Commentaires supplómenteires:

This item is filmed at the reduction ratio checked below/
Ce document est filmé au taux de réductlon indiqué ci-dessous.

The copy filmed here has been reproduced thanks to the generoalty of:

Seminary of Ouebec
Library

The images appearing here are the best quality possible considering the condition and legibility of the original copy and in keeping with the filming contract specifications.

Original copies in printed paper covers are filmed beginning with the front cover and sading on the last page with a printed or illustrated impression, or the back cover when appropriate. All other original coples are filmed beginning on the first page with a printed or illustrated impresaion, and ending on the last page with a printed or illustrated impreseion.

The last recorded frame on each microfiche shall contain the symbol $\rightarrow$ (meaning "CONTIAUED"), or the symbol $\nabla$ (meaning "END"). whichever applies.

Maps, piates, charts, atc., may be filmed at different reduction ratios. Thoee too large to be entirely included in one exposure are filmed beginning in the upper loft hand corner, laft to right and top to bottom, as many frames as required. The following diagrams illustrate the method:

L'oxemplaire filmo fut reproduit gratce al lo gênérosité de:

Séminaire de Ouébec Bibliothique

Les images suiventes ont été reprodultes avec le pius grand soin, compte tenu de la condition ot de in nottete de l'exempiaire filmb, ot en conformite avec les conditions du contrat de filmage.

Lee exemplaires originaux dont ia couverture en papior est imprimée sont filmés on commencant par le premier plat ot en terminant solt par la darnibre page qui comporte une empreinte d'imprestion on d'iliustration, solt par ie second plat, selon le cas. Tous les autres exemplaires originaux sont filmés en commençant par ia premidre page qui comporte une emprointe d'impression ou d'iliustration ot en terminant par la dernid̀re page qui comporte une telie empreinte.

Un des symboles suivants apparaitra sur ia derniĺre image de chaque microfiche, selon ie cas: le symbole $\rightarrow$ signifie "A SUIVRE", le symbole $\nabla$ signifie "FiN".

Les cartes, planches, tableaux, etc. . peuvent être filmés dea taux do réduction différents. Loreque le document est trop grand pour âtre reproduit on un soul cliché, il eat filmé à partir de l'angle aupérieur gauche, de gauche id droite. ot de haut en bes, en prenant le nombre d'images nd́cessairs. Les diagrammes suivants lilustrent ia móthode.

## PREFACE.

The want of a comprehensive commercial work has long been felt in the United States-a work exhibiting the condition and resources of the United States and the separate States, as well as of foreign nations. The only attempt hitherto made in this country to supply the want of such a work was the reprint, twenty-five years ago, of M'Culloch's Dictionary of Commerce and Commerciai Navigation. This work, probably as complete in reference to the commercial statistics of foreign countries as could be made at the time of its compilation, is very deficient in statistics relating to this continent, particularly of the United States. The later editions of Mr. M'Culloch's work contain much matter of an obsolete or local character, in which the American reader feels but little interest; while many subjects of great importance to commercial men in this country are, in the English work, either omitted entirely or mentioned only incidentally.
The extensive and importent changes that have taken place within the $\mathrm{pa}^{-r t}$ ten years in commercial affairs-the establishment of new States, new Territories, new commercial places-the unexampled increase of the commerce of the United States, of the development and the record of the great industrial resources of the United States-all seem to require a new and distinct work, with a view to place before commercial readers a more ample account of the progress of commerce throughout the world. The present volume has been prepared with a view to supply this want; and while we have aimed at presenting a fair exhibit of the finances, the internal and foreign commerce, the staplo products of each State, we have at the same time gathered together the latest statistics in reference to the products and the comr ercial relations of forcign nations; especially of those with whom the United States have the most intimate intercourse.

Wo have endeavored to present, in a con ensed manner and from reliable sources, historical and statistical details in reference to the great staples of the country; of those important products whose export to foreign countries has contributed largely to the prosperity of the States; and the increase of which is calculated to give us in future ycars a control of the vast markets of the world, and
thus add greatly to the material wealth of the Union. Among these we mention the subjects of Wheat, Corn, Cotton, Rice, Hemp, Provisions, Iron, Copper, Gold and Silver, etc.

This is the first attempt in the Unted States to collect the histo:ical and statistical facts in reference to these important subjects into one single work. In collecting these materials, and condensing them within a moderate compass, we have been aided by the valuable official Reports issued by the Treasury Department and by the Patent Office of the United States, for a series of years; and by the recent and highly valuable Reports of the Department of State upon The Commercial Relations of the United Slates.-Mueh of the varied and important information contained in those official documents is brought together in the present work under its apprepriate heads; so that the reader, instead of the labor of consulting some fifty or sixty volumes, may find every subject discussed under its alphabet?
 A leading featore of the Cyclopedia of Commerce, at least to the Americaniread er, is tho reproduction, in brief, $c_{2}$-views urged by Chancellor Kent, Juàge Story, Professor Parsons, and other authors, upon the subjects of the Laws of Shipping, Insurance, Mariame Law, Seamen, etc. The extracts from these writings are only such, however, as will lead the careful reader to refer for further information on
 In regard to the commercial relations of foreign countrics-their finanoes, popt ulation, internal and foreign trade, staple productions, etc. , the reader will find condensed, from the most reliable authorities, much valuable information of a late date. The commerce and resources of the principal maritime countries are illustrated up to the years 1856-37; and the relative importance of each in reference to the others, especially to the United States, is fully illustrated The foreign trade of the United States with each country for the last thirty-six ycars is also shown, compiled with great care from the Treasury Reports of the United States from 1821 to 1857. These tabular details, valuable as showing the commercial progress of the United States, have not been offlially communicated in a compact form to Congress, but are reproduced from "an Historical and Statistical Account of the Foreign Commerce of the United States," by the junior editor of this work.
The editors take pleasure in acknowledging the valuable aid derived from Mr Poole's Index to Periodical Literature, a necessary nppendage to the cditorial table, and a key to the fugitive writings of the most able authors, English and American, of the present century; also from Mr. Alexander's eleborate and reliable Dictionary of Weights and Measures; from Professor Bache's official Reports on the Ooast Survey of the United States'; from Mr. Browne's able work on the Trees of America ; and from Mr. Maury's Physical Geography of the Sea, ete, wishs

A Cyciopedia of Commerce must necessarily be, in a great meastre, a compilation, and any attempt to prepare a work of this character without taking advantage, to the fullest extent, of the labors of predecessors, would result in a failure. And though all of the articles have been rewritten or remodeled, to adapt them to this country, and with new information to bring them up to the present time, many of the important ones are entirely original, as far as compilation goes, and are carefully collated with the latest commercial statistics. Full use has been made of those standard works on commercial affairs which could give information pertaining to the anbjeate discussud. Under this view nothing more is claimed for this Work than that it is a well-digested compilation The plan of the work is based in many respects upon M'Culloch's Dictionary of Commerce, and from this work and the eighthedition of the Encyclopedia Britannica (now being published) have been principally compiled the articles relating to the commercial law and commercial trade of foreign countries. The statistics of the commerce of this country have been prepared from official sources, through a series of years; and in all instances no pains have been spared to obtain the latest and most reliable tabular details on all srbjects, as they are the foundation and principal value of a work of this kind. In all cases where possible, charts of the harbors and sea-poits, by the latest suryeys, have been obtained; and in this we are much indebted to the United States Coast Survey Reports for accurate details of the harbors of our own country. We add here a list of those works consulted, from which we have obtained much of the valuable information contained in the present work.

## COMMERCIAL NAVIGATION

A AM, Aum, or Ahm, a measure for liquids, used A. at Amsterdam, Antwerp, Hamburg, Frankfort, etc. At Amsterdam it is nearly equal to 41 English wine gallons, at Antwerp to $36 \frac{1}{2}$ gallons, at Hamburg to $38 \frac{1}{2}$ gallona, and at Frankfort to 39 gallons.

Aback (a sea term), the situation of the saila when the surfaces are flatted agaiast the masts by the force of the wind. The sails are said to be taken aback when they are brought into this situation either ly a sudden change of the wind or by an alteration in the sk!p's course. They are hid aback, to effect an inmediate retreat, without turning to the right or left; or in the sea phrase, to give the ship stern-vay, in order to avoid somo danger discovered before her in a narrow channel, or when she has advanced beyond her statioa in the line of battle, or otherwise. The sails are placed in this position by slackening their lee braces, and hauling in the weather ones; so that the whole effort of the wind is exerted on the fore part of their sarface, which readily pushes tho ship astern, unless she is restrained hy some counteracting force.

Abacus is the name of an ancient instrument for facilitating operations in aritimetic. The exbibitlon of numbers by counters appears happily fitted for unfolding the principles of calculation. In the achools of ancient Greece, the hoys acquired the elements of knowiodge by working on a smooth board with a nar-row rin-the $a b a x ;$ so named, evidently, from the combination of $A, B, \Gamma$, the first letters of their alphabet, resembling, oxcept perhaps in size, the tahlet likewise called $A, B, C$, on which the cinildren with us used to begin to learn the art of reading. The pupils, in those distant ages, were instructed to compute by forming progressive rows of counters, which, according to the wealth or fancy of the individual, consisted of small pebbles, of round bits of hone or ivory, or even of silver coins. From $\psi \eta \phi$ os, the Greek word for o pebble, comes the verb $\psi \eta \phi \iota \zeta \varepsilon \iota \nu$, to compute. But tho same board served also for teachiag the rudimenta of writing and tho principles of geometry. The abax being strewed with green sand, the pulvis eruditus of classic authors, it was casy, with a radius or small rod, to trace letters, draw lines, construct triangles, or describe circles. Besides the original word $\Lambda \beta a \xi$, the Greeks had the diminutlve $A$ Baktov; and it seems very probable that this smalier board was commonly used for calculations, while the larger one was reserved anoong thou for the purpose of tracing geometrical diagrams.
To facilitate the working by counters, the construction of the abacus was afterward improved. Instead of the perpendicular lines or hars, the board had its surface
divided by aets of parallel grooves, by atretched wires, or even hy successive rowa of holes. It was easy to move amall counters in the groovea, to slide perforated beads along tho wires, or to stick large nobs or roundheaded nails in the different boles. To diminish the number of marks required, every column wa. surmounted by $p$ ahorter one, wherein each counter had the same valu's as fivo of the ordinary kind, being half the index of the Denary Scale.
The civil arts of Rome were communicated to other nations by the tide of victory, and malutained throngh the vigor and firmness of her imperial sway. But the simpler and more useful improvements survived the wreck of empire, among the various people again restored by fortuno to their barbarous independence. In all transactions wherein money was concerned, it was found convenient to follow the procedure of the abacus, in represeating numbers by countera placed In parallel rows. During the Middle Ages, It became tho usnal practice over Europe for merchants, auditors of accounts, or judges appoint to decide in matters of revenue, to appear on a covered bank or bench, so called from an old Saxon or Franconian word signifying a seat. . Hence those terms were afterward appropriated to offices for receiving pledges, chombera for the accommodation of money-dealers, or courts for the trying of questions respecting priverty or the claims of the crown. Hence also the word bankrupt, which occur in all the dialecta of Europe. The term scaccarium from which was derived the Fronch, and thence the English name for the Exchequer, anciently signified morely a chess-board, being formed from scaccum, denoting one of the movable pieces in that intricat game. The reason of this application of the term is sufficiently obvious. The table for accounts wa, to facilitate the calculations, alwaya covered with a cleth, resembling the surface of the scaccarium or abacus, and distinguished by perpendicular or chequered lines. The learned Skene was therefore mistaken in supposing that tho Exchequer derived its name from the play of chess, because its suitors appear to fight a keen and dubious batile.*

The Court of Exchequer, which takes cognizance of all questions of reverue, was introduced into England by the Norman Conquest. Richard Fitznigel, in a treatise or dislogue on the subject, written about the middle of the twelfth century, says that the scaccarium

[^0]was a quadrangular tabla about ten feet long and five feet broad, with a ledge or border about four inches high, to preveut any thing from roiling over, and was surrounded on all sides by seats for the judges, the tellers, and other officers. It was covered every year, after the term of Easter, with fresh black cloth, divided by perpendicular white lines, or distinctures, at intervals of about a foot or a paim, and again parted hy similar transverse lines. In reckoning, they proceeded, he says, according to the ru'zs of arithmetic, using small coins for counters. The lowest bar exhibited pence, tha one above it ahillinge, the next pounds; and the higher bars denoted successiveiy tens, tecenties, hundreds, thousands, and tos thousands of pouads; though, in those eariy time: of penury and severe economy, it very seldom happensd that so large a sum as the last ever came to be reckoned. The first bar, therefore, advanced by dizews, the second and third by scores, and the rest of the stock of bure by the multipies of ten. The teller sat about tha middle of the table; on his right hand eleren penaies were heaped on the first bar, and a pila of nineteen sh! lifings on the second; while a quantity of pounds was coilected opposite to him, on tho third bar. For the aske of expedition, he might empioy a different mark to represent haif the value of any bar, a silver penny for ten shillings, and a gold penny for ten pounds.

In early times, a chequered board, the emblem of cajculation, was hung out, to indicato an office for changing moncy. It was afterward adopted as the sign of an inn or hostelry, where victuals were sold, or strangers lodged and entertained. We may perceive traces of that ancient practice exiating even at present. It is customary in London, and in some provincial towns, to have a chequer, diced with red and white, painted againat the sides of the door of a chop-house.

The Chinese have from the remotest ages used, in all their calculations, an instrument cailed the Suranpan, or Compaing Table, sinsiiar in its shape and construction to the abacus of the Romans, but more completo and uniform. It consists of a small oblong board surrounded by a high ledge, and parted Iengthwise near the top by another tedge. It is then divided verticaliy by ten smooth and siender rods of bamioo, on which are strung two small bails of ivory or bone in the upper compartment, and five such balls in the lower and larger compartment; each of the latter on the several bars denoting unit, and each of the forn ; for the sake of abbreviation, expressing five.

The syatem of measures, weights, and coins, which prevails throughont tha Chinese empire, being entirely founded on the decimal subdivision, the swan-pan was admirabiy suited for representing it. The caiculator could begin at any particular bar, and reckon with the same facility either upward or downward. This advantage of treating fractions exactly like integers was, in practice, of the utmost consequence. Accordingly, those srithmetical machines, but of very different sizes, are constantly used in ail the shops and booths of Canton and other cities, and are said to be handied by the native traders with such rapidity and address as quite astonisis tha European factors.

Abaft, a sea term signifying the hinder part of a ship, or all those parts both within and without which lie toward the stern, in opposition to afore. Abaft is also used as a preposition, and signifies further aft, or nearer the stern; as, the barricade stands abaft the main-mast, i.e. behind it, or nearer the stern.

Abandonment, in commeree and navigation, is used to express the abandoning or surrendering of the ship or goods insured to the insurer.

It is held, by the law of Eagland, that the insured has the right to abandon, and to compel the insurers to pay the whole value of the thing insured, in every case - Ife calls it Arimetica: In the Myrroutr of the Worlde,
printed by Caxton in 1451, it is strangely named Ars Metrike, printed by Caxton in 1451, it is straogely named Ars Metrike, a proof of the total ignorance of Greek at that period in Eogland.
${ }^{13}$ where, hy the happening of any of the misfortunes or periis insured against, the voysige is lost, or not worth purauing, and the projected adventure is frustrated; or where tha thing insured is so damaged ant spolied as to be of little or no vaiue to the owner; or where tha salvage is very high; or where what is aaved is of less value than the freight; or where further expense is necessary, and the insurer will not undertaka to pay that expense," etc.-Maraitall, book i. cap. 13 , 81.

Abandonment very frequently takes piace in cases of capture : the loss is then total, and no question can arise in respect to it. In cases, however, in which a ship and cargo are recaptured within such a time that tha object of the royage is not lost, the insured is not entitled to abandon. The mare atreading of a ship is not deemed of itself such a loss as will justify an abandonment. If by some fortunata accident, by the excrtions of the crew, or by any borrowed assistance, the ship be got off and rendered capable of continuing her voyage, it is not a total loss, and the insurers are only ifable for the expenses occasioned ly the strancing. It is only where the stranding is followed by shipi-reck, or in any other way renders the ship incapable of prosecuting her voyage, that the insured can abandon.

It has been decisied that damage sustaincd in a voyage to the extent of forty-eight per cent. of the value of the ship did not entitle the insured to ebandon. If a cargo be damaged in the course of a voyage, and it appears that what has been saved is less tian the amount of freight, it is held to öe a total loss.-PAHK on Insurance, cap. 9.

When by the occurrence of any of the periis insured against the insured hss acquired a right to abendion, he is at liberty either to aliandon or not, as he thinks proper. He is in tue case bound to sbandon; but if ha make an election, and resolve to absndon, he must abide by his resoiution, and has no longer the power to ciaim for a partial loss. In some foreign countries apecific periods are fived by law within which the insured, after being informed of the loss, must elect either to abandon or not. In England, however, no particular period is fixed for this purpose; but the rule is, that if the insured determine to abandon, he must intimate such determination to the insurers within a reasonable period after he has got inteliggence of the lossany unnecessary delay in making this intimation being interpreted to mean that he has decided not to abanden.

No particular form or solemnity is required in giving notice of an abandonment. It may be given either to the underwriter himself, or the agent who subseribed for him.
"The effect of an abandonment is to rest all the rights of the insured in the insurers. The latter become the legal owners of the ship, and as such are liable for all her future outgoings, and entitled to her future earnings. An abandonment, when once made, is irrevocabie.
"A total loss within the mesning of the policy may arise either by the total destruction of the thing insured, or, if it specifically remaing, by such damage to it as renders it of littie or no value. A loss is said to be total if the voyaga be entireiy lost or defcated, or not worth pursuing, and the projected adventure frustrated. It is a constructive total loss if the thing insured, though existing in fact, is lost for any beneficial purpose to the owner. In such eases the insured may abandon ali his interest in the sulject insured and ail his hopes of recovery to the insurer, and call upon him to pay as for a total loss. The object of the provision is to enable the insured to be promptiy reinstated in his capital, and be thereby enabied to engage in some now mercantile adventure. Long interruption to a veyage, and uncertain hopes of recovery, would often be ruinous to the businces of the merchant; and therefore, if the olyject of the voyage be lost, or not worth pursuing ly reason of the peril insured againat, or if the cargo be so damaged as to be of little or no value, or where
the salvarye is very high and further expense be necessary, and the inaarer will not engaga to bear it, or if what la saved be of iesa value than the freight, or where the damage exceeds one half the value of the goods inaured, or where the property is captured, or arrested, or even detained by an indefinite embargo; in these and other cases of a like nature the insured may disentangle himeelf and abandon the aubject to the underwriter, and call upon him to pay a total losa. In anch cases the insurer atands in the place of the insured, and takes the sulject to himself, with all the chances of recovery and indemnity. A valid abandonment has a retronpective effect, and doea of iteeif, and without any deed of cession, and prior to the actual payment of the loss, transfer the right of property to the insurer to the extent of the inaurance; and if after an abandonment, duly made and accepted, the ship shonld be recovered, and proceed and make a prosperous voyage, the insurer, as owner, would reap the profta.
"These considerations have introduced the right of abandanment into the insurance law of every country, and yet the text writers have generally condemned the privilege aa inconsistent with just notlona concerning the nature of the contract of insurance, which is a contract of indemnity. But it has now become an ingredient so interwoven wlth the whole system of ingurance, that It can not le abolished; though the late English cases, saya Mr. Benecke, ahow a stronger inclination in the courts to restrict than to enlarge the right. The laws of Ilamburg distingulsh themaelves from all others, by restricting the right of abandonment to the only case of a missing ship.
"As soon as the insured is informed of the loss, he ought (after being aliowed a reasonable time to inspect the cargo, and for no other parpose) to determine promptly whether he will or will not abandon, and he can not lie by and speculate on eventa. If he electa to abandon, he must do it in a reasonable time, and glve notice promptly to the insurer of hia determination; otherwise he will be deemed to have waived his right to abandon, and will be entitled to recover only for a partial loss, unless the loss be, in fact, absolntely total. If the thing insured existc in specie, and the insured wishes to go for a total loss, an abandonment ia indispensable. The same principle which requirea the insured, who abandona, to do it in a reasonable time, also requires the insurer, who rejects an abandonment, to nct promptly. The olject of the abandonment is to turn that into a total loss $r$.ich otherwise would not be one; and it is unnecessary, and would be idle, to abnandon in the case of an ontire destruction of the subject. It is only necessary when the loss is constructively total within the policy, and not an actual total loss. The right of abandonment does not depend upon the certainty, but upon the high prolability, of a total loss, cither of the property, or royage, or both. The Insured is to act, not upon certainties, but upon probabilities; and if the facts present a case of extreme hazard, and of probable expense, exceeding half the value of the ahip, the insured may abandon, though it should happen that she was afterward recovered at a less expense. Though the aulject may physically exist, yet there may be a technical total loss to tho owner if the things be taken from his free use and possession. Such are the common cases of total lasses by embargoes, by captures, and ly restraints, and detainments of princes.
"The right to abandon exists when the ship, for all the oseful purposes of the voyage, is gone from the control of the owner; as in the cases of submersion, or shipwreck, or capture, and it is uncertain, or the time unreasonably distant, when it will be restored in a state to resume the voyage; or when the risk and expense of restoring the vessel are disproportioned to the expectel henefit and oljects of the voyage. All these general doctrines concerning abandonment have been entirely incorporated into our American law, and they
exist to all essential purposes in the French jurisprudence.
"Upona valid abandonment, either of tha vease! or of the cargo lnaured, the master becomes the agent of the inaurer, and the insured la not bound ly his aubsequent acta unlesa he adopta them. The owner or inaured, equally with the master, becomea the agent of the insurer on abandonment, and he can not purchase in the property on his own account without the consent of hia princlpals; and if he does, it revokes the abandonment, and turns the total into a partlal loss. It ia the duty of the maater, reaulting from his aituation, to act with good falth, and care, and diligence, for the protection and recovery of the property, for the benefit of whom it may eventually concern. The master of an inaured ship injured by the perila of the sea, and not : ompetent to complete the voyage, may seli her in a case of necesaity, as when the ship la in a place in which she can not be repaired; or the expense of repairing her will be extravagant, and oxceed her value; or when 1: has no money in hia posseasion, and is not able t' ralse any. In cases of capture, he is bound, if a r. atral, to remain and assert his clalm until condemuation, or the recovery be hopeless. His wages, and those of the crew, are a charge on the owner, and ultimately, in case of recovery, to be horne as a general average by all partics in interest; and if the abandonment be accepted, the underwriter becomes owner for the voyage, and in that character liable for the scamen's wages, and entitled to the freight subsequently earned. If the master purchases in the vessel, or ransoms her, the iasurer will be entitled to the benefit of the purchase or composition; and, on the other hand, if the 'nsured affirma the purchase of the master, it will be, at the option of the insurer, a waiver of the abandonment. The insurer can accept of the repurchase of the master, as his conatructive agent, and affirm the act, or he may leave it to fall upon the master.
"The aasired has the right of abandoning the freight when there has been a constructive total loss of the ship ; and he has sustained a total logs of the frelght, if he ahandons the shlp to the underwriters on the ship, when the case justifiea It , for after such abandonment, he has no longer the means of earning the freight, or of receiving it if earned, for the freigitt goes to the underwriters on the ahip. But it has been a very controverted question, whether an abandonment of the ahip transferred the freight in whole or in part. It was finally settled in the jurisprudence of New York and of Massachusetts, and adopted as the true rule in the Cir. cuit Court of the United States for Massachusetta, that on an accepted abandonment of the ship, the freight carned previous to the disaster was to be retained by the owner or his representative, the inaurer on the freight, and apportioned pro rata itineris; and that the freight subsequently earned went to the insurer on the ship."-See Kexr's Comin., Lect. XLVIII. vol. til.

Abassi, or Abassis, a silver coin cnrrent in Persia, equivalent in velue to a French livre, or at present tenpence sterling. It took ita name from Schah Abbas II., king of Persin, under whom it was struck.

Abatement, or Rebate, is the name sometines given to a discount allowed for prompt payment; it is also sometimes used to express the deduction that is occasionally made at the custom-house from the dutica chargeable upon such goode aa are damaged, and for loss in warchoisses.

Abattoir, the term applied by the French to designate slaughter-houses for cattie. These useful estal. lishments were introduced into Paris and other large cities ly Napoleon. Formerly the multitude of animals alaughtered in Paris became a nuisance of great magnitude to the Inhatitants, from the exhibition of the barbaritice practiced on the poor animals by the butchers, the piteous crics of shecp and cattle pent up,
without food or water, in the confined atalls in which they were crowded, and from the offensive exhalations of putrid blood and offal that proceeded from slaugh-er-houses, often pianted in the most populous part of the city. The same nuisance, till lately, diagraced the British metropolis, and many other English towna. It appears hardly conceivable that London should, till 1852, have tolerated the nuisance of Smithfeld market. When this mart was established five centuries ago, it was far beyond the preelncts of the elty. There, in the midat of a dense population, no fewer than 248,537 head of cattle, and 1,455,249 ahoep were cold in 1852, to be afterward alaughtered in the crowded lanes and illventilated courts of the metropolis; whilo the French, and the peopie of the United States, do not tolerate auch sources of diagust and disease in the interior of their great towns.
The abattoirs of Paris, created by Napoleon's decree of 1810 , amounted to five in 1818 , when they were all completed, and put ander excellent regulation. There are three on the north, and two on the south side of Paris; and all are in the outskirts of the town, about two nillea from ite centre.: The largest to the north is in the Rue Rochechouart, between the Barrieres Poissonnieres und des Martyres; the largest on the south side is just tebind the Place Breteuil ; the rest are near the banks of the Seine. The cattle-markets are all at the distance of some miles from Paris; and the cattle are driven fiom them to the abattoirs, round by th external Boulevards, so as to avoid the streets as much as possible.
Each butcher goes to his own abattoir; to whlch are attached proper places for preserving the meat, provided with an iron reck for the fat, pana for melting the tallow, and atalis for the cattle before they are slaughtered. The stalls are furnished with proper racks and tronghs for hay and water, that the animais may suffer as littie as possible before they are slaughtered. The abattoirs and the whole estallishment ere kept very clean by an abundant supply of water, that carries off the blood and all impurities into sewers. Conaldering the nature of the place, every thing is commendably clean.
An inspector is appoluted to each abattolr, whose business $i t$ is to prevent the sale of unwholesome meat, and to enfurce order and cleaniliness. For these accommodations a butchor pays according to the number of animals he slaughters. The sum now paid for each ox is six francs, four for a cow, two for a calf, and one for a sheep or lamb. The money thus raleed from all the Parisian abattoirs in 1842 amounted to about $£ 48,000$ sterling. It ia greatly to be wished that some regulations like those of the French abattoirs were introduced Into the principal English towns, especially London, Liverpool, Mancuester, Glasgow, etc., as has lately been done at Edinburgh.

In 1851, the corporation of F. $\mathrm{N}^{\prime}$ burgh constructed a greatly improved abatt ${ }^{2 \text { : }}$ cluat elty, from designs prepared by Mr. David Cousin, the elty architect. It occuples an area of four acres and a quurter, surrounded by a screen-wail, with entrance gates ou each side fin the Egyptian style of architecture; behind the screenwall is a large oper area, trom which access is given to all the different buildiags connoeted with the establishment. The alaughterling boot hs consist of a double row of bulidings, extending in a straight line to about $3 i 6$ feet in leugth, with a centre readway 25 feet wide. There are three separatu blocks of buididing on each sido of the roadway, the extreme blocks being each 100 feet in length, and the central one 140 fect, with cross-roads 18 feat wide between these, giving access to the other portlons of the grounds. The diferent ranges of building contain 42 booths in all; esch booth is 18 feet wide, 24 feet in leagth, and 20 feet in height, having a cattle ahed attached, 18 feet by 22 feet, and a amall incloced yard behind, with a aeparate pack entrance, by which all the cattle are driven into the sheds, where
they are kept previoualy to being slaughtered. By a series of large ventilatore along the roof, and by other contrivances, these buildings are thoroughly ventilated. The large doors of the booth, instead of being hlaged in the usual manner, are hung by halance weights, so as to sllde up and down slmilarly to an ordinary sash-window, so that they never interfere with the operations within, or with the thoroughfare of the road.
Improved mechanical contrivances have been introduced, some of them of a novel application, which have secured great facilitles in the dressing and preparation of the meat. Each booth ia amply provided with water. In addition to the slaughtering booths, there is large accommodation for triperies, pig-slaughtering houses, tall $n$ w-weighing houses, and all the other necessaries of such an establisinment.
The whole of the booths have been lald with thick, weli-dressed pavement, resting on a stratum of concrete twelve inches thick, and the walls to the height of seven feet are formed of solid ashler, so as to prevent the poasibillty of rats burrowing in them. With thls vilw also, the whole surface of the roadways has been lald with concreto and causewayed with well-drebsed whinstone pavement. The dralnage, also, consists entirely of giazed earthen-ware tiles, so that the whole area of the buildings is rendered impervious to these destructive vermin. There are two distinet sete of drains, one for surface water, which is conveyed directly Into Lochrin burn; tho other for soli from tho booths, which is conveyed into large tanks formed for its receptlon, and sold for agricultural purposes.
Before the erection of theso buildings, private slaugh-ter-houses were scattered all over the clty, often in the moat populous districts, where, through want of dralnage and imperfect ventilation, they contaminated the whole neighborhood. Since the opening of the public abattoir, all private slaughter-houses are prohibited.
Aboard, the Inside of a slip. Hence any person who entere a ship is said to go aboard: but when au onemy enters in the time of battle, he is sald to board; s plirase which always implies hostillty. -To fall aboard of, is to strike or eacounter another shlp when one or both are in motion, or to be driven upon a ship by the force of the wind or current. - Aboard-main-lack, the order to draw the main-tack, i. e. the lower corner of the mainsall, down to the Cuess-Tree.
Abrasion is sometimes used to denote the wear and tear of colns. The deticleney In the weight of the old worn coins, on thelr being called in to be recoined, falla upon the pubilic. Mr. M'Culloch reckons, that if the curreucy of the United Kingdom consisted wholiy of gold, It would amount to at least slxty mlliions of sovereigns, and that the loss austained by abrasion, including what resuits from shipwreck, fire, and other aceldents, l . uld amount to a hundredth part of the sum in circulation, or $\mathbf{E 6 0 0 , 0 0 0}$ annually.-M'Cullocn's Treatises and ELanays on Economical Policy, p. 33.

Acaola, Egyptian Thorn, or Binding Beantree, In Botany, a specles of mimosa, aecording to Linneous, though other hotanists make it a distinet genus. Several apecies of acacin produce gum arabic, enpecially A. Ehrenbergii, A. tortilis, A. arabica, A. rera, A. Seyal, A. Verek. An lnferior sort is produced by $A$, Adansonii, A. albida, and A. Karro. These are natives of Egypt, Arabia, or Africa. The lispissated gum of the bark of A. catechu forms the astringent substance named catechu; whlch, however, is also produced in India from several other trees. The bark of several species of acnela produces a tannin; of which a large quantity is now imported from Van Diemen's Land for the purposes of the tanner, and is chiefly the produce of $A$. decurrons and $A$. mollissima.
A. julibrissin, a native of Persia, haa, on account of its elegant follage and flowers, been long acelimated in England; A. sophora is a fragrant species, that has
more lately been introduced, and la nearly accllmated in the south of our lsland. ${ }^{-1}$ It flowars early in apring, and bears many clusters of rich yellow flowers. 'The flowera of a speciea of the acacia are used by the Chlnese in making that yellow which we see bears washIng la their silks and stuffe, and appears with so much elegance in their painting on paper. The method is this: They gather the flowers before they are fully open; theao they put in a clean earthen vessel over a gentlo heat, and stir them continually about as they do the tea-leaves, till they become drylsh and of a yellow color; then to half a pound of flowers they add three apoonfula of fair water, and after that a little more, till there is juat enough to hold the flowera incorporated together; they boil thia for some time, and the juice of the flowers mixing with the water, it becomes thick and yellow; they then take it from the fire, and strain it through a pliece of coarse ailk. To the liquor they add half an ounce of common alum, and an ource of calcined oyster-shells reduced to a fine powder. All is then well mixed together; and thia is the fine lastlag yellow they have so long used.
The dyers of large pleces nse the flowers and seeds of the acacia for dyeing three different sorts of yellow. They roast the flowers, as before obaerved, and then mix the seeda with them, which must be gathered for this purpose when fully ripo; by different admixtures of these thoy give the different shades of coler, only for the deepeat of all they add a amall quantity of Brazil wood.
Mr. Geoffroy attributes the origin of bezoar to the seeds of thia plant; which beling browsed by certain animals, and vellicating the stomsch by their great great aourneas and astringency, cause a condensation of the juices, till at length they become coated over with a stony matter which we call Bezoar.

Acapulco, a sea-port on the western cosat of Mexico, in lat. $10^{\circ} 60^{\prime} 20^{\prime \prime}$ N., long. $99^{\circ} 46^{\prime}$ W. Pop. 4000 ( $($ ). "It is," aaya Captain Hall, " the very bcau ideal of a harbor. It is easy of acceas, very capacious, the water not too deep, the holding ground good, quite free from hidden dangers,* and aa secure as the basin $\ln$ the centre of Portsmouth dock-yard." - South A merica, 11.172. Previously to the emanclpation of Spanish America, a galleon, or large ship, richly laden, was annually sent from Acapulco to Manilla, in the Philippine Islands, and at her return a fair was held, whlel was much resorted to by strangera. But this sort of intercourse la no longer carricd on, the trade to Menilla and all other places beling now conducted by private individuals. The exporte consist of bullion, cochincal, cocoa, Indigo, atc. The Imports princlpally consiat of cotton goods, hardware, artcles of jewelry, raw and wrought silka, apices, and aromatics. Acapuleo, for forelgnera, is extremely unhealthy; and though it be one of the principal ports on the west coast of Mexico, its commerce is but inconsiderable. The navigation from Acapnico to Guayaquil and Callao is exceedingly tedious and difficult, so that there is but Ifttle intercourse between Mexico and Poru, Panama having of late ycars become the leading port for forclgn imports near this latItude.
Account, or Accompt, in a gencral aenso a computation or reekoning of any thing by numbers. Collectively, it is used to express the books which merchants, traders, bankers, otc., use for recording their transactions in business.
Accountant, or Accomptant, In the mest gen. cral sense, is a person skilled in accounta. In a more roatricted sense, it ls applled to a person or ofticer appointed to keep the accounta of a pablio company or office.

Accountant-Cengral, an officer in the English

[^1]Court of Chancery; appointed by act of Parliament to recelve all moneys lodged in court, instead of the masters, and convey the same to the Bank of England for accurity. There ia also an accountant-general in the' Irish Chancery; and one in Scotland, who has charge of the accounte of the Coirt of Session.

Acoounts, Chamber of, in the French polity, a sovereign court of great antiquity, which took cognizance of and registered the accounts of the king's revenue; nearly the aame with the Engliah Court of Exchequer.
Acids are a class of compounds which are distingulahed from all othera by the following properties: They are generally possessed of a very sharp and sour taste ; redder the infusions of blue vegetable colors; are often highly corrosive, and enter into combination with the alkaliea; eartha, and metallic oxides ; forming compeunds in which the characters of the constituents are entirely destroyed, and new ones produced differing in every respect from those previously existing. The quallty or strength of an acid is generally ascertained either by ita specific gravity, which la found by means of the hydrometer, If the acid be liquid, or hy the quantity of pure and dry aubcarbonate of potasa or soda, or of carbonate of lime (marble), which a given weight of the acid requires for lts exact neutralization. This latter process is termed Acidimetry; or the ascertaining the quantity of real acid existing in any of the liquid or crystallized aclds.
The principal acida at present known are, the Acetic, Benzoic, Boracic, Bromic, Carbonic, Citric, Chloric, Oyanic, Fluoric, Ferroprussic, Gallic, Hydrobromic, Hydriodle, Iodic, Lactic, Malic, Margaric, Meconic, Mnriatic or Hydrochloric, Nitrous, Nitric, Oleic, Oxallic, Phosphoric, Prussic or Hydrocyanic, Purpuric, Saccholactic, Suberie, Sulphurous, Sulphuric, Tartaric, Uric, and many others which It would be superfluoun to detail. It is the most important only of these, however, that will be here treated of, and mere particularly those employed in the arts and manufactares.

Acetic or pyroligneous Acid.-This acid, In its purs and concentrated form, is obtalned from the fluid matter which passes over in distillation, when wood is expoasd to heat in close iron cylinders. This fluld is a mixturo of acetle acid, tar, and a very volatile ether; from these the acid may be separated, after a second distillation, by saturating with chalk, and evaporating to dryness; an acetate of lime la thua procured, which, by mixture with salphate of soda (Glauber's salt), fa decomposed, the resulting componnda being an insoluble sulphate of lime, and a very soluble acetate of soda; these are casily separated from each other by solution In water and filtration; the acetate of ada being obtalned in the cryatalline form by evaporation. From this, or the acetate of lime, some manufacturers employing the former, others the latter, the acetic acid is obtained by distillation with sulphuric acid (oll of vitriol); as thus procured, it is a colorlens, volatile fuld, having a very pangent and refreshing odor, and a atrong acid taste. Its strength should be ascertnined by the quantity of marble required for its neutralization, as its specffic gravity does not give a correct Indlcation. It is employed in the preparation of the acetate of lead (sugar of lead), in many of the pharmaceutical compounds, and also as an antiseptic.

Vinegar is an lmpure and very dilite acetic acid, obtained by exposilig either weak wines or infusions of melt to the air and a slow formentation; It contains, begides the pure acid, a large quantity of coloring matter, some mucllage, and a little spirlt; from these it is readily separated by distillation. The impurities witi which this distilled vinegar is sometimes adulterated, or with which it is accidentally contaminated, are oil of vitriol, added to increase the acidity, and oxides of tin or copper, ariaing from the vinegar having been distlled through tin or copper worms. These may be casily detected; the ofl of vitriol by the addition of a

Ilttle solution of mariate of barytas to the distilled vinegar, which, ahould the acid be present, will cause a dense white preciplite; and the oxides of tin or copper by the addition of water impregnated with sulphureted hydrogen. Vinegar is employed in many culinary and domeatic operations, and also vory largely in the manufacture of the carbonate of lead (white-lead).

Benzoic Acid existe naturally formed in the gum ben. zoln, and may be procured either by submitting the benzoin in fine powder to repeated aublimations, or by digesting it with lime and water, straining off the clear solution, and adding muriatic acid, which entars into combination with the lime, and the benzolc acid, being nearly insoluble in water, falls as a white powder; this way be further purified by a sublimation. Benzoic acid ls of a beautiful pearly white color when pure, has a very pecullar aromatic odor, and an acrid, acid, and bitter taste; it is used in making pastillee and perfumed incense. This acid also occurs in the balsams of Tolu and Peru, and in the urine of the horse and cow.

Boracic Acid is fonnd in an uncombined atate in many of the hot springs of Tuscany, as also at Sesso, in the Florentine territory, from whence it has recelved the name of Sessolin. In Thibet, Persia, and South America, It occurs in comblastion with soda, and is imported from the former place into this country in a cryatalline form, under the name of Tlacal. These cryatale are coated with a rancid, fatty subatance, and require to be purified by repeated solutions and crystalIlzations; after which it is sold under the appellation of borax (biborate of soda); from a hot solution of this salt the boracle acid ts resdily ohtained, by the addltion of eulphuric acid in slight excess; sulphate of sode is formed, and the boracic acid cryatalizes as the solution cools. When pure, these crystals are white, and have an unctuous gresay feel; they are solublo in alcohol, communicating a green linge to its flame; when fused it forms a transparent glass, and has been found by Mr. Faraday to unite with the oxide of lead, producing a very uniform glass, free from all defects, and well adapted for the purpose of telescopes and other astronomical instrumente. Borax is much employed in the arts, particularly in metallurgic operations as a flux; also in enameling and in pharmacy. (See BoRax.)

Carbonio Acid.-This acid occura very abundantly in nature, combined with lime, magnesia, barytes, aerial acld, fixed air, mephitio acid: from any of these It is easily soparated by the addition of nearly any of the other acids. In it uncombined form it is a transparent, gaseous fluid, having a denality of $1: 58$, atmospheric air being unity; it in ahsorbed to a considerable extent by water, and when the water is rendered silghtly alkalline by the addition of carbonate of soda, and a large quantlty of gas forced into it by pressure, it forms tho well-known refreshing beverage soda water. This gas is also formed in very large quantities during combuation, respiration, and fermentation. Carbonic acid ges is deatructive of animal lifo and combustion, and from its great weight accomulates in the bottoms of deep wella, celis, cavos, cte., which have been closed for a long period, and numerous fatal accidents arise frequently to persons entering auch places incautiously. The precaution should alwaya be taken of introducing a lighted candle prior to the descent or entrance of any one; for, should the candie be extinguished, it would he dangerous to enter until properly ventilated. Tho combinations of carbonic acid with the alkalles, earthe, and metallic oxides are termed carbonatea.

Citrio Acid exists in a free atate in the juice of the lemon, lime, and other fruits, combined, however, with nucilage, and sometines a little sugar, which ronders It, if required to be preserved for a long period, vary Ilable to ferment ; on this account the erystallized citric acid is to be preferred. It is propared by saturating the lemon juice witis clialk; the citric acid c. "abines
with the lime, forming an Insoluble compound, while. the carbonic acid la liberated; the Insolublo cltrate, after being well washed, is to be acted upon by dilute sulphurio acid, which forms aulphate of lime, and the citric acid enters into solution in tho water; hy filtration and evsporation the citric acid is obtained in colorless transparent crystals. The chlef usea to which it is applied are as a preventive of sea acurvy, and in making refreshing acldulous or effervescing drinks; for which latter purposes it is peculiarly fltted from it very pleasant flavor.

Fluoric Acid is found in the well-known minersl fluor spar in combination with lime; from which it is procured ln tho llquid form by distillation with dilute sulphuric acid in a leaden or silver retort : the receiver should be of the same material as the retort, and kept cool by fee or anow.
This acld is gaseous in its pure form, highly corroaive, and Intensely acid; It is rapidly absorbed by water, communicating its properties to that flaid. Its chief use is for etching on glass, which it corrodes with great rapidity. For this purposo a thin coating of wax Is to be melted on the surface of the glass, and the sketch drawn by a fine hard-pointed instrument through the wax; the llquid acid is then poured on It, and after a short time, on the removal of tho acid and coating, an etching will be found in the eubstance of the glass. A very excellent application of this property, possessed by fivorio acid, is in the roughing the shades for table lamps. All the metals, except silver, lead, and platina, aro acted upon by this acld.

Gallic Acid.-Tho sourco from which this acid is generally obtained ls the nut-gall, n hard protuberance produced on the oak by the puncture of Insects. The most simple method of procuring the scid la its puro form is to submit the galls in fine powder to subliman tion in a retort, taking care that the heat be applied slowly and with caution; the other precesses require a very long period for their completion. When pure, gallic acid has a white and silky appearance, and a highly astringent and slightly acid tasto. The mutgalls, which owo their propertics to the gallic acid they contain, are employed very oxtensively in the arta for dycing and stalning sliks, cloths, and woods of a black color; this is owing to ita forming with the oxido of iren an intense black precipitato. Writing-ink is made on tho asme principle; a very excellent receipt of the Iste Dr. Black'e is, to take 8 ounces of the best Aleppo galls in fins powder, 1 onnce aulphate of iron (green vitriol), 1 ounce of logwood fincly rasped, 1 ounce of gum arsbic, 1 pint of the best vinegar, 1 pint of soft water, and 8 or 10 cloves; in this case the black precipitate is kept suspended by the gum.

Hydriodio Acid is a compound of iodine and hydrogen. In its aeparate form it is of very littic importanco in the arts.

Malic Acid exista in tho juices of many fruits, particularly the spple, as also in the berries of the servico and mountain ash.

Meconic A cid is found in oplimm, in combination with morphia, forming the meconate of morphia, on which tho action of oplum principally deponds.
Muriatic Acid, or Spirita of Salts.-Thia acid (the hydrochlorio of tho French chemiata) is manufactured from the chloride of sodium (IIry aca salt), by the action of auljhuric acid (oll of vitriol). The most oconomical proportions are 20 pounds of fneed salt, and 20 pounds of oll of vitriol proviouely mixed with an equal weight of water; these are placed in an iron or earthen pot, to which an earthen hicsd and receiver are adapted, and submitted to distilation; the muriatla acid passes over in the vaporous form, and may be easily condensed. The liquid acid thus obtained should have a specific gravity of 117, water being equal to 100 ; it lins a strong seld taste, and a slight yellow color; this is nw. ing to a amall quantity of oxlice of lron. By redistilIation in a glass retort at a Juw temperature, it may lue
obtained perfectiy pure and colorless. It sometlmes contsius a little suiphuric acid; this is detected by a solution of muriate of barytes. Muriatic acid, in its uncombined state, la an invislble elastic gas, having a very strong affinity for water; that fluid absorbing, at a temperature of $40^{\circ}$ Fahrenheit, 480 times Its volume, and the resulting liquid acid has a density of 121. So great is this attraction for water, that when the gas is liberated into the alr, it combines with the moisture always present in that medium, forming dense white vapors. Its comblations with the alkalies, etc., are termed muriates; those of the greateat importance are the muriates of tin, ammonia, barytes, and sea salt. The test for the preseace of muriatic acid in any liquid ia the uitrate of silver (lunar caustic), which causes a curdy white precipitate.
${ }^{\prime}$ Nitric Acid, or Aquafortis.-This, which is oae of the most useful acids with which the chemist is aequainted, is prepared by acting upon saltpetre (nitric or vitrate of potass) with oil of vitriol : the proportlons beat auited for this purpose are three parts, by weight, of altre, and two of oll of vitriol; or 100 nitre, and 60 oil of vitriol previously diluted with 20 of water: elther of these proportions will produce a very exceilent acld. When submitted to distillation, whlch should be conducted in earthan or glass vessels, the nitric acid passes over in tho form of vapor, and a bisalphate of potass (sal mixum) remains ln tha retort.

Nitric acid of commerce has usually a dark orangered color, giving off coplous fumes, and having a specillo gravity of 150 , water being 100. It is atrongly acid and highly corrosive. It may be obtained perfectly colorless by a second distillation, rejecting the first portion that passes over. It is much employed ln tha arts for etching on coppar platee for engraving; also, for the separation of aliver from gold in the precess of quartation. In pharmacy and snrgery it is oxtensively used, and is employed for destroylng contagious effluvis. Comblned with muriatic acid, it forms aqus regia (nitro-murlatic acid), used as a solvent for gold, platias, etc. This acld is frequeatly contaminated with the muriatie and sulphuric aclds; these may be detected by the foilowing methods: A. portion of the suspected acid should be dilucod with thres or four thines its volume of distilled water, and divided into two giasmes ; to one of which nitrate of silver (lunar caustic) in solution is to be added, and to the other nitrate of barytes: if mariatic acid be present, a whito curdy precipitate will be thrown down by the former; and if sulphuric, white granular precipitate by the latter.

Oxalic Acid occurs in combination with potass as binoxalate of potasa in the differcnt varieties of sorrel, from whence the binoxslate of potass has been terined salt of sorrel. This acld ls uaualiy prepared by the action of nitrie acid upon sugar, evaporating tho solution, after the action has ceased, to the comsistence of a slrup, and redissolving and recrystallizing the crystals which are thus procured.

It is sold In smali white acicular crystals, of a strongly scid taste and highly polsonous, and sometimes in ita external appearance bears a strong aimillarity to Epsom salta (sulphate of magnesia), which it has been unfortunately frequently miataken for. It is instantly distinguished from Epsom salts by placing a mmait crystal upon the tongue; when its atrong acid taste, compared with the nauseous fitter of the sulphate of msgnesla, will be quite a sufficient criterion. In cases of polsoning, however, by this acid, lime or chalk, inixed with water to form a cream, should be inmediately adminiatered, the combinatious of oxalio acid with these aubstances beiog perfectly inert. It is omployed in removing ink-etains, Iron-moulds, ete., from Iinen and leather $;$ the beat proportions for these purposes are 1 ounce of the acld to a pint of water. The most dellcate teat of the presence of oxalic acid la a salt
of lime or llme-water, with either of which it forms a white precipltate, Insoluble in water, but soluble in acids. Its combinations are termed oxalates.

Phosphoric Acid is of very little importance in a commercial point of view, except as forming with lime the earth of bonas (phoaphate of lime). It is prepared by heating bones to whiteness in a furnace; from this phoaphorio acid is obtained by the action of sulphuric acid, still combined, however, with a small quantity of lime. The action of vitrio acld upon phosphorus, the latter being added gradually and in small pleces, yields this acid in a atate of purity : its comblnations are termed phosphates. ${ }^{*}$

Prussic Acid, or Hydrocyanic Acid.-This acid, which is the most virulent and poisonous acid known, is contalinod in peach blossoms, bay leaves, and many other vegetable productiona, whioh owe their peculigr odor to the presence of prussic acid. For tho purposes of medicine and chemiatry, this acid ls prepared either by distilling one part of the cyannret of mercury, one part of muriatic acid of apecific gravity $1 \cdot 15$, and six parts of water, six parts of prussic acid being coliected; or, by dissolving a certain waight of cyanuret of mercury, and passing a current of sulphureted hydrogen through the solution, until the whole of the mercury ahall be precipitated; if an excess of sulphureted hydrogen should be present, a little carbonate of lead (white lead) will remove it; on filtering, $=$ colorleses prussic acid will be obtained. By the firat process, which is the one followed at Apothecaries' Hall, the acid has a density of 995 , water being equail to 1000 ; by the latter, It may be procured of any required strength, depending on the quantity of cyanuret of mercury dissoived. The best test for the preaence of this acid is, first to add a small quantity of the protosulphate of fron (solution of green vitriol), then a little solution of potassa, and, lastly, diluted suiphuric acid; if prussic acid be present, Prussian blne will be formed. Its combinations are calied prussiates or hydrocyanates; when in its concentrated form, it is so rapid in ita effects that large animals have been killed in the short space of 80 sec onds, or from a minute to a minute and a half.
Sulphurous Acid is formed whenever sulphur is burnell in atmospheric alr; it is a suffocating and pungent gas, strongly acid, bleaches vegetable colors with great rapidity, and arrests the process of vinous fermentation, For these purposes it is therefore very much cmployed, eapecially in bleaching woolen goods and straws. Fermentation may be immodiately arrested by burning a small quantity of suiphur in casks, and then racking off the wine while atilil fermenting into them; thla frequently gives the wine a very unpleasant taste of suiphur, which is avoided by the use of sulphate of potass, made by impreguating a solutlon of potass with sulphurous acid gas.

Sulphuric Acid, or Oil of Vitriol, called oll of vitriol from its havlug been formeriy manufactured from green vitriol (sulphate of Iron). In some parts of tho Continent this process is stili followed. The method generaily sdopted in this country is to introduce nine parts of sulphur, intimstely mixed with one part of nitro, in a state of active combustion, into large leaden chambers, the bottems of which are covered with a stratun of water. Sulpisurous and nltrous acld gases are generated, which, entering Into combination, form a white crystaline solid, which falls to the bottom of the chamber; the instant that the water comes in contaet with it, this solld ls decomposed with a hissing noise and effervescence, sulphuric acid combines with the water, and nitrous gas is liberated, wilich, coubining with oxygen from the air of the chamber, is convarted into nitrous acid gas, again combines with sulphurous acid gas, and agala falis to the bottom of the chamber: this process continuce as long as the combustion of the sulphur is kept up, or as long as atmospherle air remains in the chamber; the nitrous acld merely serving as a means for the transferenco of oxygen from the at-
mosphere to the sulphurons acid to convert it into sulphuric acid. The water is removed from the chamber when of a certain etrengtl, and replaced by fresh. These acid waters are then evaporated in leaden boilers, and finally concentrated in glass or platina vesselo. As thus manufactured, sulphuric acid is a dense oily fluid, colorless, intensely acid, and highly corrosive, and has a specifle gravity of 1846, water being equal to 1000 . This acid is the most important with which we are acquainted; it is employed In the manufacture of the nitric, muriatic, acetlc, phosphoric, citric, tartaric, and many other acids; also in the preparation of chlorine, for the manufacture of the bleaching powder (oxymuriate of lime, or chloride of lime), for the preparation of enlphate of mercury, in the manufacture of calomel and corrosive sublimate, and in Innumerable other chemical manufactures. In the practice of physic it is also very much employed. It naually contains a little oxide of lead, which is readily detected by diluting the acid with sbout four times ita volume of water, and allowing the sulphate of lead to subside. Its combinations are denominated sulphates. The fuming sulphuric acid, as manufsctured at Nordhausen, contalus only one half the quantity of water in its composition.

Tartaric Acid,-This acid is procured from the cream of tartar (bitartrate of potass), olitained by purifylug the crust which separates during the fermentation of wines by solution and crystallization. When this purfied bitartrate is dissolved, and lime or carbonate of linie added, an insoluble tartrate of lime falle, which, after washing, should be acted upon by sulphurio acid; sulphate of lime is thus formed, and the tartaric acid enters into solution, and may be obtained by evaporation and crystallization. It is employed very much in the arts, in calico-printing, as also in making effervescing draughts and powdera in pharmacy.

- Uric Acid is an animal acid of very little importance, except in a scientific point of view : it exists in tho excrement of serpents to the amount of 95 per cent., and forms the basis of many of the urinary calcull and gravel.

Acorn, in sea langrage, a little ornamental piece of wood fashioned like a cone, and fixed on the uppermost point of the spindle, above the vane, on the mast-head. It is used to keep the vane from being blown off from the spindle in a whirlwind, or when the ship leans much to one side under sail.

Acorns (Ger. Licheln, Eekern; Fr. Glands; It. Ghiande; Sp. Bellotas; Rus. Schedudii ; Lat. Glandes), the seed or fruit of the oak. Acerns formed a part of the food of man in early ages, and frequent allusion is made In the classics to this circumstance (Virail, Gearg. lib. i. lin. 8; OVid, Met. lib. i. lin. 106, etc.). In some countries they are atill used, in periods of ecarcity, as a substitute for bread. With us they are now rarely used except for fattening hogs and poultry. They are said to make, when toasted, with the addition of a little fresh huttor, one of tho best aubatitutea for coffiee. Their taste is astringent and bitter.

Acre, a measure of superficies, and the principal denomination of landineasuro in uso throughout the whole of Great Britain and the United States. The word (formed from the Saxon acher, or the German aker, a field) did not originaliy signify a determinate quantity of land, but any open ground, especiaily a wide campaign; and in this antique seneo it seems to be prescrved in the names of places; as, Castle-aere, West-acre, etc. The standard nere is formed by raising a square of which the basis is the chain of 66 feet, or 22 yarts, or 1-80th of a mille; and ten of these squares form the acre, whicis thus contains 4840 square yards. This in divided into roods, of which there are four in the acre; and Into poles or perches, of which there are 40 in each rood, or 160 in the acre. The rood will thue meaaure 1210 square yards, and the pole $30 t$ square yards, according to the foliowing table,
which contains also other denominations useful to be compared with the acre:

The following table containa tho princlpal forelgn land-meanures, with their equivalents in acres:

In the Cinited Btates of America the imperial acre is used. The Roman jugerums was somewhat larger than half an imperial acre, centalning 2 roods, 10 perchies, 189 aquare feet. Two jugera formed a heredium, so called from ita betug the quaniny of land originally assigned to each Roman citizen $;$ a hindred heredia formed a centuria, and four centurie a maltus. The Greek plethron consinted of 4 arura, and was equal to 87 perchea, 163 square feet.
Aotion, in Commerce, is a term used abroad for a certaln part or share of a pubiic company's capital stock. Thue, If a compeny has 400,000 livres capital stock, this may be divided into 400 actions, each consisting of 1000 livrea.

Aotuary, a person skilled in tho doctrine of life annuities and insurances, and who is competent to give opinious upon all cases involving aunuitice, reversions, etc. An aetuary sometimes combines with the professional dutles of a scientific adviaer those of a secretary, in all matters involving calculation, upon which it may be supposed that the members of the board are not generally conversant.

Adarcon, or Taric, $\delta \rho a \chi \mu \bar{\eta}$, the most ancient gold coin of which any specimens havo been preserved to the present day. It was tho earllest coined money known among the Jews; the improsaion on the coln is a crowned archer, in a garb such as is seen in the sculptures of l'ersepolis. The specimena weighed by Ir. Bernard were tifienn grains heavier than tho English guinea; their intrinsic value nay therefore bo reckoned at twenty-five shillinge oterliug.-ECKHEt, Doctrina Nummorum Viterum; liansard, De Mensuris et Ponderibus.

Adarme, in Ccmmerce, a amall weight in Spain, which is aleo used at Buenot Ayres, and in all Spanish America. It is tho 16 th part of an ounee, which at Paris ls called the demi-gros. But the Spanlsh ounco

ADE

#### Abstract

ADA 9 is seven per cent. lighter than that of Parie. Stephens renders it In English by a drachm.

Adatais, Adatis, or Adatys, in Commerce, a muslin or cotton cloth, very fine and clear, of which the piece is ten Freach elis long, and three quarters

 broad. It comes from the East Indies, and the finest is made in Bengal.Adelaide, a city of South Ausiralia, capital of the British colony of that name, about 7 miles S.S.E. from its port, an inlet on the east side of St. Vincent's Gulf, let. $84^{\circ} 57^{\prime}$ S., leng. $188^{\circ} 38^{\prime}$ E." Though founded so recently as 1834 , and not well situated, this is a well. built, prosperous town. Some of the heuses, and 1 . at part of the princlpal buildings, are of briek and stone. Popalation in 1846, 7143 ; and in 1858 probably about as great.

The river Torrens, on which Adciaide is bullt, loses itself in a marsh before reaching the sea, so that the city is about 7 miles distant from its port, an inlet of St. Vincent's Gulf. This inland situation is a serious drawback en the trade of the city; and it would seem that a mistake was committed in net building it on, or much nearer to, the coast. This, we are aware, has been denied, though, as we think, upon very unsatisfactory grounds. There appears, indeed, to be but little doubt that in no very lengthened period mest part of the commerce of the town will be transferred to the port, and that it viili be preferred as a residence by ali commercial people. In the rainy seasen the Torrens is much fleoded, theugh it seldom overflows its banks, which are ateep and lofty; but in the dry season it hss no curceat, ite bed being then formed inte a series of pools or tanks.

Port Adelaide, 7 miles N.N. W. from the city, in a low and marshy situation, consista of a number of dwelling houses and warehousea, some of which are of stone, with wharves, partiy belonging to government, aud partly to the South Auetralisn Company. Population in 1848 ahout 1800 . The inlet of the sea, forming the harbor, oppesite the entrialce to which a lightvessel is meored, stretches from the Gulf, from which it la separated by a narrow neck of land, for sbout 8 miles southward, surrounding Torrens Island. At its month is a sandy bar, with 8 feet water at ebb and 16 feet at flood tidn; this depth being censiderably increased during south and southwest winds. Ships of 409 or 500 tons may, consequent's, pass the bar in asfety; and once over, there is depth eneugh for the lsrgest ships to the head of the harbor.-Dutron, South Australia, p. 112. Large vessels are, however, obliged to lio in mid-channel ; but projects were recently on foot for improving the harbor, either by carrying out plers into the deep weter, or by establishing a new port about 2 miles nearer to the herher's meuth, where the water inshore is deeper, and the situation affords grestor facilitics for the accommodation of shipplng. Port Adelaide has a custom-heuse; but vessela are exempted from ail port charges in this and in the other perts of tho colony. A railway, planned to unite the clty witis the port, will most likely bo completed at an early date.

The trade of Adelaide ls already extensive, and will continue to incrense with the increase of the pepulation and trade of the celeny, of which it ls the grand emporium. The mines of conper, lead, cte., discevered In its vicinity are of the richest description, and the ores furnishod by them form at present the principal article of export. In 1852, the imports of cepper into England from Seuth Austraila, prinelpslly frem the Burra-13urra mine, ameunted to 8582 tons, worth abeve $£ 600,000$ ! The discovery of the gold fields, by attrsetIng many of the laborers from the cepper mines, gave a serious eheck to the progress of the latter, tho 1 gh it is probable that it will be but temporary. Wool is also en important article; and the Imports of it into Engisnd, which in 1852 amounted to $3,022,318$ pounds, have increased wlth the aanse extraordinary rapldity

84 those from the other parts of Australia. Among the items of import from this colony in 1852 were 1858 pounds quicksilver, and 2267 cwt. bark. We subjoin the foliowing statements with respect to the trade, shlpping, etc., of Port Adelaide in the following years :

| Yease. | Total imports. |  | Total Exports. |
| :---: | :---: | :---: | :---: |
| 1844 | 4118,915 611 |  | 485,272 146 |

It weuld be to no purpose to give any later detalls in regard to the trade of this colony. The discevery of the gold fields in Victoria and New Seath Wesles have had nearly the aame influence here as in Van Diemen's Land (sea Gold). They occasioned an excesslve emigratlon, and gave a suddeu and severe shock to all sorts of indastry. And though, no doubt, the colony will in the end recover from the contingency, and will mest probably be impreved by the circumstances in which it originated, some considerable time will have previously to eiapse.

Aden, a sea-port town of Southern Arabia, in the pessession of the East Indis Company, on the Indian Ocean, 118 miles east from the Straits of Babelmandel, lat. $12^{\circ} 46^{\prime} 15^{\prime \prime}$ N., iong. $45^{\circ} 10^{\prime} 20^{\prime \prime} \mathrm{E}$. It atands on the east side of a promontory, projecting south into the ecean, calied the Peninaula of Aden. This peninsula, which terminates in a lofty meuntain, bearing a striking resemblance to the rock of Gibraltar, is conuected with the msin iend by a low isthmus about 400 yarda in breadth. On the north and west the town la overhung by stecp and craggy rocks, on which are the remains of old fortifications. The east or outward harber of Aden, formerly (and apparently at a recent poriod) large and commodiens, is now partly filled up with sand. But the harbor on the west side of the town, between the promontory on which it stands and snother paraliel thereto, is a magnificent basin, capable of accommodating the largest. fleets. It has a contracted entrance, which might easily be fortified, so as to make it inaccessible to a hostile squadron. From this harbor the approach to the town is over a low ridge of the monntain, the road being in parts cut through the rock.
The site of thls town, the best adapted for trade on the whole cosst of Arabia, and the key of the Red Sea, hss always msde it a point of primary importance in the direct trade between Europe and the East. It became at a very early period a celebrated emporium (the A rabiac emporium of Ptolemy). After the Remaus obtained possession of Egypt, and Hippalus (A.B. 50) had discovered the direct route te India, they ciestroyed Aden, lest it shouid fall into hostlie hands, and interfere with their monepely of this lucrative traffic.--Vincent's Conmerce, etc., of the Incian Ocean, It. 327, 528. It is not known when or by whom It was rehuilt; but from the 11th to thio 16 th century it was tho great, er rather the excluaive entrepót of Eastern commerce. The discevery of the passage by the Cape of Good Hepe was the first great blow to ita impertance. Simuitancously with the appesrance of the Portuguese in Indis, the Turks, under Solyman tise Magnificent, took pessesslon of various Arabic ports, Aden among the number. They erectel the fertlicetions, the ruins of which excite the admiration ef every traveler, and which repelled the attacks of the fameus Portuguese general, Albuquerque. From this date, however, Aden
rupldy declined; nor did the expalsion of the Turke, which took place about the middle of last century, retard Its downfall. Ita ruin was more complete than could have been anticipated; for ite convenient harbors and plontiful supply of water make 1 it , apart from other considerations, a most deeirable port.

When first occupied by the British, it had not more than 100 houses, with a parcel of wretched huts, and from 3000 to 4000 inhabitants. It had, indeed, the ruina of several cisterne and reservoiss cut in the solid rock, and of aqueducts for conveying water from the mount ains of the interior, which fully testified its former greatness. But within the last half dozen years a vast change has taken place, and the anclent proap -ity of Adea bids fair to be again restored. Hoteis fo: the accommodation of the passengers by the steamers have been erected; and the population of the vicinity, attracted by the security afforded by tho English fiag, have flocked to the place, which has now (1853) from 25,000 to 30,000 inhabitanta! Some defensive works have already been constructed, and others projected, which, if completed, will make it (which it should be) the Gibraltar of the Red Sea. While its commanding position, excellent port, and abundant anpply of water, make Aden an important station in the route from Indis to Eurepe by the Bed Sea, it is no less favorably situated for becoming an entropót for the contiguou: countries of Arabia and Africa., It owed ito former consequence mainly to tit natural advantages, and these it still retains. And It can hardly fail again to become an important emporium, and to be of the greatest utility to the surrounding continents. The climate, though hot, ls not unhealthy. The abundant supply of water, for which Aden is remarkable among Arabio towns, is drawn from the ravines and gulliee of the surf vunding mountains, and from the land apriags, which are abundant on the se -shore.-(See Gicograph ical Dictionary, art. Ades, ar.- other authorities there quoted.)
Adjuntment, in Commercial Navigation, the settlement of a loss incurred by the insured. In the case of a total loss, if the policy be an open one, the insurer is obliged to pay the goods according to their prime cost; that ia, the invoice price, and all duties and expenses incurred till they are pat on board, includiag the premium of insurance. Whether they might have arrived at a good or a bad market, is held by the law of England to be immaterial. The insurer is supposed to have lusured a constant and not a variable sum; and In the event of a lose oceurring, the insured is merely to be put into the same situation in which he stood before the transaction began. If the policy be a valued one, the practice is to adopt the valuation fixed in it in case of a total lose, unlese the insurers can show that the insured had a colorable interest only, or that the goorls were greatly over-valuod. In the case of all partial losses, the value of the goods must be proved.
"The nature of the contract between the insured and insurer is," says Mr. Justice Park, "that the goods shall come safe to the port of delivery; or, if they do not, that the insurer will indomaify tho owner to the amount of the value of the goods stated in the policy. Wherever, then, the property lnsured is lessenod in value by damage received at sea, justice ls doue by putting the merchant in tho same condition (relation being had to the prime cost or value in the policy) ir which he would liave been had the goods arrived f.ee frem damage; that is, by paying him, such proportlon of the prime cost or value in the policy as corresponds with the proportion of the diminution in value occasioned by the damage. The question then ie, how is the proportioll of the damage to be ascertained? It certainly can not be by any measure taken from the prime cost; but it may bo done in this way 1 Where any thing, as a hogshead of sugar, happena to be spoiled, if you cas fix whether it be a third, a fourth, or a fifth worse, then the damege is ascertained to a mathematical certain-
ty. How is thia to be found out? Not by any prica at the port of shipment, but it must be at the port of delivery, when the voyage is completed and the whole damage known. Whether the price at the latter be high or low, it is the same thing; for in either case it equally shows whether the damaged goods are a third, a fourth, or a fifth worse than if they had come sound; consequently, whether the injury sustained be a third, fourth, or fifth of the value of the thing. And as the insurer pays the whole prime cost if the thing be wholly lost, so if it be only a third, fourth, or fifth worse, he pays a third, fourth, or fifth, not of the value for which it is sold, but of the value stated in the policy. And when no valuation is stated in the policy, the invoice of the cost, with the addition of all charge, and the premium of insurance, shall be tho foundation upon which tha loss dhall be compated."
Admeasurement. Sea Toxnage,
Adminintrator, in English Latp, he to whom the ordinary conmits the adminitration of tho goods of a person deceased, in default of an executor. The origin of administrntors ie derived from the civil law. Their establishment in England is owing to a statute made in the 31st year of Edward III. Till then no office of this kind was known besides that of executor; in default of whom, the ordinary had the disposal of goods of persons intestate, atc.
Admiral, a great officer or magistrate, who has the government of a navy, and the hesring of all maritlme canses. There can be little doubt of the Asiatio origin of the name given to this officer, which does not appear to have been known in the languagee of Europe before the time of the holy wara. Amir, in Ara' ic, ia a chief or commender of foross; it is the same word as the ameer of the peninsula of India (as ameer al omrah, the chief of lords or princes), and the emir of the Turks or Saracens, who had, and still have, their emir or amcer'l dureen, commander of tho sea, amir'l asker dureea, commander of the naval armament. The incorporation of the article with the noun appears, we believo, for the first time in the Annals of Eatychiue, patriarch of Alexandria, in the tenth century, whe calls the Calif Omar Amirol munumim, sea, Imperotor fulelium. Spelmen says, "In regno Saracenorum quatuor pretores atatuit, qui admiralli vocabantur." The $d$ is evidently superfluous, and is omitted by the French, who say Amiral. The Spanish write Alnirante ; the Portaguese the same. Milton would seem to have been aware of the origin of the word, when he speakg of "the mast of some great Ammiral." It is obvic"s, then, that the supposed derivations of a $\lambda \mu v \rho o s$ from the Greek, aumer from the French, and aen mereal from the Saxon, are fanciful and unanthorized etymologiea.
Admiral is also an appellation given to tho most conaiderable ahip of a fleet of merchantmen, or of the veesele employed in the cod fishery of Newfoundland. This last has the privilege of choosing what place he pleases on the ahore to dry his fish; pives pioper orders, and appoints the fishing-places to those wbo come after him; and as long as the fishing season continues, he carries a flag on his main-mast.
Admiralty, Eigh Court of. Thia is a court of lew, in which the authority of the lord high admiral is exercised in his judicial capacity. Very little has been luft on record of the ancient prerogative of the admirals of England. For some time after the first institution of the offleo, they juiged all matters relating to merchanta and marinors, which happened on the main aea, in a summary way, according to the laws of Oleron (so called because pronuigated by Richard I. at that place). These laws, which were little more than a tranecript of the Ihodian laws, became the universally receivod cuatoms of the western part of the world. "All tise sea-faring nationa,' saya Sir Leoline Jenkins, "soon after their premulgation, received and entertained theso lawa from the English, by way of deference to the sovereignty of our kings in the British
ocean, and to the judgment of our sountrymen in sea affaira."
The vicc-admiralty courts. - the British colonies are of two descriptions. The one has power to inquire into the casuses of detention of enemies or nentral vessels, to try and condemn, the same for the benefit of the captors, as well as to take cogniasnce of all matters relating to the office of the lord high admiral. The other has power only to institute inquiries into misdemeanora committed in merchant vessels, and to determIne petty suits, etc., and to guard the privileges of the admiral. The former are usually known by the name of Prize Courts, the latter by that of Instance Courts.

The following are the colonies and forelgn possesIons of Great Britain in whieh Prize Courts have been eatabliehed in the course of the last war: Gibraitar, Malta, Newfoundland, Halifex, Bermuds, Bahama Islands, Barbadoes, Antigua, Tortola, Jamaica, Cape of Good Ilope, Ceylon, Bombay, Madras, and Calcutta. The following British colonies had Instance Courts only: Dominica, Grenada, St. Vincent, St. Christopher, Trinidad, St. Cervix, Martinique, Berhice, Demerara, and Essequibo; in addition to which is a court estab lished at Sierra Leone for the trial and condemnation of captured slavers only; and siace that time, Gibral tar, Maita, St. Helena, Berbice, Domerara, and Essequibo, Sierra Leone (this court has jurisdiction only over ships concerned in the slave-trade), Newfound land, Hallfax, Nova Scotia, Prince Edward's Island, Lower Canada, Barbadoes, Tobago, and St. Lucia, Antigua, Montserrat, and Barbadoes, Tortola, Jamaica, Bahamas, Falkland Islands, Cepe of Good Hope, Gambia, Goid Coast, Ceylon, Bombay, Calcutta, Madras, New South Wales, Van Diemen's Land, Western Australis, South Australia, New Zealand, Vancouver's Island, Hong Kong, Lahuan.-E. B.
"The ordinary admiralty and maritime jurisdiction, exclusive of prize cases, embraces all civil and criminal cases of a maritime nature; and though there does not aeem to be any difficulty or doubt as to the proper jurisdiction of the prize courts, there is a great deal of unsettied discussion respecting the civil and criminal jurisdiction of the district court as an inatance court, and possessing, under the coostitution and judiciary act of 1789 , admiralty sad maritime jurisdiction.
"The act of Cengress gives to the district courts, exclusive of the State courts, and concurrently with the circuit courts, cognizance of all crimes and offenses cognizable under the authority of the United States, and committed within their districts, or upon the high seas, where oniy, a moderate corporal punishment, or fine, or imprisonnent, ia to be inflicted. This is the ground of the criminal jurisdiction of the district courts; and it is given to them as district courts : and as it it:cludee the minor crimes and offenses committed on th.s high seas, and cegnizable in the courts of admiralty under the English law, the district courts may be conaldered as exercising the criminal jurisdiction of a court of ad miralty in those nases. The Constitution of the United States declares that the judicial power of the Union shall extend to all cases of admiralty and maritime jurisdiction; and it has boen supposed that the federal courts night, without any statute, and under the genoral deiegsation of admiralty powers, have exercised criminal jurisdiction over maritime crimes and offenses. But the courts of the United States have been reluctant to assume the exarcise of any criminal jurisdiction which was not speeially conferred by an act of Con-gress."-Kent's Comm. Lect. XVII.

Adulteration, the act of debasing, by mixing with any pure and genuine commodity a spurious article, or an inferior ono of tho same kind, for pecuniary profit but it may also occur accidentaliy, as, for instance, by the action of aoids and oils on vessels of copper or lead In cullnary and other operations. But fow articles of cominerce, comparatively, are exempt from fraudulent deterioration; and althongh tho adulteration of excis-
able commodities and of food are offenses punishable by iaw, the risk too frequently is outweighed by the temptation of gain. In Paris, malpractices connected with. the adulteration of food are investigated by the Consell de Salubrite, and punished ; but Eaglish laveinme directed chlefly to the protection of auch the revenue. Adulterations of foo been made punishable by the l In Great Britain numerous acte the pravention of adulteratione ished by a fine, determined by fore a magistrate. In Turkey, ears nailed to his door.! By 5 § $1,3,8$, manufacturers of tobac to a penalty of $£ 200$ for having in subatance or líquid to be need, or cappion eforin as a subatitute for tobacco or snuff, or to minitionite or give them weight. .The preparer, vender, or disposer of such articles, ie liable to the aame. For actual adulteration the penalty is $\mathbf{5 3 0 0}$, and for having auch adultersted gooda in poasession, $\mathbf{£ 2 0 0}$. After a similtar manner, beer is protected by still heavier penalties; which laws extend to chemists, druggists, and beer retailers. See 56th Geo. III. c. 58, 1st Will. IV. c. 51, 64, 4th and 5th Will.IV. c. 85. Tea, coffee, cocoa, pepper, etc., are protected by law; but the adulterations of these, as of most other articles of food, are almost ondiess. The mixture of chiccory with coffee, is, however, authorized under certaln conditions. A treasury minute of 27 th July, 1852, prohibiting the sale of "chiccory or other vegetable aubstances mixed with coffee," was rescinded by in subsequent minate of 25th February, 1853, which permits dealers in coffee " to keep and sell chiccory prepared and mixed with coffee, provided the packages in which such mixture is delivered to purchasers have printed distinctly thereon, according to directions which will be given by the Board of Inland Revenuo, the whole of the following words, 'Mixture of Coffee and Chiccory."

The following results were obtained by a recent so ries of analyses of some articles of common domestic coneumption, purchased from different dealers, chiefly In London. In the several kinds of tes were found (partiy, perhaps, accidentally present) exhausted tealeaves, leaves of the beech, elm, horse-cheatnut, plane, bastard-plane, fancy-oak, willow, poplar, hawthorn, and sloe; catechu, rose-pink, black-lead, sosp-stone, sulphate of Iron, logwood, indigo, starch, rice husks, excrement of silkworms, Prussian blue, sulphate of lime, verdegris, etc. Of 18 eamples of chiccory procured from manufactories, 5 were adulterated with rossted wheat-flour; and of 16 samples of chiccory, purchased from different grocers, several were colored with Venctian red, or reddle. Of 68 samples of cocos and chocolate, 89 contained colored earthy substances; in some amples of cocoa, atigar and starch constituted more than half the article. Of 24 samples of bread, all contained more or less alum; and it may be observed that the quartern loaf, as delivered at houses by 18 different bakers, showed deflelency in weight, the max imum beigg between 8 and 4 ounces. Out of 30 sam ples of oatmeal, 16 were adulterated with bariey-meal; In one instance, apparently, much more than one half. Of 86 samples of arrow-root, 18 were mixed with potatcflour, or petato-starch, sago-powder, or taploca-starch, etc.; snd 5 were almcst entirely potato-starch. Of 26 esmples of milk, 11 were mixod with water, in proportiona varying from 10 to 00 per cent. Of 28 samples purchased as isinglass, 10 consisted entirely of gelatine. It is well known that quack medicinea frequently contaln ingredients they are guaranteed not to contain; henee the evils resulting from their indiscriminate nse. Nor are woolen, linen, and silk goode exempt from inferior admixture; various subatances are employed to give body to silk fabrics; as in China a gluey preparathon from the F'ucus Tenas is usod to give thom weight and gloss. The above facte will give aome idea of the
oxtent to which adulteration is practiced in the most enmmon articles of consumption. We may add that all legislative enaetments on the auhject will prove ineffectual nnless the pablic exercise their own diserimination, and dealere who are discovered to hav, im. posed spurious commodities are made to foel that honesty is the beat policy.
Adulteration of Wines.-The varions substances used In the mannfacture to flaver and to color wines (such as almonds, raisins, orris root, burned sugar, brandy, logwood, whortleberries, elderberries, etc.) must be distinguiahed trom others which aro directly deieterions, euch as alum, used to impart astringency, and litharge and ceruse, to dnleify "pricked" or sour wines. The foilowing is an excellent test for any of the preparations of lead: mix an aqueous solution of tartaric acid with liquid sulphureted hydrogen; when added to the snspected wine, should any copper or iron be present, they are kept in solution by the tartaric acid, while the lead is thrown down by the sulphureted hydrogen as a dark precipitate. Red wine should be decolorized before using the tees, which is conveniently done by mixing the wine with an equal weight of milk, and filtering it. When the tarirate of lead is found in the bottom of the cask, it may easily be detected by calcining a portion of the insolubie matter, and redueing it by the blowpipe on chaicoai. A portion of the sediment may be digested with vinegar, which would give, by evaporation, acetate of lead; and it may be tried by aulphureted hydrogen. Alum may be precipitated from white wine by carbonate of soda gradualiy added until no more falls down; filter; on the filter w : 1 i be found alunine. The sulphate of potassa remains in the eolution; but the quantity present may be found by precipitating the sulphuric acid by muriate of baryts. Iron is sometimes accidentally present in wines; but it is not dangerous, and may be detected by nutgalis. Copper sometimes occurs from the use of copper stop-cocks: it is dat .ed by the addition of ammonia ; and, if much, by a plate of polisbed iron teft some time in the wino. Arsenic bas occasionaliy occurred from the suiphuring of the cask. After decolorstion by animal charcosi, pass a atream of sulphnreted hydrogen through the wine, and a yellow precipitate wiil fail, which may be reduced to the metallic state by charcoal and soda. The same tests are applicabie to all fermented liquors. -E. B. See Henderson'g Ancient and Modern Wines.

Adulterntion of Coin.-This has been accounted among all nations, iuth in ancient and modern times, a very grave offense, and punisbable by death in several ways. It was formeriy considered as treason in Great Britain, and rigorously punished with death; bat in the amelioration of the criminal code by Lord John Russeli's act (Will. IV. c. 34, Viet. 1), the punlisbment has been commuted to transportation for sny period not less than seven years, or by imprisonment for not more than four years, at the discretion of the jodge. The specific gravity of pure gold $=10 \cdot 30$; standard geld $=18.88$; pure siiver $=10.31$; standard ailver $=10 \cdot 34$. The proiortion of ailoy in the gold and silver coin of Britain is one-twelfth copper, which gives durability. A genuine coin, uniess it be cracked, is quite sonorous; yet even thlis quality is net an invariable test for counterfeit money. Much false coin is in circuiation, especially in the metropolis, a atatement confirmed by its very frequent reception as change. Beaidea the frauds by clipplng, fling, easing, electroplating, etc., the debasement of coin has been effected by boring the edge of a piece, and plugging the cavity with inferior metal: in hia manner has piatinum been inserted in gold. Another method has been practiced by sawing a gold piece latersliy, and skilifuily flling the centre with platinum; a freud which cutting aione could detect.
To ascertain the adulteration of silver and gold coin by excess of copper, the foliowing processes wili suffice : dissolve a given woight of the silver in nitric acid,
and precipitate by a solution of common salt; dry; and weigh tbe precipitate, which is the chloride of sit ver, and contains 76.5 per cent. of the metal ; or it may be reduced on ctarcoal before the biowpipe, when a Lutton of pure silver will be obtained, by weighing which, the proportions of silver ard of copper will be known. Sliver coin is very frrquently imitated by some white alloy, gencraliy of tiu, antimony; and lead; it may be knewn by its piiancy and dull appearance, or it may be tested for ailver, as described above. German silver, a beantiful imitation of siiver by nickel and copper, may be detected by ite deficient specific gravity, and its emitting, when briskly rubbed, a faint, coppery odor; or by disaolving it in nitric acid, and adding a soiution of common salt, when it wili give no precipitate. The amount of alicy in gold may readily be ascertained, for ordinary parposes, by the atreak on touchstone, and comparing that with the atreak of the gold needlea made for the purpose; or more nicely by this process : filo off a given weight of the goid, and dissolve in aqua regin, then precipitate the gold by immersing in the solution a plate of siiver or copper; or more quickiy, by weak galvanic action; or the geld may be thrown down by addition of an alkaline aolution, or by adding the muriate of tin, which throwa down the purple powder of Cassius, from which the quantity of goid may be easity ascertained, by oxidating with the blowpipe a given weight of the powder, and so obtaining a button of pure geld.

The purity of copper is ascertained by dissolving a given weight in any of the mineral acids, and obtaining copper of cementation by immersing a piate of iron or zine in the solution; or by decomposing the salt of copper by chareoal, aikeli, and heat, in the usual way. (Ses Chemstry.) It may be noticed as a curions fact that, in England, the copper coinage of Wiiiiam IV. was found to centain gold, from which discovery these coins apeedily became scarce.-E. B.

Ad Valorem, a term ciniefly used in speaking of the duties or custems paid per cent. on goods. The duties on some articles are paid by the number, weight, measnre, tale, etc., and others paid ad valorem, that is, according to their value.

Advance implies money paid before goods are delivered, or upon consignment. It is usual with merchants to advance from a half to two-thirda of the value of goods consigned to them, on being required, on their recelving invoice, bili of lading, orders to insure them from sea risk, etc.
Adventurers, Merchant, a celebrated and enterprising company of merchants, was originally formed for the diacovery of territories, extension of commerce, and promotion of trade, by Joln, duke of Brabant, in 1296. This ancient company was afterward tranolsted into Engiand in the reign of Edward IIL., and Queen Eiizabeth formed it into an Engli 4 corporation in 1564. -Asnerbon.
Advertisement, in its general sense, is any information as to any fact or circumitance that has occurred, or is expected to oceur; but, in a commereial sense, it is understood to relate only to intimations with respect to the sale of articles, the formation and dissoiution of partnerships, bankrupteies, meetings of ereditors, etc. Advertisements in newspapers in England, as now rubilisied, were not generai until the beginning of the 18th eentury. A penalty of $\mathbf{5} 50$ was inflicted on persons advertising a reward with "Ne questions to be asked" for the return of things stoien, and on the printer, 25 Geo. II. 1754.-Statutea. The advertisement duty was formeriy charged according to the number of lines; it was afterward fixed in England at 8s. $6 d$, and in Ireland at $2 s .6 d$, each advertisement. The duty was further reduced, in England to 1s. 6d., and in Ireland to 1 s . each, by statute 8 and 4 Wiii. IV. 1883. The duty was aitogether aboliahed in the United Kingdom, hy 16 and 17 Vict. e. 63, Alg. 4, 1853.-Hards,
Advioe ls usualiy given by one merchant or bank-
er to another by letter, Informing him of the bills or drafts drawn on him, with all particulars of dste, or sight, the sum, to whom made payable, etc. Where bilis appear for acceptance or payment, they are frequently refused to be houored for want of advice. It is also necessary to give advice, as it prevents forgeries: if a merchant accept or pay a bill for the houor of any other person, he is hound to advise him thereof, and this should always be done ander an act of honor by a notary public.

Affreightment. "A charter-party is a contract of affreightment in writing, by which the owner of a ship lets the whole, or a part of ber, to a merchant, for the conveyance of goods on a particular voyage, in consideration of the payment of freight. All contracts under seal were aaciently called charters, and they used to be divided lato two parts, and each party interested took one, and this was the meaning of the charta partita. It was a deed or writing divlded, consisting of two parts, like an indenture at common law. Lord Mansield observed, that the charter-party was an old informal instrument, and, by the iatroduction of different clauses at difforent times, it was inaccurate and sometimes contradictory. But this defect has been supplied by giving it, as mercantile contiacts uaually receive, a libersl construction, in furtharance of the real inteation and the usage of trade.
"This mercantile lease of a ship describes the parties, the ahip and the voyage, and contains, on the part of the owner, a stipulation as to sea-worthiness, and as to the promptitude with which the vessel shall receive the cargo and perform the voyage; and the exception of such perils of the sea for which the master and shipowners do not mean to be responsible. On the part of the freighter, it contains a stipulation to load and unload within a given tlme, with an allowance of so many lay, or runniug days, for loading and unlosding the cargo, and the rate and times of payment of the freight, and rate of demurrage boyond the allotted daya.
"When the goods of several merchante, unconnected with each other, are laden on board, without any particular contract of affreightment with any individual for the entire ship, the vessel is called a general shlp, because open to all nierchants; but where one or more merchents contract for the ship exclusively, it is said to be a chartered ship. The slap may le let In whole or in part, and either for such a quantity of goods by weight, or for so mach space in the ship, which is letting the ship by the ton. She may also be hired for 2 gross sum so freight for the voyage, or for a partlcular sum by the moath, or any other determiaate period, or for a certain sum for every ton, cask, or bale of goods put on board; and when the ship io let by the month, the time does not begin to run until the ship breaks ground, unless it be otherwise agreed. The merchant who hires 2 ship, may either lade it with his own goods, or wholly underlet it upon his owa terans; and if no certain freight be atipulated, the owner will bo entitled to recover, upon a quantum meruit, as much freight as is usual under the like circumstances, at the time and place of shipment. It is the duty of the ownor of the ship, not only to see that she ls duly equipped, and in a suitable condition to perform the voyage, but ho is bound to keep her in that condition throughout the voyage, unleas he be prevented by perils of the sca. If, In consequence of a failure in the due equipment of the veasel, the charterer does not use her, he is not bound to psy any freight; but if he actualiy employs her, he must pay the freight, though he has his remedy on the charter-party for danages sustained, by reason of the deficiency of the vessel i- her equipment. The freighter is bound, on his part, not to detain the ship beyond the stlpulated or uaual time, to load, or deliver the cargo, or to saii. The extra days beyoad the lay days (being the days allowed to load and uaload the cargo) are called days of demurrage; and that term is likewise appliod to payment for such delay, and it
may become due either by the shlp's detention, for thy purpose of lcading or unloading the cargo, either be": fors, or during, or after the voyage, or waiting for convoy. If the claim for demarrage rest on expreas contract it is strictly enforced, as where the runniag dayn for delivering the cargo under the bill of lading had espired, sven though the consignee was prevented from clearing the vessel of the goode by the default of others.
"The old and the new French codes of commerce require the charter-party to be in writlag, though Valin holds that the contract, if by perol, would be equally valid and blading. In the English law, the hiring of ships without writing is undonbtedy valid; but it would be a very loose and dangerous practice, at least in respect to foreign voyages. In the river and coasting trade, there ia less formality and less necessity for it; and the contract 18, no doubt, frequently without the evldence of deed or writing. If either party be not ready by the time appointed for loading the ship, the other parts, if he be the charterer, may seek another
ip, or, if he be the owner, another cargo. This right wo iges from the necessity of precieion and punctuality In all maritime transactlons. - By a very short delay, the proper season may be lost, or the object of the voyage defeated. And if the ship be loaded only in part, and she be hired exclualvely for the voyage, and to take in a cargo at certain specified rates, the freighter is eatitled to the fill enjoynient of the ship; for he la answerable to the owner for freight, not only for the cargo actually put on board, but what the vessel could have taken had a full cargo been furnished. The master has no right to complete the lading with the goods of other persons without the consent of the charlerer; and if he grants that permission, the master must accuunt to him for the freight. He has no right to complain if the clarterer refuses to grant the permiseion, or to complete the lading, provided he has cargo enough to secure his freight. This was the regulation of the French ordiLance, and it has been adopted into the new code. By the contract, the owner is bound to see that the ship be sea-worthy, which means that she must be tlght, atanch, and atrong, well furnished, manned, victuaied, and in all respects equipped in the usual manner for the merchant service in such a trade.
"The shlp muat be fit and competent for the sort of cargo and for the particular service for which she is engaged. If there ahould be a latent defoct in a vessel, unknown to the owner, and undiscoverable apon examination, yet the better opinion is that the owner must answer for the damage occasioned by the defect. It is an implied warranty in the contract, that the ship be sufficient for the voyage, and the owner, like a common carrier, is an Iasurer against every thlag hut the excepted perils. To this head of sca-worthinese may be referred the owner's obligation to see that the ship is furnished with all the requisite papers according to the laws of the country to which she belongs, and according to treaties and the laws of nations. Such documents are necessary to aecure the vessel from disturbance at home, on the high seas, and in foreion porta. If the chartor-party contains any stipulatio. on the part of tive owner to kcep the ship in good order doring the voyago, the entire expeuse of the repairs requisite in the course of the voyage are then to be boroe by the owner, and are not, in that case, the subject of general average or contribution. But the owner does not insure the cargo sgainst the perils of the sea. He ia answeraile for his own fault ot negligence, or those of his agents, and for defects in the ship or her equipments; and gencrally, as a common carrier he is answerable for all losses other than what arise from the excepted cases of the act of God and public enemies. The respoasibility of the owner, begins, where that of the wharfinger ends, and whea the goods are delivered to some accredited person on board the ship. The cargo must be taken on board with care and akill, and bo properly stowed, and the contract by the lill of lading

Imports that the gooda are to be safely stowed inder a deck $;$ and if they are atowed on deck without the consent of the shipper, or withont the sanction of custom, they are at the risk of the ship-owner or master, and he and the owners of the ressel would not be protected from liablity for their lose by the sxception in the bili of iading of the dangers of the seas. If the ship has been advertised by the agent of the owner for freight as a general ship, and the notice had stated that she was to sall with convoy, this would amount to an engagement to that effect; and If she salls withont corivoy and be lost, the owner becomes answerable to the shipper in damages for the breach of that representativen."Kexr's Comtm., Leet. XLVII.

Africa. The knowiedge of thia great continent which ancient writers have tranomitted to posterity is of very limited extent, owing principally to ito physical construction. The great desert, which in a broad beit atretches quite across the continent, forbade every attempt to pass it until the introduction of the crmel by the Arabs. The want of any inown great niver, except the Nile, that might conduct into the interior, contributed to confine the Greek and Roman colonists to the habitable belt along the northern coast. The Phcenicians are known to have formed establishments on the northern coast of Africa at a very eariy period of history, probably not less than 8000 yeurs ago; and the conquest of Eqypt by Cambyses dates as far back as the year n.c. 525 . We may consider, thercfore, the coasts of Egypt, of the Red Sea, and of the Mediterranean, to have been settled and well known to the ancient Asiatics, who were constantly passing the narrow isthmus which divided their country from Africa, and led them immediately from purched deserts into a fertile vailey, watered by a magnificent river. Bnt whether they were much or little acquainted with the western coast, which bounds the Atlantic, and the eastern coast washed by the Indian Ocean, is a question that has exercised the research and ingenuity of the ablest scholars and geographere, and has not yet been satisfactorily answered.

From the shores of the Mediterranean to about the latitnde of $20^{\circ}$ north, the population of Africa consists largely of tribes not originally native to the soll, bint of Arabs and Tarks, planted by conquest, with a considerable number of Jews, the children of dispersien ; and the recently introduced French. The Berbers of the Atlas region, the Tuarieks and Tibbus of the Sahara, and the Copts of Egypt, may be viewed as the descendants of the primitive stock, while those to whom the general name of Moors is applied are perhaps of mixed descent, native and foreign. From the latitude stated, to the Cape colony, tribes commonly classed together under the title of the Ethiopic or negro family are foand, though many depart very widely from the pecullar physiognomy of the negro, which is mast apparent in the natives of the Guinea const. In the Cape colony, and on its borders, the Hottentots form a distinct variety in the population of Africa, most closely resembling the Mengolian races oi Asia.

The British colony of Sierra Leone extends from Rokelie River in the north, to Kater River in the sonth, and about twenty miles iniand. The population, consisting chiefly of liberated siaves, amounted in 1847 to 41,735. Freetown, the capitai, has 10,580 inhabitants, and is, after St. Louls, the most considerable European town on the western coast of Africa.

The Maiaghetts or Grain Coast extends from Sierra Leone to Cepe Palmas. Malaghetta is a species of pepper yieided by a paranitical plant of this region. It is sometimes styled the Windy or Windward Coast, from the frequency of short but furious tornadoes, thronghout the year. The Republic of Liberla, a settlement of the American Colonization Society, founded in 1822, for the purpose of removing free peopie of color from the Unitrd States, occupies a considerable extent of the coast, and has for its capital Monrovia, a
town named after the president, Mr. Monro. The popnlation amounts to from 10,000 to 18,000 native inbabitants, and 8200 liberated fiegroes from America.
The I vory Coast extends from Cape Paimua to Capo Three Points, and obtained Its name from the quantity of the article auppilied by ita numerous elephants. The Gold Coast atriu'hea from Cane Three Pointa to the River Volta, and has been long frequented for gold dust and other products. The Dutch have several trading ports, of which Elmina, a town of 19,000 inhabitants, is the princlpal and oldest of the European stations, founded by the Portuguese in 1411. The Britiah posecsy Cape Coast Castic, a opacious fortress, and James's Fort, near Aecra. The Danish settlements of Christiansburg and Friedensburg were ceded to the Engliah in 1849. The Sisve Cosst extenda from the River Volta to the Calabar River, and is, as its name implies, the chief scene of the most disgraceful traffis that blots the histery of mankind. Eko, or Lagos, one of the chief towns of the cosst, was destroyed in 1852. The kingdoms of Ashanti, Dahomey, Yoruba; and others, occupy the interior country of the Guinea coast. The coast from the Old Calabar River to the Portuguese posseasions is inhablteci by various tribes.' Duke's Town, on the former river, is a large town of 30,000 to 40,000 inhabitants, with considershie trade in pnim-oil, ivory, and timber. On the Gabnn River, close to the equator, sre a French settlement and American missionary stations. At the equator, Southern or Lower Guines begins, where the only European settlements ars those of the Portuguese. Loango is reckoned from the equator to the Zsire or Congo river. It chief town is Boaily, called Loange by the Europeans. Congo extends south of the Zaire, comprising a very fertile region, with veins of copper and iron. Banza Congo, or St. Salvador, is the capital. Angola comprises the two districts of Angola proper and Benguela. In these regions the Portuguese settlements extend farther inland than in the two preceding districts, namely, about 200 miles. The population of the settiements is sbont 400,000 , comprising only 1880 Europeans. The capitai, St. Paole de Loando, contair. 1600 Europeans and 4000 native inhabitants, and has a fine harbor. St. Felipe de Benguela is situated in a pieturesque but very marshy and most unhealthy spot.
The coast from Benguela to the Cape colony may, in a general arrangement jike this, be included either within West Africs or South Africs. The whole coast is Ilttle visited or known, being of a most barren and desolatc description, and possessing few harbors. From Walfich Bay, Mr. Gaiton recently penetrated nearly 400 miles into the interior toward Lake Ngami, and explored the conntry inhabited by the Ovaherero, or Damaras, and other tribes.
Under Sonth Africa the Cape colony only is generally conprised. It takes its name from the Cape of Good Hope, and extends from thence to the Orange River in the north, and to the Tugeis River in the east. A iarge proportic. 7 of the territory inciuded within these Ilmits, esjecelaily in the north, is cither unoccopied, or, excepting missionary stations, entirely in the hands of the aborigines.
Natal, or Victoria, a district on the east coast, and separated from the Cape colony by Kaffraria, is a recently formed Britioh settlement, containing an area of abont 18,000 square miles. It is highly favored in those respects in which the Cape is most deficient, having abundance of wood and water, with coal and various metallie ores, a fine alluvial soll, end a climato adapted to the cultivation of the products for which the home demand is large and constant-cotton, silk, and indigo. Pietermaritzburg, the capital of the settlement, lies 50 miles from the coast. Port Natal, now D'Urban, seated on s fine iake-like bay, is the only harber.
To Africa belong a considerabie number of islands. The Madeiras, belonging to Portugal, lie off the north-
west cosst of Africa, at a distance of about 860 milea. Madeira, the chiof island, is abont 100 miles in circuit, and has long been famed for ftes picturesque beauty, rich fruite, and fine climate, which rendars it a favorIte resort of invalids. Wine is the staple produce. Funchal, the chief town, with nearly 80,000 inhableants, is a regular atation for the: West India mail stesm-packeta from Southampton, and the Brazilian aailing-packets from Falmonth. The Canaries, belenging to 8 pain, the anpposed Fortunate Ialands of the ancients, are situated about 800 milee month of Madesra. They are 18 in number, all of volcanic origin, Teneriffe being tho largeat. The latter is romarkable for tos peak, which rises as a vast pyramidal mases to the height of 12,172 feet. . The Cape Verd Ialands, aubject to Portngal, are a numerous group about 80 milles from Cape Verd. They obtained th' name from the profusion of sea-weed found by the diacoverery in the neighboring ocean, giving it the appearance of a green meadow. They are also of voleanic origin. Fernando Po, a very mountainous island, is in the Bight of Biafra. Formerly a British settlement, it was abandoned owing to ita unhealthiness, and is now only inhabited by a fow negroes and mulattoea. St. Thomas, immediately under the equator, is a Portuguese settlement ; as also Prince's Ialand, $2^{\circ}$ nerth of the line. Annobom, in $20 . \mathrm{S}$. lat., belongs to the Spaniards. Ascension, a small, arid, volcanic isiet, was made a Britiah pert on the arrival of Napoleon Bonaparte at St. Helena, and since retained as a station, at which ships may teuch for atores. Green Hill, the sunmit of the island, rises to the height of 2840 feet. St. Helena is a huge dark mass of rock, rising abruptly from the ocean to the height of 2692 feet. James' Town is the only town and port, containing 5300 inhabitants. Medagascar, the largest ieland of Africa, and one of the larger tin the worid, is separated from the Mozambique coast oy a channel of that name, about 250 miles wide. . $\therefore$ he area excoeds that of France, comprising 225,00C square milea, and the population is eatimated at $4,000,000$. It has an atmosphere so pestilential, in perticular lecalities, that to breathe it for a short duration is generally, and very quickly, fatal. But other parts are not insalubrioss. The lemurs, an interestiog tribe of animais, are peculiar to Madagascar and the Comoro Archipelago. The inhabitants are diverse races of Negro, Arab, and Malay origin. The Ovaha, a people of the cantral provinces, are now dominant. The prinelpal own, Tananarivu, hes 8000 inhabitants. The Comoro iales, four in number, are in the north part of the Mozambiquo Channel, and inhabited by Arab tribes. Bourbon, 400 milea east of Madagascar, ia a colony of France, producing for export eoffee, sugar, cocos, spices, and timber. Mauritius, ceded to the Britiah by the French in 1814, is 90 miles northeast of Bourbon. The augarcane fa chiefly cultivated. Port Loulg, the capital, besutifuliy oituated, has 26,000 inhabitants. Within the jurisiliction of the Governor of the Mauritins are the isiands of Rodriguez, the Seychelles, and the AmIrante islands. Socotra, a large island, east of Cape Jerdaffun, with an Arab population, has been known from carly times; it is now a Britioh possession. This ialand was long celebrated as producing the finest aloetic drug: a few yeara ago this was denied; but now It is found atill to produce a fino kind of aloe, though much of what passed as Socotrine aloca really came from India.-E. $\mathbf{B}$.

Afrioan Company, a society of merchants trading to Africa. An association in Exeter, which was formed in 1588, gave rise to this company. A charter was granted to a joint stock company in 1618: a third company was created in 1681 ; a fourth corporatior in 1662 ; and ancther formed by lettere patent in 1672, and remodeled in 1605 . The rights vested in the present cempany, 23 Geo. II. 1749.-See Slayze Tande.

Aspate (popularly Cormbisan), Germ. Achat; Du. Achaat; Fr. Agata; It. Agata; Rus; Agat ; Lat. Achates. A genus of temi-pollucid gema, so called from the Greek oxarfs, because originally found on the banks of the river of that name in Italy. It is never wholly opaque like Jasper, nor transparent as quarte-cryatal; it takes a very high polish, and its opaque parts naually present the appearance of dots, eyes, veins, sones, or bands. Its colore are yellowish, reddiah, bluish, millr-white, honey-orange, or ochreyellow, fieah-blood, or brick-red, reddish brown, violet blue, and brownish green. It is found in irregular rounded nodulea, from the size of a pin's head to more than a foot in diameter. The lepidaries distinguish agates according to the color of their ground, the finer eemi-tranaparent kinda heing termed Oriental. The moat beautiful agates fornd in Great Britain are commonly known by the name of Scotch pebbles, and are met with in different parta of Scotland, principally on the mountain of Cairngorm; whence they are sometimea termed Cairngorma. The German agatea are the largest. Some very fine ones have been brought from Siberia and Ceylon. They are feund in great plenty at the eastern extremity of the aettiement of the Cape of Good Hope, and are atill met with in Italy. 7 But the principal mines of agate are situated in the little principality of Rajpepla, in the province of Gujrat, 14 miles distant from the city of Brocch, whero they are cut into beads, crosses, anuff-boxes, etc. They are exported in considerable quantitiea to other parts of India, and to this country; and hence, perhaps, tho jewelers' term "broach."

## Agent. See Facton.

Agto, a term used in Commerce to denote the difference between the real and the nominal value of money. In some atates the coinage is so debased, that the real is greatily rednced below the nominal value. Sometimes this is owing to abrasion, and the wear of circulation. Where this reduction amounts, e.g., to 5 per cent., if 100 severeigns wero offered as payment of a debt in England, while euch sovereigna were current at their nominal value, they would be received as just payment; but if they were offered as payment of the same amount of debt in a foreign atate, they would be recelved only at their intrinsic value of $\mathbf{£ 9 5}$, the additional $\mathbf{5 5}$ constituting the agio. The same principle ia applied to the paper currency of a country, when reduced below the bullion value which it professes to represent. According to the respective demand for gold or paper money for the purposes of comme.ce, it becomes necessary, in order to procure the one or other, as the case may require, to pay a premiam for it, which is called the agio.-E. B.

Agrarian Laaw, Agraria Lex. This was an equal division among the Roman people of all the lands which they acquired by conquest, limiting the acres which each person should enjoy, first proposed by Sp. Cassius, to gain the faver of the citizens, 486 n.c. It was enacted nnder the tribnne Tiberiua Grac chus, 182 b.c. ; but this law at last proved fatal to the freedom of Rome under Julius Cessar.-Lrvy; Vos8108.

Ahead, a sea term, aignifying farther onward than the ahip or at any diatance before her, lying immediately on that point of the compass to which her stem is directed. It is used in opposition to astern, which expresses the situation of any object bahind the ship.

Ahull, in Naval Language the situation of a ship when all her sails are furled on account of the violence of the atorm, and " $\lrcorner \mathrm{cn}$, having lashed her helm on the lee-alde, she liea nearly with her side to the wind and sea, her head boing somewhat inelined to the dircetion of the wind.

Alabama, one of the Sonthern United States, is bounded north hy Tennessee, east by Georgia, south by Floride and the Gulf of Mexico, and west by Missigsippi. It is between $80^{\circ} 10^{\prime}$ and $85^{\circ} \mathrm{N}$. lat., and $85^{\circ}$
and $88^{\circ} 80^{\prime}$ W. long, and between $8^{\circ}$ and $11^{\circ} 80^{\circ}$ W. Jong. from Wachington. It containe 50,722 square miles, or $82,462,080$ acres. Population in 1800 was only 2000 ; in $1810,10,000 ; \ln 1820,127,901 ;$ in 1880, 808,997; in 1840, 690,756 ; and in 1850, 771,671. Whiter, 426,607 ; free colored, 2272 ; alaves 842,892 . It contained in 1850 ffty-two counties. The capital is Montgomery, situated on the left bank of the Alabama River, 838 milea above Mohile by the cuarse of the river. Moblle, the metropolis, is the most popnious and commercial place in the State. The other principal placee are Huntsvilie, Florence, Wetumpla, Tusceloosa, Cahaba, Eufala, etc.

Surface, $\$$ oil, efc.-The surface of this State exhiblte much variety: bordering the Gulf shore, and for some distance interior it is low and level, soil sandy, and the prevalling timber is pine. The central portion exhibita an undulating surface, with a deep, rich, and productive soll, especially along the margins of atreams. Approaching the north, it rises into a hilly region, and in the nertheast corner of the State it becomes mountainous. This is caused by the southeru termination of the Alleghany Ridge, which here, in crossing the State, melts away into a hilly diatrict, and is finally lost in the rolling prairiea and gently undulating plaing. The Tennessee Valley, from where it enters the State, near the northeast corner, until it leaves it at the northwest corner, presents rich and fertile bottom lands, and the landa bordering thereen are the richest agricultural portion of the State. The climate, varying from the south to the north part of the State, ia favorable for the production of its great staples, cotton, rice, sugar, aweet potatoes, and Indian corn, and in the middie and northern part wheat and other cereais. Alshama has great mineral resources; the entire middie region is underiaid with bituminous coal, and deposita of iron ore, and in different localitics throughout the State are lead ore, manganese, limestone, marble, etc. $;$ in the northeast gold mines have been wrought with some success.

There were in this State, in 1850, 4,435,614 acres of land improved, and $7,702,067$ of unlmproved iand in farms. Cash value of farms, $864,823,224$, and the value of implementa and machinery was $\$ 5,125,663$. Live Stock: horses, 128,001; asses and males, 59,895; millch cows, 227,791 ; working oxen, 66,961 ; other cattle, 433,263 ; sheep, 871,880 ; awine, $1,904,640$; value of live steck, $\$ 21,690,112$.

Agricultural Producto, etc.-Wheat, 294,044 bushels produced; rye, 17,261; Indian cora, 28,764,048; oats, 2,965,696; bariey, 8,958 ; buck wheat, 848 ; ; peas and beans, 892,701 ; potatoes, 248,001 ; sweet potatoes, $5,475,204$; rice, $2,312,252$ pounds. Value of products of the orchard, 15,408 ; produce of market gardens, 884,821 ; pounds of lutter made, $4,008,811$; of cheese, 81,412; sugar, hogsheads of, 8242; maple-sugar, 643 pounds; molasses, 83,428 gellona; beeawax and honey, 897,021 pounda; wool, 657,118 pounda produced; cotton, 564,429 bales ; flax, 8921 pounds ; silk cocoons. 167 ; hops, 276 pounds; tobacco, 164,990; hay, 82,685 tons; clever seed, 138 busheis; other grass seeds, 547 ; flax seed, 69 bushels; and there were made 220 gals. of wine. Value of home-macoe manufactures, $\mathbf{8 1 , 5 3 4 , 1 2 0 ;}$ of slaughtered anlnals, $84,828,485$.-Census, 1850.

Rivers, etc.-Mobile, the principal river, is formed by the junction of the Alabama and Tombigbee rivers, and enters Mebile Bay by two mouths. The Alabsma is navigabie for vessels requiring aix feet of water 60 miles above ita junction, and has four or flve feet of water 150 miles to the mouth of the Cahawha, and to the junction of the Coose and Tallapooes, of which it is formed; it has in ita shaliowest places three feet of water. The Tombigbee, the other constituent of Mobiln River, is navigable for schooners 120 miles to St . Stephens, and for steamboats to Columbus, Mississippi. The Black Warrior, a large branch of it, is navigable for ateamboats to Tuscalooss. The Chattahoochee for a
considerable diatance eparatea this State from Georgls on the east. The Ter neesee curves southwardly from the northeast to the nurthwest corner of the State, and is navigable for steamboata to Florence, at the foot of the Muscle Shoals.

Mobile Bay sete up 80 miles from the Gulf of Mexico, with an average breadth of 12 miles. See Moniln.

Interwal Improvements, eto-Muscle Shoals Canal is denigned to overceme an obstruction in the Tennessee River, and extends from Florence 852 milee, and cost $\$ 571,835$, and when completed to Brown's Ferry, at the head of the shoal, is eatimated to cost $\$ 1,361,057$. Huntsvilie Cansl extenus 16 miles from Triana, on Tennessee River, to Huntsville. There were in this State, January, 1854, tix railroads, four of which were wholby or in part in operation; aggregate miles finished, 221 ; cosk, $88,546,000$; and 65 milea chartered or in course of constraction. There are three banka in the State, with an aggregate capital of $\$ 2,100,000$. The State Penitentiary is at Wetumpka. There is also a State insane hospital, and a school for the deaf and dumb at Robinson'o Springa.

The rail way syatem is yet in its infancy in this Stato. There are 286 ruilea in operation, and 608 milea in construction. Congreas has this year ( 1850 ) granted land for Alabama railroads, and this grant will doubtiess be aufficient to build the roads now in progress. Alabama is one of the States that peculiarly need railroads. Its producte are not censumed in the State, but have to be transported to the sea-board, and the absence of large rivers makes railroade Indispensable to the prosperity of the State.

Manufactures.-There were in this State in 1850, 18 cotton factories, with a capital invested of $\$ 681,900$, employing 849 malea and 897 females, producing 8,281 ,000 yards of sheeting, etc., and 790,000 pounde of yarn, valued at $\$ 398,585$; 8 woolen factories, with a capital of $\$ 3600$, employing 11 males and 3 females, manufacturing cloth valued at $8470 ; 1$ eatabiishment making pig iron, with a capital of $\$ 25,000$, empioying 40 porsons, producing 522 tons of pig iren, valued at 828,896 ; 10 establishments with a capital of $\$ 216,625$, employing 212 persons, and making 1915 tons of castinge, etc., valued at $\$ 271,126 ; 1$ eatabliahment with a capital of $\$ 2500$, employing 14 persons, manufacturing 100 tons of wrought iron, valued at $87500 ; 217$ flouring and grist mills, 294 saw mills, 149 tanaerics, 50 printing-offices, issuing 60 newspapers, etc.

This State was originr ily included in the territorial Jimita of Georgia, except the part which beionged to Florida. In 1802 Georgla ceded all her territory west of Chattahoochee River to the Missiseippi River, to the United States, and in 1817 it was constituted the Mississippi Territory, and Alsbama continued a part of this territory until it was admitted into the Union, and became an independent State in 1820.
Alabanter (Germ. Alabaster; It. Alabastro; Fr. Albátre; Russ. Alabastr ; Lat. Alabastrites). A kind of atone resembling marble, but softer. Under this name are confounded two minerals, the gypseous and calcarcous alabaster* ; they are wholly distinct from each other when pure, but in tome of the varieties are occasionally mixed together. The former, when of a white, or yellowieh, or greevish color, semi-transparont, and capable of receiving a polish, is employed by statuariea. It is very easily worked, but is not susceptible of a pelish equal to marble. Calcarcous alabaster is heavier than the former; it is not so hard as marible, but is notwithstanding eusceptitle of a good polish, and is more used in statuary. The statuaries distioguish alabaster into two sorts, the common and Oriental. Spain and Italy yield the best alsbaster. That produced at Montan!a, in the Papal States, is in the highest esteem for its beautiful whitenesa, Inferior sorts are found in Erance and Germany. Alabaster is wrought into tables, vases, atatnea, chlmneypleces, etc.

- Dloohol (abdent apisit), (Fr. Eoprit de Vin; Germ. Weingcivt; It. Spirito ardem . Spirito di Vino, Aequarzente), the name given to the, sre spirib oltainable by diutillation, and subsequent reotification, from all liquors $t$ at have undergone the vinous fermentetion, and from none but such as are susceptlble of lt. It is light, transparent, colorlese; of a sharp, ponetrating, agreeable amell; and a warn, stimulatlag taste. It is quite the same, whether obtained from brandy, wlae, whlaky, or any other fluld which bas been fermented. The apecific gravity of alcohol when perfectly purc is from $\cdot 792$ to 800 , that of water belng $1 \cdot 000$; but the strongest apirit afforded by mare distillation la about 820 ; alcohol of the ahopa ls about 835 or 840 . Alcohol can not be froaen by any known degree of cold. It boils at $174^{\circ}$. It is the only diseolvent of many resinous aubstances, and la extensively used In medicine and the arts.-Dro. A. T. Thomson, Une, etc.

Alder, ine Betula alnus of botanists, a forest tree abundant in England and most parts of Europe. It thrives best $\ln$ marshy grounds and on the banks of rivers. It. rarely attains to a very great size; lits wood is extremely durable In water or in wet ground; and hence it is much nsed for piloe, planking, pumpe, pipes, slulces, and generally for all purposea where it is kept constantly wet. It soon rots when exposed to the weather or to damp; and, when dry, it is much subject to worms. The color of the wood is redulish yellow, of different shades, and nearly uniform. Texture very uniform, with large septso of the same color as the wood. It la soft, and works easily.-T'redgold'e Principles of Carpentry.
Ale and Beer, well known and extensively used fermented liquors, the principle of which is extracted from soveral sorts of grain, but most commonly from barley, after It has undergone the process termed maltIng.

1. Historical Nutice of Als and Beer.-The manufacture of ale or beer is of very high antiquity. Herodotus tells us that, owlng to the want of wine, the Egyptians drank a liquor fermented from barley (lib. ii. cap. 77). The use of it was also very anciently lutroduced into Greecs and Italy, though it does not appear to have ever been very extensively used in these countries. Mead, or metheglin, was probably the eamliest intoxicating liquor known in the north of Europe. Ale or beer was, howover, In common use In Germany in tho time of Taeflua (Morib. Germ. cap. 23). "All the nations," says Pliay, "who inhabit the west of Europe have a liquor with which they intoxicate themselves, made of corn and water (fiuge nadida). The manner of making the liquor la somewhat different in Gaul, Spain, and other comntries, and it is called by many various names; but its nature and properties are overy whore the samo. The peoplo of Spain, In particulat, brow this liquor so well that it will keep good for a long timo. So exquisite is the ingenuity of mankind in gratifying their vicious appetites, that thoy have thus iuvented a method to make water itself intoxicate."-Hist. Nat. lib. xiv. cap. 22. The Saxons and Danes were passionately fond of beer; and tho cirinking of it was supposed to form one of the prineipal enjoyments of the heroes admitted to the hall of Odin.-Mallet's Northern Antiquities, cap. 6, etc. The manufacture of alo was early introduced into England. It is mentioned in the laws of Ina, king of Wessex ; and is particularly specilied among the liquors provided for a royal banquet in the reign of Edward the Confessor. It was customary in the roigns of the Norman princes to regulate the price of ale; and it was enacted by a statute passod in 1272, that a brower should be allowed to sell two gallons of alo for a penny ln citles, and three or four gallons for the same price in the country.

Tho use of hops in the manufacture of ale and beer seems to have been a German invention. They were
used in the broweries of the Netherianda in the beginning of th. 14 th century; but they do not seem to have been introduced into England till 200 years afterward, or till the beginnlag of the 16 th century. In 1580 , Hoary VIII. enjolad brewers not to put hops lato their ale. It woud, however, appear that but little attontion was paid to this order; for in 1652 hop plantations had begun to be formed.-Becknann's \#liat. Invent. vol. Iv. p. 836-341, Engl. edition. The addition of hopa renders ale more palatable, by giving it an agreeable bitter tate, while, at the same time, it fits It for being kept mueh longer without injury. Genorally speaking, the English brawers employ a much largor quantity of hops than the Scotch.

2. Distinction between Ale and Beer, or Porter.-This distinetion has been well elucidated by Dr. Thomas Thomson, In his article on Brewing, in the Encyclopadia Britannica: "Both ale and beer are In Great Britain obtained by fermentation from the malt of barley; but they differ from each other in several particulars. Alo is light-colored, brisk, and sweetish, or at least free from bitter; while beer is dark-colored, bitter, and much lars brisk. Vhat is called porter in Englsind is a apecic. of beer; and tho term 'porter' at present algnifies what was formerly called atrong beer. The original difference between ale and beer was owing to the malt from which they were prepared. Ale muit
was dried at a very low heat, and conseqnently was of a pale color; while beer, or porter malt, was dried at a higher temperature, and had of consequence acquired a brown color. This inclpient charring had developed a peculiar and agreeahle bitter taste, whleh was commnnicated to the beer along with the dark color. This bitter taste rendered beer more sgreeable to the palate, and less injurious to the constitution than ale. It was consequently manufactured in greater quantities, and soon became the common drink of the lower ranks in England. When malt became highpriced, in consequence of the hesvy taxes laid upon it, and the great increase in the price of barley which took place during the war of the French Revolution, the brewers discovered that a greater quantity of wort of a given strength could be prepared from pale malt than from brown malt. The consequence was that pale malt was substituted for brown malt in the brewing of porter and beer. We do not mean that the whole malt employed was pale, but a cousiderable proporlion of it. The wort, of course, was much paler than before; and it wanted that agreeable bitter fiavor which characterized porter, and made it so much relished by most palates. The porter brewere endeavored to remedy these defects by geveral artiticial additions. At the same time, varions substitutes were tried to supply the place of the agreeable bitter communicated to porter by the use of brown malt. Quassla, cocculus lndiess, and we believe even oplum, were cmployed in succession; but none of them was found to, answer the purpose sufficiently. Whether the use of these substances be still persevered in we do not know; but we rather believe that they are net, at least by the London porter brewers."

Ale and Wine are said to have been invented by Bacehus; the former where the soil, owing to its quality, would not grow grapes.-''Cooke's Pantheon. Ale was known as a beverage at least 404 n.c. Herodotus aseribes the first discovery of the art or brewing barleywine to lsis, the wife of Osiris. Tbe Romans and Germans very early learned the process of preparing a liquor from corn by means of fermentation, from the Egyptinns.-'TMitcs. Ale-houses are made mention of in the laws of lad, king of Wessex. Booths were set up in England a.d. i28, when laws were passed for their regulation. Ale-houses were licensed 1621; and excise duty on ale and beer was imposed on a system nearly similar to the present, 13 Charles II. 1660.llayin.

Alearndria, so called from its illnstrions founder, Alexander the Great, the prineipal sea-port of Egypt, on the coast of the Mediterranean, about 14 miles W.S.W. of the Canopie mouth of the Nile; the light? bouse being in lat. $31^{\circ} 11^{\prime} 31^{\prime \prime}$ N., long. $25^{\circ} 51^{\prime} 28^{\prime \prime}$ E. The situation of this fumous city was ndmirably chosen. Litil the discovery of the route to Indin by the Cape of Good Llope, Egyit formed the centre of the comnerce between the Liastern and Western Worlds; and Alexandria was placed In the most favorable position In legypt for an emporlun, being the only port on its northern coast, where there is at once deep water and security for shipplig throughout the yenr. The ports of hosetta and Demictia, the former on the west, nud the latter on the eastern arm of the Nile, are hoth difficult of entrunce, each having a bar, upen which there is aiways a dangerous surf. Ships bound for Alexantria avold this serious inconvenience; nod hy means of an artitieial mavigation, stretehing from the eity to the western branch of the Nile, lt has almost the amme faciaties for internal navigution that are enjoyed by the cities referred to.

It may be proper, however, to mention that this nrtificial commumicntion with the Nile las not always been open. It existed in antipuity, but fell into decay during the barbarlsm of more modern times. After leigg shut up for some centuries, it has bean reopened! by Mchemet Ali, who dug the Mahmoudie ennul from

Alexandris to Atfeb, on the Nile, abont 27 miles above Rosetta. Thia important work is $\cdot .4$ miles in length, 90 feet in breadth, and from 15 to 18 feet deep. It was opened in 1819; but owing partly to the nature of the grouna, partly to some defects in its construction, and partly to the mud deposited by the water of the Nile, it is difficult to keep in repair; and can only be narjgated by boata that draw little water, and are not suitable for the navigation of the Nile. But, with all ita defects, the construction of this canal has been of the greatest advantage, not to Alcxandria only, but to Egypt and oven Europe.

Ports, etc.-The ancient city was situated a little more Inland than the modern one, opposite to the small island of Pharoa, on which was erected the light-house, so celebrated in antiquity.-CAsar, De Bello Civili, lib, tii. cap. 112. This island was, partly by artificial means, and partly by natnral causes, graduslly joined to the land by a mound, and on this the more modern town is principally built. The isthmes and island have now the form of a T , its head being northesst and southwest. A square castle, or tower, built on a small islet or rock, at the extremity of a male projeeting from the northeast angle of the city, is still called the Pharos, and may perhaps occupy the site of the ancient llght-house: a light wasiexhtited on it down to 1842, when it ceased. On each side of the celty there is a port. That on the westem, or African side, called the Old Port, the Fiunostos of the ancienta, is by far the largest and best. It stretelres from the town westward to Marabout, about 6 miles, and is about $1 \frac{1}{2}$ miles in wilth. It ls bounded on the north, partly by the westeri. iongue or angle of the island on which the city is partially built, at the extremity of which is the new light-bouse, and partly by rocks and sand banks, It has three entrances. The first, or that nearest the city, having 17 feet water, is nearly $1 \frac{3}{4}$ miles southwest from the light-house; but it is too narrow and diftienlt to be attempted by any ono not thoroughly acquainted with the port. I'he eastern side of the second or middle entrance is marked by buoys which lic about $2 \frac{1}{2}$ miles southwest-from the light-house; it is about a quarter of a mile wide, and has, where shallowest, 27 feet water. The third or western entrance has its western boundary within nbout three-cighths of a mile from the east end of Marahout island: it is about half a mile wlde, and has from 25 to 27 feet water in its shallowest places. This last is the best entrance. Ships, wben in, may anchor elose to the town in from 22 to 40 feet water, and there is good anchorage ln deep water all nlong the shore. Foreigners were formerly exeluded from this port; but this prohbition no longer exists, and it is now prinelpally resorted to by the shipping frequenting the port.

What is called the New (though it be really the oldest) or Asiatic harbor is on the eastern side of the town. A roek called the Diamond lies a little to the east of the l'haros tower; and ships entering the port ought to liave this rock about a cable's lengtit on the right. If they get much farther to the left, they will come in contact with a shoal which stretches westward from the l'harillon, or litthe tower, on the enst side of the port. The water immediately within the port southwest from the l'haros is from '10 to 40 feet deep; but the space for anchorage is very limited, and is exposed to the northerly gales; and the ground being fonl and rocky, hempen cables are very npt to chafe, and several aceldents have happened in conseqnence to ships unprovided with iron cables. Orilinary tides rise 2 feet; but during the overflow of the Nile the rise is 1 feet. Variation $13^{\circ}$ west.

Trude of Alexandria.-The imports principally consist of cotton stuffs, timber, woolen and silk stutlis, iron and hardware, including copper and tin plates, jewelry, machinery, ammunition, paper and ntntionery, cutlery, etc., etc. The experts cohsist prineipally of raw cotton, rice, whent nud burley, beans, linseed, seman, and other drugs and gums bronght from the interior;

Indigo, opium, ostrich feathers, dates, soda, linen cloth, coffeo from Arabia, etc. The exports of wheat, barley, and pulse for a whils doelinad in consequence of the superior encouragement given to tha growth of cotton; but they have again increased, and in 1849 we brought from Alaxandria 129,954 qrs. wheat, 247,594 qra. beans, and 13,151 qrs. Indian corn. The culture of flax has declined: formerly from 50,000 to 60,000 quarters of linseed have baen exported from Alaxandria in 9 single season, but the exports are now much less. Sugar has been long cultivated in Egypt, but not to any great extent, though the soil and climate of Upper Egypt are said to be especially favorable to its growth. Indigo and madder are among tho articles ot culturs introduced by the late Pacha.

Cotton has been grown in Egypt from a very remote period; previously, however, to tho ascendency of Mehemot Ali it was but little cultivated, and that little was of inferior quality, short-stapled, and closely resembling "Surats," under which namo the amall quantitics exported from tho country were usually sold. But in 1820 a Frenchman of the name of Jumel accidentally observed a very valuablo variety of longstapled cotton, raised from seeds hrought from Dongola and Senaar, growing in the garden of Mahè Boy, at Cairo. Jumel having reprosented ita suporiority to tho Pacha, its cultivation was undertaken on a large acale on account of the latter; and has succeeded so well, that Mahe or Makko cotton has been for a leugthened period by far the prineipal articlo of export from Egypt. At a lator period seeds of the Sea-1sland cotton were introduced, and for a whilo it also answered remarkably well; its produce, which in Egypt was called Senuar, and in England "Egyptian Sea-Island," ranking next in the estimation of the manufacturers to genuine "Sea-island." Unfortunately, howover, this variety was found to degenerate, and its culture, which was never very extensive, as woll as that of tho old short-stapled varicty, has, we believe, been wholly abandoned.
Cunstantinople and the islands of the Archipelago are the great markets for the wheat and other grain exported from Egypt. Tho supplies are, however, oxtremely uncertain. Every thing in Egypt depends on tho Nile; and when it does not rise to the usual height, the crops aro very much below an averago. Beans are extensively cultivated, and havo sometimes been brought to Englani, but rarely, if over, with advantago to the importors. They aro huferior to English beans, and are peculiarly suljoct to the worm. No oats aro raised in ligypt, tho horses being entirely fed npon barley. Silk is grown to sume exteut. Tho date-palm thrives in every part of Eagyt, and tho fruit is largely exported. It is singular that, notwithatanding the luxuriance of many of its vegetabie proluctions, Egypt shouid bu entiroly destitute of timber.

Afomey.-Accounts are kept at Aloxandria, as at Cairo, in current pirstres, each piastre boing equal to 40 paras, or medini, and each medino to 30 aspers. The medino is also divided into 8 borhi, or 6 forli. A purse contains 25,000 medini. At the closu of 1812 the exehango with Eugland was $93 \cdot 08$ current pinstres per fl ; but in general caleulations 100 piastres are suiposed to equal $\mathbf{£ 1}$. Payme.ts, in transuctions of any lmportance, aro generally mado in Spanish tollurs.

Duties,-With the exception of the arbitrary principles on whith the Pacha tixes tha prieses of eommodities, thero is nothing oljectionable in his poliey as to commerce. The duties on inports are only 3 per cent. We helievo, however, that a small inerease of the customs' duty would compensate tho l'acha for the aholltion of other oppressivo charges, and there can be little doult that his subjects would bo materially benefited by the chango.
Lutters written last summer (1855) at Aloxandrin,

Egypt, state that Said Paoha, the vlceroy, hiven the necessary ordera for the construction of a Mway acrosa the desert between Cairo and Suez, a disk a of 84 milea. The rails are to be brought out from E . gland, and the Pasha's own engineers, who are Frenchmen, are to carry out tho works. In about three years from this time it may be hoped that a railroad will run quito across the country, and the transit of passengers, which now occupies more than two days of uncomfortablo traveling, will be reduced to ten or twelvo hours of easy conveyance. For tho extension of trade and communication with India, it will he very desirable if the Pasha should consent to carry coal to Suez at a moderate charge, as tho high price of coal at Suez is at present tho principal obstacle to other steamers regularly coming up the Red Sea besides those of the leninsular and Oriantal Steam Navigation Company. Accorling to letters from Egypt dated December, 1855, tha railway betweon Alexandria and Cairo has beer nearly completed, and, according to tho last advices, is about to be opened for passengers and goods. The importance of this communication, in superseding both tho canal and the Nile passage, and shortening the transit between the two cities to about eight hours, will be readily appreciated by every person who has traveled across Egypt. The construction of the portion of tha railway from Cairo to near Suez, which is to completa tho communication botween the Mediterranean and the Red Sea, is in activo progress. The directors are endeavoring to induce his highness, the viceroy, to construct at the termini of these railways at Cairo and the Red Sea commodious hotels, adapted to the convenience of travelers from the East. The spirit of improvement in the East is further shown by $t^{1} 10$ recent establishment of a
tric telegraph across Egypt. This has been determined upon by his highness the viceroy, and will form an important improvement in the overland communication with India, China, etc. Tho directors sometime since submitted, at the request of the viceroy, a proposal to establish a monthly postal communication with Australia as soon as tho release of tho vessels now engaged in the war service should enable them to do so. No dofinite arrangement has, howover, been yet made to that effect.
Ancient Trade of Alexandria.-Alexandria was for a long serles of years-first under tho Greek successors of Alexander, and subsequently under tho Romansthe principal entreput of tho ancient worla. Most part of the traffic between Asif und Europe, that had at a more early period centred at Tyre, was gradually diverted to this new emporium. An intercourso between the ports on the eastern coast of Egypt and those on the opposite coast of Arabia had subsisted from a very carly period. That between Egypt and India was moro recent. It was at tirst carried on by ships, which having sailed down the Red Sea from Myos IIormos and Berenice, consted along tho Arablan shores till they reached Cape Rasselgate, whence a short course brought them to India, near the mouth of the River Indus. This was tho erurse followed during the dynasty of tho P'olemies; liut about eighty years after Lipypt had been annoxel to the Roman ompire, Mippulus, the commander of on Epyptians ship trading to India, having olserved the regular shifting of the tradewinds, ventured to snil with the western monsoon from tho Struits of Bahelmanded, right across the Arabian Ocean; and was fortunate enough, after a prospe ous voyage, to arrive at Nusitis, in that part of ulia now known by the namo of the Malabner const. Ilaving taken on board a cargo of Indian produce Jrippalus retarned in safety with tho eastern monsoon to Figyt. This discovery was deomed of so much importunce, that the namo of tho ilscovorer wns given to the wind which had carred him acrosa the ocenn to India: and how trifing soever this voyago may now appear, thoso who consider that llippalus had no com-
pass by which to direct his conree, and that owing to pass by incumstance, and tho otherwise imperfect state thig, art of navigation, the ancients seldom ventured sut of sight of land, even in seas with which they were well acquainted, will be forward to admit that his enterpriae and daring were nowise inferior to his success; and that he was well entitled to the gratitude of his contemporaries, and the respect of posterity.

From the epoch of this discovery, fleets traded periodically from Egypt to Mrusiris, conveying the products of Europe to India, and conversely. The Indian gooda having been landed st Myos Hormos and Berenice were thence conveyed by caravans to Coptos (the modern Kenné), on the Nile, where they were put on board lighters and sent to Alexandria, whence they were distributed all over the Western World. The goods sent to India were conveyed to Myos Hormos and Berenice by the same route. Myos Hormos was situated on the ghore of the Arabian Gulf, about a degree to the north of the modern port of Cosseir. The distance from it to Coptos, in a straight line, is about 70 English miles. Berenice was situated a good way farther sonth, being nearly under the tropic. It was built by Ptoiemy Philadelphns. Its distance from Coptos is stated by Pliny at 258 Roman miles; the different resting-piaces on the road were determined by the welis, and the journey occupied about 12 days. Ptolemy seems to have preferred this station to Myos Hormos, though the land-earriage to Coptos was $s o$ much farther, from Its greater proximity to the Straits of Babelmandeb, and its lessening the voyage up the Red Sea. Pliny says that the cost of the Indian commodities brought to Kome through Alexandria was increased a hundredfold (centuplicato veneant) iby the expense of earriage, etc. We suspect, however, that this is a rhetoricai cxaggeration, meaning merely that their price was very materially enhameed. If the increaso was any thing like that mentioned, it must have been owing to the imposition of oppressive tolls and duties, for it could not possibly have been occasioned by the mere expenses of conveyance. In the 16th century, the cost of Indian commodities, brought to Western Europo by way of Alexandria and Aleppo, was about three times the cost of those brought by the Cape of Good Hope.-See post, East India Company, Mistory of. But Egypt was then oceupied by the Mamelukes and Turks, who threw every sort of ohatacle in the way of commerce, and loaded it with the most oppressive exactions.Plin. Ifist. Nat. lib. vi. cap. 23 ; Amerlion, Commerce des Egyptiens, p. 161-176, etc. ; Roneutson's Ancient India, note 20, etc.

Besides this important triffic, which supplied Rome and the Western World with the silks, spices, precious stones, and other products of Arabia and India, a great trade in corn was carried on from Alexantria to Rome. Egypt, for a leugthened period, constituted the granary from which Rome, and afterward Constantinople, drew the principai part of their supplies; and its possession was, on that account, reckoned of the utmost consequence. Augustus employed merchantmen of a iarger size than any that had previously tratied in the Mediterranean to convey the corn of Egypt to Ostia. They were escorted by ships of war. The fleet re-
ceived the names of sacra and felix embole, and enjoyed several peculiar privileges. The ships belonging to it were the only ones authorized to hoist the small sail called supparum, when they drew near the coasts of Italy. Some of the fast-satiing vessels attached to the fleet were sent on before, to give notice of its approach; and a deputation of senators went down to Ostia to receive the chips, which anchored amidst the acclamations of an immenae number of spectators." The captains were obliged to make oath that the corn on board their ships was that which had been delivered to them in Fgypt, and that the cargoes were entire as shipped. -Huer, Commerce et Navigation des Anciens, cap. xlvili. ; Senecas Epist. Ixxvil., etc.

Intercourse with India through Alexandria.--Theso few details willi, perhaps, serve to give a faint idea of the importance of Aiexandria in the commerce of antíquity. It is impossible, indeed, for any one to glance at a map of the world, or of the ancient hemisphere, and not to perceive that Egypt is the natural entrepôt of the commerce between Europe and all the vast countries stretching east from Arabia to China. The discovery of the route to India by the Cape of Good Hope, in 1498, must, no doubt, have, under any circumstances, diverted a considerable portion of the trade with the western States of Europe, and in the heavier and bulkier class of articies, into a new channel. It is, however, abundantly certain that, had the seme facilities for conducting the trade with the East existed in Egypt in the 16th and 17 th eenturies that existed in it in antiquity, she would have continued to the the centre of the trade for all the lighter and more valuable products, and the route of the greater number of the Individuals passing between Europe and Asia. But the lawless and arbitrary dominion of the Mameiukes, who loaded all individuais passing through the country with oppresaive exactions, st the same time that they trested all forcigners, and especially Christians, with insoience and contempt, pnt an entire stop to the intercourse so long carried on by this shertest, inost direct, and most convenient route. Happily, however, a new era has begun, and Egypt has once more hecome the grand thoroughfare of the Eastern and Western Worlda. After good order and a regular government had been introduced into Egypt by Mehemet Ali, it was scen that it might he again made the channel of communication with India; ancl the importance of facilitating the intercoaree with that continent forcibly attfaeted the attention of the British government and the East India Company. We belleve, however, that the pullic are principally indebted to the exertions of Mr. Waghorn for the early end successful opening of what has been called the "over-land route" to India. At ali events, the cstabitshment of a steam commnnication between Europe and Southern Asio, by way of Aiexandrie and Suez, is one of the most striking and ime portant events in recent times. It has shortened the journcy to Indi.. from Engisnd more than a half, and rendered it comparatively safe and oxpeditious. Steamers aseent the Nile as far as Cairo; and the passengers and mails are tience conveyud across the desert to Suez, and conversely, with comifort and expedition! We subjoin the foilowing detalis :

Canal between the Nile and the Red Sea.-We are assured that, were it not for the hostilitios in which the Pacha has been almost always engaged, he would havo attempted to reopen the famous canal that formerly conuected the Red Sea and the Nile. According to Herodotus, this canal was commenced by Nechos, king of Egypt, and finished by Darius (lib, ill. § 158, iv. 39). Under the Ptelemies, hy wham, according to some authorlites, it whs coupleted, this canal became an important channel of communication. It joined the east, or Pelusiac branch of the Nilo at Bubastis, tho ruins of whieh still remain; it thence proceeded east to the bitter or natron lakes of Temrah and CheikAneded, whenee it followell a nearly sonth direction to its junction with the Rel Sea at Arslnoe, elther at or near where Suez now stends. It is salid hy Strino (lib. xvli. p. 805) to have been 1000 statlia ( 122 miles) in length; hut if we measure It on the best modern maps, It could hurdly have exceeded from 85 to 95 miles. Herolotus ssys that it was wlde enough to admit two triremes sailligg abreast. This great work
having fallen into decay after the downfall of the Ptolomaic dynasty, was renovated either hy Trajan or Adrtan; and it was finally renewed by Ainrou, the genoral of the calif Omar, the conqueror of Egypt, anno 639. Tho French euglineers tracell the remains of this great work for a considerable distance, and lt would be of singular advantage to Egypt and the commerce of the world were it reopened.

Marshal Marmont states that the ground has been carefully axamined by M. Lepère, an able engineer, aud that it presents no sort of difficulty that may not eaeily be overcomo. This, indeed, might have been Inferred from the fact of its former construction; for the anclents, beling unaccuuainted with the use of locks, had to encounter diffeculties In the construction and working of eanals which aro now obviated with the utmost facllity. According to M. Lepere, the cost of constructing a navigable eanal from the Nilo to the Red Sea would not exceed $17,000,000$ franes, or less than $£ \mathbf{E} 00,000$ (Maiemont, Iv, 101). The completion of this work need not, therefore, be despaired of. The

opening of the Mahmoudith Canal from Alexandria to Atfeh shows what the present gevernment ia able to aehieve; and an enterprise lika that now under considerstion, thaugh more difficult, wonld be of atill greater Importance to Fgypt, as well as to Europe and Asis.

Algebra is a general method of resolving mathematical problems by means of equations, er it is a method of performing the calculations of all sorts of quantities by means of gencral aigns or characters. The modern writers on the subject are Lambert, D'Alambert, Lagrange, Ozanam, Saunderson, Clairaut, Cousin, Templehof, Kastner, Bezout, Gauss, etc. Where algebra was first used, and by whom, ia not preclsely known. Diophantus first wrote upon it probably about A.D. 170; he ls said to be the inventor. Brought inte Spain by the Saracens, about 900 ; and Into Italy by Leonardo, of Pisa, in 1202. The first writer whe used algebraical signs was Stifelius, of Nuremberg, in 1544. The introduction of symbols for quantities was by Francis Victa, in 1500, when algebra came inte general use.-Morent. The binemial theorem of Newton, the basis of the doctrine of tluxiens, and the new analysis, 166s.-lliayn.

Alicante, a sca-pert town of Spain, in the new province of Alicante, lst. $38^{\circ} 20^{\prime} 41^{\prime \prime}$ N., long. $0^{\circ} 30^{\prime}$ W. Population of the elty about 20,000 , and of the province 363,000 . Tha port is an open and apacious bay, between Cape da la IIuerta ou the northeast, and Isla Plana on the south, distant from each other southwest and northeast ahout ten miles. Ships may enter on any course between these points, stecring direct for the castle, which stands on an eminence about 400 feet high. Those of considerable burden moor north and aeuth, distant from to 1 mile from shore, in from 4 to 8 fathoms water; they are expesed to all winds, from E.N.E. to S. by W.; bat the holdingr ground is good, and there is no instance during the last twenty years of a ship having been driven from her moorings. Small crait lia alongside the mole, which is already 320 yards in length, und is continuluy to be projected atill farther into the sea. The mole has a fixed light, 95 feet high, visible 15 miles. The trada of Alicante, though still considerable, has declined much within the last few years; a consequence partly of the emancipation of America from the Spanish yoke, but more of the oppressive duties laid on the importation of mist articles of foreign produce into Spain (see Camz), and the extensive sauggling carrled on from Gibraltar, Algiers, etc.

Iaisins form the principal article of export; and their prodnce, which amomes to nearly $200,000 \mathrm{cwt}$., has increased rapidly of tate years. Thay are principally taken off by lingland, the shipments thither, in 1812 , having leen 146,496 ewt. But with this aingle exception all the other artheles of export have deellued. The prineipal are silk, wool, barilla, alnonds, wine, sult, oll, lead, mats, sattron, brandy, anise, ete. The exportation of burilla, which formerly amonnted to from 60,000 to 100,000 ewt., has deelined, partly from lts having been largely adulterated, but princlpally from Its lo-ing to a great extent superseded by soude fuctice (artiticial soda), to little more than $20,000 \mathrm{cwt}$. The importa consist princlpally of sugar, coffee, cocoa, and other colonial products; cotton, and linen stuffs, and other manufuctured gools, from liugland and France; salted fish, tobacco, iron and hariware, deals and tar, ete.; lut it is lmpossible to form any estimnte of the tmports from offieial or other ruturns, as by far the largest portion are supplied dandesthely. Indeed, the whole population of this part of Spain are elothed In prohlbited articles, whilh are sold as openly in the towns as If they were of Spanish munufacture! - Consul's Ileport for 1811. An Associucion Mritanicu has rccently lieen formed in thls port for smelting and refining the rich argentiferous lead ores of Almagrera and other parts of the prevince of Alurela. The manufucture of woolens is carried on pretty extensively
at Aleoy, 23 miles north from Alicante; but they are coarse, and of inferler quality.

Aliens. "An alien, according to the laws of the United States, is a person born out of the jurisdiction and alleglance of the United States. This varies from the rule adopted by the ancient English law, as in the case of the children of public ministers abroad (provided their wives be English women), fer they owe not oven a local allegiance to any foreign power. So, also, it is said that in every case the children born abroad ol' English parents were capable, at commen law, of inheriting as natives, if the father went and continued abread in the character of an Englishman, with the approbation of the sovereign.
"The Act of Congress of the 14th Aprıl, 1802, establishing a uniform rule of naturalization, atlects the issue of two classes of persons. Jy the th section it was declared that 'the children of persons duly naturalized under any of the laws of the United States, or who, previous to the passing of any law on that subject oy the Government of the Linited States, may have become eltizens of any ona of the States under the laws thereof, being under the age of twenty-one years at the time of their parents being so naturalized, or admitted to the rights of citizenship, shall, if dwelling in the United States, be considered as citizens of the United States.' This provision appeurs only to apply to the children of persons naturalized, or specially admitted to citizenship; and there is color for the construction, that it. may have been intended to be prospective, and to apply as well to the case of persons thereafter to be naturalized as to those whe had previously been naturalized. It applies to all the children ef 'persons duly naturalized'-under the restrictions of residence and minority-at the time of the naturalization of the parent. The act applites to the chililren of persons duly naturalized, but does not explicitly state whether it was intended to apply only to the ease whero both parents were duly naturalized, or whether it would be sufficient for ene of them onty to be naturalized, in order to cenfer, as of coursc, the rights of citizens apon the resident chilliren being under age. l'erhups it would be sufficient for the father only to be naturalized; for in the supplementary act of the 26 th of March, 1804, it was declared, that if any alien who should have complied whth the predimbury steps made requisite by the act of $100^{2}$ dies before he is actually naturalized, his $u$ jiduw and children shall be considered as citizens. This provision shows that the naturalization of the father was to have the etlicient force of conferring the right on his children; and it is worthy of notice that this last act speaks of children at large, without any allusion to residence or minority ; and yet, as the two acts are Intimately comucted, and make but one system, the last act is to lee construed with reference to the prior one, according to the doctrine of tho case of Eix parte Orerington. lly a subscquent part of the sume 4 th section, it is declared that 'the children of persons who now are, or have been eltizens of the United States, shall, theugh horn out of the limits and jurisdletion of the United States, be consflered as citizens of tho linited States; provided that the right of eitizenship shall not descend to persons whose fathers have never resided within the l'nited States.' This clanse is certainly not prospective in its operation, whatever may be the just constructicn of the one preceding lt. It applied only to the children of persons who then were or had been cithans; and, consequently, the benefle of this provision narrows raphlly by tha lipse of thme, and the period will soon arrive when there will be no statutory regulation for the beneft of children born abroad, of Amerlem parents, and they will beoblged to resort for ald to the slormunt and doubtful prineiples of tho English common law. The provise annexul to this last provision serems to remeve the denbt arising from the generalliy of the precding sentence, and which was whether the aet

Intended by the words 'children of persons' both tho futher and mother, in imitation of the statute of 25 Edw. Il $\mathrm{t}_{0}$, or the father only, according to the more liberal decharation of the atatute of 4 Geo. 11.; the provision also differs from the preceding in being without any restrletion as to the age or resldence of the child, and it appears to have been intended for the chiddren of natural bora citizens, or of citizens who were original actors in our Revolution, and therefore it was more comprehensive and more liberal in their favor; but the whol atatute provision is remarkably loose and vague in tus terms, and it is lamentably defeetive in beling coufined to the case of children or parents who were citizens in 1802, or had been so previously. The former act of 29th January, 1795, was not so; for it declared generally, that 'the children of citizens of the United States, born out of the limits and juristiction of the United States, shall be considered as citizens of the United States.' And when we consider the universal propensity to travel, the liberal intercourse between uatlons, the extent of commercial enterprise, and the genius and spirit of our municipal iustitutions, it is quite aurprising that the rights of the children of American citizens born abroad should, by the existing act of 1802 , be left so precarious, and so far inferior in tho security whieh has been given, under like circumstances, by the English atatutes."Kent's Comm., Lect. XXV.

In England, aliens were grievonsly coereed up to A.D. 1377. When they were to be tried criminally, the juries were to be balf foreigners, if tbey so desired, 1-130. They were restrained from exercising any trade or humdieraft by retail, 1483. The oelebrated Alien [Bill passed, January, 1793. Act to register Aliens, 1795. Bill to abolish their naturallzation by the holding of stock in the banks of Scotland, Junc, 1820. New Registration act, 7 Geo. IV., 1826. This last aet was repenled and enother statute passed, 6 Will. IV., 1836. The celebrated Baron Geramb, a conspieuous and fashionable foreigner, known at court, was ordered out of Finghand, April 6, 181\%.-IIayon.

Influence of the Residence of Aliens.--Thero can be no doubt that, gonerally speakligg, the resort of foreigners to a country, and their residence in it, are highly conducive to its interests. Those who emigrate in order to practlee thelr calling in an old settled country are pretty uniformly distinguished for netivity, cuterprise, and good conduct. Tho native inhabitants have so many advantages on their side, that it would be absurl to suppose that foreigners should ever come into any thing like successful competition with them, unless they were nequalnted with sone branch of trade or manufucture of which the others were ignorant, or possessed superior \&kIII, Industry, or economy. But whether aliens practice new acts, or intruduce more perfeet proeesses into the odd, or displuy superior economy, ete., their intlux can not fail to be of the greatest advantage, They practionlly instruct those among whom they reside in what it most concerns them to know-that is, in thoso departments of art and selence in which they are lnferior to others; and emable them to avail themselves of whatever foreign sugacity, skill, or practiee las producel that is most perfect. It is not easy, indeed, to overrate the henefits conferral on most countries by the resort of allens. l'reviansy to the invention of printing, there was hardly any other way of becoming aeguainted with foreign inventlons and dlseoverles; nul even now it ls lur easler to learn any new nrt, method, or process, from the example and listructlon of those familliar with its details, than from the best possible deseriptions. The experienee, incloed, of every age and country shows that the progress of nations in the career of arts and civilization depends more on the frecdom of commerce, and on the llherallty with which they have treated forclgners, thun almost any thing clse.

Allsalies. The distlnguishing eharacters of these bodies are, a strong acrld and powerfully caustle taste ; a corrosive actioa upon all aximal matter, destroying its texture with conaiderable rapidity; exposed to the atmosphere, when in their caustic atate, they absorb carbonic acid with great rapidity, and becomo carbonated (or mild). Their action upoa vegetable colors also affords us means by which the presence of an uncombined or carbonated alkali may be detected; the yellow color of turmeric is changed to a red brown tint when immersed into solutions containing them; the blue oulor of the litmus, after being reddened by an acld, is agnin restored; the infusions of the red cablage, the violet, and meny other purple vegetable colors, are converted to green. Litmus paper reddened by carbonic acid is, however, the most delicato test of the presence of an alkali. With the verious acids they also combine, forming the very important and extenaive class of compounds generally called salts-a aalt being any compound tormed by tho union of an acid with an alkali or metallie oxide.

Alkulimetry.-The methed by which the value of tho alkalies, or carbonated alkalies, is determined, being of considerablo importance in a commorcial point of view, wo shall here treat it somewhat in detail. 'It is an established fact that 49 parts, hy weight, of oil of vitriol of the specitic gravity of 1.8485 are exactly equivalent to the nentralization of 70 perte, by weight, of pure carbonate of potash, or 48 of purc potass, or 54 of carbonnto of socla, or 32 of sode, and that 70 parts of oil of vitriol will thereforo be neeessary to neutrallze 100 parts of carbonate of potass. Hence, by employing a glass tubo of about two ounces' cupacity, and accurately divided into 100 épual parts, taking 70 grains of oil of vitriol, and diluting it with water, to make the 100 measures complete, every measure of this dilute ncid must be equal to a grain of pure carbonate of potass. The percentage of real carlionate of potass existing in any sample of pearlash may be at once ascertuined by taking 100 grains of the sample, dissolving it in hot water, straining, and adding by degrees 100 measures of the test acid above mentioned; the point of neutralization (when it coases to affect litnua paper or reddened litmus) being acourately aseertainel, the resldual neid will give the percentage of impuritics ; for instunce, say that 75 measures of the dilute acid have been employed to render 100 greins of a sample of pearlash perfectly neutral, then we have ascertained that it contains 25 per cent. Impurities. The same proeess, of conrse, must bo followed in examining samples of harilln or kelp, except that the alkali contained in them heing carbonate of soda, 90.75 of oil of vitriol innst he employed instend of 70 . The process recommended by Mr. Faralay, nud in which he uses only one test acid, is as follows: Into a tube about three quarters of en luch in diameter, and nine and a half loug, and as evilndrical as possible throughout Its whele length, 1000 gralns of water are to be weighed, and the spuce oceupied marked on the tube by a the file; this space is then diviled from above downward into 100 equal parts. At $23 \cdot 14$, or 76.56 parts from the bottom, an extra line should he made, and sodn marked opposite to lt ; at $48 \cdot 96$ potass should be marked in the same way; at $5+63$ carbonate of soda; und at 65 carbonate of potass. A diluted nedd ls now to be prepared, which shall have a specilic gravity $1 \cdot 127$, mad thls is made by mixing intimately together 19 parts, hy weight, of oll of vitrlol and 81 of water. The method to be followed in the employment of this achd is as follows: Tho dilute neld is to be measured in the tube up to the line opposite to which the alkali sought for is marked ; If barilla, which contalns carhonate of soda, $54 \cdot 63$ measures are to be taken. The 100 measures are then made $\mathrm{n} p$ by the addltion of water, and is then roady for use, following tho method before statel.

The alkallea aro four In number; namely, ammonla

## ALK

(or volatile alkali), potasa (or vegetable alkali), soda (or mineral alkali), and lithia ; which last is of so littie importance that we shali not treat of it here. The combination of these alkaliea with the various acida, whenever they form compounda of any importance, will be noticed.
Anmomia, or Spirits of Hartshorm, or Volatile Alkali, in its uncombined form, is an elastic gaseous body, having a very pungent and auffocating odor, deatroya animai life, converta the yeliow of turmeric paper to a brown, which, from the voiatility of the alkaii, is again restored by a gentle heat to ita original color. This gas is rapidly absorbed by water, which takea into solution about 780 times its voiume, forming the iiquid ammonia, or what is commenly calied hartshorn. Ammonia is libersted whenever any of the componnds of this alkail are acted upon by potass, soda, lime, and many other aikaline earths. Lime, from ita being the most ecenomical, is generally employed; the best proportions for its preparation are equal weights of sal ammoniac (muriate of aminonia) and fresh alaked lime. When these are introduced into a retort, and heat applied, anmonia is liberated in the gaseons form, and is conducted by a Wetter's safety-tube inte a vessel of water, by which the gas is instantly absorbed. Muriate of ifme remains in the retort; sometimes water is added to the mixture, and then distilied. As thua obtained, it has a speclfic gravity of ' 930 or 940 , water being equal to $1 \cdot 000$. The most concentrated solution of ammonia has the specific gravity of $\mathbf{8 7 5}$.

Carbonate of Ammonia, or Volatile Salt, or Subcarbonate of A mmonia.-Tinis salt, which is very much employed in various processes of the arts, was formeriy obtained by the action of chaik (carbonate of lime) upon muriste of ammonia; a double decomposition takes piace. Carbonic acid and ammonia are sublimed in vapor, and muriate of lime remains in the vessei. A much less expensive process is, however now foliowed, namely, from the waste gas liquors obtained in the purification of coal gas; these are evaporated, and the biack, impure suiphuric acid added. By this means a sulphate of ammenia is formed, and the carbonate procured from it by the action of powdered chalk, as in the former process. Its nses are principaily in forming other compounds of ammonia, as smeiling salts; and it is likewise empioyed rather extensively by pastry-cooks for making light pastry, which is caused by the reiatiie carbonate of ammonia escaping and raising up the pastry by the heat of the oven. It is entirely dissipated during the baking, so that no ill effect can arise from its use. Both this compound and the preceding act as vlolent stimulants on the animal syatem.

Muriate of Ammonia, or Sal Ammoniac, was formeriy brought to Europe from Egypt, where it was procured by submitting the soot of cameis' dung (there employed for fuci) to sublimation in closed vesseis; it is, however, it present manufactured in very iarge quantities in Engiand in a variety of ways. The most economical processes are either submitting sulphate of ammonia mixed intimately with muriate of soda (sea salt) to sublimation, or hy substituting the inittern of sea-water, which consists chiefly of muriate of magneain, for the sea sait. In the first process a suipliate of soda is formed, and tise muriate of ammonia, which, being volatile, rises in the vaporous form, and is condenseni in the cooi parts of the apparatus; in the iatter process a suipinate of magneria (Eprom salts) results. It is generaliy from this snit (murinte of ammonis) that the liquid ainmonia is manufactured ; it is also empioyed in tinning and seldering, to preses ve the metals from oxidation. It is $\Delta$ semi-transparent, tough salt, having an acrid and cooi taste, and is usually met with in the form of hemispherienl masses. Sal ammoniac is made at Calcutta, and is thence exported to Great 13ritain, the United States, and the Arabian and Persian Guifs. In 1824-25 the exports amounted to 114 tons.

Sulphate of Ammonia.-The preparation of the sulphate has been aiready given under the head of ammonia; it is employed in the manufacture both of the carbonate and muriate.
Acetata of Ammonia.-The spirit of Mindererus is obtained by acting upon the carbonate of ummenia by acetic acid; the carbonic acid escapes with effervescence, and an acetate of ammonia is formed; it is employed in medicine as a febrifinge. All these salts of ammonia have the following properties: they are volatile at a low red heat; the fixed alkalies decompose them, combining with their acid, and the ammonia is liberated. When combined with a fixed acici, such as the boracic or phospheric, they are decomposed, the ammonia alone being volatilized, and the acid remaining pure. This process was described for obtaining pure phosphoric acid.
Potass, or Vegetable Alkali.-The original source of this alkali is in the vegetable kingiom, whence is derived its name of regetable alkali. When wood is burned, and the ashes lixivjated with water, boiled, strained, and evaporated to dryness, an intensely alkaline mass is obtained, which is known by the name of potash, from this process being conducted in iron pots. It is then removed to a reverberatory furnace, and submitted to heat, and a current of air. This burns out extractive matter and other impurities, and the salt assumes a peariy white coior, and is hence calied peuriashes. Care should bo tsken during this process that the potashes do not enterinto fusion, as this would destroy the fuli effect of the operation.

Pearlashes.-Pearlashes generally contain about from 60 to 83 or 84 per cent. of pure carbonate of potass. Its nses in manufactures are numerous and im portant. It is employed in making flint-glass, of which it constitutes about one sixth of the materials empleyed ; in soap-making, especially for the softer kinds of soap; for this purpose, however, it is first rendered caustic by means of lime. In the rectification of spirits large quantities are employed to combine with the water prevlously in union with the spirit.

Subcarbonate of Potass, or Salt of Tortor, is used in preparing the subcarbonate of potass of the Pharmacopceia (zarbenate of potasa of the chemical nomenclature), and likewise in rendering hard spring waters seft, and in cleansing substances from grease: it is sometimes calied salt of wormwood. When made ly the deflagration of two parts of tartar of argol and one of nitre, it is called black flux, and is nsed extensively in metallurgic operations. From the subcarbonate of potash the pure and uncombined potass is obtained, by adding an equal weight of fresh burned lime, previousiy slaked, and boiiing them with balf their weight of water. By this process the lime combines with the carbonic acid, and the potass remains in solution in its canstic state; by bolifing the clear soiution rapidly in iron vessels, and submitting it to fusion, we obtain the fused petass. If it be required perfectly pure for chemical jurposes, it is necersary to evaporate in silver vesseis, and dissoive in strong alcohol. This takes up the pure potass, und leaves any portion of the suibearhonate that may not have been acted upen by the lime; then the alcohol is to be distilled off, and the potass fused at a red heat, and poured out in its iiquid state on a eold slal. As thus procured, it is a white, brittle mass, highly deliquescent, absorbing moisture and carbonic acid rapidly from the atmosphere. When evaporated in iron vessels it has a dirty color, and lets fall a quantity of oxide of Iron when dissoived in wster, from its having acted upon the fron hollers. Petass acts with grent rapidity upen nnimai substances, destroylng their texture, and is on this account employed as a caustic, and was formerly cailed lagnis infernalis.

Carbonate (or, in the chemical nomenclature, Biearboncte) of Potoss, is prepared hy passing carbonic acici gas through a solution of the subcarbonate; and evap-

## ALK

orating at a temperature below $212^{\circ}$, and cryatallizing. It is used in making efforvescing draughts. It ioses one proportion of its carbonio acid when heated, and is converted into the subcarbonate.
Sulphate of Potass, or Sal Polychrest, or Vitriolated Turtar, is obtained by submitting the salt which remains after the manufacture of nitric acid from nitre and sulphuric acid to a red heat, or by neutralizing the excess of acid contained in that salt by subcarbonste of potass.

Bisulphate of Potass, or Sal Enixum.-This is the salt mentioned above, as the residua from the process for obtalaing nitric acid. It is employed in very large quantities in the manufacture of alum; also in tinning iron, for pickling, as it is termed; it is sometimes also used as a filix.

Nitrate of Potash, Nitre, or Saltpetre.-This salt, which is of so much importance in every branch of the arts, is found native in many parts of the world, especially in the East Indies. It is ohtained from soils composed of decomposing granite, the feldspar of which givos rise, as is supposed, to the potass. The nitric acid is not so easily accounted for, except it is by a union of the nitrogen and oxygen gases in the atmosphere taking piace in those hot climstes; for, from authenticated accounts, no decaving animal or vegetable mattor exists in the nitre districts of India. By lixiviation with water the nitre is dissolved from the soil, which is again thrown out into the air, to be washed the following year; so that it is formed continually. These lixiviations are then evaporated; and when of a certain strength, a no:antity of common salt separates, which is removed as it fulls ; and the nitre is then crystallized and imported to England, always containing a certain quantity of impurities, which aro deducted in the purchase of large quantities of the article, being termed its refraction. It is generally used for the inanufacture of gunpowder and pure nitric acid, refined or recryatallized. Nitre may be also made artificially, in beds of decaying vegetable or animal substances, mixed with old mortar, or other refuse calcareous carth; these a. e watered occasionally, tou much moisture being hurtful; after a certain period, depending on the rapidity with which the process has gone on, tho whole is submitted to lixiviation together with voodashes, which contain subcarbonate of potass, and which decounposes any nitrate of lime formed, of which theie is generally a considerable quantity. After the lixiviation is complete, which takes some time, the solution is esparatod and boiled down; the salt separates as in the other process, and the nitre is then erystallized. It was from this source that the whole of the nitre, nearly, eaployed by the French during the long-protracted wr $r$ with the continental powers was abtained. Nitre has a cold, penetrating, and nauseons taste; enters into igncous fusion at a gentie heat, and is then mouided into round cakes, calied sal prunelia. It is employed in the manufacturo of nitric acid; of gunpowder, which is composed of 75 parts by weight of nitre, 16 of charcoal, and 9 of suipinur (the nitre for this purpose should be of great purity); and in the manufucture of oit of vitriol: as a fiux it is one of the most powerful we possess; it is also used for the preservation of animal food, and in making frigorific mixtures 1 ounce of nitre dissolved in 5 ounces of water lowers its tempersture 15 degrees of l'alarenheit's thermometer.-See S.n.tpetre.

Oxalate and Binoralate of Potass.-The binoxniate of potass, or sait of lemon, or sorrel, by both which last names it is very commoniy known, is procured from tite juice of the common sorrel (Rumex Acetosa), or the wood sorrel (Oxulis A cetosella), by crystallization, after the fecuient matter has heen scparated by standing a fow days. Its chief uses aro, in removing ink spots or iron moulds; and aiso as a refreshing beverage when mixed with sugar und water. The neutrai oxainte is obtained from this salt by combining the excess of acid which it contains with a solution of sub-
carbonate of potass. Is very much used in chemistry, as the best test of the presence of lime.

Tartrate and Bitartrate of Potass.-Bitartrate of potass, or cream of tartar, is, when in its crude and Impure state, called argol, and is deposited in the interior of wine-caske during fermentation, and from this source the whole of the cream of tartar is obtained. It is generally of a very dark brown color, but may be purified and rendered perfectly white by solution and crystallization. It is employed very extensively in dyeing, hat-making, and in the preparation of tartaric acid, and many of the compounds of tartaric acid, as tartar emetic, soluble tartar (tartrate of potass): when heated to redness, it is converted into carbonatc of poiass and charcoal ; mixed with half its weight of nitre and thrown into a red-hot crucible, it forms the black flux, and with its own weight of nitre the white flux, both of which are very much employed in metallurgic operations. The tartrate is made by the addition of subcarbonate of potass to a solution of the bitartrate until perfectly neutral : it is used in medicine as a mild purgative.

Ferro-cyanate, or Prussiate of Potass.-This salt is obtained by the action of subearbonate of potass, at a low red hest, upon refuse animal matter, such as hoofs, horns, skin, etc., in the proportion of two of atrbcarbonate to four or five of the snimal matter. But the process recommended by M. Gautier is preferable; he finds that when animal matter is heated with nitre, it yields a much larger quantity of the ferro-Prussiate than when either potass or subcarbonate of potass are emiployed; the proportions he finds most cconomical are, 1 part by weight of nitre, 3 parts of dry blood, and iron ecales or filings equal to a fiftieth of the blood employed. The congulum of blood is mixed intimately with the nitre and iron filings, and dried by exposure to the air; they are then submitted to a very low red heat, in deep iron cylinders, as long as vapors continue to be liberated; when cold, the contents are dissolved in 12 or 15 times their weight and strained. On evaporation till of the specific grnvity $1 \cdot 284$, and allowing it to cool, a large quantity of bicarbonate of potass crystallizes; and by further evaporation till of the specifle gravity 1.306 , the ferro-Prussiate of potass crystallizes on cooling. This is to be recrystallized. It is a bcautiful yellow salt, very tough, having a tenacity similar to spermaceti, and is decomposed at a red heat. It is cmployed very extensively in dyeing blues, and in calico printing; also in the manufacture of Prussian blue, Which is a compound of the ferro-Prussic acid and exido of iron, prepared by adding 1 part of the ferroPrussiate of potass dissolved in water, to 1 part of copperas, and 4 parts of alum in solution.

Chromote of Potass.-This salt is ohtained from the nativo chromate of iron by the action of nitre at a full red heat in equal proportions. By solution, filtration, and evaporation, a beautiful lemon-yellow colored salt results. It is very much employed in dycing, calico printing, and calico making, from its producing bright yellow precipitates with solutions of lead.

Bichromate of Potass is prepared from the abovementioned sait, hy the addition of nitric acid to tho yellow solution obtained from the heated mass by the uetion of water; on evapornting this, a dark red colored sait crystalizes, which is the bichromate. This is also vory largely employed by the catico printers, and when mixed in sohition with nitric acid, possesses the property of destroying vegetnble colors; on this account it is of great importance, as it at the same time removes a vegetable color, and forms a base for a yollow dyc.
Chlorate or IIyperoxymuriate of Potass.-The preparation of this salt is attended with some littie difliculty; and requires a grent deal of nicety. It is obtained by passing a current of chlorine ges through a solution of caustic potass; then boiling and evoporeting; the first salt that eeparates is the chlorate of potass; and by
further evaporation, muriato of potass is obtained. It Is used in making matches for instantaneous light boxes, which are prepared by first dippling the wood in melted sulphur, and then into a thin paste, formed of 3 parts chlorate of potass, 2 parta starch, and a little vermilion; with aulphur it furma a very explosive compound, generally employed for filling the percussioncaps of fowling-pieces.

Soda, or Mineral Alkali.-The auurces of this alkali in nature are various. It is obtained in combiation with carhonie acid, when plants which gruw by the sca-side are burned. The ashes thus obtained are called barilla and kelp; and also in some countriea it is found as an effloresecnce upon the surface of tho earth, and is called nitrum or natron; this occurs particularly in Egypt and South America. Trona is also another native carbonate of soda, and is exported from Tripoli. In combination with muriatic acid it is also found in immense abundance, forming the rock salt, and sea salt or muriate of soda. It is obtained from the carbonate exactly in the same way as potasa is obtained from its carbonste, namely, by boiling it with fresh-burned line previously slaked. decanting the clear solution, and evaporsting and fusing. It is a white brittle aubstance, and by exposure to the air heconucs converted into a dry carbonate. Ita uses in the arts and manufactures are of considerable importance. In soap-making it is employed in very large quantities, and for this purpose is generally procured from barilla or keln. by mixing them with lime, and by the infusiun of water procuring a caustic sodu ley; this is mixed with oil and fatty matters in varions proportions, and builed; the saponitication of the fatty matter takes place, and the soap forned rises to the surface; the ley is then drawn from beneath, and fresh leys added, until the soap is completely free from oin; $i t$ is then allowed to dry. Soda is also employed in the usnufacture of plate, crown, and bottle glass, though for thls purpose it is generally in tho form of carlionate or sulphate.

Subcarbonate of Soda. (In the cher ical nomenclature it is called carborate.)-This is get erally prepared from barilla, which contains about fiom 16 to 24 per cent. Barilla is procured liy incine:ating the salsola soda, and other sea-side plants; it is mada in large quantities on the coast of Spain. Kelp is another inpure carbonate of soila, but daes nat contain more than 4 or 5 per eent.; it is the ashes obtained from sea-weeds by incineration, and is made on the northern shores of Scotland. From these, the erysta lized carbonste (or suhcarbonate, as it is more frequently called) is made by the addition of a small quantity of water, boiling, straining, evaporating, and skimming off the common salt as it forms on the surface; on cooling. the subearbonate of soda crystallizes. Another methud is hy heating the sulphate of aoda with carbonate of lime and charcoal, and then dissulving out the eoluble carbonate; also, by the action of carionate of potass (pearlash) upon solutions of sea salt.-Sce Bainled and Kelis.

Bicarbonate of Soda is procured by driving a current of carbonic acid gas through solutiona of the carbonnte, and then evajorating at a temperature below $212^{\circ}$ Fahrenheit; it is ehietly employed in making soda-water powders. This is the carbonate of soda of the Pharmacopoia. By the application of a red heat it loses carbonic acid, and is converted into the sulscarbenate.

Sulphate of Soda, or Glauber Salts.-This salt, which has received the name of Glauber, from its discoverer, is the residue of a great many chemical processes; for instance, when muriate of soda is acted upon by oil of vitriol, muriatic acid and sulphate of soda result; in making chlorine gas for the manufacture of the chioride of lime, or hleaching powder, sulphate of sodu and sulphate of manganese result-the materials employed being sen salt, sulphurie acid (oil of vitriol), and bluck
oxide of manganese ; also, in the preparation of acetie acid from the acetate of soda, and in the preparation of muriate of ammonia from ses salt and sulphate of ammonia. Sulphate of soda is a colorless, transparent salt, efflorescea readily when exposed to the air, and becomes converted into a dry powder; it has a coll, bitter taste. It ia used for the preparation of carbonate of soda, snd as a medicine. It la found native in some countries, particularly in Persia and South Americafrequently as an efflorescence upon new walls.

Nitrate of Sodu.-Thls sslt is found native in some parts of the East Indies, and is called, from its square form, cubie nitre; it is, however, very little used.

Muriate of Solla, or Sea Salt.-This compound is found in immense quantities in the eartl, and ia called from this cireumstance rock salt, or, sal gem. The mines of Cheshire and Droitwich, In England, and those in I'oland, Ilungary, and Spain, and many others, afford immense quantities of this compound. It is also obtained by the evaporation of sea-water, both spontancously in pita formed for the purpose, and in large iron boilers; the unerystallizable fluid ia called the bittern; basket salt is made by placing the salt, after evaporation, in conical laykets, and paasing through it a saturated solution of salt, which dissolves and carries off tho muriate of magnesia or lime. I'ure salt should not become moist by exposure to the air; it decrepitates when heated: it is employed for the preparation of muristic acid, carbonatt of soda, muriate of ammonia, and many other operations; also in glazing stone-ware, pottery, etc.; and from its great antiseptie properties, is used largely for the preservation of aninal food; as a flux also in metallurgy.

Borate of Soda, or Borax.-This salt is found in Thibet and l'ersia, deposited from aaline lakes; it is called tincal, and ia imported into this country, where it is purified by solution-the fatty matter with which the tincal is always coated being removed, and the solution evaporated and erystallized: ita principsl uses are aa a flux, from its acting very powerfully upon earthy substances.

Alkanet, or Anchusa (Ger. Orkant ; Du. Ossetomy ; Fr. Urcanette; It. Ancusa; Sp. Arcaneta), a speciea of bugloss (Anchusa tinctoria, linn.). It has been cultivated in England; but is found of the finest quality in Siberia, Spain, and more particularly in the south of France, in the vicinity of Nontpellier. The roots of the plant are the only parta that are made use of. When in perfection, they are about the thickness of the finger, having a thick bark of a deep purplish red color. This, when separated from the whitish woody pith, imparts a fino deep red to alcohol, oils, wax, and all unctuous substances. To water it gives only a dull brownish hac. It is principally employed to tint wax, pomatum, and unguents, oils employed in the dressing of mahogany, rose-wood, etc. The alkanet brought frou Constantinople yielda more heautiful hut less permanent dye thon that of France.Lewis'a Mfat. Med.; Maninem, Dietionnaire des 'roductions.

Alligation, the name of a method of solving all questions tha's relate to the mixture of one ingredient with anothe Though writers on aritlemetic generally make allibesion a branch of that science, yet as it is plainly nothing more than an application of the comnion properties of numbers, in order to solve a few questions that ocenr in particular branches of business, we choose rather to keep it distinct from the science of arithmetic. Alligation is generally divided into mediual and alternate.

Alligation Medial, from the rstes and quantities of the simples given, discovers the rate o. the mixture.
Rule. As the total quantity of the simples,
To their price or value;
So uny quantity of the mixture,
To the rate.
Example. A grocer mixes 30 pounds of currunta, at

4d. per pound, with 10 pounds of other currants, at $G d$. per pound; Wh.t is the value of 1 pound of the mixture? Ans. $4 \frac{1}{\frac{1}{2} d . ~}$

Alligation Alternate, being the converse of alligation medial, from the rates of the simples, and rate of the mixture given, finds the quantities of the simples.

Rules. I. Place the rato of the mixture on the left side of a brace, as the root; and on the right side of the brace aut the rates of the several almples, under one another, as the branches. II. Link or alligate the brauches, so as one greater and another less than the root may be linked or yoked together. III. Set the dillerence between the root and the several branches right against their respective yoke-fellows. These alternate differences are tho quantities required. Note 1. If uny branch happon to have two or more yoke-fellows, the difference between the root and these yoke-fellows must be placed right against the said branch, one after another, and added into one sum. 2. In som 3 questions the branches may be alligated more ways than one; and a question wlll always admit of so many answers as there are different ways of linking the branches.

Alligation alternate admits of three varietios; viz., 1. The question may be unlimited, with respect both to the quantity of the simples and that of tho mixture. 2. The question may be limited to a certain quantity of one or more of the simples. 3. The question may be limited to a certain quantity of the mixture.

Variety $I$. When the question is unlimited, with rospect both to the quantity of the eimples and that of the mixture, this is called Alligation Simple.

Example. A grocer would mix sugars at $5 d ., 7 d$., and 10 d . per pound, so as to sell the mixture or compound at $8 d$. per pound: What quantity of each must he take ?

$$
\left.8\left\{\begin{array}{c}
5 \\
5 \\
10
\end{array}\right){ }_{3}^{2} \right\rvert\, \begin{array}{c|c}
l_{b} \\
2 & 2 \\
4
\end{array}
$$

Here the rate of the mixture 8 is placed on the left side of the brace as tho root ; and on the right side of the same brace are set the rates of tho several simples, viz., $5,7,10$, under one another, as the branches; according to Rule I. The branch 10 being greater than the root, is alligated or linked with 7 and 5 , both these boing lesa than the root, as directed in Rule II. The difference between the root 8 and the branch 5, viz., 8 , is set right against this branch's yoke-fellow 10; the differeneo between 8 and 7 is likewise set right against the yoke-fellow 10; and tho difference between \& and 10, viz., 2 , is set right ugainst the two yoke-fellows 7 and 5, as prescribed by luule III. As the branch 10 has two differences on the right, viz., 3 and 1 , they are added; and the answer to the question is, that 2 pounds at $5 d ., 2$ pounds at $\bar{i} d$., and 4 pounds at $10 d$., will make tho mixture required. The truth and reason of the rules will appear by considering that whatever is lost upon any ono branch is gaiued upon ita yoke-fellow. Thus, in the above example, by selling 4 pounds of $10 d$. sugar at $8 d$. per pound, there is $8 d$. lost : but the like sum is gained upon its two yoke-fellows, for by selling 2 pounds of $5 d$. sugar at $8 d$. per pound, there is Gel. galned; and by selling 2 pounds of $7 d$, sugar at $8 d$. thure is $2 d$. gained; and $6 d$. and $2 d$. make $8 d$. Hence it follows that the rate of the mixturo must always be mean or iniddle with respect to the rates of the simples; that is, It muat be less than the greatest, and greater than tho least; otherwise a solution would be impossible. And the price of the total quantity mixed, computed at tho rate of the mixture, will always be equal
to the sum of the prices of the several quantities csast up at the respective ratea of the simples.
Variety II. When the question is limited to a certaln quantity of one or more of tie simples, this is called Alligation Partial.
If the quantity of one of the simples only be limited, alligate the branches, and take their differences, as if there had been no such limitation; and then work by the following proportion :
As the difference right against the rate of the simple whose quantity is given,
To the other differences reepectively;
So the quantity given,
To the several quantities sought.
Example. A distiller would, with 40 gallons of brandy at 12s. per gallon, mix rum at 7s. per gallon, and gin at 4s. per gallon: How much of the rum and gin must be take to sell the mixture at 8 s . per gallon?

$$
\left.8\left\{\begin{array}{c}
12 \\
7 \\
4
\end{array}\right) \quad \begin{array}{l}
1,4 \\
4
\end{array} \left\lvert\, \begin{array}{l|l}
5 & \begin{array}{l}
\text { Gallons. } \\
4
\end{array} \\
40 \text { of brandy } \\
42 & 82 \text { of rum, gin. }
\end{array}\right.\right\} A n s
$$

The operation gives for answer, 5 gallons of 1 :andy, 4 of rum, and 4 of giu. But the question limita the quantity of brandy to 40 gallons; therefore say,

If $5: 4: \mathbf{: ~} 40: 32$.
Tho quantity of gin, by the operstion, being also 4, the proportion needs not be repeated.

Variety III. When the question is limited to a certain quantity of the mixture, this is ce!led Alligation Total.
After linking the branches, and taking the differences, work by the proportion following:

As the sum of the ditterences,
To each particular difference;
So the given total of the mixture,
To the respective quantities required.
Example. A vintner has wine at 3 s. per gallon, and would mix it with water, a as to make a composition of 144 gallons, worth 2 s . $6 d$. per gallon: How hueh wine, and how much water, must he take?

> Gallons.
$\left.30\left\{\begin{array}{c}36 \\ 0\end{array}\right) \begin{array}{c}30 \\ \frac{6}{36}\end{array} \left\lvert\, \begin{array}{c}120 \text { of wine, } \\ \frac{24}{120 \times 80=4320} \text { of water. }\end{array}\right.\right\}$ Ans..
$24 \times 0=0$
Proof 144) $4320(30$
As 36: $30:$ : $144: 120$
As 36: 6::144: 24.
There being here only two simples, and the total of the mixture linuited, the question admita but of one answer.-E. B.
Allocation denotes the admitting or allowing of an article of an account, especially in the exchequer. Hence Allocatione Facienda is a writ directed to the L.ord Treasurer, or Burons of the Exchequer, commanding them to allow an accountant such sums as he has lawfully expended in the exceution ot his office.E. 1 .

Allowances, Tares, etc. In selling goods, or in paying duties upon them, certain deductions are made from their weights, depending on the nature of the packages in which they are inclosed, and which are regulated in most instances by the eustom of merchants, and tho rules lald down by public offices. These allowances, as they are termed, are distinguished by the epithets Draft, Tare, Tret, and Cloff.
Draft is a deduction from the original or gross welght of goods, and is substracted before the tare is taken off. Tare is an allowance for the weigit of the bag, box, cask, or other package, in which goods are welghed. Real or open tare is the actual weight of the package. Customary tare is, as ita name implies, an establlahed allowance for the weight of the package. Computed tare is an estimated allowance agreed upon

## ALL

## ALM

at the time. Average tare is when a few packages |natlons, interspersed with a great number of astroonly among aeveral are weighed, their mean or average taken, and the reat tared accordingly. Superatare is an additional allowance, or tare, where the commodity or package exceeds a certain weight. When tare is allowed, the remainder ia called the net waight ; but if tret be sllowed, it is called the suttle weight. Treet is a deduction of 4 pounda from every 104 pounds of suttle weight. This aliowance, which is said to be for dust or sand, or for the waste or wear of tha commodity, was formerly made on most foreign articlea sold by the pousd avoirdupois ; but it is now nearly discontinued by merchanta, or else aliowed in the price. It is whelly abolished at the Eaat India warehouses in London; and neither tret nor draft is allowed at the custom-house. Cloff, or Clough, is another allowance that is nearly obsolete. It is atated in arithmatical books to be a deduction of 2 pounda from avery 8 cwt . of the second suttle; that is, the remainder after tret is aubtracted; but merchanta at present know cloff only as a smali deduction, like draft, from the original weight, and this only from two or threa articiea.-See Kehiy's Cambist, art. London.

Alloy, or Allay, properly signifies a proportion of a baser matal mixed with a fincr one. The alloy of gold is estimated by carata, that of silver by pennyweights. In dificrent nations different proportiona of alloy are used; whence their moneys are said to be of different degrees of fineness or baseness, and are valued accordingly in foreign exchanges. The chief reasons alleged for the alloying of coin are, 1 , the mixture of the metals, which, when smelted from the minn, are not perfectly pure; 2 , the eaving of the expense it must otherwise cost if they were to be refined; 8 , the necessity of rendering them harder, by mixing some parts of other metals with them, to prevent the diminution of welght by wearing in passing from hand to hand; 4, the melting of foreign gold or coin which is alloyed; 5 , tha chargea of coinage, which must be made good by the protit arising from the money coined; 6 , and lastly, the duty belonging to the sovareign, on account of the power he has to cause money to be coined in his dominions.-E. B.

Almadie, a kind of canoe or small vessel, about four fathoms long, commonly maile of bark, and used by the negroes of Africa. At Calicut the same name is applied to a kind of long boats, 80 fect in length and six or seven in breadth. They are exceedingly swift, and are otherwise called cathuri.-E. 13 .

Almanac, a beok or table, containing a calendar of days and months, the sising and setting of the sun, the age of the moon, the eclipses of both luminaries, etc. Authors are divided with regaril to the etymology of the word; seme deriving it from the Arable particle $a l$, and manach, to count ; some from almanach, Newyear's gifta, because the Arabian astrologers used at the beginning of the year to make presents of their epitemerides; and others from tha Teutonic almaen ache, observations on all the montis. Dr. Johnsen derivea it from the Arabic particie al, and the Greek $\mu \eta \nu$, a month. But the most simple etymology anpears from the common spelling; the word being composed of two Arabic ones, Al Manack, which signify the Diary. All classes of the Arabs are commonly much given to the study of astronomy and astrology; to both of which they are inclined by their belief in fate, and by their pistoral life, which affords time and opiortunity to cultivate them. They neither sow, renp, plant, nor undertake any expedition or business, without previously consuiting the stars, or, in other words, their almanacs, or some of the makers of them. From these peopic, by their viclnity to Europe, this art, no less useful in one sense than trifling and ridiculous in another, has passed over to us; nnd those astronomical compositiona have atill every where not only retained their old Arabic name, but were, like theirs, for a long while, and still are smong many European logical rulea for planting, sowing, bleeding, purging, etc., down to the cutting of tha hair and paring of the nails. Regiomentanua appears to have been the first in Eurepe, however, who reduced almanacs Into their present form and method, gave tha characters of each year and month, foretold tha eclipses and other phases, calculated the motions of the planets, etc. Ilia first almanac was published in 1474. The easential part of an almanac is the calendar of montha and dayn, with the risings and settings of tha sun, age of the moon, etc. To these are added llats of posts, offices, dignities, public inatitutions, with many other articles, pelitical as well as local, and differing in different countries.

Almanac, Nautical. This, whleh in some respects is a national almanac, is published under the sanction of tha Board of Longitude, and ia designed chictly to facilitate the use of Mayer'e Lunar Tables, by superseding the necessity of maring calculationa to determine the longitnde at aea. it commenced with the year 1767, and haa ever since been continued annually, but two or three years in advance. Tha late Dr. Maskelyno was the originater of this very valuabie publication. It is now published under the immediate superintendence of the secretary to the board. Similar to this almanac is the French publication entitled Comnoissance des Tems, directed by the Bureau de Longitude, and which commenced so carly as the year 1698. At Ilerlin, the celelrated Bode for about 50 years conducted the excellent astronomlcal almanac, Astronomisches Jahrbuch, which is still continued.-E. B.

The American Ephemeris and Nautical Almanac is n valusble work for navigetors. The act establishing this work was passed by Congress in 1849, and the preparation of the first volume was commenced in the fell of the same ycar. The work was put under the superintendence of Commander C. H. Davis, of the navy, with Professor Benjamin Peirce as consulting astronomer. Owing to the smalluess of the first appropriations, and the great amount of preliminary iabor, the firat volume, for 1855 , was not published until 1852 ; since which time a volume has been issucd each year. The volume for 1859 is now in a forward state of preparation, and will be ready about January, 1857. The primary olject of the work is to promote the intcrests of commerce; and for this reason great pains have been taken with those problems upon which the science of navigation tlepends. Especially is this the case with the Lunar Epinemeris; and ali the tests which iave been applied show that this labor has been rewarded with great success. Professor Peirce's Tablia are used in preparing this ephemeris. The ephemeris of the sun is prepared from Ilansen's Tables. The nautical part of the work, besides the foregoing, contains the ephemerides of those planets most commonly used with the moon in determining a ship's place at sea; also the appurent places of about one hundred fixed stars. All this part of the work is referred to the incridian of Greenwich; and to prevent confusion in its use, the arrangement of the British Almanac is adopted. The astronomical part is referred to the meridian of Washington, and such changes in the ordinary forms of the ephemeridies have been adopted as would render them most practical in the daily routine of the observatory. The ephemerides of the plancts are being hased upon now theories, ns fast as can be tone consistently with the demands which tine regular issues of the almanac make upon the annual appropriations made by Congress for its support.

The Egyptians computed time by instruments. Log calendars were anciently in use. Almon-aght is of Saxon origin. In the Irftisit Museum and universities are curious specimens of early almanacs. Michnel Nostrodamus, the celelirated astrologer, wrote an almanac in the style of Meriin, 1566.-Defresnoy. Tha most noted eariy almanacs were :
John Somer's Calendar, Oxford. ..... 1880
One in Lambeth palace, written in. ..... 1460
Ftrst printed one, publlished at Budn. ..... 1472
First printed in Engtand, by Richard Pynson. ..... 1593
Tybanlt's Prognosticattons.
153
153
Lity's Ephenerls. ..... 164
Joor Rebin's Almauac. ..... 165
Lady's Diary.. ..... 170

Brittah Atmanac and Companion ..... 1828
American Atmanac, Uleston...... ..... 1820
Nantical Atmanac, United States. ..... 1865

Of Moore's, at one poriod, upward of 500,000 coples were annually sold. The Statloners' company claimed the exclusive right of publishing, until 1790, in virtue of letiers patent from James I., granting the privilege to this company, and the two universities. Tha atamp duty on almanaca was abolished in England, $\mathbf{1 8 8 4}$.

Almonds (Ger. Mandeln; Du. Amandelen; Fr. Amandes; It. Mandorli; Sp. Almendra; Port. Amendo; Russ. Mindul; Lat. Amygdalee amarce, dulces), a kind of medicinal fruit, contained in a hard ahell, that is inclosed in a tough sort of cotton skin. The tree (Amygdalus communis) which produces this fruit nearly resembles the peach both in leaves and blussoms; it grows spontaneously only in warm countries, as Spain, and particularly Barbary. It flowers early in the spring, and produces trult in August. Almonds are of two sorts, aweet and bitter. They are not distingulshable from each other but by the taste of the kernel or fruit. "The Valontia almond is sweet, large, and flatpointed at one extremity, and compressed in the middle. The Italian almonds are not so sweet, smaller, and less depressed in the middle. The Jordan almonds come from Malaga, and are the best sweet almonds brought to England. They are longer, flatter, less pointed at one end and less round at the other, and have a paler cuticle than those we have describel. The sweet almonds are inported in mats, casks, and boxes; the bitter, which come chiefly from Mogadore, arrive in boxes."-Thomson's Dispensatory.

Aloes (Du. Aloe ; Fr. Aloés; Ger. and Lat. Aloe ; Russ. Subir; Sp. Aloe; Arab. Mfucibar), a bitter, guminy, resinous, inspissated julce, obtained from the leaves of the plunt of the same name. There are four surts of aloes met with in commerce; viz., Socotrine, Hepatic, Caballine, and Cape.

1. Socotrine-so calied from the island of Socotra, in the Iudian Ocean, not very distant from Cape Guardafui, where the plant (Aloe spicata), of which this specles is the produce, grows abundsntly. It is in pieces of a reddish-brown color, glossy as if varnished, and in somo degree pellucid. When reduced to powder, it is of a bright golilen color. Its taste is extremely bittor, and it has a peculiar aromatic odor, not unlike that of the i asset apple decaying. It softens in the hand, and is ar'luesive, yet is sufficiently pulverulent. It is imported by way of Sinyrua and Alexandria, in chests and casks, but is very scarce in England.
2. Hepatic.-The real heputic aloes, so ealled from its liver color, is believed to be the produce of the Aloe perfoliate, which grows in Yemen, in Arabia, from which it is exported to Bombay, whence it finds its way to Europe. It is duller in the color, bitterer, and has a less pleasant aroma than the Socotrine aloes, for which, however, it is sometimes substituted. Barbadoes aloes, which is often passed oll for the hepatic, is the produce of the A loe vulgaris. It is brought home In calabashes, or large geurd shells, containing from 60 to 70 pounds. It is duskier in its hue than the Bombay, or real hepatio aloes, and the taste is more mauscous, and intensely bitter. The color of the powder is a dull ollve yellow.
3. Caballine, or Horve Aloes, seems to be merely the coarseat species or refuse of the Barbadoes aloes. It is used only in veterinary medicine; and is easily distinguished by its rank, fetid smell.
4. Cape Aloes is the produce of the Aloe spicata, which is found in great abundance in the interior of the Cape colony, and in Melinda. The latter furnishes the greater part of the extract eold in Europe under the name of Socotrine aloes. The odor of the Cape aloes is stronger and more disagreeable than that of the Socotrine; they have also a yellower hue on the outside, are less glossy, softer, and more pliable ; the color of the powder is more like that of gamboge than that of the true Socotrine aloes.-Ainslis'a Mfateria Indica; Tromson's Dispensatory and Materia Medica.

Aloen-wood (Ger. Aloeholz; Du. Aloehout, Paradyshout ; Fr. Bois d'Aloes ; It. Legno di Aloe ; Sp. Aloè chino; Lat. Lignum Aloes; Sans, Aguru; Malsy, Agila; Slam. Kisnu), the produce of a large forest tree, to be found in most of the countries between China and India, from the 24th degree of north latitudo to the equator. It seems to be the result of a diseased action confined to a small part of a few trees, of which the rest of the wood ia wholly valueless. It appears to be more or less frequenc according to soll and cllmate, and from the same causes to differ materlally in quality. It is producell both in the greatest quantity and perfection In the countries and islands on the east coast of the Gulf of Slam. This article is In high repute for fumlgations, and as incense, in all Hindoo, Mohsinmedan, and Catholic countries. It formerly brought a very high price, being at one time reckoned nearly as valuable as gold. It is now comparatively cheap, though the finest specimens are atill very dear. The accounts of thls article in most books, even of good authority, are singularly contradletory and insccurate. Thls is more surprising, as La Loubère has distinctly stated that it consisted only of "certains endroits corrumpus dans des arbrea d'une certaine espèce. Toute arbre de cetta espèce n'en a pis; et ceux qui en ont, ne les ont pas tous en méme endroit."-Royaume de Sium, t. i. p. 45, 12mo ed. The difficulty of finding the trees which happen to be diseased; and of getting at the diseased portion, has given rise to the fables that have been current as to fts origin. The late Dr. Roxburgh introduced the tree which yields thls production into the Botanical Garden at Calcutta, from the hills to the esatward of Sylhet, and described it under the name of Aquillaria Agalocha.

Alpaca, a species of the South American family of quadrupeds called Ilama, the soft hairy wool of which is now largely employed in the falsrication of cloths of different sorts. There would appear to be three species of this family, the Guanaco, or wild Llams; the Alpaca, which was domesticated as a beast of burden by the ancient Peruvians, and hence considered as the camel of the New World; and the Vicuirir, a small species, chlefly valued for the softness of its fine wool. Some considar the Paco a fourth species; but the descriptions of travelers aro too Indefinite to enable us to decide this point. The fleece of the alpaca is fine, long, and shaggy; and the animal exceeds much in size the other two.

Alum (Ger. Alaun ; Du. Aluin ; Fr. Alun; It. Allume; Sp. Allumbre; Russ. Kwasszz̄? Lat. Alumen; Arab. Sheb), a salt of great importance in the arts, consisting of a ternary compound of aluninum, or pure argillaceeus earth, potass, and sulphuric acid. Alum is sometimes found native; bit by far the greater part of that which is met with in commerce is artilicislly prepared. The best aIum is the IRoman, or that which is manufactured near Civita Vecehia, in the Papal territory. It is in irregular, octahedral, crystaltine masses, about the size of a walnut, and is opaque, being covered on the surface with a farinaceous efflorescence. The Levant, or Roch alum, is in frugmenta, about the size of the former, but in which the crystal-
line form is more obscure; It In externally of a dirty -se-color, and Internaliy exhlblts the same tinge, but 'zarer. It la unually shlpped for Europe from Smyrna; but It wat anciently made at lloceha, or Edensa, in Syria; and hence Its name, Hoch alum. Engligh alum In in large, Irregular, neml-transparent, coloriens masses, having a glassy fracture; not efflorescent, and conslderably harder than the others. It is very inferior to either the Roman or Roch Alum, The princlpal use of alum in in the art of dyelng, as a mordant for fixing and givlng permaneney to colors which otherwise would not adhere at ali, or but for a very short time; but it is also used for a great variety of other purposes. Beckmann has shown (IIistory of Incentions, vol. I. article Alem) that the ancienta wers unaequainted with alum, and that the subatance which they deslgnated as auch was merely vitriolic earth. It was first diacovered by the Orientals, who established alun works in Syria in the thirteenth or fourteenth century. The oldeat Ilum works In Europe were erected about the middle of the fifteenth century. Toward the conclusion of the relgn of Queen Elizabeth, Sir Thomas Chaloner established the first alum work in England, In the vleinity of Whitby, In Yorkahire, where the prinelpal works of the sort in that country are still carried ous the shipments of alum from Whitby in 1841 amount to 3237 tons. There is alao a large alum work at Hurlett, near Palsley, the produce of which may be eatimated at abont 1240 tons a year. A lum la largely manufactured in China, and is thence exported to all the western Asiatle countrics. In 1837, 35,642 piculs ( 2120 tens) were exported from Canton.

Amalgamation, the operation of making an amalgall, or mixing mercury with any metal. For tho comlination of one metal with another, it is generally suftleient that one of them be in a state of finidity. Mercury being always floid, ia therefore capable of amalgamation with other metals without heat, iron excepted; nevertheless, heat considerably facilitates the operation. To amalgamate without heat requires nothing more than subbing the two metals together in a mortar; but the metal to be united with the mereury should be previously divided Into very thin plates or grains. When heat ss used (which is always most effectual, and with some metals indispensalily necessary), the mercury should be heated till it begin to smoke, and the graina of metal made red hot before they are thrown into it. If it be gold or silver, it ia sufficlent to stir the fluid with an iron rod for a little whlle, and then to throw it lnte a vessel filled with water. This amalgam is used for gilding or silvering on copper, which is afterward exposed, to a degree of heat sufficient to evaporate the mercury. Amalgamation with lead or tin is effected by pouring an equal weight of mercury into either of these metals in a state of fusion, and stirring with an iron rod. Copper amalgamates with great diffieulty, and lron not at all.-F. I.

Amazon, Maranon, Orellana, or Bolimoes, the ehief river of South America, and the largest in the world, whether regarded as to its volume, or the extent of its basin. It is formed by the union of the Maranon and Ucayale; the former vising in Lake Lauricocha (Peru), in lat. $10^{\circ} 30^{\prime} \mathrm{S}$., long. $76^{\circ} 10^{\prime} \mathrm{W}$.; and the head stream of the latter, the Apurimac, ariginating about lat. $16^{\circ} \mathrm{S}$., long. $72^{\circ} \mathrm{W}$. Both rivers have a general eourse at firat uorthward; the Maranon, for the first 500 miles of its course, flews N.N.W., and at about lat. $6^{\circ} \mathrm{S}$. bends eastward, and at lat. $4^{\circ} 40^{\prime}$ takes an almost due east course, and after receiving the II ualInga from tho aouth (where it ls about 500 yards broad), it pursues a course of 46t leagues, and joins the Ueayale at lat. $4^{\circ} 3 \bar{o}^{\prime} \mathrm{S}$., long. $74^{\circ} \mathrm{W}$. Ilere the stream has depth sufficient to tioat the largest class of ships. Thenceforth the Amazon flows generally east to the Atlantle, which It enters nearly under the equator, and between long. $48^{\circ}$ and $60^{\circ} \mathrm{W}$., Its estuary widening until it is 180 miles across. Taking the Apurimac as its
source, Ita direct length is estimated at 1769 miles; and Including Ita windinge, nearly 4000 mlles; for great part of which (via., from the ocean to Pongo de Manseriche, long. $76^{\circ} 50^{\circ} \mathrm{W}$.) it ia navigable and uninterrupted by any rapld or cataract. At least twenty ncble rivers, uavigable to near their sources, pour thelr waters into It, besldea numeroua other less important streams. Chlef tribntaries, the Napo, Putumayo, Yapura, and Illo Negro, from the north; the Yavarl, Jutay, Jurua, Coary, Purua, Madelra, Tapajos, and XInga, from the south. By the Caslqulaire, a branch of the Rio Negro, the Amazon has a direet and remarkable connectlon with the Orinoco. The Amazon and its tributariea afford an immense inland navigation, estimated at 50,000 miles ; and the extent of 3 ts basin has been computed at about two millions of square mlles, or ahout two fifthe of the whole continent of Soutli America. The depth of the river is great; In mid-current no bottom is found with 20 fathoms. The veloclty of the current ls pretty uniform, ot the rato of $3 \frac{1}{2}$ milles ar. hour. Tldes ascend this river for 400 miles from the Atlantle-as far as Obidos, where tho Amazon is atill more than a mile in width-and near the full moon the rlse of the tide oceasions a formidable rush of water into the channel, sometimes bringing In several waves from 10 to 15 feet In helght. Thls phenomenon, called the bore, ls witnessed on a smaller scale in the Ganges, and in some Eurepean rlvers. The upper part of the rlver, as far as the month of the Yavari, which forms the boundary lino between Brazll end P'eru, is called Maranon; thence to the mouth of the Rlo Negro it is called Solimoes or Solimas; and from the Negro to its mouth, Amazon. The tropleel ralns swell the river annually to $\mathbf{4 0}$ and $\mathbf{6 0}$ feet above Its ordinary level. The Maranon attains its greatest helght in January, the Solimoes in Feliruary, the Amazen In the middie of March. In tho lower part of its course, the Amazon abounds with Islands, and in Its estuary aro Marajo and Caviana, of considerablo extent. Santiago (Ecuader), S. Ilorja, S. Joaquim, Tabatinga, Olivenza, Matura, Serpa, Santarem, Montalegre, Para, Arayates, and Gurupa, are towns on its banks; but, with trifing exceptions, the whole country which it traverses is atlll In a state of nature. In 1848, a steambont made a passuge from Para, up the river as far as the Negro. The estuary of the Amazon was discovered by Pincon in 1500 ; in 1539, Francis d'Orellana sailed down it from the Napo, and it obtalned its name of Amezon from his having reported that he had seen armed won, 1 its shores.-Manpens' Gazetteer.

Its capaeities for trade ayd commerce are inconceivably great. Its industrial future is the most dazzling; and to the touch of steam, settlement, and cultivntion, this rolling stream and lts magnificent water-shed would start up into $n$ display of Industrial results that wonld indicate the Valley of the Amazon as one of the most enehanting regions on the face of the earth. From ita meuntains you may dig sllver, iron, conl, copper, quacksllver, zine, and tin; from the ennds of its tributaries you may wash gold, diamonds, mud precious stones; from its forests you may gather drugs of virthes the most rare, spices of nroma the most exquisite, gunss and resins of tho most varied and useful properties, dyes of hues the most brilliant, with enlinet and building woods of the finest polish and nost enduring texture. Its ellmate is an everlasting summer, and Its harvest perennial. I translate from a book of travels in these countries, by Count Castelnan (received since my return to the United States), an account of the capaeitles of some of the southern portions of this vast water-shed:
"The productions of the country are exceedingly various. The sugar-cane, of whleh the crop is gathered at the end of eight months from the time of planting, forms the chicf source of wealth of the province of Cereado.
"Coffee is cultivated aiso with success in this province, and In that of Chiquitos yields its frnit two years after having been planted, and requires acarcely any attention. Cocoa, recentiy introduced into these two provinces, given lts fruit at the end of three or four years at most. The tamarind, which thrives in the game locailities, produces lts harveat in tivo yearn. Cotton gives annual erops; there are two varietiesthe one white, the other vellow. Tobacco grown, so to speak, without cultivation, in the province of Valle Grande, where it forms the princlpal article of commerce. Indigo, of which there are three cultivated kinds and one wild, is equally ahundant. Maize yields at the end of three months all the year round; it is also cultivated in the province of Cercado. The cassave proluces in elight montha after planting ; there are two kinds of it-one eweet, and the other litter; the first can replace the potato, and even bread; the second is only good for atarch. Jincee is an enormous ?mount of kinds or varieties of bananas, which produce in the year from seed; they are specialiy cultiva $d$ in the province of Cercado. 'I'wokinds of rice-one white, the other colored-are cultivated in the two provincea of Cercado and Chiquitos. They produce every five or six months; they say it is found wild in the region of Chiquitos.
"The grape, whlch growa well every where, and ospecialiy in the province of Cordlllersa, where it was cuitivated in the Missions up to the time of the Independence, is nevertheless made no article of profit. It will some day, perhaps, form one of the principal sources of wealth of this country. Wheat, barley, and the potato might be cultivated with advantage in the provinces of Chiquitos and Cordllleras ; but till now resuita have been obtained ouly in that of Valle Grande. The cultivation of cocos has commenced in the province of Cereado, and it is also found in a wild atate, as well as the Peruvian bark, on the mountains of Samaripata. As we have already said, fruits abound in this region. They cultivate there principaily oranges, lemons, citrous, figs, papaws, pomegranates, melons, water-melons, chirimoyas (which the Brazilians cali fiuto de conde), pine-apples, ete. The last of these fruits grow wild, and in great abundance, in the wooda of Chiquitos. We met it, particularly the evening of our arrival, at Santa Ana. Ita taste is excelient; but it leaves in the mouth such a burning sensation that I bitterly repented haviug tasted it. They cultivate in sufficient abundance, in the province, jalap, Peruvian bark, sarsaparilia, vanilia, rocou, copahu, ipecacuanha, caoutchouc, copal, etc. Woods for dyeing, cabinet-making, and building, abound; and the people of the country collect carefuily a multitude of gums, roots, and harks, to which they attribute medicinal virtues the most varied. In many points in tho departmenta, and cspecially in the provinces of Valle Grande and Cordilleras, iron is found, and traces of quicksilver. Gold is found in the province of Cercado, near the village of San Xavier. The Jesuita wrought mines of silver in tise mountains of Colehis. Don Sebastian Rancas, while Governor of Chiquitos, announced to the government that diamonds, of very fine water, had been found in the streams in the environs of Santo Corazon."

The citizens of the United States are, of ail foreign people, most interested in the free navigation of the Amazon. We, as in comparison with other foreigners, would reap the lion's ahare of the advantages to be derived from it. We would fear no competition. Our geegraphical position, the winds of heaven, and the currouts of the ocean, are our potential anxiliaries. Thanks to Maury's investigations of the winds and currents, we know that a chip flung into the sca at the mouth of the Amazon wiil tloat close by Cape IIatteras. We know that ships sailing from the month of the Amazon, for whatever port of the workd, are forced to our very doors by the aoutheast and northeast trade-
winde ; that New York is the half-way house between Paráa and Europe.
The present limitted commerce of the Amazon may be judged of by a statement of the exports and imports of l'ara, the port of entry, and situated most advantageously at the moath of an eatuary of the Amazon.

The city of Santa Maria de Belem de Graó Pará, founded by Francigeo Caldeira do Castelio Branco, in the year 1616, ia situated on a low ellow of land at the junction of tise liver Guamá with the River Pará, and at a distance of about eighty milies from the sea. A ship generally requiros three tides, which run with a velocity of about four miles to the hour, to reach tise sea from the city. The harbor is a very tine ors; it is made by tho long isiand of Onças in front, and at two miles distant, with some smaller ones farther down the river. There is an abundance of water, and ships of any size may lie within one hundred and fifty yards of the shore. There is a good landing-place for boata and lighters at the custom-house wharf; and at halftlde at the atone wharf, some five hundred yards above.

Owing to tho miserable policy of the Brazilian government, the free commerce of the Amazon wiil he retarded until Brazil is forced to do justice to heraclf amil others.

The Bolivian government are pursuing a more liheral policy, and have issued the foliowing decree, dated La Paz, 27th January 1853:
"Whereas, 1at, the eastern and western parts of the republic, inclosing vast territories of extreordinary fertility, interoected by navigable rivers flowing to the Amazon and to the La Plata, offers the most natural channels for the cominerce, population, and civilization of these districts;
"Whereas, 2d, the navigation of these rivers la the most efficacious and certain means of devoloping the riches of this territory, by placing it in communication with tho exterior, and applying to its waters the fruitful principle of free navigation, as useful to the intercsts of the repuhlio as to those of the world;
"Whereas, 3d, by the law of nature and of nations, confirmed by the conventions of modern Europe, and applied in the New World to the navigntien of the Mississippi, Bolivia, as owner of the Pllcomayo, of the tributaries and the greater part of the Madeira, of the left shore of the Itenes from its junction with the $\mathrm{Sa}-$ ravé to ita emptying inte the Momore, of tho western benk of the Paraguay to the Marco del I——, as far as $26^{\circ} 54^{\circ}$ of south latitnde, and of the greater part and the left shore of the Bermejo, has the right to navignte these rivers from the point in her territory in which they may be suseeptible of it to the sen, withont any power being able to arrogate to itself the exclusive sovereignty over the Amazon and La Plata;
"Whereas, 4th, this navigation can not be effected without the necessary ports are afforded for trade;
"Therefore, be it decreed:
"Ant. 1. The Iholivian government declares free to the commerce and mercantile navigation of nil the nations of the globe the waters of the navigable rivers which, flowing through the territory of this nation, empty into the Amazon and Paraguay.
"Art. 2. The following are declared free ports, open to the traffle and navigation of all vessels of commerce, whatever may be their flag, destination, or tonnage:
"In the River Mamoré-Exaltacion, Trinidad, and Loreto.
"In the Beni-Renenavaque, Muchanis, and Magdalena.
"In the Piray-Cuatro, Ojos.
"In the Chaparé-Coni and Chimeré, tributarjes of the Mamore, the ;oints of Asunta, Coni, and Chimoró.
"In the rivers Mupiri and Corolco, tributaries of the Beni, tho points of Guanay and Coroice.
"In the Pilcomayo-the pert of Magrinc on the east cuast of the Paraguay, La Bahia Negra, and the peint of Borbon.
"In the Bermejo-the point situated in $21^{\circ} 30^{\prime}$ souch latitude, at whith embarked, in 1846, the national engineers Ondarza and Mujia.
"Ant. 3. The vessels of war of friendly nations will nlso be permitted te visit these ports.
"Aht. 4. The govermment of Dolivia, availing itself of the unquestlonable rights which the nation has to navigate these rivers as far as the Atlantie, invites nll the nations of the carth to navigute them, and promises-
"1st. To donate in the Bollvian territory, for the purpeses which the law allows, tracts of land, from one league to twelve leagues square, to the individuals or companies who, sailing from the Atlantic, shall arrive nt any one of the points declared to be ports of entry, and may wlsh to fond near them agriculturel or jndustrial establishments.
" 2 d . To guarantee the reward of ten thonsand dollars $(810,000)$ to the first steamer which, threught the La I'lata or Amazon, may arrive at either of the abovementioned points.
"31. To deeree free the river exportation of the products of the earth, and of the national industry.
"Ith. In due time thero will be established and regmated at the nhove-mentioned points, where at may be necessary, custom-houses for the loacling and unlonding of merchandise, the government seehig that the chargen for tho uso of these custom-houses may be as mederute as possible.
" 5 th. This decree will be snlmitted for the examination and approval of Congress on their next meeting.
" 6 th. The Minjster of State, in the office of foreign relations, is charged with its fultillment, by circulating it and communicating it to all whom it may conerrn.
"Given in the l'alace of the Supreme (iovernment,
in the place of Ayacuelio, 27th of Jannary, 1853,
44 th of independence, and 4 th of liberty.
"Manuel lahono Betzit.
"Rafael Busthilo,
"Minister of Foreign Relations.
"A ertiffed cepy: Amari Aivabifz,
"El Official Mayor."

Amber (Ger, Bernstein; Du. Barnsteen; Da. Bernateen, Rar.; Fr. Ambre jaume; It. Ambra yialla; Sp. Ambar; Luss. Jantar; l'el. Bursztyn; Lat. Succinum, Electrum), a brittle, light, hard substunce, usually nearly transparent, sometimes nearly colorless, bit commonly yellow, or even deep lrown. It has considerable lustre. Epectfic gravity 1066 . It is found in notules or rounded masses, varying from the size of coarse sand to that of a man's linud. It is tasteless, without stucll, except when pounded or liented, when it emite a frugrant odor. It is highly electric. Most nuthors assert that amber ts bituminons; but IIr. Thonson staten, that "it is umboubtedly of a vegetable ortgini ; and though it differs Crom resins in some of its properties, vet it agrees with them in so many others, that it may withot haproprirty be referred to them." -C'iemistry, vol. kv, p. 147, fithed. I'ieces of amber oernsionaliy inclone parts of toads ant insects in thelr sulistanes, which are beantlfully prenervid. It is pribsciputly fonnd on the sthores of l'omeranla and loolish l'russin; but it is somethnes dug out of the earth in

Ducal Prussia. It is also to be met with on the banks of the River Giaretta, in Sicily. Sometimes it is found on the east coast of Britain, and in gravel pits round London. The lergest mass of ambar ever found was got near the surface of the greund in Lithuania. It weighs 18 peunds, and is preserved in the royal cabinet at Berlin. Most of the amber imported into this country comes from the Baltic, but a small quantity comes from Sicily. Amber was in very high estimation among the anclents, but is now comparatively negleeted.

Ambergris, or Ambergreame (Gcr. Amber; Du. Amber; Fr. Ambergris; It. Ambragrigia; Sp. Ambargris ; Lat, Awbra, Ambra grisea), a selid, opaque, generally ash-colered, futty, intlammable substance, variegated like marble, remarksbly light, rugged and meven in its surface, and has a fragrant odor when heated; it does net effervesces with acids, melts freely over the tire into a kind of yellow resin, and is hardly soluble in spirit of wine. It is found on the seacoast, or tlenting on the sea, near the ceasts of India, Africa, and Jlrazil, usually in small pieces, but sometimes in masses of 50 or 100 pounds weight. "Various opinions have been entertained respecting its origin. Some affirmed that it was the concrete juice of a tree, ethera thought it a bitumen; but it is now considered as pretty well established that it is a concretion formed in the stomnch or intestines of the I'hyseter macrocephalus, or spermaceti whale."-Tnomsos's Chenistry. Ambergris ought to be chosen in large pieces, of an agreeable odor, entirely gray on the outside, and gray with little black spots within. Ihe purchaser should be very tautions, as this article is easily connterfeited with gums and other drugs.

America. Our elject in this article is to take a comprehensive survey of the American continent in its physical, moral, nud geoeral rolations. In attempthg this, we do not intend to go much into detail upon those suljects which will be more fully and appropriately discussed in the distinet articles assigned in this work to the several States included in the Western World; but we shall dwell at somo length upon those features, peculiarities, and classes of facts which either belong to it as a wholo, or can be most advant:ageously considered or deseribed when all its parts are viewed in connection with one another. Such are the elimate und pinysical structure of the country, the geographleal distribution of its cultivated plants, its inillgenous pep)ulation, its animal tribes, its commercial and political capabilitice, and its menns of progressiveimprovement. The now continent may be styled emphatically "a land of promiso." The present there sinks into nothing in itself, and derives nil its importance from the germs it contuns of a mighty future. The change must not ouly be great, but rapid, beyond all which the past history of mankind would lead us to expeet. Even after we have fumiliarized our minds with the princlples upou which lis progress depreuts, we find to diffeutt to reconcile ourselves to the consequences that inevitally result from them. Hut time will do its work; and the great randrons of those now in existence may live to see the New Wordd contain a greater mass of clvilized men than the Old. It is this greatuess in prospeet which lenis an interc to tho Western Continent shmilar to that which the liastern derives from Its historical rucolleetions. The same circumstance reyaires that wo should dwell at some length on the physical structure of America, and on those indigenons tribes which, in the course of three centuries, will only live in poetry and tandition. The futuro history of the New World untast be read by ns in the conflguration of its surface, the distribution of its mometains nad rivers, the productions of lits soil, its natame nud politionl capabilities, and in the charncter rather than the numleers of its clvilized iniabitants.

Tho continental part of Amertea extends from the bith legree of south to tha 7 Ist of north latitude, its oxtreme length, from the Straits of Magellan to thoae
of Behring, being 10,500 English miles. The islands of Tierra del Fuego roach one degree beyond ita southern extremity into the Antarctic Ocean; and Greenland, which is connected by geographers with Americs, has been traced to the 78th degree of north latitude, and probably is prolonged much farther Into the polar circle. The late discoveries of Captains Parry, Ross, and Franklin have given us much more exact ideas than we formerly possessed of the northern regions of Ancrica. The coast of the main land has been traced almest completely from Behring's Straits to Fux's Channel on Iludson's Bay, and is found to run in a direction east and west, in an uneven line near the parullei ef $70^{\circ}$. The bounds of continental Ameriea may therefore be considercd as nearly determined on every side. The additional lights furnished by Captaln Parry's and other recent voyages render it extremely probable that a great archipelago of islands occupies all the space between the northern coast of the continent and the 80th parallel; and there is even some reason for beileving that the country known by the name of Greenland is traversed from east to west by arms of the sea, like the regions on the west aide of Baflin's Bay.

Tho new continent, when compared with the old, enjoys three important advantages. First, It is free from such vast deserts as cover a large part of the surfare of Asia and Africa, and which not only withdraw a great proportion of the soil from the use of man, but are obstacles to communication between the settled districts, and generate that excessive heat which is often hijurious to health, and always destructive to industry. Secondly, no part of its seil is so far from the ocean as the central regions of Asia and Africa. Thirdly, the interior of America is ponetrated by majestic rivers, the Mississippi, Amazon, and Plata, greatly surpassing those of tho old continent In magnitude, and atill more in the facilities they present for enabling the remotest inland diatricts to communicate with the sen.

Acrording to the geographical system atopted in the Old Worid, America ought to be considered as two distinct continents, connected ly the isthmus of Darien. Its two great divisions have ovidently more of a defined and separate character tian Africa and Asia, or than Asin and Europe; but though this arrangement may bo very properly adopted for the purpose of deacription, It is too late now to think of assigning separate names to regions which have so long been known ly a common appellation. In the physical arrange. ont of the parts of South and North Amorica there is a remnarkable resemblance. Both are very brond in the north, and grailually contrnct as they proceed southward, till they endi, the one in a narrow isthmus, and the other in a narrow promontory. Dach has a lofty chain of mountains near its western coast, ahounding in volcanoes, with a lower ridge on the opposlte side, destitute of any trace of intemal fire; and each has one great central plain doclinlug to the south and the north, and vatered by two gigantic streams, the Mlssissipli corresponding to the llata, and the St. Lawrence to the Amazon. "I their climate, vegetahle productions, and animal tribes, tho two $\mathrm{r}_{\mathrm{s}}$ ons are very disaimilar.

The extent of the Amerlcan contlnent and the fslands connected with It is as follows:

The American Conthent, therefore, with its dependent lslands, is fully feur times as iarge as Europe, ahout one third Iarger than Afrlen, and almost one half less thun Asin, if we inchule witi the latter Australin and Poiynesla. It constitates alonat three-fonths of the dry
land on the surface of the gicbe. Of the continental part of North America, a considdorable portion is condemned to perpetual sterility by the rigor of the climate, as wo shall explain more fully by-and-by. At present it is sutficient to state, that if we draw a line from the head of Cook's Inlet, in latitude $61^{\circ}$, on the west side, to the Straits of Bellisle on the east, so as to pass through Fort Churchill, on Hudson's Bay, we shall cut off a space rather exceeding one million and a half of square miles, which may be considered as incapable of cultivation. At the south extremity of America, a small tract, extending 200 miles north of the Straits of Magellan, though far within the limits of the temperate zone, is nearly in the same condition. These and the aummits of tho Andes are the only parts of the American continent which are rendered jacapathe ff cultivation by the severity of the climate.

Tho vast chain of the Andea is distinguished by aeveral pecaliar features from all other mountains in tho world. It has its principal direction nearly north and south, while all the great ridges of the old continent run from east to west; it is unparalleled in its prodigjous length, In the richness of its mineral treasures, and in the number and magnitude of its volcanoes. The Andes, if we connect with them the Mexican Cordillera and the Rocky Mountains, extend from the Straits of Magellan in a line which may be considered as unbroken, to Point lirownlow on the shores of the Aretic Ocean, in the latitude of $70^{\circ}$, over a space equal to 10,000 miies in iength, or two-fifths of the circumference of the globe. Their height, which attains its maxianum within the tropics, deellnes toward both poles, but in such a manner that, with a few exceptions, its higher summits ascend to the lino of perpetual snow from one extrenity to the other. It may thus le sald to earry the temperature of the pole over the whole length of the American continent. The chain of the Andes is common to the two parts of America, and is in fact the link which connects them nud makes them one continent. As wo propose, however, to describe North and South Amcrica separately, we shall reservo the details for another part of this articlo.

Souih America is a peninsula of a triangulnr form. Its greatest length frem north to south is 4550 miles; its grentest brendth 3200; and it covers on area, as already montiened, of $6,500,000$ aquare English miles, about tirec-fourths of which lio between the tropies, and the other fourth in the temperate zone. From the configuration of its surface, the peninsula may be divided into five distinet physical regions: 1. The low country skirting the shores of tho l'acific Ocean, from 50 to 150 miles in brcalth, and 4000 In length. Tho two extremities of tills territory are fertile, the mididle a sandy desert. 2. The basin of the Orlnoco, a country consisting of extonsive plalas or steppes, ealied Llanos, either destitute of wood or merely dotted with trees, but covered with a very high herbage during a part of the year. During the Iry scasun the heat is intense here, and the parched soil opens into long fissures, In whleh lizards and serpents iic In a atato of torjor. 3. The basin of the Amazen, a vast plain, embracing a surface of more than two millions of squaro miles, posacssing a rich soli and a humid eliminte. It is covered almost every where with tienso forests, which tiarbor innumerable tribus of wild andmals, and are tininly ininalited by narnges, who tivo In huntling mul fisiilug. 4. 'the great soutinern plain, watered by the l'lnta and the numerons streams deacending from the eastern summits of the Cordilieras. Open ateppes, which are here called P'mmpas, oceupy the greater jroportlon of this reglon, which is diry. and in some parts burren, lut ln general is covered with a atrong growth of weed and tall grass, which feeds prodigions herda of horses nudi cattle, and nffords shelter to a fow wild animals. 5. The country of Irazil, eastwarl of the l'arana and Araguay, presentling
altornate ridgea and valleys, thickly covered with wood on the side next the Atlantic, and opening into steppes or pastures in the interior.

Nine-tenths of North America lying under the temperate zone, the climate follows a different law from what is observed in the southern peninsula, and presents mors striking contrasts with that of the best known parts of tho Old World. The long narrow region now denominated Central America, whieh connecta the two great divisions of the continent, atretehing from Panama to Tehuantepec, has in general a very humid at mosphere; but, for a tropienl country, it must he only moderately hot, as every part of it is within a small distance of the sea. At Vera Paz the rains fall during nine months of the ycar. Mexico is hot, moist, and onhealthy on the low coasts ; but two-thirds of its area, comprising all the populous districts, consist of tableland, from 5000 to 9000 feet in helght. In eonsequence of this singular configuration of its surface, Mexico, though chiefly within the torrid zone, enjoys a temperate and equable climate. The mean heat at the capital, which is 7400 feet ahove the sea, is $62 \frac{1}{2}^{\circ}$, and the difference between tho warmest and coldest months, which exceeds $30^{\circ}$ at iondon, is here only about $12^{\circ}$; lot the atmosphere is deficient in moisture, and the conutry suffers from drought. Beyond the parallel of $24^{\circ}$ the western shores are hot and arid.

In the extensive region lying letween the parallels of $30^{\circ}$ and $50^{\circ}$, whieh comprehends three-fourthe of the useful soil of North Ameriea, we have three well-marked varieties of elimate, that of the cast coast, the west const, and the basin of the Mississippi. On the east coast, from Georgia to Lower Canada, the mean temperature of the year is lower than in Lurope by $9^{\circ}$ at the latitude of $40^{\circ}$, nut by $12 \frac{1}{3}^{\circ}$ at the latitude of $50^{\circ}$, according to IIumboldt's caleulation. In the next place, the range of the thermometer is much greater than in Europe, the summer being mueh hotter and the winter much colder. At Quebec the temperature of the warmest month exceeds that of the eoldest by no less than $60 \frac{1}{2}{ }^{\circ}$ of Fahrenheit; while at laris, which is nearly under the same latitude, the difference is only $31^{\circ}$. In the third place, the elimate undergoes a moro rapid change in America as we proceed from sonth to north, a degree of latitude in the middle of the temperate zone producing a decrease of annual temperature of $1.13^{\circ}$ in Europe, and of $1.57^{\circ}$ in America. The comparison is greatly to the disadvantage of Amoricn when made in this form; but when the cast eoasts of the two continents are eompared, the case is altered: the Old World is found to linve no superiority over the New, for I'ekin lins still colder winters and warmer summers than Philadelpha, wheli is under the same latlude. It is the west coast of the new con** pnt which ought to exhibit the ellmite of Europe; ...d from the few facts known, we have reason to believe that it is quite as mild and equable. At the month of Columhia River, in latitude $462^{\circ}$, Captains Lewis and Clarke found the rains to be coplots nnd frequent; bat they hat very little frost, und saw no lee even in the depthof winter. From observations made in 1822-4, it appears that the mean heat of the warmest month was about $62^{\circ}$, of the coldest about $36^{\circ}$, aud of the whole year $51^{\circ}$. Now the place is moder the same latitud? with Quehec, where the snow lies flve months, and the mean temperature chring the three winter monthas 1 s $18^{\circ}$ below the freeaing polnt. This single circuastance marks mophatically the contrast in the ellmate of the enst and west coasts of North America. Hut the mouth of Columhin River is also under the same parallel with Nantes at the mouth of the Loire, where snow and lee are no strangers in the cod season of the year. We have, therefore, good grounis to conclude that the west coast of Anterica, In the midile latitudes, has nearly as mild and equable n elimate as the west const of Enrope. The ellmate of the great central valley, or basin of the Mississipfi, has a considerable affinity
to that of the east coast. It was long a matter of dispute in what the difference between the two consists; but this seems at last to have been clearly settled, by the metearological registers kept at the nilitary posts of the United States. From a comparison of four of these registers, from posts near the centre of this great valley, with others kept on the Atlantic coast in the same latitudes, it appears that in the hottest month the temperature is from $5^{\circ}$ to $6^{\circ}$ higher, and in the coldeat month as much lower, in the hasin of the Mississipji, than on the coasta of New England. The proportion of fair weather to eloudy ia as 5 to 1 in favor of the east coast. The elimate of the interior, therefore, exhibita in atill greater excess those extremes of temperature which distinguish the castern coast of this continent from the western, and from the shores of Europe. The fourth region of extra-tropleal America includes the parts beyond Mount St. Elias on tho west eoast, and, in the interior, the plains extending from the 50th parallel to the Polar Seas. The intensity of the cold in this tract of country is searcely equaled by any thing that is known under the same parallela in Northern Asia. The northernmost spot in America where grain is raised is at Lord Selkirk's eolony, on Rel River, in latitude $50^{\circ}$. Wheat, and also maize, which requires a high summer heat, are cultivated herc. Barley would certainly grow as far north as Fort Chippewayan, in latitude $588^{\circ}$, where the heat of the four summer months was found by Captain Franklin to be $4^{\circ}$ higher than at Edinburgh. There is even reason to belicue that both this species of grain and potatoes might thrive as far north as Slave Lake, since the spruce fir attains the height of 50 feet tliree degrees farther north, at Fort Franklin, in latitude $65^{\circ}$. These, however, were low and sheltered spota; but in this dreary waste generally it will not be found practicable, we suspeet, to carry the nrts of civilized lifo beyond the 60th paraliel; and the desirable country, capable of supporting a dense population, and meriting the name of temprrate, can scarcely lie sald to extend beyond the 50th parallel. At $65^{\circ}$ the snow cavere the ground in winter to the depth of only two feet, but small lakes continue frozen for elght months. The sea is open only for a few wecks, fogs darken the surface, and the thernemeter in February descended, in one instance, to minus $58^{\circ}$, or $90^{\circ}$ Lulow the freezing point. At Melville lsland, under the 75th parallel, such is the frightful rigor of the climate, that the temperature of the year falls $1^{\circ}$ or $2^{\circ}$ below the zero of Fahrenheit's scale. It is a peculiarity in the climate of America, that beyond the parallel of $50^{\circ}$ or $52^{\circ}$, it seems to become suddenly severe at both extremities. At the one, summer disappears from the circle of the seasons; at the other, winter is armed with double terrors.

In no single cirenmstance la the superiority of America over the Old World so conspleuous as in the numLer and mapnitude of ite navigable rivers. The Amazon alone discharges a grenter quantity of water than the eight princjpal rivers of $A$ sia, the liophrates, Indus, Gangea, Oby, Lena, Amour, and the Yellow River and Kang-tse of Chinu. The Misslssipji, with its branches, affords a greater amonnt of inhand navigation than all the strenme, great and small, which irrigate Europe; and the l'lata, in this respeet, may probably clain a superiority over the collective water of Africa. But tho American rivers not only surpass those of tho Old World in length nad volume of tiuld, hut they are so placed as to penetrate overy where to the heart of the couthent. By the Amazon, a person llving at the eastern foot of the Andes, 2000 milles of direet distance from the Atlantic, may convey himself or his property to the shores of that sea in forty-fivo days, almost without effort, by conflding his bark to the giding current. If he wishes to return, he has but to spread his sails to the enstern breeze, which biows perennially against the stream. The naviga-
tion is not interrupted by a singla cataract or rapid, from the Atlantic to Jsen, in west longitude $78^{\circ}$, where tha surface of the stream ls only 1240 fect above the level of its estuary at Para. This remotest and least acceasiblo part of North America is the great interior plain extending from the Rocky Mountains to the Alleghanies and the lakes, between the parallels of $40^{\circ}$ and $50^{\circ}$; but the Mississippl, Missouri, and St. Lawrence, with their branches, are so wonderfully ramified over this region, that when it is tilled with civilized inhabitants, two centuries hence, those who dwell in ita inmost recesses, at the falls of the Missouri, for instance, $\mathbf{1 7 0 0}$ miles from the Atlantic, will have a more easy communication with the ocean than the population of the interior of Spain and IIungary. It is only necessary to cast the eyo over a map of South Americn, to see that all the most sequestered parts of the interior are visited by branches of the Plata and the Amazon. These streams, having thelr courses in general remarkably level, and seldom interrupted by cataracta, may be considered, without a figure, as a vast system of natural canals, terminating in two main trunks, which communicato with the ocean at the equator and the 35th degrea of south latitude. Since tho inventlon of steam navigation, rivers are, in the truest $6 e n s e$ of the term, Nnture's highways, especially for infant communities, where 'he people are too peor, and live too widely dispersed, to bear the expense of constructing roads. Thero is littlo risk in predicting that in two or three centuries the Mississippl, the Amazon, and the Plata will bo the ecenes of an active inland commerce, far surpassing in magnitude any thing at present known on the surface of the globe. The Mississippi is navigable for boats from the sen to the fulis of its principal branch, the Missouri, 1700 miles from the Mexican Gulf in a direct line, or 3900 by the stream; and the whole amount of boat navigation offorded by the system of rivers, of which the Mississippi is the mnin trunk, has been estimated as equal to 40,000 miles in length, spread over a surface of $1,350,000$ square miles. Perhaps this is rather beyond the truth; but let us eall the navigation 35,000 miles, and the following table will exhiblt the lengths, size of the basins, and probable extent of the novigablo waters of the grenter rivers of America:

|  | Length. | A rea of Batin. | Navignble Waters. |
| :---: | :---: | :---: | :---: |
|  | Milea. | 8q. Miles. | Mil |
| Mississippl to source of Missourl | $4{ }^{4} \mathrm{ta} 10$ | t,250,010 | 35,460 |
| 8t. Lawrence through tho lakes | 2260 | 000,000 | 4,000 |
| irinoco . . . . . . . . . . . . . . . . . | 1860 | 410,000 | 8,000 |
| Amazon, not tnetuding Araguay | 4000 | 2,100,000 | 50,000 |
| IPtata, Including Uruguay....... | 24100 | 1,200,060 | 20,000 |

The Amazon contalus many islands, is broad, and in the upper part so deep, that on one occasion Condamine found no bottons with a line 103 toisea long. At its month, two tlays before and after tho full moon, the phenomenon calied a Bore occurs in a very formidable shape. It ls a wave of water rushing from the sen, with its front as stecpe as a wall and as high as a house. No smatl vessel can encounter it without certain deatruction.

The eatuaries of all theso great Amerienn rivers open to the enstward; and thus I'rovidence seems to lave plainly indicated that the most intimate commercini relations of the inhnhitants of America should be with the western shores of the Old Worid. It should at the same time bo observed that the position of the great rivers of America ia but one example of $n$ physical arrangement which is common to the whole globe; fur it is remarkablo that, in tho Odd World as well as in the Now, no river of the first class flows to the westward. Some, as the Nile, the Lema, and the Oly, fluw to the north; others, as the Indus and the rivera of Ava, to the south; but the largegt, as the Woiga, Ganges, Great Iliver and Yellow River of China, the Euphrates, and the Amour, lave their
courses to the east or southeast. This arrangement is not accidental, but depends most probably on the incliastion of tho primary rocks, whlch, in all cases where their direction approaches to the south and north, seem to have their steepest sides to the west and the longest declivities to the east. We have examples in the Scandinavian Alps, the mountains of Britain, the Ghauta of India, tho Andea, and the Rocky Mountains.

North America, liko the Southern peninsula, naturally divides itself into five physical regions: 1. The table-land of Mexico, with a strip of low country on its eastern and western shores; 2. The plateau lying between the Rocky Mountaiaa and the Pacific Ocean, a country with $n$ mild and humid atmosphere as far north as the 55th parallel, but inhospitable and barren beyond this boundary; 3. The great central valley of the Mississippl, rich and well wooded on the east side, bara but not unfertile in the middle, dry, sandy, and almost a desert on the weat; 4. The enstern declivities of the Alleghany Mountains, a region of natural forcsts, aod of mixed but rather poor soil ; 5 . The great northern plain beyond the 50th parsilel, four-fifths of which is a bleak and bare wasts, overspread with innumerable lakes, and resemblinf, Siberia both in the physical character of its aurfaes and the rigor of its climate.

Wo should exter d this article to en unreasonable length were we to describe in detail the discoveries and settlements made by the several nations of Enrope in America. We shall therefore confine ourselves to a very hrief claronological notice of the more important events.
1495. The first place in which the Spaniards established thelr power was the Irge island of Hayti or Itispanlola, which was inhabater! by a numerous race of Indians. of a mild and gentle character, a third part of whom ore said to havo perished within two or three years after the Spaniards conquered them. - 1497. John Cabot, in the servite of Henry VII. of England, discovered Newfoundland, and coasted Blong the shores of North America to Florida.-1500. Cabral, a Portugueso, visited the coast of Brazil, and discovered the mouth of the Amazon. It was probably colenized before 1515 , as the first eargo of wood was sent from it to Portugal in that year.-1508. Vincent Pinzon is aaid to lere entered the liio de le Plata. It was in the same year that the Spaniards, finding the aboriginea too weak for the labor of the mines in Haytl, first imported negroes from Guinea, and thus lsid the foundation of a traffic which continuea to this day to disgrace the elvilization of Europe, - 1511. Diego Columbus conquered the island of Cuba with 800 soldiers, of whom he did not lose one.-1513. Halboa crossed the isthmus of Darien with 290 men , and aliscovered tho South Sen.-1519. Mernande Cortes sailed from Cuba with 11 ships and 550 men , and landed on the coast of Mexico, which had been allscovered in tho previous year. The conquest of the emplre was finished in 1521 by 050 Spaniards, assisted by a vast number of the Indians of Tiascala,-1531. l'eru invaded by Pizarro, and conquered in little more than one year, with a force of 1000 men.- $\mathbf{1 5 3 4}$. James Cartier, n Frenchman, discovers the Gulf of St. Lawrence.-1535. Mendozn, a Spaniard, with 2000 followers, founda Iluenos Ayres, and conquers all the country, as far as Potosi, at which silver mines were discovered nine years nfter: -1537. Cortes discovera Califoruia.-1511. Chiii conquered; Suntlago founded; Orellana sails down the Amazen to tho Atlantic from the sources of the Rio Napo. -1578 . Now Atbion, on the nurthwest coast of Anerica, dlscoverad by Sir Franels Drake.-156.6. The Spaniards found St. Thomas'a Island, in Guiana. 1587. Davis's Straits and Cumborland Ialands discovored by Johin Davis.-1604. Do Monta, a Frenchman, founded the first settlement in Nova Scotia, then called Acadie.-1607. After many Ineffectual attempta dur-
ing mor than twenty years, the first permanent settlement of the English in North America was made this year, on the banks of James's River, in Virginia,-1608. Quebec founded by the French, who had had a small neglected colony in Canada since 1542.-1611. Newfoumlland colonized by the English ; n Dutch colony established at Hadson's River. New York was founded in 1614.-1618. Baffin penetrates to the 78th degree of Intitude, in the bay which bears his name. -1620 . The lirst English colony establisbed in New England, at Plymouth. It was in this year that the first negroes were imported into Virginia. They wero brought by $n$ Dutch vessel.-1635. A French colony established in Guiana.-1655. Jamaica conquared by the English.1664. The Dutch colonies on IIndson's River capitulate to the English.-1666. The luccancers begin their depredations on the Spanish colonies.- $\mathbf{1 6 8 2}$. William Penn establishes a colony in Pennsylvania. La Salle takes possession of Louisiana in the name of the French king.-1698. A colony of 1200 Scots planted at Darlen, and rained in the following year, in consequence of the miserable jealousy of the English.-1733. Gcorgia colonized by the Engish.-1760. Canada, and all the other French settlementa in North Amerlea, conquered by the English.

The following table, given by Ilumboldt, exhibits the average prodace of all the gold and silver mines in the New World about 1803:

|  | Pure Gold. | Pure Sulver. | Solue of both. |
| :---: | :---: | :---: | :---: |
| Mtexico | Marke. 7, (kN) | Marks, <br> 2,305, 220 | $\begin{aligned} & \text { Dollare. } \\ & 23,(14), 0000 \end{aligned}$ |
| Peru | 3,400 | 6t1,1410 | 6,240,000 |
| Chill | 12,212 | 29,700 | 2,060,000 |
| La Plats. . . . . . . . . . . . | 2,201 | 481,830 | 4, 8560,000 |
| Cotombla (New Granada) | 90,606 |  | 2,9901000 |
| Brazil . . . . . . . . . . . . . | 29,200 |  | 4,360,000 |
| In English money. . . . . . . . . \& $^{\text {S }}, 700,000$ |  |  |  |
|  |  |  |  |

The Spanish mark, in which the quantity is expressed in the first two columns, is valued at 145.82 dollars in gold, and at $9 \cdot 4$ dollars in silver. This branch of indestry has been injured more deeply than any other during the late wars. The great exertions required to maintain the mines free of water, the amount of capital necessary to keep them woriling, and the facility with which volent hands could be lald upon their produee, all rendered these establishments extremely liable to sufifer from domeatic convulsions. Mr. Warl computes that In tho 15 years between 1810 and 1825, the annual produce of the Mexican mines did not exceet $10,000,000$ of dollars, or about teco-fifths of thelr average annual produce during the 15 years preceding, In Brazil, the washinges have prcbably experienced no interruption. Humboldt computes the whole produce of the American mines from 1492 to 1803 to be $5,706,000,000$ dollars, or $£ 1,255,000,000$, of which only $4 \frac{1}{2}$ per cent. was retained in America, and 5,445,000,000 dollars ( $£ 1,197,900,000$ ), or $95 \frac{1}{2}$ per cent, was remitted to Europe.

The project of jolning the Atlantic and l'selfic Oceans by a canal carried across the narrow part of the American coutinent, has often exeited the nttention of statesmen and commereial men. This cannl, If executed upon a scule sufficient to almit vessels of 300 or 400 tona, would have n powerfol influence upon the fate of Amerlca. For all the purposes of conmerelal intercourse it would bring the enst nud west sides of the contlnent withln one-third part of their present dlstance from one another, and would be of even more advantage to the New World than the discovery of the passage to India by the Cape has lieen to the Old. It has also been proposed to accomplish the same obsject by a boat canal, or by a rallroad, and four different routea have been recommended. A digest of the surveys and explorations comnected with these, and an estimate of their comparative merita, has been published in the Journal of the Geographical Socivty (vol.
xx. 1851), by Captnin Fitzroy, R.N. From this our materials are derived.

1. The Isthmus of Tehuantepee, at $94 \frac{1_{2}}{}{ }^{\circ}$ west longltude. The distance from sea to sea in a straight line is 140 English miles, the surface has few great inequalities, and the lowest summit level is about 700 feet above the sea. The climate is said to be rather better than nt the parts of the isthmus farther eastward, and there is $n$ settled population, though not very numerous, from whom labor might be obtained. On the ather hand, there is no port at either end of the line, tbe rivers are small, and barred at their mouths by sand-banks, and the length of the route, as well as the clevation of its summit level, would render the execution of a railroad or a canal too expensive to permit the hope of even a moderate remuncration for the ontlay. The project, however, has found warm support in the United Stntes, as it would render available by far the shortest maritime ronte to California. A survey has been made, and a cesslon of the necessary quantity of land has, wa believe, been obtained.
2. The Nicaragua route, at $11^{\circ}$ of north Intitude. Tho first portion of this is the River San Juan, which flows from the Lake of Nicaragun, and, after a course of 80 miles, falls into the Cariblvean Sea. It is of considerable depth, but is obstructed by rapids, and the port at its mouth, now called Greytown, is only capable of receiving small vessels. The lake is 90 or 100 miles long, 30 or 40 broad, and 125 feet above mean tide level at Greytown. Its depth varies from 2 fathoms to 40 , but much of it has never heen sounded, and recent surveys show shallows at both ends. From this lake to the Paelfic six different routes hare been traced, and some of them surveyed. One through the lake Managua (which is 28 feet higher than Nicarngua Lake), west ward to the Bay of lonseca, would require 90 or 100 miles of canal, and the whole length of inland navigation from Greytown wonld exceed 300 miles; another route from the same lake to Realejo is 40 miles shorter; and a third to Tamarinda a good deal shorter still, but both the latter want good ports at their termlni on the Pacific. A fourth route goes direct from the southwest side of Nicaragun Lake to San Juan del $\mathrm{S}_{\mathrm{ur}}$; it is only 10 to 12 miles in length, but reqaires a tunnel (for ships) 1 or 2 miles long, and the port at its month is very amall. A fifth rums from tho same lake a little farther east to the Iny of Snllnas, a distance of 15 miles, half of which ls by the River Sapoa, and now navlgable for boats; and the sunmit level is only 130 fect above the lake, and twice as mueh above the Pacific. It is believed there would be a suffictent supply of water from the streant, mud the canal would further have the advantage of n food port. Captaln Fitzroy seems to think this one of tho most promising lines, but it has not yet heen carcfully surveyed. Of the sixth proposed route, rmuling from the east end of the lake to the Gulf of Nicoyn, neither the precise length nor the nature of the intervening country is known. Of the whole distriet Captnin Fitzroy says, that though insufficiently explered, "enough is known to ilscourage any attempt to construct elther canal or rallway, unless the Sapon track (the fifth) should prove to he as eliglble as Dr. Oersted belleves. Even then there will be the disadvantages of so inferior a harbor as that of Greytown, and the difficulties of the river, which must he cleansed from its numerous obstructions, though renewed mununlly by floods." IIe considers the climute pestilentind, perticularly in the low grounds on both sides of the river, which holds its course anidst forests, swanips, and mud banks. Mr. Squier, however, in lis work on Nicaragua, thluks the cllmate comparatively good. In reference to $n$ canal there is n pliysical evll not to be overlooked, namely, the volcanle eruptlons which shake the soll, and might tlisturb the levels; and there is n moral one still more aerlous, arlsing from the fre-
quent insurrections and politlcal revolutions, which makes property insecure, sad may render engagements with the government niere waste paper. The latter evil applies to the whole isthmus, but more especially to this district, touching as it does the territories of three States (Nicaragua, Cesta Rica, and Mosquito) which are often at war with one another.
3. The Panama tine, at $79^{\circ}$ and $80^{\circ}$ of west longitude. The extreme narrowness of tha lathmus here called attention to it as an eligible polnt for establishing a communication between the two seas, before any other locality was thought of. Numerous explorations have been made; four routes have been pretty carefully surveyed-those of Loyd, Morel, Garella, and Hughes; and along the last of these a railway has been in operstion since liebruary, 1855. It commences on the Atlantic at Linon or Navy Bay, from which the direct distance to Panama, according to Captain Fitzroy, is (:13 geographical) $38 \frac{1}{2}$ English miles. It passes by Gorbona, and is carried 42 miles over elevations of nearly 300 feet, through a tunnel, and over large viaducts and bridges, terminating a little westward of Panama. The port of Chagres is unfit for large ships. Limon Bay, whlch is targe, and has a good depth of water, is exposed to strong north winds. A breakwater, to protect it from these, has been proposed, but is impractleable on account of the vast sum it would cosc. But Cuptain Fitzroy thinks that a large wet dock $c_{:}$basin might be excavated between Manzanilla Island and the main land, at the terminus of the railroad, and might serve as the first step toward an artiticlal harbor, to which Limon Bay would be accessory as a useful roadstend. "On the opposite coast, near Panama, is spacious snd tolerably sheltered unchorage, with access to works carricd out into the sea, may be found in the bay, but not very near the city." A ship canal here, whether at the elevation of the railroad ( 300 feet), or at the lower level proposed by Garella, of 150 feet, would require works on a gigantic seale; for his plan includes a tumel for ships, 125 feet in interior height, 97 feet wide, and nearly three miles long, with about 33 locks. Without some better security than can now be obtained, it is not probable that any private company will risk the capital necessary for the exceutlon of such works. Morel, in his survey, professes to have found a valley or tract of low ground between the Trinidad, $a$ branch of the Chagres, and the Caymito, which falls into the Pacific 10 miles west of Panama, of which low ground the summit level is ouly 40 fect ubove the sea. This, unluckily, is contradicted by other authorities; but if such a low summit hevel exist, a channel navigable by the largest ships might possibly be made from sea to sea without a lock. The portion of the ruilroad now in progress ia the gouthern half, extending from l'anama to Gorgona, and was expected to be finished in 1853. On the north side, the liver Chagres ls made use of as far as navigable.
4. The Atrato and Cupica line commences on the Atlantic side in the Gulf of Darien, at $77^{\circ}$ of west longitude. It has not been surveyed, but the nature and form of the ground are well known, and lts suitableness for a canal was polnted out by IIumboldt 40 years ago. 'Ithe route extenis from the inner part of the Gulf of Darlen up the River Atrato, thenca westward aloug lts hranch, the Naipi, and through a low tract of ground to the River Cupica, which fulls lnto the l'acille. The whole length of the pro, ,osed tine is esthmated at 14 miles. For twe-thirds of this distance, or 76 ...lles, the rivers aro sald to be navigulble by ships, for 19 miles mora by loaded boats, and it ls sup) posed that a canal might be ent through the remainIng 19 miles without any extruordinary difficulty. The proprietor of an estate on the Nuipi told Mr. Watts, the Irritish vico-consul at Carthagenn, that he was In the habit of crossing to the llay of Cuplea, and the rise between the bay and the river was gradual,-5. 13 .

A company with a large capital wss formed in England, within a few years, for the purpose of constructing a ship canal oves the Isthmus; but accordlag to the recent Report by Lieutenant Strain, of the U.S. Navy (1855), the work is almost impracticable. He represents the summit level between the oceans to bo one thousand 'rstead of one hundred and fifty feet. An Enghish expedition started from the Pacific side in December, 1853 , and returned after a few days' lnvestigation of the route before suggested, and found it unfavorsble for any canal near the proposed route. A few years will perhaps develop a more exteaded series of observations in this quarter.

Amethyst (Germ. Amethyst; Fr. Amethyste; It. A matista; Sp. Ainetisto; Last. Amethystus), a precious stone, of which there are two species differing widely In quallty and value. The Oriental amethyst is a gem of the most perfect violet color, and of extraerdinary brillisncy and beauty. It is said to be as hart as the sapphire or ruby, with which it also corresponds in ita form ant apecific gravity (see Sapphne), differing in color merely. It has been met with in India, Persia, Sium, and other comntries; but it is exceedingly scarce. That found in India is ssid by Pliny to be the best. -Principatum amethysti Indicee tenent, Nat. Hist. lib. xxxvii. cap. 9. Mr. Mawe says he had rarely seen an Oriental amethyst offered for sale, unless small and inferior in color. Mr. Hope, the author of Anastasius, had in his cabinet the tinest gem of this sort in Europe. This exquisite specimen exceeds an inch In its greatest diameter; in daylight it exhilits the most beautiful violet color, while by candlelight it is a decided blue. The Occidental amethyst is merely colored crystal or quartz. "When perfect, its color resembles that of the violet, or purple grape; but it not unirequently happens that the tiuge is confined to one part of the stone only, whlle the other is left almost colorless. When it possesses a richness, clearness, and uniformity of hue, it is considered a gem of exquisite beauty; and as it oceurs of considerable size, it is suited to all ornamental purposes. In specific gravity and harduess it beurs no comparison with the Oriental amethyst; it is also inferior in beauty and lustre; though I have often seen the common amethyst ofiered for sale as Oriental. Brazil, Siberia, and Ceylon produce very fine amethysts: they are found in rolled pieces in the alluvial soil, and tinely crystallized in fissures of rock. From the first of these localitles, they have lately tieen imported in such quantities as considerably to diminish their value; but as they are the only colored stones, except garnets, that are worn with mourning, they still retaln, when perfect, a distinguished rank among the precious genis. The present price of inferlor light-colored stoncs, in the rough state, is abont 20s. per pound, while those of good quality sell at $10 s$. or $12 s$, per onnce. Amethysts calculated for brooches or seals may be purcuased at from loss. to twe or three guineas each, for which, ten years ago, treble that sum would lave been given."-Mawli on Diamonds, 2d. ed.

Amianthus, Asbestos, or Mountain Flax, a mineral of which there are several varleties, all more or less flbrous, flexile, and elastic. It is Inconsumable by a high degree of heat; and lin antlquity the art was discovered of Urawing the filbres inte threads, and then weaving them luto cloth. Pliny suys that he had seen napkins made of this substance, which, when solled, were thrown into the tire, and that they wero better cleaned by this means than they could have been by washlng! IIence it obtained from the Greeks tho name of Autavros (undettled). Its princlpal use, as stated hy Pliny, was to wrap the bodies of the dead prevlously to their belng exposed on the funeral plle, that the ashes of the corpse might not be mixed with those of the woul. And lin corroboration of this statement wo may mention, that la 1702, a skull, some calelned bones, and a qumntly of ashes, were fuund at Rome, in a cloth of amlantlus nine Roman palme in
length hy seven in width. Its employment In this way was, however, confined to a few of the very richest famllies, incombustlule cloth belag very scarce, and bringing an enormously high price. Rurum inventu, difficile textu propter brevitntem. Cùm inventum est, aquat pretia excellentium margaritarum.-l'Lis., Ilist, Nat. lib. xix. cap. 1. The disuse of the practlo of cremation, or of burnlng the dead, caused the manufacture of amianthine cloth to be neglected. Several moderns have, howevor, succeeded in making it; but if it be not lost, the art is now rarely practiced,-For further partlenlars, see Rees's Cyclopedia.

Ammoniac, Bal. See Alkilies.
Ammoniacum (1r. Gomme Ammoniaque; It. Gomma dmmoniaco; Sp. Goma Ammoniaco; Lat. Ammoniacum; Arab. Feshook), п concrete resinons juice obtained from a plant resembling fennel, found in the north of Africa, Araluia, Persia, the East Indies, ete. Pliny asys that it derlved ite name from its being produced In the vicinity of the temple of Jupiter Ammon, in Africa.-Hist. Nat. lib, xii. cap. 23. It has a faint but not ungrateful smell; and a bitter, nauscous, aweet taste. The fragments are yellow on the outside and white within, brittle, and break with $u$ vitreous fractnro; their sper ${ }^{9}{ }^{\circ} \mathrm{g}$ gravity is $1 \cdot 207$. The best ammoniacum is bi ant from Persia by Bombay and Calcutta, packed in cases and chests. It is in large masses, composed of amall round fragments or tears; or in separate itry tears, which is generally considered a sign of its goodness. The tears should be white internally and externally, and free from seeds or other foreign substances. Reject that which is soft, dark-colored, and foul. It is used principally in the materia medien, and the quantity imported is but small.-liees's Cyciopedia; 'Tuonson's Dispensatory.

Ammunition, a general name for all warlike provisions, but more particularly powder, ball, ete.-E. 13.

Amoy, $n$ commercial city and sea-port of China, province of Fo-kien, on an island of the same name in a bay of the China Sea, opposite Formosa, ant 320 miles E.N.E. of Canton, Lat. $24^{\circ} 10^{\circ}$ N. ; long. $118^{\circ} 13^{\prime}$ E. Population, 250,000 . The city is separated from the suburba or outer town by a line of rocky hills, comsmanded by a citadel on a height, and fortified with numerous works constracted daring the late war. The town is not handsome nor clean, but hus many roomy public buildings, well-sapplied shops, and good private houses. Harbor excellent ; ships can lle close to the quays, or in a deep and sheltered creek. There is a considerable trade, especially with Formosa; manufactures of porcelain, grass cloths, umbrellas, paper, cte., which, with sugar-eandy and Congon ten, compose its principal exports. I mporta comprise rice, sugar, camphor, and European produce. Amoy, then the great military depot of the province, was taken on the 26th August, 184t, by the English, who held the fortlfied jsiand of Kolungao, commanding the entrance to the harbor, untll the final payment of tho eum of six million dollars exacted from the Chinese govermment by the treaty of Nankin.

Amplitude, in Astronomy, an arch of the horizon Intercepted between the east or west point and the centre of the san or a planet at its rising or setting; and which therefore is said to be either north and south, or ortire and occasire.

Bagnetical Amplitude, the different rising or setting of the sin from the east or west pointa of the compass. It is found by observi..g the sun, at his rising and setting, by an amplitude compass.-li.If.

Amstardam, the principal city of Holland, situated on .. Y, an arm of the Zuyder Zee, in lat. $52^{\circ}$ $22^{\prime} 17^{\prime \prime}$ N., long. $4^{\circ} 53^{\prime} 15^{\prime \prime}$ E. From 1680 to 1750 , Amsterdam was, perhups, the first commerclal city of Europe; and though her trade hus experienced a great falling off since the last-mentloned epoch, it is still very considerable. In 1785 the population is said to have amounted to 235,000 ; $\ln 1815$ it had deellined to

180,179; but its increase in the interval has been such, that it amomsted in 1840 to 210,077 . The harbor is spacious and the water deep; and It has recently been much improved by the construction of docks, two of which aro already completed, and a third in a very advanced state. Owing, however, to a bank (the Prampus) where the $Y$ joins the Zuyder Zee, large vessels going or coming by that sen are obllged to load and unload a part of their cargoes in the roads. The navigation of the Zuyder Zeo is also, by reason of its numerous shallows, very intricate and diffieult; and as there were no hopes of remelying this defect, it became necessary to resort to other means for improving the access to tha port. Of the various plans suggested for this purpose, the preference was given to the scheme for cufting a conal capable of admitting the largest class of merchantmen, from the north side of the port of Amsterdam to Newdlep, opposite to the Texel, and a little to the east of the Helter. This canal has fully answered the views of the projectors, and has provod of sigual scrive to Ansterilam, ly enahling large ships to avoid the Pampus, as well as the difficult navigation of the Zuyder Zee, where they were frequently detained for three weeks, and to get to and from Newdiep wlthout any sort of risk in less than twenty-four hours. The canal was begun in 1819, and completed in 1825. It has fivo sluices large enough to admit ships of the line; the dues and charges on account of towing, otc., being at the same timo very moderate. At Newdiep the water is deeper than in any other port on the coast of Ilolland, and ships are there in the most favoralle position for getting expeditiously to sea.-See Canals. The importa principally consist of sugar, coffee, spices, tobacco, cotton, tea, indigo, cochineal, wine and brandy, wool, grain of all surts, timber, piteh and tar, hemp and fiax, iron, hides, linen, cotton and woulen stutfs, hardware, rock salt, tin plates, coal, dried lish, ctc. The exports consist partly of the produce of Ilolland, partly and principally of the produce of her possessions in the East and West Indies, antl other tropical commtries, and partly of commolities brought to Amsterdam, as to a convenient entiepôt from different parts of Enrope. Of the first class are eheese and butter (very important articles), madder, clover, rape, liemp, and linseeds, rape and linseed oils, I uteh linen, ete. Geneva Is princijally exported from Schiedam and Rotterdan; onk bark and cattle principally from the latter. Of the secont elass are spices, cotlie, and sugar, prinelpally from Jeva, bat partly also from Surinam, Brazil, and Cuba; indigo, cochlneal, cotton, ten, tobacco, and all sorts of Eastern and colonial prodnctr. And of the third class, all kinds of graln, linens from Germany; timber, and all sorts of Baltic produce; Spaulsh, German, and Finglish wools; French, Rhenish, and IIungarian whes, brandy, etc. The trade of Amsterdam may, Indeed, to sald to comprise every article that enters into the commerce of Europe. Iler merchants were formerly the most extensive dealers in hills of exchange, and though Lonton bo now, in this respect, far superior to Anisterdam, the latter still enjoys a respectable share of thla business.

The llank of the Netherlands was established at Amsterdam in 1814. It is not, like the old llank of Amsterdam, which ceused in 1796, merely a bank of deposits, but a bank of deposit and circulation formet on the model of the Bank of England. Its capital, whict ariginally amounted to $5,000,000$ thorins, was doubled In 1819. It las the exclusive priciloge of issuing notes. Its original charter, which was limited to twenty-five years, was prolonged in 1838 for twen$t y$-five years more. Ahont 300 or 350 large ships belong to Amsterdam; they are employed In the East and West Indin trades, nall fin trading to the baltle, tho Mediterrmean, etc. There is eomparatively little consting trade at Ansterdam, the communlention with most other ports in the vielnlty belng principally kept up by canals, and that with Friesland ly regnlar
packets. The total imports into Holland in 1851 were estimated at $303,093,224$ florins, and the exports at $242,744,806$. The United Kingdom, the German Customs Union, Jelgium, Java, France, and Russia, are the countries with whieh ghe carries on the most extensive trade.

Dutch Commercial Policy.-The poliey of Holland, civil, religious, and commercial, has long been of tho most liberal and enlightened description (see post) ; and she was the first country to follow the example set in repeallng the Navigation Laws in 1840. The Dutch law on this subject was paased in 1850. Previously to that period diseriminating duties were imposed on most articles imported on foreign bottoms, and also on those inported by forelgners into Java and her other colonies. But these preferences no longer exist. The following is an extract from the law relative to theso matters: Differential duties are abollshed on the vesaels of those Statea whlch " $a$. I lace tles Dutch flag on the same footing with their natlonal flag trading to and from their own ports (eoasting trade and fisheries excepted); $b$. Which place the Duteliflag on the same footing with their national flag trading to and from their colonles, if they possess any ; and, c. Whieh do not levy other differential duties to the disadvantage of the produce of the Netherland colonies, or to the prejudice of produce imported from other parts of the world, from Netherland ports, than those which are levied in favor of the produce of their own colonies, when Imported direct."

The fisherles and the coasting trade of Holland and of her colonies is reserved to Dutch ships. BL. it is no longer necessary that the latter should be of Dutch build. Foreign built shlps have, however, to pay, on being registered, an ad valorem duty of 4 per cent. over and above the fee charged on the registration of Dutchbuilt ships. Soveral important reductions were at the same time made in the tariff of import duties. The nuvigation dues or tolls that were formerly charged on vessels or goods passlug through Holland by the Rhine and the Yssel, and transit duties of all kinds, have also beer repealed. And thouglt it may be said, and truly, that these wise and liberal measures will be mueh more advantageous to the Duteh than to any other people, still they are of the greatest importance to all commercial nations, ant especiully to those who have an extensive intercourse with them. We are glad to liave to state that this Ilberal poliey has in Holland, as in England, had its appropriate reward. Commerce has been largely extended. The mercantile marine is in a hlighly prospereus state, and is dally receiving large milditions. Many Dutch ships have latterly been chartered ly English neerchants.

The importations into the United States from IIolland, in the yeer 1852-3, were, freo of duty, \$il5,227; dutiable, $\$ 1,509,043$; total, $\$ 1,625,170$; in American vessels, $\$ 162,641$; foreign, $\$ 1,162,529$. Total value of imports for the same year from the Dutch East Indies, $\$ 38 \cdot 1,583$; Duteh West Indies, $\$ 109,185$.

The exports of domestic produce for the same year wero, in American vessels, 8872,780 ; in foreign vessels, $\$ 1,110,913 ;$ total, $\$ 1,983,723$. To the Dutel Eatat Indies, $\$ 202,822$; to the Dutch West Indles, $\$ 251,258$.
Comparative Table of Exiogts of Domestic lioonuek to
llolidind, fon the figcal Yeare eninno June 30, 1 Sb3,
185 H . 185.

| Yenrs. | Exporta. |  |  | Imports. |

|  | Ametican Vomelo. | Foraign Vemaela | Total. |  |
| 1853 | 402.04 t | 1,162.620 | 1,625,170 | 1,083,723 |
| 1554 | 1,400,105 | $8(10,615$ | 2, 24040,710 | 1,685,971 |

In 1852 Great Iritaln imported from II olland 221,550 quarters of wheat, oats, and other grain, but she frequently supplles more considerable quantities. She nlso sends large quantities of butter and cheese ( 226,671 ent. of the former, and 266,857 ditto of the latter in 1850), with, in 1851, 56, i6i head of enttle and 160,365
sheep; her other exports are bark for tanniag, flax and hemp, clover-seed, madder, geneva, nutmegs, etc. England also takes considerable quantitiea of Dutch sugar and coffee. The greater portion, however, of the trada between the United Kingdom and Holland is carried on with Rotterdan, which is much more conveniently situnted for such intereourse than Amsterdam. But the latter continues to engross by far the larger share of the commeree with the flourishing colony of Java and the other Dutch possessiens in the East; and is, consequently, tho principal continental mart for Eastern produce.
The warehousing system has been long established ::: Amsterdam; and all goods, whether for home consumption or transit, may be deposited in bondod warelouses. Speaking gencraily, goods can only be kept in bonded warehouses for two years; but grain of all kinds may be kept for an unlimited period. The warehouse rent chargentlo per month on a quarter of wheat is, on an upper loft, 1d. and 2-5ths; on an under loft $1 \frac{1}{2} d$. On a ton (Engl.) of augar in casks the charge is $8 d$. ; in bags, $6 d$.
The dock and its adjacent warehouses, belonging to the Entrepót General, or establishment for warehousing goods imported by sea, or intended to be re-experted by sea or by the Rhine, are largo and commodious. The doek has water to float the largest ships, and the dues rnd other charges are excecdingly moderate. Merchents may employ their own men or those of the dock in loaling or unloading; and may either place their property in separate vaults or floors of which they keep the key, or intrust it to the care of the dock officers.
Dutch Trading Company,-A large proportion of the forelgn trade of Molland was for a considerable period engrossed by the largo trading company enlled the Nederlandsche Handelmaatschappy, created in 1824. Its eapital, which consisted originully of 37 million florins, was reduced in 1824 to 24 million florins; but as the company borrowed 10 million florins in 1835, and 13 millions more in 1837, its capital consists of 47 million florins. At first it extended its operntion to America and the West Indies, as well as to the East Indies. But it has latterly very much contracted the seale of its operations; and having lent 40 millions of its capital to government, it is now merely the ngent employed by the latter to bring home and sell that part of tho produce of Java which, under the new colonial system, belongs to the State, and to carry on the trade with Japan, which, however, is of little or no value. The company has no ships of its own, bnt charters those of private individuals. Its charges on importation nre limited to certain fixed rates. The business of insurnnco is extensivnly practiced at Amsterdam; the premiums are moderate, and the security mexcoptionable. The high duty formerly imposed in other countries on policies of insurance contributed to the inerease of this business in Holland.
Credit, Discount, etc.- Holland Is, and has nlways been, a country of short eredits. A discount is usually given for prompt payment, nt the rate of 1 per cent. for six weeks, and 2 per cent. for two months; but the terms of credit on most articles and the discount allowed for ready money, have heen tixed by usage, and are regarled as essential condltions in every bargnin. In consequence of the preference given in Holland to rendy money transaetions, It is not a country in whieh adventurers without capital have muel chance of speedily making a fortune. " Rien, en effet, de plus faeile que de s'établir à Ansterdam; mals rien de plus difficile de s'y sontenir sans des grandes resources. Dans cette ville, oú l'argent abonde, où on lo prête contre des sûrétes à si hon marché, il est pourtant impossible de s'en procurer à credit; et sans argent It n'y a plus de possibillté d'y travailler, que te trouver quelgu'un qui veulle de se charger d'un papier nonveau qui ne seroit pas appryý d'un erélit que l'opluion, la protection, ou des cllets réels ferolent valoir à la bourse. Les Hollandois suivent lá-dessus des maximes très austères,
méme à l'égard des maisona d'une certain considéra-tion."-Encyclopedie Methodique, Commerce, t. ii. p. 650. But this austerity is not a disadvantage, but the reverae. It preventa commeres from degene: ating, as it has too often done in other places, into gambling adventures, and places it on a comparatively solid foundation. And it should be mentioned to the honor of the Dutch, and as a proof of the excellence of this system, that not withstanding the distress and loss of trade oceasioned by the invasion and occupation of their country by the French, the bankruptcies in 1795 and subsequent years were not, compuratively, so numerous as in England in ordinary scasons! The regulations in the Code Napoléon as to bankruptey are enforced in Holland.

It has long bcen the practice in IIolland to make, on selling articles, considerable deductions from their weight, particularly from 'hoae of largo bulk, as compared with their value. These tares and drafts, as they are termed, are now fixed by ancient usage.

Nagnitude of the Commerce of Iholhund in the Seventeenth Century.-Causes of its I'rosperity and Decline.We belleve we need make no apology for embracing this opportunity to lay before our readers the following details with respect to the commerce and commercial policy of Holland. It forms one of the most insstructive topics of investigation; and it is to be regretted that so little attention should have been paid to it in this country. Previously to the commencement of the long-continued and glorious struggle made by the Dutch to emancipate themselves from the blind and urutal despotism of Old Spain, they had a considerable marine, and had uttuined to distinction by their fisheries and commerce; and the war, instead of being injurious to the trade of the republic, contributed powerfully to its extension. After the capture of Antwerp by the Spaniards, in $\mathbf{1 5 8 5}$, the extensive commerce of which it had been the centre was removed to the ports of IIolland, and principally to Amsterdam, which then attained to the distinction she long enjoyed, of the first commercial city of Europe.

In 1602 the Dutch East India Company was formed; and, notwithstanding the pernicious influence of that association, the Indian trado increased rapidly in magnitude and importance. Ships fitted either for commercial or warlike purposes, and having a considerable number of soldiers on board, were sent out within a few years of the establishment of the company. Amboyna and the Moluccas were first wrested from the Portuguese, and with them the Duteh obtained the monopoly of the spice trade. Factories and fortlications were in no long time established, from liussorah, near the mouth of the Tigris, in the Perslan Gulf, along the coasts and islands of lidia as far as Japan. Alliances were formed with several of the Indian princes; and in many parts, particularly on tho coasts of Ceylon, and in various districts of Malabar und Coromandel, they were themselves the sovereigus. Batavia, in the largo and fertile island of Jave, the greater part of which had been conquered by the Duteh, formed the centro of their Indinn commerce; and though unhealthy, its port was excellent, and it was admirably situated for commanding the trade of the Eastern Archipelago. In 1051 they planted a colony at the Cape of Good llope, which had been strangely neglected by the l'ortuguese.

Every branch of commeree was vigorously prose. cuted by the Juteh. Their trade witis the llaltic was, however, by far the most extensive nud lucrative of which they were in possession. Guicciardini mentions that the trade with P'oland, Demiark, Prussia, ete., even lefore their revolt, was so very great, that theets of 300 ships arrived twice a year at Amsterdam from Dautzle and Livonla only; but it increased prodigiously during the latter part of the sixteenth and the beglaning of the aeventeenth centurics. The great population of Holland, and the limited extent and un-
fruitful nature of the soll, render the inhabitants dependent on foreigners for the greater part of their supplies of corn. The countries round the Baltic have always furnished them with the priacipal jart of those supplies; and it is from them that they have licen in the hablit of bringing timber, Iron, hemp and tax, piteh and tar, tallow, ashes, and other bulky artictes required in the bnilding of their houses and ships, and In various inanufactures. Nothing, however, redounds so much to the credit of the Dutch as the policy they have invariably followed with respect to the trade in corn. They have at all timea had a large capital embarked in t'is business. The variations which are perpetually occurring in the harvests early led them to engage very extensively in a sort of speculative corn trade. When the cropa happened to be unusually productive, and prices low, they bought aad stored up large quantities of grain, in the expectation of profiting by the advance that was sure tu take place on the occurrence of an unfavorable year. Repeated efforts were matle, in periods when prices were rising, to prevail on the government to prohibit exportation; but they steadily refused to interfere. In consequence of this enlightened policy, IIolland has long been the most important Europeari entrepot for corn; and her markets have on all occasiona been furnished with tho most abundant supplies. Thoas searcities which are so very disastrous in countries without commerce, or where tho trade in corn is suljected to fetters and restraints, have not only heen totally unknown in IIolland, but became a copious souree of wealth to her merchants, who then obtained a ready and advantsgeous vent for the supplies accumulated in their warehouses. "Ansterdam," says Sir Walter Raleigh, "is never vithout 700,000 quarters of corn, none of it of the growth of llolland; and a dearth of only one year in any other part of Europe enriches 11 olland for seven years. In the courso of $n$ year and a half, during a scarcity in England, there were carried away from the ports of Southampton, Bristol, and Exeter alone nearly $£ 200,000$; and if London and the rest of England be included, there must have been $£ 2,000,000$ more."Observations touching Trade and Commerce with the IIollander. Miscel. Works, vol. ii. The very well informed author of the Richesse de la Holdumele, published in 1778, observes, in allusion to these circumstances, "Que la disette de grains regne dans les quatre partles du monde; vous trouverez du froment, the seigle, et d'autres grains à Amsterdam; ils n'y manquent jamais."

The lank of Amsterdain was founded in 1609, The principal object of this establishment was to obviate the inconvenience and uncertainty arising from the circulation of the coins imported into Amsterdam from all parts of the world. The merchants who carried coin or ballion to the bank obtained credit for an equal value in its hooks: this was called bank-money; and all cousiderable payments were effected ly writing it off from the account of one individual to that of another. The establishment continued to flourish till the invasion of the French in 1795 . Between the years 1651 and 1672 , when the territories of the republic wero invaded by the lirench, the commerce of IIolland scems to have reached its greatest height. De Witt estimates its increase from the treaty with Spain, concluded at Munster in 1043 , to 1669 , at fully a half. He adds, that during the war with IIolland, Spain Jost the greater part of her nayal power; that since the peace, the Dutch had obtained most of the trade to that country, which hat been previously earried on ly the Hanseatic merchants and the Engllali; that almost all the conating trade of Spain was carried on by Dutch shipping; that Spain had even been fored to hiro Dutch ships to sail to her American possessions; and that so great was the exportation of goods from llolland to Spain, that all the merehandise brought from the Spanish West Indies was not suflicient to make returis for them.

At this period, indeed, the Dutch engrossed, not by means of any artificial monopoly, but by the greater number of their ships, and their superior skill and economy in all that regarded navigation, almost the whole carrying trade of Europe. The value of the goorls exported from France in Dutch bottoms, toward the middle of the fourteenth century, exceeded $40,000,000$ livres; and the commerce of Ei.gland with the Low Countries was, for a very loag period, almost entirely carried on in them.

The business of marine insurance was largely and successfuliy prosecuted at Ansterdsm; and the ordinances published in 1551, 1563 , and 1570 , contsin the most judicious reguistions for the settlement of auch disputes as might ariso in conducting this difficult but highly usefui business. It is singular, however, notwithstanding the sagacity of the Duteh, and their desire to strengtien industrious inabits, that they should have prohibited insurance upon lives. It was reserved for England to show the advantages that might be derived from this beautiful application of the science of probabilities.

In 1690, Sir William Petty estimated the shipping of Eurepe at about $2,000,000$ tons, which he supposed to be distributed as followa: viz., England, 500,000; France, 100,000 ; Hamburg, Denmark, Sweden, and Dantzic, 250,000; Spain, Portugal, and Italy, 250,000; that of the Seven Linited Provinces amounting, according to him, to 900,000 tons, or to nearly one half of the whole tonnage of Europe! No great dependance can, of course, be placed upen these estimates; but the probability is, that, hal they been more accurate, the preponderance in favor of Holland would have been greater than it appears to be; for the official returns to tite circulars addressed in 1701 by the commissieners of customs to the officers at the different ports show that the whole mereantile navy of England amounted at that period to only 261,222 tons, carrying 27,196 men.-Macinenson's Annals of Commerce, anno 1701. It may, therefore, be fairly concluded that during the seventeenth century the forcign cemmerce and navigation of Holland was greater than that of all Europe Lesides; and yet the country which was the seat of this vast commerce had no native produce to export, nor even a plece of timber fit for ship-building. Alt had been the fruit of industry, economy, and a fortunate combination of circurstances. Holland owed this vast commerce to a varicty of causes : partly to her peculiar situation, the industry and economy of her inhabitants, the comparstively iiberal snd eniightened system of civil as well as of commercisl pelicy adopted by the republic; and partly also to tio wars and disturbsuces that prevailed in most Eurepean countries in the sixteenth and seventeenth centuries, and prevented them from emulating the successful carcer of the Dutch.

The ascendency of Heliand as a commercial state began to decine from about tie commencement of last century. After the war terminated by the tresty of Aix-la-Chapelie, the attention of tho government of Holland was forcibly attracted to the state of the shipping and foreign conmerce of the republic. The tliscovery of means by which their decline might be arrested, and the trade of the republic, if possible, restored to its ancient flourishing condition, became a prominent object in the speculations of every one who felt interested in the public welfare. In ordier to procure the most correct information on the subject, the stadthoider, William IV., add:essed the following queries to all the most extensive and inteliigent merchants, desiring them to favor him with their answers: " 1 . What is the actual state of trade? And if the same should be found to bo diminished and fallen to decsy, then, 2. To inquire by what methods the same may be supported and advanced, or, if possible, restored to its former luctre, repute, and dignity." In discussing these questions, the merchants were obliged to enter
into an examination, as weil of the causes which had raised the commerce of Hollisnd to the higin piteh of prosperity to which it had once attained, as of thoso which had occasioned its subsequent decine. It is stated that, though not of the same opinion upon all points, they, speaking generally, concurred as to those that were most important. When their answers had been obtained and compared with each other, the stadtholder had a dissertation prepared from them, and other authentic sources, on the commerce of the republic, to which proposals were subjoined for Its amendment. Some of the principles advanced in this dissertation npply to the case of Ilollend only; but most of then are of universal application, and are not more comprehensive than sound. We duubt, indeed, whether the benelits resulting from religious toleration, political liberty, the security of property, and the freetom of industry, have ever been more clearly set forth than in this dissertation. It begins by an enumeration of the causes which contributed to advance the commerce of the republic to its former unexampled prosperity : these the authors divide into thrce elasses, embracing under the first those that were natural and physical; under the second, those they denominated meral ; and under the third, those which they considered adventitious and external.

The central situation of the country, its command of some of the principal iniets to the Continent, and the necessity under which the inhabitants have been placed, in consequence of the barrenness of the soil and its liability to bo overfiowed, to exert all their industry and enterprise, are circuinstances that seem to be in a great degree peculiar in Ilolland. But though there can be no doubt that their Influence has been very considerable, no one will pretend to say that it is to be compared for a moment with the intluence of those free institutions which, fortunately, are not the exclusive attributes of any particular comntry, but have flourished in Phcenicia, Grcece, England, and America, us well as in Holland.

Many dissertations have been written to account for the decine of the commerce of Holland. But, if we mistake not, its leading causes may be classed under two prominent heads; viz., first, the natural growth of commerce and navigation in other countries; and, second, the weight of taxation at home. During the period when the republie rose to great eminence as a commercial State, England, France, and Spain, distracted by civil und religious dissensions, or engrossed wholly by schemes of foreign conquest, were unable to apply their energies to the cultivation of commerce, or to withstand the competition of so industrious a p-uple as the Dutch. They, therefore, were under the necessity of allowing the greater part of their foreign, and even of their consting trade, to be carried on in Dutch bottoms, and under the superiatendence of Dutch factors. But after the accession of Louis XIV. and the ascendency of Cromwell had put an end to internal commetions in France and Englanct, the energies of these two great nations began to be directed to pursuits of which the Dutch had hitherto enjoyed almost a monopoly. It was not te be supposed that when tranquility and a reguiar system of government had been established in France nad England, their active and enterprising inhabitants would submit to see one of their most valuable branches of industry in the hands of the foreigners. The Dutch ceased to be tho carriers of Europe, withont any fault of their own. Their performance of that function necessarily terminated as soon as other nations lecame possessed of a mercantile marine, and were able to do for themselves what had previously been done for them by their neighbors.

Whatever, therefore, might have been the condition of Holland in other respects, the natural advence of rival nations must inevitably have stripped her of a large pertion of the commerce sho once possessed. But
the pregress of decline seems to have been conslderably accelerated, or rather, perhsps, the efforts to arrest it were rendered ineffectual, by the extremely heavy taxatlon to which she was subjected, occasioned ly the mavoldahle expenses incurred in the revolutionary strugglo with Spain, and the subsequent wars with France and Enghad. The necessities of the State led to the finposition of taxes on corn, on flour when it was ground at the mill, and on bread when it came from the oven; on butter, and fish, and fruit; on $\ln$ come and legacies; the snle of housea; and, in short, nlmost every articlo of either necessity or convenlence. Sir Willian iemple nentions that in his time-and taxes were greatly increased afterward-one tlsh sauce was in common use, which directly prid no fewer than thirty different duties of excise; nnd it was a common saying at Amsterdant, that every dish of tish bronght to table was paid for once to tho fiblermen, and six times to the State.

The pernicious Intluence of this heavy taxation has been ahly set forth by the author of the Richesse de la Hollande, nul other well-informed wrlters; nnd it has also been very forcibly pointed out in the Dissertation already referred to, drawn up from the communications of the Duteh merchants. "Oppressive taxes," it is there stated, "must be placed at the head of all the causes that have co-operated to the prejudice and discouragement of trade; and it may le justly sald, that it can only be nttributed to them that the trade of this country lias been diverted out of its channel, and transferred to our neighbors, and must dnily be still more and more alienated and shut out from us, unless the progress thoreof be stopped by some quick and effectual remedy; nor is It ditlicult to see, from these contemplations on the state of our trade, that the same will be effected hy no other meand than a diminution of all duties. In former times this was reckoned the ouly trading state in Europe; and foreigners wera content to pay the taxes, as well on the goods they brought hither as on those they came here to buy, without examining whether they could evude or save them, by fetching the goods from the places whero they were produced, and carrying others to the places where they were consumed: in short, they paid us our taxes with pleasure, without any further inquiry. Nut, since the last century, the system of trade is altered ull over Europe: foreign nations, seeing the wonderful effect of our trade, aud to what an eminence we had risen only by means thercof, they did likewise apply themselves to It ; and, to save our duties, sent their superfluous products beside our country, to the places where they are most consumed ; and in return for the same, furnished themselves from the first hands with what they wanted." But, notwithstanding thls authoritative exposition of the pernicious effects resulting from the excess of taxation, the necessary expenses of the State were ofogreat ns to render it impossible to make any sufficient reductions. And, with the exceptlon of the transit trade carried on through the Khine and the Meuse, which is in a great measure independent of foreign competition. and the American trade, most of the other branches of the foreign trale of llolland, though still very considerable, continue in a comparatively depressed state.

In consequence prineipally of the oppressiveness of taxation, hat partly, too, of the excessive accumulation of capital that hal taken placo while the Duteh engrossed the carrying trade of Europe, proits ln Holland wero reduced toward the middle of the soventeenth century, and havo ever since coutinued extremely low. This clrcumstance would of itself have sapped the foundations of her commercial greatness. Iler capitalists, who could hardly expeet to clear more than two or three per cent. of net profit by any zort of nndertaking earried on at home, were tempted to vest their eapital in other countrles, and to speeulato in loans to foreign goveruments. There are the best rea-
sons for thinklng that the Duteh were, untll very lately, the largest creditors of any natlon In Europe. It Is impossible, indeed, to form any accurate estlinate of what the sums owing them by foreigners previously to the lece French war, or at present, may amount to; but thera can be no doubt that at tho former period the nmount was immense, and that lt is still very considerable. M. Demeunler (Lictionnaire de l'Economis Politique, tom. ill. p. 720) statea the amount of capital lent by the Dutch to foreign governments, exclusive of the large sums lent to France during the Amerlean war, at seventy-ihree milllons sterling. According to the author of the Richesse de ln Hollands (il. p. 292), the sums lent to France and England only, previousiy to 1778 , amounted to $1,500,000$ livres tournols, or slxty millons sterling. And besides these, vast sums were lent to private Individuals in foreign countrles, both regularly as loans at interest and in the shape of gooda advanced at long eredits. So great was the liffeulty of finding an advantageous investment for money in Hollnnd, that SIr WIlliam Temple mentione that the payment of any part of the national debt was looked upon by the credltors as an evil of the first mngnitude. "They receive it," says lie, " with tears, not knowing how to dispose of it at Interest with anch safety and ease."

Among the subordinate causes which contributed to the deeline of Dutel commerce, or whleh have, at ali events, prevented lis growth, we may reckon the circunistance of the commerco with India having been suljected to the trammels of monopoly. De Witt expresses hls firm conviction that the abolition of the East India Company would have added very greatly to the trade with the Fast ; and no doubt can noveremain in the mind of any one that such would have heen the case. The interferesce of the adnulnistration In regulating the mode in which some of the most important branches of industry should be carried on, seems also to have been exceadingly injurious. Every procceding with respect to the herring fishery, for example, was regulated by the orders of government, earried into effect under the inspection of officers appointed for that purpose. Some of these regulations were exceedingly vexatious. The perlod when the fishery might begin was fixed at fivo minutes past twelve o'clock of the night of the 2fth of June! and the master and pilot of every vessel leaving Holland for the fishery wero olliged to mako oath that they would respect the regulation. The species of asit to be made use of in curing different sorts of herrings was also fixed by law; and there were endless regulatlons with respeet to the size of the harrels, the number and thickness of the staves of which they were to be made; the gutting and packing of the herrings ; the branding of the barrels, etc., etc.-Histoire des Pêches, etc., dans les Mers du Nord, tom. i. chap. 24. These regulationa were intended to secure to the Ilollanders that superiority which they liad early attained in the fishery, a, 1 to prevent the reputation of their herrings from helng Injured by the bad falth of indivlduals. J3ut their real effect was precisely the reverse of this. By tylng up the fishers to a system of routlne, they prevented them from making any improvements; while the faeility of connterfelting the public marks opened n much wider door to fraud than wnuld have heen opencd had government wlsely declined interfering in the matter.

In desplte, however, of the East Indla monopoly, and the regulations now deseribed, the commercial polley of liolland has been more liheral than that of nny other nation. And in consequence, a country not mure extensive than Wales, and naturally not more. fertile, conqucred, Indeed, in a great measure from the sea, has aceumulated a population of upward of two millions; has maintalned wars of unexampled duratlon with the most powerful monarchles; and, besides laying out inmense sums in works of utility and orna-
ment at home, has been enabled to lend hundreds of millions to forelgnera.

During the oceupation of Holland by the French, firat as a dependent State, and subsequently as an integral part of the French empire, her foreign trade was almost entirely destroyed. Her colonies ware snecessively conquered by Engiant; and, in addition to the loss of her trade, she was burdened with fresh taxes. But such was the vaat accumulated wealth of the Dutch, their prudence, and energy, that the influence of these adverse circumstances was far less injurions than couid have been imagined; and, notwithatanding ali the lossea ahe had sustaired, and the long interruptlon of her commercial pursuits, Holland contlnued, at her emancipation from the yoke of the French in 181.4, to be the richest country in Europe! Java, the Moluccas, and most of her other colonies were then restored, and she is now in the enjoyment of a large foreign trade. Her connection with Belghum was an unfortumate one for both countrics. The anion was not agreeabie to either party, and was injarious to Holiand. Belgium was an agricultaral and manufacturing country; and was inclined, in imitation of the French, to lay restrictions on the importation of most aorts of raw and manufactured produce. A policy of this sort was clirectly opposed to the interests and the ancient practice of the Dutch. Bat thongh their deputies prevented the restrictive system from being carried to the extent proposed by the Belgians, they were onable to prevent it from being carried to an extent that materially affected the trade of IIolland. Whatever, therufore, may be the consequences as to Belgium, there can be little doubt that the separation of the two divisions of the kingdom of the Netherlands will redound to the advantage of Moiland. It must ever be for the interest of England, America, and all trading nations, to maintain the independence of a State by whose means their productions find a ready nccess to the great continer ${ }^{+} \mathrm{nl}$ markets. It is to be hoped that the Dutch, profiting by past experience, will adopt such n liberal and conciliatory system toward the natives of $J_{n}$ va as may enable them to a vail themselves to the full of tho various resources of that noble ialand. And if they do this, and freely open their ports, with as few restrictions as possible, to the ships and commodities of all countries, IIolland may still be the centre of a very extensive commerce, and may continue to preserve a resjectable place among inereantile nations. Even at this moment, after ali the vicissitudes they have nndergone, the Datch are, beyond all question, the most opulent and industrious of European natlons. And their present no less than their former state ahows that a free system of government, security, and the absence of restrictlons on industay, can overcome simost every obstacie; "can convert the standing pool and lake into fat meadows, cover the barron rock with verdure, and make the desert smlle with flowers."

Amulets, or Charms. All nations have been fond of amuiets. The Eigyptlans had a great variety; so had the Jews, Chaldeans, and Persians. Among the Greeks, they were much used in exciting or conquering the pession of love. They were also in estimation among the Romans.-Piny. Orio. Among the Ciristians of early ages, amulets were made of the wood of the true cross, ahout $1.1 n, 328$. They have been sanctioned by rellgion and astrology, and even in modern times by medieni and other sciences; witness the anodyne neciniace, ete. The pope and Catholic clergy make and seli amulets and charms even to this day.-Abie. Haydn.

Anam, or An-nam, an empire of Southeastern Asia; between lat. $10^{\circ}$ and $23^{\circ} \mathrm{N}$., and long. $102^{\circ}$ nnd $109^{\circ}$ E.; comprising Cochin-China, Tonquin, and n part of Camboja. Surface generaily fertile, and climate heaithy. The coasts are bell, and include some of the best harbors in the world. Products, rice, sugar,
cinnamon, pepper, and other spices ; indlgo, dye-wonds, an inferior tea, ivory, and the procioua metais. These articiea form the principal exporta. Imperts are manufactured silks, porcelain, fine teas, and drugs from China, opium from India, cottons from Canton and Singapore, wooiens and fire-arms frem Europe. The navy is large; and the people have a maritime taste, excelling most Asiatics in ship-building.-marpen'g Gazetteer.

Anchor, in Navigation, from the Greek äycupa, which Vosaiua thinks is from $0 \gamma \kappa \eta$, a crook or hook, an instrument of iron or other heavy material used for holding ships in any situation in whlch they may be required to lie, and preventing them from drifting by the winda or tldes, by the currents of rivers, or any other cause. This ia done by the anchor, after it is let down from the ahip by means of the cable, fixlng itself into the ground, and there holding the vessel fast. The anchor is thus obviously an implement of the first importance in navigation, and one on which too innch attention can not be bestowed in its manufactore and proper construction, seeing that on it depends entirely the safety of the vessel in storms. The invention of so neceasary an instrument remounts, as may be supposed, to the remotest antiquity. The most ancient anchors conaisted merely of large stones, baskets full of stonea, sacka filled with sand, or logs of wood loaded with lead. Of this !ind were the anchors of the ancient Grecks, which, according to Apollonius Rhodius and Stepheu of Byzantium, were formed of stone ; and Athenaus states that they wore sometimea made of wood. These sorts of anchors retained the vessel meroly by their inertia, and by the friction along the bottom. Iron was afterward introduced for the constraction of anchors, nad also the grand improvement of forming them with teeth or linkes to fasten themselves inte the bottom; whence the words ofóvtȩ and dentes are frequently taken for anchors in the Greek and Latin pocts. The invention of the teeth is ascribed by Pliny to the Tuscans; but Pausanias gives the merit to Midas, king of Phrygia. Originally there was only one fluke or tooth, whence anchors were called ধtモé́sto $\mu 0 \iota$; but shortly afterward the second was added, according to Pliny, by Eupalamus, or, according to Strabo, by Anacharsis, the Scythian philesopher. The anchors with two teeth were
 uments appear to have been much the saine with those used in our days, except that the atock is wanting in them all. Every ship had several anchors, the largest of which, corresponding to our bower or sheet anchor, was never used but in extreme danger, and was hence peculiarly termed lepí or sacra; whence the proverb sacram anchoram solvere, as flying to the last refuge.

IVeight.-Anchors are now universally made of wrouglit iron, excepting in Spain and some parts of the South Sea, where they are made of copper. One essential quality in every anchor is a sufficient weight and angle of arm and fluke to t. i itself in the bottom; and this has br $n$ determined by practice for different anchors, and fut vessels of dillerent sizes. Large vessels have several anchors of different sizes, which are stowed in different parts of the vessel. These are distinguished by different names; viz., the best bocer to the starboard; and the smoll bower to the port cathead, with the flukes on the bill-board; the sheet-anehor on the ufter part of the fore-channels, on the starboard side; and the spare-anchor on the port slde. The above anchors are of the same size and weight. The two latter are only let go in eases of danger, when the vessel is riding in a heavy gale. In men-of-war they are nlways kept ready for letting go. The stream-anchor is of a much smaller size than the above, used only for riding in rivers or moderate streams. It is not generaliy above one-fourth or one-fifth of the weight of the others. Lastiy, the kedge-anchor is still smaller, being only about onc-half of the strenm-anchor, and is
only used when kedging in a river. Ships of the large class carry four Jarge and three amall anchore, and the smallest class, as brigs, cutters, and achooners, three or four.

The weight of anchors for different vessela is allowed by the tonnage. A pretty near rule for the priricipal anchor of ondinary-sired veaseis is to allow for the cwte. In the anchor one-twentieth of the tonnage. Thus a vessel of 400 tons would require he, principal anchor to be 20 cwt ., or according to the following tables:

| atercuant Vebbels. |  |  | Vebbels or War. |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Form and Dimensions.-Next to the weight, the form of the ancher, and the propertions of the different parts, are of great importance. The most general form, and that which fas indeed been almost universally adopted ali over the world, consists of the two hooked arms for penctrating and fixing themselves into the soil; the long bar or shank for attaching the cable; and the stock, which is attached to the extremity of the shank, and serves to direct one of the points downward into the soil. The weigitt of the anchor, then, causes the point to penetrate more or Jess according to the softness or harduess of the bottom; and the action of the vessel on the cable, instead of loosening the anchor, tends rather, by the hooked shape of the arms, to fix these deeper and firmer into the soil; so that the vessel is held quite fast, unless either the cabjo itaelf gives way, or any part of the anchor, or the anchor is tiragged along owing to the loosencss of the soil. The catile drawa upwari by the extremity, and turns the whole round the point of the fluke. The one end of the shank is made square, to receive and hold the stock steadily In lis place without turning. To keep the stock also from shifting along the shank, there are raised on it from the solid iron, or welded on it, two square tenonlike projections, called nuts. The length of the square of the shank is about one-sixth of the whoje length of the shaft, and the thickness about one-twentieth. From the end of this square the shank increases in thickness, tapering toward the extremity, where the arma are attached: in all this part it is either made wholly round, or with a fiat on opposite sides, or polygonal. The end next the stock is called the small round. The other extremity, where the arms and the shank unite, is called the crown, and the point of the angle between the arms and the shank the throat. . Here the thickness of the shank is from $1 \frac{1}{2}$ inch in amall anchers, to 3 inches in large ones, greater than at the small round. A distance equal to that between the thront of one arm and its bill is marked on tha shank from the place where it joins the arms, and is called the trend. Near
the extremity of the square part of the shank is the hole for receiving the shackle for the cable, which ia about balf the thickness of the amall round, and the diameter nearly equal to the length of the square. The shackle is lapped with cordage to prevent the cable from chafing. When hempen cables are used in the British service, one length of bower chain cable, called a ganger, ia bent to the spare anchor, and the hempen cable united with Admiral Elliott'a nhackle.

The arms make an angle of about $66^{\circ}$ with the shank. They are made either round or polygonal like the shank, about half thalr length. The remainder of the arm consiats of three parte, the blade, the palm, and the bill. The biade is merely the continuation of the arm in a square form. The palm or fluke is a broad, flat, triangular plate, fixed oll the inside of the blade, the use of which is, by exposing a broad surface, to take a flrmer hold of the ground. The bill is tha extremity of the arm, where it ia tapered nearly to a point, for the purpose of penctrating more readily into the soil. In some cases the arm is made quite straight from the crown to the bill; in othere, and particularly In small anchors, the interior half is made with the arch of a circle. The whole length of the arm is nearly half the length of the rourd part of the shank. It tapers alightly from the throat to the blade, where it is about the same thickneas with the small round of the shank. The paim is about one-third of this in thickness, and the breadth of its base is nearly equal to its length.
The stock of the anchor is made of oak, conslsting of two beams embracing the square, and firmly united by iron bolts and hoops. The length of the stock is rather greater than that of the shank, the thickness in the middle about one-twelfth of its iength, and tapering to about the half of this at the extremities, the taper being all on the under surface next the arms, and the other quite straight. The taper ls not quite regular. It commences at about half the. breadth of the atock from the shank, and continues in one straight line to the extremity. The beams of the stock are fiooped close together at the extremities, but gradualJy open toward the centre, that, in casa of the wood shrinking, the hoops may be driven farther in. Of lato years the stock haa frequently been made of wrought iron, the same as the anchor; and this plan is now very generally followed in anchors up to aixty cwt. It has this advantage, that the stock can be at any time taken out and Iaid I sallel with the anchor, which is very convenient for stowage. The iron stock consists nucrely of a long round bar, mbout half the djameter of the anchor at the equare. Iratead of embracing the anchor, like the wood, it goes through a hole in the square, which is awelled out to receive $3 t$. it has a shoulder in the middle, which rests against the squarc, and a key through a hole in the stock on the other side keepa it fast. When the stock is to be taken ont of its place, the key is driven out : the stock then slides throngh the hole in the shank, and by meana of a bend at its extremity, it is laid parallel with the shank.

The operation of the anchor is casily understood. Being let down by means of the cable, the weight of the arms throws them downward, and keeps the whole In a vertical position until it reachea the ground, where it lights upon the crown; and then falling over, the position of the stock at right angles to the arms, and its length and height, together with the weight of the calle, are sure to throw it with one of the arms pointad into the ground, if it does not take this aituation of itself. This effect is aided by the anchor descending quickly-and hence it muat be allowed to descend freely ; for which purpose, in throwing or casting the anchor, the cable is arranged, ona end being attached to the anchor and the cable bitted on deek, and the inner end removed below. Every thing being prepared, tho lashing of the anchor is cast off, and the men stand
ready to let goi and when this worl is given by the person in command，the fasteninga are all cast off，aud the anchor，falling into the sea，descends with rapidity． When the anchor，again，is to be removed from ite sit－ uation and drawn up into the vessel，the operation is tarmed weighing；which requires often a very heavy purchase，particularly at starting．This is oltained by means of the windlass or capstan，round which the cable is wound，and a number of hands appiied to work it．With cables which are too large to be wuund round a windlass，a smaller rope or chain is used， termed a messengar，which，leing attached to tha ca－ ble at different points，and woind round the capetan， serves to bring the cable forward．But aince the lit－ troduction of chain cablee this contrivance is not so much required．

When the anchor is brought above water，a tackle frem tine cat－head，called the cat，is hooked on to the shackle of the anchor，and hoisted up；tho cat－head stopper is then passed，viz．，one end of it is fastencd round tho cat－head，and the other is brought through the shackle of the anchor，then over the stopper－cleat， and is belayad round a timber head；the cat la then unhooked，and another tackle，called the fish，is hook－ el on just witinin the flukes，and the arms are hove up so as to lic upon the gunnel，or bill－board；the stock is then madn vertical by liauling upon another tackle， called the ateck－tacklo，in which position the anchor is secured by the stock－lashing for sea．In the event of bad weather，and before commencing a long voyage， the cat－head atopper and shank painter is cloubled．

Mooring Anchprs are those which are fixed in cer－ tain situations in aarbors or roadstcads，and to which any of the vessels frequenting the place may be se－ cured．As these are no way limited as to welght lik portablo anchors，they often consiat merely of a large block of stone，with an laner ring fixed in tho middile of the upper side；or several such stones may be fast－ ened together so as to act as one mass．Mooring an－ chors are also often made by choosing one of the larg－ est anchors used for first－rate ahips，weighing 80 cwt．， and by iending one of the arms close down upon the ohank，to prevent it catching hawsers when transport－ ing ships，nets of fishermen，fouling，etc．These an－ chors are lowerad down into the water with a very atrong iron morring chala fastened to the ring，to which the ships are fastened：they are usually made from such as are damaged in one of the flukes or arms．A new kiad of nooring anchor，of cast iron，was described by Mr．IIemman，of Chatham，to the Society for the Encouragement of Arts，etc．，in 1809，for which he ob－ tained a silver medal from the society．

Floating Ancher．－This is the name given to a sort of anchor which has often been proposed，but never re－ duced to practice，for preventing a vessel from drifting，

In cases where the great depth of the sea precludes the use of the cable and oruinary anchor．＇The plan sug－ gested by Dr．Franklin seems the most rational．This anchor consisted of two cross－bars，secured together in the middle，and haviag sail－cloth fastened to them in the shape of a parallelogram．To the centre of these bars the cable was attached，and，being thrown over－ board，it was thought the resistance of ao large a sur－ face would at least check the rapldity of the ship＇s motion．

The fnllowing is Mr．Aylen＇s plan for anchoring in deep water out of soundings，to prevent vessels from drifing in a calm when in a tlde－way，or if disabled： Holat out linmediately one of tise boom boats，let go the kedgo anchor，and veer out 40 or 50 fathoms over the bow，and stop it to the ring in the bow and stern of tho loat，and then veer out from the ship from 70 to 80 fathoms．

Much attention has been pald of late to the improve－ ment of the manufacture of anchors，and several speci－ mens were sent by the makers to the Royal Exhibition in 1851．A committee，consiating of five ship－owners of Lor don，Liverpool，and Glasgow，with five nominated by tne Lords of tho Admiralty，was appointed to test the relative merits of these．After trying，on the parade ground of Sheerness dock－yard，on the beach at Garrl－ son point，at Blackatakes in the River Medway，and at the Nore，thoae that were sulmitted fur competition， viz．，Admiralty，Aylen＇s（a modified Admiralty），Honl－ ball（or Porter＇s），Isaacs＇（United States），Lenox＇s， Mitcheson＇s，Kodgers＇，and Trotman＇s（an impruved Porter＇s），they reported in 1853 that，taking into con－ sideration the reaults of all the trials to which the an－ chors had been subjected，they thought lt best to re－ ce：d their opinions in the following talulated forms：

The following is a recapitulation of tho order in｜gether with their relative percentage of inferiority or which the anchors wore ranked by the committee，to－$/$ superiority to the Admiralty anchor，the value of
which, as given in the foregoing table (18.17), was taken as the standard or unit:

Supposing both the flukes, and about two feet of tho shank and crown of the anchor ia gone (invariably the place where all anchors break), the weight of the broken par would be about half the weight of the original, say

> Bower anchor for the Heatings uhase 74 owt, half. ..... 87 8tream anchor and stock for the above ship Kedge and atock for do. do.............

In making anchors in the Royal dock-yarda of Great Britain, t'le different parts are ferged by the ateamhamnars. In the first place, large slabs or pieces are mado about five teet long, and three of them put together, soundly wolded, and drawn out of sufficiont length for the shank; the prms and palms are forged nearly in the same way; the palma are welded on to the arms, and then the arms welded on to the shank, and the shacklo is riveted on to the shank, the anchor then beling completo.

The shank for an anchor is mado larger at tho lower end, where the arms are to be welded to it, and is of a square figure. A sort of robate or scarf is here formed on cacin sido of the square, in orde that the arms may apply mure properly for weiding. This scarf is made in the original shape of tho fagot, and finiehed by cutting away some of this metal with chisels while it is hot, and naing seta or punches, properiy formed, to make a square angle to the shoulder of the scarf. The upper end of the shonk is likowise square ; and the length between theso square parts is workod either to an octagon or round, tapering regularly from the lower to the upper end. The holo to receive the ring of the anchor is pierced through tise square part at tho upper end, first by a small sunch, and then larger ones are used till it is sufficiently enlarged. Tho punch is mado of steel; and when it is ohserved to change color by the beat, it is atruck on the opposite end to drive it out, and is inatantly dippod in water to cool it, and another driven in. The I ojecting pieces or nuts, which are to keep tho stock or wooden beam of the anchor, and its place on the shank, are next welded on. To do this the shank is heated, and at the same time a thick bar is heated in anothor forge: the end of this is iaid across the shank, and the men hammer it down to weld it to the shank; then the piece is cut off by the chisel, and atother pieco welded on tho opposite side.

Whilo this process of forging the shank is going on, the amiths of another forge, piacod as near as convenient to tho former, are errployed in making tho arms, which are made tron fagots in the san.e menner as the shank, but of less size and shorter, they ore made taper, one end of each beling smaller than the other; the larger ends are madas square, und eut down with ucarfs, to correspond with those at the lower end of the shank. Tho middlo parts of the arma aro rounded, and the cuter extremities are cut away as much as the thickness of the fiukes or paims, that tho palms may be fiush with the upper slifes when they are welded on. The fiukes are generally made at the iron-forges in tho country, by the ferge-hammer; but in some yards they are made by fagoting small bars, leaving a long oue for a handlo. The next busiaess is to unite the arms to the end of the shank; and in doing this particular care in nocessary, as the goodness of the anchor is entirely dependent upon its being effectualiy performed. In mo large a weld, the outside is very
liable to be wolded, and make a good appearance, while the middle part is not united. To guard agninst this, both murfaces of the scarfs should be rather convex, that they may be certain to touch in the middle first. When the other arm is welded, the anchor is complete, except the ring, which is made from several small bars welded together and drawn out into a round rod, then bent $t$ s circle, put through the hole in the shank, and its ends velded together. If the shank or other part is crookod, it is set right by heating it in the crooked part, antl atiking it over the anvil, or by the Hercules. After all this the wholo is heated, but not to a white heat, and tho anchor hammered in every part, to finish and make its aurface even. This is done by lighter haminers, worked by both hande, bat not awung over tho head. This operation renders the surface of the motal hard and smooth; and if very effectually performed, the anchor will not rust materialiy by the action of the sea-water.

The iron from which anchors are mado ought to be of the best quality : that kind of it which is called red short will not bear sufficient hammering to weld the bars; and coid short, from its brittleness, is not to be depended upon whon tho anchor is in use. A good anchor should be formed of the toughest fron that can ks procured. The most extensive establishment for fabricating anchors, etc., in England, is that at Woolwich dock-yard, where the British Admiralty anchors are made. There the blowing apparatus, the working of the lift and tilt hammers, etc., is all done by a steamengine of fron fourteon to sixteen horse power. E. B.

To steer the akip to her Anehor, is to steer the ship's head toward the placo where the anchor lies when they are heaving in the cable, or lying in a strong tide-way, that the cable may thercby enter the hawse with leas resistance, and tho ship advanee toward the anchor with greator facility. Ships often prevent coliision by attention to the belin.

Anchorage, or Anohoring Cround. Good anchoring ground should neither be too hard nor too soft; for, in the, first casc, the anchor is apt not to tako a sufficient hold, and in the other to drag. The beat bottom is a rtiff clay, and next to it a firm sand. In a rocky bottom tho flukes of the anchor are sometimes torn away, and bempen cablea are liable to chafe and be cut through. It is also essential to a good ancherege that the water be nelther too deep nor too shallow. When too derp, the pell of the cable, bsing neariy perpendicular, ia apt to jerk the anchor out of the girund; and when too shallow, the ship is exposel to the danger, when riding in a etorm, of striking the bottom. Whare a ship is in water that is land-locked, and out of the tide, the nature of the ground is of comparatively 'ittle importance.
Anchovy (Fr. Anchois; It. Acciughe; Lat. Encrasicolus), a amsll fieh (Clupea encrasicolus, Linn.), common in the Mediterranean, resembling the aprat. Those brought from Gorgona, in the Tuscan Sea, are estermed the heat. They should be chosen smali, freah pickied, whito outsido and red within. Their lacke should be round. The se dine, a flah which is flatter and larger than the anchovy, is frequontly substituterl for it. Ahout $\mathbf{1 2 0 , 0 0 0}$ pounds are ancualiy entered in Great Britain for home consumption.
Andermon, Adam, was born in Bcotland in 1092. IIe was a clork for forty years in the South Sea IIouse in london, whero he pulblished a iarge work, entitled Ilistorical and Chronologieul Deduetion of the Origin of Commerce, containing a Ilistory of the Great Commercial Interests of the Britiah Eimpire, etc., which is volnminous and heavy; but he eeema to havo anticipated, in some of his spreculations, the opinions of inter times. it was firat puillishod in 1702, in two vols. follo. A. third edition appeared in $1707-9$, in four vols. Ato, the last volume being an appendix and continuation ty the editor, Mr. Walton. Anderson died in 1705.

Andes. The Andes form a mighty mountain chain running nearly parallel to the western coast of South America. The central ridge extends in an undivided chain from the Rlo Atrato, at the Iethmus of Darlen, in lat. $8^{\circ} \mathrm{N}$., to the Cordilleras of Vileanoto and Cuzeo, in lat. $15^{\circ} 50 \gamma$ S., where It separates into western and asatern rldges that iaclose the extensive and elevated valley of Desaguedero, and exhilit some atupendous peake that almost rival the altitude of the Himalayas of the East. After running parallel to each other to lat. $10^{\circ} .80^{\prime}$ S., they again coalasce, and conatitnte one central chain to the Straits of Magelian, in lat. $58^{\circ}$. The Andes of South America, then, have a range of about 4200 miles. 'ine most western of the two longitudinal ridges runs parallel to the Paeific, and is called the Cordillera of the Coast; the eastern chain id genarally termad the Cordillera of the Interior, and its northern prolongation Cordillera Rea. The vailey of Desaguedero extends from lat. $15^{\circ} 5^{\prime}$ to lat. $19^{\circ}$ 80'. \&. , whth a varying breadth of 85 to 60 miles, presensing an area of 16,000 square geugraphical milee. It contalas the celebrated Lake of Titicaca, the oradle of Peruvlan civillzation. It was on the shores of this lake that Manco Capac, the flrat Inca, was miraculously discovared by the Quichn, the ancostors of the Peruvians.
"The central Andes are rioh beyond conception in all the metals, lead only excepted. One of the most curious ores in the bowels of those mountains is the pacos, a compound of clay, oxide of iron, and the muriate of silver with native silver. The mines of Mex100 and Peru, so long the ohjects of envy and admiratlon, far from being yet exhausted, promise, under a liberal and improved syatem, to become more produciive than ever. But nature has hlonded with those hidden tressures the active elements of deatruction. The whole chain of the Andes is aubject to the most terrible earthquakee. From Cotepaxi to the South Sea no fewer than forty volcanoes are constantly buraing; some of them, especially the lower ones, cjecting lave, and others discharging the muriate of ammonia, scorifled basalt, aut porphyry, enormous quantities of water, and ospecially moya, or ciay mixed with sulphur and carhonaccous matter. Eternal snow invests their sides, and forms a barrier to the animal and vegetabla kingdoms. Near that confine the torpor of vegetation is marked by dreary wastes."-Ldinb. Review, vol. xv. p. 233.

Anemometer and Anemomoope, machinos for measuring the force and Indicating the course of the wind.

Angelloa, a large umbellifereus plant, with hellow jointed atalks, of which there are soverul varisties. It grows wild, and is cultivated in moist places near London, and in most Eurot aan countites from Lapland to Spain. Its roots are thick, fleshy, and resinous; havo a fragrant agrueable amell, and a bitteriah pungent taste, mixed with a pleasant sweetness glowing on the lipa and palate for a long time after they have been chewed. To preserve them, they must be thoroughly dried, and kept in a well-aired place. The other parts of the plant liave the same taste and flavor as the roots, but in an inferior degree. The leaves and seeds do not retain their virtues when kept. Tho London confectioners mako a sweetment of the tendor atems. The faculty used to direct that none but the roots of Spsuish angeliea should be kept by the drugglsts. In Norway the roots are sometimes used as broad, and in Iecland tho atalks aro enten with butter. Tho plant is used n.ostly in confectionery and tbe materls medicd. -Lawis's Mat. Med.; Ress's Cyclopedii., etc.

Angels, in Commerce. in agge, wss an ancient gold coln, woighing four pennywelghte, sud was valued at $6 s, 8 d$. In the reign of Henry V1., and at 10 s . 11) the reign of Elizabeth, 1662. The angelot was en ancient gold coin, value half an angel, struck at Paria when that capital was in the handa of the English, in the reign of IIeary VI., 1481,-Woow.

- Anise Beed (Fr. Anis; It. Anise; Lat. Anisum); a small seed of an oblong ahape. It is cultivated In Gemar 1 y , but the best comes from Alicant, in Spain, It is also a product of China, whence it is exported. It should be chosen freah, large, plump, new? y dried, of a good smell, and a sweetialh aromatic taste.

Anker, a liquid measure at Amsterdam. It contains about $10+$ gallens English wiue messure.
Ennale (Annales, from annus, a year), a term commonly applied to a concise and plain kind of narrative of historical facts digested in the order of time, each event being arranged nuder the particular year it. which it happence. Although this style of composition does not necererrily exclude the casual observations of the writor, episodes or formal digressions are incompatible with the brevity characteristic of annals; while history, on the other hand, comprises not ouly the narrative and exposition of facts, but also the w titer's observations on actions, motives, canses. and conaequances in general; thus affording amp'd scope for illustration and cmbelliahmont. Annale may be said to constitute the cesence of history, binca they are the eloments or materials of which it is m aposed.
? Annealing, by the workmen caited nealine; is a process used in glass-making, and in tho manufacture of certain metala. In glass-making it consista in placing the bottlea, cte., while hot, in a kind of qven or furnace, where thay are suffered to cool gradually. They would otherwlse be too brittle for use. The difference between unanaealed ard annealed glass, with respect to brittleness, is yery remarkable. When an unananealed glase vessel is broken, it often flies into a small powder, with a violence aeemingly very unproportioned to the etroke it has received. In general it is in greater danger of breaking from a very slight stroke than from one of some conaidershle force. Ono of these vossels will often reast the effects of a pistolbullet dropped lato it from the height of two or three feat; yet a grain of sand falling lnte it will make it burnt into small fragmente. This takes place sometimes immediately on dropping the sand suto it ; but often the vessel will stand for several minutes after. eeemingly seeure; and then, without any new injury, It will fly to pieces. If the vessel be ver; thin lit does not broak in this manner, but seens to possess all tho pruportiea of anncaled glass.

The ammo phenomena are atill more strikingly soen in glass drops in' tears. They aro globular at one end, and tapor to a sinall tail at tho other. They aro the drops which full from the melted mais of glass on the rods on which the bottles are mado. Thoy drop int? the tubs of water which are used in the work; tito greater part of them burst Immorilately in the water. When those that rucain entire are examined, theydiasovor all the proferties of unannealed glass in the highest degree. They will bear a smart atruke on the thick end without breaking; but if tho small tall be broken, they shiver into singll powder with a loud explosion. They appear to burst with moro violence, and the powder is smaller in an exhausted receiver than in the open air. When they are annealed they lose these properties.

Glass is one of those holics which incrense ln hulk when passing from a fluidi into co solid stato. When it is allowed to crystallize regularly, the partleles are so arranged that it has a illurous texture. It is elastic, and susceptiblo of leng-continued vibrations; but when a mass of melted glass is suddenly exposed to the celd, the surface erystallizes, and forme a sel'd shell round tho intorior fluid parts. I' is prevents them from oxpanding when thoy become solid. They therefore have not the opportualty of a regular erystallization, but ere compressed togethar wJth little mutual cohesion. On the contrary, they press outward to occupy' more space, but are prevented by the oxternal ernst. In consequence of the effort of expanaion in the lnternal parta, the greater numbor of glass drops burst
in cooling; and those which remain entire are not regularly erystallized. A amart stroke upon them coinmunicates a vibration to the whole inase, whlch is nearly synchronous in every part; and therefore the effort of expensica has little more effect than if the body were at rest; but the small tall and the surface only are regulariy crystallized. If the tail be broken, this communicates a vibration along the crystallized surface withuut reaching the internai parta. By this they are allowed some expansion; aud overcoming the coheaion of the thin outer ahell, they burst it, and are dispersed in powder.

In an unannealed glass veasel the same thing takes place. Sometimes the vibration may continue for a considerable time before the internal parts overcome the reaistance. If the vessel be very thin, the regular crystallization extends through the whole thickness; or at ler st the quantity of compressed matter in the middle is so inconsiderable as to be incapable of bursting the external plate.

By the process of annealing the glass is kept for some time in a state approaching to fluidity; the heat increases the bulk of the crystallized part, and renders it so soft, thet the internal parte have the opportunity of expanding and forming a regular crystallization.

Iron.--In the manufactures in which the malleable metals are employed, annealing is used to soften a metal after it has been rendered hard by the hammer ; and also to soften cast iron, which is rendered very hard and brittle by rapid cooling.

In the manufacture of steel goods, which are first formed by the hammer, and require to be flied or otherwise treated, and in which softness and flexibility are easential to the change, annealing is absolutely necessary. This is particularly the case in making files and scissors, that the metal may be leift sufficiently soft for cutting the teeth, and for flling off those parts whick can net be ground. Annealing is not less necessary in the drawing of wire, whether iron, copper, brass, silver, or gold. The operation of drawing soon st ves the wire a degree of hardness and olasticity which, if not removed from time to time by allnealing, would prevent the extension of the wire, and render it extremely brittle. The same operation is also necessary in rolling or flattening those metals ohich are in a cold state, such as brass, silver, gold, etc. The brazier who form:, vessels of copper and brass by the nammer, can work upon it only for a little time 'refore he is obliged to anneal it.

The methods often employed for anncaling iron and ateel are very injudicious, and materially injure the latter when it is used for making cutting instruments. After they have been formed by the hammer, they are sometimes piled up in an open tire, slowly raised to red heat, and then allowed as gradually to cool. By this method the surface of the steel will be found considerably acaled, from the action of the exygen of the atmosphere. When it is remenbered that steel consists of iron joined to carbon, It will be evident that the steel immediately uoiler the scaly oxide will be deprived of its carbon, which has been carried off by the attraction of the oxygen; and, in consequence, will lose the property of ecquiring that degree of hardness necessary to a cutting instrument.

Nothing, therefore, can be moro obvlous than that uteel particulariy should be annealed in close vessels, to prevent that effect. For this purpose the goods should be placed in a trough or recess made of firestone or fire-briek, and stratified with ashes or clean sand, and finally covered with a thick stratum of the same; "ut if the size of the vessel be small, it may have a cover of its own materials. This oven or trough must now be heated by the flame of a furnace passing under and round it, till the whole is of a red hest. It muat then be suffered to cool, without letting in the air. The gools on treated will be much softer than by the other method. The surface, lustesd of becoming
scaled, will have acquired a neetallio whitenesa, from the presence of a small quantity of carbonaceoua matter contained in the ashes in which they were lmbedded. They will become so flexible also, as to allow them to bend considerably without breaking, which is very far from being the case before the operation. The fracture, before annealing, will be smooth and short; but afterward it will be rough, exhibiting bright parts, of a crystalline appearance.' Wire, especially that of iron and steel, should be treated in a similar way when It is annealed. The wire used for somo purposes requires to be soft, and is sold in that atate. If the wire, after finishing, when it is bright and clean, were to be annealed in contact with oxygen, it would not only lose all its lustre and smoothness, but much of its tenacity. The procese above mentioned will therefore be particularly necessary in annealing finished wire, as well as in aoftening it from time to time during the drawing.

Copper and brass suffer much less than iron and steel from annealing in the open air, and do not require to be heated above a low red heat. If, however, the lustre is to be preserved, a close vessel would be desirable. The latter metals, after annealing, although much discolored by the oxygen of the atmosphere, may be cleansed by lmmersion in a hot liquor composed of water and a small quantity of sulphuric or nitric acid. Very amall brass or coppey wire is freque, +1 l annealed by exposing it to the flame of hay or stra. . In casting minute pieces of pig-iron, which is geacrally done in damp sand, the metal possceses the property of steel to such a degree as to assume, by the rapid cooling, a degree of hardness equal to hardened steel; at the saine time that the articles are so brittle as to break by falling on the ground. When, however, these goods are treated in the way above directed, they acquire a dcgree of aoftness which renders them penetrable by the file, and at the same time capable of bending. In this state they are much less tenacious than steel, but still so much so es to have been sold in the form of cutlery for steel.

The change which metals undergo by annealing is net yet thor uughly understood. Most of the malleable metais are ruaceptible of two distinct forms, one called the crystalline form, which they assume by slow cooling; and the other the fibrous, which is acquired loy hammerim; or rolling. When this, however, is carried beyonila certain point, the metal becomes so hard that it is nut capalle of being bent far without breaking. All the malleable metals in the ingot or in their cast state are brittle, and exhibit a cryatallina fracture. By hammering or rolling they become more tenacious, and break with difficulty, exhibiting what is called a fibrous fracture. At the same time they become stiffer and more clastic. They lose the latier properties by annealing, but become more malleable. If the anneal. ing, however, be leng continued, the malleability diminishes, and they again have a cryatalline fracture. Zinc oy wire-drawing becomea very flexible, and possesses a degree of tenacity not inferier to that of copper; but if it be kept in boiling water for a length of time, it will resume its original brituleness, and show a clystalline appearance when broken. This proves that the particies of metals can change their arrangement without losing their solid form; which is still more strongly confirmed by the fact that brass wire loses its tenacity by exposure to the funes of acids, and even by the presence of a damp atmosyhere. This is not caused by the moisture, lut by the action of air upon the molstened surface. The manufacturers of cemmon pins are obliged to keep their wire In a dry atmoaphere, or immersed in water. If the wire be first moistened, and then oxposed to the eir, it will assume the brittle atate much sooner. In this condition it breaks with a crystalline fracture, similar to that exhibited by'sn ingot. When a ateci-plate, such as a watrimpilig, has been once tempered, the operation
of cimply rubbing it bright will render it soft and elastic. The aame change is bronght about by slightly hammering it. It, however, resumes its elastio state by being carefully heated till it becomes of a blue color. If the heat be continued to redness, particularly in a close vessel, it becomes perfectly annealed.-E. B.

Annotto, or Arnotto (Fr. Rocou; Ger. Orlean ; It. Oriana), a species of red dye formed of the pulp enveloping the seeds of the Bixa Orellana, a plant common in South America, and the East and Weat Indiea; but dye ia made, at least to any extent, only in the first. It. is prepared by macerating the pods in bolling water, extracting the soeds, and leaving the pulp to subside; ${ }^{\dagger}$. fluid being subsequently drawa off, the residuum, h.... which oil is sometimes mixed up, is placed in al ulow vessels and gradually dried in the shade. I's of two sorte, viz. flag or cake, and roll annotto. The first, which is by far the most important article in a commercial point of view, is furniahed almost wholly by Cayenne. It is imported in square cakes, weighing 2 or 3 pounds each, wrapped in banana leaves. When well made, it shoald be of a bright yellow color, soft to the torich, and of a good consistence. It imparts a deep but aot durable orsage color to silk and cotton, and is used for that purpo : by the dyers. Roll annotto is principaily brought from Brazil. The rolls are small, not exceeding 2 or 3 ouncea in weight; It is hard, dry, and compact, brownis'1 on the outside, and of a beautiful red color within. The latter is the best of all ingredieats for the coloring of cheese and butter, and is now exclasivaly used for that purpose in all tite British and in aome of the Continental deiries. In Gloucestershire it is the practice to allow an ounce of anuotto to a cwt. of cheese; in Cheshire, 8 dwte. are reckoned sufficient for a cheese of 60 pounds. When genuine, it neither gffeots the taste nor the smell of chesse or butter. The Spanish Americana mix annotto with thelr chocolate, to thich it givea a beautiful tint.-Gray'a Supplement to the Pharmacopaias; Loudon'a Encyo. of Agriculture, and private information.

Annuities. An annuity is a periodical income arising from pensions, lands, houses, or money lent. When the possession of an annuity is not to be entered upon until the expiration of a certain period, it is called a reversionary, or deferred annuity; when the time of possession is not deferred, the annuity is somotimes called immediate, but in general it is simply termed an annuity.

Annuities or Pensions ware first grarted In 1512, when $£ 20$ were given to a ledy of the court for services
 man, 1536. The sum of $£ 136 \mathrm{~s} .8 \mathrm{~d}$. was deemed competent to support a gentlemen in the study of the law, 1554. An act was passed empowering the government to borrow one million aterling upen an anauity of fourteen per cent., 4 and 6 Wiliiam and Mary, 1691-8. This mode of borrowing acun afterward becaine gencral anong civilized gevernmente. An annuity of $£ 1$ per anaum, accumuleting at ten per cent., compound intercst, aniounts in one hundred yeare to $£ 187,796$.IIayde.

The doctrine of compound intereat and annuitiescertain is too simple ever to have occupied much of the attention of mathematicians: inquiries into the valnes of interests dependent upen tho contirinance or the fuilure of human life, being more interesting and diffcult, have oceupled them more, but yet not so innch as tieir importaince would seem to demand; the discoveries both in pure Mathematice and Phybics, eapecially those of Newton, which diatinguished the close of the seventeenth century, having provided them with ample employment of a more istereating kind, over aince the subjects of this artiole were aubmitted to calculation.

Wien annulties are lependent upon the exiatenco of a life or tives they are called Life Aanvitics. The
values of such annuities are calculated by means of tables of mortality, which show, out of a considerable number of individuals horn, how many on an average have lived to complete each year of their age, and consequently th.d expectation of life for each particular age: this, combined with a certain rate of per cent., will reduce the calculations, if made apon a sufficiently large scale, to mathematica: certainty (see articles Tables of Mortality, Interest, and Life Insurancs):

In the year 1808 the British government commenced granting life sonuities at prices calculated according to the Northampton Tables of Mortaility, and continued so to grant them for 20 years, at a great lose to the nation, especially on younger lives, as was shown at the time by a distinguished writer (Joshua Milne, Esq). None were granted then, however, on lives under 85 years of age. After the yesr 1818 annuities were granted to all persons of ages above 21 years.

In March, 1819, Mr. Finlaison was appointed government actuary, with proper assistants and access to the registers of the nominees in tontines, and others on whose lives annuities had been granted by governmant for mere than a hundred years before; in which regigters the exact ages at which the annuitants were nominated, and at which they dicd, were stated. Upon these data Mr. Finiaison made a table of mortality niore valuable than any thing of the same kind which had yet been published, according to which the British government grant annuities at the present time.

By Mr. Finlaison's table it was found that the livea of annuitante wero generally better (longer) than the general average of the populstion, as insured lives generally helong to the better classes. This subject will be more fully treated in Tables of Mortality, Interest, and Life Insurance.

Calculations are made, and annuities granted by the British government and by Life Insurance Companles, both in Europe and this country, upon all combinations of lives, such as joint lives, survivorships of two or more livcs, etc., etc., afforling a perfectly eafe and reliable investment, and in the case of a Mutual Life Office, one of very great advantage to the annuitant.

The doctrine of annuities, with its kindred science of Life Insurance, is ec abstruse that few writers are found wllling to devote their time and attention to it unless actuated by professional motives or an unusual taste for the subject; fortunately, however, ite trestment is marked by uniform and ominent talent and ability, oo that nearly all the works upon this subject contain something new and valuable. The standerd authors are, David Jones, Jenkins Jones, Milne, Morgan, Lubbock, Samuel Brown, G. Davies Babbage, and Dr. Price.

The lives on which annuities depend will generally be somowhat better (by which we here mean, will attain to groater longevity) than the gentral average of the population, though probsbly not nearly so much better as many believe them to be. The prevailing error in the popular eatimate on this subject appears to have arisen in great measure from comparing the murtality smong annuitants and assured lives, with that represented to take place by tabies of mortality erroneously considered to correspond with the general average of the people; while, from being constructed on erroneous principles, and from insufficient data, or else being derived fron, observations mado where the mortality was and la nuci ereator than In Britain, the mortality, according to these tables, was considerably greater than that whith aetually prevails among the buik of the people here. Proos of this will be found under the article Jaw of Mortality.

The tables on the following page show the cost of an annuity of $\$ 100$, and the amount of snnuity which a deposit of 1000 will purchase according to the iife table of the Mutual Life Insurance Company of New York. The rates cinarged by that company are found in the columns marked five per ceut.

＂Select lives．－That the lives on which annulliea depend can not be so very select or so much better than the common average，as has generaily been supposed， might reasonably be exprected on thene grounds：1．As to annuitants．The lives are not aii chosen on aecount of their presumed goodness；for many perseds who have no occasion to provide for others whe may sur－ vire them，purchase annuities on their own lives，only that they may themelves enjoy thie wiole benefit of the purchase－money，both principal nod interest，dur－ lug their lives．And the greatest recommendation of these lives secins to be，that they are generally pru－ dent persons，of temperate and regular habits．Many other persona，eapecialiy femsles，apendithrifte，and faithful servants，enjoy annuities bequeathed to them hy their decensed reialivea，matera，or mistressea，as the most eligible provision for their future comfort and secarity from want；and there seems littie ground to suppoen them to be letter liven than the common aver－ age of the samo age and sex．
＂ 2 ．In such cases as tontines，where most of the lives
are selected for their preaumed goodness，the best crite－ rion probably is，hereditary longevity lu the family of the nominee；bat partiality for their own friends or kindred often has considerable influence in biasing the judgment of these who aelect them．That they will generally be parsaus of good constitutions and regular habits when selected，is all that ia likely to be obtained under these circumstances；and that is also the case with the average of the population in comfort－ able circumstances．Whatever the constitutious and habits of annuitants may be，tho annuities held by them during their own lives，by protectling them from many of the wanta，cares，and nnxietiea which the bulk of the people are exposed to，no doubt contribute to their longevity．But where powerful motives to raise money by the eale of an annuity on a person＇s own life exist，it is extremely difticult to prevent him from parting with it，whatever preeautions may have been taken with that view ；and with it he alse losea that belp to longevity．
＂3．Inaured llves are also generally supposed to bn
much better than the average of the population, as it is incumbent apon the insurance offices to be cautlous in selecting them. But bad lives, by the failure of which nersons interested in them. would sustain loes, are -1ost likely to be offered, and are continually offered, for insurance: and there is reason to believe that all the caution in selection which the offices in general can exercise, is neccssary to keep the lives insured up to the average goodnces of the bulk of the population; supposing always that people in general of the industrious classes are in prosperous, or at least in comfortsble circumatances. When that is not the case, as for some yeara previous to 1830 there ie reason to apprehend it was not in this country, there wiil be a correspooding increas in the general mortality, which will not sensilbly affect the general mase of persons on whose lives annuities and reversions or assurances depend."E. B.

Antarotio. The south pole is so called because It is opposite to the north or arctic pole. A contlnent of 1700 miles of coast from east to west, and 64 to 66 degrees south, was discovered in the Antarctic Ocean by French and American Exploring Expeditions, under D'Urvilid and Wilkes, respectively on the same day, January 19, 1840; a coincidence the more singular, ss the discoverers wero at a distance from each other of 720 milcs. It was coasted by Captain Wiikes for 1700 miles. Mr. Briscow, of the British Navy, fell in with land, which he coasted for 300 miles, in lat. $67^{\circ}$, long. $50^{\circ}$, in the year 1830.

Antimony (Ger. and Du. Spiesglus ; Fr. Antimoine; It. Antimonio; Russ. Antimonia; Lat. Antimoniumb), s metal which, when pure, is of grayish white color, and has a good deal of brilliaucy, showing a radiated fracture when broken ; it is converted by exposure to heat and air into a white oxide, which oublimes in vapors. It is found in Saxony and the IIartz; also in Cornwall, Spain, France, Mexico, Siberia, the Eastern Islands, and Martaban, in Pegu. We are at present wholly supplied with this metal from Singapore, which receives it from Bornco: it is imported in the shape of ore, and commonly as ballast. It is about as hard as gold; its specific gravity is about $6 \cdot 7$; it is easily $n$ duced to a very fine powder; its tenacity is such that a rod of one-tenth of an iach in dismeter is capable of supporting tua pounds weight. Antimony is used in medicine, snd in the composition of metal types for printing. The oros of antimony are soft, and vary in color from light lead to dark lead gray; their specific gravity varics from 4.4 to 6.8 ; they posseas a metallic lustre, are brittle, and occur in the crystaliized massive forms.-Timonson's Chemistry and private intormation. Antimony was very carly knowo, and applied by the ancients to varions purposes. It was used as paint to blacken both men's and women's eyes, as appeans from 2 Kings ix. 30, and Jeremiah iv. 30, and in Eastern countries it is thus used to this day. When nixed with iead, it makes types for printing; and in physic its uses aro so various that, according to its preparation, alone, or in company with one or two associates, it is sufficient to answer all a pliysician dealres in an apothecary's ahop.-Boyle.

Antipodes, in Geography, a name given to thoso inhabitants of the glole tinst live diametrically opposite to each other. The word is Greek, and compounded of avri, opposite, and rov́s, a foot, because their feet are opposite to each other. $P$ ato is regarded as the first who thought it possible that antipodes existed, and is looked upon as the Inventor of tho werd. As this philosopher appreheaded the varth to be spherical, he hisd only one step to mako to conciude the existenco of the antipodes. The ancients in gencral treated this opin. ion with the higheat contempt, never being able to conceive how men and trecs could aubsist suspended in the air with their feet upward, for so they apprehended they must be iu the otiner hemisphere. They never reflected that these torms upvard and downward are
merely relative, and signify only nearer to, or farther. from, the centre of the earth, the common centre to which all heavy bodies gravitate.-E. B.

Antwerp (Flem. Antwerpen; Fr. Anvers), a famous fortified city of Helgium, and the centre of its foreign trade (capital and province of the same name) on the Scheldt, 60 miles from the sea, and distant by railroad $27 \ddagger$ miles from Bruasels, 32 from Ghent, $150 \frac{1}{2}$ from Cologne, $258 t$ from Peris, and 74 from Oetend. Lat. of cathedral, $51^{\circ} 18^{\prime} 2^{\prime \prime}$ N.;-long. $4^{\circ} 24^{\prime} 2^{\prime \prime}$ E. Population 90,000 . Its port wae greatly improved by Napoleon, who erected two large batins; and ships anchor in the river opposite the city in from 82 to 40 feet water at ebb-tide. Chief manufactures, silk and cotton hosiery, thread, tape, and linen cloths, calico-printing, embroidery, bleaching, and sugar refining. Ship-building is extensively carried on, and the diamond-cutters of this city are celebrated. The principal imports are coffee, grain, and seeds, raw sugsr and woven fabrics; exports flax, woven goods, refined sugar, metals, glasa, etc. In the 16th century Antwerp was the richest and most commercial city in Europe, and contained 200,000 inhabita ${ }^{\text {ts. }}$ In 1648, at the treaty of Westphalis, it was stipulated by Spain and Holland that the navigation of the Scheldt should be shut ap-a stipulation which was observed till the occupation of Belglum by the French, when it was abolished. It was taken by the Spaniards in 1576 and in 1585, and by the French in 1792 and 1794. It was the capital of the department Deyx Nethes, under the dominion of the French, to whom it again surrendered December 24, 1832 . It is the birth-place of the paintors Teaiers, Jordaens, and Vandycic, the geographer Ortelius, and the cngrever Edelinck. In 1803, the improvement of the issrbor was bcgun, and extensive new docks and warchouses have since been constructed. Ships of the largest burden come up to the town, and goods deatined for the interior sre forwarded with the greatest facility by means of cansls and railways. Almost all the foreign trade of Belgium is at present centred in Antwerp, which has again become a place of much commercial importance. There is regular steam communication between Antwerp and London, and Hull and Rotterdam.

Goods may be warehoused in Antwerp en entrepót, at the rates of charge specified in a fixed tariff. The exports chicfly consist of fiax, cotton and linen manufactured goods, refined sugar, glass, zinc, oak-bark, grain and seeds, lacc, etc. The imports consist principally of coffice, sugar, and other colonial products, cotton atuffs and other manufactured goods, corn, raw cotton, leather, timber, tobacco, wool, rico, dye-stufis, salt, wines, fruits, ete. A large proportion of the imjorts not bcing intended for home consumption, but for transit to other countries, their amount is always much greater than the amount of the exports. Of the total value of the articles imported into Antwerp in 1839 , amounting to $07,960,200$ francs ( $£ 3,918,408$ ), those aupplied by England were worth very near $30,000,000$ francs ; ditto by Russia, $14,366,900$ francs ; ditto ly the United States, $8,217,800$ francs ; ditto by France, 7,630,200 francs, etc. The principal srticles were coffoe, worth $14,745,500$ francs; grain and seeds, $13,936,800$ francs ; sugar, $11,480,800$ france ; woven fabrics, $11,339,100$ francs ; raw cotton, $5,225,200$ francs; metals, $4,87^{2}, 300$ francs, etc. The total valum of the articles exported during the same year was $56,630,000$ francs ( $£ 1,425,440$ ), whereof those sent to England were worth $14,849,100$ francs; ditto to Ilolland, $5,777,500$ franca ; the IIanse Towns, 4,320,200 francs.

Money, Weights, and Measüres.-The French system of moncys, woights, and measures has been adopted in Belgium. Formerly accounts were kept in
 in use, and still sometimen referred to, $=108 \frac{1}{3}$ pounds nvoirdupois. In 1837 the Commercial Bank, a jointatock association, was founded in Antwerp. It has a
capital of $25,000,000$ francs ( $\mathbf{~} 1,000,000$ ), divided into 25,000 shares of 1000 francs asch, and transacts all sorts of banking business.- Here also are two conslderabia insurance companies. The rallway from Antwerp to Brussels, $28+$ milea in length, has been aignally snccessful, and has been of great advantage to both cities, but especislly to Antwerp.

Cutem-house Regulations,-Captains of ships arriving at Antwerp, or any of the Belgisn perts, must make, within twenty-four hours, a declaration in writIng of the goods of which their cargo consiste, specifying the marks and numbers of the bales, parcels, etc., their valne, according to the current price at the time when the deciaration is made, the name of the ship or vessel, as well as that of the captain, and of the country to which she belongs, otc.

Nine-tenths of the commeree of Belginm carried on by sea centres in Antwerp. The grest articles of export are com, eapecially wheat ; flax ; cattle, sheep, and pigs ; cast and wrought iran; muskata, fowling-plecea, and small arms; linen and woolen fabrics; clover and other seeds; coal, butter, books, ato. Ine total value of the exports of articles of the growth and manufacture of Belgium amounted, in 1850, to 263,647,000 francs. Of these the exports to France (principally by land) amounted to $74,480,000$ francs ; these to Great Britain to $41,943,000$; the other great importers of Belginm preduce being the German Customs Unien, the Netherlands, and the United States. The great articlea of import are raw cottou, sugar, coffee, and other colocial products $;$ indigo nnd all sorts of dyewoods, spices, wins, rice, ashas, fish, oils, etc. We subjoin

Anville, Jean Baptiste Bourguignon d', a Freach geographer of the highest eminence, and perhaps unsurpassed in any age. This celebrated man was born at Paris on the 11th of July, 1697 . His passion for geographical research displayed itself from his earliest years. At the age of twalve, while reading tha Lstin authors at college, he amused himaelf with drawing maps of the countries which they described. Whils he was thus busily employing himself one day in the class, his master observed and was about to punish him; bat upon casting his eye upon the performsnce, ha immedistely judged him to be rather deserving of encouragement. D'Anville from this time devated himself entirely to geography, particularly that of the ancient world; and at the age of twenty-two he began to delinests maps which attrected the attention of the most eminent geographers.--E. B.

Apeak, in Seamen's language, signifies perpendicular; thus the anchor is said to be apeak when the stem of the ship is brought directly over it by drawing in the cable.
Apotheoary. In the United States, a dispenser of medicines. In England, frequently preacriptions as well as medicines are furnished.
Apron, in Naval Architecture, is a plece of curved timber fixed behind the lower part of the atem, immediately above the foremost end of the kecl. Apron is also a name given to a platform or flooring of plank raised at the entrenco of a dock, against which the dock gates are shut. Apron, in Gunnery, a piece of lead which eaps or covers the vent or teach-hole of a gun.

Appellation, the name by which any thing is known or distinguished when spoken of. Nothing can be more foretgn to the original meaning of many words sid proper aames than their present or vulgar appellations, frequently owing to the history of those things being forgotten, or an ignorance of the language in Which they were expressed. Who, fur example, would dream that the legal proclamation called "O yes," was a proclamation commanding the talkers to become hearers, being the French word Oyez, listen, retained in our courts ever since tha law pleadings were held in French? Or would any person suppose that the luead-land on the French coast near Jalais, called by seamen Blackness, has been so entitled from Its F'rench name of Blane Nez, or the White Head-land?

King Henry the Eighth having taken th, e town of Boulogne in France, the gates of whlch he brought to liardes, in Kent, where tioy are atill romaining, the flatterers of that reign highly maguified this metion, which, Porto Bello like, bocame a popular sulject for
signs; and the port or harbor of Boulogne, called Boulogne Mouth, was accordingly set up at a noted inn in Hlolborn. The name of the inn long outliving the sign and fame of the conquest, an ignorant painter, employed by a no less ignorant isndlord to paint a new one, represented it by a bull and a larga gaping human mouth; siswering to the vulgar pronunciation of bull and mouth. The same piece of histery gave being to the bull and gate, originally meent for Boulogne Gate, and represented by an embattled gate or entrance into a fortified town.

The barber's pole has been the subject of many conjectures; some conceiving it to have originated from the word poll or head, with several other conceits as far-fetched and as unmeaning; bat the true intention of that party-colored staff was to show that the master of the shop practiced surgery, and could breathe a vein as well as mow a beard. The white band which encompasses the staff was meant to represent the fillet thus elegantly twined about it.

Nor were the chequers, at this time a common sign of a public house, less expressive-being the representation of a kind of draught- board calfed tables, and showing that there that game might be played. From their color, which was red, and the similarity to a lattice, it was corruptly called the red lettuce, which word is frequently used by ancient writers to signify an ale-house.
The Spectator has explained the sigu of the Bell-sacage Inn plausibly enough, in supposing it to have been originally the figure of a beautiful femaie found in the woods, called In French la belle sauvage. But another reason has since been assigned for that appellation, namely, that the inn was once the property of Lady Arabelia Savage, and familiarly called Bcll Sarage's Inn, probably represented, as at present, by a bell and a savage or witd man, which was a rebus for her name, rebuses being much in fashion in the sixteenth century.

The thres gilt ball so commanly hung out as signs at pawnbrokers' shops, by the vulgar humorously enough said to indicate that it is two to one that the things pledged are never redeemed, were in reallty the arms of a set of merchants from Lombardy, who were the first that publicly lent money on pledges. They dweit together in a streat, from thom named Lombard Street, in London, and also gave thelr name to another at Parls. The appelistion of Lombard was formeriy all over Europe considered as synonymous with that of usurer.

At the Intitution of yeomen of the guards, they uaed to walt at tabio on alt great solemnltics, end were ranged near the buffets. Thia procurad them the neme
of buffetiers, not very unike in sound to the jocular appellation of beefeaters, now given them; though probably it was rather the veluntary misnomer of some wit than an accidental corruption arising from ignorance of the French language. ino
The opprobrious title of bum bayliff, so constantly hestowed on the sherif's oficers, is, sccording to Judge Blackstone, only the corruption of bound bayliffe, every sheriff's officer being obliged to enter Into bonds, and to give security for his good behavior, previous to his appointment.
A cordwainer seems to have no relation to the occupation it is meant to express, which is that of a shoemeker. But cordonier, originally spelled cordaunier, is the French word for that trade; the best leather used for shoes comiog originally fr$m$ Cordova, in Spala.E. B.

Apples, the frult of the Pyrus Malus, or apple-tree. It is very extensively cultivated in most temperate climates. An immense variety and quantlty of excellent apples are raised in England, partly for the table, and partly for manufacturing into cider. Those employed for the latter purpose are comparatively harsh and sustere. The principal cider conntics are Hereford, Monmouth, Gloucester, Worcester, Somerset, and Devon. Mr. Marshall estimated the produce of the first fonr at 30,000 hogsheads a year, of which Worcester is supposed to supply 10,000 ; but it is now probsilly much greater. Half a hogahead of cider may be expected, in ordinarily favorable seasons, from each tree in an orchard in full bearing. The number of trees on an acre varies from 10 to 40 , so that the quantity of cider must vary in the same proportien, that is, from 5 to 20 hogsheads. The produce ia, however, very fluctuating, and a good crop seldom occurs abovo once in three years.-Lovdon's Encylopedia of Agriculture, etc. Besides the immense consumption of native apples, the English impert, for the table, large supplies of French and other fereign apples. Owing, however, to the duty, previously to 1842 , having heen an ad nalorem one of 5 per cent., we are unable to specify the quantities imported. They must, however, have lren very considerable, as their declared value ameunted, in 1841, to $£ 41,1974 \mathrm{~s}$. 10 d . In 1842 the duty was fixetl at $6 d$. per bushel on raw, and $2 s$. per bushel on dried apples. At an aversge of 1850 and 180̄1, the entries for consumptlon amounted to $44!, 950$ bushels. The duties in England were reduced in the course of the year 1853 to 3d. per bushel on rew, and 1s. per bushel on dried apples. The apples produced in the viclnity of New York are univereally adioltted to be the finest of any ; but unless selected and packed with care, tiley are very apt to spoil before reaching England. The exports of apples from the United States during the year ending the 30th of June, 1852, amounted to 18,411 berrels, valued at 43,635 dollars. Of these 1808 barrels were shipped for the United Kingden. In the year 1851-5, the quantity exported was 83,959 barrels, at a value of $\$ 107,600$.

Appraiser (from ad, to, and pretium, value), one who rutes or sets a value upou goods, etc., used princlpally in the custem-house to designato men who appraise goods entered for duty.

Apprentice, a person of cither sex bonnd by indenture to serve sonio partieular individual or company of indtviduals for a specified time, in order to be lustructed in some art, science, mystery, or trade.

Apprentioeship, the servitude of an apprentice, or the duration of his indenture.

Seven years seem tuncieutly to havo been, all over Europo, the usiai term establisilied for the duration of apprenticeshipe in the greater part of incorporated trades. All such incorporations were anciently called univeraities, which indeed ls the proper Latin name for any incorporation whatever. The unlversty of smiths, the university of tailors, etc., are expressions whlch we ceinmonly meot with in the old charters of ancient
towns. When those particular incorporations which are now peculiarly called universities were first established, the term of years whlch it was neressary to atudy in order to obtain the degree of master of arts, appears evidently to have been cepled from the term of apprenticeship in common trades, of which the incorporations were much more anclent. As to have wrought seven years under a master properly qualified was necessary in order to entitle any person to become a master, and to have himself apprentices in a common trade; so to have atudied seven years under a master properly qualified was necessary to entitle him to become a master, teacher, or doctor (words anciently aynonymous), in the libersl arts, and to have scholars or apprenticea (words likewise orlginally synonymous) to atady under him.

Apprentlceships were altogether unknown to the ancients. The reciprocal duties of master and apprentice make a considerable article in every modern code. The Romen law is perfectly silent with ragard to them. Ther is no Greek or Latin word which expresses the idea we now annex to the word apprentice-a servant bound to werk at a partlcular trade for the benefit of a master during a term of yeare, upon condition that the master shall teach him that trade.-E. B.
Aqua Fortin. See Acrd (Nitric).
Aqua Marina. See Beryl.
Aqua Vitse (Ger. Aquavit; Fr. Eau de vie; It. Aequa vite; Sp. Agua de vida; Russ. Wodka; Lat. Aqua vitce), a name familiarly applied to all native distilled spirits; equivalent to the eau de vie, or brandy, of the French, the whisky of the Scotch and Irish, the geneva of the Dutch, ete. In thls way it is used in the excise lawa relating to the distilleriea.
Aqueduct, a conduit or channel for the conveyance of water. It is derived from aqua, water, and ductus, a conduit. It is applied more particularly to those etructures of masonry which have been erected for the conveyance of water acress valleys, to which, however, we would rather give the name of aqueduct bridges, extending tho term aqueduct to the whole conduit or channel by which the water is cenveyed from one place to another. The conveyance ot water for the supply of lerge citles has in all ages formed a very important object of public economy; and aqueducts of various kinds have been in use for this purpese frem the earliest tines, the remiains of which have been examined by travelers in different parts of the East. Pocecke describes a work of thls kind erected by Solomon, for conveying water frem the pools and fountains near Bethlehem to Jerusalem. "The aqueduct," he says, "is built on n foundation of stone; the water runs ln round earthen pipes ahout ten inchea diameter, which are cased with two stones, hewn ont so as to fit them, and they are covered over with rough stones well cementel together; and the whole is so sunk into the ground on the slde of the hills, that in many places nothing is to be seen of it." But it was in the luxurious capital of Reme that the system of aqueducts was brought to the greatest perfection, and carried to an extcut which has never been equaled even in modern times, and has justly exclted admiration both from the number and magnificence of the works themselves, and the prodigieus quantities of water which ly these means were conthually poured into the city. These nqueducts extended, some of them 30,40 , and even 60 miles from the city, in one contlinued covered channel of stone, carrled by arcades over the wldest and deepest valleys, and by tunnels running in many parts for miles through mountains and through the solld rock. "If we consider attentlvely," says l'liny, "the quantltles of water brought into tho elty for the use of the public, for baths, for fishponds, for private heuses, for artificlal lakes, for gardens in the neighborheod of the clty, and for villas; if we luek also at the works wheh have been constructed for forming a regular channel for the waters-arch-
ea raised up, mountains pierced with tannels, and valleys filled up to a level ; it must be acknowledged that there is nothing in the whole world more wonderful.".

Within the last cantary, the invention and improvement of the manufacture of cast iron has completely changed the mode of conducting water into citiea, by the introductlon of cast-iron pipes lnstead of the atone conduits of former times. These pipes can now be formed of almost any dimensions, and unlted together into a continued aerias, so clonaly as to prevent the escape of the water, aven under a violent pressure arising from the altitude of the fountain-head. They ensble ua, therefore, to take advantage of and give effect to that grand principle in hydrostatica, that the fluid element tends continually to a level, even though it be confined in the smallest or most complicated aystem of pipea; so that howaver low it be rarried in any valley, or to whatever distance, atill it will rise on the oppoaite side to the orignal altitude of the fountaln-head-a principle which is most imnortant, indeed, in such works, seeing that by it we are not restricted, as the Romans were, almost to a perfect level in the line of the conduit. We have seen that, for the purpose of attainioug thls level, or very gentle ceclivity, all along the conduit, they were under the recesalty of ruising it by arcades continued in une ulwoken serice, frequently 30 or 40 miles in extent; anc', in addition to this, often prolonging the length of the srack ly a circuitous route, turning and winking for miles out of its course, for the very purpose of increasing its length.

But the usa of pipes enables us to dispense with these long arcades, all raised nearly to the same level with the fountain-head; because the conduit may be varied in its lovel to any extent, and still vill rise at last to its original altitude. The pipea, therefore, aro merely laid all along the surface of the ground, with a cover of two or three feet of soil to place them beyond the reach of frost. To prevent, however, the frequent or sbrupt alternations of rise and fall, any erdilen lnequalitiea in the ground are equalized by cuttinga and embarkments, but not to any thing like the extent that would be required to raise the whola to a lovel. This, therefere, forma a capital inprovement in the method of conducting water, and the greateat, Incleed, which has ever been inade In this important braneh of practical mechanics. That it was not introdaced by the Romana, ia not to be ascribed, as many have done, to their iguorance of the hydrosta*ie principle that the fiuld would rise to a level in the opposito branclese of the same train of pipee. Professor Leslie has shown that they wera well aequainted with tbis principle, and has moreover obtained from Italy a portion of a leaden pipe, supposed to ilave been used in the buths of Caracalla, which sets this matter at rest. But from the low state of tbe arta at that period, they were unable to give effect to tha principle. They had not the means of falricating pipes of such a magnitude as would have been recuired for the enomous quantlity of water consumed in Rome, and at the same time of strengat suffielent to withstand the pressure from the fountainhearl. Lead was the anly material that conid be used by them for the purpose; and besldes the enormons thickness that so weak a materia! would ha: $:$ e required, and the lmpracticability of their forving them, and uniting them together endwise, they were toe well acquainted with the fendency of lead to render the water unwholesome by its poisonons impregration. The nae of cast iron was guite suknown. There remoined, therefore, no resousian but in the argueduets, which, though attended to doubt with vast expense, and requiring great enterprise, as well as both akili and patience, were yet attainable by these menus, and formes when completed a simple and very perfect mode of c fecting the object. Hence arose all thote works abo. 1 deseribed which have since excited such astonishment. Now, howeser, when the manufacture of enst iron has been brought to auch perfectios, and methods contrived
for uniting perfectly together all the 1 dpea into one connected train, this lmproved syatem has beea univeranlly dopted.

Croton Aqueduct.-The Creten Aqueduct, by which the city of New York is supplled with water, may be regarded as the most magnificent work of the kind executed in modern times. It was commenced in 1837, and completed in 1842, at an experies of $8,575,000$ dollars, the distribution pipes coating $1,800,000$ dollars additional. Its length from the Croton Lake to the receiving reaervoir is $38 \frac{1}{\$}$ miles. The Croton Lake, which is formed by the Croton Creek, a amall atream of wholeaome water falling inte the Hudson, covera 400 acres, and contalua a body of water of about $500,000,000 \mathrm{gal}$ lona. To the valley of the Harlem River, a distance of 88 miles, the aqueduct la built of atone, brick, and coment, arched over and under, 6 feet 8 inchea wide at the bottom, 7 feet 8 inches at the top, and 8 feat 5 inches high; and capable of discharging $60,000,000$ gallons per day. It is carried over the Harlem valley in iron piper, laid upon a magrificent bridge 1460 feet lcag , ce.atructed of arches 114 feet above jigh-water mak at Yorkville. Theae pipes pass into .be receiving reserv vir, which ia 1826 feet long and 886 feet wide, covering an area of 37 acrea, and capable of containing 150,(000,000 gallons. Hence, to the distributing reservoir, a distance of 51 milea, the water is conveyed by a double line of iron pipea 3 fcet in diancter. Thls second reserveir is 420 feet aquare and $4 \$$ feet chove the strects, with a capacity of $20,000,000$ gallonz-whence the water is conveyed through the city by about 170 milea of pipe, principally from 6 to 12 inches in dianater.

In those parts of British India where the fall of rain Is seanty and uncertain, recourae la had to artifieial irrigation, and the waters of wany of the rivers of the country have been rendered available for this purpose by meana of public worka constructed by the government. Of thes the most important is the Ganges Canal, which traversea the northwestern provinces of Bengal, and distributes over their vast area nearly the wholr volume of the watere of the Gauges. The canal begins at the point where the river isenes from the mountaita and enters the plains of Eengal. Alout 20 miles from ita source, the line of the canal crosees the valley of the Solsai River, and the works for efliecting the transit are depigned on a seale worthy of the undertaklig. The valiey is between two and three nilex in width. An earthen embankment is carricd ncross, raised on an average between 16 and 17 feet above the surrounding country, and having a width of 350 feet $5 t$ ita base, and 290 feet in the upper part. This embankment forms the led of the canal, which is protected by banks 12 feet in depth and 30 feet wide at the top. To preserve these banks from the eflecte of the action of the water, linea $f^{f}$ masoury formed into stepa sxtend on cuch side throughout their entire length. 'The Sulani River is crossed by an aqueduct 920 feet :ung, laving side walle 8 feet thiek ond 12 deep, the dep,h of the water beside 10 fcet. Thr water of the esnal passes through two separate chanuris. That of tae Rlver Solmal flowa under fifteen arches, having a span of $h 0$ feet ench, conatructed in the moat ubstantial manner, and spriaging from piens resting on block s of masor. ry annk into the lied of the river.

The great water-works that supply the sity of Marscillea with the $\mathfrak{l}$ ater of the Durance, by a ean. 1 about 60 milea in lensth, are among the boldest undertakiugs of the kind in medern times. This canal, begun in 1830, and not yet completed (1855), has airearly cuat athove $\mathbf{t}^{2} 2,000,000$ stering. It is conveyed through tibre chains of limestone mountains by foricyfivg tunnels, ft : wing an aggregate length of $8 \frac{1}{2}$ miles, and across numerous val: ys by aqueducts; the lar gest of whieh, the Aqueduet of Jinquefinvor, over the ravine ot the River Are, about 5 milea from Aix, sur. passes du slae and altitude the anclent lent din Gard.

The immanse volume of water, which passes at the rate of 138,000 gallons per minute, is carried across as In the old Roman aqueducts by a channel of masonwork. The beight of this aqueduct is 262 feet, and its length 1287. The number of cubio yards of masonry contained in it is 57,000 ; the total cest has been \&151,394.

Edinburgh Water-works.--The works onde: iken by the Ediniurgh Water Company in 1819 were p bably the most complete and periect of the time. Thy were designed by Mr. Jardine, the then engineer of the company, and carried out under his auperintendence in a style quite worthy of the city, and offering, both in the gevoral design and in' all the details, a model of propriety and akill in this species of hydraulic architecture. The Crawlej springs were conducted by an aqueduct into a covered cistern at a point about 7 milies distant from Edinburgh, and a eupply from the stream called the Glencorse Burn, conveyed by an open-work tomnel from abont a mile and a half weatward. This tunnel is in some places upward of 30 feet dcep, and the valiey through which it passes, consisting entirely of gravel, acts as a filter through which the water descends and percilates, all solid matter being intercepted in its passage to the tunnel from whence it is dolivered into the cistern, and conveyed to Edinburgh by a chain of pipes varying from 20 to 15 in chee of interior diameter, without being exposed to the light of day. From the numcrous undulations of the surface, the fall of the pipe is not uniform. Abrupt Inequalities, however, were removed by eutting and embanking. Toward the northern termination of the line the pipe is carried through a tunnel of 2160 feet in length, and abont 70 or 80 feet under the surface of Heriot's Green. In crossing the Grass Market it forks off by one branch to $A$ reservoir in the Castle Hill, and by another alvout 120 feet under the reservoir, through a tunnel 740 feet in length, cut through the rock of which the ridge leading to the Castle is composed. Branches were laid through all the principal streets.

The pipes are in lengths of $9 \frac{1}{2}$ feet each, and were tested before being laid by a pressure equal to a verticsl column of 800 feet of water. The joints are what are termed spigot and faucet. Cocks for the dlscharge of air accumulating in the pipes are placed at the summits of all the considerable elevations; and in the hollows are placed sluice cocks for the purpose of running off sand or othor aolid inatter which may colleet in the pipe. It is capable of delivering 953.56 culic feet of water per minute into the reservoir at tho Castle Hill.

The formation of the Compensation Reservoir was undoubtedly the greatest work of hydraulic engineering of its day. It was designed and completed by Mr. Jardine, and, with the then limited experience rí contractors and workmen in the construction of sim:tar works, its successful completion loes great hono: to the genius and perseverance of the engineer. It has jeen twice enla'ged, and now forms an artificial lake extending over an area of 46 imperisl acres.-E. B.

Arangoes, a species of beads made of rough enrneiian. They are of various forms-as, barrel, bell, round, etc.-and all drilied. Tino barrel-shaped kind, cut from tie best stones, aro from two to three inches long, and should bo chosen as clear as possitle, whether red or white, having a good notish, and free from faws. The beil-shajed ure from one to two inches long, being ln all respects inferior. Considerable quantitles were formorly imported from Bombay, for re-expot tation to Afriea; but since tibe abolition of the slave-trade, the imports and exports of Arangoes are comparatively trifling.-M1.aunn'g Orient. Com.

Arbitration, a term derived fro. the nomenclature of the Rouan law, and applied to an arrangement for taking and abiding by the judgment of $n$ selected person in some diaputed matter, listead of carrying it
to the established courta of justice. Arrangements for avoiding the delay and expense of litigation, and referring a dispute to friends or neutral persona, are a natural practice, of which traces may be found in any state of society ; but it is to the Juatinian jurisprudence that we owe it as a system which has found its way into the practice of Europeen notions in general, and has even evaded the dislike of the English common lawyers to the civll iaw. 'The elghth section of the fourth book of the Pandects is devoted to this subject, and may be consulted througi the commentary of Heineccius, or a more minute critical inquiry by Gerard Noodt, in his commentary on this section (Opera, il. 185 j. Almost all the advantages, as well as the defects of the system in modern practice, aeem to have been anticipated by the Roman juriste. Thus it ia shown that voluntarily selected judges can only prop. erly decide questions which the parties themselves could aettle by giving and taking, and that they ought not to be authorized to desl with criminal inquiries or public questions ; while, by excluding matters of personal status, such as marriage or legitimacy, the Roman jurists anticipated the principie, that even private questions which may affect the public morals or poliey can not be thus extrajudicially disposed of. They dwell on the principal advantage of the aystem in exeluding appeal from the arbiter's decision on any such ground as erroneous law, or false views of the influence of well-investigated facts. But, on the other hand, they discuss, with their usual scientific subtlety, the many defects, such as excess of authoritr, neglect of form, and partiality in receiving pleadings er evidence, and the like, by which arbitrationa become vitiated; and thus these jnrists at once suggest what is ever the defect of a system of arbitration, that the more it performs its function of doing justice, the more it becomes what the established tribunals of the country ought to be, and fosters two systems of judicature where one shouid be aufficient. Some of the civilinns make a distinction between tho arbitrator, the name teehnically upplicable to a person coluntarily chosen by parties to decide disputes, and the arbiter, an offieer to whom the pretor remitted questions of fact as to a jury. In this sense arbiters uppear to have been employed as a suhstitute for jury trial in some of the old provineial laws of France; and hence, perhaps, it comes that, by a very remarkable provision in the French code of commerce, all questions between partners touching the partnership mast be referred to arbitration. In the code of civil procedure, the title des arbitrages is treated so fully and minutely, as very foreibly to convey the impression of a separato system of voluntery jurisdiction being created for performing what ought to be uccomplished by the ordinary tribunals in a well-regulated judicial system.
Arbitration, in the Lavo of England (according to Blackstone), is "whero tho partics, injuring and injured, submit all matters in clispute, concerning any personal chattels or personel wrong, to tho judgment of two or moro arbitrators, who are to decide thic contiversy; and if they do not agree, it is usual to ndd, that another person be called in as umpire (imperator), tc, whose sole judgment it is then reforred; or frequentiy there is ouly one arbitrator originally appointed." The decislon must be in writing (unless otherwise expressly provided in the sulmission), and is called an aveard; and thereby tho question is as fully determined, and the right trausferred or settled, ss it could have heen by the agreement of the parties or the juigment of a court of law or equity.
There were, however, many inconveniences attending this mocie of proceeding; and in the year 1698, the Legislature accordingly interfered, and passed the act 9th and 10th Will. III., cap. 15, which enacted that, "for promoting trade, and rendering the awards of arbitrators thes more effectual in all cases, for the final determination of controversies referred to them by
merchante and traders or othera, concerning mattera of acconnt or trade, or other matters;" all merchants and others desiring to ead any controversy, wult, or quarrel (for which there is no other rtanedy but by personal action or suit in equity) by arbitration, may agree that their submission of their auit to the award or umpirage of any person shall be made a rule of any of the courte of record, and niay insert auch agreement in their submission; which agreement being proved by the affidavit of one of the witnesses thereto, the court shall make a rule that auch arbitration or umpirage pursuant to such submission shall he conclusive; and after such rule made, the parties disoleying the award shall be liable to be punished, as for a contempt of court; pniess auch sward shall be set axide, as procured by corruption or undue means in tha arbitrators or umplre, to be proved on osth to the court, before the last day of the next term after the award ia made.

An application for an attachment for not performing an award may be resisted at any tima for defecta appearing on the face of the award itself; for such an award, after that time, might be pleaded in bar to any action brought upon it, although it can not be aet aside for auch defects after the end of the next term. Sulmianions of disputes to arbitration may be by consent of the parties, or with the interposition of a court of justice; by rule of court, or order of a judge, when a cause is pending, either by bond, agrement in writing, or by parole. A verbal agreensent, however, to abido by an award can not be made a rule of court. Nor can matters purely criminal be submitted to the decision of an arbitrator. And by the 12th and 13th Vict. c. 45, § 12-15, the provisions of the former atatutes as to arbltrations are extended to "controversies and disputes, for which the remedy is by appeal to a Court of General or Quarter Sessions of the Peace." Lastly, although the right of real property can not pass by a mere award, yet if a party be awarded to convey land, and refuse, he will be liable to an action, or to an attachment for not performing the award. The agreement of reference must be expreased with great care and accuracy; provisiona shonld be ineerted giving power to either party to make the submission a rule of court, to enabie the court to refer the matter back to the same or to another arbitrator; and in case of the death of either party before award, for its making and delivery to his represeatatives; and also as to the coata, which are usually directed to be in the diseretion of the arbltrntor as to those of the reference, and as to those of the cause to alide the event of the award; and a certain day should be appointed on or before which the arbitrator is to minke hia award, with a power to eael arbitrator to enlarge the time.

When arbitrators have the power of electing an untpire, they may choose him, and call in his assiatance as soon as they begin to take the subject into considcration; and this is the more convenient practice, as it secures a decision upon a single investigatir of the controversy. As to the award: it must be i.. pursuance of the submission, and embrace all the nuatters submitted, and not extend beyond lt in the suljectmatter, in persons, in time, or in particular circumstances; it must be certain; it inust make a final end and determination of all mntters contained in the submission; it must be mutuai, that is, it muat not bo entirely of things to be performed by one party, without such things being in satisfaction of the matters in lifference; and, finsily, it innst not be unreasonable, iilegal, or impossible to be effectuated. Formerly, is sabmission to arbitration, heing a mere authority, might be revoked at any time before execution by an instrument of as high a nature as that by which the submission was creatod. Ilut now, by thu English Law Amendment Act (3d and th Will. IV., cap. 42), the aubmission to arbitration by Rule of Court, or Judge's order, or order of Nisi Prius, or if there be an ogreement to make the submission a Rule of Court, can not be
revoked by any party thereto, without leave of the court or a judge. The deatl, lowever, of either party before award is a revucation of the authority, unleas otherwise provided ju the submission; and ao also is the marriage of a female lefore award; the marriage operating as a civil death to all ber rights as a feme sole. Under this statute the attendance of witneasea, or production of locuments before the arbitrator, may be compelied by a rule of court, or order of a judge, on payment of expenses and losa of time; and the arbltrators are empowered to administer oaths to the witnesses, where it is so agreed or ordered ly the rule or order of reference. Any witneasea falling to attend are deemed to be guilty of contempt of court, or giving false evidence guilty of perjury. The court or judge may also, in the casea within the statute, enlarge the time for an arbitrator to make hia award.--E. B.

Archangel, the principal conmercial city of the north of Russia, in lat. $65^{\circ} 82^{\prime} 8^{\prime \prime}$ N., long. $40^{\circ} 33^{\prime}$ E., on the rigat bank of the Dwina, about 35 English miles above where it falls into the White Sea. Pop. 24,500. The harbor is at the laland of Sollenbole, about a mile from the town. The bar at the mouth of the Dwina has from 13 to $14 \frac{1}{2}$ feet water; so that shjps drawing more than this depth must be partially leaded outside the bar from lighters. The Dwina being a navigable river, traveraing a great extent of country, and connected ly canala with the Wolga on the one hand, and the Neva on the other, Archangel ls a considerable entrepot. It was diacovered in 1554 , hy the famous Iichard Chaneellor, the companion of Sir Hugh Willoughby in his voyage of discovery ; and from that period down to the foundation of l'etershurg was the only port in the Russian empire accessihle to foreignera. Though it has lost its ancient importance, it atill enjoya a pretty extensive commerce. The principal articles of export are grain, tallow, flax, hemp, timber, linseed, iron, potash, mats, tar, etc. Deals from Arehangel, and Onega in the vicinity of Archangel, are considered superior to those from the Baltic. Hemp not so good as at Riga, but proportionally cheaper. Tellow is also inferior. Iron same as at I'etersburg, some--imes cheaper and sometimes dearer. The quality of the wheat exported fruin Archangel is alout equal to that from Petersburg. The importa, whieh are not very extensive, cousist principaily of sugar, coffee, spices, sait, woolens, hardware, ete. The trade of Archangel has latteriy been deelining. It is much inthuenced by the demand from the more southerly parts of Europe, and especlaily from England, for corn. When a brisk demand is anticipated, oats are brought in large quantities from the interior, sometimes even from a distance of 1500 miles, in covered barks capable of bolding several hundred quarters. But as there are few extensive establishmenta here, the supplies are scanty, except when a large demand is expected for some time previously to the season for bringing them down.-Ondy's Europeon Commerce, and private information.

Moniz:, Weights, and Measures, same as at Petehsnung: which see.

Archipelago, called by the Turks $A V$ degniz, the White Sea, to distlnguish it from Cara degniz, the lllack Sea, is generaliy applled to that part of the Mediterranean extending from Furopean Turkey and Greece on the west, to Asia Minor on the east, and stretching southward to the island of Candia.

The name Arehipelago was unknown to the ancients, and is generally supposed to be a corruption of Nizaiov rédayos, by which name, the derivation of whieh is uncertain, ft was knowa to the Greeks. The ancienta divjded icinto, (1.) Mare Thracium, the northern part, extending aouthward to the northern coast of Eubria ; (2.) Mar Myrtoum, the southweatern part, washing the shores of Attica and Argolis; (3.) Mara Icarium, tha southeastern part, extending along the coasts of Caria and Ionia.

The navigation of this sea is rendered difficult by the many islands and rocks with which it ahounds, and by the frequent occurrence of sudden squalls, especially about tho equinozes; but it has a great number of safe and commodious gulfe and bays. Besides the Cyclades ant Sporades, which are the two principal groups of smaller islande, it con ${ }^{+ \text {sins }}$ Euboea, Samos, Chios, Lesbos, Lemnos, Imbros, Samothrace, etc. All these islands are mountainous, snd many of them are of volcanic formation ; whilo others are almost entirely composed of pure white marblo, for which Pares, one of tho Cyelades, in particular, is so celebrated. The larger islands have some very fertite and wellwatered valleys and plains. The principal productions are wheat, wine, oll, mastic, figs, raising, honey, wax, cotton, and silk. The inhabitanta are much engnged in tishing, and the coral and sponge fishery are actively prosecuted among the Sporades. Manufactures are at a very low ebh, alroost the only branch carried on being that of cotton-weaving. The ellmate is mild and salubrious; the heats of summer being tempered by the sea-breezes, while the wintere are less severo tian on the neighboring main-land. The men are hardy, well-huilt, and handsome; and the women are noted for their beauty. The islands of the Archipelago are considered to belong partly to Europe and partly to Asia. At prosent the Cyclades form a portion of the Greek kingdom, while most of tho other islande are aubject to Turkey.

The name Archipelago, which was primarily given to the Agean Sca, is now applled to various othor seas which contain numerous islands, as the Eastern Arehipelago, Caribbean Archipelago, etc.

Archive, or Archivea, a chamber or apartment wharein the, records, charters, and other papers and evidences, of a atate, house, or comusulty are preserved, to be consulted occasionally. Thus we say the archives of a collige, of a monastery, etc.

Arctio Cirole is a lesser circle of the ephere, parallel to the equator, and $23^{\circ} 30^{\prime}$ distant from the north pole; from whence its name. This, and its opposite, the antarctic, are called the two polar circles, and niay be conceived to be described by the motion of the poles of the ecliptio round the poles of the equator, or of the world.

Arctio Ocean, that portion of tho North Sea which extends from the arctic circle (lat. $66^{\circ} 80^{\prime}$ N.) to the north pole. It receives the waters of the northern slopes of the great continenta, and is the recipient of the drainage of an area of $3,751,2 ; 0$ equare miles. It enters deeply, in the form of gulfs, bays, etc., into the northern parts of the continents of both hemispheres. The principal of these indentations are the White Sea, in Europe; Sea of Kara, Gulfs of Obe and Yonisse, in Siberia; and Baffin's Bay, in North America. It is united to the Pacific by Behring's Strait, and to the Atlantic by Davis'Strait, and a wide sea extending from Greenland on the west to Norway and Lapland on the east. This portion of the Arctic Ocean is occupied centrally by Greenland, and on the east is the extensive group of Spitzbergen, the small island of San Mayon, and Iceland. West of Greenland, and divided from it by Davis' Strait and Baffin's Bay, are a considerable number of islands of great size, which hnve been but imperfectly expiored. The region north of lat. $70^{\circ}$ is the most dreasy on the face of the globe.

The shores are covered with eternsl snows, and the surface of the sea, when its icy covering is rent asunder, presents a series of huge floating masses in perpetual motion, and whose tremendous collisions are nttended with the most appalling sounds. Dense fogs, violent storms, and endiess nights, add to the horrors of the acene. In the region of Spitzbergen the sun is not scen for several months in the year, and the thermometer rarely risos above $45^{\circ}$ Falsrenheit; whilo there is but one month in the year (July) in which snow does not fall. The only, or at least the greatest de-
gree of light the 1 habitants enjoy during their long winters, or from the latter end of September to the beginning of May, is that which proceeds from the borrowed lustre of the moon, the stars, the aurora, or the saow blink. This ocean freezes even in summer, and during the eight winter montha a continuous body of lee extends over its entire surface, filling the area of the circle of between 8000 and 4000 miles in diameter. The icebergs, of which vast numbers are continually in motion wherever an opening appears, vary from a fow yards to miles in circumference, and rise to hundreds of feet in height. The ice in these regions is very transparent, compact, and remarkalie for tho variety and beauty of its tints. The water is extremely pure, shells being distinctly visible at a depth of 80 fathoms. The preasure of the water at a depth of $1+$ miles has been found to be 2809 lbs , on a equare inch of surface.

The history of adventure in the Arctlc Seas presents a striking disproportion hetween effort and achievement. All that human daring can do has been done to open up the mysteries of these dreary regions. *The first attempt to explore the Polar Seas was made in 1553, by Willoughby and Chancellor, who were sent out with instructions to ascertsin if there was a northeast passage, or if they could reach China by nassing to the north of Europo and Asia. Willoughby reached Nova Zombla, but he and all his crew were frozen to death. Chancellor entered tho White Sea, and thus opened a communication with Russia. Cnptain Cook resched Icy Cape from the Pacific in 1778. In 1607 Captain IIudson was sent out to attempt to discover tho northwest passage, and reached the lat. of $81^{\circ}$, hut was under the necessity of putting back on account of the ice. In 1773 this experiment was again tried by an expedition under the command of Captsin Phipps, who advanced sbout as far as Captain Hudson had previously done; and a similar attempt was made in 1818, which proved equally unfortunate, under Captain Buchau. In 1818 Captain Ross attempted a northwest passage, and passed through Lancaster Sound. In 1810 Captain Parry reached long. $110^{\circ}$ W., and in 1821-23 examined the coast to the north of Hudson's Bay; in 1824 he reached Prince Regent Indet. In 1826 Captain Franklin was sent overland to explore tho nerth cosst of America, to the west of Mackenzie's River; and at the same time Cuptain Beechey waa dispatched to meet him in Behring's Strait. The two expeditions approachod each other to within a distance of 146 miles, bui returned without meeting. In 1827 Captain Parry was acnt out to penetrate as far as possible in tho direction of the Pole in bosts and sledges, over the ice, and he reached about $82^{\circ} 40^{\prime}$, the highest latitule yet attained. In 1829-83 Captain Ross sailed up Prince Iiegent Inlet, ascertained that there is no communication between the Arctio Ocean and the Atlantic south of Barrow's Strait. The expedition sent out in search of the long-desired route from the Atlantic to the Pacific, through the Polar Seas, commanded by Sir John Frauklin, saited in 1845, with two ships, the Erebus and Terror, and has not since been heard of. Several expeditions have been dispatehed in scareh of the missing navigator and his compnnions, but hitherto without success. Ono of these expeditions, commanded by Captain Kellet, attained, on Auguso 15, 1849, the lat. of $71^{\circ} 12^{\prime}$ N., long. $170^{\circ} 10^{\prime} \mathrm{W}$. ; and on the 16 th discovered an almost innecessible island of granito, rising 1400 feet abovo the sea, beyond which a range of high land was scen; but constant snowstorms compelled him to quit the neighborhood without doing more, to prevent his being hemned in by the pack-ice.

The long absence of tho oxpedition under the command of Captain Franklin, and the unsuccessful efforts made fiom Britain to aseertain the fate of the missing navigators, induced Jady Franklin to appeal to Amerlea for aid in seeking for her husband and his compan-
lons. Iler appeal was resporided to by Henry Grianell. Ile purchased vessels, which, with the countenance and ald of the Ünited Statea Government, were sent to assist in the search. Thia munlficent act of Mr. Grinneli is without a precedent. It was an undertaking by a private citizen of one country to seel out and restore to their homes, if possible, the officers and crews of the absent ships of another. The American searching vessels were placed under the command of Lieutenant De Haven, of the United Statea navy. The Reseue, the formost vessel of the American expedition, entered Wellington Channel in company with the Asistance, the foremost vessel of all the British expeditions, on the 24th of August, 1850; and when, at the close of the season, It became apparent that no further progress could be made, the American vessels, without the aid of steam, were at the farthest point that was made by any vessel of the three llijitish expeditions then engaged in the search, all of which had been assisted by ateam on thelr outward voyage, when in and while crossing Ihaffin's liay. The expeditions of Ross, Austin, and Penny made harbors. The Americans were afioat the whole of a long arctie winter, at the mercy of the winds, the currenta, and the ice. On the 18 th of September, De Ilaven was nortin of Cape Bowditch, the most northern point seen by Parry in 1819, and farther north within Lancaster Sound than had been attained by any vessel of all the exploring and searching expeditions. Ilia discoveries began at Cape Bowden, on the $\mathbf{1 7}$ th of September; by the end of the month he was at $75^{\circ} 25^{\prime} \mathrm{N}$. Here be anw hitherto unknown land to the east, and the west, and far to the north. To this new-liscovered 1 aid he gevo the name of Grinnell Lavd; and to a lioght of land seen, Mount Franklin; and named tho bodies of water Maury Channel, ete. The following season this country was exploted by passing over the ice much farther weat, by Captain Penny and others of the British navy. The name of Ginnveis. Land has been ungenerously onitted from the charts of this region published by the Britiah Admiralty, and the name of Albert Land supplies its place.-Hanrer's Gazetteer. Captain Sir Hobert M'Clure, in the autumn of 1850 , by traveling over jee, connected the geography of the waters of the Pacifie and the Atlantic for the first time. When in 1853 this newa arrived in England, he was hailed, very justly, as the discoverer of the Northwest Passage. But ne veasel has ever passed through the frozen etraits traversed by M'Clure. The passage discovered by him has been crossed on the ice many times, but never by ship or boat of any sort.

May 31, 1853, Dr. Kane started on his second voyage, and being longer than the time proposed, the Aretic, under Lieutenent IIartstein, was sent in search of him. Dr. Kane was found at the Danish aettlements on his return home, having lost his vessels and suffered great hardship, but without meeting any success in his efforts or making further discoveries. Lieutenant llartatein arrived, with Dr. Kane, October 11, 1855. It is now almost certain that the remains found by Dr. Rae were those of Sir John Franklin and party, and the Royal Geographical Society propose giving him the reward of $£ 10,000$ which was offered.

Argo, in Antiquity, the ship celebrated in ancient poetry as that in which the Argonauts mado their expedition to Colchis in quest of the golden fleece. Jason having happlly accomplisied his enterprise, consecrated the shlp Argo to l'oscidon (Neptune), or, as others sny, to Athena (Ninerva), on the isthmus of Corinth, where, they add, it did not remain long before it was translated into lieaven, and made a con-stellation.-E. II.

Argol, Argal, or Fartar (Gern. Weinstein; Du. Wynsteen ; Fr. Tertre; It. Sp. and Port. Tartaro; Russ. Winnui kamen; Lat. Thrtarus), n hard crust formed on the sides of the vessels in which wine has been kept; it is red or white according to the color
of the wine, and ia otherwise impure. On being purfled, it is termed cream or crystals of tarter. It censiats principally of bitartrate of potash. White argol is preferable to red, as containing less drossy or earthy matter. The marks of good argol of either kind are, its being thick, brittle, hard, brillient, and Hittle earthy. That brought from Bologna is reckoned the beat, and fetches the highest price. Argol is of considerable use among dyers, as serving to dispose the stuffs to take their colors the better. Pure argol, cr cream of tartar, is extenaively used in medicine. It has an acid and rather anpleasant teste. It is very brittle, and easily reduced to powder: specific gravity, 1.95. The English duty on argol, of $6 d$. per cwt., was repealed in 1845 . In 1852 the importa and exports of argol into Great Britein amounted reapectively to 17,839 and 8540 cwt. The price of argol in Iondon, in September, 1858, varied; Boiogna, from 88s. to 62s. per cwt. ; Leghorn, 46s. to 56s. pel cwt.; Naples, Sicily, cte., $88 s$, to $89 s$.

Aristolochia (Fr. Serpentaire; Germ. Schlangenvursel; It. Serpentaria; Lat. Aristolochia serpentaria), the dried root of Virginia snake-root, or birthwort: It is small, light, and bushy, consisting of a number of fibres matted together, sprung from one common head, of a brownish color on the outside, and palo or yellow within. It hat an aromatie ameil, something like that of valerian, but more agreeable; and a warm, bitterish, pungent taste, very much resembling camphor.- Bineyclopadia Metrop.
Arithmetic. Where first invented is not known, at least with certainty. It was brought from Egypt into Greece by Thales, about 600 b.c. The oldest treatise upon arithmetic is by Euclid (7th, Bth, and 9 th books of his Elements), about 800 в.c. The sexagesimal arithmetle of I'tolemy was used A.D. 130. Diophantus of Alexandria was the author of thirteen books of arithmetical questions (of which six are extant) in 156. Notation by nine digits and zero, known at least as early es the sixth century in Hindostan; introduced from thence into Arabia about 900 : into Spain, 1050 ; into England, 1258. The date in Caxton's Mimor of the World, Arabic characters, is 1480 . Arithmetic of decimals invented in 1482. First work printed in England on arithmetic (de Arte Supputandi) was by Tonstall, bishop of Durhem, 1522. The theory of decimal fractions was perfected by Lord Napjer, in his Rabdologia, in 1617.-lliayns.
Arls, Noah's, a floating vessel built ly tho patriarch Noah, for the preservation of his family, and the several species of animals, during the Deluge. The ark has afforded several points of curlons inciuiry relating to its form, capacity, materials, etc. The wood of which it was built is called in the Hebrew gopher voood, and in the Septuagint, square timbers. Some translate the original cedar, others pine, others bor, etc. Pelletier prefers cedar, on account of its incerruptilility and the great abun nee of it in Asla. Fuller and Bochart contend that .. was buit of what the Greeks cell кvirapiooós, or the cypress-trec; for, taking away the termination, kupar and gopher differ very little in sound. In what place Noah built and finished his ark is no less a matter of dispute; but the most general opinion is, that it was built in Chaldea, in the territories of Babylon. Its dimenslons, as giren by Moses, aro 300 cuhits in Iength, 50 in breadth, and 30 in height. Dr. Arbutinot computes its burden at 81,062 tons. It contained, besides eigbt persons of Noah's family, one pair of every species of unclean animals, and seven pairs of every species of clean animals, with provisions for them ail during the whole year. The insuperable difficulties connected with the belief that all the existing species of animals were provided for in the ark, are obviated by adopting the suggestion of Bishop Stillingficet, approved by Matthew Poole, Pye Smith, Le Clerc, Rossenmoller, and others, that the Delugo did not
extend beyond that regl iof the earth then inhabited, and that only the unimuls of that rogion were preserved in the Ark. - Nee Delcue, and Kitro's Biblical Cyclopedia.

Arkanase, one of the Weatern United States, is bounded north by Mlasouri, east by the Missisaippl River, separating it from Tennessee and Mississippi, south by Loulsiasa, and west by the Indlan Territory. It is between $33^{\circ}$ and $35^{\circ} 30^{\prime} \mathrm{N}$. lat., and between $89^{\circ} 30^{\prime}$ and $94^{\circ} 30^{\prime} \mathrm{W}$. long., and between $12^{\circ} 30^{\prime}$ and $17^{\circ} 30^{\prime} \mathrm{W}$. loag., from Washington, It ls 240 miles long and 228 wide, containling 54,500 square miles, or $34,800,000$ seres. The population in 1330, 30,388; in 1840, 97,574; in 1850, 209,639 . It ls divided into 51 counties. The capltal is Little Rock, situated on the right bank of Arksnsaa river, 300 miles from its ontrance into the IIlssisslppi. Tho other principal towns are Helena, Columbia, Van Buren, Fort Smlth, Washiagton, Batesvilie, Feyetteville, El Dorado, etc.

The eastern part of tho State, for tho distance of 100 miles from the Mississippl, la low, and much of it is subject to be overflowed at cortain seasons; but thls has been in a great measure obvlated by en extensive embankment or levee along the Mississippi, Arkansas, and White Rlvers. The central part of tho State is uneven and broken, and in tho west it is hilly and mountainoys. There are some extensilvo pralries, and some heavily timbercd lands. On the margin of tho rivers the soll ls exceedingly fertio. The Ozark Mountains, rising sometimes to the height of from 1000 to 2000 feet, cross its northwest part. A range of hllls, called the Biack Mountains, runs between tho Arkansas and Whito Rivers, extending west from near White River to the weat border of the State. A little southwest of the centre of tho State are boiling springs, the temperature of which at times rises nearly to the bolling polnt, though subject to much variation. Near these springe aro ridges of hilis, which rise into elevated peaks known as the Poteau and Washita Mountains, whose highest clovations aro west of the State in the Indian Territory. Wild animala, as the deor, elk, bear and wolf; and wild fowls, as tho wiid goose, turkey, and quall, aro found in abundanco. Its mineral productions aro extensive, consisting of iron oro, lead, zlnc, and copper, gypaum, coal, and salt. The country is well adapted to the raising of cattle.

There were in thls Stato, $\ln 1850,781,531$ acres of land improved, and $1,816,684$ of unimproved land in farms; cash value of farms, $\$ 15,265,245$; value of implementa nnd machinery, $81,601,296$.

Live Stock.-Horses, 60,197; asses and mules, 11,559; milch cows, 93,151 ; working oxen, 84,239 ; other cattle, 165,320 ; вheep, 91,256 ; swlne, 836,727 ; value of live atock, $\$ 6,647,969$.

Agricultural Products, etc.-Wheat, 199,639 bushels produced; rye, 8,047 ; Indian corn, $8,893,939$; oats, 656,183 ; barley, 177 ; buckwheat, 170 ; peas and leans, 285,738 ; potatocs, 193,832 ; sweet potatoes, $\mathbf{7 8 8 , 1 4 9}$; rice, 63,179 pounds ; value of products of the orchard, 840,141 ; produce of market gardens, 817,150 ; pounds of butter madc, $1,854,239$; of cheese, 30,088 ; maple augar, 9,330 pounds; molasses, 18 gallons; beeswnx and houcy; 192,338 pounds; wool, 182,595 pounds produced ; cotton, 65,344; flax, 12,291; licmp, 15 tons; ailk cocoons, 38 pounds ; hops, 157 ; tobacco, 218,936; hay (tons of), 3976 ; clover aeed, 90 bushels; other grass aceds, 436; fiax seed, 321 ; and there were made 35 gallons of wine; value of home-made manufactures, $\$ 638,217$; of alaughtered animals, $81,162,913$.

In the eastern part, particularly on the bordera of tho rivers, the climate is generally molat and unhenlthy; but in the middlo and western parts it is salubrious. Its rivers afford great facilities for contmerco. The Mississippi flows slong ita eastern border for tho distance of nearly 400 miles. The Arkansas River, which gives namo to the State, flows through it
in a sontheastwardly direction; la a broad and deep stream, and is navigable for ateamboats $\mathbf{3 0 0}$ milea to Little Rock, and in the spring floods 850 mllea farther to Port Glheon, beyond the weatern border of the State. White Kiver rises in Ozark Mountalns, flowa through a fortlle and healthy country, shoundlng with aprings and atresma of pure water, and affords many mill seate. It flows into the Arkansas River, and ls uncommonly clrcuitous in its course. The St. Frencis Rlver rises in Miseourl, and flows south nearly parallel to the Misslssippi, whlch it at last enters. It in boatable for 300 milles. The Washita waters its southern, and the Red River, a majestic stream, its southwestorn part.

The internal improvements are in embryo, but when carried out will forms an excellent system. The rivers are numerous, and would give good facilitles for commerce, but for the rafts of sunken wood which obstruct nesrly all. Congress has made appropriations for tho clearance of some, including the Red River, but to anch a limited extent as not to remove the obatructions entirely. The railroad system needs but dovelopment to glve prosperity to the State. Congress has grented lands to all the principal roads in progress; one of which, from Memphis to Little Rock, will be important ss a part of the trunk lino to California.

Manyfactures.-There were in the State in 1850, 3 cotton factorics, with a capital lavested of $\$ 16,500$, employing 13 males and 18 females, producing sheetIngs and 81,250 pounds of yarn, valued at 816,637 ; 28 flouring and grist mills, 57 ssw mills, 51 tannerlea, 0 newspapers, including periodicals, published. Capital invested in manufactures, 8324,005 .

Arkwright, Bir Richard, fumons for his inventlons in cotton-spinning, was born at Prcaton, in Lancashire, in 1732, of parents in hamblo circumatances. Ho was the youngest of thirteen children, reccived but a very indlficrent education, and was bred to the trade of a barber. But tho res angusta domi could not repress the native vigor of his mind, or extinguish the deaire he felt to emergo from his low aiteation. In the year 1760 he had eatablished himself in Bolton-lc-Moor, whero ho exchanged the trado of a barber for that of an itnerant hair-merchant; and having dlacovered \& valuable chemical process for dyeing lisir, he was $\ln$ consequence enabled to amass a little property. It is unfortunate that very little is known of the ateps by which he was led to those inventions that raised him to distinction, and havo immortalized his name. His residence in a district where a considerablo mnnufacture of linen goods, and of linen and cotton mixed, was carricd on, must havo given him aniple opportunltics of becoming acquainted with the varioua processes that were in use in the cotton manutacture, and of the attempt 3 that had been made and were then making to improve them. IIs attention was thus naturally drawn to this peculiar department; and, while he saw reason to conclude that it was likely to prove the most advantageous in which he could engage, he had aagacity and good fortuno to invent and improve thoso extraordinary machines by which, unlike most inventors, he amassed vast wealth, at the same time that he added prodigiously to the demand for labor, and to the riches and comfort of the civllized world.

The spinning-jenny, invented in 1767 by Hargraves, a carpenter at Blackburn, in Lancashire, gavo the means of apinning twenty or thirty threads at once with no more labor than had previoualy been required to spin a single thread. The thrcad spun by the jenny could not, however, be used, except as weft, being destitute of the firmness or hardncss required in the longitudinal threads or warp. But Mr. Arkwright aupplied this deficiency by the inventlon of the spinning-frame -that wonderful plece of machinery, which spins a vast number of threads of any degree of tineness and hardness, leaving to man merely to feed the machine with cotton, and to join the throads when they happen
to break．It is not difficuit to understand the princl－ ple on which this machine is constructed，and the mode of its opseration．It consists of two pairs of rollers， turned by means of machinery．The lawer roller of each pair is furrowed or fluted longitudinally，and the upuer one is covered with leather．to make them take a hold of the cotton．If there were only one pair of roliers，it is ciear that a carding of cotton，passed be－ tween them，would be drawn forward by the revolution of tho rullers；but it would merely undergo a certain degree of compression from their action．No sooner， however，has the carding，or roring as it is technicaliy termed，begun to pass through the firnt puir of rollers， than it is received by the second pair，which are made to revoive with（as tho cass may be）threc，fulur，or five times the volocity of the first pair．By this admirabie contrivance，the roving is drawn out into a thread of the desired degren of tenuity，a twist leing givon to it by the adaptation of the spindio and Hy of the common flax whed to the machinery．

Suck is the principle on which iur．Arkwright con－ structed his fanous spinning－frame．It is obvious that it is radieaily ditierent from the previous methods of spiming either by the common hand wheel or distaff， or by the jenny，which is ruly a moditication of the commen wheel．Spinniz．rollers was an antirely original idea；and it is c．．．．use to determine whleh is most werthy of admirntien－the genius which led to so great a discovery，or the consummate skill and address by which it was so speedily perfected and reduced to practice．Mr．Arkwright statel that he accidentally derived the tirst hint of his great invention from seeing a red－hut iron bar elongated by being made to pass be－ tween rollers；and though there is ne mechanical ansl－ ogy between that operation and his process of spin－ ning，it is not ditheult to imagine that by reflecting ujon it，and piacing the subject in ditferent points of view，it might lead him to his invention．The preciso era of the discovery ts not known；but it is mot prob－ able that the felicitous iden of spitning by rollers had oceurred to his mied as early as the preriod when llar－ graves was engaged in the invention ce the jenny，or alnost immediately after．Not beiag a practical me－ chanic，Arkwright employed a person of the name of John Kay，a watch－maker ut Warrington，to whom we shail afterward hava to refer，to assist him in the prep－ aration of the parts of his machine．Ilaving made some progress toward the completion of his inventions， he applied in 1767 to Mr．Atherton，of Liverpool，fo： pecnniary assistance to enable him to carry then int ） effect ；but this gentienisu declined embarking his prop－ erty in what appanred so hazfrious a speculation， though ho is said to have sent him some werkmen to assist in the construction of his machine；the firnt medel of which was set up in the parler of the houso belo：＂цing to the free grammar school at Preston，

Ilisimventions being at length brought lnto a pretty advanced stato，Arkwright，accompanied by Kay，and a Mr．Smalley，of Preston，remeved to Nottingham in 1768，lit order to avoid tho attacks of the same lawless rabble that had triven Iargraves out of Laneashire． Here his operations were at first greatly fattered by a want of capital．But Mr．Stratt，of Derby，a gentle－ man of great mechandeal skill，and largely engaged in the stocking manufucture，having seen Ark wright＇s in－ rentions，and satistied himself of their extraordinary vaiuc，immediately entered，conjeintiy with his part－ ner Mr．Need，into partnership with him．The com＂ mand of the necessary funds being thus obtained，Mr． Arkwright erected his first mill，which was driven by horses，at Nottingham，and took out a jatent for apin－ ning by roilers，lis litu）．lint as the mode of working the machinery by horse－power was found too expens－ ive，he bullt a second factory，on a mucl：larger seale， at Cromford，in Derlyshire，in 17̈̈l，the machinery of whish was turned ly a water－wheei，after the manner of the famous silk－mill erected by SIr Thomns Lembe．

Having made soveral additional discoverics and im－ provements in the processes of carding，roving，and spinning，ho took out a fresh patent for the wholo in 1755；and thus completed a series of machinery so various and complicated，yet so admirably combined， and well adapted to produce the intended effect，in its most perfoct form，as to excite the astonishment and aduirstion of every one capable of appreciating the in－ genuity displayed and the difficulties overcome．－E．B．

Armada，a Spanish term，signifying a fleet of war．The armada which attempted to luvade En－ giand in the time of Queen Elizabeth is fansus In histery．

Armed Neutrallty．The confederacy，$s 0$ called， of the Northern powers，against England，was com－ menced by the Empress of Russin in 1780；but its objects were defeated in 1781．The pretension was renewed，and a treaty ratified in order to cause their tlags to be respected by the beiligerent pewers，De－ cember 16，1800．The principio that neutral flags protect neutral bottoms being contrary to the mari－ time systent of England，the British cabinet remen－ stratud，and Neison at．d Parker destroyed the fleet of Denmark before Copenhagen，April 2， 1 H01．That newer，in consequence，wns ohliged to sccede from tho alliance，and acknowiedge the clain of England to the empire of the sca；and tho Armed Nentrality was soon after dismolved．－IIaydn．

Arms．Dee Finf－Anms．
Arrack，or Rack（Fr．Arac；Germ．Arrack， Rack；Du．Arak，Rak；It．Araco；Sp．Arak；Port． A raco＇；liuss，Amk），a spirituons liquer mannfactured at different piaces in the East．

Arrsek is a term appiled in most parts of Indla， and the Indian islands，to designate every sort of spiritueus ilquers；a cireumstanec which neconnts for the discrepancy in the statements as to the mat rials used in making it，and the mode of lts manufacture． The arrack of Gioa and Bintavia is in highe estimation； that of Columbe or Ceylon has been sald to be inferlur to the former；lut this is doultful．Gon and Columbo arrack is invariably made from the vegetable julec， toddy，which flows by inclxion from the cocen－nut tree （Koco nucifera）．After the juice is fermented，it is distiliet and reetificd．It usualiy ylelds about an －ighth part of puse spirlt．Datnvin or Java arrack is obtained by distillation from molasses and rice，with only a small admixture of todily．When well pre－ pared，arrack is clear and traneparent；genernily， homever，it is slightly strawncolored．Its flavor is peculiar；but it differs considerably，no doubt in con－ sequence of the various articlen of which it is prepared， and the unequal eare taken In its mennfacture．In Englard，arrack is schiom used excent to give flaver to punch；formerly the imports were quite inconsld－ erable；but they have recentiy been a geod deal greater，though，as they are mixed up in the official returns with rum from indin，it is impossible to state their exact amount．The duty on rack from a Ilritish possession is 3s． 2 d ．a gallon，and on that from a foreign comitry，15s．jer gnllon．In the East its con＊ sumption is inmense．It la lsaued to the soldiers in India as part of the cetablifitied rations；and it is suppiled，insteati of rum，to the a amen of the royal navy enipieyed In the Indian sean．It ls one of the princlpal protuctn of Ceylon．Its prime cest in that island varies from $8 d$ ．to 10 d ．gallou；und largo iquantitlen are exported to Indis and disewhere．It is seld in Ceyion liy the legger of 150 ，and In Jnva by the legger of 160 galions．In 1841 the exports from the latter amounted to 4672 leggers，or $717,520 \mathrm{gal}$－ sonn，valued at 286,813 florins．liatavis arrack sold in bor 1 In l．ondon，in Septemier，1853，at from is，6d． to 2s．per gallon．

Puriah－arrack la a phrase used to deslgnate a apirlt diatilled in the penlusula of India，which is said to be often renlered unwhelesone liy as admlxture of ganga

## ART

(Cannabis satio), and a apecies of Datura, in tha view of increasing its intoxicating power. But it is not clenr whether the term pariah-arrack bo meant to imply that it is an inferior spipit, or an adultorated compound. This liquor is sometimea distilled from cocoanut toddy, and somatinses from a mizture of jagery, water, and the barks of various trees.-Wea Mileburs's Orient. Com. ; and Mr. Marshall's taluabla Eisey on the Cocoa-nut Tree, p. 13.

Arrow-root, the pith or starch of the root Maranta arundinacea.' It has recelvr a ite conmon name from its being aupposed to be min antidote to tho pissoned arrows of tha Indians. The powder is prepared from roots of a year old. It is reckoned a very wholesome, untritious food: it $\boldsymbol{i}_{3}$ oiten aduitersted, when in the shops, with tho starch or flour of potatoos.. It is a nativo of South America; but has been long introduced into the West Indies, where it forms a pretty important articlo of cultivation. An excellent kind of arrow-root, if it may be so called, is now prepared in Intia from the root of the Curcuma angustifolia. The plant is abundant on tho Malabar const, where the powder is urade in sueh quantitica ns to be a considerable object of trade. Somo of it has been brought to England. The Maranda arundinacea has beon carriod from the West Indiea to Coylon, where it thrives oxtremely well, and where arrow-root of the finest quality has been manufactured from it.-ArnsL.1k's Mitt. Indi:q.

Arrowamith, Aaron, an ominent geographor and hydrographer, born at London in 1750 . Ho published, in $181 \%$, a new Gencral Atias, Ato, and produced a great number of maps and charts. His map of the world on Meicator's projoction is unch esteemed. He dici in 1823 .

Arsenal (irom the Romaunt arthenol, a citadel), originally denotod oxclusively a maguzine of navai stores and warlike npparatis, giving probability to the etymology which deriv a the word from the Latin arr navalis, a naval citadel. Now, howover, the term is applied to a repository of warliku stores, whether for land or sea service. The paval arbenaia aro, however, still the more numeroas, and will be fund doscribed at length under the articie Dock-yands.

Thu great arsenal of Britain (if we excapt the Tower) is that of Woolwich, where all warlike stores and apparatus are not only preserved, but manufactured in the immense buildings devoted to the purpose. At Woulwheh, Deptfuri, Chnthan, Sheocness, Iortsmouth, and I'lynouth, are the grent naval aracnals. In France, thors aro military arsenals at Paris, Straburg, Motz, Lilic, ete, ; and flve groat maritime arsennis, the chicef of which and thosu of Brest, Touion, and lochefort; noxt to them L'Orient and Cherbourg. Thero aro also inforior arsenais nt Dunkirk, Ilivre, Saint Servan, Nantos, Bordeaux, and Bayoune. Thu other principai naval arsenals in Europo aro, titose of Kinssin, at St. Petersburg, Cronstadt, :. at surnastopel ; of Iloliand, at Auvers, Vlusising, Iteivoetgluys, and the Texel ; of Prussia, at Dantzig; of llamlurg ; of Lominark, at Coponhagen; of Turkey, at Constantinople; of ltaly, at Genoa, Villafrance, livorno, Spezzia, Civita Vecchia, Naples, Ancona, Venico, and 'Lriesto; of Spain, at Cadiz, Carthagena, and llarceicnn, and tho British one at Gibraltar ; of l'ortugal, at Lisbon; of Britain, at Miaitn and Cor-fu.-Li. If. Tho principal navel arsonale of the Unitod States are at New lork, lloston, and Norfolk. The military arsemals of the Enited Stateanare ut Keunobee, Maino; Watortuwn, Massachusutts; Watervhict, Now York; New York city; Alleghany and Franliford, Jonnaylvanla; Piksdville, Indians; Washington, District of Colambia; Fors Monrue, Virginiu; Augusta, Georgla; St. Louis, Mobilo; Daton Ronge, Loulsiana; Monnt Vernon, Alabama 1 Detroit, Michigan; Fayetteville, Nortis Caroliua; Charlestun, South Caroilina; Little Rock, Arkausas; San Antonio, Texas ; Deniein,

California; of Brazil, at Rlo Janeiro and Bahia; c. La Plats, at Buenos Ayres and Monto Video; of Chili, at Valparaisu; and of Mexico, at Vera Cruz.

Armenio (Germ, Arsenik; Fr. Arsenio; It. and Sp. Arsenico; Russ. Mäachjah; Lat. Arsenicum). This metal has a bluish white color not unlike that of stecl, and a good deal of brillianey. It has no sensiblo amoll while cold, but when heated it omits a strong odor of garlic, which is very characteristio. It ia the softest of all the metalio bodies, and so brittla that it may be easily reduced to a very fine powder by trituration in a mortar. Its specific gravity is 5.76.Tuonson's Chemistry. Metallic arsenio is not used in the arts, and is not, therefore, extracted from the ore, except for the purposes of exporiment or curiosity. T!ıe arsenic of commerce is tho white oxido, or arsenious acid of chemists. It is a white, brittle, compact substance, of a glassy appearance; is inodorous; has an acrid tasto, leaving on the tongue a swectish impression; and is highly corrosive. In its metallic state arsenic exerts no action on the animal systom; but when oxidizel, it ls a most virulent poison. The arsenio of the shops is sometimea adulterated with white sand, chalk, or gypauin: the frand may be detected by heating a smail portion of the suspected powder, when the arsenic is dissipated, leaving the impuritios, if there ho any, behind. 'Though the most violent of all the mineral poisons, the whife oxide of arsenic, or the arsenic of the slops, is yet, when judiciously ndministered, a modirine of grent efficacy. It is also used for various purposes in the arts. It is principally imported froin Saxony and Bohomia.'Thomson's Chemistry; A. 'I'. Tmomson's fhispensatory.

Arsura, in term used in anciont times for the meiting of goid or silver, either to reting them or to exsmino their value. Tho mathod of doing this is explainad in tha Black Book of the Exclequer, ascribed to Gervaiae, in tho chapter De Officio $M / i k i t i s$ Argentarii, heing in those days of great use, on account of the various piaces and different manners in which the king's monoy was paid. Arsura is alao used for the loss or diminution of the metal in the trial. In this sense a pound was said tot ardera denarics, to loso so many pennyweights. Arsura is likewiso used for the dust and sweepings of silversmiths, and others who work in silver nielted duwn.

Artcsian Wells, the nmme applied to artificial springs, protuced by boring a small hoid through strata destituto of water, into lower beds in which wator is percolating in considerable quantity. On msking such perforation, the water often rises forcibly to the surfoce, and is conveyed to a convenient receptacie by a pipo introlncod thy the perforation into the struta aflording the water. The ilrat place in Europu where such artiticial fountaina wore extensively formed was in the lirench province of Artois, anciontly Artesium. But there is reason to beliove that the art wne long hefore practiced hy the Chinese, who are vecy expert in the formation of such weils. They are extensively used in tice Mllanese, In aeveral parts of Germany, and hava niso been for soveral vears omployerl in the south of England, on the coast of Lincolnshire, and more lately in the vicinity of Lomdon.

An artegian welt was sunk nt Sheerness in 1781, to the depth of 330 feet.-Philowenical Tranaactione, 178.1. it was carried tirough a thick bed of Invion chay, and water, which rose nearly to the surface, was found on reaching the subjacent sand-beds. 'Two of better conatruction ware carried to the aame ciepth through similar materials at Portsmoutì locka in 1828 nud 1820. The soii of the diatrict on the const of Lincuin, lietween Lowth and the sea, rests on a thick hed of clay, which precludes the puasilility of springs ; hut by penatratiug through thia, water was found in abundance In the chalk on whleh the clay reposed; und arteslan wells there now afford a plentifut anpply of this necosary element, titat risen with such force
through the pipes as to have oltalned the local name of bluiu-cells. The theory of artesian wells is founded on the fact that water derived from $\%$ higher level may percolato through certain strata, or pass in seams between them, and be prevented from reaching the aurface by the superposition of other beds or strata impervious to water. In such circumstances a perforation through the latter allowe the water, by hydrostatic pressure, to reach tha surface; and it will overflow, or even gush out, with a force proportional to the difference of level of the different parts of the water-bearing atrata, especiully if the free course of the subterranean sheet of water be iniurrupted by what are termed fauls in the atrata, or the occurrence of veina of stony bodies intersecting them. Thus, in the diagram of a supposed section of a country, let P P
movement to the har of iron, aufficient to vary the position of the chlsel at each stroke of the instrument; and when the chamber is full of the debris of the rock, it is drawn up and dlscharged. This mode of working has greatly diminished the labor and expense of such operations; and is applleable to many proceeses in mining, blasting in quarries, and the like.

An ingenioub Serman engineer, M. Sellow, has by a similar instrument of greater size, succeeded in ventilating the minee at Saarbruck, oy' perforations 18 inches in diameter, and aeveral hundred feet in depth.
The importance of artesian wells can searcely be overesitmated. They are capable of rendering districta now scantily supplied with or destitute of potable water, convenlent domiciles for man; and under an enlightened government might render habitabla no emall portlons of the arid wastes ef Africa and Arabia. In the latter, recent observations show that there are abundant subterranean sources of water, and possilly a serles of artesian wella might diminish the perils of the passuge of the Great Sahara.-E. B. The United States Government has recently authorized a serics of experi-
represent a thick bed of plastic clay, ABC strata affording water, alternatirg with strata; EF, impervious to water, and let $V$ represent a vein of trap rock traversing these strata, and producing a shift or fault; by sinking the pipes $a b c$ into the strata A BC respectively, we shall obtain the water derived from the more elevated portions of these strata at such artesian fountaina.

The same principles are applicable to the sinking of common wells. It has sometimes happened that a weil haa been lost in attempts to in-rease its flow by a deeper excavation. Thus, if the bottom of the well was a bed of clay resting on sand, a perforation made through that clay has occasionally lost all the water; because the stratum of clay had jrevented the water from escapiug to a lower level, and conducted it toward the surface. The direction of the strata, as well as their nature, are essentlal elements for the auceessful formation of either common or artesian wells; which last are of great consequence in champaign countries, where nataral springs are less common.

Artesian wolla have been also sunk for the purpose of oltalning uarm water. It is well ascertained that in the suterior of our sarth there is a source of heat, which may be reached by deep artesian perforations, so as to bring warm water to the surface. Thus Von Bruckmann, of Wortemburg, heated a paper manufactory at IIellboun by water from a deep artesian well; and by the same means prevented the freezing of the watur in winter round the wheels of mills. In the arteslan well at Jochelle, at the depth of $\mathbf{8 7 0}$ feet, the water has a temperature $12^{\circ}$ algher than that of the atmesphere. N. Arago was the chief promoter of the arteslan well in the plain of Grenelle at laria, which, at the depth of upward of 1900 fect, affor's water at $92^{\circ}$ Fahrenhelt. In the deepest artesiar: well yet made, that at Kissengen, the temperaturo of the water ls also very considerable.

The instrunient now used in minkisg artosian perforations to great depths is not the old machine emplayed in boring fer coal, ete., a serien of iren roals serewed tegether, and forced down by repeated hlows with a mailet. That was a costly and tedious operathon: a Chinese instrustent has lately been intruduced with great aflect. It consists of a heavy bar of cast inon, six feet long and four inches in dlameter, armed at its lower end with a eutting elisel, sirrounded by a cylindrieal chamber, which, by means of simple valves, receives and retains the abraded portions of the rock. The Instrument in suapended by a rope passing over a wheel. As it is wrought up and down, the torsion of the rope givea a circular
ments for the construction of a number of artesian wells on the plolns of Western Texas, on or near the milltary and emigrant roads leading toward New Mexico and Callfernia, for the relief of emigrant parties. An expedition for this purpose left Texas In January, 1855, under the command of Captsin Pope, United States army, and had not cempleted their operations in December, 1856.-See Hraicat de Thuny, Considerations sur la cause du Jasilissement des Kaux des I'uitsfurts, Psris, 1829; Von Bnuckmann, C'eber Artesische Brunnen, Heilh. 1833 ; M. Anago, Notices Scientifiquec, A nnuaire du Bur. des Iong. pour Annes plus.

Artificer, a person whe works in iren, brass, wood, etc.-such as smitlis, brasiers, carpenters, ete. The Roman artificers had their peculiar temples, where they assembled and chose their own potron to defend their causes; and they were exempted from all personal services. Taruntenus Paternus reckons 32 species of artificers, and Constantine 35, who enjoyed this privilege. The artificers were incorporated into divers colleges or compankes, each of which had thedr titelar gode, to whem they oflered their worship. Several of these, when they quitted thelr prefession, liung up their toels, ns votive offerings to their gods. Artificern were held a degreo below merchants and argentarii, or money-changers, and their employment more sordid. Seme deny that in the earllest ages of the Roman State arthficers were ranked in the number of eitizens ; others, who assert their citizenship, allow that they were held in contempt, as belig wint for war, and so peor that they could searcely pay any taxes; for whleh reason they were not entered among the eithens in the econser's books; the tesign of the census belng only to see what number of pursons were yearly fit to bear arms and to pay taxes toward tho support of the state. It may be added, that much of the artificers' husiness at liome was dene ly slaves and forelgners.

Artifioial Forizon, a contrivance of great utility for enablltug an observer to aletermhe the altitude of a heavenly holy, or of a terrestrial object, ahove the herize , f any place, when the senaible horizon is ill defincc.. The surface of a thid not ensily disturbed lyy the air, auch as quicksilver, or nome viseld, opague thuld, is usually employed for this purpose, as they will alljnst themselves to a plane parallel to the rational horizon. To prevent the Infiuence of winds in the open air, the surface is usually covered by a pinte of ground-glass with parallel surfacea. In fled ebservatlons thla is not necessary ; and the mercury is contained in an ohlong trongh; for locomotlve observations, a cup of three inches in diameter is the containing
vessel. But as carrying about mercury is inconvenient, some have employed polished metallic or glass mirrors, adjusted by acrews st the corners, and a spiritlevel, to horizuntality; though this is less accurate than the fluid surface. The surface of the quicksilver, or mirror so adjusted, ls a plane touching the surface of the earth where the ebservation is made, and parsilel to the rationsl horizon; therefoce, a ray of light passing from the object to the surfsee of the instrument, forms an angle with that surfoce equal to the angular elevntion of that objeci above the true horizon of the place, when it is corrected for parallax and refraction. -E. B.

As, in Antiquity, a weight, consisting of 12 ounces, heing the ssma with libra, or the Roman pound. The word is derived from the Greel " $/ \mathrm{S}$, which, in the Deric dialect, is used fo. éls, sue. $\quad \rightarrow$ an entire thing; or, aecording to others, froir becauss made of brass. It was alse the name of a timinen coin, whleh was of different weight and material in different ages of the cominonwealth. Under Numa Pomplius, accerding to Eusebius, the Roman money was either of wood, leather, or shells. In the time of Tullus Hostilius it was of brass, and called as libra, libilla, or pondo, becauso setuaily weighing a pound, or 12 ounces. The first Punio war, 420 years later, hsving exhausted tho treasury, the as was reduced to twe ounces. In the second Punic war it was again reduced to half its weight, viz., to ono ounce. And, lastly, by the Papirian law it was still further reduced to tho dininutive weight of half an ounce; and it is generally thought that it continued the same during the commonwealth, and even to the reign of Vespssian. The as, therefore, was of four different weights in the commonwealth. Its original stamp was that of a sheep, ox, or sow; but from the time of the emperors it hat on one side a Janus witis two faces, and on the reverse the rostrum or prow of a ship. As also denoted any integer or whole; whence the English word ace. Thus as signiffel the whole inheritance; whence heres exs case, the heir to the wholo eatnte.

Asaforitas (Ger. Teufelsdrech; Du. Duivelslreck; Fr. Assa-ftide; Sp.Asa-fetidu; Lat. Asa-fatida; Per. Ungoozeh), a gum resin, consisting of the inspissated julce of a large umbelliferons plant, the Ferula asafietida. It is produced in the sonthern provinces of Persia, and in the territory of Sinde, or country lying at the mouth of the Indus. It is exported from the Persian Gulf to Bombay and Caleutta, wher 3 it is sent to Europe. It has a nauseous, somewhat bitter, biting taste, and an excessively strong, fetid, alliaceous smell : the newer It is, it possesses its smell and other pecullar properties in the greater perfection. It is imported, packed In irregular masses, in mats, easks, and enses; the last being, in general, the best. It should ta chosen clean, fresh, strong-scented, of a pale reddish color, varlegated with a number of tine, white tears: when broken, it should somewhat resemble marble in appearanee; anc, after belug exposed to the air, should turn of a violet red celor. That which is suft, blaek, und foul, shoull be rejected. 'lho packoges should to carefully ex:mined, and ought to bo tight, to prevent. the smell from injuring any other artlele. Neither the lmports nor the quantities cleared for consumbtion are considerable, though the fitter are probnbiy greater than might have been expectel, amounting to about 0000 itss. a ycar. The duty in liggland is 1s. a ewt. In Engranil it is used ouly in the materia medica. In France it is used hoth lin thint way, and, to some extent, also as a condlment. It is werth, in houl, in the London market, from 25 , to $\mathbf{s}^{5}$ per cwt.-Munutun's Orient. Com.; I'apl. I'apers; nul private information.

Ash, Common, the Fraxinus excelsior of botanists, a forest tree of which there are msny varieties. It is abundant In Fingland, and is of the greatest utility. The ash is of very rapid growth ; and, unilke mest
other trees, its value is rather increased than diminished by this circumstance. Like the chestnut, the wood of young trees is most esteemed. It grows on a great variety of solls, but is best where the growth has been most vigorous. It is inferior to the oak in stiffiness, and ls more easily split; but in toughness and elasticity it is far superior to the osk, or to any other species of timber. Hence its universal employment in all thoso parts of machinery which have to sustain sudden shocks, such as the circumference, teeth, snd spokes of wheels, slip-biucks, ete., and in the mauufacture of sgricultursl implements; In the latter, indeed, it is almost exclusively made une of. The want of prolonged durability is its greatest defeet; and it is too tlexitle to be einployed in luilding. The wood of old trees is of a dark brown color, sometimes Lesutifully figured ; the wood of young trees is brownish white, with a shads of green. The texture is alternately compact and porous: where the growth has been vigorous, the compnet part of the several layers bears a great proportion to the spengy, and the timber is comparatively tough, clastic, and durable. It has neither taste nor smell, and, when young, is difficult to work. The mountain ash (Pyrus aucuparia) is guite a different tree from the common ash, and its timber is far less valuable.-Tnevgolib's Principles of Carpentry ; Timber Trees and Fruits, in Library of Entertaining Knovledye, etc.

Ashes (Fr. Vedosse; Ger. Waidasche; Du. IVeedas; Da. Veedashe; It. Feccin bruciata; Sp. Alumbre de hez; Russ. IVeldasch; Lat. Cineres infectorii), the residuum, or earthy part, of any substnmee after it has been burned. In commeree, the term is applied to the ashes of vegetable substances; from which are extracted the alkaline salts called potash, pearlash, barilia, kelp, ete.; which see.

Asia. Thls divislon of the globe is distinguished by its vnst extent; by the striking character of its interior geography; above all, by the stupendous revolutions of which it has been the scene; and, lastly, by the high antiquity of its eivilization, of whieh wo can still faintly tracs the preeious remsins. Stretehing from tho southern hemisphere into the northern regions of perpetual winter, it comprises within its bounds the opposite extremes of heut and cold; all the varieties, consequently, of the animal and jegetalle tribes; and that still more interesting variety which the irresistible law of elimate impresses on the human species. The surface of $\Lambda$ sia, tewering to its helght far above the regions of perpetual snow, presents, when superticially examined, a confused mass of lofty mountains, diverging into nu endless variety of inferior ridges, apparently withont plan or systen, 13ut a more attentive survey discloses, nmidst the bold irregularities of nature, the same order and mity of design in the structure of this great continent as in all the other works of creation.

Asia was the earliest abode of the luman race; and, when all the other parts of the word were either uninhabited or sunk in barbarlsm, It was the sent of great empires, and of tlomrishing and splendid cities, of commerce, of literature, and of all the arts of civilIzed life. But lts early prospority was blighted loy the ruthless devastations of war ; its populous elties were utterly destroyed, so that the spot on which many of them stood is now only marked by masses of ruins; their arts and liteature have porished; and in soch fragments of their writhg as still survive, the meaning is huried under the almost hupenetrable vell of an auchent and unkwown character. In touching on the varlous toples which are eonnpretended ander the resignntion of Asin, it must be remembered that In the following artlele we are to conlline nur attention to such general vlews of its geography, hlstory; lusthtutions, poliey, and manners, as " ..s not supersede a more particular description of its various states under their reapective deniguations.

- Asia containe a larger area than any of the other divisiona of the globe, viz., inclading ita islands, $12,960,000$ square geographical milea; the area of America being $10,600,000$, that of Africa $8,550,000$, and that of Europe 2,660,000.
The isiands of Asia are: In the Arctio Ocean, Nova Zembla, consisting of two large ialands, and New 81beria, consisting of three islands of coneiderabie extent discovered in the course of this century. Along the east const : the volcanic group of the Kuriles; the Japanese Islands, of which Nipon is the principal; the Lu-ku group to the eouth of Japan; the large islands of Formoss and Hainan, on the coast of China. Saglialia, oppoaite the coatt of Mantchuria, was long believed to be an island, but is a peninsula extending over 8 degrees of latitude, and connected with the continent by a low, narrow, and sandy isthmus, a little to the aouth of the mouth of the River Amar. In the sontheast and south : the Philippines, among which Luzon and Magindanao are the largeat, and half a dozen othere have areas surpassing or approaching those of Cyprus and Candia; the great islands of Borneo, Sumatra, Java, and Celehes ; the Moluccas or Spice Islands, among which Gilolo, Ceram, Baro, and Amboyna, between Celches and New Guinca; Nias, Batu, the two Pora, etc., on the west coast; and Battam, Linga, Banka, and Billiton, on the east coast of Sumatra ; and, finaily, the Sunda and Banda islands, a vaat latitudinal Archipelago, extending from the east point of Java toward Australia and New Guinea, and composed of myriads of isiands, among which the principal are in a direction from west to cast; Madura, Bali, Lambok, Sumbara, Sandelbosh or Tshindana, Flores, Timor ( 250 milee long), Timor Laut, and Aru, which form a bridge, as it were, between Asia and Australia. In the Indian Ocean: the Nicobar and Andema Archipelagos, between the no-thweat point of Sumatra and the mouths of tho Irawaddy; the large island of Cerlon; and, on both sides of the 70th meridian east, stretching due north from south lat, $8^{\circ}$ nearly as far as the latitude of Goa, the Archipelagos of the Tshagos, Maldives, and Lakkadives, all three composed of myriads of mostly very email islands of coral formation. In the Persian Gulf: Ormuzd, Kishm, and Bahrein. In the Red Sea: Perim, Arish (erroneously called Harnish), Farsan, and Dhalak. In the Mediterrancan: Cyprus, Rimoles, Cbios, etc.
The aur' of this vast continent is exceedingly varier' In some places it towers in stupendous mountains, sorming fonr grea. chains, with subordinate bramehes, of different names. It often exhibite vast plateaux or elevated table-lands, of prodigious extent ; in other points:- etretches in plains little elevated above the level of the ocean ; while in certain points it presenta enormons hollowa or depressions that are lower than the surface of the Black Sea. Humboidt computea the auperficies of ail Asia at $1,346,000$ geograplical equare lengues. Of this a large proportion ia mountainuus, or raised in elevated plaine. The same eminent authority estimates these as follows:
The meuntalnous parts of Arabta, Belnchlatan, or
the plateau of Kclat, Kandatiar, with the moumtniln ridges of india..

240,010 The mountalnous parte of China.
The ptateaty of (rolt or Sha-mo.
The piateau of Thibet and Ladak, between the ilimalaya and Kuon-lun Meuntatoa. The pleteat of persia. .

The Thurua of Asta Mituor, Ararst, and the 2itindoo $\}$
Of whleh that of Ararat alone ta. The Cancasan, from laku to Anapa
The Gural and Altui groupa. ................................
64,400
42,000
41,000
27,000
81,800
3.500 plains divided by mountains of small elevation, forming the comparatively low land of Siberia, Intersected liy several liarge rivers, and occupied often by extensIve wamps. This region la eatimated at about 400,009 square lengues. The cuntral part of Asia.
still imperfectly known to Europe, was till lately concelved to be one vast table-land, of irregular form, buttressed on every side by lofty mountains; but it now appears, on the contrary, to be traversed by long mountain chains.

Asia presente to the eye such a compactness of conformation, and its outlines are at the same time 80 diversified by deep indentures of the sea, forming gulfs and peninanlas of every shape and dimensien, that neither Africa can be called more compact, nor North America more diversified. Every prominent feature of thle vast continent ia on a gigantic acale; and the aggregate of its mountains and rivers, lits low plains and its elevated plateaux. surpasses those of the other divisions, not only in magnitude, but also by its contrasting variety,* Its inere steppe rivers approach the aize of the Don and Dnieper; and the second of its salt lakes, the Aral, is still larger, by 6400 equare geographical milea, than Lake Superior, the largest sheet of water in America; while the combined superficies of all the American lakea would not suffice to cover the area of the Casplan. Ite Indian Archipelago forms a world by Itself; with which the West Indian Islanda can be compared neither for extent ner importance; its mountains rise higher into the regions of eternal snow than the far-famed Chimborazo; it has its deserts of buming sand and of frozen swamps, alike deatructive is the haman race. Nowhere is there anch an exuberance of animal and vegetable life, not only apread over the whole continent, but aliso displaying itself within the narrowest limite, es the traveler rapidly deacende from the creas of the Himalaya into the plain of Bengal. The eame variety, the same contrasts, appear in its history. Asia, the cradle of mankind, the mother of religion, the nurse of civilIzation, where arta and letters ware cultivated in the remotest times, containa within her inaccessible mountain forests numerous deacendants of her primitive inhabitante, who still continue that brutish life which their forefathers led when thu first vine was planted, the first hiereglyphic character carved in the rock.

Of the domestic animals, the elephont clelms the proeminence, being unequaied by any other animal for the purposes of dranght. This animal is confinet to the southern countrics of India, where the climate ia hot, leing seldom aeen in the monntainous tracts toward the north. The camel ia meed for domestic purposes over a far wider extent of country than the elephant. This animai is of two species, the one with two humps, and the common camel with only one bamp. The latter ia the camel of Arabia, Syria, Persia, India, and Northern Africa. A lighter variety of this specles is the dremedary, used only for riding, and differs from the camel of burden as the racer does from the dranght-horse. The two-humped camel is the Bactrian species, and is so rare, even in Western Asia and India, that Captain Lynch states, that in a caravan of 6000 camela there were not above eight or ten of this liactrisil apceies. In Mongolia, howover, they are very numerous. The dromedary is chicfiy used for traveling, and its vaiuable quality is swiftness, hy which, jolned to its eopacity of cnduring

- Accorllng to Berghaum, there are 10 riveri in America, and 12 in Atla, the bainin of each of which containe upward of 10,500 German, or 108,000 geograjulcal square mileas. The untted area of the former, the first of which to the Aniazon, and the last the Rio Negro, is 824,500 German, or $\mathrm{B}, 182,000$ geographical minaro mitea; of which the hasin of the Amazon occoples not tes" than $\mathbf{2 , 0 1 8} 8,400$. That of the latter, the Otit atanding at the head with 024,800 geographical muare milem, and the Tarhm belug tha leat, ia 808,738 German, or $5,820,000$ geographical square mites; giving a differsnce of 628,000 geographical aquary milles in favor of Asla. The total length of the 10 American rivers, winilnga included, ts 70,040 geographical miles ; that of the Aslatic, 08,448 geemaphical mittea: itfierence in favor of the tatter, 91,808 geographical milces Yet the kyatem of the Maranon in the formor atanda unequal. ad toy any in the world.
hardship, it is quallied to travel at an incredible rate for many suecesalve daye. In all the low countrles, especially in the dry and aandy tracts, such as Arabia, Syria, etc., the common camol is employed. The twolumped camel is a native of tho bigh eountriea in the neighborhood of the Oxua and the Jaxartes, where it is still chiefly used. So large a portion of Asia ia occupied by vast plains and wastes of sand, that lts interior intercourse must be maintalned by land journeys. But without the aid of the camel, it would be impossible to traverse extensive deaerts destituta both of food and wator; and in those arid countries such an animal, which has been truly called the ship of the desert, is the most valuable glift whici Providence could bestow.

Animals.-The other domesic animsla of Southern and? Western Asla are horses, mules, asses, buffalocs, black enttle, sheep, goats, etc. Arabla may be considered the native country of the loorse, In which he arrives at perfection, and combines all the most estimable qualities of symmetry, form, fineness of skin, fire, docility of temper, fleetness, and hardiness. It ia chiefly from the Arabian breed that the horses in other parts of the world have been improved. In Persla the horsed aro neither so graceful nor so swift as those of Arabia, belng high, with long legs, spare carcasses, and largo heada; but they are highly prized by the inhabitnats for their extraordinary capacity of enduring fatigue. To the east of lersia, at llerat, the breed of horses is fino; also on the banks of tho Indus and ita tributaries; and in the higher regions of Balk and Bokhara thoy aro excellent and numerous, and are exported in great numbers to 1 lindostan. The mule and the ass, all over India, are miserable animals. The mules are of better quality in the Punjaub, on the upper course of tho findus, and they inprove still more farther west. In the countries west of the Indus, they aro superior to thoso in Mindostan, and in I'ersia there is a still finer breed. But the mule of the East is inferior to that of Europe. The ass partakes of a similar improvenent in his progress westivard, and is a far finer anibal in Western Asin than in Europe. In Syria, Pulestine, and generally in Asia Minor, he is distinguished by ngility, Ilre, and patienco of fatigno, and ranks in the lirst class of domestic animuls. Buftiloes a:e found in the hot plains of Asia, as well ns in the mountainous tracts; and the oxen which are used in the prow have ull $n$ homp on their backs. The wealth of the pastoral tribes, who rove about in the western plains of Khorassan, and in the billy tracts of Af fhanistan, consists chlefly in sl:eep, which have tails a foot broad, and composed entirely of fat, but in other respects resemble the English sheep, being better and handsomer than those of Indin. Goats are common all over $A$ sia, especinily in the mountains, whare there aro some breeds with curiously-twlated horns; and they are by no means searee in the plains.

In the northern parts of Asla, and In tho high mountain thests, $a$ diflerent elass of animals is to the found. These cold regions are not distinguished by the same profusion of animal life as the tropienl countries. The beasts of the forest decrease in numbers, size, and tlerceness; and the wolf, the bear, the ghitton, and the wild bour, are the only ferocious animals which thrive in these northern elhmates. In advancIng on tho desolate plahins of Siberin to about the G0th degree of north latitude, we find the cold still takting ettiect on the animal as on the vegetable crention, and the living ereatures, as well ns the plants and trees, stunted in their full proportions. Beyond this limit a dillerent order of animuls appeara, protected against the severity of the climate by a thlek covering of fur, wh isought after ns a rleh article of dress in more opucur comitries. These antmals are accordingly lumited for thelr skins, which constituto the great ataple artielo of trade in Nurthern Asia. In the Arecic regions the benr seems to form the only exception to the dimink hed grandenr of the animal creation. This
animsl, nourished in the regiona of Northern Aala, acquires a larger size, and far greater power and fierceness, than in eouthern climates. The domestic anlmals of the northern and mountainous countries of Asia are of a less imposing appearance, and not nearly of the same strength as those in the lower valleya of the south and west. In the high and cold plains of Central Asia the camel is no longer uaed ss a besat of burden, nor la the northern parta of the continent. Thibet and Central Asia, till beyond the Altal Mountalns, are inhabited by Mongollish and Turkish tribes, whose wealth consists in their cattle, which not only furnish them with food, clothing, and shelter, but are also used as beasts of burden, and In the labors of agriculture. The yak of Tartary, or the bushy-tniled bull of Thibet, seems to supply the place of the canel in these mountainous countries. This animal is about the size of a small bull, of great atrength, and is reckoned a valuable property among the itinerant hordes of Tartars, to whom it affords tho means of easy conveyance, of clothing, and shelter for their tents, from the prodiglous quantity of long, flowing, glossy hair on its tail, and, finally, of subsistence from its milk and flesl. In thonse monntaius is also found the musk-deer, which dell $b_{b}$ 'ts in the most intense cold, and of which the musk, a secretion by the male, aflords a revenua to the governuient, as well as a valuabla article of trasle. Ilere, also, on the highest mountains, amidst ice and snow, is the Cashmere goat, the wool of which affords the materials of the finest shawls. Wild horses are seen In tho high plains of Thibet; and the breed of sheep, a peculiar species of whlch is indigenous to the climate, is of great value. They are nourished on the short and dry herbage of these exposed plains, and eerve for anbaistence to the Inhabitants, as well as for beasts of burden. The wild nud extensive plains of Tartary are inhabited by pastoral tribes, who depend in like manner on their herds. On the southern side of the Altai "ountains we find the same tribes of wanderers, most of them the scattered remnants of the Trurtar nations who had formerly so deep a share in tha great rovolutlons of Asia. All these trihes subsist chiofly ly pasturage. Near the Ural Mountains sume live chiefly by hunting or ensnaring the elk and other wild aninals for their furs. Among those who are shepherds, sheep and horned cattlo are found; while the lunting tribes have scarecly any domestic animala. In all these countries tha wolf and the bear are known to abound. In the rigorous climate farther to the north, whera the cattle are stunted in eizo, and can scarcely subsist, their place is supplied by tho reindeer, a species peculiar to a rigorous climato, and most vnlunble for all domestlc purposes, whether for draught or for subsistence. During part of the year the inhabitants of those desolato countries aubsist upon its flesh or milk; Its skin furnishes them with the chief part of their dress, and its horns with such domestic utensils as thoy require. The dog ls also trained to draw the aledge.

Birds.-The festhered race in Asia includes almost every known species. In the southern parts are found all the tropical birils, distinguishect by beautiful plamage, aud some of them uttering sounds that have a resemblanee to the human voice. Were are also found some of the largest nud rarest birds-the ostrich, the cassowary, nud, in the IImalayn Mountalns, the gypaite, one of whieh, shot by a British officer, is stated by llishop lleber to have measured from the extremity of one wing to another the enormous length of It fect. Tho other birds aro eagles, kites, vultures, naggles in the higher countrics, hawka, crows, wild geese and ducks, Hamlugos, herohs, bustards, florikens, rock plgcons, lapwings, storks, plovers, balpes, quails, partridges, different species of fringillide, and almost all the other amall birds to be found in slmilar climates. In Northorn Asia the feathered creation ia nearly the rame as in Furope.

Early Commerce.-Asia, notwithstanding the wars by which it has been desolated, was from an early period the seat of eommerce and of wealth. The eastern conntries of Hindostan and China preceded Europe in eivilization and indastry, and, independent of that diversity of natural productions whieh is the foundation of crade, they had cuitivated many arta and manufactures which were unknown in the Western World. Asla, accordingly, abounded in many preelous commodities which cov?d not be produced by the ruder industry of Europe. Thus China had its silk and porcelain; Hindestan its musiins, cotton, precious atones, and aromatics of all sorts; coatus, bdellium, spikenard, ivory, tortoise-shell, pepper, ete. These were in general demand throughout Europe, where they could not be produced ; and they were procured in exchange chiefly for bullion, which then, as in later times, was the great article of export to India; also for woolen cloths, wine, brass, lead and tin, glass, coral, femule slaves, etc., all which commodities met with a reedy sale in the marketa of Ilindestan. The staple commodity of China was ailk; an ${ }^{t}$ the mode of producing this esteemed luxury being unknown in Europe, it was brour'it in large quantities, either by the caravans or uy the annual fleeta, to Alexandria, at that time the great commercial mart of the East, and was thence sent to aupply the demand at Rome, where it sold at one time for its weight in gold; but, owing to the ligh profit, caravans began to travel so regulariy to China, that the supply inereased with the demand, and the price was reduced. Between the sixth and the aeventh centuries, Eastern Asia was robbed of this precious monopoly by the art of two Persian monks, who contrived, in a hollow cune, to transport the eggs of the silk-worm from China to Europe, where they were hatched by means of heat, and the race quickly propagated ; and one great liak of commerce between China and Europe was in this manner broken. The trade of Asla was intarrupted by the Irruption of the bar'harians, who invaded and finaliy subverted the Roman empire; but tho mument the stom was past commerce reaumed its quiet course. Constantinople, the eastern capital of the empire, was atill the centre of luxury and trade; as were also such parts of the Roman territory as had not been swept by barbarian invasion; and with those places the caravans still traded, shaping their conrse as they best could to avoid the distractions of the interior. Farther to the east, the califs who reigned at Bagdad encouraged science, commerce, and the arts; and the extensive country throngh which the Oxus and the Jaxartes flowed was the seat of a flourishing commerce, and of many opulent citics. Beaidea Bokhara, stil) a great city, Balk, Samsreand, Cosh, and others in the valley of the Oxus and the Jaxartea, numerons splendid eitics are enumerated which are scarcely known to Europeans. To the east of the great range of mountains, which takes a direction from the main Illmalaya ridge, the country of Cashgar contained Cashgar, its capital, and Khoten, whlch were both larce, popnlous, and weaithy. Those countries served as the connecting link between India and Enrope, and the resting-piace of the caravane, which there colleeted in great foree, and prepared for their journey to China across the great ensiern desert, or for a more southeriy course, through the country of Thibet. The armies of Zinghis Khan in the thirteenth, and of 'lamerlane in the beginning of the fifteenth century, laid waste this highIr eultivated and Jourishing region. But these confinerore were not the enemies of commerce, and the surplus produce of Indis still reushed Europe, though thy a route retidered more diffienlt and dangerons from the decolation of the intervening countries. But the offect produced on the trade of Axia in the liast hy the encroachments of barbarism, and ly the disorders in
the interior, was more than counterhalanced by the growing civilization of Europe, Abott the beghuing
of the fourteenth century, the darkness which had so long covered the Western World began to dispel, and the Italian citice of Veniee, Genoa, and others, had already made advances in letters, aeience, a nd commerce. The costly articles of Asia, her rich stufis and precious aromatics, were now required to anawer the growing demands of luxury and wealth; and the produce of India, imported into Alexandria through the Red Sea, was thence brought into Italy by the nobies of Venice and Genoa, who were all engaged in trade, and waa diffused in amaller quantities all over Europe. The Italian States were enriched by this lucrative traffic, which oniy ceased with the discovery of the maritime route to India by the Cape of Good Hope. From this period the trade between Asia and Europe took a different direction. The commontities of India and China were transported to Earope Eireetly by sea; and neither Alexandria nor the other ports on the Red Sea or of Italy were any longer the depositories of the Eastern trade. The Portuguese, always distinguished by their ardor for maritime discovery, were the first adventurers in the Aslatic seas. In the course of the sixteenth century the Eaglish and Dutch appeared as their competitors; and with the growing wealth of those conntries the trade to the East rapidly inereased. The commeree of Asia may therefore be distinguished into the following branches: 1st. The inland trade of China, Ilindostan, Burmah, ete, with Turkey, the castern countries of Europe, and with the intervening countries of Persia, Balk, Bokharo, and the regions of the Oxus; also, by a different ronte, the trade with Russia and the north of Asia. 2d. The maritime trade, including the coasting trade and the trade to the Eastern Archipelago, and the great trade to Europe and America, in which, from the progress of wealth and luxury, there is a great consumption of Asiatie produce.

Caravans.-The iniand trade is carried on by curavans, or bodies of merchants, who travel together for the sake of security through those parts of the cor.ntry which are disturbed by predatory tribea. It is only from the southern countries of Asia, such as Ilindostan, Chinm, the Burmese countrien, Thibet, snd the western countrica of Persia, Affhanistan, Hokhara, and the regions of the Oxus and the Jaxartes, that Europe can derive any supply of valuable cemmodities; and all this trade, from whatever quarter it comes, must flow in its progress to Europe through the countries that lie between the Persian Gulf and the Caspian Sea; as the caravans could not, without inconvenience and danger from wandering tribes, pass to the north of this sea or the Sea of Aral; and accordingly, though an annual caravan is sent from Asirneau to Khyvah and the countries on the Oxus, the chief trade with Kuasia is lyy sen to the pert of Mangalshuck, and thence to Khyvah and Ilokhara. The Russians have also begun to trade with Persia from the Cancasian province of Georgis, of whieh Tifis, the capital, han, from a wretched coliection of wooden hnts, been rapidiy improved, under the proteeting infuence of a European government, into a respeetaite and wealthy town, the future emporium, as may be antiepated, of this growing trade. The caravans from Constanthople and Syria proeeel through Asia Minor and the northern or southern provinces of Persia, according as their uiterior route is tirough Afghanistan and the P'unjanb into Ilindostan, or to 'Thibet and China, or the more northern distriets of Balk, llokhara, and the eountry of the Oxus and the Jaxarteg. Bokhara, though reduced to desointion by Zinghis Khan, is still one of the largest towns of the East, ite population being eatimated by Burnes at 160,000 . It is niso a great commercial mart; and the caravans which come trom the W'est, passing along the southern shore of the Cuspian Sea, throngh the l'ersian provinee of Astraliad, a noest luxuriant and fertile country, arrive successively at Balfroesh, Ashruff, Astrahad, Mushed, Serrukis, Merve, formerly the enjital of the Seljook soverefgns, but now
surrounded by deserte, and at Bokhara. From this great centre of commerce they proceed northeastward about 400 or 500 miles to Khojend and Kokaun, the former a large city, said to contain 30,000 houses ; and crossing the Bolor range of the Himalaya Mountsins, they arrive in tho Mohammedan States of Kashgar and Yarkund, 600 miles east of Kekaun, passing some towns on the way, of which Ueh is the most important, heing a trading and populoua tewn. Those two latter Statea lie within the precincts of the Chinese authority, where the most exact order ia enforced; and they are fertiia, rich, and well cultivated. Tho town of Cashgar is said to contain 20,000 houses, and to be thronged with strangers from all parts of Asia. Yarkuad is also wealthy and populous. So strict a polico is malnteined by the Chinese authority, that, according to the information given to Fraser, a single traveler may traveree the whele torritory as anfely as a large caravan. From Kashgar there ia a censtant intercourse through Chinese Tartary, along the edge of the great central desert, with China, though we know little of the intervoning conntries beyond what we learn from the accounts of the carly missionaries. Besides this eastern trade, and the trade westward along the southern shore of the Caspian, two caravsns, consisting of 4000 or 5000 camels each, proceed to Astracan by Khyvah, reund the nerthern shore of the Caspian Sea. The importa from Russia into Bokhara are, iron, steel, copper, brass, quicksilver, vermilion, coral, hardware, plated goods, gold and silver embroidery, copper wire; furs, the broadcloths and cotton manufactured goods of Britaln, Germany, and France; refined sugar, cochineal, paper, and a variety of rich goods, which, from thia great commercial dépôt, are diffued far snd wide over Central Asia. Russis receives in exchange black lamb skins, certain manufactures of cotton and siilk imported from Persia, antique gems and coina, lapis lazuli, rubiea, and turquoises, which are received from the seuthern country of Buducksha, where there are famoua mincs of these precious stones. From Cashgar, Yarkund, and the side of Chins, Bokhara receives large quantities of tes, the great modern staple of the China trsde, porcelain and China ware, and the various manufacturea of China; and in return sends turquoises, coral, aheep, lamb, and fox skins, and furs, etc. From Persia shawla are imported, and woolea goeds from Kerman ; silk stuffs from the cities of Yezd and Ispahan; gold and silver embroidery, copper ware, losf, candy, aud raw sugar; Hamadan leather; and turquoises, of which there are mines in Persia; and, in return, black sheep and lambl skins are sent, which are in great requost, to be manufactured into black capa; camblet made of camel'a hair, cosrse colored silk handkerchiefs, lapia lazull, indigo from India, cochineal, tebacco, chintzea from Masulipatam, and cotton manufactures. Slaves form a siapie article in the commerce of Bokhara, and also of Khyvah. These are made prisoners by the disorderly tribes of Asia, the Koords, Turkomsus, etc., in the course of the wars in which they are constantly engaged; and they nre carried to the great slave markets of Bokhara and Khyvah, where they are expesod for sale tiko cattle. The balance of trate is always in favor of liokhara. Money is consequently in great plenty, and can not be importad with a prefit into tisis trading city. The Russian caravans, ss they jouraey round the nort hern share of the Caaplan Sea, aro frequently attacked by the Kirgecsh and Cosaack tribes, and prisoners are carried off and aold into slavery. Frager wea assureci tisat the numbor of Bersian slaves in Khyvah and its dependencies excoeded the maio population of these countries, and amounteci to 150,000 ; and that, according to inquiries set on foot by the Empresa Catierine, there were in Ilokliara no losa than 60,000 Rissian slaves.

The commorec of the wsol with the southern countries of Asia-namely, Kanbul of Afghauistan, Cashmere, and India-pusses through l'ersia by n dilleremt
and more sontherly route, namely, by Cashan, Yezd, which is the aeat of rich silk manufactures, a great entrepôt of commerce, and a convenient resting-place for all the caravans, both from the East and other quarters; through Furrsh and Herat, on the frontiers of Persia, famed for its rich manufactures of silk stuffs, a great channel of communlcation between the East and the West, and also an entrepot of all the richeat productions from Kabul, Cashmere, and India on the one aide, and from Bokhara, Peraia, Arabia, Turkey, and even Europe, on the etther. From Herat the route continues through Furrah and across the River Helmund and the ranges of the Faropamisan Mountaina, to Candahar, a journey of about 800 miles; thenco to Kabul, Peshai -r , and the countries on the Indus, and across extensive sandy deserts to the rich valley of the Ganges, whence by this river there ia an easy acceas to Bengal and to Central Indis. There are various other routea by which the commerce of Asia, concentrated within the comparatively narrow beundaries of the Caspian Sea snd the Pereian Gulf, diverges in its progress eastward to the north, as well aa to the south. From Bokhars there is a meuntainous reute into Little Thibet, and thence through Thibet into China; beeides other more sequestered and difficult roads, through glens and mountains, whicre the only mode of transport is on the backa of asses and mulen.
Persia.-Porsia, from its central situation between the Fust and the West, is not only a great entrupit of trade, but, though on the whole rather a pour country it still contributes some valuablo productions to the commorce of the East. It has long been famed for its abundant produce of raw silk, of cotton, and of woolthat of the provioce of Kerman especially being so valuable for shawls that it rivala in aome respecta that of Cashmere ; of fruits, turquoises, tobscco, grain, etc. Almost ali the principal tuwns of Persia, such ss Kashan, Ispahan, Yezd, Tsbreez, Kerman, Herat, etc., excel in the manufacture of silks, cottons, woolens, fine carpetz, etc.; Kerman alao in the manufacture of aliawls; and others in that of cutlery, arme, etc. These are its chief exports to other countrics, in exchange for their manufactures or produce. To India Persia aends raw silk, carpeta, Kerinan shawls, dried fruits, tebecco, horscs-in which there is considerable traffic, awords, etc., and specic to mske up the deficient balance. The imports from India are cotton goods, as chintzea, sent from Masulipatam by sea to Bushire, whence they reach tine interior of Persia, and ano thence carried eastward into Kabul and the countrica on the Iodua; the samo srticle from Moultan, Lucknow, Deihi, etc. ; some muslins, indige, spices, sugar, and sugav-candy, in large quantitica; gold and silver stuffe and brecades from Benares; precious stones, Csalmuere shawls, iron, lead, copper, etc. Many of :iese articles, namely, Cashmere ahswls, spices, indigo, musilins, etc., aro carricd through Asia Minor by s long land cerriage to their final destination in Europesin Turkey, and are found, with the lamb skins of the no less distant Bukbara, in the bazara of Bagdad and Constantinople. To those countries Persis exports also every article of her own rude and manufactured produce ; coarse fabrics, beth of silk and cotton, for the consumption of Asia Minor; and many heavy articles, such us grain, rice, tobscco, salt, coffee, cotton, etc.; besides fine siiks, brocades, and printe, which are exchanged in Turkey for European goods breught through tho countries of the Levant, namely, broad and narrow cloths, cassimeres, cotton goods, chintzes, muslins, vells, silks, satins, Frencil brocades and embroilered goeds, imitation shawls, cutlery of ali sorte, giass, etc., und a considerablo quantity of gold and silver bullion. Persia inports cutteo and pearls from Arabia, in exciange for wheat, dried fruita, and cloaks. The mountainous country of Afylimistan, on the southern deelivity of the llimalsyn ridge, and the country en the heal streams of tho Indus, axpert to Intlia
horsea and ponies bred in Tartary, fur, shawls, Moul tan chintz, madder, asafoctida, tobaceo, and dried and other fruits, sucl. as almonds and jpistachio nuts. The imports from India are, xarse cotton cloths, worn by the common jeople of this countiy, and atso in Tartary; wuslins and other fine manufactures, silken cloth and brocede, Indigo in great quantities, ivory, chalk, bamboos, wax, tin, santal-wood, almost all the sugar which is used in the country, and spices from the Malabar coast, through Kurrachee and other parts of Sinde, and t'ence to Kabal and Condahar. 'The Ipl':an cloths, shawla, chintzes, and also the indigo, are exported to Bokhara, from which are Imported the soadcloths, cutlery, and hardware of Earopo, received from the lussians, and tinally consumed in Kabul and the conotries of the Indus, loaded with ice expenpay if a and jeurney acrass nenrly lalf thi

ireen tho seat of wealtu and of at
Tha Chinese have been always nritou les. thion triuas habits, and the country hass arm rial abounded in the most valuable produ: ent man factures. These were sent westward in the caraval. to Asia Minor and into Europe, or they wera trans ported lyy sea to ludia, and carried thence by thie Eniropean decta to the Red Sea. The same commerce is still coutinued, and China exports its produce of woolens, silk, and patin; tea in small boxes of thin lead; china; poreelain, raw silk, cechineal, erystal, gold dust, golden Infots, and silver with the Chinese stamp. These are sent through Chinese Tartary into the countries on 1 : Oxus, and also to Cashumere, Kabul, and the comntries situafed on the sonthern dedlvity of the Llimalaya Mountains. Liegular carayaus of horses and ponies-no other animal being tit to travel through those mountainous districts-set ont from Cashmere, and from Jeshawzer, the cmpitul of the Afhhan country of Kabul, aid a consiterable commereial resort, to make their way through Chinese 'lartary with goods imported from India and P'ersia. Chisa carries on alco an interior trade to a considerable extent with Russin, by the frontier town of Maimatchin, in which Furopean goods and furs are received in excliange for tea, sitk, aud other artictes of Cininese produce and manufacture.

Foreign Commeree. - Ir addition to her internal tracke, Asia malntains an extensive intercourso by son uith Furope, Ameriva, Egypt and the Mediterrraneas. A great trade is also carried on from llindostan and China to the Asiatic Archipelago, and the trade of the Asiatic islaucts with each other is of great importance. It uppears that thuse islands were at a very carly periud the seat of conmere; and the learned researches of Eu; opeans have lire Jit to light, in some of them, the monuments of ancient civilization. Siumstra was the reat of the Malay empire, Java of a ilindoo State; and the Celebes were inhabited by the llugis, a race of $3 x$ pert navigators and merchants. The productions of these islands, and of the Moluceas and Hornco, namely, splees, aromatics, and gold, entered into the commerce of tho ancient workl, and were imported into fome throngh Eygyt. In later times, nhont the sinth century, the Asiatic Archipelago was visited hy the Arahs and the Chinese, while the adventurous Malays frequented the consts of Asia, and eren of Africa, aind particularly the Afrionn inland of Madagascar. When these inlands were visited by Furopeank, ahout the fifteenth century, Malacea, Acheen, and Hantam were the great marts of the Liastern Archipelago, whero the rich produce of Sumatra, Borneo, and the Molucens, conveyed in the suall trading craft of the country, was exchanged for that of India and China. The Portuguese fixed on Goa, on the Malabar ruast, as thie capital of their Winstern settlements; and they ufterward selected Nalacea us a central station for proterio forg and extending their intereourse with the nejghbor. ing nations. The Duteh choso llantam, und afterward

Batavia, situated midway between Ilindoatan and China, as the centre of their commercial settlements. The situation was most adventageous, and the port was soon frequented by viasela from China and Japan, Tunkin, Malecea, Cochin China, and the island of Celebes. But the great and flourishing trade of Java was crushed under the colonial monopely of the Dutch, and under what Sir Stamford Raffles terms "the shortsighted syranny of a mercant'le administration." The conquest of Java lyy the British in 1812 put 'n ent to ihis thraldom, and the great trede of the Asiatic Archipelago began to centre in Batavla, which was fast rising into a great commercial emporium ; all the articles which were the exclusive produce of the Eastern islands being collected at its principal ports for re-exortation to India, China, and Furope. Zince Jave as restored $t$, the Dutch. the free poit, ut Singapore, tablished $u_{0}$ the Britisi, Is the centre of a great tr de, and is frequented by the Chinese in their junks, and by all the other navigators of those seas with the produce of their respective islands. The Chinese lake tek with them the nests of a certain species of bird,
ith are esteemed a great lnxury at their tables, and sel., it is said, for their weight in silver; biche-de-mer or sripang, a dried sea-slug, also used in Chinese dishes; Malayan camphor, tho exclusivo produce of Sumatra and llorneo; the tin of Banea, the spices of the Moluceas, opium, indigo imported from Ilindostan; gold and silver, the first collected in Sumatra, Borneo, and some of the other islands. The maritime country trade of the Asiatie islands is carried on chiefly by the Chinese in their junks and brigs, by the Arabs in square-rigged vessels, and by the llugis, the inhabitanta of Celelies, who are all bold and expert narigators.

Products. - The annual feent of Chinese junks arrives with the favorable monsoon among these islauls, from Canton, Anoy, and other provinces, with cargoes of feas, raw silh, silk, plece goods, and innumerable minor articles, for the use of the Chinese, who are setiled in great numbers here, and are distinguished by their shrewd, intelligent, and industrious habits. The Chinese extend their royages to Sunatra, the Straits of Malaces, and eastward as far as tho Muluccas and Fimor collecting edible bird-nests, biche-demer, and ether artieles of which Java is the great entrepót. Java is also a great dépôt of European goods; and the people being rather industrious cultivaters of their fertile ishand than mariners or traders, it expurts rice, a variety of vetches, salt, oil, tobacco, timber, lrasewire, and ita own cloths, and a considerable quantley of European, Indian, and ¿hinese goods, i-: exchange for gold dust, diamonds, camphor, benjamin, and other cirugs; edible bird-nests, biehe-de-mer, raitans, heeswax, tortoise-shell, and dyeing woode from Norneo and Sumatra. The rice and other productlons of Java are exchanged for splees and pungent olls of the Moluecas, and for the tin of Jlanca. The natives of Celebee are famed for the manufneture of a particular species ef tino cloths, of a very strong texture, which are in greet requent, and, along with spices, wax, and sandal-wood, are exchanged for the produce of Sumatra, Hormeo, and Java, whence they are exported to China. The llugis have a lurge share of tho carrying trade of the Asiatic Arebipelago; and they bring the proatace of the Moluccas, and of Horneo and Sumatra, to dava whe the other islands, and recelve in exchange tolaceu, rice, and salt, from Java, besldes ophun, iroin, eteel, luropean chintzes, and broadeloths and Inlian piece gookls, with which they return castwird durling the suitliwest monsoon.*
Tho eastern comntrics of Asin, viz., India and Chira, as we have alreudy stated, have from time inmenorial been famod for certain manufacturea, such as silks, cambrics, muslina, etc., as well as for other products

- Hartless' Listory of Jata; Mabsbrm's Sumatra.
peculiar to the climate; viz ., epices, precious aromatics, medicinal herbs, etc. These were always in great demand in Europe, while the produce of Europe was not wanted in Asia. From the rude state of industry , 'nong the Western nations, they had r thing to uffer on "xchange for the fluer manatisctures of Ini.a, and
- I less conid the soil of i'urope yield at a cquivalent the more genial produce of Eastern clinca. Hence gre at article of export i those times from Europe -. Asia was always bultion, the ins:rument of exchange $t$ lover the world. Bullion could ouly be procurcd by on exporin lon of Earopenn produce or manafactares such low prices as to insure a sale; and the lo ton wuch transactions mast have been made up to the merchant by the high price of Asintic goods. The ancient monopoly of silk serl. ed to - sta n favorable balance of trade with Lurope, ballioa being the only article with which it could be purchaseil. Notwithstanding the introduction o? the silk manufacture into Europe about the cisth or seventh century, the conmercial pre-eminence of Asia still continucif, and bulion was the chief article of export to the East. Throughoat the interior of Asia this superiority remains to the present day; and a continual stream of bulition fiows from the Bosphorus eastwar 1, through Asia Minor and l'ersia, Into Hindostan, and is finolly dispersed in the grest ocesn of the Chinese currency, Bullion is niso the principal article sent from Arabia to Irdia in exchange for Indian goods.

But a great revolution has taken place in the trade between Asia and Earope, and eapecially with Great Britain. Europe is now in a condition to offer an equivaient in manufactures for the produce of Asia; goods of various kinds are sent in exchange for those of India; and from Great Britain remittsnces in bullion have nearly ceased. So prodigionsly has the price of goods been lowered ly the use of machinery, that the cotton wool of India is now imported into Britain, and, after being manafuctured, is re-exported to the place of its growth, and soild at a lower price than the same goods from the loom of the India workman, though it is londed with the expense of a doubie voyage across half the glote. The goods of the European manufacturers are poured into Asin through all its sea-ports, and reaching the interior on the backs of mules snd asses, often after a journey of severnl thousand miles over deserts and mountains covered with perpetual snow, they are sold cheaper than the same articles by the native workmen. The woolen manufactures of Yorkshire, the cotton goods of Manchester and Glasgow, French cloths, and German linens, are dispersed all over India, and even partially In China; they are found in the bazars of Bokharn, Samarcand, and Cashgar, and are carried castward by the caravans inte the wilds of Tartary. The natural productions of Asia, namely, spices, rich aromatics, dyes, and other rare luxuries of tropical ellmates, will always be in demand in Europe; and the monopoly of tea by the Chinese gives them the command of the European markets. Tea has now almost become one of the necessaries of lifc, andi it travels for a market across half the globe. It ls the great commercial Ink between Europe and China, from which, like ..ro precious protuce of silk in ancient times, it can only be procured. But the improved ladustry of Europe supplice, as is niready observed, an equivalent in weolen and cotton goods for this highly-prized luxary. Since the expitration of the Last India Company's charter, in 1834, the trade has been thrown open to all classes of British suljecta, and their merchants can now freely trate to all jlaces accessihle to Europeans to the east of the Straits of Malacca. Durlag the short time that has elnpsed aince then, the increase of the exports and imports has fuliy realizet the expectatlons heid out by those who opposed the company's mowopoly.-EL. II. Acs Ilsidostin.

Asphaltum, Bitumen Judaicum, or Jews-
pitch, ia a light, solid bitumsn, of a dusky color on the outside, and a deup shin!ug black within; of very littie taste, and having scarcely any smell unless heated, when it emita a strong pitchy odor. It is found in a soft or liquld state on the surface of the Dead Sca, and ly age growa dry and hari. The anme kind of bitumen la inet with likewise in the earth in other piaces of the world-in Chlna, America, and in some pisces of Europe; as the Carpathian Hills, Franen, No chatel, etc.-E. B.

Assaying, taken in its general acceptation, is a chemical process by which any ore, or other metallic compounil, is analyzed, and its constituent parts determined. But the term more particularly denotes the peculiar art by which gold and filver ore examined, and their qualities aseertained, in relation to their state of purity. By the former the whole contents of the substance under exsmination are separated and collected; by the latter it Is only uccessary in practice to find, by the destruction or separation of the alioys, the amount of pure metal contained in the gpecimen operated on, so that a value may bo given, by computation, to the whole mass. To this apecific liranch we purpose to confine ourselves in the fellowing obscrvations.
The art of assaying the precious matala must be esteemed of considcrable importance in many poirts of view, but more especinliy to commerclal natlons tradIng extensively in these commodities. For although the ultimate destination of these metals be their conversion iuto coin, plate, or other articles of use and ornament, still there are vast treasures of bullion consigned to the stores of different countries merely as commodities, as convenient representatives of vaiue. or in security for nominal wealh, the marketable value of whilch is determined solely by the skili and accuracy of the assayer. Every one having experience of such matters knows that, unlike other things of a mercantile uature, bullion can not be valued by its bulk, weight, or any simple external characteristie, but by ascertalning in some way the amount of fine metal contalned in n given quantity. Aud implicit condidence being placed in the honesty, accuraey, and fldelity of the assayer, who, by examinling a small portion enly, gives a certificate of its quallty upon which the whole is estimated, meschants are ennbled to buy and sell bullion without risk of loss, and with the most perfect assuranco of the value being maintalned. Iy uneans
of the art of assaying, as applicable te small aa to large thinge, we also possess a certain safeguard against frand in the manufacture of plata and other articles of personal or domestle use, which must be regarded as of some importance in a country rich and affluent like Great Britain, where gold and silver have become so common ameng the middle classes as acarcely to be esteamen luxuries. We could oaly wish that the lawa which prevail in refereace to plate were more geaerally extended in their application to the manufacture of jewelry, and other personal ornamenta; for $1 n$ these things the public have no gaaraatee against fraud and knavery beyond the character or assurance of the dealer.
If the art of assaying be deemed valnable and important as regards bullion and plate, securing a certain and rellable. test of value, as well as a sufficient check apon fraudulent designs, we can not sureiy question ita aven graater importance in reference to the metalic curreney of a country, tha standard accuracy of which affects materialiy the lntereats of all, and so far teads iv prumote the welfare of mankind. What. aver this standard be, it ls obvious the value of all property la exchange must be regulated and determthed by it, whether in land, houses, comnodities, or the wages of labor; and if wa had $n o$ reliance on the integrity of our coin as a measure of value, we could enjoy no security in our property. In all countries, therefore, claiming a character for honesty, the 'ategrity of the standard should be a fundamental priaciple. Any the slightest deriution from it will lastantly be discovered, feilowed by a losa of credit, and viclent finctuations in the exchange, which of all things are most injurious to trading communities. For the exchange between one country and another is net determined by coin merely as a circulating medium, but, in reality, by the exact amount of fine metal contained in the eoin; sand, therefore, it is necessary to know that the proportion is maintained called the standard, which, in our gold currency, consists of eleren-t welfths of pure metal and one-t welth of alloy. This fact can only be ascertained by the process of assay. But when rations acquire a character for benesty and integrity, the enurency will freely circulate all over the world without auspicion, at ita repotel value, and the currency of one be catily coaverted finto the currency of another. But we should fail to secure this great advantage, this implicit confidence, without the assayer's skill and check, by whieh the dice proportions of metal are guaranteed, and any depreclation detected.
We need now ne longer apprehend any of those capricions and dishonorable changes in the currency, not unknown to our bistory before the reign of Dilizabeth, which enriched the monarch at the expense of his mbjects, created sulden and violent changes in the value of property, and ofteli spreaf dismay and poverty ameng all classes, without any clear knowledge of the cause. That patriotic and sagacious queen, of whem Eagland is justly prouil, among other great and durahe nierits, is honerally distinguished by the restoration of our carreacy to purity, and by fixing our present standari of value, from which, happily, no deviation can the notified in succeeding ages. In this respect science and knowledge, if not always the liandmaids of integrity, are the best guarantees against fraud and evil designs; and we can scarcely believe it possilule, in these times, to sutfer from a dishonorable depreclation of the currency, white any vague apprehension of error is instuntly dissipated by the numerous checks, public and private, on the purity of onr coin.
Trial of the Pyx--Among these we may bricfiy lnstance the ancient ceremony called the Tiral of the Pyx, which, in the most public manner, secures an impartial examination of the coinage, and a verdiet, as public, of lta legal or atandard purity. In no other country have we been able to discover an instilution onalogous to this, which, after all intermediate tests
have been tried in tha process of manufacture, affords an ultimate and jodicleus appeal for the public satiofaction. And it may be added, to the credit of the officere of the Mint, that, whatever may happen in future times, amildst the sudden and hasty revolutions in public affairs, during the past, we are unable to adduce any instance of this ordeal being passed without hener and integrity; and instead of the allowance or romedy by law for errors, unavoidable in manufacture, being taken advantage of, as a protection to carelessness, we may proneunce that the coinage has always been proved to be as uigh to tha legal standard as is possible, the deviation being on the average acarcely worth notification.

The Trial of the Pyx, in England, takes place once in about avery three years, but no specitied period is fixed hy law. It ia so denominated from the pyx, or clest, in which the spectmen coins are deposited in the Mint for future exanination; these coins being supposed a fair representation of the whele noney coined within a certain period. Out of each bag of coin, whether gold or silver, two pieces are taken; one for tha trial by assay within the Mint, the other for the general pyx; and these are carefully sealed up in paper by three officers, and deposited in the chest. It should be remarked, that previously to the issne of coln to the public, a minor pyx takea place within the Mint, intended for the examination of the coined money by appointed officers, as regards both weight and fineness, and ne coin is pernitted to be delivered lefore it has passed this necessary ordeul.

It having been notified to the govemment that a trial of the pyx is called for, the Lord Chancellor is?nes his warrant to aummon a jury of goldsmiths, who, on the appointed day, proceed to the e cehequer office, Whiteliall, and there, in presence of several privy-counaelers and tha officers of the Mint, receive the solemn charge of the Lord Chancellor, whe directs them in their importane functions, and requesta them to delliver to him a verdict of their finding. A piece of gold and silver, cut from the triut-plated deposited in the Exchequer, supposed to be of the exact legal standard, are delivered to the foreman of the jury, who is required to declare to what degree the coin under examination deviates from them. This leing dene, the jury proceed to Goldsmith's Hall, London, where assaying apparatus, and all other necessary appliances, are in daily use for the trial of geld and sliver plate ; and sealed packets of the sprecimen ecins being delivered to them by the effirers of the Mint, they are first tried by welght, and then a ccrtain number are taken from the whole and melted lito a bar, from which the assay trials are subscquently thkea.

The verdict of the jury, founded on the results of these proceedings, proving favorabic, the Master of the Mint and suborlinate officers are releasci from ali further respousibility, while the conntry recelves, by the publicity of the verdict, an attestation of the standard purity of the coinage.

In tinies of comparative ignorance, the art of assaying was rsteemed a mystery, andi, like some othier crufts, the practice of it was retained in few hands. There were supposed secrets in the conduct of the procegses, which nene but the initiated were pr rmitted to know ; but now it is admitted that those secrets are nothing but the knowledge açuired by long experience, amounting in reality to certain allowances or adjustments in the results of tha operallons. The uncertain tests and appilances enployed in ancient tines, which afforded only a wide approximation to truth, and exposed the public to extortlon and frand, have in more acientific timea been supherseded by chemical processes as accurete as they are delicate and beautifnl. The exquisite and varied laws of nature, in connection with metals and their transformations, are made instrumental to the use and knewledige of mankind; and science, so called, enables man to nicely balance and
estimate the vast treasures found in the bowels of the earth, and constitute them measures of value more unchanging than any other product of nature. As science has progressed, so hss the art of assaying improvetl while In modern tines new fields have leen opened up for its use and application. Along with increased aceuracy, it has become more varied and extensive ln lts practice. The smount of the precious metals have not only increased immeasurably, thereby magnifying the importance of the art, but in recent times changes in the mode of refining or aeparating these metals have created a new branch of buslness little practiced in former ages. The application of sulphuric acid to separste gold from silver, and silver from gold, by whlch the operation is effected with great economy, and nearly all the contents recovered at comparatively llttle cost, has led to an extensive busineas in parting assays, which did not formerly exiat. In this manner the holder of Lnllion, of a mixed character, has a higher value put upen his metal by reason of the gold or giliver contained in it; and in the market he is able to realize the whole value by assay, less the deductlon made to cover the charge of refining. The parting assay is different from the slmple assay int this, that it declares upon the certlicate of a gold assay the amount of silver combined with it, and of a silver asssy the number of gralns of fine gold contalned in each pound.

The bullion to be valued having been melted into ingets or bars, om" 11 pieces are cut from esch and folded separately in slips of paper with a corresponding mark or number of the bar, so as to preserve the identilication of the assay reports with the bars. On these slips of paper the assayer writes his report, which declares the quality of the gold and silver, and this is the certificate upon which the bullion is bought and sold in the market. The Bank of England, however, and the Mint, in order to guard against any aurreptitioua change or fraud, require the assays upon which they receive bullion to be cut off in preseace of appointed oflicers. The assayer reports gold by carats, and silver by pennyweights. In the one case the Troy pound is divided Into 24 parta or carats, snd Britlah standard being $11-12$ ths fine gold and 1-12th alloy, the carat will thus represent 10 dwts. Troy, the standard being therefore 22 carata fine and 2 earats alloy. In the other the Troy peund is divided into 240 dwts., and the standard of sllver being 222 dwts. fine and 18 dwta. of alloy, the pennywelght will represent the 1-240th of the pound.

Carats are subdivided Into four carat grains, $=60$ Troy grains oach, and these aro again further subdivided into eighths of a carat grain, $=7 \frac{1}{\frac{1}{2}}$ gralns Trey. The lewest trade report of gold is one-eighth of a carat graln, and of silver half a pennyweight. In reporting gold, the practice in general use is to take 2 carats as the representative of fine gold for bullion better than standsrd, and 24 carats for bullion worss than stand. ard. Thus a bar reported better 137 , or one carat, three carat grains, sud three-quarters of a grain, is within one-quarter of a carat grain of purity; or 15 gralns Troy. But if a bar were found to contain only one-half of fine gold, the repert wonld not be one earat worse, but viorse 12 earsta, or $12-24$ ths. We may observe, however, that this complex mode of enumeration, $s 0$ great a inystery to the uninitlated, will probably in a few years be entirely superseded by the decimal system of notation in general use on the continent. Already it is partlally adopted by assayers in England, who are now required to append the deelmal report to the ordine $y$ one on the certlficate. Instead of carats and penny welghts, the numeral 1000 will represent tine gold and silver, and any deviation in purity from this will he expressed by a decimal instesd of a vulgar fraction.

It has been alresdy remarked that the lowest denomination of the trade roport is $\frac{1}{8}$ th of a carat grain, or $7 \frac{1}{2}$ grains Troy, as respects gold, and half a peunyweight,
or 12 grsins, as respects silver; but practlcally an assayer ean arrive at a much nearer approximation to the truth. As in the Royal Mint in making the combinstion for standard coln, he can report to a single grain, or 1-5760th, in epch ease; but in buying and selling bullion some prcisction to the purchaser is deemed necessary an an indemnity against errurs and, irregular mixture of the alloy, and hence arises the above latitude in the assay report. It is probable, however, that the general use of decimsl notation will eventually canse a more accurate report, and deprive the bullion dealer of a share of that ad"antage which obviously is greater than is necessary.

An ordinary sssay report of gold and silver expresses the variation from the standsrd, and not the fine metal contalned In lt; and it is, therefore, marked as either better or worse than standard. The standard of gold being 22 carats find and 2 alloy, or 11-12ths fine, an ingot of gold found to contain only 21 carata pure gold wonld be reported worse 1 rarst ; if it contained 231 carats, it would then be reported better 1 carat, 8 grains, and half a grain. The standard of silver being 11 oz .2 dwts . fine, and 18 dwts . alloy, an inget of silver found to contaln only 11 oz . of fine would be reperted worse 2 dwts., but if it contained $11 \mathrm{oz} .4 \frac{1}{2}$, the report would then be better $2 \frac{1}{2}$ dwts.

In buying or selling, the betterness or worseness of the bar is added or deducted from the gross weight; and the value is computed on this, the standsed weight, at the market price of the day.
When the assay required is a parting assay, or an assay of golc: eontainlag ailver, a report is glven of the weight of fine silver in the pound; and when the silver exceeds 15 dwts. per pound, all above that is usually added to the value of the gold, that heing an allowance made by general agreement for the cost of separation or refining. So likewise with an assay of silver holding good. The report declares the number of graina of fine gold in the pound, and all above 3 or 4 grains ls added to the computed value of the silver.
In theso delicate operatlons we need acarcely impress upon the reader how important an instrument an aecurate balance must be in securing a certain and uniform result. The specimen taken by an assayer is no more than 12 or 15 grains of tho mass, and if 12 grains, eaeh graln would represent an ounce, or 1-430th. In the Koyal Mint, the tine b llances in use are sensible to the $1-1000$ th of a grain.
The priuciplo of assaying gold and silver la very simple theoretleally, but in practice great experience is necessary to insure accuracy ; and there is no branch of business which demants more personal and undlvided attention. The reanlt is liable to the influence of so many contingencies, that ne assayer who regarda his reputation will delegate the principal processes to one not equally skilled with hlmself. Besides the result ascertainable by weight, there are allowances and compensstions to be made whlch are known only to an experienced assayer, and if these were disregarded, as might be the case wlth the mere novice, the report would be wide from the truth.-E. B.
Assessor, a person appointed to assess property, and partieularly to determine the valne of property for taxation.

Assets, in Commerce, a termed used to designato the stock in trade, and the entire property of all sorts, belonging to a merchant or to a trading asseclation. It is also applied to goods or property plsceti, for the discharge of aome particular trust or obligation, in tho hands of executors, assignees, etc.

Assiento, a Spanish word slgnifying a contract. In commercial history, it means the contract or agreement by which the Spanish gevernment ceded first to a company of French, and afterward (by the treaty of Utrecht) to a company of English merchanis, the right to import, under ecrtsin condltlous, a specified number of slaves into the Spanlsh colonics. For Gull
particulars with respect to this contract, sue Mr. Bandinel's valuable work on the Slave-trade.

Asaignat, the name given to a pecuiliar apeciea of paper money issued during the first French Revolution. The Influence of the aystem, operating along with the other attempts to regulate trade, form a prominent feature in the calamitous nistory of the epoch. The share borne in it by :he assignats ls at the same time a memorable instance, for the use of the economist and financier, of the hopelessness of projects for creating or preserving national wealth by an isaue of paper money, not the representative of avallable wealth and real business transactions. The first issue of asaignats was mado in the secarity of the forfeited ecelesiastleal property, and was adopted as a preferable alternative to throwing the forfelted lands on the market, which It was no doubt judlciously belleved that so large an amount of property would glut. The holder of the assignats might use them as money, or claim the land which they represented. As more forfeltarea oceurred, the issue of assignats was increased. Dut it soon ceased to be measured by property, and was enlarged according to the exigencles of the revolutionary government. The paper money fell to lialf, then to a sisth part of the value of the same denomination ln silver, and alnking rapidiy through succesaive grades of alecrease, silver held at last the value of 150 times its denomlnation in peper. In August of 1778, 8776 inillions of francs were thus put in circuiation: and virtually the assignats became worthless. The establishment of the maximum, and the other tyrannical Interferences with trade by which revolutionary govermments endeavor to support ercdit, have their proper place, slong with the account of the condition of the country during the depreciation of the assignats, under the head of Fisance,-E. B.

Assignee, a person appolnted by competent anthority to do, act, or transact some business, or exercise some particuiar privilege or power, for or on account of some specified individual or individuals. Assignees may be created by deed, or by law: hy deed, where the lessec of a farm essigns the same to another; by law, where the law makes an assignee, without any appointment of the person entitled, as an exccutor is asaignce in law to the testator, and an adminiatrator to an intestate. The term is most commonly applied to the official assignees appoiuted to manege buakrupt estates.-See Banknurt.

Assignment, Assignation, Asaignee, are of frequent techaicai use in law. To assign is to make over, and the term ia generaliy used to express a transference by writing, in contradistinction to a transference by actual delivery. In England the usual exprossion Is assignment, in Scotland it is assignation. The person making over is called assignerer, assigner, or cedent; the recipient, assignee. This last term is of important application in the law of Lankruptcy In Englend and Ireiand, as expressing persons of two classes, the official assignees and the trade assignees, to whom the realization and distribution of the bankrupt estate is committed.-D. B. See Banknurtcy.

Assize. See Bheall.
Association (from the Latin associare, to join in fellow ship), the act of associating or constituting a society or partnership, in order to carry on some acheme or business with more advaftage. The reader is referred to the Encyelopedia Britannica, articles Socsetifs and Aomation, in reference to the influence of association upon workmen and employers, and as a political engine.

Agsumption, the capital of the province of Paraguay, in South America. It is situated on an obtuse angle formed ly the eastern bank of the River I'araguay, 18 miles above the junction of the first mouth of the Picomayo, and 48 above that of the second. It was originally a small fort, but, from the convenience of its situation, in a few yeara it became a eity, and in

1547 was erected loto a bishopric. Tha adjacent territory is rich and fertile in a high degree, and abounda in a great variety of fruits. The air la temperate and. the climate salubrious; the trees are perpetually green, and the rich pastures in the neighborhood feed numerons flocks of cattle. The city la inhabited by Spaniards, Indians, and Mestizoes, who trade in hides, tobacco, and sugar. The Paraguay affords a channel of communication with Buenos Ayres; but the passage lo long, owing to the rapid flow of the waters of that river: this, however, ia considerably obviated by the favorable winds which blow from the south for a great part of the year. Populatlon, 12,000. I.ong. $67^{\circ} 37^{\prime}$ W. ; lat. $25^{\circ} 16^{\prime}$ S.-E. $B$.

Asturance. See Insurance.
Astern, a sea phrmae, used to signify any thing at some distance behind the ship; being the opposite of Anfas, which signifies the space before her.

Astringents, a class of medicines used for binding or contracting the several parts, external or internal, of the human system, for restralaing profuse discharges, coagulating the fluide, condensing and sirengthening the solids. The prinelpal astringents are tho mineral acids, alum, lime-water, chalk, aeveral preparations of copper, zinc, iron, etc., catechu, kino, oak-bark, galis, and all vegetuble substances containing tannin.-E. B.

Astronomy. The earliest accounts we have of this science are those of Bahylon, about 2234 b.c.Blain. The stody of astronomy was much advanced in Chaldea under Nabonassur: it was known to the Chinese about 1100 n.c.; some say many centuries before. Lunar eclipses were observed at Babyion with exceeding accuracy, 720 b.c. Spherical form of the carth, and the true cause of lnnar eclipses, ianght by Thales, 640 n.c. Further discoveries iny Pythagoras, who tanght the doctrine of celestial motions, and believed in the plarality of habitable worlds, 600 n.c. Hipparchus began his observations at Ihodes, $167 \mathrm{~s} . \mathrm{c} . ;$ began his new cycle of the moon in 143 ; and made great advences in the science, 140 n.c. The precession of the equinoxes confirmed, and the places and distances of the planets discovered, by Ptolemy, A.d. 180. After the lapse of neerly seven centuries, during which time astronomy was necflected, it was reaunsed by the Arabs about 800 ; and was afterward brought into Furope by the Moors of Barbary and Spain, but not sooner than 1201, when they also lntroduced geography:

The distance of the flxed atars is supposed to be 400,000 times greater from ithan we are from the sun, that is to say, 38 millions of militoss of miles; so that a

Basin of the North Atlantic Ocean. by Lieut. Maury U.S.N.

cannon-ball would take near nine millions of years to reach one of them, supposing there were nothing to hinder it from pursuing its course thither. As light takes about oight minutes snd a quarter to reach us from the san, it would be about slx yerers in coming from one of those stars; but the esleulstions of later astronomers prove some stars to le so distant, that their light must take centuries before it can reach us; and that every particle of Jight which enters our eyes laft the star it comes from threa or four hundred years ego.-Haydn,

Atlantio Ocean (Atlanticus Oceanus), one of the five great bydrographical divisions of the glohe, oceuples an imineuse valley, and extends from the Arctic circle on the north to the Antartic circle on the south, wra:hed wost by the coast of America to Cape Horn, and thence by a line continued on the same merldian to the Antarctic circle, and east by the shores of Europe and Africa to the Cape of Good IIope, and thence prolonged on the meridian of Cape Agullas thll it meets tho Antartic cirele. Its extrome breadth is about 5000 milles, and lits srea is computed at $25,000,000$ square miles. It is naturally divided into three portlons: 1st, the north ; 2d, the south ; and, 3d, the intertropienl Atlantic. The North Sed, or German Ocenn, the Caribbean Sea, and the Irish Sea, form pertions of the Atlantic; but the Baltic and the Mediterranean, whlch communicate with the North Sen by narrow shannels, are properly considered separate seas. The principal gulfs of the Atlantic are, in Enrope, the Bay of Biscay, or Golfe de Gascogne; in Africa, the Gulf of Guinea; In America, the Gulf of Mesico and the Gulf of St. Lawrence. The chief islands are, in Europo, the Britlsh Isles and Iceland; in Africa, the Azores, Madeira, ant Canary islands, and tho Archlpelago of the Gulf of Guinea; in America, the Antilles, Newfoundland, and the Islands of the Gulf of St. Lawrence. The Atlantic, with its branchas, Irains nenrly the whole of Europe west of the basin of the Volga; all North Amerlea east of the Rocky Momntains and the Sicrra Madro of Mexico; and the whole of South Amorica east of the Andes. Its chief affluents nre, in liurope, the Rhine, Loire, and Tages; In Africa, the Sanegal, Niger, anil Congo; and in North America, the St. Lawrened and Mississippi ; in South Amerlea, the Orindeo, Amazon, and La l'lata. Tho wed of the Atlantic is very unequal ln elevation, in some places rising In immenso sand banks to within a fow fathoms of the surface, and in others slinking to great depths. In 1853, Lieutenant Berryman, of the United States navy, ran a line of deep sea soundings from the neighborhood of Newfoundland to Ireland, to test the practicability of finding a base for n submarine telegraph between America and Europe. Average depth, 12,(000 feet. But farther south, Leutenant Jerryinan made a sounding (lat. $52^{\circ} 55^{\prime} \mathrm{N}_{\mathrm{s}}, 47^{\circ} 58^{\prime} \mathrm{W}$. long.) 89,600 feet in depth, equal to a littlo ovar $7 \frac{1}{4}$ miles. The most extensive banks nuo those of Newfoundland, the Dogger Bank in the German Ocaan, and the $A$ gulhas Bank off the south polnt of Africn. Tho minimmm depth on the Sank of Newfoundland is 60 feet. The German Ocean varies In depth from 60 to 000 feet.
"From the tep of Chimbinazo to the hottom of the Atlantle, at the deepest plaee yet reached by the plummet in the North Atlantle, the distance, in a vertheal line, is nine miles. In lts entire length, the bash of this sea is a long trongh, separating the Ohl World from the New, and extenting probably trom pole to pole. Could the waters of the Atlmale bo drawn off, so as to expose to view this great sen-gash, which separates continenta, and extends from tho Aretle to the Antartie, It would present a scene the most rugged, grand, and impesing. The very ribs of tho solid earth, wlth the foundatluns of the sea, woild be brought to light, and we should have presented to us at one vlew, In the empty cradle of the ocean, 'a thousaml fearnil wree'ss,' with that dreadful array of dead men's skulls, great anchors, heaps of jearl, and Inestimulle stones,
which, in the poet's eye, lie scattered in the bottom of the sea, msking it hideous with sights of ugly death. There is at the bottom of this sea, hetween Cape Race in Newfoundlend and Cspe Clesr in Ireland, a remarkable steppe, which is now known as the telegraphlc plateau. A company is now engsged with the project of a submarine telegraph across the Atlantic. It is proposed to carry the wires along this plateau from the eastern shores of Newfoundland to the western shores of Ireland. The great-circle distance between these two shore-lines is one thousand six hundred miles, and the oca along the ronte is probably nowhere more than two thousand feet deep."Mauny's Geography af the Sea.

Ons attempt has been made to lay a cable from Port au Basque, Nowfountland, to Cape North, the extremest point of Cape Breton Island, but owing to contlnued storm the cables had to be parted, and it was given up. Preparations are now being made for another trinl.

The trade-winds blow regularly in the intertropical portion of the Atlantle; beyond these limits the winds are variable. The priacip=1 curret.s of the AtJantle are, the equatorial current, which flows from the coast of Africa to the Caribbean Sen, with a velocity of from 30 to 70 miles a day, and the Gulf Stream, which, leaving the Gulf of Mexiro, flows through the Stralt of Florida, with a vel :. y of 80 miles a day, and a temperature of $86^{\circ}$ Fahrenheit, and extends with a gradually decreasing volocity and diminished temperature to the Azores. Immense numbers of fish are found In the Athantic, and herring and cod fishing are important branches of industry in the northern portion. A great part of the surface of the Atlaitic, between lat. $16^{\circ}$ and $45^{\circ} \mathrm{N}$., and long. $35^{\circ}$ and $75^{\circ} \mathrm{W}$., is covered with 8 . species of weed (Fucus Natans) of $n$ beautiful g, reen color, from which circumstance it is called the St ryazo Sea-the sea of duck-weed, or the grassy sea. In the higher latitudes of the North ani South Atlantic, navigation is impeded by immense icebergs, which are floated from the polar regions, and although these are generally melted before reaching the frequented parts of the ocenn, they have occasionally been met with as far south as lat. $40^{\circ} 45^{\prime}$ in the Norel Atlantle, and in the viclalty of tho Cape of Good IIope in tho South Atlantic Orean. Fr, extenslve information on the navigation and currents of the Atlantle, see Mavny's Wind and Current Charts of the Atlantic Ocean.

Ilate I., îrom Mauny's Geograpiny of the Sea, "presente a msp of the depths of che occan according to recent soundings. "It relates exclusively to the bottom of that purt of the Atmatic Ocem whleh lies north of $10^{\circ}$ south. It is stippled with four shades; the darkest (that which is nearest the shore-llne) shows where the water i: less than 6000 feet deep; the next, where it is less thin 12,000 feet; the third, where it is less than 18,000; and the fourth. and lightest, where it is not over 24,000 feet deep. The thanl: space soith of Nova Scotia and the Grand Bunks includes n tistrict within which very deep water has been reported, but from casts of the derp-sea lead which unop tisenssion do not appenr satisfatory. The decpest part of the North Atlantic is mrobably somewhere hetween the Bermudas and the Grand lanks, hut huw deep it may he yet remains for the cannon-ball aud tho sounding-line to determine."--Maviy.

The Athntle, nceorilng to Inmbolet, presents all the lutications of a valley, ns if a tlow of edtlying waters had been directed from toward the northenst, then toward the northwest, and back agnin to the northeast. The parallelism of the coast north of $10^{\circ}$ south latitute, the projecting and receding angles, the convexlty of Brazil opposito to the Gulf of Guinea, that of Afrien under the anme parallel with the Gulf of the Antilles, all favor this upparently speculative view. In this Athantic valley; as ls almost every where the case In the conilgmration of largo continental masses, coasts deeply Indented and rieh in islands are sltuated
oppeaite to those possessing a different character．The depth of this ocean is oxtremely various；and is enor－ mous，both to the north and，south of the equator． Thus，Captain Sir Edward Belcher，K．N．，in lat． $0^{\circ} 4^{\prime}$ N．long．， $10^{\circ} 6^{\prime}$ W．，sounded to the depth of 3665 fathoms $=18,390$ feet ；Captain Barnett，R．N．，In lat． $41^{\circ} 2^{\prime} \mathrm{N}$. long． $44^{\circ} 3^{\prime} \mathrm{W}$ ．，souuded to the depth of 3700 fathoms，or 22,200 feet；Captain Sir Janes Ross，R．N．， in 1840 ，to 2677 fathoms，or 16,062 feet；and afterward， in lat． $33^{\circ} 3^{\prime}$ S．，long． $9^{\circ} 1^{\prime}$ E．，to 4600 fathoms，or 27，600 feet ；and Captain H．M．Deuham，H．M．S．Her－ ald，has obtained soundlings at the vast depth of 7706 fathons $=46,236$ fect，or ubout 83 English miles．This， which is the deepest sounding ever yet taken，ocenrred on 30 th Octover， $185^{5} 2$ ，in lat． $36^{\circ} 49^{\prime}$ S．，long． $33^{\circ} G^{\prime} \mathrm{W}$ ， Two American captalns have also obtained souncilags at the depth of 3100 and 3500 fathoms．
Ine intertropical part of tho Aclantic is under the influenco of the trade－winds，which frequently extend to the 32 l degree of north or south latitute．The winds blow almost invariably in the sume direction， from east to west，occasionally varying a fow points to the nerth or south，on the north and south sides of the equator．A region of caline，varying from 3 th 10 de－ grees of latitude，necording to the season of the year， separates the two trade－winds．It is，however，daily agitated by a squall，which begins about two o＇eloek in the afternoon，and continues about an hour．This region dues not always oceupy the same part，but its central line may be placed about the 5th degree of norih latitude．In some tracts the influence of the trade－winds extends to the slores，bit in general it does not come within 200 miles of the coasts．
The current of this ocean first known to mariners， is called the equinoetial，and is within the tropics，es－ pecially flowing from the coast of Senegal to the Ca－ iiblean Sea．Its direction is constandy from east to west，with a mean rapldity ui 9 or 10 miles in 24 hoars． This current is ntributed to the impulso which is given to the surface of the sea by the trade－winds．＂＇n the chamel，＂says $1 l$ umboldt，＂which the Atlantic has dug Letween Guiana and Guinea on the nieridian of 20 or 23 degrees，and from the 8 th or 9 th to the 2 d or 3t degrees of north latitule，whero the trade－winds aro often interrupted ly winls blowing from the south or south－southwest，the equinoetial current is more incon－ stant in its direetion．The equinoctial current is felt， though feebly，even beyond the tropic of Cancer，in the 206 h and 28 th degrees of latitude．In the vast hasin of tho Atlantic，at 600 or 700 leagues from the coasts of Africa，vessels from Europe hound to the Wert Indies fint their sailing accelerated before they reach the torrid zone．＂In the Carilhean Sea，the motion of this current is much accelerated by the action of an－ other current．The Mozambique current，fiewing from north to so ith，botween Madagascar and tho eastern coest of Africa，bends to the north of tho Lagullas bank， round tho subthern point of Africa，and advanees with much vidence ulong its westorn coast beyond the equa－ tor to the island of St．Thomas．It gives a non thwest－ erly direction to $n$ portien of the waters of the South Athantic，causing them to strike Cape St．Augustin， and to follow the shores of Cuiana heyond the moath of the Orinoen，the llerea del Drago，and the coust of laria．The coast of Anerica presenting a barrier to the efuinuetial eurrent，i：s waters are driven with ve－ ＇ocity thr ：urh the strit formed by Cape Caterhe und

is 17 ；and in the parallel of Charleston，oppoaite Cape Ilenlopen，from forty to fifty leagues．＂The waters of the Mexican Gulf forcibly drawn to north－ east preserve thelr warm temperature to such a point， that in 40 and 41 degrees of latitude I found them at $22 \cdot 5^{\circ}$ cent．（ $=72 \cdot 4^{\circ}$ Fabrenheit），when out of the eurrent the lieat of the occan at its surface was scarc Iy $1 \overline{7} \cdot 5^{\circ}\left(=63 \cdot 5^{\circ}\right.$ Fahrenheit $)$ ．In the parallel of New York and Oporto，the temperature of the Gulf Stream is consequently equal to that of the seas of the tropics in the 18th degree of latitude；as，for instance， In the parallel or Porto Rico and the Islands of Cape Verd．＂－Humboldt．In lat． $41^{\circ}{ }^{\circ} 25^{\prime}$ and long． $67^{\circ}$ ， where it is nearly 80 leagues broad，it turns suddenly to the cast，and almost tonches the southern edge of the Great Newfoundland Bank，from whence it con－ tinues its course east and east－southeast to the Azores． On the meridian of Corvo and Flores，the most west－ erly islands of the Azores group，the breadth of the current is 180 leagues．From the Azores it turns to－ ward the Struits of Gibrultar，the islaud of Madei－ ra，and the Canary group．There are several other minor currents in the vast ocean，as the hranch sent of by the Gulf Stream before reaching tho Western Azores，which at certain seasons of the year flows toward Ireland and Norway．The experimenta of Sir James Ross and Captain Denham show that，after the depth of 200 or 300 fathoms，the temperature of the Atlantic waters is stationary at $40^{\circ}$ Folirenhelt，whatever be the temperature at the surface．This uniformity of ten－ perature in the waters of great occans renders them the means of mitigating the extremes of tropical and polar regions．－E．B．See Gulf Streash．See also Rexnblu＇s Investigation of the Carrents of the Atlantic Ocean；Ilrmnonint＇s Cosmos，personal narratice；and Mavn＇s Physical Geography of the Sea．

Atlas，in Literature，a collection of maps，charts， or other tables ；so celled from the fabulons king of that name，who is sometimes represented as supporting tho world on his shoulders．The term was first used in this seuso ly the celelrated geographer Mereator，in the 16th century．
 measure），an instruacut contrived by Professor Lealie for measuring the quantity of moisture exhaled from any humid surface in a given time．It consists of a very thin ball of porous carthen－ware，from one to three inches in diameter，having a small neck firmly cement－ ell to a long and rather wide tule of glass，to whieh is adapted a brass cap，with a narrow collar of leather to fit close．Being filled with distilled or pure water，the waste and descent of this column serves to indicato the quantity of evaporation from the external surface of the ball．Tha tube is marked downward，through its whole lyngth，by the point of a diamond，wlth divisions across it，amonating to from 200 to 500，each of which corresponds to a ring of lishd，that，spread over the whole exhaling surface，would form a film only one thousaudth part oi an fuch in thickness．Thla gradua－ tion is performed ly previonsly sealing one of the ends of the tube with wax，and intreducing suecessive por－ tions of quieksilver，to mark every 20,50 ，or 100 of those divlslons；being enleulated of equal bulk to dlisks of water，that have the surface of the bull（ex－ clanive of the neek）for their hatse，anll so many thou－ sand parts of an inch for their altitule．

Atmosphere，is the name applied to the Invisilile elastic methun which surrounds the globe of the earth to an unknown height．The fuid of which it is com－ posed is usually known hy the name of air．

Attachment，in English Lau，is a process from a court of recori，awarded by the justlees at their disere－ tim，on a bare suggestion，or on thelr own knowlelge； and ls properly grantable in eases of contempt．It differs from arrest，in that he who arresta a man carries him to a $;$ erson of higher power to be forthwith disposed of； but he that attaches keeprs the party attuched，and pre－
sents him in court at the day assigned, as appears by the words of the writ. Anather difterence ls, that arrest ls only upon the body oi' a man, whereas an attachment is often upon his goods. It is distinguished from distress in not extending to lands, as the latter does; nor does a distress touch the body, as an attachment does. Every court of record has power to fine and imprison for contempt of its authority.-E. B.

Attar, or Otto of Roses, a well-known perfumo of great strength, is an essential oll prepared in several parts of Asia and in Egypt from the Rosa moschata and Rosa Damascena. It is sald that 100,000 roses yield but 180 grains of attar. This oil is at first of a palish green color, whlch by keeping becomes daiker, and presents varlous tints of green, yellow, and red.

Attorney-at-law is one who is put in tho place, stead, or turn of another (attornatus), to manage or conduct his law proceedings or affalrs. The term is used in Lingland to denote the class of legal practitioners whose functions are preparatory to these of the barrister or advocate.
Auotion, a i.ell-known mode of selling property; in open competition, to the highest offerer, by means of an agent or auctioneer. When the property is of considerable value, a person is sometimes appolnted to superintend the sale, who is denominated indge of the roup, and sets as an arbiter in settling any disputes that may arise. The terms of the sale may be regulated at the will of the exposer, provided they are distinctly annoonced to the public betorohand. The party offering the highest price is declared the purchaser. When furmal articles of sale are employed, they commonly regulato how much each offer shall exceed the previous one; whether the exposer shall be allowed to make an offer, or to withdraw the aubject, if tho lighest offer does not amount to a given sum; and sometimes it is deelared that an installment of the price stali be paynble instantly, or thet se.
shall be found within a stipulated period; failing which the immediately preceding offerer is preferred. Secret contrivances, elther to raise or deprecinte the price, are unlawfol. The seller must not attempt to practice any lmposition on the public; nelther are tho bidders permitted to adopt any unfair menus to prevent the natural operation of free competition. Where any such thing is detectod, not only is the sale vitiated, bit reparation is due to the injured party. For exunple, the secret employment by the seller ef a friend to raise the price by msking a fletitious offer is fraudulent, and entitles the highest offerer, on detecting it, to repudiato the transactlou, or (in case he has been outblideu by such fietitious party) to demand the prop. erty at the price which he fairly oftered. On the of erer hatd, the obligation on the part of the public to act fairly is equally stringent. Accordingly, if two or more indlvidunls comblne to withhold their liddings that one of their number may purchase cherply in order to divide amoug them the expected prolit, or if a bilder were te give money to ethers to induce them to refrain from bidding, the exposer is entitled to have the sale declared void, on the gromul that inch a secret cembination or paction obviously deprivel him of the rdvantage which he expreted from that competition which a prablic sale is intendod to secure.--1. 13 .
(If Sules at Auction.-_" An auctioneer has not only pessession of the groods which he is employed to sell, but he hisanu Juterest coupled with that possession. Ho has n speclal property in the goods, and a lien upon them for the charges of the sale, and his commission, and the anction duty. IIo may sue the buyer for the pur-chase-money, and if he glves credlt to the venter, and makes tlolivery without payment, It ls at his own risk. If the auctluneer has notliee that the property he Is alout to sell does aut belong to his prineljal, ant he sells botwithstanding the notlee, he will be held responsible to the owner for tho amount of the sale. So, If the anctioneer does not diselose the nane of his prin-
cipal at the tlme of the sale, the purchaser is entitled to look to him personally for the completion of the contract, and for damsges on its non-performance.
"In the sale of real preperty at auction, care should be taken that the descriptien of it be accurate, or the purchaser will not be held to a perfonnance of the contract. But if tho description be substantially true, and be defective or inaccurate in a slight degree only, the purchaser will be required to perform the contract, If the sale be fair and the title good. Some caro and diligence must be exacted of the purchaser. If every nico and critical objection be admissible, and sufficiont to defeat the salo, it would greatly impair the efficacy and value of public judicial sales; and, therefore, if tho purchsser gets substantially the thing for which he bargaincd, he may generally be held to abide by the purchase, with the allowance of some deduction from the price, by way of emmpensation for any small detlciency in value by reason of the variation.
"A lidding at an auction may be retracted before the hammer is down. Every bldding is nothing more than an offer on one side, which is not blnding on either side until it is assented to, and that assent is signified, on the part of the seller, by knocking down the hammer.
"If the owner employs puffers to bld for him at an auction, it has been held to be a fraud upon the real bidders. He must not enhanco the price by a person privately employed hy him for that purpose. It would be contrary to good falth, as persons resort to all suction under a confidence that the articles set up for sale will be disposed of to the highest real bidder. A secret puffer employed by the owner is not fair biddiug, and is a fraud upon the public, nor can the owner privately bid upon his own goods; or secret dealing on the part of the seller is deemed fraudulent. If ho bo unwilling that his goods shall bo sold at an under price, he may oriler them to be set $\mathrm{u}_{1}, 1$, his own price and not lower, or he may previously declare, as a condition of the sale, that he reserves a bid for himself." -Kevt's Comm., vol. li. Lect. XXXIX.

Auctioneer, a person who conducts sales by auction. It is his duty to state the conditions of sale, to declaro the respective biddings, and to terminate the sale by knocking down the thing sold to the highest bldder. An auctioneer is held to bo lawfully authurized by the purehaser to sign a contract for him, whether lt be for lands or goeds; and his writing down the name of the highest bidder in his book is sufficient to bind any other person fer whom the highest bidder purehased, even though such person be present, provided he do not olject before entry. An auctioneer who declines to disclose the name of his principal at the time of sale makes himself responsible. But if he diselose tho name of his prinelpal, he ceases to be respensiblo, either for the sounduess of er titlo to the thing sold, unless he have expressly warranted It on his own responslbillty. If an auctioneer pay ever the produce of a sale to his employer, after receiving notice that the goods were aot the property of sueh employor, the real owner of the goods may recover the amount from the auctioneor, It has long been a common practico at certain auctions (called for that reason mock auctious) to employ puffers, or mock biddere, to raise the value of the artlelea seld by their apparent competltion, and inany questions have grown out of it. It was long ago decided that if tho owner of an estate put up to salo by auction employ puffers to bid for him, It is a fraud on the real bidder, and the highest bldder ean not be cempelled to complete his contract.-6 T. Rep. p. 642. But It would soety is, if the mere employment of puffers under any es $\cdot{ }^{n} \cdot \mathrm{t}$.stances were now held to be illegal. "The Inelinnwon of the courts at the present timo is, that a salo by anction should be conducted In the most open and public mamer posslble; that there shonltl be no reserve on the part of the seller, and no colluslon on the part of the buyers.

Puffing is illegal, according to a late casn, even thoug'h there be only one puffer ; and It was then decided that the recogulzed practice at auctions, of employing such persons to bld upon the sale of herses, could not be sustained."-Woolnych on Commercial Lau, p. 262. A party biddiug at an anction may retract his offer at any' time before the hammer is down. Another clearly eatablished principle is, that verbal declarations by un auctioneer are not te he auffered te control the printed conditions of sale; and these, when pasted up under the box of the auctionee., are held to be aufficiently notified to purchasers. Auctioneers, like all other agents, should carcfully observe their instructions. Should these who employ them sustain any damage through their carelessness or inattention, they will be responsible. They must also answer for the consequences, If they sell tho property intrusted to their care for less than the price set upon it by the owners, or in a way contrary to order.

Auditor, in English Law, ia an officer who, by examining yearly the accounts of the under officers, makes up a general book, which shows the difference between their receipts aad charges, and their several allowances.--E. B.

Auncel Weight, an ax.cient balanee, prohibited hy several statutes, on account of the deceits practiced by it. It consisted of seales s anging on hooks, fastened at each end of a beam, which wero lifted up by the hand. In many parts of E igland auncel weight signlfies meat sold by the hand, n thont acales.--E. B.

Aureus, the standard gold cein of Rome, first struck A. $\mathrm{H} . \mathrm{c} .546$; current valuo $=25$ den. rii, or 100 sestertil, equivalent to $17 \mathrm{~s} .8 \frac{1}{2}$ d. Forty aure were made fre:a a peund of gold; but their value was gradually diminished, till, under Nero, 45 wero mad riom a pound, aud under Constantine, T2.- !ussey, on Ancient TVeights and dfoney.-E. B.
Australevia, in mo :r.0 ceograpky, tho fifth great division of the earth's surface. The learned and intelligent President de Brosses was the tirst writer who suggested that all the lands and islands in the Austral world should be divided into three portions, corresponding with the three great oceans, the Iudian or Ethiopic, the Atlantic, and the Paeitic; those in the Indian Ocean and to tle sonth of Asia to be named Austrolasia; those in the twe Pacifics, from the multitude of islands, Polynesia (a name first used, we believe, by De Barros); and these in the Athantic to the south of Cape Ilorn and the Cape of Good Hope, Mfagellanica. The last, bowever, hecame unnecessary, as soon as it was asceltained that the Terra Australis incognita had no existence.

The two divisions of Australasia and Polynesia will be found to comprehend, with sufficient convenience, all thase islanis that can rot with propriety he referred to any of the four continents of the globe. Nor is there any difficulty in drawing a line of separation between these two divisions; though it is not quite so easy to mark the diatinet boundary between the Australasian and the Asiatic islands, where they melt into each other, about the equator, at the northwest extremity of l'ajua or New Guinea. In a geographieal view, the small islants of Waygiou, Salwatty, Matanta, Mysol, and Tlmorlaut, ought strietly to helong to Austraiasia; but peopled as they are by Asiatics of the Malay trilie, and under tho influence of the Duteh settlements, it may jerhaps be more proper, in a moral and pelitieal point of view, to consider them as belonging to the Asiatie Islands; more particularly as we shall then have all the Australasian population, with very few exceptlons, marked with more or less of the African or Negro character. Ilut, in fact, all geographical divisions are and must br, to a certain degree, arbitrary.

1f, then, we take the equater as the northern boundary from the $132^{\circ}$ to the $176^{\circ}$ of east longitude; conanne a line on the latter ineridiati to the 5bth parallel (bending $n$ li' lle to take in New Zealand) fir the east-
ern; anether line along the same pasallel to the 65th degree of cast longitude for the south m ; and a slanting line to the point on the equator fom which we set out, 80 as to Include Kerguelen's Land, and pass on the eastern sides of Timorlaut, Ceratn, Mysol, and Sn]watty, for the western boundary; these lines will circumseribe the whole of the Australasian islands. We have included the uninhabited islanda of Kerguelen and St. Paul and Amsterdam, because they can not properly be considered as African islands, though arranged, we believe, under that ivision by Pinkerton; they are of less impertance to geography than to geology.

Australasia, then, may bo subdivided into the following greves and islands: 1. Australia, or New Holland; 2. Van Diemen's land, or Tasmania; 3. New Guinea, and th.: Louisiade Archipelogo; 4. New Ilritian, New Ircland, at I nelghboring islands; 5. Solomon's Islands; 6. Ne.r Hebrides; 7. New Caledonia; 8. New Zealand, and isses to the southward; 9. Kerguelen's Islands, $v^{r}$ Islands of Desolation; 10. St. Paul and Amsterdan: 11. Numerous reefs and islets of coral seattered over the Australasion Sea.

Tho first attempt to explore New Ilolland, which, from its size, may be considered as the fifth continent of the carth, is unquestionally due to the Dutch; for althongh sone part of the northern coast may havo been seen by the early navigators of Spain and Portugal, there is no dircet testimony in favor of such a discovery. There are two charts in the British Museum which belonged to the Ifarleian Collection; one Irrach, without date, which was probably the original ; and the uther English, apparently a copy: the tatter is dedicated to the King' of England, and beare date $15-12$. In both of these charts is marked down an extensive tract of country to the southward of 'lee Moluceas, under the name of Great Jata, agreeing more nearly with the position and extent of New llolland than any other land. The form given to the northwest part of the coast in these charts approaches nearest to the truth; a part, indeed, which may have been seen by those early navigntors whe visited the Molucens long lefore the date of the Einglish chart. It is a siligular coincidence in geographical nomenclature, that, on the east coast of the l'reach chart, something like a Rotany Bay should be designated under the name of Custe des IIc:baiges. The Abié Prévost, in tho Ifistoire Ginérale des Foyages, and the President de Brosses, in his IIistoire des Natigations aux Terves Australes, are not very lappy in advancing a claim in favor of Paulovier do Gonin ville, a Freneh captain, to the discovery of this Terra Australis in 1504. It was the ceast of Madagascar upon which Gomeville was driven, as is evident by tiseir own accounts.- R. B.

Australia, or New Holland, the largest island on the globe, is situated in the sunthern hemisphere; and, as deseribed in the preceding article, forms the main land around whteh are clustered those groups of islands which, in modern geography, constitute the fifh great division of the earilh's surfare Wilson 'I'romentery, its most southern angle, is in in.. nis ${ }^{\circ} 11^{\prime}$ S., and Cape York, its northermmost licalientel, in lat. $10^{\circ} 43^{\prime} \mathrm{S}$. Its greatest buydth from north to somtis is thus 1708 geographical miles, or 1965 statute milos. Cape Ilyron, tho eastern limit, is in long. $183^{\circ}$ :17 $1^{-1}$... and Cape Inseription, in $112^{\circ}$ ob $^{\prime}$ E., forms its westernmost point; making the extreme length of the island from east to west ahout 2603 llritish mi'cs, by an average breadth of 1200 miles-a tract of land weil entitled to be called a continent, by which name it is frequently designated by geographers. Its superficies approxinates to $2,080,810$ square miles. That of the continent of liarepe being $3,08 i, 841$ gquare nailes, we can form some lilea of its extent by comparison.

The nemenclaturo und gengraphical subulivisions of this island-continent have mulergono many nlferations from tian to time, as the territury has leconse colo-
nized, Before any settlement had been effected by ( continued more or less (within half a degree) the same the British government upon its shores, the entire island was dealgnated New Holland, not only by the Dutch-from whom it received its name-but on our own charts and mapa. The east coast, first discovered and explored by Captaln Cook $\ln$ 1770, was named hy him New South Walos. The middlo portion of the north coast hore the name of Arnhim Land, after the ship of its discoverer, Zeachen, in 1618. The west and southwest coasts wero named in like manner by their discoverers tho Dutch navigators, in the seventeenth century, De Witt's Land, Endraght's Land, Edel's Land, Leeuwin's Land, and Nuyt's Land. That of Van Diemen's Land was given by Tasman to what he supposed was the southern peninsula of Now llolland, but which was afterward discovered by Bass to he an island. The colonists have been anxious to name it ufter its discoverer, but the govermment still retain the first title.

Since this great territory has become the undisputed possession of Britain, other names, with the excoption just mentloned, have, according to tho law of nations, been substituted for the old Dutch titles. Now South Wules is only applied now to about one-half tho east coast territory. The name of the entiro island also is changed from New IIolland to the more appropriate designation of Anstralia, by which it is now universally recognized and described. The subdivisions Sonth, North, and Western Australia would be equally proper if their boundaries woro defined according to the ordinary rules of geographical dissection. But while the first section, South Australia, is only the middle portion of the south coast, trending inland to the central region; and the secont, North Australia, embraces all to the north of New South Wales; the third section, Western Australia, nearly bisects the island, leaving a small tract of land between it and Sonth Australia with no name at all. A better division would be to draw o line right across from east to west in lat. $26^{\circ}$ S.; thas hisecting the island near its intertropical purallel; for although this lino would be $3 \frac{1}{2}$ degrees south of the tropic of Capricorn, still the intluenco of $t^{1} \mathrm{v}$ tropleal rains and winds ascend even higher than this parallel. At all events, thls would bo sufficient for us to designate the horthern section Tropical Ausralia, and the southern Temperate Australia. Besides these two great meteorological divisions, they could conveniently be subdivided into four political sections by drawing another line from south to north in the moritian of $133^{\circ} \mathbf{3 0} 0^{\prime}$. Each of these sections might thon the designated, according to its directlon from the centre, Southwestern and Northwestern Mustralia, Northeasterr. nud Southeastern Australia. And these, again, might tre subdivided into provinces, as the last-named section includer the three colonies of New South Wales, Vetorla, and South Australia. This arrangement would tend to simplify an important section of geography which at present is very much confused.
lf, for the better elucldation of our sulject, wo suppose these lines and boundarles to exist on the map, the northern or tropical division has little to do with the history of Ilritish colonizntion in Australia. It is within the temperate zone that our colonies havo been planted and successfully murtured. Anl thls tract, again, separated by the meridias line suggested, ecalines to a still smaller compass the suljeet of our deseription. The group of colonies whichabsorb the attention of the statesman and merchant in thut fareff land are comprised within the last-mamed seetion, Sunheastern Ausirulia. On tho west it is hounded by a line drawn from the south const, in long. $182^{c}$ E., meeting anotier line drawn at a right angle from the east coast, in lat. $26^{\circ} \mathrm{S}$.; the southern and eastern boundaries being formed by the coast line; which, by fullewhir then sinuosithes of the gulfs and burs, comprehends a sin-loard of nearly 2000 miles. Again, if a line be trued on the map, conmeneing ubout 150 miles inland from the head of Cinlf St. Vincent, and distance from the coast until it reachea the northern boundary-line, the intermediate space will give a fair average of the extent of country at present colonized, which may be estlasated in round numbers at 1500 miles Jong by 150 miles broad, or 225,000 square miles ; or nesrly thres times the superficles of England.

From a letter written by Mr. Edward IIammond Ilargraves to the colonial secretary, dated the 3 d April, 1851, we learn that on the 12th of Fehruary previous he had discovered the existence of gold among the alluvium of the surface rucks over a large area of crown lands within the settled districts of the colony; which subsequently turned out to be from 20 to 30 miles beyoud the town of Bathurst, an inland town 125 miles from Sydney. He was led to prosecnte a search for the precious metal in that locality, from the similarity of that mountainous section of New South Wales to the auriferous regions of California, where he had successfully worked as a gold-digger. Governor Fitzroy was doubtful of the discovery, from the circumstance of a similar statement having been mado to lim two years before, by a Mr. Smith, of Berrima, who allowed the matter to drop on the governor's refusing to pay him a large fixed sum for the discovery. At the same time, Sir Roderick Impey Murchison, president of the Royal Geographical Society, and other eminent geologists in the colony and in England, had predicted the discovery of gold in the Austrulian mountain ranges, from their presenting similar characters, both geographically and geologically, to the gold-bearing mountalis in Russia. Partiy from these representations, and partly from the general claims of the colony to have its mineral verith scientifically investlgated, the governinen 'sti jost recently appointed Mr. Samuel Stutchbur; the 'gical surveyor; and that gentleman at this peliua h is prosecuting his stcreotyped researches not very zealously in the mountain ranges at a short distance from Mr. Margraves. It is worthy of notice that gold had been found in its nativo state from time to time some twenty years prevlous, hy a Scotch shepherd, who was known to have sold a large quantity to the jewelers in Sydney; having kept the secret so long from a fear, as he stated, that, if any one dogged lim to the spot, they might nurder him. Notwithstanding these and other evidences which need not be specitied, no one had prosecuted tho search systematically before Mr. Hargraves, who demonstrated the fact pnllicly and without delay. To him, therefore, is due all the honor of the discovery.

After haviag intimatod to tho government that he wns satisfied to leave to their liberal consideration any reward or renumeration they chuse to offer hin for his discovery, ho pested off to liatliarst, and mmonnced to the astounded inhalitants that they were living within a day's journey of the richest gold mines in the world. Followed by a number of the enterprising inhabitants, he led tho way to Summer-hill Creek, and there, in a romantie vale, surrounded by hills, where this streamlet wound its course round a pieturesque point of lund, they dug the auriferons earth from the adjucent bank, washed it In the strean, and found that the soil was mixed with graius of gold. Jhese gold pioncers, who thronged to the first "diggings," reininded of the resemblance between their country and tho rich gold mines mentioned in Scripture, called uis spot the Valley of Ophir.

This was in May, 1851, and it hecamo the signel for the eolonists in other parts of the territory to be up and doing. "Ascertuining the nature and deseription of the rocks oceurring in the vicinity of the gold deposits, they immeaiately set to work in their own localities to search for the hidden treasure, instead of tlocking with the multitude to the liathurst monntains, concluiling whely that these comprised only a small section of the great mountain chain where it existed. like the industrlous tenants of ain Australian ant-hill
suddealy roused, the whole cammunity of bushmen becatna aliva emong the rock sad valleys of the colony. Stock-whips and shepherd's crooks were thrown aside for pickaxes and shovels, with which these adventurons men might be seen exp'oring the gold regions, and with what saccess is now well known to tha werld." Tha Turon Kiver, Mnckerwa Creak, Louisa Creek, Meroo Creek, Frederiek's Valley, Abererombie River, and Araluen Vala, had their hidden treasures exhumed by the industrious diggers; and in three months after the workings at Bathurst had been set in operation, the newly-erected ryovince of Vletorin, within seven weeks from the time of her separation from New South Wales, diaclosed her treasures at Ballarat; and before the ciose of the year, the Mount Alexander gold region gavo forth that astonnding yield of the precieus metal, to which no record of aucient or modern times can furnish a parallel. The reault of the latter discovery not ouly arrested the departure of the Vintoria colonists who were flocking to the liathurst, Mountains, birt aftervard turaed the tide of adventurers from the parint coleny to t'se greater attractiona of the Mount Alexuader gohif fields, which threatened at one time to decinsate the populalations of Sydney and the surrounding townships.

The gold was not merely found in the scales or grains which at first came from the stream-washings at Ophir, but it was now dug up in large masses, varying fron: severai ounces to many pounds in weight, which were familiarly called "nuggets" by the diggers, sfter the Californian name giveu to these pepitas or nodules; cnd In one instance, at Louisa Creek, 106 lb . weight of pure gold was found by an aboriginal shepherd imbelded in the quartz matrix, which formed one soiis lilock of about 3 cwt. Neither was it found in the beginning at any great depth in the ground, but in many localities lay seattered among the surface soil, and hung to the roots of trees and shrubs. So easily and plentifully did it come to tha hands of the gold-seekers, that it bore the aspect (and such was the belief of many of the less-informed cirgers) of having only then sprung into existence from the earth, or having recently licen scattered over the land by some mayterious agency, instead of carrying along with it the geological faci that its veins are coeval with the primary rocks. It was aiso discovered that the convicts had built a bridge acrosa a small stream on, the Bathurst roa', to Carcoar, above the gold forma. 'on, and that they had unconselously paved the rond with broken frag, nents of the gold quartz velos. Even in the streets of Bathurst and Melbourne, small particles of the precious metal were picked up by ehildren In its natural bed; and several farmers and gardeners foum that they lad been plowing, digging, sowing, and planting their grain and trees in the auriferous soil. A knowledge of these facts industriously circulated by the colonial press throughout a community possessed of all the modern faeilitiea of information, and keenly alive to the speculations of meneymaking, could not but fairly upset the minds of the people. Consequently, a gold mania seized every class of colonists, to the temporary suspension of all industrial pursuits.

Then followed a heterogeneons scramble for the coveted ore throughout the length and breadth of the land, which spread like wildfire to the neighboring colonies of South Australia, Van Diemen's Land, and New Zealand, threatening to depopulate them of their male adult inhabitants. Masons and 1,rieklayers lcft unfinished buildinge in the towns; shopmen left their counters, clerks their tesks, suilors their ships; and artisans of every deseription threw up their empleyments, leaving their masters, and their wives and families, to take care of themselves. All other interests were absorbed in the search for gold; scarcely any other shi)ject was talked of or thought, of; and the hass of the people ran off to the " sliggings," as this new occupa. tion was termed. Nor did the mania confine itself to the laboring classes, for "these were soon followed by
reaponsible tradesmen, farmers, captains of vessels, and not a few of the superior classes; some unable to withatand the mania and the force of the stream, or because they were really disposed to venture time and money on the chance; and others because they were, as employers of labor, lefi in the lurch and had no alternative. Cottages became cieserted, houses to let, business was at a stand-still, and even schools were closed. In soune of the suburbs not a nan was left, and the women were known, for self-protectioy, to forget neighhors' jars, and to group together to keep housa." The ships in the harbor, also, were in a great messure deserted; and instances were known where not only farmers and respectable agriculturists found that the only thing they could do, sceing that the people employed by them had deserted, was to leave their farms and jein their men In the golden scramble; "hut even masters of vessels, ficresecing the impossibility of malntaining any control over thelr men otherwise, agreed to make up parties umong them, abundon their vessels, and proceed with their crews to the gold fields." Th. towns and their environs being thus drained of their laboring pepuletions, the prices of provisions rapidly rese. The common necessuries of life reached famine prices, which fell hesvily upca those depending upon salaries. Thls, ecuipled with the high wagea demanded by domestic servants, forced the upper classes of aociety to dispense with thelr services, and the ladies had to perform the household drudgery. Clerks and others under government, and in public and prlvate offices, finding it impossible to make both cnds neet, threw up their appointments and rushed to the diggings, and even the constabulary force were leaving the towns unprotected. Duriag this state of affairs the government was obliged to raise the alarins of thelr ofticers, in order to maintain a sufficient stafl for the public service, and to preserve the public peace, which was becoming sadly dis turbed. The lanks and mercantile firms were obliged a!so to follow their example.

Meanwhile, the governments of New South Wales and Victoria-the two gold colonies-looked with apprehension upon the probable result of this gold-revolution among a pastoral population widely acattered over the couniry, a portion of which had but recently been reclaimed frons the ranks of the felon. Therefore, how to regulate the prosecution of this new pursuit on crown lands became a mntter of greve cousideration. The erime and anarehy which had provailed In Callfornla upon a similar discovery brought the worst fears to their recollestion. Precautionary measures were promptly taken, and all the available military forcewhich was but alender-was called into requisition, assisted hy the mounted pelice to maintain order and authority at the localities whare the diggers were working; for at sone places comnunities had assembled, and erected tenta with the rapidity of a military encampment, In larger numbers than were to be fonnd congregated within the ordinary townships scattered over the comutry. A proclamation was issued asserting the right of the queen's government to all gold or precions metals found on crown lands; and that every person diggiog therein in search of it, or any individuals trading or otherwise protitably enuloyed at the diggings, must take out a monthly license and pay the sum of 30s. This measure was at once acceptable to the people, and gold commissioners were appointed to see that it was carried into effeet. Notwithstanding the excitement which prevailed at the first blush of the discovery, and during the sulseguent discoverles in other localities, which drew from time to time one half of the adult male population to the gold fields, to then hor of the people of New South Wales he It said, that no greater antount of erime existed in that colony during the foliowing eighteen months than the usual average. "Jivery where," stated in the dispatches of his excelleney the governor general, "the gold-iliggers were loyal, orderly, and oliedient to the laws," and they
cheerfully paid the fee of one shilling per diem for license to dig. The same flattering testimony can not be borne to Victoria, where a Calfornian atate of anarchy ut one time threatened the subversion of aill law and order; the conslderation of which will be reserved for our remarks on that colony. At the close of 1851, six months' experience had proved the most satisfactory results as to the extent and richness of the gold depesita. In New South Wales, upward of $20,000 \mathrm{Ii}$ censes wero issued; and the export sheet from the port of Sydney showed that 142,975 ouncea, valued at upwarl of half a million sterling, had left the colony.

By this time also, hundreds, nay, thoueands, had ascertained that they were morally and physically unfit for the hard labor and privations to be encountered in the search for gold. The consequevees were, that not only did many clerks, shopmen, and artisans come back to their former occupations in the towns, but much distress was felt by those who had abandoned Iucrative employments, which were shut against them on their return ; in many jastancea impaired in heaith from exposure to the rigorous climate of the gold regions, which, it will be understood, wers first worked in the winter season in Australia. The beneficial effects which, accrued from this reaction in favor of the industrial pursults, was the supply of inbor to bo had, although at exorbitant wages, for securing the woolcrop of tho season. Not only was this evil result anticipated, among others, at the beginning of the gold discovery, but at many sheep and cattle stations in tho far interior, the herds and flocks were abnndoned by their keepers, and at that period nothing short of ntter ruin to the pastorsl Interests of the colony hovered over the sheep-farmers and graziers. In ono instance, an enterprising squatter drove 26,000 sheep into one flock, which he shepherded with four trusty shenherds on horseback. Here, as in other matters, the gentiemen aettlers and capitalists in the colony proved themselves equal to the oceasion; and much consideration is due to them for assisting to maintain the peace and prosperity of the community, by their untiring energy and support given to the government, under such an un-looked-for event. And where at first the squinters antietpated a ruinous reduction in the value of their strock, the demand for sheep and cattle to supply tine diggeis with food raised the prices 50 per cent., whilo the lant-holders found new purchasers of land among the judicious and fortunate gold-diggers. So at the close of tho year 1851, the prospects of Now South Wales, on ail sides, were most cheering, where the reverse was expected. The ponulation hat hereased to 197,168 persons. The value of the importe was $\mathfrak{£ 1}, 563,031$, and tho exports $£ 1,796,912$. Thus the average of tio former, for every man, woman, and chid in the colony, would bo at tho rate of $£ 8$ per head, and of the latter about $£ 9$. The ordinary revenue $=£ 277,728$; and tie crown revenue $£ 208,969$; the coin in the colony $£ 560,766$; and the paper currency $£ 418,541$. The wool exported $=\mathbf{1 0}, \mathbf{2 6 9 , 3 1 7} \mathrm{lb}$., valued at $£ 828,342$; the tallow $86,460 \mathrm{ewt}$., value $£ 114,168$; and the gold $144,120 \mathrm{oz}, 17 \mathrm{dwt}$., value $£ 468,33 \mathrm{G}$. Saipping inwards 553 vessels, of 153,002 tons, having 7055 men on board; and the shipping outwards 563 vessels of 139,020 tons, having 7988 men .
From the circumstance of gohl mines having heen hitierto only worked by inarisarous or despotic nations, who, from ignorance or poilicy, shromled their operations in mystery, our information regarifing the extent and character of goid-bearing rocks throughout the world was ot' $n$ very meagre teseription. Tho "great fact," therefore, of gold regions being discovered, and worked within territories claimed by the Anglo-Stixon race in California and Australia, is not only an event of considerabie interest in the history of the world, but has proved of the utmost ieneflt to scienee in determining tiis important question in auriferous geology. Not only was the gold found in the ordinary quartz
matrix; but the reporta of the geological surveyors of New South Walea have ahown that :is found in granite at Araluen Creek; sehistose or slaty rocks at the Turon; and in Frederick's Valley s'jecimens were found of a ferruginous rock, beautifully lotted with globulea of gold. It wonld e.em, therefore, that gold is the most universally distribated of metals among the unstratificd rocks, although found in greatest abundance in the quast + veias which intersect these rocks. However, the suat bulk of the gold found in Australia has not been extracted from its matrices, but dug out of the gold alluvium formed by tho disintegration of these rocks. Hence the gold mines in this region have received the familiar name of "diggings," from the prac-tical-minded Americans and Australians. What are termed the "gold diggings," thien, are apots where the miners have to dig pits from 10 to 15 feet deep before they arrive at the substratum of auriferous soil in which tire particles of gold are found loosely imbedded. This subsoil is generolly a atiff blue ciay mised with sand and gravel, and the pure metal appears in scales aboat the size and shapo of bran or shellings; and in rounded grains and lumps varying from the size of a pin's head to the form and dimensions of flints as they oceur in chalk, a specimen of which, when gilded, gives exactIy the appearance * sented by these gold nodules, or, as tisey are now universally called, "nuggeta." This alluvium is collected and mixed freely with water in a tub, which is termed "pudelting." After having undergone two or three waslings, tho residuo is thrown into a cradle or wooden trough, with "cleets" or ribs fastened across the hottom, and a sieve at the head, which prevents large atones or lumps of gold from passing through. The cradle is then rocked and tilted to and fro, whife water is poured over the auriferous sand or gravel. When sufficiently washed, the residue at the bottom of the cradle is examined carefully, tho large pieces, if any, picked out, and the scales of gold scparated from nny foreign substance by further washing in a tin dish, untll it is perfectiy elean; after which a magnet is passed through it to extract small partieles of iron-sand, which are frequently mingled with it. Upon reachling the "washing-stuff," as the "diggers" term the gold aliuvium, they sometimes see the nuggets dotting the earth, and collected Into heaps or "poekets," which they extrnet easily with the point of a knife. This pleasing operation to the fortumate digger is called "wuggeting." Agaln, a similar process is followed at some localities whers the grains of gold lis on the surface of the ground, teclinically termed "forsicking."E. B. See Ajelaite.

Average, a term nged in maritime commerce to signify damages or expenses resulting from the uccidents of navigation. Average is etther general or particular. General average arises when sacrifices have been advizedly made, or expenditures incurred, with a view to the preservation of the ship, eargo, and freight from tho effects of soms extraordinary peril; and it implies a aubsequent contribution from all the parties concerned, in order to make good the loss which one or more of them may thes have sustained. l'articular arerago signifies the dnmage or partial loss happening to the ship, goods, or freight, in consequence of some fortuitous or unnvolilable accident ; and it is borne by the individual owners of the articles damaged, or by their insurers.

It may be here remarked, that the term Avernge was originally used to signify what is now distinguished as General Average. The expression "Particular Average" is not strictly accurate, as it dous not, in its current acceptation, iosply the iden of an equalizing contribution, as originaily signiffed by the word Average. It has, neverticless, been generally adopted, nud is now fully recognized as the distinctive expression for damage or partial loss falling on some one of the individuals interested in a see adventure. Average is said by Cowell to be derived from the Latin
word areagiam, from the verb averare, to carry. II supposes it to have been introduced into commeree to ahow the proportion to be paid by every man according to his goods carried. Loccenitus, on the other hand, derives it from the Erench harre, or the German baben, a port; it being a contribution pald fer having goods brought sofeig to port.-De Jure Maritimo, lib. il. cop. vii. sect. 1 .
l'et'y trerage consisted of certain amall e when for pilotages, Hight-dues, etc., which were apporti
for thiral to the ship and two-thirds to the cargo; but this is now superseded by the apreement that the freight payuble for the cargo shall include all such expenses; and the term has, consequently, become obsolete.
Although nothing can be more simple than the fundnmental principle of general average-which is, that a loss incurred by one party for the advantage of several shall be mado good in equitable proportions by all who are benefited by it-yet the applicatio. of this principle to the varied and complicated cases whieh arise in the course of maritime commerce has oceasioned many diversities of usage in different countries, and even in the same country at different periods. Without enterkg on so wide a field as the discussion of these diversities would open up, we shall endeavor to present a brief summary of the leading principles which have been estubllished in Great Britain, by usage or by legal deelsions, in connection with the subject.

All general averago losses may be divided into two principal classes: 1. Sacrifices of part of the eargo and freight, or of part of the shlp, for the genersl benetit ; 2. Extraordinary expenditures, Incurred with the same object. Under the first of these classes we shall begin by noticing the nets which involvo sacrifices of part of the eurgo and freight. When a part of the eargo is thrown overboard (or jettisoned, as it is termed) to save the ship from foundering in a storm, or to fleat ber when strandel, or to facilitate her escape from mancmy, the loss of the goods and of the freight intached to them must be mado good by average contribution. In like manner, if goods be danaged in the ship by opening the hatches in order to effeet $n$ jettlson, or by being brought upon deek for thint purpose, the damage forms a general average charge. But if goodsjettisened have been originally stowed on deek, no contribution can be denanded for them, unless they are so carried according to tho common usage and course of trade on the voynge for which they were shipped.
If, instead of being thrown overboard, the goods ure put into bouts or lighters, and lost or dainaged before reaching the shore, such loss is regarded as a virtual jettison, and gives a claim to average contribution. The same rule applies to damage occasioned by the goods belag put ashore on muddy ground, as may sometimes ha; pen, when there is no other place where they can be landed. But when the goods hava been conveyed to a place of ordinary safety, they are no longer at the risk of the general interest; and should they be damaged by fire or other accidents, the loss must be borne ty the indiridual proprietors or ${ }^{3}$ 'y their iasurers. The loss of com, sult, guano, or similar goods, arising from their belig pumped up or bailed out with the water in the vessel, can not be recovered by averago contrihution. If, in consequenen of thers being no other means of raising money at a foreign port, a part of the cargo be sold for the purpose of repairing losses or defroying expenses which are themselves of the nature of general a verage, the loss arising from the sais gives a claim to contribution. Ilat if the funds are required fnr the purpose of repairing particular average losses on the ohip, or of defraying the ordinary expenses of the navigation, the loss muat be borne by the shipowner.
The damage done to the cargo by means of water thrown down the hatehes to extinguish na accidental fire or by acuttling the ship for that purpese, is excluded, by usagr, from general average. This point
seems to have never yet been settled by any legal decision; and the usuge referred to is considered by several writers of high authorlity to be at variance with sound privelplo. It is somethmea defended on the ground that the damaga in question is secondary and incileutal, and not primary and intentional. But this reason seems somewhat fanciful for the purposes of equity, and is, besides, inconaistent with the unalogy of certain other cases, where an opposite principle is practically recognized; as, for inatance, in the case of goods incidentally damaged in effeeting a jettisen of other goods. The amount of compensation to be made for goods accrificed by general average acta ia determined by the net market price they would have produced on arrival at the port of destination had :not been sacrificed; but huder deduction of the frel ${ }_{\text {bat }}$ : attaching to them (which is made good to the shipowners), and of the charges for duties and landing expenses which ara saved.

We now proceed to notlce the general average acts which involve sacrifices of part of the ship or her materials. The same principles which regulate the case of goods thrown overbos rd apply also to the jettison of the ship's chains, anchors, hnwsers, spars, boats, or other stores. But if water-caaks aro stowed on deek, or if chains and hawsers are carried en deck when the vessel is not near the land, so as to render it necessary that they sheuld be so carried, the losa arising from the jettison of theso articles falls on the ship-owner; and if boats are jettisoned in consequence of their having been broken alrift from their fastenings on deek by the force of the sea, they are exelnded from genersi average, and are charged to partlcular average on the ship. The damage done to tho ahlp by cutting holes to effect a jettison of the cargo, or to pour down water to extinguish a fire, or by scutiling her for that jurpose, is allowed as a general average charge. The damage arising from eutting or knoeking away a portion of the ship's bulwarks in order to prevent the cleek from being flooded in a storm, ia compensated in the same manner. When salls or ma. d are eut away in order to righten a ship which has been thrown on her licameends, or to prevent her from driving on $n$ lee shore, the loss is made good by average contribution; but if the object in cutting away a sail or spar be merdy to sare a mast, the loss is not made good in gcueral average.

It irequently happens chat masta or yards are sprung and carried away by the force of the wind, and ore left entungled in the rigging, or hanging over the ship's side in what is termed "a state of wreek;" in these circumstances it becomes necessary to eut them away, with the sails and rigging attached, and to throw the whole overboard, otherwise they would impede the usvigation, aud endanger the ship and cargo. On this ground it is held by some authorities that the loss cansed by the aet of cutting them away should he made good by average contribution. But this act is the direct consequence of the previous accident, which places these artleles in a situation where it is impossibe to save them without inperiling the ship, eargo, and lives. It would not be reasonable to imperil these for such a purpose; whence it follows that the displaced articles are already virtually irrecoverably lost by meane of the orlginal accident, before the loss is actually consimmated by cutting "m away. And as the general interest ought not to bo endangered for the purpose of attempting to save these articles, so neither should it be implicated in the lose resulting from the only remaining alternative of clearing them away. This loss is accordingly excluded, by the usage of this country, trom average contribution. On the same principle, no contribution can le demanded for any articles which are sacrificed as having themselves become, through previous accident, the immediate cause of danger to the whole interest.

a press of canvas to avoid a lee-shors, or to escape from an enemy, is not the aubject of general average in thls country; neither is the damage auffered by the ship from straining, under any auch extraordinary peass of sail. When anchors and cables are slipped from in order to work a vessel off a lee-shore, or to avoid collision with another ship, the loss is mado good by average contribution; but if the cable is slipped in order that the vessel may join convoy, or because the anchor has become hooked to some oljjoct at the bottom and can not be raised, tho loss is borne hy the ship-owner. When sails, ropes, or other materials are cut up and used at sen for the purpose of stopping leaks or to rig jurymasts, or when the common benefit requires that they should be applied to some purpose for which they woro not originally intended, the loss is made good in geberal average. The aame rule applies to the casa of hawsers, cables, anchors, saila, or boata, lost or damaged in attempting to force off a stranded vesael frem the shere. The damago austained in defending a ship against a pirate or an enemy is not the subject of general average; it is treated as particular averago on the ship.

It has been much debated by writers on maritime law, whethor tho voluntary stranding of a ahip, in order to prevent her from foundering, should be treated as a general or as a particular avergge loss. In tho United States it has been settled, by judicisl decision, that tho loss in question constitutos a general average claim; but the oppesite doctrine is acted upon in the usage of Great lifitain, and the polnt has never been raised before the courta of law. It appears to ua that tho argument greatly prepondorates againat the rule adopted $\ln$ tho United States, and in fuver of the usage catabliahed in Great Britain. The only reason for regarding thia loss as the subject of general average is, that it originates in the intentlonal act of running tho ship aground, for tho preservation, as far as possible, of the whole interest concerned. But it can seldom be known beforehand how the different interests at stako will be specially affected by the act in question; whether, for instance, the damage to the cargo may not be more serious than tho damage to the ghip, or vice versa. Thus no particular part of the Interest can be said to be intentionally sacrificed for the benefit of the whole; the intention, indeed, is not to sacrifice any one part, but to place the whole intereat in a situation of less peril than it would otherwiso have bcen in. What particular damages may thoreafter enaue to either ahip or cargo will depend, in each case, on a variety of circumstances entirely accidental in their character, and thereforo in no proper sense the aubject of provious intention. Tho same rule, thercfore, which excludes from general average accidental damages in all other cases eught to excludio them in this cass also. Moreover, when tha alternatives are, cither that the veasel be left to founder, or that she bo run ashoro with a chance of preservation, there can really be no room for choice, or, at all events, tho clements of will and intention are entirely subordinate in the part they must play under the pressure of the existing circumstancea; and in this view the stranding is as truly incvitablo as if it had been caused by the force of tho winds and waves alono.

But, oven wers these reasons less weighty than we hold them to be, a scrious practical objection might be urged against the doctrine that voluntary stranding should ho a general averaga loss, on tho ground that it would in most cases be impossible to diatinguish between tho damages received by the ship and cargo prior to tho stranding, and those sustained after or in consequenca of it. It is needleas to remark, that bofore a ship can be in such imminent danger of foundering as to render it necessary to run her ashore, she must he preaumed to have sustained a very considerablo amount of damage; and the probability is, that the cargo also will have suffered to a corresponding extent. Up to this polint these damages are confessedly
particular average; and were it held that the damages aficr the atranding were the sulject of general average, It would, of course, he necessary to distinguish the separate damages that belongei to each. But in every case these different damages would exist in varying proportions, yet alwsys so incorporated together that justice could never have a moro perploxing task than that of discrimiasting between them. No general rule could tee applied that would meet the widely different circumstances of each particular case; and the anbitrary mothod of adjustinent that would alone be possible would doubtless glvo rise to endloss disatisfaction and dispute. On the ground of expedlency; thorefore, as well as on that of principle, the usago now established in Great Britain ought to he malntained, notwithstanding the high authorities by whom the opposite has been countenanced.

Tho amount of general average losses on the ship is compenated by ailowing to tho owners the cost of repalrs, or of new materials in place of thoso aacriticed, sulject to the deduction of one-third for the difference of value between old and new; but no deduction is made from the cost of new anchors, and only one-aixth is deducted from the coat of new chain cables. If the ship be on her first voyago (which is held to include tho homeward as well aa the outward passage), the repalrs and new materials are allowed io full.

Extraordinary Expenditures.- Whon a shlp is obliged to put into a port of refuge, in consequence of damage received in the course of tho voyage, tho usage in Great Britain is to allow as general average all the charges ceunected with the entranse of the vessel into the part, and with the landing and warehousing of the cargo, when this is necessary to admit of the ship being repaired. Thua the expenaes of pilotage or other assistance into the port, the harbor dues and shmilar charges, the costs of the protest taken by the master and crew, and of the survey held to ascertain whether the cargo requires to be discharged, together with the chargea for landing tho cargo and conveying it to a warehouse or other placo of affety, aro all made good as general average. Tho costs of repairing the ship aro chargod to general average only in so far as tho rcpaira may refor to damages which aro thenselvea the proper subject of general contribution. If the damagea are of the nature of particular average, as is more usually: the case, they are charged accordingly ; or if they proceed from "wear and tear," they are stated againat the ship-owner.

Tho warehouso rent for tho cargo at a port of refuge, and any expenses connected with lits preservation, form special charges against that particular interest, and are berno by the proprietors of the goods, or by their insurars. When goods ars insured "free from particular average, unlesa the shlp be stranded," it ia necessary, if the ship has not been stranded, to diatinguish the charges for warehouse rent and fire insurance from these incurred in connection with the preservation of tho goods from the effecta of damago; the underwriters being lable for the former, but not for the latter. The expenses of reshipping the cargo, and the pilotage or other charges outward, aro borno by the freight. If the entire cargo can not be taken on board again, from the want, at the port of refuge, of the usual facilitics for atowing it, the loss or expenses resulting from the exclusion of part of it are not treated, in Great Britain, as the subject of general contribution. The wages and provisions of the master and crew during the period of detention at a port of refugo are not admitted as a charge against general average; it being held that the ship-owner is bound to keep a competent crew on board the ship from the commencement to the end of the voyage at his own expense.

The charges for agency at a port of refugo are brought against the general average, even though they may have been originally made in the form of separata charges against the ship and cargo reapect-

ively. Commissions on money advanced, maris me interest on bottomry and respondentia, and the lcis on exchanges, etc., are apportioned relatively to the grose sums expended on behalf of the several interests concerned.

The expenses incurred in getting a atranded ship off the ground, the hire of extra hands to pump a ship which has sprung a leak, and tha suma a warded for aslvage or for other servicea rendered to the ship and cargo under any extraordinary emergencies, are compensated by average contribation. But this rule applies only to the extraneous assistance that may hava been obtained; the crew being bound to do their utmost in the scrvice of the alip on all occasions, without extra remuaration for what thay might consider extraordinary exertions on their part. The costa of reelaiming the ehip and cargo after having been captured, are allowed as gencral average charges; and although ransom to an enemy is proi ibited in Great Britain by legal enactment, it seems that this does not apply to the case of monay or goods given up by way of composition to pirates for the liberation of the shlp and cargo, and that this would also form a sulject of average contrihution.

When the ahip and cargo arrive at tho port of degtination, it ls unnecessary, in ordinary casea, to distinguish, in the adjustment of the general average, between the losses which have ariaen from sacrifices, and those whlch have resulted from expenditures for tho common bencfit. But if the ship and cargo ahould be loat before reaching their destination, no contribution ia duc for the goods or ship's materiale which may have been sacrificed at a former stage of the voyage, the owners of these being in no wores poaltion than any of thelr coadventurers. On the other hand, it is avident that when money has been experted for the common benefit, the subsequent loss of the ahip and cargo ahould not affect the right of the party who has mado the advance to reco cor it in full from all the partlea for whoad advantage it was orlginally made. Hence, while sacrifices are mide good only in the event of the ship and cargo being ultimately saved, expenditures muat be reimbarsed whether the ahip and cargo be eventually saved or lost; and the contribution for theas expendlturee must be regulated by the values of the ship, cargo, and freight, as they atood at the time when the advances were made.

If, however, the money required for avarage expenditures has beell reised by meane of bottomry, and the ship be iost before completing the voyage, there can be no clalm for reimbursement; the risk being assumed by the bottomry lender in consideration of the premium he receives on the sum advanced. It is by no means clear that the arerage expendituree which havo been advanced whthout any contract of bottomry form a specific insurable intercst, accordling to the law of Great Brilain, although in practica they are very frequently insured. When this has heen done, and when the amount has been recovared on the subsequent lose of the ship, no claim can be equitably made against the Individuals who would otherwise have heen liable. Bat if the expraditures are not insured, elther by a bottomry contract, or by a special pollcy, and if the ship and eargo be totally lost in the subsequent course of the voyage, the partles for whoae bencfit the expentItures ware incurred must reinhurse thom on the principles already explained. These partics, however, have recourse on their original insurers, not only for the total loss of the interesta insured, but also for the previons expenditures, although the insurers may thus be calied ou to pay a barger sum than the amount of the insurance.

The contribution for genernl averaga losses ls regulated by the values of the respective lintereats for the benefit of which they were incurred. The practical roie adopted, in all urdinary cases, is to estimate the ship, cargo, and frolght, and thair net valuea to their
owners, in the state in which they arrive at the port of destination, but including in thess values the sums made good for sacrifices, and to assess the contribution accordingly. The necesalty for including the amount of compensation made for aderifices in the valuations on which the contribution la charged, arisea from tha principle that all the parties interested in the adventure should bear the ultimate loas in exact proportion to their reapective interests, which would not be the case if the owners of the articlea sacriticed were to recover thair full value without being thamselves asseased for the loss thareon in the same manner as their coadventurers.
The contributory value of the ship is accordingly her actual valua to her owner in the state in which she arrivee, whether damaged or otherwiae, including the sum made good in the general average for any sacrifices which may have been made of part of the shlp or her materials.
The value of the cargo for contribution ls its net market value on arrival, after deducting the charges incurred for freight, duty, and landing expenses, but without deducting the costa of insurance or commisslon. If gooda be damaged, they contribute only according to their deteriorated value; and if apecial charges have been incurred on the cargo at a port of refuge (as for warehouse rent, etc.), the amount of these charges is deducted. The sum charged to general average for gooda aacriticed is of course added to the valuation. All goods carrled in the ship for the purpose of iraffic muat be included in the valuation of the cargo; bat the wearing apparel, or personal eftects, of the passengers and crew are exempted from contribution.

The value of the freight for contribution is the sum received by tho ship-owner on the completion of the voyage for the carriage of the cargo, after deducting from that sum the wages then due, the port chargea at tine place of destination, and the speclal charges agalnst the freight which may have been incurred at a port of refuge, consisting of the costs of reshipping the cargo, and of outward pilotage, etc. The provislons for the voyage are not deducted, as these are held to have formed part of the original value of the ahip. If the frelght has been paid in advance, it forme part of the value of the goods, and, consequently, does not contribute as a separate intereat. It has been decided that wherr a vessel has been originally chartered for a double voyage, the whole freight to be earned under tho charter-party must.contribute at ita net value, after deducting the wages and other charges which must be incurred in earning it. The effeet of this rule is to render tha freight attaching to the return voyage, as well as that attaching to the voyage outvard, linble to contribute for average lossea arising in the conrse of the outward passage; a result the equity of which is not always very apparent.

An aljustment of general avarage made at any for cign port where the voyage may terminate, ff proved to le in conformity with the law and uaga of the country to which such forelgn port belongs, is binding on all the parties interested as coadventurers, although they may be suljects of Great Britaln, and although the adjustment may be made on princlpies different from those sanctioned by the lawa or uagea of Britain. The reason for this rule is, that the parties engaging in the adventure are held to abacnt to the known naritime usage according to which the general average ls acljusted on the arrival of the ahip and gooda at the port of destination.
The sulject of general average is only incidentally connected with that of marine insurance, being itself a distinet branch of inaritime law. Hut the suhject of particular average arises direetly out of the coutract of Insurance, and will thercfore he heat considered in connection with It.-F. B. Seg Insumance, Mamine. For further Infurmation with respect to the sulject

Avoirdupois, the nama of a weight, derived from the French, avoir du poise-to have weight. Its pound contains 16 eunces, in distinction to the pound Troy, which has only 12. This weight is used for groceries and all ether commodities, except the precious metals, gems, and medicines. Tha pound avolrdupois centains 7000 grains Troy, and is equal to $8532 \cdot 5$ Paris grains.-E. B. See Weigifts and Mrasures.

Azimuth, in Astronomy, an arc of the horizon intercepted between the meridian of tha placa and the vertical circla passing through the centra of the object. Azimuth, Magnetical, an arc of the horizon iutercepted between the vertical clrcla passigg through the centre of any heavenly body and the magnetical meridian. Azimuth Compass, an instrumant fer finding elther tha magnetical azimuth or amplitude of a heavenly ebject. Azimuth Circlea, called alse azimuths or vertical circles, are great circles of tha sphare intersectIng each other in the zeaith and nadir, and cutting the herizon at right angles. On these are reckoned the height of the stars and that of the sun when not in the meridian.-E. B.

Azoga Ships (from the Spanish azoque, mercury), vessels which carried quicksilver to the Spanish West Indies, in erder to extract the silver from the mines of Mexlco and Peru. They carried no goods except for the king.-E. B.

## B.

Bacon and Eams. The former is made from the sides und belly of the pig, and the latter from its hind legs. The process of curing may be affected indifferently by tha employment of salt or sugar, or both; but the first is by far the most commenly used. After lieing impregonted with salt or augar, and allowed to remain a certaln time in the selutien, tha bacen and hams are taken out, lried, and smoked. In the States of Ohio, Indiana, Kentucky, Virginia, Maryland, ete., large quantities of bacon are put up yaarly for domestic use and for expert. The counties of England most celebrated for lecon and hama are York, ILants, Berks, and Wilts. Ireland produces great quantities of leth; but they are coarse, not so well cured as the English, and much lower priced. Of the Scotch counties, Dumfries, Wigtown, nud Klikeudbright nre celebrated for the excollence of their hecen and hams, of which they export large quantities, principally to the Liverpeol and I onden marketa.-See Ponk Trade.

Baggage, in Commercial Navigation, the wearing apparel and other articles destinsd for tha sele use or accommedation of the crews and passengers of ships.
Bahamas, or Lucayas, a chain ef lslands stretehing in a nerthwesterly direction from the north const of'St. Domingo to that of East Florida, and lying between lat. $21^{\circ}$ and $27^{\circ} 80^{\circ} \mathrm{N}$., and long. $70^{\circ} 30^{\prime}$ and $79^{\circ} 5^{\prime} \mathrm{W}$. The group is composed of about twenty inhabited islands, nud un immense number of ialets and rocks. The principul islands in this greup are Now l'rovidence, containing tha capital, Nassau; II arbor Ishand; Abace; Eleuthera; IIenengna, or Inagua; Maymguana; St. Salvador; Andros Island; Great Hahama; Ragged lsland; Rum Cay; Exuma; Long Islund; Crooked Island; Long Cay; Watling's Island; the Calces, the Turks, and the Berry Islands.

Most of these islands are situnted on these remarkabie flats called the (Freat and Little Buhama Ilanks, and some ent of soundings in the ocean. Tha Great Brhama Bank is about 300 milies in longth from northwest to sontheast, and 100 in breadth; and the Little Bahama is niout 130 miles long. The islands liave, in generul, a very flat appenrance, and many of them consist of mere bleak nud burren rocke. The soll in those that ate under cultivation is ifin, nnd genarally light and sanly, but interspersed w'th occasional patches of rich mould. The sabibtratum, so far ns has leen ascertalued, consists of caleareons rocks, composed of cornl, shells, madrepores, and marine deposita lurdened inlo solid inasses. The surfuce atratum is a combination of dehris of tha rock, exuvie, and decayed vegetable matter. Though deatituto of ruming streama, they possess numerous springs ; and loy digging welis down to the level of the sea, fresh water is olitalned. The productions of the sell comprelend ult the varleties of
a tropical climate. Provisions-such as malze, yains, sweet potatoes, ete.; and fruits, as oranges, lemons, pine-apples, cocoa-nuts, etc.-ara produced in abundanca. There are also several species of valuable trees; ns mahogany, fustic, lignum vitæ, cedars, pines, etc. Oxen, shcep, horses, peultry, and a great variety of liva atock are reared; and wild hogs and agoutis are found in the woods. There are many varieties of birds, and the sheres and creeks abound in turtle and excellei.t fish of various kinds. In the most southerly islandsare aalt ponds of great value.-E. B.

Bahia, or St. Salvador, a large city (formerly a capital) of Brazil, contlguens to Cape St. Antenio, which forms the right or eastern side of the entrance of the nohle bay of Todes os Santos, or All-Saints, 170 miles seutlıwest of Serglpe del Rey, and abeut 880 miles nerth-nertheast of Rio Janeiro. Population 100,000, one-third of whom are whites, ene-third mulattoes, and the rest blacks. Accerding to the observations of M. Reussin, the light-heuse on tha Cape is in lat. $13^{\circ} 0^{\prime} 30^{\prime \prime}$ S., long. $38^{\circ} 80^{\prime} \mathrm{W}$. The opposite sida of tha ent rance to the bay is fermed hy the island of Taporica, diatant from Cape St. Antenio ahout $2 \frac{1}{2}$ lengues. But a bank nleng the shore of the islund narrows the passage for large ships to abeut two-thirds this distance. Anether bank runs south-southwest frem CapeSt. Antonio abeut 11 lengues. Within, the bay expands inte a capacleus binsin, having several Islands and harbors, the depth of water varying from 8 and 10 to 40 fathoms, afford. Ing ample nccommedation and secure anchoraga for the largest fleets.

Thera is nuether entrance to the bny, partly exhibfted in the annexed plan, on the west side of the island of Taporica; but it la narrow, intricute, and at its mouth has net mere than 6 feet water. ${ }^{\circ}$ Several rivers have their emhouchure in the bay, which generally occasiens a current to set frem the nerth end of the island by Cape St. Antonio; when the rivers are fieed. ed, this current is somathos very streng. The lighthomea at the extrentty of tha cape has no grent elovation, and can not bo seen at a distance of mero than 3 or 3f lengues. The usual place of anchorage is abreast of the clty, nerth and eeuth of Fort de Mar.

The eity stands partly on a height, and partly along the shore of the hay. The lower town lis dirty and londly lad out; lint in the upper tewn and suburlia are several good streets, a rich eathedral, palaces of the archbishop and governor, town-hall, court of appenl, theatre, hospitals, and many religlous heuses. In the lower town are an oxchange, arsenal, and imperial deck-yard ; and about 3 miles nertheastward are yarde for the construction of mercantilo shipplng. Llouses of the elty mostly of stone, and often lefty; the elty is defonded by several forta, none of great strength.

Bahia, founded In 1549, by Thomas da Sonza, first factured goods, proviaions, fiour, salt, salt-fish, sosp, captain general of Brazil, is one of tho most important commercial cities in America.

In 1858, the trade of Bahia waa very extenalve: abont 60,000 tons eugar, 18,500 baga ( 182 pounde) cotton; 20,000 bags ( 160 pounda) coffee; with hides, tobacco, rice, dye and fancy woods, bullion, etc. The imports consiat principally of cottons and other manu-

## wines, etc.

Plan.-The suhjoined wood-cnt conveys a clearer and better idea of this celebrated bay than could be acquired from any description. It is copied, without any reduction, from a revised edition of a Portuguese chart published by Mr. Laurie, and exhibits the banka, sonndings, anchorage, etc.

References to the Ptan-A, Cape, Jight-house, and fort of St. Antonlo; B, Fort do Mar; C, Fort St. Phtilp; D, Tapsgippe: E, Isle do Mer; F, Inla don Frados; G, rart leaumont. The trures in the plan are tho soundings in fatiome.

Bailifis, or Bheriffe, sre sald to be of Saxen origin. London hat its shire-rere pricr to the Conquest, and this officer wan generally appointed for counties in England in 1070. Sheriffa were appointed in Dublin, under the name of bailiffs, $\ln 1308$; and the name was changed to alicriff, 1548. There are atill some placea where tie ehlef magiatrate is called baillif, as the high baillff of Weetminater. Tha term Bum-bailiff in a corruption of bound-bailiff, every haillff heing obliged to enter into bonds of sceurity for his good behavior.Blackstone.
Balachong, an article consisting of pounded or bruised fish. It consista principally of amall fiah, with prawns and shrimps. Though fetid and offensIre to strangera, this aubatance, vaed as a condiment to rice, ia largely consumed in all tha countries to the east of llengal, Including the sonthern provinces of China, and the islands of the Esstern Archijelugo.

It distributlon gives rise to an extensive internal traffic.

Falance, a machine for ascertaining the weight of substances. There aro several kJinds of balanees, as the corimon linlance or seales, the steclyard, the Danish or Swedish balance, the Chinese bulance, the hydrostatic balance, etc. The aame name ia nlao given to certain kimis of npparatus for measuring or comparing the intensities of very amall forces, us the inalance of torsion, the electric halance, etc.-F. 13. Balance, in accounta, is the term used to express the difference between the doith: and croilitor sides of an account.
Balance of Trade, in Commerce, is the term commanly used to express the difference lietween the value of the exporth from and imports into a country. The balanea la said to the farorable when the value of the exports exceeds that of the imports, and unfaverable when the valuc of the imports exceeds that of the could be without rtuguese se banks,
the weight ralances, as I, the Dance, the hyalso given or comparthe balance Bahance, difference account. term comen the vala country. te value of d unfavorthat of the
exports. According to the cuatom-house returns, the official value of the exports from Great Britain, exclusive of foreign and commercial merchandise, during the year ending 5th of January, 1842, amounted to $£ 102,180,517$; and the official value of the imports daring the year had increased to $£ 64,877,962$; leaving a favorable balance of $£ 37,802,555$. The attainment of a favorable balance was formerly regarded as an object of the greatest importance. The precious metals, in consequence of thelr being uaed as money, were long censidered as the only real wealth that could be possessed either by individuals or natlons. And as countrics wlthout mines could not obtain supplies of these metals except in exchange for exported prodncts, it was concluded that if the value of the comanodities exported exceeded that of those imported, the balance would have to be pald by the importation of an equivalent amount of the precious metals; and conversely. A very large proportion of the restraints imposed on the freedom of commerce during the lat two centuries grew out of this notion. The importance of having a favoruhle balance being universally admltted, every effort was made to attain it; and nothing seemed so effectual for this purpose as the devising of schemes to facilitate ex portation, and to hinder the importation of almost all producta, except gold and silver, that were not intended for future exportation. But the gradual though slow growth of somnder opinions with respect to the nature and functions of money, showed the futility of a system of policy having such objects in view. It is now conceded on all hunds that gold and sllver are nothing but commodities, and that it is in no respect neccssary to interfere, either to encourage their importatlon or to prevent their exportation. The truth is, however, that the theory of the balance of trade is not erroneous merely from the false notions which its advecates entertained with respect to money, bu*....ocecds on radically mistaken views as to the nature of commerce. The mode in which the balance is usually estimated is, indeed, completely fallacions. Supposing, however, that it could be correctly ascertnined, it would be found, in opposition to the common opinion, that the imports into every commercial country genernlly exceed the exports; and that when a balance is formed, it is only in certaln cases, and those of rare occurrence, that it is canceled by a bullion payment.

The proper business of the wholesale merchant consists in carrying the various producte of the different countries of the world from the plaees where their valne is least to these where It is greatest; or, which ls the arme thing, in distrituting them according to the effective demand. It is clear, however, that there could be no motive to export any apecies of produce, unless that which it was intended to import in its atead were of greator value. When an English merchant commissions a quantity of Polish wheat, he calculates on its selling for so much more than its price in Poland, as will be sufficient to pay the expense of freight, insurance, etc., and to ylekd, besilies, the common and ordinary rate of profit on the capltal employed. If the wient did not sell for this inuch, its importation would olviously be a loss to the importer. It is plain, then, that no merchant ever did or ever will export, but in the view of limporting something more valuable in return. And so far from an excess of exporta over fimports leing any criterion of an advantugeous commeree, it is ilirectly the roverse; and the truth is, notwithstanding all that hae been salil and written to the contrary, that unless the vulue of the lmports execedel that of the exports, foreign trade could not be carried on. Were this not the case-that ia, were the value of the exports always greater than the value of the imports-merchants would lose on overy transactien with forelgners, and the trade with them would be speedily abandoned.

In ligglaml, the rates ot which all articles of export
and import are officially valond were fixed so far back as 1696. But the very great alteration that has aince taken place, not only in the value of money, but also in the cost of most part of the commodities produced in this and other countries, has rendered this official valuation, thongh valuable as a means of determining their quantity, of no use whatever as a criterion of the true value of the exporte and importe. In order to remedy this defect, an account of the seal or declared value of the exports is annually propared, from the declarations of the merchants, and laid vefore Parliament: there is, however, no auch account of the imports; and, owing to the difficulties which high duties throw in the way, it is, perhaps, impossible to frame one with any thing like accuracy. It has also leen alleged, and apparently with some probability, that merchante have not unfrequently been in the habit of exaggerating the value of articles entitled to drawbacks on exportation; but the recent extension und improvement of the warehousing system, and the diminution of the number of drawbacks, must materially lessen whatever fraud or inacciracy may have arisen from this source. Most articles were formerly charged with an ad valorem duty of 10 s . per cent. on exportation, so that, if any hing, their value was probably rather under than overrated; but now that this duty has been repealed (5 and 6 Vict. cap. 47, § 40), the presumption is that their declared value comes very near tha truth; at least, sufficieatly so for all practical purposes. Now the declared value of the exports of Great Britain in 1841 was $£ 51,634,623$, being only about half their official value, and nearly $£ 18,000,000$ under the official value of the imports. What the excess of the latter might be, had we the means of comparing their real value with that of the exports, it is impossible to say ; but there can be bo manner of doubt that, generally speaking, it would be very considerablo. The value of an exported commodity is estimated at the moment of its being sent abroar ${ }^{2}$, and before it is lacreased by the expense incurred in transporting it to the place of its destination; whereas the value of the commodity imported in its atead is estimated afier it has arrived at ite destination, and, consequently, after it has been enhanced by the cost of freight, insurance, importer's profits, etc.
In the United States, the value of the imports, as ascertained by the custom-house returns, always excceds the value of the exports. And although practheal politicima have been in the halit of considering the excess of the former as a certaln proof of a disadvantageons commerce, "it is nevertheless truc," says Mr. Pitkin, "that the real gain of the Unlted States has been nearly in proportion as their imports have excerded their exports."-Conmerce of the United States, 21 ed. p. 280. The great excess of American imports has in part been occasioned by the Aincricana generally exporting their own surplus produce, and, consequently, receiving from forelgners not only an equivalent for their exports, but also for the cost of conveying them to the forelign market. "In 1811," anys the anthor just quoted, "flour sold in America for nine dollars and " half per barrel, and in Spaln for ffleen dollars. The value of the cargo of $n$ vessel carrying 5000 linrrels of tlour would, thereforo, be eatimated at the period of its exportation at 47,500 dellars; but as thit flour would sell, when carried to Spain, for 75,000 dolhars, the American merchant would be entitled to druw on his agent in Spain for 27,500 dollurs more thun tho thour cost in Amerien, or than the sum for which he could have drawn hail the tlour heen exported in a vessel helonging to a Spmish merchant. Hut the transaction would not end here. The 75,000 dollars would the vested in aome apecies of Spanish or other European goods fit for the American market ; and the froigit, insurance, etc., on account of the return cargo, woull probably lincrease Ita value to 100,000 dolfars, so that, in uill, the Ameriean merchant might

## BAL

have imported goods worth $\mathbf{5 2 , 5 0 0}$ dollars more than the flour originelly sent to Spain." It is es impossible to deny that such a transaction as this is advantageous, as it is to deny that its advantage consists entirely in the excess of the value of the goods imported over the value of those exported. And it is equally clear that America might heve had the real bslance of paymenta in her favor, though such transections as the above had been multiplied tc any conceivable extent.

The argument about the balance of payment is one of those that contradict and confute themselves. Hail the apparent excess of exports over imports, as indicated by the British custom-honse books for the last hundred years, been always peld in bullion, as the supporters of the old theory contend is the case, there should at this moment le abont $450,000,000$ or $500,000,000$ of bullion in the country, instead of $50,000,000$ or $60,000,000$, which it is supposed to amount tol Nor is thls all. If the theory of the balance be good for any thing-if it be not a mere idle delusion-it follows, as every conntry in the world, with the single exception of the United States, has its favoralle balance, that they must be pald by an annual importation of bullion from the mines corresponding to their aggregate amount. Bat it is certain that the entire produce of the mines, though it were increased In a tenfold proportion, would be insufficient for thla parpose! This reductio ad absurdum is decisive of the degree of credit that should be attached to conclusions reapecting the flourishing state of the commerce of any country drawn from the excess of the exports over the imports! Not only, therefore, is the common theory with reapect to the balance of trade erroneous, but the very reverse of that theory is true. In the first place, the value of the commodities imported by every country which carries on an advantageous commerce (and no other will be prosecated for any considerable period) invariably exceeds the value of thone which she exports. Unless such were the case, there would plainly be no fund whence the merchanta and others engaged in foreign trade conld derive either a profit on their capital, or a return for their outlay and trouble; and in the accond place, whether the balance of delt be for or against a country, that balence will neither be paid nor received in bullion, unless it be at the time the commodity by the exportation or importation of which the account may be most profitably aettled. Whatever the partisans of the doctrine as to the balance may say abont money being a preferable product, or marchandise par excellence, it is certain it will never appear in the list of exports and imports, while there is any thing eise with which to carry on trade, or cancel debtn, that will yield a larger profit, or occasion aless expense to the dehtore.

It is difficult to estimate the mischicf which the absurd notions relative to the belance of trade have occasioned in slmost every commercial country ; in Great Britain they have been particularly injurious. It is principally to the prevalence of prejudices to which they have given rise that the restrictions on the trade hetween Engiand and France are to be ascribed. The great, or rather the only argument insisted upon by those who prevailed on the Legisinture, in the reign of William and Mary, to declare the trade with France a nuisance, was founded on the statement that the value of the importe from that kingdom consilerailly exceeded the value of the commodities Great Britain exported to it. The balance was regarded an a tribute paill by England to France; and it was sagaclously aaked, What had we done, that we should he ohliged to pay so much money to our natural enemy? It never occurred to those who so loudly abused the French trade, that no merchant would limport any commodity from France, unless it brought a iigher price in the country than the commodity exportell to pay it; and thai the profit of the merchant, or the nationnl gain, wonld lie in exact proportion to this excess of price. The very
resson assigned by these persons for prohibiting the trade affords the beat atteinable proof of its having been a lucrative one; nor can there be any doubt that an nnrestricted freedom of interconree between the tho countries would still be of the greatest service to both.-J. R. M.
The production of gold in the United States since the acquisition of Callfornia has been such as to stinulate trade throughout the country. The importationa from Europe have been very large, more than commensurate with the export trade. Hence gold has been required to the extent of more than 170 millions during the five years 1851-1855 to dischorge this accumulated debt or balance of trade. This is demonotrated by the following officlel table:

Statignent exhibiting thig amount of Conn and Bullion IMPORTED INTO AND EXPOBTED FROM TUR UNITED STATEB AKNUALLY PBOM 1821 TO 1855 INCLUBIVE; AND ALGO THE AMOUNT OF Imiortation ovir Exroontation, and op ExPORTATION OVER IMPOATATION, DUKINO THI BAME YEABB,

- Nine montha $\quad t 2$ monthe ending Juno 80 .

Bale, a pack, or certain quantity of goods or merchandise; as a bale of silk, cloth, etc. Bales are always marked and numbered, that the merchants to whom they belong may kuow then, and the marks and numbers correspond to those in the hills of lading, etc. Selling under the bale, or under the cords, is a term usell in France and other countrics for selling goods wholesale, without sample or pattern, and unopened.
Balks, large pieces of tlmber.
Ballast (Du. Ballast; Fr. Lest; Ger. Ballast; It. Savorra; Sp. Jastre; Sw. Ballast), a quantity of iron, stonea, sand, gravel, or any other heavy inaterini Inid in a ship's hold, in order to sink her deeper in the water, and to render her capabie of carrying sull without being overset. All ships clearing outward, having no goois on board other than the personnl longgnge of the passengera, are sald to he in ballinst. The quantity of liallast required to fit ships of equal lurden for a voyage is often materially different; the proportion being always less or more, according to the sharpness or thatneas of the ship's bottom, called by scamen the thoor. The proper tollasting of a ship deserves pecullar attention, for, although it be kuown that ships in $s$ having oubt that ween the aervice to ates since to atimuportationa than comgold has 0 milliona ge this acis demon-
a Bullion ted State p albo tie AND OF Ex ME Years,

Ballant ; It. ity of iron. terial laid per in the sail witisward, havhl baggage The quanburden for proportion shsrpness eamen the vea peenlat ships in
general will not carry safficient ssil till they are lsden so that the surface of the water nearly glances on tho extreme breadth midships, more than this geveral knowledge is required. If the ship have great weight of heavy ballast, as lead, iron, etc.; in the bottom, the centre of gravity will be too low in the hold; this no donbt will enable her to carry a press of ssil, but it will, at the same time, make her sail heavily, and roll eo violently as to run the risk of being diamsated. The object in ballasting a ahip is, tharefore, so to dispose of the ballset or cargo, that she may be duly poised, and malntain a proper equilibrium on the water, so as neither to be too atiff nor two crank, qualities equslly pernicious.: If too atiff, ahe may carry much sail, but her velocity wili not be proportionally increased; while her masts are endangered by audden jerks and excessive laboring. If too crank, she will be unfit to carry asil without the risk of oversetting.

Stiffinass in bailasting is occasioncd by disposing a too grest quantity of heavy ballast, as lead, iron, etc., in the iottom, which throws the centre of gravity very near the tieel; and this being the contre about which the vibrations are made, the lower it is placed, the more violent is the rolling. Cranknese, on the other hand, is occasioned by having too little ballast, or by disposing the ship's lading so ss to raise the centre of gra 'ty too high: this slso endsngers the maste when it blows hard; for when they cease to be perpendicular, they atrsin on the shrouda in the nature of a lever, which increases as the sine of their obliquity ; and it is superfloous to add, that a ship that loses her masts is in great danger of being lost. Hence the srt of bsllasting conaists in placing the centre of gravity to correspond with the trim and shape of the vessel, so as to be neither too high nor too low; neither too fur forward, nor too far aft ; snd to lado the ship so deep, that the surface of the water may nearly rise to the extreme breadth midships: she will then carry a good quantity of sail, incline but little, and ply well to windward.-Ses Falconer's Marine Dictionary.

The mischievons consequonces of not attending to the circumstances now mentioned are often oxperienced by shipa losding barilis, brimatone, and such heavy articles, on the coast of Sicily and Spain. Tho habit thore is to cut large quantities of brushwood and fagots, and to spread them in the hold, to hinder the cargo from sinking the centre of grsvity too low, and causing the ahip to lsbor violently; but it very frequently happens that the pressure of the cargo on this aort of dunnage is so great as to squeezo it into a much smalier space than could at first have been supposed; so that ships sfter getting to see are sometimes obliged to return to port to unlosd a part of their cargo, to prevent their foundering. In such cases, firm dunnafe, such as oak staves, shouid, if poosible, be slways employed.-See Jackson's Commerce of Mediterranean, p. 125-128. Ships thst have cargoes of light goods on board require a quantity of ballast; increasing, of course, sceording to the greator lightness of the goods.
Balloon. Gnilien of A vignon wrote on aerostation in 1765. Dr. Biack gave the hint as to hydrogen in 1767. A hslloon was constructed in Franco iny MM. Montgoifier, in 1783, when Kozirr and tho Marquis d'Arlandes ascended nt luris. Puitre Desrozier and M. llomain perished in an attempted voyage from Boulogne to England, tho balloon having takon fire, June 14, 1785. At the battle of Fleurus, the Frenci maile use of a balloon to reconnoitre the enemy's army, and convey the observatiens lyy telograph, Junc 17, 1704. Garnerin ascended in a balloon to the haight of 4000 feet, anl deacended hy a parachute, September 21, 1802. Gay-Lussac ascended at Paris to the hoight of 23,000 feet, Neptemher 0,1804 . Marlame Blanchard ascended from Tivoll at nigit, and the balloon, being surrounded by fire-works, exploded, and she was precipitated to the ground and killed, July 6, 1810.Hayon.

Balam (Ger, Balsum; Du. Balsem; Fr. Baume ; It. and Sp. Balsamo; Lat. Balsamum). Balsam's are vegetable juices, either liquid, or which spontaneonsly become concrete, conaisting of a substance of a reainons nature, combined with benzoic acid, or which are capable of affording benzole acid by being hested alone, or with water. The liquid balssms are copaiva, opobslaam, balssm of Peru, storax, snd Tolu; the concrete are benzein, dragon's blood, snd red or concrete storax.-Une. 1. Copaiva (Fr. Baume do Copahu; Ger. Kopaiva Balsam ; Sp. Copayva), obtsined from a tree (Copaifera) growing in South America and the West India islsnda. The largest qusntity is furnished by the province of Para, in Brszil. It is imported in amall casks, containing from 1 to $1 \frac{1}{2} \mathrm{cwt}$. Genvine, good copaiva, or copsiba balsam, has a peculiar but agreesble odor, and s bitterish, hot, nsnseous tante. It is clear and transparent; its consiatence is that of oil; bot when expoaed to the sction of the air it becomes solid, dry, and brittle, like resin.-Thomson's Dispensatory.
2. Opobalsam (Fr. Balsamier do la Mecqus; It. Opobalsamo; Lat. Balsamum verum album, Xgyptiacum; Egypt. Balessan), the most precions of sll tha balsams, commonly called Bslm of Gilesd. It is the produce of a tree (Amyris Gileadensis), indigenous to Arsbia and Abyasinia, snd transplanted at an early period to Judes. It in olitained hy cutting the bark with an sxe st the time that the juice is in the strongest circulation. The true balssm is of a pale yellowish color, clesr snd transparent, sbout the consistence of Venice turpentine, of a atrong, penetrating, agreeable, aromatic amell, and a alightly bitterish purgent taste. By sge it becomes yellower, browner, and thicker, losing by degrees, like volatile oils, some of its finer and more oubtile parts. It is rarely, if ever, brought genuine into this country; dried Canada balssm being generally substituted for it. It was in high repute among the ancients, but is now principally used as a cosmetic by the Turkish ladies.-Drs. Une and Tiomson. The Csnada balsam, now referred to, is merely fine turpentine. It is the produce of the Pinus Balsamen, and is imported in caska, esch containing about 1 ewt. It has s strong, but not a disagreeable odor, and a bitterish taste ; is transparent, whitish, and has the consistence of copaiva balaam.--See Turpentine. "Szsfra sad Beder sre the only plsces in the Hedjaz where the baissm of Mecha, or Balessan, can be procured in a pure state. The tree from which it is collected growa in the neighboring mountains, but priscipally upon Djebel Sobh, and is called, by the Arubs, Beshem. I was informed that it is from 10 to 15 feet high, with a amooth trunk, and tbin bark. In the middle of aummer, small incisions are made in the bark; and the fuice, which immedistely isaues, is taken off with the thumb nail and put into a vessel. The gum appears to be of two kinds, ono of a white, and the other of a yellowish white color: the first is the most esteemed. I saw here somo of the latter sort in a small sheep-skin, which the Bedouias use in bringing it to market: it had a strong turpentine amell, and its testo was hitter. The people of Szafra usually adulterato it with sesamum oil and tar. When they try its purity, they dip their finger into it and tien set it on firo; if it burn withont lurting or leaving a mark on the finger, they judgo it to be of good quality but if it burn the finger as soon as it is sot on fire, they consider it to be adulterated. I remember to hnve rend, in Bruce's Travels, sn account of the mode of trying it, by letting a drop fall into a cup filled with water; the good halsam falling coagulated to the bottom, and the bad dissolving and swimming on the surface. I tried this experiment, which was unknown to the people here, and found tho drop swlm upon tho water; I tried also their test by fire upon the finger of a Bedouin, who had to regret his temerity; I therefore regarded the balsam sold here as adulterated; it was of less density than
honey. I wished to purchsse some; but neither my own baggage nor any of the ahops of Szafre could furnish any thing like a bottle to hoid it; the whole skin was too dear. The Bedouins, who briog it here, usually demand 2 or 8 dollars per pound for it when quite pure; and the Szafra Arabs resell it to the hadjeys of the great caravan at between 8 and 12 doliars per pound in an adulterated state. It is bought up principally by Persians."-Borckhardi's Travels in Arabiu, voi. ii. p. 123.
8. Balsam of Peru (Fr, Baume de Peru; Ger. Peruvianischer Baloam; Sp. Balsamo de Quinquina; Iat. Bolsamum Perutianum), the produce of a tree (Myrory$\ln$ Peruiferum) growing In the warmeat parts of South America. The balsam procured by incisions made in the tree is called white liquid balsam; that which is found in the shops is obtained by bolling the twigs in water: it is imported in jars, each containing from 20 to 40 pounds weight. It has a fragrant aromatic odor much resemblling that of benzoin, with a warm hitterIsh taste. It is viacid, of a deep reddish-brown color, and of the conslatence of honey.
4. Storax (Fr. Storax; Ger. Stryarbroom; It. Sto race; Sp. Azumbar; Lat. Styrax; Arab. Usteruh), the produce of a tree (Styrax officinale) growing in the sonth of Europe and the Levant. Only two kinds are found in the shope: storax in tears, which is pure, and storax in the iump, or red storax, which is mixed with sawdust and other impuritles. Both kinds are brought from the Levant in chests and boxcs. Storax has a fragrant odor, and a pieasant, antb-acidulous, slightly pungent, and aromatic taste; it is of a reddish-brown color, and brittia.-Thomaon's Lispensatory.
5. Tolu, Bulsam of (Fr. Baume de Tolu; Ger. Toluttuischer Balsam; Sp. Balsamo de Tolu). The tree which yields this balsam is the same as that which yields the balsam of Peru, it being merely the white balaam of Peru hardened by exposure to the air.
6. Benzoin, or Benjamin (Fr. henzoin; Ger. Benzoe ; Sp. Bengui; It. Belzuino; Lat. Benzoinum ; Arab. Jiban; Hind. Luban; Jav. Menian; Malay, Caminyan), is an article of much greater commercial importaneo than any of those balsams previously mentioned. It is obtained from s tree (Styrax Benzoin) cultivated in Sumatra and Bornee, hut particuiarly the former. The piants produce in the seventh year. The balsam is olitained by making inclsions in the bark, when it exudes, and is scrapel ofi. During the tirst three years the balsam is of a clear white color, after which it becomes brown. Having borne 10 or 12 yeara, the tree is cut down, a very inferior artlele beling obtained by scraping the wood. The balsams procured in theso different stages are distinguished in commerce, and dlffer widely' in value. Benzoin has a very agreeablo, fragrant odor, but hardly any taste. It ia imported in large massea, packed in ehests and casks. It should lo chosen full of clear, light-colored, and white spots, lasving the appearance of white marble when broken; it is rarely, however, to be met with in so pure a state, but the nearer the approach to it the better. The worst sort is lackish, and fuli of impurities.-Min nenv's Orient. Com., and private lnformation. The price of Benzoin in lond varied, in the Londen market, in Fehruary, 1843, from $£ 3$ to no less than $£ 46$ per ewt.! Mr. Crawfurd has given the following interesting and nuthentic details with respect to this articie: " Denzoin, or frankincense, cailed in commercial language Benjamin, is a moro general article of commerce than camphor, thoughits production be confined to the same ialands. Benzoin is divided in commerce, like camphor, into three aorts (head, belly, foot), accorling to quallty, the conparative value of which may be expressed by the figures 105, 45, 18. Benzoin is valued in proportion to its whiteness, semi-transparency, and freedom from adventitious matters. According to lta purity, the first sort may be bought at the emporia to which It is brought, at from 50 to 100
doliars per picul (188s poands), the second from 25 to 45 dellars, and the worst from 8 to 20 dellars. According to Linschoten, benzoin, in his time, cost, in the market of Sunda Calapa or Jacatra, from 19.05 to $25 \cdot 40$ Spanioh dollars the picul. By Niebubr's account, the wol : b benzoin of the Indian islanda is more eateemed by the Arabs than their own best olibanum, or frankincense. In the London market, the beat benzoin ls fourteen times more valualle than olibanum, and even the worst two and one third times more valuable. Benzoin usually sella in England at 10s. per pound. The quantity generaliy imported thers in the time of the monopoly was 812 cwt . The principal nse of this commodity is as incense, and it is equally in request in the religious ceremonles of Cathollcs, Mohantmedans, HIndoos, snd Chinese. It is also used as a luxury by the great in fumigating their apartments, and the Japanese chiefs are fond of smoking it with tobacco. Its general use omong nations in such various states of civilization, and the steady demand for it in sill ages, declare that it is one of those commedities the tasta for which is inherent in our nature, and not the result of a particular caprice with any individual people, as in the case of Malay camphor with the Chi-nese."-Indian Archipelago, vol. iil. p. 418. An inferior description of benzoin, the produce of a different tree from the Slyrax benzoin, is produced in Siam. It is comparatively cheap and abundsat.

7 Dragon's blood (Fr. Sang-Dragon; Lat. Sanguis Druconis ; Arsb. Damulähhwain; Hind. Heraduky), the produce of a large specics of rattan (Calamue Draco) growing on the north and northeast coast of Sumatra, and in some parts of Borneo. It is largely exported to China, snd also to India and Europe. It is eithor in oval drops, wrapped up in flag-leaves, or in large and generally wince impure masses composed of smaller tears. It is csternally and internally of a deep dusky red color, and when powdered it should become of a bright crimson : if it be black, it is worth little. When broken and beld up agalnst a strong light, it is somewhat transparent, and it has little or no smell or taste ; what it has of the latter la resinous and astringent. Dragon's blood in drops is much preferable to that in cakes, the latter being more friabie, and less compact, resinous, and pure than the former. Being a very costly artlcle, it is very apt to be adulterated. Most of its alloys dissolve like gums in water, or crackle in the fire without proving Infiammable, whereas the gennlno dragon's blood readily melts and catches fiame, and is searcely acted on by watery llquors. It sells in the market of Singspore at from 15 to $\mathbf{3 5}$ dollars per pleul, according to quality; but the Chinese have the art of purifying and retlning lt , when It sells at from 80 to 100 dollars per picul.-Milburn's Orient. Com.; Cnawfund's East. Archip.; and private informstion. The price of dragon's blood, in the London market, varied, in November, 1853 , from $£ 5$ to $£ 15$ per cwt.
Baltio Bea. The denomination of the Baltic, applied to the iniand aea which forms the subject of this articie, is first found in the work entitled Chorographia Scandinaricr, by Adam of Bremen, whe was canon of that city at the close of the eleventh century. The otymology of the name has given rise to many conjectures. The Swedes derive it from the Scandinuvian word baell, s girdle, because of lis pecuiliar form ; the Prussians from the Sclavonian or Lettonian word balt, white, from its heing frozen part of the yoar, or from Baltus, one of their klngs; while by others it is derived from Bellea, the name of an islund mentioned by Pythcas, a merchant of Marselles, who, in the second or third century before the Christian era, ls supposed to have sailed as far north as thls sea. In the comntries which bound it, ita ancient name was Variatzkoĭ More, or the Sea of Variaghl; by the modern Russians It is called Boltiskod More; and by the Swedes, Dancs, and Germans, the East Sea,

The any conjecandimuian form; the a word balt, ar, or from rs it is deentiened ly the second s supposel the counVariatzkoic n Russians les, Danes, ed by Swe
den, Susala, Prueaia, Mecklenburg, and Denmark; and it communicates with the North Sea by the Ska-ger-Rack, Cattegat, Sound, and Great and Little Belts. From Swinemunde in the soath, to Tornea in the north, its length is 770 geographical miles; and Ite width from Karlscrona to Memel ia not leas than 180 milea. Its whole area, Including the Gulf of Bothnia, is about 125,000 geographical equare milee. It runa first in an easterly direction as far aa Memel, a distance of 800 miles, and then northward as far as lat. $59^{\circ} 21^{\prime}$ N., a distance of 850 miles, at which point it separates into two great gulfs. One of these, the Gulf of Finland, runs nearly due east ; the other, the Gulf of Bothnia, almost north. The Gulf of Bothoia is 400 miles in length, with an average breadth of 120 milea, but where narrowest it does not exceed 40 miles. . The Archipelago of Aland llee at its entrance. The Gulf of Finland is 200 miles in length, with a mean breadth of $\mathbf{6 0}$ or $\mathbf{7 0}$ miles. Numerous rocky lalands and reefs, many of them level with the water, render the navigathen of this sea extremely dangeroua.

Depth of ths Bultic,-The greatest depth of the Baltic rarely excoeds 100 fathems. On the western side it la not more than 15 fathoma; and, in general, only from 8 to 10 fathoms. On the sonth it nowhere exceeds 50 fathome. The Gulf of FIniand auddenly shallaws from 50 or 60 fathoms to 5 , or even less. The average depth of the Gulf of Bothnin is net greater than that of the rest of the sea. It has long been a gencrally recelved opinion that the waters of the Baltic are gradually diminishing. Cetsius, a learned Swede, who flonriahed toward the middle of last century, advances this hypothesis; and, from observatiens made on the coasts of the Baltic, he eatimated the diminution at 45 inches in a humired years. This hypothesis was supported by Linneus, who founded ons it a theory of the earth. M. Otto, in his physical observations on this sen, has auggested another theory to account for its apparent decrease. He supposes that, instend of really aubsiding, it may be only shifting lta position, and galning in one quarter what it lases in another; and this he aacribes to the large and rapil rivers, which carry along with them an immense quantity of earth anil sand, by which the beds at their mouths are raised, and their banks extend toward the sea. The viewa of Celsius have been confirmed by the observations of Von Buch, who also discovered at severnl places on the weatern ahores of Scandinavia, and at considerable elevationa, deposits of sand and mud centaining numerous marine shells of species atill existing in the neighboring ocean. Mr. Lyell at first entertained doubts of theae phenomena; but on snlisequent inspection he was led to concur in the opinien of Ven l3uch. Mr. Lyell faund the marks which were cut la the rocks at water-line aome years provious to his visit to be actually several inches above the level of the Baltic. From these ebservations, that eminent geolegist cencludes that, in several parts of Sweden, n gradual elevation of the land lsitnking place.-Lyenis's Principles of Geology. The great quantity of sand and mud carried dewn ly the rivers has considerably raised the bottom of this sea, and affected its navigation, so that the moutha of rivers formerly navigable are now inuceessible.

In the lialtic, the thles are scarcely, if at all, perceptible. There are sensible tides in the Sknger-lack; but these begin to diminish in the Cattegat, and are very tritling in the Sound and lielts. There are, however, irregular variations in the level of the waters of the Baltic which bear nome resemblance to tldes. These clevatlons generally occur in autuinn, when the weather threasens rain; and thoy last sometimes a few days, sometimes several weeks. The maximuin rise is threo feet and a half, and the lew shores nre occesionally innudatod. They also render brackish the fresh-wnter lakes which communicate with the sea. In the Gulf of Bothala, the aubaidence of the waters is usually
succeeded by north winds; whereaa, near Stockholm, thase winds uaually follow their rise. M. Kraft, fermerly profesaor of experimental philosophy in the Imperial Academy of Sciences at St. Petersburg, in hia treatias on the inundations of the Neva at the autumnal equinox, observes that, three or four days before or after the full or new moon, a violent northweat wind drives the waters of the Northern Ocean, during the influx of the tide, into the Baltic, and is accompanied or Immedlately succeeded by a south wind in that aea and the Gulf of Finland. By Schultens, a learned Swede, who paid particular attention to the physical geography of the Baltic, the irregular elevations of this sea are attributed to the state of the atmosphere. F.a had observed thet when the waters were about to rise the barometer fell, and that when they were about to fall it rose. Hence he inferred that the unequal preasure of the atmesphere on different portions of the water deranged the level of the waters. The difference between the greateat and the leapt rise of the baronieter in the nerthern parts of Europe is two and a hulf inches, which answers to three and a half feet of water, or the difference of the elevation of the waters at their extremes.

Suparior and inferior Currents.-In the Sonnd there are superior and inferior currenta. These were first observed by aame Engliahmen, who, being in a boat in the middle of the channel, found that they drifted teward the Cattegat; but buving let down a loaded bucket to the depth of four or five fathoms, the soat became atationary; and when the bucket waa sunk deeper, the boat drifted against the auperficial current. The general currenta of the Baltic are strong, and evidently occasioned by the vast number ef rivers and streams that pour their waters into it, many of which, especially toward the north, rise thrice in the course of the year. At the northern extremity of the Ialand of Bornholm, a vielent agltation of the waters, or kind of whirlpool, called by the Swedes malt-quern, or the grinding-mill, is occasiened by the current rushing over a circular cluster of sunken rocks. The waves of the Baltio are shert and breken, in comsequence of sudden changea of wind, irregular deptha, and strong currents.
Saltness.-The waters of this aen are not nearly so anlt as those of the ocean; and when the wind hlows strong from the north they become so fresh as to be fit for drinking or cooking meat. The degree of their saltness varies in different parts, and even in the same parts, according to the seaaon or wind. According to Bergman, in lis Physical Geography, the waters near the sGuth coast of Nerway, at the entrance of the Ska-ger-lack, contain from one-tenth to onc-seventh part of their weight of sult; in the Cattegat, one-twelfth; In the Baltic, one-sixteenth; and in the Gulf of Bethnia from one-fortieth to one-fiftieth. The southwest and west winds nugment the saltness, by introducing the waters of the ocean. In the aummer it requires 300 tons of the water of the Gulf of Bethnia to produce one ton of salt, but in the winter only $\mathbf{5 0}$ tons. This differe: ce is eai sed by congelation, and by the diminlshed flow of fresh water.

Temperature.--There is great difference in the temperature in different parts of the Baltic. The general temperature of the Gulf of Hethnia in July is from $48^{\circ}$ to $56^{\circ}$, but it is semetimes heated to $70^{\circ}$; the medium of the thermoneter throughout the year at Uleoborg is $29^{\circ}$, and at Stockholm $424-5^{\circ}$. Near the land in the Gulf of Bethnia, the temperature of the atmosphere in the month of July was observed to be $68^{\circ}$, while the temperature of the surface of the water was $65^{\circ}$; and in October the temperatures of beth were respectively $39^{\circ}$ and 46 . In the Sound, the temperature of the atmosphere in the menth of August was $70^{\circ}$; on the surface of the water, $68^{\circ}$; and at three fathoms, $66^{\circ}$. On the 10th of Ootoher, 1818, Dr. Thomson found the temperature of the Sound to be $54^{\circ}$. The Skager-

Rack and Gulf of Norway are open to navigation all the winter, whereas aeveral portione of the Haltie are covered with ice $\ln$ a very moderata degree of cold; and generally th: bays and channels are encumbered wlth Ice at the latter end of Decenber. The waters toward tha heade of the Gulfs of Bothnia and Finland are first frozen; and the lee being conveyed by the currents to the south, the masees of it are united by the Increasing cold lnto vast fielde, which beceme stationary on the west toward Stockholm, and 14 the eaet toward the islands of Dagce and Fisel. In the seuthern parts of the sea the ice begins to break up $\ln$ April, but the Gulfa of Bothnis and Finland often contlnue closed till May. The riger of the climate in the Baltle ls supposed to be considerably diminished by the clearing of the foresta and the progress of cultivation; at least the froste during the fourteenth and fifteenth centuries appear, in their intensity and long continuance, to hava exceeded those of the severest seasons in more recent tlmes.

The wlads are extremely variable in the Baltle, but they blow most commonly frem the east in the spring, and from the west in sutumin. Calms are seldem experienced except in the middle of summer.

Fisheries.-There la hlstorical evidence that the herring fishery was a branch of national lndustry ln the Sound as aarly as the year 1168; and In 1389, accordIng to Philip de Mezieres, such vast shoals of herrings erowded into the Sound, that 40,000 boats, with from six to ten men each, were employed ln ihe fishery, besides 900 large vessels, in which the herringa were salted. This important branch of lndustry, however, no longer exists. "In the year 1238, the inhabitants of Gothia (Sweden) and Frise were prevented, by their fear of the Tartars, from scnding, as uaual, their ships to the herring fishing on the coast of England; and as there was no exportation, 40 or 50 of these fieh were sold for a shilling.-Mattieew Pairs, p. 396. It is whimsical enough that the orders of Mogul Khan, who reigned on the borders of Chins, should have lowered the prica of herrings in the Euglish market."-Ginbon, vol. xi. p. 422. Salmon ascend the rivers from April to June, accerding as they are frea frum ice. On the south, they abound nest lin the Oder, Vistula, Duna, and Narrowa; on the north, in the Motala, Dnlecariia, Ules, Kemi, Tornea, and Keymen. Salmon-trout is taken in some baya of the Baltic. In the midde of the River Kemi is a small island where an anaual ealmon fuir is held.

Whales very rarely enter the Baltic. The common porpoise is the only one of the lesser species of cetaceous animals that lives habitually in this sea; and at Middlefahrt, in Funen, is a company which enjoys the exclusive privilege of taking it. There are two varieties of the common geal, which are hunted for their oil, in March and April, ly the peasants of the Jsle of Gottland, and of the islands ln the Gulfs of Bothnia and Finland.

The trade of the Baltic is of great extent and importance. In 1852, 17,568 ships paseed up and down the Sound, of which 3902 were Britislı vessels. The internal trade is also very considerable. The exports consist of tho vurious productions of the countrics on its cossts, nud luclude corn, timber, pitch and tar, hemp, flax, tallow, hides, linseed, bristies, wool, etc. Its imports are colonial products, manufactured goods, dry stutfe, wines, salt, coal, etc. The most important ports are St. Petersburg, lign, Königsberg, Danzig, Swineminde, Labeck Copenhagen, Kariscrona, and Stockholm. By ueans of numerous large rivers and canals a considerabie trade is carried on with the in-terior.-E. B. See Thomson's Travels in Sueden; Tableau de le Mer Ballique, par Catteav; Tableau des Etuts Danois, par Catteau.

Of all seas, the Baltic is one of the most dangerons to shipping and harnssing to crews. Sudden and frequent changes of the wind, shallow waters off shore,

Innumerable shoals and lasulated rocks, wlth currents divided by these obstacles, branching off in different directions to be divided by the same cause, till, meetIng from opposite quarters, the waters are embroiled in the hurly-burly of a sturdy conflict ; these are almost constant causes of anxiaty to the mariner, for the navigation is most beset with such impediments precisely ln these parts which are eminently the highways of commeree. Hence the proportion of maritime cosualtles is much greater in the case of vessels sailing to the Baltic ports than in the instance of merchantmen passing between Great Britain and America.

Three of the rivers flow Into the North Sea; the Oder flowa into the Baltic, and the trade of all the four, particularly that of the Iveser, is incressing. Of the Jahde the world has heard but little till lately, when it was made known thst Prussia had anquired a port on It. By an agreement between Oldenburg and Pruesla, concluded in July, 1858, and ratifled in December, Prussia purch $\quad 1$ of Oldenburg for 500,000 thalers (about $\mathbf{5 8 0 , 0 0 0 )}$ the sovereignty of 500 morgens (about 8000 acres) of land and marehes, in order that Prussia mlght have a sea-port on the Nerth Sea, to give protectlon to her trade. Jahde, or rather Fahrhuh, will probably hereafter become a place of some importanee. It la seated on a large and tolerably safa bay between the Ems and the Weser, and may probably, In the hands of Prussia, lnerease in Importance. At present lt possesses little except coastling trade. The Weser, a short river, with all Its tributaries, so far as navigable, flows through the territaries of six different Powers, and, as tineir territeries are mixed and mingled tha sovereignty through which it flows changee no less than thirty-four times. Formerly every aovereign had his tolla, and at every change of sovereignty there was a toll-house. At present the tolls are reduced to one aum, and the toll-houses, which were 22 , are reduced to 9 . The toll at present, from Bremen to Carishafen, is nearly a third of the freight.-Die Deutschen Ströme, u. s. w. Vierte altheilung die Weser, Ems, Jahde, und Oder: Lelpzig.Pol'E's .Journal of Trade.

Baltimore, a city, port of entry, metropolis of the State, and capital of Baltimore county, Naryland. The third city ln extent and population in the United States ; situated on the north side of Ps tapsco River, 10 milea from its entrance into Chesupeake Bay, and 200 miles from the ocean by ship channel. In $89^{\circ} 17^{\prime} 23^{\prime \prime} \mathrm{N}$. lat., and $76^{\circ} 87^{\prime} 80^{\prime \prime} \mathrm{W}$. long.

It is hy rallroad route 88 miles from Washington, 98 from Philadelphia, 186 from New York, 590 from Pittsburg, and 590 northeast from Charleston. Population in $1790,18,503 ; 1800,26,514 ; 1810,35,583 ; 1820$, 62,738 ; $1830,80,625$; $1840,102,813$; 1850, 169,055; 1854, with environ 200,000 . The branch of the Patapeco River, aroun. which the city is built, is about a mile and three-quarters long, and varies from ouceighth to three-quarters of a mile in width, having its greatest breadth opposite to the tract called Canton. It affords an easy access to the city, and a capacious, safe, and well-protected harbor of a depth and extent sufficient to fleat ships of the largest class, and to afford nmple accommodatlon for at least two thousand vessels. Its harbor consists of an inner bnsin, at the wharves of which vessels drawing ten or twelve feet of water miny lie, and an outer iny lying between Fells Point and Canton on the north and east, and Whetstone Point on the south, with from sixteen to twenty feet of water. Ships of heavy burden do not ge up higher tian the Point. From the facilitiee offered by the depth of the water, the Point is also the seat of the principal ship-yards, from which hava been launched some of the finest and flectest vessels of tha Americnn marine, which are especlally noted for beanty of propertion and excelience of construction. The
name of Baltimore clipper is synonymous all over the world with all that is beantiful in naval architecture， pointed ship．
The commerce of Baltimore is extenaive and rapld－ ly increasing．The recelpta for the year ending 1853 were 406,000 tons of Cumberland，and 183,000 tons of snthracite coal， 85,003 balea of cotton， $8,411,985$ bush－ cis of wheat， $3,906,404$ bishels of corn， 780,000 bush－ eis of ests， 160,000 bushels of rye， 18,000 bushels of peas， 4000 bushels of beans，and $88,000,000$ feet of lum． ber．There were $1,181,608$ barrela of wheat flour in－ spected， 5394 of rys flour，and 88,478 of corn meal． imports，of coffee， 208,702 hags ；molaseses， 3820 hogs－ heads， 632 tierces，and 72 barrels from the West In－ dies，and 192 hogsheads， 115 tierces，and 18，187 lar－ reis coastwise；of sugar，New Orleans and West in－ dies，12，582 hogsheads，and 14，850 barrels；tobacco in－ spected， 40,667 hogshead －wool，foreign and domes－ tic， 000,000 pounds；mac ．erel inspected，12，507 bar－ reis；herringa， 29,000 barrels；shad， 6671 barrels．
 （tonnage 88，798）American vesaels cleared from this port，and 227 （tonnage 55，772）foreign．Tonnage reg－ istered， $92,772 \cdot 46$ ；enrolled and licensed，65，706．14； totai， $158,478 \cdot 60$ ．Number of eeseela built 71，and their aggregate tonnage 18，391－62．There were，in 1853， 12 ，anks with an aggregate capital of $47,292,815$ ， a savings bank，and 8 inaurance oftices； 20 printing－ offices，issuing 5 daily， 4 tri－weekly， 8 weekly news－ papers， 1 semi－monthly，and 3 monthly publlcations． Manufictures．－A great amount of water－power is concentrated in the vicinity，which has been extens－ ively lmproved for msnufacturing purpones．Jonea＇ Falis，a small stream which passea through the city， has a suecession of falls which afford conslderable wa－ ter－power．The Patapsce，though not a large river， has a fall of about 800 feet in the course of 80 miles， afforling many valnable mili sites．There are within 20 miles of the city sixty flouring mills，besjdea numer－ ous cotton manufactories and other manufactories of cloth，powder，paper，iron，copper，glass，steam－en－ gines，chemleais，tobaceo，etc．
Ship－building．－The number of vessels built at Bal－ timore，and other ports of Maryland，in the flscal year 1854－5，wero as foliows：

Bamboo (Fr. Bambon, Bambouches; Ger. Indianischer Rohr; It. Rambu; Hind. Rans; Malay, Builuh ; Juv. I'reag), a species of cane, the Bambos arundinacea of botanists. It grows every where wlthin the troples, and is of the greatest utility: strictly speaking, it is a gigantic grass with a ligneoua stem. It often. rises to the height of 40 or 50 feet, and sometlmes to even double those heights. Like most plants long and cxtensively cultivated, it diverges into many varieties. Some of these are dwarfish, while others, instead of being hoilow canes, are solid. The bunhoo is of rapid growth, and in four or five years is fit for many usea, but does not bear fruit or grain till it is 25 years old, after which it periehes. The grain makes tolerable bread. The young but gigantic shoots, as they spring from the earth, make a tender and good eseulent vegetable. The mature bambo is emjloyed in an lmmense variety of ways-in the construction of housea, bridges, boats, agricultural lmplements, ete. Some varleties grow to auch a size as to be, in tl. g largest part, near two feet in circumference, and single knees of these are used as pails or buckets. The Chinese are believed to fabricate their cheap and useful paper of macerated bamboo. The canes used in Europe as waiking-stleks ara not bamboos, but rattans-a totally distinet class of plants. Bamboos are never used for that purpose.-Private information.

Banana (Musa sopientum), in herbaceous plant, a natire of the West Indies. Its fruit is produced in large ciusters weighing many pounds, and forms a consideruble articie of food among the better elasses.

Bandanas, silk handkerchiefs, generally red spotted with white. They were formerly manufactured only in the East Indies; but they are now manufactured of a very good quality ot Glasgow and other places.

Banglsok, or Bankok, the erpital city of Siam, and one of the most commercisl cities in Asia, on the Menam, about 20 miles above its mouth. Lat. $13^{\circ}$ $58^{\prime}$ N., long. $100^{\circ} 34^{\prime} \mathrm{E}$. Population from 50,000 to 60,000 (?), half of whom are Chinese. It stretches along both banks of tile river, and consists of three portioas; viz., the palace or citadel, on an island inclosed by walls, and comprising the residences of the soverelgn and court, with many temples and gardens; the city proper; and the floating town, composed of movable bamboo rafts, each bearing rows of 8 or 10 honsea. It has numerous Buddhic temples; and in the palace is a spacious audience-hall. The more solid buildings are of brlek; but the majority of the dwellings are of wood, mounted on posts. Most of the intercourse is carried on by water, and the Menam is navigable to the city for vessels of 250 tons. Bangkok lus manufactures of tin and lron wares, and leatler. Exports comprise sugar (from 10,000 to 12,000 tons yearly), hack pepper ( 4000 to 5000 lons), tin, cardamoms, fine woods, ivory, cotton, rice, hides, horns, skins, and feathers. Inports, tea, quicksilver, raw and manufactured silks, porcelain, and numerous manufactured articie: from China; eamphor, and edibie birds' nests, from the Asiatic Archipelago; and European and Tndian plece goods, opium, and glass wares, from the British and Duteis settiements in the East. The country around is flat, Lut contains rich mlnes of iron, and extensive forests of teak. The most favoratie time for reaching Bangkok, in ships of consider-
able draught, is about the beginning of Nevember, when the rains are just over, and the season is cool and healthful. There is then on the ber of the river, at low water, a depth of $8 \frac{1}{2}$ fathoms. In the spring and summer months it is sometines as low as two fathoms, or a little more, and the eapital is then reached with sume difficulty.

Bank-Banking. Banks, cre cstablishments intended to serve for the safe custody and lsane of money; for facilltating its payment by one indlvidual to another; and sometlmea for the aecommodation of the public with loans. These subjecta will be considered under the heads: I General Principles of Banking; II. Account of Bank of England; III. Engitsh Private and Provinclal Banks; IV. Seotch Banks; V. Irish Banks; VI. Forelgn Banks; VII. Banking In the United States; VIII. Savings Banks.
"The first established was in Italy, A.1. 808, by the Lombard Jows, of whom some settied in Lombard Street, London, where many bankers still reside. The name is derived from baneo, a bench, which was erected in the market-place for the exchange of money. The mint in the Tower of London was anclently the depository for merchauts' eash, until Charles I. laid his hands upon the money, and destroyed tha credit of the mint in 1640. The traders were thus driven to some other place of seeurity for their gold, which, when kept at home, their apprentices frequently ab; sconded with to the army. In 1645, therefore, they consented to lodge it with the goldemiths in Lombard Street, who wero provlded with strong chests for their own valuable wares; and this became the origin of banking in England."-Haydx.

| Branch Banks in Great |  |

J. General. Pinctiples of Banking.-Banks are commonly divided into the two great classes of banks of deposit and banks of issue. This, however, appears at first sight to be rather an imperfect ciassification, inasmuch as almost all banks of deposit are at the same time banks of jssue, and aimost all banks of issue also banks of deposit. But there is in reality no anliguity; for by banks of deposit are meant banks for the eustody mind employment of the money deposited with them or intrusted to their care by their customers, or by the public; while by banks of issue are meant banks which, besides employing or issuing the money intrustod to them by others, issue money of their own, or notes payable on demand. The Bank of England is principaliy a bunk of issue; but it, as well as the other banks in the diflerent parts of the empire that issue notes, is aiso a great bank of deposit. The privats banking companies of London, and the
varions provincial banka that do not wisue notes of tieir own, are strictly banks of deposit. Banking busineas may be conducted indifferently by individuals, by privato companies, or by joint-atock companies or associationa.

Utility and Functions of Banks of Deposit.-Barks of this class execute all that is properly understood by banking lusiness; and their eatablishment has contributed in no ordinsry degree to give security and fucility to commercial transactions. They afford, when properly conducted, sufe and convenient places of deposit for the money that would otherwise have to be kept, at a considerable riak, ia private houscs. Thay giso prevent, in a great measure, the necessity of carrying money from plase to place to make paymenta, and enable tham to be made in the most convenient ani lear expensive manner. A merchant or tradesman in London, for example, who employs a banker, keeps but very little monay in his own hands, making all his considerable paymenta by drafts or checke on his banker; and he aiso sends the various checks, bills, or drafts payable to himself in London, to his bankera befora they become due. By thia meana he saves the trouble and inconvenience of counting aums of money, and avoids the lossea he would otherwise be iiable to, and would no doubt occasionally incur, from receiving coins or notes not genuine. Perhaps, however, the great advantage derived by the merchant or tradeaman from the employment of a banker, consista in its relieving him from all trouble with reapect to the presentation for payment of due-bills and drafts. The moment theae aro trimaferred to the banker, they are at his risk. And if he either neglect to present them when due, or to have them properly noted in the event of their not being paid, he is reaponsible for the consequences. "This circumstance alone must cause an immense saving of expense to a mercantile house in the course of a year. Let us ouppose that a merchant has rnly two biils due cach diy. These bills may le payabie in distant parta of the town, so that it nay take a clerk half a day to present them; and in large mercantile catablishmenta it would take up the wiole time of ona or two clerka to prasent the duebilis and the drufts. Tho aaiary of these cierks is, therefore, saved by keeping an account at a banker's: besides the aaving of expense, it is also reanonable to suppose that losses upon bills would sometimes occur from mistakes or oversights ; from miscalculation as to the time the bill would become due; from errors in marking it up; from forgetfulness to present it; or from presenting it at the wrong place. In these cases the indorsers and drawees are exonerated; and if the acceptor do not pay the bill, the amount is loat. In a banking-house such mistakes occur sometimes, though more rarely; but when they do occur, the loss falls upon the banker, and not upon his customer."-Gitmant's Practical Observations on Ranking.

It is ols other grounds particularly desirable for a merchant or truleaman to have an account with a lnuking-housc. He can refer to his bankers as vouciers for his respectability; and in the event of his wishing to acquire any information with respect to the circumstances or credit of any one with whom he is not acquainted, his bankers render him all the assiatince in their power. In this respect they have great facilities, it being the common practice among bankers in London, and unost other trading towns, to communicate information to each other as to tho credit and solvency of their customers.
In Greut Britain, to provide for the public security, tise atatute $7 \& 8$ Gco. 4 , c. $29, \S 49$, "for the punishment of embezzlement committed by agents intruated with property," enacts, "That if any money, or accurity for tine payment of money, shall be intrusted to any banker, merchant, broker, attorney; or other agent, with any direction in writing to appiy such money, or any part therenf, or the proceeds, or any part of the
proceeds of anch security, for any purpose specified in anch direction, and he shall, in violation of good faith, and contrary to the purpose so opecified, In any wise convert to his own use or benefit such money, security, or proceeds, or any part thereof reapectively, every such offander shall be guilty of a miademeanor, and, being convicted thereof, shall be liabie, at the discretion of the court, to be tranaported beyond acas, for any term not exceeding fourteen years, lor leas than seven years, or to suffer such punishment ly fine or imprisonment, or by both, as the court shail award; and if any chattel or valuable security, or any power of attorney for the sale or transfar of any share or intarest in any public stock or fund, whether of this kingdom, or of Great Eritain, or of Ireland, or of any foreign State, or in any fund of any body corporate, company or society, shalt be intrusted to any banker, merchant, broker, attorney, or other agent, for safo custody, or for any anecial purpose, acithout ony authority to sell, negotiate, tranafer, or piedge, and he shall, in violation of good faith, and contrary to the object or purpose for which auch chattel or securitv or power of attormey, shall Lave been intrusted to $\mathbf{b}$., sell, negotiate, transfer, pledge, or in any manner convert to his own use or benefit auch chattel or security, or the proceeds of the same, or any part thereof, or the share or interest in atock or fund to which such power of attornoy shall relato, or any part thereof, every suci offcnder ahall be guiity of a misdemennor, and, being convicted thereof, shall be liable, at the discretion or the court, to any of the puniahments which the court may award, as hereinbefore laat meationed."
This act is not to affect trustees and mortgageen, nor bankera recciving money due upon securities, nor securitice upon which they have a Uit.., claim, or demand, entitling them by law to aeli, transfer, or otherwise dispose of them, uniesa such sale, tranafer, or other disposal siall extend to a greater number or part of auch securitics or effecta than shali be requisite for satiafying auch lien, claim, etc.- $\$ 50$.
Nothing in this set is to prevent, impeach, or lessen any remedy at law or in equity, which any party aggrieved by any auch offonse might or would have had had it not been paased. No banker, merchant, etc., shali be convicted as an offender agaiast this act, in respect of any act done by him, if he shall at any time previously to his being indicted for such offense have diaclosed auch act on oath, in consequence of ay compulsory process of any court of law or equity, in any action bond fide Instituted by any party aggrieved, or if he shall have diaciosed the aame in any examination or deposition before any commisaioner of bankrupt.- $\$ 52$. Under the provisions of tilis act the memicra of the firm of Strahan, Paul, and Bates, bankers, London, were found guilty, and on the 27 th of October, 1855, were sentenced to transportation for fourteen years.

The Bank of England, and the private banking conpanjes of London, as well as some of the Engitah provincial banks, charge no commission on the payments made and received on account of thoae who deal with them. And until the recent introduction of jointstock banks, none of the London bankers, except in peculiar cases, allowed interest on deposits; nor is it yet allowed by the great majority of the metropolitan private bankers. It is also either atipulated or distinctly understood that a person cmpioying a banker should, beaidea furnishing him with auficient funds to pay his drufts, kcep un average balance in the bauker's hands, varying, of course, according to the amount of lusiness cione on inis account ; that is, according to the number of his checks or drafta to be paid, and the number of drafts and billa to be received for him. Tine bankers then calculate, as well as they can, the prolable amount of cash that it will be necessary for them to kecp in their coffers to meet the ordinury demands of their customers, and employ tho baiance in dis.
counting mercantlle bills，in the purchase of securi－ ties，or in some other sort of protitable adventure；so that their profits consiat of the suln they realize from such part of the moneys lodged in their hands as they can venture to employ in an advantageous way，after deducting the varioua expenses attendant on the man－ agement of their establiahments．A bank of deposit would never be established if it had to depend on ite own eapital ；it makes no profit，in its capacity of bank， till it begins to employ the capital of others．

The directors of the Bank of England do not allow any individual to overdraw his account．They answer drafts to the fail extent of the funds depesited in their hands；lut they will not pay a draft if it exceed their amount．Private bankers are not generally so serupu－ lous；mest of them allow respectable individusls in whom they have confidence to overdraw their aecounts， those who do so paying interest at the rate of 5 per cent．on whatever sums they overdraw．Tho posses－ sion of this power of overdrawing is often a grest con－ venience to merchan $\hat{s}$ s，while it is rarely productivo of loss to the banker．The money which is overdrawn is usuaily replaced within a short period；sometimes，in－ deed，in a day or two．The directors of the Bank of England declino granting this facility，from a disin－ clination on their part to come into competition in a matter of this aort with private bankers，who transact this kind of business better，probably，than it could be done by a great establishment like the Bank．

Banks afford great facilities to the public in the ne－ gotiation of lillis of exchange，or in the making of pay－ menta at distant plsees．Many of the banking com－ panies establighed in different districts have a direct intercours3 with each other，and they have all corre－ spondents in London．Hence an individual residing in any part of the country，who may wish to make a payment in any other part，however diatant，may effect his elject by applying to the baak nearest to him． Thus，suppose A．of Penzsnce has a jayment to make to 13．of Inverness：to transmit the monoy by letter would be hazardous；and if there were fractional parts of a pound in the sum，it would hardly be practicalle： how then will A，mansgo？He will pay the sum to a banker in Penzance，and his creditor in Inverness will receive it from a banker thore．The transaction is ex－ tremely simple：the Penzanco banker orders his corre－ spondent in London to puy to the correspondent of the Inverness banker the sum in question on account of B．，and the Inverneas banker，being advised in course of post of what has been dene，pays 13．A small com－ mission eharged by the l＇enzanco banker，and the post－ ages，constitute the whole expense．There is no risk whatever，and the whole affair is transacted in the most commodious and cheapest manner．

By far the largest proportlon beth of the inland bills in circulation in the couniry，and also of＊＊soreign bills drawn upon Great Britaln，are mave payable in Lonion，the grand focus to which all the pecuniary transactions of the empire are ultimately brougint to be sdjusted．And in order still further to economize the use of money，the principal bankers of the metropolla are in the halit of acnding a clerk each lay to the clearing－house in Iombard Street，who carries with him the various bills in the possession of his house that are drawn upon other bankers；and having exehanged them for the bills in the jossession of those others that are drawn upon his constituents，the balance on the one side or the other is paid In cash or Bank of En－ gland notes．By this contrivance the bankers of Ion－ don are able to settle tranaractions to the oxtent of sev． eral milions a clay，by ties employment of not more，at an average，than from $£ 200,000$ to $£ 300,000$ of cash or bank notes．$\rightarrow$ Sed Clmanimg－utodse．

In consequenee of these and other facilitles afforded ly the intorvention of lankeis for the dettlement of pecuniary transactions，the monoy required to conduet the busincss of an extenslve country is reduced to a
trifie only，compared to what it would otherwise be．It ． is not，indeed，pessible to form any very aceurate esti．＂ mate of the total ssving that is thus effected；but，sup－ posing that 50 or 60 millions of gold and silver and bank－notes are at presont required，notwithstanding all the devices that have been resorted to for econo－ mizing money，for the circulation of Great Britain，it may，one should think，be fairiy concluded that 200 millions would，at the very least，be required to trans－ act an equal extent of business but for those dovices． If this statement be nearly accurate，and there are good grounds for thinking that it is rather under than overrated，it strikingly exhilits the vast innportance of banking in a public point of view．By its means 50 or 60 millions are rendered capable of performing the same functions，and in an infinitely more commo－ dions manner，that would otherwise have required four times that sum；and supposing that 20 or $30 \mathrm{mill}-$ ions are employed by the bankers as a capital in their establishments，no less than 120 or 130 millions will be altogether disengaged，or cease to be employed as an instrament of circulation，and made available for employment in agricultore，manufactures，and com－ merce．The security afiorded by a bank of deposit is a matter as to whiels there must always bo more or less of doubt．When，indeed，s banking company confinea i．self to its proper business，and does not em－ bark in speculations of unusual hazard，or from which its funds can not bo easily withdrawn，in the event of any audden run or demand，it can hardiy ever faii of being in a eituation to meet its engagoments；whilo the largo private fortunes that most commonly beiong to the partners afford those who doal with it on addi－ tional guarantee．Much，howover，depends on tho eharaeter of the parties，and on a varioty of eireum－ stanees with respect to which the public can nover be correctly informed；so that though there can be no doubt that th，security afforded by many private banks of deposit is of the most unquestionabis descrip－ tion，this may not he the case with others．
All joint－stock lonnke，or banks liaving moro than six partners，whether for deposit and issue，or for deposit merely，are ordered，by tho act 3 and 4 Will．4，cap． 83 ，to send quarteriy returns of the number and names of their partners to the stamp－office．llut this aet does not apply to private banks，or banks not having moro than six partners，though we see no good reason why similar returns should not，ont several why they should，be required from them us well us from others． At present few havo any ecrtain knowledgo of tho partners in privato banks．Individuals often appear in the names of firms who have been dead for many years；and it has not unfrejuently been found in eases of bankruptey that parties of iarge fortune，who wero supposed to havo belonged to the coneern，hail with－ drawn long proviously．All uncertainty and obseurity of this kind might，however，be easily put an ent to by making periodical deelarations of the names ri the partners；and provkied this were clone，and the names mado sufficiently publie，we duubt whether any other step should be taken for interfering in any way with banks of deposit．Thera is in this respect a wicie dif－ ference between them end lunks of issus．It is the duty of the government to take care that the value of the currency shall be ns invarlabie as possiblo；but it has never been jretended that it is uny part whatevor of its duty to inguire into the aecurity given by the borrowers to the lemilers of money，any more than into the security given by the borrowers to the lenders of any thing else．Government vory properiy obliges a goldsmith to have his goods stamped，this leing a security to the publle that they shall not he imposed on in buylng articles of the quality of whleh they are generally ignorant；but it does not require that the persons to whom the goldsmith sells or lends his gools should give lim a guarantee for their payment．This is a matter as to which individuals aro fully eompetent

This :ompetent
to judge for themselvea; and there neithar la nor can be any reason why a lender or depositor of bullion or notes should be more protected than a lender or depositer of timber, cosl, or sugar. Goid being the standard or mausure of value, government is bound to take effectual precautions that the eurrency shall truly correspond in the whole and in all its parts with that standard-that every pound note shall be worth a sovereign, and that the amount and value of the aggregate notes in circulation shall vary exactly as a gold currency would do wers it substituted in their stead. But this is all that government is called upon to do. If A. trust a sum of money in the hands of B., it is their affair, and concerns no one else. Provided the money afiont correspond with the standard, it is of no importsnce, in a public point of view, into whose hands it may eome. The bankruptey of a deposit bank, like that of a private gentlemen who has borrowed largely, may be productive of much loss or inconvenience to Its creditors. But if the puper in circulation be equivalent to gold, such bankrupteies can not aftect either the quantity or, value of monay, and are therefore injurious only to the parties coneerned.

Substitution of Notes for Coins-Banks of IssueMeans' by which the Value of Notes may be kept on a Luvel with the Inlue of the Precious Metals,-Notwithstanding the precious metals are in many respects admirably fitted to serve as u medium of exchange (see art. Money), they have two very serions drawbaeks-their cost, and the difficulty and expense of carrying them frem place to place. If the eurreney of Great Britsin consisted only, of gold, it would amount to at least sixiy miliions of sovereigns; and the expense attending such a currency, allowing only, $\ddagger$ per cent, for wear and tear and loss of coins, could not be reckoned at less than $£ 3,250,000$ a year. The weight of 1000 sovereig. is axceeds 21 pounds Troy; so that, were there nothing but eoins in cirenlation, the conveyance of large sume from place to place to diseliarge accounts would bo a very laborions process, and even smail sums could not be conveyed without considerable difficulty. Hence it is that most commercial and civilized nations have fabricated a portion of their money of less eostly and henvy materials, and resorted to various devices for economizing the use of coin. Of the sulbstitutes for the latter hitherto suggested, puper is in all respects the most eligible. When governments aro sufficiently powerful and intelligent to enforce the olservanco of eontracts, individuals possessed of written promises fre'r others that they will pry ecrtain sums at specified periods begin to assign them to those to whom they are indebted; and when thase by whom such obligations aro subscritied are persons of whose solveney no doubt can be entertained, they are readity aceepted in payment of the debts due by one individual to another. But when the circulation of obligutions or bills in this vay has continued for a whild, individuals legin to perceive that they may derive a profit by lesuing them in such a form as to fit them for being readily used as a substitute for money in the ordinary transactions of life. IIence tho origin of bank-notes, or paper mones: An indivilual in whose wealth mud discretion the public have contidenco being applled to for a loan, say of $£ 5000$, grants tise applicant his hill or noto payalile on demand for that sum, on his recelving adequate security for its repayment with interest. Now, as this note passes, in consefuence of the condidence placed In the lssuer, currently from hand to hand as cash, it is quite as nseful to the borrower ns if he had oltalned an equivalent anount of gold; and supposing that the rate of finterest is 4 per cent., it will yieli, so long as it continues to circulate, a revenue of $£ 200$ a year to the issuer. A sense of the adyantages that might, in this way, be derived from the circulation of bills or notes, led to the formation of hanks for their regular issue. Those who issue such notes coln, as it were, their credit. They
derive the same revenue from the loan of their written promises to pay certain sums that they would derive from the loan of the sums themselves; and while they thus inerease their own income, they at the same time contribute to inerease the wealth of society. Besides being ineomparably cheaper, bank-notes are also incomparably mora commodions than a metallic eurrency. A bank-note for $£ 1000$ or $£ 100,000$ may le carried about with as much freility as a single sovereign. It is of importance, too, to olserve, that its loss or destruction, whether by fire, shipwreek, or otherwise, would be of no greater importance, in a publie point of view, than the loss or destruction of as much paper. No doubt it might be a serious calanilty to the holder ; but to whatever extent it injured him, it would proportionally benefit the issuer, whereas the loss of coin is an injury to the hoider without being of serviee to any one else; it is, in fact, so mnch abstracted from the wealth of the community.
To olviate the endless inconveniences that would arise from the cirenlation of coins of every welght and degree of purity, were there no restrictions on their issue, all goveruments have forbidden the circulation of coins except they be of a certain specified or stendurd weight and fineness. And the recurrence of similar ineonveniences from the issue of notes for varying sums, and payable under varying conditions, hes led, in all countries in whieh paper money is maile use of, to the enacting of regulations forlidding the issue of notes below a certain amount, and layling down rules for their payment. In England at this moment no note payable to bearer on demand can be issued for less then five pounds, and they must all be paid the moment they are presented. In Scotland and Ireland the minimum value of bank-notes is fixed at one pound, the regulations as to payment being the same as in England. In order to preserve monopoly of the London eireulation to the Bonk of England, no notes payable to bearer on demand are allowed to be issued by individuals or associations, other than the Bank of England, within sixty-five miles of St. Paul's. But beyond these limits every ono who complies with the above regulations es to the minimum amount of notes, and who promises to pay them on demand, may, on paying the stamp-duty, and making returns of the issues to the stamp-office, circulate any amount of notes he cansucceed in getting the public to take off.

But thongh the condition that they shall be paid on demand, and the belief that this condition will bo complied with, be necessary to sustain the value of notes issued by private parties or assochations, it is not neeessary to sustain the value of paper money, properly so ealled, or of notes which have been made legnl tender. The only thing required to sustain the velue of the latter deseription of eurreney is, that it should be lssued inlimited quantities. Every country has a certain number of exehanges to make; end whether these are effected by the employment of a given number of coins of a particular denomination, or ly the employment of the sume number of notes of the same denominatien, is, in this respect, of no Importunce whatever. Notes whleh have been made legal tender, and are net payable on demand, do not circulato beeause of any eonfidenee placed In the capacity of the issuers to retire then; neltion do they cireulate hepause they are of the same reai valne as the commodities for which they are exelanged; but they cireulate beennso, laning been selected to perform the functions of money, they are, as such, readily recelyed by all individuals in payment of their delts. Notes of thils description may be regarded as a sort of tickets or eomintera to be used in computing the value of property, and in transferring it from one individual to mother. And as the $y$ are nowiso atlected by Auctuations of eredit, their value, it is ohvious, must depend outirely on the quantity of them in circulation ns compared with the payments to le made tirough their instrumentality, or the business they have to per-
form. By reducing the supply of notes below the supply of coins that would circulate in their plsce were they withdrawn, their value may be raised above the value of gold; while, by increasing them to a greater extent, it is proportionally lowered. Hence, suppesing it were possible to obtain any security, other than immedinte convertibillty into the precious metals, that notes declared to be legal tender would not be issued in excess, but that their number afloat would be so adjusted as to preserve their value as compared with gold nearly uniform, the obligation to pay them on demand might be dispensed with. But it is needless to say that no such security can be oltained. Wherever the power to issue paper, not immediately convertible, has been conceded to any set of persons, it has been abused; or, which is the same thing, such paper has uniformly been overissued, and its value dopreciated from excess. And it is now admitted on all hands to be quite indispensable, for the prevention of injurious fluctuations in the valne of money, that all notes be mado payable, at tho pleasure of the holder, in an unvarying quantity of gold or silver.

But though such be the law in this and most other countries, it is, we are sorry to say, operative only on the richest, most cantious, and respectable bankers, and is found to afford no real security against tho roguery and misconduct of others. This security is, however, the more indispensable, seeing that the issuo of notes is, of all businesses, that which seems to hold out the greatest prospect of success to the sehemes of those who attempt to get rich by preying on the public. The circumstances that excite the public confidence in the first instance, and that afterward keep it up, are often of the most treacherous description. The cost of engraving and issuing notes ls alse but an inconsiderable item, compared with the sums for which they are issued, and provided they be got into any thing like extensive circulation, they beeone at once consldorably productive. They are aeldom issmed except on tho deposit of bills or other securities yielding a considerable rate of interest ; so that if an indlvidual, or set of individuals, with little or no eapltal, contrive, hy fair appearances, promises, and shmilar devlees, to insinuate himself or themselves lnto the public contidence, and can maintain $£ 20,000, \mathcal{L} 50,000$, or $£ 100,000$ in circulation, he or they secure a good income in the mean timo; nad when the bubblo bursts, and the limpostare is detected, they are no worse off than when they set up thelr bank. On the contrary, the preaumption is that they are $n$ great deal better ofl; and that they have taken eare to previle, at the cost of the eredulous and decelved publle, $n$ reservo stock for their future maintenance. Hence, seeing the facilitles for committing frumbl are so very great, the propriety, or rather necesslty, of providing against them.

It must not be imagined that this is mere hypothetieal reasoning. On the cont rary, as every hody knows, innumerntle lastances have occurred of the population of extensive distrlets having suffered soverely from the insolvency of bankers in whom they placed the utanost confldence. In 1793, 1814-16, and 1825-26, a very large propertion of the Iritish banks stopped payments, anl proluced by their fall an extent of lankruptey and ruin that hat seldom been equaled elsewhore. Jut when such gigantic disasters had aiready happened, and were on the eve of agah happening ln $1 \times 1 / 7-38$, it becane the boumen duty of govermment to himier, by every means in its power, their recurrence. It is no exaggerstion to affirm that Engiand has suatained a thonsand thmes more injury from the circulation of worthless puper, or paper lasued by persona without the means of retiring it, than from the lasue of spuriolt coin.

It has lieen supposed that the oljections to the lasne of notes liecanse of the rlsk of non-pryment inlylit lee ofvinted, were they issned only by assoclations or joint-ntock companies. Int there is no real foundi-
tion for any such supposition. There can not, in fact, be a greater error than to suppose that because a bank has a considerable number of partners it will necessarily be etther rich or well managed. It may be neither the one nor the other. A single individual may possess more wealth then a number of individuals assochted together; and the chances are that, if he engrge in banking or any other business, it will be better managed than by a company. Uniler the present system (and it can not be prevented under any system), the partners in joint-stock banks, as in others, may be men of straw, or persons without property, and unable to fultill their engagements. It is of the easence of a secure and well-established paper currency that the notes of which it consists should be of the exact value of the gold or silver they profess to represent, and that, censequently, they should be paid the moment they are presented. But it is not enough to order that this condition shall be uniformly complied with. Such order is obeyed only by the opulent, prudent, and conscientious bankes, and forms little or no check on the proccedings of these of a contrary character. It is the latter class, however, that it is especially necessary to look after; and it is needless to say that any system that permits notes to be issued without let or hinderanco by speculative, ignorant, or naprincipled adventurers, must be essentlally viclous.

It has sometimes heen contended, in rindication of the plan of allowing any individual, or set of hndividuals, how bankrupt soever in fortune and character, to issue notes without cheek or limitution of any kind other than the prombse to pay them on demand, that they are essentially prirate paper; that their acceptance in payment is optlonal ; mil that, as they may be rejeetet ly every one who either suspects or dislikes them, there is no room or ground for interferiag with thelr issue! llut every body knows that, whatever notes may be in law, they are in most parts of the country practically and in fuct legal tender. The bulk of the people are totally without power to refuse them. Tho currency of many extensive allstricts consists in great part of country notes, and such small farmers or tradesmen us should decline taking them would be exposed to the grentest inconveniences. Every one makes use of or is a dealer in money. It is not employed ly men of husiness only, but ly persons living on fixed inconses; by women, laborers, minors; in short, by every elass of individuala, very many of whom aro necessarily, from their situation in life, quite unable to form any estimate of the solidity of the different linaks whose paper is in circulation. Such purties are uniformly severe sufferers by the failuro of banks. The paper that comes into thelr hands is a jurt of the currency er money of the country; and it is quite as much the thity of govemment to take measures that this puper shall he truly and substantially what it professes to be, as that it should take measures to prevent the jssue of spurious coins or the use of false or deficient welghts aul mensures.
The fact is, that the paper currency of a country can not be on a perfectly aound footing until the issue of notes, whether hy joint-stock hanks or privato individuals, he suppressed. It hins heen proposed, to olviate any recurrenee of the wide-sprend ruln that has so frequently resulted from the bankruptey of banks of issue, to compel them to glve securlty for the payment of their notes; and the adoption of anch a regulation would, no douht, have been n vast hmprovement on the late system. Jut though the exaeting of securlty would have haterlally mithgnted, it would not have eradieated the vices of a system whileh allowed banks to be estabilshed at the pleasure of intdivhlunls. A paper currency la not in $n$ sotund or wholesome atate, unless, 1at, means be taken to hisure that each partlenlar note or purcel of such currency be pa'; inmediately on demnind ; and unless, 2d, the whole currency vary in amounl and ralue exactly as a

The last condition is quite as indispensable to the existence of a well-eatabliahed currency as the formor ; and it is one that ean not be fully realized othrwiae than by confining the issue of paper to a aingle source.
It is exceedingly dificult to prevent the iasue of forged notes. Various schemes have been auggested for this purpose; and though it be hardly poasible to suppose that an inimitable note will ever be produced, it is contended that by judicionaly combining different sorts of engraving, forgery may be rendered so difficult as to be but rarely attempted. But however this may be, during the period from 1797 to 1819, when the Bank of England issued $£ 1$ notes, their forgary waa carriad on to a great axtent. And the desire to check this practice, and to lcssen the frequency of captial punishments, appeara to have been among tho most prominent circumstancas which led to the return to specis payments in 1821, and the suppression of $£ 1$ motes.
Bank of England Notes legal tender.-According to the law as it stood previously to 1834, all dascriptions of notes were legally payable at the pleasure of the hoider in coin of the atandard waight and purity. But ths policy of such a regulation was very queationable; and we regard the enactment of the stat. 3 \& 4 Will. 4, c. 98 , which makes Bank of England notes legal tender, every where except at the Bank and its brunchos, for all sums above $\mathbf{E 5}$, as a great improvement. The unjust liebilities imposed upon the Bank of lingland by tha old system placed her in a situation of great difficulty, and hazard. Thay obliged her to provide a aupply of coin and bullion, not for her own exigoncies only, but for those of all the country banks; and, what is harder still, they exposed her to be deeply injured by any misconduct on the part of tho latter, as well as by the distress in which thay might accidentally be involvad. In consaquenca, her free action was at all times in some degree impeded; and har power to render ns. Istance to the banking and mereantilo interests in perioda of discredit materially diminished. The country banks kept but a small aupply of coin in their cotiers. Thoy wero all, howaver, holders, to a grester or lass extent, of government securities; and whenever any circumstance ocourred to oceasion a demand upon them for coin, they immediately sold or pledged tha whola or a portion of their stock, carried the notes to the Bank to be exrhanged, and then carried the specie to the country. Hence, when any suspicions were entertained of the credit of the country banks, or when a panic originated among the holders of their notea, as was the case in 1798 and 1825 , the whole of them retrested upon the Bank of Cnglinnd, and 700 or 800 conduits were opened, to drnw off the apecic of that estalilishment, which was thus, it is evident, exposed to the risk of stoppage without having done any thing wrong. It was not the drain for gold from nbroad, but the drain for gold from the country, that neurly exhansted the Bank's coffors in 1825, and forced her to lasuo ntout a million of $£ 1$ and $£ 2$ notes. The enrrency could not be in a soutd, healthy state, while the liank of England, and, throngh her, public credit, were piaced in so perilous n situution. But the making of Jank of England notes legnal tender at ali places except tite Bunk, has tended materinily to protect her from the injurious consequences of paniea or runs numong the holdera of country bank paper; and while it does this, it hat not, it appears to un, any wise impaired the securities against overiasue or depreclation.

It ins, no doubt, been contended that the mensure now referred to might iend to the deprecintion of provinciai paper; inasmuch as the expense of sending notes from a tistanee to London, to be exchanget for goid, would pravent any ona from demanding llank of Lingland notes from country lanke in good credit,
till the value of the notes issued hy them was 60 much tepreciated below the value of gold that the difference would more than pay the expense of sending them to London, and bringing gold back. Thers can not, howaver, be the lesst difference, as respects valne, in the provinces, between Bank of England psper, now that it is logal tender, and gold. London leing the place where the exchanges are adjusted, the vnlue of money in every part of the empira must depend on its value in it; and this, it is plain, is not in any degree affected by the measura under considerstion. Formerly the provincial currency, gold as well as paper, might be, and indeed frequently was, depreciated. This was brought about either by an overissue on the part of the country banks, generally in the first instance the effect, but always in the end the esuse, of a rise of prices; or by the issues of the Bsnk of England being, in consequence of an adverse exchsnge, narrowed sooner or more rapidly than those of the country banks. In either case, the provincial currency being redundant as compsred with thist of the metropolis, there was a demand on its issuera for bills on London; hut it is matarial to ohserva that, unless their credit was suspected, there was not, in such cases, sny demand upon them for gold. It is, indeed, olvvious that a redundancy of the currency is a defect that can not he obviated by getting gold from the country banks, unless (as hoarding is out of the question) it bo intended to send it abroad; and that may alwsys be done better and cheaper by getting from them Bank of England notes, or bills on London. A local redundancy of the currency msy take place now as it has done formerly ; and its occurrence can not be prevented, even though paper wero wholly bsnished from circulation, so long as the whole enrreney is not supplied from one souree, and as London is the focus where the exchanges with foreign countries are ailjusted. But the statements now msde show that it is a radical mistake to suppose that it can take place more readily, or to a greater extent, under the present system than formerly. In this respect no change was made in 1834. And while the ancient security against overisaua was maintained unimpsired, the arrangements then made increased the stability of tha Bunk of England, and consequently inproved tha pecuniary system of the country.

If any doubt could possibly remain as to the opera. tion of this system, it would he removed by roferring to Scotland. Gold has been practically bsnished from that country for a long series of years; and yet no one pretends to say that prices aro higher in Scotland than in Fingland, or thnt her currency is deprecinted. The Scoteh eurrency is kept at its proper level, not by the check of gold psymenta, lint liy the ctemand for bills on London; and it is as effectually limited in thia wsy as it would be wore the banks universally in the habit of exchnnging notes for gold. On what grounds, then, is it to he apprehended that the obilgation to give Ilank of England notes or bills on Iondon will he less effectunl in restraining overissue in Yorkshire or Durham than in Scotland? A banker who issues notes must keep beaide him such a stock of cash and hullion as may be suffeient to unswer the demands of the priblic for their payment. If the value of the easin mul bullion in his coffers were equai to the value of his notes in circulation, ho would not, it is plain, mako any profit; but if he be in gond are:m, a third, $n$ fourth, or even ufflh part of this sum will probnhly be suffclent; and his profit consists of the excess of the interent derivod from hia notes in eircnintion over the intorest of the sum ho is ohllged to keep dormant in his strong-hox, nul the expenses of mannging his establisituent. The Ilank of Enginnd, as will he afterward seen, kegps an nverage stock of coin and bullion equal to a third of her ilabilitiea.

No particuiar form of worts is necessary in a banknoto. The easontial requisites are, that it should be for a definite sum (in E.gland and Wales not less than

## BAN:

$\mathbf{~} \mathbf{5}$, and in Scotland and Ireland not less than $\mathbf{£ 1}$ ), that it ahould be payaile to bearer on demand, and that it should be properly stamped. Promissory netes, though isaued by bankers, if not payable to bearer on demand, do not come under the denomination of bank-notes; they are not, like the latter, taken as cash in all ordinary transactions; nor are they, like them, easignable by mere delivery.

The circulation of notes for less than $£ 5$ was restralned by law (stat. 15 Geo. 3, c. 51) from 1766 to 1797. In 1808 , it waa enacted by atat. 48 Geo, 3, c. 88, that all bank-notes, promissory notea, or other negotiable instrumenta for less than 20 s., should be absolutely vold: a penalty of from $20 s$, to $\mathbf{£ 5}$, at the discretion of the justices, being imposed on their issuers. It was chacted by the 7 Geo. 4, c. 6, that the issue of all bank-notos or promissory notes for less than $£ 5$ by the Bank of England, or by any licensed English bankcrs, and atampel on the Jth of February, 1826, or previously (after which period auch notes were not stamped), should terminste on the 5th of April, 1829.

By the 9 Geo. 4, c. 23, English bankers not in the city of London, or within three miles thereof, are authorized to issue promissory notes, and to draw and Issue bills of exchange, on unstamped paper, for any sum of $\mathcal{L} \overline{5}$ or upward, oxpressed to be payable to the bearer on demand, or to order, at any period not exceeding 7 days aftar sight (bills may aloo be drown at any period not exceeding 21 days after date), upon obtaining licenses, coating $\mathbf{£ 3 0}$, to that effect; provided auch bills of exchange be drawn upoo bankers in London, Westminster, or Southwark; or provided such bills be drawn by any banker or bankers at the place where he or they ahall be licensed to issue unstamped notes and bills, upon himself or themselves, or his or their copartner or copartners, payable at any other place where such bankor or bankers shall be licensed to issue such notes and bills. Bankers having auch licensos are to give aecurity, by bond, that they will keep a true account of all pronisaory notes and bills ao issued, and acconnt for the duties on them at the rate of $3 s, 6 d$. for every $\mathbf{£ 1 0 0}$, and also for the fractional parts of $£ 100$ of the avorage value of such notes and billa iz circulation. Persons post-dating unstamped notes or bilis shall, for every euch offense, forfcit $£ 100$.

Legal Effect of the Paymient of Bank-notes.-Notes of tha Bank of England were not, previously to the act $3 \& 4$ Will. 4, c. 98 , like bills of oxchange, mero securities, or documents of debt, but were treated as money or cash in the ordinary course or tranauctions of business; the reccipts given upon their payment being alwaya given as for money. Now, however, they are legal tender, cvery where except at the Bank, for all suma above $£ 5$. All notes paynble to bearer are assignable by delivery, The hojder of a banknote is primá facie entitled to its prompt payment, and can not be sffected by tho provious fraud of any former holder in obtaining it, unlers evilence be glven to show that he was privy to such frund. Such privity may, however, be inferred from the circamstances of the casc. To use the world of Lond Tenterden, "If a jerson take e bill, note, or any other kind of sacurity, under circumstancea which ought to excite suspicion in the mind of any reasonable man acqualnted with the ordinary affairs of life, and which ought to put him on his guard to make the necessary inquiries, and he do not, then he Juses the right of maintaining porsesslon of the instrument aguinst the lawful owner,"-Guiklhall, 25th Octobar, 1820.

Country bank-notea are usually received as eash. But though triken as such, if they be presented in due time and not paid, they do not amount to a payment, and the delliverer of the notos is still llable to tho holder. It is not easy to deteringe what in a due or reasonable time, inammuch an it must depand in a great measure on the circumstances of each particular case.

On the whole, the safest rule seems to be to present all notes or drafts payable on demand, if received in the place where they are payable, on the day on which they ara recelved, or as soon after as possible. When they have to be tranamitted by post for payment, no unnecessary delay should be allowed to intervene.Ciritry's Commercial Law, vol. iil. p. 590; and the art. Check in this work.

Distinction between Bank-notes and Bills of Exchange, -It is common with those who object to any restrictions beiog laid on the isaue of bank-notes to repreaent them aa subatantially identical with ordinary bills of exchange, and to contend that If it would be imprident or impracticable to interfere wlth the issue of the latter, tho issue of the former should also be left to the discretion of the parties. The cases, however, are net parallel. It ls true that bllls of exchange perform in some respects the functions of money; and, being transferred from one individual to enother, make payments much in the esme way as If thoy were bank notes. But though there are, no doult, certain points in which bills of exchange and bank-notea closely reasmble each other, there are others, and those too of the greatest importance, in which there is a distinct and material difference between them, Bank-notes are lsaned only by parties llcensed for the purpose, or by bankers; they are unlformly payable on demand, or when presented; they are not indorsed by the holder on his paying them away; tho party receiving has no cluim on the party from whom he received them In the ovent of the fullure of the lasuers; and every one is thus encouraged, reckoning on the facility of passing them to others, to accept bank-notes, "even though he should doubt the ultimste solvency of the isaners." -Thonston on P'aper Credif, p. 172. Bllla, on the contrary, may be drawn by all Iodividuals; they are mostly all made payable at some distant period; and those Into whose hands they come; if they be not in want of money, prefer retaining them in their possession, in order that they may get the intereat accruing upon thom. But the principal distinction between notes and bills is, that the latter are not assignable by mere delivery, bat that every individual, in pasaing a bill to unother, has to indorse it, and by doing so makes hilmself responsible for its payment. "A bill cireulates," says Mr. Thornton, "In consequence chiefly of tho conflence placed by ench recelver of it in the last indorser, hls own correspondent in trade; whereas the circulation of a bank-noto ls owing rather to the circumstance of the name of the lssuer being so well known as to give it a universal credit."-P. 40. Nothlng, then, can be more inaccurste than to represent blles and notes in the same point of vlew. If A. pay to $\mathbf{B} . \boldsymbol{£ 1 0 0}$ in astiafuction of a debt, there is an end of the transaction; but if A. pay to B. a bill of exchange for $£ 100$, the transaction Is not completed; and, in the cvent of the blll not being pald by the person on whom it is drawn, B, will have recourse upon A. for its value. It is clear, therefore, that a great deal more conslderstion is alwaya required, and may be falrly presumed to be given, before any one aecepta a bill of exchange In payment, than before ho accepts a bank-note. The note is payablo on tho lustant, without deduction-the bill not until some future peried; the note may be passed to anot her without inenrring any risk or responsbility, whereas every fresh issucr of the bill mukes himself reaponalble for its value. Notea form the currency of all classes, not only of those who are, but also of those who are not engaged in businesa, very many of whom are, as already seen, without the power to refuse them, and without the means of forming any correct conclusion as to the solvency of the lasuers. Bills. on the other hand, pass only, with vory few exceptlons, among persons engaged in businces, who, being fully aware of the risk they run in taking them, reject such as thay apprehend might involve them in loss. There is plainly, therefore, a wide and obvious distinc-
e to present received in ay on which ble. When payment, no Intervene.-
90 ; and the
f Exchange. any restric. to represent vary bilis of d be impruissue of the be left to the ever, are not e perform in and, being r, make paywere bank ertain points 18 closely rethose too of is a dlatinct Bank-notes purpose, or on demand, by the holder iving has no 1 them in the every one is $y$ of passing oven though the issuers." Bilis, on the le; they are period; and ley be not in their possesrest accruing ion between ussignable by in passing a ing so makes A bill cireurence chiofly of it in the de; whereas rather to the reing so well -P. 40. Noto represent If A. jay is an end of of exchange ; and, in the son on whom for ita value. pre consideraly presunied of exchange k-note. The duction-the hote may be k or responsa bili makes form the curare, but also , very many power to rehing any corners. Bilis, few excep, who, veing them, reject hem in less. tous distinc-
tion between the two species of currency; and it wonld be ridlculous to argue that because government is bound to interfere to regulate the lasue of the one, it should also regulate the iasue of the other.
II. Account of the Bank of England,-Thig great establishment, which has long been the principul bank of deposit and circulation, not in that conntry only, but in Europe, was founded in 1694. Its principai projector was Mr. William Paterson, an enterprising and intelligent Scotch gentleman, who was afterward engaged in the ill-fated colony at Darien. Government being at the time much distressed for want of money, partiy from the defects and abuses in the system of taxation, and partly from the difficulty of borrowing, because of the eupposed instability of the revo lutionary establishment, the bank grew out of a loan of $£ 1,200,000$ for the public service. The subscribers, besides receiving eight per cent. on the sum advanced as interest, and $£ 4000$ a year as the expense of management, in all $£ 100,000$ a year, were incorporated into a society denominated tho Governor and Company of the Bank of England. The charter is dated the 27th of July, 160 . It declarea, among other things, that they shall "be capable in law to purchaec, enjoy, and retain to thom and their anccessors, any manors, lands, rents, tenements, and posseasions whatsoever ; and to purchase and aequire all sorts of goods and chattels whatsodver, wherein they are not restrained by act of Parliament; and also to grant, demise, and dispose of the same.
"That the managemont and government of the corporation be committed to the governor, deputy govemot, and twent y-four lirectors, who ahali be elected between the 25th day of March and 25th day of April, each year, from among the members of the company duly qualified. That no dividend shall at any time be made by the said governor and company, save only out of the interest, profit, or produco arising by or out of the said enpital stock or fund, or ly such dealing as is allowed by act of Parliament. They must be natu-rai-born subjects of Engiand, or naturalized subjects; they ghall have in thelr own name and for thelr own use, severnlly, viz.: the governor at least $£ 4000$, the deputy governor $\mathbf{£ 3 0 0 0}$, and each director $\boldsymbol{£ 2 0 0 0}$ of the capital stock of the aaid corporation. That thirteen or more of the said governors and directors (of whieh the governer or deputy governor must be alwnys one) shall conatitute a court of directors, for the management of the alfairs of the company, and for the appointment of ail agents and servnnts which mny be necessary, paylng them such salaries as they may consider reasonstie. Every elector must have in his own name and for his own use, £500 or more cupitul stock, and can only glve one vote. He must, if required by any member present, take the oath of stock; or the declaration of stock, in case he the one of the peopie called Quakers. Four generai courts to ive held in every year; in the months of September, December, Aprii, and July. A general court may be aummoned at any time, upon the requisition of nine proprictors, duly quaified as electors. The majority of electors in general courts have the power to make and conatitute byfaws and ordinances for the government of the corporation, provided tint such by-laws and ordinumees be not rejugnant to the laws of the kingtom, and be confirmed and approved, according to the statutes in auch case made and provided." The corporation is prohibited from engaging in any sort of commercial undertaking other than deuling in bilis of exchange, und in goid and silyer. It is authorized to advance money upon tie security of goods or merchandige pledged to it ; ond to seli by putblic auction such goods as are not redeemed within a specified time.

It was also enacted in tie same year in which the Bank was established, by statute 6 William and Mary, e. 20, that the Bank "siasii not deai in any goods, wares, or merchandise (except bullion), or purchase
any lands or revenues belonging to the crown, or advance or lend to their majesties, thelr heirs or successors, any sum or sums of money by way of loan or anticipation, or any part or parts, branch or branches, fund or funds of the revenue, now granted or beionging, or hereafter to be granted to their majesties, their heirs and successors, other than such fund or funds, part or parts, branch or branches of the said revenue only, on which a credit of loan is or ehall be granted by Parliament." And ln 1697 it was enacted that the "common capital and prineloal stock, and also the real fund of the governor a - company, or any profit or produce to be made thereof, or arising thereby, shall be exempted from any rates, taxes, assessmenta, or impositlons whatsoever, during the continuance of the Bank; and that all the profit, benefit, and advantage, from time to time arising out of the management of the said corporation, shull be applied to the usea of all the members of the said corporation of the Governor and Company of the Bank of England, ratably and in proportion to each member'a part, share, and intercst in the common capital and principal stock of the asid govarnor and company hereby established." It was further enacted, in 1697, that the forgery of the company's seal, or of any sealed bill or bank-note, should be faiony without benefit of dergy, and that the making of any alteration'or erasure in any bill or note should also be felony.

In 1696, during the great recoinage, the Bank was involved in considerable difficulties, and was even compelied to suspend payment of her notes, whlei wore at a heavy discount. Owing, however, to the judicious conduct of the directors, and the assiatance of govemment, the Bank got over the crisis. But it was at the same time judged expedient, in order to place her in a situation the better to withstand any adverse circumstances that might afterward oceur, to increase her capital from $£ 1,200,000$ to $£ 2,201,171$. In 1708, th: directors undertook to pay off und cancel one million and a half of Exchequer liils they had circuiated two years before, at $4 \frac{1}{2}$ per cent., with the interest on them, amounting in all to $£ 1,775,028$; Which increased the permanent debt due by the public to the Bank, inciuding $£ 400,000$ then advanced in consideration of the renewal of the charter, to $£ 3,375,028$, for which they were allowed 6 per cent. The Bank capital was then also doubled or increased to $£ 4,402,343$. But the year 1708 is chiefly memorable, in the history of the Bank, for the act that was then passed, which declared that, during the continuance of the corporation of the Bank of England, "it should not be lawful for any body politic, erected or to be erected, other than the sald Governor and Company of the Bank of Engiand, or for any persons whatsoever, united or to be united in covenants or partnership, exceeding the number of six persons, in that part of Great Britaln calied England, to horrow, owe, or take up any sum or aums of money on their bills or notes payable on demand, or in any less time than six months from the borrowing thercof." This proviso, which has had so powerfui an operation on banking in lingland, is enid to have been elictted by the Mine-adventure Company having commenced banking businesa, and begun to issue notes.

It has been pretty generally imagined, from the privnte banking companies in the metropolls not issuling notes, that they were legaliy inenpacitated from doing 80. 13ut the clause in the net of 1708 , which has been tise only restriction on the lssue of notes, npplicd generally to ali Engiand, and had no pecullar reference to London. The fact that banks with six or fower partners have not issued notes in tho metropolis, us weli as in the provinces, is, therefore, ascribable either to their being aware that their notes wonid obtaln no considerable cireulation concurrently with those of a great aasociation like the Bank of England, or from their believing that their issue would not be profitable.

It also peparates the banking from the lssulug depsrtment of the estabtishmant, and effects other important changes. | 11,016,100 0 |

The charter of the Bank of England, when first granted, waa to continue for cleven years certain, or till a year's notice after tho 1st of August, 1705. The charter was further prolonged in 1697. In 1708, tho Bank having advanced $£ 400,000$ for the public service, withnut interest, the exclusive privileges of the corporation were prolonged til] 1733; and, in consequence of various arrangements made at different times, tho exclusive privileges of the Bapk have been continued by succeasivo renewals, till a year's notice after the 1at of August, 1855. For further details as to this subject, see the Appendix No. 1 of the Report of 1832 on the Renevoal of the Bank Charter, and the Acta of Parliament referred to in it; see alao Postlemthwart's IIisfory of the Repenue, p. 301-310; and Fatrman on the Funds, 7th ed. p. 85-88, etc.

The capital of the Bank on which dividends aro paid has nover exactly coincided with, though till of late it seldom diffored very matorially from, the permanent ativan s by the Dank to the pubiic. Wo have already seen tnat it amounted, in 1708 , to $£ 4,402,343$. Between that year and 1727 it was increased to near $£ 9,000,000$. In $1 \mathbf{1 4 6}$ it amounted to $£ 10,780,000$. From this period it underwent no change till 1782, when it was increaeed 8 per cent., or to $£ 11,642,400$. It continued stationary at this sum down to 1816 , whon it was raised to $£ 14,553,000$ by an addition of 25 per cont. from the profits of the Bank, under the provialuna of the act 56 Geo. 3, c. 90. The act for the renewal of the charter in 1833, the $3 \& 4$ Will. 4 , c. 98 , directed that the sum of $£ 3,671,700$ of the debt due to the Bank should te ropaid by the public, giving the directors power, if they
thought fit, to deduct it from the bank capital. But at the $^{\text {a }}$ ment when the order in conncil appeared, this was not done, the sum being reinvested in a government annuity, terminable in 1860 . The Bank of England has been frequentiy affected by panics among the hoiders of ita notes. In 1745, the alarm occazioned by the advance of the Highlandere, under the Pretender, as far as Derby, led to a run upon the Bank; and in order to gain time to concert measurea for averting the run, the directors adopted the device of paying in shillings and sixpences! But they derived a more etfectual relief from the retreat of the Highianders, and from a resolntion agreed to at a meeting of the principal merchants and traders of the city, and very numerously signed, deciaring the willingness of the subscribers to receiva bank-notes in payment of any sum that might be due to them, and piedging themselves to use their utmoat endeavors to make all their payments in the same medium. During the tremendous riots in June, 1780, the Bank incurred considerable danger. Had the mob attacked the establishment st the commencoment of the riota, the consequences might have proved fatal. Luckily, however, they delayed their attack till time had been afforded for providing a force sufficient to insure its safoty. Since that period a considerabla military force is nightiy placed in the interior of the Bank, as a protection in any emergency that may occur. In the iatter part of 1792 and beginning of 1793 , there was, in consequence of a previous overissue on their part, a general run on most of the private banks, and about a third part of these establishments were forced to stop payments. This ded to a considerablo demand for coin from the Bank.

The year 1797 is, however, the most important epoch in the recent history of the Bank. Owing partly to events connected with the war in which Engiand was engaged - to loans to the Emperor of Germany; to bills drawn on the treasury at home by the British sgents abroad; and partly and chiefly, perhaps, to the advances most unwillingly made by the Bank to govemment, which provented the directors from having a sufficient control over their issues-the exchanges became unfavorabie in $\mathbf{1 7 9 5}$, and in that and the following year large sums in specie were drawn from the Bank. In tho latter end of 1706 and beginning of 1797 , considerable apprehenaiona were entertainell of invasion, and rumors were propagated of deseents having been actually made on tho coast. In consequence of the fears that were thus excited, runs were made on the provincial banks in different parts of the country; and some of them having failed, the panic becamo general, and extended itself to London. Demands for cash pourcd in upon the Bank from all quarters, and on Saturdny, the 25th of February, 1797, she had only $£ 1,272,000$ of cash and bullion in her coffers, with every prospect of a vioient run taking place on the following Monday. In this emergency an order in council was issued on Sunday the 26th, prohiblting the directors from paying their notes in casin until the sense of l'arijament had been taken on the subject; snd after l'arliament met, and the measure had been much discussed, it was agreed to continue the restriction tili six months after the signature of a definitive treaty of peace.

As soon as the order in council prohibiting payments in eash appeared, a meeting of the principal bankers, merchants, traders, ete., of the metropolis was held at tho Mansion IIouse, when a resolution was agreed to, and very numerously signed, pledging, as had been done in 1745, those present to accept, and to use every menns in their power to cause bank-notes to be accepted as cash in all transactions. This resolution tended to allay the apprehensions that the restriction had excited. Parliament being sitting at the time, a committee was inmediately appointed to examins into the affairs of the l3ank; and their report put to rest whatever doubts might liave been entertained with respect to tho boivency of tho establishment, by showing that,
tho Bank was possessed of property to the amount of $£ 15,513,690$, after all claims upon her had been deducted.
Much difference of epinion has existed with respect to the policy of the restriction in 1797; but, considering tha peeuliar clrcumstances nnder which it took piace, its expediency seems abundantly obvious. The run did not originate in any overissue of bank paper, but grew entlrely out of political causes. So long as the alarms of invasion continued, it was clear that no bank paper immediately convertible into gold would remain in clrculation. And as the Bank, though possessed of ampie funds, was without the means of instantly retiring her notes, she might, but for the interference of government, have been obliged to stop pay-ment-an event which, had it occurred, must hava produced consequences in the last degree fatal to the public interests. It had been generally supposed, proviously to the passing of the Reatriction Act, that banknotes would not circulate unless they were immediatiIy convertible into cash; but the event showed, conformabiy to principles that have since been fully explained, that this was not really the case. Though the notes of the Bank of Engiand wera not, at the passing of the Restriction Act, publicly declared to be legal tender, they were rendered so in practice by being recetved as cash in all transactions on account of government, and of the vast majority of indivlduals. For the first three years of the restriction, their issues were so moderate that they not only kept on a par with gold, but actually bore a emali premium. In the latter part of 1800 , however, their qusntity was 80 much increased that they fell to a dlscount of 8 per cent. as compared with goid, but they soon after rose nearly to par; and it was not until 1808 that the decline of their value excited any considerable attention. Early in 1810 thay wers at a discount of about $13 \frac{1}{2}$ per cent.; and this extraordinary fall having attracted the attention of the Legislature, the House of Commons appointed a committee to inquire into the circumstances by which it had been occasioned. The committee examined several witnesses; and in their report, which was drawn up with considerablo ability, they justiy ascribed the fall to the overissue of bank paper, and recommended that the Bank should be obliged to resume cash payments withln two years. This recommendation was not, however, acted upon; and the valus of bank paper continued to decline, as compared with gold, till 1814.

At the period when the reatriction on cash payments took place in 1797, it is supposed that there were about 280 country banks in existence; but so rapidiy were these eatablishments multiplied, that they amounted to above 900 in 1813. The price of corn, influenced partly by the depreciation of the currency, and the facility with which discounts were obtained, but far more by deficient harvests and the unprecedented difticuities which the war threw ln the way of importation, had risen to ar extraordinary height during the five years ending with 1813. But the harvest of that year being unusually productive, and the intercourse with the Continent being then aiso renewed, prices, lnfluenced by both circumstances, sustained a very heavy fall in the latter part of 1813 and the beginning of 1814 ; and this fail having ruined a considerabie number of farmers, and produced a general want of confidence, such a deatruction of provincial paper took place as has rarely been paralleled. In 1814, 1815, and 1816, no fewer than 240 country banks stopped payment; and eightynine commissions of bankruptcy were issued against these establishments, being at the rate of one commission against overy ten and a half of the total number of banks existing in 1813. The great reduction that had been thus suddeniy and violently brought about in the quantity of country bank paper, by extending the field for the circulation of Bank of Eagland paper,
raised its value in 1817 nearly to a par with gold. The return to cash pnymenta being thu: facilitated, it was fixed, in 1819, by the act 59 Geo. 8, c. 78, commonly called Sir Robert Peel's Act, that they should take place in 1823. But to prevent any future overisaue, and at the same time to render the measure as littie burdensome as possible, it was enacted, In purauance of a plan suggeated by the late Mr. Ricardo, that the Bank should be obliged, during the interval from the passing of the act till the raturn to specie payments, to pay her notes, if required, in bars of atandard bullion of not less than sixty ounces weight. This pian was not, however, acted upon during the period allowed by law; for, a large amount of gold having been accumulated at the Bank, the directore preferred reconmeacing apecie payments on the 1st of May, 1821. See Tabie for an account of the price of bullion, the depreciation of paper, etc., from 1800 to 1821. .
A great diversity of opinion has been entertained with respect to the policy of the return to the old standard in 1819. By one party it has been represented as a wise and politic measure; they contend that Sir Robert Peel's Act not only put an end to those fluctuations in the value of money, which had previously been productive of great mischtef, and gave effect to the soiemn engagements into which the publlo had entered with the national creditor, but that it did this without adding any thing material to the national burdens. But another, and also a very numerous party, take a total different view of this measure: they contend that the public was not reelly bound to re.urn to cash payments at the old standard at the termination of the war; that the return has very greatly enhanced the value of the currency; and that this enhancement, by adding proportionally to the fixed burdens laid on the industrious classes, has been most injurious to their interests. It will, however, be found in this, as in i...ust cases of the sort, that the statemente of both parties are exaggerated, and that if, on the one hand, the measure has not been so advantageous as its eulogista represent, neitier, on the other, has it been nearly so injurious as its enemies would havo us believe.

In discussing this question, it is material to observe that the value of paper, which had been in 1815 and 1816 about $16 \frac{1}{2}$ per cent. below that of gold, rose in 1817 and 1818, from the eauses alroady mentioned, without any interfareace whatever on the part of govornment, to within littie more than $2 \frac{1}{2}$ per cent. of the value of gold ; and that in 1819 the depreciation ouly amounted to $4 \frac{1}{2}$ per cent.-Sce Table. It is, thereforo, fuilie to ascribe to the act of 1819, as is often done, the whole rise that has taken place in tho value of the currency since the peace, seeing that the currency had been for three years previously to its enactneent from 12\} to 141 per cent. above ite value In 1815, and from $!1$ to 23 per cent. above its value in 1814 ! The main olject which the promoters of the act of 1819 had in view was to sustain the value of the currency at the point to which it had recovered itself without iegislative interference. This, however, could not be done without recurring to specie payments; and the difference of $4 \frac{1}{\text { per cent. that obtained in 1810, be- }}$ .veen tho value of gold and paper, was not deemed sufficientiy considerable to warrant a departuro from the old standard, and from the acts ongaging to restore it.

But it is alleged that those who suppose that the act of 1819 added only 41 per cent. to the vaiue of the currency mistake aitogether the eviect of the measure. It is admitted, indeed, that paper was then only $4 \frac{1}{2}$ per cent. less vainable than gold; but by reverting to specis paymante, 71 unoxpected purchase of thirty millions of gold was sunde; and it is affirmed that this nove ol and largo demand, concurring eimultaneourly with the contraction of paper in several of the Continental states, and with a falling off in the supply of bullion from the mines, had the effect of adding very greatly
to the value of gold itself, and consequently to that of the carreacy. It is very difficult, or rather, perhaps, imposesible, to determine the precise degree of credit that ahould be attached to this statement; but, while we inclins to think that it is well founded to a certain extent, we ses uo grounds for believing that it is so to any thing like the extant that has been stated. The gold imported into Great Britain, to enalis the Bank to resume specis payments, was not taken from any particular country or district, but was drawn from the market of the world; and considering the vast extent of the aupply whence it was derived, it is againat all reason to suppose that its vaiue could be materially influenced by the purchases. We donbt, too, whether the contraction of the paper currency of some of the Coutinental states, and the substitution of specie In its stead, was not more than belanced by the cessation of the demand for specie for the military chesta of the different armies, by the stoppage of the practice of hoarding, and the greater security consequent to the return of peace. And with respect to the falling off in the supplies from the mincs, it is not a circumstance, supposing it to have had a considerable infuence, that Parliament could take into account. It conld neither deternine the oxtent to which bullion had been raised, nor at what point the rise would atop, nor how soon it might again begin to decline. The diminution in the supply of bullion had then continued for too short a period, and ite influenco on the value of gold was moch too uncertain, to make it a ground for interfering in any degree with the standard. And notwithstanding tho falling off in the productiveness of the American mines still continues, the diminntion thence arising has been since more than compensatod by the extrasrdinary increase that has taken place of late years in the produce of the Russian mines and washings.
The decline in the price of most articles that has taken place since the peace has been often referred to as a conclusive proof of the great enhancement in the value of bullion. But the inference is by no means so certain as has been represented. The prices of commodities arc as much affiected by changes in the cost of their production as by changes in the quantity of money afloat. Now, there is not one of the great articles of commerce the cost of which has not been considerably reduced, or which has not been supplied from new and more productive sources within the last few years. The growth of corn, for example, has been vastly extended in France, Prussia, and gencrally throughoat tive Continent, by the splitting of large estates, and the complete subversion of the feudal system; and the reduction of its price in England has been wholiy owing to the astonishing improvements made in agriculture, and to the i - rease of imports from Ireland. The fall in the prico of wool is satisfactorily accounted for by the introduction and rapid multiplication of Merino sheep in Germany, wherc they seem to succeed even better than in Spain; and by the large and rapidly growing imports from Australia, where littlo more than 80 years ago there was not a singlo sheep! And a very large portion, if not the whole, of the fall in the price of colonial products, is admitted, on all hands, to be owing to the destruction of the monopoly system, and the vast extension of cultivation in Cube, Brazil, Java, Louisiana, etc. Although, therefore, we do not deny that the falling off in the supply of bullion from the inines must, at first, have had some influence over prices, we hold it to be the greatest imaginablo crror to aseribe to it the entire fell that took place after the peace. Were its effict rated at from 5 to 10 per cent., we belicve it would be very considerably overstated. See Palcious Metals.
On the whole, therefore, we are disposed to approve of the conduct of those who framed the act of 1819. That it added sonewhat to the burdens of the industrious classes, and has been in so far hostile to the public interests, it secms imposilibe to doubt; but it has
$y$ to that of er, perhaps, ee of credit ; but, while to a certain at it is so to tated. The le the Bank $n$ from any wa from tha vast extent agalnst all materially too, whether some of the specie in its cossatlon of hests of the practice of juent to the falling off in rcumstance, fluence, that ould neither been raised, how soon it ution in the too short a Id was much terfering in pithstanding 10 American ence arising $y$ the extralate years in binga. les that has a referred to ment In the no means 80 ices of contin the cost quantlty of The great arot been conapplied from the last few as been vastlly throughrge ebcates, pystem; and been wholly ade in agriom Ireland. $y$ accounted plication of n to succeed ge and raj. a little more reep! not been so in any thing like the degree whieh its enemilas represent. The period, too, when it was passed is now so distant, that the existing engagements among individuals have almost all been formed with reference to the altered value of the currency; 80 that whatever Injury it may have occasioned In the first Instance must be nearly gone by. To modify or change the atandard at this late poriod, would not be to repair injustice, but to commit it afresh. At the end of the war, the circumstances were considerably different. The standard had been really abandoned for the previous 18 years; and perhaps we may now say that It would have been better, all things considered, had the mint price of bullion been ralsed in 1815 to the market price. But having surmounted all the difficulies attendant upon the restoration of the old standard, and malntalned it since 1821, It would be In the last degree impolitic to subject lt to new alterations. Should the country become, at any future period, unsbie to make good Its engegements, it will better consuit ita honor and its interest by fairly compounding with lts creditore, than by endeavoring to slip from lta engagements by resorting to the underhand and dishonest expedient of enfeebling the standard.

The price of grain, which had been very much depressed In 1821 and 1822 , ralled in 1823 ; and this circumstance contributed, slong with others peculiar to that period, to promote an extraordinary rage for apeculation. The issucs of the country banks being in consequence far too much extended, the currency became redundant in the autumn of 1824 ; and the exchanges having been depressed, a drain for gold began to operate upon the Bank of England. But the directors of the Bank having entered, in the early part of that year, into an engagement with government to pay off auch holders of 4 per cent. atock as might dissent from its conversion into a $8 \frac{1}{2}$ per cent. stock, they were obllged to advance a considerable sum on this account after the depression of the exchange. This tended to counteract the effect of the drain on the Bank for gold; and, in consequence, the London currency was not very materially diminished till September, 1825. When, however, the continued demand of the public on the Bank for gold had rendered money ecarce in the metropolis, the pressure speedily extended to the country. Such of the provincial banks-and they were a numerous class-as had been originally eatablished without suffieient capital; or had conducted their business upon orroneous principles, began to give way the moment they experienced an increased diffeulty of obtaining pecuniary accommodations in London. The alarm, once excited, soon became general ; and confidence and credit were, for a while, almost wholly suspended. In the short space of six weeks, above 70 banking establishments were destroyed, notwithstanding the very large advances made to them by the Bank of England; and the run upon the Bank for cash to supply the exigencies of the country banks was so henvy, that sie was well nigh drained of all the coin in her coffers, and obliged, as already remarked, to lssue about a million of $£ 1$ and $£ 2$ notes.

To guard agalnst a recurrence of tho wlde-sprend mischief nnd ruin produced by this and the prevlous bankruptcies of the country banks, it was resolved, in 1826, with consent of the Hank of England, to make a change in the law of 1708 limiting the number of partners in banking cetablisiments to six only. And it was accordingly enacted that thenceforth any number of partners might form themselves into associations to carry on the business of banking, including the lisue of notes, any where not within sixty-five miles of London. The directors of the Bank of England came, at the same time, to the resolution of establishing branches in some of the principal towns; and these have since been established in Glouceater, Manchester, Birmingham, Leeds, Liveri.v, Bristol, Exeter, Newcaatle-upon-Tyne, Hull, Norwich, etc.

Bealdes attempting to lessen the frequency of bankruptey among the country banks by repealing thé law limitiag the number of partners, it was further resolved, in 1826, to prohibit the isiue of $£ 1$ notes. The policy and effects of this measure gave riae to much diepute. It seems clear that it went far to shut op one of the moat convenient channels by which the inferior clasa of country bankers contrived to get their notes Into circulatlon, and must, in so far, have done good. But there were many other channela still open to them; and to lmagine that this measure was to place the provincial currency on that solld basis on which It should be placed was quile visionary. There were no notes under $£ 6$ in circulation in 1792; and yet fully one third part of the country banks then in existence became bankrupt! The truth la, as already stated, thet it la not posaible to guard against lose and fraud from the proceedinge of the country bankers, otherwise than by compelling them to give security for their is. suea; and as secu $y$ may as easily be given for $£ 1$ notes as for those of $\mathbf{5 b}$, the suppression of the former does rot appear to be essentlal. No doubt can, however, be entertained that the representations of the extreme injury occasioned by the withdrawal of $£ 1$ notes were greatly exaggerated; though $\mathrm{f}_{\text {. }} \mathrm{lg}$, at the saine time, obvious that the means of the bankers to make advances, as well as the profit derived fromimaking them, must both have been diminished by the suppression of the amall notes; and it would be foolish to deny that thia circumstance must have occasioned some loss and inconvenience to many individuals. These remarks are meant to apply only to the case of the country banke. The extraordinary extent to which the forgery of the $\boldsymbol{x} 1$ notes of the Bank of England was carried affords a aufficient vindication of the policy of their auppreasion. But the comparativeiy limited circulation of the country banka, and perhaps we may add the greater attention pald to the manner in which their notes were engraved, hindered their forgery from becoming Injuriously prevalent.

Charter of 1844.-The defecta jaherent in the old system were again fully developed in 1836 and 1837. It is needless now to enter upon any Investigation of the circumstances which led to the overtrading of these years; but it was carried to a great extent in England and in the United States. In nothing, however, was this more strikingly evinced than In the rapid increase of joint-stock banks; their number, which in 1834-85 had amounted in England and Wales to 55, having risen in 1835-36 to no fewer than 100! Many of theee were banks of issuc, and in consequence of the large additions that were thus suddenly made to the number of notes aflost, and atill more to the number of bllis, check, and other aubstitntes for money, the currency became redundant and the exchange depressed; and the deflcient harvests of 1838 and 1839 , conspiring with thia rcdundancy, occasioned a further fall in the exchange, and a severe drain upon the Bank of Eugland for gold. But whillo the latter was narrowing her issues by supplying the exporters of bullion with gold in exchange for notes, the country banks went on increasing thelr issucs! What the former did by contracting on the one hand, the latter more than undid by letting out on the other. The vacium created by the withdrawal of Bank of England paper was immediately filled up, nud made to overflow, by the lasue of a more than equal amount of provincial paper; 80 that had it not been for the rise in the rate of interest, and the other repressive messures ndopted by the Bank, the probability ia that she might have gone on paying away bullion for notes till she was drained of lier last sixpence, without in any degree aflecting the exchange; and as it was, the bullion in her coffers in August, 1839, was reduced to $£ 2,420,000$, so that the market narrowly escaped a tremendous crisis.

This perilous experience having again forcibly attracted the publio attention to the state of the banking
system, Sir Robert Peei was encouraged to atiempt its $\mid$ notes issued to it by the former, under the 2d clause of improvemeat. The clause in the act $8 \& 4$ Wili. $4, \mathrm{c}$. 98 , for the renewal of the charter in 1833, which gave to Pariiament power to revise or cancel it in 1845, afforded a logitimate opportunity for the introduction of the new system. . But, however desirable, the total suppression of the issue of notes by joint-stock and private banking companiee would have been a measure too much opposed to popular prejudices, and to the real or supposed interesto of a large and powerful class, to have had any chance of being carriod; and there also would have been great, thoagh inferior, difficulties in the way of the plan for taking security. It was, indeed, indispensable, in attempting to obviste the defects inherent in the banking system, to proceed cautiousiy, to reapect, in as far as possible, existing interesta, and to avoid taking any step that might excite the fears or suapicions of the public; the grand diffcuity being to reconcile the introdaction of such a course with the adoptlon of any plan that would obviato in any considerable degree the defecte cemplained of. Happily, this difficult problem has been dexteroualy and satisfactorily soived by Sir Robert Pcel; tho measures he introduced and carried through Parliament in 1844 and 1845, for the improvement of the banking system, having been so skilifuliy contrived as to provoke little opposition, at the came time that they effected very extensive and, as we think, most beneficial changes.

The measures in question consist of the act 7 \& 8 Vict. c. 82, which refers to the Puk of Engiand and the English country banks; and the acte $8 \& 9$ Vict. c. 37, 88, referring to the Banks of Scotland and Ireland. The principal object of these statutes has been to obviate the chances of overissue and of sudden fluctuations in the quantity and value of money, by limiting the power to issue notes payable on demand, and by making the emount of such notes in circulation vary mere nearly than previously with the amount of buliion in the possession of the issuers. Sir Robert Peel adopted, in deaiing with the Bank of England, the proposai made by Mr. Loyd, in 1837, for effecting a complete separation between the issuing and banking departments of that estallishment. And while the directors are left at liberty to manage the latter at discretion, their management of the former, or issue department, is anbjected to what seems to be a weli-devised system of restraint. The Bank is allowed to issue $£ 14,060,000$ of notes npon securities (of which the debt of $£ 11,015,100$ lent by her to government is a part); and whatever paper the issue department may at any time issue over and above this maximum amount of securities, it must have an equai amount of coin and builion in its coffers. A clasue is inserted in the act aliowing the Bank to increase her issue upon securitien in the event of her notes being used instead of those of any or ail of the existing banks of issue. Hence it is impracticable for the issue cicpartment to increase its issues without, at the same time, proportionally increasiug lts atock of coin and builion; or to diminish the latter without proportionaily diminishing the amount of paper supplied to the public and the bauking department. And, therefore, if the latter issued the whoie notes assigned to it , the total smount issued by tho issue department and the amount in circulation wouid be identical; and it might under such circumstances bo truiy said that, in so far es the currency consists of Bank of England notes payable on demand, it varicd $\ln$ amount and vaino as it wonid do were it wholly metallic, and, consequently, by being so closeiy identiffed with the standa. 1 , realized the beau ideal of a paper currency.

But, though tho currency approsches to, it has not arrived at this degree of perfection. The public does not deal alone with the issuo, but also, and to a far greater extent, with the baking department. And this latter department retained aucil a portion of the
notes issued to it by the former, under the 2 d clause of
the 7 \& 8 Vict. c. 82 , an was supposed at the time to be sufficient to carry on its busiacss, their amount having since variod with the varying demands for bullion, the sales and purchasen of securities, etc. But it ia sufficient, in illastration of what is now stated, to observe that during the week ending the 4th of November, 1848, notes to the amount of $£ 26,796,660$ had been iesued to the public and the banking departmeat, of which the latter had $88,242,575$ ia its coffers, naking the sum in tho hands of the publlc $£ 18,684,085$. And as it is sometimes suppneed that the banking department might issue this sum of $\mathbf{£ 8 , 2 : 1 2 , 5 7 5}$, or the spare noten at any time in its coffers, in the discount of bills, or any other way, it is concluded that there is still room for some, though but little, derangement of the carrency from mistaken proceedings on the part of the Bank; and this, no doult, may be sometimes true, at least to nome extent. But it is idle to auppose that the banking ciepartment could carry on husiness wlthout a large reserve of notes or of coin. This department may have, owing to a veriety of circumstances, to meet a drain for deposits; and as it is very unsafe to trust to the sale of serurities in periods of discredit, a very considerable supply of notes or of bullion, or of both, can never be advantagcoualy or asfely dispensed with.

This showe the little weight to be attached to the statements of those who contend that the late messure has Isid no real restraint on the issned of the Bank, because, say they, she has a large reserve of unissuod notes which she might legitimately throw on the market. But in truth and reality she can do nothing of the cort. A reserve is indispensable, not oniy to her safety, but to her ability to cany on banking business; and it is at present (November, 1848) sufficientiy narrow. More vigilance and caution are now required on the part of the bank directors than formerly ; for otherwise the banking department of the Benk may be reduced to the greatest difficulties, witheut its belng possible for it to obtain any assistance from tho issue department, how able soever the latter mirht be to reader it. This was atrikingly eviaced in the autuma of 1847 ; and nothing but the exercise of a proper degree of forcsight and caution can prevent its recurrence. No gold can now be obtained from the issue department except in exchange for notes; nor can the latter be obtained from it except in exchango for gold. Hence it is no longer, as formerly, in the power of the Bank to create paper money at pleasure to suppiy the place of cash in eny emergency in which she may be involved; and instead of less she requires to act with more circumspection under the new system than under the oid.

But though the check on the overissue of bank-notes be thus neariy effectual, it appears ratior singuiar that no check should be established on the issue of bank post-bilis, which amounted to $£ 1,048,508$ on the 4 th November, 1848 , and which are and may be substituted for notes. No doubt, however, were tho Bank (which is hardly to be imagined) to abuse tho privilege of issuing post-bilis, by making advances in them wisich ohe could not have made in notes, mensures would be taken to prevent the abuse; and perhaps, on the whole, it was as well to pestpone devising means for the prevention of what seems so unlikely to occur. Weekly returne are now published of the issues of the Bank, and of the securities, bulion, etc., in her possession. The sum to be deducted by the Bank from the charge on account of the management of the nstional debt is in future to be $£ 180,000$ instead of $£ 120,000$ a year, as fixed by the act $3 \& 4$ Wiil. 4, c. 98. The charter is to be continued till twolve months' notice sfter the ist of August, 1855. The provisions made in this act for restraining the country circulation were, perhaps, still more important. The maximum future issue of the joint-stock and other banks in England and Walce was limited to the average amount of the cireulation
of each during the twelve months preceding the 27th of April, 1844. It was farther enacted that no new bank shall be eatablished for the issue of notes, and that the names of the partners in joint-stock and other banks shall be periodically published. The regulations in the statutes relating to lanking in Scotland end Ireland are nearly similar. The maximum amount of notes to be issued by the banks of both countries is, in time to come, net to exceed the average amount which each hank had in circulation during the twelve montha ending the 1st of May, 1846. Certain returns, including among othera the amount of gold and sifver coln held by the banks, the names of the partnora, etc., are to be poriodically published. The small-note currency of Scotland has not been affected by the measure.

It is impossible to doubt that these regulationa interpose a formidable obstacle to overissue; and that, consequently they discourage overtrading, and tend to reduce boti. the number and the violence of those commercial revnlaions and changes in the value of money, that have always been, and must necessarily continue to be, productive of the greateat mischief. No one ever pretended to say that these or any other measures which could be adopted with respect to the currency would wholly prevent unsafa speculation and overtrading. These may originate in an endless variety of circumstances; but in times past the tendency to speculation and gambling, when once set on foet, was in most cascs powerfully stimulated by ine facility which banks then posseased of issuing additional quantitles of paper; and of that facility they are now all hut deprived. It is, perhaps, true that the fair and legitimate influence of the acte now referred to may be in some degree countervailed by the circulation, to a greater extent than formerly, of bills and other sorts of paper not payable on demand, but at ahort datea; and it is not nprobable that sooner or later the question may a se whether any regulations should be adopted in reg.rd to the issue of such paper. In so far, however, as respects the issue of paper money, or notes payable on demand, the regulations in the act of 1844 appear to have left littlo to be desired. Ne doubt, also, numbers of the private and other banks thet now lasue netes will from time to time wind up their affairs ; and as no new banks of isaue can be eatablished in their stead, the vacuum caused by the withdrawal of their notes will be supplied by those of the Bank of England; so that a gradual progress will be made toward the desirable consummation of having only one bank of isauc.

It is sometimes contended, by those opposed to the policy of limiting the issues, that they never can be in excess so long as they are payable on demand. Such, however, is not the case: netes payablo, and really paid, on ucmand, can not, it is true, fall below the value of specie in the country in which they are issued; but the check of payment in specie does not, in fact, begin to operato till their overisaue has depreciated the value of the whole currency, gold as well as paper, in such ceuntry, below its level in the surrounding countries, and till, consequently, the exchange becomes nnfavorable, and it is of advantage to export gold. Then, of course, the overiasne is atopped, but such stoppage is almost always accompanied by a great deal of public distress and inconvenience; while it by no means necessarily follows that any considerable portion of the lose thence srising will fall on those banks by whose misconduct or overiasue the fall in the exchange and the demand for bullion may have heen occasioned.

The measures adopted in 1844, theugh they deeply affected many powerful privato interests, were, as siready etated, passed with littie difficulty, and were very generally approved of. In this reapect, however, the public opinfon has, to aome extent, changed; and the act of 1844 has been charged with having aggravated the pressure experionced by the mercantile world in 1847. But we are satiafied that there is $n$ r. Mal room or ground for any auch imputation. The cisus
of 1847 was a consequence partly of the railway mania of the previous year, and partly of the failure of the potato crope of 1845 and 1846. The failure in the latter year deprived fally two-thirds of the people of Ireland, and a considerable portion, elso, of those of Great Britain, of 'heir accustomed supplies of food. In conseqnence of this deticiency, and of government having come forward to provido the means for its rellef, there was on unprecedented importation of all sorts of corn ; and the demand for bullion for expertation to meet this importation, occurring simultaneously with e vast railway expenditure, pecuniary accommodations were obtained with the greatest difficulty, and the rate of interest rose to an extrtordinary height. Insterd. however, of being increased by the act of 1844, .. 6 is abundantly certaln that the operation of the latter contributed to alleviate the aeverity of the crisis. The restraints it impesed on the lasues of the country banks had hindered them from embarking to any great oxtent in rallwey adventures, so that they were better ahle to assist their customers ; and it also prevented the Bank of England from attempting to meet the exigencles of the case, otherwise than by raiaing the rate of interest and restricting her issues. And besides being the natural and proper, these were, in fact, the only means by which the ralue of bullion could be raised, its demand for foreign remittance checked, and the exchange turned in favor of England. $\Lambda$ great many mercantile houses that had bean trading upon very Inaufficient capitala, or which had previ usly been virtually insolvent, werc, of course, swept off during the crisia ; and the alarm that was thereby ocasioned, though for the mest part witheut any good foundation, gave rise to a species of panic. During the prevalence of the latter, government consented (25th October, 1847) to a temporary suspension of the act of 1844; but there is now, we believe, little doubt that this was an unwise proceeding. When it took place the violenco of the crisis had ahated. The drain for gold for exportation had not only ceased, but had begun to react ; and the probsbility is, that in a very few days all alarm would have passed off, without the dangerous precedent which was set by the interference of ministers. Hence, in our view of the matter, the experience afforded by the crisis of 1847 tella strongly in favor of the act of 1844 . But for its influence, it is most prot ' 'e that the Bank would have attempted to meet the demand for bullion without raising the rate of Interest, at least to the extent to which ahe did raise It; and if so, she shouid have been exposed to the jmminent risk of a suspension of cash payments. If, therefere, the act of 1844 should be aubjected to any modifications, it is to be hoped that they may be auch as may tend to carry out and strengthen the principles on which it is founded.
Previoualy to the late changea, the Bank directors endeavored, as a general rule, to have as much coin and bullion in their coffers as might together amount, when the exchange was at par, to a third part of the Bank's liabilities, including c'eposits as well as issues; so that, in the event of the notes afleat, and the public and private deposits in the coftiera of the Bank, amounting to $£ 27,000,000$ or $£ 30,000,000$, they did not consider the establishment in a perfectly satisfactory state, unless she was, generally speaking, pesseased of about $£ 9,000,000$ or $£ 10,000,000$ of coin and bullion. The issues of the Bank were then wholly governed, at least in ordinary cases, by what Mr. Horsiey Palmer ev presively calied "the action of the public;" that is, they were increased during a favorsble exchange, or when bullion was sent to the Bank to be exchanged for notes; and diminished during an unfavorable exchenge, or when notes were sent to the bank to be paid. But the vice of the old system was that this rule was net strictly enforced, and that the directors were every now and then compelled to relax it. But under the present aystem such relaxation is practicablo only to a very
limited oxtent, and can be but littlo abasea, which for- |are rogulated completely diapro es sncis suatemental murly was not alwaye the case. It is frequently sald that tha value of money, and consequeatly that the price of all aorts of property, depende on the fiat of the Baak, by which it is capriciously elevated at one time and depressed at another. But the account previously givan of the mocis in which tha lssues of the Bank and independently of this, every we who knows that the Bank must pay her notes in cosn whea presented, and that coin may be at all times obtained from the Mint withont any charge, in exchanga for bullion, muat kaow that the very nupposition of their being true involves a contradiotion.

Connection with Government ond the Public.-The to entor into competition with private bankers in the Bank of England conducts the whole banking businees of the Brilish government. "It aets not only," saya Dr. Strith "as an ordinary bank, but as a great eugine of state. It recelves and pays the greater part of the annuitles which are due to the creditors of the public; it circulates Exehequer bills ; and il advancos to government the annual amount of the land ond malt taxes, which are frequently not paid till some years thereafter."

Adrances by the Bank in Discornts, etc.-The greater part of the paper of the Bank has generally been issued in the way of alvances or loans to government, upon sccurity of certain branches of the reveaue, and In the purchase of Exchequer bille and bullion; but her issues through the medium of discounts to individuals have, notwithstanding, been at all times considerable, while during war, and in periods of distress, they have been occasionally very great. Generally speaking, however, the directors do not thiak it advisablo
transacting of ordinary banking business, or in the discounting of mercaatile paper. Mr. Horsley Painuer is decidedly of opinion that all banklog businesa, apart from the lssue of notes, is better transacted by private bankers than by public bodies.-Min. of Evidence, Report of 1832, p. 37. He also thinks that were the Bank. to come fairly into competition at all times with the private bankers and other indlviduals in discounting, it would be very apt to lead, every now and then, to an excess of the currency, and a fall of the exchange, producing fluctuations that could not fail to be injurijus. At preeent, thesefore, and generally since the peace, the rate of interest charged by the Bauk for loans has been somewhet above the market rate. The consequence is, that, in ordiary periods, very few applications are made to her for discounts. But, at the same time, every one who has any reasonable security to offer, knows where they may slways be had; while the rate of interest charged by the Bank
necessarily forms a maximum rato which no other establishment can exceed. When, however, any cireumstances occur to occasion a pressure in the money market, or a difficulty of obtalning accommodationa in the usual channels, the market rate of interest immediately rises to the rate fixed by the Bank; and on auch occasions the private hankers, and the publie generally, resort to the Bank for aid. She then becomes, as it were, a bank of support; and has, as such, on many trying nccasions, particularly in 1798, 1815 and 1816, 1825-20, and 1838, rendered essential service to public credit, and to the commercial interests of the country. The usual limited amount of the Bank's disconnts does not, therefors, proceed, as has been absurdly enough stated, from any indiaposition on the part of the directors to render every assistance in their power to the commercial classes, but is, in fact, the effect of such disposition. They conaider, and wa believe juatly, that, except under peculiar circumstances, the business of discounting and banking fas best conducted by private partics ; and that by abstaining from coming into competition with them they are better able to act as a bank of support in ecasons of distress and difficulty. This is not to neglect the interests of the mercantile ciassea, but to promote them in the best ' ad most efflcient manner, oven though it should be at the expense of the Bank.

At the same time, however, it mast be admitted that the interference of the Bank in asaisting the commercial interest is a matter that requires the greatest conp:deration, and that it can only be safely undertsken under very peculiar circumstances. It shouid always be borne in mind that however a drain for gold may originate, the fact of its existence ia of itself a conclusive proof that gold is more valuable abroad than at home, and consequentiy that the currency is redundant, and ought to be diminished. Under such circumstances, it is the imperative duty of the directors, in order to provide for the safety of the Bank, to prevent the vscuum caused by the exchange of bullion for notes from being again filled up by the issue of fresh notes. This may be done in various ways; but the best and surest way is by raising the rate of discount so as to lessen the number of applicants for loans.-See Post. It is at such periods, however, that the applications for assistance aro the most urgent; and it is exceedingly difficult to yicld to them, and at the same time to enforce that systematical and continuous reduction of the issucs that is now indispensable to reduce the currency to its proper Jevel, and to restore the exchange to par. Unquestionably the Bank allowed the stock of bullion in her coffers to be reduced in 1839 a great deal too low. And though, perhaps, as things turned out, less hardship was, in the end, inflicted on individuale than if the directors had adhered more to the stern path of duty, atill it is extremeiy hazsrdous to trust in mattere of such vast importance to the chapter of accidents; and we incline to think that in this, as in most other cases, the safest plan, or the systemstic reduction of the issues whenever the exchange becomes unfavorabic, is that also which, speaking gencrally, is most advaniageous to all ciasses. And this, as already seen, is now ail but imperativo on the Bank.

In 1839, and we believe, also, on a previous oceasion, the Bank negotiated credits abroad, and endeavored to restore tho exchange to par by selling bills on the Continent. The policy of this device gave rise to a good deal of discuseion at tise time; but in the particular cases at appears to us to have been most judicious; and we incine, also, to think that under the old system the same course might and should have been fellowed on various occasions. This device is now less necessary ; but we may still easily conceive occasiona when it might be advantageous. What merchants want during an adverse exchange is good forcign bills, it being only in default of auch that they export builion; and the Bank, by supplying them
W. . a such bills, and getting, of course, her nates in exchange, is able to diminish her isaues quite at effectually as if her notee were sent in for bulliun. Another advantage of this plan is, that no one knows when it is in operation, and, consequentiy, that'it goes far to obviate that internal discredit and alarm that are apt to be produced when the stock of bullion in the Bank is reduced annaualiy low. In fact, had the Bank not acted, in part at least, on this plan in 1839, the probability is that she must have suspended payments. No doubt the Bank would be sxposed, if she adopted this plan, to the contingency of losing by her foreign accuritics in the event of the breaking out of hostlifties, or of the occurrence of any event by which their valuo might be reduced. These events may, however, be in genaral foreseen and provided againat; and if the Bank's investments were jadiciously made, nut in one only, lut in several qusrters, the risk they would involve does not appear to be at all equivalent to the advantage. Perhaps, as the law now stands, there may be legal objections to the Bank's holding foreign securities; but if it be expedient that she should do so, the law might be easily altered. The amount of the discounts of private paper at the Bank and her hranches varies, as already seen, greatiy in different periods; and depends, indeed, wholly on contingent and acci dental circumstances. Thus, on the 13t of January, 1839, the bilis discounted in London amounted to only £ 596,000 , whereas on the 3 d of December of the stme year they amounted to $£ 3,026,000$. Then annuai average loss by bad delbts on the diecounts of the Bank of England in London, from 1791 to 1831, both lisinsive, was £31,698.-Appendix to Rep. on Bank Charter; No. 60.

Advances to Government.-These are madc on account of the produce of taxes not yet received, and on the security of the Exchequer bills, etc. They varied, from 1792 down to 1810 , from about $£ 10,000,000$ to sbout $£ 16,000,000$. During the remainder of the war, and down to 1826, they were a good deal larger; but in 1819 provislon was made for reducing the amount of theas advances ; and they do not at present, e:zcluding the permanent advance on account of the dead weight, exceed a fourth part of their amount in 1820. They are represented by the Exchequer bills and deficiency bilis in the hands of the Bank.

Balances of Public Money.-In point of fact, however, a very large part of these advances has been nominal only, or has been virtually canceled by the balances of public money in the hands of the Bank. Thus, from 1806 to 1810 , both inclusive, the average advances to government amounted to $£ 14,492,970$. But the average halance of public moncy in possession of the Bank during the same period amounted to about $£ 11,000,000$; so that the real sdvance was equal only to the difference between these two sums, or to about $£ 8,500,000$. This statement completely negatives, as Mr. Tooke has justly stated, the supposition so commonly entertained and reasoned upon as a point beyond doubt, that the Bank was rendered, by the restriction, a mere engine in the hand of government for facilitating its financial operations.-First Letter to Lord Grencille, p. 64. The Bank being enabled to employ the greater part of the balances of public money in her hands as capital, they have formed one of the main sources of the profit she has derived from her transactions with the public. This subject was brought very prominently forward in the Second Report of the Committee of the House of Commone on Public Expenditure in 1807. And it was agreed in the same ycar that $t^{\circ}$ a Bank should, in consideration of the advan iges derived from the pnbilic balances, continue the loan of $£ 3,000,000$ made to government in 1800 for 6 years without interest, on the same terms, till 6 months after the signature of a definitive treaty of peace. In 1816 this sum was finally incorporated with the debt dae by government to the Bank, at an interest of 3 per cent.

## BAN

Management of Publio Debs.-P Previously to 1788, the Bank received an allowance on this account; that is, for tronble In payiag the dividends, auperintending the transfor of stock, eto., of $\mathcal{L 5 6 2}$ 10s. a million. In 1786 this allewance was reducod to $£ 450 \mathrm{a}$ million, the Bank being, at the eame clme, entitled to a considerable allowance for her trouble in receiving a ntributions on leans, lotterics, etc. This, however, though long regarded as a very improvident arrangement on the part of the public, was acquiesced in tlll 1808, when tho allowance on account of management was reduced to $£ 310$ per million on $£ 300,000,000$ of the public debt, and to $£ 300$ per million on all that it exceeded that sum, exclusive of eeme separate sllowances for annuitles, etc. The impression, however, was still entertained that the allowances for management should be further reduced. In consequence, the act 8 \& 4 Will. $4, \mathrm{c} .98$, directed that $\boldsymbol{£ 1 2 0 , 0 0 0}$ a year should be deducted from their amount; and the late act, the 7 \& 8 Vict. c. 32, directs that this deduction shall be increased to $£ 180,000$. During the year euding the 5 th of January, 1846, the Bank received $\mathbf{£ 9 3 , 1 1 1} \mathbf{1 9 s}$. 10d. For the management of the public debt and annuities. It should be observed that the responsibility and expenae Incurred by tho Bank in managing the public delot are very great. The temptation to the commiasion of frond in tranaferring atock from one Indivilual to another, and in the psyment of the divilends, is well knowa; and notwithstanding the skillfully doviset system of chocks adopted by the Bank for its prevention, she has frequently sustained very great lossea by forgery and otherwise.

In 1803 the Bank lost, through a fraud committed by one of her principal cashiers, Mr. Astlett, no less than 534,000 ; and tho forgeries of Fauntleroy the banker cost her a still isrger aum. At an average of the ten years .nding with 1831 , the Bank loat, through forgeries on the public funds, $£ 40,204$ a year.-Report on Pank Charter, Append., p. 165. Tho total sums p.id by the publio to the Bank on account of the loans raised, Exchequer bills funded, transfer of $8 \mathbf{i}$ per cent. stock, etc., from 1793 to 1820, both included, amounted to $\mathcal{L 4 2 6 , 7 9 5} 1 \mathrm{~s}$. 11 d. - Parliamentary Paper, No. 81, Sess. 1822.
Dead Weight.-Beaidea the transsctlons alluded to, the Dank entered, on the 20th of March, 1823, into an engagement with govornment with respect to the public pensions and annuities, or, as they have been more commonly termed, the read weeight. At the end of the war, the naval and milit. ry pensions, supersmuated alluwances, etc., amounted to abovo $£ 5,000,000$ a year. They would, of course, have been gradually lessened and ullimately ertinguished by the death of the parties. But it was resolved in 1822 to attempt to spread the burden equally over the whole period of forty-five years, during which it was calculated the annuitiea would continue to decreaso. To offect this purpose, it was supposed that, upou government offering to psy $£ 2,800,000$ a year for forty-five years, capltalists would be found who would undertake to pay the entire annuitles, according to a graduated scale previously determined upon, making the first year a payment of f4,900,000, and gradualiy decreasing the payments until the forty-fifth and laat year, when they were to arreunt to enly $£ 300,000$. This supposition was net, however, realized. No capitalists were found willing to enter into such distent engagoments. But in 1823 the llank agreed, on condition of receiving an annuity of $£ 585,470$ for forty-four years, cemmencing on the Sth of April, 1823, to pay, on account of the pensiene, etc., at diffirent sf ified poriods botween the years 1823 and 1828, both laclusive, the sum of $\mathcal{L 1 3 , 0 8 9 , 4 1 9 . ~}$ -4 Geo. 4, c. 22.
Rate of Diccount.-The Bank discounted private bills at 5 per cent. during neariy the whole period from her establishment till 1824, when the rate was reduced to 4 per cent.

When the currency happens, from any cause, to become redunilant, its contraction, always $n$ matter of some difficulty, is to be ettected only (If she hold no foreign securitiee) by tho smlo of bullion or publio securies by the Bank, or by a diminution of the uaual diacounts, or botb. But were tho Bank to throw any considerable amount of publie securitics upen the market, the circumstance would be apt to excite alarm; and, even though it did not, it would be difflcult to diepess of them without a heavy loss. Hence, when a reduction is determined upon, it is moat commonly effected, in part at lenst, by a contraction of discounts; and lt is phain that such contraction can not be made except by rejecting altogether some of the bilis sent in for discount, or, which is in effect the same thing, by shortening their dates, or by raiaing the rate of interest, so that fewer may be sent in. Of these methods, the last scems to be in every respect the most expedient. When bills are rejec'al for no other renson than that the currency may be centracted, the grentest injury is done to individuals, who, entertaining ne doubt of getting their usual accommodation from the Bank, may have entered into transactions which they sre thus doprived of tho means of completing. When the reduction is made by raiaing the rate of Intereat, it principally affects those who are best able to bear it; at the same time that its operstion, instead of being, like the rejection of bills, arbitrary and eapricions, is uniform and impsertial. It does, thurefere, scem that the Bank should seldom or
never throw ont good bills that she may cünธizist her isaues; but that, when she has resolved upon such a measure, she should, provided the contraction can not be made by the sale of bullion and publlo securities, raise the rate of discount so as to lessen the demands upon her for loans.

Previously to 1759, the Bank of England issued no notes for less than $£ 20$. She began to issue $£ 10$ notes in $1759 ; £ 5$ notes in 1793; and $£ 1$ and $£ 2$ notes in March, 1797. The issue of the latter may be aaid to have ceased in 1821, though they were again issuad on the emergency in 1825.

Interest on Deposits. -The Bank of England does not allow, cither in London or at lier branches, any interest on deposite; but it would be excecdingly desirable if sle could srifely make some alteration in this respect. The want of the power readily to inveat amall aums prodactively, and at the asme time with perfect aecurity, tende to weaken the motives to save and accumulate. Nothing has contributed more to diffuse a apirit of economy, and n desire to save, among all clesses of the population of Scotland, than the readiness with which deposita of small anms are received by banks of undousted solidity in that part of the country, and the allowance of intereat upon them. - Sea Scorcit Banks. Thia advantage is now, however, in aome degree accured in Eagland, not only by the inatitution of savings banks, but by the joint-stock banks that have been opened in moat parts of the country. Tho receiving of deposits is, indeed, an essential part of tho proper businese of a bank. "A banker is a dcaler in capital, an intermediate party between the borrower and the lender. He borrows of one party and lends to another; and the difference between the tarms at which he borrowa and those at which ho londs is the eource of his profit. By this meana he drawa into active operation thoes emall aums of monoy which were previousiy unproductive in the hands of private individuals, and at the same time furnishes accommodation to another class, who have occasion for additional capital to carry on their commercial traneactiona."-See Gile datr's Practical Observations on Banking, p. 52.

In further corroboration of what has now been stated, it may be mentioned that it is estimated by the best anthoritles that the doposits in the Scotch benke may omount at present (1846) to about $£ 80,000,000$, of which mere than a helf consists of sums of from $£ 10$ to $£ 200$ ! This is a most aatisfactory proof of the veat importance of the system. Perhaps it ia not going too far to affirm that but for the recoiving of deposits by the banke, and the ailowing of interest upon them, not a third part of the sums under £200, and not a half of those above it, would cver have been accumulated. - Sea Scotch Banks. Wo are not, however, able to say whether the Bank of England could offer interest on deposita Without having ao iargo a aum forced upon her aa might In periods of distrust scriously ondanger her atability.

And it were better that the aystem ahould continue aa at preaent, than that any riol of this sort should be incurred. Since 1826, the private deposito in the handa of tha Bank have been greatly augmented. Their incraase ia mainly ascribable to the preceding panic, and the loss that was theu occasioned by the failure of private banka.

Method of conducting Business at the Bank.-All accounts kept at the Bank with individuals are termed drawing accounts; those with whom they are opened being entitied to draw cheeka upon them, and to send the bills and drafts in their favor to be presented by the Bank, exactly as if thay dealt with privata bankers. There is no fixed aum with which an individual must open a drawing account; nor is there any fixed sum which the Bank requires him to keep at hia credit to indemnify her for her trouble in anawering his drafta, etc. Mr. Horsley Palmer gave in his avidence, in 1832, the following atatement $e 8$ to the facilities granted by the Bank in drawing accounts since 1825 : 1. The Bank receives dividenda by power of attornay for all persons having drawing accounts at the Bank. 2. Dividend warranta are received at the drawing office for ditto. 3. Exchequer billa and other securitiea are received for ditto; tha bills exchanged, the laterest raceived, and the amount carried to their reapective accounts. 4. Checka may be drawn for $£ 5$ and upward, instead of $£ 10$, as heretofore. 5. Carh-boxes taken in, contents unknown, for auch partiea as keap accounts at the Bank. 6. Bank-notea are paid at the counter, instead of drawing ticketa for them on the pay clerks, as haretofore. 7. Checks on city bankers paid in by threa o'clock may be drawn for between four and five; and those paid in before four will be received and passed to account the same evaning. 8. Checks paid in after four are sent out at nine o'clock the foliowing morning, reccived and passed to account, and may be drawn for as soon as received. 9. Dividend warrants taken in at the drawing office until five in the afternoon, inetead of three as heretofore. 10. Credita paid in to acceunt are received without the bank-book, and are afterward entered therein without the party claiming them. 11. Bills of exchange accepted payable at the Bank are payable with or without advice; heretofore with advice only. 12. Notes of country bankers payable in London are sent ont the same day for payment. 18. Checks are given out in books, and not in aheets "s heretofore.

A person having a drawing account may have a discounl account; but no person can have the latter without, at the eame time, having the former. When a diacount account la opened, the signatures of the partiea are entered in a hook kopt for the purpose, and powors of attorncy are granted, empowering the parsons named in tham to act for their principals. No bill of exchange drawn in the country is discounted by the Bank in London under $£ 20$, nor London note under $£ 100$, nor for a longer date, under existing regulationa, than three months. The number of holidays formeriy kept at the Bank has recentiy been reduced about a haif, in the view, as stated by the directore, of preventing the interruption of business. There aro no holldays in the months of March, June, September, and December, exeepting Chriatmea; Eastor Monday and Tuesday are no longer kept.

We subjoin an account of the days for transferring atock, and when the dividends aro due at the Bank of England, the South Sea Houre, and the East India Houee:

Branch Banke of the Bank of England.-The Bank of England, as already observed, has within these few years established branch banks at several of the most considerabie towns throughout the country. The mode and terms of conducting basiness at these establishments have been described as follows: "The branch bank at Swansea (and the aamo is true of those eatablished in other places) ia to be a secure place of deposit for persons baving occasion to make use of a bsik for that parpose; such persons are sald to have drawing accounts: to facilitate to tha mercantlie and trading classes the obtalaing discounts of good and unexceptlonabie billa, founded upon real transactions, two approved namee beling required upon every blll or note diecounted; these are cailed discount accounts. The appilications of partlea who desire to open discount accounth at the branch are forwarded to the parent establishment for approval, and an answer is generally received $\ln$ about ten daya. When approved, good billa may be discounted at the branch withont reference to London. Bllla payable at Swangea, London, or any other place where a branch is cetablithed, are discounted under this regulation. The dividends on any of the public fuads, which aro payable at tho Bank of England, may he received at the branch, by parsons who have opened 'drawing accounte,' after aign!ng powers of attorncy for that purpose, whic' tho branch will procure from London. No charge is made in thls caso, except the expense of the power of attorney and the postages incurred in transmitting it. Purchases and sales of every descriptlon of government securities nre effected by the branch at a charge corresponding to that made by the local bankers where the branch is situated. A commission, including brokerage in London, and all expenses of postage, ls charged on paying at the Bank of England bills accepted by persona having drawing aecounts at Swansea, such bills to be advised by the branch; also for grantling letters of credit on London, or on the other branches. The branch grants bills on London, payable at acven days' date, without ncceptance, for sums of $£ 10$ and upward. Persons having drawing accounts at Swansea may order money to be paid at the Bank in London to thoir eredit at Swansea, and rice versi, at a charge of $6 d$. In lieu of pestage. The branch may be called upon to change any notes issued and dated at Swansea; but they do not change the notes of the Bank in London, nor receive them in payment, unleis as a matier of courtesy where the parties are known. Dank post-bills, which are accepted and due, are recoived at the branch from parties having drawing accounts, and taken to account without any clarge for poatage; but unaccepted bank post-bills, which must be sent to London, are sulject
to tha charge of postage, and taken to account when due. No interest lo allowed on deposits. No advance Is made by the branch upon any description of landed or other property, nor is any acconnt allowed to be overdrawn. The notes are the aame as those issued by the pareat establishmeat, except being dated Swansea, and made payable there and in London. No note lsaned exceeds the sum of $£ 500$, and nona are for a leas amount than $£ 5$."

Bank-notes to be legal Tender, except at the Bank and Branch Banks.--From and after the 1st of August, 1834, unless and until Parliament shall otherwise dlrect, a tender of a note or notes of the Governor and Company of the Bank of England, expreseed to be payable to bearer on demand, ahall be a legal tender to the amonnt expressed in auch note or notes, and shall be taken to be valid as a tender to ouch amount for all aums above $\mathbf{5 5}$ ou all occasions on which any tender of moncy may be legaily made, so long as tha Bank of England ehall continue to pay on demend their said notes in legal coin : provided always, that no such note or notes shall be deemed a legal tender of payment by the Governer and Company of the Bank of England, or any branch baak of the eaid governor and company; but the sald governor and company are not to becomo liable or be required to pay and satisfy, at any branch bauk of the said gevernor and company, any note or notes of the sald governor and company not mado specialiy payablo at such branch bank; but the said governor and company shail be liable to pay and satiafy at the Bank of Eagland in London all notes of the said governor and company, or of any branch thereof. $-\$ 6$.

## BAN

11I. English Pnivate and Provinclal Banks. -Bealdes charging the nsual rate of interest on bllls discounted, the provinclal bankers are mostly in the habit of charging 5s. or 6s. per cent. as commission. They aiso charge a commission on ail payments, and derive a profit from ehurges for the transmisslon of money, etc. They usuully allow from 2 to 3 per cent. on money deposited; lut the numerous failures that havo taken place among them have, by generating a feeling of insecurity in the minds of the depositors, conlined this branch of their business withln comparatively narrow limits. When their customers overdraw their accounts, they are charged with interest at the rate of 5 per cent. Country baaks, established by individuals possessed of adequate funds, and managed with due discretion, are productive of the grentest service. They form commodions reservoirs, where the flonting and unemployed enpital of the surrounding districts is collected, and fror which it is agnin distributed, by way of leun, to thosa who will employ it to the best advantage. It is, therefore, of the utmost importance, iu a public point of view, that these establlshments should be based upon solid foundntions. But In England, unfortuantely, this, till recently, has beeu but little attended to; and the destruction of country bunks has, npon threo different occasions-in 1792, in 1814, 1815, and 1816, and in 1825 and 1826produced an extent of bankruptey and misery that has never, perhaps, been equaled, except by the breaking up of the Mississippi scheme in France. Government is tound to interfere to hinder such disnstrous results, and we have alrealy glven some necount of the mensures adopted in this view.

The following is an account of the number of commisslons of bankruptey lssued against country hankers in England from 1809 to 1830 , both hnclusive:

| Vears. | Comatisatos. | Years. | Commixalons. |
| :---: | :---: | :---: | :---: |
| 1510 | 4 | $1 \times 20$ | 4 |
| 1510 | 20 | 1821 | 10 |
| 1811 | 4 | 1522 | 9 |
| 1812 | 11 | 1823 | 9 |
| 1813 | 8 | $18 \% 4$ | 10 |
| 1814 | 27 | 15:6 | 37 |
| 1815 | 25 | 1826 | 43 |
| 1816 | 87 | 1827 | 8 |
| 1817 | 3 | 18.8 | 8 |
| 1818 | 3 | 1829 | 3 |
| 1819 | 13 | 1830 | 14 |

Exelusive of the alove, many lanks stopped payments, to tho grent injury of their creditors and the publie, that afterward resumed them; at the same thme thint the affairs of somo bankrupt concerns were arranged without a commisalon. During the whole of this period not a single Scotch bank gave way.

Besides the stamp dutles payuble on notes, each individual or compuny issuing them must take out a license, renewable annually, which costs $£ 30$. This lleense speclies the numes and plnees of abode of the body corporate, person or persons in the firm to whom it ls grantell, the nume of sueh firm, the place where the buslness is earried on, etc. ; and a separate license is to be taken out for every town or place where any notes shall be issued by or on necount of nay banker, ctc. Unless the license granted to persons in partnership set forth the names and places of nhode of inl persons concerned in the partnership, whether their names nppenr on tho notes issued by them or not, such license shall te ntiselutely void.-55 Geo. 3, c. 184, 8. 24. For the regulations an to the lasue of unstrmped notes, see ante, $p$. 60 . The issue of notes $f$ : less than $£ 5$ wns prohibited in England, ns prev.ously shown, from 1777 to 1797 ; but they continued to le lsaued from the latter period down to the 5 th of $A$ pril, 1829, when their further issue censed, in consequence of an act passed in 1826. This net dhl net extend to Scotland or Ireland, and was Intended to give grenter stabiliity to the syatem of country bunking lo England, by shutting up one of the prinelpal channels through which
the inferior class of bankers had heen in the hablt of getting their notes into circulation. The joint-stock banks estublished in different parts of England and Wales, undor the provisions of the act 7 Geo. 4, c. 46, authorizing their estublishment, consist of bodies of partners, varying from seven, the miaimum, to any greater number. Each partner holds one or moro shares of the company's stock, and is individunlly liable for the entire debts and engagements of the company; so that a person helding a $£ 50$ or $£ 100$ shnre in a joint-stock bank may, in the event of its becoming bankrupt, he called upon to mako payment of as many thousands of pounds! They are unlformly almost managed by boards of directors appointed by, and generally responsible to, the body of shareliolders. The conditions of copartnery vary materially in different assochations; but the alove are distlinguishing features common to them all. The shares in many jolnt-stock banks are very smull, few being above $£ 100$, the greater number not exceeding $£ 50$, whlle many ure only $£ 25$, and some not more than $£ 10$, and even $£ 5$ ! Generally, too, it is understood, or rather it is distinctly set forth in the prospectus, that not more than five, ten, or twenty per cent, of these shares is to bo called for; so that an indivldual who has ten or twenty shillings to sparo may lecome a shareholder in a bank. And owing to a praetice, or rather a Hagrant nbuse, introduced luto the mangement of various lanks, by which they make large nflvances or discounts on the credit of the stock held by the shareholders, not a few individunls in doubtful or even desperute circumstances take shnrcs in them, in the view of obtaining loans, and bolstering up their credit! The great danger arising from such banks is ubvious; and were one of them to stop payment, it is phin, even though the claims on it should tie ultimately made good, that they could tie so only nt the cost, and perhaps ruin, of sueh of its proprietors as had abstained from the abusive practices resorted to by others. It mny well excite nstonishment, that any one who can renlly afford to make a boni fide purehnse of shares in a lonk should be foolhardy enough to cmbark in sueh concerns.

No doult a joint-stock bank, if it possess adequate capitnl, and be discreetly managed, may afford ample security to its sharcholders nad the public. But there is no foundation for the notion that liecause a bank has 50 or 100 partners, it will therefore be hetter managed than if it had only 5 or 10 . On the contrury, the falr presumption ls that it will not he so well managed. A few wealthy individuals engaged in lanking or any other sort of business, must, if they would protect themselves from ruin, pay unremitting nttention to their concerns, and act in a disereet and cautious manner. But the partners and managers of a great jointstock compuny aet under no such direct nud pressing responsilility. "I think," sahl the highest nuthority on such subjects, "thant joint-stock banks are deficient in every thing requisite for the conduct of lunking business, except extended responsibility; the banking business requires peeullarly persons attentive to all its details, constuntly, dally, und hourly watelfful of every trunaction, much mero than mercantile or tradiug businesses. It also requires Immediate, prompt decisions, upon circumstunces when they arise-in many cases a decision that does not ndmit of delny for consultation; it also requires a diseretion to bo exereised with reference to the special cireumstances of each case. Joint-stock bunks being, of courso, obllged to net through agents, and not by a prineipal, and therefore under the restraint of general rules, cun not he guided lyy so nife a reference to degrees of difference in the character or responsibillty of parties ; ner cun they undertnke to regulate the asslstince to be granted to cencerns under tempornry emburrassment by so necurnte a reference to the cireumstanees, favorable or unfavorable, of each case. "-Ervilence of S. J. Lord, Esq., lefore the Committec of 1832 on the Renewal of the Bank Charter.
he hahlt of joint-atock ngland and Geo. 4, c . t of bodies umm, to any no or more idually liaof the com100 share ln ts becoming of as muny mly almost y, and geulders. The In different ing features joint-stock 0 , the greatay are only
d even $£ 5!$ er it is dis$t$ more than ires is to lie on or twenty er in a liank. rant abuse, 13 banks, ly unts on the r, not a fow circumistanining Joans, danger aris* one of them ho claims on rey could he such of its ive practices ite astonish1 to make a ould be fuol-
ess adequate afford nmple But there o a bank has er managed ary, the fair ranaged. A king or ony uld protect attention to utious mangreat jointnd pressing st nuthority are delicient of busking the banking ve to ull its ful of every radiug busit decisions, many cases reconsultacach case. red to net d therefore the guided nee in the in they united to conto aceurate unfiavoraEsq., lefore $n k$ Charter.

In faet, more than nine-tenths of the partners in joint-stock banks are wholly ignorant of banking busjness, and hnve nothing better to trust to than the supposed honesty and Intelligence of the directors; and, even if they were acquainted with the busineas, the result would be nearly the same, as it would not be possible for any one, by a mere cursory inspection of the books of any bank (if such were permitted), to form nny accurate estimate of its condition, or of the mode in which it transacted business. And hence the directors in these eatablishments are practically all but absolute. If they be worthy of the confidence placed in them, all goes on smoothly; and thls also is the case when they are most unworthy, till they have involved the concern in inextricable difficultles! The history of the Norwlch Bank, of the Northern and Central Bank, the Marylebone Bank, the Manchester Bank, and a host of others, sufficiently atteats the truth of What has now been stated. The responsibility of the directors to the shareholdors has not been found, in any of these instances (and it is, Indeed, ludicrous to suppose that It ever should be otherwise), to have been any check whatever over their frauds and improvidence. The whole paidnop capital of tho Manchester Bank, amounting to about $£ 750,000$, had been wasted in the most improvident speculations, and additional dolits incurred, before the great body of the sharoholders hud the least suspicion that tho compuny was otherwise than prosperous!
We may ohserve, by-the-way, that the misctief oceasioned by an establishment of this sort, when perverted from its proper objects, and mismanaged, is not to he estimated by the ruin it entails on its partners, and probsbly, also, on its customers. It hecomes, in fact, a public nulsance, and entails privations on many who might he supposed to bo beyond the aphere of ita influence. Within the ten yerrs ending with 1842 , we believe it may he moderntely estimated that about $£ 1,500,000$ of hanking capital was wholly dissipated in Manchester noul its inmmediats vieinity. And as nine-tenths of this enormous loss was occasloned by advances mado to manufacturers who had littlo or no eapital of their own, it is not easy to imggine what a ruinons stimulus it must have given to reckless competition, and how very injurious it must have been to parties trading on their own cajital. Indeed, no inconsiderable portion of the distress in Manchester, in 1842 and 1843, may be traced to this source.
Remedial Mfeasures that should be adopted.-The set of $1844,7 \& 8$ Viet. c. 32 , has successfully ohviated some of the defects formerly existling in the joint-stock and private banking system, especially by limiting the extent of their lssues; but in other respeets tho system is still open to scrious ohjections. We rotuin the remarks made upon it in a former edition of M'Culloeh's Dict. of'Commerce, hefore tho net of 1844 wss passed:
"We do not, however, think that it would bo at atl necerssary, in provtding for a secure eystem of joint-stock hanking, to mako any regulatlons with respeet to many of the points notiecd by the committee as to which the law is silent. At present every partner in a jolnt-stock bank is liabic to the public for the whole debts of the firm; nud this may loe truly said to he the anving princijple of the system, and without which it would the an unmixed oril. No Individual should, howover, by merely withdmwing from $n$ Jotnt-atoek coneern, get rid of fins ifatilities in comnection with it. To prevent fraud, sad to Insure due cautlon, these ought to contlaue for a period of three years at least after ho has pubilicly withdrawn hits name. The pulilic, too, nre clenrly entitled to know the partners lin Johnt-stock assoclations; that ta, to be luformed who the indithluals are with whom they are deating, and who are responsilie to them. But, unluckily, no effective mesas uro taken for supplying this necensary Information, or, consequentty, of propetly discriminating between one estabtishmont sud another. The aot of 1833 directed that an account of the places whoe they carry on business, and of the names and realdences of thin partnors, should be quarterly tranamitted to the Stampofflec. But doubts have been entertained as to the correetncess of these niturns, and comparativoly little use has been, or, indeed, can be mude of them. The accounta of the namea and
realdancea of the proprietors are not pablushed, bnt are secluded from the public uye in the reponitortea of Somerset House I It is true that these lista may be seen, by those who choose to apply at the office, for a small fee, and that certlifed coples may be procured nt no great expense. But fow know that auch retorna oxist; and fewor atill have the oppurtunity, or thlak of uvalling themselves of them as sources of taformation. To render them of any real utllity, they ahould be brought under the publto eye, by befng hung up la the offices of the banks to which they refer, and periodically published in tha newapapers of the placea where they carry on bualaess. By this meana the publle would know exactly to whom they had to look, snd would act accordingly. They would not be deceived, as they are Hable to be at present, by supposligg that, because a bank has a number of partaers, some of them must bo opulent and trustworthy. They would know the precise atate of the fict; and if it were seea, from the quarterly returna, that opulent and jatalligent Jadivlduals were withdrawing from a bank, every oue would be put on his guard, and would naturally conctuda that the partles hed very nufficlont reasona for quitting the concern. Thus far pubticity may be made effectual, and would be of the greatest Importance. Nelther is it possible to allege es siaglo plausiblo objection to this proposal. It interfcres to no degree, nor in ony way, with the proceedings of the parties: all that It does is to declare who and what they are; and to this degrea of publlelty no honeat man will ohject." And we are gisd to have to atote that thls is now effected by the act $7 \& 8$ Vict. $c .82,821$. -See ante, p. 84.
"But we have great douhts whetier it be poskible to carry pubhicity farther than thls. The committee state that 'the law docs not provide for any publicatlon of the Hibilities sad assets of these banks, nor does it enforce tha publlcation of any balance-sheet to the proprietors at large;' and it has been proposed to compel the periodical publication of a statement of this sort; hut it ls very questionable whether say anch publlcation would not be a great deal worse than neeless. It is not proposed that commlssloners ehould be appointed to inspect tho accounts of the different banks, and to see that the returns are accurate: thla would be too inquisitorial, too cumbrous, and too costly a plan to be thought of for a moment. There would be nothing for $1 t$, In fact, but to trust entirely to the honor of the parties ! Hence, in all cases in which a djaclosure would be really uacful, the publleation of an account of assets and Ilabilities would afford the means of decelviog the puibltc, and of répresebtling a bankrupt cobcorn as beling in a prosperous condition. Supposing, however, that the parties were, In all instances, perfectly honest, still the publication of a balance-sheet would be good for nothlng. Every ono knows how sangulne people are in retation to their own affalrs, and that debts and obllgations that other partics would hardly reckon worth any thing are estmated by them as if they were so much bullien. But, Independently of this, the futility of the thing is obvious. A bank with a capital of $£ 100,000$ discounts billa and other ohligatlons to the extent, perhaps, of $£ 300,000$ or $£ 400,000$; the fuct that It has alscounted them shows that it belleves these bills and obligationa to be good; and they will, consequontiy, be reckoned among its assels. But should a revulsion take place, or any circumstanee occur to shake eredit, these bills may not be worth $£ 100,000$; und those who have dealt with tho bank, on the hypothesis of its having capital and assets mors than enough to meet all its obligations, may find, to their cost, that it is not possessed of a 日linglo shilling, hut is, on the contrary, some $\mathbf{\Sigma 2 0 0 , 0 0 0}$ or $\mathbf{£} \mathbf{3 0 0 , 0 6 0}$ worse than nothing!
"The committee seem to think that some regulation should be enacted, providiag that a certain portion of its capltal should be pald up before a bank begins buniness. Ilut the better way would be to prohlbit all advertising of nominal capItal. This, in fuct, ts a mere device by which to entrap and delude the pubtic. A bank is abnounced with a capltal of $£ 1,000,000, ~ £ 2,000,000$, or $£ 3,000,000$; and a great number of peoplo, perhaps the majority, Immediatety conetude that thero can be no risk in deatiug with sn establishment possessed of so great an smount of property. But what ls the fuct? The capitat ndvertised ts nominal merely ; not more, perinaps, than a tenth or in fifh part of it has been recelved Inte the coffers of the bink, and wo have nothing better than the statement of the bank proprietors, or thicir agents, that they will pay up the remainder, if necessary; of which necesslty they of courso aro to be the only judges I Practically this is nelther more nor less than a fraud unon the pubilic; It ls a contrivaneo for making $£ 10,000$ pass in the puilio extlmation for $£ 100,000$, and for procuring tho asme degree of cred! to Ita holders. This, bowover, is not all. Whero is the security that, If a greater amount of capttal were reslly required, It would be forthcoming ? The notion that the bulk of the ahareholders in muny, we aro pretty aure we might safoly sey mosh of the joint-atook banka now th existence, could pay np the full

## BAN

mount of their ahares, is too judicrous to deserve notice. We might as well call upos is man worth cs to extinguiah a debt of 2500 .

There can be no doubt, therefore-unless it be meant to aftirm that deception and fatlacious atatements are Indiapensable to the auccess of joint-stock banking sehemes-that atl advertistog of nominal capitals shouid bo pat anend to ; and that no association ahould be allowed to represent ita capital as exceeding the aum actually paid up by the proprietors, Hut though this would obviste one source of fraud and deception, there would still be abondant meuns of practiofig oa the credulity of the pubtle at the disposal of parties facined to use them. Admit that a bank has a capital of $\mathbf{8 5 0 0 , 0 0 0}$ actually recelved into ita coffers, what is to hinder the direetors from lending out the whole of this sum, or even more, to themseives or to partners in the bank i or, supposing them not to do this, who can tell whether the entire capital, or some considerable part of it, be not wholly ingulfed in ruinous apecaiationa? It is indeed alieged, and truly too, that thile couid not happen with any 'respectable' bank; that 'gantlemen of character" would not lend themseives to anch transactional Uniacktly, however, thers are no decisive marks or teats by which the public enn, a priori, say what is or what is not a 'reapectable' bank, or who is or fe not a 'gentleman of character;' and it is not a ilttlo hazardous in such mattera to induige in apeculativo remarks. Ilenco it is that the Marylebona Bank, the Liank of Manchester, and indeed all banks, are :.eid to ba respectable, that is, soivent, till the event prove the centrary ; and thast all gentiemen conneeted with banks are held to be 'mon of eharacter, parsgoas, in fact, of honor, honesty, and intetligenee, till their fraud or ignorance has lavolved hundreda or thousanda in benkruptey and ruin.
"We do not ' 'ato these cireumstances ita order to raise sny pryjudice against joint-atock luntrs or other associations, for they apply equally to banks with ons or a small number of partners; but wo state them to show the folly of plaging any reliance on atatements as to the eapital of any bank, or tho charseter of its managers. Such statements may be cither true or false; but, as the puhlie can not tell which, they are plainiy good for nothing. The oniy real security is to be found, If it exist at ail, in the names of the partuers responsible for the detits and obligations of tho bank. The number of auch part. ners is a very inferior consideration. There ean not, in truth, be a greater error than to suppose that becanse a bank hss a great number of partners, ita sectirity anay be sufely depended upon. A single findividual worth $£ 100,000$ is an ineomparably better security than fifty individuals worth $£ 2000$ cach; and a fundred Individuals worth $£ 1000$ would hardily be any seeurity at alf, at least for a aum of $\mathbf{£ 1 0 , 0 0 0}$ or $\mathbf{£ 2 0 , 0 0 0}$. A private benk with aix may be a safir place of depoait than a joint-stoek banh with eix hunired partners. Every thing depends upon the revilable vealth of those responsible for the debts of the concern; and hence the propriety and justice, whether tho firm consint of one or of many partaers, of publiciy deciaring and apeeifying their names,
"We are decidedly heatile to a proporition we have heard mooted, and which seems to be countenanced by the committes on joint-atock banks, for obliging all banks to eatalitisil a gisrantee fund; that is, for obilging then to aceumulate a portion of their profits as a reserve ntock. Where in the security that anch reserve would be alwayd dedicted from profita $?$ The truth is, that bankright spd frandulent conecrns, and none else, would gain by buch n regulation; inasmuch as it would enaHe them, by oppearing to be prosjuerank, the better to deceive the publie, and to blind them to the reni nate of their affairs, It is worse than absurd to induce the puhife to depend on guarantees that can not be enforced, nul which, consequently, mitst the good for nothing. The knowledge of whom tho partners in banks really consift, and timir unlimited reaponsibility, ary the only securitics that, , leasking genersily, are wortin a pinch of amuf. If theso can not jurotect the pullic from fraud or loss, nothing else will: and the question will eome to lie, mot whether the nysten should be reformed, but whether it should be alsated an an incurable nuisance. On this ground, aiso, wo mhould be disjosed to dimsent from any attempt to prevent, ty legislative enactment, the makiog of loans upon the eredit of lank stock. We do not queation the advantage of anch a reguiation, provided it were honestly earried inta effect. Ifut it in areless to may that, whenever the partica were disposed to defiat such in rigulation, it woad ine quito inoperative.
"Some of the joint-atock banka have nu extmorilnary number of firsucies; and the multipilication of these subordinate extabliamments all over the country ia not one of tho ieast striking fentures of tho system. Nelther is it very dificult to discover why banks of imntie, at least, are so very anxious nbout the formation of theme outworks. They aro hound, it neems, iy the prosent inw, to juy their noten only at the parent entab-

Liohment; so that by ismuing them at a brench baak, perhaps is hundred miles diatant from tho hend bank, the chanees are ted to one that they wifi continue for a macli 'onger period in circulation, aud that they will consequently be able to carry on business with a less amonnt of capital than if they were, as they ought to be, obliged to pay their notes at the branchea as well as at the principal offiee, It ia obvious, indeed, that the convertiblity of the paper, even of first-class banke, into either cash or Bank of Eagiand notes, is int prosent exceediugly im. perfect; and that very great facilities are afforded for getting the worst class of notes into circalation, and for keeping thens afloat even after their quailty may be suspected. This defect In the law should undouhtedly be amended, by obliging alt banku that dasue notes to pay them indiffervitly at any of their officen. But we incling to think that Pariament might go farther than this; atd that it should enset that no braneb bank be eatablithed, whather for the issue of notes or otherwine, beyond a certain distanco (say fifty mities) from the head oftice.
"Several of the points recapitulated by the committee, as to which tho Jaw is Blient, respect the righte and interesta of the partaers in joint-atoek banks, in reiation to each other, and not as between them and the pubilc. But it is always a very difficult matter to interfere to dietate the footing on which partica in any undertaking should siand among themscives. Mueh should, ju sueh esses, be left to the judgment of the partles; and pabile reguistiona, If enforeed at atl, should only go to pravent ohviona and acknowledged ahuse ; the parties may, in moat easea, be safcly left to take care of themselves. The protection of the public intereat is the paramount consideration; and we do not well know what can be done to effect this, in the case at least of euch banks as do not lasue notes, other than the making known who their pastuers ore.
"The joint-stock banka formed in the city of London offer a fair rato of interest for deposits; and ff they go on tuccessfully fin doing this, they will confer no slight advantage on the community, and will beeome, ss it were, an many savings' banks for the middio classes, sad for the rich as well as the poor, But the responaibilities thia ayatem will bring along with it are neither few nor small. A bank with a numerous body of rartners of andoubted wealth and integrity, that should give 2 per cont. interest on alt deposith of $£ 10$ snd upward, how aliort soever the period for which the depoait night remain in tho bank, would, there is Jittle doult, speedily havo amplo funds at its disposal. In quiet and prosperous times tho aystem would work exceedingly well ; snd the bank and the publie would he vastly well pieased with each other. But when the eycle of prosperity has gone by, and the eyele of adversity has begun; when the waters ane out, and the winds begin to hlow-it is doubtful whether cither the bank or itu depositors may feed quite at easo. The former will probabily raise the rate of interest ; but it is douhtful whether that will have the wished-for effect. Shoutd the cxchange set against us, nid the laank of Eagland be foreed to narrow her issues, and alionjd bankruptey and a feeling of inseourity begin to prevali, as they have donc hiltherto on all aimilar occaslona, $\boldsymbol{n}$ run for depoalta may, and most probably will, be made upon the lank; and In uncin a ease bur situation, however well who may liave been managed, will be most eritical. She will be compelied to dispose of or piedge sucurtiea in a market whero they may bo all but unsalabie; and it will be imposalbie for her suddenly to puit up in discounting, without exporing lerself to the imminent danger of extra joas, by bringing on the stoppage of thoan who have heen aecustomed to trust to her for loans.
"It will he said, perhaps, that this is all imaginary, and that notining of the sort ever occurs in Scotiand it Hit it would realiy be about an mueh to the jurpore to may that nothing of the sort ever occurs in Japsn. London fa tho pivot on which the forsign excliangen turn, and when they breome dejressed many of the London depositors will do what tho Scotch dejonitors nover so much ss dreamed of, that is, they will demund theie drjoaita, convert then in' $^{\prime}$, gold, and either send this gold olmoad, or get a profit fre those who will, From this aource of sanoyance and lobs whe Scoteh bnnke aro perfectly fres; and thle, hy exbausting the rescurces of the Londan Jminka, und anbjectiug the weaker ones to dificuitles, occaisions diseredit, and, in tho end, rima or panics. Nothing, therefore. can be nore gerfortly futile than to contend that because this syaten has proved profitable for the Seoteh bank $\mathrm{H}_{1}$ it will also be profitatia for the London banks. We do not presumo to affirm that anch will not, and we hope that it may, be the ease. Itht it would the rather lifiogical to affirm, becanse whest anteceeds remarkabiy well in the valo of Glomeenter, that it will succeed equaliy wril on the Weish mountains.
"The joint-atock fianks niny, if they do not aiready, elldeavor to obviate nome of the difficultles now atated, by deciining to pay interent on deposits unjess thoy lio for a certain time. or by stipulating for a eertain notice before thoy are paid. But either the one condition or the other is subversive of what ta chances are ger period in e to carry on hey were, as branches as eed, that the cs, Into elther eedlugly imd for getting reeping them Thla defect - obllging all $t$ any of their nt milght go branch bank therwise, bebead office. unittee, as to terests of the f other, and Iways a very ag on which themselyes. nt of the parlould only go partles may, selves. The nt conslderato effect this, notes, other 1 uuccessfuliy $e$ on the comwings' banks as the poor. ng with lt aro body of partild give 2 per how aliort soIn the bsnk, funds at Its ystem would blie would be tho cyele of y has begun: 0 blow-It is tors may feel 18 rato of Inhe wighed-for the Ilank of Id bankriptas they have leposlts may, ; and in such a been man. ed to dispese lay be ail but denly to pull he imminent of those who ary, and that lint it would at nothlng of vot on which wa depreased Seateh deposwill demand eer send thla From thls are perfectly the London lea, occastons ng , therefore, beeruse thls n, it will also t presume to , be the case. wheat ancthat lt will certain tlme, re pald. But ve of what ia
meant by granting intercet on depoaits, and goes far to maka tho announcementa to that effect little better than a hoax upon the publlc. All, or nsariy all, the sxiating banks are bankw of deposit in thia sense of the word; that ly, thay give Intereat on depoalts of a certain amount, provided they be net called for thif after tho lapse of an agreed-en period, and that the depositors givo thein no further trouble. But it is doubtful whether money deposited at 2 per cent. under auch conditions, and stlli more under an eagagement to give notice of demand, be as well lald out as if it wers deposited with the Bank of Lingland, or any other bank of undoubted solldity, at no Interpst, but payable on demand. Noat men of business would, undoubtelly, prefer the latter. Nobody, Indeed, not wlshing to get into difficulties, would be disposed to deal with any bank that required notice of demand ; and it is queationable whethgr any sueh stiputation should be sanctioned by hww.
"Tho cemmittee on joint-stock banks onslted all raference to what la by far the most promiuent evil In our banking ayu-teil-wo mean the power conceded to all privnto and jointstock banks and companios, whether with or withont property or character, to iasue paper money or notes payablo on demand, without let or hinderance of any sort. Thls abuse should eertainly be put down ;" and wo hava already seen that this power can now be but little sbused.
"Rexponsibility olght not, in any case, to be limited.-We protest againat tho proposal for allowing tho partners in banks not lssulng notea to limit thoir reaponasbility. Such a measure would be good for nothing, except to serve as a premilum on avery suecles of fraud. What check would there be, under such a system, to hinder the partuers of a bank going on for a series of years dividlng largo profits, whon perhops they werc reaily Incurring a loss, untll every farthing of its capltel and deposits $v$ as absorbed 9 To talk of anhjecting auch persons to pmishmunt as frandulent bankrupts, onevidence derived from thelr books, is absurd : fur, aupposing that It was tho intention of the parties to defraud, they might easlly keep their books so that they could afford no informstion that was not false or mis. leadlag. Tho onnexed list of jolnt-ateck bsnkling companles whows that there is no disincliaation on the part of Individuals to engage in such concems, oven with the present unlimited respunalblity. And the way in whleh some of them are condueted proves aufficlently, If such proof were wented, that the serions Ilabllitlea incurred by tho partners are not moro than enough for the protection of tho publle. To lessen them would be an net of gratuitoun folly. If wo are to interfere, let them be Incressed, net diminlalied. Init In the care of banke not issiling notes, enough is done, If messures bo taken to prevent deeeption, by letting the public know tho partners in them, and making aure that they shall have no means of evading the responslbility attaching to their angagements. Tha first ohject may be secured by compeling all hanking assoclutions whatever to publish snnusily s list of the names and addresses of their partnors, with the amount of their palif-up capital ; and to accompllah the latter object, we have merily to abstain from

Drawing on London,-The net $3 \& 4$ Will. 4, c. 83, repeals the regulation la the 7 Gco. 4, c. 46. prohihiting bunks with more than six partners from drowing on L.ondon on demand, or otherwise, for sums of less than $£ 50 .-\S 2$. For statistics of Euglish joint-stock banks, see conclusion of article on Banking.
IV. Scotct Banks.-The act of 1708, preventing more than six individuals from entering into a partnership for carrying on the business of banking, ald not extend to Scotland. In consequence of this exemption, several banking companies, with numerous bodies of partners, havo always existed in that country.
Bank of Scotlend.-This institution was projected by Mr. John Holland, merchant, of London, and was established by act of tho Scotch Parliament (Will. 3, Parl. 1, §5) in 1695, hy the name of the Governor and Company of the Bank of Seotlund. Its original capital was $1,200,000$ pounds Scotch, or $£ 100,000$ sterling, distributed in shaves of 1000 pounds Scoteh, or $£ 83$ Gs. 8d. stering, each. Tho act exampted tho eapital of the bunk from all public burdens, and gave it the exclusive privilege of banking in Scotland for twenty-one years. The oljeets for which the Bank was instltuted, and its made of management, were intended to be, and have leen in most respects, similar to those of the Bank of England. The responsibility of the shareholders is limited to the amount of their shares. The capitul of the Bank was increased to $£ 200,000 \ln 1744$, and was enlarged by subsequent acts of Parliament, the last of which (44 Geo. 3, c. 23) was passed in 1804 , to $£ 1,500,000$, its present amount. Of this sum, $£ 1,000,000$ has been puid up. The last-mentioned net directed that all sums relating to the affairs of tho Bank should henceforth he rated in sterling money; that the former mode of dividing bank stock by shares should te discontinued; and that for the future it should be transferred in any sums or parcels. On the miion of the two kingdoms in 1707, the Bunk of Scetland undertook the recoinage, and effected the exchange of the currency in Scotlund: it was also the organ of government in the issue of the new silver coinago in 1817. Tho Bank of Seotland is tho only Scotch bank constituted by act of Purliament. It legan to establish brunches in 1696, und issued notes for $£ 1$ so early as 1704. The bank also began, at a very early period, to receivo deposits on interest, and to grant credit on cush accounts, a minute of the directors with respect to the mode of keeping the latter being dated so far baek as 1720. It is, thercfore, entitled to the credit of having introluced aml set on foot the distinctive prineiples of the Seoteh banking system, which, whatever may he its defects, is probubly superior to every other system hitherto eatahlished. Gencrally speaking, the Bank of Seotlund has always been conducted on sound and liberal principles; nor can there he a doult that it has been productive, both directly and as an example to other bunking eatablishments, of mueh pulilic utility and advuntage. It may he worlh mentioning, that the act of Will. 3, establishing the Bank of Seotland, declared that all foreigners who hecame partners in the inank should, by doing so, become, to all intents and purjoses, naturalized Scotchmen. After being for a long time forgotten, this clause was taken advantage of in 1818, when several aliens aequired property in the bank in order to secure the henelit of naturalization. Hut after being suspended, the privilege was Inally canceled in 1822. We subjoin an official abstract of the constitution aud oljects of the llank of Scotlund, printed fur tie use of tie proprictors; the terms and mode of transacting business ure, of course, sometimes altered, according to eirenmstances:
I. The liank of scotiand is a pmble national ostabllament, crected und regulated by the Legialaturo alone; and exprossly na a publle bank in thia kingdom: for the beneft of the nation, and for tho sdivancement of agrlculture, commerce, and manufactures, and for other objects of public policy.-
 c. 25 ; 34 Geo. 3, e. 19 ; 44 Geo. 3, c. 23. II. The statutory espital is at present $£ 1,600,000$ aterling. It is raleed by voiuntary aubscrlptlon, and has been aubserlbed for. $£ 1,000,000$ has been called for, and paid In .-4 Geo. B, cap. 23. IIJ. Subseribers, If nat under obliggntion to tho Bank, may, at jlenaure, transfer their right. If under ebllgation to the Bank, the obligation must be previouly Hquadated; or tho procesda of the saio, at a price to the autlafuction of the direct-
ors, mant be applifed toward auch Hquidation. Transfera are made by a ahort asedgment and acceptance thereof, both in a reglater appointed for that purpose. The expense, besides tho government atamp, is 11s. Will. 1'arl. 1, \&5. IV. Bank of scotland atock may be acquired, in any portione by any person, communlty, or other lawful party whalsoever; without selection, exeluvion, or limitation of numbers. Will. Perl. 1, $85 ; 44$ Geo. 8, c. 23. V. Bank of Scotland atock may be conveyed by will, and, If apecially mentioned, without expense of confirmation. It can not be arrestad: the holder'a right may bs adjudged. Dividends may be arrasted.-. Will I'arl. 1,85. VI. The Bank of Seotlaud la a pablle corporation by act of Parilament. The Bank's transacilone aro dhetinet from thoee of the stockholders, and theirs from those of the Bank.- Will. Parl. 1, \& 5 . VII. The eatabllehment in expremsly dobarred from any other butiness than that of band ing.- Will. I'arl. 1,85. VIII. The management is veated, b, atatute, In a governor, depety governor, twelve ordiusry, and twelve oxtraordisary directors. They are chosen anmually, on the laat Tuesdey of March, hy the stvekholders having $£ 250$ of atoek or upward. Thoac above $£ 250$ have a voto for every $£ 250$, to $\mathbf{\Sigma 5 0 0 0}$, or twenty votes. No person can have more than twenty votes. The governor must hold at least $£ 2000$ of atock; the deputy governor $£ 1500$; and each direetor $\mathbf{2 T 5 0}$. They swear to be equal to all persons, and can not hold any inferlor offico in the Bank. - Fill. Parl. 1,85 ; 14 Geo. 3, e. $32 ; 44$ Geo. 3, c. 23. 1X. The executivo part is conducted by a tressurer, seeretary, and other pubilio officers, all aworn. Those having the official chargo of cash find dno securily.- Will. Iarl. I, \& 5 . X. The board of 43 rectors eits for the general administration of the Bank, at the Bank's publio head office ta Jidinburgh. Tho local bubinera of that district fe also conducted at that office. For the local Insiness fu the other parta of the kingdom, the Bank has Its regular pablic offece in the principal towns, At each of these offices there ju the bank agent or cashjer, who gives due secarity, nud conducts the Bunk's business for that district in the maner after mentioned. There is alvo tho Bank's accountant for that offec, who in appoisted by the directors. Hill. Parl. I, 85 . XI. The Bank takea in money, at all ith peblic offlees, on deposit recelpls or promlssory notes, or on eurrent deposit account. At tho head office, dmfts on Leurdub, or on any of tho agencles, are given; at each agency, drafta on Iondon, or on the head offlec, are given. All these documentr aro on the Bank"s check (and sealed vith the Bank's seat). They bear, in worde, to bo "For the bunk of Scotland;" or, "For the Governor and Company ef ic Dank of scotlasd." These documenta aro algued, If at Edinburgh, by the treasurer, and countersigued by tho prinelpal accountant: If at an ageaey, they must be slgaed by the Bank's agent as aycut, and countersigned by the bandi's aecountant for that agency; otherwise they finfer no obligation on tho Bank.-Resolution of Court, 28th Feb. 16es. XIJ. Mills on Lundon, Edjnhurgh, or any town where the Bank has Its offcial corrcapondente, are discounted and purehaned at all the Bank'a publio offices. The Bank'a ageuts judgo, in ordinary cakes, of the bills presented; ;o that partles meet with no delay. Tho Bank doea not sell, at uny of Its ottices, the bills which it has discounted and purehased. Its agenta eass not Indorse its bills, unless officially to the treasurer.-Rcoolution of Court, 23 d Feb. 1 i 89 . XIII. Guvermment stock and oth. er publle funds, tranaferablo in London, may be purchased or seld, and divideads thereon may he receired through the Bank. XIV. The Bank givea eredlt on cash accounts at any of tre offices, on bond, with security. Tho security may bo peraonal co-obligantr, conjunetly and severally; or lank of scotland etbek; or botil; or unch other becerity as may bo specially agreed on. Applications for casha accounta aro givon in to the office where the eash acconnt is wanted, and must specify the eredit destred and the security proposed; and the individual partners, whero copartnericy are proposed. Cash accounta are granted by the directore only, and are not reeatled unless hy thelr apecial anthority. It is understood that these erenlits are not ured as dead Jonns, to produce intereat only. In the falr coure of busineas, the advantage of the Bask is conautted by an actlvo cireliation of its noter, and by frequent repayments to it in e way leastaffeeting that elrculation.-Resolution of Court, 6th Nov., 1729, and 93d Feb, 1789. XV. Tho Rank's dividend of profits has been for sone considerablo perided aix per cent. per annum, ou Its paldup capltal of $£ 1,000,000$ sterling. The dividends are jald regularly twiee a year, without expene. They may be drawn either at the Bank's head office, or at any of its other offices, as moat agreeable to tho stock bolder.
Most of the other Scotch bunks are conductel on the same priuciples and In the same way as the Bank of Sct sand, ao that the details as to its management will
nearly apply to them all. The Royal Bank of Seotland was established in 1727. Ita original capltal of $£ 151,000$ has been lncreased to $£ 2,000,000$. The Jritivh Linen Company was lucorporated $\ln 1746$, for the purpose, sa ita name implies, of undertaking the manufacture of linen. But the viewa in whleh it originated were af aedily abandoned; and It became a banking company only. Its capital nmounts to $£ 500,000$. None of the other bunking companles established in Scotlund are chartered assoclatlons, whth limited responsilility; tho partners being jointly nud individually llable, to the whole extent of their furtunes, for the debts of the firme. Some of them, such as the Nutlonal Bank, the Commercial Banklng Company, the Dundee Commercial Bank, the Perth Banking Compruy, ete., lave very numerous bodies of purtners. Their affialrs are uniformly conducted by a Board of Directors, annually chosen by the shareholders. The Banh of Seoiland began, as already stuted, to tssue $£ 1$ nutes so early as 1704 ; and their issue has slnce leen continued without interruption. "In Scothinl," to use the atatement glven in the Report of the Commlttee of the House of Commons of 1826 on the l'romlssory Notes of Scotland and Ireland, "tho lssue of promissory notes payable to the hearer on demund, for is sum of nut less than 20s., has been at all times permitted by law; nor has any act lieen passed limiting the period for which such jssue shall continue legal in that conntry. In England, the issue of promissory notes for a less sum than $£ 5$ was prolihited by law from the year 1777 to the epoch of the Bank Restriction in 1797. It lins been permitted since 1797; and the permission will cense, as the law at present stands, in A pril, 1829."

There have been comparatively few hankrupteies smong the Scotel. hanks. In 1793 and 1825, when so many of the English provincial banks were swept off, there was not a single establishment In Scothand that gavo way. This superior stability scems to be ascribable partly to the formation of so many banks with numerous hodies of partners, which tends to prevent any company with only a few partners, unless they are knuwn to possess considerable fortunes, from getting paper into circuintion; partly to the less risk attending the business of banking in Scotlund; and partly to the facility afforded lyy tho law of Scotland of attaching a debtor's property, whether It consist of land or movables, and making it available to the payment of his lehts.

In the Report already quotel, the last-mentioned topic is tourhed upon as follows: "The general provixions of the law of Scotland bearing apon this subject are culculnted to promote the solility of banking establishments, ly nffording to the ereditor great fucilities of ascertaining the pecuniary circumscances of indivilual partacrs, und by making the private fortunes of thore partica available for the diseharge of the ohligations of the lank with which they are connected. There is no limitation upon the number of partuers of which a banking comprany In Scotland may consist; and, exeepting in the case of the luank of Scotland and the two chartered lanks, which have very consideraWe capitals, the partners of all banking companies are bound jointly and severally, so that eneh partner is liable, to the whole cxtent of his fortune, for the whole debts of the compmang. A creditor in Scotland is empowered to attach the real nnt heritalle, as well as the personal estate of his debtor, for payment of persomal dehts, among which may te classed debts due hy lills and promissory notes; and recourse may be had, for the purpose of procuring payment, to each description of property at tho same time. Exccution is not contined to the real property of a debtor merely during his life, but proceeds with equal effect upon that property after his decease. The law relating to the establishment of records gives ready means of procuring information with respect to the real and heritable est ne of which any person In Scotland may be possessed.
of Scotland of $£ 151,000$ british Linen purpose, as sufacture of inated were nkling com,000. No purchase of an estate in that coantry la secure ontil the seizin (that is, the Instrument certifying that actusl delivery haa been given) ls put on record, nor la any mortgage effectual until the deed is in like manner recorded. In the cuse of conflieting peeunlary claims upon real property, the preference is not regulatell by the date of tho transaetlon, but by the date of its record. These records are accessible to all persons; and thus the public can with ease ascertain tho effective neuns which a banking company possessos of discharging its ohligutions; and the partuera in that company are enabled to determine, with tolerable aceuracy, the degree of risk and responsibility to which the private property of each is exposed."
Deporits.-As was previously olserved, all tho Scotch banks reeeive deposits of so low a value as $£ 10$, and sometimes lower, and allow interest upon them. "The interest," says the committee, "allowed ly the bank upon deposits varies, from time to time, aceorling to the current rate of interest which money generally bears. It the year 1826 tho interest allowed upon doposita was 4 per cent." (At this moment [1846] the interest ullowed on deposits is 3 per cent.) "It has been ealculated that the aggregate amount of the sums deposited with the Scoteh banks amounts to aloout $£ 20,000,000$ or $£ 21,000,000$." (It is believed to be now [18.16] little, if any thing, under $£ 28,000,000$ or $£ 30,000,000$.) "The preelse acenracy of such an estimute can not, of course, be relied on. The witncss by whom it was made thought that the amount of doposits could not he less than $£ 16,000,000$, nor exceed $£ 25,000,000$, and toek an intermediate sum as the probathe umount. Another witness, conneeted for many years with different banks In Scotland, and who has had experience of their concerns at Stirling, Edinburgh, Perth, Abe-deen, and Glusgow, stated that mors thun one half of the deposits in the banks with which he had been connected were in sums from $£ 10$ to $£ 200$. Being asked what elass of the community it is that makes the small deposits, he said the laboring class; from which it appears that the mode of conducting this branch of the banking business in Seotland lus long given to that country many of the benefits derivable from tho establishment of savings banks.
The system of eush credits has been very wcil deseribed in the Report of the Lords' Committee of 1826 on Scoteh and Irish Banking. "There Is also," suy their iordships, "one purt of their system, which is stuted by all the witacssea (and, in the opinion of the committee, very justly stated) to have had tho best effecta upon the people of Scotland, and pirticularly upon the midlling and poorer classes of society, in produeing and eneouraging hatits of frugality nud industry. The praetice referred to is that of cush credits. Any person who applies to a bunk for a eash credit is called upon to produce two or more competent sureties, who are jointly bound; nud, after a full inquiry into the eharucter of the applicant, the nature of his bushess, and the sufficlency of his securities, he is nllowed to open a eredit, und to draw apon the bank fur the whole of its amount, or for such part ns his daily transactions may require. To the credit of the account he pays in such sums ns he maty not have oecasimn to usc, and interest is churged or credited upon the duily balaneo, as the case may be. From the faeility which these cusi credits give to all the small transactime of the country, nnul from the opportumities which they afford to persous who hegin business with little or no capital but their charneter, to employ prolitally the minutest products of their inlustry, it ean not be doubted that the most important advantages are derived to the whole community. The advantage to the banks who give these cush credits arises from the call which they eentinually produce for the issue of their paper, and from the opportunity which they afforl for the profituble employment of part of their deprasits. Tho banks are indeed so senslule that, in
order to make this part of t . sir husiness advantageous nnd secure, it is necessary that their cush credita should, as they express it, be frequently operated upen, that they refuse to continue them unless thla luplied condition lie fulllled. Tho total auount of their cash eredits is stuted $7 y$ ono witness to be $£ 5,000,000$, of which the average amount advanced by the banks may the one-third."
Recapitulation of Scotch Bankis, Stptember 1, 1855.Tho following return shows the eireulation of the Scoteh lanks, and the nverage amount of coln held during the four weeks ending the 1st September:

V. Inisit Banks.-"In no country, perlups," says Sir Henry Purnell, "has the issuing of puper money been carried to suel un Injurious exeess as in Ireland. A nutional bank was established in 1783, with similar privileges to those of the Bank of England, in respeet to the restriction of more than six partuers in a bank; and the injury that Ireland has sustuined from the repeated fuilure of bunks may be mulnly attributed to this defective regulation. Ilad the trude of banking heen left as free in Irclund as it is in Scotlund, the want of paper money that would have arisen with the progress of trade would, in all probability, have been supplied iy joint-stock compmies, supported with large eapitals, and geverned by wise and ellectunl rules.
"In 1797, when the Bunk of England suspended its payments, the same privilege was cxtended to Irelaud; and ufter this period the issues of the Bunk of Ircland were rapidly incrased. In 1797, the amount of the notes of the Bank of Ireland in circulation was £621,917; in 1810, £2,266,471; and in 1814, £2,986,999. Theso increased lssues led to corresponding inereasel issues by the private lunks, of which the number was 50 in the year 1804. The censequenee of this increase of paper was a great depreciation of it; the price of hullion nud guinens rese to 10 per cent. athore the mint price, and the exchange with London hecame ns high as 18 per cent., the par licing 8 . This unfavoralis exchange was afterward correeted, not by any reluction in the issucs of the Bank of Irelan ${ }^{\text {; }}$, hut by the depreciation of the British currency in the year 1810, when the exchange between London ar 1 Inublin settled agnin at nbout par. The loss that lyo lund has sustained by the failure of bunks may be dow scribed in a few worls. It appears hy the Report of the Committec on Irish Exchunges in 1804, that there were nt that time in Ireland 50 registered banks. Since that year a grent many more have been estublishel ; but the vehole hare failed, one after the other, involving the country from time to time in immense distress, with the following exceptions: first, a few that withdrew from business; secondly, four banks in Duhlin ; thirdly, three at Belfast; and, lastly, one at Mallow. These eigh banks, with the Ne: $\begin{aligned} \text { Provin- }\end{aligned}$
cial Bank, ar the Bank of Ireland, are the only banks now ax st og in Ireiand.
"In 1821, in consequence of 11 banks having failed nearly at the same tinie in the preceding year in the south of Ireland, government aucceeded in making an arrangement with the Bank of Ireland by which jointstock companies were allowed to be catablished at a distance of 50 miles (Irish) from Dublin, and the Bank was permitted to increase its capital $£ 500,000$. The net of 1 \& 2 Geo. 4, c. 72, was founded on this agreement. But ininisfers having omitted to repeal in this act various restrictions on the trade of banking that had been imposed by 83 Geo. 2, c. 14, no new company was formed. In 182.4 a party of merchants of Belfast, wiohing to establish a joint-stock company, petitioned Parliament for tho repeal of this act of Geo. 2, aud an act was accordingly passed in that session repealing somo of the most objectiunabic restrictions of it (the 6 Geo. 4, c. 73). In conse fuence of this act the Northern Bunk of Belfast was converted into a jointeatock company, with a capital of $£ 500,000$, and commenced busincss on the Jst of Jannary, 1825. But the remaining restrictions of 33 Geo. 2 , and certain provisions contained in the new acts of 1 \& 2 Gco. 3, ani 5 (ico. 4, oistructed tho progress of this company, ant they found it necesanry to appj' og govermment to remove them; and a bill was accordingly intrednced which would have repealed all the obnoxious clauses of the 33 Geo. 2, had it not been so altered in the committea as to leavo several of them in force. In 1825 the Irovincial llank of Ireland commenced businesa, with a capital of $£ 2,000,000$; and the linnk of Jreland has of late established branches in all tho principal towns in Jrelnad.
"The losses that have been sustained in Ireland by abusing the power of isauing paper have been so great, that much more is necessary to be done, by way of protecting the pubiic from future loss, than the measure propased in the year 1820 by Parliament for abellahing small notes, and tho measure already adopted of nllowing joint-stock companies to be established in the interior of the country. As the main source of the evil consists in the interference of the law in creating a national bank with exclusive privileges, tise first step that ought to be taken for introducing n good system into Ireland is the getting rid of such a bank, and opening the trado of banking in Dublin. The next measure should be the requiring of each bank to give security for the amount of paper that is issued; for after the experienca of the ignorance with which the Irish banks have conducted their business, and the derangement of the natnral course of the trade by the long existence of the Bank of Ireland, it would be unwise to calculate upon a sound system of banking speedily supplanting that which has been establisiod. Under tho circumatances in which Ireland is placed, nothing would so much contribute to her rapid improvement in wealth as the introducing of the Scotch plan of cash credits, and of paying interest on deposits. By cash credita the capital which now exists would be rendered more efficient, and the paying of interest on anali deposite would lead to babits of economy, and to the more rapid accumulation of new cap-ital."-Observations on Paper Moneg, etc., by Sir Il enny Pannelle, p. 171-177.

The capital of the Bonk of Ireland, at ite eatablishment in $\mathbf{1 7 8 3}$, amounted to $£ 600,000$, hut it has been increased at various periods, and thas, sinco 1821, amounted to $£ 3,000,000$. Tite Bank of Ireland draws on London at 10 days' date. She neither grants cash credits, nor aliows any interest on deposits. She discounts at the rate of 5 per cent. In 1828 the currency of Ireland was assimilated to that of Great Britain. Previously to that period the currency of the forner was 8 f per cent. less vaiuable than that of the latter.

Proxincial Bank of Ireland.-Thia important estab-
lishment was, as aiready stated, fonnded in 1825. Its subscribed capital consiste of $£ 2,000,000$, dlvided into 20,000 shares of $£ 100$ each, of which 25 per cent., or $\pm 500,000$, has been pait up. Its head office is in London; and at present it has aubordinate offices In Cork, Limerick, Clonmel, Londonderry, Sligo, Wexford, Waterford, Belfust, Galway, Armagh, Athlone, Coleraine, Kilkenny, Ballina, Tralee, Youghall, Fnniskillen, Monaghan, Banbridge, and Ballymena. The last five have been opened since 1831. The entire management of the establishment is vested in the conrt of dlrectors in London. The business of the branch banks is conducted, nnder the control of the head offlee, hy the munugers, with the adrice and assistance of two or more gentlemen of respectability in the district, each holding 10 shares in the bank. The business consiats of discounting bilis; granting cash credits after the manner of the Scotch banks; receiving deposite, on which interest, varying according to circumstunces, is aliowed; in drawing and giving letters of ereuit on other places of Ireland, Great Britain, etc.; and of other details incident to banking. It has had meveral pretty severe runs to suatain. In the course of a single week, in October, 1828, about $£ 1,000,000$ in goid was sent from England to Ireland on account of the Provincial Bank! This prompt and ampie supply effectually maintained the credit of the eatablishment, and did much to restore confidence.

The notes of the Provincial Bank have always been payable at the places where they are lasued. The Bank of Ireland began to establish branches in 1825; but the notes jasued by her branches were not, at first, payable except at the head office in Dublin. This distinction, which tended to thruw the principal presaure of runs in the country on the Irovincial Bank and other private companies, was ubolished ly the act 9 Geo. 4. Several joint-stock banks liave heen established in Ireland since 1825, especialiy in 1836. But the greatest of these, the Agricultural and Commercial Bank, which had nearly 4000 partners and 28 branches, was in no iong time obliged to suspemi payinents. Some of the others have also been almanioneli.
There are comparatively few private banks in Ireland.
"Not many ycars ago there were upward of six hundred loan societies in Ireland, besides private pawnbrokers, who abounded in every town throughout the kingdom. Two hundred were enrolled under 6 \& 7 Will. 4, one hundred and sixty-eight were under the direction of the Irish Reprodnctive lonn $\mathrm{F}_{1}$ - 80ciety founded in 1822 . These varions losa assuciations were productive of very little good to the people, tho rates of interest charged to their customers being nearly such as are charged at ordinary pawnbrokers' establishments."-Lawson on Banking.

The provisions in the act $8 \& 9$ Vict. c. 37 , with regard to banking in Ireland, do not differ materially from those in the preceding act relating to Scotland. The prohibition that formerly existed against jointstock banks carrying on business in lniblin or any where within 50 miles thereof is repenied; the charter of the Bank of Ireland is prolonged till January, 1855, when it may to dissolved on notice; nutes of the Bank of England are declared not to be legal tender in Ireland; and notes for less than 20s, are not negotinbie.

VI. Foukign Banks.-To attempt giving any detailed necount of tho princlpal foreign banks would very far exceed our limits; we shall, therefore, only notice a few of the more celelirated.
l'he Bank of Venice seems to have been the firat banking establishment in Europe. It was founded so early as 1171, and subsisted till the aubversion of the republic in 1797. It was assentially a deposit bank, anit ita bills bore at all timea a premium or agio over the current money of the city.

The Bank of Amsterdum was established in 16009. It was a deposit bank, and paymients wera made ly writing off aums from the account of one individual to those of another. According to the princlples on which the bank was established, it should have had at all times in its coffers bullion equal to the full amount of the claims upon It. But the directors privately lent about $10,500,000$ florins to the Statos of Ilolland and Friesland. Thia circumstance transpired when tho French invadod Holland, and caused the ruin of the bank,
'The Bank of the Netherlands was established in 1814. It is formed on the model of the Bank of England, and has the exclusive privilego of issuing notes. The original capital of $5,000,000$ florins was doubled in 1819 . The king holds one-tenth of the slares. The affairs of the bank are managed by n president, secretary, and five directors, who aro chosen every six months, but may be indefinitely re-elected. This bank discounts bills of exchange with threo responsible signatures; it takes continuations on stock, and sometinies lends on bulition at such a rate of interest and to such an extent as may be agreed upon. It occasionally, also, makes loats on merchandise, but never at less than 5 per cent. Its notes vary from 1000 florins to 25 florins; that is, from $£ 83\}$ to $£ 2$ 1-12. The dividends have varied from 3 to 7 per cent. The shares are each 1000 florins. The responsibllity of the shareholders is limited to the amount of their stock. Its original charter, which was limited to 25 years, was prolonged, in 1838, for 25 years more

The Bank of Hamburg is a deposit bank, and its af-
fairs aro managed according to a syatem that insures the fulleat publicity. It recelves no deposits in coin, but only in bullion of a certain degree of fineness. It charges itself with the bullion at the rate of 442 shillinga the mark, and issucs it at the rato of 444 shillings, being a charge of four-ninthe, or nearly one-half per cent., for its retention. It advances money on jewcla to three-fourths of their value. Tho city la answerable for all pledges deposited with the bank; they may be sold by auction, if they remain 1 year snd 6 weeks without any interest being paid. If the value be not clalmed within threo years, it is forfeited to the poor. The Bank of IIamburg is universally admitted to be one of the best managed In Europe.

France. -The Bank of France was founded in 1803. The exclusive privilege of issulng notes payablo to bearer was granted to it for forty years, and was continued, by a law passed in 1840 (contlrmed in 1852), till 1867. This law was preceded by a very able Report, drawn up by M. Dufaure, in which, among other questions, the policy of having only ono bank of issue in Parls is examined, and decided in the affirmative. Tho capital of the 13nnk consisted at first of $45,000,000 \mathrm{fr}$; but it was subsequently increased to $90,000,000 \mathrm{fr}$., divided into 90,000 shares or actions of 1000 fr . each. Of these shares, 67,900 passed Into the hands of the public; 22,000, having been purchased up liy the bank out of tho surplus profits, wero subsequenily canceled; hence the capital of tha bank consisted, previously to the Revolution of 1848 , of $67,900,000 \mathrm{fr}$. $(£ 2,716,000)$, exclusive of a reserve find of $10,000,000 \mathrm{fr}$., sinco increased to $12,280,750 \mathrm{fr}$. But notwithstanding the laudable skill and cantion with which her affinirs were conducted, tho bank could not avoid suspending payment under a decree of the Provisional Government of the 16th March, 1848, to which and to the city of Paris she had to make large adrances. To set somo limit to the abuses that might havo taken place under the suspension, the maximum circulation of the IBank was fixed, by tho decree now referred to, at $350,000,000 \mathrm{fr}$. ; while, in the view of supplying a currency suited to the smaller class of paymeuts, sho was permitted to re-
duce the denomination of notes in circulation from 500 to 100 fr . At the same thme, or soon after, the departmental banks, or banks which had beeu established in some of the principal provincint towns, were consolidated with, and made branches of the Bank of France. We subjein a copy of the decree of the 2ith of April, 1848, by which this amalgnuntion was ellected.
Art. 1. The banks of Frunee, of Houev, Lyens, Havre, Lille, Teulonse, Orleans, and Marseilles are onited.
Art. 2. The departmental benks above enumerated will contlme in eqeration es branches of the liank of France, conformably to the regulstions stlpulated in the decree of the Isth of May, 1508, and the ordonance of the 25 ch ef March, 1841.

The prevent number of the adminatrators of the departmentul banks is malntained, as also the beards of disceunt, organized for the servlee of severd of thent.
The number of shares, the possession of which is at present required as a guarantes from the directors, censors, administritors, nad members of the coune.fy of discount of those departmestal banks, is provisiounlty maintalned.
Art. 3. The shares of these banks ure nnnutled, and the holders shall meefve In exchange shares of the Bauk of France at a nomian value of 1000 fr . for a neminal value of 1000 fr .

Art. 4. In order to excente the above artiele the Hank of Frsnee is empowered to lssue 17,200 new sbares, whleh will Inerense ita capital to $\$ 5,100$ shinres of 1000 fr .

Art.5. Hy the cesmlen of those new sharea to the sharehelders of the bank of llonen, hyons, Ilavre, Lllle, Toulouse, Orteanf, and Marselles, the liank of Franee shall become preprietor of the capital of these banke, and be mude chargealle with their eagagements. The reserve funds, existling in ench of those banks, shall be adden to the reserve fund of the lank of France. The multiog of the landed and chattel property, resultlog from the present artiels, shall be rulypeted to the fixed registry daty lmposed on deeds of patituc $r$ :hip.

Art. 6. The Bank of France is authorized to add to the maximum of elrenlation, fixed by the deeree of the 15ith of Mareh inst, the maximum of the clrculation fixed for ench of the departmeutal baiks by the decree of the 55 th of the same month.

Frona the date of the promulgation of the present decree the notes lssued by the banks lacorqorated with the Jtank of Frameo alall be recelived throughont the repulilic as a legat tender by all the branches of the puhtic treasury and private ludividuala. The hotders of sald notes shall have to present them to the lank of Vrance, or te fts lmaches, within the followhig alx montha, lin order to exchange them fir notes of that bank. Beyond that periad those notes rhall ceaso to be curment an a legul teoder, but the Bunk of France and its branches shall not be exonerated from the ebligation of exrhanglug them.

Art. 7. The Inspeetera of the fiunne tepartoment, of an order of the miniater, may verlfy the altuatlan of the branch banks
Art. \& In future the branch banke of the Bank of lirance shall bear the following deneminatien: "Dabk of France, brameh lank of -_."

The banks of Bordeanx and Nantes wero at first dlsposed st rennonsly to resist the project for their incorporation with the llank of Frnnee. In the pmil, however, they gave way ; and, in consequence, 1150 shares, ant in additional capllal of 6,150, ,hot fr., were added to the shares and capital of the llank of France, making at present (i853), the former 91,250 , and the latter $91,2611,000 \mathrm{fr}$. The maximum circulation of the bank was at the same time hereased from $350, \theta \mu, 000$ to $452,0 \mu 0,040 \mathrm{fr}$.

On the whole, we are inclined to think that this conversion of the departmenta] tanks into hranches of the liank of France is a considerable inprovensut. It glves an equrlity of value to the puper currency,
which it could not otherwise have had, and makea it equally serviceable in all parts of the country. It is surprisil. fr, indeed, how soon the Bank of France recovered from the severe shocks to which she was exposed in 1848, and to what a degree she has regained the public contidence. But despite the able msnagement of the bank, her intimato connection with the govern. ant makes her stability in a great degree dependent on that of the latter.

A decree the 31 Mareh, 1852, has prolonged tho charter of the bank till 1867, and has authorized her to make advances on railway stock and on the bonds of the city of I'aris. The issue of notes for 50 fr. and 25 fr. would, we incline to think, be a great improvement. There has been, wihhin the last three or four years, a great accumulition of bullion in the cofters of the bank. lecently, however, it has heen diminished notwithstanding a rise in the rate of interest.-SEnetin, Traité de Banque, p. 196-224, 2d ed., ete. No bills are discounted that have more than three months to run. The bank is obliged to open a compte courant for every ono who requires it, and performs services for those who have such acconits similar to those renderell hy the private hasks of Londen to their customers. She is not allowed to charge any commission upon eurrent accounts, so that her only remuneration arises ont of the use of the money placed in her hands by the individuals whose paynienta she makes. This branch of the business is sainl not to be protitable. The bank advances money on pledges of ditlerent kinds, such as foreign coin or luallion, government or other securities, etc. It also undertakes the care of valuable articles, as plate, jewels, tille-dceds, etc. The charge is $\frac{1}{5}$ per cent. of the value of cach deposit for every period of six months or under.

The adminiatration of the bank is vested in a coun-eil-general of 20 members, viz., a governor and deputygoverner, nominated ly the emperor; and 15 directors and three censors, chosen by the general body of the chareholders. The bank has a large surplus capial, anil a1 present enjoys a high degree of eredit.
"The circulation of the Bank of France has hucreased since 1818; lirst, in consequence of smalier notes being put into circulation (for notes of 100 fr. aro now eurrent); and, secondly, hecanse of the establishment of branch banke fsellitating intercommunication with all the principal eities of the empire. The cireulation in 1853 and 1851 exceeded 500 millions. But in those years the nmount of specie in the hank cellars exceded the amonnt of the whole cirenintion, so that the subsiltution of paper for gold was not of so thuch service, or so economical to tho conntry, as it might have been under other circumstances. Not less than the value of 10,000 franes is received as a deposit, and discount for forty-five days is delucted from the amonnt of the sum advancel ; nor, if the deposit be redemed the noxt day, is any part of the discount, refunded. The paper of the lank of France checty circnlates in l'aris and tho neighborhood; at a distance from l'aris its notes pass at a discount of one and a half pur cent., as they are not recrivet in payment of taxts or clus-tom-honse duties in keapurts."-E. 13.

New Financial Institution in $\mathrm{P}_{\text {tris. - "The Societé Gino }}$ érule rde Cristit I /nbilier, estubllshed by a decree of 18 lh Novemher, 1852 , is a species of a bank, the partners in which have not given theld numes. Its prinelpul operations conaist itu purehashig or acquirlug shares in public companies, provided they he en smiftion anonymes; secondly, in circulating its own securities for a sum equivalent to the shares or stock purchased; thircly, In exchatiging all actlons antl obligntions so acquired; fonsthiy, in lenillug on multle securlties on the deposit of aetions and ohilgalions, ete. The eaphtal of the soclety is Ilved at $60,000,000$ fr., and it is represented hy 120,000 slares of 600 fr . each. The soelety can circulate lts own 'ohligations' for a sum six tintes as large as lta eapital."-D. II.

Banks have also heen established In Berlin, Copenhasen, Vienna, and l'etershurg. Thoso who wish for detailod information with respect to these establishments may consult the 4 th vol. of the Cours d'Economie Politique of M. Stonct, which contains n good account of the paper money of the diffirent Continental states down to 1823 . We also refer to other portions of this article; lout in the mean time we lay before our realers the following detalls with reapeet to the Commercial Bank of Rassia, ostablished in 1818:

This hank recelves deposits in gold and silver, forcign as well as Russian coin, and in hars and ingots. It has n department for transferring the sums depositel with it, on the plan of the llamhuig Bank. It discounts biils, and lends money on deposits of merchamlise of Russian proluee or orlgin. Its capital consists of $8,571,429$ silver ruhles. It is administered by a governor and fuar dirctors, appointed by government; and four direcurs, elected by the commercial body of Petersburg. The property in the bank is proterted ncainst all taxation, sequestration, or attachment ; midit is enacted that suljects of countries with which Russia may ho at war shall be entitled at all times to reecive back thoir cleposits without any reserration. It is also declared that at no time sianli the bunk be cailed ujon for any part of its capital to assist tho government. Ail ieposits must lie made for 6 months at foust, and be repuyable at or hefore that period, and not be less than bito paper rubles: sums so deposited to piy $\frac{1}{8}$ pur cent. The deposisn, if th bars, ingats, or foreigo specio, nre estimated in Ihassian silver coin, und so registered in the attretation; and if not demanded back within 15 days et' the expiration of 6 monthe, or the necesnary preminm prid for the proloughtion, the owner loses the right of claiming his originai drposit, and must take its estimated value in liussian silver coin. No hills are discomented that have less tian 8 days or more than 6 months to run. The rale of discount is 6 per cent. No interest is allowed on monoy deposited in the finnk, unleas notice be given that It will he nilowed to lis for a year, and 3 months' notico le given of the intention to draw it out, when
six per cent. interest is allowed. The bank has branches at Archangel, Moscow, Odessa, Riga, \&c.

By means of its capital and deposits, which in 1839 amounted together to $161,881,839$ sllver rubles, the bank effected in that year the following operations:

| 1. Repayments on deposits in tranafer | Rubles. Cop. 24,966,101 45 |

The net profit during the same year amounted to 656,501 silver rubies, and the reserve capital of the bauk was tisen also $1,279,970$ silver rubles.-See Supplement to the Journal de St. Petersbourg for 1839, p. 87.

Banks of Germany,-The Bank Royal of Prussia was founded at Berlin in 1765, upon the model of that of Hamburg. So it existed until 1846, when it was reorganized under a new charter, by which more extension was given to its operations. In accordance with this new constitution, which has been in force since the 1st of January, 1847, the issue of notes has been carried to fifteen millions of thalers (the thaler equal to $2 \mathrm{~s}, 10 \$ \mathrm{~d}$. sterling. In 1850 this issuo was raised to twentyone millions of thalers. The capital of the bank is always to le in proportion with the notes in cireulation, two-sixths in silver, three-sixths in bills discounted, and the rest in loans on securities. The bank-notes are from twenty-tive to flfty thalers each. The share of the government in the bank amounts, at most, to 500,000 thalers. The sharcholders are entitled to an nnnual interest of $3 \frac{1}{2}$ per cent. upon tho capital, and, after deduction of the sum set apart for the reserve or rest, which is not to exceed 30 per cent. of the capital, one moiety of the surplus profits is apportioned to them In addition, and the other goes to the treasury. 'The bank has branches in a great number of eities, as BresInu, Königslerg, Dantzic, Stettln, Magdeburg, Munster, Cologne, Memel, 1'osen, Stolpe, Elberfell, 'Treves, Aix-ln-Chajelle, Dusseldorf, Coblentz, Minden, Erfurt, Frankfort-sur-Oc , Stralsund, Kosth, Liegnitz, and Oppuln, and thus forms a vast networ's of financial operations through all the kingdom.

The private bank of the noblesse of Pomerania was founded at Stettin, in 1824, by an association of noble proprictors, with a capital of $1,000,000$ thalers. After the crisis of 1830 , this capital was carried to $1,534,500$ thalers. The operations of this bank embrace discount, loans upon lodgments of merchandise, loans upon publie and private securitles, current accounts, and deposits with interest. Formerly, it issued promissory notes to bearer ; but this privilege was withdrawn from it in 1835. There is a circulation of about ninety milliuns of thalers of $m$ 'gage notes in Prussia (these are, in faet, for oue hundred and five millions). They havo heen issued, at dilferent periods, hy nssocintions of proprietary nobles in various parts of tho kingiom, and carry interest at $8 \frac{1}{2}$ per cent.

The National lank of Vienna was founded in 1815, to re-establiah ordor in the finances of Ausiria, and more particularly for the rejurchase or the conversion of the juy ar money in cifreatation, the value of which was become almost nominal. Tho ditferent ereations of shares linve raised its capital to ubout $89,000,000$ tiorins. This capital is divided into 50,621 slares of 1500 florins each. The netunl operations of the bank are discount; tho issue of bank-noter, $n$ privilege widc: it enjoys exclusively throughout the Aastrian empire; lonns upon dejosits, and negotiations of loans. The lonnk pays an annual interest of 6 per cont. upon the primitive cajital, nad $n$ dividend, after deduction of the roserve fund. Ite privilege, or charter, extends to the year 1806. It has branches at J'rague, Brimm,

## BAN

Troppau, Ogen, Temeswar, Kashan, Lemberg, Trleste, lnnspruck, Goritz, Linz, and Hermstadt.
The Bank of Extraordinary Credit of Vienna was constituted in $\mathbf{1 8 4 6}$ by imperial decree, and has for its object to devote a part of the sums destined for the redemption of the national debt to the purchase of certain sbares in railwny and other enterprises, in order to sustain useful undertakings, and communicate a greater impulse to theu.
The Loan and Exchavge Bank of Bavaria was founded at Munich, in 1835, ly shnres, mider the surveillance and control of the government. It is privileged for ninety-nine years. The original capital was $10,000,000$ florins, with liberty of increase to $20,000,000$. In 1846 there was a new emission of shares of 500 flerins. The net prolits are dividell as fellows: Three per cent. ns divided to the shareholders, and, of the surplus, three-fourths as extrn livilend, and the remainIng fourth carried to the reserve, until it shall reach to one-tenth of the capital. Three-bifths of the capitul are employed in loans on mortgage. The other operations are discounts, loans on securities and ingots; the issuc of bank-notes, whose amount is imited to four-tenths of the capital, and three-fourths of it to be covered by a value of double the sum in mortgage credits, or in silver. The bank has a branch at Augsburg.
'Ihe Roynl Bank of Bavaria, first established at Ansbaeh, and now at Nurenberg, is one of tho oldest establishments of the kiad. lts operations are discounts, deposits, loans upon personal and other securities. The government is cutitled to half the prolits. It has branches nt Ansbneh and Bamberg.
The Royal Bank of the Court of Wurtemlerg, founded in 1802 at Stutgardt, limits its operations to discounts and loans.

The Bank of Leipsic was fomded in 1839, under the auspices of the government, with a capital of $1,500,000$ thalers, livited into shares of 250 thalers, receiving 3 per cent. interest. Its operations are deposits, loaus, and liscounts. It has the right of lssuing notes of 20 and 100 thalers cach, of which the two-thirds should be graranteed by values to the amount in speeie or ingots.
There exists, besides, nt Dresilen, a loan bank, which makes advances to land proprietors and farmers for the payment of taxes, tithes, etc. Lelpsic has also an institution of this kind under the name of " Union of Credit for the hereditary lands of the Saxon nobility."

It was in agitation, in 1846, to found at Dessan a great central establishment, to nnswer the purpose of a vast banking system for the nerth of Germany. It was proposed to endow it with an accumulation of capitals to tho extent of from $50,000,000$ to $100,000,000$ thalers. But this glgantic project has resolved itself into a private enterprise, established in the begimning of 1847 , under the title of the Provisional Bank of An-halt-Dessan, with a capital of $2,500,000$ thalers, divided in shares of 200 thalers. This establishment issues notes of $1,5,10,20,50,100,500$, und 1000 thalera each. One-fourth the value of the bank-notes in circulation should be covered by an equivalent sum in specic.

The Bunk of Ilamburg was founded in 1619. The minimum deposit of a member desiring to open an account is $\mathbf{1 0 0}$ marks banco in bar silver, or in a bill, fer the same sum, of one of the menbers of the bank, which is then trausferred from the account of the latter to that of the former. Transfers can not take place for a less sum than 100 marke, except some days before Christmas, or in the middle of July. Hitherto, for each. mark of fine silver of Cologne, the denositor was accredited with 27 A marks baneo; while, in withdrawling his money for a slmilar sum, he was debited with 27 marks banco, so that the simple usage of the operation brought a cost of 9.20 per cent. A new regulation, which is to come into force on the 15th of August, 1857, imports that the mark of fine silver of Cologne shail be credited 27 a marks banco, and debited at a slmilar rate after deduction of 1 per mille. Independently of this sort of business, the bank leuds ujon Spmish and Americun dollars, and sometimes also on cepper. These are its only operations.
The association of the new loan, established equally at llamburg, in 1839, possesses a capital of 100,000 marks baneo, and does business prohibited to the bank, principally loans on securities, public funds, cte.
There have been muiaerous financial enterprises, Intely started on the Continent of Europe, absorbing a henvy amount of capital hitherto available for other purnoses. Tho following list of new Ennks in Germany represents a capital of nearly $115,000,000$ dollars, which forms but a small part of the nmount lately finvested by German enpitalists within the borders of their own country. The shares of all the hanks named herenfter command $n$ high preminm, although but few of them have been sufllelent time in operation to pny dividends.

VII. Banking in tine United States.-The Danking interest of the United States has attained an importance in the varied concerns of this widely-axtended country, and is so interwoven with all our eommercial, manufacturing and agrieultural pursuits, that it must be conceded that it is a great motive power in our contition of national prosperity, and secondary in its inlluence only to that of the government itself. And yet there are few suljeets of a praetical nature on which the people of the United States hava so widely differed in opluion as upon the poliey of banks and the substitution of a paper currency, based even upon coin, for one purcly metallic. On one side, the zealous friends of banks have sometises overrated the utility of paper credit, and ateributed to it a ereative power which even grold and silver do not possess; on the other side, their opponents, withont distinguishing between the uses and abuses of banks, discerned, in these useful sud almost indispensable auxiliaries to commerec, manufactures and agriculture, nothing but mischlef, anil regarded them as impeding the wealth of the nation, and even as injurious to its morals us well as dangerous to its liberties. Both parties, perceiving the glaring errors of their adversaries, have been strengthened in their own opinions, and as each party has ajternately come lato power, it has established or subvertel, encouraged or rejected, the present bankingt policy of the comutry. $A$ compmison of the amounts of bink eapital in several inportunt years, from 1837 to 18int, will exhlhit the thetations which have taken placo during the last twenty years:

| Years | Capitul. | Manka. | Citeculation. |
| :---: | :---: | :---: | :---: |
| 14.37 | \$240, 772,0101 | 788 |  |
| $1 \times 10$ | 158, 14.609 | 811 | lint,gis, itic |
| 1488 | 22S,801,144 | 691 | 64, 368 , 4118 |
| 1541 | 104, 904,1019 | 711 | 1015,5024,427 |
| 14id | 217,317,21t | $8: 4$ | 181, 1463,526 |
| 141 | 1111,376,0171 | 12118 | 9014,4890,207 |
| 1550 | 347,4211,2411 | 1371 | 1ii,15i,412 |

These banks lai, in the corresponding years, speche in their vaults, $18,33,3: 12,12,45,59$ and tin millions of dollars, and the nmount of specie in circulation stomblily lacreased from 35 to 101 militons, in addition thereto, aecording to the most rellatble esthuates, viz, :

| Years. | Beposita. | 1.0 his amd Diseromit. |
| :---: | :---: | :---: |
| $1 \times 37$ | * $127,3187,1 \mathrm{~s}$ ) | $45.50,110,762$ |
| 18110 | 76, 1541,207 | 402, $8: 16,323$ |
| 1813 | 60,168, 62.2 | 954, $64.4,183$ |
| 1814 | 011,413,17711 | 1192, 144.4104 |
| $18 \% 1$ |  | 34,4,204,078 |
| 195 | 188, 185,74 | 607,937,42\% |
| 1sinl | 237,014,981 | 634, 183,2811 |

It mast be borne in mind that tha two last erises in bank affairs occurred in the years 1837 and 1842-43, and their cirealation, as it appears above, was reduced from $\$ 149,200,000$ to $\$ 58,563,608$, and their specie from $837,915,340$ to $\$ 33,515,806$. The consequence was a ruinous fall in prices of property, and many business men found it impossible to comply with their engagements, under the sudden contraction of bank loans from 525 to 25.1 millions of dollars.

The history of all our bank pressures and pranies has been the sante in 1825,1837 , and 1843 , and the causes given in two simple words-universal expansion; and nothing bat gold and silver possesses the conservative power to regulnte the state of our eurrency or cheek the rulnous intiation to which our banks are prone, but for this check on their issues. All other kinds of property have but a tictitlous value, which in periods of continued prosperity is enhanced beyond the limits of reason or common diseretion. At such times the banks themselves have aided the popular delusion by stretching their ntmost spread of canvas to court the fuvoring breezo; but when eaught aback, are the most alarmed at the perils which they are sura to encounter. Instead of becoming auxiliary to others, they but increased the panic and aggravated the troubles, which foresight might have prevented. Experience has shown that the contraction whiels sueceeds an uninterrupted prosperity is more disastrous than if the community hat never enjoyed any hank extenslon. If the effect of these fluctuations was continel to the speculators whe originuted them, thera would be little to excito public anxiety or sympathy; but the misfortune is, that they reach the industrial elasses of socioty, and alf who are dependent on their duily labor for support. When the banks fail to redeen their chreulation, the latorer, the artisan ami small dealer, who earn thetr ten or twenty dollurs per week, aro despoiled of their lard earnings, and it is not surprising that among these classes of sochety there should exist a jealousy of bunks, when they are always in danger of recelvlng and hohling bankrupt notes; since, In the interior, most of them ure unaciualnted whith the character of the curreney which is protlered to thom lin puyment.

But the laborer and the operntive not only suffer by the suspension of banks; they are in a greater or less degree atfected by bank inflatious. When money is abundant in what are termed prosperous thmes, their daily wages have never yet kept prace with the high prices of prodnce or manufactures. Nor do our senmen always particlpute la the advanced rate of frelghts; bitt when the price of every thing ubout us is cmhanced,
we are acenstomed to adhere to the ame valuation of the wages of labor. If the standard of their value is rightly estimated in part by the cost of subsistence, the rate ought, in justice, to be advanced when prices are high, as well as to reduce the rate when the market is depressed ; but the latter course is frequently adopted, while the formor is aubmitted to with evident reluctance.

But are the banks alone to blame for these fluctuations of expansions and contractions? To a certain extent they are, but not whelly so; they are but auxiliaries. In periods of prosperity they have on hand money to loan, and diepense it freely while it is in their power, as it is their duty to do, in order to secure good dividends for their atockhelders; but it was the excess of confidence out of the banks which first induced speculation, and the expansion of individual credit to its utnost tension. While money is redundant and capital unemployed, temptations are offered to the adventurous, and speculation becomes rife in atocks, lands, railroads, mines, and the countless "fancies" which pomise such flattering results in such a brief period of time. Nor is this speculative spirit confined to our commercial cities; It pervates the whole country, and a fictitious value is attached to every thing animate and inanimate, movable or fixed, which possesses any value at all. The property thus enhanced in valuation, without any reasonable cause, is either seld to some irresponsible purchaser, or perhaps mortgaged as sccurlty for some other speculation ; pay day comes round, the suber second theught discloses the infatuation, and the dreamer awakes to the appalling perception of his true cenclltion. The property is sacrificed; in other worls, it is soll forita specie value, and the speculater is ruined, involving in his fall the credulous individuals whe have trusted in his aupposed forecast or his plausible representations. All classes of the community feel the shock, and the general outery is against the bunks as the origia of the evil; but lis it an evll?

It must be neknowledged by all that an uninterrupted course of prosperity caused by a redundancy of currency, and the censequent supply of bank facilities, would, in the end, be prejudicial to the true and permanent welfare of the country. We have had experience enough during our intervals of success to note the consequences of a prosperous career, and the benefita have never been equally shared by the community. Bold and reckless speculators, monopelists in every branch of trade, wealihy capitalists, nnd a few adventurers, may have amassed fortunes in some few instances, but ten times the number of cach description have been ruined; and uoder any clrcumstnuces, the great mass of the community, the laboring classes, salaried officers, nnnnitants of every sort, professional men, medical, legal, and clerical, while they derive litthe benefit from the golilen hirvest, are Inevitahly doomed to suffer their full propertion of the losses which ensue.

Tho moral tone of society is also deteriorated and corrupted by the continuance of prosperity; lusury, with its enervating influence; extravagance, with its Invish expeniltures, undermine the foundation of our moral strength, cconouy, and Integrity, and corrupt not only our mornls but our legislation. An extravagant style of living and habits of persennl expenditure on the nameless artiticinl wants and luxurles of soclety, which are almost Insepnrable from suddenty acguired or even suppositive wealth, have no smill share in creathg a demand for money, which ultimately leads to ruln ; first, hy a loas of cenfidence and impnired credit; next, teniperary sacrifices ; and, finslly, by bankruptcy. And it ls better that it should be so, for the ocensional sifting of the ehaff from the wheat has al ways heen fellowed hy perioda of well-regulated trade, reasonable profits, and that degreo of thifit with which men of integrlty and substance are contented. Trade flows on In lts nat-
ural channels, neither impeded by artificial barriera nor impelled by the force of speculation. Reverses, then, are the aurest safeguards against approaching ruin, and banks managed by conscientious and prudent directors are the great conservatives which arrest the proclivity of financial protigacy to national destruction. What reason ia there, then, in the popular outery in the dominant party against banks, when it is obvious that they are one of the strongest and best protectors of the interests of the Industrial chasses? " It is true that the banks are not beyond the reach of adversity; like other business corporations, they may be on the high tide of success, and tempests from distant quarters may sink them beneath the waters, without any fault of their own. Channels of trade, now full, may dry up; important departments of industry may be broken down ; the earth may not yield Its increase in unpropitlous seasous; wars may arrest or reverse the great currents of trade; embargoes and non-intercourso may sweep commerce from the ocenn; and when the whole ceuntry is overwhelmed with embarrassment by events so great and controlling in the commerce of the world, it can not be expected that the banks should escape."

From 1843 to 1850 , there was at first a diminution and then an increase of enpital, but the circulation steadily advanced cach successlve year, especlally in 1848, oceasioned by the large exportntion of breadstuffs to Europe the preceding year, and the return of nearly twenty-five millions of specie, which gave to all the western banks the long-needed relief. During the fimanclal year ending in June, 1847, our exports amounted to $\$ 158,000,000$, of uhich $\$ 68,000,000$ were in breadstuffs, and $\$ 54,000,000$ in cet ${ }^{\circ}$, and exceeded our imports $\$ 12,000,000$. This amount of exports was larger by $\$ 10,000,000$ than in any preceding yenr (excepting in 1839, when the nmount was $\$ 162,000,000$ ), and nbout $830,000,000$ more than in $1855-16$ or 184 . The amount of domestic experts has never been exceeded before nor slnce, with the exception of $1 \times 54$, when the export of breadstuffs was nenrly $\$ 66,000,000$, and of cotten $\$ 94,000,000$; the whale export having been, in 1847, $\$ 158,000,000$, ns above stated, nud in 1854, $\$ 2-7,000,000$; but In the latter year the imports exceeded the exports nearly $\$ 30,000,000$; while in 1847 the latter were $\$ 12,000,000$ grenter.

We have stated these facts increly to show some of the causes of the fluetuatlons which periodienlly occur in our financial difficulties. It is common to attributo these difficulties to excessive impertations; but this is not so. A tabular statement of the excess of imports over experts will aid us fil our examlnation of this sulject. Slnce 1800, there have been thirteen years when the exports have exceeded the amount of imports frem two to tive millions; $\ln 1839$, $\$ 11,000,000 ;$ in 1813, \$20,000,000; and in 1847, \$12,000,000.

In the intervening years the excess was from two to ten millions, but which our freighta discharged by their enrnings. Wlth the exception, therefore, of 1836 , none of our crises can with justice be attributed to excessive importatiome.

We do not, however, nssort that our hanks are inculpable, ner that they are net responsible for much of the mischlef that this overtrading and speculative approaching us and priswhich arrest national dethe popular aks, when lt rest and best rial classes? ad the reach ations, they mpests from the waters, els of trade, ments of inay not yield may arrest bargoes and n the ocean; ed with em. olling in tho pected that

spirit has occasioned. When the course of our foreign trade is prosperous, and specie is not in demand for export, the baaks have been and are strongly tempted to extend their loans, by the seeming impunity with which they can increuse their prolits, while the cheering influence of public prosperity lias given a great spring to the spirit of enterprise, and by affording aliment to this spirit, they give it a force and vigor of misehief which lt would not otherwise attaln. Thus, without intending $i$, and in tho mero pursuit of their own vocation, they stimulate tho love of gain in all sorts of schenes and adventures. The wihd and extravagant spirit of speculation is never found to prevail to such an extent as will be found in all places where there are banks of eirculation, and especially in those cities and Jarger towns where banks aro numerous; If banks would confino their discuunts to the paper of those who are engaged in a regalar cours, of business, and refuse accommodation to tho rash, adventurous, and oversanguino; if they would restrain their issues whenever the spirit of speculation was rife and rampant, they would do much to preservo the balance of trade, and keep the equilibrium between imports and exports. But whilo hank clarters, for small capitals in country towns as well as larger ones for citica, ran bo so easily obtained, and often is trusted to the ranagement of directors destitute of the knowledge eve 1 of the theory of banks, and especially of that practical knowledge so essential to $n$ right managenent, the course pursued by them will inevitably be injurious to tho commnnity, and probably disastrous to those who own tho stock.
We have in the United States at this period (1856) about 1400 bnoks, with capitals amounting to $\$ 34,000,000$, and a circulation of $\$ 200,000,000$. The discounted paper of these banks is abont $\$ 634,000,000$, and the amount of bonds and stocks held in Europe is prohably near $\$: 100,000,000$ moro, making an aggregate of $\$ 93 \cdot 1,000,000$. Now the ralife of this immense amount of credit is affocted by the condition of our money market, and a depreciation of ten per cent. of its nmonnt ls equal to tho loss of one of our colton crops. Should we allow a few reckless alventurers to trespass upon the rights of others, and by the agency of a few small banks, scattered throughont tho country, disturb our financlal equilibrium and deprecinte the value of property, by causing needless fluctuations? Still, however. the multiplication is going on with fearful rapitlity; some orlginating with partles who havo surplus capital, and wish to facilitate their own and their neighbor's commercial transactions; with others, who wish to invest funds for the suko of tho incomo; with ancther class, who tre solicitous to creato bank capital, as it is called, for tho supply of thelr business wants, by an exchange of thelr own stock notes for tho bills of their chartered banks; and last of all, by those whose sordid motivo is to speculate on the community, by folsting upon it notes of circulution, and then decrying their value, to purehase them baek again through other chanuels at a discount, or perhaps finally abundon them to their fate, without relemplion, on any terms. Our banks are the otspring of twenty-seven different Stntes, and are founded upen the thre different systems of a specio hasts, a safety fund, and tho "freo banking" prinelple, a deposit of stocks; but untll some uniform system of bank circulation is adopted, wo can not hope to escupe the evils of our present heterogeneous currency. The issucs of our bnnks or $\boldsymbol{r}_{\text {d }}$ ht to be regulated ly the state of our foreign exch rges, restricted when gold is thowing out of the conntry, and expanded when it is combig $\ln$. As it is now, however, if the banks in our commercial eities curtail their circulation, the vacumin is seon supplied by tho comintry banks, who eagerly avail themselves of the opportunity, and thas nothing is gained, bul, on tho contrary, much is lost by this substitution of a weaker curreney ; and when n pressure comes, these smaller hnuks adh fuel to tho flames, by their linportumate eries for assistanco and indul.
gence. Tho efforts of our banks on the sea-board can produce but littlo perceptible effeet in contracting the currency, if the great mass of the interior banks persist in issuing their paper as long as they havo contidence in their customers, or the public are willing to receive it. We therefore need a restraining or an werawing power, which can be exercised for the general good; tund until wo have this, tho currency will contiaue to be fluctoating, both in quantity and quality.

An annual report on the condition of the banks throughout the Union is mado to Congress by tho Treasury Department. The resolution adopted in July, 18:32, under which these annual reports are made, calls for "such statements and returns as may havo treen communicated to the Legislatures, governors, or other ollicers of tho several States within the year, and mado public." The want of uniformity of dates, however, is not the only deficiency in theso annual reports; there is no specitication of immediate liabilities and deferred, or of immediate and drferred resources-wit hout a knowledgo of which it ls impossiblo to arrivo at a true knowledge of the condition of the banks. It will be fortunato for the conntry if this sulject should ever nttract the attention of Congress and the State Legislatures, and they should be induced to unito in some common system of action, by which all the banks ln the country sloould be required to mako quarterly statements of their affairs at the same specified dates, at the close of the day's business, and upon a uniform and simplo plan, so that no one who is acguainted with an ordinary account current could fail to understand them. Such, however, we fear, will never tako place, and for the present wa must bo content with tho imperfect, heterogencous, and mystitied statements which are annually furnished to Congress in the voluminous documents of the Secretary of the Treasury, with such condensed tables as the arts of fitunce and divintion will enablo him to mako out, and we must abandon the idea of stntistical exactness.

1800-1810.-The number of State banks in 1800 was thirty-two, having authorized capitals of $\$ 23,550,000$, but it was not all paid ln; nnd it has been stated that the caplanl of the first United States Bank, chartered in 1791 ( ( $10,000,000$ ), prohably excceded the paid up capital of the thirty-two local banks. Of these, eighteen were in New England, five in New York, two each in lemneylvanla, Maryland, District of Columbia and Sonth Curollan, and one in Delaware. Thers are no reliable statements of tho amount of circulation or speeit on record prior to 1808 , but estimates have been putblished by the Secretary of the Treasury, in 1855, which givo tho circulation at $\$ 10,500,000$ in 1800 , and gradually increasing to $\$ 18,000,000$ in 1807 , while tho specie in the country was cstimated at $\$ 17,500,000$, run ning up to $\$ 20,000,000$ during tho aame reriod; tho nmount in the banks, however, is not even conjectured. In 1808 the Bank of the United States had $84,787,000$ in circulation, against $\$ 15,300,000$ in opecio ; and the Secretary adds, "the poliey of the bnnks in New England was whlely different. They pushed their issues to the very limits of their credlt, some of them issuing notes for even frnctional parts of the dollar. The result was, that thero was, in 1808-9, a grand explosion minong tho bauks in New Eugland, by whiel nost of them wero shattered, and some of them totally destroyed."

The tirst return of specio In tho binnks was in 1811, when the amonnt was $\$ 15,400,000$ agralust a circulation of $28,000,000$. Thls amount mast havo heen mainly Irawn from the United States Bank, whoso chartor expired the same year; for from tho time of the embargo in 1808 to 1811, "when our produco could no longer be exported, nll who had any engagements to meet in foroign countrles-nill to whom remittances abroad waro ndvantageous, If not Indispensable-transinitted specie as the commodity must easily concoaled and transported. From this timo the amount of specie di-
minished; the unsettled state of our commereial and political regulations with foreign powers during the three succeeding years presented a new accumulation; and soon after our declaration of war against Great Britain, in 1812, the banks throughout the Middle and Southern States, which had for some time been paying specie reluctantly and sparingly, suspended altogether their specio payments."-South Carolinu Bank lieport.

In 1814 all tha banks in the Union, with the exception of those in New England, suspended payment, and the confusion and depreciation of their notes assisted the plan of re-establishing another United States lank, which was finally accomplished in 1816, with a capital of $\$ 35,000,000$, and a charter of twenty years' luration. This capital, as in the former bank, was paid "oncfourth in coin and three-fourths in stock, which the bank anight sell at the rate of $\$ 2,000,000$ per year." Though its allairs were mismanaged, and it sustained some heavy losses in the flrst ycars after its establishment, it was afterward cenducted with great skill, prindence, and success. It established branches in nesrly every State, and bought and sold bills of exchange lictween all parts of the Union to an immense amount, beeause the low rates of itr -niums and discounts gave to it almost a monopu. of this branch of business. While it rendered this and other important services to commerce, it was the general tinancial agent of the government through nearly the whole term of its existence, and transmitted the public revenue te whatever points it was wanted with equal promptitude nad certainty, and without charge. Its charter expiring in 1836, it was then dissolved, after inctlectual attenpts in both houses of Congress, during twe terms, to connteract the opposition of l'resident Jackson, and to renew its charter. In June, 1832, the rencwal of its cusrter passed the Senate by $n$ vote of 28 to 20 , and in July following tho llouse of hepresentatives contirmed the vote by 107 to 85 , but the president vetoed the bill a week afterward. The same cerporation afterward obtained a charter from the State of Pennsylvana, but in 18.11 it tinally suspended payment, and its shares were sold during that ycar at $\$ 17 \frac{1}{2}$, and subsequently at 89 , the sume year. After the fate of the United States lank was acelded, in 1832, the number of local banks was greatly multiplied, aul rose from 330 banks in 1830 , with eapitals amounting to $\$ 1 \cdot 4,000,000$, to 829 banks in 1838 , with $8: 317,000,000$ capital. So great an increase, and the consequent distention of the circulation, contributed, with the execssive inportations of the four preceding years, especially in 1836, to the general suspensien which tuok place in May, 1837. At this period we commenced these remarks, and we will now advert to some of the local diversities in lanking; for which purpose we will consider the State banks according to the geographical divisions of the United States, as tho banks in each of the tive divisions have some common features of resemblance. We shall then take up the several States where there is a material difference in each division.

New England.-Banking in the New England States has, whth the exception of the Suuthwestern States, been carried on to a greater extent than in any other portion of the Union. The first attempt at banking among the colvaies in New lingland was in the years 1739-10, when the " Land Bank" was established by about eight hundred subscribers, who pledged their real estate to the amount of their respective slaies, and, after the choice of ten directors and a treasurer, agreed to issue $£ 150,000$ in bills, to be circulated as lawful money, each $\& 1$ note beling eeg ' alent to three ounces of silver; but it was soon aiter dissolved by act of l'arliament, and each holder of the lills was entitled to a right of action agaiast any indivhlual purtner fur the amount, with interest. The tirst legitimnte bank in Hoston was instituted in 1781 , the second $\ln 1792$, the third in 1803, all of which are now in existenee; there were, howover, four other banks in the State in 1800,
one of which was the Essex Bank, in Salem, incorporated in 1799. There are no reliable tables of the aggregate condition of the banks prior to 1836; but from various sources we ascertain that the following tabular statements of the number of banks, and the amount of capital at the periods mamed, arc nearly correct, in reference to New Eingland:

| Pears. | Bankn. | Capital. |
| :---: | :---: | :---: |
| 1805 | 47 | \$13,353,000 |
| 1811 | 47 | 12,207,3¢4 |
| 1815 | 63 | 19,053,092 |
| 18:0 | 42 | 19,802,194 |
| 1830 | 172 | 36,297, 869 |
| 1838 | 319 | 66,257,640 |
| 1860 | 312 | 06,2:9, 185 |
| 1856 | 480 | 111,340,836 |

The amual reports of the Treasury for 1850 and $185 \cdot 1$ present the following comparative views of the condition of the New lingland banks on the lst of January:

| 1850. |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| stintes. | llanks | Capitul. | Circulation. | Surcia. |
| Matre. | 34 | \% 3,0, 8, 040 | 42,252,704 | \$4839,231 |
| New Ihampshire | 23 | 2,180,5141 | 1,716,921 | 130,125 |

| Nassachubetls . | 143 | 49,060, 16 | 25,620,472 | 3,731,564 |
| Connceticut... | 63 | 13,164,604 | $10,224,411$ | 1,145, $5^{5} 1$ |
| Hhodo I lanml.. | $7 \%$ | 15,917, 429 | 4,85 5,629 | 259.699 |

Of tha six States of New England, Whode Ishand has the greatest amomint of bank capital in proportian to its population, but its extensive matufacturing concerns require it all. Vermont has the smallest capital, tat its circulation is proportionately the largest, as the preceding tables exhibit.

Prior to the commencement of the present century, and for several years afterward, the presperous condition of the commerce of New lingland gave an inpetus to trade, and a speculative spirit prevailed, athd large invesments, for those days, were made in real estate and the construction of turmpikes. Muncy, in 1808, was in great demand, and at a high rate of interest, lout during that and the succeeding year a great vevulsion occurred; real cstate and all other descriptions of property, depreciated, and several banks failed. The Farmers' Exchange Bank of Hhode 1sland, with a cirenlation of 8650,000 , was among the number, nund the entire amount was a total loss to the billholders, in February, 1809. The falure of this lank caused others to tall, and nmong them, the Farmers' llank of Gleucester, the Coos Bank in New Hampohire, and others of less nete. No slieck of pullic or private credit had taken place, since 1783 , which so alarmed the people of New lingland ns did these fuilures.

Mussachusetts:-After this peried the amonat of hank capital was diminished ahout one million of dollars, although the mumber of hanks was, in 1811, the sume as that of 1815 , being forty-seven in both of those years. In 1811 the State llank, with a cupital of threu millions, was chartered in loston, and tho Merchants' Mank in Salem, both of which were subseribed for by the dominant purty of the digy; and when war was declared in 1812, the State lhank suliseribed \$500,000 toward the tirst war loan of eleven millions, the Merchants' Hank $\$ 20,000$, and the Providence llanks \$80,000, which was the entlie sum taken by the Lanks oi New lingland of the ilrst loan. Of the second lom of thirteen millions, in 1 lecember, $1812,89,230,000$ was subserlbed for by the hanks throughont the conntry, and $88,870,000$ by indivhluals; but the whole amount centributed ly New Eingland was only $3: 2,311,500$, of which Hoston and Salem furnished $\$ 2, i 41,100$. During the war of $1812-1 \cdot 1$, all the banks in New lomgand maintalned specte payments, while all the rest lu thu Middle, Western, nid
em, incorposs of the ag6 ; but from ving tabular the amount y correct, in

Southern Statea suspended payment. The following table exhibita the accumulation of specie in Masaachusetts $\ln 1814$,

| Years. | Banks. | Copplat, | Circulalion. | Sprecia. |
| :---: | :---: | :---: | :---: | :---: |
| 1805 | 16 | \$5,460,000 | \$1,553,824 | \$817,988 |
| 1810 | 15 | 6,685,000 | 2,008,491 | 1,347,722 |
| 1814 | 21 | 11,450,000 | 2, $1222,6 \mathrm{tI}$ | 6,146,542 |
| 1815 | 25 | 11,402,000 | 3,464,241 | 2,740,5tt |
| 18.0 | 28 | 10,600,000 | 2,614,734 | 1,280,852 |
| 1825 | 41 | 14, 635,000 | 6,094,264 | 1,038,986 |
| 1830 | - 63 | 10,205,009 | 5,124, the | 1,258,4+4 |
| 1835 | 105 | 30.410,000 | 9,430,35 | 1,136,357 |

As all the banks in the other New England States were founded on the same basis, It is fairly to be inferred that they wore all well fortified wlth specle, but we can not find any specifications of their condition in any anthentic sliape. We give, however, a comparative view from 1820 to 1837 , to show how rapidly both banka and banking capital were multiplied during thia brief period of seventeen years: showing an Increase between 1820 and 1830 of eighty banks and $\$ 15,335,675$ capitgl, and between 1830-37, of one hundred and slx-ty-three banks and $\$ 33,650,328$ capital:

|  | 92 | \$19,862, 104 | 172 | \$ $86,197,869$ | 335 | \$68,848,107 |

In the suspension of specie payments in 1837, all tho New England banks concurred, but they all resumed in 1838 ; ar.d in the suspension of 1839 , only three banks in Maine (one of which resumed) suspended; one in New IIampshire partlally, and sixty-threo In Rhode Island, twenty-one of which immediately resumed payment; the remaining banks in the other fivo States all redeened their bilis.
The banks of New England were originally founded upon the only true principle of banking-a full paid up capital in coin, placed under the management of disereet and responslble directors. The caution which characterized these important personages in those early days superseded the necessity of providing ngainst the cunniug devices which modern financiering has discovered; aad hanks were regarded as the depositories of surplua wealth, concentrated for the ostensible purpose of accommodating the publle by discounting short paper with anple security, and thereby yielding to the stockholders a satisfactory remuneration whthout any personal exertion or care. The trade of our country was then limited in its extent ; manufacturep were carried on by individual exertions only, and disposed of within the narrow precincts of their own neighborhood. The products of agriculture were exchanged for artleles of domestic use, and our commerce, then in lts infancy, was principally employed in the conveyanco of our domestic productlens, and the proceeds of our fisheries, to the West Indies, South Amerlea, and Europe, and returned home with such productions of those countries as were required for consumption or use ; and for such eperations bank facllitles were not needed. But the unparalleled increase of the commerce and navigation of Massachusetts, Maine, and Rhode Island, as well as throurhout the country at large, aoon ereated a class of traders who purchased and held larger stoeks of merehandise for their husiness, and whose transactions were protlalily enrrled on between the merchant and the agriculturist, the lmporter and the consmmer, the exporter and the producer. In proportion as trade and commerce increased, their operations call dinto requisition a larger amount of capital, and bank facilitles were more and more needed. The stringent regulations of earlier days did not suit the whats of the community, nul new hanks were created with more liberal views, liut still conducted with great cantion. With every decude of years, the hanking institutious have always kept pace with the legitimate wants of trade, nul sometimes transcended then. They have now renehed a point where it is desirable that they should rust a while, as tho banks in New laghand are more than one-third of all the conntry in number, and but little less than one-thitrd of Its entire hank capilal.

It is now upward of seventy yenrs sluce tho first bank was established In New England, and the country has passed through the varlous viclssitudes of prosperity, und adversity, commercial selzures and embar-
goes, peace and war, growing out of the continental troubles in Europe; and when, after the general peace of 1815 , the country emerged from its dark cloud of despondency and resumed her commercial pursuits, it was with a buoyancy which astonished the world with her unprecedented succeas. Since that period we have been in imminent peril of war, once with France, three times with Great Britain, once with Spain, and engaged in actual hostillties whth Mexico, to say nothing of Austria and Peru, which were of minor importance; and although all theso national troubles have, with but one exception, been amicably acttled without an appeal to arms, atill their effeets have been felt in our financial circlea, producing those audden fluctuations which operate so disastrously upon tho interests of trade. Throughout all these perilous periods the New England Stetes heve proudly sustained their banking system, yielding only once to the financinl erisis of $183 \%$, which prostrated every bank in tho Cuited States, for one brief year, and even then with reluctance. It must then be conceded that a system which has been aubjected, fer so long a period, to such various vicissitudes and severe experience and trial, must possess elements of vitality and atrength which should entitle it to the confidenco and support of the community, however antiquated lt may appear to he, in comparison with those aubtle theorica which our modern linanciers so strenuously advocate.

In reviewing the bank listory of New England, we find many errors and omissions which have from thene to time been corrected, as the various developments of batik failures were scrutinized ly successive Legislatures in every State. The very first charter granted in Boston was unlimited in its duration, but it has aince been restricted by consent, and expires in 1870. But the greatest error was in relation to the power of issuing notes. An overissue of pajer is one of the greatest mischiefs of hanks, nnd one to which they are most strongly tempted by the desire of inereasing their profits; it is obvlously wise, therefore, to impose a limit on these issues, which should not under miny circumstances be transcended. But we tind that when tho tirst eharters were granted, the Legislatures, heing unfomiliar with the subject of banking, and lenrning probably from English books that the Bank of lingland considered it a safo rule to huve in its vaults one-third as much specie as it had notes in circulation, they coneeived that after having refuired the whole enpital stock to be puid in specie. they were ndopting tho same rule ns the llank of England, ly limiting the amount of circulation to three times the amount of the capital steck.
I'his provision having once found its way into some of the early churters, it was copied linto others on the presumptlon that it had been tested by experience. In some of tho States the only restriction was that the mmount of their loans should not exceed three times
the amount of thelr capltal stock, or that their issues should not eaceed that proportion; but both theae restrictions are merely nominal, for there is not a bank In Naw Eagland whose discounts have ever amounted to three times the capltal. Thia error, however, has been remedied in all the States of New England, first by law, and secondly by the operation of the Suffolk Bank aystem, whlch exerclsea a constant watchfulneas over the iasues of every bank, and not one can venture apon an excessive issue without immediate exposure. The laws of Massachusetta, in relation to clrculation and leans, are as perfect as leglslatlon can make thein; they limit the circulation te 25 per cent. hayond the amount of the capital pald In, and impose upon the atockholders an individual lisbillty to the amount of thelr atock, for the redemption of the billa of the bank. The loane are Ilmited to double the amount of the capital pald in, nor can they be extended beyond this amount, however large or permanent the deposits may be. Weekly returne from the banks in Beaton, and monthly returns from all others in the State, are required to be made to the Secretary of State on the first Monday of the month, showlng their true condition, under a penalty of $\$ 500$ for every omlasion; and, finally, three commissionera are appointed, whose duty it is to visit every bank and savinga bank "at least once in every two years, and to examine every new hank, and every bank whose capital has been increased, within a year after they go into operstion, or after the atock shall have been pald in respectlveiy." Msine, Vermont, and Connecticut. have bsink commissioners also, and with the aid of the proposed new" Bank of Mutual Redemption," shoult it go inte operation, the currency of New England will be the safest in the Union.

There liave been other crrors In banking in past tlmes, of which we have not yet taken notice. The Legislatures of the different States have not been eufflciently careful to discrimlnate between real and nominal capital; and while the stockholders have gone through the form of paying up the stock of the bsnks, it has been too often nothing but form. In some instances, stock notes have constituted the chiof part of the capital; gold has been borrowed from other banks for the purpose of exsmination on pay day, and then returned to its rightful owners. The stock notes were the nrxt day discounted by the new bank, its bills paid out therefor, and acattered far and wide for the purpose of circulation. Being new, curiosity would retain them for a whlle, until the bank could gather In its deposits, and these would enable lt to redeem that portion of them whlch would be presented for specio payment.
Again, the banks have been too numerous, though the capltal may have been real, and thls part of the machlnery has been not only more expensive, but more casily deranged. In consequence of the excessive competition induced by the undue multiplication of banks, arts and achemes have been resorted to for the purpose of obtaining a larger share of circulation, thereby enlarging thelr profits, the currency greatly distended, and the safety of the lisnka themselves endangered. In general, the same capltal will be safer, as well as more profitable, if concentrated in one bank, than If distributed among severul smaller ones. When the number of banks has been sufticlently enlarged to secure to the public the benefit of competlition, $1 t$ appears to be as unwise to moltiply them any farther as lt would be to make any unnecessc. $y$ addition to the number of our collegea, churehes, or any other public inatitutions.

The only innovations which have been attempted upon the banking system of New England have been Introduced in Vermont, Massschusette, and Connectlcut, hy the passage of free banklng laws; but the experiment has signally failed, and the laws have become almost inoperatlve. The charters of the banks in Maine expire by limitation in 1857 ; those in Rhodie Island are perpetuai, and therc, aa in Massachusette,
sterkholders are Individually liahle for the redemptlon of the circulation. The faiiures which have occurred have been numerous, but they have all originated elther from a deficiency of the paynient of the original capital, or by palpahle mismanagement. It hmo been truly remarked by a keen observer, that "the personal charac. ter of the officers and atuckholders of banks is intimately bleaded whth thelr amfety. At the atart, good intentions prevail as a general rule, and the directors psy strict attention to business; gradually, however, the management passea into fower hands, and sometimea into one only. Trade in money has lts pecullar effecta upon character, like all other occupations and avocations, from which effect only the most sterling men escape. Malpractice will grow as care and dillgence slacken; so, from neglect or undue anxiety to make me.1ey, lossea occur. Thls ls the general feature of all banking; much of the safety of banke lles in the unreinitting attention of directors and atockholders to the affairs of the bank."

The truth of these remarka will be admitted by those who were conversant with the circumatancea attending the dissaters of the followlng banka in Masaschusetts: American, Kilby, Conimonwealth, Oriental, Middling Intereat, Cochituate, and many othera in Boston; and the Newburyport, Woburn, Rox bury, Chelsea, Nahant, Dover, and others in the country. In Malne-Kennebec, Custlne, Hallowell and Augusta, Wiscasset and others. In Connectlcut-Eastern, Derby, Esgle of New Ilaven, Commerclsl Bank of Tolland, Bridgeport Manufacturing Company, and others. In New IIsmp-shire-Hilsboro and Piscataqua. In Verment-Windsor, Barrington, Agricultural, Green Mountain, etc. In Rhode Ialand-Bnrrlllvlle, Eagle, Franklin, Mount Hope, etc. We hava speclfied these banks becsuse they are the most promlnent and the most recent, and, with perhaps some few exceptlons, owe their downfsli to one of the two causes to which we have alluded, viz., fictitious capital or palpable nilsmanagement. Tie art of auccessful banking is in itaclf a science, not acquired with facillty or mere observation, but by laborlous study and application to its practical details and operations; and when we investlgate the orlgin, foundation, and carcer of the various hanka in New England, and the vlclssitudes and political changes througit which they have passed during the period which we lave been considering, it appeara marvelous that any of the earlier banks should have been conducted in safety through the mysterics and perplexities of currency in its frequent contractions and expansions, and of exchange in lts constant fluctuations, produced by silent operatlons in distant mickete, and imperceptibly, yet inevitably, influencing the monetary condition of their sphere of operatlons. And yet, in comparison with the whole number of banks In New England, how few of them have failed? And to what cause can we more probably attribute it then to the excellence of the system under whleh they aro constitnted-a specie basis 9

Middle States. New Iork,-In the early history of banking in Now York, since 1800, politics and finance were so intermingled that the question of granting a bank charter was a matter of direct isaue between the two polltical partlea of the day; but prior to that period, in tise cstabllshment of the first banks, this state of partisan excitement did not exlst, but in lieu of It there was a jealousy in regard to the incorporation of moneyed instltutlons; and after they were estabiisised, great caution was requlred to avold the perils which their opponents had predicted would inevitsbiy ensuc. Fortunately, however, tha first bank cstablished in New York was managed with such abillty and diseretion that It disarmed all opposition, and became an important auxiliary to the gevernment of the Unlted States, by' a losn of $\$ 400,000$ at five per cent., thereby securlng in its early career great popularity, aa the bank owed no favor to the government, and hed ted either al capitas, a truly retal charac. intimately ond intenectors pay wever, the sometimes liar effiects ind avecarling men 1 diligence $y$ to make ature of all n the unreders to the 8 attending sachusetts: 1, Middling oston; and ea, Nahant, ne-Kennescasset and , Eagle of Bridgeport New llamp-ont-Winduntain, etc. klin, Mount aks because recent, and, eir downfall lluded, viz., ment. The pace, not acput by labodetails and prigin, founw England, yes through d which we us that uny onducted in ities of curansions, and roduced lyy perceptibly; condition of comparison igland, how Luse can we xcellence of d-a specie arly history and finance granting a etween the to that pe3, this state n lien of it poration of estallishthe perils inevitably k establishability and Ind becaine ent of the oper cent., opopularity, ht, and had
no interested motives in loaning the money. The organization of this bank (the Bank of New York) was, however, an association for banking purposes, rather than a regular bank. It commenced business in 1784 (ita first application for a charter having been unsuccessful) without a charter, and diacounted short paper at 6 per cent. per annum, which rate was advanced to 7 per cent. three years aftervard. In 1791 a charter was granted, the act of iacorporation having been drawn by General Alexander Hamilton, which was not materially altered before its expiration. Its authorized capital was $\$ 1,000,000$, but it is now double that amount, and its annual dividends hava uaually been 8 to 10 per cent. per annum.

The next banks incorporated were the Bank of Albany in 1792, and the Bank of Columbia, which were chartered without any other opposition than that of the timid portion of the community, who had not forgotten the disastrous losses by the Continental aystem of paper money.

In 1799 the Manhattan Company was incorporated, with an unlimited charter, and was regarded as a partisan triunph; and from thls period all projected moneyed institutions in the city of New York were advocated or opposed on political considerationa only, and thus finance and politics became blended in the contest, which continued untll the question of the construction of the Erie Canal diverted the gladiature of zealous politicians to this new area of strife. In 1801 the whole number of banks in the Stata wae but five, whose authorized capitals were $84,722,000$. In 1803 the New York State Bank at Albany was chartered, and In 1805 the Merchants' Bank in New York, having cominenced busincss, however, two years previous to its being chartered. There were then, in 1805, but seven banks in New York State, the aggregate of whosc capitals was oaly $85,430,000$; but it has now 300 banks, having a capital of $\$ 96,000,000$. In 1810 the Mechanics'Bank was chartered; in 1811, the Union, and the Farmers and Mechanics' in Albany; in 1812, the Phoenix, the City, and the Bank of America. The projectors of this latter bank originaliy applied for a cspital of six millions of dollars, to eupply the place of the United States Bank, whose charter had ao recently expired, and offered for the charter a bonus to the State of $\$ 400,000$ unconditionally : $\$ 100,000$ in ten years, and $8 \mathbf{1 0 0 , 0 0 0}$ in twenty ycars, if, at the expiration of those terms, there should be no additional banking capital authorized by the Assembly in the city of New York. Th $3 y$ further offered to loan the State one miliion of dollars, at 5 per cent., for the construction of the Erle Canal, and one iniliion more at 6 per cent., to be reloaned to farmers and otiters ou landed security.

As in the case of the Manhattan Company'e application for a charter in 1799, all the arts of political intrigue were brought into requisition, but after a protracted and violent opposition the bill was finally passed as pettioned for; hut a subsequent Legislature suthorized the bank to reduce its capital to two millions of dollara, and at the same time reduced its bonus to the State to $\$ 100,000$, as immediately after the charter was granted war was declared against Great Britain, and "with it came the long scries of commercial disssters and financial troubles, and a gencral interruption of our forcign trade." In 1814 the banks in New York, in consequence of their iiberal bonus to the government, and their excessive iseues of paper consequent thereon, suspended epecie payments, ill common with all the other banks in the Middle, Western and Southern States. Six months after the euspension, the news of peace was recelved, but the banks did not resume specio payments; and instcad of contracting their circulation, they increased it, and were ellcouraged to do so by the general governinent, who coutinud to recelve their inconvertible paper for public dues, until February, 1817, when there was a partial resump-
tion of specie payments, and the second United States Bank commenced lts operations. After the peace in 1815, large amounts of specie were annually exported to the East Indies and China, and the premium on silver was from 15 to 18 per ceat. The United States Bank resarted to forced importations of specie to supply the vacuum, and having spent 8500,000 on one experiment, they wisely abandoned the acheme, and allowed trade to follow its natural chanacls. Between 1812 and January, 1818, about two hundred new banks were chartered in various parta of the Union, which distended the currency to its utmost point; but a day of reckonlng was near at hand, and ail further inflation was at an end. In the middle of 1818 the contraction commenced, and banka and individuals were owept away in one promlacuous masa of ruin. The disastrous effects of this local banking mania were felt until the cloas of 1820 , and in many pertions of the country for many succeeding years. The following tabular statement exhibits the lanking capital of New York during this period of twenty years:

| Yoare. | 8enka. | Copital. |
| :---: | :---: | :---: |
| 1801 | 5 | $\$ 4,720,000$ |
| 1805 | 7 | 8 |
| 1811 | 8 | $7,480,000$ |
| 1815 | 26 | $19.62,760$ |
| 1816 | 27 | $18,766,818$ |
| 1820 | 38 | $18,988,766$ |

but we have no means of ascertuining the amount of circulation or specic. The estimates of the whole country for 1815 were 208 banks, $\$ 82,260,000$ capital, $\$ 70,000,000$ to $\$ 110,000,000$ circulation, $\$ 15,500,000$ specie.

When the suspension of epecic payments took place in 1814, a public meeting of the merchants and others interested was held, and they promptly sanctioned the measure, under the assurances of thie banks, however, that whenever the war was terminated specie payments should be resumed. Duubtless this was the intention of the banks, as they commenced the curtailment of their loans immediately after their suspension; but when peace took place the redemption of this pledge was not demanded at the stipulated time, and the banks, regardless of all moral obligations, and scinnulated by the prospect of large profita and enormoua dividends, extended their circulation to an amount unexampled in the anuala of foliy. The "plenty of moncy," as it was called, was so profuse, that the bank directore were fearful that they could not fiad a demand for all the "mouey" they could falsricate, and not unfrequeatly aolicited individuals to become borrowers, under promises of indulgence of the most liberal and tempting nature. Every city, town, and county had ita own local currencs; bearing no equivalent with, or fixed proportion to, any other; and r. acw and extensive class of brokers appeared, who stih exist, and have cver been supported at the expense of those who have been defrauded by tite banka of their just right, the par value of their notes.

When the United States Bank was incorporated, the city banks becane alarnied for their safety, and made a retrograde movement, and, by a reduction of their loans immediately, occasioned great commercial distress. This temperarily produced a reduction of the currency, and the directors of the National Bank proposed to the State banks a resuinption of apecie paymests on the 21st Feliruary, 1817, and the city banks, reiying upon the forbcarance which had been extended to them by a conflding but defrauded commanity; whe for two years and a haif had been paying 6 per cent. per annum for their depreciated and dishonored bank bills, assented to the arrangement, and specie payments were nominally resumed on the appointed day. But the resumption was merely nominal, for silver, beth foreign aud American, stiil commanded a premium over the par value of city bank-notes, and depreciation may result, as weli from the forbearance of
creditors in demanding their righte as from tha refusal of hanks to meet their engagements; and this arrangement was not a real resumption, but a mere change of one species of inconvertible paper for another of like character. As soon, however, as the directors of the National Bank had completed their arrangement for elevating this depreciated paper to the atandard of their own convertille notes, instead of reviewing the experience of the past, or acting upon the genersl principle that circulation could not be extended beyond a certain limit, and that, when this point was reached, any further isenes would occasion depreciation, and with the full knowledge tinat auch was the actual state of exiating affairs, they at once commenced issuing their own circulation, and in a few months added to the currency an anount greater than that which had previously been withdrawn. By their operations, the currency nominally convertible was depreciated below its former rate, and retrograded instead of advanced toward restoration. But the bank tinally diacovered its error when almost too late, and sought to retrieve it by withdrawing their circulation, reducing their Joans, and curtailing all their other transactions, thereby causing a second pressure in October, 1818, which continued for more than a year, and in many parts of the country many years longer. If the city banks had availed themselves of the opportunity of curtailing their operations while the United Stater Bank was extending, it would have heen financial wiadom; hut the same cupidity controlled their movements, and they were aiso compelled to contract thelr issues, Joans, and all other operations.

The banking system of New York was originally founded on the universal principle of a specie basis; but after tho disasters of the period which we have just been reviewing, financiers and political economista were impressed with the beiief that there was something defective in tho system; that sone reform was necessary in regard to the currency, and that unless a remedy was found, the whole banking fabric would uitimately be overthrown. The first innovation which was tried commenced in New York with the adoption of the "safety fund" system in 1829. It required from each bank an annual contribution of half per cent. of its capital to a common fund, to be deposited with the State Treasurer as a "bank fund," until it amounted to 3 per cent. of the capital of each bank, and was to be applied to the payment of the dehta of any bank whicit might become insolvent which had contributed to the sama; and in case the fund was at any time dimiuisined by payment thereffom, the lanks were again required to make their aunual contributions, till each had in deposit the 3 per cent. on its capital stock. For a series of years this system was regarded with favor, but the sudden failure of 10 banks, with capitala amounting to $\$ 2,059,000$, occasioned a loss of $\$ 1,548,560$ for redemption of circulation, and $\$ 1,010,376$ for the payment of the other liabilities of these insolvent hanks. At the time of the failure, the fund amounted to $\$ 1,876,073$, and the balauce was paid lyy a 6 per cent. stock authorized by the State, the redemption of which stock was provided for by the subsequent contributions of the banks to the fund. Under this same law of 1829, three bank commissioners were appointed, with large powers, to superviso and Inspect the several hanks of the State. These officers were at first appointed, one by the governor and Senate, one by the city banks, and one by the country banks; but in 1837 the power of appointing the whole number was transferred to the governor and Senate, which placed these officers " within the vortex of the great political whirlpoel of the State, and the place was sought for and conferred upon partisan aspirants, without due regard, in ali cases, to their qualifications to discharge the delicate trust committed to them." In 1843 the Legislature abolished the office, couferring the power of examining the banks upon the controller of the State.

After nine years trial of the " safety fund" acheme, it was virtually abandoned, and arother experiment was sulustituted in 1838, by the passage of the "free bank" law. Ey this system "every jndivldual and agsociation was anthorized to engage in the business of banking; and on depositing with the controller the stocks of the United States, the storks of any State which should be or be made equal to a $\delta$ per cent. atock, or auch stocks and bonds, and mortgages to the same amount on lmproved, productive, and unincumbered real estate, worth double the amount secured by the mortgage, over and above all buildings thereon, and bearing an intereat thereon of 6 per cent. per annum, the controller was required to deliver to auch individual or association an equal amount of hanknotes for circalation, duly numbered, registered and aigned at his office." No specific amount was required from individual hankers before they commenced operations, nor were the stockholders Hable in their individual capacity. The reault was, that in the alundant supply of stocks of every description, banka were immediately created out of the chespest materiala, and bank-notes were furnished to the community with the most generous profusion. This extraordinary expansion prodaced the uanal resulta, inflation of prices, extension of credits, and wildness of speculstion; and to aid the delusion, the bonds of the Western and Southwastern States were freely supplied. But the crisls came with fearful reaults; firat in the ahape of nonpayment of interest, next of great depreciation, and, finally, the repudiation of the State bonds, and this consequent failures of the banks which owned them. But these disaaters did not discoarage the peopie from a peraistence in the scheme of free banking; on the contrary, the Legislature of 1840 preserved the system, by excluding tha stocks of other States, after that date, and required the banks to deposit the stocks of New York and the United States only. Although the sys. tem has been materially impreved by legislative enactments since it was first established (and aimost every year furnishes some valuable amendment to its provisions and restrictions), and is now regarded witis favor by prominent financiers, as affording ample security to bill-holders, yet even on this point there may iinger some doubts. In perieds of prosperity all would be well; but in the event of severe pressure and a panic, a sudden contraction of the currency, and a general withdrawal of all fiosting capital, the free banks would find it difficult, if not impossible, to convert their stocks and mortgages into the requisite funds to carry on their redemption; and the failure of cven one of them wonld be disastrous to inany. In confirmation of these remarks, we have only to recur to the contreller's past reporta, and ascertain what the results of the failures of some of these free banks were, and we find the following, among others: St. Lawrenco Bank, securities $\$ 81,277$, sold for $\$ 27,23250$; New York Banking Company, N. Y., securities $\$ 26,000$, sold for $\$ 4,370$; Erie County Bank, whose mortgages for $\$ 15,000$ on property valued at $\$ 31,500$, exclusive of buildings, were sold fer $\$ 3,000$; State Bank of New York, Buffaio, $\$ 5,000$ lilinois 6 's, sold for $\$ 81250$; and so on with the remaining 27 banks in his report of 1849. To illustrate the rapid progress which the banking interest has made within the last twenty years, we add the following tabic:

| Years. | Bank. | Capital. |
| :---: | :---: | :---: |
| 1838 | 160 | $\$ 37,101,480$ |
| 1850 | 198 | $48,618,762$ |
| 1854 | 298 | $80,726,370$ |
| 1850 | 300 | $06,000,000$ |

Weekiy returns of the condition of the banks in the clty of New York were first made In Septenker, 1849, and in October, 1853, a "clearing-house" was establisined for the city banks. The returns for two years, for 1858 to 1855 , show an aggregate of exchunges of $\$ 11,875,996,450$, and of balances aettjed of $\$ 600,273,826$.

Te ilking intereat o add the fel-Pennsylvania,-The first bank which was established in this State was the Baok of North America, whici was chartered by Congreas on the 81st December, 1781, with a capital not to exceed ten millions of dellars, and withont any llmitation of duration. The charter was confirmed by the State In April, 1782, and It commenced its operationa upon a capital, paid $\ln$, of \$ 400,000 , and as the country was deficient in netes of circulation, and its credit stood high, it was enabled to extend its issues vastiy beyond its capital. The extensive circulation of the notes of the bank, occasioned by the disbursements of the government, which was a heavy borrower, emboldened Ite directors to overstep the bounds of discretion. The channela of circulation soon became surcharged, and the public, beginning to doubt the ability of the bank to redeem its notea on presentation, they were reiurned so rapidly for payment, that it was compelled to call epon its debtors for payment also. This reduction of losns occasioned a genersl preasure for money; bankruptcles, nsurlons extortions, the disappearance of apecie, and the impos. sibility of procuring money at the legal rates of intercat. Petitlona were ahortly after ward presented to the Legislature for the repeal of the charter, which was granted on the 13 th September, 1785 ; but the bank contioued its busineas, claiming the right to do so under the charter granted by Congresa. In March, 1787, the i.egislature revived its charter, limiting its capital to $\$ 2,000,000$, of which only $\$ 830,000$ were paid in, and its duration to fourteen years. In Februs ry, 1791, the first Rank of the United States was chartered, with a capital of $\$ 10,000,000$, for twenty years, and on the expiration of its charter in 1811 , It was weund up. In 1793 the Bank of Pennaylvania was chartered, with a capital of $\$ 2,000,000$, for twenty years, with four branches; in March, 1804, the Philadeliphis Bank, with s capital limited to $\$ 2,000,000$, of which $\$ 1,800,000$ were paid in, and limited to 1st of May, 1814, but afterward oxtended to 1824 , with liberty to establish branches, and four of which were established; in March, 1809, the Farmers' and Mechanics' Bank, with a capital of $81,250,000$, to continue till tho 1 st May, 182. These were the only incorporated institutions in 1811, although there were others in the State, such as the Farmers' Bank of Lancaster, with a capital of $\$ 300,000$, establiahed in 1810, and several others in the city as well as in the State. The foliowing circulation of the three chartered banka wo give:

| Sanks. | $\begin{aligned} & \hline \text { Circulation. } \\ & 1811 . \end{aligned}$ | Circulation. 1816. |
| :---: | :---: | :---: |
| Bank of Pennsytvania | \$1,425,203 | \$1,400, 850 |
| Phtisdelphta liank ............ | 718,309 | 654,420 |
| Farmers and Mechanics' Bank | 804,730 | 504,700 |

In March, 1810, the Legislature enacted a law to prohibit unincorporated associations from issuing notes or pursuing any of the operstlons of banks; but in defiance of its provisions, the system was persevered in, and even companies Incorporated for the purpose of constructing bridgea departed from the apirit of their charters, converted themselves into banks, and isaued notes for circulation. This mania for banking would soon have been checked by the return of the notes for paymeut, had not the war of 1812 intervened, and the cessation of the demand for apocie for exportation to India and Chins removed the usual check at that period agsinst excessive isanes of bank paper. The apparent success of the Farmers' Bank of Lancaster, wiich, frem the enormous extent of its lssucs, was ensbled to divide 12 per cent. per annum, and to accommodsto its atockholders with loans to double the amount of their stock, had a powerful influence on the public mind. During the session of 1812-'18, a bill was passed by the Legislature, by a majority of one $\ln$ each branch, to incorporate twenty-five new banks, whose aggregate capitals amounted to $\$ 9,525,000$, but it was vetoed by Governor Snyder, and returned with his objections, some of which were, that "it would, by
readinese to give credit, invite to visionary speculations, divert men from useful pursuits, danmp the ardor of industrious enterprise, and consequentiy demoralize the community." In March, 1814, the aubject was renewed, and a lill was passed Incorporating fortyone banka, witi capitala amounting to upward of \$17,000,000, of which only one-fifth part was required to be paid in. Although the hill passed both houses by large majorities, Governor Snyder returned thia bili also, with his objections, but two-thirds of both houses voted for its passage notwithstanding; it became a law, and thirty-seven banka went into operstion nuder its aanction.

The immediate commencement of a number of these banks, whose bona fide capital was licie more than the first installment required, increased the amount of circulation, already too redundant, and the depreciation of the currency grew worse and worse, and ali confidence In Ita convertibility was lest. The new banks discounted stock-notes to meet the remaining installments, and hence only one-fifth part of their capitals was ever paid in, aa before atated. In our remarks upen the New York banks, wo have commented upon the movements and operations of the United States Baak in 1817 and 1818, and their influence was, of course, more severely felt in the central polnt of its negotiations, Philadelphia. And hero it would be most appropriate to glance at the rise, progress, and final doom of the second United States Dank; but so much has been written on the subject, a ad its history is so familiar to our readers, that we shall add no further remarks to thoan which have already been made in a previous portion of this review.

In 1819, 16 of the 37 banks chartered in 1814 failed, and in due time were officially announced as "diasolved, unlawful, and unincorporated," and there were at the same time 22 banka more in the State transacting business without charters. In 1820 there were 86 banks in existence, with capitals amounting to $\$ 14,681,780$, and an indefiaite number of "freebooters." It is an unpleasunt task to run over the next deeade of years, from 1820 to 1830, for there is nothing cheering in the review; throughout almost this entire peried there was a rs.pld succession of untoward events, leading to embarrassments, insolvency, litigation, diahoneaty, and more flagrant crimes. It is a continuous history of bankraptey throughout a large portion of the country, and of frauds npon the community wlthout any provious parallel. Hanks wers bribed to fuil, that the stockholders night pay their indebtedness in the currency of the same bank, after it had reached its minimum poiat of depreciation, commenly 50 per cent. "Money mills" were established In New York, Yhiladelphia, and other places, which were based on the system of the celebrated Malepar, the keeper of an oyster cellar in New York, who had the adroitness to swindle the community out of $\$ 500,000$ by his notes of circulation, and whose moto was, "Make money, horestly if we can, but ruscally if we must." In 1822 there was a pressing acarcity of money; in 1825 and 1826 , convulslona and bankruptcies among the banks; in 1827 and 1828 among the banks and the manufacturers from Now England to Georgia; but in 1829 and 1830 the gloom which had settled so long upon the country was dispelled, and a brighter prospect was unfolded. For the first time for eight years, the natural conrse of trade had brought a balance in specie of eight millions and a half of doliars into the country, and to Pennsylvania there is due a large share of this fortunate resnit, by her effective act for the suppression of the circulation of sinall notes wlthin the horders of the State. Here was an illustration of the principles which have been alwaya maintalned by the ablest financiers of our country, "that we must widen the basis of our metallic curreney by aioliahing the use of small notes, so as to allow coin to take the place of them, as it inevitably would."

Another causo of this influx of gold in 1830, and its
temporary retentlon in this couniry, was the partial cessation of tha exportation of apecie to India and Chinn, occasloned by the sulstitutlon of bills of exchange, and letters of credit on London for the inperts from these countries. On a review of the talular atatements of the capitals of the banks in Pennsylvania, there does not appear, with the exception of If14, when the 41 banks were chartered, any exiraordimary augmentation of banking capital.

| Yaars. | ginakg. | Capital. |
| :---: | :---: | :---: |
| 1901 | 9 | \$5,000,010 |
| 1805 | 3 | 7,000,000 |
| 1811 | 4 | 6,153,000 |
| 1815 | 42 | 15,048,800 |
| 1820 | 86 | 14,081,780 |
| 1588 | 25 | 98,760,838 |
| 1845 | 51 | 16,154,400 |
| 1850 | 54 | 18,066,360 |
| 1806 | 57 | 21,281,464 |

During the four years of $1832-1836$, the speclo ime ports exceeded the experts more than thirty-six milljens of doliars, owing to a combination of favasable causes, viz., high prices for cotton, au increase of English credits, foreign Indemnitles paid in gold, Increased production of our Southern gold minea and the sllver mines of Mexice, loans effected ln Europe by the United States Bank, and varieus other operatlons in atocks and bends. The consequence of this influx of gold was an increase of lasues by the old banks, and the establiehment of new ones. The number of banks in the country was estlmated in 1830 at 829 , wlth 110 millions of capital. In 1837 there were 788, including branches, and a capitni of 290 milions.

In 1836 the Bank of England required payment from the "American housea" in Lendon, whicis was resounded throughout our commercial cities, and shortiy after Congress passed "the surplus revenue" bill, and tho bank credits, which represented the surpluas revenue, were tranaferred from place to place without any regard to tho laws of trade. The combination of theso circumstances was too much for the banks, and they all simultaneously stopped specio payments in May, 1837, as well as three of the leading American banking hourcs in London. The depreciation of bank-netes throughout the country varied from 12 to 25 per cont. The banks at the eastward adopted all needful measures to secure a speedy resumption of payments, but in the west and south an opposite pollcy was adopted, and new banks were created. During the residuc of 1837 and 1838 , the excess of apecie importa over exports was eighteen millions of dollars, of which a part was aent by the Bank of Eingland to enable the American banks to reaune. In May, 1838, the banks in New York and New England resuased, and continued to pry specie. In Augusi following, the banks of Philadelphia professed to pay specie; and in January, 1839, there was a nominal resunption throughout the United States. In October, 1839, the Philadelphla banks suspended a second time; resumed in January, 1841 ; suspended a third time 4th February following, and permanently resumed in March, 1842.

Moryland.-The first bank established In this State was the Bank of Maryland, which was incorperated In 1790, with a capital of $\$ 300,000$. Next in the order of successlen was the Bank of Baltimore, incorperated in 1790 , with a capltal of $81,200,000$, of whlet $\$ 1,122,900$ were paid In. In 1803 the Farmers' Bank of Maryland, wlth two branches, was chartered, with a capltal of $\$ 1,000,000$, of which $\$ 752,745$ were paid in. Next,

and four others in. 1814, one in 1815, and one in 1816, the aggregate capital of ali uf which was $\$ 13,300,000$, of which only $88,506,595$ w ere pald in.
Thn annexed tabular statement, derived from the Treasurer's reperts and eatimutes, will exhibit the amount of lianking capital In the State for the last fifty years, and presenta a striking contrast to the banking mania of other Atlanilc citles.

The progress of bank caplial in Maryland has heen less than In other States, viz.:

| Yamm. | Banks. | Capital. | Years. | Bank. | Capital. |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1702 | 1 | \$500,000 | 1530 | 21 |  |

| 1 220 | 14 | 0,708, 180 | 1860 | 80 | 11,180,881 |
| 1830 | 13 | 6,280,496 |  |  |  |

Somo of the banks apecliedi In the preceding schedule failed in 1834, auch as the Bank of Maryland, Farmers' Benk of Maryland, Elkton Bank, liavre de Gruce Ilank, Susquehanna Bridge and Banking Company, and various others; but the loas of their capltals was supplied by the enlargement of others, and is scnrcely perceptible in the above returns. As an Illuatration of the vlelssitudes of some of these banks, we select at random the history of the FrankIIn Ilank, of Baltimore, chartered in 1810, whth a capital of $\$ 600,000$, for five years, and of which $\$ 415,000$ only were paid In. In 1815 the charter was extended twenty ycars, and in 1821 ten years more, but a tax for the benefit of the acheel fund was impesed, of twenty centa on every hundred doilars of its stock. In 1834 the charter was extended from 1815 to 1857 , and in 1835 the bank was autherized to double its stock, making its capitat \$1,200,000; but in 1840 it was discorered th.. i is caahior had conmitted Jarge frauda on the bank, and it was compelled to stop payment $\ln 1841$. After an exambation of Its affalrs, tha legislature authorized a reduction of its capital to $\$ 301,595$, and in 1853 lt was Increased again to $\$ 500,000$. The acioption of the new Constitution in 1851 imposed upon stockholders in new banks, or in these whose charters might be renewed, personal liabillty for the debts or lishilities of such banks, to the extent of the stock held by them respectively. lin 1852 the circulation of notes under five dollara was prohilited by law, under similar penaltles to those In various other States, and we believe has had a favorable influence in creating a isrger clrculation of coln.

The banks of Maryland all suspended specie payments in 1814 and 1887, in comnion with all the others In the Middie, Weatern, and Southern States; and it would be superfluous to recapitulate the circumatances attending these events, as they have already been doecribed in the precedling pages. The same cnuses occasioned and the same results followed in hoth periods. It wlll be recellected that in 1814 the New Eugland banks did not suspend payment, and this produced great jealousy and acerbity of feeling, especially in Baltimore. In Niles' Register, in 1814, we find the following remarks: "If meney (specie) be the evidence of commercial prosperity, Massachusetts was never half so well off as now. Soine ycars ago, when tho trade of the United States naturally sougint the places where its commeditics were to be had, one of the Baltimore banka had mere specie than all the banks in Massaclusetta combined; nay, prebably nore than there was In the whole State, whether in possession of the banks or of Individuala ; and so it will hava again, when a regular and honest commerce shall succeed the British war and Eaatern smuggling." Instead of the "cominercial prosperity of Massnchusetts" being derived from " Eastern smuggling," the true cause may be found in the following ahstract from the report of a committee of the Senate of Pennaylvania in 1819:
"The 'rws of the New England States hed been so rigerous on the aubject of banks, which were llable to

- in 1816 , $.3,300,000$,
from the chibit the e last fifty e banhing

## pecie pay-

 the others es; and it umstances y been decausea octh periods. $v$ England jroduced ecially in e find the e evidence never half the trade aces where Baltimore in Massahan there ion of the ve again, ncceed the ad of the being deause may eport of a 1819: d heen so liable toa penalty of 12 per cent. per annum for the non-puyment of their notea, that no diprecintion of their currency twok pitice. The connequence thereof was, that the difference between the New England pricea of commoditiea, stocka and foreign bille of exchange, and those of lennsylvania, was equal to the extent of the depreclation of the currency of the latter, and as our hank-notea were at that time redeemable on demand, the moat protitable remittance which could le made to New Englánd in exchange for her commodities was specie; and this demand created a run upon the banks which they were not able to withatand. The aituation of the Southern and Weatern banks was precisely oinilar to that of our own; all had overiasued, and a general depreclution had ensued. The aume cuusea produced the same effects, and a general atoppage of payments of ail the bunks in the United States, except those of New England, took place in Auguat and Septemier, 1814. The New Lagland demand, it is true, was Increased by two causes, viz. : tirst, by fucilities in foreign trade through neutral vessela, which wero afforded them by an exemption from the blockade of the enemy ; and, secondly, ly a well-grounded apprehension that the Southern Lanks, from tiseir extensjve emissiona, would necesaarily become embarrassed. Certain it ta, however, that all these causea combined conld not have produced a general suspension of payment hat our banks observed the same caution in their issues fas that which characterized the banks of the Eastern States." Again, in Niles' Register of 1821, we find the follow. ing remarka: "That country whose money currency is kept at the highest rats of value will havo tho greatest advantage in trade with other countriea. The hand of lubor ia not injured by monoy being scarce; no interest of the country la injured, but the apeculator and monopolizer. It is true that the acarcity of money checka imports, but it encouragea exports; it is not ao important in what the money consiste, as that it ahould be at aa bigh a rate of value as that of other countries."

New Jersey.-There are two other States in our subdivision of "Middle States"-New Jersey and Dela-ware-which claim our attention next. Tise increuse in New Jersey was us followa:

| Yuara | Bunka | Crapital, |
| :---: | :---: | :---: |
| 18105 | 2 | $\$ 1,000,000$ |
| 1811 | 3 | 780,740 |
| 1815 | 11 | $2,121,932$ |
| 1820 | 14 | $2,120,049$ |

From and after this period banks occasionally failed, and new ones created to take their places, and talular gtatementa would not exhibit the unnual rise and fall of the moneyed institutions. In our ordinary "Bunk-note Reportera" there may be found the numea of about thirty of these banks, ogainst three of which the word "fruud" appears, and among these ia the "Morris Canal and Banking Company"-a concern which made no inconsiderable commotion in Wall Street at one period. Besides these fuilures, there is nothing in particular to note, until 1835, when the Fegislature pussed a law prohibiting the issue of amall bills. From authentic sources, we learn that the New Jersey banks had in circulation $\$ 500,000$ in bitis of denominations below tive dollars, and an equal amount in five dollar notes, being one-eighth part of the entire amount of small bilis in circulation in the United States, and one-half of their own emissions.

In 1850, general bunking iaw wus passed in New Jersey, which, like those adopted in other States, has subsequently been revised and amended. "The new banks establighed, or at least noat of them, instead of being legitimate banks of discount as well as of issue, are simply manufactories of paper money, for the benelit of their owners rosiding in other States, having no affinities here, and of no advantage to Now Jersey, save in the amount of tax on their capitals that may be pald into the State Treasury ; and it ia queationable
whether that ls not more tian counterbalanced to the people of the State by the loss they suatain in the diacount upon notes pasaing through their hunds. As the protite to the ownera depend entirely upon the depreciation and the circulation of their notea, it becomes deairable that the tanks should be oatensibly located in places difficult of accese, ao that no one wiil be disposed to apply at their counters (if perchance they should have offices) for the "pecie or its equiralent; and the more diatant and out of the way, the greater the discount they will bear, and the greater the accruing protit. And to extend their circulation, nothing ia easicr than to adopt the name and general nppearanco of some well-known bank, in good eredit, keeping the place of issue as mucin in tho background as possible. For example, locuting a 'Delaware and Iludson Bunk' amidst the sanda and pines of Oceun County, making the title very prominent, but having the place quite the reverse, so that the inexperienced are readily induced to recelve tho noten." These bankn aro entitled to three days' grree upon any application for rudenption, and of course they have ample time to procure the specle from Wall Street whenever they are pressed. In 1853 there wero 24 regulur banks in New Jersey, the aggregate of whose cupitals was $\$ 4,080,815$-whose charters expired in from one to twenty-one yeura. Besides these, there were fourteen "free banks," the aggregute of whose capitals was $\$ 1,026,966$, and circulation $\frac{1}{8} \mathbf{i} 22,895$. In him message of 1852, Governor Fort recommended the prohitition of the issuo of any notes under five dollars; after two years, ull uncer ten dullars, and in a few years all under twenty doltars, and then proceede: "I am satiated, however, that fifty dollars, as tho minimum denomination of hank puper, should be our ultinuate aim. If we excommunicsto all small notes, whether of our own or other States, specio must necessurily flow in to aupply their places.. The smalliness of our territory presents no serious olsjection; the constant trade with the large cities on our borders would supply us with an abundance of the precious metals, which no adverse policy of neigibboring Statea could possibly prevent. The State which soonest ndopts the use of coin, by the expulsion of paper in the amaller business trunsactions, will outatrip all others in the permanent prosperity of every other branch of useful industry. Bank explosions and individual bankruptciea would then be as rare as they srenow frequent."

He further adds, "the persistent evasion of the law by some of the free banka calls for prompt and efficiont action on the part of tho Legislature. They are of no adrantage to the business community, and add nothing to our reputation as a State. I would recommend that an inguiry be instituted in regard to theso banks, to the ead that auch as do not coniluct a regular and buma fide banking busineas be dissolved. This may be done by the legialature, under the provisions of the 17 th aection of the general banking act."

The following atatement showa the practical working of the general banking law:

| Vans. | Banko. | Carital. |
| :---: | :---: | :---: |
| 1841 | 26 | \$3,834,816 |
| 1849 | 25 | 3,407,061 |
| 1850 | 24 | 3,5c5,283 |
| 1882 | 25 | $4.019,00$ |
| 1854 | 24 | 4,080,st5 |
| 1854 | 14 Free | 1,006,023 |
| 1850 |  | 5,522,060 |

Delaurare.-In the State of Delaware there was onc bank in 1801, with a capital of $110,000-$ Bunk of Delaware.

| Yoarn. | nanka. | Capital. |
| :---: | :---: | :---: |
| 1815 | 5 | \$990,980 |
| 1800 | 6 | 974.900 |
| 1807 | 8 | 818,020 |
| 1849 | 2. | 210,009 |
| 1850 | 4, with 8 branchea | 040,000 |
| 1854 | 6 , with 3 branches | 680,000 |
| 1856 | 8, with 3 tranches | 1,090,000 |

Banking is done in this State on a specie basis, and we believe that the oniy failures which have ever occurred in it were the Bank of Milford, in 1854, and the Laurel Bank. In New England, as we have previo ousiy jtated, there are 486 banks, with capitals amount-
 are in Maskechusetts.

Weatern States: ${ }^{7}$ Ohio.--The first bank chartered in Ohio was in 1803, called the Miami Exporting Company, with a capital of $\$ 200,000$. It was nut a regular bank, but "its main. arpose was to facilitate trade, then suffering under great depression." The Bank of Mariotta wat chartered in 1808, and subsequently the Buak of Chililicothe, the former with $\$ 600,000$, the latter with $\$ 100,000$ capital. Other institutiona were soon after incorporated, and the following atatement shows the progress of banking in the State:

| Yearl | 旦nake. | Caplial. | Years. | Bank. | Capital. |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1805 | 2 | \$ 2000,00 | 1568 | 88 | \$9,247,296 |
| 1811 | 4 | 8.6,000 | 1840 | 87 | 10,807,521 |
| 1815 | 12 | 1,484,710 | 1845 | 8 | 2,151,807 |
| 1810 | 21 | 2,031,927 | 1850 | 66 | 7,189,827 |
| 18:0 | 20 | 1,797,463 | 1850 | 60 | 6,906,240 |
| 1836 | 24 | 6,510,692 |  |  |  |

Of the banks chartered in this State, 18 have been closed under various circumatances of disaater or want of auccens, and their bilis are sold at 50 to 75 per cent. diseount, and about 86 of them have falied, and their bihs are reported as worthless. Two branches of the second Bank of the United States were astablisired in Cincinnati and Chilicothe is 1817, and the State imposed a tax of 500,000 on each brancl: in $1819 \boldsymbol{i}$ inut after a long controversy in the courta, it wes decided at Wuahington that the tax was ilieral, and the State sabmitted to the decree. In 1845 a new syatem of banking was introduced into the State, knowr as the "safety fund syatem," and under the ammo act, an "independent bank aystem." The fonner was based upon the New York system, but it was more perfect; it ereated a State bonk, subdivided into about forty branches, under the supervision of a Board of Control, who farnish all the notes required for circulation ; and to this board each branch is required to contribate 10 per cent. of the amount required for circulation, either is stocks of the State or of the Uuited States, or the amount in money; to be appiied by the board, in case of need, to the redcmption of the notes of circulation of any coe of the Granches which may fall to redeem its bills; and each brinch is required to contribute in the ratio of the circulation to which it is entitjed, to the sumn necesaary for the redemption of the notes of the failing bank, to be remunernted from the anfety fund as scon as the sale of the atocks in the hands of the board of control can be effected. Whenever a tranch fails, all its property, notes and assets, pasp inco the hands of the Board of Contrel, who appoint a receiver to wind up its affaira, and distribute the proceeds among the stockholders after all the delits are paid. Of the $\mathbf{4 2}$ branchea there arv aow $\mathbf{8 6}$ remalning, whose aggregate capital is $\hat{⿻} 4,034,525$; four irranches have become insolvent and are closed, and one hus withirawn and become re private tank. The atreugth of this inatitution lics in the obligation of each branch to recelve the notes of the others in payment of debts, and with a safety fund of 10 per cent., serared by a deposit of 4808,000 , io protect the circuiation in the event of the faliure of any one or mora branches; the constant superviaion of the lloard of Controi over ail thinir movementr, and the jeaious vigilance of each other to protect themselven from lose by tie mismanagement of others. All these furnisil a guarantee of the eirculation as perfect as can be desired; quarterly atatements are required from each bank, which are regularly published by tine Auditor of Stute, and the community et large have tiereby a full knowledge of their true condition at desiraile intervais. Under the old syatem, bank commiasioners were appolnted to ex-
amine the banks periodicaily; but the Board of Control now perforn these duties. The independent banka are twelve in number, having a capital of $\$ 587,500$, one of them having become insolvent, and two others are liquidating thelr concerns. These banka are required to deposit with the Stata Treasurer certiflentea of atocks, either of the I'tate of Ohio or of the United States, for the entire amos nt of their circulation, which can not exceed three times the amount of their capital. These banka are annualiy examined by a commissioner appointed by the auditor, and quarteriy returns of their condition must be furnished to him, and are publiahed with those of the State Bank branches. The banke are all required to have 80 per cont, of the amount of their circulation aiwaya on hand, in goid or silver coin, or its equivalent in value, one-half at least being in gold or dilver; "but deposita in any bank or banker'a hands of established credit in the cities of New York, Boston, Philadelphia, or Baltimore, subject to drafta nt aight, and payable in apecie, shail be deemed equivalent to gold and ailver." Of the brnke chartered prior to 1845, but one remains in existence, the Ohio Life Insurance and.Trust Company, whcre operations are managed in two departments: the "Trust Department," and the "Banking Department." Its capital is two millions of dollars, and it was chartered in 1884, and at one time ita circulation was nearly one miliion of dollare; but in 1842 the bank surrendered the right to isaue noten, and its circulation has all been rednemed, excepting 84350 , which hav: never been presented for payment, and a large portion of which probably never will be; as, for the past aeven years, long intervala (in one instance, neariy eighteen months) have elapsed without the presentation of a singie bili, and that for only five dollars. in 1851, the Legislature passed on act authorizing "free banking," and under its provisions 18 banks were established, the aggregato of whose capitais was $\mathbf{7 3 8 , 0 5 0}$, and a circulation was created of $\mathbf{6} 769,397$. At one period thls was nearly one million of dollars lurger; but in consequence of some of the bank plates having been stolen, un alarm was raised, and the notes of these banlis were auddenly presented for redemption. A few monthe after the passage of the free bank law, the now Conatitution of Oinio was submitted to the prople and was adopted. By its proviaions, the Generai Assemily were no longer authorizad to grant hanking powers to associations, untii the peopic ratified any act passed for that purpose, and approved it thy thelr votea, taken at the next general election after the passage of auch acts. : In addition to thls fatal blow to all projected banks, in 1852, the General Assembly pasaed the notorious "tax law," which, under a forced cunstruction, levied an exorbitant tax upon all the banka, and which for a time ihreatened deatruction to every moneyed institution in the State. Fortunately, the Supreme Court of the Unlted States overraled the decisions of partisan judges, and pronsunced this outregeons tax wnionstitutional. From the preceding, it appears that there are fo r clasaes of banks in Ohio, and each of them has furnished one or more instances of failure, oceasioned more by imprudence and mismanagement than from any defect in the syatem under whicin they were organized. Tho experience of four yeers has taught the people of Ohio some aevere lessons in regard to currency, whilch hua been chiefly supplied to them by the banks of other States, unt eapecially iy Indiena; and a law has passed the Legisiature, which is now before tie peopic for adoption or rejection, during the present montis, authorizing "the incorporatlon of the Jank of Ohio and other isunks," in order to furnish additional banking fucilities to the increnaed trade and popuiation of this pronpeross Stata. ${ }^{2}$ We are, however, nnt without apprehenalon that the "personal liability" clause, or thir-ty-fifth section of the act, will render it inojerative, oven If the act should be ratifled by tise peopie. certlficates the United tion, which eir capital. mmissionreturns of ad ẹre pubhes. Indiana.-Next in order comes the State of Indisna. This State was admitted iato the Union in 1816, snd in 1820 it had two banks, whose capitals'amounted to \$202,85\%. In 1834 the Stata Bunk of Indlanu vas incorporated, with a capital of $\$ 1,600,000$, and with tea branches, subsequently irsreasel to thirteen in num ber. By the originul charter, $\$ 160,000$ were assigned to each branch, but they were subsequently authorizes to increase the amount to $\mathbf{\$ 2 0 0 , 0 0 0}$ each. The branches were muttally liablo for the debte of each other, but divided cheir own profits; each share was subject to a tax of $12 y$ cents for educational purposes, In lieu of all other taxea; but in case of an ad valorem aystem of taxation in the State, then the atock was lisblie the eame as other capitai, not exceeding, however, 1 per cent. sltogether. No note under, five dollars was allowed to be issued, and the Legislature reserved the right to restrict it to ten dollars within ten years. Tho capitul of any branch might be increased by and with the asseat and concurrence of the Legisiature and the directors of the State Bank. The directors of the parent bank were to have charge of the platea and bank paper of the branchea, and were empowered to delive: "o them an amount of auch paper not exceeding twice the anount of the stock subacribed for. One-half of the stock was subecribed for and owned by the State, for which they anthorized bonds to be issued to the amount of $\$ 1,300,000$, at $\overline{5}$ per ccit, to realize tho funds to pay for their half of the stuck; the remsining half was to be subscribed for, and owned by Individuala and corporations. : 'The depta of oach branch were limited to double the amount of cupital puid in, exclusive of deposits. In Jenuary, 1836, an amendment vas passed by the Legislature, and the discounts were allowed to bo extonded to twice and a half of the amount of the capital paid la. In 1841, the branches were authorized to issue notea of $a$ less denomination than five dollars, not exceeding one mililion of dollars, on the payment of ono per cent. for the privilege; and of ita circuiation, about $\$ 3,800,000$, nearly one-sixth part was ic small notes. After tho resumption of specie bayments in 1838, out of the 959 banks thou in existence, 848 wholly auspended, and 62 partislly so; of which latter numiser were thoee of the Stute Bank of Indiana, which dis not again resume the payment of apecie until October, 1841 , when the branchea held $\$ 1,12 \overline{4}, 018$ In specio, to meet a circulution of $42,340,414$, and deposits amounting to $\$ 317,890$ oniy. Since that period the bank lias muintained Its credit Inviolate, and under able management succeasfuliy offerted a regular reduction of its saspended debt, which had rapidly socumulated during the inflation of basiness in former yeare, without ruinous sacrifices to tho debtors of the bank If we scrutinize the origin of this bank, we perce ve at once that lt was founded on false princlplos, and that the lssue of the State bonds for $\$ 1,300,000$, to provite for tho payment of $\$ 800,000$ of atocks, was a violation of the tirst article of the Constitution of the Inited States, which prohibits any State from issuing "bills of credit." "No Stato can coin monay -na State (not even Congress itself) can make any thing a tendor hut goid and silver-no State can emit lills of credit." In direct opposition to those views, Indiana issued hor bonds to procire her quota of stock, und for upward of twenty years has been participating in the prolits of the institution. In Novembor, 1851, a now Censtitution wont into operation, and in May, 1852, a general banking law wae passed under ite provisions; it is called "An act to authorize and regulate the business of banking." It was liberal enough in its detalls to ault all parties, and ninety-four banke wora in a brief period in full operation, und supplying all the neighloring States, and expecisily Ohlo, with avery variety of pictorial bank-bills which the art of engravera could devise. In Ootober; 1804, there were 84 of these hunks whose bilia could be found in any
of the banks of Cincinnati, and the returns whleh were publighed of 67 of these exhiblted $\$ 7,428,067$ in circulation; and their authorized capitale $\$ 32,900,000$. At one time the circulation was not far from nine millions of dollare, and as the securities deposited with the anditor (and for which bank-notes were exchanged dollar for dollar) might be ladiana 5 per cent, bonds, worth only about 95 per cent., the law prosented atrong temptatlone to bank operators, :"A Board of Direntors was not a necessary appenduge to a bank, nor were the stockholders required to be citizens of the "tate.". The reault wan, that after the oppreseive tax law of Ohlo had driven banking capital from that State, It was at once lavested in the "free banks" of Indiana. The puil., were duly warned of the danger of thle acheme of banking in the following suggestions: "Is It not obvious tha; a banker who issues ten times the amount of his capital in circulation does so for speculative purposes only ? The temptation is great-for in periods of proeperity he can make 80 to $\$ 40,000$ per annum by hie circulation; and $\mathrm{j}_{\mathrm{c}}$ the bank faile, he $\mathrm{I}_{\mathrm{s}}$ oaly liable for $\$ 50,000$, or the amount of hia atock; and even this he might avold by a timely tranefer of hia stock to irreeponaible parties, and thua avoid personul responsibility altogether. But how long would it require to dispose of the $\$ 000,000$ of Indiana 5 per ceat. bonds in the New York market at par (at which rate they have been received by the auditor), in a period of punic, or even In a severe monetary crisis; and meanwhile, what would be the discount on the bills of his lunk if driven into liquidation P Past experience hae taught us that the comusunity would suffer a loss of twenty-fice per csut. of their amount, and we maintain that that is not legitimate banking which axposes a community to such a contingent huzard." Such was the prediction in 1854; whut was the result? Of the 04 iree banks of Incliana, 81 have, suspended, and their bills are selling at from 25 to 75 per cent. discoant in the city of Cincinnati. The charter of the State Bank of Indiaas expirea this year, but the Legislsture, at their last eession, churtered a new State Hank, with a capital of $\$ 6,000,000$, having 15 to 20 branches, one in each apecitied distrist-the new bank purchasing the Interest of tho State in the old bank, and the capital to be puid in by the lst of January, 1857.

- Jliznoir,-Bank legialation in Illinois has been quite as extroordinary as in any other State in tho Union. This State was admitted into the Union In December, 1818, hut the firat bank was established whilo it was under territorial government, in 1818, at Shawnee iown, the whole territory then containing but 1500 lniabitants. In 1816 it was regularly incorporated, and, aided by the governmont deposite, it acquired extensIve credlt, paying specie for ita bills until Auguat, 1821, after the Kentucky banka had ouspended; it was at length compelled to atop, and remained dorinant until Fobruary, 1885, when tho Legislature renewed its churter until 1at January, 1857. In the following month its capital, originally $\$ 300,000$, was lncreased to $1,400,000$, and subseribed for ly the Stato; and their bonds, payable in 1861, were issued to provide the funds for this increase of capital.

Tho Constitution, in 1818, prohibited the establishment of any new hanks oxcept a State Bank and its tranches ; and in March, 1819, "the Stnto Hank of Ilinoia' 'ras incorporated, with n capital of $\$ 4,000,000$, for 25 ye d, ouc-hulf to be antisacribed for ly individuala, and the bulance by the Stute, whenevor the legislaturo thought proper. This charter was repealed in 1821, ss no effort wns made to carry it into operation, and another bank was chartered In liou of lit, with a eapital of $\$ 000,000$, for ten years, to be owned by the State and managed by the Legialature. The capital consisted of ifs office furniture and banh-nofe plates only; andi 3000,000 were dirgeted to be lissued and loaned on notes for one year, with mortgages as securities, and
noi exceeding $\$ 1000$ to each individual. These notea were receivable for taxes and all debte due to the State or the bank. It had hurdly commenced operations before lta bills fell to $\mathbf{7 5}$ per cent. ; shortly after to $\mathbf{5 0}$ per cent., and finally to 25 per cent., when they ceased to circulate at all. The members of the leglslature recelved their pay in the dapreciated currency at the market value, and on one occasion received $\$ 9$ per day for their servicea, which the State was compelled to redeem at par; and a loan of $\$ 100,000$ recelved in these notes at par was pald out at fifty centa on the dollar.

In February, 1835, a new bank was lncorporated, with a capital of $1,000,000$, with the liberty to incl 188 it to $\$ 2,000,000$-the State taking $\$ 100,000$ of the atock; but in March increased the cuplitul $\$ 2,000,000$; the whole of which tise State subscribed for. The bank was allowed fifiy days for the redemption of its billa, and was required to redeem the $\$ 100,000$ loan above referred to. The career of this bank was brief; it was sortly compelled to auspend pryment, and in 1842 it went Into liquidation. After the auspension of epecle payments in 1837, the State was without any bunks until 1851, when a gencral banking law was passed, similar to that in the States we have already elescritied. The bonds of all States paying 6 per cent. Interest, United States atocks and Illinois bonds st 80 per cent. were received by the autitor in exelange for the notes of circulation, and the bank commenced operations. The amount of burk-notes is limited to the umount of the honds in the hands of the aadItor; but the denominutions are optlonal, so that the whole circulation may lie in one dollar notes if the parties choosa to require them; but in case of fallure to redeem them, they are subject to $12 \frac{1}{2}$ per cent. Alamagea per annum, ten days having elupsed after specio is demumed, and the corporate privilege becomes forfeltel. The stockholders are individually liable for atl the debtes and liabilities of the bank, and provision is made for the collectlon oi the aame, if occasion ahould require. The act iloes not limit the amount of caplal, excepting that it shall not be less than 850,000 for cach brak, nor the 'ength of time, but learea tooth optional whth tho applicants, who may designate any number of millions for any mumber of years, unlimited end perpetual. There are now Ifty banks in Illineos, whose enpitals amount to alout $\mathbf{8} 5,000,000$, and thirteen of uncertain value, rangine from 10 to 75 per cent. discount.

These three States-Ohlo, Indlana, and lllinolsall of which are usually culled "Weatern;" but there are three more ilealgnated as "Northwestern"-Mlehigan, Jowa, and Whaconsin-which we include in the aame divislon. Michigun was almitted into the Unlon of the States in Jsnuary, 1818 ; and in 1838 there were 11 thanks, with an eggregute capltal of $\$ 1,400,000$. IHring that year many more wero creatod, as tho following atatement will slow:

| Yoars. | Hanka and nranchea. | Capital. |

The obly linnka whl is are now in existence In the State are the Michlgun Insmrance Company, the J'enlnnular Ilank, and F'urmers' and Meehanies' Hank, all of Detroit; the llank of Macomb County, and llank of Tecumseh in the interior. "Free lank Inws" were adopted by this State in 184!, mind persomil liabillity is also imposed upon the stockholiters. The Treasurer of the Stute has the supervision of the banks, and the cus-
tody of the aecurities deposited for the bank-note circulation.
lowa.-Iowna was admitted into the Unlon In 1946, but at present this State is deatitute of sny Incorporated banks. There la a private bank, called the Miners' Bank, ut Dubuque, but lts bills are not current, nor even salable in Cincinnati.

Wisconsin was admitted into the Unlon in 1848. The first bank was established in Milwaukie, in 1851. with a capital of $\$ 220,000$. In 1852 the free banking law was adopted, almilur to those in other States, receiving all Stato atocks paying 6 per cent., and first mortgage railread bonds, on roads of their own State, at 80 per cent. of their par value, but not exceeding one-bulf of the cost of the road on which they are a lien, nor for more than one-half the amount of the circulating notes delivered. A tax of $1 \frac{1}{2}$ per cent. was imposed, and the personal liability of the stockholders, to the amount of their stock.

There is a bank controller by law, wio has the supervision of the banks, receives the aecuritles, und issues the notea therefor. Dills under $\$ 5$, of forcign banks, are prohibitel from cireulation.

Soutifen Statis, Keutuchy.-This State was admitted into the Unlon in June, 1792, and the first bunk was establibhet in 1802, with a cupital of $\$ 150,000$, in Lexington, under the covert name of an insurance company, which was authorized to lssue notes, payable ta Learer. In 1904 a regular bank was incorporated, uniler the nane of "The llank of hentucky," with a capital of $\$ 1,000,000$. This bank suspented payment in 1814 , but resuncd it in 1815; in 1817 forty new banks were incorporatel, with capitals amounting to $\$ 10,000,000$, and had permission to redeem their notes with the bills of Kentucky banks, instead of apecic. In 1818 the State was lnundated with the paper of these lisaks large loans were maile, apeculation was rife, and mont of the bublles which were set afluat collapsed within one brief year. The pressure became universal, and for "reliei" the Legisla: are churtered a new bank, "The Commonwoalth," wiih a capital of three mill lons, pledging the public faith for the redemption of its clrculution; and as security held certain lands, south of Tennessea River, us a gruarunty. If a creditor refused to receive this paper in payment, the debtor was authorized to "replevy the telt for the spuce of two years." Tho paper of the new bunk fell 60 per cent., and creditors hat the choice of the payment of one-l:slf the amount of their clalma, or a delay of two years in the settlement, with all tho hazard of ultimate bankrujtey, and a totnl loss. The conflict of the two parties, known as the "rellef" and antl-rellef," or the "old court" and "noer court," was the flercest which ever agitated the State, but ufter five years struggle, tho "old court" party trimphed, the replevin act was repealed, and the paper of tho Commonwealth Bank was suppreased, and ultimately leatroyed by anceessive acts of the legishature. In 1883 the dominant party determined to supply the place and curreney of the two branches of the United States Bank, at Lexington and Lonisville, ly the establishment of State hanks and in 1884 the llank of Kentucky, with a capitul of flive millions, the Northern llank of Kentucky, with three millions, and the llank of looujville, with tive millions of dellars, were chartered, and aro now in exiatene; but whose aggregute capitals are only $\$ 7,030,000$, instaad of tha thirteen millions grantel. In 18107 all theae banks suspended paymenta in specie, but resmmed agrin in 1830, and the Legishinture ehartered the Southern llank of' Keutucky, Shortly afterward, however, the banks suajended a second time,

 tain lands, If a creditor the deliter to space of fell 50 per ayment of lay of two of uitimate of the two ef," or the cest which s struggle, in act wis alth lank successlve mant party ney of the Lexingion te hanks; cky, with with five fo now lil are ouly granted. in specie, ture charrtiy afterond time,and the universal prostration of trade, the repudiation of their bonds by some of the Stater, and the universal derangement of the currency South and West, prevented the atock of the now bank from belng taken up. The trading community was in a desperate condition, yet they staggered on under their oppressive load of debts; but by the liberal accommodations and indulgences of the banks, thay were partially relieved, until 1843, when the pressure gradually diminished, and shortly afterward it ceased altogether. In 1842 the three banks resumed specie payments, and from a circulation of $\$ 2,800,000$ in 1842, gradually extended their issues until $: 950$, when they amounted to $\$ 6,688,000$. The Soutisern Bank of Kentucky had i. : $\mathbf{c}^{\mathbf{L}}$ \& r amended, and in : 852 went into operution with. : capital of $\$ 1,800,000$. Since then chas ers have beela granted to the Farmers' Bank, with $\$ 2,300,000$ eapital ; the Commercial Bank, with $\$ 400,000$; the Kentucky Trust Company, with an unlimited capital ; and tho Newport Safaty Fund Bank, wilth $\$ 300,000$ capital. Both of these institutions failed in 1854, and their notes are now selling at 50 per cent. discount; and the small netes of the latter bank at 00 per cent. With the exception of the charters of these two laat banks, the legislation of Kentucky has bee. I of a fixed character, and her circulation has ever been eateemed in the Western Stutes as of the highest charucter. There
now 34 banks and branchea in the State, the ag-
te of whose capitals is $\$ 11,730,000$, and circuLitien abeut $\$ 13,3000,000$. In the session of 1854 , it was proposed to charter six new banks, with capltuls anounting to $\$ 0,100,000$; but tho governor having veloed one of the blils of incorporation, the bilis all failed to pass, and there for the present the matter rests.

Tennessec.-In 1807 the Nashville Bank was incerporated, with a capital of $\$ 200,000$, afterward increased to $\$ 400,000$, and after one or twe suspensions It wound up with loss to all parties. In 1811 the Bank of tho State of Tennessce was chartered, with a capital of 400,000 , and nine other banks, with capitals of $\$ 200,000$ to $\$ 400,000$ each, and wero permitted tu become branches of the Bank of Tennessee. In 1819 the Farmers' and Mechanics' Bank of Nashville was chartered, with a capital of $\$ 400,000$, but within a year it was insolvent. In 1820 tho State Bank of Tennessee was established, with a capital of $41,000,000$, on the basis of funds belenging to the State. This bank loaned money to individuals, in sums of $\$ 500$ to each, on twelve months' credit, secured by a mortgage. The bank was not required to haeg any specie, but was anthorized to sell $\$ 250,0006$ per cent. State stocks as its working capital. The proceeds of the IIlawasse lands, and seme other securitles, were pledged for the redemption of the clrcuiation, and although its paper was rejected by two of the oldest banks In the State, and was 10 per cent. below par, yet the bank struggled on, and after six years it attained an availablo capital of $\mathbf{6} 575,000$ out of the proceeds of the pledged lands. The bank was llnally weund up in 1892, with consideralle loss to the Stato. The Union Ilank was incorporated in 1832, with it capital of $\$ 3,000,000$, the Stato owning one-third of the stock; in 1833 tho Planters' lank was incorpornted, with a capital of \$2,000,000; and in 1885 tho Furmers' and Merchanta' Bank of Menphis, with $\$ 600,000$ eapital. This latter hank for a short time enjoyed a high credit, but it attempted to do too much business, ond falled in consoquenco. In 1838 the Jank of Tennessee was incorporated, with a capital of $\$ 3,220,976$, all owned by the Stute, its nominal capital lieling $\$ 5,000,000$. Tho State requisitions on this bank were so onorous, that its capItal, in 1849 , was reduced to $2,500,000$. Subsequently to the charter of the Bank of Tennessce, in 1843, the Bank of Eaat 'l'ennessec, enpital of $\$ 800,000$; in 1848 , the Lawrenceburg Bank, capitai $\$ 100,000 ; 1852$, the Citizens' llask of Nashrille and Memphis, capital
$\$ 200,000$, were chartered. In 1852 a free banking law was passed, similar in its provisions to thoae we have previously described, but, like those in other States, requiring amendments. Some eight or ten banks have been organlzed under it, but it is not very popular in the State. In addition to this, the Legisluture, in 1853, chartered seven stock banks, with a view of supplying the vacuum which the winding up of the Bank of Tennessee would occasion, and which Governor Johnson recommended in 1855. The last returns of the banks in this Stete are in number 46, capltals $\$ 11,827,197$, and all are under the supervision of a State controller.

Arkansas.-We have little to say of Arkansas, where there are no remaining banks to claim our attention, and proceed at ence to $M$ ississippi, whera the theme is as fertile as thelr cotton crops are luxnriant. Thero were formerly two banka In Arkansas, the Real Estato Bank and the Bank of the State of Arkansas. They are both in the hands of trustees for liquidation, and are indebted to the State about $\$ 1,500,000$, and interest to an equal amount for State bonds loaned to them, and still unpaid. This State was admitted into tho Unien in December, 1817, and it had then one bank, with a capital of $\$ 100,000$. In 1820 this capItul $w$-a increased to $\$ 900,000$, and in 1830 it had but one bank, capital 8950,600 . At thls period there wero no banks in Kentucky or Missouri, enly ene in Tennessee, two in Alabama, and four In Louisiana.

Afississippi.-During thls year tho Planters' Bank of Mlasissippi was chartered, with a capital of $\$ 3,000,000$, of which two-thirds were reserved fer the State, and one-third alletted to individuals. In July, 1831, tho State lssued $\$ 500,0006$ per cent. bonds, and in March, 18:2, $\$ 1,500,000$ more, for her proportion of the stock. These bonds were sold at $13 \pm$ per cent. advance, and yielded to the State a preminm of $\$ 250,000$. This was deposited in the bank as a slinking fund, to he increased by the dividends on the State's stock in the bank, from which fund the interest on the two millions of bonds was te be regularly paid. Tlte bank paid 10 per cent. dividends up to September, 1889, when tha State stock was transferred to tho Natchez Railroad Company. The sinking fund was then $\$ 800,000$ boyond the amount roquired to pay the interest on the State bonds. In 1830 to 1839 , a large proportion of this fund was lost, and the remnants left were only $\$ 00,000$, to which nbout an equal sum has since been added by the commissloners, ly collectlons from the assets of the Planters' Bank. In 1835, the banking capital of the Stato amounted to $\$ 12,000,000$, and such was the presperous condition of the State, thut it was proposed to add $\$ 10,000,000$ mere te the amount; and in the sessien of i835-36 about $\$ 17,000,000$ in banks and rall. roads were chartered. In 1837 there were 18 banks in Misaissippl, the aggregato capltals of which were $\$ 12,872,815$, having a circulation of $\$ 5,073,425$, and loans $\$ 24,851,414$. But the emi was not yet. In 1838 the Mississippl Union Bank was chartered, with a capital of $\$ 15,500,000$, to be "ruised by means of a loan, to be ehtalued by tho directora of the institutiun." Tite governor was authorized to lsane 7500 houds of $\$ 2000$ each, interest at $\sigma$ per cent., and payable $\ln 12,18$, and 24 years, and for the payment of which the faith of the State was pledged. Two nud a half per cent. in casis was required of indivitual sul)scriptiens, and the balanco aecured by mortgerges on real estate. In Juno, 1838, Governor M'Nutt executed and delivered to the bank 2500 of the proposed honds. The three cemmissioners appointed under the charter negetiatod these bonds with Mr. lliddle, who pald the commiasioners of the hunk $\$ 5,000,000$ thorefor, in five installments of one miliion each. I'his contract was guaranteed by the Pennsylvania liank of the United Staice:, on behnif of Mr. IHdile. Upon this suin of tlve millions, and $\$ 8000$ recelved from indl-
vidual subscribers, the bank based all its operations, and the deplorable issue of which we shall shortly state. In 1889 another series of bonds, for a similar amonnt, was isaued to the bank for further "active capital; ${ }^{n}$ but in 1840 the governor isuued a proclamation, warning the community against advancing inoney on the hypothecation of these bonds, on any ferms not authorized by the charter. In 1841 the governor communicated to the Legislature that this prociamation had prevented an illegal sale of these bonds, and with it the following interesting summary of the "coudition ${ }^{n}$ of the Union Bank:

Nearly a year previous to thia date the bank had become hopelesaly insolvent. The governor's proclamation was followed shortly after by his atrocious scheme of "repudiation" of the $\$ 5,000,000$ of the bonds of 1838, on the pretext of "alleged fraud and illegality," snd communiested to the Legislature; to which they reaponded, "that the State of Mississippi will pay her boods, and preserve her faith inviolats!' In the whole of this disastrous transaction, there is no-
thing but diegrace; Governor M'Nutt was the first open, avowed, and relentless assassin of American credit in Europe, and the "deep damnation of its taking off." originated a feeling of diatrust and disquistude in financial circles, which will be forgotten only when John Law's Mussissippi scheme has been surpassed in extravagance. Well and truly did the Seuator from Mississippi utter that unforgotten sentonce, "the moral sense of communities and of mankind will condemn us," unless a tax was raised for the payment of these bonds; and it may be safely asserted that the deepest injury eyer inflicted upon the commercial and financial reputation of the United States was in this reprobated and diahonest act of "nepodiation." The Planters'. Bank bonds were not officially repudiated, hut the people of the State, in 1852, refused, by a majority of 4400 votes, to authorize a tax to pay them, and redeem "the plighted.faith of the State." In July, 1854, the amount of these bonds, with intereat, was $63,518,081$, and the bende of the Union Bank, for $85,000,000$ and interest, may bo added thereto, as the cost of banks to the State, independent of the individual loss that can be superadded thereto. The following tabular statement furnishes a sufficient warning of the fate of banks which are based upon fictitious capital. There were in the State in

| Years. | Bankn. | Capital. | Cireatation. | spoele. | Loans. |

Louici.nn.-We gladly turn away from this melancholy review of past disasters, and enter upon a acene of still larger operations in Louisiana. The State was admitted into the Union in 1812, but there was a bsonk capital in the Territory in 1805, of $\$ 500,000$, which in 1815 was increased to $\$ 1,432,800$, distributed among three banks; and in 1820 four luanks, with $\$ 2,597,420$. There are no reliable returne of the banks between 1820 and 1830 ; lut as the increase of their number in the United States was but twenty-two, and of their capital only eight millions, we take Mr. Gallatin'a report of four banks in 1830, as the actual number in Louisiana at ilat period, as "in all the Western and Southwestern States there were, in 1830 , only eighteen banks, with capitaia amounting to $\$ 9,462,268$. By the 1st of January, 1837, the number of banks in these States was increased to 161, including branchos, with
paid up capitals of tho amount of $888,699,974$," of which Louisiana had 16 banks, with 81 branches, and \$36,769,455 capital, $47,909,788$ circulation, $\$ 11,487,431$ deposits, $\$ 3,108,416$ specie and losns $\$ 59,108,741$, which wae the ligheat point of the operations of the lanks. Niles* Regiter, of March, 1836, givea the following statement of bank capital in Louisiana at that date:

of whici about thirty-two malions were paid in, and the circuiation of six millions-less than the specio in the banks to redeem it. The officiul reports, however, exhibit a more correct viow of the matter, und from it we copy the following table:

| Yeara. | gonk. | Aranches. | Caplial. | Circulation. | Specle. | Loans. |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1837 | 16 | 91 | 480, 769,465 | \$7,009,789 | (93, 148,416 |  |

to los, in the last line, in 1850, were

Besides these, there were tho Clizens' Bank and Consolidation Association, with Hiabilities amounting to $88,751,813$, and assets, $48,000,971$. In 1852 the new consolidution was adoptel, and the Citizens' llank charter was restored to the bank, which had been forfeited by its continued suspension. The charter of the City llank expired in 1853; that of the Mechnnics' and Trudors' also expired. Tho latter reorganized under the general banking law, The provisions of the free banking law of Louisiana are auch as will compel the banka to retain apecie to the amount of one-third of their liablities. In 1854 the returns were,

In 1856 there were nine banks, whose capitals amounted to $\$ 15,702,600$. As New Orleans is the grand entrepit of the products of the whole Weatern country, large lanking fucilities aro requisite to expedite the cotton, sugar, and tobaceo shipped annualiy from this great commercial mart, ond to supply the demands of the planters during each successive mason. For many years past there has been a deflciency of Lanking eapital in New Orleans, in consequenco of ths restrictive limita of the banking policy of the Stute in relation to discounta, as the supply of apecie in the banks has teen always large enough to justify a nuch larger amount of circulation than has ever been iscucd. Under the general banking law, it is probalife, from the general appearances of things, that this deficiency wili no longer exist, but, on the contrary, there will be a tendency to an upporite extreme.

With the State of Texas we ahall close the remarks on the Southwestern division of the Southern. States, with merely atating the fact that there is one bank in the, State, at Galveston, having a capital of $\$ 822,000$. This State was admitted into the Union in 1845, and although she has cost the country a vast amount of monsy, in prolonged debates In Congress, in the wasted bours of the excited masses of the people, in cities, towns, and villages, and the exhaustion of all the intease expletives that suppositive patriotism could invent, yet beyond those straws, after the payment of the hard money of the contract, we believe that the government have made a good bargain, and that her territory may be our favored pathway to the Paclfic. We have done with the Southwestern division, when we have quoted a remark of Professor Tucker, twenty years ago, 1836. "The banking manta has prevailed in the Southwestem States beyond any other in the Unlon, not excepting New England, but in consequence of which, with the most profitable agriculure in ths United States, the bank circulation has been the most depreciated, and they are still sutfering the evils of a disordered currency."

Virginia.-The first notice of any bank in Virginia was in 1805, mentioned In Mr. Gallatin's report, capitul $\$ 1,500,000$. This was the Bank of Virginia, chartered in 1804, and which oxpires in April, 1857; Ita capital has been enlarged to $\$ 2,650,000$. There was, it is true, a branch of the first Bank of the United States in Norfolk; but the paper of this bank rarely found lts way into the interlor of the country, where the currency was purely metallic. "The desk of every agrioulturist in Virginia had some gold or silver to spare, if he was a prudent, hulustrious man; or he had something like money to spare In the hands of his merchant, whe, $h_{1}$ the dnys of which I min speaking, acte ss a banker to bls prospering eustomers. The curven $y$ heing specle, was widely scattered through the lanal, and indiversilled hande, so that ita concentration at nny particular point was impossible ; and consequently ita removal from the country could not huppen to any grent extent." The same writer proceeds: "No people had more cause to rejoice than the people of Virginia; but ulas! the banks cume, and all things became changed. like the Upas-tree, they have withered and ilestroved the henlthful eondition of the country, and intlicted on the people polltical and pecunlary discase of the most deatly character."

Alabama was admitted into the Unlon in 1819, and in the following year there were three banks, whose capitals amonnted to $\$ 469,112$; in 1830 , one bank, with $\$ 495,503$ capltal ; and we glve below the tabular statementa of four yean o, to exhibit its hank history during the memorable epoch of 1836-'42.
In 1843 the hanking capital was redueed to $\$ 1,500, \hat{\imath}^{\wedge} \eta$, the Bank of Mobile being the only institution until 1851 . The State owned two-ffths of the stock, $\$ 600,000$, for which it issued its bonds, and the bank paid the interest thereon. Slnce then the Southern Bank of Alabama, capital ${ }^{\text {t }} \$ 500,000$; Bank of Montgemery, $\$ 100,000$; and the Northern Bank of Alabama, $\$ 200,000$, have been organizèd. In 1850 a free banking law was passed, but there has been no advantage taken of its privileges, by establlshing any auch inatitution in the State. The Bank of the State has been winding up ita affairs ever aince the expiration of its charter, and it has furnisined another illuatration of the principle that there abould be no interwoven intereats of State and bank, or of politica and finance; they may be correlative, but not comjoint. The executive messages have fully argued this point, and there is no occasion for further comment.

Such was the tone of public sentiment in the Southern States, originating with the establiahment of the first United States Bank, and cherished by Virginla until the expiration of its charter in 1811, when, through fear that its sovereignty would not be represented at the funeral orgles, the Assembly, in January, 1811, passed a spechal resolve, "to instruct their senators and request their representatives to vote afainst the renewal of the charter of the United States Bank" -a puny little insitution, on Its last lega, with an embargo behind it, and a war before ita last expiring moments. But in one brief year the mystery was explained: Virginia vanted a bank of her own, and in F'eiruary, 1812, we percelve that the Formers' Bnnk of Virginia, with a capital of $\$ 2,000,000$, and with a right to lssue $\$ 0,000,000$ of circulation, was cha:tered; and with the Bank of Virglnia (in which the State was interestel $\$ 300,000$ ), and the enlargement of capital to the old, and the creation of new banke, it certainly was very politic that the State should wish to avold cither the rivalry or the survellunce of a national instltution. Three other banka followed in quiek succession, with copitals amounting to four mililions more, and there was no further ontery againat paper money or banks, hecause the "Old Dominion" had adopted them. The charters of the two first banks prohibited the issue of notes under 45 , whicn they adhered to, until it was found conventent to lssue $\$ 7, \$ 8$, and $\$ 9$ notes to suppiy the use of coin ; and thus the lutent of the law was frustrated. Our usual iabular statement furnishes the readiest mode of showing the banking operations of the State from 1820 to 1850:

| Yeare. | Banka. | C'apital. | Lomme. | Circulation. |
| :---: | :---: | :---: | :---: | :---: |
| 1800 | 4 | \$5,212,192 |  |  |
| 1890 | 4 | 5,751,100 | \$7,000,000 | \$3,568,000 |
| 1837 | 6 | 6,781,200 | 18,021,000 | 9,107,000 |
| 1840 | 6 | 10,283.083 | 15,500,900 | 6.707,000 |
| 1549 | 0 | 10,303,362 | 14,170,000 | 7,740,000 |
| 1844 | 6 | 0,684,970 | 17,302,060 | 8,907,000 |
| 1850 | 0 | 0,731, 170 | 18,163,000 | 8,044,000 |
| 1854 | 16 | 12,791,436 | 24,013,000 | 14,248,000 |
| 1850 | 60 | 18,734.806 | $\cdots$ | .... |

With the exception of 1837 , there docs not eppear to be any extravagunt banking; but in January of that year the proportlon of loans to capital was lurger than that of any other State in the Unlon-being 50 per cent. nhove the ar erage rate of all the hanks, and lits cironlation in excess ly a larger ratio, 214 to 91 average proportion of circulation to capital. In 1851 the general
banking law was passed, ond as the chartored banks ly undertaken. The consequence was, that the bank expire, they buve lieen required to comply with the general rule of securing their circulation by a pledge of pullio stocks. The Bank of Virginia and the Farmers' Bank charters expire in 1857; but they have been wisely renewed upon their old basis, "as the experlment of 'independent banklng' bas not so triumphently vindicated the sound wisdom of the principle as to induce the public to sacrifice a system which has oper. ated, in the main, equally to the advantage of the State and the community. There is certainly nothing in the financial condition of the State to warrant any hazardous experiments with its monetary relations."

North Carolimu.-The first bank incorporated in thia State was the Bank of Cape Fear, in 1804, with a capital of $\$ 250,000$, located at Wi'nington. Ita charter has been extended, and its capital increased by varions enactments. It has now $2,000,000$ of capital, of which the State owns $\$ 532,200$; and lts present charter expires, by limitation, in 1880 . It has seven branches. Tha Bank of the State of North Carolina was origioally Incorporated in 1833, with a capital of $\$ 1,500,000$. It is now $\$ 2,000,000$, of which the State owns $\$ 500,000$; and its charter expires in 1860. It has nine branches. In 1834, the Merchants' Bank, $\$ 800,000$ capital ; in 1847, Commercial Bank, $\$ 300,000$; in 1849, Bank of Fayetteville, $\$ 800,000$; in 1850, Bank of Washington, $\$ 400,000$, and Bank of Wadeaborough, \$200,000 capituls, were severally incerporuted; and the whole number in the Stato ot present is 29 banks and branches, the aggregata of whose capital is $\$ 6,050,000$. In one of the late reports of the Bank of North Carolina we find the following remark: "By auccessful management, this bank has obtained a position and infiuence which acarcely any State institution ever possensed, ond certalnly none in North Carolina. After pussing uninjured through the crisis of 1837, under the able gutdunce of its first president, Mr. Cumeron, it rapidly acquired confidence and atrength, and now stands pre-eminent emong the State institutions of our lund." We are happy to add that there are no "free hank" laws io this State.

South Curtina,-The first bank established in this State wan the Bank of South Carolina, chartered in 1792 , with e capital of $\$ 1,000,000$. In the uppendix to Mr. Woudbury's report of the banks in 1837, he states tie South Carolina banka aa follows:

| Yearn. | Unaka. | Capital. | Veara. | Ranka. | Capital. |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1742 | 1 | + 6376,010 | ISII | 4 | \$3,475,010 |
| 1801 | 9 | 8,000,000 | 1815 | 5 | 8,780,900 |
| 1805 | 2 | 6,000,000 | 1820 | 5 | 4,475,000 |

But wa belleve that tha account we subjoin is tho correct one:

| Yame. | Name. | Banke. | Capital. |
| :---: | :---: | :---: | :---: |
| -17:2 | liank of South Carolinn | 1 | 罒1,000,0010 |

| 1812 | Hank of the State of Bouth Carolina\| | 1 | 1,123,067 |
| Making an aggregata eapitai, In 1880, of. . . . . |  |  | 45, 463,357 |

The Bank of the State of South Carelina was a purely State institution, and had no private atockholders. It was originally founded tor the purpose of furnishing temporary aid to planters, by loans of $\$ 2000$ to each, and for many years was a mere "Inan inatitution." In 1820 the cupitai of this bank was pledged us security for the redemption of the honds of the State, lssued to carry out a system of interual improvementa recent-

| Years. | Banke. | Capital. | Clreviation. | Doposite. | Bpatia. | Loant. |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Georgia,-In Georgia, the first bank which appears in Mr. Woodbury's report is, in 1811, one bank, rapital $\$ 210,000$; in 1815 , two banks, capital $\$ 628,580$; in 1816, three banks, capital $\$ 1,502,600$; In 1820, four banks, with an aggregate capltal of $3,401,510$; and
the following table shows that Georgia has had her fult phare of banking business, notwithstanding her frequent complaints of dependence upon Charlenton for facilitiea, and her own want of bank capital. There were in the State, in

| Yeame. | Bankn. | Capital. | Cireulation. | Deponits. | Apecla. | Loans. |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 1837 | 82 | 11,438,828 | 8,058,789 | 2,149,682 | 2,800,828 | 16,608,215 |
| 1840 | 39 | 15,048,6:4 | 5,518,822 | 1,985,418 | 1,800,604 | 13,783,221 |
| 1848 | 24 | 10,250,708 | 1,972,215 | 1,056,812 | 1,204,971 | 6,461,761 |
| 1848 | 24 | 8,970,789 | 2,471,204 | 1,818,263 | 1,104,236 | 5,549,238 |
| 1849 | 18 | 12,505,010 | 4,118,419 | 1,607,009 | 1,547,026 | 6,058,166 |
| 1859 | 18 | 12,957,600 | 9,618,777 | 2,529,227 | 1,570,818 | 18,507,460 |
| $18 \% 5$ | 21 | 13,413,100 | 6,998,866 | 2,084,455 | 1,451,880 | 11,648,659 |

These statements give a very imperfect idea of tha real state of financlal operations in Georgia, For instance, In the report of 1849, tho Central Bank, the property of the State, which had for ten years been winding up its concerns, had its capital lacluded, $\$ 1,480,000$, and the two railroad companies, capitals $\$ 6,694,000$, making, in the aggregate, $88,171,000$, which should be deducted from the banking capital, as above stated, when the return would be, in 1849 , fifteen banks.

| Capttal. . . . . . . $84,480,764$ | Specle. . . . . . . . \$1,404,706 |
| :---: | :---: |
| Deporlta. . . . . . 1,373,780 | Loans. . . . . . . . . 5, 502,714 |
| Circulation . . . . 8, 019,749 |  |

The banking community are indebted to a distlnguished representátive from Georgia (the late Richard Henry Wilde) for the introduction and adoption of the resolution in Congress by which we havo our nnnuul reports on the banks of the United States. Imperfect as these reports are, they illustrate the importunce of having moro attention bestowed upon them, even if their preparation should require an additional bureau at Washington.

| Years. | Rranchen. | Capltal. | Circulation. | Depoults. | 8pecie. | Loanc. |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1837 | 1 | 4533,5038 | \$028,0MM | \$810,000 | \$406,000 | \$1,109,000 |
| 1810 | 2 | 1,16.123 | 410,000 | 1,174,000 | 562,000 | 2,077,000 |
| 184:1 | 3 | 1,200,688 | 731,000 | 1,116,000 | 1,260,000 | 951,000 |
| 1845 | 5 | 1,200,582 | 2,106,000 | 1,2 50,000 | 1,458,000 | 2,658,000 |
| 1843 | 5 | 1,208,107 | 2,560,000 | 1,735,000 | 2,4i7,000 | 3,152,000 |
| 1853 | 5 | 1,208,751 | 2,524,000 | 1,877,009 | 1,002,000 | 3,265,000 |
| 1858 | 5 | 1,216,400 | 2,805,000 | 1,331,000 | 1,355,000 | 4,300,000 |

This bank is owned by the State to the extent of $\$ 951,205$, and the balance by individuals, and its chnrter will expire in February, 1861, having been extended to that date by act of 1856 . A committee on banks formerly recommended a sale of the State's interest in the luank, and the charter of a new one with $\$ 5,000,000$ capital. The constitution allows but one bank and branches, and, of course, without its alteration free banks can not be introluced. It will be perceived that the bank has always had on hand a large supply of apucie for the redemption of its circulation, and hus consequently always enjoyed a high reputation. It has muintained specie payments siuce $\mathrm{fts} \ln$ corporation, althuugh Its circulation was necessarily restricted, while many of the banks of the East and West were under suspension during the years 1837-1840. We trust that it may conthus a fortress of strength to resist the encroachment of free banking principles, which are now pervading several of the States, and furnish an enduring evidence of the profit and socurity of banks based upon a specte cnpitnl.

California.-We are not aware of any incorporated banks in the State of California; and it only remalns for us to apeak of those of the District of Columbin. The tirst bank estubllsined at Washington was in 1792, with a capital of $\$ 500,000$; in 1802, there wire two lanks, $1,500,000$; in 1805 , three bauk., $\$ 2,000,000$; In 1811, four banks, $\$ 2,341,395$; in 1815, ten banks,

| Yean. | Hanke. | Captial. |
| :---: | :---: | :---: |
| 1830 | 0 | \$3,870,674 |
| 1837 | 7 | 2, 204,445 |
| 1842 | 8 | 1,7814,020 |

Florida.-We come now to Florids, the last State in the Southern diviaion, and which was admitted into the Union in 1845. Under its territorial government, it hat, in 1838, fivo banks, with an aggregrte amount of capltal of $\$ 2,113,302, \$ 774,040$ circulation, $\$ 145,842$ specie, $\$ 493,623$ deposits, and $\$ 2,652,614$ loans. These were located at Pensacola, Tailahassea, Appalachicola, and Magnolia, but they are all broken and worthless. A law was passed in 1849 authorizing a bank at Tallahassee, but we believe that it was not organized, and we know of no regular bank in the State.
Missouri.-'This State was admitted into the Union in 1821. There was one hank in existence prior to this date, the operations of which were disastrous, but the first we find In the regular reports is the State Jank of Misaouri, at St. Louis, with one branch, in 1837, and a capital of $\$ 583,588$, circulatlon $\$ 28,000$, and specio $\$ 466,000$. Thls is now the only bank in the State, although it has Increased the number of its branches. to meet the increasing demand for banking facilitles. We give a tabular atatement of Its operatlons, during a serics of years, from 1837 to 1856 :

The chartera of all these banks expired some years since, and passed into the hands of trustees for the benefil, of the stockholders. The Farmers and Mechanics' Bank, Georgetown, the Bank of the Metropolis, Bank of Washington, and Putriotic Bank of Washington, are of the above class, and are about the only banks whose bills are current on any terms, and they are looked upon with diatrust out of their own neighborhood.

Conclusions.-The past financinl history of the Unlted States abounds with examples and warnings; but the milfortune ls, that they are apt to be unheeded and írgotten. How many of our merchanta now on the atuge of netive enterprise have an intimate acquaintnnce with the past hilatory of commerce in our oun country during the present century, if, Indeed, they know that which relates to their own business, beyond the Inst twenty ycars?

IIow few statesmen and financiers of these modern days of high attainments are familiar withr the finunclal events of 1836-'42! Those who retnin a fresh remembrance of that financial crisls will ever dread a recurrence, and be Insplred with cautlon, prudence, and diatrust. Hut the race of these "conservatives" is fast passing away, and the counsels of the few remaining are nlmost derlded. Junior partners, or successors, and "Young Amerlea," fill their places, and now take the lend. The pust is dlsregarded, and similar errors will probably eventunte in similar dlsasters.

Our illustrlous statesman, Daniel Weister, who has left for our use invuluable lessons of political wisdom, in his celebrated speech at Trenton, $\ln 1844$, uttered these words: "We are well instructed by oxperionce; hut let us not he lost to experience. Iet not all the good, all the comforls, all the blessinga, which now
veem in prospect for all classen, be blighted, ruined, and deatroyed, by running into danger which wa may avoid. The rocks before ua are all visible-all high ont of water. Thay lift themselvea, covered with the fragmenta of the awful wrecks and ruin of other timen. Let us avoid them. Let the master and the pilots, and the helmaman and all the crew, be wide awake, and give the breakers a good berth."

In 1832, Mr. Biddle, the Fresident of the United States Bank, was examined by a committee of the House of Representatives, of which Mr. Cambreleng, of New York, was chairman. Tu one of the interrogatories he answered in the following language: "The Idea, at the present day, of doing the basiness of this country scithout bonks wonld be equal to the project of renouncing canals, and railroads, and steamboats, and all the other improvementa belonging to trade. That hanks do occasional miachief there can be no doubt: but nutil some valuable improveinent is found which at'pp jeq numixed goud, thia is no objection to them, an'i, $\cdots$ astituted as they now aro, tha banks of the United States may be considered safe instruments of cotnmerce. On the whole, it seeris wisar to retain thn established Institutiona of the couniry, instead of $r$ sorting to doubfful and hazardous erperime $\neq s, \quad$ W/hat is wanted, I think, in our binking system id this: first, to widen the basis of our metullic circulation, by abolishing the use of small motes, so ne to aliow coin to take the place of them, as it inevitubly would; und, secundly, to annex to the non-payment of specie by the banks so heavy a penalty, aay an interest of 12 per cent., as in the case of the Bank of the United States, or $2 \cdot 4$ per cent., as in some of the Jersey banks, as would deprive the banks of all temptation to incur the risk of insolvency."

Nearly a quarter of a century has elapsed aince these remarks were niale by the "moneyed autrcrat of l'hiladeiphia," and the very principles avowed by him are now the adopted dogmas of his former opponents. We believe that it is now generslly adiaitted that, in order to carry on successfuliy the extensive business of this country, we require a solid, stulle, and uniform currency. It is undeniable, also, that a system like bankIng, which has constituted a prominent engine of trade, commerce, and manufactures in all civilized comman?ties, must possess intrinsic, tixed, and ascertained principles; the dlacovery, development, and application of which, in the most equitable and advautagcous manner, shenld be the leading oiject of those who exercise any agency in the creation or management of our moneyed institutions.

The early antipathy of our people against banks was $n$ blinded prejudice; the retrospect of half a century discloses many great evils und albuses, springing from inultifurlous causes not iniputable to the aystem, but rather fungous exerescences, which a luxurinnt growth has produced. Frunds without number have been perpetrated, andiscovered anil hepeless; thousands and millions of dollars have licen scattered in thoughtless profusion by Boards of Dircetors, who knew nothing of tho first elemants of insiking, and loaned their paper pronises wo otilige thoir friends, taking a worthle.e written individual promise for an equally worthless printed bank-nete. But what of all these things, and many inore which might be adided, the great extension of credit, consequent upou the increased banking facilities, unrestrained as they havo fiomerly been, has leen beneficiai to all clarses, to the farmers and mechanics not less than to the arerchanta. "Young Americunn," men of industrious, enterprining, and energetic charucters, have left the comiforts of their parental homes, and by the ail of bank capital have fount the facllifies liy which they conld ennvert houndless torests and untrodien wilds into cultivatedifirms and viliages, within the precincts of which they have estathished schools and churches, erected work-shops and factories, and clustered arouml them the chsiliza-
tion, the comforts, ond refinements whlch are now spread over our Western Statea. True it is, that this expansion of bank facilities has cast ita dark shadow as well as lts sunlight. In many a eity and town, thousands have been ruined by the recklessness or improvidence of thoae who have made haate to he rich, and many a possessor of an ample fortune, acquired by a life-long labor, has gone down te hia grave in asdness, sorrow, and deprivatien, by the violent explosion of those fearful volcanoes which periodlcally bave acattered harning lava and ashes over the golden vistas whlch apeculation had conjured np.

But the question now arisea, When are our experimenta in banking to end? We have tried national banks, specie banks, safety-fund banko, free banks, and bogua banks; and we have a sub-treasury scheme, and untold treasures of gold in California, bat these are merely chaotic materiala, moving in apace at randomno single mind directs their movementa, and the result will probably be "confanion worse confounded." Where, then, are we to ivok for succor? ? We can discover but oue sure point, and that is the general govermment, who alone have the power to excreise a saluary control over the currency of our whole country, through the agency of that grand regulator of exchange, an exchequer aystem, aided, if need be, hy that pet of the government, the present aub-treasury acheme.

From the following; thble of the number of banks, amount of capital, and circnlation, it will appear that the number of hanke had doubled in a peried of nearly twenty years; while then capital and circulation have incresscd only about 30 per cent. in the same time, whish ratio is not equal to tho growth or increaso in wealth of the country.

| Yanm. | Banks | Capital paid in. | Eirealation. |

Our task is ended, when we heve acknowledged the sourres from which this compilation has been derived. From Condy Ragnet and Heffessor Tucker's works on Banks and Banking, front Nies' Figister, the Bankers' and Hunt's Mogazines, liberal sxtracta have Leen mate, and all the tabilar statemants t.ave been derived : ther from the Bankers' $M_{\text {egasine or the renorts of the }}$ Secretary of the Treasuy. The adniratila Index to Periolical Literadure, by the accomplisined librarinn of the Boaton Athena m, has heen un efficient guide to authoritles and essuys which mikit etherwise have escapeti our atiention, and has fully verifled the motto on his title-page
"Qui meit ubl ait retentia, hahenil est proximus."
Bonk of the Inired Nutes,-The old Bank of the linited States was incorpotated hy an act of Congress, approved February, 1791. Ity tha limitation of the charter, it was to expire on the 4th of March, 1811. This, like the lla'iks of linglund, F ...ise, and Sweden, was a bank of de, onit, liscount, aud clreulativ. :, with a canital of $\approx 10,000,300$.

Those Europear writers, loth 13ritish and French, who have enlogized this linstitution ur beping purciy commercial, aril distinguished from those of Enghatd
lleh are now $t$ is, that this dark shadow y and town, saneas or im. te to he rich, , acquired by ve in sadness, explosion of ly have scat. golden vistas
e our experiried national ee banks, and scheme, and but these are at random, and the reconfounded." We can dis. Eaneral govcreisa a saluhole country, alator of exneed be, by sub-tressury
ber of laanks, 1 appear that riod of nearly culation have o same time, or increase in
and France by not belng connected with the govern-
ment, or un englne of finance, can not have read the charter, the preamble to whlch begins thus: "Whercas the establishment of a bank will be very conducive to the conducting of the national finances, will tend to give facility to tho obtaining of loans for the use of the goverument in sudden emergeneles, and will be productive of considerable advantuges to trado and industry in general," etc. Instead of being a merely commercial establishmont, thereforo, it was essentially and mainly of a financlal and political charaeter, and it was on this ground that its constitutlonality was defended; the right of Congress to grant such a charter leing claimed inostly upon tho strength of that elause of the Constitution which gives to Congress the power necessary for carrying into oxecution the powers enumerated, and exprossly vested in that boly. The origin of this establishment was, thorefore, similar to that of the Bank of England, and the resemblance is not limfted to the general parposes of its institution, for, as the Bank of England originated in a lonu to the British government, so the act by which the old Bank of the United States was chartered provided that the sums sabseribed by Individusls and corporations should be payable one-fourth in gold and silver and three-fourths in the public debt certificates. Tho President of the United States was authorized to subscribo for two millions of the stock in behalf of the United States. The directors, being twenty-fivo, were chosen by the stockholders withont any interference on the part of the government in tho election; but the government reserved the right of inspeeting the atfairs of the Bank, and for this purpose the Seeretary of the Treosury was atthorized to demand of the president and directors a statement of its concerns as often as ho might sce fit. The corporation was authorized to establish branches in sny part of the United States. Tho only restriction as to circulation was, that the amonnt of dobts due from the corporation by bond, blll, note, or otherwise, besides the debts dae for deposits, should nover exceed $\$ \mathbf{i 0}, 090,000$; and in caso of excess, the directors by :/hose agency such delt should bo incurred were vade personally answerable. This bank went into oparation, and liad a most powerfnl agency in establishing the credit of the governinent, facilitating its financial operations, nud promoting the interests of industry and comnerce. Congress having refused to renew the charter, it exphad, by its own limitation, in 1811. But during the war which ensued the want of a national bunk was severely felt, not only as an agent for collecting the rovenues, but inore espocially for transmitting funds from one part of the country to another, and then it might have been a useful anxiliary to tho pnblic credit by supplying temporary lonis in cases of emer. gency. So thoroughly convinced wore the public of the nesesaity of such un institution, that the members of rete same political party from which the constitutif I oljeetions had been made to the ohl Bank, and which harl to e'sed to renew its charter, passed an act of Congress, whicis was approved hy the President, April 10, 1816, chartering the second Bank of the United States, with a capital of $\$ 35,000,000$, upon principles and with provisions very simitar to those contained in the former charter. For this charter the government demanded and received a bonus of $\$ 1,500,006$ from the stockhoiders, I'l: govermment leecame a stockholder in the samo proportion as in the former bank, taking one-fifth, or $\dot{\psi} 7,000,000$ of the stock. The direction of the institution was left to the stockholders, as in the old bank, except tinat tho govermment reserved the right of appolutment and removal at plensure, by the l'resident, of 4 ve directors out of the twenty flive, the other twenty belng eiected by tho stockho'ders. The government also reserved the right to demand a statement of the concerns of the institution by comnittees of either branch of the Legislature. Ono quarter of the subscriptlon to the stock was payable cither in
gold and silver or Unitel States stock, at the option of suhscrituers. The $\$ 7,000,000$ to be subscribed by the government was payable either in gold and silver, or public stock, at an interest of 5 per cent., at the option of the pevernment. The transactions of the corporation wer. Ilmited to making loans and trading in the precious "retals, and the sale of such goods or proceeds of such lands as should be pledged.

Branches were established in various parts of the Union. No other almilar corporations could be chartered by the government, except banks in tha District of Columbia, with a eapital not exceeding in total $\$ 6,000,000$, during the perlod for which the charter was granted, namely, to the 3d of March, 1836. The bank was prohibited from purchasing any part of the public delt, taking interest over 6 per cent., or loaning to the government over $\$ 000,000$, or to any State over $\$ 50,000$; and the debts of the bank were in no case to exceed the amount of doposits by more than $\$ 35,000,000$. And in case of refusing specte paymeut of its notes or deposits in specie, the bank was made liable to pay interest at the rato of 12 per cent. per annam. The bank was also obliged, by its charter, to give the government the necessary facilitles for transferring the public funds from place to place withln the United States without charglag commissions, or clainnling any allowance on necount of the difference of exchange, and to transact all the business of commis. sioners of loans whenever required so to do. The bank was prohibited from issuing bills under the deaomination of $\% 5$.

The bank commenced operatlons on the 7th of April, 1817; and soon after entered into a compact with the State banks for a simultaneous resumption of specie payments, which took place on the 20th February, $181 \overline{7}$. Every effort was made to push its paper hato circulation. Its discounts were Increased in one month from $\$ 3,000,000$ to $\$ 20,000,000$; and in October, nine months after going into operation, they had increased to $\$ 38,000,000$. Of course, with this immonse expansion, the currency denreciated; prices of overy thing ranged high; apeculation, especially in stocks, was rifo. The management of the lank was very bad; money was lent on the stock of the bank to lts par valuc, and so persons of no means lecame stockholdersnledging the stock for the loan with which they bought the stock. Tho branches which had heen made at all points, North, East, West, and South, wero issuing notes, limited by the abillty to make them. In obedience to a fixed law of action and reaction being oqual, a revulsion soon came, and, owing to the mismanugement of the directors, it was increased. The branches met with great losses: at Baltimore, for instance, from the impruper conduct of the officers, it whis estimated at $\$ 1,{ }^{\prime} 71,221$; and the aggregate losses of the parent bank up to the Gth of March, 1810, excceded $\$ 3,500,000$. The dividends in the same time amounted to $\$ 1,410,000$, of thits sumn $\$ 1,348,553$ was recelved for interest on public delt held by the bank, which made the profits on tha banking operations less by half a million than lts losses. These losses, and the flucturtions cansed by the difficulcies of the bank in the currency and in money affairs genorally, created a strong feelirg aguinst the bank, which added to the party who held that the bank was unconstitutional and inexpedlent.

In the sessions of 1831-'32 the bank made appliea. tion to Congress for a renewal of the charter; and a bill was passed incorporating anew the bank. This vas votoed loy President Jackson. It was then reconsidered by Congress, but failing to obtain the constitution. " mujority of two-thirds, it was finally rejected, July, 1882.

The removal of the government depoilta from the Dank of the United States by the Presldent, September 23,1833 ; the adoption, lis consequence, by Congress of what was afterward called the "deposit-bank
system," at a means of safely keeping the public monev ; the resolution of the Senate that the removal wat uncalled for, and the responsibility assumed by the President unconstitutional, atc., lntroduced by Mr. Webster, and passed March 28, 1884; the passage of the act of June 28, 1886, for the distribution of the surplua revenue among the different States of the Union; the lasue by the Secretary of the Treasury of the famous specie circular of July 11, 1836; the incorporation of the Bank of the Unlted Statea by the Legislature of Pennsylvanla early in the aame year; the derangement in the currency of the country, which led, in May, 1837, to the general suspension of apecie payments by the banks; the resumption of specie payments by the banks in the aummer of 1838 , with the adoption of the "free-banking aystem" by the State of New York, and several others, were events which may be regarded as belag latimately connected with the suspeasion of the Bank of the United States,-E. A.
"When It was faally settled that no recharter of the national bank was to be olitaised, a plan was projected to combinc the advantages of the long-cstablished correapondonce, name, and machinery of the former bank, by lncorporatigg its atock with a new institution under the name of "The President, Direct ors, and Company of the Bank of the United States of Pennsylvania," which was chartered on the 18 th of February, 1826, by the Legislature of that State. The transfer of the funds of the old institution was made into the new State bank. More than 15 per cent. was restored by the govermment beyond ite subscription at the period of the transfer, and 34 per cent. had been paid to the same soureo every six montiss for a ling course of years. In ronsequence of the advantages te be derived from tho new institution, the stockholders were content to subscribe anew in the new State bank; and it is alicged that all of them might, at this juncture, have received their investments back, not only at par, but with a large advasace. Thia the government actually did, and no power was enjoyed by the government that wos nut shared by every individual. Indeed it was alleged by Mr. Nicholas Biddle (who heid the administration of the affairs of the State lunk, as he had done in the national bank), as recently as April, 1841, that the State institution was prosperous down to the end of his admiaistration in Marth, 1839. The downfall of the State institution, Jowover, soon occurred, bringing dissster upon tho atockholders. From March, 1839, to March, 1841, the stock of the State bank deelined from 116 to 17 per cent., nnd this loss fell in considerable part upon those who had been the origian stockholders of the national bank. The stock is now quoted from $\$ 1$ to $\$ 2$ per sharo. The new iastitution did not rest upon the broad foundation of national aid, and of course had not the confldence jossessed by the national banik."-Hunt's Merch. Mag.

A bill for establishing a Fiscal Bank of the United States passed the IIouse of Representutives, August 6, 1841 ; vetoed by President Tylor, Auguat 16. Another bill for a Fiscal Corporation vetoed September 9, 1841, followed iyy a resignation of all the Cabinet, except Mr. Webster, which eaded for a time all efforta to ohtain under any name a new national bank.

Canaina.-There are eight hanks in Cunada besidea the Bank of British North America, which has ita chief effice in England, nad spreads its lirnaches all over British America. This tinnk, which was incerporated in 1840 , has a capital of $£ 1,000,000$ sterling. Of the eight more strictly coloninl banks, four ore in Inwer and four in Upper Canada. Tho most important of these is the Bank of Montreal, with a present capital of $£ 1,500,000$ currency. The three other banks in Lower Canada are, the City Bank of Montreal, with a capital of $\mathbf{£ 3 0 0 , 0 0 0 ; ~ t h e ~ B a n q u e ~ d u ~ P e u p i e ~ i n ~ M o n t - ~}$ real, with a capital of $\mathcal{A} 300,000$; and the Quelsec Bank, with a capital of $£ 500,600$. The luanka in Upper Cansda are, the Bank of Upper Canada, Torontn,
ineorporated 1821, with a present capital of $£ 1,000,000$; -he Commercial Bank of the Midland District, Kingston, incorporated 1832, capltal $£ 1,000,000$; the Gore Bank, Hansilton, incorporated with a capital of $\mathbf{£ 1 0 0 , 0 0 0 ; ~ a n d ~ t h e ~ N i a g a r a ~ D i s t r i c t ~ B a n k ~ a t ~ S t . ~ C a t h - ~}$ erines, with a capital of $£ 500,000$.

Almost all of these instlutions have branches In various parts of the country, and lesue notes, payable on demand, from one dollar upward. The least denomination of the notes of the Bank of British North America is fourdollar notes, representing $£ 1$ colonial currency. The greater number of these jastitutions ure now understood to be paying from 6 to 7 per cent. jer anaum upon their paid-up stock; and the stock of the most successful among them was selling, in April, 1854, at from 16 to $\mathbf{2 5}$ per cent. premlum. All occounts are kept in Canada in pounds, shillings, and pence, provincial currenc; . The present one pand of provincial currency is about equal to $16 s .4 d$. sterling, or four dollars United States currency. The English aovereign is equal to 24 s .4 d . currency ; the shilling within a fraction of 1 s .3 d. ; and the half-crown about 3s. $1 \frac{1}{2} d$. colonial curreney. The bank capital of Canada was largely increased by act of 1854, viz.:

Fniexdly Societies.-Friendly Societies are associationa, mostly in England, of persons chiefly in tho humbler classes for the purpose of making provision by mutual contribution against those contiagencies in human life, the occurrence of which can be calculated ly way of average. The principul objecte contemphated by such societies are the following: the insurlag of a sum of aoney to be paid on the birth of a member's child, or on the denth of a member or any of his family; the maintenance of members la old age and widowhood; the admiaistration of relief to members incapncitated for labor ly sickness or accident; sad the endowment of membera or their nominees. Frieadly societics are, therefore, associations for mutual assurance, but are distinguished from assurance societies, properly so called, by the circumstance that the sums of money which they insure aro comparatively small.

Although the period when auch societies originated appears to be unknown, their existenco in ancient times is unquestionale. They wero numerons in Englead among the Anglo-Saxons, but from the general want of saraing at so early an age, and the difficulty of preaerving written documenta even of the lighest importance relatiag to a period so remote, it can not bo expocted we should now possess any vary complete records of their history or proceedings. Writers of credit, however, have mentioned severnl of these fraternities or "guilds" as existing both before and subsequently to the Norman Conquest, and their rulce, which are still preserved, are highly interesiing, from their similarity to those of the friendly societies of the present day. "These guilds or social corporaticns," observes an excellent writer, "seem, on the whole, to have beon friendly associations made for mutual aid and contribution to meet the peeuliar exigencies which wero perpetually arising from torrials, legal oxactions, penal mulets, and other payments and compensations." -Tuner's Anglo-Sazons. Some of them had for their objecte the bestowal of annual charity, the jnyment of stipends to poor persons, the entertainment of poor strungers and travelers, and various other works of a like claritable and benevolent character.

Banks of the United States, 1857.-The following is $\mid$ ficial returns in or near January, 1857.-From the Fia summary of the liabilities and the resources of the nance Report of the Secretary of the Trecusury, December, banke of each State in the Unlon, according to the of- 1857.

Since the early portion of this article was prepared ber following, a resumption of specio payments took for the preas, important oventa have occurrad both in Europe and tho United States, Involving the stability of the banking concerns of both continents. The above tsbles contain the latest official returns of the liabillties and resources of the banks of the Union, and may be considered as a fair exhibit of the condition of theso institutions in tho several States at tho beginning of the yesr 1857. The unfavorable condition of the foreign trsde of the Union, added to a redundant baok circulation, led to a large export of specie from the United states daring the nine months ending September, 1857. A panic followed theso continuous exports, which was sccompaniod by a sudden reductlon of bank loans during the monthe of August and September in the Atlantic cities, producing in September a suspension of tho banks of Philadelphia, Baltimore, Washington, and other cities; and in October, 1857, to a suspension of those of the citles of New York, Boston, and other portions of the Union. Thoso of Ohio, Kentucky, Illinois, Indiana, and a portion of those In South Carolina, Now Orlesns, Pennsylvania, Missouri, ete., and one in New York city, being the axceptions. On the 14th Deceluplace throughout New York and New England; a measure soon after adopted by those of Pennaylvania, Maryland, and other States.

The enspenslon of specio payments in the United States was followed by the fallure of several provincial banks in England and Scotland; and by an order in council on the 12th November, authorizing the tempornry auspension of the Bank Charter Act, whereby tho bank was authorized to enlarge its issues, if necessary, beyond the charterod prescribed limits. This necessity did not, however, arise; but the announcement had the effect at onco to allay tho panic prevailing in England at the lime. The rato of interest adoptod by the bank was raised to 10 per cent. temporarily. In Scotland, tho City of Glaggow Bank, and Western Bank of Scotland, suepended, and are now in process of liquidation. The Borough Bank of Liverpool also failed, together with numerous small banks In tho interlor.-For recent discussions as to tho principles of banking and tho currency, the render is referreil to tho Bankers' Mragazine, Now York, 1850-1858; London Quarterly, 1857-'58.
VIII. Saviwge Banks.-These banka were originally eatabilished in Eagiand for the receipt of emali sums deposited by the poorer class of persons, and for their accumuiation at compound interest. They are there managed by individuala who derive no benefit whatevor from the deposits. All montiys paid into any Savings Bank eatablished according to the provisions of the acts 9 Geo. 4, c. 82 , and 7 \& 8 . Vict. c. 83, are ordered to be pail into the Baaks of England and Ireland, and vested in Bank annuities or Exchequer billa. The interest paysbie to depositors is not to exceed $2 d$. per cent. per diem, or $\mathcal{C 8} 0 s .10 d$. per cent. per annum. No depoaitor can contribnte more than $\mathbf{8 3 0}$, exclusive of compound interest, to a Savings Bank in any one year; and the total deposits to be reccived from any individual are not to exceed 150 ; and whenever the deposits, and compouad interest accruing upon them, standing in the name of any one individual, sidsil amount to $\mathbf{c} 200$, no interest shail be payablo upon such deposit so long as it shell amount to $£ 200$. The commissioners for the reduction of the national delt have the dispossl of the sums vested in the pullic funds on acconnt of Ssvings Banks.

Titis system began in 1817; and on the 20th of November, 1850 , there was due to depositors, including interest aceruing on deposits, $£ 31,208,322$. It farther appears that from the 6th of August, 1815, down to the 20 th of November, 1842, the pubic paid on account of interest and charges on the sums dua to Savings Banks and Friendly Societies under the act 9 Geo. 4, e. 92 , $\mathbf{E} 14,070,34128.6 d$. , and that the dividend received during the samo period on the stock and other public securitice in which the commissioners for the reduetion of the national debt inveated the said sums, amounted to $£ 12,039,7818 s .6 d$., leaving a balance of $£ 2,030,659$ 14s., which consequently may be said to be the sum which tho system has cost the publlc.-Parl. Paper, No. 258, Sess. 1843. But the reduction of the interesi. on deposits in 1844 from 21d, to $2 d$. per cent. per diem, has cither entirely or in a great measure obviated this source of loss.
The principio and object of Savings Banks can not be too highly commended. In the metropolis, and many other parts of Vingtand, pubtic banks do not recelve amall deposits, and untii recently they did not pay any interest on them. And oven in Scotiand, where the pathic banks aliow intereat upon deposits, they do not generally recelve less than $\Sigma 5$ or $£ 10$. Bat few poor persoos are ahie to mave even this much, except by a lengthened course of cconomy. The truth, therefore, is, that until Savinge Banks were estahilshed, the poorer ciasses were evory where without the means of secureiy and profitabty inveating those smail auma they are not uafrequently in a condition to asve: and were consequently led, from tho difficulty of disposing of them, to negiect opportunities for making savlnges, or, if they did make them, were tempted, by the offer of high interest, to iend them to persons of doubtful cisaracters and deaperate fortunca, by wbom thoy were, for the most part, squandered. Linder such circumstances, it is pialn that nothing couid be more important, in the view of diffusing habtes of forethongit and economy among the laboring classes, than the establiahment of Savingn Banka, where the smallest sums are ptaced in perfect affety, are accumutated at componad interest, and aro paid, with their accumalations, thin moment they are demanded by tho depositors. The syatem in yet ittle more then in lts infancy; hut the magnitodo of the deposita already received sets its powerful and salatary operation in a very striking point of view.
We subjola a copy of the rutea of the St. Panercs Savings Bank, which may be taken as a model for similar institutions, inasmuch af they have been drawn up with great care, aud ciosely correspond with the provisiona in the acts 9 Geo. 4, c. 92 , end 7 \& 8 Vict. c .8 ,

1. Maingement.-Thls bank is under the management of a president, vice-presidonts, trustees, and not less than fifty maasagers, none of whom are permitted to derive any benefit whatsoever, directly or indirectly, from the deposits reveived, or the produce thereel One or more of the managere attead when the benk is open for business
2. Superintending Committec.-A fommittee of not iess than ten managers, three of whom form a quiurum, is empowored to superintend, manage, and condnct the general. husiness of thia bank; to add to thefr number from aniong the inanagers; to
fill op vacancies ta their own body, and to appoint a treasarer or treasurssh, agent or ageate, auditors, an setuary and claris, and other officern and servants, and to withdraw any such appotetuents, and to appolnt others, should it be conuldered aecessary so to do. The proceedinge of thia committee are regulariy taid before the general meetings of the bank,
3. Eleetiona.-The auperintending committes is ompowered to add to the aumber of managers, uatil they amount to one huadred and twenty, excluaively of the precident, vico-prealdents, and trustees; and any vacancies of preuldent, vios-prealdenta, and trunteen are to be filied ny at a general meeting.
4. General Meetings,-A general meeting of the president, vice-prealdents, trusteen, and managers of thia bank shall be held once a year, in the month of February. The auperinteading committee shalt lay before every such meeting a report of the (ranaactions of the bank, and atate of tha accounta. The superinteading committee for the auceeeding year shall be elected at such general meeting1 and falling such oleotion, the former comnittee ahati be conatidered as reappointed.
5. Special Meetings.-The mperintending committee are authorized to call apecial general meetings when they think proper: and also, on the requiaition of any ten managena, delivered in writing to the actuary, or to the manager in attencance at the bask: and of such meeting seven daya' aotice alall be given.
6. Liability of Trustees, Managere, Offeers, etc. $\rightarrow$ No trustee or manager ehali be personally thatie except for hia own acts and deeds, wor for any thing done by him in virtue of his offle, oxcept where he shall be gullty of wiliful negiect or default ; but the treasurer or treamorers, the actuary, and every officer intruated witi tho recelpt or enstody of any sum of money de. ponited for the purposes of this inutitution, and every offleer, or otier person, receiving aalary or allowance for their services from the finde thercof, shalt give good and sufficient securlty. b- boad or bonds, to the cierk of the pesce of the county of j: 1 lditesex for the juat and faithful execution of auch office of tirust.
7. Investment and Limitations of Deposita,-Deposila of not less than one shilling, and not exceeding thirty pounds in tho whole, exciusive of cooppound interest, from any one de. poaitor, or truatee of a depositor, during each and every year onding on the 20th of November, will be received and invented, parsuant to 0 Ge0. 4, c, 02, s. 11, uatil the same sinais amount to one humired and Afty pounds in the whole; and when the principat and intereat together whali amount to two hundred poundo, then no intereat will be payable on ouch deponth, ao long as it shall continue to amonnt to that num. But deponifors whosh accounts amounted to or exceeded two hundred pounds at the passiog of the said act, on the 28th of July, 1828, will continue to be antitied to intereat and compound interest thereon.
8. Interest to be alloured to Depoeitors.-In conformity wilh the act 7 \& 8 Viet. c. 88, an interest at the rate of 2 d . per ceat. per day, being $\mathcal{L 8} 08.6 d$. per cent. per annam the full amount authorized by the aid act, will be allowed to depositors, and placed to their acconnts as a cash depoatt, in the month of November in each year. Depositore domanding payment of the whoie amount of their deposite in thia bank witt be allowed the intereat due on zuch deposita up to the day on which nollee of withdrawing ahali be given, but no intereat wili be allowed, In any case, on the fractional parts of a pound atering.
9. Description and Declaration. - Every person deeirous of making any depostt in thts benk shall, at the time of nusing their first deposit, and at auch other times es they shali 1 required wo to do, declure their reaileneo, oceupation, profor $\mathrm{m}_{\text {, }}$ or calling, and aign (cither by themselves, or, in case of infunts under the age of seven yeurs, hy some perion or persons to he approved of by the trustees or managers, or their offecr) a declaration that they are not directly or indirectiy entitied to any doposit in, or bencfit from, the finds of any other Sarings Bank in Engiand or Ireland, nor to any sum or sums standing In the nsme or names of any other person or persons in tho booka of thits bank. And in case any much declaration shali not be true, evory such person (or the person on whose behalf such declaration may have been signed) shail forfeit and lose all right and tide to such depoaits, and the trustees and mana. gers shali cause the sum or sums so forfeited to be paid to the commissioners for the reduction of the astional deht; but no depostor shall be subject or lialile to any such forfeitare on account of being a truntee on behalf of others, or of being interested in the funda of any Friendly Socicty legally established.
10. Trustees on behalf of o'hers.- Persons may act as trustecs for depositora, whether such persons are themselven depositors in any Savings Bank or not, provided that such truatee or trunteea ahall mako such deciaration on behaif of euch depositor or depositors, and be subject to the like conditions in every respect as are required in the case of persons making deposits on their own account, aad the receipt and receipts of
nueh trontee or truateen, or the aurvivor of them, or the exeentors or administrators of any sole truatee, or aurviving trustee with or without (an may be required by the maasgera) the receipt of the perwon on whose sccount such sum may have been deposited, shall bo a good and valld discharge to the truiteen and managery of the inatitution.
11. Minork - Deposits are rocelved from, or for the benaft of, minors, and are eubject to the mame regulations as the dopontts of pernons of 81 years of age and upward.
12. Friendly and Charitabls Soclefies.-Friendly Socletien, legally eatablinhed previous to the 28 th of July, 1828, may deposit their funds through their treasurer, ateward, or other officer or officers, without any limiltation as to the amount. But Friendiy focteties formed and enrolled after that date are not permitted to make deponitr exceeding the num of $\mathbb{\&} 00$, principal and Intareat included i and no interent will be payable thereon, whenever the mame ahall amsunt to, or continue at, the sald aum of $\mathbf{2 3 0 0}$ or upward.
Deposits are recelved from the truatees or treasurers of Charitable Socletics, not exceeding $£ 100$ per annum, provided the amoent ahell not at any time exceed the anm of $\& 200$, excluaive of intereat.
13. Depoeite of Persone unable to attend.一Forma are given at the office enabling persons to become depositona who are unable to attend perwonally; and thome who have previously made e deposit may send additional anma, together with their book, by any other permon.
14. Depositors' Dook.-The deposits are entered in the books of the bank at the time they are made, and the depositor recetves a book with a corresponding entry thereln; which book muat be breught to the office every time that any further aum is deposited, also when notice is given for withdrawing money, and at the timu the repayment in to be made, so that the transactiona may be duly entered thereln.
15. Withdrauing Depostts.-Depositon may recelve the whole or any part of their doposits on any day appointed by the managers, not exceeding fourteen days after notice has liece given for that purpose: but auch deposits can oniy be repald te the depositor personaliy, or to the bearer of an order under the hand of the depositor, aigned in the presence of etther the minister or a chureh-warden of the pariah in which the depoastor realdes, of a juetice of the peace, or of a manager of this bank.
The dipositor's book must altoxy be produced when notice of uithdrauing is given.
16. Money withdraven may be re-deposited.-Dopositors may withdraw any aum or auma of money, and re-depoalt the amme at any time or timea within any one year, reckoning from the 20th dey of November, provided such aum or sums of money re-deposited, and any previoua deposit or depoaits which mey have been made by auch depoaltor in the course of the year, taken together, whall not exceed, at any time in oueh year, the bum of ClO additional principal money bearing Intereat.
17. Return or Refusal of Deposits. -Thia bank is at Hiberty to return the amount of the deposits to all or any of the depoaltora, and may refuse to recelve deposits in any case, where It ahall be deemed expedient so to do.
18. Arbitration of Dfferences.-In case any diapnte thall arise between the trustecs or mamagers of this bank, or any person er persons acting under them, and any individual depoasitor therein, or any trustee of a depositor, or any person claiming to be such executor, adminiatiator, or next of kin, thell, and In cvery such case, the matter so in dlapute shall be refurred to the barrister at law appolated hy the commissionera for the reduction of the national debt, under the enthority of the $9 \mathrm{Geo} .4, \mathrm{c} .92, \mathrm{~s} .45$; and whatever award, order, or determInation clall be made by the sald barrister, ahall be binding and conclusive upon ell pertion, and shell be final, to all intenta and purposes, without any appeal.
Government Annuities by Depositors in Savings Banks. -The act 2 \& 3 Wiil. 4, c. 14, enables depositore in Savings Banks and others to purchase governmont annuitica for life or for yeara, and either immediato or deferred. At present these annuities are limited to ci30 a ycar. The money advanced la returnablo in esse the contracting party does not live to the age at which the annuity is to become payable, or is unatie to continue the monthly or anmual instalimenta. Thel this measure waa benevolently intended, and that it may be productive of advantage to many individuals, can not be doubted; but we look upon all attempte, and poriculariy those made by government, to get individuais to excbange capital for annuities, as radicaliy objectionabie, and as being subversive of principies which ought to be atrengthened rather than weakened. -See Fuxtes. We subjoin

BAN

Bankoks, or Bangkok, the capital of Siam, situated about 20 miles from the sea on both aidea the Kiver Menam, but chiefly on its left or eastern bank, in lat. $13^{\circ} 49^{\prime}$ N., long. $101^{\circ} 10^{\prime}$ E. The Menam opens in the centre nearly of the bottom of the Gulf of Siam. There ia a bar at its mouth, consiating, for the most part, of a mud flat 10 milea in length. Tho outer edge of this flat, which is little more than 200 yards broal, is sandy, and of harder materials than the inner part, which is so sof, that when a ship grounds on it during the ebb, she often sinks 5 feet in the inud and elay, which supporta her upright, so that abe is but littlo inconvenienced. The highest water on the bar of the Menam, from February to September, is alout 13i feet; and in the remaining 4 months aomewhat more than 14 feet; a diffierence prolably produced by the accumalation of water at the head of the bay after the southweat monavon, and by the heary thoods of tho rainy season. On account of thodet $\therefore$ ney of water out the bar, vessels sent to Bangkok had better, perhapa, not oxceed 200 or 250 tons bardeu. In all other respects tho river is extremely safe and commodious. Ita mouth is no aooner approacl- ${ }^{`}$, than it
 there are 6 and 7 fathoms water. This depul nereases as you ascend, and at Bangkek is not less than 9 fathoms. The only danger is, or rather was, a sandbank eff Paknam, baro at low water; but on this spot a butiery has been erected within the last few years, affording at all times a distinct beacon. The chamel of the river is so equal, that a ship may range from oun side to another, approaching the banks so closely that her yards may literally overhang them. The navigation is said to be equally safe all the way up to the old capital of Yuthia, 80 milea from the mouth of the river.
The city of Bangkok extends along the banks of tho Menam to tho distanes of about $2 \frac{1}{2}$ miles; but is of no great breadth, probally not exceading $1 \frac{1}{2}$ miles. On the left bank there is a long atreet or row of floating houses-meach house or shop, for they are in genera: both, consisting of a distinct vessel, which may be moored any where along the bnnka. Besides the principal river, which at the city is about a quarter of a mile broad, the country is intersected by a great number of tributary streams and canals, so that almost all intercourse at Bangkuk is by water. The population has been computel at 50,000 or 60,000 , half of whom are Chinese settlers.

The total area of the kingilom of Siam has beell estimated at 190,000 square miles, and the population at ouly $2,850,500$, principally resident in the rich valley of the Menam. Of the entire population, it is aupposed that not less than 40, mof aro Chiuese. The common necessarien of life at langkok are exceedingly cheap. A ewt. of rice may always be had for 28. , and very often fer 1 s. Other necessaries, auch as salt, palm-sugar, apices, vegetables, fish, mul even flesh, are proportionully cheap. The price of good pork, for example, is 2td. per 1b. A duek may be had for $\overline{\text { did }}$., and a fuwl for 3d. The neighliorhood of laugkok is one of the most productive places in the world fer fine fruits ; for here are assembled, and to be had in the greatest perfection aed abundauce, the orango and lichi of China, the mango of ilindostan, and the mangosteln, durian, and elsaddock of the Malay countries.

Trade. -The foreign trade of Siam is conducted with China, Cochin China, Cambogia, and Tonguin, Java, Siagapore, and the other liritish ports within the Straits of Malacra, with an ocensional intercourse with Bonbay and Surat, England and America. The most important branch of the foreign trade is that with China, which is wholly carried on in vesels of Chinese form, navigated by Chineac, the greater portion of them belng, however, built in Slam. The lmports fromi Clina are very numerous, consistiug of what are called in cominercial language "assortcd cargoea." The fol-
lowing ia a llat of the principal commodities: coarse earthen-ware and porceluin. spelter, quicksilver, tea, lacksoy (vermicelli), dried truits, raw ailk, crapes, satins, aud other silk falrica, nankecna, ahoes, fans, unbrellas, writing paper, sacrificial paper, incense rods, and many othor mincr articles. Not the least valuable part of the importations are immigrants.
The exports from Siam are also very varlous, inclading, among others, black pepper, sugar, tin, cardamoms, eagle-wood, sapan-wood, red mangrove bark, rose-wood for furniture and calinet work, eotton, ivory, stick-lac, rice, areca-nuts, salt lish; tho hides and akins of oxen, buffaloes, elephants, rhinoceroses, deer, tigers, leopards, otters, civet cats, and pangolins; of snakes and rays, with the belly-shell of a species of land tortoise; the horns of the Luffalo, ox, deer, and rhinoceros; the bones of the ox, buffalo, elephant, rhinoceros, and tiger; dried deer'a sinews; the feathers of tie pelica:l, of stverul species of storka, of the peacock and kingfisher, etc.; and, finally, esculent awallowa' neats. The tonnage carrying on the China trade amounts in all to probably aliout 130 junks In number, a few of which are 1000 tous burden, and the whole shipping is net short of 35,000 tons.

The crade with the ditferent countries of the Malay Arehlpelago is, also, very considerable. In this intercourse, tho staple exports of Siam are sugar, salt, oil, nad riee; to which may be added the minor artieles of stick-lac, iron pans, coarse carthen-ware, hogs lard, etc. The returus are British and Indian piece goods, opium, with a little glass ware, and some British woolens from the European settlements, with commoditiea auited for the Chinese market-such aa pepper, tin, dragon's blood, rattans, bicho-de-mer, esculent swallows' nests, and Malay camphor from the native ports.
The total exports of clayed sugar and black pepper, the staple articles of Siamese export, may be estimated, the former at about $10,00 \mathrm{C}$ tous, and the latter from 3500 to 4000 tons.

Bankrupt and Bankruptoy. Bankrupts, in England, tirst haw enacted regarding them, 35 llenry VII1. 1543. Agaln, 3 of Elizabeth, 1560; again, i Jamea I. 160\%; again, 1706; and more recently. It was deternined liy the King's Bench that a luankrupt may be arreated except in going and comiag from any examination before the commissioners, May 13, 1780. The lord chaneslor (Thurlow) refused a bankrupt his certificato beet ase he liad lost five pounds at one time in gaming, July 17, 1788. Enseted that members of the II ouse of Commons becoming bankrupts, and not paying their debts in full, shall vacate their seats, 1812. thit new baukrupt bill, constitating a new bankrupt court, passed October, 1831.—Statutes at Large.

It would really, therefore, as it appears to us, be for the ndvantage of creditors, were all penal proceeding, against the porsona of honest deltors abolished. The dependenco placed on their effleaey is deceifful. A tradesman ought rather to trust to hir own prudence sud sagacity to keep out of acrapes, than to the law for redress: hefmay dual upon eredit with those whom he knows; but ho ahould deal for ready money only with those of wiose circumsinncea and characters the is either ignorant c: suspicions. By bringing penal statutea to his aid, he ls r-nderod momiss und negligent. lle has the ouly effectual means of aecurity in his own hands, and it aecuas highly liexpedient that ho should to tanght to negloet them, and put his trust in prisous.

It is pretty evident, too, that the ethicacy of imprisoinent th deterring individuala from runing into delt has been greatly overrated. Insolventa who are bon-

est mus'. have sufered from misfortune, or been dlsappolnted in the hopes they entertained of being able, in one way or other, to discharge their debts. The fear of imprisonment does not greatly influence such persoas; for when they cuatract debts they have no doubt of their abllity to pay them. And though the imprisonment of bona fule insolveats wero abolished, it would give no encouragement to the practices of those who endeavor to raise money by false representutions; for these are to be regarded as swindlers, and ought, as such, to be subjected to adequate punishment. At present, indeed, the lav is much too indulgent to this description of persous. Traders or others who endeavor to obtain goods or loans of monoy, whether by conccaling or misrepresenting the real state of their affairs, are, in fact, about the very worst specles of cheats; and the temptation to resort to such practices, and the facility with which they may be carried into effect, should make them, when detected, be visited with a proportionally incs:ased saverity of punishment, on the prineiple laid down by Cicero, that ca suat animadrertenda peccata maxime, que dificillime precaventur.

While, however, the law of England has always given the crediter an unnecessary degree of power over the delitor's person, it did not, till very recently, give sutficient power over lis property. In this resject, indeed, it was so very defective, that one is almest tempted to think it had been intended to promote the practices of fraudulent debtors. The property of jersons subject to the bankrupt and insolvent laws was, $i$ is true, nemloally placed at the dicpossal of assignees or trustees, for the benelli, of siteir creditors; bet when a person possessed of property, but not subject to the bankrupt laws, contracted debt, if he went abrond, or lived withln the rules of the King's bench or the Ivet, or remained in prison without petltioning for relief, le continued most probably to enjoy the income arising from that property without mulestation.

France.-In June, 1838, the French law of bankruptey and insol voncy was abrogated, and an entirely new law was promulgatel, which now forms llook III. of the "Code de Commerce."

Cnitel States.-The power of maklng uniform laws on the subiject of bankriptey in :lu Thited States, is, by the Constitution, conferred upon Congress, and was generally understeod to be excluslvely vested in that body. This power was exercised by Congress ln 1800, by the ennctment of a hankrupt law, limited to tive years, and which was repealed by act of December 19 , 180:1.-Kenr. The Congress of the Uuited States legislated a second thme on the subject of bankruptey, by an net, pussed in Angust, 1811, to establish a uniforn' system throughout the Uniun, which took effect on the 2d February, 1842, but was repealed Mareh 3, 1843 . The repeal of this act scarcely allected any existing interests, us almost every delitor lind hastened, in anticipution of the possibility of lts repenl, to take advantare of it voluntarily. *At present there ls uot any bankrupt system under the general govermment of the United Stater, and the several States are left free to Institute their own haukrupt systems, under certaln limitations. The Suprene Court of New York had ileclared the bankrupt net of Cougross to be cunstitutional (Justice Bronson dlssenthg), but the U. S. District Court of Mlissouri deelared it to be uuconstitutional.

Barbadoes, or Barbados, is one of the West India islands belonging to Great Britain, and the oldest of her settlements in that part of the world. The exact date of its discovery is unknown, but it was probably not later thar the early part of the sixteenth eentury. The Portuguese are supposed to have heen the first Europeans that visited this islantl, as it lay alr ost directly in thelr course to and from Brazil. They, however, had not regarded it as holding forth sufficient inducements for colonizing, as when first visited by the English in 1605 it was destitute of inhabitants, and covered with thick forests. The first Eugllsh vessel that arrived there was the Olive Blossom, the crew of which took possession of the island in the name of King James, by erecting a cross upon the spot where Jamesiown was afterward built, and cutting upon the bark of a tree that stoed near, "James, K. of E. and this island"-Iames, king of England and this island. The favorable accounts which Sir William Courteen, a London merchant, afterward received of the island from one of his ships thnt had tonched there, iaduced him to attempt a settlement. He accordingly fitted out two large vessels under the protection of Lord Ley, afterward Eari of Marlborough, who had obtained a grant of this island from Jamea I. One only of these ships arrived at its destination on 17th February, 1625, and landed 40 Eoglish, and 7 or 8 negroes, who laid the foundation of a town, which, in honer of their sovereign, they called Jsmestown.
Harbadoes is the most eastern of the Caribbee islands, lying 78 miles due east of the island of St. Vineent, between lat. $13^{\circ} 2^{\prime}$ and $13^{\circ} 19^{\prime}$ N., and long. $59^{\circ} 26^{\prime}$ and $59^{\circ} 39^{\prime} \mathrm{W}$. It presents almost the form of m irregular triangle; its greutest length, in a direction north by west, is nearly 21 miles, and its extreme breadth from east to west is $14 \frac{1}{2}$ miles. Iis circumference, excluding the sinuosities of the bays, is 55 miles, and its area 106,470 acres, or about 166 square miles. $\mathrm{J}_{\mathrm{i}}$ size, and in some measure in its outline, it bears a considerable resemblance to the Isle of Wight. It is almost, encircled by coral reefs, which in some parts extend seawaril for nearly three miles, and $p$ :ove very dangerous to navigation.
The chlef stople articles produced in Barbadoes for export are sugar, arrow-root, aloes, and cotton. The following table gives the value of the imports and exports for the years 1849,1850 , and 1851 :

| Yent. | Importa. | Exporis. | Tonnage. |
| :---: | :---: | :---: | :---: |
| 1849 | C691,478 | 2701,740 | 85,731 |
| 1850 | 784,368 | 831,634 | 96,38t |
| 160t | 78:1,477 | 887,627 | 95,272 |

Carlisle llay, the port or harbor of Barbadoes, forms an open roalstead, which is much exposed to the wind when blowing from the sov:h and southwest. It is spacions, and capable of contalning upward of 500 vessels of all sizes. It allords, however, no protection cluring gales; and at such thmes vessels at anchor generally prefer putting to sea, to runnlug the risk of being driven ashore.-E. 13.
Barcalao, or Bacalao, the Spanish nume for cod. Barcelona, the enpitnl of Catalonia, nut the principal town of Spain on tho Mediterranean, lat. $41^{\circ} 22^{\prime}$ $68^{\prime \prime}$ N., long. $2^{\circ} 8^{\prime} 11^{\prime \prime} \mathrm{E}$. It is a strongly fortilied, well-bulat city. The population is supposed to amount to about 120,000 . Burcelona is eminently distinguished in the history of the Middle Ages for the zeal, skill, mad suceess whth whleh her citizens prosecuted commercial adventures at a very enrly perlod. She would seem also to be eatitled to the honor of having compiled and promulgated the famous cole of marithme law known by the nawe of the Consolato del Mare; and the earllest authentle notlces of the practice of marine insurance anal of the negotlation of bills of exchange are to be found ln her annuls. Catalenla has continued, amidst all the vicissitudes It has undergone, to be the most lndustrious of the Spmish provinces. Soveral

## BAR

extensive manufacturea hava been eatabliabed in Parcelona, especially of cotton; and no fewer than 23 steamengines were erected in Catalonia in 1842, the greater number being in Barcelona. Latterly, however, her commerce, owing to a varlety of causes, but principally to oppressive restrictions on the importation of foreign groods, the emancipation of South America, and internal dissensions, haa very much declined.

Imports.-The principal articles of import are raw cotton, sugar, coffee, cocoa, and other coionial products, principally from Cubs and Porto Rico; aalted fish, lides, and horns; iron and hardware, etc. Moat species of manufactured goods are prohibited; but it is needless to add that they are, not withatanding, largely imported into this as inte most other parta of Spain. The trade with the colonics, France, and the coasting trade is pretty active. The imports from England are not very considerable, and the exports little ornothing. In 1842, no fewer than 3667 vesacla entered the port: but these were mostly consters of small size, the bur den of the whole being only 189,117 tons.

Exports.-The principal exports are wronght silks, soap, tire-arms, paper, hats, laces, ribbons, steel, etc. But no vessels, except a few that take on board manufactured goods for the Spanish West Indies, are loaded here; and even this trate is much fallen off. Upward of 2000 hends used formerly to be employed in the city in the manufacture of shoes for the colonies; but their export hes now nenrly ceased. The prineipal articles of native produce that Catelonia has to export are most conveniently shipped at Villanova, Jarragona, and Solon. They consist of wine, brandy, nuts, almonds, cork, bark, wool, fruits, etc. Of these, Cuba takes annuelly about 12,000 plpea of wine, worth at an average $£ . l$ per pipe, and about 3000 pipes of brandy, worth $£ 8$ per do. ; South America, 16,000 pipes of wlne, and 6000 do. brandy ; the north of Europe, 2000 pipes of wine, and 2000 do. brandy. A good tieal of brandy is sent to Cadiz and Cette: most part of the former finds its way into the wine vaults of Xerea; and the latter, being conveyed by the ennal of Languedoc to the Garonne, is used in the preparation of the wines of Bordenux. From 25,090 to 30,000 bags of uuts are annually sent from Tarragona to England. Tarragoua also exports about $12,000 \mathrm{bags}$ of ainonts. The shipss belonging to the port carry on no foreign trade except to the Spanish West Indles; thoy are fow in number, and are daily decreasing. Those engaged in the coasting trade are usualiy of very kmall burden. We linve derived these detalls from various sources; but principally from Ibritish Consular Returns, and from Inglis's Spain in 1830, vol. ii. p. 384-387, and 362.

Barilla (1)u. Sr la; Fr. Soude, Harille; Ger. Sode, Barilla; It. Burriplia; I'ort. Solde, Barrilha; liuss. Socianka; Sp. Barilla; Arab. Kali), carbonnte of soda (see Aıkarizes), is found native in Hungary, Efypt, and many other countrics. It is largely used by bleachers, manufacturers of harl soaps, flass-makers, ete. The barilia of commerce consists of the nshea of several marine and other planis growing on the seashore. The best, or Allcant Ibarilin, is jrepared from the Salsolu soda, which is very extensively cultivated for this purpose in the huerta of Murcia, and other places on the eastern shores of Spain.-'t'owsensis Trurels in Spain, vol. IIi. p. 195. The plants are gathered in Sepitember, dried, and burned in furnaces heated so ns to bring the ashes into a state of imperfect fusion, when they conerete into hard, dry, cellular masses of a grayish bue color. Sicily and Teneritlo produce gool barilla, hat inferic: to that of Alicant and Cartharena. Keli, which ls a less pure alkali, Is formed by the incineration of sea-weed. See Ket.r.

The Saracens established in Spain scens to have been the first who introduced the manufacture of bariila into Eorope. They ealled the planta employed in its preparation kali; and thia, witl the Arabic article al prefixed, has given rise to the modern chemical term
alkall. Prime quality in barilla ia to be distinguighed by Ita strong smell when whetted, and by its whitish oulor. I'articular attention ahould be paid to have as littie small or dust as possible. The manufacture of artificial soda (soude factice), now very extensively carried on, occasioned an oxtraordinary decilina in the imports of barilla, the quantity entered into Great Britain for home consumption in 1834, amounting to 237,712 ewt., having been reduced in 1811 to 47,380 ewt. Conslderable quantitiea used formerly to be im: irted from Tencriffe, but it now comes principally from Alicant in Spain, and Sicily. Thus, of 1744 tons imported into Great Britain in 1850, 836 came from Spain, 753 from Italy (Sicily), 109 from the United States, and none from the Canarics. The duty on barilla, after being reduced ill 1842 from 40 g , to 5 s , a ton, was whelly repealed in 1845 . But even this judicious measure has not had so much infiuence over the consumption of the article as was expacted. In 1852, the imperts amoonted to 1807 tons, or $36,140 \mathrm{cwt}$. none of which was re-exported.-Parl. Paper, 1853.

Bark, the outer rind of plants. Thero is an immense variety of barks known in commerce ; as, cinnamon, Perovian bark, oak bark, quercitron, ete. Tho ' rm " bark" is, however, generally empleyed to ex1:ress either Peruvlan bark or oak bark, and it is these only that we shall notice in thia place.

1. Perurian or Jesuits' Bark (Fr. Quinquina; Ger. Kron-china; Du. China-bast; Sp. Quina, Quinquina; Lat. Quinquina Corter Pervrianus). There are three principal species of this bark known in cemmeree, which have been elaborately descrihed by Dr. A. T. Thomson, from whose account the following partienlers are selected. The first species is the pale bark of the shops. It is the produce of the Ciuchona lancifolia, and is the original cinchona of Peru. It is now very searce. It is imported in chests covered with akins, ench contuining about 200 pounds, well packed, bat generally mixed with a quantity of dust nnd other heterogencous matter. It consists of pieces 8 or 10 inches long, some of them leing searcely one-tenth of an inch thlek, singly and donbly quilled, or rolled inward, the quilis generally being in size from n swan's quill to an inch and a half. It is internally of a palide fawn or cinnamon hue, but approximates, on beling moistened, to the color of n palo orange. When in subistance it has searcely any odor, but during decoction the odor is sensible, and agrecably aromatic. The taste ls bitter, but not unpleasant, acidulous, and austere. The second species, or rei linrk, is olitained from the Cinchona oblongifolia, growing on the Andes. It is imported in chests containing from 100 to 150 pounds cach. It conslsts of variously alzed pieces, most of them liat, Int some partialiy quilled or rolled. The internal part is woody, and of a rust red color 1 it has a weak jeculiar odor, and its taste is much less bitter, but more austere and mauscous, than that of the other barks. The third species, or yellow hark of the shojes, is obtained from tho Cinchona corlifislia, growing in Quito and Sunta Fí, It is imported in chests containing from 90 to 100 pounds ench, consisting of pieces 8 or 10 inches long, some quilled, but the greater part flat. 'The Interior is of a yellow color, passing to orange. It has nearly tho same odor in decoction as the pale; the taste fa more bitter and leas anstere, nud it excites no astringet feeling when chewed. 'The goodsess decreases when the color varies from orango yellow to pale yellow; when of a dark color, bet ween red and yeliow, it should he rejected. It is needless to add, that lark is one of the most valuable medleal remedies. The Indians were unacquainted with its uses, which seem to have been Ilrat discovered by the Jesuits. It was lutroduced into Europe in 1082, hat was not extensively used till the latter part of the nevententh century. Accorling to IIumboldt, the Jeaults' bark minually exported from America amounts to from 12,000 to 14,000 quintals. Of these, 2000 are
furnished by Santa Fó, and 110 by Loxa; Peru furnishing the remainder, which is shipped at Callso, Guayaquil, ete.
2. Oak Bark (Fr. Ecorce de la Chêne; Ger. Eichenrinde; 1t. Corteccia della Quercia; Lat. Quercus cortex). The bark of the common oak la a powerful astringent, sad is preferred to all other substances for tanning leather. The bark of the larch is now, however, used for twe same purpose. Though the importatlon of oak bark into lingland for tanning has somewhat decline?, it is still very considerable. It is impossible, however, to state its exact amount, inasmuch as a species of oak bark, called quereltron, the produce of the Quercus tiactoria, importell from abrond, and used to give a yellow dyo to silk and wool, is mixed up in the cus-tom-house retu.ns with bark for tanning. rite dat: which is ly far the most important, is brought pri pally from lBelgium and Holland, Germany, Itai, wid Spain, Norway and Australia. Quereltron is found prineipally in the United States. The quality of bark differs-according to the ago and size of the tree, the season when it is burked, etc.-so mueh that its price varies from $£ 5$ to $£ 10$ a ton. The duty on bark for tanning and dyeling, which prevlously to 1842 was 8 d . a ewt., after being then reduced to $3 i$., was repealed in 1845. In 1852 the imports and exports of Pernvian bark were rospectively 18,207 and $10,092 \mathrm{cwt}$. DurIng the same year was lmported 403,930 cwt. bark for the use of tanners and dyers, of which only 146 cwt. was re-exported. But in addition to the above wero imported, in 1852, 2515 tons divi livi, and 13,871 tons valonia, of which very littlo was re-exported. Belgium, IIolland, the United States, Germany, Italy, and Norway furnish by far the largest portion of the imports of oak bark. Wo are intobted for the discoverv ind application of the uscful properties of quer eitron to Ibr. Bancroft. The tloctor obtalned a pritent for his invention in 1755; but the Amerlean war breaking out soon after, deprived him of its advantages. In consideration of this circumstance, l'arliunent passed, in 1785, an act ( 25 Geo. 3, e. 38) securing to him the privileges conveyod by his patent for 14 years. At the expiration of the latter period the Honse of Commons agreed to extend the doctor's privilege for mil additional 7 years, but tho House of Lords rojected the hill. Like too many discoverers, Dr. Bancroft prolited but little by hls invention, though it has been of great use to the arts and manufactures of tho coun-try.-J. K. M. See Bancroft on Permanent Colors, vol. li. p. 112, and the Report of the Committee of the Ilouse of Commons on Patents, Appondix, p. 175.

Barley (Fr. Orge; Ger. Gerstengraupen; Du. Ryg; It. Orzo; Sp. Cebada; Russ. Litschmea; lat. Ifordeum; Arab. Dhourra; Ilind. done), a species of hread-corn (Ifordeum, Limu.), of which there aro several varlotles. It is extensively cultivated in most European countries, and in many of the temporato districts of Asha nud Africa. It inay also be ralsed between the tropics; but not at a lower elevation than from 3000 to 4000 feet, and thee it is not worth cultivating. Large quantitles of barley have leen, for a lengthened poriou, raised in Grent Britnin. Itecently, howover, its eulthvatlon lans been supposed, thought probably on no gool grounds, to be decllaing. In 1765 Mr . Charles Smith estimated the number of bari ; cousmmers in England and Wales at 739,000 ; unil as a large propertlon of the population of Wales, Westmorehand, and Cumberland continue to subsist chictly on larley brend, wo aro Inellued to think that this estimate nay not, int present, he very willo of the inark. But the prinelpal temmal for luarley in Great IIrltain is for conversion fito malt, to lie used in tho nunufucture of ale, jorter, and BrltIsh spirits; and though its consumption in this way has not certalnly lnereased proportionally to the lincreaso of wealth and population, still thero does not scem to be any ground for aupposing that lt has diminlshed. Barley is also extenslvely used In futten.
ing black cattle, hogs, and poultry. It now generally followa turnips, and lo a very important crop in the rotation best adapted to light soils. The produce vam ries, according to soil, preparation, season, etc., from about 20 to 60 or 70 bushels an acre. The most usual crop is from 28 to 86 or 38 bushels. Barley is a tendar plant, and easily hurt in any stago of ita growth. It is more hazardoua than whent, and is, gencrally speaking, raised at a greater expense; so that its cultivation should not be attempted except when the soil and climate are favorable for its growith.-For further Catails as to its consumpition and culture, see Smitu's Traets on the Corn Trule, 2d ed. p. 182; Brown on Rural Affairs, vol. il. p. 42; Lovdon's Encyel. of Agriculutre, etc.

Barometer and Thermometer. Torricelli, a Florentine, having disoovered that no principlo of suction existed, and that water did not rise in a pump) owing to nature's abhorrenco of $a$ vacuum, imitated tho aetion of a pump with mercury, and made the first barometer in 1643, and Descartes explained the phenomena. Wheel barometers were contrlved in 1668 ; pendent barometers in 1695; marine in 1700 . The invention of the thermometer is aseribed to severs] selentific persons all about the same time. Invented by Drebbel of Alemaer, A.d. 1609.-Bomminavic. Invented by Paulo Sarpi, 1609 .-Fulaentio. Invented by Sanetorio in 1610.- Bonelin. Fulirenheit's thermometer was invented about 1726 ; and tho scale called Reaumur's soon after, 1730 . The mode of construction, hy substituting quicksilver for spirlts, was invented some years subsequently.

Barra, or Vara, in Commerce, a long measure used in Portugal nud some parts of Spain, to measure woolen and linen eloths and sorges. In Valencla, 18 barras $=$ 12 6-7 yarls English measure; in Castile, 7 barras $=$ $64-7 \mathrm{yds}$; and in Aragon, 3 harras $=24-7$ yds. -E. I3.

Barracan, in Commerce, a sort of stutf somethiog liko camlet. It is used to make various outer garments. The citios where barracans are chiefly made, in France, are Valenciennes, Lisle, Abbeville, Amiens, and Ronen.-D. 13.

Barratry, in Narigation, is, in its most oxtensivo sense, any frandulent or unlawful aet committed by the master or mariners of a ship, contrary to their duty to their owners, and to the prejuctice of the hatter. It appears to bo derived from the Itallian word barratiare, to cheat. It may be committed by running away with a ship, willfully earrylng her out of tho courso preseribed by the owners, telaying or defesting the voyage, deserting convoy without leave, sinking or desertiag tho ship, embezzllug the cargo, smuggling, or any other offense wherely the shlp or curgo may bo subjected to arrest, detention, loss, or forfeiture. It is the practice in most countries to insuro ngainst barratry: Most foreign jurists hold that it comprehenils every tault which the master and erow can commit, whether lt arise from iraud, negligenco, unskillfulness, or mero imprudence. But in England it is ruled that no act of the master or crow shal] bo deemed barrutry, unless it proceed from a criminal or froudulent untive. "Jlarratry can only bo committed by the master and mariners ly some set contrary to their luty in the relution in which they stand to the owners of tha ship. It is, therefore, an offense agalnst them, ume censerpuently an owner himself can not commit barratry. He may, by his fruudulent conduet, make bimselt liablo to the owner of the goods on hoatd, hut not for barratry. Nelther can barratry be vommitted apainst the owner with his consent; for though he may lie linhle for any loss or damage oceasioned by the misconduet of the master to whleh he consents, yet this is not larratry. Nothing is more clear than that a man can nover set up as a erime an act done by lifs own tlirectlon or consent."-Mansilaid on /nauramice, look 1. c. $12, \S 0$.

When, therefore, the owner of a ship is also the mas-
ter, no act of barratry can be committed; for no man can commit a fraud against himsolf. It is a maxim in law, that fraud shall not be presumed, but must be clearly proved; and it is a rule in questions of insurance, that he who charges barratry must substantiate it by conclusive evidence. It is not necessary, to render an act barratrous, that it should be committed with a criminal intent as respects the owners, in order to injure them, or to benefit the eaptain or erew. It may chen be committed with a view to promote the owner's interests; for an illegal act done without the authority or privity of the owners, and which proves detrimental to them, ia barratry, whatever be the motives in which it originated. Lord Ellenborough, in ati able judgment, has laid it down as elear law, "that a breach of duty by the master in reapect of his owners, with a fraudulent or criminal intent, or ex maleficio, is barratry; that it makes no difference whether this act on the master be Induced by motives of advantage to himself, malice to the owner, or a disregard of those laws which it was his duty to obey; and that it is not for him to judge or suppose, in cases not intrusted to his discretion, that he is not Ireaking the trust reposed in him, when he endenvors to advance the interests of his owners by means which the law forblds, and which his owners also must be taken to have forlidden." The circumstance of the raners of ships heinf permitted to insure against the warratry of the master and mariners can hardly fiill, it may ? not uncharitably presumed, of rendering then less serupulous in their inquiries with respect to their character than they would otherwise 's. Perhups, therefore, it might be expedient to prohilit such insurances, or to lay some restrictions upon them. They were, indecd, expressly forbidden by the Ordinance of Rotterdam; and lord Manatield, whose authority on all points conneeted with the law of at: rance is so deatrvedly high, seems to have thought that it would be well to excludo lan ratry entirely from pulicies, and to cease "making the uncierwriter become the insarer of the conduct of the eaptain whom he does not appoint, and ean not dismiss, to the owners who can do either." Hut though it were expedient to prevent the owners from making an insuranee of this sort, nothing can lie inore reasonalle than that thirt partos, who freight a ship, or put goods on tourd, should be allowed to insure aguinst such a copious souree of loss.

F'er a further diseussion of + .s sibjeet, see the articlo Mabine Insulance; nnd Nanshalif om ${ }^{\text {B }}$ Insurance, book i. c. 12, § 6, ...d Palik on Insur.nce, e. b. Owners, masters, or seamen, wloo wulfully cast away, harn, or destroy ships, to the prejudice of freishters or insurers, incur the penalty of death. - -See Stamus.

Barrel, a caak or vessel for hohblag licuids, particularly ale and beer. Fomerly the burrel of bear in London contained only 32 ate gallons $=32 \frac{1}{2}$ [mperia] callons; but it was enacted by 43 Gico. 3, e. 69, that 86 galtons of heer shoulit be tuken to be a hat rel; and ly the 6 Geo. 4, c. 58 , it is enaeted, that whenever any gallon measure is mentioned in any exelse law, it shall always be deened and taken to be a staniard imperial gallon. At present, therefore, the harrel contalns 86 imperial gallons. It may le worth while observing that the barrel or cask is exciusively the produce of Finropean Ingenulty; nud that no such article is hnown to any mation of Asin, Afrien, or Ameriea, who have not ilerived it from Europeans.
Barricade, in Natal irchitecture, a ktrong wooden rall, supported by stauchions, extending acrose the foremost part of the quarteraleek in ships of war. The vacant spaces between tho atanchions ure coms. monly tilled with ropemats, cork, or pleces of okd eable; and the upper part, which contains a double rope-netting alove the rail, is stuffed with hammocks, to prevent the execution of small-ahot in time of no-tion.-E. B.

Barwood, a red dye wood brought from Africa,
particularly from Angela, and the River Gaboon. The dark red which is commonly seen upon British bandana handkerehiefs is for the most part produced by the coloring matter of barwood, saildened by sulphate of iron.-Bancuoft on Colors. The imports of barwood into England, in 1841, amounted to 2012 tons. It brought, in January, 1843, from $£ 3$ to $£ 4$ a ton (duty 2s. Included) in the London market.

Baskets (Fr. Corbeilles; Ger. Körbe; It. Paniere; Sp. Canastas, Canastos; Russ. Korsinü) aro made, as every one knows, prineipally of the interwoven twigs of willow, osier, bireh, etc., but frequently also of rushes, splinters of wood, straw, and an imnense variety of other materials. They ar used to hold alt sorts of dry goods, and are constructed of every variety of tuality and shape.

Bast, for straw hats or honnets.-See Hats.
Batavia, a city of the islund of Java, the capital of the Dutch possessions in the East Indies, and the principal trading purt of the Oriental islands, lat. $6^{\circ}$ $8^{\prime} \mathrm{S}$., long. $106^{3} 50^{\prime}$ l., on the northwest coast of the islomul, at the month of the Jaceatra River, on an extenslve bay. The harbor lies between the main ?and and several small uninhablted islands, which, luring the boisterous or northwestern monsoon, afford sufficient shelter and grood anchorage. Population in 1842, 03,860 , ineluding about 3001 Europeans; the rest are Chinese, Javanese, Malays, etc. It is built on marshy ground, and intersected by canals in the Iuteli style; defented by a citatel and several batteries, anil has a consideraille garrison and marine arsenal. Mean temperature of year, $78^{\circ} \cdot 3:$ winter, $78^{\circ} \cdot 1$; summer, $78^{\circ} \cdot 6$ l'ahrenhelt. Temperature at midday, $80^{\circ}$ to $90^{\circ}$; nt night, $70^{\circ}$ Fuhrenheit. It has a studthouse, exchange, hospital, numerous churches, a mosque, a Chinese and two orphun hospitals, several Chinese temples, a large clubhouse termed the Harmonie, and a br tanic garilen. Hutavia was formerly so very iasalubrious, that General Daendels was anxions to transfer the seat of government to Sourabaya; but belng thwarted in this, he set about luilding a new town, a little farther inlund, on the heights of Welte. vreden, whither the government uffices were immeliately removed. Most of the principal merchants have now their residences in the new town, repairing only to the old city, when business reguires it, churing a portion of the day. In consequence, the ohd town is at present principally oceupied by Chinese, and the rescendants of the ancient colonists, several of its streets having been deserted and demollshed. More recently, however, the Haron Capellen, whose enlightenced ahatinistration will long he gratefully rememlered in Juva, seusible of the superior ulvantages of the old town as a place of trade, exerted himself to 1 revent its further decay, by removing the causes of ite unhealthiness ; to accomplish whleh, he whilened sercral of the streets, filled up some of the cumals, and eleansed others, demolished ureless fortificutions, ete.; and the effect of these judlcious measures has Leen, that Batavia ls now as healthy as any other town of the silant. It is the sent of a supreme commission of pullic instruction for the Dutch East Indies, und has a sched of arts and selences, and jublishea n newspuper. The Juecatra la navigalie by vessels of 40 toms two miles inland; whips of from 300 to 400 tons anchor in the luy; one mille and a half from shore. Hatavin is the great commercinl emporimm of the Asiatic Archipelago, and absoriss by far the greatest projortion of the trude of Java mid Madura; the annual exports of which islands amount to $\mathbf{t 0 , 4 0 0 , 0 0 0}$ florins ( $825,123,000$ ), mul the imports to $89,000,000$ Ilorlas ( $012,000,000)$, Exports consist mostly of coffee, sugar, pepper, hudigo, hides, cloves, uutmegs, mace, tin, rice, ratans, and nrrack. Chief imports, linen anil cotton good, woolen stufls, provisiona, whes, metallle wares, fad munufnctured articles of all kinds from Europe nod Amerina; with the prod-

nets of the Archipelago, China, Siam, Bengal, Japan, and the West Indies. It was founded by the Dutch in 1619; taken by the English in 1811, and occupled by them till 1816. The district of Batavia, extendligg along the north shore of the island, is flat and not so fertile as the other provinces of Java. The residence of the governor general was transferred from Buitenzorg to Batavia in 1847. As the population has inereased slnce, it may at present be estimsted at from 130,000 to 140,000 , independently of the military, of which there are always a considerable number. Among the principal merchants are Dutch, Engllsh, Americans, l'reneh, and Germans. The island of Java forms the most important portion of the Dutch possessions in the East, and is, in fact, oue of the finest
colonies in the world. It contains, Including Madura, an srea of 52,000 square miles, with a population of nearly, if not quite, $\mathbf{1 0 , 0 0 0 , 0 0 0}$.

Bank of Bataria. - A bank, for the issue of notes must have stopped payments! This intervention has, and other lanking business, was established at Butavin in 1827, with branehes at Sanarang and Sourabays; the history of which ls not unlustruetive. The eapital of the bank, consisting of $2,000,000$ tlorins, divided into 4000 shares, was subseribed with difficulty; and the most unfavorable unticipations were entertainel of the success of the establishnent. No sooner, however, had the bank been set on foot than she began to enjoy a large share of prosperity. Tho rapid inerease of cultivation and commerco in Java led to a corresponiling demand for capital, anil to tho payment of a very high rate of interest on loans; and as the leans mado by the bank consisted of bauk-notes, which cost next to nothing, the protits became quite enormous; so much so that they anounted in 1837 to 33 per cent., the price of the 500 florins share of hauk stock heling then also 1550 florins. But this prosperity was us lirief as it was signal. The offor of an exorbitant Interest had tempted, in not a fow cases, the lank to make advanees no doultful security ; mill in Java, as elsewhere, issucs of paper payable on demand necessurily stop, the moment the circulation lus been fully saturatel with notes; and this result having theen attuined in 1838, mad the notes isaued by the bank beling henceforth returned on her for payment, she speedily became luvolved in the greatest difieultizs; many of thuse who depended on her advances for suppiort were no louger nblo to meot their engagemrnts ; and the whole lsland was suljeeted to a severe pecuinary and commerelal orisis: in fact, lint for the interventlon of the government, in 1840, when lianknotes were made ligal tender for a limited period, site
however, given her time to recover from the difficulties into which she had been precipitated; and having again, after sustaining a very heavy loss, resumed specie payments, it is to be hoped that she may profit in future by her past experience. We subjoin dividends paid by the Bank of Java from 1829 to 1840, both inclusive:

General Remarks on Java.-The previous statements show that the produce and trade of Java have increased during the last dozen years with a rapidity unknown in any other colony, Cuba, perhaps, excepted; and if the resources and capahilitles of this noble island he fully developed, it is quito impossible to say how much further her trade may be extended. It would far exceed our limits, aml, even were this not the case, it would Invelve us in discussions nowlse sultalle for thils work, were we to enter into any detailed examination of the means by which the extension of culture in Java has lieen brought ehont. We may, however, shortly mention that the produce for exportation is prinelpally roised on account of government, partly by contributlons in kinu, and partly and principally by contributions of compulsory lator applied to its production. And, provided these contributions le not carrled to an excess, we inc., ne to think that they are at onco the loast onerous mode in which

## BDE

the natives can be made to pay their taxes, and the most profitable for the goveriment. It is, we apprehend, Idle to suppose that industry, If left to Itself, will ever become flourlahlng in a country llke Java, where the wants of the inhabitants are so fow and so easily satlsfled, or where the climate Indisposes to exertion. No doubt the system of compulsory labor may be eavily abused and converted into an inatrument of the most grinding oppresslon; but so long as it is managed with discretion and good sense, we are dlsposed to believe, from all we can learn, that it is preferable to every other system hitherto devised for developing the resources of tropical countries.-For some remarks on this aubject, see the learned and able Dissertatio IIstorico-Politica, on the Dutch East India Company, by Van Lijnden, published in 1839, p. 161-171.

Very great public improvements have also been al. ready effected, and are still in progress in the isinnd. Among others, an exceilent high road has been constructed through its whole length, from Bnntam, on Its weatern, to Sourabaya on ita enstern coast, whencecrossroads lead to all the principal stations. A number of forts have, also, been constructed in commanding situations In the interior, the principal of which, at Surackarta, near the centre of "te island, is a regulnr and atrong citadel. It is said to be the intention to transfer the seat of government thither from Batavla. These forts have been erected principally to keep the natives in check, and to prevent those outbreaks that have done so muci to retard the prosperity of the island. Several important establishments have nlso heen recently founded along the southerin coast, which had previously been all but neglected,-See Argout sur Jara, Singapore, etc.

Rice used to be the stnple product of Java; but it is now far surpassed by coffec and sugar, the culture of both of which has been astonishingly increased. In proof of this we may mention that the exporte of coffee, whlch in 1830 amounted to 288,740 piculs, had increased in 1845 to $1,006,190$ picula, or to 61,090 tons; while the exporte of sugrar, which in 1830 ambunted to 108,640 piculs, had increased in 1845 to $1,455,423$ piculs, or 88,365 tuns. More than linlf the trade of the lslund centres in Batavia. Indigo has also become an Important product. The other principal articics of export are tin from Banca, tobaceo, tea, and birds' neats. The Imports compriso cottons, woolens, and other manufactured goods; wines and spirits, with iron, hardware, and machinery ; opium from the Levant and from Bengal; and a great variety of other articles.

Port Regulations.-The following is the aubatance of the port regulations of Batavia: 1st. The commander of a ship arriving in the roada is not to lund hlinself, or permit any of his rrow or passengers to land, until his vessel be visited by a loat from the guardshlp. 2d. The mnster, on Innding, is flrst to wait on the master attendant, and nfterward report himself at the pollce office. 3d. A manlfest of the whole cargo must be deiivered at the custom-house within 24 hours of the ship's arriving in the roads. 4th. The mnster of a vessel must lodge the ship's pnpers with the mnster attendant when he tirst landia, which are duly delivered up to hinı when the recelves his port clenrance from the aame authority. 5th. No goois cun be ahipped or landed after sunset, under n penulty of 500 florins. 6th. No goods can be rhipped on Sundey without a special permission from the water fiscal, whleh, however, is never refused on npplication. 7th. No muskets or ammunition can lie imported; but tho prohibitlon does not extend to fowling-pleces exceeding 100 forine value.

Tariff.-After a good deal of negotintion, it has been fixod that goods imported In forelgn vessels shall pay an ad ralorem duty of $\mathbf{2 5}$ percent., and under the Netherlanda flag of $12 \frac{1}{2}$ per cent. ; that la , a duty upon the wholesale price at Eatavia, not in bond. 'l'te export
duty on coffee, if exported on a forelgn bottom to a foreign country, is 5 florins per picul; if on a foreign bottom to a port in the Netherlands, 4 florins; and if on a Netherlands bottom to a Netheriands port, 2 florins. Sugnr exported on a foreign bottom pays 2 florins per picul ; but if exported on a Netherlands bottom, 1 florin. Rice, on whatever bottom exported, and to whatever country, pays a duty of 3 florlns per coynng of 27 pleuls. Tin, exported in a forelgn ship to whintever port, 4 florins per picul; and by a Netherlands ship, 2 florins per plcul. The trade in splces is monopolized by the Netherlunds Tradling Company.

Goods are received in entrepot not only at Batavin, but at the porta of Samarang, Sourabaya, and Anjler in Java, and Rhio In the Straits of Malacea, on paymient of a duty of 1 per cent. levied on the lnvoice valuo.

Money.-Accounts are kept, at Batavia, in the florin or gullder, dlvided into centimes, or 100 parts, represented by a copper coinage or doits. The florin is a new coln made expresaly for Indin, but of the same value ns tho florin current In the Netherlands. It is usually estimated at the rate of 12 to the pound aterling, but the correct par is 11 florina 58 cent. per pound. Doubloons, and the coins of Contlnental Indin, are receirable at the custom-house at a fixed tariff; the Spanish dollar, for example, at the rate of $\mathbf{1 0 0}$ for 260 florins.

Weights.-The Chlnese weights are invarlahly used in comnercial transnetions at Batavia nud tirroughout Javn and the other Dutch possessions in India. Theae are the picul nud the eattie, which is its hundredth part. The pieul is commonly estimated at 125 Duteh, or $133 \frac{1}{3}$ lhs. avoirdupois, but at lhatavin it has been long ascertained and considered to be equal to 136 Jbs , avoirdupois.-IIooennonp, Coup d'thil sur l'lle de Jaia, cap. 8, ete.; Eividence of Gilinan Maclaine, Hisq., before the Nelect Committee of the IHouse of Commons on the Affairs of the East India Company, 1831 ; Nederlandsche Staats-Courant, 13th August, 1842, and other official information.
Batten, a name in common use for a acnntling of wood $2 k$ inches thlek and 7 wide. If above 7 inches wide, it is called deal.
Bay (Saxon byge, nn angle), an arm of the sea extending into the land. It is omaller than a gulf, and larger tha: a creek.
Bayou, bioo, or more nsually bio, n term confined chictly to Inlets of the Lower Mississippi River, signifying properly any strenm whlch ls derived from some other strenm, or from n lake; In other words, uny atream which is not fed by fountains. The word is supposed to be $n$ corruption of the French boyau, a "gut" or "chnnnel"-a derivation which is rendered more probable by the prevalent pronuncintion, b'o. Several of the bnyous from Lake Pontchartraln, near New Orleana, and from the Gulf of Mexico, are very important chmnnels to the interior country, nnd aftord great facilities to commerclal intercourse.

Bazar, a term used in the Enst to designate a market, or bulliling, in which varlous articles of merchandlse are exposed for snle. Baznrs nre now met with In most large citles of Europe. There are several in London, of whieh the one in Soho Square is the most conslierable.

Bdellium (Arnb. Affatoon), a gum-resin, remipellneid, nad of a yellowlah-hrown or dark-irown color aceording to its nge, unetuous to the touch, lut britthe; soon, however, softenling between the thgers: In appearance it ls not unliko myrrh, of a bitterish taste, nad moderately atrong amell. Two kinds have been diatinguished: the opocalpasum of the nacients, which ls thick like wnx, and the common dark sort. It is found in Persia nud Arabla, hut prineipally in the Intter; all that la met with In Indin is of Arabic orlgin. The tree whieh proinces it hins not heen clearly aseer-tuined.-Ainslie's M/ateria Indica.

Beach, a shelving tract of sand or shingle washed by the sea or a fresh-water lake, and intorposed between the water and the land, on which regetation growa. The beuch of the occan is, generally speaking, little nore than the space between high and low water-murk; the beuch of a lake, that between the water marks of the highest and lowest ordinary level of the lake. An inlund 'ea without tide, such as the Mediterranean, has commonly very littls beach, except on tlat coasts, where tho waters are apt to fall and rise considerably, according to the prevailling winds. -F. A.

Beacons, in Commerce and Navigation, public murks or signals to give warning of recks, shoals, etc. No man is entitlod to erect a light-house, beacon, etc., without belng empowered by law.-See Buoys.

Beads (F'r. Resaires; Ger. Rosenkrünze; Du. Paternosters; It. Corons; Sp. Coronas), sinall globules or balls uset as necklaces, and made of different muterials; as pearl, stee, smber, gurnet, ceral, diamonds, erystal, ghass, etc. Roman Catholics use bests in rehearsing their Ave Murias and Paternosters. GLass beads or bugles are imported in large quantities into Iudia uinit Africa, 288,058 lus. having been shipped from linglant to the west const of the later in 1841. Large quantilies are sent from China to fudia, the Liasten islands, etc. The glase beuds sent from lingland are neurly all hojorted, prineipaily from Venice, where they are very largely prodnced. Their non-manufacture in Great Ilritain is suld to le a consequence of the excise regulations as to the manufacture of glass; but the truti is, that the Venethin manafueturers color them hotter, und give them a vetter thish than the Englith.

Beam, la weaving, a long thick wooden cylinder, placed length wise on the lack part of the loom of those who work with a slouttle. That eylinder on which the sl:ait is relled as it is weuved is also culled the beam or roller, and is placed on the fore part of the low.s.-EV. 13 .

Beam-compasa, an instrument consisting of a square wooden or brass beum, with sliding sockets that carry steel or pencil polnts. lleam-compasses are used for describing larger cireles than can conveniently be drawn by the common compasses.

Beams of a Ship are the great main cross-tinbers which hold the sides of the ship from falling together, and also support the deck and the orlops. The main lieum is noxt the muin-mast, and from it they are successively reckoned us tirst, second, thlrd, and 80 on . The groatest benm of all is called the midship beam. A ship is suid to be on her beam-ends when she laclines so mueh to one shle that her beums approach to u vertical position.-E. $\mathbf{3}$.

Eean-cod, a small tishing vessel, or pilot-boat, common in Portugal. It is extremely sharp forward, having its atem bent above into a great curve inwurd, plated on tho fore side with lron, and fortitied with bolts. It is commenly navigated with a large lateen saii.-E. II.

Feans (Fr. Feves; Ger. Rohnen; It. Fave; Russ, Bondïi; Sp; Habu; Lat. Faba), a well-known vegetable of the pulso species, largely cultivated both ingardens and fields. Its cultivation is of much importance in rucal economy, innsmueh ns it has gone far to supersede fallows on strong lonms and clays.
Bearing, in Navigation, an urcla of the horizon intercepted between the nearest meridian and uny distant ohject, either discovered by the eye and referred to a point on the eompuss, or resulting from the spherical proportion; as, in the tirst case, "At four J.m. Cape Spuilo, in the Isle of Candia, bore south by west by the cempass." In the second, the longitudes and latitndes of myy two places being given, and consequently the difference of latitude and longitude letween them, the bearing of one from the cther is discovered by the following anulogy: As the me-
ridlonal differenco of latitude is to the difference of longitude, so is the radius to the tangent of the bearlng.

Bearing is slso the situation of any distant object estimated from some part of the ship according to her position. An object so discovered must be either ahead, astern, abreast, on the bow, or on the quarter. If the ship salls with a side wind, it alters in some mensure the names of such bearings, since a distant object on the beam ls then said to le to leeward or to windward; on the lee quarter or bow, and on the weather quarter or bow.-E. B.

Beating, in Navigation, the operntion of making progress at sen agaiost the wind, by steering in a zigzug courbe.-E. B.

Beaver, er Castor, an amphlbions quadruped of the order Rodentia, with a thick glossy fur, and horizontally flattened tail, abounding in North America and Siberia, and still found in the north of Europe. It formerly appears to have been known as far south as the Rlione and the Danube; and though with us now extinet, was formerly an inhabitsnt of Great Britain. The fur of the beaver forms a considerable article of commerce. Among truders the skins ure distinguished into three kinds: 1. The fresh beaver, which is obtalned in winter, before the animal has shed any of its hair, and consequently that is most csteemed by furrlers. 2. The try or lean beaver, which is captured in summer, when the animal is moulting. 3. The fat beuver, which differs from the fresh only in having acquired additional seftness and oiliness from belng worn for some time on the persons of the native hunters. This is the kind that is chlefly used in hat-making. The substance called castor is found in pouches in the inguinal region of the beaver. It is regarted as a powerful antispasmodic.-E. B.
Beech (Fapus sylvatica), a forest tree met with in England, the linlted States, etc. There is only one epecies, the difference in the wood proceeding from the diflerence of soil and situation. A consideruble quantity of beech is grown in the sonthern parts of Bueks. It is not much used in building, as it soon rots In damp places; but it is used as piles in places where it is constantly wet. It is manufuctured into a great ruriety of tools, for which its great hardness and uniform texture render it superior to all other sorts of wood; it is also extensively used in making furniture.

Beech-mast, the fruit or nuts of the beech-tree, used for fattening hogs, deer, and other animuls. It has sometlmes proved a useful substitute for bread, as experlenced at Chios during a menoruble siege.-E. B.

Beech-oil, an oil expressed from the mast of the beech-treo. It is common in Northern Germany, also in licardy, and in other purts of France, instead of butter ; but it is said to he unwholesome.- l:. 13.

Beef is used either fresh or sulted. Formerly it was usual for most tumilies, at least in the country, to supply themselves with a stock of salt beef in Oetuler or November, which served for their consumption until the ensulng summer; but in consequence of the unjversal establishment of markets where fresh beef may he at all times obtained, the practice is now nearly relinquished, and the quantity of salted heef mude use of as compared with fresh beef is quite inconsiderable. Large supplics of sulted beef are, however, prepared in the United States for exportation to the East and West Indies. During the war, large supplies were also required for victualing the nuvy. The vessels engaged in the consting trade, nnd in alurt voyages, use only fresh provisions. The Englifh have at all times been grent consumers of beef; and at this moment more beef is used in Londun, es ceapared with, the population, than any where else. Previously: to 1842 tho jmportution into England of fresh leef was prohibited; and sult beef from a forelgn country was charged with a duty of 12 s . a cwt. But in that
year the duties on both sorts were reduced to 8s. 4 $\ddagger$ d. a ewt., and in 1846 they wers wholly repealed. In $185:$ the imports of salted beef into Great Britaln amounted to $122,665 \mathrm{cwt}$., and those of fresh beef to only 2028 cwt.-SLee Phovisions.
Beer. All ancient Greek witers egree in assigning the honor of the discovery of beer to the Egyptians; but fros: the circumstanco of no notice being taken of beer in the books of Moses, it has been rather rashly concluded thut such a drink was unknown to them till after his death. This, however, is unlikely. Thu vine was alone cultivated in Egypt in those distriets which were beyond the reach of the inundations; and the quantity of wine raised being limited was reserved for the rich, while the poorer classes had to content themselves with a cheaper drink prepared from barley. Herodotus, who wrote about 450 years n.c., is perhaps t' arrliest writer who gives sm. vartienlars regardin ${ }_{6}$ digypt, and he describe leer prepared from parlcy an tho ordinary drink of the Egyt tlsos in his day. Plimy, Aristotle, Strabo, and ethers, who mention that this beer was knewn by the name of Zythos, give full descriptions of its qualities and intoxicating properties; and Diciorms evon aflirms that some kinds were so palatalile as to lee scarcely inferior to wine. The regearches of Sir J. G. Wilkinson relative to the ancient Egyptians have thrown much light on this suliject, and render it probable that beer was used as a drink by the ameient ligyptians nearly as early as wine itgelf. Xenophon, in his account of the retrent of the ten tholasand Greekn, 400 years o.c., mentions that the inhabitants of Amenin used a fermented drink made fr $\quad \mathrm{m}$ barley. Diodorus Siculus states, that the aation of Galatip prepared a fermented drink from harley, styling it zythus, like the Egyptians. Jeer was distimguished among the Greeke ly a varicty of names. It was called únos noithoos (barley wine), from its vinous properties, and from the materinl employed in its formation. In sophocles, and probably in other (ireek writers, it is dis. tinguisied by the name of Bpuzov. Dioseorides describes twe kints of heer, to one of which he gives the name 弓ilos, and to the other koipht; but he gives no description of oither sufficient to enable us to distlnguish them from each other. Both, he informs us, were made from harley, and similar liquors were masufactured in Spain and Britain from wheat.

Tacitus informs us that in his time beer was the common driak of the Germans, and from his imperfect description of the process which they followed, it is not unlikely, or rather there can be no douth, that they were acguainted with the met'wod of converting barley into malt. lliny gives us some details respecting beer. ITe distinguishes it by the mame of cererisia or errrisin, the appeilation liy which known in modert Latin works.

This theverage does not appear to have come into general use In Grece of Itsly ; but in Germany and Britain, and some ather countries, it appears to have been the commen drink of the Inhabitants in the time of Tacitns, and probably long lefore. It has conthued in these countries ever since; and great duantities of beer are still manufactured in Germany, the Low Countries, and Britain. We might quote mumerous prasages fros's the narratlues of recent travelers to show that the use of a drink prepared from barley is nearly universal over the northern and temperate parte of Eurone and Asla. One of the latest of these travelers, M. Hac, the French missionary, remarka that the drink of the tarmers in Thitect is " n sort of sharp drink made with fermented barley, which, with this addition of hops, would be very like our beer."

Purier is a strong lieer of a dark color and peeuliar flavor, and Is said to be so named, cither from its have lag been the common drink of tho porters, or from Harwood, the original brewer of the drink, sending It round to his eustomers by men, who when they
knocked at the loors called out "porter," meaning therely not the drink, but themselves, its prortere or carricrs. lorter was originally lirewed to take the place of two or three kinds of becr which used to be mixed by the retailers in the mug as they drew them from the taps; and as this new drink had tho taste of all three, buc was brewed at once, and run onc of one tap, it saved the publican trouble, and was denominated "entire." Hence, as the sign so oftea noticed in London, such a brewer's "entire."

Bavarion leter is the only other malt liquor which, from the pecularities attending its fernentation, requires a spesial notice. The liermans, from the earliest historital periods, have teen a lieer-drinking nation, and some expallent malt liquors are mude in that conntry. Th, " wriss bler," the trily patriotic bev. rice of $F{ }^{\circ}, 1 a$, is made from warley alo e, tut $\because$ wn 1 , one or it and 5 part, wheat mal!; but Aco: ind ent: 10 give the admired tartness. The othe: 1. somwer nore especially the ones now to the notict, the Buwit . heers, ivoth the common fot beer (schank-bi r) in intoxicating luscious herklieer, are brewed from berey malt alone.--Sce Lager BiEn,

Ale appears to be an nneient drink, and the name is usually given to strong beer of a pale color, as perter is to that of a dark color. The varicties of ale are infinite, but wo jurpose only to notice the peculiarity in the manufacture of English ale, Imian ale, Euglish home-hrewed ale, and Scottish ale.

In all ligh-priced Finglish nles of the present day, brilliancy and paleness of color, with as little excess of sweetriess as possible, are the oliects to be attained by the brewer. fo accomplish these ends, nothing but the finest pale malt must be used; and to secure sound-keeping ale, it is of first Importance that the malt shall have been thoroughly dried on the kiln. If prepared from what is techicically known as "slackdried malt," that is, malt not thoroughly dried for far of coloring it, or which has had water sprinkled over it whilo still warm from the kiln, the wort as run from the mash-tun will he found acid, and will tinge litmus paper of a much deeper red than ordinary wert from well dried mult, mill the alr prepared from it will not keep beyond a few months. It is necessary also to le carcful in the selection of the hops for ale. Gool sound hops should alone he used; many brew* cra now use a proportion of forelgu nops along with the English hop.

Anle, Indian, or Burtun Ale, origirally intended for exportation, and now so deservedly in high repute as amongy our most estecmed anil wholesome heverages, requires more partienlar treatment in its manuficture, This ale can only be prepared from the best gale malt and the hest hops; and the ehief peculiaritice attending its munufneture are, that it requircs more than donble the usual iroportion of hops, that the attemation is generally carried to a much grearer extent, sud that the temperature during the fermentation should never be allowed to exceed $65^{\circ}$ Fahrenheit. That a considerable amount of sheetness should exist in common ale is allowable, and indeed it is the presence of a large quantity of unlecomposed asecharine extract which gives to common strong ale its hascious mill. ness. It is, however, the presence of this large quantity of undecomposed saccharlme extract which prevents common ule from being uked us a diet drink by the invalid, or being relished in a warm country; and it is the circumstance of the Indian or pala ale laving its fermentation carried so much furtier, and its saccharine matter rednoed in guantity, together with its larger proportion of bitter, that commende it on much us a grateful and stimulant stomachie to the Eurojean resident in a warm climate, and to the invalit.

Home-bretced Aic, as brewed by the middle classes
Yeart

[^2]Beet,
The cemm heet, has I is also use dured for tury from of manget termed wh chictly bee thon of sug leet-root is $\mathrm{t}_{3}+2110$ gen, nine extrict of formerly : is capalile process of Was espercis policy it w render the possession in a comp manufictu any digree in 1828 no

in England, is usually made ir quantities of 2 barrels, i. e., 72 gallons. For this purpose a quarter of malt, or if wished to be extra strong, 9 bushels of malt, are taken, with 12 lbs . of hops. '1, ध malt being croshed or ground, is mashed with 72 K :ifons of water, at the temperature of $160^{\circ}$, and cov. up for three $b: a r$ s, when 40 gallons are drawn of ; f... into this the 12 Jbs . of hops are put, and left to iufato this the 12 jos. vater, at the temperaturs $\mathrm{c} 1100^{\prime}$, ire then added to the malt in the mash-trib and well rif ed, and, after standing two hours, 60 gallons are irawn of The wort from these two mashes is boils: lonig with the hops for two hours, nd after being ". ated down to $65^{\circ}$, it is strained thenur', $n$ flanel bag into the fermenting-tub. wharn it in mix d with $1+$ gailons of yeast und lefe ti rook for twenty-four or thirty-six hours. It is then run into barrets to cleanse, a few gallons being reserved for 1 lling up the casks as the yeast works over. Eighteefl or twenty gallons of beer are obtalned from the used malt by making a third mash with 25 or 30 gallons of water, ant boiling the wort thus procured with the used hops.

Scottish .Ile, but especially the Elinburgh ale, has been long celebrated, but as an ordinary heverage it is much more loseions and heady than london porter, Encrish aie, or pale Indian ale. It is a much stronger drink than any of these, the home-brewed English ale approaching nearest to it in thia respect; and as the attemution of the saccharine extract is only carried the length of the decomposition of two-thirds of its original strength, the largo quantity of undecomposed saccharine extract renders it much moro luscions to the taste, and milder than the linglish ales. The Scottishales are brewed of varion- atrengths, and are known in the uarket ly their price pur hogshead, and are hence commonly mentioned ns $£ 7$ ale, $£ 6$ ale, ete.-E. B. See Ale and Buewing.
hamptation of llerr, Ale, and Ponten into the Tinited
States, acxorming to Trapasury Mepont of 1855.

Beet, or Beta, a well-known genus of plants. The common beet, Refa rulgaris, a variety of the red beet, has long been eultivated as a food for cattle, and is also used for the table as a piekle. It was introdued for this purpose in the latter part of the last century from Germany, whero it is known ly the mame of mangel-icurzel. - See Acmicultine. The variety termed white beet is smaller than the former, and has chictly been eultivated on a large acale for the formaton of sugar from its root. The chemical clements of beet-root sugar are expresed atomically thus: C12, II9, $0_{3}+210$, or, twelve atoms of carbon, nine of hytrogen, nine of oxygen, and two of water. The largest extract of pure sugar from bect-roet in llelgium was formerly 3 per eent., but is now 6 per cent., and is capathe of further increase liy hoprovement in the process of manfucture. The cultivation of beet-root was especially fostered in France by Napoleon, whose poticy it was te enconrafe every thing that tended to realer the Continent independent of IMritaln, then in possession of the chlef sugar colonies. It is only within a comparatively recent period, however, that the mamufneture of beet-root sugar in Curope las assunsed any tlegree of importance, the total quantity produced in 1828 not exceeding 7000 tons, while in 1851 it was $t$.imated at not less than 180,000 tons. Wro sulpoin a
few statisties relatlue to the increasing importance of this manufacture from The Economist (Nos, 431 and 482, Nov. 29th, and Dec. 26th, 1851). The quantity of beet-root sugar ar. mally produced in France is 60000 tuns, or filly ons-half of the entlre consumption. Thotgh now subject to a higher duty than colonial ame augar, it is considered probable that very shorily it will excludo foreign susi + from the French market altogether. The producti, is of beet-root sugar in Belgium also is rapllly on the increase, the quantity produced in 1850 lelng 7000 tnns, or half the entire consumptlon of that ki.uglom. This had increased in 1851 to 10,000 tons, while of foreign cane augar only 4000.13 wero imported. In Germany it has made simiar progress. In 1818 tho quantity produced was 26,000 tons, which had risen in 1851 to 43,000 , with a corresponding decrease in the imports of forelgn sugar. Of 85,000 tons of sugar estimated to have been consumed in Isussia, 35,000 tons were heet-root sugar. In Austria, also, the production of this article inereased from 8000 tons in 1848, to 15,000 tons in 1801, while the consumption of cane sugar had sunk from $3:, 000$ to 25,000 tons.-E. B.

Behring's Btrait, explored by a Danish navigator in the service of Kussin, whose name it bears. Behring thus estallished that the continents of Aala and Amerlca nre not unitel, but are distant frons ench other about thirty-nine miles, 1728.
Belfast, a maritime town, a municipal ind parliamentary horough, the capital of Clster, the chief manufacturing and commercial town in Ireland, and since 1850 the county town of Antrim. It is mainly comprised in the county of Antrim; but the large suburb of Ballynaentret, sepurated from the town by the River lagan, is in the founty of Jown. Belfant is sithated in lat. $54^{\circ} 36^{\prime \prime} 8 \cdot 5^{\prime \prime}$ N., sml long. $5^{\circ} 00^{\prime \prime} 53.7^{\prime \prime}$ W., at the month of the River lagon, which flows immediately into Jlelfast Lough (Carrickfergus Bny), an estutry about 12 miles in length, and 5 miles broad. The town is built upou an allavial deposit and land reclamed from tho sea, tho greater portion being not more than six feet above high-water mark. In common with all places so situate, it is exposed to oceasional inundations, and somewhat to the visitatious of epidemics; but independently of the lowness of its site, Belfast is in other respects advantageously placed, and generally by no means unhealthful. The environs of the town are highly agreeablo and picturesque. Helfast has been steadily progressive in population from an enrly period. In 1758 the number of inhalhitants was 8519 in $1782,13,105$; in $1798,18,320$; in $1821,45,177$; in 1831, 48,221 ; in 1841, 75,308 ; and in 1851, 100,310 . Tho custom duties collected at the port in 378.1 momented to $£ 104.376$, nul, after various lluctuations, reached $£ 288,756$ in $1834,\{339,989$ in 1843 , and $£ 377,320 \mathrm{in} \mathrm{18052}$. The great increase of shipping fiequenting the port uppears in the following necount of the mumber and tonnago of vessels entered inward at various periods:

| Years. | $\begin{aligned} & \text { Nu. of } \\ & \text { Vessels. } \end{aligned}$ | Toncage. | Veark | $\begin{aligned} & \text { No. uf } \\ & \text { Ven sela. } \end{aligned}$ | Tonnage. |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1766 | 75 | 34,487 | 18.5 | \%, 1160 | 133,441 |
| 1795 | 801 | 52.6 \% | (30, ${ }^{\text {c }}$ | 2,730 | 290, 16.9 |
| 1805 | 840 | 08,255 | 18.5 | 3 3, 065 | 445.637 |
| 1815 | 1,154 | 91,361 | 1851 | 6,0t6 | 650,408 |

The chief export trade is carried on by the cross-channel mavigation; lout a consilerable direct trade also exists with the United States and Cundu, the West Indles, the Mediterramean, and the Baltic. Ilelfust is the centre of the Irish linen manafacture, to the cultivation of which it is mainly indelted for its prosperity, In 18.11 about 240,000 spindles were employed, and the increase during the last ten years has been so rapid, that about 510,000 spindles are now in operation. The total value of all products of the linen mamufacture exported abroad in the ten menths ending oth Novemher, 1852, was $£ 1,357,87 \cdot 1$, agaiust $£(150,157$ in 1851 ; and
the export of linens and yarns, eapecially of the latter, continnes on the increase. In $1851,5,060,160$ pounds of liney yams wero exported from Belfaat; and in 1852, $\epsilon_{.}^{779,680}$ pounds. The harbor of llelfast, originally a creek of the River Lagan, has been much improved of late years, and nuw allows vessela druwing eighteen reet of water to reach the quays at spring-tides.-L. B.

Belgium. Belgium extends from lat. $49^{\circ} 27^{\prime}$ to $51^{\circ} 50^{\prime} \mathrm{N}_{\text {i }}$, and from long. $2^{\circ} 34^{\prime}$ to $6^{\circ} 4^{\prime} \mathrm{E}$. On the north lt is bounded by Jlolland; east by Duteh Lintbourg and Luxembourg, and Ihenish Prussia; south by France; and on the west by the North Sea. It is somowhat of a triangular form, of which the longest side is that adjoining Frunce, being 366 miles in length. The eastern boundary is 233 miles, and the northern and western are together 259 miles in length. Its greatest length from northwest to sontheast (from Ostend to Arlon) is 503 leagues of $\mathbf{b} 000$ metres, or 174 English miles, and its greatest breadth from north to south is 105 miles. It has an area of $2,945,593$ heetures, equal to $7,278,968 \mathrm{E}$, ish acres, or 11,373 square miles; being about one-etghth of the area of tireat Britam. This country is divided into nine provinees -Antwerp in tho worth; West and East Flandors and Hainanlt in the west; Namur in the south; Luxembourg in the southeast; Licgo and limbourg in the east ; and brabant in the centre.

Cemmercial Association.-Belgium possesses a great number of commercial and tinancial associntions. In 18il there were no fewer thin 191 legally authorized joint-stock compunies for carrying on public works or entergrisea, having a united capital of $880,34 \overline{7}, 208$ franes. Of these 12 were ussurance compmies, 12 private Lanking eompunies, and 1.1 railway compankes. It has eight commereial exchanges, under the diresfien of government; namely, in Antwerp, Erussels, Gibent, Bruges, Osteud, Mons, Tormonde, and Louvin. In $182: 2$ the General Society for the Encouragement of National Industry was lormed at Brussels, under a roval charter for 27 years, and which has since heers extended to 1875 . It has a social chpital of $30,000,000$ ) Horins, divided into 60,000 shares of 500 tlorins, bearing intorest at 5 per cent. The nuministrative body consists of a governor, nominuted by the liug, six directors, a secretary, and a treasurer. It discomits bills, receives money at interest, grants loans and advances on titles and other deposits, etc. The national hank, instizuted by churter granted in 1800, for twenty-five years, has its seat at Jrussels, and has branches in all the provincial capitals and several other towns. Its capital is $25,000,000$ franes, in shares of 1 owo frumes each. It lays a dividend of 5 per cent. upon the shares, and one-third at least of the profits, exceding is per cent., goes to form a sinking fund. The udministration conshats of u governor, nominated by the king, six directors, and a council of censors. The banking operations are sujerintended by a government commissary; a report npon its atite is presented to the government every monith. The situte funds ure deposited in this lank. The Bank of llelgium, charfered in 1885 for twenty-five yearn, but which has been extended to 18.5 , has a eapital of $30,000,000$ fruncs. Its seat is at Brussels. The Bank of lhamers is established in Ghent. Antwerp is the principal sea-port of Delgium; it has a good harinor, and st:perior commercial facilities. Population, in 1850, 420,000 .

The weights and measures of Belgium are tho same as those of Franco. Gold, silver, and copper coins are struck at the royal mint in Irussels. The gold cuins are ten and twenty-five Irunc pieces; tho silver are of the value of $1, \frac{1}{2}, 1,2$, and $2 \frac{1}{2}$ franes; and the copper of $1,2,5$, and 10 centimes.

Commerce.-In 1851 Belginm possessed 149 tradiug vessels, of the agigregate burden of 30,577 tons. The value of the imports and exports for the years 1849, 1850 , and 185 l , was as follows:

In 1851 the imports by Belgic vessels were valued at $44,702,097$ francs ; by foreign, 124,736,164 franes; and by land und rivers, $249,117,064$ francs. Exports by Ilelgic vessels, $24,107,306$ franes; by foreign, $81,326,815$ f:ancs ; and liy land and rivers, $295,741,931$ franes. The laden lielgie vessels enterhig were 402, of 70,261 tons ; and forelgn 1591, of 229,771 tons. The laden Belgle vessels leaving were 351 , of $C 2,996$ tons; and foreign, 1168 , of 161,314 tons. The number entering in ballast was 149, of 17,484 tons: 1359 vesaels entered the port of Autwerp, 448 Ostend, 234 Ghent, and 101 Nicuport. The imports are prinelpully from France, England, Holland, and the United States; and the exports principally to France, IIelland, l'russla, and England. The imports are divided into three classes : those for direet consumption in the eountry, those for transit, und those lirought into warehouses to be either consomed in the country on paying the duties, or exported. The value of geols imported for consumption, ond of the productions of the country exported, was for the three years alove as follows:

| Years | Imported, | Esported. |
| :---: | :---: | :---: |
| 1810 | Franea. 60, 77000 | franes. <br> 50) 1b4000 |
| 1850 | O1t, 523,0000 | $210,083,000$ |
| 1851 | 218,045, 070 | 200,129,626 |

Theee are divided into three branches. 1. Fremiares matieres, articles consumed in the state in which they are found, as. conls, ete. ; 2. Articles of food; und, 3 . Manulinetures. The imports and experta of 1851, so divided, give

|  | Imports. | Exporls. |
| :---: | :---: | :---: |
| Premicres matieres. . . . . . . | varanes. | Frioci. $01,442,481$ |
| Food . . . . . . . . . . . . . . . . . | 8t,36: 555 | 26, 658.255 |
| Manulacture | 40, (5, 015 | 70,128, 590 |

The value of the grods in translt for the years 1850 and $18: 11$ was

| 18 mb | Dirued. | By Warchotike. |
| :---: | :---: | :---: |
| 155.) | tranes. <br> $1754 \cdot 508,6060$ | Franer. <br> $25,710,100$ |
| 1581 | 175, 144292 | 25,049,134 |

Of the latter, the value exported by Belgic vessels was $7,046,645$ franes ; by foreign, $28,712,479$; and by land and canals, $165,287,202$ francs. Although there is a slight decrease in 1450 ns compared with 1850 , in comparing 1850 with 1841 we find an inerense of 259 per eent. The value of goods in warchouse on the 1st Jumuary, 1851, was 26,626,000 franes; entered during that year, 65,006,000; taken out for consumption, $32,922,000$; for export, 25,542 ; and $25,480,000$ were in bond at the end of that year.

Linder the rule of Frince, Belgium, like th:e other parts of the Continent, had suffered severcly from the operation of the conscription laws, which had aleprised the country of those active laborers whe were necessary to cultivate the fields. Although peace could not restore the great numbers who had perished, yet it stopped the further progress of the evil in the Netherlands, by the establislment of a voluntary enrollment for a sinail regular army, and of a militia, whose servhe was required only for one month in the year. The mines felt the benefit of this regulation. The minerals of dielgrium consist of coal, iron, and calmmine. As seon as the union had been formed, and latorers became less searce, a grent impetus was communicated to this branch of industry; and companles were formed, who were most literally' repaid ly the profit of their investments in this branch of industry, which was augmented from yeur to year as long as Belgium and Jouland censtituted one kingdom. Ily the exeltement com-
munlcated to mining, the provinces of Llege and perlod the demand for tron was great, and the prices Hainatit, and a part of Namur, were greatly ea- were augmented by the number of railways constructriched; and a company formed to explore the mines of Inxembourg were amply rewarded in their latora and their protits, till interrupted by internal commotions. The various branches of manufacturing industry received a similar impulse, thouglt at first they wero checked by the peace. The continental system of llonaparte had given a factitlous encouragement to some articles of manufacture, which coased with the return of peace; and, till the formation of the kingdom of tho Netherlands, many branchea wero doprossed by the rivalry of foreign goods in the markets to which they had aceess. But as soon as the junetion was completed, a sthmulus was given to tho manufacturers, by opening to their good; the markets of the East and West Indies, and those of all countries with which tho llollanders bad traded. The iron manufactures of Liege alvanced rapidly ln prosperity; the woolen manufactures of Verviers felt most powerfully a similar impolsion; and many large establishments wero formed at Ghent and other places, whero cotton goods were falbricated which rivaled those of England, and so far surpussed those of Frunce, that much of tho roods was sold by the contraband trade in that kingdom. The opening of the Scheldt was the necessary effect of the formation of the united kingdom. Merchants from various countries formed es ${ }^{+}$gblishments with large capitals at Antwerp; its deeks becume crowded with ships from all countries; its warehouses were loaded with celonial and other produce; and it advanced rapidly to a rivalry with Ainsterdam, lectterdam, and llamburg in the transit trade to the interior of Germany. Tho king directed his best efforts to the state of the roads, the grenter part of which had suffered dilapldation, while the cross-roads, so important in a country chiefly agricultural, were in many places acarcely passable. The management of tho former was under the general govermment, while that of the latter was auperintended by the loeal authorities; but in the first few years of the union the whole wero repaired and placed in tho most e:cellent stute. The interests of internal uavlgation were sedulously watched over by the king. The old canals were repaired, the shallow parts of the rivers were deepened, and now and important water communicatious were formed. The ehief of these, the Camal Guilhame, which extends from Maestricht to Bois-le-Duc, was an expensive but highly bencticlal work; and that of Antoing in Haimault, that of Charleroy in the province of N:mur, and that of Ternuse in Flanders, have been found in a very ligh degree heneflcial. Though no longer of any importance to Belgium, it may not be quite out of place to remark, that the spirit of Improvement which spread throughout the whole kingdom was to be seen in IIolland in the Grund Canal of North Mollaud, which opens to Amsterdum a way for shlps of the largest size to the oeean by way of the Helder, without ineurring the risks arising from the shonls of the Zayder Zee.

The following table shows the annual income and expenditure for the seven years preceding 1851:

| Yearn. | Ineonis. | Eixpendliture. |
| :---: | :---: | :---: |
| 1844 | Franea. $108,810,508$ | Franca. $195,1 \times 5,657$ |
| 1845 | 196, $25 \%$, 961 | 184,1884,349 |
| 18.41 | 114,064, 043 | 122,762,909 |
| 1817 | 113, 228,003 | 127,572,874 |
| 1818 | 140, 117,886 | 18F 060,595 |
| 1819 | 113,871,437 | 112,207,069 |
| 1850 | 132, 577.157 | 118,730,904 |

The number of works, in 1850 , for the preparation of iron was 351 , steel 2 , lead 8 , copper $9 \overline{0}$, zine 19 , slum 2, thass 35 ; 13,223 workmon were ongaged, and the value of the produce was $51,261,457$ francs. There is a decrease of 37 per coat. on the average of the three years preceding 1848, us compared with the three subsegnent, in the irom manufacture. Duriug the former
ing in Belgium and other countries.
The population of Belgium In 1881 was $3,7 t-814$; in $1840,4,078,162$; and In $1850,4,426,202$; distribated as follows:

|  | 1831. | 1840. | 1350. ? |
| :---: | :---: | :---: | :---: |
| Antwerp. | 340,942 | 871,157 | 420,553 |
| Urabani | 561,828 | 621,078 | 734,617 |

| Liege. . | 875,030 | 410,17i | 407,843 |
| Limbourg. | 100,090 | 169,000 | 188,198 |
| Inxemtrourg | 100,762 | 174,719 | 192,688 |
| Namur. | 218,784 | 238, 868 | 274,073 |
| Tutal.... | 8,785,514 | 4,073,162 | 4,426,202 |

There are aineteen chambers of commerce and manufacture established ln the principal towns, the memhers of which are nominated by the king from es triple list of candidates presented to him by the chambers. The members of each vary in number from ninc to twenty-one, one-third going out amually. They present to tise government or legislative cbambers their views as to the best means of increasing the commercial and industrial prosperity of the country, report annually upon tho state of their districts, and give useful information or direction to the provinclal or clvie authoritics under their administration.
Schools of navigation have been established at Antwerp and Ostend for furnishing properly educated unsters for merchant vessels. Instruction is given gratuitously in navigation and the branches connected with it-as arithmetic, geometry, trigonometry, nautical uatronomy, etc. ; with the elements of commercial law, as applicable to merchant vessels, the English langrage, and the manouvring, rigging, and trimming a vessel, both theoretically and practinally. Certificutes of qualitications as musters or mates are given by a jury of examiners.--E. B.

Alteratoons and Modefications in the Tariff, Tonnage Duties, and Port Regulations of Belgum, by Acts of the 12: h day of i pril, and the 30th day of March, 1855.-A lat of the 21st July, 1844, article 6, suthorizes the government to provide, by royal order, the necessary messures for admitting the products of Asia, Africa, und America, imported direct into Belgium nmder the flag of the countrles of production, or of the countries whence imported, on the same termas as if imported under the Belgian flag, provided Belgian veasels are plaed in such countries on an equality with the national flag. By royal order of the 12 th July, 1854, this law is mado applicable to Mexican ressels and products. Tho law of 8th June, 1853, provides that the government is empowered to allow vessels procecding from transatlantic countrics, or from a port beyond the Straits of Gibraltar, to touch at an intermedlate port, whether for the purpose of receiving orders or carrying on commercial transactions by discharging or receiving cargoes. This law, being of limited duration, is continued in force until the 31 st day of Mnrch, 1856, by the law of 30th March, 1855.* 'l'he law of the 11th of Jane, 1853, authorizes the government to adnit, free of duty, machines, new or innproved machinery imported for the purpose of introdueing new branches of industry or perfeeting those already establlshed, or for agrieultural purposes; also, steam-vessels constructed on a now principle or improved plan, or such as could be regarded as models. This law is continued in force to the 24th day of May, 1856, hy law of 4th June, 1855.

The last is the grest unsuspended bell, the wonder of travelers. Its metal alone is valued, at a very low calculation, at $\mathbf{£ 6 6 , 5 6 5}$ sterling. In its fusion great quantities of gold and silver were thrown in as votive offerings ly the people.- IIayns.

Bell-metal, an alloy of copper and tin, usualiy in the proportlon of 80 parts of copper to 20 parts of tin. Zinc generally enters into the composition of small shrill bells. By anslysis Dr. Thompson found an Einglish bell-metal to consist of 800 parts of copper, 101 tin, 56 zinc, and 43 lead. The thickness of a bell's elige is usually 1-15th of the diameter, and its height is twelve tlmes its thickness. The bell-founders have a diapason, or scale, wherewith they mensure the size, thickness, welght, and tone of their bells.-F. B.

Bending, in Nautical Language, the tying of two ropes or caliles together; thus, to bend the cable, is to make it fast to the ring of the anchor; to benil the sail, to make $\%$ fast to the yard.
Bends, in a ship, more generally called uales, are the thickest and stoutest planks in her side, on which mea set their feet when climbing up. They form the chicf strength of a ship's sides, and have the beams, knees, and foot-hooks boited to them.

Bengal, the largest and most important division of Hindostan, aituate toward its eastern extremity, and containing Calcutta, the seat of the British government In India. Exeluding the possessions of the native princes, over which the IIritish government merely exercises politicai supremacy, and excluding also tie Punjab and the Agra, or northwestern provinces, which are administered by functionaries having the powers and authority of lieutenant governors, the tract embraced within the presidency of Bengal lies between $10^{\circ}$ and $28^{\circ} \mathrm{N}$. lat., and between $83^{\circ}$ and $99^{\circ} \mathrm{E}$. long. Its most northern extremity is situate in the province of Assam, and its most sonthern point lies on the const of Tenasserim. The district of Mirzapore, under the jurisdiction of the lientenant governor of Agra, forms the extreme boundary on the west, and the frontier of Siam constitutes its most eastern limit. The longest line which could be drawn with extremities lying within the limits of the presidency, is that in a direction from southeast to north west, from the Pak Chan River, in Tenasserim, to the northwesteris angie of the district of Sarun, where the River Gunduck issues from the meuntuins of Nepaul, in lat. $27^{\circ} 25^{\prime}$, leng. $83^{\circ} 55^{\prime}$, and would measure about 1550 miles in length. A consiterable part of this line would, however, lie across the Bay of Bengal. The longest line that could be drawn without crossing the bay is from northenst to southwest, from the boundary of Assam to tinat of the British district of Palamow, a distance of about 870 miles. The extreme breadth of the presidency, mansured at right angles to this last-stated line, is about 465 miles, bearing from southeast to northwest, from the mouth of the IIooghly to the exit of the Gunduck from the mountains of Nepaul. The aren of the presidency, as thus defined, umounts to 225,103 squares niles.
Bengal, especially as it approaches the sen, may be designated a level country. Even in its northern frontier, it is reached only on one point by any of the brunches that diverge from the Himalayas. A epur from the grest culminating range bounds the nertheastern extremity of Assam; and thence taking a southeriy direction through the native States of Mun-
neeporo nnd independent Tipperah, forms the castern frontier of the British district of Chittageng. Continaing from this polnt its southerly course, it stretches, under the name of the Yoomadonng Mountains, through the province of Arracan to ita soutiternmost point at Cape Negrais, forming the veatern boundary of the valley of the Irrawaddy. This spur where it tonches upon Assam attains an elevation of $\mathbf{1 4 , 5} 50$ feet above the level of the sea, and there its aummit is cevered with perennial anow.

The soil of so extensive a province varies, of course, in its character and fertility with the physical peculiarities of the country. In the level tract interlaced by the Ganges and Brahmapootra, with their numerous branches and tributaries, the aoil is alluvial, its basis being composed of anand, on which are nnnually deposited, by the retiring watera, clay, calcareous matter, and other fertilizing substances. In the tracts which lie beyond the reach of inundation, it is marked by different degrees of productiveness, from the dry and arid rocks of the southwestern frontier overrun with brushwood, to the hills of Chittagong and Tenasserim clothed with magnificent forests. Taken as a whole, howerer, the soil of Bengal, enriched as it is by the combined influence of fierce auns and deluging rains, may he said to be characterized by an amazing fertility. Its productions are those hoth of the tropical and the temperate climates. Of the gra na which contribute to the subsistence of man, rice is of the first importance: It is the great stuple of Bengal agriculture, is purtlcularly laxuriant within the tract of inundation, and thrives in all the southern districts. It is sown after the first showers at the end of March down to the setting in of the rainy season, and occupies a period ranging (according to ita variety, of which there are three principal denominations) from three to five months to ripen. The early crop is sown broadcast; the later crop, after the seed hns attained the height of $n$ few inches, is plantell with the hand in rows at the distance of ubout a foot asunder. The rice harvest is succeeded by the cold-weather crops, which are sown In autumn and reaped in spring. They consist chiefly of vetches, granu, barley, peas, mustard, etc. Millet and other amall grains, sown at the beginning of the rains and reaped at the end, constitnte the food of the poorer classes, and, bearing a very low price, are of importance. Maize is less cultivated in Bengal than in those countries where the climate is more suitable, having no preference above millet to compensate for the grenter labor required for ita culture. Potatoes have lately been introduced into Bengal, and have succeeded well. They are suited to the climate; and the small potnte is little inferier to that raised in England. Esculent plants are found in Bengal in great nbundance and variety. The different species of the cucumber are much more numerous than in Europe, and whole fields are covered with them. The watermeton is of incredible size; snd its stalk, leaves, and blowoms form a finely variegated matting, with which most of the cottages in the villages are entirely covered.
The universal and vast consumption of vegetable oils which takes plnce in Bengal is oupplied by the extensive cultivation of mustard, linseed, sesamum, and palma-christi, in addition to the produce obtained from the cocos-nut. The sesamum comes to maturity during the rains, or soon after them, the others during the cold season. Among the most important of the commercial crops are tobacco, augar, the opium poppy, indigo, cotton, and silk, most of which require land solely approprinted to their peculiar culture; of late years coffee has been succesafully cultivated. Tobacco, which was unknown in Indis before the discovery of America, is now produced every where. The sugar-cane h..s flourished in Bengal from the remetest times; there is scarcely a district in which its cultivation is not pnrsued with auccess, and there seems to be no limit to its production, except the demand for it. It is cheaply
and frugally manufactured; and as it now enters the British market on opual terms with West India sugar, it forms an iaspertant article of export. The manufacture of indigo appeara to have been known and practlced In Bengal trom an early period; and from the East Europe was aupplied with this dye until the superior produce of America engrossed the uarkets. European skill has, however, succeeded in reviving this branch of trade in Bengal, and the indtgo now exported from this presideney amounts to five-sixtha of the supply obtained from the whole world. Cotton is raiaed in abundance, but the produce scarcely exceeds the consumption; and the demand of the Brit sh and China markets tor the cotton wool of India is ulmost wholly supplied from the weatern side of the country. Silk is an anclent product of India; the silkworm, it is said, belng origiually introduced from China. FormerIy the raw material was brought from India to Greeeo and Itsly, whenco Evrope was chiefly supplied. Bengal still carries on a trude in this valuable article; and although the quality is acarecly equal to the tinest Italiau silk, the annual export from Culeutta exceeds in value half a million aterling. A course species of silk is procured from the wild silkworm, which is found in the countries bordering on llengal, and in several districta ineluded within it. It is rendered uecinl in the fabricathon of infecior silke, though hearing rocemparson to the produce of the domesticated insect. The cultivation of the poppy ia entirely regulated and controlled by the goverament. Amual contracts are made wirh the farmers to sow rtain quantities of, land with the plant, and to delive so proluee to the government in the torm of opium ic a tixed price. The sowhigs commence in Novomber, and the crop arrives at maturity by the end of February. The revenue realized by the government from the sule of opium produced in Bengal alone amounts to between two aud three millions sterliug per annum.

The orebard is a great object of eultivation with the peasant in Beagal; und it attaches him to his native soil, from the almest superstitious predilection which he feels for the trees plauted ly his ancestor. The seasons, howe:-er, from the long continuance of tho ruins, which occupy the greater part of the summer, are not particularly faverable for bringing fruit to maturity ; yet the orange, lime, shadilock, citron, tamarind, and other fruits, may be reckoned among the productions of Bengal. Cichards of mango, a tree thriviey with little care, and vielding a fruit estemed one of the best among those of Indis. diversify the plalins. In si e. and feliage this tree restmblea the Spanish chestnut; ita fruit ia extramely delicious, and is said to surpass ..) flavor the large yello's peach of Venice. Another fruit tree is the cocoa-nut, valuable not only on aecount of the nut, from whlel a superior oil is largely extracted, but in consideration also of its timher, which is peculiurly fitted fer the construction of waterpijes and other useful purjoses. Even the luusk which emselops the lirult furnishea a tibre irom which the best corlage is manufactured. The molberry is extensive1y planted in consideration of its leaven, which afford the food of the silkworm. Assam ahounts witit the gemuine tea phant; and the bassla thrivea in various loealities, expecialyy in the hilly districts. Its prodneco is esculent and nutritious, und its tlowers yich an intoxicating spirit. From its seedy la expressed un vil which is somethmes used as a substitute for butter. There are also valuathe forest trees, among which may be notieed the teak, byual to the oak for purposes of ship-building, the sul, and the banym. 'There is also the hamboo, which, behg hollow, light, mud strong, is serviceable la supplying the peasant whth materiais for his bubhlings, us well an for the manfacture of buskets, mats, and other articlea of like character, to which, when kjlit, lta llexible thire is well nilapied.
d/ineruls.-From the alluvial character of the grenter jurtion of the soil of llengal, no great amount of
mineral wealth is to be expected. In the hilly tracts, however, both in the eastern and western parts of the country, two of the most useful products whilel the mineral kingdom can boast, coal and irun ore, exist in abundunce. Gold, in the form of dust, is found in s few places, but not in quantities sufficient to encourage to any extent the seareh for it.

Manyfactures and Commerce,-Cotton plece goods form the stuple manufacture of Bengal; though the use of Indian fubrics of this description in Europe has almost entirely ceased, while even in India the demund for them has been in a great degree anperseded by the cheuper gooda of Groat Britain. The district of Ducea, In the eastern quarter of Bengul, has long been famed for the munuficture of pluin nuslins, distlmguished by various names uccording to the fineness and the closeness of their texture, as w ell as for flowered, striped, or eheckered muslins of the most beuntiful und expuisite fabrics. Soveral kinds more closely woven are munufactured on tho western side of the delta of the Ganges; but those of a more rigil texture do not seem to be limited to purticular dlstricts: coarse turbans und handkerchiefs are also mude in almost every province. Uuder the general appellation of ealicoes are included various species of cloth which are still distinguished ly thetr Indian designations. Moorshedubud und its neighborhoed is the ehief seat of the silk manufucture.

The internal trade of Bengal consiats chiefly in the expurtation from the grain districts of corn and rice in exchange for salt. The supply of this article in Bengal is provided partly by manufacture condactod on account of the government, partly ly importation, and to a small extent by private manufucture under a gystem of exeise. Tho duty on all imported salt is at the rate of tive shillings on $8^{2}$ pounds, or about three furthings per pound; and the sume rate of duty is levied ou the home mamufucture of the article, the prime cost of which amounta to about one farthing per pound. The wholesule price of sult at Culeutta may therefore be estimuted at one peony the pound. Its supply is no longer a monopoly; for though the manufucture and sale have not been relinquished by the government, yet the public purticipate in ita provision, under s combined system of customs and excise. The net revenue derived from salt by the government within the presidency of Bengul exceeds a million and a half sterling per unnum.

Salt is a very ancient source of rovenue in the Bast; but a feeling agginst its manufacture being carried on by the government has been for some time on the incrase. During the parliamentary session of $1 \times 53$, a clanse was preposeal to to laserted in the India bill, then in its progrees through l'arliament, forbidding the manufucture uffer the Iat Muy, 1856; nnd thongh oppesed by the ministry, it was in the llouse ot Commons carricd. lly the IIouse of Lords it was, howerer, rejected, it belug deened nusafo thus auddenly to diminish the resources of ludia by bo large manamit us that of the revenue produced by the trade as at present conducted. The facilities atlorded for the introduction of Engllah salt have for several years past cansed a grent increase of the imported srticle, the conntity recelved in Calcutta in the otheisl year 1850-51 heing double that of previous years.

The intermal trade of Ilengal la greatly aided lye the nuvigulle communications which haterseet the comintry in every direction. The boars uset in this navigution vary in form and constructlon, helng each alapted to the nuture of the rivert which they kenerully travers? Stean movigation has been introgluced upon the Ganges with success; and the Mucadmized trunk road from Calcutta to Dellif has athorded fueility of communicatho: with the caplal to varioun parts of tho presidency; but there can be little doubt that in the course of a few years the rivers and roads of Ilengal will ulike lecome subsidiary to the great arterles of commundeation which, in the form of rallways, ure now com- irts of the which the e, exist in lond in a encourage Europe has he demamil ded by the tof Daeca, seen famed guibhel by the closestriped, or 1 exquisite are manu10 Ganges; $a$ to bo linnand handrince. Une included stinguished bad and its anufacture. iefly in the and rice in cle in Benuducted on rtation, and mder a sys alt is at the it three farty is levied a prime cost per pound. y therefore supply is no facture and overmment, m, under a the net revwithin the and a half
n the linst ; carricd on on the inof 14i3, a India lill, theding the though opse ot Com. as, howerutdenly to ail amount tas at presthe introyears past irticle, the ticial year
meneing to intersect the country. The line from Cal- elosed on all sides by rngged rocks and lslands: the cutta to Burdwan is advancing rapidly to completion; frem this point it will be continued in a northerly direction to Rajmathal, on the Ganges, whence it will traverse the heart of the presidency in a northwesterly direction to Allahabad.

Bengal carries on an extensive commerce with Britain. The exports consist chlefly of all the staple articles of the country-such as cotton, silk, sugar, rum, and Indigo. The imports are metals of all sorts, wrought and unwrought ; woolen and cotton mannfactures of various kinds, which oan be sent from Britain and sold cheuper than the home manufactures of the same description; naval and milltary stores; gold and silver bullion ; and almost every article of Uritish manufacture. An extensive trade is carried on to China and the conntries and island' to the east. The exports are chiefly opium, saltpetre, gunpowder, cotton, and cotton piece goods.-E. B.

Bengal, Bay of, a portion of the Indlan Ocean of the tigure of a triangle, having on its western aide tho coast of leagal, and on the east the const of Arracan, Pegn, and tho Malayan peninsula. Its two sides, from Bengal to Ceylon on the west, and to Junkseylon on the east, may be estimated at 1120 miles in length, and the whole is comprehended within tho latitudes of $8^{\circ}$ snd $20^{\circ} \mathrm{N}$. At the bottom of the bny the breadth from Chittagong to Balusore is not above 250 iniles; and at its mouth, from Cape Comorin te the Malnyan peningula, the breadth may be estimated at 1200 milles. Tho westorn and eastorn coasts of the Bay of Bengal form a singular contrast in all the points most essential to $n$ navigator. On the western coast thore are no harhors for large ships, whilo on the eastern coast there nro many excellent hurbors, such as Arraean, Chedutia, Negrais, and Syriam, in Pegu; a harhor near Martaban, Tavny River, and King's Island; and several harbors in tho Mergul Arehipelago, besiden Junkseylon, Telebone, and l'ula Lada. Off the west const of Coromandel thero are no soundings about thirty milles from the shoro, whilo the cast coast has soundings two degrees from it. Coromandel presents an open comntry : it is parched with drought from winds hlowing over sultry sands; the mouthe of its rivers ure shallow from bars of sand, and it is often vistted by dangerous gales. The east coast, on the other hand, is covered with wood. The climato is always temperato; the rivers ore deep and muddy; and the weather is generally caln. The monsoons blow over tho Bay of llongai, though it is remarkable that here, as in many parts of India, strong whads are found blowing directly from the sea, while at some distance from tho land it is a dead calm. Thus in Bengal thore are strong northerly winds, while at sea culus prevail until May nud June; and on the Malabar coast the southwest monsoon dees not commenco blowhg thl the beginaing of the ralny reason, whilo on shore there are strong westerly winits about and after the time of tho vernal equi-nox.-li. 11 ,
Bergamot, a species of citren, Citrus limetta, disthguished from the orange and womon by having wingless leaf-stalks. It is a native of the south of Europe, and is produced abundantly in the neighborhood of Nice, The fruit luns a deliclons taste and smell, and its essential ofl is highly esteemed an a perfinne. Tho essence of hergamot is also called pasenzia di cedro. It is extracted from the yellow rind of the frult by eutting it in small pleces, and expressing tho oil, or by distilling it from vater. Une hundred bergamots of Nhe yiedi, by oxprosalon, at ounces of oll.
bergamot is also the denomination of a coarse tapestry, manufuctured with tlocks of silk, wool, cotton, hemp, cow's or gont's hair, and supposed to be invented at Bergamo, In ltuly.

Bergen, tha ilrst commercial elty of Norway, situated at the bottom of a leep bay, in lat. $60^{\circ} 24^{\prime} \mathrm{N}$., long, $t^{\circ} 20^{\prime} \mathrm{E}$. l'opulation 26,000 . Tho hay is in.
water is deep; but, owing to the number and intricacy of the passages, the access to the town ia attended at all times with a good deal of difficulty; and ahould never be attempted without a pilot. Codfish, salted or dried, is the principal article of export: when dried, it is called stock-figh, and goes chiefly so Italy and Helland. Tho fishery is the princlpal employment; and considerable quantities of fish and other products are also brought hither for exportation frum the more arortherly parts of the kingdom. At an average, from $25,000,000$ to $30,000,000 \mathrm{lbs}$. salted and dried fish are annually exported. Herrings, whale-oil, skins, bones, tar, lobsters, ete., are also largely exported. The ex. ports of timber from Bergen are inconsiderable, and nono has latterly gone to Englend. Norway timber is not so large as that brought from Prusslan ports, nor so free from knots; bnt, heing of slower growth, it is moro compaet, and less Ilable to rot. The planks are either red or white flr or plao: the red wood•is produced from the Scotch fir ; the white wood, which is inferior in price and estimation, is the produce of the spruce fir ; each tree yields three pleces of timber of 11 or 12 feet in length, and is 70 or 80 years of nge before it arrives at perfection. The planks or deals of Bergen are, however, a good deal inferior to those of Christinna. The imports into Bergen prlncipally consist of grain from the Baltic; and salt, hariware, coffeo, sugar, etc., from England.-For Moneys, Weights, and Mensures, see Cumstiana, where thero are further detalls ns to the trade and navigation of Norway.

Berlin Decree, a memorable interdict against the commerce of England. It declared the British islands to be in a state of blockade, and all Englichmen found In countries ocenpied by French troops were to be treated as prisoners of war; tho whole world, in fact, was to ceaso from any communlention with Great Initain. Issued by Bonaparte from the court of the l'russian king, shortly after the hattle of Jena (which for the timo dechled the fate of l'russia), Nov. 21, 1806.
Bermudas, or Bomers' Isles, wero dlscovered by Joîo Bermudas, a Spaniard, in 1527; but were not inhabited until 1609, when Sir Georgo Somers was cast away upon them. They were settled by a statute 9 James l., 1612. Among the exlles from England, during tho efvil war, wis Waller the poet, who wrote, while resident bere, $n$ poetienl deseription of tho islands. There was an awful hurricane hero, Oct. 31, 1780, and noother, hy which a third of tho houses was destroyed, and all the shlpplag driven ashore, Juy 20, 1818.

Berrles (Bacer), the fruits or sceds of many dlffer. ent spectes of plants. The berriea quoted in London price-currents are bny, juniper, Turkey ant Persian. 1. Bay-berries (Fr. Baies de Laurier; Ger. Iorbeeren; It. Bacehi di Lauro; Sp. Bayas), tho trult of the Laumus nobilis. This treo is a nutive of the south of Europe, but is cultlvated in England, and is not uncommon in thelr gardens. The berry is of an oval shape, fleshy, and of a dark purple color, almost black; it has a sweet fragrant oflor, nud an nromatic astringent taste. 13ny-berries, and the oll obtalued by boilligg them in water; aro haported from Itnly and Sphin.-Titomsox's IVispensatory.
2. Juniuer Rervies (Fr. Gevirrier; Du. Srcenbom; It. (ine pro; Sp. Fimbro), the frult of the common junlper (.luniperts commumis). They are romod, of a black purple color, and reguire twn years to ripen. They haven moderately strong, not lisagreenble, but pecullar smell, and a warm pungent, sweetlsh faste, which, If they be long chowed, or prevtonsly well bruised, is followed hy a conslderable bitterness. They are found in lingland; hut most of those made uso of there are imported from IJolland, Germany, and Itaiy. They shoukd bo chosen fivesh, not much shriseled, and free from inouldiness, which they are apt is contract in keeplag. On distilintion with water, they yfeld a volutlle essential oll, very subtle and pungent, and in
amell greatly resembling the berries. The peculiar flavor and diuretlc qualities of Geneva depend principally on the presence of this oil. English gin is asid to be, for the moat part, flavored with oil of turpentine. -Lewis's Mat. Med.; Thomson'a Dispensatury.
3. Turkey Yellowo Berries, the unripe fruit of the Rhamnus infectorius of Linneus. They are used as a dye drug la prepuring a lively but very fugitive yellow, for topical application in calico-printling. Conaiderable quantitles of them are exported from Salonica, to which thoy are brought from Thessaly and Albania. An inferior aort is produced In France.-Bancroft on Colors. Price in tho London market, September, 1853, 34s, to 40 s , per cwt.
4. Persian Yellow Berries are aaid by the merchants to be of the same species as tha Turkay yellow berriea. The colors which they yield are moro lively and laating. They are high-priced, fetching from 80 s . to 110 s a a cwt.

Beryl, called by the jewelers Aquimarine. This stone was suspected by lliny to be a variety of the emerald; a conjecture which modern mineralegists have completely confirmed. The term emerald is applied to that particular variety which presents its own peculisr color, or emerald green; while that of beryl is given Indiscriminately to all the other varicties; as the aea green, pale hlue, golden yellow, and colorless. Pliny says that the beryl is found in India, and rarely elsewhere; but besides India, it is found in Peru and Brazil ; at Nantes and Limoges, in France; in the Wieklow Nountains, in Ireland; in the district of Cairngorm, in Scotlend; and in various other places. -Plixy, Ilist. Nat. lib. xxxvii. cap. 5; Eneyc. Brit. new edition.

Those only which are of gooll color and sufficient depth are manufactured; they have a pretty, lively etfect, if in good proportion and well polished. Large atones, from one to three and four ounces, are not uncommon, but from their bulk are ouly in request as specimens for the cabinet; smaller stones, suitable tor neckluces, may be bought at low prices, within the reach of every description of purchasers.- Mawe on Diamonds, etc. 2 d edition.

Besant, or Bezant, a coin of pure gold, struck at Byzantium in the tine of the Christian emperors; and hence the gold offered by the king at the altar is called besant or bisant. It seems to have been current in linglend from the tenth century till the the of Edward III. Its value is not prectisely ascertained, but it $\mathrm{i}^{3}$ generally estimated at $9 s .44 d$. sterling.

Betel-leaf (IIind. Pan; Nalay, Sireh; Javan. Surv), the lcaf alluded to in the following article. It ls the prodines of a species of pepper vine (liper brtle), and somewhat resembles the iry leaf. In. their fresh ainte, betel le wes form an important article of Eastern trathe, being every where used in the preparation of betel. The Piper betle la a scandent plant, nud poles ure placed in the ground, round which it twles itself. In consequence of the great comsumption of its leaves, It is extensively cultivated throughout tropical Asin' It grows in the greatest perfecion in rich noils close to the equator, and is raised whlt more difliculty the farther we recede from it.-Encyc. Britannica, new edition, article Betel; Cantwevin's iodian A rchipelago, vol, 1. p. 403.

Betel-nut, or Axeca (Sans, and Ilind. Suapri; Malny, I'inang; Javan. Jambi), the frult of the Areca catechu, a slender and graceful palnt, rising to the height of aboat 30 or 40 feet; it produces frot: at the ag, .... - nix years, and continues bearing till its 25 th o: 30th year. The fruit, which is the only part of the palm that is made uso of, is eaten both in its unripe and In its mature state. When rlpe, It is of the size of a small egg, and of an orange color; the extirio: part consiats of a soft, apongy, til roun matter, inclosing a nueleus resembling a nutmeg In shape, lnternal st ructure, and color, hut usually larger, und always liarder. A sliggle tree producea, accordlug to les aitu-
ation, age, culture, etc., from 200 to 800 nuts. They are objecta of great importance in the East, forming the principal ingredient of a compound in universal use as a masticatory in all Central and troplcal Asia. The other ingredients are the leaf of tle betel pepper (which aee), in which the areca-nut is wrapped; a fittle Chunsm (which aee); and generally, but not alwaya, a little catechu or terra japonica.-See Catecne. The whole compound is called betel, and is uaed to an extent of which it is difticult for a European to form a just lden. All individuals, without exception of age or sex, begin at ancarly period to accustom themselves to betel. They are unceasingly masticating it, and derive a gratitication from ita use that strangers can neither underatand nor explaln. It reddena the saliva, givea a bright bue to the lipa, and, in course of time, renders the teeth quite black. It is sald to dispel naosen, excite appetite, and strengthen the stomach. Besiles being used as an article of luxury, it is a klnd of ceremonial which regulates the intercourso of the move polished classes of the East. When any persen of consideration visits another, after the first salutations, betel is presentad: to omit it, on the one part, would be considered neglect, and its rejection would be judged an affiront on the other. No one of inferior rank nddresses a dignlfed individual without the previous precaution of ehewing betel; two people seldom meet without exchanging it; and it is always offered on the ceremonivus interviews of public missionaries. The areca-nut is, in consequence, an article of very extensive trade. The countries which yield it mest lurgely for exportion are, Malabar, Ceylon, and Sumatra. Of the extent of this trade some notion may be formed from the fact that the imports of areca into Calcutta in 1841-1842 umounted to 53,633 Ind. mannds, or 1966 tons, and those into Cunton in 1837, by British ships only, amounted to 25,978 pieuls, of 1502 tons, notwithstancting Bengal and Southern China are countries in which areca is largely produced.--See the article P viten. in the new edition of the Cincyc. Britannica; Belu's Rericw of the Erternal Commerce of Bengal; Cuswran's Indian Archipelago, vol. 1. j. 102, vol. ii. p. 414 ; Chinese Colendur ond Register.

Beyrout, Beirout, or Bairut (hery/us), a fortified sea-port, and the most flourishing commercial town of Syria in proportion to its aize, pashawlic of Aere, on a bay of the Nediterruneun, 57 miles west-northwest of Damascus, of which eity it is the port, and 3 miles south of Cape Beyrout, which is in lat. $33^{\circ} 50^{\prime}$ N., long. $35^{\circ}$ $26^{\prime}$ E. I'opulation estinnated at 12,000 . Its walls are ubout 3 miles in cirmmference, outside of which are suburbs equaling the town in extent. It has some large and well supplied bazars. Streets narrow, hut rean, it being plentifully furnished with springs; and it is said to have lerived its origlual name from the Phœuician deity, Baul Reerith, "lord of wells." Along the shore are same rumalus of antloulty, comprising moraic pavements, columns, and a thick wall. The harbor, protected by n mole, is adnpted only for small boats; but In the bay beyond it ships may nuchor in from 6 to 11 futhoms. The town has seme manufactures of silk stulls, and gold and silver thread. I'rineipal exports, silk, gallk, madder, gulns, wine, and oils: imports, muslins, cottons, tiu, hardware, cloths, and manufactures of western Europe. In 1811, $8 \times 3$ ships, woatly Turkish, Arab, and Greek, nggregnte burdet 38, $4 \cdot 11$ tons, entered the port with cargoes to the value of $£ 66,7.18$, nud nearly the sume mamber cleared ont with cargoes worth e2di, 128 , hesides ballast. Heyrout was bombiaried mel teken by the English in 1840.
Bezoar (Arab. I'alyj; Ilinch. Zehrr-mowh; l'ers, I'adzehr Konie), a concretion found in the stomach of an auimal of the goat khed; it has a smooth glossy surface, and is of a dark green or olive color: the word hezonr, however, has Intely been extended to p!l the concretions found lu animals; such at the hog bezour, found In the stomach of the wild boar In Indla; the

borine bezoar, found in the gall-bladder of the ox, common in Nepaul ; and the camel bezoar, found in the gall-bladder of the camel : this last is much prized as a yellow paint by the Hindoos. The fineat bezoar is brought to India from Borneo and the sea-ports of the Persian Gulf; the Persian article is particularly sought sfter, and is said to be procured from animals of the goat kind, Capra Gazella. Many extraordinary virtues were formerly sseribed to this substance, but without any sulficient reason,-Alnside's Materia Indica.
Bible. The first translation from the Hebrew into the Greck was made by seventy-two interpreters, by order of l'tolemy Philadelphus; is is ibence called the Septuagint version, and was completed in seventy-two days, nt Alexandria, 277 n.c.-Joseritus. It was commenced 284 a.c.-Lenglet. In 283.-Bbain. The Jewish Sanhedrim consisted of seventy or seven-ty-two members, and hence probably the seventy or seventy-two tranelators of Josephus.-Hewhett. The seventy-two were shut up in thirty-six cells, and each psir translated the whole; and on subsequent comparison, it was found that the thirty-six copies did aot vary by a word or a letter.-Justin Martyr.

Incient copies of the Bible.-The oldest version of the Old and New Testament belonging to the Christisus is that in the Yatican, which was written in the fourth or fifth century, nud published in 1587. The next in age is the Alexandrine MS., in tho British Muscum, presented by the Greek patriarch to Charles 1., and said to have been eopied nearly about the same tine. The most ancient copy of the Jewish Scriptures existed at Toledo, about A. D. 1000; and the eopy of Ber Asher, of Jerusalem, was made about 1100.llarion.
Bishops' Bible.-Hishop Alley prepared the Pentateuch; llishops Davis and Sandys, the Ilistorical Books; Bishop Bentham, the I'sulms, etc.; Bishop llorne, the l'rophets; Bishop Grinalal, the Minor Prophcts; lishope Prarkhurst rud Burlow, the A poerypha; lishop Cox, the Gospels and Acts; and Archbislop l'arker, the remainder, l'rinted A.D. 1558.

Dirivion of the Bible.-The Ilible was divided into twenty-two books by the Jews, the number of letters in the alphathet. The Christlans divided the Bible inte thirty-nine books. The IIehrew division into chapters was made by the Rabbi Nathan about 1445. Our lible was divided lato chapters, and a part into verses, by Archbishop Langton, who died In 12:8; and this division was perfected by Robert Stephens, about 15:1.
biditions of the Bible.-The vulgate editien, in Latin, was made by St. Jerome A.D. 405, and is that acknowlelged by the Catholic Church to be authentic: it was first printed by Guttenberg at Mayence, 1450 -145j.-Wee books. The flrst perfect edition in English was hinisbed, as njpears from the colophon, by Tindal and Covertale, October 4, 15:35. A revision of this edftlon was made, linis-rias. This last was orderel to he reail In clurehes, 1549 . In 1604 , at the conference at liampton conrt, a new translation was resolved upon, which was executed $1607-1611$, by ordor of King dames $I$., and is that now generally used in Great Brituin. J. Ellot's luillan llible, one of the first books printed In North America, at Cainbridge, 1664. The lible was first printed ln Ireland, at lielfast, in 1704. Permitted by the Popo to be transinted into the langunte of the Catholie States, 1750. The lllble Was prlited in

Bight (Dutch bogt, participle of boogen, to band), a bend in the sea-coast, forming an open bay; also a round of a rope or cable when coiled.

Bilbao, a city and priacipal pert of the north of Spain, capital of the proviace of Vizcaya (Biscay), on the Nervion, 6 miles from its mouth at Portugalete, and 28 miles north of Vitoria, lat. $43^{\circ} 14^{\prime} 3^{\prime \prime}$ N., long. $2^{\circ} 56^{\prime} 5^{\prime \prime} \mathrm{W}$. Population 11,906 . It is inelesed by lofty mountaizs, and is well built. Prineipal manufactures, hardware, anchors, leatber, paper, hats, tobacco, and earthen-ware ; there are large rope-walk. and docks for building merehant vessels, with iron and copper misee in the vicinity. Exports comprise weol, iron, fish, and fruits. Princlpal imports, cotton snd woolen fabrics, and colonial produce. Bilbao was fou.2ded In 1300 ; at the end of the 15 th century it became the seat of the famous consulado, originally cstablished nt Burgos, and having the highest authority in Spain as a commercial tribunal. It was the scene of frequent contests in the late Carlist wars, and Zumalacarregui received his death wound here, June 10, 1835.
Bilge of a ship, the buttom of her floor, or the breadth of the part she rests on when agrounl. Bilgerater is that which lodges on her floor below the level of the well of the pump; and bilge-puiaps, or burrpumps, are those that carry off the bi'ge-water. A ship is said to be bilged when her bilg' is broken in and she springs a leak.

Bilge, the greatest circumference of a cask.
Bill, in Nautical Language, the point of the fluke of an anchor.

Bill, in English Law, a declaration in writing, expressing either some wrong the complainant has suffered from the defendant, or a fanlt committed by the person complained of against some law or statute. In Scottish law, every summary applieation, by way of petition to the Court of Session, is called a bill.
bill, in Commerce, has been usually defined a writing in which one man is bound to another to pry a sum of money, on a day that is future, or presently ou demand, according to the agreement of the parties at the time when it is drawn; and on which, in the event of failure, execution may be summarily done to enforce pay-ment.-E. B.
Bills of Exohange. Withont evtering into any Inveatigation regarding the origin of hills of exchange, which has been assigned by dillerent writers to different countries and cmises, we may say that it is now the most generally adoptel oplnlon that they originated in the twelfth or thirteenth century, in ltaly, ut the public fairs, which raceived a marked importances in commerce, threugh the Crusades. The noney-changers transacted their principal business at the pe:blle fairs in the principal citirs, and bills or orders tor the payment of money at a distant place were at first drawn only from one fair to another, and were ealled cambia regulatio. Ilat when commerce increased, through the Ilmuspatic lengue, and extended to placea where $n o$ public fairs were held, bills of exchauge wers also drawn upon such other places, and these bills were ealled conbiz irregularia.
The oldest copy of a formnil lill of exchange known at present is one ilated at Milan on the 9th of March, 1825 , and runs in the orgginal ns follows:
"Ingute per questa prima litera [lettera] a di $I X$. thtobre a luco de foro Lib. WLI. Somo per la vaiuta qui da Marco Reno, ul tempo il pagate e joneto a mio conto e R. che Chriato ei grtarde Bionrumeo de Bonromei de Milan IX. de' Marzo, "TMo."-"Pay for this Ilre", bill of exclange, on the 9 of of I'ctober, to Luea de

BIL

Goro XLV. Livres; they are for value recelved here from Maseo Reno; at the tlme of matnrity pay the same and pasa it to my account, and thanking yon, may Chriat protect you, Honromeo de Bonromei of Milan, the 9th of March, 1325."

In England, reference was made, in the statute of 5 Rich. II. ch. 2, to the drawing of forelgn bills, whieh was in the year 1381. The legal propertics of bills in England are derivud from the cuatom of merchants, but promissory notes are aald to derive thelr propertiea from the aet of Parliament of the 3d and 4th Anne, c. 9 , which puts them on the same footing with inland bills. In the United States, bills of exchange and promissory notes are reeognized in law as negotialle instraments, with all the properties ustially attaehed to them by the custom of merchants. The slatute laws in many States espectally provide for their negotiability ; but In States where this is not the ease, the same customnry properties wonld be held to attach to them.

Name and Inefinition.-A bll of exchange, in common speceh called a draft, is an open letter of request, addressed by one person to a second, desiring him to pay a sum of money to a third, or to nny other to phom that thlrd person shall order it to be prid; or it may be macie payable to bearer. For instance:
" Exchance for $\$ 1000$.
" Eoston, let January, 1852.
"Sixty duys after sight of this bill of exchanye, say to the order of G'eorge Gireen, One Thousamb Dollors, ealue received, ond place the same to account, as adrised by
"C'iariaea Winte.

## "To Mr. Jacon Brown, Dee Iork."

Parties.-The person who writes the request is called the drazer, and he to whom it is nddressed is ealled the drauce; and if he ngrees or consents to pay the money signitied in the bill, le is said to accept it, and is then called the acceptor. The third person, to whom the money is payable, is callet the payee. In the tabove Instance, Charles White is called the drawer, Jacob brown the dravee, and after he has cousented or aceepted to pay it, the ouceptor, and George Green is called the payye. If it is made paysble to him or order, or to the order of him, as above, and he then assigns it to another person, to whom the money is to be paid, by writing his name on the back of the hilt (which is called indorsing the hill, and the act itself an indorsement), he is then called ant indorser. The person to whom he orders the money to be paid is ealled the indorsee or holler, and if this one again asslgns the bilil to mother person, the later is called the indorsee or holder, and the cther the second indorser; and every other person whe successively puta his name oa the back of the bill is called nu indorser, and the person to whom it is last delivered is called the bolder.

If in the above-cited instance George Green should write on the back of tho bill, "l'uy to the orter of Whllam llaker," blgnhng his name bencath, "tieorge Green," the latter would be called anl indorser, and Willian liaker wonld be called indorsee or holder; and! if laker, agnin, should slgn his name under that of Green, and order the contents ot the bill to he paid to someboly else, baker would be called an indorser, and the person designated by him the indonsee or holder, and so on .

Blank Indorsemente -t is velvermmon for porties to erign simply their not wo with Pi is of thin bill, whont designathg to whas the wottents y! , ll be pald. This is ealled $n$ "blar: Siniorsement," und Whosoever hollds the bill miny wate wove the shennature that it is paynble to 'is ar r. Fin 'nstas ', If

 nad hall dellvered it to " $n i^{\prime \prime}$. fisior, nut raker nyalu had stmply put hin s:anit of the bin k w1 r that of Green, ant hat delivere "th: '111 : one J. Brown, the latter would lie the hoilet it, 1 m .t w is. owe:
the signature of Green, "Pay to the order of Willlam Baker," and over the signature of Baker, "Pay to the order of J. Broum." Although these blink indorsements are very common, it woald be desirsble, and it is highly to be recommended, that each indorier should write in full over hia name the place of hia risidence, the date, and the name of his indorsee; that is. the name of the person to whom he assigna the bill. Thus, In the above instance, if George Green resided in New York, he ahould write on the tack, over his aiguature:
"New York, January 8d, 1852.
"Pay to the order of William Baker,
"Geonge Green,"
And in a similar way the suceessive indorsers should do. This way of indoraing has two advantages. In tha first place, if the bill alould be lost or stolen, with a blank indorsement on it, any person who finds or holds it might fill up the blank in his own name, and demand payment; whereas if it were Indorsed in full, the finder or holder wonld have to forge the name of the indorsee before he could get payment. In the aecond place, if the bill should be protested for nonacceptance or non-payment, the holder would know at once the places of residence of the different ludorsers, and be able to glve them due notlee withont delay.

Forms.-When blls of exchange are drawn on a place at a dlstance, and In a forelgn country, it is castomary to glve a set of three bills of the aame tenor, dint they may be sent separately by different mails, so that in case one should be lost, one of the others might reach the pe:son concerned safely. One of the common forms of a bill of this kind would be substantially as follows :
"Erchange for $£ 1000$.
"Sixty duys after sight [or after dute, or at sight, or on demand ], pay this my vinst bill of exchange (second and third of the same tenor and date not puid) to the order of $1 / r,-$ One Thousamd Pounds Sterliug, value received, and place the same to my account, as adrised by
"Pael Jones.

## "To Messrs, Guern \& Co., London."

The aecond hill of the anme set would be the every respect the aame with the tirst, exeept that it would rend, "Pny this my sccond bill of exchange, tirst sud third, etc., not pald."

And the thied bill would rin, "Pay this my third hill of exchange, flist nnd second, ete., not paid."

Foreign and Inland Jills.-Wills of exchange are divided into foreign bills of axclange and inland lills of excha' re, becanse the rights of proceeding ind rementies mereon are not unlformly groverned by the same rules and regulations. A lill of exchange is called a foreign bill when it is drawn in one state or country upon a person residing in a forelgu state or country; as, for lr tance. when trawn ly a person in one of the I'nite 1 States of America yion a person resident in Eugland, and pinyable liy the latter. And it is entled an inland bill (or a domestie bill) when hoth the drawer and drawee reside in the same state or country; for instance, when the bill is drawn in loston upon a person residing in Salem, lioth places bring in the State of Massachusetts. The different States of the Unitel States are cor uidered as forelgn to each other, so that a bill drawn in Massachusetta upon a pervon in New York is considereil a forelign hill. In like mmmer, a bill drawn In England upon Scotland or lreland is considered it forelgn bill-Mahoney r. Ashlin, 2 Jlarn. \& Adolph, in. : : $8,4 \times 2$.

ft form of langrage se sliould ting, and a anether ately and
at all events. The writing may be in peneil, as well as in ink, nor is it necessary that tho whole inatrument be in writhg ; the general formulary is generally printed, bat the eignatures must be in writing. If a person shoald order another person to deliver a particular sum of money to A. B., or to he accountable or reaponsible for a partioular sum of money to A. B., it would constltute a bill of exchange. So if the expression should be "Please to pay," or "I request yon to pay or deliver," it would be a good bill, becauas theso expressions are mero words of politeness, in the place of an absolate order. But if the language used necosaarily or natarally imports a request as a favor, and not as a matter of right, it would not be a good bill. So it has been held in England that a noto addressed by $A$ to 13 in these words: "Mr. Llttle, please to let the bearer hava $£ 7$, and place it to my account, and you will mach oblige your humble servant, J. Slackford," was not a bill of oxchange,-Little $v$. Slackford, 1 Mood. and MI. 171. However, where the languago used is susceptible of two interpretations, the true rule seems to be, that the mere drawing of a bill is deemed to be the demand of a right, and not the asking of a favor, and to deem it a favor only when the language used repels, in an unequivocal manner, tho notlon that it is elaimed as a right.-Stony un Bills of Exchange, § 33. If the word "at," instead of "to," should be put before the name of the drawee; e.g., "Two months after date pay to the order of J. J. £z8, value received, T. S. At Messra, John Morson \& Co.," it might be held a hill of exchange (Shuttleworth $v$. Stevens, 1 Cump. $\mathbf{f 0 7}^{\circ}$ ), or a promissory note, at the electlon of the holder. So in a ease where the instrument was as fellows: "May 20, 1s13. Two months after date pay to me or my order the sum of.E30. W. S. l'ayable at No. 1, Wilmot Street, opposite the Lamb, lethnal Creen, London," and was accepted hy the person reslding at that place, it was held to tre a bill of exchange.-Gray o. Wilmer, 8 Taunt. 739. The rule is, that, where an instrument is so framed as to admit of reasonable donbt whether it was intended for a bill or a note, the holder is at liberty to treat it elther as $\mathfrak{a}$ bill or as a note, as against the maker.

It does not seem necessary that tho whole of the blll be written on one and the same sille of a paper, or on one snd the same paper; It may be written in part on one papor, and in part on another aeparate and detachod paper, provided the writing ou each be done at ono and the same thme, and both parts be intended to furn one entire contract.-Stoliy on Bills of Erchange, $\$ 3$, and note 1 . If there should be no room left for indursements, a paper might be affixed to the orighal bill for this purpose, but it would require proef of the fact that this paper formed a part of the bill. It often happens that there aro but two parties to a bill, which is the case when tho drawer makes the bill payable to his own order; and when he then indorses it, the indorsee becomes in fact the payeo. And if no drawee should be numed, hut the bill be made payable nt a particular place, and the person living at that place should aceept it, he would be held answernble as neceptor.

Negotiability.-In order to mnke a bill negothable, it must be made payable to the payee and to his order or assigns, or to bearer. The counmon form, ns staterl thefure, is "to the uriler of A. H.," or "to A. H. or errler," or "to lemerer." It would the adviabile to adopt the dirm, "to A. Il. or his order." If no expression be used which gives to the payee the power of transfer, it is nevertheless a bill. If the payce of a negotinhle bilf indore it in hank, it in transferatile liy nere delivary, In the samo manner an if it were payatile to bearer. If the nume of the pryee be left in blank; e, g., "l'uy to - or order"-imy holder may insert his nave, and then indorse It ; the etleet would be the sume as if it were mado payahle to lomarer. Ko, niso, If the name of the payee is thetitious, and the bill be
indorsed in the name of thls fictitious person, a holder who was Ignorant of this fact when he took it may regard is as a blll payablo to bearer, and may sue the drawer, and also the acceptor, if the latter knew that tho name of the payee was fictitious. The words "value received" are generally inserted in a bill, but it is not necessary, for the law in cases of negotiable Instruments of this kind presumes it.

Seceral Inawees,-A bill addressed to " A, or In his absence to B," Is valld, and will, if aceepted by elther, bind him. If a bill is intended to be aecepted by two persons, it should be addressed to both; otherwise, although accepted by both, it will bind only the person to whom it ls addressed as aceeptor. If a bill is drawn upon A, B, and C, it may be accepted hy A and B only, and it will bind them.-Stouty on Bills of Exchange, $\S 58$. On the Continent of Europe it is not unfrequent to put, besides the name of the principal drawee, the name of another person, to whom application may be mate for acecptance or payment, if the first-named drawee should be absent or refuse payment; which is generally done in this form: "In ease of need, apply to Mr. - at _-" (In French, "Au besoin, chez M. -, $\stackrel{\lambda}{2} ;$ " in Germun, "Im Nothfall bei llerrn $\qquad$ in Is obliged to follow the direction, If the first drawee should be alsent or refise. Although it is common to use the wordr, at the ent of the bill, "and put it to my account," or "to your accomt," or "and put it to the account of A. B.," or "put it to account as jer advice," or "as ndvised by," these words are not essentlal, but are used only as a matter of convenience. If the llawer should be indebted to the drawee, he would say, "and put it to my aceonnt;" if, on the other hand, the drawee should be intebted to the trawer, he would say, "and put it to your account;" and if the hill were drawn on account of a third person, he won'd say, "and put it to the account of $\Lambda$. B." If the hill concludes with the words "us per adviee," then the drawee is not obliged to accent or pay, without receiving further directions or advice, and if he do so, he does it at his own peril. If the bill conclude with the worls, "withont advlee," or "with or without ndvice." then the Irawee may oecept or pay without theing further Instructed by the drawer. But the worls may be altogether onitted without impuiring the validity of the bill. We may geberally state, that all persons who are legally capable of entering into any other contract are capatle of tecoming parties to a hill; or, in other words, all persens of full age and sound mind, both mules and females, may draw, hold, indorse, and aceept bills.

I'arturrs.-In regard to partners, the sigunture of the firm must be put to the hill, either in case of indorsement, Irawing, or acceptlag; and each partner has complite authority to use it ; and when so used, the hill is deemed to be on partnership account, unless It appear on the fice of the bill, or it can the proved that the party fuking th had full knowledige that the bill was inrawn, Indorsed, or aerepted, not for partnership, but individnal purpeses.

Agerts.-Agents, if cmpewered for the purpese, either expressly or tacitly, many hand thelr prinelpals to the full extent that their prinelpals might do for themselves, provided that they to not exreed the scope of their unthority. Hat If rigents would hind their prine elpals, they must Iraw, indorse, or aecept tho bills in the name of their primeipals, and not in their own name. The most proper way of delurg this is lin the following form, supposing A. Green to be tho prinei[nl, and II. White, the ngent :

## "A. Green,

## by II. White, hle Agent."

A number of other forms may he usel; eare shomld he takem, however, liy the ngent, if he means to exempt himsplf from persomal responsibllis, to use clear and explleit words to show that intention, mad to ex-
press on the contract the quality in wisich he acts; otherwlse he does not bind tho party who employa him, but binda himself. A great many lawsuits have arisen in consequence of an indistinct and loose way of stathg the quality in which a person signs a biil, and different decisiona In difierent States have been the consequeneo. It ia understood in all these cases that the agent has aufficient authority from hia prinelpal to draw or necept billa, or make notes. If the agent, however, has no authority, then the agent himaslf is llabla on the itstrument.-Sea Ballour. Talbot, 16 Mass. 461 ; Rossiter v. Roasiter, 8 Weni. 494.
Ioyment in Money.-A bill of exchange must be for the payment of mowey, but it mattars not what denomination the money specified has, whether it la called dollars, francs, pounds aterling, Mare Banco, or nny other currency, because tho value of aach kind can be ascertained. In England negotiablo paper mast be for the payment of money in specie, and not in banknotes, and it may be anid that the ame rulo obtains generally in the United States of Anerica, although there are some cases lu gomo States which huve extended this rule.-Kent's Comm., Ieet. XLIV., p. 45, 46. Hence an order to pay money "in good East Indis, bonds," or to pay "in cash or Bank of lingland notes," or "ln foreign bills," or "in goods," is not a negotiable bill. In New York it las been held that a note payable "in Sork State bills or specie" was a nerotiable paper.-Keith v. Jones, 9 Johns. IK 120. So also a nute " payable in bank-notes current in the city of New York;" and the court remarked that it would have been a note under the atatute if payable in lanknotes geaerally.-Judnh $v$. IIarris, 19 Johns. R. 144. IHut a note payalile "in Pennsylvanha paper currency, or New York, to be current in the State of Pemsylvania or the State of New York," was held in Now York not to be a note for the puyment of money, within the statate, becanse the court say that they may take notice, officially, of their own bank paper ijang rega lea as casl, but not of the value of the paper eurrency of other States.-Leiber r. Goolrich, 5 Cowen, 116. A note made payatle in New York in Canada money, is not a negutiable promissory note within the statute. -Thompson r. Sloan, 23 Wendell, 71 . In l'emazlvania it was held that a note payable to A. 13, or order "in bank-notes of the chartered banks of I'ennsylrania" was not a negotiable note. - I'Cormick $v$. Trotter, 10 Safg . and Llawle, 9.f. In New York it was held that a check, drawn in that State, upon a bank in Mississippi payable in currint notes, is not nego-tiable,-Little r. The Iharnix llank, 7 lill's 13. 359. A note payable to the bearer in goorls is not negotinhllo. -Clark $f$. King, 2 Mass. $\mathrm{j}_{2} \mathrm{I}$. Nor a note payable in "foreign bills."-Jones $\varepsilon$. Fules, 4 Muss, 215 . It is not necessary that the sam paynhlo should he expressed in wodds; it is suflicicut if it he in ligures. Ihat it is necessary that the order lee for a specitic umount. A lill or nute for a gives sum, "and for whatever else may be dre to the payee," is wot, even between the
 $1 \because$. So an order for " $\% 1000$, or what might be due after delucting all advances mad "xpenses," is not ne-gotiable,-C'ushman $r$. 11 aynes, 20 l'ick. 132.

Pagable abolutely, - $I$ hill mast also be payable airsolately and at all events, and the payment must not be made to depoul on ayy umeertainty or contiagency, or it will mot be comblered a bill of exchunge. Thas a bill drawn payable "provided tho terms mentioned in certaln letters shall be romplied with;" or "out of rents;" or "on the sale of produce when sold;" ar "when the drawer shall come of age;" or "at thirty days after the ship A. shall urrive nt 11 .;" "or when the drawes shall marry;" or "when freight hecomes due;" or "if the money be not paid at a certain duy by a thirll party ;" or "provided a eertain act is donio of not done;" or "on the balance of aceount bet ween the parties;" or "provideal, et the maturity' of the bill,

I am living ;" or "when eertaln carriages are aold by payes;" in all these and almillar easea the inatrument is not considered a bill vi exchange.-Bayıey on Bills, p. 14-17, and Srony on Bil's, §46. But where payment only seemingly depends upon a contingency, lut in roality is certain and at all evonts, although the particular time when It will arrive la uncertaln, it will ta a good bill of exchange in law ; e. g., a hill payable at the death of the drawer or of another person, or at a tixed timo afterward. A note payatile "provided the shlp M/ary arrives," stc., "fres from capturo and condemnation," ia not negotiable.-Coolidge i. Ruggles, 15 Mass. 387.
deceptance.-The person who mecivea a blll or note theraby contracts with overy other party to the bill or note who would be entitled to bring an action on paybing it, to present it in proper time to tha drawee for acceptance when acceptance is necessary, and to the acceptor for payment when the hill shall have arrived at its maturity and be payable; to allow no extre :ne for paymeat to the acceptor; and to give notice in a reasomulie time, and without delay, to every Licch person, of a failure in procuring a proper acceptanca or payment. Any default or neglect in any of these respects will discharge every such person from responsibility on account of a non-acceptrance or non-payment; und will mako it operate generally as a satisfaction of any tlebt, demand, or value for which it was given.hidebxhear on Eridence, vul. ii. § 175; Wallace $v$. 11 Connell, 13 Peters's IS. 136; Stony on Dills, § 227.

1 "hen Necessary.-If a bill is payable at siglit, or in so ${ }^{1}$ any daya ufter sight or after demand, or upon miy other contingeney, or after a certain avent, a presentwent of the hill to ?! o drawee for accent nee must he made, $n$ order to tix the period of pryment. But if the bill is payable on demand, or payible at a certain ur aber of days after dute, or after any other certain
sut, it need not le presented merely for neceptance, tut only for payment ; lint if it be presented for aeeeptance, and aceeptance be refused, the hulder must give notice of the dislionor, in the sane manner as if the bill were payable at sight or after aight.-STonr on lills, § 112, 227, 228. It is, however, usial nud alvisable to present a bill drawn payalile a certain number of days ufter date, for acceptance.

By thom to be presented.- Tho presentment for acceptance must be mude by the holiler or his agent. If the bill is presented by one not authorized to hold the bill, the drawee may not lee bound to accept it ; but if he does accept it, it is availulle to the holder. A presentment by any person in possession of a bill or nute bona jide is suthicient, and no letter of attorncy or other writing from the proprietor of the lill or bute is necessury to give an authority to another person to make a presentment,-Freeman $t$. Hoyntun, 7 Mass. 13. 483 ; Bank of Útica $\because$. Smith, 18 Johns, 1:. 230. And a person'a having a bill or note in his jossession on the day und at the place of payment is presimptive evidence of authority to demand payment.-Agnew $r$. Bank of Gettysburg, 2 Ilar. and tiill, 478.

To whom to be presented.-The bill must be presented to the Irawee, or his muthorized agent. If it is Irawn in partmors, a presentment to one of them is sullirient; but if drawn on several persons rot partners, it has been said that it should he presented to ench; mul if one of the drawees should retuse to aecept, the holder woald not le loound to take tha sceeptamee of the oth. ers abone,-Stokx on Bills, §229. The death, baikruptey, insolvency, or abscomlling of the drawee will not nibsulve or excuse the holder fron presenting the bill. If he ls slead, it should bo presented to bis personul representatives, hits executor or uiminiatrator, if nuy there lo, not if not, at his last domleile; and if he has nhsconded, it should he presented at hils last domicile or phace of buiness,-Cuitry and Ilveas un Billa, p. 279, 220; (iroton r. Dulheim, 6 Greenl. 476. If the hulder, upon presentisent, should ascer-

ascer-
tain that the draweo is a married woman, or a person under age, or etherwise incapable of contracting, ho is not bound to take their acceptan ee, but may treat the bill as dishonered,-Chitty on Bills, eb. 7, p. 810.

Time of Presentment.-As regards the time within which a bill ought to be presented for aceeptance, no definite sule can be laid dewn, and the law says only that it must be presented within a reasonable time; but what this reasonsbla time is, depends upon the peculiar circumatances of each case. If the heisar keeps a bill, payable at sight, or payable a certain number of days after sight, in his own possession for an unrensonable time, he makes the bill his own, and loses his right of claim upon the drawer and indersers. But if the bill (whether it be foreign or domestic) is kept in circulation, and not held by any one holder an unreasonable time, no particular time can be assigned in which it ought to be presented. It is nat necessary to send a bill, payabla after aight, by the most clirect route to the place where it is payable, when it is the common ceurse of trade to send such bills by an indirect route. Thus, where a bill of exchange was drawis in llavama upen Londen, payeble at sixty days after sight, it was held that the holder need not send it dlrectly to London, but might send it to the United States for sale, such being the common course of trade. -Wallace $v$. Agry, 4 Masen, 356. So, where a bill wus drawn at New Orleans on Liverpeol, it was held that it might be sent to New York lirst for sale, that being the usual course of business.-Belton $\boldsymbol{c}$. Harrod, 9 Martin, 326. But if the holder of a foreign bill carry it to the place whore it is payable, he ought to present it fur acceptanes witheut delay.-Fernandez $v$. Lowis, 1 M 't'orl, 32:. But if a bill, puyable utter sight, is negotinted, and thus sent to different places before it is presented for acceptanco, the courts have held this delay allowable.-Goupy e. 1Iarden, 7 Taunt. 159; Gowan r. Jacksun, 20 Jelns. R. 17 f. A presentinent for acceptance or a demand of puyment must also be made at a proper time. No drawee is required to aceept a bill on any day which is set apart, by laws or observances, or usages of the country or place, for religiuas or other purposes, and which is net deemed a day for the tranaction of secular business, such as Sambay, Finst, er Thanksgiving-day, the Vourth of July, or any other general beliday. Out of New England, Christmas und New-year's day are also generally regarded ns holidays. The statates of several States point ont the days, which may be found under tho statute laws appended. And in all cases the presentment must be made at a reasonable hour of the day. If mate at the place of business, it must be made within the usual basiness hours, or, at farthest, while some person is there who has authority to receive and answer the presentment. If made at the dwelling-house of tho druwee, it may be mude at any seasonable hour, while tho fumily.is up.-Cuitty sind llulate om Billd, p. 4ït, 9th ed.; stony on Hilld, § 236 .

Ilace of I'resentment.-As to the proper place where presentment for nereptance shouhl te made, the general rule is, that it is the town or municipality of the domicile of the drawee, withont any regard to its being drawn payable generally, or payable at a particnar specitied place.-Cutrry mul llumat on Billa, p. 365,
 dwelts in one place, and hus his phace of tusiness in another, whether it be in the sume town or in another town, the bill may ho presented for acceptance at either place at the option of the holder. If the bill is adilressed to the drawe ut a place where he never lived, or if ho has reunved to another place, tho prosentment shoull be at the placo of his netunl domictle, if by diligent inquiries it can be ascertained; and if it can not be ascertaired, or if the draweo has a breonded, the hiit may be treated as dibhonored.-Cumty and
 held that if the drawee or maker of a nute has moved
out of the State of his former residence, either into a foreign country or into anothe: State, a presentment to him is not necessary.-Magruder $v$. Bank of Washington, 9 Wheat. R. 598 ; Baxley on bills, p. 198, 109. If, however, an absent drawee has a known agent int the same place, the bill sliould be presented to the agent.-Stony on Bills, $\$ 235$. Or if he have still a place of business there, it should be presented there. But it he have neither, then it sheuld be presented at his last placo of abode, if it cun be ascertained, and the bill is to be consldered as dishonered. In the case of the draweo's bankruptey, it is not necessary to present a bill for acceptance to the assignees of his catute, lecause eccepting bills forms no part of their duty.
Foreign Laus.-As the English law agrees, in ulmost every particular, with that is the United States, we shall here peint out only the prineipul and essenLial rules which prevail on the Continent of Eurepe, ameng tho difierent nations, in regard to tills of exchange and promissory notes. The most important untiens aro the French and the (Jermun. The French Commercial Code on bills and notes has heen adopted In a number of other countries, viz. Belgium, Moilena, Sardinia, Lueca, Polund, Greece, Geneva, Hayti, Ionian Islands, Turkey and Wullachia, the Pupal States, Luxemhurg, Tessin, and Wallis, with but slight variations here and there; so that when we speak of the French law, it will equally apply to all these countries. A new and nniform colle of laws regarding bills of exchange and promissory notes has teen introduced, since 1849, throughout Gormany (with the exception of the small States of the Grand Duchy of Luxemburg, the Duchy of Limburg, and the principality of Lichtenstein), so that when we speak of the Gerinan law, it will apply to every one of the thirty-eight states of Germany (excepting the above-named three), includling the whelo of Austria and her erown-lunds, and the whole of Prussia, Wurtemierg, Bavaria, llumover, Saxony, Brunswick, Iladen, ete., containing more tham sixty millions of people, and the inportant commercial cities of IIamburg, Bremen, Frankfort-on-the-alaine, Lulseck, Leipsic, Berlin, Vienna, Trieste, Brunswick, Stuttgart, etc. There exist yet distinct cotes on tills and netes in Russia, Ilolland, Copeniagen, Spain, Iortugal, at Baslo, und St. Gallen, which we shall notice where they essentially difler from other cedes. The luw on the Continent of Europe, in regurd te legul remedies on bills and netes, is more stringent than in regard to ether civil centracts, in so far as it ullows personal imprisonment for a breach of such a commerciul engngement, be it as drawer, acceptor, or indorser; whereas no persenal arrest and imprisenment can be had against a debtor for un ordinary deht. When we uso the expression, that a purty is liable according to the laws of bills of exchange, it must bo understeod, also, to mean that these extremo legul remedicio of coercion may be applied to him. Tho timo of imprisomment diflers in diflerent States, and varies according to the amount of indebtedness. The French law allows personal imprisonment net execeding one year, if the debt does not exceed 50 franes; two years if tho debt does not exceed 1000 francs; three years tor a hill of from 1000 to 3000 franes; nud four years for a delit of from 3000 to 5000 franes; und tive years for any sum hevond this. But persons of the age of seventy are entirely oxempted from arrest, and parties to promissery notes (billets it ordre), if not merchants. except the netes were given on account of seme mercantilo transaction, trattie, oxelange, banking, or brokerage, are also free from personal urrest in France. In Anstria the imprisonnent for a debt on bills can not excced one year, in l'russin tive yeurs; other German States difler in regard to thene, but they are generally less rigorens than the French law, and exempt from arrest, hesiles persons of the nge of seventy, vurlous uthers; for instance, relations by blood or otherwise, military persons, public oflleers, ete. The creditor,
however, has to bear the expenae of bont for the law of Copenhagen, the bills payable to hearer (letires debtor, and if he neglects to provido for it, the debtor is released and can not be arrested agaiu.

Requisites of bills of Exchange.-A Hill of exchange Is called in French luttre de change; in Ittilian, lettera tii cambio; in Germun, vecheel, or gezogener wechsel (a Drawn Bill, to diathiguish it from a promissory note, which is called a Dry 11ill, trockner wechsel).-See Piomissonv Notes. The essential requisites of a bin of exchange in Germany are $\left(A r A^{\prime}\right)$ ) 1. That the word "bill of exchange" (teccheel) the contained in the instrument, or, if written in a foreign lamgunge, the expression corresponding to it. 2, The epecifioation of the sum of money. B. Tho name of tho person or tirm to whom or to whose order it ia payable. 4. The statement of the time of payment; arid this can be mate only on a day certain, at sight (a vivta, etc.), or at a certain time after sight, or at a certnin day ufter date, or at a certain fair (messe). b. The signature of the drawer, ly his name or firm. 6. The atatement of the pluce and date of month and year where nod when it was drawn. 7. The name of the person or firm on whom it is drawn (dratree). 8. The specification of the place of puyment; if wo place is mentioned, the place of the drawee is to he taken es tho place of payment and the domicile of the drawee. The hill munt be for the payment of a sum of money, and not for gools or State atocks; nor can it he male payable with interest, or wish any conultion nttuched to it. The Code of the Kinglom of the Two Nicllies allows also payment in gools. The bills of exchange payable to bearer (au portetr) are not andmissible, either in (iermany or France. The French law (Avt.110) requires that bills of exchange shall he drawn from one place on $y$ ' Mace; that they shall he daterl, and that they The sum to lie paid. 2. The name of the person who in to pay the same. 3. The time when, and the place whe payment is to to made. 4. The valuo furnished, v vother ill money, in merchandise, in account, or in any other manner. They are drawn to the order of a third person, or to the order of the drawer himself. If they he drawn in sets, $1,2,3$, etc., it must le so expressed.

In Germany, every person who can lawfully hind himself by a contract may become a purty ' $n$ lifll of exchange. The age of majority is, howev:r, lifierent in different Stutes; in I'russia it commencen vith tise completion of the twenty-fourth yeur of age; a Anstria, llavaria, Saxony, Baden, and in those Statea on the Hhine where the French Civil Code presails, it commences with the twenty-first year of age, and the same is the case in Frunce nud Turkey. In Sardinla, only merchants can draw inland billis, hut any body may draw foreign bills. The Russian law excluden on ${ }^{1 \text {. }}$ women who dir not earry on commerce. The Code of the Kingdom of the Two Sieilies exchides women in generat. The Code of Copenhagen makes the capalility of becoming a purty to a blll of exchange general, but confines it only to bills of exehange, and does not include promissory notes. The Spanish Code of Commerce of $1829, \S 434$, prants to other persons than merchants the right of also becoming parties to hills of exchange, but only in cases where they have drawn or accepted hills on account of a mercantlle transactiom. Parma and Tuncany grami only to merchants the right of becoming pirtles to hills. The Code of Basle of $1809, \S 68$, requires that a person'a name be entered in the book of mercantlle firms, called the look of Roygiones, which is in many cities kejt either at the exchange or the city-hall. The law of Basle requires the amm payable to be atated in letters, and not merely in ligures; the lawe of Ruashat and Copenhagen require the sum to the stated both in letters and in figures; and the law of St. Tiallen provides that any eranure or alteration of the annt, or any other reculalte part of the bill, renders the bill vold, and entitles the drawee to refuse parment. liy the
au porteur) are allowed, but not by the law of Germany or France.

By the Fronch law (Art. 129) a bill of exchnnge may be drawn payable at sight, or at ono or more days, or months, or usances, atter sight or after date; or on a day fixed, or at or during is falr (en joire); and (Art. 132) the usance is thirty days, which run from the day after the date of the bill ; and (.1rt. 13:1) a bill payable at the fair is at nuturity on the evening preceding the day fixed for the termination of the fair, or the day after the fair, if it comrinue only one day. The fierman law ( ( $1 \cdot t .4$. No. 4) tioes not now allow bille drawn in Germuny on $u$ foreign country, or inland bills, to be drawn at usance (a uso, mezzo umo, doppio uso, i. e. nt single, half, or doabls usance), or a piacere, "on demnnd" (with the exception of Austria, which allows the latter). If forelgn bilis are drawn upon any (ierman State at a uance, the time of maturity (ichernee, scandenza) is to be determined by the forelgn law, viz. that of the place where the hill In drawn, which law also deterinines whether the unace ls comuted from the day of presentation, or from the day of drawhg. The German lav does not admit either of fixing the time by the happening of certain events, or if certain periods of time, as "en luster," etc. The law in
 this respect from the French law. Tl:e law of Norway (of 1842) provides (Art, 1) that tills shall not be drawn leyond the time of sis: monthe, or, if jayuble ont of Europe, not hesond one year. The law of Copenlagen appolats still shorter jeriods.

Iudursement. - In Germany, the law in regard to indorsement (indossamevt, widoxa, giro) is, that the payee can transfer a hill of exchange mens nuwther person ly indorshag it elther bin thank or in full, and the indorsee will have the same rights against nll other antecedent partien as the indorser; and the payee mayindorse, and the bill ls negothale, althongh the drawer did not make it payable to order. If de drawer does not wish to make it neqotiable, lie must insert the words "not to order" (nicht an order), or something aimilar. Tho mere striking out of the word "order" in the printed formula, anil adding the word "self" to the name of the payee, wili not operate as forbidding the negotiability. The blank indorsement must be put on the luck of the bili, or of a copy of it, or on a piece of paper, commonly called "rider" (alonge), connceted with, and joined to the till or eopy. Gvery holder muy fill up the Wank indorsement, or may also indorse it further in blank, and is unswerable to all suhsequent holdera, unless ho adds the words "without gunranty" (whne gezeihhrleiveng, ohne wigo) or some similar expression, which corresponds to onr "without recourse." If the words "not to order" (nicht an ordre), or a almilar expression, are added to an indorsement, and the lill is yet indorsed ni lambed over to other persons, these sulisequant holders can have no recourne againat auch un Indorser. But if tho words in procura, "for collecting" (zur cinkassirung), are added to an indorsement, then surh an indoraement does not transfer the projerty in the hill, lut empowers such indorsee to imborse it further for the amme purpose, and also to have the hill protested, and to give motice to his antecedent indorser, and to commence legal proceerlings for non-payment. The lawe of Copenhagen (Demmark), LIolland, Juspha, mot Swolen, nimo allow blank indorsements. Hat the Freneli law refuires (. $1 \mathrm{~m} .1: 17$ of the Code) that, in order to pass a ralld title to a hill, the indorsmemt shonll be lated, and the name of the indorsee and the valuc should he stated, nul it' further megotialility be Intended, the words "to order" should lie nded. A blank Indorscment is held to lee a mere "procum ithdorsement," i, e. for the purpose of collectlmir. The Spmish law, which also prevnils in Mexico and South Amerien, lolds the blank Indorsement of no effect. w of Germany exehnnge may more days, or date; or on a e) ; and (Art. from the day n till payolje preceditig the ir, or the day y. The French and liassian laws panish the antedating |drawn on the western coust of Africa, ae far as, and of un ludorsement like forgery. But tho Spunish and including, the Cape of Good Hope. A year ls also Dutch laws regard it as forgery only when it is dono for an avil parpose. The law of Portitgal requires the date to a blank indorsement. The French law, and all the countries fellowing the same, the Hussian law, aul that of St. Gallen, hold ouly bills mude payahle to ordar as negotiable and transferable. The Spanlsh law (of Billsio) requires the indorsenent ou the back of the lustroment The Sardinian luw regards the clanse "without recourse," "wlthout obligo," as uoi written at all; and if the druwer should add these wori's to his name, the instruntent is not regurded as a bili. The law in Germany is (.tet. 16), when a bill has been indorsed after the lapse of those accorded to pretesting for non-puyment, that the intorsee acquires the rights springing from the accoptance against the drawee, nad the right of recourse against thosa who indersed it after the lapse of this period, Jlut if the hill has been proteated for non-payment before the indersement is made, then the indorsee has only the rights which his indorser has agalnst the acceptor, the drawer, and the indorsers up to the time of protest. Nor is such min indorsor after protest, in such a case, liable according to the lawa on bills, but only aceording to the common law. The Russian law makes a like distinction. The Dutch and Portugueso laws regarl $s n$ iudorsement after maturity only as a cession of rights. The Sardinian law regarde it only as an indorsement for procuration. The French daw is not decidect on this point, and the courta regard such an indorsement generally as admissible, but sometimes as a fall aud goed indorsement, and then again only as one for prucuration, i. e. power of attorney. . In Italy it is regrrded as a procura indorsement, i. e. as a power of attorney.

Presintation for sceeptance.-The German law ( Irt . 18) provides that the holder of a bill is eatitled to preseat the lill for acceptance at once, and, if not accepted, to have it protested for nondicceptance. Hat hills payable at fairs (mess-wechsel, cambia regularia vel jeriurum) ean be presented only ut the time fixal by the law for presentation. Tho mere possession of a lill cetitles a persen to present it, and to have it protesifd, lu case of dishonor. Bnt (Art, 19) the Lolder of a bill, payable at sight, or a certain time after sight, must present it at least within tuo years from the date of ite being drawn; and if a perlod of presentation has been prescribed either by drawer or indorser, the bill must be presented within that period, or the holder will loso his right of recourso aguinst drawer and indorace as deltors on accomnt of tho bill. The law of Russia fixes the time within which bills at sight or after sight must be presented at one year, unless the drawer has preseribed a period; but in case of neglect to prosent the bill, it will still be grood as evidence of indebtedness for the ordiuary period beyoud which debta become outlawed. The laws of other countries tix the time of presentation for aeceptance or payment accorling to the distance from the place of drawing to the place of payment. The French law ( 1 Nt .160 ) requires that the holder of a bllf ot exchange, Irawn from the Continent and the European islands, and payable in the European possessions of France, whether at sight, or at one or more days, months, or usances after sight, must demend pay. ment, or acceptance, within six months from its clate, under the penalty of losing his remedy apainst the indorsers, and even against the drawer, if the latter had made provision for the payment of the hill in the hatuls of the drawec. A delay of cight menths is allowed for the presentment of a bill drawn from the ports of the Levant, unl northern eoast of Africa, on the European possessions of France, and, reciprocally, from the Conthent and Eurepean isdauds on the French estahlishments in the Levint, nud northern coast of Africa. A year ia allowed for the presentment of blls
allowed for the gresentment of bills of exchangedrawn from the Amer, an coutinent and West Indla islands on the European possemsions of lirance, and, reclprooally, from the European coutinent and islands on the Freneh pussessions or establishaments on the western coust of Africa, on the American continent, und West India ialands. Two yeara is allowed for the presentment of bille of exchaugg drawn from the East Indiau coutinent and islands on the European jussessions of Frauce, and, reciproenlly, from the European continent and islunds on the French possessions or establislsments on the East Indian continent and islands. The delaya above mentioned, of eight montha, one year. aud two years, are allowed to be doubled in time of maritime war. If the druwer has not made provision for payment with the drawee, the former will be ield liable, although a protest has beeu made after the time fixen by law.
Of Acceptance.-The law of Germany (Art. 21) requires that acceptunce of a bill shall be made in writing on the bill itself; and lf the drawee writes but his name or that of the firm on the face of the bill, it is considered an abselute aceeptance, and every declaration written on the bill and signed is taken as an absolute acceptance, unless the drawee expressly states in it that he will not accept, or will aceept ooly on certain conditions. The acceptance, once made, can not be taken buck. The French law (Art, 122) requires that the acceptanco of a bill of exchange must be signed; it is expressed by the worl "accepted" (accepte); it is. datel, if the lill be at one or mere days or months after sight. And in the latter case, the want of a date to the aeceptance renders the bill payalle at the term specitied in it, counting from the date when it was drawn. The saune rule prevails in those countries which havo fermed their laws on bllla after the French law, which countrics have been specified before; it also obtains by the law of Copenhagen. 13y the Spanish law, suth a bill runs from tho day on which it might have been presented, according to the ordinary course of the post. The French law (Avt, 124) enucts that the acceptance can not be conditional, but it may be limited in regard to the sum accepted. But in this case the lolder is beund to have the bill protested for the deticiency. Aud (Arf. 125) a bill of exchange must be necepted on its presentment, or, at the latest, within twenty-four hours afterward. Aftor the twentyfour hours have elapsed, if it be not returned, necepted or not accepted, he who has retained it la liable in damages to the holder. The German law (Art. 20) provides, that if a ilraweo refus a acceptance, or refuses to date his aceeptance, tho holder must have tho bill pretested within the period preseribed for presenting a bill (i. e. two years from date or the time proserited by drawer or indorser), or he will lose his legal chan against indorser and drawer. The day of pro. teat is, in that case, takon for the day of presentation. If no protest has been tahen, and the scceptor has omitted to date his accentance, the maturity of the hill is counted from the lust dny of the period within which it ourht to have theen presented. The liw of Portugal and Russia and St. Gallen makes it generally obligatory, and the law of I Iolland makes it obligatory only upon the holder, who presents the bill for aceeptance, to have the bill protested, absolutely and without delay. The Spanish law (Law of Bilbae, chap. 1:l, § 35, which also provails in Mexico and South America) provides that the drawee who gets tho bill into his hamils with the consent of the holder, and lets the day of presentation pass ly without returuing it, is obliged to pay, that is, it is clecmed a silent acceptance; and If tlie accoptunce is made in writing, it is required (Bilbno, chap, 13, §33) that, besides the mame of the drawee, also the worl "accepted" be added. The law of bilisoo (chap. 13, § 82) has yet the peeuliar
provision, that, when bills at aight aro accepter, only one-half of tha name of the firm need be algned. By the French and Portuguese lawn, is simiiar word with "accepted" may be substituted; but it is a mooted juestion whether the word $v$, " seen," in sufficient. The iawn of Copenhagen and Portugal also aliow, like the French and German lawn, the acceptance for a smalier sum than the face of the blli states, and oblige the holder to have the bill proteatell for the rent, but consider all other conditions as not written. The Rusxian law also requires the holder, in such a case, to have the bill jrotested, or he will lose his right of recourse against the other parties. In Germany, the law requires the drawee to dechare at once, withont delay, whether he will accept er not. But the law of France, and of those coumries which have been named lufore as having followed tho French law, allows the cirawec twenty-four hours' time, as stated before. The law of Cepenhagen also aliows twenty-four hours for consideration, and requires the protest culy on the next day following. The law of Tessin allowa three days for consideration, and the law of Russia grants time, for taking protest and rending it, till to the secand past.
Proceedinya npon Non-asceptence.-When acceptance has been refused, or when the acceptance is qualified, or fur a smal'r ram than stated in the bill, the law in tienmayy (.12. 25) ebliges the indorsers and drawer, upon receiving the protest for non-acceptance, to give sufficient eecurity that payment of the whole sum, or of so much as has not heen aceepted, shali be made on the day the bill falls due fur payment, together with the annount of cost. The sum may likewise he deposited in seme court of justice, or other authorized lastitution. (Aft. 28.) The deposited security is resterell if the bill should afterward be fully acecpited, or if the holder or other jerson who takes recourse does not commence a suit within a year from the maturity of the biil, or if the biit has been puid. The Frencli law is the same with that in Germany: But the law of Denmark, Sweden, and Norway; like the Engiish and American law, allows immediate zecouse against drawer and indoriers for payment if the bill has not tuen aceepted. The law of lortugal follows the Freneh law, but gives the holder also the right to demand from the drawer that he assign and hand over to hime all his claims against the drawee, and all the papers relating thereto. The German law further prevides, that when the bill has been accepted, and the acceptor stops payment or goes into bankruptey, or if an execution against the property of the acceptor has not bern eatisfied, or his percon has lieen arrested for non-payment-in all these caser, the holder of a bill may demand serurity, if tie acceptor has not gives security, and a protest has been taken in consequence. The French luw ( Art J 163 ) goes yet farther, and provides that, if the acceptor failis before the day of payment, the bill may be cousidered as due, and recourae may be had for payment against the drawer and indorsers;
and that if the drawer of a prominsory note, or the acceptor of a bill, or the drawer of a non-accepted hill, shull fail, the other persons liable on the instruments shall lie oblliged to give security (Law of 28th May, 1838).

Time of Payment. . The following days have been fixed by law at the principal citics: in Brunswick it is law that no proteat for non-acceptance can be had on a blll drawn on - Hrunswick fair before Monday in the first week , theo fair, and the day of payment of theac billa is the .esday in the first week of the fair. In Frankfort-on-the-Maine it has been enacted that bills which are drawn payable at a fair, without specifying the week of the fuir, must he prid or protesteri on Tuesday of the third week, i. e. on the last day of the falr. In Austria, in the countries where the general civil code prevails, such bills fall due, if the fair last but one day, on this day; if it last severai duys, but not mere than eight, on the duy before the legal termiantion of the fair; and if the fair last longer thun a week, on the third day before the legal termination of the fuir. In II ungary such bilia fall due, if the markets last hut one day, on this day; if they last from two to eight days, on the last day of the market ; if the markets last ionger then eight days, on Wednesday of the second week. In Leeipsic bills that are drawn payable at the Michaclman fuir fall due on the Thursday after the fair has been opened by the ringiag of the heli, and bills payable at the New-year's fair fall due on the 12 th of January, and if this sheuld fall on Sunday, then on the next following day. According to the law of Portugal and Spuin, bills itrawn payable at the fairs full due on the lust day of the fair. The law of France (Art. 130) providics that a bili drawn at sight is payable on its presentment, and (1rt. 131) that the maturity of a bill, ut or after a certain time after sight, is determined by the date of the aeceptance, or hy that of the protest for non-acceptance. (Irt. 132.) The uance is thirty days, which run frem the day after the date of the bill. The mentis are according to the regulation of the Gregorian calendar. (.trt. 133.) A bill payable at the fuir (en foire) is at maturity on the evening preceding the day fixed for the closure of the fuir, or the day of the fair if it centinue ooly one day. The law of Copenhagen conunta the day when the bill is dated, and grante to the acceptor eight days of grace, and to the holder ton daysuf grace (catied in Itaiian giorni di riepetto). The inw of Russia (§ 66) allows on bilits at or after sight three days of grace, and ou other bilis ten days of grace, and the same on promissory notes. The law of St. Gallen allows aix days of grace on bilis and promissory notea. The German Ian ( $A \mathrm{rt} .38$ ) enacts that the holder must net rufuse an ofiered part-payment, even though the bill has tieen recepted far the whole sum. The French law (Art. 156) statet inat the payments made on acceunt, as part of the amount of a bill of exchange, operate in discharge of the drawer and inderscrs. The holder is bound to have the bill protested for the balance.

Proceedings upon the Non-payment of Bills.-In order note or bill of exchange has been lost or destrnyed, the to entille the holder to redress, it is required of him, holder must, nevertheless, make demand of payment in Germany, that he present the bill for payment, and at its maturity, and, in case of non-payment, give due that he have the bill duly protested. The protest may notice to the antecedent parties. But whether the be made on the day of payment, but it must be made, promisor or ncceptor and indorsers can be compelled at latest, on the second secular day after the day of to make payment, without a delivery or production payment. The presentation of the bill for payment of the note or bill, is a question on which the authorinay likewise be made within this period of two days, and the holder would not lose his rights, even if he had waited with the presentation to the last day of protest, and the drawee were yet solvent on the day the hill fell due. But a protest before the day of maturity is not good, although payment would not have been made on the day of maturity. The law of Basle, St. Gallen, Zurich, Russia, Spnin, and Portugal, requires ihat the bill be protested on the day of maturity, and up to a certain hour of that day (the latter provision is not law in Portugal). The law of Franco (Art. 162) and IInlland (§ 179), however, requires protest on the day after the day of maturity (lendemain); and if this day be a legal holiday, the protest is made on the following day. If a bill is made paynble at a place different from the domicile of the acceptor, nnd a person there is specified, the German law requires that it must be presented to such person; and if no person be specltied, it must be presented to the acceptor at the place specified; and, in case of non-payment, it must be protested there. If the proper protest is neglected the holder loses his recourse, not only against the drawer and indorsers, lut also ngainst the acceptor. But in no other case is tho acceptor discharged from his liability by the German law.

Notes and Bills lost or destroyed.-If a promlssory ties in Amcrica differ. In England it has been held that the holder can not recover in a court of law, but only in a court of equity, on a negotiable note or bill lost or destroyed. A distinction is had between negotiable and non-negotiable instroments, or those which have been specially indorsed, so that no person but the holder, who sues, could have acquired a right to sue thereon. In the latter cascs, the note or bill may be recovered at law. And in an action on a lost note, where the evidence does not prove affirmatively that it is negotiable, the presumption in New York is held to be that it is not negotiable, and the plaintlff is thercfore entitled in such case to recover. If a bill or note transferable by delivery be lost, the loser ehould give immediate notlce thereof to the drawee, or persons who are to pay it; and if such persons afterward pay it to a person who has not taken it bonn fide, or puid valite for it, they will be responsible to the loser. If the note or bill lost is negotiable and trinsferable when lost, it has been held in some States that a suit at law is maintainable against the maker, in others that it is not; and, again, in others it has been held that the holder muy recover nt law, provided he executes a proper instrument of indemnity. It was held in Missachusetts that, where a note has been stolen from the payce, he may still prove his demand against the

maker, and enforce payment ; the court in such case prescribing the bond to be given to the maker. But If a bill or pote be destroyed by fire or other aecident, an ection may be brought thereon for recovery. Bayley on Bills.

Forged Instruments.- When the slgnaturs of the drawer of a bll of exchange is forged, and the bill is accepted by the drawee, the latter will be bound to pay the same to a bona fide holder; and if he has gaid it, he can not recover back the meney frem the person to whom he paid it, although ha'can not recover it beck from the repated drawer. The same doctrine applies to an acceptor supra protest, as to the signatures of the parties for whose honer he accepts. But If the slgnature of the payee, or of any other indorser, be forged, and even if the drawer is at the same thme payee and indorser; and his signature be forged, in these cases the aceeptor is not bound to know their aignatures, and if the indorsement under which thie helder claims is forged, the acceptor is not be-יnd to pay the bill; and if he does, the real owner is entitled to recover the amount from him and the bolder. If a person not a party to a bill pays it for the acceptor, or indorser, whose name is forged, he may recover back the money from the person to whom he paid it, if he gives notice thereof on the same' day to the holder. Bat If he does not discover it or give notice until the next day, then he is not entitled to recever back the money from the holder. But if an indorser pays the blll under a forged indorsement of the name of a prior Indorser, or of the drawer, he can not recover back the money from any subsequent indorsee to whom he paid It, because hia indorsement admits the genuineness of the antecedent indorsements and that of the drawer. -Story on Bills, §451. In cases of promissory notes, If the signature of the payce, or other indorser, under whom the actual holder claims, is forged, and the maker pays the note, such payment to the holder will be null and void, and he will be entitled to recover back the money from the holder. So; if the payee should pay the note to the holdèr under a suhsequent forged Indorsement, he may likewise recover back the amount. But if a subsequent indorser should pay tho amount to the holder, where the signature of the moker or of a prior indonser is forged, he could not recover it back, because every indorser warrants the genuineness of the signatures of the antecedent partles, both of the Indorsars and maker. - Soe Stony on Notes, § 887. Therefore, before the maker or an Indorser paya a note, he should be satisfied that the algnature of the payee or other indorser under whom the actual holder claima is a genulne signature, for if it be a forgery, the paymont would be a nullity.

Damages ta be Recorered. - When the holder of a bill of exchange has complied with all the requlaitions of the law, upon the dishonor of a blll, either for non-beceptance or non-payment, he is catitled to an Immediate recourse againat the drawer, acceptor, and indorsers or guarantors, and to a full reimbursement of all the damages sustained by him. These ilifferent parties are llable according to the law of the place where they entered into their respectlve contracta; uamely, the drawer according to the law of the place where the bill is drawn; tno acceptor according to the law of the place of acceptance; and the ladorsers and guarantors according to the law of the place where the Indersements and guarantles wore made. Tho acceptor, upon mon-payment of the bill, is ordtaarily liable to the holder only' for the princlpat sum, aut the expenses of the protest, and literest thereon from the tlme of the maturity of the bill, and he ls not liable for re-exchange. liat if the acceptor line expressly or Implledly agreed with the drawer, or with any indorser, for a valuable consideratlon, to pay the bill at its maturity; and has failel so to do, and the drawer or indorser has been compelled to take up the bill, and pay damages and other expenses, he may perhaps be

Lipble to the drawer or indorser for ell such damages auli expenses. - See STopy, on Bills $\frac{8}{8}$ 398, and BAy-
 bills of exchange are liable to the holder for the principal sum, and fotercot, and the damages and expenses incturred liy the dishonor. The intereat is due according to tho legal rate allowed at the place where the Lill is payable; and the expenses ara the ordinary cost of proteat and other incidental expenditures, such as postuge, commission, and brokerage, if the party has been obliged to pay the holder, in consequence of the acceptor's refusal. The damagen, in the absence of any positive rule, which, however, exists in nearly all the States of the Union, are ascertained by the rate of re-exchange between the conntry where the bill is accepted and the country where the bill is drawn, in case of the drawer; and between the former and the country whare the bill is indorsed, in the case of the indorser. If the bill hes been in part paid by the acceptor, damages and interest are to he dedactad in proportion. By re-exchange la meant the amount for which'a bill can be purchased in the country where the acceptance is made, drawn upon the drawer or indorser in the country where he resides, which will give the holder of the bill protestad a sum equal to the ausaut of that bill at the tlme when it ought to have been paid; together with his necesbary expenses and interest. The full lademnity of the helder, hence, requires him to draw for such an amount as will make good the face of the bill, together with interest from the time it ought to have been paid, and the necessary charges of protest, postage, and broker's commission, and the current rate of exchange at the place where the bill wai to be demanded or payable, or the place where it was drawn or negotiated. The law does not require an actual re-drawing, but it gives the holder the right to recover what would be the price of another new bill, with juterest, and the necessary expeuses, including the amount, or price, of the re-exchenge. But the indorser of a bill is not entitled to recover of the drawer the damages incurred by the non-acceptence of the bill, unless he has paid them, or is liable to pay them.- 3 Kent's Comm., Lect. XIIV.

Billa of Exciange dnawn in the Enated States,-In order to avoid the difficulty of ascertaining what is the true rate, of exclange, most of tho States of the Union have provided by a atatute a certain fixed sum, in the place of damages and re-exchange. The law In the different Stutes, in this respect, is as follows:

Maine.-The damages on bills of exchange negotiated in Maino, payable in other States, aud returned under protest, are as follows (R.S. 510): 1. Now liampshlre, Vermont Massachusetts, Mhode Island, Connecticut, New York, 3 per cent. 2. New Jersey, l'enusyIvania, Delaware, Maryland, Virginia, District of Columija, Souti Carolina, Georgia, 6 per cent. 3. North Carollna, Alabama, Arkansss, Florida, Illinois, Indiana, Iowa, Kentucky, Louislaza, Mlichigan, Miso sissippi, Missonri, OLie, Tennessee, Texas, Wiscensin, 9 per cent. The danages on foreigu bllls of exchange returned under protest are 10 per cent.

New Hampshire.- No statute in force in this State allowing dainages on foreign or domestic bills returned under protest.

Vermont.-There is no statute in thls State lu reference to damages on protested foreign or domestic bills of exchange.

Masachusetta.-The damages on lills of exchange negotiated In Massuclusetts, payable In other States, and returned under protest, are as follows: 1 . $13 i 11$ s payablo in Mahno, New llanpahire, Yenwont, linede Island, Conneetlcut, or New York, 2 per cent. 2. Illis payahle In New Jersey, Dennsylvanla, Marylami, or Delaware, 3 per ceut. 3. Dills paynhie In Virgluia, Distriet of Columinin, North Carolina, South Carolima, or (jeorgla, 4 jer cent. 4. Bille juyable elsewhere
within the United States of the Territeries, 5 per cent. 5. Bilis for one hundred doliars or more, paysble at any place in Masaachnsetto not within seventy-five milea of the place where drawn, 1 per cent. Foreign Bills.-1. Bilis payable, returned under protest, beyond the limits of the United Statee (excepting places in Africa beyond the Cape of Good Hope, and piaces in Asia and the islands thereof) shall pay the current rate of exchange when due, and 5 per cent. additional. 2. Biils payable at any place in Africa beyond the Cape of Good Hope, or any place in Asia or the islands thereof, ahall pay damages, 20 per cent.

Rhode Ialand. -The damages on bilie of exchange, payabie in other States, and returned under protest, are uniformly 5 per cent. The damages on foreign bills of exchange returned under protest are 10 per cent.

Connecticut.-The damages on blls of exchange negotiated in Connecticnt, payable in other States, and returned under proteat, are as follows: 1. Maine, New Jiampshirs, Vermont, Massechusette, Rhode Island, New York (interior), New Jersey, Pennsylvania, Delaware, Maryland, Virginia, District of Colmmbia, 8 per cent. 2. New York city, 2 per cent. 3. North Carolina, South Carolina, Georgla, and Ohio, 6 per cent. 4. Ali the other States and Territories, 8 per cent. There is no statute in force in Connecticut in reference to damages on foreign bilis of exchange.
New lork,-The damages on bilis of exchange negotiated in this State and payable in cther States, and returned under proteat for non-acceptunce or non-payment, are as foliows: 1. Maine, New Hampehire, Vermont, Massachusetts, Rhode Ialand, Connecticut, New 'ersey, Pennaylvanie, Delaware, Maryland, Virginia, Listrict of Columbia, and Ohio, 8 per cent, 2. North Carolina, South Caroina, Kentucky, and Tennessee, 8 per cent. . B. Alabama, Arksasaa, Florida, Illinols, Iadiana, Jowa, Louisiana, Missisaippl, Missouri, Michigan, Texas, Wisconsin, 10 per cent. The damages on foreiga bills, roturned under protcat, are 10 per cent.

Nero Jersey.-There is no statute in force in reference to damages on protested bilis of exchange, either foreign or domestic.
Penneylrania.-The damages on bilis of exchange negotinted in this State, payable in other States, and retarned under protest, are as follows: 1. Payablo in China, India, or other parts of Asla, Africa, or islanda in the Pacitic Ocean, 20 per cent. 2. Mexico, Spaniah Main, West Indies, or other Atlantic lalands, east cosst of South Amorica, Great 13 ritain, or other parts of Europe, 10 per cent. 8. West coast of South America, 15 per cent. 4. Ail other parts of the world, 10 per cent.
Delascare.-There la no statute in force in reference to damages on domestic bilis. The damages upon blla of exchange drawn upon any person in England or other parts of Europe, or beyond the seas, and reiurned under protest, are 20 per cent.
Maryland.-The damagea on bilis of exchange negotiated in Maryland, payalle in other States, and returned under protest, are uniformly 8 per eent. The claimant is entitied to recelve a sum aufficient to bny another bill of the anme tenor, and 8 per cent. damages on the value of the principal sum mentloned in tie hill, and interest from the time of protest, and costs. Imefice includen the District of Coiumbia in this law of tamuges (Act of Assembly, 1785, c. 88), but it is questionntile whether the District the within the law, which provides only for States. Foreign Bills.-The dausges on these, returned under protest, aro 15 per cent. The claimant is to receive a aum sufficiont to buy snother bill of anme tenor, and 15 per cent. damages on the value of the princlpal sum mentloned in the till, and Interest from the time of protest, and conts.
'Virginia,-Demages on bills of exchange negotiated in Virginia, payable in other Statea, and returned under protest, are uniformly 8 per cent. The damages on foreign bills of exchangs returned under protest are uniformly 10 per cent.
North Carolina:-The damages on bills of exchange: negotiated in this State, payable in other States, and returned under protest, are uniformly 8 per cent. The damages on foreign bills of exchangs returned under protest are as follows: 1 . Bills payable in any part of North America, except the northwest coast and the West Indies, 10 per cent. 2. Bills payable on Madeira, the Canaries, the Azores, Cape de Verd Ialands, Europe, and South America, 15 per cent. 3. Bill: payable elsewhere, 20 per cent.
South Carolina. -The damages on bllls of exchange negotiated in South Carolina, payable in other States, and protested for non-payment, are nniformiy 10 per cent., together with coats of protest. A bill drawn in South Carolina, payable in another Stato, is deemed a foreign hill, and damages may be claimed, althongh auch bill be not actually returned after proteat. For eign Billa.-The damages on foraign billa of exchange negotiated in Snuth Carolina, are: 1. On hills on any part of North America other than the United States, and on the Weat Indiea, $12 \frac{1}{2}$ per cent. 2. On bills drawn on any other part of the world, 15 per cent.

Georgia.-The damages on billis of exchange negotiated in Georgia, payable in other Statea, and returned under protest, are uniformly 5 per cent. The damages on foreign bills of exchange returned under protest are 10 per cent.

Alabama.-The dat: ages on lills of exchange negotiated in Alabama, payable in other Statea, and returned under proteat, are uniformly 15 per cent. Bills payable within the State of Alabama, 5 per cent. The damages on foreign bills of exchange returned under proteat are 20 per cent.

Arkansas.-The damages on bills of exchange drawn or negotiated in Arkanas, expressed to be for value received, and proteated for non-acceptance, or for nonpayment after non-acceptance, are as follows (R. S. 1848, c. 25): 1. If payable within the State, 2 per cent. 2. If payable in Alabama, Louisiana, Misaissippi, Tennessee, Kentucky, Ohio, Indiana, Illinois, or Missouri, or at any point on the Ohio River, 4 per cent. 3. If payabla in any other State or Territory, 5 per cent. 4. If payable within either of the United Statea, and protested for non-payment, after acceptance, 6 per cent. 5. The damages on bilis of exchange, expreased for inlue received, and payable heyond the limits of the United States, 10 per cent.

California.-By an aet passed April 18, 1850, the damages on protested bills of exchange drawn or negotiated in Calitornia were fixed as follows: 1. If drawn upon any person or persons cast of the Rocky Mountains, and within the limits of the United States, 15 per cent. 2. If drawn upon any person or persons in Europe, or in any foreign country, 20 per cent. Isy nu set passeci March 13, 1850, the rate of interest on monoy loaned in California was tixed at 10 per cent. per annum, whare there is no special contract; but "partles may agree in writing for the payment of any rate of interest whatever on money due, or to becom? due, on any contract. Any jucigment rendered on auch contract shall conform thereto, and shall bear the intereat agreed upon by tho partics."

Florida,-The damages on bilila of exchange negotlatod in Florida, payable in other States, and returned under protest for non-payment, are uniformiy 5 per cent. Damages on foreign billa of exchange, 6 per cent.

Illinois.-The damuges on hills of exchange nogotiated in Illinola, pay able in other Statoa or Territories, and returned uniler proteat for now-payment, are uniformly (by act of March, 1845) 6 per ceat. Damages on foreign billa, 10 per cent.
Indiana.-The damages ou bills of oxchange negotl-
ated in Indiana, payable in other States, and returned under proteat for non-payment, are uniformly 5 per cent. The damagee on foreigm bills are 10 per cent.".
Joven.-The damages on bills of exchange negotiated in Jowa, payable in other States, and protented for nonpayment, are uniformly 5 per cent. No atatute exista aa to damages on foreign bille of exchange.

- Kentucky.-There la no statute in force upon the anbject of damages on either domestic or foreign bills of exchange.
Louisiana.-The damages on bills of exchange negotiated in Lonisiana, payabie in other States, are uniformaly 5 per cent. The damages on fireign bills of eachange, returned under protest, are uniformly (atatute of 1838) 10 per cent.
Michigan.-The damages on bllls of exchange negotiated in Michigan, payable in other States, and returned under protest, are uniformly 8 per cent. ; and the damages on foreign bills are also 8 per cent.

Misaissippi, - The damagea on bilis of exchange negotiated in Misaissippi, paysble in other States, and returned under protest, are oniformly 5 per cent. The damages on forrign bills are 10 per cent.
Miesouri.-The damagea on bills of exchange negotiated in Missouri, payable in other States, and retarned under proteat, are uniformiy 10 per cent. On billa payable within the State, 4 per cent. On foreign bille, 20 per cent.

Ohio,-The damages on bills of exchange negotiated in Ohio, payable in other States, and returned under proteat, are uniformly (by act of February 15, 1831) 6 per cent. On foreign bills, 12 per cent.

Temnessee.-The damages on bille of exchange negotiated in Tennessee, paysble in other States, and proteated for non-payment, are 8 per cent. The damages on foreign bills protested, are: 1. If drawn upon any person out of tho United States, and in North America, bordering upon the Gulf of Mexico, or in any part uf the Weat India Islands, 15 per cont. 2. If puyabie in any other part of the world, 20 per cent.

Texas,-There is no atatute in force $\mathrm{i}_{\mathrm{t}}$ tuserence to damages on either domeatic or foreign bills of exchange.

Wicomsin - The damages on bills of exchange drawn or Indorsed sconsin, payable in either of the States adjoining this ate, and jrotested for non-acceptance or mon-payment, aro 5 per cent. If drawn upon a person, or body politic or corporate, within either of the United Statca, and not adjoiaing to that State, the damages are 10 per cent. The damages on bilis of exchange drawn or indorsed in Wisconsin, payable beyond the limits of the United States, and protested for mon-acceprance or non-payment, ere (1. S. 1849, p. 263) 5 per cent., together with the current rate of exchange at the time of demand.
See Manual jor Novariea Public, by 11. Roklken, New York; Stony on Bills; Cintry on Dilla; Kent's Commenturies; and for late decisions in the United States Courta, refer to the Bankers' Magazine, pullished in New York.

Bill of Eiealth, a certilicate or instrument signedi by consula or other proper authorities, delivered to the masters of ships at the time of theiz clearing out from all porta or places auspected of being particulariy sub)ject to infectious disoriera, certifying the atate of licalth at the time that such ship sailed. A clean bill Imports that at the time that the ship sailed no infectious disorder was known to exlst. A suspected bill, commonly calied a fouched patent or bili, imports that there were rumors of an infectious disorder, but that it had not actuully appeared. A foul hill, or the absence of clean bilis, inioorts that the place was lufected when the vemel asiledi.--Sec Quainanting.

Bill of Iating, is a formal receipt subscribed by the muater of ship in thia eapacity of carrier, acknowledging that he has received the goods specified In It on boaril his ship, and binding limself (under cer-
tain exceptions) to deliver them, in the like good order as received, at the place and to the individual named in the bill, or hia asaigne, on hia or their paylog him the etipulated freight, etc. When goods are sent by a ohip hired by a chs"'er-party, the billa of lading are deliv. ered by the mister to the merchant by whom the ahip is chartered, but when they are sent by a general shipthat is, by a ship not hired by charter-party, but employed as a gencral earrier-each individual who aende goods on board receives a blll of lading for the same, In all casen, therefore, the bill of lading ia the evidence of and titie to the goods shipped. The lisbility of a carrier, at common law, to deliver the gooda intrusted to hia care, is canceled only by "the act of God and the king's enemies." But to limit this responsibility, the following oxception is now invarially almost introduced into the clause in bills of lading binding the mater to the delivery of the geods: "The act of God, the ling's enemies, fre, and all and erery other dangere and accilents of the seas, rivers, and nurigation, of whatever nature and kind soever, excepted." Billa of lading are not, in general, imnediately given by the master on receiving the goods. The usual practice ia for the master or hia deputy to give a common receipt for the goods, which is delivered up on receiving the bill of ladiog. The latter ahould alwaya be required within twenty-four hours after the gools are recelved on board. Three seta of all bilis of lading are made ont: one of these should be remitted by the first post to the person to whom the goods are consigned, a second beling sent to him by the ship; the third is retained hy the shipper of the goods. The master ought always to retain copies of the bills.of lading for his govermment.

Trangfer of Bills of Iading.-Blils of lading are transferable either by blank or special indorsement, liku bills of exchange. And whatever may le the cisaracter of the person to whom the gooda are consignen, whether ho be a buycr, or merely the factor, agent, ar broker of the consiguer, the bona fide holder of a bill of lading indorsed by the consignee is entitied to the goode, and anay claim them from the master if he can prove that he has purchased the hill for a goord considerotion; but unjess he can do this, he in not entitjed to the goods.-Ilol.t, Law of Shiping, 2d ed. p. 363.

Delitery under Bill of Jading.-It being usual to sign and deliver three bills of lading, it is possible that there may be conflicting demands upon the captain by the different hoiders. Nothing, however, is, in such a case, required of him, except that he act with good faith, and to the best of his judgment; and that he make delivcry of the goods to the person who first demande them of him, upon presentment of the bill of ladiug, prorided the circumstances be not such ne to jutify a surpicion of his having unfairly got possession of it. If he act differently, he is answerabie, according to the pecutieritics of the case, to the person injured by his negijgence; the bill of Jading being not only the lnstructhons of the merchant to him, as his carrier or servant, but his own expecial agreement to deliver according to ita cond['ons. Where several bila of lading of a different import have been aigned, no regard is to be jaid to the thase when they were first aigned by the master; but the person who first gets legal posacssion of one of them froms the owner or shipper, fias a right to the consignment ; and where ouch bilis of ladlug, thengh different upon the face of them, are constructively the same, and the master has acted bona fide, a dellvery according to such legad title will diacharge him from all.-HoLt, p, 875 and 377.

Bill of Sale, a contract under acal, ly which an individual conveys or passes away the right and litereat he luse in the goods or chattels named in the bill. The property of ships is transfurred by hill of sute.

Bill of Bight. In Eugland, when a merchant is ignorant of the real quantities or qualities of any goods assigned to him, so that he is unable to make a jerfect
od order il named 3 him the by a ship are delivthe ship ral shipbut emwho aends the same. evidence illity of a intrusted God and onsibility, dmost innding the cl of God, er dangers n, of whatof lading is for the lipt for the the bill of red within 1 on hoard. nt : one of the person leing sent $y$ the ship's to rotain ent. lading are dorsemcht, nay be the da are conthe factor, fide holder is entitled e master if for a good e in not en$9,2 \mathrm{~d} \mathrm{~cd} . \mathrm{p}$.

 e that thero tain by the such a case, d falth, and nake delivhands them ug, procided a surpicion If he act the peculy lifs negilthe listrucor servant, necording to ing of a difIs to be paid the master on of one of figlit to the ing, though uctively the , a delivery se hilin fromby which 8 n it and linter. IIt the bill. i of saie. merchant is of any goods ke a jerfeet
entry of them, he mast acqualnt the collector or controller of the circumstance; and they are anthorized, upon the importer or hila agent making oath that he can not, for want of full information, make a perfect entry, to receive an entry by bill of sight for the packages, by the best description which can be given, and to grant warrant that the same may be landed and exanined by the importer In presence of the officers; and within tbree days after any goods shall have been so lended, the importer ahall make a perfect entry, and shall elthor pay down the dutles, or ahall duly warehouse the same. $\mathbf{8}$ \& 4 Will. 4, c. 52, § 24. In default of perfect entry within three days, such gooda are to be taken to the king'e warehouse ; and if the importer shall not within one month make a perfect entry, and pay the daties thereon, or on auch parts as can be entered for home use, together with chargea of moving and warehouee rent, such goods shall be sold for payment of the duties.- 82.

Bill of Btore is a license granted hy the customhouse to merchants, to carry such stores and provisions as are neceseary for a voyage, free of duty.

Billiards. Invented by the French, by whom, and by tho Germans, Dutch, and Itallans, they were brought into general vogue throughout Europe.- Nouv. Diet. The French aecribe their invention to Henrique Devigne, an artist, in the relgn of Charies IX., about 1571. Slate billiard-tables were introduced in Engiand in 1827.

Billingegate, a market for fish, contiguous to the custom-house in London. It is held every lawful day, sod was eatablished in 1669. Every person buying fish in Blilingegato market mey sell the arme in any other markat-place or places wlithin the elty of Iondou or elsewhere, by retail, with this condition, that none but fishmongers be permited to sell in fixed ahops or houses. No person or porsons shall purchase at 1311lingagate any quantlty of fish, to be divided by lots or In shures among any fishmongers or other persons, in order to be afterward put to asie by retail or otherwise; not shall any fishmongor enmoss or buy in the sald market any quantlty of fish, but what shall be for his own sale or use, under the penalty of $£ 20$. No person Is to have in his possession, or expose to sale, any spawn of fish, or fish unsizable, or out of season.- 36 Geo, c. 118. The minimum slze of the lobsters to be mold at lifllingsgate is fixed by statute.-See Lonaren.

Previously to 1842 no fish of foreign taking or curling, or In foreign vessele, could be imported Into tho lintted Kingdom, except turbote and lobaters, stockfish, live ceis, anchovies, sturgeon, botargo, and caviare. But the importation of all sorts of fish was then permitted on payment of duties, whilh were finaiiy repeaied in 1858 . At present, therefore, the trade in fish is quite free.-For some further remarks with respect to this sulijeot, see Fisis.

Binacle, or Binnacle (formeriy Bitfucle, from the French habitucle), a wooden ease or bex in which the compasses are kept on board a slilp, with llghts to show the compasa at night.

Birch (Fr. Rouleas; Du. Berke; Germ. Birke; It. Betulh; lat. Betula; Pol, Brzoza; Russ. Rereza; Sp. Abedul, Betulla), a forest tree inet with every where lin the north of Europo. It is applied to varions purposes. In Lapland, Norway, and Sweden, the long twigs of the birch are woven linto mata and twisted into ropes; the outer bark forms an alniost incorruptiblo covering for houses; and tha inner bark in used, lu periode of scarcity, as a substinte for bread. Russin leathor is prepared by means of the empyreumatic oil of the birch. It is an excelient wood for the turner, heing light, compact, and easlly worked. It dirability is not rery great. It is sometimea used in the manufacture of herring barrela,

Bird-lime (Germ. Vogelleim; Fr. Glu; It. Inain ; Sp. Lign; Kuss, I'itschei Klei) exudes spontaneor ly from certain pianta, and is obtained artificially from
the middle bark of the holly. Its color is greenish, Ite fiavor wour, and It is gluey; shining, and tenacious. The natural is more adhesive than the artificial bird-Itme,-T1romson'a Chemistry.

Birds' 2Teste (Germ. Indianische Vogelnerter; Dn. Indiaansche Vogelnestjes; $\mathbf{F r}$. Nide de Tunkin; It. Nidi di Tunchino; Sp: Nidos do la China; Javan. Subu; Malay, Sarungburung), the neata of a apecies of swallow peculiar to the Indian lelands (Hirundo esculenta), very much esteemsd in China. In shape chis nest resembles that of other swallows; it in formed of a viseld substance; and In external appearance, as well as consiatence, is not unlike fibrous, ill-concocted isinglass. Esculent neste are princtpally found in Java, in caverna that are most frequently, though not alwaye, situated on the sea-coast. Many conflicting atatemente have been made as to the substance of neate; some contending that they are formed of sen-foam or other marine ,producte, and others that they are elaborated from the food of the bird, otc. But these are pointa as to which nothing vatiafactory la known.

We borrow from Mr. Crawfurd'a valaable work on the Eastern Archipelago (vol. II. p. 482-437) the following authentic and carious detaila as to the traffic in thls aingular production: "The best neste are those obtained in deep damp caves, and auch as are taken before the birds have laid their eggs. The coarsest are those obtained after the young nre fledged. The finest nests are the whitest, that la, hose taken before the nest has been rendered impure ly the iood and faces of the young birds. They are taken twicen year, and, if regulariy collected, and no unueual injury be offered to the eaverns, will produce very equally, tho quantity being very little, if at ail, improved by the caves being left altogether unimolested for a year or two. Some of the caverns are extremely difficult of access, and the nesta can only be collected by persons accustomed from their youth to the office. The most reinarkablo and productive eaves in Java, of which I superintended $n$ molety of the collection for several years, are those of Karang-bolang, In the province of Biglen, on the south coast of the island. Here this cavea are only to be approached by a perpendicular descent of many hundred feet, by ladders of hamboo and ratan, over a sea rolling violently agalnat the rocks. When the mouth of the cavern is attained, the perilous office of taking the nests must often bo performed hy torch-light, by penetrating into recesses of the rock, where the slightest trip would be Insiantly fatal to the adventurers, who seo nothing belore them bit tho turbuient surf making its way Into the chasms of the rock.
"The only preparation which tho birds' uests undergo ts that of simplo drying, withont direct, exposuro to the sun, after which they are packed in small boxes, usually of half a picul. They are assorted for tho Chincse market Into three kinds, according to their qualtties, distinguished into first or best, second, and third qualities. Caverns that are regulariy managed will ufford, ill 100 parts, $53 \cdot 3$ parts of thone of the first quality, 85 parta of those of the seconil, $11 \cdot 7$ parts of those of tho third. The common prices for birds' neats at Canton are, for the first eort, no less than 8500 Spaniah dollare tho picul, or $£ \delta 18 \varepsilon .1 \frac{1}{2} d$. per pound ; for the second, 2800 Spranish doliars per pleul; and for the third, 1600 Spanish doilnrs. From these prices it is sufficiently ovident that tho bircis' nests are no more than an articie of expensive luxury. They are consumed oniy ly the great ; and, indeed, the hest part ls sent to the eripital for tho coneumpition of tio court. The sensual Chinese use them, under the Imagination that they are powerfnily atimulating and tonic; hut it is probable thint their most valuable quality is their being perfectly harmleas. The jreopie of Jnpan, who so much resemble the Chinese in many of their hahits, have no taste for the edlbl/s nests ; and how the jatter acquired a tasto for this foreign commodlty is no lems
singular than their persevering in it. Among, the Weatern nations there is nothing parallel to it, unless wo except the whirasionl eatimation In which tbe liomans held some articles of luxnry, remarkabla for their scarcity rather than for any qualities ascribod to them."
Mr. Crawford eatimatee the whole quantity of birds' neats exported from the Archipelago at 242,000 pounds, worth $\mathcal{L} 284,290$. "The value," he observes, "of this immense property to the country which produces it reste upon the capricioua wants of a aingle people. It is claimed as the exclusive property of the sovereign, and every where forms a valuable branch of his income, or of theq revenue of the State. This value, however, is of courne not equal, and dependa, upon the situation and the circumatancea connected with the caverns in which the nests are found. Beligg often in remote and sequestered situations, in a couatry so lawless, a property so valuable and exposed is subject to the perpetual depredation of freebooters, and it not unfrequently happens that an attack upon it is the principal object of the warfare committed by one petty State against anothor. In such situations, tho expense of aftiording them protection ia 20 heavy, that they are necesaarily of little value. In aituationa where the caverns are difficult of access to atrangers, and where there reigna enough of order and tranquillity to aecure them from Internal dopredation, and to admit of the uests being obtained without other expense than the simple labor of collecting them, the value of the propcrty is very great. The caverns of Karang-bolang, in Java, are of thia dencription. These annually afford 6810 pounda of neats, which are worth, at the Batavia prices of 3000,2500 , and 1200 Spanish dollars the picul, for the reapective kinds, nearly 139,000 Spanish dollars ; and the whole expense of collecting, curing, and packing, amounts to 10 moro than 11 per cent. on this amount. The price of birds' neats is of course a monopoly price, the quantity produced being by natare limited, and iacapable of augmentation. The vaiue of the labor expendod in bringing birde' nests to market is but a trifing portion of their price, which consists of the higheat sum that tho luxurious Chinese will afford to pay for them, and which is a tax paid by that nation to the inhabitsnte of ie Indian islands. There is, perhaps, no production upon which humau induatry is exerted, of which the cost of proluction bears so small a proportion to the market price."-See also the valuable work of Count Hoaendonr, Coup d' Eill sur C lle de Java, p. 291.

Búrmingham, a parliamentary and municipal borough, one of the principal manufacturing towns of England, near its centre, county and 17 miles northwest of Warwlek, 100 miles northwest of London, and $78 \frac{1}{2}$ miles southeast of Liverpool. Area of borough, which includes the adjacent townships, Aston, Edgbeston, etc., 2660 acres. Population in 1690,4000 ; in $1801,00,822$; in $1841,182,922 ; \ln 1851,282,841$. The towd, on the River Rea, occupica the eastern declivity of three undulating hills, and from the southeast presents to view a mass of red brick houses, intersperined with several lofty church spires, and a vast number of tall chimneys belonging to Ita factories. Birmlugham exiated in the relgn of Alfred, A.13, 8i2; but ita importance as a manufacturing town commenced in the relgn of William III. Birmingham was besieged and takeu by Priuce Rupert In 1643 . The great works of Soho wcre established by the illuatrivus engineer, Matthow Boulton, in 1764. The Birmingham canal was originated by act of l'arliament, lics. Memorable riots commeuced here, July 14, 1701, on some perwons conmemorating the French Itevolution. The theatre was deatroyed ly fire, August 17, 1792. Mure commotions, November, 1800. The theatre again burned in 1817; and again, January 7, 1820. Birmingham poitical union formed, 1831 ; dissoived itseif, May 10, 1834. Town Hall built, 1838. Birmingham and Liverpor! railway opened as the Grand Junction, July 4, 1837.

London and Birmingham Railway opened Its entive length, September 17, 1838. Great political riot, firing of housea and othar outrages commilted by the Chart. iste, July 15, 1839. Corn Exchange opened, October 27, 1847. Birmingham has made most rapid progress in manufacturing induatry within the present contury. Ite manufactures comprise almost every description of iron and steel goods, bracs and Iron founding, saddlery, fire-arms, cutlery, gold, silver, plated, bronze, ormolu, and japanned wares; papler-mache goodn, toys, jewel. ry, clectroplated goods, buttons, ateel-pens, glass, tools, steam-engines, and all kinds of machinery.

Biecay, Bay of (Fr. Golfe de Gascogne, Aquita. nicus Sinur), a vast bay or gulf formed hy the Atlantic, and extending between Ouessant ialand on the weat coast of France, and Cape Ortegal on the north coast of Spain. It receives the waters of the Loire, Charente, Gironde, and Adour. Ita principal ports are, L'Oricat, Nantes, La Rochelle, Rochefort, Bordeaux, and Bayonne, in France. Paeaages, San Seloastian, Bilhan, Santander, and Gihon, in Spain. Chief islands, Bello Isle, Ré, and Oleron, on the coast of France, Ite north and south conste are bold and rocky ; but on the east, from the nouth of the Gironde to the Adour, the coast is composed of sand downs, and interrupted by numerous lagoons. The depth varies from 20 fathoma on the west coast of France, to 200 fathoma on the north of Spain. Navigation is mach Impeded by the heavy seas prodacod by the northwest winde, and by a current (Renmel's) which sets in from the Athantic, and sweeping round the north coast of Spaln, runa nerth and northwest along the weat coast of France, and cnters the Irish Channel.
B'mmuth (Ger. Wimmuth; Dn. Bismuth, Bergateen, Fr. Bismuth; It. Biomutte; Sp. Biemuth, Piedra ingu; Russ. Wiomut; Last. Biemuthum), a motal of a reddish white color, and almost destitute of taste and smell. It is softer than copper; its specific gravity is 9.822 . When hammerell cautioualy, ite density is considerably Increased ; it breaks, however, when struck smartly ly a hammer, and, consequently, is not malieable, neither can it tee drawn out into wire; it melts at the temperature of $476^{\circ}$,-Thomson's Chemidry. Blamuth is used in the composition of pewter, In the fabrication of printers' types, and in various other metallie mixtures. With an equal weight of lead, it forms a brilliant white alioy, much harder than lead, and more malleable than bismuth, though not ductile; and if the proportion of lead be increased, it la rendered still moro malleable. Eight parts of lismuth, five of lead, and threc of tin, constitute the fuaible metal, sometimes called Newton's, from Ite diacoverer, which melts at the heat of boilling water, and may he fueed over a cartdle in a picce of atiff paper without burning the paper. Pewterers' solder is formed of one part of bismuth, with five of lead, and three of tla. It forma the besia of a sympathetie lak.-URE.
Bitumen (Germ. Judenpech; Du. Jodenlym; It. Aefallo; Sp. Aefalto; Port. Anphadto; Russ. Aefali; Lat. Aaphaltum Bitumen Judaicum). This term includes a considerable renge of inflammable mineral subatances, hurntag with the flame in the open air. They difier in consistency, from a thin fluid to a solid; but the solids aro for the most part liqueflable at a moderate heat. They are: 1. Naphtha; a fine, white, thin, fragrant, colorJess oil, which issues out of white, yellow, or black clays In Persia and Media. This is highly infiammable. Near the viliage of Aniano, in the State of Parma, there exists a spring which yielda tivis substanco in sufficient quantity to lilluminate the city of Genoa, for which purpose it is cmployed. With certaln vegetable oils, uaphtha is said to form a good varnioh. 2. Detroleum is much thicker than naphtha, resembiling in consistence common tar. It has a strong disogreeable odor, and a blackish or reddish brown color. During combustion, it emits a thick biack smoke, and Jcaves a littio reaidue in the form of black conl. It is more abund-
entir6 ot, firing - Chart October progress contury, iption of saddlery, , ormolu y, jewel ces, tools,
ant than the first-mentioned variety, from which it does not seem to differ, except in being more inapiseated. It is found in various conntries, and is eapeciaily abundent in the Birman empire, where it is imet with above Prome, within abont two miles of the Irrawaddi. The gross annual produce of the wella in this place has been estimated at about $80,000,000 \mathrm{lta}$., worth on the epot about 1 s .8 d . a ewt. ; and the aupply might; if a market could be fonad, be indefinitely incressed. It is used as a lamp oil, and, when mingled with earth or ashes, as fuel and in the paying of boats.-Geographical Dictionary, i. 377. In the United States it is found abundantly in Kentucky, Ohio, and New York, where it is known by the name of Seneca or Genesee oil. It is also obtained from weils in the isisnd of Zante. Herodotas tells us that he liad seen these weils (lib. iv. c. 105) ; and the description he has given of them, and of the mode of obtaining the petroleum, corresponds in all respeots with the accounts of the best modern travelers. The average annual prodace of the Zante springs is about 100 barrele. - Cuandlkir'y Travels in Greece, 1 to ed. p. 301 ; Holland's Travels in Greece, 4to ed. p. 18. Petroleum is particularly abundant in Peraia. "When taken from the pit, it is a thick liquid resembling pitch. The botto:ns of most vessels which navigate the Euphrates ant Tigris are covered with it, snd it is also used in lampsins tead of eil by the natives. The most prorituctive fountains are those of Kerkis., Mendall, and Badku. The welis In the neighborhood of the latter seem to be quite inexhaustible, being no sooner empticd thsn they sgain begin to fill. Some of them have been found to yield from 1000 to 1500 llas . a day !"-Kinnien's Persian Eimpire, p. 39 and 359. 3. Maltha, or Sea-wax, is a solid whitish substance, not unlike tallow. It melts when heated, and in cooling assumes tite consistence of white cerate. This ia most probably the bitumen casdidum of Pliny.-Hist. Nat. 1ib, xxxv. c. 15. It is not used as pitch; but it affords a better light than petroleum, and emits a lass disagrecable smell. It is found on the surface of the Baikal Lake In Siberia, at the foot of the mountains of Bucktiari in Persia, and in some other places. 4. Elastic Bitumen yields easily to pressure; is flexible and clastic. It emite a strong bituminous odor, and ia about the weight of water. On exposure to the air it bardens, and lases its elasticity. It takes up the traces of crayons in the same manner as caoutchous or Indian rubber, whence it has obtained the name of mineral ccoutchouc. It has hitherto been found ouly in the lead mines of Derbyahire. 5. Compact Bitumen, or Asphaltum, is of a shining black color, solid, and brittie, witil a conchoidal fracture. Its specific gravity varies from 1 to $1 \cdot 6$. Like the fermer varieties, it burns freely, and leaves but little residuuni. It is found in India, on the shores of the Dead Sea, in France, in Switzerland, and in large deposits in sandstone in Albania; but nowhere so iargely as in the island of Trinidad, where it forms a lake tiree miles in circumference, and of a thickness unknown. A gentie heat renders it ductile, and, when mixed with greaso or common pitch, it is used for psying the bottous of ships, and is said io protect them from the teredo of the West Indian seas. Tite ancients employed bitumen in tise construction of their buildinge. The bricks of which the walls of Balyion wero bui: were, it is sald (Henonotue, lib. i. $\$ 170$ ), cemented with hot hitumen, which gave them unusual solidity.
Blacking (Ger. Schuhachoörze, Wichse; Fir. Noir (de cordonnier); 1t. Nero da ugner le scarpe; Sp. Negro de sapatos). A factitious articie, prepared in various ways, used in the blacking of boots and shoes. The priseipal ingredients in its manuiacture are oil, vincgar, und various sorta of blacking matter. It is in very extensive demand. Some of the establishments for ita manufacture, especially those in the metropolis, are on a large seale; and it ia in sucin only thst it can be cheaply and advantageousiy produced.: One of the
principal, or rathet we may say the principal outiay in eatablishing a blacking businese, consists in advertising: Indeed, any individual or set of individusls, provided tieey supply a reasonably good article, may, by continnous advertising and pufing, attsin to the higheat eminence in the "blacking line."

Black-lead, Plumbago, or Wad (Dn. Potioot; Fr. Mine de Hlomb noir, plomb do mino, Potefot; Ger. Pottloth, Reisobley; It. Miniera di piombo, Piombaggine, Corezolo ; Lat. Plumbago ; Sp. Piedra mineral de plomo), a mineral of a dark steel gray color, and a nuetallic lustre; it is soft, has a greasy feel, and leaves a darkcolored line when drawn'along paper.
This mineral is found only in a state of purity in Borrowdale, in Cuniberiand, the mines in which have been wrought since tha days of Elizabeth. The lead is not found in veins but in detached pleces, or in what are called acps or bellies, so that the supply is very irregular, the miners being frequentiy employed for a lengthened period in seeking at random for the lead. Its quality also differs very widely. The beat is that which is lightest, and the trace of which on paper is easily and completely removed by the application of India rubber. The mine used only to be opened at intervals, but for a considerable number of years past it has been constantly open. The supply; however, has been extremely scanty, and inostly also very inferior. This lead is now almost whoily employed in making pencils: an inferior variety from Spain and Ceylon being used in the mamifaeture of crucibice, the polishing of cast-iron utensils, the diminishing of friction, and other purposes to whioh genuine black-lead was formerly applied.

Black-lead Pencils (Du. Potlootpennen; Fr. Crayons noirs; Ger. Bleystiffe; It. Lapis nero; Port. Lapis negro; Russ. Karanaschü; Sp. Lapiz negro) are formed of black-lead, encircled with cedar. There is hardly, perhaps, any thing in which the temptation to substitute a spurious for a genuine article is grester, or in which, consequently, the purchaser is more liable to be deceived, than black-lead pencils. This is occasioned hy the vast difference between the cest of genuine Cumberland lesd and of the other articles that are or rasy be substituted for it. ${ }^{\text {. }}$ Pencils are usnaliy described as foliows: first quality, or drawing pencile; second quality, or prepared pencils ; third quality, or composition pencils. 1. Pencils of the firs quality are, when genuine, made of puro Cumberland lead, and coet, in the year 1848, 80s. per 1b., or $£ 168$ per cwt. From 18 to 20 tiozen such pencils are produced from a pound of this lead. These pencils are usualiy made by sawing the lead into the pieces inserted in the cedar. Sometimes, however, the lead is in parts gritty and defective, so that a pencil of this kind may, in fact, be very infcrior. To obviate this defect, some makers prepara the lead, to free it from the grit or earthy particles; and, provided no antimony or other alloy be mixed up with the prepared lead, the pencils produced from it are most to be depended on. 2. Pencils of the aecond quality are manufactured out of the sawinge or dist of pure lead, with the dust of the small pleces picked up by peer people from the rabbish thrown out of the mine, mixed or alloyed with a greater or less quantity of antimony. The goodness of this pencil depends, of course, on the proportion in which the pure lead exceerls the antimony. But as the cost of the former may be taken at $\mathcal{C 1 0 0} \mathrm{a}$ cwt., and that of the latter at only 26 s ., there is an all but irresistible tev ptation to increase the propiortion of the latter beyond dre bounds. This sort of composition produces about 15 or 16 dozen pencils to the pound; their price varying aocording to the purity of the lead. 3. The third quality of pencil is made by using Mexican or Spanish lead dust, coating 45 s , or 60 s . a ewt., with antimony costing about 26 s . per owt. It produces abont 14 or 15 dozen penciis to the $1 \mathrm{l} .$, which may be soid at from 2 a .6 d . to 12s, per gross, aecowing to the cost of tite articles employed
and the care taken in mixing them. This sort of pencil may take a firm point, and make a fine atroke, but its trace will not obliterate on being rubbed with India rubler. The easy and complete obliteration of the atroke ia, in fact, the best and perhaps only teat of a pencil being of pure Camberland lead.-Private infor mation.

Black Ben, or Buxine Sea (Pontus Euxinua of the ancients), la a large inland sea, hounded on the west by Rumolia, Bulgaria, andi Bessarabia; on the north by Russian Tartary ; on tha east by Mingrelia, Circaseia, and Georgla; and on the eonth by Anatolia. It is entered from the Mediterranean through the channet of the Dardanelles, anciently the IIcllespont, the Sea of Marmora or Propontis, aud the channel of Conetantinople or Thracian Bosporus; and it is connected with the Sea of Azof, or Palus Masotis, by the atrait between the Crimea and the Isle of Taman, anslentiy the Cimmerian Bosporus, and known by the various modern namee of the Strait of Kertch, of Yenikale, and of Taman.

Tili within less than half a century, the extent of the Black Sea, and the position of aeveral of ita principal capes, gulfs, and ports, were very imperfectly ascertained. But soon after the commencement of the French Revolution, the National Institute sent M. Beauchamp to examine this sea, and eapecialiy its southern shores. In this enterprise he was muels impeded by the jealousy of the Turks: nevertheless, he ascertained that Cape Kerempe, Carambis, was placed in the charts too fur to the soath; that the Gulf of Sansoan, A misenua Sinus, was deeper than it is commonly represented; and that Trebizend, the Tarahazan of the Turks, anciently Trapez was five or six leagues farther ts the west than i) eleared in the charts. But recent travelers have discovered that even the Parisian charts are inaccurate. According to Dr. Clarke, the Iale of Serpenta, the Ulan-Adassi of the Turks, the Fidonisi of the modern Greeks, and ancient Leuce, lies fifteen minutes, and the port of Odessa twenty-seven minutes, too far toward the north (Clanke's Travels, i. 653); and Mr. Macgill ascertalned, from two observations of his own, compared with those of some eaptains who had navigated this sea, that in the French charts even Cape Kerempe is set down fifteen miles too far north, while Cape Aria or Saritch or Careza, Kriu-Metopon, in the Crimea, is placed twonty-two mitea too far south. This, of course, makes a difference in the width of the sea at thia place of thirty-seven miles.-Macoilh's Travshe, i. 190.

According to the best anthorities, which Mr. Arrowanith has followed in his mape of this sea, it lies between 41 and $46 \frac{1}{2}$ degreen of north latitude (the bottom of the Bay of Sansoun peoetrating searly to the 40th degree, and Cape Kerempe stretching out nearly to the 42 d ), and between 28 and $41 \frac{1}{2}$ degrees of east longitude from Greenwich. This wiil give for ite extreme breadth, from Cape Baba, in Anatolia, to Odessa, about 380 iniles, and for its extreme length, from the coast of Rumelia to the mouth of the Phasis, 700 mikes. The Black Sea, however, may be considered as divided into two parts, by Cape Aria on the south of the Crimea, and Cape Kerempe on the coast of Paphlagenia; the former lying in about 44t, and the latter in about 42 degrees of north latitude. Both these capes being high land, vessels sailing between them can liscover the coast on either side. The circumference of the Black Sea is about 8800 miles.

Kuatian statistical reporta are so little to be relied upon, thist it is difficult to give any very ascurate returns of the generai trade of the Black Sea. Within the last twenty years a total change has been effected in the aspect of its commerce. This is ehiefiy to be atttributed to the exiatence of the British market. When importations of corn into Eingland wero freed from fiacal influences, the vast and fertile plains of southern Russia, and the rich valiey of the Dauabe;
supplied the ever-jncreasing demand; and the requiremente of Great Britaln, however they may Increape, will be met by enormoully eiantic powers of prodaction. The prohibltive policy of Russis exercises, however, a most injurions influence upon foreign trade, and combines to render the oxpense of freight opon the coasta of the Blatk Sea higher than upon any other eastern sea-board. In conaequence of the more liberal commercial peiicy of Turkey and the Danubian principalitiea, the exporta of Rumelia, Moldavia, and Wallachis, are increasing far more rapidly than those of the Russian provinces, while the grain is more highly eateemed in the English market. The total amount of wheat received by Great Britain in 1852 from the Russian shores of the Black Sea was 789,750 quarters, in 874 vessels. The total amount shlpped from Kumelia and the Danubian principalities was 112,650 quarters, in 92 vessela. The general exports of the principaities have been gradualiy increasing. In 1849 the total value of the importe amounted to £809,240; in 1850, $\mathbf{2 8 9 8 , 7 1 5 ; \text { and in 1851, } £ 8 9 6 , 8 9 5 . ~}$ The total value of the exports in 1849 was $£ 1,118,272$; in 1850 it was $£ 839,712$; and in 1851, $£ 1,274,525$. As the com trade to the Britiah dominions is the mainly important branch of commerce in the Black Sea, those atatiatics connected with it which are derived from the Eıglish official reporte contain all that is most importanc. Apart from this no very remarkuble features in the local trade have been recently developed, nor, if there were, are there any authentic reports of its extent.
The principal articles of commerce afforded by the countries on the Black Sea are, wheat, rice, tobacco, lides, tallow, hare-skins, honey, wax, iron, and yellow graina for dyelng from Rumelia and Bulgaria, by the ports of Varna and Bourgas. The same articles, with theaddition of wool, butter, hemp, masta, ship-timber, and pitch, are exported from Moldavia and Waliachia, by 1 braiia and Galata, on the Danube. From Bessarabia by Ovidopol, and from the province of Cherson by Odessa, Akermann, and Cherson, come corn, eak timber, hides, tallow, ter, shagreen, wax, honey, hemp, sail-cloth, and wool; from the Crimea, by the ports of Actiar, Kosloff, and Cafia, corn, wool, wax, honey, dried and salted hides, deer-akina, moroceo leather, sineep-skina, saited and dried fish, potash, felt, caviare, whe, silk, and saltpetre; from the countries on the Sea of Azof, by the ports of Taguerog; Berdianski, and Mariapol, iron (of which Constantinople and Snyyrna require about 60,000 quintals each), dried fish, caviare, butter, hides, tallow, wheat, timber, furs, saii-cloth, corilage, hemp, linens, wax, and wool; from Anatolia, by the ports of Erekii, Amasreh, Inebohi, Slnope, and Unish, lides, dried fruits, linena, linen thread, wax, honey, hemp, copper, and ahip-timber; from the ceast of lloum and Sansoun the same articles; from the couutries of the Laziens and Gurions, principally by Trelizond, all the above articles, except ship-timber; and from Mingrelia, and the country of the Abasses, principally by Soudjuk and Anapa, slaves, timber, Lox-wood, wool, ailk, furs, butter, hides, wax, and honey. The trade to these coasts is entirely carried on by a few Greeks of Constantinopie, and is very in-signilicant.-E. B.

Blank (Froncin Blanc) hiterally signifies white, Blancus, or Blaner, was a kind of winite or silver moncy, of base alioy, coined by Henry V. In those parts of France which wore tinen subject to England. It was valaed at 8d, sterling. Blank also denotea a small copper coin, formerly current in France, at the rate of five deniers Tournola.-EL. B.
Bleaching is the art of depriving cotton, linen, silk, wooi, wax, oto., of their coloring matter, and rendering them as white as possible. The word is probaluly derived from the French term blanchiment, which signifies the process of rendering whita.

This art was known oariy in Egypt, Syria, and

 ailver monse parts of d. It ws ea a amal] the rate ofIndia. Known in ancient Ganl.-Pliny. In the last century an Improved chemical syatem was adopted by the Dutch, 'ho introduced it Into England and Scotiand in 1768. There are now Immense blen :t. fields in both countrise, partlcularly in Lancashlr and in tho countiee of Fifo, Forfar, and Renfrow, so in the vale of the Leven, in Dumbarton. *The c'.cemical process of Berthellet was introduced in 1795.-Blanchíment des Toiles.
Blockade, in war, the shutting np of any place or port by n naval or military force, se as to cut off all communlcation with those whe are wlthent the hoatile line. There ls, perhaps, no part of the law of nations which, In practice, presents so many perplexing questions as that which concerns the respectlve rights of neatral and belligerent states. No definite llne of distinction has yet been drawn between the prlvileges of war and peace; and the consequence has been, that, In all tite wars which have been waged in Europe, tho general tranquillity of the world lius been endangered by the jarring of these two different faterests. It has commeniy happened, too, that all these important questions have been agitated during a seasen of war ; when the passions of the contending parties were keenly engaged in the dispute; when principles were slready subverted; and when the minds of men, exasperated by the glaring infraction of acknowledged rights, were not in a state to agree on any system of general equity by which to regulate and reform the erring policy of states. In these clrcumstances, many points of internatlonal law, which appear to rest on the most ebvious princlples, and which are very clearly settled in the writlngs of clviliane, have, nevertheless, been the occasion in practice of no amall controversy, and have frequently Involved nations in all the miserics of protracted war. Thls has been in some measure msnifested In the case of the Rights of Blockade, respecting which, though no difference of opinion has ever prevailed ameng speculative writers, a controversy arose during the late contests in Furope, which, along with ether points, ultlmately Involved Great Britain in a war with the neutral powers. We propose, in the course of the subsequent observations, to state, 1st. The general prlaciples from which the most approved writers have deduced the rights of blockade; and, 2 d . Togive a short account of the differences which took place between the neutral and the belligerent states respecting the extent of those rights.

In regulating the respective privileges of the neutral and the belligeront, it has generally been held as a fundamental principle, by writers on the law of nations, that those rights from the excreise of which less henefit would accrue to one party than detriment to the other should be abendoned; and in all cases where the rights of war happen to come into colllsion, the appilication of thls rule will decide which of the two parties must yield to the convenlence of the other. Thus the neutral state is debarred from carrying on any trade with elther of the beliigerents in warlike stores. The general right to a free trade is modlfled, In this particular instance, by the paramount rights of the belligerent. To refrain for a tlme from trading with an individual state in warlike steres can at most enly impose a trlfiling inconvenience on the neutral power, whlle the continuance of such a trade might terminate in the destruction of the belligerent. The detriment occasioned to the one party by the existence of such a trade, is, in this manner, infinitely greatcr than the loss auffered by the other from its abandonment. Warlike stores, and whatever else bears a direct reference to war, sre accordlngly proscrlbed as unlawful articles of trade, and made liable to selzure by either of the belligerents. To this Inconvenlence the neutral Is exposed, to avold the greater Inconvenlence and damage which might fall on the belligerent by the licensing of such a trade. On the other hand, the neutral state enjoys the most unlimited freedem of
trade in all other articles with either nf the powers at war; and though, by means of thia beneficial interconrse, they may be both furnished with the means of carryling on a protracted conteat, thla la a centingent and incidental coneequence of the trade, which, In Its character, is aubatantially pacific, and which is attended with such great and immedlate advantages, that they could net, with any regard to equity, be sacrificed to the remote convenlence of the belligerent.

Applying these principlea to a slege or to a blockade, it is evident that the belligerent who had an expensive acheme of hostile operations of either kind in dependence would be far more serieusly injured by its interruption than the neutral would be benefited hy in free intercourse with the bleckaded place. On this ground, therefore, a belligerent who has formed a sicge or a blockade har an indisputable right te debar the neutral from all intercourse with those who are included within his lines; and any attempt to penetrate the bleckade for the purpeses of trade subjecta thoae whe attempt it to destruction, and their properties to col. fiscation. The very exlstence, indeed, of a siege or a blockade, as a lawful act of hostility, implies the right of enforcing it by an Indiscrimlante exclusion of all who seek access to the besleged.

But although this vlew of the natnre of $n$ blockade, and of the righte attaching to $i t$, ls clearly laid down by all writers on the law of nations, and although it has been acknowledged in practice by all clvilized atates, a question was agitated in the late wars of Furope, between the neutral and the belligerent powers, as to the degree of restraint necessary te constitute a biockade, and, of course, to entitle the bleckading party to all the rights consequent upon this scheme of operations; and It is this dispute which was, in a great measure, the occasion of a general war with the neutral powers.

The success which attended the naval operations of Great Britain during the war with France naturally snggested to her rulers the possibility of extending this species of annoyance, and of converting the all-pewerful navy whlch they possessed iuto an instrument of active hostility. With this view, instesd of confining its efforts to the mere watching of the enemy's already ruined trade, it was resolved to give greater scope to such an Immense engine of maritime power, by placing under hlockade the enemy's ports, the moutha of nevigable rivers, and even extenaive tracts of his coast. Proclamatiens to this effect were accordlingly issued; and the neutral trader was duly varned off, and prolibited, under the peril of detention, from all intercourse with the interdicted coast. But the legality of these blockades by proclamation being disputed both by the neutral powers and by the enemy, their executlen was resisted by a counter decree, which, on the plea of retallation, placed under blockade the whole island of Great Brltaln, and subjocted all neutral vessels to detention and capture whlch should have been found touching at any of tis ports. On the same plea of retallation, sevoral decrees or orders in council were lasned by Britain, ordalning that no neutral vessel should have any Intercourse with France and her dependencles, except such ressel should first touch at a British port, whero, in some cases, the cargo was to be landed, and was to pay certaln dutles to the Britlah government. From this perlol the maxims of equity and the rules of internatlonal law were set aelde, and the occan became a scene of proscrlption and plllage. All thls anarchy having orlginated in a dlsagreement respecting the nature and extent of a blockade, it becomes of impertance to iring back the question to Its true elements, and to fix the princlples by which alone It shnridd be settled.
The ulject of a blockade is to reduce the inhabitants of the blockaded town to such stralts that they ahall be forced to surrender to the discretion of their enemics In order to preserve thelr IIves; and hence the legality
of avery blockade, except with a view to ceiptare, has ' been questioned. But without entering into this question, it seems obvious that, in order to conatituse the hlockade of a town, either with a view to capture or to temporary anneyance, the line by which it is aurrounded ahouid be so complete as entirely to obstruct all access into the place. When a place is blockaded with a view to capture, the task of maintaining a real blockade may eafely be left to the blockading party. Bnt when a port is blockaded with a view to mhere maritime annoyance, the case ia widely different; because, in these circumatances, the beliggerent will equally attain his end by maintaining the mere show of a blockade, while he is in possession of all its aubstantial rights. He may, to save himself expense and trouble, relax the blockade of his enemy's ports, while he enforces the exclusion of all neutrals as rigorously as if he were maintaining an effectual blockade; and, in this case, his prociamations, while they are basued oatensibly for the blockaile of the enemy's ports, would, in reality, amount to edicts for the suppression of the neutral trade. The urgent, immediate, and obvious interests of the neutral wouli here be sacrificed to the remote, and in many cases imaginary, convenience of the belifgerent. An ediet might be issued for the blockade of the enemy's ports, or of extensive tracts of his coast, round which no hoetile line could ever be drawn to as to conatitute a real blockade; and the whole trade of the neutral with these interdicted parts of the enemy's territory would be immediately annihiIntel at the arbitrary mandate of one of the belligerents. Instead of being carried on as a matter of right, instead of beiog regarded as a common benetit to the civilized worid, and on this account as proper to be cherished and encouraged, the neutral trade would, under such a aystem, be looked upon in the light of a toleratec evil, existing only by the sufferance of those who imagined they had an interest in obstrueting and in erushing it. The law of nations is not a partial syatem, modeled to suit the convenience of one party. It is a system of general equity, and its ediets are founded oa a comprehensive view of what is for the common welfare and protcction. In this view, then, the consequences to the neutral of those extensive and nominal blockacies are aufficient to constituto them illegal. The damage to the ueutral is infinitely greater than the bencfit to the belligerent. The rights of blockade, atd the limitation of those rights, must stand upon the same principle of justice and of publie law ; and their extension beyond this equitable principle must termiuate in univeralal confusion and anarchy.

In opposition to these arguments in favor of the neutral powers, it has been urged that the new system of naval annoyance, introduced by Great Ilritain in 1806, was legal according to the atrictest construction of the law of blockade, because the proclamations for interrupting all intercourse between the different parts of the Freach coast were not issued until it was ascertained, by the most particular inquiries, that Great Britain possessed an effectual naval force to blockade the enemy's coast from Brest harbor to the mouth of the Elbe. It is eolely upen this principle that the minaters of that country maintained the legality of those blockades; and any breach in the line of blockade, they admitted, would be sufficient to constitute them ilicgal. Such, then, is the state of this innjortant controversy, which seeuse to resolve itnelf into a mere question of fact, namely, whether the blockading power has actually carried into effect the blockade, of which notice by proclamation has been given to the neutral powers.
At the conclusion of the last treaty between Great Britain and America, no settiement of these disputed questions took place. The main wa' between the Etrropean belligerents, ont of which ",ee American diepute had incidentaliy sprung, boing at an end, the controveray respecting righte whith could only be exercised
atate of war had lost all practical importance. It become mere queation of ahatrict right, the da. cinion of which was wieely adjourned by the powers at war, and net suffired to clog the work of a general peace. It is likely, however, that on the breaking out of any new war, this and other questions of a like nature would recur, and on this account it might be of importance to the future peace of the world if these questions could be cettled according to some acknowledged rule of equity or policy, and that without delay. -E. 1.
Blubber (Germ. Threw, Fiecheran ; Du. Thraan; It. Olio di pescs; Sp. Giraesa, A eeive de pescado ; Russ. Salo worwanmee, Worworn; Lat. Olewm piscinum), the fat of whales and other large sea-animule, of which train-oil is made. The blubber la the adepe of the animal: it lies under the okin, and over the muscular fieah; it is about six inches in thickneas, but about the uader lip it is two or three feet thick. The whole quantity yielded by one of these animais ordinarily amounts to 40 or 50, but sonnetimes to 80 or more honured weight. For merly train-oil was menufactured from the blubber in the seas round Spitabergen, and other places where whales wero ceught; lut the practice ia now to bring the blubber home in caake, and to prepara the oil afterward.

Board of Irade. Cromwell seema to have given the first notions of a board of trade. In 1655 he ap pointed his son Kichard, with many lords of his council, judges and gentlemen, and about twenty merchanta of Loudon, York, Newcastle, Yarmeuth, Dover, ctc., te meet and consider by what means the trade and navigation of the republic might be leat promoted.Thomas's Notes of the Rolle. Charles II., on his restoration, eataillshed a council of trade for keeping a control over the whole connerce of the nation, 1660 ; he afterward instituted a board of trade and plantations, which was remedcled lyy Wiliom III. This board of superinspection was abolished in 1782; and a new council for the affaire of trade, on its preeent plan, was appointed September 2, 1786.-11Ayms. In many cities of Europe and the United States, a voluntary Board of Trade is established by the merchants of such cities-in aome instances termed a "Chomber of Cinnmerce." Such associations are productive of incalculable benefit to the commercial interests at large.

Boat, a small open vessel, propelled on the water by oars or sails. The construction, machinery, and even the names of boats, are very ditterent, according to the various purposes for which they are intended, and the eervices on which they are to be employei. Thus they are occasionaliy slight or strong, sharp or flat-bottomed, open or deeked, plain or ornamented; as they may be designed for swiftness or burden, for deep or shallow water, for sailing in a harbor or at sea, and for convenience or pleasure. The largeat baat that ususily accompanies a ship ia the long-boat, which is generally furnished with a mast and sails. Longboats fitted for men-of-war are oceasionally decked, armed, and equipped, for cruising short distances against marchent ships of the eneny, or smugglers, for impressing aeamen, and oth services. The berges, which are next in order, are longer, olighter, and narrower. They are employed to corry the principsl seaofficers, as admirals and captains of ships of war, and are unfit for the open sea. Iinnaces exactiy resemble barges, but are somewhat amalier, and have never more than eight oars; whereas a barge properly never rowa less tian ten. The cutters of a ship are brosder, deeper, and shorter, than tho barges and pinnsecs: they are fitter for sailing, and are commonly employed in carrying atores, provisions, pessengers, and the like, to and from the ship. In the atructure of this sort of loet the lower edge of every plank in the side overlays the upper edge of the plank below, which is called by ohipowrights elinker-build. J'ouls are somewhat less than cuttera, nearly of the aame form, and used for
tance. It ht, the da. powers at a general 1 breaking is of a like aight be of Id if these acknowlnout delay.

In many a voluntary hants of such noer of Com of incalcula. large. on the water chinery, and tt, according re intended e employed. ng, sharp or maneented burden, for bor or at sca largest boat -bout, which ails. Jongally decked, rt distances smugglers, The barges, er, and narrincipal seaof war, and ly resemble have never perly never are broader, 1 pinuaces: y empleyed nd the ilike, this sert of aide overich in callet somewhat and used for
imilar mervioes. They are generally rowed with aix ours. The above boata more particularly belong to men-of-war.- Merchant veasels above 150 tona huve at least two, a long-boat and yawl. it Merchant shipe employed in the Mediterranean find it moro convenient to ase a launch, which is longer, fiatter in tha bottom, and better adapted every way to the harbors of that sea than a long-boat. A wherry la a light, aharp boat, used in a river or harbor for carrying passengers from place to place. Punta are a aort of oblong, flat-bot tenned beate, nearly resembling floating atages. They are used by ohip-wrights and caulkers, for breaming, auikinz, or repairing a chip's bottom. It is also the name for the emallest boat of yachta, etc. A moses is a very flat, broad bout, used by merciant ahipo among he Caribbee lalands, to bring hogsbeads of sugar of from the sea-beach to the shipping anchored in the ronds. A felucca is a strong passage-boat used In the Mediterranean, and propelled with oare and lateen uails. The pirogue of the Southern and Eastern seas is a kind of cance made of the trunk of a tree hellowed out. It is generaliy worked with paddies, but some times it is decked and furnisher vith aails and an ontrigger. The proa, so much used by pirates in the Eistern Archipelago, is sharp at both ends, in order to sail either way. Its lee wide is rounded, but the weather side ia flat, and provided with an outrigger to secure its stability.-E. B. The invention of boats was se carly, and thair use so general, the art ran not bo traced to any age or country. Flat-bottomed boats wero made in Eagiand in the reign of the Conqueror the flat-hottomed boat was again brought into use by Barker, a Dutchman, about 1690. Tho lifo-boat was first suggested at South Shields; and one was built by Mr. Gresthead, the inventor, and was firut put to sea, January 30, 1790 - IIArns.
Boatawain, the officer in a ship who has the charge of the boats, sails, rigging, colors, anchors, cabies, anil cordage. It is also the duty of this officer to aummon the crew to their duty; to assist with his mates in the necessary buainese of the ship; and to relieve the wateh when its time expires. He has a mate who has the charge of the long-boat, fer setting forth anchors, weighing or fetching home an anchor, warping, towing, or mooring.
Bobbin, a amall cylinder of wood, with a littla border or head at each ond, and bored througit to receive an iron pivot. It is used in spinning, to wind thread, worsted, hair, cetton, silk, gold, and silver.
Bobbing, among fiahermen, a method of entehing eels, different from sniggling. To bob for cels, a number of large lobs aro well acoured, and a twisted silk thread is run through them from end to ond with a neelle: they are then tied fast with the two ends of the silk thread, that they may hang in so many hanke; after which the whole mass is attached to a strong cord, with a plummet fixed a little above the worins to sink the bait, and the cord is mada fast to a strong pole. This apparatus is tisrown into muddy water the ceis tug lustily at the bait; the rope is then to be drawn in gently, and the cels are brought ashore.

Bogs, commonly the remains of fullen forests, covered with peat and leose soll. - Moving bogs aro slips of land carricd to lower leveln by accumulated water. Of recent acto, one relating to Ireland for their drainage, passed March, $\mathbf{1 8 3 0}$. The bog land of Iroland has been estimated at $3,000,000$ acres; that of Scotiand at upward of $2,000,000$; and that of England at near 1,000,000 of acres. In January, 1849, Mr. Rees Reece took out a patent for certain valaablo products from Irish peat.-ffousehold Words, No. 41.

Bohea, a species of tes. Sec Tra.
Bole, a frialile earthy subs ance, a apecies of the soap-atone fumily. Specific gravity $1 \cdot 4$ to 2, It is feund in the island of Lemnos, whenea it is sometimes csited Lemmiall earth; and in Armenia, Italy, France, Silesia, various parts of South America, ete. Arme-

Dian and French boler ere at one time net uncommon in this country, boing used in the materia medica; but they are now ontirely, or almost entirely, disearded. In India, however, Armonian bole acill continuea to be in extensive demand. : It is hrought to Bombay from the Persian Gulf. It la soft, feals greasy to the touch, adheres atrongly to the tongue, and is very frangibles It is generaliy of a yellowish hrown color; though sometimes it is seen of a fine flesh red, whloh is the variety held to the higheat eatimation. Some savage nationa, such as the Ottomaques, dencribed by M. Humboldt, are in the hablt of allaying the paina of hunger by eating bolos. The Javanese, when they wish to become thin, eat caken, called tannampo, made of bole,-Lewis's Mfateria Medica; Tiomaon's Chemistry; Ainalis's Materina Indica.
Bolivia. Thia name wan given in 1825 to a new State or Republic in South America, formed froin the rrovinces of Upper Peru, which formerly constituted part of the vice-royalty of Buenos Ayres, and were well known by the nnmes of Charcas, Potoal, La Paz, Cochabamba, and Santa Cruz de la Sierra. These provinces, on securing their independence, soon after the battle of Ayacucho, 9th December, 1824, found it necessary to come to a determination as to their future political state and inatitntiona; and therefore it became n question with the inhabitants of Upper l'eru whethor they should contlnue their former connection with the Buenos Ayrean or Argentine provinces, attach themeelves to the republic of Peru, or form their country into a separate and independent republic. Bnt the existing government of Buenos Ayres hnviag with equal judgment and generosity divested itself of the cluim which it had on the provinces of Jpper Peru, the inhabitants of the latter were left at jerfect liberty to decide on the future political government of their country. Deputiea from all the provinces wero in consequence nominated; and having assembled in Chuquisaca, the capital of the republic, in August, 1825, the resnlt of their deliberations was, that the provinces of Upper Peru should in future constitute a separate and independent nation. This ussembly, continuing its sessiona, lamed a decluration of national independence; and, in the exuberance of their gratitude to General Bellivar for the inportant influence he had exercised in accomplishing the liberation of their country, they determined on giving the nume of Bolivia to the whole country

Bolivia extends from $9^{\circ} 30^{\prime}$ te $25^{\circ} 40^{\prime}$ of S . lat., and from $68^{\circ}$ to $71^{\circ}$ of W. long. from London, and it is bonnded on the north by l'eru and Brazil, on the east by Brazil and Paragnay, on the south by the Argentine provinces and Chili, and on the west by the Pacific Ocean and l'cru. It has been diviled by the constituent Congress of Bolivis into six departments, viz., Potosi, Chuquiraca, La I'az, Santa Cruz, Cocinabainbn, and Orure; and these have been aublivided finto provinces and cantons. Thue cach dejartment in cludes in its jurisdiction certain provincen of the ancient régime. The department of Petosi contains Atacama, Lipez, Potosi, Porce, Chayanta, and Chicas; Chnquisuca contains Charcas or Chuquisaca, Cinti, Yamparnea, and Tomina; La l'az, the provinces of La I'ax, Pacajen, Sicuslea, Chulumani, Omasuyos, Larecaja, and Apolobamba; Snnta Cruz, the provinces of Sunta Cruz, Mojos, Chiquitos, Vallegrande, Pampas, and 13nires; Cochabamba containe Cochabamba, Sa cata, Tapacari, Arque, Palca, Clissa, and Misque; nad the department of Oruro, the provinces of Paria, Oruro, and Carungas.
The only productions hitherto furnished by Bulivia as articles of cominerce have been the precious metnls, which were exchanged for various articies of huxury and necessity. The rude and simple fabrica manufactured liy the Peruvian Indians are usualiy appropriated to their own domestic uses; while the valuable vegetable productions, and the herds of cattle and
mules, whieh are reared in the eastern parts of the repulsic, have hitherto scarcely been auficient for the supply of the inhabitants of those populous mining districts that are princlpally dependent on them for subsistence. Cocos to the value of $\$ 200,000$ is annually exported from La Paz to other parts of Bolivia and Peru.

Before the Revolution, a very oxtenaive traftio was maintained between the upper provinces on Peru and the provinces of the Rio de la Mata, for aupplies of cattle and mules. These were reared in great nombers in all the interior Argentlne proviuces, expresely for the use of those conntries, and wore first sent by easy journeys to the luxariant pastures of Salta and Jujuy, where they were carefully fed and tended during the winter, previous to their being conveyed to their final destination In Bolivia and Peru. Sonie Idea may be formed of the extent of this traffic by stating, that besidea all those fornished by the other Argentine provinces, the prevince of Salta alone sopplied annually to Upper and Lower Peru from 60,000 to 80,000 mules, on all of which they reallzed considerable profits, the prices being projortioned to the distance to which they were conveyed. The war of independence, which has so greatly desolated the northern provinces of the Rio de la Plata, and the diminished working of the mines of Balivia, have almost annihilated this lucrative truffic; but it may be expected to revive with increasing vigor on their again resuming their former babits of tranquillity, and becolning stimulated ic increased exertion, by the accession of hahorious and intelligent Europeans, and by the spresd of education nd intelligence.

By the route of Cordova, Tucuman, and Salta, the provinees of U'pper Peru or Bolivis formerly received their supplies of articles of commerce from Europe, which were landed at Buenos Ayres; and by the same channel they likewise obtained inge supplies of Kerba or Paraguay tea, to the great amount, it is affirmed, of 100,000 arrobas, or about $2,500,000$ pounds annually, which had been proviously conveyed by water from Praguay to Baenos Ayrea, and from thence by wagons and mules to Jujuy and Bolivis; thus enhancing its value by a circuitous and expensive land-carriage of from 2000 to 8000 miles, while, by a more improved syatem of conveyance, it might be sent by the rivera Vermejo and Pilcomayo into tho heart of Bolivia, at a vast saving of trouble und expense. The large amount of goods sent from Buenos Ayres by wagons to Jujuy tended greatly to enrich the various provinces through which they passed, giving employment to numbers of the inhabitants ; and Jujuy, which formed the most distant point that could be reached by wagons or carriages, became a place of considerablo importance, forning the entrept of the cemmerce of Pertu and the Argentine provinces. From this place the various articles of commerce were conveyed on mules to their ulterior destination.

The new order of affinis consequent on the Revolution has neceasarily produced importunt changes in this branch of commerce, and Bolivia has in a great measure ceased to reccive her supplies of foreign commoditiee by this expensive route. Commerce, where unrestricted, always finds out the shortest and least expensive channels for the introduction of its commodities. The trade is now in a great degree diverted to the ports of the Pscific, called the Puertos Intermedios. Taena and Arequipa, with their respective ports, have now become the principal channels through which Bolivis receives the produce and manufactures of other countrien. How far the Bolivian government has succeeded in making Cobija or Puerto la Mar of that exclusive commercial importance which it contemplated, remains yet to te ascertained. Nature presents great ohstacles to the success of the underteking, which is certainly a most praiseworthy one; while all the rest of the coast, in which are situated
the I'uertos Intermeding, forms part of the republic of Perv, to which, therefore, they must necescarily pay tranait duties. A now and very lmportant channel of communication for commerce w!ll be upened between Bolivia and the Atlantic, whenever commercial onterprise and increasing civilication shall heve established atesm navigation on the lio de la Plata and its tributary streams, the Vermejo and Pilcomayo, and from the mouth of the A mazon to its distant tributaries, the Beni and the Mamori.
By a decree of the republican government of Peru, dated 22d February, 1881, the following judicious reg. ulations have been established for settling the commercial relations of that state with the reputlic of Bolivia: 1. The productione of the territory of the Holiviun republic, jntroduced Into Peru for its consumption, shall be aubject to an import duty of 4 per cent. on their valuation. 2. Those productions uf Bolivia which only pass through the territory of Peru for embarkation from its ports, shall only be subjeeted to a transit duty of 2 per cent. 8. Silver and gold, cither coined or otherwise, introduced from Bollvia into Peru, shall be exempted from any duties. 4. All foreign articles of commerce passing through the territory of Pern, and destined for Bolivia, shall only be eubjected to the payment of 2 per cent. ad valorem; and the decree of 22d January, 1830, which imposed transit dutios of from 15 to 45 per cent. on such commodities, has been repealed.
Silver, however, has hitherto been the staple metal lic production of Bolivia, rud has given to it thst celelrity which it has long possessed. In the rich mountain of Potosi alone, from the year 1545 to the yoar 1800, no less than $\$ 823,950,509$ were coined; and if to this he added the smount of the preceding years, not included, and that olstained in a clandestioe manner, S1,647,001,018 has been olitained in the apace of 225 yeare.-E. B.
 large shell of cast iron, with a vent to recejve a fusee, which is made of wood. The shell being filed with gunpowder, the fusee is driven into the vent within an inch of the head, and fastened with a cement made of quick-lime, ashes, brick-dust, and atcel-filingn, worked together in a glutinous water; or of four parts of pitch, two of colophony, one of turputine, and one of was. Thir tube is filled with a combustible mutter made of tr ounces of nitre, one of sulphur, nnd three of gunpowder-dust, well rammed. To preserve the fusee, it is pitched over, but uncased when the bomb is put into the mortar, and covered with gunpowderdust, which, taking fire by the flash of the powder in the chamber of the mortar, burns all the time the bomb is in the sir; and when the composition in the fusce is spent, it fires the powder in the bomb, which bursts with great violence and commits dreadful devastation.

Bombs may be used without mortars, an was done by the Venetians at Candia, when the Turks had jossessed themselves of the ditch. Bombs were rolled down upon them along a plank with ledges set sloping toward tucir works. Bombs did not come into comonon use before the year 1634, and then only in the Dutch and Spanish armies. One Malthus, an English engineer, is said to have first carried them into France, where they were used at the siege of Collioure.-E. 13 .
Bombay (Portug. Buon-Bahia, "good hurhor"), a city, sea-port, and capital of the presidency, is situated on a narrow neck of land at the southeastern extremity of the island of Bombsy, separated from the main land by an arm of the sea, forming, with the contiguous islands of Colabah, Salsette, Butcher's Island, and Caranjult, one of the beat harbors in India. Lat. $18^{\circ} 56^{\prime}$ N., long. $72^{\circ} 58^{\prime} \mathrm{E}$. In 1716 the populstion was 16,000 ; in 1816, 161,350; and, according to the Bombay Calendar, in 1845, 235,000. Of these twothirda are Hindoos, 20,000 Parsees, and the rest Mussulmans, Jews, and Christlans; with a great varicty

of fuctaating population, chlefly sallors and traders. It conalsts of the fort or old town, 1 mile in length by $t$ mile in bremdth, in which the European inhabitants and most of the Parsee merchants reside; and the new town, about 1 mile diatant northward, inhabited by the Hindcos and Mohammedan native population, leyond which auburb are many detacbed villas and iungalows, belenging to Furopean and other res!dents. Bombay Island was ceded by the Portuguese to the Engliah in 1661, as the dower of Queen Cath arine, wife of Charles II., ant was taken possession of in 1664 ; so that it has been in their ocoupation about 180 yeara, being by far the oldest of their possessions in the East. In 1068 it was tranaferred by the crown to the East India Company by letters-patent, in free and common soceage, on payment of the annual rent of E10. 3ut by the present charter It has reverted to the crown, wlth the rest of the company'a assete, being lield by the company in trust merely. On its ceseion to the erown of England, in 1661, its population did not exceed 15,000 ; but at prasent it has npward of 230,000 inhabitante. The fort stands on the southesstern extremity of the island, on a narrow neck of land, Immediately over the harbor. The fortifications are extensive, and on the sea-side very strong.

Bombay has a lively appearance from the sea; but as a city it is greatly inferior to Calcutta or Madras. The houses within the walls are built of wood, and covered with tiles. Principal editices in the fort are the coart-house, secretariate, and other government offices, custom-houso, town-hall, castle, mint, eathedral of St. Thomas, St. Andrew's Scotch church, European hospital, etc. In the centre of the fort is an irregular open apace called the "Green;" and outside of the massive fortifications is the csplanade. In the new town are Elphinstone college, Sir J. Jejeobhoy's hospital, the Byculla church and club, the house of correction, theatre, and the great Hindoo temple of Momba Devi. On the southwest the fort is connected by Colabba causeway with the Island of Colabba, on which are the light-house, observatory, lunatic asylam, some mercantile buildings, and a stono pier. The government-house is at Parell, 6 miles north of the fort. There are two banks-the Bank of Bombay and the Commercial Bank of India. The property of the island belongs principally to the Parsecs, who are the chief merchants and moneyed men. The harbor of Bombay is one of the beat in India, and aftords good anchorage for ships of the largest burden. On it are also excelient buitding and other docks for ships of the first class. Next to Calcutta and Canton, Boinbay ls the principal commercial emporium in the East, and for many years its trade has been uniformly incrensing. In 1837 a steam navigation was commenced between Bombay and Suez; three stenmers were at first employed, which the war in 1848 increased to 8 ; and a regular monthiy passage is now miade from London to India, under the arrangements of the Orientai Stenn Navigation Company. Bonbay Island, on which the city is built, la 8 miles in length, and 3 miles in breadti, and is formed of two ranges of green-stone, connected in the middle by sand-atone strata. The interior lies low, and was at one time liable to be flooded hy the tide, but an embankment was erected to keep ont the sea.
Rombuy IIarbor is one of the safest and most commodious in India. It is bounded on the west and north by the island of Colabai, or Old Woman's Island, Bombay Island, and the laland of Sulsette. The first two nre separated only by a narrow creek fordable at low water, and Bombay Island was joined to Saisette by a causeway constructed in 1805. On the east side of the harbor, between it and the main land, is Butcher's Ialand, distant aloout 4 milies from Bombny; and Imnediately behind lluteher's Island is the famone island of Elepisanta. About 3 mifes sonth from Butcher'a Island is the lsiand of Caranjah, on the west-
om aide of which, next the harbor, ia an extenaive shoal. Southwest from Caranjah, dictant nbout 5 milen, is Tull Point ; between which and Cclabah, or Old Woman's Island, is the entrance to the harbor. There $i_{b}$ n light-house on the southern extremity of Colubah Island, elevated abont 160 feet above the level of the sea, which In clear weather may les seen at the distance of 7 leagues. The point on which the lighthouse standa is surrounded on all sldes by an extensivo reef of rocka divided lnto prongs: of these, the most dangeroua is the prong atretching southwest about 8 milea from the light-house, and forming tha northern bonndary of the entrance into the harbor. The reef, stretching west-northwest from Tull Polnt about 8 miles, forms tho southem lat ndary of the entrance; the breadth of the channel between them being about 8 miles, with a depth of from 7 to 8 fathoms. In going into the harbor, it is necessery to clear a s ink en rock, Jying almast due east from the light-l use, at aiout $1 \frac{1}{2}$ mile distant; and also a bank, f ed the middle-ground, lylng rearly oppoeite to ani avout 11 mile from the southern extremity of the town.-Dfe Nicholson and Watson's Pian of Bombay Hirbor.

Docks.-Bombay is the only port of consequence in Britiah Indis in which the rise and fall of the tlde are so considerable as to admit of the formation of extensive wet doeks. At ordinary spring-tides the rise is about 14 feet, but oceasionally si high as 17 feet. The capacious docks constructed by the East India Company are their property, and are for the most part under the direction of Parsees, who, exeepting the Chinese, are the most industrious and intelligent people of the Last. Merchant vesseis of the largest class, or from 1300 to 1400 tons burden, for the cotton trade to China, have been built ln these docks. Frigates aud line-of-battle ships have also been occaaionally constructed ln them, sometimes under the exclusive direction of Parsee artificera. The timber having to ise brought from a great diatance, shlpa built at Bombuy are very costly; but being, contrury to the practice In other parts of India, entirely constructed of teak, they are the most durable vessels in the world, requiring little repair, and often running 50 or 60 yeurs. Being for the most part buit by natives, without any very strict application of the rules of the art, they are cominonly, though not aiwaya, heuvy sailers.

Com nerce, etc.-The amall and sterile ialand of Bombay aucords no produce for exportation; indeed, hardly a week's consumption of corn for its inlabitants. Nor does the whole presidency of Bombuy, although comprising about 130,000 square miles, and from $8,000,000$ to $9,000,000$ inhabitants, with a net revenue in 1848-'49 of $£ 2,460,000$, yield, with the exceptlon of cotton, rice, and coffec, any of the great colonial ataples, such as augar and indigo; a cireumstance which muy, perhaps, be ascribed to the impolitic restraints upon the employment of British setticrs and capital that were long imposed by Jaw, and acted upon with peculiar rigor in this and the sister presidency of Madras, in contradiatinction to the greater latitude afforded in Bengal. Bombay is also much less favorathy situated, in respeet of internal communieations, than Calcutta. The Ganges and its tributary atreains intersect the richest provinces of India, and give Calcutta a vast command of injand navigation; whereas all the inland trade of Bombay has to be carried on by means of rouds that are scidon availablo for carriages and which can be used only by pack-bullocks and camels. Tie transit dutics, by which the inland trede wus grievously oppresaed, have been aboliahed; and if this judicious measure be followed up by the formation of tines of railwaya to the principal markets in the interior, a great increase of the trude of tho town and improvement of the presidency muy be expected.

The principal trado of Bombay is carried on witi China, Great Britain, the countries on the Persian and Arabian gulfe, Calentta, Cutch and Scinde, the Mala-
bar coast, foreign Europe, etc. The imports from China consist principally of raw. sillk, sugar, and sugarcandy, ailk piece goods, treasure, etc. I The principal articles of export to Chine are, raw cotton, oplum ( 18,000 chesta), principally from Malwa, sharks': fins and fish mawn, sandel-wood, pearls, etc. The exports to China being mnch greater than the imports, the returns for several yeare past have been made to a large oxteut in bills on London, and on the Indian governmenta, drawn by the merchants in China.
The trade with the United Kingdom has been regularly increasing since the abolition of the restrictive syztem. The chief articles of import from Great Britain are, cotton and woolen atuffs, cotton yarn, hardware, copper, iron and lead, glass, apparel, fur, atationery, wine, etc. The principal articles of export to Britain are, raw cotton, raw silk from China and Parsia, ivory, pepper, and spices, piece goodk, coffee from the Red Sea, and wool. The export of the last-mentioned article increased with extraordinary rapidity, the quantity ghipped for England in 1838-'34 being only 69,944 lbs. ; whareas the shipments for England in 1840-'41. amounted to $8,428,055$ lbs. But it has aince continued nearly stationary. At present the principal aupply of the article is drawn from Cutch and Sojude, and from Marwar, ria Guzerat; but active measures have been taken by government for improving the flocke in the pastoral country of the Decean, po that a further and very conaidersbla increase of this naw and important trade may be anticipated. .
Bombay Presidenoy, the most westerly and the smallest of the three presidencies of British India, mostly between lat. $14^{\circ}$ and $24^{\circ} \mathrm{N}$., and long. $72^{\circ}$ and $76^{\circ}$ E., having northwest and north the Guicowar's dominions, east the territorice of Indore and the Nizam, south Goa, Mysore, and the Madras presidency, and wast the Indian Ocean. Area, with Scinde and Sattara, 120,065 aquare miles. Population 10,485,017, and is composed of the following subdivisions: Bombay lsiand, Poonah, Ahmeduugrur, Candeish, Dharwar, South Jaghiredars, South Concan, North Conean, Surat, atc., Baroach, Ahmodabad, Kaira, Sattara, etc. The Western Ghauts separate tile western or maritime from the castern districts, which latter form a part of the great table-land of the Deccan. In the north the mountains belong to the Sentpoora and other ranges connected with the Vindhyen chain. Prineipal rivers, tho Nerbudda, Taptee, Mhye, end Sabermutty, falling into the Gulf of Cainbay. Above the Gliauts, the rivors are tributary to tile Godavery and Kistnah. Climate for tile most part leas hot and more haalthy than in the other presideucies, a great part of the country being under the infiuenee of the aea-hreezes. Rice and cotton are the f.incipal artieles of culture, and the cotton of this presidenoy is decidedly superior to that of the othere. Soma bugar and indigo are rnised in Can©wis. Opium la nowhere cultivated, and other gre "captos of Indian produce are only prodnced :. .asall phantities; but in return, the cardamoms, pepper, and toak, exported from India, are almost excluaively the i. it th of this region. The northern districts are famuna for thoir great variety of fruits; cocoa pelimn cover a very large extont of sundy land in the Concan, ate.; wool has lately been exparted in considerable quantities from Bombay; and great exertions huve been made to latroduce the culture of silik. The cattle of Gujerat are a large and fine breed. Weat of the (ihaute, the ox end buffalo are almost the only domestic animals. Tho whole presideney ia assebsed under the native village system of India, except the districth of Surat and Kairn, where the ryoucarry system da in force. In the capital of anch colleetorato is tine seat of a British collector and a judge, aubordinata to the central court of Bombay. A few years ngo the army comprised about 30,000 men and officers, of whom 6250 were Europeans. Tho whole of the Indian marine ls attuched to this presidency. In the south there aro
many native and Roman Catholic and Nestorian Christians. The Parsees are now almost confined to this part of Asia. Revenue, 1849, 24, $\mathbf{6 0 8}, 876$ rupees. There are in the presidency an English eplseopal bishopric with 24 clergy, a Scottish kirk, and Roman Catholic establishments, which receive government ald. E1phinstone college was founded in 1837, and there are 120 schools for the native Hindoos, in which from 800 to 900 boys receive education, besides nearly 2000 ma tive village schools. Bombay was the earliest possession of the British in the East. It was ceded by the Moguls to the Portuguese in 1530, and it came into the possession of the English in 1662 as a part of the dowry of the Infanta of Portugal, on her marriaga with Charles II.; bnt by far the greater patt of the terrltory has been acquired between 1803 and 1818.—See India.

Bombazine, a kind of silk atuff, originally manufactured at Milan, and thence sent into France and other countries. Now, however, it is manufactared in large quantities and of a good quality in Great Britain as well as on the Continent.
Bomb-vessel, or Bomb-ketoh, a small ship of unusual strength, employed for throwing bombs into a fortresa; said to have been invented by M. Reyneau, and firat used at the bombardment of Algiers. Till then it had been judged imprecticable to bombard a place from the $\mathrm{pan} .-$ E. $\mathbf{B}$.

Bond, in Laur, is a deed whereby the party obliges himself, his exeeutors, or administratore (and, if the deed so expresa $i t$, his heirs alao), to pay a certaia sum to another at a day appointed. If this be all, the bond is called a simple one (simplex obligatio). But there is generally a condition added, that, if the obligor does some particular act, the olligntion shall be void, or elee shali remain in full force; as, payment of rent, performanes of covenants in a deed, or repayment of a principal sum of money torrowed of the obligee, with interest ; which special aum is usually one-half of thr penal sum specified i.. the bond. In ease this condition is not performed, the bond becomes forfeited, or abselute at law, and charges the obligor while living, and, efter his death, his personal repreeentatives, and lisa heirs if the heirs be named in the bond. In ease of a failure to perform tha condition of tha bond, the obligee can recover ouly his principal, interent, and expenses; if the bond were given to secure the payment of money, or if it were given to secure the performance of a covenant, he can recover only searonable damages for the breachi.-E. A.

Boves of eattle and other animals are extensively used is' the arts, in forming hundles for knives, and various other purposes; hat of lata years they inave been of most importance in agriculture. When employed in tie latter, they are, in most instances, ground or reduced to powder, and are commonly used as manure for turnips, boing in general drilled in with the seed, though somatimes, nlso, they are sown broadesat, and with other eropa. The quantity used varies from alout 25 bishels of dust to athout 40 busiels large an acre. Their effect is sald to to comsiderally incrensed when they have undergone tho process of fermentation. They were first used in England on a largo acala as a manure in Lincolnshire; and there can the no doult that their extensive employment in that county ilas been one of the chief eauses of its rapid limprovement, and of the high state of cuitivntion to which it has attained. Bone-dust is now, however, very fargely used, and ite influence in inereasing the crops of corn and turniph, and consequently, also, the supplies of butcher's meat and farm manure, has been quite extraordinary.
Book-keeping, the art of keeping the necounts and books of a merchant. Book-keaping by dontle entry moans that mode or ayntem in which every entry is doulie, thint is, has both a deltor and a creititor. It ia called siso the Italian method, hecause it was
in Chris1 to this b. There sishopric Catholle Id. Elhere are from 800 2000 nait poesesd by the ame Into urt of the lage with the terri-818.-See
fivat practiced in Vonice, Genon, and other towns in Italy, where trade was conducted on an extenalve acale at a much earlier date than in England, France, or other parts of Europe.". This method, however familliar to merchants andi book-keepers, seems intricate to almost ell who have not practiced fit; nor is the dryness and difficulty of the task much lessened by the printed works on the subject, which, having been compiled more by teachere than by practical merchants, contain a number of obsolete rules and unnecessary details. To dlscuss this subject fully would require more space than could be appropriated in this work. We therefore refer our readers to the reliable volumes of Mr. Marsh (published by Appleton \& Co., New York) and other writers.
Books (Ger. Bücher; Du, Boeken; Da. Böger; Sw. Bücher; Fr. Llvres; It. Libri; Sp. Libros; Port. Limos; Ruse. Knigi; Pol. Ksiaski, Kniegi; Lat. Libri), written or printed treatises on any branch of science, art, or literature, composed in the view of instructing, amusing, or persuading the reader. Ancient books were originally boards, or the inner bark of trees; and bark is stlll used by some nations, as are also skins, for whleh latter parchment was substitnted. Papyrus, an Egyptian plant, was adopted in that country. Books whose leaves were vellum were Invented by Attulus, king of Pergamus, about 198 n.c., at which time books were hi volumes or rolls. The MSS. In Herculanoum consist of papyrus, rolled and charred, and matted together by the fire, and are abont nine laches long, and one, two, or three inches in diameter, each being a separate treatise. . The Pentateuch of Moses, and the history of Job, are the most ancient in the world; and in profane literature, the poems of llomer, though the names of othera still more ancient are preserved.-Haydn.
Prices of Booke.-Jerome states that he had ruined himself by luying a copy of the works of Origen. A large estate was given for one on cosmography, by Alfred, about A.D. 872. The Roman de la Rose was aold for above £30; and a Homily was exchunged for 200 sheep and five quarters of wheat; and they usually fetched double or treble thelr weight in gold. They sold at prices varying from $£ 10$ to $£ 40$ each, in 1400 . In our own times, the value of some volumes is very great. A copy of Macklin's Bible, ornamented by Mr. Tomkins, has been deelared worth 500 gulneas.-Butler. A yet more superb copy is at present ingured in a London office for $£ 3000$,-Times. Il Decamerone of Boccacio, edition of 1471, was bought at the Duke of Roxburgn's asalo by the Duke of Marlborongh for £2260, June 17, 1812.-Pinlutis. A copy of the "Mazarin Bible," being the first edition and first book (ver printed (by Guttemberg at Mentz, in 1455), was sudat auction In London, in April, 1816, for $\mathbf{5 0 0 0}$. This eopy, the only one known to exist exeept 10 in publie libraries, is now in a private library in New York.-Id.
Irinted Books.-The first printed books were trifling hymns and psalters, and, being printed only on one side, the leaven were pasted back to back. The tirst printing was, as a book, the Book of Poalms, by Fanst anil Schweffer, his son-In-luw, Aug. 14, 1457. Several works wero printed many years before; but as the inventors kept the secret to themselves, they sold thelr first printed works as manuscripts, This gavo rise to an adventure that brought calamity on Faust. He began in 1450 an cdition of thn Bible, which was finished $\ln 1460$. The second printed was Cicero de Offciit, 1466,--llwark. The first book printed In England whs The Gome and Play of the Chesse, by Caxton, 1474. The first in Dulilin was the Liturgy, in 1550. The first clessical work printed in Russla was Com. Nepotis Vite, in 1762. Lueian's Dialogues was the first Greek book printed in Americe (at Phllatlelphln), 1789. Books of astronomy and geometry were all tlestroyed in England as belug infected with maigle, 6 Rdw. VI. 1852.-Stuwe'a Chmides. Accordlag to Pritignew
(Biblio. Suserv.), the first book printed with movable. types was the Latin Bible, printed by John Guttemberg at Mayence, about 1455." It was in' two folio volumes; and so excellent was the workmanship, hoth In type, Ink, paper, and press-work, that it has scarcely been eurpassed since. * The succeeding editions for 200 years were mach inferior. "This edition is called the Mazarin Bible, as a copy was first found in the library of Cardinal Mazarin. Only 20 copies are now known to exist, all but one being in pubile libraries in Europe. Specimens of the block books, printed with engraved wooden blocks, Instead of type, are now very rare. Of the Biblia Pauperum, done in this way, only two copies exist, one of which belongs to a citizen of New York.

Copyright is the right whieh the authors of books or treatises claim to the exclusive privilege of printing, publishing, and selling them.

Books are divided into classes, according to the mode in which the sheets of the paper on which they are printed or written are folded: viz., folio, when the sheet is folded into two leaves; quarto, when folded into four ; octaro, when folded into eight; duodecimo, when the sheet is folded into twelre, etc. In making these classifications, no attention is paid to the size of the sheet.

Progress and present State of the Law as to the Copyright of Books.--It has been doubted whether, in antiquity, an author had any exclugive right to a work, or whether, having once published it, he could restrain others from copying it and selling copies. We incline to think that he could. The public sale of copies of works is often referred to in the classics; and in such a way as warrants the inference that they were productive to the anthor, which could not have been the case had every one been permitted to copy them at pleasure. Terence, in one of his plays (Prol. in Eunuch. 1. 20), says, Fubulam, quam nunc acturi sumus, postquam cedilea emerunt; but why should tho magistrates have bonght it, had it been free to every one to copy it ? It wonlal have been singular, indeed, had it been otherwise. Of all the species of property a man can posseas, the fruite of his mental labors eeem to be most peculiarly his own. And though it may, wo think, be shown that many serions inconvenieaces would result from giving the same absolute and intermlnable property over inleas that is given over material objects, these inconvenlences could hardly have been perceived in antiquity. It will also be olserved that in antiquity a copyright was of much less value than in modern times. Books could then only be multiplied by copying them with the pen; and If any one chose privately to copy a work, or to buy it of another, it must lave been very difficult to hinder him; but when printing lad been introduced, the greater cheapness of books not only extended the demand for thein in far greater proportion, and consequently rendered copyrights more valuable, but it aiso affordod the means of preventing their piracy. Printing la not a doviee by whleh a few copies of a book can be olitalned at n cheap rate. It is productlve of chenpness only when it is employed upon a large seale, or when a considerablo impresslon is to be threwn off. Anil hence, after Its invention, plraey could hardly be committed in secret: the piruted book had to be brought to market the frand was thus sure to be tetected, and the offendling party might be prosceuted and punished.

For a consldarable time after the invention of printIng, no questions seem to have oceurrod with respect to copyrights. This was occasioned by the early adoption of the lleensing syestem. Governments soon percelved the vast importance of the powerful engine that had heen brought into the field; and they endeavored to avail themselves of its energles ly interdleting the puhlication of all works not previously liconsed by authorlty. During the continuation of thils aystem, piraey was effectually preventorl. The licensing act ( $18 \& 14$ Chas. II. c. 2), and the previous acts and proclamations to the enme effect, prohibited the printing of any book
without consent of the owner, as well as withont a l1oense. In 1094 the licensing act finally expired, and the prese then became really free. . Instead, however, of the summary methods for obtaining redress for any invasion of their property onjoyed by them undar the licensing acts, authors were now laft to defand their right at comanon law; sad as no author or bookseller could procure any redreas for a piracy at common law, except in so far as he could prove damage, property in books was virtually annihilated; it leing in most cases impossible to prove the sale of one printed copy out of a hundred. Under theme circumstances, applications were made to Parliament for an act to protect literary property, by granting some speedy and effectual method of preventing the sale of apurious copies. In consequence, the etatute 8 Anne, c. 19 , was passed, securing to authors and their assignees the exclusiva right of printing their books for 14 yeare certain, from the day of publication, with a contingent 14 yeara, provided the author were alive at the expiration of the first term. Persons printing books protected by this act, without the consent of the authors or their asnignees, were to forfeit the pirated copies, and $1 d$. for every sheet of tho asme. Such books as were not entered at Stationers' Jiall were excluded from the lenefit of this act.
Every one mnat be satisfied that 14 years' exclusive possession is far too short a period to indemnify tho author of a work, the composition of which has required any considerable amount of labor and researeis; though 28 years is perhaps, all thinge considered, not n very improper period. But the grand defeet of tho atatute of Anne conaisted in ite making the rigint to the excluaive posseasion for 28 years contingent on the fact of a person having lived a day more or less than 14 years after the publication of his work. This was making the enjoyment of an importart right dependent on a mere accidentai circumstance over which man has no control. Could any thing be more oppressive anti unjuat than to hinder an author from bequeathing that preperty to his widow and children thut would have belonged to himaelf had he been alive ? Nothing, indeed, as it appears to us, can he more obvious than the justice of extending ali copyrights to the same period, whather the authors be dead or not.

In the Uinited States, the jurisdiction of this nulject in vested in the Federal government iny the Conntitntion (art. 1, sec. 8), which declares that Congress shall have power "to promete the progress of reience and useful arts, by aecuring for limited times, to nuthors and inventors, the exclunive rigit to thair respective writings and diseoveries."

By the acta of Congress, May 31, 1790 (c. 15), and April 20, 1802 (c. 86), the authors of mapa, elarten, books, engravings, etehings, stc., being citizens of the United States, or resident therein, are entitled to the exclusive right of pullishing for 14 years, and, if the nuthor be living at the end of that period, for an additional term of 14 yours.
The English law does not distinguish ietween residents end non-residents, aliens, like the A merican law.

A copyright may exist in a tranaiation, or in part of a work (as in notes or additional matter); imt a boma jule abridgment of a trook is not considered in Eingland and the United States a violution of the original copyright. So a person mny use a fair quotation, if by appiicution he makee it part of his own work; but ean not tako the whole, or Jarge part, under pratense of quotation. If an oncycioperlia or review coples so inuch of a hook as to serve as a abbatitute for it, it loecomes liaile to an aetion for a violation of the law. An encyciopedia in not allowed by its transeripte to sweep up all modern works. In Germany abriligments are not protected ms in the United States.
The great practical difficulty in interproting tho eopyright acts is in dintinguishing between an orig. inal work and a copy made, animo furandi, frout one
already in existence. The following is a summary of Mr. Godson's remarks on this sulject:
"The identity of a Itterary work consista entirely in the sentiments and language. The same conceptions, ctothed in the same words, must necessarily be the mame composttion; and whatever iuethod is taken of exbibiting tbat compoattion to tho ear or the eye, by recilal, or by woriting, or by printing, In any number of coptes, or at any period of time, the property of an. other persom bas beon violated; for the new book in tilli the Identical work of the real author. Thua, therefore, a transeripk of neariy all the nentiments and language of a book fa a giasing pirucy. To copy part of a book, elther by tuking a fow pagea verbatim, when the sentiments are not new, or by $\mathrm{fm}(-$ fation of the princtpal Ideas, although the treatises in other reapeets are different, is also cousidered to be ittegal. Although It was held by Chtef-justice Ellenborough that a variance in form and manner ta a varianco in subetance, and that any material elteration which is a melionation can not be constdered as a piracy ; yet a piracy ia commttted, whether the euthorat. tempt an original work, or call hta book an abridgment, if the princtpal parts of a booik are mervilety copled or unfairly varied. But if the main dcalgn be not copted, the eircumatance that part of the compositton of one authoris foand in another to not of itself ptruey aufficlent to support an action. A man moy fatrily adopt part of the work of another: the may so make use of another'a labora for the promotton of sclence, and the benefit of the pablif; but having done ae, the question whil be, Was the matter so taken used falrly with that view, and without what may be termed the animus furatidi In judging of a quotation, whether it ta fair and candid, or whether the person who quotea has been swayed by the animus furandi, tho quentity taken, and the manner in whitch it ta adopted, of courso must bo conatdered. If the work compleined of be in stibutance a eopy, then it is not necessary to show the intention to ptrate; for the greater part of the matter of the book having leeen purioined, the intention ta apparent, and other proof is superflaous. A piracy has undoubtedly been committed. But If oniy a mall portion of the work ta quoted, then it becomes necessary to show that th was done animo furandi, with the Intention of depriving the author of hta jast reward, hy giving hits work to the puhile tn a cheaper form. And then the niode of dolng tt becomea a aubject of inquiry; fer it is not auftictent to conatitute a piracy that part of one authrr'a hook fa found in that of another, untess it be nearly the whole, or so much as will ahow (belog a question of fact for the jury) that it was done with a bad futent, and that tho matter which accompanien it has been colorably introdueed,-P. 2to-217. If a work be of such a tlbelous or mischievous neture as to affect the publio morals, and that the aotbor can not matutain anaction at law upon it, a court of equity will not interpose with an injunction to protect that which can not be cailed property. Even if there be a doubt an to ftes evil tendency, the tord chisueclior witit nut interfere."-Gonson, p. 8 t2.

Expediency of limiting Copyrighta to a reasonable Term.-It is argued by muny that copyrights shoutd Lo made perpetual; that, were this done, men of talent and jearning would devote themselves much more readily tiun at present to the composition of works requiring great labor; inasmuch an the copyright of euch works, were i. perpetuul, would ie an alequate proviaion for a family. But we doubt mueh whetiser these enticipations woult be realized. Most books ur manuacripts are purchased by the bookseliers, or published upon the presumption that thero will immediately be a consideralse demand for them; and we apprehend that when copyrights are secured for 42 years certain, very little more would be given for them weru they made perpetual. When an annuity, or the rent or profit ariaing out of any fixed and tangible property, with reapect to which there can be no riak, is nold, if the number of years for which it is to contisue be consideraile, the price which it is worth, and which it fetehes, does not differ materially from what it would bring were it perpetuai. Hut the copyright of un unpuhilisined work in, of ail descriptions of property in which to speculate, the most hnzardous, and tho chnnces of reaping contingent advantages from it, at tho diatance of 42 yeare, would be worth very jittlo indeed.

Perhape the period of 28 yeara has been ndvantegeous) y extended to 42 ; but we are satinfled that more injury than nufit would resuit to jitorature by extending it beyond this term. In France, copyrights
continue for 20 years after the death of the author. In must of the German States they are perpetual; this, however, until very recently, hardly indemnitied the authors for the ease with which spurious copies might be obtained from other States. But by s lute resolution of the Diet, in copyright eecured in one State is good in all.

International Copyrights.-The establishment of an internatlonal copyright system, that should enalise the uthors of one country to secure the copyright of their works in other countries, has of late excited a good deul of attention. We doubt, however, whethor the sdvantages that would result from such a system, were It established, would be so great as many seem to suppose. No doubt it would be advantageous for the authors of popular works in Great Britalis unt the United States, for example, to be able to secure a copyright in both countries; but the real question $\mathrm{I}_{\mathrm{s}}$, wouid the interests of literature and of the public be promoted by such arrangement? Now we incline to think that thls question muet be answered in the nogative. The eingle market of either Great Britain or the United States is quite large enough to secnre a sale for really good works sufficlent to afford smple encouragement to their suthors; and such being the case, it is diflicult to see on what ground the republication at s cheap rate in the one country of books originally published in the other should be prevented. Indeed, such prevention would appear, by obstructing the circulation of knowledge and of amusement, to be injurious to both. It has, it is true, been alleged that if we had a copyright system in common with England, English and American books might be published at a leas price, Inasmuch as the extension of the market would securo them a larger sale. But though this result might, we doubt much whether it reully would, happen. We apprehend that then, as now, authors snd publishers would impose such prices on their works as they supposed would reulize the largest amount of profit, and that if they thought a high price more likely to do this than a low one, it would be preferred. The extensive reprinting of cheup editions of French works that has for a lengthened period been curried on at IBrussels has certainly bean disadvantageous to the literuti of France. Still, howaver, the :izatict of that kingdion seems to be sufficlentiy oxtensive to insure the unlimited production of works displaying the greateat talent, reseureh, and Industry ; and it is plain that if the production of valuable works be not checked in France by thoir being roprinted alirond, the injury done to French men of lettera redounds to the udvintage of every foreigner who has occusion to look into or consult their works. Every effort shouid tie mude to prevent copyrights beligg invaled ly pirates at home, and by the clandestlne importation of books printed abroad; but fartier than this we should not go. We are well convenced that it is for the ndvantage of the putble and of literature that nations should have full liberty to republish ouch otioer's works in such forms and at such times and prices as they may think fit.
The renl evil with whicil our literature has to contend ortginates in the burefuced piracy carried on at home, and not in the proceedings of forelgnars. The latter may, perhaps, interfure a little with the sale of native works, by supplying the publle with foreign thstesi nf home editions; but the proceedings of the indigenous pirates are ten times more mischiovous. 'They consist, for the most part, of knaves and drudges, without talent or learning of any sort, save only that of transmuting and adulternting the lubors of others, and disgulsing thoir own ruseality. Such persons fusten like lecehes on any now work of talent, research, and induatry ; they forthwlth announce some system, compilation, or abridgment of the same sort, every ilea mull statement In which is stolen; and then publish their spurious rubbish at a low price, advertles it as
boing decidedly the beat work on the subject, and find numbere of newapaper writers reedy to puff off and eulogize their disinterested and meritorious labors I It is difficult, we admit, to deal with such a nuiasnce, and it can not, perhaps, be abated by legislation. But while we regret the fact, there can not, we believe, be a question that courts and juries have for a lengthened period inclined too much to a lenient interpretation of the law as to piracy ; and that literary plunderers, whose robberies are but little disgulsed, too often escape with Impunity.

By the following table it will be meen that the forelgn trade in books and maps is limited. Tho imports are from England and France principally, and also a fow from Germany.

Boom (Dutch boom, a beam), in naval language, a long spar for spreuding out the clew or corner of particulur ssils; as the jib-hoom, studding-sail hoom, main hoom, square-ssil boom, etc. Boom denotea also a strong chain or cable stretched across the mouth of a river or harbor, with apars lashed to it , to prevont the entrance of an enemy's ships.-E. B.

Booming, smong sallors, denotes the application of a boom to the sails, in order to aceelerate the speed of the ship.--E. 13.

Boote and Shoes, the external covering for the legs and feet, too well known to require any description. Boots are sald to have been the invention of the Corians, and were made of iron, brass, or leather; of the last materisl, some time after thelr Invention, boots were known to the Greeks, for Homer mentions them about 907 n.c.-FFor an account of the value of the boots and shoes annually produced, see Leatiren, and for tho duties on those imported Tarifr.

Borax, or Tincal (Arul. Burak; Pers. Tunkar), one of the sults of sodu. It is white, transparent, ruther greasy in its fracturs; its taste is styptic, and it converts sirup of vlolets to a green. It readily dissolvea in hot water, and swells and bubbles in the tire. It ia of grest use as a flux for metals.-Tuoason's Chemitry. This snlt is found in a cryatallized state at tho bottom of ecrtain lukes in Thibet, and in various localitice in Persiu, China, South America, and Europe. Formerly, however, the domand of Europe was alnost wholly supplied froin the East, and cepecially by importations from Thibet, where the salt is comparatlvely abundant. Crude borax, when imported, is called tincal, being enveloped ha a futty matter, from which it has to be separated by a process that was long kno *n only to the Venetinns and Dutel. Large quantitios uro supplied from the fumoua lagoons near Monte Cortolo, in Tuseany. Theno lagoons, which occupy a large extent of surface, coneiat of an infinlte number of low volcunoes, and springe in a turious atate of obullition; the ground, which shakes and burns benenth the feet, is covered with erystalizations of sulphur and other minerals; the wholo scene presenting a atriking pleture of the most tremendous energy und sterility. The vapors that are constantly burating forth from the hoiling lagoons helng foumb to contain boracle acid, It occurred to a most ingenlous person, a M. Larderel, to construct pans through which tho vapora being mude to pass inpregnate the water in them with the acid. The pans are kept boillng ty the heat of the lugoona; and the water being evaporated, the acid io deposited lu crystala. In consequence

## BOR

of this discovery, the lagoons, from being altogether worthless, have become most valuable. From 10,000 to 12,000 ponnds ( 12 ounces each) of acld were, a fow years ago, daily produced; and thly vast enpply, and the facility wlth which borax may be obtained from the acid, bas occasioned a great reduction in its price, and enabled it to be much more extensively employed than before,-Nee Dr. Bowaina's Report on Tuscany.

Bordeauce, a large and opnlont commercial elty of France, on the Garonne, about 75 miles from its mouth, lat. $44^{\circ} 50^{\prime} 26^{\prime \prime}$ N., long. $0^{\circ} 34^{\prime}$ W. Population, in 1851, 180,927. The commerce of Bordeaux is very extensive. The Garonne is a noble river, with depth of water aufficient to enable large ahipe to come up to the city, laying open, in conjunction with the Dordogne and their tributary etreams, a large extent of country. The commerce of Bordeaux is greatly promoted by tho
famoge canal of Languedoc, which eommanleater with the Mediterranean. Hy Its means Bordeanx is enabled to furnish the south of France with colonlal products at nearly as cheap a rate as Marsellies. Wlaes, brandies, and fruits are the staple artleles of export; but the merchants apply themselves more partlcularly to the wine trade. Most part of thelr other buainess le confined to dealing on commission; bat thln they conduct almost invarjably on thelr own account. The reason they asaign for this is, that the difficulties attending the purchase, racking, fining, and proper care of wines, so an to render them fit for exportation, are so very great, an to make it almost impossilule to condnct the business on any thing llke the ordinary terms so as to satiafy their employers. Colonial products, cotton, dye-stuffs, pepper, hldes, tobacco, rice, form the priacipal artleles of inportation.

Wine,-The culture of the vine la by far the most important branch of industry carriod on in the department of the Gironde. The ennual produce of ita wines, the red growths of which are known by the general uame of claref, amounta to about $2,500,000$ hectolltres, or about $55,000,000$ imperial gallons. The vineyards are the property of about 12,000 familles, and the expensea of their cultlvation are estimated to amount to 45 or 46 million francs a year. The best growths are from the confines of the "Landes," behind Hordeaux; the secondary growths are chiefly the produce of the country between the Garonne nnd Dordogne, and the l'alus, a district of a strong rich soll bordering the banks of those rivers. The firat growths of the red wines are denominnted Iafite, Intomr, Chiteau-Morgaux, and Ifaut Brion. The first three are the produce of the district of Hout Medoc, northwest of Bordeanx, and tho last of the district callod dea Graves. These wines are all of the highest excellenco; their produce is very limited, and in favorable years sells at from 3000 to 4000 francs the tun, whleh containg 210 linperial galions; but when they have ficen kept in the cellar for slx years the price is toubled, so that even in Bordeanx a bottle of the best whe cun not bo had for less than 6 or 7 franca. The lafitte is tho most cholee and delicate, and is characterized by its ailky moftness on the palate, and ita charming perfunc, which partakes of the nature of the violet and the ruspberry. The Iatour has a fuller body, and, at the same time, a considerable aroma, but wanta the softness of the lafitte. 'The Chatteau-Margaur, on the other hand, is lighter, and possesses ail the delicate quaifica of the Lafitte, except that It has not quite wo high a flavor. The Haut Brion, again, has more apirit and boly than any of the precedling, but is rough when new, and requires to be kept 6 or 7 yeara in wood; while the
others become fit for hottling in much less time.Henderson on Wines, p. 184.
Among the secondary red wines, those of Rozith, Gorce, Leoville, and Larose, Bran-Mouton, PichonLongueville, and Calon, are reckoned the best. The thind-rate whes comprise those called Pauillac, Margoux, St. Jullien, St. Fitiphe, St. Nimiliom, etc. It is but seldom that any of theso growthn are exported in a state of purity. The taste of the Jinglish, for example, has been so much modified by the long-continued use of port, that the lighter wines of the Gironde would scem to us to want body. Hence it lis naual for the merchants of Hordeaux to mix and prepsre whes according to the markets to which they are to be sent. Thus the atrong rongh growths of the l'alus and other districts are frequently bought up for the purpose of strengthening the ordinary wines of Medoc; and there la even a particular manufacturo, called travail à r'A nglaise, which consista In adding to ench hogshead of Hordeaux wine three or four gallons of Alicant or Ilenjearlo (large quantliea of which are imported into llordoaux by way of Cette and the camal of Sanguedoc), half a galion atum wine, a bottle of alcohol, and sometimes a smsll guantity of hernitage. This mixture undergoes a alight degree of fermentation; and when the whole is sufflefently "fretted in," it la ex. ported under the name of elaret. This mixture chiefly conajsta of aecondary wines, the first-rnte growtins fallIng fur short of the demand for thent.- Hfendension, 1. 184; ace ilso Julliek, Tipegraphie des Vignolles, p. 203. Iiut even the first, ilase wines are most frequently intermixed with tho best seconinry growths; and It is eustousary to employ the wines of a superior to mix with anil bring up thoso of nil inferior vintuge. Hence we need not wonder at the statement of a gentioman who, after living twenty years in the best soel- Ines, bransport ; but leularly to business le they conunt. oty in Bordeanx, doubted whether ha had tasted more than thres times any pure: wine of the firnt quality! The white wines of the Gironde are of two kinda; those called Grares, which have a dry, finty taste; and an aroma somewhat resombling cloves i of these, the principal are, Souterme, Barsac, Preignac, and Langon. These are said by Jullien to be tris-moelleux, ou, pour mieux dire, semi-liquoreus aset spiritueux. .is The white wines of the Gironde have for ceveral years past been adyancing in eatimation and value, and may be ssid, speaking generally, to come to us in a less adulterated state than tha red wines. $n$ About half the winas of the Gironde are aent to other parts of France: onefifth part is conqumed in the department; one-fifth is exported, the finest growths to England, but the larger quantity; to the north of. Europe and Holland; and about one-fifth part lo supposed to be converted into brandy. A person aocustomed to good soclety in Iondon, and, indeed, in most other parts of the country, would be apt to conclude: that French wines were consumed in England, to the almost total exclusion of other wines. But any such inference would be in the last degree erionequs. : The fact Is, that French wines are rarcly drunk, except by the upper classes, and their, consumption. Is inconsiderable, compared with that of the middle and lower classea. So much is this the case, that while, in 1852, 2,489, 850 gallons port, and $2,696,857$ gallons sherry, were entered for home consumption, the entries of all descriptions of French wines (including champagne, claret, Sauterne, and every thlng elae) mounted to only 475,948 gallons ! See jout, art. Wint. The purchase of wines, whether from the grower or merchant, Is always effected through brokers, some of whom have aoquired a reputation for securacy in diseectling the difierent flavors, and in traclag the reaults of the wines by certain measures of traiaing or treatment. Eugland takes off nearly half the highest-priced winen, snd very little of any other quality. Except in Bordesux itself, there is but a very moderate portion of the superior Medoe consumed in France. The eapltal takee off only second, third, and fourth rate wines. The Dutch, who are large consumers of Bordenux wine, go most economically to work. They send vessels to the river in the wine soason, with skilliful supercargoes, who go among the growers, and purchase the wines themselves cheaper eren than a broker would do. Thay livo on board abip, take their own time to select, and wait often for moaths before the cargo is completed; but they attain thair object, getting a supply of good sound wine, and at as low a rute, witt. all charges of shipping Included, as the wine-merchanta can deliver it into their stores in Bordenux. Thoy never purchase old whe; they tako only that nowly made, which, being without the support of stronger-bodied wines, must be consumed in the course of 2 or 3 years. They follow the samesyatem at Bayutne, where 2 or 8 shijs go anuually for the whito wines of Jurançon, etc. The cargo wines, which are the lowest class, are so manufactured that it is hardly possible to know of what they are composed. Thay are put free on board for $£ 2$ per hogshead and upward, accorling as thoy are demanded. They will not bear exposuro in a glass when shipping; the tasters have a small flat silver cup expressly for them. These whon are principally alipped to America and India, and some at a higher price to the north of Europe.

Branelies, atul spivita of Wine. --The quantity distilled in the neighiborhood of Horleaux is estinated at sbout 18,000 pleces, of 50 veltes each; ditto, in the Armagnao, 20,000 dittol ditto, In the Marmauduis, 8000 ditto; making in all 40,000 pleces, ordinary proof. Of this quantity France takes off ehout 28,000 pleces for consumption; England, 2500 ; United States, 10,000; Iatha, 2500 ; north of Europe, 5000 ; In all 48,000 pieces. Languedoc produces ennually about 40,000 pieces, of 80 veltea each, the greater part of which comen to llordeaux to be forwarded to the different jorta of the
north of France, or to foreign countries. France conrumes about two-thirds of the above quantity; the remalning one-third goes to the north of Europe. The prices of brandy are from 130 fr . to 150 fr . per 50 veltes, ordinary proof; spirits of wine, from 4 fr. to 5 fr; per velte, The greatest ahlpmenta of brandy take pluce to England from the port of Formay, on the Charente. Cognac, from which the brandy takes its name, and whene there are large distilleries, is a few leagues up the river. The quantity exported is far greater than what is made at Cognaci the .0 lesding distillers thers (Martel and Henessay) buying great quantitles from the small cultivators. = The greater part of the wines made a bout Angoulême, and thence down toward the sea, are of inferior quality, and fit only for making brandy ; and ao little do the prices vary, that the proprietors look upon it nesrly in the same light as gold. When they augment their capital by ssvings or profits, it is employed in kceping a larger stock of brandy, which has the further advantage of paying the interest of their capital by its improved value from age. England is said to recelve upward of 6000 pieces annually from Charente. At Bordeaux, as at Paris and Maraeilles, there is a constant gambling business in time bargaine of spirits of wine. It is in whe form of apirita of wine that nearly all the hrandy consumed in France is oxpedited, as in this form there is a great asving in carriage.-For an official account of the exports of wine and brandy from France, see Wing. The fruits exported consist almost entirely of prunes and almonds. The latter como prineipslly from Languedoc. Burdeaux posseases nome iron foundries, cotton factories, sugar refinerles, glass works, etc., but labor and living are too high to admit of lts becoming a conaiderable manufacturing city.

Banking Eistablishments.-The "Bordeanx Bank," which had a capital of $8,000,000 \mathrm{fr} .$, in shares of 1000 fr. each, was inco"porated, in 1848, with the Bank of France, of which it is now a branch. Its affairs have been well managed,-See Banxs, Fonergn.

Brohera,-No one is ullowed to act as a inercantile hroker in France who is not 25 years of age, and who has not served 4 years in a comncreial house, or with a broker, or a notary public. They are nominated by the govermment, after their qualifications have been ascertained hy the Chamber of Commerce. All brokers must deposit the sum of 8000 fr , in. the treasury as a guarantee for thoir conduct, for which they are allowed interest at the rate of 4 per cent. All foreignors are obliged to employ ship brokers to transact thelr business at tho custom-house; and although masters and owners of French vessels might sometimes dispense with their services, thoy never to so, finding it to be, in all cases, most advantageons to use their intervention. All duties outward on vessels and cargoes are puld by the shlp brokers, who invariably clear out all vesaels, trench as well as foreign.

Operation of the French Commercial System on the Trade of Bordeaur, etc.-The trade of this great city has suffered soverely from the shert-sighted, nntisoclal polley of the French government. This pulicy was first broadly laid down, and systemntically acted upon, by Napoleon; and wo lelieve it would not be difficult to show that the privations it entailed on the people of the Contionent powerfully contributed to nccelerate his downfill. Ibut those by whom he has beon succesded have not hitherto seen the expediency of re. turning to a sounder system; on the contrary, they have carrled, in somo reapects at least, the "continental systen" te an extont not contemplated by Napolcon. Notwithstanding the vast importance to a country like France of supplies of iron and hardware at a cheap rato, that which is produced by foreigners in oxeluded, though it mighit be obtained for a thlrd part of the price of that which is manufactured at home. A similar line of pollcy has been followed ns to cotton-yarn, earthen-ware, etc. And in order to forco the manufac-
ture of singar from the beet-r00*, oppressive dutias have been laid, not only on foreign sugar, but even on that imported from the French colonies. The operation of this system on the commerce and industry of the country has been most mischiavons. By forcing France to raise at home articles for the production of wisleh she bas no natural or acquired eapabilities, the exportation, and consequently the growth, of those articies in the production of which she is superior to avery other country, has been very greatly narrowed. All commerce being bottomed on a fair principle of reciprocity, a country that refuses to import must cease to export. By excluding foreign produce-by refusing to admit the sugar of Brazil, the cottons and hardware of England, the iron of Sweden, the linens of Germany, and the cattle of Switzeriand and Wirtemberg-France has done all that was in her power to drive the merchants of those countries from her markets. Thay are not less anxious than formerly to obtain her wines, brandien, and silks; inasmuch, however, as commerce ls merely an exchange of products, and as France will accept very few products belonging to othere, they can not, how anxious soever, maintain that extensive and matualiy beneficial intercourse with her they would otherwise carry on: they sell little to her, and their purchases are, of course, proportionally diminiahed. This, indeed, is in ail cases the necessary and inevitalle effect of the prohibitive system. It never faila to lessen exportation to the same extent that it lessens importation; so that, when least injurious, it nerely subatitutes one sort of industry for another-the production of the article that had been obtained from the foreigner for the production of that which had been sent to him as an equivalent.

France is not only extremely weli sitnated for carrying on an extensive intercourse with foreign countriet but she is largely supplied with several productior... which, were she to adopt a iliberal commercisi system, would meet with a ready and advantageons asle abroad, and enabie her to furnish equivaients for the largest amount of imports. The superiority enjoyed by Amboyna in the production of cloves la not more decided than that enjoyed by France in the production of wine. Her claret, Burgundy, Champagne, and brandy are unrivaled, and furnish of themselves the materials of a vast commerce. Indeed, the production of wine is, next to the ordinary business of agriculture, by far the most extensive and valuable branch of industry in France. It is stated by the landholdera and merchants of the department of the Gironde, in the adinirable P © tition et Memoire à I'Appui, presented by them to the Chamber of Deputies in 1828, that the quantity of wine annualiy produced in France amounts, at an average, to about $40,000,000$ hectolitres, or $1,060,000,000 \mathrm{gal}$ lons; that its value is not iess than from $800,000,000$ to $1,000,000,000$ franes, or from $£ 32,000,000$ to $£ 40,000,000$ sterling; and that upward of thres millions of individuals are employed in its production. In some of the southern departments it is of paremount importance. The popilation of the Gironde, exclusive of Bordeanx, amounts to about 450,000 individuals, of whom no fewer than 230,000 are supposed to be directly engaged in the cultivation of the vine. Here, then, is a branch of industry in which France han no competitor, which oven now afforde employment for about a tenth part of her population, and whieh is susceptible of indefinite extension. She has, in this single articie, the means of carrying on the most extcasive and iucrative commerce. "Le gouvernement Francaia," says M. Chaptal, in his work Sar I'Industrie Fłangaise, "doit les plus grands encouragements à la culture des vignes, soit qu'il considére ses produits relativement d̀ ia consommation intérieure, soii, qu'li les envisage sous le rapport de notre commence avec l'itranger, dont il est en effit ia bas essentielle."

But inatead of iaboring to extend this great branch of industry, government has consented to sacrifice it
to the Interests of the lron-founders, the cotton and IInen manufacturers, and the planters of Martinique and Guadaloupe! We do not, indeed, imagine that thay were at all aware that such would be the affect of their policy. Theirs is only one instance, among myrinds that may be apecified, to prove that ignorance in a ministry is quite as pernicious as bad intentions. The consideration, apparently not a very racondite one, that, notwithstanding the bounty. of nsture, wine wis not gratuitously produced in France, and conld not, therefore, be exported except for an equivalent, would seem never to have occurred to the ministers of Louis XVIII. and $\mathrm{C}^{\prime}$ arles X.' Bnt those whose interest. were at stake lid not fail to apprise them of the hollowness of their system of policy. In 1822, when the project for ralsing the duties on sugar, iron, linens, ete., was under discussion, the merchants of Bordeaux, Nantes, Marseilles, and other great commercial cities, the silk manufacturers of Lyons, and the wine-growers of the Gironde, and some other departments, presented petitions to the Chambers, in which they truly stated that it was a contradiction and sn absurdity to attempt selling to the foreigner without, at the same time, buying from him; and expressed their conviction that the imposition of the proposed duties would be fatal to the commerce of France, and would consequentiy inflict a very serious injury on the wine-growers and silk manufacturers. These representutions did not, however, meet with s very courteous reception. They were atigmatized as the work of ignorant and interested persons. The Chambers approved the policy of ministers; and, in their ardor to extend and perfect it, ald not hesitate deeply to injure branches of industry on which several millions of persons are dependent, in order that a few businesses, nowise suited to France, and the support of which costs her aeveral mililions a year, might be bolstered up and protected! It is piain, had there not been some powerfui counteraeting cruse in operation, that the exports of wine from France should have been very greatly augmented since the peace of 1815. The United States, Ruasia, Engiand, Prussia, and ali those countries that have at all times been the great importers of French wines, have made prodigious advances in weaith and population aince 1789 ; and had the commerce with them not been subjected to injurions restrictions, there is every reason to think that their imports of French wine would have been much greater now than at any former period. So far, however, from this heing the casc, they bave deciined in a most extraordinary degree. This is proved beyond all question by the following extract from a report made to the Council General of the Gironde in 1841, and published by ita orders and with its sanction. "Previousiy to 1790, the wine trade at Bordeaux had an immense development. The books of our most ancient housen, tranemitted down religiously from father to son, and the registrics of our lands, prove that in the years preceding 1787 our exports had reached more then 100,000 tuns of wine, 10,000 casks of brandy, and 5000 of vinegar. They also show that from 1200 to 1400 versela from the north took large quantities of wine, in return for their national produce, witich they ensily diaposed of among us. It was a nost luerative commerce, for we then sent 15,000 tuns to Prussia, 18,000 to Enginnd and Ireland, 6000 to Dantzic, 40,000 to Hamburg, l.ubeck, and Bremen, 15,000 to IIoiland, 7000 to Sweden, 5000 to IDenmark and Norway, and 12,000 to Rusaia. But at that period we had not ciosed our frontlers to the produce of all these nations; we received at moderate duties their woolens, linens, hemp, iron, wood, cattle, and other articies, the consumption of which was leas expenaive, and the quality better, than similar articies made at home, and forced on us by cuatoms duties. At present, notwithatanding the rapid inerease of commercial affuirs, notwithstanding the new nations of America, the advantages of a nore expeditions, certajn, and economical navigation, the
ton and irtinlque ine that effect of ong myrorance in tentlons. Idite one, wine was ould not, $n t$, would 1 of Loula interesta when the nena, etc. 3ordeaux, clal citles e-growers , presenthey truly surdity to the same ir convictiea would uld conse. vine-growtatlons did reception. ant and $\ln$ the policy and perfect tof indusre depenid9 guited to protected ul counterf wine from ented since Sussia, Enhave at all wines, have population m not been would have period. So y linve deis ls proved act from a Gironde in s sanction. denux had ur most anfrom father ove that in ached more randy, and om 1200 to ontities of which they at lucrative to I'russia, tzice, 40,000 to Holland, orway, and I not closed ons; we re ens, hemp, onsumption llty better, preed on 119 miding the thatandling 8 of a more gution, the
demands of nations increased in number nnd indnstry, and consequeatly more disposed to purchase for consumption, our commerce in declining in a most alarming manner. Anthentic documents prove that ia 1839 our axports only reached 1839 tuns to England, 2499 to Russia, 147 to Swedan, 342 to Norway, 2964 to Prassia, 612 to Denmark, 8188 to the Hana Towns, and 7621 to the Netherlands. Since then our exports have not locreased, $s 0$ that Instead of 100,000 tuns at least taken by the north of Europe from the dapartment of the Gironda previously to 1790 , not more than 25,000 tuns are taken at present. Yet tha taste for wine and the necessity to uae It have not been weukaned among the varions natlons; but the exaggerated duties with which lts introduction has been loaded only allow It to be consumed by the weslthy classes, who are every where the least numeroua. Theae duties are eatablished in retaliation of those which France lays on foreign productions. If the exportation of wins has diminished in so great a proportlon, the cauas must ba sought in the protective system. When the variations in the exporta of wins ara attentlvely axamined, and thalr decreasa looked to since 1822, when this systam attalned its helght, to 1840, it is limpossible not to be atruck with tha fact that these variations are intimately connected with the aystem Itself. The decrease in the exports of wine has followed tha increased development of the protective system, and tharefore we are forced to draw this conclusion, that it is this system which destroys our export trade. Yet foreign consumption is the most certain and moat profitable for Bordesux wines, and it is perticularly in the markets of the north of Europe and of England that the wines of the finest juality which our dapartment produces tind purchasers. Let us, then, Insist on the acceselty of reopening these markets, which hava been cloaed by tha enormous amount of duties imposed by foreignera In reprisal of those luid by us on thelr products."

Besides the injury inflicted on the wine trade by tha prohlititive aystem of comnercial policy adopted In France, and the retallatory measures it has provoked In other countries, It has suffered aeverely from the octrois and other dutles on Internal consumption. But the depression, though felt avery where, is greateat in the Gironde, which la eapeclally dependent on lits axport trade. This la strikingly evinced by the larga stocks of wina that remain in the hands of the growers snd merchants, and by the full in Its price. This hus, of course, reacted on the vineyarda, many of which have become all but unsalablo; and a stop has been put to avery aort of Improvement. Nor hava matters been in the least amended during the current year: on the contrary, they acem to ba gradually gettlng worse. Such is the poverty of the proprictors, that wine la now frequently seized and sold by the revenus officers in payment of arrears of taxes; and such la at present the extent of the evil, that In the course of thits year (1843) the committes of wine growers have spplicd to goverument for a loan of $2,000,000$ franca to be applled to the payment of taxes due by the wine growers.
Such are the effects of the restrictive syatem of policy on tha wine trade of France-on a branch of Industry which, as already seen, employs three millions of people. It is satisfactory, however, to ohserve that the lanl-ownera and merchanta are fully oware of tha souree of the misery in which they have been involved. They know thut they are not suffering 80 much from hastile or vindletlve measures on the part of foreigners as from the blind and aenseless policy of their own govermment; that they are victims of an attempt to counteract the most obvious principles-to make Frnnce produce articies directly at home, which she might obtain from the foreigner in exchunge for wine, brandy, etc., at it third or a fourth part of the expense they now cost. They can not export, because they are not allowed to imporf. IIence they do not ask for bounties and prohibitions; on the contrary, they disclalm all such
quack nost ums ; and demand what can alone be useful to them, nd beneficial to tha conntry-a free commercial system. And notwlthstanding the powerful Interests involved in the support of the prohilitive policy, we can not doubt but that, In the end, they will be compelled to give way; and that France, by opening her porta to a freer lmportation of foreign producte, will insura the proportional extenaion of her exporta of wines, brandles, silks, and other products, which she can furnlah more chaaply and of a better quality then any other conntry. It is reasonable to auppose that the experience that has been afforded of the rulnous effects of tha prohibitlve system, and tha more general dlffualon of correct ldeas with reapect to the real sources of wealth, will at no diatant period occaslon the adoption of such changes in the commercial legislation of France as way render It more conducive to her interest, and more in accordanca with the apirit of the age. Indeed, we incline to think that but for the unfortunate misunderstanding about the Turklah question, and the Irritation thance arising, a commercial treaty on a comparatlvely liberal footing would hava been already entered into hetween France and this country; and It la much to be wlahed that some auch arrangement ahould apeedily be completed. If, indeed, we were hostile to France, we should wish her to continua her present aystem, for it must effectually prevent her making any considerabla progress either in manufacturea or commerce; but we disclalm being actuated by any such feelings. We are truly anxious for her prosperity, for her sake and our own; for unless she ba surrounded by Bishop Berkeley's wall of brass, whatever contributes to her well-being must, in aoms degree, redound to the adventage of her neighbors.-J. R. M.
"Were such narrow and malignant politics to meet with auccess," gald Mr. Hume, writing in the middle of tha last century, and when tha prosperity of others was gencrully regarded with an evil eye, "we should reduce all our neighboring nations to the same state of aloth and Ignorance that prevails in Morocco and the coast of Barbary. But what would be the consequence? They could aend ua no commodities; they could tako nona from us: our domestic commerce itself wonld languish for want of emulation, exumple, and instruction; and we ourselvea should aoon fall into the aame abject conditlon to which we had reduced them. I ahall, therefore, venture to acknowledge, that nut only as a man, but as a British subject, I pray for the flourishing commerce of Germany, Spain, Italy, and even France itself. 1 am , at least, certsin that Great Britain, and all those nations, would flourish more did their soverelgn and ministers adopt such enlarged and benevolent sentiments toward each other." - Eissay on the Jealousy of Tirude.

Borneo, or, as it la called by tha natlyes, Brıné, an Island forming part of the great East Intian Archipelogo, and, next to New IIolland, which may be consithered as a apecles of continent, the largest in the known world. It reaches from about $7^{\circ} \mathrm{N}$. to $4^{\circ} \mathrm{S}$. lat., and from $109^{\circ}$ to $118^{\circ} \mathrm{E}$. long. Its length may be estimated at 750 mil $s 8$, its grentest breadth at 600 , and its average breadth at 350 . Its area has been calculated by llaron Melvillo, of Carnbee, at 12,745 geographical square leaguce. It exhlbits the usual insular structure, a mass of lofty mountains in tha centre, aloping gradually down to level and alluvinl tracta along the seashore. It is in every part intersected by fine rivers, inany of them navigable to a considerable distance from the aca. The interior of Borneo ts covered with lmmense forests, filled with wild animals, partlecularly orang-outnngs. A great part of the coast is marshy, so that it la in portions only thint it displaya the exuberance of tropienl fertility. Of all the East Indian Islands, Borneo ranks lowest as to civilization and lmprovement. Nothing, perhaps, has tended so powerfully to check Its progress as the solld and unbroken form of Ita coasts, lestitnte of those large bays or in.
land seas which have always proved the noreery of commerce.
The commerce of Bomeo, though not equal to its extent aod natural capacitiea, is by mo meand inconsiderable. , Gold is its principal export. ' Mr. Mitiburn estimates the annual quantity exported at 200 peculs, or $\mathbf{2 6 , 0 0 0}$ lbs, avoirdapois, which wouid coin into upward of 900,000 gaineas. Like some other commodities, it is divided, by a grotesque acale, into three kinds, called the head, the belly, and the feet; the first being tha beat, and the two othera gradually diminishing in value. "Camphor is exported to the extent of thirty peculs (3990 Ibs.), all to China, where it is more esteened than that of Sumatra. The singular Chinese luxuries of biche-de-mer, or sen-slugg and edible birds' nesta, are found in Borneo, as orer all the Indian Archipelago. Pepper to a considerable amount, canes and ratans of various descriptions, sago, and a littie tin, complete the list of exports. . The chief import is opimin to a very grest extent, with piece goeds, hardware, coarse cutlery, arms, and toys. By far the greater proportion of the trade is in the handa of the Chlnese.-E. B.
Boston, city; capital of Massschusetts, and metropolis of New Englaud, the second conmercial city, and the fourth in population in the United States of America, is mostly situated on a peninsula, 3 miles long, and a little more than 1 mile broed, st the head of Massachusetts Bay. The harbor extends from Point Alderton to Medford, a distance of 14 miles; is 8 mlies in width, and covers an sres of 75 square miles. It has a depth of water sufficient for 500 vessels of the largest ciass to ride at anchor in safety. The entrance is barely sufficient for two slips of a large ciass to sail abreast, and is defented by three fortresses, two of which, situsted on George's and Castle Islands, are on the largest scale, ard constructed with all the improvements of modern science; the third, or the citadel, on Governor's Island, is stlil incompicte, but, when finished, the defenses may be cousidered impregnable.

Tise territory now covered by the city was, in $\mathbf{1 6 3 0}$, a peninsula, connceted with the main land by a narrow isthmus : this tract contalned 600 acres-it was called Shawmut or Trimountain, and derived its name from
fts eprings, and three lofty hills. The spot was un. doubtedly selected for its security from the inroads of the Indians, an'! its facilities for trade, Before the Revolutionary War, Boston became the most commercial town in the colonies. The narrow limits of the peninsula have long since been found insumicient for the growth of the popalation, and her extended commerce. "Dorcheater Polnt, containing 600 acres, was firat annexed, then Noddle's island, comprising 600 acres more, and several hundred scres have heen reclsimed from the sea; but so rapid has been the increase of populstion, that the number of inhabitants of the suburbs within a few miles of the city limits nearly equals the city proper. Boaton lies in $42^{\circ} 21^{\prime} 27^{\prime \prime}$ N. lat., $71^{\circ} 8^{\prime} 30^{\prime \prime}$ W. long., from Greenwich, England. It is 105 miles seuth-southwest from Portiand, Maine; 216 miles from New York, tia Stónington, 236 via New IIaven and Springfield; 313 Philadelphia ; 411 Baltimore; 449 Wasihington; 990 Charlesfon, South Carolins, and 1838 from Now Orleans. The population in 1790 was 18,033 ; in $1800,24,037$; in $1810,38,250$; in $1820,43,298$; in 1830, 61,391; in 1840, 93,383; in 1850, 138,788; and in 1854, 178,000.

Boston has overstepped her sca-girt isles, and attached herself to the main Jand by one wide, enlarged avenue, the Neck, pered, and planted with trees; by one granite structure, the Western evenue, a mile and 3 half in length, 6 bridges; 8 railroads, and 3 ferries; 8 railroads branch into 16 , and 10 avenues divide into 80, within the first 9 miles from the Exchenge. The city e.ibibits a picturesque and beantiful appearance when approacled from the sea; and in surveying its several parts, the visitor finds much to adnire. Beacon Hill, ol which the State House stands, is 110 feet above hIgh water mark; it was originaily 30 feet higher. Fort IIIII, on the east side, fronting the harbor, is 80 feet, and Copp's Hill, in the north part, is 50 feet above high water. On this hill the British had $n$ battery in 1775, from which, during the memoralle battlo of Bunker IIill, they bombarded and luried Charlestown. Mount Washingion, or Dorchester Heights, is 130 feet above the ses. On these lieights, the Americans under Washington erected a fortification, in 1775, which soon compelled the British to evacuate Boston.

India Trade of Boston.-This important branch of business has attelned in Boston at the present tlme a magnitude Jitllo thought of hy the early founders of this trade. Salem wae the pioneer in many branches of the India trade, and for many years a great mart for the sale of teas, splees, dye-stuffs, drugs, coffee, etc. Shlps and brigs from two hundred to three handred and fifty tons burden were at that time the class and aize of the vessela employed. The course of trsde, and the anperior advantages of Boston and New York as central markets, have diverted thla buainess very much from its ancient sest. Quite a number of Salem houses have atlll an extensive interest in the East India and Pscific buainess, but their vessels are, for the most part, fitted from and arrive at Boston or New York. The East Indla and Pacific trade of the United States employs, in all its varioua branches, at the prasent time some six hundred ships and barks. Most of these ves-eels-at least two-thirds of them-are owned in Boaton and New York, and many of the remaining third at ports east of Boaton, in Massachuaetts and Maine. To show the extent of the Boston tracle with India, we would atate that one hnndred and nine ahips were, in January, 1857, expected at this port from Calcutta alone previous to August 1, 1857.

The salo of the heavy and bulky kinds of East India gooda at Boston has greatly inereased witiln a few years, in consequence of the enormous growth of the manufactures and gereral trade of the common wealth. The annual sale at the present time in Boston of the principal articles of East India produce would much surpriae any one not acquainted with the extent and rapld growth of this important branch of our business. Onc would hardly beliera that we received at tints port nearly as many hushela of Iinseed as of Indian corn; yet for several years past auch has been the fact.Boston Board of Trade Report, 1857, p. 104.

Mediterraneon Trade.-Among the various brapches of commerce which have contributed to augment the wealth and extend the fame of Boston, nono deserve mention more than the Mediterranean and fruit trade. At various porta of Malaga, Palerme, Messina, Marsellles, Genos, Leghorn, Trieste, elc., the merchants of Boston enjoy a large portion of the American trade, and at some of the above-named places the trado may be said to be entirely controlled hy the cities of New

York and Boston, the other commercial citles of the United Statea baving but an occasional vessel arriving st titelr purts from these places. It fa well known that Doston hes neerly the entire control of the American trade whith Turkey through that country's princlpal port of Smyrna.-Boston Board of Trade Report.

Direct Trade with British Irovinces.-The treaty betweon the United States and Great Britain, cencluded the 5th of June, 1854, known as the "Reciprucity Treaty," was intended to regulate a direct reciprocal free trsde between the British North American provincea and the Unlted States in certain deaignated artlcles of their respective growth and production. This purpuse is clearly atated in the preamble of the treaty, and in the act of Congress cerrying it Into effect.

On an application, titerefore, tor the free admission of certain products of the British North American Provinces, Imported into the United Ststes from IIavana and London, tho Treasury Department declded that they could not be so admitted; and that the sricles, if of the growth and production of the North American British Provinces, and dealgnated as free in the treaty, would he entitled to the privilege of free entry only when imported directly from those provinces into the United Ststes.

Statement minimitino tif prolamed Valde of MreCHANDIBR TBANEPORTED IN BOND TO CIANADA FROM THR Dibteict op llogton and Cilableatowit, dobino the tem Ifars ending Jund 30, 1850.

|  |  |  |  |
| :---: | :---: | :---: | :---: |
| 18 | 24,344 | 1853. | 4041,484 |
| 44. | 33,140 | 1854 | 6,175,911 |
| 1850. | 151.817 | 1555. | 4,970.408 |
|  |  |  |  |

This talite fully Illustrates the operation of the Reciprocity Treaty and other treatles with Great Britain in reference to Canada.
It may not be uninteresting to mention here that the "Clearing-house" for the banks in Boston, which was orgenized January 15, 1856, is in full operatlon, snd perfectiy succeaeful. The business began March 29, 1856, and tine transactions from that date to the 31et December, incluaive, amount to $\$ 1,129,794,519$, being a monthly average of $\$ 125,532,724$. With tie commencement of the Clearing-houne all the bank ledger accounts of daily transactiona with each other were merged into ond Clearing-house account.-Ibih.

Ship Buiding.-Number of vessels launched during the yeare 1854 and 1855, at East Boston, Medford, Chelsea, Bouth Bostoa, and Charieatown:

|  | 1854. |  | 1855. |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Number. | Tomincy. | Number. | Tonvege. |
| East Boston . . . . | 30 | 49,604 | 20 | 14,675 |
| Medford . . . . . . . | 19 | 19,760 | 10 | 8,870 |
| Cheisen . . . . . . . | 10 | 10,116 | 5 | 4,805 |
| Sculh Boston... | 4 | 4,254 | 4 | \$,000 |
| Charlestown.... | 8 | 9,308 | 9 | 1,308 |
| Total....... | 60 | 78,147 | 41 | 89,658 |

Estimating this amount at 860 a ton, which is a fair average price paid for shlpe during the year, the amount of the ship-buildlag la Boaton and vicinity during 1855 is as follews:

|  | Toas, | Valum. |
| :---: | :---: | :---: |
| Fast Boston | 14,675 | 1,174,500 |
| Medford ............... | 8,870 | 539,200 |
| South Bostou. . . . . . . . . | 8,000 | 300,000 |
| Chelses . . . . . . . . . . . . . . | 4,805 | 988,800 |
| Charlestown . . . . . . . . . . | 1,308 | 78, 100 |
| Total. . . . . . | 84,658 | \$2,873,480 |

Duties collected at Boston.-The annexed statement exinilita the amount of dutles collected at the port of Boston ln aach year, from 1838 to 1853, distinguishing the amounc paid on merchandise brought in American snd foreign vessels.

| Years. | Ammricas. | Foruign. | Total. |
| :---: | :---: | :---: | :---: |
| 1838 | \$3,305,197 | \$105,858 | \$2,411,155 |
| 18:39 | 3,134,614 | 160,916 | 3,294,829 |
| 1846 | 2,804,506 | 92,419 | 2,450,026 |
| 1841 | 9,018,083 | 218,579 | 8,223,683 |
| 15.4 | 8,543,748 | 236,437 | 2,780,180 |
| 1248 | 2,784,184 | T57,854 | 8,491,019 |
| 154 | 4,800,877 | 1,234,067 | 5,084,945 |
| $18 \pm 5$ | 4,027, 836 | 1,242,297 | 6, 240,684 |
| 19.10 | 3,030,744 | 1,241,825 | 4,872,610 |
| 1847 | 3,936,325 | 1,012,086 | ¢,448,381 |
| 1848 | 8,790,247 | 1,118,553 | 4,908,827 |
| 1819 | 8,607,003 | 1,429,708 | 5,037,810 |
| 1850 | 3,008,440 | 2,224,877 | 6,127,817 |
| 155t | 3,899,822 | 2,696,704 | 6,490,627 |
| 18.22 | 3,826,428 | 2,466,028 | 6,293,050 |
| 18.3 | 4,589,777 | 8,187,415 | 7,696,108 |

In the year ending June 30,1853 , the amount of duties was upward of a million dollare more than in ady previous year. The foreign trade of Boston has increased very rapidly since the Cunard steamers commenced running between that port and Liverpool.
British Royal Mail Packets,-The mall packets between England and America (nine in number) leave Liverpool every Saturday, alternately for Boston and New York. The iatter convey large quantities of tho more valuable descriptions of goods; the Imports by them into Boston in 1846 leing estimated at $\$ 4,445,000$. They aleo convoy large numbers of the more opulent ciass of passengers.
Ihsurance Companies.-Insurance, both fire and marine, is carried on to a great extent by jolnt-stock compsnics, and to some extent also by individuals. The stacks of the different insurance conipanies amounted, in 18.56, to $\$ 5,000,000$. There is a great deal of risk In the business, which ls more, indeed, like a lottery than a regular trade; and the dividends consequently vary from next to nothing to 10 and sometimes even 20 per cent. and upward. The dividends paid by the different companies varied, at an average of the previous ten years, from $3 \frac{1}{3}$ to 20 per cent.
Banks.-There were, In January, 1807, in Boaton, 36 banking companles, having an aggregate capital of $\$ 31,960,000$. Their dividends have recently varied from $5 \frac{1}{2}$ to 10 per cent.

East Boston, a part of the city, Suffolk county, Massachusetts. P'opulation, In 1850, 10,214; and in 1854, 15,000.

The following summary of statistics will exhinit the amount of capltal inveated in manufacturing and mechsmical business in East Boston, the number of handa enployed, and the amount of annual producta:

| Maslasen. | Cupiual. | $\begin{aligned} & \text { Kaf of } \\ & \text { Hunda. } \end{aligned}$ | Ananal |
| :---: | :---: | :---: | :---: |
| Manufacturing wnd mechanies | \$1,858,000 | 1148 | \$3,760,010 |
| Shlp-buldtag . . . . . . . . . . . . . | 71,000 | 898 | 861,000 |
| Lumber, wood, conl, | 45,000 |  | 33y,000 |
| Teamlog, trucking, etc........ | 32,000 | 275 | 140,000 |
| curing and packíng fish..... | 49,000 | 23 | 188,600 |
| Total. ..... | \$2,056,00 | 1786 | \$5,231,710 |

Steam power is used in twenty of the eatabllahsnents mentloned ia the table, and several others are making preparations to use it. There ware built in 1850 at the different ahip-yards fourteen slipe and barks, making an aggregate teanage of 14,035 tens. East Boston, with lts superior location for commerclal and manufacturing purposes, will doubtless soon double its present population. It ha water frontage of 17,000 feet on the deep water of tne harbor, as well adapted and better protected for commerce thar, wharves in the city proper. The Grand Janction Rallroad unites East Boston with all the principal roads from the city, thus affordlag au unbroken chain of railroad commanication from the deep-water wharves in this eection of the city through the great mannfacturing districts of New England to the Canadas, the lakes, and the Great Weat, greatly' to the advantage of the commerce of Boston, by bringing to and taking from the ships and warehouses all merchandise intended for the interior, and products and manufactures destined for shlpment, free from expense of transhipment. East Boston was for merly known as Maverlek's, Noddie's, and Willams' Island. In 1814 the cltizens of Boston erected a fort on its eastern extremity, which was called Fort Strong. In 1830 some eight or ten of the most enterprising capitalists purchased this island, and commenced laying it out into atreete and lots, with a view of making it an important vart of the city. Among the important improvement in that portion of the city termed East Boston are the introduction of the Cochituate water by the city of Bor ton, the construction of the Grand Junction Railrosd, and the construction of tho sea-wail across the Basin, thns reclaiming a large quartity of low lands which were hitherto partirlly covered by the tide-watera. These lands consist of marsh and fiats to the extent of about ninety-five acres, lying between Westwood Island and the Eastern railroad.-Ses Massachusetts.

Botany Bay. A bay of the Pacific Ocean, on the east coast of Australis, i ir South Wales, county of Cumberland, five miles south of Sydney, about five miles ia length and breadth. Lat. $34^{\circ}$ S., long. $151^{\circ}$ $15^{\prime}$ E. It was discovered by Captain Cook in 1770, and derived its name from the varicty of new plants then observed on its shores. It became an English penal colony in 1787. On its coast is a column crected in 1825 to the memory of the French navigator, La Perouse.-See Syinner.

Botargo, called in Provence Bouargues, a sausage made on the shores of the Mediterranean and the Black Sea, of the roe of the mullet. The beet come from Tunis and Alexandria.

Bottles (Fr. Bouteilles; Ger. Bouteillen; It. Botiglie, Fiaschi; Russ. Bulülhi; Sp. Botellas), glass vessels for holdíng liquids, too well knewn to require any description. They are manufactured in considerable quantities. The imports of bottle glass ioto the United States average about $\$ 140,000$ annualiy. The imports of all other descriptions of glass amount to about $\$ 2,200,000$ yearly, and are very conatant. About one-fourth of this coneists of window glass. The principal places of manufacture of bottle glass, in the United States, are Pittsburg, Pennsylvania, and Esat Cambrldge, Massachinsetts.-For further detalls, see Glass.
Bottles, of glass, wore first made In England about 1558. The art of making glass bottles and drinkingglasses was known to the Romans at least before 79 A.D., for these articles and other vessels have been found :ie ruins of Pompeil. A bottle which con-
talned two hogeheads was blown, we are told, at Lelth, In Scotland, in Ianaary, 1747-'8,

Bottom, in Mercantile Language, is a famillaz expression for a ship; as in the phrase to ship goode in foreign bottome,-E. B.

Bottotonry, a maritime contract by which a ship (or bottom) is bypothecated in security for money borrowed for the purposes of her veyage, under the condl. tion that, If the ahlp arrive at her port of deatimation, the borrower perspaally, as well as the ship, shall be liable for the repayment of the loan, together with auch premium thereon as may have been agreed on; but that, if the ahip be loat, the lender shall have ne clalm against the borrower, eithe: for the aum advancad or for the premium. In consideration of the risk thea incurred by the lender, the premiun (which is sometimes termed maritime interest) is usually high : it may rarge from 10 to 25 per cent., or even more, according to the nature of the tisk, or the difficulty of procuring the neoessary funds. The fretght may be piedged as well as the ship, and, if neceasary, the cargo also. When money is borrowed on the security of the cargo, It is said to oe takea up at respondentia, a term which seems to have been introduced from the circumatance of the borrower engaging to answer for the repayment of the loen on the arrival of the goods. But theugh the terms are distinetive, there ia no essential difference in the nature of bottomry and respondentia contraets, and beth are regulated by the same principles of maritimo law. Indeed, the contract of reapondentia is now seldom or nevor entered into unless in conjunction with that of bottomry.

A bottomry contrect may be writton out in any form which oufficientiy shows the conditiona agreed on between the two parties; but it is usually drawn up in the form of a bond. The document muat ahow, either by express terms, or from its general tenor, that the risk of loss is assumed by the lender; this being the consideratit n for which the high premium is conceded. The lender may transfer the bend by indoriation, in the aame mannar as a bill of exchange cr bill of lading, and the right to recover its value becomas invested in the indorsees.

According to the law of England, a bottomry contract remaing in force so long as the ahip exiats in the form of aship, whatever amount of damage she may have sustained. Consequently, the "construetive total loss," which is recognized in marine insurance when the ship is damaged to such an extent that ahe is not worth repairing, ia not recognized in reference to bettomry, and will not absolve the borrower from hia obligation; " .t If the ship go to pleces the berrower is freed from all liability nader the hottomry contraet; and the lender is not entitied to recelve any share of the proceeda of such of the ship'a stores or materials as may hase been saved from the wreck. Money advanced e bettomry la not liable, in England, for general av' age lossea.

If the ship should deviate from the voyage for which the funds were advanced, her subsequent loss will not discharge the obligation of the berrower under the bottomry contraet. If she should net proceed at all on her intended voyage, the lender is not entitled to recover the bottomry premium in addition to his advance, Lut only the ordiaary rate of interest for the temporary loan. As the bottomry premium is preaumed in every case to cover the riaks ineurred by the lender, he fa not entitled to charge the borrower with the preminm which he may poy for insurance of the aum advanced In addition to that atipulated in the bond.

The contract of bottomry seema to have arisen from the eustom of permitting the master of a ship, when in a forelgn conntry, to pledge the ship In order to raise money for repairs, or other extraordinary expenditures rendered necessary in the course of the voyage. Circumatances often arise in which, without the exercise of this power on the part of the master, It would be im-
posalbla to privide meana for acoomplithing tio voy. age : and it is better that the master should have atsthority to burden the ahip, and, If neceasary, the freight and eargo alse, in security for the mency which has become requifite, than that the adventure should be defeated by Inability to proceed. But the right of the master to pledge the ship or goods must always be created by necensity; if exercised witheut necessity the contract will be void. Accordingly, the master of a Bricish ahip has no power to grant a bottomry bond at a British port, or at any foreign port where he might have been able to raise funda on the personal credif of the ahip-owners. Nelther haa he any power to pledge the ahip or goods for private debti of his own ; but only for such supplies as are indiapeneable for the purposes of the voyage.

The bottomry lender must ase reasonable diligesce to ascertain that a real necessity exiats fur the loan; but he is not bound to see to the applieation of the money advanced. If the lender have originally advanced the funda on the persenal eredit of the master or owners, or on any otiver security than that of bettomry, he is not entitied at a subsequent period to convert his claim into a bottomry obligation; and although the master ahould grant him aach obligation, it would not bind the owners. In overy case a bond procured by compulsion would be vold.

The power of the mester to pledge the cargo depend upon there being some reasonable proapect of bencfit to it by bis so doing. Ile has no such power axcejts in virtue of circumstances which may oblige him to assame the eharacter of agent for the cargo, in the absence of any other party authorized to act on its hehalf. Under ordinary cireumstances he is net at liberty to pledge the eargo for repairs to the ship. If, indeed, the goods be of a perishalife nature, and if it be impossible to get the ship repaired in aufticient time to obviate serious loss on them by delay without including them under the bottomry contract, he has powor to do so ; because it may fairly be mesumed, in the case supposed, that the cargo will be benefited by this procedure. But if there be time to commusicste with the proprietors of the cargo, it is his duty to give them notice before resorting to this course. The general principle is, that the master must aet for the cargo, with a reasonable view to the intereats of its proprietors, nuder the whole eircamstances of the case. When he does this his proceedings will be sustained; but shonid he manifestly prejudice the intereats of the cargo by Including it under bottomry for the mere purpose of relieving the ship, or of earning the frelght, the owners of the cargo will not be boand by the bottomry contraet. Any bottomry or reapondentia bond may be good in part, or bad in part, eccording as the master may have aeted within or beyond the seope of his iegitimate authority in granting it: If two or more bottomry bonds have been granted at different atages of the voyage, and the value of the property be insufticient to diecharge them all, the last-dated bond has the priority of payment, as having furnished the menns of preserving the ship, and thereby preventing the total lose of the security for the previons bunds.

In a recent case In the English Admiralty Court (the Cynthia, 20 L. 7, 54), it was decided that a hond granted by a Britioh consul over a British ship, the master of whieh had been' murdered in a mintiny by the erew, was valid, although the new nisster, appointed by the consul, had not been required to sign it.

When the sam due under a bottomry bond over ship, freight, and eargo, is not paid at the stipulated time, proceeding: may be taken by the bond-holder for rccovery of the freight, and for the sale of the ship; and should the proceeds of these be ineufficient to discharge the olaim, a judicial sale of the cargo may be reeorted to. As a goneral rule, the value of the ship and freight must be exhausted before recourse can be taken against the cargo.
, The bottomry preminm must be ulitimately paid by the parties for whose especial beneff the advasces were obtalated, as ascortained on the final ndjustment of the avarage expenditures at the port of clestination. Ind it

Bougalnville, Count Louis Antonio M., n circumanvigntor of the eighteenth century, wis born at Parls, 1729: | He first madied law; and was. afterward a ulstinguished soldior, diplomatist, tcholar, and navlgatur, anil remarkable in each for his energy of character. Ile fought In. Ganada, under Montealm, where he was wounded, in 1758. On the denth of his auperior mid friend, ha roturned to France, and served with distinction In Germany, In'1761. + On the conclusion of peace, he entered the French navy, and led the expedition intended to form asettlement in the Falkland Islands, for whioh he sailed in 1763. The prior elaim of the Spanish government to these islands compelled him to surrander them; and he returned to France, the government of whleh commissioned him to carry the surrender iato oxecution, on receiving from the Spanish government roinuneration for his expenses. Having accomplished this, he set sall on his voyage of circumnavigation, and having eariched geographical nejence by number of naw discoveries, he returned to France in March; 1769. 1 During the Amerlean war, ho was again in service, from which, however, he wholly retired is 1700, and devotod himself exoluaivaly to cientific research.
Boulogne-mur-mer (Gesoriacum), a fortlied seaport town of France, capital of arrondisyoment, department Pas de Calais, on the Euglish Channol, at the mouth of the Lianne, and on the Boulogne and Amiens Railread, 140 miles from laris, and 112 from London, and 19 southwest from Calais. Lit. (of the column) $50^{\circ} 44^{\prime} 32^{\prime \prime}$ N., long. $1986^{\prime} 10^{\prime \prime}$ E. Population, 1853, 31,000 , of whom a great number are English reaidents. It la divided into the Upper and Lower towns. The first, on hill whence the English coast is distinctly visible, is well, though irregularly built, and has two quares ornamented with fountains, a feudal citadel, and ramparta, a modern cathedra, an episcopal palace, a town hall, and a house in which Le Sage, the author of Gil Blas, lived and died. The Lower, or new town, stretching from the Upper town to the sea, is newly and regularly: built, and more populous. It has fine public buths, with ball and concert reoms, a commercial college, a theatre, a musdum, including a library of 23,000 voluues, a henpital, custom-house, and barracks. Boulogne has also an English librasy and reading-room, six English churches, several excellent hotels, a great number of boarding-schools (beth French and Engilsh), a school of navigation, tribunal of commerce, societies of agriculture, commerce, and arts; manufacteries of coarse woolcns, sall-cloth, cordage, bottle-glass, and earthen-ware. In its vicinity are $\mathbf{i m}$ portant marblo quarries. Its fisheries aro very extenslve, and furnish tho chief anply of fish for the Parls markets ; but the town is ma' ily indebted for its prosperity to its Engliah realdents, whe, since the peace, bave resorted thither in great numbers, particularly during the summer. Steamers make the passage to Folkstone in two houra, and to London in ahout twelve hours; and the number of passengers who diseinbark here annually exceeds 50,000 . The port la not very easy of access, being formed by two wooden piers stretching out anly to low-water mark, but the tide rises upward of 16 feet, and ships find pretty good anch-
orage about half a $-\cdots$ from the htrbor: It was of the heights of Bosiogne that the Emperor Caligula, A.D; 40, eneamped an army of 100,000 men for the fruitises parpose of Invading Britain, and here also, in 1804, nearly 18 centuries later, the Vimperor Napoleon anjombled an artiny of 180,000 mien, and a flotilld of 2100 traneports, with the same design. The Colonine Napoldowe, a column 164 feet high, nearly one millefrom the town; commenorateg the lateer futile attonipt;

Bounties. They wers first granted on the exportation of Britigh commoditles-a new prinefole'Introduced Into commarce by the Britioh Parliamert. The firat bounties: granted on com were in 1688. First legally granted in England for ralsing naval storea In America, 1708. Bountles have been granted by Great Britain on alil-cleth; linen, and other goods, and by thin country on fiaheries.-See Fismerika, Elamenifa of Commerce, il Boantiea on production are most commenly given in tha view of encotaraging the establishment of some new branch of induatry ; or they are intended to foster and extend a branch that is belleved to be of paramount importance, is In nelther case, however, is their utillty very obvions. In all old settled and wealthy countries, numbers of individuals are always ready to embark in every new undertaking, if it. promise to be really advantagcous, without any atimulus from government; and if a braneh of lndustry already astablished be really important and suitable for the country, it will assuredly be prosecuted to the necessary extent, without any encouragement other than the natoral demand for its produce.

However injurious to the state, it has been pretty generally suppesed that bounties on exportation are advantageous to those who produce and export the artheles on which they are paid. Bat the fact is not so. A trado that can not be carried on without the aid of a bounty must be a natarally disadvantageous one. Hence, by granting it; individuala are tempted to engage or coutinue in businesses which are necessarily very insecure, and are rarely capable of being rendered lucrative; at tho same time that they are prevented, by trustisg to the bounty, from making those exertions they naturally would have made had they been obliged to depend entirely on superior skill and industry for the sale of their produce: The history of all husinesses carricd on by the ald of lountiea proves that they are hardly lese disaidvantageous to those engaged in them than to the publie.

Bowaitch, Nathaniel, self-taught American mathematician, born in 1773, of humble parents, at Salem, in Massachusetts. He was bred to his father's business as a cooper, and afterward was apprenticed to a ship-chandler, His taste for mathematics early developed itself; and he acquired Latin that he might study Newton's Principia. In 1795 he aailed as eupercargo, In which capacity he mado four leng voyagen ; and, boing an excellent navigator, he afterward commanded a vesdel, instructing his crewa in taking lunsar and other ohservations. He edited three editions of Hamilton Moore's Navigation. In 1804 he became nctuaty to a Boston insurance company; and in the midst of his active and nseful career pubitished a transIation of the Mécanique Celeste of Laplace, with annotations; a work which will better prove the great acquirements of this self-taught philosopher than any labored panegyric. He died in 1838, nt Boston. A statuo of this distinguished mathematician has been crected to his memory in Mount Auburn Cometery, Cambridge, Massachusetta.

Bowline, a rope leading forward from the leech (side border') of a square sail, to keep it tightly out. When a vessel is aniling close-hauled she is then s id to he sailing on a bowline or on i taut bouclins. Bowline bridles are the spans of cord by which the bowline ie fastened to the leech.-E. B.

Bowaprit, or Boltsprit, a largo spar whleb projects over the etem of a ship, resting slopewiso on the
head of the maln stem, and having its lower end fastened to the partners of the foremaat, and further supported by the foreatay. It carries the sprit-bail, aprit-tep-sail, and jack-staff; and its length is usually the mame as that of the foremast.-E. B.

Bor-haul, in Navigation, to bring a shlp, when close-hauled, round upon the other tack, when she refuses to stay and there is net room to wear,-E. B.

Boxing the Compass, denetea the rehearsing the points in their proper order.-E. B.

Box-wood (Germ. Buchsbaum; Du. Polmhout; Fr. Buis; 1t. Busso, Bosso, Borsolo), the wood of the box-tree (Buxva semperrirens), growing wild from Massachasetts to Florida. A very cemmon name in the United States is dogwood, though both namea are used. This tree was greatly admired by the ancient Komans, and has been much cultivated in medurn times, on account of the facility with which it is faehiened into different forma. Bex is a very valuable wood. It is of a yellewish color, close-grained, very hard, and heavy; it euts better than any other wood, is susceptible of a very fine polish, and is very durable. In consegaence, it is inueh userl by turners, and mathematical and musical instrunent makers. It is teo heavy for farnituic. It is the conly woed used by the engravers of weod-cuts fer books; and provided duo care be exercised, the namber of impressiens that may be taken from a box-wood cut is very great. In France, box-wood is extensively used for combs, knIfehandlea, sad button meulds; and sometlmes, it has been said, as a substitute for heps in the manafactare ef beer. The value of the bex-wood sent from Spain te l'aris is reperted to amount te about 10,000 francs a year. In 1815, the box-trees cut down on Bex-hill, near Derking, In Surrey, England, produced upward of $£ 10,000$.

Bracelets. They wero early worn and prized amongthe ancients; vesead of then in almest all natiene: these that wero called armille were usually distributed as rewarda for valor among the Roman le-gions.-Nout. Diet. Those of pearls and geld were wern by the Roman ladies; and armlets are female ornaments to the present day.-ILayins.

Bradford, a parliamentary borough, market, and parish of England, county of York, West Riding, on an afflaent of the Aire, and branch of the Leeda and Liverpool cana!, 8 miles west of Leeds, en tho Leeds liailread. Area of parisl. 34,146 acres. Population in 1851, 140,643. Pupulation of the berough, 103,778. Area of parliamentary beroagh, comprising the townships of Bradford, Manningham, Bow, ng, and Ilorton, ti590 acres. The town, built entirely of atone, has atrects mostly narrow, hut well paved and lighted. Brulford is now the principal seat of the worsted yarn and stuft manufactures in England, and the great mart for the leng wools used in these fabrics. In 1838 it had 142 worsted, 9 woolen, and 2 cotten mills, empleying together $11,6 \mathrm{~B}_{5}$ hands. In the same year there were In the town upiwned of 1500 pewer looms, each producing three to four feces per week. Its rapld advance
is mainly attributable to Its central position in the great manufaetaring district of Yorkshire, and to the abundance of coal and iron in its immediate vicinity. The Leeds and Liverpool canal connects it with both the Irish and North Seas.
Bran, the thin skins or husks of cnm, particularly wheat, ground, and separated frou the corn by a sleve or bolter.
Brandy Germ. Brantewein; Du. Brandewyn; Fr. Eau de rie, Brandevin; It. Aquarzente; Sp. Aguardiente ; Port. Aguardente; Russ. Wino; Lat. Vinum adustum), splrituous and inflammable liquor, obtained by diatillation from wine and the husks of grapes. It is prepared in most of the wine countries of Europe; but the superiority of French brandy is universsliy admitted. The latter is princlpally dlatilled at Bordeaux, Rochelle, Cognac, the Isle de Rhé, Orleans, Nantes, and in Poitou, Touraine, and Anjou. That of Cognac is in the blghest estlmation. Whos ef all deseriptlons, but chiefly those that are strong and harsh (pousses), are used in the manufacture of brandy. The ouperior vintages, and thoee that heve most flavor, ere sald to make the worst brandy. It is neturally elear and colorless. The different shades of color which it has in commerce arlse partly from the casks in which it is kept, but ehlefly from the burned sagar, sanders weod, and other coloring mattor intentionally aclded to it by the dealers. It is sald that the burned sugar gives mellowness to the flavor of the liquor, and renders it more palatable. The art of distillation is believed to have been firat discovered by the Arablans. From a passage in the Testamentum Norissimum of the fanoua Raymond Lully, who fleurlohed In the thirteenth century, it would appear that the production of brandy and alcohol from whe was familiar to his contempo-rarles.-I'. 2, edit. Argent. 1571. But the practice does net appear to have been Introduced inte France till 1313.-Ie Grand d'Aussi l'ie privé ds Frangois, teme iii. p. 64. When first introduced, brandy or barned wine (cinum adustum) appears to have been used prineipally as an antliseptle and reatorative medicine; und the most extravagant panegyries were bestowed en its virtues. It was deseribed as a soverelgn remedy in almest all the disorders of the human frame; it was commended for Its efficacy in comferting the memory and strengthening the reasoning powera; it was extolled, in short, as the elixir of life, and an infalitie preservative of youth and beauty.-IIendenaon'i. Ilistory of Wine, p. 24. Dr. IIenderson says that the experience of later times has shown how little the culogy was merlted; but in this he is contradicted by Burke, who malntains, with equal eloquence and ingenuity, that "tho alembic has been a vast henellt and blessing." -Theughts and Details on Scarcity, p. 41. Brandy form ed, fer a lengthened periorl, a prominent artlcle in the exporte of France-few ships sailling from Berdeaux, Rechelle, or Nantes, without taking a certaln quantity of it on board; but of lato yenrs there has been an extraordinary falling eff In the exports of brandy as well as of wine. We sulijoin

Brass, an alloy of copper and zinc. This name, however, has not been oxcluaively applied to the alloy of thess metals; for the gun-metal, which has been also called brass, is an alloy of copper with tifn. The same alloy, with more tin, is used in machiaery, and is preferred to the alloy of copper and zinc on account of its greater hardness. It appears from the analysis of the brass of tho ancients that it was an alloy of copper and tin. A small portion of tin gives to copper great hardness, and renders it capable of bearing much greater resistancs. A larger portion of tin gives increased hardness, but is less fitted to bear a straining resistance, on account of its brittleness. Its elasticity is very great, which fits it for bells. In thia state it is called bell-metal; and with a still greater proportion of tin it forms an alloy employed for the mirrors of roflecting telescopes. The alloy of copper with th is essily distinguished from that with zinc, from the agreeaile color of the latter, which varies with the proportions of the metals. Pinchbeck has the lenst proportion of zinc. Common brass has more zinc, and the gold-colored alloy called prince's metal contains a still greater proportion of zine. An alloy of copper with a very large propertion of zinc is used for the common white metal buttons.
Brass-color is prepared by braziers and colormen to initate brass. There aro two kinds, tho red brass or broaze, and the yellow or gilt brass. The latter is made only of copper-tllings, the amallest and brightest that can be found; with the former it is usual to mix aome red ochre, finely pulverized.
The various alloys of coppor with tin and zinc forming the different kinds of brass, are to be considered as chemical compounds, and, of course, governed by the same laws of detinite proportions which obtuin in the more conspicuous compounds. On these principles, which can not be doubted, wa havo an unerring rule for uniting these and other metals in the best proportions, the weights of their atoms being previously known. The woight of the ntom of copper being 8; tin 7.35 , and zine 4 , the following tables exhibit the proportions of tha various alloys, expressed in atoms, and their proportions by weight, tho third column pointing out the color and character of the reaulting compound. $\mathrm{C}, 7$, and T are to represent the atoms of tho mutals respectively.

IItherto the proportions of these alloys have depended upon the practice of workmen, guided by numerous trials; but what confirms the law of definite proportions, is the necesaity of adhering to fixed proportiona, ascertained by trial. By attending to the proportions pointed out above, the most striking and proper compcunda will be produced, without the trouble of trial. Any intermediate proportions will, douitless, be marked by defective color, irregular cryatallization, or imperfect malleability.

Although the most direct way of forming these difforent kinds of brass is by immediately comblning the metals together, one of them, which is moat properiy called brass, was manafactured long before zinc, ons of its component parts, was known in its metallic form. Tho ore of the latter metal was comented with aheets of copper, charcoal heing present; and the zinc was united with the copper without becoming visible in a distinet form. The same method is still practiced for making brass.-E. II.

Brass was known among all the early nations.Usnent. The British, from the remotest period, were acquainted with its use.-Whittaken. When Lucins Mummius burned Corinth to the ground, 146 b.c., the riches be found were immense, and during the confiagration, it is sail, all the metals in the city melted, and, running together, formed the valuable composition described as Corinthian brass. This, however, may well be doubted, for the Corinthian artists had long before obtained great eredit for their method of combining gold and silver with coppor; and the Syriac translation of the Bible says that lliram made the vessele for Solomon's temple of Corinthian breas. Articlea made of this brilliant composition, though in themselves trivial and insigulicant, were yet highly valued. - D) Finessnoy.

Brazil, an extonsive empire of South America, occupyiug n large proportion of the eastern and central part of that country, extending between lat. $4^{\circ} 28^{\prime} \mathrm{N}$. and $32^{\circ} 45^{\prime} \mathrm{S}$., and long. $34^{\circ} 55^{\prime}$ and $65^{\circ} 20^{\prime} \mathrm{W}$. Length Prom nerth to eouth, about 2030 miles ; greatest breailh, 2540 miles. Its internal boundaries cone in contact with all the different stutes and territories of South Amerlea, with the exception of Chili and Patagonia, while the Atlantic tecan washes its shores from its northeast to its southern limits.

Ilrazil was discovered by Alyarez da Cabral, a Portuguese, who was driven npon its coasts by a tempest in 1500. Ho called it the land of the IItoly Cross; but It was subsequently ealled IIrazil, on account of ita red wood, and was earefully explored by Amerigo Vespuecl about 1504 . The golil minos were first opened in 1684; and the diamond mines ware discovered in 1730. The French having aeized on Portugal in 1807, tha royal family and nobles embarked for Brazil. A revolution took place here in 1821. lirazil was orected into an empire, when Don Podre assumed the title of emperor, Nov, 18, 1825. He abdicated the throue of Port-

A decree of the govermment of Brazil, under date of January $10 \mathrm{th}, 185 \tilde{5}$, exempts foreig. iers from permits of residenee, and permits them to trs vel in the interior of the emplre with such passports as they may have brought with then, and, for the want of such, with the passport of their respective ministers, consuls, or viceconsuls, the same bearing the $\boldsymbol{v}$ isa of the Brazilian authorities.
[Translation.]
Art. 1. Permits of resideuee aro abolished, and forelgners coming to the emplre are exempted from tho same.
Art. 2. At every pollee offiee a book shall be kept for the reglatration of forelgners entering or loaving the emplre.
Art. a. On the occasion of the police vialt forelgnera ainall state their names, oondition, the place of thoir nativity, pro. feasion, the object for coming liere when they arrived, and where they intend to reside. In thuse phaces where no poltco visit is made, the oforesaid dectaration shath be mado before the chlef of police, delegaie, or sub-delegate within twenty-four hours after landing, under peralty of from $\$ 10$ to $\$ 50$ fine, im. posed by tho competent anthority.
Art. 4. The deelaration alluded to in the foregoing article does not exonerate captulns and masters of merchant vessela from the olllgaton haposed upon them by the twenty-fifth arHele of regulation No. 120, of Jnauary $31 \mathrm{st}, \mathbf{1 8 4 2}$, to declare, in a statement signed by them, the mumber, namo, employment, occupalion, and placo of nativity of the passengers they bring wlit them, with or whithout passports.
Art. 5 . The deelaration of the foreigner and of the master or eaptalit of the vessel shall be immediately transmittod to tho tureas of pollee by the visting offieer or the authority who recelves them.
Art. 0. The visithing offieer, tho ehtef of pollee, or the detogate or anb-delegate to whom the forelgner presents himself, shall exumine his possport, and the same istug found in duo form, It ahail be rethrned to him visaed, dated, und algned.
Art. 7. If there should be any doubt as to the legallty of the paspiprt, or the forikner come withoat one, the ohicf of peltee, the delegate, or sub-delegate shall pormit him to hand fif there Is no reuson for auspeeting him to be a eriminal; lut if he should be suspielous, and have no cerlificate to present in his fisvor from his mblalster, or, In the abseuce thereof, from his respeetivo consul or vice-consul, the chief of police, the twlegate or suld-delegate ehall compel the vessel which brought him to lake him back, reporllag the eircumataneo to the gove ernaent at the eapital, and to the prealdent in the provinces.
Art. 3. To euahle a furelgner to travel from ono provlace to another, or ln the finterior of the amas, the paspport whth which he arrived th the empire with be anmedent, provided it bears the vise of the cempetent authority whil this chanse, "For the province of --_" The vipa must he dated, algnen, phid for, and renewed overy tho the forelgner fenvers ono proviace for another.
Art. 0. Itht If the foreigner should happen te have come without a puespert, or have lost the ene he brought whth him to the enpile, the pasyonert of the minister, or, in the absente thereof, that of his respeellve consal or vice-eonsul, with the viba of the Itrazillan anthorthes, na set ferth in tho preceding artlelo, nhall nawer tho same purpose.
Art. 10. A forelgner who has resided in the emplre for two yeary, belag in possesmion of an entablithmeat, and combucted hamall well, or belug married to a liraaltimn, ahall be at llburty to truvel freely tike a liraalian, afor having obtalued
from the cillef of pollee a vertifieate of elther of sald conditiona. thas certlficate is revokable in case of a change of elrcumataneer.
Art. 11. In case of there being no diplomatle or consular agent, or the forelgnor be in refugee or emigrant, or not come uader the provisions of the preceding article, tho passport ahall be lesued by the chlef of police, the delegato, or aub-delegate, the same beling alwaja fred of charge for the omigrent or the poor.

Art. 12. The ministers of atate, or the chlef cierks of the several departments at the seat of government, tho presidente or their aecretartes in the capitala of tho provinces, the chlef of pollee, the delegato or anb-delegate, at the plaec of Innding or of departure, ahall be empowered to grant the passport or the visu referred to in the preooding artleles The poword con., ferred by this decree upon the chief of pollee, tho delegate and sub-delegate, are not concurrent, but shall bo exercleed hy the delegate in places where roo chief of pollee resides, or by the sub-delegate where no chlef of pollce or delegate exists.
Art. 13. In eonsidenation of the foregolng artleles, the re. spectlve portlons of the artleles in regulation No. 180, of Jah. uary 31 at, which, referred to permits of realdenee, and to pasa, ports for forelgners travellag in the luterior of the emphe, are herely abolithod.
Brazil-nuts, or Chestnuts of Brazil, tho fruit of the Juvia (Bertholletin excelsa), a majestic treo growing to the heiglt of one hundred or one humelred and twenty feet, aboundiag on the banks of the Orinoeo, and in the northern parts of Brazil. The nuts are trl. angular, having a euneiform appearance, with sutures at each of the angles; the shell is rough and hard, and of a brownifis ash color. The kornel resemblos that of an almond, but is larger, and tastes moro like a comnon hazel-nut ; it contalas a groat deal of oil, that mny be obtainod by oxpression or otherwise. These unts do not grow aeparately or in elusters, but are contalned, to tho number of from fifteen to litty or more, in great ligneous pericarps or outer shells, generally of the size of a child's head. This outer shell is very hard null strong, so that it is rather diticult to get at tho nuts, which are closely packod in cells inslde. The notives aro partieularly fond of this fruit, and celobrate the harvent of tho juvia with rejoleings; it is also very much esteemed in Europe. The nuts exported to Bugland and the Europoan continent aro chlefly from lara, and form an nrtiele of conshlderable commereial importance.- 11 umnobat's ${ }^{\text {norsonal }}$ Narrative, vol. v. p. Sids, English trunalntion.

Bragil-wood (Fr. Bois do Brisil; Ger. Brasilienholz; Du. Bravilienhont; It. Leyno del Brasile, I'ersino; Sp. Malera del Bresil; l'ort. Pao Brasil). It has heen commonly supposed that this wool derived its unmo from the comitry in which it is princlpally preduced; but 1r. Hancroft has conchusively shown that woods ylelding a red dye were called llrazll-woods long previously to the discovery of America; and that the enrly vojagors give tho namo of lirszil to that part of that conlinent to which it is still nppled from their having ascertained that it abounded in such woods.-

See the learned and excellent work, Philosophy of Col ors, vol. il. p. 316-321. It is found in the greateat abundance, and ia of the beat quallty, in the province of Pernambuco, where it ia called Pao de rainha, or Queen'a wood; but il ia also found in many other parts of the Western hemlaphere. The tree is large, crooked, and knotty; the lenves are of a beautiful red, and exhale an agreenble odor. Ita botanical name la Cow salpinia Brasileto, but it la called by the natives ibiripitanga. Not withatanding ita apparent bulk, the bark is so thick, that a tree as large aa a man's body with the bark will not be so thick as the leg when peeled. When cut into chips, it loses the pale color it before had, and hecomes red, and when chewed has a sweet tasto. It is used for various purposea by cabinet-makers, and admits of a beautiful varnish, but ita principal use ls in dyeing red; and though the color is liable to decay, yet, by mixing with it alum and tartar, it is casily made permanent. There is also made of $i t$, by means of acids, a sort of liquid lake or carmino for painting in miniature. Brazll-wood has been for many years past a royal menopoly ; its exportation, except on account of governmicnt, being prohilited under the severest penalties. Owing to the improvident manner in which it has been cut down by the gevernment agents, it is now rarely found within several leagues of the coast. Indeed, wo are assured that many of the planters have privately cut down the trees on their estates, and used the timber as tire-wood, that they might net expose themselvea 10 annoyance from the arbitrary and vexatious proceedings of these functionariea. The quantity of Brazil-wood imported Into Great Britain is but inconsiderable. Its price in the London market, exclusive of the duty ( 2 s , per ton), varies for the first quality from $£ 60$ to $\mathbf{E 8 0}$ per ton.-Dr. Banerort in loc. cit. Encyclop. Metrop. Modern Traveler, vol. xxix. p. 87 ; Malte Bnun, vel. v. p. 525, Englibh edition, etc.

Bread, the principal article in the food of mest civilized natiens, zonsists of a paste or dough formed of the fleur or meal of ditferent serta of grain mixed with water, and baked. When stale dough or yeast is added to the freah dough, to make it swell, it is said to be learened; when nothing of thla sort is added, it is said to bo undeazened.
historical Sketch of Bread.-The President to Goguet has endeavored, with his usual sagacity and learnbing, to trace the successive steps by which it is prob.. able men were led to discover the art of making lread (Origin of Laves, etc. vol. i. p. 95-105, Linglish translation); but nothing posilite is known on the subject. It is certaln, however, from the statements in the sacred writings, that the use of unleavened bread was commen in the daya of Abraham (Gen. xvili. 8); and that leavened bread was used in the time of Moses, for he prohibits eating the l'aschal lamb with such bread.-Exod, xij. 15. The Greeka affirmed that Pan had instructed them in the art of making bread; but they ne doult were indelted for thin art, as well na for their knowledge of agriculture, to the Egyptinns and Phenicians, who had early settled in their country. The method of grinding cern by hand-milla was practiced in Bgypt and Grecee from a very remete epech; but for a leugthened period the llomans had no other method of making flour than by beating roasted corn in mortars. The Macedonian war helped to make the Romans nequininted wilh the arts and refinements of Greces; and lllay mentiona that public bakera were then for the firat time eatablished In llome.-Hist. Nat. lib. xviii., c. 11. The conquesta of the Remans diffused, among many other useful discoverles, a knowledge of the art of preparing bread, an praeticed in Rome, through the whole south of Europe. The use of yeast in the raising of bread seems, hewever, from a passage of Pling (lib. xvili. c. 7), to have been practieed hy the Germans and Gaula before it was practiced hy the liomans; the latter, like the Grecka, having lenvened their bread ly lutermixing the fresh duagh with that
which had become atale. The Roman practice seema to have superseded that which was previously in use in France and Spain; for the art of raising bread by an admixture of yeast was not practiced in France in modern times till toward the end of the seventeenth century. It deaerves to be mentioned that, though the bread made in this way was decidedly superior to that previously in use, it was declared by the faculty of medicine in Paris to be prejudicial to health; and the use of yeast was probibited under the severest penaltics. Luckily, however, the taste of the public concurring with the interest of the bakers, proved too powerful for these absurd regulations, which gradually fell into disuse; and yeast has long been almost every where used in preference to any thing else in the manufacture of bread, to the wholesomeness and excellence of which it has not a little contributed.

The apeciea of bread in conmon use in a country depends partly on the taste of the inhabitants, but more on the sert of grain suitable for its soil. Hut the superiority of wheat to all other farinaceous plants in the manufacture of bread is so very great, that, wherever it is easily and auccessfully cultivated, whesten bread is used, to the nearly tetal exclusion of most others. Where, however, the soil or climate fs less favorable to its growth, rye, oats, etc., are used in its stead. A very great change for the better has, In this respect, taken place in Great Britain within the last century. It is mentiened ly Ilarrison, in his description of lingland (p. 168), that in the reign of Henry VIII. the gentry had wheet sufllelent for their own tables, but that their household and poer neighbura were usunlly obliged to content themselvea with rye, barley, and outs. It appears from the heuschold book of Sir Edward Coke that, in 1596, rye bread and oatmeal formed a considerable part of the diet of servants, even in great families, in the southern counties. Barley bread is stated in the gront of a monopoly by Charlea I., in 1626, to be the usual food of the ordinary sort of pee-ple,-Sir F. M. EDEN on the Poor, vel. i. p. 561. At the Revolution, the wheat produced in England and Wales was estimated by Mr. King and Dr. Davenant to emount to $1,750,000$ quarters.-Davenant's Works, vol. ii. p. 217. Mr. Charles Smith, the very well informed auther of the Tracta on the Corn Trade, originnlly published fil 1758, states that in his time whent had become much more generally the food of the commen people than it had been in 1689; but he adds (2d ed. p. 182, Lond. 1766) that, notwithstanding this increase, some very intelligent inquirers were of ojinion that even then not more than half the people of lingland fed on wheat. Mr. Smith's own extlinate, which is very carefully drawn up, is a little higher; for, tnking the pepulation of England and Wales, in 1766), at $6,000,000$, he supposed that $3,750,000$ were censumers of whent ; 739,000 of barley ; 888,000 of rye and 623,000 of oats. Mr. Smith further aupposed that they indivilually conammed, the tlrst elass, 1 quarter of whent ; the accond, 1 quarter and 3 bushela of barley; the third, 1 quarter and 1 bushel of rye; and the fourth, 2 quarters and 7 bushels of oats.

About the middle of last century, hardly any whent was used in the northern countlea of linglaid. In Cumberland, the princlpal families uned only a small quantity nbout Cliristmas. The crust of tho goose pie, with which almost every talise in the comnty is then nupplled, wha, at the period referred to, almost miformIy mado of barley meal.-limen on the I'oor, vol. i. p. 6ibs.

Every one knowa how innpplicablo these statements are to the condition of the people of England at the present time. Wheaten brend is now malvereally made une of in towns and villages, and almost every where In the country, larley is no longer used, except in the distillerles and in brewing ; oata are employed only In the feeding of horses; and the consumption of rye hreal is comparatively liconsiderable. The produce
etice seems aly in use in bread by an nes in modenth centilth tho bread to that pre. lty of mediand the use at penaltics. coneurring powerful for fell into diswhere used lufacture of co of which

 s, bat more But the sulants in the wherever it en bread is 108t others. a favorable s stead. A his respeet, at century. tion of lin. $\checkmark$ VIII. the tables, but ere usualiy barley, ond 8 of Sir Eidaneal formits, even in arley bread arles 1 ., in sort of peop. 5 tii. At gland and . Davenant NT's iYorks, ry well inade, origintime wheat of the com. he adids (2d ing this inof opinion ple of En ate, wilch $r$; for, takin 1760, at consumers and 623,100 ry ludivitiwheat ; tie he third, 1 2 quarters any wicat tanid. In ly a small goose pie, ty is ticol t uniform; vol. i. 1. sally mule ery whero except in loyed only ion of rye a produceof the wheat creps has been, at the very least, quadru. in the form of dough, its glutinous or adhesive properpled sinco 1760. And if to this immense increase in the suppiy of wheat we add the atill more extraordinary increase in the supply of butchers' meat (see article CATrick), the fact of a very signal improvement having taken place in the condition of the population, in respect of food, will be obvious.

But great as has been the improvement in the condition of the people of England since 1700, it is but trifling compared to the improvement that has taken place sinco the same period in the condition of the people of Seotland. At tho middle of hast century, Scotch agriculture was in the most depressed atato; the tenants were deatitute alike of capital and akill; green crops were almost whoily unknown; and the quantity of wheat that was raised was quite inconsiderablo. A feld of eight acres sown with this grain, in the vicinity of Edinburgh, in 1727, was reckoned so great a curiosity that it exclted the attention of the whole neigiborivood.--Robentaon's Rural Recollections, p. 267. But even so late as the Anerican war, the wheat raisod in the Lothians and Berwicksiiire did not exceed a thini part of what is now grown la thom; and taking the whole country at sa average, it will be a moderato estimato to say that the cuitivation of wheat has increased in a tenfold proportion aince 1780. At that period no wheaten bread was to be met with in the country places and viliagea of Scotlind, oat cakes and barley bannocks being universally made use of. But at present the caso is wideiy diflerent. The upper and also the niddle and lowcr ciasses in towns and villages uso only wheaten bread, snd even in farm-houses it is very extensively consumed. There is at this moment hardly a viliage to be met with, however limited ite oxtent, that has not a public laker. In many parts of Englaud it is the custem for private familios to bake thoir own bread. This is particulariy the caso in Kent, and in some parts of Lancashiro. In 1804 there was not a singlo public baker in Manchestor, and their numbor is still very limited.
The word bread is sometimes used for all the necessaries of human life, especially in tho Scriptures. Chilug-Noung, the successor of Fohi, is reputed to have been the lirst who taught men (the Cinnese) the art of husbandry, and tine method of making bread from wheat, and wine from rice, 1998 n.c.--Universal Ilistory. Baking of bread was known in the patriarchal ages; see Lixodus, xii. 15. Baking bread became a profession at homo, $170 \mathrm{n} . \mathrm{c}$. During the aiege of laris iny lienry IV., owing to the tamine which then raged, bread, which had been sold, whilo any romained, for a crewin a pound, was at last made from the bones of the charnei-house of the lioly Innocente, A.D. 1694. -ilesault. In the time of James I. tho ubual ibead of the joor was mals of barley ; and now in Iceland, cod-fishi, beaten to jowder, is madio into bread; and the poor uso potato-breai in many parts of Ireland. Farth has been eaten as bread in seme parts of tho world; near Moseow is a pertion of land whose clay will ferment when mixed with tienr. Some of the Indians of the Southwest eat a white earth with salt; and the indiuns of the Oronoko eat a white unctuous carth. -Gham; Pumbive.

Breal-making.-Bread is a most inuportant and genecally used article of food, and its proier proparation is a matter of the first Importance. In Now York it is chieftiy composed of wheat tiour, although ryo and $\mathbf{I n}$ dian meal enter somewhat into the composition of gome species, $\quad 100$ parts of wheat flour consist of

| Stareh. | s. |
| :---: | :---: |

| Suga | 5 |
| Vegeta |  |

Of thoso different constituents, tho gluten is that which gives to it tho universni preference it enjoys over all other articles for bread-making. In onta, bariey, and ryo, the amount of gluten is small. Aa its name imperts, it gives to the tiour, when mixed with water,
ty; and hence, although wheat flour can easily be converted into a plastic paste with water, yet it is found exceedingly difficult or impossiblo to mako an adhesivo dougl with rye or oat meal flour without the addition of a portion of wheat flour.
Tho quality of wheat flour is greatly insproved by threc or four months'age, and it makes a much stronger bread after this period than before. If, however, it is kept too long, it is not only liable to fermentation, but loses in part its giutinous property. It is the custom with bakers, who seldom une flour before it is of the age Indieated, to mix that of three or four months' ago with that which is one or $t$ wo years old; beyond tiin period it can not be well kept without especial care; and, indeed, so great is the demand, that it is aeldom permitted to accumulato for a longer time.
Most of tho bread used in New York is fermented or raised bread, which is induced by adding to tho dough a portion of leaven, or yeast, which quickly diffuses itself through the wholo mass, and cansea it to ferment. This fermentation, which, although daily observect, is far from being so weil understood as st flrat siglit might be sopposed, evolves a quantity of fixed air into the dough, which the gluten of the flour, by ita tenaeity, causes to ho retsined in tho littlo ceils seen in the raised dough before baking, or in the bread as it comes into the consumer's handis. Flour is now sold which contains tartaric ueid and saleratus, or soda, in a dry state. When water is sdided to this, it causes an evolution of tioe carbonie acid gas contained in tho soda, or potash, and tho bread is suddenly raised without the process of fermentation.

Tho method of making bread in large bakerica is to aift a quantity of flour into a kneading-trough, into which is thrown a quantity of hot water in which salt has been dissolved. Into this mixture yeast is cast in the centre, and worked with a portion of the surrounding mass, which is made of the consistence of a stiff batter. The surface is covered with a little loose flour, and tho whole is left in a stato of reposo untii it begins to manifest decided signs of "working," when it is kneaded into doagh.
This dongh is sprinkled with a littlo flour, covered witi a warm woolen cioth, and left for an hour and a half, when it is anbjected tc $n$ secoud but less general kneading, eut in pieces, welghed, and shaped into the form it is iutended to assome in tho loaf, and bet abidio for some time in a warm place. When ready for the oven, the loaves aro placed in It, buked, and removed in tho form of bread. Thic loaf increases to about twice the sizo which it had in the form of dough, but loses somowhat in weight in the process of baking.
In most Europenn countries the weight of the loaf is regulated by law, the assize being at tended with atrict rogulations and penalties; but in this country the subject of quantity and quality, as a general rule, has been left for tho baker and inis customars to regulate between themselves, it being conaidered that competition would irrobabiy regulato this matter as advantageously for the consumer as it could be done by atriet legal enactments. This is the nore alvisaile, becauso the baker lans it in hila power to increaso tho weight of his loaf iy adulterntions, which are difficult to detect, without adding to its nutritious properties. Is it is, ino is free to solect tho mixture of tlour which la best suited to the wants and tnates of his customers.

There is a great difference in tho ability of varioua kinis of flour to make a given quantity of breai. A portion of this dillerenee consists in tive eapacity of the Hour to nbsori, and retain water, which is not ouly used to meisten the fleur, but absolutely enters into the composition of the bread. Notwithastanding a large portion of tho water used in makiug dough is expelled by the hent of the oven in linking, yet a sufficiency is retainod to ineronse tino weight of the bread largely over tho solid materinls usad in making it.

Whan the bread is weighad immediately after baking, it is found that for every 100 pounds of flour about 138 pounds of bread are mads. This will diminish, by keeping, four or flve pounds, but even when atale It is much above the weight of tha flour actually used. As a general rule, fifteen pounds of flour and ten pounds if water will make twenty pounda of bread, so that ine-fourth of ecich louf of bread consists of roater chemically combined and solidified.

Each baker has his own standard for the aizo and welght of his loaves, as well aa his partlcular method of making bread, "As a general rule, the sixpenny loal welgha from ons pound two ounces to ons pound six ounces, and larger loaves bear a liks proportion of weight to price, Those whose custom ia among the more fashionable classes use a higher-pricad quality of flour, and make a smaller loaf, whilo those who supply tho laboring class of tho community use a good but less high-priced flour, and furnish their custemers whth a large loaf. Many of tice shops contain American, Freuch, and German loaves, whila large numbers of establishmonts confine themselves to the one or the other of tiess species. The chicf difference between the Amorican and French bread consists in the larger quantity of yeast used in the latter, and its greater porosity, or want of closencss. The German bread is more danse than either of these, and contains, in addition to wheat flour, a small admixture of rye flour, which gives to it a slightly sweetish taste, much relished by those accustomed to its use.
The amount of bread censumed every whero is very great. According to M. Iusson, the l'arisim uses about one pound cach day, or three hundred and sixty pounds ench year. 'Tbo Londoner consumes in the ssume time about three hundred pounds; and tha Naw Yorker about two hundred and sixty pounds. The reason of this great disparity in the cousumption of hread in these thres great citlea is easily acen in the larger quaritity of meat and vegetablas used in the one than ill the other. The Loadoner consumes more meat than the Parisian, and consequently less breal, while the amount both of meat aud vegetables used by the New Yorker exceeds tliat of the Londoner; and his consumption of hread is preportionably diminished. This, however, is sulject, in svery country, to great variations; but it may be safely assumed that the famliy that uses nueh mest consames but little bread; and that which consumes but little meat requires a corresponding incrense in the amount of bread.
Bread-fruit. The bread-fruit is a large, globular berry, of a pale-green color, about the size of a child'a head, marked on the surface with irregular sixsided deprossions, and contalning a white and somewhat filrous pulp, which, when ripe, becomes juley and yellow. The tree that produces it (Artocarpus incisa) grows wild in Otahelte and other islands of tha South Seas, is about 40 feet high, with large spreading branches, and has large, bright green leaves, deeply divided into seven or nina spear-shaped lobes. We are informed, in Captain Coek's first Voyago round the World, that the eatable part of this fruit lies between the ekin and the core, and that it is as white as snow, and somewhat of the consistence of new bread. When gathered, it is generally used immeilately; if it be kept more than 24 hours, it becomes lard and choky. The inhabitants of the South Sca islands prepare it ns food tiy dividing the frult into three or four parts, and roastlug it in liot embers. Its taste ls insipid, with a slight tartness, somewhat reaemhing that of the crumb of wheaten bread mixed with Jerusalen artichoke. Of this frult, the Otaieitans make various messes hy mixing it with water, or the milk of the cocoanut, then beating it to a paste with a stone pestle, and afterwarl mingling with it ripe jlantalus, bananas, or a sour pasto, made from the lread-fruit jtself, celled mahie. It continues in season eight montha, and so great is ita utility In tho island of Otaheite, "that," observes

Captain Cook, "t if in those parts where It ia not apontaneously produced, a man plant but ten trees in bis whole lifetime, he will as completely fulfill his duty to his awn and to future generations as the native of our leas temporate climate can do by plowing in the cold of winter, and raning in the aummer'a beat, as often as these seasons return; even if, after ha has procured bread for his present hpusehold, he should convert the surplus into money, and lay it uip for his chlldren." Not only does this tree supply food, hut elothing, and numerous other conveniences of life : The inner bark, which is whito, and composed of a net-like series of fibres, is formed into a kind of cloth. The wood is soft, annooth, and of a yellowish color, and is nsed for the buililing of bosts and housess: In whatever part the tree is woandad, a glutinous mliky juice lasues, which, when boiled whth cocoa-nut oil, is smployed for maklng bird-llma, and as a cement for filling up cracks in such vessela as ars intended to hold water. Seme perts of the flowers serve es.tinder, and the leaves are used for wrapping up foor, and other purposes. As the climate of the South Sea islands is conidered nol very different from that of the West Indies, it was, about 42 yeare ago, thought desirsble that some of the trees ahould he transferred, in a grewing atate, to ths Engilah islands there. Ilis majesty's ship, the Bounty, sailed, in 1787, for this purpose, to the South Seas, under the command of Lieutenant, afterward Admiral Bligh. But a fatal mntiny of the crew at that time pravented tho accomphishment of this benevolent design. The cominander of the vessel, however, returned in zafoty to his country, and a second expedition, under the same person, and for the same purpose, was fitted out in the year 1791. He arrived in eafety at Otahelte, and, after an alsence from England of aboat 18 monthr, landed in Jamaica with about 852 hread-fruit trees in a living state, having left many others at different places in his passage thither. Froin Jamaica these trees were transferred to other Islands; but the Negroes having a general and long-established predilection for the plantain, the bread-frult is not unch relished by them. Where, however, it has not been generally introduced as an article of food, It is used as a delicacy ; and, whether employed as bread, or in the ferm of pudding, it is considered highly palataile by tho European inhalitanta.-E. A.

Breadetuff. Noxt to the cotton trade, that of hreadstutis and provisions is the most important in our foreign export trade, and of far more importancs in ita general bearings upon commerce, and amounts yearly to about one-fifth of the total exports from the United States. As will ajpear from tide table loclow, the exports are increasing very rspidly, laving quadrupled from 1844 to 1804 . It is probabile that this increase will contlnuc, as tho same causes are now operating to enlarge tha demand that have increased the exports for the past.

Great Britain has always heen the best customer for the surplus breadstuffs of the United States. To most other countries which take bresdstuffs of us, our shijiments of flour havo been comparatively unlform, whetier the crop was large or smilil; but to liritsh perts the shipmenta have varied with the quantity we inve had to apare, although averaging nearly half the totai clearances of all farcign ports. Brazil and the West Indies aro regular customers for our tiour, as they furchase about the same quantity every year, nul, nfter Great I3ritain, take tise largest quantity in a series of ynars; but a large portion of our shipments of grain (with' wheat and corn) go to Jritish ports. Thus, of 18,548,151 busbicls of wisent alsipper to all ports from July 1, 1849, to June 30, 1855, 14, 061,211 were sent to Grent lBritain; and of $43,737,517$ bushels corn oxported to all ports within the aame period, $\mathbf{3 6 , 6 6 3 , 9 5 1}$ inshels had the anme destination. We annex a tubinlar statement showling the exports from all jorts of the United States to all forelgn porta, of wheat, whent

## BRE

flour and Indlan corn, both in quantity and valuo, from 1849 to 1855 iaclusive, with a comparison of the quatity of each sent to Groat Britain. The totals are all taken from official documents, and may bo relled upoa as nuthentlo, although it must be noted that of many direct clearances to Great Britaln for orders there are sometimes conaiderable quantities directed from thence to Continental ports. The "famine" of 18.17 led to large shipments of breadstaffe, and to the inauguration of free trade In Englanel, and we commence, therefore, with 1848-' 9 , when the business hat becomo settled under this ayatem. The perlods noted are for the fiscal years endiag June 30:

The ordinary ehipments in former years havo not : cluded any thing direct for France. In the first year named abovo (1849) thero were no exports of flour to French ports, and only 108 bushels of wheat; in 1852 the total includes 2700 barrols of flour, and In 1853 only 8784 barrels; but in tho year ending June 30, 1854, there wera shipped direct to France $1,0.11,086$ busbels of wheat, 728,279 harrels of flour, and 39,200 bushels of Iudian corn. In the following fiscal year (1851-'55) the shipments of flour to the same ports hat dwindled down to 8557 barrels, and thero was no shipment of wheat, but the exports of corn increased to $312, i t 0$ bushels. During the year 1855 , the partinl failure of the crops on the Continent of Larope led to large direct shipments, nul the total exporta to France for 1835-'j6, not yet otficlally compiled, have been larger than ever before recorded to the same ports. As soon as the threshing of whent commenced in the west and north of France ln 1855, its bad quality and light weight created a general panic, nud prices continued to advance up to the firat of Jumury. The abundance caused by the largo recelpts from this country, Spmin, and other sources of supply, cansed a downward temdency in prices throughout Jmuary, 1850, nud every thing was promising for the next harvest until tha Inundations in May. These cheekel the decline without wholly arresting it; but ins the harvest approached, the hopes of an averago crop becumo less sanguine, and it is now generally admited that the supply will be teficient from flve to ten million heetolitres, that is, from fourteen to twenty-elght millions of bushels. The quantly of arable lund in France is set down at Sf,810,000 neres, of which fourteen million hectares, or $34,580,000$ acres, ara devoted to the eulture of grain. The average annunl product is $495,000,000$ bushels of wheat, oats, rye, malze, and meslin, of whith about one-fourth are oats, and two-fifths, or $198,000,000$ hushels, are wheat. With an averago crop, Franca has
beretoforo been able not only to anpply her wanta, but to furnish about $5,500,000$ bushels of wheat (or its equivalent in flour) for the coneumption of Great Britain. It is evident that this export trade muat be cut off or greatly reduced during the current year, as the crop in France is below the wants of her own peoplo. Indoed the total exporte to Great Britain from all the French ports for the year 1855 amounted to an equivalent of only 880,000 bushels, or about 15 per cent. of the usual shipments, and this was all foreign produce, shipped from bond.

months, to June 30 . $\quad+12$ months, to June 30
In Great Britain the crop this year is very good; but it is never sufficient to supply the wants of the people. The total imports of breadstutts into the United Kingilom for the last threo years (reckoning flour, etc., at its equivalent in grain) are as follows:

| Yoars. | Equal to Hushols Wheut. |
| :---: | :---: |
| 183 | $84,416,632$ |
| 1854 | . . . . . 63, 207,240 |
| 1855 | . . 58,227,608 |

The high prices have contributed to reduce the imports into the United Kingdom during the last two years to the lowest possiblo point; but the first six months of the current year tho total imports amounted to $1,859,000$ quarters, showing an increase of 161,000 quarters, or $1,248,000$ bushels, and must continue at about this rato throughout the remainder of the year. Even with a good harvest, the kingdom must need at least $40,000,000$ bushels of grain, or its equivalent in flour, forits own consumption. Of this amount Russia -Northern and Southern ports-whose supplies were cut off during the war, can now furnish $10,000,000$ bushels; Prussia, whose harvest is this year below the avernge, $10,000,000$ bushels; all other countries $5,000,000$ bushels; leaving $15,000,000$ to come from the United States. If prices rule at a comparatively low rate, the consumption will be increased, and the quota from this country may reach 20 or 25 millious of bushels. Spain and Portugal havo hitherto exported to both Franco nul England, the shipments to the latter Inst year being upward of $4,000,000$ bushels.

It is difficult to ascertain the exact production of the United States. The total arnble land under actual eultivation le glven in the Census of 1850 at $113,032,614$ neres, of which $51,700,000$ neres were producing lireadstulfs. The fellowing was the total production of graln as given in the Census returns for 1840 and 1850:

## BRE

A large amount of arablc land haa been brought under cultivation aiace 1850, and those most convarsant with the Weat think that tha product of wheat has increased 50 per cent. aince tha date last given, while other graln has lacreased 20 to 25 per cent. The total yield of wheat being computed at $150,000,000$ bushela, it ls easy to see that the export demand can be filled without creating any extraordinary excitement throughout the country. Last year the farmers anticipated such high rates, that many of them refused to sell in time, and thus were obliged to dispose of their stock far beiow the average price. This ycar the early saics promised to be the best, but there appears to be a limit below which foreign orders will rapidly diminish any home accumulatlon. At present good whito wheat is worth hero about $\$ 160$, and good red about $\$ 150$. Wa acarcely expect to see a decline of 20 centa from these rates during the current season, but within that rango an active foreign businces may be expected. The prospects for Indian corn can not be given until nearer the ciose of the harvest. Fiour will fluctuate more than wheat in price; salcs have been made to arrive in England at a price which would net here about $\$ 5$ for a standard superfine, but this is general'y thought to be an insido price. We have complied from the official recorids a atatement of the averago export price in flour since 1836. The highest price, since 1800, was \$14 75 per barrel, at which ali the shipments averaged in the year 1817. The lowest was $\% 425$, which was the average of 1852. The following is the average of the totol shipments to all ports in each year for the last twenty years. The price in $1854-155$ was enhanced materialiy by the demand arising for export to Europe during the war with Russia. At intervals of that period lirst brands producell over $\$ 13$ in the New York market, and common shipping flour over $\frac{10}{} 10$ per bar-rei.-See Cenaga lepport, United States.
Iearit avbzage Pricg of the Fixports of Wheat Floun fbon tue Unitei 8tates to fonkion Ponts, frow 1886 to 1855.

| Years. | Price. | Years. | Pries. | Yaars. | Price, | Yearo. | Price. |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1836 | \$750 | 1841 | \$5 20 | 1846 | \$518 | 1801 | \$477 |
| 1837 | 1025 | 1848 | 600 | 1847 | 5 tis | 1852 | 424 |
| 1838 | 960 | 1843 | 450 | 1848 | 622 | 1553 | 560 |
| 1809 | 675 | 1844 | 475 | 1849 | 535 | 1854 | 788 |
| 1840 | 587 | 1845 | 451 | 1850 | 500 | 1855 | 1010 |

The periods before noted are the government fiscal years, ending June 30. The average of 1856 is not yet made up, but will be considerably below thet of 1855. If any think we have overestlmated, in the following table, the present production of wheat in this country, we have only to remind them that the cultivetion of thia grain for export received but little stimulus until the repeal of the British corn laws; and since that time we have added the States of Illinois, Iewa, snd Michigan to our wheat-producing States, and by means of railroads made them equal compatitora with the At lantic States.-See Art. Wheat.

Breakers, a namegiven to those billows that break violently over rocks lying below the aurface of the aea. -E. B.
Breakwater is any obstruction of wood, stone, or other material, as a boom or raft of wood, sunken vessels, etc., placed before the entrance of a port or harbor, or any projection from the land into the aea, as a pier, mole, or jetty, so placed as to break the force of the waves, and prevent their action on shlps and vesaels lying at anchor, within them. Thua the plers of the ancient Piruus and of Rhodes; the moles of Naplee, Genoa, and Castellamare ; the piers of Ramagate, Margste, Folkstone, Howth, and the wooden dike de Gichelien, thrown across the port of Roehelle, may all be donominated Breakoaters. In French it ls sonetimes called Battre d Eiau; a nsme which appesre to have heen applled to the mole at Tangier, a work commenced In 1663, under the direetion of Lord Tiviot, Sir J, Lawson, and Sir IIugh Cholmley, and finished, or rather discontinued, in 1676, after having cost Englsnd the sun of $£ 243,8975 \mathrm{~s}, 4 \frac{1}{2} \mathrm{~d}$. The term Breakwater, however, has of lato years been considered as more pecnliarly appropriate to large insulated dikes of stone, whether of regular mssonry or sunk promis cuously in rough masses, so placed as to form an artificial island across the mouth of an open roadatead, and therely, from obstructing and breaking the waves of the sea, to convert a dangeroua anchorago into a safe and eommodious harbor tor the reception of ships of war or merchent: .en.
Of this description of dike for sreating an artifielal harbor on a grand scale, fit for the reception of ships of war of the lurgest class, there are remarkablo examples in the break waters of Cherbourg, Plymouth, Portland, Delaware, ete. The first stone of the break water at Plymouth was lowered in the presence of multitodes of the peoplo, August 12, 1812. It was designed to break the awell at I'lymonth, and stretches 5280 feet across the Sound; it is 360 feet in breadth at the bottom, and more than 30 at the top, and conguned $3,666,000$ tons of granite blocks, from one to five tons each, up to April, 1841 ; and cost a million and a half storling. The architect was Rennie.-See Art. Ciennotug and Dela waire Bneakwatens.
Breeches. Among the Greeks this garment indlcsted slavery, It was worn by the Dacians, Parthiaus, sud other Northern nations; and in Italy, it is said, it was worn in the time of Augustus Cresar. In the reign of ILonorius, ..bout A.1. 394, the braccari, or breeches-makers, were expelled from Rome; but soon afterward the use of breeches was adopted in other countries, and at length it beesme general,-Ilayids.
Bremen, one of the free Hanseatic eities, on the Weser, about 50 miles from its mouth, lut. $53^{\circ} 48^{\prime} \mathrm{N}$., loug. $8^{\circ} 48^{\prime} 3^{\prime \prime} \mathrm{E}$. Population in 1849, 53,478. Its situation renders Bremen the prineipal emporium of Ilsuever, Brunswlek, IIesse, and other countries traversed by the Weser. Tha charges on the buying, selling, and shipping of goods are very moderate. The principsl German exports aro, woolen goods, linens, grain, osk bark, glass, smalts, hides, rape-seed, beef and jork, rags, wool, whe, etc. 'The wheat and barley shipped here are mostly inferior ; but the oats are useful common feed; beans are good. The linens are mostly the same ns those from llamburg. The limports consist of tobace (of which large quantities are re-exported), coffeo, sugar, and other colonial prodnets; whale-oil, iron, rice, hilles, wines, raw cotton, cotton stuffs and yarn, earthen-ware, brandy, tar, tea, dye-woods, timber, hemp, etc.
Bramen lias long been, and continues to be, the most inportant eatrepôt on the Continent for the sale of tolacco. In 1851, about 5000 hands were engaged in the manufacture of cigars, of which the export was estimated at 235,000 boxes of 1000 euch; hut an increase of the duty on eigars lmported into the German Custems Union subsequently gave the trade a check.

Entrance to Bremen.-The entrance to the Weser lies between the Mellum and other aands on the southweatern, and the Teglers Plaat, etc, on the northeastern side. Ita conrse from Bremerlehe to its mouth Is nearly seutheast and northweet. It la buoyed throughout. The buoya on the right or starboard side, when enterlng, being black and marked with letters, while those on the left or larboard are white and numbered. The first or outer llack buoy has a gilt key upon it, and ls, therefore, called the schlussel, or key buoy; it lies in 101 fathoms, bearlag northeast 5 mlle from Wrangeroog light. Thls is an intermitting light, having replaced, in 1850 , the old coal-fire beacon on the lsland of Wrangeroog, opposite to the northern extremity of East Frlesland. It ls, according to the most authentic ststements, in lat. $53^{\circ} 47^{\prime}{ }^{\prime}$ N., long. $7^{\circ}$ $51^{\prime} 55^{\prime \prime}$ E. $;$ is elevated $68 t$ feet above high-water masrk, being alteraately visible and lnvislble for the apace of a minute. A light-vessel la moored in the fair-way of the Weser, between the blsek buoys $E$ and $F$, and the white buoys 2 and 3. She has two maata ; during the day a red flag, with a white eross upon it, is kept flylng at the main-mast ; and at night ahe exhibits 7 lantern lights, 28 feet above deck. This vesael is on no ac count to leave her station, unlesa compelled by the ice. Large vessela do not now gencrally ascend farther than Bremerlele, on the east side of the river, about 38 miles below Bremen, where a new and spacious harbor, called " Bremer Haven," has been constructed. But vessels not drawing more than 7 feet water come up to town; and thoso drawing from 13 to 14 feet may come up to Vegessack, about 13 miles from Bremen. The latter had, in 1849, a population of 8538 , und Hremer Haven of 3618.--See the Sailing Direetious for the North Sea, published by Mr. Norric.

Breslau, a city of Prussia, capital of the province of Silesia, and of the circle of same name, on the Oder, at the intlux of the Ohlau, snd on the railroad from Berlin to Vienns, 409 feet above the Baltic, 190 miles sontheast of Berlin. Lat. (of observatory) $51^{\circ} 6^{\prime} 57^{\prime \prime}$ N., long. $17^{\circ} 2^{\prime} 33^{\prime \prime}$ E. Population of the circle in $1849,1,17 \cdot 1,676$; of the eity, 112,194, of whom nearly three-fourths are I'rotestants. It is the greatest emporium for tho linens of Silesia, for which it has four annual fairs of eight days each, and the grentest mart for wool in Germnny. It has mnnufactures of linen, wool etr, cotton, and silk fu'brics, lace, needles, plate, jewel ry; earthen-ware, colors, sonp, alnm, starch, snuff, und sealing-wax ; and an extensive trado in mining produce, timber, fins, hemp, madder, corn, and oxen, from the southern Russian provinces, and in IIungarlan wines and other merchandise. It hass an active trade on the Oder, and communientes by railroad with Berlin and Frankfort on the north, Dresden on the wesi, Cracow and Warsaw on the east, and Vienna in the south. It was bomburded and taken by the Frenel, January 7, 1807, and its fortress, then partly destroyed, has since been eutirely razed.

Brewing is the art of preparing an exhilarating or
intoxicating beverage by meana of a process of fermentation; but at the present day the term is usally linitted to the manafactare of different kinds of beer, from lafuslota of malt or of gralns. In all ceuntries, aavage and civillzed; one kind or ether of exhllsrating or Intoxicating drink is prepared. In the warmer regions of the globe the julee of varlous palm-trees is extracted, and, when fermented, forms the favorite beverage. Over all the warmer regions of South Amerlea, and in Mexico, the universai drink is Pulque, the fermented julce of the American aioe (Agare A mericana). Guarapo, a favorite drink with the Negro races is the fermented julca of the sugar-cane; and when the sugar-cane is not in season, these races prepare fermen'ed drinks from heney and from rice. In many North rn countrics, aud even occasionally in the highiands of Scotland, the juices of the birch, maple, or ash, are fermented, and form a palatable drink. Koumis, the intoxicating beverage of the Mongols and the 'Sartars. is' the fermented miik of the mare. In countries favorable to the growth of the vine, wine is the usual heverage. The Peruvians and many other Indians prepare their favorite intexicatlng drink, chicha, from maize. The Arablans, Abyssinlans, and eeveral tribes in Africa, prepare their fermented drink, bousa, from the flour or bread made from teff (Poa Abyssinica) ; but the durrha or millet (Sorghum rulgare), and even barley itself, are occasionally substituted for the teff to prepare the muddy, zour bousa. Tha universsd Russian beverage, krass or quass, a sharp, aeld, muddy liquid, almest the samie in taste and appearance as "bousa," is made by mixing rye bread or rya flour, or sometimes barley fiour, with water, and fermenting it. The well-known natlonal German drink, the weiss bier, is prepared from a fermented infusion of wheat malt with only a gixth part of bariey malt. But over almoat sll the civilized world, the fermented infuaion of barley malt, seasoucd or not with hops or other Litters, when it takes tho name of beer, is the favorite leverage.-E. $\mathbf{B}$.
Bribe. The glving or offering a recompense or :ward to any person to induce bim to neglect lis dury.
Bricks and Tiles, well-known articles used in the bullding and covering of houses. They ure made of baked clay and sand.

Fire-bricks.-A mode has been invented intended to do away with menual labor in the manufacture of tre-bricks made from ground clay, by passiug it directly from the griadlng-mill to the machine, whare it is made lnto bricks ready for the kiln, instead of adding water and making it lnto a paate according to the present process. The Invention consists of a combination of hydraulic machinery, for compresslug clay in a pulverized atate inte bricks, and for chenging the position of the moulda in which the clay is compreased, so that they may fill and discharge themsel ves after compresslon. After the clay is formed inte bricks the aides and end of the mould recede, and leave them free, without any forcing, which cffectually prevents ali liability to fracture or damage. A machine with two moulda wlil produce from 2000 to 4000 per day.
Bridges. Se eariy and gencral, and the expedients for their construction so various, their origln can not be traced; they were firat of wood. The ancient bridges In China are of great magnitude, and werc built of stone. Abydos ls famous for the bridge of bonts which Xerxes built across the licilespont. Trajan's magnlficent stone brldge over the Danube, 4770 feet in length, was huilt in A.d. 103. The Ievil's bridge, in the canton of Uri, so called from its frightful altuation, was built reating on two high rocks, se that It could acarcely be concelved how it was erected, and many fabuleus stories were invented to account for it . At Shaffhausen an extraordinary bridge was bullt over the Rhlne, which is there 400 feet wide: there was a pler in the middle of the river, but it is deubtful whether ti bridge rested upon it; a man of the iight-
est weight felt the bridge totter under him, yet ragons heavily lsden passed over without danger. This bridge was destroyed by tha French in 1790. Suspension bridge at Niagara Falls completed Jnly 29, 1848. The ancient bridges in England were of woed, and were fertitied wlth planka and merlined; the first bridge of stene was buit at Bow, near Stratford, A.D. 1087. Westminster bridge, then the finest erected in these realms, and not burpassed by any in the world, except in China, was completed in twelve years, 1750 . Tho other London bridges are Blackfriars, completed 1770; London (reluilt), 1831; Sonthwark, of Iron, 1819. The first iron bridge, on a large scale, was erected over the Severn, in Shropshire, 1779. The fineat chain anspension bridge is that of the Mens! Strait, completed in 1825. Hungerford suspension bridge, 1848.-Flaydn.

Bridgewater Canal, the first great werk of the kind in England, was begun by the Duke of Briagewater, styled the father of canal navigation in that country, in 1758. Mr. Brindley was the archltect. The canal commences at Worsley, aeven miles from Manchester; and at Barton bridge is an aqueduct which, for upward of $\mathbf{2 0 0}$ yards, conveys the canal across the navigable River Irwell : the canal is $\mathbf{2 9}$ miles ieng.

Brimstone. Sce Sulriun.
Bristles (Fr. Soies; Ger. Borsten; Da. Borstels; It. Setole; Sp. Cerdas, Setas ; Pol. Szezeciny; Russ. Schtschetina; L.at. Setae), the strong glossy halrs growing on the back of the hog and the wild boar.

Bristol, a clty, sca-pert, and county of England, situated chiefly in Qloucestershire, and partly In Somersetahire, on the A von, at its confuence with the Frome, and 8 miles southeast of its emhouchure in the Bristol Channel, $11 \frac{1}{2}$ miles northwest of Batli, $33 \frac{1}{2}$ miles south-southwest of Gloncester, and $118 \pm$ miles west of London, with which it is connected by the Great Western Railroad. Lat. of cathedral, $51^{\circ} 27^{\prime}$ N., long. $2^{\circ}$ $36^{\prime} \mathrm{W}$. Area of border, including the distance added by the mundeipal act, 9870 acrea. Population in 1801, 39,914; in 1841, 123,188; and in 1851, 137,328. Bristol extends over several hills and intermediate valleys. It long ranked as the second commerelal emporiuns of England, but its progress has not kept pace with that of other porta niore adventageously placed as outlets of great manufacturing districts. It has, however, large Iron and brass founderies; copper, tin, zinc, and giasa works; chemical and color works; sugar refineries and distilicries; and considerable manufactures of plns, shet, chlns, carthen-wares, soap, leather, tolacco, cottons, hats, and foor-clothe, with extensire estsblishmenta for shlp-building; and in its vicinity aro large brick and coal works. The Avon at l3ristol, though narrow, is deep enough for large ships, and carly in the present century its course was turned for some distance at a cost of $\mathbf{5 7 0 0 , 0 0 0}$, and its own channel now forms a harbor furnished wlth locks and qusys 6000 feet in length. Ships of large burden and tirst-rate ateainers load and discharge carge at Kingruad, in the mouth of thls river. The city retains a large share of the West India trade. Imports consisting chiefly of sugar, molassea, rumi, coffee, tolaceo, wlth wool, turpentlne, hemp, timber, wine, and brandy, from North and South America, the Baltle, and France. Bristol communicates by raliroad with Birmingham and Eseter, with the Themes, ete., by the Kennet and Avon canal. It was the first port in Britain whence regular steain communicatlon with the Unlted States was established. It has a chamber of commerce and seversl mercantile corporate bodies; and it lately had six banking companles. In 1848 it was made a free port. The city is divlded into ten wards, and governed by a mayor, sixteen aldermen, and forty-eight councilors. Ita corporation has jurisdletion on the Avon from four miles sbove the city down to the sea, and along the channel to Clevedon; also the right to license pilots for numerous perts on the Brlatel Channel. Markets
daily, that on Thuraday, for cattlo. Fairs for horses, leather, etc., Mareh 1st and Soptember lst. Spring Assizes for civil causes, Quarter Seasions, Sheriff'a and other coarts are held here. ; Bristol bolenge to Clifton and Dedminater poor-law union. Under Henry VIII. It was made a blahop's see, lately united with that of Gloucester. It sends two members to the House of Commonn. It was a fortified clity as early as the fifth century. In Norman tlmea it had a castle built by the Earl of Gleucester, mon of Henry 1. In 1831 it was the scone of a vlolant riot, during which Its Episcopal palace and many other buildinga were destroyed. Among its distinguished nativea may be noticed Sebastian Cabot, Chatterton, Southey, and the sculptor Bailey. Bristol confors the title of Marquis on the Her vey family. The sconery in the vicinity, especially at Ilot well Saline Spring, la exceedingly beautiful.

Bristol Channel, an arm of the Atlantic, entering between St. Ann's Head on the north and Land's End on the sonth, extending lnto the southwest part of Great Britain, between lat. $50^{\circ}$ and $51^{\circ} 40^{\prime} \mathrm{N}$., and long. $3^{\circ}$ and $5^{\circ} 30^{\prime}$ W., bounded northward by South Wales, and southward by the English countlies of Somerset, Deven, and Cornwall. At its eastern extremity it terminates in the estuary of the Severn, besides which river it reccives the Parrat, Taw, Torridge, Taff, and Towy. Sandy island, with its lighthouse, is in tho meuth of the channel, and the towns of lifracombe, Combe-Martin, Watchet, Swansea, Kidwelly, and Tenby, are un Its coasts. It contains Milford Haven, Carmarthen Bay, and Swansea Bay on the nerth, and Barustable, Porlock, and Bridgewater Bay on the south. Ita tides tow rapidly upward, and, meeting with the currents of the Severn, cause the phenomenon called the bore.

Britain. See Great Baitain.
Brocade (Spanish brocodo), a stuff of gold, silver, or silk, raised and enriched with flowers, foliages, and other ornaments. Formerly the word signitied oaly a stuff woven all of gold, both in the warp and in the woof, or all of silver, or of both mixed; at present all stuffs which are ralaed and enriched with flowers or other figures are called hrocadcs. The trads in this article was carried on by the Venetians.-Anderson. Its manufacture was established with great success at Lyous in 1807.
Brokerage, the commission or percentage paid to brokers on the sale or purchasc of bills, funds, goods, etc.-See Factorages.
Brokers. Those both of money and merchandise were known early in England. Their dealings were regulated by law, and it was enacted that they should be licensed before transacting busincse, 8 \& 9 Will. III. 1695-96. The dealings of stock-brokers wero regulated by act 6 Geo. I. 1719, and 10 Geo. 1I. 1736. Some derive the word broker from the French broier, "to grind;", others from brocarder, "to cavil or lilggle;" and others, again, from a trader broken, and that from the Saxon broc, "misfortune."
A broker is an agent or intermediate person appointed for transacting special business on account of another, but differing somewhat from an ordinary factor in functions and responsibility. Of this class there are various descriptions exercising employment witheut the smallest analogy, though all are brought under the general name of brokers; and of these the principal aro exchange brokers, whose province is to ascortain the rates and rolation of exchange between countrios; stock-brokers, who negotiate transactions in the putblic funds; insurance brokers, who effect insursnces on lives or proporty, aud pawnbrokers, who advanco money on goods, on condition of being aflowed to sell the goods, If the aum advanced la noi repaid with Interest, within a limited time,-See Agent, Insurance, and Sale.

Separating pawnbrokers and those dealers in old warss whe are ealled brekers, as beth listinet from the class to whom the term In its broader acceptation ap-
plies; the broker is an agent for both : riles, the buyer and the seller; and for the general principles of jurisprodance applicable to his position, referance may be made to the word Agesr. It la a murked pocullarity, however, of the broker an an agent, that his quality of agency is not only palpable in the face of the transaction, but he is agent for both partles, and therefore those subtle niceties of law whlch arise out of the agent acting as principal can not apply to this class of agencles. The function of the broker $\mathrm{ls}^{2}$ ladeed, a very aimple one, and easily aeparatea ltself from the usual in. tricacies of the law of sale and of agency. It is hls proper function to find buyers and sellers, and to bring then together that they may trausact with each other. Hence the rise of such a class in any department of busineas is an indication of its great increase. In small towns, and in narrow and peculiar departments of business, the buyers and the scllers know each other, and need not be at the expense of employing a third party. But where both bodies are numcrous, and the individual members of each find enough to occupy their attention in the production of their commodity, or its purchase and distribution, thero is economy in the establishment of a distinct class who bring the buyer and the seller togother. The late enlargement of the railway system has created a pecnliar and extensive aygtem of brokerage transactions.-E. B.

Brokers are divided into different classes, as bill or exchango brokers, stock-brokers, ship and insurance brokers, pawnbrokers, and brokers, simply so called, or those who sell or appraise household furniture distrained for rent. Exclusivo, too, of the classes now mentioned, the brokers who negotiate sales of produce between different merchants usually confine themselves to aome one department or line of business, and by attending to it exclusively they aequire a more intimate knowledge of its various details, and of the credit of thoas engaged in it, than could bo looked for on the part of a general incrchant, and aro consequently able, for the most part, to buy on cheaper and to sell on dearer terms than those less familiar with the business. It is to these circumstances-to a sense of the advantages to bo derived from using their intervention in the transaction of business-that the extensive employment of brokers in all large commercial cities ls wholly to be ascribed.

Bronge (Ger. Stülgut, Stükmetall; Du. Stühgoed: It. Bronzo; Sp. Metal de Canones; Lat. Metallum tormentorum), "a mixed metal, consisting chiefly of copper, with a small proportion of tin, and sometimes other metals. It is used for casting statues, camon, bells. and other articles, in all of which the proportions of the ingredients vary."-Urk. Bronzo was knewn to the ancients, some of whose statues, vessels, and various other articles, made of bronzo are in the l3ritish Museum. The equestrian statue of Louis X1V., 1699, in the Place Vendóme at Paris (demolished August 10. 1792), was the most celessal ever made; it contained 60,000 pounds' weight of bronze. Bronze is two parts brass and one copper, and the Greeks added one fifteenth of lead and silver.

Brooms (Ger. Besen; Fr. Balais; It. Scope, Granate; Sp. Escobas; Iluss. Metlii) aro principaliy mnde of birch or heath. Vast quantities are manufactored in Southwark for the supply of the London market.

Bruges (Fleu. Brugge), a fortified city of Belgiam. capital of the province of West Flanders, on the Brussels, Ghent, and Ostend railroad, 75 miles from Brussels and 14 from Ostend, and at the junction of the canals from Gheut to Ostend, and to Sluis. Lat. (of the halle apire) $51^{\circ} 12^{\prime} 80^{\prime \prime}$ N., long. $3^{\circ} 13^{\prime} 44^{\prime \prime}$ E. Population, 50,272 . Bruges is surrounded by walls, and defented by an old citadel ; it is one of the most flourfshing commercial cities in the kingdom. It owes its name to the number of its bridges (upward of fifty), which cross its canals, and is remarkable for the many fine Gotlic buildings which it a ntains. Chief ladue-
try; the manuficture 0 . sace, which is celebrated, and occuples more than a sixth part of the female population; manufactures of llaen, woolen and cotion fabrics, cordage, foliacco, and soap. Bruges has numerous dlstilleries, breweries, tanneries, dye-works, sagar and salt refneries, and ahip-bullding yards. Its docks are capable of containing one hundred barges, and are surreunded with spaclous warehouses. Principal exports, lace and other manufactured goods, graln, and cattle. Importa, wool, cotton, dye-woods, wine, and colonial products. Bruges was formerly the capital and residence of the Connta of Flandera; In the thlrteenth century it was one of the most commercis! citlea In the world, and the richest entrepót of the Hanseatio Leaguc; It was long renowned for the excellence of its woolen cloths and tapestrics; It began to decline at the end of the tifteenth century, when the religioua persecutlons of Philip 1I. obliged Its Inhabltants to seek refuge in England. In 1430 Philip the Good, duke of Burgundy, here institated the order of the Golden Fleece. Charles II. lived at Bruges during his exlle from England.

Brush, a well-known Implement used for various purposes, such as clearing away dust, amoothing or pulishlng surfaces, etc Ordlinary brusher se made of amall bundlea of bristlea or hairs, secured at one end by a ligature; and this knotted end is set with glue or censent into a wooden stock, which is shaped and pierced with holes for the purpose. A patent was obtained in 1830 for aeveral improvements in the construction of brushes. Of these the chlef feature consists in pressing the knotted ends of the bundles into wedge-shaped grooves in the stock; after which they may be further secured by being covered with a ferule of metal, or a wooden pallet. Small brushes are generally made by doubling the hair or bristle, and bringing it through the holes in the stock by means of a thread or wire which ls engaged in the fold, and serves to secure it; after which the bristles are cut even. Brushes vary In thelr size, form, and materiala of construction, according to the several uses to which they are applied. Silver-smitha and other artificers use a wire brush for scrubbing sllver, copper, or brass, previous to gilding. In some countries the luainboo or other fibrous plant is converted into a kind of brush, for paintlag and slmilar parposes, by fretting the extremity by beating and then bhding it firmly above the part so treated.

Brusself (Fr. Bruxelles), a city of Central Europe, capital of tha kingdom of lelgium and of the province of Brabant, on the Senne, and on the Belgian railroad, 88 milea from Ostend, 27 from Antwerp, 48 from Ghent, 71 from Liege, 92 from Lille, 149 from Cologne, 150 from Paris, and 272 from London. Lat. (of observatory) $50^{\circ} 51^{\prime} 11^{\prime \prime}$ N., long. $4^{\circ} 21^{\prime} 10^{\prime \prime} \mathrm{E}$. Population in $1845,117,462$; in $1853,145,000$. Altitude of oisservatory, 190 fcet. Cllmate temperate, humid, and very variable, but healthy. Mean temperature of year, $49^{\circ} \cdot 6$; winter, $38^{\circ}$; summer, $64^{\circ}$ Fahrenheit. It is the most important city in the kingdom, and the chief acat of publlic instruction and industry, the residence of the courts, the seat of the legislative assemblies, courts of appeal, and chamber of commerce. Brussels is remarkablo for the number and richness of its ancient baildings; and, from the elegance uf its new quarters, it ranks amoug the finest cities of Eorope. It Is the seat of the priacipal hanka, end of the only mint of the klugglom, and has a savings lisnk and many wealthy ard charitable institutiuna; it la one of the great centres of Belgian industry, and lt ja stlll celebrnted for its lace, considcred the finest in the world; its other chief manufactures are of fime linens, damask, silk and cotton ribbons, gold and silver embroldery, hats, paper, machlnery, jewelry, and mathematical and nusical instruments. It has also establlshmenta for coach-hullding and cabinet-making, msnufactorics of chemical products, soap, porcelaln, and crystal, and extensive sugar refincriea and breweries. It has many extensive
typographlcal and Ilthographic estahlishmente, which are chlefly employed In reprintis of workn published In France. The commerce of Brussels fs facilltated by a canal which connects it with Antwerp, and admits vessels of 300 tons burden, by excellent roads and by rallways, which radiate from It In every directlon. Brussels is a very anclent city; it is belleved to have been founded in the seventh century; It was fortlifed In the eleventh centary, and was the reaidence of the Dukes of Brahant, and afterward of the Spanish and Austrian governors general of the Netherlands: Its furtifications were dismantled by Joseph II. It was, under the French empire, capital of the dependencles of the Dyle; prevloua to 1830 , it was one of the capitals of the kingdom of the Netherlands, and alternately wlth the Iague, the seat of the court and of the States-General: It ls the blith-place of the physicians Vesallus and Van IIelmont, and one of the two painters Champaigne.

Bubblea, famltiar name apolied generally to fraudulent or unsulastantial commerelal projects, which hold ont hopes of rapld galn, for the purpose of enrichIng the projectora at the expense of sanguine and ignorant adventurers: and partlcularly used to designate those projects the funds for whlch are raised by the sale of shares or aubscriptlon to a transferable stock.

In consequence of the mischles produced by the gambling in transferable shares of buhble companies at the tlme of the South Sea project, 1719 and 1720 , the stat. 6 Geo. I. c. 18 , reciting that several undertakings or projects had been contrived and practiced, which "manIfestly tended to the common grlevance, prejudlee, and Inconvenience of great numbers of hla majesty's subJecta in their trade and commerce," and describing, among other practices of the time, the ordinary mode of ralsing money by shares and subscriptlons to a pretended transferable stock, enacted that the undertaklngs and attempts so described, and public subscriptlons, assignments, and transfers for furthering them, and particularly the ralsing or pretending to raise transferable stocks without authority of charter or act of Parliament, should be deenied illegal and vold, and prohiblted them under severe penaltics. Some declslons limited the operatlon of, and finally the stat. 6 Geo. IV. c. 91, sltogether repealed these enactmenta and prohibitions. The projectors of bubbles, therefore, are now punishable only when they can be deemed guilty of frauds or conspiracies at common lsw; and there is no other check on the adventurers than the los ind troublesome labilitles under the law of partnershı, la which partlcipation in these projects ofteainvolver them.

Buccaneer (from the French boucaner), In its primary sense, denotea one who drles and smokes flich or fish after the manner of the Indians. The name was particularly given to the first French setticrs In the island of St. Domingo or Hayti, whose principsl employment consisted ln hanting bulls or wild boars, In order to acll their hldea and flesh. The name has also been applied to those famous piratical adventurers, chlefly English and French, who joined together to commit depredations on the Spaniarda of America.

The Buccancers of St. Domingo.-The Spanlards had not long been in possession of the West Indles and of the contloent of America, when other natlona, especially the Einglish and the French, began to seek establishments there. But though the Spaniards were unable to people auch extensive countriea themselves, they were resolved that no others should do it for them, and therefore waged a cruel war on all those of any other nation who attempted to aettle in any of the Antilles or Caribiee 1slands. The French, however, were at last lucky enough to acqulro some footing in the island of St. Christopher's; but by tho tlme they began to subside into a regular form of government, the Spanlards found means to dislodge them. Upon thls the wretched fugitlvea, considering at how great a distance they were from their mother conntry, and how near to the Island of Ilispaniols or St. Domingo, the

 1 lescribing, nary mode to a pre-undertak-subseriping them, $g$ to ralse rter or act 1 veid, and ome tecisthe stat. 6 tments and refore, are ned guilty nd there is e logr ind nersbis, lat ilver them. in its priokes flesh The name settiers in principal vild boars, name has renturers, ogether to nerica. niards had lies and of , especial. cek estabs were unhemselves, ( for them, ose of any iny of the , however, footing in time they vernment, m. Upen ow great a , and how alago, the
northern parts of which were then uninhabited, and full of awina and biack cattle, immediately resolved to take possession of that country, in eonjunction with anveral other adtwaturers of their own and the English nation; especially as the Dutch, who now began to appaar in these eeas, promised to aupply them plentifully with aill kinda of nec•ssariea they might require, in exchange for the hidea and taliow they ahould procare by hanting.
These now settlera ohtained the name of buccaneers, from their custom of bucanning their beef and pork in order to keep it for asie or for their own consumption. But some of them aoon grew tired of thia new way of life, and took to planting; while many more ehose to turn pirates, trusting to tind among those who remained on shore a quick saie for ali the plunder they could make at sea. This new body of adventuren were calied freebootera, from their making free prey or booty of whatever came in their way.
The colony now began to thrive at a great rate, by the cheap and easy manner in which the freebooters acquirad the greatest riches, and the profusion with which they distributed them among their old companjens, the buecancers and planters, for the merest triffes. Thía brought numbers of settlera from Franee in qualjty of indentured servants, though they toiled rather liks slaves than aervants during the three years for which they generally bound themselves. One of these men presuming to represent to his master, who always fixed upon Sunday for sendlog him with skins to the port, that God had forbidden such a practice when he had deelared that "six days shalt thou labor, and on the seventh day shalt theu reat," the brutish buccaneer repiied, "And I say to thee, six days shalt thou kiil buils, and atrip them of their skins, and on the eeventh day shalt thou earry their hides to the sea-shores ;" and this command was followed by blows. Thus the colony consisted of foar classes-buceaneers, freebooters, piantars, and indentured aervants, who generally remained with the huecanears or planters. And these four orden composed what they now began to call the body of adventurera, who lived together in perfeet harmony, under a kind of democracy ; every freeman having a despotic authority over his own family, and avery captain beling sovereign in his slip, though liable to be discarded at the diseretion of the crew.

Tise pianters had settled chiefly in the little island of Tortuga, on tho northern coaat of Ifispaniela; but soon afterward some of them having gone to the great island to hunt with the buccaneers, the rest were surprised by the Spaniards ; and ail, oven these who had surrendered at discretion in hopes of mercy, were put to the aword or hanged. The next care of the Spanjards was to rid the great istand of the luccsueers; ant for this purpose they assembled a body of fiva hundred lance-men, who, by thair seldoin going fewer than fifty in a company, obtaincd frem their enemiea the name of the Fifties. But before detaliling the particulars of this attuck wo ahali endeavor to give some account of the manners and eustoms of the peopie whom it was proposed to extirpate.

The buecancers lived in little huts built on aome apots of cleared ground, juat large enough to dry their skins on, and contain their bacanning houses. These spots they calid boucans, and the huts they dwelt in ajoupas, a word winch they borrowed from the Spaniarls, and the Spaniards from the natives. Though these ajoupas lay open on all sides, they were very agreeable to the hardy inhahitants in a climate where a free cireulation of air is so desirable. As the buceancers had neither wives nor children, they associated by pairs, and mutually rendered each other all the services a master eouid reasonably expect from a servant, living togetier in so perfect a community that the survivor always succeeded his deceased partuer. This kind of union or feliowship they cailed s'emateloter (insailoring), and each other matelot (sailor), whence is derived the cuatom
of giving, at loast in some parts of the French Antilies, the name matelotage (aaliorage) to any kind of society formed by private persona for their mutual advantage. They behaved to ench other with the greatest juatice and openneas of heart ; it was considered as a erime to keep any thing under lock and key; but, on the other hand, the least pilfering was unpardonable, and punlahed with expulaion from the community. And, indeed, there could be no great temptation to steai, seeing it was reckoned a point of henor nover to refuse a neighbor what he wanted; and where there was so little property, it was imposaible there should be many disputes. If any such happened, the common friends of the parties at variance interposed, and soon put an end to the differenco.

As to law, the buecaneer acknowledged none bnt an odd Jumble of conventions made between themselves, wh!eh, however, they regarded as the sovereign rule. They stenced all objections by coolly answering that it was not the cuatom of the coast; and grounded their right of at ng in chis manner on thair baptism under the tropic, which freed them, in their opinion, from all obligations antecedent to that marino ceremony. The governor of Tortuga, when that island was again settled, though appointed by the French court, had vary little authority over tham; and they contented themselves with rendering him from time to time some slight homage. They had in a manner entirely shaken off the yoke of religion, and thought they did a great deal in not wholly forgetting the God of their fathers. Wo are surprised to meet with nations among whom it is a difficult matter to discover any trace of a religious worship; and yet it is certain that, had the buecanecrs of St. Deminge $t$ en perpetuated on the same fuoting on which they subsisted at the time we are speaking of, tho third or fourth generation of them would have possessed as littla religion as the Caffres and Ilottentota of Africa, or the Cannibals of the South Sea islands.

Such were the buecancers of St. Domingo, and such was their situation when the Spaniards undertook to extirpate them. And at first the assailants met with great success ; for as the buccaneers hunted separately, every one attended by his servants, they were casily purprised. Hence the Spaniards killed numbers, and took many more, whom they condemned to a mest cruel slavery. But whenever the buecancers had time to put themaclves into a state of defense, they fought like lions, to avoid falling into the hands of a nation from whem they were sure to receive no quarter; and by this meana they often eacaped; nay, there are many instances of single men fighting their way through numbers. These dangers, however, and the success of tho Spaniards in discovering their boueans, where they used to aurprise and ent the throats of the buccaneers and their servants in their sleep, engaged them to cohalit in greater numbers, and even to act offensively, in hopes that by ao doing they might at last induce the Spaniards to let them live in jeace. But the fury with which they behaved whenever they met any $S_{j}$ )aniards served only to make their enemies more intent on their destruction; and assistance coming to both parties, tie whole island was turned into a slaugh-ter-heuse, and so much blood spilled on both sides, that many places, on account of the carnage of which they had been the acencs, were described as the hill of the massacre, the plain of the massacre, the valley of the massacre, and so forth.

At length the Spaniards grew tired of this mode of proceeding, and had recourse to their old method of aurprise, which, againat enemies of more ceurage than vigilance, was likely to sueceed better. This placed the buecancers under the necessity of never hunting except in large partiea, and flxing their boucans in the littie islands on the coast, where they retired every evening; an expedient which succeeded very well, and the boucans, by baing more fixed, aoon aequired
the alr and conaistency of little towna. When the buccancers had once cetablished themselves, as here related, each boucan aent out acouts every morning to the highest part of the isliand, in order to reconnoitre the coast; and see if any Spanish parties were abroad. If no enemy appeared, they appointed a placo and bour of rendeavous in the evening, and were never absent if not killed or mado prisoners. When, therefore, any one of the company was miesing, it was not lawful for the rest to hunt again till they had got intelligence of him if taken, or aveaged his death if killed. Things continued in this altuation for a long time, till the Spadiards made a general hunt over the whole Island, and, by deatroying the game, forced the buccanoers to hetake themselves to another courso of life. Some of them turned planters, and thus increased the French settlements on the coast, or formod othera; while the rest, not relishing so confined and regular a life, entered among the freebootera, who thereby became a very powerful body. France, which had hitherto disclaimed for her subjects these ruffians, whose succosses were only temporary, acknowledged them, hovever, as soon as they formed themselves into settlements, and took proper measures for their government and defeaso.
Buccaneers, the Pivates.-Defore the English had effected any zettlement ln Jamaica, and the French in St. Domingo, some pirates of both nations, who were afterward so much distinguished by the name of Buccaneers, hail driven the Spaniards out of the small island of Tortuga; and, fortifyiag themselvea there, hat with an amazing intrepidity made excursions against the commen onemy. They formed thenselves into small cempanies consisting of fifty, a hundred, or a himdrod and fifty men each. A bont, of groater or amaller size, was their only armament. -Here they were exposed vight and day to all the inclomeacies of the weather, having scarce room euough to lie down. A love of aboolute independence readered them averse from those mutual restreints which the members of society impose apon themselves for the common good; and an the authority they had conferred on their eaptain was confined to his giving orders in battie, they lived in the greatest confusion. Like the savages, having ne apprehension of want, nor any care to preserve the nocessaries of life, they were constantly expased to the reverest extremitics of hunger and thirst; but deriving from their very diatressea a couruge superior to every danper, the sight of a ship tramsported them to a degree bordering on frenay. They never delliserated on the attack, lut it was their custen to board the ahlip as soon as pessilite. The amallness of their vessele, and the akill they showed in the management of them, acreened them from the fire of the larger class of ships; and they pmented only the fore part of their little vessels filled with fusileers, who fired at the port-holea with so much exactness that it entirely confuanded the most experienced gumuers. As soun as they threw out the grappling, the largest vessels aeldom cacaped them.
In cases of extrence necessity they attacked the people of everf oation, but fell upon the Spaniards at all thees. They thought that the crueltien whleci the latter lad exereised on the inhabitants of the New World juatified the implacalile aversion they had aworn againat them. Hut this was hoightenell by the mortification thoy felt In seeing theuselves debarred frown the privileges of hunting and lishing, which they contshlered us natural rights. Thetr principles of justice and rellgion in no degrec interfered with their prednatory habits ; for whene. er they embarked on any expedifton, they used to pray to IIeaven for the buccens of it; and thoy nover came buck from plundering witheut returnlug thanks to God for their victory.
The ships which eniled from Europe to America seldom tempted their avility, since the merchandise which these contained could not have been easily nold, nor indeed very proftallo to those bariarians. They al-
ways walted for them on their return, when they were certaln they were laden with gold, eilver, Jowels, and all the valuable productions of the Now World, If they met with a single ship, they never failed to attack her. As to the fleeta, they followed them till they eailed out of the Gulf of Bahama; and as soon as any one of the vessels was aepurated by accident from the rest, it was taken. The Spaniards, who trembled at the approach ot the buccaneers, whom they called devlis, immediately surcendered. Quarter was granted if the cargo provecu to be a rich one; if not, all tho prisonors were thrown into the sea.

The buccaneers, when they had got a consideralle booty, at first held thoir rendervone at the island of Tortiga, in order to divide the spoilf, but afterward the Freach went to St. Domingo, and the English to Jamaica. Each persen, holding up his hand, soleminly protested that he bad secreted nothing of what he had taken. If any one among them was convicted of perjury, a case whloh seldom happened, he was left, as soon as en opportunity ofercd, upen rome desert Island, as a traitor unworthy to live in soclety. Such of their number as had been malmed in any of their expeditions were first provided for. If they had lost a hand, an arm, a leg, or a foot, they recelved twentysix pounda; while an eye, a fillger, or a toe, loat in fight, was valued only at half this sum. The wounded were allowed half a crown per day for two menths, to enable thein to have their wounds taken care of; and if they had not money enough to anawer these several demands, the whole company were obliged to engage in some fresh expedition, and to continue it till they had acquired a sufficient atock to cnable them to antisfy theso honorable contracte. The ramainiler of the booty was then divided into as many bhares as there were buccancers. The commander could eulylay elaim to a siogle slare; but they complimented him with two or three, in proportion as he had acyuitted himself to thoir satisfaction. Favor never had any influence in the division of the liooty, for every share waa determined by let. The most rlgid juatice was extended even to the dead. Ilis share was given to the man who was knowu to le his connpnion when alive, and thercfore uccounted hie holr. If the person who had been killed had no intimate, his g ertion was sent to his relations when they were known; and if there were no friends or relations, it was distrihuted in charity to the poor, and to the churelsee, which censented to offer up prayers for the person in whore name these benefactions were given.
Among the buccuncers who signalized themsolves in this new species of freebootling, Monthur, a gentleman of Langnedoe, particularly diatinguished himeelf. Having by chance, in his infancy, met with a circumstanthin account of the crueltlea practiced in the conquest of tho New World, he conceived an aversion, which he carried to a degree of frenzy, aguinat that nation which had committed auch cuormities. The enthusiasm which this epirtt of humanity worked him up to merged In a ferocity still more crael than that of the relgious fanaticiem to which so nany victims had been sacrificod. The sounes of these unhaypy sufferers seemal to rouso him, and call for vengeniec. He bad heurd some account of the linccaneers, whe were anid to bo the most invaternte enemies to the Spanish nume; aud he therefore embarked, with some others, on board a ahlp in order to join them.

Hlis anvage diaposition, us well as that of the other buceaneers who attended him, having ohliged the Spaniarila to confine thenselves within their setticmente, the freohootera resolved to uttack them there. This now method of carrying on the war required superior forces; sud their associntions in conectuence beeane more numerous. The first consideralle one was that furmed hy L'Olonols, whoderlved his name from the sande of Olones, the place of his tirilh. From tha abject utate of a bondaman, he had gradnally raised himseif to
they were owels, and Forld. If d to attaek a till they oon as any It from the rembled at called dev as grantod 20t, sll the

the command of two canoes, with tweaty-two men; and with these he was so successful as to take n Spanish frigate on the coast of Cuba, it lie then repaired to Port-au-l'rince, in which ware four ships, fitted out purposely to aail in porauit of bim; but ho took them, sul threw all tho crews into the sea except one man whom he saved in order to send him with a letter to the governor of tho Huvana, acquainting him with what he had done, und assaring him that he would treat in tho aame manner all the Spaniards who should fall into his hands, not excepting the governor himself, if ho were fortunata enough to take him. : After this expedition he ran hia canoes and prize ehips aground, and sailed with his frigate only to the island of Tortuga.

But while they were idly dissipating tho spoils which they had made on the coast of Venezuela, Morgan, the most renownod of the English buccmneers, sailed from Jamaica to attack Porto Dello. Ilis plan of operations was so well contrived that ho aurprised and took the city without upposition. The conquest of I'anama was an object of much greater importance. To secure this, Morgan thought it necessary to eail in the Iatitudes of Costa Rica, in order to procure some guides in the island of St. Catharines, where the Spanhards confined their malefactors. T This place was no strongly fortified that it might have held out for ten years against a considerable army. But notwithatanding this, the governor, on the first appearance oi the pirutes, sent privatoly to concert measures how he aight surrender himself without Incurring the imputation of cowardice; and the result of this consultation whs, that Morgan in the night-time was to attack a fort at seme diatance, while the governor was to sally out of the cltadel to defend a poat of ao much consequence, and that the asaailants should then attack him in the rear and take him prisoner, which would occasion an immediate surrender of the place. It was sgreed that a smart firing should be kejt up on botis shise, without doing mischiof to either. This furco was almirably carried on. Tho Spaniarda, without being exposed to any dangr" appeared to have dono their duty, and the buccanears, after having totaliy demolished tho forttications, and put on bonrd their vessels a prodigious quantity of warlike ammunition, which they found at St. Catharines, ateored thelr courso toward the River Chagrea, the only chanael whereby thoy could arrlve at the place which was the olject of their wishes.

Morgan left his vessels at anclior, with \& sufficient number of men to guard them, aud alled up the river in his sloops for thirty-three miles, till ho camo to Cruces, whore it ceabea to bo navigable; and he then procecded by land to Panama, which was only tive leagues distant. Upon a large anse extenaive plain which stretched ont before the city, he mot with a considersble body of troops, whom ho put to flight with the greatest ease, nud entered the city. which was now sbandoned. Hore were founil proaigious treasures concealed in the wella and caves; some valuable commeditics were also taken in the boats whieh were left aground at low water; and In tho voighboring forests were likewise found neverul rich leposits. Having burned the eity, they set eail with a great number of prisoners, who wore rassomed a few day afterward, sid arrived at the mouth of the Chagres with a prodigouna booty.

In 1603 an expedition of the greatest consequence Was furmed by Yan Hom, a native of Ostend, but who hasd served all his Hfe among the French. Hia own intrepility preventod his tolerating the least sign of cowardice among thome who assoclated with bim. In the heat of an ongagemont he went about his ahlp, observod tis inen In succession, and Inmedlately killed those whe ahrunk at the audden report of a pistol, gun, or cannon. This extraordinary diecfiline rendored him the terror of the coward and the idal of the brave.

In other reapects he readily shared with the men of spirit and bravery the immense richee which were acquired in the course of his marauding expeditions. When he went apon such expeditions, he generally sailed In his frigate; which was his own property. Bat his designs requiring greater numbers to carry them into execution, he called to his assistance Grommont, Godfrey; and Jonquef, three Frenchmen distinguished hy thelr oxploitg, and Lawrence de. Graff, a Dutchman, who bad aignalized himself still more than they. Twelve hundred buccaneera joined themselves to these commandors, and sailed in six vessels for Vera Cruz.
The darkness of tho night favored their landing, whtch was offocted about three Inagues ixom the place, whero they arrived withont boing discovered. The governor, the fort, the barracks, and the posts of the greatest consequence, every thing, in short, which conld occasion any resistance, were taken by the hreak of day. All the citizens, mon, women, and children, wers shut up in the churehes, whither they had fled for shelter. At the door of each church were placed barrels of ganpowder to blow up the building; and a buecaneer, with a lighted match, was to set fire to it upon the least appenrance of an Insurrection.

While the city was kept ln this state of terror, it was oasily pillaged; and after tho buccanears had carried off whatover was most valuabla, they made a prom posal to the cltizens who were kept prisoners ia the churches to ransom their lives and libortics by a coutribution of $£ 437,500$. This unfortunate people, who had neither oaten nor drunken for three days, cheerfully accepted the terma which were offiered them. Half of the money was puid the same day, and the other part was expeeted from the interior of the country, whon there appeared on an eminence a considerable body ot troope advancing, and uear tho port a flect of seventeen ships from Europe. At the aight of this armament, the buccancers, without any marks of surprise, retired quietly, with fiftecn hundred slaves thoy had eeized, as a tritllug indemuitication for tho rest of the monoy they expected, the gettling of which they referred to $n$ more favorable opportunity. Their retreat was equally daring. They boldly sniled through the midest of the Spanish floet, which let thom pase without firing a single gun, and, in fact, scemed afraid of leing attacked and beaten. The Spani. is would not probably have esonped so easily if tho vessels of the pirates had not beon laden with silver, or If the Spanish fleet had heen freighted with any othor effects hut such merchandise as was littlo valued by these daring frcebooters.
A year had acarcely elapsed since their return from Mexico, when, on a sudden, they were all seized with a passion for going to plunder Peru. It is probablo that the hopes of tinding greater treasures upon a sea Ilttle frequented than on one long exposed to piracies of this kind, was the eanse of this expedition; but it is somewhat remarkable that both the English and French, and tho associations of these two nations, had projected thls plan at the a. co time, without any cominunication, intorcourse, or design of aeting in concert with each other. About four thousand men were omployed in this expedition. Some of them proceeded by Terra Firma, othera by the Straits of Magellan, to the place which formed the olffet of their wishes; and if tho intrepidity of thene harbarians had been directed, under the intluence of a skillful commander, to a single end, it is, certain that thoy would have deprived the Spaniarde of this important colony. But their natural character presented an invincible olistade to so rare $n$ union; for they always formed themsulves into several distinct bodiea, sometimes even so fow in number as ton or twelve, who acted together, or separated, as whim or caprice dlotated. (iregnier, Lecuyer, Picard, anil Le Sage, wors the most diatinguished officers among the French; David Samme, Poter Wilner, and Towley, among the English.

Sea by the Siralts of Darien seized $u_{j}$ on the first vessel which they found upon the coast ; and their associates, who had sailed in their own vessels, were not much better provided. Weak, however, as they were, they several times beat the squadrons which were fitted out agalnat them. But these vietoriea were prejudicial to them, by interrupting their navigation; and when there ware ne more ahips to be taken, they were continually obllged to make descents upon the coasts to get provisions, or to go hy land in order to plunder those cities where the booty had been secured. They successively attacked Seppa, Puehla-Nuevo, Leon, Realejo, Puebla-Viejo, Chiriquita, Lesparso, Granada, Villia, Nicoy, Tecoanteca, Mucmeluna, Chiloteca, New Segovia, and Guayaquil, tho mest considerable of all these places.

Many of these places were taken by aurpriso, and most of them deserted by their inhabitants, whe fled at the sight of the enemy. As soon as the buccaneers took a town, it was directly set on fire, unless a sum proportioned to its value was paid to anve it. Tho prisoners taken in battle were massacred witheut mercy if they wero not ransomed by the governor or some of the inhabitants; while gold, pearls, or precious stones, wero the only things accepted of for the payment of their ransom. Silver being too common, and too woighty for its current value, would have been troublesome to them. The chances of fortune, which seldom leave guilt unpunished, or adversity wilhoul a compensation for Its suffering, atoned for the crimes committed in the conquest of the New World; and the Indlans were amply avenged on the Spaniards.

While such piracies were being committed on the Southern Ocean, the Northern was threatened with the same by Grammont. IIe was a native of Paria, by birth a gentleman, and had distinguished himself in a inilitary eapacity in Europe; but his passion for wine, gamiag, and women, had obliged him to join the pirates. Nevertheless, he was affablo, polite, gencrous, and eloquent ; enducd with a sound judgment, and a person of approved valor; qualities which soon made him be considered as the chief of the French buccaneers. As aoon as it was known that ho had taken up arms, he was immediately joined by a number of brave men. The governor of St. Dominge, whe had at length prevailed upon his master to approve of the project, equally wise and just, of fixing the pirates in some place, and inducing them to become cultivators, was desirous of preventing the concerted expedition, and forbade it in the king's name. But Grammont, who had a greater share of sense than his associates, was not on that account inclined to comply, and aternly replied, "How can Lonis disapprove of a design he is unacquainted with, and which has been planned only a few days ago ?" This answer highly pleased all the buccancers, whe directiy embarked in 1685 to attack Campeachy.

They landed without opposition. But at some diztance from the coast they were attacked by eight hundred Spaniards, who were beaten and pursued to the town, which both parties entered pell-mell together. The cannon they found there were iminediately leveled against the citndel; but as theas had very littie effeet, they were contriving some stratagem to enable them to become masters of the place, when intelligence was brought that it had been abandoned. There remained in it only a gunner, an Englishman, and an officer of signal courage, who chose rather to expose himeelf to the greatest extremities than basely to fly from the place with the reat. The commander of the buccanesse reeeived him wlth marks of distinction, generonsly released him, gave him up all his effects, and, besides, complimented him with some valuable presente 1 such influence have courage and fidelity even on the minds of these who aystematicaily violate all the rights of society.

In 1697, twelve hundred luccanecrs were induesd to
join a squadron of seven ships whlch sailed from Europe under the commiand of one Pointis, to attack the tamous city of Carthagena. This was the most difficult enterprise which could be attempted in the New World. The aituation of the pert, the atrength of the place, and the badness of the climate, were so many obstaclea which would have aeemed insurmountable te any but auch men as the buccancers. But every ohatacle yielded to their valor and good fortune; the city was taken, and booty gained to the amount of £1,750,000. Their rapacious commander, however, deprived them of the advantages resulting from their success. ILe scrupled net, as soon as they set sail, to offer £5250 for the share of those who had been the chief instruments in procuring hin so conslderable n spoll.

The buccaneers, exasperated at this treatment, resolved inmediately to board the vessel called the Nefptre, whero Pointis himself was, and wore with great difficulty prevented from assassinating him. They then set sail for Carthagena, where they amply repaid themsalvea for the losses they had austained through the avarice of their late commander.

At length, after amassing all they could, these adventurers set sail, when unfortunately they met with a fleet of Dutch and Einglith ships, then In alliance with Spain. Several of the pirates were either taken or sunk, with the cargoes they had on beard; and the rest escaped to St. Domingo.

Such was the last memorable event In the history of the buccancers. The separation of the English and French, when the war on account of the Prince of Orange divided the two nations; the success of the means employed to promote the cultivation of land among their colonics, by the assistance of these enterprising men; the prudence ovinced in selecting the mest distinguished among them, and intrusting them with civil and military employments ; and the protection afforded to the Spanish settlements, which till then had been a general object of plunder; all these circumstances, and various others, besides the impossibility of supplying the pluce of theso remarkable men, who were continually dropping off, concurred to put an end to a society as extraordinary as ally that ever existed. Without any regular system, without lawa, without subordination, and even wilhout nny fixed revenue, they became the astonishment of the age in which they lived, as they will be also of posterity.E. 1.

Buckles. Tho wearing of buckles commenced in the reign of Charles I1., but people of inferior runk, and such ns affected plainness in their garb, wore at $; 8$ in their shoes some years after that jeriod: these last were, however, ridiculed for their singularity in using them. Buckles continue to ho used In court dress, and by persons of rank in most countries of Europe.

Buckwheat (Fr. Ble Sarrasin, Nlé noir; Gerın. Buchureizen, Meidekorn; It. Grano Saraceno, Faggina, Fraina; Sp. Trigo Saraceno, Trigo negro; Pol. Tra* tarca, Giyka, Pohanea; liuss. Gretseha; Lat. F'agopyrum) is principally cultivated in order that it may be eut when young nna green, and employed ns fodder for cattle, when allowed to ripen, the grain is usually employed to feed pigeons and poultry. When rije, it is of a deep yellow color, the seeds bearing a great resemblance to becels-mast : it will grow on the poorest moils. It is cultivnted in almost every part of the temnerate and arctic cilmates of the elvilized world for the farinuceous albumen of its seeda, which, when jroperly cooked, affords a delicious article of food to a large portion of the human race. It also nerves as excellent fodder to mileh cowa, and the straw, when cut green and converted into hay, as well as the ripened seeda, are fed to cattlo, poultry, and swine. It is believed to be a native of Central Asia, as it is aupposed to hava been first lurought to Europe in the carly part $o$ attack the 1 most diffiength of the re ao many countable to it overy obortune; the amount of r, however, ; from their $y$ set sail, to ad heen the asiderable a

It is hes supposed early part
of the twelfth century, at the time of the Crusadea for the recovery of Syria from the dominion of the Saracens; while others contend that it was introdnced into Spsin by the Moors, four hundred years before. This grain appears not to have been much cultivated in this conntry prior to the last centiry, as it is not often mentioned by writers on America previons to that period. Holm, in his History of Pennsylvania (Nieu Swedeland), published at Stockholm in 1702, mentions it smong the productions of that province; and Kalm, the Swedish naturalist, whe visited this country in 1748-49, speaks of it ns growing in Pennsylvania, New Jersey, and New York; and several American writers on agricultural subjects have treated of it since. The cultivation of bnck wheat, in one or other of its species, is principally confned to Great Britain, France, Switzerland, Italy, Netherlands, Germany, Sweden, Rustia, China, Tartary, Japan, Algeria, Canada, and the middle and northern portions of the United States. In this country, from thirty to forty-flve bushels per acre may be considered as an averago yield in favorable sessons and situations, but sixty or more bushels nre not unfrequently produced. This grain heretofore has never entered into onr foreign commerce. According to the census returns of 1840 , the annual quantity raised in the United States was 7,201,743 bnshels; and of 1850, 8,956,916 bushels.-Census Report. Sec Bneadsturrs.

Buenos Ayres, the Inrgest and most important provinco of the Argentino Confoleration, ts bounded on the north liy the l'orana, which separates it from the prevince of Entre Rioa; and ty the provinces of Suntu Fo, San Luia, and Mendorn; on the enst by the Atlantic; on the aonth by the Rio Negre, which separates it from Patagonia; and on the west by the country of the Indians, which extends westward to tho Andes. The aren of the province is estijsated by Sir Woodbine Parish at about 200,000 soquare miles, being little leas than that of Frunca, Itesen-hoard alohig the Jie de la llata and the ocean is upward of 600 mites in lengeh. Since 1825 wo oenams of the population has been taken.

At that date it was found to amount to 183,000. Parish eatimates the present popnlation at 320,000 , of which number 120,000 belong to the city of Bnenos Ayres. By M'Cann, another authority, the entire population of the province is computed at 200,000 . This small increase over the results of the censns of 1825 is attributed by him to the civil wars, to the prohitition of the slave-trade, and other causes.

The general aspect of the conntry, as vlewed from the sea, is eminently uninteresting. From the month of the Plata to the Bahla Blanca the sea-line presents an unbroken series of sand-dunes, varied here and there with low ridges of rock. From this latter point to the Patagonian frontier the aspeet of the coast is less monotonous, though equally destitute of life or interest. Though Buenos Ayres is tho only province of the Argentine Confederation that borders upon the sea, and thongh all the exports and imports of the country pass throngh it, it possesses only two harhors, ono of which (that of the city of Buonos Ayres) is extremely bad; the other (that of Belgrano, near the southern extremity of the provinee), though possessing great natural advantages, is by no means adequately appreciated. It might bo turned to good account as a starting-point for vessels engaged in trado with the South American states that border upon the Pacific, but the difficnlt and sometimes dangerous navigation of the adjoining seas connterbalances in the mean time the other advantages which it offers. The interior of the country, except where it is intersected by the low monntain ranges of the Ventana and Vaulean in its southern portions, and the spurs of the Andes in the west, is one vast plain, of which by far the larger part is laid out in estancias, or cattle farms, though the soil is in itgelf well adapted for prodncing all the European cerealia. Agricultural pursulta, however, are by no means in favor with the natives, who can not bring themselves to engago in any pursuit that can not be prosecntect on horsaback. "Every man, woman, and child in the conntry rides," says Parisi. "One might fancy one's self in the land of centaurs, amid a population half-men half-horses. Even beggars rite on horseback." Some of tho eattle-farms are of immense extent; one in particular is mentioned by travelers as comprising more than 300 aquare miles of land, and yidding an enormous revenne to the proprietor. Some of the largest of them belong to British setttlers, and are worked by British servants. Tio cattlo were formerly hunted down and killed merely for the sake of their hides and tongues, while the curcasses were abandened to heasts and birds of prey. They are now slaughterd in abattoirs, where every part of the animal is made available. The beef is salted for exportation; the tallow is beiled down, sul now forms an important item in the farmer's revenue; and the trade in hides is steadily increasing. Ileef and minfusion of the native ten are the ataple food of the untives. By the care of $n$ fow British colonists, sheep have of Inte years been extensively reared, and their wool ts annually increasing in value. Till recently they were reputed so valueless that their careasses were used ns fuel for kilns, ete. A decree of government orlaned that no livo sheep should the employed for this purpose. The number of cattle in the provinco is estimated at $12,000,000$; of sheep, about the linif of that munher. The total value of exports from lluenos Ayres in 1849, was $£ 2,537,821$; in $1850, \pm 1,083,513$; and in $1851, \mathrm{c}^{2} 2,126,705$. In this latter year the vilue of tho jerked heef exported was $£ 172,749$; of hides, $£ 1,800,570$; of tallow, $£ 217,690$; of wool, $£ 190,060$. Tho other exports consisted chiefly of hair, homs, bones, skins, and foathers. The vulue of tmports into liuenod Ayros may he stated approxi. mutely, for the year 1851, at $£ 2,110,000$; of which Great llritnin contributes $£ 900,000$; France, $£ 500,000$; northern Eurojee, $\mathbf{5 1 7 0 , 0 0 0 ;}$ Gibraltar, Spain, und the Mediterranenn, $£ 120,000$; the United States, $\mathbf{£ 2 0 0 , 0 0 0 ;}$ Brazil and othor countrios, $£ 220,000$. Of the cerouls
grown in Buenos Ayres, the anost important is maize, which is indigenous to the country. Wheat thrives well in the southern parts of the province, but the inhabitants rarely grow more than enough to supply their own necessities. In the event of a surplas, it is commonly exported to Brezil. Flax and hemp are cultivated with success. The vlne, fig, orange, and olive, have been introduced from the Old World, and are found to suit the climate adiulrably; hut the anost valuable of European fruits is the peach. A consideralle fruit trade is carried on in coasting vessels, by merchants for the most part Italiun or French. The geographical position of Buenos Ayres is auch as to enable it completely to control the foreign commercial relations of the entire confederation of which it forms a part. The exclusive poliey which it has always pursued on this point has often involved it in serious quarrels, not only with many of the South American states and the other provinces of the Argentine Confoderation, hut with England and France. Since the expulsion of General Rosas, tho navigation of the Parans and Uruguay has been thrown open, and other mensures have been taken to place both the provinee and city of Buenos Ayres on a level with the other provinces of the confederation. Buenos Ayres has published a protest agninst any such measure, and the dispute is still unsettied. The only other towns in the province of nny importance, besides the capital, are San Nicolas, which is situated on the Parana, about 200 miles northwest of Buenos Ayres, and contains a popnlation of about 10,000; San Pedro, also on the Parana, about 150 miles from the capital in the same lirection, with a population of 1000 ; Chascamas, on the shores of a cognominal lake, once a place of considerable importance, but seriously injured by the long continuance of the civil wars; and Belgrano, which, from its position, bids fair to become the rival of the capital itself.

Buenos Ayres, the enpital of the Argentine Confederatiou and of tho province of Buenos Ayres, is situnted on the right bank of the estuary of the Plata, in lat. $34^{\circ} 39^{\prime} \mathrm{S}$., long. $58^{\circ} 18^{\prime} \mathrm{W}$. The river is at this poini so wide, that it is quite impossiblo with tho naked ey'e to distinguish the opposite bank; and at the same time so shallow, that ships drawing 15 or 16 feet of water must anchor seven or eight miles from the city. Small eraft generally anchor in what are cailed the inner roads, abreast of the city. As the depth of water is never sufficient to admit of their coming to shore, passengers and goods are landed by means of targe-wheeted carts, which nre either drawn or pushed by the requisite number of horses. The town of Buonos Ayres is situnted in a vost plain extending wostward to the Andea. The level uniformity of its outline in only broken lyy the spires of tho various churchos. The stranger, on landing, ia struck with the regularity of tho streets, which nro quito straight, and intersect eachother at distances of 150 ynrda, forming equares like those of a chess-board, with the clemily appearance of the houses, and the general air of independence that distinguiahes the inhailitants. The only publie iuildings that havo any jretensions to nrehitectural beauty are the churches, which were built for the most part by the Jesuita. The housea have never more then two steries, and commenty only one, the rooms of whieh open into each other, and till lately were chlefly supphied with furniture of a very inferior deacription from the United Stater. A chinney was a thing unknown, as tho old Spanish irazero alone wan omployed in
heating the damp and white-washed rooms, A great change has, however, taken place in these respects within the last fow years. The furniture is now supplied from Europe, the walla are papered, grates and chimneys have conse into fashion, snd English coal is burned at a lower priee than it brings in the London market. These comforts are all the more valuablo, as the climate of Buenos Ayres is one of the most humid and changeable in the world. Aa the system of police is still somewhat of the rudest, the inhahitants are obliged to guard themselves and their property by means of the iron railings with which they protect the windows of the housen. Even this, however, is not alwhys found to be an efficient guard against the dexterity of thieves. Though the city is built within 50 yards of the largest river in the world, the supplies of fresh water are both scanty and expensive. There are no public reservoirs or fountains, and the wells of the city yield only a brackish and disagreeable wster. By the wealthier classes tanks are constructed, in which a sufficiency of rain-water for demestic purposes is collected from the roof of the house. The common people are obliged to purchaso water from the water-carricts. As it is derived from the river, It is commonly muddy, and must stand for twenty-four hours till the sediment sinks to the bottom. It is then found to be excellent. The streets of the city are now tolerably paved with gronite. Many of them, however, are still unpaved; and these in wet weather can hardity he traversed ty a mounted horseman, and are utterly impassable ly a person on foot. Floricultare is a favorite pursuit; and many English and Scotch gardeners have uurseries ln tho neighborhood of the town.-E. B.

The I'lata is one of the largest rivera of the worde, traversing a vast extent of country, of which it is the great outlet. Unluckily, however, its estuary, though broad, is in most parts shatlow, being also encumbered with sund banks, and infested with sudden gusts of wind cailed pamperos. Its navigation is consequently attended with a good deal of difticulty, and ships bound for Buenos Ayres generally take pilots on board. There is no harbor, and vessels drawing 16 or 17 fect of water anchor in the outer roats, cnlied the Amarradero, 7 or 8 miles from shore, loading and unloading ty' menns of lighters. This, tow, is mn operation by' no means free from danger, hoats being sometimes awamped in crossing the bar tietween the outer and inner roads. From the want of a pier, mad the shallowness of the water on the beach, even the hoats are net able to come close to the ahore, but are met at a little distance from it by a rude sort of ex-cnrta, Jito which they deposit their goods at no Jittle risk, and sometimes much loss. These unfnvoraide circumstances, which might, hewever, be materially improved by $n$ little exertion nad outlay on the prit of the government, operate as a heavy drawhack on the trade of the city, and tead proportionaliy to nugment that of Montevideo, which is more easily necessibie. But notwithstanding the competition of the latter, Buenos Ayres is atill the principal outlet for the produce of the vast countries traversed by the Plata, and especially for the provinees situnted on its right bank. The prineipni articles of export nre specitied in the subjoined talle.-See Plata Riven.

I'revioualy to 1828 no wool was exported from Bucnos Ayres. Inut in that year merino and Saxon sheep) were introduced; and notwithstanding the constant recurrence of diaturimncen, they have surcceeded remarkaily well, as is obvious from the following

Corn, which for a considerable peri $\mathfrak{d}$ was not produced in sufficient quantity for home consumption, has latterly hecome an occasional artlcle of export. Most part of the jerked beef, and numbers of males, are exported to the Havans and Brazil. Ilides, tallow, okins, tones, and homs, especially the first, are leading articles of export. Sir Woodbine Pariah eatlmates the total amount of the imports into the Plate at about f: $2,110,000$, of which about one half may be for Buenoa Ayres. The value of British exports to the latter, in 1851, amounted to $\mathbf{5} \mathbf{4} 8,329$, cottons being by mueh the mest important article, and next to it silks, lineas, and woolens, wlth cutlery, hardware, etc. Franco auppiies silks, wines (of which the limporta have largely increased), jewelry, perfumery, etc. The Imports from the United States consist chiefly of unbleached cloths, spirits, boap, sporm candles, dried and aalted provisions, tobacco, furniturc, and deals. Germany sends woolen and linen cloths, and Rhenish cottons; the Notherlands, fire-arms, sworda, etc. ; Hollund, butter, cheese, Westphalia hams, cte. The Bulttc furnishes iron, cordage, canvas, pitch, doals, ote. The Mediterranean trade is principally in Sicilian and Spanish produce, partieularly cheap wines, brandies, olive oll, ascaronl, dried fruits, and peppor. Spanish gooda ore in little demaud, though some sargea, handkerchiefs, and ribbons, sewing silk and salt, are luportod. The annual importation of Spanish and Sicilian winos is from 10, 000 to 12,000 plpes, besides about 1000 pipes of brandy. The yerba mite, or Puraguay tea, formerly an import article of aome consequence, has beell nearly superseded, even in Buenos Ayres, by genuine tea. The trade with Chili and Peru is insignillcant. The markets are well supplied with butcher'a meat and fish. Poultry, vegetaliles, and fruit are generally dear. All the butter used is imported. (We have derived these details principally from the excellent work of Sir Woodbine Parish on Buenos Ayres, 2d edition, p. 349-369.)
Iorl Charg"s.- The Argentine government has notified that, 1. From the 1at of January, 1847, national vessels sniling for ports beyond sea shall pay 8 dollars per ton; 2. Foreign vessels shall pay 4 dollers por ton, except those whlch, in virtue of existing treaties, are assinitated to national vessels; 3. Voreign vessels shall psy, for the visit of the health officer 25 dollars, and the same amount for the bill of health; 4. Foreign vessels beionging to nations having no consul, and whose reil is made out by tho captain of the port, shall pay 40 deilars for it; 5 . The duties fixed by tho preceding articles shall bo paid one half on tho ontrance of the vessel, and the other half on her departure; 6. National and foreign vessels, which do not leave nor receive cargoen, shall pay oue half of the dulles bere established; 7. let this decree be communicated and published in the official registers.
Buff (Ger. Bilffl, Baffelhiute; Fr. Buffe, Prau ds bufles, at Pinux passice en bufthes; It. Bufalo, Cunjo di bufido), a sert of leather prepured from the skin of the bullilo, dressed with oll, miter the manner of ehamois. The skin of elks, oxen, and other liko animals, when prepiared after the same manner as that of the buifulo, is tikewiso called buff. It is used In making swordbelts and other articles, whore great thickness and firmness are required.
Buffalo, city, port of entry, and capital of Erio county, Now York, is sitnated at the entranco of Buffalo Creek into Lake Erie; it ls at the northoastern extremity of the lake, and near tho commencement of its outlet, Niagara River. Lat. $42^{\circ} 53^{\prime}$ N., und $78^{\circ} 56^{\prime} \mathrm{W}$. long, from Greenwleh, England; 208 miles west from Allany, 391 northwest from New York, 188 east from Cievelund, Ohio, 327 from Dotrolt, and 810 from Washington. Population in 1810, 1508; 1820, 2005; 1830, $8803 ; 1840,18,218 ; 1845,20,773 ; 1850,42,261$; and $\ln$ 1834, with the addlion of Black Ituck, annoxed to it in 1853, 73,000.

The eity of Buffalo occupiea a very important and commanding position at the western terminus of the Erie Canal and the central line of railroad from Albany and loaton, and also the northern termination of the Erie and otiler railroads, and has communleation with the principal cities of the Weatern States, and also with Western Canada. It is the eastern port of tra. hipment of the great lakes Erie, Huron, Mlichigan, and Superior. Ita coinmerce is immenze, employing a vast number of ateamers, brigs, and aloops, whieh convey from the several lake ports a large amount of produce, which from hence is transported to eastern markets by canal and railroad. The ground on which the city is built rises gradually from Huffalo Creek on the south, and within a short distance from the lako on the west it becomes an extended plain 50 feet above the surface of Lake Erie. From this elevation is obtained a picturesque view of the Canadian shore, Niagara River , and the lake. The streets are broad and straight, crossing each other mostly at right anglea. Main Street is 100 feet in bruadth, and extenda for a distance of four miles, and is built very compactly with stores, hotels, and expensive private dwellings. The housea gencrally aro constructed with neatnesa and taste.

The manufactures of Baffalo are very extensive, consisting of engine and bolier factories, furnaces, carwork, founderies, etc. The capital employod in 1850 was $\$ 1,946,348$; value of manufactured articles, $\$ 3,674,988$; and ainco that time both the capital employed and value of products have been largely increased. In 1853 there were six steam flouring mills, manufactaring during the year 216,206 barrels of flour.

The connnerce of Bufialo is inmensely large, iar surpassigg all other ports on the great lakes. The number of arrivals and clearences in 1853 wore 8298 vessels, with an aggregate tonnage of $3,252,978$. There are owned in Buffalo 30 steamers, with an aggregate tonnage of 26,$503 ; 46$ propellers, aggregata tonnage 18,004; 39 brigs and barks, aggregate tonnage 10,376 ; 115 schooners, aggregate tonnage 17,090; total tonnage of steam and sail vessels, 72,917. Value of tho leading articles landed at Buffalo churing the year 1858, $\$ 1168,898,360$. Value of the real and personal estate, \%27,155,502. Buffalo was origiaslly laid out by the Holland Land Company in 1801. Its progress was slow for many years. In 1812 It contained 100 houses; in December of tho next year (1818) It was entirely burned by the Dritish and Jndians, with the exception of two houses, und at the close of the war the inhabitants received from the Uaited States government $\$ 80,000$ as a compensation for their losses. The rapid growth and its commercial importance commenced at the completion of tho lirie Canal in 1825. It was incorporated as a city in 1832. It is divided into thirteen wards, and is governed by a mayor and common council, elected by the people.-See Lake Trades.

Bugle-horn, a small brass instrument used in the buntling-fleld, and in cavalry reglments. The compass of the bugle is now extended by finger-keys.

Bugles, small glass beads of difterent colors. They are in considerable demand in Africa, to which they are mestly exported.
Buhl, ormamental wood-work, Inlaid with mother-of-pearl, brass, etc. The name la derived from the inventor.

Bullder, in the general sense of the term, and undertaker of works of buidding. With reforence to the operutions of ivil architecture particularly, the builder stauds betweon the proprietor and arohitect on the one hand, snd the artisan, merchant, and mianufacturer on the other, he engages to the first to carry a certain proposed work into execution, as ho may bo directed by the second, and saves to both of them the trouble and responsibility of procuring materlals and employfing workmen.

The builder's emolnment arisea from an inproved price, or charges bearing an advance on the prime cost,
to remnnerate him for the use of his capital in materials, work-shope, plans, and labor, and his own personal application and risk. A builder has the power also of deriving an advantage from the divislon of labor by employling artissus in those operatlons only whlch habit onables them to executo with the grestest facllity.
The bullder contracts to do certain specified worka for a certain total sum of money, the amount of which he determines by a previous eatimate, or to do prescribed operations at so much for a certain fixed quantity of every sort invelved, per yard, per rod, per foot, and so on, the amount to be ascertained, when they are completed, by measurement; or he executes works according to instructions or specifications, leaving the charges to be determined according to the usual and accustomed rates, on the quantitics ascertained by admeasurement. In the two former cases he is sald to work by contract, and in the last by measure and value. For jolbing, in repairs and alterations, a day account is kept; that is, a record of the time workben are employed, and of the materials used, In performing certain operations. This is made out with an advance of so much per cent. on the prime cost, or wages of the workmen and selling prices of the unwrought materials, for the builder's protit or remuneration efore stated.
A builder should be theoretically acquainted with the priniples of construction, and practicully converaant with the details of all the mechanic arts used in huilding ; as well to be enabled to carry on his business with advantage to his own laterest as to the proper execution of the works he may undertake. He sloonld be qualified to ascertain with the utmost minutencss, from the drawings of a design, and the apeclfication of the manner in which, and matter of which, it is to be carricd into execution, the quantity of labor and materisls of every kind and description, and the exact value of them all. In this is involved the necessity of being well acquainted with the market prices of raw and msnufactured articles to a very great extent, and a matured judgment of the quantity of labor required, or how much time a workman will take to produce a certain result. These things, however, whleh involve the making of eatimates on which to make contracts, in the practice of this country are generally referred to a nurveyer or measurer, becamae of the gencral lguorance and incompetence of huilders, or hecause of the greater aptitucle of the latter, in consequence of their attention being solely occupied by such things.-li. 13 .

Euilding. The first structures were of wood nad clay, then of rough stone, and, in the end, the ert allvanced to polished marble. Building wlth stene was practicel carly aniong the Tyrinas; and as oruaments and taste arose, every natlou pursucd n different aystem. The art of buslding with stone may he referred in England to Benedict or Benet, a monk, about $A, n$. 670. The first bridge of this material In England was at low, in 1087. lluilding with brick was introduced by the Romans into their provinces. Alfred encouraged it in Eingland in 886. Driek-building was generslly Introduced by the Earl of Arundel, about 1598 , London being then almost built of wood. The increase of building in London was prohibited within three miles of the city gates by Elizabeth, who ordered that one family only should dwell in one house, 1580.

Bulk-heads are partitions made nthwart a shlp with boards, by which one part is divided from the other; as the great cabin, gun-room, bread-roam, ete.E. 13.

Bulk of a Bhip, the whole space in the hold for the atowage of goods.
Bullets. Those of atone in use, A.D. 1514; and iron ones are first mentiored in the loedera, 1550. Leaden bullets wers made before the close of the sixteenth century, and continue to be thore in use in all natlens for muaketry. The chanen-ball in some Eastarn countries la stlil of stone Inatead of irc $n,-$-Ashe.

Bullion, uncoined gold or silver in the mase. The
preclous metals ars so called either when smelted and not perfectly refined, or when refined and melted down in liars or ingots, or in any form uncoined, as in plate. $-E .11$.

Bum-boat, a small boat used to sell vegetablea, etc., to ships lying at a distance from shore.
Bunk is a word used, in the United States, to sig. nlfy a case or cabln of boards for a bed. Thus, in the arny, the soldier's berth is called his bunk.
Bunt, the middle part or cavity of the pritucipal square salls, as the malnsail, foresail, etc. : if one of them be supposed to be divided into four equal parts from one side to the other, the two middle divisions, which comprehend balf of the sall, form the limita of the bunt.-E. A.

Bunting, a thin woolen stuff, of which the colore and signals of a alip are usually formed.
Buoy, a close empty cask, or a block of wool or cork festened by a rope to an anchor, and floating on the water to show where the anchor is situated. Huoys are of varions kinds; as can-brooys, in the fcrm of a cone; nun-buoys, which awell in the middle, and taper to a point at each end; cable-buoys, cmpty casks cmployed to buoy up the cable in rocky anchorage. Buoya are also used to indicate the position of rock a and shosls, or to mark a chanuel.

The life-buoy, of which there are various kinds, is used to throw overboard to preserve a persen from drowuing. The kind now commonly used in the navy cousists of two hellow copper vessels connected togeth. er, between which there is fixed a hollow pole, with a port-firo fixed to its top. This apparatus, which is properly bsllasted, is suspended so as to he ready for use at a moment's notice; and it is so contrived that by the act of letting It off the port-tire is ignited; thus enabling the person in the water to discern the huoy in the darkest night.
Burden or Burthen (Saxon byrden or byrthen), a fixed quantity of any commodity for transit.
Burden of a Bhip, its contents, or the number of tons It will carry.-See Tonnage.
Burgundy. See Wine.
Burgundy Pitch, a resin, the produce of the Pinus Abies, or spruco fir. It is obtained ly making incisions in the bark down to the wood, whence it flows thickly and languidly, Immediately concreting into flakes that ndhere firmly to the tree. These, heing taken off, nre melted in boiling water, and strained through coarse claths. It is of a close consistence, rather soft, has a reddish-brown color, and a not unpleasant smell: it is very adhealve. The greatest quantity is collected in the neighborhood of Neufchatel, from whonce it is brought packed in casks. A tictitious sort is made In England, and found in the shops under the title of cammon luurgundy pitch: it may bo Ilistinguished ty Its friability; want of viscidity, and of the odor which characterizes the genuine sort.
A species of liurgumly pitch exudes spontancously from the Norway spruce fir. This, whith undergocs 110 proparation, is the resin or thus of the old J.ondon Pharmacopoias. It is limported in the form of tears or small masaes, packed in ensks, cach containing from 1 to 2 cwt. It fetches about half the price as that which is stralned.-Ghay's Supplement to the Iharmact peias, Tuomson's Dispensifory.

Burmah, or Birmah, the Burmese empire, or kingdom of Ava, a statc of Farther Indla, ond formerly the most extensive and powerfui in that peninsula; but slnce the war of the Burmese with the 13ritish, In 1824-'26, itn territories have been comprised within lst. $16^{\circ}$ and $27^{\circ} \mathrm{N}$. , and long. $03^{\circ}$ and $99^{\circ}$ E., hsving on the west Aracan and Munipoor, on the north the Nngas territory and Upper Assam, on the east the Chinese provlace of Yun-min, the independent Luos country, and the British province of Martaban (from which last it is separated hy the Sa-luen or Than-lweng Rlver), and on the south the Gulf of Martaban, a perticn

BUS
smelted and aelted down as in plate. :ted togeth. oole, with a 8 , which is e ready for trived that nited; thus n the buoy
of the Bay of Bengal. Estimated area, 200,000 aquare miles; population from two to three milliona. It is composed of the kingdoms of Burmah, Pegu, and Pong, with portions of the countries Inhabited by the Khyen, and the Shang countries, and the Kubo valley (Munipoor), reanmexed to it by treaty with the British in 1834 ; It is inclosed on most eides by mountain zanges, in clevation from 2000 to 5000 feet above the sea, ita central part consisting of the basin of the Irrawaddi. Lagoons are numerous in low beds of the south, and in the centre, a little north of Ava, is a lake thirty miles Ia length by ten miles across. The country is reekoned salubrlous. From May till the middlo of September is tho rainy season. From September till March the weather is dellghtful, the temperature seldom exceeding $75^{\circ}$; In April and May the heat becomes very great, but la soon mitlgated by the commencement of rain. Annual fall of rain 150 to 200 inches. The soil is of very hlgh fertility; but except near the towns most of it llea waste, or is only irregularly tllled; and agrlealture is generally in the most backward conditlon. Rice is the chief crop, especially in the south; pulges, Indian millex, and maize are raised in the north, and sesamum is universally cultivated for cattle. Other products are, cotton of short staple, indigo (though this product is so badly managed as to be untit for export), yams, sweet potatoes, tobacco, capsicums in grent quantitios, gourds, oil-plants, bananas, and other fruits, betel nut and leaf, eugar-cane, onions, garlic, and in the north a kind of tea. Teak, of a quality inferior to that of both Malabar and Jeva, oak, and other valuable woods, abound on the mountaln ranges, and palm and bamboo are also plentiful. Oxen, buftaloes, and goats are the prlacipal domestic animais used for draft, and the elephant ls domesticated for the same purpase; a gooll breed of horses is also rearel. Nlineral products are numerous and valuable. The gold and silver obtalned in the empire has been estimsted in value at upward of $£ 200,000$, and the produce of petroleum in pits, along the Irrawaddl, to $8,000,000$ lbs. ammally. Fine marble, serpentine, amber, sapphirea, and other gems, iron, copper, tia, lead, antimony, sulphur, nitre, and coal, are also found. In physical form the Burmese are more allied to the Mongolians of Eastern Asla than to the Hindoos. Their figure is short, squat, robust, and fleshy, face lozenge-shaped, ehcek-bones large, and eyes obliquely placed. They excel in bont-bullding, and they cast hells, woris in gold and silver, and lyo silk and other fabries, weave silk and cotton goods, and manufacture lacquered wares, paper, coarse earthenwares, and some other artieles in a respectuble manner; but most of their manufactured gooda in ordinary use are imported from foreign countries. China aends silks, porcelain, copper, carpeta, metals, drugs, tea, ete., in return for raw cotton, festhers, lvory, hirds' nests, horas, gums, and some British manufactures; this intercourse being chiefly conducted at a large annual fair at llhamo. From the Shan tribes the llurmese obtain their best sword-blades, with lac, wax, varnish, in return for salt and dried fish; other articles are mostly imported by sen from British India and the A. Intic Archipelago, and consist of British eatton goode, areca and cocom-nuts, tobacco, lron, hardwares, copper, lead, and other minerals, opium, sugar, spirits, linglish glass, earthen-wares, fire-nrms, and gunpowier, the manufnetures of the liurmese In the two last articles being of the most wreteled description. Publie revenue is derlved from a titho of the profit of cultivation, duties of 10 per cent. on imports, and 5 per cent. on exports, and on petrolcum collected, a royal monopoly of marble, amber, and the preelous metals, and gems above a certain size, a poll tax on the unsettled tribes, etc.; and the whole fiscal system is "replete with uncertalnty, rapacity, and volenee." The llurmese empire is divided into aeven provinces. Ava and Monchobo have alternately been constituted the capital of the empire. The other principal towns are, Amarapure, Sa-
kaing, Rangoon, Bassain, Martaban, Setang, Taungo, Prome, Patango, Yandabo, and Bhamo. In 1823 the Burmese, by encroaching on the East India Company's territories, brought on a war with the Brltish, which lasted during tho years $1824-25$, and terminated in their defeat and the cession of several territories to the English.

Burning-glass and Concave Mirrors. Their power was not unknown to Archlmedes, but the powers of these instruments are rendered wonderful by the modern improvements of Settallu; of Tchirnhausen, 1680 ; of Buffon, 1747 ; and of Pazer and others more recently. The following are experiments of the fusion of aubstances made with Mr. Parker's lens, or burning mirror :

| Substances fused. | Welyde. | Ti |
| :---: | :---: | :---: |
| Pire getd | 20 gratns | 4 beconds. |
| Sllver. | 20 gralng | 3 seconds. |
| Copper. | 33 grains | 20 seconds. |
| Platina | 10 grains | 3 seconds, |
| Cast iron | 10 grains | 8 seconds. |
| Steel. | 10 grains | 12 meconds. |
| A topaz | 3 gralns | 45 нeconds. |
| An emerald | 2 grains | 26 seconds. |
| A erystal peb | 7 grains | 0 secends |
| Flint... | 10 graina | 30 seconds, |
| Cornellan | 10 grains | 76 seconds. |
| Pumice-rton | 10 gratns | 24 seconds. |

Green wood takes fire instantaneously; water boils immediately; hones are calcined; and things not capable of melting at once become red hot like iron.

Bushire or Abushire, a sea-port town of Persia, in the province of Fars, on the northenst const of the Persian Gulf, lat. $29^{\circ}$ N., Jong. $50^{\circ} 50^{\prime}$ li.. Population uncertain, but estimated by Major Wilson at from 15,000 to 20,000 . Bushire is sitnated at the northern extremity of a asandy peninsula, to the north and east of which is the bay. There is a convenient anchorage for large ships due west from the town, three or four miles distant, in from 25 to 28 feet of water; but ships of 300 tons lurden or thereby lie in the inner rouls, to the north, about six miles from shore; the anclorage is pretty good; but during violent northwesterly gales they are sometimes obliged to cut their cables, and bear up for Karak, a sinall island about 15 leagues west-northwest of Bushire. The water immedintely to the east of the town is deep, but the passage to it is obstructed by a bar, which ean not be passed by vessela drawing more than eight or nine fect of war ter, except at spring-tides, when there is a rise of from eight to ten feet. The variation in 1811 was $4^{\circ} 43^{\prime}$ W.-Chart of the Persian Gulf, by Captarn litrcuis: etc. The climate here, as in all the other ports of the Persian Gulf, is extremely hot, particularly June, July, and Auguai. The unhealthy season is in the fall of the year.

Buss, a small sea-vessel, used ly the English and the Duteh in the horring tlshery, commonly from 50 to 60 tons burden, and sometimes more. A buss has two sunall sheds or cabins; one at the prow, and the other at the stern: that at the prow serres for a kitchen.
Bussorah, or Basrah, a clty of Arnbla, on tho western bask of the Shat-el-Arab (the name given to the river formed by the junction of the Thgris and the Euphrates), above 70 miles from Its mouth, lat. $30^{\circ}$ $30^{\prime}$ N., loug. $47^{\circ} 32^{\prime} \mathrm{E}$. Population about 60,000 , conslsting of Arabs, Turks, Persians, Armenians, dews, etc. The houses and strects are mean and filthy There is a vast aren within the walls, oceupied principally by gardens and plantutlons of date-trees, ond interseeted by canals, on which are numerous smul) cruft.

The bur at the mouth of the Shat-el-Arab lias only about twelve feet of water, but the chansel within is deep, so that ahlps of 500 tons burden, provided they cross the bur at the springs, may without difficulty ascend the river as far as the clty ; and both its grand branches muy be navigated to a great distance by amnlier vessela. Bussorah is the principal inlet on the east, through whish Indian and other Eustern protucts find their way into the Turkish empire. Ita eommerce
is, therefore, eren at present, pretty considerable ; and were the rioh and extensive countries traversed by the Thgris and the Euphrates oceupled by a elvilized and induatrious people, it wonld be very great. Its lmports from Indis and Europe are oimilar to those at Bushire. From Persia it imports shawls, pearls from Buhrein, etc., and coffee from Mocha. At an aversge, six or eight British ships arrive in the course of the year from India; but the principal part of the trade is carried on in Arablan bottoms, the nerchants of Muscat being the owners of some of the finest ships that are to be met with in the Indiun seas. Its exports are prinelpally bullion, poarls, dates, copper, raw ailk, horses, gall-nuts, and drugs. Ciptain Hamilton mentlons that in the early part of last century the exports of dates from Buseorah excceded 10,000 tons a year.New Account of the East Indice, vol. i. p. 78. The commerce with the interior is conductel by means of caravans to Aleppo and Bagdad; but it might be carried $r z$ to much more advantnge by means of ateamboata. It was at one time proposed to forward mails from Indla by steam by the Shateel-Arab and the Euphrates to Bir, thence by land to Scanderoon, and again by steum to the Gibraltar und Englund; but this project was very wisely given up in fiver of the route by the Red Sea.

Money-All sorts of coins circulate here, but their values are constantly fluctuating. Accounts are kept in manoodis of 10 danims, or 100 floose; 100 mamoodis make a toman, which may be valued at about 10 sleca rupees, or 26 s. sterling.

Wights and Mcasures.-Gold and silver are weighed by the chekl of 100 miscale, or 7200 English grains.

The commercial weights are the maund atteree, the maund sofy or sesse, and the oke of Bigdad. 1 vakia $=19 \mathrm{oz}$. avoirtupols; $2 \frac{1}{2}$ vakias $=1$ oke of Bagdad $=$ $47 \frac{1}{2} \mathrm{oz}$. avolrdupois; 1 maund ntteree $=28 \mathrm{lba} .8 \mathrm{ez}$. avoirilupois; 1 maund sofy $=20 \mathrm{lbs} .4 \mathrm{oz}$. avoirdupols; 1 cutra of indigo $=138 \mathrm{lbe} .15 \mathrm{ez}$. avoirdupois.

These are the weights used by the Europeaus settled at linssorah; those used by the A rabians differ a littlo from the above, and frequently also anong themselves -a circumstance to which the merchant must pay particular attention.

The long measures are the Aloppo yard for silks and woolens $=2$ feet $2 \cdot 4$ inches; the liadded ditte for cotton and linens $=2$ feet 12 inches; the Bagdad ditto for all purposes $=2$ feet $7 \cdot 6$ inches.

For further details as to the conmmerce of Bussorab, see Kinney's Mcmoir on the Persian Empire, p. 283; Keliv's Oriental Metrology; Tuonntox's Last Indian Calculator, p. 42:1. Niebuhr has given a plan of Bussorah, Voynge en Arabie, tome ii. 1. 170.

Butchers. Among the Romans there were threo classes: the Suarii provided hoge; the Boarii oxen; and the Ianif, whose office was to kill. The butchera' traile is very ancient in lingland; so is their company in London, although it was not incorporated untll the second year of James I., 1604.-d nnals of Lomdon.

Butierage. Sce Impagk.
Butt, a veasel or measure for wine, containing two hogsheads, or 126 wine gallons.

Butter and Cheese (Da. Smor; Du. Botcr; Fr. Beurre; Germ. Butter; It. Burm, Butiro; Lat. Butyrum; I'ol. Maslo; Port. Mfonteiga; Russ. Masslo Korowe; Sp. Mantecra; Sw. Smör). Jlutter is known as a fat, unctuons, and, in temperate climates, a pretty firm anbstance, obtained from milk, or :nther from cream, by the process of churning. According to somo writers, it was late before the Greeks had any notion of luatter, and liy the early Romans it was used only ns a medleine-never as food. The Christians of Figypt burned buttor in their lamps, instead of oll, in the third century. In 1675 , there fell in Ireland, during the winter time, a thick yeliow dew, which had all the medlelnal properties of butter. In Africa, vegetable butter ls made from the fruit of the shea-tree, and is
of richer tasto, at Kebba, then any butter made from cows' milk.-Mungo Park. The various circumstances attending the introduction and uae of butter in antiquity have been investigated by Beckmann with great learning and induatry. The conclusion at which he arrives is, "that butter was not used elther by the Greeks or Komana in cooking or the preparation of food, nor was it brought upon thelr tablea by way of dessert, as is every where customary at present. We never find it mentioned by Galen and others as a food, theugh they have spoken of it as applicable to other purposes. No notice is taken of it by Apicus; nor is there any thing suid of it in that respect by the anthors who treat of agriculture, though they have given us very particulur information with respect to milk, cheese, and oil. This, as has been remarked by others, may be easily accounted for by the ancients having accustomed themselves to the use of good oil; and in the like manner, butter is very little employed at present in Italy, Spain, Portugal, and the southern parts of France."-History of Incenticns, vol. ii. p. 413, Engllsh edition.

Beekinann has further ahown that the little butter that was used ly the ancients was in an oily or liquid state; and such is its usual state in ell hot countrics. It ia rather singular that Beckmann does not allude te the consumption of butter by the Aralos, by whom it has been very extensively used from a remote period.
"Arub cookery is extremely fiuint, more so thas even the Itallan; but no oil is used for eulinary purposes, except in frying fish. Butter is their universal sauce, and of it the consumption is lmmense; their vegatable dishes tlost in butter; with it they work their adjoue (paste made of dates) into a proper consistency ; driod corn, or bread crumbs, boiled in butter, is a cominon breskfast with all classes; and In the dessert, the ktmnutyes are prepared for use in the same manner. In short, lutter forms an indispensablo part of the diet of the Arab; and, besides the various forms in which it ia taken with other articlea, it is a common practice with both Bedouins and townspeople to swallow a coffec-cupful of butter every morning; the former, and the lower orders of the latter, adding snother half cup, which-to the disgust of strangers-they sunff up their nostrils! Arab butter is made from the milk of sheep and geats, that of enmels not belng used for that purpose. The home supply ls not nearly sufficient for the consumption, and butter consequently forms an important article of importstion." - Cieographical lictionary, article Aralia.

Considorablo quantitics of butter are made in Ireland, and it forms a prominent article in the exports of that country: gencrally it is very inferior to that of Irritaln; but this is a consequence rather of the want of cleanlluess and attention than of any inferlority in the milk. Some of the best lrish butter brouglit to Londen, after being washed and repacked, is sold as Dorsetahiro and Cambridge butter. The salt butter of IIolland is superior to that of every other country; inge quantities of it are annually exjorted. It forms about two-thirds, of all the forsign butter imported by England, the rest being brought from Germuny, Denmark, ete. The production and consumption of lutter in Great Iritalis is very great. The consumption in the English metropolis may, it ls belicred, be averaged at alout elght pounds a year for eachi individual; and supposing this estimate to be nearly accurate, and the population to amount to $2,300,000$, the total annual cousumption would, on this hypothesis, bo $18,400,000 \mathrm{lbs}$., or 8214 tons; but to this may be added 3000 tons for the butter required for the victualing of ships and other purposes; making the total consumption, in round numbers, 11,200 tons, or $25,088,000$ llis., which at IOd. per poind would be worth $£ 1,045,333$.

The ceasun of 1840 furnishes us no statlaties from which we can accurately determine the quantliy of butter and cheese then produced. The vslue of bot: 8 circuum.

Milch Cows,-Under the general term of "neat cattle" were embraced In the sixth census of the United States the three deacriptions of animals designsted in that of 1850 as milch cows, working oxen, and other cattle. The sggregate of the three classes, in 1840, was $14,971,586$; In $1850,18,355,287$. The Increase, therefore, between the two periods was $3,383,70 \mathrm{I}$, or about 20 per cent. They eppear to be distributed quite equally over the Unlon. The amount of butter produced gives an sverage of something over 49 pounds to each milch cow. The average production of cheese to each cow is 16$\}$ pounds. As with horsea, the samo allowance must be mado, on account of the omisaion of cows, except in connection with agrioulture. The only schedules in which the llve stock of the country conld be coumerated were those used for obtaining the agricultaral products of farma. From the fact that the schedsles for enumerating agricultursl productions and iive atock were not used In citiec, their live atock was necessarlly omitted. Tho value of the butter producell in the United States in 1850 was estlmated at $\$ 50,235,000$; and cheese, $\$ 5,276,000$.-Census Report, 1800 .
Butternut-tree (Juglans cathartica). This species of walnut is known is the United Statea under different denominstions. In Muesachusetta, New Hampshite, and Vermont, it bears the name of vibnut; in Pennaylvanis and Maryland, and on the banks of the Ohio, it is generally known by that of white walnut; in Connectinut, New York, New Jersey, Virglnia, and
the mountainous districts of the upper parts of the Carolinas, lt is called butternut. The lest of these names we have sdopted, because it is most generally used. This tree is found in the Cansdss, in all of the New England States, New York, New Jersay, Kentucky, Tennessee, and on the banks of the Missonri, and in the bottoms which border on the Ohio. It flourishes most abundantly in a cold, unproductive soil, luterspersed with large rocika, and on the steep, elevated banks of rivers. From lta want of solidity, and from the difficulty of procuring pleces of considcrable length, the timber of the butternut la acldom used In the construction of houses. As it long resists the effects of heat and of moisture, it is esteemed for the posts and rails of rural fence. For corn shovels and wooden dishes, it is preferred to the red flowering maple, because it is lighter and less liuble to aplit. In Vermont lt is used for tho panels of coaches and chaises; the workinen find it excellently adapted to this object, not only from lts lightness, but because it is not lisble to split, and receives paint in a superior manner. Bnown's Sylva Americana.

Button-wood, or Byoamore-tree. In the Atlantic Stutes this tree is commonly known by the name of button-wood, and sometimes in Virglais by that of water-beech. On the banks of the Ohio, and in the States of Kentucky and Tennessee, it is moat frequently known by the name of sycamore, and by some persons plane-tree. The Franch of Canada and of Upper Louialana, give lt the name of coiton-tree. The wood,

## CAB

In seasoning, becomes of a dull red; its grain is fine wad close, and it is susceptible of arighter polish than the wood of the beech, to which it bears some resemblance. Its concentric circles are divided into numerous sections, by fine nedullary rays extending from the centre to the circumference. When a trunk is sawn in a direction parallel to these rays, they appear larger than when it is cut parallel to the concentric circlea. It would seem, then, that the division should be made in the intermediate direction, so that the spots may be of a proper size and at equal distances, which gives an elegant surfuce to the wood. Cabinetmakers seldom make ase of this wood, on account of its liabillty to warp, except for bedsteads, which retain the color of the wood, and are coated with varnish. This wood speedily decays when exposed to the atmosphere, hence it is only proper for work that is sheltered from the weather; when thoroughly sessoned, it may be usefully employed in the interior of houses for joists, and for sheathing the frame. It never is used in nasal architecture.-Bhown's Sylra Americana.

Buttons (Du, Knoopen; Fr. Bouton; Ger. Knöpfe; It. Rottoni; Russ. Pogovizin; Sp. Botones) are wellkucwn articles, serving to fasten clothes, etc. They are manufactured of an endless variety of materials and forms. Buttons were of early manufacture in Eargland; those covered with cloth were prohibited by a statute, thereby to encourage the munufacture of netnl buttons, 8 Gea. 1., 1721. The manufacture owes nothing to encouragement from any quarter of late years.

Buttress, a kind of abutment built archwise, or a mass of stone or brick, aerving to support the sitle of a
building or wall externally, when very high or loaded with a heavy superstructure. Buttresses are chiefly used against the angles of ateeples and on the outside of such buildinge as bsve heavy roofa, which would be apt to thrust out the walls if nnsupported in this manner. They are sometimes placed for a support and abutment againat the feet of archee that are turned acrose great halls in old palaces, abbeyn, etc. Flying buttresses are anch as are carried acrose by an arch from one wall to enother.

Byron, John, was tho second son of Willlam, lord Byron; born November 8, 1723. He went out with Lord Anson, in the Wager, alout 1740, and was wrecked on the ceast of South America. An Indian chieftain conveyed him and his companions, after thirteen months of dreadful sufferings and privations, to the lsland of Chiloe, from whence they made their way northward, and were kindly treated by the Spaniards (though they wore at war with England), in consequence of the chivairous conduct of Lord Auson toward some Spanish lndics whom he had taken prisoners. Thia wreck, and the oufferings throagh which they pussed, form the subject of "Byron's Narrative," which was published in 1745. He was constantly emploced by the British government, both in war and peace, and, among other public services, he destroyed the French squadron, then lying in Chaleur Bay. In command of two ships, he made a roysge to the South Sea in 1764; was appointed superior of the West Indis fleet in 1778 , and soon after created vice-ndmiral of the white. Ife died in London, A pril 10, 1786, enjoying to the lnst a well-earned reputation. The poet, Lord Gcorge Gordon Byron, was his grandson.

## C.

Cabbage, a biennial plant (Brassica, Linn.), of which there are many varieties. It is too well known to require any particular description; it is extensively cultivated in the United States. Sour-crout, or more properly sauer-hraut, ia a very favorite dish in Germany; it consists of a fermented mess ofsalted cabbage.
Cabin, an apartment in a ship for officers and passengers. In large ships there are several cabins, the principal of which is oceupied by the commander. In small vessels there is only one cabin, which is in the stern. The bed-places in ships are aiso called oabins; or, more commonly, berths. Berth is used, likewise, for the room where a number of men mess and reside. -E. A.
Cables are strong ropes or chains, principally used in the anchoring or mooring of ships. Rope cables are principally manufactured of hemp; but in the East they are more frequently made of coir, or the fibrous part of the cocoa-nut, and in some places, particularly on the Red Sea, of the costing of the branches of the date-tree. Hemp cables are formed of three principnl strands, every straud of three ropes, and each rope of three twists. The twists havo more or fewer threads, according to the greater or less thickness of the cable. All vensels have ready for service three cabies, which aro usually designated the sheet cable, the beat bower cable, and the mall bower cable; but besides these, most shipe have some spare cables. The ordinary length of a cable is from 100 to 120 fnthoms.

Iron Cables.-The application of strong iron chains or cables to the purposes of navigation is a late and an important discovery ly Captain Samuel Brown, British navy. It is singular, indeed, that this application should not have beeu made at a much earlicr period. On rocky bottoms, or where coral is abundant, a hempen cable speedily chafes, and is often quite destroyed in a few monthg, or perhaps days. M. Hougainvilic, the French navigator, in his voyage of discovery, lost six anchors in the space of nine days, and narrowly
escaped shipwreck-a result, says that able scamen, which would not have happened, "si nous eussions tete munis des quelques chaines de fer. C'est une précaution que ne doivent jamais oublier tous les narigateurs destines $\grave{a}$ de pareils rogages."-loyage autour du Monde, p. 207, 4to ed. The work from which this extract is taken was published in 1771; and yet it was not till nearly forty years after that any attenipt was insde practically to profit by so judicious a suggestion, The difficultics in the way of importing hemp from 1808 to 1814, and its consequent high price, gave the first great stimulua to the manufacture of fron cables. Iron cables are constructed in different ways (seo Kincyciopedia Metropolitana); but they are uniformly tested by a machine, which strains them by a force greater than the absolute strength of the hempon cable they are intended to replace. By this means the risk of aceident from defective links is effectually obvinted; and there aro exceedingly few instances in which an iron cable has broken st sea. Their great weight also contributes to their strength, inasmich as the impulse of the ship is checked before the calle is brought nearly to $n$ atraight line, or that the strain appronclies to a maximum. Bolts and slanckles aro provided at every fathom or two fathoms, ly striking out which the ship may, If necessnry, be detached from her nnchors with leas difficulty than a hempen cable can le cut. Even in their most defective form, iron cables are a great desl stronger than those of hemp; and as to durability, no sort of comparison cmn be made. No wonder, therefore, that they should be rapidly superseding the latter; which are now almost wholly inid aside in the mavy, and to a great extent nlso in the merchint service. The sheet anchor able is the greatest cable belonging to a ship. The strcam cable is a hawser or rope used to moor the ship in a river or haven shelteled from the wind and sea.

Cabot, Sebastian, the celebrated nuvigator and re-discoverer of the American continent (the continent of Nortis America had been gecm, and even repeatedy are n great s to durabilNo wonder, erseding the aside in the rchant servpst cnble ben hawser or wen shelter-
vislted about five centuries beforo by the Icelandere), was the son of John Cabot, a Venetian merchant resident in England, and waa born about the year 1477. Although long the aubject of much dispute, it is now certaln that England was the place of his nativity. In an anclent collection of voyagea and travels by Richard Eden, a learned writer and contemporary of Sebastlan, the author, in marginal note, says, "Sebastian Cabote tould me, that ine was borne in Brystowe (Bris(ai), and that at liti yeare ould he was carrled with his father to Venice, and so returned agayne into Engiand with his father after certayne years, whercby he was thought to have been born in Venice."-Decades of the Neio World, fol. 255. It also appears that he returped, while still young (pane infans), to England, and remained there till he grew up to manhood. The brilllant diecoveries of Columbua having awakened $n$ spirit of enterprise throughout the enlightened nations of Europe, Henry VII. of England was not slow in percelving the adrantages to be galned by promoting sdventure in the new career opened up to haman ambition. The all-important and engrossing object was to discover a route to Indla; and an expedition in a northwesteriy direction, ostensilily to reach what was cal!ed Cathay, or the Land of Spice, was projected by Sebastian Cabot, and fitted out under the auspices of ths English government. The first patent, which bears dste March 5, 1496 (Rymen, Fadera, vol, xii. p. 595), was given to John Cabot and his three sons, Lewia, Sebustlan, and Saucius. The patentees were empowered to set up the royal banner, and occupy and possess all the "newly-found" lands in the name of the king, who reserved a fifth of the profits. It was also stipulated that the vessels should return to Bristol, and that the privilege of exclusive resort and traffic should belong to the patentees. Although the patent waa conferred on John Cabot and his threo sons, there can be no doubt, even if the father did necompany the expedition, that ite suecess was entirely owing to the genius of Sebastian.
It is now undoubted that to Sebastian alone belongs tbe glory of the re-discovery of the terra firma of the Western World. The expedition, conslisting of the ship commanded by Sebastian, and three or four smalier vessels, sailed from Bristol in the beginning of Mar, 1497; and an ancient Bristol manuscript records the fact that. "in the year 1497, the 24th June, on St. John's day, was Newfoundiand found, by Bristoi men, in in ship called the Mathew." On the authority of Peter Mnrtyr, we learn that, after quitting the north, where he reached latitude sixty-seven and a haif, Cabot proceeded along the coast of the continent, to a latitude corresponding probabiy with that of the Straits of Gibraltar. Indeed, hu is said to have gone so far soutiwward, "ut Cubam Insulam n lieva longitudins graduum pene parem habuerit." A fallure of provisions nt this point compelled him to desist from further pursuit, and the expedition returned to England. The sceond patent is dated 3d Feloruary, 1498, and gives nuthority to "John Knbotto, or his deputies," to take at pleasure six English ships, and "them convey nuld lede to the tonde and isles of late found." Shortly after the date of this patent, Juhn Cabot died; and it is said that his sons, Lewis and Snucius, went to settic in Itaty. Sehastinn, however, did not abandon the enterprise in which he hid embarked; and a secand voyage was zealously undertaken under his superintendence. A shlp equipped at the king's expense, aiong with four small vessels, sailed from Bristol in the spring of the year 1498. The repuit of the expedition is unfortunately wrapt in much obscurity. Gomara alone furnishes us with what may be a correct account. Accerding to this author, Cahot "directed his course by the tracte of islande, uppon the Cape of Labrador, at iviii. degrees; affirmynge that, in the monethe of July, there was such could, and heapee of ise, that he durst passe no further ; niso, that the dnyes
were very longe, and in maner without nyght, and the nyglites very clear. Certayne it is, that at the lx. degrees, the longeet day is of xviii. houres. But consyderynge the coulde, and the straungeness of the unknoven lande, he turned his coarse from thense to the west, folowynge the coast of the lande of Baccalios unto the xxxvili. degrees, from whense he returned to Englande."-Eden'a Decades, fol. 313. The reaults of this aecond voyage were not snfficientiy important to induce Henry to equip another expedition. We have good anthority for belleving, however, that Cabot, in 1499, "with no extreordinary preparations aett forth from Briatoll, and made greate dlacoveries."-Seyen's Memoirs of Bristol. But the narratlve of Cabot's Ilfe for tise ifteen yeare subsequent to the departure of lis second expedition is meagre and nnsatisfactory. One circumatance deserves notice, that during that period Amerigo Vespucei, In company with Hojeda, croesed the Atiantio for the first time, while Selastian was prosecuting his third voyage.

After the death of Henry VII., upon the invitation of Ferdinand, Sebastlan Cabot went to Spain; and Vespucel, who held the office of pilot-major, having died, he was appointed his suecessor. He was soon employed in a gencral revision of mapa and charts; and his public and private character endeared him to most of the learned and good men in Spain. Tho death of Ferdinand put an end to an expedition then in contemplation. The ignoble commencement of the reign of Charies V. frustrated all further hopes of its prosecution; and Cabot returned to England, where, under Henry VIII., ise got honorable employment, and performed another westwardiy voyage in 1517, which, however, proved unsuccessful. In 1518 we find Cabot in Spain, and again reinstated in the appointoment of pilot-major. The dispute between Spain and Portugal in regard to their respective rights to the Moluceas having been decided at the Congress of Badajos, in 1524 In favor of Spnin, a company was formed at Seville to open a commercial intercourse with those islands; and Cabot, with the title of captain general, after many delays, set sail with a fleet in April, 1526. The squadron was ill assorted, and a mutiny broke out; in consequence of which he diverted his course from the Moluccas to the mouth of the Rio de la Plata, up which he penetrated about three hundred and fifty leagues. He erected a fort at St. Salvador, and afterward sailing up tise Parann, he built other two forta. He subsequently entered the Paraguny, where he was drawn into a sanguinary contest with the natives. From the report thes made by him to Charles V., it is probabie, had he been supplied with means and ammunition, he would have made the conquest of Pern, which Pizarro afterward accomplished with his own private resources. After turrying in the hopee of receiving supplics, Cabot was forced to returu to Spain, where he resumed his functions of pliot-major.

He finally settied in England, where he appears to have exercised a general supervision over the manitime concerns of the country, and enjoyed a pension of two hundred and fifty inerks. It was then that he disclosed to Edward VI. his discovery of the phenomenon of the varintion of the neelle; a discovery for which alone his name deserves to be immortaiized. It was also at his instigation that the important expedition wes undertaken which resulted in the opening of tho trade with Russia; and in the charter of the company of merchant adventurers ine was nominated governor for lifo, as "the chiefest setter forth" of the enterprise. Cabot lived to a very ndvanced age, and died about 1557, probnbly in London; but neither the date of his death nor the place of his interment is properly authenticated. Sebastinn Cabot may be justly regarded as one of the most illustrious navigntors the world hns ever scen, and the worid owes him a deltt of imperishnble gratitude. "Ho ended," says the author of the memnir whlch has rescued so much of his life from
obscurity, "he ended, ns he had hegun, his eareer in the service of his native country; liffusing into her marine a spirit of lofty enterprise, a high moral tone, and a ayatem of milid but inflexibla disciplins, of which the resulta were not long after so conspleuousiy displayed. Finally, he is seen to open new sources of commerce, of which the influence may bo distinetly truced on lier present greatness and promperity."-E. B. See Memoir of Sebastiam Cabot, with a Revievo of the History of Maritime Discovery, illuatrated by documenta from the Rolls, now firat publiched. 8vo. London, 1831.

Caoso, or Cocoa, the anhatance prepared from the seeds of the Theobronia cacao. When the hruised seeds are flavored with the Eipidendrum eanilla, mixed with a Littie augar, thay form the agreeable confection well known under the name of chocolate.

Cadis, the principal commercial city and sea-port of Spain, on its southwestern coast, on the rocky and elovated extremity of narrow, low peninania, or tongue of land, projecting from the Isle de Leon, northnorthwent mbout $4 \frac{1}{2}$ nautleal iniles. It is anrrounded on all sides, except the south, where it joine the lind, hy the sea, aid is very atrongly fortified. Population in 1837, 58,025. It is well built, and has, at a distance, a very striking appearance. The tower or light-house of St. Sebastian stands on the western side of the city, being, according to Tolino, in lat. $36^{\circ} 31^{\prime} 7^{\prime \prime}$ N., long. $6^{\circ} 18^{\prime} 52^{\prime \prime} \mathrm{W}$. It is a most conspicuous object to vessels approaching from the Attantic. The light, which is 172 feet high, is of great brilliancy, revolves once a minute, and in fair weather may be seen more than six leagues off,

Bay of Cadiz.-The entrance to this noble basin lies between the city and the town and promontory of Rota, bearing north west hy north, distant about if league. The bay is of very great extent, atfording, in most places, good anchorage. The port is on the eastern aide of the city, where a molo of considerable dimenslons has been constructed; but the water ia not sufticiently deep to allow large vessela to approach nearer than within about three-quarters of a mile, where they anchor in from 5 to 7 fatnoms. The rocks called the Cochinos, the Puercas, and tho Diamante, lle to the north of the eity, in the entrance to the bay ; the first two at abont three-fifths of a mile distant, and the Diamante at rather more than it mile from the city. Vessels may enter between the Puercas and the Diamante; but none, except those not drawing more than 15 feet water, and well acquainted with the channel, ought to attempt entering between the Cochinos and Puercas and the city. The town of St. Mary's, on the opposite side of the bay, is famous for being the dépit of the wines of Xeres. The outer bay, or that of Cadiz propcrly so called, is separated from the inner bay by the promontory having at its extremity the castle of Matagorda, which approaches within about three-quarters of a mile of the Puntales castle, on the Iala de Leon.

Within the inner bay in the famous arsenal of the Carucas, the town of San Carios, the canal of Trocadero, atc. At apring-tides the water in the bay risen 10 or 11 feet, but at neapm the riee does not axceed 6 feet.For further particulara see the excellent Chart of the Ray of Cadix, by Tofino; Malham's Naxal Gazelleer; and Pondy's Sailing Directigas for the bay of Biscay, etc.

History, Trade, etc.-Cadia la a very ancient city, having been foonded by the Phoenicians about 1200 years before the Christian era. The temple which they erecied in it in honor of IIercules was one of the most celehruted in antiquity.-Sainte Croix, dea Ancienmes Colonien, p. 14 ; Pemp. Mela, lib. lii. cap. 6. Its excellent port, and ita situation, favorable alika for commarce and security, have made lt , whether possessed by Carthaginians, Romans, Moora, or Chriatians, and under every vicissitude, alace of considerabie commercial and political importance. It has long been one of the principal atations of the Spaniah naval foree. In 1720 the commerce with Spenish America, which had previously been exclusively carried on from Sevilie, was transferred to Cadia. It enjoyed thle valuable monopoly till 1765, when it was partially relaxed by the trade to Cuha, St. Domingo, Porto Rico, and the other iolands, being opened to all the grester ports of Spain. The benefits reaulting from thia relaxation were ou very great, that in 1778 the trade to all parts of America was opened to ships from every considerable Spanislı port, except those of Biscay, which, not being subject to the general laws of the kingdom, were not allowed to participate in this privilege. In cousequence, however, of her aituation, the great capital of her merchants, and their established connections, Cadiz coutinued, notwithstanding the abolition of the monopoly, to preserve by far the largest sharo of the American trade. But since the colonies achieved their independence, her commerce bas been contracted within comparatively narrow limits ; nor is there nuch prospect of ita being materially improvad, without a total change of policy on the pert of the Spanish government. Barcelona is at present the principal meat of Spanish commerce.Rodentson's America, b. viii. pubsim; Townsend's Trarels in Spain, vol. Ii. p. 395-401, 2d edition.

The white wines of Xeres in ita vicinity form by far the principal articie of export from Cadiz. The quantity exported may amount to about 30,000 pipes a year. The prices vary from $£ 12$ to $£ 65$ per pipe; but as the lower qualities predominate, the price may be taken, at a medium, at uhout $£ 25$, making the tutal vaiue of the exports $£ 750,000$. More than three-fourths of ihe whole goes to England. The other articles of export are quicksilver, brandy, oranges, and other fruita, oii, proviaiona, flour, salt, wool, etc. The Imports consist principally of sugar and coffee from the IIavana and Porto Rico, cocoa, hemp, Hax, linena, dried fish, hides, cotton wool and cotton manufactures, rice, apices, indigo, ataves and timber, etc.
 WHEL ENTERED AND CLEARED AT THE PORT OF CADIZ IN 1845 AKD 1846.

of the traffic with Spanish America. It proaperity began to decline when the trade of St. Domingo, Cuba, Porto Rico, and the other islands was opened up to the greater ports of Spain, and decayed almoat eatirely in the begianing of the present century, when the coloaies achieved their independence. An sttempt was made by the Spanish govemment in 1828 to restore its former greataess, by making it a free warehousing port; but this valuable privilege was withdrawn in 1832, and commerce relapsed into its former depreased condition. By far the greatest obstacle in the way of its future profperity is the oppressive commercial reatrictions imposed by government on all imports-a poilicy which throws three-fourths of the trade of Spain iato the ksands of contrabandistas. The principal manufactures of Cadiz are, soasp, glass, coarso woolen, cotton, and silk stuffi, and hats. There are alse some sugar refineries and tanneries. A considerable stimulus to induatry is given by the Sociedad cconomica de Amigos del pais; which introduced the cochineal plant, and grants medals for improvements in manufactures. -E. B.

Caen, the capital of the arrondissement of the same name, in the department of Calvados, in France. It stands in an extensive valley, on the jeft bank of the Orue, at the infiux of the Oden, 9 miles from the Engiish Channel, and 122 weat of Paris, Lat. $49^{\circ} 11^{\prime} 12^{\prime \prime}$ N., iong. $0^{\circ} 21^{\prime} 88^{\prime \prime}$ W. The town is handseme and weil built; the atreeta are generally wide, straight, and clean; and the houses, being bulle of freeatone, have a very good appearance. Population (1851), 40,569 ; while that of the arrondissement amounted 'o 139,922 . The cemmerce and manufactures of Caen are considerable. It exports corn, wine, brandy, fruit, cattie, stones, hardwure, eto. Its manufactures consist chiefly of laces, caps, table-linen, cotton fabrics, eartheu-ware, cutlery, etc. ; it has also breweries, dyewerks, and ship-building yards. Several large tairs are annually held hore. At high water, vessels of 150 or 160 tons can come up to the town, and a canal to connect it with the sea is in course of censtruction, which will render it acceasible to large vessels.-E. B.

Caffila, a kind of caravan or company of merchants. It differs, however, from a caravan, at least in Persia; for the caffila properly belongs to some sovereign, or to some powerful company in Europe; whereas a caravan is a company of particular merchants, each trading upon his own account. Caffilas also cross some parts of tie deserts of Africa, particularly that of Sahara. E. B.

Cagliari, the capital of Sardinia, on the northeast shore of a spacious bay on the south coast of the ialand, lat. $39^{\circ} 12^{\prime} 13^{\prime \prime}$ N., long. $9^{\circ} 7^{\prime} 44^{\prime \prime}$ E. Population in 1850, 30,000? The city stands on a rising ground, and has an imposing effect from the ees. The public buildings and churches are numerens, and some of them splendid; hut the streats are, for the most part, narrow, steep, and filthy. The Gulf of Cagliari extends from l'ula on the wesi, to Cape Carbonara on the east, a distance of about 24 miles acress, and about 12 in depth, with good ancheruge every where after getting into soundings. A mole projects from the Pratique office, nud ahips usually jie abeut 1 mile southweat by south from it, in 6 or 8 fathems water, on an exccilent bottom of mud. There is a very convenient pier harbor at the south angle of the tewer wall, capable of contsining 14 or 16 vessels of a tolerablo size, besides smull craft. Altogether, Caglisri is oue of the best and afest ports in the Mediterranean.-See Sardinia.

Cairo, the modern capital of Egypt, occupies the natural centre of the country, situate on the east bank of the Nile, 12 miles above the apex of its delta, 112 miles southesst of Alexsndria, and 75 miles west from Suez. N. lat. $30^{\circ} 2^{\prime} 4^{\prime \prime}$; E. Jong. $31^{\circ} 15^{\prime} 88^{\prime \prime}$. It is bnilt partly en the plain and partly on the lower alopes of the rocky range of Mokattem, on a apur of which
stands the citadel, in a most advantageous position to command the town. Cairo occupied a site of about 7 milea in circumference, and is surrounded by a wall strongly built and fortified with lofty towers. The prospect from the ramparts of the citadel is one of great magnificence and benuty. The commerce of Cairo, although still depressed, is conaidarable. Deing the readezvous of one of the great caravans to Mecca, it ls the centrai mart in which the slaves, gun, and gold duat of the interior, and the olls and flamels of the north of Africa, with tho European zuerchandise from Alexindria, are exchanged for the coffee, perfumes, spicen, and shawls of Arabia and India. As the residence of the learned and wealthy of Egypt, it affords a market for the agricultural produce of the surrounding districta; and in addition to the making of arms, already extensive, it contains manufectories of sal-ammoniac, saltpetre, coarse gunpowder, glass lamps, and linen cleths. From the central situution of Cairo, and ite proximity to the hot sandy deserts, its temperature is much higher than near the cosst; but the diseases whlch infeet it, auch as the pingue, ophthalinia, and malignant fevers, seem 's originate in its " stifled filth," and other local causes which advanciag civilization wili greatly remove, rather than in the unhealthiness of its situation. Population estimated at abont 200,000 , comprising abont 121,000 Mohammeduns, 60,000 Copts, 4000 Jews, and the rest Franks, Greels, and Armenians.-E. B.

Cajeput Oil, the volutilo oil obtained from the leaves of the cajeput-tree (Mehileuca Leucadendron, Linn.). The namo is a corruption of the native tern cayu-puti, that is, white-wood oil ; because the bark of the treo which yields it has a whitish appearance, like our birch. This tree is commun in Amboyna and other Eastern islands. The oii is obtained by distilla. tion from the dried lesves of the smaller of two varieties. It is prepared in great quantities in Banda, and sent to Iolland in copper flasks. It is of a green enlor, very limpid, Jighter than water, of a strong smell rescmbling campher, and a strong pungent taste. It lourns entirely away without leaving any residunm. It is eften adulterated with other essential eils, colored with resin of milfoil. In the genuine ell, the green celor depends on the presence of copper; fer, when roctified, it is colorless.-Thomson's Dispensatory.

Calabar Blcin (Fr. Petil-gris; Ger. Grauterk; It. Vaor, Vajo; Rusa. Bjelka; Sp. Gris pequeno), the Siberian equirrel skin, of various colors, used in making muffa, tippets, and trimmings for clothes.

Calabash (Spanish calabaza), in Commerce, a kind of vessel formed of the dried ahell of the cucurbita, or gourd plant. It is nsed for containing liquors or guma, as pitch, rosin, and the like.

Calamander Wood, a beatutifnl species of timber brought from Ceylon. It is ao hard that common edge-tools can not werk it, se that it must he rasped and almost ground into shape. It is singularly remarkable for the variety and admixture of colers. The most provailing is a fine chocolate, now deepening almost into absolute black, now fading inte a medinm between fawn and cream colors. It arrcsts the eye from the rich beauty of the intermingled tiats, not from any undue showiness. It takes a very high polish; and is wrooght inte chairs, and particularly inte tables. Sir Robert Brownrigg, late governer of Ceylong had the doors of the dining-room of his seat in Monmouthshire made of calamander. It is scarce in Ceylon, and is not regularly imported. In a few instances, it has been imported by private gentlemen, returning from the colony, for their own use. It is iny far the meat beautiful of ail the fancy woods. The nearer it ls taken from the root of the tree, the finer it is.-Milburs's Orient. Com.; Library of Entertaining Knowledge, Vegetable Subatances, p. 179.

Caloedony. The distinction between this nnbatence and agate rests upon very arbitrary gronnde.

Agate frequently presents a variety of colors, and a multiplicity of beantiful delineations. Calcedony is generally of ons nniform coler, of a light hrown, and sometimes nsarly white. IIt occure in irregular masson, formin; grotasque cavition in the trap rocks, particulariy in Ireland and the Faroe Isles, from the former of which there are apecimons in the Museum of Edinburgh of a very large aize. These atalactites appear alwaya to have proceeded from the upper pert of the cavity, which is sometimes filied to the very summit with solid met+ar. Crlcedony ie used for the conotruction of caps anci platas, and ether artielee of tarte, of which the most aplendid specimens are imported from India. The labor which has been beatowed in the manufacture of theae articles, and the perfectlon with which It has been accomplished, is a matter of surprise to all who examine them. There are some of them as thin and us delicate as cbina, The fineat stones are of course selected for this purpose. , They are generally clear and almoat tranoparent, atill mailltalning the warm brown color which characterizes the stone. They often hava the appearance of having been hammered, so shaded and undulated is the aspect of the mass; and to add to their beauty, the fine dondritio Mocha atonis are often selected, We are in ig. norance even of the locality where these beantiful objects are manufactured, whether in Japan or Chiua; but thoy generally come from India, where, we lelieve, they are found among the mont preclous treasures in the repositoriea of the nabobs and princes of the East. - E. 1 .

Caloutta, the prinelpal city of the province of Bengal, the capital of the Britieh dominions in India, and, with the excejtion, perhups, of Canton, the greatest emporium to the eastwand of tha Cape of Guor IIope. Its citadel is in lat. $22^{\circ} 84^{\prime} 49^{\prime \prime}$ N., long. $88^{\circ} 27^{\prime} 10^{\prime \prime} \mathrm{E}$. It is about 100 miles from the sea, being situated on the eastern bank of the western "Jranch of the Gengee, denominated by Buropeans the Hooghly River, which is the ouly arm of the Ganges navigable to any considerable distance by large ehlps. At high water the river opposite to the town is about a mille in breadth; but during the obb the side opposits to Calcutta esposes a long range of dry sand banke. Owing to the length and fotri sacy of the navigatior: from the ses, It can not be undertaken without a pilot; so that, even If it did not excesd our limits, it wonld be useless to attempt any description of ${ }^{\prime}$ in this place.-See Hooghly River.

Ic 1717 Caleutta was only a petty village; but it subsequently increased very rapidly, and was aupposed, toward the clusu of the last century, to have 600,000 or 700,000 inhabitsnts. This, however, was a gross exaggaration. A census of the population, taken in Mey, 1860, by order of the chief magistrate, gives the following reaults :

The occuputions of these various classee are nearly what might be expeoted la the luxurious capital of a greac omplies, and in so great an emporium of maritime commerce. Public efficers, lawyera, phyaicians, merchants, and their fumilion, make up the luilk of the British Inhabitanta. The natives and forelgnern of respectability are mostly engaged in trade, or live upon their property; and the lower classes are principally compowed of retail dealers, mechaniog, and aervanta. A great part, however, of what may be fairly considered the population of Calcutta, conaiatligg of laborora, mechanice, and persons engac od in trade, reside at night in the suburbs, or nelgh ring vilia-
ges, coming into town early in the morning to their reapective smployments. These were eatimated, in 1887, on tolerably good data, at 177,000 . The smal! number of Engliah resident in Calcntta (where, howover, thoy are far more numorons than in any other part of India) may weli icrite surprise." It' was sup posed thut the cessation of ithe Eat India Company'n monopoly, and of the prohilition of European resort to Indis, would occasion an isflux of British settlers and capltal. But this antioipation has not been realised. Scarcely a single English agrieulturist, with capital anficient to cultivate 100 acres of lend, has establishid himself in Indis, and there has been no immigratlon of artisans. And this, after all, is only what might have been expected-the country being too fully ocenpied, the burdens on the land too hauvy, and the wages of labor far too low, to admit of suy thing like ar extensive imnigration. The Eurasans, the progeny of white fathers and native mothers, are mostly employed as clerks in the government offices and mercantlie eatabhshunenta, and are aald to be an industrious end useful class.-Bengal and Agra (iozettees. The town, excluding suburbs, extends about 44 miles along the bank of the river, with an average breadth inland of $1 \frac{1}{2}$ mile. Fort William, the citadel, lies on the ame aide of the river, a little lower down. It is a strong, regular fortification; but so extenaive that it would require a garrison of 10,000 men for lts effectual defense. ${ }^{\text {ch }}$ Calcutta possesses great natural advantages for iviand navigation, all sorts of foreign nroduce being trenaported with great faclity on the Ganges and its subaidiary atreams to the northweatern quarters of Hindostan, over a diatance of at least 1000 miles, while the productions of the interior ann received by the same eaay channels. "
The principal morehants and truders eonsist of liritish and other Europeans, Portuguase born in India, Armenians, Jews, Persians from the coast of the Peraian Gulf, cunomoriy called Parsees, Moguls, Mohammedans of Hindostan, and Mindocsj the latter ueualiy either of the Brahminical or mercantile esstes, and nativee of Bengal. The native Portuguese and Armenian morchants have of late greatly declined in wealth and importance. On the other hand, the l'eraian merchants have increased in numbers and wealth, several of them being worth $\pm 250,000$ sterling. The large fortunes of the llindoo marchants heve been much broken down of late yoars by litigation in the courts, and uaturally through tha law of equal coparcenary anong brothers. To connterbalance this, there hus been, since the opening of the free trade in 1814, a vast nugmentation of the number of inferior mer chants, worth from $£ 20,000$ to $\boldsymbol{£ 5 0 , 0 0 0}$ aterlhing. There are but few Hindoo merchants at jresent whose weslth exceeds $\mathbf{\$ 2 0 0 , 0 0 0}$ starling.
the British merchants form a most respectaile clase, and contribute essentially to the proaperity of the settloment. Many of tbens are possessed of large fortunes, and live in a atyle of suitabla splendor. The Armenians are the mest numerons body of foreigu merchants in Caleutta. They trade oxtensivi y to all parts of the East, are uncommonly diligent and attentive to buainesa, and are coma!dered to lave a more minuto inteligence from foreign ports than any ether body of merchants. The native bankera, sgente, und money-dealars, are numerous. Though formerly timorous, the llindoo now adventures in alnoat every species of mercantile speoulations; and gooris belong. ling to native merchants, to the amount of neveral millions steriing, are generally lying for asle in tho warebousea of Caicutta. The native merchants of an inforior class engross nearly :lie whoie of the retull trade of Caleutta, under the titles of Barlans, Sirears, and other appelintions. In the transactions of usury', these men are watciffil and acnte beyond tven those engaged in similar pursuits in the Went.
The Engliah society in Caloutia is of the beat de-
aing to their stimated, in The small where, howin any other It was supa Company's opean resort trish settlers ot been reslIturist, with of land, hag has been no r all, is only untry being d too heavy, dmit of any - Euratiana, mothers, are ament offices ald to be an Agra Giazetnda about 4 4 an average $m$, the eitadon; but be on of 10,000 вseaser grest all sorts of reat facility to the north. atance of at the interior triat of llithrn in India, of the Perule, Moham-- latter usuatile esestes, luguche and declined in od, the l'erand wealth, rling. There is a theatre, chiefly supported by amataur performers ; and publlo concerts are given, also supported by amnteur taiont. The usual n.ode of visiting is in palanquins, but many of tha British have carriages adspted to the elimate; and the breed of horses haviag been greatly improved, it is the universal practice to drive out between sunset and dinner. It is only during the cold season that it is poselbla to venture

mpia, witi tizia Equivalints
MADDAS, AND Bombay Wriouts.

Caicutta is the great emporium of India. By meane of the Ganges and its tributary streams, it has an uainterrapted water communication with the whole of the lower provinces of Bongal, and alao with the fertile territory subject to the jurisdietion of thu linuteanat governor of Agra. Being thus advantagnorsly sltuated for commerce, it trades oxionsively with almost every coantry in the worid, and numbers of vesaels of every form and description are constartly arriving in or departing fron the river, which, in the vicinity of the town, presenta the buaiest aceno Imaginshis. Numeroua dock-yards have aiso been established, in which are built vessels of great burden and of admirable construction. Indigo, bugar, cotton, rice, oplum, silk, and saltpetro, are the ctaple commoditios of export. Those of Import nre, British cotton goods, sait, copper, Iron, and hardware.
The comiserce of Caleutas has for a long period of years onjoy sd the advantage of a bank, called the Bank of liengal, estahlished by government authority and earried is "nder government inspection. Various acts lave at different periods been passed hy the govermueut of Iudia for its regulation $I$ the last bears dato the 18th of March, 1839, and took effect from the 1st of May following. By this all previous charters and acts, excopt on far as conthued by the new act, were canceled and repented; the capital stock, proviously fixed at 75 lace of rupecs, whe increased by ono half, the nature of the tranauctions in which the bank migit engage was preseriled, and the conditions and limitatiens under whleh Its husiness was to be conducted were ladd down. The stock is divided Into shares of 4000 rupees, or quarter shares of 1000 rapees oach; and a portion in, and always hae been, held ly governmant.
Pilotage.--The navigation of the River Ilooghly, from the Sand Heads to Caleutta, a distance of about 130 milen, fo naturally dangorous and intrioate; but rendered comparatively afofo by a akillful and excellent, though costly, pilot estabitishment.
the year, is devoted to repose. . The hot aeason begins in April. Every day the beat incresses until the middie of June, when the periodical rains begin, which last till Auguat. The weather then being extremely elose, is more oppresive and more unhealthy than before. The mean temperature is about $66^{\circ}$ in Jamuary, $69^{\circ}$ In February, $80^{\circ}$ in March, $85^{\circ}$ in Aprll and May, $83^{\circ}$ in June, $81^{\circ}$ in July, $82^{\circ}$ in August and September, $79^{\circ}$ in Octuber, $74^{\circ}$ in November, and $66^{\circ}$ in December. The annual fall of rain during six yeare, commencing with 1880, averaged sixty-four inches.,-E. B

All foreign veasels pay the same pilotago as those under British colors. By brokon pilotago is meant the proportion of full pilotege botweon the different atages or places of snchorage. All ships the property of foreignors, as well Asiatic as Earopesn, are subject to the charge termed "Jead money;" it being ladispensably necessary that the pilot should have with him a leadsmen in whom he can confide.
Dotention money, at the rate of 4s. per diem, from British and foroiga vessels, is charged by persons of the pilot service kept on bosrd ships at anchor by desire of the commander or owner.
In the river before Caicutta, and in other parts, there are chaln moorings, of which the eharges are as follew:

| Burden of shipe. | $\begin{aligned} & \text { April to Oelober, } \\ & \text { \& Monlhe. } \end{aligned}$ | Novamber to Marth, 5 Monihe. |
| :---: | :---: | :---: |

| Under 500 tons. . . . . | 148, per dilom | 103. jer dlom |

Hire of the chain-mooringe at Diamond Harhor, $£ 1$ per diem. The lowest ehargo to a ship requiring the accommodation of the cbain moorings at oither of the places above mentloned is for ten days; and using them longer, a further chargo is mado at the establiahed rato por diem for every day oxceeding ten. Tho elarge for transporting a ship from her moorings into any of the docks at Kildorpore, Howrah, or Sulkea, or from any of the docks to her mooringe, is fixed at 50 rupees; and no highor clarge for such sorvice ia autiorized. Bealdes pilotage, every ship is chargeable with the iste of a row-hoat to accompany her; viz.: for a boa' of ine first class, 24s.; of the second clasa, 18 a .1 ana of the third clasc, 14e. Of late years a light-house has bnen oreoted at Kedgeree, for which the charge on Britieh or Amerioan Aags is at the rate of $8 d$. per ton per annum. Shipe preceeding to Cal. cutta must land their gunpowier at the powder maga$2 \operatorname{lne}$ at Moyapore: the charge ls at the rate of 1 dd. per ton for each voyage. The wholo pilot establishmont, and the care of the navigation of the Hooghiy,

Is under the management of government, and is directed by a marine board, with a master attendant and har-bor-master.

The Marine Board at Calcusta have isened the following resolations with respect to pllotage, ete.:

1. Commanderz are requented, prior to quitting their vessela, on arrival of Calcutte, to all up and certify, or canse to be flliod op and certised, a form of cortificate chowing the actuais rugidered tonnaye, the draupht of water, and whether the veecol has or has not been tugred by a steaner any part of the way, or has or has not had the use of a row-boet? which form will be furnished to the pllot, in order to the bllts of the verseln being correctly made out 2. Commanders are further requested, as early aftor thoir arrival as posaible, to notily in writing to the master attendant the name and rendence of the refomnee for the paymont of his veriouta bllis. On the recelpd hy the master attendant of the above cartiscate, and written reference for payment, $r$ single bill will be prepared, Includ!ng in ward pilotage, Ight-thouse duty, Moyapore magazine duty, and row-beal hire (ff any), which, together with the certificate, will be forwarded to the marine peymaster, for collection within fifteen daye of the arrival of the vessel, and having on it ''s name and residence of the party referred to for payment, Jich commanders are requested to furnish to the master attendant, in writing, as eariy after their arrival as practicabie, that offiver will more readily be enabled to present it. By this nrrangement, all the eharges connected with the vemel, up to her arriral of Calcutta, will be embodied In one bilt, instead of, as htherto, being made up in meparate billa. $\therefore$ In the event of vessels docking, or being transported at the desire of the commander, it is requetted that a certificate may be given by the commanding officer of the operation having been performed, In order to its accompanying the bill when preeented for payment to tha referee. 6 . The practice of chargIng for hauling to the chaln-moorings, for thicir monthly hire, and for hauting from the moorings, lis i pparate bliis, Is discontinned, and henceforward one hill will be prepared, including the charge for haulligg to the moorings, that for occupying them, and that for hauliog from them; and commanders are requeated to give, or cause their commanding officers to give, to the manter attendant, or the harbor-master, cortificate of the daie of hatiling to mad from the moorings, which certifioate, es before, will accompany tho bill when presented for payment. The hire of the mooriogs will be charged for the day on which the vessel is hauled thereto, withoni: reforence to the period of the day; and Ia like manner, no charge will be made for tho day on which ahe hauls from her moorings, hewever late in the day she may yuit them. Tho chargea conneuted with the chainmoorings will thus be emiodied in une bill, anu be discharged in one payment, inasead of thre 3 or more, according to the number of munths the versel occupied the moorings, 6. The aystern of charging eutward pilotage on an estimated draught of rister, with an addition of 10 per cent., subject to adjubtment after the vemsel has aslied, and of charging $n$ certnin number of daya for a mow-bout, aubject to a like adjratment, Is aboitshed; and In future the entwand pilotage and ciarge for rew-boat hire on outward-bound vesmela will be as followa: When the vessel is Anally laden, the commander is to give notice thereof to the master atteadant, when the draught of water is to be ascertalned and certified by the commander or commanding officer on the part of the vessel, and by the harbor-master on the part of the government! subjeot, in case of diapute, to the decision of the master attendant. On receipt of the eertificate, the manter attendant will cause a blii to be made out for tiee regular amonnt of pliotage, and for the row-boat hire, soconding to an average rate, with refereuce to the size of the veselis and the season of the year, fixed by a marine commitico which Iately eat at the Bankshall, the majority of which was composed of menibers of honses of agency and commanders of ahipa. The hill and certificate will bo presented in due connci for payment. 7. As, however, it frequently happena that vesolis are taking in cargo or alling their water up to the last day of their departine, or that from other eaunes the bilia for tbe chain-ntooringa and outward pilotage can not bo made out till the eve of depariure, ownerg, agenta, and commandors are in auch easen particulariy requented, with a view to dinpatch, to caume an individnal to attend at the Bankehall, and oxpedite the tranamiselon of the bill and certificate to the boand for regintry, and to the pay 'ffice for coliection! at each of which ofticen they may in auch cases depend upon the mont reedy and special attentlon. 8. in the event of a resnef beIng tugged any part of the way down by mtemm, or not bavIng the use of a row-boat, commanders are to obtain from the pllot of Kedgeree a certificate to that effect, which they ahould forward by the DAk to their agenia, Un recelpt thereof, agenta are requented to make out a bill ogalast the honorabie company for the quarter deduction from the pllotage allowed

If tugged by eteam, or for the row-boat hire prifd, as the case may be: and to forwand it, together with the certificate, to the marine board for audit and payment. 9. In casea where a vensei leaves Calentta avowedly intended to fill up cargo at some place beiow, the pllotage will be charged at the draught at which she leaves Caleutta, in like manner, though at the reduced amount, as if sho had preceeded to sen ; and, with respeot to the subnequent pllotage charge, from the place at which the vemel takes in the additional carge to mea, owners or agents of veasela will be required to furniah a apecial guarantee to pay the amount ohargeable according to a certificate of the draught of water, to be adgaed by the cormmander, or commanding officer and pilot. 10. Bix mets of moorings at Diamond Harbor having been fitted eapecially to enable vessela arriving in distress from lons of al hurs and cablea to be readHy moored, the charge will be Co.'s Rs. 60 for mooring and unmooring, and the dally hirs the mame as for the mooring at Calcutte. The moorings will, of conrse, be ., valiable to ves. sels not in distress from loss of anchors and cubles; but the harbor-master will be ingtructed at all timen to keep two nets vecant during the southwest monsoon, to meet casualties.
There are several dry docks at Calcutta, in which vessels of any size may be built or repaired. Ships built at Caloutta are of inferior durability to those constructed at Bombay, in conaequence of the framework being always of the inferior woods of the conntry; and the planks, sheathing, upper works, and decks, alone of teak; which last is furnished almost entirely from Pegu. In 1848, the number of registered ships belonging to the port of Calcutta was 184, of the burden of 43,569 tons; being at an average of abous $\mathbf{3 3 0}$ tons for each. The iargeat claes of vessels carry nearly 750 tons; but ships drawing 60 much water are unfit for the navigation of the Hooghly. Not being able to load et Caicutta, they are obliged to receive part of their cargo at Diamond Ilarhor, about thirty-fuur milea farther down the river. The most convenient-sized snip for trade between Calcutta, and Europe, and America, is from 400 to 500 tons.

Duties, etc.-The export and import duties and drawbacks are regulated by an ordinance of the year 1886, revised in 1845, and are the eeme for every port under the government of Bengal ; or, es it is technicnily called, the Presidency ef Fort Wiliam and Britisi India generally.

The following ls an act of the Indisu government, which took effect from the 251 h Marolh, 1848 , and which abolished all duties on goods carried coastwiee in the company'a territorlea.
I. It is herrby enaeted, that from and after the $25 t h$ day of Mareh, 1849, all goods imported on foreign bottoms by sea foto any port of the Iresldencien of Fort Willam, to Bengal, Fort 8 i. George, or Bombay, ahall be chisged only with the aume rates of duty as such goods would now by law be charged with if auch gooda were imported Into any of the mald ports on Britioh bottomes, any thing in any act of the Couneli of India contalised to the contrary notwithstasding.
II. And It is herehy enacted, that from and after the aald day, all goois exported on forelgn bottoms by wea, from any port of tio mald prealdenelies, shall be eharged only with the mame rates of duty as such good would now by law be charged with If anch goods were exported from any of the aald poris on Iritiah bottoase, any thing in any act of the Councll of Indla contained to the contrs:y notwithatanding.
III. And it ta hereby enacted, that from and after the arid day, no duty shall be chargen on any goods lawfully carried from any port in the territeriea aniject to the government of the Eant Indis Company, to any other port in the sald terrltorios, any thing in any act of the Counell of India contalued to the contrary notwithatanding.
IV. I'rovided niwnyw, that nething in this Aet contained ahall apply to the aricies of alt or oplum.

When the duty is declared to be ad valonem, the same shad be levied on the market value of the articie at the place of export, without deduction. Since the 1et of April, 1837, eredit has not been given, nor drawbeck aliowed, of any inland cuntoms or land-frontier duty pald at any cuntom-hotuse or chokee of the Jumas frontler Ine, or of Benares, except only upon the article of cotton wool, covered by ruwanas taken out at the custom-house of the western provinces, and proved to have been deatined for expert by eea when passed out of those provinces.

The policy of charging duties on exported articies seems very questionable. Tho great difficulty under which India labore, in a commeroial point of view, consists principally in her inability to furnish equivalents for foreign imported goods, and to make the necessary payments abrosd; and, when anch is the case, it is certainly not a littlo contradictory to lay dutiea on exports. The most obvious considerations of expediency and common sense would auggest that they should bo aliowed to be exported duty free. There can le no dou't that the stimulus this would give to their production would, by increasing the pullic wealth, infinitely more than compensato the government for the loss of the inconsiderable sum produced by the duties with which thoy are charged.

Trade of Calcutta. Exports,-During the last forty years the trade of Calcutta has experienced somo very striking vicissitudes. Previously to the opening of the trade in 1814-15, cotton piece goods formed the principal article of export from India; the value of those exported from Calcutte, at an average of the five years from 1814-'15 to 1818-'19, being (at 2s. per alcea rupee) $£ 1,260,786$ a year. The extreme cheapness of lator in India, and the excellence to which the natives had long atteined in several departmenta of the manufacture, would, it might have been supposed, havo sufficed to placo this important department beyond the reach of foreign competition. But the wonderful genius and the admirable skill of the European machinista, and their inmense capital, have fur more than countervailed the apparently insuperablo drawback of high wages, and the expense of bringIng the raw material of the manufacture from America, and even India Itself; and have onabled English manvfacturers to boar down all opposition, and to triumph over the cheaper lulhor, contiguous material, and traditional art of the Hindoos. The imports of British cottons and twiat into Inlis have increased alace 18:4-15 with a rapldity unoxampled in the aunals of commerce, and the native manufueture has sustained a shosh from which it is not very Hkely it will ever recover. The Influence of theso circumstonces on the trade in plece goods has been very striklug. During the your 1851-'52, the value of those exported from Bengal was no moro than $£ 62,352$, ieing only about one-twentieth part of what it amountal to twenty-six or twenty-eight years previously.
It does not, however, appear to be very difficult to account for these variations. Formerly the oxport of Inallion to India, thongh influenced hy other catises, was mainly oceasioned iy the dificulty under whilch merchants were placed of proviling articles of merehandise auitable for the Indian markets sufficient to balance the imports. The uatoulahing Increase of Britioh exports of cottou gooils and yurn to India has, however, gone far to olviate this diffeculty; In truth, the fair presumption seome to be, that in future the circumatances of the case will te reversed, and that the difficulty of procuring return oargoes of produce sultable for a market will, In ordinary years, be found to be the principal obstncls to the extenslon of the trade with Hilndostan ne woll as with Clina. There seems

## CAL

tu be no limit other than the necessity of furnishing equivalents in their stead, to the indefinite sale of our producte in the East; and in so far, at least, as India is concerned, the facilities for furnishing such equivalents will, most likely, be gradualiy increased. "The soil and climate of Bengal seem to be peculiarly well - quited to the production of grain; augar, indigo, oplum, silk, cotton, ealtpetre, and a host of other articles. And as the inhabitants are not deficient, in industry, nor in the desire to improve their condition, it would seem that there wante only a reduction of the landtax, which is so heavy as to paralyze all their energiee, to cnabie them to increase their articles of export to an indefinite extent, and to render their, country comparatively flourishing and prosperous.
In the ycar 1853, the great articles of export from Calcutta were opium, indigo, sugar, raw silk and silk plece goods, saltpetre, rice, hides, cotton and cotton plece goods, gunny bage and ganay cloth, rum, otc. We subjoin

The export trade of Calcutta would be much increased if facilitios were creatsd for internal commerce, especially in inuilding railroadu and improving the water communications with the interior. Something hne
been done in the way of building good tnmplke roads and in locating railroads, and farther improvements may be anticipated. The preseat mode of communication between Howra, on the oppoalte bank of the river, and the metropolie, is by ferry; but How'ra has been selected as the locality for the terminus of the East India rallway; and upon the opening of the first section, which is now complete, greater facilities will be required, as well of access from Howra, ae ef egress from the city in the same direction.

Oprum.-The trade in opium has rapldiy grown in magnitude and importance. At an average of the years 1830-'31 and 1831-'32, the exports from Culcutta were 7278 cheats, worth $£ 1,121,560$; whereas during the year 1851-'52 the exports had increased to 82,306 chests, worth $£ 8,137,781$. China is not the priacipal morcly, but almost the only market for opium, eo that the trade between Calcutta and her is now second only to that between the former and England. It is troe that large quantities of opium are ahipped for Singapore and other intermediate porta, but China is its ultimate destination. Suljoined is a statement of the quentity and value of the opium shipped from Culcutta in 1840-'41 and 1851-'52.

Previously to the year 1815, the exports of indigo from Calcutta were comparutively trifing. But about that period Europeans began to engage in the business; and the culture of the plant was, la consequence, so much extended, and the preparation of the drag so much improved, that it has bcen for a lengthened period an article of primary commercial importance. Of late years, however, the growth of Indigo appeurs to have been nearly stutionary, the shipments in 1830 '31 and 1831-'32 licing about equal to those in 1840-'41 and 1851-52. This stationary state of the trado has been ascribed partiy to the influence of the imposta. tions from Java, where indigo fs now very extensively raised, and partly to the alleged decrease in the use of biue cloth. France is, next to England, the great market for indigo.

In 1835, the Britisi duty on East India augar, which had previously been comparatively high, was redured to the same amount as thut on West India sugar; and that circumstance, and the continued high price of sugar, did not fail to give a powerful stimulus to its culture in and exportation fron Indiu. On the whole, bowever, great as was the increase in the exjorts of sugar between 1830 and 1840, it hns sinco receded. And now that the sugar trade is placed on a proper footIng by the abolition in Great Britaln of the discriminating dution on foreign sugara, the imporiations from India will, perhapa; be still farther reduced. Sulijoined is a statement of the quantity und value of the augar shipped from Culcutta in 1840-41 ard 1851-'52.

The exports of cotton from Calcutta continue stationary; the expectations that it would be improved in its quality by greater attention belng given to its culture and preparation have not been realized. The exports of aaltpetre fron India have not, ae many anticipated, been affected by the competlition of nitrete of soda from South America. In 1830-'31, the exports from Calcutta wore 424,729 factory mannds, whereas in 1851-'52 they amounted to 709,500 Indlan maunds. The exports of rice from Bengal fluctuste very greatly. This is not caused so much by variations in the crops of the country as by variations in thoes of other countries; for when a scarcity occurs in most parta of continental Asia, or in any of lta lslands, recourse is almost invariably had to Bengal to aupply the deficlency; and the demands thence arislng have been sometimes enormous. In 1831-'82, for example, the exports of rice from Calcutta to the coast of Coromandel amounted to only 16,545 maunds, whereas in 1832-'34 they amounted to $1,252,056$ maunds.-BELL'S Comparative View of 1832-'33 and 1833-'34, p. 41. It is worthy of remark, that while Bengal is shipping Immense supplies of rice and other grain to distant parts,
a large part of her own population is frequently. In a state of great want and suffering. Ireland is not, tharefore, the only country in which the most abject poverty and wretchedneas on the part of the inhabitants are found combined with great fertility of soil and a large exportation of food. Bealdes the articles of natlve Indlan produce exported from Calcutta, she reexports pretty considerable quantities of varlous articles brought from other parts. The value of the British cotton goods re-exported amounts to about $\boldsymbol{£ 2 0 0 , 0 0 0}$ a year. They are princlpally bartered with the Burmese for silver. The conveyance of the latter out of the Burmese dominions is strictly prohlbited; but in Burma, as in England and clsewhere, the ingenuity of the smuggler is too much for the vigilance of the government, and the trade is carried on without much difficulty. The great articles of import into Calcutta are, colton manufactures and cotton twist ; bullion; copper, with spelter, tin, lead, iron, and other metals; woolens; wines and splrits; ale and beer; haberdashery, millinery, etc. ; coffee; hardware and cutlery; splces; coal; coral, glasa, and bottles; plate, jewelry, watches, etc. ; books and stationery; tea, 'etc.

Total customs duty collected at Calcutta in 1851-'52,
 kinsen'a excollont Account of the Commerce of Bengal ia 1850-'51 and 1851-'52.
The number of vesaela which arrived at Calcutta during the year 1854, and their aggregate tonnage, were as follows:

| British shtps | 441 |
| :---: | :---: |
| French ahipe | 108 |
| Amertcan ahipa | 96 |
| Arablan ohips | 17 |
| Dutch ahips. | 8 |
| Hamburg shipa | 6 |
| Swedish shipg. | 6 |
| Sardinian shipa | $g$ |
| Belgian ships. | 2 |
| Danish shtps. | 2 |
| Prusalan ships | 1 |

Aggregate tonoage about. 430,000 tons
This gives an increase of vesaels over that of the previons year of 49, and of toanage of 49,281 tona.-Bengal Ilarkaru, March 21, 1855.
Failures at Calcutta.-During the three years ending with 1833 some of the principal mercantile establishments in this city failed for immense sums. To examine minutely into the origin of these diaastera wonid lead us into inquiries foreign to the object of this work, and with respect to which it would be difficult to get accurate information. We believe, however, that the main source of the evll was the combination, by most of the principal housea, of the business of merchants with that of bankers. Their credit being high, at the ead of the war iarge sums wore doposited in their bands, for which thoy engaged to pay a high rate of interest. But instead of employing these depnsita, as bankers in England would have done, in the discount of hills at short dates, or in the purchase of government aecurities readily convertible into money, they employed them, probably because they could with difficulty diapose of them otherwise, in ail manner of mercantiia speculations; advancing very large sums to the indigo pianters, exporting goods to Euroie, either directly on their ewn account, or indirectly by iending to those who did, becoming owners of Indian ahipping, etc. Most of those speculations turned out excoedingly iii. The production of indigo was ao much increased, partly in consequence of tho large capitals turned to the business, and partiy of the high prices in England, that "fine blue violet," which had brought in the London market, at an average of the tirree years ending with 1827, from 12s. 10d. to 18 s .4 d . per lb., foll, at on average of the three years ending with 1832, to from 68. 8d. to $6 \mathrm{~s}, 4 d$. por lb., and other sorts in propacion. At these prines tiso production would not pay; and very heavy losses were sustained and much capitai sunk by the planters and those who had supplied them with funds to extend their undertakiags. The inventmenta in Indian shipping turned out eveu worse than those in the Indigo plantations, the shipping of England having noarly Iriven that of Indla out of tie
field. The embarrassment occasioned by this locking up of their capital, and by the ruinous nctare of the adventures in which they were embarked, began to manifeat itself aimaltaneously with the scarcity of money occasioned by the draina on account of the Burmese war. The grest mercantile housea began then to find that thay ware entnngied in difficulties from which they were wholiy unsble to extricate thomaclves. After struggling on, some for a lenger and some for a ahorter period, most of them subsequently failed, the greater number for very large sums.

But, however distressing in the mean time, the embarrassment and want of confidence arising from the failurea alluded to were not of long continuance, and have in the end been advantageous. It is of the utmost consequence that the vicious combination of tho business of a merchant with that of a banker ahould be put an end to. It is singular, indeed, that individuals ahould be found willing to intrust large sums in the hands of those who they are aware are employing them in the most hazardous advertures. The higher the interest promised by such persons, the greater ought to be the caution of tive public in dealing with them.
Internal Transit Luties.-A very great improvement has been effected in the domeatic economy of British India by the abolition of the duties on the tramsit of gooda from one part of the country to mnother. This import int measure was preceded, and, wo believe, principully brought about, by the publication of an elalorate and valuable report on the inland customs of Bengal, by Mr. Trevelyan (now Sir Charles, K. C. B.), then one of the accretaries to the Indian goverament, and now Secretary to the Treasury. These duties had existed in India from a vory remote period; and, by obatructing the intercourse between its different districts, wero singularly pernicieus. After the East Indi.4 Company began to acquire a footing in India, they availed tinemseives of a favorablo opportunity to procure an exemption from the transit dutiea in favor of their own trade ; "the goods which they imported heing allowed to pass into thie interior, and those which they purchased for exportation in the interior being allowed to pass to the sea, without either atoppage or du-tics."-Mill's India, 8vo ed. vol. iii. p. 289. They wero, however, not long permitted to monopoliza this privilege. Immedately after the victorice of Clive had raised the company to the situation of a great torritorial power, their servants engaged largely in the inland trade, and cndeavored, partiy by frand and partiy by force, to extend to their own goods the exempcion from transit duties estabilisiad in favor of those bsionging to tie company. Every reader of Indian history is aware of the muitiplied abuses and diaturbances that grew out of this attompt of the company's servants to reioase themseives from duties nnd charges that pressed with grinding severity on the natives, and, by conseçuence, to engross (for such was their object) the whole internal trede of the country. The company endeavored to olviate the evil by atrictiy forbidding
their aervants from engaging in Internal traffic ; but its orders to this effect were long either totally disregarded, or bat very limperfectly obeyed. At length, in 1788, Lord Cornwallis adopted the declsive and Judicious measure of abolishing the dutiea. They were, however, agaln renawed in 1801. Tha exclusion of Englishmen from all participation $\ln$ the interior traffic of the country having been gradually carried Into complete effect for a leng thened period, they were less allive than they wonld otherwise have been to the injurious influence of the duties, so that their re-establishment met with comparatively little oppoeition. In 1810 a new tarif was introduced, by which the dutiey "were frightfuily augmented;" and they continued from that epoch down to their receat abolition seriously to obatruct all sorts of luternal traffic, and to oppose the most formidable obstacle to the improvement of the country.

Had the hiland transit dutiee been productive of a large ame $\cdots$ of of reveutr, that would lave been some set-off agai ast the teormous evila of which they have been ${ }_{\mathrm{p}}$ ruluctive. But such has not been the casc. The expenses of coliection, and the interruption of convuanichain, were so very great that the net produce of the inland transit duties was quite inaignlficant; so mueh so, that, according to Trevelyan, it did not exceed in Ho , ctensive proviace of Bengal, the miserntio pit ..nle , i $£ 27,500$ с year.-Report, p. 148. We see no reason to doubt the accuracy of this statement; and, assuming lt to be correct, we are warranted in affirming that there is not another instance to be found in the history of taxation of a tax so fruitful of mischievous results and so barren of revenue.

Town Duties.-These were charged on tho principal articles of consumption in 23 of the chief towns of Bengal. They were in many respects similar to the octrois in France; and, though not nearly so injarious as the internal transit duties, were productive of much inconvenience. We are glai, however, to have to atste that they, as well as the transit luties, have recently been abolished; and that the internal trado of Bengel ls now as free, in so far, at least, as statutory regulationa can make it, as the iaternal trade of England.
This article has been compiled from various authorities. Inciuding Milaurn's Ifiental Commerce ; Belle's Comparative Vieno of the extirnal Commerce of Bengal, with the Continuation by Wilkisson for the years from 1828-'29 to 1841-'42; The Bengal and Agra Guide and Ginzetteer for 1841 and 18:2; Parliumentary Papers relating to the Finances of India, and the Trade of India and China, 1830-1848; and private communications.

Caledonian Canal, from the North Sea to the Atlantic Ocesu. By means oi this magnificent canal the nautical intercourse between the western ports of C reat Britain, and those also of Ireland, and tho North Sen and Baltic, is shortened in some Instances 800, and in others $\mathbf{1 0 0 0}$ miles. $\Lambda$ sum exceeding a million sterling was granted by Parliament from time to the; and this safe navigation for ships of nearly every tonhage wat completed and opened in 1822 .-Hayin.

Calendar. The Ioman calendar, which has in great part been "lopted by almost all nations, was introduced by Romulus, who divided the year into ten monthe, comprising f04 days, A.d. 758 n.e. The year of Romulus was of fifty daya less duration than the luuar yetr, and of sixty-one less than the solar year, and Its commencement did not, of courso, corrsspond with. any fixed season. Numa Pompillus, 713 a.c., conserted this caleudar by adding two months; and Julins Cesar, lesirous to make it more correct, fixed the sclar year as belng 365 tlays and six hours, 45 n.c. This almost perfect arrangement was denominated the Julian sty te, and prevailed generally throughout the Christian world till the time of Iope Gregory Xilit. The calendar of Julius Cesear was defective in this particular, that the solar year consisted of 806 days five heurs and fortymine minutes, and not of 363 days and
inx hours. Thladifference, at the tlme of Gregory XIII., had amounted to ten entiro days, the vernal equinox falling on the 11th instead of the 21 st of Narch. To obviate this error, Gregory ordained, In 1582, that that year should consist of $86 \dot{b}^{\circ}$ days only; and, to prevent further Irregularity, It was determined that a year beginnlag a century should not be bissextile, with tha exceptlon of that beginning each fourth century ; thus 1700 and 1800 have not been bissextile, nor will 1900 be so; but the year 2000 will be a leap-year. In this manner three days aro retrenched In 400 years, because the lapse of eleven minutes makes three days in alout that period. The yeaz of the calendar is thas made as nearly as possible to correspond with the true solar yrar; and future errors in chronology are avolded.Haydx. Sea Almanac.
The Gregorian calendar was Introinced lato Spain, Portugal, and part of Italy, the same day as at Romo. In France it was received In the same year In the ronth of December, and by the Cathol'c atates of Gerniany the year following. In ih. Protestant states of Germany the Julian calendar was adhered to tiin the year 1700, when it was decreed by the Diet of Ratisbon that tbe new atyle and the Gregorinn correction of the in. tercalation should be adopted. Instead, however, of employing the golden numbers and epacts for the determination of Easter and the mevable feasts, it was resolved that the equinox and the paschul meon shonld be found by astronomical computation from the Rudoljhine tables. But thit melind. though at first view it may appear more accurate, wis socn found to be attended with numerons iaconvenieneca, and was at length, in 17ii, a a andoned at the listance of Frederick II., king of Pruesia. In Deumark and Sweden the reformed calendar was received abou: the same time as in the Protestant states of Germany. Russia still adheres to the Julan reekoning.

In Great butain the alteration of the atyle was for a long time auccessfully opposed by popular prejndice. The inconvenienee, however, of using a different date from that employed by the greater part of Europe in matters of history rnd chronology began to be generally felt; and at length, in 1751, an act of Parliament was passed for the adoption of the new style in all public and legal transactions. The difference of the two atyles, which then amounted to eleven days, wns removell by ordering the day following the $2 d$ of September, of the year 1752, to be accounted the 14th of that month; and in order to preserve uniformity in future, the Gregorian rule of intercalation reqpecting the secular yeurs was adioptel. At the sane time, the commencement of the legal year was changed from the 25th of April te the first of Januery. In Sootland the new style wns vdopted from the legerning of 1600 , acrorting to an act of the l'rivy Council in December, 159\%. This fact is of importance with reference to the date of legal deeds exceuted in Seotlund het veen that period and 1751, when the change was efected in England. With refpect to the movable feasf, wiste: is determined by the rule lald down by the Cou reil of Nife; hat inatead of ensploying the, new moons and rpacte, the golden numbers are pretis : to the days of the fill moons. In those years in which the line of epncts is changed in the tiregorian calendar, the golden numbers are removed to different clays, and of cour. 3 a new table is retuired whenever the solar or lemar eqnation occurs. The golden numbers have been placed so tuat Easter may fall on the same day a3 in the Giregorisn calendar. The enlendar of the Chuych of Euglade 13 therefore, fiom century to century, the sane in form as the old Romnn calendar, exceping that ""gnlden numbers indicate the fu. noons lustead of the new meons.-E. 13.

ico-printers, in order to oxtend and smooth the surface of their cloths after they have been bleached; and before they are subjected to the operatlons of the print-iag-table or coppor-plate press. Britleh muslins are folded generally to a yard in length, with a small allowance for extra measure ; and as the foldlag is alternately trom right to ieft, every part can be instantly exsuined upon a table or connter, every fold openiag os easily as the loaves of a book in its uncnt state. The picce, when folded, is reduced by doubling it longitudinally to about ninoteen inches, aud it is then folded across to tho broadth of about thirteen inches. An ordinary-sized trunk, $39 \times 19$ Inches, thus contains three laycrs of pleces, in which package goods for exportation to the coloulos are generally paeked, the tronk there forming an artlele of merchandiso as inuch in general demand as the muslins which it contains. Even the indian ornaments of gilt silver threads which were at firet woven into one end of each piece, although they did not exceed the value of twopence each, have been either greatly curtaited or totally glven up upon principles of aconomy. Even the cost of this trivial ornament has been computed to have amounted annually in Glasgow and Paisley to about $\mathbf{£ 3 0}, \mathbf{0 0 0}$. Pullice te and other hsadkerchiefs are most commonly folded up in dozens. For the African and some othe foreign trades, pieces containlng only eight handkerchiofa are preferred. Thege, are still Imitations of Indian precedents, coafined to markets where competlion continues to exist, not only with the British company, but with Americans snd others trading to Iudia. A specles of pale orange-colored Indis handkerchiefs, dlatlnguished by the name of Malrus, heing in extensive reputation in the Caraccas and other Spaniah sottlements in South Americs at the period of tho enpture of Trinldad, in 1703, patterns were procured by some British traders, who ordered very large quantitiea to be manafectured in Scetland of the same quality and appearance. With such etfect were these imitated in texturo, in dye, in finishing, and evria in the packages, that some hundreds of pieces sont to London for exportation were aetnally seized at the custom-house as India goods, either illegally lstported, or stolen from some of the Company's shipls in the rivor. A scrutiny, howover, clearly ascertained that those goods were not Indion, but British, and that no trespass oither against the privileges or the property of the company had been even attempted. The goods were of courso rcleased, and per:nittod to proceel to thelr destination, where, after examination and trinl, it was found totally unnecessary longer to conceal their real origin; and a very extenslve trade, through direct chamnols, has since been carried on for similar goods.-E. 13.
Calloo (Ger. Kattun; Du. Katoen; Dan. Kattun; Sw. Cattun; Fr. Coten, Toile de Coton; It. Tila Bambagina, Tela dipinta; sp . Tela de Algodon; Port. Pano de Algodar lRuss. Wiboik; Pol. Aawelnik(), cloth made of co in; so called from Calent, on the Malabar coast, s.tence it was Irst imported. In Eugland all winte or unprinted cotion clothe aro denomianted calicoes; but in the United States this cerm is applied to those only that are printed.
Calico 1 'rinting.--'lisis art, though npparently one of tha most difficult, has been practiced from a very remote era. LIerodotus mentions (lib. 1, \& 202 ) that $n$ nation on the shores of tha Caspian were in the hablt of painting the figures of animals on their ciothes with a coler formed from the leaves of treos bruised and soaked in water; and ho adds that this coler wns not einecable, ard was as durable as the clothes themnelves. it is difflcule to imagine that the colore could nave been so promauest, had not thoso using them been acquainted with the vise of mordants. There is, however, a passago in Pliny (llist. Nut. lib. xxxv. § 11), which, though in some respects obscure, ahowa that the ancicut Egyptims isere fully acquainted with the prinriple of calico printing. "They pmint,", says ho, "the
clothes, not with colors, but with druga (sorbentibus medicamentis) that have no color.: Thls being done, they immerae them in a vatfol of bolling dye, and leave them there for a little: when they take them out they are palnted of varlous colors. It is extraordinary, zeeing that there la anly one color ln the vat (unus in cortina color), that a w. iety of colors should be produced by the operation of the drugs." Pliny further states that the colors wero so adhesive that they could not be washed out ; and that clothes waro the stronger for belag dyed. A similar process is known to have been followed in India from tho earliest times. The chemleal and mechanical laventions of modorn ages have been the canse of vast improvementa in this ingenlons and beautiful art; but the passage now quoted shows distinetly that wo have, in this instance, been only perfecting and improving processes practiced in the remotest antiquity.

California. The name "California" is found in the history of the conquest of Mexico by Bernal Disz, a compsuion of Cortez. But there it lis only applied to a bay. Afterward it was glven to the whole country north of that bay. Its origln is uncertain. Some learned men atarted the opinion that it ought to be derived from the Latin "Calida fornax" (a hot oven), and that it was given to the rocky peulnsula because the first discoverers suffered there much from the heat. Some other derivations of the name Californin from the Latin may he found in Clavigero's history of Mexieo, in paragraph firat. Clavigero makes the remark that Cortez was very fond of sueh Latin words. Prohably It is a corruption of the original Indian name. Because it was for n long time supposed that it was a large ialand, and that many amall islands belonged to It, some called tho country "Las Californias" (the CalIfornias). One hundred and thirty years after Cortez, after the middle of the soventecth century, some geograpiers culled those supposed Californian islands "Islas Carolinas" (King Charles' Islanils), In honor to Charles II., king of Spain, who intended to conquer the whole.

What wo now call "Lpper Califomia" was called by the geographers of the sixteenth centary " Zuivira," from a supposed rich kingdom of this numc. The northern part of this same Upper California and of our Oregon 'Territory was called (1578) by Sir Praneis Drake "Nora Albion," and this name was pretty genorally adopted by the European goographers, execpt the Spanish. It whs extended at last over the whole of Oregon and Lpper California.
Tho name "L'pper California or Neso California" (California Nueva) sprung into existence when the Franciscan missionarics, since 1769, mado settlements to the north of the old Califor:ian Peninsula. They ealled "California Nuera" the wholo Pacific slope, ns far north as it became know: to them.
Since 1819, the date of the so-called Floridn treaty; the northern boundaries of New California were fixed at the $42 d$ degree of latitude, nud ihen soon the more northern part began to he called the "Oregon Cuantry."
Sinee the conquest and cession of the provinco to the United States (since 1847), tho southern bemadaries were fixed at $82^{\circ} 35^{\prime}$ of lit.
Wo now generally cull the country only "California," By geographers it is sometimes ealled "Contirental Culifornia," ins contrast to the Californian penin-sula,-1rom Mistorical Notes on the Ancient and Morlern Names with which the Regions, Countries, Territories, awd States alomg the C'oasts aj the North Anerican Union have bees designated, by J. ©. Knill..

Caltfornia is bounded on the north hy Oregon, on the east by Ute" and New Mexleo, and on the west ly the Pacific Ocean. The Constitution of the State thus describes its limits. Commencing at the polnt of intersection of the 421 degree of north latitude, with the 120th degree of lougitude west from Grecuwich, and ruming south on the line of eald 120fin legree of
west longitude until it intersects the 89th degree of north latitude; thence running in a straight line in a southeasterly direction to the River Colorado, at a polnt where it intersects the 35th degree of north latltude; thence down the middle of the channel of aaid river to the boundary line between the United Stateo and Mexico, ss entablished by the treaty of May 80, 1848 ; thence running west and along said boundary line to the Pacific Ocean, and extending thereon three Engliah milea; thence runaing in a northwesterly direction, and following the direction of the Paclic coast to the 42 d degree of north latitude; thence on a line of suid 42d degree of north latitude to the place of beginning. Also all the islands, harbors, and bays along and adjacent to the Paclic coast. Area, 188,982 aquare milles. Population in 1802 (IUumboldl), 16,862, consisting of 15,562 converted Indians, and 1300 of other elasses; In 1813 the population was eatimated by Forbes to be 23,025 . Emiguante from the United States began to enter the country before 1835, and so numerous had become the settlers that when the war commenced with Mexico, Colonel Fromont had little difficulty in raising a regiment of 500 men. At the close of the war, the population, exclusive of Indisns, amounted to about 12,000 .

The number of wild Indians scattered through the movintains is tankuowa, but is very cousiderable. The native Californians are, like the Mexicans and South Americans, chiefly of Spanish descent, but generally with a very large mixture of Indian blood, so that in complexion and features they are of all shades and degrees, from the pure Indian to the pure Castilian.

The population of the State, according to the census of the United States In 1050 , was 92,569 ; and by the State census in 1852, 264,435.

The seat of government is at Sacramento City, on the left bank of the Saeramento, Just below the entrance of the American Fork. The principsl places are Sars Francisco, Stockton, Monterey, Santa Barbara, San Dlego, Humboldt, etc.

Surface.-The greater part of tho State ls hilly or mountainous. The most prominent range of mountains is the Sierra Nevada, lying nearly parallel with the coast, and from 100 to 200 miles distant. On the weatern slope of thls range are the principal gold roines, extending 400 or 500 miles in length, snd $\mathrm{E0}$ or $\mathbf{v 0}$ in wldth. This slope of the Sierra is broken by the numerous tributaries of the Sacramento and San Joaquin into deep gorges and ravines, and tho surface of the region is extremely rugged and uneven. West of the Sierra Nevada range of mountains, the great valley of the Sacramento and San Joaquin spreads 500 miles in leagth, and 00 or 60 in width. This 18 very ievel, contains but little timber, and though fertile in some portions, is extenslvely covered with an arld unproductive soil back from the streans, and by lmmense tule or bulrush marshes In the vicinity of the rivers. The annual freshets in this valley secur In the winter and apring, and the streams are often at their maximam height as lato as June, in consequenco of the melting snows of the Sierra. This grest valley is bounded on the west by the coast range of hills and mountains, which rise in some parts to the helght of 3000 fent and upward, and lio from 30 to 80 miles back from the coast. These hills are Interepersed with numerous valleys, some of them of grest beanty and fertllity,

Soil and Productions.-The best agricnltursl lands are found in the grest basins of the Sacramento and San Joaquin, and these valleys in spring and summer are covered with a luxuriant vegetation of various grasses, wild oats, etc. The hills are generally covered with wild oats, and furaish excellent pastnrage, though for the nost part too dry for cultivation. Farther north, the valley of tho Mendocino or Eel Itiver is represented by recent explorers as well adspted to agriculture. Tho lands in the vicinity of Ifumboldt
harbor are also said to be very fertile, and In consequenc $i$ of oceasional ahowers through the dry aeason, they stand in no need of irrigation, which, though not essential to the auccess of most crops in other parts of the country, la, nevertheleas, occasionally deairable.

The grape flourishes all over the State, and wlae has long been manufactured at Loa Angelos and other placea. The varions vegetables and frults of the temperate sone flourish finely, and in the southern counties many troplcal productions may be suecessfuliy cultivated. Californis seems by nature peculiarly adapted for graaing; but, under a judieloue cultivation, ite agricultural resonrces are very great.

Thure were in this State in 1850, 62,824 acres of land improved, and $8,881,571$ of unimproved land in farma; cash value of farms, $88,874,041$, and the value of Implementa and machlnery 8108,483 ; live atockhorses, 21,719 ; assea and muids, 1666 ; milch cows, 4280 ; working oxen, 4780 ; other cattle, 258,599 ; sheep, 17,574; awine, 2776; valne of live atock, $83,851,058$.

Agricultural Products.-Whent, 17,328 bushels; It dian corn, 12,236 busheis; barley, 9712 bushels; peas and beaus, 2292 bushels ; potatces, 9292 bushels ; sweet potatoee, 1000 bushela; value of producta of the orchards, 817,700 ; producs of market gardens, 75,275 ; pounds of butter made, 705 ; of cheese, 150 ; pounds of wool produced, 6520 ; of tobaeco, 1000 ; hay, tone of, 2038 ; and were made 58,055 gallons of wine; value of home-made manufactures, $\$ 7000$; of slaughtered animals, $\mathbf{8 1 0 0 , 1 7 8}$. The State census of 1852 shows an lucrease of improved lands tu 110,748 acres; of live stock - horees, 64,778 ; mulcs, 16,578 ; mileh cows, 104,339 ; beef cattle, 315,392 ; working oxen, 29,065 ; agricultural producte-wheat, 271,763 bushels; Indisn cora, 62,532 bushels ; uats, 100,497 bushels; potatoes, 1,393,170 bushels; barley, 2,978,734 bushels.
The State, as a whole, can not be described as well timbered. The plains and valleys are, In the main, destlute of forests, though in many of them is an extensive growth of scattered oaks. Among the coast range of mountains are many forests of red-wood, species of cedar, growing to an immense size, anid furnishing an extremely durable material for building. In the nerthern part of the State, and among the snowy mountains, are forests of gigartic pines, firs, cedars, and other valuable foreat trees, ranging from 100 to 200 feet in height, and from 5 to 15 feet in diameter. In the central part of tho valley of the Sacramento and San Joaquin, nesr the junction of these rivers with the Bay of Suiann, is an extensive tract of low, marsh land called the Tulares, or Tule lands, from the tule or bulrush with which they are thickly covered. These lanls aro estimated to cover an area of at least 600,000 scres, and aro drained ly a net-work of eloughs which generally afford navigable channels from two to six fathoms in depth. Should these lands be reclatined, their fine al. vial soil will doubtless prove well sdepted to the cultivation of rice. The coast range of mountains, and the valleys of the Sacramento and San Joaquin, abound in deer, elk, antelopes, and other wild game, and the plains are traversed by inmense herds of wild horses. The furmidable grizzly bear is found in ueurly all parts of the State. The cattle of the country are fine, and are owned by the native Californlans often in herds of many thousanda. These were formerly kilied in grest numbers for their hides and tallow, which conatituted the prlncipal exports of the country, and the ehief aourco of veaith to the Inhabitants.

Mines,-Silver, lead, copper, platlnum, and other mines, have been discovered In California (though not yet worked), but the great minersl wealth of the State consists in its mlacs of quleksilver and gold, particularly the latter. The quicksilver mine of New Almaden, discovered in 1845, 18 miles south of San José, Is prohably the richest in the world, and, if properly orked, would yield a iniliion of dollare a year. Gold

There were in 1852,108 quartz mills, with a capital of $85,871,405$, and other mining operatlons employing capital of $88,026,042$.

Position of the Gold.-The gold la found under two principal forms; interspersed in irregular velns through beds of quartz rock; in grains and irregular water-worn lumps of all sizes, mingled with the beds of drift or gravel, which cover the face of the country, but most abundantly in the bottoms of the mountain ravines. These grains and lumps wero once parts of veins traversing quartz rock, and have been dislodged from their original matrix and reducei to the form in which we now beheld them by those aqueous and clemental agencict which have every where dialntegrated and broken down the gurface rocks, and of their ruins formed the present aand and gravel beds that cover the face of the earth. Their origin, or rather the origin of the forms in which we see them, was tho same as that of all our aand and gravels. They are, in faet, aething more nor leas than golilen pebbles-nretallic gravel and sand. The idea so prevalent that the gold has been thrown out from volcanoes In a melted state, is antirely unscientific and erroneous. The gold region is not voleanie, and all soarch for the "blowholes," or "fountalns," from which the gold is suppesea to have been thrown must always be, as it heretofore has been, antirely fruitless. In general, the loose gold is found in the immediate vicinity of the parent veina of which it once formed a part; or, at least, at no great distance down the slopes of the valleys and ravir. 3 which have in process of time been excavated by the clements.

The vein gold found in place in the quartz rocks occurs in various parts of the mines, but chietly In the southern districts-in the neighborhood of the Cosumne, Moquelumne, Tuolumne, and Mariposa rivers, and elsewhere. Tho working of these veins requires machinery, and has not yet been fairly tested. Some trials have been made with fiattering success.

The scale and lump gold is found most abundantly in the bottoms of ravines, and in tho banks and beds of the rivers, particularly in the bars of sand and gravel thrown up in the streams by the rush of the mountain torrents. The gravel bed containing the gold lies generally not ovcr two or three feet below the aurface; but occasionaily it is covered to the depth of 10,20 , and even 50 feet. Most of the gold hitherto obtained has been taken from such localities. The banks and beds of the rivers yied most abundantly at the lowest stage of water In the autumn and lntter part of summer. The side "gulches," or ravines, are usually destitute of water in the dry season, and hence the explorations in thom are denominated "dry diggings," and are condueted most auceessfully during the winter, spring, and early part of summer, particularly the two latter.

It is imposaible to any which portion of the mines is tha richest. All parta of then have ylalded Immense quantities of gold. The southern mines have turned out the greateat number of large lumps, and more of the cosrse or lump gold is generally found in that reglon. But for this very resion, perhaps, digging in them is somewhat more precarious and lottery-like than elsewhere. In the northern minee tha chances of fiading large apecimena may be lesa, hut the proapect of making fair dally wages has been considered rather more certaln there than in the southern mines. . Tho recently-discovered depoaits In the coast range on the Klamath and Trinlty, and their affluents, ara reported to bo unusually rich, and many have hasteaed to glve thom a trial.

The implements needed for procuring the alluvial or loose gold are plcks, shovels, and washera. The washers are either simple pans or wooden bowls, or machines, generally in the form of a cradle, nad hence called cradles or rockers. These are sometimen more expensively constructed, and furnished with cells for quicksilver; by maane of which the gold may be more completely and economically extracted.

It is well known that comparatively but a small portion of the products of the nines is entered at the San Francisco custom-house. Large sums are takon by passengers leaving the country among their baggage. An immense amount has also been taken out overland, by the Sonoratalans and other Mexicans who have returned from the mines to their homes. It may be eatlmated, therefore, that not muel less than three hundred and twenty millions of dollars have been dug from the gold region of California ainee its discovery.-II. G.

For later Callurnis statiatics, see articles San Francisco and Gol.D.

California, Gulf of, en arm of the Pacific Ocean, separating the peninsula of Lower California from the main land. It lies between lat. $23^{\circ}$ and $32^{\circ} \mathrm{N}$., and long. $107^{\circ}$ and $114^{\circ} \mathrm{W}$. ; and is atout 700 miles in length, with a breadth varying from 40 to 150 miles. Its weatern shores aro generally high and rocky, with few places of shelter; its eastern shores aro lower and less rocky. It contains numerous islands, and at its northern extremity receives the rivera Colorado and Gila.

Calk, to drive a quantity of oakum into the seams of planks, to prevent the entrance of the water. After the oakum is driven in, it is covered with melted piteh or resin, to preserve it from tho action of the water.

Callao, a fortified town of Peru, department, and six miles west of Lima, of which it is the port, on the Pacitle, in lat. $12^{\circ}$ S., long. $77^{\circ} 13^{\prime} 7^{\prime \prime} \mathrm{W}$. Population perhaps 20,000. It is generally well built ; lts castle, formerly very strong, has lately been diamantled, and is now used for a euston-house. Its roadatead, sheltered by the island of San Lorenzo, is the best on the Peruvian coast. It has a convenient quay, and communicates with Lima by a good carriage road, along which omnibuses now run daily. Customs revenue, about $\$ 1,000,000$. Exports consiat chiefly of bullion, specie, copper, cotton, bark, and hides: In 1841, 498 vessels, aggregate burden 101,034 tons, entered; and 494 vessels, burden 09,944 tons, cleared out of the port. In 1746 tho old town of Callao was deatroyed by an earthquake. In 1820, the Earl of Dundonald (then lord Cochrane) gallantly cut out the Eameralda, a large Spunlsh ship of war, from under the guns of the fort.-See lisha.

Calms, Region of. In the Atlantic Ocean, between the Trople of Cancer and latitude $29^{\circ}$ north, and on the confines of the trade-winds, between $4^{\circ}$ and $10^{\circ}$ north latitude, calms of long duration prevail; and hence these tracts nre ealled the calm lutitudet, or the region of ealms. In the latter tract, particularly, these perpetual ealms are accompanied by in suffocating heat, by thunder-storms and floods of raln, so that it is some-
times called the Rainy Sea. The only winds that occur are sudden squalls of short duration and extent. In these calma the provislons are corrupted, the deck seame open, and the atagnant air breeds disease. When a ship is in this position, if the current sets in toward rocks, and the eea ia too deep to caat anchor, her deatruction is almoat inevitable. In the Mediterranean, where there are no tides, dead calms are more common than in the open ocean; but they are often the presages of approaching storma,-E. A.

Calomel, a preparation of mercury, much used in medicine.
Calorio, the principle or matter of heat, or the aimple slemant of heat.

Cambric, or Cambriolx (Ger. Kammertuch; Du. Kamerykwdoek; Fr. Cambruy Batiste; It. Cumbraja; Sp. Cambrai; Port. Cambraia; Russ. Kamertug), a species of very fine white lines, firat made at Cambray, in French Flanders, whence it derives ita appellation. Cambrica were tirst worn in Engiand, and accounted a great luxury in dreas, 22 Elizabeth, 1580.-STowe. The importation of them was reatricted in $1745 ;$ and was totully prohibited by atatute of 82 Geo. $11 ., 1758$. Readmitted in 1786, but afterward agnin prohibited: the importation of cambrice is now allowed in Grest Britain.-Hayidn.

Camel (Fr. Chameau; It. and Sp. Camelo; Ger. Kameed; Arab. Djimel; Lat. Cumelus; Greek Ka ${ }^{\prime} \eta \lambda$ os), is indlgenons to Arabia, and we only mention it in this place on account of its extreme importance in the commerce of the East.

The camel is one of the mest useful of the animala over which the inhabitants of Asia and Africa have acquired dominion. These continenta are intersected by vast tracts of borning sand, the seuts of desolation and drought, so as, apparently, to exclude the posnibility of any intercourse taking pluce between the countries that they separate. "But aa the ocean, which appears at first view to be placed as an insuperable barrier between different regions of the earth, has been rendered by navigation subservient to their mutual intercourse ; ao, hy means of the camel, which the Arabians emphaticaliy call the Ship of the Desert, the most dreary wastes are traversed, and the nations which they diajoin are enalied to trade with one another. Those painfui journeys, jupracticable by any other anImai, the camel performs with astonishing diapatel. Under heavy burdena of 600,700 , and 800 pounds' weight, they can continue their march during a long periont of time, with little food or rest, and sometimes without tasting water for eigit or nine daye. By the wise ecenomy of lrovidence, the camel seems formed on purpose to be the beast of burden in those regions where lie is placed, and where his service is most wanted. In ali the diatricta of Asia and Africa, where deserts are most frequent and extensive, the camei abounds. This is his proper station, and beyond this the uphere of his activity does not extend fur. He dreads alike the excesses of heat and cold, and does not agree even with the mild climate of our temperate zone."-Ronertson's Ancient India.

The first trade in Indian commodities of which we have any account (Genebla xxxvii. 25) was carried on by camels ; and they stili continue to be the medium eimployed in the conveyance of merchanta and mer. chandise throughout Turkey, Persia, Arubia, Egypt, Barbary, and many contiguous countries. The merchants assemble in considerable nuubbers, forming themelves into an association, or caravan (see CaraVAN), for their mutual protection against the attacks of robbers, and the ciangers incident to a journey through such rude and inhospitable countries. These caravans are often very largo, and usually conaist of more camels than men. The capacity of the camel to endure fatigue, and the small supply of provislons that he requires, fs almost ineredible. "His ordinary hurden," says Volney, "is 750 poands; his food what-
ever la given him-straw, thistles, the stones of dates, beans, burley, etc. With a pound of food a day, and as much water, he will truvel for weeks. In the journey from Cairo to 8 ues, which is 40 or 16 heurs, they neither ent nor drink; but these long fasta, if often repeated, wear them out. Their usual rate of traveling is very slow, hardiy alove two milea an hour: it is in vain to urge them; they will not quicken their pace; but if allowed some short rest, they will travel 15 or 18 hours a day."-Voyage en syrie. The Arabians regard the camel as a sacred animal, the gift of ILeaven, without whose aid they could neither subsist, nor trade, nor travel. Ita milk is thelr ordinary food; they also eat its flesh, especially that of the young camel, which they reekon excellent; ita hair, which is renewed every year, is parily manufactured into stuffis for their clothes and furniture, and partly aent aliroad as a vainable article of merchandise; and even its feese serve them for fucl. Blessed with their camels, the Aralis want nothing, and fear nothing. In a single day they can travese 40 or 50 miles of the desert, and interpose Its trackless sanda as an impenetrable rampart het ween them and their foes. (See the admirable deacription of the camel, in Hupros.) But, however oseful to the inhabitants of parched, sandy deserts, it may be worth while, perhaps, to olserve, that the camel is of very little service elsewhere. He can not walk 100 yards in wet or slippery gronnd without stumbling. He is totally unknown in all hilly or woody countries; and, with few exceptions, may be said to be as great a atranger in the Eastcrn Islands, Japan, the southern parts of Chints the whole country lying bet ween China and india, und sli the southern parts of the lister, including Bengal, as he is in Europe. In all those vast countrics the ox is the most usefui of the lower noimais. It is used for draught (for which the camel is totally unfit), in the curt and plow, in the carrying of hurdens, in treading corn, in the oil-presa, etc., and finally as foot.
In 1855, Congress, in accordance with a recommendation of the Secretary of War, granted an approprlation for the purpose of importing and introducing the camei into the United States, to be used principally on the prairies end deserts of the Weat-the States of Texas and New Mexico especially. To cearry out tbis julun, an expedition, under Major Wayno, of the United States Artillery, and Lientenant Porter, United States Navy, visited tha Mediterranean, and purchased a number of camels and dromedaries, and conveyed them to Texas. A second expedition has just started, as the plan promises to succeed, and the plan wlll be tested on a larger scale. Emigrants have suffered much in their trains for the want of a burden animal that could do without water for a long time, and a great number of animais are annualiy lost on the plains with thirst.
There are now thirty-t wo camels, old and young, in the State of Texas, in charge of officers of the army. and forty more on their way to this country. Witi the natural increase, the experiment will thus he commenced with nearly a bundred of these "shijp of the desert." The War Department has the highest expectations of their avallability for the Iniand truvel on southern portions of this continent, and there can be little doulit of the justification of hin hopes. The route to the Pacillc offers better foraga for these hardy animals than they find in their own deserta; and as to climate, the Tartars use them on the steppes of Asia, in regions as inhospitalile as can be found on the Cadifornia route, except in mid-winter, when travel may be suspeoded. A correapondent of the Galreston Nerrs states that the Indians have never yet had a sight of these strange animala, and it is expected that the appearance of such ungainly creatures will cause, for a aeason at least, such terror to the red man as to prove a protection for caravans. The indians may get over this; lut, unless the horses of the prairies differ from their Asiatic cousins, they will require long training to learn to like the aspect of the camel. The Tartars

who visit Chinese frontier towns and markets throw every thing into confusion. Horses fling, and bound, and break their halters to escape a creature to which they wlil not get accustomed. We happened once to see a couple of camels driven through a country viliage, and never were horses and muies Inspirited with mere ridicuious frlght than the farmers' naga were at this ungainiy apparition.

Camel, a machine, of Datch invention, for rajuing large ships so far above the water-line as to enable them to pass over the obstruction of a bar or shallow. It consisted of two large boxes, or half ahipe, which were applied to each aide of the huli of a large vessel, and from which a number of cables were paseed under the keel, and attuehed to horizontal windlasses on the deck of either haif of the camel. When the machine was to be used, water was allowed to enter, so as to sluk the two parta of the machine to the requisite depth; the ropes were then caat loose, and large leams were placed horizontaliy through the port-holes of the ship, with their ends resting on the camel on each side. When the ropes were made fast, and the ship properly secured, the water was pumped ont of the camel, which then rose and bore up the shlp along with it. By thle contrivance, East Indlamen drawing 15 feet could be made to draw only 11 feet; and ships of war carrylng 90 or 100 gans were enabied to pass the sand banks of the Zuyder Zee.-Deckmann's Hist. of Inventions, vol. iii. p. 338. This machine is also available for ruising sunken vessels.-E. B.
Camel's Elair (Germ. Kameelhaar; Fr. Poil de chamesu, Laine de chevron; It. Pelo di camello; Sp. Pelo i lana de cimello). The lhair of the camel lanported into this country is prineipally used in the mannfacture of fine pencila for drauing and painting. In the East, however, it is an important article of commerce, and is extensively used in the arts. It aerves for the fatiricatlon of the tents and carpets of the Arabs, and for thelr wearing apparel. Cloth is also manufactured of it in lersia and other places. Tho mort esteemed hair comes from Perala, divided into three qualities-luack, red, and gray. The hinck is the deareat, and the gray only worth half the red. Considerable quantities of eamel's hair are exported from Smyma, Constantinople, and Alexandria. It is used in the manutacture of hats, particularly by the Firench. -Rees' C'yclopedia, art. Camei.us.

Camelia, a very ornamental genus of plants, natives of China and Japan, belonging to the nutural order Ternstromincece. Many varieties of this plant are grown in England and Belglum, sometimes in the open air, but more generally in hot-houses. Though usually cultivated in pots, they are found to thrive best in open soil in a glass-house artlicially heated.

Cameo, a peculiar kind of onyx ; also a stone, on which are found various figures or representations of landscapes, a kind of lusus natura, exhibiting pleturea without puinting. It is of these camaieur that Pliny is anderstood to speak when he says of the manlfold pictures of gems, und the party-celored spots of precious stones, Cemmurum pictura tam maltiplex lapilunique tam discolores macule. Cameo is alao frequently applied to any kind of gem on which tigures are sculpturen, elther indentedly or in reiievo. The shell of large univalves is now much used for making cameos, the auhject being wrought on the onter or white layer of the shell, and the pink or hrown under one serving for the ground. Cameo is ulse naed for a painting of only one color, where the lights and shadows are of gold, wrought on a goiden or azure ground. When the ground is yellow the French call it cirage; when gray, gristaile. This kind of work is ehiefly used to represent basso relievos. The Greeks called such works $\mu_{0} \boldsymbol{\rho} \boldsymbol{\chi \rho} \omega \mu$ ага.-E. B.

Camera Lucida. Invented by Dr. IIook, alsout 1674.-Woon's Ath. Ox. Also an Instrument invented by Dr. Wollaston, In 1807.

Camera Obsoura (i. é. Vark Chumber), in Cpfice, a machine or apparatus representing ant artlficial eye, by which the images of external oljects, recelved through a doubie convex gians, are exhibited distinctly, and in thelr native colore, on a white matter placed within the machine, in the focus of the glass. The camera obscura affords very diverting spectacles, hy representing images perfectly like their objects, while at the same time it exhibite all their motiona. By means of this instrument, a person unacquainted whth desiguing inay delineate objects with the greatest ac-curacy.-E. B. The camera obscura, or dark chamiser, was invented, it is believed, by the celebrated Roger Bacon, in 1297; it was improved by Raptista Porta. the writer on natural magie, about 1500.-Moncri. Sir Isaac Nowton remodeled lt. By the recent invention of M. Daguerre, the pietures of the camera are renderod permanent : the last was produced in 1839.IIayde.

Camlet, or Camblet (Ger, and Du. Kamelot; Fr. Camelot; It. Ciambellotlo; Sp. Camelote; Rusa. Kanlot), a plain stuff, manufactured on a loom, with two treadlea, as linens aro. There are cainleta of various colors and sorts; some wholly of gouts' hair; others In whieh the warp in of hair, and the woof half halr and bulf silk; others, agaln, in which both the warp, and tho woof are of woot ; and, lastly, some of which the warp ls of wool and the woof of thread: some are striped, soine watered, and somo figured. The true Oriental camlet is made of tho hair of a sort of goat frequent about Angora, and which coostltutes the riches of that eity. Camlets nre now made in Europe. Writers of the Middle Age mention stuffs of camel's hair, under the denominations of camelctam and camelinum, whehce probably the term; but these are reprenented as coarse and rough, and seem to have been chlefly used among the monks by way of mortification, as the hair shirt of later times.

Camomile, or more properiy Chamomile, tho flowers of the Anthemis nobilis. The flowers have a white ray with a central yellow dlsk, and an aromatic bitter taste and powerful oclor. The infusion of the flowers is, when cold, a useful stlmulant, bitter or tonle; the infusion taken warm, however, acta as an emetic. The virtues reside in a volatije oll, and in a bister principle, which may be separuted from one another.

Camphor or Camphire (Ger. Kampfer; Du. Kamjer; Fr. Camphre; It. Canfora; Sp. Alcanfor; Russ. Kumfira; Lat. Camphora; Arab. and Pers. Küfoor; Mal. Kuy $\mathrm{fur}^{\prime}$ ). There are two deachiptions of this valuable article, which must not be confounded. 1. Camphor of Commerce, which is obtained by boiling the timber of a species of laurel (Laurus camphora) found in the foresta of Fokien, in China, near the elty of Chineliew, and in certain localities in Japen. Most of tho camphor imported Into Europe is from Chinn; but a small quantity, considered of superior quality, comes from Japan by way of llatuvia. The exports from Canton may be estimated at about 3000 piculs, or $400,000 \mathrm{llss}$. ; and if to this we add the experts from Batavia of Japan eamphor, amounting to about 500 piculs, the totai annual exports will be alout 466,000 Ibs. It is packed in chasts, drums, and casks; and is in small, granuiar, frialio masses, of a dirty white or grayish color, very much resembling half-refined sugar. When pure, the camphor of commerce has a strong, peeuliar, frugrunt, penetrating odor, and a litter, pungent, uromatic tnate. It is in renlity a concrete essentlal oil. Cauphor, when retined, is in thin hollow enken, beatifully whito, and, if exposed to the air, totaliy evuporates. Great care is, therefore, reguisite in packing camphor to prevent serious loss. 2. Camphor, Ifalag, commonly calied, to distinguish it from the last, camphor of Baros, from the port of Sumatra, where it is mostly shipped. It is a product of the Dryobalanops camphora, a forest tree confiner? to Sumatra, Borneo, and the Malay peninauia. It is

## CAN

found in concrete masses in the flssures of the wood there are, however, but vety few trees that afford it; and those thet do, o.lly in small quantities. This apecies of camphor is more frugrant, and less blting and pungent, than that yielded by the laurel, and is in high repute among the Chinese, by whom it is almost whel ly conrumed. There is an immente disparity in the pricea of the two apeclea in China; the fident Chinese camphor being sometimes quoted at $\$ 30$ per picul, while the Malay eamphor is quoted at $\$ 30$ per eatty, making the price of the latter 100 timea greater than that of the former! Mulay camphor is wholly unknown in this eountry as an article of trade.

Camphor Oil (Malay; M/inyak), a fragrant essental oit, obtained in large quantities by heating the wood of the Iryobalanops camphora. It is nearly as cheap as spirita of turpentine, but is not held in any esteem by the Chinese. It might, perhsps, be profitnbly imported as a aubatitute for spirits of turpentine in the arta, and for medicinai purposes. We nay add, that the timber of the Dryobalanops camphora is not inferior to any prodnced in the countries where it grows, for the purposes of house and ahip builling Private information, and Crawfund's Indian :Itr. pel:(y).

Cam-wood, a red dyewood, firat brought to Europe from Africn ly the Portuguese. It is principally ohtained from the vieinity ef Sicrra Leone. The coloring muiter which it affords differs but little from that of ordinary Niearagua wood, either in quality or quantity; and it may be employed with similar mor-dants.-Banchoft on Colors.

Canada. This extensive tract of country, and most important colony of England, may be tescribed as a great belt of territory stretching from the centre of North America to the shores of labrador, and from the waters which flow into the Northern Ocean to the parallel of Pennsylvanis, in the United States. Its extent from east to west is computed at about 1400 miles, and from north to south at from 200 to 400 miles. Its precise geographical limits are between the parallels of $41^{\circ}, 71^{\prime}$ and $50^{\circ} \mathrm{N}$. lat., and letween the meridian of $57^{\circ} 50^{\prime}$ and $117^{\circ} \mathrm{W}$. long. Canndn, Jying diagonally along the frontier of the United States, from northenst to southwest, and possessing an Inlund navigation along its entire border, i.l a eeries of fakea and rivers unrivaled for extent and grandeur, han, especlally of late years, heen making such rapld jrogreas, that it promises soon to become, in conjunetion with ita alster IIritish provinces, a power of irst-class importance, commrercially and politieally. The entire surface of the present terrltory of Canads, exclualve of its grent waters, has lieen estimated at $196,000,000$ neres, or bet ween two and three times the size of त́reat Britain and Irelund. This sountry, formerly divided Into two provinces known an Ipper and Iower Cansda, was is 1841, by an act of the Imperial Parllument, constituted one province, with one Legisluture. Although sow united, bowever, for legislative and other purposes, the country will mogt probaily continue to be viewed and spoken of under lta formerly recognized divisions of Upper and Iower Cannda.

Canula may be anid to comprise one vast valley, throngh which the great Rlver St. Lawrence takem its course, isaning from lake Superior and fowing successively through Iakea Iltron, Erie, ond Oatario, until it falls lato the ocean after a course of $\mathbf{2 0 0 0}$ millen. This immense valley is on each side encomparsed by diffrent mouniain ranges, sometines nearly approaching the water, nui at other thes receding into the interior, and thus forming exiensive plaina, for the most part alluvial, and nuitabie fur nearly every deserijution of prodisee. The high table-lund along the northern boundary of thas valley separatea the atreams which toke their rise wlthin it and flow into ita busin from those that take their rise in the almost unknown territory beyond, and whleh fall Into Hudson'a llay. The
high land along the southern boundary of the valley separates the atreams whieb flow northward Into its basin from those that have thelr course southward toward the Atlantle and Mississlppl. Commencing at tie northern ohore of the St. Lawrence, toward the mouth of that river, whrie the width is 90 miles, we find oue of the walla of thia vaat valley which constitutes Canada rising boldly in mountaineus form, close to the river, and continuing thus to form ita rugged bank for upward of 100 miles. One of the most remarkalle of the heights of this northern lank is Cape Tourment, overhanging the very brink of the river, and somewhut prepering the voyager for the still bolder and more magnifieent grundeur of Cape Damond, the Gibraltar of Ameriea, which risea to a height of 400 feet, and is crowned hy the citadel of Quebec.

The city of Quehec, here elinging around the rocky steeps of Cupe Diamend, and overlooking one of the noat magniticent harbors in the world, la situate on the northern bank of the 4 . Lawrence, and ahout 400 miles from the mouth of that river. The view from the citadel presents on every side a country with fcutures of jeeuliur and striking grandeur. Immediately . poaite Quelsec the St. Lawrence contracts to about half a mile in width, with bold rocky banks on elther ide. Tho northeru or Cape Diamond alde, being much the bolder of the two, coinmands a view of the wide stretch of table-land extending beyond the southern bank, the vast plains presenting for leugues upon leagnes their dark masses of forest, with houses and eultivatel tields interspersed, until the distant mountains of the States of Maine and Vermont bounl the view. The northern shore prenents a wilder und inore rugged aspect. From the heights of Cape Dhumond the sjectator aurveys bold ranges of hilla fringing the northern borizon, und forming the beundaries of almust unexplorel territories beyond.
Al:ont 30 miles below Quelise is Crpe Tourment, to which, in our upward progress, we hind traced the roeky northern hank of the rivet. Here the ridge, takiry a direction west-southwest, terminutes on the River Ottawa, about 120 miles aheve its confluence with the St. Lawrence, thus extending westward from Cape Tourment along the course of the St. Jawrence about 800 miles. Tho tract of country y ying hetween this ridge and the St. Lawretace, wifh may lis estimuted at from 15 to 80 miljca is breadth, is heautifully picturesque, well watered, level, nud fertle. "his portion of Cansala, n reteli!ng along the northern shore of the river, from below Quebee uprurd to Montreal, in distance of about 200 miles, rind thence along the banks of the neautlful Ottawa, may he considered, especially toward its upper and weatern extremity, one of the choicent parta of the country.

The terriony lying heyond this ridge is internacted by another and higher range of monutnins, which runs into the interior ln a nortiwest direction, at the diatance of about 200 milies from the other, and furms the witer-ahed between the trlhutary st.eums of the St. Lawrence and those that fall into Iludson's Buy. 'Ihis territory may ho sald to le only one great wilderness of forest, whose solitndes are as yet unexplored, and only ocensloantly traeked ly wandering hunters.

Glancing at the south alore of the St. Lawrence, a ridge commences nenrly 100 miles lichow guelec, which, passing rpwaril In a aouthwest direction, njposite that city, at a diatance of $\mathbf{0} 0$ milles from the rlver, crosaes tho bound.ay line lietween Conath und the United States, and finally alopes down to the River IIndson. Ileyond chis ridge, at ahout the dilatume of tho miles, is nother ant' a higher one, which commences at Cape linaicre, the hold hradlanal at the moutio of the St. Jawrence, and, running for aliout 400 milles in a difectlon nearly $p$ :nllel with the river nud with the other ehain, terminatea upon the eastern i, ranch of the River ('omerticut. This forms the divilling ridige ine tween the tributary atreams of the St. Lawrence and

those which flow toward the At'antic Ocean, and sep-1 arates a portion of Canada from the ter ritory of the United States. The general charmeter of the country slong thie south side of the river, from Cape Zozicre upward, to within about 100 milles of Quehec, where the lesser ridge commences, is somewhat rugged and mountsinous; but there are many fertile parts near the river which are populous and well cultlrated. On the south side of this main ridge, down to the shores of Gasps and Chaleur Bay, tha country is mountainous, but interspersed with level and fertile spots, some of which are under cultivation, especially along the coast, where the inhabitants are principally dependent on the fisheries. The country for 100 miles below Quabec, and extending to the River Chsudiere, a fow miles above that city, has much of the broken and billy character which it has farther down tho river, but with extensive tracts of excellent land. This portina, ss well as for a distance of above 100 miles farther down along the banks of the river, is a succession of settlements. Between Quebec and the lower ridge of mountuin-land already meutioned, the country presents a fertile plain, bruken by a few insulated hills covered with trees to their summits. It is well setthed, and a considerable portion of the land cultivated. The country atove Quebee, stong the south sido of the St. Lawrence, to the line $45^{\circ}$ of N . lat. (which is the southern boundary of Lower Canada), may be characterized as one extensive and fertile plain, in parts agreeatly broken and undulating. N. ach of it is covered with populous and prosperous settlements. As it lies contiguous to the United States, and embraces soms of the principal points of communlention hotwen the two territories, it is at present, and bids fair to conthne to be, the most flourishing portion of this lower division of Crmada.
The city and $\mathrm{l}_{\text {oinnd }}$ of Montreal, situated in Lower Cauad, and inmediately below the confluence of the River Ottiwn with the St. Lawrence, muy he sald to form the chief connecting link between the lower and upper provinces. ' Being about 180 miles sbove Quebec, and Quebee being itself about 400 miles up the river, Montreal is thus oltuated nearly $\mathbf{6 0 0}$ miles in the interior of Canada.
"The Lanks of the St. Lawrenco are here presented otretehed out into smiling plains of most luxuriant sppearance, in mitst of which, and forming a main fenture, is the garden-islund of Montreal-jroduciag grain and frult, especially some descriptions of the latter, in perhaps greater perfection than in any other part of the country. The slze of this island is 82 miles in length and about 10 in broudth, upon which is situatel the eity, covering nbove one thousand aereswith its quaint inixture of Engilish, American, and old French architecture, in its streets, shops, English, American, and Scotch churehee, French cathedrala and spiter, and ancient convents. Rislng frori., aid forming a sheltering background to the elt, on the north, is 'The Monntain,' as it is called, thickly wooded to the summit-an elevation of between 500 and 600 feet, commanding a nungnificent vlow of the pleturesque mid laxuriant country around, the expanse of the St. lawrence, and the bold mountaln acenery in the distalice. Along the substantially-built atone wharfe skirting the south of the town, and toward the broudest channel of the river, lio thirongs of shlps, barges, and ateam-vessels, londing and unlouling the naturaj products of the interibr, und the manuficture end other merchandise of Ibritnin. Montreal, situated alnut 600 milles up the St. Lawrence, forms the hend of navigation for the large elass of ocean vessels, and is the maln polnt at which the produce of the interior arrives, In steamboata, screw-propellera, and barges, for reshlpinent on board of the Atlantle vessels."

Ocenn veasela may now, however, by recent improvements of the internal navigation upward through the great lakes, proceed with their cargoes many hun-
