—the more northern one being called the Gulf of Mexico; the middle one, the Bay of Honduras; and the southern one (as already noticed), the Carribean Sea. The latter takes its name from that class of islands which bound this part of the ocean to the east, originally inhabited by a nation of cannibals denominated Carribs or Charaibs, and from which Columbus afterwards styled their possessions the Carribean Islands.

The Gulf of Mexico is almost completely separated from the other two basins, by the near approximation of the southernmost point of the island of Cuba to the northernmost part of the coast of Yucatan, South America. The channel between these two points is so shallow that it is supposed they must have been at one time connected.

DISCOVERY.—NATIVE INHABITANTS.

These islands were first discovered by Columbus, when engaged in his adventurous attempt to find out a western passage to India. It was from this circumstance that he gave them the name of the Indies, which, after the Cape of Good Hope was doubled by the Portuguese, was changed to that of the Indies of the West, and this name they have ever since retained. Some of the older navigators and writers, however, designated them the Antilles, by which even some modern geographers distinguish them. They are, however, best known under their original designation, and by this we shall continue to call them.

The first land discovered was the Bahama Islands, the most northern of the group, in the year 1592. Columbus afterwards visited Cuba, Jamaica, St. Domingo, and most of the Carribean, or, as they are geographically termed, the Leeward and Windward Islands.

Respecting the inhabitants found in the West India Islands by the early voyagers, it is impossible to trace their origin with certainty, although it is most probable that they came originally from the continent of America. There appears to have been at least two distinct tribes inhabiting these islands at the period of their discovery, between whom a marked distinction existed in language, manners, and appearance. The most warlike and powerful of these tribes was that of the Charaibs, or Carribs, who are supposed to have come from the southern continent, as similar tribes of Charaibs were found to exist in Guiana by subsequent voyagers. The Charaibs always manifested the most sanguinary spirit, and continued for ages to be the scourge of the other inhabitants of the islands. They seemed to consider war as the prime occupation of their lives, and although cruel to their prisoners, they manifested the greatest affection for each other. Like most savage nations, they seem to have possessed a strong repugnance to every species of subordination, neither kings, magistrates, nor laws, existing among them. Their

frames were robust, muscular, and active; but they disfigured their faces with paints and dyes in the most extravagant manner, and even made deep gashes in their faces, to render themselves more hideous. The children were early initiated into the barbarities of their parents, being taught to feed upon the bodies of prisoners captured in war, and to anoint themselves with the fat of their victims. On arriving at the age of manhood, the youth were subjected to dreadful tortures, in order to prove their fortitude, and powers of endurance; and when any one aspired to the dignity of chief, he was subjected to even greater tortures before the honour was conferred upon him. They took as many wives as they wished for, or were able to maintain, and the women were treated with great brutality, and subjected to every species of domestic drudgery and labour. The Charaibs were likewise addicted to that most disgusting and brutal practice, so common among [illegible]

of tropical climes, of flattening the heads of their offspring. Notwithstanding these barbarities, the Charaibs, at the period of their discovery, had attained some proficiency in many kinds of manufacture. Columbus observed abundance of substantial cotton cloth in all the islands he visited, which the natives dyed of various colours. Of this cloth they made hammocks, or hanging beds, such as are used at sea, both name and pattern having been adopted by Europeans. These savages also formed various vessels of clay, some beautiful specimens of which have been dug up in Barbadoes and other islands. Their religion was a compound of idolatry and superstition; but they believed in the existence of a Deity, and in a future state.

The inhabitants of the larger islands of St. Domingo, Cuba, Jamaica, and Porto Rico, presented the most striking contrast to the Charaibs. They were indolent and sensual in their habits, but mild and forgiving in

disposition, affectionate to their wives, and seem to have been of a domestic turn of character. They were particularly fond of dancing and various other peaceable amusements and games. Their form of government was monarchical, the kings being called *caciques*, and their power hereditary. Subordinate chiefs or princes governed each district, who were tributary to the king. They had likewise an established priesthood; but their religion consisted of the usual savage superstition. They, however, believed in the existence of a Deity, and a future state of rewards and punishments. These simple people showed great kindness to Columbus and his companions while visiting their islands, believing them to be a species of superior beings; and observing the avidity of the Spaniards for gold, they gave them all they possessed. A remarkable speech has been preserved, which an old man, a native of Cuba, addressed to Columbus when presenting him with a basket of fruit. The speech shows the quiet disposition of the people, and their profound veneration for their white visiters. "Whether you are divinities," said he, "or mortal men, we know not. You are come into these countries with a force against which, were we inclined to resist, resistance would be folly. We are all, therefore, at your mercy; but if you are men, subject to mortality like ourselves, you cannot but know that after this life there is another, wherein a very different portion is allotted to good and bad men. If, therefore, you expect to die, and believe with us that every one is to be rewarded in a future state according to his conduct in the present, you will do no hurt to those who do no hurt to you." It was upon these simple people that the Spaniards afterwards perpetrated the most barbarous cruelties, which ultimately extirpated the whole race.

NUMBER OF ISLANDS.—PRESENT POSSESSORS.

No actual survey of the West India Islands having ever been made, it is impossible to state with certainty their actual number. It must, however, be very great, from the fact that the Bahamas alone amount to five hundred. A great proportion of these are uninhabitable rocks, which generally furnish fine water; and being possessed of good natural harbours, afford shelter for ships in the event of storms. We shall only enumerate the principal colonial possessions belonging to the British and other European powers, and the free native settlements, with a short historical and topographical sketch of each; and then proceed to give a general view of their appearance, productions, climate, inhabitants, government, trade, &c. The first in point of importance, both as to number and value, are the

BRITISH POSSESSIONS.

1.—JAMAICA.

This is the third island in point of size in the western hemisphere, being inferior only to Cuba and St. Domingo. It lies about one hundred miles south of the former, and about ninety west of the latter. Jamaica is situated between latitude 17° 35′ and 18° 30′, and 76° and 78° 40′ west longitude. It is 160 miles long, 45 broad, and contains 4,000,000 acres of land. This island was discovered by Columbus during his second voyage, and was well populated at that period. The natives opposed his landing at first, but he soon effected a reconciliation with them, and took possession of the island in the name of his sovereign. It was not, however, until his last voyage that a settlement was formed on the island; and this arose from his being obliged by tempestuous weather to run his ships ashore. Columbus stayed on the island for twelve months; and after enduring great hardships, he was rescued, and died soon after his return home. In 1509, the son of Columbus despatched Juan de Esquivel to take possession of the island as deputy-governor, and the colonists for many years were engaged in perpetual warfare with the natives. The Spaniards committed great atrocities on the Indians, whom they at last completely extirpated, not a single native being left alive when the English took possession of the island in 1655, nor, it is said, for a century before. The traditionary accounts of the cruelties inflicted by the Spaniards upon the natives are truly revolting; who, instead of retaliating, soon sunk into the condition of slaves, and hard treatment at last effected their complete destruction. The first regular settlement was fixed upon the banks of a small rivulet, called Seville Nueva. Here a town was built, of which, however, nothing now remains but the name, it having been destroyed by French Buccaneers. During the period the Spaniards held possession of Jamaica, they appear to have made some advancement in agriculture; but their rapacity for gold, which they were constantly in search of, prevented any great improvement in this department. They, however, cultivated the sugar-cane, the vine, and the cotton-tree, and introduced cattle from Europe. The Buccaneers made frequent descents on this island, and committed great depredations both on the Spaniards and Indians. It was twice taken and plundered by these rovers; but no regular attack was made by any European power until 1655, when an expedition was sent against Jamaica by the English government. It arrived in the month of May; and so expeditious and successful were the operations, that the fleet was enabled to sail for England in the following month. For some time after, however, little progress was made in the cultivation of the land, the Spaniards having fled to the mountains, from whence they attacked the colonists at every fitting opportunity. Cromwell greatly encouraged the settlement of this island; and in the course of a few years, the number of whites amounted to 4500, and 1400 Negroes. The population rapidly increased, the settlers being principally soldiers from the disbanded parliamentary army, and outlaws from the mother country. Large importations of Negro slaves also took place, which in 1688 were calculated to amount to 10,000 annually, and from that time the population has gradually increased.

Jamaica has been subjected to several dreadful earthquakes; one of which, in 1692, caused almost the entire loss of the town of Port Royal. Only about two hundred houses in the fort stood after the shock; and about three thousand inhabitants are estimated to have lost their lives on this occasion. Port Royal was also reduced to ruins by fire in 1703; and a similar catastrophe took place so recently as 1815. It was also much injured in 1722 by one of those dreadful hurricanes so frequent in tropical climes. The sea, during this hurricane, completely inundated the town, 400 persons perished, and twenty vessels were destroyed in the harbour. The white inhabitants have been repeatedly in danger from the revolts of their slaves, which were the occasions of much bloodshed and cruelty on both sides. The slaves are said to have been at first instigated to rebellion by the Spaniards; but being defeated by their English masters, they fled to the mountains, assumed the name of Maroons, and continued for nearly a century and a half in constant hostility with the colonists. The most remarkable rebellion broke out in 1795, and which has been known since by the name of the Maroon war. The blacks at first obtained many advantages over the English; inciting their slaves to revolt, and committing the greatest cruelties upon the whites. The rebellion lasted for about seven months, from the Maroons having possession of the mountains, where no troops could reach them. The mode of warfare was quite in the Indian style; never facing their foe openly, but lying in ambuscade, and cutting off detachments and stragglers. The whites were at last compelled to import bloodhounds from Cuba, to assist them in this warfare; and this, which at

first sight appears a great cruelty, was in reality the most humane action of th.. war. Not a drop of blood was spilt after these dogs were employed; and the ambuscades of the Maroons being discovered by the sagacity of the animals, they were soon subdued. From the revengeful disposition of these people, it was judged expedient to break up the community; and six hundred were accordingly shipped off to Nova Scotia, and land purchased for them at the expense of the island. No other event occurred to disturb the peace of Jamaica until 1831, when an extensive revolt took place from the exaggerated hopes of the Negroes for emancipation. It is remarkable, that during this revolt, although much property was destroyed, no personal violence was offered to any white person, beyond a few hours' captivity. Since the passing of the Emancipation Act, no disturbances of any importance have taken place, although the Negroes in some places have struck work. In all likelihood they will remain quiet, although years must elapse before they are brought into such a state of intelligence as fully to understand their real position.

Jamaica is of an oval shape, and it presents a greater variety of scenery and climate than any other island in the West Indies. A range of mountains, called the Blue Mountains, runs from one end to the other, and rises in some parts to the height of nearly eight thousand feet above the level of the sea. These are again occasionally intersected by cross ridges running north and south. At the south end, near the sea, these mountains are in some parts covered with forests, high and abrupt in appearance, and difficult of access. On the other side the hills rise with a gentle acclivity, and are separated from each other by vales, the vegetation of which is described as extremely beautiful. The view of the island from the sea has been long celebrated for its splendour; the mountains sometimes appearing above the clouds, and studded with forests. The great savannahs or plains are covered with the most beautiful pasture, woods, and all the magnificent vegetation of the tropics. The mountains in some parts reach a great height; Blue Mountain Peak being 7770 feet above the level of the sea; Portland Gap Ridge 6501; Catherine's Peak 4970; and others of a lesser elevation. Some authorities assert, that at the eastern part of the island, three peaks of the grand ridge of the Blue Mountains reach the heights of 8184, 7656, and 7576 feet above the level of the sea. The mountains are generally of a conical form, very steep, and approaching on the north side very near to the sea. The deep ravines between the lofty mountains are densely covered with woods, and are denominated cockpits. These offer a striking contrast to the lower mountains, where the coffee-plant, pimento, cotton, &c., are cultivated. On the south side, the mountains are situated a little distant from the sea, leaving plains of about twelve miles wide.

There are numerous rivers in Jamaica, two hundred of which have been enumerated; but none, owing to the irregular nature of the country, are navigable for vessels of any burden. Black river is the largest; and running through a flat country, is navigable for vessels of small tonnage for about thirty miles. The only other rivers of any note are the Rio Cobre and Rio Minho on the south, and the Marthabrae, White, Ginger, and Great River on the north side. These rivers are extremely valuable in the cultivation of the soil, the great height from which the water runs allowing it to be carried a considerable length in irrigating the country, and turning mills upon plantations. The rapidity of the current also prevents it from stagnating; and thus it is kept pure for animals to drink, from its source to the ocean. There are numerous springs and rivulets throughout the country, several of which are of a medicinal nature. Two sulphureous springs, one hot and the other cold, are very celebrated and exceedingly beneficial in cutaneous diseases. There are sixteen principal harbours which afford secure havens for shipping, and thirty bays or roads with good anchorage.

The soil of the country is generally deep and fertile, presenting a shining appearance to the eye when first turned up. In some parts it is of a chocolate colour, in others a bright yellow, and even scarlet. The best soil for cultivation is what is termed the brick mould, which is of great depth, so rich as to require no manure, and of a quality which seems well suited for the climate. It is so far retentive, that in dry weather it retains enough of moisture for the preservation of the plants, and so porous as to admit of the superfluous water sinking through it during heavy rains. This soil is composed of clay, sand, and black mould, and is thought the best soil in the island for the cultivation of the sugar-cane. The next soil in point of fertility is the black shell mould; and there are many varieties throughout the island, all more or less fitted for cultivation. Silver and gold mica frequently occur in the soil, and the latter is sometimes mistaken for gold dust. No gold has ever been discovered, however, although it is certain that the natives were possessed of plenty when the Spaniards first visited the island. A rich lead ore is found in some parts of the country, which is impregnated with silver. This ore is worked at Liguana; and varieties of copper, striated antimony, and iron-stone, have also been obtained in some parts of the island. White freestone, quartz, limestone, and a species of bastard marble, also occur in considerable quantities.

Jamaica is divided into three counties, Middlesex, Surrey, and Cornwall. Middlesex is divided into nine parishes, Surrey into seven, and Cornwall into five. The seat of government is Spanish Town, in the county of Middlesex, situated at the extremity of an extensive plain. The mountains closely approach the town, and the river Cobre runs past it, at the distance of about a quarter of a mile. The town is not large, but the buildings are very magnificent, being built in the style of Spanish architecture. The finest building is the governor's residence, called King's House, which occupies one whole side of a quadrangle. Kingston is the most important town in the island, and is generally considered as the capital, although not nominally so. It is situated upon a gentle inclined plain, which is enclosed on the north by the Liguana ridge of mountains. These mountains form a sort of semicircle, and the plain stretches down to the harbour, which is amongst the finest in the world. It affords excellent anchorage all round, and the largest merchant ships can ride close in shore. This harbour is defended by numerous batteries, and is considered perfectly unassailable from the sea. The streets of Kingston are built with the greatest regularity, somewhat in the style of the New Town of Edinburgh. The houses are principally of wood, and, in general, two stories high, with verandas above and below. The English and Scotch churches are very elegant buildings, particularly the former. It contains about 40,000 inhabitants, of whom 12,000 are whites, and the rest people of colour. There are excellent markets for butcher meat, fish, and vegetables of every description. On a plain at the top of the declivity on which the town is situated, stands a fine range of barracks, called Up-Park Camp. This camp is situated about two hundred feet above the level of the sea, and is capable of accommodating upwards of twelve hundred men. There is an excellent hospital attached to the barracks, and a bath, which, only four feet deep, is capable of containing 70,000 gallons of running water. Montego Bay, situated on the opposite side of the island from Kingston, is a seaport of some importance. It lies at the foot of a range of mountains which nearly surround the town, and possesses a neat church and commodious barracks. Falmouth is situated about fifteen miles east of Montego

and is rising rapidly to importance. The harbour in the inside is deep and well sheltered, but the entrance is intricate, and not more than seventeen feet deep across the bar. The town is built on the west side of the harbour, and possesses several good public offices, a free school, and commodious barracks. There is more produce shipped from this port than from any other in the island after Kingston. Savannah Le Mar is a fine healthy military station, situated in Westmoreland parish. The town is built upon the beach, the harbour of which is good, and the barracks are situated about a mile from the town, in the midst of a highly cultivated country.

The government of Jamaica consists of a governor, a council of twelve, and a house of assembly. The governor has the chief civil and military authority, and he holds his appointment from the home government. The members of the council are selected from amongst the justices of the peace by the queen; the lieutenant-governor, attorney-general, and bishop, being members by right of the offices they hold. The house of assembly consists of forty-five members, two being sent from each parish, and one additional from each of the towns of Kingston, Spanish Town, and Port Royal. There is also a supreme court, an assize court, a court of common pleas, which sit at stated times for the punishment of crime. The military force of the island consists of about three thousand regular troops, some of which are people of colour; and the militia force, which amounts to from sixteen to eighteen thousand men. All white males, from the age of fifteen to sixty, are obliged to enlist in the militia service, and no substitutes are allowed.

II.—TRINIDAD.

This island, the next in importance to Jamaica of the British West India possessions, is favourably situated at the mouths of the large river Orinoco. It lies between latitude 9° 30′ and 10° 51′, and longitude 60° 30′ and 61° 20′; being separated from the continent of South America by the Gulf of Paria. It is 90 miles long and 50 broad, with an area of 2400 square miles, and was discovered by Columbus in 1498. The island was colonized by the Spaniards in 1588, and at that time was well populated with Carribs, who were of a mild disposition and industrious habits. The native inhabitants, however, were soon either destroyed or sent to the continent of America to work in the mines by the Spaniards. The island belonged to Spain until 1797, when it was taken by the British, and has ever since remained a colony of this country.

Along the south and north sides of this island, run two ridges of mountains, extending nearly across the country, and along the north shore, giving it the appearance, at a distance, of being nothing but an immense line of rocks. The western side, for some distance, is flat, richly wooded, and is described as presenting a most beautiful appearance. The high mountains of Cumana, on the American continent, are visible from this side; and when viewed from a height, with the Gulf of Paria, and the beautiful verdure of the island, present a picture which is scarcely to be equalled. The centre is diversified with many finely wooded hills, and valleys of the greatest fertility. The highest land lies on the north side, and in some parts reaches 3000 feet in height. The other mountains are not of any great elevation, but they are all thickly covered with wood and pasture. There are numerous rivers in this island, several of which are navigable for ships of some size. The principal are the Caroni on the west coast, which is navigable for six leagues; the Nariva on the east coast, which has been found deep enough to float a vessel of 250 tons at less than a league from its source; and on the south is a fine river called the Moruga. The best harbour in the island is that of Port Royal, after which Port of Spain, which has the most extensive bay in the world; and all around the west coast there are numerous bays, which afford good anchorage for shipping. Several craters exist in Trinidad, some of which give occasional indications of not being quite extinct. Mud volcanoes also occur, the largest of which is 150 feet in diameter. The mud never overflows, but remains always within the surface of the crater; and when one crater ceases to act, another appears in its vicinity. The celebrated pitch lake is situated on a small peninsula, about eighty feet above the level of the sea. The pitch has usually the appearance of pit coal, but is gray in colour and somewhat hard, except in very hot weather, when it becomes liquid to a small depth. This substance has been used in many parts of the island with success for the improvement of the roads, and is thought well adapted for painting ships' bottoms. The lake is about a mile and a half in circumference, with several small islands covered with trees, and the country around is wooded to its banks. There are occasional symptoms of boiling observable in this lake, but no account of its ever having boiled over exists. The soil of Trinidad, generally speaking, is good; the only barren parts being the sandy plains, and these occasionally afford pasturage for cattle. It is thought that the mountains might be cultivated to their tops, but there being abundance of low ground, this is not likely to take place for many years. The sugar-cane, coffee, and cocoa, are cultivated to a considerable extent, and the produce is increasing very rapidly. Several spices have also been introduced, such as the nutmeg, cinnamon, and clove, and these by some are thought equal to what are produced in the East Indies.

The capital of the island is Port of Spain, which is said to be one of the finest towns in the West Indies. The streets are wide, and intersect each other, so as to catch every breeze. The houses are all built of stone, none being allowed to be erected of wood. The Protestant church is a beautiful edifice, and the St. James's barracks and the market-place are both commodious buildings. There are also numerous other ports around the island, which are gradually rising in importance with the increasing produce of the country. The government is in a manner despotic, being vested in a governor and council, but with no representative assembly. The powers of the governor are absolute, for he may either act upon the advice of the council or not as he pleases. The militia is the best disciplined of any in the whole of the West India Islands, and consists of between four and five thousand men.

III.—TOBAGO.

This island is about thirty-two miles long and twelve broad, and is the most southerly of the West India Islands. It is about six miles distant from Trinidad, at the east end, and about sixty miles from Grenada. Tobago was discovered by Columbus in 1496; and in 1580 it was taken possession of by the English. It was afterwards settled by some Dutch colonists; and after many takings and retakings, it was ceded to Britain at the peace of 1763. In 1781 the island was captured by the French, but retaken in 1793 by the British, with whom it has ever since remained.

The appearance of this island from the north is gloomy and mountainous, being principally composed of conical hills and ridges, which in some parts reach the height of 1800 feet. The north-west is the least mountainous, and the south is diversified with occasional hills and rich valleys. There are a number of small streams, which, rising in the hills, water the low country down to the sea. The natural harbours in this island are numerous, and several of them adapted for ships of the largest class. The principal are Man of War, Courland, Sandy Point, and King's Bays, besides numerous others, affording good anchorage for vessels of small

tonnage. The chief town is Scarborough, situated on the south-west side. It is built without much regard to regularity, and is about half a mile from Fort King George, the principal military station. The soil is rich, and the produce as varied as that of any of the other islands. It is ruled by a governor, council, and house of assembly.

IV.—GRENADA AND ITS DEPENDENCIES.

This beautiful island is situated between 12° 30′ and 11° 58′ latitude, and 61° 20′ and 61° 35′ longitude. It is about sixty miles from the American coast; twenty-five miles long, and twelve at its greatest breadth, and containing 80,000 acres of land. This island was discovered by Columbus in 1498, but was not settled till 1650, when a party of French from Martinique took possession of it. It was taken from the French by the British in 1762; again retaken, but finally ceded to this country in 1783. The face of the country is mountainous, and extremely picturesque. The island is traversed from north to south by one irregular ridge of mountains, which at some parts reach the height of 3000 feet above the level of the sea. There are a number of rivers, none of which are of any great importance for commercial purposes, but all useful for irrigating the country. Several hot springs exist, some of which are hot enough to boil an egg. A fresh-water lake, two miles and a half in circumference, is situated at an elevation of 1740 feet above the level of the sea, and surrounded with hills. This island is divided into six parishes, of which the principal is St. George. The capital is the town of St. George, situated within an amphitheatre of hills. The houses are well built, of stone or brick, and the streets wide and well ventilated. The harbour is spacious, protected on all sides from hurricanes, and is said to be capable of containing a thousand ships. Cotton was formerly the chief article produced on this island, but sugar, cocoa, and coffee are now also cultivated. The government consists of a lieutenant-governor, council, and house of assembly.

The Grenadines are a group of small islands running towards St. Vincent, the largest of which are Carriacou, Becquia, Canuan, &c. Several of these islands are inhabited, and produce sugar, cotton, fruits, live-stock, &c., in great abundance.

V.—ST. VINCENT AND ITS DEPENDENCIES.

This is thought the most beautiful of the Carribean islands; it was discovered by Columbus in 1498. It is about twenty-four miles long and twenty broad; fifty-five miles west of Barbadoes, and about the same distance from Grenada. This island was first settled by the French; captured by the British, and retaken; but finally ceded to this country in 1783. Its character is decidedly volcanic, traces of strata which have undergone the action of fire being everywhere visible. The mountains are high and sharp at the top, running from north to south with [illegible] valleys between. The soil is of a strong loam in the valleys, but assumes a more sandy nature on the hilly ground. In 1812, St. Vincent was visited by a severe volcanic eruption, the matter from which nearly covered the whole surface of the island; some particles even reached Barbadoes; and the noise was heard for three hundred miles. The damage done to the island was not great, but fifty persons lost their lives on the occasion. The island is divided into five parishes, of which the principal is St. George, in which the capital, Kingston, is situated. The houses of the town are built of stone in the lower stories and wood in the upper; and there are many commodious public buildings, but none of them of any great elegance. There is a famous botanic garden about one mile from Kingston, occupying about thirty acres of ground, and containing a fine collection of tropical plants. The most celebrated object in this island is the Souffriere, a volcano, the crater of which is three miles in circumference, and five hundred feet in depth. The climate is thought very healthy; but hurricanes are frequent and sometimes very destructive. This island is governed much in the same manner as Grenada. There are eight small islands adjoining to St. Vincent, which are cultivated; but they are not of such importance as to warrant particular mention.

VI.—BARBADOES.

This is the most easterly of the Carribean islands, and was the first settlement made by the British in the West Indies. It is about twenty-two miles in length, and fourteen in breadth, containing an area of 106,470 acres. The period of the discovery of this island is unknown, the first mention made of it being in 1600. It was colonized by the British in 1625, Charles I. having made a grant of it to the Earl of Carlisle, who encouraged emigration to the island. A society of London merchants accepted of 10,000 acres on certain conditions, and sent out a governor of their own. After this the settlers increased very rapidly; and in 1650 it was computed that there were upwards of twenty thousand British in the island. During the Commonwealth, an armament was fitted out by Cromwell against Barbadoes, for adhering to the royal cause, which committed great depredations against the inhabitants; and since this time the population has rather decreased. The island is generally level, except in the north-east quarter, and here, in some parts, the hills reach the height of 1100 feet. It has a beautiful appearance, from the land being well cultivated and the vegetation luxuriant. The soil is good, varying from a rich deep mould to a light sand, and a red clay of considerable depth is occasionally found. There are a number of springs in the island, one of which casts up a bituminous matter called Barbadoes tar, and another emits a stream of sulphureted hydrogen gas, which can be ignited. Oxen, horses, and other cattle, are plentiful, the first being most generally used for labour. Considerable numbers of hogs and poultry are reared; and, indeed, this island is distinguished from most of the West India colonies by the quantity of provisions which are raised, the inhabitants depending little upon foreign supplies. Plovers, curlews, wild-duck, teal, and other water game, frequent the coast in great numbers, and afford an agreeable article of food.

Barbadoes is divided into five districts and eleven parishes, and contains four towns. Bridgetown, the capital, is situated on the shores of Carlisle Bay, and contains about twenty thousand houses. The town is well laid out, many of the houses are very handsome, and spacious barracks occupy the southern extremity. The climate is considered healthy, but would feel extremely hot were it not for the constant trade-winds. The island is subject to hurricanes, one of which, in 1780, laid waste its whole extent. The loss of lives on this melancholy occasion was estimated at three thousand, and property valued at upwards of a million was destroyed. The island is ruled by a governor, a council, and house of representatives. The powers of the governor are entirely negative, he being only entitled to recommend measures to the assembly, which they may either adopt or reject. Barbadoes seems to have reached the height of its prosperity at the end of the seventeenth century, and since that time the population has in some measure decreased. In 1670, the white population was estimated at 50,000, and the blacks at 100,000, while at present the whole population does not exceed 90,000.

VII.—ST. LUCIA.

This island is situated in latitude 13° 50′ north, and longitude 60° 58′ west. It is about thirty-two miles

long and twelve broad. The English were the first who made a settlement in this island, but the colonists were completely destroyed by the natives. It was again settled, and since that time has passed repeatedly from the British to the French, until 1803, when it was captured by the British, in whose possession it has ever since remained. This island is traversed longitudinally, or from north to south, by a ridge of lofty mountains, which terminate in most fantastic sharp points. These mountains are densely wooded, and at times, from the attraction of the trees, are completely enveloped in clouds. The approach to the island from the south is very remarkable. Two rocks, called the Sugar-Loaves, rise perpendicularly out of the sea, tapering away towards the summit. These rocks are covered with vegetation, and stand at each side of the entrance to a beautiful bay. On the west coast, there is an excellent harbour, called the Little Careenage, which, admitting only one ship at a time, is capable of containing thirty ships of the line. The island is divided into Basseterre, the low or leeward country, which is the best cultivated district, and Capisterre, the high country. Both of these districts are considered unhealthy, the first from the abundance of stagnant water, and the other from the denseness of the woods. As cultivation proceeds, however, these causes will be removed, and the island rendered as healthy as any in its neighbourhood. The capital is Castries, which is the only town in the island, and a place of no importance. There is a small island, called Pigeon Island, about six miles from St. Lucia, which is considered a healthy and important military station; and there is excellent anchorage ground between it and St. Lucia.

VIII.—DOMINICA.

This island is situated between the French colonies of Martinique and Guadaloupe, in 15° 25′ north latitude, and 61° 15′ west longitude. It is about twenty-nine miles in length and sixteen in breadth, containing about 186,436 acres. It was considered a neutral island until 1759, when it was taken possession of by the British, with whom, after being repeatedly taken and retaken, the island still remains. Dominica is of volcanic origin, and has many lofty mountains, the highest of which is 5314 feet above the sea's level. Several of these mountains contain active volcanoes, which frequently discharge vast quantities of burning sulphur; and there are many hot water springs throughout the island. The valleys are fertile, well watered with thirty fine rivers and numerous smaller streams. The trees are lofty, affording the finest timber, such as locust-wood, rose-wood, mastic, iron-wood, cinnamon, bastard mahogany, and a gum tree of considerable value. The ferns are of immense size, some of them even reaching the height of twenty-five feet, and of great beauty. Domestic animals are very abundant throughout the island; and, indeed, all European animals succeed extremely well in this place. In the woods are innumerable swarms of bees, which lodge in the trees, produce large quantities of both wax and honey, and are said to be identical with the European bee. The capital is Charlotte-town, situated in the parish of St. George. The streets are spacious, well paved, and from the heights above the town look new and clean. The roadstead is open to the hurricanes which frequently occur from August to October, but otherwise safe. Prince Rupert's Bay is the safest harbour in the island, and is said to be capable of containing the whole British navy. The government is much on the same footing as the other islands; consisting of a lieutenant-governor, council, and assembly. There is a free school on the island for educating about two hundred pupils; and fourteen places of worship. The fortifications are very strong; and the militia are thought little inferior to regular troops.

IX.—MONTSERRAT.

This is one of the smallest of the British West India Islands, being only about twelve miles long, and seven and a half broad. It was discovered by Columbus, first settled by the English, and taken once by the French; but has ever since remained a colony of this country. Montserrat appears to be of volcanic origin, and presents a very uneven and mountainous surface. It is extremely difficult of access from the broken character of the land, and the coral beds and rocks which stud the sea around the southern part of it. The mountains are in many places inaccessible, and seem to have been rent from each other by some strong convulsion, from their being so precipitous. Both mountains and valleys are covered with wood; and many fine streams run to the low lands. The capital is Plymouth, a small but well built town, the houses of which are constructed of stone, and exceedingly comfortable. Indigo was formerly much cultivated in this island, but this article has been abandoned; and the principal productions now are cotton and sugar, the latter of which is much esteemed. This island has been called the Montpelier of the West Indies, from the healthy nature of the climate, although occasionally subject to hurricanes.

X.—ANTIGUA.

This island, which was discovered by Columbus in 1493, is about twenty miles long, fifty-four in circumference, and contains an area of 69,277 acres. It was first settled in 1632 by the English, but its progress was slow at first, in consequence of the want of water. This island is somewhat oval in shape, indented with many bays, and surrounded with small islands, rocks, and shoals, which render it difficult of access. The face of the country in the south-west part is low, and even marshy, but it gradually rises towards the south and west. None of the mountains are of any great elevation, the highest being little more than 1200 feet above the sea's level. The island is almost destitute of water, there being only a few small rivulets running from the hills. The colonists are obliged to have tanks to collect the water which falls during the rainy season; but it does not appear that boring has been ever tried. The land, however, is very fertile, and vegetation in every part most luxuriant. Tobacco was formerly much cultivated, but the sugar-cane has entirely superseded this commodity; and there are several medicinal plants produced on the island, such as the aloe, cassia, &c. Antigua is divided into six parishes and eleven districts. The capital, St. John's, is situated on the north-west, and possesses an excellent harbour. English-town, on the south, is the next town which has a fine harbour, with a royal naval-yard, arsenal, and conveniences for careening ships. The whole coast is indented with bays, which, although difficult of access, afford excellent shelter to shipping. The climate is dry and healthy; and the island is not subjected to either heavy dews or severe hurricanes, like most of the other islands. Antigua is ruled by a governor, who is also commander-in-chief over Montserrat, Barbuda, Anguilla, St. Christopher's, Nevis, the Virgin Islands, and Dominica; with a legislative council, and house of assembly. There are nineteen free schools in the island, which afford instruction to 1216 scholars; and religious instruction is administered with great care by all sects. Antigua was the first island to ameliorate the slave laws, by affording the accused the benefit of trial by jury; and an act of assembly, 13th February, 1834, decreed the emancipation of every slave, without requiring the period of apprenticeship prescribed by parliament.

XI.—ST. CHRISTOPHER'S OR ST. KITT'S.

This island, situated in latitude 17° 18′ and longitude 62° 40′, is seventy-two miles in circumference, and c

tains sixty-eight square miles. It was discovered by Columbus, who is said to have given it his own name; and it was first settled by an Englishman of the name of Warner and fourteen associates. Warner found several Frenchmen already on the island; and these two parties, after making war upon the natives, divided the island between them, one part, called Capisterre, or high country, being assigned to the French, and the other part, called Basseterre, or low country, given to the English. Many bloody battles were fought between these two parties until 1713, when the whole island was ceded to Britain. St. Christopher's is of an irregular oblong shape, divided from north to south by a ridge of mountains; and the whole land of the island is somewhat elevated, sloping gradually from the centre to the sea. The greatest height is Mount Misery, which rises 3711 feet, almost perpendicularly, and is clothed with vegetation nearly to the summit. There is no plain in the island which can be called swampy, the gradual fall of the ground carrying off any superfluous moisture from the earth. The vale of Basseterre is described as extremely beautiful, the ground being very rich, and everywhere highly cultivated. The soil is chiefly of a dark gray loam, lying upon a bed of ashes, very porous, and is considered the finest soil for the cultivation of the sugar-cane in the West Indies. There is said to be a sulphur mine in one of the mountains of the centre, and another of silver; but it does not appear that these have ever been worked. The island is watered by four rivers, none of them of any size; and there are numerous springs in the low lands. These, however, from strong saline impregnations, are not fit for drinking, and the inhabitants have to collect rain water in tanks for domestic purposes. This island is extremely dry and healthy, the rains being more frequent than heavy, and the nature of the land preventing the water from stagnating. The capital is Basseterre, which is the best shipping station. The government consists of a lieutenant-governor, council, and house of assembly; and the colonists have always shown a desire to promote education.

XII.—NEVIS.

This beautiful little island, consisting only of a single mountain, which rises like a cone out of the sea, green, unbroken, and verdant to the summit, was discovered by Columbus at the same time with St. Christopher's, from which it is separated by a channel about two miles broad. It was first taken possession of by a party of English from St. Christopher's; and the population is said to have rapidly increased. The mountain of which Nevis is composed is about four miles in length, and three in breadth; its area being about twenty square miles. The summit has the appearance of a crater. The hill is well cultivated; and at the height where cultivation ceases, evergreen forest-trees grow luxuriantly, the whole island having a cheerful picturesque aspect. It is divided into five parishes, with three good roadsteads. The capital is Charlestown, which is described as a neat well-built town, with several handsome public edifices. The government consists of a council and assembly, subject in certain matters to the government of St. Christopher's.

XIII.—BARBUDA AND ANGUILLA.

These two islands, although far separated, may properly be classed together, from the similarity of their scenery and the occupations of the inhabitants. Barbuda is situated about twenty miles north-east of St. Christopher's, and ten north of Antigua. It is about twenty miles long and twelve broad. The first notice made of Barbuda is in the time of Queen Anne, when it was given in perpetual grant to General Codrington and his descendants, by whom the greater portion of it is still possessed. Anguilla, or Snake Island, is about 100 miles north of Barbuda, and the same distance north-north-west of St. Christopher's, situated in latitude 18° north, and longitude 64° west. It is thirty miles long and three broad, and receives its name (signifying an *eel*) from the peculiarly winding shape it presents. These islands were both first settled by the British; and, although subject to occasional attacks from other powers, they have always remained in the possession of this country.

The interior aspect of these two islands is quite different from that of any of our other West Indian settlements, being in many respects, indeed, quite *English*. The sole occupation of the inhabitants is farming, rearing stock, and cultivating provisions, for which a ready market is found in the neighbouring islands. There are no groups of masts in the bays and harbours; and instead of the laborious bustle, smoke, and noise, incidental to the sugar and coffee plantations, there are to be seen only numerous little rural dwellings, surrounded by waving crops of grain, and verdant fields covered with sheep and cattle.

XIV.—VIRGIN ISLANDS.

This name was given by the discoverer Columbus (in 1493) to a group of about forty small islands, lying to the northward of the Leeward Carribean Islands, and between them and Puerto (or Porto) Rico. They extend about twenty-four leagues from east to west, and about sixteen from north to south. They are divided between the British, Danes, and Spaniards, but much the larger and more valuable number belong to the former. The names of these are Tortola, Virgin Gorda (or Peniston, and sometimes corrupted into *Spanish Town*,) Josvan Dykes, Guana Isle, Beef and Thatch Islands, Anegada, Nichar, Prickly Pear, Camanas, Ginger, Cooper's, Salt Island, St. Peter's Island, and several others of little or no value. Those belonging to the Danes and Spaniards will be noticed in their proper places.

The British Virgin Islands were first possessed by a party of Dutch buccaneers, who built a fort on Tortola, but they were expelled soon after by a party of English. They have remained in the possession of this country ever since. The largest of these islands is Anegada, the next Tortola; and although never considered of any great importance, they afforded excellent shelter to shipping during the late war. Tortola is mountainous, the interior containing large tracts of waste land difficult of access. The soil is thin, and not well suited to the cultivation of the sugar-cane, although this and cotton are the chief articles of produce. The harbour of Tortola is very extensive, completely land-locked, and has afforded shelter, in many cases during the war, to 400 vessels. Anegada, although the largest island in extent, is of little importance, only a very small portion of it being under cultivation. It is surrounded by a reef which renders it difficult of access, and the other islands being so near, it is little frequented. Virgin Gorda is of an irregular shape, and contains two good bays, where ships may ride in perfect security. The soil is of a light sandy nature, and the chief articles of produce are sugar, indigo, tobacco, and cotton. These islands were formerly ruled by a deputy-governor and council, who exercised both the legislative and executive authority, but they are now subject to the government of St. Christopher's, with a council and assembly of their own.

XV.—THE BAHAMAS OR LUCAYOS ISLANDS.

These are the most northerly of all the West Indian islands, stretching towards the coast of Florida, and forming with it the channel called the Strait of Florida. They were the first land discovered by Columbus in 1492, and amount in number to fully five hundred. The island which gives the name to the whole is the most northern, as well as the most important of the group.

settlement was established by the British in 1629, which was ravaged by the French and Spaniards several times, and the group of islands became a nest for pirates, until the beginning of the last century, when they were expelled by the British. The Bahamas are evidently of coral formation, and although flat, they have a very pleasing aspect, from the richness of the vegetation. The chief island is New Providence, which contains the capital Nassau. These islands are very healthy, and from their situation the climate is delightful, being of a medium temperature. The chief article produced for exportation is cotton, neither sugar nor coffee having succeeded. Provisions of all sorts are very plentiful, cattle and sheep thrive well, and the shores abound with fish and turtle. The government consists of a governor, council, and house of assembly.

XVI.—BERMUDAS, OR SOMER ISLANDS.

These are a small cluster of islands, lying almost in the shape of a shepherd's crook, in latitude 32° 20′, and longitude 64° 50′, distant about six hundred miles from the nearest point of the American continent. Their discovery was owing to the shipwreck of Juan de Bermudez, a Spaniard, who was driven ashore upon these islands while on a voyage from Spain to Cuba. The same fate happened to Sir George Somers, an Englishman, in 1609, who was the first to colonize the Bermudas. They are upwards of three hundred in number, contain about fourteen thousand acres of land, and are so much alike in character, that to describe one is to describe the whole. The principal islands are St. George, Ireland, St. David, Somerset, Long and Birds' Islands, &c. These lie close together, in such a way as to form capacious bays, which afford good anchorage when once got into. The coast, however, is of the most dangerous description, being thickly studded with rocks, which are visible at low water, and disappear at flood tide. The chief articles of produce consist of arrow-root, coffee, cotton, and indigo. The cedar-tree grows to a great height, and is used for ship-building, and the palmetto is much cultivated for making straw hats. The soil is very fertile, and produces many kinds of vegetables fit for food; and medicinal plants, such as the aloe, jalap, &c., grow spontaneously. The whale is an annual visiter to the coast, the catching of which forms a lucrative employment to the inhabitants. Bermudas possesses no fresh-water streams, and only a few wells, the water of which is brackish; but there are a great many tanks which fill during the rainy season, and supply the inhabitants. The climate is not considered healthy, the yellow fever being of frequent occurrence. Hurricanes visit the islands annually, the inhabitants being able to tell their approach by a halo round the moon. The Bermudas have never been considered of great importance to this country; but they are likely to become more so in consequence of their being formed into a penal settlement.

BRITISH GUIANA.

The British South American settlements, now forming the colony of Guiana, although not properly belonging to the West Indies, naturally come to be noticed here. This colony, as claimed by Britain, extends from the river Coventyn, in 56° 58′, to Punta Barima, at the southern outlet of the Orinoco, in 60° 6′ west longitude, in breadth, and from the Acaria mountains to the sea, in length. It formerly consisted of the settlements of Demerara, Essequibo, and Berbice, but these are now united under one government, and include 76,000 square miles. The whole coast is flat, and on approaching from the sea, nothing is visible but the tops of the trees, which seem to be growing out of the water. This alluvial flat extends from ten to forty miles inland, and is terminated by a range of sand-hills, which approach within two miles of the sea, on the south side of the Essequibo. Parallel with these sand-hills run several detached groups of hillocks, of moderate elevation. Farther into the interior, the country is much diversified with mountains and valleys. The greatest height of the mountains is supposed to be 7500 feet above the level of the sea, and there are other ranges which reach 3500 and 4000 feet. Immense savannahs, or plains, occupying 14,400 square miles, extend between the rivers Demerara and Coventyn, approaching the sea at the river Berbice. These plains appear to have been an inland lake, and are sandy, growing only a few stunted trees; but they are very rich in pasturage. Guiana has three great rivers, the Essequibo, the Berbice, and the Demerara. The Essequibo, the largest of these rivers, is about 620 miles in length, but, from the number of rapids, it is only navigable for fifty miles from its mouth. During its course, it receives the waters of several large tributaries, which irrigate an immense tract of country. To the eastward, and running parallel to the Essequibo, is the Demerara, which is navigable for vessels of small size about eighty-five miles above Georgetown. This river receives no tributaries of any magnitude, and its navigation is much obstructed by a bar running across its mouth, which has only nine feet water over it at half flood. It deepens, however, towards the eastern shore, and the channel here has nineteen feet at high water. The Berbice, although smaller than the Essequibo, is of more importance, from its course being free for vessels drawing twelve feet water about one hundred and five miles, and for vessels of seven feet draught, one hundred and sixty-five miles into the interior of the country. The river Coventyn forms the boundary between the British and Dutch possessions, and is navigable one hundred and fifty miles for vessels drawing seven feet of water. There are also several smaller streams in the intervals between these great rivers, which, although of no importance for navigation, are extremely useful in the irrigation of the country. These rivers periodically inundate their banks, which renders the soil extremely fertile. This fertility is kept up during the dry season by heavy falls of dew, and this takes place not only on the banks of the rivers, but also in the open plains. The soil is very fertile, in some parts sandy, but growing abundance of grass, and in others it is a strong retentive loam, well adapted for the cultivation of coffee, sugar, rice, &c. The coast is covered with mangrove and curina bushes, and towards the interior, thick forests occur, which yield many valuable kinds of timber. The principal trees are the mora, which grows one hundred and twenty feet high, the green heart, the purple heart, the kakaralli, and many others, admirably adapted for the construction of ships. Besides these may be mentioned the iron-wood, the locust-tree, the letter-wood, and the lame, which, from the closeness of their grain, their beauty, and durability, are much in request for the manufacture of articles of furniture. Many valuable medicinal plants are also indigenous to Guiana, besides fruits, such as the pine-apple, the guava, the marmalade fruit; and the woods afford dyes of various kinds. The animal kingdom is very varied, and contains, besides the American tiger, lion, alligator, and different kinds of serpents, many animals which afford wholesome and delicate food for man. Among these may be mentioned the tapir, the water-haas, the wild hog, the Mexican hog, and various species of deer. Numerous herds of monkeys people the forests, which are used as food by the natives, and the sea-cow is sometimes found in the rivers, the flesh of which is said to resemble veal. The feathered tribes are very rich in plumage, comprehending parrots, macaws, humming-birds, mocking-birds, &c., besides wild-ducks, wild-pigeons, the duragua, and the maam, which afford delicate and nutritious food. Land tortoises, and fresh-water turtles, are very abundant, the

latter being chiefly found in the Essequibo and its tributaries. The rivers are well stored with fish, some of which are very large, and said to be as delicate as any European fresh-water fishes. The wild animals seldom attack man unless provoked, but they prove sometimes very destructive to the flocks of the settlers. The serpents are all described as sluggish and loath to bite, unless irritated; they satisfy themselves with attacking deer and smaller animals. The inhabitants of Guiana are constantly annoyed by the insects, which are very numerous, and their bite is painful, although not dangerous. The worst of these are the centipede, the scorpion, the bush spider, the chigo, the mosquito; and some species of ants prove very destructive to vegetation.

British Guiana is divided into three counties, Demerara, Essequibo, and Berbice. The two former have been united, and are divided into eleven parishes, and the latter into six. These colonies were first settled by the Dutch, captured by the British in 1796, given up to the Batavian Republic in 1802, retaken in 1803, and finally ceded to Great Britain at the general peace of 1814. The settlements are all situated upon the banks of the rivers from which they receive their name, extending along both sides, and generally as far inland as the rivers are navigable. Each plantation has a wharf or landing-place of its own, and canals are cut into the land for the admission of boats and the draining of the surrounding country. For fifty miles along the seacoast of the county of Berbice, a huge embankment has been raised against the sea, on which is a carriage-road sixty feet broad. A comparatively small portion of Guiana is yet cultivated, and an immense field for colonial industry still lies open. The extent of cultivated land, however, is gradually increasing as the advantages of the colony are becoming known. The staple products consist of sugar, rum, coffee, and cotton; and it is thought, from the fertility of the soil, and the constant summer which prevails, that many other valuable plants might be cultivated. The climate is very genial and regular throughout the year, the maximum heat being 90, the minimum 74, and the mean temperature about 82 degrees. Two wet and two dry seasons constitute the changes of the year; the great wet season, as it is called, commencing in the middle, and continuing till the end of August, and the great dry season from the end of August till the end of November. The short wet season occurs from December to the middle of February, and the short dry season from February to April. The foregoing applies to the coast regions, the interior being marked by only two great changes during the year. Hurricanes never occur in this colony, and even severe gales are little known. Earthquakes are occasionally felt, but they are very slight, and little attention is paid to them by the inhabitants.

The capital of British Guiana is Georgetown, situated on the western bank of the river Demerara, which has a population of from twenty to twenty-five thousand. The streets are generally wide, traversed by canals; the houses built of wood, two stories high, and separated from each other by gardens and ditches. It is built in two rows, about a mile long, on the river side, and contains several handsome buildings. New Amsterdam, the chief town in the county of Berbice, extends about a mile and a half along the western bank of the river Berbice. The houses have all gardens behind, and are separated from each other by canals or trenches, and the town is described as presenting a very pleasing aspect on entering the river. The population of this town, according to the last published census, was 2900, and there are many other villages which are gradually rising in importance.

The exports from Guiana, as is the case with all the other West India colonies, have decreased of late years, but from the encouragement which is now given to emigrants, it is hoped that this will in the course of time be remedied. The exports from the whole of Guiana in 1839 amounted to 35,845 hogsheads, 2135 tierces, 2396 barrels of sugar; 13,245 puncheons, 3817 hogsheads, 882 barrels of rum; 11,664 casks, 85 hogsheads, 14 barrels of molasses; 1,350,700 lbs. of coffee; 912 bales of cotton. The value of the imports in 1836 was £1,204,560, and since that period it is thought to have increased to nearly £1,500,000.*

The population of Guiana may be divided into Europeans, Africans, people of colour from other parts, and native Americans. The native Americans have dwindled down to a very small number, who lead a wandering life on the frontiers and savannahs of the colony.

The government is vested in a governor and court of policy, consisting of the governor, chief-justice, attorney-general, collector of customs, government secretary, and an equal number of persons elected from among the colonists. Formerly all free male inhabitants were liable to serve in a military capacity, but since the abolition of slavery the militia has been disbanded. The local government have made the greatest efforts to promote education in the colony, and many schools and churches have been erected, at considerable expense. The number of individuals who received instruction in 1839 amounted to 4683 adults, and 6680 children; making together 11,363.

GOVERNMENT OF THE BRITISH WEST INDIES.

The forms of government established in the British colonies in the West Indies, may be divided into two classes; those having a governor, council, and representative assembly; and those having only a governor and legislative council. The first includes Jamaica, Barbadoes, Antigua, Tobago, Grenada, St. Vincent, Montserrat, Nevis, St. Christopher's, Honduras, the Virgin Islands, the Bahamas, and the Bermudas; and the second, Guiana, Trinidad, and St. Lucia. The reason for this difference is, that most of the colonies were acquired by conquest, and the inhabitants who chose to remain in the island were guarantied their laws and the exercise of their religion. The governor has the chief civil and military authority; the council is somewhat analogous to the privy-council in this country, and the House of Assembly to the House of Commons. A member of the House of Assembly in Jamaica must possess a freehold of £300 per annum, or a personal estate of £3000; and an elector must have a freehold of £10 per annum in the parish for which he votes. Some of the islands have only lieutenant-governors, who are under the governor of some adjacent island. The lieutenant-governors of St. Vincent, Grenada, Tobago and Guiana, are under the governor of Barbadoes. Their powers, however, are nearly equal to those of a governor. In those islands which have no representative assembly, the legislative council consists of the chief secretary, the treasurer, the chief-justice, the attorney-general, and the commander of the troops. These are appointed by the crown; and sometimes a few of the principal landed proprietors are made members of the council. Several islands are sometimes included in one government, who send their representatives to the island which is the seat of legislature for the time being. Thus, in the Leeward Islands, St. Christopher's, Nevis, Montserrat, and one or two other small islands, send their representatives to Antigua, which is the seat of government for them all; or, in other words, the residence of the governor. The superior and inferior courts of judicature resemble those in England, the laws being the same, unless as they may be affected by the special colonial enactments passed from time to time. Assize courts are frequently held, to expedite

* Schomburgk's Guiana.

the course of justice. There are, likewise, parish courts, wherein justices of the peace decide summarily in small debt cases. There are offices where all deeds, wills, sales, and patents, are recorded. All persons intending to leave the island are obliged to give notice at the office of enrolment three weeks before they can be entitled to a pass, or to find security for what debts they may leave unpaid in the island; and, for further precaution, masters of vessels are taken bound, under heavy penalties, not to carry off any person without such pass. The procedure of the assembly follows as near as may be the formula of the British legislature, and all their bills have the force of laws as soon as the governor's assent is obtained. The power of rejection, however, is vested in the crown, but, *until rejected*, the laws are valid. The governor can also refuse his assent to all such laws, and can dissolve and call together the assembly at pleasure. His salary is paid partly by the crown, and partly from the island revenues.

FOREIGN POSSESSIONS.

FRENCH.

The French possessions in the West Indies comprise the islands of Martinique, Guadaloupe, Marie Galante, and Deseada. Martinique is situated at the entrance to the Gulf of Mexico, between the parallels of 14° 23′ and 14° 52′ north, and 63° 6′ and 63° 61′ west from Paris. It is about fifty miles long and twenty broad, and a hundred and forty miles in circumference. It is of volcanic origin; romantic in appearance; and the mountains are covered with almost impenetrable woods. Martinique is well watered, seventy fine rivers being enumerated; and there are many other streams in the island. The soil is good, although it varies much on account of the volcanic eruptions, which have in some places covered the surface of the land. About two-fifths of the whole island are cultivated; the rest being occupied with mountains, forests, and plains, which latter yield good herbage for cattle. Port Royal, the capital, is situated on one of the several bays which indent the coast, and possesses the safest and most capacious harbour in the West Indies. The town is well built, the streets regular, and running at right-angles to each other, with a stream of water on either side. The population is about 7000. The chief commercial town is St. Pierre, which is described as exceedingly neat. The houses are high, having a European aspect, and the streets regular and clean: population 30,000. The population of the whole island is estimated at 101,865 inhabitants, of whom, in 1827, 9937 were whites, 10,786 free people of colour, and 81,142 slaves.

Guadaloupe is situated in latitude 16° 20′ north, and longitude 62° west. It is divided through the centre by a small channel, which is navigable for vessels of fifty tons, and forms as it were two islands. The eastern division, called Grandeterre, is fourteen leagues long and six broad; and the western Basseterre, is fifteen leagues long and fourteen broad. There are several volcanic mountains in Guadaloupe, one of which still emits smoke, and sometimes sparks of fire. The island is well watered, and diversified with hills and valleys. The soil is good, and yields abundance of fruits and grain. The chief productions are sugar, which, although the cane reaches a great height, is not good; and coffee, which is also of an inferior description. The capital is Pointe à Pitre, which possesses a spacious port; and here the principal trade is carried on. Basseterre is also a considerable town, with many fine buildings, fountains, and public gardens.

Deseada and Marie Galante are small islands, situated near Guadaloupe, and subject to its government. The former is famous for its cotton, and the latter yields sugar and coffee. These islands, along with Guadaloupe, contain 334,142 English acres, with a population of 112,111 inhabitants.

SPANISH.

A few years ago, the colonial possessions of Spain extended from the frontiers of the United States almost to Cape Horn. Now, she has not a foot of land on the whole American continent; and of the islands, is possessed of only two worth mentioning—Cuba and Porto Rico, the situation of which has been before mentioned.

Cuba is by far the largest island in the West Indies, being seven hundred miles in length, and a hundred and seventeen at its greatest breadth. It is traversed throughout its length by chains of mountains, some of which reach the height of 8000 feet above the level of the sea. From these mountains flow numerous streams which water the soil, and render it highly productive of all tropical vegetables. The savannahs, or plains, are very extensive, stretching on both sides from the mountains to the sea. The soil of these plains is so fertile, that two, and even three, crops of grain have been cut annually; and, during the whole year, the fields are covered with plants in blossom. There are several salt lakes in the interior, which afford abundance of fish, and mineral springs, which have proved useful in the cure of cutaneous diseases. The island is very rich in minerals, particularly copper, iron, and lodestone; and mines of gold and silver have also been worked. Coal mines have likewise been opened, but it does not appear that they have been worked to any extent. Marbles of various kinds have been met with; but, from the rugged nature of the mountains, and the thickness of the forests with which they are covered, the geological structure of Cuba has not been well ascertained.

The indigenous animals of this island are numerous; the principal being the alligator, the sea-cow, the iguana, a species of lizard, the turtle, &c. The breeding of mules has recently been carried to a great extent, large numbers having been brought from the mother country for this purpose. The mahogany-tree, the cedar, lignum-vitæ, ebony, the well-known *palma real*, and several other kinds of wood, are abundant. Among the fruits cultivated may be mentioned the chestnut, pine-apple, custard-apple, plantain, orange, and melons. Maize, rice, beans and peas, are cultivated in considerable quantities in the agricultural districts; but the rearing of wheat, which was formerly largely grown, is now abandoned. This fine island was for a long time little cultivated by the Spaniards, being looked upon more as an intermediate station between the mother country and her American possessions, than as a valuable colony. Its position, commanding the entrance to the Gulf of Mexico, gives it great commercial importance; and since the ports were opened to foreigners, the productions and trade of the island have greatly increased. The chief exports of Cuba are sugar, coffee, and tobacco, which, manufactured into cigars, is in high estimation.

The capital is Havana, situated on the north side of the island, and which is the finest city in the West Indies. It possesses a splendid harbour, which, although narrow at the entrance, is without bar, and, inside, is capable of containing a thousand ships. There are several handsome churches in the town, which give it an imposing appearance; but the streets are narrow and ill kept.

The other towns in Cuba are Trinidad, on the south, Mantanzas on the north, Santiago de Cuba on the eastern extremity, and Villa del Principe in the heart of the island. The exports of sugar from Cuba in 1832, amounted to 250,000,000 lbs.; coffee, 50,037 lbs.; the amount of tobacco has not been well ascertained. The population, in 1827, amounted to 704,487, of whom

317,064 were white, 57,514 mulattoes, 48,980 free negroes, 286,942 slaves.

Porto Rico, the only other island belonging to Spain, is situated about twenty-five leagues to the eastward of St Domingo. It is about ninety miles long, thirty-three in average breadth, and contains 2970 square miles. It is intersected by a chain of lofty mountains, which run through it lengthwise, and possesses table-lands and valleys of great fertility. The island is well watered by rivers, some of which are navigable for two or three leagues from their mouths; and they all abound in excellent fish. The soil on the east and north is rich in pasturage, and numbers of horned cattle are reared by the inhabitants. That on the south side is well adapted for the raising of sugar; but the climate is often very dry, and the land parched. The climate of this island is somewhat peculiar; on the north coast it often rains during the whole year, while on the south coast, an entire want of rain for twelve or fourteen months is no uncommon phenomenon. The chief productions of Porto Rico are sugar, coffee, indigo, rice, and live-stock. The value of the exports in 1830 was calculated at 3,411,845 dollars, and that of the imports at 2,208,941 dollars; the dollar being equal to about four shillings and threepence sterling. The number of inhabitants in 1830 was estimated at 323,838, of whom 162,311 were whites. The chief towns are Mayagues and Aguadilla.

DUTCH.

The Dutch possessions in the West Indies are Curaçoa and St. Eustatius, Saba, and part of St. Martin—all in the Carribean group. The two former are naturally barren. Curaçoa, from its proximity to South America, was formerly a place of great contraband traffic; but, since the independence of that continent, it has ceased in a great measure to be an *entrepôt*. It is thirty miles long and eleven broad, and produces sugar and tobacco. Like some of its sister isles, it is entirely dependent on the rains for a supply of water. It was held by the Spaniards until the year 1632, when it was taken by the Dutch, in whose hands it has since remained. The population is estimated at about thirty thousand.

St. Eustatius consists of a single mountain, which is twenty-nine miles in circumference, and cultivated to the very summit. The productions are sugar and tobacco, and the population may be about fifteen thousand. It was first colonized by the Dutch in 1635, and continued for many years a subject of contention between them and the French, by whom it was alternately possessed, until 1781, when it was captured by Admiral Rodney. The booty which fell into the hands of the English on this occasion was estimated at £4,000,000 sterling. It was restored to the Dutch by the peace of 1795; and, after being again captured by the English, was finally secured to the Dutch by the peace of 1814.

Saba and St. Martin are too inconsiderable to need further mention.

DANISH.

The Danish settlements, all belonging to the Carribean group, are three in number—St. Croix (or Santa Cruz), St. Thomas, and St. John, of which the former alone is of any importance. It is about eighty-one miles square, and contains about thirty thousand inhabitants. The soil is fertile and well cultivated, producing sugar, rum, and tobacco. St. Thomas is about six leagues in circumference, and St. John about the same. They are both quite inconsiderable.

SWEDISH.

The only colony belonging to the Swedes is the small island of St. Bartholomew, in the leeward Carribean group, and about fifteen miles in circumference. It has only one town and one harbour—Gustavia, and Le Carenage. The population is about six thousand.

INDEPENDENT ISLAND.—ST. DOMINGO.

This island, lying between Porto Rico on the east and Jamaica and Cuba on the west, is three hundred and ninety miles long, and from sixty to one hundred and fifty miles broad. It was discovered by Columbus, who called it Hispaniola, or Little Spain, but the native inhabitants call it Hayti, or the mountainous land. The French and Spaniards took possession of the island in 1650, dividing it between them. No particular event took place till the period of the French Revolution, when, taking advantage of the contest between the royalists and republicans, the natives and slaves rose in a body, massacred the whites, and established their independence. Christophe, formerly a slave, was elected chief, and governed the island with great wisdom for a number of years. In 1811, he was crowned king, created princes and nobles, and reigned undisputed till 1820, when his jealousy and despotism caused a general revolt, and, seeing his affairs desperate, he shot himself. A republic was then established, which was soon extended over the whole island, the Spanish half having also made a successful revolt. The government at present consists of a president, who is elected for life, and a senate and chamber of representatives.

The greater part of the coast of St. Domingo is rocky and dangerous; but the bays of Samana and Neyba afford secure anchorage for large ships. There are also many small ports, situated generally at the mouths of rivers, in which small vessels can anchor with safety. The rivers are numerous, the principal being the Haina, the Nigua, the Neyba, and the Yima, which are navigable for some leagues from their entrance. In this island a salt-water lake exists, which is about eighteen leagues in circumference, and contains fish similar to those found in the sea, such as the shark, the seal, the porpoise, &c. The country is mountainous, but interspersed with fine plains of great fertility. The mountains intersect the island from east to west, some of them reaching the height of 6000 feet above the level of the sea. On the north-west side is an extensive plain, supposed to be eighty leagues long, and from ten to fifteen broad, which is extremely fertile, being watered by numerous streams. The soil is of the finest description, and is distinguished by the variety of its vegetable productions. The mahogany-tree grows to a great height, and the manchineel affords a species of wood veined like marble, and which is susceptible of the highest polish. Several species of dye-woods are found in the island, and also the lignum-vitæ, iron-wood, a species of oak of great size, and abundance of pine. The cotton-tree is the largest in the island, and is formed by the natives into canoes, which are light and capacious. The fruits are very numerous, and are described as extremely fine; and flowers of endless variety adorn the woods. The indigenous quadrupeds were only four in number, and they are now all extinct. The French and Spaniards, however, introduced breeds of horned cattle, hogs, sheep, horses, mules, and asses, which have multiplied exceedingly, and are of great value to the inhabitants. Wild-fowl are abundant; and turtle, and numerous varieties of fish are caught on the coast and in the rivers. Mines of gold, silver, iron, and copper, were formerly found in this island, but it does not appear that they are worked to any extent at present. The island is divided into six districts, named generally from their positions, West, South, Antihonite, North, North-east, and South-east.

St. Domingo was formerly considered one of the most important islands in the West Indies, and it is evident from its size, and the fertility of the soil, that it might be made so again. The policy of the government, since

the independence of the island was declared, has been illiberal; heavy burdens are imposed upon merchants settling in the country, and all foreign merchandise is liable to a duty of 12 per cent. upon entering the country, except French, which pays 6 per cent. Sugar and coffee were formerly exported in very large quantities, but these have now very much decreased. In 1789, the amount of raw sugar exported was 93,500,000 French pounds, and in 1801 this had fallen off to 18,500,000. The export of coffee in 1789 was 76,835,219 pounds, and in 1801 this had decreased to 43,420,270 pounds. The exportation of wood has increased as that of sugar and coffee have declined, and tobacco is also more extensively cultivated. The population of the island has diminished considerably since the revolution. According to some accounts, it is estimated at 422,939, but others give it so high as 900,000. Port-au-Prince, the capital, is situated in the department of the West, has an excellent roadstead, and is the chief seat of trade. The town is built of wood; the streets are unpaved, and, from the marshy nature of the surrounding country, it is very unhealthy in summer. The population is about 15,000. The other towns are Port Haytien, which is the best built place in the island; Les Cayes, and St. Domingo, the capital of what was formerly the Spanish part of the island.

CLIMATE OF THE WEST INDIES.

The year may be divided into four seasons:—The first commencing with the mild vernal rains in April or May, which usually last six weeks; the second includes June, July, August—hot and dry; the third includes September, October, and November, which are the hurricane and rainy months; and the fourth, December, January, February, and March, which are the most serene and cool months.

The climate of the West Indies is pretty nearly alike in all the islands. The average of the thermometer in the towns may be set down at 80 degrees during the summer months (from July to November). It often attains to above 90, but in the mountains it has been known to be so low as 44 degrees, so that a fire at noon is there necessary a great part of the year. The temperature is kept cool by the alternations of the sea and land breezes, the former blowing only during the day, the latter only during the night. Of the latter, which always blows from the centre of the island (be it ever so small), the only scientific account ever given is that of Dr. Franklin, which is as followa:—"As soon as the sea-breeze dies away (in the afternoon), the air of the plains, being rarefied, ascends towards the tops of the mountains, and is there condensed by the cold, which, making it specifically heavier than it was before, it descends back to the plains on both sides of the ridge." It is a singular dispensation of Providence, that in Barbadoes and the smaller windward Carribean islands, which are without these landward breezes, the sea-breeze (or trade-wind) blows both night and day.

The most delightful time of day in Jamaica is at daybreak, before the sun has yet begun to pour his effulgence over the hemisphere of the Carribees, and before the land-breeze has died away. The sea-breeze, or "doctor," as it is gratefully designated by the inhabitants of Jamaica, which invariably blows from the south-east, or some other point ranging from south to east, generally sets in about nine o'clock, A. M., at first only gently rippling the surface of the ocean, and increasing gradually, until it often assumes the strength of a temporary hurricane. Its coming is hailed by the panting, and literally melting inhabitants, with a degree of thankfulness and a sensation of relief, which can only be known by those whose lot it has been to inhale the oppressive and suffocating atmosphere of these climes.

Were it not for this regular alternation of trade-winds and inland-breezes, the islands of these seas would, to Europeans at least, be perfectly uninhabitable. Let such of our readers, therefore, whose destiny has never led them beyond the cool shores of Britain, conceive, if they can, the sufferings of their brethren in the tropics, when it happens that the "doctor" absents himself for a whole fortnight at a time.

In the afternoon, the sea-breeze dies away, as it comes—gradually; after which, for a few hours, earth and sea are again locked in a stillness of repose—a syncope of motion, which, to a new comer, has something almost ominous; and as his imagination is generally saturated before his arrival with descriptions of those fearful visitations, the earthquakes—which are there so frequent, though seldom occasioning much damage—he instinctively listens, in that period of profound stillness, for the first rumbling growl preceding the volcanic explosion. Earthquakes, however, have for many years been becoming rarer and rarer in the West Indies—a fact which seems to confirm the hypothesis that these islands having, at one time or other, had their origin in volcanic eruptions, are gradually cooling, and that these fearful visitations will soon altogether cease. There is scarcely a house, however, of many years' standing, in the walls of which several huge cracks are not to be seen.

The most dreadful scourge of these islands is the hurricanes, which have devastated them all repeatedly from time to time. Between the years 1780–87, a succession of hurricanes desolated Jamaica to such an extent, that, combined with the scarcity of provisions produced by the American war, no less than 15,000 negroes perished from famine. The more mountainous islands also suffer severely from the violent rains, which pour down, as it were, in solid masses, sometimes sweeping the entire soil, and all growing thereon, from whole plantations, and leaving nothing but the bare rock! Since the gradual clearing of the islands from wood, thunder is much less frequent now than formerly, and seldom does any damage. It is, however, terrifically loud.

The following table will show the number of deaths between the years 1820 and 1832, among the labouring population when still slaves, and give an idea of the comparative health of the islands:—

PRODUCTIONS.

The natural productions of all the West India islands are nearly alike. The sugar-cane is the principal production of the West Indies, and is the commodity which has always given the colonies their commercial importance. There are four varieties of the sugar-cane, two of which, the Bourbon and the transparent cane, are those chiefly cultivated. The next plant is the coffee, which was introduced in 1728, and is extensively grown in almost every island. Cotton, indigo, cocoa, and various kinds of spices, are also more or less cultivated. Of late years, many proprietors have been in the habit

* Schomburgk's Guiana.

of planting cocoa-trees on their estates, which it is thought have been too much neglected. Almost every kind of fruits produced in tropical climates grow in one or other of these islands: the vine, the pomegranate, the pine-apple, the water-melon, tamarinds, oranges, the star-apple, the bread-fruit tree (introduced by Captain Bligh in 1793), and numerous others. The pimento of commerce is also produced in these islands; the avocado pear, the papaw tree, and the banana or plantain, of which Humboldt says that it is doubted whether there is another plant in the world which, on so small a space of ground, produces such a mass of nourishing substance. The best description of the vegetation of the West Indies is that given by the Rev. Lansdowne Guilding in his account of St. Vincent, from which we quote the following:—"The ground is overloaded with plants, which have scarcely room for their development. The trunks of the older trees are everywhere covered with a thick drapery of ferns, mosses, and orchideous plants, which diffuse into the air the richest odours, and almost conceal from sight the noble stems that uphold them. Their growth is favoured by the great moisture of the air; and these lovely parasites, sheltered from the direct rays of the sun, are seen ascending on every side, even the larger branches. So great is the variety of vegetable beauties that sometimes decorate a single trunk, that a considerable space in a European garden would be required to contain them. Several rivulets of the purest water urge their meandering course through the brush-wood; various plants of humbler growth, and which love humidity, display their beautiful verdure on their edges, and are sheltered by the wide-spreading branches of the mango, mahogany, teak, mimosa, and other woods remarkable for their stateliness, and clothed in wild and magnificent pomp. The vegetation every-where displays that vigorous aspect and brightness of colour so characteristic of the tropics. Here and there, as if for contrast, huge masses of trap, blackened by the action of the atmosphere, and decayed tremellæ, present themselves: those blocks, which in colder climates would be doomed to eternal barrenness, or at most would only nourish the pale and sickly lichen, here give support to creeping plants of every form and colour, which cover with yellow, green, and crimson, the sides of the sable rock. In their crevices the succulent species are daily renewed, and prepare a soil for larger tenants; from their summits, the old man's beard, and similar weeds, which seem to draw their nourishment from the air, hang pendant, floating at the pleasure of the winds. At a distance is seen the trumpet-tree, whose leaves seem made of silver plates, as the blast reverses them in the beams of the mid-day sun. In a solitary spot rises a wild fig-tree, one of the gigantic productions of the torrid zone. The huge limbs of this tree, covered with perpetual verdure, throw down, often from the height of eighty or ninety feet, a colony of suckers of every possible size, from that of pack-thread to the vast cable of a ship, without any visible increase in their diameter, and without a joint; these, reaching the ground, become other trees, still remaining united. At other times, the suckers, blown about by the winds, are entangled round the trunk, or some neighbouring rock, which they surround with a network of the firmest texture, as if the hand of man had been employed. Above the rocky summit of the hills, the tree ferns, which are the principal ornament of our scenery, appear at intervals: convolvuli, and other creeping plants, have climbed their high stems, and suspended their painted garlands. The fruits of our country, scattered within our reach, and the green leaves of the bananas and heliconias, planted beneath, serve to minister to our refreshment, and to convey water from the neighbouring spring. On every side, innumerable palms of various genera, the cocoa-nut, date, cabbage palm, &c., whose leaves curl like plumes, shoot up majestically their bare and even columns above the wood." Although the foregoing description was written for St. Vincent alone, the vegetation of these islands is so much alike, that what is said of one will apply equally to the rest.

Potatoes are cultivated, but they are watery, and never attain a large size. The yam grown in the mountains, however, is much esteemed; and the sea-ports are well supplied with potatoes from Britain and America. There are green peas at all seasons, and a plant called callaloo, resembling spinach, is much used in the interior. The plantain, and what is called the garden marrow, are also abundant, and much in request as food. The flowers indigenous to these islands are numerous, and exceedingly rich in colour; and it frequently happens that fruits and blossoms are seen growing from the same branch.

Regarding the cultivation of those plants which give the West Indies their vast importance, we quote the following from Loudon's Encyclopædia of Agriculture: "The culture of the sugar-cane in Jamaica in some respects resembles that of the hop in this country. The ground being cleared, and worked a foot or more in depth, the sets or cuttings of the cane, which are the tops of the shoots cut off about a foot long, are planted in rows, generally five feet distant, and from two to five feet apart in the row, according to the quality of the soil, more plants being allowed for poor than rich soil. The ground is kept free from weeds, frequently stirred, and some earth drawn up to the plants. From each hill, a number of shoots are produced: in six months or more, these will generally be from seven to ten feet high; the skin smooth, dry, and brittle, heavy with a gray or brown pith and sweet glutinous juice. In this state, the canes are cut, tied in bundles or sheaves, and taken to the mill to be divested of their leaves and decayed parts, and then passed through rollers to express their juice, &c. Cane plantations are formed either in May or June, or in December and January, these being the rainy seasons.

The cotton plant is propagated by seed, which is sown in rows, about five feet asunder, at the end of September or beginning of October; at first but slightly covered, but after it is grown up, the root is well moulded. The seed is subject to decay when it is set too deep, especially in wet weather. The ground is hoed frequently, and kept very clean about the young plants, until they rise to a moderate height; otherwise they are apt to be destroyed by caterpillars. It grows from four to six feet high, and produces two crops annually; the first in eight months from the time of sowing the seed, the second within four months after the first; and the produce of each plant is reckoned about one pound weight. When a great part of the pod is expanded the wool is picked and afterwards cleared from the seeds by a machine called a gin, composed of two or three smooth wooden rollers of about one inch in diameter, ranged horizontally, close and parallel to each other, in a frame; each extremity they are toothed or channelled longitudinally, corresponding one with another, and the centre roller being moved with a foot-lathe, makes the two others revolve in contrary directions. The cotton laid upon these rollers whilst they are in motion, readily passing between them, drops into a sack below, leaving the seeds, which are too large to pass through, behind.

Indigo thrives best in a rich free soil and a warm situation frequently refreshed with moisture. Having first chosen a proper piece of ground and cleared it, it is made into little trenches, not above two inches deep, two inches and a half in depth, nor more than fourteen or fifteen inches asunder. In the bottom of these, at the season of the year, the seeds are strewn pretty thick

immediately covered. As the plants shoot, they are frequently weeded and kept constantly clean, until they spread sufficiently to cover the ground. Those who cultivate great quantities, only strew the seeds pretty thick in little shallow pits, hoed up irregularly, but generally within four, five, or six inches of one another, and covered as before. The plants grow to full perfection in two or three months, and are observed to answer best when cut in full blossom. They are cut with reaping-hooks a few inches above the root, tied in loads, carried to the works, and laid by strata in the steeper.

In cultivating the coffee, the berries are sown immediately after being gathered, as they are found to retain their vegetative quality only a few weeks. In three months they are fit to transplant, either to a nursery or to a final plantation. In the low lands, they are planted five feet apart, and in the mountains ten feet or more. In three years, the plants will produce a crop, and continue bearing for a number of years. The berries are gathered when they are just about to drop; and are immediately carried to sheds, where they are dried upon cloths, or mats, till the husk shrivels. They are then passed through between wooden rollers turned by a mule, which separates the husk, after which they are winnowed, sifted, cleaned, exposed to the sun for a few days, and then barrelled up for sale."

Various European animals thrive remarkably well in some of the islands. Amongst these may be mentioned the ox, which is much used both for food and labour. Oxen never attain such a size in tropical climes as in this country; and from the labour they have to undergo, the beef is not so good. Horses and mules are abundant in Jamaica, they being principally used for riding or drawing light burdens. Sheep are also plentiful, but the mutton is coarse. Pigs, especially such as are fed upon sugar estates, are very highly esteemed as food; their flesh being described as exceedingly delicate. Goats are kept in considerable numbers for the sake of their milk, which is thought better than that of cows. Fish are very abundant on the shores of every island, and form an important article of consumption. Their flesh is described, however, as pulpy, and not to be compared to that of the salmon. The most delicate are those caught in the mountain streams; and sea and land turtle are also frequently met with. Oysters are to be seen hanging on the pendant branches of the willow, which grow into the water. The black crab of Jamaica is esteemed as a great delicacy; and is somewhat peculiar in its habits. They burrow in the sand during one season, and at others they are frequently found far into the interior of the country. It is supposed that they migrate across the islands on which they are found annually. The domestic fowls are numerous, comprehending almost every kind known in this country, except geese and the common duck. In place of these, however, the Muscovy duck, the turkey, and the Guinea fowl, thrive remarkably well.

The green turtle is very common in many of the West India islands, and is much prized as an article of food. This species derives its name from the fat being green, and is that most esteemed by epicures. There are very few shell-fish in the West Indies which are either useful or ornamental. The most beautiful are the horned helmet, the strombas gigas, and the rare plecocheilus undulatus, which is confined to St. Vincent alone.

With such resources, it may be supposed that the inhabitants live in comfort, from the highest to the lowest. The mode of life followed in Trinidad, as described to us by a resident, is to rise at five, get a cup of coffee, and go to business till seven. Breakfast is then served, and business is suspended for two or three hours during the heat of the day, during which time the reading-room is much frequented. Work again commences at four or five in the afternoon, and is given up altogether at nine in the evening.

INSECTS, REPTILES, BIRDS.

One of the most annoying pests of the West Indies is the myriads of ants that everywhere swarm, as well within as without doors. There are innumerable varieties of them—some black, some brown, some large, and some very small. But, like all the other productions of nature, these little animals, which, by some superficial writers, have been called the "plague of the West Indies," prove of the most beneficial consequence to the health of the island. They are carnivorous, and prevent the accumulation of putrid animal matter. Their scent is remarkably acute, and a dead fly, wasp, or even mosquito, will not lie on the floor for two minutes, before a procession of ants will be seen issuing from some distant corner of the apartment, who drag off the prize bodily to their store-house, to be consumed at their leisure.

Perhaps the greatest annoyance experienced by new settlers in these islands is from the bites of the mosquitoes, although these animals are not nearly so formidable there, in size or sting, as on the South American continent. In the latter they are so dreadful a plague, that people obliged to sleep out of doors can only find protection from the smoke of rank and green weeds thrown upon a fire to windward of them. In the islands, however, they are exceedingly troublesome, and a new settler may almost be recognised from the blotched and swelled appearance of his face, hands, and ankles—in short, every part of his person exposed to their venomous probosces. They resemble exactly our British midge, and are in fact of the same family of insects After a short residence, they cease to be any annoyance to Europeans, who become callous to their stings, and whom, indeed, they cease to fix upon after being some time in the country. They do not at all trouble the Negroes, whose oily skins are impervious to their stings. They are most tormenting during the night, and, to guard against their attacks, gauze curtains are hung round the bed of every respectable inhabitant in town or country. The process of getting into bed without admitting any of these tiny persecutors, is one requiring great dexterity, and not a little scientific manœuvring, as will be seen by a most humorous description, given by Captain Basil Hall in the third series of his entertaining "Fragments;" and which, although applying to the eastern hemisphere, is equally applicable to the west.

Another of the pests of the West Indies is the *chigre*, a small invisible insect, which enters the skin, and unless extracted speedily, breeds the most disgusting sores. They abound chiefly on the coffee plantations. After getting into the flesh, they will hatch a colony of young chigres in a few hours. They will not live together, but every chigre sets up a separate ulcer. Their presence is known by a sharp itching of the part.

The cockroach is a large and disgusting insect, but harmless. It resembles our cricket in appearance, and abounds in thousands.

One of the most singular of the animal phenomena peculiar to the West Indies, are the fire-flies. The light emitted from their bodies is phosphorescent, and only glows during the night. "I was in the habit," says a writer of Jamaica, in our Journal, "almost nightly, of enclosing a dozen or more of fire-flies under an inverted glass tumbler on my bed-room table, the light from whose bodies enabled me to read without difficulty. They are about the size of a bee, and perfectly harmless. Their coming forth in more than usual numbers is the certain harbinger of impending rain; and I have frequently whilst travelling, met them in such myriads, that, be the night ever so dark, the pathway was as plain and visible almost as at noon-day. The light they emit resembles

exactly the lustre of the diamond, and I have been told that it is no uncommon thing for the Creole coquettes to insert a few of them, confined in pieces of thin gauze, amongst their hair, and in various parts of their dress, just as our belles at home avail themselves of the ingenuity of the paste-jeweller."

There are few poisonous reptiles in the West India islands besides the scorpion, which is very numerous. It lodges principally about old walls and the trunks of felled and decayed trees; its bite always produces fever, and often causes death. There are many varieties of serpents, but they are almost all harmless. The kind most common in Jamaica is the yellow snake, which is frequently found of seven and eight feet in length. It often comes into the houses; and one of them is reckoned an excellent prize by the negroes, from the great quantity of oil it yields.

One of the most common of the reptile tribe is the lizard, exactly resembling the alligator in shape. These animals are to be seen frisking about in thousands throughout all the interior, especially about the public roads. Some of them are two feet long; and many of the inhabitants consider them a great delicacy when stewed. Their flesh is white, and resembles that of a chicken or rabbit.

Amongst the most destructive of the animals which infest the West Indies, is the rat, which is very large in size. The history of this animal is somewhat peculiar. It was introduced into several of the West India islands about fifty years ago, by Sir Charles Price, for the purpose of extirpating the native rat. This it soon did most effectually, but at the same time overran the island itself, proving by a thousand degrees a greater pest than its predecessors. It annually does great damage to the cane-grounds. One of the first animals which attracts the attention of a stranger in the West Indies, is the large carrion-crow, called by the Negroes the "John-crow." It is a large, heavy, sluggish bird, about the size of a British turkey, the head exactly resembling that of the latter. It is black in colour, and in the interior of the country is seen floating at an immense height above every hamlet. Its sense of smell is so keen that it will discern the effluvia from the body of the smallest dead animal at several miles' distance; and has been known to scent the dead bodies in wrecks when the vessels themselves were out of sight of land. They are found so beneficial to the health of the island, in thus consuming all putrid animal substances, that a fine of a doubloon (£5 currency) is exacted for killing one of them. When sickness prevails in a house, these birds perch upon the roof even in the midst of towns, where they will remain for many days, as if waiting for their loathsome banquet—in the same manner as sharks are said to attend sick ships at sea.

CONDITION OF THE NEGRO POPULATION.—TRADE, &c.

Previous to 1834, the British West India islands were all cultivated by Negro slaves; but in that year a bill passed the Houses of Parliament by which slavery was abolished, the planters receiving £20,000,000 sterling as the price of Negro emancipation. This bill declared that after the 1st of August, 1834, all slaves should become apprenticed labourers; the apprenticeships to cease in August, 1840. In the interval, disturbances occurred, and much property was damaged, from the Negroes believing that they had now only to work for themselves; but in the course of a few months they returned to their labour. This they did, however, with great reluctance; and in many instances the crops were ruined for want of sufficient attendance. The produce of the islands in consequence greatly decreased; nor has it yet reached the amount it stood at before the passing of the Emancipation Act. The island of Antigua totally abolished slavery in 1834, without requiring the stipulated apprenticeship; and it is highly gratifying to know, that the amount of crime greatly decreased in this island since that period. Bermuda followed the example of Antigua, which was imitated by many of the smaller islands, and afterwards by Barbadoes. Jamaica and some other islands, however, held out till August, 1838, when slavery was finally abolished in the British West India islands. It was anticipated that this event would lead to a considerable degree of social disorganization, but nothing of the kind occurred; and the conduct of the emancipated Negroes, who now may be termed the *peasantry* of the West Indies, has been peaceful and orderly; and on all occasions they have manifested a desire to work at fair wages, and to improve their moral and intellectual condition. Mr. Gurney (a member of the Society of Friends,) who travelled through the West Indies in 1840, and has published the result of his investigations, corroborates all official information on this subject, and describes the improvement of habits and desires among the peasantry as most remarkable. The only dispeace that has occurred in the islands, has, it seems, been caused by employers exacting heavy rents for cottages and provision-grounds; but this source of disquietude, we believe, no longer exists, and tranquillity and industry everywhere prevail.

In Dominica, he found the Negroes manifesting great anxiety for instruction—a thing that cannot be said of English peasantry. One day, he observes, "The people gathered around us, and a woman came forward on behalf of the company, to beg for a school. 'We are hungry for a school,' said she; 'we are tired of waiting for it.' Nor were these idle words; for the people on this and a neighbouring property had agreed to subscribe eight dollars per month in part payment of a teacher. Nothing, indeed, can be more eager than the desire of the Negroes of Dominica for education—they seem determined to obtain it; and it is gratifying to know that the efforts now making for the purpose are at once considerable and successful. There are nearly 700 scholars in the four Mico schools, which are ably conducted, and being quite clear of any peculiar religious bias, are acceptable to the whole population." This forms an agreeable piece of information. In Dominica, a majority of the lower house in the legislature is composed of coloured persons, and the same class of persons are now eligible as jurors, both in this and other islands: it becomes absolutely necessary that the people should, by means of instruction, be prepared for performing these functions with propriety. Another circumstance which fell under Mr. Gurney's notice at Dominica deserves to be made widely known. During slavery, it was below the dignity of any free person to labour in the field; and all who could do so preferred to live in idleness rather than work. The abolition of slavery has removed this detestable plea for living in a state of slothful indulgence. *It is now quite respectable to work*—labour in the fields is not discreditable. This indicates an important social improvement. In speaking of Jamaica, Mr. Gurney shows, that a coffee estate which he visited is now conducted at a much cheaper rate than during slavery, when the planters were obliged to support not only the actual workers, but all the young, old, sick, and idle. The owner of the estate in question described the two different conditions of affairs as follows:—"One hundred and seventy slaves, or apprentices, used to be supported on this estate. Now, our friend employs fifty-four free labourers, who work for him four days in the week, taking one day for their provision-grounds and another for market. This is all the labour that he requires in order to keep up his former extent of cultivation. And willingly did he acknowledge the superior advantage which attends the present system. The saving of expense is obvious.

"I understood our friend to allow that the average cost of supporting a slave was £5 sterling per annum.

170 slaves, at £5 per annum, is - - - -	£850	0 0
Now, he pays 54 free labourers 4s. 6d. per week, one day's labour being set off against rent, for 50 weeks, two weeks being allowed for holidays. - - - - - - - - -	607	10 0
Saving under freedom, - -	£242	10 0"

In the course of another journey, Mr. Gurney offers the following useful fact:—"'Do you see that excellent new stone wall round the field below us?' said the young physician to me, as we stood at A. B.'s front door, surveying the delightful scenery. 'That wall could scarcely have been built at all under slavery or the apprenticeship; the necessary labour could not then have been hired at less than £5 currency, or 15 dollars per chain. Under freedom, it cost only from 3½ dollars to 4 dollars per chain—not one-third of the amount. Still more remarkable is the fact, that the whole of it was built under the stimulus of job-work, by an invalid Negro, who during slavery had been given up to total inaction.' This was the substance of our conversation; the information was afterwards fully confirmed by the proprietor. Such was the fresh blood infused into the veins of this decrepid person by the genial hand of freedom, that he had been redeemed from absolute uselessness—had executed a noble work—had greatly improved his master's property—and, finally, had realized for himself a handsome sum of money. This single fact is admirably and undeniably illustrative of the principles of the case, and for that purpose is as good as a thousand." Of the condition of Jamaica generally, Mr. Gurney observes—"The imports of the island are rapidly increasing; trade improving; the towns thriving; new villages rising in every direction; property much enhanced in value; well-managed estates, productive and profitable; expenses of management diminished; short methods of labour adopted; provisions cultivated on a larger scale than ever; and the people, wherever they are properly treated, industrious, contented, and gradually accumulating wealth. Above all, education is rapidly spreading; the morals of the community improving; crime in many districts disappearing; and Christianity asserting her sway, with vastly augmented force, over the mass of the population. Cease from all attempts to oppose the current of justice and mercy—remove every obstruction to the fair and full working of freedom—and the bud of Jamaica's prosperity, already fragrant and vigorous, will soon burst into a glorious flower."

Notwithstanding the symptoms of industry and improvement which prevail, it happens that the West Indies suffer from a general deficiency of labourers, and to relieve this serious difficulty various schemes have been adopted, though without any important result. Whether from this deficiency or from the effects of the seasons, the produce and trade of the islands have not kept pace with the improvements in their social condition. We have been unable to find any official statement which can furnish a view of the export and import trade during late years. In 1833, the exports from the West Indies amounted to £8,008,248, and in 1834 they were only £5,410,113. The exports of these colonies are considerably greater than their imports, and consist of four leading articles—sugar, rum, molasses, and coffee. In 1835 they sent out 3,624,209 cwts. of sugar, 5,453,317 gallons of rum, 507,627 cwts. of molasses, and 14,866,580 lbs. of coffee. Much the largest export from any individual colony was from Jamaica. The imports from the United Kingdom in 1838 amounted to £3,393,441, a sum so inferior to the value of the exports, that there must be a great payment to the planters in cash.

The principle on which the trade with the West Indies is conducted, like that of all our colonies, is pernicious in the extreme. It consists in our obligation to prefer buying from them instead of from Brazil, or any other foreign country, which could supply us at a cheaper rate. While we now write, for example, sugar could be imported into Britain from Brazil at less than half the price we are paying for it to the West Indies. The people of the United Kingdom are in this manner, as it is calculated, losing several millions per annum, exclusively of civil and military expenses. It is needless, however, to dilate on this absurd system of trade, as at present certain plans are in contemplation for revising the tariff of import duties, which leads to such decided injury to the mother country, and which is compensated by no commercial advantage whatsoever.

The currency employed in the West Indies is an imaginary money, and has a different value in different colonies. The following are the values of £100 sterling, and of a dollar, in the currencies of the different islands:—

	Sterling.	Currency.	Dollar.	Currency.
Jamaica, - - -	£100 =	£140	1 =	6s. 8d.
Barbadoes, - - -	100 =	135	1 =	6s. 3d.
Windward Islands (except Barbadoes), - -	100 =	175	1 =	8s. 3d.
Leeward Islands, - -	100 =	200	1 =	9s.

As far as we know, there is not any census of the population of the West Indies later than that of 1834. The following is the census for that year: the number of the population in Jamaica, however, is only an approximation, there being no available census for that island:—

Colonies.	Whites.	Free Coloured.	Apprenticed Labourers.	Totals.
Antigua, -	1,980	33,432	...	35,412
Barbadoes, -	14,959	5,140	82,807	102,012
Dominica, -	840	3,606	14,384	18,830
Grenada, -	801	3,786	23,536	28,123
Jamaica, -	30,000	...	...	347,692
Montserrat, -	330	974	6,355	7,659
Nevis, -	700	2,000	8,722	11,422
St. Kitt's, -	1,612	3,000	20,660	25,272
St. Lucia, -	881	3,019	13,438	18,148
St. Vincent, -	1,301	2,824	22,097	27,122
Tobago, -	280	3,000	11,621	14,901

DESCRIPTION OF THE EAST INDIES.

GEOGRAPHICAL BOUNDARIES.

India, or Hindostan, or the East Indies, as it is called, to distinguish it from the West India Islands, is a large country in Asia, forming, as may be seen by the prefixed map, an extensive triangular-shaped territory, pointing with its narrow peninsular extremity southward to the Indian Ocean. India is nearly comprehended between the latitudes of 8° and 35° north; its extreme length from north to south is about 1900 miles, and from east to west about 1500; its superficial area measures 1,280,000 miles. The northern boundary of this extensive region is formed by a range of mountains running from east to west, which are higher than any other on the surface of the globe, some of them reaching 25,000 feet above the level of the sea: they are called the Himaleh Mountains, from an Indian word, *heem*, signifying snow—some of their peaks being perpetually clothed with ice and snows. From the extremities of this mountain chain flow two large rivers, which form on either side the boundary of India; that on the east is called the Brahmaputra, and that on the west, the Indus—a river from whose name the whole country has derived its present designation. Each of these streams with its tributaries water an immense tract of fertile country, and afford excellent means of internal trade to the people situated on the banks. From the mouths of these rivers the coast stretches both ways to the southward, the eastern and western side inclining to the same point, so as to meet at Cape Comorin. Beyond this, the adjoining Island of Ceylon extends a little farther outward, and reaches to within about six degrees of the equator.

This large country presents a great variety of surface, being diversified in some places with wide sandy deserts; in others with fine undulating hill countries, well watered and fertile; a third portion consists of flat, high-lying regions, called table-lands, which, from their height above the sea, are cool and temperate; and a fourth division consists of immense fertile plains, watered by the large rivers of the country, and their numerous tributaries. A considerable portion of the low-lying country is of a marshy, shrubby character, called jungle, and unfitted for cultivation. Each of these divisions of India presents an aspect peculiar to itself, and all of them are distinguished by natural productions, both plants and animals. Besides the Indus on the west, and the Brahmaputra on the east, there are other large and important rivers descending from the outskirts of the Himaleh Mountains, or from ranges of hills called Ghauts, and descending to the sea both on the east and west coasts. The principal of these streams is the Ganges, which, with its tributaries, drains a large portion of the north-east division of the country, and enters the sea in the province of Bengal, along with the conjoined waters of the Brahmaputra. The valley of the Ganges, and the valleys of its tributaries, form the finest and richest portion of India. This district, in its largest extent, may be described as a semicircle, with its base extended along the line of the Himaleh Mountains, and its curve running along from Soodiana on the Indus, to Delhi, Gualior, Punnah, Sumbhulpoor, and Balasore, where it meets the sea and the mouths of the Ganges, thence along the coast to Chittagong, and north by Silhet and Rungpore, to include the country of the Brahmaputra.

The first sight of India to European voyagers has little which can please or interest. The coasts are remarkably flat, and frequently dangerous to approach through the raging surf; the shore is only discernible by the tall cocoa-trees which surround the villages or temples. This extreme flatness of the shores of India is one of the peculiar distinguishing traits of the country, and is exceedingly disadvantageous in a maritime commercial point of view.

The southern district of this magnificent valley is called Bengal, and extends along the sea from Chittagong to Balasore, about four hundred miles, and reaches about the same distance northward. The sea-coast is not the most fertile or useful part of this territory; great part of it towards the centre being composed of marshy ground, or of mud islands, among which the branches of the river are spread like net-work. These islands are covered with a rank vegetation of reeds, which are sometimes twenty or thirty feet high; or with trees and underwood so tall and dense that it is impossible to penetrate them. They afford shelter to tigers and other wild animals, but the air of the whole of them is pernicious to health. About 150 miles upwards, the soil becomes higher and less marshy, so as to afford good ground for cultivation; and the country is here fertile and thickly peopled. It is in this district, immediately above the mouths of the Ganges, that Calcutta, the capital of British India, is situated. The inundations of the Ganges cover and fertilize immense tracts of the level country near the river, while others more remote procure the same advantages from an artificial irrigation. Luxuriant fields, divided by groves of tall trees, with villages under their shelter, and swarming with a population beyond any thing that Europe can show, form the general features of the vast alluvial plain of Bengal

DIVISIONS OF THE COUNTRY.

The modern territorial and political subdivisions of India may thus be specified:—First, Northern Hindostan, an extensive and rugged territory, comprehending—

1. The country between the Sutuleje and Jumna.
2. Gurwal or Serinagur.
3. Sources of the Ganges.
4. Kemaoon.
5. Painkhandi.
6. Bhutant.
7. Dominions of Nepaul.

Second, Hindostan Proper, which is the most comprehensive division. It stretches across the centre of India, and obtains the most prominent place in the history of the old Mohammedan empires of India. It reaches south to the Nerbudda river, where the Deccan commences, and includes the following thirteen large provinces:—

1. Bengal.
2. Bahar.
3. Allahabad.
4. Oude.
5. Agra.
6. Delhi.
7. Lahore.
8. Cashmere.
9. Ajmeer.
10. Mooltan.
11. Cutch.
12. Guzerat.
13. Malwa.

Third, The Deccan.—This division lies next, in a southerly direction, to the above, extending from the Nerbudda river on the north, which flows into the sea on the west coast, to the Krishna, a river flowing into the sea or Bay of Bengal on the east coast. Between these rivers lies the Deccan, a much less fertile division of India than the preceding; Bombay, a small island on

the west coast, belongs to the province of Aurungabad in this division. The Deccan comprehends the following provinces, a portion of which once formed the Mahratta empire:—

1. Gundwana.
2. Orissa.
3. The Northern Circars.
4. Candeish.
5. Berar.
6. Beeder.
7. Hyderabad.
8. Aurungabad.
9. Bejapoor.

Fourth, India South of the Krishna.—This division forms the extreme southerly portion of the Indian peninsula, and comprehends the following provinces:—

1. Canara.
2. Malabar.
3. Cochin.
4. Travancore.
5. Balaghaut, ceded districts.
6. Mysore.
7. Coimbatoor.
8. Salem, and the Barramahal.
9. The Carnatic, in which is situated Madras.

Besides the foregoing divisions and provinces, the large territories of Ava and the Burmese empire, lying east from the Brahmaputra, are now attached to India, besides other conterminous regions in different quarters.

HISTORY.

What was the original political condition of the vast territory now composing the British Indian empire, it would be needless to detail minutely. Like other portions of Asia, it was early inhabited by a primitive people, more or less barbarous, professing different pagan religions, and speaking many more different languages. The principal religion, however, was Hindooism, which we shall afterwards allude to; and it has been said by some historians that the early Hindoo race of inhabitants manifested many symptoms of civilization, and even a knowledge of some of the sciences. However this may have been, the inhabitants generally were in some measure an industrious but simple race, and little inclined to war. Reasoning from what has occurred in their history, as well as from the information communicated regarding them, they seem, from the earliest times, to have had little or no care with regard to who ruled over them, provided they were insured in the possession of their ancient religious usages, and their system of living in small communities, under a primitive species of local government. They were reckless of what sovereign was placed over them, or to what dynasty they were transferred, so long as the internal economy of their village districts remained the same. The species of political apathy produced the results which might have been expected. From the most remote period of which any record is preserved, the inhabitants of India, including those tribes which possessed more decided warlike propensities, or who had the spirit to resist aggression, were subjected to the government of strangers, who seized upon their territories, and made them the objects of taxation. Among other warlike princes who thus made inroads on the country, Alexander the Great, in the course of his ambitious career, marched with an army to India, the northern part of which he conquered.

Of this remote period of Indian history, little is correctly known; all that may be said of it is, that both the Greeks and Romans were supplied with some of their articles of luxury from Hindostan, and that for many centuries this eastern clime was supposed, by the ill-instructed inhabitants of distant parts of Asia and Europe, to be the richest and most sumptuous country on the globe. The tales related of Indian grandeur appear to have in time excited the avarice and ambition of Mohammedan or Saracen chiefs. The first of this barbarous though intrepid race, who made a successful inroad upon India, was Muhmood, sultan of Ghizni, or Affghanistan, a kingdom on the north-west of India. Mahmoud commenced his successful expeditions into India about the year 1000 and he continued them till 1024, making the destruction of pagan idolatry more the object of his visits than the acquisition of wealth or power. In this period of twenty-four years he had subdued a considerable number of the native princes, and, notwithstanding his professions, exacted immense tributes in gold and every kind of valuable commodity. A successor of Mahmoud, named Mohammed, after carrying on war with the Indian princes for some time, at length, about the year 1193, entered Hindostan with an exceedingly large force, and bore down all opposition. The king of Delhi was slain in battle, and having advanced to that ancient capital, Mohammed there left a viceroy to maintain his authority. In this manner a Mohammedan dominion was for the first time established in the heart of India, and in one of its greatest cities; and thus commenced the Affghan or Patan sovereigns and their dynasty.

The dynasty so planted continued in existence for rather more than three hundred years, when, in 1525 or 1526, it was subverted by Baber, who was considered one of the most adventurous warriors of his time, and who, like his prototype Mohammed, was of the Moslem faith. Baber was either descended from a Mogul or Tartar chief, or in some way, not clearly explained by historians, connected with a race called Moguls, who assisted him in his attempts upon India; and from causes of this nature, the empire which he founded in Hindostan has ever since been called the Mogul empire. From the year 1526, a series of Mohammedan emperors, whose seat of authority was at Delhi, ruled the largest and finest portions of India. By them the country was in many places newly subdivided into provinces, and put under the government of tributary kings or nabobs, who superseded the Hindoo rajahs or petty princes. One of the greatest of these Mogul emperors was Akbar, who flourished between the years 1556 and 1605. By his daring and judicious management, the central provinces were preserved in complete tranquillity, and Guzerat, Bengal, and part of the Deccan, were added to his already extensive empire.

While the emperors of India were thus establishing their power, multifarious schemes were formed in Europe for getting possession of some of the wealth, if not some portions of the territory, of Hindostan. The commodities of Indian manufacture or produce were hitherto imported into the European states only by means of tedious overland journeys, or partly by the Red Sea, and were endangered in their passage by the attacks of ferocious Tartar and Turkish tribes. The discovery of a new and safe road to India thus became a matter of very great consequence. A route by sea round the Cape of Good Hope was at last found by the Portuguese, who, under the command of Vasco de Gama, in 1498, landed in Hindostan, on the coast of Malabar, where they at once established themselves. The whole commerce of the East Indies was now in the hands of the Portuguese for nearly a century—and this was the golden age of Portugal. Lisbon became the great depôt of Indian spices and other commodities, greatly to the envy of the Dutch and other nations. Portugal was united to Spain in 1580—the Spaniards oppressed Holland, and caused it to revolt—this revolt was followed by the capture of the Dutch ships trading to Lisbon—and this capture compelled the Dutch to engage in a direct trade to India. The English soon followed their example. The political and spiritual tyranny of the Portuguese in India, as well as the abuses which they permitted in commerce, gradually subverted their power, and divested them of respect. The Dutch and English, therefore, found every thing in that state of division which is favourable to the establishment of a third party. The Dutch established an East India Company in 1602, and a prosperous trade was thereafter carried on. The Dutch adopted quite a different line of policy from that of the Portuguese in their

transactions with India. They cared nothing about the religion of the Hindoos, and set up no inquisition to force Christianity on those they dealt with: all they wanted was commercial intercourse, and their excellent management soon secured them a large share of the Indian traffic. They possessed themselves of Batavia, in the island of Java; in 1641, they acquired Malacca, the capital of the Portuguese East Indies; they subsequently acquired the Cape of Good Hope for a settlement; and these colonies were a great assistance to the intercourse between Europe and India. The Dutch subsequently acquired a number of other possessions in the East; but most of these came afterwards into the possession of the British.

We now enter upon the history of the rise and progress of the British power in India. The English became animated with a desire to open a commercial intercourse with India as early as the reign of Edward VI. (1553); but their expeditions failed in reaching the desired country, from their want of geographical knowledge: and it was not till the shutting of Lisbon against the Dutch, that they were so far excited as to persevere in their maritime attempts till they were successful. They at length learned which was the true course to steer for India; whereupon, in 1600, a company of merchants was formed in London to prosecute the traffic with the East; being empowered to do so by a charter from Queen Elizabeth, which was to last fifteen years. The first expedition of these adventurers cost £69,091, and consisted of five ships, the largest of which was 600, and the smallest 130 tons burden. The articles which they took were principally bullion, iron, tin, broad-cloths, cutlery, and glass. This expedition proved remarkably successful, and led immediately to a repetition of annual voyages of the same nature. This early trade was nevertheless considerably hampered by the Portuguese; and it was found necessary to try to secure the favour of the Mogul emperor. In 1607, therefore, Captain William Hawkins was sent out by the Company, to endeavour if possible to open a commercial intercourse with the dominions of the Mogul. Hawkins, after surmounting great difficulties placed in his way by the Portuguese, reached the court of the Mogul emperor Jehangire, son of the famous Akbar, already mentioned. This visit was unfortunately of no avail, from the pernicious interference of the Portuguese Jesuits; and another English mission, on a greater scale, and from the king, was sent forth in 1615. This embassy, which was conducted by Sir Thomas Roe, proved more successful in securing the favour of the Mogul, but did not lead to any important results. The affairs of the Company, nevertheless, continued prosperous, and factories were in many places planted on the coasts of India. These factories were warehouses for the reception of native produce, and the storing of imported goods from England, and were no doubt of considerable use in the objects of their establishment. From the real or pretended dread of being attacked by marauders, the keepers, merchants, and servants, at these places, at length began to strengthen the defences; and so, from being mere mercantile warehouses, the factories partook of the decided character of armed garrisons. It does not appear that the native powers of India took any active measures to prevent this insidious process of planting settlements. The natives were fond of dealing with foreigners, and the princes were so eaten up with jealousy of each other, that the British always contrived to gain the friendship of one by taking part against another, and in the end getting the advantage of both. Besides, it was not for some time that the British disclosed any intention of securing the jurisdiction of provinces, or a property in the soil. A watchful hypocrisy led them to yield, on all occasions, a reverence towards the political sway of the native emperors, rajahs, and nabobs. The original East India Company, with its charters at different times disputed and renewed, continued throughout the seventeenth century to carry on a profitable traffic with the East. Its factories were extended to Java, Sumatra, Borneo, the Banda Islands, Celebes, Malacca, Siam, the coasts of Malabar and Coromandel. In 1610, the native authorities gave permission for the building of Fort St. George, at Madras; and in 1645, a factory was established on the banks of the Hooghley, a branch of the Ganges near its mouth, which formed the foundation of Calcutta. The island of Bombay was also procured as a settlement in 1664–5, after a struggle with its Portuguese possessors. The affairs of the Company were not, however, in a prosperous state; and soon after the Revolution of 1688, the question of the validity of the old royal charter was started. The consequence followed, of the Company not being able to perform its obligations, on account of losses occasioned by wars, infidelity of officers, extravagance, &c.; and Parliament, in 1698, granted a charter to a new East India Company, on condition of a loan of £2,000,000 sterling to the state, and which was required to carry on King William's wars. But the great contentions between the two Companies soon made it necessary to unite them, and a union was effected in 1702, when an act of Parliament was passed, establishing the conjoined association under the title of the United Company of Merchants, trading to the East Indies. Stock was raised by the sale of shares, and the shareholders to a certain amount were entitled to elect the directors of the Company.

The progress of the Company's settlements in India was, on several occasions about this period, caused by the superior skill of the British in medicine. In 1715, an embassy being sent on a commercial commission to Delhi, it happened that a medical gentleman named Hamilton, who accompanied the factors, had the good fortune to cure the Emperor Feroksere of a severe illness, which could not be overcome by the ignorant native physicians. In gratitude for this important service, though it is likely some very valuable presents from the Company had an equally liberalizing effect, the emperor granted liberty to the Company to purchase in Bengal thirty-seven townships in addition to that of Calcutta; he also conferred upon them some important commercial privileges, which soon rendered Calcutta a flourishing settlement.

The charter of the East India Company was from time to time renewed during the eighteenth century, though (but not without great difficulty) against a powerful opposition. But loans to government carried them always through these embarrassments. In 1744, they advanced £1,000,000 at three per cent., in consideration of an extension of their privileges till 1780. Hitherto we have seen this company of English merchants acting only for the avowed object of commercial intercourse with India; we now open a new page in their history, and show the origin of their political power.

The East India Company assumed the qualifications of a military and political power in the year 1748. But their advances towards territorial dominion were retarded by a rival, which gave them no small trouble. This competitor was France, which had in the mean time hastened to share in the commerce and spoils of India. In 1746, a French battalion had destroyed the army of the nabob of the Carnatic, and soon after the French officers succeeded in disciplining Indian troops according to the European method. The inferiority of the native Indian troops opposed to European soldiers, and the facility of instructing Indian soldiers, known by the name of *Sepoys*, in the European tactics, was thus proved. Ambition and avarice, political and mercantile cunning, could now act on a larger scale; and the inde

pendence of the Indian princes was gone whenever this trading Company, which was already encroaching upon all the rights, both of the rulers and the people of these countries, should establish a permanent military force. Thus far the military organization of the Company had been merely on the defensive; it now became able to act offensively; and the entire difference of the European and Indian notions of law could never fail to furnish opportunities to put this new means of power into action. The rights of succession, and all the rights of princes, subjects, and families, were so much disputed on the different principles of the Indian, Mohammedan, and British laws, that the Company, which often interfered as arbitrator, easily succeeded in extending their legal jurisdiction. If called to account in England for any of its undertakings, it was easy to uphold the correctness of its conduct, politically, on the ground of self-defence, which, at the distance of several thousand miles, could not be called in question; and, in legal matters, by taking advantage of the impenetrable labyrinth of the law. Edmund Burke, who experienced, in the case of Warren Hastings, the head of the Company's affairs in the east, this impregnability of the association, accused them justly "of having sold every monarch, prince, and state in India, broken every contract, and ruined every state who had trusted them." In 1749, the robberies of the Company began with the protection of the pretender of Tanjore, a fine province of the Carnatic. Under pretence of illegitimacy, the nabob of this district was driven out, for the purpose of obtaining some cessions of territory, and then restored on making further concessions. The rapid progress of the Company in the art of extending their possessions, appears from their treaties with Surajee-Dowlah, the nabob of Bengal, whom they contrived to depose in 1757, when large and rich provinces were the reward of their faithless policy. The French, who in a similar manner had acquired considerable territorial possessions in the Carnatic, now came into collision with the British merchants, and a hot war was carried on in India between these contending Europeans. The indecency of this conflict, as to which party should be the greatest robber, seems to have shamed both France and England, and commissioners were mutually sent to India to reconcile the differences which oristed, as well as to check the acquisition of territory either by the English or French companies. As a matter of course, this affectation of justice ended in nothing. After the commissioners had agreed that each should restore its acquired territories, and after a "solemn" treaty to that effect had been arranged, hostilities commenced as before. It would be needless to recount the particulars of this struggle for power; it will suffice to state, that the French ultimately were deprived by the British of their possessions.

By the defeat of the French forces in 1761, the British were left at liberty to pursue their schemes on India, being in no small degree favoured by the unhappy political condition of the Mogul empire. This large empire came under the rule of Aurungzebe, a descendant of Akbar, in 1658, and his reign lasted till his death in 1707. Under this celebrated Mohammedan emperor, the empire of the Moguls came to the height of its glory, and attained its largest extent. After Aurungzebe had added to it the kingdoms of the Deccan, it included nearly the whole peninsula of Hindostan, with the neighbouring regions of Cabul and Assam. The revenues extorted from this populous and wealthy territory amounted to £32,000,000 sterling. During the reign of Aurungzebe, it was attacked by the Persians under the bold prince Nadir, and also by a growing nation, called Mahrattas, whose kingdom comprehended large portions of the provinces of Malwa, Candeish, Aurungabad, and Bejapore, in the Deccan. By Nadir, and his successor Ahmed Abdallah, the Mogul empire, after the death of Aurungzebe, was almost entirely subverted to the character of a tributary to the Persians. Under these circumstances there was scarcely a native power that did not consider itself entitled to trample on the feeble authority of the throne of the Mogul; and between the Affghans, whose kingdom lay to the north-west, and the Mahrattas, the empire was distracted, and made the object of greedy contest. The Affghans were at length victorious over their enemy; and in 1753 they placed a descendant of the old dynasty on the throne, and in the possession of the empty but still venerated title of Great Mogul, to be the tool or captive of the first daring power which should seize the capital.

From this period the dignity of the empire was at an end, and a favourable opportunity was offered to the various dependent princes to throw off their allegiance, as well as to enterprising chiefs to take advantage of the unsettled state of things, and establish new kingdoms for themselves. In this state of general revolution, a bold Mohammedan adventurer rose from an obscure rank, named Hyder Ali, who, by summoning round him bold and predatory bands, and waging war with considerable address, established his power as a sovereign in the Mysore, a territory forming one of the most remarkable of those elevated table-lands that diversify the southern provinces. Hyder was succeeded in 1782 by his son Tippoo, a person equally bold, though less prudent and fortunate. Against both these powerful rulers the British for a number of years waged war with various success. In 1792, Seringapatam, the capital of the Mysore, was besieged by the Marquis Cornwallis, with a strong British army, and after some show of resistance, Tippoo was fain to offer terms of surrender. He agreed to give up half of his dominions, and pay £3,500,000 in bullion. For the fulfilment of the treaty, he was under the necessity of giving up two of his sons as hostages. Having fulfilled his engagement, these young princes were returned in 1794: but after this he again commenced hostilities, and in 1799 the British forces, under General Baird, once more attacked and now captured Seringapatam. In the general slaughter which occurred in entering this strongly fortified place, Tippoo was shot, and his body was afterwards found among a heap of the slain. Thus terminated a dynasty which, though short, and limited in respect of territorial dominion, was undoubtedly the most vigorous and best organized of any that had sprung out of the wreck of the Mogul empire. The principal war in which the East India Company was engaged after this successful contest, was that with the Pindarees, roving tribes of Mahrattas, who, without any territory, carried on predatory warfare against all whom they could rob with impunity. The war with the Pindarees was one of great difficulty, and it cost the British a number of years before they finally quelled them. The Pindaree war terminated in 1817, and it was followed by a contest betwixt the British and the Birman empire, which was successfully closed in 1826, and by which the Company gained a considerable territory along the Bay of Bengal, east of the Brahmaputra river. By the foregoing, and other less conspicuous contests with native princes, among which may be reckoned the war against the Nepaul, in 1814, and also by means of purchases, negotiations, and voluntary or involuntary renditions of territory, including the capture or cession by treaty of the French and Dutch settlements, the British power was at length established as supreme over nearly the whole of India.

EXTENT AND POPULATION OF INDIA.

The following has been given by the best authorities as an estimate of the extent and population of the territories now included in British India:—

	Square Miles.	Population.
Presidency of Bengal, -	220,312	65.710,071
Madras, - - - - -	141,923½	13.508,535
Bombay, - - - -	59,438¼	6,251,546
Districts, the population of which is doubtful,	91,250	
	512,923¼	89,470,152

According to another statement, the territorial extent is 514,190 square miles, and the population is 89,577,206. The territory of the allied or protected, that is, the subject states, is estimated at 614,610 square miles; their population, however, is not supposed nearly equal to that of the territories under the immediate government of the Company. Mr. Hamilton, in the second edition of his East India Gazetteer, estimates it as follows:—

The Nizam, - -	10,000,000
The Najpoor Rajah, -	3,000.000
The King of Oude, -	3,000,000
The Guickwar, -	2,000,000
The Satara Rajah, -	1,500,000
The Mysore Rajah, - - -	3,000,000
Travancore and Cochin, -	1,000,000
Kotah, Boondee, and Bopaul, -	1,500,000
Rajpoot and other petty states,	15,000,000
	40,000,000

The same author makes the following conjecture as to the states that still remain independent:—

Sindia, - - - - -	4,000,000
Lahore, Rajah Runjeit Singh, -	3,000,000
Sind, - - - - - -	1,000,000
Nepaul, - - - - - -	2,000,000
Cashmere and other districts belonging to the King of Cabul,	1,000,000
	11,000,000

This would give for the whole of India a population of upwards of 140 millions; but in the foregoing estimate, notice is not taken of the portion of India beyond the Ganges, including part of the Burmese territory, having, according to Mr. Hamilton, an extent of 77,000 square miles, and a population of 301,000.

Hitherto the Company have governed their Indian territories by means of the presidencies of Calcutta, Madras, and Bombay, each of these places being the head-quarters of a local military and civil government. In future there will be another presidency, that of Agra, a place of note in the interior. The whole are under the supreme control of a governor-general appointed by the British court; these governors-general seldom retain their situations above a few years. Mr. Pitt, in 1784, passed an act establishing a Board of Control, composed of six privy-councillors, to superintend the territorial concerns of the Company, which check is still continued, and reappointed under the act of 1833. To retain possession of so large a territory as India, the Company require to keep up a numerous and well-appointed armed force, which is composed chiefly of natives or sepoys, with British officers, and partly of troops raised in Great Britain. The Company further employ a number of queen's regiments, who have double pay allowed them. Mr. Hamilton gives the following statement of the amount of the forces employed:—

Artillery, - - - - -	15,782
Native cavalry, - - - -	26,094
Native infantry, - - -	234,412
Engineers, - - - - -	4,575
Queen's troops, - - - -	21,934
Total, - -	302,797

Of these, the irregulars of all descriptions amounted to 82,937 men. This formidable army of native and European soldiers is distributed throughout Hindostan, at appointed stations, forming a chain of military posts, and keeping up a continual communication with the seats of the various presidencies. Latterly, the number of troops may be different from that above stated. In 1830, they amounted to 224,444 men.

The relations which subsist between the Company and the tributary and dependent states may thus be described:—The Company undertake the defence of the dependent prince's territories against all enemies, domestic or foreign. He is bound, on the other hand, to enter into no alliances with other sovereigns or states without the Company's consent; and he pays them a certain annual subsidy out of his revenues for their protection, while he generally keeps up an army at the same time, for the maintenance of internal tranquillity. In some cases, instead of paying a subsidy, the prince cedes a portion of his territories, of which the Company draw the entire taxes. The Company keep a resident at the prince's court, who is entitled to demand an audience at any time; and by this agent, the Company do in fact interfere pretty regularly in the internal concerns of the state, particularly in settling the succession to the throne. The princes are in reality mere viceroys, or rather tax-collectors for the Company; and when in any state gross mismanagement or breach of engagement repeatedly occurs, these pageants are dethroned and pensioned off, and the Company take the government of the country into their own hands. The Company's protection is often found to shelter internal misgovernment; for the prince, being secured by the British army against the resentment of his own subjects, is tempted to indulge the more freely in extortion and oppression.

REVENUE SYSTEM OF INDIA.

To sustain not only the above military force, but the civil management of India, a revenue of £22,000,000 requires to be levied. About two-thirds of this large sum is derived from a tax on land; and as the mode of collecting, imposing, and administering it, enters deeply into the system of Indian policy, and has a powerful influence on the social condition of the people, we shall here attempt its explanation.

Under the old Mogul empire, the sovereign was considered the universal proprietor of the soil; but the ryots, or cultivators, or actual owners, were held to have a perpetual right of occupancy, so long as they paid the fixed annual tribute or rent demanded by the sovereign. The rent was fixed at a third, and sometimes at a half, of the value of the produce, and the functionaries appointed to ascertain the amount leviable, and to collect it, were called *zemindars*. In 1793, Lord Cornwallis, governor-general, with a view to establish a better system for all parties, changed the zemindars from the character of hereditary tax-collectors to that of proprietors of the soil, though still accountable to government for the rent. This created a vast deal of misery at the time; thousands of poor ryots were ejected from their ancient possessions; but ultimately the country at large was benefited. It was arranged that the sum payable by the ryot for several years, should be fixed as the permanent rent; one-tenth of this was allowed as the zemindar's share, and the other nine-tenths the proportion payable to the government or Company. The rent paid to the Company being fixed, great quantities of land which had been "concealed," that is, left out of the rough and partial returns formerly made, and which had lain in a wild state, or in pasture, were now put under crop. The practice is, to allow the ryot to occupy waste lands rent-free for three years, and to charge only a moderate rent for a few years more. In this way a considerable extent

sion of cultivation has taken place; and some of the zemindars have acquired wealth. From their improvident habits, however, such wealth seldom lasts more than one generation; and no progress has been made towards the institution of a rural aristocracy. The Company have begun very recently to retrace their steps. When zemindaries fall into their hands, as they are always doing from time to time, by the inability of the holders to fulfil their engagements, the Company replace the ryots as nearly as they are able in their original situation, allowing them to hold their lands under payment of a rent which remains fixed, either permanently or for a period of years. The Company in this case come in the room of the zemindar, and collect the rents in detail from the ryots by their agents.

This system of "zemindary settlement" prevails generally in Bengal, Bahar, Orissa, and Benares. It has also been tried on a small scale in the Madras presidency, but with very bad success; but in a modified form it has long existed in some parts of Southern India, where hereditary chiefs, called *polygars*, occupy a similar situation to that of the zemindars in Bengal.

There are other two modes of collecting the rent or land-tax (for it may receive either name); the *Ryotwar*, and the *Mouzawar*.

The ryotwar was first extensively introduced by the late excellent Sir Thomas Munro, when governor of Madras, in 1802. In this system, the government collects the rent directly from the ryots, without the intervention of zemindars. An actual survey was made, with great labour and expense, of the lands of the villages, in which it was attempted to fix the extent and value not merely of every occupancy, but of every field. The records showed the whole sum which the village had paid in former years; and from this, with the opinions of practised assessors, checked and guided by the advice of the village *potail* and *carnum* (the headsman and accountant), an estimate was formed of the gross produce, forty-five per cent. of which was assumed as the rent. The sum thus ascertained was fixed as the maximum which the tenant should be called on to pay. The rent is taken from the ryots in monthly payments, and very summary means are used to extort it. The system was extremely unpopular at its introduction, and occasioned great distress; but this was attributed to the excessive amount of the tax, rather than to defects in its imposition. The reader should be told, that the perquisites of the potail, carnum, brahmin, astrologer, schoolmaster, and a long train of other village functionaries, are supposed to absorb ten per cent. of the ryot's crop, so that the forty-five per cent. which government took in a good year, was, and was meant to be, one-half of the clear produce after this deduction was made. In consequence of the outcry against the tax, considerable abatements were made; and the ryotwar system remains in operation in a part of Madras presidency at this time, with, we believe, comparatively few complaints.

Village settlements.—The third system is the *Mouzawar*, or "village settlement." A village in India does not mean a collection of houses at a particular spot, but corresponds to what is called a township in America. "It is a tract of country (says Mr. Hamilton) comprising some thousands of acres of arable and waste land; politically viewed, it resembles a corporation or township. Its proper establishment of officers and servants consists of the following descriptions:—The potail, or head inhabitant, who has the general superintendence of the affairs of the village, settles the disputes of the inhabitants, attends to the police, and performs the important duty of collecting the revenues within his village—a duty which his personal influence, and minute acquaintance with the situation and concerns of the people, render him best qualified to discharge: the carnum, who keeps the accounts of cultivation, and registers every thing connected with it: the *talliar* (constable), or *totie* (watchman); the duty of the former appearing to consist in gaining information of crimes and offences, and in escorting and protecting persons travelling from one village to another; the province of the latter appearing to be more immediately confined to the village, consisting, among other duties, in guarding the crops, and assisting in measuring them: the boundary man, who preserves the limits of the village, or gives evidence concerning them in cases of dispute: the superintendent of the tanks and water-courses, who distributes the water therefrom for the purposes of agriculture: the brahmin, who performs the village worship: the schoolmaster, who is seen teaching the children in the villages to read and write in the sand: the calendar brahmin, or astrologer, who proclaims the lucky or unpropitious periods for sowing and thrashing: the smith and carpenter, who manufacture the implements of agriculture, and build the dwelling of the ryot: the potman, or potter: the fisherman; the barber; the cowkeeper, who looks after the cattle; the doctor; the dancing girl, who attends at rejoicings; the musician, and the poet. These officers and servants generally constitute the establishment of a village; but in some parts of the country it is of less extent, some of the duties and functions above described being united in the same person; in others, it exceeds the number of individuals which have been described. Under this simple form of municipal government, the inhabitants of the country have lived from time immemorial. The boundaries of the villages have been but seldom altered; and though the villages themselves have been sometimes injured, and even desolated, by war, famine, or disease, the same name, the same limits, and even the same families, have continued for ages. The inhabitants give themselves no trouble about the breaking up and division of kingdoms; while the village remains entire, they care not to what power it is transferred, or to what sovereign it devolves; its internal economy remains unchanged; the potail is still the head inhabitant, and still acts as the petty judge and magistrate, and collector or renter of the village."

It will be understood that, under the zemindary settlement, the government transacts with one individual for an extensive district, probably as large as a county; under the mouzawar or village settlement, it transacts with the chief person of the village for the whole community; and, under the ryotwar settlement, it transacts with each individual cultivator. It may be proper to add, that in India a ryot seldom holds more land than he and his family are able to cultivate, and that there are few farm-servants in our sense of the word.

Of the three modes of settlement, it may be stated that the zemindary plan has yielded the largest revenue; the method of "village settlement" does not cause much more trouble to the government, and is better liked by the cultivators; the ryotwar is the most expensive and troublesome, and has been the least productive of revenue; but it would be the most equitable and most advantageous to the people, if the ends of justice were not defeated by the frauds of the native officers intrusted with its details, and whose corruption is almost universal.

The revenue derivable from land by these various processes of exaction, amounts, as has been said, to two-thirds of the whole revenue of the Company, or the sum of £14,000,000. The next greatest head of revenue is the receipt from native princes, or from ceded and conquered countries, and which averages in amount from £7,000,000 to £8,000,000.

The Company have hitherto gained a million sterling per annum by the monopoly of opium. They have offered a price annually, which has been fixed at the lowest rate that will remunerate the producer; and ryots, whose lands have been suited to the cultivation, entered

into engagements to deliver certain quantities. About two-thirds of the opium used to be smuggled into China, until the Chinese stopped the importation; and one-third was sent to the eastern isles, Java, Sumatra, &c. Salt has also been an article of valuable taxation. It has been manufactured on the coast of the Bay of Bengal exclusively for the Company. Before it reaches the consumer, its price is enhanced five, eight, or ten-fold. The Company have realized a gross revenue of two millions per annum from this monopoly.

The customs drawn by the Company consist partly of taxes collected at the seaports on foreign goods brought in, and partly of *transit* duties levied on goods passing through the country. There are provincial duties paid in passing from one presidency to another; town duties on certain articles at the gates of towns; and market duties levied at the market stations where fairs are held. To collect these taxes, and guard against contraband trade, there are custom-houses, called *Chokies*, at every considerable village. In the single district of Madura, with a million of souls, in Madras presidency, there are twenty-one custom-houses, each of which has four or five subordinate establishments; and at these stations, even when no duties are exigible, fees are charged by the native officers for the trouble of examination, and a good deal of delay is caused in the transmission of merchandise. These taxes are sources of annoyance and occasional extortion to the trading classes. They produce a gross sum of £1,800,000, which is reduced to £1,600,000 by the charges of collection, &c. We believe that a considerable portion of the revenue derived from these duties on traffic is laid out by the Company in the construction of roads and bridges, where improvements of this kind are most wanted.

Territorial Revenue of India, for the year 1829–30.

Mints,	£36,483
Post-office,	132,565
Stamps,	424,692
Judicial (fees),	114,670
Land-revenue,	14,314,660
Customs,	1,837,127
Ceded territory,	569,678
Burmese cessions,	103,240
Salt,	2,421,619
Opium,	1,757,400
Marine,	61,769
Ava indemnification,	92,220
Bhurtpore,	34,800
Subsidies,	392,355
Bank profits,	8,640
	£22,301,948
Deduct over-estimation in land-revenues of Bombay,	247,500
Total revenues,	£22,054,416

In 1833–4, the annual revenue was £13,680,165, but this large sum scarcely covered the expenditure, including interest on the debt due by the Company, which at that time amounted to £35,463,483. As India, by the taxes which it contributes to the Company, clears the cost of its own protection and all its other expenses, it may be considered as the only foreign possession of Britain whose connection is not a cause of loss to the mother country. By means of its vast import trade, India forms one of the best customers for British manufactures, and is therefore a source of wealth to the United Kingdom. In this respect, India has been called "the right arm of England."

As may be generally known, an act of Parliament was passed in the year 1813, permitting the free trading of British subjects with India, reserving the commerce of China to the Company; the territorial and commercial branches were separated, as well as all accounts connected with them; and the king was empowered to create a bishop of India, and three arch-deacons, to be paid by the Company. This act, which was in force till the 22d day of April, 1834, did not afford perfect freedom of trade to India, yet it led towards that desirable result, and greatly increased the commerce with the East. By the act 3d and 4th Will. IV. cap. 85, passed in August, 1833, entitled "An act for effecting an arrangement with the East India Company, and for the better government of his Majesty's Indian territories, till the 30th day of April, 1854," the company were deprived of the exclusive right of trading with China, and ordained to close the whole of their commercial business, and make sale of their merchandise, stores, and effects, so far as regarded commercial assets. It was further ordained, that the whole debts of the Company should be chargeable upon the revenues of their Indian territories, but leaving a yearly dividend of ten per cent. to be retained by the Company; this dividend to be redeemable by Parliament. The Company to pay into the Bank of England two millions annually, till the sum of twelve millions is accumulated, as a security fund to the government. The other principal provisions were—A board of commissioners, to be appointed by the king, to superintend affairs of India; Bengal presidency to be divided into two presidencies—Fort William (Calcutta) and Agra; the whole government, civil and military, of India, to be vested in a governor-general and councillors.

The 81st clause is in these terms:—"And be it enacted, That it shall be lawful for any natural born subject of his majesty to proceed by sea to any port or place having a custom-house establishment within the said territories, and to reside thereat, or to proceed to and reside in, or pass through, any part of such of the said territories as were under the government of the said Company on the 1st day of January, 1800, and in any part of the countries ceded by the nabob of the Carnatic, of the province of Cattack, and of the settlements of Singapore and Malacca, without any license whatever; provided that all subjects of his majesty, not natives of the said territories, shall, on their arrival in any port of the said territories, from any port or place not within the said territories, make known in writing their names, places of destination, and objects of pursuit in India, to the chief officer of the customs, or other officer authorized for that purpose, at such port or place as aforesaid." Clause 86 permits his majesty's natural born subjects to purchase lands in India: 87 enacts that no native of India, or natural born subject of his majesty, shall, by reason only of his religion, place of birth, descent, colour, be disabled from holding any place, office, or employment under the Company: 111 enacts that St. Helena be placed under his majesty's government.

By this act, it will be perceived that several very important provisions are made for the benefit both of Hindostan and Great Britain. India is henceforth open to the settlement of British emigrants; trade may be carried on freely with either India or China; and Indo-Britons, Hindoos, or other natives, are now placed on a level as to political, military, or civil distinctions, with Englishmen. It is stipulated that the governor-general in council is empowered to legislate for India, and for all persons, whether British or native, foreigners or others: if the laws thus made by the governor-general are disallowed by the authorities in England, they shall be annulled by the governor-general. In virtue of these arrangements, it is evident that India, with all its social improvements, retains very much of the character of a despotically governed country; no part of the population having any right to interfere in the legislation or

executive. To enlightened foreigners this may prove an inconvenience; but, in the extraordinary condition of the whole Indian territory, a more liberal policy would most likely be unsuitable if not injurious. As it is, England may expect to derive very great advantages from the policy pursued. To use the words of Dr. Wallich, superintendent of the Company's botanic gardens at Calcutta—"The Company's territories in India are productive of every article which can conduce to the happiness of men; and it only requires skill, and ingenuity, and encouragement, both to the natives and Europeans in India, to select every thing that can possibly be desired." As the Indian population possess a taste for British manufactures, a reciprocal benefit will be the result of every increase of intercourse.

NATIVE POPULATION—HINDOOS.

The bulk of the population of India is composed of Hindoos, the primitive inhabitants of the country, and forming one of the most ancient nations in the world. This race was distinguished for their humanity, gentleness, industry, and were polished by letters and arts, at a time when most of their Asiatic neighbours were yet only in the first stages of civilization. This remarkable people have preserved their national character for thousands of years, even under the dominion of foreigners, and have retained to the present day their language, their written characters, their local government, religion, manners, customs, and habits of life. The Hindoos are in general of a brownish-yellow complexion, but the higher and richer classes are almost as white as Europeans. They are somewhat above the middle height, well proportioned, and very flexible and dexterous. Temperance, frugality, hospitality, and obliging manners, are the favourable traits in their character; but they are now reproached with indolence and avarice. With proper discipline, they form excellent soldiers and faithful servants of the Company. They possess great natural talents, but are at present deprived of opportunities for their development. They practise agriculture, breeding of cattle, fishing, hunting, and mining, and are largely engaged in manufactures, commerce, and navigation. They manufacture cloths of great variety and value, particularly cotton and silk, among which are the finest muslins and shawls, mats, cordovan leather, &c., and are inimitable in dyeing. In the arts of music and singing they are backward, but in dancing, statuary, and architecture, they are more advanced. They are acquainted with arithmetic, astronomy, and chronology, and are fond of poetry.

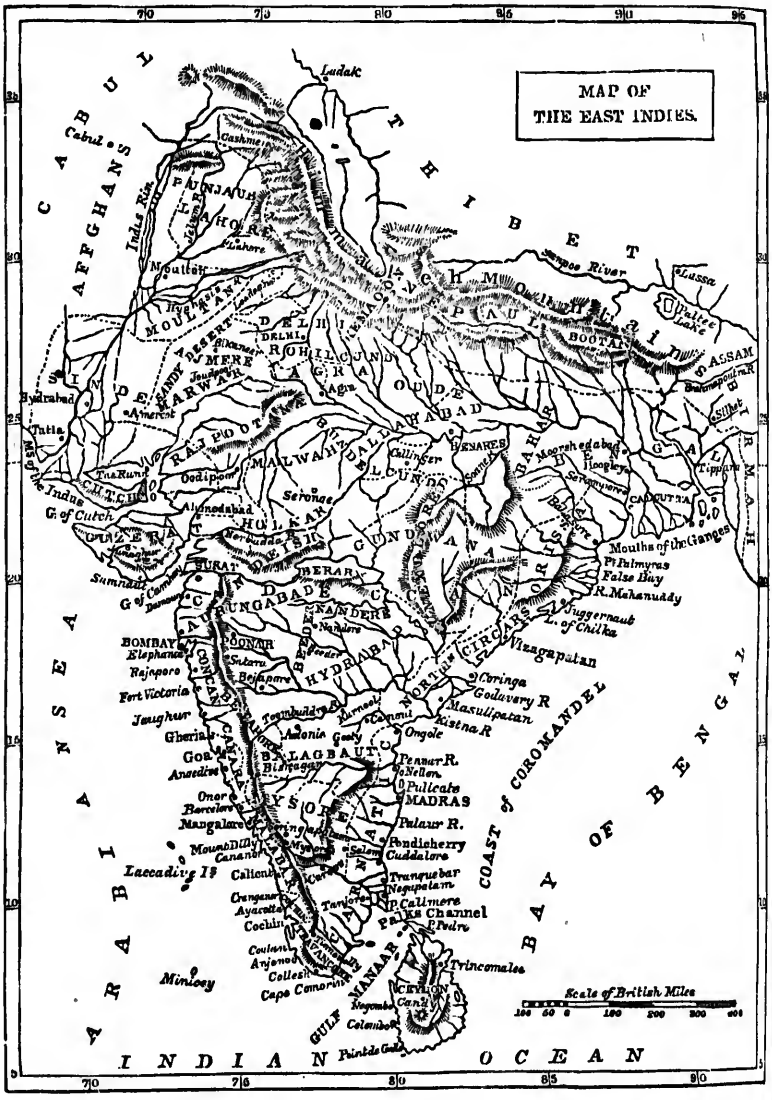
The most extraordinary peculiarity in the Hindoos is their division into *castes*, or perfectly distinct orders of society, which have existed from the remotest times. There are four castes, and it is strictly enjoined by the Hindoo religion that no transition from one to another shall take place; no connection between them by marriage or any other way is allowed, and no individual of one class can assume the habits or engage in the occupations of another. The distinction is complete in every sense, hereditary and personal; all the privileges or disabilities are inherited; no one is permitted to become what he is destined to be by his natural abilities, but is obliged to become only what his birth permits, or to remain what it condemns him to be. The slightest transgression of these laws is punished with loss of caste, and sometimes, in particular cases, with death. Even the difference of food is precisely marked out. The three higher castes are prohibited entirely the use of all flesh; the fourth is allowed all kinds except beef; all others are outcasts, and may eat what they please. Thus, the lower the rank of the Hindoo, the less he is restricted in his meat and drink; but, on the other hand, the burdensome restrictions increase with the inferiority of rank.

The first, or most noble caste of the Hindoos, are denominated Brahmins; they are priests, scholars, teachers, lawyers, and state officers, and are required to be virtuous, learned, peaceable, just and self-denying. The second order is the Kyetra, who are kings and warriors; and they are required to have a thirst for glory, to die rather than retreat, and to be generous to captives. They preserve the ancient name of rajnputs, by way of distinction, in their old hereditary dominions. The third order, which is called Bhysya, or Vaisa, are husbandmen and merchants. The fourth caste is that of the Soodras, who are labourers, and they are enjoined to serve with patience and fidelity. A lower caste, if it can be called such, are the Parias—those unhappy beings who have lost their station in the noble orders, and who are obliged to do whatever no one else can do without pollution. They are not only reckoned unclean themselves, but they render unclean every thing they touch. They are deprived of all civil privileges, and stigmatized by particular laws, regulating their mode of life, their houses, and their furniture; they are not allowed to enter the temples of the other orders, but must worship by themselves. Their houses are miserable hovels, distant from cities and villages.

The Brahmins, who are not legitimately entitled to possess property, and who must live upon the bounty of others for their support, cherish in the people the most debasing superstitions, and exact from them the most profound veneration. Instead of being holy, harmless, and undefiled, they are vicious, tyrannical, avaricious, and to the last degree impure. This infamous aristocracy is the curse of India, and presents a barrier to the attempts which have been made to meliorate the condition of the inferior orders. We believe the Kyetra and Bhysya castes are nearly extinct, and that the Hindoo nation is now composed principally of Brahmins and Soodras, with their subdivisions. These subdivisions are innumerable:—Every trade, every peculiar department of service, has its class, wherefore the retinue of servants to be kept is very large; for the man who carries in your water cannot wait at table, nor the man who cooks a dinner serve it up, nor the servant who waits at table sweep the room; and the same kind of classification goes on through all the pursuits of life. In a number of instances, Brahmins have become soldiers in the service of the East India Company, but without engaging in menial employments; and they still claim precedence even of kings, in point of etiquette. This rigorous classification of the Hindoos undoubtedly presents an obstacle to the advancement of Christianity, which, though hardly thought of by the British at home, is next to insurmountable, and will retard proselytism for an indefinite period. The Hindoo who becomes a Christian loses his caste by partaking of the Lord's Supper, and it therefore requires an extraordinary strength of mind to make a profession of faith in the gospel; for by losing his caste in this or any other way, no one will speak to him, or touch him, or have any intercourse with him—his own wife and family will disown him—he becomes a Paria, a dog.

From recent investigations, it appears that the foregoing rigorous classification of the Hindoos is much less an obstacle to improvement in manners than was formerly supposed. It would seem that the classification is more theoretic than practical. The altered state of society has obliged members of the aristocratic castes to engage in divers employments or trades not permitted by their religion; but to accomplish this object, various subterfuges and self-deceptions are practised. Besides, there have arisen a prodigious variety of subdivisions by the intermixture of castes; and the employments allowed to these mixed or impure castes may be said to be every description of handicraft and occupation for which the wants of human society have created a demand. In

point of fact, we are told by the best authority, that men of all castes may be seen working together in one handicraft employment. A kind of purity of caste is perhaps, nevertheless, kept up by the members of different castes not eating with each other, or not eating forbidden things. It is related that purity of caste is sustained by means of clubs or lodges scattered throughout Hindostan, and existing in considerable force in every large town; yet it seems that excommunication from these fraternities, is, upon the whole, unable to prevent the breaking down of ancient habits, or to subdue the disposition to imitate the English in the arts of civilized life



The Hindoo races are, indeed, described as now exceedingly anxious for improvement; and it is rational to expect, that, through the means of schools for education, and a conciliatory behaviour on the part of their British neighbours, they will attain no small degree of cultivation. On this subject, Bishop Heber—an authority on whom every dependence may be placed—makes the following statements in his work on India:—

"To say that the Hindoos or Musulmans are deficient in any essential feature of a civilized people, is an assertion which I can scarcely suppose to be made by any who have lived with them: their manners

least as pleasing and courteous as those in the corresponding stations of life among ourselves; their houses are larger, and, according to their wants and climate, so the full as convenient as ours; their architecture is at least as elegant; nor is it true that in the mechanic arts they are inferior to the general run of European nations. Where they fall short of us (which is chiefly in agricultural implements, and the mechanics of common life), they are not, so far as I have understood of Italy and the south of France, surpassed in any degree by the people of those countries. Their goldsmiths and weavers produce as beautiful fabrics as our own; and it is so far from true that they are obstinately wedded to their old patterns, that they show an anxiety to imitate our models, and do imitate them very successfully. The ships built by native artists at Bombay are notoriously as good as any which sail from London or Liverpool.

"In the schools which have been lately established in this part of the empire, of which there are at present nine established by the Church Missionary, and eleven by the Christian Knowledge Societies, some very unexpected facts have occurred. As all direct attempts to convert the children are disclaimed, the parents send them without scruple. But it is no less strange than true, that there is no objection made to the use of the Old and New Testament as a class-book; that so long as the teachers do not urge them to eat what will make them lose their caste, or to be baptized, or to curse their country's gods, they readily consent to every thing else: and not only Mussulmans, but Brahmins, stand by with perfect coolness, and listen sometimes with apparent interest and pleasure, while the scholars, by the roadside, are reading the stories of the creation and of Jesus Christ.

"The different nations which I have seen in India (for it is a great mistake to suppose that all India is peopled by a single race, or that there is not as great a disparity between the inhabitants of Guzerat, Bengal, the Doosb, and the Deccan, both in language, manners, and physiognomy, as between any four nations in Europe) have, of course, in a greater or less degree, the vices which must be expected to attend on arbitrary government, a demoralizing and absurd religion, and (in all the independent states, and in some of the districts which are partially subject to the British) a laxity of law, and an almost universal prevalence of intestine feuds and habits of plunder. Their general character, however, has much which is extremely pleasing to me: they are brave, courteous, intelligent, and most eager after knowledge and improvement, with a remarkable talent for the sciences of geometry, astronomy, &c., as well as for the arts of painting and sculpture. In all these points they have had great difficulties to struggle with, both from the want of models, instruments, and elementary instruction; the indisposition, or rather the horror, entertained, till lately, by many among their European masters, for giving them instruction of any kind; and now from the real difficulty which exists of translating works of science into languages which have no corresponding terms."

RELIGION OF THE HINDOOS.

The religious belief of the Hindoos is called Brahminism, and is founded on a most extensive collection of sacred records, of which the Brahmins are allowed to be the sole expounders. "These sacred writings (says Mr. Statham, in his 'Indian Recollections') are of two kinds—the Vedas and Shastres. The former may be termed their Scriptures, the latter expositions of them. Beass Muni (that is, Beass the Inspired), a prophet who lived in the reign of Judistheer, on the banks of the Jumna, near the present city of Delhi, collected all the detached pieces which form the Vedas, from all parts of India, and gave them their present form and arrangement. They are divided into four books, all written in the Sanscrit. The first book is called Rug Veda, which signifies the Science of Divination, concerning which it principally treats. The second is distinguished by the title of Sheham, which signifies Piety or Devotion, and this book treats of religious and moral duties. The third is the Judger Veda, which, as the word implies, includes the whole science of Religious Rites and Ceremonies. The fourth is denominated Obater Bah: in the Sanscrit, *obater* signifies the being or essence, and *bah*, good; this, literally interpreted, is the knowledge of the Good Being, and accordingly this book comprehends the whole science of theology and metaphysical philosophy.

"The Vedas, as also the Shastres or commentaries, pretend to great antiquity; so much so, that many Europeans have been strangely staggered in their belief of the Mosaic chronology by reading them. But it only requires a little consideration and research to discover a vein of imposition running through the whole of their details They reckon the duration of the world by four ages, or *jogues*, extending altogether to about eight millions of years; but the fallacy of this reckoning has been fully exposed by astronomical observation.

"The idea which the Shastres give of God, is that there is one supreme Being, whom they style Bhogabon or Esher, sometimes Khodah; proceeding from him, are three powers or deities, namely, Bruhmha, the Creator of all; Vishnu, the Preserver of all; and Seeb or Sheva, the Destroyer of all. Now, while the latter is worshipped by all, the former has scarcely any attention paid to his temples; and even Vishnu, the Preserver, has few votaries compared with the destroyer Seeb. Subordinate to these are 330,000,000 inferior gods and goddesses, each representing some peculiar virtue or vice. The Hindoos suppose that each of the three presiding powers oftentimes seeks to encroach upon the prerogative of his compeer, and thus are often quarrelling and seeking to subvert each other's arrangements."

One of their most superstitious practices consists in worshipping or deifying the waters of the Ganges. This large and beautiful river extends from west to east across an extensive district in Hindostan Proper, and with its tributaries may be reached by a very large proportion of inhabitants in the most populous and productive part of India. The sacred ceremony of adoring the Ganges consists in the population crowding morning and evening to bathe in it, and quantities of the water are carried to all parts of India, and are sworn by in courts of justice. "At Allahabad (continues the above entertaining writer), where the streams of the Ganges and Jumna unite, the country for many miles round is considered sacred ground; and so great is the number of pilgrims who resort thither for bathing, that the vizier has received in one year half a lac of rupees for permission to enjoy the benefit of immersion in the sacred flood. Many are the lives sacrificed here annually. The persons who thus fall victims to their superstition are generally females, who come from all parts of the country to perform the tragic deed, and who show a firmness of purpose worthy a better cause. Several of them, accompanied by the priests, embark in a boat, and proceed to the spot where the streams unite, when each of the victims in succession descends from the boat to the river, with a large earthen pan fastened to her body, and is supported by a priest till she has filled the pan with water from the stream, when the priest lets go his hold, and she sinks to rise no more, amidst the applauses of the spectators, while the Brahmins enjoy the scene, and extol the fortitude of the last victim to her who is about to follow."

The cow is an animal held sacred among the Hindoos, and cow-dung is used in the temples and other places as a species of holy ointment. The lotus, a plant with tall luxuriant leaves, is likewise held in deep vene-

ration. Some of the temples or pagodas of the Hindoos are of high antiquity and gigantic conception, majestic appearance, and tasteful architecture. The entrance is always made in a huge pyramid, in a number of stories, which gradually grow narrower as they approach the top. Inside may be seen the cow lying down, a serpent, or some other object of adoration. Here sacrifices take place. One of the most extensive pagodas of India is that of Juggernaut, whose towers are seen at twenty miles' distance. Here, as at other places, there are processions of idol cars, large heavy ornamented structures, which are dragged along by the multitude amid the shouts of assembled thousands. As the wheels pass swiftly on, self-devoted victims rush forward, throw themselves before them, and are crushed to death, exulting in the hope of thus securing a passage to the celestial abodes. The practice of widows sacrificing themselves on the funeral pile of their husbands, is another horrid rite; but it has been suppressed in recent times by the British government.

Besides Brahminism, there are a variety of religious beliefs and sects in India, but all less or more founded on the most gross superstitions. Each possesses its own temples, images, and orders of priesthood. The Boodhists, previous to their violent expulsion by the Hindoos, were second in point of numbers; but their religion is now little known in India, and is confined chiefly to Thibet, Birmah, Siam, and Ceylon.

INDIAN LANGUAGES.

There are, it is believed, four original languages in India, and of these there are some hundreds of dialects, differing less or more from each other, and from the originals, and maintaining also a partial distinction, from the introduction of Arabic, Persic, and other foreign words. While, however, each tribe has its own peculiar dialect, all use one language, the Sanscrit, in their sacred writings. The Sanscrit is a dead language, though probably once spoken; it is wonderfully perfect in its construction, and extremely copious. Its alphabet is called *Devanagari*, divine alphabet, because it is said to have had its origin from the gods, whose language it is; it consists of fifty letters, and has three genders. The next language in estimation is the Pracrit, which comprehends the various dialects used in common writing and social intercourse. The dialects of the Pracrit are spoken in Bengal, and include that which is called Hindostanee, the principal spoken tongue in India.

MOHAMMEDANS AND OTHER CLASSES.

According to Mr. Hamilton, "the modern Mohammedans may with safety be estimated at one-seventh of the total population; and notwithstanding the subversion of their political predominance by a Christian power, their religion continues to expand. They are no longer, however, the sanguinary zealots who, eight hundred years ago, in the name of God and the prophet, spread desolation and slaughter among the unconverted Pagans. Open violence produced little effect on so patient a people; and although the Mohammedans subsequently lived for centuries intermixed with Hindoos, no radical change was produced in the manners or tenets of the latter; on the contrary, for almost a century past, the Mohammedans have evinced much deference to the prejudices of their Hindoo neighbours, and a strong predilection towards many of their ceremonies." The warlike portion of the Mohammedans having recently been dislodged by the British from the Mahratta courts, where they had found shelter, they have been obliged to seek employment in inferior stations. The Mohammedans of India are more intelligent, and possess greater strength and courage than the Hindoos; but they are also more proud, jealous, revengeful and rapacious, and their fidelity is much less relied on by the British government. In some districts the Mohammedan population is nearly as numerous as that of the Hindoos, and both seem to live in a state of mutual amity.

Besides the Hindoos and Mohammedans, there are various scattered tribes in India, of a very different character from either, and often inhabiting mountainous tracts of country, and called Garrows, Monguls, Tartars, &c. Among the different races is found that of the Parsees or Persians, the ancient worshippers of fire, long since driven from their native country by the persecuting sword of the Arabs. Many of this people are opulent, and they take the lead in the commercial transactions of Bombay, Surat, and other north-western parts. Their general conduct is quiet, orderly, and respectable.

Notwithstanding what has been related of the strictness of the Hindoos regarding modes of living, they seem liable to fall in with European usages. In Calcutta and other large towns, many of the wealthy natives imitate the British in their dress, household furniture, equipages, and style of living, and show a strong desire to mix in their social parties, to which, however, they rarely find access. The English take no pains to conciliate the friendship of the native tribes, however well behaved and intelligent they may be. "Of this foolish, surly, national pride (says Bishop Heber), I see but too many instances daily, and I am convinced it does us much harm in this country. We are not guilty of injustice, or wilful oppression, but we shut out the natives from our society, and a bullying, insolent manner is continually assumed in speaking to them." The exclusiveness of this species of hauteur is perhaps fully more remarkable with respect to that class of persons who have drawn their origin from the intercourse between the English and natives. These Indo-British, as they are called, form a part of the population of Calcutta, and are a very interesting and increasing people. "Many of them, (says Statham) are very opulent, and others can vie with the more cultivated of their European neighbours in literary attainments; notwithstanding this, there is a marked contempt shown them by Europeans generally. If a European lady should wed with an Indo-Briton, the doors of all the higher circles would be closed against her, however rich the man of her choice might be." This state of things will happily be modified by the provisions of the act of Parliament already narrated.

RURAL CHARACTERISTICS AND PRODUCTS.

In the large and fertile territory of Bengal, as well as in all other parts of India where the cultivation of the soil is pursued, the art of the husbandman is, as may be expected, still in the rudest state; and in every quarter there exists great room for improvement, which nothing could so well facilitate as the settlement of intelligent European families. In the inundated districts of Bengal, rice is the main crop which is raised, at least during the wet season: it grows to its greatest height while the lands are overflowed, and is frequently reaped by men in canoes, the ear only being cut off, and the stalk left. When the peasants go to market during the height of the flood, they take their families with them, lest the house should be washed off during their absence with the boats. Rice is the summer crop, requiring much heat and moisture; but during the cool dry season, from November to April, they sow and reap another harvest, consisting of wheat, barley, or different kinds of pulse: this is called the *dry crop*, because it is reared without flooding the lands; the rice being considered as the *wet crop*, for a contrary reason. There are, therefore, two seed times and two harvests in this rich country. Besides these regular crops, many small grains are sown, which are limited to no particular sea-

son of the year, and which reward the industry of the Indian cultivator with a rich vegetation at all times.

Besides the different kinds of grain, the farmers of Bengal raise a number of other products, of great value. Of these, one of the principal is indigo; this is a small plant, shrubby in its growth, but in its leaves and flowers very much like the common tares of this country; it is sown during the rains, and raised in rows or drills. The leaves only are useful, on which account it is cut repeatedly, without being allowed to flower, which would make it drier and less juicy. The leaves are steeped and beaten in a vat among water; after which the liquid is strained through cloths, and set to evaporate in shallow troughs placed in the shade. This is soon effected in that warm, dry climate; and the indigo is then found deposited in a crust at the bottom. The process requires much preparation and expense; and it has only succeeded well since the country has enjoyed peace, and there has been a prospect of employing large capitals with security. It now produces, however, a large return to the cultivators; and gives a new source of wealth to the country. It is cultivated along the whole course of the Ganges up to Delhi, and is an annual in the lower, but a triennial in the upper provinces. It succeeds best on overflowed grounds, and in dry seasons is apt to fail. The number of factories of indigo in the Bengal presidency is estimated at 300 or 400. A few of them belong to natives: but they are chiefly in the hands of Englishmen, who take leases of ten or twenty thousand acres of land in the name of native servants (not being allowed to hold it in their own) from a zemindar, for the purpose. They encourage the ryots (native cultivators) to raise crops of the plant, by making advances to them in money. They purchase the produce at a price agreed on, and erect works for extracting the dye from the plant; the whole of the operations being generally conducted by native labourers, under native superintendants. It is observed that the establishment of such factories raises the value of land, extends cultivation, and spreads a certain degree of improvement in the villages. The importation of Bengal indigo into Britain began about forty years ago, and has since increased to an amazing extent. Mr. Crawfurd calculates that about 9,000,000 lbs. are annually exported from Calcutta, of which 7,000,000 lbs. come to Britain, and the rest goes to America, France, Germany, Sweden, &c. About £1,680,000, he thinks, are expended for rent and labour in its production, and it realizes in Europe a sum of £3,600,000. In the countries named, Bengal indigo is silently obtaining a preference over every other.

Silk is raised in great quantities in Bengal and Orissa, between the latitudes of 22° and 26°, and it has hitherto been very nearly a monopoly in the hands of the Company. It is chiefly produced by the native Indian worm, which affords four crops, or sometimes six in the year: the Italian worm, which was introduced half a century ago, yields only one crop a year, but of a finer quality. The Indian silk, compared with the best European varieties, is "foul, uneven, and wants staple;" but its cheapness has brought it into extensive consumption. The Company have eleven factories, or "filatures," which form the centres of "circles," within which the cultivation of silk is carried on, each having a certain number of subordinate stations. The silk, in the raw state, is purchased from the ryots at the factories or subfactories, wound off the cocoons, and prepared for transmission to Europe. About 1,800,000 lbs. are annually brought to England, of which a very small quantity (one per cent.) is equal to the finest silk; the mass of it is decidedly inferior. There is a strong ground to conclude that, under the new act, the production of silk in India will be greatly increased, and its price in Great Britain lowered.

Cotton has long been cultivated by the natives in all the three presidencies. It is universally of the kind called "short staple," and being coarse in quality, and badly cleaned, it fetches only two-thirds of the price of American short staple in the British market. The best quality comes from Bombay (the Guzerat); the next from Madras; and the worst from Bengal. The cultivation being entirely in the hands of the natives, is rudely conducted; and, in particular, pains are not taken to renew the plant constantly from the seed, as the Americans do with the most advantageous results. Experiments have been made under the sanction of the Company, and by private individuals, to introduce and cultivate finer species than those in use, but they have generally been failures. There is no doubt, however, that by the introduction of European capital and skill, the quality of Indian cotton may be much improved, and what is raised sent to the market in a much cleaner and better condition. The exports of cotton from India to all countries amounted in 1827, to 68,000,000 lbs., of which only a third part came to Great Britain.

The cultivation of the sugar-cane is pursued with great success in Bengal and other parts of India, but chiefly by the natives, for domestic use. The process of bruising the canes is on a rude plan, and the sugar which is produced is from this or some other cause very inferior to the sugar of the West Indies. In no article of produce is there greater room for improvement than in this. The cultivation of the cane requires great care and skill, and the mechanism for extracting and preparing the sugar can only be erected at a great outlay of capital. It is anticipated that when Europeans are permitted to hold lands freely, and to embark capital on sugar plantations, sugar of good quality may be manufactured much cheaper than in the West Indies, where the price of labour is much higher.

The bamboo, a species of cane or reed, is much cultivated in Bengal. It grows to the amazing height of forty feet; and though it arrives at perfection in two years, it has all the firmness of the hardest timber. It has joints like a reed, or like grass, and is, like them, quite hollow; yet it is so strong that the porters of the country use it for suspending the heaviest burdens between their shoulders. It is used for beams and uprights in building houses; and being protected from damp by a kind of natural varnish, it will last, in such situations for a hundred years. It serves also for making bridges, for the masts of small boats, and for innumerable other purposes; yet of this useful material, one acre of land will yield ten times as much as the same space will produce of other wood. None of the productions of India puts so many conveniences, in regard to furniture, houses, boats, &c., within reach of the poorer classes, as the bamboo. It would require a large space to mention even the names of the plants useful to man, which flourish in the luxuriant soil of Bengal. Cotton, tobacco, the opium poppy, rape (which is cultivated for the sake of its oil), cucumbers, vegetable marrow (as one of the gourd tribe is called), and innumerable other plants, always afford a plentiful harvest. Of fruit-trees, there are the mango, which is something like our peach, the date-tree, the vassia, the guava, the pomegranate, and others. Another production, which is peculiar to warm climates, and which grows in high perfection along the sea-coasts, is the cocoa-palm. This tree would of itself be almost sufficient for the subsistence of mankind in the countries where it grows, so various and useful are its products; indeed, there are some populous islands—the Maldives and Laccadives—on the coast of India, where little else is cultivated.

In the interior of India, the tea-plant is said to flourish, and is likely to become of great importance to the trade of the country. Districts lying between the 26th and 28th degrees of north latitude, and the 94th and 96th degrees of east longitude, are described as possess

ing this shrub in abundance, and of a quality equal to that of China. In Assam, which lies between Bengal and Thibet, the attempt has lately been made to cultivate and gather the product of the tea-plant for purposes of commerce. In 1838, ninety chests of it were imported into London, and found to be of a good quality. Persons skilled in the gathering and preparation of the leaves have been introduced from China; and there seems little reason to doubt that Assam is capable of producing tea to any extent, if sufficient capital and enterprise were exerted in the undertaking.

ANIMALS.—CLIMATE.

India possesses a variety of animals, both quadrupeds and birds, which are found in no other region. Among the quadrupeds, the most conspicuous is the elephant, which affords amusement in the hunting, and which is of great service, when tamed, in carrying persons on its back, in an ornamental and commodious seat fitted up for the purpose. The tiger is found in the low marshy regions, or jungles, and is also made the object of hunting; but this ferocious animal is now becoming of rare appearance, except in the remote parts of the country. India abounds in monkeys, and has some peculiar races of dogs. When English-bred dogs are taken to the country, they speedily degenerate. In the forests, deer of different kinds, and a race of antelopes, prevail. There are also various descriptions of oxen, among which is the white or sacred bull and cow. There are many splendid specimens of birds, as shining creepers, the ring-necked paroquet, lories, cockatoos, parrots, and other highly coloured feathered animals. There are likewise vultures, bustards, peacocks, and nearly all the game birds and poultry of Britain. India and its islands possess many dangerous reptiles, as crocodiles, lizards, and poisonous serpents or snakes, all of which are more or less found about rivers and marshes, and render bathing in the waters by no means safe. India has also many remarkable insect tribes, one of which, the kermes, produces a fine scarlet dye. Fish, of an immense number of varieties, abound in all the streams and waters, and are frequently of exceeding brilliancy in colour.

The climate of India, though in some high districts salubrious and pleasant, is, on the whole, ill suited to the constitutions of Europeans. There are three seasons—the rainy, cold, and hot: the rainy in general extends from June till October; the cold from November till February; the hot from March till May. During the rains the climate is unhealthy. The temperature of the atmosphere ranges during the hot months from 72° to 105°. At Calcutta, the temperature varies throughout the year, from 69° to 89°, but is more commonly about 82° At Bombay, the temperature is generally somewhat higher; and at Madras it is higher still, the Carnatic being a dry and hot region. This general hotness of India, and the insalubrious character of the rainy season, produces not only discomfort, but renders Europeans liable to fevers, diseases of the liver, and other complaints not common in England. To accommodate invalids, the East India Company have fitted up sanatory stations at certain parts of the country, on the higher grounds, where the air is cool and agreeable; but these places cannot always be depended on by the enfeebled functionaries of the Company, and visits to England are often necessary for the preservation of life. In consequence of the heat of the climate, Europeans amply provide themselves with light cotton garments, which are universally worn as undress.

CHIEF CITIES.

Calcutta, the British capital of India, is situated about 100 miles from the sea, on the east bank of the Hooghley, a branch of the Ganges, in latitude 22° 23′ north, longitude 88° 28′ east. The length of the town is about six miles along the bank of the river. When seen from the south, on which side it is built round two sides of a great open plain, with the Ganges on the west, it presents the view of a very noble city, with tall and stately houses ornamented with Grecian pillars and spacious verandas. The esplanade between the town and Fort William leaves a grand opening, along the border of which is placed the new and splendid government house, erected by the Marquis Wellesley. Fort William, which was commenced by Lord Clive, is the largest and strongest fortress in India, but is considered too extensive to be easily defended: its garrison usually consists of European regiments, with artillery, besides a supply of native troops. The public buildings of Calcutta, besides the government house, are a town-hall, a court of justice, two churches of the established religion, and one for the Scotch presbyterian worship, which is a very handsome edifice. There are also several chapels for other religious bodies, mosques, and pagodas—the latter generally decayed and ruinous, the religion of the people being chiefly conspicuous in their worship of the Ganges. Behind the elegant front lines of houses is ranged the native town, deep, black, and dingy, with various crooked streets, huts of earth baked in the sun, or of twisted bamboos, interspersed here and there with ruinous brick bazaars, pools of dirty water, cocoa-trees, and little gardens, with some fine large dirty houses, the residences of wealthy natives. "Fill up this outline," says Bishop Heber, in his valuable Correspondence, "with a crowd of people in the street, beyond any thing to be seen even in London, some dressed in tawdry silks and brocades, more in white cotton garments, and most of all black and naked, except a scanty covering round the waist, besides figures of religious mendicants with no clothing but their long hair and beards in elf-locks, their faces painted white or yellow, their heads in one ghastly lean hand, and the other stretched out like a bird's claw to receive donations; marriage processions, with the bride in a covered chair, and the bridegroom on horseback, so swathed round with garlands as hardly to be seen; tradesmen sitting on the ground in the midst of their different commodities, and old men, lookers on, perched naked as monkeys on the flat roofs of the houses; carts drawn by oxen, and driven by wild-looking men with thick sticks, so unmercifully used as to undeceive perfectly all our notions of Brahminical humanity; attendants with silver maces, pressing through the crowd before the carriage of some great man or other; no women seen except of the lowest class, and even these with heavy silver ornaments on their dusky arms and ancles; while coaches, covered up close with red cloth, are seen conveying the inmates of the neighbouring seraglios to take what is called 'the air,' a constant creaking of cart-wheels, which are never greased in India, a constant clamour of voices, and an almost constant thumping and jingling of drums, cymbals, &c. in honour of their deities; and add to all this, a villanous smell of garlic, rancid cocoa-nut oil, sour batter, and stagnant ditches, and you will understand the sounds, sights, and smells of what is called the 'Black Town' of Calcutta. The singularity of this spectacle is best and least offensively enjoyed on a noble quay which lord Hastings built along the shore of the river, where the vessels of all forms and sizes, Arab, Indian, Malay, American, English—the crowds of Brahmins and other Hindoos washing and saying their prayers—the lighted tapers, which, towards sunset, they throw in, and the broad bright stream which sweeps by them, guiltless of their impiety and unconscious of their homage—offer a scene such as no European and few Asiatic cities can at all parallel in interest and singularity."

In recent times, considerable improvements have been made in and about Calcutta, jungles being cleared away, streets drained, and stagnant water removed. The

the situation of Calcutta has not been well chosen, it is excellently adapted for commerce. At high water the river is here full a mile in breadth. The advantages possessed for inland navigation are considerable; foreign imports may be transported with great facility, on the Ganges and its tributaries, to the north-western quarters of Hindostan, while the valuable productions of the interior are received by the same channels. There is at all times a vast quantity of merchandise deposited at Calcutta, and the trade carried on is now very extensive. Besides a government bank, there are three private banks which circulate to a considerable amount. There are several daily, twice-a-week, and weekly newspapers published. The religious, and charitable, and educational institutions, are numerous and of great service. Society in Calcutta is gay and splendid; and the British inhabitants among their own class are described as hospitable, though jealous of etiquette, and of an overbearing disposition. There are no hotels, or inns, or lodging-houses of any description—a want which appears perfectly amazing—and all strangers, male or female, must be provided with introductions to the houses of residents. The expenses of living are very considerable: and as there are now no more opportunities of acquiring wealth by the spoliation of native principalities, fortunes are much seldomer realized than formerly. There being also now fewer deaths, there are fewer chances of promotion. According to Mr. Hamilton, "Without being attached to some department of service, or trained up to some mechanical trade, there is little hope of prosperity to a young man migrating on chance from Europe. Here all the inferior situations of clerks, overseers, &c., are necessarily occupied by the natives; and it is by these gradations in Europe that young men rise to opulence in the commercial world." The population of Calcutta is composed of about 14,000 Christians, 48,000 Mohammedans, and 120,000 Hindoos; but this is the amount only within the city proper. If the environs or suburbs be included, the population will amount to perhaps 500,000; and so densely peopled is the surrounding district, that within the circuit of twenty miles there is a population of nearly two and a half millions.

Serampore, a Danish settlement, about twelve miles above Calcutta, is the head-quarters of the missionaries sent from Europe, and here a printing-press has been established, and from which Bibles in a great variety of languages have been issued. The missionaries also here conduct a college for the education of native Christians, Hindoos, or Mohammedans. The enterprise and judicious exertions of the missionary body at this place cannot be sufficiently commended.

Madras, the seat of government of Southern India, is situated in the Carnatic, on the shore of the Bay of Bengal, in latitude 13° 5′ north, longitude 80° 21′ east. The shore is here low, and dangerous to approach by vessels. On the beach stands Fort St. George, a place of considerable strength, and which may be easily defended by a small garrison. A noble range of public edifices including a custom-house and court-house, also adorn what is called the north beach. Madras differs in appearance from Calcutta. It has properly no European town, the settlers residing in their houses in the midst of gardens, and transacting business in the district appropriated to the residence of the natives. The principal church in Madras, St. George's, is a beautiful edifice. There are many excellent charities here; and the school for male and female orphans, into which the philanthropic Dr. Bell introduced the Lancasterian system of education, is superior to any thing of the kind in Calcutta. The society of Madras is more limited than that of Calcutta, but the style of living is similar. The roads in the vicinity are excellent, and afford most agreeable drives to the European residents. According to Heber, "the native Christians are numerous and increasing, but are, unfortunately, a good deal divided about castes." The Armenians are here numerous, and some of them wealthy. A Scotch Presbyterian church is now erected The population of Madras and its suburbs has been stated at upwards of 400,000.

Bombay, the seat of government for the western parts of India, is a small rocky island, lying on the west coast of Hindostan, in latitude 18° 56′ north, longitude 72° 57′ east. Bombay was originally some hilly, rocky islets, but these, by the influence of the high tides, have been joined to each other; and now the island is composed principally of two unequal ranges of whinstone rocks, extending from five to eight miles in length, and at the distance of about three miles from each other. All the ground that can be cultivated is now laid out in agriculture, and the remainder is either barren or covered with the residences of Europeans and natives. These residences are on wet, low, and unhealthy grounds, ever below high-water mark; and from this and other circumstances, Bombay is described as being the most insalubrious of the presidencies. The fort of Bombay is situated at the south-eastern extremity of the island, on a narrow neck of land. The chief advantage of Bombay is its deep tide water, which permits the most extensive system of maritime trade: excellent docks are erected for the accommodation of the shipping. Bombay is the seat of very extensive trade with the Persian Gulf on the north, as well as with the south of India. Cotton is the principal article of export. The population is stated at about 160,000, composed of Christians, Jews, Mohammedans, Hindoos, and Parsees.

Delhi, once the capital of the Mogul empire, is situated in 28° 41′ north, in the province to which it gives its name, and at the distance of 976 miles from Calcutta. This once magnificent city is said to have, in former times, covered a space of twenty square miles; in the present day an immense number of its ancient streets, houses, temples, and other edifices, are in ruins, and the modern town, removed at some distance from the old, occupies a space of seven miles in circumference. It is seated on a range of rocky hills, and is surrounded by walls, recently improved and strengthened by the British. The city contains many large and good houses, mostly built of brick. There are a great number of mosques, with high minarets, and gilded domes, and above all are seen the palace of the emperors, a very high and extensive cluster of Gothic towers and battlements, and the Jumna Musjeed, the largest and handsomest place of Mohammedan worship in Hindostan. The chief material of these public buildings is red granite, of an agreeable colour, inlaid in some of the ornamental parts with white marble. One of the principal characteristics of Delhi is thus described by Bishop Heber:—"We passed, in our way to the Agra gate, along a very broad but irregular street, with a channel of water, cased with stone, conducted along its middle. This is a part of the celebrated aqueduct, constructed, in the first instance, by Ali Merdan Khân, a Persian nobleman in the service of the Emperor Shahjehan, then long neglected during the troubles of India and the decay of the Mogul power, and within these few years repaired by the English government. It is conducted from the Jumna, immediately on leaving its mountains, and while its stream is yet pure and wholesome, for a distance of about 120 miles; and is a noble work, giving fertility to a very large extent of country near its banks, and absolutely the sole source of vegetation to the gardens of Delhi, besides furnishing its inhabitants with almost the only drinkable water within their reach."

The British resident at Delhi exercises a most extensive authority, from his having the exclusive charge of the emperor and his family, his taking cognisance of all political events in the north-west of Ind a, and his super

mtendence of many ex-kings and chiefs. The office is therefore always filled by one of the ablest and most experienced of the public functionaries of the Company. The population of Delhi is now computed not to exceed 200,000.

Agra, the capital of the province of the same name, is commodiously situated on the south-west side of the river Jumna, in latitude 27° 11′ north. The greater part of this once flourishing city is now in ruins. In the habitable part, the houses are several stories in height, and the streets remarkably narrow. There is a large and ancient fort, surrounded with high walls and towers of red stone, which commands some noble views of the city and its environs. The principal sights, according to Heber, are the Mootee Musjeet, a beautiful mosque of white marble, carved with exquisite simplicity and elegance; and the palace built by Akbar, in a great degree of the same material, and containing some noble rooms, now sadly disfigured and destroyed by neglect. Agra has been in some measure renovated by the British; and when made the seat of a presidency, will most likely be still further improved.

Benares is an ancient and highly venerated city in Hindostan situated in latitude 25° 30′ north, on an elevated piece of ground on the banks of the Ganges, about half-way between Agra and Calcutta. The streets of this holy city are extremely narrow, and the houses, which rise to the height of six stories, are in some cases united by galleries. The number of stone and brick houses from one to six stories high exceeds 12,000, and the mud houses are about 16,000, besides garden houses. The number of inhabitants is estimated at upwards of 600,000, exclusive of a large body of temporary residents, who come hither for religious purposes from all parts of India. Benares may be called the university town of the Hindoos, as their laws and religion are here taught by Brahmins and learned men in various establishments for the purpose. It is also reckoned to be a place of extraordinary sanctity; and to die at Benares is the greatest happiness of a Hindoo, because he is then sure of immediate admission into heaven. The town is distinguished by a magnificent temple dedicated to Siva. From its great antiquity, relics of former greatness, and religious character, Benares may be considered the most interesting city of India.

PORTUGUESE SETTLEMENTS.

The possessions of the Portuguese in India are now confined to Goa, and a small territory round it; Damaun, a sea-port in the province of Guzerat; Diu, a small island near the southern extremity of the Guzerat peninsula; Dhelli, on the island of Timor; also Macao, in China; and establishments on Sumbhawa, Floris, and some others on the Eastern Isles. Goa is the only place here worthy of notice. It is situated on the west coast of India, in the province of Bejapoor, in latitude 15° 30′ north, 250 miles south-east of Bombay. During the period of Portuguese dominion in India, this was their splendid and populous capital, the head-quarters of their tyranny, the seat of their inquisition. It is now a wilderness, of which the monasteries form the only tenanted portion, and a few miserable monks, half of them natives, are the only inhabitants. "Indeed (says Mr. Hamilton) the city may be traversed from one extremity to the other without meeting a human being, or any other signs of former population than pavements overgrown with grass, gardens and court-yards choked with underwood, and princely dwellings and venerable abbeys mouldering rapidly to decay." There are still several churches in preservation, also the building once occupied by the inquisition, which has been shut up for many years. Panjim, or New Goa, is situated five miles nearer the entrance to the harbour of Goa, and is now the seat of the Portuguese authorities, and of the business carried on. The territory in th neighbourhood of Goa, forty miles in length, by twenty in breadth, forms the possession of the Portuguese; and it was estimated, in 1808, that within this tract there were two hundred churches and chapels, and above two thousand priests.

INDIAN ISLANDS.

The islands usually considered to belong to India, both from proximity and similarity of social condition, are Ceylon, Sumatra, Java, and Borneo, with the Moluccas and a great number of smaller size. Ceylon, lying between 5° 50′ and 9° 50′ north latitude, and near the southern promontory of India, extends to 270 miles in length by about 100 in breadth. The island is generally mountainous, and possesses an agreeable climate, considering its short distance from the equinoctial line. The rivers and rills are numerous. Rice, coffee, cocoa-nuts, with cinnamon and various other spices, form the staple produce; the sugar-cane has also been cultivated of late years. The country possesses various tribes of wild animals, and among others the elephant, which is an object of sport to British and native residents. The population is now believed to amount to 1,400,000. Candy is the capital. Once a possession of the Dutch, Ceylon is now a free crown colony of Great Britain, and open to British settlers. By improvements in roads, agriculture, education, trade, &c., it is in a state of considerable advancement from barbarism, and will ultimately prove a most valuable colony.

Sumatra is an island lying immediately under the line, extending to 1000 miles in length by 165 in breadth: at a short distance on the north is the peninsula of Malacca. The population are a branch of the Malay race, and are in a backward condition, under native chiefs. At Bencoolen, the Dutch are established, and derive advantage from the export of coffee, spices, &c. The straits of Sunda, on the south, separate Sumatra from *Java*. Java extends 642 miles in length by about 100 in breadth, and is an island of extraordinary fertility and luxuriance. It possesses many fine palm and cocoa-nut trees, and its fruits of all kinds are abundant. The chief produce for export consists of rice, sugar, pepper, coffee, and tobacco. The greater part of the island is a possession of the Dutch, whose capital is Batavia; native chiefs claim the sovereignty of the remaining part. *Borneo*, lying under the line, is one of the largest islands in the world; it extends about 800 miles long by about 700 in breadth. The Dutch have formed settlements upon it; but the greater part is in a primitive barbarous condition, and unexplored by Europeans. In Borneo is found the pongo, the largest of the monkey tribe. Of the Moluccas, the Philippines, and other scattered groups of islands in this quarter of the world, little is satisfactorily known: all are inhabited by a savage Malay race, and there is no present prospect of their improvement, notwithstanding their fine climate and great productive powers.

MISCELLANEOUS PARTICULARS.

The preceding brief sketches can convey but a feeble idea of the immense extent and varied character of the Indian empire, as well as of its vast capabilities and importance as a possession of Britain. In India, the European traveller is everywhere charmed with the wild grandeur of the scenery and the luxuriance of the soil; and he is equally surprised at the density of the population, and the traces of superstitious observance which meet his eye. The people for the most part live in an exceedingly simple manner. Much of their food requires no cooking; plantains, cocoa-nuts, pumpkins, and other fruits, being more palatable raw than dressed. The chief cooked article is rice. Houses are made of bamboo or cajann stakes, without splitting, planing, or

dressing of any kind; they are then woven together with small twigs equally unprepared; the whole is plastered over with mud from the nearest clay-hole, and then thatched with cocoa-nut leaves fresh from the tree. Oars for their boats are only bamboos, with a round board tied to the end; the masts are two or three of the same bamboos lashed together with strings. Drinking cups are made of a large nutshell, with one end rubbed off on a stone; a most palatable and wholesome drink is found in the juice of the cocoa-nut palm, which is received into an earthen jar as it drops from the point of a broken branch; and its only preparation is straining through a kind of natural sieve, which is found at the roots of every leaf on the tree. The common people wear little or no clothing; and when it comes to rain, their only umbrella is formed of a number of palm-tree leaves sewed together by the edges into a shape resembling a cradle cut across, which covers their head and back. All processes of manufacture and handicraft are on the rudest possible scale, and carried on without what we term capital. The people only scratch the ground instead of ploughing it; they never apply any manure; their corn is thrashed by setting bullocks to tread upon it; the smith's anvil is the nearest stone, his bellows a rough goat-skin; a shoemaker tans the raw hide one day, and makes shoes of it the next, sitting the whole time at the door of his customer; the weaver's apparatus needs but the shadow of a tree for shelter—and it can be removed at an hour's notice to any other tree which is more convenient. Even their distillery needs only an earthen kettle, some cold water, and a few bamboo reeds for a worm; and with these they produce liquors as intoxicating and pernicious as any manufactured by the science of Europe. This absence of skill in all the processes of industry, renders the labour of the working man of very slight value: hence, he never receives more than what is barely necessary for subsistence; and the whole mass of the people are consequently at the lowest ebb in regard to domestic accommodations or mental acquirements. Their celebrated countryman, Rammohun Roy, who died lately in this country, believed that many of them did not know whether the British or the Mohammedans were masters of India.

Simple as the bulk of the population is, there are not wanting scattered tribes and families dexterous both in cunning and crime. Skill in jugglery, or sleight of hand, has been carried to a pitch never elsewhere equalled, and the tricks performed are so wonderful as to confound the sagacity of the most acute Europeans. Tranquillized as the country is in its civil affairs, there is still a great want of police or effective local jurisdiction. In the accounts of all travellers, it is mentioned that there is no possibility of travelling in almost any part of the interior in safety without a guard and retinue of servants. The roads, if they can be called such, are hardly discernible tracks, quite unfitted for wheel-carriages, and travellers must therefore ride on horseback, or on the backs of elephants, or be carried in palanquins—a species of litter supported on men's shoulders. There being also no inns in India, each traveller is obliged to carry tents and provisions for daily use.

In the states of Bhopaul, Oude, Gwalior, and Bundelcund, and the Company's possessions in the Doab, as well as in some other quarters, there exist hordes of wretches, called Thugs, who infest the roads, and carry on a methodic system of murder, for the sake of plunder. They kill by strangling their unhappy victims. The Thugs form a peculiar race, and practise their murders, as is alleged, from a religious principle; at all events, they attach no idea of criminality to the offence. They have practised the trade for centuries, and are with difficulty restrained within bounds by the European forces.

Slavery prevails in Bengal and some other parts of India, but neither to a great extent nor on a severe principle. The slaves are mostly used in domestic labour, and are generally treated with kindness, both by Hindoos and Mohammedans. Although the British government does not countenance slavery, it would be found almost impossible to extirpate it, either by law or admonition, for it originates in the sale of children by parents during famines, or under circumstances of peculiar calamity. Such is sometimes the distress of the parents, that they will dispose of their offspring for the merest trifle, not from want of affection, but most likely with a view to the saving of their lives. Selling children into slavery, therefore, prevents infanticide, or what is as bad, death by starvation; and so long as no fund exists to relieve the famishing natives during times of exigency, it does not seem possible to prevent the disposal of children by their parents, especially since the laws of the Hindoos permit the practice. We may, however, naturally expect that, with the advance of civilization and habits of carefulness, slavery will here, as elsewhere, cease. At present, slaves in India are frequently liberated by their owners from motives of piety.

Independently of the efforts of the Bishop of India and the religious establishment with which he is connected, the Church of Scotland and other bodies of Christians have for some years been putting forth their exertions to attempt the conversion of the native pagan races, and consequently to elevate their condition. But on the whole, very little success has crowned their well-meant labours; the loss of caste, which inevitably follows the abandonment of the Hindoo faith, may be stated as a barrier to conversion which no power of persuasion can remove; in short, it has been proved beyond the possibility of doubt, that to Christianize India, the people must in the first place be instructed in secular knowledge. Aware of this fact, attention is beginning to be directed to the education of the young. Fortunately, the general population throughout Bengal and Bahar, where investigations have been made, are zealously anxious for instruction in useful knowledge, as well as to learn the English language; and there is a prospect of a plan of education being carried into effect, on the basis of native schools already in existence.

From all that we can learn, it would appear that the present rude state of learning among the native population is a degeneracy from something of a lofty character in ancient times. It seems beyond a doubt, that, some thousands of years ago, there was as enlightened a race of inhabitants in Hindostan as there was about the same period in Egypt. Certain remains of art are on a truly gigantic and splendid scale. The most celebrated are the temples of Ellora, a town near Arungabad, 260 miles from Bombay. They are said to extend over a circuit of three leagues, and consist of stupendous edifices sculptured in the solid rock, like the most exact and beautiful architecture. They are generally about 100 feet high, 145 feet long, and 62 feet wide; and contain thousands of sculptured figures, including sphinxes and other objects similar to those now seen among the ruins of Egypt. The history of these now deserted temple is entirely lost, and imagination wanders in quest of their remote and mysterious origin.

Turning from such matters to others more intimately connected with the modern condition of affairs, it is gratifying to anticipate that British capital and skill will speedily be directed in India to the cultivation of sugar, coffee, tobacco, and particularly cotton, all which products, from the extraordinary cheapness of labour, may be increased to an incalculable extent, and with the most enlivening prospect of profit. Hitherto the system of jurisprudence established by the Company has been a vain mixture of Hindoo, Mohammedan, and English law, and by no means well calculated to preserve public tranquillity. Should the government proceed to modify and extend the system of administering the laws, at the

same time relaxing the burden of taxation on land, and endeavouring to conciliate the natives by promoting those worthy of trust, much good might be anticipated. By these and other measures, suited to the genius of the people, a solid basis would be afforded for the investment of capital, and India would gradually improve both in its moral and physical condition.

Until within the last few years, the intercourse with India was carried on by means of vessels belonging to the East India Company or private traders, which made the passage in about five months by the Atlantic and Cape of Good Hope. This most tedious route is still pursued by trading vessels; but the more expeditious route by the Mediterranean, Egypt, and Red Sea, to Bombay, with concurrence of Mehemet Ali, is adopted for mail conveyance and passengers who desire a quick transit. The line pursued is London to Paris; Paris to Lyons and Marseilles; thence by steamboat, touching at Leghorn and Naples, to Malta; and by another steamer from Malta to Alexandria; from Alexandria by canal to the Nile, and onwards by boat to Cairo; thence by a land journey to Suez; down the Red Sea from Suez to Bombay, touching at Mocha—total length of time from London to Bombay, sixty-one days. The expense of a single traveller is stated at £153, 19s. 0d.

The circulating medium of India consists of gold and silver coins, paper-money, and cowries. The most common silver currency is the new coinage of Calcutta. Potdars, or money-changers, are a common class in every town, and sit generally in the open air with heaps of cowries placed before them. Cowries are small shells, which, not being depreciable by imitation, form a good medium for buying and selling among the lower classes. Their value varies in different places. The following is their value in Calcutta:—4 cowries 1 gunda; 20 gundas 1 pon; 32 pons 1 current rupee, or two shillings sterling (2560 cowries); 10 current rupees 1 pound sterling. The sicca rupee is 16 per cent. less in value than the current rupee, which is an imaginary coin. The Bombay rupee is valued at 2s. 3d.; a pagoda is 8s. The British government now supplies a handsome and commodious coinage, the more common silver coin being the rupee, which nearly resembles our half-crown.

An idea of the trade with India may be obtained from the following statements:—The leading articles of export to India from Britain in 1832, were cotton manufactures, valued at £1,531,000; cotton twist yarn, £309,000; woollen manufactures, £237,000; copper wrought and unwrought, £364,000; iron, wrought and unwrought, £144,000; hardware and cutlery, £82,000; wines, £150,000; beer and ale, £87,000; glass, £101,000; stationery, £50,000; books, £27,000; linen manufactures, £49,000; jewellery, £33,000; silk manufactures, £125,000; apparel, £32,000. Each of the other articles is under £30,000. Total value of the articles exported, £3,750,000. In 1838, including those to Ceylon, the total exports were £3,876,196.

The leading articles of import from India in 1832, were—indigo, £1,212,000; raw silk, £1,189,000; cotton wool, £807,000; saltpetre, £413,000; coffee, £284,000; sugar, raw, £209,000; dyed cotton, £136,000; white calicoes and muslins, £49,000; rice, not in husk, £128,000; pepper, £70,000; tortoise-shell, £77,000. Each of the other articles was under £45,000.

The following words are frequently used in reference to India:—

Adawlet, a court of justice.—*Bega*, a land measure amounting in Bengal to about the third of an acre.—*Bungalow*, a dwelling formed of wood, bamboo, mats, and other light materials.—*Chokeydar*, a watchman.—*Choultry*, a place for the accommodation of travellers.—*Circar*, a large division of country.—*Coolies*, labourers, or porters.—*Cos*, a measure of distance not less than a mile, nor more than two miles.—*Crore*, ten millions.—*Dacoits*, robbers.—*Dewan*, a head officer of finance.—*Dewanny*, the privilege of exacting taxes in perpetuity.—*Durbar*, a court of audience.—*Gentoo*, a Portuguese term, signifying a Gentile.—*Ghaut*, a chain of hills, or pass among mountains.—*Howdah*, the seat elevated on the back of an elephant.—*Lac*, one hundred thousand.—*Lascar*, a native sailor.—*Looties*, a plunderer.—*Musnud*, a throne.—*Nabob*, or *Nawaub*, a viceroy governor under the Mogul empire.—*Paddy*, rice in the husk.—*Pagoda*, a word of Europeans for a Hindoo temple.—*Perwana*, a license.—*Pergunnah*, a certain number of villages, or tract of country.—*Peshwa*, a leader.—*Pundit*, a learned Brahmin.—*Raja*, a king or prince.—*Rajpoot*, literally, the offspring of kings, now meaning persons of distinction.—*Soubah*, a district of twenty-two circars.—*Subahdar*, the governor or viceroy of a soubah.—*Tiffin*, a lunch, or mid-day meal.—*Vakeel*, an agent or ambassador

THE PRIVATE DUTIES OF LIFE.

The temporal duties enjoined on rational beings may be thus classed:—1. Duties which one owes to himself.—2. Duties which arise from domestic relations.—3. Duties which arise in the communities of which each one is peculiarly a member.—4. Duties which arise from the political relations of society.—5. Duties which arise between individuals who are of different nations. We propose, in the mean time, to treat of those duties which a rational being may be said to owe to himself, or as they are generally termed, PRIVATE DUTIES.

LIFE AS A WHOLE.

Life is a succession of parts—infancy, youth, manhood, maturity, decline, old age, and death. What man becomes, depends in part on his genealogy: as his infancy is, so will be his youth; as his youth is, so will be his manhood; as his manhood is, so will be his maturity; as maturity is, so will be decline; as decline is, so will be old age. If youth be passed in idleness, ignorance, folly, and crime, how can one hold his way in the world, side by side with the intelligent, the worthy, and the virtuous? If manhood has been passed in low pursuits, in rooting in the heart evil propensities, in wasting natural vigour, what awaits one in old age but poverty, pity, and contempt? If infancy be devoted to the reasonable expansion of the physical and intellectual powers—if knowledge of human duty be acquired, and be rightly used, will not manhood be worthy, maturity respectable, decline honoured, and old age venerable? Life, then, must be taken as one event, made up of many successive ones. On these unquestionable truths we found all that is worthy of any notice in the following pages.

PURPOSES OF LIFE.

We believe that human life, rightly understood and rightly used, is a beneficent gift; and that it can be so understood and used. It is irreconcilable to reason, that man was sent into this world only to suffer and to mourn; it is from his own ignorance, folly, or error, that he does so. He is capable of informing himself; the means of doing this are within his power. If he were truly informed, he would not have to weep over his follies and errors. It is not pretended that every one can escape at once from a benighted condition, and break into the region of reason and good sense. But it is most clear, from what is well known to have happened in the world, that each generation may improve upon its preceding one; and that each individual, in every successive period of time, may better know the true path, from perceiving how others have gone before him. There can be no miracle in this. It will, at best, be a slow progress: and the wisdom arrived at in one age, must command the respect of succeeding ones, and receive from them the melioration which they can contribute. We understand nothing of what is called the perfectibility of human nature; but we understand this, that if human nature can be made to know wherein its greatest good consists, it may be presumed that this good will be sought and obtained. Man was created on this principle, he acts on this principle, although he is seen so frequently to make the most deplorable and distressing mistakes. If it be not admitted that mankind will always strive to obtain whatsoever seems to them good, and strive to avoid whatever seems to them evil, their moral teaching is in vain. If this principle be admitted, the sole inquiry is—what is good? and what is evil?

INFANCY.

Every human being comes into the world with physical and intellectual qualities, propensities, and aptitudes, which distinguish him as much from all other beings, as he differs from them in figure and appearance. As society is a consequence of the Creator's will, as the proper divisions of labour are a necessary consequence of society, it is not irrational to suppose that individuals are born with adaptation to labour in some departments, and not in others. In the early stages of life, these qualities are sometimes developed, whether they happen to be understood or not. But almost immediately after gaining some hold on life, all human beings become subject to the incidents which tend to strengthen original qualities, or to obscure or stop their progress, and even to suppress them, and engraft on the original stock those which are entirely different. It would be unjust to make infancy responsible for the evils and errors which arise in this manner; but certainly those who have the guidance of infancy are responsible, and will be held to be so. Children have a right to complain, and society has a right to complain, if duties to children be neglected; and, it is needless to remark, there is another and inevitable accountability of a far more serious character. We shall have occasion to remark on the very sober duties of those, who, according to the order of natural and necessary law, are intrusted with forming and giving effect to natural qualities. This matter properly belongs to another place.

YOUTH.

We come now to a period when accountability begins in all the relations which were placed in the division of duties. If it be asked at what age this is to be fixed, we answer, that the good sense of judicial law recognises that a child may be a witness in solemn judicial proceedings, when inquiries addressed to him are so answered as to make it certain that he understands the nature and the obligation of an oath. This may be at the age of ten or twelve years. But the perception of right and wrong, and the sense of duty, begin at an earlier age. There certainly are children of the age of eight years who have a very clear sense of moral propriety; and very many who, between that age and twelve, can discern and reason on right and wrong, and arrive at a very sound judgment. We shall presume that all into whose hands this article may fall, will be fully capable of comprehending its purpose, and of judging of its fitness to be useful to them. We must assume, then, that we are speaking to those who are willing to be instructed in serious things, and that they will not reject instruction from any source, however unpretending it may be, if it come to them in a manner which they can reconcile with their own reason, and with their own duty to themselves. Young persons think that they can see for themselves and that they need not to be told what others have seen But let us reduce this to common sense. Suppose a person to be under the necessity of going from the place in which he has lived, and which is familiar to him, to a far distant place. Let it be supposed that the road he must travel is crossed by many roads, and that he is frequently to find himself at points where several roads are seen, either one of which, so far as he can discern, may be the right one. Will it be of use to him to have been told before he departs, which of these many roads

to take? Will it help him onward to his destination, when he is bewildered, and unable to decide for himself, to find some one who can assure him of the right course? Life is a journey. Every step we take in it brings us to something new, something unexpected, and perhaps entirely different from that which was looked for. Those who have gone through it before us, have left us their instructions in what manner it is to be undertaken and accomplished. They tell us of their own troubles and difficulties; they warn us how to avoid the like in our own journey. Which is wisest—to listen to them, and weigh the worth of their warning, or to push on heedlessly, and take the consequences?

HEALTH.

We suppose that every child, of the ages last spoken of, can form some opinion of the value of health. Most of them have suffered, more or less, by that time. They are now old enough to consider the purposes for which life has been given to them. They then feel that the purpose is to be pleased and gratified; to want and to have; and that restraint is disagreeable. But let them remember that life is a whole; that though all of them will not, yet some of them will, attain to its longest duration, and that it is wholly uncertain to whom that lot will fall. Long life may depend, and often does depend on what children do, or omit, at an early age. Among the first gratifications which are looked for at this period, is the indulgence of the appetite for food. Here comes in a rigid law of the Creator. It cannot be broken without consequent suffering, nor repeatedly broken without impairing, and perhaps destroying, the material frame which has been described as so fearfully and wonderfully made. To require of that delicate machinery, on which the action of life depends, that which it is not qualified to do, and which it cannot do—to force it to do that which is offensive to it—and to make this requisition habitually—is a sin against natural law. Its punishments are well known. The restless sleep, the heavy head, the many sensations of uneasiness, the positive pain, the disgusting remedies, are the punishments which follow. They are not all. Nature loses its charms, companions their interest, duties become irksome, the mind hates its labour, penalties are incurred, parents or teachers are regarded with displeasure. These are the fruits of momentary gratification of the appetites. On the other hand, there is a law of nature that food shall be grateful. It is required to supply the daily waste—to continue life. If there were not a craving want, we should take food as a mere necessary duty. It is kindly made to be a pleasure, and, like every other pleasure, it is to be used, and not abused. Thus, by ignorant or wilful pursuit of pleasure, we violate a law which brings with its just punishment not only the loss of the like pleasure for a time to come, but also pain and suffering from indispensable remedies. When children are sick, they are subjects of tenderness and pity; but in most instances they rather deserve to be punished, for they have broken a law wilfully, since they have disregarded their own experience. As to kinds of food, nature is not unreasonably nice about this: that which it complains of is quantity.

CLEANLINESS.

This is not a mere matter of decency. It is one of the positive commands arising from the constituted order of things. Be it remembered, that every thing that lives, vegetable or animal, is wasting while life continues; and that all which is sent forth through the millions of openings by the skin, has run its round, and is lifeless; and that more than half of all the food taken comes forth in this manner. If perspiration, sensible and insensible, be permitted to rest on the skin, and stop the way of that which is coming, nature is offended, and will show that she is so. Such neglect is one of the causes of disease. This fact was probably well known to eastern nations, since it was part of their religious duty to cleanse the skin. These nations were ignorant of the modern comfort of wearing a garment next the skin which can be frequently changed. The absence of this comfort was one of the causes of those dreadful diseases of which we read, and which are now unknown among Christian nations. There are classes of labourers and mechanics, whose health would be preserved, and their lives prolonged, if they knew how much depended on periodical cleansing. It may be said that there is a connection between cleanliness and moral feeling. Perhaps it may be going too far to say, that those who habitually disregard cleanliness, and prefer to be dirty, have no moral perception; but it may be truly said, that those who are morally sensitive are the more so from respecting this virtue. There is a close affinity between moral depravity and physical degradation. The vicious poor are always shockingly filthy: the depraved rich are visited by worse penalties: they may have clean garments; but what can wash away the impurities which vice has made part of themselves? It is not for one's self only that the virtue of cleanliness commends itself. Every one comes within the observation of others. However uncleanly one may be himself, he is not the less offended at the like neglect in those whom he observes. Now, it is every one's duty to himself to recommend himself to others, so far as he innocently and reasonably can, and to obtain their respect. Clean and costly garments may fall very short of doing this, if it be seen that they are a covering for the neglect of this important law. If there be a lovely object to the human eye, it is a clean, clear-faced, healthy, innocent, neatly-clad, happy child. There are few children who may not, if they will, be neatly dressed, for this does not depend on that of which the dress is made. There are fewer who may not have a clear skin, and healthy look, if they are properly fed, and sleep in pure air. There are none who may not have a clean skin; for we speak to those who are old enough to judge for themselves. And let it be added, for their inducement, that, in obeying the command to be clean, they are performing a moral duty; i. neglecting it, they are inflicting an evil on themselves in two ways—first, in diminishing their own comfort; second, in losing the esteem of others.

AIR.

Among the generally unknown causes of loss of health, is the respiration of impure air. The congregation of many persons in one apartment, especially when artificial light, in great quantity, is permitted, is a cause of more maladies than is commonly supposed. Three causes, in such case, combine to destroy the fitness of the air for respiration—the animal heat of the assembly, the lights, and the breathing of the same air again and again. There must be such assemblies. The remedy is proper ventilation. The smoke of lamps has frequently occasioned death. No lamp is properly trimmed if it emit any thing more than a pure bright flame. It is a common practice to keep sleeping apartments shut up. If there be several persons in a small room which has been shut up for several hours, it would be shocking to know how often they must breathe again and again the same air, and how unfit it is to be breathed after it has once visited the lungs. Add to this the impurity of the air, which is continually in contact with the furniture prepared and constantly used for sleeping, in an unaired apartment. It is not mere nicety, or fastidious delicacy, which requires that the pure air should be admitted where the human lungs are in action, but it is a law as old as the creation of man, and cannot be disregarded. A skilful observer might select among many, from the appearance of the countenances, those who have just left

an apartment in which they have been respiring for hours a spoiled atmosphere. No doubt that this cause, long continued, so affects the whole mass of blood as to bring on many diseases. If pure air be peculiarly necessary to any class of persons, it is so to children. We believe a more useful suggestion could not be made on the subject of health to the whole community, than to invite them to respect this law of nature—that there cannot be perfect health where the air is impure, and that this applies especially to apartments appropriated to sleep. Visiting friends are often put into sleeping apartments which have not been opened for days and weeks; this is far enough from kind treatment, however innocently it be done.

TIME.

Every person connects himself, in his usual thoughts of himself, with all the lapse of time in which he can remember, and with all the lapse of time through which he expects to live. This he calls his life. He does not live in time that is past, nor in time that is to come. He actually lives only in the present moment. Yet he feels that he lives in the past, and will live in the time to come, because the past, the present, and the future, are so connected that he cannot separate them. It is, then, a law, prescribed to us, from which no one can free himself, that he shall suffer in the passing moment for the wrongs done in time gone by, and for the evils of which he dreads the approach. As this is certainly so, how little does he regard the operation of inflexible law, who provides for himself a load of self-reproach, for any gratification which he can procure by error or by crime!

Let us lay out of the case those errors and crimes which have been alluded to, and consider negligences and follies. Man was meant for action, and his actions were intended to enable him to secure good to himself. Good to himself depends on the performance of his duties to himself. Duty to himself requires that he should improve his faculties, and should avail himself of all the opportunities given to him for that purpose. The hours, then, which are permitted to slide by without any improvement, are lost. In so losing them, he breaks the law of the Creator. Apply this to the vocations in which one is to cultivate his mind in any business, mechanical, scientific, or learned. When one sees himself surpassed by others, and left far in the rear; when he is called on to measure himself against another; and when he sees that comparisons are made between him and others, greatly to his disadvantage—he may feel, and most men do feel, that they are thus depreciated because the precious time which was allotted to improvement has been passed in trifling amusements or in idle pursuits. To some minds, the suffering from such causes is extremely acute. They have no one to blame but themselves. The bitter remembrance which they have of the past, as connected with the present and the future, is the punishment for breaking a positive law. They may console themselves, perhaps, with the firm resolution, that they will repair the wrong done in the past time by diligence in the time to come; but they find that time brings with it its own demands. They are fortunate, indeed, if they can do in one space that which belongs to it, and that also which belonged to another and in another season of life.

One cannot innocently say his time is his own, and that he may dispose of it as he pleases. His time is his life. It is given to him in trust. Like other trustees, he will be held to an account, in which there is no possibility of concealment, and where nothing will depend on proof. It may be supposed that it will be said to him, There was confided to your use a term of time; you knew, or could know, the laws prescribed to you in performing your trust: are you come from that trust to render an account of it, burdened with reproach from your own conscience, and with marks of guilt which you cannot hide? or, are you come without any advancement in the knowledge of your duties, and with no other account than that your days rolled by in childish pursuits or idle amusement, *no wiser* when you were severed from the world than when you left the cradle of infancy? or, are you come with the exalted acquirements which you might have, and with that innocence and purity which you would have, if you had read the laws of the created world, and those which have been revealed and placed before your eyes? Where have you read in these laws, that no duties to yourself, and to your associates, nor to the *Lawgiver*, were enjoined upon you? Have you not been told by every breath you draw, by every movement of your frame, by every thought of your immortal mind, by every just pleasure that you have had, by every pang that you have suffered, and by all that you have been made capable of perceiving and learning, that there were laws prescribed to you in your trust, and that an account of your stewardship would be exacted from you by a Judge who cannot be deceived?

SELF-LOVE.

It is an invariable law of nature, that every human being shall do those acts which he thinks will secure good to him, and that he shall avoid those acts which will occasion evil to him. Why, then, should not every one do any and every act in his power by which his own will may be gratified, and avoid doing any and every act which is disagreeable to him? The only answer that can be given to this question is, that man is a free agent, intrusted with the power, and charged with the duty, of ascertaining for himself what is good and what is evil; and that this power and duty extend to those with whom he dwells in society, and also to his Creator.

Children always conform to the natural impulse of self-love, until they learn, from the discipline which is applied to them, that they cannot have their own will without subjecting themselves to a suffering, the dread of which controls the natural impulse. They learn, after a time, that the greater good lies in giving up what they will to do, and doing what is required of them, rather than to meet the certain consequences. We think that the whole science of morals will be found in the principles contained in the truth above stated.

Self-love is just as strong throughout life as it is in childhood. It is that quality of our nature to which all excellence may be referred; but it is also that to which all unworthiness may be referred. As the dread of punishment, or an unwillingness to displease those whose kindness a child desires, will restrain him, or put him into action; so, in more advanced life, the dread of suffering a certain or probable evil, and the certainty of losing the good will of others, will restrain or impel to act. With those whose minds have been properly disciplined, and who have learned to comprehend their relation to the Creator, there is a far higher motive, which is founded in a submission to the Creator's laws. As one goes on in life, he may or may not acquire more and more clear and just perceptions of what will be the greatest good to himself, and how he can obtain it. It is a self-evident proposition, that if a person could certainly know what it would be best for him to do, or not to do, in relation to all things and persons, and under all circumstances, and if he should conform to this knowledge, he would best obey the impulse of self-love, and most exactly conform to the laws prescribed for his good.

It cannot be too often impressed upon the youthful mind, that *life is to be taken as a whole:* for if this extended view be not taken, it must frequently happen that it will seem right in certain circumstances, and when the view is limited to these circumstances, that certain acts may be done or avoided as the greatest good. Yet, if the consequences could be foreseen, they would disclose that this seeming good would turn out to be a

positive evil. It often seems good to the young to avoid the performance of labours which are assigned to them, and to spend in amusement the time which should be devoted to fit them for duties which will be incident to their future condition. This misapprehension of good is to be lamented; but with some this is not all. Their own self-love prompts them to engage in a course of folly, so that not only do they fail to obtain that which is real good, but they find, under the mask of pleasure, that which proves them to be the most grievous suffering.

The same truth runs, in an endless variety of forms, into manhood, and through all the stages of life. We are impelled by self-love not only to provide for the craving wants of our nature, but to seek pleasure, riches, power, distinction, and luxuries. These propensities are given for wise and beneficent purposes. It is the misapplication of them, as seen in the world, which constitutes human misery. He is called brave and honourable who defends himself, even at the risk of life, against those who would do to him that injustice and wrong which would make the gift of life of no value. But the brave, who invade the rights of others, and subject them, by violence, to losses and to sufferings, without cause, misapply this principle of action. To get riches by honest industry, or the reasonable exercise of one's talents, is a commendable use of self-love. To get riches by unfair and dishonest means, to hoard them up, and to brood over them in secret, is a pitiful misuse of this commendable impulse. To have power over one's fellow-men, and to use it faithfully, and for their benefit, is a relation which one may honestly and commendably desire, as a reasonable exercise of self-love. To seek such power by deceitful representations, and to obtain it by violence and fraud, and to use it for purposes of supposed self-benefit, and to the injury and oppression of others, is another form of self-love. But there are few, if any cases, in the history of mankind, in which self-love has appeared in the latter form, without eventually overwhelming the agent with disappointment and sorrow. It is true that for a time such an one may seem to flourish in his schemes, and command the applauses of those who look up to him in his apparently fortunate elevation; but, in the very nature of things, if his heart could be sounded, there is not one whom he looks down upon, who is not more at ease than himself. His day of humiliation may be at hand, in the course of events which he cannot control; and if not, he learns, when it is too late to correct his error, that he has misapplied the impulse of self-love. This misapplication is to be seen in many cases of daily occurrence, and in things of little, as well as in those of comparatively great, importance. The principle is everywhere the same.

We shall be answered, perhaps, that all this is incident to human nature. There is no help, it is said, for these evils. Every boy who has learned Latin repeats the maxim, *Humanum est errare* (It is human to err). A more mischievous maxim was never invented. If men understood, as most certainly they may do, that they need not err, and that it is best for them they should not, they would rather adopt as a maxim that none but the wilfully ignorant, and the wilfully foolish, *err*. Such a state of things is yet afar off. It may seem to be foolish, indeed, to assert that any society should ever come to be so well informed as to make a proper use of self-love. Let us not despair. We may improve very slowly; yet, if every one does even the little that he can, in showing, by precept and example, what things a rational and accountable being should desire, and what he should avoid and reject, certainly the time may come when self-love will never be so misapplied as to be necessarily followed by penitence and sorrow.

Will it be denied that there is a certain best course of action for every human being, in every possible condition in which he may find himself? Or, that no small proportion of human suffering arises from not having discerned that it was best, in past circumstances, to have acted differently, or not to have acted at all? Or, that whether one did or did not act, in the supposed case, that his motive was to secure to himself the greatest good of which that case was supposed to allow? If these things cannot be denied, then the great end of life is so to regulate self-love as that it may secure the greatest good. Let us suppose that every person in society knew what it would be best for him to do or not to do, so that his physical, intellectual, and moral condition, should be as good as he could make it. His self-love would never be directed to any end which would impair his bodily powers, or keep his mind in ignorance, or misinformed, or make him a subject of reproach or contempt in his own view, or in that of others. This, it will be said, is an impossible state of things. So it was said that it would be impossible to root out the use of *ardent spirits*. This great change is not wholly accomplished; but does any one doubt that great advance has been made towards its entire abolition? Let us go on, then, in the work of improvement. Let every one try to show the proper uses of self-love. The day may come when every one will admit that all the sufferings which may visit the human family are of their own making, those only excepted which arise from the general laws of the Creator. As to those, they may be greatly mitigated by intelligent moral agency. When these come, they can and will be endured with piety and resignation, if the sufferer can console himself with the certainty that he has done no wrong thing, nor neglected any proper one, to which the cause of his sufferings may be referred.

LABOUR.

It is commonly considered that labour is the *curse* declared to [illegible] as a consequence of the transgression of the *fi* [illegible]. It is foreign to our purpose to enter into any discussion as to the true meaning of this historical or allegorical account; the Christian revelation may not be dependent on a literal understanding of it. However this may be regarded under the influence of further reasonable research, we must take man as he is; and so considering him, labour is not an *evil*, but a *pleasure*. Is it a curse to man, as he now is, to be enabled *by labour* to comprehend the existence of the Deity, and the beauty and utility of his works? to adorn the earth and bring its productive power into action? to apply the material substances of the earth to reasonable use, convenience, and ornament? to expand and improve the human mind? to cultivate and strengthen the moral power? Certainly these are the effects of labour; and labour so applied constitutes man's highest happiness.

There are two kinds of labour:—1. Mere bodily labour; 2. Labour of the mind. These two are sometimes necessarily combined. The mind and the body demand some sort of employment. No one whose mind is free from natural defect can prevent its action. It will think of something, good or evil, profitable or foolish. Every one who attends to the operations of his own mind, must be convinced that this is so. The body and limbs cannot be kept in any one position for any considerable space of time, unless they have been in action and demand repose. If it were painful to us to direct the action of the mind to useful labour, and if it were distressing or inconvenient to us to exercise our muscles for purposes which we believe to be proper, then it might be that labour is a curse; but many, nay all, who require of the mind to perform its duties to any useful purpose, and especially those who have disciplined the mind to an accustomed service, find that the absence of employment is an affliction. We cannot see how this should be otherwise, if we rightly comprehend man's relation to the universe, of which he constitutes a necessary part.

As to bodily action, it is seen that children in their sports go through a series of exertions, often exceedingly violent too, from mere pleasure. Men frequently exercise the body much more severely in matters of amusement than they have any occasion to do in necessary labour. This action seems to be a dictate of nature. In many cases of indisposition, bodily motion is the prescribed remedy, and is commonly a successful one. There are sound reasons why this should be so. There is an universal action of the material system to which man belongs, and a continual waste and demand for supply. Excepting only in the involuntary movements in man's structure, which are not confided to his care, he is required to aid nature in her operations. If he would put himself in the best condition to receive and derive pleasure from his daily food, he must keep himself in action. Those who have the least pleasure in using what was given to be used as the means of pleasure to the senses, are those who keep the body inactive. This is true of those who labour with the mind only; more strikingly true of those whom affluence excuses from labour of body and mind. They seek happiness in indolence and in luxury. They find it not, because they violate a law of nature. No product of the vineyard, the field, or the sea, however aided by inventive art, will furnish a welcome repast to one who sits in listless idleness, on a downy cushion, from breakfast time till dinner. The day-labourer who sits down to his coarse meal, has a pleasure to which the luxurious idler is a stranger. The one receives a rational benefit from the kind and just bounty of nature; the other seeks it where nature has decreed that it shall not be found.

The labour of muscular action is not only in itself a pleasure, but it is the means prescribed to us for the acquirement of subsistence; for the gradual improvement of society; for applying natural and artificial products to our comforts, to our convenience, and to reasonable luxuries. Nor only so; this is the groundwork of all the beautiful and imitative arts; of the discovery and application of the chemical power of matter; of the wonderful contrivances by which man securely moves on the face of the ocean; by which he cultivates his acquaintance with the stars, and raises his thoughts to the Author of all being. Let us not, then, regard labour as a curse, but a blessing, and rank it among the many causes for thankfulness. It is obvious that muscular action would have been given to us in vain, if it were not directed by intelligence. There must, then, be labour of the mind. This is nowhere said to be a curse. If there be any thing for which we should be specially thankful, certainly it is that we are blessed with the power of mental exertion. This labour is in itself a source of happiness; and in its fruits has made, out of savage man, a rational and improving social being. The most restless and comfortless of all creatures is he who has no occupation for his mind. If one would invent the most miserable condition for a human being, other than mere physical suffering of the most excruciating kind that can be, without extinguishing life, it would be to deprive him of all employment of body and of mind.

Can there be a doubt that, in man's present condition, the ability to labour is his exalted privilege? And is he not accountable for this privilege? Is not reason given to direct him in the use of it? It is well known to those who have compared the condition of mankind in different ages, how much the labour of body and mind have been able to accomplish. Even within the last half century, the most surprising changes for the better have taken place, from the right use of this productive power. On this depends the condition of the human family. From the joint labours of all who wish well to their fellow-men, there will be obtained, eventually, the knowledge of the best manner of using the products of the earth, the best mode of ruling men in their social relations, the just homage due to the Creator, and the true purpose for which human life has been given.

To some descriptions of persons, labour is irksome. They are obliged, in their vocations, to use certain muscles, and those only. They repeat the same act throughout the day. Their labour becomes tedious, because it requires little or no action of the mind. To this numerous class we venture to offer a relief which is within the easy reach of many of them. It is well known that the nature of habit is such, that the hands will do what they have been accustomed to do, without any obvious attention, and the mind is left to do what it will. The mind might be employed, while the hands are busy, in pursuing some connected train of thought. Muscular action, so far from being an interruption to the action of the mind, may be made to assist it. Persons who think intently are often seen to have some habitual movement; and we have heard several persons acknowledge that their best ideas had come to them when they were engaged in some simple occasional duty, such as the folding of paper, or the cutting of the leaves of a book. The stir of body seems to produce a corresponding stir of mind. The relief which we suggest is, that sedentary labourers should provide themselves with subjects for reflection, and exact of their minds to attend to these subjects. By such simple means, the memory may be strengthened, the stock of knowledge may be greatly increased, and the mind surprisingly invigorated. One might begin this exercise by attempting to remember, with the utmost precision, every act done during the preceding day, and so go back from day to day. Better still would it be, if the purpose were to see wherein one had not done as well as he might, and as he may wish he had done. This exercise may be applied, also, to the contemplation of subjects suggested by reading; and this contemplation will raise questions which will lead to the examination of books. There may be hundreds of poets, philosophers, and moralists, at the work-benches in this country, who have no thought, of themselves, that they are such. It is in the power of any person who can read and understand the English language, to strengthen his memory, give himself an interesting employment, and furnish himself with a rich fund of the truest philosophy, in this manner. He may commit to memory six lines, each successive day, of Pope's Essay on Man, and on each day repeat all he had learned on preceding days. On the 218th day he would be able to repeat the whole essay. This might be done without losing one moment of time, and without making the slightest error in one's work. When accomplished, it would be an intellectual treasure for which any man might be thankful, and of which he might be justly proud. The first efforts may be discouraging, but perseverance will ensure success. Every one who is accustomed to thinking can attest that most new subjects are at first confused and undefined; but they gradually disclose themselves, and fall into shape and order, just as material substances, used on the work-bench and the anvil, take that form, smoothness, and polish, by successive operations, which the workman requires.

HABIT.

This quality of our nature has engaged the attention of many philosophic minds. It has been considered an *ultimate fact*, as it is called; that is, one of those qualities, which, like respiration, digestion, and many others, are found to exist: and beyond which fact no investigation can be made. Its laws, rather than its nature, have been the subject of remark. It may be, that habit is to be referred to the law of action, which appears to

pervade all material and intellectual being. Life is divided into parts; in one we are awake, and active; in the other, wrapped in sleep, and quiet. Each successive day is a sort of new existence, in which we are to repeat many of the acts of the preceding day. We repeat these acts, because nature demands the repetition of them. Also, almost every one is engaged in some vocation, on which he relies to supply his wants and gratify his wishes; and most persons have in view certain pleasures, which are innocent, or otherwise. It seems to us that habit arises from this demand for action, and from the manner in which this demand is supplied. Action relates to ourselves, to other persons, and to things around us which minister to our wants; supplying its demands associates us with these persons and things. The want, whatever it may be, arises, and forthwith all things connected with satisfying it force themselves into notice, and these become a part of our very existence. It is a well-known fact that the appetite for food will associate itself with a particular hour of the day, and with persons, places, and objects of gratification; so that one becomes hungry rather according to the hour than the natural want.

It may perhaps be an ultimate fact, beyond which we cannot go, that those acts are most easily and well done which are oftenest done. One who uses a flail, an axe, a scythe, a sword, or a pen, can use either the better the oftener it is used, until he arrives at a point of excellence at which his power of improvement stops. This may perhaps be accounted for by supposing that the first effort which the mind makes to direct muscular action, is the most difficult one. After repeated efforts, the mind seems to understand better and better how to direct, and the muscles how to obey, till at length a very slight effort of the mind seems to be all that is required, and even an effort so inconsiderable and rapid as not to be the subject of notice. On this, too, seems to depend the astonishing facility of action to which (among many other instances) jugglers and musicians attain. This is called *habit*, which word is derived from a Latin word which signifies custom or use. There are customs or habits of the mind as well as of the muscles. Persons who accustom themselves to extemporaneous speaking, acquire a surprising ease and readiness in the complicated action of conceiving, uttering, and expressing, by sounds, by looks, and gestures, whatsoever they would impress upon an audience. The mind has its own habits also, in the quiet of contemplation, and in exercising its various powers. It has its own associations, too, with external objects, of which many curious instances are stated in philosophical works.

The moral deduction which we make from these general principles is this, that there is a continual craving to do some act, to obtain some object; or a continually recurring necessity to do some act, to prevent an evil or inconvenience. The frequency of this call upon us to do something, whether it be for eventual good or evil, leads to the practice, custom, or habit of doing; and in some cases the impulse to act becomes so powerful that reason, self-respect, the laws of society, and even those of the Lawgiver of the universe (if these are heeded) present no sufficient barrier to the impulse. It is to this all-important truth in the nature of man, that we earnestly invite the attention of the young. The capacity to create habits is the consequence of the power given to us to promote our own welfare, individually, socially, and as accountable beings. This capacity was designed to fasten us down to that course of action which will accomplish these ends of our existence. Like every thing else with which we are intrusted, it may be rightly and profitably used, or may be misused, and perverted to our certain ruin. Habit is the kindest friend or the cruelest foe to human welfare. When it assumes the latter character, it approaches us in the most deceitful and seductive forms. It comes wearing attractive smiles—it delights—it fascinates—it substitutes its own irresistible will for our own—it triumphantly points to the gulf to which it bears us. The fly caught in the spider's web is a faint illustration of the power of habit. He knows, from the first moment, his destiny. The gambler, the drunkard, and the felon, when and how do they learn that they have been caught in the web of habit!

INTEMPERANCE.

This word has attained a meaning more limited than its proper one. It is applied commonly to persons who take habitually ardent spirits; but it is equally applicable to all transgressions of the law of moderation. All acts which may be lawfully done for one's own good, when carried to excess, are acts of intemperance; and all such acts are sooner or later followed by some sort of suffering, according to their nature and degree. Excessive labour of body or mind is as much an act of intemperance as to make one's self dull and stupid by taking food, or irrational and giddy by taking spirits. But there is a wide difference in the degree of immorality in the kinds of excess. An intemperance in study, which brings untimely death in some instances, is not condemned as an immoral transgression (though it certainly is such), for the motive which leads to this intemperance is an honourable one. The loss of health and character, from abusing the privilege of taking nourishment, is universally condemned, because the motive, and the acts done in obedience to its impulse, are irrational and disgraceful.

There are two kinds of intemperance against which the young should be warned. The one is drinking, not for nourishment, but for pleasure; the other is, using tobacco. It has been already demonstrated that nature requires a certain quantity of proper food to maintain a healthy and happy condition of body and mind; also, that excess of any kind will be followed by suffering. This is just as certain as that a full vessel must throw off just as much as is added to its contents. It is very natural that young persons should assemble for the sake of society; being assembled, they must have some employment for the muscles of the body and the craving of the mind. We have shown that such propensities spring from natural constitution, and that they must be satisfied. There must be a community of purpose in the meeting. That may be found in any muscular action in which all can join, and which has some definite object, as athletic games; or it may be found in some intellectual employment which is common to all present. Unhappily, the most frequent bond in such meetings is, *to drink*, for in this all can join. Connected by this common attraction, the mind is called into action; but for what purposes? Those who frequent places of public entertainment can answer this question. Some who are sent to public seminaries can also answer it; and some can answer it who know that they are maintained *there* by pinching economy at *home*. Some others could answer it, who never had a serious thought why such places were established, nor for what uses they were intended.

We refer again to the demonstration heretofore made, that the law of nature, which cannot be broken with impunity, inexorably admits so much, and no more. Let us, then, look in upon a gay company of young persons, around a table, and half concealed by tobacco smoke. What sort of air are they breathing? what sort of substances are they casting into their physical system, already bursting with excess? what sort of thoughts have they in their minds? and what sort of words are flowing from their lips? We *could*, but will not, answer these questions for them. Let us pass by this revel, and go to the next morning. We might then

propound some other questions. Are not their heads heavy, hot, and throbbing? Are not their eyes thick and burning? Are not their tongues white and parched? Do not the nerves tremble? Is not the mind muddy and confused? In what condition are they to perform duties to themselves, to those they serve, to instructors, to affectionate parents? *Is not this dear-bought pleasure?* How long can nature bear to be *pleased* in this manner? This matter does not stop here. The same scene is repeated again and again. *Soon habit asserts its awful dominion;* and then the scene *must* be repeated. The craving cannot be resisted. From social drinking, the step is an easy one to solitary drinking. *There is no resting-place for habit; every thing in this system of being must keep on, or end.*

It is believed that the sort of criminal excesses to which we allude, are not from the promptings of nature. We venture to assert that they are entirely artificial in the beginning. It seems irrational that any one should like to take more of any thing than nature requires; and more so, that one should naturally desire to take burning liquids to the degree of intoxication, or perhaps to take them at all. It is believed there is no such natural propensity; but that such liquids, when first taken, afford less pleasure than pure water. The taste for these articles is created by association, by imitation, by fellowship; and, above all, because there is a kind of tradition that it is *manly* to drink. Songs in praise of the juice of the grape, and of meaner liquors, have some effect in the delusion of drinking. There is a fascination in combined poetry and melody. Such combinations are well known to have the most powerful influence in national associations. They inspire a feeling which bears men on to victory or death. The songs of Bacchus do the same. They conquer the strength of those who sing, and of those who listen to them, and sometimes lay their admirers not in the bed of honour, but of contempt.

If one could get the ear of such a misguided youth, he would not do much by reasoning with him. He might do something by getting him to reason for himself. It would be necessary to bring to his view some facts from which he could reason. He must be made to know what a wonderful contrivance the digestive power is, and by *whom* it was contrived. That its purpose is to take the inanimate substances which nature provides for it, and convert them into living sensitive being, and, possibly, into thinking power and immortal spirit. He must be reminded how easily every human contrivance may be deranged, and the more so, and irreparably, in proportion to the minuteness and delicacy of construction. But as one might fail to make a thoughtless boy comprehend the nature of the principle of life which resides in his own bosom, because he cannot see it, some illustration must be made. Unhappily, there is none which can be effective to this end. The nearest that occurs is this. Let us suppose, then, one knows the use and the value of the human eye in its physical, intellectual, and moral relations; that he knows he must take care of it, and frequently bathe it in cold water, as well to cleanse it as to refresh and brace it, so that it may still be an eye to him, when decline and old age shall come. Let us further suppose, that, instead of so using and so preserving this delicate organ, he should, when he first rises in the morning, let fall into it a drop of burning spirit, and at eleven o'clock another, and so on, at the proper hours, until he sleeps again—how long would the power of vision remain to him, and how soon will this organ of delight become a source of insufferable pain? It must be much the same with the digestive organs as to the abuse of them.

If one could, in some such way, bring home to the perception of an erring youth the grievous wrong which he is inflicting on himself, he might be prepared to reason on his own case, and might be asked some such questions as these. Is it of any consequence to you to be free from suffering and sorrow? As you must inevitably keep company with yourself as long as you live, is it of consequence to you to make of yourself a pleasant and agreeable companion, and not one who will be continually complaining and upbraiding? Is health of any value to you? Can you use your limbs, and the faculties of your mind, as you would like to do, without it? Can you have health, if your habit is to throw into that delicate part of your system whereon the action of life depends, substances which excite it to an unnatural exertion, or deprive it of all power of exertion? Does not every part of your system sympathize with the injustice which you do to your digestive organs? Will not your brain, and consequently your mind, suffer by this violence? Do you expect to attain middle age, and old age? Will not the seeds you are now sowing come up in that space of time? Will they come up in the form of enfeebled muscles, chronic aches, self-reproaching thoughts, the loss of the capacity to enjoy the bounties and beauties of creation? Will they grow up to overshadow your moral sense, and shut out the delights of intellectual power? Was life given to you for the few years in which you can sing, drink, and "enjoy yourself," or that you may enjoy life in every stage of it, as a rational being, and by rendering your homage to nature in obeying her laws, and your gratitude to Him who ordained these laws for your happiness? Do you not look forward yourself to be at some time a parent? Have your own parents ever so conducted themselves towards you, that you have a right to punish and afflict them? Are you willing that your parents should see you and know you as you know yourself? If you should be a parent, are you willing that your children should be told with whom, and in what manner, you "enjoy yourself?" Would you tell them how you spent your youthful days and nights, and recommend to them to take yourself as an example?

TRUTH AND FALSEHOOD.

These two subjects relate to two parties: 1. That one who speaks truth or falsehood; 2. That one to whom it is spoken. We propose to consider this matter only in relation to the first party, and as to him in two views. 1. Whether there be any, and what law, which requires that the truth should be spoken; and, 2. What good or evil one may do to himself by lying.

1. One reason why truth should be spoken is, that the knowledge which any one person can have from the use of his own senses, in many things which it most materially concerns him to know, is very limited. He must therefore often depend for his knowledge on what others say to him; and when the thing spoken of is exclusively known to the party speaking, the other must rely entirely on what he says. If, therefore, it be considered how great a part of the most serious concerns in life proceed on declarations made by one person to another, we may readily conceive, that, if these could not be relied on, the affairs of mankind would be greatly embarrassed, and confidence in each other would be destroyed. As this matter of speaking the truth is one which concerns all persons, so all persons agree in holding liars in contempt. Even the very lowest persons consider themselves to be disgraced when charged with the guilt of lying. They can endure charges which would subject them to public punishment, with more composure than they can endure this. A lie is always understood to be resorted to, to secure some advantage or prevent some evil to the person who resorts to it; or to occasion some disadvantage or injury to the person to whom, or of whom, the lie is told; sometimes both these purposes concur. The object in view is always an immoral one, and the means used are always regarded as disgraceful. It is at once obvious that wilful falsehood is forbidden by natural law, which is intended to regulate our social relations, and is expressly forbidden by divine law, which condemns all acts

of fraud and deceit, and commands us to do to others as we would have them to do to us.

2. It is a rare occurrence that any one who descends to falsehood succeeds in the object which he may have in view. He is commonly detected, and, if not, is suspected, which may operate quite as much to his disadvantage. If he should escape detection and suspicion, he lives in constant fear of both. He has a very troublesome secret to keep. If he should be able to do this, still he cannot hide it from himself that he is a liar; and such a person, by natural justice, is compelled to pass that sentence upon himself, which he knows that others would pass upon him if they were as well informed as he is. A liar is therefore obliged to feel like a guilty person, and a habitual liar very soon comes to look like one. If there be no higher motive than one's own interest and welfare in speaking the truth and avoiding falsehood, this is a very sufficient one. If a man is known to be a person unworthy of confidence when he speaks, he has not the benefit of being credited even when he speaks the truth; he voluntarily deprives himself of the advantages of social life; his assertions secure to him no credit; his promises are contemned; he makes himself to be alone in the very bosom of society, for every one shuns him. In the administration of justice in courts, a person is not regarded as a witness, whose common reputation is that he is not believed when he speaks. The objection to him is not that he might not tell the truth in the matter which is on trial, but that such a person ought not to be received as a witness, because he cannot be credited in any thing that he says. When such a person has been called and examined as a witness, it is usual to examine other witnesses to prove his character; and if it be proved that he is unworthy of credit, what he has sworn to is disregarded, though he may have declared the truth. This is the common fate of all such unfortunate persons in society, as well as in courts. Independently of the criminality, lying is very poor policy. If the object be to obtain a supposed good, it rarely is obtained by such means; and if it be, the price so paid must always be greater than the good is worth. If the object be to conceal a wrong done, it is rarely successful; and if not, it leaves the offender without excuse for his error, and adds another wrong. If the object be to charge an innocent person with a wrongful act, or to deprive one of his good name, or of some lawful possession, or subject him to some evil which he ought not to endure, the offence is of that cast which the law of the land holds to be *malicious*, and it deals with such offence accordingly. In short, it is very difficult to violate any law of natural justice or divine prohibition without encountering an adequate punishment; and it may be assumed that the punishment which follows lying is as certain and just, as in any instance of criminality. If every tenant of every prison, and if every person who is in the custody of a goading conscience, were asked this question, *What was your first step from innocence and purity?* he would probably answer, *Telling a lie!*

SINCERITY AND INSINCERITY.

These are other names for truth and falsehood. They are not commonly applied to the most serious concerns of human life, but to what are called the "imperfect obligations." Such obligations, it is well known, are not enforced by the law of the land, but are binding as duties arising as well from natural law (reasonably expounded) as from divine law. Sincerity is a duty to one's self, because it is demanded by self-respect. As every one has an individual separate physical being, so every one has a *separate circle* within which he exists, and into which no one has a right to intrude. His thoughts, motives, opinions, and policy are his own. What he will or will not do (so that no wrong be done to others, and no act of duty be withheld from them) is for him to decide upon. Within this circle, he makes up his judgments on all persons and things. In his outward deportment, he must frequently act in manner not consistent with these judgments. As an example: one has made up, from repeated observations of a certain individual, a very clear but very unfavourable judgment of his qualities; but there is no occasion to disclose what the judgment is. The observer is obliged, or finds it convenient, to meet this individual, and to deal with him, and perhaps to interchange courtesies with him. It is undoubtedly proper to manifest the respect, in such case, which the decencies of life require, and to show the common proofs of good will. There is no insincerity in this. Though no one can possibly avoid forming judgments of others, nor avoid liking or disliking them, even including very near friends and relatives, yet there may be a positive violation of duty in publishing these judgments or in disclosing these feelings. The Divine law, "judge not, that ye be not judged," does not, it is believed, interdict these judgments, because they cannot but be made; but it forbids the wanton, unnecessary, and injurious publication or manifestation of them. Those who are keen observers of their fellow-men, see in their faces, in their manners, in their modes of speaking, in their tones of voice, in the sentiments which they express, &c., causes for respect, esteem, confidence, and approbation; or they may see causes for disrespect, suspicion, strong disapprobation, and disgust. But all these things belong to the *individual circle*. It is not insincere to keep them there. On the contrary, society would be intolerable if they were not kept there; it is very hazardous to the observer to let them out unnecessarily. He may be mistaken both as to the favourable and unfavourable judgments which he forms. Further observation, new circumstances, unexpected changes, may essentially correct his judgment; and, therefore, a prudent man will keep them to himself: they are his own peculiar property, and were obtained for his own use. Insincerity is often demonstrated by paying false and silly compliments, which assume the form of *flattery*—a word which is derived from the Latin, and signifies wind, breath, puff. This is a kind of aliment which perverted self-love finds to be exceedingly pleasant. Although it is in truth precisely what its origin indicates, there is hardly a man, woman, or child, who is not disposed to partake of it, if it be artfully disguised. But, on the other hand, all sensible persons, of whatever age or sex, who see what it is, and why offered, feel for the flatterer the contempt which he deserves. This insincerity is, and ought to be, deemed a high offence. It implies art and deceit in the flatterer, and sufficient weakness in the flattered, to be subdued to the purpose in view. The flatterer's purpose may be no more than to secure to himself a better esteem than he can have any pretence to, and it may be, through that, to secure to himself something which may be very costly to his victim.

CIVILITY.

The well-being of society would be greatly promoted if the nature and use of this Christian virtue were more generally known. We take this to be, in personal intercourse, the observance of the command, Do to others as you would that others should do to you. The most rapid glance at any community shows this—that some of its members are brought into contact, in matters of business, necessarily; others meet, incidentally, who have no particular connection; others meet for social purposes, in various forms: and that there is a large proportion who know of each other very little beyond the fact that they are of the same country, and perhaps not even that. There must be a *best rule* of deportment for all these classes; and no one will deny, that if this rule were defined, and faithfully applied, there would be much more of every-day comfort and complacency in the

world than there is well known to be. If we rightly understand the meaning of civility, it is the manifestation of kind feelings, and of a desire to do all things which are to be done under the influence of such feelings, in a becoming and agreeable manner.

If every person understood the true foundation of society, the common origin of all its members, their natural and necessary sympathies, their community of interests, their necessary action upon and with each other, it might be supposed that all who are reasonable would be civil. They would be so, because they would promote their own good, because they would be doing what it is proper to do to promote the good of others; and because they would know, that in so doing they would conform to the design of their creation. We do not include under the term *civility*, the great duties of justice, acts of munificence, important personal services. These arise out of some special relation which an individual bears to one or more other individuals. It seems to be limited to the manner in which the common or accidental intercourse of the members of society in general should be carried on. This matter may be better understood by some examples. Thus, if one comes into the presence of another as a beggar, servant, labourer, mechanic, trader, merchant, farmer, lawyer, physician, clergyman, or public officer, or if it be a female, or child of either sex, there may be very various modes of receiving these different persons—yet, certainly, by every one of the laws which we are endeavouring to illustrate, these several persons are entitled to civility. Even the beggar—perhaps one should rather say, the beggar in particular—if not deformed by voluntary transgression, should be received with civility; that is, gentleness, kindness, decorum, are to be observed relatively to each one. Why? because no man can afford to be deemed insensible to the cause of reasonable humanity; nor a stranger to the decencies of life; nor ignorant of what is due from him, nor to him, in any of his proper relations.

There is one other consideration which operates on all men who have had much experience in the world. Men and things change, and take new and unexpected relations. Persons who have been long, and even intimately connected, suddenly or gradually sever; persons who have known little of each other, and that little uninteresting or unfavourable, are brought in contact by some unexpected turn of affairs. Sometimes one needs favour or at least good will, from those he never thought to be of the least importance to him. In such, and in a multitude of other circumstances, one may find the advantages of having been acquainted with the virtue of civility, which implies that one has given no unnecessary offence. There are other cases in which one is called on by duty to do things disagreeable to himself, and exceedingly so to others. But there is no good sense in performing such duty morosely, and with inhumanity.

POLITENESS—GOOD MANNERS.

A refined species of civility is sometimes expressed by the term *politeness*, which is an exterior indication of good breeding or good manners, and may be defined as that mode of behaviour, which not only gives no offence, but which affords agreeable sensations to our fellow-creatures. In our intercourse with the world, this species of civility is imperative. We possess no right to give offence, by language or actions, to others; and we are bound to conduct ourselves agreeably to the reasonable and set rules of society. Some severe writers on morals have confounded *politeness* with *insincerity*. They seem to imagine that the act of speaking gracefully to another, is necessarily mere grimace, or an empty flourish signifying nothing. In many instances, with insincere people, this may be the case, but it is not so with those of well-regulated minds. It is always better to speak politely, that is, with extreme propriety and delicacy, than coarsely, sulkily, or impertinently. We say, cultivate politeness of manner by all means, for it is *refined civility*, and will spare both ourselves and others much unnecessary pain.

Civilized society has in the course of time instituted certain rules in the code of politeness, which, though of little actual value, it is every one's duty to learn, because, by knowing and acting upon them, we can make life glide on much more smoothly and pleasantly than if we remained in ignorance of them. These rules are sometimes called the rules of *etiquette*. We shall here mention a few of the more important of these social regulations:—

1. *Honour to the female sex.*—Women are physically weaker than men. They are unable to defend themselves from insult or injury, and it would be considered indelicate for them to do so, even if they possessed the power. For these and other reasons, it is only simple politeness and a sign of good sense to render any little service to women—to assist them when they appear in any difficulty, to speak respectfully of them and to them, and to give them honour whenever it can be reasonably required. It will be observed, therefore, in what is called good society, that women are treated with exceeding delicacy and deference; they are offered the best seat, or the only seat if there be no other; allowed to walk next the wall, or at the farthest point from danger, in the street; never rudely jostled against in a crowded thoroughfare, and are always parted from with a respectful bow. All this is considered essential in good manners, and attention to it will not in the smallest degree degrade any man in the opinion of the world. At the same time, as respects the women who receive these attentions, it is expected that they will not "give themselves foolish airs," or presume on the forbearance and kindness of the stronger sex. In fact, no female will do so who is acquainted with good manners, or wishes to avoid being despised.

2. *General courtesy and respect.*—It is incumbent on every one to be courteous or respectful in his intercourse with neighbours, acquaintances, or with the public generally. To inferiors, speak kindly and considerately, so as to relieve them from any feeling of being beneath you in circumstances; to equals be plain and unaffected in manner; and to superiors, show becoming respect, without, however, descending to subserviency or meanness. In short, act a manly, courteous, and inoffensive part in all the situations in life in which you may be placed. Society, for good and sufficient reasons, which it is needless here to explain, has ordained certain modes of address, and certain exterior signs of respectfulness, which it behoves us to support and personally attend to. In eastern countries, as of old, it is the custom to uncover the feet and to sit down, in token of respect, on going into the presence of kings, or on entering any religious edifice or private dwelling. In our country, the custom is entirely the reverse. It is an established mark of respect to uncover the head and to stand, in the situations which we have mentioned, and to this point of etiquette we are bound to adhere. We must not, from any crotchet of our own, violate the rules or customs which society sanctions and enjoins, as long as these rules and customs are not opposed to reason and sound morals, and only refer to such trivial arrangements as taking off our hat, making a bow, shaking hands, or other matters equally unworthy of deliberate consideration. None but persons of a silly, eccentric turn of mind, think of disputing about these trifles. On the same principle, give every one the title, which, by law or courtesy, he usually receives.

3. *Personal behaviour.*—A well-bred man is always known by the perfect ease and tranquillity of his man-

ner. These are points to be carefully cultivated. Acquire, if possible, an easy confidence in speaking, so as never to appear abashed or confused; taking care, however, not to fall into the opposite error of forwardness or presumption. Persons moving in the highest circles of society never allow themselves to appear disturbed or vexed, whatever occurs to annoy them. Perhaps there may be an affectation of indifference in this; still their conduct is worth admiring, for every thing like fidgetiness or boisterousness of manner is disagreeable to all who witness it.

Carefully avoid the following things in personal behaviour:—Loose and harsh speaking; making noises in eating or drinking; leaning awkwardly when sitting; rattling with knives and forks at table; starting up suddenly, and going unceremoniously out of the room; tossing any thing from you with affected contempt or indifference; taking any thing without thanking the giver; standing in the way when there is scarcely room to pass; going before any one who is looking at a picture or any other object; pushing against any one without begging pardon for the unintentional rudeness; taking possession of a seat in a coach, theatre, or place of public meeting, which you are informed belongs to another; intruding your opinions where they are not wanted, or where they would give offence; leaving acquaintances in the street, or a private company, without bidding them good-bye, or at least making a bow to express a kindly farewell; slapping any one familiarly on the shoulder or arm; interrupting any one who is conversing with you; telling long and tiresome stories; whispering in company; making remarks on the dress of those about you, or upon things in the room; flatly contradicting any one, instead of saying, "I rather think it is otherwise," "I am afraid you are mistaken," &c.; using slang expressions, or words of a foreign language; acquiring a habit of saying, "says she," "says he," "you know," "you understand," &c.; helping yourself at meals, without first asking if you may not assist others to something which they would like; picking your teeth with your fork, or with your finger; scratching or touching your head; paring or cleaning your nails before company; mentioning the price of any article of food or drink which you are offering to guests; asking questions or alluding to subjects which may give pain to those you address; neglecting to answer letters. It would be easy to enumerate many other things which should be avoided as savouring of bad manners, but these will be sufficient to indicate the principle of politeness, and if that be understood, there can be no difficulty in knowing how to act with delicacy and discretion in all the concerns of life.

4. *Gentility and vulgarity.*—By attention to the rules of good breeding, such as we have just alluded to, the poorest man will be entitled to the character of a *gentleman*, and by inattention to them the most wealthy individual will be essentially *vulgar*. Vulgarity signifies coarseness or indelicacy of manner, and is not necessarily associated with poverty or lowliness of condition. Thus, an operative artisan may be a gentleman, and worthy of our particular esteem; while an opulent merchant may be only a vulgar clown, with whom it is impossible to be on terms of friendly intercourse. Vulgarity of manner is often exhibited, in its most offensive form, by persons originally of humble birth and breeding, who have risen to wealth by the force of fortuitous circumstances. It is not uncommon to hear persons of this class, particularly "ladies," speaking of "my coach," "my house," "my governess," "my family," "my servants," "my furniture," and so forth; all of which is *pure vulgarity*, and indicates a low tone of breeding, and weak understanding on the part of the speaker. A man or woman of refined taste never alludes to matters of dress, domestic convenience, or things strictly personal, and rather endeavours to direct conversation into those channels in which all may harmoniously join.*

ANGER.

One of the most important of our private duties is the due regulation of the passions. We naturally possess certain mental affections called *propensities*, which, when properly restrained, serve a good purpose, both individually and socially, but when let loose, or badly regulated by the understanding, lead to the commission of many vicious and abominable actions, which in moments of calm reflection, and when our conscience is aroused, we deeply lament and regret. Irritability of temper, as demonstrated in the passion of anger, is one of the most unhappy of these derangements of our intellect.

The causes of anger are supposed to be these;—First, by the law of nature and of society, every one has rights in what he regards as his own property; second, one has a right to hold unimpaired whatsoever he can justly acquire in reputation and character; third, he has a right to have his feelings respected by others, if he do no wrong to their feelings; fourth, he has a right to have the like rights respected in those with whom he is necessarily connected by family and social ties; fifth, he has a right to be treated with justice, and according to established laws, by those who are intrusted with power; sixth, he has a right to have those who are bound with him, in a common subjection to such laws, treated with justice. Whenever any one is offended by the violation of any of these rights, he may be justifiably angry. But in what manner, and to what end, he shall express his anger, so as to do himself the greatest justifiable good, is the thing to be known.

Every one who has had a violent fit of anger upon him, knows that it was to himself (independently of the cause and object of his anger) a painful and even a very distressing sensation. No one ever looked back upon such a state of things, as to himself, with satisfaction, but generally with regret, and sometimes with remorse. He feels humbled and grieved in his own estimation of himself. He may too well remember that he used expressions and did acts which he is grieved to have resting in the memory of others, or in his own. It is probable, also, that no one ever saw another in a violent passion, without feeling that this angry person was degrading himself, and acting more like a brute than a rational being. Whatever be the cause of such anger in another, cool spectators always regard the angry person as under a temporary loss of reason, and in danger of doing some serious mischief, and are prompted to restrain him. Every one feels, in such a case, that the least that can happen to one so acted upon, and so acting, is, that he is preparing for himself hours of self-reproach and of bitterness. If no one likes to remember that he was violently angry himself, and if he is offended in seeing others so, it must be admitted that violent anger is contrary to natural law, as it most certainly is to divine law. It is an abuse of the trust confided to us to promote our own welfare.

It is consistent with reason for any one, who is under the influence of anger, to be prepared to ask and answer the question, whether the wrong is real or only supposed, and whether he is himself free from the first imputation of having occasioned, by his own error, that which he regards as a wrong. If the offence is real, other questions arise, of this nature: What real good shall I secure to myself by attempting to get a reparation? and in what respect shall I advance my own welfare by attempting to punish the offender? May I not, in either of these attempts, involve myself, by words or acts, in some wrong, and give my adversary the advantage of finding me an offender, in trying to vindicate myself? If I

* The above section has been written by one of the editors.

could succeed in my attempt, what will it come to? Shall I not make the wrong done to me more notorious, and subject myself to the pity and compassion of others? Is it not better to be silent, and quiet, and leave the offender to time and his own conscience, than to engage myself in a controversy which is sure to be vexatious, and in which I shall run the risk of doing wrong, and in which I shall not be likely to get any good? If I succeed in humbling my adversary, I shall surely make him my enemy for ever: for, in the nature of man, he is slow to forgive the wounds inflicted on his own self-love. When this matter is over, and time has dissipated the mists which now prevent a clear view of it, and when other feelings and sentiments have arisen, shall I like myself the better for having been silent and quiet, than if I shall have attempted to command justice and to inflict punishment? It is probable that young and ardent minds, and those who are looking back by the light of experience, will answer such questions very differently. But the experienced can tell the young, with sorrowful truth, that among the most painful sufferings of life are to be numbered those which have arisen from sudden impulses of anger, expressed in words or acts. The experienced can also tell, with like truth, that in the common occurrences of life, angry words and acts have seldom, if ever, accomplished the purpose for which they were intended; they have neither obtained justice nor punished the offender; but, on the contrary, they have often converted the injured party into an offender himself, and involved him in bitter recriminations, keeping up an irreconcilable aversion, and even enmity, through life. We have, so far, supposed that a real and justifiable cause of anger existed. But it is in many cases imaginary, especially among young persons. They take up sudden impressions concerning the supposed conduct and words of their associates and acquaintances, when no such conduct or words have occurred; or, if any did, none with intention to wound or offend. If there be one case in which one feels himself peculiarly humbled, it is when he has manifested anger towards one who has committed no offence, or who is entirely unconscious of having done so.

It sometimes happens that an offended person can restrain himself from expressions and words when he has been seriously offended. But he cherishes a malicious sort of feeling against the offender, broods over the wrong done, and permits his imagination to inflame the sense of wrong, until he makes himself too unhappy, under this excitement, not to express it in some mode which will occasion pain or affliction to the offender. If there be any one who has fallen into such a condition, he may be asked, whether he knows of any thing in the nature of regret or remorse for his own follies and sins which is so exceedingly burdensome as to carry about with him the feeling of aversion, ill-will, and malice, towards one who has offended? What, then, is to be done? angry words and acts are forbidden by the law of nature, by self-respect, and by convenience; the memory of an unavenged wrong is intolerable. Is there no remedy? We think there is one in every person's power. If the individual with whom one is at variance can, by calm expostulation, or by mutual friends, be brought to a just perception of the case, that is the remedy. If that fails, there is another; it is of high authority: "if thine eye offend thee, pluck it out." Blot such a person from the memory; never permit him to come into your thoughts. Will you pass your life in humiliating bondage to such an one? We say, *blot such an one out of your memory.* You do him no wrong by that. You do yourself a just and great good; you cut a moral cancer out of your heart.

Among the sources of affliction in human life, is the uncalled-for interference of third persons in the angry collisions of others. It may sometimes be an unavoidable duty to take a part in an angry quarrel. When this duty is to be performed, it concerns every one who is mindful of the trust confided to him of taking care of himself, not to engage in the controversy in such a manner as to become a principal party in it. As a general rule, it is the safe course to let angry persons settle their own concerns as they can. Certainly, no one who claims to be regarded as having a discreet sense of his own welfare, plunges himself into a quarrel. Yet this is a very common thing. It is often seen in schools. Parties and divisions grow up, extend, and become more and more bitter, from the most trifling causes, and are often carried out into manhood, and show their evil consequences through life. This is so, because impressions made in that season are very vivid and durable. It is a duty sometimes to take a part in controversies. It must be remembered, when one engages in such quarrel, that one is dealing with persons who are under a sort of derangement, and who are most exceedingly sensitive, and perhaps mutually vindictive. Those who interpose are bound, by the law of self-regard, to interfere with calmness and sound discretion, and so to conduct themselves, in word and deed, as to do no evil to themselves while they attempt to do all the good possible to the angry parties. On the whole, mismanaged anger is a prolific source of suffering. Yet when calmly looked back upon, in a great majority of cases, the cause was some insignificant trifle, magnified into serious importance by angry words and pitiful acts. Such is the propensity of persons to busy themselves in the quarrels of others, that there is little reason to hope that a preventative can be successfully offered to any but to those who have studied out and who reverence the will of the Deity, as disclosed in the nature of things, and in his own positive law

SELF-RESPECT.

Every one has some sort of opinion, more or less distinct, of all persons with whom he is acquainted. This opinion may embrace intellect, disposition, virtues, vices, personal appearance, deportment, condition in life. So also every one has some opinion of himself on the same, and on many other subjects best known to himself. When one examines his own opinion of himself, he seems to do it as though he were another person. He uses the eyes of others. He turns aside, as it were, by the way, to see himself pass by. The judgment which one forms of himself is often much more unsound than that which he forms of others. The eye cannot see itself; so neither can any one see himself. He must use a mirror. There are many of these. History, books, daily example, his own experience, every person he comes in contact with, are mirrors. If he sees himself in these, and thereby corrects his own errors and follies, and gives himself reasonable and just credit for his attainments, he may come at length to be entitled to entertain a respect for himself. There is a certain best thing to be done, and a certain best manner of doing it, in all possible circumstances in which one may find himself. Nothing is entitled to be considered *best* which does not conform to natural law, the law of God, the positive law of the land, the conventional laws of society (so far as they are founded in reason and good sense), and to the decencies of life. To that best thing, and to that best manner, no one, perhaps, ever perfectly attains: but it cannot be doubted that there is some such standard. He who comes the nearest to it is he who is best entitled to entertain a respect for himself.

PRIDE.

There is a kind of pride which is often mistaken for *self-respect*. We hear of honourable and of a laudable pride. We take pride to be that self-esteem in which a man holds himself. It may be founded in his estimation

of the qualities of his mind, in his attainments, in his possessions, in his strength, his beauty, his parentage, and descent. It may also be founded in a consciousness of virtue, and of having faithfully done one's duty in all the relations of life. It seems to arise necessarily from comparing one's self with other persons. If this be the right meaning of pride, it is very clear that it is not always a sentiment which entitles one to respect himself. A man would be thought to be very unwise who should openly declare that he valued himself, in comparison with other men, on account of his wealth, his beauty, or his family connection; equally unwise, if he should declare his opinion of himself to be, that he was superior to other men in the gift of natural intellect, in the cultivation of it, or in the practice of the various virtues. The common sense of mankind, founded in natural reason, does not approve of that self-gratulation which rests on the accident of birth, of inheritance, or even on the acquisition of fortune by one's own industry; nor does it approve of that feeling, when founded on qualities which belong to the mind, nor even in the practice of the virtues, unless when manifested in a certain manner. There must be, in the very nature of things, some persons in every community, large or small, who are superior to others in these sources of self-esteem. In every city, town, and village, in this nation, there are some persons who are in possession of some of these causes of self-esteem in some comparative degree, and other persons who have the fewest or the least of them. Those who so use their advantages as to entitle themselves to the esteem of others, and who are acknowledged to be respectable for that use, may well be entitled to respect themselves from such causes. Those who use them in such a manner as to announce the feeling of superiority over others, and habitually to offend the watchful feeling of self-love, are properly called *the proud*. It is believed that these views conform to natural law, and to the necessary constitution of human society.

VANITY.

A still greater mistake is made in substituting vanity for self-respect. The word vanity is made out of two Latin words which signify *exceeding emptiness*. It is commonly understood to mean a strong desire to be noticed, considered, and esteemed by others, but on account of things rarely worthy of a rational mind. Vain persons covet praise. They thrust themselves, and all on which they value themselves, upon the notice of others. They delight in recounting their achievements, and sometimes make the sad blunder of speaking to those who know they are mistaken. They touch adroitly on their own excellencies, and provoke others to descant upon them. They have such delightful visions of self-complacency, that it seems cruel to disturb them. Such persons are very ready to become tools in the hands of more knowing persons. In general, the display of this poor passion is made by persons of very light and frivolous minds. It is seen at all ages, but strikingly in youth. To see a young person strutting or mincing along in a new garment, or in some personal ornament, and watching to see if he is noticed, and by whom, excites a feeling of pity and contempt. The same feeling arises when young persons are seen, who say in their movements, as intelligibly as though they spoke in plain English, "Do they not think me very handsome—elegantly dressed—a charming figure—most exceedingly graceful?" In some instances lookers-on do think so, and smile contemptuously at the same time. But, in general, lookers-on see no such thing as the vain imagine; they do see that which it would be shocking to those votaries of vanity to know is seen. They do see talents wasted, time misspent, foolish hopes, and vain desires. They do see that the purposes of life are misunderstood or perverted. Is there any remedy for these follies? None, probably, unless one would bring home to minds of the vain, that they violate the strongest precept laid down in the code of natural law for the government of persons individually and socially. That precept commands them so to conduct themselves in all things, as to entitle themselves to self-respect, and, consequently, to the respect of others. If the vain could conceive how small a portion they make of created being, how insignificant a part they make of civilized society, how many there are in that society, whose pretensions, if asserted, would be transcendently superior to their own, they might, perhaps, dismiss their little vanities, and devote themselves to gratifications worthy of their intended nature.

GRATITUDE AND INGRATITUDE.

If a destitute young person should attract the notice of a wealthy man, and should be by him supported, educated, and established in the world, so as to be able to live, to become independent and respectable, every one would say that this is a case for the feeling and the expression of fervent gratitude. Let us suppose that the patron of this young man frequently reminds him of his former condition, and by what means he finds himself where he is. Suppose the patron exacts a frequent acknowledgment of his bounty, and takes to himself unqualified praise for his goodness. Let us suppose that the obliged party finds his condition very irksome, and almost wishes that he had never been the subject of such burdensome favour, and is at length provoked to say so —*is he ungrateful?* It would seem, then, that gratitude had two sides to it, as well as two parties. He who has conferred a favour has not done all which it concerns him to do; and he who receives a favour may have a difficult task to perform. A bargain is an exchange of one thing for another, and the parties are even. The conferring of favours, whether these be asked for or not, seems to stand on very different grounds. Many elements make up that compound from which gratitude is said to arise. The parties may understand the nature of the favour very differently at the time when it is conferred, and more differently afterwards. He who confers, has a retentive memory; he who receives, a fading one: time regraves the favour deeper and deeper in the former, and wears it out more and more in the latter. In the former it often preserves the freshness of a new occurrence; in the latter the sense of favour often goes, and the weight of obligation alone remains. It may be that the complaints made against ungrateful persons are not always well founded, and that the expectations of those who confer favours are as little so. Some poet has written,

> He that's ungrateful has an only fault—
> All other crimes may pass for virtues in him.

The meaning of this couplet must be, that the members of society are under no obligations to confer favours, and that, if they do confer them, the party obliged is a monster if he do not—*what?* We know not what is intended, nor that there is any rule by which gratitude is to be manifested. We think that every member of society is to do what of good he can, and to whomsoever stands in need of it. He is not to stop to measure and calculate how he is to be paid for it. He may not be paid by the party benefited directly, but by some other, and in some other and unexpected way. Whosoever confers favours opens an account with the changes and chances and accidents of life. His credit side will look well in the close. If he confer a favour, he does it because he thinks he can and ought to do it. He has the *pleasure* of doing it. If he wishes to avoid the affliction of ingratitude, he has only to avoid letting the party obliged know, unnecessarily, whence the benefit comes. When a favour is done, the party conferring it takes on himself the duty of respecting that feeling of the human heart which is founded in reasonable self-love, and which is entitled

respect—that is, *not to ask one who has had the misfortune to be bound in chains, to clank them for the gratification of him who put them on.* There are cases of extreme ingratitude. They may have been occasioned by the irritating or indiscreet conduct of the party who was entitled to a different return. They are not of common occurrences. When they do occur, uncaused, the disappointed party may hope to find a better subject in his next essay.

SLANDER.

This is a twofold crime: 1. It is a breach of natural law, of divine law, and of the implied law of society, in relation to the party spoken of; 2. It is a breach of the same law, in relation to the party speaking. It has been commonly treated of in the first relation. It is now to be noticed in the second; and if it be shown why it is a breach in this, the other will take care of itself. We beg leave to ask a slanderer a few questions: Do you desire to be esteemed in society for your intelligence, your sense of justice, your knowledge of the decencies of life, and for the observance of them? If you happen to be ill-tempered, petulant, and disagreeable to your family connections and associates; if you make hasty and troublesome judgments, which you have to rescind or reform; if you happen to be ridiculous in your deportment, and remarkable for silly vanities; are you willing to have these things set forth in any, and every company, by any one who knows of them? Suppose there to be only some slight foundation for some one or more of these things, which, if you could have an opportunity to explain, would be entirely cleared up, are you willing to have that slight foundation made the basis of a structure of reproach, which, if true and real, ought to expel you from decent society? Suppose there to be no foundation at all for any such accusation of yourself, and yet somehow, and unaccountably, it is afloat and circulating, should you not think great injustice to be done to you? This is just what you do to others. You take away their good name, if they deserve to have one; you magnify their little faults and errors, and make them ridiculous or odious; you try them on indictments for serious offences, on which they have no opportunity to defend themselves, and of which they are ignorant. Where did you get your information? What credit were they entitled to from whom you had it? Did you understand them as they meant to be understood? Where and how did your informants learn what they communicated? Were they thoughtless or malicious slanderers like yourself? How much have you added to their slanders by way of recommending and making yourself agreeable? Have you broken any law by this conduct? We take the liberty to answer for you.

You have broken every law which an honest and honourable man, and a rational individual, should respect. 1. You have made every person whom you have spoken to, fear you and shun you. You have shown that you know not what the value of a good name is, and have forfeited your own, if you ever had any. You have shown that you are a stranger to self-respect; that you have probably every one of the faults, follies, and errors, which you impute to others; and desire to bring them down to your own level. Thus you have broken that law which commands you to do no evil to yourself. 2. You have violated that principle of natural law which commands you to do no injustice to your fellow-men. You know not what opinions you may entertain of the party you have slandered, if circumstances (as they may) should bring you into connection with him. You may find him to be, on a better knowledge of him, an amiable and worthy person. You may find all that you have said, and helped to circulate, utterly groundless. If he or one whom you occasionally meet, and even ask to partake of your hospitality, how can you meet him, and manifest towards him every sentiment of respect and esteem, when you have so spoken of him? One of two things must be true: either you *act a lie*, when you meet him in such a manner; or you *spoke a lie*, when you represented him as you did to others. 3. You have broken the law of God. To this law, perhaps, you are a stranger, and know not what wrong you have done. If so, the kindest thing that any one can do you is, to urge you to find out what it is, and to learn there the sentence of the slanderer.

It may be asked, whether one is to be entirely silent at all times, and on all occasions, as to the character and conduct of others? Certainly not. There are many occasions for speaking of others, and for speaking the *truth* of them, whatever that may be. All the members of any community are interested in knowing the true character of each other. The knowledge that this character may be known, is one of the most salutary correctives of erroneous conduct, and one of the strongest inducements to pursue that which is commendable. It is probably the case, that the members of every community are pretty well understood by all who have an interest in knowing them. We know not of any law which holds it to be immoral *to speak the truth of any one from good motives, and for justifiable ends.* It is all-important that this principle should prevail in our country, where so much depends on public opinion. Surely one's arms are not to be folded, and his lips closed, when he sees one bent on mischief, public or private. It may be one of the highest moral duties to declare what men are, and what they are aiming at, in many supposable cases. There can be no surer guide than the *motive* and the *end*. Inquiries are sometimes made, in matters of greater or less interest, concerning others, confidentially, and where the inquirer needs to be truly informed. The party inquired of has a right to be silent, if he thinks he has good reason to be so; but if he answer, he is bound to state the truth. If he choose to speak, and wilfully conceal the truth, so that the inquirer is deceived, he subjects himself to the imputation of an intentional deceiver.

There may be also, and there frequently are, confidential discussions of character, especially concerning public men, and where perhaps there is no particular end in view. This does not seem to be wrong; such intercourse is not founded in malicious or unworthy motives. It is even sometimes instructive and philosophical. This, perhaps, is the extreme limit. In all other imaginable cases, it is probably most consistent with one's own self-respect, and all truly respectable motives, to let other persons alone, and leave to them the care of their own characters.

PROFANITY.

Excepting the high crimes which are punishable by the public laws, there is no one so shocking as *profanity*, nor any one which there is so little inducement to commit. Profane swearing is of two kinds: 1. That in which the Deity is called on to do the pleasure of a sinning mortal; 2. That in which the Deity is called on to witness the truth of such a being's thoughtless or wicked declarations. This common practice can be accounted for chiefly on two grounds: 1. Pitiable ignorance; 2. Abominable wickedness. On the first ground, surely the profane swearer must be ignorant of the import of the terms which he uses. If he did understand his own words, he would be struck with horror. Surely, if there be any escape for the profane from that condemnation which they impreeate on others, it must be, that mercy will be extended to them in compassion for their ignorance. On the other hand, if they are not ignorant, but do knowingly and wilfully so misuse the gift of an immortal mind, and that unquestionable proof of Divine power and goodness, *the ability to speak*, they cause to

subjects of moral instruction. They should be left, like the consumers of alcohol and tobacco, to shock and to warn others.

Swearing, which formerly pervaded every rank of society, is now to be chiefly found in a very low and uninstructed class: it is, in fact, a vulgar and proscribed mode of speech. Nevertheless, it is still used occasionally by persons of no humble rank, especially by the young, though chiefly for the purpose of giving an emphasis to speech, or perhaps simply to give token of a redundancy of spirits, and a high state of excitement. To those who are guilty of it for these reasons, it is only necessary to point out, that no well-informed person can be at the least loss, with the genuine words of the English language, to express all legitimate ideas and feelings, and that to use either profane or slang words, is, at the very least, the indication of a low taste and an inferior understanding. A direct, pure, manly use of our native language, is an object which all may cultivate in a greater or less degree; and we have invariably observed, through life, that the most virtuous persons are the most exempt from the use of mean and ridiculous phraseology, and monkey tricks of all kinds.

Does not one who is habitually profane, necessarily entertain a low opinion of himself? Would any respectable merchant, or mechanic, or farmer, receive into his service a youth whom he knew to be a profane swearer? Could any one who is known to be such, find admission into any school, academy, seminary, or college? Would any respectable parent admit such an one to be a companion of his children, or a visitant in his family? Would not every reasoning person say, that a youth who is so ignorant as not to know that swearing is a violation of natural and divine law, must be ignorant enough not to know that there are many other laws for the proper government of society, and consequently that he is an unsafe person to be trusted? If the profanity be the consequence of voluntary wickedness, then surely all reflecting persons would say, that he who is wicked in this respect, is indeed wicked; but then he will be wicked in others also. For, as there is one chain which runs through all the virtues, and binds them in a sympathetic union, so also is there a chain which unites all the vices. He who swears, may be justly suspected of drinking; he who swears and drinks, may be justly suspected of gaming; he who swears, and drinks, and games, must keep very bad company by day and by night. He who keeps such company from such motives, must squander his own property, or steal that of somebody else to expend. He who robs another will commit forgery, and he who is so desperate as to commit these two latter crimes, will not hesitate long to put a human being out of the way of his pressing wants, if he is tempted to do it. It is probable that habitual lying and swearing are the first steps in that mournful series of crimes, and the first beginnings in the course of deplorable wretchedness, which deform and disgrace human society. Will any one maintain that these are necessary evils, and that God has so made man that they cannot be prevented? Surely these are evils wholly of human origin; and where they begin, there lies the power to extirpate them.

ENVY.

It is to be kept in view, that the main object is to show that this is a good sort of existence, if man knew how to use it, and that he is the author of his own afflictions. This is remarkably illustrated in the matter of *envy*. It is probable that a large proportion of mankind, in all classes, suffer from the dominion of this passion. It can be shown that it is peculiarly the passion which man has made for himself out of emulation, which latter is the Creator's work. In this instance, man has been wonderfully ingenious and successful in making himself miserable. He has done worse; he has provided for himself, in creating envy, a fountain which sends forth not one water, but many, and each one foul and poisonous. He who has submitted himself to envy has bound himself to think, to feel, and to act, as envy prompts. It would be most shocking to know what agency this monster has had in human affairs. If any one should read history, and watch the movements of his fellow-men, merely to learn the operation of this principle of action, he would see, probably, the most operative cause of the misery which men inflict upon themselves and on each other. If one has not time to read history, and watch his fellow-men, he may perhaps learn much of what he would find in these authorities, by reading his *own heart*.

The word envy comes from two Latin words, *in* and *video*, and signifies *looking against*. It arises from perceiving, in other persons, qualities which one's own self-love leads him to wish to have—as beauty, strength, grace, learning, eloquence, power, &c. It extends to riches, to office, to distinction, to the respect and esteem in which one is held by his fellow-men, and even to birth and ancestry. It makes one *sorry* that he has not these good things, and makes him *angry* that others have them. One easily persuades himself that great injustice is done to him, in that *he* has them not. The next step is to *hate* him who has them. Then comes the desire to deprive the supposed fortunate possessor of the benefit of them. But to admit that one has these malignant promptings, is contrary to another principle of self-love; and therefore no man tells another of his own envy, and he tries to wrap it up from his own view. As he cannot and dare not openly manifest that he is envious, he must obey the suggestions of malice in the dark. He therefore intrigues, insinuates, and becomes adroit in putting one thing for another; he secretly and by covert means undermines the object of his hatred. He whispers his doubts, suspicions, opinions, and belief. If the tenure of the hated object is too strong to be shaken, then the bad uses which he makes of his advantages are sought out. The base accompaniments of his fine qualities are brought forth, and placed in the strongest light. "She is beautiful; *but* she is vain, haughty, and silly. He is rich; *but* he got his wealth by frauds, and hoards it like a miser. He is able, eloquent, and popular; *but* he is selfish and insincere, and would put a yoke on every neck in the country if he could. He is making a great flourish in the world; *but* it is all false and hollow—he came from nothing, and will go back to nothing." It may be easily inferred that one who has surrendered himself to the dominion of envy, not only deprives himself of the profitable use of what he has or might have, but makes himself wretched in contemplating what he must know he cannot have: he is so wrought upon, that whatsoever seeds of crime he may have in his heart, are sure to start into luxuriant growth.

Can any rational being doubt that this sort of suffering and crime is entirely of man's making? Can it be doubted that he can prevent them? These are violations of natural law and Divine law; and no law comes from this source which cannot be understood and obeyed. Let us take an example, and seek out the unreasonableness and immorality of envy; and to do this effectually, we must take a strong case, and in some degree a fanciful one. Let us suppose that in a seminary of females there is one who is very beautiful; her parents are very rich, and are highly respectable; and that this young lady is distinguished by her genius, and her diligence and good conduct, and is obviously in the receipt of the preceptor's unqualified approbation. Let us further suppose that there are some of her school-fellows who envy her. Their countenances show what they feel. Every mark of favour manifested to this fortunate person is a blow on every envious heart. Discontent, distress, and

malignity, take up their abodes in these hearts, and enter into thriving partnership. But the beauty, the genius, the diligence, the wealth, the parentage, the applause, are not among the dividends which these partners make: these remain where they were: and what dividends do they make? Let us suppose that the envious would do what they would; that is, annihilate the envied qualities, and make the possessor too low and contemptible to be more thought of; and let us suppose, too, that the successful adventurers succeed to what is now the first eminence—Is there no one below to pull them down? They are soon down, and by like means; and thus the demolition would descend, until the seminary became too low a place for even envy to find something to live on.

Is not this a fair example of what we continually see in all grades and classes of social life? and is not this passion of envy, earth-born, mischievous, and odious? What is the remedy? Common sense and plain reason point out the remedy. Generally speaking, every member in society is just as much in his own place as he is in his own skin. No one can be in another's place. Every one has his place originally assigned to him, and his natural condition in it, by means over which he had no control, and in making which he had no agency. What he will make out of himself, and of the circumstances in which he finds himself (must depend (after the irresponsible state of infancy is passed) on his own thoughts, motives, and acts. He will find his greatest good, not in repining at the good of others (which he can never make to be his own, and which he cannot destroy without expecting retributive justice as to himself), but in making his own condition as good as he can, consistently with self-respect and peace of mind. That which is given to others, and all that they can lawfully acquire, is rightly only their own. All that is given to one's self, and all that he so acquires, is in like manner his own. If he would have no injustice done to him by those who are below him, he must do no injustice to those who are above him. We entertain no doubt that the day will come when youth will be so instructed, and men so self-disciplined, as to know that the laws of nature, and the laws of society when conformable to these, permit to every person a proper place, enjoin duties in that place, and ensure happiness from the performance of those duties. When that day comes, envy will die.

EMULATION.

This has been sometimes classed with envy, but they have nothing in common. One would feel like a culprit in being known to be envious, but would rightly take praise to himself in being emulous. This motive to action was given to man for the best possible purposes; and upon the application of it, with justifiable views, and to commendable ends, the advancement of human welfare mainly depends. You understand it to mean, the desire to obtain excellence in laudable pursuits. An envious man may be supposed to say, "Your eminence distresses me; I cannot bear to see you sitting up there; and though I have not the shadow of hope that I can ascend to your place, if you were out of it, nevertheless I must pull you down if I can, and then we shall stand on the same level." An emulous man may be supposed to say, "I admit that you are where you should be. You have raised yourself by fair and just means. I have no desire to disturb you, nor to impede your further progress. You have done me no injustice; on the contrary, you have rendered me the important service of showing me how one may honourably rise. I shall follow your example, and endeavour to place myself by your side. If I can get there, we shall have a fair, good-tempered rivalry, and we may animate and quicken each other's efforts. If you are able to keep always in advance of me, you will make me diligent, and enable me to excel others, if I cannot equal you." There seems to be nothing immoral in this. In this view, emulation is presented in its true and amiable character. Like every thing else intrusted to man's use, it may be, and often is, perverted. It frequently excites very unworthy feelings. Hence it has been confounded with envy. It is upon the principle of emulation that diligence in schools is commonly founded; and it is in schools that the perversion alluded to is frequently noticed. When several children are required to get and recite the same lesson, there must be a best and a worst among them. That they are such respectively, may depend on natural talent, and upon industry, or on both. It deserves great consideration, whether rewards and punishments are generally understood in their true philosophy. There must be emulation in schools; because there is, and ought to be, that stimulant everywhere in all the vocations of life. If men had not the advantage of comparing themselves with each other, and the promptings to exertion which arise from that comparison, this life would be very still and stupid. But what use is to be made of this principle in schools? is a question of exceeding interest. We express no opinion on this point, because we might not express a sound one, and might thereby do some injury, and very possibly no good in any case. Add to this, that such an inquiry does not come within our general object.

PEACE OF MIND.

It is believed that most persons pass a large portion of their lives in a state of inquietude and uneasiness. Persons who have no bodily disease are anxious and disturbed. They have some urgent want which cannot be gratified, or which cannot be so without incurring some evil which would be worse than the unsatisfied want. They have the dread of some probable or possible evil to come, and which is the more terrible because of the uncertainty of the manner and of the time in which it may come. Others are uneasy from remembering the past, in which some benefit was not secured, some blunder made, some wrong done to themselves, some vain gratification not obtained. There are many persons who are habitually discontented. They find every thing goes wrong. The weather is bad; their food is not as they would have it; no one does any thing in the right time, or right manner; or that is done which should not be, or that is omitted which should be done. Such persons are always groaning, sighing, or grumbling. They dislike everybody, and everybody dislikes them; and particularly, their abundant *advice* is disliked, and their manner of giving it. There are other persons who are of unquiet mind for more serious causes. They have recollections which distress or torment them. They are transgressors; perhaps criminally so. They have been able to conceal this, but they live in the fear of disclosure; at any rate, the fact cannot be hidden from themselves.

These are frightful instances of the agency of this companion which every man has in his own bosom. There are hours in every one's life, when he must compare the condition in which he is, with that in which he thinks he might have been. To some persons, these are hours of dread and terror. It is believed that this cause of suffering is purely of human origin, and that prevention must be found where the error began. It is the law of the Deity that there shall be such suffering when the guilty mortal makes it necessary to apply that law. There are great differences in the temperament and natural dispositions of persons. It is incredible that the worst-tempered persons would not make a better whole of life, by suppressing their natural propensities, and acquiring a control over themselves, and teaching themselves to look out for what may be pleasant and agreeable, (passing by that which seems ill to them,) instead of doing exactly the reverse.

There are cases in life in which it is said, there must

be anxiety and inquietude, from the very condition in which men are placed: persons who sustain public offices, persons who are placed in important trusts, persons whose vocations are perilous, those who are pricked by the thorn of political ambition. It is probable that such persons do experience many painful and distressing emotions, and that they sometimes pay dearly for their distinction; but it is demonstrable that even such persons might have tranquillity, if they had a right frame of mind. There are persons who substitute an aching solicitude for the reasonable discretion and care which is all that is required in the performance of duty. There are others who greatly overvalue the distinctions to which they attain or aspire; and very few of them reflect, that, when they do succeed, they must take success, especially in popular governments, with the accompaniments of having their worthy acts misunderstood and reproached, and their mistaken ones magnified and distorted, to suit the occasions of adversaries.

The remedy for this sort of suffering is within every one's power. Those who are poor, and in humble life, if not in extreme poverty, may possess peace of mind; and it is of easier acquisition by these than by those who are involved in the duties of office, and the responsibility of trust, and the embarrasement of wealth. Certainly, without this treasure, no earthly grandeur, no promise of posthumous glory, is worth having or seeking for. If the laws of nature, and the teaching of revelation, were properly known, respected, and obeyed, the common causes of inquietude would hardly be known. For example, what is more common than complaints of the weather? It is too hot or cold, wet or dry. It is not nature that mistakes about the weather, but ourselves. The movements of the winds and the waters, and the temperament of both, proceed on some great and universal laws, far beyond human perception. That which is exacted of us to believe is, that it is so, and to adapt ourselves to it, by our experience and ingenuity. What sort of effect would it produce in the earth, if such things were regulated by human perception of what is best? When one has occasion to put to use a board or stick of timber, which has been in contact with the ground for a certain length of time, he disturbs and puts to flight families, communities, and whole nations of living beings. Man may be much in the same relation as to general laws (not meant for him to comprehend) in which these insects are on the removal of their covering.

As to all causes of inquietude arising from the operation of nature's law, in which human agency has no concern, they must be right, although they occasion inconvenience to individuals. As to the acts and omissions of others which affect us, some questions are to be asked and answered before one can rightly judge of these; namely—What is the real cause of our complaint? Did not the first fault arise from some act or omission of our own? Do we judge reasonably of the supposed wrong? Do we make charitable allowance for the misapprehension which may affect the party complained of? When the inquietude arises from our own wayward and peevish disposition, from our own misconduct, negligence, or breach of laws, which we could know if we would, the remedy lies in becoming wiser and better, and more reasonable in learning how we may make of life that which it was intended to be, when we use it as we should. Let any reasonable being look back on his own life, and calmly consider the causes of his own contentions, ill-will, and sufferings, in body and mind; how many of these can he fairly lay to the blame of the Creator's laws, of nature's laws, or those of society, whether positive or implied? If to these he can charge but very few, who but himself is there to take the residue?

We have been trying to show what peace of mind is not. We have to show what it is, or rather, in what it is founded. It comes from sober conviction that the Creator has made his own laws for his own universe; that he requires conformity to these laws; that he permits and enjoins the use of what is good and right; that he punishes all that is wrong and disobedient. He has trusted every mortal with his own welfare, but has associated with him others who live in the same trust, each one for his own, but yet for mutual welfare. All are to contribute their common efforts to the common good. Those who have the means are to aid others in acquiring a knowledge of the laws which are common to all. If these laws were understood and applied, how abundantly would peace of mind increase in the world! The school boy would get his lessons and obey his preceptor; the labouring classes would labour diligently, live temperately, and find a greater pleasure in their frugal food than the luxurious in their festivals; for the former live as nature orders, the latter as fashion dictates. The opulent and luxurious would learn that the accidents of their fortune do not exempt them from the laws of nature; that if they have affluence beyond their reasonable and commendable wants, they are blessed with the means of purchasing a precious name; they would learn that no wealth will exempt any man from earning an appetite for his pleasure by physical motion; that, if he is tired of being rich and happy, *he must work* to accomplish some reasonable purpose. His distinction is, that he may choose the means in which he will expend *to be busy*, while others can only work in some prescribed mode *to live*.

The middle classes, and all who are not dependently poor, have as many and as valuable sources of enjoyment as those have whom they think to be better off than themselves. They can love and be loved; they can be respected and esteemed; they can have the consciousness of behaving well, where their lot has been cast; they have a far keener zest for natural and reasonable pleasure than those who misuse the bounties of accidental condition; they can have peace of mind when it is denied to those whom they deem more fortunate. If these natural laws, which seem to be so plain and obvious, were understood and respected, the labourers *in mind*, in all their varied employments, would do diligently, and in the best manner in their power, that which they have undertaken. Men of public trust would do honestly, and with a single view to their trust, that which they have undertaken. Suppose it were all so, and yet troubles and disappointments come. This may be, and yet there would be peace of mind. If every one were assured that no act, no omission of his own, makes him suffer, that he has acted faithfully and honestly, and to the best of his ability, in the circumstances in which he was placed, he would be entitled to have, and by the law of immutable justice, he would have, *peace of mind*.

HAPPINESS.

There is no word in our language more commonly used, nor any one less defined or less understood. It is sometimes taken to mean pleasurable sensations derived through the senses; sometimes it means a peculiar state of mind. It may be said that a pirate who has been brought to the most perfect penitence, and who is sensible that he has forfeited his life to the demands of justice, and that he is about to be transferred from the perplexities and sufferings of this state of being to endless felicity, is *happy* that he is going to be *hanged*. Perhaps it is easier to tell what happiness is not, than what it is. The most perfect *health* is not happiness, unless one has something to do. Health and *riches* do not make one happy. These accidents of being rather excite cravings for enjoyment. They are means, not ends. A rich man can ride but one horse, or sit but in one coach, or eat but one dinner, or wear but one suit of garments, or live but in one house, at a time. Persons in moderate circumstances can do the same.

Health, riches, *power*, and *distinction*, do not make happiness. Distinction is troublesome: it has more pains than pleasures; it is jealous, envious, and distrustful. Power does not make one happy; it demands the most busy watchfulness to keep it. If lost, its absence is often followed by painful suffering, and the possession of it is always accompanied with the fear of losing it. Riches are sometimes regarded as means of enabling one to live in elegant luxury, and even in voluptuous enjoyment. This is no way to be happy; the appetites soon become satiated; the stomach wears out; the senses are palled; diseases come: the body may be racked on a velvet couch as well as on a straw bed. Is there, then, any such thing as happiness? There must be such a thing, or the laws of nature, which provide for physical intellectual, and moral being, are false and deceitful, and the gift of revelation is a fable. If there be such a thing as happiness, it will be found in that knowledge of and obedience to the laws of nature which make health. It will be found in obeying the propensity to action, to some continuous, useful end; that is, in pursuing reasonably some one of the many vocations in society which tend to secure one's own self-respect and peace of mind, and which tend also to the common good. But there may be disappointments, ill luck, and causes of mortification and sorrow. These, we apprehend, do not seriously disturb any well-regulated mind, when there is a consciousness that no reasonable foresight or prudence would have discerned and prevented the cause. Perfect happiness in this world, it must ever be remembered, is not to be expected: the only happiness that we can really attain, consists in a certain contented tranquillity of mind under all the shocks and changes of this mortal life. There is a point called the *happy medium;* and this should be an aim in all human arrangements. Be moderate in all things. For example, to take no amusement is bad, for it deprives the mind of needful rest and recreation; so likewise it is bad to be altogether given up to amusement, for then all serious objects are lost sight of. The true plan is to take amusement in moderation. Some minds have never awakened to a taste for poetry, fiction, the imitative arts, and music, and they thus lose much pleasure which others enjoy: again, there are some in whom nature has implanted, and use cultivated, so strong a predilection for these things, that it becomes a vice. To be very much in society is sure to deteriorate the human character, making it frivolous, and incapacitating it for taking abstract and elevated views: on the other hand, a perfectly solitary life weakens the mind, lays it open to odd fancies and eccentricities, if not to hypochondria, and ends in some instances by altogether throwing it from its balance. The medium is here also found alone salutary. To be excessively gay, in a world where so many evils lurk around our every step, and so many onerous things call for our attention, is wrong: so is it to be always serious, seeing that the world also contains the materials of much happiness. What is proper is, that we should be ready to rejoice and mourn in moderation on the appropriate occasions. Finally, one may feel assured, that if he abide by these moderate desires, and so use his time as to be reasonably busy to some good purpose, and so conduct himself as to be justly entitled to his own approbation, and if he live in the habitual assurance that there is an omnipresent, omniscient, and merciful Judge of moral, accountable, and immortal man, he will certainly be happy.

NOTE.—The matter of this sheet has been extracted, with a few slight alterations, from the Moral Class-Book of Mr. William Sullivan, published a few years ago at Boston, in the United States. Of the excellence of purpose, firmness and expressiveness of language, profound observation, and amiable sentiment, displayed in this book, we need hardly speak, after presenting the reader with such ample materials for forming a judgment of his own. It is impossible, however, to omit the opportunity of congratulating our brethren on both sides of the Atlantic—for we never can consider them but as one nation—on the rise, in America, of a body of moral writers, of whom Mr. Sullivan is but a specimen, who seem resolved, as they are unquestionably able, to seek the improvement of their fellow-creatures in all that tends to elevate them in the scale of being. The present sheet contains Mr. Sullivan's view of the Duties which one owes to Himself: another, which follows, will comprehend the Duties which one owes to Others as classified in the opening paragraph.

PUBLIC AND SOCIAL DUTIES OF LIFE.

The preceding article upon this subject embraced the duties which one owes to himself as a rational being. The present is not less important in its character, being intended to point out those duties which we are required to perform with respect to our various public and domestic relations. We begin with our

DUTIES AS SUBJECTS.

Every civilized nation is governed by some species of authority, for the purpose of preserving order in society. Some governments are good, others are bad; but it does not fall within our province to point out where the ruling authority is injurious, or where it is most advantageous to the people. According to a law of universal application, every independent nation is understood to have the undoubted right to model its government according to its own fancy, genius, or necessities, provided that, in the execution of its plans, it does not wantonly injure its neighbours. Directing our attention to our own country, with which we have here alone to do, we find, as soon as reason dawns upon us in youth, that we are members of a great and enlightened community. We find ourselves subject to laws which were framed long before we were born, and that we must act in a manner not to please our own caprice, but according to the arrangements which have been instituted for the benefit of society at large. But if we thus discover that we are trammelled by certain legal restrictions, not very agreeable, perhaps, to the wildness of our untamed nature, we likewise find that we possess a great many compensating privileges. While yet opening our eyes to the light, we enter into the enjoyment of all the transcendent privileges of British subjects, and come within the powerful protection of the laws as fully as the oldest and most honoured in the land. It will be perceived that this is a boon of incalculable value. For us, armies have fought and bled; for us, in past time, hosts of martyrs and patriots have contended; for us, the wisest statesmen and legislators have transacted negotiations securing civil liberty; for us, the people who have gone

before us have established a variety of the most excellent, the most beneficent, institutions. All these things we enjoy without having been put to the smallest trouble. All that we are called on to give in return, as soon as emancipated from the ignorance of childhood, is *obedience to the laws.*

A cheerful obedience to the laws is, therefore, our chief public duty. Possibly some of our laws, from having been framed for a former state of society, or in order to meet particular exigencies, may not now be very judicious in their provisions; yet that forms no solid reason why we should break through them. It is always safer to obey a bad law than to oppose it by violence. Unhappily for some nations, they seem to have no accurate idea of the value of obedience to the laws. When they find themselves aggrieved by oppressive state measures, they are exceedingly apt to break into tumults, and take up arms against the officers of their governments. This is a very short-sighted policy, as the history of all nations proves; for the people are always sure to suffer far more by the coercive measures adopted to restrain them than they would have done by submitting to the evil they originally complained of. It is the boast and glory of Britain—and long may it be so—that its people know how to respect the laws, even while they consider them to be injurious, and how to correct them by quiet and orderly procedure. In this lies the important secret of their national greatness, their wealth, their public liberty. The advantages arising out of a scrupulous obedience to the laws, consist, in the first place, of social order and quietude, by which the rights of property are respected, commerce and trade permitted to flourish, and the sacred inviolability of the person preserved. The results of turbulence and civil commotion are, poverty, ruin to property, insecurity of the person, destruction of commerce and trade, and, at length, military oppression and barbarism. Every intelligent man, therefore, in this country, yields not only a bare submission but a becoming respect to the laws, as well as to the various institutions established by their authority.

Perfect obedience both to the letter and the spirit of the laws, does not, however, imply that we should not examine whether they are in every respect answerable to the present condition of society, nor keep us from resorting to legal means to have them corrected, or altogether rescinded. The constitution points out how this is to be done. It is illegal to conspire secretly to overthrow the law. All measures calculated to improve our social condition must be conducted openly and honourably. The means put into our hands by the constitution for improving the law are very powerful, if wielded with discretion. The people have the appointment of the men who constitute the most influential branch of the legislature; if they do not appoint individuals who will meet their views with regard to correcting or abolishing laws, they have themselves to blame: the constitution confers upon them a liberty of choice. It besides gives them the right to present petitions to the legislature, either individually or in bodies, praying in respectful terms for the amendment or abolition of any law which is deemed oppressive or antiquated. This right gives a vast addition to the power of the people. It is of much greater value than one would at first be inclined to suppose, and is infinitely preferable to the use of violence. The right of petition implies the right of meeting publicly to discuss the propriety of petitioning. This practice of meeting together excites the public mind to renewed efforts in the cause it undertakes. The speeches of the orators are circulated and commented upon by the newspapers all over the country. One meeting gives rise to others, men's minds are enlightened and warmed, and the public opinion acquires a degree of moral force, any resistance to which would be useless. It is not without reason, therefore, that the people of this country set so high a value on the right to assemble for the discussion of public affairs, and place it in the first rank of their constitutional prerogatives.

Besides yielding obedience to the existing laws, we are under a collateral obligation to be loyal to the sovereign who rules over us. Loyalty is hence another of our chief public duties. There is some difference of opinion with regard to what extent loyalty ought to be carried. It appears to us that this is a simple matter. A power to protect the nation from foreign insult, and to preserve the internal peace of the country, *must be lodged somewhere.* It is found to be most convenient to lodge it in the hands of one person, under proper restrictions. In Great Britain, as will be seen in our history of that country, it has been placed in the possession of a hereditary prince or king. This person is entitled our ruler or sovereign; we are termed his subjects. Loyalty signifies a fidelity and willingness in serving the king, so that he may be enabled both to protect the nation from outward harm, and to preserve order in society, through the agency of the laws, or, failing them, through the application of force. Seeing that the sovereign is prevented by the constitution from infringing upon the rights of the subject, through the exercise of his power, it is discovered that loyalty is rewarded in the comfort we enjoy; or, to use another expression, self-interest alone, if no nobler sentiment interfere, would lead us to afford assistance to the king in the execution of his high and important trust. This assistance is demonstrated, not only by personal service, if necessary, but by respect. Loyalty may be greatly enhanced by esteem for the private virtues and conduct of the sovereign. When so influenced, it is certainly both an amiable and commendable feeling, and can never, but in ill-regulated minds, degenerate into servile prostration.

In the United States of America, in which the executive is lodged in an elective president, the people call themselves citizens, not subjects; and what we mean by loyalty to the sovereign, they term duty to the commonwealth. It is obvious that there is extremely little essential difference, *practically*, between these phrases, whatever there may be in *feeling*. The subjects of Great Britain are as free as any people in the civilized world; much freer, indeed, than the inhabitants of France, who disclaim the appellation of *subjects*. These explanations are perhaps useful in admonishing us to beware how we vex ourselves about mere words and sounds. Our duty clearly consists in appreciating the numerous blessings we enjoy in our public and private relations, by whatever name these relations may be called. We are each individually fractional parts of a great nation, whose honour we are called on to sustain through good and bad report. Let us remember that individual virtue can alone promote social happiness, and that social happiness and peace form the bias of political independence. No man can be a good and respectable subject or citizen who is a bad son, a bad husband, a bad father, or a bad master. The nation is but a composition of a great many families, knit together by kindred sentiments and mutual wants; and how can it be great, or worthy of esteem, if its component parts exhibit in their constitution the worst of vices?

Loyalty to the sovereign leads to a subordinate but important duty. It induces us to respect inferior constituted authorities. All judges, magistrates, or other civil functionaries, stand in the light of representatives of the sovereign. The king cannot be everywhere at once, and he deputes these individuals to attend to the wants of his subjects, and to keep good order in society. To show contempt for any court of justice, or for any magistrate, is, therefore, equivalent to showing contempt for the king himself, as well as for the laws, and is justly punishable. To show our respect both for the laws and the sovereign, we must respect the decisions of judges

and magistrates, and support their due execution by our personal influence. Nevertheless, it is in every one's power, when they feel themselves aggrieved by these decisions, to appeal to higher authorities for redress; such being the only means allowable by the constitution, in opposing the legal power of the established courts of civil and criminal jurisprudence.

A becoming obedience to the laws, and a generous respect for the supreme and inferior constituted authorities, produces the agreeable result of good order and peace in society. Every one is not acquainted with the different ramifications of the common and statute law; indeed it would be impossible for us to acquire a correct knowledge of these things unless we devoted a lifetime to the study. This difficulty in acquiring a knowledge of the laws has sometimes given rise to a low sort of jeering at our excellent constitution, and it has been represented as cruel to compel an obedience to laws which few can have an opportunity of learning. But this is a fallacy into which we hope our young readers will not fall. The administration of the common law, such as that which applies to inheritance, debtor and creditor, and civil rights generally, rests with a body of educated men, or lawyers, whose services may at all times be commanded. Besides, we may, if we please, purchase digests of these laws for our private amusement and instruction. The other description of law which is made applicable to the preservation of the peace of society, any one can understand, if we have the ability to know right from wrong. We surely all know that it is illegal and criminal to steal, to rob, to murder, to break into our neighbours' houses, or to attack their persons by violence. It can require no reading of acts of Parliament to understand this. Common sense here serves us instead of legal knowledge.* Our duty in this matter is very easily defined. We must ever bear in mind that one of the principal acts of duty which the constitution enforces, is the abstaining from meddling violently with the persons and property of our fellow-subjects. In this well-regulated realm, the person of every man, woman, and child, is inviolable from private attack. It is a crime almost punishable with the highest penalty of the law, to strike any one, either from an idea that they have injured us, or through the influence of passion or prejudice. If we consider that we have been injured, we must apply to the law or the magisterial authorities for redress. We are only permitted to use physical force when in absolute danger of losing our lives or property by violence, there being then no time to apply to the law for protection. It would be gratifying if these regulations were more generally attended to than they seem to be. There are many young men, who, from what they are pleased to term a love of fun, but which can be no other sentiment than a love of mischief, or gross ignorance, assail the persons of individuals of both sexes, to their great discomfort, and sometimes serious injury. Now it is clearly illegal to do so, and is generally punished by the infliction of severe penalties by the civil magistrates, though seldom marked with that ignominy which it deserves. Inasmuch as it is held that ignorance of the law does not excuse its infraction, so it is reckoned an invalid apology for the commission of crime to say that you were under the influence of intoxication at the time. Drunkenness is very properly esteemed an aggravation, not a palliation of the offence.

CONDUCT AT PUBLIC MEETINGS.

The right of meeting together publicly to discuss matters connected with our social condition, being so invaluable a prerogative, it is right and fitting that all young men entering into the busy scenes of life should make themselves well acquainted with the rules which have been established by general consent for the proper conducting of such assemblages.

According to usage, a public meeting is not constituted until a person be appointed to preside, or to "take the chair." Without this ceremony, the meeting is a tumultuary assembly, or a mob. The first movement is, therefore, the appointment of a chairman. This functionary, on taking his seat, is for the time supreme in the meeting. His chief duty is the preservation of order. He allows only one to speak at a time, giving the preference to him who has first caught his eye in the act of rising, and giving every speaker a fair hearing. Another of his chief duties is the preventing of speakers from wandering from the subject under discussion; and if they do, he must remind them to keep to the point. In the execution of these and other duties, he claims the support of the meeting, and all are bound to yield to his reasonable dictates, and help to maintain his authority. In proportion to the firmness, yet mildness of manner, of the chairman, so is the meeting well or ill conducted.

At some public meetings there is no set plan of operations, and a general discussion on the subjects which are brought forward takes place; but at all meetings for specific important objects, there is a previous arrangement among a certain number of individuals to bring forward particular points to be spoken upon. In this case speakers are prepared, and the business assumes the form of the proposal and carrying of a set of resolutions, or motions. The following is the routine of procedure:—The chairman having stated the object for which the meeting has been called, an individual steps forward and proposes a resolution for the adoption of the meeting. Whether he enforces the propriety of carrying such a resolution by a speech on its merits, or simply propounds the matter, he must be *seconded* by another individual (with or without a speech), otherwise the meeting cannot entertain his resolution for a moment. If duly seconded, then the motion is fairly tabled. It is before the meeting. After a resolution is proposed and seconded, it is the duty of the chairman to ask the meeting if it be carried or not; if agreed to by a general acclamation, or by an obvious majority, he pronounces the word "carried," which settles the point, and the business proceeds by the bringing forward of the other resolutions in the same manner. It is unusual for any member of a meeting to oppose the passing of a resolution, unless he have a better to offer in its stead. If he have, and if he wishes "to take the sense of the meeting" on the subject, he has a right to be heard. Yet this can only be permitted, provided the meeting has been called in general terms. For instance, if the inhabitants of a town or district generally be called, in order to consider of the propriety of such and such measures, in that case every one is entitled to give his opinion, and to oppose the formal resolutions brought forward. But if the meeting be described by advertisement to consist of those inhabitants or others only who agree in the propriety of such and such measures, then no one is entitled to intrude himself on the deliberations who professes opinions contrary to the spirit and end of the meeting. An inattention to this exceedingly delicate point often creates serious heart-burnings and disturbances; and, on that account, committees who call public meetings ought to be very particular in the terms of their announcements.

As much regularity is necessary in respect of opposition to motions as in their proposal and carrying. The counter-motion of an opponent is called an amendment, which, to be available, must also be seconded. If not seconded, it drops; but the opposer may place his protest on record; that is to say, if the discussion be in a corporation, or other meeting where books of the minutes

* At the same time, we willingly allow that there is room for great improvement in the dissemination of a knowledge of the statute law, particularly that of a recent date. It is likely that some plan will soon be carried into execution to remedy this defect.

transactions are kept. On being seconded, and discussed by those who wish to speak upon the subject, the matter is brought to the vote by the chairman, but not until both the mover and amender have replied, if they please to do so. After they have spoken, not another word can be uttered, and the vote is taken, a majority carrying. If the votes be equal in number, the casting-vote of the chairman carries. There is another way of suppressing a resolution, which is by "moving the previous question." This signifies, to return to the point at which the business of the meeting stood previous to the tabling of the motion; or means, in other words, to do nothing on the subject. But this must also be seconded, and put to the vote in opposition either to the motion or amendment, or to both. The routine is generally to place it in opposition to both; if carried, the matter is settled; if not carried, the order is next to place the motion and amendment against each other, and vote.

Such is an outline of the mode of procedure at public meetings, and it is particularly desirable that attention should be shown to the preservation of regularity. At all public meetings there is a strong tendency "to go out of order." By this expression it is meant that speakers are under a constant liability to wander from the point under discussion. They are apt to digress into other subjects, and confuse their auditors; and these, getting impatient, are equally apt to interrupt them, so that a single irrelevant observation may lead to hours of idle debate or colloquy, or "speaking to order," as it is termed. and thus the harmony of the assembly be destroyed. Those who attend such meetings should therefore have a regard for the following regulations:—If they speak, they should keep closely to the subject in hand. If they be listeners, they should preserve a strict silence. It is ungentlemanly, not to say disorderly, to utter any sound or make any observation on what a speaker is saying. The speaker must on no account be interrupted, so long as he keeps to order; and if not in order, it is the chairman's duty to check him. It is likewise disorderly to speak more than once, except in replying before the vote is put, or except it be the rule of the assembly to permit it. Sometimes persons who have spoken rise again to speak as to "a matter of form." This is allowable, but in speaking as to form, the merits of the case should not be introduced. On this, however, as on every other point, there is a perpetual tendency to go out of order, and hence the absolute necessity for appointing a chairman well acquainted with the forms of public deliberation, and who has the strength of mind to insist on order being preserved.

At all our public assemblages, a certain degree of courtesy is used both among speakers and listeners. On an individual rising to speak, he addresses himself politely to the chairman, and the chairman in return politely mentions the name of the speaker; by which means the audience is made acquainted with the gentleman who is about to address them. When the discussions of the meeting are over, the chairman closes the business with a few observations, and then dissolves the assembly by leaving the chair. When any dispute arises in the course of the business of the meeting upon points of form, it is customary to appeal to the usages of the House of Commons for an example to be followed.

DUTIES AS ELECTORS.

There are duties of another nature which we may be called on to perform in our character of citizens. We are invested with the high and solemn trust of electing our representatives in Parliament, as well as representatives in our municipal institutions. In the execution of our duty as electors, we are bound to divest ourselves of all factious or personal considerations. We have certainly to consult our own good in making a choice of a representative, but it is only as flowing from the good of the whole community. We must hence act entirely without passion or prejudice. Let us examine the previous habits of life, public conduct, and avowed sentiments, of candidates, and calmly consider whether they are such as we can approve of, or as being consistent with the general welfare of the people. We should also recollect that we exercise the trust of electors for many who do not possess that privilege. A large proportion of the community consists of women and children, persons in an humble condition, the sick, and the helpless. These look to us for protection from wrong, and it is our duty to afford it to them. If we, therefore, act with levity and imprudence in appointing men, who, from their conduct and character, are unfitted to exercise the important function of public representatives, we in more ways than one commit a crime against society, and are unworthy of possessing the valuable prerogatives with which the constitution has invested us.

In our capacity as citizens, we are frequently called upon to elect representatives in different municipal bodies; such as civic managers of the city in which we reside, managers of local trusts—general, political, and religious. There is often much heat at such elections; a petty factious spirit frequently governs the choice which is made: sometimes the meanest passions of our nature are exhibited during the contest. The observations we have made on our duties as electors generally, apply here with peculiar force. As those who present themselves as candidates live amongst us, we can never find any difficulty in estimating their character and qualifications. But we must take care not to be borne away by private feelings; we must not give our vote simply because the candidate is an acquaintance. A consideration for *what is best for the public interest* should in every case govern us; and we should not be afraid to let these our sentiments be known, for they can give no honourable man offence. In all cases of elections of members of civic corporations, and such like bodies, the chief merit in electors, after that of good and respectable character, is soundness of judgment, and after that, activity of habits. The power of fine speaking, or eloquence, is not required in such a functionary, and should be esteemed very lightly. That which is required is a power of thinking coolly, an integrity of purpose, and a willingness and ability in taking a share of the burdensome duties to be performed. Our qualifications as electors, perhaps, render us liable to be ourselves elected. In the event, therefore, of being called forward by our fellow-citizens to fill the honourable situation of their representative, it is our duty to sacrifice perhaps our own feelings and a portion of our time in the public service, provided we conscientiously consider ourselves qualified for the task, and that our health and private circumstances permit it. The principal question we have to put to ourselves, when we are so brought forward, is, "Have we sufficient time to spare to attend the various meetings—to sit and deliberate in the numerous committees—to have our minds frequently occupied with public affairs?" If we deceive ourselves in answering this important question, we wrong society, and give ourselves cause for much after disquietude. Is it, or not, the [illegible] way for every one who is worthy of this trust, calmly, deliberately, and to the best of his knowledge and belief, to do those acts which will best preserve for his own use the beautiful fabric of our political institutions? If he perceives and rejoices in the good which he and others derive from it, will he not best perform his duties to those who come after him, to use it, and not abuse it, that they may have the like good? Little suggestions of selfishness, rivalry, and petty local interests, and, most of all, perverted and mischievous ambition, are the blocks over which citizens stumble and fall, in the otherwise luminous and clear path in which they are permitted to move.

DUTIES AS JURORS.

The laws under which we live give us the invaluable privilege of trial by jury; in other words, we are tried for the commission of offences by a body of men chosen indiscriminately, as nearly as convenient, from the class of society in which we have moved. By such a considerate regulation, there can be little risk of individual oppression, provided those who compose juries do their duty. It is therefore incumbent on citizens who are liable to serve in juries, to make themselves acquainted with what is understood to be their duty when so called upon. It requires no learning to fulfil the character of a juror. It requires no more than a coolness of thinking, and a mind above being carried away by prejudices or feelings. The juror is to remember that it is the jury which is the judge in the case, not the judges who sit on the bench. Keeping this in view, it is one of the chief qualities requisite in a jury to maintain its proper dignity and honour inviolate, nevertheless with all courtesy, and to act with firmness in the execution of its important function. Besides deliberating dispassionately on the evidence presented, it is the duty of the juror to be totally regardless of every consideration but that of strict justice. He is neither to regard the rank or life of the culprit, nor of the injured party. In a court of juriaprudence all men sink to an equality. It is also the duty of the juror, after forming his conscientious opinion, not to be coerced, or flattered, or spoken into a different opinion. He is invested with a solemn trust, and that trust he must preserve with scrupulous care, as consonant with the dearest interests of society.

DUTIES AS NEIGHBOURS.

Besides the duties which we have to perform as members of a great nation, we have duties of a similar nature to perform as inhabitants of a town, district, or neighbourhood, and in relation to which we sometimes receive the appellation of citizens. Every person belongs to a neighbourhood, which is both local and social. Even those who have removed into new countries, and who dwell in solitary abodes, do not lose the sentiment of neighbourhood. The nearest person to them is a neighbour, though separated by long distance. And when this sentiment cannot be preserved in fact, it may be in thought, and by that means it usually is so. Perhaps the last impressions that leave the heart of one who has wandered into far distant regions, are those made in his early days, in his native home. In general, as every one lives in a neighbourhood more or less dense, he can promote his own happiness, and that of those around him, by observing a becoming moral conduct. He has a right to enjoy life, and to use all things which he has, to that end; but he has not a right to any enjoyment which necessarily disturbs that of others. Peace, tranquillity, and security within one's own walls, is the main purpose of life. No one has a right to interfere in these things but by order of the public law. A neighbour, therefore, who so conducts himself, and those means of pleasure which he commands, as to vex, harass, and disturb those who are necessarily within sight, hearing, &c., commits an offence against morality. It often happens to be the pleasure of one who dwells in a dense neighbourhood, to keep one or more animals, whose habitual noises disturb those who necessarily dwell within hearing, in the hours allotted to repose, and frequently when persons are visited by sickness, and when any noise is distressing. Now, whatever the rigid law of the land may say on such cases, the law of morality says that the suffering party has an unquestionable right to remove his trouble, if the proprietor of the cause of such nuisance will not, on request, remove it himself. A more peaceable way would be, to have it removed by order of the public magistrate. Many of such petty nuisances ought to be removable on summary verbal application, and not in the slow, written, and printed process, in which the movements of ordinary law are commonly made.

The moral duties of neighbourhood extend to all things which minister to the common comfort, convenience, and security. Each one of a neighbourhood is bound to make his own dwelling-place as agreeable and pleasant to those around him as he reasonably can. Each one is morally held to uphold and sustain a good name for his own little community. He is, therefore, to join, with a liberal and manly feeling, in all the improvements which tend to please and adorn. Such things, even if they occasion some expenditure, are sources of self-satisfaction; and one comes at last to take an honourable pride in hearing his street, his village, his town, or city, commended by observers.

There is another sort of neighbourhood which is founded in social intercourse, and in the interchange of visiting and hospitality. As the world now is, this is commonly regulated by artificial and somewhat unnatural rules. It is often ostentatious, luxurious, and destitute of all feelings and thoughts in which well-trained moral minds can take pleasure. A profuse and voluptuous entertainment, comprising food little adapted to promote health and vigour, and in quantity sufficient for ten times the number, that rather look at than consume it, is an unsatisfying way of being happy in social intercourse. There are modes of maintaining such intercourse, which are innocent, pleasing, and dutiful. Mankind are fitted for such. The interchange of friendly visits, for conversation, music, and rational amusement, with such things as may be used without suffering or impairing health, is that kind of neighbourhood (in such relations) which is permitted and enjoined. We have, however, little reason to think that intimacies of this sort are likely to meet with such consideration as would induce the further extension of them.

Every person, in general, is a member of some kind of society or association. Some persons belong to many. These are intended for some useful purpose. Every one who is such a member has some duties to perform. He owes some proper part of his time, some proper contributions to the common object, and has an interest in the prosperity of the design. All these institutions do some good, and some of them eminent good, in helping on the great purpose of social life, which is general improvement Of this nature are public charities, educational institutions, libraries, agricultural societies, and those for suppressing intemperance and immorality. No well-disposed citizen can conscientiously abstain from giving his aid and support to such objects. It is each one's duty to try to leave the world a little better than he found it. No one can say that these are matters which do not concern him. Suppose every one should say so, and had said so from the beginning, society would still be made up of barbarians. Every good that is done in any community affects, directly or indirectly, every member of it. The law of example, of imitation, of doing as others do, has a most pervading and astonishing influence. Every community is like a full vessel of water; no one drop in it can be moved without affecting every other drop.

DUTIES IN OUR DOMESTIC RELATIONS.

Marriage.—This institution is agreeable to a law of nature, and is an ordinance of the Creator. There are profligates who have declared this; but they have exhibited no reason on their side. It is obvious that man is not only a gregarious, but a pairing animal. Marriage is consistent with the finest of his feelings—the most noble of his faculties. It began when man began. It is ordered to perpetuate the succession of the human family. It is ordered for the whole duration of adult age. It is man's peculiar privilege in this; it connects him with

generations which are gone, with that which is passing away, and with those which are to come. The memory and the ashes of the dead are precious to him, and no other animal has that sentiment. He alone contemplates that his own memory will be held in honour, and that the place of his earthly quiet will be sacred. He only is enabled to conceive that moral and physical wrong will bear his own stamp in the character and in the frame of those that follow him; he only knows that a good name may be an honourable inheritance. These are the sentiments which spring from the beneficent gift of marriage. However much one may misunderstand or abuse this gift, nature, ever faithful to her trust, forces these sentiments on the heart.

Marriage is recognised as a contract of a binding nature in all civilized nations. By some it is considered, from its solemnity, to be of a sacred character; by others it is deemed only a civil bond of connection. All, however, agree in holding it to be an irrevocable contract. The laws of the land, those of nature, and the divine laws disclose the sentiments, the feelings, and the awful sense of duty with which this undertaking should be regarded. Yet it is frequently entered into from motives highly reprehensible, and sometimes with shocking thoughtlessness. It is from such causes that we see that this sacred union, which should be the true source of the highest human happiness, becomes that inexhaustible fountain from which both parties are daily and hourly compelled to drink, and from the same cup, the bitterest waters.

In a great number of instances, marriage is contracted with exceedingly little regard to the qualities of the mind on either side, particularly on the side of the man. If one could penetrate the ear of an enamoured youth, some good might come from such suggestions as these:—Do you know what will come of that engagement which you are about to make? Are you about to tie yourself by bands, absolutely indissoluble while you live, to a mortal who has feelings, wishes, wants, hopes, and fears, which must become yours, and a part of your very self; or which you must resist, control, or contend with? Do you know that pain, suffering, and sorrow, originating in either, must be borne by both? Are you aware that whatsoever of error, folly or crime, may be chargeable to either of you, or to any who may spring from your contract, will be your common burden and shame; and that from these you can relieve yourself nowhere but in the grave? Or, do you know that this attractive being will be your kind friend; your counsellor; the welcome soother of your cares and anxieties; the generous and charitable judge of your infirmities; the inspirer of honourable ambition; your fellow-labourer in joint interests; the ornament of your life; the gracious, considerate, faithful, gentle companion, who will make your own virtuous home the place to which you refer all earthly happiness? Who that is "in love" has leisure or inclination to think of such *trifles* as these?

There is no reason why the passion of love should be wrapped up in mystery, nor any why the mind should be stained in considering its nature. It would prevent much sad and complicated misery in the world, if all young persons understood it truly. There are in every human being seeds, each one of which may be made to germinate, and may be so cultivated as to produce the most odious vices or the most pure and heavenly virtues. There is in every human heart a seed of kindness, tenderness, and affection, which ripens if known to be there in due time. It demands to be nourished. This is the trying and perilous moment in human life. There is some one somewhere, who will [illegible] and give back its full equivalent. The excited senses and the heart are in search of that one. Happy will it be for the searcher, if he will take reason as his monitor to keep the senses and heart in order. But reason is commonly regarded, not as a kind and faithful friend whose duty it is to whisper, "begin nothing of which you have not well considered the end," but as a withered scowling matron, who, being utterly dead to the impulses of youth, denies that there ought to be any. If there has been no preparation for this eventful period; if the mind has not been enriched with the teachings of rational prudence; if the eye has not been taught to distinguish between the real and the fictitious; if the ear has not learned to discriminate the meaning of sounds; if life, as a whole, if the consequences of irrevocable deeds be not thought of, there is peril; and the pure drop from the fountain may flow into any sea but that of happiness. In seeking for that being who is to be a companion during life, one grievous failing must be avoided. Young men frequently amuse themselves by playing with the feelings of young women. They visit them often, they walk with them, they pay them divers attentions, and after giving them an idea that they are attached to them, they either leave them, or, what is worse, never come to an explanation of their sentiments. This is to act the part of a *dangler*, a character truly infamous. Young men cannot be too cautious in the attentions which they bestow on unmarried females, who on their part should be equally guarded in not encouraging the addresses of any individuals whom they would not choose to marry.

According to the present state of society, one of the influential counteracting elements to marriage is or ought to be, a high degree of prudence. No one ought to marry who cannot foresee that he will be able to support the additional expenses of a wife and family, and at the same time fulfil his other necessary obligations. By good management, these additional charges are not great, but they amount to something, and he is worse than an infidel who does not provide against them. We are of belief that every industrious, active, and sober man, will find no serious obstacle in this respect. It is from idleness, love of company, and intemperance, not from simple expenditure on family necessaries and comforts, that ruin and poverty in the married life are produced. The dread of encountering the expenses of a family, though acting as a salutary check on imprudent marriages, is frequently productive of many gross vices, tending to the injury both of individuals and of society. Celibacy, especially when circumstances would permit marriage, is not respectable; it is considered akin to vagrancy. He who marries and settles down as a householder, meets with the approbation of the world. Why is this? it may be asked. Because in marrying we give a guarantee to society for our good behaviour. It is not to be doubted that a young, well-educated, industrious couple, who are sincerely and affectionately attached, on a sober examination and conviction of each other's worth and suitability to each other, may be happy with means far short of the fashionable standard. Presuming that such a couple are wise enough to take life for the real and substantial good that it can produce—and as a whole, it would do them great injustice to suppose that they could not find that good in a small, simple, cheerful, tranquil mansion—it would be doing the friends of such a couple the like injustice to suppose that they could not visit them, and be satisfied to see them happy through such means.

According to the usages of society, it is the custom for the male to propose marriage, and for the female to refuse or accept the offer as she may think fit. There ought to be a perfect freedom of the will in both parties. To impose any species of constraint on either party's most mischievous; it would be a gross violation of our most sacred privileges. Both parties, therefore, ought freely to think for themselves, however much they may seek the advice of those who are inclined to afford them counsel.

In treating of this subject, it may be of service to cite

a few special advices to young women. Our first recommendation is, that they ought to be in no haste to accept a lover. Let them know him a sufficient time to judge of his qualities of mind, temper, habits, &c., before they allow themselves to be inveigled into a marriage with him. Far better for them to remain single, than heedlessly incur the risk of being miserable during the remainder of their lives. In general, young women are much too anxious to involve themselves in this respect. The following observations on the injurious effects of making marriage the sole object of a young woman's thoughts, occur in a popular work by Mrs. Farrar, and are well worth attention.

"Some one hath said, that 'matrimony is with women the great business of life, whereas with men it is only an incident'—an important one, to be sure, but only one among many to which their attention is directed, and often kept entirely out of view during several years of their early life. Now, this difference gives the other sex a great advantage over you; and the best way to equalize your lot, and become as wise as they are, is to think as little about it as they do.

"The less your mind dwells upon lovers and matrimony, the more agreeable and profitable will be your intercourse with gentlemen. If you regard men as intellectual beings, who have access to certain sources of knowledge of which you are deprived, and seek to derive all the benefit you can from their peculiar attainments and experience—if you talk to them as one rational being should with another, and never remind them that you are candidates for matrimony—you will enjoy far more than you can by regarding them under that one aspect of possible future admirers and lovers. When that is the ruling and absorbing thought, you have not the proper use of your faculties; your manners are constrained and awkward, you are easily embarrassed, and made to say what is ill-judged, silly, and out of place; and you defeat your own views by appearing to a great disadvantage.

"However secret you may be in these speculations, if you are continually thinking of them, and attaching undue importance to the acquaintance of gentlemen, it will most certainly show itself in your manners and conversation, and will betray a weakness that is held in especial contempt by the stronger sex.

"Since the customs of society have awarded to man the privilege of making the first advance towards matrimony, it is the safest and happiest way for woman to leave the matter entirely in his hands. She should be so educated as to consider that the great end of existence—preparation for eternity—may be equally attained in married or single life, and that no union but the most perfect one is at all desirable. Matrimony should be considered as an incident in life, which, if it come at all, must come without any contrivance of yours; and therefore you may safely put aside all thoughts of it till some one forces the subject upon your notice by professions of a particular interest in you.

"Lively, ingenuous, conversable, and charming little girls, are often spoiled into dull, bashful, silent young ladies, and all because their heads are full of nonsense about beaux and lovers. They have a thousand thoughts and feelings which they would be ashamed to confess, though not ashamed to entertain; and their preoccupation with a subject which they had better let entirely alone, prevents their being the agreeable and rational companions of the gentlemen of their acquaintance which they were designed to be.

"Girls get into all sorts of scrapes by this undue preoccupation of mind; they misconstrue the commonest attentions into marks of particular regard, and thus nourish a fancy for a person who has never once thought of them but as an agreeable acquaintance. They lose the enjoyment of a party, if certain beaux are not there, whom they expected to meet; they become jealous of their best friends, if the beaux are there and do not talk to them as much as they wish; every trifle is magnified into something of importance—a fruitful source of misery—and things of real importance are neglected for chimeras. And all this gratuitous pains-taking defeats its own ends! The labour is all in vain; such girls are not the most popular; and those who seem never to have thought about matrimony at all, are sought and preferred before them." We may add the advice, that young women should not consider it a serious misfortune, even if never married: there is nothing disreputable, while there may be much happiness, in the condition of an old maid.

HUSBAND AND WIFE.

Marriage having, at length, taken place between two parties who feel a reasonable hope of being happy together for life, each has entered on a condition requiring the exercise of particular duties. These we shall endeavour to narrate, commencing with advices

To Husbands.—I. Always regard your wife as your equal; treat her with kindness, respect, and attention; and never address her with the appearance of an air of authority, as if she were, as some misguided husbands appear to regard their wives, a mere housekeeper.

II. Never interfere in her domestic concerns, such as hiring servants, &c.

III. Always keep her properly supplied with money for furnishing your table in a style proportioned to your means, and for the purchase of dress, and whatever other articles she may require, suitable to her station in life.

IV. Cheerfully and promptly comply with all her reasonable requests.

V. Never be so unjust as to lose your temper toward her, in consequence of indifferent cookery, or irregularity in the hours of meals, or any other mismanagement caused by her servants; knowing the difficulty of making many of them do their duty

VI. If she have prudence and good sense, consult her in all great operations involving the risk of very serious injury in case of failure. Many a man has been rescued from ruin by the wise counsels of his wife; and many a foolish husband has more seriously injured himself and family by the rejection of the advice of his wife, stupidly fearing, if he followed it, he would be regarded as henpecked! A husband can never consult a counsellor more deeply interested in his welfare than his wife

VII. If distressed or embarrassed in your circumstances, communicate your situation to her with candour, that she may bear your difficulties in mind, in her expenditures. Women sometimes, believing their husbands' circumstances better than they really are, disburse money which cannot be well afforded, and which, if they knew the real situation of their husbands' affairs, they would shrink from expending.

VIII. Never on any account chide or rebuke your wife in company, should she make any mistake in history, geography, grammar, or, indeed, on any other subject. There are, I am persuaded, many wives of such keen feelings and high spirits (such wives deserve to be treated with the utmost delicacy), that they would rather receive a severe and bitter scolding in private, than a rebuke in company, calculated to display ignorance or folly, or to impair them in their own opinion, or in that of others.

To Wives.—I. Always receive your husband with smiles—leaving nothing undone to render home agreeable—and gratefully reciprocate his kindness and attention.

II. Study to gratify his inclinations, in regard to food and cookery; in the management of the family, in your dress, manners, and deportment.

III. Never attempt to rule, or appear to rule, your

husband. Such conduct degrades husbands—and wives always partake largely in the degradation of their husbands.

IV. In every thing reasonable comply with his wishes with cheerfulness—and even, as far as possible, anticipate them.

V. Avoid all altercations or arguments leading to ill humour—and more especially before company. Few things are more disgusting than the altercations of the married, when in the company of friends or strangers.

VI. Never attempt to interfere in his business unless he ask your advice or counsel; and never attempt to control him in the management of it.

VII. Never confide to gossips any of the failings or imperfections of your husband, nor any of those little differences that occasionally arise in the married state. If you do, you may rest assured that, however strong the injunctions of secrecy on the one hand, or the pledge on the other, they will in a day or two become the common talk of the neighbourhood.

VIII. Try to cultivate your mind, so as, should your husband be intelligent and well-informed, you may join in rational conversation with him and his friends.

IX. Think nothing a trifle that may produce even a momentary breach of harmony, or the slightest uneasy sensation.

X. If your husband be in business, always, in your expenditures, bear in mind the trying vicissitudes to which trade and commerce are subject; and do not expose yourself to the reproach, should he experience one of them, of having unnecessarily expended money of which you and your offspring may afterwards be in want.

XI. While you carefully shun, in providing for your family, the Scylla of meanness and parsimony, avoid equally the Charybdis of extravagance.

XII. If you be disposed to economize, I beseech you not to extend your economy to the wages you pay to seamstresses or washerwomen, who, particularly the latter, are too frequently ground to the earth by the inadequacy of the wages they receive. Economize, if you will, in shawls, bonnets, and handkerchiefs; but never, by exacting labour from the poor without adequate compensation, incur the dire anathemas pronounced in the Scriptures against the oppressors of the poor.

To both Parties.—I. Should differences arise between husband and wife, the contest ought not to be, as it unfortunately too frequently is, who shall display the most *spirit*, but who shall make the first advances, which ought to be met more than half way. There is scarcely a more prolific source of unhappiness in the married state, than this *spirit*, the legitimate offspring of odious pride and destitution of feeling.

II. Perhaps the whole art of happiness in the married state might be compressed into two maxims—"Bear, and forbear;" and "Let the husband treat his wife, and the wife her husband, with as much respect and attention as he would a strange lady, and she a strange gentleman."

III. I trust much caution is scarcely necessary against flirtations, well calculated to excite uneasiness, doubts, and suspicions, in the heart of the husband or wife of the party who indulges in them, and to give occasion to the censorious to make sinister observations; and it is unfortunately too true, that the suspicion of misconduct often produces fully as much scandal and evil as the reality.

It is a good rule of reason and common sense, that we should not only be, but appear to be, scrupulously correct in our conduct. And be it observed, that, however pure and innocent the purposes of the parties may be at the commencement, flirtation too often leads to disastrous results. It breaks down some of the guards that hedge round innocence. The parties in these cases are not inaptly compared to the moth fluttering around a lighted candle, unaware of the impending danger. It finally burns its wings, and is thus mutilated for life. "He that loveth the danger, shall perish therein." "Lead us not into temptation" is a wise prayer; and while we pray not to be "led into temptation," we most assuredly ought not to lead ourselves into it. I know these remarks will be charged to the account of prudery; but, at the risk of that charge, I cannot withhold them.

IV. Avoid all references to past differences of opinion, or subjects of altercation that have, at a former day, excited uneasiness. Remember the old story of the blackbird and the thrush. "I insist it was a blackbird." "But I insist it was a thrush," &c.

The preceding rules, if as closely followed as human imperfection will allow, can hardly fail to secure happiness. And should only one out of every ten readers profit by them, I shall be richly paid for their concoction.

I cannot conclude this brief essay better than by adding the following admirable advices of Julia de Roubigné to her daughter, shortly previous to her death:—

"Sweetness of temper, affection to a husband, and attention to his interests, constitute the duties of a wife, and form the basis of matrimonial felicity. These are, indeed, the texts from which every rule for attaining that felicity is drawn. The charms of beauty, and the brilliancy of wit, though they may captivate in the mistress, will not long delight in the wife. They will shine on even their own transitory reign, if, as I have seen in many wives, they shine more for the attraction of everybody else than of their husbands. Let the pleasing of that one person be a thought never absent from your conduct. If he love you as you would wish he should, he would bleed at heart should he suppose it for a moment withdrawn; if he do not, his pride will supply the place of love, and his resentment that of suffering.

"Never consider a trifle what may tend to please him. The greater articles of duty he will set down as his due; but the lesser attentions he will mark as favours; and, trust me, for I have experienced it, there is no feeling more delightful to one's self, than that of turning these little things to so precious a use.

"Above all, let a wife beware of communicating to others any want of duty or tenderness she may think she has perceived in her husband. This untwists at once those delicate cords which preserve the unity of the marriage engagement. Its sacredness is broken for ever, if third parties are made witnesses of its failings, or umpires of its disputes."*

FAMILY RELATIONSHIP.

The marriage state is the foundation of one of the most sacred and important institutions in society—that of a family. A family is a little commonwealth, jointly governed by the parents, but under the more special guardianship and direction of the husband and father, who is morally and legally the *head of the house*. To the father the children naturally look for protection, subsistence, advice, example, and encouragement. The father, therefore, has a serious obligation to perform in the proper rearing of his children. He is bound to educate them according to his means, to support them till they are able to depend on themselves, and to have them taught a business, or put them in some other fair way of gaining an honest livelihood. The children, on the other hand, are bound to obey their parents, and to exert themselves to make them happy.

Parents are sometimes grievously distressed in consequence of the bad behaviour of their children. Their

* The above excellent admonitions to husbands and wives are from an American work, called the Philosophy of Common Sense, by Mr. Carey.

reasonable hopes are disappointed, their best feelings are tortured. An idle, ungrateful, dissolute son, is such a complicated cause of suffering, as may, if any thing may, lead one to murmur at the order of things. It may be admitted that such a parent is very likely to break out with complaints against the world. This suffering, however keen and biting it may be, is not a natural, but a moral evil. There is a moral wrong somewhere. Is it in the parent himself? Has he watched the beginning of error, and drawn his child off from the descending plane? But, perhaps, the downward course has been long begun upon, and art and deceit have made such progress that the child has been able to elude parental inquiry. This can hardly happen with a watchful parent while his child is under his own roof. Perhaps the downward course has been begun upon when a child is at a distant school, college, or in a place of business, preparing for manhood. If a parent has placed a child where he cannot superintend him, or with those who do not undertake to do this, or who will not if they do, the parent is not excused because others are in fault. A child who is sent away from home, is, as the world now is, always sent into some hazard. The hazard is, when least, that the preceptor, guardian, and master may be deceived. The seductions may be such as to plunge a boy into ruin, even before those who see him daily, and who mean to do their duty, have the least intimation of it.

Evils, such as are here alluded to, may be in some measure unavoidable in the present imperfect condition of society; still a parent ought to do all in his power to obviate them by implanting good habits in his children. It would be well, for instance, if fathers of families would endeavour to give their sons a taste for such a judicious course of reading as would lead them from the contemplation of vicious objects of pursuit. If they do so, and put them in a right bias, they may depend on them acquiring a great deal more useful knowledge after they leave school than they could possibly have learned there. Nearly all the men who have distinguished themselves in the world are found to have acquired their knowledge though private desultory study after leaving their classes; and many, in their autobiographies, trace their good fortune to the taste for reading given them by their parents.

A family of children usually consists of the two sexes. There are brothers and sisters. The intercourse which takes place between these parties ought to be of the most friendly kind. They should strive, by mutual assistance and advice, to make each other happy. In many instances, these relations make a very great mistake as to the real good of life, in not cultivating a cordial and affectionate friendship with each other. In early life they are apt to be in each other's way, and to have irreconcilable wants; thus they very soon fall into alienations. They cannot, however, shake off the laws of nature. They must have an interest in each other, whether they will or not, and it will essentially promote their mutual welfare to have a kind and gracious one. The common causes of their differences are exceedingly insignificant, and often contemptible. They will see the day when they will so think of them. The time presses hard upon them when they will need counsel, support, and some one to care for them in a manner which none but brothers and sisters can do. When all has gone on well from the cradle upwards, among such relatives, they become to each other not only the most useful friends, but the most agreeable companions. They are the natural confidants, when it would be folly to trust any one whose sympathy and solicitude may change. Brothers and sisters, who are thus bound together by affection, sometimes hazard the connection by volunteering friendly, but very unwelcome, commentaries and advice. This is a very delicate matter. Giving unasked advice on any occasion requires very great discretion. If one sees that his brother is blundering, there are many modes of so approaching him as to lead him to find that he needs advice, and of putting him in search of it. If there be a right understanding, he will go where he is sure of having the best and the sincerest. To assume a dictatorial authority over a brother or sister, is to inflict a wound on self-love which is not readily forgiven. We have already noticed the value of civility and politeness between such near connections; and we add, that sincerity and truth are nowhere more profitable and necessary. "Familiarity breeds contempt" is a true saying, and is very apt to find an application of its truth not only in the intercourse of brothers and sisters, but in that among more distant relations. We beg to warn all classes of relations who frequently meet together, against using too much familiarity, against using too little ceremony, against taking liberties with each other. Let them preserve towards one another the most respectful yet friendly terms, if they wish to avoid falling into differences. Let them remember that the quarrels of relations are almost irreconcilable, and that, even when forgiven and in a great measure forgotten, they leave very disagreeable feelings among all parties.

DUTIES OF MASTERS AND SERVANTS.

From the earliest ages down to the present time, there have been different classes of society. As elsewhere explained, this necessarily arises from the very order of society. The well-established and very proper right of inheritance, and the ability which some members of society have to acquire, and which others have not, the difference of education, and other obvious causes, necessarily produce these distinctions. Who among the various classes is the most contented and happy, is quite another matter. There must be some to serve, and some to be served. They are mutually dependent. We hear great complaints, sometimes from masters with regard to their servants, and sometimes from servants with regard to their masters or employers. This connection is regarded as one of the miseries of life; yet it is not necessarily so. If the connection produce vexation, there must be error somewhere. We shall first speak of the duties of masters, in which we always include those of mistresses.

It is the duty of masters to cultivate the esteem and affection of those whom circumstances have placed under them. Servants have the same sort of bones, muscles, heads, and hearts, the same selfishness, and the same sensibilities, as their employers. They may not be so refined, still they have rights to be maintained, and must not be tyrannized over, merely because they are in an inferior condition. They have as good a right to be happy as those above them. If they behave with propriety, and do their duty, they should be spared when sick, advised and relieved when in trouble, and be made as comfortable as circumstances will permit. The commands given to them should be plain, clear, uniform, and not contradictory or capricious. They are not to be sneered at, or commanded with virulence and reproach, but mildly, and rather by request. They are also to be treated with uniform civility; but every approach to familiarity with them should be avoided, if respect on both sides is to be preserved. It is always best to let servants know what is their duty, what is expected of them; this being beneficial to both parties. Much mischief is sometimes created by not attending to this rule.

The duties of servants to masters are equally clear. Their entering into servitude is a contract which they engage to fulfil. They are bound to execute all reasonable and proper orders in the line of service in which they are engaged. But besides this, they would consult their interests in being generally obliging and willing to assist in any kind of exigency. A seeming wish to please an employer, goes a great way to compensate

deficiencies in ability. A civil, obliging turn is indeed one of the chief virtues in a servant, and is certain to secure the affection of masters and mistresses. A strict attention to an employer's interest, regularity of habits, and perfect integrity both in speech and action, form the principal qualifications of a servant. There is usually much less actual dishonesty among servants than a regardlessness of their masters' interests and time. This is more the case with domestic than other servants. This class of persons, who are chiefly females, are very apt to encroach on the time of their employers for their own pleasure and convenience. If sent an errand, they will spend a great deal more of time in executing it than is necessary. It is an idle love of gossiping which generally produces this great failing among servants, and it is our duty here to admonish them of its impropriety. Their time belongs to their master, and it is dishonest to use it for their own purposes, unless by permission. Speaking with regard to persons in service generally, we are sorry to notice that there is a tendency to reduce the terms of contract betwixt employers and employed, to one of a purely mercenary nature—so much work for so much money. There appears to be a growing inclination to drop all kindliness of intercourse betwixt the two classes. The consequence is, that many masters feel perfectly indifferent with respect to giving employment to those who have long served them. The injury is, however, mutual; for, when servants know that they are only valued in proportion to the amount of their actual labour, and that they will be paid off without regret, they care little for a master's interest. There can be no question as to who began this improper system. It originated in servants and workmen endeavouring to establish by violence and intimidation a certain amount of wages for their labour, and which the state of society could not warrant. We earnestly trust that it is not yet too late to restore the ancient bond of sympathy betwixt every description of employers and employed. Individual and social benefit would be the result.

DUTY OF TRUSTING TO OURSELVES.

There is a duty of an important nature which we have to perform towards society; and that is, we must *trust to ourselves*. We have each been endowed with reason to guide us, and hands to work; why, then, unless prostrated with bodily disease, or some other infirmity, should we think of leaning upon others for support or assistance? It would not be desirable to see men shut up their hearts against each other, and each stand in the panoply of his own resolutions, determined against every friendly appeal whatsoever. It is possible, however, to be not altogether a churl, and yet to take care lest we be tempted into an exertion of benevolence dangerous to ourselves, while it is of little advantage to our friends. Notwithstanding the many ties which connect a man with society, he nevertheless bears largely imprinted on his forehead the original doom, that he must chiefly be dependent on his own labour for subsistence. It is found by all men of experience, that, in so far as one trusts to his own exertions solely, he will be apt to flourish; and in so far as he leans and depends upon others, he will be the reverse. But there are many who do not recognise this principle. They trust only partially to themselves, and are always poking about after large favours from friends. We find them asking loans of money, asking others to be surety for them, asking acquaintances to interfere to get places for them. If they ask for nothing else, they intrude upon their friends to seek advice. Neither physically nor morally do they seem able to exert themselves for their own behoof. This is so contemptible a mode of living, that it cannot be too severely reprehended. Those who depend on others can never succeed in life. In whatever manner they may be assisted, they can never become front-rank men in society. We would earnestly impress upon the young the propriety of depending as little as possible upon prospects of advantages from others, all of whom have enough to do with themselves. It is obviously the duty of every one to think and act for himself, as soon as he attains manhood, and neither be burdensome on relatives nor troublesome to acquaintances. The acceptance of a trifling favour from an acquaintance always lays us under an obligation, which is sometimes difficult to remove. If the acquaintance ever need similar favours, we feel bound to grant them, and perhaps he estimates the original favour so highly, that he thinks we cannot do enough to serve him. In this way hundreds of men are ruined. We would say, accept no favours, unless upon a principle of common courtesy. If you employ others to execute a piece of work, take care to pay them faithfully and promptly, and lie under no obligation to them, otherwise you may be called upon when you least expect it, to make payment an hundredfold. Be liberal, affable, and kind; but, knowing that you cannot do more injury to society than by greatly injuring yourself, exercise a just caution in giving way to the solicitations of your friends. Never be too ready to convince yourself that it is right to involve yourself largely, in order to help any person into a particular station in society; rather let him begin at the bottom, and he will be all the better fitted for his place, when he reaches it, by having fought his way up through the lower stages.

MAKING A WILL.

Much distress among families is often produced by individuals who have property to bequeath, not making a will or testament. Why such individuals do not make their wills, it is difficult to explain. Perhaps it arises from carelessness and a spirit of procrastination, or a want of resolution in men to make up their minds with respect to how they would distribute their property at their decease. Some may indeed be so foolish as to imagine that the making of their will would hasten the approach of death. From whatever cause it proceeds, it is a highly blamable failing. It is the duty of every person possessing property, whether engaged in business or otherwise, to make a will, and describe in some species of document how he would wish his affairs to be arranged in the event of his dying. There certainly are cases in which men of property would not wish their possessions to be distributed in any other way than as the law would dictate; yet it is a mark of a well-regulated mind to leave a will descriptive of the means to be pursued in the accession to, and management of, their property and concerns. To do so, at least, would often save a great deal of trouble and some expense, and be a preventive of litigation among relations. We therefore must insist that the making of a will is a sacred duty which ought to be performed, and performed without procrastination. In the midst of life we are in death; no one knows but in an hour hence he may be no more. We beseech fathers of families, and others similarly placed—those even who may have property but to the value of a few pounds—to lose no time in executing their will. By leaving so much as a letter subscribed by their name, to be opened after their decease, they may spare much vexation to those whom they hold dear; they may quench much petty jealousy, much unseemly disputation. In a country such as Scotland, where a wife dying without having had any live children, the one-half of the movable property of the husband goes legally to her relations, it is incumbent on wives so circumstanced, if they have any love and esteem for their husbands, to make their wills: that is, put in writing a simple expression of their desire that their husbands may inherit the property which belongs to the wife in virtue of their marriage. By an inattention to this easily get

formed duty, there are many litigations—many widowers ruined.

MISFORTUNES—EVILS.

Evil is a part of the system of things in which we live, and, as such, must be patiently submitted to. Man was intended to be an active creature. One of the grand aims of the Creator in his formation evidently was, that he should never settle down into a sluggish or stagnant state. It would have been easy for the divine power which breathed into him so wonderful a thing as life, to have surrounded him with nothing but blessings, as they are called, so that he would have nothing to do but enjoy himself. But this would not have produced what the Almighty wished, a world in which a rational being was to exercise his faculties, and use his endowments, with a proper regard to a certain end—an account, namely, to be rendered at the close, of what and how he had done. We are here placed between evils which we are to avoid or subdue, and good which we are to aim at and enjoy; and hence, instead of being a set of torpid machines, as we would have been in any thing like a world of perfect happiness, we are in a perpetual state of vigilance and activity, making the fullest use of those mental and bodily properties with which we have been gifted.

If we narrowly inspect the evils or misfortunes with which we are visited, we will find them invariably to be, either of two kinds. Some are the simple result of an occasional or habitual violation of the laws of nature, or an occasional or habitual failure in that vigilance and activity which we are bound to employ for the avoiding of such distresses. These may be called moral evils. The second class are the result of circumstances over which we had no control, and may therefore be called natural evils. Such a division, however, is only necessary in the present state of our attainments as a race; for there can be no doubt that means were intended to be discovered by the ingenuity of man, for the avoidance and neutralization of all evils whatever; and, therefore, in the case of what we call natural evils, we should only consider ourselves as the victims of imperfect knowledge, and be the more induced to strain after the improvement of ourselves and of our fellow-creatures, so as to obviate these as well as the rest.

Great care should be taken, when an evil befalls us, to ascertain whether it be moral or natural—in other words, whether it be the consequence of our own error, or of circumstances at present beyond our control. Our self-love makes us extremely apt to attribute all our mishaps to the latter cause; but if we are wise, we will not do so. We will rather search back unscrupulously into our own nature, or our own history, for the causes of the evil; and if we find them there, resolve for the future to be more circumspect or more active, so as to make a recurrence of the mischief less likely. The most of the accidents that occur, though they appear at first sight to be natural evils, would be found, on close inspection, to be moral. The most of the diseases that befall us could be traced to a failure in our duty to ourselves, and are therefore moral evils: the rest, such as cancers, worms, organic malformations, &c., which appear natural and unavoidable, are, we have no doubt, moral evils also. If *we knew better*, we might probably avoid them, as easily as we can avoid colds. They may be called natural in the mean time, but not so unless we strive to discover their causes, so as in the long-run to obviate them. They are certainly destined to be obviated at last, as many disorders, now understood, formerly were; and we must at present consider them only in the light of an inducement to the exertion of the spirit of inquiry.

There are some evils which we incur through hereditary channels, and are quite beyond our own control. We are charged, for instance, with the seeds of a harassing ailment, or of an early death, by the long foregone and perhaps long repented vices of our parents. But all this may be accounted for on the same principle. It has been intended that our moral natures should be so much improved, that even the possible distresses of a descendant may operate as a check to our wickedness; and what is a contemporary instance of innocent consumption but a warning to prevent us from doing that which may bring future lives into the same hazard? It is hard, in the mean time, for the sufferer; but what can we say against the course of nature? Perhaps the spectacle (and few can be more painful) of a youth dying in his very bloom, in consequence of natural debility derived from weakly parents, may be the means of preventing two persons from putting themselves into the situation for bringing on similar evils. A very high kind of conscientiousness, but one not unattainable even by ordinary minds, is called into force by the contemplation of such a case of unbought distress. A man who has any reason to fear for the validity of his own constitution, will, if fully impressed with a sense of such results, as likely to arise from his quitting a condition of celibacy, condemn himself to perpetual solitude rather than purchase an improvement of his own happiness, at the expense of unreckonable evil to others. Fortunately, society is beginning to look more narrowly into such matters than it used to do; and we do not despair of seeing a time when it will be nearly as infamous to communicate life under certain circumstances, as, under others, to take it away.

There are other evils which affect society, and which do their full part in making this a world of wo. There is squalid, miserable poverty; there is disgusting, lamentable vice; there is horrible crime, public execution, and national war. All these things, it is said, are inevitable; they spring from the nature of man, and from the laws which compel him to dwell in social connection. Those who say so are shallow thinkers. The world is naturally a beautiful world. But what God has made a paradise for our dwelling-place, mankind have often rendered a desert by their crimes. Nature and revelation alike proclaim that the Creator intended we should be happy; but how has brutal ignorance, vile intemperance, gross crime, and every species of evil desires, blighted our comforts and degraded our immortal being! It has never yet been proved that there must *necessarily* be poverty, which is the source of many evils. A striking instance of the absence of poverty in a large class of society is found in the case of the Quakers, or community of Friends. With some peculiarities in speech and dress, not worth while to heed, this numerous body of individuals act upon a fixed uniform principle of suppressing the passions. They curb the appetites and headlong impulses of human nature. In this may be said to lie the substance of sound morals. The Quakers, therefore, habitually practise what other classes only theorize upon, at least are seldom performing. The consequence of this guardedness in thought and action is, that although there are many thousands of Quakers in Great Britain, and many thousands in the United States of America, neither in the one country nor the other do we ever find a Quaker begging in the streets, or an intoxicated Quaker, or any one of this class of subjects and citizens at the bar of a criminal court! The Quakers are, like other people, engaged in the common affairs of the world; they are merchants, mechanics, artificers, mariners, and otherwise employed in the ordinary business of life. They are subject to the same temptations and perversions that we are; yet, by the exercise of a singular degree of prudence, they avoid them. Here, then, is a clear demonstration, that even without the aid of civil power, but by the mere force of moral influence, there is a class of men, in the midst of society, who do escape disgraceful poverty, and who are free from vice and crime.

With regard to death, which is so generally looked upon as an evil, and the last and worst of all, it is in reality no such thing, unless it occur prematurely, which it never would do if men were perfect in the observation of the laws of nature. As the conclusion of an existence which never could have been given if others had not died, it must be regarded as only a part of our earthly destiny, and submitted to accordingly.

INEQUALITY OF RANK AND CONDITION.

When the young grow up, they find society to consist of classes of various degrees of rank and condition; some with titles of distinction, others without any title whatever; some rich, some poor, and many in a middle state between great wealth and poverty. The youthful reasoner perhaps thinks that all this is wrong, and that by *natural right* all men ought to be upon a level. It is proper that not only the young, but others who take up notions of this kind, should be told why these differences originate, and why they exist. Mankind, we may suppose, were originally equal in rank and condition; and they might have remained so, or nearly so, had they continued to remain in primeval barbarity, and lived apart from each other. But it was not in their nature to remain in this condition. According to naturalists, man is a gregarious animal; that is, he desires to live in society. As soon as men began to consort together, they began to separate into ranks and conditions. He who was the bravest was made king; he who was the most clever or the most prudent became the most wealthy; he who was the most idle became the most poor. From this kind of beginning all ranks and conditions sprung; and subsequent events have modified society into what we now see it. It may be said that this explanation would do very well if we now found that those who enjoy distinctions in rank were the cleverest of the people; if we found that the richest were always the most deserving of riches. Here, again, we must apply to human nature.

In one sense, titles are contemptible; they are fantastic trappings which a wise man would not covet. But, on the whole, there are few men possessing that degree of wisdom and self-denial which would lead them to despise titles, or the dignities connected with them, *when applied to themselves.* As far as we can discover, the Quakers are the only people who do not regard these things. The citizens of the United States of America affect to despise titles; yet, it is curious, they give a title of distinction to their chief magistrate, whom they style "*His Excellency;*" they also write *Master*, or its contraction *Mr.*, before their names. In this we see a degree of the same vanity and weakness which affects the subjects of ancient monarchies. It would appear that there is a yearning after these follies among mankind. Be it so or not, it is an idiosyncrasy which, from time immemorial, has been seized hold of by rulers for the purpose of stimulating men to deeds beneficial to their country. The prospect of being entitled to have *Sir* written before their names, or of being called a *Lord*, induces numbers of individuals to do great and good actions, which they would not do for money. As these titles generally descend to their children, they have a double stimulant to action. Genius not being hereditary, these titles may and do fall into the possession of men of no ability; nevertheless, the stimulant to acquire titles such as they have, continues to act beneficially, as it is thought, through the nation; and they themselves feel bound to sustain a certain honourable character consistent with their rank.

The principles of human nature apply in a similar manner in solving the mystery, why there are men enjoying riches which they never wrought for, and may be undeserving of. Riches consist of that part of the surface of the earth which can be used for human habitations and their appendages; of that part which can be used to produce vegetation; of that part over which, and near which, there are flowing waters capable of imparting motion; they consist of all personal estate; and of money, the agreed representative of all property, which is, at the same time, property in itself. Possessions of these various kinds are acquired by inheritance or by industry. Right by inheritance is not wrong. Would any rational mind maintain, that, when the father of a family, or any one who has no family, has acquired property, and dies, that it shall belong of right to any and to all who can get possession, by fraud, force, or whatsoever other means they may? Society could not be held together if such were the rule of right. It is at once apparent, that if such were the rule, there would be nothing to contend for, because all inducement to acquire for the benefit of one's family and connections would be annihilated. Society would be forthwith reduced to barbarism. The right to acquire, and the right of inheritance, are wisely ordained to be a necessary consequence of society, and one of its strongest motives to act to useful ends.

If it be reconcilable to justice, to convenience, and to the common good, to take by fraud or violence that which the dead must have left behind them, much more so is it to take from the living, by like means, that which they can honestly acquire by the exercise of their own industry. If a member of a community were always liable to be despoiled of the fruits of his labour, the great principle of the system of being to which man belongs would have been misplaced: there would have been no sufficient motive to action. If one would know what society would be, if such were the law and the practice as to property inherited or acquired, he must visit countries steeped in barbarism, and on which the light of Christianity does shine.

It is contended by some persons that there should be a periodical division of land and property, and that every member of the community shall have an equal share. How often should this division be made? Shall it be made once a year, once in ten years, once in fifty years? Why should it be made at one time rather than at another? Suppose it could be made, and were made, it must be but a very short time before it ought to be made again, if the reason for making it be, that some have more and some less, and that some are rich and some poor. One must be wilfully blind not to see that either the whole action of society must stop, or that inequality of condition would arise in a single year, perhaps in a single month; and even such inequality as would call for a new division. In a country where the spirit of enterprise and speculation has an unrestrained agency, the causes of regret are, that sad reverses occur, and that property changes hands too often, rather than that it is unreasonably held in the hands of a few of their successors. A small number of generations is sure to bring equality, considering our community as a continuing one. Thus, property comes and goes, in this country, as fast as any one can reasonably desire to have it. The changes which are seen, as to the ownership of it, are regulated by authority far wiser than any of man's institution.

ON FORMING OPINIONS.

Opinion signifies belief. There are good and bad opinions. It is our duty as rational beings to cultivate good or correct opinions upon every subject, and to eschew those which are of a contrary description. There is nothing more easy than to form hasty, inaccurate opinions, but it is very difficult to form a correct belief on many topics. Opinion is found to be more or less dependent on times, circumstances, and bodily temperaments. It frequently arises out of prejudice, and is often influenced by impulse. When we form an opinion upon any subject, we are inclined to believe that all opinions

of an opposite character have been, and are, erroneous. We are apt to laugh at everybody's opinion but our own. All this betrays a deficiency of sober reflection, an ignorance of the history and faculties of mankind, and a want of knowledge of the world. The people of every country possess opinions favourable to their own fashions, customs, laws, and religion, and unfavourable to those of other nations. A love of one's own country is certainly a commendable feeling, but it should be a love arising from examination and conviction, not from prejudice. The Hindoo worships the river Ganges. *We*, by our education, know that this is nonsense. The bigoted but conscientious Turk will go to death upon it, that Mohammed was a true prophet. *We*, by our superior intelligence and reading, know that Mohammed was a vile impostor. The people who lived in our own country a hundred years ago were of belief that certain old women, whom they termed witches, could, by supernatural powers, raise tempests at sea and land, and malevolently interrupt the course of human affairs. The people who possessed this belief were perfectly conscientious in their opinion; yet *we* know that this opinion was a gross absurdity. *We* know that our ancestors believed in an impossibility. Opinion is therefore, as we see, a thing of time and place. The opinion that is supposed to be right in one century, is wrong in the next. What is considered to be a right opinion in Asia, is thought wrong in Europe. What is deemed a correct and praiseworthy belief in Britain, is reckoned an absurdity in France. Indeed, it is often seen that the opinion which is held good in one district of a country, is looked upon with contempt in other districts—so that the whole world is found to be covered, as it were, with a variety of opinions and shades of opinions, like the diversified colours by which countries are depicted in a map. Opinion, we have said, is also dependent on temperament of the body. This is a melancholy truth. A fat and choleric man does not think in exactly the same way as a lean man. A man who enjoys all the comforts which opulence can purchase, has a tendency to think differently in some things from a man who is suffering under misfortunes or poverty. So strangely constituted is the principle which governs opinion, that most men have reason to alter their opinions on many points in their progress through life. They form an opinion in youth from which in manhood they depart, and form another; and this other they modify into something else as old age comes upon them.

What does all this wonderful contrariety of opinion teach us? Since we see that opinion is dependent on the locality of our birth, on the age in which we live, the condition in which we may chance to be placed, and on the physical qualities of our bodies, have we then no power over opinion? Must we be its slave? These are questions of a solemn character, and we must answer them soberly. The contrariety of opinion existing in times and places teaches us, in the first place, *humility*, which is the foundation of many heavenly virtues. It shows us that the opinions which we may form, particularly on abstract subjects, may possibly neither be the most correct nor the most enduring. Perhaps what we have taken up and cherished as our opinion may after all be a delusion. In learning a lesson of humility and distrust of our own style of thinking, we are impressed with a tender regard for the opinions of others—opinions which, most likely, have been taken up on grounds equally conscientious with our own.

Although opinion is commonly dependent on those contingent circumstances which we have noticed, it cannot be allowed that we have no power over it. We have a power over the formation of opinion to a certain extent, and it is our present object to show how this power can be exerted in order to enable us the better to fulfil the duties of life. The reason why opinion is so illusory in its nature, is, that mankind have ever been excessively careless in the adoption of their opinions. They are in the habit of picking up random ideas, which they mould into an opinion; and after having made up their minds, as they call it, on what *they think* is their opinion, they will listen to no explanation of the opinions of others. Their obstinacy, their self-conceit, their self-interest, their wish to please the party to which they have attached themselves, induce them to hold fast to their original opinion, until time or experience, in all likelihood, wear it down, and its absurdity is secretly pressed upon their notice. But even after its absurdity is disclosed, they are sometimes ashamed to say they have altered it; and so, perhaps, they have one opinion which they keep locked up in their bosom, and another which they bring into daily use, and flourish before company. In the apposite language of Scripture, these men war against the Truth.

It is our duty as good members of society, and with a view to self-respect, to be very cautious in the formation, and, most of all, in the display of our opinions. Many excellent men, on arriving at middle life, have deeply regretted that they should have heedlessly published their early and hastily-formed opinions in youth. They had reasoned, as they thought, soundly, but it was without a knowledge of the world, or of its history. Speaking to the young, we would say—while yet under the training of parents, guardians, and teachers, it is your duty to receive with confidence the instructions by which it is attempted to enlighten your minds, and to put you in the way of well-doing. But these friends of your youth will probably tell you that when you pass from under their guardianship into the active scenes of life, you become a responsible being—responsible alike to human and divine laws; and that you must now think for yourself. At this critical period of your existence, you have every chance of coming in contact with the idle, the dissipated, the frivolous, who will try to make you embrace erroneous opinions, and who will possibly put the most mischievous books into your hands for perusal. Do not be led away by such machinations; neither be dismayed by the number of wits or profane jesters who may assail you. Do your duty manfully. In order that you may attain a correct opinion on the most debatable subjects that you will hear rung in your ears through life, begin a course of reading those good authoritative works which intelligent friends will recommend to your notice. Take every opportunity of cultivating your understanding, of enlarging your ideas, of removing prejudices. Look always at the different sides of a question; for you must remember that there are many ways of telling a story. In proportion as you advance in your private studies, and acquire a knowledge of the passions and conduct of mankind, you will be more and more able to form a correct opinion. There is one thing which you will learn with surprise from this kind of experience, and that is, that many, though holding different opinions, are driving towards the same end in the main. They have only differed upon trifles, and perhaps fought about mere words. This is one of the strange weaknesses of the human race, into which you will find it difficult to avoid falling. The more that you learn, the more will you see cause to entertain a liberal view of the opinions of others. It is the exercise of this liberality of mind which forms a distinguishing trait in the manners of our country. By the British constitution, every one is allowed perfect freedom of opinion, a gift above all price, which it is our duty not to prostitute or abuse. Let us form our opinions on solid grounds of conviction—let us cherish these opinions to the adornment of our lives—and let us so maintain a due regard for the opinion of others that we show forth, in our feelings and actions, that most excellent of all virtues—Charity.

These observations apply indifferently to various subjects upon which opinions may be formed; and we would, in conclusion, beg to say a few words, in particular, on opinions of a political nature, which are the most difficult of all to be correctly formed. Political opinions are applied to the theory and practice of national government. The policy of national government is not an exact science to be learned, as some would imagine. It is more a fashion than a science. It is a thing dependent on time, place, and other circumstances. The form of government which suits one age or country would not suit another age and country. Some nations are best governed by a despotism, others by a mixture of monarchy and democracy, others by a pure republicanism; but, as we say, what is best at one time is not best at another. The genius and necessities of every people are subject to change, and consequently their governments change with them. If we feel the force of these facts, we will be cautious how we assume an unalterable opinion upon any mode of administering government. The young are particularly liable to take up notions on this subject which they afterwards feel inclined to fall from. We would admonish them to read and digest the history of their country, and reflect well upon the genius of the nation, before they come to a determinate opinion in politics. They will learn, as they advance to maturity, that in nothing is there such a mass of duplicity and affectation as in political matters. They are therefore called upon, by duty, to examine extensively, and probe deeply, the grounds upon which they form their opinion. They will find it much the safest course, as already expressed, to think lightly in the matter till they have had some experience of the world, and been convinced by the evidence of their senses. National exigencies sometimes call upon us to engage more deeply in politics at one time than another. Discretion must here be our guide; yet there is generally greater danger in our wasting much precious time on political disquisition, than in falling into an apathy upon public affairs. He is a wise man who knows how so to guide his steps as to preserve himself from falling into either extreme. Every one who has been for a long series of years politically busy, will acknowledge, that though he thinks he was right in the main (in which opinion he may be right or wrong), yet, that he has spent many busy hours and anxious thoughts on subjects, which, looked back upon, are seen to have been profitless and insignificant.

DUTIES WHICH THE PEOPLE OF ONE COUNTRY OWE TO THOSE OF ANOTHER.

It is seen that all the people of the earth belong to some one of the many nations with which it is covered. It is also seen that nations are generally separated from each other, not only by language, manners, customs, religion, and forms of civil government, but also by geographical boundaries. The division of mankind into nations is natural, and possesses obvious advantages. There is a limit beyond which the government of a nation cannot well be administered. By being confined within certain limited bounds, the national institutions may be improved, security and prosperity promoted, and the interests of the people advanced. We frequently find that the people of one nation live at enmity with those of another nation. We find many at open war with their neighbours—that is, they are resorting to brutal physical force to settle a dispute. These are evils deeply to be deplored. Nations have mutual wants, which a mutual intercourse and trade will obviate. They have similar interests at stake. Their inhabitants all alike belong to the great human family, and should live at peace with each other. But ambition, and many evil passions—strife, malice, and uncharitableness—are constantly in operation to retard their advancement towards a universal philanthropy. National war is the heaviest curse which afflicts humanity. It leads to enormous debts and taxations, and in reality is the beginning of all kinds of distresses among the people. Yet the people have been frequently very clamorous for war. We say *have been*, for we hope that this sentiment will in future be otherwise regulated. We ought to impress upon our minds a suspassing horror of war. Let us think of it as the scourge of the human race, and as one more destructive, physically and morally, than the most virulent epidemic. Were the inhabitants of countries duly impressed with these feelings, did they reflect upon the blessings which are showered upon nations during a lasting peace, they would henceforth resolve to oppose, by every constitutional means, the commencement of wars by their governments. Besides the actual loss of lives and of property to a nation during war, it is incalculable the injury sustained by society by such an infliction. A war of a few years' duration may retard intellectual improvement for a century. We hold, therefore, that it is the duty of every man to discountenance such a system of folly. He cannot be a lover of his country, he cannot be the friend of moral cultivation, who would countenance such an idiotic process of settling quarrels between intelligent nations. According to a rational view of men's condition in separate nations, war can in no case be reconcilable with social happiness, unless on the obvious principle of self-defence. So long as there remain such masses of ignorance over the earth, so long, we are afraid, force must be employed to preserve the little spots of civilization from the flood of barbarism which might overrun them. May it be anticipated however, that this urgent necessity will not exist much longer! How glorious would be the prospect, if universal peace were permanently established! We should find one nation instructing another in all the arts and sciences of which it was itself master; we should find an honourable spirit of emulation running through the whole; and all shaping their policy so as to promote the most beneficial intercourse in commerce, literature, and refinements. In the present state of things, as far as it can be accomplished, a kind and friendly international communion is a high and moral duty. It is our duty to look with an eye of charity on national peculiarities. We have no right to insult the feelings of the people of any nation, however strange their language, their fashions, or their customs may appear to us. We have, likewise, no right to taunt them with any apparently improper characteristics in their forms of government. It is our duty to consider them as entitled to live and act according to their own fancy, as independent, responsible beings. To write, print, and disseminate any scurrilous jests, tending to lower them in general estimation, is not only immoral, but inconsistent with the principles of honour, which do not permit any one to be struck who cannot defend himself. When we therefore insult a foreign nation by our obloquy, we commit the mean and cowardly action of injuring a party which has no means of redressing the grievance.

RECREATIONS AND AMUSEMENTS.

We have often had occasion to show, that this state of being is one of alternate action and repose. There must be serious action, and there must be amusements. It was intended that mortals should be pleased and happy, if they deserve to be so. Those who maintain that life is to be an uninterrupted scene of labour and gravity, are, we hope and believe, entirely mistaken. We discern nothing in the natural world, or in man's peculiar constitution or relations, which gives the least countenance to such an opinion. Amusement, like every thing else in which free agency is concerned, may be innocent and grateful, or improper, pernicious, and introductory of the worst of evils. Young persons must have the former, or they will seek out the latter. It is the duty and the

interest of parents to lead children to take pleasure in such things as can be approved of, and to divert children from such as must be injurious to them, and afflictive to those who are deeply interested in them. We apprehend that there may be persons, and classes of persons, who will disagree with us on this subject, as they may have done on some which have been already touched upon. We should deeply regret to displease any one; but on a matter so important as the making good citizens and good moral agents out of children, one should not hesitate to speak frankly and sincerely. If wrong, persons better able to judge will take care that no evil visits them in consequence of such error.

Amusements are physical or mental. It may be more proper to say, that there may be, first, amusements which are intellectual, and, second, such as consist of some bodily motion, in which the mind is more or less interested. If there be such distinctions, athletic sports may be of the second sort. The simple use of the eye, of the ear, and of the imagination, may be of the first sort. It is believed that all amusements must have some contemplated end or result, whether that be defined and certain, or contingent. We believe so, because every thing in this world seems to be moving on to some purpose. One who is acting without knowing for what, is neither labouring nor amusing himself, but is trying to get rid of himself, and of time. The most captivating sports are those which are contingent; that is sports or occupations wherein the result may be highly favourable or otherwise. No one engages in them without expecting to come out on the successful side. Hence, hunting, fishing, horse-racing, and gaming, are of this order. The hope of success is a very high excitement, but the mortification and distress of failure ever far exceed the pleasures of success. There is a tendency to discourage out-of-door sports. This is certainly wrong. If not carried to excess, they are among the most salutary and pleasing amusements in fine weather.

Every one admits that the mind and moral faculties are to be developed, and strengthened, and made to do the best, by exercise. This is equally true of physical power. Every action which it can be proper to do at all, ought to be done in the best way, otherwise we do not answer the end of our being. In the vegetable and animal departments, all proper care and cultivation tend to use and beauty. Is there any reason why the physical powers of man should not have care and cultivation to the same ends? Those who prefer a stooping, lounging, awkward, graceless figure and motion, may be on one side of the question; those who think it was intended that man should be an upright, easy, frank, comely, and convenient being to himself, and pleasant to all within whose observation he may come, will be on the other.

Although the frame of man is so made as to permit him to assume an endless variety of positions, and to apply his strength in all of them, he does, or should, return always to an upright position. No essential deviation from this position can possibly be a natural one, but for a temporary purpose. This is proved by the framing of the human bones. This framing shows, that, when one walks, it was intended that he should be perpendicular; if he walk in an inclined position, he has not only to move himself, but to resist the power of gravitation at the same time. The muscles, in such case, have a strained and unnatural duty to perform. It seems to have been intended, by the same sort of proof, that human beings should walk with the lower limbs, that is, from the hips downward, and not with an unmeaning and ungraceful action of the whole person, as is often seen to be done.

Dancing.—As to the best modes of acquiring strength, ease, and grace, there may be very different opinions. There are many who think the discipline of *dancing* a proper mode, and others who think this highly improper. We would not run against any opinions, whether well or ill founded. But as to dancing, just like every thing else, it may be misused and perverted, or be made to be an innocent, healthy, and commendable accomplishment. There is no mode so much within the reach of the community, in general, as this. Properly taught, it brings out the power of the muscles, and gives them their natural action: all natural motion is graceful. Why should not man conform to this general law of nature? Dancing well is one mode of conforming. Possibly it is considered frivolous and corrupting. Nothing is frivolous in this system of being which is innocent, pleasing, and adapted to promote healthy action. Persons who are capable of being corrupted by dancing, will certainly find some much more effective mode to become so, if this be denied to them. Dancing among the very young is usually conducted under the eye of discreet seniors, and well-educated adults need no supervision in dancing, but that of good sense and their own self-respect. But suppose dancing could in any case be perverted, so may every thing else be. If we are not to do any thing till it is impossible to err in doing it, what will there be for any one to do?

Music.—It is one of the most convincing proofs of the benevolence of the Deity, that he has so formed the human ear as to make it capable of finding a rational and elevated pleasure from the action of sound. There might have been organs of speech, and ears to hear, without imparting to the ear the power of knowing and delighting in music. It must have been intended that this gracious gift should be used, and (most probably) as one mode of praise and thanksgiving as well as for innocent pleasure. Music is action; it is action to some end; the end is innocent and delightful. The enjoyment has the double advantage of being solitary and social. Music may be made to produce a sense of high moral feeling, and it may be made to produce a feeling of very opposite character. The same rules must be applied to this subject as to all others, that every thing was created, and for some good and wise purpose; and that every thing must act, and will act, to some useful end, if human ignorance or error do not interfere. We therefore contend that the power to make music is to be cultivated, and its benefits to be thankfully enjoyed.

It is consistent that man, as he is so superior to all other animals, should be alike superior in the making and enjoying of musical sounds. He undoubtedly is so. His voice (it would be more proper to say woman's voice) includes all the sweet sounds which can be made by all other animals. He has, by cultivating this power, by applying the atmosphere through the human lungs, and by delicacy of touch, end by bringing substances in contact with each other, and by sending the wind through that wonderful work of his own hand the organ, found the means of rendering tribute to the Most High, and of softening and purifying his own heart. No doubt, music was given to mortals for their amusement, and that it is their duty to take it in that light, and be thankful for it.

Games.—Games at cards are a very common amusement. They may be innocent, but there is nothing to recommend them. They give no action to the body; they are a very humble occupation for an intelligent mind. Whether the chances in distributing fifty-two pieces of spotted pasteboard fifty successive times in three or four hours, shall possess some of the engaged with fortunate pieces, and others with unfortunate ones, can hardly be said to be doing any thing to any useful end. When the sport is over, the thing proved or arrived at is, that in this use of three or four hours of a short life, A. counted so much, and B. so much. This, however, is not the end usually proposed in playing cards. The cards are only the machinery which, with more or less skill, submits to the laws of chance the result of emptying one

man's pocket and filling another's. A passion for this kind of gaming extinguishes, or converts into a withering curse, every fine feeling of the human heart. Time, health, property, the proper use of the tongue, character, self-respect, and peace of mind, are the sacrifices made at the gaming-table. Unnoticed by the miserable victim, the shackles of habit are put on, which no earthly power can unrivet. When the gambler's last shilling is gone, he starts, as from a dream, into a full sense of the complicated misery and ruin in which he has involved himself. He must then devote himself to infamy, and submit himself to the power of a gravitation which will bring him inevitably to the bottom of its abyss. The evils of gaming may be judged by the number of suicidal deaths which it occasions, especially in the great cities of Europe.

All gaming for property leads, in proportion to its character, to such results. The means of gaming, and especially with cards (as they are the easy and most common implements in use), are regarded with the abhorrence which is associated with them by all persons who feel an interest in the young. The young and the middle-aged have no need of cards for amusement. They may have many amusing occupations which are innocent and improving. There may be persons in an advanced time of life, who are beyond the seduction of gaming, to whom the interest of a game of cards may be an innocent and welcome amusement. Undoubtedly, friends who are met for social purposes, and who have nothing better to do with their time, hands, and minds, may play cards in a manner to give no offence to themselves or others. But it is pleasing to know that the state of improvement is such, that in most social meetings there are higher entertainments than that which cards afford, and which are justly in higher esteem.

There might be games, one would think, adapted to amuse children, and to be at the same time innocent and useful ones. Whatever they are, they must be consistent with the principle which requires a beginning, an interesting succession of circumstances, and a result worth attaining. Children must be busy. To require of them to be still, is to require what nature has forbidden. To place a child on a hard bench, and tell him to sit still there two or three hours, without any employment for his hands or mind, is as great a violation of natural law as to require of him to stand on his head for the same length of time. There is an obvious want in the means of amusing children; and we apprehend that it arises from disregarding the principles on which the construction of physical and intellectual being rests. If there were an extensive workshop, provided with every variety of tools, with a proper superintendent, to which boys might resort on some proper arrangement, and where they could make articles for themselves, there can be little doubt that it would be diligently frequented. The reason is, that their little efforts would be to some end, and by natural means. On the other hand, the gymnastic machinery is fallen into disrepute. These exercises are uninteresting repetitions to no end, except with those who know that bodily motion must be had to secure health. In such case they endure the labour for the end in view. But the amusements of the young must be of a nature to secure action to an innocent and useful end, and health will take care of itself. Perhaps there may be some persons who can follow out this matter, and invent rational amusements. They would deserve to be regarded as benefactors, and would probably find a substantial reward. We cannot but remark that there is one game, which is one of the most interesting and healthful that can be played—that of tennis, or handball. There are many things to recommend it; and among others, it is one sufficiently interesting to be played for itself, without adding to it the zest of winning or losing any thing but the game. We incline to think that it is the game, of all others, which deserves the patronage of colleges and seminaries, and is well adapted to develope the physical force.

Conversation.—The principal amusement of rational people is the interchange of thoughts by speech or conversation, which word is made out of the Latin words *con* and *versor*, and means literally *to be turned to* or *with*. The principle of this amusement is found in the law of association of thought. Intelligent persons can always make a conversation. The only difficult step is the first; that ought not to be so considered. Persons who are skilled in the art of talking can always give it a direction. The purposes of conversation are to put one's self in the way of learning something; to impart something that others want to hear; to form opinions on interesting subjects; to settle the merits or demerits of public action; to recount amusing or extraordinary facts, &c. &c. Every human being knows something which he is willing to tell, and which any other that he is in company with wishes to know; or which, if known to him, would be amusing or useful. To be a skilful conversationist, one's eyes and ears should be busy; nothing should escape his observation. His memory should be a good one, and he should have a good-natured willingness to please, and to be pleased. It follows that all matter of offence in conversation should be avoided. The self-love of others is to be respected. Therefore, no one is tolerated who makes himself the subject of his own commendation, nor who disregards the feelings of those whom he addresses. There is as much demand for politeness and civility in conversation as in any other department of social intercourse. One who rudely interrupts another, does much the same thing as though he should, when walking with another, impertinently thrust himself before his companion, and stop his progress. Under favourable circumstances, and among persons who know how to train a conversation, there are few if any amusements more grateful to the human mind. We need not say any thing of the amusement derived from reading. It is very properly one of the standard amusements of persons of all ages. The influence of the press on the character of a country is not to be measured or calculated. It is strikingly true of this admirable invention, as it is of so many other things in natural and moral agency, that, *well used*, it is an inestimable blessing; ill used, the corrupting demon of social life. Happily, attention to the proper wants of the young has required of the press its action for their benefit; not as to books of study only, but sheets of amusement.

RELIGIOUS OBLIGATIONS.

Religion signifies a system of faith and worship. Religion arises from man's perception of his relation to the system of being of which he is a necessary part. The presence and influence of religion is to be felt and manifested throughout the duration of human life, in all that is thought and done, with a view to a happier and more perfect state of existence after death. Just conceptions of the character and attributes of the Deity are of the utmost importance, especially to the young, whose minds require to be led aright in all that pertains to the great truths of religion. The religion professed in this country is Christianity—the most cheering, the most noble of all faiths. The books to which we point for instruction in the religion of Christ are those of the Old and New Testament. To them the instructors of the young will direct the religious studies of those under their charge, as may best seem fit. Besides inculcating religious obligations, these works furnish us with the most perfect system of moral duty ever promulgated. The sum of the earliest delivered moral law is comprehended in the Ten Commandments, which are as follows:—1. Thou shalt have no other gods before me.—2. Thou shalt not make unto thee any graven image, or any likeness of any thing that

in heaven above, or that is in the earth beneath, or that is in the water under the earth: Thou shalt not bow down thyself to them, nor serve them: for I the LORD thy God am a jealous God, visiting the iniquity of the fathers upon the children unto the third and fourth generation of them that hate me, and showing mercy unto thousands of them that love me, and keep my commandments.—3. Thou shalt not take the name of the LORD thy God in vain; for the LORD will not hold him guiltless that taketh his name in vain.—4. Remember the Sabbath-day, to keep it holy. Six days shalt thou labour, and do all thy work: But the seventh day is the Sabbath of the LORD thy God; in it thou shalt not do any work, thou, nor thy son, nor thy daughter, thy man-servant, nor thy maid-servant, nor thy cattle, nor the stranger that is within thy gates: For in six days the LORD made heaven and earth, the sea, and all that in them is, and rested the seventh day: wherefore the LORD blessed the Sabbath day, and hallowed it.—[By the practice of Christians, the Sabbath has been transferred to the first day of the week.]—5. Honour thy father and thy mother, that thy days may be long upon the land which the LORD thy God giveth thee.—6. Thou shalt not kill.—7. Thou shalt not commit adultery.—8. Thou shalt not steal.—9. Thou shalt not bear false witness against thy neighbour.—10. Thou shalt not covet thy neighbour's house, thou shalt not covet thy neighbour's wife, nor his man-servant, nor his maid-servant, nor his ox, nor his ass, nor any thing that is thy neighbour's."

Such was the sum of the moral law, until Christ added to it a number of the most transcendently excellent admonitions, and which are found scattered throughout the history of his ministrations in the four gospels in the New Testament. The chief moral which he inculcated was, "Whatsoever ye would that men should do unto you, even so do unto them; for this is the law and the prophets." But the whole of his sayings breathe a similar spirit of benevolence and gentleness. He preached for the first time that it had been done on earth, the doctrine of "peace and good-will towards men;" that is, universal love and peace among all mankind. "Ye have heard," said he, "that it hath been said, Thou shalt love thy neighbour, and hate thine enemy: but I say unto you, Love your enemies: bless them that curse you: do good to them that hate you: and pray for them which despitefully use you and persecute you." Again, he said, "Blessed are the poor in spirit, for theirs is the kingdom of heaven: blessed are they that mourn, for they shall be comforted: blessed are the meek, for they shall inherit the earth: blessed are they which do hunger and thirst after righteousness, for they shall be filled: blessed are the merciful, for they shall obtain mercy: blessed are the pure in heart, for they shall see God: blessed are the peacemakers, for they shall be called the children of God: blessed are they which are persecuted for righteousness' sake, for theirs is the kingdom of heaven: blessed are ye when men shall revile you, and persecute you, and shall say all manner of evil against you falsely for my sake." In this manner he taught the great necessity for being humble and lowly in spirit as the basis of all virtue and social happiness. He likewise inculcated, at different times, the necessity of putting away every thing like ostentation in doing good actions. He tells us not to give our alms before men, but to bestow them in secret; not to pray ostentatiously in public, but in a private place. No one, until he appeared, ever pointed out that there was no difference betwixt actual transgression and the wish to transgress. He tells us that sins of the heart are equally punishable with the commission of an offence. He likewise taught that men "cannot serve two masters," that is, do evil actions, however apparently trivial, and at the same time be good men. To break "the least of the commandments" is to be reckoned equivalent to breaking the whole; and it is further said, it is impossible that our oblations to God can be accepted of so long as we live in enmity with a brother; that is, having a quarrel with any one. "Leave thine offering before the altar, and go thy way; first be reconciled to thy brother, and then come and offer thy gift. Agree with thine adversary quickly whilst thou art in the way with him." Who among us, may we ask, keeps this saying in remembrance? Do all who attend the public worship of God hold it in mind?

Again, he says that we are equally to avoid hypocrisy, or a pretence of self-righteousness and ability to show our neighbours their faults, before we have put away the same or other faults from ourselves. "Hypocrite, first cast the beam out of thine own eye, and then thou shalt see clearly to cast out the mote out of thy brother's eye. Judge not, that ye be not judged." How valuable are these reproofs! Continuing to admonish us of the danger of hypocrisy, he says that we shall know men by their fruits; that is, we shall know them by their actions, not their words. "A good tree cannot bring forth evil fruit, neither can a corrupt tree bring forth good fruit: therefore by their fruits ye shall know them. Not every one that sayeth unto me, Lord, Lord, shall enter into the kingdom of heaven; but he that doeth the will of my Father which is in heaven." We are likewise told that there must be no stop to the extent of our forgiving of injuries. Being asked if we should forgive an injury for seven times, he said to those about him, "I say not unto thee, until seven times, but until seventy times seven;" by which we are to understand that there is to be no limit to our forgiveness. Three things, we are told by St. Paul, are essential—Faith, Hope, and Charity, but that the greatest of these is Charity, or a disposition to think well of our neighbours whatever may be their actions. It is also variously inculcated that charity is the first of the Christian virtues. Personifying it, it is said, "Charity suffereth long, and is kind; charity envieth not; charity vaunteth not itself, is not puffed up, doth not behave itself unseemly, seeketh not her own, is not easily provoked, thinketh no evil; rejoiceth not in iniquity, but rejoiceth in the truth; beareth all things, believeth all things, hopeth all things, endureth all things."

CONCLUSION.

We have now given an elucidation of what we consider to be the principal duties we are called upon to perform during life, both to ourselves and to others. The subject is by no means exhausted, yet enough has been said to afford human beings a view of what line they ought to follow in the pursuit of individual and social happiness. The object we held in view has been accomplished. We have, to the best of our ability, put young and old, high and low, rich and poor, *in the way* of executing their temporal duties. We hope we have shown that if man be not a happy, a grateful, a satisfied being, he must accuse himself, and not complain that the system of being to which he belongs is wrong and malevolent. We have attempted to prove that man, individually and socially, is capable of improvement; that he has removed himself from his original condition, and has advanced far in disclosing his own powers, and in applying them in the promotion of his own happiness. But it has to be added, that he has still much farther to go in the same course, that the way is known to him, and that there are no obstacles in it which he may not remove. We do not believe in the perfectibility of mankind. The crimes and follies which affect even the most cultivated of our race, tell us too plainly that there is a natural bias towards evil, which it requires the utmost skill on the part of religion and reason to counteract. The passions ever seem to stand as a barrier against human perfection, and it is only by their due regulation that we can gain so much as comparatively worldly happiness. Yet it is incalculable to what extent the exaltation of the mental faculties may be carried by systems of education, an

to what extent the community may be purified of its vices. Let us hope that nothing may occur to interrupt the physical, the intellectual, and moral improvement of society, which is now so happily in the way of advancement.

NOTE.—The former article was an abstract from the Moral Class-Book of Mr. William Sullivan, a work published at Boston, in the United States. The present is partly original, and partly selected from the same production. The heads in the present article, Duties as Subjects, as Electors, as Jurors, as Masters and Servants, Conduct at Public Meetings, Making a Will, Misfortunes and Evils, Inequality of Rank, Duties which the People of one Country owe to those of another, Duty of Trusting to Ourselves, Religious Obligations, and Conclusion, are the composition of one of the Editors, as also a number of passages in other places. It is humbly trusted that both numbers will be found to form the most complete as well as the most applicable body of admonition on the moral duties ever given to the public; and that parents and teachers of youth will find it available in their purposes of intellectual cultivation.
