Pages wholly or partially obscured by errata slips, tissues, etc., have been refilmed to ensure the best possible image/ Les pages totalement ou partieliement obscurcies par un feuillet d'errata, une pelure. etc., ont óté filmées à nouveau de façon à obtenir la mellieure image possible.

This item is filmed at the reduction ratio checked below/ Ce document est filmb au taux de réduction indiqué ci-dessous.

L'oxemplaire filmb fut reproduit grace al la généroalté de:

Le bibliothéque des Archives publiques du Canada

Les images suivantes ont 6 t́d reproduites avec le plus grand coln, compte tenu de la condition et de la netteté de l'exemplaire filmb, et en conformité evec les conditions du contrat de filimage.

Les exemplaires originaux dont la couverture on papler est imprimée sont filmés en commençant par la premier plat ot en terminant soit par la dernidre page qui comporte une empreinte d'impression ou d'illustration, soit par le aecond plat, selon le ces. Tous les autres exemplaires originaux sont filmés on commençant par le premiare page qui comporte une empreinte d'impression ou d'illustration at en terminant par la derniére page qui comporte une telie emprainte.

Un des symboles suivants apparaîtra sur la derniére image de chaque microfiche, selon le cas: le symbole $\rightarrow$ signifie "A SUIVRE", le symbole $\nabla$ signifie "FIN".

Les cartes, planches, tableaux, etc., peuvent être filmás à des taux de réduction différants. Lorsque le document est trop grand pour être reprodult on un seul clichb, il est film6 à partir de l'angle supérieur gauche, de gauche à droite. ot de haut en bas, en prenant le nombre d'images nécessaire. Les diagrammes suivants illustrent la méthode.

The lass recorded freme on each microfiche shall contain the symbol $\rightarrow$ (meaning "CONTINUED"), or the aymbol $\nabla$ (meaning "END"), whichavar applies.

Maps, plates, charts, otc., may be filmed at different reduction ratios. Those too large to be entiroly included in one exposure are filmad beginning In the upper iaft hand cornar, left to right and top to bottom, as many frames as required. The following diagrams illustrate the method:
The copy filmed here has been reproduced thanks to the genarosity of:

Llbrary of the Pubilc Archives of Canada

The lmages appearing hare are the bast quality possible considering the condition and lagibility of the original copy and in keaping with the filming contract specifications.

Original copies in printed paper covers are filmed beginning with the front cover and ending on the last page with a printed or Illustrated Impresslon, or the back cover when appropriate. All other original copies are filmed beginning on the first page with a printed or illuatrated impresslon, and ending on the last page with a printed or illustrated impression.

1803

THE ROYAL JENNERIAN SOCIETY took its rife in January, 1803, in confequence of a Requifition, figned by His Royal Highness the Duke of Clarence, feveral of the Nobility, the Lord Mayor, and many other active and benevolent Individuals of rank and refpectability, who convened a Meeting at the London Tavern, where an unanimous fentiment prevailed as to the importance of the object: the eftablifhment of this ufeful inftitution was refolved upon; a Subfeription was entered into, and an Addrefs to the Public adopted.

It has been thought proper to notice thefe circumftances refpecting the origin of the Society, as meriting the particular attention of the chief Magiftrates and principal inhabitants of the feveral Cities and Towns of the United Kingdom, with the earneft hope of inducing them to adopt fimilar meafures within the fphere of their influence; as by fuch extenfive cooperation alone will it be poffible to attain that great and defirable object, the Extermination of the Small-Pox.

## ADDRESS.

THE fubject for which we now claim the public attention is a difcovery of no common importance, which greatly involves the fafety and happinefs of mankind, and comes home to the feelings of every family, and of every bofom : a difcovery which in its confequences will not be of partial or local operation, but is equally interefting to every rank, clafs and ftation in fuciety: nor are its benefits confined to 2 fingle country, or a fingle age; they extend to the whole world, and to the remoteft pofterity.

Our familiarity with any difeafe is too apt to render us indifferent to its effects, when not immediately connected with our perfonal feelings, and to lead us to confider its ravages as refulting from the eftablifhed courfe and order of nature. It is the province of reafon to correct thefe prejudices; to roufe us from this fupinenefs; and when a difcovery is made, unequalled in the hiftory of the healing art, which af-

## (14)

fords an antidote to one of the moft fatal and diftreffing of all difeares, it would be the higheft ingratitude to the Author of our being to reject the boon fo providentially offered, fo that it becomes the duty, as well as intereft, of every individual to ufe his beft exertions in promoting its adoption and enfuring its fuccefs.

We therefore exhort every man who has any juft regard for himfelf, for his family, for his friends, or for his country, to examine and to decide.

Many centurics have now elapfed fince the SmallPox began its deftructive career, and fo widely has this calamity been extended, that fcarcely a fpot on the habitable globe has efcaped its ravages. In fome parts of the world it has appeared only at uncertain intervals, fpreading its defolating contagion with fuch rapidity as to exterminate whole tribes of people: in other countries it has taken permanent root, and by becoming as it were domellicated, has purfued a more moderate courfe of deflruction; but fill, even in this illand, and in the other civilized parts of Europe, it is actually fatal to at leaft one twelfth part of the human fpecies.

Small-pox, when received by contagiou: ciftuvia, (or in the natural way as it is termed) is, in a she eroportion of cafes, a fevere and deplorable malady, thocking and loathfome to the fenfes, and to the fufferer
peculiarly painful and diftrefling. It is almoft equally deftructive to all ranks and clafles of fociety; nor is the rifk to life the only caufe for dreading its attack; fince, even when not fatal, it often leaves indelible fcars, often produces weaknefs of fight, and even incurable blindnefs,* and tends, in a peculiar degree, to excite fcrophula and other difeafes.

To mitigate the feverity of Small-pox, the practice of inoculation was introduced into England about eighty years ago, and has spread at different periods, (though flowly and partially) into the moft civilized parts of Europe. Many were the difficulties it had to encounter from prejudice, ignorance, and timidity, and from the unfkilfulnefs of its earlieft promoters; but experience has fo fully eftablifhed its character, that the eminent fuperiority of the inoculated over the natural Small-pox has long ceafed to be called in queftion.

However, the friends of Small-pox inoculation have had to lament imperfections which no art could obviate, and to deplore an evil of no inconfiderable magnitude, which has attended its partial adoption. Though its mildnefs, compared with the natural dif-

[^0]eafe, has been fuch as to reduce the number of fatal cafes from one out of fix infected perfons (the average proportion of death by the natural Small-pox) to about one in three hundred, ftill this degree of rik muft give fome alarm to the anxious parent, when the life of a beloved child is at ftake; nor has inoculation been able in all cafes to prevent the unfightly fcars and deformities, and the fubfequent injury to general health, which are the lamentable confequences of a fevere form of this difeafe. But the pofitive evil produced by the partial adoption of Small-pox inoculation has been a more extenfive propagation of the diforder in the natural way; for though this contagion might perhaps have been exterminated by a vigorous fyftem of univerfal inoculation carried on at the fame time in cvery part of the kingdom, yet as this plan was never purfued, the neceffary confequence has been, that whilft individuals have been receiving the infection by the mild method of inoculation, they have been uniformly fpreading it abroad under the terrible form of general contagion. Before inoculation was introduced, many remote and little frequented fituations might be found, where the inhabitants had efcaped the Small-pox during the courfe of a long life: but fince this practice has been ex-

## (17)

tended widely, and without precaution (the intercourfe between diftant parts of the kingdom having at the fame time become more frequent), fcarcely a village or hamlet in the moft retired corner of the ifland can be pointed out, which has not been repeatedly vifited by this contagion. Inoculation, therefore, has been faving with one hand, and deftroying with the other; and authentic documents prove an actual increafe of late years in the mortality of Smallpox of about feventeen in every thoufand. On a fair unexaggerated ftatement, three thoufand lives in London and its immediate vicinity, and forty thoufand in the United Kingdom are annually the direct victims of the Small-pox, befides a great mortality occafioned by diforders confequent upon this difeafe. Other countries fuffer ftill more from this calamity than our own; and it is important to remark, that this facrifice of life occurs for the moft part at an early period, to thofe who might otherwife have become ufeful and valuable members of fociety.

All the difadvantages under which the inoculation of Small-pox has hitherto laboured, all the rikk to life and general health which has attended its ufe, and all the hazard of fpreading a moft dangerous contagion, are now however completely removed by the invalu-

## (18)

able difcovery of our countryman Dr. Jenner. A difeafe has, from time immemorial, been known in certain parts of the kingdom to exift in the Cow, to be communicated from this animal to the hands of milkers, and to fecure perfons, thus infected, from ever after receiving the contagion of Small-pox. This difeafe Dr. Jenner has moft happily applied to the purpofe of inoculation; and the ineftimable advantages, which it is found to poffefs, are fo fully eftablifhed by many thoufand experiments, as to emable us to affert, without fear of contradiction, that by this eafy, fafe, and effectual procefs, the Small-pox may be fpeedily exterminated from this kingdom, and ultimately from the whole earth.

The following are the peculiar advantages of the new inoculation: It is never contagious by eflluvia, or by any other known mode of infection, except by actual contact or infertion of matter; and this fingle circumftance gives it the moft decided fuperiority over the common inoculation, fince it obviates the moft important objection urged againit this practice on the ground of its fpreading a dangerous and highly contagious difeafe. Even in other refpects it is preferable to Small-pox inoculation, for while it gives as perfect a fecurity from all future contagion, it affords
this invaluable benefit on much eafier terms: The inoculated Small-pox, though mild in moft inftances, is fometimes fevere, and occafionally fatal: the inoculated Cow-pox, on the contrary, is almoft invariably mild, requires no confinement, and feldom any medical treatment, produces no eruption beyond the part inoculated, leaves no injury to the general health, and, if we may form any conclufion from the extenfive experience of Dr. Jenner and other medical practitioners, will, when properly conducted, never endanger life.

The intereft excited by this difcovery has been, in fome degree, though not entirely, proportionate to its high importance. The new inoculation has been extenfively patronifed in this its parent country by a large body of enlightened and liberal men, and by numerous public inftitutions, whilft many forcign nations, with a deference to this country, highly flattering to its exalted reputation for good fenfe and liberal enquiry, have already adopted, and are rapidly extending it to every quarter of the globe. Above all, the Britifh Parliament, after a long and accurate inveftigation of its merits, has given it the fanction of public approbation, by beftowing a reward on the difcoverer of this invaluable bleffing.

It muft be admitted that the new inoculation has met with fome oppofition, and objections have been urged, which it would be uncandid to pafs over in filence. Some of thefe objections, and certainly the moft weighty, relate to matter of fact and actual obfervation; others have a more vague and uncertain bafis. It is unqueftioned, that fome cafes have occurred, in which a fuppofed inoculation of Cow-pox has failed to produce the promifed fecurity : other cafes have been met with, in.which the fymptoms of the difeare induced by inoculation are ftated to have been fo fevere, and even fatal, as to perplex and aftonifh thofe who had been accuftomed to view in the new practice nothing but an uniformly mild, fafe and effectual preventive of a moft formidable contagion. In anfwer to thofe objections, it might be urged, that were all the alleged inftances of ill fuccefs acknowledged to be true in their fulleft extent, and the mildnefs of Cuw-pox allowed to be only proportionai, ftill this proportion, compared with the moft favourable inoculation of Small-pox, would give the new practice a moft decided claim to the preference of individuals, whillt its uncontagious mature (which is not difputed) would equally recommend it to public approbation. But it would be highly unjuft to the merits of Cow-

## ( 21 )

pox inoculation to make this conceffion. The action of Cow-pox does not prevent the conftitution from being at the fame time attacked by infantile and other prevalent difeafes, fo that the few cafes of fatal termination imputed to this fource may fairly be afcribed to the concurrent operation of fome nortal diforder wholly uncomnected with the new inoculation. It is the more candid to allow of this explanation, fince by far the greater number of the fuppofed failures have been actually traced to fome palpable mifreprefentation of facts,* or have been moft fatisfactorily accounted for, from the want of experience in the infancy of the practice, to afcertain the characteriftic marks of the true difeafe. To conduct with fafety and propriety this inoculation, fimple as it is, an accurate knowledge of its genuine appearances, and of the fpurious varieties which fometimes intrude, is indifpenfably neceffary; its fimplicity has introduced fome degree of careleffnefs in attending to its real character; fome precautions, not at firft noticed, are now found to be requifite;

[^1]for, as the fuccefs of all medical practice has experience for its bafis, it would have been wonderful indeed, and next to miraculous, if every circumftance relating to the new inoculation had been at once fuggefted to the minds of its earlieft promoters by intuitive perception.

Certain opponents of the new practice have fpread an alarm of fome terrible calamity, fome myfterious change in the very nature and propenfities of the human race, to be apprehended from the introduction of a difeafe originating in a brute animal. To fuch an objection as this, which has never been fairly brought forward, and is even now almoft entirely abandoned, what more need we fay in reply, than that it is a mere creature of the imagination, not only unfupported by a fingle fact, or probable analogy, but actually deftroyed by the experience of time immemorial, in the countries in which Cow-pox was firf difcovered ? Since then the infection derived immediately from the animal is found entirely free from thefe objections, and fince fucceflive inoculations from one human fubject to another have hitherto produced no other effect, than to mitigate all the fymptoms that attend the original difeafe, what is there of prefumption or rafhnefs in endeavouring to root out from the human race a prefent evil of gigantic magnicude, by the fub-

## ( 23 )

Stitution of a mild and benign diforder, derived from an animal fo long devoted to the fervice of mankind ?

Still, however, there are fome who without openly controverting the fuperiority of this new difcovery, reject it in practice, fimply becaufe the Small-pox inoculation has fucceeded with themfelves and their families to the utmoft of their wifhes. But will not the feeling and confcientious parent experience fome uneafinefs in reflecting, that whilft his own child is receiving the antidote, it is at the fame time fyreading the poifon, and bringing into imminent danger the children and families of thofe, who have not thought proper, or found it convenient to refort to the fecuricy afforded by inoculation. On this very account, Smallpox inoculation, in feveral well regulated countries, has been prohibited $\mu$ nder heavy penalties, or practifed under fevere reftrictions.

So rapidly is the new inoculation fpreading throughout the kingdom, and fo ardently is it now patronifed by private and public favour, that we cannot but entertain the hope, that the inhabitants of this country will now eagerly unite in the great undertaking of extending it over every part of the Britifh empirc. The time is arrived when all that was requifite for experiment has been more than amply fulfilled, and a farther delay in the gencral adoption of this beneficial

## (24)

practice, is only to allow needlefsly of the lofs of thofe thoufands of lives that yearly fall a facrifice to the contagion of Small-pox. So completely is the extermination of this deftructive difeafe within our controul, that could inoculation begin at the fame time over every part of the kingdom, a fingle year, a fingle month, almoft a fingle week, would annihilate a peftilence which twelve centuries have been eftablifhing.
'To promote this laudable work by the high example of exalted patronage, by the advice and afliftance of public bodies long accuftomed to lead and direct general opinion, by the active exertions of men habitually employed in carrying into execution the noblest and moft extenfive undertakings, by the united fkill and advice of the medical profeffion in every part of the kingdom, and by every other method of encouragement and perfuafion, is the object of our Society; nor have we any fear of being accufed of prefumption in undertaking more than we can hope to accomplifh, when His Majefty has been pleafed to give the Society his exprefs fanction, by condefcending to become its patron; and when we can boaft of the higheft additional fupport and affiftance which the empire can beftow.

With fuch exalted claims to public encouragement, with fuch pure and unbiafled motives of general good, with an object of fuch magnitude to be accomplifhed

## ( 25 )

by means fo fimple, fo fecure, fo effectual, a fo entirely within our command, we look with full confidence to the Britifh public for the moft cordial affiftance, and zealous co-operation, and for the cheering influence of perfonal example to remove prejudice and difpel doubts: we expect that the enlightened, the benevolent, and the opulent will condefcerd with patience and firmnefs to reafon with the uninformed, and will affift this Society with contributions, with advice, with example, and with perfuafion. It is not in the courfe of human probability that centuries will again prefent fuch an opportunity of doing good; the means are not given to every age to difarm the dreadful energy of a peftilence, which regularly deftroys one twelfth part of the human race; and as this our native ifland has been the noble fource of this benefit to mankind, let us be the firft to carry to its utmoft extent the bleffing which Providence has put into our hands; fo that the contagion of Small-pox may be known to our pofterity only in hiftory, and recorded as the defolating calamity of twelve centuries, at laft fuccefsfully refifted by medical fkill, and fubdued by a noble effort of public fpirit and perfeverance.

# PLAN AND REGULATIONS 

## OF THE

## SOCXITV.

I. That this Society, having been horbured with the gracious patronage of their Majeftics', be denominated "The Royal Jennerian Society for the Ex. "termination of the Small Pox."
II. That this Society do confift of a Patron, a Patronefs, Vice-Patrons, Vice-Patroneffes, Sub-Patroneffes, a Prefident, Vice-Prefidents, Governors, Truftees, Directors, a Medical Council, and fuch' other officers as may be neceffary for conducting the bufinefs of the Society.
III. That Subfcribers of One Guinea annually, or of Five Guineas and upwards at one payment, fhall be confidered as Governors of the Society.
IV. Any perfon, upon the payment of a legacy of Twenty Guineas and upwards to the Society, fhall become a Governor.
V. There fhall be four Gencral Courts held in every ycar, viz. on the firft Wednefday in March,

## ( 27 )

June, September and December.
 fall be called by advertifements meted in fix of the morning papers, at leaf one week previous to the meeting. At there meetings twenty-four fall form a quorum.
VI. A Vice-Patron, the Vice-Prefidents, or, in their absence, a Member of the Board of Dinctors, hall take the Chair at
 debates.
VFI. al any General Court, the outran fall commelee by reading to Minutes of the lat General Court, and the Minute of the intervening meetings of the Board of Directors, and of the Medical Council, nAnce the Preceding Ge of Cost Court.
VIII. The proptefs of the Inflation shall be laid before each of pe General Courts, by the Board of Directors and the Medical Council.
IX. At the Geneal Court in M. h, a Report of the fate of the Society hall be laid before the Governors: the Board of Directors and Medical Council fall be appointed, when of each body one fourth fall go out of office by rotation. (The rota in the firft inftance to be determined by numbers and lots.)

## ( 28 )

X. The Board of Directors fhall be empowered to call a Special General Court, whenever they deem it expedient.
XI. Any twelve Governors may call a Special General Court by a requifition, fpecifying the bufinefs in writing, to the Secretary of the Board of Directors, who fhall give notice in fix Morning Papers, and fend fummonfes to each Governor (refident in or near the metropolis,) four days at leaft before fuch meeting fhall be convened.
XII. No new Law, nor abrogation, nor alteration of any exifting law fhall be valid, unlefs confirmed at a fubfequent General Court.
XIII. All Queftions brought before a General Court fhall 1 : determined by a majority of the Governors then prefent.
XIV. In cafes of equality of Votes at any Court, Board, or Committee, the Chairman fhall be entitled to a cafting Vote.
XV. Ladies, Peers, Members of Parliament, and Vice-Prefidents may, on all Queftions to be decided by Ballot, vote by Proxy, given to any Governor.

## ( 29 )

XVL. No Governor, who fhall be more than one Year in Arrear, fhall have any power or privilege as a Governor, until fuch Arrear be paid.
XVII. After the prefent Year (1803) no Perfon fhall be entitled to vote on any Election at a General Court, who has not been a Governor fix Calendar Months.
XVIII. No Perfon fhall vote on, or be prefent during the decifion of any queftion, in which he is perfonally interefted.
XIX. Every Governor may recommend any number of Patients for the benefit of inoculation.
XX. There fhall be an Annual Feftival on the r 7 th of May, that being the Birth-day of Dr. Jenner.This Feftival flall be under the direction of twelve Stewards, ammally appointed by the Governors.

At each Anniverfary the Stewards fhall be requefted to prepare twelve new Stewards for conducting the fucceeding Feftivals. No Steward fhall be liable to 2 grenter expsuce at the Anniverfary Feftival than Five Guineas.
XXI. The number of Vice-Prefidents and of SubPatroneffes fhall not be lefs than fifty each.
XXII. The Board of Directors, in addition to the Patrons, Patroneffes, Prefident, and Vice-Prefidents, thall confift of forty-eight Governors who are not of
the medical profeffion; Five of whom fhall be a quorum. This Board fhall manage the general affairs of the Society, and fhall meet on the firft Wednefday in every month, or oftener if they deem it neceffary.
XXIII. The Medical Council fhall confift of a Prefident, Vice-Prefident, and forty-eight other Governors of the medical profeflion, who fhall meet. every Thurfday, or as often as they fhall judge it neceffary; Five of whom fhall be a quorum.
XXIV. The Medical Council fhall affign diftricts in the Metropolis and its environs, appoint medical practitioners to inoculate in the refpective places, give inftructions, fuperintend the medical concerns of the Society, and make report to the Board of Directors of the progrefs of inoculation in the refpective ftations.
XXV. The Board of Directors and the Medical Council fhall reciprocally communicate their proceedings.
XXVI. The Metropolis fhall be divided into twelve diftricts, or more if neceffary, each of which fhall have an inoculator or inoculators: and for the prefent, the following diftricts fhall conflitute the faid divifion.
1.-Mile End and Lime-houfe.
2.-Ratcliffe.
3.-Spitalfields and Bifhopfgate.
4.-Hoxton and Bethnal-Green.
5.-WCripplegate and St. Luke's.
6.-City.
7.-Clerkenwell.
8.-St. Giles's.
9.-Mary-le-bone
10.-Weftminfter.
11.-St. George's Fields and Lambeth.
12.-Southwark and Suburbs.*
XXVII. There fhall be three Truftees who fhall be annually elected at the General Court in March.They fhall receive all money due to, and by order of the Board of Directors fhall pay all moncy due from the Society, and keep an account of all fuch reccipts and payments.
XXVIII. The accounts of the Truftees flall be audited by three Auditors appointed at the General Court in December, and their report fhall be laid before the Society at the General Court in March.
XXIX. All Sums of Money, for which the Directors Thall judge there fhall be no prefent occafion, fhall be by thcir order to the Truftees vefted by them, in their own names, in the public funds.
XXX. The appointment of a Secretary and Officers

[^2]
## ( 32 )

of the Board of Directors, and of the Medical Council, Thall be vefted in thofe refpective Boards, fubject to the approbation of a General Court.

The Secretary of the Board of Directors Mall officiate at all General Courts.
XXXI. All other Officers, whofe Election is not otherwife provided for, fhall be elected by the Governors at large.
XXXII. In a central part of the Metropolis, a Houfe fhall be prepared, which fhall be called, The Houre of the Royal Jennerian Society, for the Extermination of the Small-pox.
XXXIII. In this Houfe, Accommodations fhall be provided for conducting inoculation, and for the Meetings of the Board of Directors, and the Medical Council.
XXXIV. To this Houfe all correfpondences flall be addreffed, and applications made for the matter of inoculation, which thall be furnifhed free of expence to fuch medical practitioners as may apply for it, and to others whom the Medical Council may approve, the names of whom thall be regittered.

## REGULATIONS FOR THE CENTRAL HOUSE.

THE Central Houfe of the Inftitution, Salifbury Square, Fleet Street, will be open for Inoculation -for advice on cafes and fubjects connected with the vaccine practice-for diftributing vaccine matter and inftructions; and for all other public bufinefs of the Society, from the hours of Ten in the forenoon till Three in the afternoon every day, except Sundays: during which hours perfons of all ages may attend for inoculation, free of expence, and applications may be made to the Refident Inoculator and Secretary for the above purpofes.

Two Phyficians and one Surgeon of the Medical Council, are officially attached to the Central Houfe for every month in rotation; to vifit during the hours of public bufinefs as often as they may deem neceffary; and to be reforted to for advice on particular cafes by the Refident Inoculator, whenever he may fee occafion for it.

Perfons having been inoculated at the Central Houfe are required to attend there every fourth day, till they are informed that fuch attendance is no longer necesfary.

## ( 34 )

## RECULATIONS FOR THE STATIONS.

Persons of all ages may attend for Inoculation free of expence, and applications as at the Central Houfe may be made at any of the Inoculating Stations of the Society, on Mondays, Tuefdays, Thurfdays, and Fridays, from the hours of half paft Nine till Eleven in the forenoon.

Two Confulting Phyficians are attached to each of the Inoculating Stations, to attend as often as they Thall think proper; and to give their advice whenever it is requefted by either of the Inoculators of the ftations to which they belong.

Two Surgeons appointed to each of the inoculating ftations attend at the prefcribed hours in rotation. Their office is, to inoculate patients, to give advice when called upon in matters relating to vaccine inoculation, to diffribute vaccine matter and inftructions to fuch as may apply for them, and to regifter the inoculating practice, with the cafes on which they are confulted, and the names and places of abode of the perfons to whom the matter and inftructions are given.

## REGULATIONS FOR THE ATTENDANCE OF THE PATIENTS.

Persons having been inoculated are required to attend at the fame inoculating ftation, three or four times, or oftener if defired, in the courfe of the next enfuing fortnight, viz. on every other inoculating day;-in order that the progrefs of the inoculation may be carefully obferved, fo as to fatisfy them of being fecured from the Small-pox for ever afterwards: and alfo that every cafe may be duly regiftered.

Particular care muft be taken to avoid injuring the inoculated arm by fqueezing, rubbing, or fcratching the part;-by the preffure of tight fleeves, or otherwife.

Perfons inoculated are not required to take any medicine, nor to obferve any particular regimen refpecting diet or exercife; or other care than fuch as is at all times neceffary for the prefervation of health.

## INSTRUCTIONS FOR VACCINE INOCULATION.

AN ACCURATE KNOWLEDGE OF THE SIGNS OF INFECtION, AND OF THE CHARACTER AND PROGRESS OF THE VACCiNe vesicle, is essential to the success of THIS INOCULATION.

> The Signs of Infection, and Defcription of the Vaccine Veficle.

WHEN Vaccine Inoculation proves fuccefsful, a fmall red fpot, with a degree of elevation which may be felt, commonly commences on the third day. When examined with a magnifying glafs, it feems to confift of a fmall tumour, furrounded by a flight efflorefcence.

Between the third and fixth day, a veficle appears; the fhape and magnitude of which depend much on the mode in which the inoculation has been performed: when it is performed by a flight puncture, the veficle will be fmall and circular.

## ( 39 )

The edge of the Vaccine Veficle is elevated and well defined; the centre is depreffed, and a fpeck is there vifible, of a darker colour than the reft of the furface. This veficle is diftinguifhed from other veficles by the peculiarity of its ftructure, which is cellular, and fomewhat hard and firm. At firft it is of a light pink colour, fometimes blended with a bluifh tint, graduaily changing in its progrefs into a pearl colcur. Its contents are limpid, and almoft colourlefs. It commonly increafes in fize till about the tenth day.

In its early ftages it has ufually a fmall inflamed ring round its bafe, which about the ninth day begins to fpread rapidly; and about the tenth forms anAreola, niore or lefs circular, an inch and half or more in diameter. This areola is of a pink, fcariet, or crimfon hue; and is attended with fome degree of hardnefs and tumefaction. It continues nearly ftationary a day or two, and then begins to fade; fometimes forming on its decline, two or three concentric circles.

When the areola is perfectly formed, the veficle begins to decline : firft it turns brown in the centre; then it is gradually converted into a hard, fmooth, fhining fcab, of a dark mahogany brown colour, approaching to black; and, in its general appearance, has not unaptly been compared to the fection of a tamarind fone. This fcab commonly falls off about the end of the third week; and leaves a circumficribed

## ( 40 )

cioatrix, clearly denoting, that the true fain has been affected.

In the computation of time the day of inoculation is to be confidered as the firft day.

## Occafional Deviations of the Vaccine Veficte, from its ordinary appearances and cbarater.

Deviations are occafionally met with, even in the genuine vaccine veficle; chiefly with regard to its rife, duration, and contents.

It feldom or never appears earlier, but often later than the period already mentioned; fometimes not till after the expiration of a fortnight or three weeks; but if it then makes a regular progrefs, it renders the patient equally fecure, as if it had appeared at the ufual time.

Sometimes the veficle is ruptured by external violence. In that cafe, the fcab will in general be lefs firm, and of a lighter colour. Occafionally alfo, inftead of the regular progrefs to deficcacion, as above defcribed, it paffes into a ftate of ulceration, with a much more extended inflammation.

The coatained fluid inftead of being limpid as ufual, is now and then found opake.

## (41)

## Spurious Putulues,

which afford no fecurity againf the Small-Pou.
The fuccefs of the operation is doubtful, when there is any confiderable deviation from the ufual courfe of the difeafe; whether premature inflammation, irritation, itching, or vefication occurs; or the progrefs of the veficle is too rapid, its contents yellow or opake, its texture foft, its centre elevated, or its form not well defined; or whether a premature efflorefcence takes place, and a diftinct, vivid, circumfcribed areola is wanting.

This anomalous veficle, or fpurious puftule, as it is called, is more liable to be broken than the regular genuine veficle, from its centre being more elevated, and its texture lefs firm. When broken, it is frequently fucceeded by ulceration; or by a light brown, or amber-coloured creeping fcab.

## ( 42 ) <br> Probable Caufes of Spurious Puffules.

Spurious puftules may be occafioned not only by matter taken from a fpurious puftule, but alfo by matter taken from a genuine veficle at too late a period; or by that which has been injured by keeping, expofure to heat, or any other caufe. They may alfo be occafioned by ufing rufty lancets in inoculating;-by rude and unikilful methods of performing the inoculation; or by the genuine veficle having been deftroyed at an early ftage; and the regular progrefs of the difeafe thus interrupted.

## The Mcthods of taking Vaccine Matter for

Invculation, and of preferving and conveying it.
Matter may be taken from a genuine veficle at any time, from its commencement till the areola begins to fpread; commonly till the eighth or ninth day, fometimes later, but never after the areola is fully formed

It is to be taken by fmall iuperficial punctures, made in feveral parts of the veficle with the point of a lancet introduced horizontally. Time fhould be allowed for the fluid to exude, which will appear on
the veficle in the form of fmall pellucid drops. If neceffary, very flight preffure may be applied with the flat furface of the lancet, to quicken the difcharge.

Great caution muft be obferved in this procefs; or violent inflammation, and extenfive ulceration may fometimes enfue.
The matter may be received on the points of common lancets, when it is defigned for ufe immediately, or within a very few days; otherwife thefe inftruments cannot with propriety be employed either for the prefervation or conveyance of vaccinc matter, as when charged with that fluid they foon ruft. An ivory lancet is not liable to this objection. It may be fixed in a handle, and fcrewed into a cafe, in order to exclude air.

A common method is, to take two fmall fquare picces of glafs, on the centre of one of which the matter may be received, by applying the glafs to the veficle, punctured in feveral places in the manner before defcribed, and covered with the fluid : it may then be fuffered to dry, and applicd to the veficle repeatedly. When fully charged, and dry, it is to be covered with the correfponding piece of glafs, and wrapped up in writing paper, or goldbeater's fkin.

Matter may alfo be taken on thread, which, being imbued with it, muft be fuffered to dry, and then

## ( 44 )

charged again : this procefs may be repeated till it is well faturated : it may be kept in a phial, or in a quill, or a piece of a tobacco-pipe, fopped with white wax: -the heat neceffary to melt fealing-wax might injure the matter.

Another way of preferving matter is to take it on the end of a quill, which, when dry, may be inferted into the barrel of another quill : or if flender portions of a quill be pointed like tooth-picks, a number of them, when charged, may be inclofed in the barrel of one quill. Thefe, as well as the thread, afford convenient modes of conveying the matter in a letter to any diftant place.

A fmall inftrument made of ivory, fhaped like the tooth of a comb, and pointed like a lancet, which may be called a Vaccinator, is in every refpect as well adapted to the fame purpofe; and not being liable to bend, it is introduced into the puncture with more eafe and certainty than the tooth-pick. Thefe inftruments require much lefs matter to charge them than thread or glafs; but when they are not intended to be ufed foon, they ought to be repeatedly charged.When they are to be ufed in a fhort time, it is fufficient to wrap them in paper.

Matter muft always be allowed to dry without heat in the fhade, and be kept in a dry and cool place.

## ( 45 )

## The Modes of Inoculation.

The confitutional, as well as the local fymptoms of the Vaccine Affection, depend in a great degree on the mode in which the virus is inferted. The fmaller the wound of the $\mathbb{f k}$ in is, the lighter in general is the difeafe.

Fluid matter is better than dry, when it can be procured, becaufe it is more likely to produce infection; and the operation is more lightly and quickly performed. Hence it is evident, that in every inftance where it is practicable, the patient from whom the matter is to be taken fhould be prefent, and the matter thould be transferred immediately from arm to arm.

Inoculation is generally performed in the upper arm, near the infertion of the deltoid mufcle; but in fome adults, who are likely to ufe the arm much, it is more advifeable to inoculate on the infide of the leg, a little below the knee.

The point of a lancet being charged, the fkin fhould be fretched, that the cuticle may be penetrated with
( 46 )
more eafe.: A fmall fuperficial puncture is then to be made with the point of the lancet, which will be more likely to leave the matter in contact with the Ikin, and to produce the defired effect, if it be held nearly in a horizontal direction. It is alfo worthy of remark, that when held in this direction, the lancet meets with greater obftruction when it has penetrated to a fufficient depth. On the contrary, when it is inferted in a more oblique or a perpendicular direction, it often penetrates fuddenly to fuch a depth as to caufe an effufion of blood, which wafhes away the matter, and prevents the operation from fucceeding. In order to render infection more certain, the point of the lancet may be charged with matter a fecond time, and wiped on the puncture.

When feveral fucceffive inoculations are to be performed, the lancet fhould be dipped in cold water, and wiped after every puncture.

Dry matter has been fometimes known to fucceed after the expiration of feveral months, but that which is recent is always preferable.

Dry matter on glafs may be moiftened with a little cold or tepid water on the point of a lancet, allowing it fome time to diffolve, and blending it by a little friction with the lancet. It mult not be much diluted,

$$
(47)
$$

but of a thick confiftence. It is to be inferted in the fame manner as the recent fluid.

Dry matter on the barrel of a quill may be applied without dilution, to a very fmall abrafion or incifion of the fkin; and, being held in contact for fome time, and then repeatedly drawn over the part, it will diffolve and be lodged in the wound.

When ivory lancets, toothpicks, and vaccinators, charged with dry matter, are ufed, the matter fhould not be firft diluted, but a puncture having been firft made with a common lancet, the point of the inftrument is to be inferted, and held in the puncture half - minute or more; when the matter will gradually thelve, and remain in the part. If the part of the inftrument which is charged, be afterwards wiped repeatedly upon the edges of the puncture, it will tend to enfure fuccefs.

Thread, charged with dry matter, may be ufed either dry or jult moiftened with cold or tepid water. A flight incifion or abrafion is then to be made, not more than an eighth part of an inch in length, on which a fmall portion of the thread is to be placed. This is to be covered with a fmall bit of paper, and to be retained two or three days by a mild adhefive plaifter : what is called court plaifter is liable to produce irritation.
( 48 )
Ineculated patients muft be cautioned not to wear tight fleeves, and not to injure the arm by preflure, friction, or any other violence, left extenfive inflam$m$ - on or ulceration fhould enfue.

One vaccine veficle fecures the patient from all danger of the fmall-pox; but in many inftances it is better to inoculate in both arms, efpecially when the fmall-pox is epidemic, or the matter is dry, or the place of the patient': refidence diftant.

Lancets ufed for inoculation fhould be kept clean and bright.

Constitutional Symptoms.
The conftitutional fymptoms fometimes occur at a very early period; but more commonly from the feventh to the eleventh day.

In fome cafes the patient is drowfy; in others reftiefs. Sometimes there is a chillinefs, lucceeded by heat, thirf, head-ach, and other marks of febrile affection. Now and ther a ficknefs or vomiting takes place, efpecially in infants.

The conftitutional fymptoms, of whatever kind, are in general flight and tranfient, and fuch as require no remedy.

## ( 49 )

In a great proportion of cafes there is no perceptible indifpofition; neverthelefs, the perfon vaccinated is not the lefs fecure from the future infection of the Small-pox, provided the progrefs of the veficle has been regular and complete.

Care mult be taken not to confound the fymptoms of infantile or other difeafes with thofe of vaccine inoculation.

## Medical Treatment.

In general no medicine :s required in this mild affection; but if the fymptoms happen to run a little more high than ufual, the fame remedies are to be applied, as if they proceeded from any other caufe.

No preparation is neceflary; and no cathartics need be given either before or after vaccination.

Should inflammation of the arm exceed the ufual bounds, which rarely happens but from tight fleeves, preffure, or friction, it may foon br checked by the very frequent application of compreffes of linen dinped in water, aqua lithargyri acetati nmpofita, or a folution of one drachm of ccruffa acetata in a pint of water. Thefe are to be applied cold.

If the fcab be rubbed off prematurely, and ulceration take place, cooling and aftringent applications
may be ufed, fuch as a drop of aqua lithargyri acetati, which fhould be allowed to dry on the part, and then be covered with compreffes, dipped in water, or 2n f the faturnine applications above mentioned, and frc, ;iently renewed.
When the ulceration is deep or extenfive, a poultice, either of bread and milk, or of bread with any of the faturnine preparations may be applied, as the cafe feems to require. They muft never be applied till they are nearly, or quite cold.
In fuch foul and obftinate fores, as refift the foregoing applications, the unguentum hydrargyri nitrati; the argentum nitratum, or other fimilar applications, are fometimes reforted to with advantage. A fingle dreffing with thefe fubitances is ufually fufficient; after which the fore heals under the mildeft applications.

Spurious puftules are frequently followed by ulceration at an early period. This ulceration is to be treated in the fame manner as if it proceeded from the genuine fpecies.

An affurance of perfect fecurity from vaccine inoculation can only be obtained by carefully obferving the whole progrefs of the difeafe. If any doubt remain, the operstion ought to be repeated.

## (51)

When the patient has been previouny expofed to the infection of the Small-pox, that difeafe will be fuperfeded more or lefs, according to the time which is fuffered to elapfe before the inoculation of the Cow-pock.

The advantages of vaccine inoculation being now fully aicertained, it is the duty of every member of fociety, and particularly of every member of the medical profeffion, to difcourage the inoculation of the Small-pox.

As it is deemed highly proper and advantageous, that particular and exact Regifters of the vaccine practice fhould be kept by every inoculator, the forms of the Regifters, employed by the Royal Je:nerian Society in their central houfe, and the feveral inoculating ftations, are amexed.-A feparate book a alfo kept for detailed accounts of any remarkable cafes, which may require to be more fully recorded than the plan of an ordinary regitter may admit of.

Copies likewife are here given of fuch papers as have hitherto been printed, both for the ufe of the patients, and for more gencral diftribution, for promoting the views of the Society amonglt all claffes of the community.

$$
\text { D } 2
$$

Ot It is presumed, by the Socicty, that the Community would derive considerable advantage by their receiving from ther Vaccine Societies, an Annual Return of the Number of Patients inoculsted; which should be sent to the Central House, No. 14, Salisbury Square, before the I/ Wednesday in March, in each Year.
$\mathcal{O}$ Communications of real importance, relating to the Vaccine Pralice, wwill meet with ready attention by the Medical Council of the Royal Fennerian Socity.——It is requefed that they be drawn up concisely, and well autbentisated.

## AN ADDRESS

## TO BE PRESENTED BY

## CLERGYMEN at the BAPTISM of CHILDREN.

To Fathers and Mothers,
You who are parents muft feel yourfelves not lefs bound by religion, than prompted by affection, to guard your child from every impending evil; and efpecially from infectious difeafes endangering its life. No human malady can give more ferious caufe of alarm than the Small-Pox. When taken in the natural way, it is, as you well know, violent, painful, and often fatal. Even in thofe who recover from it, the countenance is permanently disfigured, or the conftitution receives fome irretrievable injury, by lofs of fight, deafnefs, tedious ulcers, white-fwellings, confumption, \&c.-In the Small-pox, communicated by Inoculation, there is certainly lefs danger; but to enfure fuccefs, the moft anxious attention and niceft management are requifite for a length of time.Notwithftanding every precaution, the inoculated

Small-pox has, in many cafes, proved fatal: and it is further highly objectionable, fince, by fpreading infection, it endangers the lives of all perfons in the neighbourhood, who have not previoufly had the difeafe. A mild and certain preventive of the Smallpox, was a few years ago providentially difcovered by the Jinnerian Inoculation of the Cow-pock. This, after the ftricteft inquiry, has been approved and recommended by the Britifh Parliament ; and is now extenfively practifed, under the patronage of their Majefties, and the whole Royal Family. The new Inoculation may be fafely performed at every feafon of the year, and at every period of life, fince it occafions no material diforder, nor is attended with any danger whatever. At the fame time no infection is communicable from the perfons inoculated to others with whom they have intercourfe. Thus this fimple and eafy procefs, without endangering the community, preferves all thofe who undergo it, from a moft loathfome difeafe; and never excites in the conftitution the dreadful maladies above-mentioned, which fo frequently fucceed both the natural and inoculated Small-pox.
That you might not remain ignorant of fo ineftimable a bleffing, this fhort fatement is prefented to you; and as you value the life of your infant, and

## ( 55 )

nd it is ng inin the ad the Smallered by .This, ed and is now f their ne new feafon fince it ed with fection ated to us this ing the t , from in the ntioned, ral and o ineftiented to nt , and
the fafety of your neighbourhood, you will immediately avail yourfelves of the advantage offered to you; for doubly poignant muft be your forrow, if, by. neglecting fo to do, your child fhould perifh, or be materially injured by the Small-pox.
(Signed)

Minifter of

Papers of this kind bave been under written by Medical Pralitioners of the respeltive places in which they are difributed, offering to inoculate the poor gratuitou $\beta_{v}$.

Any information with refpect to errors, or omiffions, in the preceding lift, will be thankfully received.
** Subfrribers and Benefactors are particularly requeited to give their places of abode at the time of payment.

THE PUBLIC MUST BE AWARE THAT IK AN UNDERTAKING OF SUCH MAGNITUDE, WHERE INFORMATION IS NECESSARY TO EE SO WIDELY AND GENERALLY DIFFUSED, AND WHERE SO MANY AGENTS ARE REQUISITE TO CARRY THE DESIGNS OF THE SOCIETY INTO EFFECT, A VERY CCNSIDERABLE EXPENCE WILL UNAVOIDABLY BE INCURRED.

THE DIREC'TORS THEREFORE EARNESTIY APPEAL TO THAT PROMPT LIBERALIIY. WHICH, UPON IMPORTANT OCCASIONS, HAS EVER BEEN A DISTINGUISHING CHARACIERIS'IIC OF THE BRITISH PUBLIC, TO ENABLE THEM TO PROSECUTE WITH SUCCESS A PLAN. WHICH INVOLVES NOT ONLY THE DEAREST INTERESTS OF HUMAN NATURE, AND THE SOUNDEST PRINCIPLES OF NATIONAL POLICY. BUT THE REPUTATION OF THIS COUNTRY, WHERE THE INVALUABLE DISCOVERY ORIGINATED, IN THE EYES OF EUROPE, AND DF THE WORID.

The following form is recommended to thore who may be difpofed to become Benefactors to the Society by their laft Will.
"I give and bequeath the Sum of $£$ " out of my perfonal Eftate, to the Truftees for " the time being, of the Royal Jennerian " Society, for the EXTERMINATIION of the " Small Pox, eftablifhed in London in 1803, " to be applied towards the charitable defigns of " the faid Society."

SUBSCRIPTIONS ARE RECEIVED BY
The Rt. Hon. Charles Price, M. P. )
Lord Mayor.
John Julius Angertein, Efq. PallMall. Benjamin Travers, Efq. QueenStreet. Truftecs.

And by Mr. Charles Murray, Secretary to the Board of Directors, No. ז9, Greville Street, Hatton Garden.

[^0]:    - It is worthy of remark, that in the Scbool for the Indigent Blind, in St. George's Fields, the lofs of fight in more than one balf of tbe abildien, has been occafioned by the fmall-pox.

[^1]:    * Two cafes of death by the Cow-pox having been publifhed in the Iondon bills of mortality, a committee of the Jenuerian Society was appointed to inveftigate their particulars.-The committee have reported, on the moft authentic and fatisfavory documents, that there was not the flightef foundation for attributing thefe inflances of fatality either immediately or remotely to the Cow-pox. One of the children died of fcarlet fever twelve months after it had paffed through the vaccine difeafe. - The other, of convu!fions from tecthing fourteen weeks afterwards.-In both, the inoculation was attended by none but the moit favourable circumitances, The errors arofe with the Searehers.

[^2]:    * A thirteenth DiAriet has fince been appointed in Ratherhithe. Sec the lif of fation.
