"Notice to Mariners in regard to Changes.-This Is a suhject which, in the opinion of the loard, requires more attentlon than has ever been given to it in this coantry. It is not sufficient to publish changes in a local newspaper. They should be pullished, as far in advance of the proposed change an possilite, in all the leading commercial newspapers, I'itical periodicals, snd by placards in large type, with conspicuous headlags, and distributed at home and nbrond, at the cus-tom-louses, and efflices of the different consulates. In making changes, they should take place nt the precise time designated, and nothing should prevent the perfect fultillment of the originally publlshed design. Changes of lights in light-houses, removal or placing of light-vessela, sheuld nover take place with less than six months' notice: a year's notice would be fetter. Shoald a light-vessel break adrift, nlthough replaced within a few days, a notlee of both facts should appear together in the same papers, and on the same placarls, as the navigainer might otherwise see the notice of the breaking adrift, and not the other, and thereby he deceived. This la one of the nost important branches of the lighting service, und one that can never be perfectly systematized witheut a corps of competent and efficient local inspectors. In this respect the Trinity IIonse, Northern Jights, Irish Hoard, Iiverpool llock Trustees, etc., are good models. Notices of proposed changes of lights, buoys, beacons, and of new lights, are to be found in every part of the globe, and always placed where the navigator is obliged to go before leaving port-the clearnnce office, and at the office of the consul of hla country. The milmiraile system followed by these indepentent boardx, in all the minute detalls of the service, for the lienefit of comnerce and navigation, can not he too highly commended. Those who have been around the world, and visited nearly every pribcipal port it contains, never saw a notice to mariners relating to an Amorican light, except by chance, in some corner of a newspaper, and thut probably a merely local one.
"Changes arising from casualtios should bo pub-
liahed widely in the manner prescritied, and at the eame time reported by the local inspector to the $\mathrm{De}-$ partment:- No changes sheald be made except on the authority of the Department, which should authorize at least six months' notice, in all cases of lights. The looseness of the system in this country heretofore in these respects is proved by the fact, that although a circular was issued by the general superintendent of lights, otc., directing the collectors, acting as suparintendents of lighta to report to the superintendent of the coast survey all changes in regard to lights, beacons, buoys, otce, that they might be placed upen the charte, but one collector ever complied with the direction. Changes which otherwise would be improvementa, unless known to the meriner, become snarea. No list of beacons, bnoya, or sea-marks exists; no description of them can be obtalned, except by a general vislitation and Inspection of them along the whole coast. Having falled to ebtain the required Information, efferta have been made by the Board te procure this important infermation from the local superintendenta, for the purpose of arrangling a descriptive list of them. Se far only a few returns have been made, and some of these not full enough to carry out the design. European light-house boards do not confine themselves to giving notice to mariners of proposed changes, etc., in their own lights, etc., but they cause those in foreign languages to be translated, and as widely disseminated ns their own. The Trinity House corporation of Iondon canses the netices relating to lights, etc., on the French coasts, as well as on thejr own, to be published in the commerclal papers in this country.
"Relative Economy of Reflector and Lens Systems.Now, although the most decided results in favor of economy are to be expected from the reformation of the minor classes of lights, we do not therefore conclude that we should begin with them, becanss humanity, and the more general interests of commerce, and the safety of our ships-of-war, have their claims. Our shlps-of-war, vessels engaged in foreign commerce, all that arrive on our const from distant voyages, are more linile to suffer from the lnferiority of our seacoast lights, or higher elass lights, than are our coasters froun the deficiencies of the inferior classes; and, necordingly, it is along our exterior coast line that we ind occurring the greator number nnd the most disastrous shipwrecks during the stormy seasons.
"The minor lights are usually so multiplled, and the localities inslde of the general coast line so well known to the navlgators of our bays and rivers, that they can not often be at a loss for a secure harbor somewhere in heavy weather; whereas the sea-coast llghts, at times comparatively few, nnd even deficient in number, and at others complicated by thelr superabundance, occupy positions full of danger to the navigater. It is, therefore, of the first importance to ships arriving on the coast from distant voyages, that the light which they tirst make should le clarrly vialibo at the greatest distance from the land, and that it should be so disthuct in chnracter as unt to le confounded with other lights; and it ls not less important that we should net delay glving to such lights all the perfection they are enpabie of receiving; and having accomplished this purpose with respect to the most prominent and important, we should extend tho improvement to the lighta of inferior elasses and of minor inportance, although by so doing we were to save at the outset something less than if we were to begin by reforming the minor lights, becanse in the mean time our foreign commerce and the navy might be suffering to an emount far surpassiug that which might be saved to the revenue.
"Mr. Alan Stevenson saya: ' In comparing the fixed dioptric and the fixed cateptric appuratus, the results may be summed up under the following heads:
"'1. It ls impossible, by means of any practical
comblation of parabololdal reflectora, to diatribute round the horizon a zone of light of exactly equal Intonalty, while thls may bo easily effected by dioptrio means in the manuer already deacribed. In other worda, the qualitles required in tixed ilghta can not be no fully ohtalned by reflectora aa by refractors.
u42. The average light produced In every acimuth by burning one gallon of. oll in Argand lamps with reffectors, is only abeut one fourth of that produced by burning the same quantity in the dioptrio apparatua, and the annual expenditure is $£ 14088.8$. lese for the entire dioptric llght than for the catoptric light.

64 . The characteristlo appearance of the fixed reflecting llght in any one azimuth, would not be changed by the adoptlon of the dioptric method, although Its increased mean power would render it vislible at a greater distance in every direction.
" '4. From the equal distribution of the rays, the dloptric light would be oheerved at equal distances on every point of the horizon-an effect which can not be fully attained by any practicable combination of paraboloidal reflectors.
645. The inconveniences arising from the uncertalnty which attends the use of the merhanical lamp, are not, perhaps so much felt in a ixed as in a revolving light, because the greater simplicity of the apparatus admits of easier access to it, In case of accident.
" 'There can be but little doult that the more fully the aystem of Fresnel is understood, the more certainly will it be preferred to the catoptric system of illuminating lighthouses, at least In those countrles where this important branch of administration is conducted with the care and sollcitude which it deserves.
" 'The expense of fitting up a revolving light with $t$ wenty-four reflectors, ranged on three faces, may be eatimated at £1298, and the annual maintenance, including the Interest of the first cost of the apparatus, may be calculated at $\mathcal{C A 1 8} 8 \mathrm{ss} .4 \mathrm{~d}$. The titting up of at revolving light with elght lenses, and the diacatoptric acceasory apparatue, may be estimated at $\mathrm{C1450}$, and the annual maintenance at $\mathbf{5} 354 \mathbf{1 0 s}$. 4d. It thereiore follows, that to establish, 3nd aiterward mahntain, a catoptric light of the kind called revolving white, with a frame of three facen, each equal In power to a face of the dioptric light of Corlonan, an annual outlay of $£ 63$ 18s. more would be required for the reflecting llight than for the lens light; while for a light of the kinil called revolving red and white, whose frame has four faces, at least 36 reflectors would he required in order to make the light even approach an equality to this of Cordousn; and the catoptric light would, In that case, cost $£ 225$ more than the dioptric light."
"Convert these two Jums Into our currency, and it will be seen that we have a saving in the first case of *309, and in the recond case of 41089 jer annum.
"The effect produced by burning' an equal quantity of oil in revolving lights in elther aystem, may be estimated as follows: In a revolving light, like that of Skerryvore, having eight aliles, each lighting with its greatest power a horizontal sector of $4^{\circ}$, we have $32^{\circ}$ (or units) of the horizon illuminated with the full power of 3200 Argand flames, and consequently an aggregste effect of $\mathbf{1 0 2 , 4 0 0}$ flames prolueed by burning the oil required for 16 retiectors; while in a catoptric apparatua like that of the oid light at Inchkeith, having aeven aides of one reflector each, lighiting with its greateat jower a sector of $4^{\circ} 25^{\prime}$, we have nearly $31^{\circ}$ (or units) of the horizon Illuminated with the full power of 400 Argand thames, and consequently ans skgregate effect of 12,400 flames as the result of burning the oil required for meven reflectors. Hence the effect of barning the same guantity of oll in revolving lights In either aystem will be represented resjectively by $16-7,12,400=24,343$ for the catoptric, contrasted with 102,400 for the dioptric light; or, ill other words, re-
volving lighta on the dioptrio principle use the oil more economically than thowe on the catoptric plan, nearly ln the ratio of 8.6 to 1 .
"Let us, then, take the appropriation for oll for the Ilghts In the United States, deducting the quantity used in the four towers fitted with dioptric apparatus, and divise It by $8 \cdot 6$, the proportion to 1 , in favor of the lens apparatua.
" 1851-2.-Appropriatiou for oll (lees oil burned in lena Ilghts) 122,62055 ; 1 to 36 will give necessury quantity for lens llghts of equal power, $034,063 \mathrm{cs}$ : annual savlag for oll by thle mode of comparison, 888,565 57. Glase chlmneys, wleks, and repuirs of lightling apparatus, will be In the proportion of not lese than 810 to 8193 ; thut 18,1 to 10 . Amnunt appropriated for these oljecta, minus the expenses of the same artleles, for the four lens llghta, 15,$16230 ; 1$ to 10 will give the necessary expenee with lenses, $\$ 1216$ 23: annual saving by this comparison in theso artlcles, $18,61607$.
"The oil being the most bulky article of anpplies, it may be assumed that the saving $\ln$ oll will be a fuir proportion for the transportation, tho more especially as apare lampa, burners, reflectors, and the great wear and tear of the Argand lamps, burners, and reflectors, is not included in the estlmate of annual aaving.
"Amount appropriated for the transportation and dellivery of oll and other annual supplien, 1851-2,道 11,437 ; 1 to $3 \cdot 6$ will give the necessary expense for this article, 3176 04: annual saving with lenses, $\$ 826006$. It may be urged that there would not be se, great a aving in transportation by the chauge; of that, the experiment alone can decide. By the uid of a small ateamer, ne half of the anount appropriated could be saved In money, while very importutat additional servlee would be rendored in the way of inspections, and more frequent visits to the principal sea-count llghts. Taking, then, the savings of this mode of comparison, it will be follows: for oil in one year, $488,5655^{7}$; for wicks, chimneys, repuirs of apparatus, etc., 13,64607 ; for transportation, $£ 8.60$ $06:$ total annoal eaving, $\$ 110,471$ 70. Making within a fraction the same amount which would be saved annually by the introduction of the lens apparatus by thls comparison, that was shown by taking the lights in thelr regular order of powers, and comparing with orders of an nearly as possiblo equal powers in the Fresnel system. Nothing therefore can be clearer than the results thus set forth.
"The effect produced ly the consumption of a gallon of oll in a fixed light, with 26 reflectors, which is the smulleat number that can be properly employed, may be estimated an follows: The mean effect of the light apread over the horizontal sector, sulastituted by one reflector, as deduced from measurements mude at each horizontal degree, by the method of shadows, is equal to 174 muassisted Argand burners. If, then, this quantity he multiplied lyy 360 degrees, we shall olitain an aggreguto effect of $62,(\mathbf{e - f} 0$; which, divided by 1,040 (the number of gallons burneid during a year In 26 reflectors), womld give 60 Argand flames for the effect of the light mointained throughout the year by the combustion of a gallon of oil. On the other hand, the power of a catadiopt:ie light of the firat order, like that lately catablished Cirdleness, may be estimated thum: 'The mean effert of the ligit produced by juint effect of both the dioptric and catadioptric parts of a fixed light apparatus, may be valued ut 450 Argand flames; which, multiplieil by 360 degreen, gives an aggregate of 162,000; and if this quantity be tivided by 580 (the number of gallons burned by the great lamp In a year) we shall have about 281 Argand flames for the effect of the light produced by the combuation of a gallon of oil. It would thus aphen $r$, that In fixed lights the French apparatus, as lately improverl, produces as the average effect of the consumption of the ame quantity of oll over the whole horizon,
upward of oltained b directlons, catoptric lis than the di "But th rests chlefl ant conditio the rayn equ the raving etc, spprop saving on of annum, $\$ 11$

upward of four times the amount of light that is obtained by the cateptric mode, although in certaln directions, opposite the axes of esch raflector, the catoptrie light is fully 50 per centam more powerful than the dioptrle light.
"But the great auperiority of the dioptrio method rests chlefly upon its perfect fulfiliment of an important condition required in a fixed light, by diatributing the raya equally in every point of the horizon. IIence, the asving for fixed lights in the same amount of oil, etc., sppropriated for as before, will be 001,07104 ; saving on other articlea, 82,220 07: total saving per

"It may, and probalily will be urged, that a large portion of thls annual eaving will be absorbed in the wages of additional keepers. In anawer to that, it may be stated, that in the comparisona of reflecting snil refracting systems in Europe, the same number of keepers is required for both, of equal class or order, and therefore the ancertained asving fa a net annuai gain.
"In the United States, as a general rule, but one keeper íthere boing only 14 assistants belonging to an establishment of 301 light-stations, fitted with reflector apparatus) is attached to a light-station. To render tho lurger, or sea-coast lights efficient and safe, two keepers should be attached to each station having a single towet, and three to those with two towers, whether fitted with reflectors or lenses.
"Huwever, as it may be contended, that inasmuch as our reflector lighta in general have only one keeper, and tiat the change to the lens system would require two to each light of the first or second class or orders, it may not be inappropriate to eee how many of the present lights on our const would be required to be changed, and the increased expense for an additional keeper to ench. From the north-eastern boundary to the Rio Grande there are 38 positions whlch ought to be fittel with the most powerful first order lenses.
"There are polnts between some of these first order lights, which ought to be fitted with second order lens apparstus, making a total of about 50 lighte of the first and second orilers. An ndditional keeper for each, at the rate of 8800 per annum, will be $\$ 15,000$.
"If this aum be deducted from the total already shown (which, on the centrary, ought to be added to the present expenditures, to reniler our lights in that department equal to European lights), there will still he an annual saving of $\$ 95,47170$, or $\$ 90,19801$. If additinnal evidence were required to prove ao plain a proposition, that the reflector aysatem is more expensive than the lens syatem in the proportion of $3 \cdot 6$ to 1 , disregarling the great auporiority of the lens aystem for all the aseful purposes of the mariner, it would be found in the action of the Trinity IIeuse corporation, of Deptford Stroud, London ; Northern Lights commissionets, of Pdinburg; and the Bullast Board, of Dublin, Ireland.
"In 1835 the first leus apparatus was introduced into Scotland.
"In 1837 the first lens was introduced into England, under the Trinity llouse corporation; and since 1845 the first lens light was Iighted in Ireland.
"Now ( $\mathbf{1 8 5 1}$ ) there nre very few lights fitted with reflectors in Scotland; the commissioners having abandoned the use of that upparatus, and substitutod for it the Fresnel and holophutal svatem of Mr. Thomas Stevenson.

The Trinity IIouse (Iondon) has upward of 20 lens lights of the firat and aecond order, besides numerous fourth order harbor lights. Lons lights are also being introduced into Ireland; the precise numher, however, now existing there, is not known, as they are not marked in their printed lista, and no information has yet heen received from that board.
"It is worthy of remark, that these three lighthonse boards of Grent Britain and Iroland, are closo
corporations, deriving their means entirely from lightdues levied upon the shipping of all naticis, including that of their own. They derive no pecunlary advantagea from the government, and are only under its general centrol ; coneequently their acte are independent of Parliamentary legiolation.
"If these boards had found the recommendations of the select committee of the House of Commons of 1845, to use less expenalve apparatus and combuatibles in their lights, with a view to the reduction of light dues, hod not been based upon sound priugiples, they would have had no Inducement to follow them; for whether the lights are economically kept or not, good or bad, the same amount of light-meney would be collected. It is, therefore, plain that the introductlen of the lens apparatus, and the celza oil, into the estahlishmenta under the control of these independent corporations, was the result of close examination and trial by those charged with, and most interested In the subject. The introduction after France, first by Holland, and auccessively by Helgium, Hanover, Prussia, Denmark, Sweden, Norway; Russia, Italy, Spain, Portugal, and Brazil, and the coloniea of the respective natione, goes far to ceunteract any prejudice which may exist in any quarter, of the globe against this inimitable illuminating apparutus for light-houses.
"Notwithatanding the renovations of English, Scetch, and Irish lights, and the erection of new towera, fitted with the lens apiaratus, a material reduction has been made of late years in the light-dues levled in Great Britain upon shipping. This may in soine degree be attributed to the increased ameunt of commerce and navigation, and the more frequent and rapid intercourse between natiens, by the aid of steam navigation; but, it can not fairly be contended that it is wholly due to that cause.
"These facte ure undeubted, and the deductions from them, it is believed, will, upon the elosost serutiny, be found to be cerrect.
"Mr. Alan Stevenson says, 'It therefore followe, that, by dioptric means, the consumption of oil neceseary for betweeen 14 and 16 reflectors, will produce a light as powerful as that which would require the oil of 24 reflectors in the catoptric system of Scotiand; und, consequently, that there is an excess of oil equal to that consuned by 10 reflectors; or 400 gallons in the year agninst the Scetch oystom. But in order fully to compare the economy of producing two rovolving lights of equal power, by those two methods, it will be necessary to take into the calculation the interest of the first outlay in establishing then.'
" It is worthy of remark that the French were followed by the Duteh government in introducing lenses into their light-houses.
"The sublject of introducing lenses inte the Scetch light-houses was brought before the commissioners of Northern Lights liy the Engineer* of that body, at the instance of General Colby, of the Royal limgineers, as early as 1824. Tho Scoteh commissioners direeted their engineer to visit lirance, and report upon tho lights of that country. At the closo of the year 183t, the boarl direeted lenses to be importel for the purjuse of making experiments. These experiment resulted in the recommendation that un impurtant light should te changed from a retiector to a lens apparatus.
"It is believed the powerful and nnanswerable arguments contained in the letters of Sir David lirewster, in 18:33, to the Bell-Rock committee, in faver of lensen, contributed greatly to the early introduction of them into the lights of Scolland.
"Netwithstanding the ummerous oxperiments from 1825 to 1834 , made by the Northern Lights cominissioners to test the relative merits of the two systems, it way not until the latter yeur that decisive steps wers taken to decide the question.
"In October, 183s, the refiecting apparatua of the revolving light at Inchkelth was remeved, and doptrio a pparatus subetitnted.
"So great was the satisfuction which this ohange produced, that another light was inmediately changed to a lena light. The second lens light erected in Seotland wae at the Ieje of May, In September, 1830.
"The Trinity House, Lonion, fitted the Start Point light with a lene apparatus in 1837 .
"The Torkish government employed an Englina engineer in 1836-7, to make experiments with the Froanel lensea, Drummond'a light, etc., to enable it to decide upon the best illuminating apparatus for the Bosphorns from the Hiack Bea. The letter upon thin suhject from Williain Henry Barlow, Esq., whleh was read liefore the Royal Soclety of London, will be found to contaln much valuable information for those interested in the experiments of light-house navigation.Vule Philnsophienl Transactions of the Royal Society of Iondon, 1837, p. 211.
"Number of Lenses in the Word.-At the present moment (1851), there are lens llghts of the three first orders (first, aecond, and third ordere), 216, and of the omaller claeses, 152; making the total number of lenser 868.
"They are found now in England, Seotland, Iroland, France, Belgium, the maritime States of Germany, Denmark, Norway, Sweden, Rnasla (the Kusalan governument has a French artist established at St. Peteraburg, for the manufncture of lenses for their lights), Italy, Spain, lortugal, the Mediterranean, Egypt, Turkey, Mast and West Indies, Braxil, nnd, In general, in ali the colonial dependencien of the Enorpean States. One first, two scoond, and one thind order, are the only lenses at present in the United States.
"The three first named were procured in obedience to specinl acts of Congress, and the third order was placed on the Brandywine shoal by the Topographical Bureau.
" It is understood that the t wo light-towers now in the counse of erectlon at Sand Key and Carysfort Reef, under the direction of the Tape traphleal Bureau, are to be fitted with first order lenst...
"Mr. Stevenson pays this merited tribute to the distinguished snvan whose ayatem la now almoat univereally admired and adopted thronghout the maritime world: 'Fresnel, who is already classed with the greatest of those inventors who extend the boundaries of human knowledge, will thus at the same time receive a place among those benefactora of the apecies who have consecrated their genius to the common good of mankind ; and, wherever maritine intercourse prevalla, the solid advantages which his labors bave procured will te felt and acknowledgel.'
"Illumination.-On a review of thin subject, the adoptlon is recommended, an early as practicatile, of the lens aystem instead of that of reflectors, as most effectfive and economical.
"It has been shown that the Fresnel lens is essential for sea or lake-coast lights of the tirst orifr ; that for those of the second onder, or for aecondary or hencon lighta, including the third, fourth, tifth, and sixth orders, the useful effect of a lens 1 ith ht in from 3.6 to $t$ times that of reflector lights of the same clans, and that, economically, the reflector lights are 4 thies as expensive for oil alone as the lens lights.
"It has been clearty ehown, it diactuasing thin matter, that If it were possithe to convert in a moment all the present reflector lights of the Uuited Seates into lens lights as nearly as possible (though, in alnoost every instance, they would the superior), of equal orders, the annual saving, for oil and other supplies, would be $\$ 112,1 \times 527$, taking the appropriations of 1851-'62 as the bnsls of the calculation, with, at the same time, an increase of 3 to 4 times as much light from each lantern as at present.
"If the eetimates for 1852-'53 bo taken as a hasis, then the annual saving may lo increased 420,000 , whloh will make the entire saving for one year, with all the advantages to be derived from euperior lights, 132,185.
"Add to this aum $\$ 40,000$, the mean of the value of the lamupe and refiectors proposed to le taken from the light.houses, to be fitted frrst with the lens apparatus, and which would be required, under any cireumatancen of Improvement, for the 42 light veseols niready oxlatipg, and the aum of e172,185 may be put down as clear proft, with which to purchase lena apparatus fo: the first year.
" By appropriating this sum, or as much of it as can be oconomically and judlciously employed in in. proving the sea-coast lights, there will the an additional gain, at the end of the flisat year, in the diference in the cost of oil, etc., under the two systems, for all the apparatue procured with this aavlog. 'This saving wll go on from year to year, on compound interest, at the rate of 30 to 50 per cent., un ${ }^{* 11}$, in $\bar{\delta}$ or 6 years, should the appropriationa be made as requirel to carry out gradually the aystem, we ahall have lights equal to those of France and Great liritain in brilliancy, neefnl effect, and economy, and apparatus that never requires renewing, without, in the aggregate, having apent one cent more than would have been required for the ordinary aervice under the present systen, with inferlor lights and enormous sums for annual repaira and renovations.
"These estimates are based opon the assumption that the sperm oil now in une is to le continued. Should it be decided, however, to foilow tho example of nearly the whole maritime worill in introducing the colza or rape-seed oil, a asving of 35 to 40 rents per gallon will be gained, eqnivalent to $\$ 10,000$ to $\& 45,000$ more.
"The price of the first-quality elarified colza oil is, on an average, at the prineipal markets in France, $i 2$ francs the heetolitre, or for a littie more than 26 gallous, which is equal to nearly 55 t cents per gallon. Sperm oil, in this country, rangea from $\$ 1.30$ to $\$ 1$. 80 per gatlon, and it is doubtful if a fair quality can be furnished at these prices. The supply of the best sperm oil to stand a temperature of $28^{\circ}$ Fahrenheit, is not equal to the demand, and no other quality should ever be hurnt In a light-house. A fow galions of rapesseed oil have been sent from Havre to the lhoard, costing about 60 centa per gallon.
"This important agricuitural proluct (rape-seed) only requires to be lutroduced favorably to the notice of our planters and farmers, to thecome a boon to the nation of no ondinary value. Adapted to the soils of nearly every portion of this great country; its aduirable qualities for domestio lilumination would soon bring it into favor, and, by its means, expel frour our houses the many dangerous fluids now used for the sake unly of eronomy.
"The experiments made hy Presnel, Faraday, Stevrowen, nuil other distinguishet individuals have proved, beyoud all question, that the colza in not only better than the best aperm oil (an article now very dificult tos procure), but that it will burn 17 hours without conaling the wicks; that it will remuin in a fluid state in a lower temperature than the best sperm oll, and that it is cheaper ly nearly one third.
${ }^{4}$ In this country, the quantity of sperm oil, independently of its bigh jrice, has not been sufficient to meet the demanda for the various pirposes connected with veam machinery, etc., for meveral years. Lari and other prepared oils have leeen forced to take the place of it, for these and other purposos for which it is peculiarly adapted.
"The returns from the thshing grounds show that this liraneh of commerce is becoming more and more uncertain, and less profitable, every year. Whin thase engaged in the whale fisheries find it unprotitable,

they will not pursue it because the government may requ're a fow thousands of gallons annuaily. We can not go wrong in this matter, in following the example of other countries.
"France introdnced the rape-seed oll, from conviction of Jts auperiority. Engiand, Scotland, Ireiand, and the northern powers if Europe generally, have followed; first from motives of economy; and continue Its use from the conviction that it is not only more conomical, bnt is better for tight-house parposes than the best winter-strained sperm oll, the only kind used in most lights. Ollve-olf hns been introduced into the fight-houses of Liverpool, England, at a saving of 40 per ceut. over sperm oll.
"In the United Stntes, the oll (two kinds, 'winter anil summer,' heing used) for our IIghta, is not of the best quality. It is now nearly 50 per cent. higher In price than it was a few yeara since; and with the preseat prospects, it must continue to lncrease in price so long as the demand is so great for it as at present.
"It has been proposed that the 88 most Important sea-coast lights should be fitted, with as little delay ns poseible, with first order lenses, and that the Argand lamps and reflectors taken from them (or such of them as may, upon examination, be found to be sufficiently good for that purpose) be uscd for fitting $u p$ the 42 light-veszels now existing, whleh havo heen pronounced by high anthority comparatively useless in their present state. Several years would be required to effect this change, as the new lightitanthorized by law, anounting to 34 , exclusive of those for the ccasts of California and Oregon, require illuminating apparatus; and as there arn only two establishments from which the lenses could be procured fer some time at least, it would not be prudent to demand a larger number at once than could be easily sapplied.
"IIaving fitted the most important sea-coast lights with the best lens apparatus, as well as the newly anthorized fighte, by changing therenfter such only of the minor lights as now, or herenfter, require new apparatus, would in two or three $y^{\prime}$ ears place the lighthouse establishment of this country far In advance of Its present state in efficiency and economy.
"To purchase Argand lamps and refiectors for the 42 light-vessels, woald be to retrograde in light-houso illumination st a first cost of $\$ 40,000$ or $\$ 45,000$, and an annual waste of $\$ 7560$ for oil alone; antl of the supplies, to the extent to increaso the amount to $\$ 10,000$, with apparatus which must be frequently renewed, producing only from, one fourth to one sixth the usefulness of the laoe economical system, whlch never requires renewlng.
"Taking the estimate for 1852-3 for maintaining the lights of thls country as a bnsis, the present systein costs annually within a fraction of $\$ 135,000$ more than the same lights would under the lens system. But in so important and humane a branch of the public service us this is, upon the efflelent and proper management of which depends, in n grenter or less degree, the loss of humun life and property, in which every inulividual in the land is co a sertain extent interested personally, mere saving of money, which is ly no means always truc economy, should not be the only guide. The Incalculable benefits to the seaman; the merchant, who receives the foreign products to gratify the wants of our citizens; the planter, who ships his cotton, tobscco, grain, lereadstuffs, provlsions, naval stores, and the thousands of products of our clime, to the best markets, would scem sufficient to show the necessity for this change.
" By those of our citizens nlong our southern coasts, fiom the month of Delawnero Bay to the Rio Grande, who are now and have ever beent suffering in consequence of a badiy lighted coast, will this additional reason be best understood and apprecinted. Their frelght lists and heavy insurances speak out truly on this point.
"The $\mathbf{6 7 , 0 0 0 , 0 0 0}$ worth of property sent into Key West, and there adjudicated for salvage, within the six yeare prior to January. 1850 (lost to our citisens and our government chiefl; ; speakn trumpet-tongued on this subject. But this is not all. The wreck lists of Nasean and New Providence exceed by far those of Key West.
"Let us light our coasts as France and Great Britain have done theirs, snd wreckers will be compelled to turn their attention to other means of livelihood, and the consumers of every class and grade will pay less for their necessaries and laxuries, and the pianter, farmer, mechanic, will liave amaller freight and insurance bills to pay on their exports.
"If we ansume the neceasity for changlng all of the lights on our coast to lena lights, and give to each one of them its proper powtr and efficiency, we should have shout as follows: 36 first order iens Ilights, costlng for apparatus $\$ 244,800 ; 10$ second order lens lights, costing for appaiatus $\mathcal{Y} 44,000 ; 61$ third order lens lights, costing for appsaratus $\$ 113,460$; 206 fourth, tifth, and sixth order iens lights, costing, in the aggregate, shout $\$ 98,700$; total amount necessary to purchase lens apparatus for all the lights in the United States, $\$ 494,960$; deduct value of refiectors and lamps for light-vessels at present exlating, and for proposed ones, 845,000 ; deluct value of present illuminating apparatus, lamps, reticctors, chandeliers, etc., merely eatimating the value of the old allver, copper, and Iron, say 2500 lamps and reflectors, and 815 chandeliers, at one fifth their cost, $\$ 50,000$; deduct first yesr's saving on oil and other supplies, $\$ 110,000$; total expenditure, $\$ 205,000$; leaving at the end of the first year, with lenses, only a balance of 4289,960 ; saving for four years, $\$ 440,000$; making a gain, at the end of the fifth, of $\$ 150,040$.
"Thus, at the end of the fifth year the country will have galned $\$ 150,000$ in money, including interest, and an annual saving of 110,000 , the interest of which will make it $\$ 117,600$, and afford to the mariner lighte equal to the hest In the worll, by which means every consumer and exporter will derive a pecunlary advantage; and those who go to sea, either from plensure or necessity, will be doubly insured against ohipwreck on our Inhospltalle coast.
"To make the reform in our present light-house system perfect in its illuminnting departnient, it only remains to introdace, in addition to the lenses, the colza or repe-seed oil, which will produce an additional saving, as has already been shown, of about $\$ 10,000$ per annum ; making the grand total, in five years, of $\$ 200,000$. It may be contended that, inasmuch as interest is included in the saving, it is but fair to allow it on the first cost, which will he, at the end of the second year, $\$ 15,397 \mathrm{k0}$; third year, $\$ 8,79760$; fourth year, \&2,197 $60 \mid$ making for interest, $\$ 215,39280$; atill leaving a nett gain, at the end of five years, of $\$ 132,647$ 20, without taking into consideration the saving from the rape-seed oil, if introduced, which would increase it to $\$ 182,6.1720$ of clear guin at the end of five years, in addition to the annual guin and other advantages already stated.
"But lf we continue to employ refiectors, auch as we have now in uso and are constantly introducing into our lighta, we will not only lose the amount annually which has been shown wo should gain with lenses, but, in addition to that, these reflectors und lamps will require to be renewed once in 10 to 15 $y$ vars, at a cost very little short of that of the lenses, which suffer no deterioration from long use, and humanity and commerce will continue to suffer for want of good and efficient lights on our coast.
"Inspection.-Withoat a rigid system of inspection by competent persons, the light-house system oan never be efficlent or economical. The whold sea and Inke consts of the Unitell States should be divided into light-house districts, with less regurd to geographicai
than to local Irea. For example, the New York dintriet she., .d ombrace all the lights from Wateh IIIll, includte $;$ slock Island, Montauk Point, ete., to the Ilighlande of Naveaink, up tho baya, lacluding the Raritan, Hackensack, Pasailo anl North Rlvers, to the head of navigation. The Philadelphia or Delaware Bay district ahould ombrace the coast from the Baraegat to naar Asseteague, and up the Delaware on both aldes to the head of navigation. Thn Baltimore or Chesapeaze Bay district ahould embrace ali the coant from Aenateague to Cape Henry, Ilampton Koadn and tributaries, and Chesapeake Blay and tribus. tariea, to the head of navlyation. The other districts *hould be formed upon the aame prineiplea. In each of theae dintricte there mould be a local Inspector, whe should be furniahed with the necesaary means and fuellities for regularly inspecting the lights, attending to the wante of the keepere, superintending small repairs, reporting the ennilition of the establishment, at shert Intervals of thi e , to the executive offl cet or engineer of the Light-1louse Hoarl, superintend the placing, replacing and renovating buoy, beacons, etc., etc., under the general and special Instruction of the Llight-House Iloand, communicated threugh thelr executive officer or engineer.
"For thla purpose, there would be required on the lakea two Inspectorn, und e the Atlantic, Gulf, and north-west coasts, lacluding all the adjacent navignble waters, from 10 to 13 Inspectors more, making the whole number required from 13 to 16.
" Each of these light-house diatricts should be placed under the charge of an active and zealous ofticer of the aray or navy, who should recelve all his Inatractions from, and be responsible to the Jight-liouse Honrd, through their executlve officer or engineer, and to whom all reports should the made.
"The facilities for inspectors auperintending such repairs, etc., etc., as may be conflded to the local inspector, to be furnished by the light-honse vessela, revente cutters, and such other means as the 'Treasury Departinent may from time to time atuthorlze,
"Hy this mode of inspection, very little if any allditional exjense will be incurred, while there will be secured an independeat examination of every light on the coast, say from four to six times per annum, by a competent person, whose duty it will be to inform himself upon all essential matters connected with thla service. In adilition to the foregoing means, the revenue boarding beats might and wonld be approprintely put in requisition, as occasion might require, to askist the Inspector in his duties in situations where a strict economy would not authorize the elpployment of a vessel permanently to peform this wervice.
"Instead of, an now, contracting with persons to keep the huoyn In their places for a certain sum per annum, and who aeldom, if ever, perforn the service faithfully, the inspector would, under proper instruetions, be required to exanine the barn, channels, etc., etc., of his distriet, at regular periode, and always inmediately after heavy gales of wind to ascertain what bueya are out of position, and to replace them.
"The inspectiag offleers wonlil occaslonally be accompanled by tho secretary or engineer to the lightHouse Board, or perhaps by both of them; a thorought system would be providel, which would inevitatily be less expensive in the afgregate than that at present existing without pecific law. In connection with these inspections, dépôts for storen, spare buovs, mooring", etc., etc., are indixpensable in each district. These dépita might in nrost placen be at sonse place requiring but little annual expenae, where the bioyn and their mooringa could be repaired, palnted, ete, and where a ipare light-vessel might be kept realy for une. There ahould be at least one spare light-vessel for every three placed in exposed open sea-positions. Dupllcate buoya and moorings whould be ready at all times. The light-House Board should have autherity
to cause huoys to be placed on newly-discovered shoolg, wrecks, etc., etc., whenover necesary, lly the employment of these inapeetors, the country would derive the henefit of their services wlthout expense, and have an amurance, from their position and standing, of a falthful exceution of their dutlea. The flound would refer again to the reports of the committeg of the Senate and House, already pointed out in thls report, on thia Important branch of the lighting service. In connection with this recommenilation, the lloard would advise that light-keepers be examined, as naval engineers, midahlpmen, and cadets are, In refrerence t) quallficationa for thelr appointments; that they shoulil not be allowed to take charge of the Jights without sultable preparation ; nor the more importunt lights withont proportlonally hligher qualifications; that such meteorologieal and tidal observations be requirel of them in addition to the kepping of suitable registers of lighting, consumptlon of supplles dully, etc., ss may tend to tent the capaelty of the keepers, and to slevate the standard of information and pructleal akill of them as a class.
"To Givide Legishation in Eirtending and Improving Our I'resent System of Construction, Illumination, Inspection, and Superintendence. -The seventh section of the act making approprlation for light-houses, lightboatn, buoys, ete., approved March 3, 1851, provihes, - That hereafter, in all new light-housea, in all lighthouses requiring new lighting apparatus, and in all light-housea as yet unsupplied with lluminuting apparatua, the lens or Freenel system shall be adoptell, if, In the opinion of the Secretary of the Treasury; the fillilic Interest will be subserved thereby.'
"This is a wise provision. There are very few cases, in the opinion of the Boarl, where the puthic interest will not be greatly subserved by the subistitution of the Fresnel lens for the reflectors now employed in Illuminatlig our light-hnusee. In positinns where the light ls only required to Illuminate a small are of the horizon, it may lie of questionable propriety; but in all such cases, the capable light-house engineer should decide upon the merits of thie two kinds of apparatus. In no case ropuiring one half or more of the horizon to be illuminated, is it belleved reflectors ought to be employed, in preference to the lens. There may be occaslonally circumstancen of a paramount character, which may render the employment of reflectors preferable.
"The ninth section of the uct approved March 3, 1851, provides, 'Thut the I'resilent he, and he is herely' required to canse to be detailed from. hangineer corpis of the army, from time to time, such, valsers as may be necensary to superintend the constuction and renovation of light-houses.'
"The Hoard are of opinion tbat this act is one calculated to produce the most beneficial results, in increasing the durability of light-house structures, and consequently lespening, to some extent, at least, the present large aunual appropriations fur renovations asml repuirs; and they recommend that no new structure be erected, and no old ones be repairel, except under the superintendence of a competent officer of the rorpr of engineers.
"The lboard are of opinion that, pending the action of Congress upon the autiject of improving our lights, ete., nuch may be done toward introducing a more officient and economical administration of the astatilishment, hy a rigid adherence to the provinions of the seventh and ninth sections of the lar of $18: 1$.
" Lorvting of Sea and Lake-coast Lights.-The Hoard bave adoptent the same principle which has proved so effective in the organization of the lirenc! system of lighta; numely, to place a wea-coast light of the first oriler, in general, every 42 nantial miles, so that, as a rule, one light will not be lont elght of until auther is above the horizon. If It should be necessary to adopt only two main aystems of distinction for these

IIghts into ahould be ahly dlatin lighte of the foum each o in the publ navigatoion arising fron (without th if, however, ticahle, and tions of ligh ed on appro sea and lake essary to a though not There are merce will thoutgh nere

Congres on a few of t to aill the 1 coast, which priate lens a। of the act 0 names of the coast to thil:
lights into fixed and revolving, then a fixed light shosld be placed between twe revolving lighta, nuitably dlatinguished by flasien, etc., so that no two llghts of the same kind should be nearer than 84 miles from each other. Other distinctions, earily descrited in the published lista, and easily comprohended by navigatoin, which wonld render all fear of mistaken arising from the want of proper distinctions Illesory (without the use of coloreil medlu), can be employed. lf, however, Mr. Nalbhage's nystem prove to be practleable, and be adopted, all doult in regaril to distinctions of light will be obvlated. The Board have adopted an approximate programme, in this report, for the sea and linke-coast lights, the number of which in necessary to a full nyatem. Of these many now exiat, though not with the requiaite range of visibility. There are many loeatlons where the wanta of commerce will not require such lights for many years, though nere $4 \pi a r i l y$ inciucled In a generul programme.
"Ata full menting of the IIght-house Iloard, holden on the fth of Junuary; 1852, the following realutions were offered and unanimnusly adopted :
"Resolved, That it la the opinion of this Board, 1. Thas the lens or Fresnel aystem of light-house illumination is the best at present known. 2, That the fens or Fresnel system of llght-house illumination is, in economy; brilliancy, power, and usefulness, superior to the best reflector aystem of illuminution in the ratio of nisout 4 to 1 ; or, in other words, that the lens syatam is about four times more alvantageous than the best reflector system, and at the same time, at an expense, for oil alone, of only one fourth as much as the reflector system. 3. That the lens system of lighthousc illumination is as well adapted to the coasta of the U'nited States as to those of the rest of the marltime world. 4. That while there is no well-founded objection to introducing the lens system of illumination lato this country, there is every reason for ilolng seas rapilly as possible. 6. That the flonting lights of this entintry are comparatively useless to the mariner, in consequence of the very lnferior apparatus omployed in them. 6. That the reflector lights of the United States ure greatly liferior, in usefolness, power, and range, to the sume description of lights in foreign countrics gencrally, but expecially to those of Great Britain."
"The object of these notes is to point out cortain Improvements in the use of existing light-houses, ly which it shall become almost impossible-1st, To milstake any casual light, on shore or at sea, for a lighthouse ; id, Ever to mistake one light-house for another. The plan requires, in most instances, no change in the optical saeans at present nsed for condonsing and directing the lliumination of light-houses; It adde slightIy to the facility of observing them at great dintances, and from its simplicity and generality is equally adapted to the use of all countries. Revolving-lights must become fixed; but the mechanism alrealy existing for their rotation may, with littie alteration, be employed for the motions required by the new system. The principle by which these objects are to be accomplished, is to make ench light-house repeat its own namber conthualiy during the whole time it is lighted. This is necomplishod by inclosing the upper purt of the glass cylinder of the Argand burner by a thin tube of tin or brass, which, when maile to descend slowly liefore the flame, and then allowed sudilenly to start tack, will cause an occultation and reappenrance of the light.
"Congress hoving authorized lights to be erected on a few of the most prominent and inijortant points to aid the rupldy increasing commeree along that coast, which it is preaumed will be fitted with appropriate lens apparatus, in conformity to the 7 th, section of the act of 1851, the Hoard have only addel the numes of the remaining most prominent points of that coast to this list, leaving the more detailed wants of
this branch of the publlo servies to be devaloped by tha operations of tha coast-survey, now In rapld prog. ress for external or net-coast, and of population and interior coinmunication for local lightn.
"Petit Manan lighi-house.-This in a fixed light, 53 feet abova the level of the sea, aituated on the south end of Peiit Manan Imland, Mulat, lat. $44^{\circ} 22^{\prime}$ north, long. $67^{\circ} 52^{\prime}$ went. This light in fitted with 12 lampa and 15 -Inch reflectors, to illuminate the whole horizon. If the mpparntun belonged to the flrst clasa, Instead of, as it does, to about the fourth, the greateat diatance at which It could be meen, under the mont fivorable circumstanees of weather, wonld be, from a vessel's deck 15 feet from the rea-level, about 13 milen. If wa take into connideration the small size of the reflectorn, and the amall number of lamps for so large nin are of the horizon, it is fair to presume this light is seldom aeen over 10 mllea . Dintant from this light to the enet ward are Seal Islands, 84 miles (two fixed lights), and Gannet Rock (turshing light), 44 miles at the mouth of the Hey of Fundy, belonging to the Dritish government. This light, with a proper elevation, and a lens apparatus, woull serve to gulde vessela bound to any of the porta on the coasi P'Maire, from Frenchman's Bay to Passamaquoddy llyy, having the sea-coast lights of Seal Island and Gonnet llock to the eastward, and Hount Desert Rock, distunt 27 miles to the southward and westward. [Now become a flashing light (180̈6).]
" Mount Desert Rock Light-house.-This light is on the keeper's dwelling, with an elavation of $56 \frac{1}{5}$ feet alove the level of the sea; it is fitted with 12 lumps and 21-Inch reflectors, to lliuminate the whole horiacn. Lat. $43^{\circ} 58^{\prime} 55^{\prime \prime}$ north, long. $68^{\circ} 08^{\prime}$ west; It is situnted about 20 milea S.S.Li. of Mount Desert Island; is 27 miles distant from Patit Menan light and 83 miles from Matinicus light (two fixed lighte). This light, with the best illuminating a paratus, could not be seen, under the most favorable circumstances of weather, at a greater diatance than 14 miles. The small number of lamps for so grent an arc, renders it littls better than a fourth order light, whila its elevation can only give it the range of a light of that class.
"A much greater elevation is required for this light, with the most powerful lens apparatus that can be constructed. Vessels bound from the eastward into any pert from the neighborhood of Mount Desert to I'enohseot Bay, would run for it ; having made it as a Ifrsteclass light, it would guide them into the ranges of the different harbor-lights along the ceast. From its isolated position at the datance of $\mathbf{1 4}$ to 18 miles from the nearest land, it is one of the most inportant points on the eastern coast for a first-cluss light.
"Martinicus Hock Light-house.-These lights (two fixed), are situated on the rock south of Mnrtinicus Island, at the mouth of Penobacot lay. They are placed 40 feet apart, N.N.W, and S.S.E. on the keeper's dwelling. Jach light las 14 lamps and 21 -inch rellectors, at an clevation of $82 \frac{1}{2}$ feet above the level of the sea; 33 miles from Mount Desert Kock and 39 miles from Segnin's Island light, lat. $43^{\circ} 46^{\prime} 30^{\prime \prime}$ north, long. $68^{\circ} 49^{\prime}$ west.
"Seguin Islamed Light.-This is a fixed light, 166 feet ahove the level of the sea, fitted with 15 lumps and 21 -inch reflectors. This light is deficient in illuminating apparatus; with 24 hamps and 21 -inch parabolic retlectors of the proper shape and linish, it could, unler fivoralile circumstances of weather, be seen 18 to 19 miles. It is 39 miles from Martinicus Rock light, 46 mites from lloune Island light, and 21 miles from Monhegan and Cape Elizabeth lighta. Lat. $53^{\circ} 41^{\prime} 30^{\prime \prime}$ north, long. $69^{\circ} 4 t^{\prime}$ west.
" Roone fsland Light.-This light is situated on the west part of the amall low inlund bearing its name, of York River, Maine. It is titted with 12 lamps and 15 inch reflectors (fixed), with an elevation of 70 feet $n^{3}$ hove the level of the sea, in lat. $13^{\circ} 08^{\prime}$ north, long. $70^{\circ} 29^{\prime}$ west.
"Thatcher's Island Lights.-These two fixed lights are situated abont two miles off Cape Ann, fitted with 11 lainps and 21 -lnch reflectore, each with an elevatlon of 90 feet; greatest range, 16 milea. Cape Ann forms the northern Ilmit of Maseschusetts Bay, Distant from Boone Island Hight 80 miles, Boston light 24 milles, and from Truro, Cape Cod, 48 miles. Lat. $42^{\circ}$ $38^{\prime} 21^{\prime \prime}:$ north, long. $70^{\circ} 84^{\prime} 48^{\prime \prime}$ weat. Thle ls a very important light-station, and the lights require to be Increased in power nad range.
"Trwro, Cape Cod; Light.-This is an important sea-coast light, aituated on the bighlanaim ontside of Cape Cod. It is 43 miles from Thateher's Island $1 \mathrm{lghts}, 45 \mathrm{~m}$ mes from Sankaty Ilead light, and 41 miles from lioston llght. It is fitted with 15 lamps and 21Inch refiectors (fixed), with an elevation of 180 feet, giving it a range, in good weather, if the apparitua is of the firat onder, of 20 to 21 miles. A first order lens is required for this tower; Lat. $42^{\circ} 02^{\prime} 23^{\prime \prime}$ north, long. $70^{\circ} 08^{\prime} 55^{\prime \prime}$ weat.
"Sankaty Head Light.-This is a second orier Fresnel flashing lens light, It is placed on the south-east extremity of the island of Nantucket, with an elevation of about 150 feet above the level of the sea, which gives it a range of about 19 miles in ordlanry atates of the weather. It has been seen at a much greater distance, and is comsiderad equal to the Highlands of Navesink lighta (first and second order lensea).
" In copsideration if the dangerous mavigation sround the reefs and shoals off the island of Nantucket, it would have been advisable to have placed a first order lens in thls tower; but the superiority of this light to those in its vicinity, renders it of doubtful propriety to propose any change in It.
"Gay Ilead Light.--This light ls placed on the west polnt of Martha's Vineyard. It is a revolving light. fitted with 10 lamps and 14-Inch reflectors, having an elevation of 172 feet above the lovel of the sea. This light is deficient in jower, and not arranged to anbserve the wants of the anvigator. At the distance of about $\mathbf{1 2}$ miles it is obscured abont three fourths of the time. Its present elevation, with first onder upparatus, would give it a range of 19 to 20 miles. Lat. $41^{\circ} 20^{\prime}$ $54^{\prime \prime}$ north, long. $70^{\circ} 50^{\prime} 26^{\prime \prime}$ west. Dlstant from Sanksty Ifead 39 miles, Montank Polnt 88 inlles, and Point $\mathbf{j}$ udith light 80 miles. This Ifght is not second to any on the eastern const, and nhould be fitted, with. out delay, with $n$ first order illuminating apparatus. A glance at the chart will suffice, to see its great larportance.
"Mowtauk Point Lighr-house,-ILat. $41^{\circ} 04^{\prime} 10^{\prime \prime}$ north, long. $71^{\circ} 61^{\prime} 58^{\prime \prime}$ west. This is a very important light, especially for navigators bound from Europe to Now York. It in fitted now wlth only 15 lampa and 21 -Inch reftectors for a Axed light. Its reported elevation is $\mathbf{1 6 0}$ feet above the leval of the sea, and with a first order apparatus would he neen under ordlnary circumstances alsout 20 nautical miles. Diatant from Gay Ilead 47 miles; from Fire Island Inlet light 66 millen. By erecting a llght in the vicinity of Creat West Bay, Long Iskand, mliway between Montauk Polut and Fire Ialsnd lighta, the trale between New York and all ports to the naxtward, includlug the whole of Furope, would log greatly henefitel.
"Lights near Great Wewt Ihay, lang Ishond, New York,-It is propowed to erect a first-clasa light on Long Istand, midway between Jontank l'olnt ond Fire Islund Iulet, distant 33 milea, to facilitate navigators golug to and coming from the eastwarl. The letters of packet and other shipmasters in Appendix II, will snow concluslvely the necessity for a light in thim vieinity.
"Fire Inland Inlrt Iight-house, Iong Islawi, Vem York.-This is a most important light to navigatons trading to New York. It may be said to mark the eastern entrance to the liay of New York. It is nituatel on the south side of long Island, New York, cast
side of Fire Ioland Inlet, lat. $40^{\circ} 37^{\prime} 46_{n}^{\prime \prime} \mathrm{N}$., and $73^{\circ}$ $13^{\prime} \cdot 3 e^{\prime \prime}$ W. long. ; diatant 37 miles from the High. lands of Navealnk, whleh mark the western entrance to the Bay of New York. This towor has an clevatlon of only 80 foet 3 inches, and has only 14 lamps, and 21 -inch reflectors for a revolving light. The range of this light, with Its present elevation and the best apparatus that could be procured, would not exceed $14 \frac{1}{\frac{1}{2}}$ nautical miles in orlinsry weather. It is, thereforo, clearly necessary to increuse its boight, and place in the tower the inost powerful lens apparstus that na be procured.
" Highlands of Navesink Lights, New Jersey,-Thers are two towers and lights at this station; a first orler fixed, and aseond order revolving lens apparatue. The great iuportance of the lights on this point rendera it highly necessary, in carrying out the proposed plan of inproving and increasing the numbor of seacosst lights, that the second order apparatum should be changed for a inst order one. Thess lights are now the best on the coast, but are not, when combined, equal to better than a second order lens light. With the present elevations of these lights above the level of the sea, and the substitution of a first order lens for the second order apparatus, navigators would be warranted in running toldly for thom, and with the certainty of seeing them, under ordinary circumstances, at the distance of 22 nautical miles.
" harnegat Light-house.-This is a light in print of importance equal to that of Fire Island Intet. It is situnted 37 miles from the IHghland lights, en Long lieach New Jorsey, mu the sonth side of lharnegat Inlet. At present. it is fitted as a fixed light, with 11 lamps and $1 \cdot 1$-inch refiectors, equal in powor to nbout a fifh order lens llght. The numerous wrecke, involving the great loss of lifo and property, attest the truth of the necessity for making chis a first class sea-coast light. 'I'he tower is 40 feet hlgh, placed on a low beach, giving !t a range of probably $11 \frac{1}{1}$ nautical niles. The iniprovement of the Montauk, Fire Island, and Barnegret lights, and the erection of a first class light near Grent West Bay, Long Island, would render the approsches to New York Bay mueh safer than they are at present, and would eave to our government and to our citizens many millions of dollars' worth of preperty, and provent the untimely lons of many valuable lives.
"Absecum Jench, Nem Jersey.-A sea-cosst light is aboolutely necessary in this vicinity to guide vessels, bound north, clear of the Absecum and Ilrigantine shoals. The coast here is very low, and diflicult to distinguish, and the light on Tuckor's leach, near Elttle Eigg Hartior, although fitted with 15 lamps and Ib-inch retlectors, mowing a Axed red light, from its little elevacion (891 feet) is not seen further than tive to eight miles; in addition to which the woods on the Absecum beach to the nonthward hide it from the mariner going north. A light shoulil be phaced some where In this vicinity, west of the fulet, and as nearly midway between lameg and Cajee May light is posslbie. An examination of this const by competent professinnsl persons can alone decile the luest site for a sea-coast light.
"Cape B/ay Light-house, New Jirsey.-The position of thin light on the east aide of Delaware llay, und its contiguity to the dangerous bank known to navigators as the Five-fathom lank, renders it of great importance that it atoould be of the that order. "Ihis is a revolving light, 88 feet aliove the level of the sea, fitted with 15 lampis and 16 -ineh rettectors. This light bas been shown to be inferior to the third onder lens light on Ilrandywine Shoal, in the proportion of three to one. Its present range, under the most favorahle circomstunces of weather, is not grenter thin ift matical milles, ant, with the present apparatus, it is duubttal If It can be seen wo far by soveral miles. Make Cape May and IIenlopen lights first order lughts, with
proper $\mathbf{e}$ place the without ti fathom $B_{1}$ miles fron two light the navig mast dire
The light
Five-fathe the more be mada.
"Cope

vast amoul coast nlton waintainin ble site in badly locat subserve fil ligation. to make th ing curren tleme, to $n$ linites of $t$ trend of $t$
proper elevations, and navigatora will be able to place their vessel in positions for receiving pllota without the risk of shlpwreck on the dangerous Fivefathom Bank, distant 16 miles from Cape May, and 20 miles from Cape Henlopen. With bearings from these two lights, seon at the distance of 20 to 25 miles, the navigator could always shape his course hy the most direct line into the bay, or for the breakwater. The light vessel authorized by law to be placed on the Five-fathom Bank is so often out of position that it is the more important that these improvements should be made.
"Cape Henlopen Light-howse.-This is one of the best reflector fixed lightes on the coast, although inferier to the third order lens on Ilrandywine Shoal in the proportion of one to six. This light has an elevation of 180 feet, and only requires a first order lens apparatus to make it equal to the requirements of commerce and navigation. The large amount of trade from Philadelphia warrants the preposed expenditure, and humanity would seem to dictats it as consistent with trae policy and philapthropy.
"A sseteague Light-house, Virgivia.--Thia light is situsted on Assateague Island, between Capes Henlonen and Charles, in int. $37^{\circ} 54^{\prime} 86^{\prime \prime}$ N., and long. $75^{\circ} 21^{\prime}$ t5 ${ }^{\prime \prime}$ W.; a fixed light, fitted with only 11 lampe and 1 -inch reflectors. The shoals of this low and dangorous const render the improvement of this light one of paramount Importance. Hy elevating this tower to 150 feet, and placing in it a first order lens apparatus, there will be no great nacessity foz any other seacoast light until we reach Capa Churles (Smith's Inland). The very dangerons shoals extending aleng this entire coast, at a conalderable diatance from the low coast, at distances ranging from five to twelve miles, as shown from the secent surveys by the coast survey, make it the duty of the government to canse this light to be increased in power and range to the rank of a tirst class sea-const light, without delay.
"Smith's Island Light-house, Cape Charles.-Thls Itght is placed on the north-east of Cape Charlea, and at the north entrance of Chesapenke Bay. This very Important light has at present only 10 lismps and 21inch reflectors. Tha dangers nt the entrance to Chesopeake llay render It extronely important that this light should be increased to a first order one. The tower has an elevation of only 55 feet, placed on a very low coast, giving the light, if in other respecta good, a range of net uthere than 12 nanticul nilea, which it can soldum reach In consequanco of the very inferior illuminating apparatus. This is one of the ilghts rectuiring the earliest attention of the light-house department.
"Cape Ifenry Light-house, Virginin.-This la one of the beat reflector lights on the coast. It is altnated on the south sile $\mathrm{c}^{c}$ the entrance of Chesapeake lhay, has an elevation of 120 foet, and is fitted with 18 lamps and 21-inch retlectors. It belug a prominent lending mark for vessels bound Into Chesapeake Ilay, Inmpwh Foads, and their numerous tributaries, every argn. mest would seem to be in fhvor of its speedy finpre, ement, to runder it equal to the beat first claas lights of other maritime nations.
" Liyht-house half"uny betureen Cape Ifenry and Body's fsland Light.-The large number of shipwrecks and the vast amount of lifo nnd property loat anuually on this const should be a sufficient reaaon for erecting and maintainlog a first clans sea-c ast light on some plighble sito in this vicinity. The Ilouly's Island Light is bally located, and insuflelent in power and range to subserve fully the requirements of commerce and navlgation. Vessels bound aonth from the eastwaril run to make this coast, with the vlew to avold the opposlng currents of the (iulf Stranm, nall, nt the anine thare, to avail of the favoratile cutconts within the linits of the cold wall bounding the Gulf Stream. The trend of tho consts on elther side of the Chesneake

Bay renders navigation more dangerous than it would otherwise bel, and therefore it becomes the more lmpertant to light well the entlre coast from Cape Hatterras to Cape IIenlopon.
"Body's Island Lighthouse, North Carolina.-This light has already been referred to. It is of great lm. portance, especially to the oeasting trade, and would be of much more if. it were increased to a first class Hight. It is now fitted with 14 lampe and 21 -inch reflectors, revolving, with an elevation of $56 \frac{1}{2}$ feet, giving it a range of about 12 nantical millen., Thls, in addition to the proposed sea-coast light between It and Cape Henry, would, If properly fitted, save the life of many a gallant seaman, and mililons of dollars' worth of property to the country.
"Cape Hatteras Lightohot:Re, North Carolina.-There is perhaps no ligat on the entire coast of the United States of greater value to the commerce and navigation of the country, than this. That it is not atuch a light aa any sea-coast light ahould be is too apparent to require much argument; while ite special requirement, having reference to the Gulf Stream, the currenta and counter-ourrents which aweep past it, and the very dangerous shoals, extending to the distance of 10 nautical miles from the llght, all tend to make it one of no ordinary importance. Vessels propelled both by wind and steam run for sonndings off this cape; and It is of the tirst Importance to navigutore wishing to make quick pasenges, that thoy should see this light In going south. At preaent it is of very little use, in consequence of its Ilmited range. Navigatora do not, as a general rule, rely upon it sufficient!y to warrant them in running for It.. It is fitted with 15 lamps and 21-inch reflectors, having an elevation of about 95 feet, which would give it a range, under favorable circuustancea, of $14 \frac{1}{3}$ nantical miles, provided the apparatus for illuminating was of the best desoription. There is no slngle light on tha coast believed to require renovation more than this does. An elevation of 150 feet, and a first class Illuminating apparatus, are imperionsly demanded, and without any unnecesary delay.
"Gape Lookout Light-house, North Carolina.-This is at present a fixed light, fitted with 13 lamps and 21 inch retlectors, and elevated 95 feet above the lovel of the sea. In consileration of the manner in which navigators have to follow this low coast, this light becomes, ne ssarily, one of the important sea-coast lights, anil requiros to be elovited anil Improved to that extent. The shoals of this cape are of auch a character as to render it a very huportant light.
"Nero River Inlet, North Caralina.--The great distance from Cape lookout to Cape Fear, and the dangerous shoals extending to such a grent distance from them, witheut any prominent mark latervoning to gaide navigators, render it necessary, in making up a general plan for lighting the entire sea-coast, to include a tint class light, to be placed anmewhere in the vicinity of New Iliver Iniet. The coast between Capes Hatteras and Fear forms a eurve, but not to such a degree is to render a light near this point unnecessary, Although the nevessity for this proposed light may not be considerod as pressing, yet In a welldevised seheme it can not be entirely omitted.
"Ratd Head, Cape Fear, North Carolina,-This light in lts prosent position and whith its preaunt apparatus, etc., is comparatively useless. The apparatus, 15 lampis and 21-inch refiectors, is Inndequate to tho roosirements of the aervice of an ordinary sea-conat light, while this in one of the npecisl onses requiring extraordinary mouns to insure any chount of good. The tower ls nearly 4 miles from the piteh of the cape, and 20 nautical miles from 10 fathoms water, in a direct line on the end of the 'Erying l'an shoala,' which extend continuously from the pitch of the cape. The aspumed elevation of the light is 110 feet, which, with good llluminating apparatus, would give a range, un-
der the most favorsble circumstances, of 17 to 171 nautical miles. Carefui observation has, however, ahown that it is very seldom seen 12 miles; and then only resembling a atar of the fifth or sixth magnitude. This llght is consldered by the pllots as of very little, If indeed of any use at all, for the local purposen of the harbor; while it is perfectly clesr that it is of no value to the navigator in guiding him around and clear of these shoala, which, in the oplnion of naviggators, are only exceeded in importance by those off Nantucket. This light should either be reduced to a mere harbor llght, or removed to the pitch of the cape, and given an elevation sufficient to insure a first order light being seen, under ordinary circumatances, outaide of the shoala. This light as a first-class sea-coast light, and a first-clasa light-vessel placed on the shouls, would tend greatly toward increasing the aafety of navigation.
"Cape Romain, South Carolina.-The dangerous shoals off this point render this an important light to navigators bound to Charleston, and as far south as St. Augustine. To save the current, and to keep out of the infuence of the current of the Gulf Stream, navigators run for sonndings off the Cape Romaln shoals. A first-class light wonld tend greatly to lessen the hazards of this navigation. The present light. fitted with only 11 lamps and 21 -inch reflectors, at an elevation of only 87 feet, can not be seen with'any degree of certainty at a greater diatance, under the most favorable circumatances, than about 14 nautical milea, which is by no means far enough to enable navigators to run their vessels with that boldness which is essential to anceess. This light, in point of power, brilliancy and range, is not auperior to a fourth order lens.
"Charleston Light-house, Sowh Carolina.-This im portant light is fitted with only 12 lamps and 21-inch reflectors; revolving, with an eievation of about 126 feet. Its greatest range about 16 miles. The necessity for a ilrst onder iens apparatus for this light is too appurent to require inore than a bare reference to the chart. This light ahould be changed to a fixed light, and the lights on either $s^{i}$ de of it changed in their characteristic distinctions, fur the reason that it is used as a range with the beacon-light for croasing the bar. Revolving lights are not adajted to thin purpose, especiaily where chsunels are narrow and the eclipses of long duration.
"Munting Leland, Georgin.-This point is one of the positiuns selected for new lights in earrying out the general programme. Distant 33 milea from Charles ton, South Carolias, and about inidway between the Charieston and Tybee lights.
${ }^{4}$ Tybee Light.-This is an important light both In a general and local print of view. For the over-sea royager along the eoast, It is of equal is rance to those generaliy on the coast fur local purposes, an the guide to the entrance to Ssvannah River. This light at present is litted with 15 lamps and 16 -inch rellectors, and has an clevation of 100 feet. This light, in consideration of the sameness in the appearance of the coant, should be well ilistiuguished and louroved to the extent of making it a tirst onler light.
"Saprlo Jsland lighthouse.-Thia light is 46 miles frum Tybee light, and comes ints the liat enabracius the general programine. As a sen-coast light, its importance will appear clearly by referring to the chart, and in a local polint of view it is tho mark to ghide vessels into the important iniaud-watera constituting Doloy Sound. This is at present a light fitedi with 16 lampa and 10 -inch reflectons, elevated iit fent above the level of the nea, and is revolving. Its greatent range now, will nut oxemed list ne uciral miles. An a senecose light, it should he seess clearly and distinetly at the distance of 20 nauticul milea.
"Amelia Idand light-house, Florida.-This Hight, 41 miles frum Sapelo ligit-house, is another of the propesed ena-conat lights. It in at present fitted with

14 lamps and 15 -Inch reflactors; a revolving $\mathrm{llght}_{\mathrm{gh}}$, having an olovation of about 60 feet, and a consequent range for the beat descriptlon of apparatus. of 13 nautlcal mlles. The tower requirea to be elevated, and in other respects improved, to the extent of making it a first-class asa-coast llght.
"St. Augustine Light-house.-This light, being 50 miles from the Amelia Islaud light, is included in the list of ses-coast lights. The present light is one of a merely local character, being fitted with only 10 lamps and amull refiectors.
"Mfuquito Bar.-A light is proposed to be placed in this vicinity. Although its immediate necessity is not apparent, yet in time it will become necessary to orect a sea-coast llght half-way between St. Augusting and Cape Canaveral. This point is 50 milen from St. Anguatine, and 48 miles from Cape Canaveral.
"Cape Canaveral.-Thls ia one of the prominent points on the coat, requiring the most powerfui seacouat lights to facilitale navigation. Dangerous ahoals extend to a considerable diatance off this cape renderiug it still mors important that a flist order light should be subatituted for the present very Inelficlant one. The present apparatus conaiste of 15 lamps and 21 -lnch reflectors, revolving, in a tower of oniy 55 feet elevation. The present ranga of this light does not exceed 12 nantical miles, and should he increased to not less than 20 nautical miles.
"Cape Florida.- Between this and Cape Canaveral it ia propeaed to erect 3 new sea-coast lights of the hrst order: one near Jupiter Inlet is considered of immediate importance; and the other two at different periods, according to circuastances, and as the expend itures for light-houes service on other peints may warrant. The Cape Florida light, marking, as it dues, a prominent point on a most dan, gerous coast, should necessarily be of the noast powerful illuminating opparatus. The present apparatus la composed of 17 lampa and 21 -inch reflectors, with an elevation of 70 feet above the level of the sea, giving a range of not more than 13 nantical miles. The currenta and dangerous reefs alung the Fiorida coast, render it of absoIute importance that it should be increased to the rank of a tirst-clase sea-coast light.
"Caryffort Reef and Sard Key Lights.--''hese two important lifhts are now lu course of construction by the othicers of the 'Topographical Engineers, tu be fitted with tirst order lens apparatus.
" Dry Bank.-This position has been selected as an intermediate point for a first-class light midway between Carysfort Reef and Sand Kay lights, at the distance of to milen from them. It is leileved to he of the first importance that the entire Fiorida coast should be lighted with the lens apparatus of the grcatest power, without delay.
"Dry Tortugas,-This is a very important light, es. pecially to those wavigators hound to and from the liulf of Mexico. It is fitted at present with 17 lamps and 21 -inch reffectors, with an elevation of 70 feet, giving a range of about 13 nautioni miles. This light in $\$ 5$ milen from Sand Key, which makes it ntill more lmportant that it should to of the first order.
"/'ensacolet Light-house.-This light is deticient in power, being fitted with only 10 lampe and lf-ibch rellectors. This and the light at Mobile iruint, boing alout 40 wiles apart, are beth revoiving. As an important naval statiou, l'ensacola requires a inst-class sea-coast light. The present light is very little better than the ordinary local lights aloug the const. The diatinction of this llght shuald be changed, na it is liabie to be mistaken for the une at Mobile l'oint. The propesed ilghts along the florida const, from tho Keys and I)ry Tortugas to l'ensacola, etc., aithough necessary in n general plan, are not deemed to bo of pres. ent great iamortance. With the lncrease of trade and population, the coust must keep pace in its injurovemente In lighising.
"Mobile flactor-ligh with 21 lar of this ligh restricted nautical m could be a tower ahou the light of teresta of 1 mistaken $f$ characteris changed.

"Passes of the first them the $\mathbf{r}$ present ligh sive, witho lights are of Gulf of M efficient in lights along of minor im merated; b or may be, Many of th lights, esper bsys, at an Pacific coast delsy, and n with first-cla
"Lake C" Michigan, St links.-The tha United lights is conc few importau power and ra merce snd ne small lights of 6 in Mich eral in Super pier-head be into classes, actariatic, la portant ligh Barques, dis trance to Sap
"Many of reflectors, a ranges, than Guif coasts. near the Riv and raflector lamps and Capper Ilsrt cipal lights order lenses, circumstanet the Wagoosl the Topogra considered til third order Ontario, tixe Fort Niagar Erie, fixed; Lake Eirie, Buffile, Lat lifuron, fixe fixed; lreas Tour, Lake igan, thind quared ; Suu Milwaukie,
Michigan,
" Mobile Point.-This is belioved to be the best re-fector-light on the coast ; being revolving, and fitted with 21 lampe and 21 -inch reflectors. The elevation of this light being ouly 65 feet, its range is necessarily restricted within the very narrow limite of only 12 nautical miloe. This light, from a proper elevation, could be seen at a distance of 18 to 20 miles. This tower should be elevated to at least 125 feet, to render the light of as much importance as the navigation interests of Mobile demand. This llght may be easily mistaken for the one at Pensacola, and therefore the characteristic distinction of one of them should be changed. In carrying out the general plan, it may become a question as to whether Mobile Point or Sand Islend light should be the principal or sea-cosst light.
"Passes of the Mississippi.-These lights should be of the first class, with such elevations as will give them the ranges of at least 20 natical miles. The present lights are inefficient, and nnnecessarily expensive, without any commensurate benefits. These lights are of great importance to the commerce of the Gulf of Moxico, and should be rendered the most efficient in the shortest space of time. The remaining lights along the coatt, embraced in the programme, are of minor importance, compared to those alrendy enumerated; but deserve the attention of those who are, or may be, charged with the light-house service. Many of the points along the coast of Texas require lights, especialiy at the entrances to the porta and bsyo, at an early day. The prominent points on the Pacific coast should have lights without unnecessary deiay, and no sea-coast light should be fitted oxcept with first-claes apparstas.
"Lake Coast. Champlain, Ontario, Erie, IIuron, Michigan, Superior, and their tributaries or connecting lirks.-The shores of these inland seas belonging to the United States, are, so far as the number of the lights is concerned, pretty well lighted. There are a few important points which require lighta of greater power and range than those now existing ; and as commerce and navigation increase there, a few additional small lights may be required, to the extent probably of 6 in Michigan, 1 in Ontario, 3 in Huron, and several in Superior. The most of these lights are mere pier-head beacons. A syatem arranging the lights inte classes, and giving to each one a diatinctive characteristic, is necessary. In Lake Huron, the two Important lights of Thunder Bay Island end Point aux Barques, distant about 22 miles, and marking the entrance to Saginaw Bay, are both fixed.
"Many of these lake lights have more lamps and reflectors, although only requiring to have short ranges, than many eea-coast lights on the Atluntic and Gulf coasts. Galloo Island, enst end of Lake Outario, near the River St. Lawrence, is fitted with 15 lamps and refiectors; in Lake Superior, Manitou Lalund, 15 lumps and refiectors; White Fish Point, 13; and Cepper IIarbor, 13 lampa and refiectors. These principal lights on the lakes should be fitted with third order lenses, of smailicr or larger model, according to circuastances, similar to the one recently pinced in the Wagooshance light, built under the direction of the Topograpitical Bureau. The following may be considered tirst-clasa lake lights, and should be of the third order lens apparatus, vix.: Galloo Island, Lake Ontario, fixed; Sedus llay; Lake Ontario, revoiving ; Fort Niagara, Lake Ontario, flxed; Dunkirk, Lake Erie, fixed; I'resq' Iole, Lake Erie, fixed ; Cleveland, Lake trie, fixed; Western Sister, Lake Erle, fixed; Huffalo, Lake Eric, fixed; Point aux llarques, Lake liuron, fixed; Thunder Bay leland, Lake Iluron, fixed; Prenq' Iale, Lake IIuron, revolving ; Point de Tour, lanke Huron, fixed; Wagooshance, Lake Miohigan, third order lena ; Fox Isles, Lake Michlgan, required; South Manitou Island, Lake Miehigan, fixed; Milwakke, Lake Michigan, fixed; Chicago, Lake Michigan, fixed; White Fish Point, Lake Superior,

Axed ; Copper Harbor, Lake Superior, fixed; Maniton Island, Lake Superior, fixed.
"Of the 72 lighte on the lakes and their tribntaries; 68 are fixed and 4 revolving.
"Arrangement into one Syatem in reference to Classi. fication.-The following claseification of lights is recom. mended according to their positions, uses, etc., etc. : 1. Main coast lights for the most prominent points on the coast. 2. Secondary 1 lgh te for the inferior points on the cosets, and in broad sounde, bayes, etc. B. Minor sounda and baya, and for harbors and river lights. 4. Range, beacon, and pier lights. Also into six classes, scordling to the dimensione of the lighting apparatus and the range of the lights. All the main sea-coast lignts should be of the first order, and the classea to which the eecondery, eound, bay, harhor, river, range, beacon, and pler lights should belong, would be determined by the light-honse board, accord. ing to the locality, objects for which placed, etc., etc. This applies to new lights, and to the gradual replacIng of the old ones as they may require renewal. 'It is believed that many of the present lights might be dispesaed with if effective ones were subatitnted for those now placed on important points, but not of sufficient power and range, which would in the end produce a considerable saving.
"Distinctice Characteristica.-Experiments will throw light on this important eubject. The light-houses and veasels, as well as the lights, should be distinguished from each other by sight, as well as, in case of fogs, by eound. Colors should only be used for distinguishing small lights of ahort range, as river, pler, beacon, or range lights. In employing colored media at all for lighte, it is important that the most approved modes, with the best quality of appliances, only be usad; a duty which should devolve npon professional men. Mr. Stevens enumerntes the number of distinctions of which reflecting lights are ousceptible as nine: 1 st fixed; 2d, revolving white; 3d, revolving red and white; 4th, revolving red with two whites; 5th, revolving white with two reds; 6th, flashing; 7th, intermitting ; 8th, double fixed light; 9th, double revolving white lights; to which may be added, 10 th, double, one fixed and one rovolving. Of these, three depend on color and ahould be discarded, redacing the distinctions to seven. In the Scottish lights, by oausing a rapid revolution of the frame, and placing the rima of the mirrors of each eide in one vertical plane, Whie their axes are in a plane inclined to the vertical, flashes are produced every five seconds, which appear to rise and sink. The intermitting light suddenly appears, is steady for a short time, and then disappears suddenily. These changes are produced by the vertical motion of circular sliades in front of the reflectors. The different characteristic combinations in the lens system, according to M. L. Fresnel, are nine: 1st, flashing at the interval of a minute; $2 d$, flashing ak the interval of half a minute; 8 d , white and red flashes alternating; 4th, fixed lights flashing every five miluutes; 5th, flakhing every three minutes; ©th, overy two minutes; 7th, fixed white lights with red thashea; 8th, flxed white lighte; 9th, double fixed lights. These are applied only to the first three orders of lights. In England the lights are classified as aeam coast, secondary, and harbor and river lights. In France they are divided into six orders, according to their range and the slze of the lighting apparatus $;$. the first order befing the largest, and the mecond, third and fourth orders being each divided Into two clasees, the larger and smaller, or first and second classes. The objections to colored lights are, the large aboorption of the incident light, and the difficulty of distingaishing the color. Ked is admitted to be the best color. A good red light is seen 16 miles, and sometimes 22. Green lights from a powerfal apperatus, in Mr. Stevenson's experimente, wers eewn 7 miles in very elear weather, and blue lights anly 5.
"The objections to red are: 1. The great lona of light by abaorytlon. A full red glass used as a chimney of a lamp abeorbed 80 per cent. of the whole. A plak French glasa abaorbed but 67 per cent. of the light, but the light was not eharacteristic.
"2. White lights grow reddish in a fog. In a revolving light, showing a!turnately red and white, the red is absorbed at a lesa distance than the white, and the light may be mistaken for a white llght of half the period of revolution. Two IIghts will appear blended in one, which are not separated by at least $3^{\prime} 18^{\prime \prime}$; call II the required diatauce bet ween the llghts in feet, $\Delta$ the olserver's distance In feet, $\theta$ half of $3^{\prime} 18^{\prime \prime}$. Then II $=2 \Delta \tan . \theta$. For 1 mile, II $=5.84$ feet, and for $n$ milea $H=n \times 5 \cdot 84$. Leading, or range Jights, should be nearly on the same elevation, ac as to cause them to appear nearly, but not quite in one. The distance between them should not be less than one alxth of the distance at which they, are thus to be used.
"In forming a programme for lighting the coast, the following conditlons ahonld be reallzed: 1. The most prominent polnts should be first lighted. 2. Revolving lights, as more powerful than fixed, should be used, when posstble, on the projecting polnts. 3. Lights identlcal in appearance ahould not occur within 80 to 100 miles of each other. 4. Distinctions of color should not be adopted except In casee of absolute nocesslty. 5. Aa few lights as poaslble should be used, not only for the sake of economy, but to avoid confusion. 6. Distlnctions of lights lepending on the estimations of omall differences of time, of appearance and disappearance, shoull never be reaorted to. 7 Harbor or local lights ehould generally be tixed, and may be distinguished by colors. 8. Floating lights ahould never be used when fixed lights can be employed.
"The aystem proposed by Charles Balibage. Feq. 1 of London, and which has been communicated by its distinguished author to the Board, at the request of ome of ita members, in to distinguish lights ly occultations; or, to make each lighthouse repeat its own number continually during the whole time is is lighted. This is accompliahed by lnclosing the mpper part of the glaen cyllnder of the Argand burner by a thin tube of tin or brass, whleh, whea made todescend slowly before the flame, and then allowed suddenly to start back, will cause an occultation and reappearanoe of the light.
"The nnmber belonging to a light-house may be thus Inclicated to dintant ressels. Take, as an example, 243. 1. Let there le tuo occultations. 2. A ehort pause. 3. Four occuitations. 4. A nhort pause. 5. Three occultations. 6. A longer Interval of time. This syatem of occultations may be repeated all night by means of proper mechanism.
"The rapidity of the occultstions themselves, the leagth of the pauses between the units and teras and between the tans and hundreds, as well as the duration of the long interval of time which marks the termination of the number, must be made the subject of experiment. A light has been already nsed as an Illustration, In which the occaltationa occurred at intervals of one recond; the pauses occupied four and the long interval ten seconiln. The pause was thought to be unnecessarily long, and wan diminishet. Whatever may be the times ultimately alopited, the experiments already made render it lmprobable that the average timo required liy a light-house for repeating its number should anount to one minute. It is by no meank necessary that the counting of the number of a Ifght-house shonh commence with the digit which expressen hundred. No greater anmunt of time would have elapsed, If, In the above Instance, the otmerver had commenced with countling the unit'a dgure. It would then have read thua: (three occultations) long interval; (two occultations) passe: (four oceuliations) jusue. Ily the long linterval denoting the com-
mencement of a number, it is already apparent that the number of the light-house is 243, and not 324. In order atill further to prevent miatakes ariaing from ail incldental error in counting the number of occultatlona, It will he convenlent to establish another principle for the purpoae of numbering the light-houses. Light-houses muat not be numbered In the order of their position; but every light-house must have such a number asaigned to it, that no digit occurring in the number densting the aeveral light-houses nearest to it on either side shall have the same dlgit lo the same places of figures.
"If five adjucent light-houses were thus numbered:

$$
361, \quad 517, \quad 243, \quad 876,182 \text {; }
$$

supposing a mlatake to have occurred in the first time of counting 243, and that It had been reported to tha master of the vessel as 253 , he would immediately; on looklng at hla numerical list of light-houses, perceive that a mlstake had been made in the middle figure; because, in any general arrangement, 253 would have been assigned to some light-house on a coast very distant from that on which 243 was placed. In fact, two out of any three figurea would always detect the crror of the thitrd.
"The occultationa would diatinguish every lighthouse from all casual lights, and thelr aumber would identify the llght. The whole illuminating power would be alwaye employed, undiminished by the interposition of colored glasa. Theso lights would bo more readily visible at a distance, because it is known that the eye percelves more readily a falut light which is intermittent than an equal light which is fixed. The Board regard this as the most important proposition for distinguishing lights which has ever been made, and propose to make full experimental trials of it. In fogs, Mr. Bubbage proposea to mako the pausea between the strokea of the goug take the places of the occultations of the light. To give this plan a full development, sll matious should unite in a system ef numbering forlight-houses. Such a co-operation might reasonably be looked for, If the plan have all the succese which is now expected.
"Hest mode of ascertaining the necessity for introducing new Lights, Beacons, etc.-Legislation is, of course, necessary to the establishment of a new light, The recommendations of the Light-house 13oard, of officers of the corst survey, nf pilots, navigators, und others, all reach the Committees of Commerce of the two llouses of Congress, through different appropriate channels. It does not seem practicable to prupose any syatelu of examination of sites which woud not be very expensive, vihlle legislation is pending on the suliject. A reterence to the Light-house Board, in doubtful cases, would mecure the committees from recommending appropriations for ohjects which certainly would not have the approval of professional men. The law of the last session provided for the examination of sites, for which appropriations were made, by the officers of the coant survey, aud a report by the superlutendent. As this will leeve a full knowledice of all the circumatances of the case, and be attended with very llttle expense, the same plan whould be pursued lu all future cases.
" Best node of supplying new Lights.-When it has been shown, to the satisfartion of Congress, that new llghts are required, and appropriations nade for the purpose, the plans and specifications for cunstruction, Illuminating ajparatus, distlisetion, etc., mhoulit be made Liy the engiueer of the Light-house Boaril. Should a previuus eatluate have been made hy this engineer. for the inforination of Congress, genarsily, there will be required but little nore than to fill up the detains. The conatruction haviug been approved hy the lighthouse Board, a contract should be entered into, iccoriIng to law-based entirely upon tho plats, drawings, anil specifications and estimates of the engitner-and the building should be erected, and the lighting apps-

The syatem examination the exercise glect or dis due degreo o mate entlrel general or lo lig upon w would be dot edge, skill, "/mprore In regard to seed), now in France, most of the for spermuce our lights, t reommenda of Commnis
ratus and accessories be procured, under the inspection of the engineer of the Board, or of such officer of the corps of engineers of the army as may be detailed for the purpose, in conformity to the 9th section of the act approved 8d March, 1851. All the details should be subject to similar inspeation.
"Mode of renoratir y Lights.-Whenever the Lighthouse Bosrd is atiafled of the necessity for renovating suy existing light, $b, t$ the introduction of better illuninating apparatus, ein., the engineer of the Board should be required to prepare estimatea and plans in detail, to be subinitted to the board, which should be pasped upon, and, if approved, the necessary steps should be taken to make the repairs, etc., according to law ; or, in the event of the expense being too great to sdmit of the works being done, except by a special uppropriation, then the necessary estimates, explanations, etc., should be prepared and anbmitted, through the Secretary of the Treasury, for the conaideration of Congress. It should also be the duty of the Board to procure all the necessary iuformation relating to the establishment of new lights, abolishinent of old ones, etc.; to be accompanied by estimstes of cont, to be sabmitted, through the Secretary of the Treasury, to Congress, at the commencement of each session.
"Discontinuance of unnecessary Lights.-The steps in regard to the discontinuunce of lights shouid be similar to those necessary in cases of renovation of tights.
"Subjects of Ivstruction to Employees.-Inspectors and light-keepers should be provided with printed instructions, in the form of manuals of instruction, as well ne those necessary to guide them in the police of the estabilishments, similar to those provided for the inspectors and keepers of light. houres in France and Great Britain. This manual should embrace a detailed account of the modes of executing every part of the duties confined to the inspectors and keepers; a description of the parts of the machinery employed; and the means to be employed, in case of accident to the machinery; etc., until it can be repaired. The instructions for the light-house service of France embrace every point in the most minute detail, and serve not only for the guidance of inspectors and keepers, bat also of the engineers and others in any way connected with the service. The instructions for lighthonses, light-vesgels, etc., of England, are full and explicit ; printed in large type, with conspicuous headlage; and are kept in the quarters of the keepers, in frames, so that no one can ever be at a loss to know his duty. The different kinds of lamps employed are described, and the modes of attending to them pointed oat, in plain, clear, and explicit terms, adaptel especiatly to the understandings of the keepers of the lights. The subjects contained in the printed instructions and mannals, would form a part of the essentials in the examinntions for qualifications of keepers.
"Beat Mode of securing Attention to Instructions.The system of inspection already recommended, the examinations for higher positions in the districts, und the exercise of the present power of removal for neglect or disoliedience of instructions, wonld secure a due degree of attention to them. If promotions wern made entirely liy merit, on the recommendation of the gencral or local inspectors, anil changes, not depending upon want of qualification, were avoided, there would he douitiess, grent improveinent in the knowledge, skill, and attention of the light-keepers:
" Inprocements in the Materials fir Illumination.in regard to the subatitution of the ofl of colza (rapeseed), uow used exclusively for light-house purposes in France, Enginnd, Scodand, and Ireland, nnd in most of the light-houses of the other mnritime nations, for spermaceti oil, or, more properiy, for that used in eur tights, the Bonrd woull refer to the fact, that the recommendation of the select committee of tite liouse of Cummons of Grent Ilritain, in 1845, to the Light-
house Board, to introduce the more economical oil of colzs into their light-house establishments, had the effect of causing a thorough experimental examination to be made of the two oils (colza and the best winterstrained sperm oil), by Professor Faraday, Mr. Alan Stevenson, and others interested in light-house service, by which, it was clearly demonstrated that the colza oil is auperior, in every essential particular, to the best winter-strained sperm oi: Professor Faraday saya, in his report: : Having burnt the lamps for many days, I have been much etruck by the great steadiness of the rape oil lamps, either as considered alone or in comparison with the sperm-oil lamps. They would burn for 12 or 14 hours at a time with little or no alteration of the light, the cottons or lamps not leing touched the whole time; whereas the sperm oil lamps would in the course of four, five, or six hours, give a diminished fiame, from the incrustation of the charred purt of the cotton retarding the flow of oil. In the rape oil lamps the coal is broken and porous, and serves for wick almoat as well as the fresh cotton; but in the sperm oil lamps the coal forms a hard, continuous ring, which seals up the ends of the threada; and this, with the more conflned condition of the burner, and the greater distance of the oil beneath (from intentional difference of flow in the lamps), csuses the sperm oil lamp flame to fail in brightness, and requirea that the wick should be re-trimmed. * * I have made many careful experiments on the proportion of light produced by the two kinde of lamps, in every case weighing the oil before and after combustion, so ns to know exactly the quantity burned, and making, during the experiments, above 100 comparisona of the lights one with another. The rape oil lamps were always more brilliant than the sperm oil lamps, except, indeed, one or two rare cases; but, at the same time, more oil was burned in them. * From 108 obaervations of the lights, taken at auch times as appeared fitted to give the best mean expression of the light of the lamps compared with the oil burned in them, the avarage light of the rape oil lamp came out as one and a half, that of the sperm oil lamp being one.' Mr. Alan Stavenson says: ' In my isst annual repert on the state of the light-houses, I directed the attention of the Board to the propriety of naking trial, at several stations, of the patent colza or rape-seed oit, prepared by Mesers. Brigge, of Bishopsgate-street. These triala have now been made, during the months of January and February, at three catoptric and three dioptric lights. * * Tho substantial agreement of ail the reports, ns to the qualities of the oil, renders it needless to enter into eny details as to the slightly-varying circumstances of each case ; and I have, therefore, great satisfaction in briefly stating, as follows, the very favorable conclusious at which I have arrivel: 1. The colza oil pesseasea the advantage of remaining fluid at temperatures which thicken the eperinaceti oil, so that it requires the applicati $: 1$ of the frostlamp. * * 3. The coles oil burns, both in the lireenct lamp and the single Aryand burncr, with 8 thick wick, during 17 hours, without requiring any coaling of the wick or any adjustment of the damper, and the flame seems to be more steady and free from tlickering than that from spermacetl oil. 4. There scems (most probably owing to the grenter steadiness of the tiamo) to be less breakage of glass chimney: with the colza than with the sperm oil. B. The consumption of oil, in so far as that can be ascertained during so short a pieriod of trial, seems, in the Fresnel inmp, to lie 121 for colzs and 114 for spermaceti; while in the common Argand lump, the cousumption appears to he 910 for colza and 902 for spermaceti. 6 . If we nuy assuine the means of these numbers, 515 for colza and 508 for spermaceti, as representing the relative expenditure of these oils, and if the price of the colza is 8 s .9 d ., whils that of aperuaceti is 6 s .9 d .
per imperial gallon, we shall have a saving in the ratlo of 1 to to $1 \cdot 775$, which, at the present rate of supply for the Northern IIghta, wonld give a saving of about £3226 per annum.' The ovidence of these two distinguished gentlemen is concluslve of the superiorIty of the colss or rape-seed oll to the beat winterstrained sperm oil; and how mnch better than that used in our lighte, may be readily lnferred without the ald of experiments on so nice a scale as these employed by Profeesor Faraday and Mr. Stevenson, when It is remembered that our lights are supplled with oll called winter and spring or summer ofl. That efficlent llghte along the coasts of all maritlme countries are oseentlal to a safo navigation, and the ouccessful proeecution of a lucrative commerce, will not be contested; that all mere personal or local interests ahould give way to the general good, is an asoumption which will not meet with disfavor in this country; and inasmuch us it is of paramonnt importance to the best interesta of the whole country, that our lights and other aids to navigation ohould be the best which money, science, and the mechanic arto wili afford, it is, in the opinlon of the Board, the duty of these charged with thle important branch of the public eervice to emnloy every reasonable means, not fuconaistent with law, to perfect them, and $t^{2}$ - ore recominend that the anbject of introducing othe smbustlbles than the oll now used, be taken Into serious conslderation, as one of the means of improving our lights, and, at the same time, of effecting considerable annual saving of expense to the country. If the rape-seed were cultivated to any extent in this country, it is not doubted it would oupply the plsce of the namerous chemical olls, flulds, etc., now in general nse for domestic purposes, as well as for llghtlng our llght-houses and light-veasele. To insare the consummation of so desirable an object as the cultivation of this plant on a large scale in thla country, where climate and soil are so well adapted to it, will be to place it in a fair competition with fts rivals. It will be the duty of the Boant, if authorized by Congrese, among its nnmerous other important duties connected with the light-house establishment, to examine into the merits of all proposed improvements in apparatus and combustibles, and, by their recommendations to Congress, keep pace with the Improvemente of other countries in this branch. The introduction of gas Into light-houses has long been looked forwant to as an important step. Hitherto it has met with but little favor in any quarter. While the introduction of gas into our light-houses, if found adaptable to them, would involve important points to be coneldered, it ls by no means certain that by the means of a series of experiments, the Boand would not be enabled to decide conclusively as to the practionbillty of making the attempt in the present state of knowledge, or the best and anfest means of generating, conducting, and contlnuing It for light-house purposes. The persone charged with the few gas-ilights now exiating in thls country, for want of praetical and theoretical ktowledge, it is believerl, are not competent to report results anficiently rellable to deche so important a question.
"Buoy:-The material is iron or wood, sometimes covered with copper. The anchom are heavy blocks of atone, or mushroom snihmra, or Imen ainkers (which shonld be hollowed out below), or Iron serews. It ls worth trial whether fastening the buoys by a traverse line passing through the centre of osclllation wonld not diminish the liability to chafe nff the chain, and separate the booy from the snehor. A awivel-thackie, in a degr . prevents this, but not effectually. The colora of truays are made to indicste their parpose, as dealgnathig a channel, ohoal, spit, etc. They are eonetimes even characterinticaliy marked to dietingaish them. The law passed in 1860, in rugand to colorIng and nambering lonoys in the United States, in sim. ple and effective. The numbers were intended to
begin at the exterior of a bay, barbor, etc. This lay is as follows: Extract from an act making appropriation for Ilght-houses, light veesele, bnoyt, etc., and providIng for the oreation and establishment of the amme, and for other purposes, approved September 28, 1850 ; 'Sectlon 6. And be it further enacted, That hereafter all buoys along the coast, or in the bays, harbore, sounde, or channele, shall be oolored and numbered, so that, pasaing up the coast, or eound, or entering the bay, harbor, or channel, red bucys with even num. bere shall be passed on the otarioard hand; black buoys with uneven nambera, on the port hand; and buoys with red and black stripes, on either hand. Buoys in olannel waye to be colored with altarnate white and black perpendicular stripes.' Of ecurse the bucys show, with more or less distinctness, when projected on the water, against the aky, treee, etc. The red buoys ahould be palnted a hirlght red, and not a Spanish brown, in order to be well dietinguishedred lead or vernillon belng used as the paint. The experiments and ohservatlons of the Board satisfied them that In such a case, red and black were good col. ora for distinguirhling buoys. The ean-buoys, in some lnstances (as In New York harbor) are too small to be easily seen. The numbering is a simple natter, but is by no meana effectlvely executed, especially on the epar-buoys, where the numbers repeated on the different sides, belng seen in range in a diagenal view, lead to confusion. The Board have given eome attention to plane for numbering buoys. The numbers should be placed above the buoys, on stems or perches ; should present the same appearance on different sides, and have their distinctions by dlfference in a vertical line, and not by varying horizontally. Several plans have occurred to them. Three solids, the cone, cylinder, and ephere, arranged in groups of not more than 3 each, will give 42 combinations ; no one of these flpures can be taken for the other, and they may easily be placed on atems projecting nearly vertically ubove the buoy, the several solide being placed one alove the other, with a anfficleut interval. They can be of adequate size, and may be cheaply made In the turning lathe. The elementary forms of the unit, the 5 and the 10, of the Roman numerals, are the cylinder, the cone and the Gouble cune. Iy cominations of theso, 89 numbers are represented. Seven numbers may be represented by 2 signs and their combinations ; 28 by 3 signs, restricting the number of elements in any one comblation, to 4 . Seven nunbers of every 10 may be represented by only 2 mere signs than those expressing the value of the ten's place, giviug a vely great variety. A letter made to revolve about a vertical axis, pruluces a solld of revolution which is easily recognized as the sign for the letter. Fourteen of the twenty-aix letters are adapted to characteristic sigas, as shown in the fignres ( $\mathrm{A}, \mathrm{I}, \mathrm{E}, \mathrm{I}, \mathrm{J}, \mathrm{L}, \mathrm{O}, \mathrm{P}$, Q, It, T, W, V, Y). Nine digits of the Arabie numorals, viz. : $1,2,4,5,0,7,8,9$, and 0 , give easily formed and easily recognized slgns, as is shown in the accompanying plate; and these the luard rtcommend for nanbering buoys, excluding 3 as not sufficiently characteristic. In the English system of placing bnoy, a red and black are placed on opposite sides of a charmel, and the vessel runs between them. In our system only ona buoy ls placed on the starimard or port hand, and the veseel rans for the buoy, keeping It elose aboard In passing. The linglish system is most ample, and even the most economical. In order to reader buoys available at nigit, various propositions have been made for causing thet to appear lamlnous, but none have succeeded practically. Lighting by gan in among the methods proposed.
"Of Fog signuale.-During the prevalence of fogs, the lights whlch ought to guide the seaman are often indiatinctly eeen, or entirely olsecured, untll he has approached too near the danger against which they wera intended to warn him. In casea of fog, light-
ohlps an with go soundin lng the shortest The lig of from bell is $h$ When th cate dun some cat bell sho This cou tion ln th ment at $f$ Interval 1 eively rep ships, jus for lightnumber two blowa three blew ism which produce ti planationa or light-sh might ren very near the oysten each light. to every chosen for tion, and t! will farais case. "Suggest nols, Buoys, might betucee. occur in wh ahould coms sead a boat be the beare vey some pf great objec The etate 0 sead for or even under tions from could be ed happ, be pre directed to possilly be be organise navy in the where, larg it is true, ar numbers $m$ lampa. An pressed by
whips and light-houses are, in aome lnatancea, provided with gongs and belle, which are then kept constantly counding. It in .nfortunate that the means of warning the seaman of his danger ahould extend to the ahorteat diatance when that danger is most imminent. The lights naually employed are visible at a distance of from 6 to 80 miles; but the sound of a gong or beil is heard at a comparatively very amall diatance. When these instruments are heard, they merely indicate danger, but not ite exact nature. It might; in zome cases, be of great inportance that the gong or beli should indicate the number of the light-ship. This could be accomplished by a very trifing alteration in the mechaniem. Instead of striking the instrument at fixed intervals, let there be pauses and a long interval between the number of strokes which successively represent the digits of the number of the lightchips, juat in the same manner as has been proposed for light-honses. A light-house or light-ship whose number is 248, would be thus indicated daring fo: 1 two blows on gong, pause; four blows on gong, pause; three blows on gong, long interval. The same mechanism which caused the occultations of the light might produce the blows on the gong. The preceding explanations are aufficient to show that each light-house or light-ahip, by continually repeating its own number, might render any mistaks of it for a different light very nearly impossible. The great principle on which the aystem reats is to giva numerical expression to each iight. If it be not thought necessary to apply it to every light-house, the most important may be chosen for its application. The expense of the alteration, and the amonnt of danger incurred by a mistske, will faraish the ground of decision in each individual case. In proposing, however, a now syotem which has extensive bearinge on other queations connected with the affety of those who travel on the waters, it is desirable that a general and comprehensive view should be taken of such of ita applications as the rapid advancs in mechanical and chamical acience justify us in supposing must take place in a fow years. However partially the system may be adopted at first, a judicious foresight into ita prohable applications may enable us, without any present inconveniance, to accelerste futore improvementa, and to auve considerabie expenee on their adoption. Tho following suggestions for improvements or applications, many of which are perfectly practicabie at the present time, are offered for the consideration of those who may be called upon to carry out the Numerical System of Light-houses. They are not necessury for the euccees of the situple plan which has been already deacribed, hut may be adopted or rojected without any interference with it.
"Suggestioms for the Improvement of Light-house Sigmolh, Beoys, etc.-Telegruphic communication during the might between Light-housed, and Ships in distress.-Casea occur in which it is of great consequence that a ohip should commonicate with the lenil long before it can sead a boat sahore or enter its intended port. It may be the bearer of important intelligence. It may convey some person whose prsaence is essential for some great object. The vessel itself may be in distrese. The state of the elements may render it impossible to send for or receive any aseintance fom the land; yet, aven under anch unfavorable cireumatances, if directions from skiliful pilots, acqualnted with tie coast, could be conveyed to the ship, ita wreck might, perhaps, be prevented; or, if driven on shore, having been directed to the least unfavorable spot, its crew might possibly bo asved. Such communications might easily be organized. There are already existing in the royal navy in the Fast India Company's service, and elsewhere, large dietionaries of numerical signale. These, It is true, sre made by flage, or $b_{j}$ balls; but the same numbers may be expreseed by the occultations of lampe. Any number, however large, may be exreseed by making the number of occultatione corre-
aponding to the first or higheat digit, then allowing a pause; after which the number of occultations representing the second digit, then a peuse; anil, so on, always oheerving that, after the unit'e figure has been expressed, there must follow a long interval.
"The plan for telegraphic communications would be thus arranged: 1. Light-house ropeating its own number. 2. Ship fires a gun, and holsts a light, to call the attention of the light-keeper. . 3. Light-house ceases repeating its number, and becomes a steady light, thus informing the ship that it is obsorved. 4. Ship having prepared ite measage, numerically exprasses it by the occultations of its own lamp. 5. Light-house repeats, the meesage of ship, in order to show that it has lyen rightly understood. . 6. Lighthouse now repeats ite own number, while it is preparing the answer. 7. Light-house expressea its answer by occultations. 8. Ship repeats the answer. This interchange of question and answer is coutinuad as long as necessary, during which the light-house repeats ite own number previously to each reply.
"Very little delay will occur; for these queationa and answers will be arranged on movable disce, which may be placed in the mechanism employed for occulting, even while it is repeating another meseage. Many such discs, each containing a different message, may be placed in the machine st once, and on touching any lever the light will continue repeating the corresponding message. In cass of a ship in distrese, for instance, requiring an anchor of given weight, it may be necessary to send to the harbor-master of the adjacent port to give the order, and to escertain the time when it can reach the vessel. During this interval, the light-house wiil be repeating itg own number. An eiectric telegraph from the light-house to the dwelling of the harbor-master would save much time, and, in come cases, much damage. The gun fired by the vegsel might also be heard by the harbor-master; and his attention then being directed to the telegraph lighthouse, the whole time might be saved. If even hls own house was invisible to the ship, but within view of the light-house, he might, by means of a small light, correspond with the ship, through the intervention of the light-house, repeating the signale of both partica. Colored shades might, if thought expedient, be used for different dictionaries ; or an entirely independent lantern might be specially devoted to signaia; but this would cause additional expense, and seonss unnecessary. It may the objected to this plan, that it would mielead other vessels on first coming in sight of the light-house. This olyection, however, will be found on examination to be invalid; for a ship on first getting sight of a light-house, will be at the distance of many miles ; and as all tolographic messages would conaist of more thun three places of figures, the ship would immediately perceive that the light-house was acting telegraphically, and on turning to the dictionary would even become acquainted with its message. Besides, in the course of every three minutes, at least, the light-house would repeat its own number. Thus the ship would alwaya know that it was in the presence of a light-house; and if its reckoning did not enabie it identify the light, it could only remain in doubt during a few minutes.
${ }^{4}$ Telgraphic Signals between Ships at night.-The application of the aystem of occultations to ships at sea may not perhaps be quite so easy as that which is proposed for light-housea, but no objection has yet occurred which appears at all insurmountable. The question of the position of the occulted light or lights placed on the alip must be settled by practical men, after due consideration asd experiment. It may; however, be anggeated, that a light hid by a mast or sall may yet have its occultations made perfectly apparent by reflection from anothor sail. If anch a system of signale were adopted, feets might suil in company during the night, each repeating its own number; and
any orders could be convered to any findividual ahip. Spoeific lights have already been employed to distinguish sailing-vensela from ateamera, in order to prorent colliaions." By adapting the syatem of oceultations to one or more of the lights of eteamers, their character would appear more diatinctiy, and at greater distancee. Perhaps, indeed, it would be better to have the 'distinctive character of a steam-vessel Indicated by a continual enlargement and diminution of ita light, rather than by an occultation. Two steamers aiso would have much less reason for approaching each other, becanse they could hold any correspondence hy signala. They might also, by the same means, convey to each other their Intended course long hefore they approach each other.
"Of a universal Dictionory of Signals.-Whether the aystem of occultations be ifenerally adopted or not, numerical dictionaries of signals have been found absolutely necessary, and have long been in use. The rapid increase both of ships and of steamers renders some common langage for all nations almost a matter of necessity. The concurrence between adjacent nations in numbering their respective light-houses would be essentinl if any numerical system is adopted for distingulahing them. Such an opportunity ought not to be lost of rendering those discussions atill mare usefal by attempting to organize a plan for a universal aystom of numerical signals. The first atep might, periaps, be that each nation hhould supply all questions and anewera that ships could ever require for their safety or convenience. Out of these, the duplicates being omitted, the first draught of the naval part of the dletionary might be formed. Thls being submitted to eriticism, would probably itself suggest many additions.
"The questions should be very carfully translated into the languages of all maritime nations, and should be printed in columna for each language. A dietionary of this kind, containing about 5000 terma in ten Enropean languagea, was publlahed in 1849 by M. K. P. Ter Reehorat. The words are contalned on about 200 double pages; and alnce each word, of which there are usually about 25 in a page, is numbered, this work might be used an a namerical telegraphic dictionary. If a more generni dictionary were midertaken, othor consideratione arise, and the great questions relating to the philosophy of language mast be examined with reference to such a work. It will, however, be sufficiently early to enter on that sutject when any stepa are seriously taken to accomplish so desirable an object. The continually increasing use of the electric telegraph renders a universal language atill more denirable.
"On the Identification of a Light-howse.-A case has been more than once saggented to the author, to which it may le dealrable to advert in order to point out the conrse of experiment which may lead to ite removal. At certuin periods of the year, and on certain coasta, there occar dense fogn. Under these circumstances, it has happened that a vessel han, on a partiai and momentary opening in the fig, insufficient to show more than a single ocenltation, found heraelf almost close upon a light-bouse. In such a case, there is neither time nor opportunity to ascertain its number. It may here be remarked, that the assumed danger of going sahore is so imminent that it is not mecessiry to know the number. It is sufficient for the moment to know that there is a light-house in a certain direction, which is clowe at hand. It must, however, be admitted, that in common with all received aystems of lighta, the method of ocrultatione will not furnish a remedy. If a colored light is already employed in partievlar localities to moet such a case, it will atill accomplish the parpose when occultatione are applied to it. The danger, although rare, ought, however, to be provided againnt. The following remarks are auggested to aswint in attuining that objeet:
"The time betweon two ocealtations (aaunlly one second) might be doubled in apecial casea. A little experience would enabla moet men to recognize the fact aftor two occultations. If sach light-housea were placed alternately with others, no light-houwe would be mistaken for oither of its adjacent neighborn. This plan might be partially extended, hut it is liable to objecticna. Another viaw may he taken. Ie it possible to give a ppecific character to the occultation itseif? It has been found, that if the occuitating cylinder deacend rather alowly over the lamp, and then, after a very short panee, rise suiddenly, the effect io best. It han aiso been obmerved, when an accidental defect in the apparatua caused the cylinder, after enddenjy rising up, to rebound, and again to obscure partiaily the iamp, that the nature of the oceultation was pecu. liarly charactoristic. Thia peculiarity was very remarkable up to a certain distance, aftor which it became lost. Aimost any form of peenliarity can be given to the ocoultationa by giving proper forme to the cante which govern shem. The fact that ench pechliaritien are not seen until the ship hae approached within cortain dietances, does not appear to present a material difficulty, and may even prove an adivantage. It would reem, then, to be dosirable to institute a se. ries of experiments to determine the following quastlons: Can the occuleations of a lamp, in which the rapid ro-appearanee of the light occura from the fuiting down of the shade, be distlnguished from those in which it oceure in consequence of the rapid rising up of the shade ; and if so, at what distance? In seme cases the ainadoa might move from right to left, and in ths reverse direction. What peculiarities in occultations can be soen at the greatest distances? Among the experimenta atill required may be mentioned the loss of light resultiug from the interposition of colored glasses, and also the proportion of light lost by sacrificing gives portions of various parts of the optical ap. paratus used for concentrating it, This is necessary in order to enable us to jodge what pertion may be most ecouomically sacrificed in case the space might be required for other purposes, The dangers arising from fogs are of auch an oxtent that all the resources of science ought to be called in to remove them. Voltaic light oan seareely be depended upon except under continual superintendeuce; th would therefore be expensive. If, however, any intense light can be fonnd capalle of peuctrating donee fogs, it might, during their contiuuance, be good econouy to employ it even at considerable expense. l'erhaps the ordinary light. house lamps might be supplied with oxygen during foga ; its expenditure being regulated by the olsecurity to be penetrated. Possibly portions of phosphorus might be burnt in oxygen, and the light-house would then express its numiler hy a series of flashea, and of pauses between them. The new form which that body is now known to assume, might render jts application to this purpose free from danger.
"On Sounde used for Signals,--Doth gongs and beils are employed as auhatitutes for lights during fogs. I am not aware of any meries of experiments on the distances at whleh sounda of varions kinds can be lieard. In a question on which so much property and so naany lives depend, it is surely important to be well jnformed. The only resource is experineut. It may be reuarked that the low nutes of the gong might be couffounded with thowe of the roll of waves lireaking on the shore, while the shrill whistle of the steam-engine will find a rival in the wiad wiistling throngh the rigging. The trumpet and the new and atill more powefful instrument at the recent exposition ought also to becompared.
"Again, although some of these may ise heard at grester distancos in the open air, some may he mora masily adapted to have their mound concentrated and directed, when placed in the fociss of a parabolic mirror, or, perhaps, at the end of a long tube. Sound is
transmi and it. ense of be muc motion conside nend do ments al can be 1 lte motho tsted, it atill wa Thus cha municat the elec whether makie tl tions. water, as "Wha est distan the best whether ones. "Such trimming, ench even mechanis If it is th as to inuli might be pleces of wonid be in order t probahiy beavy pe right ang tion of th? pendalun of a por waves, w
transmitted to considerable distance through water, ind it has been suggested that this might be used in case of fogs. But it seems probable that sound would be much interrupted in its progress from the constant motion of the waver; and if it were transmitted at a cousiderable depth, it might be difficult for a veasel to send down an apparatus to render it sensible. Experiments should be made on the distance at which suunds can be heard under water in various circumstances of its motion. If, during storms, the surface only is agitated, it might be ponsible to trenamit sounds in the still water near the bottom to considerable distances. Thus channels might be traversed by telographio communications with a less costly apparatus than that of the electric wire. It ought also to be ascertained whether the forms of the instruments struck would enable them to project their sounds in particular directions. Gongs, bells, and the firing of cannon under water, are among the sounds to be tried.
"Whatever may be the sound audible at the greatest distance, it will be necessary to ascertain what are the best means of produoing it in greatest intensitywhether by ons large instrument, or by many small ones. It seems probable that some combination of discordant sounds may be most effective, because it seems to be a law of our nature that contrasts produce stronger impressious than uniformity. There is one form of sound the most disagreeable with which we sre scquainted; it is said 'to set the teeth on edge.' What is the cause of this, and does that highly obnoxious seund penetrste further than others? If it penetrate as far as others, lt will certainly be the earliest to be noticed.
"Lights on Buoys.-The time is probably not remote when lights will be placed on floating buoys for the purpose of pointing out isolsted dangers-as sunken rocks, sheals, etc., on which light-houses can not be placed, or whe.e the great expense may prevent them from being built. They may also be useful to indicate the chaunels lesding to sone few ports of very great nsort in order to render the approach of vessels possible during the night. The first difficulty in placing lights on buoys arises from the necessity of trimming the lamps, and of sapplying them with fresh oll. Galvanic processes seem to present a similar difficulty. The chsmical discovaries of recent times, however, offer some hope of removing it. By the destructive distillation of pent, of coal, and of shate, as we?! as by ether methods, a variety of combinations of hydrogen and carbon have been obtained. Some of these only remain liquid under a pressure of two or three atmospheres. They possese considerabie illuminating power; und by cenfiuing them in a close vessel, and sllowing s very small aperture for their escnpe in the state of gas, a jet of flume may be produced, of uniform magnitude, and witheut the use of a wick, until the latt drop of fluid has evaporated. If such a fluid could be produced at a moderate price, a quantity might be inclosed within the buoy, sufficient to last soverel weeks, if not mouths.
"Such a light would burn without the necessity of trimming, but it would require mechanism to light it each avening, and to put it 'out each morning. Such mechanism already exists in many of our public clocks. If it is thought desirsble, too, that it should occult, so as to indicate its number, the plan already described might be applied. Thus the buoy would contain two pieces of mechaniam. The only remaining diffeulty would be the neoessity of visiting the light frequently in order to wind up the two instruments. Thio might probably be removed by having within the inoy a heavy pendulum, or perhaps two such, swlnging at right angles to each other. "If the perpendicular inotion of the buoy could be secured, then the winding np pendulums must be maintained horisontally by meens of a powerful spring. These, by the action of the waves, wonid be continualiy whading up the springs
which drive the mechanlsm. This might be so arranged that it would naver over-wind tham. Spirite of turpentiae, benzole, and several other compounds, assume a gaseous state at very low temperatures. 'If the ond of a tolerably thick rod of metal is hested by the flame of the lamp, and the other end conducts the heat to the bottom of the fluid, it is sufficient to produce a continuous strean of gas to aupply the burner until thi last drop of the fluid is exhausted. Lamps constructed on this principle have, under varlous names, been in use for several years. If the fluid were sufficiently cheap, ona of these movements might be dispensed with, by allowing the light to burn constantly during the day as well as the night. New forms would be required for such buoys. Probably a columnar form, weighted at the bottom, might give a steadier light amid the fluctuations caused by the waves. These buoys should be attached to their moorings by rings fixed at the centre of resistance.
"Of the Mechanism necessary for Oeculting Lights,The period of time occupied by any occulting light in making a signal is so short that grest accuracy in the wheel-work is not necassary. In light-houses the moving power may be a heavy weight driving a train of wheels. This must terminate in a governor, which presees by springs against the inner side of a hollow cylinder. When the length of the time necessary to indicate the number of the light-house is known, the governor must be so adjusted that some one axis shall revolve in the given time. A cam-wheel must le flxed on this axis, havling its cams and blank spsces an arranged as to lift up the tail of a lever carrying the occultating cylinder at the proper intervals of time. Each tooth of the cam-wheel will cause an occultation of the lamp by the cylinder, which is instantly drawn back by a spring. It is olvious that an axis might be used which moves round in the course of $t w o$, three, or more cycles. In this case, the same system of cams would be repeated an equal number of times in the circumference of the cam-wheel. This plun is suflicient for light-houses which are not inteuded for sigual stations also. When signals are to be uscd, it is better to have a single cam on an axis which revolves once in the time which elapses from the end of one occultation to the end of the next. The effect of this cam will be, hy acting upon a forked lever, to lift up the occulting cylinder. If nothing retain it in that position, the action of the spring on the lever will cause it to descend, and the cylinder, acted on by gravity, will instantly follow. But if an arm is interposed which retains the cylinder, then the forked lever alone will be pulled back by its spring, and the occulting cylinder will remain suspend ${ }^{\circ}$ d until the next turn of the cam-wheel. The suspending arm which was interposed must itself be governed by a cam-wheel, exprassing the number of the light-house.
"When a signal is to be made, an adjustable camwheel is to be set to the proposcd signal, and is to be fixed upon the axis currying the constant number of the light-house. When the proper time arrives for making the signal, it is only nacessary to shift the axis, so that the adjustable cani-wheel shall be moved Into the place occupled by the fixed cam-wheel. The signal will now be made and repeated as often as required, sfter which, the original position of the constant cant-wheal must be restored. It is clear that auy number of adjusting cam-wheels might be prepared for eignals, and put upon the axis at once, so that a series of different signals might be made in a very short time. Lights to mark the depth of water nust have a heavy float connected with them, which, at every foot of its rise or fall, musi. alter the number of occultations made by the colored light. It must, also, at the tarn of the tide, change the color of the light. It is anficient for the present purpose to observe that the meohaniam similar to that hy which a clock strikes different hours, might be employed for
this purpose. . The well in which the flont is plaoed ought to be open to the tida by several amall apertures thil would render the rise or fall of the float more uniform. Trelescopes are used for observing light-houses. Thoy have a amall magnifying power, but a large aper-
ture. It is lmportant that thay should be as short as possible, for taking in a given visual angle. Pooeifly, those conetructed with a lens of rock-crystal might be employed with advantage, but upen this subject, aleo, experiment must be made.

"' The spheroidal form of the earth requires that the height of a light-house tower should increase proportionally to the difference between the earth's radius and the secant of the angle intercepted between the norunal to the spheroidal st the light-house, and the normal at the point of the light's occultation from the view of a distant observer. The effoct of atmospherio refrcction, however, is too considerable to be neglected in estirnating the range of a light, or in computing the height of a tower which is required to give to any light a given range; and we must, therefore, in accordance with the influence of this element, on the one hand, increase the range due to any given height and vice rerad reluce the height required for any given range, which a simple consideration of the form of the globe would sssign.'
"If the distance at which a light of a given height can be seen by a person on a given level be required, it is oniy needful to add togetiser the two numbers in the column of distances corresponding to those in the column of heights, which represent respectively the height of the ouserver's eye and the height of the inntern above the sea. When the height required to render the light visible at a given distance is required, we must first seek for the number corresponding to the height of the observer's eye, and deduct this from the while proposed range of the light, and opposite the remainder, in the column of distances, seek for the corresponding number in the column of heights."

Statiment bhowing the Jncmeabr of Lexs Liohts in Fhaner binee 189. Fuench Lights.

Character of Ilgbt.

The lights of Algiers and the colonios are not Included in this list. An iniporfect list of theso, up to the letest dales may be found in Porm's Yearly Journal of Trade. Several important itghts have been erected in Aigters during the past year (1950).

Light-house System $\boldsymbol{f}$ the United States 1856-67.The recommendutions auggested in the Report of 1851, have been generully carried into effect. At the ond of the year $\mathbf{1 8 5 6}$, there were in operation, or neurly finished, in the United States, B09 light-houses, Ilightbonts, ete. The following extracts from the Lightheuse Board Report, under date November 1, 18:6, will show ame of the important changes that have recently taken place:
"The general condition of the alds to navigation, at the date of the last report from this office, was such as to ieave but little to be done toward completing the systematic plan of improvements of authorized alds to navigation along the coasta heyond the general routine duties of renovating and repairing existing structures, and of providing those aids for which appropriations had been then recently made. Tho syatem of buoyage and beaconage liad been carried out as perfectiy, and to as great an extent as the means provided for that object woull admit; and it is believed that bat few locafities are known to exist requiring additionai ailds of that kind. Renovitions and improvements of light-honses and light-vessels, in adilition to the ordinury necessary' repairs, have been made us extensively during the past year as the means provided and the period of time for doing so would permit. A large number of tens illuminating apparatus has been substituted for the old reflectors and fuuntain lamps, to the great benafit and economy of the service. Changes are still being made as rapidly as the lens apparatus is available, having in each case due regard to the condition of the old apparatus in the lighthouses requiring renovation. Now and improved illuminating apparatus has been placed in, or is in course of preparation for, such of the light-vessela as had not been refitted at the date of the last report. All
the alda to navigetion, for which epecial appropriatione have been made, have sither been completed or consmencel, except those condemned as being unnecessary by the proper anthorlty, or thome to the sites of willch perfect titien have not been obtained. The late period of the year at which Congrese made appropriatione at its last regular seseion for new alds to navigation, renrlered it impracticable to commenon many of the works this season; but preliminary etepe have teen taken for commencing those at the north early next apring, and those at the south will be commenced and preeecuted as far as poasible during the ensulng winter.
"The frequent laspections ot the lights by inapectors and othara, the instruction which the keepers have derived from them, and their acquirement of a better $k$ nowlenge of their dutiea, as laid down in the printed instructions and directions, have resulted in a gradual but very perceptible improvement in the character, appearance, and reliability of lights slong the entire comat. Notwithatanding the extraordinary eeverity of the past winter, and the consequent injury done to the buoys and light-vessels by the masses of floating lce on the coast from the capes of Virginia to the eastern boundary, it is believed but little serious inconvenience reaulted to navigation os account of the temporary absence at times of these sids from their proper atations. The buoys which were driven from thair atations were promptly replaced, by meuns of the buoy veasele, from tho duplicates kopt on hand at different points along the coast, and no efforts were spared to bave the light-vessels ropaired and towed by ateamers to their atatious with the least practicalble delay. Sinco the light-vessels have been provided with aervice and spare inoorings of the best description, but few of them have broken adrift from, or left even the mort exposed positions. The suppliea have been distributed to the lights on the Allantic, gulf, and lake consts, hy three supply vessels employed, with as nuch regularity, and as eatisfactorily as could be expected in a service, the succesaful perfurmanee of which depends so much upon the weather. The great diurinution in the quantity of oil required to be delivered at the lights fittad with lens apparatua, will be the means, as the nevr appuratus is substituted for reflectors, of facilitating the operations of making deliveries; and more frequent and regular visits will be made without increasing the number or expense of the eupply-vessels.
"The officer in charge of the light-house service on the Pacific coast was instructed to lose no time in commencing the erection of the light-house at Umpqua, in Oregon Territory, and it is expected, from the urgent instructions from this office, and the zeal and energy of the officer in charge, that it will he buitt as soon us tho necessary materials can be collected at the site. The illuminating apparatus and lantern for that light reached the Pucific const in July last. Instructions were also given to commence the buidding of the light at Now Dungeness, in Washington Territory, and to take tho necessary steps for commencing the one at Cape Flattery and at Blunt's Island with the leant practicable delay. The Indian hostilities in Washington and Oregon Territories, and the difflculties nttending, necessarily, operations ut such distant and sparsely populated localities, will doubtless account for any seeming delay in the execution of these works. In the lakt report from this Board at tention was Invited to the low rate of compensation allowed to light-keepers under the existing law. By the fourth section of the act making appropriations for light-houses, etc., approved May 23, 1828, the Secretary of the Treasury is authorized and empowered to regulate and fix the salaries of the respective kecpers of light-houses in auch i manner as he shall deem just and proper, 'provided the whole sum allowed shall not exceed an average of 400 to each keeper.' The Board wonld again reapectfully renew its recommendation of last year, that a reasonable incrause be made
to the present average rate of compenation to lightkeepers, as the beat means of insuring efficiency and true economy In the care and management of the light-houses on our extended, dangerous, and, in many portions, sparnely populated and inhoapitable coast. The present average rate of compensation to the keepers of light-heuses on the Pacific coast, an established by the appropriation blils, ia $\mathbf{2} 800$ per annum; but the difficulties which have heen met with in obtaining the services of competent and reliable keepers for some of tha 'ighta at isolated, though important points, on that coas., and the frequent resignations of keepers after a short trial of the duties, lead to the opinlon that the main cause of dissatisfaction with the service arises from insufficiency of the compensation in the present state of that part of the country."

The annual report of the United States IIght-house Board, under date of November, 1857, recapitulates tho progress of the work, viz.

The ayst .natic plan for an economical administration of the light-house establishment service, and for Improving and perfecting those aids to navigntion which had been authorized by the different acts of Congress subsequent to the passage of the law of Augast 7, 1789, which enacted "that al" expenses which shall accrue from and after the fifteenth day of Alggat, one thousand seven hualred and elghty-nine, in the necessary auppor, maintenance, and repairs of light-houses, lreacons, huoys, and public piers, erected, placed, or sunk, before the passage of this act, at the eatrance of or within any bay, inlet, harbor, or jort of the Einited States, fur renileriug the na igntion thereof easy and safe, shall be defraycd out of the treasury of the United States," was commencel by this lmard under the direction, orders, and instructions of the honorsble Secretary of the Treasury on the Stli of Octolser, 1852, under the authority of the act of Congreas of $31_{\text {st }}$ August, 1802.

At that time there were $\mathbf{3 2 5} \mathbf{I l}$ ght-houses and lightel beacons, and 38 light-vessels, making an aggregate of 348 light atations and 371 lights of all onders or classes, distributed In the watera and along the coasts of the Athantle, Guif, and northwentern lakes. A few buoys and beacons were placed along be coast and in the bays and harbors of the most prominent sea-ports, without syatem or phan, and often mislesding lnstead of guiting the mariner. There were no lights or other alds to navigation at that time in the t irburs or bays on the I'ucitic coast of the United States. Thero are now on the Atlantic, Gulf, Jake, and Pacific coasts of the United States, B48 light-house and light-vensel st:ations, with an aggregate of 602 lights ; also 31 lights remaining either to be condemmed according to law, or to be built In obedience to the directions of Congress, as soon as valid titles to the sites are ohtained; making, after allowing for all probable sondemnations und the discontlnuance of such as time has ahown to be wholly unnecesaary for the general interests of commerce and navigation, an aggregate of 575 light stations, including light-vessela, ant 627 lights. The tmovage and beaconage, at that tims almoxt entirely neglected, in now, it in believed, umanrpunsed in systematic arrangement, in reliability, and in cconomy (ff adminiat ration. The number of buoys and beacons may be jut down, in round numbers, at mot less than 4500 or $\dot{5000}$, with duplleates (anil at most placea along the coast apare buoys) to repince those to be taken up aach spring and autumn for cleaning and palinting, and to replace thoso removed or destroyed by ice or by storms, and by being ran into and sunk by steamers and other vessels. The entrances to the jinncipal harbora, and ship-channels leauling to them, sre marked by large nun and cau buoys, made chiefly uf iron, which have leen introduced within the last four years. The previous retorts from this office during the last five yearn have infurmed the department and Congress of the extremely Illspidated condition
of the towers and buildings, of the inferior quality of the illuminating appuratus, and of the wasteful expenditures of oll, wicks, chimneys, and other necessary aupplies, owing to the large number of lamps enployed at the difforent IIght-atationa, many of which, with proper llluminating apparatua, would have licurred less thala one-tenth the cost for far more briliant and better adapted lighta. The light-vessels ware found to be $\ln$ a ate of inefficiency, aome of them alisent from their sta:lons for months at a time, without substitutes to occupy thelr places, with an inforior description of lamps, consuming large quantitios of oii without producing anfficiently powerful lights to be seen at the required distances, or an adequate return for the exponse Incurrad.

It will appear that at the time the Light-house Iloarl was organized under the act of August 31, 1852, there were but five lighta at four stations fitted with apparatus that had long before been ahown Incontestabily to be in point of economical effect in no ense less than 4 to 1, as compared with the catadioptric or reflecting light syatem, and in point of power and brilllancy the proportion in percentage was 83 to 16 -that !s, the consumption of oll would not exceed one-fuurth in the now system of what was actually required in the old, and at the aame time the new aystem problucIng for the lenefit of the navigator more than tive times as much light with this one-fourth part of tho oll required for the argand lamps and parabolic reflectors. Ilut even this comparison is too favorable to the state of the light-house establishinent an it existed up to 18:33, inasmuch us the appuratus was not, of its kind, the hest that could be made, nad also from the fact that the great majority of ilghts (those in the hays, sounds, rivers, and harlors) were fitted with a mieh larger number of Jamps than was necessary, even under that system, attributable, however, to the great inferiority of the ajparatus, which, it wouhd seem, it was attempted to remedy ly incrensing the number of lamps at each station. The estimates for 18.33 gave 3093 lamps for thec 331 light stations. Estimating at un averuge of 10 lamps for each new light authorized or huilt since that time, the number of lamps to befed with ofl, to be suppiled with wicks and chimneys, and in projortion to be supplied with the various articies of expensive cleaning materiats, would, under the old aystem, have amomited to the large number of 5560 lamps, repuifing su annual suppiy of not less than $42,2,400$ galtols of oil, computing the consumption at 40 galions per lamp, which is the minimum rate. Tha cost of oll hus been as high as $\% 2$ per gallun at the warehouses of the manufacturer, and has been estimated for the year $1838-59$ at the rate of है1 60 per gallon.

The lights at Southweat Pass and South Pasas of the Missiswippi should be discontinued after the completion of the Southwest Pass terew-pile tower, which was suthorized August 4, 1854, and for which $8.15,000$ was appropriated, leaving about 870,000 to be apiropriated for ita entire completion beforo commencing the work.

The annuai appropi stions for renovations, repairs, ete., of light-houses, within the period referred to, have been employed to the best possiblo advantare in rebuilding auch light-houses as were in inmineut danger of falling to jieces, and, where special appropristhons had not been made for rehullding them, in providing tho neceasary improved and economioral apparatus, flting the lanterns and towers for receiving them, and in placing them; and with those nerabs alone the whole of the light-fouses uxinting in fasuary, 1853, have been provided with new apparatus of the most approved kind, which combines the greatest ad vantages yet diacovered in the scionco of lighthouse illumination-of power, durability, and economy. - See Light-house difourts, $18 i^{3} 3$ to 1805; aiso Culst Surixy Reports.

Lima, the capltal of Pera, on the weat const of South America, lat. $12^{\circ} 2^{\prime} 42^{\prime \prime}$ S., long. $77^{\circ} 7^{\prime} 18^{\prime \prime}$ W. Population varlously estimated ; hut may probwhin amount to from 80,000 to $\mathbf{6 0 , 0 0 0}$. In 1524 , Pizi rro, marching through Peru, was atruck with the beauty of the valley of Rimec, and there he founded a city, and gave it the name of Ciudad de los Reyet, or City of the Kings. This Spanish name it retains in all legal deeds, but 't is better known as Jima. Awful earthquakes occurred here, since nelemnly commemorated liy annual festivals, A.D., 1586, 1630, 1687, and Octulier 28,1746 . In the last it was almost totally destroyed, as well as Callao.

Callao, the pory of Limn, is about six miles west from the latter. The harbor lies to the north of a projecting point of land, in the angle formed by the small uninhabited island of San Lorenzo. Previously to the emanclpation of Peru, and the other ci-devant Spanish provinces In the New World, Limn was the grand entrupót for the trade of all the west ceast of South America: but a considerable portion of the foreign trade of Peru is now carried on through Buenoe Ayres, and the former is also in the habit of importing European goods at secund hand from Valparsise and other ports in Chill. The exports from Ilma consiat jrincipally of silver, which is by far the most important article, conwer ore, berk, soap, Alpaca wool, etc. Goano is found in large quantities on some parts of the const of Peru, but is principally importad from some small islands, opposite to Pisco, where it is found in vast !uantities. The grent value of guane as a manure is now gederally recognized, and it is harilly of less importance as an article of commerce, no fewer than 80,000 tons having leen imported in 1847. It was partly, however, lirought from Chili and other ports, as well as from Peru; but that from the latter is decidelly the best. The importa consist principally of cotton staffa, linens, woolens, and hardware, principally from lingland; silks, hrandy, wine, and quicksilver from Spain and France; stock-fish and fleur from the United States, indlgo from Mexico, Jaragnay herb from laraguay, spices, dyo-atuffs, ete. Timber for the construction of silips and houses is brought from Guayaquil. For :..nneys, weights, and measures, rea Pervy.
Lime (Ger. Kalk; Fr. Chatix; It. Culcina, Colve; $\mathrm{Sp} . \mathrm{Cal}$; lus. Istrest), an earthy aubstance of a whito color, moderately hard, hut whleh is easily renluced to powder, either hy sprinkling it with water or by trituration. It has a hot burning taste, and in some measure corrodes and iestroys the texture of those andmal looties to which It is applied. Specific gravity, $2 \cdot 3$. Calcium, the metallic busis of lime, was discovered by Sir 1I. Wayy. There are few parts of the Forld in which ime does not exist. It is fi und purest in limestone, marble, aud chalk. None of these suibstances is, however, strietly spoaking, lime; fint they are all casily converted into it liy a weli-known proceas ; that is, ly placing them in kilas or furnnees constructed for the purpose, and keeping them for some time in a whito heat-a process ealled the burning of time.- Trosson's Chemistry. The nse of lime as mortar in lonilding, han jrevaled from the earliest antiquity, and is nearly nuiversal. It is also very extensively uset in this country, and in on inferior degree in some parts of the Continent und of North Anseriea, as a manure to fertilize land. Hut it is a curious fact that the use of lime ns a manure is entlreIf a liuropean practice; and that its employment in that way has never been no mneh as ilreamet of in any part of Aala or Africa. Lime is of mnch importance in the arts, as a flux in the amelting of metals, in the thape of chlorate in heaching, in tanniug, etc. Lime and limestones may be carried and landed coastwine without any custons document whatever. Its conmaption in this country la very great.

Lime (lir. Citronier; Ger. Citrone; Hinil. Neem-
bo), a species of lemon (Citrus medica, var. $\delta$ C.),' which grows in ubundance In most of the West India islands, and is also to be r. ot with in some parta of France, in Spain, Portugal, and throughout India, etc. The lime ls smalier than the lemon, its rind is uaually thinner, and its color, when the fruit arrives at a perfect state of maturity, is a inse bright yellow. It is uncommenly jalcy, and its flavor is eateemed superier to that of the lemon; is is, besides, more acid than the latter, and to a certain degree acrid.

Limeriolk, the principal city of west Ireland, and a parliamentary and mnnicipal borough, river port, and county of itself, anil capital ceunty. Limerick, on an jaland in the Shannen, and on both bankn of that river, haing partiy in county Clare, 50 milea sum the Atlantic, and 25 miles N.N.W. Tipperary, wlth which town it communicales by railroad. Lat. $52^{\circ} 40^{\prime} \mathrm{N}$. , long. $8^{\circ}$ '5' W. Area of horder, 70,000 acres. Popalation 1851, 55,268. Inhabited houses, 5,506. Population of town. 53,274 . There are numerous flour mills, but manufactoriea are very limited; those of lace and flahhooks are the principal; the trade, consisting of imports of Iritish manufactuies, coal, turf, continental and colenial produce, and of exports of corn, meal, butter, beef, pork, is frent, and still ineressing. Ships of 500 tens unload at the quays, and these of 1000 tons approach withln 5 miles of tha city, which by stemmers on the upper Shannon and by canale, hat also a wuter communication with Dublin.
Lime-tree. Lime-tree, Black Lime-tree, Smoothleaved Lime-tree, 13ass-wood. The Tilia Americana, like the Europesn linden, is rogarded as one of the finest of forest trees, snd when cultivated, proves highiy ornamiental. In our native woods it often riaes more tha, 80 feet in beight, and frequently upward of fowr fect in diametor ; and there is little deubt but, if cultivated, and judiciously treated, it would reach a size little inferier, If not equal, to the Faropean species. Its body is straight, uniform, und rurmounted with an amplo and tufted summit. In winter it is rendily recognized by the rohust appearance of the trunk and branches, and by the dark-lirown color of the lurk on the ahoots.

Grogrophy ond Mistory,-The Tilin Americana is found in Caumila and the northern parts of the United States. It hecomes less abundant toward the south, except on the Alleghanies, where it ls found quite ut their termination in Georgin. It is profusely multiplied on the borders of Jakes Erie, Ontario, nnil ia Naine, Now llampshire, and Vermont. It was culthvated in England by Miller, in 1752, but has not been very extensively distributed. The Tilia Americana lariflora is said to abound from Maryland to Georgia, near the aen-coast. It was intmoluced into IBritain in 1820, and is bu: sparingly cultivated in that country. The Tilia A nericano pubescens belongs to the southern parts of the United States, Florida, Kentucky, and Taxas. It is said to be the only variety found in the marithue parts of Carolina, Georgia, and Florida. Seeds of this tree were carried from this country to Fuyland by Mark Catesby, in 1726; but it does not ajpenr to have been much cultivated. The Tilia Ameritura atba is not met with east of the River Delaware, but it is found in Pennaylvania, Maryland, Delaware, Virginia, Ohio, Kentiecky, and Georgia, It is salil, also, to grow on the Kiver Santec, in South Caroilina, and orthe Misnissippt. It is remarkable, that, ulthongh thls variety was knewn in France in 1755, it ahould not have been latroluced into England till 1811.

Properties and Uses,-The wool of the Alverican lime-tree, when dry, weighs 85 pouads to a cuble foot. It is very white, when grnen, but becomes of a lightbrown hme, when searonel. It is noft, ensily worked, and is often sawed into boards, which do not warp, like those formsd of resineus trees. In the northern parts of the United Stateg, nud in the liritish prov-

## LIN

inces, where the tullp-tree does not abound, it io need for the panels of carriage bodiea, and the seate of chairs. In Kentucky end the western Staten, the wood of the white lime lo often substltuted for that of the white pine. In various parts of the country, it is turned into domestic utensils of vartous kinds; and is also carved Lite frages. for the heads of veesels, and other ornamental work. The young trees are sometimes cut, and employed as ralls for rural ferces; but they are not durable when thus exposed. The wood ls almost useless as fuel, when green, being too full of sap, and of but littie value when dry. The cellular integument of the bark is separated from the epidermis, and, after being macerated la water, is furmed into ropes, after the meaner of making them in Europe, of the other speries. The bark was also employed by the Lennl Lenape Indians for making lines and ropes, as well as for covering their habitations. The outer bark of the Tilia Americama is rough and stringy, and the inner portion viscid, and sweet. The twigs and buds are very glutinous when chewed, and afford considerabla nutriment. In severe winters, when fodder is scame, It is common for the farmers of the British American provinces, as well as those of Malne, New Hampshire, ad Vermont, to drive thoir cattle Into the wools in the morning, and fell a base-wood or other tree, on which they eagerly browse during the day.

The wood of the European lime-tree, or iinden-tree, as compared with that of the oak, the ash, und other timber trees, holds but an inferior rank, and lo only used in such wo.ks ne aro not to be exposed to the alternatione of moisture and dryness. It is of a pale yeilow, or white, close-grainell, soft, light, and smooth; and, when seasoned, It is net llable to be attacked by lnsects. It la used by piano-forte-makern for nound-ing-hoards, and by cablnet-makers for a variety oi purposes, as it does not warp under atmospheric changes. It ls turned into domestle utensils of various kinds, curved into toys, and turned into smali boxes for npothecaries. The most elegant use to which it is appllied, is for carving, for which it is superior to every other wood. Many of the fine carvings in Win-lnor Castle, Trinity College Lilbrary, at Cumbridge, and in the Duke of Devonshire's mansion, at Chatworth, nre of thia wood. It in eaid to mako excellent charcoal for gunpowiler, even beticr than alder, and nearly $a_{s}$ good as hazel, or willow. Ilaskets and cradles were sormerly made from the twigs; and shoomakers and glovers are said to prefer pianks of limetree for cutting the finer kinds of leather upon. The leaves of this treo are collseted in Sweden, Norway, Carniola, and Switzeriand, for feedling cattle; though, in Swellen, Linnues eays, they communicate a bad flavor to the milk of cows. One of the most important ases of the lime-tree, in the north of liatupe, is that of supplying material for making ropes and mats ; the lntter of which enter extensively into European commerce. The Russian peasants weave the bark of the young shoots for the nuper partin of their shoes, the bark of the trunks or large liranches rerving for the soles ; and they also make of it, tied together with strips of the inner bark, baskets and loxes for domesthe purposes. The outer bark of odd truen also nilpplies them, like that of the birch, with tiles for covering thelr cottager. Ropes aro still made of the lark of this tree In Cornwall, and in some parts of Devonwhire. The manufacture of mata from the inner bark, however ln now chletly confined to lluassia, pind to pome pais of Sweilen. 'Trees from alx to twelve inches in diameter are melected at the beginning of summer, when, from the expansion produred from the ascendlnge mep, the bark parts freely from the weot. The bark is then stripied from thein in lengtlus of six to elght feet, and is afterwarl stecped In water till it meparates freely in layers. It in then taken out, and divhled into ribbons or strands, und hung up in the
shade, generally in the forest where it grows, and; in the course of the summer, is manufactured into mats, $s 0$ much in use by gardeners and upholsterers, and for covering packages generally. The fishermen of Swe den make nets for catching flish, of the fibres of the Inner bark, separated by maceration, so as to form a kind of flax or hemp ; and the sinepherds of Carnlola weave a coarse cloth of it, which eerves for their ordlnary clothing. The sap of the lime-tree, drawn off in apring, and evapornted, affords a considerable quantity of augar. The honey producod from the flowers is considered euperior to all nther kinds for its dellicacy; aelling for three or four times the price of common honey; and it is used in the proparation of medicine and for making particular liqueurs, more especislly rosoglia. This llme-tree boney is only produced at the little town of Kowno, on the River Nlemen, in Lithuania, which is surrounded by an extensive forest of lime-trees, and where the management of the honcy. bee oceuples the principal attentlon of the inhabitants. The Jews of Poland produce a close imitstlon of this honey, by bleaching the common klnd In the open air, during frosty weather. The fruit of the lime-tree had long been thought of little use, till M. Missa, of laris, by triturating it, mixed with nome of its وowers, succeeded in procuriag a butter, perfectly resembling chocolate, both in taste and consisteacy ; but, unfortunaieiy, it was found that the lime-tree chocolate would not keep. It has been suggested whether some of the Americsn varieties of tilia would not prove successfal in thls particular. In England, there are many ancient lime-troes, planted in towns, hecause, in olden times, their odor was considered ss purifying to the air, nni to be good against epilepsy,-1]rownf.'s Trees of A merica.
Iline, in Geomotry, a quantity extended in length only without breadth or thickness. It is formed by the finx or motion of a point. Line, in the art of war, is understood as the disposition of an army runged in order of battle with the front extended out so that it may he flanked. Line of battle ls also untlerstood es the disposition of a floet in tho day of engagement; on which occataion the vessele are usually drawn up as much as poasibie in a stralght lino, as well to guin and kerp the advantage of the wind as to run the same board. Horizontal line, in Geograjhy, and Astronomy, a line diswn parallel to the horizon of any part of tho earth. Equinoctial line in Geography is a great circle on the earth's surface exactly at the distance of $90^{\circ}$ frum eseh of the poles, and of consequence bisecting the earth in that part. From this imaginary line the degrees of longitude and latitude are reckoned In Astronomy, the equinoctial line is that cirele which the sun seens to describe round tho earth on the daye of the equinox in March and September. Meridian line, is an Imaginary circle drawn throngh the two poles of the earth and any fart of its surface.

Linan (Ger. Linnen, Lжinvaml; Du. Lymetat: Fr. Tuile; It. Tohr, Punno, lino; Sp. Lienza, Tels de lino Rus. I'hotno), a apacien of cluth made of thread of flax or hemp. The linen manufucture has been prosecuted in lingland fur a very long periol; bat though its progress has been consileruble, particularly of tate years, it lata not been an great as might have been anticipated. This la partly, perhaps, to he useribed to the efforts that have been made to looster op and encourage the manufacture In Ireland and Scotland, and partly to the rapil growth of the cotton manufacure -fabries of cotton having to a considerable extent supplanted those of linen.
linen is a fabrie of very remote antlipuity, l'haranh arrayed Joseph in ventares of the linen,-Gen., xlt. 42. This artiels was tirst manufactared in Fingland by Flemish weavers, under the protertion of Heury III. 125:. Hefore this perion woolen shirts were generally worn. A company of linen weavers catabliwhed Itself in Lomion, 1368, and the art of stain- -

# - 

ing linen became known in 1579. A colony of Scots in the relgn of James I., and other Preabyterians who fled from pereecution in that country in the succeedIng Inglorious reigns, planted themselves in the northesst part of Ireland and there established the linen manufacture. It was liberally encouraged by the lord deputy Wentworth, in 1684. Hemp, flax, linen, thread, and yarn, from Ireland, were permitted to be exported daty free, 1696. This law gave rise to the subsequently improved state of the msnufacture there. The Irish Linen Board was eatablished in 1711; the Liaen-hall, Dublin, was opened, 1728; the Board was abolished in 1828. Danfermline in Fifeshire, Dundee in Anguashire, and Barnsley in Yorkshire, are, in Great Britain, chief eeats of the linen manafacture.
Spinning by the hand is now mearly unknown in Ireland, and the manufacture has disappeared from several parts of the ecrintry, where it had been largely introducea, leaving those who were partially Anpenilent on it for aubsiatence, in a very depressed state. On the whole, however, thero can be no doubt that the introduction of the factory system will be, in the end, most advantageous. Belfsat has long been the great seat of the manufacture in Ireland, and there it is carried on in large factories furnished with the best machinery, and conducted on the most upproved principle. In 1841, there were in the town and its inmediate vicinity, 25 steam mills for spinning linen yarn, one of which employed 800 hands. In 1835, the exports of linen goods from lelfust, amonnted to 53,881 ,000 yards of the value of $£ 2,694,000$. Aecording to the offichal returns, there were in Ireland, in 1838, 40 flax-mills employing in all, 9,017 hands. The total average export of linens from Ireland during the 3 reurs ending with 1825 , was $51,917,413$ yurda, of which $49,031,073$ camo to this country; the exports to all other parts being only $2,916,340$. Since $18 \div 5$, the trade between Ireland and Great Ilritain has been placed on the footing of a coasting trade; and linens being exported and importel without any specifle entry at the custom-house, no accomst is kept of their quantity and value.
Seotch Linen.-In 1727, a Board of 'Trustees was eatablished in Seotland for the suporintendence and improvement of tho linen manufacture. It is not easy to suppose that the institution of this Board could of itself have heen of any material eervice; but conslderable bountics ond premiums being at the same time glven on the production and exportation of limen, the manufacture went on inereasing. Still, howover, it did not lucrease so fust as cotton and some others, which bave not recelved any adventitions support, until machinery bogan to be extensivaly employed in the manufacture; so that it la very doulitful whether the influence of the bounty has beon so great as it would at first sight appear to have been. The regulations us to the munufacture, after haviug beon long ol:jceted to hy those concerned, were atolished in 1822 ; and the bounties have now ceased.
Dandee is the grand seat of the Scoteh linen manufacture; and its progress thero during the last few years has been so extruorlinary, that the following detills in respect to it may not bo unscceptable. The manufaeture appears to lave been introducel into lhundee some thme toward che beginning of last century; but, for a lengthened perioil, its progress was comparatively slow. In 1740 only it tons of thax were linported, withont any hemp; the shipments of linen clath during the same year being estimated at about $1,000,000$ yarls, no mention hoing made either of sall-eloth or bagging. In 1791, the Imports of flax rmennted to 2,444 tons, and those of hemp to 299 tons ; the exports thit year being $7,842,000$ yards linen, $2 \times 0,000$ yards sall-cloth, and 05,000 yards hagging. From this period the trade began to extend itself graduslly, though not rapidly, ['reviously to the peace of 1815 , no great quantity of machinery was ell.
ployed in apinning; but about this period, in consequence, partly and principally, of the improvement of machinery, and lts exte sive introduction into the manufacture, and partly of the greater regularity with which supplies of the raw material were obtained from the Northern powers, the trade begin rapidly to increase. Its progress has, indeed, been quite astonishing ; the imports of flax, and hemp haviag lncreased from about 3000 tons in 1814 to 15,000 tons in 1830 , and 40,000 tons in 1845 , of which at least 30,000 tons were apun by the mills in the town, the rest being epun in the vicinity. The value of the exports of manufuetured goods and yarn, from Dundee, smounts at preeent (1847) to from $£ 1,600,000$ to $£ 1,700,000$, a year.

It is not easy to give any satisfactory explanation of the remarkable progress of the linen manufacturo at Dundec. Something must be ascribed to the conveniont eituation of the pert for obtalning supplies of the raw material ; and moro pe.haps to the manufacture having been long established in the towns and villages of Strathmere, the Carse of Gewrie, and the northern parts of Fife, of which Dundee is the emporium. But theee circuinstances do not seem sdequate to explain the superiority to which she has recently attained in this department; and however unphilosophical it may seem, we to not really know that we can ascribe it to any thing else than a eoncurrenco of fortunate accidents. Nothing, in fact, is so dillicult to explain as the superiority to which certain towns frequently attaia in particular departments of Industry, without apparently possessing any peculiar facilities for carrying them on. Ilut from whatever causes their pre-eminence may arise in the first instanee, it is very difficult, when onee they have sttained it, for others to come into competition with them. They have on their side established connections, workmen of auperior skill and dexterity in manipulation, improved machinery, etc. Recently indeed the advantuges in favor of old establishments have heen, to a considerable extent, neutralized by the prevalenco of combinations among their workmen; but it is to bo hoped that moans may be dovised for obviating this formidable evil.

Talue of Mannficture.-There are no means by which to form an aceurate estimate of the entire value of the linen manufacture of Great lBritain and Ireland. Ir. Colquionn estimates it at $£ 15.000,000$; but there can not he the shadow of a doubt that this estimate was, at the time, nbaurlly exaggerated. In the last edition of this work we estimated the annual value of the manufucture at $£ 7,500,000$. But It has hereased very rapially in the interval, principally through the great extension of the oxports of lirunce, and lte value is at present (18.17) certainly not under, if it do not exceed $£ 10,000,000$ or $£ 12,000,000$. llut taicing it at the former nmeunt, and setting nside a third part of this sum for the value of the raw material, and another thirl for protits, wuges of superintendence, wear and tear of eapital, coal, ete., wo havo $£ 3, a 33,000$ to be divided as wages among those euployod in the manuracture. And supposing esch individial to earn on an averuge $\mathrm{c}_{2} 4$ a year, the total number employed would be about 133,000 . It may be thought, perhaps, that £24 is to low an estimate for wages; and euch, no
doubt, would be the case were not Ircland taken into the average. But as many persona are there employed in the mudufacture at very low wages, we believe that $\Sigma 24$ la not very fur from the mean rate.
The rapld increase In the exports of linen goods and yarn, espeelally the latter, to France (eee for an account of this increase the artlcle HAVRE), though latterly they have declined, is wholly a consequence of their comparative cheapness in this conntry, oceasloned by our auperior and cheaper machinery. And If the French reaily wish to rival us in this department of Industry, they ehould endeavor, by reducing or repealing the oppressive duties on Iron and nuchinery imported into France (which would, of course, proportionally reduce the cost of the spinning-mills and pow-er-loom factories), to place their manufacturers and spinners on something like the sume footing as ours. In this way they might, perhups, have some chance of rivaling us; but the attempts that bave recently been made to bolster ap the manufacture by means of dutien, must necessarily fail, and will have no effect but to perpetuate exploded practices, and to promote the trade of smuggling. The liritish exports of linen goods are also increasing to most other countries, as well as to France; and we are galning on the Germans in most markets that are equally accessille to both. Hence the decrease of late yeurs in the export of linens from Hamburg. The improvement in the manufacture of damaska and table-linen generally, whleh is prinelpally carried on in Dunfermine anid Kirkcally, bas been quite as striking as in the other departments of the trade, especially since the intioduction of the Jacquarl mounting. In fuct, tablelinen is now shippel from this country for Germany ; so that the duty of 10 per cent. on the importation of German damasks and nuch like fabrics might be reduced or repealed without the measure having any injurious lafluence over the manufacturer.

Consumption of Fureign Linens.-Acrording to the returns of the lmports and entries of forelgn linens
for the four years ending with 1844, the consumption of forelgn llness in England ls quite inconsiderable ; the real or declared value of those entered for home ; consamptlon in 1844 conld hardly amount to $£ 40,000$.

Until recently, this manufacture has been neglectod in the United States. Lately, however, mills have been erected to teat the profitablenese of linen manufacture. In Fall River, Mass,y new mills bave been bullt, but not long enough in operation to give any
etatlistles.
Lingeed. The manufacture of linseed oil has greatly Increased within a fow years, encouraging the Importation of seed from Calcutta and other placea. The Imports of linseed into Bonton from Calcutts for the yeur 1856 were $1,387,944$ bushela, valued at \$1,841,719. The imports of linseed into the United States for the year 1856, amounted to 1,606,294 hushosl, of whlch $1,691,875$ bushels were from the East Indies.
By the offletal returne it appears that the imports into the United Kingdoma in 1856 amounted to $1,180,179$ quarters of llinseed, and to 264,919 of rape-seed, showlug a very great increase in both cases as compared with the previous annual arrivals. Annexed are the official returns for the laat 16 years, during which the consumption of the manufactured articles has made rapid atrides.

Liquorice (Ger. Suasholz; Fr. Réglisse, Racine douce; 1t. Regolizia, Logurizia, Liquirizia; Sp. Kegaliz Orozuz), a perennial plunt (Gilycirrhiza glabra), a native of the south of Europe, but cultivated to some extent in Englumi, particularly at Mitcham in Surres: Its root. which is its only valuable part, is long, slender, fibrous, of a yelluw color, anil when fresh very juley. The liquorice growa in Englund is sit for use at the end of 3 yoars ; the roots, when taken up, ure either Iminediately sold to the brewers' druggists, or to common druggiste, by whom they are applied to difforent purposen, or they ure pucked in sums, fike carrots or potatioes, till wanted. The roots of liguorice have heen introduced into the middle und southern States, and huve thus fur lieen successful. Firom the increaning demands for this root, it is probuble that it could tee cultivated profitably. The amount annually imported (and manufactured), is valued at ulx ut $\$ 300$,000.

Liquorice Juice (Sucrus Liquoritir), pupularly black sugery, the Inspissated juice of the roots jusc mentioned. Yery little of this extract is prepareel in lirit. ain, by far the larger part of our supply leing inported from Spala and sicily. The juice oltained by erushing the roots in a mili, and subjecting them to the prens, is slowly hoiled till it becomes of a proper connistency, when it is furmed lato rolls of a considetable thickneas, which are usitully covered with lay leaves. This in the state in which we impert it. Most part of it is afterward redissolved, puritied, and cast into smali eylindrical rolls of abvout the thichness of a goose quill, when it is called refined liquorice. It is then of a glosay black color, brittle, huving a aweet muellaginous tuste. It is used in the materia nedica, particularly in colds, eic.-Trosssos's Chemistry.

Lisbon, the capital of Portugal, sitnated on the north bank of the River Tagus, the observatory of the fort being in lat. $88^{\circ} 42^{\prime} 24^{\prime \prime} \mathrm{N}$., long. $9^{\circ} 5^{\prime} 50^{\prime \prime} \mathrm{W}$. Popalation : aisout 240,000 . The Moore are sald to buve given the name of Lisboa to thls city when they co"qui d it, - ?. 718. It was made the capital of Porturgal by Emanuel, 1506. Lishon was almost deatroyed by an earthquake, November 1, 1755. See Earthquakes. It became a point of the late war, and the court fled to the Brazils, November, 1807, in which month (the 80th) the French army under Junot entered Lisbon, and held possesalon of it until the battle of Vimeira, In which they were defeated hy the British, under Sir Arthur Wellesley, August 21, 1808. Insurrection at Lisbon, August 21, 1881. Massacre at Lisbon, June 9, 1884. See Portvonl.
Port.-The harbor, or rather road, of Lisbon is one of the finest ln the world, and the quays are at once cosvenient and beantiful. Fort St. Jullan marks the northern entrance of the Tagus. It is bullt on a steep projecting rock. There is a light-house in the centre, 120 teet sbove the level of the sea. At the mouth of the Tagus are two large banks, called the North and South Cachops. There are two channels for entering the river; the nurth or little, and the south or great channel, exhibited in the ordinary charts. On the middle of the South Cachop, abont $1 \frac{1}{2}$ miles from Fort St. Julian, is the Bugio fort and lighthouse, the latter being 66 feet in height. The least depth of water in the north channel on the bar is 4 fathoms, and in the south, 6. The only dangar in ontering the port arises from the strength of the the; the ebb running down at the rate of 7 miles an hour; and after heavy rains, when there is a great deal of fresh water in the river, the difficulty of entering is considerably angmented. When at such periods, there is s strong wind from tho sea, there is a complete break all over the bar; vessels moor up and down the river with open hawee to the southward. In gome parts they may come within 200 yards of the shore, being guided by the depth of water, which, from nearly 20 fathens in mid-channel, ehoals gradusily to the edge.

Trude, etc.-Lisbon is one of the best situated commercial cities of Europe. But notwithatanding this circumstance, the excellence of the port, and the command of the nevigation of the "agus, her commerce is comparatively trifling. Lisbon has a royal manufactory of fire-arms and powder, and a csninon foundery ; other manufactories comprise silks, parceiain, paper, noap, jewelry, and trinkets ; none of these, except the inst, is in a flourishing state. The despotism, intolersnce, and Imbecility of the goveremont have weighed down all the energles of the nation. The law and $p$ lice theing alike bad, there is no adoquato security. Assassination is very frequent. Induatry of sil sorts is, in consequence, paralyzed ; and alnce the independence of Brazil, commerce has rapidly decliced. Formeriy I.lsion had about $\mathbf{4 0 0} \mathrm{ships}$, of from 300 to 500 tons burden, employed In the trade with South Americu. But at present tisere are not above 50 ships belonging to the port enginged In foreign trade; and, of these, the average burten tioes not exceed 150 tens! The produce of Portugal ment to foreign countries, is almoat entirely conveyed to its destination $\ln$ forelgn ships. The trale between Ilstwa and Cork, is, we believe, the only except' in to this; it being principally carried on in l'ort' \&uese ressels, which take salt from St. Ubes, and bring lonek botter in return. About 200 small craft belong io the city, which are exclusively employed in the coasting trade. There are neither price currenta, shipping lists, nor official returna of any kind, published In Lisbon. The priacipal exports are lemons and orangeswhich, however, are very Inferior to thoee of Spain; wine, particularly Llston and Calcavella ; wool, oil, tanned hidea, woolen caps, vinegar, salt, cork, eto.

Besides colonial produce, the principal imports consist of cotton, woolen, and linen gooda; hardware, earthenware, drled fish, butter, corn, cheese, timoer and deals, hemp, etc.

Mfoney.-Accounts are kept in rees, 1000 of which $=1$ milree. In the notation of accounts the milrees are separated from the rees by a crossed cypher ( $\theta$ ), and the milrees from the millions by a colon: thus, Rs. 2:700 $\theta 500 \Rightarrow 2,700$ milrees and 500 reea. The erur sado of exchange, or old crusado $=400$ rees; the new crusado $=480$ rees; the testoon $=100$ rees; and the vinten or vintem=20 rees. The gold piece of 6,400 rees $=35 \mathrm{5}$. 11d. sterling ; the gold crusado $=2 \mathrm{~s}, ~ 8 \mathrm{~d}$; and the mifree, valued $\ln$ gold $=67 \frac{1}{2} \mathrm{~d}$. sterling. It appeare, however, from assays made st the London mint, in 1812, on modern eilver crusadon, that the average value of the milree $\ln$ silver may be estimated at 60 d . or 5 s . sterling. Weights and Measures.-The commerclal weights are, 8 ounces $=1$ maro; 2 marcs $=1$ pound or arratel ; 22 pounds $=1$ arroba ; 4 arrobas $=1$ quintal; 100 lbs , or arrstels of Portugal $=101 \cdot 19$ lbs. avoirdupois $=45 \cdot 895$ kilogrammes $=9 \pm \cdot 761 \mathrm{lbs}$ of Hamburg $=92 \cdot 918$ lbe, of Amsterlsm. The principal measnre for corn, salt, etc., is the moyo divided into 15 fanegas, 30 alquí́res, 240 quartos, 480 selemis, etc. The moyo $=23.03$ Winchester hushels. The princlpal liquid measure is the almude, divided into 2 potes, 12 canadus, or 48 quartellos; 18 almudes $=1$ baril; 26 almudes $=1$ pipe; 52 almudes $=1$ tonelada. The almude $=4 \cdot 37$ English wine gallons; snd the tonejada $=227 \frac{1}{3}$ ditto. A plpe of Lisbon is estimated by the custom-house (Britlsh) at 140 gallons; and this plpe is supposed to be 31 alnudes. A pipe of port is 160 galtons, divided into 21 almudes ot Oporto.. Of measures of length, 2 pes $=3$ palmos $=1$ covado, or cubit; 19 covados $=1$ vara; 2 varus $=1$ branga. The pe or foot $=12 \cdot 9 \cdot 4$ English inches ; 100 feet of Portugal= 107.8 English feet; the vara=.43.2 English inches. For freight a last is reckoned at 4 pipes of oil or wine, 4 chests of sugar, 4000 lbs . of tobscco, $8,600 \mathrm{lbs}$ of shumac. Bat from one place In Portugab to another, a tonelads is reckoned at 52 ulmudes of liquld, or 54 almuiles of dry goods. Coffee is solit per arraba; cotton, indigo, and pepper, per lb. ; oll, per almude; wine, per pipe; corn, per alquiere; salt, per mojra Grain, seed, tish, wool, and timber aro sold on board. Weights and long ineasures are the came throughont Portugal; but there ls a great discrepancy in the measures of capacity. The slmude and alquiére, at the principal places, are in English measures as follows: Lisbon almude $=5.37$ gals. Engligh wine measure; Lisbon alıjuiére $\Rightarrow 3-07$ gals. Winchester measure; Oporto aimude $=6 \frac{5}{5} \mathrm{~g}^{2} \mathrm{l}_{\mathrm{s}}$. wine measure; Oporto alquiére $=37$ gals. Wbichester measu:e ; Faro ailmude $=$ $4 \frac{1}{4}$ gals. wine uneasure ; Faro alquióre $=34$ gals. Winchester measure; HIguiera shnude $=5$ g gals. Wine meusure; Figuiora alquere=-34 gals. Winchester measure; Vianna aimude $=6 \frac{1}{2}$ gals. wine measure; Vianua alquiére $=37$ gals. Wlnchester measure.

Bunk of Lisbon.-1'his establishment was founded in 1822. Its capital conslsts of about $£ 700,000$ ster ling, divided into 7000 shares. The ahareholders are not linble beyond the amount of their shares. The tank discounts bills not having more than 3 months to run, ut 5 per cent. Its dividends, at an average of the 3 years ending with 1831 , wero about 6 per cent. It eajoys the singular but valuabie privilege of haviut its ciaims on all estates pald off in full, provided the entate amounts to so much; other creditors being obiged to content thenselves with a division of the residue, if there be any.

Port regulations.-Ail vessels ontering the Tagus are obliged to come to anchor off lielem Castle, where there is an office at which they must be entered, their cargoes declared, from whence they come, and whether the cargo be Intended to bo landed In Lision or not: If not, the mater appliea for "franquic," that is, for
loave to remain 8 days in the port for the parpose of disposing of the cafgo or of departing with ito is Two custom-hause officers are then eent on board; and if the cargo is to be discharged at Lisbon, the vesmel proceeds to the custom-house, when ishe mastor makes ontry, delivering the manifest and bilis of ladiag attached to the certificate of the Portnguese conanl, at the port of lading, in order to identify the cargo. The officers put on board at Belem are then relieved by two others, who remain until the veasel be diacharged and visited by the custom-house searcher, The port dues have to be paid in different affices; but the vessel is not aubject to any other chargea.
All goods sent on board for exportation muat be accompanied by a permit from the custom-house. When the cleurances are obtained, the papers are presented by the master, or the ship's agent, to the authoritien at Belem, wha deliver the signal the vensel is to hoist when going to sea.
There is no regular warehousing and bonding system at Lisbon. All imported dry goods are allowed to remain In the cuatom-honee atores 2 years, and liquide 6 months, without being charged warehouse reat, provided thoy are Intended for coneumption, and pay the duties accordingiy. But if, after that period, they are then taken ont to be exported, they are charged 2 par cent. duty.

Pout Charges.-On a foreign ship of 300 tuns entering the port of Lision, with a general or mixed cargo, and clearing out with the same:

Total. . $\qquad$ $66,260=511$ fa, Och.
Vessels coming with a cargo, or in ballast, and departing in ballast, pay 200 rees per ton lighte, or 4 times as much as if thry sailed with cargoes. Vessels coming with seargo, and sailing with the same carge, fay no tonnage duty.

Commision-T The ordinary rates of commisaion are, on the sale of goods, $2 \frac{1}{2}$ per cent.; del credere, 21 pur cent.; on the value of goois laniled from a vessel putLing in to offect repaira, I per cent. ; on ship's disbursements, 5 per cent.

Inarumaces are effected to $n$ trifling amennt. There is one national company for effecting insurances ; but it enjoy. littie credit.

Tares are not regulated ly any certain rule. Those allowed are generaity those invoiced or marked on the packaye. See Annuaire du Commerce Maritime, p. 290 ; Kelly'm Cambiat ; Connula' Anarera to Circular Querime, etc.

Litharge (Ger. Giotte, Glatte; Du. tielit; Fr. Litharge; It. Litargirio; Sp. Almartaga, Litorjirio; Rus. (ilet; Jat. lithurgyrium), an oxyd of lead in an injerfect atate of vitrification. Most of the lead nuet with in commerce contains silver, from a few grains to 20 ounces or more in the fodder: when the quantity is aufficient to pay the expense of separation, it ia refined; that is, the metal is exjosed to a high heat, paseing at the samie the a current of air over the aurface: the lead is this oxydised and converted into litharge, while the ellver, remaining unctanged, is collected at the end of the process.- Tuomsun's Chem. istry. litharge is used for varions purposes in the arts, by poters, giass makers, palutern, etc.

Litre. The French standard meanure of capacity in the decimal syatem. The itre is a cubir decimetre; that is, a cube, each of the nicke of which are 8.937 English Inches; it contains $61 \cdot 048$ Vinglish cubic inches, and is, therefore, rather lese than our guart.

Four and a half litres are a close approach to the En. glinh Imperial gallow.'
IIVe Onk. Under acts of Congrens, tho Preaident of the United States is authorized to take messurca for the protection of the live oak timber growing on Iands owned by the United States in Florkda and elsewhere Persons cutting or removing live oak. or red cedar, and other timbor belopging, to the United States (without nuthority), are aubject to ismprisonment. for twalve monthe and to a fine: the vessels engaged in auch unlawful rensoval are subject to fore felture, and the captain to a fine of $\$ 1000$. (Act of 1881.) See OAK.

Itiverpool, a borongh of England, in Laucashire, and one of the grenteat commercial towns in the world is eltuate on the Morsey, along whioh it extends for nearly six milea. For five miles of this distance $n$ line or chain of docks rune parallel with the river, and from these docks, at intervals, streets extend at right angles, tolerably direct, to the extremity of the bound. ary. These are crossed by sticets more or less parallel to the river; but dis the town graw up rather suddenly, no great attention was paid to regularity. The boundary line, from where it tonches the river at the south, to it termination at Bootle Uny, embraces a circle of about eight aciles. As yet the extremities are imperfectly filled up, but in some placea the houses extend beyond the line.

History.-Local archmoiogists have boen eager to invest the town with the dignity of a remote antiquity; lint their labors have not heon very successfui. In Doomsday Hook the name does not appear, altheugh sites within its present houndary are montioned. Mr. Picton, in his adınirahie paper on "Ancient Liver. pool," contends that the place mentioned as Smedore must have rejiresented Liverpool, and that Smedone is identical with Smithdown, now one of tho seuthern streets. This, however, is not likely, for Snuithdown was reasote from ancient Liverpool, and un the south side of the Pool, then called Mersey Sea. The name has been a subject of wasatisfying onntention; for ajthough the final ayillable pool is derived frous the locality, lieer is of donhtful origin. In early times the town was called inditforently Lirpool, Litherpool, Lith. pood, and Liferpole. $\boldsymbol{F}$ 'and $v$ were commatable; bat in the most ancient records, the name is written indifferently Lithepol and lithepols. Mir. Muines, in his History of Lierrpool, is disposed to think that lithe must in accepted for sea, anti thas the derivation will be the pool on the eea. Originaliy the place was oniy a muali tishing village; for the Mersey, up to a very recent period, was remarkabie for ita supply of salmon and other fish. The tirst anthontio record of the tonn is found in a charter of Ilenry II., in the year 1173, declaring that the estuary of "the Nersey shall be for ever a jort endowed with all the literties belonging to a purt of tho sea, and that the men of Lyrpul, near to 'Jexteth, may come and go from euch aide of the sen with their ahips and merchandise free and without obstruction." it is supposed that his majeaty in this charter had reference to the conquest of Ireisind; for, not content with the beatowai of a barren privitege, he actnally erected dweilings called turgage houses, the tenants of which were the primitive freemen of l.jverjool. These heuses continued to yieid a rental to the crown up to the time of Fitizabeth, and constituted, to a great extent, the dweilinge of the inhahitants. In 1207 King dohn granted the town a chaster, as fullows: "Know ye, that we have granter to ali our faithfal subjects who have taken burgage housce at Liverjool, that they may have all the litierties nad free customs in the town of Liverpool which uny other free lorough upon the nen has in our territories. And, thorefore, we command you, that, securely and in our prace, you may rome thither to recelve and dwell in our burgage houses; In witness whereuf, we transmit to you these our lettera patent. Witness-simon de

Patestitt, at Winchester, the 28th day of August, in the 9th year of our reign."
The first palpable step 'In advance taken by the town was in the relgn of Charles 1I: "A now world had then been epened to the enterprise of the old; and Liverpool Invited to, lts port such trade as was created by the Infant manafactures of Lancashire, Yorkshire, and Cheshire. As the plantationis in America ficreased, so did the trado of Liverpool; and fiom un eariy period her merchants took a prominent part in the llave-trade. She sent out ships to Africa, conveyed their IFe burdens to "America and the West Indies, and in return brought back to the Mersey the sagar, tobacco, and other prodace of thote regions. The English merchants and ship-ownere had competed successfully with tie Spainlards and Portuguese; but It was not until 1708 that the first 'slaver was' despatched from the Mersey. Having entered on the trade, they moon partleipated largely in It; for, in 1752, 101 Liverpool merchants were engaged in the slave traffic, 185 appertaining to London, and 157 to Bristoi. The number of Liverpool vessels engaged in tie Americun and West India trade was 106, and of these 88 were slavers. In due time this trade greatly lacrensed; ond that it enriched Liverpool may be inferred from the fact that the greater portion of the West Indies belonged to merchants of this place. This trade, however, like every other; wha affected by war. It almost ceased daring thi French war of the 18th century, and the merchant ships unemployed were eateriy converted into prifivateers. "At first the gala was immense; bot subsequently the French predominated, and Liverpool saffered sovereiy by the privateers of the enemy. On tiie return of peace trade was resuned, but not with any accelerated force until the inventions of Arkwight and others created the cotton trade in Laricashire. The war of American Independence had the wont possibie effect on the prosperity of liverpool; and the late war of the French Revoution at first operated most adversely. Still, two circumstances ohviated these bad effecte. The great increase of popuiation and trade in the United States of America created a demund for British manufactures, and these manufactores had neariy all to pass from the Merser, which received in return the raw produce indirectly paid for them. At the close of the war Liverpooi was still advaneing, hat not so rapidly as within the last 25 years. The population of the old horoug; In 1801 was 77,000 ; la 1811, 94,$000 ; \ln 1821,118,003$; in $1831,203,000 ;$ in 18.11 , In the new borough, 286,050; and in 1851, 376,000. The usual rate of increase from 1851 to 1857 will have augmented the population to more than 400,000 , and iatterly it has gone on in aceelerated ratio. l'roof of this is derived from the fact, that the number of new honses erected in 1855 wns 1355 , whitie in 1856 it was 1703.
Trade of the Port.-In 1750 tiverpool bud only 20 salling vessels engaged in the continental trade; now she bas trobie that number, and flects of screw steamers, which constantly visit every port in the Mediterranenn, and render the Mersey a medium of comnunication hetween France, Moliand, leeigium, ani America. The East Indles, too, have been opened to Wiverpool enterprise. Since the nlteration in the Company's eharter, and in the amount of business done in the East, Liverpool stands next to London. Asother trade she has aimest monopoizized-the Australian trade. Her clijper vosseis are admitted to be the finest in the warid, und, in consequence, the emigration to tho antipoies is the largeet from this jort, and the return cargoes the henviest ; for ne eessarily the freights are low, us mare goods r., than come, and cheapness Induces silppers to send their wool hero sather than to London, although London is the principal market. But Liverpool is now cresting a wool market of her own. The first authentic nceount of the number of ressels entering the port dates from

1577; and the following returns indicato at a glance the progress of the trade:

| til: Years. 1. | Vessela, | - Tonnage, | Doek drtios. |
| :---: | :---: | :---: | :---: |
| 1757....... | 1,871 |  | . 298,888 |
| 1780........ | (1) 2,26t |  | 8,628 |
| 1800........ | 4,746 | 450,000 ${ }^{\prime}$ | 28,879 |
| 18204....... | 7,277 | 805,088 | 94,412 |

| 1840......... | 15,998 | 9,445,708 | 178,196 |
| \| 1840......... | 20,457 20,886 | $8,589,807$ $4.890,618$ | 211,748 |
| 1,1600........ | 20,886 | 4,880,618 | 828,801 |

- This id the firat year when goods wero rated as well as shlps.
The custom-house revenue collected in the port wan, in $1855, £ 3,570,844,2 \mathrm{~s} .8 \mathrm{~d}$, and $1856, £ 3,824,177,14 \mathrm{~s}$. 8 d ., showing an increase of $£ 247,848,12 \mathrm{~s}$. The lant quarter, of 1856 exhibits a comparatively further increase of $£ 18,581$ over the correaponding quarter of 1855. The town dues now produce more than $£ 120,000$ a year, and there is another impost calied light-dues, Which produced in $1856 £ 99,965$, agalnst $£ 86,182$ in 1855. These light-ciles go altogether to the Board of Trade, and are disposed of as passing tolls. The greater number of veesels frequenting the port comes from the United States of America; for the great trade of Liverpool is in cotton, and the cotton supplied comes in largest quantities from the southern States of the Union. The foliowing returns will give a correct idea of the progress of this trade. In 1770 there were imported into Liverpool 6037 laggs 3 hales 3 barrele of raw cotton; but since the improvements of Hargreaves and Arkwright in spinning, the trade has greatiy incressed. Thus the importation was, in

In 1856 there were imported into Liverpool $2,028,850$ bnles of cotton. A large trade is carried on in flour, gtaln, and corn. The imports of these in 1856 were: Wheat......qrs 1,870,152 || Flour.....sacks 232,704 Corn....... * 897,407 || ....barrels 1,188,260
Two thirds of ali this came from the United Statee. Tho quantity re-exported is smali. The total sugar impsrtod in 1856 was 76,000 tons, of which 17,840 tons were from the British West Indis plantations, 18,555 from IBengai, and 10,996 from Brazil.

Doeks,--For carrying on a trade so large great facilithes are afforded. In 1715 the first dock was constructed with an area of 81 acres. This anfficed for 42 years; but, at an interval of 18 years, another dock appeared, and within a period of 30 years five additional docks were made. In 1826 the corporation filied up the primitive doek in order to erect the customhouse on lts site. In consequence of this proceeding, and the rapid increase of buiidings, none of the docks run iniand, but ail extend aiong and paraliel with the river. From 1830 to 1842, eigit new docks were opened; and from 1845 to 1852, not less than 14 docks and basins have heen added. The total water space afforled by the docks is 200 neres; and the quays mensure 14 miles in length. The river wall is 5 miles 200 yaris iong; the total area of the dock estate is 712 acres. No other port can present any thing to be compared with the Liverpool Docke. One acrious inconvenience, howevor, is, that running aluug the river wali, they interrupt the approaches to the ferries, and when the gates are open, stop intercourse for a siort time altogether. To remedy thla, an linmense ianding atage, constructed $1, y$ Mr. Cubitt, has theen piaced at St. George's Pier, snd this has not oniy promoted the comfort of passengers, but served as a very popuiar promennde. Another landiug-stage has been constructed, three times the size of the former one, at a ront of $£ 150,000$. Means, too, are under consideration for faclitating approach to the ferries. Until 1826 there were few wareiouses on the dock quays. The warehouses are in general up the town, or at some dis-
tance from the quaye. The inconvenience of this provoked a lively agitation among the merchants, and, through the great exertion of several members of the councll, the Albert Dock was constructed aud surrounded, like St. Katherine's Dock, Londen, hy piles of ponderous warehouses. Stanley Dock has alnce alao been surrounded by warehouses, and the new Wapping Dockn are to have the seme advantage. Extensive as the dock accommodation is, it is ne longer adequate to the wants of the port. Several new docks are projected at the nerth end, on land reclaimed from the bay, ander a certain understanding with the Earl of Derby ; and in 1854 the corporation became purchasera of the Birkenbead Dock and estates for a sum of $51,143,000$. Sut these docks, to be rendered available, will require a further outlay of $\mathbf{£ 8 0 0}$. 0nO. The constitution of the dock management has uudergone some changes. The corporation having been the first projectors and axpporters of the docks, were recognized as trustees of the eatate. Under the act 51.t veorge III. the committee censisted of 21 persens, all members of and appointed by the common council, and this continued until the passing of the act 6th George IV., 1225, whin the dock rate-payers were first difectly repleaentel hy retur.ing 8 niembers to the committee; the cuincil olecting 13, including the chalrman, and the courcil having a veto on the proceedinga. This cont inued until the act of 1851, by which a commitio or 24 Ja appinted-12 by the council and 12 by the dock 1 ate-payers. The committee appoint their own chairnan and deputy-chairman; the chairman being, however, one of the 12 members elected by the coancil. The council have also a veto on the proceedings of the commitece by a majority of two thirde. The care of the port is "'vided between the dock committee and the corporation. The latter constructed the light-house and built the Wallan y embarkment, to prevent the rea encroaching on the district and impairing the channels leading to the river; and the former provide buoys, and a morine surveyor whose duty it is to nute the shifting of the sandbanks, and give notice to the pilots and marlners.

Ship-building.-'There are several eminent shipbuildera in Liverpool, but of late the greater part of tha trade has been in repairiny and in the buidding of iron shipy. There are Ave building-yarda on the lancashire side of the river, and three on the other side. Those on the Cheshire side combite graving with boildhy docks, and, although thare are severni graving docks on the Liverpool aide, they are found to be inadequate to the wants of the port. As milght ine expected, a large trade is oarried on in shipus. In 1856, 694 shipe, of 328,991 tons were sold, and of these one fifth were bought by foreigners. Liverpool is a place of trade rather shan of manufactures, and those manafactures which exist are more for the suinly of local wanta than for general purposea. An atfenist was made to estabiah a cotton inenufactory, but without auccens.

Next to Landon, the corporation of Liverpool is decidedly the richest in the kingdom. At first ber incoms was miserably suall, and centories passed without improving it ; but in 1777 the cor, oration parchased from Lord Slolyneanx, for f2250, his reversion, expectant on the determination of his leaso in the town dues, and these rose gradually from f*n,000 a year to $£ 120,000$. The incolise of the corporation is also derived from band within the town, from markets, and from jolloe rates- tho whole estimated at $\mathcal{E} 38,000$ for 1853. The clain to the town duea bus often been questioned. A case was tried in the Corirt of inhig's leneh in 1831, and deched in favor of the corporation; but in $\mathbf{1 8 5 6}$ governmes: brought in a bill to abolish them. Great resistance being affered, a selert committee was appointed ; If beard evldence, tut made no report. The people of Manshester ore opposed to
these dues, and it in believel thet altimately there must be a compromice. Thu dues consist of small aums, hardly appreciable in amonnt, collected on merchandise. The dock-rates belong to no special in. tereat, being devoted not to deniends, but simply to interest of money borrowed, and the coat of working.

With the increase of trade and wealth, the mode of doing businese underwent a great change. At the beginning of the present century the merchant had his counting-house and warehouse behind his dwellinghouse. These mansions may now be seen in Jisnoveratreet, Duke-street, Seel-street, and othera, bearing atill, in their architecture, evidence of cost and taste, although now mostly devuted to mesner ases. 30 years later the mercantile offices began to gather about the Exchange; mean buildings were transformed lato lordly edifices; and as much as $£ 600$ or £800 a year ls now (1857) pald for a suite of rooms on a single floor. Such rents are, of course, temptations to an Increase of luildings; and in 1856 as much as £47 a square yard has been paid for building-land near the Town-hall. All the opulent classes live in the envircas. Vy to the year 1833 New Brighton vas a sand-nii, without a single temement on it; nor it is covered with rillas. TH villas cover the hills and crowd the gorges, which extend from the Red Nuses :o Ruck Fierry; while on the Lancasbire side, Aighurt,., Allerton, Woolton, Wavertree, Oll Swan, Knotty Ash, West Derby, Walten, Crosky, Litherland, Wuterloo, and Bootlo, have been entirely occupied by the tnansions and villas of the opulent people of Liverpool.

The mer:antile othices which have aprung ap around the Exchange are iemarkabie for thoir nrchitectural beant; as vell as for their convenience. Waterstreet, from ine Town Jhall to George's Dock, presents a succesaion of such buildings. On the site of the old tower, the last remnant of the Castle, have been crected the Trwer Building -a mass of countinghouses, ornamented toward the river by an ftalian tower, now used as a remaphore telegrajp station. Fenwick-street, ut right angles witin Wader-strect, presents a succession of buildings equally beautiful. The Corn Exchange is in Brunswick-strect ; and in the same strect is the Union Bank, a perfect architectural bijou; and a little further on, in James-street, at the top of Fenwick-street, is the North and Sonth Wales Hank, equally entitled to notice. In Custle-street stands the 13ranch Bank of Eagland, constructed by Mr. Coekerell; and in the same strect the Commercial Bank Buildings, crected after Mr. Cunningham's deaign. North John-street, which runs parillel with Cantle-street, is entirely devoted to eflices; and in
 remarkable for boldneas of design, The Customhouse, which rianits at the fort of South-street, was bailt after a fesign of Jolin Foster, at the cost of © $283,80 \%$. Thie estimate was $£ 175,000$; and although the buillin; is an imposiags one in app sarance, it is regarded us not fully naswering ita purposes. In front of it is a bonze statue of Ifaskisson, by Gibson. Purt of the custem-house is used $c$ dock-office, and another fart of it ua the post-offee; for neither af which in the building particularly suita' le. To the eant of the contom-house in th. Suilors' llone, which is dmirably adapted to the intended object of the Marine Board, and for a sailors' téphit.-F. II.

Breabeater fur lifierpoon,-Mr, Georg? Renaie, C. L., has projected for "ue port and harior of liverpool a jetty or lireak water, from tho Black Jowk l'oint, at th, entrance of the Merwy, on the Cheshire shore, ir a line newrly parallel to tide Januashire ehore. Tho breakwate, will tuke is inctli-wester'j direction sud curve outward towarl) the Victoria Channel, scross the llazail andi 13 "'w I lanks, for a listance of upward f three miles, when lt will bow ended by a light-house. Simultanoously with the construction of a breakwater, tt is propesed to continue the line of qualy wall of the

The wester' $j$ direction and toria Channel, scross r a distance of upward - uded by a light-house. uction of a break water, He of quay* wall of the
north docks, in airection curving inward as far as Formby Point, eo as to assimilate the form of the entrasce lato the Mersey to a trumpet's mouth. The advantages proposed by this plan are cald to be: 1 . The general improvement of the entrance into the harbor, by which the flow and obb of the tides will be more regular and more favorable to the deepening and preserving the low water channels, and to their navigation generally. 2. The protection of the north docks (occasionally inacceaslble in otormy weather), and of the Bootle and Formby shores from the violent effects of the prevailing winds. 8. The acquiaition of nearly 2000 acres of valuablo land, which will be inclosed between the new wall and that shore. 4. The ralualie coaveraion of from 80,000 to 40,000 acres of sand-banks now rapidiy aceumulating cand rising above low water, along the whole shore in front of the Lea-
sowes, from the Rock Point to the ontrance of the Dee eatuary at Hilbre Point. 5. The prevention from entering into the barbor of vast quantities of drift sand which come from the North Burbo banks, in south-westerly gales. 6. The prevention of many shipwrecke and loss of lives and property which occur ann illy. 7. The reductlon to a minimum of the great exper ens now incurred in maintaining the llghts, huoy steam-tuge, dredgers, vte., now employed in preserving the direction and depth of the sen channels, and which heavily tax the 40,000 ships and $4,000,000$ of tons carried by them annually. Finally, the preservation and Imprevement of the port and harbor of Liverpool, and which, like its neighbor, the estuary of the Dee, will be entirely ruined if prompt measures be not taken to prevent it. The following table shows the grain trade of Liverpool:
 $1854,15 \$ 5$, AND 1856.

For a full exhibit of the commerce of Great Iritain, a screnty-aghth part of the silver contained in the livre including a statement of that of Liverpool, see articies of Chariemagre. It would then have requirel 7880 Great Britain mad Encland.
IIvie. From nisout the year 800, In the reign of Cbuis nagne, to the year 1103, in that of Philip. I., the French livre, or moncy unit, cuntained exactly a poind weight of twelve ounces (poids de marc) of pure ailiver. It way diviled into 20 sols, each of which, of course, welghed 1-20th part of a pound. This ancient standard was first violated by Philip I., who diminished conshlerably the quantity of pure silver containol in the sols. The examplo, once set, was so weli fultowed up, that in 1180 the livre was reduced to less than a fourth part of its original wolght of pare silver. In aluost cvery sueceeding reign there was a fresth diminution. "La Monnoje," saya Ia Minne, "qui ent la pius précieuso et la julus important des nésures, s chanfe en France presque ansol souvent quo nos habits ont changé de mode." And to auch an extent had the process of degradation been carried, that, at the epoch of the Kevolution, the livre did not contain livres really to axtinguish a debt of 100 livres contructed in the nims or tenth century; and an individual who, in that remote period, had an annual Income of 1000 livres, raa as rich, in respect to money, as thone who, at the Kevolution, enjoyed a revenue of 78,850 livres. (Paucton, Traité des Mésures, Poids, etc., p. 603.) It was not to be expected that degradations orighating in the necessities, the lgnorance, and the rapacity of a long serles of arbitrary princes, should te mule according to any fixed principle. They were sometimes the reault of au increase in the tonominatiga of the coins, but more frequently of a diminution of tie purity of the metal of which they were struck. A degradation of this kind was not eo easily detected; and in order to render its discovery still more difficult, Phlı; of Valois, John, and some other kings, obliged the officers of the mint to swear tn conceal tho fraud, and to endeavor to make the morchanta believe that the eoins were of full value. (afi Blance p. 212.)

Sometimes one apecien of moner was roduced, without any alteration being made in the others. No aooner, however, had the people, in their dealings, mhuifented a prefereace, an they uniformiy did, for the money which had not been reduced, than its circulation was forbidden, or its value brought down to the axme level with the reat. By an enactment of Congress, the commercial value, in the United States, of a livre tournofs of France, is fixed at $18 \frac{1}{y}$ cents.
Inloyd'e, a nnmber of rooms in the Royal Exchange of London, frequented by underwritera, merchante, ship-owners, ahlp and inaurance brokera, and others, chlefly for the purpose of obtaining shipping intelligence, and of traasacting business connected with marins insurance. The principal room is that of the Underwriters, in whioh two enormons ledgers 'lio conetantly open, the one contalaing notices of speakinge, or ships apoken with, and arrivals of vessela at their varlous destinutions; the other recording disaters at sea. All intelligeace is ontered immediately upon its reception, without removing the ledgera from their places, in order that they may at any moment be inapected by those Interested in their contents. At the finner end of the room is an ingenlous plece of mechanism, by means of which the indications of an anemometar and an anomoscope are inacribed every hoar in the $\mathbf{2 4}$, by a couple of pencils, upon a aheet of white paper. The advantage to the underwriter, in the cos:duct of his business, of this information respecting the force and tho direction of the wind, can scarcely be over-eatimated. The underwriters are jersona whe, for a premiam, grant an iudeminity to merchanta againat risks by sea; and they are so called from the custon of writing their names under, or at the foot of the pollcies of huaurance. The method of effecting an insurance at lioyd's is the following: When a broker recelves an order to insure interest to a rertala amount in a particular ship, he writea upon a slip of paper the name of the vensel, the master's name, tho nature of the vorake, the subject to be insured, and its value, and any ozher information which the cireumstances of the case may require. Ho tbea offers the risk to different underwriters until the value of the interest to be insared is exhausted, each underwriter subseriting his name opposite to the amount he engagen to insure, sand all agreeing to accept a uniform premiuns. The insurance js now virtually effected; the stamped poltey being afterward extended frem this slip. This distribution of the risk ameng many individuals is, of course, very conduclve both to the solvency of the underwriter and to the security of the lasured. The number of underwriters is under 200 ; but some idea of the immense aluount of insurance business done at Lleyd'e may be derived from tize fact, that the valuh of the laterest annually insured at the jresent is estimated at about $\{40,000,000$. No person is permitted to trankact businens at Lloyd'a as an underwriter or insurance broker until be shall heve lrees duly' a. itted as a member, and shall have pulil on eatrunce fea. Communicating with the 'inderwritery' Buom is the Chart liowm. Ilere a valuable collection of charta, and shipping intelligeuce as o-iginally receivel, are carefully arranged, so as to be at all times easy of acceas. In this room almo lie, for the use of members, four ledgers, in which the uames of ships are arranged in alphatietical order, each name having under it all tbe Information poasessed regarding the veasel. The Berchanta' Roon is a place of rewort for general news : it is, in fact, a news or reading-roori. The Captuing' Room is employed as an auction-room for sales of ships, etc. Every perwon who enjoya the privilage of freyuentigg Lloyd's pays a fixed annral sulsecription.
The shipping intelligence recelved at Lloyd'b is furnished by agents, who aro appointed for the purposes; and as thare is acarcely a port of any consequence where oue is not resident, their number is very large.

The information which each transmits to head-quar. ters is regular, aceurate, and complete, it is surnished ly moanse of locters, aigned by the agents, nui by meana of the newapapers, and ahipping hista which are published at the vanous porta; the intelligunce thus roceived consisting not only of lists of vesselis which had arrived at and which bad ealled froun the par. cieular porta, togethor with their aecoruplishod and futended voyages, and of casualties which had oecurred at or near the ports, but also of notices of ahipe sjoken with, and of canualtios at soa, furnished by vessels. No salary attsolhes to the office of arent for Lloyd's; the labor involved being amply recompensed hy the husinesa which It commanda, and by the credit which the appointment confers upan its holder as a person of worth and respeetability. The intelligence, besides belag made known to the membera of Lloyd's by meane of the ledgers, of which we have already apoken, ta puthished every afternoon ln Lloydr's Iist for diffusion over the country. The management of Lloyd's lies with the subecrliers, who select a committee from their number for the purpose, called the "Committee for managing the affairs of Lioyise," This committee appoints the agents and the officiuis of the estabilshment. The expenses connpeted with the eatablishment are defrayed ty the fees and unnuai aulscriptlons.

The designation $I$ loyds originated with a person of the name of Lloyd, who kept a coffee-houso in At chureh Lane, Lombard-atreet. From the vicinity of this house to the Old loyal Exelunge, it speedily hecame a rendezvous of merchants for news, and for the transaction of business. It was afterward removed to Pope'a Heail Alley, and theneo again, in 1774, to ti: Royal Exchange. After the dentruction of the Exchange, in 1838, by fire, which origisuted in Lloyd's, the bnilness was carried on in the South Sea llonse, in Old Broad-street, where it remained natil the ojening of the present loyal Exichange, in 18.14, when it was thally removed to tos present splendid apartments. Similar catablisbments exist in our principal sea-ports. Idoy Is Riggister of British aud Forcign shippint , a volume published annually, and furnishing information resirecting the nature of vesseis, their class, place where hailt, materiala, owners, captuins, age, repuirs, ete. The ehips are registered according to the rejorts of salaried Rgents, appointed at various portn. The offce of thls Register is in White Lion Court, Cornhill, and is quite diatinet from Lioyd's of the Exchange.-E. 13.
Loadatcne (Ger. Magnet; Du. Magneet; Fir. Aimant ; It. C'alamita; Sp. Iman ; Rus. IJgnit; Lat. Magnes). M. Hany observes, that the ores in which the iron voncains tine least oxygen without being engaged in other combinations, form natural magnets; and he calls the bodstones of commerce, which are found in considerahle masses in Germany, Sweden, Nerway, Spain, Italy, China, Sism, the Philippine Isles, Corsica, and Vthiopia, oxyduluted iron. The loadstone is characterized by the following properties: A very atrung action on the magiefic needilo. Spieclice gravity $4 \cdot 215 \pi$; not ductile ; of a dark gray color, with a metallic lustre; primitive forna, the regular vetahedron; insoluble in nitric acid. This singular subatance was knowu to the anceisats; and they had remarked its pecaliar property of attracting; iron; but it does not appear that they were acquaninted with the wonderful property which it also has of turniug to the jole when suspended, and left at ibiberty to inove frecly. Upou this remarkalise circunutance the mariners compans depeads-an instrument which gives us ruch intaite advantage over the anclents. It is this which enables the mariner to conduct his vessel throu,h vast oceans out of the aight of lund, in any given direction; and this lifective property also gaides the miuer in subterranean excavations, end the traveler through deserts otherwise impassable. has also the qualfty of communicating its properties to iron and atecl ; and when pleces of ateel properly propared are touched, as It is called, by the loadstone, theyare denominated artificial magneta. ${ }^{\text {en }}$ See Compans. Its virtues were but indintinctly known to the anclents, yet its attractive quality had been taken notice of from very remote times.-Sturmius. Aristotle assures as that Thales made mention of It, and IIppocrates apeaks of it under the naine of atone that attracta iron; and Pliny was atruck with its attractive power. The, polar attraction of the loadatone whe, it is enld, known in Prance before A. w. 1180; but thls honor la accorded to Roger Bacon about 1267, The Italians discovered that it could communleate its virtues to ateel or Iron; and Flavio Giojo, of Amalf, was the inventor of the mariners' compass,-Hoydn.

Loank. Those for the service of the crown of England were generally bormowed at Antwerp untll after the reign of Elizabeth. " In 1559, the queen borrowed $\mathbf{~} 2000,000$ of the elty of Antwerp, to enable her to reform her own coln, and Sir Thomas Gresham and the city of London joined in the security.-Rapin. The amount of the English loans, during four late momorable periods, was, viz. :

> Sevea years' war, 1755-1768............. $2 x 2,100,000$
> Anericaa war, t76-1784. $75,500,000$
> French hevolntionary war, $1798-1802 . .$. 169,500,060
> War agalnat Boaaparte, $1808-181$ t ..... 209,800,000

Beshles the property tax. In 1818 were raised two loans of $21,000,000$ and $22,000,000$; and it deserves to be recorled, that a subacription loar. to carry the war agalnst France was flled up in London In 15 hours and 20 minutes, to the amount of $£ 18,000,000$, December 5, 1796.
Lobos, or Beal Islande, two gronps of guano islands in tho Pacitic Gcear, lying off the coast of $\mathrm{Pe}-$ ru. The landward and horthern group are about 20 milea west of the main land, in S. Int. $6^{\circ} 29^{\prime}, \mathrm{W}$. long. $80^{\circ} 53^{\prime}$, and consist of one large Island, 5 miles long by 2 in breadth, with severnl rocky inlets. The seaward group lie nbout 38 miles from the main land, in S. lat. $6^{\circ} 56^{\prime}$, W. long. $80^{\circ} 85^{\prime}$, and consist of two istands of abrut the same size, viz., 1 mile long by 1 in breadth, and separated from each other by a narrow channel. Hoth belong to Pert, although nnauceensful attempta havo been made at various times by private companies to obtain posseasion of them. On the north group there la estimated to be a deposit of guano of ahoat 460,000 tone, and on the other istands of more than 200,000 tons. The only linhablanta are those employed in the shipment of the manure, and consisting chietty of Indians and Chlnese.
Lobster (Fr. Ecrrvisse ; Lat. Cancer), a fish of the crab species. The Scilly Ialands and the Land's End abound in lnbsters, as well as several places on the Scotch shores, particularly about Montrose. But the principal lobster Hishery is on the coast of Norway; whence it is believed nisont $1,000,000$ lobsters are annusily imported into London. Those of ITeligoland are, however, esteemed the beat; they are of a deeper black color, and their flesh is tirmer than those brought from Norway.

## Losh. The Scotch term for lake, which see.

Lock, in Internal Navigation, Is a part of a canal included between two floolgates, by means of which a vessel is transferred from a higher to a lower level, or from a lower to a higher.
Lonk, Locks (Ger. Schldeser; Du. Sloten; Fr. Servures; It. Serviture: Sp. Cermadzras, Cermijos ; Rus, Somki), a well-known instrument, of which there are Infinite varieties. A great deal of art and delicacy is sometimes displayed in contriving and varying the wards, springs, bolts, eto., and adjusting them to the places whero they are to be nsed, and to the occasions of using them. From the varioue atructure of locks, acenmmodated to their different intentione, they wequire various names, as stock locks, spring locke,
padlocks, otc: The grand difficulty to be overcome in maklag a lock is to construet it so that it may not bo opened hy any koy exoept its own, nor admitt of being pleked ; it abould also be poseossed of sufficient strength and durability, and not be too complex. © Many ingenlous contrivanoes heve been proposed for the attainment of the desired security-several of whloh are poseensed of conalderable merlt. Common door-locks are now maually inserted in the wood, insteud of being, as formorly, ecrewed to lt; and when so placod are called mortise looks.

Cocoust-tree. 'The Robina peeudacacia, or common locust, from the valuable properties of its wood; and the beauty of its foliage and flowers, ranke amons the firat trees of the American foreats. In favorable situations, it attains a height of 80 or 90 feet, and sometines exceede four feet in diameter; but ordinarily, it doee not surpass half of these dlmensions. On the trunks and large limbs of old trees, the bark is very thick, and deeply furrowed, but on young trees, net more than two or three Inches in diameter, it is armed with strong, hooked prickles, which disappear altogether as they grow old; end in some varieties they are wanting even when young.

The common looust naturally abounds in the country weat of the Alleghanles, as far as Arkansas, It is also plentiful in the Canadas, but is not found indigenous In the United States eant of the river Delsware, nor does it grow epontancously in the maritime parte of the middle and southern States, within the diatance of 50 to 100 iniles from the sea. It is planted, however, for purpoees of utility and ornament, from Maine to Georgia. It was observed by Michaux, that "the locust forms a much smaller portion of the American foreats than the oaks and walnata, and that it la nowhere found occupying tracts, even of a few acres exclusively." Hence the tree, whers it is met with, is often spared by settlers, as being ornamental, and comparatively rare, and old specimens, which formerly belonged to the abo iginal foresta, ure frequently seen growing in the midst of cultivated fields.

Of all Amerlcan trees that have been cultivated in Europe thero is no one, of which so much has been said and done, as the locust. It was among the first plants that were carried to that country, and it has been more extensively propagated than any other, both in Britain and in France, where it has been alteraately extolled and neglected; and even at the present day, though the beauty of its foliage and flowere is unlversally admired, and the valuable properties have enthusiastically been praised and acknowledged, it in not considered as holding a high rank as a timbertree, or as being generally planted with a view to profit.
The wood of the locust, which is commonly of u greenish-yellow color, marked with brown veing, is very hard, compact, and suseeptible of a brilliant polisin. It possesses great strength, with but little elastioity ; and its most valuable property is that of resisting decay longer than almost any other epecies of wood. When newly eut, it weighs 63 pounds 3 onnces to a cubio foot; half dry, $56 t$ pounds, and when quite dry; only $48 t$ pounds, or according to others, only 46 pounds. According to M. Hartig, the German dendrologiat, its value for fuel, when compared with that of the beceh (Fagus sylvatica), is ns 12 to 15 . For duration, he places it next below the pak (Quercus robur), and next above the laroh (Larix europrea), and the Scotch pine (Pinus sylvestris). Barlow, in Wither's Treatise, gives the strength of locust timber, as compared with other wools, as follows :--Teak (Tectosa grandis), 2462 ; Ash (Fruxinus excelsior), 2026 ; Loeust (Rubina pseudacacia), 1867; Oak (Quercus robur), 1672; Beech (f'agus sylvatica), 1\%56; Norway spar (Abies excelsa), 1474; Higs fir (Pinus sylvestris rigensis), 1108; Elm (Ulmus campestris), 1018. From some experlments made at Brest, ia 1823, the weight of the lo-
cuat wood was fomnd to be one alxth heevier then that of the Fingliah oak; lte atrougth as 1427 to 820; and Ite elanticity m 21 to 9 . By experimente made in the yard of the royal naval college, at Woolwich, It oppears that the lateral atreagth of the locuat timber, In realinting fracture, la greater than that of the British oak, In the proportion of 100 to 76 . From all these experiments, however widely they may differ in their resulta, we may arfely oonclinde, that mound, wellsemaned loctat tluber "is hesvier, harder, stronger, more righl, more elastle, and tougher than that of the best linglish oak," and consequently is mope suitable for trenaile. Miehanx remarks that, "If the trunka of the loenatitrees grown in the north of Fennaylvaisa, exceed 15 mohea m diameter, when they are cut down and aplit open, they are frequently found to be decayed at the heart ; lut that this is not the case with trees that have grown further nouth ;" which would tend to show that a poor soil and a coid elimate are not sufficient to proiluce good timber.

There are, at least, three popular varieties of the common locupt, distingulahable by the color of the heart-wood, whieh may be deacribed an follown:

1. Reel locust, with the heart red, and is eateemed an far the most beautiful and durable timber. Foatm of this variety, perfectly neasoned before they are net in the gromd, are estimated to lant 40 years, or twice as long as those of the white locuat.
2. Gireen, or I'ellowe Ioruat,-This is the moat common variety, being known by les greenlah-yellow heart, and is held next leent lin quality to the rod locunt.
3. White Iocwat, wlth a white heart, and ls conoldered an the least valuable of them all.

All of the above-mentioned variation are aupposed to be owing entirely to the soil and altuations in whleh they grow, being caused in a almilar manner an the various colons of the flowere of the hydrangea, whieh depend on the nature of the earth in which they are planted, and even on the color of the water with which they are irrigated.

In naval architecture, the timber of the locust is much enteemed by American shipwrighta, and enters, with the live oak, the white oak, and the red eedar, into the upper and the lower parts of the frames of veasels, thengh in very amall proportion. It la considered an durable as the live oak and the red cedar, with the advantage of being lighter than the former and stronser than the latter. It is used for trenalla in the dockyands of Hurope and the United States, in preference to any other kind of wood ; and instead of decaying, it açulues, in time, an extraonlinary degree of harinean. In civil archlecture, In this country, it enters but little into the composition of housen, on account of its acarcity, and its value in ahip-building, and for posts of rural fencen, etc. When employed in the conitruction of houses, it is more particularly applled for the aupport of the sills, which usually consiat of more dentructible timber, and which, if they were placed immediately on the ground, would sooner deray. From the harduese of the wood when seasoned, the firmness of the grain, and lts luatre when poslished, it han lseen extensively used in cabinet-making, and has been aubstituted by turners for the box-wood, in many nperies of light work, auch as amall domestic wares, tos, ete. It has also been employed by millwrights for $\operatorname{cog}^{\prime \prime}$, but it is lens valuable for thin purpose than thut of the rock-maple.

The mont important use to which the locunt in applled in lbritain, is that of forming trenaila for ahlpfactenings ; and large quantitlea are annually imported into that country from Anerica. As long wa we can supply them for the pricee which they at present bear, It never would repay the erower to cultivate them in England for this syeclal parpues.

In France, the lucurt bae been extensively cultivated in the Girunde, in copses, which are cut at the age of four years, for vine-props; and thone prope are
mald to lant more than 20 years. In tha same dintrict, old treen are pollarded, and their hranchea lopped every third yesr, for the same purpose. In I'urla, many amall articien are made of the wood; auch as salccollars, augatdishea, apoona, forks, sand-boxea, paperknives, etc.

In Lombardy, the wood of the locust is used for many rural purposea, Young plants of it were forin. erly much employed for live fences; bat this practice has long aince been abandoned, because the tree was found to Imporeriah the soil; and, with age, luat lis prickiea ; bealdes, from being continually prunel, to keep It low, or from being cropped by animals, the hedgen became thin and open at the bottom, aisd eventually became more atumps. Italy, well as the aouthern Departmanta of France, Mlehaux cunsidera the countrien in which the greastest aivantages may be cierived from the rapid growth of thala tree. In good solle, in such climater, at the end of 20 or 25 years, he says that a mase of wood may im obtuined from the locust, twice an great as from any other species of tree.

In countriee where clover and root crops are not cultivated, the leaver of the locuat may berve as a subatitute for these articles as provender for unimals. When this apecies is cultivated for this purpose, it ahould be mown every year; or the treea may be allowed to grow to the helght of 8 or 10 feet, and treated as pollarde, the branches being cut off every other year, whlel ahould be done at mld-stummer, when they are nuceulent, and can be dried for winter's use. in performing this operation, one or two shoots should be left on each tree, to keep up vegetation, which may be pruned off the following winter or spring. When the shoote are to be eaten green, none shouki le tiken but those of the same season; because in them the prickles are herbaceous, and, consequeatly, do not lnjure the mouths of the animale.-1 howse's Trees of A merica.

Lofoden Islands, a large group of islands of the north-weat coast of Norway, stretching north-east to suuth-weat from N. lat. $67^{\circ} 30^{\prime}$ to $69^{\circ} 30^{\prime}$, und E . long. $12^{\circ} 16^{\prime} 80^{\prime \prime}$. The group reaemblea the verte. bre of an animal in form ; the lalands fitting into each other so closely, that from a distance they seem to form one long continent. The Island, which are all of a kranite or limestone formation, are precipitura, and very lufty; the hilla of Vaagoe rising almost perpendleularly to a helght of 4000 feet above the nea. The channels whlch separate them are nurrow, toituoun, and generally of great depth. The largext inlands of the group are in the north, viz., Itindoe, Andoe, and Langoe; the first treing separated from the main land by a passage about a mile in width. The tail of the chain is formed of a number of amaller idands, the chief of which are the two Vaagoes, Mouskenüsoe, Viaroe, and Roat, meparated from the main lund by West Fiord. This gulf is much dreaded ly mariners when the wind la south-west, on account of the great swell which rolls in from the North Se: and which is especially dangerous at the Malntroel hannel between Viroe and Moskenosoe. The mean temperature of the group ranges from $23^{\circ}$ in winter to $50^{\circ}$ in summer, which, conslilering the high latitule, is comparatively mild. This is casusel, lowever, by the exprosure of the group to the Gulf Stream. Jarge shoaly of berring and cod frequent the Iofodens annually, und attract to these falands a large concourse of tishing. boatn from several hundreds it miles of searcoast. in the incleusent month of Feliruary and Murch, generally about 3000 boats (montly open) assemble liere for the cod-fishing, each havlag, on an average, five of a crew, while the aggregate number of fish taken ameunts to more than $3,000,000$. These are chiefly dried in tho sun and wind, without asit, and nent to Trousoe, Trondhjem, Bergen, etc., alung with large quantitié of col-liver vil and cod-roe, for exportation or home coneumption. The cod-fielsery ends in April, and is
followe
till the perman. conalles prinelpa are kepi where Steilo, it group, al main lan fodena is 4000.

Natimated population of group, 4000.

Los, an apparatus uaed to measure the rate of a ship's veloclty through the water. For this purpose, there are eeveral Inventiona, hut the one moet generally used is the following, called the common log. It is a plece of thin board, forming the quadrant of a eircle of about 6 inches radlus, and balances by a amall plate of lead, nailed on the olrcular part, so as to awim perpendlcularly $\ln$ the water, with the greater part immersed. The log-llne is fastened to the log by means of two legs, one of which la knotted, through a hole at one corner, while the other is attached to a pln, fixed in a hole at the other corner so an to drew out occasionally. The log-line belng divided into certaln spaces, which are in proportion to an equal nimber of geographical millen, as a half or quarter minuts is to an hour of time, is wound alout a reel. The whole is employed to meanure the ahip's hoad-way in the following manner: the reel belng held by one man, and the half-minute glass by another; the mate of the watch fixes the pin, and throws the log over the atern, which, swimming perpendleularly, feels an Immediate resistance, and is considered as fixed, the line being atackened over the atern to prevent the pln coming ont. The knote are measured from a mark on the line, at the distance of 12 or 15 fathoms from the log. The gless is, therefore, turned the Instant the mark passes over the atern ; and, as soon at the sand In the glass has run out, the line is stopped. The water, then being; on the log, dislodges the pin, so that the board, now presenting only its edps to the water, is cusily drawn aboard. The number of knots and fathoms which had run off at the expiration of the glass, determines the ship's velocity. The half-mlnute glase, and divisions on the line, should be frequently measured, to determine any variation in either of them, and to make allowance uccordingly. If the glasa runs 80 seconds, the distance betwcen the knots should be 50 feet. When it runs more or less, It should therefore be corrected by the following analogy : as 30 is to 50 , 80 is the number of eeconds of the giass to the distance between the knots upon the line. As the heat or moisture of the weather has often a considerghle effect on the glass, so as to make it run elower or faster, it ghould be frequently tried by the vibration of a pendulum. As many accidents attend a ship during s day's sailing, such as the variablenees of winde, the difforeut quantity of aail carried, etc., it will bo necessary to heave the $\log$ at every alteration, and even if no alteration be perceptible, yet it ought to be constantly heaved. The Inventor of this simple but valuable device is not known, and no mention of it occurs till the year 1607, In an East Iudia voyage, published by Purchas.-E. A.

Logarithms, so useful in mathematica, are the indexes of tha ratio of numbers one to another. They were invanted by Barun Merchiston, an eminent Scotchnen (Sir John Napier), In 1614. The method of couputing by meany of marked pieces of lvory, was discovered about the same time, und hence called Napier'a lines. The invention was afterward eompleted by Mr. Brigge, at Oxford.

Log-Board, two boards shutting together liko a book, and divided into several columus, containing the hours of the day and night, the direction of the winds and the course of the ship, with all the naterial
ocenrrences that happen daring the 24 hours, or from noon to noon, together with tha latitude by observatlon. From this tabla the officers work the shlp's way, and complle their jeurnala. The whole being written with chalk, is rubbed out evory day at noon.-F. A.

Log-Bools, a book into which the contente of the log-hoard are dally transeribed at noon, together with any circumstance, deservlog notice, that may happen to the ship, or withiln her cognianace, elthar at sea, or withln a harbor, otc. The lntermediate divislons or watches of a log-book, contalaing 4 hours each, are naually signed by the commanding officer thereof, In ahlps of war, or Buat Indiamen.-E. A.

Iog-Idine, the line which in faotened to the log.
Inogwood (Fr. Bois de Campeche; Ger. Kampeschole ; Du. Campecheout ; Sp. Palo de Compecho), the wood of a tree (IIcomatoxylon Campechianum, LIn.), a natlve of America, and whlch attains the greatest perfection at Campeachy, and in the Weat Indies. It thrive best In a wet soll, with a large proportlon of clay. The logwood-tree ls like the white thorn, but a great deal larger. Tha wood is hard, compact, heavy, and of a deep red color Internally, which it gives out both to water and alcohol. It la an article of great eommercial lmportance, belng extenively used as a dye-wood. It is imported in loge, that are afterward chipped. (The logwood-tree, and the adventures of those that were formerly engaged In cutting it, are dencribed by Dampier; see hls Voyages, vol. Il.; part 2, p. 66, ed. 1729.) We borrow from the learned and able work of Dr. Bancroft, the following curious detalls with respect to the use of logwood: "Logwood seems to have been firet hrought to Wigisnd soon after the acceasion of Queen Elizabeth; but the varioue and beautiful colora dyed from It proved so fugacious, thut a general outcry mgainst its une was soon raised; and an Act of l'urliament was passed lu the 23d year of her relgn, which prohibited ita nse as a dye uniler severe penalties, and not only authorized but directed the burning of it, In whatever hands it might be found within the realm; and though this wood was afterwurd sometimes clandestinely used (under the felgned name of blackwool), it continued anbject to this prohibition for nearly 100 years, or until the passing of the act 13 and 1t Chas. 1 I.; the preamble of which declares, that the Ingenious Industry of modern times hath taught the dyers of Euglanil the art of fixing colors made of logwood, alias blackwood, so as that, by experienco, they are found as lasting as the colors made with any other sort of dyeing toood echaterer ; and on this ground it repeals so much of the statute of Elizabeth as related to logwood, and gives permission to import and use it for iyeing. Probably the solicltuile of the dyers to olstaln this permiseioa, induced them to pretend that their industry liad done much more than it really had, in fixing the colors of logwood; most of which, even at this time, are notoriously deficient in regard to their durability."-Banchozt on Permawent Colors.

Lolre, La (anc. Liger), the longest rivor in France, rlsees at the foot of Gerbier des Joncs, umong the Cevennes Mountains, in the Department of Ardeche, and after a westerly course of $5-10$ miles, falls into the Bay of Hsca:". This river drains a distrlet of Franco nearly equal in extent to one fourth of the entlre kingtom. It becomes navigable at Roanne, and passes the flourishing towns of Orlenns, Blois, 'Tours, Saumur, and Nantee. The navigation is interrupted, however, during four or five months of the year, by frost or thoods. To obviate mone of the difficulties incidental to the navigation of this river, a iateral canal has been formed along a part of its course, extending from the Canal du Centre to the Canal de Briare. The Loire communicates with the Rhone and Seiue by meuns of canuls. The affluents of this river are very numerous and lmportant-many of them navigable. Those on the right are, the Arroux, the Nisvre, the

Maine (formed by the unlon of the Hagenne and the Sarthe) $p$ on the left; the Alliet; the Lolret, the Cher, the Indre, the'Vienwe, the Thout, atad the S3vre-Nantaise. Tr To prevint the Enirn from spreading over the Iowigrounds aleng its course, thas brion banked in by dykeb, built mith above fts ordinary Iovel. These embankmente were naver known to give way previons to the grest floois of 1846. They gave.wuy at the same place during the fearful inundations of June; 1856, casrying away the bridge and vilinge of Savounieres, and inundating the oommunes of la Riche-extrs and La Cha velle-aux-Nanx, casuing a dreadful loes of llfe and property. The meuth of the river is about seven miles wide, measured from Sc . Nazare to Paimbreluf. Ships find great difficuity in taking the nooth of the river, owing to the exposed natnre of its position, and to the numetous sand-banks which traverse it.eve

Iombard, a term anolently used in Ningland for a banker or money-leader." Tha natmo is derived from the Itatian merchants, the great ia drers or money lenders of the middle ages, principaliy from the cities of Lomisandy, whoiare said to hav cettled in london in the midule of the 13th centiar., : : to have trken up their residence in's entreat in t.ae oity which still bears their name. Lomisard weumers were aent to England ty Pope Gregory IX. to lend money tweonvents, communities, and private petsons, who wert not able to puy dewn the centhe which were collected thronghout the kingdom with great rigor that year, 13 Henry III., 12\%9. 'They had officea in Iomisard stroet, which great bankiwg atreet is called after them to this day. Thefr usurionn traneactione enuaed their expulaion from the kingdom in the reign of Blianbeth. Stowe, in his Sturvey of London, bays, "Then have ye Lombarde-street, so celled of the Jongobards and other merchants, strangers of diverse nations, annembling there twlet every day. The meeting of which merchanta there continsed untll the $22 d$ of l)ecember, in the year 1568; on the which day the sald merchants to make their meetings at the Hursse, a place then new bailded for that purpese, in the ward of (Yornhili, and was since, by her mafesty Queen lizizobeth, named the Royal Exchange."

Ioudon (latin, Iondiniun; Freneh, Inomirea; Italian, Lowdra), the metropolis of the British empirn, and one of this greatent cition of ancient or modern timea, is sitaste on both banks of the Thames, about 45 nilion athove its mouth at the Nore, and is trelow the higheat tideway, Though chiefly within then county of Middlerex, I ondon Inelndes partr of Surrey and Kent, and extende into Fierex. St. Paui's, the mont striking cobject in the city, in in lat. $51^{\circ} 30^{\prime} 48^{\prime \prime}$ N., long. $0^{\circ} 5^{\prime} 48^{\prime \prime}$ W. of Greenwici. Its eariy history in loas in obacarity, aidl the first anthentic notice of $t$ existence is that of Tacitus ( $A$ wnol., $\mathbf{i f h}$, xiv., cap. 8), who, in alluding to Jomdinum, usy, "Cognomento quidem colonis non Inalgne, sei eopiâ negrotiatoram et enmmeatnum maxime celebre." The derivation of the name " London," has been the subject of mueh conjectore ; int that mentioned by Pengant (Iondon, p. 17) seoms most frasible, vis., /Iym, in Celtie, a lake, and dim, a town. It could not, howover, have lieen a place of importance at tho period of Julias Comar's invanion, an it is not notlced in his C'ommentaries. About 100 years themafter, the Romany, under Clandiun, took pmesesslon of the city, and ealled it Augasta, in honor of that prince. It was erected inte a grefecture ; and the inhalitanta, nominaliy oldizens of Home, were governed hy Roman laws and Rownn magiotrntes.
Condon was not fortiled at an early periol of the Koman oceupation ; for in A.15, 61, the Britons under Howdeas, moolted, eaptored and buraed the eitr, ar, d musasered the inhabitunts, The eity was soon, ho"over, rebuilt, but is muppoeel to live symeined ogers till the relgn of Cometantinn the Great. From the enabor of eolns of his time found asder the wallis, if
may be inferred that that omperod eonstructed the walle; and it is allogecic that he made London an eplso copal aen. The limite of these walls have been pretty exactly ascertained, $n$, They vommaneed near the site of the present Tower, extended along the Minories and tiack of Houndeditch, nerons Mishopegnte-street, in a strajght line, by London i Well, to.: Oripplegate; thence southwand to Alderagate, proeseding afterward hy the back of Christ's Honpital and OId Newgute, passing behind the aite of Nawgate Prison, and so reaching Ludgater: again proceeding weotward to the IRiver Fleet, and terminating at a fort called afterward Haynard's Castle. "Their' compasu was consleted. by another wall along the hank of the Thames. Extont of the walle from and to the side of the river, 2 miles and 1 furleng ; on the lank, 1 mile and 1-10th; uniform height, 22 feet. Through getes in these wailh, roula led to different parts of the kingdom.' The great Loman Rouda, Watling-atreet and Frmin-street, had their ternini at the London Stune, or Roman sliliari$\mathrm{un}_{\text {, }}$, portion of which still remaine, and is insert.d in the most conspieuous part of St. Swithin's Civurch, abusting on Cannon-atreet. The names of the gates are still 'preserved in eirects, etc., via., Ladgate, Alderagato, Moorgate, Bishopsgate, Aldgste, Newigate, Cripplegate, and Postern Row, on Tower Hili. After the Romans withdrew their forees from England, London suffered severely till the Baxons fixed themseives in the country. It la sald to have become then the capital of the Eust Suxon Kingloms at any rate, it quickly regained ita former importance, and is cailed thy Venerable Bede a "princely town of trade." Soon after the introduction of Christiantity, Old St. Paul's, and St. Peter's at Weatminater, were foondid. When the Saxon monarchien were united in the person of Jiptrert, Iondon becamo the eapital of the conmolidsted kingdom, and auch it has continued to be. in the reign of Alfred it recovered from the effects of the Dunish in vasion, as well as from those of a firs, which nearly coanumed it in 898.
After the battle of Hastings, the eity aubmitted to Wililam, whe granted it a charter, atiii extant; and who oommenced building the 'Tower of loadon in 1078. About this time the capital suffiored severely and frequentiy by fires, especiaily in 1077 and tox6. in the following reigm it was visited by a hurricane and an inundstion; the latter errrying away the tirst wooden hridge over the Thamen. IIenry I. granted a new charter to the city in 1100, reatoring the privileges it enjoyed previous to the Conquest, and eonferring on the eltixens the right of electing their owh magistrates, It is and that this document served as the moxill for Magna Charta. The population in 1141 was estimuted try Petar or llloia at 40,000 . The titie of tho chief ragiatrate was changed by Itenry 11, from i'ortreeve to Dlailiff; and in 1191 he ta catled Lond Mayor, in a document limatid ty the Court of Aligrmen. In 1198 Hichard I, committed the duty of fixing a nutional ntandart of weighte and measures to the sheriffs of London and Midiliesex. John, ly severu: charters, conferred additional fayors on the eity; among uthers, the jurimiliction and eonservation of the Rivers'Thinoes and Mediway; and the power of choosing nheriffs. It 1221 tha tirst atone of the proment Weatminster Abbey was inid ly lienry III. ; and in [2a6 wator was conveyed in inpes from the village of Tybarn to the eity. In 1 Sth and 1270 the city was vivited by famine, and in 1844 by a mpecies of plague, on ali of which oreashous it auffered erievonaly.
Under Eiwawi I. Iondon wos first divilied intu 24 wards, each to choose common councilmen and an aldernan. Fivard II., in 1316, prohilited as a naimance the buraling of eoal, then lately iutroduced, lut his mistake was noon discovered and rectified. Under Wdward III. the elty reoeived ths perpetusi rigit of rungintrueg over Southwark. In 1381 the citizens were alesmad by the insurrection of Wat Tyler, but

This was the era of the firit printing-prese, construcfed and wort nd by Caxton In Weatminiter Abbey; as well as the orection of water aisterae and conduite in st veril parts of the city and suburbs. In the reign of Ilenry VII., a disdise called the " oweating siokness" corried off two mayors and slx aldermen, witn many citizens. Some conalderable improvementa were made in this reign, as well as in that of Henry Villia, to which the auppression of rellgious houae by the lattar masterially contributed; these giving way to achools, hospitala, and charitable inatitutions. .. By the tid of Queen Ellizabeth, the prosperity of I.ondon rapidiy advanced during her reign. The rofugees from the Notheriands introduced zumerous manufactures befors unknown in England, and in this way conferred especial benefits on London.
liy mupe of the time of Elizabeth and James. I.j it may te seen that the ehief part of Loncion then cou sisted of Newgate-street, Cheapside, the Poultry, and Cormhill, and the various streets and alleys leading from theu to the Thanes. Along the Strand, toward Westminster, were houses on both aides-those to the south, and abutting on the river, being the palaces of the chief nobility. The nabias of Saliabury, Norfolk, Buckingham, Arundel, Fseex, etc., have been perpet. uatod in the streets now on the sites of pulaces and gardens formerly belonging to these families. Spring Gardeus formed a series of walka, with bowling green, etc, extending from Charing, Cross toward Whitehall Palace, whence to the Abbey there was reguiar street. On the Surrey side, there were not ten buildings between lambeth and the wast foot of Blackfriars Bridge; but from that poiat a now of houses Was continued to the Borough. Southwark then extended but a short distance along High-atreet; and there were smali scsttered houses from Tuoley-atreet to llorselydown. In the relgn of Jamee I. brick was introluced as a subatitute for wood in L.ond;at houses, on! the streets ware first puved with stones. The city was severely visited by the plague in 1604, and again in the reign of Charles I. Daring the civil ware a majority of the corpontion took part with the Commons, and the city treasury, was of great service to their party.

After the Reatoration London began greatly to revive; but a serious check was given to it by tise last visii of the plague, which raged from June till the end of December, 1665, and destroyed neariy a thiri of the populstion. This was speedily followed by the "Grest Fire," which commencod 2d September, 1666 , lasted four days and nights, and in that tiuse reducer to asbes five sixthe of the whole city within the walls. The ruins covered a space more than a mile long and half a mile broad; and she value of buiddings and goois consumed was eatimated at ten to twelve milHons stering. But though severe at the time, this visitation centributed auaterially to the fiuprovement of the city. It was huilt on a more conmodious plan by Sir Christopher Wren in aiout four yearn. From the time of its re-conatruction, few stirriug eventr occurred. The firat atons of St. Paul'a was lald In 1075 . The revocation of the Bilict of Nanten in 1685 brought to London mauy Freach I'roteatant familien, who peopled Spitailleilis, and introduced the manufacture of silk. The oontinued growth of the eity in the rolgn of Qreen Anue occasioned the act of 1711 for building Afty new chunolics, tha oont leeing paid by a tax on all coals brougit into the Thimse. The atreete ware then first geaerully lighted, fre-enginge were provkded, and meanures taken for watehing the city. In her reign, Ciarkenwell, Old-wtreat, the lower phart of Shore. dteh, Marlborough-atreet, Soho, Bedford-mow, Fed

Lioneagaze, and, a district north of Holbow; wasor
 -In the reign of George I. aome additions ware made to London, chiefly to the north of Oxford-street and: about Berkeloy squave. In the reign of. George II. some nev parishes were erected, yis', St. George's, Bloomabury ; St. Ann'a, Limehouso ; Et. Pau's, Dept. ford ; and St. Matthew's, Bethnal Green. The River Fleet wha covered, and a market huilt on It; Grosve-nor-square, Weatminitor Bridge, and Great Georgestreet, were built; and roads were formed in several directions, the principul one skirting the northern part of the city from Paddington to Iolington.
The accession of George 1IL. gave a freah atimulus to improvemeat and extension ( A new hridge at Blackfriars, with handsome streets leading to it, and: many new dwelilags on the Surrey adde, were orocted; On the north-west side the parishes of St. Pancrae and Marylebone were formed. At the aame period the street pavement for foot passengers was firt hid down, the kennels removed from the middle to the aides of the streets, and the numbering of housee in- , troduced. The American war gave a temporary check to extension; but soon after the peace of 1783 the advance luecame more rapid thun ever. Docks were constructed, the commerce of the city rapidly augmented, the ground near, the water side was covered with bulldings, and, wostwiad, Bedford, Jussell, and Brunswick Squares quickly sprung ,up. From the Regency iu 1811, London advanced in extent and elogance etill more rapidiy. Regent's Park was formed, and surrouaded by handsome terraces; and within the last few years the extensive and fashionabie districts called Boigravia and Tyburnia-the former to the south and the latter to the north of Hyde Purk-have been created, and literully coverad with houses of a bigh class. In 1851 there were 805,938 inhabited louses in the metropolls, and there are, no less than 6300 streets enumerated in the London Postal Guide for Jnnuary, 1857.

The situation of London, on the banks of a great tidal river, is alao peculiarly favorable for a large elty in a sanitary point of view. The subsoll is partly clay (the London clay of the geologist). The valley of the Thames has a gradusl ascent on the north aide; and the eonth eide, though below the levol of spring tldes, has been well socureu aguiust inundations by eubankments. The air lo temperate and rather dry than noist, and the health of the inhabitants has gradually but rapidiy improved from the earlier part of last cen. tury; when the deathe were aznually 1 in 20 of the population, whereas at present they are blout 1 in 40.

It ls difficult to ausig a auy distinct houndaries to the metropolis, as almost continuona lines of houses atretch like branches from the main trunk of London, to Chiswick, Kensal Green, Kilburn, IIampstead, Ilighgato, Stamporl Ilili, and Upper Clapton in Middilesex; Stratfurd and North Woolwich in Essex: Greenwich and Lee in Kent $;$ and Dulwich, Norwood, Cispham, Wandsworth, and Putney in Surrey. These, too, are constantiy inemasing in length and breadith; the vacant spaces between distant iinea of roud being tiliel up with extrsordinary rapldity. The circle formed on a radius of four milee from Charing Cross oxcluies a large portion of london; but its ex. treme length may be set down as ten miles, and thi bradich at about six. There are four divisions of the motropolis which, though rathor vague, are pretty generally underatood by Londonors-these are, the City, the West Lind, Lambeth, and the Borough; the two first on the Midulesex, and the others on the Surrey alde of the water. The city of Loudon proper lias an area of 725 acrea, and containe 108 parishes- -17 withiu and 11 without the walls. In ite mont limited senve, the metropolis includes the oltiea of London and Weatminuter, the parliameatary boroughs of Tower Ham-
lets, Finsbury, Marylebone, Lambeth, and Southwark. | cities and horoughe above mentioned, as accertained hy Annexed is un account of the populatica of the various $\mid$ the different censuees, beginning with the first in 1801:

The metropolitan district comprised within the bills / and abuses connected with the berthing and mogring of mortality includea, with the cities and boronghs embraced in the foregoing table, other integral parts of London, Bike Chelsea, Brompton, and Kensington; and the auburbs, such as Greenwich, Wandsworth, Hammersmith, Putuey, etc. In this view, the area of the metropolis is $\mathbf{7 8 , 0 2 9}$ ncres, comprising 186 pariahea, and the present population may be estimated at loward of $2,500,000$. Annexed is an account of the pepulation of this area at the date of each cenaua, commencing with 1801:

| Years. | Population. | Yee | Populatlom. |
| :---: | :---: | :---: | :---: |
| 1801. | 65,963 | 1881. | 1,654,994 |
| 1811 | 1,188,818 | 1841. | 1,948,417 |
| 182\%. | 1,878,947 | 1851. | 362,236 |

But many merchanta and citizens, taking advantage of the easy access to the country afforded by the railways, occupy bouses at such places as Kingston, Esther, Walton, Richmond, Twickenham, Staines, Windsor, Reigate, Bryghton, etc., making daily journeys to and from the city, so that they and their families are not includel in the foregoing accoant.

Commerce.-As one of the grent occupations of its inhabitants, the commerce of Londol demands the first notice. The capital of a great empire, with immense wealth concentrated in it, having casy access, toth by land and water, to all parts of the kingdom, and every facility o- communication with foreign countries, London has become, with perhaps the single exception of New York, the greatest commercial city in the worit. The commercial growth and prosperity of Lonton are especially to be ascribed to ita great river-jort, the Thames. This famous stream has its source within the berders of Gloucestershire, a little to the south-west of Cirencester, and becomes navigable at lechlade, 138 milien above London. It is first affected by the tide abont 15 miles above the metropolis; but before reaching this point it is awollen ty junction with the Isie, Kennet, Coln, and Wey. The city corporation are the chief conservators of the river, and appoint a navigation committee, who superintend the towing-paths, bridges, water-coursee, and whatever relntes to the river, as far as a atone a little alove Staine's Didge. Hif;her up the supervision is divided between the city and a body chicfly composed of the landowners on both sides of the river. The conservation of the river below London la also in some measure under the government of the city corporation, but the Trinity llouse has concurrent jurisdiction, and no ballast can be raised without ita anthority. The sppointment and control of piints, the piacing and repairs of land-marks and bnoys to indicate the channels, and the establishment of floating lighta, are also under the superintendence of the Trinity llouse. Close to landon Bridge there is water suffleient for vessels of 800 tons isurden, and the legislature has placed the shipping of the jort, and their moorings, nnder the direction of the bartor-mastere, nominatad by the corporation, and approved by the Trinity House. The sinuonities, currents, und shoals in the river, and its varying ilepth, renider the navigation rather Intricate. The river pilota, who are a distinet class, conlact vessels to Gravesend, where they are relieved by the sea pllots. Down to 1800, the commerce of Iondon, and the ahipping interest, suffered nusterially from the erowded state of the river, and the difficultien, telays,
of vessels, and the landing and storing of merchandise. These evils led to the construction of the West India Doeks, which were opened in August, 1802. These, next to the Commercial Docke, the oldest in Londen, were formed in the gorge of the Iale of Dogs, on the Middlesex side of the river. Thiey comprise the import and export dock (communicating with the river at Blackwall and Limehouse), and a dock of 19 acres for bonded timber.

The export dock occuples about 25 , and the inport doek 80, aeres. The gates are 45 feet wide, and admit vessels of 1200 tons. At the highest apring-tides the water is 24 feet deep; and within the docks thero is sufficient space for 600 vessels of from 250 to 600 tons. The import and export docks are parallel to each other, but divided by stacks of warehouses. There are sheds for sheltering the goods; and the chicf warehouses are capable of storing $170,000 \mathrm{hbds}$ of sugar, besides coffee and other tropical productions. The whole space occupied hy these docks and warehouecs is 295 acres. The East India Docks at Blackwail now belong to, and are managed $!y$, the same company as the West India Doeka. They' were commenced in 1803, finjshed in 1806, and were intended to accommodute the trede of the East India Company. They includo an import basin of 18 acres, an export hasin of about 9, and an entrance basin of 24 ncres. The entrance lock is 210 feet wide, the width of tho gates 48 feet, and the depth of water in the docks is never less than 23 feet. The extent of warehouse room at these docks is comparatively small. The East and West Indiu Docks are well inclosed and guarded, and the butilings are tireproof. The London Ducks, aituated between Rateliff lifighway and the Thames, were beguin in June, 1802, and opened in January, 1805. They conaist of two docks ; the western, covering 20 acres, and the eustern about 7 acres. The latter is entered from Shadwell, and the former near Wapping Oid Stairs, and also at the IIermituge. The whoie can receive 500 veasels of from 200 to 400 toms, The entire space inclosed is 71 acres. The warchouses are very line; the most extraordinary being that for bonded tohacco. The roof sud pillars supporting it are of iron, and the whole huilding covers five acres of land, and is capable of containing 21,000 hhis. The company is governed by a lody of directors, of whon the lort mayor is one. The regalations to prevent tire and pilfering nre as effectasio as in the Bast India Docks. St. Katherine's Docks, situnto between the Londion Docks and the Tower, were exeeuted in a year and a half, and tirst openci in Octother, 1828 . The whole extent of the property is 24 acres, of which nenry one half is jucloved in the two doeks - :nmunicating by a basin. The eutrunce lock, near Isacgate Wharf, is 180 feet long, anid 45 feet broed, and admits ships of from 20015 to 800 tons. Tho warehousea are very large and commodions, and the regulations and charges are nimilar to those of the other dock. Victoria Docks, the last constructed, were completed in 1855. They are situated in the Plalstow Marshos, inumediately below the East and West India Docks. The portion of this property appropiriuted hy the Dock Company for their own parposes is abont 200 acres, bint the dock Itself oreuples but 74 , und affords 244 foet dejth of water. The en.
trance wide. availabl acres. acre and for the ject of th portion o in the Pc river.
along the terninati India Dor iand Doct are now 70 are ws ladea wit! bulky tha basin near East Com within is d l'arallel inner and by which cation witl was forme don of artic ed for cens tropolis; ; Janction Paddington Regent's $P$ carried by and so on is 9 miles 10 is not easy, sinetch of $\mathbf{t}$ be an epitor capital are I of all soils n the ingenui globe can sp does net yifil state the nu and frequer and manufa from the sar Accoves or Lonein $185 \%$.
trance lock at Bow Creek is $\mathbf{8 0 0}$ feet long, and $\mathbf{8 0}$ wide. There ts a half-tlde busln of 16 acrea; and the available warehonee floor ls atated to be upward of 11 acres. The company have also sequired about on acre and a half between Thames-street and the river for the orection of an ap-town warehouse. One object of the company in to withdraw from the Thamea a portion of the large fleet of colliers whlch lle at anchor in the Pool; and serlously obatruct the trailio on the river. On the other bank of the Thames, axtending along the slde of the river opposite Limehouse, and terninating nearly opposite the entrance to the West India Docks, are the Commercial, formerly the Greenland Doeks, which existed In the 17th century. They are now of great extent, Inclosing 120 acres, of which 70 are water, and were denignea to renat's vessels ladea with tlmber, corn, and otuer cumer. 澺 more lulky than costly. These docks arr us tered by a basin near Dog-and-Duck Stalra, sometimes called the East Cotntry Docks, and the main body of the water within is divided into alx unequal parts. See Docks.
Paruliel to these is the Surrey Cansl, having an inner and outer dock at the entrance in Rotherblthe, by which ships are received, and affording communiestion with the Croydon Canal. The Regent's Canal wos formed to anve expense of cartage through London of articles brought by sea, and afterward forwarded for consumption to the north-weet parts of the metropodis; and also to communleate with the Grand Janction Canal. The Regent's Cansl passes from Paddington, by a tunnel under Maida Hill, to the Regent's Park, thence to Inlington, under which it is carried by a tunnel three quarters of a mlle in length, aod so on to IIoxton, Hsckney, and Llmehouee. It is 9 milea long, end la provided with 12 large locka. It is not easy, withla a moderato compass, to glve even a sixetch of the forelgn commerce of London. as would be an epiteme of that of the world. To the British capital are brought the products, natural and artiflelal, of all seils and all climates. It has in store whatever the ingenuity and induatry of man in any part of the globe can spare to exchange for what his own country does not gield. We can, therefore, do little more than state the number and alze of the vessels tias belong to and frequent the port, and the value of the produce and manufactures of the United Kingdom exported from the same:

The conveyance of coals to Iondon employs a great deal of shlpping. They are chiefly brought from the north-eastern distriet of the kingdom, and are aold at the New Coal Exchange, lately erected in Lower Thames-atreet.
Very large quantities of coal now reach loondon by mesas of the railwaya whlch centre in the metropolts.

Trinity House.-The Soclety of the Trinity House has its chlef eatabllshment In a large and handsome house on Tower HIll, built by Wyatt in 1793. It was incorporated In 1815; hut from the terms of its charter, it ovidently had a provious existence, and was then established at Deptford Stroud. Its privileges were confirmed by the charter of 1658 , and its members are now partly men of high rank, and partly those remarkable for naval knowledge and akill in maritime affairs. Its duties as to pilote, light-houses, buoys, ballast, etc., have already heen mentioned. In procesa of time this society acquired large property ; the nct revenue nnder ite management having in 1855 amounted to $\mathbf{x 2 0 4}, 195$. Until the passing of the act 13th and 17 th Vic., c. 131, the society spent much of lts surplus revenue $\ln$ pensions to poor and disabled seamen, or their wldowa and orphans ; but this act transfers their revenue, as well sa the charge for maintalning light-housea, etc., to the Mercantllo Marine Fund. It would appear, from a parliamentary paper lately pablished, that the Board of Trade expended in 1856 out of this fund $£ 1388$ as rewards for the salvage of life. The Trinity House contains some portraits of naval heroes, naval trophies, ctc.

Mint.-The Royal Mint, also on Tower IIIll, waa removed thither from the Tower in 1811. The present bullding which Is oxtonsive and woll suited to its purpose, was completed under the directlon of Sir $R$. Smirke. The interior ls aprzopriutely arranged for the manufacture of coin ; anci the machinery combines grent ingenuity and beauty. In consequence of tite report of a commilasion In 1849, the old company of moneye: was abollahed, and a acientlic chlef has since been allotted to this department, lastead of a politicul one. The amount of gold, sil'rer, and copper moncy coined here in the last three years had been as follows:
Account of the Total Valive of Gold, Silver, and Cobper coined at tar Mint in anoh of the Tubre Ykaks andige with 1856.

ant Bambe.-The Bank of England, one of the most ettractive objects in the city, waa foninded. by act of Parilament in 1694, and its business was carried on for many yeare at Grocers' Hall. -t? In 1783 it was transferred to Threadneedle-striot, and- soon thereafter the present hall and bullion ofice were opened. Betweon 1770 and 1788 the facade was extended, and two wings added, under the directions of Sir Robert Taylor and Sir John Soane. Under the superintendence of the latter, the front and wings of the original structure were harmonized. The area of the bank is an irregular quadrangle; the south or prineipal front is 365 feet, and the north 410 ; the east 245 feet, and the west 440. Its principal entrance is from Thread-needle-street, the other twe from Bartholomew Lane and" Lothbory. The interior contains several open courth, the rotwnde, or circuiar room, numerous offices, committeo-roomn, and private npartments for the residence of officers and servante. The business is carried on by a staff of nbiont 800 clerks, etc.; whose ealarios amount to nearly $\mathbf{~} 200,000$. The bank has reoeived nite anceessive renowals of Its charter since it was Arat granted in 1694, and measures have been taken in Pariament thim session (the first of 1857) for egain renewing it: The act of 1844, still in force, reparated the Bank into two distinct branches, via.: 1 . The Iasue Department, devoted to its business as agent of the State in ereating and issuing paper money, or bank-potes, convertible into gold on denand ; and, 2. The Banking Department, where the private business of deposit and discount is carrier. on. There are 60 private and 28 joint-stock banks in the metropolin. Some fow of the former; much as Child's, in Fleetstreet, were eatabliahed before the end of the 17 thi century ; while the joint-stock banks are all the offepring of the iast fow yeara. Thsre is an eatablishment near Iombard-atreet, calied the Clearing House, where a daily exchange of checks or drafta on city bankers in affected, and this process lruids greatly to facilitate bank'pg business.
Roy: : Exchange,-The Royal Exehange, colosaal in proportions, and oocupying a commaading ponition betreen the Bank of England and Comidil, is a spot Where great mercantile tranamactiona are dally concluded. : The first excias ce was built by Sir Thomas Gresham, completed in 1507, bnt fektroyed by the great fire of 1666. It was, however; apeedily rebuilt, and was opened on 28th Septemiver, 1669. Agrain destroyed by fire in 163 B, it man rebuit, and completed in 1846 by Mr. Tite. The present luilding la quadranguiar, and the inter 'r acrruanided by rrcades. In the centre, which is uncovered and noprutected from the weather, stands $c$ axstee of her majesty by Lough. The outside of the bulding, except the grand western entraace, in ocenpied ly mall shopa ; and on the upper foor is Lloyd's, where the terointas of marine insuraxce ia conducted by maderwdters. It lasy been estitanted that, on an average, 200,000 pesscas dally visit the exchange, but this can be iittlo roon than conjecture. Merchants andi broxers reaort much to coffeehouses in the vicinity of tha Exchange for the transaetion of basiness. Moat of the larges transactions ore negotiated by hrokers, who in gererai confine themeivee to one branch of trade, with whieh they ere thoroughly aequainted. Thus we have colonial brokera, insurance brokers, ship irokers, wtock broken, bill or money brokers, etc. Near the Hoyal Kxehange and the Jiank is twe Stock Fixchange, where real und fictitiona nales are made of jruperty in the public fund , ete.; the latter for the mont part being a spectes of gambling.

Iondon, when compared with some of the towns in the aurth and west of Fingland, ean searcely be calieci a manufacturing place; yet the various artieles produeed hore employ many thousand persons. The slik manafacture eapecially emplays a large number of hands. Originally Introduced by French Irotestant
refugees, many of their descendants atill continne the trudey which omployed, in 1851, 15,764 persons; of whom 8277 ; were fomales. el The manufacture of Iondon portar and hear is a much mare lucrativo busiaess, but s London lirowery requires a, very large capital. Sugamefining and olock nad watch makiny also jrerail to a considerable extont, the lactor chiesy in a distriot called Clerkenwell London-bullt carriages are generelly considered the beat, an they are undoubtedly the most elegent in the world. Londen enjoy a high reputation for the manufacture of numerous smalier articien, such as mathemutical, sargical, and innsioal instrumente, jewelry of the ouperior kinds, gold and ailver plate, etc. at The great number of these employsd in houserbuilding provee that the metropolis ia still rapidly extending; and though this business received a sevare check during the late war with Russia, It was only temporary, as ovinced by the general resumption of building in the varieus outskirts of London.

The Gheps in London are, generally upenking, weil managed, and many of them are handsomaly fitted up, eapecially those in Bond-street, Regent-street, and Oxford-street.is The wholesale shope or warehouses are chiefly to be found in the city; the retail sheps, perticularly those on a large senls, leing mere groneral in the west or faghionable end of the metropoitis. The bazaars in London, each of which forms an aggregetion of shope or stalls, are not now so attractive ns they once were. They deal mostiy in fancy goods, furnitnre, toys, oto. The four great eatablishments of the kind are those in Soho Square sud Baker-street, the Pantheon in Oxford-areet, and the Pantechaicon in Halkin-etreet, Helgrave Square. The Burlington and Lowther Arcades contain many shops for the sale of the iike commodities,

Trade of 1856.-The East India nud Chine Associstion have published their uaual comparative statement of the number of atips, both British and forelgn, with their aggregate tonnage, entered inwurd and cleared outward with cargo from and to places within the limits of the East India Company'o charter, from the 1st of January to the 81at of Narch, 1855 and 1856. According to the atatistice of the vessels ontered inward, the retirn for the port of London shows a deeresse of 31 versels and 8971 tons, the difference between 187 veasols $;$ with the oapacity of 109,484 tons, in 1855, and 166 veasele, with a capacity of 100,613 toos, in 1856. Liverpool flgures for an increase of 8 vessels and 14,859 tons, the arrivals in the former period having been 62 vessele, with a capaeity of 39,364 tons, and in the latter 70 vessels, with a eapacity of 53,703 tons. With regard to Bristol, thero la a decrease of 3 vessels, with an increase of 806 tons; the arrivuls in 1855 having been 10 veseels, with a capucity of 8917 tons, and in 18567 vessels, with a capacity of 3723 tons. The return for the Clyde exhibite a decrease of 2 vessels and an increase of 722 tons, the difference between 8 vessels, with a oppacity of a 414 tons, and 10 vessels with a capucity of 2629 tons. - A review of these figures shows a net dacrease of 24 vessels and an increase of 5452 tons $\mid$ the arrivals in 1855 hsving been 277 veassels, with a capacity of 155,179 tons, and in 1856253 vessels, with a eapacity of 160,631 tons. The principal arrivala were from Colcutta, Madras, and the Cape of. Good Hope. Aocording to the statistics of ressels cleared outwant, the returin for the port of London exhibita an increase of 6 vessels, and $5400^{\circ}$ tons; the departures in 1855 having been $157^{7}$ versele, with a eapacity of 94,78 t tons, and in 1856 $\mathbf{1 6 8}$ vessels, with a capacity of 100,689 tons. In the case of Liverpool there ls a decresse of 9 vessels and $11,197^{7}$ tons, the difference between 98 vessela, with a capacity of 80,444 toma, and 89 vessels, with a capacity of 69,247 tons. The Hgures for Bristol elow a ilecrease of 2 vesseis and 459 tons; the departures in 1855 having heen 3 vearels, with a enjselty of 1641 tons, and is 18561 versel, with a capacity of 1182 tons. With regard to the Clyde, the resuits show a decreaso of 8 vessela, with 2634 tons, the difference between 25 vessels, with a capacity of 10,044 tons, and 22 vessels, with a capacity of $\mathbf{1 8}, 510$ tove. 'Iuking the result of the whole seturn, there is a net decrease of 8 vessels, with 8285 tons ; the departures in 18.5 having been 283 vesseis, with a capacity of 102,923 tons, and in 1856275 vessels, with a capacity of 184,628 tons. The principal decline has leen in departures for Avatralis, Calcutta, the Mauritius, Juva und Sumatra, and Arabis. For a full exhibit of the commerce of Great Britain, including that of Iondon, see Gneat BratAIN.

Iong Ialand, N. F. Situated in the routh-enat part of the State, and contains 1500 square milsa, lying between the Atlantlo on the south, and Long Island Sound on the north. It matains three countiesKings on the west end, Qua. $\Sigma s$ in the middle, and Suffolk on the east end of the island. A chain of hills runs from west to oast, on the north of which the surface is somewhat hilly and broken; on the south it is level. The north shore is somewhat bold; on the south it Is a besch of and and gravel, inclosing bay, with various inlets, admitting veasels of 60 or 70 tons, and abounding with shell and other fish. At the east end is Gardiner's Bay and Island, and Montauk Point, a bold promontory, on which is a light-house. The north shore has several light-honses.

Longitude. By the term geographical longitude, is mesnt an are which measures the inclinations of two terrestrial meridional plenea, one of which passes through a known place as - place of reference, the other through any place whatever, It is sometines also detined as the distance east or weat, along the equator, of uny place from a certain meridian. Longinede was deiermined ay. Hipparchus at Nice, who fixed the firdt Cagree in the Cauarios, 162 n. c. Harrison made a time-keeper in A. D. 1759, whach in two voyuges wus found to correct the longitade within the limits required hy the act of Parlianent, 12th Anne, 1714 ; and la 1763 , he applied for the reward of $£ 20$, 000 offered by that net, which be received. The cel elorated Le hoi of Jaris, in 1766, invented watch that keeps time better; and the chronometera of Arnold, Earnehaw, and Breguet, bring the longitude abmost to the truth. Philosophors have sought the longitude in vain; but Newton has said it will yet be discovered by a fool. The selection of a station from which the longitudes of all other places are to be zeckoned is entirely arhitrary ; British nstronomers and geographers heve chosen the meridian of the Royal Observatory of Green wich as their first merilian. The French and otier continental nations refer the longitudes of all places to the meridian of their principal obeervatory. 'The longitude of a place may be expressed in hours, minutes, and seconds of thine, or in degrees, minutes, and seconds of apace; if it he given in either, it may be translated Into the other. The reason of this is, that the earth revolves on its axls from west to exst in 24 mean soinr hours, thereby causing the first meridian to describe during that timo a space equal to $160^{\circ}$, and therefore, in one hour, $15^{\circ}$. Hence, if the plane of the Grst meridian pass nt the present moment through the sun, then the meridian of $n$ place $15^{\circ}$ reest of the former, will pase through the sun exactly one hour after; If the place be $15^{\circ}$ east of the first meridian, the plane of the former will pass through the oun one hour before the letter. The sun always
easees the meridian of any place when highest in the hearene, i. e., at mid-day, or 12 o'olook mean solar time. Wherefore, places lying to the east of the firat meridian will have avery hour earlier, but places lying to the west of that merldian will have overy hour later than it ; so that If, while the meridian of one place is pasaing through the sun, the time be known before the meridian of another place pass through the oun, then the longitude of that place from the former is determined, the time being turned into epace at the rato of $15^{\circ}$ to the hour. Hence, therefore, places will have east or weat longitude, accordiag as they lis east or west of Greenwich Observatory; the longitude of the meridian of which is mero.
The problem of the longitude may be reduced to this-Given the hour by calculatlon at the place of observetion, to find the hour at Greenwich Observatory corresponding to the aame time ; the difference of times gives the longitude of the place from Greenwich. The solation of this problem was attempted in very early timee, dating even from the time of the anclent Egyptiana, but the results obtained were very inaceurate, These resulte wore deduced from tables of celestial phenomena calculated for a certain meridian, and then the times were compared with the times at which the same fi.onomena appeared at a different place; actual admesaurement was also employed. But it was not until after the invention of watchea that the problem was rendered solvable. IIarrison, in the 18th century, was the first who gave a true aolution by a watch; but the first accurate resolntion of the problem may be oaid to date from the discovery by Galileo of Jupiter's aatellites, and his tables of their motions. The result of the problem at this period, as well as now, was, as Wolfiua hes expressed it, that the means might be found whereby the art of navigation might be brought to its utmoat pitch of perfection. If the advantages of determining the longitude to a commercial and marititne people be considered, it will not appear surprising that princes and othera ohould have held out high rewards for a true colution of the problem. thlif III., King of Spain, baw Its value, and in 1598 offered a reward of 1000 crowne to the person who would solve it. The States of Ilolland imitated his example by a prize of 10,000 fiorins. In the year 1714, the British government offered a premium of $\mathbf{£ 2 0 , 0 0 0}$ for any method wherehy the longitude might be determined at sea to within 30 milies; 515,000 , if the proposed method would give it to within $40 \mathrm{geo-}$ graphical milea; $£ 10,000$, if it would determine the longitude to within 60 miles. It was also enacted, that a reward of $\mathbf{£ 5 0 0 0}$ would be given to the inventor of any time-keeper which should enable a ship, during a voyage of aix monthe, to keep her longitude to within 60 miles ; $\mathbf{2 7 5 0 0}$, If within 40 miles ; and $\mathcal{C 1 0 , 0 0 0 \text { , if }}$ within tw miles. If the method were by improved astronomical tables, the reward was to be $\mathbf{8 5 0 0 0}$, the tubles boing compared with provious observations. France, aleo, in 1716, under the regency of the. Duke of Orleana, offered a prize of 100,000 livres. In consequonce of : ‥sae reward, many and varioua methode were proposed, the bent of which, ut leant as respects frequency of observation and sbortness of calculation, is the method of Lunar Distances.
Jean Werner of Nuremberg, appears to be the first who proposed, in his I'tolemy's Geography, 1514, a method of finding the longitude by the distance bet ween the moon and a atar. The lunar method was also recommended by Oronce Finó of Briançon, in his book Ie Incenienda Longitudine; by Gearma Frisiua, in his treatise Structura Rodï Astnunomici et Geometrici, 1545 ; by Kepler, in his Rudolphine Tables; and by Chrictian Longomontanus, in his Astronomia Davica, 1622. Gemma Frislu: is, moreover, said to have attempted the longitude by a watch soma time after 1680. Carpenter, in his Geography, 1635, aaya that the lunar method is to be ascribed to Plerre Applan, a

German, born In 1496. John Baptiete Morin, In 1884 , attempted to improve the lunar method, and recaived, in 1645, a peasion of 2000 livres; but his improvements were uselees, as Paschal declared; owing to the imperfact nature of the exiating tables.
The tables of celeatlal observations previous to Flamsteed's thine were imperfect and orroneous ; those generaliy used were Tycho Brahe'a, or Kepler's, and to show that they were of little value in determining the longitude, although invaluablo in other respects, it may be otated that Flamoteed's observed differed from Tyebo's computed placea by $5^{\prime}, 6^{\prime}$, or more; and the tabulated distances of the latter differed from the obeerved distances of the former by $15^{\prime}$ or $20^{\prime}$, which would cause an errcr in the longitude of about $15^{\circ}$, or 300 leagnes. Tycho's lumar theory, and the tables grounded on It, were in error 12 ' and more. The uncertaintr, then, of theae tables helag known, of weli as the paucity of astronomical observaticus generally, a Firenchman, named Le Sleur do St. Pierre, contrived, in 1674, to get his pretenalons to the discovery of the longitude brought under the notice of Charles 11., of Britaln and the court. Commissioners were appointed, and St. Pierre's data necessary to work the probiem were as followe :-1. The heighte of $t$ wo stars, and on which side of the meridian they were; 2. The heights of the two limbs of the moon; 3. The height of the pole; all to be given in degrees and minutes; and 4. The year and day of obeervation. Flamsteed beiog in London at the time, was appointed, not only to act as a commissioner, but also to supply the necessary data. St. Pierre, having recejved the data which he required, refused to work the problem, because he alleged the observations given him were feigned. Fismsteed, on this, wrote to the commissioners, assuring tham that the observations were genuine, and at the same time stated, that the longitude could not be eolved by the conditions proposed; but if the tables of celeatial observations, especially those of the moon, could be rendered more accurate, then the longitud, might be determined by them. On the letter being shown to Charles, his majoaty was startled at the asoertion of the computed places not agreeing with the observed, and sald with some vehemence, he must have them observed, examined, and corrected anew for the use of his seamen. It was this simple incident which led to the formation of the Royal Observatory of Greenwich, the foundation of which was iaid by Flamsteed on the 10th of August, 1675 ; and it was in that building that Flameteed labored for 44 yeara, under the most trying circumstonces, to correct existing tables, and to cominence the Britian Catalugue, one of the noblest monuments of British perseverance. So valuable were Flamsteed'e obeervations to Newton, that they enabled him to form his lunar theory, which is now of such consequence In determining the longitade.

From the improvements made in watches by lluygens, llooke, snil others, previous to the year 1714, it was thought that the longitude would be solved by this machine. Hence, after 1714 , the best artists applied themeslves to the coastruction and improvement of watches. Ilenry Sully, an Englishman, but resident at l'aris, tried in 1726 to determino the longitudo by a marine weutch, but without success. Julian Leroy, one of his pupila, would appeur to lay claitn to priority" of inveation ; but it has never been disputed that the honor of solving the difficult problem of the longltude by means of a watch belongs wholly to Harrison. Thia ingenious workman began, at a very eariy period, to make experiments on preadulums made of different metals, In order to counteract the effocts of beat add cold. In the year 1730 llarrison was brought into notice by a pendulum clock which ha had maile in 1526, and which, for ten successive years, kept remarkably oxact time. This clock was tried in a voyage to Liabon during Auguat, 1736, when it corrected an error in the ship's reckoning of $1^{\circ} 30^{\prime}$. At the special
requeal vanced watcher watches and abo nometer practica was em shown rather $\mathbf{P}$ piace, be 1 anaties arrival 0 the orro $28^{\prime} \cdot 375$ of Portss miles. request of the commissioners of longitude", tho edvauced him money, he continued his experiments on watches from 1787 till 1761; when he produced three watches, or time-keepers-the third the most accurate, and about 4 inches in diameter. This watch, or chronometer, was tried In a voyage to Jamaica as to Its practicability in determiniog the longitude. The trial was eminently successful: the difference of time as shown by the chronometer indlcating Greenwich or ruther Portsmouth local time, and the local time of the place, being 4 seconds of time, which is equivalent to Inautical mile in the parallel of Jamaica. On the srrival of the veasel at Portsmonth, it was found that srrival error of the chronometer was only $1^{\prime} 53 \cdot 5^{\prime \prime}$, or $28^{\prime} \cdot 375$ for the entire voyage, which, in the parallel of Portsmonth, would be equivalent to 18 nautical miles. Since this error was withln the llmit preseribed by the act, Ifarrison clalmed the full reward of $£ 20$,000 ; but the commissioners, considering the matter in ull its detall, came to the conclusion that the watch was not yet sufficiently tried. In order, however, to testify their appreciation of the invention, they gave Harrison a grant of $£ 5000$, and sequested him to im prove the watch still further against a second voyage. This voyage was undertaken, in 1764, to Barbadoes; and that no misunderstanding might ensue, MaskeIyne and Green were also sent out to make the neceseary astronomical observations at that place. The difference of longitude, as shown by the chronometor and that by astronomical observation, was $43^{\prime \prime}$ of thme, which is equivalent to $10^{\prime} 45^{\prime \prime}$ of epace, or longitude. In consequence of the success attending this and the former trial, the House of Commons ordered one half of the reward piomised ly the act of 1714, or $\boldsymbol{E 1 0 , 0 0 0}$, to be paid to Mr. Harrison, the inventor of the longitude clock; the other half to be paid him when watches, construcled on principles stated by him, should determine by trial the longitude of any place to within 30 nautical miles. Another condition annexed to the payment of the other $£ 10,000$ was, that the inveator should give on an oath a full explanation of the principles on which the watch was constructed. This was done most willingly, and Harrison delivered over all his watches to government. The first watch made on IIarrison's principles was that by Mr. Kendail ; it was found to exceed the regularity of tho lest of its models. This instrument was committed to the care of Mr. Wales, in his voyage round the world with Captuin Cooke, during the years 1772, 1773, etc., and such wus its success, that $\ln 1774$ an appeal was made to the Ilouse of Commons to order the remaining sum to be paid to Mr. Harriaon, which was accordingly done. IIarrison realized by his invention alone upward of $£ 24,000$.
Several other parties recoived rewards for their improvements in clironometers. Arnold \& Son received $£ 3000$, and Mudge $£ 500$.

Since ltarrison's time, remarkable improvements have been made in timo-keepers, or chronometers, as they are now termed; no one sustaining a yood character that grains or loses more than a single second in one day.
But while watchos were thus gradually heing perfected, tho tables of celestial motions were nlso attended to. Hlalley, on succeeding Flamsteod ns sstronomer-royal, continued improving whit the inttor had begun, so that for 1730, and consequently for tike future, the Caroline Tables were presumed to give the true pluce of the moon within the compass of $2^{\prime}$ of her motlon. But however perfoct such tables may be made, they will be useless without $n$ proper instrument with which to tuko angles accurately at sea. Dr. Italley proposed to overcome this ohstacle, hy using on ehipboard a telescope of five or six feet; but the error in such a case would nearly equal $2^{\circ}$, or uniler the equator the longitude would be in excess or dofect about 40 leagues. But in 1761 Mr. Hadloy communi-
cated to the Royal Society' the nature of the asatane, which he had then lavented. The sextant is an instrument for taking angles at sea with surpriaing aco caracy; "its principle depends on the "lnw of the roffection of light. This instruinent was tried in sevoral voyages with wouderful succeas 1 but ite resulte were most accurate when used with Professor Mayer'e Tables of the Moon, computed for the meridian of Paris. These tables first appeared in the Memoire of Gottingen for 1742, and a manuscript copy was sent in 1755 by Mayer to the Evard of Longitude, setting forth, at the same time, his clain for some one of the rewards which he might be thought to merit. These tables were placed in the hands of Dr. Bradley, as tronomer-royal, who comparsil several hnadred compated longitades of the moen with his own observed longitudes, and never found a greater difference than $1^{\prime} \cdot 5$. Dr. Bradley ehowed the commisaioners the value of these tables. Mayer died in 1762; but having in the interval greatly improved his tables, his widow sent them in 1763 to the Board of Longitade. These are the tablen which, in consideration of their value in fiading the longitude at sea, were, by act of Parliament, honored with a reward of $£ 5000$, which was paid, in 1765, to Mayer's widow. Dr. Maskelyne, astronomer-royal, was at the sams time requested to improve and correct them as far as possible, so that they might be compiled, and form the basis of a British Nautical Ephemeris, or Almanac ; and to print the same, in order to make the lunar tables of general utility. The first of tite series of the Nautical Almanac and Astronomical Ephemeris was published in 1766, under the superintendence of Dr. Maskelyne. It was published yearly hy the Commissioners of the Board of Longitude. The Nautical Almanac has been greatly improved, corrected, and extended, under the able superintendence of Mr. Alry, the present astronomerroyal ; it is now published four or five years previons to the observatious being made at Greenwich Observa tory; hence in long voyages the set of tables may be taken out.

In consideration of Mayer having availed himself of Euler's lunar theory, the latter recelved from government $£ 300$.

The several methods for finding the longitude are the following :
To find the Longitude by a Chronometer.-Suppose that a chronometer is warranted to measure equal portions of time uniformly, and alwaya indicates Greenwich local time; it is evident that, were this instrument carried to any atation on the surface of the earth where also the local time is known, the local times of Greenwlich and that place can be compared with each other. If the chronometer be carried to any atation on the meridian of Greenwich, the chronometer and local time of the place will elwaya coincide; but if it lee carried to any station west or east of the meridian of Greenwich, then the time as shown by the chronometer will be in excess in the Sormer case, but in the latter in defect of the local time of the place; the difference of local times gives the longitude of the place from Greenwich. The time may be converted Into distance, at the rate of $15^{\circ}$ to one hour. Chronometers can never be made perfect ; they require, therefore, to be daily compared with the heavenly todies in onler to ascertaln if their motion has been nniform.
To find the Longitude by Iumar Eclipses.-Since an celipse of the monn is visilile to one half of the earth at the same time, this would seem to be an excellent method of finding the longitude. The different steps of the process are-to compute the time at which an eclipse is to happen at the place of vbservation, and to compare thin time with an accarate chronometor showing Greenwlch time ; or, in the ubaence of this, the Greenwich time of the happening of the phenomenon must be looked for in the Nantical Almanac ; or it may
be compared by the obsorver from tho Iunar tables. But this method of determinining the longitnde is rarely uwed, owing to the difficuity of anoertaining the exact time of contsct of the penambia of the earth'a ahndow with the moou's limb at the heginning or ending of the eellpse. Somatimer 3, inceed, two observers of an enlipee at the same plnee may differ mure thau two minutes in noting the time of contact ; and hence the error from thia canse alons would the about four minutes of time, which would be equivalent to nesily $1^{\circ}$ of hungitude. It was proposed in the Philosophical Tromsactions of 1786 to diminish this source of error, by observit.g the eontact of the earth's shadow with some remarkuble spot oa the moon's face. But although thin method were more accurate, the unfle. quency of innar eclipses at sea renders the method of littlo use.

Tr. find the Lougitude by the Eelipses yrif uniter'a $\$$ th : i,-Ever since the dixrover, hy © ter's satellives the observa ino of thes their primary has been ued as a motew the lonsitude. Tables of these eclir as writ atrueted by Galleo; and it was the U . agre thees tables with aetual observation that lea dushor to the difieovery of the gradual propagation of ligit. See iturt. The firat anemonomical solution of the great problem of the longitude really dates from the discoveny of these secondssices, for the tafiles of their ecipsose wore framed on sclentific principles. The thine interior satelfties of Jupiter pass through his ahadow, and are aclipsed at every revolution; the fourth, or outer one, at timen escapes eclipse, grazes the uentira, or in partially eellpsed. The computed thmes at whicl the selipses are to happen at Cireenwhel thervatory are noted in the Nisutical Almanac, pubbshed three or four yearn in advance; so that if there tables arm in tho thadk of suy one distant from Greenwieh, he has but to otserve the edipne, and cal. culate the time at which it eccurn, to find the differance of the local times hetween (iremwich and the place of ohservation, and thin ascertain the longitude. The times of inmersion and emersion are noted with much greaser arcupary than the contact of the moon's limb with the earth'e shadow.
Bat before these telipses can be oherved with accuracy, telescope of conaiderable pewer nust be ased; and as it is extremely difficult co direct a toleseope properiy on shipboard, the methed is practically aselens at bes. But, aguin, pmrieular care is required in obnerving; for iwo olservers at the nams place, with telescopes of different magnifyling powers and aporturen, seldom agree swithin a second or two of each other; hasce the mean of the resulta of inmerason aud emeralon should be taken. Hut another source of error in, that no kwo or more obeervers will agree as to tin lnatant of the oxal liminersion, or of the complete emersion of the savellite; hence the only case in which this method is practically useful in deteraining terrestrial longitudes is that in which the instant of immersion and emaralon are obnerved with the same telescope, and by the same observer, since in tbls manner lie will tind the precise instant of the satellite's opposition to the aun.
To find the Iomgitude by Sigmale-If the difference of longlude thet ween two places be small, it inay be easily fonnd by meann of the barating of a rocket, the oxy-hydrogen llme-hall ighit, or the explosion of ganpowder fired from the one place at a preconcerted tine, and observed at the other place; the local times of these places being accurntely ascertained, the longitude is known. Thene artificial slgnala, when fired from an alevated apot of country, may lre seen, when the atmosphere is in a proper state, at diatancea varyIng frum 80 to above 100 iniles. An observer, therefore, distant from the apot at which the racket or other aignal in exposed, has only to oberve the time whan be sees it, and aflerwerd compare this time with the
time when the meket was set $p$, the difference of timee giving the longitude of the one place from the other; if at one of the piaces the Greenwich thine corresponding to that of the ovent is known, the longitudes of the places from that meridian are also known. It is here supposed that tho graiuni propagation of light leads to no appreciable error in the small distance totween the two placos.

If the distance between the two jiaces be consider able, and If a rocket aent up at the oue place can not be seen at the other place, the loug fidde of which is required, thea a series of elgnals must be made od tisted ly olservara, placed at atationa intermedlate to the two extreme places.
Thus, let $\mathbf{A}$ and $\mathbf{E}$ be the two places, the longitude between whlch is required; B, C, and D, observers at : itermediate stationa; $w, x_{1}, y, z$, slgnal places, and tot these placer be arrunged to tha foll wing

Peíure the signals are sent up $\quad \begin{aligned} & \boldsymbol{D} \\ & \boldsymbol{z} \\ & \mathbf{E} .\end{aligned}$ finged hours from $w, x, y, z$, the local times of the fises ulong the whole line $\mathbf{A E}$ are supposed to le ace cozas 7 known. Let then a signal be sent up at $a$, an ${ }^{\text {B }}$ " 1 at $\mathbf{A}$ and B , the difference of times of ob, ser ntiot, as noted by the chronumeters at thaso two phices, will give the longitude AB. Let, again, another signal be sent up at $x$, and she time of appiearunce noted at B and C, thon the difference of times, as ahown by the chronemeters, gives the longitude botween B and C: and therefore between A end C. Sinnilar resuits will bo found when signals ace sent up from the station6 $y$ and $z$, to bo ohserved at $C$ and $D$, $\mathrm{D}_{\text {a }}$ ad E ; and, in this manner, the whole longitude AE between the extreme stations can be found. The longitade found on this principle, and the mode of delucing the most edvantageous reaults from a combinathun of all the observations, Is fally atated ly Sir Juhin Herschel in the Philosophical Trumsactions, 1826 , on the Difference of Longitudes of Gireenvich and Paris.
To determine the Longitvde by Moon-culminating Sturs.-This method consists in finding the increase of the moon's right ancension in the iutervals between the passago of the moon over the meridian of Greenwich and over that place whone longitude is required. It is necensary to find the right ascenvion of the monn's bright limb, and of a star aelected on, or as near us posnible to, the 'mon's purallel of decination, und not differing much from her in right ascension at the two ucridisns; then, the moon's lucrease of right ancension leing known, the difference of longitudo is determined.
Let T, for example, be the time when the moon's enlightened limb transita the meridian of any aliace distant from Greenwich; $\boldsymbol{f}$ the time of passag; of a star over the merldian of the same place ; let aloo n tie the ecror of the elock it the course of the day; then $2 A f n$ will he the luterral of time elapxing between two succemsive transits of the same star, and $2: 1 ; n$ : $T-t=360^{\circ}$ : the difference of right asceasion of the roven's bright limitr and the atar at the instant of the limb beling on the meridian; und if to this the righis ascension of the star bc milded, the right ascension, $=\mathbf{a}^{\prime}$, of the moon's bright: limb, when on the neridian in deteronined. Now the preper ntars to be ebseerved for this purpome, an well as the right a-censino of the moon's bright limb when on the uncridian of Greenwich, are given for every day of the year in the Nautical Almanac, from which the daily licerement of right ascension miay be duterminefl. Jet a be the ri, hit uscension of the moon's hright limb when en the merid. tan of Greenwleh, athe inerement of right ascenting in the thexe leet ween two successlve transits over the same meridian; chen, while the moon, by her relative motion, separates frum tha meridian of Greenwich by an anglo of $360^{\circ}$, Its real motion in right usectaston is o; and while it separates by an angle equal to the dif.
ference
ference of longitude, the motion In right atecenrion it a- $a^{\prime}$; and therefore, suppcsing the change in right

To find thin 'mgitude ". ine passages of the Moon over the Meridiar, $f$ the aun, moon, and a star be supposed to be $u$, the meridian of Greenwleh at the present ioment, then the next instant the 1 ", o bodies will be separate: from anch otliti a the war will be found most advanced to the weat, the moon least advanced from the meridlan, white the sun will oceupy an intermediate sltuation. The meridian Itself alao leaves these bodies, but will approach them with different degrees of velocity, and reach ench of them after certaln intervala of time. It will pana the atar afer the lapse of a sidereal day, or after having described $360^{\circ}$; lt will pass the sun at the end of a solar day, or sfter having described $360^{\circ} 59^{\prime} 8^{\prime \prime} \cdot 8$; and it will pass the moon after a tlmes=the sum of 24 hours and the moon's refardation for that time, or after having deacribed an angle=the num of $860^{\circ}$ and the moon's right ascension in 24 hours. This always taker places in the interval between two succesaive transits of the moon over the same meridian. So also a spectator on a different meridian will notice similar effects, but leas In degrec, and less proportional to the distance of hls from the first meridian. The aun's right ascer 'on will be increased (or the separation of the sun fism the etar), but lees than $09^{\prime} 8^{\prime \prime} \cdot 3$; the moon's right ascension (or the separation of the moon from the star) will alao be increased to the spectator, but less than lts Increase between two succesalve transite; consequently there will be an excess of increase of the moon's right ancension above that of the san's, but less than the oxcess that taker place between two succeseive transits of the moon over the meridian of Greenwich. Wherefore, since the spectator at the second meridian may compute the respective incrementa of right nacension of moon and sun that take place between two auccessive passages of the moon over the meridian of Greenwleh; then, aince he is also sble to compute, by actual observation, the right ascenaions of sun and moon at the times of their pasagge over his own muridlan, he has determined the jongitude. The spectator may choose the aun and a star, the moon and a star, or the moon and sun; the two former are preferable.--Woodnouse's istron., 1821 ,

To determine the Longitude by means of Eiclipses of the Sun, or by Occultations of Stars by the Moon.-One of the most exact methoda, and at the same time the simplest, for finding the longituile, ls by means of solar eelipses and oceultationa. If the commencement and ending of an eclipse of the sun, or the immerslon and emersion respectively of a atar from the enllghtened and dark limb of the moon or of a planet, he ohservei, It is only neceasary to deduce the true time of conjunction for Greenwich and also for another place of observation; the difference of the times gives the difference of meridians, and therefore also of longituden. Kepler employed this method, and it is one of the simplest.Kevier, sfatron. pars opt. The only incouvenlence of this methol is the large amount of calculation required.

To find the Iongitude by Lunar Distances; that is, by the distance of the Moor from a star or the Sun.This method supposes that the fuce of the heavens is a dial-plate, the stars marks apparently irreguiarly
diatributed apon it, and the moon the hand movablo among them and round the oarth as a varialile centre Three chinges require pertjeular notice about this clock : 1. The intorvala of place separating the princlpal and secondary marks from one another and from the moving hand-the noon. 2. The exact antount of the eccertriclty of the earth, the centre of motion of the band. 3. The pisper motion of both moon and oarth at. any part of their respective paths. When thete data are properly known, the tlme as shown by this clock may be rep? The time as pointed out on this dial-plate Is gen s sily read at Greenwich Observatory; and tabulated In the Nautical Almanac, 4 or 5 yeurs beforehand, for every three bourd. But this clock is supfesed to be accurately sean by a spectator at the centre of the earth, and consequently, aince observers are on the aurface, the moving band belng rather neur, and the marks Immenaely distant from the earth, it is evldent thet thls movable hand will be diaplaced, or undergo a parallax with respect to the stars, which must be allowed for, ere the true place is known which she occuples in apace, as seen from the contre of tho earth. A reduction must also be made to the centre of the earth. The necessary steps fur computing the longitude by this nethod are: (1.) Find by a sextant the distance between a atar and one of tha moon's limbs; or, between the limbs of the oun and moon; add or aubtract, in the former caas, the semi-diameter of the moon, and in the litter, the simm of the semldiametcra of sun and moon, which gives the distance of the moon's centre from the star, or that between the centrea of aun and moon. (2.) When two observ: are making the observations, one should take the ainc: distance, while at the ame instant the ather take * altitude above the horizon of the moon and star, or of i: : moon and aun. In the case of one ebserver, he must : the altitudea immediately before and after the dis* ${ }^{4}$ has been found, and allow for the changes of altithos which may have taken place in the intervals betweos their observatlons and that of the distance. (3.) The true altitudes are derived from the spparent and observen, by correcting the latter for refraction and parallax; tha apparent altitude being the observed altitude corrected for the dip of the horizon and instrumental errors. (4.) The ubserved is also an apparent distance, and must, like the altitude, be corrected for parallax and refraction $\ln$ order to find the true distance. (5.) Since the true distance is found, the hour, minute, etr., of Greenwlch the corresponding to It will also be found by the tubles of the Nautical Almanac. (6.) The local time of the place of observation is now to be computed from the trua and corrected altitude of a star or the sun, the sun's or star's north polar distanco, and the latitude. (7.) The diffarenee between this local time and Greenwleh time givea tho longitude.

To find the Iongitude by the Electric Telegragh.This beautiful and ingenious application of electricity for recording astronomical observations is the latest method of finding the longitude, and was proposed by Mr. Bond of the Cambridge Observatory, United States. Mr. Airy, of the Greenwleh Ohscrvatory, has also carricd it into effect with great improvements. During the summer of 1847 experiments were made on the electric telegraph connecting Now York, Philadelphia, and Washington, fur the purpose of determining the differences of longitude hetween these threo eities. A competent observer was stationed at each observatory. A continuous wire connected the threo cities, so that telegraph slgnals might bo exchanged between sny two of them at pleasure. In some of the first experiments, aignals wero exchanged between Philadelphia and Washington, but it was found lmpossible to transmit signals from Jersey City to Washington, the power of the battery being inadequate to that distance. This, howevar, was remedied on the 29th of July, when 20 elock signsls were given at Jersey City, and recorded both at Philadelphis and

Washington; 20 aignaly were given at Philadelphis nad recorled at Jersey Clty and Wanhington; and 20 signals were given at Washington and rucorded at Jorvay Clty and Phltaielphla. Thus the comparizon of the threo clocka was deelisively made in a romarkably ahort period of time. The auccese of these experiments amply repald the first ansucceoaful affirts. The difierence of longltude between Jersey City and Philadelphia is $40^{\circ} \mathrm{g}^{\circ} \mathrm{i}$ and between Jarsey Clty and Fiashington, $12 \mathrm{~m} 8^{\circ}$; omilting in each case the amsll fractional part of a second, whleh was ulttmately allowed for. The fistance between New Ynrk and Wayhington is 225 miles, and the time required to make a communication pess hetwixt these twn places was 4 fraction of a escond which cinn not be measured.
Soon after a syotem of telegraphic wires was erected on the principal English lines of railway, Mr. Alry had thens put in communicatlon with Greenwich Obaervatory, hia object being to give Greenwich time on a given day to the United Kingdom. It wan at frst proposed that a ball ahould be dropped from the upper part of Green rich Observatory, so ns to touch a apring communicatif. 3 with all the tolegraphic wires in the kingdom, and then, hy the striking of a beli, glve instantancously true Green wieh time to Liverpeol, Manchester, and all the northern towna, But this method was found impracticable, owing to the nou-completion of all the lines with Greenwich. On the 1st of December, 1847, true Greenwich time was communicated directly from the ofservatory to the several stations of the London and North-Western and Midland lines in connection with it; but to all other atations of these lines apecial messengers wero sent with chronometers indicating true Greerwich time. Hence, since Green wich time is naed over the whole of the V'nited Kingrom, if the local time of any piace be known, its longitude from Green wich io also determined. Since submarino cables connect Greenwich with Brassela and l'aris, and these agnin with the princlpal citiea of Firope, Mr. Airy waa very lately enabled to correct the latitudea and longitules of their observatories. Hence, also, when the salmarine cables which are to conacet Indls, Anatralia, and America, with Greenwich. shall have lieen completed, the true longitudes of the principal cities of the world wll easiny be detennined.-E. B. Sie articles L.atitrie and Losgitelof, Eartr and Degake.
L.oo-Choo Islands, a group connisting of alout 36 Lshands in the North Praifíc Ocean, between Japan und Formosa. They Nie between N. Jat, $24^{\circ}$ and $28^{\circ}$ $40^{\prime}$, and E. long. $127^{\circ}$ and $129^{\circ}$. They are amall and insignificant, with the exception of Great Ionn-Choo, which extenda about. 60 miles in a north-easteriy d!rection. aud has an averare breadth of alout 10 or 12 miles. This ieland is entireiy encincled by coral reofs, whicti, however, do not appyar above wator. Along its centre runa a chain of hills, movered for the most part by forests of pine, and broken at intervals by rupt criga that bear aeening traces of volcunle action. Their slopea ha many parts asa covered with terraced gardens aud finlds of grain, and are watered by streams led in artificitl charnels. The valleys are well watered, fruitful, ans covered with a luxuriant vegetation. Then villagen are ahnont comphitely hididen aroong groves of bananas, bunforos, banyans, and pines. how of trees overanch the roals, lina the otrcets of the chief towns, and form a acreen in front of the houses. There are large rich fiedds of rice, intermingleal with crop of augar.cane, whest, miliet, sweet petatuen, plums, oranges, cotton, and tohaceo. The principal surfactorock in argillaceous, and is inter3ected at intervals ly pecaliar ridges of limestone. The diaintegration of the furmer rock forms the chief ingredient of the rich adbeaive moil which in most prevalent in the island. Situate within the range of isie trado-windt, Loo-Clico has in general a mild climate. The domestic animals are, geese, ducks,

Powls, pigs, goats, a mall apeciea of biack ox, and n nimble, and bardy breed of horsea. Wild toars abound in the axtensive forests. A striking trait in the
soology of the faland lat the scarcity of hirds in the woods.

The droas, curtoma, hut espeeially the language, of the Ioo-Chooans, indieate a Japanese origin. Suso pleious of atrangers, they are, novertioleen, gentie and hoapitahle. They are diminutive in statnre, and in complexion reseenhle tha Chinsse. They bave dark ayea and black halr, plaited into a knot on the crown of the head; and the character of the hair-pin determines the sex as weil as tha rank of tho wearer. The women wear ainglo, and the men double hair-pin:. Among the higher classes, these articles are made of gold or allveri among the lower, of brass, lead, or pewter. The highest grade of aociety includer the sples and officere of the govarnment, and also the mechanica and amall merchants. Immediately below them are the literary class, who puss the most of their time in amoking tolacce and drinking tea, and are supported by tha subordinate rank of field-lalorers, The meanost orior are the publio daver, possessing no personal freelom, and no eivil rights. Suibected from mere Infaney to perpetual toif, elosely watched hy aples, and prevented frota all intercourse with strangers, the lower classes are spiritlesa, nncomplaining drudges, subeisting apon two tenths of the produce they reap from the soll. In the same slavish labor the women also are engaged. The Loo-Chorvans of one villuge aelloon intermarry with those of nnother. Their dead are treated with grent reapect; and their capacious tombs, built of white limestone, appear at a listance like cottagea, checkering the hill-sides. The huts are generally placed in the middie of well-cultivated gariens. Their floors, covered with thick mits, are used both for sitting and sleeping. A gre 2 part of the industrial population are engaged in winving the grass-cloth that forms the onilnury garnent, and in turning woolen implementa and covering them with lucquer. There are alao manafactured tohace, sugar, and amall quantitios of anlt. Saki, a strng intoxieating liquor, is distilled from rice. All the processes of agriculture, and eapecially that of irrigation, are carried on with great guccens. The entire trade of the island is with Japan, and consist, chiefly of eugar, anki, and grass-cluth. The goverument of Ian-Choo seema to consist of an oligarehy of literati aubject to Japan. Learning is imited to a knowiedge of the Chinese eharater and the Confucian classirs, and the principal means of disseminating it is home education. A fow regular achoola, however, are scattered over the inland, and at Napakiang there is an advanced seminary. The Loo-Chowans have no native literature. Their religion is a hytrid betwe?n Confucianism and Buddhism. Concerning the history of the island nothing eertain is known, luat tradition reports that it was once subject to three distinct serereigns.
The principal sea-port is Napa, or Napt-Kpang, gituated in latitude $26^{\circ} 13^{\prime} \mathrm{N}$., and lougitude $125^{\circ} 96^{\circ} \mathrm{E}$ The harbor is secure, and the jourt is now open to Amerinan vesaels, for the purposes specilied in the convention ronduded July 11, 1854, and proclaimed March 9,1835 . The goverrment of Japan having virtualiy disclaimed any jurisisietion whatever over the Loo-Choo Islandf, a sepparate compact was entered Into between the United States and the kingdom of Lav-Choo. It in aa follown:
" Hereafter, whenever citizens of the 1 'nited States come to Ioo-Choo, they slall be treated with great courtesy and rriendehip. Whatever articles theso peojile ask for, whether from the offleers or people, which the country can furnish, shali be seld ta then; nor ahall the authorities laterposo any prohibitory regalations to the people celling; and whatever either party may wist to buy, shall be axchanged at resson-

able prices. Whenevar ships of the United Staten ahall coma into any harbor in Loo-Choo, they ahall be supplied with wood and water at recconable prices 1 but If they wish to get other articlen, they shall be purchasable only at Napo. If shipa of tha United Staten are wrecked on Great Loo-Choo, or on islands under the jurisaliction of the royal government of Loo-Choo, ties local autheritias ahall diapatch persons to asolut in saving life and property, and proserve what can be brought ashore, till the ahips of that nation shall come to take away all that may have been saved; and the expenses incurred in rescuing these unfortunate persons shall be refuaded by tha nation they belong to. Whenever persons from shipe of the United Staten cone ashore in Loo-Choo, they shall be at liberty to ramble whers they please, without hinderance, or having officiale sent to follow them, or to spy what they do; but if they violentiy go lnto honses, or trifle with women, or furce people to sell them thiags, or du other such like illegal acts, they shall be arrented by the local officers, but not maltreated, snd shall be reported to the captain of the ship to which they belong, for punishment by him. At Tumat is a burial-ground for the citizens of the United States, where their graves and tombs shall not be moleated. The government of Lou-Choo shali appoint skiliful pilote, whe shall be on the look-out for ships appearing off the isiand; and if one is seen coming toward Naps, they shall go out in good boats, beyond the reefs, to conduct her into a secure anchrage; for which eervice the captain shall pay the pliot five dollars, and the ame for going out of the barbor, beyoad the reefe. Whenever ahips anchor ot Napa, the officers shall furnish them with wood at the rate of 3600 copper cash ( 43 cents) per 1000 catties; and with water at the rate of 600 copper cash for 1000 cattles, or 6 barrels full, each containing 80 American gallons,"
Loom (Fr. Metier a tisser; Ger. Weberatuhl), is the ancient and well-known machine for weaving cloth hy the decussation of a series of parallel threada, which rua length wise, called the warp or chain, with other threads thrown transversely with the shuttle, calied the woof or weft. Sce Jacquard, articie, Woolen Mancfactuafs.
Lorcha, the name of a coasting vessel used in the Chincse seas. One of those vessels, salling under British colors, was, in 18566, boarited by the Cantonese, had her fiag pullec down, and her crew forcibly carried off. Governor Yoh refused either reparation or apology, and this led to the conflict between Britain and China during the same year.

Lorient, one of the five great naval porta of France, and the principal town in the arrondisseraent of the same name in the Department of Morbihan, is situated on the northern shore of the Hay of Biscay, where the Kivers Searf and Havet, after mingling their waters, fall Into the Hay of St. Louis. It is a large and flourishing town, strongly fortlied, tolersbly well built, but not very clemn, standing in an angle bet ween two creeks, one of which forms the naval, and the other the mercantile port. The port, which is large and commodioun, is walied off frons the town, therely excluding all view of the water from the inhabitants. It is the eest of a maritine prefecture, of a civil tribunal, of a tribunal of commerce, of a college, and of a school of naval artllery. The dockyard is the first in France for the bullding and equipment of ships of war: there is accommodation on tia slips for the simultaneous construction of 20 shlps of - war. It has an arsenal, a park of artillery, engineering works, masting-shede and forges, etc. There is a good trade in sarilines, marine stores, iron, wax, honoy, etc. The town is quite modern. Founded tyy the French India Company, In the reign of Louin XIV., in 1664, it was not till the sline of the Duke of Orleans that the company took full advantuge of the accommedation of Lorient. The greater portion of the town
was then built, and the port. fortifed. In 1745 it contained 85 frigates, beaides a very great number of ahipa, averaging from 900 to 1200 tons burdes. In the comparatively short apece of 30 years Lorient had risen to the first rank of towns. On the diasolution of the company in 1770, it wee made one of the stationa for the French navy. Its population, nd ahipping declined daring the unsettled period of tise Revolution, but alnce the peace of 1815 it has been more than remoted to its formar activity. Population 25,700.

Inom Angeles (the City of the Anyels), capitul of Los Angelos county, Callfornia, 850 milee sonth south-east of San Franoisco, and in a direct lina 3,000 mlles a Jittle south of west from Weshington. It contains as large Koman Catholle chureh, and 1620 inhabitants. This elty was founded in 1781, by order of the Viceroy of Now Spain, Ballio Frey, Antonlo Bucareli y Uram, and is situated on the right bank of the Porciuneula Kiver, which copiously watere the highly fertile plain on whlch the clty stands. Invited by a genial climate, the inhabitente have converted this plain Into a delightful garden, covered with all sorte oad native fruite, but eapecially the vine, which ls cultivated with care and extraordinary success (the product of 1852 ameunted to $2,250,000$ pounds). This valley, famous for its whes and liquors, contuins the misaions of San Juan Capristrano, San Gabriel, and San Fernando, which but a few yeara eince constituted the richeat estabilshment in Califurnla, and numbered very nearly $\mathbf{5 0 0 , 0 0 0}$ head of cattle.

Iotteries, in their higheat application, are institutions for raising the revenue of the country by granting to those who veluntarily contribute the chance of olitaining a reversion os part of the money collected. This reversion is dictermined by lot. The first mentioned in English history began drawing at the weatern door of 8t. Paul's Cathedral, Jonuary 11, 1569, and continued, day and night, until May 6 fellowing. Its profite were for repairing the fortifications on the cosst of England, and the prizes were piecen of plate. The first lottery mentioned for auma of money took place in 1680. Lotteries were established in 1693, and fur more than 130 years ylelded a large annual revenne to the crown. The Irish state lottery was drawn in Dublin in 1780. All lotteries were suppressed in France hy a decree of the National Convention, No vember 15, 1793. They were abolished in England 1826 ; and an act was passed imposing a penalty of $\mathbf{4} 50$ for ad vertising foreign or any lotteries ia the Britiah newspepers, 1836. Abolished in Bavaria by unanimous vote of the depatiles, October 19, 1847. They have long been abolished in New England: In New York they were prohibited about 1830. In nearly all the States there is a penalty againat lotteries not specially authorized liy the legislatures. The practice may be traced back to the Romane, who were accustomed, at least in tho days e? the emplre, to ealiven their feativals with the diatribution of tickete, uniform in appeurance, but entitling the holdera to receive articles of various value. Instead of granting largesses to the lesders of the Plebs, the Emperor Augustus frequently dlatributed his gifs on the same princlple; and Heliogobalus has the merit of devising in sport a plan frequently resorted to in fraud to avoid the ponaltien against lotteries in England, of making prizes really worthless take the place of b l inks. In the middle ages the same practice prevalled at the banquets of feudial princes, who distribued their presents economically, and without the fear of jealousy; by granting lottary ticketo indiscriminately to their frlenda. The practice soon descended to the merchants; and $\ln$ Itaiy, in the 16th century, this became a favorito mode of disposing of their wares. In 1530 the "Lotto" of Florence was established for the necessities of the State, and the example was quickly followed throughout Enrope. The first lotteries with numbered tickets wers instituted at Genoa. Mercentile lotteries were
eatabilinhed in France, under Francis I., In 1890, and a tax lovied on ench tieket; but these were sopplanted In 1600 ly lottorime of money, under the diroct control of the king. The firct lottory eetablished in Eingland was drawn it 1569." It consimed of 40,000 loth, whioh were sold at 10s.' each. The prisee were plocen of plate; and the profte were devoted to the repaire of certain hariori in the kingdom. The printed plan of this scheme to ettll in posseasion of the Antiquarian Siciety of London. In 1612 a lotery was granted in behalf of the Virginin Company ; and in 18euthe ndine priviliege was mecorded to a contractor who under took to supply london whth water. From this time forward the epirit of gambling Inerensed so raptidy, and grew so ntrong, that, in the relgn of Queen Anne, private lutteries had to the suppressed as public not sances. The first parliamentiary lottery whe inatituted in 1709; and from this period till 1824 the passIng of a lottery bill wae in the programine of every sestion. Up till about the elose of the 18th century the prizas were generally pald in the form of terminable, and sometimes of perpetual, annailies. Ioans wrere also raised ly granting a bonus of lotiery tickets to all who subacribed a certaln nmount. Thls gambiling in annuitien, however, dexpite the restrictionn of an wet passed in 1793, soon lecl to an appaliling anount of vice and misery; and in 1 ane a conmittee of the Ilouse of Commona nrged the auppression of thin rulnove mode of Alling the natlonal exchequer. In October, 1896, the last publle lottery wan drawn in Britain. In France, State lotteries have been aholished, but they stlll exint in most of the continental Staten; and alitheagh demonstrably a source of lons to those who embark in them, they nre upheld as a very ready mole of procuring money from the poor, the miserly, and the adventarous. The lismburg lettery nffords the morl favorable representation of the aystem, as in it all the money raised by the sale of tickets la re-distributed in the drawing of the lats, with the exception of 10 per cent. dedncted in expenses and otherwise. In the United States, lotteries were established ly Congress in 1776, but with the exception of the southern States, heavy penaltes are now Imposed on persons attempting to establish them. Private lotteries are now illegal at common law in Great Hritain and Ireland ; and penalties are also Incurred hy the ailvertsers of foreign lotterien. Some years ago it became common in Scotland to dispose of merchnndise by meana of lotteries; but this in specially condemued In the statute 42d Geo. III., c. 119 . An evasion of the law has been attempted by affixing a prize to every ticket, no as to muke the transaction rosenible a legai nale ; but this has been punlabed as a fraud, even when it could be proved that the prise equaled in value the price of the ticket. Thin declsion rested uppon the plea, that In such a transaction there was no ilefinite enie of a specific artlele.
In 1814 art-unlous began to be entabilished in Iritain; anil an the princlple on which they are founded Involvea that of the lottery, their operations, which are in roality lilegal, were immediately sunpentied liy onder of government. In the following year, however, an act was passed to indemnify those who had emlarked in them for the loxies whict they had incurred lyy the arrest of their proceedings; and alnce that tinte they have been toleruted under the eye of the law without any expreas stutute beling fruued for their exemption. -i. 13.
Lotus. The letus ( Nymphics hotus) Is a native of the
lakes of the Cashinere, and its stema serve as an article of food. In autumn, after the plate of the leaf has begun to decay, the stem has arrived at maturity, and being bolled till tender, fumishea a wholesome, nutritious diet, which is sald to support 5000 persons in Cashmere for nearly eight monthe in the year. This plant would probably succeed weil in the maddy bottoruy of the coves, creeks, and aloughs of our lakee and
atreams) and, if not relishel as human fond, douhtiesa Iten producte would serve to nourish malmala, -I Iatenk Ofhos Rep., 1806.

- Zough, an Irish term, synonymoue wlth the Scotch loch, but not with the Einglinh lale: for loch und lough are applied to deslgnate arms of the rea, as wall we calloctuons of frosh water, which lake is not.
nols d'Os, a French ooln, firnt struck In the yeas 1640, under the roign of Louin XIII. Hy the Yronoh mint regaiations it was at longth mado equal to 24 livres, or $\& 1$ aterling. Thls, however, was unden rating it as oompared with allvir; and hence, as every one proferrod paying their delta in the oven valued coln, allver became the priacipal currency of Francethe gold cotna beling elehar sont to the malting-pot or
oxported. In oxported. In Great Britain tha procens wha reversed, gold baving, for a long period, been overvalued by their mint.
- Louiciana, one of the couthern United States, Jiea between $29^{\circ}$ and $83^{\circ} \mathrm{N}$. lat. It is 240 milles long from north to south, and 216 hroal, contalaing 41,346 square milles. Population in 1810 was 76,566 ; In $1820,103,407$; in 1830, 215,575; In 1840, 852, 411 ; and in 1850, 611,974 . The State is divided into 47 parishes. Rubert de la Sale, whea he reached the mouth of tha Miseissippl (J6N2), Introllaced the name Louisiane, in honor of the great king, as the name of the country along the great river, "from the 1llinola to the Guif of Mexleo." (Cuanlasvoix, toni, i.) Many other points and locations were vowed round the estue gulf to the mame name, king and hids sulat. Lat Side ( ficis) vowed to the saint and to the king "the Bay of St. Lonis" (Matagords Hay), discovered by him on the coant of Texan. When linerville, on the 12 th of .prili, 1699, discovered that little bay opposite Cat faland, on the coast of the continent, he introluced this name again into the Mississippl country, by naming the harbor "La Baye do St. Louin." In the jear 1001 Mr. Bienville, when he evacuated Billoxi, and removed the Fronch head-quarters to Molile Day, calleal his fort there "Fort de St. Iowia," and this name, Fort St. Louls, then designated, for more than 20 yeurs, the central settJement or capital of the Freneh Misxinsippl colony. It is carious that the nume "Ioviniame" seems noe to have been uuch used before 1712. We do not find it, fur instance, a olngle tiane mentloned in the Afemoira of MI. De Sacrolk, writen in this colony in the heginning of the 1sth century: In the yenc 1712 King Loais XIV. aulopted officially the naure "Lowisiane" for that province, which seemed now promising and Important enough for such a grace. IIe pronouncas that the countries at the mouth of the Nisuisisippl shall henemborward be called "In I'rovince de ha Lowisiane." He nt, the sauna time changes also the name of the Missinespt:, und say: that it shull at present be called "Riviere c.n St. Iantis" (the St. Louis River). The French extended the name of Lovisiena over the whole Misaiaslppl vailey, between the A1leghany Mountaina, the Lakes of Canada, Mexico, and the Rocky Muantaine, and gouth they went as far with their pretensiona as the Rio Bravo, iucluding all Texas. All the old French napp go with their "Louisiame" as far eouth nu the litio Bravo. On some maps even the peninsula uf Fiorida was called "Ia I'eninente do louiniune;" no that, according' to these French pretensions, the name "Jauisiane" comprehended the whole consts of the Gulf of Mexico which belong now to the United Stater.

The Spaniards, on the other hund, went with their name "sferion" as far as Red River and the wentera shere of the Minaisilppl, and they kept in Tex therir ground. They also kejt up their old dominion in the Fhoridna; ao that, in time, the name "Louisiane" was on the French mape more contracted. When the Spuniards acquired (1763) from France the tominien of Louislana, they retained that name, chaoging it only to "Louisiana," or sometimes also to "Lusinna,"
and eve of their Mermen the wes time of 1788) as Spuin ( branch lakes (1763-18 very am When t Loninian gulshed part of New Orl mgaln in colluny wi of the " ment of 1 inlana cor Tearl Riv weat, the little nore the name Spanish, h "Lomisian Kout. and even to "Isuciand," They put the eastorn limit of their Mexican provinces and of Toxan' at the River Mermentua, quite near to the Mialesippi Delta; and the weatern Ilmit of the Morlian wan, an well at the time of the Finglieh dominion in the Florldas (1788${ }^{1788}$ ) am after the retroceasion of theae provinces to Spain (1783), considered to be at the eastornmost hranch of the Minainalppi (Riviere, Iberville and the lakes Pontchartraln, ete.); so that during thia time (1763-1800) the name "Luaiana" comprised only a very amali part of the cosata of the Mexican Gulf. When the United Ststen acquired the dominion of Louisians (1802) this name was at flrat quite extingaished on the shoree of the Gulf. The whole southern part of old Loulsians was ealled "The Territory of New Orlenns." The old name was, however, novived ggain in the year 1812, when a part of the old French colony was admitted into the Union under the name of the "State of Iouislana." After the final nettlemeat of the boundarles of this State, the namo Louisinna comprised all the ehores between the mouth of Pearl River to the east and that of Sabine River to the west, the whole Mlasiselppl Delta, and on both eides a little inore. We may remark that the orthography of the name Joonsiana, which we have adopted, ts half Spanish, hall French. Purely Freneh it ought to he "Lowiaiane," and purely Spanlsh, "Luisioma."-J. G. Kollı.

Physical Feotures, etc.-Below the mouth of lied River, the Miasiasippl dividea into eeveral branchen or outlets, whloh, diverging from each other, slowly wend their way to the Gulf of Mexice, and divide the sonthwest part of the State into a number of large inlands. The western of these outleta is the Atchafalaya, whleh leavea the main stream at the mouth of lied River, and laclining eastward, flows Into Atchafalaya Bay, in the Gulf of Mexlco. About 128 miles below the Atchufalayn la the outlet of Phaquemine, the main strean of which unites with Atchafalaya, but other portions of it internect the country in different directions. 31 miles below the Plaquemine, and 82 stove New Orleans, is the outlet of Ta Fourche, which comaunicates with the Gulf of Mexico by two months. Below the La Fourche, numerous other amall streams brach off from the river at various pointe. On the esst side of the Missisaippl the principal outlet is the Jberville, which communicates with the Gulf of Mexico through Lakes Maurepas, Pontchartrain and Borgne. The whole territory between the Atchafalaya ou the west, and Iberville, etc., on the enst, la called the Delta of the Miseissippi, from ita resemblance in shape to the Groek letter of that name. A large extent of country in this State is annually overflowed. The alluvial margin along the Mississlppi has a breadth of from one to two milea, and is of great fertiliig. To prevent the river from inundating the valuable tracts in the rear, an artiticial embanknent has been reised on the margin of the river, called the Leveo. On the east alde of the river this embankinent commences about 40 miles below Now Orleans, and extends up the river for a diatance of 180 miles. On the west olde It continues with little interruption to ther Arkausas line. Along this portlon of the river therv are many beautiful and finely-cuitivated plantations, and a continual auceession of pleassint realdences. The southwestern part of tha State conslsts of sea marsh on the margin of the Gulf, but further inland of extensive and fertile pralries, which contain many flourishing settlements. The surface is elevated from 10 to 50 feet above high tlde. The country between the Mississippi, Iberville, and Pearl Rivers, In lis southern parts, is generally level and highly productive in cotton, augar, corn, rice, and indigo. The northeru part has an undulating aurface and a heavy natural growth of white, red, and yellow oak, hickory, black walnut, sassafras, magnolia, and poplar. In the north-western part, the Red Biver, after entering the State by a
dingle ohannel and Aowing mbout 80 miles, spresde into a namber of channela, forming many lakea, talands, und ewamps, over a opace of 60 mlles long and 6 broed. The bettoms on the river are from 1 to 10 millen wide, and vary fertile. The timiner is willow, cotton-wood, honey-locunt, pawpaw, and buekeye ; on the rich uplande, elm, ast, hlekory, mulberry, black walnut, with i profusion of grape vines. On the lese fertile and asendy eplands of the State are white pltch and yellow plnes, and various kinde of oak. There wore in this State in $1850,1,590,025$ acres of land lmproved, and $8,989,018$ of unimproved land In farms. Caah value of farms, 75,814,398; and the value of implements and machinery, $11,576,038$.

Live Stock,-1Horses, 89,514; sases and mules, 44,849 ; milch cowa, 106,576 ; working oxen, 54,968 ; other cattle, 414,798; sheep, 110,388 ; swine, 597,301 . Value of live stock, $11,152,275$.

Agricultural Praduets, elc.-Wheat, 417 buhhels; rye, 476; Indlan corn, $10,266,378$; oats, 89,637 ; buckwheat, 8 ; peas and beann, 161,732 ; potatoes, 05,632 ; sweet potatoes, 1,428,453; rice, 4,425,349 lbs. Value of products of the orchard, 222,859 ; produce of market gardene, 148,829. Pounds of butter made, 683,069; of cheese, 1,957 ; Bugar, hhds, 228,001 ; maple nugar, 255 pounda; molasees, $10,931,177$ gallona ; bees' wax and honey, 06,701 pounde ; wool, 100,897 ; cotton, 178,787; silk cocuons, 29; hops, 125 ; tobseco, 26,878; hay, 25,752 tons ; clover seeds, 2 bushels ; other graas needa, 97 buahela; and there were made 15 gallons of wine. Value of home-made manufactures, 139,232 ; of alaughtered anlmal , $1,458,990$.

Rivers, etc.-The Misolsaipil River forme the boundary of the State for a conalderable datance, and in Its lower part runs wholly within the State, and entirs the Gulf of Mexico by eeveral channels. It is navlgable for veasela of the largeat slze. Red River enter the State noar the north-west corner, and passes through In a southeaat direction, Gischarging a vast nmount of water Into the Missiasippi, 236 miles alove New Orleuns. The Washlts runa in a south direction in the north part of the State, and enters Red River a little above Ita junction with the Mississippl. Buyou Ia Fonrche and Atchafalaya are large outleta of the Mlasisalppl. The other rivers and streami are the Black, Tensuit, Sabine, Calcasieu, Mermanteau, Vermillon, Teche, Pearl, Amitie, Iberville, ete.

Manufactures.-There were in this State in 1850, 8 estahliahments with a capital of 225,000 , employing 347 persons, and making 1,570 tons of castings, etc. valued ut 312,500; 96 flouring and griat mills, 120 asw mills, 16 tannerles, 47 printing offices, 60 newspapers -11 daily, 6 tri and semi-weekly, 87 weekly-and one monthly publication; aggregate number of coples issued annually, 12,416,224. Capital invested In manufactures, $\$ 5,304,92.4$; value of manufuctured articlen, $\boldsymbol{6} 7,045,814$. On the lat of January, 1856, there were 7 railroads, with III miles of track rinished and in operition.

The principal places in the State are Baton Rouge, the capital, New Orlenns, Jackson, St. Francisville, Opelousas, Grand Coteau, Alexandria, Natchitoches, and Shreveport. There wore, January 18t, 1853, 7 banks in the State, with an aggregate capital of 612,000,000. Tonnage, same year, 156,273 tons. Total value of exports of American and forelgn produce, $1852, \$ 49,058,885$. Value of imports, $\$ 12,057,-$ 724.

Loulsiana was first explored by the French, and meceived its name in I682 from M. La Salle, in honor of Louls XIV, and a aettlement was attempted in 1684, but falled. In 1699 a more auccessful attempt was made by M. Tberville, who entered the Mississippl and founded a colony. His efforts were followed by Crozat, who held the exclusive trade of the country for a number of years. About 1717 he tranaferred his intereat to a chartered comp.ny, at the bead of which
was the notorieus John Law, whoee mational bank and Misodeolppl apeculation Involvod half the Freach nobllity. In 1781 the company resigned the concern to the crown, who, in 1762, oeded tine country of Louislann to Spain. In 1800 Spaln re-conveyed the province in France, from whom, in 1803, the United States
purchased the entire territory for $15,000,000$. The portion now included in the State formed a constituBlon, and was admitted into the Union in 1812. A second conatitution was adopted and went into operation in 1845, and the third and prenent one was iormed und adopted in 1852.

New Orleans is the prinejpal port on the Shasisaippi, and the natural dépôt for the commierce of the great central valley. It is situated on the left bank of the river, 100 miles from the Gulf of Mexico, In Int. $29^{\circ}$ $58^{\prime}$, and long. $90^{\circ} 7^{\prime}$. Its site is low and ntarnhy, and in the nommer and fale very sickly. Two rallroads connect it with Lake Pontc,artrain, and thence ateamtoats connect with Mobile, etc. it communicatea northward by the New Onleans, Jncknon, and Great Northem Rallroal, and weatwarl by the New Orleans, Opelousar, and Great Weatern Railroad. Its conumerce by river ls carried on bis steaniboats In constant anccession, and theae traverse the great riveand tributarien for thousands of miles. lly these means it recelves and diptributes its merchandive. The nverage value of produce recelved from the interior, is about $120,000,000$. Its forelign eraile ts $\mathrm{co}-$ extenalve, and with regard to cotton and algar, it in the first port of the Unlon. The depth of water in the river, opposite New Orleuna, in at a inedlum of 70 feet, and it malntains soundings of 30 fept untll within a mile of its confluence with the sea. The river has four principal passes. The tonnagge of the port in 1856 , wai 163,308 tons.

Low oll, an important manufartoring town in Middlesex county, Masmachusetts, on the rlght bank of the Sterrimack IIlver, at itn Jonetion: with the Coneord, 25 miles north north-west ef Ioston. Although the site of the town has consifleralile inequality of nurface, lts otreets ure regularly lahd out, and lntersect each other at right angles. The private residences are spacious, and many of them elegant bullainge. Among the
putilie edffices, the chlef are the court-house, the tueclannles' hall, a nick hoapital for operatives, and a market-honae. The literary Inatitutions of the town aro very efficient, and have lieen of constideratile service to che community. The Mechanic Assacintion, Ineorporated in 1825, han a valuable llbrary of abont sonn volumen, and a acientlic apparatus; whlle the eity nehool llirary contains 9600 velumes, and is op-11 to all on a small yearly payment. The great advantnige which lowell enjoys for a manufacturing town is derived from a descent of 80 feet made by the Merrimack, and known as the Pawtucket Falls, which, hy seans of canals nnd locks, proviles aluudanee of water power. Iiesldes these there is a spaclous reservoir, placed on an clevation eastward of the city, which furnialies an inmerse supply of whter at all times in easo of fire. The principal goods mantfactured leere are cotton, wool, and iron. The first is made Into cotton cloth ranl enlico; the aecond into carpets, cloth, and coarse atnffs; and Iron into machinery and wire fences. Ilealilen these, lowever, Heaching is carricd on extensively, as well as the preparation of dyet, glue, and other essenthuls of the cotton and wool manufactures. In dabaary, $18: 50$, there were 12 manufacturing companles in lowell, owning 52 mills, and working 371,838 quinilles, and 11,407 looms. The nggregate quintlies prouluced every week wero $2,230,000$ yards of cottin cloth, 30 , 000 yaris of woolen cluth, 25,000 yards of carpeting and 50 rugn. In the same year. $414,500,000$ of coplat was invested in the while nanutactures of the place; while the number of handa einployed ameunted to

8723 femalos, and 4542 males. Nivery attention is paid by the mill-ownere to the heulth and morality of their operatives. One of the best proofs of the general good conduet of the mill-workers here is shown in the jurge amounte daposited by them in the savings-bank; sad also in the interest they take in the Ilterary and scientifio assoclations connectod with the factories.

In the rapidity of its growth, and in the extent of Its manufactures, it stands prememinent ; it has attained its present poaltion altogether from the extent of liss munufacturing facilititis. A tract of 400 acres, constituting the most central part of the present city, was isid out in 1821. It was purchased for $\$ 100,000$, and the owners were incerporated the following year, under the title of Merrimac Manufacturing Company, and the first mill ereated. Population 1820, about 200; $1830,6,477$; 1836, 17,830; 1840, 20,796; 1850, 88,283; and in 1854, 40,000. In 1834, Belvidere villags Was atded to it, making a territory of nearly 5 aquare miles, and in 1836 it was incorporated as a city. Loweif ties on the right bank of Merrimack River, at the junction of Concord River, and at the intersection of several lines of rallroads, It was originally known as Pawtucket Falis. The water power is very oxtensive, sad easily available. A canal, 100 feet wide, 16 feet deep, and 11 miles in length, supplies the factories with water, taken from the Concord River, at I'awtucket Falis. The entire descent is 31 feet. The proprietors of the "Locks and Canals Company," acting under a chartor granted in 1792, with a capitai of \$600,000 , supplies the water power to the different manufacturing estabishments. The Merrimac Manyfuefuring Compaty, was chartered in 1822, has a capital stock of $\$ 2,000,000$; with 5 cotton factories, with $67,-$ 965 spindles, and 1,920 looms, employs 1,600 malos, and $6+5$ females ; manufactures 18,000 yards of printe and sheetings annuslly. Connected with this Compary is an extensive print works. The flamilton Mawufacturing Company, chartered in 1820, with a capfanl stock of $1,200,000$, has 3 cotton factories, with 36,228 spindles, and 1,002 looms, employa 875 fomales, and 360 males ; manufactures $10,000,000$ yards of priats, flanneis, and sheetings annually. 1t also has aa extensive print works. The Appleton Company was incorporuted in 1828, with a capital of $\$ 600,000$; has 2 cotton factories, with 17,920 spindles, and 538 looms; employs 480 fomales, and 120 mules; munufactures $6,500,000$ yards sheetings and shirtings annually. The Lonvell Manufacturing Company was chartered in 1898 , with a capital of $\$ 1,000,000$; has a cotton factory, 7,142 spindies, 244 looms, and 4 earpet factory, 4,300 spindles, and 80 loonis, the whole employing 500 females, and 225 males; manufacturing 4,940,000 yards rugs, earjeting, and cotton eloth, unntally. The Sfidllesex Mfanufacturing Company was chartered in 1830, with a capital of $\$ 1,000,000$; has 3 mills, with 13,006 spindles, 45 broadeloth, and 375 cassinere looms, nad 3 dye-houses, omploylug 950 females, and $8: 20$ majes ; munufacturing 950,000 yarda of broadctoths ond cassimeres manully. The Suffolk Manufacturing Company, ehartered in 1830, with a capital of $\$ 600,400$, has 2 factorien.-Sen Statistits of Mass., 1855, for further items.
Lowering, among distiliers, a term empinyed to express the debssing the strengti of any spiritnous liquor by mixing water with it. The standurd and marketaile price of these ligaors is fixed in regari to a certain strength in them cailed proof; or, that streng:in which makes them, when shaken in a phial or jourei from on high into a glase, retain for some time a froth or crown of bubbies. In thin state sjifites consist uf about haif pure, or totally infiammable spirits, and half water; and if any foreign or home ajuirit be exposed tor sale and found to have that proof wanting, searcelj; any iody will buy it until it has been distijied argain and brought to the proper atrength; and If it lee above that strength the proprietor usually adds water
to bring it down to the etandard. There is another kind of lowering among the retailers of spirituons liquors to the vulgar, by reducing it under the standard proof. Whoever has the art of doing this without destroying the bubble-pronf, which is easily done by means of some addition which givea a greater tenacity to the parts of the spirits, will deceive all who. judge by this proof alone. In this oase, the best way to judge of liquors is by the eye and the tongue, snd eapecially by the instrument called the hydrometer.

Iubber, a contemptuous name, given by sallo-a to those who know not the duty of a seamsn, Lubber: Hole is the vacant space berween the head of a lower mast and the edge of the top. It is so termed from a aupposition that a lubber, not caring to trust himself ip the futtock shrouda, will prefer that way of getting into the top.

Jubec, one of the free cities of northern Germany, and nominally the chief of the Hanee Towns, is the capital of a small territory, is situate on a gentle sidge between the givers Trave aud Wakenitz, 10 miles from the mouth of the former at Travenuande, and 36 miles north-east of Hamburg. Lubec is the espital of the four free or IIsnseatia towns, and the meat of their supromo court of appeal. The court eonsiats of six members, one of whom is chosen by each of the free towns; Frankfort and Bremen nominate the fifth; while the sixth is named alternately onee by Lubee and twice by IIamburg. The president is choeen annually by the senates of the four towns. The present city of Lubec was founded in 1143 by Adolphus 11 ., Count of Uulstein and Schaumburg, by whom it was ceded in 1158 to IIenry Duke of Saxony, surnamed the Lion. In 1226 it was made a free imperial city by Frederic II. At this time it was an important comunercial city, and was rapidly inereasing. In 1241 it entered into treaty with 1 Hamiurg, and thus laid the foundation of the IIanseatic League, of which it became the head about 1260. For four centuries Lubee continued in a flourishing condition, and is said to have at one time contained 200,000 persoas. After the dissolution of tho League, which took place in 1632, it gradually fell into decay, and has never again attained its former impretance. Afler the battle of Jena in 1800, tho Prussian general Blucher, with the remains uf his army, took refuge in Lubec, which was then stormed by the French, and sacked and pillaged for three days. In 1810 it wus annexed to the French empire, and so remained till after the battle of Leipzig in 1813, when it was restored to its political independence, and subsetueatly joined the German Confederation as a free city. It has one vote in the full council; but in the select council it has only one in conjunction with the other free towns. Lubec is one of the anost picturesque old towns in Germany. Ito streets are genorally straight and regular, and its public bulidinge, which are mostly of brick, have undergone little change since the 15 th century. Many of the houses are in the old-fashioned atyle, with their guaint gables toward tho street; and not a fow of them are remarkable for the richness of their architecture. The old rumparts of the town have been laid out in public walks. Tho finest building in Luisec is the Marienkirel e, founded in 1804. It is in the pointed Gothic style, constructed almost entirely of brick, and surmounted by swo towers with spires rising to the height of 430 feet. It has three naves; the roof of the centre one rising to the unusual height of 184 fect. It contains numemos monnments and paintings-tho latter by llobbein, Vaudyck, Overbeck, etc. The "Dance of Death," dated 1463, is remarkaile as representing the costumes of the period. Tais church possesses a very fine organ, and bas also a curious old astronomical clook, construeted in 1405. The Dollkirche, or cathedral built betwren 1170 and 1341 , is alinost entirely of briek, and has two towers suranounted by spires 300 feri high. It contains numerous

## LUC

monuments to bishops and othors connected with Lubec. The screen of the choir is $n$ master-piece of wood-carving of the early German school. ' In one of the slde chapels is a painting by Menling representing the Passion of uir Saviour in 23 distinet groupa. The town-house, on the market-place, is a curious old Gothic brick bullding, completed in 1517. Heré in uncient times depaties from 85 citles In Germany composing the Hanneatic League, held their alttlog*. The educatlonal and charitsble institutlons are numerous; bealdes which there are an exchange, mint, arsenal, publle library with 87,000 volumes and a theatre.

Lubec is rtill a place of considerable commercial haportance. It trades lurgely with Hamburg by menns of the Trave and a canal, and aleo with Russia, Deninark, Sweden, and Finland. A branch line conneets it with the Hamburg and Berlln rallway: Regular steam communleation is kept up with Copenhagen, Stockholm, and'St. Peteryburg. Vessele drawing not more than ninc feet of water can come up to the town, but larger vessuls load and unload by means of lightere at Travemfinde, between which and Lubec smail steamers are constantly plylng. 'The chlef exports are-corn, cattle, wool, fron, and timber; imports-wines, silks, cottons, hardware, coloninl products, and dye-stuffs. In 1855, 972 vessels, carrying 55,266 Jasts, entered; and 958 veasels, carryling 54,246 lasts, left the port. The manufacture are numerous, thut not large or important. Among the chlef are woolen, linen, cotton, and silk goods; tobacco, eoap, paper, playing-cards, musical iristruments, hats ; and lron, eopper, and brass wares.

Its trade is principully carrled on with tho Baltle States, to whleh it exports com, eattle, wool, fish, fron, and timber. Its imports comprise wines, ailks, cottons, hardwares, and other manufactured goods; also colonial produce, dye-stulfs, etc. The terrltory belongligg to Isubee is about 20 milles in lenifth, hy 3 miles in breadth, containlng a population of 59,166 , chlefly employed in the rearing of live atock. In 1852 there entered the port of Lubec 2086 vessels, measurIng 262,724 tous, viz. : salling veksels, 1609, of an ag. gregate tonnage of 170,096 tons, and 387 regular steam-packeta, of an aggregate of 92,628 tons. Russia holds the first rank in the trade of Lubec. Of the whole number of vessels entered in 18.22 (20R5), there were ander the Russlan flag 456 vtasels, with an aggregate of 85,730 tors. The total ihports into this port in 1852 reached, in weight, $122,000,000$ kilos. ( $2 \cdot 20$ Jhs. each), viz.: ly sea, $94,000,000$ klles.; hy land, $28,000,000$ kilos. Thls was a falling off from tho preceding year of $10,000,000 \mathrm{kllos}$.

Among the imports of 1852 were: tobaeco, $1,049,132$ kllos. ; entton, drugs, and dye-stuffs, 4,031,8.19 kilos. ; coffee, $2,291,526 \mathrm{kllos}$; sugar, $4,278,066$ kilos.

The total imports in 1851 amountad to $182,333,000$ kilos. ; but the increase of $10,000,000$ kilos. was attributahle to the heavy stock of material introdnced by those engraged In tin sonatruction of the rallond bet ween liuber and Hamburg. A comparison with the precedling years of regular trade wifl show a steady, though a gradual increase. In 1850 the total Imports reached $120,000,000 \mathrm{klios} .$, or $2,000,000$ less thain In 1852.

The general imports of Lubec are thun ciassifled : Manufarfuree.-Incinding, principnlly, Hquorn, watches, jewelry, hariwane, gunpowder, plece-goods, glass-ware, 13,954, ben kllon. Coloninl, or tram*. 1 tlantic Jerchundise.-Coasisting of coffee, cotton, drugs, dyestuffe, augar, tobarco, anil tea, $11,708,795 \mathrm{kjlos}$. Animal Substances.-Consisting of lutter, cheese, wax, ollh, wool, peitry, sllk, $2,827,253 \mathrm{klloz}$. Mfetnf.Chlefly of inon and copper, 6,121,736 kllos. Bfisel-lumeous,-llucluillng sulted fish, tailow, grainn, tlmber, pot-anhea, etc., 88,424,913. 'Sotal, 123,037,477 kilos. Manufactures reoreacut 11 角 per cent., coionlal, or
trens-Atlantle merchandise $0 \frac{1}{2}$ per cent., metals 5 per cent., and all other Imports 74 per cent, of the total trade.
Elatement showing the Steam Navigation between Lnbec and the Baltic Ports, from 1849 to 1852.-1840.- Between Travemande (the port of Labec) and Copenhagen-royages; 67; passengera, 1955; recelpte, 152,046 france. 1850.-Bet ween Trsvemunde, Copenhagen, and Gothenhurg-voyages, 61 ; peaset. gere, 2858 ; recelpts, 194,788 france, 1851.-Between Travemande, Copenhagen, and Gothenburg-vo;agen, 87 ; pasaengers, 8,415 ; receipts, 187,884 francs. 1852.-Between Lubec, Copenhagen, ${ }^{\text {a }}$ and Gothen-burg-voyages, 20 ; passengert, 8081 ; recelpts, 114,860 francs.
The merchant marine of Lubeo in 1853 consisted of 65 vessels, of 18,800 tons aggregate, viz., 60 sailing vessels, of 11,898 tons, and 5 steamers: The once extemsive and flourishlng trade of Lubec had dwindied down to the mere shadow of its former greatness, The tardy communlcation with Hamburg (a city on which it depende almost exeluaively for lta commercial activity) by canal navigation, contributed much to deprens Its commerclal enterprise; and, hence, its merchanta have, for a long period, been strenuous and unremitting in thelr efforts for the construction of a railroad that would connect them with that city. Denmark, however, jeulous of any enterprise that would be likely to create a rival for the trade of Kiel, whlch town is also connected by railrond with Hamburg, long refused permiselon to construct the contemplated railroal acroas any portlon of its territories. The dlfficultles were, however, adjusted, the roml conatructed, and during the past few years the trade of Lubec has risen to considerable Impertance. In $1 \times 50$, before tho connectlon by rallroad was entabliahed, the merchandise whleh passed between the two cities amonnted to lut $\mathbf{2 6 , 0 0 0}$ quintals of 106.85 lis , each; in 1853, after the rallroad was opened, It ascended to 267,380 quintala, vlz., 89,575 Hamburg merchandise, and 177,805 forelgn merchandise, forwarded via Janburg. The Unlted States has no direct trale with Lubec, such of its staples as reach that market heing supplied either from llamburg or Altona, chiefly the former.

The total value of imports in 1854 (principally articles of liritish manufacture, flour, dried fish, butter, live stock, lumber, sulted meat, olive oil, wine, rice,
 United Kingdom, $£ 27,880$ from liritish colonies, and $£ 26,433$ from forelign States. The nett amouut of the general revenue in 1854 was $£ 14,098$; belng, custom duties on inports, $\mathbf{£ 6 4 8 2}$; on tonnage, $£ 744$; assessed and other tuxes, $\mathbf{£ 6 8 7 2 \text { . The nett expenilture for that }}$ year was $£ 18,505$. The total population in 1854 was 24,123 , of whom 480 were male and 517 femsle whites, 11,081 male and 12,095 female persons of eolor. The chief town of the Island is Custries, which contalus sbout $\mathbf{3 0 0 0}$ persons. St. Lucin was tirst colouized by Engilsh settlurs in 1639, but these were soon after driven off by the Caribs. About 1650 the French effected a settlement, and from that time to 1803 , when it was tinully capitured by the English, it betonged alternately to Franco and Eugland. The government is administered by the commanding officer of the troops, a lleutenant-governor, and an executive councll, consisting of the colonial eecretary, the attor-ney-pencral, and the secoud military officer. There is also a legislative ceuncil, composed of tive official and tive non-offictal mombers, in which the celonisi secretary and nttorney-general have seats and votes, and of whieh the commanding officer is presldent. The
altered by orders of council; are the lawa of France, antecedient to the Code of Napoleon.

Lufir, the order from the pllot to the stersman to put the helin toward the lea side of the ship, in order to make the shlp sail nearer the direction of the wind. Hence, luff round, or luff a-lee, is the excess of this movement, by which it is intended to throw the shlp's head up in the wind in order to tack her. A ship is also sald to spring her luff when she yields to the efiort of the helm by salling nearor to the line of the wind than she had done before. Luff Tackle, a name given by sallors to any large tackle that is not destined for any partleular place, but may be variotsly employed as occasion requires. It is generally somewhat larger than the jigger tackle, although smaller than those which serve to hoist the heavier materials into and out of the vessel; which latter are the main and foretsekles, the stay and quarter-tacklee, and so forth.

Iug-Bail, a square sail, holsted ocensionally on the mast of a loos or small vessel, npon a yard which hangs nearly at right angles with the mast. These sails are more particularly used in the barca-longas navigated by the Spanlards in the Moditerrancan.

Iumber. One of the distinguisning characteristics of the United States is the quantity of $v, o o d$ and lumber they furnish. Of the well-wooded countries of the world, Russia, Sweden, Norway, and Amerlea, this country, no doubt, ranks as first. A discriminating writer, Volney, onee described this country as "one vast forest, diversified occasionally by cultivated intervals." If this is less true than it was a century or even half a century ago, it applies in the main at the present moment. Evon the oldest States of the Union, such as New Harapoh ire, New York, and the Carolinas, are still famois for both the quality and quantity of thelr lumber. And Maine, that had nomething like settlemente before any other portion of New England, is to this day the great lumber State of the land. lience, perhape, the name it sometimes gete the Pine-tree State. The trees of any country are valuable for at least four distinct purposes, for fuel, for shelter, for the fool many of them afford, ind for ornament. In the last point of view, which is generally considered the least important, irees are of much consequence. England has oftained the name of an extensive garden, very much through its beantlful snscle trees and shrubbery. One half of the beauty of many of our New England villages would be lost in the warm seasen without their elegant naturel sereens in the shape of trees. It was Lord llacon who said that "a tree in full leaf is a nobler object than a king in his coromation robes." No artist would ever think of presenting a tine lindseape without trees, And eo iniportant are trees regaded as objects of beauty and shade, that ornamental tree assoclat'ons are springing "ri in different parts of the country, whose olijects are to adorn streets and highways with our beautiful eimas, maples, and evergreens.

It is stated by Michanx that the Inited Statos there are 1.10 species of torest trees which attain a greater height than 30 feet, while in France there are only 18 of the same description. And we suppose that the con:purison would be similar if exiended to Grest Britali, Spuin, or Germany. No wonder, then, that our forest scenery so much surpasses that in the west und eouth of Eumpa, and that Eamopean travelors tilink that it la worth while to ceoss the Atlantic to see our forest seenery as painted by the Invisible artist every nitumn.

So great is the interost in portions of Europe to promote the growth of foreat trees that assoclations have theen formed in Germeny and other countriss to plant forests upon soll udapted to thoir growth. The vast amount of forest trees unnually used by such a country as Great Itritnin may be estinated by the fact that to build a 70 gun ship 40 acres of ship timber are re-
quired. In the light of auch a fact, it may be meen | eate aiready existlog, and to promote the growth of that it is none too early for the people of this country $\left\lvert\, \begin{aligned} & \text { others-on the waste lands thit already ebound in va- } \\ & \text { rious wections of the conntry }\end{aligned}\right.$

more sparingly. It is atated that the oent hard pine for ahlp-building grows on the Alatamaha River in Georgia, and on the Waccamaw River In Sonth Carolina. It la but a few years alnce bard pine has been used in ship-building. It is now omployed extensively In New England, and is considared as good for many parts of a ship as oak. During the year 1854 a commission house of thia city sold alout $23,000,000$ of feet, to be used mostly jn Massachusetts and Maine. It will be perceived that this house sold $5,000,000$ feet more thun all that was anrveysd in the elty for that year, showing how large a part of the lumber sold here is not aurveyed under our surveyor-general. Formerly there wss no hard pine obtained at the Bouth axcept what grew immedaitely upon the rivers. But within five or six yeara the timber upon the margin of the streams has become scarce, so that now it in conveyed for sevoral milen to the rivers, and in some cases is floated 300 miles to some sea-port, from whence it is shipped to the North or to ferelign ports.
The reciprocity treaty that has recently been effected between the Unlted States and the British possessions in Nerth America ls quite sure to increase our lumber trade, es Canada and the other provinces abound in this great staple. A few statisties will give some iden of the wealth and activity of the Britsh provinces in this department. In 1832 the new shlps buitit in the British colonles were of 32,778 tona burden; while in 1841 the tonnage of the shlps built amounted to 108,038 tons, and in 1850 to 112,787 tons. Most of these ships were built for the British markst. In the city of Quebec, according to Andrews'a Report on Colenial and Iake Trade, there are about 25 shipbuiding establishments, and 8 or 10 floating docks. The vessels bulit there aversge from 500 to 1500 tons. In 1849, 114 vessels were buitit in New Brunawlek, of 36,534 tons burden. Most of the ships built in New Brunswick are censtructed in St. Jehn and St. Andrewa.

Of these exportationa, more than half of the naval slores go to England, and more than half of the lumber to Cuba.
The ship-building Interest alone of Massachnsetts consumes a vast amonat of lumber. In 1837 the ves. sels built In the State were estimated to be worth 81 ,370,649 , and the agricultural and damestic artlcles consuming lumber were worth $\$ 2,952,317$. The persons employed in this handiwork were $\mathbf{3 9 5 0}$. The extimated vaiue of ahips built in thils State in 1854 was \& $5,000,000$. If the value of agricultural and other articles requiring tinther adraneed in the same ratio the value was fuily $10,000,000$ for that yoar.
There were built in the United States in 1854, 1774 veasels of all descriptions, with a tonnage of $5: 3,636$. About a sixtl of the value of the whole we flud to have been built In Massachusetta. The value of the whole, then, in round numbers, may be stated at $\$ 30$,$000,(0) 0$. It la true that the demand for vassels was unusual, and the prices obtained tha same. What de. struction of forests was made by the ship-binilding of that single year !

The lumber trade of this country in limmenan. It costa $830,000,000$ a year to bulld our ahips, and we may form some ilea of the cost of all the buidings erected in the country for a year, and then of the cost of ali other articles made of wood, and of the coat of the lumber material required.

Lute, a substance used for making vessels or apparatus air-tlght, by closing the apertures of their jointa, or for costing, so as to enable thein to bear a higher temperaturs, or for repairing a fracture. Clay is the basia of masy lutea; whence the term, from lutum, clsy. Among the princlpi lutes are Stowerbridge clay, in fine powder, inade into a paste with water; Windsor loam, a naturs mixture of clay nad sand; Wilis's lutd, a thin paste made of a solution of borsx, in boins; water, with slncked lime. Mixturea of borax and clay also form useful lutes. Whst is called fat luts is a mixture of pipe-clay with drying linseed-all. Caustic lime furnisiea, by admixture with orther bodies, a varicty of lutes. A mixture of lime and white of egg, or glue, forms a powerful cement. Cron cement is useful for making johints tight, as is alao white lend ground up with oil and apread on atrips of cloth. Among the other substances used us lutes, may be mentiotsa: molatened bladeler, paste, and paper ; pajeer propar with a mixture of wax and turpentine, linsced-me $u$, and canatchouc. The last named substance is in exten-
olve nee for making chemical joints or olastio connectors, getting rid of that rigidity: which, in a complicated arrangement of apparatus la coliable to lead to acoidont.

Inte, atringed Inetrument of muale, long aince superseded by the harp and the gultar, but for centuries very fashlonable in Europe. The music for the lute was writton in tablature.
Tuzury. The Instances of extravagance and luxury are numorous in the history of almost all conntries, anciant and modorn, and many- lawa have been enforced to represe them. : Horace mentlons fuwls dressed in Falornias wine, musclea and oyaters from the Lucrine lake and Circean promontory, and black game from the Umbrian forests,-Iardver. Lunullus, at Rome, Fis distingulahed for the Immedorate expensee of his meals. Il is halle were named from the different goda; and when Cleero and Pompey attempted to surprive hlm, they were amazed by the cootlinese of a supper which had been prepared upon the word of Lucullus, who merely ordered his attendants to serve In the hall of Apollo. This feast for three persons casually mat would have auficed for 800 nobles opecially Invited. In Englaud, luxary was restricted by law, whoreln the prelates and nobllity were confined to two conrmes every'meal, and two klinds of food In every course, oxcept on great feotivalo. The law alvo prohiblted all who did not onjoy a free entate of $\mathbf{\Sigma 1 0 0}$ per annum frum wearing sirs (see Funs), skine, of sllks: and the nee of foreign cloth was confined to thi royal family alone: to all others lt was prohibited A. D. 1837. An edlet was lasued by Charies VI, of France whleh anid: "Let no man presuma to treat with more than a soup and two dishes." 1340.-Maydn.

Iying-to. A nautical term denoting tive state of the ehlp when the aails are so dlsposed us to sounteract each ocher, and therehy retand or dest roy the srogreasIve motlon of the vessel. The fore and main s'ay-kails and mizzen try-sail serve very well f . chis purpose, as they cause but litt's way, and b* dfficient power to keep the ship heeted over, and therefore ateady, with her decks turned from the sea. When the rea runs very high, the lower salls are llable to the becalmed by the waves, and therefore to suffer the ahip to roll to wind ward; the malntop-sail is then med.
IyOns ( Yr . Lyom, ancient Ingdunum), the capltal of the French Department of Rhone, and till rucently ranking, In point of population and commercial importance, as the necond eity of the empire; but the last census returns ehow that in the former of these reapects it has leen exceeded by Marseilles, It la situated at the junction of the Saine with the Rhone, and on the Paris and Marnellles Ruliway, 316 miles frotn the former, and 218 from the latter city; lat. $45^{\circ} 45^{\prime}$ $45^{\prime \prime} \mathrm{N} ., \mathrm{long} .4^{\circ} 49^{\prime} 33^{\prime \prime}$ F. ; elevation alove the level of the sea, 963 feet. The livera thône and Saóne heIng looth navigable, it enjoys great faclitien for trade; but it is as a manufacturing eity that it la chlefly cet. obrated; and in this reapect it is juatly elititled to the name of the French Manchester. Tbe staple articles of manufucture are ailk stuffis of all descriptiona, and whleh for richness and beauty are unequaled. In this manufacture about 100,000 of the population are either actively or Indirectly concerned. There are no exuct athtiatice of the silk mannfacture at liyons; but the following extract from a letter by the I'resident of the Chamber of Commenceat I.yons, dated Irecenber 19, 1863, is mald to give very naarly the exact results : " Juring the present year, and the two preceding, the manufacturern of silk at L.yous have employed about 60,000 machines (metiers), acattered over a district of alwat 40 miles. These machises have consumed alout $2,600,000$ kilogrimmes of allk ( $5,500,000 \mathrm{Jbm}$ ), valued at $160,000,000$ france ( $\$ 32,000,000$ ) ; and the manufac-
trared' atuffrat at $250,000,000$ france ( $050,000,000$ ). It le entranted that the home consumption amounte to one fourth or one thind of that quantity. The balarice is ex ported to all parts of the civilized world $;$ but b: fur the largeat foreign market ls found in the vidited States:" The allk manufacture in Lyons is not er rried on in lazge fectories, but on the domestio syotur in the dwellinge of the mator-wcarvers, each of which hes nsually from two to aix or alght looms, which, with tholr fittings, are gemerally his own property. IIlmcolf and as many of his family as can work are employed on these booms, and frequently alps one or more compagmont, ur'journoymen. The numlerr of masterweavars In the oity and anburbe la esticicated to be about 9000. . The ailk merchante, of whon there are about 600 in Lyoss, oupply the ollk and patterns to the owners of looms, who are intrusted with the task of producing the wob in anished atato. The weav Ing populatlon, though earning comparatively good wages, are an lguorant and degraded race, living in a diagracofully filthy state, and anowing little denire to lmprove thelr econdition. Few of 'so journeymen ever raise themaelvea to be master-weavers. The ailk manufucture was established here $k ;$ Itulian refugees in the middle of the 15th century. It was aearly ruined by the revocation of the edlet of Nantes, which dispersed most of lts best workmen to Spltalfields, Amsterdam, Crefeld, and other places. Lyons has nomeruus dyoworks, printing entablishmenta, founderies, flasgo works, potterien tan-yarle, breweries, chemical works, boat-building yards, erc.; but these are all insigniticatat compared with its chief hranch of lndustry. The commerce carried on by meana of the rivers is very considerable. The town is built principally on thr tonepis ui iand, or penineula, het ween the khone and Saone, each of which is erossed hy elight or nine bridges communicuting with axtensive ouburbs lying to the east and west. The old portion of lyons conaists ehiefly ef narnow, crooked, and dirty atreets, rendered dark and gloomy by the grent height of the houses on each slde, which are generally seven or eight stories high. Aloout tbree fourths of a century ago, the point of confluence of the two rivers was romoved about a mile further south, and on the alditional terrioory thus acyuired the suburb of l'errache was formed. This has been laid out on a regular plan, and now coutsins many elegant streats and some very agreasble promenades. The suburb of La Croix Konase, to the north of the town, and that of Fourvieres, on the right bank of the Saone, are chietly inhibited ly silk=weavers. Those of Brotteaux and Guillutiere are on the left bank of the thine. The best view of the cown and neighborhood is obtained from the summit of the ateep hill of Fourvieres, on the right luank of the Saone. The fortifications of Lyona consiat of 18 detached forts, erranged in a circle of $12 \frac{1}{2}$ miles around the town, crowning the helghts of St. Cruix and Fourvières, and of Croix liousse, alove the suburb of that name, and including In its circuit the auburbs of Brotteaux and Guilloticre. These fortilleations are required more to quell insurrections among the Inhabitants than to withatand attacks from without. In 1831, 1834, and 1837, formidable riota tools place, in which many lives wero mat. Both banks of the Stônc and the left bank of tike thone are lined with quays, susie of wbich are phanted with trees, and afforl very agreeable promenades

In the revclution of 1793 , the people of Lyons hav. ing declared agalust the revolutionary party, the city was laken by the cons sentional army after a seige of upward of two montha, and almost reduced to ruins. It suffered sevorely from the inundations of its two rivers in June, 1856. Population in 1851, 156,169.-E. 17.

Maoadam, John Loudon, the Introducer of macadamised road-mating, was descended from an old and respectable family in Kirkoudbrightshire, and was lom in Ayrshiro, Scotland, In 1756. His plan of rond limprovement occurred to hlm when acting as trustee for a district of roads in Ayrsblre, and was tiss carried fato practice on the Bristol roads, of whieh he had been appolnted aurveyor-general in 1815. He explalaed his syatem fully in two works-A Practical Fsony on the Aoiencififo Repair and Presercation of Public Roads, London, 1819 ; and Remarises on the Present state of Road-making, London, 1820. In 1827 he was eppointed general surveyor of roads; and for the large soms which be expended while performing the dutles of this office, he was afterward compensated ly two grants from goverament, amountling together to $£ 10$,000 . The honor of knighthood, whlch he declined, was conferred upon his son In 1884. Macadam disd in 1886.

Macao, a sea-port and settiement belonging to the Portugnese, on the island of the same name, at the mouth of the Canton Klver, in Chins, in lat. $22^{\circ} 12^{\prime}$ $45^{\prime \prime} \mathrm{N}$., long. $118^{\circ} 35^{\prime} \mathrm{E}$. The eltuation of Macao strikingly reeembles that of Cadiz. It is built near the extremity of a peninsula projecting from the sonth-west corner of tha isiand of Macao, to which it is joined by a long narrow neck. Across this iethmus, wiich is not more than 100 yards wide, a wall is crected, with a gate and guard-house in the middie for the Chinese soldiers. The greatest length of the pesiosuis helonging to the Portuguese, from northcast to south-weat, is under three miles, and its breadth under half a mille. The broadeet part, to the nortil of the town, is dat, and of a light, sandy soil; but is weil cultivated, princlpally by Chinese, and proluces all sorts of Asjatic and European culinary vegetables. Provisions are obtained from the Chinese part of the island or from the maln land; and wisenever the Portuguese do any thing to offend the Chinese authorities, the provisiona are cut off till thay are obliged quietly to submit. They are seldom aliowed to pass beyond the narrow precincts of the territory assigned to them. The population of the peninsuia may amount to from 12,000 to 18,000 , of whon conslderably mere than half are Chinese. The functionaries belonging to the East Indis Company's factory at Canton resided bers during the whoie of the dead season. The Portuguese oltained possession of Macao in 1586. It was for a considerable period the seat of a great trade carried on not only wlth China, but with Japun, Siam, Cochin-China, the Philippine Islands, etc.; but for these many years past it has been of comparatively little importance, though it is probable that, if it belonged to a more enterprisiug and aetive people, it might stili recover mont part of its former prosperity. The public administration is vested $\ln$ a senate composed of the bishap, the judge, and a few of the principal inhahitants; but all resi authority is in the hands of the Chinese mandarin reaident in the town.
The harior is on the west sile of the town, hetween it and lrieat's Island; but the water in It not being sulliciently deep to uilmit large ships, they generally anchor in the roals on the other side of the peninsula, from five to ten wiles enst reuth-east from the town. All vessels coming into the roads send their boats to the Portuguese custom-house on the south sile of the town. When a nhip arrives among the inlands, she is goneraily bourded by a pilot, who carries her into Macao roads. As soon as sile is anchored, the pliut proceeds to Macau to inforn the mandarin of the nation she belungs to. If there lie any women on
board, application muet be mado to the biahop and senato for leave to send them on shore, as they will not be permitted to proceed to Whainpoa in the ship. As soon as the mandarin has made the necessary inquiries, be onders off a river pilot, who brings with him a chup or license to pasa tha Bocca TIgria, or mouth of the Canton River, and carries the shlp to Whampon.
The Cblnese regulations do not permit any vessels, except auch as belong to Purtuguese or Spaniards, of which there are very few, to trade at Macho. But the Portuguese Inhaliltants lend their names, for a trifling. conalderation, to such fortigners as wish to be assoclated with them for the purpose of trading from the port. Independently, however, of this, vesseis of other natione usually experiencs no difficuity in obtalining the connivance of the Chinese officera to the landing or recelving of goods in the roads hy meana of. Portuguese bonts. At intervals the prohihitory regulation la atrictly enforced. Vessels of other nations, if in distress, and nut engaged in the contraband trade, are admitted into the hartor for repairs, on applicution to the senste.

The following summary exhilhits the dlrect trade between the United States and Macao during the years 1854 and $1805-$-the latter year up to Murch 6th: Arrived, 3 barks and 1 shlp, measuring 1828 tone, laden with ricc, sundries, solt provisions, and mlscellaneous goods. The return cargres were chiefy Coolies.
Port Charges.-The measurement duty paid by Spanish and l'ortuguesc vessela is moderate. When a vessel has once paid the full amount, and as mis ritted on the list of registered ehips belongin thite port (limited ly the Chinese to 25), she is liavel io a third of the original charges, on every swbsequeut occaslon of her entering, so long as she continues on the register. Portuguese vessela from Europe do not possess this privilege, unless they be registered as belonging to a morador of Macao. The rates of measurement duty, which vary, ss at Canton (which eee), on thres classes of vessels, are the following: On vessels of 154 covids and upward, $6 \cdot 223$ taels per covid; on vessels from 120 to 104 covids, 5.72 taels per covid; on vessels from 90 to 120 covlds, 4 taels per covid.
These rutes are nearly the same as those levied on Canton junka trading with foreign countries, and ought, in fact, to be entirely so. The dimensions are taken and calculated in the manner formerly practiced at Canton; but the Chinese, at both places, speak not of the covid, but of the chang of 10 covids. However, as this is only a decimal increase, it makes no difference in the method of calculation. The following additional charges, to lie calculated on the amount of measurement duty, are the same on every class of vessel2, vix.: 2 per cent. for inspectors; 8 per cent. for difference in welght by the treasury scales; 10 per cent. for loss in melting; 17 per cent. for making sycee. Also the sum of $\mathbf{7 0}$ taels for the "pubilic purse," or hoppo's treasury.

In addition to these, the following aro the charges levied by the hoppo (cullector of customs), or hls deputy: On a 1st class vessel from Europe, 250 taels; if belonging to Macao or Manilla, 50 taels. On a 2 d elass vessel from Europe, 240 tacis; if belonging to Macuo or Manilla, to theis. On a 8d class vessel fro:n Europe, lio tuels; If belonging to Macao or Manilla, 30 taels. Ships importing rice sre exemit from tho measurement duty, and pay only $\boldsymbol{\$ 5 0}$, as fees to the procurador of Mucav and the officers of his department. Portuguese vasscls from Liarope, in addition to the measurement duty, have to pay to the Canton

## MAC

hong merchants a charge, termed by tho Portuguese, IIanistagem, or Consoo charge, which is usually a matter of opeelfic bargain, varying from about $\$ 200$ on a vessel of 200 tons to $\$ 8800$ and npward on thesa of sond tons, and of larges sizes. The chasgey on goods carried by the inner passage, between Canton and Macao, being generally less than thoee paid on goods to and from Whampoa; and the duties levied by the Portuguese, on artiries of merchandise imported by vessels belonging to Macao, being very modurate 1 the Chinese are often led to engage In speculations on board the Macao vessele the risk being so much lees than in native junks. If the shlp owners conld manuge their expenses so as to be satisfied with only the same frejght as is charged by English vessels, it would probably induce many more Chinege to make remittances in this way.
Opium.-The trade in oplum is prohibited at Macao by the Chinese government, as well as throughout the rest of the empire. It was, nevertheless, formorly carried on to 3 great extent by the Portuguese moraderes, or cltizens, to the exclusion of all others, sven Portuguese who were not citizens. But this reatriction, having occasioned the decline of the trade, it was abolished in 1823, when the senate passed a regulation throwing open the trade to all, without distinction, whether Portuguese or foreigners; mecuring to the latter "hospitality and the utmost freedem in the speculations." At present, however, very little opium is imported, in consequence, it ia said, of the heavy lribes demanded by the Chinese officers, to Insure their conulvance. The trade in now principally carried ou at Lintin, about 30 miles from Macao.

Impe:te.-Goods imported pay at the Portuguese custor -house a duty of 6 per cent. on a fixed valua'ion. bealdes some fees, and Coolie hire. The follow$0 ;, 1$ e few articles extracted from the tariff :

Gold and eilver, whether in coin, in bullion, or manufactured, pay, on Importatlen, 2 per cent.; except in Spunish vessels from Manilia, when the charge is 13 per cent.

Eisports.-No duty is levied by the Portuguese on goods exported from Macao; nor does the customhouse take any cognizance of them.

Inties and Charges on Goods landed at Macao.Mincao is a jlace without any mannfactures or commerce of its own. Prices are, in consequence, generally dependent on those of Canton. Money ls usually paid at 72 taels per 8100 . It is a point of some interest to ascertain the internal duties and expenses to which goods landed at Macao are liable hefore coming into the Chinese purchaser's hands at Canten. But the subject in so involved in mystery and uncertainty, the charges varylng according to the quantity of goods laden in one boat, etc., that it is searcely posmible to arrive at any accurate information reapecting it. We believe, however, that the following may be considered as a pretty close approximation to the real amount of charges incurred on cotton landed at Macao:

Portugueso duty, feer, etc., 2-6 inace per picul ; luties and charges on convegance to Canton, 6-3 mace per picul ; Canton charges, llfference of weight,
brokerage on sale, etc., 8 mace per pienl; total, about 2 taels 6-9 mace. The duties and chargen on convey. ance fronı Macao to Canton are, for pepper, 9 mace pe picul; rattans, 4.5 mace per pleul; betel nut, 4-5 mace per pieul.
The hoppo's examiner chargea 00 taels per boat of 1000 pleuls, the largest quankity allowad to le eon veyed ly a single boat ; but the same eharge of of taels is levied, althengh the boat should only contain 100 picals. The duty on exporting goods from Can ton to Macao 5 in some cases less, in other cases greater, than the Whampoa duty. Thue, nankcens to Micso pay 82 per 100 less than to Whampoa, Most deseriptions of silk piece goods also pay less duty. On the other hand, tea, paper, China ware, etc., pay a higher duty to Macao than to Whampoa,
For details as to the Weighrs, Measures, etc., used at Macac, see Canton.

For further particnlars, see IIamicton's Eaet India Grevtteer, art. Macao; Milaunn'm Orient. Com. ; and tLe Anglo-Chiseso Kalendar Conepanion to the Almanac. Macao, 1332.
drimearoxt, specles of wheaten paste formed into long, slender, hollow tuikes, used smong us dressed with cheese, und in souph, trouths, etc. Macaroni is the stme substance as vermicelli; the only difference hetween them being that the latter is made into smaller tribes. Both of thein aso prepared in the greatast perfection in Naples, where they form the favorite dish of ail clapses, and the principal food of the bulk of the populatien. The flom of the hard wheat (gramo duro) inparted froci the Bhek Sea is the best sulted for the manufacture of macaronl. Being mixed with water, it is knesded by moaus of heavs wooden llocks wrought by levers, till it sequires a sufficient degree of tonscity; it is the 2 forced, by simple pressure, through a rumber of holes, so contrived that it is furmed Into heliow evliuders. The name givon to the tuhes depends on their diameter; those of the largest size selng macaroni, the next to them vermicell, and the amallest fedelini. At Genos, and some other places, the paste is colored by an ode mlxture of eaffron; but at Naplea, where its preparation le hest understood, nothing is used except flour and water; the best being mside of the tion of hard wheat, and the inforior sorts of the flour of soft whent. When properly prepared and bolled to a nieety, Nespolitan micaronl asammes a greenish tinge. It is then taken out of the calilion, druined of inc water and lieing saturated with concensrated ment gravy, and eprinkled with finely-grated cheere, it forms a dish of which all clasmes, from the prince to tae beg gar, are passionately fond. Hnt the macaroni used by the poor is merely bolled in plain water, and is rarely eaten with any condiment whatever. The masaroni neually aerved up in Fingland is said, hy those familiar with tbat of Naples, to be a diagrace to the name it iears. When properly preparel, mecaroni is nutrithous and easy of digestion. The lazzaroni pigue themselves on the dexterity with which they ewsllow long strings of macaronl and vermiceili without brenklug them.

Mace (Ger. Macis, Musketembluthe; Ihu. Foelie, Foely, Muacaathoom; Fr. Macia, Fleur de muscade; It. Mace; Sj. Macio ; Port. Maxcis, Flor de noz moscada; Lat. Muria), a thlu, flat, memliranous sulutanre, enveloping the nutmeg; of a lively, reddish yeliow color, a pleasant aromatic smell, and a warm, litterish, pongent taste. Mace should be chosen fresh, tough, oleaginous, of an extreinuly fragrant smell, and $n$ bright color-the brighter the better. The smaller pieces aro eateemed the beat. The preferable mode of packing in in inles, pressed down close and firm, which preserves its fragrance and congistence. It is imported from the Moluecas, where the best is to be found. The finport trade in mace for home conanmption in Great Jritain for three years ending with

Machinery. The effects produced upon the world by the interposition and general use of machinery, are very important. Serioua obstacles were at first presented and objections made by the massen, upen the ground that the use of machinery was eppoaed to the interests of labor. Gradually theae objectiona were away, it being found that there was, and atill is, emplorment for all classes, even with the extreordinary facilities added by the many improvements in machinery. These questions have been fully discuased by some of the ahleat writers in England and th.e United States. As to the "efects of machinery and nceumulations," see Ldin. Rev., xxxv., p. 10f, lvi., 813 ; Quar. Reci, $\times \times x i .1,391$; Fraser, vili., $1 € i$, il., 419 ; Am. Mon/hly, ili., 24 ; Westm. Rev., v., i.11, xiv., 191 ; North Am. Rev., xxxiv., 220, xiv., 401 ; Am. Quar., xii., 800 .

Macintosh Cloth. The manufacture of the Macintosh cloth is a aingular ene. The material is merely two layers of cottin cemented with liquid Indig-rubler; but the junction is so well effected, that the three become, to all intents and purposes, one. The atont and well-woven cotton eloth is colied upon a horizontal beam, like the yarn beam of a leom; and from this it is atretched out in a tight state and a nearly horizontal position. A layer of liquid, or rather paste-like, solution is applied with a spatula, to a conaiderable thickness, and the cloth is drawn under a kaife edge, which acrapes the solution and diffusea it equally over every part of the cloth, which may be 30 or 40 yarls long. The cloth is then axtended out oa a horizontal framework to dry ; and, when dried, a second coating is applied in a similar way; and a third and fourth may be similarly applied if necesaary. Two pleces, thus coated, are next pluced face to face with great eare, to prevent creasing or distertion; and, being passed between two smooth wooden rollers, they are so theroughly pressed as to be made to unite durably and permanently. Cloth, thus cemented and doubled and dried, may be cut and made into garments which will bear many a rough trial and many a deluging hefore rain or water can penetrate.

Madder (Ger. Färberöthe; Du. Mee; Fr. Alizari, Gamance; It. Robbia; Sp. Granza, Rubia; Rue. Mariona, Arrop; Ilind. Munjith), the roots of a plant (Kubia tinctorum), of which there are several varieties. They are jung and slender, varying from the thinkness of a goose-quiil to that of the little finger. They are semi-transparent, of a reddish color, have a atrong smell, snd a mmooth bark. Madder is very extensively used in dyeing red; and though the color which it imparts be less bright and beautiful than that of cochinesi, it has tite advantage of being cheaper and more durabie. It is a native of the south of Europe, Asia Minor, and India; but has been long since introduced into and successfully cultivated in Holland, Alsace, Provence, etc. Its cultivation has been attempted in England, but without any benefleial reault. Our aupplies of madder were, for a lengthened period,
almost entirely derived from 1 olland (Zealand) ; but large quantitios are now imported from France and Turkey. Dutch or Zealand madder le never exported except in a prepared or manufactured atate. It is divided by commarcial men into fonr qualities, diatinguished by the terma mull, gamen, ombro, and crope. The roota being dried in stoves, the firat species, or mull, conalats of a powder formed by pounding the very small roots, and the husk or bark of the larger onea. It is comparatively low priced, and is employed for dyeing cheap dark celora. A second pounding separatea about a third part of the larger roots; and this, being aifted and packed separately, is sold here under the name of gamens, or gemeens. The third and last pounding comprehends the interior, pure, and bright part of the roots, and is sold in Heliand onder the siame of kor lraps, but is here simply denominated erops. Sometimes. however, after the mull has been aeparited, the entire residue ls ground, aifted, and packed together, under the name of onberoofde, or ombro. It consists of about one third of gamene, and two thirds of erope. Prepared madder should be kept dry. It attracts the moisture of the atmosphere, and is injured by it. The Smyrna or Levant madder (Rubia peregrina), the alizari or lizary of the modern Greeks, is cultivated in Bootia, along the border of Lake Copais, and in the plain of Thebes. It also grows in large quantities at Kurdar near Smyrna, and In Cyprus. The maduer of Provence h.as ween raised from seede carried from the latter in 1761. Turkey madder affords, when properly prapared, a brighter color than that of Zealand. It is, however, imported in its natural state, or as roets: the natives, by whom it is chiefly produced, not having industry or skill aufficient to prepare it like the Zealanders, by pounding and separating the skins and infucior roots; so that, the finer colering matter of the larger roots being degraded by the presence of that derived from the forner, a peculiar process is required to evolve that beautifui Turkey red which is so highly and deservedly esteemed.-Tuom8on's Chemiatry; Bancnort on Colors, vol. ii., pp. 221-278; see also Beelmann, IIist. of Inrent., val. iii., art. Madder.

In France, madder is prepared nearly in the saine manner as in Zealand. The following details are in regard to its cultivation, price, etc., in Provence.

This town (Avignon) is the centre of the madder country, the cuitivation of which was introduced here about the middle of the 18th century, and, with the exception of Alaace, ie stitl conflned (in lirance) to this Department (Vaucluse). The soil appears to be better adapted fur its cultivation here than anywhere else, and it has long beer the scurce of great wealth to the euitivators. Of lutc years, however, the prices have fluctuated o much, that many proprietore have abanduned, or only occasionally cultivated this root, so that the erop, which was formerly estimated to average 500,000 quintals, is nuw aupposed not to exceed from 300,000 to 400,000 . The root 18 called alizari, nnd the powder (made from it) garance. The plant is raised from eeed, and requires three years to come to maturity. It is, however, often pulled in 18 months without injury to quality ; the quantity only is smaller. A rich eoil is necessary for ita successful cultivation; and when the suil is impregnated with alkaline matter, the root acquires a red color; in other eases it is yellow. The latter is preferred in England, from the long habit of using Dutch madder, which is of this color; but in France the red sells at 2 francs per quintal higher, being used for the Turkey red dye. It is calculated that when wheat s6lls at 20 franes per liectolitro, alizari should bring 85 franes por quintal (poids de table), to give the same romuneration to the cultivator. That is, wheat 63s. per English quarter, and alizari 84s. per English cwt. The price has, howover, been frequently us low as 22 franes per quintal. Prices undergo a revolution every 7 or 8 years, touch-
ing the minimum of 22, and riaing as high ay 100 trancs. An in every similar case, she high prices induces axtonalve cultivation, and this genarally produces itn fuil effert 4 or 5 yeass after. The produce of Alaace, ohleh in inferior both in quantity and qualIty to that of Vaucinse, is genorally sold in Strasbarg market. Finginad employs both the root and the powder, according to the purpone for which they are intended. The Datch madder is more employed by the woolen dyera, aud the French hy the cotton dyers and printers. In making purchases of ganance, it is essential to employ a hoane of conaddence, hecanne the quallty dependa ontirely nuon the care and honesty of the agent. The finent is prodiced from the roots after being cieaned and stripped of their bark. The recond loy grinding the mots without clenning. A third ly niixing the bark of the firat while grinding। and ao on to any degren of ndulteration.

Madagasoar, a large and important island in the Indian Ocean, about 300 miles from the coast of Africa, from which it is separated by the Monamblque Channel. Cape Amber, its northern exiremity, is situate in S . lat. $12^{\circ}$, whence it extends nouthward, slightly inclining to the west, alout 937 English miles, to Capm 8t. Mary, in 8. Iat. $25^{\circ} 40^{\prime}$; Its extreme western shore is in E. leng. $43^{\circ} 10^{\prime}$, and its most eanterly capo in E. Jong. $60^{\circ} 30^{\circ}$. The treadth of the island incroases gralually from the northern point to the centre, where it is wiflest, being about $\mathbf{3 5 0}$ milea accons; whlle the average brealth of the southern portion in atout 250 miles. It has heen estimated to contain $150,000,000$ of even $200,000,000$ acren of land ; and thougl such estimaten, in the absence of actual measurements, can only be rugarded as approximations to its actual extent, its surface is equal to three fourths of the territory of Frence, and larger than Great Brituin and Ireland combined.
The monsts of Madagascar contsin a number of hays and hartores, sonse of them spacious and aheitered, and eapable of affording excelient and secure anchorage for shipplag of the largest dimensiona. Among these may be apecified Diego Saurez May, or British Sound, near the north-eastern extremity of the island; Port Loquez, Antongil Bay, and the hay of St. Luce, on the enstern coast. Samatave and Foule loint, though the mont frequented ports on this side of the islami, are oniy open roadsteads, protected by reefo of coral. St. Augastine'n Bay, a port of frequent resort for vessels trading on the north-weat coast and whips engaged in the white sishery, 'Tolia Bay, Boiann, Baminetoka, Majamto, Namenda, Pasandava, and Chitapaykee hays, are the moet import int on the western cuast. There are several manall islants adjacent to the nurthern mhoren of Mialagasear, of wi leh St. Mary's, al miles long, and 2 or 3 inilea broad, on the eastern coaft, and Nosihé, a somewhat larger and mere compact islanil, on the north-weat coast are the mont im. portant. Both thesm suall felandia are now oecupied by the French-the iatter having lieen taken posmession of by them in 1840.

The commerce of the island, though at present but trifing, is capable of almout unlimited extension. The chief articies of export are eattle, poultry, rice, rufia cloth, matting; a kind of grass hat, woven by hand, light and duraile; guma, and bees' wax. Coffee
would grow well in many parts of the island; Indigo might be produced to almont any extent; and both might furnish valuable articles of export. Good sugar has been made, but at present the cane it only cuitivated for purposes of food, or for distilling from its juien a ntrong, fiery sort of arrack, the use of whilh in extended ameng the people, eapeeinlly at the portar ard threatens to produce the most disastrous conse(4) .cen. Other articles of axport might be proluced intry an fertilo and extensivel and rice migight, w... a ut comparatively little additional labor, be raineel In much larger quantities than it is produced at present. It in scarcely possible to conceive of a soii more alapted for the cultivation of rice than that of nuny parts of Madagasear, or more fertife than, in favorahle seasons, it often provas-a singie bushel of seed yield. ing, under the most skillful modes of culture, in a favoratile season, 100 bushels of grain. The erep when ripe, is reaped, dried, and thrashed on tho ground. Their process of thranhing conaines in taking up large haniffulla of rice and atraw, and beuting tha ears on a stone or portion of nock fixed in the midet of a dry, hard, throahing-floor, prepared for that purpose in nome central spot easily accessible from the coitivated fields. When the grain in thrasied, it is carried on the heads of alaven to the granarion of thair owners. These granaries vary in structure in iliferent parts of the inland. On the eastern coast and to the southward, the grain is stored in amali houses raised on posts, with projecting ledgen, to provent the access of rats and mice. At the cupital and some of the central provinces, the rice is preserved In granariea bollt of cluy, in the form of a cone, with only one aperture on the summit. Some of these granaries are built alove ground adjacent to the dwellings of their owners others are constructed of the same furm and dimenrions under ground-the aperture at the top, generally about a foot beinw the surface, leing covered with is atome, and then the hollow filled up with earth con posing the aurface of the court-yari, in whieh the nnderground granary in naualiy aunk. Riee, hy these meanu, is often prescrved for a great length oc time in oxcelient condition. With land no fertile ani andapted for the growth of such abundant crepls of rice sathe phantatioos in tho interior often yiefil, it might be raised for oxportation to almost any extent; but the absence of canala and pailic roads, and all means of land carriage, precludea the ponsibility of convering the profuce of many of the provinces to the sel-inits, excepting in comparatively amall quantities, and thog impedes very materially the development of the renources of the island. The government has leen deterred from conatructing or eneouraging the furnation of publio roads, from an apprehennion of the facilitics they would afford to a hortile force invaling the country and seeking to penetrate the interlor. The want of good roads, therefore, though detrinemital to their commercial interesta, is preferred by them as a means of necurity. This disadventage might be, to a great extent, comprensated in some of the provinces by greater attention to the moans of carriage by water. The iatn Ralama commenced the work of conneeting some of the principal takes on the eastem coast by means of a canal, but since his death the work has heen discoustinned. Boats, better alapted for conveyIng grain in larger qu, ntities to the places aljacent to the ports, and accessifise by wat ${ }^{-\cdots}$, might be comstructed, and would andist in augme... ing the exports from the isfand. Their imports are chietly cotton and woolen goocls, wearing apparel, articles of domentic ase, fire-arims, ammunition, wines and fliquurs; and to thene other articies will doubtless lie addel as thein means of jurchasing them increasc. The ilovas, the paramount puce in the conntry, exhifit many of the eiementa of a thoroughly commercial people; keenness in trade aeems to be intuitive with many, and the love of bartoring almest a passion among ail ; scurcely any

engagement interferes with the market, and multitudes employ themselves in hawking goode of forelgn or domeatic manufacture about the country for sale. In this occupation many pereons of rank and property employ thelr alavea, giving them a percentage on the amount or the profit of thelr aales. The dealings of the IIovas are seldom transactions of harter or exphange, but nsually monoy purchases. The only coine they uas are Spanish dollars, and very recently flvefrane Firanch pleces. For all the cattle exported, these silver colns alone are received in payment. The Malagasy luave no native currency; and for ordinary use among themselves, the Spanish dollar la cut Into halves, quarters, eighths, and smaller portions, oven to the 1-72d part of a dollar. The cut pieces of the dollar are weighed in every Inatance, and a pair of money scales with their appropriate lron welghts, are aot only considered essential in every house, but are often seen thrist into the girdles of the men when empleyed in their ordinary avocationa. Money-changers are a distinct class among the traders, and the rate at which whola dollara and cut sllver are exchanged flactuates almost daily at the capital and other princlpal places, as the ons or the other are most In demand. in other parts of the island, especially thone remote from the capital or the ports visited ly shlpping, the trade among the inhabitants is carried on to a grent oxtent by axchange, or harter. Several attempts insue been made by the forelgn tradere to linduce the nstives to recelve gold coin in payment for cattle and other articles, but hitherto without auccess. "The llovas are not ignorant of the relative value of gold and silver, but at present seem only to value the formar for the manufacture of jewelry and other articies of personal ornament.
Madeira. The Madeira Isles are a group in the Atlantic Ocean, belonging to Portugal, from the southwest coast of which thoy are distant 660 miles sotithwest. They consist of the islands of Madelra and Porto Santo, and the islands called the Desertas, situated botween $32^{\circ} 23^{\prime} 15^{\prime \prime}$ and $33^{\circ} 7^{\prime} 50^{\prime \prime} \mathrm{N}$. lat., and $16^{\circ} 18^{\prime} 30^{\prime \prime}$ and $16^{\circ} 38^{\prime} \mathrm{W}$. long. The largest island, Madeira, is 31 milea long and 12 milea brond. Population, 1850, 108,461. Capital, Funchal. It consiats of a mass of rolcanic rocks, which, in l'ico Rulvo, rise to 6050 feet in elevation. From the central mass, stecp ridjes extend to the const, where they form preeipicen of 1000 to 2000 feet in helght. The only plains sre a small portion of the weat coast, and the tableland of l'aul de Serra in the interior. The ruads are very ateep and unfit for carriages. Oxen are the only beasts of dratight, and ponies are used in traveling. Climute remarkably equable, and celchrated for its salubrity, on which account numerous vlsitors, affictod with disease of the lungs, constantly resort to Madeira. The soil, which on the south elde extends 21 miles inland, is well watered, and extremely productive. Sugar, onco extensively cultivatod, is now neglected. Coffee is grown of superior quality, and the arrow-root is excellent. The orange, banaua, and ganva, are sbuadant. Wheat, maize, beans, and barley, are cultivatud to a small extent, but quite insufficient for bome consumption. The fallure of the potato, formerly the chlef support of the populntion of the villnges and remote districts, has added to tho oxisting distress, and the condition of the lower orders is that of aqualid peverty. Maieira was acttled by the Portuguese in 1431.

It is sald that plants of the vine were conveyed from Crete to Madeira in 1421, and have since suceceded extretuely well. There is conshlorablo diffurence in the flavor and other qualities of the wines of Mudeira; the best are produced in the south side of the lalund. The method of cultivation mnst genurally followed is to trench the ground from threo to soven and soven to nine feot deep, according to the nature of the soll, and lay a quantity of loose and stony earth at the bottom,
to prevent the roota from reaching the clayey soil beneath, which would otherwiee oppose thelr growth. The ground is watered three times if the summer has been very dry, the slulces being left open until the groand is pretty well eaturated; the less the ground is watered, the atronger the wino, but the quantity la dlminished in proportion. The vinee are found to bear fruit as high as $2700^{\circ}$ feet, but no wine can be made from it. Adjacent to Madelra is the laland of Porto Santo, about alx miles long, and two and a half brosd. It is high and rocky, composed principally of sand-atone, and a calcareous tuffa of a greenish gray color. The vlne is cultivated in considerahle quantitles, and the soll ylelda good crops of wheat, Indian corn, barley, and beans. The population la estimated at 1400, and there are $\mathbf{8 0 0}$ militia. It possesses a good roadstead, but the landing-place is bad. The Desertas are amall, uninhabited lslands, which, with Madsira and Porto Santo, form the group called the Madelras.
The manufactures of Madeira are insignificant ; their chlef object being to satlafy some of the slmple wants of the poorer classes. Basketa, atraw hats, coarse linen and woolen articles, and shoes, are the princlpal objects. Artificial feathers, flowers, and sweatmeats are made for sale by the nuns. A good deal of needlework embroldery has been executed of late yeura by the women of Funchal for exportation, and a few fancy articles are made of the fibre of the Agave Americana. The bulk of the laboring population is emplosed in agricultural pursuits. Wine has hitherto been the chief article of export, but thls branch of trade will soon cease. The rearing of the cochineal insect has been lately undertaken, in the hopes of its supplying the luss of the grape. Many of the coopers empioyed during the exiatence of the wine trade have emigrated; the rest earn a precarious subsistencs. The casks they made possessed repute for excellence of construction. The chief artisana of Funchal at present are boot and shoamakers, cabinet-makers, carpenters, and stone-masons. The number of merchant ships anchoring at Funchal (which is the only foreign port) during 1855 was 242, of which 121 were British, and 91 Portuguese. The chlef imports are, mannfactured goods, iron ware, grain, salt, and timber. In 1865, of grain there was imported 195,765 tushels, principally from the nelghboring coast of Africa, and from the Azores. In the same year 27,800 bushels of salt enterod. The othicial returns of the imports of manufactured goods can not be relled on. The total reccipts of the custom-house in 1855 amounted to rather more than $£ 17,000$. Thero is no tank on the island ; the gold and silver coin in circulation is not Portuguese, but British, American, and Spanish. Acconnts are made out in reis, Imaginary coins, 4800 of which are equal by law to the pound sterling. Spunish and American dollary are current, at the value of 1000 reis, or 4 s . 2d. British money. Funchal is a coaling station for the British mail steamers from England to Ilrazil and the African coast, which touch here once a month on tieir outward voyages, and again on their return. The Portuguess and French steamers to Brazil likewise touch here. Besides thoes vessels, two English sailing-packets ars continually plying between London and Madelra, and a Portuguces paeket-brig to and from Lisbon.

The cereal crops of Madeira are scarcely equal to one third the consumption; hence, and owing also to the general poverty of the inhahitants, a decree was passed in 1848 reducing the dution on the leading forolgn imports to one haif the dutios levied in Portugal. This decree is in force at this time, and, consequently, but half the duties fixed in the tariff of Portugal are now levied on foreign imports into Madeira. In 1843 the importe from the United Statem amounted to 65,900 , and the exports from Madeire to the United States to 2750 , employing 38 veasels, with an aggregate tonnage of 8538 tons. The commerce of thic island with foreign nations, and eapecially with the United States, in declining, and must continue to decline so long as the vines remain diseased, as wine is the only article of export from Madeira.
See Am. Jour. Science, xxiv., 287 ; North Brit., vil., 73 ; North Am. Rev., xlvi., 836 (by J. W. Webeter). For Madeira Wine, see Wins.

Madeira Nut, or Peraian Walnut (Juglans regia), originally a native of Persia, or the north of China, has been somewhint extenaively distributed, and appears to be weil adapted to the climate of the middle and aouthern latitudes of the United States. A tree of the "Titmouse" or "thin-shelled" variety (juglans regia tenera), about 20 years planted, 45 feet in height and 15 inchea in diameter, standing on the premises of Colonel Poter Force, in the city of Waahington, in perfectly hardy, and bears ycarly an abundance of ex. cellent nuts. This is considered the most valuable of all the walnits, as the tree begins to bear in cight or ten yesra from planiligg the aeed; and the fruit is very delicate, keepa well, and is rich in oil. In Cashmere, where the walnut is the eubject of careful cultivation, there are four varieties: The "Kanak," or wild, the mut of which is diminutive, with a thick shell and acanty kernel; the "Wantu," having a large nut, with a thlek and hard shell, a deficient kernel; the "Denu," also a large nut, with a thick nnd rather
hard oboll, and a kornel large, good, and easily extracted; and the "Kaghazi," so called from its sheil being nearly as thin as paper. The latter, which may be readily broken by the hand, is the largest of all, having a kernel easily extracted, and producing an excellent oii. Its auperiority is said to be attributable to its having heen originally engrafted, but it is new raised from seeds alone, and does not degenerate. Tha nuts, after being ateeped in water eight days, sre planted in the beginning of March, and the sherit generaliy makes its appearance in about 40 days. is reared by grafta, the procese is performed when the plant is five years old. The head being cut off horizontally, at a convenient height, the stock is partially eppit, or opened, and the geion inserted in a similar manner to that adopted by our cleft method, in grafting the apple or pear; but clay-mortar, worked up with ricehuska, is put round it, and kept from washing away by being enveloped in broad slips of birch-bark. $-P a$ tent Offico Report, 1855.

In Cashmere, the walnnt-tree begins to fruit, ordinarily, whon seven yeara old; but twe or three years more elapse before it is in full bearing The average annual number of nute, brought to maturity on a singlo tree, often emounts to 25,000 . It has been observed that, after a few seasons of full bearing, the trees fall off in producing fruit, and run, with great luxuriance, to leaf and branch. To this Iatter condition the Cashmereans apply the appeilatlon of "must," and te remedy the evil, cat off ail the small branches, bringing the tree to the state of a pollard. The year following, ehoots and leaves alene are produced, which are succeeded the next season by an abundant crop of nuts. The cut ends of tho branches ewell into knots, or knobs, which are somewhat undightly in the tree, until they are concealed by tho growth of the young branches and leaves. Whon ripe, the frult of the Wantu walnut is retailed in the eity at the rate of about 2 cents a 100 . The nuts
of the Dunu are sold for about 8 cents per 100; and of are constantly beat by a heary surf. Besides these the Kaghazi, at about 4 cents per 100. It is a common prectice for the country people to crack the walnuts at home, and carry the kernela alone to market, where they are sold to oil-pressers, for extracting their oii. The kernele yield half thoir weight in oil; and the other half, which consists of oil-cake, is mach yalued as food for cows in winter, when it is usually oxchanged for its waight of rough rice. Abont $1,150,000$ pounds of walnut kernols are annuaily consigned to the oill-press in Cashmers, producing a large amount of oil and cake, besides a considerable quantity eaten by man, or consumed by other modos. Wainnt oil, in that country, is preforred to linseed oil, for all the purposes to which the latter is applied. It is employed in cookery, and also for baraing in lamps, without much clogging the wick or yieiding mach smoke. It is exported to Thibet, and brings a cousiderable profit. By ancient custom, the crop of nats was equally divided between the government and the owner of the tree, bat at present, the former takes three fourths: yet, even under thia oppression, the cultivation of this product is axtended, and Caahmere, in proportion to its surface, produces a much larger quantity of nuts than any other portion of the globe. Estimating the product of aach tree at a bushel of nots, and auppoeing that it will produce that quantity in 12 or 15 years after pianting, and considering that the amount imported into this country is valued at least at $\$ 100,000$ per annum, the inducements for its culture by the farmers and plantars of the middle and oouthern States would appear to be sufficlently ampis for their immediate attention.-Patent Office Report.
Madras, the principal emporium of the coast of Coromandel, or western ahore of the Bay of Bengal; istitade of light-house $13^{\circ} 5^{\prime} 10^{\prime \prime} \mathrm{N}$., long. $80^{\circ} 20^{\prime} \mathrm{E}$. It is the aeat of the government of the second presideacy of British Irdia, having under it a territory, including the tributary Statea, of 187,482 square miles, with a population, according to the census of 1850-51, of $27,054,672$, paying a gross annual revenue of nearly £4,900,000 sterling. The town is situated in the Carnatic province, a low, sandy, and rather aterile conntry. It is withoat port or harbor, lying close upon the margin of an open roadstead, the shores of which
disadvantages, a rapld current runs along the coust ; and it is within the sphere of the hurricanies or typhoons, by which it is occasionilly visited. In overy respect, indeed, it is a very inconvenient place for trade, and its commerce is consoquently greatiy inforior to that of elther Calcutta or Bombey. It ha's been in the posseasion of the English above two centuries, having been founded by them in 1639; and retained ever since. Fort St. Georgo is a strong and handsome fortification, lying close to the shore. The Biack-Town of Madras, as it is called, atands to the north and eastward of the fort, from which it is separated by a spacions esplanada. Here reside the native, Armenian, and Portnguese merchants, with many Europeans unconnected with the government. Like most other Indian towns, it is isiogular and confused, being a mixture of brick and bamboo housea. Madras, like Calcutta and Bombay, is subject to English law ; having a Supreme Conrt of Judleature, the judges of which are named by the crown, and are altogethor independent of the local government and the East India Company. The population is not exactly ascertained, but there are said to be about 400,000 persons within a radius of 2$\rfloor$ miles round Fort St. George.
Madras is the seat of all the chief government offcos for the President of the Supreme Court, Boarde of revenue, admiralty, education, eto.; and though having leas foreign trade than the capitals of the other preaidencies, its commerce is atill considerahio, as it is the chief emporium of the Coromandol cosst, and tradea direct with Great Britain and the other European countries, the United Statea, Ceylon, and southeast Asia. Principal imports are rice and other grains, chiefy from Bengal ; cotton piece gooda, twist; and metallic wares from Great Britain; raw silk, areca, betel, gold dust, epicea, and teak timber from Pegu; spirits and wines, coral beads, horses, drugs, to the total value, in 1851-52, of $£ 1,958,786$. Exports of cotton stuffs and wool, indigo, pepper, timber, coffee, and other natlve produce, amounted in the same year to $£ 3,075,103$. The site of the city formed the first territorial acquisition hy the British in Indla, permission to erect a fort here having been obtained in 1639.

In Madras roads, large ships moor in from 7 to 9 fathoms, with the flagstaff off the fort bearing W.N. W., 2 miles from shnre. From October to January is generally considered the moat unsafe season of the year, in consequence of the prevalence, during that interval, of storms and typhoons. On the 15th of October the flaggtaff is struck, and not erected again antil the 15th of December; during which period a ship coming into the roads, or, indeed, anywhere within soundings on the coast of Coromendel (reckoned from Point Paimyras to Ceylon), vitiates her lnaurance, accorling to the conditions of the policies of all insurance offices in India. The cargo boata used for crossIng the surf, callsd Masaula boats, are large and light ; made of very thin planks aewed together, with straw in the sesms lustead of caulking, which it is auppoaed might render them too stiff. When within the influsnce of the surf, the coxawain stands up, and beata time in great agitation with his voice and feet, while the rowers work their oars backwarl, until overtaken
by a strong surf curling up, which sweeps the boat along with frightfal violence. Every oar is then plied forward with the utmost vigor to prevent the wave from taking the boat back as it recedes; until at longth, by a few auccessive surfs, the boat is thrown high and dry upon the beach. The boats belonging to ehips in the roads sometimes proceed to the back of the surf, and wait for the country boats from the besch to come to them. When it is dangercus to have communication with the shore, a flag is displayed at the beach-house, which stands near the landing-place, as a caution. The fishermen and lower clasaes employed on the water use a speciea of flosting machino of a very simple construction, named a catamaran. It ls formed of 2 or 8 logs of light wood, 8 or 10 feet in langth, lashed together, with a small piece of wood inserted between them to serve as a stom-plece. When ready for the water, they hold generally 2 men, who with their paddles impel themselves through the surf, to carry lettery, or refroshments in amall quantities,

## MAG

to shipe when no loat can venture out. They wear a pointed cap made of matting, where they secure the letters, whech take no damage. The men are often washed off the catamaran, which they regain by swimming, unless interrupted by a shark. Medals sre given to such catamaran men sa diatingnish themselves by saving persons in danger.

The limited extent of the trade of Madras as compared with that of Calcutta and Bombay, is partly ascribable to the badness of its port or roadstead, the want of any navigable river or other easy means of communication with the interier, and the backward state of the provinces of which it is the capital, in consequence of the beavy and fluctuating land tax to which they are subject. In 1839-40, there arrived at Madras no fewer then 5,426 vessels (including their repeated voyages of the aggregate burden of 335,465 tons. But by far the greater number of these were of very small burden; 2,832 belng country craft from Bombay, 853 from Ceylon, and 585 from Goa. In the course of the same year 81 vessels arrived from the United Kingdom,-Hamiltox's East India Gazetteer; Geog. Dicl., art. Madras; Madras Almanac for 1839, 1840, and 1845; Official Returws of the Trade of Mfadras, etc.
Maelitrom, or Moskoe-Strom, a whirlpool in the North Sea, near the Island Muakoe. In summer it is but little dangerona, but it is very much so in winter, eapecially when the north-west wind restrains the reflux of the tide. At auch times the whirlpool rages vielently 80 as to he heard acveral miles, and to engulf small vessels, and even whales, which approach it. See Lovoden Islands. See also Fraazu's Mag., x., 267.

Magelian, or Magalhaens, Btraits of, divide the continent of South Ainerica from the Island Tierra del Fuego; the east ontrance is formed by Cape de la Virgines, on the mainland, and by Cape del Espiritu Santo (Queen Catharine's Foreland), on one of the largest ialands composing Tierra del Fuego. Length nearly 300 miles, extending between lat. $52^{\circ} 10^{\prime}$ and $55^{\circ}$ S., and long. $68^{\circ} 20^{\circ}$ and $75^{\circ} \mathrm{W}$. Navigation difficult. Discovered in 1020 by Fernando Magalhaens. Ferdinand De Magellan, or Magathaens, the discoverer of the atraits that bear hia name, was by birth a Portuguese. He served with honor in the East Indies, and in 1510 distinguished himself at the battle of Malacca. He entered into the employment of Charles V., King of Spain, and in conjunction with Ruy Folero, formed the bold design of diacovering a new passage by the west to the Molucea Islands. On the 20th September, 1519, he sailed from San Lucas, with five ships and 236 men. After many exertions, he induced two of hia ships to prosecute the entire voyage; and entering upon the atraite which now bear his name, he boon reached the South Sea. The weather was so uniformly temperate, and the sea so calm, that they called the ocean Pacific. Msgellan visited places seen for the first time by Europerns; and in visiting Matun, ate natives gave becile, and Magellan was slain, in the year 1521. But for this he would have been the first circumuavigator of the world, which honor was aecured by Caro, who brought his ships home ly the East Indies.
Magnesia (Ir. Magnésic; Ger. Gebraunte Magnesue; It. Magmesia), one of the primitive carths, having a metallic basia. It is not found native in a atate of purity, but is easily prepured. It is inodorous and insipil, in the form of a very light, winite, soft powder, having a speciflc gravity of $2 \cdot 3$. It turns to green the more delicate vegetable blues, is infusibje, and requires for its solution 2000 parts of water at $60^{\circ}$. See Manganese.
Magnet. Sturmius, in his Epistola, dated at A1torf, 1682 , observes that the attractive quality of the magnet has been takea notice of from time immoniorial; but that it was Roger Dacon, of Ilchester, in

Somersetghire (he died the 17th June, 1294), whe first discovered its property of politing to the north pole. The Italians discovered that it could commanicate its virtue to steel or iron. The variation not leing always the same was taken notice of by Hevelias, Petii, and others. "Flavio Glojs', of Naples, invented or improved the mariner's compass in 1802. The important discovery of the inclination or dip of the magnetic needle was made about 1578 (published 1580) by Robert Norman, of London. Dr. Gllbert's experiment was mude in 1600. Artlifical magnets were Invented, or rather improved, in 1751. A magnetic clock, inveated by Dr. Locke, of Ohio, announced at Washington, January 5 ,
1849. See Compass. 1849. See Compass.

Magnolia. The magnblia conspicua, or lilyflowered magnolia, as its name indteates, is a beantiful and showy troe, and diatinguishable from all others of the genus by tho expaniding of the flewers before sny of the leaves. "A full-grown tree, in its nutive country, is aaid to attinin a height of forty or fifty feet, and it has arrived at noarly the samio elevation in Euroje and America. The tree was first introduced into En-
gland by Sir Joseph Banks, in 1789 ; but it was many gland by Sir Joseph Banks, in 1789 ; but it was many years before it attracted much attention, being considered merely as a green-house or conservatory plant.
Within the last 20 years, it has been discovered to Within the last 20 years, it has been discovered to be nearly as hardy as the American magnoliue, and is now most extensively cultivated in the nurseries of Britain, continental Europe, and the United States. It flowcrs freely every year, as a standard in the neighberhood of London, New York, and Philadelphia, when the wood has been properly ripened daring the preceding aummer; and at White Knights, in Englund; at Fromont, and various other places in France; and at Monza, in Italy, and Brookiyn, in New York, it has ripened, seeds from whlch young planta have been raised. Propertics and Uses.-Besides the value of the magnolia conspicua es an ornamental plant or tree, the Chinese pickle the flower-buds, after having removed thelr calyxes, and use them for flavoring rice. Medicinally, the seeds are taken in powder, in colds, and inflammations of the chest. It is also regarded as stomachic; and water, in which it has been steeped, is used for bathing the eyes when inflamed, and for clearing them of gum.

Geography and History,-The magnolia glauca has the mest extensive range, especially ncar the sea, of any of the genus. It abounds from Massachusetts to Louisiuns and Missouri. Its most northero boundary may be considored a sheltered swainp in Manchester, Cape Ann, about 80 milies northerly of Boston. It here attains but a amall slze, and is frequently kiiled to the ground by aevere winters. In tise maritims parts of the Floridas and lower Leuisiana, it is one of tine most abundant among the trees which grow in morasses or wet grounds. It is not usualiy met with fur interier, nor to the west of the Alleglisnies. In the Carolinas and Georgls it grows only within the linuits of the pinc-barruns. This speecies was introduced into Englund by Rev. John Hanister, who sent it to Bishop Compton, at Fulham, in 1688. It was soon afterward generaliy propugated by American seeds, and became known throughout Europe many yeara liefore any of the other apecies. At Woburn Farm, Chertaey, there was formerly a row of these trees 20 fect high, and nearly a century old, which frequently ripened their seeds. In France, and snutilern Europe generally, this species in not very abundant, from the great hent of the summers, and the gereral dryness of tho air. At Versailles and the I'etit Trianon, sa well ns in Belgium, it has attained the helight of 15 reet. In the north of Germnny, and in Sweden und Russia, it is n green-houso plant. At Monza, in Italy, it is found in all of its varicties. In genoral, this tree can only be used for ornamental purposes, and no coliection shonld be without it. Ths wood, however, is sontetimes euployed for making

joinere' tools; and the bark Is alse used in some parts ef the country, like that of the cinchana, in the case of internittent and remittent fevers. It is aromatic and pungent, apparently more so than the other ipecies. When distlled, it has a pecullar flavor, and an empyreamatic emell. In a dry state It affords a little resin. The aroma is volatile, and probably contsins an essential eil: or a variety of camphor. The bark, seeds, and cones, aro employed in tincture, in chronic rheamatism. That from the cones is very bitter, and la sometimes used to cure coughs and pactoral diseases, and for preventing autumnal favers. The flowers in a dried state may be used in drawing-rooms for pot pourri, sa a substitute for those of the lily of the valley.-Browne's Trees of A merica.

Mahogany, the wood of a tree (Svieteria Mfahogani) grewlag In the West Indles and Central America. There are two other species of Swietenia found In the East Indic 3 , but thay are not much knewn in thla country. Mahegany Is one of the most majeatic and beautiful of trees: its trunk is often 40 feat in langth, and 6 feet In dlametar ; and It dividea Into so many massy arms, and throws the shade of Ita shining green leaves over so vast an extent of surface, that fow more magnificent objects are to be met with in the vegetablo world. It is abundant in Caba and Haytl, and it used to be plentiful in Jamsica; but in the latter island, most of the larger traes, at least in accessible situatinns, hsve been cut down. The principal importations into Great Britain are made from IIonduras and Campeachy. That which is imperted from the islands is called Spanish mahogsny ; It is not so large as that from Henduras, balng genarally in loge from 20 to 26 inches stitare and 10 feet long, while the latter is usnally from 2 to 4 feet square and 12 or 14 feat long, but some legs are much larger. Mahegany is a very beautiful rnd valuable specles of wood; its color is a red bro a, of different shades, and various degrees of brightness; sometimes yellowish brown; often very much veined and mettled, with darker shades of the same color. The texture is uniform, and the annual riags not very dlatinet. It has no largar septa; but the amallar aepta ars often very visible, with pores between them, which in the Hondurss wood are generally cmpty, but in the Spanish wood are mestly filled with a whitlsh substance. It has naither taste ner smell, ahrinks very little, and warps or twista less than any other species of timber. It is vary durable when kept dry, but does not last long when axposed to the weathar. It is not attacked by worms. Liko the pine tribe, the timber ja best on dry rocky soils, or in exposed situatiens. That which is most accessible at lienduras grows upon moist, low land, and is, generally speaking, decidedly infarior to that brought from Cuba nnd Hayti ; belng soft, cearse, and apongy, while tha other is clese-gralned and hard, of a darker color, and sometimes strongly flgared. Honduras mahegany has, however, the advantage of holding glue udmirally well; and is frequently used as a ground on whieh to lay veneers of the finer sorts.

Not leng since, Messre, Broadwood, the piano-ferte manufacturers of London, gave the Immense aum of £3000) for three logs of mahegany 1 Thess legs, the produce of a single tree, were each abeut 15 feat long, and 38 inchas square : they were cut into veneers of eight to an inch. The wood was particularly beautiful, capable of receiving the highest poliah, and, when polished, reflecting the light In tha most varied manner, like the aurface of a eryatal ; and, from the wavy form of the poren, effering a diffarent figure, in whatever direction it was viawed. Dealers in mahogany generaliy introduce an nuger before buying n log; but, notwithatanding, they are seldom able to dacide with much preciaion as to the quality of the woed, so that there is a good deul of lottery in the trade. The loga for which Measrs. Broadwood gave sn high a price wara brought to England with a full knowledge of
their superior worth. Mahegany was used in repairing aome of Sir Waiter Raleigh's ahipa at Trinidad, In 1597 ; but lt was not Introdr 'ed inte use in England till 1724. The daty on fereign mahogany used to be $£ 7$ 10s. a ton, on Honduras, $£ 1$ 109., and on Jamaica mahogany; $\mathbf{x 4 - i t a}$ effect being to force the consamption of the inferior in preference to the auperior article. Lacklly, hewever, the duty on foreign and colenlal mahogany, after being reduced $\ln 1845$ to $20_{\text {a. and }} 68$, a ton, was wholly repealed in 1845. There has been, in censequence, a very great Increase in the consamption of the superior sorts of mahogany for upholstary purposes, while the cheaper varietles are now largely employed, notwithatanding the diffieulties thrown in the way by Lloyd's regulations, in the construction of ships, and in coarser fabrica. In 1840 the imports ameunted to 23,115 , snd in 1852 to 41,090 tons, the re-exporta duriag the lattar yaar being only 2755 tons. Hnnduras, Caba, and Hayti, are the great sources of supply; the timber brought from the first being the cheapest and hy far the mest abundant. See Tredanld's Principles of Carpentry, p. 204 ; Library of Entertaining Knouledge, voluns on Timber-trees and Fruits; Edwaris's West Indies, vol. Iv., p. 208, ed. 1819, ete. ; and the Mahogany Tree, by Measra, Chaloner and Flemino; Living Age, xxix., 354.
The imports of ir hegany and other weods into the United Statea for the fiscal year ending June 30th, 1856, were as follows:

| Cabinet furniture. | Mannfactured. <br> . 46,781 | manufactured |
| :---: | :---: | :---: |
| Cedar, mahegany, | 22,807 | 8440,246 |
| Whilow....... | 125,803 | 86,554 |
| Cork. | 202,567 | 9,180 |
| Dye woods. |  | 796,802 |
| Others not speelfed | 429,915 | 25,157 |
| Total. | 8827,878 | 81,807,859 |

There are several varieties of mahegany, much admired, and sought after, for the beauty of thair figures, and the gradations of thair colors, which may be described as follows:

1. Plain Maifogany. Acajou uni of tho French, the wood of which is of one color, and equal throughout. 2. Veiny Mailooany. Acajou veiné, French. The wood of this veriety is veined longitudinally with the grain, displsying alternately dark and light streake, continuous, interrupted, or re-appearing. 3. Watered Mahoonny. Aeajou moired, French. This variaty is known by the traneverse waves which exhilit to tha eyo an effect similar to those of a watared ribbon. 4. Velvet-cord, or Catenilllar Mailoanny. Acajou chenille, French. This variety is distinguished by its whitlah lines, accompanied by a figured shade of fragments of rossate sprige, here and there disposed diagonally, longita inally, interrupted, or crossing one another. 5. IIn.'s-eyf Mahogany. Acajou moucheté, French. This variety is besprinkied with little oval knets, which, when duly proportioned, render the wood half light and half dark. 6. Festooned Mahooany. Acajou ronceux, French. This variety offers in its color a mixture of light and shads usually reambling ahcaves of wheat, feathars, wreaths, festoons, or figures of shrubs. As the wood of mahogany is generally hard and takes a fine polish, it is found to serve better than that of any other tree for cabinstmaking, for which purpese it is univeranlly admired. It is very strong, and answers well for beams, joista, planks, boards, and shingles, for which It was formerly much used in Jamaioa. Its adaptation to ship-buililing we have elready mentioned in the history of this tree.-Bnown a's Trees of A merica.
Maine, the most nerth-easterly State of the repuhlie of the United States of America, extends from lat. $43^{\circ}$ to $47^{\circ} 24^{\prime} \mathrm{N}$., and between leng. $6^{\circ}$ and $10^{\circ}$ E. from Washington, and contains an area of 35,000 square miles. Pepulation in 1790 was 06,540 ; in 1800, 151,719; in 1810, 228,705; in 1820, 298,385; in $1830,899,995$; $\ln 1840,501,793$; and in $1850,583.088$.

Sebastian Cabot, who was, after the time of Colnmbus, the first European navigator along the coasts of Maine and ita vioinity, appeara net to have given name to the countries discovered by him. The eldest and greateat name in these parts of North America is that of "Baccalaos"-a name given by the Biacmy fishormen at first to Newfoundland, and then also to all the countries which they found near this island. On some old maps the name "Baccalaos"-that is to say, the cod-fish country-reachea over a great part of the eastern const of America, but it appears more particularly in the regions of our State of Maine. Stephen Gomez was the firat Spanieh navigator who discovered (1525) and explored the cosate to the west and to the north of Cape Cod a little more particularly, and we therefore see on the Spanish mapa these regions designated with the name of "Tierra de Gomes" (Gomez's Land). So, for instance, at first on that of Ribiero (1529), and afterward on many others. After the middie of the 16th century, when Gemez was more and more forgotten, another name was introduced for these regions-that of "Norumbec." We can not exactly point out the occasion at which this name was invented; but we find it in the latter half of the 16th and in the beginning of the 17 th century, on nearly all the maps of these regions. The name seems to be of Indian origin, like the name of Kennelec, Quebee, and different ethers which have bec for the last syliable. Perhape some unknown sailors heard it pronounced by the Indiana, and introduced it ameng the geographers, whe were alwaye fond of new numes. It was, hewever, changed and apelled in many different ways: Norubec, Norombec, Arambec, Norumberge, Nerumberque, Norimbequa, etc.

The asvans of the time supposed that there was in the interior ef this northem country a lurge city of the same name, like that old fumed "Temistitan," in Mexico, and that through this city was running a large bread river, which was also called the River of Norumberge. It is probable that with this name our Penobscot Bay and its rivers were designated. They from this, therefore, called the whole country " La Terre de Norumberque," or the coasts of Arambec.

English Settlers.-At the sanne time the English introduced here another name, that of Virginia, under which they comprised, since 1584, pretty much the whole Atlantic coast of North America. Custom and use already introduced very soon a division in the Southern and the Northern Virginia coast. The royal patent of 1606 , by which the two Virginia companies were eatabliahed, made this custom legal and offleinl. After thie patent the whole section of the conntry north of the 40th degree of latitude, comprising our Maine, was designated as "Northern Virginia," or also, since some attempts at settlement, "the Northern Plantations," or also "the Second," or "Plymenth Colony," becanse the king had given this latter name to that particular society of merchants who had taken upon themselves the exploration and settlement of Northern Virginia. In the year 1616 the name of "New England" was introduced. The celebrated Captain John Smith was no doubt the inventer of it, and Prince Charlea approved of it. Smith says this himself in his history of New England, and states that he gave this name, which made some epposition against the neighboring French name of "New France" and the French pretensions; and, secondiy, he did it in contraposition to the country on the Pacific aide of Americs which was discov. ered by Drake, and named by him New Albion, and which was under the same latitude.

Sir Fernando Gerges gave, in the year 1686, to the territory between Piscataqua and Kennebeo Kivors, the name of "New Somersetshire," from the shire in England where he was born. Sometimes the whole vast region was therefore then called "Somersetshirs ;" and we find, even "'hen the name of Maine was already introduced, once the expression "Maine
or Somersetohire." In the same way the whole of Maine was also sometimes called "Lacona," from a part of the country to which this name was given for a time. We find on a map by Seller, of the beginning of the 18th century, written with great letters, "the Province of Laconm or Maine." The early English settlers on the coast of New England had for Muine the popular name of "the Eastern ahore," or "the Eastern country."

The name Maine was first introduced in the year 1639, when King Charies I. granted to Sir Fernando Gorges all the land from Piscataqua River to Sagadahoo, to which tract of land he gave the name "Irovince of Maine," "in compliment to the Queen of Charies I. who was a daughter of France, and owned as her private eatate the province of Maine in France." This, at least, is the opinion of the tirst good historian of Muine, Mr. Suilivun. But Sullivan gives no autherity for this opinion, which has, however, been adopted as a pretty general and popular one. The truth seems to be that it can not be proved that Queen Henrietta Maria had any rights at uil in Maine. An old author on Maine observes, "it is very curious that the name of our country hue been made shorter by an ' $e$ ' than the French Maine." In fact the word is, in old docnments, very commonly written "Main" or "Mayn." From this, one could be induced to suppose that the name originated in the Engiish expression for terra firma or continent: "Main" or "Mainland." Nearly all the first Engiish tradiog and fishing establishments along the ehore were on the numereus islands of the coast. From there the expiorers made excursions "to the Main," to trade with the Indians and to explore the country. There are innumersiife allusions, in their traveling reports, to "the Mayn." Could not from this have grown the custom of caliing the country " Main ?" From similar reasons and cir. cumstances the north coast of South America is callicd by the inhsbitunts of the Antilies and Caribhean Islunds, "Costa firme," or "Tierra firme."-J. G. Kont.

The name Maine extended st first only a amali distance along the coast. I3y degrees, and in the ceurse of time, in consequence of growing settiements and of many treaties and grants, it was oubsequeutiy extended as far east as Penobacot Bay, and at last as far as St. Croix River, and in the year 1819 the "Province of Maine" was erected into the "State of Maine."
There were in this State in 1850, 2,039, 596 ucres of land improved, and 2,515,797 of unimproved lund ia farms; cash value of land in farms, $\$ 54,861,748$; and the value of implenents and machinery, $\$ 2,284,557$. Live Stock.-Horses, 41,721; ssses and mules, 45; milich cows, 183,556 ; working oxen, 83,893 ; other cattie, 125,890 ; shcep, 451,577 ; swine, 54,598 ; vaiue of live atock, $9,705,726$.

Agricultural Products, etc.-Wheat, 296,259 busheis ; rye, 102,916; Indian corn, 1,750,056; oats, 2,181,037; bariey, 151,731; buck wheat, 104,523 ; peas and beans, $200,5-11$; potatoes, $3,436,040$; value of products of the orchard, $\$ 342,865$; produce of market gardens, $\$ 122$, 387 ; pounds of butter made, $9,243,811$; of cheese, 2,484,454; maple sugar, 93,042 pounds; molasses, 3,167 gallons ; beeswax and heney, 189,618 pounds; wool, pounds produced, $1,864,034$; flux, 17,081 ; silk cocoons, 252 ; hops, 40,120 pounds ; hay, tons of, $75{ }^{5}$, , 889 ; ciover seeds, 9,097 bushein; other grass seeds, 0,214 ; fiax seed, 580 fushels ; and were made 724 gallons of wine; value of home-made manufactures, © 513,599 ; of siaughtered animals, $81,646,773$.

Rivers, Lakes, efc.-It has been estimated that one sixth part of the surface of Maine consists of water. There are numorous laken, the largest and most nuted of which are Mooschead, Sebago, Chesuncook, und Umbagog. A part of the waters of the intter extend into New Hampshire. Some of these lukes are justiy celebrated for the picturesque beauties of thair scenery. A ateamboat has been built to piy on the waters

1. The p entry, altura ity of Csac long., $70^{\circ}$ aafe, und ar protected b by ice, and enough for of the port the Kenneb principal tic
of Moosehead Lake. The Kennebee and the Penobecot are the two most important atreama; the former Is navigable to Auguata, and the latter to Bangor. Their shores are adornad with villagea, and the interrales along their margina are the most fortile and beat cultivated In the State. The Saco, Androscoggin, and St. Crolx Rivers enter the Atlantle. St. John, and its confluenta, the Walloostook, Allagash, and Aroostook, drain the northern part of the State. The St. John forms a part of the northern part of the State by tha late treaty of Waahington, and its waters are open to the free navigation of both nations. The princlpal bays are Casco, Panobscot, Machias and Passsmaquoddy.

Ifanufactures.-Thore were in this Stato in 1850, 13 cotton factoriea, with a capital investad of $\$ 3,847,700$, employlng 840 males and 8,672 females, producing 83 ,168,536 yards of ahaeting valued at $\mathbf{2 , 6 8 0 , 6 1 6 ; 4 5}$ woolen factoriea, with a capital of $\mathbf{\$ 6 4 4 , 2 0 0 , ~ o m p l o y - ~}$ ing 388 malea and 890 femalea, manufactaring 2,926,320 yarda of cloth, and 1,200 lba, of yarn, valued at e034,923; 1 eatabliahment making pig-iron, with a capitsl of 8214,000 , omploying 71 jersons, producing 1,484 tons of plg-iron, etc., valued at $\$ 36,616 ; 25$ establishmenta, with a capital of $\$ 150,100$, omploying 244 persons, and making 8,631 tons of castings, valned at $\$ 265,000 ; 183$ flouring and grist millis, 752 aaw
mills ; 218 tanneries, with a capital of $\% 732,447$, omploying 780 persons; value of producta, $\$ 1,620,636$; 45 printing officea, 4 dally, 8 tri-weekly, 4 eomi-week: $1 y, 48$ weekly, and 1 monthly publication; aggregate number of copies pablishsd annually, $4,20 \mathrm{~d}, 064$. Capp ital invested in manufactures, $\$ 14,700,452$; value of manufactured articlea, $\$ 24,644,430$.

There were, January 1856, 11 railroads In this State; 494 milea completed and $\ln$ operation, and 00 milas in course of construction. The only canal in the State is the Cumberland and Oxford, $20 \frac{1}{2}$ milles long, connacting navigation from Portland to Sebago, and by a lock in Saco River, navigation is extended to Long Pond, 80 milea furthar.

The receipta on the principal linea of railroad in Muias, during the last four years, have been as foilows:

1. The princlpal porta are Porthand, city and port of entry, situated on a peninsula at the western extramity of Casce Bey ; lat. (Mount Joy), $48^{\circ} 39^{\prime} 52^{\prime \prime}$ N., leng., $70^{\circ} 18^{\prime} 84^{\prime \prime} \mathrm{W}$. The harbor is capacious and safe, and among the beat on the Atlantio coast. It is protected hy islands from storms, seldom obatructed by ies, and haa a good ertrance. The water is deep eneugh for veseels of the largest class. The tonnage of the port in 1836, was 136,154 tons. 2. Bath.-On the Kennebec, 12 milee from the ocean, la one of the principal towns of the State, and the largest ship-
building port in the world. A branch of the Kennebee and Portland Railroad connects the city with Portlund. The tonnage of the port is the largest in Maine, nnd in 1856 amonnted to 193,320 tons. 3. Bel-fast.-At the head of Belfust Bay, 30 miles from the ocoan, has an excellent harber, and a considerable trade in lumber and fish. Its chief industry, howaver, is ship-building. Stoamboats ply to Portland and lloston. The tonnage of Bolfast, in 1856, was 76,812 tons. 4. Bangor, on the Penohscot. Toanage in $180{ }^{6} 6,38,048$ tons.

Finances of he State.-The whole amount of tho funded debts of the Stats, December 81, 1856, was $\$ 699,000$; of that sum $\$ 30,000$ became due March 1. 1857, and the current expense of the year wili be dis: charged, without resorting to other masns than the nasual tax imposed by the Legialature. No Legitature will be required to provide for the payment of that suin. Recoipts and disturnementa for the yei ending December 81, 1856. Recejpts, balsace from year 1855, $\$ 89,18087$. From all other sources, $\$ 598$, 812,04. Total, 8632,442 41. Dishuraenients, $\$ 486,-$ 165. Balnnce in the treasary, 146,277 41. Soe North Am. Maise, or Indian Corn (Fr. Bled de Turquie; Ger. Trarkisch korm, Mays; It. Grano Turco o Siciliano; Sp. Trigo de Indias, Trigo de Turquia), one of the cereal grasses (Zea Mays), supposed to be indlgenous to South America, being the only species of corn caltivated in the New World previously to its discovery. It was Introduced into the Continent abont the beginning; and Into Engiand a little after the middlo of the 16th century. Its culture has spread with astonishing rapidity; being now extensively grown in most Asiatio countries, and in all the southern parts of Europe. It has the widest geographical range of all the cerealia, growlog juxuriantly at the eauator, and as far us the 50th degree of north, and the :-vth of sonth latitude. It has been raised in England, in nursery gardens near the metropolis, for more than a century ; and recently it has been attempted to raise it in the fields, but with indifferent success. Like other plants that have been long in cultivation, it has an itnmenae number of varieties. The ear consiets of about 600 gralar, aet close together in rows, to the number of 8,10 , or 12 . The grains are usually yellow; hut they are sometimes red, biuish, greenish, or olive-colored, and aometimes striped and variegated. The maize of Virginia is tall and robust, growing 7 or 8 feet high; that of New England is shorter and lower; and the Indians further up the country had a stili emailer sort in common uas. The stalk is jointed like the sugar cane. The straw makes excelient fodder; and the grain, as a bread corn, is liked by some; but though it abound in mucllage, it coutains littie or no gluten, and is not llkely to be much used lyy those who can procure wheaten or even rye bread. See Cons.
Malachite. Until 1851, so little was known abeat it, except to mineralogists, that the publio knew not whether it was a stone or a composition. The industrial history of the substance, however, is exceedingly curious. Malachite is a peenliar variety of green carbonate of copper, found in a few localities in Siberia and Soath Australia. It is softer lut leavier than marble, and much more difficult to work. It can rarely be fuund in masses weighing more than from 10 to 20 pounds; and the finer specimens have a very high value. Thore is a mine in Siberia, where a mass of malachite, supposed to weigh 500,000 pounds, lios inbedded at a dejth of 280 feet In a copper mine; and there is every indication that the maluchite has beon formed by the aolidification or petrefaction of a liquid carbonate of copper, on aome such principle as the stalactites in the Derbyshire caves. Tho material breaks so readliy, that it is generally pleces of only two or three pounds' weight that can be brought eafely to light.
MM. Demidoff, the owners of this valuabie mino, have establiahed a malachito mannfactory at St . Petersburg. The production of large doors, or vanes, or other articies in this anbatance, is exceedingly difficult. The fragments of malachite are flrst eawn into
thin plates, the thickness of which varies from a twelth to an elghth of an inch. The cutting to effected by vertical circular sawa, controlled hy very delicate machinery; and molstened with aand and water. For curved surfaces, the malachite is cut by bent saws of a pecnllar kind, the working of which is oxtremely precarious and difficult. The malachite has markings in different tints of green, which give to the material no amall part of its beauty. Theartist'.0 workinan determines what convolution or pattern these markings shall present in the finished article; and he so selects the veneers or small pieces as to attain that end. The pieces are cut at the edgoa to Join with graat nicety ; and to make these joints accord better with the markings, they are often made curved. The grinding of the edges is effected by the aid of rapidiy-revolving copper wheels. The anbstance on which the malachite is veneered is generally iron or copper, but sometines, atone or marble. When the pleces havo been fixed down with cement, omall interstices are filled up with a cement mixed with fragments of malachite, and colored with a powder of the eame material. After this the surface is ground and polished. The price of the raw malachite, in average pleces as brought up from the mine, is about $\$ 850$ to $\$ 4$ per pound; lut very great waste occurs in the working; and this, coupled with the lengthened time required in the working, will account for the great costliness of doors, vases, etc., made in this material. The malachite doors which occupled so prominent a place in the Great Exhibition, London, empioyed 80 workmen for a wholo year.

Malaga, a city and sea-port of Spain, in the kingdom of Granada, in lat. $86^{\circ} 431^{\prime}$ N., long. $4^{\circ} 25^{\prime} 7^{\prime \prime}$ W. Population, perhaps, 65,000. Nalaga his an oxcellent harbor. It is protected on its eastetn side by a fine mole, full 700 yards in length. At its extremity a light-house has been constructed, furnished with a powerful llght, revolving once every ninute. At a distance it appears obscured for 40 seconds, when a brilliant flash ancceeds for the uther 15 seconds. A shoal has grown up round the mole-head; and the depth of water throughout the harbor is said to be diminishing. Latterly, however, a dredging-machine has been employed to doopen it, by clearing out tho mud end eccumulating sand. The deptis of water at the entrance of the harbor and within the mole is from 26 to 30 feet ; and close to the city from 8 to 10 feet. The harbor could easlly accommodate more than 450 merchant shlps : it may be entered with all winds, and affords perfect shelter. Owing to the want of officisl returns, and to the prevalence of smuggling, which may be said to have annibilsted all fair trade, it is not possible to obtain any accurate accounts of the trade of Malaga, or indeed of any Spanish port. The great articies of export are wine and fruits, particularly raisins and almonds, grapes, figs, and lemons ; there is also a considerable exportation of olive oil, with quantities of brandy, snchovies, cummin-seed, aniseed, harilla, soap, etc. Tho lead oxported from Ifalaga is broaght from Alra. The imports are salt fish, iron hoops, bar iron, and nails; cotton stuffs, hides, earthenwaro, etc., with dyo stuffs, all sorts of colonial produco; lutter and cheese from Ilolland and Ircland, linen from (iermany, etc. The trade with Eaghand neems to be diminlshing, and that with tho United States to be facreasing. This is a consequence, no doult, of Malaga wine being very littic in domand in the former, while it is pretty largely consumed in the latter. The Americans are also the largeat consumers of Malaga fruit. See Marcy's Com. Rel. U. S., vol. il., pj. 63 , 64, published 1856-7.

Commerce with the United States.-The following table will show, approximately, to what extent the direct trade between the Unitod Statea ond Spain has falien off within the past few years. Most of this trade is carried on through the port of Malaga: ander the of duty us ports of to $\$ 228,0$ States to exports $t$ quansity, high price brings ap amount, as is $\$ 1,240,9$ ing a tota been very not much actiptions ing to the been very the grape the Muscat season 1,50 scription he States: th France; an shipments of Europe.

## MAL

 of Malaga in the pollowine Yeare.

| Yeara. |  |  |
| :---: | :---: | :---: |
| 184 | 14.978 | 1850.............. 16,600 |
|  | 12,988 | 1851............. 11,018 |
|  | 15,609 | 1852. . . . . . . . . . . 12, 1210. |
|  | 18,002 | 11,378 |

The fulling off in tonnage which the above table exhibits is, hewever, perfectly reconcllable with the com-
parative tablea for 1854 and 1882; when we take into conalderation the fact, that at least one third of the exporta to the United States is carried hy privileged vessels ; and even national vessela, notwithetanding the dlacriminatlig duty of 10 per cent. to whlch they are subject in the ports of the United Statea, partictpate largely in this carryling trade, for the purpoee of returning with cargoes of cotton for Malaga and Barcelona, or with codfish from Newfonniland.

The following extructs are taken from the comtnercial report of Malagn, dated the B1at of January, 1857, communicated to the Department of State: "The imports from the United States, which are usually limited to staves by Ameriean, and one or two cargoes of cotton by Spanish vessels, have been Increased by a few cargoes of flour and wheat, toward the end of the year, onder the late royal decree admltting breadatufis free of duty until June next; the approximate valne of imports of American produce for the last year amounted to $\$ 228,030$, and of foreign produce from the United States to 32,700 , making a total aum of $\$ 260,730$. The exports to the United States have not been large In qusnity, owing to short crops the past year. The high price of every article of exportation, however, briugs up the value equal to any former period. The amount, as per proximate returns of American vessels, is $81,240,907$, and by forelgn vessels $\$ 407,360$; making a total sum of $\$ 1,648,267$. The rulsin crop has been very short, the last vintage being estimated at not much over 600,000 boxes of Muscátela. Other descriptions of ralsina show a still greater decrease, owing to the cenlza, a disease of the vines which has been very general the two laat years. The culture of the grape is extending throughout the province; and the Muscatel vines would probably yield, in a favorabe seasen $1,500,000$ boxes. Over two thirds of this description have been shipped the last year to the United States: the finer quality is shlpped to England and France; and when very abundant, at low pricos, large shipmente would be made to Germany and the north of Europe. Prlcea have ruled very high, averaging $\$ 2$ for M. R., and $\$ 225$ for ordinary luyers, for the American market; fine London luyers from $\$ 3$ to $\$ 4$ per box. The stock existlng at the end of the year did not exceed 30,000 boxes, about two thlrds of which may go to the Unlted States. The various productiens of this and the ndjoining provinces, for want of good roads and rapld communicatlon in a mountainous country, can not be brought to market so as to compete with the same of other countries, consequently they ure not lucreased. Outside of five or eight leagues, little is recsived, but at such a ligh cost of transportation that many bulky articles cun not be brought at all. Sumac, for Instance, is worth, in the Interior, from 20 to 25 per arroba, or 25 pounds. 'The frelght of this artlele to Malaga is more than double the cost. It is considered by chemists of a better quality than the Siclly, but it can not be afforded for the American market, although, notwithstanding the high cost, conoiderable is shlpped to France."

The following detalls, extracted from Mr. Inglis's valuable work, entitled "Spain In 1830," contain the fullest and best account we have met with of the trade of Malaga. The authentlelty may, we belleve, be depended upon:
"Wine.-The wlues of Malaga are of two sorts, swect and dry; and of the fermer of these there are
four kinds; first, the commen 'Malaga,' known and exported under that name. In thla there ls a certaln proportion of bolled wine, which la allowed to burn, and which communlcates a allghtly burnt taste to the ' Malege.' The grape from which thls wine is made is a white grape; and every' pipe of 'Malaga' contalns no less than eleven gallons of brandy. Secondly, 'Mountaln.' This wine la mado from the eame grape as the other, and, like it, containa coloring matter and brandy ; the only difference is, that for ' Mountaln' the grape is allowed to become ripe. Thirdly, 'Lagrimas,' the richest and finest of the sweet wines of Malaga; the name of which almost explaina the manner in whleh it la made. It la the dropplinge of the rlpe grape hung up, and la obtained without ihe appllcation of pressure. The dry wine of Malaga is produced from the same grape as the aweet wine, but pressed when greener. In this wine there is an elghth part more of brandy than in the sweet wine; no less thun 1-12th part of the dry Mulaga being brandy. The whole produce of the Malaga vineyards is estlmated at from 35,000 to 40,000 pipes; but, owing to the increasing stock of old wine in the cellurs, it is impessible to be precise in this calculation. The exports of all sorts of Malaga wine may be stated at about 27,000 pipes. The principal market is the United States and South Anerica; and to these the export is upon the Increase. The average price of the wlnes shlpped from Malaga does not exceed $\$ 35$ per pipe ; but whes are occasionally exported at the price of $\$ 170$. Many attempts have been made at Malagat to produce sherry, but none with perfect success. The sherry grape has been reared at Malaga upwn a soil very sinilur to that of Xeres ; hut the merchants of Malaga have not ventured to enter the wine for expert. One reason of the very low price of the wines of Malaga is to be found in the cheapness of labor: tield labor is only $2 \frac{1}{3}$ reals a day ( 10 cents). In the fruit end vintage time it is about double.
"Fruit.-Next to lts wines, the chisf export of Malagn is fruit, conslsting of raisins, almonds, grapes, tige, and lemons; but of these, raisins are principally exported. I have lefore me a note of the exports of Mulaga for the months of September and October, 1830-the chlef, though not the aole exporting montha -and : find that luriug that tlme the export of raisins amounted to 268,845 boxes, and 31,916 amaller packages. Of this quantity 125,384 boxes wero entercd for the United 'Statea; 45,513 for England ; the remuining quantity belng for France, the West Indies, the Spanish ports, South America, and Hollani. The raisius exported from Malagn are of three kinds, muscatel, bloom or sun raisin, and lexias. The muscatel is the flnest ralsin in the world. In ita prepmration no art is used; the grape is merely placed in the sun, and frequently turned. The bloom or aun raisin is a different grape from the muscatel, but its prepuration le the same. The lexias acqulre this name from the

Hquor, or ley, in which t rey are dipped, and which is composed of water, asher, aud oll; these, after belug dipped, are also dried in the aun. All muscatel raisina are exported in boxes, and also a part of the bloom raiains. In 1829, the expot is of muscatel and bloom raiaina were 825,000 bexen of 25 lba. each; in all, $8,125,000 \mathrm{lbs}$. This quantity la independent of the axport of bloom ralains in casks, and of lexias; the latter amounting to about $\mathbf{3 0 , 0 0 0}$ arrobas. The export of raisins to lingland has fallen off, while that to America has conaiderably increased. In 1824, 75 shipa cleared from Malaga for England, with fruit; In 1830, down to the 1st of November, 84 vessela had cleared out. Of the other fruita raised near Malaga, grapea, almonds, and lemons are the most extenaively exportad. In the months of September and October, 1830, 11,612 jars of grapes were shipped for England, 6120 for America, and 1650 for Russia. During the same months, 5335 arrobas of almonds ( $188,875 \mathrm{jba}$.) were ahipped for England, this being neariy the whole export. There were also exported during the aame period 3749 boxes of lemons for England, 4201 boxes for Germany, and 840 boxes for Rusuia.
"Oil.-There is also a large expert of oll from Malaga; but the export during the latter part of 1830 would be no criterion of the average, because the Greenland whale-fishery having failed, extenalve ordera had been received from England."
Money.-Accounta are kept in reals of 84 maravedia vellon. For the coins, and their value, used at Malaga, $s e e$ Cadiz.

Weights and Measures.-The weights are the same as those of Cadiz. The arroba or cantara $=4 \cdot 19 \mathrm{En}$ glish wine gallons; the ergular pipe of Malaga wine containa 35 arrobos, but lo reckoned only at 84 ; a bota of Pedro Ximenes wine $=53 \frac{1}{3}$ arrobas; a bota of oll is 43 , and a pipe 35, arrobas; the latter weighs about 860 lbs. avoirdupois; a cargs of ralaina is 2 baskets, or

7 arrobas ; a cask contains as much, though only calied 4 arrobaa; as a last for freight are reokoned-4 botar or 8 pipes of wine or oli, 4 bales of orange-peel ; 5 pipea of Podro Ximenea wine or oll; 10 casks of almunds (each about 880 lbs., Finglish); 20 cheats of lemons and orangea ; 22 caska of almonds (of 8 arrobas each) ; 44 casks of raisina (of 4 arroban each); 88 half caeks of ralains; 50 baskets or 100 jurs of ralsins.
Port Charges.-The port and harbor duea amount, on an English veasel of 800 tona, to about $\boldsymbol{c} 21$; on a Spanish vesmel of the same burden they would be about $£ 11$ 10s.

Warehouding.-Goods may be warehoveed for 12 montha, paying 2 per cent. ad valorem in lipu of all charges ; but at the end of the year they munt be elther entered for consumption or re-shipped. The 2 per cent. is charged whether they lie a day or the whole year. See also Townamen's Trarele in Spain, vel. III., pp, 1042.

## Malmbley See Wine.

Malt (Ger. Maly; Du. Mout; Fr. Mal, Blédyemé; It. Malto; Sp. Cebada retonada ó entallecidu; Ius, Solod; Lat. Mfallum). The term malt happlied to designate grain which, being ateoped in water, is made to germinate to a certain extent, after which the process is checked by the application of heat. This evolves the saccharine principle of the grain, which is the easence of malt. The process followed in the manufacture la very aimple. Few changea have been made in it; and it la carried on at this moment very much in the same manner that it wus carried on by our ancestors centuries ago. Rice, and almost every speciea of grain, has been used in malting; hut in Europe, and especially in England, malt is prepared aimost wholly from bariey. It is the principal ingredient in the manufacture of beer, and is little used except in brewing and the distliation of spirits. Its conaumption In the United Statea is rapidly increasing.

Owing to malt liquor having early becone the bushels a year; whereas the annasl average quantity favorite beverage of the people of Fingland, the manufacture of malt has been carried on in that country, for a lengthened period, on a very large scale. Instead, however, of Increasing with the Increasing wealth anc. population of the country, it waa nearly atativaiary for the 100 years ending with 1816 . In proof of this we may mention that the quantity of malt that paid duty in England and Wules, at an average of the 12 years ending with 1720 , was $24,191,304$ that paid duty during the 12 years ending wilh 1816 , was only $28,197,754$ bushels. This spparentiy anomalous result is probably in some measure to be secounted for by the increased consumption of tea and coffee; but there can not be a quection that it is mainly owing to the exorbitant duties with which malt, and tho ale or lieer manufactnred from it, have leea loaded, and to the oppressive regulations imposed on the manufacture of malt and the sale of beor. But

the pubile attention belng at length forcibly attructed to the suljeet, and the offect of the exorbitant dutioe on malt and beer in increasing the consumption of ardent apirita having been clearily pointed out (see Edinbury Reriew, No. 98), the beer duty in Great Britain was repealed in 1830.
Malta, un island in the Mediterranean, belonging to the Britioh, neariy opposite to the southern extremity ef Sicily, from which it to about 54 miles distant. Valetta, the capital, is situated on the north const of the isisnd, the light-honse in the castlo of St. Elmo being in lat. $85^{\circ} 54^{\prime} 6^{\prime \prime}$ N., long. $14^{\circ} 31^{\prime} 1^{\prime \prime} \mathrm{E}$. Maita is about 20 miles long, and 10 or 12 broad. The island of Gozo, about a fourth part of the size of Malta, lies to the north-west of the latter, at about four miles' dlatance; and in the stralt between them is the amali island of Cumino. In 1847 the population of Malta amounted, excluding the gu-rison (except the Maltese regiment), to $\mathbf{1 0 8 , 1 4 0}$. Tho population of Go20, at the same period, was 15,130 ; the total popuLation of both islands making 128,270. The entire revanue co? sted in Malta usually amounts to abont $£ 100,000 \mathrm{a}$ yuar, of whleh about $£ 23,000$ is derived from the rent of lands. Valetta, the capital of the island, is defended by almost impregnable fortifications. "Thess," says Mr. Brydone, "are, indeed, moat stupendeus works. All the boasted catscombs of Rome and Naples are a trifle to the immense excavations ond have been made in this little island. The ditches, of a vast size, are all cut out of the solid rock; these extenil for a great many milles, snd ralse our astonishment to think that so amall a State has ever been able to make them." (Tour through Sicily nnd Malta.) Since the island came Into the possesaion of Great Britain, the fortifications have been considerably Improved; so that at present it is a pluce of very great strength. After the capture of Rhodes by tha Turks, the Einperor Charies V. made a present of Malta to the Knights of St John of Jerusalem, in whose possession it remainod till 1798, when it was taken by the French. It was taken from the latter by the English in 1800, and was definitely ceded to Great Britain in 1814. The Island consiata mostly of a rock, very thinly covered with soil, a good daal of which has been brought, at an immense expense, from Sicily; but being cultivated with the utmost cure, it producea excollent fruits, particularly tha celabrated Maltese oranges, corn, cetton, with small quantities of indigo, saffron, and sugar. The principal dependence of the inhalitants is on their cotton; the crop of which, amounting to about $4,000,000 \mathrm{lbs}$ a year, is partly axported raw, and partly manufactured to the value of from $\$ 400,000$ to $\$ 500,000$. The corn raised on the island is not sufficient to fced the inhalitants for more than fiva or six months, snd, st an sverage, sbout 100,000 quarters of fureign wheat are requirgd for their use. In addition to corn, cattie, provisions of all sorts, jncluding dried fish, fruits, Spanish peas, etc., are largely imported. The other leading articles of import cemprise cottons and most sorts of manufactured goods, sugar, coffee, and other colonial products, tahacco, oil, wines, timber, etc. The tride in corn used to be monopolized by government; and after the monopoly was sibandoned, duties on importation, varying, like those in this conntry; with the price, were imposed. But in 1825 these dntics were abollshed, and the fixed duties on corn entered for consumptien, specifiod in the subjoined tariff, were substituted in their stead. Maits presents unusual facilities, which have not hitharto been taken proper sdvantage of, for becoming the entrepót of the corn trade of the Meditarranean and Black See. Her warehouses for corn are, like those of Sicily and Barbsry; excavated in the rock ; and are, perhaps, the beat fitted of any in Europe for the ssfo keeping of corn. The wheat lodged in them may be preserved for an indefinto period; and it is affirmed that though it
shoud, on belag deposited, be affected hy the weevil, it is very soon freed from that destructivo inseet. It is not often that corn can be hrought direct from Odesaa, Taganrog, etc., to England, without the riak of beling damagod; but were it brought, in the first Inatanca, to Malta, and bonded thero, it migitt afterward be conveyed in the beat order to the Engilah market. Malta is almo admirahly well suited for liecuming a centre of the corn trade of Egspt, Barbary, Italy, ote. During the wars of $1800-1816$, particularly during the period when Napoleon's anti-commerclal bystem was in operation, Malta became a great entrepót for colonlal and other goods, which were thence conveyen, according as opportunities offerad, to the adjacent ports. This commerce ceased w'.'h the circumetancea that gava it birth; and for some yoars after the retarn of peace, tha trade of the island was depressed below its natural leval, by the imposition of varions oppressive discriminating dutios. In 1819, this vexatious oystem was partially obvisted; but it continued to exert a pernicions influence till 1837, when, purenant to the recommendation of the commisaloners of Inquiry, the then existing tariffs of customs duties and port charges wore wholly abolished, and a new tariff was issued in their atead. It imposed moderate duties, for the sake of revenue only, on a few articles in genaral demand, without regard to the conntry whence they came, at the asme time that it equslized the tunnage duties; and reduced the warehouse rent on articlas in bond to the lowest level. There are some good aprings of fresh water. Vuletts is partly sapplied by water brought by an aqueduct a distance of abont six milles, and partly by the rain rollected in elsterna.

Harbor.-The hartor of Valetts is double, and is one of tha finest in tha world. The city ls built on a narrow tongue of land, having the castia and light of St. Elme at its extremity, and an admirsble port on each side. That on the south-eastern side, denominated the grand port, is the most frequented. The entrance to it, about 200 fathoms wide, has the formidable batterias of St. Elmo on the ona hand, and those of fort Ricasoll on the other. In antering, it is necesasry not to come within 50 or 60 fathoms of the formar, on account of a spit which projects from it; bnt in the rest of the channel there is from 10 to 12 fathoms water. The port, which runs about $1 \frac{5}{4}$ miles inward, has deep water and excellent anchorsge throughout ; the largest men-of-war coming close to thaquys. Port Marsmusceit, on the north-western sic of the city, is also a nobla harbor. The entrance to it, which is about the same ureadth as that of the grand port, ia between St. Eimo and Fort Tiqua. In the centre of the basith is an island on which are built a castle anas lazaretto, for the convenlence of tha ships performing quarantine, by which the port is principally used. Owing to the narrownosa of the entrance, and the uaual variableness of the wind, it is customary for most vassels bound for Valetta to take a pilot on board before entering the harbor.
Clasbification of Merchant Vessels whor have ar. hived in Malta duaino the Yeae 1843.

This arrivals of merchsnt-veasals and ahips of war at Maita during the year 1849, were as follows:-Mer--hant-vessels, 8251 ; ships of war (including steamers), 3 in; total, 3591.

Lut of Vraselu hemozomo to The Inlanm of Mastąon

The central positinn, excellent port, nnd great strength of Multu, mako it an admirable naval station for the repair and accommodation of the men-of-war and merchunt-abipm frequenting the Mediterrancan, and render ita possenalon of material importance to the Jritish emplre. Since Malta-built vessela were admitted into ports of the United Kingdom on the same terms at those of British-bult, the trade of ahlpbuilding has materially laereased in the Island. The Multese shipwrights are diligent expert workmea, and, their wages belag modernte, it is a favorahie place for careening. Owing to the want of a dry dock, all ablpa above the aize of a sloop of war, that require to have their bottoms oxamiued, have to come to England for that purpome. This, surely, ahould be obvinted. Quarantias ia strictly enforced at Malta ; but there is every facility for its porformance, and the chargea are leas chan at any other port in the Mediterranean.
Malta ls now the centre of a very extensive ateamspacket aystem; the ateamors froin England for the Iouian Islands, Constantinople, Alexandria, and other ports of the Levant, touching here. The French
atemmers from thase po: ' (uavally perform quarantine

Commercial Aehutions with the United Stutes.-The commercial intercourse of the Uniterl States with Malta is dependent, as la that of all other nations, on the regulationa and legialatlvo enaetments of the mother eountry. The traice of the United States with this isiand is not, however, very important, though an examination of the follonwing table will show a perceptible incrense in the mmonnt of our tomage, and but little varlation in the value of oar exports ciuring the years which they embrace:

ons, and the soll nuwhere very productive. Population in 1851, 82,887. This ialand uned to be one of the principal stations of the horring. fahory; but for a connideruble period, it hus been comparatively denerted by the herring ghoale, a sircumatanes which is not to be regretted, for the fishery, by withdrawing the attention of the Inhalitants from agriculture and manufactures, and lowing them to engage in what has usually ibeen gambiling and naproductive bun'ness, has been, on the whole, injurious to the island. TEs ateam packeta from Glasgow to Liverpool, and from the latter to Belfast, touch st the Iale of Man; which is, int consequence, largely frequented lyy vislters from these citisa, and other parts of the euplre, whone influx lian materially contributed to the improvement of Duuplas, the prinelpal port in the island, and other towns. The feudal soverolgnty of Man was formerly vasted In the Farls of Deriy', and more recentiy ln the Dakes of Athol, a clrcumstance which a coounts for the fact of the duties on most comanoditles consumed in the island having been, for a lengthened peribl, much lower than those on the ame eominolities when conaumed in Grent Iritain. This distinction, whiluh atlll aubsists, has produced a great deal of ensugyling, and been in no ordinary degree injurlous to the revenue and truie of the empire. The customs revenue collected in the Isle of Man in 1852, amounted to $\mathbf{\Sigma 2 8}$,077 ; but from this sum $£ 14,378$ was deducted on account of expenses of coliection, publio works, Internal govariment, etc.
Manohester, a city, parliumentary and munlelpal borough, and parish of Englund, county Lancaster. Aren of parish, including the borough Salford, 33,853 seres. l'opulation, 452,158. Inhabited houses, $53,697$. l'opulation $\ln 1801,110,988 ; \ln 1841,853,890 ; \ln 1851$, $401,5: 1$, of whom 316,213 were in the borough of Manchester, and 85,108 in that of Salford. 'Jhe town stands on a plain, and consists, with Salford, of a dense mass of buildlings, extending aliout two miles from east to west, by somewhat less from north to south, snd covering sbout 3000 acres. It has a bruuch of the Bank of lingland, 5 joint-stock banks, and 5 weekly newspapers. Market, T'uesday', Thursiluy, and Saturday. The proximity of an aliundance of coal, the improvenents iatroduced lato spinnling and weaving muchlaery by llughes, Arkwright, Ilargisavea, and Croupton, and the applicaton of steum power, have ralsed Manchester to lts eminence of monopolizing two thirls of the cotton manufucture of Groat Ilritain. Its manufuctures are mostly conducted In large mills and factories. Of these in 1853, there were a Manchester and Salford:

Woolen fubrics, machinery, hats, puper, ropes, twins, pins, and nnmerous other goode, are made in large quantities; and there are many blenching and chemical works, and breweries. Annual export valued at $£ 12,000,000$. Manchester communicates with Birminghain and London by the Grand Junction (N. W.) railroad, and by other railroads and canals with Liverpool, Bolton, I'reston, Rochdale, Sheffield, etc.

Manganese (Ger. Braunstein, Glasseise; Du. Bruinsteen; Fr. Mangonèse, Magalese, Saron du verre; It. Mangavesia; Sp. Manganesia; Lat. Magnesio nigra, Manganesium), a metsl which, when pure, is of a grayish white color, like cast-iron, and has a good deai uf brilliancy. Its texture is granular; it has veither
taste nor smell, it is softor than cast-iron, and may be filed, ite specific sravity is 8 . It is very brittle, and can neither be hammered nor drawa out into wiro. Its tenacity is unknown. When exposed to the air, it attracts oxjggen with considerably rapiaity. It soon loges its lustre, and becomes gray; violet, brown, and at last black. These changss take, place atill more raplally if the metal lo heated is an open veanel. Ores of manganene are common In Devonshirs, Someraetshire, ote. The ore of mangavese, known in Derbsshire by the name of blact wadl, is romarkable for ita spontaneous inflammation with oll. Oxyd of mangunese is of considerable une; it is emplojed in makIng oxymuriatio acid, for forming blamching liquor. It is alec uod in glaxing lilack easthenware, for giving colors to enamels, and in the manufucture of porcelain. It is the substance generally used by chemists for obtalning oxygen gas.-Tuomson's Chemisiry, etc.

Mangel Wursel, or Fiold Beet (Fr. Hetteraves; Ger. Mangold Wurzel; It. Bieltola), a mongrel between the red and white beent. It has been largels: enitivated in Eurupe and the United States, partly as food for cattle, and partly to be us $d$ in distillatlon, and in the extraction of sugar. Ite cure in Great Britain is very recent; and Mir. Lon ¿questions whether it has any advontages over the turnip for general agricultural purposes. Tho preparatlon of the soil is exactly the same as for turnips, snd immense crops aro raised on strong clays. The produce per acre is chout the sume as that of the Swedish turnip; it is applied aimost entirely to the fattoning of stock, and the feedIng of mlleh cows.-Loubon's Ency. of Agr.

Manger, the space near the lawse holes, bounded on the upper side by a partition acress the bows, called the manger board, to receive the water whlle it enters the lawas holes and prevent it from flooding the deck.

Mangle (Fr. Calandre; Ger. Mfangle), this is a weli-known machine for anoothing table-elotha, tablenapkins, us well as linen and cotton furniture, and much usci in botels. As usually made, it consists of an ohlong rectangular woorlen chest, flled with stones, which load it to a degree of pressure that it should exerclse upon the two cylinders on which it rests, and which, by rolling backward and forward over the linen apread upon a polishel tablo undernath, renier it smooth and level. The noving wheel, belng furnished with teath upon both surfaces of its periphary, and having a notch ent out at one part, allows a pinion, uniformly driven in one direction, to act alternately upon its outside und inside, so as to cause the reciprocating motion of the chest. This elegant and much admired English lavention, called the mangle-wheel, has heen litroduced with great advantage Into the machinery of the textile munufactures.

Mango (mangos marum, in the Tamul language of lndla), is a very lurgo fruit-tree, inhabitlag the tropleal parts of Asla, throughout all which it is as extensirely cultivated us the apple and pear-trees are In Europe. Old specimens have been seen with a trunk from 10 to 10 feet in circumference. The frult is sometling like a nectarine, but more compressed, longer, and more curved. It contains a large stone, covered with coarse fibres, which lose thomsclves in the succulont flesh. The wild and inferior varieties of the fruit tasto so strongly of turpentino as to bo wholly unfit for use by Enropeans; but in tho fine verietics this fluvor is replaced by a rich sugary quality, which renders it very dellcions. In this country the mango has rurely ripened its fruit, but it is common in tiee sloeps in a pickled state. The frnit of the Mangifera Indica, a tree cultivated in Asia, is also calied mango.

Manifest, in commercial navigation, is a document signed by the inaster, containing the name or unmes of the places where the goods on bourd have been laden, and the place or places for which they are
respectively destined; the name and tonnage of the vessel, the name of the master, and the name of tho place to whlch the vessel belongs; a particular account and description of all the packages on board, with the marks and numbera thereon, the goods contalned in such packagee, the nsmea of the reapectivo shippers and consignees, as far as such particulars are knownto the master, etc. A separate manifest is required for tobacco. The manifest must be made out, dated, and signed by the captain, at the place or placea where the goode, or any part of the goods, are taken on boarl.

Manilla, the capital of Luconia, the largest of the Phllippine Ialands, and the principal settlement of the Spaniarils in the East, in lat. $14^{\circ} 36^{\prime} 8^{\prime \prime}$ N., long. $120^{\circ}$ $63^{\prime} 30^{\prime \prime}$ E. Population about 100,000 , of whom from 4000 to 5000 may be Europeans. Manilla is built on the shore of a suacious bay of the same name, at the mouth of a river naviguble for small vessels a considerable way into the interior. The smaller class of ships anchor in Manilla Roada, in 5 fathoms, the north bastion bearing N. $\mathbf{3 7}{ }^{\circ}$ E., the fiahery atakea at the river's mouth N. $18^{\circ}$ E., distant about a mlle; Lut large ships anchor at Cavita, about 3 leagues to the southward, where there is a good harbor, well sheltered from the west and south-west winds. The arsenal is at Cavita, which is defended by Fort St. Ihilip, the strongest fortress on the islands. The city is surrounded by a wall and towers, and some of the bastions are well furnished with artillery. Though .ituated within the tropice, the climate of the Philippines

Is sufficiently temperate ; the only considerable disadvantage undor which they labor in this reapect being that the principal part of the group comes within the range of the typhoons. The soil is of very different qualities but for the moat part aingularly fertile. They are rich in mineral, vegetable, and animai prodactions. It ls stated in a statistical sccount of the Philippines, published at Maxilla in 1818 and 1819 thut the entire population of the isiands amounted to $2,249,852$, of which $1,376,222$ belonged to Lucenia. There were at the period referred to oniy 2837 Europeans in the lalsnds, and little more than 6000 Chinese. The nativea are anid to be the most active, boll, nad energetic, of any belonging to the eastern Archipelago. "These people," says a most intelligent navigator, "appear in no respect inferior to those of Europe. They eultivate the earth like men of understanding; are carpenters, joiners, smiths, goldsmiths, weavers, masons, etc. I have walked through their viliages, and found them kind, hospitable, and communicative; and though the Spaniards speak of and treat them with contempt, I percoived that the vicea they attrils. uted to the Inilians, ought rather to be imputed to the government they have themselves establislied."-l'oyage de M. De la Perouse, c. xv.

The principal articles of export consist of sugar, hemp, indigo, segars, cotton, coffce, rice, supun-wool, mother-of-pearl, hides, ebony, gold dust, cte. Tho principal articles of import are atuffa for clathing, iron, hardware, furniture, fire-arins, and ammunition, etc.

Tise quantity of rice and padily ahipped to China from the islands can not the ascertained with any degree of exactnens; what goes from Manilia is very emall, because, before arriving there, it has, by its transport expenses, added to the price at which it is obtainable in the districts where it is proluced, which, of conrse, prevents its being whipied from the capitul. Probabiy, however, abont * $\quad 40,000$ coyans, each of which, one with anot' , relghs about a China pecul, or $133 \frac{1}{2}$ ibs., may be annually exported. The export is regulated by the aupposed scarcity or ntbundance of fool in the country.-M'Mickis's Mranilla, p. 270.

The principal currency of Manilla consista of Spanish dollars, of 8 reals ard 96 graine ; but South American dollars are also current. The weights in use aro the Spanish pound, which is nearly 2 per cent. heavier than the English; the arroba $=251$ linglish lbs, nearly; the quint:al 102 lbs , and the pecul of 5 nrrobas, or $1 \frac{f}{6}$ cwt. inglish. The coyan is a measure for rice, etc., varying from 96 to $1: 5 \mathrm{lbs}$. According to a recent list, there are in Manilla 47 Spanish merchanta and 11 foreign firms. The Spanislt merchants liave a chamber of commeree and a joint-stock insurance society. The United States, France, and Helgium have consuls, and each of the Cantun innrine insurance companies has an agent here. There are, however, neither tire nor life-oflices norsgents ; nor is any nowapaper, price-
curreat, or other periodient publication issued in Manilla. Considering the great fertility and varied productions of the lliilippines, and their pecuiarly favorable situation for carrying on commerce, the limited extent of their trade, even with its late increase, may excite surpriso. This, however, is entirely a consequence of the wretched policy of the Spanish gove.... ment, which persevered until very recently in excluiling all foreign ships from the ports of the lhilippines, confining the trade tetween them and Mexico and South America to a single shipi liven shipis and settlers from China werc excluled. "l'rovisions," says La l'erouse, " of all kinds are in the greatest atimilance here, and extremely chenp; but cluthing, burvpean hurdware, and furniture, hear an excessivcly high price. The want of competition, together with preshibitions and rextraints of every kind laid on consmerce, render the productions and merchandise of India and China nt least as iear as in Europe!" Happily, however, this miserable policy the reffects of which have heen adinirubly depleted by M, De lia lerouse, has been materially morithed luring the last few years. The events of the late war destroyed fon ever the old colonial system of Spain ; and the ships of all nutions are now freely admitted into Manilia and the other ports in the Philippines. An unprecedented stimulua has, in consequence been given to all sorts of

Cotton twist, gray, black, blue, and purple, knives or bolos, such as the natives use, ready-made clothes, boots, shoes, preserved fruits, confectinnery, and vinegar, by Spanish vessels, 20 per cent., and 30 by foreign. British and other foreign catton and silk manufactures, made in imitation of native cloths, chiefly stripes or checks, of blaek, liue, and purple colors. Madras and Bengal gray, white, snd printed cottons, towels, table-napkine, and tablecloths, 15 per cent. by Spanish vessels, and 25 by foreign. Ileche de mer, rattans, diamonds, tortoise-shell, mother-of-pearl-shell, and biris' nests, 1 per cent. by Sbanish vessels, and 2 ly fureign. Machinery of nil sorts for the promotion of the industry of the country, cotton twist of red, rose, yellow, and green colors, gold and silver, coined or uncoined, plants and seeds, free. Tropical productions similar to those of the Philippines, also arrack and gunpowder, are prohibited. Opium is only ndmitted to be deposited for re-exportstion. Swords, fowling-pieees, muskets, pistols, and warlike stores may be deposited for re-export, and can not be introduced without the special license of the government; but cannon and dress-swords are admitted.
Eirport Duties.-Conmodities and proluce of every description to Spain, by national vessels, pay 1 per cent., nnd 2 loy foreign; elsewhere, $1 \frac{1}{2}$ by Spanish vessels, and 3 ly foreign. Hemp, by national vessels, to whatever destination, 1 per cont., nad 2 by forelgn. Kice, by Spanish vessels, free, and $4 \frac{1}{2}$ per cent. by foreign. Manufactured totogeco, and cordage of Manilla hemp, free by all flaga. Gold dust, gold in linrs, nud silver in bara, free.

Entrepút IVuties.-One per cent. ad valorem, and 1 per cent, at the exportation, with $l_{1}$ per cent. more if the commodities should be kept there more than 12 months, two years being the longest time nllowed for it.

Port and Custom-house Regulations.-Vessels nowly artived are not to communicate with the shere until having been visited by the port captain's boat; and within 30 hours nfter this visit, in manifest must be prescited, stating packages, marks, and numbers, but the vessel may retain her eargo 10 days in transit without atating whether for consumption or deposit, and without being obliged to land, or incurring nny charge on the same, except gunpowder, pocket-pistols, and forhididen arms.

Terms for Nales an: 1 Purchases.-Snles and purchases made, duty paid, at 8 to 5 monthe' credit, nccasionally at $2 \frac{1}{\text { per cent. discount for prompt payment, and ex- }}$ ports are bought for cath. See Philipirine Islands.

Manioc, is the Indlan name of the nutritious matter of the ahrub jatropha manihot, from which cassava and tapioca are made in the West Indies.

Manna (Fr. Manne; Ger. Mannaesche ; It. Manna), the concrete juice of the Fraxinus ornus, a species of ash growing in the south of Europe. The juice exudes spontaneously in warm dry weather, and concretes into whitioh tears; but the greater part of the manna of commerce is obtained by making incisions in the tree, and gathering the juice in baakets, where it forms Irregular masses of a reddlsh or brownish color, often full of impurities. Manna is imported in chests, princlpally from Slcily and Calabria. The best is in oblong pleces or flakea, moderately dry, friable, light, of a whitlah or pale yellow color, and in some degree transparent: the inferior kinds are moist unctuous, and brown. It has a slight peculiar odor, and a sweet taste, with some degree of bitterness not very plensant, and leaving a nauseous impression on the tongue.

Mantua-maker. The word is supposed by some, and we think rightly, to be a corruption from manteau, French. Othere assert that a court-dress was early known in England by the name of Mantua, either on aecount of its having been invented at Mantua, or from the celebrated Manto, in honor of whom that famous city was built by her son, Dianor, or Ochnus, about 1000 n.c.-Buther.

Manufacture, a commodity produced from raw or natural materials, either by the work of the hand or by machinery.

Manufacturer, one who works up a natural product into an artificial commodity.

The State of Loulsiana produces four fifths of all the sugar crop of the Union, looth maple aud cane.

The production of maple depend.. very much upon the circumstances of the market. Its manufacture is not a regular husiness, like that of cane, lant ls proseruted or not, very much to sult the convenlence of the farming pojulation nowong whom the sugar orchards lie. Nothing hat a very high price of sugar-so high as to make its purchase a severo burden-stimulates a large production of maple. Accordingly we thad that from 1850 to 1855 the product of nugle sugar in New York State feil from $10,367,484$ poumls to $4,935,815$ pounds-a reduction of more than one half. If tho falling off in prico from 1850 to 1855 reduced the production one half, we are inclined to think it not extravagant to estimate that the present Increased price has doulled the production of 1850 , and wo accordingly estimate the maple augar crop of the present year In New York State nt $20,000,000$ pounds. It is worth not less than $12 \frac{1}{3}$ cents per pound, making its tetal value $\$ 2,500,000$ !

Adopting the same estimste, would give the maple augar crop of the whole Union for the present spring as $68,500,000$ pounds, and its value $88 \$ 8,662,500-$ making the quantity and value very nearly equal to one half the cane product of last yenr-and contributing In a very important degree to relleve the last year's deficlency. See Sugar.

Maple-tree (acer saccharinum) known as the rock maple, hard maple, blrd's-eye maple, angar maple. The acer saccharinum is one of the most noble and majestic of American trees. In favorable situations it sometlmes grows to a beight of 70 or 80 feet, and from 2 to 4 feet in diameter; but usually It does not exceed an elevation of 50 or 60 feet, and a dinmeter of 12 or 18 inches. The trunk is generally stralght, though often studded with projections and excreacences. In all healthful and vigorous trees, the outward bark ts llght-colored, by which they may readily be dlatlnguished. When growing in open situntions, with room to sprend on every slde, where all its branches are exposed to the free action of light, this tree is an object of great beauty. It somewhat resembles the Engllsh oak, in its outline, in the form of its trunk, and dispesltion of its branches, and in the dense and massy character of its foliage.
The wood of the acer saccharinum, when newly cut, is white, but after being wrought and exposed for some time to the light, It takes a rosy tinge. Its grain is fine and cloie, and when polished its lustre is silky. It ls very strong and heavy, but wants the property of duralility, for which the English and American white oaks are so highly esteemed. The northern wood, when dry, welghs 46 pounds to a cuble foot, but that grown south weighs much loss. When cut, and properly ilried, it makes excellent fuel, which is equally esteemed by some, for that purpose, with the onk and hickory. When exposed to the alternatlons of moisture and dryness, it soon decays, and for this reason it is not much used in civil and naval architecture. In Malne, New IIampshire, Vermont, and further north, where the oak is not plentiful, the timber of this tree is sulistituted for it, in preference to that of the beech, the hirch, or the elm. When perfectly seasoned, which requires two or three years, it is used for axletrces, spokes, runners of common sleds, mill-cogs, and for chairs, and calinet-work. It is also sometimes used for the frames of houses, keels, and the lower frames of vessels, files, and foundation pleces for mills, caunl locks, and for many other purposes where strength is required, and the work is not exposed to the alternation of meisture and dryness. The wood of thls treo exhibits several accidental forms in the arrangement of its fibre, of which cabinet-makers tako alvantage in manufacturing beantiful articles of furniture, such as hedstends, writing-desks, and other fancy works, and for lnlnying malogany and black walnut, In burenus, piano-fortes, etc. These forms or varieties may be classified and described as follows:

1. Curlen Misme. Erable gris ondule, French. The undulations or medullary rays of this variety, like thase of the red-fiowered maple, are lustrous, and in one light appear darker, and in nnother lighter than the rest of the wood. Sometimes the zlg-zag llnes are crossed liy beautifully-colored veins; but, unfortunutely, tho lustre of these shades disappear by long exposure to light and air.
2. Bambs. eye Marte. Erable mouchéte, French. This varlity' exhibits small whitish spots or eyes, not excecling $n$ tenth of an inch in diameter, sometimes oceurring a little way apart, and at others contiguously disposed. The more numerous these spots, the more beantiful and valuable the wod. They are seen only in old trees, whleh are stlll sound, and uppear to ariso from an inflection of the fibres from the centres of their trunks toward the surface across the grain. To ohtain the finest effect, the wood should he sawed
as nearly as possible in a direction parallel with the concentric circles.

In addition to the above-named varietles, two other kinds occur in the wens, or excrescences, which grow on the trank or roots of thls tree, and, like them, are covered with bark. The most valuable variety is known by the name of Variegated Maple-knob, or Loupe d'erable de couleurs variees, of the French. It presents an assemblage of shades, agreeably disposed, sometimes resembling Aralic characters, which renders the wood very appropriate for fancy works, and from its searcity it usually commands high prices. The other variety, known by ths name of Silver-schite Mapledinob, or Loupe d'érable blanc argente, of the French, exhibits a silvery lustre by the arrangement of Its fibres, and is highly prized for the same purposes as the preceding, although more common.

The wood of this species is easily distinguished from that of the red-flowered maple, which it resembles in appearance, by its weight and hardness. There is, besides, a very simple and certain test. A few drops of water saturated with copperas (sulphate of lron), being poured upon ammples of different woods, that of the sugar maple turns greenish, and the white maple and the red-flowered maple change to a deep blue. The ashes of the sugar maple are rich in the alkaline principle, and it has been asserted that they furnish four fifths of the potash exported from the United States to Europe. In the forges of Maine, New Ilampshire, Vermont, and places further north where this tree grows, its charcoal is preferred to that of any other wood; and it is said to be one fifth heavier than that made from the same species in the middle and southern States.

The extraction of sugar from this tree is a valuable resource in a new country where it abounds; lut it is obvions that this mode of obtaining sugar is only clestined for a certain atage in the progress of society, and eventuaily gives way to the suggar of commerce, produced by cane. For this reason we shall not detail the process of its manufacture, as it can not be regaried as a matter of practical atliity. In a country like the United States, intersected by canals, railroails, und other channels of inter-conmmuication, where labor is expensive, and fuel is becoming more and more vaiuable, the manufacture of this article can not fail to be an unprotitable occupation. lesides, the annual drawage of the aap renilera the trees sickly, and causes a premature decay.

From the great height, extonted branches, regular and often pyramidal form, and the rich verdure and cleaniness of the foliage in apring und summer, the ougar maple is accounted aa one of our finest shadetrees, and is highly recommended to be phanted along streets and ayenues, in pastures, atd ornumental grounds. And it is no less beantiful in our forest or woodiand scenery in autume, whea it puts on ita brightorange and deep-crimson robes, At firat, the extremitlea of the boughs alone change their color, leaving the internai and more sheitered parts atili in their verilure, which "gives to the tree the effect of great dejth of shade, and dispiays advantageously the light, lively coloring of the sprayn." later in the erason, on the contrary, when the thats become mors sul more gorgeous, and the fuli leans of the sunshine full upon the large masses of foliage, the warm uad glowing colors of the wholo summit ponsess a great deal of gramienr, and add much to the beauty and effect in the landsape.

The wool of the uiveriovarpum, or white maple, ts very white when newly cut, and of a tine texture; but it is softer and lighter than that of any other maple in the United States; and from the want of streugth and durability it is little used. When dry, it welgha 38 pounds to a culsic foot, and in seasoning, loses neariy half of its weight. It is sometimes used in cabinet. making, Instead of the holly or other light-colored

Wood, for inlaying furniturs of mahogany, cherry-Live, and black walnut; though it is less suitable for this purpose, as it soon changes color by exposure to ilght, Wooden bowls are also made of it, when that of ash, or tullp-tree can not be obtained. The charcoal of this wood is preferred by hatters and dyers to every other, as it affords a heat more uniform, and of longer duration. The sap is in motion earlier in thia species tian in the sugar maple, beginning to ascend, in the middle States, alout the 15th of January ; so that when it is employed for making sugar, the operations are sooner completed. Like the sap of the red-flowered maple, it yields not more than one half of the product of sugar, from a given measure, as that of the acer saccharinum. Its inner bark produces a Jack precipitate with copperas (sulphate of iron), and is sometimes employed in domestic dyeing.
The wood of the acer rubrum, or red maple, when dry, weighs 44 pounils to a cubic foot, and when green, it is soft, fuli of aqueous matter, and loses in drying nearly one half of its weight. In this treo, as in others which grow in wet places, the sap-wood bears a large proportion to the heart-wood, the latter of which censists of an irregular column, star-like in its transverse section, and occupies the central parts of large trunks, with its points projecting into the sap-wood. This wood has but little strongth, is liable to injury from insects, and ferments, and speedily decays when exposed to the alternation of moisture and dryness. Yet it is solid, unil for many purposes is preferred by workmen to other kinds of wood. It is harder than that of the white maple, ani of a finer and cleser grain ; hence it is ca-ily wrought in the lathe, and acquires, by poishing, a glessy and silky surface. It is principaliy employed in the manufacture of chairs, sullile-trees, shoe-lasts, ox-yokes, broom-handies, and varions other articles of domestic use. it sometines hnppens that, in very old trees, the graln of the wood, instead of following a perpendicular direction, is unifulated; and this variety bears the name of curled maple. This singular arrangement is never found in young trees, nor even in the branches of auch as exhibit it in the trunk; it is also less conspicuosus in the centre of the tree thau near the bark. Trees offering this disposition, however, are rarc. The serpentine direction of the flbres, which renders this wood difficuit to split und to work, protuces, in the hands of a skillful mechanic, the most beautiful effects of light and shude. These effects are rendered mure striking, if, after smoothing the surfuce of the wood with a double-ironed plane, it is rubbel with a littie sulphnrie ucld, and afterward with linseed oil. On examining it attentively, the varying shates are fouml to be owing entireiy to the inflection of the rays of light; which is more sensibly perceived in viewing it In different directions by canille-light. Wefore mahogany became generally fashionabie in the L'nited States, the beat furniture in uxe was mude of the red-flowered maple, ami bedsteads are still mule of it, which in richness of iustre exceed those of the finest impored wools. fiut one of the most constant uses to which the curled maple is applied is for the stocks of rifles and fowling-pieces, which, to elegance and hiphtness, unite toughness and strength, the rexult of the tortuous direction of the tibres. The colidar matter of the lamer hark is of a dusky-red. By luiiing, it yidels a purplish colored ilquor, which, with the midition of nulphate of iron (copperas), nequires an intense lark blue, or black; mad is wometimes emploved as ink hog American youth in village achools. For this purpose, however, it is very inappropriate, as it never dries pruperly, unj in damp weather the writing becones glutinoas, and biote. A fluid prepured in a similar manner, lov adiling sulphate of alumina (commen aium), instoal of copperas, is also used for dyeing black. The French Canadiana minka sugar from the sap of this maple, which they cali plaine; but, as in the
preceding specles, the product of a given measure is not move than ons half as great as that of the sugar maple.
The acer campestre, or field maple, is found thronghout the middle States of Europe, end in the north of Asla. According to Pallas, it abounds in Now Ruseia, and about Cancasus. It is common in hedgea and thickets in the middle countiea and soath of England; but in the northern counties, and in Scotland, it is rare. It is not indigencus to Ireland, and perhaps not to Scotland. The wood of the acer campestre, when allowed to become a tree, and of a proper age, la very compact, possesses a fine grain, sometimes beautifully veined, and is susceptible of a high polish. When dry, it weighs 52 pounds to a cuble foot. It makes excellent fuel, and produces charcoal of the best quality, which is sometimes employed in the manufacture of gunpowder. It was celebrated among the ancient Romana for tables; and Pliny, who has treated at length upon the brusca and mollusca, the names under which the knobs and excrescences of this tree were known, informs us that cabinet-work of the most costly description was fabricated from them. In France and other European countries, it is still extensively nsed by turners, carvers, and cabinet-makers, and the wood of the roots, which is often knotted and cariously marbled, is wrought into snuff-boves, pipes, and various other articles of fancy.-Buowne's Trees of America.
Maps and Charts. They were invented by An$4 x i m a n d e r$, the Milesian philospher, $n$ disciple of Thales, and the earliest philosophical astronomer on record, 570 n.c. He was also the first who constructed spheres. A celestisl chart wos, it is sald, constru ted in China in the 6th centnry.-Freret. And sja-charts were first brought to England by Bartholomew Columbus, to illustrate his brother's theory respecting a western continent, A. D. 1489. The earllest msp of England was drawn by Gcorge Lily in 1520. Mercater's chart, in which the world was taken as a plane, was iavented in 1556. A map of the moon's gurface was fint drawn at Dantzic in 1647.-1LArinn.

Of the Construction and Use of Maps.-In represeuting the geographical divisions of the earth's surface, two objects are to be kept in view; on the one hand to exhibit accurately to the eye the relutive position of the different countries, and, on the other hund, to give a delineation sufficiently minute to furnish a distinct knowledge of the necessary details. As a globe has very nearly the exact figure of the earth, the representation whici it affords of the surface fulfills the first of these objects in the most perfect manner; but to attain the second it would be requisite to enlarge the globe beyond all convenient size. A glole of the ordinary dimensions serves alnost no other purpose in this respect but to convey a clear conception of the earth's surface as a whole; exhibiting the figure, extent, position, and general foatures of the great continents and islands, with the intervening oceans nad seas. To oltain a detailed representation of any part of the earth's surface, geographers have therefore foand it necessary to have recourse to maps, in which countries are delineated on a plane, whilo the mutual proportions of the distance of places are preserved as ncarly as possible the same as on the globe.

For the construction of inaps different mathematical hypotheses have bcen adopted. lly one method of construction, that of projection, the boundaries of countries, and their inore remarkable features, are reprosented according to the rules of perspective, on the supposition of the eye being placed on some point of the sphere, or at some given distance from it, which may be increased indefinitely. Wherever the eye is supposed to be situated, the reprenentation thus ohtained answers very woll, provided the surface to be represented is of small extent, and the point of view, or projecting point, is nearly over the centre; but when the surface is of great extent, for example, a
whols hemisphere, those places which are situnted near the border of the projection are in all of them much distorted. Another method, that of development, is founded on the supposition that the spherical surface to be represented la e portion of a cone, of which the vertex is situated somewhere in the polar axis produced, and the conical surface is supposed eithar to touch the ephere in the middle parallel of the map, or to fall within the sphere of the middle parallel, and withont it at the extreme parallels. The surface of the cons la then supposed to be spread ont into a plane. For the "History and Constraction of Maps," see Eclec. Ret., xxv., 865 ; same article la Living Age, xxi., 853 ; Srithsoni- A nnual Report, 1856-7.

A third method, witich depends on the development of a cylindrical surface, is that according to which maps are so delineated as to have the parallels of latitude and circles of longitude respectively represented by parallel straight lines. By this method marine charts are constructed. As the rhumb makes equal angles with every meridian, it necessarily, according to this mathod of delineation, becomes a straight line. Such a representation of the earth's sarface is commonly called Mercator's Chart, although the invention is dne to an English mathematician, Edward Wright. These are the three principal methods employed to represent to the eye the several countries on the surface of the earth. See Chartr and Coast Surver.

The maps and charts of our country and the coasts, besides being of great general interest, are of such importance to the commercial community that any account of the progress made in this direction, should be made known as matter of common interest. The United States' Ceast Survey have completed the surveys of a large portion of our coast, and, with a view of obtaining the important facts relative to the old surveys of the country, have employed Mr. J. G. Kohl to investigate the earliest recorda extant of the history of our maps and charts. Mr. Kohl has extended his researches, and in a series of lectures before the Smithsonian Institute (and published in their last Report), has embodied a general history of the origin of the chartographical art, and from these lectures we make some extracts that have an especial relation to the early history of our own country: The Chartographical Art originated probably averywhere with travelers by land and ses and their requirements; all the maps which we see mantioned in ancient tines were probsbly more or less of this kind; as, for Instance, those which the Greeks received from the Phenicians, and which they improved upon; so, too, the mape of the Romana, who scarcely mention any other than travelers' maps, called "itineraria picta" (painted itineraries), of which n separate class was formed by the "itineraria mariti$\mathrm{ma}^{\text {" }}$ (marine itineraries).

By far the greater part of the mapa painted during the middle ages belonged to this class, and more especially to the class of marine maps; because the greatest map-makers of that time, the Venctians and other Italians, wers also the greatest navigators. Thus we sec that the art of map-making particularly flourished among the great trading and navigating nations-the Phenicians, Grecks, and Italinns. The different classes of chastographieal works for which they had names in the mildde ages related all of them more or less exclusively to the hydrography of the sea. Very common, for Instance, were the so-culled "portulanos," or indicators of harbors. The "isolarios" (books of lslunds) form a very curious sort of composition, also probably designed for the special use of mariners. In these inaularies the authors represented and described all the most important islunds of the world, which they separated from their surrounding continente. From the class of maps, made by conquerors and distributors of land, have grown onr officinl government surveys, which often are very
valuable, because they are made, wlthout a too great fear of expense. They generally contain the mioat important information as regands the political divisiona of the country, and for the adjustmont of boundary questlons. Sometimes, being particularly destined for government use, they have not been given to the publlc, or at least not to any great extent. With respect to America we have many most lmportant publications of this character made by the French and British governments for Canada, hy the British Admiralty for nearly every part of America; by tha Spanish hydrographical dépôt ln Madrid, tor Spanish America, and by the Iand Office, Topographical Bureau, Coast Survey Office, and other branches of the United States' government, for different parta of the territory of the United States. The governments of Brazil, of New. Granada, and other South American States, have likewise caused splendid publications to be made, descriptive of the territories under their dominion.

Until the time of Columbus and Gama, nations had no accurate knowledge of the world, except that of their own immediate neighborhood. Ilence, for thousands of years, the art of constructing maps made but little progress. The maps that were in use at the time of Columbus were not much better than those made for the work of Itolemy a thousand years hefore. They do not include a grester extent of country, they exhibit no new facts, nor do thoy show any greater accuracy in the location of points on the earth's sarface. After the discovery of Amorica and the countries bordering on the Pacific Ocean and the Indian Sea, the extent of the known and habitable world was much increased, and the figure of the continents aud the limits of the oceans were more correctiy given on the maps. But it was atill very long ere the classes of interesting facts represented on the maps were enlarged, and the manner of de 'icting them improved.
Water remained for a long time a blank on all the old maps. It was not known thet the ocean offers su much variaty in color, depth, tampersture, and fitness for motion as the dry land itself. The Spaniards know that some parts of the ocean are rough and boisterous, and called a certain part "el Gulfo de los Cabellos" (the IIorse Gulf), and a quiet portion "el Golfo de las Damas" (the Ladies' Gulf). . Some of the regular currents of the ocean were also of carly discovery. The Gulf Stream was known as early as 1512, or since the first voyage of lonce de Leon to Florida. We find on many maps, in the neighborhood of Florida, legends like the following: "Here the water runs continually to the north." it would have been easier to have designated this by a few strips of color; and yet it required the inventive gen is of Franklin, for it was he who first located definitely the Gulf Stream in our maps.

The regular trade winds between India and Arabia, with their nature, direction, and changes, were not only known, but daily taken advantage of ly auvigators for centuries. So too the trade winds of the Atlantic were described, discussed, and used, at leust since the time of Columbus. Nuvertheless, thongh there are curreuts that flow with nearly the same regularity as rivers, no mapanaker gave any visible hint respectling them to the navigater to whom be pretended to furnish useful charts, until the time of our unolern Rennell's Wind-maps, which are also a very into innovation of our century.

The existence of the Lanks of Newfoundland was known to the very first diseoverens of the eastern coast of North America, Nay, for a lung timo these banks wers the most frequented part of tho North American waters, heing visited mince the year 100.1 by whole deets of French, Portuguese, Spanish, and English tisherusen. To have a true conception of their configuration, extent, varying depths, currents, and
ther clrcumataaces, was simost of greatar lmportance for all the navigating nations of Europe than to know the configuration of the coasts of the great continent Itself. Yet at a time when the whole east coast of North America was already very well represented on the mape, we see the Georges Bank, Nantucket shoals, and the other great banks, before this coast, either not given at all, or else in a shape so little like reality that it would have been almost botter to leave them ont altogether. The other qualitius of the bottom of the ocean, its deep valleys and lofty mountain ranges, were of coarse not noticed in an age which did not possess our doep-sea sounding Instruments, and which had alsu no practical occaslon for such explorations. This pra. cial Interest has existed only since the question has been mooted where we can lay with snfety our electric wires for the connection of the two continents. For thia purpose we now explore those hidden recesses, and we may expect that ere long our pictures of the oceans will present as great variety of scenes as do those of the dry lund itself.

We should endeavor to collect and preserve all the old records and charta of our enrly maritime listory. These are valuable to science, and are oljects of curiosity and interest to our morchants, and it should be the object of the Chamber of Commerce to colloct and preserve these records of tho past.

Maranham, or Maranhao, a province of Brazil, in South America. Thls name, which is comman to the province, the capital, the island on which it stands, the Rlver Meary, and the Amazen, is derived from Marafian, the appellation which the unvigator Pinzan first hestowed upon the estuary of the Amazons, upon finding that its waters did nut possess th saline properties of tho ocean. It lies heween $1^{\circ} 20^{\prime}$ and $10^{\circ} 50^{\prime}$ of south latitude, and $45^{\circ} 10^{\prime}$ and $53^{\circ} 20^{\prime}$ of west longitude, being nenrly 400 miles in length from north to south, and having an nverage breadth of about 200 miles. Maranham, or St. Inlz, the capltal, is siturted on an island of the samo name of nhout 42 miles in circumference. It forms the south-eust side of the Bay of Narcos, having to the eastward the Bay of San José, in latitude $2^{\circ} 32^{\prime}$ suuth, nnd longitude $43^{\circ} 40^{\prime}$ west. It is fertile, and well inhabited, there being, besides the capital, numerous small hamlets belonging to the natives. Much difficulty is experienced in reaching this island, on account of the rapidity of three rivers at the mouth of which it is sitaated. The harbor, which is formed by a narrow creek, is of a sufficlent depth to ndmit of merchantmen enterlag; but it is so besot with shonla na to require n pllot, and its depth is diminiahing. Population about 30,010 . Chief public edifices, an episcopul palace, cottege, hospital, theatre, und numerous convents of the Franclscan and Carmelite urilers. It is tho residence of the governor, and has a lycentm and achools of navigation and commerce. Chicf exports, cotton, rice, ani arsaparilla. Chief imports, Blaves. The average number of slavea imported bet ween the years 1810 and 18.15 averaged 5000 annually, for whom a considerable cuty was derived. With regard to exports and innorts, there are no returns which can be relied on later than the year 1820. From 1815 to 1820, the average number of Lags of cotton exported was 68,000 . The exports of rico varied during these years from 56,000 to $8:, 000$ bags. The other artleles sout out of the country codsi ted of hides, tannod and untanned, skins, nud gums. '2he eutire population of the province mavanted, in 1821, to 182,000. This province might ine made one of great importance, for it possesses vast capabilities; but as yet it is in an infunt or semi-barbarous state.

Marble (Ger., Ilus., and Lat. Mfarmo; I)u. Marmer; Fr. Marbre; It. Marme; Sp. Marmal), a genus of fussils, composed chielly of limo; being a bright and beautiful stone, moderutely hard, not giving tire with steel, fe:menting with and soluble in ncid menstrua, and caleining in a slight fire. statuaries of Crete, were the first artists. who sculptared marble, and polished their works; all atatnen previously to their time being of wood, 568 s.c.-Pliny. Marble afterward came into uee for atatues and the columne and ormaments of fine huildings ; and the edifices asd monuments of Rome were constructed of, or ornamented with, fine marble. Tha ruins of Palmyra prove that its magnificent structures, which were chiefly of white marble, were far more extensive and splendid than those of even Rome itself. These latter were discovered by some English travelers near Aleppo, A. D. 1678.
The colors by whlch marbles are distinguished are simost innamersble. Some are quite black, others, again, are of a anowy white ; some are greenish, others gryyish, reddish, bluish, yellowish, etc. \{ while some are variegated and spotted with many different colors and abades of colors. The finest solld modern marbles are those of Italy, Blankenburg, France, Flandere and the United States.
Italy produces a most valuable marble, and its exportation makes a considerable branch of her foreign commerce. The black and the milk-white marble of Carira, in the duchy of Massa, are particularly esteemed. The marble of Germany, Norway, and Sweden are very inferior, beling mixed with a sort of scaly limestone. Marble is of so hard, and compact, and fine a texture as readily to take a beautiful polish. That most esteemed by statuaries is brought from the island of Psros, in the Archipelago. It was employed by Praxiteles and Philias, both of whom were natives of that ishnd; whence alao the famous Arundelian marbies were brought. Tho marble of Carara ls likewise in high repute among sculptors. The specific gravity of marble is from $2 \cdot 700$ to $2 \cdot 800$. Black marbie owes its color to a elight mixture of iron.

Brande divides marbie, according to their localities, int cinsses, ench of which contains eight subdivisions: 1. Uni-colored marbles, including only the white and the biack. 2. Variegated marbles; those with irregular spots or veins. 3. Madreporic marbles, prosenting animal remnias in the shape of white or gray apots, with irregularly disposed dots or stars in the centre. 4. Sheil marblea; with only a few shells internpersed in the calcareuos base. b. Lumachella marbles, entirely composed of ehells. 6. Cipolin marbles, con-
tainlag veins of greenlah talc. 7. Breecla marbles, fonned of a number of angular fragments of different marbles, united by a common cement. 8. Puddingvone marbles ; a conglomerate of round pieces.
I Of Cutting and Polithing Marble.-The marble saw is a thin plate of aoft iron, continually supplied during its sawing motlon, with water and the sharpest asand. The aswing of moderate pieces is performed by hand, hut that of large alabs is moot economically done by a proper mill.
The first eubstance used in the polishing process is the sharpest sand, which must be worked with till the surface becomes perfectly flat. Then a second, and even a third sand of increasing fineness is to be applied. The next substance is emery of progressive degrees of fineness, after which tripoli is employed; and the last polish la given with tin-putty. The body with which the sand is rubbed upon the marble, is usualiy a plate of iron ; but for the subsequent process, a plate of lead is nsed with fine sand and emery. The polishing-rubbers are coarse linen clothe or bagging, wedged tight into an iron planing tool. In every atop of the operation, a constant trickling supply of water is required.
Marbling, the method of preparing and coloring marbied paper. There are several kinds of marbled paper, but the principal difference between theim consista in the forms in which the colors are laid on the ground; some being disposed in whlrls' or circumvolutions, othere in jagged lengtha, and others only in spots of a rounder oval figure. The general manner of managing each kind is, nevertheless, the same, namely, the dipping the paper in a solution of gumtragacanth, or, as it is commonly called, gum-dragon, over which the colors, previously prepared with oxgall and spirjt of wine, are first spread.

Marine, a general nume for the navy of a kingdom or state, as also for the whole economy of naval affalrs, or whatever respects the building, rigging, arming, equipping, navigating, and fighting of ships. It comprehends, likewise, the government of naval armaments, and the statio of all the persons employed therein, whether civil or military.

Marines, or Marine Forces, a body of soldiers raised for the naval service, and trained to fight either in a naval engagement or in an action on shore.
Mariner's Compams. The Chlnese ascribe the invention of the compass to their Emperor Hoag-Ti, who, they any, was a grandson of Noah ; and some of their historians refer the lnvention of it to a later date, 1113 n.c. The honor of its discovery, though much disputed, ls generally given to Flavio de Gioja or Giovia, a native of Amalfi, an ancient commercial city of Naples, A.D. 1302. The variation of the needie was first discovered by Columbus in his voyages of discovery, 1492; and it was observed In London in 1580. Tho dipping-needle was invented by Robert Norman, a compasa-maker of Ratcliffe in that year. See Compass; Am. Jour. Sc., xl., 242.

Maritime Law. By maritime law is meant the law relating to harbors, ships, nnd seamen. It forms an important branch of the commerciel law of all maritime nations. It is divided into a variety of different departments; auch as those with respect to harbors, the property of ships, the dutics and rights of mnsters anil seamen, contracts of affreightment, averuge, saivage, etc. The reader will find those suljects treated of under their respective heads.
Sketch of the Progress of Maritime Lav.-The enrliest aystem of maritime law was supplied by the Rhodians, seversi centuries before the Christian era. The most celelirated authors of antiquity hato spoken in high terms of the wisdom of the lihodian laws; luckily, however, we are not wholly left, in forming our opinion upon them, to the vague, commendntory statements of Cicero and Strato. (Creano pro Lege Manillia; Strab., lib. xiv.) The lawa of Rhodes
were adopted by Auguatua inte the legislation of Roma; and auch was the eatimation in which they were held, that the Emperor Antoninus, being solicited to dooide a contested polnt with respect to shipping; in reported to have anowered, that lt ought to be decided by the Rhodian laws, which were of paramount anthority in auch cases, unless they happened to be directly at variance with some regulation of the Roman law.-("Ego quidem muwdi dominus, lex autem maris legis id Rhodia, qua de rebus nauticis proscripta est, judicetur, quatenus nulla nostrarum legum adversatur. Hoc idem Dirus quoque Augustus judicavit.') The rule of the Ghodian law with respect to average contributions In the event of a sacrifice belog made at aca for the safety of the ship and cargo, is expressly laid down in the Digeat (lib. xiv.); and the moat probable conclusion seema to be, that most of the regulations as to maritime affiairs, embolied in the compilations of Justinian have been derived from the same source. The regulations as to average adopted by all modern nations, are borrowed, with hardly any alteration, from the Roman, or rather, as we have seen, from the Rhodian law !-a conclusive proof of the sagacity of those by whom they had been originally framed. The only authentic fragments of the Rhodian law are those In the Dlgest. The collection entitled Jus navale Rhodiorum, published at Bale in 1561, ls now admitted by all eritics to the spurious. See ante, pp. 1188-1192.

The first modern code of maritime law is said to have been complled at Amalfi, in Italy, a city at present in ruins ; but which, besides belng early dlatinguished for its commerce, will be forever fanous for the diacovery of the I'andects, and the suppose. invention of the mariner's compass. The Amalfitan code is anid to have been denominated Tabula Amal. fuana. Llut if auch a body of law really existed, it is aingular that it ahould never have been publiahel, nor even any extracts from lt. M. Pardessus has shown that all the anthors who have referred to the Amsititan code and asserted its existence, have copied the atatement of Freccia, in his book De Subfeudis. (Collection des Loic Maritimes.) And as Freccia assures us that the Amalfitan code continued to be followed in Naples at the time when he wrote ( $157^{\circ} 0$ ), it is difficult to suppose that it conld have entirely disappeared; and it seems most probable, as nothing peculiar to it has ever transpired, that it conaisted principally of the regulations laid down in the Roman law, which, it la known. preserved their ascendancy for a longer period in the sonth of Italy than any where else.

But, besides Amalfi, Venice, Marselles, Plse, Genos, larcelona, Valencia, and other towns of the Mediterranean, wore carly distinguished for the extent to which they carried commeroe and navigation. In the absence of any positive information on the sulject, it seems reasonable to suppose that their maritime Laws would be principally borrowed from those of Rome, but with such alterations and modilications as might be deemed requisite to accommolate them to the particular views of each state. Ihut whether in this or In some other way, it is certain that various conflicting regulations werv estallished, which let to much cobsfusion and uncertaiuty; and the experienco of the inconveniences thence arising, doubthess contributed to the universal adoption of the Consohuto del Mare as a cole of nuritime law, Nuthing certain is known as to the origin of this code. Azuni (Droit Maritime de l'Europe, tome I., or rather Juata, Colice F'crdinambe, from whose work a large portion of Azuni's is literally translated) contende, in a very able dissertation, that the I'isans are entitled to the glory of having compiled the whole, or at least the greater jurt, of the Consolato del Jeare. On the other hand, Ion Antonio de Capmany, in his learued and excellent work on the commerce of Llarcolona (Antiguo Comerrio de Barcelosa, tome 1., pp. 170-183), has endeavored to show that the

Comsolato wat complled at Barcelena $\boldsymbol{1}$ and that it containg the rules according to which the consula, which the Barcelonese had established in foreign places so early as 1268, were to render their decislens. It is certain that the Conoolato was printed for the first time at Barcelona, in 1502 ; and that the early Italian and French editions are translatione from the Catalan. Azunl has, indeed, sufficiently proved that the Pisans had a code of maritine lawa at a very early period, and that several of the regulatlons in it are subetantially the same as these in the Consobato. But it does not appenr that the Barcelonese were aware of the regulations of the Pisana, or that the reacmblunce between them and these in the Consolatu is more than accidental ; or may not falrly be ascribed to the cencurrence that can hardly fall to obtain among wellInformed persons legislating upon the same topics, and Infuenced by principles and practices derived from the clvil law.
M. Pardeasus, In the second volume of his excelient work already referred to, appears to have been suffciently disposed, had thore been any grounds to go upon, to set up a claim in faver of Marseilles to the honor of being the birtli-place of the Consolato; but he candidly admits that such a pretunsion could not he supported, and nnwillingly adheres to Capmany's opinion. "Quelque Francais," suys he, "quolque portie par des sentimena de reconnolssance, qu'aucun évènement ne saureit affoiblir, à faire valuir tout ce qui ext en faveur de Marseilles, je dols reconnoitre franchement que les probabilités l'emportent en faveur de Barcelone." -Tome 11. Bat to whichover city the honor of comjuiling the Consolato may bo due, there can be no tloult that ita antiquity has been greatly exaggerated. It is affirmed, in a preface to the different editions, that it wa solemnly accepted, subscribed and promulgatel, as looly of maritime law, by the Holy See lu $100^{\circ} \mathrm{j}$, anu by tho kinge of France and other potentates at different periods hetween 1075 and 1270. But Capmany, Azuni, and l'ardessus, have shown in the clearest and most satidfuctory manner that the circumstances alluded to in this sketch could not possibly live taken place, and that it is wholly unworthy of uttention. The most probable opinion seems to he, that it was compiled, and began to be introduced ubout the end of the 13th or heginning of the 14th century. And notwithstanding its prolixity, and the wont of precision und elearness, the correspondence of the greater number of its rules with the ascertained principles of justice and public utility, gradually led, without the intervention of any agreement, to its uloption as a system of maritime jurisprudence ly all the nations contlguous to the Mediterrancan. It is still of high authority. Casaregis suys of it, though perhaps, too strongly, "Consulatus maris, in muteriis maritimis, tanquam universalio consuetulo habens vim legis, inviolubiliter attemenda est apul omnes procincias et na-tiones."-I isc. 214.

The collection of sea laws next in celebrity, but anterior, perhaps, in point of time, is that denomin ated the Roole des Jugements TOteron. There is as much divorsity of opinion as to the orlgin of these laws, us there is with respect tu the origin of the consolato. The prevailing opinion in Great Ifritain has been, that they were compiled liy direction of Queen Eleanor, wife of Henry 11., in Jeer quality of l)uchess of Guienne; and that they were afterward enlarged and improved hy her son Mhelard I., at his return from the Iloly Land; but this statement is new admitted to rest on no good fonndation. The most probable theory neems to be, that they are a cullection of the rules or practices followed at the principal French ports on the Atlantic, as Burdeaux, Rochelle, st. Malo, etc. They contain, indeed, rules that are essential to all naritime transactions, wherever they nay be carried on ; but the refercnces in the code sulticiently prove that it is of Erench origin. menarch's having large poseessions In France at the period when the Rules of Oleron were collected, natnrally fucilitated their introduction into England; and they have long enjoyed a very high degree of anthority in that conntry. "I call them the laws of Oieren," sald a great civilian (Sir Leoline Jenkins, Charge to the Cinque Ports), "not but that they are peculiariy enough English, belng long slnce incorporated into the customa and etatntea of our admiralties; but the equity of them is so great, and the use and reason of them so general, that thay are known and received all the world over by that, rather than by any other nsme." Molloy, however, has more correctiy, perhaps, sald of the laws of Oleron, that "thay never olitained any other or greater force than those of Rhodes formerly did; that is, they were esteemed for the reason and equity found in them, and applled to the case emergent." -Do Jure Maritimo et Navali.

A code of maritime law isaued by Wisby, in the island of Gothland, in the Baltic, has long enjoyed a ligh reputation in the north. The date of its compilation is nncertain; but it is comparatively modern. It is true that some of the northern jurists contend that the laws of Wisby are older than the Rules of Oleron, and that the latter are chlofly copled from the former! But it has been repeatedly elown that there is not so much as the ahadow of a foundation for this statement. See Pardessus, Collection, etc., tome 1., pp. 425, 462 ; F'oreign Quarterly Review, No. 13, art. Manseatic League. The laws of Wisby are not certainly older than the latter part of the 14th or beginsing of the 15 th century; and have obylousiy been conpiled from the Consolato del Mare, the Rules of Oleron, and other codes that were then in use. Gretius has spoken of these laws in the mast laudatory man-ner:-"Quce de maritimis negotiis," says he, "insula Gothlandios habitatoribus placuerunt, tantum in se habent, tam equitatis, tum prudentic, ut omnes oceani accoles eo, non tanquam proprio, sed velut gentium jure, tatantur."Prolegomena ad Procopium, p. 64.
Besides the codes now mentioned, the ordinances of the llanse Towns, lasued In 1597 and 1614, contain a system of lawe relating to nsvigation thut is of great suthority. The judgments of Danme, the customs of Amsterdam, etc., are also often quoted. A tranalution of the law of Oleron, Wisby, and the Hanse Towns, is given in the $\mathbf{3 L}$ edition of Malynes's Lex Mercatoria, but the edition of them in the work of M. Pardessus, referred to in the text, is infinitely superior to every other. But by far the most compiete and well-digested system of maritime jurisprudence that has ever appeared, is that comprised in the famous Ordonnance de lo Marine issuad by Louis XIV., in 1681. This excellent code was compiled under the direction of M. Colbert, by individuals of great talent and learning, after a careful revislon of all the anclent aea laws of France and ether countries, and upon consultation with the different parliaments, the courts of admiralty, and the cham'sers of commerco, of the different towns. It combines whatever oxperience and the wistom of uges had shown to be best in the Roman iawe, and in the Institutions of the modern maritime states of liurope. In the prefuce to his treatise on the Law of Shipping, Lord Tenterden gaya:-" If the realer should be offended at the frequent references to this ordinance, 1 must request him to recollect that thoso references are inaile to the maritime code of a great commercial nation, which has contributed much of ita national prosperity to that code: a code cemposed in the reign of a politie prince; under the ausplees of a wise and enlightened ministor; by luborious and learned persons, who selected the most valuabie principles of all the maritime laws then cxisting ; and which, in matter, method, aad style, ls one of the most finished ucts of legishation that over was promulgated." The orillnance of 1681 was published in 1760 , with a detailed and most elaborate commentary by M. Valin, in 2 vol-
umes, 4to. It is imposaible whlch to sdmire most in thla commeatary, the learning or the eound good sense of the writer. Iord Mansfield was indebted for no inconsiderable portion of his euperior knowledge of the principlas of maritime jurisprudence to a careful study of M. Valin's work.

That part of the Cude de Commerce which treats of maritime affairs, inurance, ete., ta copled with very little alteration, from the ordinance of 1681 . The few changes that have been made are not always improvements. No system or code of maritims luw has ever been isaued by authority In Grest Britaln. The laws and practices that now obtaln among thein, in reference to maritime affalrs have been founded psincinally: on the practices of morchanta, the principles laid down in the civli law, the laws of Oleron and Wiaby, the warks of distinguished jurisconsults, the judicial decisions of their own and foreign countries, etc. A law so conatructed has necessarily been in a progressive state of improvement ; and, though still susceptible of amendment, it correspends, at this moment, more naarly, perhapa, than 8 other systom of maritime law, with those nnlvorsally recognized principles of justice and general convenlence by which the transactions of merchants and navigators ought to be regulated. Tite declaions of Lerd Mansfield did much to fix the princlples, and to improve and perfect the maritime lav: of England. It is also nuder great obllgations to Lord Stowell. The decialons of the latter chlefly, indeed, respect questions of noutrality, growing out of the conflicting pretensions of belligerents and neutrals during the lute war; but the principles and doctrines which he unfolds in treating those questions, throw a strong and steady light on those branches of maritime law. It has occaaionally, indeed, been al-leged-and the allegation is probably, in somo degree well foundad-that his iordship haa conceded too much to the claims of belligerents. Still, however, his judgmenta must be regarded, allowlng for this excusable bias, as amonys the nollest monuments of judicial wisdon of which any country can boaat. "They will be contemplated," saya Mr. Serjeant Marshali, " with appluuse and veneration, as long as depth of leurning, soundness of argument, enlightened wisdom, and the chaste beautios of eloquence, hold any place in the estimation of mankind."-On Insurance, Prelim. Disc. The Treatise of the Law Relative to Merchant Ships and Seamen, by the late Chicf Juatice of the Court of King's Bench, does credit to the talents, erudition, and llberality of its noble and loarned uuthor. It gives, within a brief compass, a clear and admirable exposition of the most important branches of our marItime law ; and may be consulted with equal facility and advantage by the werchant, the general acholar, and the lawjer. Mr. Serjeant Marshall has entered very fully into some, and has touched upon most points of maritime luw, in his work on Insurance; and has discussed them with great lcarning and sagacity. The works of Mr. Justice Park, Mr. Ifolt, and a few othcrs, are also valuable. Of the carlier troatises, the Lex Mercatoria of Malynes is by far the best; ind, considering the period of its publication (1622), is a very extraordiuary porformence. See North Am. Rev., vi., 323 (J. Stour), ii., 218, xiii., 1 (i1. WueAton) ; Munt's Mag., xiii., 232, 455, x., 337, ix., 261,358,643 , xiv., 547, xv., 75 , xxiv., 191.

The marine law of the United States ia the sume as the marina law of Eurepe. It is not the linw of a particular country, but the general law of nations; and L.ord Mansfield applied to its universal adoption the expressive language of Cicero, when speaking of the eternal laws of justice: "Nec erit alia lex IRoma, alia Athenis; alla nunc, ulia posthue; aed ct omnosgentes, et omni tempore una lex et sempiterna, et linmortalis continebit."

In treating of thia luw, wo refer to its pacific character as the law of commerco and navigation in time of peace. The respective rights of belligercuts and neu-

## MAR

trale in time of war constitute the code of prise law and that forms a distinet law of inquiry. Whan Losd Mansfield mentioned the law-morchant as belag a branch of publio law, It was because that law did not rest essentially for its oharacter and autherity on the positive institutions and local oustoma of any particejar ceuntry, but consiated of certain principles of equiky, and uages of trade, which general commerce and a common aenee of juatice had satabliahed to regelate the dealings of merchants and mariners in all the commercial countries of the civilized worid.

In the atuily and cnltivation of maritime law our improvement has been rapld, and our career Iliustrious, since the adoption of the present Conatitution of the United States. The decinions in federal courts, in commercial cases, have done credit to the intellectual and moral character of the nation, and the aimiralty courts in particular have dinplayed great research and a fumiliar knowledge of the principies of the marine law of Europe.
The reports of jadicial decisions in the several States, and especially in the States of Massuch:setts, Now York, and Penneyivsnia, evince great attention to maritime questiona; and they contain abundant proofs that our courts have been dealing largely with that business of our enterprialng and commercial people.
Deelaration respeding Maridime lawo signed by the Plemipotentiaries of Great Bricain, Austria, France, Prussia, Russia, Sardinia, and Turkey. assembled in Congrese at Paris, April 16, 1856:
The plenipotentisries whe signeal the Treaty of Paris, on the 30 th of March, $18 \% 6$, assembied in conference, considering: That maritime law in time of war has long been the subject of depiorable diaputen ; that the nncertainty of the law and of the duties in euch a matter gives rige to differences of opinion bet ween neutrals and belligerents which may occasion serious dificulties, and even conflicte ; that it is, consequently, advantageons to establish a uniform doctrine on so impertant a point; that the plonipotentiaries assembled in Coogress at Paris can not better respond to the intontions by which their governments are animsted, than by seeking to Introduce into international relations fixed prisciples in this reapect. The alove-mentioned pienipotent iaries, belng duly authorized, resolved to concert among themselves at to the means of attain. ing this object; and having come to an agreement, havo adopted the following solemn declarations 1

1. Privateering is, and remains, abolighed. 2. The neutral thag covers enemies' goods, with the exception of contraband of war. 3. The neutral goods, with the exception of contraband of war, are not liable to capture under enemy's flag. 4. Blockaden, in order to be binding, muet be effective; that is to any, maintained by a force sufficient realiy to prevent access to the coant by the enemy.

The governmente of the undersigned plenipotentiaries engage to bring the present deciaration to the knowledige of the States which have not taken part in the Congrean of Parin, and invite them to accede to it. Convinced that the maxims which they now proclaim can not but the received with gratitude by the whole worid, the undersigned pionipotentiaries doubt not that the efforts of their governmente to obtain the general adoption thereof will be crowned with full success. The present declaration is not, and shall not be binding, except between those powers who have acceded or ahall accede to lt.

Done at Paris the 16 th of April, 1850.

The United States', Executive, through the Dopartment of Stete, communicated to the Fronoh government ite roply in Auguat 1856, vis. :
Thees four pointe are indivicible, because he can uot accept the first point-sho abolition of privateering. Goverat Masoy respeotfully proposen, however, iwo distinct amendmentse $\mathbf{r}$

1. Either to add to the firse proposition in the "deolsration" of the Congrese of Paris-
" Ars that the private property of the subjects or citisons of a belligerent on the high seas shall be oxompted from selaure by pablio armed veosels of the ether balligerents, sxeept it be contraland," or
2d. To adopt the 2d, 8d, and 4th propositions, without the first.e

The argument contained in the reply of Goveranr Marcy is hintorical, argumentative, and forcible.

It goes to may, that no nation has a right to pregcribe to another what shall constitute her military or naval force; and that we can, conmiatently with our inatitntions and policy, neither agree not to employ volunteers on land, nor privateere on the high seas. When a nation having a large standing army is threatening a nation with a amail standing army, the latter must have recourse to volanteers; and so when a nation with a large navy, makes wat on enother with an inferior navy, the latter must have recourse to privateera, otherwise the nation with a large navy could empley a portion of her navy to keep the inferior navy of her enemy in check, and with the rest aweep the commerce of the latter from the occan. larity of position could only be reached if the armed cruisers of the auperior navy and other national ohips of war woull forego making capturen of the enemy's property on the high seas, or if the nation with sn inferior navy armed privateers to inflet as much inmage on the commerce of the greater naval power as the latter does on its inferior enemy. The concluding portion of Mr. Marcy' reply is as follows :
"In discussing the effect of the proposed measurethe alsolition of privateering-a reference to the exist. Ing condition of ontions is almost unavoidable. An instance will at once present itself in regard to two nations where the commerce of reach io about equal, and about equally wide-spread over the world. As connmercial powers they approach to an equality, hut as naval powers there is great disparity between them. The regular navy of one vastly exceeds that of the other. In case of war between them only an inconsiderable part of the navy' of the one would be required to prevent that of the other from being used for defense or aggresnion, while the remainder would be devoted to the unembarrassed employment of destroying the commerce of the weaker in naval nt rongth, "The fatal consequence of this great inequality of naval forco between two unch belligerents would to in part remedied ly tise use of privateera; in that case. while either might assail the commerce of the other in every sea, they would be obliged to dietribute ani pmploy their reapective navies in the work of prutection. This statement only illustracen what would lie the crse, with some molitication, in every war where thare may be considerable disputity in the naval strength of the belligerents.
" History throws much light upon the question. France, at an early period, was without a navy ; and in her wars with Great Britaln and Spain, both naval powers, she resorted, with sigual goosl effict, to privateering, not only for pintection, but successui apgression. She olitained many privateers from floflanit, anil by this force pained decided indvantagen on the ocean over her enemy. While in that comilition France could hardly have been expected to orlginate or concur in a proposition to abolish private ring. The condition of many of the smalier States of the world is now, in relation to nova' powres, net much unlike that of France ln the middle of the lith coutury.

Atala orsi e, whilly played Those осела manner project netions will be ascenila all the age. menach power iog a m esianhis wieided The inj minion powerfu jecting ligerent should b auch pro found ${ }^{1}$

At a later perlod, during the relgn of Loula XIV., several axpeditions were fitted oat by hlm, componec wholly of privateers, whleh weie most effectively employed In prosenutlag hostilities with naval powers. Those whe muy have at any time a control on the oceaa will be atroagly tempted to regulate Ita une In a manner to subserve their own Intereatis and ambltous projects. The ocean in the cominon property of all nations ; and inatead of ylelding to a measure which will le likely to secure to a fow-posailily to one-an ascendancy over it, each should pertinaclously retain all the means it possesses to defend the commen heritage. A predominant power upon the ocean is more menacing to the well being of others than auch a power on land; and all are alike interested in reaiatlag a measure calculated to facilituta the permanent esiatilishmeat of such a domination, whether to be wielded by one power or shared among a fow others. The injuries likely to result from surrendering the dominiou of the seas to one or a few aations which have powerful navies, arise mainly from the practice of aubjecting privi ie property on the ocean to selzure by belligerents. Justics and humanity demand this practice should be abandoned, and that the rules in relation to auch property on land should be extended to it when found upon the high seas.
"The Presldent. therefore, proposes to ndi to the first proposition in the 'Doclaration' of the Congress at Paris the following worls: 'And that the private property of the subjects or citlzens of the belligerent on the high eeas ehall be exempted from seizurs by pullic armed veasels of the other belligerent, except it tue contraband.' Thus ameaded, the government of the United States will adopt it, together with the other three principles contained in that 'Declaration.' I am directed to communicate the approval of the Iresident to the seconil, third, and fourth propoaitiens, independently of the first, should the ainendment be unacceptable. The amendment is rece $n$ mended by so many powerful considerations, snd he principle which calis for it has so long had the $m$ phatic sanction of all enlightened nationa in mili ary operations on land, that the President is reluctant to believe it will meet with any serious opporition. With.out the projosed moditcation of the first principle, he can not convlnce hinself that it would be wise or safo to change the existing law in regard to the right of privateering.
"If the smendment should not he alopted, it will be proper for the United Statea to have some understanding in regarl to the treatment of their privuteera when they shnil have occasion to visit the porta of those powera which are or may become parties to the declaration to the Congress at Paris. The United States wlil, upon the ground of right and comity, claim for them the same consideration to which they are entitled, and which was extended to them under the law of nationg, before the attempted modification of it ly that Congress.
"As connectel with the subject heroin discussed, it ls not inappropriate to remark that a due regard to the fair claims of the neutrala would seem to require some modification, if not an abandonment, of the doctrlne in relation to contraband trade. Nations which preserve the relations of peace should not be injuriously affected in their commercial intercouree hy those which choose to involve themaclves in war, provilad the citizens of such jeaceful nations do not compromise their character as neutrals by direct Interference with the military operations of the telligerents. The laws of siege and blockaile, it is believed, afford all the remedies against neutraia thut the partjes to wir can justly claim. These laws interdict nll trade with the besieged or blocknded places. A further interference with the ordinary pursuits of neutrala, in nowise to blame for an existing atate of hostilities, is contrary to the obvious dictates of justice. If this view of the
subject could be adopted, and preotically obeerved by all civiliaed nations, the right of eearch, whlch has been the sonrce of so much annoyance, and of so many njaries to noutral commerce, would be restrioted to a wh casen only as justifed a surpiolon of an attempt $t$ : trade with places actually in a state of slege or b ockada.
"IIrmar'ty and juatice demand that the calamitles 3u sitent oo war should be atrictly limited to the bellig .. t, themselven, ind to those whe voluntarily take pe it with them; but neutrals, abotaining in good fu th from auch complicity, ought to be left to purave tl cir ordinary trade with elther belligarent withoat ristriotions ln respect to the articles entering into it.
"Though the United States do net propose to embarrase the other pending negotiations relative to the rights of neutrala, by pressing this change in the law of contraband, they will be ready to give it their sanction $w^{\prime}$.ever there is a prospect of ita favorable reception ly other maritime powera.
"The undersigued availa himaelf of this opportunity to renew to the Count de Sartiges the assurance of his high coneideratlon.
"W. L. Mancy."
The points here settled are all of them inportant. Privateering has been the scourge of the ocean-a lawless sort of warfare between belligerents them-selves-a grievous annoyance and damage to nentrale, and a most prolifie school of pliacy. those whose recoliection exteads back 80 or 40 years remember when the ocean was traversed by piratea, trained for their fiendish basiness by the long ware of the earlier yeara of the century. The best men of modern Christendom had never ceased to protest against the system. Sweden and Holland nttempted, in the 17th century, to put an end to the practice, but without effect. The Unlted Statea and Prussia, in 1785, enteral into stlpulations against privateering, as between themselves, but did not renew the provision. The Fronch Iegislature, in 1792, made a similar, but fruitless effort. Privateering wea destined to have one license more for perpetratiag its atrocities, and shocking the sease of mankind. Jurists lamented the practice, but were forced to acknowledge it a part of the law of nations, and gave up in despair all expectation of an early elandonment of the legalized outrage.

When the late war between the United States and Mexico occurred, it was matter of genersl grutulation that the circumatances of the case saved the woild from the curse of privateering; and much more did the worll rejoice, at the commencement of the late European war, when Euglund and France announced their intention to graat no letters of marque. With the conclasion of that war-as part of the conclusion, in-deed-we have the solemn compact of tho grent powors of Europe, that "privateering 18 , and remains, abelished." It is an important step in the progress of humanity.

The declaration that "the neutral flag covers enemies' goods, with the exception of contraband of war," diminishes greatly the liabilities of the world to fature strifos. Until the breaking out of the recent wur, Great Britain land steadily majntalned the contrary doctrine as the lnw of nations. The Empress of Russia, in 1780, set forth precisely the doctrine of the late Paris Conferance, and gained tha concurrence of most of the States of Europe, and of the government of the United States. Great Britain refused to yiold, and the other nutions, one ufter another, aubmitted to the interpretations of that power. Even Russin herself conceded that point, and in 1801 agrep ${ }^{\text {, }}$ by treaty, that an cnemy's property was not protected in neutral ships. Jurists, our own with the rest, regarded the question of international law as aettled on the Ilritish interpretation. The qualified accession of Engiand, in the Declaration of 1854 , to tite principles of the Armed

Neatrality occamloned, therofore, general and gratliyIng aurprise. It then ontered the minds of none, how. evar, that wlthin two years she would make her full acceaninn to thone principles, by a compact with thone very powern againat whom, on thia same question, she had leveled the hrondeldee of her fleets. In regart to thia particalar, Rusila is the victorious party, and lier triumph in a note of human progress. Turkey, too, has a proad diatinction in this decleration, for in settling the point that free ships make free goodn, sha is hut publishing anew what she was the firut to declare 250 years ago. The labora of our own government have been in the anme direetion through the whole period of our national history. Oar government, while admitting the Finglish rule as to the law of natlons, has decdaned that the rule had no foundation in natural right, and in repeated treation has gained the insertion of the doctrine now proclaimed In Parin.

The thind item in the late Ieclaration has iseen lens the oceasion of differences than the aecond. The fourth is a conclualve teatimony againat "paper blockadea."

Whether our government will "accede" in form to the poluts named may be doulited, though every one of them la a concesalon to principles or usages for which we have contended, and all, it may be hoped, will have our uniform and hearty practical coneurrence. It han been generally the pollicy of our atatesmen to keep our government clear from alliances which might, under any clrcumstancen, the embarrassIng, nud that diapoaition may demand for us, even In thif instance, an attitude of independence. IIowever this may be, the moral sense of the nation will accept with thankfulness the resulta of the Paris Conference, and the Christlan wlll see new forstokening of that day when nations shall learn war no more.

Maritime Loans. The contracts of botfomiry and respondentia are maritime loans of a very high and privileged nature, and they are always upheid ty the admiralty with a strong hand, when entered Into bond jule, and withoat any muspicion of fraud. The principle on which they are founded and supported is of great antiquity, and penetrates so deeply into it, that Emerigon says its origin can not be traced. It was borrowed by the Romans from the ancient Rhodians, and it is deeply rooted in the maritime general law of Europe, from which it has been transplanted into the law of this country. The object of hypothecation bonds is to procure the necessary suppliea for ships which happen to be in distress in foreign ports, where the master and owners are without credit, and in cases in which, if assistance could not be procured by means of such instruments, the vessels and cargoes must be left to perish. The authority of the master to hypothecate the ship and frelght, and even the cargo, In a case of necessity, is indisputable. The vital pripeiple of a bottomry tond is, that it be taken In a case of unprovided necessity when the owner has no resources or credit for olstaining necessary supplies. If the lender knew that the owner had an empowered consignee or agent in the port, willing to supply his wants, the taking the loan is a frand; but if fairly taken under an lignorance of the fact, the courts of admiraity are disposed to uphold such bonds, as necessary for the support of emmmerce in its extremities of distress. And if the lender of money on a bottomry or respondentia lond be williug to stake the money upon the safe arrival of the ship or cargo, and to taky upon himself, like an insurer, the risk of sea periln, it is lawful, reawonable, and just, that he should the authorize: to demand and receive an extraordinary interest, to be agreal upon, nud which the lender shall deem commensurate to the hazaril the runa.

A bottornry bowl is a loan of money upon the ship or shlp and accruing frelght, at an extraonlinary interest, upon maritime rinks, to be borne liy the lender for a specific voyage, or for a definito perici. It is in
the nature of a moregage, by which the shlp-owner. or the master on his behalf, pled, on the ship as a seeprity for the maney borrowed, anc it covera the freight of the voyage, or during a limited 'Ime. A respondentin bond la a loan upon the pledge of the cargo, though art hypothecation of beth ship and cargo may be made in one bond; and it amounts at most to an equitable Iien on the aalvage in case of lons. The condition of the loan is the aafe arrival of the subject hypothecated, and the entire principle an well as intereat is at the risk of the lender during she voyage. The lwittomry holier undertaken the risk of the voyage an to the enumerated perils, but not an to those which arise from the fault or misconduet of the master or awner. The money ls toaned to the borrower, upon condition that if the sulject pledged be lost by a peril of the sea, the lender shall not lie repald, except to the ex. tent of what remainn, and if the aubject arrives safe, or If It shall not have heen injured, except by its own defect, or the fault of the master or cuariners, the hore rower must return the sum borrowed, together with the maritime interent agreed upon, and for the repayment the person of the borrower is bound, an well is the property pledged. Thin in the definition of the contract given by Pothler, and it was taken from the Roman laws, and has been adoptod by Emerigon, and he anys the deflnition la given In neariy the same terms by all the maritime jurists. -Kenr'n Com.

Mark, or Maro, a welght used In several parts of Furoje, for varions commodities, enpecially gold and niliver. In France, the mark was divhled huto 8 nza. $=64$ drachuns $=192$ denlera or pennyweights $=4$, fir8 grains. In Ifolland, the mark weight was also called Troy welght, and was equal to thut of France. When gold and silver are sold hy the mark, It is divided into 24 carats.

The pound, or liere poids de marc, the weight most commonly used in retali dealings throughout France, prevlous to the Revolution, was equal to 2 mares, and consequentiy contalned 16 ozs. $=182$ drachms $=3 \mathrm{kH}$ den, $=9,216$ grains. One kilogramme ls nearly equal to 2 livres. Subjoined is a table of livres, puitis de marc, from 1 to 10 , converted into kliogrammes. Any greater number may be learned by a simple nultiplication and addition.

There is good anchorage ground for men-of-war and other large shipe hetwoen the Isles de Rattoneau and Pomeguea, to the west of the Isle d'If. When coming from the sonth, it is usual to make the Isie de Blanier, in lat. $43^{\circ} 11^{\prime} 54^{\prime \prime} \mathrm{N} .$, long. $5^{\circ} 13^{\prime} 69^{\prime \prime} \mathrm{E}$. $\mathrm{A} 1 \mathrm{Ilgh}_{\mathrm{g}}$-house erected on thls lsland ls 131 feet hlgh; the flashee of the light, which is a revolving one, succeed each other every half minute, and in clear weather it may be seen 7 leagues off. Ships that have mude the Isle de Planier, or that of Le Maire, lying east from it about $4 f$ miles, ateer northerly for the Isic d'If, distant about 7 miles from each, and having got within $\frac{1}{6}$ or $\frac{1}{1}$ a mile of It, heave to for a pilot, who curries them luto a harbor; It It nut, however, obilgatory on ahips to take a pilot on board; lut belng obliged to pay for one whether they avall themselves of his services or not, they seldom dispense with them. The chaso ls 4 snus per ton in, and 2 sous per ton out, for French vessels, and the veascla having reclprocity treatles with France. There la a light-house in the fort St. Jean, on the north sille of the entrance of the port. The lizaretto, which is one of the best In Europe, lizs a little to the nurth of the clty; and there is an hospital on Rattoneau Island, for individuals whose heaith Is dubious. With the exception of the above charge for pilutage, and the charges for such vessels as perform quarantine, there are no port charges on shipe entering at or elearing out from Marseilles.

Cages.-As soon as the master has, on hia arrival, male his decluration at the Health Oflice, and received pratique, he is directed to an offico close liy, called the Datache, where ho makes two almilar declarations, the one for the captain of the port, and the other for the custom-house; the day and hour of the istter being made is markel, la order to ascertain if the regular uanifest of his cargo is delivered at the customhouse within 24 houra after, as required by luw. As boon as these declarations are made, the master is accosted by one or more public brokers, who nlone are authorized by law to enter shlps at the custom-house and other putlic effices, and to interpret, if it be necessary; for the master. The broker whom he may select then gives the master all the necessary information rexpecting the asages of the port as regards tho ship and cargo, and gees thrugh all the formalitios respecting them that the law or loeal regulations require. Independent of the regular manifest which it is usual in all ports for the master to give in to the customhouse, he is here required to give in a full and complete list of ali the ship's stores, provisions, etc., that he has on board for his own use, and that of his crew ; and he can not be too carefui to make this list as correct as possible, as when it is subsequently verilled on board liy the castom-house and excise ollcers, eny variation aubjects the shlp to penalties. 'I'his is partheularly tr $s$ case with tobacco, which, being a government monopoly; is watched with the greatest vigilance. All the tubacco on board over that which the crew have in their chests for their own uso, must be declared, and any attempt at concealment or smugging is visited with heavy fines. When the ship
salle, the stores, provisions, etc., are again oxamined, and an excles duty charged on such provisiona and oth excisabie articles as may lave been consumed in t. port. No fire or light is allowed on board, and the cookling is all done on shore. Marseilles $L$ L $A$ elty of great antiquity, and hes long enjoyed a very extensive commerce. Havre, partly, no doubt, from Its being, an it wore, the port of Paris, used to anjoy a greater whare of the trade of Erance ; bat, notwithstanding the increased Importance of the former, it has recently been surpassed by Marsellise. The custom duties coliected at Ilavre In 1851, were 20,164,000 francs, whereas those collected at Marsellies during the same year mounted to $30,077,000$ france ; having increased to that amout from $\mathbf{2 5 , 8 0 0 , 0 0 0}$ france In 1830.
This statement shows conclusively, thut the trade of Marselilas is not only lnereasing, but that it is already very extenslve. She is the grand emporiums of the south of France, and the centre of $\mathbf{9 - 1 0 t h s}$ of her commeree with the countries on the Mediterranean and Black Sea. The exports censiat principally of silk stuffy, wines, brundies, and liquora; woolens and linens; madder, oll, soap, refined sugar, perfumery, atatlonory, verdigris, and all sorts of colonini products. Among the prinelpal imports are augar, coffee, and other colonial products; dye stuffa; corn fom the llisck Sea and the north coast of Africa; cotton from Egypt and America; coal, linen, thread, and various descriptions of manufactured goods from England ; with hides, wool, tallow, tlmber, eto. Marneilles engrosses almost the whole trade between France und Algiers. She is now also the principal seat of the intereourse carried on by atramers with Malta, Alexandria, and Constuntimople; and besides the steaners employed by the government as packeta, she ran upward of 28 ateamera belonging to private companies. Mr. Maelaren says that in 1839 most of the latter had English-mude engines, and English engineers; and that they burnt English coal, which sold here for about 30s. a ton. There belonged to the port, on the 31et of December, 1851 , c 84 sailing vessels of the burden of 63,577 tons; and 43 steumers of the burden of 9,505 tons. A jolnt-stock bank establishod here in 1835 is auld to have been exceedingly auccebsful.

The arrivals and departures $i$ this and ate precedling year are conalderably above the average, a consequence of the great limportations of foreign corn. In

1846 the imports of whent ameunted to $1,290,000$ quarters, and In 1847 to above $2,200,000$ quarters.
t Wo are unable to lay before the reader any very recent aceount of the import and export trade of Marseilles. We belleve, hovever, that the valne of the first was, in 1858, eatimeted at abont $\mathbf{2 0 0}, \mathbf{0 0 0}, 000$ francs, and that of the exports at abont as much. For informatlon as to moner; wrighta, measures, dutles; etc., the reader is reforred to Francis and llavar, under which heads he will find an' account of the trade of France.

The trade of Murseilies has been much increased by the oceupation of Algiers, she being the grand centro of the intercourse carried on with that country. But independently of thla clrcumstance, Marsellies engroeses by far the largest share of the extenelve commerce carried on betweeu France and the east coast of Spaln, Italy, Greece, and the Levant. See France.

Martinioo, or Martinique, one of the French Weat India Islands, in the windward group, between lat. $14^{\circ} 24^{\prime}$ and $14^{\circ} 53^{\prime} \mathrm{N}$., and long. $60^{\circ} 80^{\prime}$ and $61^{\circ}$ $18^{\prime}$ W. Population, 1850, 121,145. It is monntaluoun, and contalne several extinet volcanoes; the numerous' amall rivers are used to turn sngar-milla. About one quarter of the surface is covered with dense foreste. Soll fertile, but only one fifth of the superficles is cultivated. Chlof products, sugar, cofiee, and acao. This laland, called by the natives Madiana, was diecovered by the Spaniards in 1493. The French founded a colony on it in 1685. It was taken by the English in 1762, but resigned in 1768 ; thoy again oocupied it from 1794 to $\mathbf{1 8 0 9}$, and it was finally given up to France in 1814. The capital of the colony ts Port Royal, but St. Plerre is the most populous town and the centre of commerce. The laland is nasrly 50 mises in length by about 16 in breadth, and comprehends an area of 860 square miles. The surface is une: ea, and intersocted In all parts by eteep and rugged rocka. Piton de Corbet, one of the highest, is about 812 feet above the level of the sea. The shape of this calcareous hill resemblen a cons, and It la on that eccount very difficult of access. The palm-treen with which it is covered, become more loty and abundant near the aunmit, and these continually attract the clouda, which occasion noxious dampe, and contribute to rander it more rugged in appearance, and more dangerous to ascend. There are also two other meuntains conspicnous from their clevation, and from these, particularly from the first, descend numerous streame, which irrigate the island. Martinique is better aupplied with rater, and less exposed to hurricanes than Guadaloupe, whlle the productiona are neirly the same. Of 75,821 bectaren, the superficial aren of the island, 17,1522 are employed in raising engar-cane, 3861 In coffeo, 719 in cocoa, 491 in cotton, 17,191 are pasturage, and 19,997 are woods. The annual production la valued at $21,000,000$ franca. In 1824 the laland consumed French products to the value of $16,000,000$ francs, and exported to tho mother country goods to the amount of $18,000,000$ francs. The tonnage engaged in this commerce amonnted to 33,500 tone. The revenue in 1823 , was $4,000,000$ francs. The conmerce of Martinlque has continued nearly the ame since the period at which the above eatimate was made.

Port Royal, tho capital and seat of the courts of justice of Martinlque, is sltuated on one of the several bay's which indent the iviand, and possess one of the safert and most capaclous harbors in the West Indiea, or even in the world.

The commercial relations of Martinique and Guadaloupe are regulated hy the royal decree of February 5, 1826, and lyy such other decrees as have subsequently been promulgated. Forelign and natlonal uhlpa may Import into all open ports of the lelands (la Martinlque, the ports of 8t. Plerre, Port Royal, and Trinito; in Guaduloupe, Deule, Ia Basseterro, and

Poin-a-Pitre; and in Mariogalante, of Grandbonrg, the principal town and only port of the Island), articles of merchandise enumerated in the fellowing tariff:

Tarify ron all Flaga, National and Foneton.
Denomilnption of mereh. No., wrighi or weanure. Rata of doly.

 Indlan corn, in graln.... 1 hect, $=24-5$ bush. $\quad 1871.5$ Vegetmbles, drled........ , Rlce. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . 220 lbs. Balt.... $644-5$

 Wine, forelgn............ 1 hect. $=26$ gale.. $\{$ In for. shipa, 98 c . Stone coal. $\qquad$ \$0 02

By decres of Narch 10, 1855, ealted provislena (meats) of every description pay only 50 centimes ( 0.8 eents) per $100 \mathrm{kllog} r a m m s{ }^{2}$. Wood of all serts, other than hoop-poles; tar, pltch, and other extracts of plne, etc. ; hides, with the hair on; forage, green and dry $;$ table fruita, and seeds, pay 4 per cent. ed valorem.

No. 2.-Free of Duty.-Ammonin, unpulverized; mnimal substances used in medicine and perfunery; bones and horns of animals ; cassia; cochineal ; cocoashells ; copper; elephants' teeth; fats, except of tish; ginger; gloves ; gums ; indlgo; Jeauits' bark; kermes; lse; lead; medicinal baleamn, julcee, roots, barks, nerbe, lesves, and flowers; mother-of-pearl ; nutmegs; peltries; pepper: potash; quercitron; rocon; rushes and reeds ; seeds hard to he arushed ; skins, dry and undressed ; sumach ; tin, unwrought ; tortoise-shell, a.... merio ; vanilla; vegetables, green; wax, not werked; whale fins ; woods, odoriferous, dye, and cableet. Forelgn vessels importing the above enumerated merchandlse are aubjected to no other port chargea, lighthouse and tonnage duties, than are levied on French vessela. All goodn not enumerated in the above tarIff, and imported from foreign countries, either in forcign or French iottoms, are liable to confiscation.

The artlcies eaumersted in lists Nos. 1. and 2, as well as all articles imported from France, ma; be reexported, duty free, from one colony to another, hut only in French vessels; on condition, however, that the importer of merchandise contained in list No. 1 proves that the dutles have been discharged in the colony of original importation. Forelign vessels, as well as French, may export, duty free, to foreign countries, articles imported into the two colenies, whetber from France or elsewhore ; but these exportations can only be nllowed from the ports opened by the orilinance of Felruary 5, 1826, for the importation of merchandise enumerated in lists 1 and 2. Foreign flour may be imported (if neceasity or urgence suthorlzes the importation) for a fixed duty of 8391.2 per 80 kilogramines, or 1771 lbs. $;$ lut then it cam only be lone if a apocial order by the governer pernitting the Importation has been issued, which sllewance will never extend beyond the term of three months.
Maryland, one of the central United States, lies hetween $38^{\circ}$ and $39^{\circ} 44^{\prime} \mathrm{N}$. lat., and between $75^{\circ} 10^{\prime}$ and $70^{\circ} 21^{\prime}$ W. long. It is 106 inilea long and 120 brod, contalning 11,000 square miles. l'opulation in 1790 , 319,728 ; In $1800,3.15,824$; in $1810,380,5.56$ in 1820 , 407,350 ; in 1830, 416,018 ; in $18.40,469,232$; and in 1850, 583,035.

Aarly History of Maryland.-In the year 1632 King Charies I. gave a charter to Cecilins Calvert, Lord Laatlmore, and granted to him a tract of land fying in that peninsula, between the ocesn and Chesapeake Bay, and mound the northern extremities of that ame bay, and ordered this land to be called "Marylani," In honor to the Queen IIenrietta Maria, the consert of Charles I. She was of the Catholic religlon, like Jord Baltimere himself, and likewine the greater part of the settlers which he carried out. The name eppenrs for the first time in the charter of Maryland of the 20th

June, 1 his asso alse ut Americ is called that the old and that the cient tln cali acel by an a Other and the rettled $t$ this nam and not Spanlard ists and country of some that sair for instar lumbus, because t his prote gelag on likely, fn settiemer this settle so called name Ma: glons, spl dences in Kohl.

June, 1682. It is posslble that Lord Baltimore and his associates, m proposing to the king that name, had
 America before their eyjes, on which Chesapeake Bay is called "St. Mary's Bay" (Bahia de Santa Maria) and that they hidd a deeire to carry baek to this hay that old and historical name. ${ }^{\text {ln }}$ It may be $n$ mere aceident that the name Maria was as well in modern as in ancient times applied to the same regions. But what we call accident in history is often secretly linked together by an association of ideas which eacapes our research.
Others thlnk that the Calverts and their ussocistes, and their Catholic missionaries, who explored and settled the territory of Maryland, thought, in giving this name, exclusively of the Queen Henrietta Maria and not at all of the Hoiy Virgin. It was among Spaniards and French, and among all Catholie colonists and discoverers, very customary to vow a new country or plate, to which they gave a name in honot of some person, st the same time to the protection of that saint which bore the same nsme. They would, for instance, call a place named after Christopher Colambus, not "Chrietophoro," bat "St. Christophoro," because they thought at once as well of the man as of his protecting saint." That something similar was going on at the baptiam of Maryiand seems not unlikeiy, from the cireumstance that the first principsi settlement of Msryland was called St. Mary, and that this settlement, as well as the sarrounding country, is so calied to this day. The fact that the old forgotten name Mary, in ister times, retnrned to the eame reglons, appears one of the so-called "curious coineidences in history worthy to be pointed out."-ل. G. Koht.

Physical Featurea; ofo.L-Eastorn Maryland, or thatpart of the Stata enst of the Chesspenke Bey, is mostiy level. The conntry on the west shere to the head of the tides in elmilar to the eestern shore; the soll of thio portion in generally fertile, producing wheat, Indlan corm, tobacco, ote. Above the tidea the surface rises into hills, and the western part attains an elovated region, boing croased by the Alleghany Mountains. The western purt containe much fine land, adapted both to grain and grazing. Extenslve beds of coal and iron ore exist. There were in thls State in $1850,2,797,905$ acres of improved land, and $1,886,448$ of unimproved land, in tarms; cash value of farms, $887,178,546$; and the valae of implements and machinery, $\$ 2,463,448$.

The Potomas River, which dividas tho State from $\mid$ ton ; the perpendicular descent is 76 fect, and the rapVirginia, is 350 mileo long, and navigabie about 150 miles to Washington city. it is 71 milse whe at its mouth. The greut falls are 14 milles above Wusilugids extend for several miles up the river, snd form a very pleturesque viow. The Susquehunna is a large river which entors into tho head of Chearpeake Bay in
this State. It is 14 miles wide at Its mouth, bnt is naviguble only 5 miles, being above that much obstructed by falls and raplds. The Patapsco is a amall river, naviggble, however, 14 miles to Baltimore for ships. The Patuxent is 110 miles long, and is navigable for 50 miles for vessels of 250 tons. The other rivers are Elk, Sasssfras, Chester, Choptank, Nsnticoke, and Pocomoke. The Chesapeake Bay is $\mathbf{2 7 0}$ milles long, and from 70 to 20 wide, and by ita numerous inlets furnishes many fine hsrbors.

Ifanufactures, etc. -There were in the State in 1850, 33 cotton factoriea, with a capital invested of 42,248 , 600 , employing 1212 males and 2035 females; products valued st $82,021,396$; 43 woolen factories, with a capital of $\$ 258,100$, enuploying $26 \$$ males and 106 females; products valued et $\$ 319,240 ; 19$ establishments making plig Iron, with a capital of $81,033,500$, employing 1351 persons, producing 43,641 tons of pig Iron, etc., valued at $41,048,250 ; 16$ establishments, with a capital of $\$ 350,-$ 100, employing 761 persons, and making 6244 tons of castings, etc., valued at $\$ 685,000 ; 17$ establishments, with a cupital of $\$ 780,650$, employing 568 persons, manufacturing 10,000 tons of wrought iron, valued at $\$ 771,431$; 392 flouring and grist mills; 130 saw mills ; 116 tannories, with a capltill of $\$ 628,900$, employing 470 persons; value of products, $\$ 1,108,189 ; 59$ print-ing-offices; 6 daily, 4 tri-weekly, 64 weekly, 1 semimonthly, and 2 monthly publications. There were in this State (January, 1856) 3 railroads, with 460 miles of rosd tinished and in operation, and 30 miles in course of construction. The Chesapeake and Ohio Canal, 184 miles long, is mostly in thila State. Capital invested in munufactures, $814,753,143$; value of manufactured articles, $\geqslant 32,477,702$.

The principal places in the State are Baltimore, the metropolia; Annapolis, the capital; IInvre de Grace, Frederick, Jlagerstown, and Cumberland. There were (January, 1854) 25 banks, with an aggregate cush
 1852 of domestic produce in American vessels amounted to the value of $\$ 4,391,692$; in foreign vessels, $82,122,-$ 949. Foreibn produce in American vossela, 120,129 ; in foreign vessels, $\$ 38,091$. Total value, $\mathbf{*}, 667,861$. The imports same year in American vessels amounted to $\$ 5,620,114$; in foreign vessels, $\$ 1,099,872$. Total, $\boldsymbol{*}, \mathbf{1} 19,586$. Tonnage, $1852,201,181$.

For Iliatory, Finances, etc., of Maryland, see Am. Quar., ix., 483; llunt's Mag., v., 50; Bank. Mfag., i., 394 ; Jo. Sce., xxvii., 1 ; 12e llow's Rer., x., $64 \mathrm{~J}^{2}$.

The principal jort is lhaltimore, situnted on the north side of tho I'atapsco liver, about 14 miles sbove its entrance intu) the Chenapeake Bay, in lat. $39^{\circ} 17^{\prime} \mathrm{N}$., long. $76^{\circ} 36^{\prime} \mathrm{W}$. The harbor is spucious and convenlent, and the water deep. Its tonnage in $18: 6 \mathrm{~m}$ amounted to 183,344 tone. In tho fiscal year, $18: 3$. 6 , there were built at this jort, 12 shipa, 8 barks, 48 schooners, 3 sloops, with an aggregate tomage of 15,393 tons.

Annapolis, city, port of entry, and capital of Maryland, on the Chesapeake llay, at the entrance of Severn 1kire. The State Ilouse is remarkable as the Iniding in which the American Congress, turing the revolutionary war, held some of its sesaions. The Senate Chamber, whleh witnessed the last ucenc of the great drama of the lievolution, Wushington's resignation of his commission to the t'ongress, has been grenerved unaltered. The United States' Naval Academy, at Fort Severn, has 7 professors, and $7(1$ midshipmen ns atudents. Tonnage of the port in 1856 , was 10122 tons.

Massachusetts, one of the eastern United States, lies betweon $41^{\circ} 23^{\prime}$ and $42^{\circ} 52^{\prime}$ north lat., and between $69^{\circ} 30^{\prime}$ and $73^{\circ} 30^{\prime}$ weat long. It is about 190 milles long, with an average breadth of 00 mlles, and contalns 7250 square miles. Population la 1790 was 388,727 ; in $1800,422,845$; in 1810, 472,040; in 1820, 523,287 ; it 1830, 610,408; in 1840, 737,699; and in 1850, 094,499.

Early History.-The first and most ancient names which were given by historians to the territory of the State of Massachusetta were more or lesa the same with those of Malne, and wo need not repeat thenhere. The nsme "La Cóte des Almouchiquo's" (the Coast of the Almonchlquois Indlang), which the Freach Introduced, and which the Duteh geographers frequently changed to "The Iand of Almushikosca," covered particularly tho whole extent of Massachusetts. This latter name was first introduced ly the English navigators and explorers. The word is said to be composed of the Indian words Mos (Arrowheal) and We+ tuset (hill). The pure and correct orthography of the componind word is from thls asid to be Mosuctuset, the hill in the shape of an arrowhead. The king of an Indian tribe is sald to have resided on such a hill near the shoros of Massachusetts Bay, and his tribe of Indians received from this, the namo "The Indiuns of Ifoswetuset. The name is already mentioned by Captain Juhn Smith under the year 1016. He writes it Massachuset. In the early times, the name was, however, corrupted in many different ways. Captain Dermer writes, in his celebrated letter on his discoveries, Massachusit (1619). In a letter from Mlymouth in the year 1629, the namo is written Massachutets Bay, and In the patent of Sir Fernando Gorgen, repeatedly M/assachusiack. In the earlieat time of tho Plymouth Colony this name included only the country round llo- on harhor, and the name was princlpally given to that great bay, of which Boston harbor is a part, and which was called Massachusetts Bay. The first English colony or province was therefore not called from the conntry, but from the bay, "The Colony of Masanchusetts Bay" (since 1026). The territory which this name covered was at first not extensive, but by and by it became the greatest name throughout the whole of New England. In the year 1692 the country of the Plynonth Colony was nnited to it, and for the whole was now introduced the name of "The Province of Massachusetts." So long also as New Ilampshire and Maine were united to the mighty Massachusetta, during the greater part of the 17 th and 18 th centuries, the geographers, forgetting local names, extended the name of Massachusetts often over the greater half of all the New Englund acas and countries; while aince 1774 the name "State of M/asxachusrffs" inchudes the consts between Merrimack River in the north and Naragansett llay in the sonth.-J, G. Koul.
Physical Feutures.-This State presents three distinct zones. The tirst towarl the ocean, is a marine nlluvion hut little elevated alove the sea; it is mostly sandy, and the least frrtilo and amallent in extent of the three sections. This plain is followed ly a tine hilly tract which crosses the State from north to south, elevated In some flaces 300 feet nbove the sea: from these elevations the rivera thaw in every direction. The second, or middle zone, Includes part of the beantiful valley of the Connecticut, and ls followed dy the mountainous, bit highty fertite comnty of Berkshire, which comprises the whole weatern prit of the state. through iferkshiro pusses two mountain ranges, the Taglakanle, on the western horder of tho State aul between the llousatonic and Connecticut livers, the Green Mountsin range here called the Iloonick Mountailns. Mount llolyoke, near Northampton, is near 1200 feet above the level of the sea, anil Wachusett Mountain in Princeton, is an elevated peak from 2000 to 3000 feet high. Sadile Mountain in the Toghkanic rainge in the north-went corner of the State is 4000 feet

high, and Mount Wsahington In the same range in the south-west corner of the State, is aboat $\mathbf{8 0 0 0}$ feet high. The valleya of the Connectlut are fertile, as are also those of the Housatonle. There were In this State in 2850, 2,183,436 acres of land improved, and 1,222,576 of unlmproved land in farms; cash value of farma $\$ 109,076,847$, and the value of implementa and machinery $\$ 3,200,584$. Live stock-horses, 42,216 ; asses and mulos, 34 ; milch cows, 130,099 ; working oxen, 46,611 ; other cattle, 83,284 ; sheep, 188,651 ; swine, 81,119 ; value of live stock, $\mathbf{6 9 , 6 4 7 , 7 1 0}$.

Agricultural Products, etc.-Whe: 31,211 bushels ; rye, 481,021; Indian corn, 2,345,490; oats, $1,165,146$; barley, 112,385 ; buckwhest, 105,805 ; peas and beans, 43,709; potatoes, 3,585,384. Value of products of the orchard, $\$ 463,995$; produce of market gardens, $\$ 600$,020 ; pounds of butter made, $8,071,370$; of cheese, 7,088,142; maple sugar, 705,525 pounds; molasses, 4693 gallons; beeswax and honey, 50,508 pounds; wool, pounds produced, 855,136 ; flax, 1162 ; ellk cocoons, 7 ; hops, 121,595 pounds ; tobacco, 138,246; hay, tons of, 651,807; clover seed, 1002 bushels; other grass seeds, 5085 ; flax seed, 22 bushels; and were made 4688 gallons of wine. Vnlue of home-made manufuctures, $\$ 205,333$; of slaughtered animals, $\$ 2$,500,924 .
The principal rivers are the Connecticut, a noble stream winding for 50 mlles across the State. Housatonic, which rises in Berkshire connty, and flows through the west part of the State, and Merrimac, which rises in New Hampahlre, and has a course of 50 miles in the north-east part of the State, and enters the acean below Newburyport. It is navigable for large vessels to Haverhili, 15 milea. Besides these, there are Nashua, Concord, Taunton, alid Blackstone livers. Massachusetts has numerous good harbors. There sre several important islands off the south shore of this State, to which they belong. The largest is Nantucket, 15 miles long and 11 milos broad, and which constitutes a county of its own name. Martha'a Vineyard, west of Nuntucket ts 20 miles long and from 2 to 10 miles broad, which, with other small islands, constitutes Duke's county. The shores of Massachusetts are diversifled by eome bold promontorios and capacious bsys. Of the latter, Massachusetts Bay, between Cspe Ann on the north and Cape Cod on the south, is sbout 40 iniles in breadth. Buzzard's Bay is on the south-west side of Cape Cod, and is 20 miles long. Cspe Ann, in the north part of tho Stute, is a rocky promontory 15 miles in length. Cape Cod is a peninsula in the south-east part of the State, extending 75 miles long and from 2 to 20 milles broad, with a bend in tho middlo neurly at right angles. The peninaula of Nahant, a fow miles north of the harbor of Boston, is connected with the malnand by Lynn-bench two milea long. It has hecome, on accouut of its cool breczes snd wild sea views, a place of fushionable resort during the summer months.

There were, January, 18i6, 43 rallroads, of which 1409 miles were finished and In operation, and 18 miles in course of construction. The Midullesox Cannl, 27 miles long, connects Boston with Lowell. The Blackatone, and the Ismpshire and Hsmden Canals are both in diause.
The value for the year of tho products of industry, as found by adding the separate returns throughout the State, is found to be $\$ 295,820,681$. If allowance be made for defective and erroneous returns, the Secretary thinks the whole amount would be at least $8350,000,000$. The returned value without allowunce, shows st enormous increase of the productive energy of the State as comparod with the prevlous returns, viz. :

|  | Produelion. | laton. |
| :---: | :---: | :---: |
| 1587. | *36,232,616 | 700,000 |
| 1845, | 124,749,457 | $8.45,0001$ |
| 1835. | 990, 310,681 | 1,183,123 |

That ls, while the population has lacreased only 34 and 62 per cent. reapectively; the value of the product $\mid$
of industry (ratnrned) has Increased 188 and 242 per cent. The amount of capital inveated in manufactures and other productions in Mussachusette, Is shown to he $\$ 120,000,000$, and the gross value of products §295,000,000 annually. The nuinber of hands employed is 245,908. The leading products of the Stste In 1855, and the amount of capltal emplnyed in 1845 and 1855 are sa follows:

The prinelpal ports are: 1. Boston, lat. $42^{\circ} 23^{\prime} \mathrm{N}$, , leng. $71^{\circ} 4^{\prime} \mathrm{W}$. The city is situated at the head of a deep bay, on a peninaula, being murrounded on three sides by water, Generally there is suflicient depth of water to enable the largest ships to come up to the city at all timen of the tide; and they usually moor alongside of doeks where there is perfect rafety. The depth of water in the channel varies from 15 to 30 feet. It ls the great centre of the commerce of New Fingland, and in this capacity rocelves und distributes one fifth of the whole commerclal material of the United States. The tonange of Hoston in 1856 was 621,117 tons. See l3osron. 2. Salem, city and port of entry. It is cblefly built on a tomgne of land formed by two Inlets from the sea, called North and South Rivers ; wer the former are two bridges (one of which in erossed hy the railroal), connecting it with lleverly. The harior has gool anchorage ground, but vessels drawing more than 12 or 14 feet of water must he partially unloaded before they can come to its wharven, The tonnage of Salem in 1856 was 29,970 tons. it. Nantncket. Tonuage in 1856, 16, Xint tons. 4. Now IBedfond. 5. Fall River. 6. Newharyport. 7. Gloucester.

Mast, a long piece, or systen of piecen, of timber, placed nearly perpendlealarly to the keel of a vessel to support the yards or gaffis on which the saile are extended. When the makt is one entire piece, it is called a pole-mant; hut In all larger vessela it is composed of eeveral lengthe, called lower, top, and top-gallant masts : sonnetimea a fourth, called a rojal mast. The
method of eupporting each mast on the one next below it, is peculiar. On the siden of the luwer mast, some feet below the head, are placed checks: on these are tived horizontally two slort pieces of wood, fore and ift, called trestle treoa. Across these at right angles ure laid, before and abaft the mast, two or more longer and lighter pleces, called cross trees, which give the name to the entire aystem. On the mast head itself is a cap. The topmast being placed up and down, the fore side of the lower mast is swayed ap between the trestle trees, and through the ronnd or foremost bole in the cap. When ralsed mo higit that the hed of the topmast is nearly up to the surface of the eross trees, a piece of iron, called the fid, is put through the hole in the heel for the purposo; and on this idd, of which the ends are snpportenl on the trestle trees, the topmont rests. When flddel, the topmast is atsyed, mind the rigging or shrouls set up to the dead eyes in the enils of the cross treen. These dead eyes pull from the lower rigging luflow, and that the cross trees serve merely to extend the rigging. The topgallant is supported in the same manuer on the topmiast. When the mast is to le taken down, it is tirst ralsed to relieve the fid; which heing drawn out, the mast is lowered. The masts are supported ly a strong rope, leading forward, called the stay; by others, leading aft on each side of the ship, ealled, in general, backotiges; and by others abrast, called shrouds, and also breast luackstays Large lower masts are composed of pieces, and have for some years been male of several lengths, about a foot or 80 aquare, and the whole ampurten merely by hoops at intervals. 'The mainmast is near the middle of the vessel, the foremast is that which is nearest the fore part, and the mizzenmast is ahaft tho mainmast. The old rule for the length of the maia

lower mast is to take one half the sum of the length of the lower deck and extreme breadth; the foremast is eight ninths of the mainmast, the mizzenmast considerably smaller. The topmast is about three fifthe of the lower insat. These rules, as well as others for the thicknesses, etc., are meroly for convenience, based on no mechanical principle, and are by no means atrictly followed.
Masts ure still built up in pieces, but by the sid of murine glue. A joint secured by this glue is leas easily separuble than the actual fibres of the wood itself. In the greut Exhibition of London there were many curious specimene illustrative of the uae of this extruordinary cement. One was a plece of the mast of the ship Curafoa, found Inseparable even by the wedge. Another was part of a mainmast, from which a glued frugment was torn awsy only after a force of 22 tons had been applied. A third was a block of elm, joined witi glue; it was exploded by gunpowder, but the joint did not yield. Inother was an ouk cannon-ball, made of two glued pieces; it had been fired with eight ounces of powder, but the joint held fast. Another was a doal block, which broke in the fibres by a farce of four tons.' Others were pieces of masts, inteaded to show how intensely strong a mast becomes when built up with pieces which are joined ly this giue. It is not only a giue : it is also a substitute for pitch. Muny vessels have tho soams puyed or calked with this glue, which is found much more durable for the purjose than ordinary pitch.

Master, in commercial navigation, the person intrusted with the care and navigation of the ship. "The master is the confidential sorvant or agent of the owners; and in conformity to the rules and maxims of law the ownere sre bound to the performance of every lawful contract made hy him relative to the usual employment of the sinip."-ABnotr on the Lave of Shipping. From this rule of law it follows that the owners are bound to answer for a ibreacis of contract, thuagh conmitted by the master or mariners against their will, and without their fault. Nor can the expediency of this rule be doubted. The owners, by seiecting a person as master, hold him forth to the pulblic as worthy of trust and confidence. And in order that this selection may le made with due care, ond that all opportunitios of fraud and coliusion may be obviated, it is indispensabic that they should be made responsible for his acts. The master has power to hypotheeate, or pledge, both ship and cargo for necessary repairs executed in foreign ports during the course of the voyuge; int neither the ship nor cargo can be hypothecuted for repairs executed at home. The master hus no lien upon the sliip for his wages, nor for money advunced by him for stores or repairs. In delivoring judgment upon a case of this sort, Lond Mansfeld said: "As to wages, there is no particular contruct that the ship should be u pledge; there is no usage in trade to that purpose; nor any inplication from the nature of the dealing. On the contrary, the law has always considered the captain as contracting personally with tire owner; and the casc of the cajetain has, in that respect, been distinguished from that of ali other persuns heionging to the ship. This rule of law nay have its foundiation in pulicy for the henetit of navigators; for, us ships nuay the making prollt and earning every duy, it uight the attended with great inconvenience, if, on the change of a cajotain for mistiehavior, or any other reason, he should be entitled to keep the ship till he is paii. Work done for a ship in Fughand is supposed to be done on the persond credit of the employer : in fureign parts the captain may hypothecate the ship. The defendant might have told the tradesman, that lie only ucted as an agent, and that they must look to the owner for payment." The master is bound to employ his whole time and attention in tie service of his employers, and is not at liberty to cuter into any engagement for his own benefit
that may occupy any portion of his time in other con cerns ; and, therefors, if he do so, and the price of such engagement happen to be paid into the hands of his owners, they may retain the money, and he can not recover from them.--A biott on Shipping.

Willfally destroying or casting away the ship, or procuring the same to be done by the master or mariners, to the prejudice of the owners, freighters, or inonrere; running away with the cargo; and turning plrates; are offenses punisliable by transportation heyond seas for not leas than 15 years, or by imprisenment for not more than 3 years. After the voyage has been commenced, the misiter must proceed direct to the place of his destinstion, without unnecessarily etopping at any intermediate port, or deviating from the shortest course. No such deviation will be sanctioned, nnless it has been occasioned by stress of weather, the want of necessary repair, avoiding enemies or pirates, succoring of ships in distress, sickness of the master or mariners, or the mutiny of the crew. -Marsinall on Insurunce. To justify a deviation, the necessity must be real, inevitable, and imperious; and it must not be prolonged one moment after the necessity has ceased. A deviation without such necessity vitiates all insurances upon the ship and cargo, and exposes the owners to an action on the part of the freighters. If a ship be captured in consequence of deviution, the merchunt is entitled to recover from the owners the prime cost of the goods with shipping charges ; but he is not entitied to more, unleas he can show that the goods were enhanced in value beyond tic sum above mentioned. If a merchant ehip has the misfortune to be attacked by pirntes or enemies, the master is loound to do his duty as a man of couruge and capacity, and to make the best resistance that the comparative strength of the ship and crew will allow. By tine common law, the master has authority over all the marinere on board the ship-it being tieir duty to obey his commands in all lawful matters reiating to the navigation of the ship, and the preservation of good order. But the master should in all cases use his suthority with moderation, so as to be the father, not the tyrunt, of his crew. On his return home he may be called upon by action of law, to answer to a mariuer he has either beat or imprisoned during the course of the veyage; and uniess he ahow suticient cause for chastising the mariner, and aiso that the chastisement was reasonable and moderate, ine will be found liabie in damages. Should the master etrike a mariner without cause, or ase a deudly weapon as an instrument of correction, sad death ensue, he will be found guilty, according to the circumstances of the case, either of mansluughter or murder.-Ausotr, part ii., o.4. The master nay by force restrain the commission of graat crimes: but he has no jurisdiction over the criminal. Ifis business is to secure his person, and to deliver him over to the proper tribunale on inis coming to lis own country.

Tise master must not take on board any oontraband goods, by which the ship and other parts of the cargo may be rendered liable to forfeiture and aeizure. Neither must he take on hoard any false or colorable papers, as these might subject the ship to the risk of capture or detention. liut it is his duty to procuro and keep on iourd sil the papers and documents required for the munifestation of the ship and cargo, by the inw of the countries from and to which the sfifi, is bound, as well by the law of nations in general, as by treaties betweou particular States. These papers and documents can not lis dispensed with at any (ime, und are quite essential to the sufe navigution oi neutrai ships during war. It is customary in bills of lading to insert a clause limiting the responsibility of the master and owners, as follows: "The act of God, enemies, fire, and overy other dangers and accidents of the seas, rivers, and navigation, of whatever nature and kind soover, save risk of bouts, as far as ahips aro
liable thereto, oxcopted." $n$ When no bill of lading in signed, the mastar and ownors are bound, according to the common law. The most difficult part of the master'e duty is when, through the perils of the een, the attacks of enemies or pirates, or other unforeseen accidents, be is prevented from completing his voyage. If his own ship have suffered from storms, and can not be repalred withln a reasonahle time, and if the cargo be of a perishable nature, he is. at liberty to employ another ship to conver it to the place of destination. He may do the aame if the ohlp have been wrecked and the cargo saved, or if his own ship be in danger of slnking, and he can get the cargo transferred to another; and in extremo cases he is at liberty to ditpose of the cargo fer the benefit of ita owners. The moet celebrated maritime codes, and the opinions of the ablest writors, have differed considerally as to these pointz. According to the Rhodian law (Pand. 1. $10, \$ 1$ ) the captain is released from all his engagements, if the ship, by the peria of the sea, and without any fault on his part, become incapable of proceeding on her voyage. The luws of Oleron (ort. 4), and those of Wiebr (arta. 16, 87, 55), say that the oaptain may. hire another shlp; harmonizing in this reupect with the present law of England. The famous French ordinance of 1681 (tit. Du Frtt, art. 11), and the Code du Commerce (art. 296), order tha captain to hire anothor shlp; and if he ean not procure one, freight is to be due only for that part of the voyage which has been performed (pro rata itineris peracti). Valln has objected to this articie, and atates that practically it meant only that the captain mast hire another ship if he would earn the whole freight. Emerigon (tom. I. p. 428) holds that the captain, being the agent not only of the owners of the ship, but also of the shippers of the goods on board, is bound, in the absence of both, to use his beat endeavors to preserve the goods, and to do whatever, in the circumetances, he thinks wiil inost condace to the Interest of all concerned; or what it may be preaumed the shippers would do were they present. This, which seems to le the best and wieent rule, has been laid down by Lords Manstield and Tenterden, as atated alove, and masy be regaried as the law of England on this point.
But to use the words of Lord Chief Justice Tenterden, "the dleposal of the cargo by the master, in a mattor that requires the utinost caution on his part. He should always bear in mind that it ia hia duty to convey it to the place of destination. This is the purpose for which ho has been intrusted with it, and this purpose he is bound to necomplish hy every reasonabie and practicable methol. What, then, is the master to do, if, by any disaater happening in the course of his voyage, he is unable to carry the goods to the place of destination, or to deliver thom there? To this, as a general queation, I apprehend no answer can be given. Every case must depend upen its own peculiar ciroumatancee. The conduct proper to le adopted with respect to perishable goods, will be improjer with respect to a eargo not perishable; one thing may be fit to be done with tieh or frult, and ancther with timber or Iron; one method may the proper is distant regions, another in the vicinity of the merchant ; one in a frequented navigation, another on unfrequented shores. The wreck of the ship ls not necessarily followed by an impossilility of nending forward tho goods, and does not, of ltself, make their sale a measuro of necessity or expedience; much lens can the loss of the season, or of the proper course of the voyage, have this effect. An unexpected interiletion of commerce, or a audden war, may defest he adventure, and oblige the ship to stop in her course ; but neither of these events doth of itseif alone mako it necessary to meli the eargo at the piace to which it may be proper for the ship to resort. In these, and many other casen, the master may be discharged of hls obligation to deliver the cargo at the place of dentination ; but it doea
not therefore follow that he is authorized to sell lt, or ought to do so. What, then, ls, he to do ? In general, it may be said, he is to do that which a wise and prudewt man will think most conducive to the benefit of all concerned. In so doing he may expect to be saff, because the marchant will not have reason to be dils. astisfied; but what this thing will be, no general rulea can teach. Some regard may be allowed to the interest of the ship, and of Its owners ; but the interent of the cargo must not be sacrificed to It. Transhipment for the place of destination, if it be practicabla, is the firat object, because that is in furtherance of the eriginal purpose; if that be impraeticable, return, or a safe deposit, may be expedient. A disadvantagenus sale (and almost every sale by the master will be disadvantageous) is the last thing he should think of, because It can only be justified by that necessity which eupersedes all human laws."-Law of Shipping, part itit, c. 3.

The master of a ship is liable for gcods of which she is robbed, in part ; and the reason, es Lord Mans. field stated, is, leat room siould he given for collusion, and the mustar should get himself robled on purpose, in order that he might share In the spoii. The master is, however, entitiled to indemnify himself out of the seamen's wages for losses oceasioned by their neglect. If any passenger die on board, the master is obllged to take an inventory of his effeets; and if no elaim be made for them within a year, the master hecomes proprietur of tho goods, but answerable for them to the doceased's legal representatives. Bedding and furniture become the property of the master and mate; but the clothing must be brought to the deck, and there appraised and dietributed among the crew. If a master die, leaving money on board, and thie mate, beconing master, improve the money, he shaill, en allowance loing made to him fur his trouble, necount for both interest and profit. The conditions under which eeamen and apprentices are to be taken on bourl ship, and the oblligations of the master with respert to thera, are fully set forth in the article Seamen, in this work; and to it also the rendor is referred for a statement of the duty of the muster with respect to the registry of seamen, and thr contrihutions, etc., due to the corporation fur the relief of decayed aeamen, their widows, etc. For tho duties of the master as respects eustomhouse regulationa, see the articles Covarls, Freigur, Seabiex, United Stater, and Insumance, etc. a and for a further discussion of thla important subject, see the exceilent work of Lord Tenterdes, on the Lam of Shipping; Palqons On Connmercial Law; Kext's Commentaries ; Curty On Commercial Late, vol. iii.; add the articles Cuaiten-panty, Fheigut, etc.
Qualifications of Masters. Means by Which Thay Shouhl be Aecertained. - Considering the important nature of the duties which the master of a ship has to perform, it has been customary in some countries to require that all perans, previously to their being nominated to act in that capacity, should unierge an examination by oome pubilc bourd respecting their knowledge of seamanship, and their possession of the various qualifications necessary to act as masters, and that none shouid be appointed without their leing licensed by auch board or ather competent auth ,rity. We are inciined to think that this practice is consistent with sound policy. "The interposition of government in a case of incapucity, is not only alselutely just and necessary, but it is conformahle to the intghest authority. The famous French ordinance of 1681, hes the foilowing article :- Aucon ne pourra ci-npris etre requ capitaine, maftre, ou patron de navire, qu'il n'alt navigué jendant cinq ans, et n'ait été examiné publlque. ment sur le fait de ia navigution, et trouvé eaputhe par deux anciens maitres, en prósence des officiers de i'Amirauté at da Professeur de l'Hydrographie, a'il y en a dans lo lieu.' A Jike article has been inserted in the Code de Commerce ; and in 1820, the French governmeut issued
an ordin are nece his fitne cosatling didstes; A simila can not est servi suthority reposed gmods of passengel duty of that it $\mathbf{b}$ hands. of passen control ol thing of may be al 3 ship. appoint th unable to necessary not the ca to lilind th ter who is the prelin which, if $n$ erful guar being appo

sn ordinance specifying, In detall, the qualifications that are necessary before any one can obtaln a certificata of fis fitness to command a ship, either on a foreign or a coasting voyage ; the persons who are to examine candidates; and the rules to be observed In the examination. A similar aystem has been adopted In-Prussia; and wo can not entertain a decuht that it would be of the greateat service were it introdnced into this country. The anthority of the master is eo very great, and the trust reposed in him, Including not merely the ship and goods of his employers, but the lives of the crew and passengers, so very extensive, that it is the boundon duty of the public to provide, in as far an practicable, that it be not committed to ignorant or incapable hands. At present the care of the lives of handreds of passengers may be commilted without check or control of any sort, and without their knowing any thing of the matter, to any incapable blockhead who may be sble to prevail on an owner to appoint him to $s$ ship. No doubt it is for the interest of the owner to appoint the hest captain lie can find; lut he may be unable to form a correct estimate of the qualiftcations aecessary for such a sitnation; and, though this were not the case, hundreds of circumstances mny conspire to blind his judgment, and to make him aelect a master who is really unworthy. Ifence the advantage of the preliminary exuminntion by competent parties, which, if made efficient, wonid certainly afford a powerful guaranty against the chance of an unfit person being appointed."

Mastic, Mastich(Ger. Mastix ; Du. Mastik; Fr. Mastic; It. Mastice; Sp. Almastica, Almaciga; Arah. Ardh). This resinous subetance is the produce of the Pistacia Lentiscus, a native of the Levant, and particularly abundant in the island of Chios. It is obtained by making transverse incisions in the trunks and branches of the trees, whence the mastic slowly exades. Ahout 1500 cwt . are anatually exported from Chios, part of which is brought to this country, packed in chests. The best is in the form of dry, brittle, yellowish, transparent tears; it is nearly inodorous, except when heated, and then it ha an agrecable odor; chewed, it is slmost insipid, feeling, at first gritty, and ultimately soft. Its virtues are trifling.-Alnslises Materia Indica; Tromson's Dispensatory.

Mate, in a merchant ship, the deputy of the master, taking, in his absence, the cominand. There is sometimes only one, and sometimes two, three, or four mates in a merchantnum, according to her size-denominated first, recond, third, etc. mates. The law, however, recognizes oniy two descriptions of persons in a merchantman-the master and mariners; the mates being included in the latter, nnd the captain being responsitule for their proceedings. In mun-ofwar, the officers immidiately subordinate to the captsin are called lieutenants. But the master, or officer whose peculiar daty it is to take charge of the navigation of the ship, has certain mates under him, termed master's mates, sometimes selected from the midshipmen. The boatawain, ganner, carpenter, etc., have each their mates or deputies, taken from the crew. See articles Masten, Simpino, and Consuls.

The mate is the uext to the muster on bourd, and upen his desth or nbsence, the mate succeeds, virtute officii, to the care of the ship and the government and management of the crew. Ile does not cease to be mate in such cases, but has thrown upon him, enmalatively, tho duties of master. IIe is quasi master, with the same general powers and responsibilitiea, pro hac vice, and with the preservatlon of his character and privileges as mate. Ile may sue in the ndmiralty for his wages as mate, and is entitled, in that character, to be curcd, if sick, at the expense of the ship. The master, and even the consignees, may appoint a substitute in a foreigu jort, in cases of necessity. Even a supercargo, in cases of necessity, and acting with reasumable discretion, may bind the owner.

- Matohen, Luolfer. According to Dr. R. Boettgor, in Annalen der Chemie und Pharmacie, vol. xivil., p. 384, take phospherus, four parta; nitre, ten parts; fine glne, oix psrta ; red ochre, or red lead, five parts; smalt, two parta. Convert the glue with i little water by a gentle heat into a smooth jelly, put it into a slighty warm porcelain mortar to liquefy; rub the phosphorus down through this gelatine at a temperature of about $140^{\circ}$ or $150^{\circ}$ Fahr.; sdd the nitre, then the red powder, snd lastly the smalt, till the whole forms a uniform paste. To make writing-pajer matches, which burn with a bright fisme and diffuse an agreeable odor, moisten each side of the paper with tincture of benzoin, dry it, cut it Into slips, and amear ons of their ends with a little of the above paste by meane of a hair pencil. On rubbing the said end sfter it is dry against a rough ourface, the paper wili take fire, without the intervention of sulphur. To form lacifer wood matches, that act without sulphur, melt in a flat-bottomed tin pan sa much white wax as will atand one tenth of an inch deep; take a bnadle of wooden matches free from resin, rub their ends against a red-hot iron plate till the wood be alightly charred; dip them now in the melted wax for a moment, shake them well on taking them out, and finally dip them separately in the viscid paste. When dry, they will kindle readily by friction.

The Manufacture of Friction Matches.-Among articles of great demand that have become of importance, though apparently insignificant, there is nothing more worthy of notice than the friction or Incifer match. About 20 years ago chemistry abolished the tinder-bax; and the burnt rag which made the tinder went to make paper. Slowly did the invention spread. The use of the match is now eo established, that machines are invented to prepare the splints. In New York one match manufactory annually cuts up a large rgft of timber for matches. The English matches are generally equare, and thus 90,000 splints are cut in a minute. The Ainerican matches are round, and the process of shaping being more elahorate, but 4500 eplints are cut in a minute. We find that a bundle of 1800 thin aplints, each 4 inches loug, is finally converted into 3600 matches. Without being separate, each end of the hundle is first dipped luto sulphur-when dry, the eplints adhering to each other by means of the sulphur, must be purted by what is called dusting.

Mats (Du. Matten ; Fr. Nattes; Ger. Matten; It. Stuoje, Stoje; Port. Esteiras; Rus. Progoshki; Sp. Esteras), textures composed, for the most part, of flagg, reeds, the bark of trees, rushes, grase, rattans, old repes, etc. In this country mats are used for a great variety of purposes. The coarser sort are very largely employed in the packing of furniture and goods; in the stowage of corn and various other articles un board ship; in horticultural operations; in covering the fleors of churehes and other public buildings, etc. The finer eorts are principally employed in covering the fioors of private houses. In Europe, mats are principally manufuctured for eale in Russia, where their production is a prominent branch of national industry. They consist of the bark of the lime or lin-den-tree, and are known in this country by the name of bast mats. The Russian peasants manufacture this sort of material into shoes, cordage, sacks for corn, ctc., and eanploy it in an endless variety of ways. In consequence of the vast quantities of matting that are thus made use of at home and sent abroad, the demand for it is immense. It is principully produced in the government of Viatka, Kostroma, and thoso immediately contiguous; and in the montha of May nod June, the period when the luark is most easily detached from the stem, the villages in the governments in question are almost deserted, the whole population being then in the woods employed in stripping the trees. The academician Köppen, who has carefully investigated this curions anbject, estiuntes the average
anaual production of mate in European Bucoia, as follows:

| Covorament of | Plocen. |
| :---: | :---: |
| Viatke.......... | 8,003000 |
| Kostroma | 4,000,010 |
| Kasan. | 1,000,000 |
| N(lut Novgoro | 1,000,000 |
| Vologra, Tamboti, Slumbir | 2,000,000 |
| Totat | 14,000,000 |

Köppon further eatluntea that about one fourth part of thls vast quantity, or 34 millions, are exported, the rest belag consumed at home. It ia olvioua from these statementa that the unaual destruction of lindentrees must be quite enormous; and it may wall excite astonisliment that they are not already all but exhausted. But whether it be from the rapid growth of the tree, or the vast extent of the forests in which it is found, the gloomy forebodiugs of Mr. Toeke ae to ita deatruction have not hitherto been realized (View of Russia, iii., 262), and mats have not become aither scarcer or dearer. It is, howover, hardly posaible to suppose that auch shouli continue to be the case, seeing the rupid inerease of population and of the consumption of matting in most parts of the empire. But in the event of lis becoming xarcer, the inhalitanta will have no dlfficulty in finding aubstitutes; so that we agree in opinion with those who think it would be bad policy to impose any rentrictions on thia branch of industry, in the view of averting an evil which may never occur; and which, if it do occur, may be easily obviated.-See Supplemeni au Journal de I'Interieur de Petersburg, fur. 1841.

Archungel is the principal port for the shipment of mats; and it appeara that at an average of the yeare 1851 and 1852 , the export of mata from that port amounted to 610,360 pieces a year. Large quantities are ulso shipped from Petersburg, Riga, and other ports ; and most descriptions of Russian produce aent abroad are packed in mats. Various descriptiona of reed mats are extensively manufactured In Spain and Portugal; some of them being very beautifully varied. In Spuin large quantities of matting are made of the Esparto rush. Rush floor mats, and rattan table nuata of a very superior description, are brought from Cifina. They should be chosen clean, of a bright clear color, and should, when packed, be thoroughly dry. 'The inats of the Japanese are soft and elastic, serving them both for carpets and beda; they are made of a peculiar apecles of rush cultivated fur the purpose. The bags in which sugar is lmported from the Mauritlus consist of matting formed of the leavea of a tree growing in the ivland, interwoven in broad atrips. They are very atrong and durable, and may the washed and cleaned wlithout sustaining any Injury. Being Imjourted In large quantisios, thoy are aold very cheap. (1)eside the works already referred to, see Miluuns's Oriental Commerce, and the valuable little work entilled Vegetable Subatennces, Materiuls of Manufactures, pabiished by the Society for the Diffusion of Useful Knowledge, London.) It is probable that mata forined the first sort of woven fabrica produced by man; and it is worthy of remark that but fow savage tribes have been discovered which have not attained to considerable eminence in their manufacture. On the coant of Guinea and other places in the west of Africa, pieces of tine mat, about a yard long, and of a pretty uniform texture, were denominated makiutes, and formed a sort of money; the value of commodities locing rated and estimated in thein.-Mouct.Ler, I'rospectus d'un Dictionnaire de Commerce. They enjoyed this distinction, no doubt, fronu their utlity, and the groat care and labor lestowed on their preparation. There is hardly an island in the south Seas in which the nativea have not acquired great skill and dexterity in the making of mats. The flnar sorts consint, generally, of dyed reeds or grasa; and have a very brilliant appearance.

Maulmain, or Moulmoin, a soanport town of India boyond the Gangen, capital of the British province of Martaban, at the mouth of the graat River Than-lueng, havlag north the Burmese town of Martaben, on the opposite alde of the river, and weat, the island of Bulu, which serves as a natural breakwater to defend the port from the heavy seas thut would otherwise be thrown in from the wast, 100 miles S.S.E. of Rangoon, 27 millea N.N.E. of Amherst, lat. $16^{\circ}$ $80^{\prime}$ N., long. $07^{\circ} 38^{\prime} \mathrm{E}$. It wan founded $\ln 1825$, when the aite was selected by Sir A. Camphell as eliglble as weil fur a cemmerclal as a military station. It la abou* 200 feet above the level of the rivar, und extenaive and fertile plains stretch eastward from it toward the mountuins. Its port is good, and, from its oxtensive command of internal navigation, it promises to becone a conaderabie omporium. The prineipal artieles of export ure teak-timber and rice; but there is also a considerable export of tobsceo, atick-iac, betel-nut, ivory, cutoh, cacoa-nuts, etc. The imports consist principally of European cotton gooda and marine atores. The principal trade of the place hus bither:o been curried on with Caleuthn, Madras, Rangoon, and Penang; but in 1837 a direct trude was commenced whth London. Owing to the fueility with which supplies of teak-timber are obtained, ahlp-lublding is carried on very extensively. The populution in 1848 was estimated at about $\mathbf{3 5 , 0 0 0}$. Tho principal article of commerce ut Maulmain is teak-thmber, with which from 25 to 30 shlps annuully load for England. The quantlty of teak exporterl to that country from 18.10 to 1847, and its eatlmated official value, was as followa:

| Years. | No. of toms. | Priee por ton, | Valoo. |
| :---: | :---: | :---: | :---: |
| 1840.. | 4.952 | $\begin{aligned} & \mathrm{R}_{1} \\ & \mathbf{2} \end{aligned}$ | ix, ${ }^{\text {a }} 3$ |
| 1841. | 6,399 | 25 | 15,939 |

| 1343.. | 10,028 | 80 | 81,68L |
| 1844.. | 14,245 | 90 | 42,375 |
| 1845. | 13,360 | 40 | 83,42 |
| $1846 .$. | 18,793 7,578 | 45 50 | 76.989 89.855 |

Maultain in a free port, on the same footing as Singapore, etc. There is no custom-house, and no duties on aea-lorne goods: but forelgn sugar, and sugar from Siagapore and Malacea, is contraband. The coins in use are tho Company's rupec and its sublivisions, the same as are current in Calcutta. The linglish sovereign is generally worth 11 rupees, and the Spanish doliar 220 rupees per 100 dollare. The weights are the Madras visa, ecqual to 3.065 lbs a voirdujois, or, say, 38 Hos. ; In this there are 100 ticuls. The Beughi ba zaar maund of 82 lhs., is also oceasionally used. Tho measures principuily used are called baskets: they are of uncertain aize. A basket of cleaned rice is alsout 65 lbs. in weight ; of mixed about 60 lbs. ; pudily 51 los. Ship-huidding is well adupted to the jluce; sind some of the finest taak-ships In the work have been huilt here. There are several dry deeks, though not of a very efficient description, for repuiring vessols. The British government bought here, during 1847, upward of 5000 tons of teak for the royal dockyards in Engiand.

The Maulmain Alman . $c$ for 1852 contains the fullowling otatemonts: "Tb falue of tho imports hy sea into Maulmain during 1850 amounted to $22,57,983$ rupeen, und the exports te $23,32,951$ rupees ; while in the lirst 10 months of 1851 the imports inereased in value to $28,78,487$, or $\boldsymbol{£} 287,848$, and the exports to $28,79,797$ or $\mathbf{5} 287,979$. The town, which 90 years back contained only a few miserable flishing-huts, is thus shown to have a trade of nearly $\mathcal{E} 600,000$ a year, whitich ls still increasing. The vaina of the piece goods imported from Europe during 1851 anounted to $£ 61,299$. coals, £ H 408 , and Iron $\mathrm{f1849}$. Provisions were imported to the extent of $\mathbf{£ 3 4 9 6}$, and winea of tha value of $£ 492$; military stores $\mathbf{£ 1 8 5 3}$, etc. The articles of export pre-
sent ne n the value first 10 m a large a sels, of ar launched three pris (ilive of English a

Manritius. The Isle of France wan diacovered by the Portuguene, A. D. 1500, but the Dutch wore the first settlers, in 1508. The Mauritius was so eslled by the Dutch in honor of Prince Maurice ; but it was first settied by the French in 1720; and is indebted for most part of its prosperity to the akitiful management of its governor, the famous M. de le Bourdonnais. It was taken by the Engliah in 1810, and was definitiveby ceded to them in 1814. Mauritius is fertile, a considerabie part of the anfface being, however, occupied by mountains. Ita shape ls circular, being about 150 miles in circumference. The climate is healthy, but aubject to hurricanea. The principal product of the islund is sugar, which la now cultivated to the almost totui neglect of every thing else; but it also produces exceltent coffee, indigo, and cotton. The blackwood, or ebony, of the Mauritius is very abundant, and of a superior quality. Very little corn or gruin of any kind is raised in the island, moat articies of provieion leing imported. Previousily to 1825, the sugar and other urticies brought to Great Brituin from the Mau. ri. : us were charged with the ame duties as the like articias from India; but in the above-mentioned year this distinction was done awuy, and it was enacted thut all goods of the growth, produce, or manufacture of the Mlauritius should, upon impertation inte any port of the United Kingdom, be subject to the same duties and regulations as the like goods being of the growth, produce, and manufacture of the British colonies in the West Indies; and that the trade with the Mauritius siduuld be placed as nearly as possible on the same footing as that of the West India Islands. This was a great boon to the Mauritius, and the exports of augar from it have since rapidiy increased. According to Mitburn (Oriental Commerce, 3i., D68), they amounted, in 1812 , to sbout $5,000,000 \mathrm{lbs}$. In 1818 they smounted to about $8,000,000 \mathrm{lbs}$; and in 1824 to 23 ,334,553 tbs. Since 1826 nine tenths of the sugar raised in Mauritius has beeu shipped for the United Kingdom.

Sugar Trade-The recent removul of the interdicthu.. against the importation of coolies into the island of Mauritius has contributed largely to the prosperity of that colony, and nuterially augmented the sugar returns of $1856-57$ over those of preceding years. Advices from tie islund, under date of July 11, refer in glowing terms to the prosperous condition of the sugar planters, and inform us of the gratifying fact-the nore gratifying, inasmuch as the price of sugur has sensilily declined since that date-that "just as we are about to harvest the largest cropi ever made, and the removal of the interdiction to emigration from Indis at the sume time, has wonderfully improved the position of every landed proprietor, and has placed the colony in a bigh state of prosperity." In 1856 the shipments were $235,9 \mathrm{x} 8,460 \mathrm{lbs}$, smounting in value to A12,483,492, equut to $5 \cdots 26$ cents per pound. From January to May there wene sinipped $98,4400,286$ lbs., valued at $\$ 6,042,000$, or $6 \cdot 13$ cents per pound. The average price in 1856 was $\$ 526$ per 100 lbs . ; und dur. ing the first five months of the present year it ruse to $\$ 613$, showing madvance of 87 cents. The shipment of the old crop, it was believed, would be brought to a close by tife end of July, and would reach neuriy $220,000,000 \mathrm{lbs}$. , against $235,000,000 \mathrm{lbs}$. produced in 18o6. This, however, was the largest crop ever mude on the island. The next crop (1857-58) it is estimated will reach $240,000,000 \mathrm{lbs}$, or $20,000,000 \mathrm{lbs}$. more than the crop now closed. We annex a statoment
ahowing the prodaction of augar in Kauritius during the past neven years:

|  |  |  | Paunde. |
| :---: | :---: | :---: | :---: |
|  |  |  |  |
|  | 1800000,090 | 1850 | 00 |
| - | 202,000,000 | 1857 | 840,000,000 |

About one fourth of the number of milla in the island wero already, in (July) in operation, and by the firat of Auguat sugar-making would be general. Some fow parcels had reached market, and aold at bigh prices to complate a eargo to Australia. Thua, for vacnum clairced $\$ 975$ to 810 ; good and fine yoliow, 4875 to 8025 per ewt. The news from Europe has, however, before this time arrested these advancing rates, and our next advices will show a considerable decline.

With the exception of molassen, ebony, and a few other unimportant articles, sugar is almost the only article of export. The principal imports consist of provisions, particularly grain and flour ; tho supply required for the use of the isiand being almost entirely derived from the Cape of Good Hope, Madugascar, India, Bourbon, etc. Earthenware, machinery, furniture, hardware, piece goods, wine, etc., are also largely imperted. The total declared value of the exports from the United Kingdenn to the Mauritius in 1852 amounted to $\mathbf{£ 2 4 3 , 0 4 5}$. In 1851 the population of the Mauritius amounted, ineluding military and seamen, to 188,506 souls, of whom between 9000 and 10,000 were whites. The population of the Seycheites-small islands dependent on the Mauritius-amounted at the eame time to 8000 . The emancipation of the slaves was little less injurious to the Mauritius than to the sugar colonies in the West Indies. But, owing to its more convenient situstion, vast numbers of hill-coolies and other laborers from India have heen enticed away and imported; and to this the increase of population and of the exports of sugar are wholly to be ascribed.

The principal imports from the United States are beef, pork, butter, cheese, candles, lard, and tobacco. The discriminating duties in favor of British produce and manufactures limit American exports to the articles above enumerated. Ad valorem duty 10 per cent., and specific duties various: On tobacco unmanufactured, 6 cents per pound; manufactared, 8 cents per pound; segars and suuff, 24 cents per pound. All foreign nations enjoy equal commercial privileges. The ports of the Msuritius are Mahebourg, Port Lonig, and Seychelles Island.

There is some direct trade between the United States and the Mauritius, Occasionaliy a cargo of lumber arrives from California, but as yet this trade has not been profitable.

Maury, Matthew F.-Lieutenant Maury is a native of Virginia. IIe reccived an appointment as midshipman in the navy in 1825, and was ordered to tho Bramlywine, then fitting out at Wushington, to convey the illustrious Lafayette to France. He returned home in that vessel, and in the spring of 1826 again sailed in her to the Pacific, and was absent about foar years, returning in the Vincennes sloop. Passing his examination, he was again ordered to the Pa ciffe station as master of the sloop-of-war Falmouth. From the time of his entrance Into the navy he was a elose student. Ile made himself master of the Spanish tongue, by studying a course of mathematics and navigation in that language. His werk on "Navigation" he commenced in the steerage of the Vincesnes, and it was completed in the frigate Potomac, to which he was orderel as acting lieutenant, when the Fal. mouth was about to return to the United States. When again Lieutenant Maury came bome, he was regularly promoted to a lieutenancy, and was appointed astronomer to the South Sea Explering Expedition, under Commander Thomas Ap-Catesby Jones. Soon after that officer gave up the command of the expedi-
tion, Lleutonant Maury retired from it also, and was aftorwand put in charge of the dópott of charts and inutrumants which has eerved an anucleus for the national olservatory and hydrographical office of the United States, of which he now has charge. His labors in organizling the ohaervatory were great and efficient, and he was successful in it once putting it on in respectable footing. The investigations of Lieutenant Maury as to the winds and currents of the ocean, the charts which be has conatrueted, mapping out better pathe and more rapid routes acroLs the tracklers depths, and the iocelculatila benefits which he has thus bentowed upon the mercantile and marine interente of the worid, nre well known. See South. Lik. Mess., vil., 660, hi., 454 ; Hunt's Mag., xvill., 616.

Mayagües, or Mayaguan. This is the moot important port on the island of Porto Rico. It possesses large eapitul, and contains several costly and fine dwellings. Hapidly rebuilt after the great conflagration, by which it was destroyed in 1841, Maym guez has gained in prosperity; huving been before that disaster but an inconsidersble vliliage, it has now become the mont impertant city on the island. The surrounding district produces large quantities of coffee, though, since 1840, thore has been a sensible diminution in that article. For that year, the exporta monounted to 80,000 quintals, while in 1858 they fell to 43,500 quintals. The coffee of Mayagues etands in such high repute in America and Germany, that purchases are frequently made in advanse of the crop. Hence comes also the best sugar of the island, which is mostiy imported in Anierican bottoms into the United States. In 1853, there arrived 83 American vessels, of 13,272 tons, carrying freight to the value of \$223,000; and there cieared 76, of 12,080t tons, taking cargoes worth $\$ 460,018$. The molasses from this port is always of the best quality, and much sought after by American and Einglish shippers. Besides coffee, in 1853 there were exported $165 \frac{1}{3}$ hogaheads of ruin; 8,221 hogsheads of molasses ; $20,766,038$ pounds of sugar ; but only 4,463 pounds of tobacco, showing a decrease, compared with the preceding year, of over 50,000 pounds. There were, beslis. 1,000 hogsheads of rum mixed with tabasoo pepper (malagueta), a preparation constituting now a nuw und protitable branch of domeatic industry. Imports from the United States and England are generally similar to the imports into San Juan.

Mead, or Metheglin (Ger. Meht, Meth; Du. Meede, Meedrank; Fir. Hydromel; It. Idromele; Rus. Lipez), the ancient, and fur a long time, the favorite drink of the northern nations. It is a preparation of honey and water.

Meal (Ger. Mehl; Du. Meel; Fr. and It. Farine; Sp. Farinu; Rus. Molk; Iat. Farina), the edible part of wheat, oats, rye, barley, and pulse of different kinds, gronnd into a specios of coarse flour. See Coun, Floua, Wheat, and Breadetuffs.
Measures and Weights. They were invented by Phidion of Argos, 860 n.v.-Arund. Marbles. They becune general in most countries soon afterward ; and were very early known in England. Standands of weights and measnres were provided for the whole kinglom by the sheritts of London, 8 Hichard 1., A.1., 1197. Standards were agalu fixed in Ensgland, 1257. They were equalized for the United Kingdom in 1825. Measure, in legal and commer. cial seuse, denotes a certain quantity or portion of any thing bought, sold, valued, or the like. See Weignts and Mmasomes.

Meats, Preserved. The interest whici has of late attached to the subject of such meats, warrants us in bringing nuder examination the principles and practice on which this important branch of industry is based. The art itself is of inodern invention, ard differs in every respect from the old or common modes of preserving anlmal food. These, an is well known,
depend on the use of culinary salt, aaltpetre, sugar, or similiar substances, which, when in solution, do not possess the powor of absorbing oxygen gat, and therefore ont off effectually all access of alr to the meat they protect. It might be imagined thut water alone wonld nuswer this purpone; but the contrary is the case, for pare water absosbe oxygen, and is, therefore, all the less adapted for presorving ment, in proportion as it is free from saline matter, since it is than so much the nore capable of combining with sxygen gas. Thus, anow, whlch is pure water crystalised, has a powor of produoing the panary formentation when mixed with flour; and this it is able to do in connequence of the large quantity of gaseons oxygen whieh it contains. Similarly, rain water, and eapeoialiy dew, will bring on the putrefaction of animal matters much sconer than apring water; and the vulgar prejudice reepecting tho effeet of the moon's raya in accelerating the corruption of ment, is, beyond doubt, dependent upon the fact, that duriug clear oonlight nights, there ia alwaye a large deposition of dew; and this having falion in a minutely divided atate, possesses the largest amount of free oxjgen, which pure or distilled water is capable of absorbing from the otmosphere, and, therefore, has a proportionate power of decomposing-just as it aiso has of bleaching. Thus far our remarks bave been applied solely to raw or uncooked meate ; bat the practical bearing of the object which we have in hand really points to those which are more or less cooked or preserved. It is with reforence to provisions of this kind, that a parliamentary inquiry is now in progress; and we can not do better than show the great importance of such a sulject to a maritime nation, by stating, that these provisions, when sound, nre an absolate preventive of sea-scurvy-a diaeate said, on good authority, to have dentroyed more Ilfe, and to have done more damage to commerce, than all the enemios and tempests which shipping ever encountered. We neel not go fir in search of evidence to prove the fearful havoc camed by this discase ; for we are well furnished hy the history of Adiniral Anson's memorable oxpedition, to damage the interests of Spain in the Pacitic Ocean, by Intercepting the anntal treasure-ship or galleod on her return to Europe. In apite of every thing that care and experience could do, Ansou tella us that he lost, In all, fully four fifths of his people by scurvy. Of 400 men with whos the Centurion departed from England, only 200 lived to reach tho isiand of Juan Fernandez, and no more than 8 of these were capable of doing duty; and but for a supply of others at St. Helena, there would not have been strengti remaining to carry the ship to her anchorago. After describIng, in the most pathetic manner, tho dreadful sufferlags of his crew, and rejoleing at the improvement caused by the ojourn at Juan Feruandez, the writer concludes-" I therefore shall eam up the total of enr loss aince our departure from England, the better to convey some idea of our past sufferings and cur present strength. We had hnriod on boarl the centurion, since leaving St. Helena, 292 men, and had remaining un board 214. This, will, doulitiess, nipear a most extraordinary mortality ; but yet, on board the Gloucester (his other ship of war) it had been much greater: for, out of a much amaller crew than ours, they had huried the same number, and had enly 82 remaining allive. It might," continues Anson, "have lieen oxjected that, on loard the Tryal (a prevision ship), the slaughter would lave been most terrible; lut it happened otherwise, for she escaped more favorably than the rest, since uhe on/y buried 42, and has now 59 remaining." The real object of tho voyage was, however, not yet commenced ; though out of 960 men with which the three vessel left Englani, 626 ware dead before thin the.

In October; 1788, the fleet of Admiral Keppell oame into harbor, and, before the end of cocomber, had sent 3,800 alck to the hoapital iat Hanlar. In 1779, the Channel fleet undar Sir C. Mardy, ment 2,800 to the haspital, and retained more than 1000 on board for want of heapital accemmodation. Wlithin 4 mnnth during a oubsequent year, 6,004 were aent to Haslar, and Sir H. Hawkins asserts, that, within the apace of 20 years, to his own knowledge, now leas than 10,000 meu had dled of senrvy. When $t$ dmiral Geary's fleet retarned to Portemouth, after a .'O weeks' cruise in the Bay ef Blscay, $\mathbf{2 , 4 0 0}$ men were ill of the acur$v y$; and the grona nnmber of admlaslons into the host pital that year was 11,732 , of $w^{\mathfrak{b}}$ wai $\approx \approx 9$ died. Now the highat modical authoriti, in this kingdom, and alan on the continent, have ail expresaed the opinien that thls fearful discase and mortality is altogether cuused by the nae ef alt provislena; and the evilence of a host of navy aurgeons and efficere can be adduced to cerroborate the truth of thia view; therefore, not ouly notlves of humanity, but also of self-interest, imperatively demand that, wherever unsalted provisions can be used, their employment ahoulif be lnsiated oa by the volce of the entire mation. Such being the case, it becomea necesary for us to Inquire bow far the art of preserving unsalted proviaions has reached that degree of unifermity, and certainty of result, which alone can warrant their introduction iato the asvy:--Brande' Dict.

Ifeut-Risenits.-The American meat-biscuits, now coning extenalvely juto use, ure a kind of preserve difforing from moat others. The manufucture ls located chiefly at Galveston, Texas. The prairles of that country abound in cattle of good quality, which are procued at so low a price as to justlfy the manufacture on the spot, thas saving the oxpease of transporting the uaelees portion of the meat. The meatbiscuit contalns in a concentrated state and portable form all the nutriment of the mest, comhined with wheaten or othor fleur. One pound of this biscuit is said to contain the nutriment or essence of five jounde of good meat; a $22-\mathrm{gallen}$ cask can contaln the concentrated nutriment of 500 pounds of fresh meat with 70 pounds of flour. As compured with corn or flour, the neat-haiscuit is said to be lesa liable to heating or molding during long voyages, and lesa subject to the attacks of weevils ara other snimale. It may be easily preserved in all climates, and for a great length of thes; thoughi it is not pretended that it posseseses the lasting quality of well-canistered food. The United States' Army in Mexico was gupplied with these meat-biseuits ; and their use is rapidiy spreading in America. The mest-biscuita are made la the following wsy:-Good beef la selected, and boiled by steam until all the nutritive qualities are extracted. The liquor is strained, allowed te settle, and then evaporated by heat to the congistence of thick treacle; the fat is akimmed off as it dises. While the liquor ls yet hot, fleur is added to it, and both are kneaded up into a stiff dough, which may then be rolled, pressed, made into biscuits, and baked. 'The biscuits are elther kept whole or are ground to powder, and are preserved in air-tight cases. For making into soup tise powdered hiscuit is mixed with hot water, and boiled with the additien of salt and other condiments. Professor Lindley, In a lecture before the Society of Arta, expressed an opinion that the meat-blacuit " is one of the mest important anbatances which the exhibition of 1851 has lurought to our knewledge."
Meat, Prices of. Prices of Meat and Bread in Cities.-'The following table of the prices of wheatbread, beef, vesl, and mutton, in 20 cities of the world, near Nevember 15th, 1856, ls derived from the report of a society in the city of New York for the improvement of the conditlon of the poor; the quantity of
each pound avoirdupois, and the price In cents and hundredths of a $a \cdot t$, Amarican weight and money :

Mediterranean Pass. The nature of this sort of Instrument has been described by Mr. Reeves, in his Treatise on the Lavo of Shipping, as follows:-"In the treatles that have been made with the Barbary States, it has been agreed, that the subjects of the King of Great Britain should pass the seas unmolested by the cruisera of those States; und for better ascertnining what elipe and vessela belong to British subjects, it is provided that they sliall produce a pass under the hand and seal of the Lord IIigh Admiral, or the Lords Commisionera of the Admiralty. In pursuance of thes treaties, passes are made out at the Admiralty, containing a very few words, written oll parchment, with
ornamus.06 at the top, through which a acelioped indeutu.e in made; the scolloped tope are aent to Barbary $;$ and being put in possension of their cruisers, the commanders are instructed to suffer all persons to paes who have paseea that will fit those acolloped tops, The protection afforled hy these passea is auch, that no ships, which traverse the naan frequented by thene rovers, ever fall to furnish themwelves with them, whether In the trade of the East indlen, the levant, Spain, Italy; or any part of the Mediterrunean; and Pron the more particular need of them In the latter, they, no doult, obtalned the name of Ifeditermanern pusses. For the accommodation of merchants in distant parts, blaisk passea, signed ly the lorda of the Admiralty, are lodged with the governors abroad, and with the Britlsh consuls, to be granted to thnse who comply with the requlaites necessary for obtaining them. Aa this plece of security ta derived wholly from the stipulations made by he erown with a forelgn jower, the entire regulation and management of it has been under the direction of his majesty, who, with the advice of the privy councll, has prescribed the terms and conditions on which these passea shall be granted. Among ethers, are the following:-They are to be granted for none but Britiah-bullt ships, or alips male free, gavjgited with a $\mathrm{m}^{\prime}$ sr and three fourthn of the mariners IIritlsh auljects, or forelgn Protestints made denizens. Hond ls to be given ln the sum of $\mathbf{E B O O}$ if the veasel in under 100 tons, and $\ln \mathrm{E} 500$ if it is of that or more, for delivering up the pans within 12 montha, unless in the case of whips trasling from one furelgn port to another; and such passea need not be returned in less than three years. It has been found expedient, at the conclusion of war, and sometimes durlng a peace, to recall and cancel all passes thut have been issued, and to isaue others in a new form. This has leen dune for two rensons. 1st. That these useful instrumeuts, by various means, either accidental or fruadulent, came into the hands of forelgners, who, under cover of them, carried on ln security $n$ trade which otherwise would belong to British auljects, and which had been purchased by the crown, it the expense of keeplng up this sort of alliance. 2d. That the liarbary States complained that, adhering to the rale of fitting the other part of the inclenture to the passes, they were obliged to suffer shlps to pass that did not helong to llritish aulijects." We have thonglit it right to give this explanation, though, since the occupation of Algiers by the French, and the disappearance of the corsairs of the other Burbary powers, Med. Iterranean passes have fulien Into disuse.

Mediterranean Bea (t/ure Internum), an Inland sea inclosed by Asia on the enst, Africa on the sonth, and Furoper on the north, and communicates with the Atlantic by the sitrait of Cilbraltar on the weat, aituated between lat. $30^{\circ} 20^{\prime}$ and $43^{\circ}$ north, and long. $6^{\circ}$ and $37^{\circ}: 10^{\prime}$ east. W'lthin this apace is in. cluded the Tyrhennian, Jonian, and Alriatic Seas, and the Sea of the Grecian Archipelago. The Sea of Marmora, the Black Sea, and the Sea of Azuv, whleh commmibate with it by the Strait of the Dardanelles, are considered na sepurate seas. The principal rivers which tlow into the Mediterranean are the Elim, Rhone, Arnu, and the Tiler la Europe, and the Nile in Aírica. The priocipal Islands ure Slcily (which divides the Mediterranean Into an eastem and weatern portion), Cyprus, Crete, Multa, and the Ionlan Ialnnds in the east, and Sardinia, Corsica, and the Inamaric IAlanda in the west. 'The most Important gulfa are Taranto in Italy, Iepanto In Creece, Syrtis and Cabes in Barbary, in the eastern portion; and Valencia In Spain, Iyon In France, Gipioa In Italy, and Tunia in Africa, in the west. The winds of this sea are very variahle; the tides are little felt, and very irregular. Flsh is abundant in the Mediterranean, especially tunny, anchovles, plleharis, and mackerel, and the fineat coral, sponge, and anbergrls, are procured. The Med-

Iterranean was called by the Ilebrewn "the Great Bea." The I'heniclana are the first peeple known to have extended their commerce along ite cosats, tha Ireeks afterwaril dinputed it with them. After the deatruction of Carthage, the Rotnans ware sole mastere of Its shorea; In tha middle agen, Lhe Venetiana monopolized Its commeree, and at present, Eagland, by the poameasion of (ilbraltar, Malta, and the Ienian Iolanils, possesses the greatent influence on It destinies. See Gibratitan.
It Is estlmated that three simes an much water as the Meilterranean recelves from lta rivarm is evaporated from lis aurfuce. Vide article Pifatcal, (ikiинapir, A'ncyelopedia Britannien. Thia may be an ovar eatimate, but the fuct that evaporation from it in in excess of the precipitation, is made obvious by tha current whlch the Atlantic sends into it through the Straits of Gilirultar ; and the difference, we may rest assured, whether it be much or little, is carried of to modify cllmate elaewhere-to refreeh with ahowera and make frultful ame rther purts of the earth. 'The great Inland banin of Asla, in whieh are Aral andi the Cuppian Seas, In aitunted on the ronte which this hypothesin repilires these thirsty windin from nouth-east traile-wind Africa nnt Amerien to take; and so seant of vapor are theae winds when they arrive in this basin that they have no moisture to leave behind ; just as much an they pour down they take up again and carry off. We know that the volume of water returned by the rivens, the ralns and the dews, into the whule ncean, is exactly equal to the volume whilh the whole ocenn gives bsek to the atmosphere; as far an our knowledge extends, the level of ench of these $t$ wo seas in as permanent as that of the great ocean itself. Therefore, the volume of water discharged by rivera, the rains, and the dewn, into thene two seas, is exactiy equal to the volume whilch these iwo meas give back as vapor to the atmosphere.-Mauny, Phys. (irog.

Commerce of the Mediterrumean.-The United Skatea' Comat at Triente communicates to the Department of State, the following detalls as to increased steam navIgation with the southern ports of the Mediterranean: "The project of establisting steam conumunication with the Mediterranean has long been a favorite one with a reapectable class of merchanta in the AtInntic States; and, If I am not mintaken, the experiment of a line to Genoa was tried seme yeara ago, but without snccess. There ls every prospect of the accomplishment of this important objeet, umiler the Immediate patronage of the Aust no rovernment. It 1s, In fuct, proposed to constrnet thece tirxt-clasa steamships of $\$ 200$ tons, huilder's w, easurement, and 1000 herse-power, to run between Trieste and New York, making 15 trijs each way per annum, and touching at Corfu, Malta, Algiers, Cadiz, and Idshon. The vesvels wonld carry the malls, passengers, and goorls from the Fast, recelved by the Iloyd's steamers und those of the Oriental Steam Navigntion Company, and prohably those of the greater part of the citles and ports of the Mediterranenn, to the United States, nnil rice rersâ. The running thne weat, from Trieste to Nuw York, wonld be 20 days und 14 hours; and eant, from New York to Trieste, 19 Inys 5 hours, Ineluling stoppages. The nteamers would the built in New York, but anil under the Austrian flag. The originator of thls enterprise Is Mr. Loosey, the Anstrian consul-general at New York-a geatleman of great experience, who has resided for the past 12 yeara in the I'nited states. I am credibly informed, also, that the new minister of finanee, Baron de Bruck, warmly fivors the scheme. He was formerly, Indeed, a lealing merchant in Trieste, and the founder of the Austrian Lloyd's Steam Navigation Company. If the project succeeds, Its effect upon the commercial and politleal relations of the United States and southern Eumpe must be very great. While it will prove a stimnlus to exertion, hy opening new channels for the Industry of the Oid

From Tuac 1842. The e

World, it mutt necessarily inorease the demand for the precieus aud abundant raw material and manufactures of the United Staten.
"The amount of goods axported direct from Triente to th city of New York, during the yeara 1800, 1851, 1854 , and 1853 , mounted to $2,045,2821$ and the ameunt of importa during the ama years, from Now lork direct, nivelinted to $\$ 1,550,516$. The amount of importa sluring the year 1852, from the porta of Philadelphia, Boston, Navannall, Mlehmond, Ihaltimore, Mobile and New Orleuns, amounted to $1,628,700$. Hut it would be very unfair to take these figurea an any criterion of the buaineea of the future. This country had then but partiaily recovered from the financial and political ombarrassments of 1848-9, and contidence, withent which commerce necessariiy dwlndies, had not been firmily eatabliahed; while the means of intiernal crol s'unication and tranaportation were comparatively thisted. Jiven now the snccean of this steamship pruject depende, in a great meuaure, upon the completion of $t i=9$ balance of 60 milea of railway between Trieste and Vienne-the last link in the chain which connecta Trieste with the principal cities of Europe. This work is, however, in a state of forwardnesa, and will, probabiy, be finiehed in the course of a tweivemonth." See Tureste and Tonkey.

Commerce of the United States with the Ports of the Mediterranean.-The trade of the United States with the countries on the Mediterraneun and in the Levant, is very irregular, and not yet developed. The statistics which we posesaa are of some value. Mactragor gives the hest report on general commerce, and speaks, in regard to the Diediterranean trade in 1842, us follaws:
"The commerce of the United States to the ports of the Dediterranean and Adrlatic, consists chiefly in the export of cotton, sugar, dried and salt fish, whale-oil, etc., which are shipped to Trieste and cther Austrian prts. The Anerican ships take bome in exchange wines and other manufactured urticles. To Spuin, the United States export cotton and other prodinee, for which thay take wines, etc."

A few words, with some statistics, will anffice to ahow the condition of American comuerce. Since that time this commerce has increased, and in some respects received a considerable impulse, but on the whois it presenta nothing of murh greater inportance. The causes are clear: the Americans have paid, untii now, very little attention to this important trade; they are not enough acquainted with it, while their successful rivals are thoroughly conversant in its sources, chances, and necessities. English and French merchante have, so far, the control of commerce in these inportant regioos; they have ugencies and branch heuses-English, French, and Austrian steausers running in the Mediterranean regularly from port to port ; while the Americans huve not a single ageucy, and not one of their numerous stenmers, such as nuvigate the ocean, the Pacifie, and numerous rivers, are to be found in the Mediterranean and Adriatic. Notwithstanding the passiveneas of American commerce in these regiens, it is still progressive, as the following statistice will show :

The exporta and imports of the United States, in the year 18.42, were as foliows:

|  | Exports. |  |  | Imports. |
| :---: | :---: | :---: | :---: | :---: |
|  | Dumestle produce. | Forelgn produce | Total. |  |
| Gibraltar | 486,987 | 118,961 | 8582,4981 | 12,263 |

Froo Tusoany and Sardinia we have no reports of 1842. The exports from Alorocce to the United States
 to 484,000 , all of which were in foreign bottoma.

The ame in the jear 1854, was $t$

From these figures it can be seen that the commerce in question has, as it regardn soms States, greatiy increased. The most remarksble ls that of Spain, in the Meliterranean. The export to that country han augmented 13 times. Also sn Important increuse is aeen in Malta, Italy, 'Trieste, and Turkey. The comme- $\boldsymbol{3}$ of Frunce, however, on the Mediterranean, ilimitusised considerubly, also that of Sicily. Froun both these reports wo learn also, that the commerce of the United Statea in the Mediterrunsan has not been developed in such an admirable manner as with othor transatlantic countries, to which numerous mail lines and other ateamera are running. What influence these communicatlons have on trude and commerce, the cumparison between the trade of France on the Mediterranean, and of France on the Atlantic, ohowa:
Expoat to, and impozt or, the Unitro Statis in the Yata 1854, from Fuance.

The commorce in the first direction, where the stenm-line exists from Ilavre to New York, shows制6n,013,842; and the commerce between the United States and France on the Mediterranean, whero no steam communication exista, was only $\$ 4,309,532$. The difference is enormous! Maraeilles is much hebind liavre, which, by its direct ateam communication with Naw York, sttracted the greatest part of commerce. See Firance.

Let us take, now, a view of the countrisa on the Mediterrancan $\ln$ general. All depend for the expedition of their letters npon the linglish post-offices, if they do not prefer to send them viu Trieste, Ustend, and Liverpool; for in botb casea the postages are very high and expensive, and, as the letters have to pass through several different offices, the loss of time js, in loth ways, very great. These difficultiex, und wo might add nuisunces, have an influance in keeping the commerce back, and to them it is chiefly attributable that the commerce of these countries with the United States hus progressed no faster. Mr. Haker, who lived for several years as American consul in tha Mediterranean, and observed pretty closely the groat progress of commerce between these parts of the giobe, hinted to his countrymen, several times, to pay more attention to the Mediterrancan trude.
"Thousands, on both sides of the Mediterrranean," says Mr. Baker, "prefer American to other produce. Eipecially are tlour and rice highly prized. The commerce with dried and sulted fish is profitable. The ireatest part of the staves and lumber which are used on the shores of Spain, are mostly imperted from the United States. Also other produce, ouch as biscuit, different kinds of outs, sperm-oil, spermaceti candles, lard and provisions, find bere ready und good markets, The port of Malaga is much frequented by American vessels ; the same may be said of llarcelona, the great emporium of Spanish wines and brandics, where Americun import articles find gool sale. But very
fow American veaseln visit Cartagens, Allcante, and Valencia, wher American produce woukl be salable, with profit.

The cargoee which American shipe take up in those places are mostly brandien, red and white wines, silk goods, shawls, cloths, woolen goods, paper, laces, saffrom, nute, raising, and other dried fruits, ollves, ote. As to the commerce with France, only Marseilles $\mathbf{p c}$. teipates in it, and this very little, in comparioon wlth the great trade with the Unlted Staten. The advantages of Harre have already been stated. Of commercial porte, we name also Genoz, Leghorn and Messina. The old plan to connect Genoa, by a regular etoamshlp line, with Now York, bas now been taken up anew, and will soon be in readiness. This connection ls expected to give a powerful Impulse to the Italian commerce, and also to awaken greater interest on the part of the Americans. "Untll now the Italian commerce with the United States hes not been of much importanee, compared with what it would be, had it frequent and regular comtuunleation.' Of American wticles, there are sugars of Louisiana and Cuba, as, also, American gralu, highly appreciated, Imported by Genoa, and again shipped to the Lovant and other amalior ports. On the other hand, the artloles Imported from Genea are many, and in the United States in fuir demand. They consist In freah and dried frulta, ollve-oll, soap, ulk goods, damasks, velvete, linen, gloves, ribbons, llquore, prepared marble, etc. Amerlcan articles for export to Genon, are indigo, dyennoota, honey, provisions, butter, otc. Roain and pitch are bought freely In Genoa, and re-sold to other amaller ports in the Mediterranean.

The commerce of the United States with Tuseany presents Interesting features. Tuscany exported, in the year 1854, to the United States, a value of nerchundise of $\$ 1,152,71$-inueh mone than Trieste and the other Austrlan ports together. The United States expurted to Tuseany, of her own and foreign produce, not more than 48,767 . This small figure ls more remariable, as Anierican produce is In falr demand at Leghorn. For Sicily, the porta of Pelermo and Mesalna are the noont prominent. From these are exported to the United States, wines, fruits, extraets, olls, brandies, argols, tongues, sardines, prepared marble, senna, cantharides, soup, leeches, etc. The Americans export there stockfish, alted and dried meat, nugar, minc, lead, indigo, cochineal, dye woods, cotton, cocoa, coffee, flour, zobaceo, etc. The commerce of Sicily is Important. England has, however, as will be seen, the lion's part.

As MacGregor relates, the Import In Sicily was, in the year 1844, $x 744,630$; the export, $£ 1,085,026$. The whole commerce with the exterior, $£ 1,779,656$. Of thls the United States exported only $\mathbf{C 5 8}, 489$, and limported from there, $\mathbf{c} 224,988$. : In the year 1804, the United States exported to Sicily only $\mathbf{4} \mathbf{2 0 0 , 0 5 1}$ ( $\mathbf{C 5} 2,000$ ) ; and Imperted from there, $\$ 059,300$ ( $£ 191$, 860), which shows a deemuse on both alden. This decrease is m peculiar fact, if we conmider the quantity and quality of the artleles there consumed. It can only be explained by the great activity of Eugland, and the little attention paid to thie quarsor by Americans. Busied with the great commorvial projecta on the Atlantic, and culture in the Interior, they have not yet found time to phy mure attencion to this commeree, and not being much poated up in the nuarket pricen In Bicily, they ignore partly the importance of that trade.

If is now thine to act with energy. The energy will not be missed, while the communication with the Medicerranean will be facilitated and trade Ineremeed. The euminerce of the United States with Trieste and othur Austrian porta, is not matisfactory to the great wents in the trameAtlantic marketa, nor to the males of Asatrian manufactures, which are consldered of very good quality. Clothe, woolen gools, linen and allk
goode, can be had from Austria, at cheap prices and in
falr quality. Nevertheless, the falr quality. Nevertheless, the lmport of the said artleles, In 1853, wss $\% 78,064,287$. Other Austrian artleles would also find good market hers, by a regular and quiek communication.
4) As to the Austrian shlps, very fow eall Into the Atluntic. In the year 1854 only four Austrian ships came to the United States. Consldering the paskivity with which the commerce with the United Strites is reparded, it will not aurprise ns that so little is done het ween them. What has been exposted from Austria to the United Statee, during 1854, vlî Trionte, and other Austrian ports, was not more than eri41,119; in fact a great sum compared to the many good indus. trial artlelea; and its navigation, as also its ports, of which eapecially Trieute and the world-renowned Venice seem to be called to play a great part in the future cominerce of the United States. The export of the United States to Trieste is muoh larger than their import from Austria, and was, in the year 1854, not leas than $\mathcal{\&} 1,908 ; 609$.
The direct commerce of the United States with Turkey is fixed by the follnwing dats: to Turker, the United States exported, In 1854, merchandise in value of $\$ 325,198$; Importing from there $\$ 808,714$. This is a very poor trude, if we consider thie means of hoth parties. This trade is In Its first development and will soon be increased, if the Americans will take hold of it with their usual entorprise. Greece and the lonian Islands aro entirely forgoten by the Amerienns; no direct commerce is carried on from there to thie United States.

Mr. Baker says, "The commeree wlth the Mores would be of the greatest importance to the Ainericans, If thoy would only attempt and explore it. The great quantity of produce would easily procure re-cargo to American vessels. The demand for zinc, lead, ete., is permanent, also of fish; rice, flour, and other American produce, would find easy market. The same," anya Mr. Inker, "of the Ionlan Jalands, where a good trade would result."

Indirect Commerce,-As to the indirect commerce of the United States to the Mediterranesn, there are very meagre data. The total exprort of the United States in 1854, to all ports In the Nediterranean, of goods not produced In the United States, was only $\$ 953,417$. These foreign productions consiat in eoffee, ten, cocon, leather, skins, pepper, rum, dye-wools, sugar from Cuba, segare, cochineal, and honuy.

As to the American indirect import from those countrles, it ia difficult to find it out. The lists of navigutlon give only the direct trade; and at the dominations of the value of Importation from the States on the Mediterranean, no port le named from where sent.

England, whlch has the greatent tmie with the Mediterrancan ports, and which is from there extended in all directions, keeps no direct ohip coumunication froin there to the United States. Of the B50x British ships, tonnage 1,748 , wod $0_{4}$ whleh eame, in 1954 , to the United States, not more than 820 tona were from (iilsraltur ; not one aingle ton from Malta! The cause is natural. England tinds it more in lier interost to do the commercial trading with the Medite rranean snd Levantine prodace to the United States, not directly, but fron Liverpol and other ports. The advantage of this proceeding is easlly explained.

The linglish merchants receive, through Jiverpool, regular rejorts by the Collins and Cunaristeamers, of the standing of the transoAtlantic niarkets. This puts them in the way to use there all the chances offering to dispono of their rich atock of Mediterranean pruduce with ulvantuge, to the United States. The same is the case In other ports of the Lurojean continent, which foilow the aame polloy. In thia way considerahle quantlties of red snd white wines, fruits, drugs, and other jroduce of the Mediterranean, cone by ladirect commerce to America.

We ported $f$ United other art no diree alrendy 1 the rich and Asis tilene. lcan vess States. which th those pol the froily tions hav is the san Adriatic, to the ind with the ation to $t$ advantag of the Ui Africa, $V$ ssys: "I if the Am would cor undertaki hus not be are no stal there. We tsko, for example, the corinthen, which are exported from Zante and Corfu to England, and other Eurppean porta, from where they aro uent to the United States in small quantities. It th the same with ether articlea, to countries where the Americans have no direct communication. In addition to the ports already namod, wo can add, undor tho eame category, the rich islands of the Turkish domioions in Europe and Asia, vla.: Cyprua, Rhodes, Candiu, Samos, Mytilene. Even from ports regularly visited by Amerjcan vessels, goods are sent indirectly to the United States. Thie is the consequence of the isolation in which the United States are placed, in relation to those ports. In Smyrna, the large atoring place of the produce in the Levant, where merchants of all na~ tions have a counting-room, there is no American. It is the same in other ports of the Mediterranean, the Adriutic, and Levant. Thim lsolution is advantageous to the indirect intercourse of the Eaglish and French with the United States; both ere in the fortunate eituation to turn the chances of both hemispheres to thoir advantagu. Mr. Baker, in speaking of the commerce of the United States with the French dominions in Africa, viz., Algiers, Tunis, Tripoli, and Moroceo, says: "It would he very profitable for our commerce If the Anericans would engage in this branch; they would convince themselves, very soon, that such an undertaking would be very profitable. This advico hus not been followed up to this time; at least there are no atatistics that there have been any imports frum there. These are alnoat exclugivoly African, and mentioned only in general torms, without branches of commerce in these dominions."
The Americau export to Africa in general, in the year 185t, amounted to $\$ 1,801,729$; the importe to $\$ 1,386,560$; of which proportion, $\$ 47,708$ and $\$ 30,007$ belong to Madelra, Teneriffe, aide other Canarian Islands, 20,417 and 39,598 ; Cape of Good Ilope, 2099,958 and 4448,903 . There is no data for the other African territories. According to late disclosures, there are considerable numbers of vessels which leave American ports to erubark secretly in the save-trude, land them at CuF- and importa consideralile quantity of gools from Africa. Americana can buy niany kinds of Arrican produco from the great caravans of the Mecca pilgrins, which traverse Africa in its greatest extrenity to the Mediterranenn.
From the above, it will be seen that the Americans appear in the Mediterranean as well as in the Levant as far less than a mercantile power of the tirst class. And it is but too plain that thesu great and rich territories, for hundreds of years the centre of shipping and commerce of well-advied natione, are, by the Americans, very much neglectel. Englaad and France are in opposit' 3 a with steamera and manufactures on the Meditc.ranean, Alriatic, and Levant. The mail lines of Cunurd, Colling, Dremen, and IIavre, are nut suticient for our ateam commerce with Europe, and a Mediterrunear line, alone, wlil le found to answer the interesta of American commerce. And through ali this, the great project of the Pacifle Railroud and Marine Telegraph aeross tho Atiantic wiil the sooner be brought to completion. It is to to hoped that 'Trieste ann the Austrian comnercinl comunuity in genoral, will not aliow auch progressive movements to jass withent considering that tho sama winth has leen done by the small city of Brensen, can be dono by Trieste, with its powerfui reesurces. Bremen can give satisfactory proof of the importance of a stoam communication with the New World. Bremen han exprorted in 1854, not less than $\$ 14,6 \cdot 13,927$. Bremen is much ahead of Ismburg, on account of its ateam communication with New York, as itn exporta lu 1854 were only $82,322,971$. Trieste woald have double the advantage; it would have all the direet counmerce with Austria, and the indirvot oonnection with tie Mediterranean and the New World. The project is great, hut
promises well-paying results. It pan be developed by a direct, regular, and quick connoctlon with New York. It is also woll to mention, that Austria would, by these mesas, come into a more productive rolationahip with the Orient, as the commerce of Austria can look to a very proaperous future, on account of the Marine Telegraph from Sardinia to Constantinople and Alexandria, as the connection of the Mediterranoan and the Red Soa.-Nautical Magazine. For Commerce, etc., of the Mediterranean, sce Ed. Rev., vi., 478; Hunt's Mag., vi., 201; Frasea, zxvli, 377 ; Quar. Rev., 1xxv., 280; same article in Eclectic, v., 83; Living Age, v., 301.

Melbourne, the capithl of the Britlah colony of Victorla, former:; Post Philip, in Australia, occupying the south-east portlon of that continent, atretching through $9^{\circ}$ of longitude, from Cape Howe on the east to the Glenelg River on the weat. The town is situated on the north bank of the Yarra-Yarra River, about nine miles, fullowing its windings, froin its mouth, in the basin of Pert Philip, hutitude $37^{\circ} 40^{\prime} 5^{\prime \prime}$ S., long. $144^{\circ} 58^{\prime} 85^{\prime \prime} \mathbf{E}$. It was founded in 1837 , and extends along the banl:s of the river. In 1851 it had a population of 23,000; and such has been the immigration consequent on the discovery of the gold-fields, that, inclucling auburbs, it had on the 24 th of April, 1804, 71,188 Inhabitants. A cunsiderable portion, however, of thls immense population is to be regarded as migratory only, and as residing in town merely till their ultimate destination has been decidel upon. This audden incresse of population raised houso rent to an unparalieled height; ami for some considerable time a large proportion of the population was not housed, but encamped under tents. But partly through the extraomlinary stimulus which wa thua given to bullding, and partly throngh the morcantile failurea consequent to the overtrading of 1853 and 1854, there has been a very heavy fall of rents, whieh do not now (1855) exceed buif thoir mmount in 1852 . The site of the town is unfortunate ; for the river being obetructed by a bar and shallowe, it is not generally navigable for vessels of more than 60 tona burden; and it has the further disadvantage of being low, and lisble to be Hlowded by tho overflowing of the river during the wet season. It has been proposed to faclitate the trade of the town by renoving the bar at the mouth of the river, an leepening its channel : but this would be a very expensive undertakling, and one of which the succesa would be not \& little doubtful. The excavation of a ship canal from the deep water in the bay to Mellowrue has also been proposed; and it probubly woukl bo the proferable plan; but, la the mean time, a railway has been commenced, and is in progress to the truy, which, when completed, as is probably tho case, will obviato nasny of the inconveniences which are now experienced. It sooms, hovaver, not unlikely that the traie of tho town, and the grester purt, perhaps, of its population, will ultimately centre at Williamstown, a village a few miles distant, on a headland oxter ? ag into the bay, opposite to which all iarge vessels coming to Molbourne are obliged to anchor. The principal objection to Willianstown is the acareity nud bad quality of the frosh water; but this gerious defect might, perlups, be obvlated by ainking welle, or by conveying hither a supply of water from sone of the odjacent- atreams. Nothing can more strikingly illustrate the present unfavorable situation or the tawn for commerciul purposes, and the oxtraordinary state of things which was lately provalont there, than the fuot that while the ordinury charge for the freight of goods froun England ta Delbourne leads was in November, 1853, $£ 3$ 10s. a ton, it was $£ 5$ to the quays.

There are very fow goods or articlea exported from the coloay to the United States. The principal articlea have been gum, in amall quantities, a fow hides, and some bones. With the exception of goid, on which

MEL
MEL
there is a duty of $\mathbf{6 0}$ cents per ounce (2e. 6d.), none are liable to duty.

A continuous high price of wool in the English markets will afford great encouragement to the nettlers to struggle with thene two tendencios so greatly deteriorative to sur wool ; and the manufacturers of Great Britaio will have to sfford that encuurugement, or they must gradually teach themselvea to look elsewhere fur a aupply.

The above rates Inclade two remeves by the pllots.
Exemptions.-All ships belonging to her majeety, all ships oatfitting to or refitting from the lisheries, sll ships employed In the coasting trude, ail ships regalarly trading between any port of Victoria and of any of the colonies of New Sonth Wales, Van Diemen's Land, New Zealand, West and South Australia (the
master of such ship holding a certilicate from the Pilot Board that he is competent to act as pllot to snch trader), unless the services of a pllot shall have been actually received; and all ships not having actually received the services of a pllot.

The basin of port Philip, which recelves the Yarra. Yarra, and other rivers, ls a large circular bay, or inlet of the sea, whence the colony derived ite former name. It has a narrow entrance, not more than $1 \frac{1}{4}$ miles in width, partly occupled with rocks and shoals. A lighthouse has been erected near the extremity of Point Lonsdaie, near the west side of the entrance, lat. $88^{\circ}$ $16^{\prime}$ S., long. $140^{\circ} 40^{\prime}$ E., and another on Point Gelltbrand, near the head of the bay, between Williamstown and the mouth of the Yarra-Yarra River, lat. $87^{\circ}$ $52^{\prime} \mathrm{S}$., long. $144^{\circ} 55^{\prime} \mathrm{E}$. The bay is about 40 miles in dopth from south to north, and where widest ls ebout 40 miles from east to west. It is said to cover an ares of above 800 square milea, snd might accommodate all the nuvies of all the countries in the world. The whole trade of the colony, whlch la already very extensive, and is inereasing with extraordinary rapidity; ls at present carried on from thls basin. And from its advantageone situation, and its stretching so far inland, it is probable it will always contlnue to engross the largest share of the trade, though, no doubt, it will be partly, alao, carried on from other ports. Geelong, st the head of a deep bay on the west sile of the basin, has a large population, and a very considerabls trade.

Commagor or tha Unitad States wita Aubthalia, yaon Octoera 1, 1887, to July 1, 1856.

Memel, a commerclal town of east lruasin, lat. | both in depth and direction, it is always prudent, on of light-honse $55^{\circ} 43^{\prime} 7^{\prime \prime} \mathrm{N}$., long. $21^{\circ} 6^{\prime} 2^{\prime \prime}$ E. Popuiation, in 1846, 9400 . Memel is situated on the northeast side of the great bny, denominated the Currische Maf, near its junction with the llalttc. It is, consequently, the princlpal entrepot of the country traversed by the Niemen, and as sach enjoys a pretty extensive comonerce. The harbor of Memol ts large and safe; but the har at the inouth of the Currisclie liaf has seldom more than 17 feet water, and sometimes not more than 13 or 14 feet; so that ships drawing more than 16 feet water are frequently obliged to load and unload a part of their cargoen in the roads, where the anchorage is but indifferent, particularly when the wiud is north or north-west. A light-honso, originnlly 75 , but now 100 feet in helght, has heen erected on the north-cast alle of the entrance to the harbor. Tho light, which is fixed and powerful, may be distinguished in eleur weather at more than 20 miles' distance. The outer buoy lies in $\mathbf{6}$ fathoma water, ahout a mile without the light-house, which bears froin it south-east by east $\frac{\text { ? }}{}$ east. The channel thence to the harbor la marked hy white buoys on the north, and red on the month site. Three bescons to the north of the town, when lirought into a line, lead directly Into the harbor. Inamunch, howaver, as the channel is subject to frequent changes,
loth in depth and direction, it is always prudent, on
arriving at the outer buoy, to heave-to for a pilot; but this is not obligatory; and the Prussian authorities have tasued directions for ships entering without a pilot, which may be found in Nonat's Sailing Directions for the Cattegat and Baltic, p. 36. Timber forms the principal article of export; for though that of Dantzic lie consilered hetter, it is generally chenper, and almost always more aluondant, at Memel. Hiere, as at Dantzic, the best quality of all sorts of wood ar ticles is called $k$ hron, or crown, the 2d, brack, and the 3d, bracks brack. Large quantities of hemp and flax are ulso exported, as are liristles, hides, linseed (the tinest for crushing broaght to England), wax, pitelh, tar, etc. The exports of graln nre rometimes very considerable. The wheat of Lithuania is reckoned the liest. All flax anic hemp shipped from Mensel must he brucked, or assorted, by aworn aelectors. See Fiax and lismp. The limports conaist prinelpuliy of sult, herrings, coffee, sagar, apices, lye-woods, tobucco, tea, iren, cotton stuffa and yarn, cutlery, wine, ete. Merchants at Memel generally send their hilis to Konlgsberg to be eold, charging their correspondents with 1 per cent. for bank commission, postagee, etc. The navigatlon generally closes ahout the latter end of Deceniber, and npens about the milddis of Narch.

1 Mercentile Agenoy Eyntem, T. Bu-The Mercantila Agoney is a name applod to varioua housen in the leading cilles of the United States, and in Montreal and London. * The principal object of the Ageney is so apply, to annual sulascribers, information reapecting the character, capacity, and peouniary condition of persons asking credit. The valuable services it hat rendered to the domestio trade of the country, at a oheck upon our credit. systein, are achnowledged by the mercantlie community, i. Its hilutory, together with an explanation of its mede of operation, may not be without interest to the general reader and foreign merchant:

The Agency was first eatablished in 1841 in the city of Naw York, by Mr. Lewis Tappan, and was conductod by him, upen a comparativoly llmited senle, until 1846, when Mr. Benjemin Douglass became his costjutor; and assumed tha chief tianagement. 1 From thls time the business increased rapldy, and asoumed a jermanent and recognlted position among the mercantile institutions of the coontry.

Our limita will not permit is to trace, step by step, the growth of the Agency, or to dwell upon the personal aspects' of its histery: Founded upon the interests of merchants, and conditeted from the beginnints by men of ability, capacity for work, high character, and thorough knowledge of the wants of mereantile business, its progress has lieen uninterrupted. From New York it has exteniled its liranches and associate oftices to seventeen other citios, vix, : Philacielphia, Boston, Montreal, Malthore, Klchmond, Petersburg, Charieston, New Ordeaus, Pittsburgh, Cleveland, Cincinnati, Chicago, Mliwaukie, Dubuque, St. Louis, Detroit, and London, Einglend. All these brancies are under the direction of the proprictors at New York, and are governed by uniform rules. A daily lnterchange of information facilitates the answering of the ingulrles of the respective anbscribers for all parts of the country.

It is obvious that the gigantic labor of reporting the buslness men of Canada and the United States could not be performed by any ono office, not cauid the expense be borne by the merchants of any one city. It is porformed by miesnes of their syatem of branch offices, each supported by the subscriptions of the merchants, bankers, and manufacturera of the eity in which it is located. The district allotted to ench office is the country of which its city is the centre of trade. For instance, the Boaton office reports that fortion of the New England States of which it has the chief trade; the Dubuque, the greater part of Iowa; the Milwankie, Wisconsin; the Charleston, South Carulina and Georgia; while the Ohio Valley is divided between the offices at Pittshurgi, Cincinuati, and Loulsville.

Thls aubdivisiou of labor is the means of securing a minuteness and accuraoy of reports, which, to any ond unacquaiated with the machinery of the Agency, is very great. The ojcrations of a branch office do not embrace a large extent of country. They are usually limited to the 150 or 200 counties, the majority of whose traders buy thoir guons chicfly at the eity where it is established. In cach of these counties the principai of the affice securas one, two, three, or more correspondents, the number varying with the population, and the division of tie local tratie among towns. These corruspondenta are selected for their integrity, long reatdence iu the county, general acquaintance, business experience, and juigment. Their duties are to adviae the Agency promptly, by letter or celegraph, of every change affecting the standing or reaponeiblity of tradors; to notify it of sults, protests, mortgages, losses by fire, indorsements, or otherwise; to anawer ali special inquiries addressed to them by any of the associate oflices; and to rovise before each tracle seaeon, or ofemer if required, the previous reports of every trader in the county, noting any change for the better or worse. No report is considered fuil unless it embraces, in regard to each trader, his businese, the
length of tine ha has pursued it his succese or the contrary, his age, character, habla, capacity, meana, prospecta, property out of buainass, real evtate, judgments, mortgages, or other liens upon his property. The greatest care is taken in selecting the agents, who furnish the bulk of the information to the Agency. Their integrity of character, freedom from prejulice, and from any entangling connectlons with mercantilo men, which might blas them in their roports, their social position, influence, and opportunities for knowIng thoroughly the inen they are reporting, are all taken carefilly into consideration, and tho very great success and expansion of the husinoss is, we have litthe donlst, to be attributed, in a great messure, to the judgment and careful discrimination which has been exercised in this particular. Neverthelens, after all this cere in the selection of the agents, predence would seem to require some check upon them. This is done by traveling agents who are sent throagh the country, and who report tho traders upon their own resourecs, and generaliy without any knowledge of what the local agent has previously reported. Their eports are compared carefully with those of the local agent, nnd any discrepancy thoronghly investigated. I'gain, much information of a most valuable character ia derived from specinl corresponitents, as bank cashiers, insurance agents, notaries public, sherifts, and others, whose official position gives them peculine opportuulties of knowing not only the resourees and character of business nien, but also the degree of promptriess with which they meet their husiness obligations. Another source of information is that afforded by merclants themelves, who frequently make "statements" of their own affairs from their books. These are given under their own aignature, with the avowed purfore of having them used by the Agency as a basis for credtt. The lending facts conteined in such "state. ments" are of course always made matter of special investigation. Ae, for iustance, a merchant in his "statement" says he owns a farm or a number of town luts, in a certain county, worth a certainsum. The records of the county are exemined to see if any such preperty stands in inis name; the estimate he puts infon it is compared with that given by persons acquainted with the value of pronerty in that locality; and, lastly, a careful examination is mate to ascertain if any incumbrance exists against it not mentioned in the voluntary statement of the merchant. All the other facts in his statement are scrutiaized in likè manner, and it is thus sutjected to a very searching analysis. lieperts obtained with the care thus exhibited, and from such a variety of scurcea, must certainly approach sa near perfection as is practicable under any circumstances.

The records of each office are arranged according to counties. Each partnership and individual name is indexed for convenience of reference on inquiry belng mado by aubacribers. The reports coming in daily ure copied without delay in the book for tho county to which they refer, and transmitted liy mail or express to the next or central office. All unfavorable information ia promptly copied on siips, and sent simultancously to all the oflices whoae subacribers' interests are probably involved therein. Serions embarrassments, assignments, and failures, are telegrajhed. The mass of information thus contributed by the lranches to the central office passes into the hands of the chief clork, ia distributed by him to the heads of tepartmenta, by them in their turn parceled out sintong the cierks, and by these last recerded and indexed in the proper books. The records of the New York office of tho Mercantile Agency contain the aggregate knowlelge of tradere possessed by the seventecn most exiensive mercantile communitiea in North America.
A comparison of the aystem of the Mercantile Agency with that of the "Commercial Traveler," which it auperseded, is much to the advantage of the former, as regards the Item of coet as well as Information, liom
a large

a large dry-goods house wo iearn that, in old times, its expenses for travelers counted by thousands, and that it was, to a vexatious extent, in the power of clerks, who were anxious to make sales, and whose good opinion was too often won oy civilities than by responsibility. Now it holís an officient check upon its salesmen, who travel no: to choose customers, but to make collectione, and ohtsin orders.
It has been arged ac an objection to the Agency that it is secret in ita operatione, and that to the caauai observer it partakes of the nature of a syatem of espionage, seemingly at variance with that candor and love of open doaling so characteristic of our commercial usages. This objection, with the explanations herein given, will appear utterly futile. It is necessarily of a confidential, and, to a certain extent, of a eecret nature, because such communications must always be so. What merchant, ianker, or presideat of an insurance company, who asked for and received such information ns that kept by the Agency, from a business cer-
reepondent, wouid think of ueing it in any other way than as confdential, and to be kept strictly secret? What would his correapondent eay if his communications wers used as though they were not so regarded? Who wouid givo such information, however pure tie inquirer's motive might be, uniess he were assured that he could implicitly rely upon this?
The principal Mercantile s.gency eetahlished in the United Siates is that in the city of New Yo:k. Branches and associate offices are at all the following noiate: New York, Boston, Philadelphia, Baltimore, Cincinnati, Louisville, St. Louis, New Orleans, Charieston, Pitteburgh, Richmond, Chicago, Cieveland, Ohio; Detroit, Michigan ; Dubuque, Iowa; Milwaukie, Wisconsin; Montreal, Canada East; London, England.
[ It is proper to add that the editors do not entirely coincide with the writer of the above an to the merits of the Mercaatiie Agency system, but insert the articie as being valuable and reilable as to statoments and statistice.—Eds. Cyc. of Com.]

Meroantile Lav. Among the anclent Romans, trade and manafactures were accounted degrading and dishonorable employments 1 and what was done $\ln$ that way was performed by slaves. None who had been employed in trade, or whose father had been a elave, could be ohosen into the nenate; and no senator, or father of a senator, could, by law, keep a bark above a certain amall burden, In order, no douht, to prevent his engaging in commerce. The Comorists likewiee deepined trade; and at the Conncil of Melf It was aolemnily determined that none could exerclas any traffic, nor follow the profesalon of the law, with a safe conacience.

These notlons, bowever, were singular, and very different from the policy which has ever preveiled in England. According to a law of Athelatan, If any merchant made three voyages on his own account beyond the Britlah Channel, or narrow teas, he was entitled to the privilege of a Thane; and it is especislly proviled hy Magna Charta ( $c$. 30 ), that all merchante, unlesa publlely prohiblted beforehand, ahall have safe conduct to depart from, to come into, or to tarry in and go through the realm, for the exerclise of merchandise, withert any unreasonable imposts, except in tlme of war; and that if a war breake out with another countr-" $\because$. merchanta of that place shall be attached, but their person only, tlll the king is informed how our merchanta are treated in the land with which we are at war; and lf our merchante are secure, theirs shall lie so too. Upon this Montesquien remarks, with admiratlon, that the English have made the protection of forelgn merchants one of the articles of their national liberty; and also that the English know much better than sny othar people on earth how to value at the same time these three things, rellgion, liberty, and commerce. 'These, ladeed, are the common rights of mankind. They are alao laseperably connected together ; and as liberty la the life of commerce, so commerce is in Ita turn the parent of man's advantagen, moral and physical, personal, and political. Its protection and encoursgement are now, therefore, an eatablished principle of the law of nations.
Trade and commerce being thus the linmedlate offspring of antural llberty, the lex mercatoria, or the law of merchants, je less a branch of this or that ayatem of munielpal law, than the law of natlons, or thut universal law which reason teaches all men. It la, if one may so call it, an ambulatory system of civll law, not confined to any one place or locality, but attaching to the persons of men in all their commercial transnctions thruughout the world; the custoun of merchants lieing everywhere acknowledged, as their persons and property are by the law of nations everywhere protected.
Thus, not to enter here at large Into all the details of nercantile law, which will he found in other parts of this work, divers sorts of writing used among merchanta and trading people in combiercial transactiona, are sustained in our courts, after the example of other Statea, althungh not executed with all the formallties of common deeds. Missive letters, in re mercutoria, are valld, although not holograph, and commlasions from merchant to merchant, thougin not sigued before wleneases; nor do fitted accounts among merchants, In mercantile mattern, require the writer's name or witnessen. Hut of all olligations, bills if exchange, which owe their origla to merchants, are the most favored. The risks erid aceldents of trade havo also caused particular favor to be extended to persona enguged therein, who have falleu iuto bankruptey ; provislon : -rig made liy atatute for thelr entire dincharge on their surrendering their effects to their creditors. See lians of Commprca.

Morcator Gerard, one of the most celebrated geographers of his time, wan born at Rupelmonde, in 1512. He appllent himself with such induatry to geography and mati smatics that he is sall to have fre-
quently forgotten to ant and drink. Thn Emperor Charles V. had a particular eateem for bim, and the Duke de Jullers made him his cosmographer, IIe composed a chronology, some geographical tabies, and an atlas, having eagraved snd colored the napps himgelf. He died in 1094. His method of laylng down charts is atill uned, and bears the name of Mercator's Charte.
Meroator's Charts. The true Inventor of these charts is sald to have been a Mr. Wright, who made several voyages; and in his absence Mercutor pubseveral voyages; in his own name, 1556.-milamons. They are, bowever, now confldently ascrithed to Mercator's own ingenuity. In these charts the meridians and parallels of latitude cut each other at rigitt anglee, and are both represented by atraight lines, enlarging the degrees of latitude as they recede from the equator.
Mercator's Charr, or Projection, is a representation of the ephere on a plane, in which the meridians ara represented by equidistant parallel straight lines, and the parallels oí latitude also by straight lines perpendicular to the n.eridiane. 'Thl', projection, which is universally adopted for nautical charts, by reason of the faclitites whlch it affords in navigation from the circamstance that the rhumb, or sailing course between two polnta, is represented by a straight line, was invented by Gerard Mercator (his true name was Kauffman, of which Mercator la the Latin equivulent), a nntive of Rupelmonde, in Fast Flanders, horu in tho year 1512. But, though Mercator gave his nnme to the projection, it does not appear that he knew the law according to which the distunce of the parallels from the equator increases. The true principles of the conatruction were found by Edward Wright, of Caius College, Cambridge, who explained them in his treatise, entitled The Correction of certain E'rrora in Navigation, pul,hished in 1599, and are as follows: Suppose one of the meridians on the globe to be divided into minutes of a degree ; one of these, taken at any parallel of lutitude, will be to a minute of Jongitude, taken on that parallel, as the radius of the equator to the radius of the prrallel; that is, as radius to the cosine of the latitude, or as the secunt of the latitude to ralius, This proportion holds true on the amip in thla sense, that if a ininute of the equator le taken tas the unit of a scale, and that unit be considered as the radius of the talles, then the representation of a minute of latitude will be expressed by the number $\ln$ the trigonometrical talles which is the accant of that hatitude. Heuce, in the inap, while the degrees of longitude are all equal, the degrees of latitude marked on the meridian form a scale of which the distances go on Jncreasing from the equator toward the pules, each leing (uppreximately) the sum of the gecants of all the minutes of latitude in the degree. The numbers resulting from the adlition of the secants of the successive minuter, reckoned from the equator, form a seale of meridional parts, whlch is given in all books of navigation. The very remarkable property of this projection, vamely, that the divisions of the meridian are analogous to the excesses of the logarithmic tamgents of half the respective latitudes augmented ly $15^{\circ}$, ulove the logarithm of the radius, wan discovered ly bond about the year 16.5: that was first demonstrated by James (iregory, in his E.rercitutiones Mathematiore, published in 16is.Une's Dict.

Meroator's Bailing is that whech is performed by Mereator's clarts.
Merchant, a peraon who huys and sells commondities in grosh, or deals in exchanges, or one whin traflics in the way of commerce, either ly inportation or exportation. The merchunts of 1 ondon and Amsterlam were accounted the most enterprisiug and richest in the world. An sttempt was made by Queen Anne's ministry to exidude merchants from sitting in the House of Cominous, $\ln 1711$; but it failed. The Bler-

chant Adventurer's Soclety was established by the Duke of Brabant in 1296. It extended to England in Edward IIT.'d relgn, and was formed into an English corporation in 1564.-Hayds.
Laws of Merchants.-The lawe controlling merchenta and commerclal transactions are namerous, and are treated of in detall in the article Laws of Commerce. As an analysis of these laws, it may be atated, that most of the Earopean and American conntries have left uncontrolled the free action of the merchant. In Lubec every merchant is required to be a citizen. Russia has established numerous restrictions. The hody of merchants are divided into three gullds or classes, to which none but Russian subjects or denizens (i. e. naturalized foreigners) may belong. In eash guild a certaln tax is lmposed, and a determinate amount of capital is required; also, the nature and extent of the commercial operationa permitted have proportioned limitstions. Nearly every ceuntry, except Great Britain, France, and the United S'ites, prescribes the enrollment in a publle register of commerce, of the name of the merchant, the nature of his business, the name of each partner of the firm, and the dormant partners included $\ln$ the firm and company, the power conferred on any party to act per procuration, and every partlcular connected with the formation and diasolutlon of the partnershlp. In some countries these detalls must be published in the gazette and newspapers. This register is either establiahed at the tribunals of commerce or at the clvil courts. Every publicity is given to such enrollments; and any persen, by paying a small fee, may obtaln extracts from then. The parties interdicted from ongaging in trade are, with a few exceptions, only those who are laboring under a civll disqualification.
General Regulations.-'The institutions of guilds or privileged companies are of Roman origin. Traces of them still exist in London and in Scotland; but the convivial meetinge in which are expended the grants, which, in ancient times, they recelved from government, are the only evidences of periedical revival. The word "guild" was originslly applied to a seclety of merchants, as by the statutes of the guild in 1283, and by the statute of Willam, c. 35, but out of them arose all the different cecporations of craftsmen. A decree, arbitral, promulgsted in Edinburg, dated from "Halyruidhouse, the twenty-t we day of Apryl, the yeir of God, one thousand foure hundreal fourscere three years," thus expresses the union of merchants and craftsmen in the gulldry: "Toward the lang controversics for the guildrie, it is finally, with common consent, appoyntit, sgreit, and concludit, that als weil crattsmen as merchants sall be recelved and admiltted gild brether, and tho ane not to be refusit nor secludit thercfra mair the uther, they being burgesses of the burgh, als met and qualified thairfore; and that gildbrether to have liberty to use merchandice;" and by the same decree it is ordered, "Thut na manner of person be sufferit to use merchandice or occupy the hardiewark of any free craft within this burgh, or yet to exerce the liberty and priviledge of the sald burgh without he be burgess and freemnn of the same." This decree was ratifled in Parllament; and, therefore, after this period, the genes il right of the originat guilding, or soclety of merchants of the realm, was abridged so far that they could not trade in Eiinburg unless they were admitted as burgesses. The cemmercial regulations of Lubec are still founded on the same system; the merchants are divided inte nine companies and colleges, and administrators, all of which bear the stamp of antiquity. Russia, besides the forming of merchants lnto guilds, divides commerce into varlous brancles, and specifies what commercial operations Include, with some notices of commerce with patent. Frunce determines what are nets of trade with regard to the competency of tribunals of commerce. Holland, Wurtembarg, and a few
other countries, have almilar determinatlons of what is comprised in commercial operationa.

Who may be Parties to Mercantile Contracts.-It was once the dectrine of the English courts, that the lawmerchant did not apply to eny sontracts betwoen partles who were not merchants. But this view has passed away; and it has long been a well-established rule in that country as well as this, that the law merchant appllea to mercantile contracts, such as negotiable notes, bllts of lading, charter parties, policles of marine Inaurance, and the like, wheover may be the parties to them. All mercantile transactions begin and end in contracts of some kind-express or implied, executed or to be execnted; and the first element of every contract : : we existence of parties capable of contracting. Generally, all persons may bind themselves hy contract. Whoever would resist a claim or action founded on hls contract, on ground of incapacity, must make this out. See Parbon's Mercantile Lav.

Minore.-By the English law, a miner cen not con*ract commercial engagements; yet he may act as a partner, and perform other functions for beneficial parposes, without belng liable for contrscts entered into during his minority. In Scotland, a minor may become a trader; and when he holds himself out as a major, he becomes reaponsilble. In France, minors, by beling emanclpated, may engarge in trade previous to the 18th year of their age, when authorized by a registered act, either of their parents or family council, or by civil authorities. They are allowed, in this case, to pledge or mertgage their estatea. Similar principles are adopted in Spain, Portugal, Prussia, etc., etc.
The age at which minority ceasea, is: In England, Scotiand, British Colenies, United States, Hungary, Roman States, Frence, Normandy, Two Sicilies, etc., 21 years ; in Mauritius, Britieh Guiane, 24 years; in Cape of Good Hope, Ceylon, Holland, 25 years ; in Gurnsey, Jersey (Ceutume of Normsndy), 20 yeare.

Married Females.-In London, a married female may engage in trade as a feme sole, but she must trade within the city, and on her account; she is, therefore, liable to be a bankrupt. In England she may engage in trade when authorized by her husbaud, but she is not responsible. Her endorsement, acceptance, negotiation of biils of exchange, are null, and no aetion can be malntained againet her. The husband is linble for the debts contracted by her in a separate trade. In Scotland, parties may settle, by marriage contract, their several rights and interests. A married female can not act by or for herself.
In France, Spain, Portugal, Prussia, and Sardinin, the authority of the husband is necessary fer her engaging in trade. Her property by dowry, and that held in common, are responsible for the obligatiens she centracts with reference to trade. The autherity of the husband ought to be made public, as also the revocution of the same. In America, the common law of England is generally retsined, with some exception, in Pennsylvaniu, Lonislana, and Seuth Carolina. In Lower Canada and St. Lucia, same as the Coutume of Paris; and in the Nauritius it is regulated by the clvil code. In Malta, a married woman may engage in trade with the censent of her husband, but she can not be imprisened for debt. In Lubec, married females must recelve the authority of the Senate for opening a shop. In Wallachia, a married female can not engage in trade without a marriage contract.
Aliens.-In Great Britain, United States and America generally, allens enjoy the eame privileges as natives with regard to trade. In France they enjoy the grentest llberty, and tho sume rights as the natives. In lussin anll Sweden, a variety of provisions are enacted with regard to aliens, hut a restriction prevails in all. In Spain and Persugal, aliens not naturalized may engage in trade, but they are estallished acoording to existing treatises with their respective govern-
menta. In Lubeo, the restrictions on foreigners are extended even to dony them the power of entablishing themselves as residente, withont the anthority of the tribunal of judicial pollice. Soe Lisvi's Com. Lauc.

Moroury, or Quichallver (Fr. Vif argent; Ger. Quicksilber; It. A rgento vivo; Sp. Azogue; Rus. Rtut; Lat. Ifydrargyrum ; Arab. Zibalh; Hind. Parah ; Suns. Pirada). Thie metal was known in the remotest ages, and eeoma to have been employed by the ancients in gilding, and soparating gold from other bodies, just as it is by the moderns. Its color is white, and similar to that of sllver; hence the names of hydrargyrum, argentum vivum, quicksilper, by which it has been known in all ages. It has no taste or amell. It possesses a good ileal of brilliancy; and when its aurface is not tarnished, it makes a very good mirror. Specifio gravity $13 \cdot 568$. It diffors from ald other metals in being a)wayn tuid, unless when subject to a degree of cold equal to $-39^{\circ}$, when it becomes solid. The congelation of mercury was first obsorved in 1759.-Thomson's Chemistry. Mercury is found in various parts of the world. Among the principal mines are those of Almaden, near Cordova, in Spain; Idria, in Carniola ; Wuifstain and Morsticld, in the Palatinate; Guancavelica, in Peru, ote. Most of the ores of mercury are readily distinguished from those of any other metal : in the first variety, glolules of the metal are seen attached to or just etarting on the aurface, which is at once a sufficient criterion, mercury being unlike every other metal; in the second, by the fine white color, and the action of the blow-pipe, which eublimes the mercury and leavea the silver behind; the third, by its beautiful deep red tint, varying from cochineal to scarlet red, excepting in those termed bepatio cinnatara, which are generally of a lead gray; the fourth, by its gray color, its partial solubility in water, and its completa volatilization by heat, emitting at the same time un arsenical odor. Before the blowpipe, theac varieties burn with a blue flame and sulphurous odor, lesving more or lese residue behind them, and which may consist of earthy matter, as silex and alumina, together with the oxyds of iron and cop-per.-Joyce's Chem. Min.

Mercury is often adulterated by the admixture of lead, bismuth, zinc, and tin. When the metal quickly loses its lustre, is covered with a film, or is lesin fiuid and mobile than usual, or does not readily divide into round globules, there ie reason to suspect its purity. Our supplies of mercury are derived almost wholly from Spain. The imports nsually amount to from $2,000,000$ to $3,000,000 \mathrm{Ib}$., of which about $300,000 \mathrm{lbs}$. are retained for home consumption, the surplus being exported to South America, France, the East Indies, etc. The oxports of quicksilver from Spain in 1848 amounted to 48,868 quintals, of which nearly 40,000 quintals were furnighed by the mines of Almaden. The province of Idria, in Austria, has also some rather productive quicksilver mines. And the produce of this metal in California, and other parts of in South Anerica, is said to be already considerable, and to the increasing. There are two sulphurets of mercury; the black or ethiops mineral, and the red or cianabar. When mercury and andphur are triturated together in a mortar, the former gradually dissppeara, and tio whole assumes the form of a black powder, denominated ethiops mineral. If this powder le heated redhot, it sublimes ; and on a projer vessel being piaced to receive it, a catra is obtained, of a fine redi color, which is calied cinnabar. This cake, when reduced to jow der, is well known in commerce iny the name of vermilion. Cirnabar may be prepared in various other ways. Culamel, or protochloride of mercury (mercurius dulcis) is the most useful of all the preparations obtained from it. It is in the form of a duli white, semitrasoparent mass, baving a specific gravity of $7 \cdot 176$, It in more generally employed, and with better effect, than ajmost any other remedy in the whole range of
materia medics. Besides its uses in medicine, meroury is extensively employed in the amnlgamation of the noble mutals, in water-gilding, the making of verinilion, the elivering of looking-glasses, the making of barometers and thermometars, etc. Fur the imports of mercury into the United States, see Quicksilver,
Meridian, in geography, a great cirule supposed to be drawn through any part of the surface of the earth and the two poies, and to which the sun in alway's perpendicular at noon. In astronomy, this circle is supposed to be in the heavens, and exactly perpendicnlar to the terrestrial ome.

Meridional Diatance, in navigation, is tho same with departure, or easting and wosting, being the difference of longitude between the meridian under which the ship now is, and any other meridian which she was under befora. Meridional parts, miles, or minutes, in navigation, are the parta by which the meridians in a Mercator's chart increase as the parallels of hatitnde decrease.

Merilian, Firat. The meridian from which loagitudea are reckoned. The choice of the first meridjan is cutirely arbitrary; and most nations recken the longitudes from thoir capital, or meridian passing through their principal observatorios. Thus, in English works, the longitude is reckoned from Greenwich; in French, from Paris; in Rusaian, from St. 1'etershurg, etc. Ptolemy emplayed the Cauary Isiands, the French formerly reckoned frum Ferro, und the Dutch from the Peuk of Teneriffe. Murcator chose the Island Dei Corvo. See Longituuns.
Meridian Line. A line traced on the surface of the earth, zoinciding with the intersection of the meridian of the place with the eensible horizon.

Mferidian of a Globe, or the Brass Sferidion, is a graduated circular ring, within which tho globe is sus. pended and revulves, and by means of which it is cunnected with the frame bearing the horizontai scale, Meridian lines arealso tracel on the glohe itself, ustually at $15^{\circ}$ distance, or a difference of longitude corresponding to an hoor of tinse. It is probaibie that these, with the parallels of latitude, suggested to Descartes the idea of cu-ordinates, which he upplied so successfulty. to connect algehra with geometry:

Merino Gheep. A. breed of sheep till lately peculiar to Spain, but now reared in Saxony, Engiand, und more particularly in Australia, chiefly for the superior fineness of thair wool. The word merizo signifies overseer of pasture lands, and is applied to this breed of sheep, because In Spain they are kept in immense flocke, under a syatein of shepherds, with a chief as a bead, and with a general right of pisturage all over the kingdom. The best flocks of Spanish merinos are found in Leon and Castile: of the Saxou variety, at Stolfen and Rochaberg; hat merinos aro to be found in North America, the Cape of Good iIope, and, above all, in New South Wales, which jromises to be one of the principul wool-growing countries in the wurld. See Wool.
Mermchaum (Ger.; Eng. sca-froth; lir. bicume de Mer Magnésie carbonatie silicif eve), is a white minerai, of a nomewhat earthy appearance, always soft, but dry to the touch, and adhering to the tongue. Specific gravity $2 \cdot 1$ to $3 \cdot 4$; affords water by calcination; fuses with dilliculty at the blow-pipe into a white enamel, and is acted upon by acids. It cousists, aceorling to Kiuproth, of silica, $41 \%$; magnesia, $1 \times \cdot \underline{5}$; water and carbonic acid, 39. Other analysts give silica 50 , magresia, 25, water 25. It occurs in vains of kidueyshaped nodules, among rocks of sorpentino, at ligribos, in the Isiand of Negropont, Eski-Schehir, in Anatolia, Brusea, at the foot of Mount Olympus, at Buadissero, in P'iedusont, in the serpentine veins of Cun. wali, etc. When first dug np, it is soft and greasy, nind lathers like sonp; and is on that account used by the Tartars in wasining their linen. The well known Turkey tobaccopipos ars made from it, by a process analogous to that for making pottery-ware. The bowis of the pipes,
whe soak
when Imported Into Germany, are prepared for sale by goaking them first in tallow, then in wax, and fivally by polishing them with shave-grass.

Measina, Zancto and Messana, a city and sea-port of Sicily capital of a province on the Strait of Messina, elght milee north-west from Reggio. Jatitude of light-house $88^{\circ} 11^{\prime} 10^{\prime \prime}$ N., long. $15^{\circ} 84^{\prime} 7^{\prime \prime}$ E. Popnlation 83,772. It is built on the west side of a noble harbor, inclosed by old walls; has wide, handsome streets, paved with lavs, and lined with white stone houses. The port, defended by several fortifications, is formed by a long curved tongue of land, projecting north-east from the main lend, snd then bending westward in the form of a sickle, whence its ancient Greek name. It is about four milea in circumference, has deep water throughout, and large vessels can load and nnioad close to this quays. The trade is considerable. The exports comprias oranges and lemons, silk, oliveoil, wine and spirits, inseed, salt, fish, etc. The imports conslst of colonial produce, cotton and woolen fubries, hardware, and other manufactured goods: It Las an active tunny and other fisheries, and manufactures of damaske and astins. Population of the province in 1851, 349,484. The Struit of Messina (Fero di Ifessina), separates Sicily from South Itsly, and unites two basins of the Mediterranean. Length, north to south, 22 miles ; breadth, 10 miles to $2 \frac{1}{2}$ miles at its north extremity, between the Faro Tower, Sicily, and the Rock of Scylla. No bettom has been reached in it with 200 fathoms of line. On its shores are the cities of Reggio and Messina, opposite which latter is the whirlpool of Charybdis.
A treaty of reciprocity between the United States and the Two Sicilies was concluded on the Ist of December, 1845 , and ratified on the Ist of Jnne, 1846. The terms of the treaty are fuithfully adhered to, inasmach as ti:e citizens of the United Stntes are Irented in the asme manner as the subjects of the Two Sicilies. The commercial intercourse of the United States is dependent solely on the regulations of the mother country: the existing regulationa are neither tempomary nor fixed to a definite period, bnt permanent. There are no privileges permitted to the commerce of other nations which are denied to the United States. There are restrictions imposed on commerce of others which have not treaties of commerce with the Sicilian government, as to he seen in the custom-horise regulations. All goods imported hy privileged vessels have a per centage nllowed of 10 per cent. on the import duty, and the vessels themselves enjoy alt the privileges and exemptions of national veasels, except the cossting tade. The few articles shipped to the United States, on which an export duty is paid, are brimstone, oil, and linen rags ; if shipped hy American or Neapolitan vessels to the United Statea they enjoy a drawhack of 10 per cent. on the export duty. The port charges consist of the tonnage duty and some small chargea in the police, the custom-hons3, and the health-office. The tonnage duty is 8 Siciilan grains, or 4 Neapolitan bajocs per ton, which is equal to $3 \frac{9}{4}$ American cents. The amall charges amonnt to nearly the same, consequently the whole port charges are from 71 to 8 cents, United States' currency, per ton. Pliotage is 85 for a vessel of any size. The transshipment of goods in veasels belonging to the United States is not permitted for another port in the kingdom of the Two Sicilies, although it is allowed for foreign ports without any privilege or restriction. United States' vessels may complete their cargoes in one or more ports of this kingdom, or on the Islan.? of Sicily, without being subject to pay the tonnage duty more than once. The moneys, weights, and measures known and in common use at the different ports are not the same as those established by the supreme law of the mother country; and they are even at variance in the ports of Nessina, Catanis, and Syracuse,-Com. Rel. U. \&., 1856-7.

Motalliquen, a kind of Anstrian stock, so called because the intereat is paid in the precions metals, and not, like the interest of other stocks, in paper money. The name was afterward used in Russia and other countries, for stocks of a similar kind.-F. A.

Mexico. Discovered in A. D. 15I8. It was conquered by the Spanisrle under Cortez, whose name is infanous on account of his cruelties to the vanquished, A. D. 1521. The mint of Mexico, the richest in the world, was begun in 1585. Thls country, like other States In the New World, has recovered its independence. Iturbide made emperor, May, 1822. Mexican constitution proclaimed by the president, Vittoria, Octaber, 1823. Iturbide shot, July 19, 1824. Treaty of commetce with Grest Britain ratified, April, 1825. Titles suppressed, May, 1826. The expulsion of the Spsnisrds decreed, March, 1829. Spanish expedition againet Mexico surrendered, September 28, 1829. Mexicsn revolution; the president Guerrero deposed, December 32, 1829. The iudependence of Mexico, previously recognized by the great Earopean powers, also recognized by the Emperor of Brszil, June, 1890. Civil war between Bustamente and Santa Anna, 1832. Santa Anna elected president, March, 1884. Declaration of war against France, November 80, 1838. Castle of San Juan de Ulloa taken by the French, November, 27, 1838. This war terminated March 9, 1839. Civil war, with change of leaders at varions times. Santa Anns displaced Bustamente again, October 6, 1841. Insurrection of General Paredes against Sants Anna, November 5,1844 ; succoeds without bloodshed, and Herrera made president, December, 1844. Paredes overturns Herrera, December, 1845. War wlth the United Ststes, 1846; Mexicans defeated st Palo Alto, May 8,1846, and subeequently st Matamoras. Santa Fo captured, August 28, and Monterey September 24, 1846. Mexican Congress authorized their government to raise $\$ 15,000,000$ for the war against the United States, upon the mortgage or sale of church property, January 8, 1847. Battle of Buens Vista, February 22, 1847. Vera Craz surrendered to General Scott, March 29, 1847. Battle of Cerro Gordo, April 18. General Paredes Isnded at Vera Cruz in diagnise, Augnst 14, 1847. Battles of Contreras and Churubisco, August 20, 1847; of Chepultepec, September 12. Surrender of City of Mexico to American General Scott, September 14, 1847. Treaty of peace with the United States ratifled st Queretaro, May 80, 1848. Mexico evacuated by the American troops, June 12. Paredes excites a revolt at at Guanaxuato, June 15. Herrera becomes president, July 6. Bustamente defeats Paredes, July 18. Vera Cruz surrendered by the United Stutes, August 1. Signor de la Roas first Mexican minister to the United States after the war, presented his credentials, December 2, 1848. See Mayer's Mexico ; Poinsett's Notes on Meaico; De Bow's Rev., ii., 27, 165 (J. R. Poinserti), v., 401 ; North Am. Rev., xlifi., 226 (Judge Bullaqd), xx., 77 (J. Spanks) ; Hunt's Mag., X., 118 (B. Mayer), xv., 250 , x vi., 455.

The territory constituting the republic of Mexico has an nren of $855,964 \cdot 49$ square miles, and forms, in its political divisions, 21 Ststes, a Federal District, and three Territories. The population has somewhat angmented since the time of its independence, and the census (Tejada's) of 1850 states its position and numbers as follows:-No two authorities agree as to the area and population of Mexico.

| Arua in 1821. | Ceded to U. S. by trealy of 1848. | Aren in 1859.* | Papulatlon la |
| :---: | :---: | :---: | :---: |
| Sq. leaguea, 216,012-27 | sq. leagues. $109,944 \cdot 80$ | sq. lenguos. 106, $067 \cdot 47$ | 7,650,910 |

* By the treaty of Dec. 80,1858 , defintag more accurately the boundary between Moxtco and the United States, add. tronal territory was ceded to the tatter, for the consideration of $\$ 10,000,000$.

More recent returns would indicate greater increase of the white than other classes of population;
but it ia probably explained by the faet that certain literary acquirements define color, and that aucceanful efforts have been made to sdivance the commen education In many of the Statea. A census atated to have been taken in 1854, makea some very elight aiterations in the preceding table. It raisea the population to 7,853,894.

Along the eastern declivity of the Cordiliers of the Andes, from 8000 to 4000 feet above the level of the sea, grow the coffee and tobacce, both of unusual excellence; but the coffee la heavily burdened with the internal taxes of the States, and the salo of tobacco ls a monopoly of the government; so that, with these restrictlons upon them, their caltivation languishes. From this elevation to the sea le the country of cane, of the prodnct of which little is at present exported. Cochineal, whleh has greatiy diminished in quantity within the past few years, has become of tittle inportance. Wheat, the growth of the table-lands, is equal to the beat in the world, and, when not absolutely forbidden, a heavy duty reata upon the imported article, which, nnless in timea of scarcity, ls equal to a prohlbition. The lunds of the people of the hot and temperate cllmates are chiefly taxed with this great difference; and; in consequence, the flour is brought to them, often a distance of 200 miles, on mule-back, Instead of being received at a fair and cheaper rate from abroad, by the sea. Thia weight fails heavily upon the State of Vera Crux, and exiata for the benefit of the proprietors of the wheat-fields, principally of Puebla; but force and wealth prove ever to ablde with the latter State, in every attempt to obtain relief. Nor do the burden and vexation stop here. Notwithstanding the exemption seemingly glven to the imported article from other than the federal duties, the owner has often to pay othor sume at the ports of entry, in the nature of municipal duties, and at every remove from State to State.

Maize, although indigenous to the table-iands, and growing in every climate of the republic, is rareiy to be found at a low price anywhere; and this, not from any falling of industry or a want of knowledge in its cultivation, but from droughta that continue, at times, for yeara, and sometimes until districts are haif depopulated. Even in the fertile valiey of Mexico, about the capital itself, corn usually beara a price of about 22 the bushel. The cetton, wherever it has been attompted to be raised, has been materisily and discouragingly affected by lnsects; and the article is yearly the subject of specisi Hicenses to individuals, to be introduced at Vera Crua at rates lower than those denignated by the tariff, to supply the calla of cotton manufacteries. The vine and the olive have been attempted to le cultivated since the revolt from Spain, but with poor, or only partial success. The price of the maruey, both in its natural state as pulque, and as the distilled ilquor made from it, mesoal, is an important item In the economy of considerable territories, but of no consideration in commerce. The pith of some varicties of the plant, baked like a potato, is, in many places, the food for nearly the year round of the haif-wlid tribes of the cierras; and the spirituous extract is the inebristing draught that keeps a large portion of the population about the citles and towns where it can be raised or bought, in a stato of wretchedness and physical deatitution.

The principal manufactures of Mexlco are augar and rum, aloes, wine, and brandy, eurthen and stone ware, glass, paper, and tiasues of cotton, wool, and silk. M. Lerdo de Tejada eatimates the entire value of the manufactures of all kinds in Mexico, annually, at $\$ 80,000,000$ to $\$ 90,000,000$.

The production of gold and sllver In the repullic has arrived at a atate of great prosperity ; but the inadequate eupply of quicksiliver is feit as a considerable obetacle to the still greater development of the mineral wealth of Mexico.

Manufactures.-The prinelpal products of Mexican Industry are brandy, and augar made from cane, mes. cal, made from the juice of the maguey, oil, wine, and brandy made from grapes, earthen and glass wares, paper pad apun and woven cotton, silk and woolen. Sugar is made in milla on all the estates where the cane in cultivated, and which are found chlefly in the States of Vera Cruz, Tabasco, Yucatan, Mexico, Guerrero, MJchoacan and Guadalajara ; and brundy by stllia Il most of them. Although the ancient aud linperfect syatem is generaliy pursued, aome improvements have begun to be introduced, of which miny be alted the apparatus lately put up on the hacionda of La Juga, near Tepic, that of San Carlos, In the Cafieda of Cuautla, and in Silva, four leagues from San Juan Bantista de Tabasco, for augar-making and distiling brandy. For the making of oil there are already in the capital 49 milla, besides those in Tacubaya, Toinca and Paebla. Not only oil is made In them from rlives, which nearly supplles the consumption, but from ajonjote, linseed, rape-seed, colwort, higuerola, almonils, cacahuate, small nuta, and tlnally from calveo' and plge' feet, otc., to oil wheels and machinery With respect to grape-wlae and brandy, althongh there were vineyards in sevoral States, they are manufactured only in those of Guanajuato, Couhuila, Lower Califurnia, Sonora, and Chihuahua, from the last of which are annually made more than 600 barrels of brandy, 300 of wine, and 200 tierces of ralsins. For the manufacture of earthen vessels of all kinds there are estallishments in the republic, where they ars made with much ekill, the best in Mexico, Guanajuato, and Gus. dalajara, In fine pottery, great improvements have been recently made in Puebia, where the business has been carried on from very romote times, in Salumanca, in the state of Guanajuato, and lately in the capitaj a manufactory excela all the reat. There ure four establishments for plain gluss in the capital, and the Statea of Mexico and Puebia, the product of which exceeds the consumption. There are eight paper mills in the Federal Diatrict, and the States of Mexico, Puebla und Jalisco, which not only supply the demand for the press, but for other purposes, particularly writingpaper equal to that of other countries. The scarcity of linen rags requires 2nost of the paper to be made of cotton, though some is made of linen, and also of the filaments of the maguey. Although many liand. wheel looms are usud in making cetton fabrics, is rebozoe, mantas and other ordinary articles, there are 62 large establishments moved by machinery, in the Federal District, and the States of Coahuda, Duratuge, Jalisco, Puebla, Mexice, Queretaro, and Vera Cruz, Although some pretty fine linens are ms le in them, they are but few, the chief part being hilazas and mantas, which in 1845 amounted to $3,000,000$ pounds of the hilazas and $1,000,000$ pieces of the latter. The manufactory of rebozos in the city of Zamora in the State of Morelis, is worthy of particular nutice. For wooien fabrics, besides the numerous shojs in which are manufactured orlinary cloths and various cemmen articles, there are seeu large establiahments in the district sud the States of Mexico, Queretaro, Zacatecas and the territory of Hexcala, in which are mide cloths, cassimeres, carpets, baize, etc., which compete with those imported, both in quality and in price. In spinaing and wheding silk, more than 60 hand machines are in the capital, I'uebia and Guadausjara, and the producta are preferred to the foreigu. In the capital is a machine by horso-power, on the French plan, which can apin above 100 lbs , a day. About 40,000 lbs. are ostimated to he epun In Dexico annually, The only woven sllk yet made are some rebozos and bands. All kinds of fancy trimmings are maces in Mexlco, as buttons, cords, bralds, and many ornsments of cotton, wool, and silk; and the best factery is that of the Hopicio for the poor in the capitsi, where they are as well made as in Europe. siliver thread of all kivda are made, and buglen, span-1 gles, galloon, cords and beita of allver and gold, and belis of silver and copper. Oll-clotha are made, of qualitiea and patterns equal to foreign. Many other minor articles are also manufuctured, to a conaidarabie smount annually. An eatablishment for etearine candles has been commenced, nnder an excluaive priviiegr. Acoording to the eatimates of Senor Quiros in 1817, this branch of producta amounted to $\$ 16,011,818$; they are now, probably, not lesa than $\$ 80,000,000$ or $\$ 00,000,000$.
Mineral Reaources of Mexico.-In a period of 27 years, from 1825 to 1851 , both Inclusive, the average value of the precious metala annually oxported was $89,481,042$, as appears from a recent work of Miguel Lerdo de Tejada, "Comercio de México dea de la Conquista husta hoy," which gives the following table of the smounts legally exported in coin and otherwise, duriug the period derignated:

It is believed that immense quantities of sulphur, sufficient, it is stated, to aupply the manufacturing wants of the whole worid, ars to be found in the Stute of Puetbla. A lato Mexican paper says, in reference to these sulphur-beds: "The volcano of Popocatapetl is no uncertain or chance enterprise. It possesses a real and certain treasure, and that treasure is the inexhsustible amount of pure sulphur whlch ls springing up every day In infinite alundance from its bowels." The Siglo nswspaper, published in Mexico, says: "The United States consume annually, in manufactures, sulphuric acid to the amount of the enormous sum of $\$ 18,000,000$ to $\$ 22,000,000$; and, perhaps, it would not be out of the way to estimate the inports of suiphur luto Great Britain at nearly the same amount. In these two countries alone, we shouid fitd a market for over $\$ 30,000,000$ worth annualiy. The price of sulphur la now at about $\$ 50$ per ton, in the Lingish and American marketa, for the article brought from Vesavius and the sulphur-beds of Italy. The articie from Popocatapetl would, of course, command a higher price, from Its superiority. * * * The sapply in Vesuvius is limlted, while that of Popocatapeti would find little diminution by the labor of a century." There seems to lie no doubt of the existence of incaleulable quantities of pure sulphur in the vicinity of this volcano. From observatious actually made, and ostimatea formsd on the spot, by scientifie officers, it is believed that the sul, inur thrown up and hardened may be set down at miliions of nitlions of arrobas. The government of Mexico has already given attention to this subject. The stipulations hy which commercial relations between the United States and the republic of Mexico are regulated are found in tise treaty of April 5, 1831, and that of May 30, 1848; the latter known as the treaty of Guadalupe Hidalgo.

Article 8d of the latter treaty provides that all the oustom-housea :hen In possesaion of officers of the United States abonld be Immediatoly restored to the Mexican authoritles, tegether with all bonds and evidencea of debt for duties on Imports and export not fallen due; and further, that all duties collected at such custom-houses by the United States' officers, from and after the ratification of the treaty, shall, after doducting the cost of collection, be delivered over to the Mexican government, at the city of Mexico, within three months after the exchange of retitications.
Articies 6 and 7 relate to the navigation of the Gulf of Callfornia, the livers Colorudo and Rio Bravo dei Norte (annulled by 4th article of the trasty of December 80,1853 , ratified and exchanged 80 th Juno, 1854). Article 17 revives treaty of 1831 for 8 years, with the usual stipnatation of 12 montha' notice by either party desirous of terminating tha same. From the treaty of 1881 the "additional article" in excepted, and also auch stipulations as are Incompatithe with the treaty of 1848 . Artlcle 20 continues ln furee, for 60 daye after the ratilication of the treaty, the tariff eatablished by the United Statee at porta and places occupled by their forces. Article 21 provides for the appointment of commisaieners or arbitrators to settie any disagreements which may hereafter arise between the two governmenta concerning ths political or commercial relations of the two countriea. Articie 22 preacribes rules and proceedings to fa followed, should a war unhappily break out bet ween the two republics, and covenants ppotection, atc., for the citizens of each residing ln the other; and also provides that this article shall not be annulled under the pretense that war dissolves all treaties, or under any other pretense whatever.

The treaty of 1831 , revived by the 17 th articie of the treaty of 1848 , secures to the citizens of ench country, In the territory of the other, equal footing with the citizens and subjects of all forelgn nations, and provides that neither country shall grant any particular fuvor to other nations in reapect of commerce and navigation, that shail not immediately become common te the other party; no higher or other duties, limposts, or fees whatsoever, to be paid by the citlzens or vessels of eitber country in the ports of the other, than are, or may be, paid by the citizens or vessels of the most fuvored nation; all merchandise, the produce, growth, or manufacture of either country, imported into the other, to be subject to no higher or other duties than similar importations from any other foreign country; no export duties or prohilitions to be prescribed by either country, that shali not equaliy apply to all other foreign nations; the vessels of both countriss, in the ports of either, to be placed on the footing of national vessels, as respects tonnage duties, light or harbor dues, pilotage, saivage in case of damage or shipwreck, or any other local charges, the coasting trade being reserved by each of the high contracting parties to lts own vessels, respectively; the duties on limports and exports of riticles, the growth, produce, or mar ifacture of either country, to or from the ports of we other, to be the same, whether such importations or exportations tuke place in vessels of the United States or of Mexico; all merchants, captains, commanders of vessels, and other citizens of either country, to have full liberty to manage, themsalves, their own affairs, or choose their own brokers, factors, agents, or iuterpreters in the ports and territories of the other. The fourth section of the 3-th article saves from the operation of this treaty all furmer or existing tresties with other sovereign States or powers.

Measu'es of Weight.-The largest measure for brandy, wine, and other liquors, is the jurva, which contaius 18 cuartilios, of 1 pound, or 16 ounces of distilied water at the temperature of its greatest density. Brandy burrels are distinguished into medidos and
redondos. The former contain 262 ouartillos, and the latter 160. The redondo barrel of wine contains 150 cuartilios. Oll la bought and sold at whoienala by weight ; but at retall a particular cuartllo is used, contuining 17 ounces and 9 drachras of distilled water. For ollva oil the same cuartilio is nsed as for brandy, wines, etc. At the mines the marco in need for goid and siiver. The gold marco is divided into 50 castilanon, of 8 tomines of 12 grains. The silver marco has 8 ochoods, of 6 tomines of 12 grains. Assayers, to determine the purity of these ifo metals, use the same marco. For gold, the caatollano is divided Into 24 quilates, of 4 granon de ley, sach grano equivalent to 50 in weight. For silver, the mareo in divided into 12 dineros of 24 granoe de loy, each grano being equivalont to 16 in weight. Lapidaries, for the ansay of precious atones, use the quilate, which la the tenth of an ounce. Apothecaries use the libra medicinal, which is divlded into 12 common ouncea of elght drachma, of 3 scraplen, of 24 granos.
Money in Circulation.-Baron Ilumboldt calculated, in 1803, the value of the money aceumulated in Mexico to ive $\$ 65,000,000$ or $\% 56,000,000$; whieh sum compared with the popuiation then exiating in New Spain, corresponded in proportion to 410 for each inhahitant. Taking this calculation for a basis, and consilering the prosperity in mining from that time to this, there Is no hazard in saying that the value of the money now in the repullic, notwithatunding the great exportation past and present, amounts to $890,000,000$ or 100,000 ,000. Althoagh this anin in, doubtless, sufficient for all the operations of the interior trude, whieh is very amall, as well in agriculture as in manufncturea and commerce, the circumatance of the greater part being confined to a few liands on the ons sids, and on the other the want of confidence, causes the frequent searcity of the money in circulation, causing the rare phenoinens of a country which produces goid and nilver se abundantly, paying a higher interest on money than in countries not yieliling it.

The geographical position of the States and Territories of Mexico is thus definel: 1. Hastern or Gulf Coast.-The States of Yucatan, Chiapas, Tabasco, Vera Crua, and Tamaulipas. 2. Western or Pacific Coast.-The Stntes of Oajnea, I'uebla, and Territory of Tlaseala; Stato of Mexico, and Federal District; States of Michoacan, Jalinco, and leeritory of Colima; States of Sinaloa, Sonora. Guerreoro, and Territory of Jower Callfornia. 3. Interior.-The Statea of Queretaro, Guanajuato, Zacatecan, San Inula Potori, New Leon, Coahuila, Darango, and Chihuahua.

Yucrian.-The State of Yucatan ocenpies the greater portion of the peninaula which bounds the southern edge of the Gulf of Mexico. It comprises an area of sbout 52,947 equare miles, and containa a population of 680,918 .

The principal productions of Yucatan are maias, cotton, riee, tobacco, pepper, augar-cane, dye-woods, hides, and moap. Forelgn trads with Yucatan In distributed bet ween the United Statem, France, Fingland, Spain, and other countries. The propertions may be estimated from the foliowing table, , howing the value of iraports into Yucaten during the year 1800 , from each of the countries above denignated: Spain, $1,950,000$ france: England, 1,400,000 francs; United States, $1,000,000$ Prance ; Francio, 225,000 france ; othe: countries, 925,000 france ; total, $5,500,000$ france, or 1,023 ,000.

The principal ports in Yucatan are Campeche and Sisal, both open to foreign commerce. In the former, the water is si shallow that vensels are obliged to anchor some considerable diatance from the town of Campeche, and discharge and take in cargoes by means of lightere and cancen. Sisal possenses a deoper port than Camperhe, but it is more expowed to the north winde, which prevall in the Guif of Mexico from October to April. It is the depot for the Jmport
and axport trada of Morida, the capital of Yueatan, and for all merchandise transperted to or from the in. terior of the State. Campeche attained, under the ancient rula, a high degree of commercisl prosperity. It enjoyed monopoly of all the lmports and exports of the province; bat since the independence of Mexico, its commerce has declined-a reault brought about by the opening of other ports to general trade, as well as by lts difficulties with tha central government, and the fearfut ravages of epldemics, by which, in one yent, fuliy two fifthe of its population were car. ried off.
Chinpas.-Thes State of Chispas possesses but iittic commercial interest. It was Incorporated into the territory of Mexico in 1833, forming, before tinat yemr, a pertion of the territory of Gumemala. Its produc. thona are corn, cocon, augar, tobacco, inviligo (of tha very finest quality, but in amall quantities), trepica! fruita, and timber of almont overy variety. like Yucatan, this state derives its chief interest from the ancient remaina of a former advanced civilization within its territories, bearing date long anterior to the Spanish conquest. The ruins of I'alenque, in Chiapas, and of Uxmal anil Chichen, in Yucatan, are, perhaps, the moat wonderful of all that have been discovered hitherto on the western contir snt.

Tabasco.-Trabasco, the smallest State of the confederacy, was, provious to the revolution, a province belonging to the Intendency of Vera Cruz. Its principal productions are cocoa, coffee, pepper, nugar, tainarinds, arrow-root, paimetto, and some tobacco. Its enpital, Villa de San Juan Bautista, llea about 70 miles from the Gulf, and is reached hy vessels of light druught. Its commerce is chiefly esrried on with th. adjuining States and with Guatemala.

Vera Cruz.-The State of Voru Cruz lies under tho burning aky of the tropics, and is coroprised within a long, but somewhat narrow, strip of territory along the Gulf of Mexico, running from the mouth of the Tampleo liver in the north, to the Guasacuaico and the boundaries of Tabasco on the south. It contains an area of $8199 \cdot 50$ square leagues, and a poputation of $264,725^{\circ}$ inhabicants. The port of Vera Crizz lies in $19^{\circ} 11^{\prime} 52^{\prime \prime} \mathrm{N}$. lat., and $98^{\circ} 29^{\prime} 19^{\prime \prime} \mathrm{W}$. long. from Paris, on a sandy plain, Interspersed with marshes, which bound the Gulf of Mexico. From the month of May to that of November, the uanal perioil during which the northers cease blowlag, the unhealthiness of Vera Crus is proverlisisl. The prineipal proluctions of the State of Vera Cruz a.d tobacco, coffee, sugar, cotton, corn, barley, whent, jalap, sarsaparilla, vanilia, mahogany, elvony, dye-wooda, and overy variety of tropical fruit. The port of Vera Cruz aיpplies a great part of the republic, and is considered by far the mont important shipping puint on either coast. Foreign vessela are sllowed to introdince goods and effects from foreign conntries oniy, and they are permitted to enter but one port for discharge; they may then proceed, in ballant, to any other port in the rapublin for the purpose of taking in cargoes of the produce of the country. During the year 1852 there arrivod at tixe port of Vora Cruz, from alt foreign countrien, 1.3 veskels, with an aggregate of $21,958 \cdot 23$ tons. The total value of merchandise exported, including gold and silver, was $\$ 10,449,07005$. Of the vessels named, there were 49 American, measuring 6234-15 tons. The charatep or valus of their inward cargoes is not given in the United States' consular returas, but the import dutics ars atated to have amounted to 159,30120 . Amouat of siiver exported, 8853,287 ; of gold, 855,884 ; other products, 205,150 ; total value of homeward cargees, 4614,322.

Juring the dame year there arrived from Great Britaln 38 veasela, with an aggregate of $2655 \cdot 22$ tons. Total amount of exports, $99,175,768$ 82, of which silver

Total value of cargoes exported 141,287, chiefly silver and gold: The residue of the foreign trade of this port, doring the same year, was diatributed between 82 vessola, with an aggregate of 4189 tons, carrying, respectively, the Belgian, Danish, Hanoverian, Mexican, Portuguese, Sardinian, and Veneauelan flags. From Hamhurg there were 8 veasels, exporting a total value of $\mathbf{8} 23,196$.

During the prevalence of the northern, the port of Vera Cruz is considered to be very uname. In 1846 the United States' Urig-of-war Somers was lost In sight of the city, making the third United States' national vessel lost during that season, in the Gulf of Mexico. A norther generally continues two or three daye. "It comes on," eays a pubilication elicited by the loss of the Somers, "gradusily, mo that the mariner who is unaccustomed to navigata the Gnlf of Mexico is often unsuspieious of danger, and flatters himself with the lies that the 'stiff breeze' which impels his vessel onward will soon carry her to her port of deatinstion. And ao it does, but not in safety; for the 'stiq breeze' freshena into a gale, and the gale into a hurricane; and, at length, the vessel atrikes on one of the rocks with which the harbor of Vers Crus is atudded. In that harbor the anchorage ground is, perhaps, the worst in the worid. At Vere Cruz no namber of anchors hardly will kecy a vessel from going ashore in a norther. All that the captain of a veseel can do, under such circumstances, ls to alip bis anchors and stand out to sea immediately. Veasels of war, even these belongling to friendly powers, are not sllowed by the Mexican government to enter the harber of Vera Crua. They aiways anchor at Eacrifcios, a barren island at the entrance of the harbor. At Sacrificios the anchorage is pretty good. Mexican menof-war, when there are any auch in the harbor of Yera Cruz, are always moored to rings set in the walls of the cartle of St. Juan de Ulloa, and by that means, are secured from the effects of a norther." The official sccount of the loss of the Somers, bearing date December 12, 1846, is on file in the Navy I)epartment, and contains many valuable auggessions relative to the dangers to which navigation is exprosed in the Gulf of Mexico.

Tamaulipas.-This State is bounded north by the State of Texas; north-west hy the Mexlcan State of Coahailn; on the weat by the States of Now Jeon, San Luis Potosi, and Vera Cruz; sud on the esst by the Gulf of Mexico. In breadth it varies from 12 to 55 leagues. This State has more than 350 miles in leogth of seacoast, and is fringed with lagoons varying from 4 to 18 miles in width, divided from the gulf by a bank of sand. The shallowness of the shores slong the ec.st, and the dangerous bars which choke the month of the rivere, render the navigation difficult and dangerous for vessels of almost all classes. Popnlation in 1850, 110,074; though the census of 1854 givee hut 100,064 . The cblef productions of this State are similar to those found In the State of Vera Cruz. The coasting and foreign trade is couductod principally in the ports of 'Tampico de Tamaulipas and Matamoras. From these places large quantities of Europoan and North American manufactures euter the middle and northern Statea of the republic. Queretaro, San Luis, Nuevo Leon, Coahuila, Zacatecas, Jaliaco, Durango, Chihushus, and Sonora, receive most of their forelign supplies from these points. Tampico do Tamaulipas, on the northern bank of the Panuco, is the principal commercial port of this State. Its bar is dangerous, and its harbor considered unsafe. The town is eituated

In the midet of extensive maribes, and ean not be appronched by large vessels. Ita foreign commerce in represented as inereaning (vide Marek' Mierico, vol. 11., p. 206), though consular return from that port, bearing data February 17, 1884, says that the trade with the United Statea is on the decrease, owing to "hlyh rutes of duties, both impont and consumption; as also circulation and municipal."

Tampico exports hides, marsaparilla, goat-skins, fustle, vanilla, wool, jerked beef, and Mexican hemp. Tampice is the outlet of the matale and other productions of San Iuis Potoni, (iuanajuato, Zecatecas, and Durango, considered to the the riobest mining districts In Mexico. The foreign trade of Tampico during the year ending December 81, 1858, was as fullows: Total value of inward oargoes, $\$ 1,228,948$; total value of outward cargoes, $\$ 3,266,0341$ total foroign trade, -4,405,582.

Total number of American vessels included in the above, 22, with an aggregate of 2207 tons. Value of inward cargoes, $\$ 196,936$; value of outward cargoes, \% 287,944 ; total trule in American vesseln, 4434,880 . Total number of British vessels, 17; aggregate tonnage not ascertained. Of these, 14 belonged to ti: a British IRoyal Mail Shamalip Company, und 8 were sailing vessels. Total value of inwad cargoes (exclusive of 1000 flasks of quicksilver, vulne not ascertained), $\$ 287,500$ ) total value of outwarl cargoes, $\$ 2,928,418$; totul trade in British vessela, $48,215,918$. Total number of French vessels, 9 , of 1,815 tons. Total value of Inward cargoes, 8398,000 ; total value of outward cargoes, $\mathbf{8} 2080$; total trade in French vesmels, 8400,080 . 'Total number of Spanish vessels, 7 , of 728 tons. Total value of inward cargoen, 4182,300 ; total value of o'tward cargoes, $\$ 50,176$; total value of trade in Spanish vessels, $4189,476$.

The residue of the trade at the port of Tampico, during 1852, whs distributed between Sardinia, Mamburg, Holland, and Mexico. Matamoras lies on the right bank of the Kio Grande, or Kio Bravo del Norto, at the distance of nearly 30 milds from its mouth. For purposes of navigation, this river is, perhapa, the mast important in Mexico, and has proved navigable by steamers for a considerable diatance into the interior. Recent returns from this port are not at hand, but the general trade of Matamoras is not of much importance. The following facts relative to its trude are dorived from French official returns: Imports into the port of Matamoras consist chiefly of breadstuffs, spices, previsions, and cloths, from New Orleans; exiorts, of specic, hides, and wool. In 1844 there entered 33 vessels, of 2054 tons, floating inward cargoes of the value of $1,638,000$ franes, and outward about an equal amount. Two thirds of all commercial operations at this port are under the American fing. In 1841 commercial movemente with the United States renched the sum of $23,000,000$ francs- $12,000,000$ for inward, and $11,000,000$ for ontward cargnes. Of the importa, British merchandise imported in American bottoms rached $5,000,000$, while Americun proluce and manufactures amounted to only $2,500,000$. French merchandise In American bottoms flgured as high as 1,300,000 francs, and German 1,080,000. Cotton cloths (mostly British) renched, in this trade, $5,136,000$ francs. Tho export trade to the United States during this year covered $9,000,000$ francs in specie, and over $2,000,000$ in hides.

Chihuahur.--The principal port in this Stnte is El Paso del Norte, lying on the right bank of the lio Grande. "The position of this town is nu important one, Inasmuch as the road by it is the only practicnblo one for wagons leading from Sazta Fé to Chiluahua." -Mayen's Mexico. The valley of El Paso is the moet fertile in Mexico, producing maize, wheat, and almost every varicty of fruita. The commerce of the United States with this port has decreased since 18011, not half the amount of merchandies baving been imported from

## MEX <br> MEX

the United States in 1852 as in 1850 and $\ln 1851$. This decline is attributed to the failure of the erops in the State of Chibushua, and the high duties, whleh amount almost to a prohibition. Mexican and forelgn merchants send to the United States whe and brandy, manufactured in the El l'aso valley, and sugar, soap, rebosas, saddlos, bridles, leather, segars, mats, and fruits, umounting annually to about $\$ 70,000$.

Oajaca.-Thls State has a sea-coast on the Puclfic extending 118 leagues, and comprises an ares of about it 50 square leagues, containing a population of 525,101 c.sabitants. The fertility of soil and richuese of productions render thls State, in a cominercial aspect, one of the most important in Mexico. There Is nut, however, any port open to forelgn commerce on this part of the Pacitic, from the boundary line of Guatemals to Acapuleo, a distance of nearly 900 miles. The coastIng trade is nearly nominal, although the State possesses uine sos-ports or anchorages, namely: Tehuantepec, 11watulco, Escoudido, Chacahoa, and Jamlltepee. Corn, cotton, coffee, sugar, cocoa, vanilla, tobacco, cochineal, wax, honey, and indigo, are the ataple productions. The iudigo crop, prodiced in the department of Tehuantepec, ls estimated at 500 garrones, of 155 pounds each, and that in the valle:- of Sonola at 600 garrone , making the whole crop of indigo equal to 192,500 pounds. The price paid to plunters is $62 \frac{1}{2}$ cents to $\$ 1$ per pound. From a message of the Governor of Oajaca to the National Congress, it appears that, during the 17 monthy previous to March 1, 185-1, the erop of cochineal prodaced in the State of Onjaca reached as bigh as $1,248,550$ pounds. The price ussally canges from 50 cents to 75 cents per lb., sccording to quality, This State possesses, also, considerable mineral wealth. There are, at present, silver mines worked, 4; not worked, 3; gold mines worked, 5; lead mines, 1. Annual produci of all the mines, $\$ 352,000$; annual products of iron mines, $24+, 000$ pounds. On both sides of the Isthmus of Tehuante-
 woots, gums, etc., are producel. The cocoa raised in some parts of this State ls of so superior a quality,
hat, while the country belonged to Spain, it was re. served for the royal family. It still has a dessived reputatlon.

Guerrero.-This State comprises the districts of Acapulco, Chilupa, Tasco, and Tlapa, and the municipality of Coyucan. Its principal port is Acapulco, so spacious and secirre that 500 vessels can lie at anchor in it with perfeot su'fety. The trade of Aeapalco Ls inconsiderable; thi foreign vessels ontering the port being either freig bted with coals for the Paoifto Muil Steamship Company, or in distress-the former being compelled to clear In ballast. By docree dated jiebruary 4, 1854, the Supreme Government made a reduction in the tonuage dues upon all vessels arriving in that port ladon with coul, and consigned to any steambost company baving a dépût of coals iu the harbor, viz. : 50 cents per ton, instead of $\$ 150$, as formerly. During the year 185\%, there entered the port of Acapuleo 81 American steamships, of 107,007 tons; 8 sailing vessels (ships) carrying 4,369 tons; 1 bark, and 2 schooners. Besides Acapuleo, there are other ports on the Paclic coast open to foreign trade; bu:t the Department is not in possession of information respectiug them. They possess, however, no commercial importance. The other States of Mexico, being either in the interior of tho republlo, or possessing no ports open to foreign commerce, are not deemed of sufijicient commercial consideration to demand separate notice. leturning to the generul commerce of Mexico with fureign nations, particalarly with the United States, it is found that the principal articles of inpportation from the latter to that country ure, machinery, articles of iron, small wares, linen, wcolen, and cotton cloths; silks, tlour (when not prohibited), raw cotton, timber fur the construction of houses, prepared medicines, housebold furniture, velicles, harnesses, horses, salt meats, sperm, paper, marble and other stone.

The imports into the United States from Nexice consist, principally, of gold, silver, dyewoods, dye stuffs, hides, skins of shoep, cattle, and other productions of less value. The following statement ohows a decrease in the importance of our commerce.

This exhlbl up from officia It will be per two countrles in the above to activity, excer reaching those 1830. This exhibit may be rellad upon, having been made up from official reports on "Commerce and Navigution." It will be percelved that the commerce between the two countries decreased during the 80 years embraced in the above table. In 1854 it experienced considerable activity, exceeding in value the totals of 1850, but not reaching those of 1840 , and still further below thoae of 1830. The value of imports in 1854, as already given, wss $\$ 3,463,190$; and of exports, $\$ 3,185,486$; making total of $\$ 6,698,676$-being $\$ 91,666$ less than for the yea. 1840 , and $\$ 8,474,023$ less than for 1830 . The inportstions from Great Britain into Mexico may be illusirnted from a r sport made by order of Parliament. For s period of saven years, from 1840 to 1840, both included, the sum total of the value of the imports was $\$ 82,246,705$, making an average value of nearly $812,000,000$ per annum. The principal articles of import were as follows : drugs, haberdashery, and wearing apparel, arms and ammunition, malt llquors, printed books, manufucturas of brass and copper, furniture, carriages, coals, cordage, manufactures of cottoa, earthenware of all kinda, glass wares, hardware and cutiery, hats, iron and steel in bars, manufactured lead, prepared skins, harnessea and aaddles, manufactures of flax, machinery and machines, and musical iastruments. Of there articles, the manufactures of cotton rank higi ast ; the eatimuted value of the linportation for the seven years amounting to more than $\$ 55,000,000$, while that of manufuctures of linen (which comes next in order of value) was more than $\$ 12,000$,000 , leaving only some $\$ 12,000,000$ or $\$ 13,000,000$ as the sggregate value of ell the other imports from Great Britah into Mexico. The character and value of merchandise eutering inte the commercial movement of Mexico with France may be exemplified by those of the year 1851, as exhibited from the data furniahed by the official returns of France. The reason of the shipments thither of the precious metals being in so amall amounts, is, that the exchunge with England can always be more conveniently arranged than with that country.

The forcgoing is excluaive of city and hospital contributions, and internacion, or intarnal duty, levied upon the same goods whea dispatched to tiele interior.
The commerce of Mexice is confined to the reception of forcign goods sufficient for tha necessities or luxury of a very small class of the population, for which is given in exchange a large portion of the products of the mines, and some few products of the soil. As the yield of the mines is estimated only at $\$ 26,000,000 \mathrm{an}$ nually, the amount of commerce can not much exceed that sum. The total numher of Mexican merchant vessels, all of which are small, does not exceed 50 , and of these more than half beloag to the merchants of Yucatun.
The following account of the trade and commerce of the republic for the year 1851-52 is compiled from the offielal returns:

| Ports, | $\begin{gathered} \text { Total, } \\ \text { Tonnage. } \end{gathered}$ | Passengors. |  |

| Total. | 256,692 | 43,816 | 40,103 |

Of the vessels arriving, (68 lelongel to Mexico, 435 to the United States, 108 to England, 69 to Frunee, 60 to Spain, 1.5 to llamburg, 2.1 to Peru, 5 to lhelgium, 8 to Ilremen, anta 1 each to lortugal, Nicaragua, Sweden, Itunover, and Venezucla.

Among the arrivals wete 219 stcumers, viz., 145 at Acapulco, 7 at Vera Craz, 4 at Tampico, 27 at San 1has, 35 at Mazatian, and 1 at Guaymmas. Of these, 1.15 were United States' vessols.

Of the classes of vessels, beside steamers, there were 55 frigates (vessels of war), 114 barks, 165 brigs, 63 hermmplirodite lirigs, 150 sehooners, and 68 pllot boats.

The chief coasting trade of the republic, on the Gulf of Mexico, is performed by schooners between Tiunjleo, Tuspan, Shal, Campeche, Tahasco, Minatitlan, Alvarado, and Tlacotalpan. For this trade, $n$ few vessels exist of about a hundred tons burlen, built at Campeche, and are equal to Ameriean vessels of like quaty in respect to capucity, sailing prope-ties, and durnhility. Nuthonal vessels make voynges only to the ports of New Orleans and Cuba; and in the year 1852 only seven sail were thus employed, and the amount of consting in the same time was very smail. There appears to be no increase in this trude, nor in the building of vessels. The commerce with foreign
countries is reported recently to have decreased; and with the Unitad States, in particular, to be on the decline. The cause of this change is consldered to be the ligh rates of duties, both on imports and exporte, and the additional charges, local as well as internal. It is known that the late Preeident of Mexico (Santa Anna), a short time before his ahdication, had granted privioges and special concessions to certain European houses for the introduction of fortign merchandise on the Pacifle coast, at from 25 to 30 per cent. less than the regular impost by the ostablished tariff, As this involved a palpable violntion of the treaty between the Uaited States and Mexico, the American minister to that country, under date of April 10, 1855, protented agninat such pri--lleges and speelal concessions. Under such is system, American nierchants were reduced to the necessit, of witnessing the prolucts of the United States contributing to the fortunes of European merchants ; while they were donied the right, notwithstanding treaty stipulations, of importing almilar merchandise on the same ierms, under a penalty of contiseation, and a fine to the extent of the market value of the eargoes at the place of importation.

The I'rin ripal P'orts are Acnp̣ico, lat. $10^{\circ} 50^{\prime} 30^{\prime \prime}$ north, long. $90^{\circ} 46^{\prime}$ west, the bert sea-port on the weatero cosst of Mexleo, and is capable of containing a large navy with perfect afety. Tampleo, n conshlerable commercisl port on the eastern enast of Mexieo, in lat. $22^{\circ} 15^{\circ} 30^{\prime \prime}$ north, long. $97^{\circ} 62^{\prime}$ west. The shifting of the har at the mouth of the river, and the shallowness of the water on it, which is sometimes under 8 feet and rarely above 15 feet, nre merions obstacles to the growth of the port. Vessels that can not enter the port, load and unload by means of lighters, mooring outside the bar, so that in event of a gale from the north, they cun readily get to ses. Vern Cruz, the prinelpal sea-port on the eastern coast of Mexico, lat. $19^{\circ} 11^{\prime} 52^{\prime \prime}$ north, long. $96^{\circ} 8^{\prime} 45^{\prime \prime}$ west. The harbor lies between the town and the island of San Juan de Ufla, about 2400 feet wide; it is insecure, the anchorage heing very bail, and no ressel is safe unless made fast to iron rings fixed into the wall of the castle on the island, and even then accidents sometimes occur. liuaymus, a sen-port town of Simors, on the Julf of California, at the mouth of a considerable river, lat. $27^{\circ} 55^{\prime}$ north, 'ong. $110^{\circ} 16^{\prime}$ west. It is neither lo-ge nor well buif, but its harbor is the best on the western coast of Mexico, and it has an netive and increasing trade.

New Porta Open for foreign Trade.-Guaymas, Camargo, Mier, Piedras-negras, Monterey, laredo, Tonala, Zapaluta, Guatzacoslcoa, la Ventosa.

Tonnage Ihuties nul Port Chargen at l'era Crvz.—On foreign ships alld natlonal vessels from forelgn ports, perton (the Mexican ton is 12 per cent. less than thnt of the United States), 150 ; fees of eaptain of the port, \&350; water dues (Mexican vessels in the coasting trade pay tit eents perton, as water tax, but are excupt from tonnage duty), $12 \frac{1}{3}$ cents; atamped paper
for ontering and elearing, $\$ 850$; pllotage, either way, per foot, 8250 ; pilot-beat, with four or six oars, 88 ; bills of health, if required, $\$ 4$; to consul of country where destined, $\$ 4$; vlsit of health officer, $\frac{\text { \& }}{} 2$. Wharf ago and mmiclpal dues are very inalgniffcant. The moneys, welghts, and moasures, In use in Mexico, are the asme as those of Spain. At the port of Tampico, the dues and charges are quite the sams as at Vora Craz. Hompital dues at the former port are $\$ 10$.

Tariff Regulations.--The tariff regulations of Mexleo have been subject to frequint changes of late. The rates established by the tariffe of $1845,185 /$, and 1856 , will be found in the Comparative Tariffs issued by tha Stato ; tapartment, Part II. The details of the tariff of Janusry 31, 1856, are as follows:

Charges on Veasels. $\rightarrow$ Tonnage, 81 per ton; free of tonnage, if in be last to load logwood, specic, etc.; or if bringing cosl for the Mexican deposits; or if enly bringing passengers or mails.

Prohibitions.-Brandy, of sugar-eane; and all ether except that made out of grape-excepting gin, rum, and others named in the tariff, in bottles, or jurs: sul. gars, of all kinds; rice ; buttons, with the Mexican or foreign arms; coffee; wax, made up in eandles; oracene pamphlets, books, etc. ; flonr of whest, except at Aespulco, Yucatan, Tampico, Mntamoras, and the custom-houses of the northerp frontier. l'or regulathons, see Comparative $\overline{2}$ ariffs, Part II. Monts, shues, slippers of leather with soles; rein-bitts and spurs of Mexican fashion ; books prohithlted by competent sy therity ; lsrd, subject to the ammo exceptions (omittin Acapuleo) as flonr; saddles, and sppurtenances of Mexican fahhion; playing-cards, of Mexican fastion; scarfs. Mexican fashion, of all kinds; speckled or printed toxtures Imitating the same; whoat, nod all kinde of grain and seeds; blanketa, woolen or cetton, or mixad excepting coverlets and bed-coverings of plqué, without seams.

Additional Inty to Tariff.-1. Munlcipal duty will will be $12 \frac{4}{3}$ cents on each package of 8 arrobas weight, payable at the time of importation. 2. For improve. tnent of the country, 20 per cent. on the inport duts. 3. International duty, 10 per cent. on importation duty, payablo at the thone of sending the goods to the inte. rior. A. Contrit registro, is 20 per cent. on impon, payable nt the tinal place where goods are sent. 5 . Amortization laty of the public debt liculuated and consoldated: this duty will be 25 per cent. on the import duty, and the payable in full at the General Treasury Department of the nation, with bonds of the public debt liquidated and consolidated.
Expurt Duty.—On coin nnd wrought gold, it per cent.; on colned ailver, $8 \frac{1}{2}$ jer cent.; on silver bars, stamped by mint, 7 per cent. All the remaining goods, prolucta, and mational manufacuures, mot specilied, may be exported without paying my duty.

All laws, deerces, elreulars and orders, which nre in contict with this tariff, directly or indirectly, will cease immediately after publication of tho present new one.

Involee of the follonoing goods shipped by the subsoribor for保 ......, merchumts of co port of Hera Crwi (Masco), whther inis reskel in bound.

Physical Features, etc.-The surface of the lower, or soathern peninaula is gensrally level, having few elevations whlch may be denominated hills. The interior is gently undulating, riaing gradually from the lakes to the centre of the peninsula, This central region may be regarded as a table land, elevated about 300 feet above the level of the lakes, covered with fine forests of timber, oak plalns, and prairlea. Along the eastern shore of Lake Michigan are sand-hills, thrown up by the winds into fantastic forms generally quite barren and naked. The part lying bet ween Lake IIuron and Saginaw Bay is low and swampy. No part of the United States ls better supplled with fish, aquatic fowl and game.

Thero were, in thls State, in 1850, 1,929,110 acres of land improved: and 2,454,780 acree of unimproved in farms; cush value of .arms, $\$ 51,872,446$, and the value of implements and machinery, $82,891,371$. Agricultural Products, etc.-Whent, $4,925,888$ bushels; rye, 105,871 ; Indian corn, $5,641,420$; oata, 2,866,050 ; barley, 75,249 ; buckwheat, 472,917; peas nnil beans, 74,254 ; potntoes, $2,359,897$; sweet potatoes, $113 i$; value of products of the orchard, $\$ 132,650 ;$ produce of market grardens, $\$ 14,788$; pounds of butter made $7,065,878$; of cheese, $1,011,492$; maple sugar, 2,439,794; molasses, 19,823 gallons; beeawax and honsy, 359,232 ; wool, pnunds produced, 2,043,283; flax, 7152 ; silk cocoons, 108 ; hops, 10,663 pounds ; of tohacco, 1245 ; hay, tons of, 404,934 ; clover seeds, 16,889 bushels; other grass seeds, 9285 ; flax aeel, 510 bushels; and were mude, $\mathbf{1 6 5 4}$ gallons of wine; value of home-made manufactures $\$ 3 \cdot 0,947$; of slanghtered animals $41,328,327$.

Of the northern penlnsula, Mr. Schooleraft says :"Portions of it are the mere developement of aublime scenery which pertains to that comparatively elevated portion of the continent. Mountains and lakes, plaina, rivers, and forests, spread over it with a boldness of outline which may be sald to conatltute almoat a pecuHar type of North American Geograplyy. This division embraces the mineral region. It is of little value for the uses of ngriculture. The luterior abounds in small lakes. On tho shoro of Lake Superior are several large luys and good harbors. Recent explorations here have discovered Immense deposits of rich copper ors; on the southern shore of lake Superior is a series of lofty bluffs and isolated rocks, havinig the sppeuranes of ruins, tottering walls, and caverns. La Chapelle, or the Arched Rock, is a benutiful speeimen of this charucter, as are the l'letured lecks, etc. There are also several pleturestuo cascades."
The southern penlnsula of Miehlgan is a; ined by several largs rivers and numerous smallor streams, which, rishig in the latecior, pass off in easterly, westerly, and northerly directions into the lakes. Maisin and Humon Rivers tlow into lake lirie, lionge River into letwit Strait, Clinton and Black Rlvers Into the Stmit of St. Clair, Saginaw Rlver formed by the junction of 'i'itibawasse, F'lint, and Cass livers enters Saginaw llay. Thunder liay, Cheloligan Rlver, and some smaller streams fall into Lake lluron. St. Joneph, Grand, Kalamazoo, nud Maskegon livers How into lake Michigan. Many small lakes of pure water, stocked with lish of tine quality, aro found in the ithterior. This State borders on four of the grent lakes, viz., Errle, lluron, Michigan, and Superior. The prineppal rivers of the upier peninsula aro Ontonagon, Haron, Menomonee, Montreal, St. Mary, Eagle, Cedar, White Fish, llack, Sturgeon, llapid, and Manlstic. 'The principal islanda are Drummond, Sugar, St.

Joseph, Bois Blanc, Mackinaw, Maniton, and Beaver Island, in Lakes Huron and Michigan; Iale Royale and the Apostles, in Lake Superior.

Manufactures, etc.-There were in this State in 1850, 15 woolen factoriek, with a capital of $\$ 94,000$, employing 78 malea and 51 females, manv'acturing 141,570 yards of cloth, valued at $\$ 90,242 ; 1$ establishment maklag pig Iron, with a capltal of $\$ 15,000$, employing 20 persons, prodacing 660 tons of pig lron, atc., valued at $\$ 21,000$; 63 establlshments with a capital of $\$ 195,450$, employing 337 persona, "and making 2070 tons of castlngs, etc., valued at $\$ 279,697 ; 231$ flouring and grist mills, 477 sow mills, 45 tunncries; 57 printling offices, 58 newspapers, 8 daily, 2 semi-weekly, $47^{\circ}$ weekly, 2 aemimonthly, and 3 monthly publicatlons. Aggregate number of coples published, 3,247,736. Capitel invested In manufactures, ${ }^{\text {P } 5,764,645 \text {; value of manu- }}$ factured artlcles, $\$ 10,407,285$. There were, Jsouary, $18^{\circ} \mathrm{K}, 590$ miles of railroad in operation.
The principsl places in the State ars Detroit, the metropolis, Monroe, Ann Arbor, Ypsiantl, Adrian, Jackson, Marshall, Kulamazoo, Lansing, the capital, St. Josephs, Mackinac, Grand Haven, and Sault St. Maris. There were in 1854, 6 banks and 1 branch, with an aggregnte capital of $\$ 1,084,718$. Exports (1852) in American vessels, of domestic produce, to the value of $\$ 100,436$; in foreign vessels, $\$ 31,030$; of foreign produce in American veasels, $\$ 4398$; In foreign vessels, $88+18$. Total value, $\$ 145,142$. Imports in American vessels, $\$ 191,976$; foreign vessels, $\$ 4264$. Total vulue, 8196,240 . Tonnage, 1853, 4,591,284.

The shipments from Detroit were aa follows:

White Fish.-One of the largest and moat important items in the commerce of Detroit, is the trade in whlte fish. From the head of Lake Erie to the head of Lake Superior, including Lake Michigan, during the fall and spring months, the fisheries form an Important branch of our western commerce. But probally thore is no place of the same area along our lakes and rivers which is so valuable in this particular, as the river contiguous to this city. lirom Fighting Island, to the northern point of Belle Isle, a distance of 17 miles, there is one complete fishery, from which large numhers of fish are yearly taken. The cost of taking them, when the run is fine, ls very light, and fishermen realize large profits. They are known through all the States, and are esteomed among the choicest delicacies to be and in any market. 'The large demand creates a correspending valaation, and in every chty they have become the firsi brand of thsh sought. Tho river thbl! are generally larger, fatter, and better flavored than those of the lakes, and are, therefore, always in greater demand, and always command better prices. In New York, lloaton, New Orleans, and even San Franclaco, the Detroit River white fish are engerly sought for.

The sesano of 1855 was a remarkably good one. At the tlsheries (about 50 in number), between lighting lsland and Helle Isle, over 7000 barrels, or some 700,000 tish, buve been taken. About lulf of these have heen sold iresh, int an average of 11 cents each, bringing in a revenue of $\$ 38000$. The remalning portions are mostly held by the fishermen until navigation shall open to them the southern and eastern trade. These 1500 barrels, when aold, will nett the holders nhout 830,000 , or in the nelghborhood of $\$ 8$ or $\$ 9$ per barrel. lirom the fisheries upon lieile lale about 7000 tish were taken, a majority of whici: were sold fresh. The remaluder of then were caught below the city, mostly upon the Amerkan side of the river.

The metiod of euteling fish here in the river differs somewhat from the means adopted for lake fishing. There gill-nets nre the principal ageney omployed, while seines are the instraments here used.

## MIL

The nnmber of barrels canght annually in the lake fiaheries ls nearly as follows:

These are sold at an average price of $\$ 11$ per barrel, the aggregate amount of sales being $\$ 462,000$, or nearly 4500,000. Probulaly one sixth of all the fish caught in Lakee Michigan, Huron, and Superior, are trout; the remaiuder being white fieh. They are commonly canght by gill-nets, set some 10 miles distant from the shore. Large quantities of the fibh are taken from the Detroit liver, which they ascend from Lake Erie to spawn. On their return to the lake they are captured. The number of fisheries in the river is 50 .
In some of the rivers that flow into the lakea, enor-
mous quantitles of piekerel are canght. Not leas than 1000 barrels are taken annually from Fox Rlver, Wlsconain! from Saginsw River, Michigan, 1500 harrele; St. Clalr River, Michigan, 1500 ; Maumee River, Ohio, 8000 barrels, and an equal quantity of bses, mul. let, ete., making a total of 10,000 barrels, which are nold for $\$ 850$ per harrel, or 985,000 in the aggregate. The annual product of the lakes and tributary rivers is thus shown:

| The Lakes. | $\begin{aligned} & \text { Bban. } \\ & 80,000 \end{aligned}$ |  |
| :---: | :---: | :---: |
| Detrolt River | 7,000 | 77,000 |
| Other river | 10,000 | 85,900 |
| Total. | 82,000 | \$547,000 |

See Hunt's Mag., vl., 833, xix., 19 (J. R. Wit inms), xxil., 131.

The principal port in Detroit, a large and flonrishing city on the Detroit River, opposite Windsor, the terminus of the Great Western (Canada) Rallroad, which here connects by ferry with the Miehtgan Central Ralroal, together oorining a convenient line between Niagara and thicagro. It is alwo the south-western terminua cithe Detroit and Milwaukee Rallroad; and a line (the Detroit and Toledo Kailroad) in now in prognress to connect with the railroads centering at Toledo. It has one of the theat harbors in the United Staten, and is admirably adapted for commerce. It has also extensive manufacturen, chiefty machinery, agricultural implements, ete., and a large trade in lamber. On the whole, it is a most Hourishing place, and ranka as the first city of the State. Population in $1 \times$ ins, 50,448 . Ihetruit was founded in 176 by the French, und wan for mary years the State capilul. Twentyfive years ago ic had only 2000 inhabitants. The tonnage of Detroit in 1 bot was 58 , 1 ind tons.
fort /luron,-A town at the month of Hhack River, on the St. Clair, and two miles south of lake llamon. It has a large lumber business and fine general trade.

Mloroscopes. Invented nearly at the same time in Italy and Holland, A. D. 1621. Those with doalife glasses were made at the period when the law of r fraction was diacovered, about $16 \div 4$. The hener of this invention is awarded to Drebel and Torricelli. Sollar microscopen were invented hy 1)r. Wooke. In Ingland, grent improvements were made in the microscope by llenry lisker, F.R.S., who wrote two treat isen upon it about $1763,-$ Riog. Ditt.

Mile (1at. mille prasurm, a thousand praces). The Roman pace helas five feet, and a Romat funt being equal to $11 \cdot 62$ modern English inches, it follows that the nacient lloman mile was equivalent to lidit Einglish yarde, or very nearly 11-12ths of an English ataute mile. 'tha Einglish statute mile was detined (iacidentally, it would neem) by an act passed lin tho sish year of the reign of (Queen lilizabeth, in which persens were forbldden to build within three mites of hondon; and the, mile was declared to be 8 furlongs of 40 perches of $16 \frac{1}{2}$ feot each. The statute mile is, therefore, lico yards, or 5280 feet. Seo Weibits and Measpras.

all countries of Europe, particularly thosa which were formerly under the sway of the Romans; but it is very difficult to conjecture the canse which has given rise to the great dicersity of its values. It has bean suppoo it thei in soins countries the Roman mile was confouncieu with th: aneient Celtlo league. The following table shows the length; in statute miles of $\mathbf{1 7 6 0}$ yards, of the modern mile, and also the leagues of various countries in Engligh yards:

Milford-Haven, a harbor of England, on a basin or deep inlet of the Atlantic, on the coast of South Wales, county Pembroke, forming one of the best ports in the British dominions. Latitude of St. Anne's lleads, the north-western extremity of the entrance, and on which are three light-houses, with fixed lights, $51^{0} 41^{\prime}$ N., long. $50^{\circ} 10^{\prime} 25^{\prime \prime} \mathrm{W}$. Leugth of haven shout 15 miles; average breaith, 2 miles. It is completely land-locked, has deep water, and the whole shipping of the empire might ride here as safely as in dock, in any weather; whilo the access is easy, and the egress can be accomplished, by aid of the strong ebb, even in head winds. It has for some time been a favorite scheme with the southern States to have a line of steanmers between this port and Norfolk, Virginia, and thereby sacuro a portion of the importing and carrying trude now absorbed by the ports of New York and lloston.

Milk (Fr. Lait ; It. La.do; Lat. Lac), a fluid secreted by the female of all those animals denominated mamalia, and evidently intended for the nourishment of her offspring. The milk of every animal has certain pecularitios which distinguish it irom all other ailk. lhit the animal whose milk is most used hy man, and with which, consequently, we are hest acquainted, is the cow. The external character of all nilk is that of a white opaquo fluid, having a sweetish tiste, and a specific gravity nomewhat greater than that of water. When allowed to remnin at rest, it separates hoto 2 parta; a thick whitish lluld ealled cream, collecting in a thin stratum over its surface, nod a more dense watery body, remaining helow. Milk which has stood for some tume after the separation of the cream, becomes ncescent, and thon coagulates. When the coagulum is pressed gently, a serous flud is forcell out, and there remains the caseous part of the milk, or pure cheese. Butter, one of the most valuable anhnal products, is solititied croam, and is obtained artilicially by churniug. Milk lats always been a favorite food of most Europen nations, and especially of the Iritish. Lacte et ca, ne riunt, says Ciesar of our ancestors; and the same articles still continue to form a large part of our subsistet:ce. See articien Muttha, Cheesp, Dairy.

Millet (Ger. Hirse; Fr. Millet, Mil; It. Miglin, Punicastrello; Sp. Mijo; Lat. Bilium, Panicum uiliaceum). There are 3 distinct species of millet; the polish millet, the common or (ierman millot, and the Iadian miliet. It is cultivated as a species of grain;
and is sometlmes employed to feed poultry, and as a substitute for rice. The Indian millet grows to a large siza; but the autumans in England are seldom dry and warm enough to allow of lts being cultivated here,-Loudon's Eacyc. of Agriculture.

Milliner. Defined hy Shakspeara and Johnson as a se'lar of ribbons and dresses for women, a very ancient occapation; the term is aupposed to be derived from Milan. There are men-milliners, and the adoptlon of such a trade by the male sex has been strongly and justly cansured. In 1810, men-milliners and other clasees of an epicene character were very strongly censured in the Society of Arts. Young females are employed at all seasons, and in all weathers, to carry bandboxes through the streets, exposed to the insolence of libertines, and the perils of vicious example, while the perfumed coxcomb ["He was perfumed liks a milliner."-Shakspeare.] measures ribbons safely at home, or folds gauzes, and lisps the while in lady phrases to females of distinction.-Butler.

Mill-stones (Ger. Mihhsteıne; Fr. Pierres meulières; It. Mole macine; Sp. Muelas de Molino; Rus. Schernowoi kamen), the large circular stones, which, when put in motion by machinery, grind corn and other articles. The diameter of common mill-stones is from 5 to 7 feet, and their thickness varies from 12 to 18 inches. These stones have been principally imported from Rouen and other parts of France; the burr-stones of that country being supposed to he more durable then our own. The leland of Milo, ln the Archipclago, furnishes mill-stones of a very excellent quality. They are exported to Greece, Italy, and other countries on the Mediterranean, where they are employed in grinding the hard wheat, or grano duro, used in the manufacture of macaronl, vermlcelli, ctc. The quarries are wrought on account of government, and the stones sold at moderate prices fixed by a tariff, which, however, lenves a handsome proft to the State.-Tournefort, Voyage at Levant; Strona's Greece. The stones usel by millers are of various sizes, according to the intensity of moving power ubtalnable. Technically, the two stones are called the rumuer and the bedder; and the operation of "hanging a runner," or adjusting the $\mathrm{m}_{1}$ per stone over the lower, is one of some delicacy; since not only must the two be rigorously parallel, but the distance between them must depend on the fineness of the flour to be produced and on the rapility with which the upper stone rotates. Other things being equal, the groater the velocity, the closer must the stones be together, else the centrifugal force would drive away the corn unground or half-ground.

Mineral Pitch, Maltha. A solid, softish bitumen. Sp. gr. alwut $1 \cdot 5$.

Mineral Tar. The bituminous substance called petroleum. It is brown, viscid, and unctuous. Its specitic gravity is 0.85 . It is found in Hritain, and on the continent of Europe, in the West Indics (Barbaloes tar), and in lersia. It may be resolved by distillation iuto naphtha and petroleum.

Mines (Mine, Fr.; Muyn, or Mun, Welsh), a subterraneons work or excavation for oftaining metals, metallic ores, or other mineral substances.

Minnesota, a north-westernTerritory of the Unit od States of America, liss between lat. $42^{\circ} 30^{\circ}$ and $49^{\circ} \mathrm{N}$., and long. $91^{\circ}$ and $103^{\circ} 5^{\prime \prime}$ W. Area, 141,839 square milies. Population, 1850; whites, 6,038; cot ored, 39; total, 6,$077 ; \ln 1857$ estimated at 150,000 .

Phyaical Features.-Minnesota is an olevated tableland, with a surface but little varled, being mostly a relling prairie, sboundlng with lakes of pure water, and streams which flow in all Jirections, excepting toward the west. The solt is a fertile, eandy loam, easily cultivnted, and well adapted to agricultural purposes. The Mississippi River riges centrnlly in the Territery, In Itasca Lake, a beautifal sheet of water. The river flows first in an eastern, thence in a southern direotion, to the confines of the Territory; In its ceurse to the ocean. It le also drained by the Missouri and its numerous tributaries, the Red River of the North, whose watere pass off to lludson Bay, and the St. Louis entering Lake Superior on the eastern border of the Torritory. Forests of pine and other valuable Froods for timber, border the principal atreams, and lead and copper ere have been fonnd to some extent and iron ore on the shore of Lake Superior. There wers in the Territory in 1850, 5,035 nores of improved land, and 23,846 acres of nnimproved land in farms. Cush value of farms, $161,9: 18$; and the value of Implements and machinery; 15,981. Lire Stock:Llorses, 860 ; assee and mules, 14; milch cows, 607 working oxen, 655; other cattle, 740; shreep, 80 ; swine, 734. Value of live steck, 92,859 . Agricul tural /roduc/s.-Wheat, 1,401 bushels produced; rye, 125; Indian corn, 16,725; outs, 30,582; harley, 1, 216 ; buck wheut, 515. Value of the products of market gardens, \$150; pounds of butter made, $1,100 \mathrm{lbs}$; inaple sugar, 2,950 ; beeswax and honey, 80 ; tons of hay, 2,010; potatoes, 21,145 bushels; wool, 85 llwa ; sweet potatoes, 200 ; pens and beans, 10,002 . Valug of slaughtered animals, $\$ 2,480$. The common travel. ing roads and military roads are the oniy improve. menta yet constructed. The route of the great Nerthern Yacille railroad has been explored scross the Territory. Congress, in May 1856, appropriated ever $1,000,000$ acres for the censtruction of railiroals.
The French were the firet Europeans to explore the region now compriged in Minnesota, and the Missiso slppi River was oxplored ly the Jesuit fathers, even beyond the Fulls of St. Anthony, at a very early period. The IIrat American military post. was eatallished here in 1819, and ealled Fort Snelling. This county has furmed a part of severul territorial governments: the last were lowa and Wisconsin. It was formed Ioto a 'Territury with its present name (in 18.9), which it derives from the original indian name of st. Peter's River.
Mint. Athelstan frat enseted regulations for the government of the mint, abont A.D. $92 \%$. There were several provincial mints under the ocntrol of that of London. Stow says the mint was kept by Italians, the linglish being ignorant of the art of coining, 7 bilward I., 12:8. The operators wore formod into a corporation by the charter of King Eidward III., iu which condition It consisted of the warden, master, comptroller, assuy-master, workers, coiners, and sul) ordinates. The lirst ontry of gold lirought to the mint fur conage, occurx 18 Eilward III., 1aH3. Tin was colned by Cliarles 1I., :ibst; and gun-metal and pewter by his anccessor, Jamen. Hetween 1800 and 1810, grants amounting to $£ 263,000$ weru mada ly Parliament for the erection of tho presont line struct ure in London. The new constleution of the mint, founded on the report of the llonorable Mr. Welleaiey l'ole, took effect in 1815. The master is now the chief oflicer.

Thus th small bran ally becom tain the she expenditur dient, whe phia for $\$ 6$ gold mine the mint 686, $56 \mathrm{c} \cdot \mathrm{F}$; pense of m (400,900) f
Mirage
at sea, und also witnes sia, and on
the expenses of the mint and branches of the Ualted Stater for the fiscal year, to the following effect :

Congress loges alght of the fact that the celnage of the branches at New Orlesna, Dahlonega, and charlotte, could be easily dispensed with, and with decided advantage to the Treasury. Those branches were established at periods when the bulk of American gold was produced In the southern Atlantle States. Now the supplies aro mainly from Callfornia, and the expenses at the three branches numed are a dead weight upon the Treasury, The colnage at Dahlonega and Charlotte, particularly, is too trifing to render either necessary or expedient any further operations there. The coinage at each place last year, and the appiopristions for the coming year, are as follows:

|  | Culnago-1888. | Expaneen-1888. |
| :---: | :---: | :---: |
| Pbllardelphta | 12,045,70298 | 177,200 |
| New Orleans | 2,868.510 60 | 68,200 |
| Drabonega, | 116,773 50 | 10,890 |
| Charlotte. | 217,885 50 | 11,600 |
| San Frauclsco. . . . . . . . . | 21,121,752 43 | 277,800 |
| New York Assay Oftice. | 20,441,818 68 | 02,210 |
| Total. | (56,812,782 99 | 8602,880 |

The coinage at Philadel phia, in 1855, was suspended for several months, in order to make extensive improvements, and to make the buildiag, for the first time, tire proof. The coinage of the parent mint has of late years been over $50,000,000$ annually. The sbove statement will, however, show that the coinage at New Orleans eosts noarly 3 per cent., Dahlonega 9 per cent., and Charlotte over 5 per cent. A Report of the Committee on Commerce, in 1850, demonstrated that the actual cost of colnage for a series of years was as fullows:

| At Philadelphia. | $\begin{aligned} & \text { Por cent } \\ & 0.23 \end{aligned}$ |
| :---: | :---: |
| New Orleans | 6.85 |
| Cliarlotte. | 890 |
| 1halonegis. | 9.97 |

This, be it remembered, was wisen tho coinuge at: the suutbern branches was more than double what it now is-the production of gold in that region being either actually less, or its profits less. The coinage at the three southern branches has now dwindled down to such small sums as to demand the closer attention of the gevernment, and indicates the expediency of cessation at all those points. The following is a summary of the gold of domestic production for each year, 185)-1855:

| Years. | New Orlanas. | Charlotte. | Duhlonrgn. |
| :---: | :---: | :---: | :---: |
| \|8iv1....... | 6,5,511,021 | (320),2-9 | \$247,698 |
| 1 5 ¢ $1 . . . . . . .$. | 8,770,722 | 818,081 | 870,349 |
| 1 $142 . . . .$. | 8,777,784 | 430,901) | 4,0,789) |
| 1553........ | 2,606,678 | S.k5, 150 | 454,290 |
| 1sit........ | 081,611 | 218,604 | 980,225 |
| 1855........ | 411,517 | 216,93 | 116,452 |

Thus the production of gold which was at the two small branches $\$ 567,000$ in the year 1850 , hus gridually hecome reduced to $\$ 383,000$, and in order to maintain the shovo of coinage at these two points, an annual expenditure of $\$ 22,000$ is hy Congress deemed expedient, when the same work could be dene at lhiladelphin for $\$ 6000$. Stnce 1838 , the gross product of the gold mines of North Carolina, as fur as indicated ly the mint returns was $\$ 4,238,236$, and of Georgia $\$ 5,-$ 6N6, N6t ; total, $89,925,100$; and the aggregate oxpense of maintaioing them $\$ 22,000$ unnually, or about Stoo, $(\mu)$ for the whole perind. See Coinages.
Mirage ( Fr .), an optical illusion very common at sea, and espeeially in high lattudes, and sometimes atso witnessed on land, particularly in Egypt and Persia, and on the margin of rivers and lakes, or on the sea-shore. It arises from nnequal refruction in the
lower strata of the atmosphere, and causes remote objecta to be asen double, as if reflected in a mirror, or to appear as If aunpended in the air. When the effect is confined to apparent elevation, the English aallors ctill it looming; when inverted images are formed, the Italians give it the name of F'ata Morgana (bee the term). Ships in the whale fiaheries are often descried, and aometimen known, by means of the mirage, at conaiderable distances. Csptain Scoreshy recognized his father's ahip at tice distance of more than 30 miles, and conaequently when below the horjzon, by its inverted Imsge in the air, though he did not prevlously know that it was crulsing in that part of the fiahery. The mathematieal thecry of the phenomenon is given by Blot, in the Memoires de l'Institut for 1809. See also Caddington's Optics; Biot's Traitd de Physique, tome lii.; Brewster's Optics, Cabinet Cyclopredia.

Mismissippi, one of the sonthern United States, is situated between $30^{\circ} 10^{\prime}$ and $35^{\circ} \mathrm{N}$. lat., and botween $80^{\circ} 30^{\prime}$ and $81^{\circ} 35^{\prime} \mathrm{W}$. long. It is 989 milea long from nerth to south, and 150 brosd, contalning 47,151 square miles. Population $\ln 1816$ was 45,929 , in 1820, 75,448 ; in $1830,136,806$; in $1840,375,651$; and $\ln 1850,606, b 55$.
The tract of land which now belongs to the present Stata of Nississippl was in olden times comprised under all those different ancient and general names under which the whole northern shore of the Mexican Gulf became known to Europe. In the year 1798 the name of the river was fur the first time given to a Territory, and the great "Missiasippi Territory" was erected, which included also the present Stato of Alalama. In the year 1817 the eastern portion of this Territory was separated from It and received the nams of Territory of Alabama, while the western portion, with a very limited sea-shore (from Pearl River to Grande Buy), was admitted into the Union as the State of Mississippl.

The southern part of the State, for about 100 miles from the Gulf of Mexico, is mostly a sandy, level pine forest, interspersed with cypress swamps, open prairies, and inundated marshes, and a few hills of a moderate elevation. This region is generally healthy, and by cultivation produces cotton, Indian corn, sugar, indigo, etc. As you proceod further north, the country becomea more elevated and agreeably diversilhed, and the soil is a deep rich mold, producing abondantly cotton, Indian corn, sweet potatoes, indigo, peaches, meions, and grapes. The natural growth of timber consists of pophur, hickory, black walnut, sugarmuple, cotton-wood, magnolia, lime, and sassafras, 'The eountry in the north of the State is healthy and productive, nud the lands watered by the Ynzoo through its whole course in the north-west are very fertile.

There were in this State in $1850,3,444,358$ acres of land improved, and $\mathbf{7 , 0 . 1 6 , 0 6 1}$ of unimproved land in farms; cash value of farms, $\$ 54,738,634$, and the value of implements and mathinery, $45,762,927$.

Live Stoch:-1Iorses, 115,460; asses and mules, 54,547 ; mileh cows, 214,231; working oxen, 83,485; other cattle, 436,251 ; sheep, 304,929 ; swine, $1,582,-$ 7ik. Value of live stock, $\$ 19,403,662$.
Agricultural Products, ctc.-Wheat, 137,990 bushels; rye, 9,606 ; Indian corn, 22,440,552; oats, 1,503,288; larley, 228 ; buckwheat, 1121 ; peas and beans, 1,072 ,757 ; potatoes, 261,482; sweet potatoes, 4,7.41,795; rice, $2,719,856$ pounds. Value of products of the orchard, $\$ 50,105$; produce of markct gardens, $\$ 46,250$. l'ounds of butter made, $4,346,234$; of cheese, 21,191 ; sugar, hogsheuds of, 388 ; molasses, $\mathbf{1 8 , 3 1 8}$ fallons; beeswax und honey; 397,460 pounds; wool, pounds produced, 559,619 ; cotton, 484,293 ; $11.1 \times, 665$; slik cocoons, 2 ; hops, 473 ; pounls tobaceo, 49,960; hay, tons of, 12,504 ; hemp, 7 tons; clover seeds, 84 bushels; other grass seeds, 533 ; flax seed, 26 bushels; and
were made 407 gallons of whe. Value of home-made manufactures, $\$ 1,164,020$ ) of slaughtered anlmals, *3,636, $\mathbf{8 8 2}$.

The Mississlppl River, with Its varlous windlngs, forms the entire western boundary of the State, and lts margin conalsta of laundated swampe, covered with a large growth of timber. Back of this the surface auddenly rises into what atre called bluffs, and behind them the country is a moderately elevated table land with a diversified surface. Cotton is the princtpal productlon of the State. The Yazoo is the largest river that has its whole course in the Stste. It rises in the north-west part, and after a course of 250 miles, enters the Missisaippl. I'he Pascagoula River, after a course of 250 miles, enters the Gulf of Mexico. At its month it widens inte a bay. It is navigable for a considerable distance for amall vessels. The Big Hlack River, after a course of 200 milex, enters the Mississlppi just above Grand Gulf. It has a bout navgation of 50 wiles. Pearl Piver rises in the eentral part of the State, and passing thiough lt to the south, forming la its lowe: part the boundary between this State and Louisia on, enters Lakg Borgne. Its navigation is much hupated by and bara and obstructions of timber. The Ilomoclitt, is a considerable river whieh entsas the Mississipyi. Leside those, there are a few other amall rivers no ! crseks. A shaln' of low, sandy islands, six or seven miles from the shore, enclose several bays or sounds, the largest of which are Misbissippi Sound, l'ascaguula Sound, and Lake Borgne.

Manufactures, etc.--There were In the State in 1850, 3 cotton factories, with a capital invested of $\boldsymbol{*}: \$, 000$, employing 19 males snd 17 females, produc ${ }^{2}$ g 11,000 pounds of yarn, valued at $\$ 30,500 ; 8$ establishme.ts, with a capital of $\$ 100,000$, employing 112 persons, and making 924 tons of castings, ete., valued at $\$ 117$,400; 157 flourligg and grist mills, 246 saw milla, 130 tanneries, 63 printing oflices, 56 newspm? $\quad s, 2$ triweekly, 2 semi- weekly, and 52 weekly pullications. Capital invested in manufuetures, $\$ 1, \times 35,395$; value of manufactured articlen, $42,962,038$. There were, January, 1856,10 railroals in the State, 87 miles completed snd in operstion.

The principal places in the State are Jackson, the capital, Natchez, Grand Gulf, Washington, Viekshurg, Columbns, Aberleen, and llolly Springs. On the 1at of January, 1854, there was one hank, with s capital of $\$ 240,000$. Total tonunge of the State, 1853 , 2,505,000 tons.

These returns are very incomplete, and only includo the direct commerce. Nost of the imports fir Misais. sippi are entered in the port of New Urleann.
Misalssippi River, the largest river of North Ameriea; and in length of navigalle tributaries, and in extent of facilities atfordel to commere, the greatest river in the world.

Discorery of the Miasissippi.-There seems to in Iltte doubt that l'inedo, the C'aptain of Cisray, saw for the tirst thae the mouth of the Mississipin when he aecomplished, in the year 1519, his first cirehomasign thon of the whole Mexican Ciulf. We have no npeerial repurt of Pinedu's peaceedings. But on the few map, or sketuhes of the Mexican liult which were mule in Spain soon after linetsis return (of the yeara lio20, 1525, and 1599), thare is to the found, near the centre of the northern ge'f shore, s large inlet called "Har pequefia" (the little sea), und a mithity rlver lea ug into it called "Rio del Beplritu Sante." Diego Ribero, on his larga and accurate map, (of 1529), which he made for the Fmperor Churles V., has this bav and
the mouth of the river already under $20^{\circ}$ north latltude, whlch is very remarkable, beoause it la the true latltude of the Mississippl mouth, and because it nearly decldes the question that not Moblle Bay, as some have supposed, but tho Miselsalppl, was indlented by it. Nobody could have made this diseovery, given theee names, and bruaght home the news of lt , hut Pinedo. Since that tline the "Mar pequena" and tho great Rlvor "Del Espiritu Santo" appoar on the old maps. We can trace and follow them or the Spanish maps through the whole of the 16 th century, und tind them slways, with some slight varlations, in the michdle part of the northern gulf shore, and generally under the latitude from $25^{\circ}$ to $30^{\circ}$ north.

It is thought that with the name "Mar pequena" is moant that great bay which is included between the projectlng promonturies formed by the Mississippl passos and the northern gulf shore, and for which we have nu general name. The Mississippi pusses must have appeared to the old Spandsh navigatora as very dangerous and difficult of npprnaei. And very often they put she name of the Iloly Cross to capse of this deacription.
The recond traveiar atter Pinedo who anw and erossed the Mississippl was no doubt Cubeca dy Vaca and his compunions, between the years $153 \%-1535$. Fron, Cambega de Vaca's report, it is evilent that his commander. Narraez, and his companions, font lost about Mobile or Porilldo Bay, or somewhere else not vary fart the cast of the Misslsslppi. Onve, he says, they believed themselves to have arrived at the " Bay of Espicitu Sants, near the Mhsmsslpli." Afterward Cabega and his followers wandered westwarl in the direction of Nex Mexlco; so they most have cros.ed the Misslssippi. But that is all we can say. He mentions so many great rivers in hls report, that we cab not recog.ize among them the true "Rio Grande," the Mississippl.

De Soto.--Fernando de Soto was the thir! discoverer and prinelpul old Spanish explorer of the Mississippi. lie arrived at its borders, in the neighturhoom of the so-ca'led Chicanaw hutfs, 1542 , and ascended and descended the river, which in the reports of his apeditions is generally only called " Jicic Grande," up and down. He died on the alore of the river, and was buried near its waters somewhere atout the mosth of the Arhansas River. De Sotu's sutcecessor, Mosenso, carried the rest of the Spanisharmy, in the year 15 d, down the whole river, and he was the first cemmander who sailed from the mouth of the river into the sea. Which of the passea it was can not be male out. Biedma. one of the writers on De Soto and Mosenso, and one of thei: companions, states, inwever, that the river had differint moths and tranches. In one of the reports on De Sotco's expelition (hy Garrilasso de la Vega) it is said that the Indian name of the great river was "Chucagu.." l'rohabl, it consequence of this, the geographers put somectimes on their maps the name "Shucagna" to the river. Generally, however, the old namn ot " Rio del Vist" itn Santo" (Biver of th" Holy (iisost) prevailed after :/s Sote for a long time Onv of ihe hisoorians of De soto, tig su called "I sptughese gentleman of cisves," sometimes calls it "the (ireat liver of Guachoya." (iunchoya vas one of the phees along the river where be Soto encamped. "In Cunchoyn," nay", tharrilasso "the fopad river is called
Tamaliven;' ite sileo, 'Tupala;' In Copa, 'Mico;' at the port or mouth it i4 called ' BI.' "
 sent to Pensacola tha, sad from thence, with his captains ind men, mali many inreds into the interior toward the ucrth ami west. It is very possila, thengh it la nowhern axactly stated, that anome of his men aliso got as far eest as the Missiseippi.
Mitrquette and /a Salle,-The Frebch Martquatte (1673) and mon aiter hin the Sieur do la Salle (16\%\%) re-discoverel the Misalsslppl, and say: a greater part
of the river than was ever acen before them. De la Salle was, after Mescoso (1643), the firat who aailed (1682) down the whole river to Its mouth, and entered the Mexican Gulf. He explored in boats the wholo delta of the passes, and saw, without however naming them, all the principal passes. A little above the dlviding point of the passes he erected a monument with the arms of France. Thls was on the 8th of Aprll, 1682. On the 7th of the same month he had explored the principal branches of the river and seen the sea. He observed also the latitude of this place; but there is a great diversity about the reaulta of ha observations. Some say that he oliservod the latitude $27^{\circ}$ north, as, for lnstance, that remarkable document of the taking posseeslon of the country at the month of the river by La Salle. Aiso, Barela aays that La Sillo nbserved the latitude of the mouth between $27^{\circ}$ and $28^{\circ}$ north latitude, "though," he adds, " some heurd la Salle say that the mouth was between $28^{\circ}$ and $29^{\circ}$ north latitudo," After this, La Salle ascended the stream agoin to the north.

Father Marquette (1672) was the person who introducal for the first time into geography the Indian nume of the river, "Mississippi." IIe, however, gave to it at the sume time the Cliristian or French name "Riviere de Conception." La Salle seems to have ratiled this latter name. He called the river, after the great French minister, "Riviere de Colbert." On some maps even the whole upper Mississippl country is called "La Colbertie" (Colbert's land). The name Riviere Colbert may be called I s Sulle's name for the Mississippi. It aeems, however, soon to have given way to the Indian name Mississipni, which really was already longer known to the European missionaries, and which was already oftener adopted in books and in commerce than those new inventions of the Finropean discoverers.
Tonti.-The next man after De la Salle who came down the Mississippi was tha Sieur de 'Touti, or 'Tonty, who hal already accompanied La Salle on his first navigation. De Tonti had heard that La Salle had set out from France to the mouth of the river, and he camc, in the year 1685, down to meet him at the whores of the Gulf. Ife arrived there during "the IIoly Week" (Faster) of 1686 , but did not find La Salle, who had reached the const of Texas instead of that of the Mississippi passes.

Origin of the Name.-" One of the names of the river under which Iberville, in 1699, hat heard it catled," says Charlevolx, "was Malbouchia." But the name Mississipil seems already then to have heen quite common. At least the first journal written in this colony-that of Captain Suuvol $(1699,1700)$-uses always the nane Mississippi, and not once that of lliviere Colhert. In the year 1712 an attempt was made to give the river atill another name. The great King of France himself ordered, in the letterd patent to Crozat, that the great river "heretofore called Mississipyi" should henceforward he called "Aiviere St. Louis." But this name, nowly sent out from France by ioyal authority, did not keep its ground against the ord long-ago adopted Indian nume. Charlevoix, who truvelet along the river in $1721-22$, and published his work in 1744, never uses it. He always calls it "Mississippi" or " 1 ficissipi." Into genernl uee the name liviere St. Lonla las certainly not eome; but on maps made ly royal geographers or great sizveros like D'Anville, we lind it still used in the yean 1332, though always besides tho numo Mississippi.

The namo "Mississipipi" is an Ojibheway wort, which the first discoverers of that strean heard pronomued in their missions round Labe Styerior. According to fome, its meaning is "the Great Water." Others, fur instance the Reverend Bishop Barage. 'xplain it as "rivers," or "woters from all sides."

The French authors generally write "Missisipi ;" Spanth avthors havo always "Misisiju." We now
double every consonant in it, and write "Missiselppl," In which word, I have no doubt, some letters could be spared.-J. G Koul.
Description.-Its extreme source, according to the explorations of Sehoolcraft, July 13, 1832, ls Itaska Lake, $47^{\circ} 10^{\prime} \mathrm{N}$. lat., and $95^{\circ} 54^{\prime} \mathrm{W}$. long., at an ele--atlon of 1500 feet, and the distance of 8160 miles ahove the Gulf of Mexico. Itaska Lake is a beautiful , set of water, lying among hills surmounted by pines. The outlet of the lake ls 10 or 12 feet broad, and from 12 to 18 incheo deep. Ita course ls then northwardly and north-eastwardly, and It passes through Iaken Irving and Travers, and then onstwardly and south-east wardly, and through some amall lakes, to Lake Cass. This lake is of conaiderable extent, and containe a large ialand, 182 miles below ita source, and Its surface is elevated 1830 feet above the Gulf of Mexico. Its course is weat to Lake Wlanipec, then south-west, through Little Winnlpec Lake, until it receives Ieech Lake Fork, the outlut of a consldorable lake of the same name. The mest northern point attainell by the river is a fow minutes short of $48^{\circ}$; it then pursues a winding couree eastwardly, passing through some smull lakes, until it attains a gouthwardly direction. The average descent of the Mississlppi, from its aource to its entrance into the Gulf of Mexico, ls a fraction over five inches per nile. The region about the source of the Mississippi is an clevated table land, ubounding in small lakes of pure water, and fed chiefly by aprings.
Extent of Steab Nafioation on the Rifers, Batous, mto, connbetrd with the Misbigsippi by Citannela navicaale for Steameha, 16,674 Miles.

The average width of the Mississiopi below the Missourl is about a mile ; but the lurge rivers which enter it greally inereaso ite depth. Its medial current is about four miles an hour. At the head of the delta, tha depth is from is to 80 feet ; at New Orleans it is
100. At the distance of 105 miles belove Now Orleans, by the course of the river, bat 90 In a c'rect course, this majestic river enters the Gulf of Mexico by eeveral mouths, the principal of which are called the Bulise, or North-east Pass, in $20^{\circ} 08^{\prime} 80^{\prime} \mathrm{N}$. lat., and $89^{\circ} 01^{\prime} 24^{\prime \prime} \mathrm{W}$. long. Draining a country of over $1,000,000$ square miles in extent, it would naturally be expected that its spring floods would be vast ; and in consequence of them, it overflows its banks at that season to a great extent. From the sources to the mouth of the Miesourl, the floed commences in March, and does not subside before the last of May, at an average halght of 15 feet. From the Missourl to the Ohio it rises 25 feet, and below the Ohis, for a great distance, 50 feet. At every flood it overspreads a country, chiefly on its western side, from 10 to 80 miles wide, 850 miles from its mouth. This river is extremely winding in its course; and sometimes a bend will occur of 30 miles in extent, in which the distance acroes the neck will not exceed a mille. This circumstance undouitedly impedes the current, and than favore navigation.

There are three light-houses at the passes, and ono at the head of the South Pass, viz. : the one at the north-east is a flxed light, elevated 78 feet above the surface of the Gulf, and vivible $13 \frac{1}{\mathbf{h}}$ nautical milee; at the South lisss is a revolving llyht, on a tower of 54 feet above the sea; at the south-west pass is a flxed light, elevated 60 fect siove the murface of the Gulf, and visible 12 nautical miles; and one with a fixed light at the heal of the South Pasw, built of iron in 1852 : it shows a fixed light.

The acquisition of Loulsians and Florids by the United States having included within their boundary the whole river from its source to the Gulf of Mexico, and the atipulation in the treaty of 1783 , securing to British suljects a right to participate in its navigation, not having been renewed by the Treaty of Ghent, in 1814 the right of navigating the Mississippi is now vested exclusively in the l'nited States.-Wingatos's International Lav, p. 258.
"The right of the United States to participate with Spain in the navigation of the Kiver Mississippli, was rested by the American government on the sentiment written in deep characters on the heart of man, that the ocean is free to all man, and its rivers to sll their inhshitants. This natural right was found to be universally scknowledged and protected in all tracts of country, united under the same political socicty, by laying the navigable rivers opron to all their inhabltsats. When these rivers enter the limits of another society, if the right of the upper inhabitants to descend the stream was !n any cace obstracted, it was an act of force by a stronger society against a weaker, condemned by the judgment of mankind. The then recent case of the attempt of the limperor Joseph II., to open the navigation of the Schollt from intwerp to the sea, was considered as a striking jroof of the general union of sentiment on this point, as it was bolieved that Amsterdan hail nearcely an advocate out of llolland, and even there hire pretensions were advocated on the ground of treaties, nad not of natural right. This sentiment of right in favor of tho ujper inhabitants must become sironger in the proportion which their extent of country hears to tho lower. The linited states held 600,000 myuare miles of inhabitalde territory on the Mississipil anl its branches, and this river with it.s branches atforled many thousamis of miles of navigable atera penetrating this territory in all its jarls. The inhabitnhle territory of Spain below their boumdary, and lardering on the river, which alone could protembang fear of being incommoded by their use of the river, wan not the thousanith part of that extent. This vast portion of the territory of the Unitel States had no other outiet for its productions, and these productions were of the buikient kind. And, in tri th, their pasemge down the
river might not only be innocent, as to the Spanish subjecte on the river, but would not fail to enrich them fur beyond their actual condition. The real interesta, then, of the inhnbitaints, upper and lower, coneurred in fact, with their respeotive rights."-Wuraton's IMernational Law, pp. 258, 259.

Missourd, one of the western United States, is situated between $86^{\circ}$ and $40^{\circ} 30^{\prime} \mathrm{N}$. lat., and between $89^{\circ}$ and $95^{\circ} 30^{\prime} \mathrm{W}$. long. It is 287 miles long, and 230 broad, containing 65,087 square miles. T'opulation in 1810 was 10,838 ; in $1820,60,688$; in 1830,140 ,074 ; in $1840,383,702$; and in $1850,682,043$.

Phyaical F'eatures, etc.-This State prosents a great variety of surface and soil. Alluvial or bottom land is found on the margin of the rivers; receding from them the land rises in mome places gently, and in others very abruptly, into elevated harrens or rocky ridges. In tho interior, bottoms and barrens, naked hills and prairies, heavy forests and streams of water, may often be seen at one view, presenting a diversified and beautiful landscape. The south-east part of the State has a very extensive tract of low, marshy country, abounding in lakes, sind liable to inundations. Back of this a hilly country extends as far as the Osage River. This section is rich in aninerals. The leati region covers an area of more than 3,000 spluare miles. In St. Francis county is the celebrated "Iron Mountain," elevated 300 feet sbove the surrounding
plain, and $1 \$$ miles across its summit, and 80 per cent. of its mass pure iron. Five miles distant is the l'ilot Knob, MOl feet high, and with a base a mile and a half in circumference of the asme species of rich ore. Hetween the Osage and Missouri livers is a tract of country very fertile, and agreeably diversified nith woolland and prairic, and abounding with coal, salt, etc. The country north of the Missouri is emphutically "the rarilen of the Weat." There is no part of the world where a greater extent of country caln be traversed inore easily when in its natural etate. The surface is for the most part delightinlly undulating und variegated, sometimes rising into picturesque hllis, then atretching away into n sen of prairies, oc. casionally interspersed with shaily groves and shining streans.

There wore in this State in 1850, 2,938,425 acres of land in: reroved, and $6,79 ., 2 \cdot 4$ of unimproved land in farms ; cash value of farms, $863,2: 5,513$, and the value of implements and machinery, $\# 3,981,555$. Live Stock,-Horses, 225,319; asses and mules, 41,667; milch eows, 230,169; working oxen, 112,1 is ; other cattle, 441,173 ; sheep, 762,511 ; swine, $1,702,625$; valHe of live stock, $\frac{a}{3} 19,487,580$.

Agricultural Products, zte.-Wheat, 2,581,652; rye, 44,268; Indian corn, $36,214,537$; oats, $5,278,079$; barley, 9,631 ; buckwheat, 23,611; pess and beans, 46,017 ; potatoes, 933,006 ; sweet potatoes, $333,50^{\circ}$; rice, 700 pounds; value of the product of the orchard,
 of butter made, $7,8: 34,359$; of cheese, 203,572 ; maple sugar, 174,910 ; molasses, 5,636 gallons; beeswax ind honey, $1,328,1722$ pounds ; wool, $1,6: 2,16 \mathrm{t}$ pomuls produced; thax, 527,160 ; silk comons, 186 ; hops, 4,180 ; tohaceo, 17,113,784; hay, 116,925 tons; hemp, 16,60, tons; clover seeds, 619 busheis; other grass seeds, 4,346 ; thax need, 13,606 ; and were male 10, obit gajlons of wine. Valta of home-made manufactares, 43,674,705; of slaughtered unimals, $\$ 3,367,100$. The Mississipui winds aton; the entire eastern boundary of the State for a distance of 100 miles, and receives in its course the waters of the Great Missonri, which indeed deserven to be rogirded us the main stroam. Through the central and richest part of the State the Missourl rolls its tmmense volume of water, binger navigable for tive montha in the year tor steambata 1 , wo miles from ite entrance into the Mississippi. The la Mine, Osage, and Gasconade on the south, and the Grand anit Chariton on the north sitle, are navigable

The foliowing statement exhilits a rapid increase in the population of Missouri for the years mentioned: poruiation.

The statement below showa a most gratifying allvancement in the number, quantity, and value of the chief oljects of taration in the State. The years mentimed are seiected merely for the reason that the aghregates for those years are the most accessible, witheut making laborious additions. Any other periods would exlithit the same flattering results:

For mineral resources, etc., of Missouri, see North Aner. Rer., xlviii., 514 (W. G. Eliot); Ilunt's Mag., viil., 635 (C. C. Wirttlesery), xiii., 222, xv., 28, xvi., 177.
Missouri, a large river in the United States, rises in the Rocky Mountalns, and takes its name after the union of three loranches, denominated Jefferson, Gallatin, and Madison, in $455^{\circ} 10^{\prime} \mathrm{N}$. lat., and $110^{\circ} \mathrm{W}$. long. The spring sourcen of Missouri, und those of the Columbla, which flows west to the Pucifle, ase not more th:n a mile apart. At the distance of 411 miles from the extrene point of navigation of its head branches, the Missouri passes through the Rocky Mountains by what is lenominated the Gates. For a distance of six milies the rocks rise perpendicularly from the water's edge to the height of neariy 1200
feet, and the river is only 160 yards wide. 110 miles below thin and 621 miles from its source, are the Great Falis, 2,575 milles alove its entrance into the Miselssippl. The river descends 857 feet in 18 miles, by a succession of talls. The Yeliowstone River, 800 yarls wide at lts mouth, enters the Missouri from south-west 1211 miles from lts source and 1,880 from its mouth. The Missouri enters the Mississippl 8,090 miles from ita source, which, added to 1395 miles, the distance to the Galf of Mexice, makes the whole length 4,491 miles. Through this whele length there is no serious impedment to navigation except tha Great Falla. The principal tributaries are navigable from 100 to 500 miles. See Mississtrpi Riven. The Mlesouri through the greater part of its course in rapid and turbd, and about a mile in width. The plat or valley of Its bunks is exceedingly fertile and from 5 to 25 miles wide on each side.

Moblle, eity, port of entry, and capital of Moblle county, Alabama, 200 miles sonth-west of Montgomery, 217 milles south by west of Tuscalosan, 170 milies east north-east of New Orleans, 35 miles west by north of Pensacols. Molile is situated on the west slde of a river of the same name, at its efltrance into Mobile Bay, 30 miles nerth Moblile Point, at the mouth of the bay, and at the commencement of the Mobile and Ohio ruilroad. Lat. $30^{\circ} 41^{\prime} 20^{\prime \prime}$ N., leng. $88^{\circ} 1^{\prime}$ $29^{\prime \prime}$ W. from Greenwich, Englancl. Population, 1830, 3,194; 1840, 12,672; 1850, 210,515; 1854, 25,000. Mobile is situated on a beautiful and extended plain, clevated 15 feet above the hlghest tides, open to refreshing breezes from the bay, and comanndiag a beautiful prospect. It is ilghted with gas, and gupplied with pure water brought from "the spring" near Spring Hill, a distance of 8 miles, and distributed throughout the city in iron pipes. The entrance to Mobile Bay ls between Mobile Point on the enst, and Dauphin Island on the west, ahout ist miles apart, the deepest channel having 15 fect water at low ebb; thit vessels Irawing more thun 8 or 9 feet water can not, ewing to a dhoul in the bay, reach the town except at high water. A light-house erected on the point, lat. $30^{\circ} 16^{\prime}$ N., long. $88^{\circ} 32^{\prime}$ W., exhibits a fixed light elevated 55 feet above the level of the sea. Vessels drawing more than 8 fect water pass up Spanish River, 6 miles, around a marshy island into Mobile River, and then drop down to the city. It is, next to New Orleans, the greatest cotton mart of the South. 681,000 bales were exported in the year 1855. The exports amount to from $\$ 12,000,000$ to $\$ 16,000,000$ annually. Tonnage of the port 1853, 176,949. It is defended by Fort Morgan, formerly Fort Bowyer, sitnated on it long, low, sandy point at the mouth of the bay, 30 miles below the eity. Near Dauphin Island is the anchorage for large class vessels, where may be scen at times a flect of 50 or lio sail. It was' surrendercd to the Americuns by Spain in 1813, chartered as a town in 181.l, ineorporated us a city in 1819 . It has suffered severely by lire : 170 buildings were burned in 1827, and 600 in 1839. But it has heen rebuilt, with additiodal beanty and convenience.

Mobile Bay, Alabama.-The bay sets up from the Gulf of Mexico, and is 30 miles long, and on an average 12 miles broad. It communicntes with the gulf by twe straits, one on each side of Dauphin lsland. The strait on the west side will not admit of vessels drawing more than 5 feet water ; that on the east side, between the islamland Moblle Point, has 22 feet water, snd the channel passes within a few yards of the polnt. There is a ber across the iny, near lts upjer end, which has only 11 feet water. The Mobile Point light-Lrouse is on the esst side of the entrance into Mobile Bay. Lat. $30^{\circ} 13^{\prime} 48^{\prime \prime}$ north, long. $88^{\circ} 00^{\prime} 30^{\prime \prime}$ west. Shows a revelving light, elevated 57 feet above the level of the sea, nad visible for a diatance of 12 nautieal miles. Three miles south-west of Mobile Point, is Sand lsland light, lat. $80^{\circ} 11^{\prime} 18^{\prime \prime}$ north, long. $88^{\circ}$ $02^{\prime}$ west. Showa a fixed light, elevated 54 feet above the sea, and is visible for a distance of 12 nautical miles. Within ths bay, a little south of the city of Molile, is the Choctaw Point light-house; it shows a fired light, elevated 54 feet above the surface of the tay, and is visible for a distance of 11 nautical miles.

Mocha, the principal port in the Red Sea frequented by Europeans, In that part of Arabia called Femen, about 40 milics to the north of the Strait of Bab-el-mandeb, lat. $13^{\circ} 19^{\prime} 30^{\prime \prime}$ north, long. $43^{\circ} 20^{\prime}$ east. Population variously catimated; lut may, perhaps, amount to from 5000 to $\mathbf{7 0 0 0}$. It is eacircled with walls, and indifferently fortified. Its appearance from the sea is imposing. Mocha is situated on the margin of a dry sandy plain. It is built close to the shore, between two points of land which project and form a bay. Vessels drawing from 10 to 12 feet water may anchor within this bay at about a mile from the town; but large shijes enchor without the bay in the roalls, in 5 or 7 futhoms water-the grand mosque bearing cast south-east, and the fort to the south of the town eouth by east, distant about two miles from the shore. The great article of export from Mocha is coffee, which is universally adinitted to he of the finest quality. It is not possible to ferm nuy very accurate estimate of the quantity exported; but we belicye it may be tnken at 10,000 tons, or perhapa more. The greater portion is sent to Djidda and Suez; but thero

Is a pretty large export to Bombay, and other parta of Indla, whence some is sent to Earope ; occaslonally, however, the exporta frum Mocha and Hodelda, lirect from Europe, are very conslderable. Hesldes cuffee, the princlpal articles of export are, dates, adjoue, or paste made of dates, myrrh, gam Arable, olibanum, senna (cassia senna), sharks' tins, tragacanth, horns and blden of the rhinoceron, balm of Gilead, ivory, gold dust, clvet, aloes, sagapenam, etc. The principal articles of lmport are, rice, plece goods, iron, and hariware, ctc. The ivory, gold durt, and elvet, met with at Mocha, are brought from the opposite const of Abyssinia, whence are also brought slaves, ghee, etc. The grenter part of the forcign tracie of Mocha is tranacted by the Itanians; and it is much sater to deal with them than with either Turks or Arabs. Europeans pay a duty of 3 per cent. al calorem on all goods imported by them from Europe, India, or China; the duty belng jevied on the aount of the sales. The bayer pays brokerage, coolle and boat-hiro. All kinds of foreign goorls are sold $r$. credit, and the payment is made by three instulme.,
rat a certain day, according as may have beea agiec, on. Collee la always pald for in ready mone; On the sale of other gomis, the produce of the country, a creait is giv $n$; or if resaly money the paid, a discount is allowed at the rate of 9 per cent. When goods are discharging the master mast furnlah the custom-house officer with a manifest, or account of the marks, numbers, and contents of each package. IIe then opens two or three hales taken at ranilum; and if they correrpond with the uccount delivered, no further examination is made; but if they do not correspond, the whole hales are opened, anil double duty is charged upon the excess. The quantities being thus usiertained, their value is leurned from the acconnt of sales rendered by the seller, and the duty charged accordingly. In this respect there is nothing to object to ut Mucha; but a good deal of extortion is practiced in the exaction of port charges, presents, etc., which may, however, be defeated ly proper tirminess. The port charges on shlps, or three-mast vessels, may amount to about 400 Mucha dollars, and those on brigs to about half as moch. Provisions are plentiful and cheap; but water is dear ; that In the vilinity being lirackish and unwholenome, whatever is ased for drint:Ing, ly all but the poorest persons, is broaght from Mesa, about 20 miles off. Fish are abandant and cheap, but not very good.
Mogadore, a rea-port town on the west consc of Moroces, lat. $31^{\circ} 50^{\prime}$ north, Jong. $9^{\circ} 20^{\prime}$ went. I'opulation alout 10,000 . It is indifierently fortitied; the conatry in the immediate vicinity is low, flat, sandy, and unproductlve. Water is scarce and rather dear; I ing either rain-water collected and preserved in clsterns, or lirought from a river about $1 \frac{1}{3}$ miles distant. The port is formed ly a small Island lying to the mouthward of the town; but as there is not more than $11 t$ or 12 feet water in it at ebh tide, large ships nochor without, the long lattery bearing onst, dintant $1 \frac{1}{2}$ mifes. The prinuipal Imports are English wooien and cotton statis and hardware, German linens, tiln, copper, earthenware, mirrors, gluss, nhpar, pepper, paper, and a variety of other artirles. The exporta principally consint of aweet and hitter almonds, gum Arabhe, and other gams, beeswax, cow and valf mkins, lvory, uatrich feathers, goid dust, olive oll, dates, etc.
"The dutles levied on importert articles are not pail in muney, but in kind, and on finglish manufactures, army and navy cloth, brass, copper, tea, and sugar, and in fact, in all casex, with fow exerptions, nre rated at 20 per cent., or a fifth purt of the goonls, whatever they may be, that are lamiled. Thla primitlve mode of Ísiness la aibo accompanied hy disulvantnger, and assists, in conjunction with the ins!) inriff, to cictpie any enleavors attempted to liring the liarhary Staten In closer mercantlie nillance with ouralreas." It la to be hoped that the government of Morveconay becone
allve to the mischlavous consequences of thla system. Nothing would do so much to promote induatry snd civIliantion in the country, as the effectual reduction, or ruther the total repeal, of the existing duties on exports.

Mohair (Ger. Mohr; Fr. Moire; It. Moerro; Sp. Mue, Muar), the hair of a variety of the commen goat, famous for belng soft and fine as silk, and of a silvery whlteness. It is not proluced anywhere but in the vicinity of Angora, in Asia Minor. The exprortation of this valuable and beantiful article, anless in the shape of yarn, was formerly prohibited; but it may now be exported unspun. The production, prepara-
tion, and sale of mohair have long engrossed the pintion, and sale of mohair have long engrossed the $\rho$ rincipal attention of the inhabitants of Angora; and it used to form an important artiole of Venetiant commerce. It is manufactured into camlets and other expensive stuftis, litherto but little has been imported Into England. See, for further partlcnlars, Tor'nst-
Font, Joyage du Levont and Ungoviant or. Turkey and its Resources.

Molre Antique. In an ordinary woven grods the threals anses each other at right angles; the lougs thre, ds forming the wurp, and the short threale the weft. According as the fuhrie is of high quality, to do these threala intersect in a regular and rinibibe quality; but be it as good as it may, there are always some irregularities; they may escupe the eye, hut they become apparent in a singular way. It good silk he wrapped tightly and curclessly round a roller, it may become moire mucle against the inclination of the possessor; it will have acquired an irregularkind of ghosing in some parts rather than in uthers; and this irrugulat glossing, when viewed firm a little distance, presents somewhat of the nprearunce of moire, or watering who knows? Perhups an aceldent to a piece of rolled silk sugerested the lirst iden of watering as a distinct mode of adornment to silken goods? Such necilents have fregueatly occurred in the history of mamufactures. lloweser, accident or no acchident, wate"ed silks liave long been in use, both in this conntry and In France. If a pattern be engravel upon one cytinder in relief, and a similar pattern on another cytiader, in sunken devices; and if one of these be heated from within, and if a plece of sitk or velvet he drawn between the cylinders, then will the silk or velvet acguire an cabossed pattern, hacause some purts of the surface are more presseal, and are consequently more glossy than the rost. Namprons varieties of this process ane employed in the greparation of tancy gothls. llut this is not exactly watering. For this promese two layers of silk are laid face to face, and are pressed tightly between wollers. What fllows? lliwever close the threads may he, there are still interstic's hetween them; they follow each other in ricige and hilLow fashion throughoat the lougth mil brealth of the plece. Now, if tho slightest ivrerglarity exists in the pressure, stmo of the threals become prosed in particular parta mora chun others: and the over. pressed portions prespat a grenter pions, a greater power of refiecting light than the rest. 'The more cse priclously these proportions Alstribute themselves, the more undulatory anl clonly will the the result. We do not way that the actual proersa ia nuthiniz more than this, hat that this is the busis on which the whole is founded. The gooula may he sprinkled with water prevonsly or not; the mollers may be loth hented or both cold, or one heated and one colld the rollers mar he plan or variously indented; they may mose whoothly over each ether or miny linve a slight lateral move-ment-how theee variations of method would proluce variations of effect evrry one will sec. The aljective "antliue" Is most likely glven to the silks thus produced from thelr resembinace to the tably silk ulresses worn in former timen. It is chletly problurem in Francs; hut in Spitultehels, Finghond, its weavers and moir:urs combined, huve lately copied the art so rleverly as actually to excel the F'rench. Jut Spitatields

guards its necret as sedulously as the magiclan in a falry tale guards the oaptlve princess in the cartle, and will not let the world have a peep at their doings.
Molasses, or Melasses (Fr. Sirop de Sucre, Mclasges; (ier. Syrup; It. Mirlazzo di zucchero; Sp. Miel de asucar, Chancaca; Port. Melasso, Assucar líquido; Res. Patoka sacharmaja), the uncryatullizable part of tha juice of the sugar cane, separated from the angur during its manufacture. It is of $n$ brown or black color, thick, and viacid; has a pecaliar odor, and a swect emprreumatic taste. About 8 gallong of proof spirit may, it le said, be obtained from a cwt. of molasses, sueh as ius recently been imported; but this depenis, of course, wholly on the richness of the molasses. L'art of the refuse that remains, after relining muscovado sugar, ls a sweet syrup, which, as well as the syrup that remains after bolling molusses to obtain lustarils, is called treacle. But the treacle obtalined from the former is always preferred to that ohtained from the latter, and fetches 50 cents par cwt. more. Molasses is mometimes used in propuring the cosrser gort of preserves; and on the lusopenis continent it is extensirely used in the manufacture of tobacco. The following statistles show the foreign trade of the United Stutes in molassea, and nlso show the reccipts to the foreign and home of this ataple. The last table shows the average vulue of the different kinds of molasses at the port of New York for two years:

| Decrease In IS50...................... . 9,228,9:4 |  |  |

It will be neen liy the foregoing statistics, that the recelpts of forelgn molasares lo the I'nited States for the your ending Decomber 31, 1856 , were $25,0: 16,724$ gallons, ngainst tital receipts in 1855 of $24,152,446$ gallons, and the total cousnumtion of this desaription in 1856 was $25,014,878$ gallons, against a consumption
of forelgn in 1855 of $23,583,423$,allone, being a decrease in the consumption of foreign in 1856, as compared with 1855 , of $2 \cdot 20$ per cent., while the total consumptlon of forelgn and domeatic in 1856 was 39 ,608,878 gullons, aguinst a consumption in 1855 of $47,266,083$ gallons, lreing a fulling off in 1856 of $7,657,207$ gallons, or the large decrease of $16 \div 20$ per cent.

The consumption of all kinds in 1856, as shown, was $16 \div 20$ per cent. less than that of 1855 , while that of 1850 was $16 \frac{1}{1}$ per cent. smaller than the consumption of 1854. This contlinued large decrense is attributuble, in a great measure, to the rupid deeline in the yich of Lonisiana cane. The following table whew the average value of molasges in New York for two years,

## See sroati.

Mole, in architecture, a mussive work formed of lurge ktunen laid in tho sea by menua of coffer tlams, extended wither in a right line or an ure of a circle, before a jurt, whinh it serven to close; to defemd the vessels in port frous the impetursity of the wavea, nid frequently fortitiod. Jole is sometimes used to signify the hartror itaelf, which it serves to form or defend.

Money. When the division of labor was first introduced, commodities were directly bartered for cach other. Those, for example, who had a surplus of corn, and were in want of wine, endeavored to find out those who were in the opposite circumstances, or who had a surplus of wine and wanted corn, and then excharged the one for the other. It is olvious, bowever, that the power of changing, and, consequently, of dividing employments, must have been subjecteal to perpetual interruptions, so long as it was restricted to mers Inarter. A carries produce to market, mal B is desirous to purchuse it; but the prolluce belonging to 13 is net enitable for A. (S, again, would like to buy If:s protuce, lut 13 is ulready fully supplied with the equiralent U'has to oifer. In wich cases-and they must be of a constant occurrence wherever money is not intro-duced-ho direct exchange could take place between the parties ; and it might be vety diffieult to hriog it about indirectly. The dificulties that would arive on such occasimes, und the devices that woukd be ahopsed to wercome them, lave been very well illustruted by Colonel Torrens, in his work on the Probluction of Weulth, p. 291. The extreme incomvenience attending such situations must ourly have forced themedres on the attentlon of every one. Fiforts wuild, in consequence, lee male to a void them; and it would speolily appear that the hest or rathar the unly way in which this coull be effected, was to exchange either the whole or a part of one's surplus produce for sonte commodity of known value, and in general temand; and whieh, consequent!y, few persons would be indinelt to refuse to, ucrejt na an equivalent for whatever they hat to dimpose of. After thin commorlity hat hegin wo he amployed as n means of exchanging wher counmonlities, indiviluals would become willing to purchase n areater quantity of it than might he required topay for the promlucts they weru cosirons of innmediately obtaining; knowing that shomb they, at any future p": :I, want a further miluly either of these or other ar:., es, they would le able readily to promure them In exchange for this univeraally dexlred commontity. Though at flrst clrculating alowly and with difliculty; It wonld, as the advuntages arlaing from lis use wire lecter apprecinted, begin to pass freely from land to hand. Its vulue, ne compared with other thinere, would thus come to be malrerrally known, und it would at last lee used, not unly us the common melimu of exchanges, but us a atandard by uhids to measuno the value of other thinga. Now this eommotity, whatever it may be, fis momy.

An intinite variety of commodities have heen used ss money in different countries and periods. But none esul he advantageously uaed as such, unless it possess severai very peculler qualities. The slightest reflection on the purposes to which it is spplied, must, indeed, he sufficient to convince every one that it is indispensable, or, at least, exceedingly dr rirable, thet the commodity selecter to eerve as money should (1) be divisible Into the smallest portions; (2) that it should adnit of being kept for an ind?finite period without deteriorating ; (3) that it should, by possessing great value in small bulk, be capable of being sasily transported from place to place; (4) that ore plece of money; of a certain denomination, should always be equal, in magnitude and quality, to evory other piace of money of the same itenomination; and (i) that: lue should he comparatively steady, or as littif, "et to variation as possitile. Without the first of : $\cdot \mathrm{r} \cdot$ qualities, or the espacity of being divided inte portions of every different mugnitude and value, money, it ls evident, would be of almost no use, and coull only be exchanged for the few commoditles that might happen to the of the same value as its indivisible portions, or ne whole multiples of them; without the second, or the capacity of being kept or hoarded without deteriorating, no one would choose to exchange commodities for money, except only when he expected to be nthle speedily to reexchange that money for aomething else; without the fhind, or facility of transportation, mouey could not be conveniently used in transactions between places at any consiterable distance; wlthout the fourth, or perfect sameness, it would be extremely diffieult to uppreciste the value of different pieres of moner; and without the fifth quality, or comparative steadlnoss of value, meney could not serve as a standaril by which to measure the value of other commorities ; and no one would the disposed to exchange the produce of his industry for an article that might shortly decline consilerably In its power of purchasing.
The union of the different qualities of comparative steadiness of value, divisibility, durablity, facility of trankportation, and perfect sameness, in the precious metals, louhtless formed the irresistiole reasen that has induced every civilized community to employ them as meney. 'The value of gold and silver is certainly not in rariable, turt generally speaking it changes only by slow degrees: they are divisible into, any number of parts, and have the singular property of being easily reunited, by means of fusion, without loss; they do not sleteriorate ly being kept; and from their firm and compact texture, they are very ilffleult to wear. Their cost of proluction, especially that of gold, is so consldershle, that they possess great value in small bulk, and can, of course, be transported with comparative facility; and an ounce of pure gold or silver taken from the mines in any quarter of the world, is precisely equal, in puint of quality, to an inuce of pure gold ur silver dug from the mines in uny other quarter. No wonder, therefore, when all tho qualities necessary to constitute meney aro possessed in so eminent a degreo by the precions metals, that they have been used ns such, in clvilized societies, from a vory remote eri. "Thisy hecame universal money," as 'Turgot has olsserved, " not in consequence of any arbitrary ugreement mong mee, or of the :nterventlon of any law, but by the nature and force oi things." When first used us moner, the precinus metuls were in an unfashioned stato, in Inars or lingots. The purtles hoving ugreed about the quantity of metal to be given for a rommodity, that quantity was then welghed off. Ihut this, it is pilinh, must have heen a tellions and tronblesome process. Indoulitediy, however, the grentent ohatacie that would he experienced in early agen to the use of guid nnil nilvur as money, would be found to consist in tha ditienity of deteroining the legree of their purity with suthcient precision ; and the discovery of somo meany liy which their welght and flneness might be readily und cor
rectly ascertained, would be felt to be indispeusable to their extensive use as money. Fortunately these mesns were not long in being discovered. The fabrication of coins, or the practlce of impressing pieces of the prectous metals with a stamp indicating thelr weight and purity, belongs to the remotest antiquity. Gougrt, Ds l'Onigine des Loix, etc., tome i., p. 269. And it may aafely be affirmed, that there have heen very few inventions of greater utility, or that have done more to accelerate the progress of imprevement.

It is matcrial, however, to observe, that the introduction and use of coined money make no change whatever in the principle on which exchanges were proviously conducted. The coinage asves the troutle of weighing and assaying gold and silver, hut it does nathing more. It dechares the weight and purity of the metal in a coin; but the value of that metai or coin is in all cases determinel by preciscly the same principles which determine the value of other commodities, and would be as little affected by being recolned with a new denomination, as the burden of a ship hy a change of her name. Inaccurate notions with respect to tho influence of coinage seem to have given rise to the opinion so long entertained, that cains were merely the signs of values! But it is clear they have no neerc claim to thls designation than bare of iron or copper, sacks of wheat, or any other commodity. They chango for other things, hecnuse they are desirablo articles, and are possessed of real intrinsle value. A itraft, check, or lill may net improperly; perbaps, be regarded as the sign of the money to be given for lt. Wut that money is nothing thut a commodity; it is not a sign-it is a thing signifled.

Money, however, is not merely the universal equiv. alent, or merchandise banale, used tiy society: it is also the standarl used to compare the values of all sorts of prochucts; and the stipulations in the great bulk of contracts and deeds, as to the delivery anil disposal of property, have all reference to, and are commonly expressed in, quantlies of money. It is plainity, therefore, of the intmost importance that its value should he preserved as invariable as possible. Uwing, however, to improvements in the urts, the exhaustion of old mines, and the discovery of new ones, the value of the precious metals is necessarily inconstant; theugh, If wo except the effects produced in the 16th centiry liy the discovery of the American milnes, it does not uphear to have varied so much at other times as might have been anticipated. Great mischief has, however, been repeatelly occasioned by the changes that have been made in most countries in the weight, and sometimes also in the purity, of exins; and since the impolicy of these changes has been recognized, similar, und perhaps atill neoro extensive, discords have sprung from the improper use of nulnatitutes for coins. It is, indeed, quito obvions, that no chnuge can take place in the value of money without proportionally affecting the pecuniary conditions in oll contracts and agrecments. Much, however, of the intluence of a change depends on its direction. An increase in the value of money is uniformly more prejudicinl, in a puthlic point of view, than its dinitation; the latter, though injurions to indlvilunls, muy simetimes be productive of natlonal alvantuge; but sush can never he the case with the former. See Prisuples of Political Economy, by Mc-

No certain estimate can ever he formed of the quantity of money required to conc'ret the husiness of mus country; this quantity lreing, in all cases, determined by the value of mnaey itself, the servicen it has to perform, and tho dovices nsed for economizing its cmployment. (ienerally, however, it ia very considerable; nad when it consints wholly of gold and silver, it occasionn a very hemvy expense. There can, indeed, be wo doubt that thit wish to lessen this expouse has heen one of the chief causes that have led .. civilized and - commerchal nations to fialiricate a portion of their
money of some less valuable material. Of tho varions substitutea resorted to for thils purpose, paper ln, In all reapects, the most ellgilse. Its employment seems to have grown naturally out of the circumstances incldent to an advancing soclety. When government lecomes anfficiently powerful and intelligent to enforee the observance of contracts, Individuals possessed of written promises from others that they will pay certaln sums at certain specilled periods, hegin to assign them to those to whom they are indebted; and when the subscrliers are persons of fortune, and of whose solvoncy no doubt can be entertained, their oblygations are readily accepted in payment of delits. But when the clreulation of promises or bllls in this wuy has continued for a while, indivihuals begin to perceive that they may derive a profit by lssuing them in such a form as to fit them for being readily used us a substitute for money in the ordinary transactions of life. Hence the origin of hank notes. An individual in whose wealth und discretion the pullic have conlldenee, heing applied to for a loan, say 85000 , grants the applicant his bill or note, payable on demand, for that amn. Now, as this note passes, in consequence of the confidence placed in the lssuer, currently from hand to hand as cash, it is quite as useful to the lorrower as if it had been gold; and supposing that the rate of interert is 5 per cent., it will yield, so long as it continues to circulate, a revenue of $\$ 250$ dollara a year to the lssuer. A banker who issues notes, coins, as it were, his credit. Ile derlves the same revenue from the loan of his written promise to pay a certain sum, that he could derive from the loan of the sum itself, or of an equivalent amonnt of produce! And while he thas increasen his own income, he, at the same time, contribises to increase the wealth of the public. The cheapest species of currency being sub) stituterl in the place of that which is most expensive, the superfluous coins are either usel in the arts or are as corted in exchange for raw muterials or manufaccured grods, by the use of which both wealth and elljoyments are increased. Ever siner the Introbluction of bills, almost alt great commercial tranametions have been carried on ly means of paper only. Notes are also used to a very great extent in the orlinary business of society; and? while they are reudibly exchangenble, at the pleasure of the holder, for coins, or for the precise puanities of goldi or wilver they profess to represe ., their value is maintainel on a par with tho "alue of theno metals; and all injurious thetuation. in the value of nut aey are as effectually uvoided as if it consisten wholly of the preeious metais.

In common mereantil language, the party who exchangea money jor a commolity' is said to buy; the party who exchanges a commoslity for money being said to sell. Price, nuless where the contrary is ulistinctly mentioned, nlways ineans the value of a commodity extlmated or rated in money. For a further account of metallic morey, see the ertlele Cins.

Sce Sunkers' Mag., v., 309, 481 , ii., 1, 1311; IIvst'e Mig., i., 50 (C. F. Ansms); Ed, Ree., x., Ist, xiii., 35 , $\times \times \times$ iii.. 548 ; IVest. Rev., ix., 93 ; De Bow's Rec., vi., 243, vil., 501.

Monopoly. Iby this term is usually meant a grant by competent authority, conveying to some une inilivilnal, or number of individuals, the sole right of buying, selling, toiking, hmoritug, exproting, wte., some one rommorlity, or net of commontities. Such grants were viry common previously to the uccossion of the lomse of Stuart, and were carried to n very ofpresnive and injurious extent luring the reign of Queen :ilizaheth. Combuercial monopolies reached to such it helght in Eifgland, that larliament petitioned against them, and they were in eonsequence mostly abolished ulsut the close of Ehazabeth'a reign, 1602 . They were further suppressinl, as being contrary to law, 19 James $1 ., 1622$; and were tota!ly abolished, and it wis decreed that none should the in future ere-
ated, as was previonsly the custom, by royal patent, 16 Charles I., 1040.-Andenson's History of Commerce. The grievance became at length so insupportable, that, notwithatunding the oppositlon of government, which lookod upon the power of granting monopolies as a vory valuable part of the prerogative, they were abolished by the famous act of 1624. The act of Jannes I. declared that all monopolies, grants, letters patent for the solo buying, solling, and making of grods and manufactures, shall be null and vohd. It excepts patents for 14 years for the sole working or making of any new manufactures within the realm, to the true and first inventors of such manufachures, provided they he not contrary to law, nor mischie vous to the State. It also excepts grants by act os Parliament to any corporation, company, or society, for ine enlargement of trade, and lettera patent concerning the naklng of gunpowiler, etc. This act effectually secured the freedon of induatry in Great liritain ; and has done more, perhaps, to excite the spirit of inventhon and Industry, and to secelerate the progress of wealth, than any other in the statute book.

Monscons (from the Malay mussin, season), periodical trade winds, which blow six months in mit direction, and the rest of the year in an opposite one. They prevail In the Indian Ocean north of the IOth degres of south latitude. From April to October a vlolent sonth-west wind blows, accompanied with ruin, and from October to April, a gentle dry northeast breeze prevsils. The chunge of the winds or the breaking up of the monsoons, as it ls called, is accompanled by storms and hurricanes. These periolical currents of whind do not reach very high, as their f rugress is arrested by mountains of a noolerate height.

Monsoons are, for the most part, formed of tradewinds. When at stated seasons of the year a trade. wind is detiected in its regilar courso from one quadrant to another, or drawn in by overheated districts, it is regarded as a monsoon. Thuy the African monsoons of the Athantic, the monsoons of the liulf of Mexico, and the Central American monsoens of the Pacitic, are, for the most part, formed of the tradewinds, which are turneil hack or defleited to resture the equilibriun which the over-heated plains of Africa, Utah, Texas, and New Mexico have disturbed. When the monsoens jrevail for five months at a time, for it takes about a month for them to change and become rettled, then both they and the trade-winds, which they replace, are called monsonas, The northeast and the soutlowest monsoens of the ludian Gcear afford an example of this kind. A force is exerted upon the north-east trade-winds of that sea by the disturbance which the heat of summer crates in the atmospliere over the interior plains of Asia, which is more than sufllcient to neutralize the forees which cause those winls to blow as trade-winds; it arrests them; and were it not for the peculiar conditiont of the tand about that ocean, whit are now called the north-eant munsoons wombld how the yar round; there wonld be no south-west monsoons there; and the north-eaxt winds, being perpetual, would hecome, all the year, what in reality for several monthe they are, via, north-eant trade-winils.

As lons ago as 18:1], Dove muintained that the sobth-west ntomoon was the sontheast tradowind rushing forward to fill the varant phaces over the northern deserts. Dove almita the promfs of this $b$ be indirect, and neknowledres the ditliculty of findin: out and demonstrating the problem.-Inmaten der Physik, No. 94. Tranalated by Dr. Resengartun for thon American Jourmel of Ncience, vol. xx., Gil.

The north-east and nouth-east trade-winls ment, we know, near the equator, where they produce the twill of equatorial calins. All vesseln that pias frum one bystem of trale-winds to the other hore to cross this culm belt. Sometimes they elear it in a frw hurs. Sumetimes they are delayed in it for weeks; an! the
calm is s water is If it be monsoon trade-wis regions o for insta tine of $t$ equatoria sheuld tit more to $t$ any belt trimmed Jansen similar d

it is call
calin ls so still and the rain ou coplous that the fresh water is somethmes found standing in pools on the sea. If it be true, as Dove insintnins, that the south-west monsoens of the Indlan Ocean are the south-east trade-winds of that sea pressing up toward the desert regions of Asia, then a vessel bound hence to Calcutta, for instance, and entering the Indian Ocean at the time of the south-west monsoon, should find no belt of equatorial calme there at all, but, on the contrary, she slould find the south-east trade-wind to haul more and more to the eouth, antil finally, without having cressed any belt of equatorial calms, she would find her sails trimmed to the aouth-west monsoon. In like manner, Junsen muintalna that the north-west monsoon is a simitar deflection of the north-east trais-vind.

The llasert of Cohl and the arid wastes uf Asia are the cause of the monsoons of the Indlan Ocvan. When the sum is north of the equator, the force of his rays, beating down upon these wide and thirsty plalns, is atch ns to cause the vast superincumbent body of air to expand and ascend. Consequently, there is an indrunght of air from the surrounting regions to supply the asceniling column. The alr that is going to teed the north-east trades is thus arrested, drawn in, heated, and cansel to ascond; and so, the north-east tradewiuls are first weakened, then "killed," and afterwarl drawn into the vortex of ascending air over the burning sande of the deserts; on the other haul, the seuth-east trade-wind, failing, when it arrives at the place w'acere the equaterial Doldrums were wont to be, to mett with them or any opposing fores from the nerth-east trades, are drawn over into the northern hemisphere. Going now from the equator towarl the poles, their tendeney is to obey the forces of cliurnal rotation, as well as thoso of the indraught for the hented plains, and thus the south-east trades become sonth-west monsoons. In this view, the "equatorial Doldraps" of the Indian Ocean are transferred, as it were, during the south-west monsoons, to the deserts of central Asia. It may le asked by some, saying, Since we can net always tally the air, how to we know that these south-west monseons are the south-east trates of the Indian Oceun? The reply is, We infer that they nre, because in co-ordinating for the Phot C arrt of that sen we have found no belt of calms beticen the southerest trudes and the south-west monswons, but " gradual change, so to speak, of the one wind into the other. Thus, contining ourselves to August -one of the south-west-monsoon months-and to the strip of ocean between $85^{\circ}$ and $90^{\circ}$ enst, the investigation fives as follows for calins and whals in the fieht between: $10^{\circ}$ S. and $5^{\circ} \mathrm{S}$. 13:l observations, wind south-east. $5^{\circ} \mathrm{S}$. and 102 observacions, 11 cahms, wind south. $5^{\circ}$ N. 99 observations, 11 calus, wind sonth-west. $5^{\circ} \mathrm{N}$. and $10^{\circ} \mathrm{N} .77$ observations, winl seuth-west. These monsoons do not, as we are generally taught to suppese, commence or end at the same time alt over the Indian Ocean. In the first tield betow Calcutta, $i$, e., between the lant and $20^{\circ}$ N., the north-uist trade-winds, toward the latter part of Jannary, begin their condict with the south-west monsoons, The contict rases in Pebrnary, and by Mareh the south-west monsoons in that "hehl" are consitered to have regularly set in. They now remain the dominant vind for upward of six monthe, and until some time in the early part of September. 'The northerdst monsoons or trables now renow the conflict, which is carried on with more and moro vigor until the latter purt of November, when they obtain the ase cembency, and prevail until the later part of dimuary, when, as before stated, the sonth-west monsuons rommence the ir annual struggle for the mastery. In the next tiehl lelow, i, e., between $15^{\circ}$ and 21$)^{\circ}$ N. lat., the north-east monseons begh to grow light and variable, anil to huve conticts with the south-west in February. The period of this conllict, or change, as it is called, frequently lasts until some time in March,
when the force that is calling in and driving the monsoons from the south-west finally gains the ascendant. They then blow steadlly until late in September, when the north-east trade-wind forces begin again to assert their ascendency and to renew the conflict on this aide throagh October, by which time the north-east tradea or monsoons become the prevalling winds. Thus, hy geing 200 or 300 milee further from the supposed place of heat and rarefaction that give rise to this system of winds, the duration of the north-east monsoms is prolonged nearly a month; for $\ln$ thls "field" they prevall from November to January Inclusive, threc mouths, whlle the south-west last from about the middle of March to the middle of September, say elx months. In the next field below, i, e., between the parallels of $10^{\circ}$ and $15^{\circ}$ the south-west monsoons blow about five months, perhaps net quite so long; they de not commence as early, nor blow so late as in the "field" above. They begin the confiiet with the north-east trade-wind ferces in the latter part of March, and gain the ascendent in May. They chen prevail till Octeber, when the north-east trade-wind forces, escaping frem the heated plains of the interior, begin to renew the annual combat which is to get them the victory. They soen achieve it, and maintain the mastery undl. wited till the last of Murca or first of April.-Maurx, Phys. Geog. of the Sea.

Changing of the lfonsoons.-Lieutenant Jansen thus describes this phenemenon: "We have seen that the calms which precede the sea-breeze generally continue longer, and are aecompanied with an upward motion of the air; that, on the centrary, those which precede the land-breeze are, In the Java Sea, generally of shorter duration, accompanied by a heavy utmosphere, and that there is niso an evident difference between the conversion of the land-breeze into the sea-breeze, and of the latter iato the former. Even as the calms vary, so thero appears to be a marked difference between the changing of the monsoons in the spring and in the autmon in the Java Sea. As soen us tho san has crossed the equato., and its vertical rays begin to play more and more perpendicularly upon the worthern hemisphere, the inlanl plains of Asia, North Africa, und of North Amprica are so heated as to givo birth to the south-west monsoons in tho China Sea, in the North Indian Ocean, in the North Atlantic, and upon the west coast of Central America; then the north-west monsoon disippears from the East Indian Archipelago, anl gives place to the south-east trade-wind, which is known as the east monsoon, just ns the north-west wind, which prevails luring the southern summer, is ealled the west monsoon. This is the only monsoon which is found in the southern hemisphere, while in the northern hemisphere the north-eust trale-wind blows in the China sea and in the Indian Ocean; in the East Indian Archipelago the west monsom prevails; imd here, when the south-east trade blows as the east monsoon, we tint the south-west monsoon in the adjacent seas of the northern hemisphere. Genarilly tho westerly monsoons blow during the stmmer months of the hemisphere wherein they are found. As the land-breeze dialy destroys in miniature the regular flow of the trude-wind, so does the latter the west monsom in larger measure, and observations will le ablo to decide whether monthly disturbunces do not also tako place. In the Java Sea, during tho month of liehrumy, the west monsoon hlowa strong almost continually; in March it blows intermittlagly, und with hard supalls; but in April the equalls fecome less frequent and less severe. Now the changing commences; all at once guats begin to spring up from the east: they ure often followed by calas. The clouds which crowa themselves uponi the clear sky give warning of the combat in the upper air which the currents there are about to wage with each other."

Montevideo, a sea-port, and the capital of the Republic of Urughay, on the north bank of the Rio de

## MON

La Plata, lat. $84^{\circ} 54^{\prime} 11^{\prime \prime}$ S., long. $56^{\circ} 13^{\prime} 18^{\prime \prime}$ W. The population, which la variously estimated, may probaibly be about 12,000. The town is huilt in the form of an amphitheatre, on a regular plan, and is well fortified. It has suffered much from the various revolutions to which it has been subject during the last 30 years. Moutevileo is altuated $2^{\circ} 3^{\prime} 33^{\prime \prime}$ W. of Cape St. Mary, tho northern limit of the embouchure of the La Platu. Vessels from the north bound to Montevideo genernlly mako thile cape, entering the river between It and the amall island of Lobos, in from 14 to 17 fathoms. The course is thenco nearly west to the lyle of Flores, on which is a lighthouse 11: feet above the level of the sea, with a revolving light. fimm Flores to Montevideo is 16 miles in a direct line, and the course west lyy suith by compass. A lighthouse, 45 fest ahove the levol of the sea, has been erected on the summit of the Montevideo, whence the town has its name. 'The latter is built on a projecting tongue of land, the prort belug on its south sile. This, which is the bent on the la l'lata, is a large circular
basin, open to the south-west. Generally the water is shaliow, not exceeding from 14 to 19 feet; lut the bottom being aoft mud, vessela are seldom damnged by groundlig. It should, however, be observel thut the depth of water in the barbor, as well as throughout the whole of the Rio de la Plata, depends very much on the direction and strength of the winds. The southwest wind, called pamperos, hlows right into the liny of Montevideo with much force, not unfrequently causing a rise of a fathom or more in the depth of water 1 But it rarely occaslons much daunge to vessels properly moored with anchors to the, molth-wext south-aast, and one to the north. (BLuNT's dwerican Pilot, edit. 1857; Cotdier sur lea Phares, etc.) Mun tevitleo has a consideruble commerce. The great articles of oxport consist of animal prolucts, or of hides, beef, tallow, hair, 'mones, grease, worl, ete. The lmports principally coasist of British cottons, woolenc, and harlware, flour, wine aud spirits, linens, sugar, tobacco, boots and shoes, aalt, etc. The follow. talle shows the exporta from these ports fer five years;

Account of benday Expoats ybom Burnos Athra and Montevideo in tir following Yeaba.

Duties on Inports, in National or Forcign l'essels, at Montiudeo.-1. Machinery, ugricultural Implements, Instruments used in the arts and sciences, lookn, prints, and mups, free. 2. Silk, raw and wrought, laces, blonde, gold nnd silver emitruidery, watches, jewelry, salt petre, plaster of Paris, coal, tiuzber, cotton fringe, and woulen hoops, 5 per cent. 3. Powder, piteh, tar, rosin, and maval stores, 13 per cent. 4. All raw matterials, and manufactured articles, not included in the preceding enumeration, 15 per cent. 5. Sugar, Paraguay and Chima tons, cosoa, cassla lignea, and chanamon, spices, drugs, aud provisions in general, 20 per eent. 6. Furniture, pictures, looking-ghassen, musical instruments, all sorts of carriages, carts, etc., and harness, saddles, horses' furniture (excepting herse cloths of the manatiacture of the aljacent provInces, which pay ${ }^{15}$ per cent.), ready-mulo clothes, boots and shoes, ligueurs, brimly, wine, viuegar, alo and porter, rider, tobacco, and soap, 2ij per cont. Salt, 2 reals the fanego, say 1 1h. per 290 prounls. T. Hides of all classes, hair, horns, tallow, silver and gold, in bullion or coin, free. A suall charge is made for warchousing and porterage on pasing through the custom-house. Goods may be londed for an indefinlte period, during which time they are sulject to a moderate warchouse rent. Fioreign hour piys as follows: €s per barrel, when whent is worth 82 to 8 per fanega, alout 224 pounds; $\$ 6$ per barrel, when wheat is worth 813 to $85 ; \$ 1$, when wheat is worth \% $\%$ to 87 ; 利, when wheat is worth 87 to $89 ; 81$, when wheat exceenls 8? Wheat: 83 per fanmg, when wheat is worti) \&te to 83 per fanega; ;2, when whent is worth sit to $86 ; \frac{5}{6}$, when wheat in worth $\$ 6$ to 810; nothing, when wheat is wortia above \%in 10 irr fanega: gools tranthipped, or shlipied out of homi, pavazer cent. Forelign grode, shipped in vessels of less than 150 tons burden, for ports of the l'ruguay and loaragnay, pay mily 1 per rent. 8. All goouls imported, paying duties, are sulyect to puy andditional 1 per cent. to the cunsulado; $\frac{1}{1}$ per cent, to the hospital; and for the extinction of conper menery, 1 per cent aditional on all gowels that pay 5 per cent. (This has, much to the honor of the anthoritles and peopie, heen alrewly arcomplished; but the duty is malatalne! for genural purineses.) in all gools that pay 1:1, 15 , and 20 pure cent., 3 per cent. On all grumb that pay 25 per rent., 6 per cent. On flour, 10 per cent. On wheat, 3 per cent.

Duties on Exports, in Nutional or Foreign I'esstls.Ox und cow hides, 2 reals, 25 ceatesinos, for reconnidor valuations of 81 , and 1 per cent. consulad. Horse hides, 1 real for reconnidur, on valuations of $;$ reals for reconnidor cach, and 1 per cent. consu'ulu. All other produce of the country pays 4 per cen. on the market value, and 1 per eent. consulado. Jerked and salt heef, pork, etc. ; nlso all foreign goods that have paid the iuport daty, free. Golel and silver, coined or in bullion, 1 per cent.

Ibet Charges.-Tonage from beyond sea, foreign vessels, 3 reals; national vessels, 2 reals, Bunag londing and unloading, twoth classes pay $\$ 1$ per day. Pratique, with pilot, foreign vessels, \&n; national ves-
 tional vessels, \&2. Without pilot, foreign vessels, $\mathbf{y}$; national vessels, \%2. National and toreicn vessels that neither divelarge nor loal cargo, and that do nut remain more than six days, pay nothing; those thut remain in the hartor more than six days pay one third of the ulove tonnage dues. National vessels, and vessels belonging to the provinces of Bumos lyres, employed within the River llatte, called coasting may for a lieense for each voyage, if 3197 tons, 4 reals; 8 to 15 tons, 10 reals, or $1102 ; 10$ to 30 time 15 reals,
 tons, 30 reals, or 8306 ; 61 to 80 tons, :is reals, or Si4 $06 ; 81$ to 100 toms, 46 reals, or $8506 ; 110$ and ahove, 54 reals, or $\% 606$.

Ihopital Ducs,--National and fureign vessels, sailing for a foreign port beyond seat or in th.e liver Phitte, pay $\$ 2$ for the vessel, 4 reals for the captain, :2 reals for cach seaman, 81 for tach passenger.

Montevideo, we find it has much diminlshed of late yeara, which may be attributed to the late clvil war of nine years' luration. Tho interior of the coontry, which formerly abonnded in homed cattle, is nuw without a sufficiency to supply the "Estanciag" for breeding those useful animals, milllions of them having been destroyed for their hides alono in the course of the war before mentloned, by the troops of Generals Rozas and Oribe; and the consequence is, that little or no produce comes ln from the country. Vessels from the United States with thelr outward cargoes proceed onward to Buenos Ayres, where they find return cargoes, which are easily obtained. Capitaliste of late have turned their attention to agriculture, particularly te the cultivation of wheat and Indian com, which flourlsh hero in a high degree; and in the course of a few years this country wlli, prohably, be ensbled to supply Ihrazil with the article of flour in abundance, in exchange for coffee, sugnr, tobnceo, etc, articles of vast consumption. There is a tine opening here for a steam mill, for the grindlng of wheat and corn, none as yet (Scptember, 18a54) having been Introduced into this country, and it is worth - the attention of some of the enterprising cltizens of the United States. Wind, and horse power for mills, are the only means nsed ut present throughout the country; and although its streams of water are innumerable, that power las not been brought into action. The manufactures consist chiefly of soap, tallow candles, chocolate, and leather, the latter of very inferior quality, which may be attributed to the specios of burk used in tanning. Stean navigation on the Rio de la Plata, and its tributaries, is grabually increasing. There are two steamers runaing regularly between this city and Buenos Ayres, and others to the Parana and Uruguay Rivers, carrying freight und passengers; however, it may be considered us yet in its infancy. The very high price of fuel is $n$ serious obstacle to steam navigution in this quarter, as ne conl mines are found here, and the coal used comes from England and the United States, at a very dear rate, and, In conseducnce, the steamers have not realized so profitable a business us was noticipated.
Fort Charges on Foreign liessels at the Rate of 800 Reis to the Montevidean Dollar.-Pilotage inward, \$10; mooring, $\mathrm{B} / \mathrm{F}$; tonnage duty, 300 reis per ton (saly on 150 , if not more), 4306 ; free of entry, if to discharge, 88 ; stamps for ditto, $\$ 12$; custom-house officer $\$ 1$ per day while discharging and loading, say for 30 days,备 30 ; stamps, in caso of londing, and on being dispatched, $\$ 20.0 .1$; hespital fees, from $\$ t$ to $\$ 6$, according to the number of hands on board the vessel, $\$ 5$; pikt to Franquia, 8.4 ; bill of health, 810.4 ; escribano's fees, if for balance of cargo, 88 , or if the vessel late here, क12. Spanish 127 to 1040 reis, or $\bar{*} 15 \times 06$ at son rein. Vessels aro allowod to lay 12 days from arrival without entering at the custom-honse, und may land samples, so as to dispose of a part or the whole of their cargocs.

Montreal, a city and river port of entry, ('analla Fast, and the largest and most populons city and chief seat of commerce of llritish America. Situated on the left taak of the St. Law rence, $1: 12$ miles ba a direct line south-west of Quebec. Lat. $45^{\circ} 30^{\prime}$ north, long. $73^{\circ} 25^{\prime}$ west. l'opulation, $1 \times 10,27,297$; in 1852, 57,$216 ; 1800,60,000$. The sito is not no commanding as that of Quebec, but it is in every other respoct superiur to that city. The position of Montreal, ut the herul of the ship navigation of tho St. Lawrence, and near its conduenco with the (ittawn, as well as its situation with respect to the city of New York, necessurily makes it one of the groatest emporiums of c'anada. The harbor, though not iarge, is secure, and vessels drawing 15 feet water, may lie close to the shore. Its general depth is from 3 to $4 \frac{1}{2}$ fathoms. Its chief divalvantage consists in the rapid St. Mary, abont one mile below the city wharves, which vessole often find it difficult to slem, without the aid of steam-tugs. To
obviate the obstructions in the navigation above Mantreal, the Lachine Canal, 0 milee long, 20 feet whe, and 5 fect deep, was undertaken $\ln 1821$, and completed at an expense of $£ 130,000$. The communication with the opposite slde of the river is carried on by several stean and other vessels; and during the summer a regular steamlroat communication is kept up with Quehee. At this sesson vat rafte of timber come down and pass the city of Quebec ; and scows, hatteaux of sbout slx tone, and Durham boata bring to Montreal the produce of Upper Canala, Neither is the trade of Montreal suspended $i_{11}$ wiater, like that of Quebec. Numerous sledges may be setn cotoing in from all directions with agricultural produce, frozen carcuses of beef and pork, tirewool and other articles. Montreal Is the centre of the comirs - "ce bet ween Canada and tho Unitel States, carried on by Lake Champlain and tho Mudson, and not only is it the depott of all the adjacent eountry, but most of tho business done in Queliec is carried on by branches from the Montreal houses. Sue Erports of Canada, p. 853 . The lmports in 1853, amounted to $£ 3,603,696$, and the net amount of dutles, $\mathbf{c 4 4 7 , 0 8 0}$. In the same year, 4885 vessels entered the port, of 191,928 tons burden. The wharves of thls city are constructed in a manner unequaled upon this continent ; tho entire line of which is over two miles in length, and considerable additions (to meet the rapidly increasing trade of the city) will be speedily commencel. The Lachine Cannl, with its locks and laasins, is anothe; of these public works of which the city may well bo proud. The Champlain and St. Lawrence Railruad, commences at Brewsterville, opposite the city and connects with the lines to New York und Boston, at Rouse's Point, a dlatance of 43 miles. This road is now completed and the cars run daily. The Lachine Railroud connects the city, hy a line of road 9 miles in length, with the village of that name. The continuation of this road from Caughnawaga till it connects with the Ogrlenshurit Road at Moers, is now complete, and the whole line is known as the Nontreal and New York Railroud. The St. Lawrence and Athantic Railroad, connecting Montreal with tho city of l'ortland, n distance of 292 miles, is now complete. A line trom Quehec to Melhonrne, in distance of 100 miles, is also in ceurse of construction, and will he completed in 1851. The Grand Trunk Railroad to connect Montreal with Kingaton, Toronto, etc., is now in ceurse of construction. The entire length of the road from Trois Pistoles to Sarnia, will he 1112 miles, und it will probably be completed in 1856. The Montreal and Bytown Railroad wlll pass through a fine distriet of country, and is in progress of constraction. The length will be about 121 miles, and will be opened in 1850 . The Itictoria Bridge.Thls splendid and useful structure is te cross the St. Lawronce from loint St. Charles to the south shore, a total length of 9.13 f feet, or some what over a mile und three quarters. It is to be built on the tubular principle, and will have a track for railrom cars in the centre, while on the outside of the tube there will ho a balcony on caela side, with u foot path for pussengers. The bridge will rest on $2 l$ piers and two ahutments of limestone masonry, the centre span being 330 feet long, and 60 feet high from summer water level. The iron used in its construction will be the hest boiler plate ' l ' iron, and the total cost of the work is to he \& $1,500,000$ sterling, or $\$ 7,500,000$. lormerly this city was the heud-(uarters of the fur-trude, but its interest in it lats greatly declined. It has establishments for the manufacture of cotton goods, India rubber, stenm engines, milroad cars, ases, ete., cast iron founderies, distilleries, breweries, soap, eandle, and tolnceo manafactories, several ship-building establishments, ete.; various articles of hardware, linseed oil, thour-choth, etc., are made in the city. Tho markets are abunduntly supplied with thesh, fish, pouliry, fruit, vegetubles, ctc. About three fourths of the population are
of French descent, the remainder consiating prisclpally of emigrants from Great Eritaln.
A letter from the Cnited Staten' Consul at Montreal, dated Uctober 9, 1855, remarka :-" Since my last communication, tiee only materin! alteration between the trate of the two countrlea has been the ratlication and adoption of the reciprocity treaty, wifle has provecl, so far, at lesst, as has come under may observution, highty satisfactery to the provincial government, and to the people of Canada at large; and there In every oppearance of its increaaling $\ln$ usefuluess, to this zountry at least. It fs, if 1 may bo allom of to une the expreasion, commereially spenking, tuntamount to annexation : while its lioneficial effecta have ahown themselves in the increased value of farms and landed eatatea on thin side of the line, and I n Is... daced to belleve, by carcful ob er antion, th, thers

United States, particularly the larger sea-port towns. This treaty hae been instrumental In doing mach for the advantuge of the carrying trade, hy conveying the prolucta of thia province over the railroada and canals of the Union, thereby placing Canada and the lowar provincek, no far an their trade is concerned, in the poaitlon of one of the Sintes of the Union. Theri has been, slnce my last commurication, hitherto alluded to, hut one enactment on the part of the Canadian govermment in relation to the trade botween the Unit. ed Srates and Canada, which was to the effect thas the governor in council had alolished the duty levieit upon the orighal packagee, containing products of the United States inported into this province, umler the provislona of the reciprocity treaty:"
The following figures will allow the somparative importance of tho trade of the priar nal cities on Tanada :

The St. Lawrence, however, with all its aeknow:edged capacity, la not without its drawhacks. Foremost was tha long winter, which sealed its waters during olx months of the year; and next may he classed the dangers of a navigation of 700 miles between Helle Isto and Quelec. There were other circumstances which threatenel that commercial prosperity which once sppeared to be the undoabted appanage o. the unost convenient port of this large river - lising the term " most convenient" in reference to breadstufts, the chief produce of the West, and to manu. factured gionds, the chief artiche in deutand by the West. The principal of thase was the diveovery that the most fertile lande lay beyond the barrier formed by Niagara. Yepce, the popmation which wonld otherwise, in the matural order, have filled op the nearest land first, was templed to the shorcs of Dake Firie and the country lying leetween that lake and the head waters of the Missinsibpi. It has been lis this reghen that the great emlgrant jepulation has chicfly extablished itself, leaving the less frutitul whores of the St. Lawrence and Lake Ondario comparatively bare of inbahitanda.

Impourts to the Jort of d'ntreal. $-\ln 1815, £_{2}^{2}, 614,-$
 993,010 . The export trate generally has received a great inpetus during the past ye ur, oxing in jurt, no doubt, to the estahtishment of the ocean steam line. The exponts from Montreal for the first three quarters of the year 1 siś were but $£ 333,610$; for the year $18 \mathrm{n}_{6}$ they have amonated to $\mathbf{E}^{-1} 16,475$, or more lhan doulde.

The pepulation of the $r$ is steallly hecreasing, and it lis helicved that at no former period was its trude and gencral husiness on s more healthy footing. In 1 N00), the population was $(000 ; 1816,16,900) ; 1425,22,000$; 18:11, 2h, 297; 1851, 57, 515; 1856, $55,(600$, at a sery moxderate estimate.

Regulations in Force..-Merchamlise whall not the noladea in ('anadian ports ex'ppt after due entry, ut phaces designated for that purpose, unter jenalig of forfciture. Merchandise ahall not be imported execpt
 mader pemalty of forfolture uf vessel and gromls, if under the value of turn; if utme that num, they shall hir retained as reverity for the pryment of that moment.
tanks cownected weith Montreul.-Montreal being a large commerclal centre, the banking facilities afforted to the business community are on an extended scale. The thanks of ('anala have heen, on the whole, pradently and judiclonsly manged, and have proved remunerative to the shareholilers, while there has yet heen no instance of the stoppage of a Canadian hank. The names and capital of the banks carrying on their business in Montreal are here given, selected from the offichal statement, with a statement of whethe, the office be a head office or agency. These banky all, with one exeeption, trunsuct business under Camalian charters, and their stockholders are liable in double the amount of their shares. The lank of British Surith America holds a royal charter, the head office being in Londe: h, hut the principal colonial office is in Montreal.

The nunber of steamers built in Canada in 1856 was 22; their tonnage 3755. Sail vessels 26 ; their tonnge 41,58 . Total number of vessels built 148 ; their tonnare 45,839 .

Sumnary of the Regulations in force at the different Ports in C'anada.-Merchandise shall not be unlnden, except after due entry, at places designated for that purpose, under penalty of forfelture. Merchandise shall not the brought or imported into the province, whether loy sea, land, coastwise, or by inland navigation, whether dutiable or not, except inte some port or place at which a custom-honse is or may be establishef, under penalty of forfeiture of vessel and goods, if uniler the value of 81000 ; If abeve that sum, then
the vessel and goods shall be retained as sect $\cdot y^{\prime}$ sr the payment of that amnant. This applies, s, ilatis muiandis, to goods brought into the province, by land, in carriages or other vehicles. Other regulations have reference, principally, to frontier sinnggling, and to the duties and powers of the officers charged with its prevention. They convey no general commerclal information, and are, therefore, omitted. Most of the articles on which a discrimination in favor of importations from Great Britain exists, nre embraced in the thirl artiele ("schedule") of the Reciprecity Treaty. The foregoing regulations, etc., apply, with sone slight modifications, to all the other colonial possessions of Great Britain in North America.

portlons of westorn Africa. Point Gallenas haa been bronght within the limits, and under the hmmanizing inflaences, of a young, vigerous, and Chriathan republic. Where the alave fuctorlee once stood, pulpits are now orectel ; and aavage tribes, and barharons chlefa, Inatend of warring with each other for human plunder, have cast a way the Implements of carnage, and now seek a common protection in the plew and the gospel. Geographteally; Macgregor divldeo Africn Into seven great reglons:
1st. The regien of the Nile, under which may be comprised Egypt, Nubla, and Kardafan. 2d. The region of the north, situated bet ween the Mediterral ann and the grent desert of Suhara, and extending from Eyypt wext to the Athantle, generally known na the States of Ilarbary-namely, Morocco, Tunls, and Tripoli. The soll and elimate of this region are cminently favorable to tho culture and growth of the choicest productions. Bh. The thitd region comprehends the vast desert of Wabara, west from Fezzan and Harfour to the Atlantic, and gonth from the Jarbary States to Senegr abia, Soudan, and Jlornou. ith. The fourth reglon comprehende Nigritia, or western Xfricn, cxtending from the south loundary of ths western desert to the seuth boundary of Jenguelu, in about latitude $16^{\circ}$ eouth, including the repubile of Iilieria. bth. Tho fifth reglon compirehends the Cape of food Itope colony; the country of the Caffren and Ilottentots; and the extensive iry desert coast north of the Hottentot conntry, to leuguela, and the great miknown southern desert. tith. The sixth region, or eastern Africa, extending along the sea-const, and to an unknown inlnud limit, from Delagra lay, in latitnde $26^{\circ}$ nouth, to the frontiers of Alyysintia. Tth. The seventh region compreliends the States of Alysshina and Somaula, extenting from Cupe Las-usser, or Guarlafo, to Zeylah, and along the lied sea to the torritories of the Jacha of Jigy jt.
the the seven divislons thus given by Mugregor, the 1st, fth, 5 th, and tith, only, jossess any cemmerclad Importance: the tirst, cumprising the Jharbary States: the fourth, the republic of Jikeria; the tith. the colony of Goot llope (some account of which will $z=$ found in the Digest of Lritiah Colenial I'ossenshons); and the sixth, the African possessions of the Sultan of Dluscat, lucluding the Jsland of Zanzibar.

Jarbary States.-Under the collective denomination of Barbary Staten, arn grouped together the countries which form the northern const of Africa, viz.; Moreve, Tunis, and Trigoli. Prior to the subnismion of Algeria to the l'rench nrms, this division was ulso comprehended under the same general natne. Ileing now a French edlusty, it is included in the Digent of French Colonial l'ossessions.

Eimpire of Norocco,-Moruce is one of the moat powerful of the Harlary States, and comprises un area of 220,0 (n) square miles, witha population estimated at $8,5100,00 \%$. Although agriculture is in the must backward state, the noil viehls, in great abondane and of the tineat quatity, wheat, turley, maizs, ollves. hemp, and cotton; uni lemons, grapes, figs, orangen, almonde, afil various fruits are grown in the greatast protusion. The amgar-cane, the tobacco-phant, and the date-tree thrive wherever they are cultivated. Under a lit eral government, and with ordinary intus. ery, Morocco could be male one of the most firoduce tive rountries in the world. Islamisn, however, wherever it estemif, spreads its withering bliffit over every branch of industrial Inprovement. Among the varied pliysical resources are mines of iron, tin, copper, untimony. and salt ; the lant of which only nppear to be wotked. Two treatiek of peace, friendship, etc., and for the security of petona nal property, have been concluled by the United States with Moroceo; the former betring dute January, 1787, and the lutecr, Sejtember, 1s3t6. The principal stipulations
relating to trade and commerce, in the treaty of 1836, are embodied in the following oummary ?

Article 8. If any vesael of the Uuited Stutea mhall meet with a disaster at sen, and put into ene of our ports to repalr, she ahall be at Ilberty te land and reload her cargo without paying any duty whatever. 14. The commerce with the United States shall be on the aame feoting as is the commerce with Spuin, or as that with the mont fuvored nution for the time being; and thelr eltizens shall be respected and esteemed, and have full llberty to pasa and repass our country anil sen-ports whenever they please, without isterruption. 15. Merchants of loth countrien shall employ only: such interpreters and anch other persona to ansint them In thelr burluesa as they shall think proper. No comminnder of a vesed alall tranagort hla carge on hourd another vessel ; te shall not be detained in part longer than he may thlnk proper; and all persons employed In loading or unlonding goods, or in any other lator whatever, ahall be paill at the customary rates, mot more and not less, 17. Merchunts ahail not be conspellent to buy or sell may klod of goods but sich as they shall think proper, ind may buy and sell all sorts of merchandise but such as aro prohlibited to the ether Christian nations. 18. All goods ahull be weighed and examined before they are sent on board; and, to avohl all detention of vessels, no examination shall ufterwarl the male, unless it shall first be proved that coat rablanill gooda lanve beensent on bourd; in which easo the persons who took the contrabmi goods on troard shall be punished according to the usugo and custom of the country, and no other perato whitever shall he injured, nor shall the slup or cargo inelr any penalty of lamage whatever. 19. No versel shall be cletained in port on may pretense what"ver, nor be othiged to tako on board any urticlo with out the consent of the commander, who slall lre at full liberty to ugree for the freight of any gools he takes on loand. The trenty to continue in force 50 years, with the ustal 52 months' notice ufter the expiration of that perioul.
The prinelpal ports of Moroceo are Mogatore, on the Athuntic, with a sufe harbor for vessols of tiou tons; Tangier, Tetuan, Dar ul Ihaida, Mazagan, Saffi, Mibat, and Laroche. The import dutles nre often arbitrarily raised, and frequently ecrruptly levied. With the exception of cochincal, coffee, cotton, iron, faw silk, supary, and tea, on which articles there are speclided duties, and tohacce, which can be sold only th the temporury assignees of the emperor's monopily, a general daty of 1t) per cent. is levied on all imports. When thas sold, it is almited free; the price of the monoply varying necording to the number of bid. dets, but ustally reaching us high us $=100,000$ ). The assignee realizes from nett males about $\$ 180,000$. Ibesides tobaceo, the saltan reserves the monopoly of lorimatone, gunpowder, and lead. Fivery article entering lato the export trado of Morocte is vubject to arlitrary, and fresuently oppressive daties. On leechea and cork-lark the sultan retains the mompor ly, which is annually sold to the lighbest bider, and sometines adde to the sultuis rovenue as muith as $\$ 100,000$ per nnnum. If we compare this large amount with the total value of these articles unnally
 (alout sll per cent. of which is puid for the monopuly), it can be seen at once bow much the trade in these urticles is affiected by ticese buritensome internal taxis. Marocco maintains an extenslvo trade with the interior of Afraca ly caravans, the principul of which usually necompanies the pilarims acrose the whole continent of Africa to the Red Sen, and the tomb of Sohammed, and Mceca. The value of the investmen.s in this curavan bas been usually estimated at $2 \cdot,(100,000$. The carbvans truding with the interior depart from Tetunn, Moroceo, und Fez, and meet at Tutiht, in order to creas together the groat desert of Sahari. The trade between the United States and the cupiro of

Moroceo is prineipally indirect, through the porta of Marselities and Glibraitar, and ta conducted for the most part in French and British bottoms. It in suggeated to the Department of State, hy the United States' connuj at 'Tangier, that this carrythg trade could lie secured to American vessels ? ? our himport duties on proluce in general of Morocco, enpecially on coarse wool, were reduced to the same standari that ruies in Fingland. In 1853 the carrying export trade of the United Strites to Moroceo, amounting to 884,000 , was entirely effected in foreign vesnels. In 1852, of the 474 vesseis of all sizen, measuring an aggregate of 30,426 torin, engaged in the foreign trade of the empire, there were but four American vesseif, measuring in all 1,100 tons. The imports into the United States from Morocee conslst of ceurse wool, guma, skius, ostrich 'eatl:ers, etc. The exports from the United States to Morocco are raw cetton, coarse domestica lown sugar, rice, and tobacco. The iatter article ls auppiied almest exclusively from the United States.
In 18.18 the maritime commerce of Morocce reached 15,046,979 francs ( $82,798,738$ ), viz.:

|  | Importa. | . |
| :---: | :---: | :---: |
| Merchandtac. | 8,747, 5is | 2is |
| Sprecte. | 228,500 | 400 |
| Total. | 2,001,304 | 0,045,675 |

In this general movement the returns asaign to the port of Mlognalore nmounts as foilews: Imports, 2,281, 038 francs; exports, 2,584 , 304 francs; tetal, $4,865,8.42$ francs. See Monadose, ante, p. 1368.
This Jeaves $10,181,137$ france for the other portsMazugan, Tangier, Tetuan, Dar ai Baida, Laroche, and Rabat.
For the purpose of comparisen, the general mevements for 1847 are given an foilows: lapports, $7,077,-$ 208 france ; exports, 6,910,946 francs; total, 13,988, 154 francs.
Compared with 1846, these figurea show a diminutien of $390,5.17$ francs ; but when compared with the returns for 18.18 , they exhibit an increase of $1,058,825$ france, exclusively en importa. The diminution principaliy alfects the trade with France; thas, in 1847, the trade of this country with Morocco amounted to 2,344,154 francs--(imports 520,965 , exports $1,793,189$ ) -whiie in 1848 it fell to $1,656,386$ france-(imports 404,906, and exjurts $1,251,480$--showing a decrease of 657,768 franch. With every other country engaged in this trala there was an augmentation in 1848, both in imports and exports. In one article, rather auspicionsly calledi "Americanos," Fingland largoly augmented her export trade to Moroceo-the whole increase in 1848 being upward of $\$ 1,500,000$. This description of merchandiae in thus explained in an officiui dispateh tranamitted to the Department of State from Tangier: "Threughont the whole empire, from the sultan down to the loweast anlject, the article which we call 'coarse domentice' is used under the appellation of Americanos. It is the principal articie ot import, and is an imitation, by the manuncturers of Manchester, England, of the cearse domestics of Massachunetts. * * * * It teok with the Moors, who were so pnthusinatic in their praise of it, that the English manufacturers diapatehed an agent to this ceuntry to examino and report on the falric, and the probabie demand. They then net to work to
manufacture an articlo in every respect similar ; and, ataliing the name, they managed to undersell our countrymen and monepolize the market." The tabular atatementa that fuliow, giving a cond'nsed view of the trade and navigation of Morocee, are brought down to the latest period for whle authentie data are acceanilile, They are compiled fr.a French offictal publications:
Tabulab Btathment eximbiting the Taade of Monoceo poa 18ty, compabid witil 1847.

Officiul returns give to England the priscipal share of this trade-an ndvantage which she enjoys, partly hecause of the proximity ef Gibraltar, but mainly because she monopolizes the large bulk of the carrying trade between the United States end Morocce.
The imports, these years, consisted of cettons (A merichnos) and woolen cloths, raw silk, iron, steel, copper and leac, sugar, coffee, grains, drugs, hardwures, tea, and specie; the exports were wool, hides and akina, leeches, gum, elive-oil, Meroces leather, nud ostrich feathers. The general commerce of the Mediterransan in 1854 increased materially over that of 1853 ; the increase was chlefly with Spain, Moroces, Sarilinia, the 1 uited States, and Tuacany.
Navigation.-The following table exhibits the navigation of the ports of Moreceo in 1850:

| Netionality. | No. of resela. | Tonnage. |
| :---: | :---: | :---: |
| England. | 012 | 88,685 |
| Franco. | 157 | 18,089 |
| Spain. | 49 | 1,889 |

In 1853 the commercial movements at the port of Mogadore renched, inporta and exports united, 10,692, 245 franca ; of which imports covered 4,984,220 franes, and exports $5,608,026$ frunca. In $1800^{\circ}$ the total was only $6,920,525$ franes; of which, for imports, there were $3,207,175$ francs, and for exports $8,603,85 C$ francs. There was, therefore, an increuse in 1853 of, impurts $1,717,045$ franes, exporta $1,954,675$, making a total of $3,671,720$ franes.

Navigation returns show that 62 vensels entered, measuring, in all, 7483 tons, viz.: Eingland, 87 France, 9 ; l'ortugal, $\mathbf{2}^{1}$ lelgjum, 1 ; Spain, 1 ; other nations, 7 .

The trade of this port (Mogadore) In 1854 exhlbita a total value of $6,946,095$ franca; of whleh there wan for imports $2,810,045$ fraucs, anil for exports $\mathbf{3 , 1 3 0 , 0 5 0}$ franes.

The principal ports of Moroccoare Tangier, Tetuan, Laroche, Rahat, Dar al Baida, Mazagan, und Mogadore. The town of Tangier occupies an eminence at the wentern extremity of a eupacious hay, within the limita of the Nitrita of Gibraltar, and nearly opponite to the Spanish town of Tarifa. The peculiar alvantagea of its situation render it the most frequented port of Morocco. The town contains 900 houson, and ahout 8 in inhabitants-consisting of tove Moors, 2200 Jews, and 210 Christions. Tho iuhubitants are, comparatively apeaking, civilized and tolerant. Christians are treated with greater reapert, and lews with less suverity, than in any other part of the empireprivilegen for which they are indelited partly to tho presence of the chief representatives of formign powers and partly to the liberality of the present alile and energetic l'asha, Sid Dohamed lien Abslel Maleck.

I'ort Charges.-The jurt charges and duea are nimply for anchorage, and vary from 82 to 825 , with a gratuity to the port cajtaln of from $\$ 2$ to *4. 'This gratulty secures the nervices of this offeer In oltainIng abundant provisions and other supplies for the vessel. free of duty. The anchorage duea, as alove,
range between the two extroines, accondlng to tha friendly or unfriendiy tarms which may nubaist beo $t$ ween the local authorities and the consul of the nation the flag of whluh the vescel may bear, $\rightarrow$ Com, Rel. U. S.

Conenlar Regulations with the Unital States,-It L stipulated by the 10th and the three following articles of the treaty conel-ided between the Ualted States and Morocco, Uotolier 1, 1837, that if any of the citizenn of the United States, ur any persons under their jrotectlon, shall have any dlepute with each athor, the conaul sball decide !etween the partion aml whenever the cousul ahall requira any ald or assistance from the governmont of Morocco to enfurce his decialons, it ahall be lmmedhately renciered to him. If a citizen of the United States should kill or wound a Blour, or, on the contrary, If a Moor aliall kill or wound a citizen of the United Stutes, the law of the countiy shall take place, and equal juntice shall he rendered, the consul asshating at the trlal; and If any dellnquent shall make him escape, the consul ahall not le answerabis fur him In any munner whatever. If an Amer. lean citizen shall die in Morosco, and no will shall appear, the conenl shall take ponsersion of his effects; and if thero shall be no consul, the effecta shall te deposited In the hands of some person worthy of trust, until the purty nhall appear who lias a right to ilemand them; but if the heir to the pernou deceased he prosent, the property shall be delivered to him without interruption; and if a will shall appear, the property whall doscend ngreeably to that wlll, as scon as the consul whall declare the validity thereof. The consul of the United Staten ia permitted to rendde lin any seaport of the dominions of the eingeror of Moroe :o thut he ohall think proper ; and he shall lee respected, and enjoy all the privileges which the consuls of any other nation enjoy; and if any of the eltizens of the Uniter States shall contract any delits or engugementen, the consul shall not lue in any mannor answurable for thom, onlese he shall have givon a promine in writing for the paymeut or fulillment thervof ; without which promise in writing no applicatlon to him for any reIrens shall be imade,

Mortgage. A mortgage is a conveyance or trunsfer of real or persunal eatate to secure the grantee or ussignee the payment of somo debt or the jeerformance of some agreement, with a condition or understanding that, in case of the delt being pald, or the agreement being performed, within a certain time, and in the specilied manner, the conveyance or assignment ahall be vold, and the land or personal property revert to, or rather, still behong to the mortguger. The Finglish, and so the Am:. inin inortgage of hand, is mostly botrowed from the cir'l law (see Kient's Commentarits, vol. Iv., part iv., leci.. Ivid. ; Buown's C'ivil Lene, vol. i. , p. 2000 ), or, at least, many of the rulea and incidents of the Roman hyputhecs, coincide with ouss reliting to mortgages. The essentinl charmeteristic of a mortgage, however, necorling to the import and detinition of the term, unat be the same in all countries, namely, that tho property conveyed or transferred, whether real or personal, shall nut alisolutely go, sad belong to the grantee or assignee, in tase the deht intendend to bo secured shall be puil, or the contract, whatever it may ins, intended to the grariantied, shall be performed within the time and termen ugreed upua. The rules and incidents of such a hypothecation will, therefore, have some resemblanco undar all costes of laws. There is no limitation of the kind of deltas or contracts, the payment or performance of which may be secured hy mortgage, for all legal ones mas be is guarantied. What will he a suffeient conveyance of the property, whetleer real or personal, will again depend on the laws of the place. A conveyance of land, for inatance, must, In most countries, be made in writIng, end with certain formalitles. So, in Englund, the right of property in a ship must appear by a bill of
sale. WI lute tranem apply to puthecatio laws to b conling to are evilen

For thls purpose, different modes lute trannfer of property in ragulated, they will equally apply to a conveyance or asslgnment by way of hypothecation. As real entute is uanally required hy the laws to be conveyed by written documentn, and, acconling to the lawa of mant places; these conveyances are evideneed by publlc recordin of the Instruments by which they are made, there is no nacearlty of an open, visitile posseanion of the eatate by the grintee, that the puible may take notice of the grant, for they may find the evidence of it at the office of publle record. The ease is not the ame with peramal property, the title to which ls uavally confirmed and eataiblished to the purchaser by a dellivery of the article into hla possession. In respent in all chattela, of whleh mannai possession and transfer from place to place is pructicable, the delivery by the vender, and actual posseasion by the purcharer, are very material clecimastances in eatablialing the right of nroperty In the latter. It la, indect, ludd down as a maxim of the English, and alsn of the American law, that movalilea can not be valilly sold or mortgnged withont a dellvery netual, or constructive, to the parchaser or mortgagee, and n posseasion live him. But this rule is very inuch moditied and relaxed; not that a delivery to and a possession by the vendee anil mortgagee are not conslilered requisite to establish his title, but a very liberal interpretation has been put upon circumstances showing a constructive delivery and possossion. The olject and policy of the $\ln w$ is to leave the inovible, just as it dues land, to be uned elther loy the mortgager or inortgagee, without affecting their matual rights and obllgations as to the property $\ln$ the thing, as far an this indulgence can be carried without leadlng other persons Into a misapprehenslon, and exposing them to frucd and imposition In giving eredit to the mortgager, apon the supposition of hia being the absolute owner of the property hypothecated. The varions rules and distinctions ly which the mortgage of chattels is regulated in this reapect, constitute an essental part of tho law upon this aubject. Bnt, after nll, wo maty lny lt down as an exsential doctrine, that a mortgaged chattel must be In possession of the mortgagee, in order to render his title socure; and when the mortgager has, by the law, been permitted still to usn the thing, it is only in cases where lils possession la, in legal construction, that of the mortgageo.
The most materinl consilieration relining to mortgages, whether of lands or chattels, is the effect of the non-performance of the condition by the mortgnger. This will depend, it is true, in part, upon the terms of the contract of hypothecation or mortgage. If it he agrced between the parties, that In ease of non-performance of the condition of the hypothecation, the mortgagee shall sell the thlng hypothicented, whether land or gools, and account to tho mortigager for the proceeds in satisfaction of the debt, or discharge of the oldigation, lntended to the secured, and pay over the surplus, if nuy, this is all that justlee or the low ean demand, and this ls, in effect, what the law aims at where the parties do not make any such otipulation; hut, of: the contrary, agree, either sxpressly or impliedly, that, in ease of a non-performanee of the conclition, the thing mortgaged ahall be abolutely and immediately forfelted to the mortgagee, withoit any right on the part of the mortgager to reilem it, or to call upon the mortragee to sell it and account with hiru for the proceeds. 'Thus, in the common form of morttiaging land, it is conveyed to the mortgragee with a provision that unless he shall par a certain deht, or do a certain thing within a tlme apecified, the conveyance whall be void. According to the literal construction, therefore, if this condition is not complied with, the thing henceforth belongs absolately to the mortgagee. But here the law steps in and controls the agreement, and attempts to prevent it from operating as a penalty or forfeitare, at the same time giving It ull its force as a
are adopted In different corles of Inwe, all of which agree In applying the value of the thing mortgaged, in sutlsfaction nond discharge of the debt or obllgation Inteniled to be recured ; so that by all the codes justice lo done, If there is no onrplus valne. Jut lf there be a surplus value, some of the coiles will reach it, and others not, and the same code will reaeh It in regard to one kind of pledge, mortgage, or hypothecation, and not another. For example, by the Engliah and American law, If a delitor pledges bllss of exchange, or any personal property for a deht, to an amount exceeding lta villue, the credltor must account fer the procceds, and pay over tho surplua to the debtor; but In England, and an in some of the United States, If the dehtor mortgages lands, of which the crelliter takes poasenslen for lireach of condltinn, the tehtor has three years to redeen it, af ter which time the land is absolutely grone, though iwlee the amount of the debt in value. 'The inw, in this case, suppoaes three yenrs to be time enough to allow the delitor to redsem It, In case of an excess of value of the land; and this snpposition is not whelly unreamonable, since tho debtor has all that the to aell the land if he can get nooe than the amount of the delt for it. The clvll law, us more generally administered, where it has been made the buais of modern codes, and so the laws of many of the United Stutes udopt a different mode, prescribling an appraisement of the mortgaged land, and providing that it may be sold by nuction, if two thlrds of the appralsed value is bld for it, and the proceeda of the sale are applied in sutlsfaction of the debtor obllgation gaarantled by the mortgage, and the sarplus, if any, pald over to the debtor.-E. A
Moss. Iceland $\dot{\mathrm{f}}$ oss (Cetraria Islandica), a specles of llchen, a native of the meantainous lieaths and vooils In the Alpine parts of Scotland, and of the Asturias, in Spain, an well as In Iccland and the north of Germany, It grows to a height of only two or three Inches, and lias rather a rugged, bushy appearance, nnt doulitleas would thrive, and perhaps with profit, in the northern parts of the United States, particnlarly in Minnesota, Wlaconsin, Mleligan, northern New York, Vermont, New IIampahlre, and Maine. In Iceland and Lapland, this plant is used es an article of diet, being bolled in broth or milk, after belng freed from its bitterness hy repeated maceration in water; or dried and mado into bread. The drled plant differs but little from lts appenrance in a recent state. Medicinally, it is tonic and demulcent. The decoction, as ordered in the pharmacopieias, is so bitter as te prevent many persens from taking it ; and when deprived of its disagreeable taste, it can only be viewed as a demulcent, and is hardly equal In itg effects to linsced, quincesoed, and marah-mallows. It certninly does not cure phthisls pulinonalls; but in the last stage of that disense, when solid food is oppressive, and the diarrhoen appenra to he kept up by the nerid contents of the stomach und howels, it has appenred to check the latter, and to impart both vigor and nourlshment to the digestivo organs.- Patent Office Rep. See Icerand.

Mosaic Gold. For the composition of this peenllar alloy of copier and zinc, called also Or-moln, Messrs. Parker and ITamilton obtained a patent In November, 1825. Fqual quantities of copper nad zine are to he " melted at the lowest temperature that copper will fuse," which belng stlrred together so as to produce a perfect admlxture of the metals, a further quantity of aine is added in amall portlons, until the alloy in the melting-pot becomes of the color required. If the temperature of the copper he teo high, a portion of the zine will fly off in vapor, and the resalt will bo merely apelter or hard solder; bat if the operation he carried on at as low a heat as possible, the alloy will ussmne first a brassy yellow color; then, by the introduction of small portions of zine, it will take a purpl. or violet bue, and will ultimately become perfectly white; which ls the appearance of the proper compound

In its fused state. This alloy may be poured Into ingots, ; but as It is difficult to proserve its character when re-melted, it should be cast directly into the flgured molda. The patentees claim the exclusive right of compounding a metal consisting of from 52 to 55 parts of zine out of $\mathbf{1 0 0}$. Mosaic gold, the aurum musirum of the old ehemists, fa a aulphuret of tin.
Mosaio (Mosaique, Fr. ; Mosaisch, Germ). There are several kinda of mossic, but all of them consist in imbedding fragmenta of different colored substances, usually glass or stones, in a cement, so as to produce the effect of a picture. The beantiful chapel of Saint Lawrence, in Florence, which contains the tonibs of the Medici, has been greatly admired by artista, on account of the vast multitude of precious marbles, jaspcrs, agates, avanturines, malachites, etc., applied in mosaic, upon fts walls. 'The detailed discussion of chis subject belungs to a treatise upon the fine arts.
Mosquito Cuast, Mosquitia. The limits of thls psendo Central American State, Mosquitia or the Sosquito Coast, are so indefinite, and ite extent inland oo imperfectly ascertained, that scarcely more of a reliable character can be said respecting it physically, than politically or commercially. It is supposed to axtend from Cise Honduras to the mouth of the River Sall Juan, having west the States of Honduras and Nicaragua, and north and east the Caribbean Sea, and to enurace abont 26,000 square miles. The Mosquito Iudians, its native and almost only inhabitants, are represented as an active and daring race, never brought Licer subuission by the Spaniards. The San Juan River is clalmed as its south boundary. Its capital is Blewfields, snd it contains several other small villages, inhabited chiefly by native Indians and some fow British colonists. The country is fertlle, and, under proper eultivation, would produce cocoa, colton, sugar, indigo, vauilla, and logwood; but, antil some change takes place either in the mode of cultivation, or tho form of government, it. resources have but small chance for devolopment. See Ioniounas.

Mowher of Pearl (Nacve de Perles, Fri; P'erlen mutter, Germ.) is the hard, silvery, brilliant internal layer of several kinds of shells, particularly vysters, which is often variegaterl with changing purple and azure colors. The large oysters of the ludian seas alone secrete this coat of sufficient thleknews to render their shells available to the parposea of manufacturers. The geaus of shell fish called pentadince farnishes the tinest pearls, as well as mother of pearl; it is found in greatest perfection round the coasta of Ceylon, near Ormus in the l'emsian Galf, at Cape Comorin, and among som of the Australian seas. The brilliant haes of mother of pearl do not depmi unon the nature of the subutance, hut upen its structure. The microscopic wrinkles or furrows which run acrons the surface of every slice, uct upon the retlected light in such a way as to proiluce the ehromatic effect ; for Sir David Brewster has shown, that if we take, with very tine black wax, or with the fusible alloy of D'Arcet, an impression of mother of pearl, it will possens the irridescent appearance. Mother of pearl la very ielicate to work, hat it may bo faslitoned by sass, tiles, and drills, with the aid aometimes of a corrosive acil, such as the dilute sulpharic or mutatic; and it is polished by colcothar of vitriol.

Mozambique, a furtilied maritime elty, and the capital of the l'ortuguese possessions ha castern dfrica, on an lisland at the entrance of Mesarli Bay, an inlet of the Muaamblque Channel, 5\% miles lroad, and 6 miles in length, and receiving 3 small rivers, ite entrance leling sheltered alse by the ishands St. (ieorge and St. Jago, which help to hound its harbor. Muanmbique Island, In lat. $15^{\circ} 2^{\prime}$ S., long. $40^{\circ} 4 N^{\prime}$ E.., in about 1 \& milen in length, low, and of coral formation.

Mulberry. Soil, Situation, Propagation, rle.The morus mgra, or black malierry-tree, will grow in almost any soll or altuation that la tolerably dry, and
any climate not much colder than most parts of Britaln aud the United States. It is very easily propagated by truncheons or pleces of the branchee, clight or nine feat in length, and of any thickness, being planted half their depth in tolerably good soil; when they will bear fruit the following year. As it is extremely tonacious of life, overy part of the root, trunk, boughs, and branches may be couverted into plunts by separation; the rootlets, and small shoots or sprisa, being made into cuttings, the larger beughs into stakes, the arms into truncheous, and the truak, stool, and roota, being cut Into fragments, leaving a portion of the bark on each, and planting them after the Ital. lan mode of propsgating the olive-tree. The mulberry may also be increased from seeds, by layers, or by grafing and budding. Thls tree, from lts slowness of patting out lts leaves, being rarely injured by spriag frosts, and lits leaves belng seldom or never devoured by any insect, except the silkworm, and nover touched with mildew, very seldom fails to produce a good crop of frult. This fruit, however, though excellent, and exccedingly wholesome, does not keep, and is so far troublesome, that it is enly good when it is quite ripe, and is hest whon it is saffored to fall fron the tree itself. For this reason, mulberry-trees aro generilly. planted on a lawn or grass-plot, to prevent the fruit that falls from beling injured by the gravel or dirt. This practice, however, is objectionable, as no tree, pe haps, receives more bensfit from the spade and the dunghiil than the mulberry, and it ought, therefore, to be frequently dug sbout the roots, sad occasionally assisted with manare. The ground under the tree should bo kept free from weeds throughout the summer, particularly when the fruit is ripening, us the reflected light and heat from the bare surface of the soil is thus increased. In a cool, moist climate, like that of l3ritain, the frait is also vory tine if the tree be trained as an espalier, with the rollection of the south side of a building or wall. As a standard tree, whether for ornament or fruit, the mullerry requires very little pruning or attention of any kind, other than that which is given sbove. As it increases in age, it ic. creases in productlveneas, and in full-gruwin trees the frult is inuch larger and better thavored than in these which are young.

Iropervies and Uaes.-The wood of tho manus nigra is less compaet than even that of the white mul. berry, and when perfoctly dry, weighs only about 40 pounds to a cubic foot. It is sald to be durable, and has been employed in England for various purposes of carpentry, for hoops, bows, whecls, and ovon riber for small vessels, instead of oak. In F'rance, this wood is considered of hut little value, execpit fior fuel. In some parts of Sjpain, in Sicily, and in l'orsia, the lewes of this species aro said to be pretorred to those of the white inulberry for the food of silk worms. The leaves are alwo eaten by cattln, sheop, and goatd. The roots have an acrid, hitter tuste, and are considered as an excellent vermifuge, when taken, in powder, in doses of half a drachim. Tho tree, in overy part, contains a milky julee, which, beiag congulated, is found to form a coarso kind of elastic gam. The fruit of this tree is of an agreeable acid and aromatic thavor, and is enten raw, as a desacrt, or may bo formed juto an agreoable preserve; and Evelyn says that, mixed with the juice of cider apples, it makes a very strong und agregable wine. Ir. Clarke observes, that he saw sume (ireeks, In the Crimen, employed in distilling brandy frem mulberrles; which he describes as "a weak hat palatable spirit, es clear as watur." A wine Is ulso made from It in France; but it requires to be drunk lmmediately, fes it very sown becomes acid. The fruit, when rije, la regaricel as cooling aud hasative, alluying thirat, and belag grateful in cases of fover. When made into a syrap, it is considered excellent for a sore throat. Like the strawberry and rasplecrry, it is saill to undergo the acotous fermenta.

Insects and $\bar{D}$ iseuses.-The lenves of the morus alba, ar white mulberry-iree, are believed to be eaten by no cther insect but the silkworm (bombyx mori). M. Pulkein, however, made experiments with varions kinds of insects, but they all rejected the mulberry lesf for food, excopt "a green worm, about an inch long, and as thick as an oat straw." Although he found it upon a mollerry, it was hls bellef that it was not peculiar to that trea alone, but found its way there by accident. The white mulberry, however, is attaiked by numerous disenses, ocessioned partly, no doult, by the unnatural manner in which it is treated, by belng stripped of its foliage. One of these diseases is brou ght on hy any endden check given to the transpiration of the leaves, which turn yellow, and fall off, sbortly after cansing the tree to die. Another is the denth of the roots, which is accompanied by the formation on them of parasitio fungi. The leaves are also apt to be gttacked with honey-dew, mildew, rust, and other discases, which render them unfit for the food of the silkworm. Those leaves covered with honey-dew may to washed, and, when thoroughly dry, may be given to the insects without injury; but the other diseased leaves should be thrown awny. If leaves covered with honey-dew are employed without wasbing, they cause dysentery and death to the worms. As it is not our Intention to trent of the whols art of the rearing and management of the silkworm, we are compelled to refer tho reader to a "Treatise on the origin and Progressive Improvement of the Silk Manyfacture," being the 2 2d volume of the London Cabinct Cyclopardia; alse to the work of Count Dandolo, entitled "Dell' Arte di governare i Bacehi da Seta;" Kenntck's "American Silk-Grower's Guide;" and to most of the sgricultural journals of the day.

Iroperties and Uses.-The wood of the morus alba, when dry, welghs 44 pounds to a enbic foot. In France, the princlpal uses of that of the trunk, is for various purposes of turnery, and carpentry, and for the maklng of wine-casks, for which it is highly valued, as it is said to impart an agreeable violet-like tlavor to white wines. The branches are used for vine-props, posts and ruils to rural fences, and for fuel. The hark may to converted Into linen of the lineness of sllk. For this purpose the young wood is gathered in August, during the second ascent of the sap, and immersed for three or four days in stlll water. It is thon taken out, at sunset, spread on the grass, and returned to the water at sunrise. Aftor repenting this process daily for some time, it is finally taken out, dried, and propared like fiax. The bark is also used like that of the Euronean lime-tree, for making bast for mats, etc. The bark, and more espechally the leaves of the white mulberry, sbound in a milky juice, which is found to possess more or less of the properties of caoutchoue, aceording to the climate in which the tres is grown. It is cloubtless owing to this property in the leaves of the inblierry, that the cocoons of the silkworm have so nillih more tenacity of fibre than those of any other insect chat feeds on the leaves of trecs. Hence, also, the silk, like the tobaceo and who of warm clmates, and of poor, dry solis, is always superior to that produced In eolier climates, and from rich and molst solls. 'Io verify this opinion, we quote the following very judlclous olservations from the "Journal d'sigriculture de Pays-llas," which will not only show the impracicability of profitably raislog slik in the higher latitudes, but will serve as an infallible gulide in the chole of a soll and clitnate for thia apecies of agricullare: "The mulberry-tree is found in different clin mates; but the juice of the leaves grown in tho north is much less sultable for the proluction of good silk, than that of the leaves of the sonth. In thila respect,
mulberry leaves and ailk differ as much as wines, according to the climste and soil in which they are produced. In general, every climate and soil that will grow good wheat will produce large, succulent mulberry leaves ; but theae leaves will, in many casee, be too nutritive ; that is, they will have toe much anp, and too much sybstance and succulency. The wild mulberry, with small leaves, answers butter, for auch a soil, than the grafted mulberry, with large leaves. A general rule, and one to be deponded on, is, that the mulber:y, to produce the best silk, requires the same soil and exposure that the vlne does to produce the best wine. Experience has proved that silkworma nourishec by leaves gathered from a dry soil, succeed much better, produce more cocoons, and are less subject to those diseases, which destroy them, than those which have been nouriahed by lenves produced by an extremely rich soii." The frult of the white mulberry is less acid than that of the black species, and that of some of the varieties, particularly of the morus a. multicaulis, is used for making robs and syrups, and is said to be remarkably good to eat, in warm climates.

The perfect wood of the morus rubra, or red mul-berry-tree, which is fine-grained and compact, though light, is of a yellowish hoe, approaching to lemon-color. It possesses strength and solidity; and, when properly seasoned, it ls slmost as durable as that of locust, to which, by many persons, it is esteemed equal. In the dockyarls at Philadelphia, Baitlmore, und the more southern ports, it is employed in the construction of both the upper and lower frames of vessels, for knees, fioortimbers, etc. ; and is preferred to uvery other kind of wood for trenails, except that of the locust. In Charleston, South Carolina, it is sometimes selected for the rilis of large boats. It is also used in the parts of tho country where it abounds, for the posts of rural fences, which, from their durnbility, are as much esteemed as those of tho loeust. As the leaves of this species are thlek, rough, and bairy, while young, they are innproper for the food of silkworms, which feed with advantage, in ucold cilinate, only on the morus alba, or some of its varieties. The red mulberry is well de. serving of cultivation, both from its thick and shady folingo, and the agreeablo finvor of its dark-red frult.

The wond of the paper mulberry, which is soft, spongy, and brittle, is of little value except for fuel. The leavas are too rough and coarse, in their texture, for the fool of silkworms; but they are found to be exceilent fodider for cattle; and as the treo will grow rapidly in almost every soll, and throws out numerous tufts of leaves, it has been auggeated that it might be valuable to cultivate, in some situations and elimates, for that purpose. The juice of this tree is aufficiertly tenacious to be used In China as a glue, cither in gilding leather or papor. The finest and whitest cloth worn by the inhabitants of Otaheite, and of the Sandwich Islands, is made of its bark. Int the principal use, however, to which this tree appenrs to he applied, is for tho manufacture of paper. The fullowing is an abridgment of Kampfer's account of the process of makiur this article in Japau, as quoted from the lifth volume of the London "I'enny Cyclopeana:" "The brimehes of the current year, belng cut into yioces atout a yard long, are bolled until the bark shrinks from the wool, which is taken out, and thrown away; and the bark, being dried, is preserved tiil wanted. In order to muke paper, it is sonked for three or fonr lusurs in wator; after which, the external skin (epider$m i s)$, nad the green internal cont, aro sernied olf, and the strongert and finesi pleces are selected; the produce of the younger shoots icing of an inforlor qualley. If any very old portions present thomselves, they are, on the other hand, rejceted as too conrse. All knotiy parts, and every thing which might impair the heauty of the paper, are also removed. Tho chosen bark is loiled in a llxiviam till its downy tibres car be sepnrated by a tou'h oit the finger. The pulp, no produced,
is then agitated in water till it resembles tufte of tow. If not aufficiently boiled, the paper will be coarse, thangh apongy ; if too much, it will be white, Indeed, but f.fieient in strength and solldity:. Upon the various degreea and modes of washing the pulp, muoh also depends as to the quality and besuty of the paper. Mucilage obtained from boiling rice, or from a root called oreni, one of the mallow tribe, is afterward added to the pulp. The paper is finished much after the Europesn mode, except that stalks of rushes are used, instead of brass wires." The article thus made, constitutas the India or China paper need by engravers for taking proofs, and by chemists for filtera. Bhowns's Treas of A merica.

Munjeet, a apecies of Rubia tinctorum, or madder, produeed in Nepaul, and in various districts of India. That which is brought to England is imported from Calcutta, and is cultivated in the high lands about Natpore in Purnea. The roots are long and alender, sad when broken appear of a red color. It is used in dyeiog ; the red which it produces being, though somewhat peculiar, nearly the asme as that prodoced by European madder. Dr. Baneroft bays that the color which it imparts to cotton and linen is not so durable as that of madder; but that upon wool or woolen cloth its color is brighter and livelier; and, when proper mordants are used, nearly, perhaps quite, as perma-nent.-Permanent Colors, vol. ii., p. 279. The best munjeet is in pieces about the ligness of a small quill clear and firm, breakiog short, and not pipy or chatify Its smell somewhat resembles liquorice root.
Muriatic or Eydrochloric Acid; anciently mavine acid, and spirit of salt. (Acile hydrochlorique, sud Chtorhydrique, Fr.; Salzsaüre, Geriu.) This neid is now extracted from sea-salt, by the action of sulplauric acid and a moderate heat; but it was originally oltained from the salt by exposing a mixture of it and of common clay to ignition in an earthen retort. The acid gas which exhales, is rapidly condensed by water. 100 cubic inches of water are capable of absorbing no less than 48,000 eubic inches of the acid gas, whereby the liquid acquires a specitie gravity of $1 \because 2109$; and a volume of 142 cubic inches. The muriatic acid of commerce haa usually a yellowish tinge, but when chemically pure it is colurless. It fumes a rongly in the air, emitting; a corrosive vapor of a peculiar suell. The characteristic test of muriatic acid in the most dilute state, ts nitrato of ailves, which causes a curdy precipitste of chlorid of silver.
Muscat, a city and sea-pert situated on the east coast of AraLia, ahout 96 miles N. W. of Cape Rasselgate (Ras-el-hud), in lat. $23^{\circ} 38^{\prime}$ N., long. $68^{\circ} 37^{\prime} 1^{\circ}$ E. Population uncertain; but estimated by Lieutenant Wellsted at 40,000 , which we incline to think beyond the mark. There are more Buniaus here than in any other city io Arabia. There are among them some very extensive merclants, who eugross almost the whole pearl trade of the Persinn Gulf, and the supply of cern from Intia. The negro slaves are numeroms, and alegenerally stout, well made, and active. The harhor, which is the beat on this part of the Aralic coast, opens to the north, and is shaped like a horsoslue. It is lounded on the west, and sonth by the lofty projecting ehores of the mainland, and ou the enst by Muscat Island, a rides of rocks from 200 to 300 feet high. The town stands on a sandy beach at the south end or bottom of the cove or larlur, atoout if milles from lts mouth. The deptly of water near the town varles from three to four und five fathoms. Shipe at auchor are exposed to the north and northwest winds; but as the anchorage is overy where good, aceldeots are of very gare oceurrence. The harhor is protested by some pretty stronb forts. Vessels are not allowel to enter alter dusk, her to loave before sunrlse. If the usunl sigmal be made for a pilot, one will cone off, but not othorwise. It is best t: bake then attend thll the vessel be secured, as they
have excellent boats for carrying qut warp anchorg. Muscat is a place of considerable importance, being at once the key to, and commanding the trade of, the Persian Gulf. The dominions of the imaum, or prince, are extenslve, and his government is more liberal and intelligent than say other In Arabla or Persis. The town, situated at the hottoin of a high hill, is ill-built and filthy; and, during the months of July and August, is one of the hottent Inhabited places in the world. The country in the immediate vicinity of the town is extremely barren; but it improves as it recedes from the shore. Dates and wheat, particularly the first, are the principal articles of produce. The dates of this part of Arabia are held in high estlmation, and are largely. exported, those of Bushire sad Bussorah being innported in their stead. A date tree is valued st from $\$ 7$ to $\$ 10$, and its annual produce at from $\$ 1$ to $\$ 1 \frac{1}{6}$. An estate is sald to be worth $2,000,3,000,4,000$ date trees, according to the number it possesses.
But the place derives its whole importance from the commerce and navigation of which it is the ceutre. The imaum has some large ahips of war, and his subjects posseas some of tho finest trading vessels to be met with in the Indian seas. The part of Arabia auljoining to Museat is too poor to have any very considerable direct trade; but, owiug to its favorable situation, the backward state of the country round the Persian Gulf, and the superiority of its ships and seimen, Muscut has Lecome an important entrepôt, and has an extensive trausit and carrying trude. Most European ships bound for Bussorah and Bushire touch at it ; and more than half the trade of the lersian Gulf is carried on in ships belonging to its merchants. (See Businne.) But, exclusive of the ports on the fulf, and the south aud west coasts of Arahia, ships under the flag of tho inaum trade to all the ports of British Inulin, to Singapore, Java, tho Mauritius, the cast coast of Africa, ete. The pearl trade of the Persian Gulf is now, also, wholly centered at Museat. All merchandize passing up the gulf on Arab bottoms pays a luty of onte bulf per cent. to the imaum. He alse rents the islands of Ormuz and Kishmee, the port of Gombroon, and sume sulphur mines, from the l'erslau govermment. In the magazines of Muscat nay be found every species of produce imported lnto or exported from the Persian Gulf. Various artiches aro also imported for the use of the surronnding country, and for tho iuternal consumption of Arabia. Among these, the principal are rice, sugar, coffee from Mocha, cotton and cetton cloth, cocoanuts, wood for builing, slaves from Zanguebar, dates from Bushire and Bussorah, cte. Payment for these is chietly made in specie and pearls; but they also export drugs of varions tescriptions, ivory, fums, hilles, ostrich feathers, horses, sharks' fins, a sort of earthen jars, called nartuban, to Tranquebar, dricd fish, an esteemed swectmeat calted huluenh, and a few other articles. The markets of Muscat areabundantly supplied with all sorts of provislon. Ilecf, mutton, and vegetablos of goom quality may be had at all tiues, and reasonally cheap. The bay literally swarms with the grintest varicty of nost excelleut lish. Whater is excellent, and is converad to the beach in such a mumener that the casks of $u$ vessel may he filled in her boats while aloat. Fire wood in also abundant, and is cheaper than at Bowthay. A duty of tive per cent. is laid on impurts, all exports being duty frec. The ontire value of the imports has been entimated at $\mathbf{E} 900,000$.
Money, Wright, and Mfeasures.-Accounts here are kept In goz and mamoedies : 20 goz $=1$ mamoody and 20 mamoodics $=1$ dollar. All l'ersian, Tharkish, and Indian colus, an well as French and German cruwns, and Spanish dollars, are met with; their valae fuctuating with the demand; and they are generally sold ing weight. The welglits are, the carcha and tuaund; 2.4 cuchas $=1$ maund $=8 \mathrm{lhs} .12$ oz. avoirdupeis. Nlebuhr thinks that Muscat occupies the site
of the Mosca of Arrisn and other Greek writers (Voynge en Arabie, vol. il., p. 71, ed. Amst. 1780) ; a conjecture which eeema to be confirmed, not merely by the resemblance of the name, hut also by the terms applied $1 . j$ Arrlan to Mosca being suffioiently descriptive of Muscat ; and as the port is bounded on all sldea by rocks, it must now present almost the aame appearance as in antiquity. Dr. Vincent, however, though he speaks doubtfully on the subject, is incliaed to place Mosca to the weat of Cape Rasselgate.-Commerce and Navigation of the Anciente, vol. ii., pp. 844347. For further partieulars, besides the wuthorities above referreut to, see Hamilitos's New Account of the Eiust Indies, vol. i., p. 63; Frazer's Journey to Khorasan, pp. 5-19; Wellated's Travels in Arabia, i., $\mathrm{pp}, 14-2 \overline{0}$. The longitude given above is that of Arsnowsmitn's Chart of the Persiten Gulf.

Conmerce with the United States.-The Sultan of Muscat concluded a treaty with the United States, September 21, 1833, and it took effect June 24, 1837, the day on which the President of the United States made his proclamstios. Its stipulations establish perpetnal peace between the two countries, and open the perts of each to the $v$ els and citizens of the other, with unrestricted libe :cy of trade, reserving In the ialaad of Zanzibar the sale of mnskets, powder, and ball to the government only, but leaving the trade in theso articles in oll other ports of the sultan's dominions free from every restriction. The treaty further stipulatos that versels of the United States entering any port within the sultan's dominions shall pay no more than five per cent. duties on the cargoes landed, which shall bo in full of all import and export dutiea, tonnage, license to trade, pllotage, anchorage, or nny other charge whatseever; that no charge shall be made on that part of the eargo which may remain on board and be re-exported; that no charge shall te inade on any vessel of the United States which may enter any of the sultan's ports for the purpose of retitting, or for refreshments, or to inquire the state of the market. It is farther atipulated that the American eitizen shall nay no other duties on export or lmport, tonnago, license to trade, or other oharge whatsoever, than the citizens of the most favored nation shall pay; and similar equality in the ports of the United States is extemed to the vessels and citizens of the sultan.

In the report to the Departnent of State, of the ggent by whom this treaty was negotinted, the following piragraphs oceur: "Tho Sultan of Muscat is a very jowerful prince. He possesses a more efficient naval force than all the native princes combined, from the Cape of Good IIope to Japan. His resources nre more than ulequate to his wants. They are derivad from conmerce, running himself a grent number of merchant vessels; from duties on foreign merchandize; and from tributemoney and prosents received from various 1 rinces; all of which produce a large sum. Ilis possessions in Africa stretch from Cape Delgado to Cape Guardaful, anil from Cape Aden, in Arabia, to Ris el liaud; they extend aloug the northern coust of Anam to the entrance of the Persian Gulf; and he claims ulso the sen-coast and Islands within the Persian Gulf, indluding the llahrein Ishads, and the pearlfishery contiguous to then, with the northern coast of the gitf, as low down is Scindy. * * * In Africa he owns the ports of Monghow, or Mongallow, Ly'mly, (̧uiloah (Keelwah), Molinda, Larmo, l'atta, Brava, Mughdoshat (alias Mogrdore), and tho valuable ishunds of Donfeca, Zarabar, Jemba, Socotra (Socotera)," etc.

The exports from the African part of his dominions are guth-copal, aloes, guin-arabio, columbo-root, and a great variety of cther drags, Ivory, tortalse shell, rhinoceros' horns, hides, becs wax, coconnut-oil, rice, millet, etc. Frum Maseat tho experts are wheat, ravins, uru;es datea, salt, drled fish, etc. It is estimated that seven-vighthe of all the ivory imported in-
to the United States, and all the copal of the finest quality, are from the island'of Zanzibar. To this place all the goods collected for thls large trade are imported, and sold to the Banians and Ilindoos at six months' credit. The United Statea supply by far the most important goods for all the coast trade, viz. : Lowell manufactured sheetlags and shlrtings. Other goods in demend for the coast trade are powder, mnskets, brass-wire, glass-beads, and India rubber goods. The currency of Muscat dlffera materially from that of the Persian Gulf or Africa, and; with ita weights and measures, is peculiar to the country, 'The Spanish dollar is carrent, and the Spanish doubloon varies in value from $\$ 14$ to $\$ 16$. See Zanziban.
Musoat, Imamat of, an extensive and powerful State of Arabia, compriaing the easteru portion of that peninsula, its authority also extending over its southeast coast nearly as far as Aden, and over parts of the coast of Persia on the Peraian Gulf, $a-\lambda$ that of east Afrien from the equator south to Cape Delgado. Area and population not ascertainsd. Besides Muscat, the capital, this dominion comprizes the towns of llostak, Mittra in Arabia, and Juba, Melinda, Mombas, Magadoxo, Bravah, Quiloa and Lyndy in Africa, witt the islands Zanzibar, Bocotra, ete., and it has an active trade with all the adjacent countries, and with British India. The imaum has a patriarchal and despotic sway, and the most efficient naval force of any native prince from the Cape of Good Hope to Japan.-Muscat or Mascua (prohably the Mosca of Arrian), a fortltied maritime city of east Arabin, capital above dominion, on a peninsule In the Arabian Sen, lat. $23^{\circ} 37^{\prime}$ N., long. $58^{\circ} 35^{\prime}$ 1.. I'rmulation ostimated at 40,000 to 50,000 . It is urrouided by heights all strongly fortified. The harbor of the city ia well sheltered, and has deep water. Muscat is the grand emporium of east Arabia, and the key to the entrance of the Persian Gulf. Imports estimated $\$ 4,500,000$ in value annually, and consist chiefly of almoseds, aloes, assa. fotida, gum ammoniac, sulphur, nitre, gum copal, frankincense, coffee, pearls, ivory, horns, hides, wax from Persia and Africa, most of which ore re-exported to Inlia and the East; the returns thence being made in I3ritish and Indil cotton goods, shawls, China manufuctures. Large quantities of dates, as also wheat, horses, salt, and dried tish, are among the principal exports. The port is usually touched at by vessels going up the Persian Gulf. Though the country around it is sterile, a plentiful supply of provisions may generally be obtained at Muscat.
Commercial Relations with the United States.-The trealy made by the United States in 1833 , with the Sultan of Mused has been duly observed, and a very friendly disposition shown by the autharities to all Americans. The present existing commercial regulatlona are fixed and perinanent. There are no privileges permitted to other nations which are denied to our own. There are no port chargea or other dues levied on vessels of the United States. There is no drawhack of duties; merehnndises from ois 1 vessel to another, or landed fur re-shipment, minst pay a duty of o per cent. The German crown, and pice, and pie, from the linst Indin Compuny's possessions, aro the culy currency. The number ci piec for a German crown (better known in these countries as the black dollar) varies, according to the aupply, from 116 to 128. At this present time, 120 pice are given for one lilack dollar, and 3 pic make one pies. Spanish and Mexican dohlars aro worth no more, and do not circulate freely. They are purchased for the Ilombay market, usually at a preminm of 2 to 8 per cent. at the commencemont of the south-west monsoon, in April, und also near its close, in September, und tind their way from thenco to Chinn. American half eagles are worth 85; English soverelgns, 8l.75; Spanish and Portuguese doubloons, $81 t \mathrm{i}$; Spanish quarters and eighths puse frecly at 25 and $12 \frac{1}{2}$ cents, and American
dimes and half dlmes at 10 and 5 cents. Marchandise is bought and sold for dollars and cents.

Ivory.-This article varies greatly in price, according to quality and size. Ths superior kiads, and largest and best, are sent to the United States. In lota, average welght 70 lbs . and upward, $\$ 40$ to $\$ 44$ per frasla of 35 l lis. Ivory, 50 to 60 lbs . average weight, $\$ 37$ to $\$ 40$ per frasls. Tortoise shell per pound, of 3 lbs. English, $\$ 2$ to $\$ 5$. Gum copal, per frasla of 85 lbs , English, $\$ 5$ to $\$ 7$. Ilides, per conge of 20 lbe ., $\$ 10$ to $\$ 10$ per conge. Cloves, per frasla of 35 lbs ., $\$ 1.75$ to $\$ 2.50$.

Commisaions usually charged, 21 per cent. As for freighta and insurance, there are no rates to the United States. Cargoes imported from the United States are invari sly sold at 6 months' credit. If cash is wanted for a sale, a discount is made of $4 \frac{1}{1}$ per cent. fur 6 months. As for exchange, the captains of whals ships draw upon their owners for the cash they require, and the usual charge is 20 per cent. Duties, 5 per cent. on all cargo landed. No duties on exports to the United States. There are no internal taxes of any kind pald by the people of thls island directly. The sultan'a revenue is derived troin dutics on all articles of cymmarce brought from the neighboring coast, Ked Sea, Aden, Persian Gulf, Bombay, and the Malabar coast. The negro slaves are alinost the only common laborers, and receive per day ahout $12 \frac{1}{2}$ cents, or $\$ 2.50$ to 83 per month. The higher order of servants to oversee the work in preparirg and shipping cargoes are paid from $\$ 7.00$ to $\$ 10$ per month. Native workmen in the various branches of mechanic industry receive alout 85 to 87 per month.

No steamers are owned or built here, and there are no facilities for ship-building, or even repairing, to any extent. The sultan has a few ships-of-war built either at Bombay or at places on the coast of Dilabar. Thoy are manned by slaves and othcered b: I rabse, The only vessela owned here by natives are called dous, and seem to snswer the purpose very well, but atu the radest kind of shlp possible to conceive of, snd never undertako to get to any place agalnat the monsoon. They sail fast, and are of very peculiar construction. Zanzibar is a large, ferile, and populous island, and the favorite residence of the sultan, who is far superior to his brother princes in Intelligeace, and has a disposition to introduce improvements into his dominions. But his subjects, like all Arals, are far behind other nations, and despiss all improvement. Cloves are produced upon this island in large quantities, and the annunl inerease is considerable. All other articles of export are bronght from other places. See Com. Rel., U. S., vol. iii., 1866-5i, pp. 36i-368.

Musk IFr. Musc; (Ier. Bisam; Du. Muskns; It. Muzchio; Ep. Almizele; Hus. Musens; Arab. and Pers. Mashe) Is ohtained from a species of dear (Moschus moschiferus) Inhablting the Alpine nountains of the east of Asia. The musk is found in a mimall bag under the belly. Musk is in gralns concreted together, dry, yet slightly unetuous, and free from grittinoss when ruhber: hetween tha fingers or chewed. It has a peculiar, aromatic, and extremely powerfol and durable olor; the taste is bitterish and heavy ; and the color deep brown, with a ahade of red. It is limported into Fingland from Chlaa ln caddies containing trom to to "04, oz ach : hut oa infarior kind is brought Srom
 sth at wach is . . .he natural follicle or pol. Weing a $v r_{y} \ln h^{\prime}$-priced artiele, it is oftem allulterated. Thar whish in mixer with the unimal's boosl may be

 in. bolin:; t-wro? and ds harder as well as heavier
than genuine mu'k. $\quad 20$ cwt. of musk are allowed to a ton. It was not permitted to be brought home in the Chins ships belenging to the East India Company.'Thomson's Diopensatory; Milamin's Orient. Com.

Muslin (Ger. A'usselin, Nesseltuch; Du. Netelloek; Fr. Mousseline; It. Moussolina; Sp. Moselina; Rus, Kissea) is derived from the word mousale or mouseln, a name given to it in Indla, where large quantities are made. It is a fine thin sort of cotton cloth, with a downy nap on the aurface. Formerly all mushins were imported from the East; but now they are manufactured in immense quantities it Manchester, Glaggow, atc., of a fineness and dursbility which rival those of India, at the same time that they are very considerably cheaper. See Corton.
Mustard (Ger. Mustert, Senf; Fr. Moutarde; It. Mostarda; Sp. Mostaza; Rus. Uortschiza; Lat. Sinapis; Arab. Khirdal; Ilind. Rai), a plant (Sinapis) of which there aro several species. It is a native of Europe, and is now naturalized, and a common weed in some parts of the United States. It is besides very commonly cultivated for the sake of the seeds, which, when powdered and mixed with vinegar, form a well known pungent condiment in daily use. The root is annual ; the stem three or four feet high; the lower leaves are lyrato, and the upper ones landolato and entire. The flowers are small and yellow. It belongs to the natural family crucifera, and is known by the smooth fuur-cornered pols which are pressed close to the stem. Table mustard, mixed with warn water, and $t$ ken in considerable quantities, acts as an emetic, and as such is so much the more valuable from its being always at hand. The white mustard (S. alba) is milder than the precering, and on this accomet is more agrecable to some palates.-E. A.

Mutiny of the Bounty. Memorable mutiny on boarl the Bounty armed ship returning from ()taheite with bread fruit. The mntineers put their captain, Hligh, and 19 men, into an open boat near Annamooka, one of the Frienilly Jslands, April 28 , 1789 , and they reached the island of Timor, sonth of tho Moluccas, in June, after a perilous voyage of nearly $\mathbf{d} 000$ miles, in whieh their preservation was next to iniraculous. The mitineers were tried september 15, 1792, when six were condemned, of whom three wers executed.

Myrobalans are the dried fruits of difierent varieties of terminalia. The fruit, varying from the size of all olive to that of a gall-mut, consist of a white pentangular nut, covered hy a subatance about two lines in thickness. The latter, which is the only valuablo part, is mucilaginons and highly astringen; nud being separated from the nut is emplosed, with the best effect, both hy dyers and tannors, especially by the latter it produces with iron a strong, darable, black dye and link; mad with alun, a very full, theugh dark, hrownisla yellow. I'he hoports vary consider-

Myrrh (tier. Jfyrrhen ; Da. Mirrhe; Fr. Myrate; It. and Sp. Mirra; Lat. Mywha; Arah. J/urr), a resinous stiontance, tho produce of an unknown tree growing in Arabia nud Abyssinia, It is imported in chesta, each contaiaing from one to two ewt. Abyssinian myrrb comes to us through the Eant Indies, while that produced in Arabia is lirought by the way of 'lurkey. It has a poculiar, rather fragramt, odor, and a bitter aromatic taste. It is in small irregularly alnuped piecen, which can hardly be called toars. (iomd merli is translucer t, of a red lish yellow color, thittle, breakling with a resinous fracture, and easily pulverized. Its speeille gravity is $1 \cdot 36$. When it is opaque, mixel with impurities, and either white, or of at dark color approaching uarly to black, with a disurveablo odor, it should be rejected.-'itosson's Ihipetwatory.

Nail
Clous; I Gwosdi) being dr together, sumption of those a
onds. Two llght-houses, called the Alguilion lights, etand on the north side of the river, near lts mouth; the lower light, adjoining Point ds Leri, being in lat. $47^{\circ} 14^{\prime} 33^{\prime \prime}$ N., long. $2^{\circ} 15^{\prime} 46^{\prime \prime} \mathrm{W}$. The light is fixed, und ls 111 feet above the level of the sea. The upper Aiguillon light, altuated about a milo N. $81^{\circ}$. E. from the lowar, is 127 feet high ; it also is a fixed light, varied, however, by a tash every 8 minutes. A beacon tower, called the Turk, is erected on the southernmost extremity of Ia Blanche, the oourse for vessela enterIng betwean it and La Couronne, is to bring the Agulllon lights in one. The depth of water on the har at the mouth of the river varies from 2 to 24 fathoms. At aprings the rise is 14, and at neaps 7 or 8 feet. High water at full and change $3 \frac{8}{3}$ hours.

Her eituation renders Nantes the emporium of all the rich and extensive country traversed by the Lolre, so that ehe has a pretty considerable import and expert trade, particuł.rly with the West Indles. The exports conslst of all sorts of French proluce, but principally of brandy; wine and vinegar, silk, woolen and linen goods, retined augar, whent, rye, biscuits, etc. The principal importa are ougar, coffee, and other colonial products, cotton, Indigo, timber, hemp, eto. Nantes is a considerable entrepot or the commerce of aalt, larse quantities being made in the Department, principally at Neirmutiers and Cr isie. During the time that the elave trade was carris 1 on, Nantes was more extenslvely engaged in it than ny other French port. The castom daties of Nantes, xclualve of those on salt, produced, in 1851, $10,817,0,0$ fruncs; sle being in this respect inferior only to $\mathrm{Ma}_{\mathrm{s}}$ reeilles, llavre, and Bordeaux. There belonged to thi port, exction river cruft, coasters, anl steamers, on tie 31st December, 1851,569 thips, of the burien of 68,121 tons.

The port charges levied vessels of the United States ars t!os came, ai 1 in, ore than the port charger levied on French vesdels, except the tonnuge duty, which is 94 cente per ton register, the eame as the French vessets pay in the United States. The transhipnent in vessels of the United States of grods is permitted to any port, exeept from a Freuch port to another French port, which would be considered as a cousting trade; and no vessels of any nation whatseever are allowed to do that trade, except the Spanish veasels, Spain having an ancient treaty with France to that effect.

Pilotage.-Veasels nader 80 tons (if French or aseimilated liy treaty) are not obliged to take a pilet at sea, but must have one for the river. The rates, whieli are fixed by law, are paid by tha foot from the sea in Paimbeuf, and from thenee to Nuntes for all vessels under 80 tans. Above ko tons, they are per ton. The master of a vessel bound to Pahinheuf or Nantes has merely to give a note to the pilot ntating where the pilot bearded bilu, where he left hilnt, the name and draught of water of his vessel in finglish feet. The nete will he deporited at the pilot's ofice, and the pilotage ise recelved from the whip's broker. No forsisn versel, however small, can lus removed from "han anchorago to another, or to or frotn a quay.
but by a pilot. Every vessel la boarde i at St. Nazaite, and If she has a foul bill of health, or lisease on board, is Instructed where to ge. River Dues on vessels ascending from Puimbeuf to Nantes are about 1dd. per ton. At Palmbocuf, and below it, none are levied. If a vessel under sail causes damage to another that if properly moored, she must pay all the expenses of repairs; if to a vessel at elngle anchor (unless intenthonally done) or under sail, tlat expense of the repalrs of beth are added together, and each pays a molety, The amme rule is enforced if tuztage be caused by one vessel properly monred driving on board another in the eams situation; but ff either wern riding at single anchor, the one proparly moored is indemnified; if hoth were at $\sin _{b}$ lo ancher, both bear the loss allke.

Naples, a large city and sea-port in the south of Italy, the capizal of the klngdom of the same nume the light-house being in lat. $10^{\circ} 50^{\prime} 12^{\prime \prime} \mathrm{N}$., long. $14^{\circ}$ $14^{\prime} 15^{\prime \prime} \mathrm{E}$. . Populalir : in 1851, 416,475. Naples is well situated for conmerce; bat the polley ef the government has hithr:to been most unfavorable to its growth, and has confined is within comparatively nar row limits. The Bay of Naples is spacious, and is celebratel for its pleturesque views. The harbor is formed by a mole, built nearly in the furm of the letter L, having a llght-house on its elbow. Within the mole there is from 3 to 4 futhoms water, the grousd being soft. The water in the bay is deep, and there is no bar; It is, however, a good deal exposed to the south-westerly wibds; and to guard agaiost their effects, vessels lying in the bay moor with open hawso in that direction. There is no obillgation to take a pilot on board, but it is usual to take one the first time that a ehip anchons within the mole. The light-house has a revolving light. The period of revolution is 2 minutes, during the first of which the fill streugth of the light is continued, and during the second minute Its brilliancy rapilly deereases. The helght of the light is 161 fect above the sea, and it is visible at the distance of 18 or 20 miles. At the extremity of the molo is a low fixed light to guide vessels round its beul. The exporte principally eonsist of the products of the adjaecnt country. Of these, silk is the must important. Olive vil is also a most fimpor sut article; but it is principally supplied hy Ga!lepoli, a town in the Terra d'Otranto, vilience it ip coummonty called Gallipoll oll. The entire exports of oil from the kingdom of Naples have been entimated at almol! ?lo, 000 salme, or 36,383 toms, a year, which, taking its mean value when exported at $\% 100$ per tom, is equivalent to the annual sum of $63,633,304$, See 9 hive Uht. The other articles of export are wool, wine, limuly, dried fruits, red and white argol, tallow, liquorice, fowes, musider, hemp, linseed, crean of tartar, fonen, lamb and kid akins, onk and chentnut staves, rags, walfou, ete. 'There is a great variety in the Neapolitan wilus, The mont esteemeal is the literima Christi, a red lasclous wine, better known in Eimpland by name than ia reality, the first growthy being contined to a small quentity only, which is chieliy reserved for the royal

collars. There are, however, larga quadtitiea of aec-ond-rate wines producel in the vecinity of Naples, such na those of Pozzuoli, Ischla, Noln, etc., whlch are sold under the name of lacrima Christi, and are largely exportad. Several parts of Calahria produce sweet wines of anperior quallty.-IIesinensox's Ancient and Modern Wines, p. 289. The price of wine at Naples depends entirely on the abundance of the vintage. The imports consist princlpally of cottons and cotton twiet, hardware, lron and tin, woolens, sugar, coffee, indigo, spices, etc. Naples is a good market for pilcharde, and it requires a large supply of dricd and barreled cod.
"The existing regulatlons as to commercial Intercourse with the United States appear fixed. When our treaty, however, shall expire, If not renewed, a change may follow, aa well for tonnnge duea aa for the additlonal 10 per cent. on the duties of merchandise. 1 know of no privlleges permitted to the commerce of other nations which are denied to the United States, nor are there any restrictions on the commerce of uther nations and not on the United States. The amount and character of the port chargea and other dues levied on vestels of the United States are as follows: On entry.-Tonnage, 4 graina, or 3 and one fifth cents per ton, when there is a treaty; without treaty and indirect voyage, 40 gruins, or 82 cents per ton. Light money, 81 ; presentation of manlfest, $\$ 1$; cus-tom-house visit, 80 cents; liquidation of manifest and boletta, 30 cents ; customary present, 60 centa. Total anount on entry, except tomange, \$3.75. On elear-ance.-Biglietto of departurs, 81 b bill of health, 81 ; mil of police, 25 cents; roll of port, 25 cents; usual present, 60 cents ; "spedizlonleri," or broker's compensation, \$2. Making a total amount on elearance of $\$ 5.10$. Natienal vassels pay the anme, but the presents are greater by them. The health officer has for grauting pratique on arrival \&5. Should the vessel he sulject to quarantine, the charges increase accurding to circumstances, and still more ao when sent to Visita to perforn it. Transhlpment in vessels of the "nited States of goods, elther to another port in the kingdom or to a foreign port is prohilited, as well as in ither veasels, except the Neapolitin steamboats. It is allowed by faver when the manifest, on arrival, specifies the gnods and the port to which they are intenilel to tie transhipped.
"Exprorts from this port have leen put on lward free of any duty, at prices as follows: Retined argols, at 20 cents per pound; refined ycllaw pink, at 23 cents per peund ; cream tartar, at 25 cents per pound; licorice puste (Codigliano) at 16 cents per pound; licorice, laracco and other, at 15 to 154 cents per pound; olive oil, in casks, at 78 cenis per gallon; orangea, per box, $\$ .20$ to $\$ 2.25$; lemans, $\$ 1$ to 8.20 ; illuerte, $4 \frac{1}{2}$ ecits per pound; walnuts, 5 cents per pound. There have been exported during the year, from the first of July lust, about $60,000 \mathrm{llis}$, of sewing silksfirst, seconil, and third qualities-at $9.20,83.80$, and 83.60 per 1b. of 16 cz ; also abrout 25,006 his. of such silks, raw ur undyed, at $\$ 3$ per 1b. of 16 nz . These are shipped ly steamers for Marseilies or liverpoot for the mest part. In like indirect way are also sent ciay pipes with reed tubes, of little value, musical stringe, eoral and lava ornaments, but no prices can he quoted, as their value depends on the hesuty of the artiche :wd the execution of the work. Hetween wheiesale and retail prices there may be a differenea of ulout 10 per cent. Five or six forelgn vessels (Neapolitan und English) lave loaded in part, with oranges and lemons for the United Stntes, and gone to Sicily to fill up, or firkt take a part eargo in Sicily and fill up here. About 20,000 loxes are shipped in the year from this port, lut the prices vary continuully; they are now double what they were in the beginning of the season."-Com. Rel. U. A., 18556-7.
Commercial Policy.-The polley of the Neapolitan
government with reapect to commerce was for a lengthened period the most objeotlonable that can well be imagined. Articles, whether of import or of export, were hurdened, alike; wlth oppressive duties and roatrictiona; and even the warehousing of foreign goode could hardly be aakd to be permitted. Of late, however, we are glad to observe, the administration appeara to have lecome aliva to the injurions influence of this felo de se syatem, and han given its aanctlon to seveial measurea of a comparatlvely liberal character.
The dutles on importa have sleo undergone various modifications. Those on fieh, sugar, and other colonial products, have been reduced fully a half. But we submit in illuatration of theas changee the following statement of the old and new rates of duty on certain artictes:

We have no coubt that the beneticial hafluence of these wise and liberal measures wi" Inad to further changee. The duties on Iren, w! a the, on cottona, woolens, and other descriptions of , 1sw'metured goods, ure a great deal too high. These dic.... + so impored partly for the sake of revenue, and partly in the view of encouraging domestic manafactures; but they bave not accomplished either object. See Two Sicilies nod Italy.
Naphtha. A limpid bitumen, which exudes from the earth upon the shores of the Caspinn and some other eastern countries. Near the village of Amiane, in the State of Parma, there exists a epring which yields this substance in aufficient quantity to illuminate the city of Genoa, for which purpoese it is employed. It has a peculiar odor, and genarally a yellow color, but may be rendered coloriess by distillation. Its specific gravity is about 0.75 . It boils at about $160^{\circ}$. It is highly inflammable, burning with a white smoky flame. It appcars to be a compound of 36 of carbon with 5 of hydrogen, and is therefore a pure hydro-carbon. A liquid very similar to mineral maphtha is oltained by the distitiation of coal tar. It has sometinee been used in lumps, but is apt to smoke. This variety of naphtha is in greut request us a solvent for caoitchouc.
Napier, John, Baron of Merchiston. Selebrated as the inventer of Logarithms. Bern 15050, and eduented at the miversity of St. Andrews. On returning from his travela, in 15i4, his leurning and accomplish ments attracted great attention, and would have raised lilm to the hlghest offices of State; but, deelining all civil employment, he devoted himself to scientile researches and to theology. In 1614 he peiblished his Logarithmorum Canonis Descriptio. To Napier science is indebted for consideratle improvements in spherienl trigonometry, etc. Ife is priucipally calebratell, however, hy his Rabidology and ${ }^{1}$ romptnary of Multiplication, or instruments and talhles for the moro casy performance of great arithnetical operations, conneeted with which were the rods of ivory, etc., known ns Napier's bowes. In addition to his selentific treatises, ha wrute eaveral works on theologleal suljects. He died $\ln 1617$, In his 68 th year, and , was buried in the cathedral of St. Giles, at Edinburgh.

Narrows, The, a channel between Long Island ard Staten Isiand, connectling Nsw York Bay with the Atlentic, nine miles sonth of New Yerk. The channel is 1905 yards wide, and is well defended by forts and batteries.
NTatal, a colonial pessension of Grear Britsin, on the south-eace ceest of Africs, hetween lnt. $27^{\circ} 40^{\prime}$ and $80^{\circ} 40^{\circ} \mathrm{S}$. , and long. $29^{\circ}$ and $81^{\circ} 10^{\circ} \mathrm{F}$., having south-east the Indian Ocean, west, the Drakenberg: or Kahlamba Mountaina, separating it from the terri tory between the Orange and Vanl Rivers, recently annexed to the Cape Coleny; and nerch-east the Buffalo and Tugela Kivers, dividing it fiom the Zooloo coantry. Estimated aree, 18,000 square miles. Population uncertain. Surface undulating, well watered, and meatly covered with tall grass. Timber in the interior grows only in clnmps, but the ecareasat is bordered by a belt of mangroves. Climate mist healthy, and the aill is reported to be far more fertilu than in the Cape Colony. Cotton and indigo grow wild, and the former has been produced for expostation, of the finest quality. Sugar, ceffee, wheat, oats, beans, and tobacco, are importent cropa. Superier coa? has been found in the interior; building stone is found all over its surface, and iron ore is abundant. Butter, com, hides, ivery, tallow, tobacco, cetton, and wool, were lately among the chief exports. Valus of exports in 1851, $\$ 15,000$. Imports same year, valued at 280,000. The territory, which is a dependency of the Cape of Good Hope, is administered by a lieuten-ant-governor, assisted by an executive and a legislative council.

It is subdivided inte the dintricta D'Urban, Pietermaritzburg, Umveti, Impafane, Upper Tugela, and Umzinzate, excluaive of a tract in the eenth, hitherto without an eatablisied magistracy. 1'ietermaritzburg, the capital, is 50 miles inland from Port Natal, which is zear the centre of the coast line. This colony derives its name from the fact of its having been discovered on Christmas day (1498), by the l'ortuguese. It was revisited in 1575 by order of King Sebastian.

National Debt. The first mention of parliamentary secusit ? for a debt of the English nation, occnrs in the reib of Henry VI. The present national debt commenced in the reign of Wiiliam III. It had amounted, in the year 1697, to about tive milicons sterling, and the debt was then theaght to be of aiarming magnitude.
1702, On the aocesslon of Quenn Anno, the debt amounted to.
£14,000,009 1714, On the necesslon of Geo. I........................ $84,000,000$ 1749, Geo. II.; after the 8pantsh war. 1768, Gea. $\qquad$ 1867, $780,000,000$
The national debt of the United States originated in consequence of the expensen incurred during the revoiutionary war, and amounted in the year 1791 to ubout $\$ 75,000,000$. The revenue of the gevernment enabled it to curtail the debt until the year 1812, when it was only $\$ 45,000,000$. The war with Fingland in 1812-15, added largeiy to this debt, the loans necessary for war expenditures being raised at a cenaiderable loss. At the end of the war the debt was over 103, , 000,000 . This was rapidly curtailed, and by the year 1835 was fully liquidated, besides an appropriation of several millions of aurplus revenue to the individual States. In 1839 , the revenue was leas than the expenditure, and another debt was created which had been nearly llquidated up to tho year 1845, when the war with Mexice rendered further loans necessary. The
progress of the national deut from 1701 to 1857 was as follows :

Naval Arohiteoture. In the smali space we can assign in this subject we ahall meraly endesvor to convey a general notion of the principles snd process of construction. Ships are built in different forms, according to the service they are intended for, and the burdens they have te carry. It is in men-ofwar, shich, besiles possessing in an eminent degree the general qualitios oí a ship, hava to support a heary armament of cannen, and which are deatined to severe and leng-continued service, that the priaciples of construction have been carried to the greatest perfection. The form of the ship, her etrength, or the seratiing necessary for the services required of her, are, fivin our impe?fect knowledge of hydredynamice, the resuits of experience alone. When a ship is to be built, hacr form is projected in three differont planes perpendicuiar to each other.

1st. The sheer dravght, which is the side view, or projection on the plane of the keel. On this are inid off the length, the helghts of all the parts from the keel, the poeition and rake of the atem and sternpost, the principal frames or timbers of the eides, the ports, decks, channels, place of the greatest breadth or midship frame, stations of the masts, etc. The irames before the midship frame are distinguished by ietters; abaft it, by numbers. The midshlp frame is not exactly in the middle of the length, but ruther be-fore it.

2d. The body plan, or end view. This shows tus centour of the sides of the ship at certain points of her length, and since the two sides are exactly ulike, the left half represents the vertical sections in the after part of the body, and the right-hand half those in the fore part. The base of the projection is the midstip, or lsrgest section, called also the dead flut, withiu which the other sections are deiinented. Un this are exhibited also the beams of the docks.
3. The horizontal or floor pinne, calied also the half breadth plan. The base of this is the section made by the horizontal surfuce of the water sad the outside surface of the ship, and is cailed the upper toater line, or load water line. If the ship now be supposed to be lightened uniformly, she will exhibit another water line, and thus any number of like paralici sections at equal distances down te the keel. On this projection the water lines sppear as curves, on the sheer draught as straight limes parallel to the keel. Theso three sec-

tlous correspond to esch other upon the same scale, and any point in one is immedistely refersble to : other two projections. The eeveral parts are drawn from these plane in their full aizo on the floor of the moldloft, and worked from the molds or model so taken.

The place in which the ship is built is called a slip. la the niddle, and leading to the water, is a row of piles of stont pieces of wood cslled the blocks, having a declivity towards the water of about one inch in one foot. On these the keel, which is of elm, is laid, and its component lengths scarfed together. Under the keel is placed the false keel for defense. At the end furthest from the water is raised the atem, which is, in fact, the keel continned npwards. Inside the stem, and just above the keel, is the apron, a curved timbe.: counecting both. On each eide of the upper part of the stem is fixed an upright timber; these are called the knight heads, and the buwsprit lies between them. At the other ead of the keel is the sternpost, at which the planking finishes abaft, and on which the rudder is hang. Iaside (or before this) are the inner post and other pieces for atrongth. Upon the keel is fixed a isyer of timber of the asme breadth, and rising forward and sft, cslled the dead wood; on this are piaced the foor timbers; these consist of one which crosees the keel to which it is coaked, and tia two parts of a like timber firmly joining it, and projecting beyond its ends. The severai pieces are got into their places by ehifting shears.

The jrames consist of pairs o- timbers composed of pieces of different longths, joining the fioor timbers, and carried upwards. The length joining the floors is called the first futtock, the next the eecond futtock, and so on, ending in the top timbers. The pairs are bolted by iron bolts, and of late adjacent pairs have been thus connected. The frames are supported tomporarily by being fixed to the cross spalls, long fir pisuks laid horizontaliy about the height of the gun deck. Those frames whose planes are perpendicalar to the keel are calied square frames; st the head and stern these plaue incline toward the extremities, and are called cant frames. These divisions of the ship are calied, accordingly, square and cant bodies. When the froming has assumed its form the ribands are fixod; these are thick, narrow planks at wide intervals, extending the length of the vessel, marking the direction of the planks; they are firmly shored, and removed when the planking comes on. The riband lines appear on the half breadth plan as diagonal lines. Upon the keel, and over the floor timbers, to which it is ecored, is laid the kelson, which is, in fact, a seconl keel over the first. The stern of aquare-eterned elips is formed upon the wing transom, the uppermost of the horizontal pieces of timber, calied transoms, crossing the sternpost inside. The wing transom is eecured to the timbers of the side by a strong horizontal knee. When the framing is complete, the outside planking is laid on. The uales, thick planks above the wator, are first secured to the ribs. The clamps aro thick planks inside, to support the ends of the beams of the decke. The beams support the decks, rest on the clamps, and are securod to the side by knees. The breast hooks are strong curved pieces of timber crossing the stem, and joining the bows. The deck hooks are the aame, being at the decks. The crutches answer a like purpose below in the after part. The port sills are the npper and lower edges of the porte. The spirketting is the plask of the side between the water way and the port siii. The chain woles are thick planke of the ontside to receive the chains and preventer-boits for the anpport of the rigging. The foot waling, or ceiling, is the piank iining the inside of the ship below. The limber boards sre short, thick pieces of wood rosting against the keison for the convenience of keeping a clear passage to the well. The knee of the head, also called the cutwater, is the projecting part of the head ; it is eecured to tho bowe by knees called cheeks.

In order to bend wood into the necassary carvayare, it is steamed in placed for the purpose. When the planking la all complete, the ohip is caulked and painted. The fasteninge of timber are effected by bolts, treenails, or coake. The present method of framing shipsoof-war ia chiefly due to Sir Robert Seppings. We shall deacribe it here generally; fur pare ticulars, see the Phil. Trans., 1814, and the published reports on the enbject. As the timbers or ribe can not be procured entire, or of the proper curvature, various methads have been uesd for joining the several pieces together. A methoi used till lately consisted of an angniar chock $C$, fastened by truenails to the ends A $\mathbf{3}$ of the timbers. By this plan all atress upon the joint, in whatever direction, falls on the treenaile ; snd
 when the chock decays, no support is afforded in any sense whatever. At present the square ends, $\mathbf{A}^{\prime} \mathbf{B}^{\prime}$, are bronght together, while a coak $\mathrm{C}^{\prime}$, or small oak cylinder, is let into each.
By this plan the two faces resist any effort by pressure from without to cloee the timbors, and the coak itself resists the effort (perpendicular to this last) to mako one timber alide past the ot ${ }^{\text {h }}-$ - by the whole force necessary to cut it off flush with the section. In the single case of lifting one face exactly perpendicularly off the other, the cosk offers no resiatance ; this effort, which is that produced by the atrain of the rigging on the eides, is opposed by other numerous connections. The method is very ancient, being used in the construction of the pillars in the temple at Bulbee; the advantages of ita application to ship-bullding is seen in the frames, which undergo no change of form while hoisting into their places. The etficiency of tho plan, however, does not appear in a single length, but in the systom of frames, each joining of which is placed near the middie of the next piece.

A shelf piece, coaked and bolted to the timbers or ribs, and resting on short vertical piecesof timber called chocks, and sometimes scored to tho ribs, is carried like a hoop entirely round the ship. On this the bean ends are coaked; and over these
 again is laid a atrong water way scored to the beams, and coaked. Besidee these the beam end is claspod by two arms of an iron knee, of which the third, which is vertical, is bolted to the chock. The shelf binds firmly the ends and sides of the ship togethor, and reaige: like an arch ail external pressure. The spaces betweon the timbers below are filled up by dry woc 'driven in tight, and canlked, thus rendering the bottom solid and water-tight, independently of the pianking. One of the most important improvements is the diagonal framework below, Instoad of the former planking in the hold are placed braces, crossing the ribs, to which they are conked, at an angle of $45^{\circ}$; those in the fore body incline (or rake) aft, and thoae in the after body forward. They butt against the kelson, and extend nearly to the water; they are in goneral placed ander every other beam, but closer at the extromities.

Longitudinal pieces of timber are lsid nearly parallel to the keei ove; the lieads or joinings of the timbers, and boiter through; these, crossing the diagonals, form a series of rhomboidal fignres, across which, inside, are firmly driven trusses, lying the opposite way from the liagonals; these are boited through, and, when necossary, are further tightened by driving in thin iron plates at the eads. The diagonals act by the tersion of the fibrea, the trussoe by the thrust, and the whoie thus resiste overy effort to change the figure of the ship. The system was firat put into complete practice in tho Tremendous, $\mathbf{7 4}$, in 1810; which ehip evinced, in several severe trials, a firmness and dryness not known before. M. C. Dupin has shown (Phil. Trans., 1817) that the principle of diagonal framing had ang-
gested liteelf, and been tried by several French engineers, but as often abandoned. The merlt; therecore, of Sir R. Soppiagh, in redueing to practice a aystem which to othere had been attended with In. superable diffieultles, more than compenaates the want of novelty in the lidea itself. The ancient s: are, masilve, but weak sterns, have been repina in ir It. Seppings by round sterns, correaponding lo whotruction, and therofore In strength, to the bow. These have again undergone various alterations, tondIng to comblne the strength of the new with the Imposing appearance of the former stern. It is only now by contrasting thes solid and immovable frame witit the former weak and unconnected structure, that we can fully percaive the inefficlency of the ancient construetion. The timbers, instend of forming an independent syatem, were often supported in part by the plankIng itself, as is the cuse in boats. The masta, resting onily upon their steps, inetead of strong platforms which diffase the pressure on all slden, and pressed downwarla hy thelr weight, and by the enermoue strain of the rigging, arising from the wind on the salis, forced the keel down, and made the ship leaky. The tinaters and framework, being at right angles, without mutasi support, the whole stress of the ahip eame on the fasteninge ; and, Inatly, the safety of the ship depended entirely upon that of the outside plink, the part most exposed to injury.

The plaaiss of the decka have also sometimea been placed diagonally ; and lately iron diagonal at raps have been aditet to the upper works inslde. The extremities being unsnpported below by the water droop, of the ship hoga, a three-decker formeriy drooped at once, on being launched, nine inches at each ond, which increased with her length of aervice; at present, snch a ehip droope oniy 84 inches, which, when the materlats are set, suffers little or no increase. Exposure to moisture leing a cause of the decay of timber, buldiing noder cover has long been practiced. This also protects the men from the wenther. "'he wood nsually employed in ship-huilding is oak. Eint, whleh does not eplit readily, is employed for the keel, and for the caps. Bast India teak, a very heavy durable wood, which does not shrink, nor is liable to splinter from shot, is now very mach used. African teak is also much used. Fir fs used for light works, masts, etc. The bottome of ehipa are linble to become covered with weeds and shells, and to be eaten through by worms. To prevent these evils, the lottoms were fommerly covered with a thin sheathing of wood, which was replaced when worn. Lead his aiso been used. Ships are now eheathed almost universally with thin sheets of copper.

For further information on this suljert, reference may be mado to the following works: Boutauen, Traite des Navire; Claikbots, I'raite il'ementaire, etc.; Cilapmon's Namal Archit., with Noten by Dr. inman; Atrate's Elerlents, with an Appendix, by J. Knowless, F.LL.S. ; Fischam's Outlines of Ship-building; the orticle "Shlp-huilding" In the new edition of the Ency. Brifannica.

Naval Courts are tribunale astablished as oceasion may require, either on tho high seas or In foreign parts, or at home, for luquiring into and dealing with various matters pertaining to maritine nifairs.

Naval Btores. The principal of these are tar, pitch, rowil and turpentine, though other articies used in tyuilling and equipping vessels are sometitres ineluden. The United States are so abundantly aupplied with naval atores, that notwithstanding she is nore extensively employed in ship-building tian nny other nation, sine exports navai atores In large quantities.

(Lat. navis, a ahip), is thit branch of science by which the mariner is taught to conduct his ship from one part or place to another. To nnderstand the principles of nnvigation, and their practical application, it is necessary that the mariner should be sequainted with the form and magnitule of the varth, the relative situations of the lines eonceivel to be diawn on its sarface, and have charts of the cosits and maps of the harbora which he may have oecasion to visit. He must also understand the use of the instruments by which the direction in which a ship is steered, and the distance $v$ leh ohe sails, are asecrtained; and be able to deduce crom the lata supplied by auch Instruments the situation of his ship at any time, and to find the directlon and distance of any place to which it may he required that the ship shouid be taken. A curve pasaing through any two plares on the earth, and cutting every intervening meridian at tise same angle, in called a rhumb line; the angle which such a eurve makes with each meridian is caifed the course between any two places throngh which the curve parses; and the aro of that curve intereapted between any two places is called thelr mautical distance. This distance is more than that measured on the are of a great circle pawing through the two places, ane

leas both placea are on the asme meridian, or both on the equator, when the rhumb line and great circle coinclile. The difference of Intitude between any two placear la an arc of a merdilinn intercepted between the parallela of latltude on which the places are situated; and the difference of longitude is the are of the equator, or the angle at the pole included bet ween the meridiana of tho places. Hence, when the latitudes or the lengitudes of two places are of the same denomination with rospect to north or wouth, east or weaf, the difference is found by subtrncting the less from the greater) but when of different denominations, what is called their diflerence la found by taking their oum. See Latituie, Longitude.

Navlgation owes its origin to the Phencians, aboat 1500 n.c. The first lawe of navigation originated with the Rhodlans, 916 3.c The first account we have of any considerable voyage is that of the Pheniclans aniling round Africa, f04 B.c.- Bi.ain. On the destruction of Thebes by Alexander the Great, $835 \mathrm{n} . \mathrm{c}$. its comnerce passed to Alexandria, and eubsequently the Remuns became the chlef masters of commerce. It passed auccesalvely from the Venetians, Genoeee, and Hanse Towns, to the Portuguese and Spaniarda; and from these to the English and Dutch.-IIAydn.

Navigation Laws. These laws form an lmportant branch of maritime law. In this country they are understood to comprlse the various acts that have been passed, defining the way in which ships are to be manned, the peculiar privileges enjoyed by thein, and the conditions under whleh forcign ships shall be allowed to engage in the trade of the country, either as importers or exporters of commodities, or as carriers of comaulities from one part of the country to another.

Shetch of the History and Principles of the Namigation Lurx.-The origin of the navigation laws of England, which ore the foundation of ours, may be traced to tho reign of Kichard II., or perhaps to a still more remote period. But, as no intelligible account of the varying and contradictory enactments framel at so distant un epoch could be compressed within any reasonable space, it is sullicient to observe, that in the reign of Henry VIl., two of the lealing principles of the navigation law were distinctly recognized, in the prohibition of the lonportation of certain commoditics, unless lmported in ships belonging to Einglish owners, and mannad by linglish seamen. In the narly part of the reign of Elizaheth (5 Eliz. c. 5), foreign ships were exchuled from the disheries and coasting trade. The repalilican Parliminent gave a great extension to the navigation laws, by the act of $\mathbf{1 6 5 0}$, which prohibited all ships, of all foreign nations whatever, from trading with the plantations in America, without hating previously ohtained a license. These acts wero, however, rather lutended to regulate the trude between the different ports and dependencies of the empire, than to regulate intercourso with foreigners. But in the following year (9th of Octoher, 1651), the repullican Parliament passed the famons Act of Navigation. This sct had a double object. It was intended not only to promote Iritish navigation, but also to strike a decisive hlow at the naval power of the Dutch, who then engrossed nlmost the whole carrying trade of the world, and against whom various circunstances had conspired
to lncense the Englieh. The act In quentlon declared, that no goods or commoditles whatever, of the growth, production or manufacture of Axia, Africa or Amerisa, ahould be lmported elther fato England or Ireland, or any of the plantationa, except In shlps belonglig to English suljecte, and of which the master and the greater number of the crew were nlso Engllsh. HavIng thus secured the Import trade of Asla, Africa and America, to the English ship-ownere, the act went on to secure to them, as far as that was poasible, the lmport trade of Europe. For this purpose, it further eascted, that no goods of the growth, production, or manufacture of any country $\ln$ Europe, should be imported Into Great Britain, except in British ahlps, or in such ahips as were the real property of the yeople of the country or place in which the gooda were produced, or from which they could only be, or most usually were, oxported. The latter part of the clause was entirely leveled agalnst the Dutci, who had but little nativo produce to export, and whese ships were prlnclpally employed In carrying the proluce of other countries to forelgn markete. Such were the leading provislong of thls famous act. They were adopted by the regsl governnent which succeeded Cromwell, and form the basls of the act of the 12th Car. 2, whlch contlaued, to a very recent period, to be the rule hy which anval intercourse with other countries was mainly regulated; and has been pompously leslgnated the Charta Maritima of England !

American View of the Righta of Navigation.-The liberty of passage to be enjoyed by one natien through the dominiens of another, was trented by the most eminent writers on pulilic law, as a quallfed, occasional exception to the paramount rights of pioperty. They made no diatinction between the right of passage by it river, llowing from the possessions of one nation through those of another, to the ocean, and the same right to be enjoyed by menns of any highway, whether of land or water, generally accessible to the inhabitants of the earth. The right of passage, then, must hold good for other purposes, besides those of trade; for objects of war as well as for those of peace; for all nations, no less than for any nation In particular, and be attached to artificial as well as to natural highways. Tho principle could not, tharefore, be insisted on by tho American government, unless it wus prepared to apply the snme principle by reclprocity, in faver of British subjects, to the navigation of the Mississippl and the Hudson, access to which from Cunadn might be obtained by a few miles of land carriago, or by the artificial communicstion created by the canals of New York and Ohlo. Hence the necessixy which has been felt by the writers on public law, of controlling the operation of a principlo so extensive and dangerous, by restricting the right of transit to purposes of innocent utility, to bo exclusively detarmined by the local soverelgn. Hence the right in question is termed ty them an imperfect right. But there was nothing in these writers, or in the stipulations of the treaties of Vienna, respecting the navigation of the great rivers of Germany, to countenance the American doctrine of an absolute natural right. These stipulntions were tho result of mutual consent, founded on considerations of mutusl interest growing out of the relative situation of the different States concerned in this navigation. The same observation would apply to the varions conventional regulations which hal been at different periods applied to the navigation of the River Missisulppi. As to any supposed right derived from the simultaneous acquisition of the St. Lawrence by the British and American people, it could not be allowed to have survived the treaty of 1783 , by which the independence of the United States was acknowledged, and a partition of the British dominions in Nerth Americs was made between the new government and thast of the mother country.

This argument, it was replied, on the part of th

United States, that, if the St. Lawrocice were regarded as a strait connecting navigablo seas, as it ought probsbly to be, there would be less controversy. The principle on which the right to navigate atraites depends, is, that they are accessorial to those seas whioh they unite, and the right of navigating which is not exclusive, but common to all nations; the right to navigate the seas drawing after it that of passing the straita. The United States nad Great Britein have between them the oxclusive right of navigating the lakes. The St. Lawrence connects them with the ocean. The right to navigate both (the lakes and the ocean), Includes that of passing from one to the other through the natural link. Was it then reasonable or just that one of the two co-proprietore of the lakes should altogether oxclide his associate from the use of a common bounty of nature, necensary to the full enjoymeat of them? The distinction between the right of passage, claimed by one nation throagh the territories of annthor, on land, and that on navigable water, though not always cleariy marked by the writere on public law, has a manifest existence in the natare of things. In the former case, the passage can bardly ever take place, especially if it bo of numerous bodies, withont some detriment or inconvenience to the State whose territory is traversed. But in the case of a passage on wator no such injury is sustained. The American government did not mean to contend for any princlple, the benefit of which, in analogous circumstances, it would deny to Great Britain. 1if, therefore, in the further progress of discovery, a connection should be developed between the Mississippi and Upper Cansda, similar to that which exists between the United States and the St. Lawrence, the American government would be always ready to apply, in respect to the Mississippi, the same principlea it contended for in respect to the St. Lawrence. But the case of rivern, which rise and debouch sitogether within the limits of the same nation, ought not to be confonnded with those which, having their sources and navigable portions of their streams in Statee sbove, tinaily diocharge themselves within the limits of other States beiow. In the former cnee, the question as to opening the navigation to other nations, depended apon the anme considerationa which might influence the regulation of other commercial intercourse with forelga States, and was to be exelusively determined by the local sovereign. But in respect to the lattor the free navigation of thio river was a natural right in the upper inhabitante, of which they could not be entire$1 y$ deprived by the arbitrary caprice of the lower State. Nor was the fact of subjecting the use of this right to trenty regulations, as was proposed at Vienna to be done in respect to the navigation of the Earopean rivera, sufficient to prove that the origin of the right was conventiosal, and not natural. It often happened to be highly convenient, if not sometimes indiapensabie, to avoid controveraies, ly prescribing cortain rules for the enjoyment of a natural right. The law of natare, though sufficiently inteiligithle in ite great out'ings and general purposes, does not always reach every minute detail which is calied for by the complicated wants sad varieties of modern navigation and connmerce. Hence the right of navigating the ocesn itself, in many instances, priacipaily incident to a stato of war, in subjected, by innumerable treatien, to varions regulations. These regulations-the transsctions of Vienna, and other analogous stipulationsshouid tee regarded oniy as the apontaneous homage of man to the permanent Lawgiver of the universe, hy delivering his great works from the artificiai shackies and aelfish contrivances to which they huve been arbitrarily and unjuntly suljected.- Whisaton's International Lawe, pp. 268-266.-[This chapter in Ma. WusaTos's mort furnishes the best view, in brief, of the rights of navigation of the St. Interence, the Missisaippi, the Whine, and of the righta of $\boldsymbol{T}$ :ritory.-Eina. C. of C.]

Laws of trade and navigation can not affect foreigners, beyond the territorial limits of the State, b:t they are binding apon its eitizens, wherever they may be. - Thus, offonees agoinst the lawn of a State, prohlbiting or regulating any particular traffio, may be ponished by ita tribunals, whion committed by its citizene, in whatever place ; but if commilted by foralgnore, such offensess can only he thus punished when committed within the territory of the State, or on board of its veseels, in some place not within the jurisdiction of any othor State.-Wheaton, Int. Law, p. 175.

Claims to Pomione of the Sea upon the Ground of Pre. scription.-Besicee those bays, galfs, straits, mouths of rivers, and ostuaries which are incloned by capes and houdlande belonging to the tertitory of the State, a jurisdiction and right of property over certain other portions of the sea have been clalmed by different nations, on the ground of immemorial use. Such, for exampie, wse the eovereignty formerly claimed by the republio of Venice over the Adriatic. The maritime supremacy claimed by Great Britain over what ere called the Narrow Seas, has generelly been asserted merely by requiring certain honors to the British flag in those seas, which have boen rendered or refused liy other nations, according to circumstancea, but the claim itself has never been sanctioned by general acquiescence. Straita are passages communicating from one sea to another. If the narigation of the two seas thus connected, is free, the navigation of the channei by which they are connected ought also to be free. Even if such strait be bounded on both sides by the tarritory of the aame sovereign, and is at the same time so narrow as to be corr nanded by cannon shot from both shores, the exclusive territorial jurisdiction of that sovereign over aueh strait is controlied by the right of other nations to commnnicate with the seas thus connected.

Such right may, however, be modified by apecial compact, adopting those regulation which are ladispensably necessary to the security of the Stste whose interior waters thus form the channei of commnnics. tion between different peas, the nsvigation of which is free to other nations. Thus the passage of the strait may remain free to the private merchant vessels of those nations having a right to navigate the seas it connects, while it is shut to all foreign armed ships in time of peace.-Wikstos's Int. Lavo, pp. 238-240.

Navigation of the Mississippi.-By the treaty of peace concluded at Paris in 1763, between France, Spain, and Great Britain, the province of Canada ras ceded to Great Britain by France, and thet of Florida to the same power by Spain, and the foundary hetween the Freneh and British possessions in North America was ascertained by a line drawn through the middie of the River Missienippi, from its source to the Iberville, snd from thence through the inter river sad the lakes of Maurepas and Pontchartrain to the sea. The right of navigating the Misaissippi wes at tho same time secured to the subjects of Great Britain from its source to the sea, and the passages in and out of its mouth, withoat being stopped or visited, or sabjected to the payment of any duty whatsoever. The provinee of Doulsiana was acon afterward ecded by France to Spain ; and by the treaty of Paris, 1883 , Fiorida was retroceded to Spain by Grent llritain. The independence of the Unitcd Stntes was acknowl. edged, and the right of navigating the Mississippi was mecured to the eltizens of the United States and the subjecta of Gireat liritain by the separate treaty be. tween these powers. But Spain, having thus become possessed of toth banks of the Missisnipjii at its nouth, and a conalderahle distance above ita mouth, claimed its exclasive navigation below the point where the monthern boundary of the United States struck tho river,

This elaim was reaisted, and the right to participate

In the navigation of the river from its source to the sea was incieted on by tha United. States, under the treaties of 1763 .and 1788; as. well as. by the law of nature and nations.: The diapute was terminated by the treaty of San Lorenzo el-Real, in 1795, by the 4th article of which his Catholie majesty agreed that the navigation of the Mississippi, in its whola breadth, from its source to the oceen, should be free to the citizons of the United States; and by the 22d article they were pormitted to doposit their goods at the port of Now Orieans, and to export them from thence, without paying any other duty than the hire of the warehouses. The subsequent acquisition of Louisiana and Florida by the United States baving inoluded within their territory the whole river from tis source to the Gulf of Mexico, and the atipulation in the treaty of 1783, eecaring to Britials subjects a right to participate in its navigation, not having been renewed by the treaty of Ghent in 1814, the right of navigating the Misaissippi is now vested exclusively in the United States.Wheaton's IMt. Lav, Pp. 257, 258. The navigation of the continuous waters of the United States and Canada is provided for in the following articles of the treaty of June 5,1854 . The third article, whose operation may be affected at the will of the American government, by a auspenaion of thin priviiege, as atipufuted in the fourthartiole, on the part of Great Britain, provides for a reciprocal trade, free of duty, between the United States and the British colonies, in the atticles of their respective growth and produce, as enumerated in the schadule theroto amexed.
"It is agreed that the citizens and inbabitants of the United States shall have the right to navigate the River St. Lawrence and the canals in Canada, used as the means of communicating between the Great Lakes and the Atiantio Ocean, with their vessels, boats, and orafts, as fuily and freely as the aubjects of her Britannic majesty, subject only to the same tolle and other assessmente as now are, or may hereafter be, exacted of her mejesty's sald eubjects ; it being underatood, however, that the British government retains the right of suspending this privilege on giving due notice thereof to the government of the United States. It is further agreed, that if at any time the British government should exercise the said reserved right, the government of the United States shall have the right of suspending, if it think fit, the operation of articie 8, of the present treaty, in so far as the province of Canada is affected thereby, for so iong as the suspension of the free navigation of the River St. Lawrence or the canals may continue. It is further agreed that British subjecta shall have the right freeiy to navigate Lake Bichigen with their veasels; boats, and crafts, oo long as tie privilege of nevigating the River St. Lawronce, secured to Americans by the ulove clause of the present article, shail continue ; and tho government of the United States further engages to urge upon the State governments to secure to the subjects of her Britannic majesty the use of the several State canals, on terms of equelity with the inhabitants of the United States."--Wheaton's Iut. Law, pp. 266, 267. [A full understanding of this aubject, and of the able views of Mr. Wheaton, cas be had only by a careful reading of his elaborate and highly-prized work on International Laro,-Eide. C. of C.]

Navigators' Islands, a group of islands in the southern I'acitio Ocean, remarkutsle for their oxtent, fertility, and population. They are about 10 in number, and are situsted betweon $169^{\circ}$ and $17^{\circ} 2^{\circ} 30^{\prime} \mathrm{W}$. long., snd from lat. $13^{\circ} 25^{\prime}$ to an uncertain boundary southward. When seen from the oceun, they present a lofty appearance, and ure mountainous, but neither surrounded with a low border nur inclosed by reefs, like the Society lslands. The first discovery of these ialands was made in 1722 , by lRoggewin and lanman, who fell in with the easternmost of the number; while Bougsinvilie, in 1768, added another; and Porouse, in

1787, discovered the two westemmost, which are the largest, being more than 40 miles in length. The last navigator was informed of three more to the southwand. The whole group was visited in 1791 by Captain Edwards. The inhabitante are a atout and well-made race, of the ordinary height of 5 feet 9 or 11 incles. They are altogether savage in their manners, which are said to be remarkably indecent. They ars also of the most ferocious disposition. "The least diapute between them ls foliowed by hlows from clabs, sticks, or paddles, and ? 3 often attended with the loss of life. They are very ingenious, and fashion their work dexterously with hatchets shaped like adzes, and made of very fine and compact basalta. With these they finish works in wood, and give them so high a polish that they appear to be coated with the finest varnish. They also manufucture a species of cloth which possesses great strength and pliabllity, and is well calcas. lated for the sails of canoes. The name of Navigators' Ielands was bestowed by Bougainville, from the practice which prevails among the inhabitants of continually traveling in canoes. We have no data upon which we can calculate the amount of the population, but it must be considerable, considering that these islands are among the most fertile in the South Seas.

Navy Department. The Navy Department was crasted by an act of Congreas, 30th April, 1798, and is under the direction of the Secretary of the Navy. The Department conducts its business in several bnreaux, namely, the Bureau of Dock3 and Navy Yarde; the Bureau of Orduance and Hydrography ; the Bureau of Construction, Equipments, and Repairs ; the Burean of Provisions and Clothing; the Bureau of Medicine and Nurgical Instruments, etc. ; and the National Observatory at Weshington is under the charge of this Department. The ministerial duties of these several bureaux were formerly exercised by a Board of Navy Commiscioners.

Neap, or Nreep Tides, are the lowest tides, heing those which are produced when the attractlons of the sua and moon on the waters of the ocean are exerted in directions perpendicular to each other. When the two forces aet in the anme or exactly opposite directions, the spring or highest tides are produced. The neap tides take place about four or flve days before the new and full moons. See Tides.
Needles. They make a conslderalle artiele of commerce, as well as of home trade in England. German and Hungarian steel is of most repute for needtes. The first that were made in England were fabricated in Cheapside, London, in the thme of the sangninary Mary, by a negro from Spain; but, as he wonld not impart the secret, it was lost at bla death, and not recovered agala till 1566, in the reign of Flizatieth, when Elias Growse, a German, taught the art to the English, who have since brought it to the highest degree of perfection.--Stowe. The family of the Greenings, aneestors of Lord Dorchester, eatablished a needle manafaetory in Bueks alout this time.-Andensos.
Needles are made from the best ateel, reduced by a wire-drawing machine to the sultable dlameter. The manufacture is supposed to have originated in Spaln, and to huve been introduced into England alout the year 1565, by Elias Krause, or Growse, who then settled in London. Dr. Ure, in his Dictionary of Arts, states that "the construction of a neetlle requires about 120 operations; but they are rapldy and uninterruptedly successive. A chill can trim the eyes of 4000 neelifes per hour. When we survey a manufaeture of this kind, we can not fail to observe that the diversity of operations which the needles unilergo bears the impress of great mechanical refinement. In the arts, to divide liabor is to aliridge it; to multiply operations is to simplify them; and to attach an operative exclusively to one process, is to render him much more ceonomieal and proluctive."-E. Nests, Esculent. A species of neata built ly swailows pecuitar to the ludian Islunds, and very much exteemed in China and other parts of the world. These nests resemble in form those of other swaliows; they ure formed of a viseid substance, and in external appearance as well as consistence are uot unilike flibate lii-concocted islaglass. Esculent nests are principaliy found in Java, in eaverus usually situated on the neaconst. Nuthlag satisfactory is known as to the subatance of which these neste are composed.

Net (Fr. Filet, reseau; Ger. Netz), is a textile fabric of knotted meshes for catching tish and other parposes. Each mesh should be so secured as to $L_{3}$ incapable of enlargement or diminution. The Freuch government offered in 1802 a prize of 10,000 francs to the person who should invent a machine for making nets upon automatio principles, and adjudged it to $M$. Buron, who presented his mechanical invention to the Conservatoire des Arts Métiers. It does not appear, however, that this machine has accomplighed the oldjeet in view; for no estallishment was ever mounted to carry it into exacution. Nets are usually made by the fiebermen and their families during the periods of leisure. The formation of a mesh is too slmple a matter to require description in this dictionary.
Nett (It. netto, pure), that which remaina of a weight, quantity, eto., after making certain deductions. Thus, in mercantile language, the nett weight is the weight of any article after deducting tare and tret ; nett profits, income, etc., is the absoolute profit or income, after deducting expenses, interest, etc. It is opposed to groses (britto).
Nottinge, in a ship, a sort of grates made of smali ropes seized together with rope-yarn, or twine, and fixed upon the quarters and in the tops. They are sometines stretched upon the ledges from this waist-troes to the roof-trees, from the top of the forecastie to the poop, and sometimes are laid in the waist of a ship to serve instead of grating.
Netherlands (Kingdom of the), or Holland (Du. Koningrijk der Nederlanden; Fr. Royoume des Pas Bas), a State of western Europe, on the German Ocean (enpitai Aneterdam), composed of the Netherlands preper, or the ancient ropublic of the Seves United Provinces, and part of the Duchy of Limhurg, situated between lat. $50^{\circ} 43^{\prime}$ and $53^{\circ} 21^{\circ} \mathrm{N}$., and long, $3^{\circ} 24^{\prime}$ and $7^{\circ} 12^{\prime}$ E., bounded east by Hanover and Prussia, south by Belgium and the Grand Ducly of Luxemburg (the south-east portion of which is heid by the King of the Netherlande), and west and north iv. the German Oeean. Extent and population as f lows:

The leading features of the new uavigation laws of the Netheriands may be gathered from the fullowing summary: 1. Unconditional repeni of diseriminating favors granted to the Dutch flag, by suppression of the rules aliowing to this flay preferencealove foreign flugs. 2. Conditional sluilarity of flag in the navigation to snd from the Netierianis' colonies. 3. Stipoiations by law concerning the trade and navigution in the colonies of the realm carried on ly other nations. 4. Repeal of interiiction to grant Netherlamis registers to foreignbuilt vessels, ly their admittance for registry (baturalization) at a duty of 4 per cent. of their value. 5. Diminishing of injort duties on principal muterials for shipbuiiting. 6. Suspension of the shipping duties on the Rhine and $Y_{\text {seel. }}$ 7. Total abolition of tramsit duties.

Public revenue, in 1853, $71,685,772$ florins, of which amount nearly half is raised by direct taxatiun and excise duties. Expenditure, 70,085,078 tioring. National debt, $1,206,493,330$ florine. The marine force in
setusi gsrvice on 1st July, 1852, comprised 6087 mon, exclustive of those in the colonles. The morchant marine is comprised of 2000 vessele, aggregate burden 20,000 lasts. The following table shows the extent and population of the colonlal possessions of the kingdom of the Netherlands in 1849 :

The Netherlands is a namo, which, for several centuries, was appiled to the countries now forming the kingdems of Belgium, and the Netherlands, and part of the north of France (Departments Nord and Pus-de-Caluis). This country belonged almost entirely to Charleo V. United to Franche-Comte, it fomed the circl of Bargundy. From this seven of the north provinces separated themselves in 1579, and formed the republic of Holland, or the Seven United Provinces. Part of the low country was conquered by Louis XIV., and called the French Netherlands ; the rest, firet nnder the dominion of Spaln, passed in 1714 to that of Austrin, and was called Spanish Netherlands, Austrian Netherlands, or Belgium.

The ligherien formed the origin of prosperity in the Nethorlandis, and the herrings prepared ly the Dutch still maintain thelr superiority. In 1842, 1603 boats, manned by 8280 men, were employed in this fishery. The while fifhery In the Sea of Spitzbergen has been profitalily carried on since the 10th century. The manuffacturing industry of the country is very netlve, Holiand having long been celebrated for Its linens, velvets, and paper; and during the 17th nnd 18th centuries, its typography enjoyed a weli-nerited reputntion. The shsence of cold, and the prevnlence of strong winds, have led to the adoption of the windmill as a motive power, and it is univerally employed in ali kinds of work. The chief manufactures are innen of the finest quality, woolens, aliks, and velvets, paper, leather, cordugo, hatn, ribbona, aaltpetre, and tobiech. Tho manufacture of cotton haa leen recently introluced. Thero are numerons distillerien of "Geneva" (rather jenever, from the juniper leerry, with which tho gin ls finvored), or "Holiands," and extensive bieach fields, brick and tile works. Holland preser. s the appoarance of an lmunense net-work of canale, which form the usual access not only to towns and, illages, hut even to private mansions. The most Inpiritant ls thnt of North Holland, between Amsterdam and the IIelder, the finest work of the kind in l. rope bi millos in length, 125 feet broad at the surfu : $:$, anit 21 feet in depth. By means of this important work, ships bound for Amsterdam avoid the danger at:d delay of navigating the Zuyder Zeo; it is spacions eliough to admit 2 frigates abreast. Since not only
the surface but the bed of many of the oanals is above the level of the land, the drainage of the polders or meadows, through which they pass, is an object of great sollcitude; it ls effected by means of pumps worked by wind-milis, 1he a country where human industry la engaged in a contlnual struggle with the eea, from the domaine of which it has been conquered, the management of dykes, canals, and roads, is a spectal object of attention on the part of the government. The rosds, which are always formed on the dykes and bordered by cansle, are excelient. In 1849 lines of rallroad were completed from Ameterdam weat to Harlen, and south to Leyden, the Hague, and Rotterdam, and south and east by Utrecht to Arnhom. The princlpal lmports consist of colonial products and manufactured goods, corn, wines, cotton, wool, and leather, valued in 1851 at $803,998,224$ florins. Chlef exports are butter, cheese, dried fiah, gin, the manufactures of the conntry; and colonlal produce; valned at $242,744,806$ florins.

A letter from the United States' consul at the Hague gives the annexed information, under date of July 20, 1855: "The ascond Chamber has, by a vote of 48 to 7, passed the bill abolishlng the tonnage dues. The deficit in the revenues, caused by this bill, is calculated at 500,000 franes a year, and is to be covered oy an additionsl excise duty on refined sugar, which has also been passed by the Chamber. The abolition of the tonnage dues, and of the still more vexations malt tax, has been hulled throughout the country with joy as an indication of a progressive policy, to which the present ministry has appeared but little inclined till now."

Neutrals. Of the General Rights and Duties of Neutral Nations.-The righte and dnties which beiong to a state of neutrality form a very interescing titie in the code of international law. They ought to be objects of particular study in this country, inasmuch as it is our trae polioy to cheriah a apirit of peace, and to keep oursel ves free from those politieni connections which would tend to draw us into the vortex of Ere ropean contests. A nation that maintains a firm and acrupuiousiv impartial neutrality, ard commands the respect of all other nations by its prudence, joatice, and good faith, has the best chance to preserve unimpaired the blessinge of its commerce, the freedom of its institutions, and the prosperity of its resources. Beiligerent nations are interested in the support of the just rights of neutrala, for the Interceuree which is kept up by means of their commerce contributes greatly to mitlgate the evila of war. The public law of Europe has established the principle, that, in time of war, countries not parties to the war, nor interposing in it, shall not be materially affected by its action; but they shall be permitted to carry on their accustomed trade, under the few necessary rostrictiona which we shall hereafter conslder.

A neutral has a right to pursue his ordinary commerce, and be may become the carrier of the enemy's goods, without being subject to any contiscution of the ship, or of the neutrai articies on board; though not without the risk of having the voyage interrupted by the seizure of the hostile property. As the peutral has a right to carry the property of enemies in his own vessel, so, on the other hand, his own property is invioluble, though it be found in the vessels of enemites. But the general inviolability of the neutral churacter goes further than merely the protection of neutral property. It protects the property of the leliigerents when within the neutral jurisdictios., It is not iawful to make neutral territory the scene of hotility, or to attack an enemy while within it; and if the enemy be attacked, or any capture made, under neutrul protection, the neutral is bound to redress the injury, and effect restitution. Tho books are full of cases recugnizing this prineiple of neutrality.-Kent's Conn.

Prizes brought into Neutral Ports.-A neutral has no right to inquire into the validity of a capture, except in eases in which the rights of neutral jurisdiction were violated; snd, in ouch cases, the neutral power will reatore the property, if found in the hands of the offender, and within its jurisdiction, regardiess of any sentence of condemnation by a court of a belligerous captor. It belongs solely to the neutral geverument to raise the objection to a capture and titie, founded on the violation of neutral rights. The adverse belligerent has no right to complain when tho prize is duly libeled before a competent court. If any complaint is to be made on the part of the captured, it must be l,y his government to the neutral govenment, for a fraudulent, or unworthy, or onnecesaary submisaion to a violation of its territory, and such submission will naturally provoke retaliation.-Jbid.

Arming in Neutral Ports.-The government of the United States was warranted, by the law and practice of nations, in the deciarations made in 1703, of the rules of neutrality, which were particulariy recognized as neccasary to be olserved by the belligerent powers, in their intercourse with this country. These rules were, that the original arining or equipplag of vensels in our ports, by any of the powers at war, for military service, was unlawful; and no such vessel was entitied to an asylum in our ports. The equipment by them of govenment vessels of war, in matters of which, if done to other vesselin, would be spplicalje equally to commerce or war, whs lawful. The equipment by them of veasela fitted for merchandise and war, and applicable to eititer, was lawful; but If it wure of a nature solely appicable to war it wan unlawful. And if the armed vessel of one nation should
depart from our jurisdiction; no armed veseel, being within the same, and belonging to an adverse belligerent power, shouid depart until 24 houra after the former, without being deemed to have violated the law of nations.-Ibici.

Prizes in Neutral Porta.-Though a belijgerent vessel may not enter within neutral juriadiction for hostile purposes, she may, consistently with a state of neutrality, until prohibited by the neutral power, bring her prize inte a neutral port, and sell it. The neutral power is, however, at iiberty to refuse this privilege, provided the refusal be made, as the privilege ought to bo granted to both parties, or to neither. The United States, while a neutral power, frequentiy asserted the right to prohlbit, at diecretion, the sale within their ports of prizes brought in by the belligerents ; and the saie of French prizes was allowed as an induigence merciy, until it interfered with the treaty of Eagiand of $\mathbf{1 7 0 4}$, in respect to prizes made by privateers.-Ibid.
Neutral Property in an Enemy's Vessel.-It is also a principle of the law of nations relative to neutral rights that the effects of neutrals, found on board of euemy's vessole, shall be free; and it is a right as fuliy and firmily settied as the other, though, like that, it is often changed by positive agreement.
'The two distinct propositions, that enemy's goods found on board a neutral ship may lawfully be seized as prize of wur, and that the goods of a neutrul found on board of an enemy's vessel were to lie restored, have leen explicitiy incorporated into the jurisprudence of the Unlted States, and deciared by the Suprense Court to be founded in the law of nations. The ruie, as it was observed by the court, rented on the simpie and inteligibie principle, that war gave a fuil right to capture the goods of an enemy, but gave ne right te capture the goods of a friend.
The neutrai fiag constituted no protection to enemy's property, and the belifgerent flag communicated no hostile character to neutmi property. The character of the property depended upon the fact of ownership, and not upon the character of the vehicle in which it is found.-Ibid.

Of Restrictione upon Nautral Trade. -The principal restriction which the law of nations inposes on the trucie of neutrals, is the prohibition to furmish the beiligerent parties with warlike stores, and other articles which aro directly auxiliary to warlike parposes. Such goods are denominatad contraband of war; but in the attempt to define them, the authoritiea vary, or are deticient in precision, and the subject has iong been a fruitful source of dispute between neutrai and belifgerent nations.
Contraband of IVar. - In the time of Grotius, some persons contended for the rigor of war, and ethers for the freedom of commerce. As neutral nations are wililug to seize the opportunity which war presente, of becemink carriers for the belligerent powers, it is natural that they whould desire to dininish the list of contraband as much as possible. Grotius distinguishes between things whieh are useful only in war, as arma and ammunition, and thinge which servo mereiy for pleasure, and things which are of a mixed nature, and useful both in pesce and war. He agrees with ather writers in prohibiting neutrsis from carrying articies of the tirst kind to the enemy, as well as in permitting the second kind to be carried. As to articies of the third class, which are of indiscriminate use in peace and war, as money, provisiuns, ships and navai stores, he says that they are sometintes lawful articles of neutrel commerce, and sometimea not ; unil the queation will depend upen circumstances existing at the tiune.
law of Blockades.-A neutral may also furfeit the iminunities of his national charscter by vioistious of blockade; and among the rights of beliggerents, there is none more clear and incontrovertible, or more just and necessary In the application, than that which gives
rise to
founded on the carrying port, as lous. '

riee to the law of blockade. Bynkerehoeck says, it is founded on the principles of natural reason, as well as on the usege of nations; and Grotius considera the carrying of supplies to a besieged town, or a blockaded port, as an offense exceedingly aggravated and injurious. They both agree that a neutral may be dealt with soverely; and Vattel says he may be treated as an enemy. The law of blockade ja, however, so harsh and severe in its operation, that, in order to apply it, the fact of the actual blockade must be established by elear and unequivocal evilence; and the nautral must have inad due previous notice of its existence; and the squadron allotted for the purposes of ita execution must be competent to cut off ail communication with the interdicted place or port ; and the neatral must have been gailty of soms act of violation, either by golng in, or uttempting to enter, or by coming out with a cargo ladea after the oommencement of the blockade. The failure of either of tie points requisite to establish the existence of a legal blockade, amounta to an entire defcasance of the measure, oven though the notification of the blockace had iseued from the authority of the government itself.

Right of Search at Sea.-In orier to enforce the rights of beliigerent nations agulast the delinquencies of neutruls, and to ascertain the reai as well as assumed character of all vesse?s on the high eeas, the law of nations arms them with the practical power of viaitation and search. The dety of eolf-preservation gives to belligerent nations this right. It is founded upon necessity, and is atrictly and exclusively a war right, and does not rightfully $e x i s t$ in time of peace, unless conceded by treaty. All writera upon the law of nations, and the highest nuthorities, acknowledge the right in time of war as resting on aeund principles of pubic jurisprudence, and upon the institutes and practice of all great maritime powers. And if, upon making the search, the veseel be found employed in contrabond trade, or in carrying enemy's property, or troops, or dispatches, she is liable to be taken and hreught in for adjudication before a prize court.

Neutral notions have frequently been disposed to question and resist the exerciae of this right. This was particularly the case with the Buitio confederacy, during the American war, and with the convention of the Baitic powors in 1801. The right of search was denied, und the flag of the Stato was declared to be a substitute for all decumentary and other proof, and to exclude all right of searcin. Those powers armed for the purpose of defending their neutrul pretensions ; and England did not heaitate to consider it as an attempt to introduce, by force, a new code of maritime law, inconsistent with her belligerent rights, and hostife to her interests, and one which would go to extinguish the right of maritime capture. The attempt was speedily frustruted and abundoned, and the right of search has, since that time, been considered incontrovertitlo.

This right of search is confined to private merchant vesech, and does not apply to publio ships of war. Their immunity from the exercise of any civil or criminal jurisdiction bat that of tite sovereign power to which they beiong, is uniformly aseerted, claimed and conceled. A contrary doctrine is not to be found in any jurist or writer on the law of nations, or admitted in any treaty; and every act to the contrary bas been promptly nut and condemned.
Neutiral Documents.-..s neutral is bound, not only to submit to seareh, but to have his veseei duly furnished with the genuine documente requisite to support her neutral character. The most material of these documents sre, the register, passport or sea latter, muster-roll, log-book, charter-party, invoice and bill of lading. The want of some of these papers is strong presumptive evidence againat the ship's neutruilty; yet the want of any one of them is not absolutely conclusive. "Ni aliquill ex solemnibus deficiat, cum equi-
tas poscit subveniendum est" The concealment of papers material for the preservation of the nsutral character, justifies a capture and carrying jato port for adjudication, thoagh it does not absolutely require a condemnation. It is goed ground to refues cost and damages on restitution, or to refuse further proof to relieve the obscurity of the case, whers the canse labored under heavy doubts, and there was prima facie ground for condemnation independent of tho concealment.
The spoliation of papers is a atill more aggravated and inflamed circumatance of suspiciou. That fact may sxclude further proof, and be sufficient to infer guilt; but it doas not in Engiand, as it does by the maritime law of other countries, create an absolute presumption juris et de jure; and yet, a case that $88-$ capes with such a brand upon it, in saved so as by fire. The Suprems Court of the United States has followed tie less rigorous Englieh rule, and held that the spoliation of papers was not, of itself, sufficisnt ground for condemnation, and that it was a circumstance open for explaustion, for it may have arieen from accident, necessity, or superior forcs.-Kent's Comm., vol. i. See Wheaton'a International Law.

Neutral Trade, - The present position of the United States in regard to neutrals may be learned from the following extract :
"Soon after the commencement of the late war in Europe, this government submitted to tho considerution of all maritime nations two principles for the security of neutral commerce; one, that the neutral fleg ehould cover enemy's goods, except articles contraband of war ; and the other, that neutral property on board merchant vessels of belligerents should be excmpt from condemuation, with the exception of contraband articles. These were not preaented as new rules of international law, having been generally claimed by neutrals, though not alwaye admitted by belligerents. One of the parties to the war (Ruseia), as well as sevoral neutral powers, promptly acceded to thess propositions ; and the two other principul belligerents, Great Britain and France, having consented to olsserve them for the present occasion, a favorable opportunity seemed to be presented for obtaining a general racognition of them both in Europe and Americu.
"But Grest Britain and France, in common with most of the States of Europe, while forbearing to reject, did not affirmatively act upon the overtures of the United States.
"While the question was in this position, the representatives of Yussia, France, Great Britain, Austria, Prusaia, Sardinia, and Turkey, assembied at Paris, took into consideration the subject of maritime rights, and put forth a declaration containing the two principles whioh this government had submitted nearly two years hefore to tho consideration of maritime powers, und adding thereto the following propositions: 'Privatcering is and remains abolished,' and ' Blockades, in ordar to ise binding, must be effective, that is to say, maintuined by a force, eufficient really to prevent access to the coast of the enemy ; and to the declara. tion thus composed of four points, two of which had alreaty been proposed by the United States, this government has been invited to accede by all the powers represented at P'arie, excapt Great Britain and Turkey. T'o the lust of the two additional propositionsthat in relation to blockades-there can certainly be ne objection. It is merely the definition of what shall constitute the effectual investment of a blockaded place, a definition for which this government has n.]. ways contended, cl ${ }^{\circ}$ ning indemnity for losses where a practical violution of the rule thus defined has been injurious to our commerce. As to the remsining ar* tidie of the decluration of the conference of l'uris, 'that privateering is und remains abolishet,' I certuinly can not uscribe to the powers rapresented in the conference of laris any but liberal and philunthropie viows

In the attempt to change the uaqueationable rule of inaritime law in regand to privateering. Their proposition was doubtless intended to imply approval of the principle that private property upon the ocean, although it might belung to the citizens of a belligerent State, ahould be exempted from oapture; and had that proposition been so framed as to give full effect to the principle, it would have received my ready assent on behalf of the United States. But the measure ,roponed is inadequate to that purposs. It is true that if adopted, private property upon the ocean would be withdrawn from one mode of plunder, but left exposed, meanwhile, to another mode, which could be used with incremsed effectivaness. The aggreasive capacity of great naval powers would be therefore augmented, while the defensive abllity of others would be reduced. Though the sarrender of the mesns of prosecuting hoatilities by employing privateers, as proposed by the conference of Paris, is mutual in terms, yet, in practleal effect, it would be the relinquishment of a right of little value to one class of States, but of essential importance to another and a far larger class. It ought not to have been anticipated that a measure, so inudequate to the accompliahment of the proposed object, and so unequal in its operation, would receive the assent of all inaritime powers. l'rivate property would be still left to the depredations of the public armed cruisere.
"I have expressed a readiness, on the part of this government, to accede to all the principles contulned in the declaration of the conference of Paris, provided that releting to the ebendunuent of privateariug can be so amended as to effect the object for winch, as is presumed, it was intended, the imnunity of private property on the ocean from hostile capture. To effect this olject, it is proposed to add to the declaration ' that privateering is and remains abolished,' the following amendment: 'And that the private property of subjects and citizens of a belligerent on the high seas shall be exempt from selaure by the public armed vessels of the other belligerent except it be controband.' This amendment has been presented not only to the powers which have asked our assent to the declaration to abolish privateering, but to all other maritime States. Thus far it has not been rejected by any, and is favorably entertained by all which have made uny communichtion In reply.
"Several of the governments, regarding with favor the proposition of the United States, have delayed definite action upon it, only fur the purpose of consulting with others, parties to the couference of Paris. 1 have the aatisfaction of stating, however, that the Emperor of liussia bas entirely and explicitly approved of that modification, and will co-operate in endeavoring to oltain the assent of other powers; and that assurances of a slmilar purport have been received in relation to the dixposition of the Emperor of the French.
"The present aspect of this important subject allows us to cherish the boje that a principle so humane in its character, so just and equal in lts operation, so easential to the prosperity of commercial nations, und eo consonant to the sentiments of this enlightened period of the world, will command the approbation of all maritime powers, and thus be incorgorated linto the cole of international law."-Mcsataye l'resident L'nited Stater, Ife., 1856. See Mahitime Law, Navigation Laws.

Nevis, s West India lsiand, belonging to Great Britain, leeward group, in lat. $17^{\circ} 10^{\prime}$ N., long. $62^{\circ}$ $40^{\circ} \mathrm{W}$., separated from the south end of St. Christopher's by a channel two miles across. Area ubout 20 equare miles. l'ojulation in $1851,10,200$. Shape circular; the aurface rises to a eentral peak 2,510 feet in elevation. Soil generally fertile, and in 18t1, the total produce exported amounted in value to $£ 17,435$, sugar standing for $\$ 15,527$. 'Jotal value of imports in 1841, 223,728 . The legislature is composed of the ad-
ministrator of the government, a legisiutive council, and a house of aseenibly of 15 members. Salary of administrator, $£ 500$. The island consists of 5 purishes. Charlestown, the capital, in at ita nouth-weat extrom. Ity. Publio revenue in $1845, \mathrm{Ct}, 560$. A letter from the United States' consul, dated Deceinber 5,1855 , says: "The legielature of Novla has passed s law, to go into operation on the Ist of March ensuling, removing all duties on imports, exports, sind tonnage duties on vessela, therehy creating 4 free port. The consequence will be that the commerchal intercourse with the United States will be very comsideruble."

New Bedford, a port of entry in Massachusetta, 65 milies south of luston, 28 east of Newport, 49 south, east of Providencs, 226 east of New York, 434 frota Washington; in $41^{\circ} 38^{\prime} 10^{\prime \prime}$ N. lat., and $70^{\circ} 55^{\prime} 16^{\prime \prime}$ E. long. Population in 1830, 7,592 ; in 1840, 12,087; in 1850, 16,443; in $1851,18,044$; and in 1854, 20,000 . There are 88 manufactories of all eorts ; the most inportant of which are, 15 for oil and candles, the product of the whale fiehery; one large cotton factory; called the Wamsutta mili, propelied by ateam, containing 12,500 spindles, 288 looms, empioying 230 hands, and turns out daily 4,800 yards of cottion cluth, which has obtwined several medala for its superior quality; one cordage factory; with an invested capital of $\$ 50,000$, employing 100 hands, and produeing annually 1,000 tons of cordage, celebrated for beling of the best quality ; a large paper-hanging inanufactory which turns out 400,000 rolls of paper annually; sisu a rivet factory worked by steam, and two lron founderies; four printing offices, issuing two duily, three weckly, and ono moathy publication; and 186 mercantilo stores. There are two narine railways, one of them capable of taking up large ships. Ruilroad cara leave three tines daily for 1 loston and Providence, and every afternoon for Fall River and Stonlngton to connect with steamboats at those places runuing to New York. The whale fishery is the principal business which is carried on at Now Bedford, and has been the means chletiy of buildfigg it up to its present importance in population und wealth. Ae early as 176 f , small sloojs of 40 to 60 tons burden were fitted out to cruise, during the summer months, of the Capes of Virginia and latteras for sperm whales ; taking care to return to port before the equinoetlcal gales commenced ; the blubber was lirought into port and tried out on shore. Gradually the vovages were extended in larger veasels to the liay of Mexico, und ubout tho West. India Islands, thence to the Azores, and Cape de Verd lstands, and coast of Guinea. In 1791, a ship called tha Rebecca, was fitted out for a whaling voyage to the Pacifle Ocean; this ship was tho first Inerican whaler that ever eutered that ocean in parsuit of whales; her voyage was succeseful. From these small beginnings, tise whale fishery has steadily increased to its present importance, with the exception of the interruption of the revolutionary war, and of tho war of 1812 with Grest Britain, nutil New isedford hae becone the greatest whaling fort in the world. Jer ships now circumnavigate the glole, and explore overy ocedn and sea from the Arctic to the Antaretie in puranit of whales. The number of vessele employod in the whale fishery from the United States at this time, 1852, is 620, their tonage, 103,090, of which there are belonging to the district of New Bedfurl, 372 vessels, employing upwards of 10,000 scamen. There were entered into tite ("aited Statex, during the year 1851, of sperm oil, 99,591 bble. : of right whale oil, 328,483 bbls.; of whatetone, $3,916,500 \mathrm{lbs}$; nmounting in value to $\mathbf{~} \mathbf{8} 10,0: 8,089$, of which there were imported into the district of New lledford, of sperin oil, 60,465 thble.; of right whale oil, 175,460 bbis. ; of whaletronc, 2, $173,300 \mathrm{lbs}$; unounting in value to $45,781,118$; of which value, alout $\$ 5,000,000$ was brought into the jort of New Ihedford. The ayerage length of the voyages of the right whale ahlys are 36 months ; aperm whule ships

44 monthat New Bedford is the great nursery for seamen in the United States. See artlele Ori.
New Erungvicic, a British provinoe, east coast of North Amorica, lat: $46^{\circ} 5^{\prime}$ to $48^{\circ} 40^{\prime}$ N., long. $68^{\circ}$ $50^{\prime}$ to $68^{\circ} \mathrm{W}$. ; bounded weat by the State of Maine; north-west Lower Canada, from which it is separated by the Rivar Reatigouche; north, Bay of Chaleurn; east, Guif of St. Lawrence and Northumberland Strait, the latter separating it from l'rince Edward Island; and south, the Bay of Fundy, and part of Nova Scotia. Its coast-line is about 500 miles in length, interrupted only at the point of junction with Nova Scotla, where an lethmus of not more than 10 miles in breadth connects the two provinces, and separates the watera of Northumberland Strait from those of the liay of Fundy, which it is proposed to unite by meana of a canal. The most remarkable lays and harbors are Bathuret Bay, on the north coast ; Mirsmichi Bay, on the east coast; 1'assamaquoddy Bay, and St. John harbor, on tha south coast. There are, beaides these larger Indentations, numerous amaller harbors, partlcularly on the south portion of the east coast. Area, 27,i0t square miles.
The population of this province is principally composed of British settlors and their doscendants. The remnant, of French oxtraction, are aettled around the Bay of Chaleurs. There is atill a few of the aboriginee left, conaistlag of the Miemacs, Melicites, and others, grounting in 1851 to 1,116 persons.
Physical Features, elc.-The general aurface of the country presents a series of bold undulations, sometimes rising into mountains, or continuous ridges of high land. The latter are seldom of any conslderable height ; but thelr precipitous acclivitien, aharp outline, and deep ravines, give them an alpine and picturesque character that finely and strikingly contrasts with the nich valleys and sheltered plains which alternate with the nore rogiged scenery. The shores of the Gulf of St. Lawrence and Northumberland Strait, however, present different and far less pleasing features. There the land, for sbout 12 miles inland, is low and sandy, covered with trees of a stunted growth, and skirted with exteusive marshes, lurge deep morassee, and long sand beaches. Along the aloores of the Bay of Chaleurs and the Gulf of St. Lawrence, gruy sundstone and gray clay-slate predominate, with detachel rocks of granite, quartz, and ironstone ; on the south coast, ilmestoae, graywacke, clay-slate, with saudstone, interrupted occasionally by gneiss, trap, and granite. Specimens of amethyst, cornelian, jusper, etc., have been picked up in various places. Coal is plentiful, and iron ors abundant; the former is sald to extend over 10,000 square miles, or above one third part of the whole area of the province.
New Brunswick is drained by numerons rivers and small streams, the principal of which is the St. John, navigable for vessels of 50 tons to Fredericton. The next river in importance ls the Miranichi, which riees near the west limits of the territory, whence it flows north-east, and falls into Miranichi liay, on tho east coast, about lat. $47^{\circ} 5^{\prime}$ N., long. $64^{\circ} 53^{\prime}$ W.; its whole course is upward of 110 miles, it is nuvigable for nearly 40 miles, and adinlts vessels of 600 or 700 tons. The hestigouche is the next considerable river; it forms the north-west limit of the province, and falls into the hend of the Bay of Chaleur, after a course of ahout 100 miles. There are a number of small lakes in New Brunswick, particularly in the northern part, but none of any considerable size. In the sonth there are a few somewhat larger, the most important of which are Grand Lake, 20 miles long, by about 5 miles broad; and Washedemoak Lake, about 20 miles long, by 2 miles luroad-both lying between St. John and Fredericton.

Mannfactures, etc.-There ware in the jrovinee in 1851, 82 woolen factories, employling 96 parsons; 261 grist mills, employing 866 parsons; 584 suw mills,
employing 4,802 parsons; 125 tanneries, omploying 255 persons; 11 founderies, employing 242 persons; 8 breweriea; 52 weavlay and carding eatablishmenta ( $5,-$ 475 hand looms), employing 96 persons; 96 of various manufacturing establishmonts, amploying 953 persons. Coals raised, 2,482 tons $\mid$ iron smoltad, 810 ; lime burnt, 85,599 caska; grindatones quarried, 58,840; gypsum, 5,465 tons quarried.

Products,-Cloth, 622,237 yards ; and $100,975 \mathrm{gal}$ lons malt liquor. Value of boots and ehoes made, $\mathbf{~} 89,367$; leather, $£ 45,165$; chairs, cahinot ware, and wood ware, $£ 33,977$; candles, $£ 19,860$; soap, $£ 18,502$ hats, $\mathbf{x 6 , 3 6 0}$; iron castinga, $\mathbf{~ £ 2 0 , 0 2 5 .}$

The principal plaees are St. John, the metropolis, and Fredericton, the capital. There were in 1854 several rallroads in course of construction; 5 lanks, aggregato capital, $£ 337,500$; a aavings' institntion, ani 4 insurance companies.
. Fisheries of Now Brunswick.--Thera were French fishing establishments in that part of Acadia now known as New Brunswlek, as carly as 1638. The English succeeded to these at the treaty of Utrecht, in 1713; but they do not seem to havo formed many others until after the cession of Canala, in 1763.* Among the first, 1 suppese, was that of Lieutenant Walker, of the roysi navy, in the Bay of Chaleurs, which was extensive, controlling the fur and fish trade of that region for several years. Thero woro similar settlemonts on the River St. John; but from the estimates of Mr. Grant, made in 1764, at the request of tho Rev. Dr. Stiles, the whole populution of British origin could not have axceoded 1000 .
At the peace of 1763, several thousand "Tories," or loyalists, compelled to abandon their native land, settled in New Brunswlek, and transferred thither the jurisprudence, the social and polltical institutions of "the old thirteen;" and, the year following, wero allowed to organize a eeparate colonlal government. Like those who went to that part of Acadia still called Nova Scotia, many of the loyalists were gentlomen of education, eminent private virtue, and distinguished consideration. Some obtained oflicos of honor and emolument ; others adopted agricultural purauits ; and another class, fixing their ubodes on islands and the shores of the main land, resolved to earn their support on the sen. Of the latter description, several, though compelied to toil and exposure in open fishing boate, had been persons of note and property. But, ruined by the confiscation laws of the Whlgs, or liy the general disasters of a civil war, they resorted to the hook and line to relieve the pressuro of inmediate want, indulging the hope of "better times," and more congenial avocatione. Few, however, abandoned the employment, and their children, trained to it from early yontis, and acquiring fishermen's habits, succeeded to boats, fishing-goar, and sinoke-houses, us their only inheritance, and continue it at the present day. I have often met with common boat fishermen of thle lineage, whose earnings were hardly sufficient to procure the absolute necessarics of life.

The fisheries of Now Brunswick are prosecuted with neither skill nor vigor. The apparent exports, small as are the statistics, do not indicate their real condition; since it is cortain, that of the products of the sea sinjpiped to other countrios, a part is first imjorted from Nova Scotia, and form a proportion of the exports of that colony. $\dagger$ The number of vessels sent to Labrador and other distant fishing grounds is never large, und often almost nomlnal. The cod-fishery in the Gulf of St. Lawrence and the Bay of Chaleurs is

- The Frencli bufft two forls on the Rivor 8 t. John prior to the peace of Utrecht (17t3), which they repaired to 1754 although the country had been ceded to lingtand quite hatf a contury.
$\dagger$ The Imports into $\mathbf{S t}$. John from Nova Ecotla for three monthe only (July 10 to Oetober 10) of tho year 186\%, were 7,80t quintuls of dried fist, 860 barrels of mackeret, $2,4: 3$ barrete of herring, aud other phekled fish
not at extenalve se might be $n, 4$, ably expected from the long experience of the Inhableanta there, and the general cofety and prais- flveness of the harbors and Indentations of the coast.'
The same remarkn need sllghe quallfication when applled to the Bay of Fundy, and lte prinelpal bramoh, the Bay of Paasamaquoddy. Cameron'e, Doggett'e, Druke's, Woodwarl's, Money, and Whale Coves ; Dark Flarbor, Jong'n Eldyr, Grand Harhor, and Long, Duck, Nantucket, and Kent's Islanda, which are nill ln the group of lalanda known as " Grand Menan," afford exceltent facilities for catching and curing ood, pollock, and herring, in large quantlites. In the waters that aurround Campo Helo, Deer, and Indian Islands, as well as In those that wash Hean's, Adama'n, Parker's, Minister'a, Hardwood, and Fiah Islands, and along the coast between L'Etite Passage and Point Lepreau, embraclng Mace's and Back Bays, IMlina' Island, Sealy's Cove, Crow, Heaver, and Deadman's Harbors, the advantages for fiahing are very good. Every place here mentioned is within a few hourn' sail of the frontier ports of Malne, and many of them are within cannon-shet distance of the ahorea of the United Staten. The fishermen of both countries meet on the same fishing gronnds; borrow and lend "bait," ask after each other's "woman"* at home; narrate the wonderful cires of the lant-discovered remedy for the "reumatla;" complain of the "scaclty" of fish, and the low price of "ille;" discourse about "flathooped flour;" and generally conduct toward one another as friends and brethren, owling allegiance to one government. Indeed, the observation of quite 25 years nuthorizes me to say that the colonints always agree fur tetter with the Americsun than with each other. Our countrys en are not often consldered interlopers when they leave the fiahing grounda neareat home and vislt these of Grand Menan; but the flwhermen of Campo Itello, and the otlier lalanila on the Hritish sde of the Passamaquoddy, are cometlmes roughly accosted and "twltted" when they venture to take the pame llberty. Frequent attempts have been made to dlaturb the friendly relatlons which have generally exlated between the people of the two ftage, but without success. The efforts of officlous Indivlduals, and of functionaries of the colonial government, have been alike disregarded. The captuins of the Jritiah shiph-of-war on the statlon, gentlemen In their feelinge, have ateadily refused to stoop to wage a petty warfare against the American boats that cross the imaginary boandary line In tho waters of the Passamaquoddy, though, of course, they have alvays obeyed their lnstructions. Yet, In the spirit of Nelson, who looked at the algnal he meant to disotey with hia blind eye, they lave never been able to aee a "Yankee," or to diatinguish one from a subject of her najjesty. Somo of them-as I remember the steried of by-gone rears-admittling the necessity of driving of the aggressors, have asked, "How ere we to know them-are they maried ${ }^{\prime \prime \prime}$, Others, sending their barges finto the fleet of boats, have directed that "all who say thay are Americana must be told to go to :": "r own side of the line;" but, strangely enough, the unbroken silence of the flshermen to whom the question was propounded afforded proof that sll were "Bluenoses." Stlll othera, natlsfying themselver, by peerIng through glasses from their quarter-deck, that all the loats in sight must belong to the islanda in New llrunswlek, have thought the sendling of luargea to inquire a needless ceremony. One, ${ }^{2} 1840$-the caj)tain of the Ringdore-in his officlal report, recommonded that "every British boat ahould have a license ; otherwise," said he, "it is impossibie to discriminate thom from Americans."
Thore who seek to put an end to this state of things, wincever thelr motiven, do not take into the account

[^35]that the instant they ahall acoomplish their olject, border strifes will follow of necesslty, ; Before renewIng their efforts, they may be kindly aaked to conilder that harmony and goodffellownhip botween the inhabItanta of frontler settlemeats are indispenamilie, and far betcer eeourities agalnat the marauder's toreh and bludgeon than armed whipa or bodies of troups. Tha produce of tha boat-finhery of the Bay of Fundy, and of the Pameamaquoddy, is not only minall in value, but generally Inferior in quality. An increase of this flahery', under present circumatances, la not dealrable. The fishermen drese and cure the cod, pollock, hake, and haddock-the kinde uaually dried-in a slovenly manner.
It is stated in an official dooumont that in 1850, at the different fishing-atationa montioned an within these hays, thers wore employed 62 vessele of 1,268 tons, 314 open boats, 65 weirs, and 1,337 men, in catching and curing the eeveral kinds of fiah just referred to ; and that the value of the products of the various branohes of the fiabery wore $\mathbf{C 3 3 , 0 8 0}$ currency; or 0132,320. These facts nhow that the fishermen rocelved a mlscrable plttance for their toil; since, without allowlag for the use and depreciation of the capital Inveated In the vessels, boats, weirs, nets, and other fiahling-gear, they earned for the yoar leay than 100 each. We may lament that men who parsue thelr avocation hoth day and night, 'mid raina and gules, are so poorly rewarded. We may lament, too, that the people of Grand Menan, falling short of those of Campo Bello, Weat Ieles, and the parishes on tha coast of the main land, enrn even less than the average. But, what then ? The fault is thelr own; entirely ao. They may, if they will, produce ss sweet and as well-cured pollock and cod an do their brethren of Barrington, and ea good colored and flavored smoked herring as do thees of Digly, and olstain prices to correapond with the quallty.

The general poverty amung them ia not to be attributed cotirely or prinelpally, as they aver, to the occaulonal lons of boats and nets, nor to glutted markets and bad seasons, nor to the Interlopers who visit their fiahing grounds, but to their own waut of industry, thrift, cleanlinesa, and honeaty. The few "who work it right," acopulre property, and onjoy the entire contidence of the dealers, command credit for supplies, and high prices for their connunoditlea when offered for sale.

It remain to apeak of the fisherlem of the Bay of Chaleurs, and of the Giulf of St. Lawrence. The county of IRestlgouche borders on Canadi, and the oountiea of Glousester, Northumberland, and Keat, are faverably aituated for adventures in these waters. The fishing grounds are eafe, and generilly closs to the shores; and those near Caraquet, in Gloucester, are much frequented by bonts from Gaspe, and owned by residenta of Canada. Since 1835, the catch of both cod and herring by the fishermen of Restigonche and Northumberiand has fallen off mure than half, aud in Kent has nearly become extinct. But the inhabitants of the port of Caraquet, availing themaeives of the advantages of their position, have actually produced a large portion of the driod cod experted from the colony for some rears. These fuur counties are more remote from the capital of Now Bruuswick, and from the markets of the United Staten, than the connty of Charlotte, which onibraces Grand Menan, and the other Islands in the Bay of Fundy (where the fish are so badly cured), and the attention of the people is livided letween sevoral branches ef induntry; but fishing, as an occasional and Irregular eatpoyment merely, has cominonly proved a source of protit, or at least has afforded a fuir reward for the labor und capital devoted to it. The Beh shlpped at Curaquet are in much better repute than these caught in the bay of Fundy, and the remark is truo of the produce of the Bay of Chaleurs and St. Lawrence Aisheries generally. It may be presumed that there the herring does not
"beco the " ent th being blood 350 , at
"becance rotten before aalting $j^{"}$ that, when sold at the "gibbed" article, it is not packed withont taking out tha ontralia; and that the cod is washed after being aplit, and mot salted and put in "kinch" In all lta blood and dirt.-SAming'日 Americans Fisheries.
The foliowing atatement exhilita the value of importa and exporta to and from the United States and New Brunawick during the years 1849 and 1850 t'

$$

The following abetract of the trade betwean the United States aud the port of St. John, New Bronawick, ahowe the number of shipa and tonnage antered inward, and the value of importa at that port during the year ending 81at Decomber, 1851: Vesasia inward: 605 veasela, of an aggregate tonnage of 166,052 tons; value of importa, $\$ 1,408,205$. Veasels outward 859 vessels, of an aygregato tonnares of 64,844 tons ; value of exporte, \$812,8y5.

The United States axport to New Brunawick, prinelpaliy, books and atitlonary, Indian corn, flaur, whest, lumier, salted provialona, rice, coal, tobacco, timber, an various kinds of manufactured gooda, and merchandise ; and recaive, in roturn, timber of differont kinda (except pitch-pina, oak, ioenat, hickory, and black walnut), junber, atavea, luthe, shingies, spars, and fieh. Coal und timber beling clasaed among the ataples of both countrias, an exanination has been instituted with a vi: ; to ascertain the probable affect of the Reciprocity Tresty on the trade In these articlea between the Unitad States and New Brunswick. To meet this inquiry, it la neccesary to know whether the coald and timber of New Branawick and the Unitail States ars similar in character and kind, or whether they differ in both, and in the usea to which thay are appiled; asch huving their own peculiar advantages for certuin purposes.
1)r. Jackson, an Amarioan gealogist of ability, in a aketch " of the arly hiatory and of the presant atate of our knowledge of the geology, etc., of Nove Scotia and New Branawick," referring to the mineral productione of these provinces, says: "The cosls of Nova Scotia are of various kinds, and are whally different from thase of the United States; at least, they differ from all the coals which are found on the eaatern alde of the Apalachian Monntains, so that they do not enter into competition with the couls obtained from minea In tha United Statas, which aupjly our coast." In a aubeequent part of this exsay Dr. Jacknon remarka, in substance, that recent explorationa in New Hrunawick haya brought to light a beuntiful and before unknown variety of highly bituminous coal, containing 60 per cent. of gas-making bitumen and 40 per cent. of coko. This coai is a new variety, particularly adapted to the usen of the gas-hause; and it la represented by Dr. Jnckson as the vary material wanted by gas-manafacturers to enrich the products of our semb-bituminous coais of Maryland and Virgina. In the formation of gas, thia New Brunawick production can not be used aione, but is mixed with other coals, in the proportion of from ons fifth to one third; and thus gives the best msterial that can be obtained. It ulso givea greater vaine to the coke of our more ash-hearing coala. If these facts are ta be relided upon (and they are supported by high authority), it fillows that the importation of the New lbrunswick coal Into the United Statea, so far from interfering with the sale of our own cosls, would cantribnte, in a great measure, to make avilubo, in the manufacture of gas, much of those which would etherwise be unsuitable for that purpose. With these distinctive characters and diffarent applications, the caals of New Bronswick and Nova Scotia will aiways :e required, whatever may be the supply of our awn mines of l'ennsyivania, Maryland, and Virginia. Indeed, the mine near Rlohmond, Virginia, is the only* ono in the United States that furnishes bituminous coal
that will fully serve In the place of the coala of Nova Sn n.
Irom the fmports and exports of timber letween the United Statea and Naw Branawick, it will the seen that Naw Drunswlek Importa from the United States largo quantities of pitch-pins, oak, locust, hickory, and black wninut, none of whieh are found in that province; while the United Statea receives, in retarn, boarda, ncantling, deals, various kinds of lumber, and fiah. Tha interchange of theee producta moat be greatiy Increased uniler a aystem which relievas them from all mport duties, - U. S. Com. Rel.

Newoantle. The following information is from the United Statea' consul at Newcantio In anawer to a circuiar inaned ly tha State Dapartment: "In thls port there are no privilages that British or any other pancla have which American vuasels hava not to the aame extent, but there are reatrictions and extra ohargea at thla port on tha vessels of some other nationa that have not treation of reciprocity with England, via., France, Two Sicilles, and Portugal. Frenoh vearela, taking cargoen to, or bringing them from, any place but France proper, are subjoct to danble the ordinary light-house dues; also, to double harbor lights, doable Kamsgate duea; and In case the veaasl lomils conls or grindstones, instead of paying 4 cente, or $2 \mathrm{~d}_{1,}$ per chalifron town dues, aa tho vessela of nations in reciprocity, 16 centa, or 8d., per chalidron, Is charged. When the vessal goes to any place but France proper, auch vasaeia also pay 12 canta, or $6 d$. , per foot extra pllotage. Vessela belonging to the Two Siciliea are abbject to the sume extra charges. Vessela belonging to Portugal have the additiunsl privilege of taking cargoes to ar from thair own coluniea on the aame terms at to Portogal proper, but to or from any other country t'iey ars subject to the alova extra clarges. There are, also, other nations, auch as soma of the South American States, whose vessela are anbject to these extra charges, but such vassels never visit thin port. These extra local dues are, neverthelesa, payable by all foreign veseela coming to this port, but the British gevernment eatisfy these claims on the vessels of natlons in reciprocity.
"The port charges on vessals of the United States are tha same as on British veaaols. Annexed aro partianlars of the charges on a vessel of 400 tone registar, carrying 200 chaldrons, or 630 tona, of coale and 60 tons of other goods. Vasaela belonging to the United States (by a law passad this (1854) sassion of Parliament) are allowod to carry goods i any kind coastwise withont any reatriction, and witn every privilega that British vessels enjoy.
Ligt of Cleabino Cuaboks at the Port of Nzwcast ie, citarozd on an Ambaicay Yfaseri op Fot h Hunuaro
 of Coala and sixty Tong of other Goons.

"If the vessel bring ballast, there is an additianal charge on it of 1a. 6d., or about 86 eents, per ton on the ballast. Sea pilotage, in winter, 1s, Gil.; and in summer, 1s. 31. per foot. Towage, according to distance, from Es. to $\mathbf{£ 3}$.
" Insurances are mostly effected in the States; the rate hera runs from $2 \frac{1}{\frac{1}{2}}$ to 5 per cent., according to season and class of vessol. Frcigits from \$484, or 20 s ., to 97 74, or 32 s , per ton, necording to circum-
stances. Commiasion for purchasing ta asually $2 \%$ per cent. Sale are made either by direct correspondence or through agonts realdent here. Torms vary, with the articles, from 2 to 4 monthr. 1 bilis, and a various dincount for eash, are the orilinary terms. There in no export duty payable on goods to the United Beates. There are no linternal taxes levied on any of the commodities mentioned, either in a erude, partially manufactured, or wholly complete atate."

Newfoundland, Colony of, in in lat. $40^{\circ} 40^{\prime}$ and $61^{\circ} 39^{\prime}$ N., and long. $53^{\circ} 44^{\prime}$ and $69^{\circ} 81^{\prime}$ W. Area, 35,013 equare miles. Dixtreme length, about 420 miles, and extrenus brea!th, alout 800 milen.

Nowfoundland is an island lying on the north-eust side of the Gulf of St. Lawrence, and is bounded on the whole east shore by the Atlantie Ucean, on the nurthwest and nurtu by the Strait of Belleigle, which sepurates It fronn l.ahrador, on the west by the Gulf of Sc. Lawrence, and on the south-west it approaches at Cape Hay towaril Cupe Breton, so as to form the main entrance from the Atlantle fisto the St. Lawrence. CinpItal, St. Juhn's. 'The island is of a momewhat triangular form, lut without any approach to regularity, each of its miden being loroken luto numeroue trays, harbors, crueks, and estuaries. Its perimetar is not leas than 1000 miles. Jrom the sea it han a wild and aterile appearance, and its general character lis that of a rugged, and, for the most juart, a barren country. Ililla and valleys continually succeed each other, the forner nover rising inte mountains, and the latter rorely expanding into plains. Of various character, the hilla sometimes form long, that-tupped sdges, and are occasionally rounded nnt isoluted, with sharp peaks and cragsy precipices. The valloys vary also from gently sloping depressions to rugged and abrupt ravinea. The sencelifis are loid and lofty, with deep water to their bases; and the rough character of the country is increased hy the existence of vat boulders acattered over it. This uneven surface is naturally distinguiahed into woods, marshea, and barrens. The " woods" are apread over the whole country wherever there is an, water-course, and are oven found crownIng the summits, and near the seancoast are especially Jnxuriant. The trees consist princijually of pine, opruce, fir, larch (or hackmataek), and birch; lu aome distriets the mountaln ash, the alder, the aspen, and a few others ure fuund. Most of the wood ls of small and atunted growth, although the claracter of the trees is greatly varied in this respect according to soil and situation, and in small groupa wood of fuir growth and length may be found. The open tracto are generally called " marshes." These are not necessarily lov, or even lovel lands, but are frequently at a consideratle helght above the sea, and have often an undulating nurface. They are open eracts, covered with moss, sonnetimes to the depth of neveral feet. Thls thick coating of moss is precisely like a great sponge njreal over the country. At the melting of the nnow, it thecones thoroughly saturated. Numerous amall holen and pools, and in the lower parts amall sluggish lirooks or gullies are met with. lint in most eases the surface in aufficiently eligible for drainage, and when the moss is strippeil off, dry ground or bare rock is generally found beneath. The "barrens" occupy the summits of the hilis and ridges, and other elevated und exposed tracts. They are covered with a thin and scrubly vegetation, consinting of berry-lvearing plants, and dwarf hushes of various kinds. Bare patehes of gravel and boulders, and crumbling fragments of rock are frequently met with upon the barrens, which are generally altogether dentitute of vegetable soll. These different tracts are none of them of grest extent ; woods, marshen, and burrens frequantly alteritating.

Not the least remarkable features of the island are its lakes and ponds. These are foumi in every direetion, and in almost every situation, not only in the
valleys, hut on the hl '4ianda, and even in the hollowa of the aummite, and 6 the very topa of the hilla, They va.jy in alze from pools of 50 yarda in diameter to lakes 80 milles in length, and from 4 to 5 milea wide. The number exceeding 2 miles is extent amount to several hundredn, while thoee of amaller size are abso Iutely conntlem.

13ut with all this lake aurface, thare are fow large water-courses ; yot this absence of any thing which can be called a navigable river ta readily explalned. The eharaeter of the natural surfaee, incleed, ls nuch that it alneorlan overy new acceasion of moisture from rain and melted anow, and only parts with it again by evaporation or a alow dralnage lato the ponds, tha overflow of which la the only supply the brookn have, Thus there is never formed current auffielently now. orful to Alig out a deep channel, or to breach oppoaing barriers. The area covered by fresh water has been eatimated at one third the whole island, and this large proportion will not probably be found exaggerated.

The const of Labrador is also ineluded in the government of Newfonndiand, to which it was annexed In 1808. It has a mea-const of aloui 100 miles, and is frequented during the aummer seasc hy more than 20,000 fiehermen. Thls vast country, inhespitabla in elimate and uninviting, is lnhabited by Finquimaux and Moravian missionaries, in all numbering somg 8000 or 10,000 aonla. Situate in a aevere and gloomy climate, and producing nothing that ean amplort human llfe, this is one of the most barren and desolate of countries. Wut, an if in compensation fur these disadvantagen, the aen in ita vicinity teems with tish, and thus thonaands of hardy adventurers are drawn to its rugged sheres, and their induatry and enterprise amply rewarded. The sea in this locality indeed forms the mont valuable fishery in the world. In no part the mainland of Labrador exceeds the height of 500 feet athove the sea, and is often much lower, as are all the Islands, except Greut and Little Meeatina. 1hoth are of granite rock, and alment bare of trees; and there are many ponds of dark bog water, frequented by water-fuwl and flocks of Labirador curlow. The coants are beset with ialanila and rocks, sometimes so intrieste as to furild navigation. There are, however, snveral harions fit for large veasels, and which may be safely entered. The Strait of Belleisle, which mepsrates the two parts of the government, is about 50 miles long and 12 wide. It is deep, but ita passage is not considered a safe onc, owing to lts currents. There are no harbers on that part of the Newfoundland coast which faces this atrait, and few on the opposite coast. During the winter months the resident populatien of Europan descent searcely numbera 800 souls, and many of these have Intermarried with the Esquimanx. The few widely scattered familiea reaide at the estalslishmenta for sen and salmon fishing and for furtrading. Seala and salmon are very pleatiful, and the latter are of a large and superior description. The furs of Labralor are very valuatiole, and consist of fox, otter, sat)le, lynx, bear, wolf, deer, ermine, hure, etc. The Canadian partridfe and the pitarmigua are also plentifnl. The "egging" buainess euploys a large number of small mehooners. The eggs oltained are chiefly these of the murr, but the egigs of putins, gannets, gulla, ohler duckn, and cormorante, ure also collected. Ilalifax is the principal market for these, slthough no small quantity ls disposed of at Joston and other United States' porta. Feathers ary also extensively cellected on the coasts and islands.

The average slee of New foundlanil vessels is alout 130 tons. The chief coasting trude consiats in carrying provisions and aupplies for the fishery, and bringing back the proceeda of the voyage.

Newfoundland proper is divided into nine distriets, the population of whlch, in 1815, the last eensus year, was as followa:

## NEW

The manufactures of the colony are very limited, and consist only of the following eatahliohmenta at St. John's, 2 corn, 1 gaw, and 1 bone mill, 1 iron foundery, and 1 brewery. The city has gas and water works. At Brigus, Conception Bay, there is 1 corn mill; at Harhor Grace, 1 corn mill and gas-works ; in Trinity Buy, 1 aaw mill; and at Groen Bay 2 saw nills. These are all that are noted.
As hefore atated, the chief wealth of tho colony consiste in its fisheries. The extent and value of these will be best appreciated ly perusal of the statistical returna.
In 1840 the numlier of fishing-boate, etc., wan as follows: boats from 4 to 15 quintala, 8002 ; boats from 15 to 30 quiatals, 1025 ; boate from 80 quintuls and upwerd, 972; cod seines, 879; and seal nets, 4368 .
The value of property employed in the fisheries, on an averags of four jearn, ending in 1819, has thus been stated:

$$
\begin{aligned}
& 841 \text { vensela engaged th the scal flabery...... } 1,028,000 \\

The chief foreign trade of Newfoundland vessels is with England, Scotland, I relancl, Spain, l'ortugal, Hamburg, Brazil, the West Indies, United States, and Britieh North America. The time occupied on the veyage to Europe and back is from six to elght weeks. To Great Britain the cargo, generally, is oll, and to the other European countries dried codish. A voyage to the Weat Indiea and back requirea about nine weeke. The outward cargo is dried cod and pickled fish, and the inward cargo West Iudia produce. Vessels from the Wcat Indics sometlmed return by the United States, briaging four and provisions. Vessels proceedlag to Drazil with dried Isil generally go from thence to Europe with cotton, sugars, etc., and on thelr retarn to thla coneulate lring manafactured goods from Great Britain. This voyage occuples thein from three to four month. The trade with the C inited States and Canada is almost exclusively in the importation of provisions. American vessels could be advantageously employed in the foreign trade, particularly in carrying lireadstuffy, provisions, etc., to this colony, and ilried fish hence to the Weat Indies, etc.
The following table exhibite the quantity and value of the prodacts of the fisheries exported for the eleven years onding 1851:

| Years. | Dried Aah, |  | Olls. |  | Sual akins. |  | Setmon. |  | Herring. |  |

The Labrador coast, as before observed, is tie resert of a large number of fishermen. Since the treaty of Paris, this fishery has increased more than alxfold. No accurate account of the products cen be ascertained, tut the following is considered te be an approx. imation. The saimon fiaheriea average annualiy about 30,000 tierces. The herring fisheries are also very large, and the neal fisheries are equni in valuo to those of Newfoundland. The imports of Lalirador have been ealimated by the authoritios of Nerfonadland at $\mathbf{~} 600,000$ per annam, and the foilowing is an approximation to the vaine of the exporta:

 Exports to Newfoundland from U. B..... $787,550 \quad 964,260$

The trade of Nowfoundland with othor countries than the United States; partieularly with Spain, Por-, tagal, Italy; and the Brazils, is mnoh more bxténaive, in proportion to 'its commercial capabilities, than is that of any other North American colony." The henvy balance against that island, in its trade with the United States, may suggest a reason why it neeks a Enropean market for so large a portion of las products. The United States export to Nowfonndland, beef, pork: pitch smd tar, corn-ment, flour, rice, tobacco, and genoral merchandise. It may be seen from the following table that fleur and pork amount to fally three fearths of the total exports from this country to Newfoundland.

Numben and Tonnank of Unithe Etatms' Vebsels abritING AT AND GLEARINO PMOM THE DORT OF, 8T. JOLN's, DשRINO TLR TEARS 1858, 1854, AND 1855.

"Article 3. It is agreed that the articles enamerated in the schedule hereunto annexed [the preceding list], being the growth and produce of the aforesaid British celomies, or of the United States, shall be admitted into each country, respectivels, free of daty." The colonies referred to in the foregoing articles are, Canada, New Brunswick, Nova Scotia, and Prince Fdward's Island. With respect to Newfoundland, article 6 providea ns follows: "And it is hereby further ngreed, that the provisions and stipulations of the foregoing articles shail extend to the laland of Newfoundland, so far as they are applicable to that colony. But, if the imperial Parliament, the provincial Parliament of Newfonndiand, or the United States, ahall not embrace in their lawe, enacted for carrying this treaty into effect, the colony of Newfoundland, then this article shall be of no effect ; but the omision to nake provision by law to give it effect, by elther of the legislative bodies aforesaid, shall not in any way impair the remaining articles of this treaty." This treaty is limited to ten years, with the usual notlce of 12 montlis by either of the high contracting parties who may wish to terminate the same. Date of exchange of ratifleations of the treaty alove reforred to, Septeniber 9,1854 . Date of President's proclantation of
the same, September 11, 1854. Date of ite neceptance by Canada, 23d September, 1854 ; by New Brunswick, 11th November, 18ö4; by Nova Sontia, December 15, 1854; by Prince Edward'a Island, 11th October, 1854 ; and by Nowfoundland, 14th November, 1855.-U. S. Com. Digeat, 1856. See Hunt's Mer. Mag., х., 880 ; Fraser, xxxil., 740; Eclec. Rer., xill., 816.

New Granada ia the most inportant of the three repablica inte which the Sonth Amerienn repnblic of Colombia reeelved itself at tha dissolution of that oenfederation in 1831. Till 1810 it was a viee-royalty under the Spanish crown, hut mubsequently a part of the republic of Colombia, the middle and western portions of which it now embraces. New Granada ls bounded on the north by the Caribhean Sea, on the east by the republic of Veneauelu, on the south-east by Bruzilian Gulana, on the south by the republic of Echador, and on the west by the Pacific Ocean. It lies nostly between the equator and $12^{\circ} \mathrm{N}$. lat., and between $70^{\circ}$ and $83^{\circ} \mathrm{W}$. long. Area about 480,000 aquare miles.

The Hanos or plains of the Orinoco extend over the entire tract, stretching away to the western banks of the Orinoco and to the Cassiquiare, between the Rlo Negro on the south, and the Rio Apure on the north. Aa far snnth as the Vichada, the nerthern part is a complete level, averaging only 300 feet above sea-level near the mountains, whence it gradually, but almost imperceptibly, declines toward the Orinoco. With the exception of a few palms that occur at great intervals ull over the plain, and some low bushy trees along the rivers, this district is quite deatitute of trees. During the rainy season, which is from April tili November, rain falis in torrents, accompanied with fearfil thun-der-storms, which usually occur between two and four o'elsek in the afternoon; but the contrast is very atriking in December, January nnd Febraary, when a cloud never crosses the sky. This immense plain is not at all fit for cultivation; but innumerable herds of eattle and horses find ahundant pasture on it during the rainy season; theugh they auffer much during the dry months, from November till April. The wet season is, on an averake, $8^{\circ}$ Fabr. hotter than the dry, and the mean annual temperature is $80^{\circ}$ Fahr.

The princlpal rivers of New Granada aro the Masdalena and Cauca, whleh run their whole course within the territory of the republic, taking their rise in the Andes near the southern frontier, and after flowing nearly the entire length of the country from south to north, unite in one channel, and discharge their combined waters through a delta, by threo channels, into the Caribbean Sea, about W. Long. $75^{\circ}$. Wesides these two princlpal streums, a large number of the tribntaries of the Orinoco, having their sources in the different ranges of the Andes, drain the lhanos of the east. Of these, the principal are the Apure, Metn, Vichada, Guaviare, lioo Negro and Japura, on the mutual boundary with Fcuador. The lakes of New Grauada are inconsiderable; the most celebrated in the Guatavita, not far from the city of Bogota, into which, it is affirmed, large treasurea were thrown by the natives during the Sjanish Invasion and cooquests.

The mineral riches of New Grumada are considerable, and mostiy occur in the western decivity of the three chains of the Audes. They consist of salt-roek, lead, Iron, copper, mercury, platinum, allver, and gold. Alung ull the central und western declivity of tho Andes gold is found, and is otitained by washing the sand of the rivers, as well as that on the sides and foot of some hillb. It is found on the plateaux of Cucuta and Girona in the eastern Andes, where silver also is obtained in considerable quantity. There are alno some very rich mines in the mountain region between the Rios Cauca und Magdalena, north of N. lat. 81 ${ }^{\circ}$. Patinuin is found in the western decllvity of the wentern Andes, and mercury in the vallej of Santa Roas, near Antioquia, and near the Pass of

Quindiu in the central Aniles. Copper is found in the eastern Anden, near Pamplona, and north of Tunja. Iron and coul oceur in the mantains border. ing on the table-lands of Bogota, and lead in varions parts of the eastern Andes. In some mountalns nerth east of IBogotá large masses of rock-salt are foand, and It is worked by the government. Large quantities of salt are furnished ulso by salt-springs in the asme mountaina.

From the great dlvorsity of sarface, soil, and cli. mate of New Granada, the natural productions are extremely varied, embracing almost every variety found in the temperate as well as in the tropical sme. The chief objects of culture over the table-lunds of Bogotá, and the district north of it, along the western sinpes of the eastern range, are the ceraals is In Europe, the aracachn-root, and potatoes; but in the river-valleys, and on the coast-piains, maize is the chief grain cultivated, with rice, sweet potatoea, and plantains. As articles of commerce, nre cultivated coffee, cotton, cocon, tobacco, some sugar, und indigo. The forests ahound with numerous kinds of useful timber trees; but those converted into articles of export are the logwood, Brazil, Nicaragua, and fustic trees, which grow most abundantly in the forests of the Santa Marta chain. The balsam of Tolu, so named from a viliage near Cartagena, lo collected largely on the bunks of the Kie Sinu, and ipecacuanha on those of the Rio Magdalens ; cinchona, or Peruvian bark, is oltained in large quantitles in the region of the Sierra le Sauta Marta, as well as in several other places; cochineal of the finest quality is procured from the banks of the $\mathrm{S}_{0}$ gamezo. Previous to the discovery of this country ly Europeans, horses and cattie were unknown in these reglens ; but now tasajo, or jerkell beef, nad hides, as nrticles of commerce, are furnished by the immense herds of eattle which the llanos support; and mules, horses, and cattle are exported to the Weat ladies.

The population of New Granads are descendants of the Spaniurds who havo settled there duriug the three lust centuries, and some of the native tribes intermixed with a few negroes. Very different degrees of civilization are found among the native tribes. Before the invasion of the Spaniands, those of the talie-iands along tho eastern Andes had organized a politicai system, and made some progress in the simpler arts of civilization. These, with the Indians in the valicy of the upper Magdalena, are still the best husbandmen In the republle. Between the Pucific and the western Andes, nearly all the population are descendants of the aloriginal native tribes, whose progress in the arts of civllized life is very small, and almost exiluaively owing to the few Spanish priests scattered mong them as missionaries. None but the descendants of Earopeans inweil in the treeless llanos; and their occupation is the cure of the herds of mules, horses, and cattle. Whadoring Indiana, still in a very barthrous state, necupy the nouthern wooded portion of the llanos, The numbers of the respective races orcupying New Gran.
asu havo been extimated by LIubner at follows:-

Total estimatel popuiation in trés, 2, $163,0 \times 4$
Agriculture holds the first place in the industry of New tiranada. Rice, cottom, tolaceo, cocoa, sibar, aud tropical fruits, are mong the productions of the coast region; while the elevated phulns yledd uaize, wheat, und ali the products of a temperate zone. The cultivation of the soil, however, is earried on ver: carelesaly ; and reclahned land lears but a small proportion to the whole. On the llanos toward the Orineco, almost the aole oceupation of the peopile is the

rearing of cattle and horses. Agriculture is chlefly in the hands of the converted Indlans, who manifeat a very deelded predifectlon for these labors of peace. Manufacturing industry is of so littlu importance that it can hardly be said to exist in the republic. It is limited to home-made coarse woolens and cottons, adapted for the use of the lower clasees only. At Bogotá, the capital, and the other principal towns, indeed, atriw hats, carpetn, and some' other articlos are made, but in no case does the native industry become commensurate with the demands of the country, so that nesrly all manufactured goods in use are imported. Nining is carried on, but only to a very inconsiderable degree. There is a silver mine at Sants Ana, in Bogota, the onls one now worked; and gold la collected in a few localitles. Emeralda, diamonds, and pearls, are also obtained. The salt mines of Zipaquira are, however, exteneively worked. With the exception of this last, the mining business of the country is left entirely to the poor and Ignorant.
Tho prinelpal purta of New Granada are-on the Caribbean Sea, Santa Marts, Cartagena, Chagres, Rio de la Ilscha, and Portobello; on the Pacific, Panama and Buenaventura. Steamera now navigate the Magdalena; and the only railway in the country is that from Aspinwall to Panama.
Christopher Columbus diacovered terra firma in 1498, and, during his fourth voyage, on the 2 d of November, 1502, found Chagres and the Bay of Limones, called also Navy Bay. Different governments have been establiahed throughout the Granadian territory, while Spanish colonles; a vlce-royalty was at length formed in 1732, of what are now the republica of New Granada and Ectudor. In 1810, New Grannda aeparated herself from the Spaniah monarchy, and maintained a constant war until 1824, when the Spanish army was conquered by the republican, of which two thirds consisted of Colombians. Bolivar, the most distinguished leader of the Spanish-Americant revolution, was the first proposer of tho union of Venezuela and New Granala, in 1818 ; and when the Congress of Angestura met, early in 1819, the fundamentul law was concted which established Colombia, on tho 17th of Decenber of thut year. Venezuela sopuratel herself in November, 1829, and Facuador In May, 1830 ; and the centril part of Colombia instltuted itself the republic of New Granadis on the 21 st of November, 1831. In 1832, the constitution of the State was sanctionel, under the form of a democratic republican government, by dividing the supreme power linto the executive, legisiative, and juilicial, under a central regimen, but giving to the provinces a munieipal corporation, that each sectan might legislato In its local alfairs. The republic was divided into provinces, these into camtons, and the cantons into purochinl districts. The State recognized no national religion; but has declured that it will pay for the Catholic worship, and protect Granalians in its exercise. The law of Colombin, which uttributed to itself the law of patronage exercised by Spain, has continued in vigor to the present time. 'The republic was tirst divided into 18 provinces; and they have since been Increasel to 35 . The constitution of 1832 was refornied in 18.13 , withont any variation in the form of govermment.

Commerciul relations between tho linited States nad New Granala are regulated by treaty of Docember 12, 184(G, proclaimed June 12, 18.18. Tho following summary presents the princlpal commercinl features of this treaty:
There shall be a perfect, firm, and inviolable pence and friendship between the two republis.s. No favors to be granted by either party to other nations, wintih shall not become common to the other. Mutual benefits in trale and residence to be equally enjuyed. The coasting trade reservol ly each country to its own flag. Fquallzation of duties granted by each country on vessels and their cargoes. The privileges respoeting
drawbacks equalized to the flag of each la the ports of elther. Importatlons and exportations of articles, the produce or manufuctnre of either country, into or from the other, equalized as to duties with aimilar importations and exportatione of any other foreign country. All prohibitions as to articles of import or export to be equal In each country as respects the flag of the other; the three preceding stipulations to apply, whether the vessels proceed from their own ports or from foreign porta, reapectively. The citizens of either country to be free to manage their own busineas, as well with respect to shippling and Its incidents, as to purchases, sales, etc., in the country of the other; and this privilege to be enjoyed peraonally or by agents--they being in all these cases treated aa cltizens or subjects of the most favored nation. In case of embargoes, detention of vesaels, etc., for pablic or private usea, full indemnity to be allowed. The vessels of either party seeking refuge in the ports of the other to be protected. Vessels captured by pirates to be delivered up to the owners. Assistaxce to be given in cases of shipwreck, etc., in the ports of each to the vessala of the other, in the sane manner as to the national flag. Citizens of either country authorized to dispose of their personal goods and roal estate within the juriadiction of the other, by asle, donution, testament, or otherwise ; and their representatives, being citizens of the other country, to succeed to thelr said personal goods or real estute, whether by testament or ab inteitato, and to take possession thereof, either by themselves or othera actiug for them, and to dispose of the aame at their will, paying only auch dues as the inh:abitants of the country are subject to in like cases. Protection to persons and property formally guarantied, whether such persona are tranaient of dwellers in the territories under the jurisdiction of either party, respectively ; aul access.to the legal tribunala of each country, free nud unrestricted, granted to the citizens of the other, on the snme terms as to the native or other citizens of such country. Liberty of conscience and the free and unrestricted rites of burial guarantied. Both parties ut liberty to trade with those at enmity with the other. Free ships to make free goods, contrabund of war exceptel. Enemy's property, to be protected by a neutral thag, must be shipped within two montha after declaration of war. Articles contraband of war specilled. Illockade definell to the the besieging or blockading of those places only which are aetwally attacked by a belligerent foree capable of proventing the entry of the uentral. All contralmul articles liable to confiscation. In eane of blockale, vessels to be turned away, but not detained. Vessels entering before bockude may quit unmolested. During a visit at sea, armed vessels to remain out of cannon-shot. In case of war, sea-letters, certlileates of cargo, etc.. to be furnishel. showing to whom the property belongs. In case of war between the two nations, merchants allowed time ( 6 months to thoge residing in ports, and 12 months to those resilling in the interier) to arrange their business, transport their effects, etc. Citizens of other nceupations, who may be estahlished in the territories of the Vnited States or of New Grunadu, to be respected and maintained in the full enjowment of their personal liberty mul property, this protection being dependent on their comiuct. No contiseation of debts, etc., in the event of war. Cithans of the United Stater, their vessels and merchandlse, placed on the samo footing us these of New Gramula $\ln$ the ports of Panuma. Right of translt acress the Isthmas of Panamn guarmitied to citizens of the United States, and no other or lilgher tolls to be exucted from them than from citizens of New Granada. The United Stntes giarantles to New Granala the perfect neatrality of the lathmins. Citizens to be helil personally responslble for infringing any articles of tho treaty; but reprisals not to be anthorized, nor war declared, until jastice has been slemunded and refused.

An additional artlele providen that the two repablice will hold and sdmit as natienal shlpe, of one or the other, all those that ahall be provided by thnir reopec: tive governments with a patent issued according to ite lawe. The treaty to continue In force twenty years from tha date of its ratlicatlon, and after that period the usual twelve month's notlce required. The navlgation and tarlff regulations of New Granada are marked by a spirit of Ilberality, though the forelgn commerce of the rapubllo has not, as yet, attained any considerable importance. The commerce of the United States, however, wlth that republic, is thought to labor under some disadvantages, as appears from the following extract from a late consular return: "Our commerce, by treaty, is put on the footing of the moet favered natlons. But this is nominal only; for, In the list of dutiable articles, theae supplied by the United States are taxed at a higher rate than such as come from England, France, and Germany. I ean not now give you many lnstances; but my recollection is, that tlour, baeon, and provisions generally, as well as common hats, boots, and ahoes, may be enumerated. The articles mainly produced by the United States belng taxed at a hlgher rate than articien produced by England, etc., etc., creatlog a practleal discrimination against us, necessarily operates as a duuble injury $\ln$ the exchange for the products of this country. * * * These matters should be corrected, snd there should be a stipulation inserted in the treaty (should a new treuty be entered into) prohlbiting the provinces from adillog any tax, direct or indirect, except, perhaps, to enforce borna fide inspection."

The principal commercial ports of New Granada are Santa Martha, Cartagena, and Panama; the aggregate trade of which ports, for the yeur 1852, la given in the following stateinent :

Commrace of New Ganalaa, 1558. .

| Primelpel porice | Eniered. |  | Cleured. |  |
| :---: | :---: | :---: | :---: | :---: |
|  | shlim. | Tons. | Ships. | Tuns. |
| Cartagena..... | 114 | [4,87 | 119 | 18,784 |
| St. Martha | *) | 4,187 | 48 | 4.127 |
| l'anama. | 818 | 148,899 | 297 | 183,836 |
| Total. | 135 | 162,4z7 | 45 | 151,697 |

The subjoined analysis of this statement will show the distribution of the commerce of New Granada for the year specitied:

The importa, during the same year, consinted of printed, dyed, and white cottona, calicoen, and other dimilar tisaues; silkn, linens, woolens, hardware, furniture, manufactures of metaly, medicinal drugs, wines, spirits, fluur, and provinions generally. The chicef article of export was gold, of which the antount for this year was about $1,000,000$.

A comparison of exportn for a number of years exhibits the fact, that the quantity of gold exported has either remalned stationary or allghtly diminished. The cause la not found in any defielency in the auriferous resources of the country, as the mines of Anthrquia, and these lit the country along the Pacific, on the Kto Zulla and the lio Hacha. contain large quantitien of the prechoua metala; but the difileculties attendlug the tranaportation of heavy machinery, indispensable in working the minen of Antioquia, seain to be lasuperable, beyond a certain weight. Until good roads rhall have teen eituthished, and the minea therely rendered more accessible, but little improve-
ment in the mining Industry of thin region (the richeat In New Granada) can be expected.

Large quantities of goid, in ingots and dust, enter into the clandestlna trade of the republlc, of which no account can be taken in the official returna.

Next to gold, tobacco lo the most impertant article In the export trade of New Granada, and its most prodactive staple. Tha soil, in many parta of the republlo, la pecullarly adapted to the growth of tobacco, and Its production might be made a source of the principal agricultural wealth of the Stato, under a different system of properiy regulated induatry. The quantity exported In 1848 exceeded thut of the preceding year by 85 per cent.; and the returns for aeveral preceding years exhibit a regular, though not eo large, augmentatlon.

Cabinet-maker'a wood and dye-atuffo rank next la the exports of the country. In 1848, they amounted In value to 8161,500 . The large bulk of these prodincts is sent to the United Statea, in part exchange for provisluns, cotton goods, furniture, medicinal drugs, und sundries. Excellent coffee and cocoa are raised, chielly In the valley of Cucuta; whence transported to Maracalbo, in Venezuela, they enter into the returns of Venezuelun axports.

In addition to these products of New Granada, a new species of berk has recently been discovered, which promises to become a valuable artlele of commerce. A letter from a mercantile house In London to a correapondent In New Granada, written in 1845, says: "We Imported last year 17,000 seroons (hampers or baskets) of New Gramada and 600 seroons of BoIlvlan, bark. The New Graneda all sold; but the Bolivian being held for a monopoly price, is atill in the market-proving that thla kind has very little demand."

Delondre, in his new work on quinine barks, gives an analyais of a New Granadlan bark containing quite as much quinine as Bolivian calisaya. If the calisaya of Santa Fe, or fusagasuga und pitaye barks of New Granada, had been intruduced Into the market lefown the Ilolivian, there would be no questien ahout the quality of the alkaloids they yleid.
There seems a probability that this New Granadiac. bark will noon enter largefy Into the expmit trade of that country. The chemieul test to which it has been subjected in lingland, has ulreudy atamped it as a valunble acquisition to the materia mediea; and the periodical scarcity of quinine, which ammetimes raises that artifle to a most exorbitant price, will render it atill more jopular. In reference to this bark, and uthre valuable products of New (iranada, a report aulanitted in July, 1856, to the French guvermment, relative to the cummercial movements of France in New firinada, suya: "Formerly, that republic had no other equivalent to otfer, in exchange for foreign morchanulise, than the gold of its mines." The ubolition, in 18is', of the monopoly of tobace, however, bas glven a new stimulus to agricultural induatry, and uttracted numbers to tho cultlvation of that article. This agrenulura, movement is not the only benefit arcruing tu New Granada from the anppression of this monopoty. In bringing the capitalists of the country in contact with foreign merchants, it has tanght them to apreciate better than formerly the lumense waith to be found in the soll of the reputilic. 'Thus, quinguina, whith hus remained almost nnknown since the depurture of the Sipanharlo, has been a second time disenverel in
 will noon beeotne n ronniferablo articie ansong the staples of New dirunala. The coltivation of corou, formerly limited to the consumption of the country, has also been hargely extended, and is nuw tecome an article of export.

The navligation lawn of New (iranada, by a decree of the Senate and Chamber of Reprenentativen of that republle, beating date May $2 \mathbf{2 7}, \mathbf{1 8 5 3}$, a translation of
which is aubjolned, undergo some modifications in fam vor of foreign commerce, as followa :
Anticle 1. The following ports and territoriea of the provines of Choco shall be free for all nations in the world, from January 1, 1854, for twenty years:

1. The ports of the Atlantic and the territory watered by the River Atrato, from its mouth to its confluence with the River Gulto, comprehended between the western chain of the Andes and that branch of it toward the eastward which eepurates seid province from that of Antrio-Chin.
2. The ports of the Paelfic and the territory watered by the River Sun Juan, from ite embouchure, as far as the city of Navita, contained between the abovementioned chaln of the Andea and that branch of it Which separates it toward the southward from the provinee of Buenaventura.
Ant. 2. Consequently, no eustom-houses can be established in sald ports and territories within the time specified; nor can any duties be levied, save those of toli, passage, and excise, corresponding to the municipal revenucs, and in conformity with the existing laws.
ART. 8. In order to recover the duties on importation of foreign merchandise whleh may bo introduced for the consumptlon of the interior of the reat of the province, and other provinces of the republic, there shall he established two eustom-houses, one in the city of Quibdo, and the other in the elty of Navita, with necessary officers, ete., ete.
Arr. 4. The executive power is authorized, when it deema it indiapensable for weighty motives of publie convenience, to asaign other ports for custom-houses than those expressed in chis law ; in which case, the naritime ports expressed in artlcle 1, and the territory comprised between the cousts and the spot on which such eustom-houses shall be fixed, ulone can enjoy treedom.
Another decree of aimilar importance to the interesta of furelign commerce was published in tho ufficial paper of the New Granudian government of the 20th of Juiy, 1856, in virtue of legislutive authority, dechríug Cartagena a free port for the commerce of ali nations, from the lst of September ensuing. By this decree, however, vessels wili continue to pay tonnage duty, conformable to the law of the 25 th of June last fo relation to that subject, The exemption from import duties is eircumseribed to the walied portion of the city, and hence does not apply to goods carried to the outside villuges of Cabrero, Boeagrande, Fspinal, und Manga f lis do In Popa. Counterfeit money, and Spanish, Culombian, and Granadian money, under the standard of 0.900 , as weli as cojper not sold for the use of the repuhlic, are prohlisted; elso, rum, and its compounds, so long as the legislature shail not decree tise free manufacture and sale of that article. Vessels must exhilit the usual papers on entering the port ; and when a vessei is only golng to leave a part of her cargo, the cuptain must, within twenty-four hours, present in manifest of what he intends to land, and whit to leave on board. If the vessel como in search of a market, and not for the determined jurpose of landing her goods, the captain will be ailowed forty-elight hours to present a manifest of what he intends to land and what to retain on boari. If the vesael come lin bullart, a manifest will not he required, but the visiting otherer wili matisfy himself that anci is the state of the versei. A vessei from another pert of tho repulilic, or from a purt of a nation in which, by virtue of atipulations elltered into with this repubilic, hy treaty or convention, merchandise jut on board in the jorts of such nation must be aceompanied by bills of lading, wili be required to produce biiis of lading for articies which may have leen shipped in ssid ports, unci a general manifest for the remainder of the cargo not enbraced in auch bili. The captain or supercargo not fuldiling these ragulations nust leave port immediately; first paying
tonnage duty, unleas oxempted from anch payment by the law of the 26 th of June, before cited. Vessels car. rying a mail, and stoam or aailing packets, ahall be visited at any hour of the day or night, and in like manner their gooda and the baggage of their paseengers may be landed. A caetom-house officer will board veseela at Bocachica. When the vessel contains gooda subject to import doties, the hatchways, et0., shall be cloaed and sealed by the commanding revenue officer, packets being oxoepted from this regulation; after which formality, the custom-honse officere will retire, leaving a anitable guard, which shall be relieved daily. The aeala on the hutches, etc., are not to be broken, except bo the commanding officer who placed them there, of ny his deputy. The decree embraces a number of additional provieions in relation to the discharge of cargo, cuetom-house inspection, re-exportation, etc., etc., and is accompanied by an explanatory note from the Secretary of the Treasury of New Granada.

The consting trade of New Granada is open to all foreign vessels, but only foreign steamers are permitted to naviggate the rivers of the republic. This ia an important privilege to foreign veesels, and one which is destined to atimulate American enterprice in this nelghboring republic. When the repairs of the canal connecting the harbor of Cartagena with the Magdalena, now in progress, under the superintendence of an American engineer, ohsil have been completed, the internal trade of New Granudu will be the means of developing more fully its great resources, and briuging to market the tobacco, India rubber, quinia, hidea, corn, cocoa, coffee, sugar, etc., the production of which can be inereased to an incredible extent. When this canal shall have been completed, Cartagena will become the great emporium of New Granada-at least of 20 of the principal agricultural provinces, containing a population of $1,628,471$ inhabitants. The present tariff regulations of New Granada, to be found in Part 11., have been in force since May 1, 1855; but by a late act of Congrese, the manumiasion duty of 20 por cent. is to be supprossed, and, in lieu, the additional duty of 25 per cent. on the total amount of the import duty is to be increased to 50 per cent. The port regulationa of New Granada are such as are deemed necessary, as weli in view of the general convenience and safcty of vessels, as to answer proper police and harbor discipline. Places are pointed ont into which all rubbish, ete., is to be thrown. Ballast is to be taken in and thrown out under writton authority of proper officers. Cannon are not to be fired without permisaion of the captuin of the port. At Curtagena, it is forbidden to sound the uipler or interior channels of the port, or to have any cominnnication with the shore bet ween eight o'clock at night and tive o'ciock in the morning. It is also forbidden to disensark any indlvidual beforo the visits of the officers of eustonis and eaptain of the port. For the violation of any of these regulations, fioes aro imposed, varying from 10 to 40 dullars, uccording to the nature of the caso.

There are no quarantine regulations ut any of the ports of New Gramada, and consequently no hills of health are required. No light or hospital money is levied. No local impost is churged. At the port of Savanilia there is a water-tax upon all vessols arri ag there of 84 each, imponed by tho provincial legisinture. lilots are employed and puid by government. Their duty is to visit all vessels requiring their assistance, and all vessels coming from a toreign port uro required to pay the fuil fees, whether they take on hoarif a piiot or not. The fee is $\$ 11$, in and out. There is aiso a fee of 9640 to be jaid to the cuitain of the port on visiting the vessel, and $\$ 160$ for the interpreter. With the exception of the interpreter's fee, this amount is also levied on New Granadian vessels. Ily a decree of the Congreas of New Granadu, bearing date June 19,1856 , which, like thut of July 20 , aiready given, comea to hand as thesu sheets go to press, new rogu-
lations respecting tonnage dues are established, of which a tranalation is given as followa: "Tonnage dues, port dues, pilotage, and. vislt foes, whall be the same in all the ports of the republio, including the free ports of the Iathmua of Panama, Cartagena, Choco, Buenaventura, and Tumaco, and the following suma ahall be collected: 1. Every vessel under 100 tom shall pay 40 cente per Granadian ton for her capacity. 2. Evary vessel exceeding 100 tons shall pay 40 conts per ton for the irst 100 tons, and 20 cents per ton for each ton over the same. 8. Tonnage duas shall only be paid at the first port at which a vessel touches, proceeding from forelgn countries: vessels proceeding from one port to another in the ropublic ahall not pay tonnage dues. 4. War vessels of the count $\tau$, or of friondly nations, and transporta assimilated so them, which moy tonch at the ports of the republic, shall not pay tonnage dues. 5. Tha executive may exempt from tonnage dues, and permit to coast, sail or ateam veasels that agree to convey the maila between the ports of the republie, and carry auch correspondence gratis as may be entrusted to them. Those that do not agree to this, shall pey tonnage dues, cush, in hard dallars of the country. 6. Vessela arriving in ballast, or which load in New Granada, shall not pay tounage dues; neither shali those chartered to bring immigrants to the republic, when the number of the same exceeds 50. Tonnage dues shail be charged at the lathnus ports from the Ist September next; the product shall he divided equally between the State and general government."-Com. Rel. U. S., voi. iii., 1857.
Since Junuary 1, 1850, Punamu, and all the other ports on the lsthmus, have been free-Aspinwsill, of course, included. The only duties levied at these free ports are navigation dres, as mbove given; from which, lowever, the vessels in the service of the Panama ruilroad at Aspinwall are exempt by charter. In February, 1855, Panam was erected into an independent State, with the po"ar vested in the legisjature to establish custom-houres, or, in other words, to abollsh the existlag freedom of its ports. It is not very likely, however, that the new State will be lisposed to take any legislative action by which the existing franchise of Aspinwall would be abolished, or ever abridged. This new State has now become the principal centre of commercial interest in this repubilic, In 185: there entered and cleared at its l'acific port (the jort of Panama) tow vessels, mensuring an aggregnte of 277,735 tons, of which 312 entered floating cargocs, including
apecie, to the value of $80,478,000$; and there cleared 297 vessels, with cargoes valued at nearly $\$ 500,000$. In this movement, the number of vessele under the Amorloan fing was. 158, measuring an aggregats of 163,118 tons; under the British flag, 188 vessela, measuring In all 88,070 tons; and under the French flag, 20 vessela, with an aggregate of 8856 tons. The freighte under the United Statos' flag were valued at $\$ 51,935,000$ I those under the British, at $\$ 8,000,000$; and the remainder of the total given above was dlstributed between the Sonth Americun, French, end other, European flags. The American and British frelghts included the goid dust brought down from California by the steamers for the former, and the sliver brought up the coast fer the latter, in neither case including the large amounts in the hands of passengers. See Panama.

The total amount of gold and silver whlch passed through Punama in transit in 1853 was $\$ 52,037,785$. The countries whence this sum was exported, and the smounts from each, are given as follows:

$$
\begin{aligned}
& \text { Caltforaia. } \\
& \text { 842,627,352 } \\
& \text { Mextco .. } \\
& \text { 2.705,010 } \\
& \begin{array}{l}
\text { Peru ane Chilii. } \\
\text { Australla }
\end{array}
\end{aligned}
$$

6,544,876
Total.
252,037,785

Tho total number of passengers who crossed the Isthmus the same year was 23,690 , of whom 13,937 came frem California, and 9753 were proceeding to that country. In 1855 the tetal number of passengers that crossed the Isthmus was 28,704 . Of this number there came from Califurnia 10,015 , and there proceeded to that Stute 16,289, all in Anserican steamers; by the British stesmere there came from Europe 1300 passengers, and there proceerled to E: ope 1100. The transit of gold and sllver the same year amounted to $\$ 40,407,907$. This amount was brought from the forlowing points:

$$
\begin{aligned}
& \text { San Franclsea. } \\
& \text { Chili and l'era. } \\
& \text { 831,671,815 } \\
& \text { Mexico. } \\
& \text { 6,854,578 } \\
& \text { Panama. } \\
& \text { 4.367,961 } \\
& \text { 813,568 } \\
& \text { * } 40,4117,9107
\end{aligned}
$$

The tatal exports of New Graindn, iluring the year ending Deceusleer 31, 1853, amounted to *30,8:19,005 65. Of this sggregate amount, Cartigena exported $\$ 17,913,146$; Cucuta, $4,153,898$; Gunapolo, 214,
 25 ; Tumaco, $834,442$.

I'ritripal ['orts.-Chagres, a sea-port town of New |shipping from the United States, C'artagena, and the Granaila, Central America, on the northern coast of the Isthmus of l'anama, at the mouth of the Chagrea Kiver, on the Caribbean Sen. Latitule of furt San Lorenza $9^{\circ} 18^{\prime} 6^{\prime \prime}$ N., leng. $79^{\circ} 59^{\prime} 2^{\prime \prime} \mathrm{W}$. It is a nere collection of hots, with a harbor only for vessels drawing 10 or 12 feat of water; but it has frequent traffic with I'anama, and is semetinses resorted to by British West Indies,

Panama, a clty and sea-port town of New Gransia, on the l'acific, 38 miles south-oast of Ciagrea, lat. $8^{\circ}$ $56^{\prime}$ N., long. $79^{\circ} 81^{\prime} 2^{\prime \prime} \mathrm{W}$. I'opulation eatimated at 7000. It atands on a rocky peninmula, projecting into the Bay of Panama, and has an imposing sepect fron the sea. Its streets are well veniliated, and it is said
to be cleaner than most Spanish American cities. It is encircled by lrregular and not very atrong fortifications, construoted at different periods.' The houses are partly of wood, struw, and other fragi ' materials. The tiden daily rise and fall from 20 to 27 feet; so that it in peculiarly well fitted for the repair and building of ships. The Panama rall road has one of its termini here, and another at Aspinwall, on Manesailla Island, Navy Bey. . Traias take about four houre in passing from sea to sea. Soe Parama.

Cartagena, or Carthagena, is atrongly-fortified city and sea-port of Now Granada, South Americs, of which repablie it is the chlef naval arsenal, capital of the proviace, on asandy peninaula in the Caribbean Ses. Lat. of the dome $10^{\circ} 25^{\prime} 86^{\prime \prime} \mathrm{N} ., \cdot$ long. $75^{\circ} 84^{\prime} \mathrm{W}$. Population, $\mathbf{1 0 , 0 0 0}$, nine tentha of whom are m mixed black race. Its excellent port is defended by two forts, and is the oniy harbor on the north coast of New Granads adapted for repairing vessela. Cartagenm is the priacipal dépot for the produce of thn provinces watered by the Cauca and Magdalena Rivers, and is connected with the Magdalena by a canal. It exports sugar, cotton, coffee, tobacco, hides, specie, huliion, etc. Under the Spaniarde, this city was the neat of a captain-general, and one of the three tribunals of the Inquisition in America. It was the first town that proclaimed independence, and in 1815 endured a most vigorous siege, and wat subdued only by famine. Population of the province, 108,783.

New Elampihire. It is situsted between lat. $42^{\circ} 41^{\prime}$ and $45^{\circ} 11^{\prime} \mathrm{N}$., and $70^{\circ} 40^{\prime}$ and $72^{\circ} 80^{\prime} \mathrm{W}$. long. It contuins 8,080 square miles.

Population in 1790, was 141,885 ; in 1800, 188,858; in 1810, 214,460; in 1820, 244, 161 ; in 1830, 269,828; in 1840, 284,574; and in 1850, 817,864.

Early History.-John Mason, one of the first ominent settlers of the north-eastern coast of New Engiand, having agreed with Sir Ferdinando Georges to make the l'iscataqua the division line between them,
took anbsequently from the Plymonth Council a patent of what lies between that river and Merrimack, nnd be calied that tract of land "New Hampohire," because he had been Governor of Portamoath, in Hampahlre, in England.

In the year 1880 New Hampshire separated from the province of Massachusetti, and was established as an independent royal province. It was afterward united again with Maesaohusetts, bat in 1749 finally separated, and has existed since that time as an independent community, first under the name of "the Protince of New Hantpuhire," and aince 1770 onder that of "the State of Net Hampshire."
The Connectiont River has its source ln the hlghlands, on the north border of the State, and its west branoh forms the boundary iine between New IIampshire and Canada to within one mile of the 45th degree of north lititude. Its general course is south by west. and dividing New Hampshire and Vermont it passes through the western part of Massachusetts, and the central part of Connecticat, where it enters Long Island Sound. Merrimack River, the Pemigewassit hranch, rises near the Notch in the White Mountaing, and is joined by the Winnipiseogee, 70 miles below the source of the former. It here taices the name of Merrimack. The Androscoggin and Saco Rivera rise and have a part of their course in this State.

Granite is plentiful throughout the State, and also marhle and limeatone. Iron ore, zinc, tin, lead, and copper exist, some of which have been worked to advantage.

There were in this State in 1850, 2,201,488 acres of Iand improved, and $1,140,926$ of unimproved land in farms. Cash value of farms, $\mathcal{S o x}^{5} 5,24 \overline{0}, 997$, and the value of lmplements and machinery, $\$ 2,814,12 \overline{0}$. Live Stock.-Horses, 84,283 ; asses and mules, 19 ; milch cows, 94,277; working oxen, 59,027 ; other cattle, 114,606 ; sheep, 384,756 ; swine, 63,487 ; value of live stock, $\$ 8,871,001$.

Formiun Commeres of thi Btatif of Nrw Itampshing, fbom Ootohen 1, 1820, to July 1, 1856.

## NEW

Manyfactures, etc.-There wore in the State In 1850, 43 cotton factories, with a capital invested of 10,874 , $^{-}$ 700, empluying 2,016 malee and 0,235 fomules, producing sheetings valued at $18,801,749 ; 91$ woolen factories, with a capital of $\$ 2,547,500$, omploying 878 malea, and 1,021 females, manufacturing $\varepsilon, 712,840$ yards of cloth, and 165,200 lba, of yarn, vulued at $\hat{8}$,499,967 ; I establishment with a capital of 34,000 , employing 30 persoris, producing 200 tons of pig iron, ote., valued at $\$ 17,200 ; 28$ establishments with a capItal of 232,700 , employing 874 persons, and maklag 5,784 tons of castings, etc., valued at $\$ 871,710 ; 2$ entabliahments with a capleal of $\$ 4,000$, employlng 8 persons, manafacturing 110 tons of wrought iron valued at 810,$400 ; 178$ fluuring and grist milla, 80 saw mile, 165 tanneries, with a capital of 441,075 , eraploying 518 persons; 40 printing offices, 2 daily, 86 weekly, 1 semi-moththly, and 2 monthly newapapers. Capital inveeted In maoufactures, $18,242,114$; value of manufactured artieles, $\$ 28,160,603$.

Agricwltural Products, etc.-Wheat, 185,658 bushels; rye, 183,117; Indian corn, 1,578,670; oets, 978 , 381 ; barley, 70,256 ; buck wheat, 65,265 ; peas and beans, 70,888 ; potatoes, $4,304,019$; value of producta of the orchard, 248,663 ; produce of market gardens, * 56,810 ; pounde of butter made, $6,977,056$; of cheene, 3,196,563; maple sugar, $1,294,863$; molanses, 8,811 gallons; teeswax and honey, 117,140 pounds ; wool, 1,108,476; tiax, 7652; silk coccons, 4,101; hepe, 257,174 ; tohseco, 50 ; hay, tons of, 598,854 ; elover seeds, 829 bushels; other grass seeds, 8,071; fiax seed, 180 ; and were made 344 gallons of wine. Valne of homemanee manufactures, 8393,455 ; of slaughtered anlmais, $1,522,873$.

Principal Port.-Portamouth is the only sea-port in the State. It is situated on the south slde of the Piscataqua River, on a peninsuia, three miles from the sea, lat. $43^{\circ} 40^{\prime} \mathrm{N} .$, long. $70^{\circ} 45^{\prime} \mathrm{W}$. The sarbor is one of the best in the world; it has 42 feet water at lov ide through the while channel, and the carrent is sutlicient to prevent it from fruezing. The United States' Navy Yarl is located on an ialand near the main bank of the river. The city has valuable manufactures and a large foreign and country trade, and being interwected by the line of railroads between lloston und lPortland is connected thereby wilth all the New Fugland and Canada towns; a railroad also extends to Concord. The tonnage of Portsmouth in 1456 , was 34,590 tons.
The principus places in thls State are Concord, the canital, Manchester, Portsmouth, Dover, Exeter and Nashua. There were in 1858,15 rallronds, with 660 miles of track completed and $\ln$ operation, and 24 ln course of construction. The only canals are those facilitatiug the navigatlon of the SIerrimack River.

For comnerce, reaurces, ete., of New Hampshlre, see IIurr's Merch. Nag., Iv., 346 ; Am. Jo. Science, xlix., 27 ; Am. Quar. Reg., xlii., 170; North Am. Rev., xviii., 33.

New Jersey lles between $88^{\circ} 55^{\prime}$ and $41^{\circ} 24^{\prime}$ N. lat., and between $73^{\circ} 39^{\prime}$ and $75^{\circ} 29^{\prime}$ W. long. It is $\mathbf{1 6 3}$ miles long and 52 broad, and containing 8,851 square miles,

Population in 1790, was 184,189; in 1800, 211,149; in $1 \times 10,245,502$; in 1820, 277,575; In 1830, 820,759; in $1810,373,309$; and $\ln 1850,480,555$.

Eiarly History of New Jersey.-The shore and territory of the present State of New Jersey were at first, since 160 H, , a part of the great English province of northern Virginia; and then (since about 1621) it was considered (at least by the Dutch) as a part of their New Netherlonds.
The Englith; however, always claimed the eountry; and in the year 1648 Sir Filmund Iloydon and nome English gentlemen recelved a charter and grant of a great tract of country "Jying midway between New England and Maryland," to whici the name of New

Albion was given. This if the first English name which this country recelved. The oharter had, how. ever, no great consequences. . The Dutch remained in possesaion, and the name Now Alblom was forgotten,
When the Faglish conquered the New Netherlands for the Duke of York, all thls land was Included in the large territory given to the Duke of York. But the Duke of York very woon sold (as early as the year 1664) that part of his grant which was lying between Delaware and Hudson'e Kiver to Sir George Carteret and John Lord Berkeloy. The grant which he gave to them is dated on the 24th of June, 1684 . The conntry recelved at once the name of New Jerney, in compliment of Sir George Carteret, whose ancestors came from the Ialand of Jersey, and who was himeslf Governer of the Island of New Jersey:

The Iludson and Delaware Rivera flow on the eastern and westorn sidee of this State. The Karitan is navigable 17 miles to New Brunawlek, and it enters Raritun Bay' the Pusatic is navigable for amall vessels fur about 15 miles, and enters into Newark liny; the IInckensack, navigeble 18 milea, also anters Newark Buy. Great Eyz Harbor Kiver, navlgable 20 miles for amall craft, passea through a bay of the sume name and entars into the Atlantic. The principal bays are Newark and Ruritan. Delaware Bay la on Its south-eastern border. It has two important capes, vlz., Cape May on Delaware Bay, and Sandy Hook at the entrance of the llay of New York. It centains quarries of good bailding stone, valuable mines of zinc and of iron, and in the south parts, beds of narl.

The principal places in this State are Trenten, the capital, Princeton, New Branawlek, Rahway, Elizabethtown, Jersey City, Hoboken, I'aterson, Hackensack, Murristown, South Amboy, Ereehold, Burlington, and Camden. I'hers were In the State, July, 1857, 38 banka with a paid capital of $\mathrm{e} 5,147,741$. The total tomnage of the State, January, 1858, amounted to 93,300 tons.

The nerthern part of the State in mountalnnus, being crossed by a branch of the Alleghany Ridge; the middle portion is agroeably diversified by hills and valleys; while the southern part is level, sandy, and mostly covered with pines and a scanty growith of shrub ouks. The northern and middle portions of the State havo a fertile soii.

There were in the State ln 1850, 1,767,991 acres of Improved land, and 984,055 of unlinproved in farms. Cash value of farma $120,237,511$; and the value of Implements and machinery $\$ 4,425,603$. Lire Stock.Horses, 63,955 ; asses and mules, 4,089 ; milch cows, 118,736 ; worklag oxen, 12,070 ; other cattle, 80,455 ; sheep, 160,488 ; swlne, 250,370 ; valre of live stock, - $10,679,291$.

Agricultural Products, etc.-Wheat, 1,601,190 bushels produced; rye, 1,255,578; Indian corn, 8,759,704; oats, $3,0.8,063$; barley, 6,492 ; buckwheat, 878,934 ; paas and beans, 14,174 ; potatces, $3,207,236$; ; weet potstoes, 508,015 ; value of products of the erchard, \$607,278; produce of market gardens, 8475,242 ; lus. of butter made, $0,487,210$; of cheese, 365,756 ; mapla augar, 2,197; molasses, 954 gallons; beeswax and houey, 156,694 lbs. ; wool, 375,396 ; flax, 182,960 ; silk cocoons, 28 ; hopes, 2, 138 ; tobacco, 310 ; lay, 433 , 950 tona; clover seed, 28,280 lushels; ether grass seeds, 63,051 ; thax seed, 16,525 ; and were made, 1 ,-81- gallons of wine; value of home-made manufacturen, 112,781 ; of slaughtered enitmale, $92,638,552$.

Sfanufurfures, etc.-There were in the State in $1 \times 50$, 29 cotton factories with a capital invested of $[1,691$, 000 , employing 739 mules and 1,299 females, produciug $8,122,580$ yards of sheeting, etc., and $2,000,000$ pounda of yarn valued at $\$ 1,289,648 ; 51$ woolen factorles with a capital inveated of $\$ 110,650$, employing 407 malea and 137 fomales, manufacturing $\mathbf{i 2 1 , 1 0 0}$ yards of cloth, etc., valued at $\$ 784,722 ; 9$ establishementa making plg lron, with a capital invested of
\$967,000, omploying 600 persons, producing 94,081 of pig Iron, etc. ; entire value of products 917,$000 ; 46$ establishments with a capital of $\mathbf{\$ 0 8 , 2 5 0}$, employing 803 persons, making 10,2059 tons of castings, valued at e 686,$430 ; 58$ oetabliahments with a capital of $\$ 1,016$,843, eniploying 598 persons, manufacturing 8,162 tona of wroughit iron valued at $\mathbf{\$ 2 0 , 2 7 8 \text { ; } 8 9 1 \text { thouring and }}$ griat mills 175 printing ottioes, 61 newapaperi, 8 daily,

50 wookly, and 8 monthly publications. Capltal invested in manufactures, $\$ 22,184,710$; value of manufwetured articlae, $889,184,614$. The Delaware and Raritan Canal, 42 miles long, and the Morris, 102 milea long, are the canals In this State. Thare wore, January 1, 1866, 11 railrouds with an aggregate length of 504 milea la operation, and 29 miles in course of construction. The State of New Jaraoy has no publie debt.

Principal Ports.-Jersey City is a flourishing eity at the mouth of the Hudson Kiver, opposite New York city, and is the terminus of the aouthern railroad travel, and also of the New York and Eria Railroad and of the Morris Cunal. Though a separate munleipality, it may be considered as a auhurb of the great metropois, with which it connects by several terries. It is a place of considerable manufacturing induatry; ship-bullding, and commerce, and it is the American station of the Cunard line of New York and Liverpool steamshipa.

Paterson is situated immediately below the falls of the Passalc River, 17 miles from New York. It ranks next to Newark in manufuctures, and ia the third eity in the State as to population. Its principul products are cotion and ailk goods, locomotives, machinory, paper, ete. On the opposite side of the river is the manufacturing town of Maneheater. I'aterson communicater with Now York by the Pateraon and Hodson Raliroad and Morris Cansl.

The other townn of note are Newark, Now lliunswiek, Cumden, Trenton, and Princeton.

New London, Connecticut, is situated on the Thames River, 8 milea from the ocean, 50 milea esst of New liaven by railroad. Its harbor in one of the best In the United States, but is seldom visited by foreign vesse: ${ }^{\text {a }}$. The whale fiaheries constituto its main Interest, and it hut also a large coastlng trade. Several maliroads connect it with the interior, Now Yerk, and Boston, and regular ateamboats ply to and
from New York. The tonnage in 1856, was 40,871 tons. Population in 1830, 4850; in 1854, 10,000.

New INexioo, a Territory of the United States of America, lies between lat. $32^{\circ} 30^{\prime}$ nnd $88^{\circ} 32^{\prime} \mathrm{N}$., and long. $103^{\circ}$ und $116^{\circ} \mathrm{W}$. from Greenwich, England. Area, 210,744 equare miles.

New Mexico is a mountainous country, with an extensive valley in the middle, running from north to south, and formed by the Rio del Norte. The valley is genarally about 20 miies wide, and bordered on the east snd weat by mountain chains, continuations of the Rocky Mountains, which have received here different namses, as Sierra Blanca, de loa Organos, Oscura, on the eastern side, and Sierra de los Grullas, do los Mimbres, toward tie weat. The height of the meuntains south of Sante Fé is from 6000 to 80 ? 'net, while near Sante F ', and in the more northern regions, some snow-covered peaks rise from 10,000 to 12,000 feet above the eea. The mountains are principally composed of igneous rocks, as granite, sienite, diorite, busult, ete. On the higher elevations, excelient pine timber grows ; on the lower, cedars, and sometines oak; in the valley of Rio del Norte, mezquite. The main artery of New Mexico is the Rio del Norte, Its head waters were explored in 1807 Ly Captuin Pike, between $87^{\circ}$ and $38^{\circ} \mathrm{N}$. lutitude; but its highest sources are supprosed to be about $2^{\circ}$ further north in the Rocky Mountains, neur the head waters of the Arkansua nnd the Rio Grande (of the Colorado of the west). Following a generally southern direction, it
runa through Now Maxico, where its prinelpal afluent ts the Rio Chamas from the west, and winda lea way then in a aouth-eastern direction along the borders of Chihuahna, Coshulia, and Tamaullpas, to the Gulf of Mexico, In $25^{\circ} .66^{\prime} \mathrm{N} \cdot$. lat. Its tributaries below RI Paso, are the Pecos, from the north; the Conehoa, Salado, Alamo, anil San Juan, from the sonth. The whole course of the river, in a atraight line, would be near 1,200 milsa ; but hy the meandering of lisa lower haif, it runn at leant 2,000 mllea from the region of perpotual anowa to the almost troplcal elimate of the Gulf. The elevation of the river ahove the sea near Albuquerque is about 4,800 feet; at el 1'aso del Norte, about 3,800 ; and at Keynosa (between 300 and 400 miles from its mouth), nhout 170 feet. The fall of lits water between Alluquerque and el l'aso, is from 2 to 3 feet in a mile, and below Reynosa 1 foot in 2 nuiles. The full of the river is aeldom uned as a motive power, except for some flear mills, whleh are oftener worked by mulea than water. The principal mivantage which is at present derived from the river, is for agriculture, by thelr well-manared ryatwm of irrlgation. As to its navigation In New Mexico, even canoes could not be used, except perhaps daring May or June, when the river is in ite highest state froin the melting of the nowa in the mountalas. The river is entirely too shallow, and interrupted by two many sand-bare, to promise any thing for navigation. On the southern portion of the river, the recent expluration by Captain Sterling, of the United States' ateamer Mfajor Broven, has proved that steamboats may ascend from the Gulf as far as Laredo, a distance of 700 miles. ilthough the steamiont used dill not draw over two feet of water, yet the oxplorers of that reglon oxpress their opinion, that "by spending some $\$ 100,000 \ln$ a proper improvement of the river above Mier, boats drawlig four feet could readily ply between the mouth of the Rie Grande and Laredo."
There were in this Territory lo 1850, 160,201 acrea of hand improved, and 124,370 of unlusproved land in farma. Cash value of farms $\{1,653,952$, and the value of Implementa and machinery 477,960 . Lire Stock.Horses, 5,079 ; assea and mules, 8,654 ; mileh cows, 10,235; working uxen, 12,257; other cattle, 10,085; sine ep, 377,271 ; swine, 7,314 ; value of live stock, 81 ,494, 6i29.
. Igricultural Producte, etc.-Wheat, 191,516 hushels produced; ludian corn, 865,411; oats, 5; herley, 5; buck wheat, 100 ; peas and leans, 15,688 ; potatoea, 3 ; value of producta of the orchard, 8,231 ; produce of the market gardens, 06,079 ; ponnds of butter made, 111; of cheese, 5,848 ; molasses, 4,236 gullona; beeswax and honey, 2 pounds; wool, 32,301 ; hops, b0; tolmece, 8,467 ; and wure made, 2,863 gallons of wine; value of home-made manufactures, $\mathbf{\$ 6 , 0 3 3 \text { ; of shaught- }}$ ered urimaly, 682,125 .
Besides agriculture, the inhabitanta of Now Mexico pay a great deal of attention to the mising of atock, as horses, mules, esttle, sheep, and gonts. Their stock is all rather of a mall size, becauso they care very lit. tle for the improvement of the breed; but it increases very fast, and as no feeding in stablea is needed In the winter, it gives thens very little trouble. There are large tracts of land too diatant from the water-coursen to the cultivated, or in 200 mountainous parts, which afford, nevertheiesa, excellent pasturage for millions of atuck during the whele year ; but unfort unately the raising of the stock has been crippled by the invasione of the hontile Indians, who consider themselves secret partners in the buainess, and anaually take their share a way.
A third, much noglected branch of induatry In New Mexico, are the minea. A great many now deserted mining placea in New Mexico, prove that mining wan pursued with greater seal in the old Spanish timen than slace, whieh may be accounted for in varioun waya, as the want of capital, want of knowledge in
mining, but eapeenally the unsettled atate of tha coun. try and the avarice of ita arbitrary rulera. The mount. ainous purts of Now Mlaxico are vory rieh in gold, copper, lron, and allver. Gold seems to be found to a large oxtent In all the mountaina near Santa $F 6$, nouth of it in a diatanee of about 100 milea, aa far as cirinn Quivira, and north for about 120 miles up to the Rlver Sangre do Cristo. Throughout thin whole region, gold duat bus boen abundantly found by the prorir chases of Mexleans, who secupy themselves with tho washing of thla metal out of the mountuin ntreams. At present, the old and new Plucer, near Sante Fis, have attracted most attentlon, and wot only gulli washes, but nome gold minea, too, are werked there. They are the only gold minee worked now in New Mexico. Several rich allver mintes were, $\ln$ Spanish times, worked at Avo, at Cerrilloos, and in the Nambe Mountalna, but none at present. Copper is found in abundance throughout the country, but principally at las Tijeras, Jemas, Ablquiu, Gaudelupita de Mora, etc. There is but one copper mine worked at present south of the placers. Iron, though also abundantly found, is entiroly everlooked. Cal has been discovered in different localities, as in the Raton Mountains, near the village of Jentez, south-west of Sunta $\mathrm{Fi}_{\text {, apit in }}$ a place south of the placers. Gypsam, common and selenito, are found; most extonsive layers of it exist In the mountairs near Algodenes, on the his del Norte, anil in the neightworhoorl of the celebrated "Salinus." It is used as common llue for whitowashing, and the cryatulline or selenite instead of windowglass.

Santa Fó is the capital of the Torritory. There were in 1850, 3 printing offices in the Territory, issuing a weokly and a tri-monthly, and a monthly puiblieation. In the same year there were 1 ncalemy, with 40 pupils; 146 Rowan Cathollc churches. Total ancuut of church property valued at $\$ 188,200$.
The climate of New Mexico is of course very different In the higher, mountalnous parts, from the lower valley of the Rio del Norte; hat generally takeo, it is temperate, uniform, and bealthy. The summer heat In the valley of the river will sometines rise to nearly $100^{\circ}$ Fabreuheit, but the nights are always cosil and pleasant. The winters are Dung and eevere; the higher mountalns are always covered with snow, and ice and snow ary common in Santa Fó; hat Rio del Norte is never frozen with ice thick enough to aulmit the passuge of horses and carriages, as was formerly believed. 'The aky is generally clear, and the atmosphero dry. Between July and Oetober, rain falls; but the rainy seasons are here not so constant and regular as in the southern Staten. Disease meenas to be very little known, except some inflammations and typheidal fevers in the winter aeason.
Of the history uf New Mexico wo authentically know but little. The Spaniards, it soems, received the first information in regard to it, in 15x1, froma party of alventurers, commanded hy C'aptaia francinco de levya bonillo, who, tinding the atorigina inhalitants and the mineral wenlth of the conutry to be slonilar to those of Mexico, called it New Sexico. In the year 1594, the Count de Munterey, then viceroy of Mexico, sent Juan de Uniste, of Tacatecas, to take formal possession of the country, in the name of Spain, and to eatablish colonies, anissions, and pres. illios (firts). They found many Indian tribes, which they suceseded in Christianizing in the uausl Spanish way, with sword in hand, and made them slaves. The villages of the Christianized Indians were called Pueblos, In opposition to the wild and roving tribes that refused auch favors. Many towns, of which only ruins exist now, were established at that time ; many minea were workel, and the occupation of the counary seemed necure, when, in 1680, a reneral insurrection of all the Indian tribes broke out, and the Spaniarls, who were quite unduspecting and unprepared, were

masaacred almont to man. The Governor of Neve Mexico, Don Antovio de Otermin, after a hard struggle, retreated from Santa F6, and marehed us far south as i'uso del Norte, where he and his followers met with some friendiy Indians, made a atand, and lald the foundation of the town of that name. The war with the Indians lasted 10 years, when the Spaniards reconquered the whole country. Subsequently, sev. eral Insurrections have taken place, none, however, have lieen so disastrous as the first, but the deep rancor of the Indlan race againat the white, has continued to the present tlme. There has grown up a hatred betwaen the Indlans and the Mexleana, never to be subdued hut with the extinction of the raee.
Santa Fis was taken by General Kearney, September $N_{1}$ 1816, and the Territory was ceded to the United States by the treaty of Guadalupe Hitalgo, Felruary, $1 \times 18$, und the prosent territorisl government entabiisheil ln 1850. The legislative ansembly conalsta of a council of 13 members, elected for 2 years, and n $h^{r}$... of repre entatives, of 26 mambers, elected for 1 year. Governur appointed hy the President of the United States for 4 yeara. Every free white inhabilant, 21 jears of age, and a citlaen of the United States, is a legal voter.
New Orleans, the capital of Loulaiana, one of the United States, on the eastern bank of the Miasiasippi, ahout 105 milea from its mouth, lat. $29^{\circ} 57^{\prime} 45^{\prime \prime}$ N., long. $80^{\circ} 9^{\prime}$ W. Population, in $1850,119,461$. The new-bullt atreets are broad, intersecting each other at right angles; and the houses are mostly of brick. It is the grand emporlum of all the vast tracta tniversed by the Missiasippi, the Misnouri, and their tributary atreams, enjoying a greater command of intemal navigation than any other elty, either of the Old or Now World. Civillization has bitherto struck its rooth, and began to flouriah only in some comparatively small portiona of the immense territories of which New Orieans ts the sea-port ; and yet its progress has beet rapid beyond all preceden'. It appears from tho accounts printed by order of longrees, that during the year endod the 30th June, i 52 , the value of the native American produce expc ted from this city amounted to $\$ 48,808,169$, while the value of that erpurted from New York was $\$ 74,042,581$. With reeppect to imports, the case is materialiy ditferent; the value of those of New Oricans, in the year just mentioned, beiag only $\$ 12,057,724$, whereas those of New York umounted to $8182,829,306$. It is believed by many, secing how rapidly settlements are formlog in the "West," that New Orleans must, at no very distant period, exceed every other city of America, as well in the magnitnde of its imports as of its exports ; snd, coosidering the boundless extent and extruordinary fertility of the uneultivated and unoceupied hasins of the Mississippi and Mlasouri, the anticipations of those who contend that New Orleans is destined to hecome the greatest emporium, not of America only, but of the world, will not appear very unreasonable. Stoam navigation has been of Incalculable service to thls port, and, indeed, to the whole of the valley of the Mississippi. The voyage up the Mississippi, that used formerly to be so difficult and tedious, is now performed in commodious steam packets with ease, celerity, and comfort. "There have been counted," says Mr. Filint, "in the harbor, 1500 flat-loats at a time. Steam-boats are arriving and dejparting every hour; and it is not uncommon to see 50 lying togather in the harior. A forest of masts is constantly seen along the levee, except in the sultry monthe. There are often 5000 or 6000 boatmen from the upper country here at a time; and we havo known 30 vessels advertised together for liverpool and Havre. The intercourse with the LIavana and Vera Cruz is great, and constantly increasing." As a shipping port, Naw Orleans now ranks third in the Union; belag in this respect inferior ouly to New York and Buaton. Vessels of the
largent hunden may navigate the river ceveral hane dreds of milles above the elity. Tha aggregate burden of the shlpping belonging to the port on the B0th Jupe, 1852, amounted to 268,018 tone; of which 102,037 were employed In ateam uavligation. In the year anding 81 st Auguat, 18b2, the arrivale of steamers, prinelpally from the interior, were 2784. The depth of water in the river opposite to Now Orleans is, at a medium, sbout 70 foet $;$ and it maintaina monndings of 30 foet till within a mile of its confinence with the sea. Besides thrte or four of Inferior eonsequence; the Mississippl has four princlpal passes or outlets. In the south-east, or main pass, at Dalize, the water on the bar, at ordinary tider, doee not exceed 12 feet; and an the rige of tides in the Giulf of Mexico la not more than 2 or 2 f feet, vesaels drawing much water can not make their way from the ocean to New Orleans. The unhealthiness of the climate is the great drawback on New Orieans. This probably ariees from the low and marshy altuation of the city and aurrounding country, which is undor the level of the Misaissippi, being protected from Inundation by an artificial levee or mound, varing from 5 to 30 feet in hoight, and extending along the bank of the river a diatance of 100 mites. The unhealthy season ineludes July, August, and September; during which period the yellow fever often makes dreadfui havoc, particularly among tho poorer elasses of immigrants from the North end from Europe. Latterly, great efforte have been made to improve the health of the elty, by pupplying it abundantly with water, paving the streets, removing wooden sewers, and replacing them with others of stono, ete. Many placen, where water used to atagnate, have been filled up; and large tracts of swampy ground contiguous to the town have been drained. And as such works will no doubt be prosecuted on a atlll larger soale, aecording to the inerease of commerce and population, it is to be hoped that the ravages uf fover may be materially abated, though the situation of the city excludes any very strong expectation of its ever belng rendered quite free from this dreadful scourgo. It has latterly been proposed to bring earth from tie upper parts of the Nississippi, and to employ it in forming a site for a new city ruised some foet above tho level of the river. It is believed that this would be the most likely means to guard against fever; and the oliject in view is of such puramount importance, that the experse of the schome should be reckoned a very inferior matter.

Several cotton pressea are among the most impesing structures in the city. The Orleans cotton press is on ground 632 feet long and 308 wide, which is nearly covered with buildings. It contains a centre building, three stories high, surmounted by a cupola, which affords a fine view of the eity. The wings are two stories high, and very extensive. It presses, on an avarage, 150,000 bales of cotton annually, but ita capacity is much grenter. There are other cotton presses. Several of the banka have fine buildings, and come of the hotels are magniticent. Two of these hotels cost $\$ 600,000$ each. The United States' branch mint has an edifice, 282 feet long, and 108 feet deep, with two wings 29 by 81 feet, the whole, three stories high, which cost 9182,000 . The city is supplied with water raised by powerful steam-engines from the Mississippi River into a reservoir constructed on an artificial nound, 21 feet high nt its base. The reservoir is 250 teet square, built of brick, and plastered with hydraulic cement. It is divided into four compartments, to allow the water to settle before it is distributed over the city in cast-iron pipes, which are laid to the nggregute length of 18 miles. The water works belonged to the Conunercial Bank, and $r^{r}$ t $\$ 722,004$. The city lighted with gas. A draining company, with a capital of $\$ 04,000$, has two steam-engines for draining the marshes of 35 -miles in extent between the city and Iake Pontchartrain. There are in the cif; a United

Btates' land offiee, several puhile and private banks, having a large capital, and everal hasuramee companies, with conmmonsurate capitals.

The maanfacturiag establishanante of this eity are eomprised under the head of furnaces, founderies, machine shops, sugar refinerlee, cotton factorien, diatilleri $x$, tobaceo fisetories, saw milis, ate. The whole employed a capital la 1850 of $\$ 2,1: 2,060$, and manufactured articlea valued at $04,462,044$; pioce which tine the Inerease has been very rapld, and in 1854 were estimated to have doubled the amounts of 1800.

On the right bank of the river, and opposite to New Orleane, connectec by a nteam ferry; is Algiers; and adjoining, the suburh of Macdonough, where are the United States' Marina Hoapital and many pleasant eshlences. Algiers contains several large machine shops, iron founderies, and ahlp-buildiag entablishments.
There are steam and salling packet lines to all the large men-port cition, sailing weekly. Also, steann packets weekly to Vera Crus and other ports in the Gulf.

Foz commercial purposes, New Orleans occuplen a very superior and cornmanding situation. It ia the natural entrepót for supplies destined to all parts of the Mississippi ralley, as well as the dépott for those proilacts of that allubrious region which neek a market geaward. Hy means of the Mississippl River and Its tributariea, an inland trade is opened to her grasp, the magnituile of which has never been equaled. Steanlers may loave ber wharves and proceed on voyages of several thousand milen without breaking bulk. The Missixsippi and its afliuente are flanked on either aide by extenaive territories, unsurpassed in richness of soil, which readily yiehi a harvest to the labors of the agricultarist, whether it be of sugar, cora, or cotton. These are the principal staples of the valley, and the receipts of each of their products at New Urieans are rapidly increasing. Ileretofore, the river has been the only channel depended upon for their transportistion. Several lines of railroad are in proceas of conatruction now, however, to facilitate the tranajortation of cotton end sugar produced at a distance from the river, to market, anil thus enlarge the area of production. Those bulky products will not bear an extensive land carriage by the ald mode, and result in wealth to the producer; but the construction of ruilroads for their cheap tranalt to the river even, will not only change the prospects of the interior planters for the better, but will adid greatly to the wealt h and commerce of New Orieans, which is eminently a pluce of exchange and distribution. It is the great dejpoit of the south-western plantations, where cotton and sugar crips are bought and sold while still in the tield, or "advonced" upon prospectively if necensary. It has alvo an extensive trule with 'lexas, Mexico, and the Guif ports, as weil as a very beavy foreign export trade. She has, healden, a large coanting trade with Atlantic ports, the value of which can only be known generally by ito results. Iler commercial life may le aaid to date after the cesaion of Louiaiana to the United States, in 1803, as prevlous to that, her coinmerce was inaignificant; and yet, in this short period of about 40 years, she already ranks as the fourth city of the world for the magnitude and value of hep commerce. The facilitiea and convenience of transacting business at New Orleans are fully equal to, and in many respects superior to those of any other place. It is the centre of fmmonee exchange operations, end any amount of funis can at all times be obtained at the shortest notice under gond letters of credit, and bllls negotiated with great readiness and facility on any prominent point in the United Statea, or any of the cominercial citles of western Euroje; and the banking institntions afford all reasonable accommodationn to the local wanta and trade of the city. Some Kuropean clties can dhow more splendid quays or magnificent docks for the accommo-
dation of ahipping, and the landing and loading of car. guea, fur axcemiling 'a appearance and durability any thing of the kind in New Orieans, but in no way superior in point of actua 'conveniance to the unprotending wharven of the city. As is renerally hnown, the ourface of the alluvial soll of Louisiana, including, of course, the site of the elty, is consideralily below the river in ondinary atages of hlyg water, and the country Is protected from inundation by a ralsed and solid ensbanknient called the "levec," extending on both sides of the river below, and a great distance above the city, Outsile of the levee the bank of the river is called the "batture," which In many placen is incrensing from the continual alluvial deposits, while in other plues the river has what is called "a falling luank," aull the water gramually encroaches on the land. In the furmer casa the levee is advanced as the batture incronses, and this has been tha casa in a large portion of the front of New Orleans, where, In aome parts, the levee has, in the last 25 yer re, adranced fully 1000 feet; and the front warehouses now atand for a long extent that distance frum the wator, afforling \& splendid space for the vast bulk of produce that is annually landed and shipped. The wharves are conatructed ontwide the levee on maseive piles, driven with a heavy imn ram into the mud, and extending ovor the river into the water sufficiently deep to admit the hervient steumboats and ships to lle up against them; heavy oleepers connect tho piles at their topa, and on thess piles the platform is laid, of thick planking, the edges of which are eeparated about one inch, to prevent the accumulation of dirt, which fulls through these interotices into the river flowing below, and in tive minutea after the heavient storm the whole aurface is in perfect condition to receive any description of merchandize. Theee wharves are thus planked back till they join the crown of the levee, in nome places 160 to 200 fert, which is male flrm and sold ly a eonatingt coating of shells, and always kept in good order. One of these wharves presente an unbroken front on the river of 1500 feet, and others 600 to 800 feet, and in the busi. ness season it is usual to see these fronts entirely occupied with nteumboats lying bow on, and each with her etage rigged out to the wharf, actively engaged in loading or unlanding. The wharves intended for seagoing vessels are detached from ench other with in intervening dock, and each wharf accommedates a tier of veasela, which, unlike the ateamboats are moored up and down the river, one outside the other, three, four, and five tiers deep, with a liruad, common stage communicating with the levee, and extending on the buiwarks of the vesael to the outaide one; the timber, plank, and all the conveniences for this ataging, leing furniahed by the eity, who even also supply tarpsuiins to protect the goodi in case of rain.
New Orleans was founded by the French in lilic. In 1762 it was conveyed to tho Spanish, who, in 1810 , re-conveyed it to the French, and in $1 \times 03$ it was in cluded in the purchase of Ioulsiana hy the Unitod States. On January 8th, 1815, the IIritish anuier General Puckenham made an attack on the city, approaching, it through Lake Borgne, but were nignaily defeated by tue Americans unler General Jackson. The Hritish loss in killed and wounded was :1040 men, and Gencral P'ackenham was killed; the Americans lost only 7 men killed and 6 wounded. In 1718 ilienvilie. at that time governor of the province, nelected the present alte of New Orleans, bat owing to difliculties he had to encounter, it was not located until lits.2. In 1727 the Jeauita arrived and wero located in a trict of land, on a portion of which St. Cha-les llotel now stands. In 1763 they were compelied to quit louisiana by an order from Pope Clement XIII., and all their property confiscated, then estimated to be wurth 4180,000 , which is now worth uver $820,000,000$. in 1769 the first case of yellow fever known, was introduced by a British slaver with a cargo from Africa.

Upon the supposition that tho averago value of cot－ ton and tobacco for the 35 years above stated may be fairly estimated at $\$ 40$ per bale for the former，and $\leqslant 70$ per bogshend fur the latter，it would give a total value for these two urtlcles alone of $\$ 1,203,048,310$ ．

he year
or"nation, was established by Sir Roger I'Estrange, in 1663; it was entitled the Publio Intelligencer, and continued nearly three years, when lt ceased on the sppearance of the Gazettc. A pablication, with few clains however to the character of a uewspaper, had praviously appeared; it was called the English Mercury, and came ont under the authority of Queen Elizsbeth, so early as 1588, the period of the Spanish Armads. An early copy of this paper ls dated July 23, in that year. In the reign of James I., 1622, apjeared the Jondon Weekly Courant, and In the year 1643 (the period of the clvil war) were printed a variety of publicatlons, certalnly la no respect entitled to the name of newspapers, of whlch the following were the titles:

England's Memorabie Accidents, The Klngdom's Intelligencer, The Diurnal of Certain Passages In Parliament, The Mercurius Aulicus, The Scotch Intelligencer, The Parliament's Scout, The Parliament's Sceut's Discovery, or Certain Information, The Mercurius Civleus, or London'e Intelligencer, The Country's Complaint, etc., The Weekly Account, Mercurius Britannicus.

A paper called the London Gazette was published August 22, 1642. The London Gazette of the existing series, was published first at $O x f o r d$, the court being there on account of the plague, November 7,1665, and afterward at Lendon, Febrasry 5, 1666. The printing of newspapers and pamphlets was prohibited 31 Charlee [., 1680.-Salmon's Chron. Newspapers were firat stamped in 1713. Number of the stamps lseued In England:

| Year. | 1 | Year. | N |
| :---: | :---: | :---: | :---: |
| 1753. | 7,41t,757 | 1825. | 26,950,028 |
| 1760 | 9,404,790 | 1880. | 80,158,741 |
| 1774. | 12,300,000 | 1835. | 82,874,652 |

| 1810. | 20,172,887 | 1849. | 76,569,285 |
| 1820. | 24,862,188 |  |  |

The total number of newspapers published in the United Kingdem in 1849 was 603, viz.: 160 in London, 232 in the Euglish provinces, 117 in Ireland, and 94 in Scetland. The number of alvertisements inserted in the Iondon newapapers in 1849 was 886,108 , paying a gross duty of $\mathbf{£ 6 0 , 4 5 8} \mathbf{2 s}$.; in the English provincial newspapers, 834,729 , yielding to the crown a revenue of $£ 62,60413 \mathrm{~s}$. $6 \mathrm{~d} . ;$ in the Irish papers, 220,524 , peying $\mathbf{£ 1 1 , 0 2 6 ~ 4 8}$; and in the Scotch papers, 240,911, paying in duty $£ 18,075168,6 \mathrm{~d}$.

Neuspapers, etc., in the United States.-The Boston Netes Letter was established in 1704, which was continued till 1714; the second was the Botton Gazette, 1719; the third the Anerican Weekly Mercury, at Philadelphis, started one day after the last. First New l'ork Gazette, in 1725; first newspaper in the Carolinas, st Charleston, 1731-2; first Rhode Island Gazette, at Newport, 1732; first Virginia Gazette, at Willismsburg, in 1736. In 1775 there were in all the colonies 97 newspupers; in 1810, in the United Ststes, 358 ; in 1828, 802 ; in 1889, 1550, and in 1850, 2526.

Newspapers in France,-'The first was the Gazette de France, estabilished by Renairdot, in 1631, and centinucd with few interruptions till 1827, when it ceused and snother paper assumed its nume. The Moniteur, commenced in 1789, has been since 1800 the official journal of the government. The Constitutionelie and the Journal des Debats have long had the largent circuiation. There were 374 newspnpers published in lirance in 1832. See 1'mitodical. Literature.

Nerspapers, Irish.-The first Irish newspaper was Pug'a Occurrences, published in 1700. Fauliknen's Journal was established by Georga Faulkner, "a man celebrated for the goodness of his heart, and the weakness of his head," In 1728.--Supplement to Suift. The oldest of tho existing Dublin newspapers is the Frecman's Journal, founded by the patriot, Dr. Lucas, ebout the year 1765,-Weatm. Rev., January, 1830. The Jim-
erick Chronicle, the oldest of the provincial prints, wes cotablished in 1768.-IIdem.

Notices of Newspapers.-The history of newspapers, and of periodical literature in general, remains to be written; and were the task executed by an individual of competent abllity, and with dne care, it would be a mest intereating end important work. It appears, from the reeesrchen of Mr. Chalmera, that the first newspaper published in modern Enrope made its appearance at Venice in 1536 ; but the jealousy of the government would not allow of lts being printed; so that, for many years, it was clrculated in manascript ! It weald seem that newspapers were first issued in Fagland by authority during the alsirm occasioned by the approach of the Armada to her shores; in erder, as was etated, by giving real information, to allay the geueral anxiety. and to blader the dissemination of false and exaggerated statements. From this era, newspapers, of one cort or other, have, with a few intermiseions, generslly appeared in Londen, sometimes at regular, and eometimes at irregular intervals. During the civil wars, both parties had their newspapers. The earliest newspaper published in Scotland made its appearance under the auspices of Cromwell In 1652. The Caledonian Mercury was, however, the first of the Scotch newepapers of natlve manufacture; it made its appearsnce st Edinburg, under the title of Mercurius Caledonius, in 1660 ; bur its publicstion was soon afterward interrupted. In 1715 a newspaper was, for the flrst time, attempted In Glasgow.

To Boston belonge the honor of establishing the first newspaper in North America. It was issued in the year 1690. It was deposited In the State Paper Office, in London, and stopped by the government. It was of the slze of an ordinsry eheet of letter paper. One copy of it alone was known to be in existence, and that it was that shared the luckless fate sbovenamed. The first regular paper that was issued was slso of Boston. Its title was the Neus Letter, its date was 1704, and It was printed by John Allen, in Pudding Lane. We have seen some of its early numbers, and they are peculiar. Its latest news from England was dated one hundred and twenty dsys previously, and consisted of a speech of Queen Anne to Parliament. An advertisement informs us that the mail between Boston and New York set out once a fortnight. Negro men, women, and children were sdvertised for sale, and an urgent appeal sppeared in one, culling upon a female who had stolen a piece of fine lace, valued at 14 shillings a yard; and upon another who had convered a piece of fine calico from its proper destinstion, under her riding-hood, to return the same or suffer exposure in the newspapers. For 74 years thls paper continned in existence as the leading Tory papar. About these days, the revelationary struggle drawing near, the Boston Gazette was iesned at Watertown as the organ of the patriots. When the war broke out, there were 37 newspapers being publiahed in the United States; eight of them were committed to the interests of the British, and five others were brought over to the government side.

Old Papers.-The Worceater Spy, published in 1770, is the oldest existing paper of Mabsachusette. There aro copies extant of the Albany Journal, or the Montgomery, Washington, and Columbia Intelligencer, printed in 1788. It was issued semi-weekly, at a subecription price of 12 shillings per annum. Its size was abont 11 by 13 inches. Charles K. and George Webster \& Co. were its puhitshers. Its leading article is an extract from a letter from Philsdelphia, dated February 20, as followa: "On Saturday linst, upon the arrival of the news of the ratification of the Federal Constitution by the powerful State of Massachusetts, the bells of Christ Cburch were rung, and congratulations of joy have appeared In every part of tile city for several days." The "latest news from Earope" Is made a feature of the sheet; it bears date December

1787, by which it would appoar that it took some three months to cross the water.

New York and her Newapapers.-The position which this city sustains, as compared with any other city of the world, in the number and circulation of her journale, can be adjudged by a glance at the following table, which gives the supposed number of newspapers in the world, 1852-56:

| Austria.......... | 10 | Belgiam. |
| :---: | :---: | :---: |
| Africa. | 14 | Denmark. ........ 85 |
| Ania. | 30 | Germanjo Statea. 850 |
| Oreat Britaln mod |  | Portugal. ........ 86 |
| Ireland........ | 800 | 8paln............. 24 |
| Roseia and Poly- | 60 | United States..... 2,800 |

Of these, New York alone lissues 122 sheets, as follows: secular journals, dally, morning, 8; evening, 6; semi-weekly, 2; woekly, 59; German dailies, 3; weeklies, 8; French daily, 1 ; Spanish weeklice, 2 ; Welsh, 3; of religious weeklies, there are 29 sheets. It is difficult to obtaln a correct estimate of the present circulation of so many papers. Of the daily papers, at least 250,000 copies must be circulstad; while 13 religious weeklies are spread before 150,000 substribers.

The whole number of newspapers and periodical publicatiuns in the United States on the 1st of June, 1852, amounted, according to the official returns, to about 2,800 . Of these, 2,494 were fully reported upou
wbile the particulars with reepeot to the others were in part estimated.

From these returns, etc., it appeara that the aggrogate oirculation of papers and other pnbllcations was about $5,000,000$; and that the entire namber of coples printed annually in the United States, amounted to about $422,600,000$. The following table shows the number of daily, weekly, monthly, and other isaues, with the aggregate clrculation of each class :

|  | No. | Oreulation. | Rrined |
| ---: | ---: | ---: | ---: | ---: |

Four hundred and twenty-four journals were lssued in the New England States; 876 In the Middle States; 716 in the Southern States; and 784 in the Western States. Of the whele 2,800 publlcatlons, about 2,200 were newspapers, properly so called; the residue being scientific, religloue, and educational journals. The average circulatlon of the mere papers was 1,785 . There was one publleation for every $\mathbf{7 , 1 6 1}$ free inhabitants in the United States and Terrltories. Tho following summary is based on the official returns:

Nbwspaprrs and Periodicals Publigitid in the Unttrd Btatks in 1950.

New Style. Ordered to be used in England in 1751 ; and the next year eleven days were left out of the calendsr-the $3 d$ of Septomber, 1752, being reckoned as the 14th-so as to make It agree with the Gregotian Calendar, which see, and also article CalenDan. In the year A.d. 200, there was no difference of stries; but there had arisen a difference of eleven days between the old and the new style, the istter being so much beforehand with the former: so that when a person using the old style dates the 1st of May, those who employ the new, reckon the 12 th. From this variation in the computation of time, we may easily account for the difference of many dates concerniag historical facts and biographical notices.-M.

New York, one of the United States of America, situated between $40^{\circ} 30^{\prime}$ and $45^{\circ} 01^{\prime} \mathrm{N}$. lat., and between $71^{\circ} 50^{\prime}$ and $79^{\circ} 50^{\prime} \mathrm{W}$. long., and contains an area of 46,000 square miles. The population in 1790 was 340,120 ; in 1800, 586,050; in 1810, 959,049; In 1820, 1,372,812; in 1830, 1,913,508 ; in 1840, 2,428,921; sad in 1850, $3,097,894$.

Eirrly Ifistory of New York State,-Tine Spaniards comprised the territory of the present State of New York under thair great name of Fiorida, and desigaated it also on their maps of the sixteenth centary particularly as the "Tiarra de Stephen Gomez," or shorter "Tierra de Gomez," "Jecanse Gomez (1525) was for a long time the only Spanish navigator who was known to have explored especially these coasts. The English comprised it since 1585 under the name Virgiaia, and siace 1606 under the name of Northern Virginia, or the Northera Colony. Since 1616 they considered it as a part of New England, which name took the piace of the old name of Northern Virginia, and went down like this as far south ss the fortieth degree of aorth latitude. The Dutch began soon after the discovery of Hudson (609) to call it "Nienw Nederlandt" (the New Netherlands). This name may already have been in use for some time, but it occurs for the first time in a public document in the year 1614. They also sometimes called it "Nieuw Holland." it is on maps siso sometimes called "New Belgium." They at first gave to it very extensive boundaries, as far east as Cape Cod, including the whole Barnstsble peninsuia, and south as far as the Delawaro River and beyond it. With these limits we find it represented on many old Dutch maps. The southern linnit on the lelawsre River remained protty much unchanged on the Dutel maps. Not so the eastern boundary. On later maps we see this advancing only as far as Nassau Bay, Rhode Island. Since 1630 or 1635 the maps hsve it only as far as the Connecticut Itiver, where at this time the English had aiready arrived with their plantations. When, in the year 1664, the English conquered the whole country, it was named the "Province of New York," in honor of James, Duke of York, lrother of Charles If. It lost in the same yesr s part of its cosst by the grant which the Duke of York made to a company of genticmen who founded the province of New Jersey, between the lower IIudson and the Dalaware Bay,-J, G. Kont,

When the province became, in 1776, a State, the name romained unchanged, and also the ifmits along the coast.
Physical Features.-This Stato is divided into three unequal parts, by two great valleys, viz, : 1st. The viley of the Ifudson, Including the depression in which Lake Champlain is situated, or, more properiy, the vaileys of the IIudson and Champlain nnited. 2d. The valleys of tho Mohawk, and Onoidia Lake, and

Oswego River, nnited. The eastern division is a long narrow beit, oxtending from New York island to the head of Lake Champlain. Its eastern limita are the borders of Connectlcut, Msssachusetts, and Vermont, with a alope westward to the Hudson, traversed longitadinally by several narrow valleys. This division comprehends the western slope of the Taghkanic mountsins, which form the waler-shed thst sepsrates the waters flowing into the Iludson, from those which flow into Long Island Sound. The north division of the State is traversed by the Cilinton rsuge. There are seversl subordinate ranges connected with this group. It begins at Little Falls, in the valley of the Mohawk, and pursues a north-east course across the country to Trembleau Point, on the west shore of Lake Champlain. There are numerous lofty peaks which formed a remsrkable group, and have been styled the Adirondack mountains. Mount Marry, the highest of the range, attains to an elevation of 6,467 feet above tho sea. This ridge presents the water-shed of the region dividing the waters of the Indson, or those which flow south into the Atlantic, from those which flow into the Gulf of St. Lawrence. The south division is eituated between Lake Ontario and the Mohawk, and the lludson valleys and Penusylvania. It rises with a gradual ascent until it resches its maximum beight near the sonthern boundary of the State. The south-eastern part of this division is comprised in three ranges, viz., the Highlands, broken through by the Hudson, the Shawanguak, and the Catskill. There were in this State in 1850, 12,408,964 acres of land improved, and $6,710,120$ of unimproved land in furms. Cash value of farms, $\$ 554,656,042$, nnd the value of implements and machinery was $\$ 22,084,926$. Live Stock.-Horses, 447,014; asses and mules, 963 ; milch cows, 931,324 ; working oxen, 178,909 ; other cattle, 767,406 ; sheep, $3,453,241$; swino, $1,018,252$; value of live stock, $\$ 73,570,499$.

Agricultural Products, etc.-Whest, 13,121,498 bushels; rye, $4,148,182$; Indian corn, $17,858,400$; oats, $26,552,814$; peas and heans, 741,546 ; barley, $8,585,059$; bnckwheat, $3,183,955$; potatoes, $15,368,368$; sweet potatoes, 5,620 ; vulue of products of the orchard, $\$ 1,761,950$; produce of market gardens, $\$ 912,047$; pounds of butter made, $79,766,094$; of cheese, $40,741,-$ 413 ; maple sugar, $10,357,484$; molasses, $56,539 \mathrm{gaj}$ lons; beoswax and honey, $1,755,830$ pounds; wool, $10,071,301$ pounds produced; flax, 940,577 ; silk cocoons, 1,774 ; liops, $2,536,299$ pounds ; tobacco, 83,189 ; hay, $8,728,797$ tons ; hemp, 4 tons ; clover seed, 88,222 bushels ; other grass seeds, 96,493 ; flax seed, 57,963 ; and were made 9,172 galions of wine; value of homemade manufactures, $\$ 1,280,333$; of slsughtered anlmals, $\$ 13,573,883$.

The principal rivers are the IIudson, 324 milies long, navigalile 156 miles to Troy. The Mohawk, 135 miles long, which enters the Iludson a littie above Troy; the Genesee, 125 miles long, which enters Lake Ontario, having at Rochester, 5 miles from its mouth, 2 falls of 96 and 75 feet. Black River, which rises near the cources of the IIudson, and flows 120 miles into Lake Ontario ; the Saranac, 65 miles long, entering Lake Champlain at Plattsburg; the Oswegstchie, 100 nilies long, fiowing Into the St. Lawrence; the Oswego, proceeding 40 miles from Oneida Lake into Lake Ontario; the Au Sable, rising in the Adirondack mountains, and having a conrse of 75 miles to Lake Champlain. The majestic St. Iawrence forms a part of the northern boundary of the State. The head branches of the Susquehanna, the Aileghany, and the Delaware, rise in this State. Besides Lakes Ontario and Erie on the north, and Champlain on the east, which are but partly within it, there are wholiy within the Stnte many picturesque sheets of water, viz., Lakes George, Onelda, Skaneateies, Ownsco, Caynga, Senecs, Crooked Lake, Canandaigun, and Chautauque. The islands belonging to New York are-Long Isisnd,

130 miles long from weat to eant，with an average width of abont 15 miles，within whoes waters on the eata are Fisher＇s，Shelter，Robin＇s，and wome other isl－ ands．Statea Island，nonth－weot of the harbor of Now York； 18 miles long，and 8 wido．Maphattan Island on which tha city of New York stands，18，miles long and about 11 wide at an average breadth．Grand Ialand，in Niagara River， 12 milea long，and from 2 to 7 wide，and extending to within a short distance of the Falls．The harbor of New York la one of the finest in the United Statea．On the bar at Sandy Hook it hat a depth cf from 21 to 27 feet．Sag Harber on the east， and Brooklyn on the west end of Loag Island，have good harbors ；Sackett＇s Harbor has a good natural， and Oawego a good artificial harbor on Lake Ontario． Buffilo and Dunkirk are harbora on Lake Erie

Manyfactures．－There were in the State in 1850， 118 cotton factosies，with a capital inveated of $85,554,320$ ， employing 8,877 males and 5,499 females，producing 39，532 yards of aheetings，otc．，and $5,808,561$ pounds of yarn，valued at $\$ 5,019,328 ; 203$ woolen factoriea， with a capital invested of $83,844,090$ ，employing 3,500 males and 2,645 females，manufacturing $7,124,600$ yards of cleth，etc．，valued at $\quad 6,442,869 ; 28$ carpet factories，employlag a oapital of $\mathbf{4} 802,175 ; 29$ estab lishments making pigiron，with a capital invested of ©727，500，employing 994 persons，producing 23,022 tons of pig iron，etc．，valued at $\$ 1,067,572 ; 823$ establish－ mente，with a capital of $8,622,482$ ，employing 5,925 persons，and making 104,888 tons of castings，etc．， valned at $\$ 5.31,980 ; 60$ establiahments，with a cap－ ital of $1,131,800$ ，employing 1,037 persona，manufac－ turing 18,036 toas of wrought iron，valued at $\$ 1,428$ ，－ $968 ; 1,442$ flouring and grist mills； 4,599 saw mills； 942 tanneries； 550 printing offlees； 458 newspapers， vis．， 54 daily， 18 tri－weekly， 18 seml－weekly， 813 weekly， 13 semi－monthly， 25 monthly，and 3 quarterly pubilicatious．Capital inverted in manufacturea，499，－ 904,405 ；value of manufactured articlea， $\mathbf{8} 237,599,361$ ．
The principal places in the State are New York，the metropolis，Albany，the capital，Troy，Brooklyn，New－ burgh，Poughkeepsie，Hudson，Saritoga Springs， Plattsburg，Schenectady，Utica，Syricuse，Auburn， Geneva，Rocheater，Buffalo，Lockpo＇t，Oswego，and Ithaca．There were，Jannary，1856， 2 2 railroads，with 2,794 miles of road finished and in operation．There is in this State the greatest extent of cenal navigation within any State or conntry on the face of the earth， forming an aggregate of 787 miles．See Canals and Railioada．There were，Jazuary，1856， 287 benks， and 1 branch，with a paid capltal of $\$ 86,890,000$ ．

Canals，－The canals of New York were the chief element of her early prosperity，and we give a short history of them，and their present commercial import－ ance．

From 1814 till 1817，the suljject of the canal was warmly discussed in the legislature by the friends and opponeats of the interasi improvement aystem；and the act anthorizing the construction of the canal was finally passed in 1817，by a vota of 18 to 9 in the Senate．The firat contract was made on the 27 th of June，1817，and the 4th of July was ceiebrated by breaking ground at Rome for the construction of the canal．Inffalo then had a population of leas than 2,000 ． Notwithatanding the vast benefita conferred upon the State by De Witt Clinton in his vigorous efforts to bring about a system of internal inprovementa，he was removed in 1824 from the office of canal commisaioner， by a vote of 21 to 3 in the Senate，and 61 to 84 in the Assembly．In 1825，a report on canals was made， written by Mr．Marcy，afterward governor，in which he said：
＂From the vlews taken by the commissioners，it appeare reasonable to indulge the hope that within the space of 10 years tha canal debt may be extinguished； and thin coplous stream of reveaus，ylelding，according o the most moderate patimates，an annual income of
more than $1,000,000$ ，may be turned into the treasury， and the government bo thereby enabled to remnve from the people the harden of taxation，to diffuse the bles－ slaga of education in a more abundant manaer than at present，and to carry forward this State with increas－ ing progress，in its career of general prosperity．＂
In 1828，Governor Clinton congratnlated the legis． lature on the completion of the water cominunication between the lakes of the Weat and the Atlantic Ocean， affording an＂inland navigation unparalleled in the experience of matidnd．＂It was in this year（1826） that the firat act for a railruad was passed by the Leg－ islature of New York，being the road from Albeny to Schenectady， 16 miles in length．This road was not completed for several years．
In 1827，Governor Clinton called the attention of the legislature to the subject of internal improvements by the general government．The project of the Ches－ apeake and Ohio Canal was then before Congrees，and the aid of the government was given in behalf of that then considered great work．Governor Clinton ob－ aerved：＂It has become a question of great moment， whether the general government has power，with or without the consent of the State governmeats，to con－ etruct canala and roads in their territories，and whether auch power，if not already veated，ought not to be granted．＊I think it due to a sense of duty and a spirit of frankness，to asy，that my opinion is equaliy hoatile to ite poeseasion or exercise by，or its investment in，the national authorities．＂See Caxals．
River and Canal Navigation．－The aubjoined tables show the date of the opening and closing of the IItud－ son River and Erie Canal for a period of 15 yeurs，and the number of days they were open each year．

The aver ge cost of railroads has been as foilows：

The number of railroads，including branches，now in progress in the United States，is $\mathbf{3 7 2}$ ．The miles in operation are 13，586；the miles in progress， 10,828 ； and the amount now expended is $400,000,000$－the average cost being 080,000 per mile．The average cost of the whole 2,579 dilles belng about $\$ 35,000$ per mile．The amount expended ou the canals of the United States is about $150,000,000$ ．

The Nevo York Camals，－The Annual Report of the Canal Aaditor of thia State，for 1856－7，has been com－
manicated to the Senate. The revenue for the pest year has been greater and tha expenses leas than for the jear 1865. The following comparative statement shows the difference in the receipta and paymenta between the two yearn:

10,183 40
Tols recelved........................... to repalr-conatrectora. ............... for repairs. .................... masters, and toupectori. ........ Refundlag tolls, malarlea, eto.....

8089,792 19
The whole amount of tolls recelved
Which amonut is componed an follows I

In tonnage of 98,465 , divided among the difierent articlen, as follows:

The increase in lockages at Alexander's lock is 850.
In flour and whest comprised in the returns of vegetable food, there has been an increase on tonnage the past year of 112,587 tons, and an inerease of tolls of $\$ 160,694$. In corn and oats there has been an increase during the same period of $\mathbf{2 8 , 6 6 9}$ tons, and an increase in toilf of 87,691. Under the head of "Products of the forest," there was an increase in tonnage upon shingles, boards, and scantling, as compared with 1865, of 32,163 tons, and ia decreased tonnage upon timber, stavea, and wood, of 97,705 tons, and an increase in pot and pearl ashes of 9,615 tons. Under the head of "Other articles," there was an increase in the tonnage of mineral coal, for the aqme period, of 77,568 tona, and an increase in unndries of 15,823 tons.
Statament No. 47, appended to the report, showa the tone and description of freight carried on the New York Central and Now York and Erie Railroads, onding 80th September, 1853, 1854, 1855, and 1856, and on the Now York Canals daring the seanons of navigation the same years.
Thus three lines of freight traneit, it is well known, take all the carriage which passes throngh the State between Now York and the Hudson River and the West, including a considerable portion of Upper Canada. It may with justice be said they are all of them competing lines of transport for what is termed "through freight," and two of tham are virtually competing linas for both through and way freight.
The ascertained results presented by these tables are intaresting, snd worthy of much reflection. They not only show the stesdy and progressive increased carriage and movement by reilway, and the ateady and progressive decreased carriage and movement by canal, but they also show the description of freight wherein the carriage by railroads exceeds that of the canal.

Tonn Curried.

|  | Railirond. | Canal. | To |
| :---: | :---: | :---: | :---: |
| 1863. | 901,08t | 4,257,863 | 5,288,892 |
| 1864. | 1,293,653 | 4,165,802 | 6,460,716 |
| 1850 | 1,512,121 | 4,022,816 | 5,584,738 |
| 1850. | 1,719,877 | 4,116,082 | 6,885,400 |

This statement shows an increase of more than 700,000 tons in 4 years by rail, and a lose of 181,771 tons to the canal in the same time.

Total Morement.

| Railroad. $1853 . .$ | $\begin{gathered} \text { Canal. } \\ 700,389,933 \end{gathered}$ | Total. |
| :---: | :---: | :---: |
| 1854...... ... . 211,976,114 | $668,359,044$ | 890,695,158 |
| 1856. . . . . . . . $250,279,834$ | 619,170,651 | 869,450,485 |
| 1856. . . . . . . . . 829,191,724 | 599,009,608 | 921,201,827 |

The total movement by railway in 1858 was not quite one fifth of that by the canals. In 1854, it was nearly one third-nearly one half in 1855, and it was quite three fifths in 1856. At this rate of progression on the part of the railioads, and of loss by the canals, the total movement of freight on those two railroads will be equal to that of the canals in about 3 years from this time, if not sooner.

The aggregate of tha total movement has increased on the railiroads from 1853 to $1856,164,483,622$, and the loss to the canal has been $108,380,330$.
The annexed tables show why it is that with an increased tonnage in 1856 of 93,485 over 1855 , the total movement should be $27,171,048$ lose. This increase in the number of tons carried was on short distances;
otherwise an increase in the recelpts of tolls would have been the result.
But thia atatement also exhtblts the amonnt of freight earnings on these railroads, and tolla received on the canala, including the tolls on boats and passen:gers duriag the above period, together with these total movements. Theae comparative atatements show the rapld and anccessful progress of the former, and the immobility of the latter:

| N. Y, \& Erlu., |  |  | ported |  |  |

The New York and Erie Hailroad received on through freight in $1855, \$ 1,461,419$ 18, equal to 1940 per ton, on the quantity transported, and in the same year the New York Central received $61,289,70697$ on throngh frelght, which givea an average of $\$ 8 \mathbf{8 5} \mathbf{7 - 1 0}$ per ton ea the amount carried,

The comperative tabula: statemunt herewith aubmitted is a condensed view of the total tonnagy and recelpts of toll on all the canals on the different descriptions of property carried, for the perlod of six years:

| Year. | Tona carried. | Tolls recelved. | Av.per tom. |
| :---: | :---: | :---: | :---: |
| 1851. | . 8,582,733 | -3,073,993 | 85.88 |
| 1852. | . 8,809,442 | 8,866,385 | $74 \cdot 19$ |
| 1853. | 4,247,863 | 8,956,697 | $69 \% 1$ |
| 1854. | 4,105,862 | 8,547,438 | $61 \cdot 16$ |
| 1855. | 4,022,617 | 2,010,420 | $64 \cdot 99$ |
| 1856. | 4,116,082 | 2,064,215 | 62-05 |

The receipts of toll above given are upon the property carried exclusive of the tolls on boats and passangers, and the average must be affected hy the rates of toll charged and received, and the distance that property or freight is transported on the canals. The average of 1851 on the tonnage of 1856 would give 83,542,178 of tolls. The Auditor is satisfied that the rates of tell as arranged in 1851 may be Imposed on most of the property transported on the canals without any injury to trade, if the legislature will interpose Its constitutional authority to protect the trade of the canals.

The canal delt of 1846, to which the annual Sinking Fund of $\$ 1,700,000$ is applicable and constitutionally pledged, was, on the 30th September, 1856, ®18, $^{-}$ 223,70433 , the annual interest of which, payable quarter yearly, amounts to $\$ 792,19328$, and $\$ 5,739,-$ 02476 of this deht are for loans made npon the credit
of this Sinking Fund to aupply the deficienclen which oxisted in that fund, to pay the delt es it fell due after 1847. Former financlal officers of the State have estimated that the Sinking Funds established by article 7, section 1, of the Constitution, would be emple to meet all the charges npon them from year to year, and finally to liquidate the Canal debt, of $\$ 16,944,815$ 57 ontstanding on the 30th of Septemher, 1846, in 18 yeare and 3 montha, with a surplus. of 895,33348 on the 1nt of January, 1865, when it was aseumed the whole of the debt would be pald.

The following statoment ahowa the tonage of all the canals of the State from 1850 to 1855 , inclusive, the tetal movement in the years stated, and the total value of all the property carried on the canals io each year.

| Years. | Tolal tonamge. | Total movetnent. | Total value of property rarried. |
| :---: | :---: | :---: | :---: |
| 1890 | 8,076,617 |  | 1156,897,929 |
| 1801. | 9,588,788 |  | 159.981, 501 |
| 1859. | 8,862,441 | 602,800,818 | 196,603,517 |
| 1858. | 4,247,853 | 700,899,989 | 207,179,570 |
| 184. | 4,165,502 | 689,659,044 | 210,291,812 |
| 1885.... | 4,022,617 | 610,170,651 | 204,890,147 |

The two lines of railway in the State, which, during the season of canal navigation, most effectually and seriously compete with the cansle in the transport of freight, are the New York and Erie and the New York Central Railroads. The operations of these lines in the transportation of frelght doring the years stated below, show a steady and progressive incresse.

The largest amount of tolls in any fiacal year was in 1851 , when the receipts werc $\$ 3,703,99984$; and the per centage of the cost of collection on the gross amount received was $\$ 203$. This was befure the repeal of the laws imposing tolls on freight transported on certain rallroads, and the consequent reduction of tolls on the cunals, to enable the State to compete for the carrying trade. In 1851 tho tonnage of all the capals was $3,582,733$. The tennago of all the canals in 1855 , was $4,022,617 ; 439,884$ more than in 1851 ; while the tolla were only $\$ 2,632,90611$, heing $\$ 1,071$,00323 leas. The tonnage of 1855 , at the rates of toll as they wero fixed in 1851 , would have yielded about $\$ 4,108,000$, or about $\$ 1,586,000$ more than were sctually received; the very natural and perfectly legitimate results of a policy adonted by the State before It was prepared by the completion of the enlargemeat to encountor an actlve and vigorous competition.

of tie cobt por enlargement and completion.
The late 8tate Engieeer and Surveyor, Hon.
John T. Clark, in his report to tha Legista ura in 1856 , estimsted the cost of complet og all the canala, after the 31 et of Decom bor, 1853, lacluding 10 per cent, for contin encles, the coat of angreaing and land encles, the coat of engiaeering and land
To this eoat he applied the constitutional
loans, under $\& 8$, applicle $\tau$....................
And eatimated a defloiency of.................. $84,191,80874$ which is a pretty large addition to any estimate hero-
tofore given by the ongineors of the total cost of enlarger nt and completion.

Trade and Tomnage of the Canalf.-From the tablee furnished the Auditor of the Canal Departmant we compile the annexed atatement of the trads and tonnage of the canals for the year 1856. The tahlea, obtained from the sams source, of the movement for the years 1854 and 1855, are also publinhad, for tha purpose of giving a compariaon in both value and quan tity with the businean of 1858. The statement will be found of much intargat.

It will be found that in the products of the forest the Report of 1858, compared with that of 1855, preasits an increase in the articles of fure and peltry, timber and ashea, whils in the other articlen there is a largs decrease, both in value and quantity. Comparing the same products with those of 1854, the increase it in the articles of furs, shingles, and ashes, both as to valua and quantity.

Under the head of agriculture the recilpts of 1858 show a large incrasse in noms important articlaa, such as pork, what, rye, corn meal, barley, oata, peas and beans, potatoes, dried fruit and hope. In other articlea, under the aame head, thare is a large deficiency ; auch as beef, bacon, cheese, butter, wool, lard, etc. The products under the same haad, compared with those of 1854, show a diffarent exhibit from those of 1855. There ia a large deficiency in pork, beaf, bacon, lard, wool, corn, corn meal, and clover ased; while in the articlen of cheese, butter, hides, wheat, rys, barlay, oats, bran, and ship-atuff, peas and beans, potatoes, dried fruit, and flax seed, there is an increaze.
The first conatitation of New York was adoptad by the Provincial Congresa, April 20th, 1777, wae ratified by the State Legislature July 26th, 1788, and was comewhat amonded in 1801. On the third Taesday of June, 1821, a convention called by the Legislature mat at Albany, and having made a revision of the conatitution, the same was ratificd by the peopls in December following. The third and preasnt constitation was adopted in convention at Albany, October 9th, 1846, was ratified by the people on the ensuing 2 d November, and went into operation January 1, 1847. Among the provisions of the exiating constitution are thess :-A sinking fund to pay the State Canal Deht ahall be thus formed : from the aurplus revenues of the State canals from Juns 1, 1846, to June 1, 1855 $\$ 1,800,000$, annually ; from Juns 1, 1855, thencaforward, $\$ 1,700,000$, annually, including $\$ 800,000$ then to bs borrowed until the dabt is wholly paid. After thus appropriating there ahall be annually aet apart $\$ 350,000$ out of the surplus canal revenues from June 1,1846 , until the canal debt is paid ; and after said payment, then $\$ 1,500,000$ annually, which appropriations shall form a ainking fund to pay ths general fund debt of the State. After thus appropriating, $\$ 200,000$ or less shall be annually paid from the surplus canal revenuea to the State treasury for general State expenses. And the remainder of the snrplus canal ravenues shall be applied to the completion of the canals. If the above sinking funds are ingufficient to satisfy the creditors of the State, cquitabie taxes shall he laid. * * The credit of the State shall not be loaned to any individual corporation. To meet casual deficits, the State may contract dehts not exceeding $\$ 1,000,000$. Other debts may be contracted if submitted by the Legislature to the people, with provisions for payment by direct taxation, and ratified by the people. * * * Corporationa are to be formed under general laws, except those for municipal parposes. Municipal corporations are to be restricted by the Legislature in their power of taxation and contracting debte. Stockholders in banka are individually reaponaible for the debts of their corporation to the amonnt of their eharoa of atock. ** The capitals of the common echool literature and United States deposit funds are inviolate.

The aggrogato atatoment showis mencreces in the In reapect to the apward movement, thare in in indowa tonange in 1856 over 1855 of 200,844 tons, and a croase of tonnege in 1888 over 1856 of 115,846 tona, decreaso in value of $\mathbf{9 2}, 674,687$. and In valuo of $\$ 80,687,844$.

## Ilomans Foreign Commerce of the United States.

For New York Canale, aee North Am, Rev., xiv.,
 mesce, Debts, etc., of New York, see IIunt's Mer. Mag., xviii., 243, xxili., 610, xxiv., xxv. (by A. C. Flaga) ; Banker's Magazime, vll., vili., lx., x., xl. Minetal Resources, ea N. Y. Rev., Iv., 71, v., 477, vill., 103 ; Am. Jo. Science, $\times x \times 1 \times$., $95, \mathrm{xl} ., 73, \times 1 \mathrm{if} ., 227$, xlvi., 148, xlvili., 296, $\mathbf{i}$. (N. S.), 43, Ili., 57, 164.

As our limite provent our giving full atatistics of many losportant elementa of commerce, we refer to these sulijecta under their proper heads. For particular informatlon, see articles Emiotiation, Tonnage, New Yoak City, Bankino, Commerce, Tarify, Sitipring, Railnoada, Canals, and Unttri) States.
Now Yoric, tha capital of the State of that name, and the commercial motropolis of the United States, on the southern extremity of Manhatian Jsland, at the polnt of confluance of the Ifadson Jiver, which separates Manhattan from Naw Jersey, with Fast River, which separates it from Long Island, In lut. $40^{\circ} 42^{\prime}$ N., and long. $74^{\circ} 8^{\prime} \mathrm{W}$. Naw York Bay, or inner harbor, is one of the most capacious end finest in the world; it is completely land-locked, and afforda the best anchorage. Tha entrance to the bay through the Nerrows is extremely beautiful. On each alde, the ahore, though wooded down to the water's edge, la thlckly studded with farms, vilagen, and country seats. At the upper end are seen the spires of the city; and In the distance the bold precipitous banks of the IIudson. From New York to the bar between Sandy IIook Polnt and Schryer's Island (the division between tise outer bay or harbor and the Atlantie) is about 17 miles. Fortifications have been erected at the Narrows, Gevernor's Island, end other places, for the defense of the city and shipping.

Manhattan was first discovered and explored by Hendrick Iudson in 1609, IIudson ascended the
river which now bears hia name as far as the preaent site of Allany. The shlp $\ln$ which he made the voyage from IIoliand was of about 80 tons barien, end called the Ialf Jfoon. In 1610 a shlp was sent by the Ansterdam merchante to trade with Indiane for furs, etc. In 1613 a small fort was erected, and four honses were built, under the auperintendence of Hendrick Corstiaensen, who explored the bay and the saveral inlets, creeka, etc. But no permanent settlement seens to have heen made until about 1625, on the south point of the island. After the formatlon of the Dutch Weat India Company, they took Immediate measures for eatablishing a permanent colony. Under their fostering cure, honwerles, or farma, were soon taken up, a subatantial fort creoted, and the dwellinga of the colonista clustered around It. In 1652 it was incorporated under the name of New Amsterdam, and was governed by 2 burgomasters, 5 achepens, and a schout or sheriff, and continued in their possession untll 1664, when it was taken by the Englisi, and the name changed to New York. Jn 1678 it was retuken by the Dutch, and called New Orange, but they held poasession only one year, whon it was again occupled by the Engligh, and continued in their possession until the period of the Revolution. The asseasors' valuation of property in the city, in 1688, was about $\$ 320,000$. In 1690 a congress of the commisaioners of the several colonies was held at New York. In 1694 there were 60 ships, 25 sloops, and 40 boats, belonging to the city. In 1095 Trinity Church was built. This building was burned in 1776. In 1725 the tirst newapaper was published in tills State.

In 1699 it contained 0000 inhabitants. In 1774, proviously to the commencement of the War of Independence, the population amounted to 22,750. Doring the war the popuiation contlnued stationary; but aince 1783 Ita Increase had been quite extraordinary. In 1790 the population amounted to 33,131 ; in 1800 , to

## NEW

in 1810, to 812,710 ; and $\ln 1850$, to 515,507 . This, howevar, is exclnaive of the population of Brooklyn, which, in 1850, amounted to 96,838 , and is as much a part of New York as Birkenhead is of Liverpool. Originally the houses were mostly of wood, and the streets narrow nad confined. In these particulare, however, a vast Improvement has taken place during the last half century; most part of the old houses having been pulled down and rebuilt with brick. The new streets, which are breal, and interse: each other at right angles, are well paved and lighted. Broadway, the principal street, is one of the lary to and finest $\ln$ the world. Many of the publie buildingsare commedious and elegant. The pools, that were formerly abundant in the clty and its vicinity, have been completely tilled up; a measure that has done much to improve the health of the population. In reepect of cleanliness, however, New York, though much innproved, is still rather deficient. Formerly thero was hardly such a thing as a sink or common sewer in the whole eity; the nlght eoll and filth were collectod in the pits, of which there was one in every house, and being conveyed to the nearest quays, were thrown into the water; and as these were made of timber, with many projections, a great deal of filth was retalned about them, producing, in hot weather, an abominahle stench. But in these respects a great amendinent has been effected; and the deticlency of water, under which the city formerly labored, bas been completely obviated by the construction of the Croton Aqueduct, about 401 miles in length, a work worthy of being ranked with the noblest of the old leman aqueducts.

New York is indebted, for her wonderful increase, to ber admirable situation, which has rendered her the greatest emporlum of the New World. The rise of the tide is about 6 feet, and even at etib there are 21 feet water on the bar; and the water in the onter and inner bays, and iu the river, is so leep that ships of the largeat burden lie close to the quays, and may proceed to a great distance up the river. The navigation of the bay is rarely impeled by ice. The great strength of the tide, and the visinity of the ocean, keep it generally open, eveu when the Chesapeake und Delaware Bays are frozen over. The influence of the tides is felt in the Iludson as far as 'I'roy, $\mathbf{1 6 0}$ miles above New York, affordiog peculiar fucilities for its navigation. Those natural advantages bave been vastly extended by a system of canals, which has connected the Hudson not merely wlth Lake Ontario and Lake Eirie, but with the Ohie River, and consequently with the Missinsippi and the Gulf of Dlexice! So prodigious a command of internal navigation is not enjoyed by any othe* elty, with the exception of Now Orleans; hut the readier access to the port of New York, the grant salubrity of the climate, and her situation, will secure her hereafter the preponderance.

New lork Jarbor.-In April, 1857, l'rofessor liache, of the L'nited States' C'oast Survey, furnished the Life Saving Ansociation with his Sailing Lirections for Sandy Hook aml its Approuches from Sea, of which 5000 coples have been printed in pamphlet form. A portion of these tas been placed in the lands of the dealers in natical instruments in the follewing jorts for gratuitous distribution to captalne of vessela, namely, Now York, P'ortland, Me., I'ortsmouth, N. Il., Boston, Mass., l'hiladelphia, Ihltimore, Savannah, Mobile, New Orleans, Norfolk, Charleston, and a supply of these puumblets, for the like purpose, hat been forwarded to the Enited States" consuls in Cork, Juhlin, llelfant, Iristul, Cardiff, Ilull, Sunderland, Portamoutl, Sosthampton, (ilasgow, Dundee, Llverponl, Londun, Harre, Marseilles, Antwerp, IIremen, Hamhurg, Amsterdam, Kotterilan, ond Havana,
lange lights from tiast Eind if' Gedney's Chumnel, between Siouly Hook uml Flymis hivulh,-'Two fix xell lhgis located near l'oint Comfort, New Jersey. The front
light will be exhlblted from a lantern on the keeper's dwelling, which is located near the beach, and painted white, with the top of the inntern black. The rear llght is loested three quarters of a mile distant from the front one, and will be exhibited from a tower painted white, with the head of it and lantern black. The keeper's dwelling is north of it and painted whito. The front light is 40 , and the rear one 76 feet above the mean level of the sea, and should be neen, under ordinary state of the atmesphere, outaide the bar. Daring the day the front building ean be readily recognizel from other bulldinge in the vleinity ly the lantern on its centre, and the rear one by the lantern of the tower belng projected on the sky atove the trees.

Main Ship Channel Range Lights.-Two fixed lights located on the New Jersey shoro, west of Ilighlands of Navesink. The front light will be exhihited from a tower near the beach, painted with 2 white and 1 red horizontal hands, and the roof of the lantern also of the latter color. The keeper's dwelling is west of the tower, and painted white. The rear light is located on the north side of Cbappel Hill, 1\% miles distant from the front light, and will be exhibited from a lantern on the keeper's dwelling. The dwelling is painted white, and the top of the lantern red. Tho front llght is 60 , and the rear one $22+4$ feet above the mean level of the sea, and both should he scen, under ordinary state of the atmosphere, the length of the range line. During the day they can he reatily recognized by the shape and colors of the towers of the front light, and ly the lantern of the keeper's dwelfing, und isolated portlons of the rear one. It is ntout 1 mile enst of Plgeon IIill.

Suash Channel Range Lights.-Two fixed light located on Staten lsland, New York. The front light will lee exhibited from a tower near the site of the "Old Elm Tree" Ieucon, painted with 2 white and I red horizontal bands, and the roof of the lariternalso of the latter color. The keejer's dwolling is south of the tower, and painted white. The rear light is lucated on a hill, near Now Dorp, atout 19 miles trom $t^{1}$. 0 front light, and will be exhibited from a lantern on the keeper's dwelling. The dwelling ls painted white, and the tup of the lantern red. The front light is 59 fect. and the rear ligint 189 feet above the mean livel of the sea; and looth shonhd he seen, under ordinary state of the atmosphere, well outside of the thar at Sandy Hook. During the day they can lee realily recognized liy the shape of the tower, and colors of the front light, and by the lantern on the dwolling, and isolated position of the rear one.

Sailing /Divcritons,-Mastern of vassels intending to enter hytiedney's Chamel aromal the nouth-west Spit lluoy, shouhl run on n north-west haff went course from the light-vessel for the black und white perpen-dicular-striped Nun Buoy at the outsilh of Gedney's Chanmel, nud from it west ly north through the channel, keeping het ween the buoys, untll the range lights near Point Comfort, New dersey, are in one, whea haul up for them, and continue upon the range until the two main channel lights are brought in ragere, which will also ho shown by the me.in light at Sandy Itork, belng a little open to the southward of the West Weacon. From this point the Main Ship Chaund range will take them up clear of the "Weat llank" and Craven'y Shoal. Masters of vessols Intending to pass through the Swash Channel, ean bring the lights in range ontabide the bar, and run for them, a;ail the Red Can huoy, No. 8 (which marks the upper middle), is pmesed, or until the Maln Ship Channel range is on, when hanl upi on that range uatil eloar of the "West lank." Vessela drawiag more than 17 feet whould not be taken through thin channel on the range line at low water. A fost more water may be carried through this channel, after erossing the har, ty keeping a little to atarbond, and opening the front light

The Croton squeduct commences at the Croton River, 5 miles from the Hudson, in Westchester county. The dam le 250 feet long, 70 feet wide at the bottom, anil 7 at the top, and 40 feet high, built of stone na's cement. It creates a pond 5 miles long, covering a surface of 500 acres, and contatining 500 ,000,0000 gallons of wator. From the dum the aqueduct proceeds; sometimes tunneling through sulid rocks, crosaing valleys ly omhanknents, and brooks by culverts, 1 til it reachea Harlom tiver a listanco of 33 miles. It is built of stono, hrick, and cement, nrehec. over and under, 6 feet 3 incles wide at botton, 7 feet 8 inches at top of the sillo walls, aul 8 feet 5 inches high; lins adescent of 13 f Inchea per milo, and will discharge $60,000,000$ of gallons overy 2.4 hours. It crosses the Ilarlem Kiver on a maghilieent bridge of stinne, 1450 fat long, with 14 plera; 8 of them hearing srches of 80 feet span, and 7 others of 50 pect mpan, 11.1 feet above the ewator at the top, The recelving reservoir at lighty-sixth-street, 38 miles from the Cruton dam, covers 35 acres, and holda $150,000,000$ of gallons. The distributing reservoir, on Murray's ILill, at Forti-eth-strect, covers 4 acres, and in eonstructed of nono and cement, 45 foet high ahove the atreet, and holds $20,000,000$ of gallons. 'Ihenoe the water ls slistributed over the city in iron piper, laid so doop under ground
as to be secure from frost. Tho whole cost of the work has been about $\$ 13,000,000$. The water is of the purest kind of river water. There are laid below the distributing reservolr In Fortleth-street, more than 200 miles of pipe, from 6 to 36 inches in diameter. See Aqueducts. There are not more than four cities in Europe larger than New York, viz., London, Parls, Constantinople, and St. Petersburg.

The Chamber of Conmerce of the State of New York holds ita meetlags monthly, for the consideration of those questions baving a direct bearing upon the commerce of the city and atete. Hitherto this body has publishect no annunl reporte, whereby the com. merce of the state could be illuatrated for the benefit of ite citizens. It is now proposed however to supply this want, and to allopt such measures ns will secure at in early day suitable rooms for the use of the members, with the use of a reference library, and such far. elgn commercial journals as will enable the conmit. teea to publish to the world an annual report at the close of each year, illustrating the commercial opera. tions, not only of this clty and state, but of the unien,

Cammerce.-The magnitude of the commerce of the city of New York will be best explained by the statistics showing the exports and imports for a neries of years. We refer to the article State of New York for en exhibit of the commerce of the State (and which has lts principal entrepôt in the clty of New York) for a series of years extending from 1821 to 1856.
Anong the importa, the great lucrease in hides, liquor, railimasl Iron, Augar, ten, and dry goods will he noticed. There has been a decrease in the iumportation of watches, handware, and cutlery. Among the cxports, the most important articlet which have increased are flour, whent, prork, hama, and bacn. The dectease has been principally in cotton, corn, leef, butior, cheese, naval stores, aperm-oil, snd India-rubler good 4.

It will be seen from the above that the value of goods put upon the market falls short of the total value of the import of merchaudise, abont $\$ 34,500,000$, and we have good reason to get down the value of goode in bond July 1,1856 , at $810,000,000$ at least, making the total value of geods in bond July 1, 1857, about 845, 000,000 , which is $\$ 6,000,000$ or $\hat{\boldsymbol{T}} \mathbf{7}, 000,000$ greater than was to have been expected from such reports as we have had from time to time. Wo must not forget to [lace to the credit of the year, an importation of apecie and buliion of $\$ 6,500,000$ against a little more than $\$ 1,000,000$ the previous year. Tho total import of merchandise is $822,000,000$ in excess of the previous year, and it is not a flattering fact, that we have been Importing most freely, when it was ovident that stocks were accumulating. The merchant can not devote a few honrs more profitably, than in a careful scrutiny of the above tinbles.

The extent to which goods have been warehoused, caused the eash receipts at the eustom-house to fall below those of last year, as is shown in the following: Casif Dutige mechifed at thes pont inerino the Fibeal.

The final result of this expansion, if continued, will be the loss of credit, and, as a consequence, a reduc-tion-not, however, until we shall have endured ali the pensitien incident to bankruptcy. With the realization of the present prospect, good crops, and the continued development of the manufactures of our country, we can expect prosperity, if we can only avoid the ovil of excensive consumption, and, as a consequence, luportation of foreign manufactures. We have prepared s statement showing the exports of France, (ireat Britaln, and the United Staten for n period extending from 1847 to 1856 , inclusive. This ntatement enalles us to compare the increane in exports, nind consequently in wealth, of the three principal maritime countries in the world. With regard to the increase of wealth, it country is in a slmilar ponition to an individual. The exports of one are equivalent to the income of the other; and the imports of one, on the other hani, are equivaient to the expenses of the other. In the case of this country, the ad valorem tariff prevents us from obtalning a correct valuetion of the imports, in order to obtain the exact difference, or, in other wordn, the increase of wealth,
through the foreign commerce of the country. We may, howevor, judge in a measure from the charater of the imports of the probable gain of wealth. If they are luxuries instead of necesnaries, or manufactures that could be home-made, instead of the products fer eign to our soil and climate, we may justiy put that nation duwn on the extravagant list. Aud this is the position of the United States. In the period of 10 years helow given, the increase of exports to the United States lias been equal to 107 per cent. ; the increase of imports has been (for the samo period) ecqual to 114 per cent. Showing that even with our enormous productive powers, and the great wants of Furope, our exports have not kept pace with our demand for laxuries. We are upt to congratulate oursclves on the unegualed growth of our cosintry, and its eommerce. Of the former we have reason; but of the latter, the figures do not prove our statements. In the last 10 years the exports of the Unitedi States have increased 107 per cent, while the increase in the exports of France for the eame period is equal to 130 per cent. ; and the increase in the exports of Great Ilritain for the same jeriod is equal to 93 per cent.

Statement showing, separutely, the total exports of domestic p,roluce of France, Great Britain, and the United States for the past 10 years:

| Year. | Frunce. | Great Brltalo. | Vulted States. |
| :---: | :---: | :---: | :---: |
| 1847 | (140,000,000 | (203, (M00, (19a) | \$188,064,000 |
| 1349 | 185,100,000 | 268,000,000 | 154,000,000 |
| 1849 | $155,1000,000$ | $815,000,000$ | 145,14\%0, 100 |

| 1455 | $808,1000,000$ | 475,000,010 |  |
| 1556 | $825,000,000$ | 575, $0 \mathrm{MO},(\mathrm{MNO}$ | $828,04 t 0,(\mathrm{M}) 0$ |

The exports of a country are the best exponent of ite commercial prosperity, and in is meusure it in ins diroct ratio. For althongh the profit which is madie on the artleles exported may vary accoriing ss they sre the nataral products of the soil, or manufactures, the raw material of which is the growth of another ciuntry, yet there are other allowances to be made which compensato for this dlfference. It is evilent, thersfore, that any thanciai tronbles we may have must be the result of our extravagant fimperts. These we have shown to have lucreased more rapidly than our ex. ports, even with the valuation of our imperts by an ad valorem tariff. The correction to be applied, if we wiah to continue prosperons, ia self-evident; and this correction wili, under our present course, become cre long a necessity. A nation'm balance-sheet is equivalent to the relation of receipts and expenditures with an Individual ; sud national bankruptey will surely follow when the imports, for a long serics of years, are greater than the exports.
The exports of domestic cottons from the port of New York to foreign ports, for three years past, has been as follows:

The increase in the total tonnage from 1821 to 1851 , thirty years, was nearly ten-fold. The increase ln American tonnage during the anme period, was more than seven-fold. Tho increase in forelgn tonnage was nearly thirty-fold-about 2,900 per cent. This explains, more clearly than any other fact, the cause of the growing interest felt by European governments in the affairs of this country. The great falling off in the foreign tonnage in 1854, in comparison with several years inmediately preceding, was doubtless mainly in consequence of the Eastern war, which employed, not only the Canard ateamers running to this port, but a vast amount of British shipping of ali descriptions, as
transports. The lnactivity in frelghts hence was also potent $\ln$ infinence. There is no reason to doubt that, with the return of peace, the foreign shipping entering this port yearly, will equal, if not surpase in tonnage, any former year.

The above table shows only the extent of the trade of this city with foreign ports. The coasting trade since 1847 is ahown, partislly, in the following. But it must be rememhered, that coasting vessels to or from ports north of the aorthern boundary of Georgia, are not compelled to enter or clear, unles distilled apirits are of the cargo. It will at once be eeen that this exhibit of the trade of thls city coastwise is far from being coraplete. The same fact will also explain the dlaparity between the tonnage entered and cleared:

| Years. | Entered. | Cleared. |
| :---: | :---: | :---: |
| 1848. | 402,143 | 805,989 |
| 1849 | 424,976 | 895,589 |
| 1850 | 489,898 | 1,020,070 |
| 1851. | 455,542 | 1,214,922 |
| 1852. | 497,540 | 1,378,762 |
| 1853. | 507,581 | 1,810,697 |
| 1854. | 548,482 | 1,490,963 |
| 1855. | 614,045 | 1,978,889 |

But the increase in tonnage is not alone remarkahle. It is a common obscrvation that the largest ships of 20 yenrs ago did not exceed $\ln$ tonnage the ordinary cossters of the present day. Then, a ship of 700 or 800 tons was a wonderful achievement of capital and mechanism. Now, shlps of more than 2,000 tons have ceased to be regarded as out of the ordinary course. The following is a statement of the number of vessels, foreign and American, that entered this port in the years indlicated, their total and average tonnage. The statement of the entries for 1855, shows a diminution in the average tonnage of foreign vessels, to below that of 1840 ; which makea $1 t$ quite clear that the dlminlehed tonnage of the year was, as we have said, caused mainly by the use of a great number of large ships for purposes incident to the war between the Allies and Russia. From 1835 to 1854, the American tonnago increased sbout four-fold, but the namber of ships increased only about 70 per cent., the average tonnago nbout 117 per cent., exceeding the average foreign tonnage about 60 per cent.

We give two tables, arranged from the report on Cammerce and Navigatlon, showing the complete commerce of the port of New York, and specifying the destination of all vessels when outward bound, or the country from whence they arrlved when inward lound; also showing their nationality. This table euables as to sen at a glance the distribution of the commerce of New York, and gives a clear exhlbit of our relations to other countries in regard to favorablo or unfavorable tariffs, and ahows some very curious statistics. In our trade to Fingland, four tifths of the toonage belongs to the United Stater, showing that we lave s fair field for enterprise; while to the

British North American possessions we have less than one fonrth, showing that we are inferior in enterprise to our neighbore, or they have some tariff advantage. We nbsorb four fifths of the carrying trade to France, while to the northern Earopenn countrles we have bat an equal amount. The carrying trade to Sonth Amerlea goes almost entiroly in American bottome. The Cubn tracle is 95 per cent. in American vessela, while to lortugal only abont one third; showing that the tariff is in favor of that country. To Hamburg we have less than one fifth; which is probably owing partly to more economy practlced by the Dutch, and iower wages.

The greater increase of the commerce of New York over the other cities，ls shown by the tables from the allinal report on commerce and navigation．The tonnage buitt during the year euding Jume 30,1856 ，in sli the States，was 469,393 tons，the leading States ranging as follows：

| 8 tases． | 交 | $\frac{6}{4}$ | 安 | 最妾 |  | ذ | Toon． |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| New York．． | 24 | 7 | H7 | 161 | 27 | 806 | 76，801．12 |
| All others．． | 34 | 17 | 848 | 818 | $1 \times 6$ | $04 i$ | 162，301 01 |
| Tutal． | （1）6 | 108 | 440 | 479 | 281 | 1，708 | 469，398．78 |

Maine，it appears from this，bulits an amount of ton－ nage nearly as large as Massachusetts and New York together，and alab nearly as large an amount as all the other States of the Inion，onltting Maseachusetts and Now York；so that there is built on the conat of Maine almost one third of the aggregute tonnr．je of the Unlon． Irobably；leaving out of vlew steamshl pas，canal boats， and river craft，Maine luilds fully one haif of the ton－ nage of tho Union．

Teking the leading ship－owning States，we have the following result as to tomnage owned：

| New York．．．． Massachusotts． | June $30,185{ }^{3}$ Tons． 1，508，618 891,860 | $\begin{gathered} \text { Jone so, } 1885 . \\ \text { Tous. } \\ 1,4649.988 \\ 919,205 \end{gathered}$ | $\begin{aligned} & \text { Tonat } \\ & \text { Ino. } 44587 \\ & \text { Dec. } 87,845 \end{aligned}$ |

Nicaragua, San Juan de. A sea-port town at the mouth of the river of the same name, State of Costa lica, on the west shore of the Caribbean Sen, lat. $10^{\circ}$ 55 $5^{\prime}$ N., long. $83^{\circ} 43^{\prime} \mathrm{W}$. The port ls excellent, and is considered the best on this part of the coast. Till lately, the town was quite inconsiderable, and consisted of little else than a cluster of huta; but latterly it has no doubt been improved.

This phace las risen into importance from its being at the western extremity of a proposed line of water cenmunic:ation between the Caribbean Sea and the Pacific Ucean. This line is to consist purtly of the River San Juan, flowing from the Lake of Nicaragua east to the sea at San Juan, partly of the lake, and jarhy of a canal to be constructed from the latter to the Pacific Ocean. This project has been often mooted; but the discovery of the extraordinary mineral riches of California, and the consequent embration to and intercourse with that country; have given it an incomparably grenter intereat thar it formerly possessed. The country apperara to present grester facilities for effecting this great work, than any other part of Central Ameriaa, except the lsthmus of Darien or Panama. The River Sill Juan, ubout 90 miles in length, is sald to have heen occusionally navigathe throughout its entire course for sea-going vessels, till the Spanlards, to protect themselves from the attacks of the buccaneers, sumk vessels loaled with stone in its hed. In consequence of the interruption thas given to the stream, a consideraile portion of the water was carried of by a now chand ceiled the Rio Colorado-Cuesalize, L! Isthme de Panama, etc., p. 8.1. The Saus Juan is still, however, navignted, though with much difficulty, in the rainy spaspn, by steamers and other vesscls drawing littlo water.
The lake itvelf has deep water throughout, and is adapted for ships of the largest burden. The distance betwebn its south-weatern shore and the Gulf of Papagayo, in the Pacitic, is only 29,880 yards, or $15 \frac{8}{4}$ miles; and though the inter-ening country le latd down in many maps as numitainous, the greatest actual height of alyy part of it alove the level of the lake is only 19 feet; at least, such is the result given by a serics of 317 hevels, ahout 100 yards apart, taken in 1781.Thompsos's Ginatrmaha, Append., pp. $512-520$. The surface of the luke is 128 fent 3 inches (Bugtlish) above the level of the lacitic; an ascent whicly might te overeome ly a succession of locks. The difference in the level al the two oceans, furmerly supposed to be so serions motstacle to the undertaking, is said by Ifumbolit not to exceed 20), or, at most, 22 feet. (NourExpuyne, i., 123, ed. 1820.) At its wentern extremity,
the Lake of Nicaragus is connected by a amall river, the Tipitaps, with the Lake of Leon or Managua. The latter, 55 miles in length by nearly 30 in breadth, is slso sald to have deep water throughout. And the plan which appears to be at presen's preferred ls, to make the channel uniting these two lakes navlgable, and to excavate a canal from the latter to the pori of Realejo, on the Paclif. Mr. Squler, late chargd des affaires of the United States at Nicaragua, hae published the following atatements in regard to this route.

Length of the route hy Lake Nicaragua, etc., across the American Continent, from the Atlisntic to the Pscific Oceans: River San Juan, 90 miles; Lake Nicaragua, necessary to be traversed, 110 miles; hiver Tipitapa, 18 miles; Lake Managua or Leon, 55 mlles; froin Lale Managua to Realejo, 40 miles; total, 803 milees. Helght of the various lakes to be passed, and the elevatic ne of lund : height of Lake Licarsgua, 147 feet 9 inches above Atlantic, 128 feet 3 inches above Pacific; height of Lake Managna, 176 feet 5 Inches above Atluntic, 156 feet 11 inches above Pacifie; highest point of land to be passed, 231 feet 11 inchss above Atlantic, 212 feet 5 inches above Pacitic.
The River San Juan reaches the ocean by several mouths. The divergence takes place about 20 miles from the sea, forming a low delta, penetrated by numerous canals, or, as they are callell on the lower Nississippi, bayous, and lagumas. The principal branch is the Colorado, which carries off at least two thirds of the water of the river, sud which emptles into the ocean some 10 or 15 miles to the southward of the port. There is an almost Impassable bar at the entrance, which would preclude the ascent of vessels, even if the depth of water above permitted of their proceeding after it was passed. The little steumer Orus, nevertheless, after repeated trials, succeeded in passing. Thero is another small channel called the Tauro, which reaches the sea midway between the port and the mouth of the Coleralo. The branch emptying into the harbor, the one through which the ascending anil desceniling boata pass, carries off only about one third of the water of the river. It, too, has a bar at the mouth, i. e., st its point of debouchure into the harbor, upon which, at low tide, there ure but three or four feet of water. This passed, the bed of the river is wide, snd studded with low islands; but excepting in the channel, which is narrow and crooked, the water is very shallow. It has been suggested that the Colorado branch might be dammed, and a groater column of water thrown into the other, or San Juan branch. But the suggestion can only he made by those who are wholly unacquainted with the subject. Allowing it to be possible to build a dan, the stream would probably find a new channel to the sea; or, if it took the direction of the harbor, fill it up duriug the tirst rainy season with samd, or at once destroy the saudy barriers which now protect and form it. It can not be made navigable for slups or vessels of any kind, except of the lightest draught, by any practicable system of improvements. The boats used upon the river for carrying freight and passengers are exaggerated canoes, called bongos. Some are hollowed from a single tree, but the better varieties are built, with some degree of skill, from the timber of the cedro, a very light and durable kind of vool, which grows abundantly about the lakes. The largest of these carry from 8 to 10 tons, and draw 2 or 3 feet of water when loaded. They are long, and rather decp and marrow, and have, when fully manned, from 8 to 12 oarsmen, who drive the boats by means of loug sweeps and setthgr-poles. Sails are seldom, if ever, used, wxcept upon the lake. The masts are unshipped and left at the head of the river In descending, and resumed again $\ln$ returning. Theso hoats have a small spmee near the stern culled the " chopa," covered with a board roof, a thatch of palm leaves, or with lides, which ly assigned to the passengers. The rest of the bout ls open, and the oarsimen, or, as they c.all
themselves marineros (sailors), are without protection, and sleep upon thelr beaches at night, covered only with their blankets, and with the gunwale of the boat for a common plllow. The eaptain, or patron, la the ateersman, and oceupies a barrow deck at the stern, called tho pineta, upon which he nlso sleeps, coiling himself up in a knot, if the boat is small and the pinein narrow. The frelght, if liable to damage frome exposure, is cevered with raw hidea, which, between aun aud rain, soon diffuse an odor very unlike the perfumes which are sald to load tho breezes of Araby the Blest. The usual freightage from San Juan to Granada a distance of 160 or 170 miles - is from 30 to 50 cents per ewt.; if the articles are bulky, it is more. The boatmen are pald from seven to eight dollars tho trlp, down from Grenada and back, which usually occupies from twenty to thirty days, alehough with proper management It might bi mado in less time. Time, however, in thesa regions is not regarded na of much importance, and every thing is done very lelsurely.

Nicaragua, a Republle of Central Amerien. It extends from lat. $10^{\circ} 45^{\prime}$ to $13^{\circ} 20^{\prime} \mathrm{N}$., at the Bay of Conchagua, on the Pacitie Ocean, long, $83^{\circ} 40^{\prime}$ to $87^{\circ} 40^{\prime}$ W.; havlng west the l'acitle Ocean, east the Caribbean Sea, and part of the so-called Mosquito teritory, north the State of Honduras and San Salvador, and South Costa Rica. Area about 49,000 square miles. Tha Repnblie is divlded into five Departments, each of which has acveral judicial districts, as followa:

| Departimenta. | Pop. | Diutricta. |
| :---: | :---: | :---: |
| Meridional | $20,0 \times 6$ | Itvas or Nicaragoa. \{ Acayopa or Chontales, Granada, Masaga, and Managua. Leou and Chthandega. Matagalpa. segovia. |
|  | 0 |  |
|  |  |  |
|  | 90,000 |  |
| Septentrional of Matagalpa | 41.000 |  |
| Septentrionat of Segoria .. | 12, (6) $\mathrm{NHO}_{1}$ |  |
| Total ............. | 247.0100 |  |

The pop,ulation here given is the resulis arrived at, in round numbers, by a census attempted in 1846 . It was only partially successful, as the people supposed it preliminary to some military conseription, or new tax. The principal towns of the State, with their estimated population, are as follows:

| Leon (the enpltat), In- | Puebla Nueva ....... $\quad \mathbf{2 , 9 0 0}$ |
| :---: | :---: |
| eludtur Subtiava... 25,000 | Nagorote ............ 1.800 |
| Chluandega ......... $\mathbf{~} 1,004$ | thouct . . . . . . . . . . . . . 2,800 |

| thilchigaipa ......... 2,804 | tranada. . . . . . . . . . . $\mathbf{1 0 , 0 0 0}$ |
| Poailtega ........... 900 | Nicaragua ............ 8,000 |
| Tellca............... 1,000 | Segovia ............. 8.0. 8.000 |
| Romotitio. . . . . . . . . . 2,000 | Matagal pa........... . 2,000 |
| Villa Neuva......... 1,010 | daugal |

It is a singular fact that the females greatly exceed the males in number. In the Department Occilental, according to the census, the proportions wore ns three to tuo! The civilized Indians, and those of Spanish andi negro stocks crossed with them, constlute the mass of the population. The Individnals of pura Furopean extraction constitute but a small part of the whole, and are more than equaled in number by those of pure negro blood. The entire population may le divided as follows: Whiters, 20,000; negroes, 15,000; Indians, 80,$000 ;$ mlxed, 130,000 .-Total, 250,000 . Most of these live in towns, many of them going two, four, nud six miles daily to labor in the fichls, starting before day and returning at night. The plantations, "haciendas," "haites," "ranchos," and "charras", are scattered pretty equally over the country, and are reached by paths so obscure as almost wholiy to escapo the notice of traveler who, passing through what appears to bo a contluual forest from one town to another, are lianle to fall into the error of supposing tha country almost wholly uninhatited. Thoir dweliings are usually of canes, thatched with palm, many of them open at the sides, and with no other floor but the bare earth, the occupation of which is stoutly contested by plgs, calves, fowls, and chilitren. These fraglle atructures, so equable and mild is the Almate, are adequate to auch jro-
tection us the uatives are accuatomed to conalder necessary. Some of them are more protonding, and have the canes plastered over and whitewashed, with tilo roofs, and other fimprovements; and theru are a few, belonging to large proprietors, which aro exceedingly neat and comfortable, approaching nearer our ldeas of inabitations for human lecingy. A large part of the dwellings in the towns are much of the same character. The residences of the better classes, however, are built of adobés, are of one atory, and inclose largo courts, which are entered under archways, often constructed with great beauty. The cuurt-yard has generally a number of shade trees, usually orange, making the corridors, upon whel all the rooms open, excectingly. pleasant.

In Octoler, 1855 , Walker, an adventurer from CalIfornia, landed in Nicarngua with a forco of one handred and iffy men, and being favored by part of the Inhabitanta, succeoded in eflecting a revolution. Firon this time until 1857 ho held possession of the country; though with varied suceess, agalnst all forces brought against lim. In 1857, his expected reinforcemeuts from the United Stutes failing to arrive, he was forced to retreat, and with an almost total losa of his army, and finally had to accept the offer of the United States sloop St. Wary to convey hlmself and command to the United States.

Unfortunntely, agriculture is at a very low ebh, and but a small portion of this valuable land is made avaifable. The productions are Indigo, of which from 800 to 1000 zeroons ure manufactured yearly; sugar, cotfee, cacao, and cotton-the last of superior quality, and formerly raised in large quantities; Indian corn, rice, beans, and plantains, the staple food of the people, are raised in abundance; wheat, also, is grown in the mountainous and cooler parts of the country. Fruits, of varions kinds, aro jlentiful, Inclnding excellent oranges and lemons. One of the principal sources of wealth consista In eattle, of which there are great numbers in all parts, particularly in the districts on tho eastern side of the lake, where extenslve and excellent pasturage is met with. The chief exporta of the State nte indifo, Nicaragua wood, and hides. The executive has the title of Supreme lirector, with two counselors, a legislative chamber and senate. From the reports of the Miuister of Flnance, it was estimnted that the recelpta into the State Treasury for the year endiug 30 th Junc, 1851, would amount to sil22,682, and the expenses to $\$ 173,646$, leaving a deticit of $\$ 00,946$. This, added to the standing delt of tho State, $\$ 523,905$, makts a total debt of $\mathbf{8}$ :374,869.

Commerce uith the L'nited States. - On the lath day of April, 18:0, a treaty was concluded between the United States and Great Britain, in respect to a proposed ship-canal between the Atlantic and the Jacific, by which both govermments stipulate sud declare that "neither the one nor the other will ever obtain or maintain for itself any exchasive coutrol over the said ship-canal." The 8th article further stipulatea that the two govermments shall "exteni their protection, by treaty atipulations, to any other practicable communications, whether by eanal or isilway, neross the lsthmus which connects North and South America, and esprecially to the inter-occanic communications, should the sano prove to bo practicable, whether by eanal or railway, which are now propesed to be established by the way of Teluantepec or l'anama." 'This treaty contains other stijulations relative to the Mosiulto coast, Central America ${ }^{2}$ enerally, etc., but nothing of commercial interest. General informa. tion reapecting the Centrai American States is exceediugly limited; thoufh, both for its productions and its geographical position, the country is one of great interest and importance. It abounds in all the jrecious and useful inluerals, and produces almosi spontancously the varied and luxuriant staples of the tropics. It has been termed the portage or stepping-stane between

Congre:
the commeree of Enrope and Eastern Asia, and between the Atlantic and the l'acille possessions of the United States; and on this account da now the scene of active operatious for facilitating its transit. Of the many routes by which the prosagg is deemed practicalle, that by the way of the Hio San Juan and lskes Nicararua and Leon is sald to he tho most no; and here, therefore, the great Inter-occanic cunal may, it is thought, bo eventually construeted. The rontes vary in length from 13il to 279 miles. By these routco, in couparison with the older ones, the distanee from New York to Canton will be reduced from 17,100 to 12,600 miles; to Calcutta, from 15,000 to $1 \cdot, 000$; and to Singapore, from 15,800 to 14,000; while from Iingland to thuse places the distaneo will be materially increased. "In a commercial point of vlew, therefore," ssys a late statistical publication, from which these facts are glenned, "lingland can care but little about the canal as proposed, since without it her advantages are much superior to theac of the Vinited States in the Asiatic trade."

The trado with the United States has been decreasing for a number of years, as is shown by the following:

Exporis to Importa from
 Totat trede from 1830 to $19.60 . .$.
Nicaragua, or Peaoh Wood (Ger. Nirarugaholz, Mhtholtz; 1). Blocilhaut: lir. Bois de Sang, Bois de Nicarayue; 1t. Legno sauguigno; $\mathbf{S p}_{\mathrm{p}}$. Falo de sangre; l'ort. I'ao sanguinha), a tree of the same genus (C'azalpina) as the 1 razil and sapan wood; but the species lias net been exactly aserertained. It grows principalIy in the vieinity of tho lake of Niearagua, whence its name. It is satid by 1)r. llaneroft to be almost as red and heavy as the true llrazil wood, but it does not commonly afford more than a third part, in quantity, of the color of the latter; and even this is rather less durable and less beuutiful, though dyed with tho same mordants. Niearagua, or peach woods, ditter greatly in their quality as well as price; one sort boing so deficient in coloring matter that six pounds of it will only dye as much wool or cloth as one pound of Ilrazil-wood, white another variety of it will produce nearly half the effect of an equal quantity of llrazil-wood, and will sell propertionalty dear.-llancuor: on Colors, vol. ii.
Nickel, a scaree metal, which occurs always in combination with other metals, from which it is exceedingly diflicult to separate it. When pure, it is of a fine white celor resembling silver. It is rather softer than iron; its specitic gravity, when cast, is $8 \cdot 279$; when hammered, $8 \cdot 9.22$. It is inalleable, and may withont ditficulty be hammered Into plates not exceeding one hundredth part of an inch in thickness. It is nttracted by the maguet, and is not altered liy expesare to the sir, nor by being kept under water. It is employed in potteries, and in the manufacture of porcelain.- 'inosson's Chemistry. The cobalt ores are commonly empitoyed in the extrnction of nickel, and they aro now trented by the method of Wohler to effect the sepmeration of the two metals. The arsenic is expelled by roasting the jowdered speise, tirat by itae:t, next with the nddhtion of charcoal powder, till the garlic smell be no longer perceived. The residuum is to be mixed with three parts of sulphur and one of potash, melted in a critibie with a gentle heat, and the product being eduleorated with water, leaves a power of metallic lustre, which is a sulphuret of nickel free from arsenic: while the arsenic associated with the sulphur, and comhined with the resulting sulphuret of potassium, remains dissotvel. Should any arsenic still be found in the sulphuret, as may happen If the tirst roasting leat was too grent, the above process mut be repeated. The sulphuret must he finally washed, dissolved in coneentrated sulphuric acid, with the uddition of a little uitrie, the metul must he precipitated by a carbonated alkali, and the carmonate reduced with charcoal. Nickel forms twelve per cent. of the new cent authorized by Congress in 1857.

Since the manufacture of German silver or Argentan tiecame an olyject of commercial Importance, a great deal of attention has been hestowed upon nickel by minerstogists, chemista, and nickel-workers, and Its extraction from its ores has been undertaken upon a considerable scale. It is sparingly found, and in comparatively few localities, and even in those It is usually associated with cobalt. In consequence of its rarity it is generally classed among the precious metals. It is, when pure, almost as white as silver, and both tuctile and malleable, elther when hot or cold. It may l:e mado Into mariners' compasses, beling susceptible of magnetism. It does not oxidizo or rust by contact with air, and only melts, when pure, at an lntense heat. It makes other metals harder and brittle when alloved with them. The nickel used for alloys ls usually olstaned from what tho Germans call Kutfer Nlekel or Copper Nickel, which is an arseninret or compound of nrsenic with nickel, which is hard and has a metallic lustre of a coppered color inclining to brown or gray, and displaying all the hues of the rainlow. It contains 66 parts of arsenic and 44 of nickel, when pure, buc usually contains a little iron, lead, sulphur, and antimony.

The Chincse probably firat made use of nickel ; their ochite copper, or prack-fong, contains about 32 nickel, 40 copper, 25 zinc, and 3 Iron; hut the proportions vary more or less. The composition known as British plate is an alloy of nickel, the ores from which the Birmingham people extract it being imported princlpally from Norway aud Ilungary. In Saxony they produce twenty thousand pounds of nickel a yeor, and in Prussla about nine thousand pounds. In Germany they make it Into German silver, and in this country our Mint is busily engaged in making it into money.

Nickel is ohtnined at Chatham, in Connecticut; also in Missouri, in the chrome mines of Maryland and Pennsylvanin, mid in Lanenster Connty, Pennsylvania.

Nile (Nilus), a great river of Finst Africa, formed by the union of the Bahr-cl-dbiad (White River) and the Bahreel-Azrek (llue liver). The first, which is regarded ns the true Nile, is supposed to rise on the castern edge of the table-land of East Africa, about lat. $2^{\circ} \mathrm{S}$., leng. $34^{\circ}$ E., but its source is unknown. Expeditions sent by the I'uelin of Egypt in 1840-2 traced it to lat. $4^{\circ} \cdot 42^{\prime} \mathrm{N} .$, In long. $30^{\circ} 58^{\prime}$ E. Here the nav. igation was interrupted ly a ledgo of rock; It flows generally noith, with a width of from one to two miles, and joins the llahr-el-Azrek at Khartum, in Nubia (lat. $15^{\circ}: 5^{\prime} \mathrm{N}$.). The second rises in Alyssinia, in Jat. $10^{\circ}$ $59^{\prime} 25^{\prime \prime}$ N., long. $36^{\circ} 55^{\prime} 39^{\prime \prime}$ E. It flowa north 55 miles, when it enters lake Dembeah on the southwest; emerging from the lako on the southeast, it flows in the form of a curve, first south, then west and northwost, traversing in its course several mountain chains, and descending by numerous falls into the plains of Nubia, where it pusses Sennaar. Its confluence with the llalir-el-Abiad forms the Nile, which from t'its print tlows northeast, north, and northwest past Halfay, Shendy, and Berber to lat. $19^{\circ} 20^{\prime}$, where it turns to the southwest, forming a wide curve called the Great llend. In lat. $18^{\circ}$ it again turns northward, and continues in a northerly direction past Dongola, Girgeh, Siout, and Cairo to its mouth, near Assounn ; and from the junction of its hegd streams to its delta its basin is formed by two paraliel chains of mountains, whlch in some places closo upon it and form rapids, and in othcrs open up and leave tine plaing between them and the river. It forms the first cataract (in ascending) near lissouan, lat. $4^{\circ} 10^{\circ}$ N., the second belng in lat. $21^{\circ}$ $52^{\prime} \div 0^{\prime \prime} \mathrm{N}$., and the thirid in lat. $10^{\circ} \cdot 10^{\prime} \mathrm{N}$. Its hanks are generally elevated In Nubla; they aro less so in Middlo Egypt, and absolutely flat In the Jelia. From Essounn to the sea the average fall is two inches to a mile, and its mean velocity is nbout three miles an hour. Ita leugth from supposed source, following lts bends to the sea, is alout 3000 miles (direct distance 2300 miles).

The delta of the Nile commences in lat. $30^{\circ} 7^{\prime}$ N., where Ita watera spread out into numerous streams in the form of a trlangle, extending at its base on the Mediterranean over a space of $\mathbf{1 2 0}$ milles; the two principal mouths are the west, or Rosetta branch, and the cast, or Dimietta branch. The others are the Llourlos anit Dibe meutha. The system of the Nile la ananomaly among rivers: in asceading Its course ne aflluent la met with for 1400 miles, the ilrat being the At bara in Nubla, which joins It on the right, 27 mlles south of Berber. It ls the only great tropleal river which, by its periodlcal lnundations, fertllizes a country surrounded throughout a great part of lts course by sandy deserts. The waters begin to rise in June, and they subside in September. - See Eaypr. From time Inmenorial the Egypilans have made use of canala for the purpose of extending the inuntatlons. The rise of the Nile appears due to the periodical rains which full in the tropical regions of Afrlia from June to September. In Upper Egypt the swelling of the rlver amomnts to about 30 fect, and at Cuiro to 24 feet, perpendleular.

Ning-po, a city of Chlna, prevince of Che-kiang, and one of the tive ports rocently opened to forcign trade, on the Takia, or Ning-po liver, tho mouth of which is dlrectly opposite Chusan, 95 miles onst-southeast of llang-chow-foo, on a tongue of land at the intlux of an alduent into the river, here crossed by a luridge of boata; lat. $29^{\circ} 54^{\prime}$ N., long. $121^{\circ} \$ 2^{\prime} 30^{\prime \prime} \mathrm{E}$. Population estimated at between $\because(00,060$ and 300,000 . The city, six miles in circumference, inclosed by walls 25 feet In helght, aul entered by six gites, is surraunled by n fine fluin covered with villages and water-courses. It has well-supplied shops, a temple of large size, hexagonal tower 100 feet high; a missionary hownital, opened In 18.13; an active trade in junk-luilding, and a large manufacture of silks fur export to lapant. It has been reported that about bio junks come to it annually from Shang-tung and Leao-tong with oil, provisiuns, fruits, caps, cordafe, horms, drugs, rice, and silk; 560 from Fooklen and Ilai-nan with sugar, alum, pepper, black tea, indige, salt, riee, and dye-wouds; from Canton and the Straits some vessels; and from the interior about 4000 small eraft yearly; the total imports being estimated at of, 650,000 annually. It exports large quantities of wood and charcoal to Shang-hai, the trade of which port It has crippled, from heing by sevcral days nearer to the green-tea districts. It was taken by the IJritish, without resistance, in 1841 , whell was captured a ponderuas bell, now in the British Masenm.

Nitrio Acid, Aquafortis (F'r., Acide Nitrique; Germ., Nulpetersaure), exists, in combination with the bases potash, soda, lime, magnesia, fir both the mineral and vegetable kingilonis. 'Ihis acid is never found insulated. It was distilled fromsalepetre so long ago as the 13 th century by igniting that salt, mixed with copperas or clay, iu a retort. Nitric acid is generated when a mixture of uxygen and nitrogen gases, confined over water or an alkaline sulution, has a suries of electrical explosiona passed through it. In this way the salubrisus atmosphere may be converted into corrosive aquafortis. When a littlo hyilrogen is introduced into the mixed gases, standing over water, the chomical agency of the electricity becomes more intense, and the achl is more rapidly formed from its elements, with the production of some nitrute of ammonia.

Noble, an uncient money of account, containing six shillings and eightpence sterling, or in linited states currency equivalent to one dollar and sixty econts.

North America lies between the $16 i \mathrm{~h}$ degree of north latitulo and the Aretic Usecn. It is more irregular in form than South America, lont of greater unlform breaith, larger in area, and more deeply findentell with gulfy, bays, and inlets. Two extcusive elevatiuns or meuntain ridges extend near and parallel, the one to its east and the other to its west coast. Between these is a vast plain, the largest in the world, stretching from the gialf of Mexico to the Aretie

Ocean. In this plain are situated the groat lakes of North America, and through it tow the rlvers Mlissisalppi, the Mackenzle, and the St. Lawrente, the one forming a southern, the other a northern, and the thisd min castern drain for its superfluous watera. Its coast inleutations and Inlots are Ballin's Bay aud Iludson's Bay on the north; the Gulf of St. Lawrence on the elast coast; the (iulf of Mexico on the south; the Gulfs of Califurnia and Geurgia, and Cook's Inlet, on the west. The ceast of North America la very extensive, cixtending In an Irregular the from Davia's Stralt to the lilarida Channel about 4800 miles, and from the latter ulonns the Inland sea to Tchuantepec about 3000. The nhole length on the Paclfic side to Beinring'y Stralt is about 10,000 miles. The extent of the nerth auil nertheast shores cun not probably be less than 3000 nites. The entire extent will thus be 22,800 milles. 'Ihe most remarkable physical characteristles of North America aro lts andy deserts, treeleas steppes, and prairies; the first stretch along the hase of the Rocky Mlountains to the 4 lat degree of north iatitude, iaving an average breadth of 200 to 500 miles. The stepies form another cheerless and extensive region in the northern part of the continent. The prairies or savannas, peculiar characteristies of North America, are chicfly in the Mississipui Valley: They conalst of extensive and generally Irregular tracts without trees, covered in the spring with bright verdure, intermingled with frugrant flowers. A vast extent is also occupited hy forests, comprising probably nat less than 600,000 square miles.

Afountains.-Of these there are four prineipal systems in North America: the Oregon or Locky Monit-alins-a continuation of the Andes-t the Sierra Nevada or Snowy Motntuina of California, mergiug in its passage northward into the coast range, a., ${ }^{\text {b }}$ the Alleghanies ar Appalachian range, extending northeust, paral. lel with the coast. The Rocky Mlountain range is a continuation of the Andes, forming the elevated talile. land passing eentrally through Mexlco; thence tretiting north, divide the waters enteriny the lacilie and Atlantic; Oceans, and continte to the Arelic coast. Several peaks rise above the line of perpetual snows. The Sierra Nevadn of California and coast range ex. tend nearly parallel with the liocky Moontain range, and are connected with the latter by several transverse ritges. The Alleghany range atretches along the castern portion of the continent. It rises in the gently. undulating ridge dividing the waters of the 'Ionnessec from those flowing into the Mississiph and the liulf of Mexico, and trending across the ceuntry in the same gencral direction from southwest to the northeast, terminates In the hea!!!nud of Guspe.

Rivers and Jales.-The principal rivers aro the Mississl $\quad 1 \mathrm{l}$, with lis alluent the Missouri, anl the it. lawrence. The first is the largest river in North America, and one of the greatest on the earth, ocruyyingr, with its trimataries, the whole of tho sonthern portiun of the great central basin of Norlh Anuri a. It hus its origin in the junction of streams formed on the eastern lecllvity of the Racky Mountains, between lat. $42^{\circ}$ and $50^{\circ}$ N., and enters into the sea in the tiulf of Mexico in lat. $29^{\circ} \mathrm{N}$. Its whele course, which is from north to south, is calculated to exreril 14n) miles. I'he St. Lawrence rises under the name of the St. louls, in lat. $47^{\circ} 45^{\prime}$ N., long. $93^{\circ} \mathrm{W}$. ; entering Lake Superior, it lluss a southeast and a northeast course, and enters the Gulf of St. lawrence at Cape Giaspe, where it has expanded to one hundred miles in width. Tho Mackenzie issues from the Great slave Lake, from which it tlows nearly due north, und enters the Arctic Sea, lat. $69^{\circ}$ I0' N. In the nomtier and magnitude of its lakes North America is unequaled. They form one of its most uoted features, sand in conjunction with its rivers present a medium of commercial Intercourse wholly unsurpassed. The principal are Jakes Suırior, Mithiran, Muron, Eric, anl that.

The $t$
rics of
same di
rio, which tegether cover an area of 100,000 square lty of the Alfeghanies. The coal-fields are of prodig. inilea. Holiuwing tae eliain of lakes which crosses the country in a northwestern direction, there occur Lakes Wiunipeg, Woolasten, Deer Lake, Athabasca, Great Slave lake, and Great Bear Lake. 'I'he Great Salt Lake in Utah, and Mono Lake and Lake Chapela in Mexicu. There are, beaidee these, many smaller yet consideraile bedies of water, viz., St. Clair, midway between Lake Iluren and Eirie; the Lake of tha Wooda, between Lakes Superior and Wlnuipeg; Neppissing, Simeoo, Champlalis, and many others of leaser magnitude.

Ishends.-In the Atlantic Ocean the principal aro Newfoundland, Antleostl, Yrince Edward Island, and Caje lireton, all lying at the emleuchure of the St. Lawrence; Nantucket, Long Island; the Bahame Islands, of the coast of the Carellnas; and the Columbian Archifelago, comprising the Iolands of Cuba, IJayti, Jamaieu, Porto Rico, Santa Cruz, Antigua, Gundaloupe, MartIniqne, St. Lucia, Barbadnes, St. Vincent, 'Tobsgo, Trinidad, and other small lalands. On the nurthwest coast the principal are the Californla gronp; Vaniouver, Queen Charlotte, Prince of Wales, Sitka, and Almiraity Islands; and on the extreme northwest the Aleutian group. In the Arctic Oceaut there are a vast number of islandr of which but little is yet known. Geology, Mineralogy, etc.-A remarkable analogy exista in the structure of the land in North Amerlca and Gentral and Northern Eirope. Gneiss, mica, schist, anil granite prevail in white areas In the Alleghnnies, on the Atlantic slope and the northorn latituie of the American continent, and in the high and middle latitudes tho silurian strata extend over 2000 miles. Crystulline and Silurian rocks fortn the aubatratum of Mexico, fur the meat part covered with Plutenic and voleanic formations and secondary limestone. The Rocky Hountains aro mostly silurian, except the castern ridye, which is of strntified crystalline recks, amygdaloid, and nncient volcanic productions. The coast range has the same character, with immense tracts of volcanie rocks, both ancient and modern, especially obsinlian. In North America volcanic action Is entirely conlined to the coast and high land along the Pacitic. The principal minerals are gold, silver, copper, iron, leai, nul coal. The first three are found In greatest abundance in Mexice, where there are nearly 3000 mines of gold and silver alone. Since 18.18 the great fich for gold gathering has leen Callfornia, where large quantitics have been obtained, and both silver and quirksilver have been found to abound. The silver supplied by the Dexican veins is extracted from a grest variety of ninerala, pure or native silver being of comparatively rare occurrence. The principal deposits of goll in the Vilted States besides Californin
ious extent, the Appalachlan stretching without interruption 720 miles, whith a maxlmum breadth of $\mathbf{2 8 0}$, and cicupying an area of 63,000 aquare miles. The IIttsburg seam, ten feet thlck, exposed on the banks of the Monongahela, extends horlzentally 225 mi?ea in length and 100 in lreadth, and covers an area of 14,000 aquare milles. Bealdes the coal-fields named, there are various others of great extent in dlfferent parts of North America, Including New Brunswick, Nova Scotia, and Vanceuver Island. Iron is also extensively worked. Salt la widely diffused throughout the continent.

Climate.-The predominating character of the cli. mate of North America is Intense cold, although in seme parts an oppresalve heat prevails during a portlon of the summer. Above the 50th degree of istltude the cold is so savere as to render the country all but unlnhabltalile, whlle frosts occasionally occur an low down as the 30th degree of latitule. In winter a keen and plercing northwest wind prevails throughout all North Amerlca, adding greatly to the rigor of the northern elimste, and carrying Ita chilling influence into the more southerly regions. The transitions from cold to hot, or from whater to summer, are very sudden, especially in Canala. Among the causes of a lower temperature than oltalna in Western Europe may be mentioned the small portlon of the continent lying in thu terrid zone, the Rocky Mlountain range, and also the Sierra Nevada mountains near the Pacific Occan, prevent the warm winds from :he Pacitic penetrating the interior; the great expansion of the Jand north and northeast, and the alinost level plain In those directions, allow full scope for the plercing Aretic blasts. The nairowness of the Gulf Streain, and the prevailing winds taking the same general course, curry away from this continent the hot circumambient air, a source of warmth to Western Lurope; and the cold polar oceanic current brings down the leehergs of Spitzbergen and Greenland to the shores of Labrador and Newfoundland.
The territorial limits of the United States include that portion of the continent of North America, extending from the Atlantic te the l'acific Ocean, which is bounded hy the British pessessions on the north, and by the Gulf of Mexico and the Mexican Republic on tbe South.

The superficial area of the Union, according to a computatien made liy the Topograplical Bureau at the ciose of 1853 , and subsequently reviewed and amended, amounted on the first of January, 1854, to tro millions nine hundred and thirty-six thousand, cne hundred and sirty-six square miles, being somewhat more than one third of the area of the continent of North Amer. ica.

Anra of Norta Amraioa, exclesife of the West Inmes.

- Accoriling to Jiathis esthnate of the area of North Anerica, Another estimate gives New Britain but $1,800,000$ square miles.
$\dagger$ th'oltoch. The Inte fansdian ccnans gives 242,482 square m!les as the arca over which jorisdictian factually exteaded. t tilitert gives 002, bin kilometres carres, or 371,611 square miles,
\& freculand, from present information, would nppear to tie a tritateral isiand, 1500 mites long and 600 miles th fta grestest bresdth. Ita nrea, therefore, can not be greater than we state above. Guibert gives the area of Danish America 3801 equare milcs, and M'Culloch only 171, meaning onty liat portion which has been explorod.
|f The arca of the continent of North Ainerica in vartonnly estimsted by geogrspbers at from five to seven millons of square miltes, liuyot ("Earth and Man") estimates it st $5,472,000$, and that of Europe at $2,688,000$, exclusively of islands.

The trenty of 1854 with Mexice scitles the henniaries of the two repullics as follows: "Retaining the same dividing-lime between the two Californias as al-
ready defined and estahlished according to the 5th article of the treaty of Guadalupe 1lidalgo, the limits hetween the two Republics shall be as follows: Begin-
ning in the Gaif of Mexieo, three leagues from land, it is frequently very fertile. The natural growth of opposite the mouth of tha Bio Grande, as provided in thas Sth artiele of the treaty of Guadalupe Hidalgo: thence, as deflned in the saill artiele, up the middle of that river to the point where the paraliel of $81^{\circ} \mathbf{4 7}^{\prime}$ nerth latitudo eroses tho aama; thonee due west one hundred milan; thence south to the parillel of $31^{\circ} 20^{\prime}$ north latitude ; thonce along the said paraliol of $81^{\circ}$ $20^{\prime}$ to the 11th meridian of hagitude west of Greenwich; thence in a straight line to a point on the Colorado River, twenty English miles below the Junction of the Gile and Coiorado Bivers ; thonce up the iniddle of the said River Colorado, until it interrects the presout tine between the United States and Mexico."

For early history, ete., of North America, see Newo England SIagazine, vil. 169; Christian Review, xiv. 6t0; North American Review, Ixxili. 210 (F. Howes).
North Carolina lios betwoen $33^{\circ} 50^{\prime}$ and $36^{\circ} 30^{\prime}$ N. Lat., and between $75^{\circ} 45^{\prime}$ and $84^{\circ} \mathrm{W}$. long. from Greenwich, and between $0^{\circ} 20^{\prime} \mathrm{W}$., and $1^{\circ} 33^{\prime} \mathrm{E}$. long. from Washington. Area, 45,500 square miles. P'opulation in 1790, 398,754; in 1800, 478,103; in 1810, 655,500; in 1820, 638,829; in 1830, 788,470; in 1840, 763,419 ; and in $1850,868,903$.
Physical Featuren, etc.-Along the entire coast of this state there is a ridge of eand separated from tho main land in some places by narrow, and in othor places by broad sounds and bays. The passages or iolete through it are shaliow and dangerous, Ocracoke Inlet being the only one through which veasels pass. Capes IIatteras and Lookont are projecting poinie in this belt, and off them, particularly the former, is the most dangerous navigation on the coast of the United Statea. Cape Fear is on an island off the mouth of Cape Fear River. For 60 or 80 miles from tho shore the country is lovel, the streams sluggish, and thero are many awamps and marshes. The soll is sandy and poor, excepting on the margina of the streains, where
this region in moatly the pitch-pina. This tree alford tar, pitch, turpentine, and lumber, whieh constitute an linportant part of the exporta of the State. In the swampe rice of a fine quality in raised. Baek of the Hat country, and extending to tho lower fallis of the rivers, is a beit of land about 40 milloe wide, of a modd erately uneven surface, a sandy soll, and of which the pitch-pina is the prevaling natural growth.

Throughout the State Indian corn is raised, and in some parta considerable cotton. In the low country, grapes, piums, blackberries, and atrawherries grow spontaneously; and on the hintorvales canes grow luxuriantly, the leaves of which continuing green during winter furnish food for cattle. In the elevated country oak, walrut, Ilme, and cherry trees of a large growth abound. Principal minerals coal, iron, and gold, It la the only State in the Union where every article enumerated in the cenaua ia produced.
Ricera.-Tho prineipal rivers aro the Chowsn, 400 milos long, navigable for amall vossela 80 miles ; Joan. oke, Pamlico, navigable for 30 miles ; Tar, Neuse, Cape Foar, the largest river in the State, 280 milies long, with eleven feet of wator to Wilmington; the Yadkin, which forme a part of the Great Pedoe in Sonth Carolina.
The principal places in the State are, Raleigh the caplal, Newbern, Wilmington, Fayettoville, Edenton, Elizabeth City, Beaufort, and Chariotte. On January 1st, 1850, there were three railroads, with 631 miles of track linished and in operation. Exports, 1852, valined at $\mathbf{e} 576,397$. Imports, same year, $\$ 300,488$. Tunnago of the State, 1853, 56,376 tons. The tirst permanent settlement in this State was on the eastern bank of the Chowan River, about 1660, by enigrants, who, in consequence of religious persecution, fled from Nansemond, Virginia. The constitution of the Unitel States was adopted in ec venticn November sezth, 1789. Yeas, 193; nays, 75.
 yrey Oct. 1,1820 , to Jcle t, 1860.

Principal Ports.-Beaufert, at the mouth of Newport River, is famons as poesessing thu finest harbor on the outhern Atlantle sea-hoarl. [t will he the eastern terminue of the Atlantio and Nurth Carolina ra!froad, which, when bullf, will open to its commeree an immense interior region, hitherto isolated from the coast. The impediment in the growth of this place up to this time has been in the want of Internal facilities for commerce. The tonnage of Beanfort, in 1856, was 1991 tons. Wilmington, elty, port of entry, situated on the left bank of Cape Fear River, just below the conliuence of the nort heast and northwest hranchen, alout thirty-five miles from the sea. It is well situated for trade, but the location is accounted unhealihy. The harbor admita vesseis of $\mathbf{3 0 0}$ tons, but the entranco has a dangerous shonl. Opposito the town are two islands, dividing the river into three channels. They affiord the finest rice-ficids in the State. In 1819, two hundred buildings were destroyed by fire, a loss of $\$ 1,000,000$. Tho tonnage in 1856 was 21,420 tons. -Seo Nerth American Rerienc, xxiv. 168; xii. 218 (J. Spainks); American Journal of Srience, xili. a36; Southern Berieer, i. 235 ; De Bow's Reriew, il. 80, 105.
Northweat Passage. The atienpt to discover a northweat passage was mado ly a Porluguese named Cortereal, about a.d. 1500 . It was atiempted by the Euglish to 1553; and the profect was greatiy encouraged hy Queen Elizabeth in 1585, in whleh year a company was associated in Londion, and whe ealled the "Fellowship for tho Discovery of the Northwest Pnssago." From 1745 until 1818, Parllament offered C 20,000 for this discovery. In 1818, the rewnel was moditied ly proposing that $£ 5000$ should to paid when either $110^{\circ}, 120^{\circ}$, or $130^{\circ} \mathrm{W}$. long. should bo passed : one of which payments was mado to Sir E. P'nery. For their Inhors in tho voyages enumerated in the list below, l'arry, Frankiin, Ross, Back, and Richardsen, were knighited. The honor of completing the northwest passago ls due to Captain M'Clure, who sailed in the Inrestigator In compnny with Commodore Colilinsnn In the Enterprise, in search of Sir Jolin Franklin, January 20, 1850. On September 6 he discoveret high land, which he named Baring's Lanul; ou the 9th other land, whith he named after Prince Albert ; on the 30th tho ship was frozen in. Entertaining a strong conviction that the waters in which the Investigntor then lay cemmunientel with Barrow's Siraits, ho set out on October 21 , with a few men in a sledgo, to test his views. On Octoler 26 he reached Point Russel ( ${ }^{\prime} 3^{\circ}$ in' N. lat. $114^{\circ} 14^{\prime} \mathrm{W}$. long.), where from an elevation of 600 feet he naw Parry or Melvitie Sound beneath them. Tho strait connecting the Pacilic and Atlantic Oceans he named after the l'rince of Wales. Tho Incestigator was the first ship which traversed the Polar Sea from Belring's Strnits to Baring Islonil. Intelligence of this diseovery was brought to Engiamd by Commodore Ingiefield, and the admirnity chart was pullished October 14, 1853. Captain M'Chure returned to Sigiand September, 1854. On Juno 19, 1855, a sint commiltee of tho Hiouso of Commons was appointed, on the motion of Mr. W. Mackinnon, to consitler the elaims of M'Clure and his companions. Sir G. Back, Sir James Ross, Sir R. T. Murelison, and Capthins M'Cluro, Keilett, and Collinson, were examined. The report was recelved July 20, in which the committee recommend that $f 0000$ be paid to Captain M'Clure, and $\mathcal{C} 5000$ be distributed hetween the officers and crew.
1553. Sir Ilugh Whlloughbrin expedition to find a northwest phassage to China, ealled from the Thamos, May 20.
1576. Sir Martin Frohliher'h attempt to And a northweat paasnge to China.
1585. Captaln Davia'a expedition to flad a northwent passage. 1594. Barente's expedition.
1602. Weymouth and Kilght's.
1010. Hudwn's voyagen ; the last uadertaken (sec II $u$ dson's Bay.)
1652 SIr Thomas Button's
1610. Mafin'u.-Ste Baghn's Bay.
1631. F'oxa's expedition.
[A number of anterprises undertaken by various cenatries followed.]
1742. MIddiaton'm expedtiton.
1746. Moore's and Smith'a.
1760. Hearne'a land expefition.
1778. Captain Yhippa, afterward lord Mulgrave, his expedttion.

## 1776. Cuptain Cook In the Resolution and Diecovery, July.

1789. Meckenatu's expedition.
1790. Captala Dunoan'a voyage.
1791. The Discovery, Captain Vanconver, returned from a veyage of uurvey and discuvery on the nerthweat conat of America, Septembar 24.
1792. Leoutenant Kotzebne's expedilon, Oetober.
1793. Captain Buchan'a and Lieutenant Franklin'o expedition in the Dorothea and Trent.
1794. Captala Hoss nind Lentenant Parry, In the Isabella and Alexander.
1795. Llentenants Parry and Liddon, In the Ifecla and Griper, May 4.
1796. They return to Ieltb, November 8.
1797. Capinine Parry and Lyon, in tha Fury and Hecia, May 8.
1798. Captain P'arry'a third expedition with the .IEcla, May 8.
1799. Captains Franklin and Lyon, ufter having attempted a tand ex, adition, agaln call frotn Liverpooi, Fub, 10.
1800. Captaln Parry, again in tho Hecta, salla from Deptford, March 25.
1801. And returna, October 0.
1802. Cuptain Ross arrived at Hulf, on hta return from hls arctio expedition, after an ubsence of four years, and when all hope of tise return had been nearly abandoned, vetuber is.
1803. Captoln Back and hia conspaniona arrived at Liverpool from thede peritona Aretic Land Expedition, after having viatted the Great Fish River, and examined Its course to the Polar Seas, september 8.
1804. Captain Back satted from Chatham in oomnand of Hia Majeaty's ahip Terror, on an explortng adveature to Wager ltiver. [Captuta Back, in the month of Docenther, 1835 , was awarded, by the Geographical Soelety, the king'a annual premium for hla polar diacoveries and enterpriae, June 21.]
1805. Dease and Slmps:n traverse the intervening space between the discoveries of Ross and Parry, and eatubliah that there da a northweat passage, Ootober.
1sth. Sir Joha Frankiln and Cuptata Crozler, In the E'rebus and Terror, leave Eingland, May 24.
1806. Captaln Ross returned from an uasuccesaful expedition In mearch of Frankitn.
1807. Another cxpedtion (ona ment out by Lady Franklin) In aearch of Str John Frunklli, conaiating of two vensels, satted from Englord, April-May.
1808. Still wnother, consiating of twe vessels, the Advance und Rescue, therally purchawed for the purpose by Ilenry Grinnelt, a New York merchant, und mannod at Governmeat cost from the Untted Statea navy, uader command of Lleutenant Du Haven, aafled from New York, May.
1809. Commanders Collinson and M'Ciure, in tha Enterprise and Inveatigntor, enited eastward in search of SIr Joln Franklin, Junuary 20.
1810. Northwcst Passage diacovered by M'Clure, October 26. 1853. The second American Arctio Expedition left New York In search of Sir John Frank!In, and for the purposen of science, May 31.
1811. M'Clure returned to England In October, 1854, and ColItnson in May.

Norway, kingdom of (Swed. Nörrige, Ger. Norwegen), a country of Northern Europe, united to the crown of Sweden, and forming the northwestern part of tho Scandinavien peninsula, capital Christiana. It exlends from Cape IIndesnnes, lat. $57^{\circ} 57^{\prime} 8^{\prime \prime}$, to the North Cape, lat. $71^{\circ} 10^{\prime} 3^{\prime \prime}$ N., and betweea iong. $4^{\circ} 50^{\prime}$ and $31^{\circ} 15^{\prime}$ E. The mountains of Norway contain rich minerals ; but, from the difficulty of transport and the want of fuel, mining industry is but little developed. The only mines in operation are those of silver, copper, Iron, cobalt, and chrome. The chief product is iron,
the mines of which are sltuated moatly in the Gulf of Chrietiana; the silver niins of Konsberg is at present one of the richest in Eiurope, and, next to the copper uine of Rorana, the most important in the kingdom.

Manufactures, properly so called, scarcely exlst in Norway. Brandy distilleries and saw-mills are the only extensive branches cf industry; next to these are forges and metal founderles, the produce of which is exported $\ln$ a raw state, except whut is uaed in the manufacture of arms at Königslerg, and in the mannfactures of iron ware and mails. The manufacture of cloth, liaen, and cotton, as well as the prepuration of skins and Jeather, are almost entirely domeatic. The other manufactures comprise those of glass, paper, oil, gullnowder, soap, tobaceo, and sugar refining. The principal forests are In the interior; the timber is felled in antumn and winter, and is conveyed over the snow to the coast. Welland is now the chief market for Norweglan timber. Fish is exported from all the towns wi the west consi, but llergen is the chicf entrepot. The most impertant branchea of this trade are 'Iricd fish and salted herrings. The export of mineral products is lees than might be expected, from the unmber of mines; the priacipsl are iron, copper, and sllver. The chief imports are salt, grahis, and celonial prodnce. Commerce in the interior of the country is grently impeded for want of means of commmalcation; none of the rivers are navigalle except near their months. Good roads exist only betweon the towns of the south coast and the principal valleys in Nordlund and Finmark; the usual communication is by nea. Amon; the numerous islands on the west cuast, there are violent and irregular currents, which render the coast navigation dangerous. Among these is the celebrated Maclstrem, or Moskenas-Strom, the danger front which laan been greatly exaggerated, since it can at nearly all times be passed over even by open bonts. Regular communications have tuccesslvely been establisheri between the principal towns of the coast from Christiann to Hammerfest, and steam vessela ply in the Gulf of Christiana, and on the lakes of Miousen and Tyrifiorl. Norway has a national discount banlr, established $1 \times 17$, which bas the exclusivi right of issuing paree money.

- Laste = two tore.

Owing to the dificulty of tranaport, all the seats of industry, and the only towns, are on the coast, and chictly on the Gulf of Christiana. Ship-bailding is actlvely carried on in the ports. In the Middle Ages, the commerce of Norway consiated exclusively in the exportation of fish, and this is atill the mest limportant article of trade. Next te thls is the export of timber, which was commenced by the Duteh in the sixteenth century; and, lastly, the products of the mines and metal forges. The timber experted annually ameunts to 200,000 lastes, value $1,685,000$ specie dellars.

Norway possesses nearly the same netural advantagea as Sweden. The inhabitants are chiefiy employed in the breeding of horses, sheep, goats, and the reindeer; cultivating small farms, fishing, mining, and such other oceupntions as a country richin its furests and mherals, and enjoylug a favorable position foc commeree, usually atfords. Ilistorians represent the ancient navigation and trade of Norway as being in a highly flourishing condition, especially when its towns, in the twelfth contury, jolned the Ilanseatic Lear;uc. As early as 1217, England concluded a treaty (the tirsi she ever made with a fureign power) witi Norway, stipulating an entire reciprocity of trade between the two countries. Tho trade of Norway has always consisted of the interchange of the produce of her foresis, of her copper and lron mines, and of her tisheries, for such articles as she required from foreign countries. The principal sea-ports are Bergen, Trondheim, Christima, Hammerfest, and its ontport Wardahums. Denmark occupies the tirst rank in the foreign trade of Norway. So much of its trade pasaes through the perts of this country, particularly Altona, that Demmark may he jusily considered the commercial entrepot of Noriray. Its conmercial relatione with nearly all thn countries of Europe are conductcd throught these perts; and it was not until during the recent troubles in the duchies of Demmark that Norway munifested any diaposition to export direct from the producing country. The maritime industry of the Norweglans constitutes the commercind bond which unites them with Denmack. Swe then, on the other hanl, being separated from the nore populons and Industrious divisiona of Norway by mountahous and sterile territories, necessarity confines her commercial relations with the sister hingdom to the sunthern frontier or the const; and, as their principal productions are generally similar, these relptions ary not ausceptiblo of any great develupment.

The llanse Towns have long been the principal entrepits fur the commercial movements of the nurth of Durope. The relations of llamburg with Norwayare, ceen at this day, considerable; but for the pasi few years they have been stationary, with ruther a deireaslug tendency. With Eugland, on the other hand, the trule of Nornay fo becoming more importan ever: year. This is tuainly owing to the liberal conmercial bystem of the former country, under which Nurnay is cuabled to conpete with Irlitish colunlal possessinns, in America, la mapplying the British markets with the varied prol' ctlons of her foreats. Franco anil Ilulland chietly import lito the marketa of Norway culonial 0 : raw produce; but nolthor of thosa conntries hiad, ia Norweglan markets, a pretitable exchange fur their manufuctures: llolland, because she has but fi'w : and lirance, for the ruason that her works of art and taste are tou costly, and perhapa not vory well adapted to ment the wanis of a people whose colil and inhospitable climate, as, well as their maritiure occupatione, would seem to demand the coarser qualities of manufachares. From offlcial documenta recently published, it appars that in $18 t 8$ the population of Norway was $1,2(1),(100)$ souls; their merchant marine combed $8 \cdot 1001$ vessels, measurlng an aggregate of 210,000 tons, and employing 1ti,5\%11 persons as allicers and crews. This would give to Norway one vesacl for every $\mathbf{3 5 2}$ inhaliftants, and | make every seventy-third sulject a mailur. At the

asme perlod, the total merchant marine of France consisted of 14,235 vessela, measuring an aggregate of 670,000 tona.
With the United States the trade of Norway is chlefly indirect. Tobacco and cotton are the principal artlelea of American produce whien enter into the consumption and manufactures of the Norweglans. The restrictlve character of the tariff of Norway, however, like that of her sister kingdom, and the fallacious princlples on which her fiscal and commerelal legislation has been so long maintained, must ever prove an insaperable obstade to the expansion of her foreign trade, and the consequent development of her vast internal resources. Su long as Norway adhores to the now generally obsolete dea that the beat way to raise revenue and relleve the land-owner is to levy high dutles nn al' goods imported into the country, so long will ber relations with furcign countries be limited to the exchange of such articles of necessity an can not be elsewhere procured. The decline whlch her iron trade has experienced during the few years past, both in England and the United States, will necessarily compel the govermment of Swedea and Norway to look for a market in France; and it is unterstood that the latter government is not averse to sucl, amelioration of ber tariff as will open her markis to this grent staple of Sweden and Norway, liy a material reduction of her present seventy per cent, duty on iron. The only equivalent, however, which could satisfy Jrance for so liberal a concession would be a total ehange in the Swedish and Norwegian tariffs, by which hes own manufactures conld enter the ports of the united kingdom, and find a prolitable as well as a ready market. Nor could such a change in any ranner have an infurious effeet upon the manafacturing industry of either of theso countries, as the great demand would be for auch heavy and coarse manufactures as are most needed in so northern a latitude, and which never huve been, and perhaps never wlll bo, successfully manufacturod in Sweden or Norway-at least, to any extent approximating the great consumption of the kingdem. Suek a reault would extend its benefits to other countries 'icaides France; and if, In addition te a remoditication of the Swedlsh and Norwegian tariffs in respect of manufactures, the present exorbitant cent-per-cent. dutles on American tobacco were liberully reduced, the trade between the United States and Sweten and Norway would be materially benefited, and exports and imports, direct between the two countries, largely augmented.

The Norwegian tariff liffers, in many easential particulars, from that of Sweden. Its range is conalderably lower, and, owing to this faet, and to the advantafes resulting from different welghts, it will be found (for instance) that tobacco blades may be imported into Nurway at a rate nearly 88.3 per cent. less than into Sweden. The oppressive system of tietitious zaluation, in practice in the Swedlsh custom-houses, is unknown in the sister kugrlom; and, besldes, greater cousideration is shown to the poorer inhabitants of remote prove inces. At llrodö and Trounsobe, In the northern part of Norway, may articles are admitted at half rates of duty; and at llammerfest and other remote ports the duty is alfogether remitted. This consideration is not shown to the inhubitanta of far-off porinces in Sweden; indeed, in distriets no further off than Dalecarlia many neccsaries of life, which the country can not supply to them, must be purchased, if at all, by the poorer jease antry, with the adillional costs of inlsmi: transportation and the coast navigation of the Gulf of I thias. The tariff now in operation cane in force on Ja: mary 1, 1805 and will expire on the 31at Deeember, 1857. The duties on tobacco have been raiked nearly to the level of those of Swedon. The latier, upon tobacco blades, is still one cent per ponnd higher. The angmentation of the duty on this staple of the United States was, doubtless, designed as an adilitional argument in any negot!ations whieh inight be proprosed by the governinent of

Sweden ant Norway relative to this iron dutics of the United States.
'The following brief summary ia presented oi the new tarifi. It will ghow the duties levied on certain American produce by the old and new Norwegisn tariffs:
Tobacco.-(Stem and blade), raised from 5 to 6 skillings per lb. 'The skilling is nearly equivalent to one cent.
Rice.-Unchanged; namely, 80 skillings per harrel (In husk), or $1 \frac{1}{2}$ skillings per llu., withoat husk or ground.

Cotton.-Raw, unchanged; one-half skilling per pound.

Maize, unground,-Luwered from 72 skillings to 16 skillings per toende (barrel of nearly four lushels).

Maize, ground.-Lowered from 16 skillings to 7 t sklllings jer lispund ( $17 \cdot 6$ lbs. avoirdupois).

IVheat.-Uuchanged; 72 skillings per barrel (toenile).

Flou:-16 skillinga per lispund.
The prineipnl ports of Norway are Christiana, Bergen, and Hunmeriest, or Alten Hammerfas , the chief port of Finmark. Christiana is a tleep s a-port, hav. ing at all seasons from six to seven futhoms depath of water close to the quay. It is the capital of Norway, and has some few fabries of woolen, glass, hardware, soap, leather, cordage, tobacco, ete. The deals of this port have ever been celolirated. Its 'rade lias flourished as far back as 1792, in which year the number of ships arrived was 521 , of which 518 cleared with cargoes of deals. Bergen has a safe and deep harhor closa to the town, lut a pilot is necessary for vessels entering or departing, on account of the numerous rocks. It has a few inanufactories of tobaceo and carthen-w are, several rope-works and distllleries, ship-yards. forges, and other establishments of ordinary handiesaft. Its fisheries, however, are lis chief resource, and its foreign trado is principally contined to Iamburg. Ilamuerfest has an extensive trade, chiefly with England, through the port of IIamburg. Its exports are copper, dried stock-fish, sslted fish, fish-oil, rein-deer skins, buckskins, walrus hides and teeth, feathers, fox and other shins, ete. Fimmark has always enjoyed $n$ high digree of commercial prosjerity. Its revenues execed its expenditures by upward of two millions of doliars. Its chlef wealth depends upon its tisheries, a source of remunerative indusiry that never fails. For centuries back, observes Macgregor, not a aingle example can be given of $n$ total filure. The value of these tisheries may be estimated from the faet thint in five years, ending with $184 \cdot 1$, the produce of cod, seth, and halibut was about 500,000 tons, and 20,000 linrrels of oi!, independently of what was taken by the Russians.

Cuarse cottens nud woolens are well adapted for the markits of Norway, more especinlly of linmark; but the contmereial privileges reserved to Russla, by treaty, have hitherto secured to that power the monopioly of this trade. Her linena, raven'soduck, and variens other manufuetures, nre ulnitted tree into Finmark; while duties, varying from 50 to 100 per cent. on the cost priee, aro Interposed on sinilar manufactures of other forelgn conntries.

Were cot!ons and woolens admittel even at $n$ moderate dinty, Amorienn nud llritish manufactures of that descripion would soou supersede the almost general use of lussian falirics.

The present condition of the trade of Norwny may be grathered from the following summary: Nuviber of vessels from ull conntries entered in 1850,8542 , measuring in the aggregato $1,17,1,501$ tons; of these there wre Norweginn, 5318 vessela, of 881,320 tons. From the linited States there arrived but nine vessels-seven earrying 2654 tons of merehandise, and two beling in ballast-all under the Norweglan flag. The prinelpal comutries of departure of nearly all the others were Enghnd, Ilolland, and Prussia.

Durlag the same yoar, there eleared from Norweglan porta 8479 vessels, weasuring $1,182,132$ tons. Of these
thore were destined for the Unlted States 31 veasels, floating 18,178 tons of merchandise; 30 being under the Norweglan flag, and one being forelgn. From these figures, tt will be seen that there arrived from Norway in the Euited Statea 31 vesaels, carrying 13,178 tons of Norweglan producta, againat nino cleared from the Uulted States for Norway with American producta to the amount of 2654 tons; or a ditference of 22 vessels and 10,524 tons of merchandian againat the United Statea in the direct trade with Norway. Ihe reatrictive tariff regulations of the latter country will readily account for this great lnequality. In 1850 , Norway imported upward of $1,700,000 \mathrm{lbs}$. of cotton. In $185 \%$, the total importation of cotton amounted in value $t$. 1,927,560 franca; viz.: from Great Britain, $1,071,200$ francs, irom the United States, 650,700 francs; from ohler places, 205,660 francs; making a total of $1,927,560$ frnmes, of $8: 266,23640$. In 1850 , there were imported into Norway $3,000,000 \mathrm{lba}$ of tohacco, $8,000,000 \mathrm{lh} 8$. of sugar, $6,500,000 \mathrm{lbs}$ of cotice. During the same yeur the effective merchant marine of Norway consisted of-

Notaries Public. The origin of that class of pablic otherers now called notares public may be traced as far back as the ancient Roman Republic, although their functicns now are ditferent. W. find, at the time of the liepublic, seribe and librarii, wio were pulidic secretario. The private secretaries were called ederptores, and also mearii, if they wero short-hand writers, which servico was frequently performed ly slaves. The public secretaries wero those whom the authorities of state appointel and paid to assist them in their duties of oflice, and they appear to havo corresponded to our present actuaries and secrotaries. It does not appear, however, that legal documents were drawn up by public functionarics resembling our notaries public. During the Empire the pulslic secretaries facreased both in number and importance. They ufpear to have been secretaries working In the cabinct of the Eimperor, In distinct depurtmeats, and they had an overscer, called magister scriniorum. Distinet, however, from these persons ware thom who misy he compared to our present notaries pulnc, and who ware called tabullions. It seems that what even at the present day may le seen in Italian eltios was already customary in the early days of anclent ltome: namely, that in the public market-place, or formm, scribes offered their serviees to persous who wauted to have letters written or tocuments drawn of,

This class of persons were called tabeliunues firenses, or persone publice. They occupied themselves with drawiag up legul instruacints and documents, and other writhugs (likelli) or statements, to lee preanted to the courts of law, or otheranthorities of state. It ajpears, from a "constitution" of Dioclethan, that a tarift of fees was established for them. The number of tohellionca constantly increasel They then furmed them-
selves into a guild or corporation (schola), under a prealding otheer callad primicerius. The state author:ties began, more and more, to exerclse surveillanco over them, which even went oo far that the magiatrates dotermined whether a pet zon ahould be admitted into, or an unworthy person be removed from, thls guild of tabelliones. 'Thesa persons prepared all kinds of legal documents and papera, but they atlll carried on their business in tho public market-place. It was soon foumd necessary, for judlelal purposes, to define by law what should be the requialies of such notarial acts and writings to make them legal evilenee. It had hecome a usage, in important matters, to have witnesses also attest the papers drawu up by these public seribes or $1 n-$ belliones, and it was finally required by law that three witnesses should attest a docnment, In case the principals cond write, and tre witnesses If the parties could not write. It was, moreover, repuired that the notary (tabelio) should be prosent in person at the drawing up of the document, and also bfix hls slgnature and the date of execution.

Iuring the Empire another class of officers, called tabulurii, came up in the eltles. Thelr functions resemDled somewhat our archivarles and anditors. They also made out certain clocuments, and these bore sometimes the names both on a tabellio and a tabulurius; but at a later period both names aro used as syonymons. Under the Trankish kluga Roman institutions were imitated. In the imperial bureanx the emperers needed and employed persons for drawin, "\% ments and conuteraigning them. Whese rilicets ese enlled referendarii, concelurrii, and notarii. The chief of these oflieers was ealled nrehinuturius or summus noturius, but at a later period cancellarius, as a more honorable tille. The Frankish kings, as early as the year 80:i, appointed these officers, and imsued laws to pre$v$ vut the abuse of their power. It became later the solu prerogative of the kings to appoint these netnrics, but by degrees the l'opes of Rome also assumr same right ; and we find in documents notaries i. I who were appointed by princes and blshops, and even by clolsters. The legal powers of notaries during the Middle Ages, and their couditlon as a distiuct class of otheers, are distinctly seen In the Italiun cities. They aeted either by authorlty of the Emperor or that of the l'ope, and were engaged for drawing fill the various logal ilocuments, and especially last wills and testaments, whidh were received in all the courts of law as full proof. They were formed Into a guild, called rolleginm, and had their own prefecte, called consules. A candidate for admission into this college had to undergo an examlation. Minute and strict rules for the drawing up of Instrumente, and their attestation, were preseribed. The stuity of notarial finctions was reduced to rules, aud notarial sehools were established in many cities.

Notaries came to be regaried at an early peried as a kind of judges (judex chartularius), nul $n$ jractice uraw up ainong them of inserting in tonds, or ather documents of indelitedness, a power for the creditur of taking out execution, hy application to the court, in case of non-fultillment of the contract, whid laid the fommation of the so-called "executory promess," which prevails still in the Civil Jaw countrles, and which corresponda somewlat to the warrant of altoracy to confess juilgment in the İnglish law. Wo shalli see that the forelgn law on bills of exchange on the Continent of liurope gives this right of "rxecutery process" to the craditor of these mercantile lustriments, and thus strengthens the security of the ereditor.

France.--In Frmee the notaries have always jlaved an infortant part in her jutieial lnstitutions, an I they do so still. The king regarded it as his prorogetive to appoint them, but the popes also arregated this power, and the lords of provinces (spigneura) nssumed it likewise. They were regarild there as juge ordinaire, and inserted In their documents thia esectory fower or
summary execution (execution parde). The basis of the present rights and dutles of notarles in France was jaid by the law of 1791 , which recognized no longer any royal notaries, but ouly notaries pablic, appointed by the gencral government. The law of the cleventh year of the Republic recognized them as publio officers, appointed for the purpose of drawing up all papere and contracts which, elther according to express laws or the will of parties, are to have the effect of public documents, and of fixing the dates thereof, of holding in safe-keeping thase acts, and of naking out coples of them for the uee of the parties concerned. All docnments inado out in the presence of two notaries, or of one notary and two witnesses, and attested by them, recoive full credence in all the courts of law, and are executory throughout the land. The original (minute) of the act remains in the hands of tho notary, and copies are allowed to be given only to the interested parti, ', unless specially empowered by the courts. The law points out many cases in which the presence of a notary nnd his attestation of instruments are essentinl; e. g., with testaments, donations, marriage contracts, protests, etc. In most cases it is left to tho choice of parties to employ a notary in the making out of instrunents and documents. Bit the courts often appoint them, to undertako the part of mediatorin come judicial proceedings; for instance, in cases of divorce, or in making out inventories, or in dividing and distributing property and estates, or in taking and moking up accounts, like the Masters in Chancery in linglish law. Tho notaries are appointed for life, and can be removed only by a judleial decision. By their official position they become the advisers in families and the cosfictants of them. They become the mediators in disputes between tho parties, and particularly in regulating and settling estates, and in the distribution of property.

The Jaw of the seventh year of the Republie requires that all acts and documents made ont by notarios be registered within ten days, the fees for which aro very ligh. Hence it otten happens that the notary must advance the unoney for the registration, and this obliges lim to have sums of money always at his disposal. Thus notaries havo gradually come to deal in money affairs in general, by louning and investing money, and procuring money for borrowers. lience it is that persons of property lutrust their money and property to the hands of notarics, as being the ilttest persons to invest It safely and udvantugeously. The great influence which they thereby must acquire in familif 3 and in all classes of society is manifest; and this great power could not hat leud to great abuses. An ordinance of 1843 prohilited notaries, under hoavy penalties, from entering into stock speculations, from acting as moneybrokers, trom investing money intrusted to them in their own names, etc. 'I'ho regnisites for hecoming in notary in liranee are, that the cundidate be a French citizen, twenty-hve years of ago, and that he has served as clerk with a notary for six years. But no man without property cin oxpect to obtain a place as notury, because he is obliged to buy, often for an enormous price (which in l'arls often amounts to from 200,000 to 300,000 france, in smaller towns to 100,000 francs, and in wnall commones to 10,000 franes), from a notary who is ahout to retire, or from the heirs of a deceased motary, a study- loom or othico (itude), with the acts and docmants belonging to it; for without such an oflice the mere appoistment of notary is of litto value. There are niso estublished by law in France notarial chambers, which consist of a number of deputies, chosen liy the notaries, who regulate the discipline among them, decide on the admisalon of canclidates, atjust disputes which may arise among themselves, and hear and decide on the complaints of third porsons against noturies, and the punishments of delinquont notaries.
Italy.-In Italy tho Jronch aystem of noliries has
been followed in Ita main features. In Germany, however, the notaries occupy but a subordinate position in most states, and it has been now almost generally established by lav that only persons who have st died law for severe'. years can be appointed as notaries.
England.-In England, notaries were known as public officers before the Norman Conquest, and at a very early period thoy were employed to attest and authenticate instruments of moment and solemulty. But whatever their duties and functions may have been in former times, at present they aro described to be, by Richard Brooke, in his treatise on the office of a notary public of Eingland, as follows: "In Englnnd a notary is a public officer of tho clivil and canen law, who derives his faculty or authority to practice from tho Court of Facuities of the Archbishop of Canterbury, in London, the chlef officer of which is the Master of tho Faculties, to whom applications are made for the admission, or removal under any special circumatances, of notaries. In the Institutes of the Laws of England the Court of Faculties is stated to be 'a court, although it holdeth no plea of controversic (like the Court of Audience next before). It belongeth to the archbishop, and his officer is called Magister ad Facultates.'" The functions and pewers of a notary in England are, to draw and prepare deeds relating to real and personal property, to note and protest bills of exchange, to prepare acts of honor, to authenticate and certify examined copies of documents, to prepare and attest instruments golng nbroad, to recelve the affidavits or deelarations of mariners and masters of ships, and to draw up their protests, and to solennize all other notarial acts. "The expression notarial act," says Mr. Brooke, "is one which has a technical meaning, and it seems generally considered to signify the act of authenticating or certifying some document or circumstance by a written instrument, under the signature and official senl of a notary, or of authenticating or certifying as a notary some fact or circumstance by a written instrument, under his siguature only." The English notaries havo always considered themselves entitled to nclminister oaths, affidavits, and affirmations, as within the powers and functions of a notary; and the net of 5th and 6th William IV. has placed it beyond dispute. The requisitions for admission to the Faculty of Notaries in England are, an apprenticeship or clerkship of five years with a notary, a certlificate from two notaries certlfying to the candidate's skill und problty, and that he is a proper person to liecome a notury. Upon due proof of these facts, the Master of Faculties will admit lijm upon his taking the prescribed oaths, which are the cath of allegiance, the oath of supremacy, the oath of due scrvico under the articles of clerkship and for the faithful exerelse of the oflico of notary. A notary is llable to he s! ruck oif the Roll of Faculties for any malpractice or misconduct in hils office, on a complaiut made to the Master of the Fueultles, and supported by allidavit or other proof.

United Stater.-In the Énited States the duties aud functions of notaries resemble those of the same offleers in lingland. 'They are appolnted by the respective governors of the States for a limited number of years, or durlng good hehavior, and derive their powers by the statute laws of the States; und in eases where theso lnws do not specify their powers - as, for instance, in Massachusetts-lt inust be presumed that all the powers whieh, by general usage, the custom of merchants, and law of nations are generally exercised by these officers, are also vested is them. Wo may state their general and enstomary functions to be, to demand acceptance and payment of foreign and inland bills of exchange and promissory notes, and to protest tho sa:ne for non-acceptance and non-payment; to note und draw up alip proteats, and all other protesta which ure customary accoriling to the usage of merchants; and to exerclise such other powers and ilutles as by the law of nations, and according to commercial usage, or
by the laws of eny other atate, government, or country, may be performed by notariea public. But although notaries publie are generally consldered as accredited oflicers in other countrles, and affidavits aworn before and instruments authenticatel by them are reeeived in evidence in foreign courto, it is required by foreign courts that the consuls of the respectivo foreign states in which the document is to be used certify to the fact that tho person whose algnatura and senl aro affixed is a notury public duly appointed. This is, however, not necessary in a proteat for the non-acceptance or non-payment of a bill of exchange. The laws of the ditierent Statea of the Uuion, in some instances, give some peculiar powers to their notaries, and bence the taws of each State must be consulted in regard to them. The principal functions of an American notary are, to protest bills of exchange and promlssory notes on their being dishonored, and, ua a part of this function, to present and demnnd payment of these mercantile instruments. Although the notaries with us generally give notice of the dishonor of bills and notes to antecedent parties, it is not their duty to do so, unless made ao by statute, or they undertake so to do as a part of their duty; and then they aro liable for any negligence in the discharge of this duty.-Sce Manual for Noturies, 8vo. pp. 2:0, New York, 1857.

Notes, Promissory. See Bankino und Banks.
Nova Scotia (l'r. . I culia), a British proviuce, forming a peninsulit, connected with the main land by an Isthmus only 8 uiles broud, having the Ihy of Fuudy on the one side, and Northumberland struit on the other. It hies, inclnding Cape Ireton Island, between lat. $43^{\circ} 25^{\prime}$ and $46^{\circ}$ N., ant long. $59^{\circ} 45^{\prime}$ and $66^{\circ} 30^{\prime}$ W., and is bounded north by Northumberland Strait, which separates it from l'rince Edwarl Island, northenst by the Gut of Causean, towiag between it and the island of C'ape Breton (which forms a part of the government of Nova Scotiu), south and southeast by the Atlantle Ocean, weat by the Bay of Fundy, and nortlwest hy New IIrunswick. Area, 18,746 stuare milhes.

Its southeast coast is remarkable for the number and capracity of its hurbors, there leing no fewer than twelve ports capalile of recoiving ships of the line, and fourteen of sulficient dupih fur merehantmen, between IlalIfax ard Cupe Cansean, a elistance of not more than 110) miles. The surfuce of Nova Scotha seldom rises to a height exceeding 600 feet above the level of the sea. A idigu of high land extends through the peninsula in a darection cast to west, and, with less prominent hills and undulations, fives a pleasing variety to the seenery. The principal rivers of the province are the Anuspolis and shubenecadie; the latter rises in Grathl Lake, IIalifax Ceunty, and, after a rapid and circuitous course of over 80 miles, enters Coleepuid Hay; by means of a canal this river forma a navigable coamunieation from IIalifax harbor to the Bay of Fundy. It is navigable for some clistance. The rise and fall of the tide at the mouth is about 50 feet. The AnnapoIfs, after a course of 75 miles, In which it recoives the usters of Moose and Bear rivers, enters Annapolis Bay. It is uavicuble for large vessels 20 mileq above Aunapol:.. At l'icton, the East, West, aud Middle rivers, all three navigable for large vessels, euter the harbor. The Avon recelves the waters of the St. Croix, Kennetcook, and several others, and empties Itself into the llay of Mines ; it is navigatle to Whndsor. The La Have, Mersey, and Medway; the Shelhurne (which forms the fine harbor of that name); (l:a Clyde, one of the most beautiful streams of Nova Scotla; the Tusket and its mumeronn tributaries ; the St. Mary, which, at Its embonchure, forms the fine harbor of St. Mary ; the Maccav, Nappao, and Giaspereau; the Muequedeboit, Sale, and lordan ; these form but a fow of nnnierous atreams of Nova Scotin. The tide rises with agtonishing rapidity in the llay of Mines to the height of $\overline{55}$ foet, while on the south shore and in the Gulf of St. Lawrence It dues not rise more than 6 feet. There
are but few large lakes; the largest is Lake Rosignol, about 30 miles iu length; Lake George is another shect of water of considerablesize, and the entire peainsula is dotted over with innumerable small lakes. The minea and minerala of Nova Scotia, though but imperfectly explored, aro known to bo valuable. Giranite, trap, and clay-alate rocks predomlate. The most abundent variety la the gray granie, which prevalls along the shore, and is woll adapted for inill-stonos. Clay slate, of tine quality, is of extensive formation In the eastern section of the provlnce, and graywacke alate along beth shores of Chedahucto Bay, Several extenalve and Leautiful grottoes are to be found on different parts of the const; and grindatonea of superior quallity are obtuined from a stratum of sandstone, found between the coal and limestone. Coal, and iron in comblnation with it, abounds in many places. Copper ore alao exists, but the attempts to work it have been hitherto unsuceessful; gypsum is plentiful, anl furmishes an active sad protitable trade. Tho soils of Nova Scotia aro various; along the south ahore the granite forms the basis, extendling in many places 20 miles into the interior. This region is the least fertile, but there are elsewhere extensivo alluvial tracts producing the most abundant crops. Mlany tine fertile districts, also, are met with on the north coast, along the banks of rivers and the heads of bays. Tho climate of Nova Scotia is affected by its almost insular position, and is characterized ly a remarkable salubrity. The aprings are tedious, but the summer heats beling for a brief season exeessive, vegetation is singularly rapid, and the autumn is de. lightful. Tho therumeter rangen from $18^{\circ}$ to $70^{\circ}$. It is estimated that about $7,000,000$ acres are still corered with primeval forests. There were in this provinee in 1851, 40,1012 acres of diked land, and 790,310 aeres of other hmproved land.

Live Stock.- Horses, 28,789; neat cattle, 154,857; milch cown, 86,856 ; shee $1,282,180$; awine, $51,5: 3$.

Agricultural I'rolucts, etc.-Wheat, 297,157 bushels produced; rye, 61,438 ; Indian corn, 37,175 ; onts, $1,1384,437$; peas and beans, 21,638 ; barley, $4: 46,037$; buckwheat, 170,$310 ;$ potatoes, $1,986,789$; pounds of butter made, $3,613,890$; of cheese, 652,069; of maple sughr, 110,441 ; hay, 287,837 tons made; grass seetls, 3ow bushels; and were made 80,976 gallons of malt and disthlled liguors. Nova Scotia, however, dees not yet supply ber population with bread, cven ingood ceusons; large importations of tine flour being yearly made from the United States. The apple orchards of the westeru ceunties are very productive. Apples and cider are annually exportesl, and the domentic supply is cheap and abundant. Cattle and sheep are raised in considerable numbers, and are exported both to lice Itrumswick and Newfoundland; but the breeds aro inferior, and little attention is pald to their improvement. Tho cod abd haddock tisheries are actively prosecuted all along the south coast. Mackerel and herrings ure also taken in great quantities; but the salmon tishing has greatly fallen off, from the erection of grist and saw mills on thos atreams. The tisheries employed, in I 411,812 vessela, with an aggregate of $4: 3,133$ tons, manned by 3681 mea, and 5161 tonts, manneth liy fitis men; the eateh amounted to $166^{\circ}$ harrels of salmon, 1531 of sharl, 100,017 of mackerel, $6: 1,200$ of herriags, and 518 lonrrels of alowives; tutal value of fisheries, © 217,220 ; and there were manutactured I $89,2 \mathrm{zin}$ lurrele of tishooil, valued at $£ 16,76 \mathrm{i}$. Several attempts hure been made to prosecuto tho whale any suat fist"rien, but hitherto whith no great success. The manufactures of Nova Scotia are yet but very limited. Coarse cloths, called "homespums," sre made, and are generally worn by tho farmers, tishermen, ete. Thero were in this provinco, in 1851,81 woolen fuctorien, cmployling 114 pernous, and 11,096 hand-looms, producing 119, bies yards of fulled cluth, $\mathbf{7} 90,101$ yards not fulled,
 founderles, cuploying $13 \times$ persons, making cattinga, cte.,

- Roaignol, 10ther sheet peninaula is The minea Imperfectly anite, trap, st abundant $s$ along the Clay slate, the castern 3 along both ve and Leare paris of the are oltained ten the coal tion with it e exists, but 0 unsucecssactive and are various; to lasis, ex the interior. re elsewhere 18t abundant re met with vers and the ia is sffected acterized ly tedious, but m excerssive, utumm is de$18^{\circ}$ to $70^{\circ}$. are still corin this provand 79,810
to the amount of $£ 8121$; $\mathbf{8 0 8}$ grist-milla, 1153 saw-millls, 237 tannerics, and 10 factoriea moved by ateam power. Cash value of agricultural iniplaments manufactured, ill,640.

The houses of Nova Scotia are moatly constructed of cimber, excepting in Hallíax and the larger towns, where sorne good stona and brick houses are th be seen; yet stone for buildiog abounds in the province -_rranite of the fineat quallty on the aouth coast, freestunc oll along the north shore; and excellent slate in the central region.

The foreign trade of Nova Scotia was very limfted previous to 1824 ; since that period It has oxtended to the Baltic, Mediterranean, China, Mauritius, East Indies, the Drazils, and tho Havana. The total amount of importa at IIalifax and the outports, in 1852, was $\$ 5,309,894$, of which $\$ 1,445,043$ were from the United States. The exports durhig the same period ausountelt to $\$ 3,925,227$, of which $\$ 941,607$ were to the United States. Of these the princlpal artlclea were-mackerel, valued at $\$ 280,145$; salmon, $\$ 30,080$; other fish, dry sul pickled, $\$ 218,693$; skins and fura, $\$ 8165$; molasses, $\$ 4625$; potatoes, $\$ 4162$; sugar, $\$ 3000$; cordwood, 833,990 ; zoals, l'letou, $\$ 1$ lol,215; coala, Sldney, $\$ 3,983$; fypsum, $\$ 32,823$; frecatone and grindatones, 84500 ; oil, lith, $\$ 18,915$. The number of vessels that enterel and cleared during the year were, 72 to Great 13ritain; 1757 to Brltish colonies; 11,429 to the United States; other countries, $\mathbf{1 5 8}$. Total tonnage, $\mathbf{3 8 3 , 4 0 0}$ tons.

The population of Nova Scotia is now chiefly compesed of the descendants of the English, Irish, and the Seotch. The western and midland counties are principally occupied by the dezcenelants of the loyalists, mostly of Einglish extraction. The county of Limenlurgh is inhabited by a race sprung from a body of Germsn and Swisa I'rotestants whe emigrated from Rotterdam in 1753. There aro also aeveral aettlements of French Acadians. The [ndinns are still a diatinet people, but there are only a few hundreds of them left in the provioce.

The following statement exhibits the deacription and volue of imports and exports to and from the United States and Nova Scotla, cluring the yeara 1852 anl 1853 , respectively. For the convenience of enlculation the $\mathbf{£}$ is e timated at

Imputs frem Nora Scotia, 18052.-Coal, fish, gypsum, lamber and plank, ataves, spars, etc., wood aul bark, potatoes, turnips, miscellancous. I'otal value, $\$ 1,280,246$.

Ejports to Nora Scotia.-Beef, pork, hooks and atationery; breat and biscuit, burning tluid, corn, corn meal, cotton manufaetures, drugs and medicines, flour (of rye and whent), hardware, rice, tobarco, wheat, miscellancous. Totul value, $1,739,216$. Showing a balanes in faver of the United States of $\$ 449,970$.
Inports from Nova Scotia, 18is.-L'rinelpal articles the sume ns in 1852 . Total value, $\$ 1,389,731$.
Expents to Nioras Scotia.-l'rincipal articles tho anme as for 1852. Total value, $\$ 2,079,516$.

The preceling taliles exhibit the course of trade between the linited States and Nova Scotia during the perions indicated. Tho following are introlneed to show the propertionate value of supplies furnished to that province ly the United states, compared with the value of imports from the mo her country, from 1849 to 1803 , hoth years inelusive

| Vears. | Creat Oritala. |  | Thited states. |  |
| :---: | :---: | :---: | :---: | :---: |
|  | li. perts from. | Exports ta. | Imy arts (rust, | Exports 10. |
| 18.9 | \$1.481,06\% | \$260,785 | \$1,761.785 | \$ 404.425 |
| 180 | 1,5922,020 | 262,045 | 1,612,5i5 | 089.165 |
| $1 \times 51$ | 2,138,485 | 142,245 | 1,990,46\% | 736425 |
| 1502 | 2,147, 261 | 813.360 | 1,739,2.0 | 1,243,250 |
| 1853 | 2,358,240 | 6t1, 130 | 2,079,517 | 1,359,7.3 |
| Total. | \$10,016,5.1 | \$1,4 4,015 | \$88,657, 102 | \$5,297, 94 |

A glance at the preceding tablea wlll suggeat the inferences which they are deslgned to corvey.

In reference to the coal trade of Nova Scotia, Conaul General Andrewa, in his report on the "Trade and Commerce of the Britlah North American Colonies," says: "The princlpal exportation of coals from Nova Scotia and Cape Breton is to porta in Maseachuaetta and Rhode Ieland, with a small quantlity to New York. Many Amerlcas vesaeis In thia trade, eapecially alnce the change in the navigation lawa, obtain frelghts for Nova Scotla, Nawfoundiand, the French Island of St. Peter, Prince Edward's Ialsud; and tho New Brunswick porta on the Gulf of St. Lawrence, and lead with coal as their raturn cargo. One hundred chaldrona of coal, I'jeton meaaure, are equal to 120 chaldrons, lioston measure. The nsual freight from Pleton to Boston is 8275 per chaldron, Boston measure. To this must be added insurance, 2 per cent., and commission, $2 \frac{1}{2}$ per cent. Anthraelte coal does not exlst in any of tho colonies; and they bld falr to become conauwers of Pennsylvania anthraeite, the importation of which has already commenced to aome extent $\ln$ New Brunswick for ateamboats and founderica. Under liberal arraugements on both sidea, the conammption of anthracite coal would greatly Increase in the colonies, and even in Nova Scotia, it being for many purposes better fitted and more economical than the bitumlaous coal of that colony."

Cord or firewood is largely exported from the porta along the coast to the United Statea, at a cost last year of $\$ 2$ per cord. Thia year nons has been shipped for less than 8250 , and latterly $\$ 3$ per cord ; retail price at Halliax, 1853, $\% 50$ to $\$ 360 ; 1854, \$ 4$ to $\$ 450$. Wood knees for ship-building have been shipped in somo quantities at 82 each for sizes averaging eight inches, and a reduction of 20 cents for each inch under: and a like addition for each inch over, the average. Snwed lumber, in small quantities, has been shipped, bnt none prior to 30th Jane, 185.4. Many cargoes of potatoes were shipped from the western ports, costing frow 40 to 60 cents $\mathfrak{p}$ er bushel.

Insursnce during the year to ports from Virginia to Maine averago one per cent. ; R half per cent. additional is charged in the winter montha to Pennsylvania and farther south. Freights to perts from Maine to Virginla range from 25 to 50 cents per barrel. A commisslon of $2 \frac{1}{2}$ per cent. is usually charged.

The usual mode of selling ls by private contract on terms generally of three montha' credit; sometlmea a longer credit is allowed; cash psyments only when specially provided for. Public anction is a favorite mode at this port. Brekers are sometimes used, but it Is ar excoption to the usual mode.

The par of exchange is $4 \%$ per cent. ; the Mexican and Spanizh dollar leing corrent by an act of the provinclal Legislature (ehapter 83 Revised Statutea), at 6s. $2 \frac{1}{2} d$, or $\$ 14$ each. The rate of exchange with the United States during the year rangea from 2 to $8 \frac{1}{2}$ per cent. There are no internal taxes.

Kemuncration for personal services in commerce and trate ranges from $\mathcal{L} 40$ to $£ 150$ per annmm. Mechanics, say house carpenters, joiners, etc., from July 1, 1853, to June 1, 1854, nlnety cents to a dollar per day; after dune 1,1854 , they received $\$ 150$ a day. Shipwrights, to December 1, 1853, $\$ 150$; from December 1, 1853, to 1st July, 1854, $\$ 175$ to $\$ 2$ per day, Day laberers, up to dune 1, 1851 , viere paid 60 , and sometimes 70 ecuta n day. Since the 1st June, 185J, they have rucrived \$1 a day.-See North American Reriew, xlx, 127 (J. Sraltks), xxx. 121 (C. W. Nova Zembla (properly Novaia Zemlia, "new laml'), un insular reglon In the Arctic Ocean, considered to be compriaed in liurope, and dependent on the liussian govermment of Archangel, between lat. $70^{\circ}$ 30 and $76^{\circ} .10^{\circ}$ N., and long. $59^{\circ}$ and $66^{\circ}$ E. Length es-

## NUT

timated at 470 miles, and average breadth at 56 miles. It consiats of two islands, eeparated by the channel Matotshkin-shar. Surface on the western side rises generally to 2000 feet, and in some places to from 3200 to 8500 feet above the sea; but the eastern shores are comparatively low and barren. Black clay-slate and IImestone are the principal constituent rocks, as In the Urul chaln, of which Nova Zembla may be conaldered an insular continuation. Its conets are frequented by walrus hunters in aummer, bat nowhere permanently inhablted. Subterranean stone tabyrinthe of great antiquity have been discoverod here.

Nut, or EIasel-nut (Germ, Haselnusse ; Fr. Noisettes, A relines; It. Naccinole, Arelans; Sp. A vellanas; Port. Avellias; Lat. A cellanat, the fruit of difierent species of Coryli, or hazels. The kernels have a mild, farinaceous, oily taste, agreeable to most palates. A kind of checoiate has leen prepared from them; and they have sometimes been made into bread. The expressed oil of hazel-nuts ls littie inferior to that of almonds. Besides those raised at home, we Import nuts from ditferent parts of France, Portugal, and Spain, but principally from the latter. The Spanish nuts in the highest estimation, though sold under the name of Barcelona nuts, are nol really shlpped at that clty, but at Tarragona, a little more to the sonth. Mr. Inglis says that the annual average export of nuts from Tarragona is from 25,000 to 30,000 bags, of four to the ton.

Nuts (Ground) (Arachis hypogrea), known in French commerce as "arachides," in America as peanuts, and in Africa as Dfandulim, the frult of a papllionaceous plant, rising to the height of about 15 luches, being very like the field pea, with yeliow flowers. The branches, after flowering, bend down till they touch the ground, into which they work themselves, and upon them grow the pods that contain the nuts. When the nuts are rije the plant dies. It ls then pulied up, and the nuta which adhere to the twigs are collected. The pods, which aro of an elongated ligure, atwout three quarters of an inch in length, snd half an inch in circumforence, and brittic, usually contain two nnts, but sometimes only one, and very rarely three. They are elliptical at one end and flattened at the other. Ground-nuts are grown in light, sancly soila in most troplcal countrics. Thuy have been used ns food from time immemorlal in Africa, Indle, Brazil, and other parts both of South and North America. The best are raised on the banks of the Hiver Gambia, where they are extensively grown in large fields, the ground belng jrepared for their reception by the natives after the rude fashion of the country. The plant is very prolific; it is also sald to be highly exhaustive of the soil, though this is perhaps questionable. Ground-nute yield large quantities of oil; and with. in the last 20 years they have begun to be grow'n in Africa as an articie of commerce, and are now largely exported for crushing. A mill for expressing oil from thein was constructed in London lin 1885. But the French Government having a few years after imposed high duties on mont descriptions of oil seede, the oilcrushers of Marseilles and other towns endeavored to find out seeds not included in the tariff; or less heavily taxed than the others. They were thus led to import aruchides or ground-nuts, which they found to answer extremely well. France has, in consequence, become the great market for this peculiar product. The exports from the Ganbia, which in 1835 did not exceed 47 tons, had increased in 1851 to not less than about 12,900 toas. Of this quantity about 800 tons went to the United States (where they are eaten at dessert, roasted, as are chestunt elsewhere), 700 tous to Engiand, and the rest to France, prinipally to Marseilles. The total inports of arachides Juto F'rance in 1851 amounted, according to the oflicial returns, to $16,472,562$ kllogrammen, or 16,180 tons.

Nuts are ulso exported from the Rio Grando, the

Rio Nonez, and from Slerra Leone, and the adjoining rivers. And though there are no accounts of the exaet quantities sent from each, it is belleved that thelr aggregate amount is fully equal to the exporta from the Gambia. Within the last three or four years conshlerable quantlties have been silpped froin the Senegal River. 'The oll expressed from the nute differs in quality and price aceording to the care wlth which it is refined. That made in London, which is equal to fine olive oil, sold. in 1858, at from $\mathbf{f} \mathbf{6 0}$ to $\mathbf{\Sigma 6 2}$ a ton. In Franco the oll is principally used in the manufacture of soap; and bolng inferior to the sormer, is only worth from e4s to \&48 a ton. Besides leing used for the like purposes as other oll in food, In the woolen manufacture, and in lamps, the oll or ground-nute is sald to be especially well fittod for lubricating heary machinery, Including the locomotive onglnes on rallways. The Belplans use it for this latter purpose in preference to all other oils. Ground-nute are worth at present (September, 1853) from 389 francs to 890 francs per 1000 kilogrammes ( n ton) in Marselles; $£ 13$ 15s. a ton in London; and from $\dot{£} 9$ to $\boldsymbol{£ 1 0}$ a ton delivered to a French ship in the Gambia. Slerra Leone nute bring from $£ 1$ to $£ 2$ less than those from the Gambla.
Nutmeg (Ger. Muskatennüese; Du. Muskaït; Fr. Muscades, Nuix muscudes; It. Noce muscata; Sp. Mos. cada; Aralı, Jowalteib; Sans. Jitiphaln; Malay, Buahpala), the fruit of the genuine nutineg-tree (ifyristica Moschata), a nutive of the Moluceas, lut which has been transplanted to Sumatra, Penang, etc. An Inferiur and long-shaped nutmeg is cotnmon in Borneo; but the fruit nowhere attains to the same perfection as in the Molucens. if the several varicties of the tree, that denominated tho Queen Nutineg, which bears a small, round fruit, is the best. The kernel, or proper nutineg, is of a roundish oval form, marked on the outside with many vermicular furrows, within of a fleshy, farinaceous substance, varlegated whitish and hay., Nutmegs are frequently punctured and boiled, in order to obtain the cescutial oll, the orifice being afterward closed: but the frand is casily detected by the lightness of the nutineg.-Ticomsos's Ihispensatory; Aiss1.1E's Materia Indica. Nutmegs should the chosen large, round, heavy, and firm, of a lightish gray color on the outside, and the inside beautifuliy marbied, of a strong frogrant smell, warm aromatic taste, ami a ftat, oily booly. They are very anbject to he wormcaten. The best manner of packing them is in dry chunam. The oblong kind, and the smaller oues, ahouid be rejected. 15 cwt . are allowed to a ton.Malavis's (hrient. Com. The dried produce of a nut-ineg-tree consists of nutmeg, mace (which sce), and shell. Supposing the whole produce to be divited lnto 100 parts, thero are 13 f of mace, 33 f of shell, and 53 f of nutmeg. In the ancient commerce, and down to tho establishment of the Dutch monopoly, nutmegs wero always sold and exported in the shelf. The natives, whenever tho commerce is left to their nanagement, continne the pactlce, which la strongly recommended ly Mr. Crawfurd.-Eiastern Archipelago, vol. ili. p. $3 \pm 6$.

Tho jealous policy of tho Dutch has reduced the trade in nutmegs to a mere trifle, compared to what it would otherwise have been. They have, in on far at lenst as it was possible, exerted themselves to exterminate the nutmeg plants every where except in Hands. The aboriginal Inhalitants of this Island have heen ex. patriated, and the land parceled amony sellers from Holland, under the name of purk-kefpers. These persons have about 2000 slaves, who cultlsate and prepare the nutmegs. The prices peid liy the cultivator are all fixed by Government; and it deserves to be mertloned, as affording one of the most striking fllastrations of the rulnous elfeets ef monopoly, that tho fixed price which the Government is now obllged to pay for notinegs is five times greater than the price at which they bought them when the trule tras firee! We can not
conceive as that scandalo lished a possesslc the Ban and 160, dans l'In that the nutmeg some of have al useful $p$ crable coolen. of bring restoral tho nut factitlou iii. p. $\ddagger$

Nutria, or Neutria, the commercial names for the skins of Ayy potamus Bonarienyis (Commerson), tho Coypous of Molina, and tho Queiya of D'Azara. In lirance, tho skins were, and perhaps still are, sold under the name of rucomila; but in England they are luportel as nutria skins-deriving their appellation most probably from some supposed similarity of the animal which produces them, in nppearance and habits, to the otter, the Spanish name for which is nutrin. Indece, Nolima speaks of the coypou as a spiecies of water rat, of the slzo and color of tho otter. Witria fur is largely used in the hat manufacture, and has become within the last 15 or 20 years an article of very coasiderable commercial impertance. The imports
fluctuate considerably. In 1841 they amounted to 1,125,212 skins; bnt in some years they are much less; and In 1840 amounted to only 242,733. Those entered for home consumption pay a duty of 1s. per 100 skins. They are princlpally brought from tho Rio de la Plata. -See Fur Trade.
The coypou or quoiya is a native of South America, very common in the provinces of Chlli, Buenos Ayrea, and Tucuman, but more rare in Paraguay. In slze it is leas than the beaver which it resembles in many polnts. The head is large and depressed, the ears small and rounded, the neck stout and short, the muzzle sharper than that of the beaver, and the whiskers very long and stlff. There are, as $\ln$ the beaver, two incisor teeth, and elghteen molar, above and belowtwenty teeth in all. Tho llimbs are short. The fore feet have each five fingere not webbed, the thumb being very small: the hind feet have the same number of toea; tha great toe and three next toes leing joined by a web which extends to their enils, and the little toe being free, hut elged with a membrane on its inner side. The naiis are compressed, long, crooked, snd sharp. The tail, unlike that of the beaver, is long, round, and halry; but the hairs are not numerous, and permit the sealy texture of the skin in this part to be seen. The back is of a brownish red, which becomes redder onothe flanks; tho belly ls of a dirty red. The eliges of the lipe and extremity of the nuzzle are white. Like the beaver, the coypou is furnished with two kinds of fur; viz., the long, ruddy halr which gives the tone of color, and the brownish osh-culored fur at its base, which, like the down of the beaver, is of much importance in hat-making, and the cause of the animul's conmercial value. The coypou is casily domesticated, and its mamers in enftivity are very mild.

Nux Vomica (Fr. Noix Vomique; Ilind. Kaachla), the fruit of a species of Strychnos, growing in various places in the East Indies. The fruit is about the size of an orange, covered with a smooth, crustaceous, yellow bark, and filled with a fleshy pulp, in which are imbedded several orbicular, flatted seeds, about threo quarters of an lich in diameter. Nux vomiea is inodorous, and has a very bitter, acrid taste, which remains long on tho palato. It is known a, a very virulent poison. A susplcion has, however, been entertained that it has been used ln porter breweries; but its introduction into them is prohilited under hesvy penalties.-Tromson'a Dispensatory, etc.

Oak (Ger. Eiche; Du. Eik; Dan. Eeg; Swed. Ek; Fr. Chene; It. Quercia; Sp. Rable, Curballo; Port. Roble, Curbulho; Russ. Dub; l'ol. Dab; Lat. Quercus; Aral. Butut). There are several varieties of this valuable tree; but the common lisgish oak ( (luercus robur) ciaims precedence of every other. The knotty oak of England, the "unwedgeable und gmarled oak," as Shakspeare called $i t$, whon eut down at a proper age (from 50 to 70 years), is the best timber known. Some timber is harder, some more difficult to rend, and some less capmble of being breken across, but none contains all tho three qualities in so great and equal proportions; nud thus, for at oncu supporting a weight, resisting a strain, and not splintering ly a camnon slıot, the timber of tho ouk is superior to every other.
A fine oak is ollo of the nost picturesque of trees; it conveys to the mind assuciations of great strength, and of aill but endiess diuration. It stands up agninat the blast, and does ncu tako, like other trees, a twisted form from tho action of the winds. Except the Cedar of Lebanon, no tree is so reminkable for the stoutness of its limbs; they do not exactly spring from the trunk, but divide from it; and thus it is somotimes diflieult to know which is stem and which ia brancle. The twisted branches of tho oak, too, ald greatly to its
beauty; and the horizontal direction of its bougha, spreading over a large surface, completes the idea of its sovereignty over all the trees of tho forest. Even a decaycd oak, sueh as that described by Spenser:

> " dry and dead,

Stili etad with rellipues of its trophies old, Lifing to heaven its aged, hosry head, Whoso foot on earth has got but feeblo hold,"
is strikingly beautiful. To such an oak Lucan compared Pompey in his decline:
"Qualls fruglfero quereus aublemis in agro
Exuvius veteres popull, saerataque gestans Donn ducum; nee jam valtdia radletbus herens, P'ondere fixa auo eat; nudoaque per aëra ramoa Effundena, trunco, non frondibus, eftielt umbram. At quamvis primo nutet casura sub Euro,
Tot circum silvu firmo so robore tollsnt,
Sola tamen coltur."-(Lib. i. Hio. 136.)
The onk is raised from acorns, zown either where the oak is to stand, or in a nursery, whenee the young trees are transplanted. The color of oak wool is a tine brown, and is familiar to every one; it is of difierent shates; that Inclined to red ts the most inferior. The larger transverse septa are in general very distinct, produching benutiful flowera when cut olliquely. Where go, uhd, in ight of lifty cllunate of that it also Midede and this tree are are $\ln$ great ontain moro tion to their called " $\mathrm{V}_{\mathrm{a}}$ f export of in England ace there is tter. now in general cultivation. Black and gray oata are little cultivated, except in some pleces in the north of Scutland. The red oat is chietly confined to Chenhir:, Derbyshlre, and Staffordahire. A species of naket oats, provinclally called pillar, ls raised in Corn-wall.-Loumon's Eincyclopedia of Agricullure; Bnown's Rural Economy.

The out, when considered in connection wii., the artificial grasses and the nourishment and impnvement it affords to liva atock, may be regarded $r$ one of the most important cropa we produce. Its history is highly interesting, from the circumstance that, while in many portions of Europe, when ground into meal, it forms an important aliment for man, one sort at least has been cultivated from the days of 'lliny' on account of its superior fitness as an article of dlet for the aick. The country of ita origin ls aomewhat uncertain, theugh the mest common variety is said to be Indigenous to the island of Juan Feruandez. Another oat, resemhing the cultivated variety, is algo found growing wikd in California. Thls plant was Introduced into the Nortb Anerican colonles soon after their settlement by the English. It was sown by Gosnold, on the Elizabeth Islands, in 1602 ; cultivated in Newfoundland in 1622, and in Virginia, by Berkeley, prior to 1648.
The oat is a hardy grain, and is suited to climates too hot and too culd either for wheat or rye. Indeed, its flexilility is so great, that it is eulluvated with suecess in Bengal, as low as latituda 25 degrees north, but refuses to yield profitable cropa ns wa approach the equator. It flourishes remarkably well when due regard is paid to the seleclion of varieties, throughort the inhabited parts of Furope, the northern and central portions of Asia, Anstralia, Southern and Northarn Africa, the cultivated regions of nearly all North Ameica, and a large portion of South America.

It this country the growth of the oat is confine! primeipally to the Middle, Western, and Northern Stales. The varisties cultivated are the cemmon white, the linek, the gray, tho imperial, the Iopetown, the Po. lish, the Egyplian, and the potate oat. The yiehd of the common varieties varies from forty to nhety bushels and upward per acre, weighing from twenty-five to fifly pounds to the bushel. The Egyptian oat is cultivated south of Tennessee, which, after being sown in autunnt and fed of by stock in winter and spring, yields from ten to twenty hushels per acre. In the manufacture of mall and spirituous litjuors oats enter hut lighly, and their consumption for this purpose does not exceed sixty thousant bushels annually in the United States. It will be seen by the following exhihit that Now York, Pennsylvania, Ohio, Virginia, sud Illinois are the largest producers of oats, and in the order in which they are here placed.

Ooean (Gr. wreuvor.) In Geograpliy, the vast body of water which surrounds the continents, and is the receptacle of all their runniog waters. It is divided by geographers intn five great basins; viz., the Pacilic Ocean (so called by reason of its comparative stillness), which separates Asia from Ancrica, and is the largest of all the basins; 2. The Athantic Ocean, which has Europe and Africa on its castern shore, and America on t's western: 3. The Indian Ocean, which washes the sculh of Asia, and the south-eastern coast of Africa; 4. The Arctic Ocean, which surrounds the north pole; and, 5 . The Artaretic, which surrounds the south pole. Other smaller portions of the great connected body of whter are called seas, of which the Mediterrancan, the German, the Bullic, and Black seas, are the most considerable. The superficial extent of the several grent lnains is not known with any certainty, nor, indeed, can their limita be exactly defined. From the nearest estimation that ean be made of the extent of the continents and principal islands, it is supposed that nearly three-fourths of the whole surface of the globe are covered by water. The Paclic Ocean alone exceeds the whole surface of the dry land.

De whi of the Orman.-If the superficial extent of the ocean ean not be easily ascertained, it will readily
be supposed that its depth is a problem of mach greator dificulty. Tbe bottom appearn, wherever it hat been reached by the aounding-line, to lave simllar inequalitles to those of tho surfice of the land: hence the depth muat be extremely various ; and it might be aupposed from analogy that the greatest depth of the ocean is at least equai to the height of the highest mountaina above ite aurface. Lord Mulgrava found uo bottom in tho North Atlantic Ocean with a sound-ing-line of 4680 feet, and Mr. Scoreaby sounded to the depth of 7200 foot without the lead touching the ground. These experiments ara not altogether to be depended on for the aetermination of sucli great depths; for, the preseure becoming very great, the lead may be drawn out of the perpendicular direction by currents, of which it may encounter more than one, flowing in different directions. Over a great portion of the Atlantic and l'acille oceana no bottom has been found. The depth of the ocean, in general, and the form of the Led on which it rolls, can not, therefure, be determined by experiment. The mathematical theory of the oscitlations of tluids has, however, thrown seme light on the sulyject. Laplace demonstrated that the difference which is indicated by observation between the height of two consecutivo tidea depends on the law of the depth of the sea, and that, but for the influence of accessory circumstances, it would disappear altogether if the depth were constant. It fulluws, therefore, that, since tho difference between the consecutive tides is extremely small, the depth of the sea, taking in a large extent of occan, must be nearly uniform; that is to say, there must be a certain mean depth from which the variations are not considerable.-Me. Cileste, book xiii.

Serel of the Ocean.- Were it not for the disturbing actions of the sun and moon, and of the winds, the level of the ocean would be every where the same, and its surface would have the form determined by the attraction of the whole mass of the carth, combined with the centrifugal foree belonging to its velocity of rotation; that is to say, the surface would the that of an oblate spheroid of revolution. This uniformity, however, can never be established. The tide at overy instant is at ditferent heighta in different parts of the ocean; and therefore the form of the aurfuce, within the limits of the rise and fall of the tides, is variahle. But even if we neglect the alternate rise and fall of the water which constitutes the tides, and take the surface of the ocean at its nean height, it is found by acrurate leveling that all its parts do not coiscile with the surface of the same spleroid. Ciulfs and inland seas, which communicate wilh the ocean hy marrow openings, are alfected according to their position with regard to the prevailing winds. The level of the Ked Sea was found, ly the French engioeers in Ejgypt, to be $32 \frac{f}{}$ feet higher than that of the Mediterrancan, which is supposed to tie a litie lower than the ocean. Ilumboldt concluced, froan ahsers funa made on the Jethmus of J'anama, that the waters of the Gulf of Mexico are about two fret higher than those of the Daritie thenis. The Datic and Wack seas rise lis spring from the great gusntity of river water joured into them, and are lowered in summer liy the joint effects of a small supply und increased evajoration.
( obor of the deem,- The neunl color of the occan is a bluish green, of a darker tint at adistance from land, and clearer coward the shores. According to Mr. Scoreshy, the hue of the Grentand sea varies from ultrammeine blue to olive green, and from the purest transparency to great opacity. The surface of the Moditerrancan, in its upper part, is ald to have at times a purpie titt. In the Gulf of Guinea the sea sometimes appears white; alout the Maldive lslands hack; and near Cndifornia it has a reddish appearance. Various causen co-operate to produce this diveraity of tint. The prevailing thue color may be ascrited to the greater refrangibility of the bilue rays of light,
which, by reason of that property, pasa in greatest abundance through the water. The other colora are ascribed to the existence of vast numbers of minute animaleulas; to marine vegetables at or near the surface; to the color of the soll, the infuaion of earthy subatances; and very frequently the tint la modlifed by tha aspect of the sky. The phosphorescent or ahining appearance of the oceun, which is a common phenomenon, is elso ascribed to animalculae, and to semi-putrescent matter diffused through the water.

Temperature of the Ocean.-. Water hoing a slow conducter of heat, the temperature of the ocean in much more uniform than that of the atmosphero. At a certain distance from the equator, it foliowa, though not very closely, the mean temperature of the corresponiling latitudoa, the aolar action heing greatiy modificd by the exirtence of currents which convey the temperature of one region to another; so that nt nuy place the temperature of the water depends, In sone measure, on the direction of the currents. Within the tropics the mean temperature at the surface is alout $80^{\circ}$ of Fahrenheit, and generally ranges between $77^{\circ}$ and $84^{\circ}$. At great depthe the temperature is probnilly nearly the same under every latitude. In the torrid zone it is found to diminish with the depth; in the pelar meas it increases with the depth; and about the latitude of $70^{\circ}$ it is nearly constant at all depths. But the small number of olseervations whleh have yet been made on this sutject do not intlicete any uniform law, accorling to which the variatluns of temperature at different depths is regnlated.

Saltuess of the Ocean.-.'The ocean holds in solution a variety of saline matters, of which ly far the most abundant is common salt, constituting, in general, about two-thirds of tho whole. The saltness of seawater at purticular places is influenced ly temporary causes-storins, fur example; as well as ly the neighborhood of large rivers, and permanent accumulations of ice. A series of experiments on this suliject were inade somo years ago by the late Dr. Narcet, and the fellowing are the general concluslons which he deduced from them: 1. That the Southern (bean contains nore salt than the Northern Ocean, in the ratho of $1 \cdot 02919$ to $1 \cdot 02$-57. 2. That the mean speeltic \&ravity of seawater near the equator is $1 \cdot 02777$. 3. That there is no notable difference lietween sea-water under diffirent meridians. 4. That there is no satisfactory evidence that the sea at great depths is more salt than at the surface. 5 . That the sea, in general, contains more salt where it is deeprest, and that its snltness is always diminished in the vicinity of large masses of ice. 6 . That small indand sens, though communicating with the ocean, are mucla less salt than the ocran. 7. That the Miditerrancan contains rather inger proporions of salt than the ocean.-Philosephical Pronsactions,
 tionary. The pecoliar hitter taste of spa-water dons not alperear to ludong to it begond a certain depth, anti is ascritied to the veretable pod animnd matler beld in a state of decomposition near the surface,-wiee Thrs,
 Atavachusetts (enarterly, ii. Bu8; American dournal ig

Oceanica. lieogrnphers have divided "Ocanica" iuto three listinct portions; viz., Mhaysia, Ausmalasia, am! "olyuesia. so comparatively bitte is known of its componene parts, that it is onjy pussihh to state the statistics of such roumries ans mont frequently come under the nothe of civilized mations, and this is itone in the annesed uccounts:

1. Maluysia.--' his portion incluies most of the is. ands of the In tian Archipelago, nod has its name from the fact that the Malay race are its most prominent inhahitants. Malayela is nuturally compobed of tive grand divislona.
2. Sumatra, Inva, Hati, Sumbawa, anil about twothirds of the weaterin portion of llorneo as far as $116^{\prime}$

"The custom-heuse receipts in 1850 ameunted to $\$ 121,50673$; in 1851, to 8160,60219 ; and in 18.52 , to \$113,091 93 ; the receipts of the latter year thus shewing a decrease of $\$ 17,51026$ as compared with 1851 , and of $\$ 541480$ as compared with 1850 . The number of merchant-vessels that visited the islands in 1850 was 469 ; In 1851, 446; and in 1852, 235. It is impossible," adds the Polynesina, "to give the number of 'whalers' that have visited the islands in 1852, but the number is about 800 , which is much more than the number in 1851 or $180^{\circ} 0$. It may be added here, in regard to the number of merchant-vessels in 1850 and 1851, that a large propertion of them were small vessels engaged in the potate traile, while in 1852 the vessels have been gencrally of a larger class. Another reason for the large number given In 1850 and 1851 was the fact that vessels more generally then touched at several perts, which would lincrease the number in the custom-house returns, though in fact it should not. The ports belng now more generally known, vessels for produce ge directly to the port where they can oltain their cargoes." In a commercial peint of view, as an entrepit between the western coast of America and Lastern Asia, these lishuds are of the greatest importance; and in view of the vast commeree now springing up in the Pacitle, and which will eventually revoIntionize the tracle of the world, it is possible that the United States may see fit to accept the offer to annex them to the national territory. Already the question las been before Congress.-imerican Statistical Annual.

Odessa, a tlou:ishing sea-pert of Southern Russia, on the northwest coast of the Black Sen, between the rivers Dneister and Bug, in lat. $16^{\circ} 28^{\prime} 54^{\prime \prime}$ N., hong. $30^{\circ} 43^{\prime} 22^{\prime \prime} \mathrm{E}$. Population in 1850, 78,000. The foundations of Odessa were laid so lately as 1792, by order of the Empress Catharine, after tho peace of Jassy. It was intended to serve as an entrepot for the commerce of the Risssian dominions on the Black Sea and the Sea
of Azef, and has In a great measure answered the expectations of ite fonnders. Hy au Imperial ukase, clated the 7th of Fehruary, 1817, It was declared a free port, and the Inhabltants exempted from taxation for thlrty years; alnce which period lia increase has been extremely rapild. The bay or roadutead of Odeass is ex. tensive, the water deep, and the anchorage good, the bottom being fine sand and gravel ; it is, howevor, exposed to the sontheasterly whal, which renders it less safe in winter. The port, which it artlicial, being formed by two molen, one of which projecta to a conalderable diatance linto the sea, is titted to contain abont 300 shlps. It hat also tho advantage of deep water. There ls a eorvenient lazaretto, on the model of that of Marscilies. The want of frealt water used to be the greatest diaadvantage under which the ivhabltanta labored; but this has been obvlated by the construction of a canal, which conveys an abundant anpply of water lnto the town. There are no treea In the vicinity, whleh has, lu consequence, a bleak and arid appearance.

Light-houses. - A light-house has been erected on Cape Fontan, about 6 f nautical miles south of Odessa. The light, which formerly revolved, is now ficed, and is aliout 203 (Russian) feet above the level of the sea. At the diatance of eleven leagnes S.E. by E. +I . from Odessa, on the north end of the long, narrow, low island of Tendra, a llght-house has been erected, of great use to ships approaching (Odessa froin the sonth or west. The iantern la elevated $92 \frac{1}{2}$ (Russlan) feet above the level of the sea. It consists of three reflecting lights, suspended in the form of a triangle, revolving in the space of four nuluutes, so that each lamp arrives at lt maximum of brilliancy after an interval of one minnto, twenty aeconds. Beling also of a red color, this light la readily diatingulshed from Fontan light, and the ot! er lights in the Black Sca. In fuggy weather a bell la kept ringing.-Coulier sur les thares, 2l ed. ; Nonaik's Sailing Lirections for the Mediterronean and Mhack Seas, etc. Not being at the month of any great river, nor having any considerable manufactares, Odesea fo net a port for the exportation of what may be called articles of native growth; but in consejuence of her convenient situation, excellent port, and tho privilegea ahe enjoys, she is, as already remarked, the eniporium where most part of the prolace of Southern Rusnia destined for forcign countries is collected for exportation, and whero moat part of the foreign articles required for heme conaumption are primarily imported. The shallowness of the water at 'raganrog, and the short period during which the Sea of Azof is uavigable, tend to hinder forelgn vessels of considerable burden from entering the Strait of Yenikalé, and occasion the shipment of a coesiderable portion of the prodace bronght down the Don lu lighters to Caffa and Odersa, espocially the latter. All the producta brought down the Dniester, the Ilug, ani the Dnieper are exported front Odessa ; but owing to the difficalt navigation of the first and last mentioned rivers, by far the greater part of the corn brought to Odessa front Podolia, the Ukraine, etc., ls convered to the town In carts drawn by oxen. The roads traversed by these earts are only practicahle at certain seasons of the year ; and nothing would contribute so minch to increase the commerce of the port, and the prosperity of Southern Rnasia, as the opening of improved communications with the interior, whether by removing obstructiona in the channels of the rivers, constructing canals, or railways, or gool common roads. Amolig the articlea of export froms Odessa, corn, especially wheat, occupies, as every one knows, the lifgheat rank; but tallow ia also an important article; rnd next to it are linseed, wool, hidea, copper, war, caviar, potash, beef, furs, cordage, aallcloth, tar, batter, isinglass, etc.
f'orts of the Black Sea, the Sen of Azof, and the Crim-ea.-The importance of the Hlack sea as a channel of Kussian commerce will be easily understood by cast-

Ing an eye over the map of Southern Rusis, and trac. ing the rich and extensive reglons which are tributary to its various ports. The Danubs and lis brenchea, the Dalester, the Bug, Dnieper, Don, and aeveral lesser rivers, empty thelr waters inte the Ilack Sea, Orieasa is altasted on a bay, 80 millea from the mouth of the Dinleater, and 60 from that of the River $D_{n l e p e r . ~}^{\text {a }}$ The bey is secure and aceesslble, and seldom closed by ice. The prort ls protected hy two moles, each extend. Ing 315 fathoms, and raised if feet above the surface of the eea; and, thus formed, It will afford ample pro tection to two hundred large-sized vossels. Akerman Is sltuated near the Black Sea, on tite lagoon on the Dnleper. It la the principal outlet of the produce of (ialicia, Pololla, and llessarabia. The lagoon, or li. man, on whith Akerman is situated, la said to pro duce annually $7,000,000$ poode ( $252,000,000$ pennis) of salt. The jort ia, however, too shallow for vessels drawlig over seven feet of water. Kherson, Nifolalef, and Sevestopol are the remaining princlpal ports of these seas.

The preceding table exhibits a total of 221 vessects (cntered and clearod), with an aggregate of (i4,598 tons, being an licrease over 1851 of 950 vessels, nith an aggregate of 265,286 tons. If to the tignres given In the table is added the coasting trade, viz., $2: 01$ ves sels, with ans aggregate tonnage of 118 , tibe, the total navigation of the port of Olessa, in 1852, will amuunt to 1525 vessels, with an aggregate of $1,0: 11,1231$ tuns, An analysis of the table given to Austria the first rank in the navigation of this port. Total tennage
 tons. Eugland holds tho secend rauk, viz., 1:37,766 tons; then Sardinia, 92,420 tons; Grecee, xil, $6: 17$ tons; Sweden, $\mathbf{d 3 , 0 1 7}$ tons. The augmentation in $1 \times 52$ over 1851 gives Austria 66, 878 tons more ; Englant, 61,531 tons more; Sardinin, 38,977 tous more; and tirece. 13,577 tona more. The steam navigatien of Olessa is maintained by the two 'ines of Constantinople and the Danube. The first mz a thirty-six voyayes (inetween the two points), and the second eighteen, sunualty. The Constantinoplo line conveyed, in 18 ite $_{2} 1: 14$ passeugers; that of the Dannie, 995; making a tual for both lines of 2.29 passengers. The lirst of these transportod to Odessa merchandise and speclo amounting to $5,411,520$ france, and the other 354,620 franes. There was exported to Conatantinople by the first line merchandise valued at $1,669,108$ francs; nul to the ports of the Danube, by the other, murechandise to the amount of $6: 3,796$ francs. Govermment steamers keep up the communieation betwecn the ports of Kherson, Nicolalef, the Crimea, and the C'aucasns. In 1852 thoy made ninety-five voyages from these different points to Odessa, tranaporting passengers and merchandise.
The different steamers which make Odessa their starting-point made, in 1852, 149 voyages, transporting 20,905 passengers, and increhamilise to the amount of $10,705,768$ franca, equal to $\$ 2,000,000$ nearly.

The principal imperta in 1851-52 were! raw cotion and cotton yarns, ollve-oil, dye-stais, drugs, metals, wines, and sugar. In 1858 the total value of the foreign trade of Odessa was $\$ 25,953,807$, viz. : exports, \$18,583,203; imports, $97,370,514$. Grains constituted the chief export in 1853. Thus, of the $\$ 26,000,000$ (lin round numbera), grains amounted in value to $\$ 13,000,000 ;$ linseed, wnol, tallow, and cordage covered $85,000,000$. In 1854 this immense trade must have been completely paralyzed, as an official notlfication was published at Odessa on 8d March, 1854, prohibiting the exportation of grains of all kinde, from ali ports of the lliack and Azof Seas, untli the Ist of September following. This prohllition, however, la now removed ; and official returna, when received, will ahow how far the biockade of the linssian ports liy the allied powers affected the trade of the Black Sea. By declaration published at St. Petersburg 7th [19th] April, 1856, all the aucreantile harbors of Itussia are opon to the merchant vessels of neutral countries.

The total value of the trade of the porta of the Sea of Azof (Taganrog, Kertch, Kostoff, Mariopol, and Berdiansk), was, in 1801: imports, 6,902,000 franes; (x.jorts, $27,182,000$ franes.

The imports were chiefiy from Turkey, the Two Sicilies, Ionlan Islands, France, and Greece. The exports were destined to 'Turkey, England, Sardinia, Tuscany, Ionian Isianda, and France. The total value of the trade at the commercial porta of the Crimea (Eupatoris, Balaklava, Theodosia, and Kerteh), in 18E2, was: imports (including apecjo), $1,092,500$ franca; exporta, 654, 500 francs. Total, $1,747,000$ francs.

Comparod with 1851, the importa increased 12 per cent., and exports deereased neariy 60 per cent. Imports conaisted of cottons, raw cotton, coals, oil, and fruits; exports, of wool, raw hides, hutter, caviar, and grains.- Lnited Stutes Commercial Relutzons.

The United States Consui, under date of July 1, 1854, conmunicates the following information: There exists a treaty of commerce between the United Statea and the Imperial Russian government, which was concladed at St. Petershurg on the tith [18tin] liecember, in tho year 1832, and was ratified at Wrashington on the 11th May, 1833, to which the Hussian government abidos with strictnesa. The city and port of Odessa was declared as porto-franeo by a lecree of the imporial government in the yeur 1823 , which was put into execution only on the 15th August, in the your 1824, by which the importation of all kinds of merchandise was allowed, on paying oniy one-fifth of the entire duty paid in other ports of this empire; and thia one-lifth duty was employed to defray the annual expenditure for the beaelit of this city, such as pavements, rotpaths, repairing streets, lights, government buildings, and for the expenses of all the jucal administrations. The importation of all kinde of merchandise is allowed, even those artleles which are prohibited at all other ports of the empire, but they are not allowed to be transported into the interior from hence, as tea, refined sugars, strong spirita, cloths-black and green-printef cottons, silka, and wools. These articlea are to be consumed at Odersa. The term of theso privileges for Olessa expired in the year 1849, hut his majesty the entperor, wishing to favor this city, granted a prolongation of the amme privilegen for a period of five years, which ends on the 14 th August, 1854. During this last period the duty was augmented; inatead of
one-fifth, it is now two-fifthe of the entire duty on the import of any kind of merehandise, whith the exception of tohaceo, rum, and other atrung spirits, on which the entire duty is paid, as at ali other ports of Rursia. Refined angars, tea, and wines, have to pay three-ffths of the entire duty, one-ffth of whieh is deatined for expenses of thla city, and the remainder In favor of government. There doed not exiat at thls port any privilege granted to any nation, in any way, which is denied to citizens of the United States. The only restriction exiating at Odeasa is on ships under French and Neapolitan colors, they not being allowed to import any merchandise from foreign countries to Russla, unless paying 50 per cent. more on the import duty, in comparison to A mericans, or ships of other natlons. Thia differenco on French and Neapolitan vessels exlists by the commercial treaties between the respective powers, ly which it is also prohibited for Rusalan vessela to impert to France or to Naplea merchandise from foreign ports not liussian produce, as the cargo must be, and from a Itussian port. There are no difierences in the charges, or any other dues, on ships of the United States and Russian vessela. A liussian vessel of 150 lasts (equal to 300 tons) pays the same charges as un American of the same sizc. The following atfords a comparative statement :
Lants, 150, at 17-100 per last
S. R. $2580=\$ 1038$

Llght dues

and fees …s, nitom-house charge
The tonna estand inge and ilues are a fixed charge, and establlalied lyy law; the quarantins and custom-house duea are not so. The amonat of the latter charges is generally paid partly for atamp paper, fees, and other trities, which reachea the sum above atated, and which every one pays without opposition, as it is the custom and haa been for many years past, and by which meana busineas la greatly facilitated. It is prohibited by law to reship merchandise from one ship to another, oven if the merchandise reshipped be destined for another liussian port, and no matter under what colors it is brought to this port. The merchandise, belore reahipment, must first be landed and visited by the custonthouse authorities, and the whole amount of duty paid, before permission ean be olstained for such merchandise to be shipped and transported to another Kussian port. But if anch merchandise bo destined for a foreign port, it has to be landed, and after being visited by the custom-houso officera, a certificate to that effect is given to the shippers of the cargo, allewing the reshipment and exportation to a forelgn port. All foreign, as well as American vessels are allowed to share in the coasting trade from one Kussian port to another in the Black Sea or the Sea of Azof. The current cein, weighte, measurea, etc., are the same at Odessa as at St. Pelershurg. The value of a allver ruble is 75 T 980 cents of an American dollar; one pood weight ia 36 English pounds; one arshine mearures 28 English inches; one chetwert of wheat is $5 \geq$ English bushela.

The only cargo exported from hence for Amarica since the lst of July, 1853, consisted of common washed wool, 505 bales, welghing 5972 poods, 23 pounds; and linseed, 1200 chetwerts-the whole shipped on board of an American bark of 380 tons, bound for New York, and clearel from hence on the 10 th November, 1853. The cluty on the cargo amounted to 342.80 silver rubles, or $\$ 257^{\circ} 80$, being on the linseed alone, as there is no duty on the exportation of wools. No insurances have ever taken place here for the United States, but the general custom is to insure in England for America. The custom in purchasing any kind of merchandise for exportation at thls place is to pay ready cash, and without any discount whatever; but in the cale of colonial and other goods imported from abroad sometimes a credit of six or eight months is granted to the buyers. There ia no established rate of exchange here for the United States, but the value of the dolier is

## OFF

nominal at $1 \$$ silver ruble. The amount of duty paid bure on merchandise exported for America during the last perlod smounts to $\$ 257$; bot no import duty was paid here, as no morchandino arrived from America. There is no duty levied in Rusaia by government on produce exported In its new state, or patily nasufactured, or entirely 80 ; the only exiating duty is on raw augars, on whlch the refiaers of Rosain pay an excleo to governmant of ${ }^{60} 00$ silver rubies per pood on the refined augars, or $45_{1} 170$ conts in American carrency. Laborers are generally pald here by tho day, and, the rate not being fixed, fluetoates accorling to the wanta of such men-rialug from $\frac{300}{100}$ to one silver ruble per day; or from $22 \frac{1}{2}$ to 75 cents per day, American currency.

A tribunal of commorce was establishod at Odeasa in 1824, whose jurisdletion extonds over all disputes connacted with trade. Thore is no appeal from ita docislons except to the arinate. There are twelve sworn hrokers, approvod and licensed by the Tribum of Commarce, who havo dr ies appeinted by themselves. They register all trs oue cons, and receive \% per cent. from each party $2 s$ cummission. There is a discoont or loan baus, established in 1828, and marlno and fire insurance societies. Most articles of provision are cheap; and fish, which costs next to nothing, is excellent. Fuel, however, is scarce aud dear. Within the last thirty years, tho Merino breed of nheep has heen oxtensively introduced inte the governments of Taurida, Chersou, and Ekaterinoslov, so that thero has been not only a great increase in the quantity, but also a very declded improvement In the quality, of the wool exported. Corn Trade. -Theprincipal trado of Odessa is with Constantinople, Sinyrna, and other towns in the Levant, Naples, Leghorn, Genoa, Marseilies, etc, "It Is generally atated," says Mr. Jacob (Memoir on the Trule of tha Bluck Sea, in the Appendir to the cetavo edition of Tracts on the Corn 7rade), "thant the supply of Constantinople requires anmually 100,000 quartors of Biack Sea riast. The Greck Islands scarcely, on the average of years, produce aufficlent wheat for their own consumptlon, and in some years require a large supply, which is farnished partly from the neighboring continent, and partly from the llack Sun. The Aalstle coasts of the Turkish Enplre, especlatiy in Anatolia, are nearly in the same predlcament. At times the market of Smyrna ls very favorable for the sale of the corn of Southern Rusia. The isiands of Malta and Gozo produce only about half as much corn as the 120,000 in' abitants require. Sicliy, though it has greatily declined from tos anclent prodnctivencss, has atili a quantlty of grain to aprare for the loss fiuitful parts of fialy in most years, and its wheat enters inte conupetition with that of the 13lack Soa, In the ports of Naples, Genos, aind leghom. Thero aro few yeara in which Tuscany grows a sufficiency of wheat; and its chief jort, Leghorn, being one of those In which ahip, can unload their cargoes of corn, wlthout being detained to perform quarantine, has been at all times a place of teposit for the wheat of the Black Sea. $A$ market at some price may always be fonnd there, as the capitaliats are disposed to parchase, relying on the uncertain productiveness of some adjacent country, in which they may realize a profit at no great distance. Genoa, like leghorn, is a port where wheat ran bo unloaded within the bound of the lazaretto. The country arount it yields but little whest ; and at some perioda it enjoye a traide in that articlo even as far as Sunderiand. This internal demand, and the chance of advantageons re-axportation, induces buch trade in corn. Thery is said to be seldom leas than I(, 000 iuarters in store ut the two ports of Genoa and Leeghorn, and at some periods a far greater qu...ticity. Nice, theugh not having the aame advantageons quarantint regulatiora. and, consequently, not being a dipts frr corn beyond its own dimand, from the nterile soll that surrounde it, requirea every year a large importation
of wheat. That of Slecly and Odeasa creates a compotition in its port, and the government draws a revenue by impoaing a hoavy duty on both. Thoogh the corn lawa of France hava kept the porta closed againat the Introdaction of foreign corn for domestle use, yet it is allowed to bo bonded for re-exportation. From the frequent local and partial acarcities which occor on the castern coast of Spain, at which periods whest is allowed to be lawfolly lmported, and, it la sald, from the facility of its iatroduction by contrsband when not legaily allowed, Marseilles has been a great depd for the whest of the Black Sea. From thence, as also from Gibraltar, where there is generally nomo in store, It can easily be transportod to Spain, to Sardinia, to Corsica, to Tunis, to Tripoll, or wherever scarcity has ereated a beneticial market. Tho coasts of Barbary, though often harlug a surplus of wheat, much of which necasionally assists to feed Portugal, In some sessons have been affected with inost deficient harvests. This was recont:y the case $\ln$ a remarkalyie dogree. Tripoli and Tanis exporionced, in the year 1820, a harvest most miserably ahort, and were aupplied from other conntries." The warchouse rent of corn at Olessa is from eight to ten copecks per chetwert per month. M. De Hagemeister supposes that Turkey and the differeat ports of the Moditerranean requlre, at an average, an annoal supply of $1,400,000$ chetwerts, or about $1,050,000$ quartors, of which $1,0 \cdot 0,000$ chetwerts, or 750,000 quarters, are furnisied hy Southern Russia, and principslly shipped from Odessa. Waliachin and Meldavia aro both very fertile in corn; and were trampuilHity and good order introduced into thom, and the free navigation of the Danube secured, Gulacz and Brailoff nould be wo of the principal European grain-shipping ports. - See tho excellent leport of 11AuFmerstris on the Traule of the Blark Sien, p. 96-114, Engl. Trans Exciuslve of corn, the other articles mentioned as inco ing exported from Wdessa find their wuy to the different markets in tho Mediterranoan. Thuse slipyed for Turkoy are tron, tnilow, sail-cloth, coninge, suchors for ahlpe of war, butter, etc. The exports to Italy and other Luropean countries nre similiar. The imperta. tion of all foreign articies Into tho Russian dominions on the Bisck Sea and the Sen of Azof is conthell to Otessa, Theodosin or Kaffa, and Taganrog. The Import trade is, however, of inferlor lmportance wien compared with the export trade. Tho principal artlicies are sugar and coffer, dye-woods, wino and brandy, cotton stuffs and ysin, woolen and silk manufac. tures, spices, cutlery; oranges, lemons, tigs and other fruit ; lemon-juice, oll, tha and thin plates, dried fruits, paper, ailk, speeie, etc.
Odesan, in addition to its greac and rapidly increas. ing trade with Conntantinople and the comntries on the Mediterrawean, itad, Before the war of 185.t-1855, a censiderable trade with lledout-kale at the mouth of the Thasis, and with Trohizond ani seversl ports on the no:ith coant of the Biack Sea. Georglan and Amenian merchants are aiready conaiderablo purehasers at the leipsin and other German fairs, and civlization is heginning to strike its roots throughout nil the extansIve countriea between the Black Sea and the Caspian. It is proliablo that at no very romote perion the fissls will be frequented by British ships; and thnt merchants, without any enchentress to nid them, and defrending only on tho auperlor cheapness and excellence of their goods, will be hospitabty received in the oncient Colebla, and bear away a richer prize than fell to the lot of Jason and his compeers,-See lirssta.

Ofilng, or Ofiln, in Noutical language, that part of tioc aen, a good distance from shore, where there is deep water ant no need of a pilot to coudnct the ship. Thus if a ship from shore be seoll sailing out to scaward, they say, "She stands for the offing;" and if a ship, having the shure near her, have another a good way without or beyond her, tow ard the sea, they say, "That alilp is In the offing." ih the corn gainst the e, yet it is From the ecur on the heat is ald, from the hen not leép for the also from in store, it ain, to Cor. ty has cre. It is 210 mites long from north to south, and 200 miles broad. Area, 89,964 square miles. The population in 1790 was 8000 ; in $1800,45.865$; in 1810, 230,760 ; in $1820,581,434$; in $1830,937,637$; In 1840, $1,519,467$; and in $1850,1,980,408$. The land in the interior of the Stato and bordecing on Laika Erio ia geoerally level, and in some places marshy. From one quarter to one third of the State, comprehending the eastern and southeastern parts, bordering on thec Onio River, is gencrally hilly and broken, hut in no part mountainous. On the margin of the Ohio liver and several of its tributaries aro alluvial iunds of great fertility. The valleys of tho Scioto and the Great and Littlo Miami are the most extensive sections of level, rich, and fertiie lands in the State. At the head of the Muskingum River are prairies of considerabie extent, some of which are wet, though generally dry and fertiie. Tho height of land which divides the waters which fali into the Ohio from those which fall into Lake Eric is the most marsiny of any in the State, while the land on the margin of the rivers is generally dry. Wheat may be regarded as the ataplo production of the State, though Indian corn and other grains aro iargely cultivated. It is rich in mineral wealth, iron, coal, lhnestone, marilo, and superior building strice, suind-stonce, etc. There are many valunble saltsprings. There were in this Stato in 1850,9,861,493 acres of land improved, and $8,146,000$ of mimproved land in farms; cash value of farms, $\mathbf{\$ 3 5 8 , 7 5 8 , 6 0 3 ;}$; and the ialue of implements and machinery, $\$ 12,750,585$. Live Stock-hezses, 463,897; asses nad muies, 3423; miich cows, 544,499 ; working oxen, 65,381 ; other cattle, 749,067 ; siteep, $3,942,929$; swine, $1,904,760$. Vaiue of tive sterk, $444,121,741$.

Ayricultural I'roduets, etc.-Whent, 14,487,801 bushels; rye, 425,918; Indian corn, $59,078,695$; oats, $13,172,712$; harluy, 954,358 ; huck wheat, 638,060 ; peas and lenas, 60,168; putatocs, $5,057,760$; sweet potatoes, 187,991. Vnlue of products of th. orchard, $\mathbf{\$ 9 5 , 9 2 1 \text { ; } ; ~ ; ~}$ of the market-gurdens, $\$ 21 s, 004$. Ponnds of butter made, $34,449,379$; of cheese, $20,819,542$; maple sugar, $4,588,209$; moiasses, 197,308 gallons ; beeswax and honey, 804,275 pounds; wool produeed, $10,106,371$; flux, 446,932; slik cocoons, 1552 ; hops, 63,731; tubacco, $10,154,449$; hay, tons of, $1,483,142$; homp, 150 ; ciover-seels, 10:1,197 bushels; other grass seedis, 37,310; flax-seed, 188,880 ; and were made, 48,207 galions of wine. Value of home-made manufactures, $\neq 1,712,196$; of slaughtered animals, $\boldsymbol{\$ 7 , 4 3 9 , 2 4 3}$.

Rivers, efc.-The Ohio River, willeh gives name to the State, washes its entire sonthern border. This river is 1004 miles iong from I ittaburg to its month, ly its various windings, though it is oniy 614 in a direct line.-See Onio Riven. The Muskingmm, the largest river winits fiows entirely in this State, la formed ly the junction of the Tuscarawas nud Walhonding rivers, and enters the Ohic at Minrletta. It ls navigable for boats 100 miles. The Scioto, the second river in magnitude, fiowing entirely within the State, ia abont 200 miles long, and enters the Ohio at Portsmouth. lis largest branch is the Whotstone, or Oientangy, which joins it immediately above Columbus. It in navigable for boats 130 mijes. The Great Niami, a rapid river in the western part of the State ia 100 ailles long, and enters the Ohio in the southwest corner of the State. The Little Miami has a course of eeventy miles, and enters the Ohio sevon miles above Cincinnati. The Maumee, $\mathbf{1 0 0}$ milea long, rises in Indiana, runs through the northwest part of the State, ani enters Iaka Erle at Maumee Bay. It la navigabie for steamboata to Perryshurg, eighteen miles from the lake, and above the rapida ia boatable for a consillerabie distance. The Sandusky rise. its the northem part of tha Stato, and, after a colsise of about eighty mitea, entera Sandusky Bay, aut thence luto Lake Erle.

The Cnychogen rises in the north part of the State, and after a curved course of siaty miles, enters Lake Erie at Cleveland. It tas a number of falls, which furnlsh valuable mill seas. Hesides these there are IInron, Vermillon, Hlack, Grand, and Aghtabula rivers, which enter Lake Erle.

The principal placea are Cincimati, the meiropolia; Columbus, the Capital; Cloveland, Sandusky, Dayton, Spriugfleld, Zanosville, Marietta, and Portsmouth. There were in Vebruary, 1854, sixty-eight banks, with a paid capital of $88,718,366$; in January, 1856, fortysix railroads, of which 2725 miies of track were finished and in operation, and 1578 in course of construction. 'Tonnage of the Stato $\ln 1853,25,632$ tons.

Nfanufuctures, etc.-There were in the State in 1850 elght cotton factories, with a capital invested of $\$ 297,900$, employing 132 males and 260 femnles, producing 280,000 yards of sheetings, etc., and 413,000 pounda of yarn, valuot nt $\$ 304,700 ; 130$ woolen factories, with a capitai of $\$ 870,220$, ensploying 903 males and 208 females, manufacturing $1,374,087$ yarts of cloth, and 65,000 pounds of yarn, valuet at $\$ 1,111,027$; thirtyfive establishments makling pig-iron, with a capital of $\$ 1,503,000$, employing 2415 persons, producing 52,658 tons of pig-iron, etc., and the entire value of products, $\$ 1,255,850 ; 183$ establishments, with a capital of \$2,003,650, employing 2758 persons, and making 37,399 tous of iron castings, etc., valued at $\$ 3,069,250$; cleven establishments, with a capital of $\$ 620,800$, employing 708 persons, manufacturing 14,116 tons of wrought iron, vaitid at $\$ 1,076,192$; 1082 flouring and grist-mills; 1730 saw-milis; 243 printing-offices, 302 newspapers, twenty-eight daily, six tri-weekly, four semi-weokly, 222 weekly, seven semi-monthly, twenty monthly, and ono yeariy publication. Capitai invested in manufactures, $828,612,136$; value of manufacturod articies, \$61,915,036.-Sce I'otr for further information.

Iducational Establishments, etc.-Tho University of Ohio at Athens, the Miami University at Onford, Franklin Coilege at New Athens, the Western leserve Coilege nt Hudson, Kenyon Collego at Gambier, Ciranvillo College at Granvilis, Marietta Collego at Marietta, Oterlin Collego at Oberin, St. Xaver at CincinHati, Ohio Wesleyan University at Delaware, Wittenberg Coliege nt Springticid, Willoughby University at Wiiloughly, Lane Theoiogical Seminary at Cincinnati. There are also theological departmeats at Kenyon, Western Reservo at Hudson, Granville at Granville, Oberlin at Oberlin, Wittenberg at Springfield, and a seminary of the Associata Reformed Clureh at Oxford, Western Rearve Medical Coilcgo at Cleveland, Me!lical Coliege of Ohio at Cincinnati, Medleal College (ilomeopathic) at Cleveland, Starling Medical College at Columbua, and Cincinnati Law Coliege at Cincinnati. The whole havlug, in 1850,3621 students. There were aiso 206 aculemies, 5052 pupiis; 11,661 ac'aools, 484,153 schoiars; 352 libraries-aggregato lumber of voilumes, 186,826 . School fund, $\$ 304,474$.

Ihs first permanent settlement in Ohio was made In 1788 at Maricta. In 1802 Ohio was admitted into the Union.

Tho progress of hanking in the State of Oillo it shown in the following summary :

| Year. | Number of Danls. | Capisal. |
| :---: | :---: | :---: |
| 1806 | 1 | 5,200.000 |
| 1411 | 4 |  |
| tSt5 | 18 | 1,484,000 |
| t8t6 | -1 | 2, $110 \mathrm{t}, 000$ |
| 1820 | 20 | 1,797,000 |
| 1835 | 94 | 6,819,000 |
| 1893 | 88 | 9,247,000 |
| 1810 | 117 | 10,617,000 |
| 18.45 | 8 | 2,171,000 |
| 1850 | 60 | 7,129,400 |
| 1886 | 60 | 6,995, 100 |
| 1807 | 0.1 | $0,808,0000$ |

The frec-banking law of Ohio was adopited in the year 1851, and forms at present a part of the bankling system in operation.

Cheinnati, the metropolis of Ohio, capital of Hamil- ally in Auguat, September, and October, and the great-
ton connty, and one of the leading commercial placen west of the Alleghany Mountains. It is situater in 3 the right bank of the Ohio River, 455 millea beluw Iltisoburg, 1 whalles atove New Orleans, and 502 milea fron Washington. It is the largest city of tha Misalesippt Valler, north of New Orlesus, and the fifth in population in the Ľnited States. Population in $\mathbf{1 8 0 0}$, 750 ; in 1810, 2510; in 1830, 24,831; in 1840, 46,338; in 1815, 65,000; in 1850, 115,438 ; in 1853, 160,141 . The Ohio River at Cincinnati is 1800 feet, or about onethird of a mile wide, and ita mean annuai range from low to high water is about fifty feet; the extreme range may be about ten feet mure. Deprestiona are gener- 1389.

Its f whole

From 1 to "cal burg, it on the cel, anc length,

Ohio, a large river of the United States, formed by the confluence of the Alleghsny from the north snd the Monoogahela from the south at Pittsburg, in the western part of Pennsylvania, lat. $40^{\circ} 32^{\prime}$ N. and long. $80^{\circ} \boldsymbol{2}^{\prime}$ W., st the helght of 1133 feet above tide-water in the Atlantic. It proceeds in a direction west-southwest, dividing the states of Virgius, and nentucky on the south from Ohlo, Indiana, and Illinois on the north, and enters the Missisaippi in lat. $87^{\circ} \mathrm{N}$, and long. $88^{\circ}$ 58' W. Its length from Pittsbu "g to its mouth, by the course of the river, is 948 miles; but the distance in a direct course is only 614 miles. It has a descent, in its whole course, of 395 feet, making an average descent of not quite five inches in a mile. The width ef the Ohio varies fron: 400 to 1400 yarda; ita aversge width is 534 yards. "pposito ', Cincindati, which is about equidistant from Fitts1, , to tta confluence wlth the Mississippi, where it is $\therefore \cdot$ : 900 yards wide. The great valloy drained by this river contains over 218,000 square miles, and a populstion of over $5,000,000$, which is rapidly increasing. There are no colsiderable falls in this river excepting at Louisville, Kentucky, where it descends $22 \frac{1}{3}$ feet in two miles. These fslle have been obviated by a csnal around them, which admits of the passage of the largest steamboats; but boats ascend and descend these rapids, when the water is high. The current of the Ohio, when low, does not exceed two miles an hour ; when at a mean height, three miles; and when higher and rising, four or five miles. The highest water oecurs in December, March, May, and June; and the lowest in August, September, and October. The average difference between high and low water ls 40 feet ; its extreme range on record, 64 feet (at Cincinnati). During eight or ten weeks in the winter, the navigation is olstructed by floating ice. Of the two confluents which form the Ohin, the Alleghuny is the most important, being navigabie for boats 260 miles to Olcan, New York, and will hereafter, by means of the Genesee Vallay Canal, terminating at this place, and extending to the Erie Canal, form sn limportant communication hetween the city of New York and the West. The principal tributaries of the Ohio on the north are the Beaver, Muskingum, Scioto, the two Miamis, Whitewster, and Wabash; those on the south are the Kanawha, Sandy, Lickiug, Kentucky, Green, Cumberland, and Tennessec. Some of these aro navigable at high water to a great extent by boats and steamboats. Tho Tennessce is navigable by boats for 1000 miles; the Cumberland is navigable for steambeats to Nashville, and for kecl-boats 300 miles further; the Wabash is navigable for 200 miles; Green River, 200 miles; Kentucky, 150 ; Great Kanawha, $6 t$ miles, to the salt works. The Ohio, with its tributaries, has 5000 miles of nsvigable waters.

The whole fall of the Olio from Pittsburg to Cairo is estimated at 425 feet, and the distance is 977 miles. Tho average fall per mile ts therefore loss than tive inches. The full of the hiver Thames is greater than this, being an average of nearly seven inches per mile for one hundred and eighty miles. Indeed fow rivers of equal length and volums of water have so few fulls or rapids inpeding navigation as the Ohio.

Its fall, however, is not distributed equally over its whole course, as the following table will show ;

|  | Dialance. | Fall. | Avoragen. |
| :---: | :---: | :---: | :---: |
|  | Milea. | Feel. | I achen. |

| From Fialis to Evansvilto ..... | 169 | 34 | 285 |
| From livansville to Cialro..... | 187 | 45 | 29 |

From this tahle it will be seen that were it necessary to "canalize" the whole river, from ite mouth to Pittsburg, It would be the urost magnilfeent channel of trado on the face of the globe. No canal was aver constructed, and probably none could be constructed, of equal length, wlth comparatively a little lockage as this.

The Erie Canal has about five times tha lockage in proportion to its length; and thes Pennsyivanla Canal, from Pittsburg to Johnstown, has more than ten times as much. But it should be remembered that It will be unnecessary, for the purpose of making this great improvement, to overcome all this fall of 425 feet by means of locks and dams. A large part of thls whola descent is due to the gentle flow of the rivar, through ihe long pools which make up the most of its distance, and which, in their natural condition, nfford a sufficient depth of water at all seasons of the year for the purposea of navigation. What proportion of this whola fsll of 425 feet is thus due to these pools, which need no improvement, wo are unable to determine; but it must be a very considerable propertion of it, and would leave a compsratively small aggregate to be overcome by locks and dums or wing dsms. It would be unnecessary to construct these dams so high as to flow back the water from one to the other, but only to rise from one of these pools to another, or perhaps, In some cases, to unite one or more of them in one. To reduce the whole river to a series of long levels, as in the construction of eansls, would not be required, sud indeed would be liable to grave oljectlons on the score of health. A depth of about five feet at the lowest stage of water would be all that would be necessary to render the Ohio the most important channel of commerce In the world. This depth could be had without atfecting unfavorsbly the healthfuluess of the river, and would be enough for the first class of steamers which now ply on the river.
'The volume of water in this stream, in an improved condition, would be ample, for ten or eleven months in tho year, to meet the wants of a commerce largo enough to tax to the utuost the capacity of ten cansls equal to the Erie when enlarged; and so favorable is the climate, that the obstructions from ice would be of very short duration, if, indeed, such impediments would ever occur. It is well known thst the Monongahela suffers less inconvenience from iec, in its present condition, than it did before it was Inproved by lucks and dams, and no good reason can be given why the samno results would not follow the improved navigation of the Ohio. That the growing demands of trade in the Great West will imperatively require this great work to bo specdily accomplished, no man who has at all consldered this sulyect can for one moment doult. Saying nothing of the grest staples of agriculture, which already seek our Lastern clties through the valley of the Ohio, snd which will continue to increase in a ratlo that will almost defy cemputstion, there are lmmense resources of undeveloped mincral wealth, whose tonnage will soon exceed that of all the traflic now done upon the river, and npon all the railroads running nearly parallel whth it through the Western Stutes. The vist treasures of conl, iron, and sslt, are there in storo for the scores of millions which will soon Inhabit the rich valley of the Ohio. But admitting that the river, when improved by locks and dams, would impose a heavy expense for lockage, still the actual experes of nsvigation would be far loss than is now inposec. upon it, ill consequence of the ruinous delays and disruptions of business, arising from the sudden risu and full of the river. Though subjected to tolls at the locks, the certainty and regularity with which teansers could make their trips would more than compensato this cxpense. The whole system of passage and frelght would be systematized, and in the afgregate rendered fur less expensive and hazardous. ladeed, in whatever light this grand scheme may be viowed, It ia matter of surpriso that public attention has not been fully directed to it before, and that statesmen should not long ago have urged its paramount tmportance upon the attentlon of Congress.-See article Miasissapri liven.

Oil (Fr. Huile; Germ. Oel; It. Oine; Lat. Oleum; Ruse. Afaslo; Sv. Aceite). The term oil is applied to
designate a number of unetuous liquors, which, when dropped upon paper, sink into it, and make it seem semilitransparent, or give it what ia called a greasy atain. These bodles are very numerous, and have been in common use from time immemorial. Chemists hava divided them into two classea; namely, colatile and fired olls. Oll was ueed for burning in lamps as early as the epoch of Abraham, about 1921 n.c. It was the staplo comenodity of Attlea, and a jar full was the prizo at tho I'anathenrean gamea. It was the cuatoin of tho Jows to anoint with oil persons appointed to high offices, as the priests and kings, Psolm cxxxili. 2; 1 Sam. x. 1, xyi. 13. Tho anointling with this liquid seems also to havo been reckoned a neceasary ingredlent in a festlval dress, Ruth, iil. 3. The fact that oil, If passed through red-hot iron pipen, will be resolved into a combustible gas, was long known to chemista; and after the process of lighting lyy coal-gas was made apparent, Messrs. Taylor and MartIneau contrived apparatus for produelng oil-gas on a large scale.-Haydis.

Wo borrow from Dr. Thomas Thoman the following atatement with respect to these bodies:
I. Volatile Oils, called also essential oils, are distioguished by the followlug properties: 1. Liquid, fften almost as liquid as water, sometimes viscid; 2. Very combustible; 3. An acrid tasto and a strong fragrant odor; 4. Voletilized at a temperature not higher than $212^{\circ}$; 5. Soluble in alcohol, and imperfectly in water; 6. Eraporate withont leaving any atain on paper. By this last test it is easv to discover whether they have leen adultecated witl. any of the tixed oils. Iet a drop of the volatile uil fall upon a sheet of writing-paper, and then apply a gentlo heat to ft ; if it ovaporates without leaving any stain upon the paper, the oll is pure; lut if it leaves a stain upon the paper, It has been contaminated with some fixed oil or other. Volatile oils are almost all olitained from vegetables, and they exist in every part of planis-tho root, the bark, tho wood, the leaves, the Hower, and even the fruit, though they are nerer found in tho sulstance of the cotyledons; whereas tho fixed oils, on tho contrary, are alnost alwaya contained in these bodies. When the volntile oils are contained in great abundanco in planta, they are sometimes obtained by simple expression. This is the case with oil of oranges, of lemons and bergamot; but In general they con only bn obtalned by distillntion. The part of the plait containing the oil is put isto a atill with a quantity of water, whlch is diat ed off hy the application of a moderate heat. The oil cume over aloug with tho water, and awimn upon its surface ; the reveiver. By this procesa are obsained atto oils of peppermint, thyme, lavendor, and a great many othe's, which are prepared and employed by the periumer. Olitors are procured liy tho distillation of recinous bodies. This is the case in particular wilh cil of turpentino; which to oltained by distilling a kind of resinous juice, called turpentine, that exudos from the juniper. Volatile wla pra exceedingly numerous. They have ieen long known; hat as their use in chenistry is but limited, they have not hitherto been subjocted to an accurate chenical investigation. They ditfer greatly ia their properties from each other, but it is imposaible at preaent to give a detailed account of each.

1. 'The greater number of volatile oils are liquid; many, indeed, are as linuid as water, and have none of that uppearance which we usually consider oily. This is the caso with the following; natuely, oil of turjeculine, oranges, jemons, berganut, roses. Othern have the oily viscidity. It varies in them in all degrees. This is the cang with the oils of mace, cardamom, sassafras, eloven, cinnamon. Others havo the property of becoming solid. This is the ease with tho oils of parsley, fennel, anise soed, balm. Others cryatalize by slow evaporation. This is the case with oll of thyme, pejpermint, marjoram. The oll of nutmegs has usually tho conaistence of butter. This is the case also with the oils of hops and of pepper. 2. The coiur
of the volatile oila ia as various as their other properties. A great number are limpid and colorless; as oll of turpentinc, lavendor, rosemary, savine, aniss seed: some are yellow; as apike, berganot : some are brown; as thyme, savory, wormwood: others hlue; as camomily, motherwort: others green; as milfoil, pepper, hops, parsley; wormwood, eajepnt, junlper, sago, valerlan: others, though at first colorlens, beconie yellow or brown by age; as cloves, cinnamon, sassafrns. 3. The odore are so various as to defy all deccription. It ls anfficient to say, that all the fragrance of the vegetable kingdom resites in volatlle oils." Thir taste is acrid, hot, and exceedingly unpleasnnt. 4. Their specfic gravity varies very conalderably, not only in different oils, but even in the same oll in dif. forent clrcumatances. When the volatile oile are beated in the open alr, they evaporate readily, and without elteration diffuso thelr peculiar odors all around; but there is a considerable difference between the different oila in thia respect. When dlstilled in close vessels, they do not ao readily aasume the form of vapor. Hence they lose their odor, become darker in color, and are partly decomposed. Olle do not secin very susceptible of nasuming the gaseous form, unless somo other eubstance, as water, he present.
2. Fixed Oils are distinguikhed by tho following characters: 1. Liquid, or ensily becomo so when exposed to a gentle heat; 2. An unctuous feel; 3. Very combustiblo; 4. A mild taste; 5 . Boiling point not under $600^{\circ} ; 6$. Insolublo In water, and nearly so in alcohol; 7. Leave a greasy stain upon paper.

Thesc oils, which are called fat or expressed oils, nee numerous, and aro obtalned partly from animals and partly from vegetahles, by aimple oxpression. As instances, may bo mentioned whale oll or train oil, obtaincd from the blubber of the whale and from cod: olive ôil, oltalned from the fruit of the olivo; linseed oil and al. mond oil, obtained from linseed and almond kernels. Fixed oila may also be extracted from poppy sceds, hemp seedf, beech mast, and many other vegetable substances.

All these oils diffice from each other In several particulars, but have also many particulars in common.

1. Fixed ofl is usually a lighuld with a certain degree of viscidity, adhering to the sides of the glass veasels in which it is contained, and forming stresks. It ia never perfectly transparelit; has always a certhin degreo of color, most usually yellowish or greenish; its taste is sweet, or nearly insipid. When fresh It has little or no smell.

Thero exist also in tho vegetable kingdom a considrrable number of bodies which, at the ordinary tem. perature of the atnosphere, are solit, and have hitherto been considered as fixed oils, l'alin oil may be mentioned as an example. The various aubstances used in India and Africa ns substitntes for butter, and as unguents, may liku wine be nientioned.
2. All the fixed oils hltherto examined are lighter than water, but they differ greatly froms one another In apectic gravity. The samo difference is ohservalle In different samples of the same oll. Fixed oil, when In the state of vapor, takes fire on the eppreach of an ignited body, and luirns with a yellowish white finme. It is upon thia principle that candles and laups hurn. The tallow or oil is tirst converted into a state of vapor In the wiek; it then takes fire, and supplies a sumicient quantity of heat to convert nore oll into vapor; and this process goes on while any oil remalns. The wick is necessary to present a sufficienlly small quantity of oll at once for the heat to act upen. If the heat wero great enough to keep the wholo oil at a temperature of $600^{\circ}$, no wick would be neeessary, as is obvious from oil catchinge fire npontaneously when it has heen raised to that temperature. When oll in usel in this manner, either In the open alr or in contact with oxygen gas, the only now products ( 'italued are water and narbonic neld. The drying olls are used os tho vehicle of paints and varmishes. Iinseed, nu!, jopiry, and

homp-seed oila lolusg to this class. These olls in their natural state possess the property of drying oils, but Imperfectly. To prepare them for the use of tho painter and varnish maker, they are holled for some thme in an Iron pot, and sometimes burned till they beceme vlscid. When they burn for aome thine, their unctuous quallty la much more complotely deatroyed than by any method that has been practiced. Hence it is followed frequently In preparing the drying oils for varaiahes, and always for printers' lnk, which requirea to be as free as posalble from all unetuosity. Nut oil has been found preferablo to all other oils for printers' ink; though the dark color which it acquires darling boiling renders it. not so proper for red ink as for black. Linseed oil is cons! Aared as next after nut oil in thls respect. Other olls cas not be employed, because they can not be sufficiently freed from thair unctuosity. Ink made with them would be apt to come off and smoar the paper while in the hands of tho booklinder, or oven to spread beyoud the mark of tho types and stain the paper yellow.

The kind of oll used for burning in lampa varies, in different parts of tho world, with the sources of supply. Whate oil is used in Great Britain, but seal oll, fish oil, and oils obtained from seeds by pressure are also
largely conaumed. In Paris the oils of rape-seed and of poppy-seed aro used; and in the south of Prance, and in Italy, an inferior klad of olive oil, and also the oil of the earth-nit, are employed. In the latter country a lainp oll ia expresaed from grape-atones. In Piedmont walnut oil ts common; oll of sesamum-scel is burned on the eastern and southern coasta of the Mediterrancen; while in tropical countries cocoa-nut oil, which is solld in the climate of Great Britain, is generally used. In China, the Camellia oleifora is cultivated for the aske of the oll obtained from fta seeds; slao a ahrub, Croton sebiferum, the frult of whlch ylelds a useful oil. In consequence of the deficient supply of tallow during the laie war with Rusais, inquirles havo been set on foot in various parts of tho world as to the seeds and other vegetablo products from which oil may be obtsined, and the result of those inquirice has already shown that many oll-yieldIng substances, not before known In commerce, oxist. The export of olls from the East Indies, especially gingelly, has greatly increased. Plstachio-nut oll is becoming common, as is also ground-nut oil from Africa. All these oils are used for burning in limps.

The following is a list of tho plants whlch yleld the ordinary unctuous oils of commerce:

Candia.-A fair erop ur ybeld of olive oll is estimated at two million gallons, and two and a half millions nu atundant erop. Alliough Immenae numbers of ollvetrees were cut down during the "Greek war" and the civil commotion in 18.10, the populatlon is atill insutficient to stlend to them, and the only culture they receive is slightly plowing tho ground on which they shanl. The fritit ls allawed to drop from the tree, when it ls collected hy women nud childron, who recelve for their trouble one-third the quantity thoy collect; If the crop la abumbant, generally one quarter is lost for want of hands to culloct it. In the district of Oprokero the frult is beaten from the trees, evidently to its injury, for it is smeller in that section then in any otiser part of the island. The fruit is collected in hoaps and taken to a wooden mill of very primitive and rough construction, operated by four men. The oil from the first presaure belongs to the owner of the
olives, out of which the government eceives one-tenth ; the mass is again pressel, and one-third quantity, in comparison with the first pressure, is obtalned, although of an inferior quality; this iz divided Into ienths, one of which belongs to the goverument, two dividel among the workmen, and the remainder belongs to the owner of tho mill.

WHAIE OIL
Etatement of the quantities of Oil anb Bone tran-
simpprid at tilk Saniowioh lalanis in 1854 .

Aninstance of tho demand for oil is manifest in the 1700,000 gailons a year, at an average of thirity-threa palm-oil trade with the west coast of Africa. A few cents a gaition; and with the United States as much yesra ago - probably less than tifteen-paim oil, in more. For lubricating machinery, particuiariy in the west of Africa, was worth a dollar a gallon, and steam factories and on railroada In Great Britain, this a late account from that regian says not one thousand oil is used more than any or all other articles, belng gallons left the conutry in a year. Now the traffic both cheaper and better. There is now a montily iine in that articie with Great Britain aione amounts to of steamers from Southampton to the west coast of Af-
rlea, the Madeira and Canary Irlea, Bristol has fiftyfour ehips In the trade wlih that coast; Iiverpool thirty-flre; and the entire number from Gremt Britain, hoth steamers and sailling vessels, is not lera than one hundred. Some of these are ships of 1000 tons burden. Preaident lloberts, of Liberia, says twenty ship.loads of palan oll go frum Monrovia every year. The import of otls into the United States has beca as follows:

Benzole, or Coal Oil, is a new disovery of poviacts; oll from certain klads of bituminous roal. At 'loverport, Kentueky, on the Obio liver, are extensive new works, runing twelve retoris night and day, consumIng from eight to ten tons of coal every twenty-four hours, and producing 750 gallons of crude oil. Re-distiflet, this quantity yields 600 gallons of refined oils; vix., 125 gallous of henzole, 75 of naphtha, 225 of lubrientiog oil, and 175 of ail for illumbating purposen. the...isle neadily sells nt 8150 per galion; lubricuting oil at \&1 25 ; maphtha and hurning at eighty cents. I'reparations are making at Cloverport for the manufacture of a beauiful semi-transparent candle from the substance called "parafline," resembling spermaceti, and which la furmed in pearly ersestals in the dark oils of the tast distillationa after they have coolet, 'The paraline, as remarked by Jrofessor Silliman, Jun., dorn not exist ready formed in the uriginal crude product, but is a result of the high temperature employed in the procesi of distillation, by which the clements are newly arranged. It derives its name from the unalterable nature of the substance under the most jowerful chemian agent. The readumm from the last distillation makes the fis:\% inality of asphaltum, used for
smearing vaulta, eis., aow imported and sold at thit ; dollars perton.

Oll-painting. laintling in which the medlum for usiog the colors is oil. It is sald to have been un. known to the ancients, and not used carlier than the fourteentis century; Its Invention being attributed to John Van Eyck, sometimea called John of Bruges, By hima It was supposed to havo heen innarted to ona Antonio da Messina, who tirst brought it to Veniee. Giovannl Bellini, by a stratagem, got possession of the secret from him, ard then minde it publicly known. Oil-painting has the advontages, above all other moiles, of affording great delicaey of execution, a union and Insensible blending of the colors, and, ahove all, that of imparting great force to its effects. The various colors chiefly used in oil-painting are white-jeal. Cremnltz white, chrome, king's yell sw , Naplea and p $九$. eut yellow, the ochres, Duth's wra, terrs ith Sienna, vellow lake, vermilion, red-lead, Indian and Venctian rell, ise several surts of lake, brown pink, V'andyka brown, burnel and unburned umber, ultrumarine, Prusstan and Antwerp blue, ivory Hack, blue blaek, osphaltum. The princlpal oils are those extracted froin the poppy, nut, and linseed. With the latter, driers are introduced.-See Painta,

Oldenburg, a state of dermany, in the northwest, with the title of Grand Duchy, compesed of threo sep. arate portions: 1st, The Duchy of Oldenlurg, which forms elght-nintlis of the territory. It is surrounded by Ilanover on the cast, south, and west, and bounded north by the North Sea; capital, Odenluurg; 2d. The l'rincipality of Jabeck, or Eutin, inclosed in the Ducby of Holstein (Denmark); and, 3d. The I'rineipality of Hirkenfeld, between Rhenish Prussin and Ilolstein Homburg: capital, llikenfeld. Area, 2421 square miles. L'opulation ln 1852, 28!,923. Oldenhurg lies in tho basin of the North Sea, and is entirely llat. Soil in gencral fertile, but in several places are extensive sand dunes and marshes. Corn raised insulticient for consmmption. Pasturage excellent ; horses, eattic, and sheep extensively reared. Manufactures confined to linen-wcaving and coarse woolens. Revenue (estimated), $18.54,8: 1,000$ thaters; expenses, 959,000 thalers; publie debt, $1,600,000$ thaters. Oldralury, the capital, is situated at the conflux of the llunte with the Ilaaren, vi.ich hero forms a small port, eighy miles wer southwest of Ilamburg. Population, 8229. It is we residence of the Grand Duke. Popmation of circle in $1 \times 52,59,453$.

Olibanum (Frr. Eincens; Ger. 1 beiranen; It. Olibeno; Arab. Aaoban), a gum-resth, the produce of a large tree (libanus thurifera) growing in Arabia and India. It is imported in chesta, containing each about one cwt., from the Levant and India; the leat comen from the former, and is the produce of Arabia. Gool olibanum is in semfotransparent tears, of a pink color, britule, and admesive when warm. When burned, the otlor is very agrecable; its taste in bitterim, and somewhat purgent and aronatic; it hamen for a long timo with a steady, cloar light, which is not casily extinguinhed, loaving beltind a black (not, whas beensaid, a whitinh) ath. Olibanum is the frankincense (thus) of the ancinuta, and was extensively used by thes in sacriticen. -l'bixy, Nut. Ifist. It hat also been used in the ceremomies of the fireek and Roman churches-Aixabie'n Material Indica; I'romsox'a Chemistry; Kurusen, Antiq. Rum.

Olve, Olives (Fr. oliven; Ger. ohien; It. Paire, olive: Sb. Areituman; l'ort. Azeitomas: lat. (hira'), a fruit ydelliug o large quantity of oil, the produce of the Alea, or olive-tien. The wild oliva in indigenous to Syrla, (ircece, and Afrion, on the lower slopass of Mount Atlan. The cultivatide rgocies krows rpontancously in Syrin, and benstly renred in Spais, Italy, and the suntio of Jrance. it hasaren treen raised in the open air in Fingiand, but it: frnit is saill not to have ripure ed. The fruit is a smooth, oval plum, shout thires quarters of an anch in lengeth, and hulf an inch in diameter: of a deep violet color when ripe, whilish atul tleshy within, hitter and nauseous, hut replete with a blaud oil; covering an oblong, pointed, fouzth nut. Olives intended for preservation are gathereyl lefure they are ripe. Ia picklinf, the ohject in to remove their hitterness, and to preserve then green, hy ims pregnating them with a brine of aronatlzed cea-site;
for this pu wood of th agrevable maliers, ol ceptihlu.

Olive Oil (Ger, Baumol; Fr. Ifuile dolires; It. Olio duli. 1: Sp. Aceite de aceitunas; Lat, Oleam licarum). Then , iva-tree is principally cultivated for tha sake of it. "This is an insinid, in odorous, ?vlo ereenisbyelien enlored, wiacid fluid, unctuoua to the feel, inHaw :ole, Incapable of combly ang with water, and neari. insoluble in alcohol. It is the lightest of all the fix i , jls; and is largely used, particularly in Greece, lu.'; Spaln, 11 France, as an article of food, and in wed' ne and the arta, It is also very extensively w- in England, particularly in the woolen manuiacture. The ripe fruit is gathered in November, and imauedia'ely bruised in a $\mathrm{m}^{\text {| }}$, the , ues of which are set so wide as not to crasn the kernel. The pulp is then subjected to the press in baga made of rushes; and by means of a gentle pressura, the best, or virgin oil, flows first; a second, and afterward a third, quality of oil is obtained by moistening the residunm, breaking the kernels, etc., and increasing the pressure. When the frult is not aufficiently ripe, the recent oil has a bitterish taste; and when too ripe, it is fatty. After the oil has been drawn it deposits r white, tilbrous, and albuminous matter; but when this deposition has taken pluce, if it be put into elcan glass tlasks, it undergoes no further alteration; the eommon oil can not, he:sever, be preecrved in casks above one and a hulf or two years. It is sometimes adulterated by the admixture of poppy oil.-.-Tnomson's Inispensutory. The best olive of is said to be made in the vicinity of Aix, in France. That which is brought from Leghorn, in chesta containing thirty bottlea, or four English gallons, is also very superior; it is known in our markets by the name of Ftorence oil, and is used mostly for culinary purposes. Olive oil is the principal articls of export from the kingdom of Naples. - See Napres. Apulia and Calabria are the provinees most celebrated for ita production. The Apulian is the best, and is preferred by the woolen manufacturers, by whom it is extensively used. By far the largest portion of the olive oil brought to England is in general imported from Italy, principally trom Gallipoli, on the east coast of the Gulf of Taranto (which see), whence it is commonly known by the uame of Gallipoli oil. Dut besides Italy, Spain, Turkey, the Ionian Islands, ete, send us large quantities.
vil Trade of Naples..-The oils of tha kingdom of Naples are produced in Apulia, from Lsari to ita southern extromity, the Capo di leuca, a district comprising tha territories which export from Gallipoli and Taranto; and in Calabria from Rossano, on the Gult of Taranto, across to Gioja. The wholo coast from Gijoja as far as Gaeta is covered with olive-trees. They are also abundunt in the Abruzzi and the Terra di Lavora; but Apulia and Calabria furnish by far the greatest quantity of oil. The principal magazines, or curicatri, for oil, are at Gullipoli and Gioja. Gallipoli suppties England, Holiand, the north of Europe, and, in slart, all those countries that require tho most perfectly purified oil. It is clarified to the highest depree ly merely keeping it in eisterns hoslowed out of the rock on which the town is built. The voyuges it las to perform being long, it is put into casks ao well constructel that it frequently arrives at l'etersbarg in the heat of summer without the least waste or leakuge -an advantage attributed to the seasoning of the atayes, which, before they are pat together, are well soaked in seu-water.

The oil recelved into the cisterna in Gullipoli, either belongs to the proprietor, who buys it of the phanter, or is received $\mathrm{l}_{\mathrm{n}}$ drposit on account of amo other party, who geta a receipt (biglietto di mugazino) aprecitying the quantity of the oil recelved on his account, its quality,
etc. Depoaitors pay at the rate of 20 grani a year for avery salma of oll to the party holding it in deposit, and who is bound to account for it. The caricatori of Bari and Monopoli furniah oils for the conaumption of Upper Italy and Germany, through the medium of Venice and Trieste. They also draw supplies from Ilrindisi and Otranto, The caricatori of Taranto, of Eastern Calabria or Retromarina, and of Western Calabria, the prineipal of which is Gloja, furulsh supplies for Marseilles, etc. But the caricatori now mentioned, having no convenlences for clarilication, produce only the thir, olls used for soap-making. The oils of Sicily, lise thase of Tunls, are too thin to be used singly in the minklng of soap; and, beling ased only for mixing, are liss valuuble than most othera. A full crop of oll in the province of Terra d'Otranto is sapposed to yield about 300,000 salme, or 41,666 tuns. To facilitate transactions, orlers or cedules are circulated, representing quantitles of oil deposited In the provincial caricatori. These orders are negotiable, like bills of exchange, and are indorsed by the intermediate holder, who receivea their value in cash, without, however, becoming liable Cor their due satisfaction. The only reaponsible parties are the drawer and drawee. The latter ls obliged to deliver the oil at sight of the order, or to hold it at the bearer's disposal, till the 10 th of November for :be caricatori of Apulia, and till the 3Ist of Dee,
those of Calabria. If the contract lee for tim from one year to another, the oil ia usuall. the purchaser's command on the 1st of M chases for , 1 uF wherein the are effected by means $n$ " the end of January, on receiving payn: on dis ther: ey; but the cil, as observed above, is not tsan . It a purchaser's disposal before the begin. 1 g oi farch. IIence, in time bargains, the payme: of the money precedes the delivery of the oil mon ...: onth: scarce an instanco is on record of an ..os ; ment of this sort having beell broken, and the ular is as readi)y negotiable as any other security'. In purchases of oil at command, payment likewise precedes the delivery of the article; but in this case the advanco is confined to the tive days necessary to transmit the order to the caricatore where the oil is kept for dellvery. The oil remains in the caricatore under the care and responsibility of the vendor, to be delivered ondemund to the bearer of the order, free of all costs and charges whatever for the first year; but for every successive year from 25 to 30 grains per salma are elinged for keeping, and for renewal of warrunty. (We are intebted for these details to a very valuablo Keport ly Mr. Stecl, British vice-consul at tinllipoli, and to a brochure of N. Millenet, entitled Couy de (Eil sur be Royamme de Naples. Naples, 1832.) Fur the trade in Otiec oit, see article Ons.s.

Olive-tree. The wood of the olive is heary, compact, fine-grained, and brillinat. The sap-wood is white and soft, and the heart-wood hard, brittle, and of a reddish or yellowish tiat, with the pith nearly effaced, as in tho box. It is employed by enbinet-makers to intay the ther species of wool, which are contrasted with it in color, and to form light articles of ornament, such us dressing-cases, snutf-boxes, etc. The wood of the roots, which is agreeably marbled, is pre. ferred to that of the trunk. On account of its hardness and durability, the wood of this tree was anciently used for the hinges of doors; and, before metal becanne common, it whs seleeted by the Greeks for the images of their gods. From its resinous and oleaginous natare, the wood of this tree is oxceedingly conbustible, and barns as well before as after it is dried. There exudes from its wood a gum, which is sometimes sold for gum-clemi. There is also extracted from this tree a substance called olirine. Tho bark contains a bitter principle, and is regarded as tonic and febrifugal. The leaves are astringent.

The olivea are tirst bruisod by a mill-stone, sufil-
cietitly hard as not to break tha kernels, and are then put lite sacks of coarse Ined, foatheragrass, or of wool, and subjected to heavy prossure, by whleh means the most fluld and the bent liquor is forced out, and is called eirgin oil. It la recelved lnto vessels half filled with water, from whleh it is skimmed, and put Into tube, barrels, and boteles for use. Several coaraor kinds of oil are afterward obtalned, hy addlug hot water to the brulsed frult. The beet olive oll is of a bright paleamber coler, withont anell, and bland to the taete. Kept warm, it becomes raneld, and at $38^{\circ}$ Fuhr, It congeals. It is of the same naturo as all mild ex. pressed vegetahle olls $\mid$ of these the most fluld are preferred, and hence the oils of ollves and of almonds are those chletly used in medicine. One of the most eatoemed kInds of oil is that produced at Aix (Huile d'Aix en Provence). Florence oil is also a ine kind, imported froin lewhorn in Hasks surrounded by a kind of network, formed of the leaves of a monocotyledonous plant. These are the kluds of olive oil In most frequent use at the table for salads (hence they are called Salad oils). Lucca ail is imported in jars helding about nineteen gallons each. Gienon oil la a fine kind. Gallipoli oil In imported in casks, and conatitutes the largest porslon of the olive oll imported into England. Sicily oil Is of an inferler quallty. Spaniah oil la the wornt, The foot deposited by elive vil is used for olling machinery, under the name of 1 troppinge of Anoet oil.

Anvother important advantage afforded by this tree is Its fruit In a pickled state. It is gathered unripe, and sutlered to steep in water for some days, and is afterward put into a lye of wator and barila, or kall, with the sabes of olivg-stores, or with lime. It is then put up in earthen boteles, or in barrele, with solt and water, and in this state ly ready for ure. Olives are eaten before, as well as after meala, and are believed to excite appetite and promoto digestion. The finest Lind of prepared fruit is known in conmerce ly the name of Preholines, after one Picholini, an Italian, who first discovered the art of pickllige ollves. The frult of the olive la of a pleasant taste, and is eaten by the modern (irceks during lent, in lit ripe state, without any preparatlun, except with the addition of a litile pepper, salt, and oil. From the value of its products, in a commercial peeint of viow, aside from other considerations, the culture of the olive strongly claims the attention of the American agriculturist, and the trial should be made in every place where les faiture is not certain, and for this purpose young grafted trees of harly and choice varieties should he obtained from Europe, and the formation of nurseries inmediately begun. A porition of Texar, L.oulsisna, the islands of Georgia, and chosen exposures of the interior of the last-named State, st well as of momo of the Western Statex, California, or of Uregon, will be the scene of this species of culturn, if ever attended with succoss in North America.- H Howsw's Truen of America.

Omoium, a term used at the hinglish Stock Iixcharuse, to express the aggregate value of the different stocke in whicha lomn la now usually funded. Thus,
 Jene, $1 k 15$, the emulum conslated of $\mathcal{E} 1303$ per cent. reducsd annuities, $\subset 143$ per cent. consoly, abil $\mathcal{C 1 0} 4$ per cent. annuitiex, for cach $£ 100$ nulwacribed. the lonn was eontrised for on the Isth of Iune, when the pricen of the bove stocka were- 3 par cant. reduced, 51 ; 3 per cent. consols, 55 ; 4 per centa., 00 ; hence the parcels of ittock given for $\mathcal{S 1 0 0}$ advaned, were worth-

which would be the value of the omnium, or 218 BA , per cent. premiam, independently of any discount for prompt payment.

Onfon (Ger. Revicbcl; Fr. Oignon; It. Cipolla; Sp.

Cebolla; Rusa, Luk), a well-known bolbous plant (All. um Cepa, Linn.) caltivated all over Europe and the U. States for cullnary purposea. The Stradurg, Spian. leh, and Portuguese varietles are the most estermed.

Ontario, a lake of New York und Canada, easternmost and smallest in extent of the five great lakes of North America. It is between $48^{\circ} 10^{\prime}$ and $44^{\circ} \mathrm{N}$. Iat., and between $76^{\circ}$ and $88^{\circ} \mathrm{W}$. leng. It recelves Ningara River, the great outlet of the upper lakes, In lis seath western part, and has its outlet by the St. Lawrence River In lte northeastern part, in whleh, Immediutely below the lake, Is the eluster denominated the "T hou. sand Islands." Its shape approaches to a long and narrow elllpse, being 190 miles long, and 65 wide in its wlilest part, and about 480 miles in ciroumference. If is In some places over 600 fect deep, so that its bottorn is conslderably below the level of the Atlantic. Its sur. face is 030 feet below the level of Lake Erie, and 134 ; feet above tide-water. In every part it has suficient depth of water for the laigest vessels. It has many good harbors, and is rarely frozen excepting in shallow parts near the shore. The princlpal rivers which enter It from the southern side are the Genesee, Oswego, and Black rivers, and a large number of creeks. The lay of Quiate is a long and Irregnlar body of water on its eastern part, which receive a considerable rlver, the outlet of several small lakes, and Burlington bay is in its western part, Both these bays are ill Canulu. It hat several linportant places on its shores, tho priacipal of which are Kingston, Toronto, and Coburg, in Canada; and Onwego, Sackett's Harbor, Port Gbesese, or Charlotte, in the United States. It is sulgect to violent storms aud heavy swells. It is comnceted with the Nirie Canal by the Oswego Canal, and from thence the Erie Canal forma a navigable communication with the Hudson liver, a llistance of 209 miles ; and much of the trade of New York for the 'Vest passes through it and through the Welland Cansl, which is 28 miles long, with 27 locks, and admits the passage of the largest vessels which navigate the lakes. This canal commences at Sherbroke, near the mouth of Graod Kiver, on lake Erie, and terminates at loot Dalhotpsie, on Jake Ontarlo, nine milea weat of Niagarn village. Ita entrance being a consiferalle distance west of the outlet of Lake Erie, it is open earlier than the Erie Canal at IUutialo, where the ice uften accumulates In the spring. The Rideau Canal forms a navigable commanication with the Ottawa River, 126 miles. It hus 15 light-houses on the American shore, and 13 on the Canadian side.-Wce Lakes, Commerce of.
Onyx (Grr. Onyx ; Fr. Ouix, Onice; Sp. Onique; Lat. (/ayx). Any stone exhibiting layers of two or more cylurs atrongly contrasted is callod an onyx, as banded jasper, chalcedony, etc., hut more particularly the latter, when it la merked with white, and stratitied with opaque and tranalucent lines. Itat the triental ousx is considered a substance consisting of two or mone layers or bands of distinct and dittercht colors. A sard, or ardobine, liaving a layer of white upon it, would be called an onyx; and according to the namler of layers it would has distinguished as an ony $x$ with three or more bands. Souse of the antique eugravings are upon onyxes of four bands.--Mawn's Treatise in Diamonds, et".

Opal (tier. Opal; Fr. Opale; It. Opalo; Sp. Opulo, Piedra iris; Port. (ppala; lat. (palus), n stone, of which there are bavernl varicties, found in cullerent parts of Enrope, particularly in Llungary, and in the East In. diez, etc. When tirst dug out of the earth it is soft, but it hardena and diminishes in bulk by exposure to the sir. The opal is alwaya amorphous; fracture cone choidal; commonly somewhat transparent. Hariness varies conslderably. Specific gravity from 1.958 to 2.51. Ihe low ness of its specifie gravity in some cases is to bo ascribed to accidental cavities which the stone contains. These ure sometimes illed with drops of water. Some specimens of opal have the property of

Oplum (Ger. Mohneafi; Fr. Opium ; It. Oppio; Sp. and I'ort. Opio; Lat. Opium; Arab. Ufyoom; IIInd. lifeem; Turk. Madjoon), the concrete juice of the white puipy (Papaver sommiforum), which is most probably a native of Asla, though now found growing wild in the southern parts of Europe, and even in Engiand. Opium is chiefly prepared In India, Turkey, and Persia; but the white poppy is extensively calivaied in France and other parts of Europe, on account of its capsuics . id oit the useful bland oil obtained from its seods. It has uso been cuitivated, and opium mado, in England; but thers is very littie prebability of its ever being raised here to any considerable extent. The poppy is an annual plant, with a stalk rising to the beigit of three or four feet; its leaves resemble thoso of the fettuce, and lits flower has the appearance of a tulij. When at its full growth, an incision is mado in the top of the plant, from which there issucs a white milky juice, which soon hardens, and is scraped oll tho piante, and wrought into enkes. In India, these are covered with the petais of the plant to prevent thoir sticking together, and in this aituation are dried, and jacked in chests lined with hides anil covered with guuny, each containiug forty cakes, and weighing two maunds, or 1491 ibe.; they are expertod in this atate to the piaces where the opium is consumed. Turkey opium is in flat pieces, covered with toaves, and the reddish capsules of some species of rumex, which is considered an indication of its goodness, as the inferior kints have none of theas capsules adhering to them. According to Dr. A. T. Thomson, Turkay opium has a peculiar strong, heavy, narcotic odor, and a bitter taste, accompanied by a sensation of acrid heat, or biting on the tongue and lips, if it be well chewed. Its color, whet good, is a reddish brown, or fawn color; its texturo compact and uniform. Its specific gravity is $1 \cdot 336$. When soft, it is tenacious; but when long exposed to the air, it becomes hard, breaks witio a uniform shining fracture, is puiverulent, and afioris a yeliowish brown powder. East Indian opinm has a strong empyrematic smell, but not much of the peculiar narcotic, heavy odor of the Turkey opium; the taste is more bitter, and equaily nauseous, but it has less acrl. mony. it agrecs with the Turkey opium in other sensihe qualities, except that its color is biacker, and its texture fess plastic, although it is as tenacious. Good Turkey opium has been found to yield nearly three times the quantity of moryhia, or of the peculiar principle of the drug, that is yiedded by last Indian opium. Oplum is regarded as bad when it is very soft, greasy, iight, friabie, of an inteusely black color, or mixde with many impuritios. A weak or empyremmatic odor, a siightiy bitter or acrid, or a awcetish taste, or the power of marking a brown or black continnous streak when drawn across paper, are all symptoms of inferior opium.-Ihspensatory. The raising of opium is a very hazardous business; the joppy leing a delicate plant, pecuitarly iable to injury from insecta, wind, haii, or unseasonable rain. The produce seidom agrees with the true avorage, but commonly runs in extremes; whiie one cuitivator is dieappointed, another roaps immense gain. One season does not pay the labor of the euiture; another, pecuiarly fortunate, ellriches ail the cultivators. This cireumstanco is well suited to allure man, ever confident of good fortune.Colenneons's Husbandry of Bengal.

The Opium Trade.-TThis drug ls chiefly grown in British India, where it has long been a strict monop-
y of the govarnment, and also in Persia and Turkey. It was first Imported Into China by tha Portuguese; but up to the year 1708 tho whole quantity importel did not exceed from 100 to 200 chesta annuaily. The East India Company commenced its Importation in 1778-1; and in 1780 small dépots for its sale waro established a little south of Macao. The trade continued to Increase rapidly fi $m$ India untll 1794, when large English shipa found it profitable to anchor near Whampen, for fifteen montha at a time, seling opinm. In 1800 its salo had risen to about 2000 chests ; but rocently its further importation into Ciina was prohibited. Since that period the smugglor succeede the iegal importer ; and al!hough the importation is no longer conducted in the vessels of the East India Compeny, It is extensively cultivated under their monopoly, and sold by them to private traders, by whom it is introduced into the prohibited markets of China.

Consumption and Trade of Opium in China.-Opium is pretty axtensively used, both as a masticatory and in smoking, in Turkey and India; but its great consumption is In China and the surrounding countries, where the habit of smoking it has become almost univorsal. The Chinese hoil or seethe the crude opium; and by this process the Impurtics, resinous and gummy matter, aro separated, and the romaining exitract only is reserved for use. Thus prepared, the drug loses ita orlinary strong and offensive aromatic odor, and has even d fragrant and agreeable perfume. A small ball of It, inserted in a large wooden pipe with some combustible matter, is lighted, and the amnteur proceeds to inhale four or tive whiffs, when he lics down and resigns himself to his dreams, which aro said to have no incor-aiderable resemblance to the sensations produced ty inhaling the oxyd of azote. Those who do not carry the indulgence to excess do not, it is said, experienco any bad effects from it. Nine-teuths of the supplies of opium for the consumption of China have always ijeen dorived from India, a comparatively small quantity only teing derived from Turkey. The trade has always been contrabs.nd, the introduction of the drug hnving been prohibited by the Chinese government. Untij about 1810 the trado had not attracted much attention, or become of any very great importance, but it has since been very greatiy extended, and has been since 1828 of first-rate consequence. The trado was at first carried on at Whampoa, about fifteen miles below Canton; next at Macao, whence it was driven by the exactions of the Portugucse; and thereafter in the Bay of Lintin. Here the opium is kept on board ships, commonly called recelving ships, of which there are often ten or twelve lying togetiser at anchor. But latterly tise trude bas been carried on all niong the southeast coast of Cinina, by means of a species of fastsaiiing vessels called "clippers," built expressiy for the trate and atrongiy armed. The sales ere mostly effected by the English and Americall agents in Canton, who give orilers for the delivery of the opium; which, on producing tise order, is handed over to the Chinese smughter, who comes along sido at night to reccive it. Frequentiy, howover, the amuggler purchases the opium on his own account, paying for it on the spot in sllver; it being a rule of the trado, never departed from, to receive the moncy before the drug is delivered. During the first ten years of the present century the exports of opium from India to Chinn averaged nbout 2500 chesta, of $149 \frac{1}{2}$ jounds each. But after tho introduction of Malwa opium Into the markets of Bombay and Calcutta, the exports began rapidly to increase.

According to the Friend of India of Calcutta, October, 1855 , the opium sales for the five precedinf years were as foliows :

The price paid to the cultivator is about Rs. 240 a chest.

Confiscation of Vymium is 1839.-Opium bas alwaya been probibiteel ln China, and consequentiy its importation has always been looked upon as a amuggilng opeculation. There would seem, however, to be gooti grounds for thinkiag that the prohibition of the importation of opium was ail along intended to be more apparent than real. At all events, it is certain that the trade grow gradually up, from a amall beginuing, to be one of great extent and value; and it ia contrallictory and absurd to suppose that thin should have been the case bail it encuuntered any conaliderable opposition from the Chinese authorities. But the truth ls, that these functionaries, Instead of opposing the trude, or even merely conniving at it, wore partica to lita teing openly carried on, and received certaln reguiated and large feea on all the oplum that was imported. It has even iwen alleged that a part of these feea foond its way into the Imperial treasury at I'ekin, though that is more doubtful, The appetite for the drug increased with the increasing means of gratifying it; and there appeared to be no assignable limita to the quantity that might be disposed of in the empire. The rapid oxtension of the trade seema at length to have drawn the attention of the court of lekin to the suliject. We doult, however, notwithstanding what has been alleged to the contrery, whether a nense of the injurious conserjuences of the use of the drug had much to do In the matter. This, Indeed, ls a part of the nibject as to which there exieta a great deal of misapprebension; and we are well assured that, provided it be not carrled to excesa, the use of opium la not more injurious than that of wine, brandy, or other atimulants. The alarm of the Chineve government was probably not so much aloout the healith or morais of its ellijecta as about their bullion! They are atill baunted loy the same visionary fears of being drained of a dne supply of geld and silver, that formerly haunted the people of this country. The imports of opium having increased so rapidy na to be no longer halanced by the exports of tea and silk, aycee ailver began also to be exported! The paternal govermment of i'ekin might have toierated what are called the demoralizing effects of opium with stoical indifference, but the exportation of aliver was not a thing to be endured. It is, howaver, only fair to state that the Chinese etatesmen are not all of the school of Mun and Gee, and that some of them appear to have taken an culightened view of tho question, and to have emancipated themselves from the prejudices that stili influence the majority of their colleagucs. The atstesmen in question contendel that, whether the use of the drug were injurious or not, the taste for it was too deeply seatel and too widely ditlused to admit of its effectual prohibition ; and they, therefore, pro-
posed that its importation ahonid be legalized, suljectlig it, at the aane tima, to a hoevy duty. There can not be a doubt that this was the proper mode of deallng with the anlject. In the end, bowever, the gove ornment of Pekin, Inflamenced by unfoundell thearies as to the mischievous effect of the ax port of the preclous metala, cums to a different conclusion, and resolved to put a stop to the traffic. No mooner had this resolution been adopted, than a most extraordinary change appears to have taken place in the conduct of the Chi. nese authorition; and thelr uaual caution acetns to have wholly deserted thom. Thoy now became as precipl. tate and vleluat as they had prevloualy been siow anu circumbpect; and resolved at all hasards to attenipt foreibly to put down the trade. To accomplish this, ail foreigners were, in March, 1839, prohibited from leaving Carton; and compuleory measures were at the same time resorted to for compelling them to deliver up the oplum in their possession. How the alfair might have ended, had the English at Canton been loft to the exereine of their own judgment in this crinis, it la Imposaible to aay; but we have been assecred lyy those on whone atatoments we are disposed to rely, that they wouid most probably have succeeded in getting out of It with comparativaly little loses. Inateail, how. ever, of acting for themnelves, they had to act in obe. dience to the orders of Mr. Elliot, ehief superintendent of the British trade in Canton; and he, while uniler conatraliut, occasioned by confinement to the factory, cemmanded all the opium belonging to British suljeetg to ho given up to him for dellivery to the Chinese nuthorities; declaring, at the same time, that "faili," the aurrender of the anid opium," the British government ahould le free "of all menturea of responsilility or llability in reapect of Britlsh-owned opiam."
We do not presume to offer any opinion as to the necessity or poilcy of this proceeding on the part of the auperintendent; but in consequence thereof, and of the unjustifiable proceedings of the Chinesp, atove 20,000 cheata of oplum were deilvered up to Mr. Niliot by British suljeetn, and ly him to the Chinese authorities; and tho latter, not satisfied with the possession of the opinum, which It was their duty to have phaced in a state of eccurity till the mattera with respect to it should be arrauged, immediately procecded to destroy it! Ilaving succeeded thus fur, the Chinese next inwlated that tho foreign merchants shonld sulserile a bond, pledging thenselvea not to import opiam iutu any part of China; or that, if they did, they were to be justiy liable to the penalty of death. Hut this condition being refused, and no arrangement having been cone to, Mr. Elliot suapended the trade on the 22 l of May. Ore waders do not require to be told that a nar with - tina grew out of these extraordinary proceedings.
Indemaity for the Opium destroyed in China.-'fie question as to the amount of the compensation that should be awarded to the parties who deilvered up the oplum to the auperintendent in China has vince attracted censiderable attention. The merchants contended that they were entitiod to ita cosi , or to the price at whleh it had been invoiced to them, or to above $£ 2,300,000$. It 18 , however, sdmitted ou all hands that the price of opium is exceedingly tloctuating, and that it in influenced In a very ligit degree by varlations in the facilities for smaggling into China. And it was contended by govermment, that suith were the ohatacles thrown in tho way of its clandestine ind portation when the delivery was made in 3839 , that the price of optum had fallen to lese than half its invoice cost, and that supposing the merchants had retained it, they must necesarily have sustained a very liasy loss. llaving taken this view of the matter, goversment proposed that Indennity athouid le made at the rate of $\mathbf{£ 6 4}$ per cheat ( $£ 1,250,000$ in all), teing (though little more than half the sum ciaimed) considersility above the corrent price of opium in Canton previously
to its bel pected, th the whol reasonatil opium ha th owner culties in onder the ing that had inter tion than ference. It should

to its being dellvered up. As might have been expected, this decislon was much found fault with. On the whole, howaver, wo think It ominently falr and ressomable. No one donbts, though not a pound of the oplum had been dellvared up to Captaln ElHot, that lta owners must, in consequence of the lncreased diffcultes in the way of lte sale, have loat heavily; and, under the clreumatanees, we sea no ground for contendIng that government was bound, because thelr agent had interfered, to place the merchants In a better position than they would have been in but for that Inter ference. ${ }^{-1}$ All that they conld juatly require was, that it should not be permitted to injure them.
L'ullication of Opium in India-Monopoly-Revenue, etc.-Oplum la produced in Bengal, principally in the provinces of Bahar anil Benares, In parts of Bombay, and In Malwa; in Central India. In Bengel tha production of oplam is a monopoly, no person belng allowed to grow the poppy except on account of gevern. ment. Thelatter r ,ake advances to the cultivators, who dellver the entlre produce Into tholr hands at a fixed price of ebout $3 s, 6 d$. per 1 lb . It is afterward sold by the Company for ahout 11s. per 1b., so that the proft of the lster amounts to ahout 7s. 6d. per lb. Oplum may be grown und manufactured in Bonbay; but it is anisjoctel to the name high duty that tis imposed on oplum Imported Into the Presidency. The ohject of this high duty is to "diacourage its production." Government purcinase what lletle fa proluced in Ilombay, snpplying through Ilcensed dealers all that is required for home consumptlon. The poppy is extensively cultivated in Malwa, In Central Indla, and ylelds a large revenuc. Down to 1831, It was produced under a monopoly. But in that year the business was thrown open to the public, and the revenue collected by linposing a duty on the oplum when passing throngh the Company's territories to Bombay. The enpture of Sclnde, by elosing the route for the ainuggling of oplum through Kurachee to the Portuguese settlements of Demunn, etc., enabled a large ndeltion to be made to the transit duty on Malwa opium, whlch was ralsed $\ln 18.17$ to 400 rupees per chest, afforiling a revenue to government of about $\delta s$ s. 8 d. per 1 b .- (We have borrowed these anfthentc details from the Offecal Papers relatlve to India, p. 73-75, publlshed in 1853.) No one doubts that opium is an excellent subject for taxation; and the bigher the rate to which the duty on It can be ralsed without encouraglng smuggling, so much the better, But a great deal has been sald for and agnalnst the system under which the oplum revenue is ralsed in hengal and other parts of India; and perhaps it might be the better pollcy to open the culture of the plant to the unfettered compatition of the puhille, Imposing a high duty on the drug when grown or when expertel. Without, however, entering on the dlscussion of this difficult questien, we may shortly observe that the monopoly does not appear to have tho consequences stated by Mr. Colebrooke; who tells us (Husbandry of Bengal, p. 118) that, except $\ln$ n few altuations that are peculiarly favorable, its culture is unproftahle; and that the peasants engage In it with reluctance, being temptel theroto only the advances made ty the government agents. But if such were the case fermerly, it would seem that elrcumntances havo changel in the interval; for it appenrs from the official nccounts that the production of Bengal opium, which amounted to 17,858 chests of 160 lbs , each in $1840-\mathrm{s} 41$, had increased to abont 30,000 chests in $18 \cdot 18-19$. The number of chests of Malwa opium ( 140 lbs . each) exported from llombay during the same period has conthued pretty stationary at about 16,000 a year. The whole, or nearly the whole, of thls immense supply of above ion, 000 cheste, ls sent to China. Latterly it has produced to the government of India a clear revenue of considerably more than $£ 3,000,000$ sterling a year.
It is very doubtful whether the nse of oplum, when taken in moderate quantitles, be so injurlous as lins
been represented. That It may, llke aplrita and wine, be abused, is shundantly certala; but it has not been ahown that it lis more liable tn abuse than elther of these articles. And tha Chinese, by whom it is prinedpally consumed, are a highly Industrious, sober, fragal people.
It is compited that, had Chlna no silk nor teas to give in part payment fer the opfum consumed In tha Celestial emplre, the draln of apecie during the last 30 y 3 ars would have amounted to $\$ 600,000,000$. It la atated In a memorlal presented to the Emperor of Chlna, on the subject of the oplum trade, that the draln from the imperial treasury, to supply thls deatructive luxury, was,

```
From 1829 to 1631.
31.
```

$\qquad$

``` 824,000,000 \(28,000,010\)
4 18 s to 188 H \(40,000,000\)
```

The latter sum, it is stated, is about the average annuai outlay at the present time; and It is consldered by an Intelligent commercial correspondent at Macao quite problematical whether the Chinese would have taken more cotton goods and other Imports from the Unlted States and England, had they not expended so much for oplam. The profts of the East Indla Company, who are entltled to whatever of credlt or discredit may atlach to keeplng up this lucrative trade In oplum, are stated at $\$ 18,000,000$ per annum. If the company succeed In opening new markets for the drus (and it is represented that they are establishing retall shops all over the Indlan emplre), they will be amply relmbursel for their diminished importations Into China, since the Imporiatlon of Turkleh opium in American hottoms has so considerably interfered with their previously almost exclusive monopoly of thls trade. It ahould be added, that the importati on of oplum into China, though Illegal, is openly tolerated by the Chlnese officials, and no difficulty Is experienced in finding eash customers for any quantlty lnperted. From 200 chests in 1756, when the traile was legnl, the importation has risen to from 70,000 to 80,000 chests per annum in 1856, when its introduction is prohibited by law. The value of opium imperted in 1756 was alout \$1,000,000; the value at the present day las risen to $840,100,000$. The hasis of foreign exchange with China is as follows: General imports, oplum (which makes alout 30 per cent. of the whole), bullion and specie, or ilrafts on L.ondon.-Commercial Relations of the United States, 1856-'57.

Cultication in the Cuited States.-A varicty of the "Commen" or "Oplum Poppy" (Papaver sommiferum), Indigenous to the warm and temperate parts of Earepe and Asia, from Portugal to Japan, and especially cul. tivated in China, Indin, Turkoy, Egypt, and in 'e Morea, has been introduced inte the United States, and has proved itself susceptlble of casy cultivation on very rich soils, and is well adapted to the climate of the Nildele and Southern States. The flowers of the "Whtte Peppy" ('aparer s. alba), the variety with which the experiment was mule, may be either entlrely white or red, or may be fringod with purple, rose, or llac, variegated and edged with the same colors, but never eccur blue nor yellow, nor mixed with these colors, ench petal being gencrally marked at the bottom with a black or purple spot. The seede are black in the plants having purple flowers, and llght-colored in those which are white; altheugh the seeds of the latter, when of apontaneous growth, are sometimes black. The largest heads, which nre employed for medical or domestic use, are olitained from the singleflowered kind, not only for the purpose of extracting opium, but also on necount of tho bland, escule:! ,if; that is expressed frem the seeds, which are simply emulsive, and contain none of the narcotic prise ipls. Fer the latter purpose, if no other, its culture in thes country is werthy of attention.

With regard to the cultivation of thls plant, nith the riew of oblaining opium, there can be but little
doubt that our clear sky, fervid aummer sun, and heavy dews would greatly favor the production of this article; but how far theso circumstances, in connection with American ingenulty in devising Improved methods for lts extraction, wonld allow us to compete with the chempness of labor in the East, can only be determined by actual trial. Certainly it is an object worthy of puhllc encouragement, as the annual amount of opium Imported into the United States la valned at upward of $\$ 407,000$, a cousiderable portion of whieh might be saved, and therelyy add to our resonrces. Besldes, if we were to rulae a aurplus, it could be went to Chlua In exchange for tea. The successful cultivation of the plant, however, requires the provision of good soll, appropriate manuro, and careful management. The strength of the juice, according to Dr. Butler, of British India, depeads much upon the quantity of moisture of the chmate. A deficiency even of dew prevents the proper flow of the peculiar narcotle, milky juice, which abounds in almost every part of the plant, while an excess, beaides washing off this milk, cansea additional mischief, by separating the soluble from the insoluble parts of this drug. This not only deteriorates its quality, but increases the quantity of moisture, which must afterward be got rid of.

Opoponax (Ger. Opponax; Fr. Opppnax; It. Opponaseo; Sp. Opopınaca; Arab. Jawesheer), a guusresin olitained from the I'ustinaca Opopomer, a species of parsnep. It ls a native of the south of liurope aud Asia Minor. The stem rises to the height of four or five feet, with a thjek branched yellow-colored root. The root being wounded, a millky juice llows from then, which, belug dri 1 in the sun, if the opopmax of the shops. It is in lumps of a reddisis yellow color, and white within. Smell peculiar. Taste titeter and acrid. Specific gravity, 1-62s. It is imported from Turkey. Being used only to a small extent in medicile, the consumption is Inconsiderable.-Tuomsos's Chemiatly; Aisstac's Materia Indica.

Oporto, or Porto, a large elty and sea-port of Jortugal, on the north bank of the Douro, alreut two milles from ite mouth, laf. $41^{\circ} 10^{\prime} 30^{\prime \prime}$ N., long. $10^{\circ} 37^{\prime}$ 18 " W. It is a scatutifully situated, well-huilt city, and is supposed to contain, inchuling the suburbs of Villanora and Gaya, on the opmosite bank of the river, ahout 80,000 inhabitants. The harbor uf Opurte is n bar harbor, and coo only be entered, at least by vea sels of censiderable burden, at high water; and It is seliom at any time practicable for veasels clrawing more than sixteen feet. On the north nile of the entrance is the cantle of St. Joso de Foz, whence a ledge u? rocky, sonse of which are at all times above water, extends in a southwest direction. The outernost of these rocks, named Filgueira, which is nlways visible, is left on the left or larboard side on entering. Cabedelo Point, forming the southern extremity of the entrance, is low and sabdy. The har being llable, frous
tho action of the tides, and of sudden awellings or freshes in the rlver, to perpetval alterations, it is exceedingly dangerous for any vessel to attempt crossing it with. out a pllot. Pilots are always on the alert, and ready to offer their services when a vessel comes in sight, unless the weather he so bad that they can not go off. On some fow occasions of this sort, vessels have heen datained for three weeks off the port, wlthout iuaving an opportunity of entering. The chapel of St. Catherine in a llne with ihat of St. Michael leads over the bar. The ordinary rise of spring tides is from ten to twelve feet, and of neaps from six to elght feet. A light-house with a revolviug light, hai ing the lautern 220 fuet above the level of the sea, is erected oll ribing ground about 600 yards north-northwest of St. Joan de Foz. The awellinge of the river, or freahes, as they are called, most commonly occur in spring, and are caused by heavy rain, and by the melting of the snow on the mountains. The rise of water at such times is frequently as much as forty fect; and the rapitity and force of the current are so very great, that no dependence can be placed on anchors in the stream. Fortunately, a fresh aever occurs without prevlous warning; and it is then the practico to moor with a cable madu fast to trees, or stone pillars erected on the shore for that purpose.-For further information as to the harbor of Oporto, seo I'erdy's Sailing Directiona for the Buy of hiscay.

Oporto is the emporium of a large portion of the kingdom of Portugal, and enjoys a pretty considerable foreign commerce. The well-known red wine, thenominated Port, from Ita belug exclusively shipped at this city, forms by far the largest article of export. The exports vary in different years, from about 26,000 to above 40,000 pipes. Englant is much the largest consumer of port. The high discriminating dutics on French whe originally tutroduced port into the liritislı markets, and gave it a preference to which, though an excellent wine, it hatl no just title; this preference tirst generated, and its leng conthuance has since so conflmed the takte for port among the great bulk of the population, that it bids fair to maintain Its ascendency as an after-limer winc, notwithstanding the equalization of the duties. At an average of the ulae years ending with 1851, there were ahipped from Oporto for England 22,861 pipes a year. Next to Englam, Hrazil, liussia, and the north of Eurofe are the prine cipal consumers of port; but it appears, from the subjoined account, that the total experts to them do not anount to a half of those sent to England. The other exports aro cil, oranges, and other fruits, wool, refined sugar, cream of tartar, shamac, leather, cork, etc. The imperts are cern, rice, beef, salt fish, and other articles of provision; sugar, coffec, ute., from Brazit; cotton and woolen goods, hardware, tin plates, etc., from Eisgland; lemp, flax, and deals, from the Daltic, ete. Desides the British masufaetured goods imported into Portugal for the use of the natives, a considerable quantity is deatined for the consumption of Spuin; being smuggled into that country through liragonza and other towna on the frontier.

Oranges (Ger. Pomeranzen; Du. Orangen ; Fr. Oranges; It. Afelarance; Sp. Naranjas; Russ. Pomeranezıi; Hind. Narunge; Malay, Simno-manis), the fruit of the orange-tree. The common or sweet orange (Citrus sinensis, or Citrus nobilis), and the Seville, or bitter orsnge (Citrus curuntium), are natives of China; and the Portugueas are entitled to the henor of having transferred the plant to other countrles. Partlcular species of Citrus seem to be indigenous to varlous Eastern countries; but the birth-place of the proper orange may be distinecly traced to China. It is now to be found in our green-houses. Oranges are imported in cheats and boxes, packed separately in paper. The best come from the Azores, Spaln, and Cuba; very good ones are also brougit from Portugal, Italy, Malta, South America, and other places.

The orange trade carried on by this country is of considerable value and importance. Oranges are not much more expensive than most of our superior domestic fruits, while they are, perhaps, the most refreshing and wholesome of those of wariner ellmatea.

The Citrus aurantium, or gelder-frulted orange-tree, under faveral le circumstances, usually attains a height of twenty-five or thirty feet, and is graceful in all Ita parts. The trunk is upright, and branehes into a regular or symmetrical head. The bark of the twigs ls of a soft snid almost translicent green, while that of the truuk sud olider branches is of a delicate ash-grny. The lenves are moderately large, beautifuily shaped, of $n$ fine heaithy green, and shining on the upper siden, while the under sides have a slight appenrance of down. The flowers eccur in little clnsters on the sides of tho tranches, are pleasing in their form, of a delicate white in the sweet oranges, and in the more acid varieties shifhly tinged with plak. In seme plants they have a more powerful odor, and aro, for thi moment, more rich; but in the orange-grove there is $n$ fragrance in the aromin which never autiates nor offends; and as the tree is at one and the asme timo in all stages of its henring-in tiower, in frult just set, and in gelden fruit, anviting the "hand to pall and the palate to taste"- it is haritly possible to concelve or lomagine any olject more delightful. There is something, too, peculiar ln the organization of the fruit of this trec. its rind, or external eovering, is of a spengy texture, containing hut little juice nr anp of any kind in its suistanco; hut the external surface is cevered, or tuberculated with ilitlo glands, which secrete an aerld, volatile oll, very
inflammable, and of a strong, pungent taste. The interlor of the frult is usually divided into from nine to twelve carpels or cells, which contain the pulp, seeds, and juice, and are united by a whitish pellicle or leath. ery ekin, radiating from the centre to the rind, and may essily be soparated without wasting the julce. The seeds are aolitary or several, and are attached te the inner angle of the carpel, and In some varieties are entrely wantlog.
The wood of the orange-tree, when dry, welgbs fortyfour pounds to a cuble foot, is hard, compact, flexible, slightly odoriferous, and In nuaceptible of being pollshed. When recently cut, it is of a yellowish hue, Lat in the course of tine it fades. From its acarclty and small size, it is but little employed in the arts, the only particular uses to which it is applied being to make boxes, dreseing-cases, and other articles of fancy: and in Florida, considerable quantities of straight, young shoots are cnt, and ahlpped in bundles, to be made into walking-cancs.
The fruit of the orange may be obtained fresh in any region of the globe, and at almost every eesson of the year. The aromstic oil and the rind preserve it from the effects both of heat and of cold; and the acridity of the former renders it proof against the attacks of Insects. It is true that oranges decay, like other fruit ; but that does not happen for a long time, if the rind remains unlnjured, and they are kept frum hnmidity, and eo ventilated aa not to ferment. With regard to the quallty of this frult in various places, there appears to be a diveraity of opinlon. Seme consider those of Malta the best; others those of St. Michael's; while others prefer those of Bahja, Havana, or of St. Angustlne.
The Maltese oranges are usually large, the rind thick and epongy, and the glands whlch secrete the volatile oil are prominent. The pulp is red and delicious, attheugh sometimes there ia a trace of bitterness in their taste. They are shipped in boxes of an irregalar size, and are generally packed in shavings or saw-dust.

The St. Michael's oranges are of a smali size, the rind is thin and smooth, the glands omall, which secrete but little volatile oil, the pulp lighit-colered, and of a delielous, sugary taste. They are put up in boxes of three hundred and fifty to four hundred, with each fruit enveloped in paper, or in the huske of maize.
The celebrated Narel oranges of Bahia are of difficult transport to Europn and the United Stater, in consequence of the length of the voyage, and of the humidity und warmth of the climnte through which they have to pass. If they are gathered green, havicver, and suspended in the air alove deck, or at the stern of the vessel, in nettlug, they will endure 'hrough the vaysge.
The flavana oranges a.e usually of a good size, with a moderately rougia rind, and a pulp well fillad with delicious juice. From the shartness of the voyage to nny oi the Ainerican markets, they may he safely transported during the winter months. The fruit is ripe in Cubn at the end of October, and is usually shipped in barrels of two humired and fifty to cour hundred frults in osch, put up loossly, without sny envelopes.
The SI. Augustine oranges are superior, both in size and quality, to those of Cubn or the Mediterranean. They reacmile those of Ilavana in flavor, but are much is $\mathrm{g}_{\mathrm{g}} \mathrm{er}$, and bring from twenty to thisty per cent. more in the New York and Boston markets. Of the smalier dizes, it requires alout three hundred frnits $t^{\prime}$ fill n unrel, but of tha largest ones only one bundred are necessary.

In Eiurope, thu Valencia oranges are eagerly sought after, on necount of their early appenrume, large size, and henutiful color. They are put up in hoxes of two hundred and twenty to two humilred and forty fruite in each, enveloped in hrown paper.

The Sicilian cranyen, and those of the sonth of Italy, may be ragnrded as ncarly of tho same quallty. They:
are of a medium size, with a fine color, and are rather acid in their gavor. Those shipped from Messina are put ap in boxes of two hundred to two hundred and ten fruits in each, and those of Palernio, which mature later, are shipped in boxes of three hundred or more frolta in each. The oranges of Reggis ripen very carly, so much so, that it is not unvesual to send theni away hy the 20th of October. . They are packed in boxes of two hundred and forty fruita in each, and, like most of the oranges of the Mediterranean, are enveloped in paper.
The Provence oranges come to great perfection, and may be classed with those of Genoa. Along the River Var, they have two harvesta of the orange, the first commencing from the 10th to the 15 th of November, when the fruit begina to turn, and continues till the 4th of Desember; the second begins abont the 10th of January, and is prolonged nearly to the end of February. They are put up in boxes of one hundred and twenty to three huodred and sixty fraits in each, according to their size and qualities.
With the Seville oranges may be elassed those of Faro, St. Ubes, Oporto, Andalusia, Malaga, and the bitter oranges of Cuba and Florida. This fruit is usually of a good size, of a beautiful color, but unfit to eat, on account of its bitter favor. Thoge shipped from Seville are put op lu large boxes, of one thousand fruits In each; whilo those of Faro and St. Ules are badly packed in cases of three hundred to three humdred and ility in each. Those of Spain and Portugal are princlpally carried to Eugland and the Baltic, and are enployed in cookery, and In the manufactare of cordials and other aromatic liquors. The essentiol product of the fruit is in the rind or peel; it is cise into quarters, separated from the pulp, and caused to be quickly Iried. It is used in Ifolland in aronatizing a liquor called curacoa.-Browne'y Trees uf A merica.

Orchilla Weed, Orchella, or Archil (Ger. Orseille; Ir. Urseille ; It. Oricello, Orcella; Sp. Orchilla) a whitlsh lichen (Lichen orcellu) found la the Isle of Portland; Lut that which is used is imported froms the Canary and Capa do Verd Islands, Madeira, Barhary, and the Levant. Frons it is obtained the arehil, or orchal, of commorce, which yields a rich purple tincture, fugitive, indeed, hat extremely beauliful. The preparation of orehilla was long a secret, knowis only to the Florentinos and Hollenders; but it is now ex tensively manufactured in Eagland. Orchil is generally sold In the form of cakes, but sometimes in that of moist pulp; it is extensively used by dyers; and in times of scarcity the weed or llohen has sold as high as f 1000 per ton!-Tuomson's Diepensatory.
Ordinary, in Nautical language, denotes the estab. liahmeit of the persons employed by government to take charge of the olips of war which are laid up in the several hathors. These are principally eomposed of the warrant officers of the ships, as the ganner, boatswain, carpenter, deputy porser, and cook. There is, besides, enrollod in the list of the ordinary a crew of laborers, who pasa from ship to ship occasionally, to pump, moor, move, and clean them, whenever it is necessary. The term ndinary is also applied sonietimes to the ships themselves, and it is likewise used to distingulsh the inferior sailors from the most expert and diligent. The latter are rated able on the navy books, and have higher pay than Hose who are rated as ordinary.
Oregon, territory, United States of America, bordering the l'acifie coast, li:s between the parellels of $42^{\circ}$ and $46^{\circ} 10^{\prime} \mathrm{N}$. lat., and west of the Rocky Momitalar. Area, 210,000 square miles. Muel of this territory is monitainons, but it abounds in fertile valleyg. It forms three sections, separated frou each other by nearly parallel ridges, and following the. general di. rection of the coast line. These aeveral sections hase each distinct characteristies of soil, produetions, and elimate. The division extending from the Pueific coast to the Cascalle range has a genial climate throughout the yeur. The valley of the Willamette is exceedingly fertile, the intervales and prairica form the best of furming lands, and the uplands afford good pasturage, nod abound with valuable timber; and there is much fertile land bordering the Shastl and Uuppua rivers. The division hetween the Cascade range and the Blue Mountains hus generally a light sandy soil, but nith many valleys of rich alluvion; altogether said to be a fine grazing region. The pertion lying west of the Hocky Mountaina ford east of tha Blue Mountaina, in extent full one half of the territory, is mostly a rocky and rough country, with sone few narrow valleys of great fertility. In the southeril jortion of the territory gold has been extensively found. Thero wero in Qregon and Washington territoriea in $18.50,132,852$ acres of land improved, and 299,951 of unimproved land in farms. the Bear River of Great Salt Lake; Unatillah, John Days, and WIllamette rivers enter the Columbia River on the south; and the Shastl or Rogue, Umpqua, Sequatchie, Yaquina, Kllamook, and several sinall atreams enter the Pacific on the west. The principal places are Salem, the capital; Portland, at the head of navigation, Oregon elty, and Astoria. The principal articles of export are lumber and agricultural produce. Tonnage in 1853, 1063 tens. Thero were in the terrltory in 1850, thirty-seven saw-mills employed in the mauifscture of lumber. The fisheries of Oregon are important and valualle. The rivers abound with salmon, especlally the Columbis and the Wiilamette, which are taken in large quantitles below the fall. The hunting and trspplag of the fur-bearing animals hes givei. conployment to a great number of persons, and the rivers and coasts abound with wild fowls. The governor is appointed by the Prealdent of the United States for four years. The Leglslative Assembly is composed of a coancil of nine members, elected for three years, and a Heuse of Representatives of eighteen members, elected annualiy. The elective franchise is enjoyed by every free white male inhabitant twentyone years of age, and a cltizen of the United States.
On the 7th ot Msy, 1792, Captain Rohert Gray, in the ship Columbia, of Boston, diseovered and entered the Columbia River; to which he gave the name of his yessel. He us the first person that eatablished the fact of the existence of this grent river, and this gives to the Uuited States the right of discovery. In 180t-'5, Csptains Lowis and Clarke, under the direction of the gevernment of the United States, explored the country from the mouth ef the Missouri to the mouth of the Colunbia, and spent the winter of 1805-'6 at the month of the Columbis. This exploration of the River Columbia, the first ever made, censtitutes another ground of the ciaim of the United States to the country. In 1808, the Mlssourl Fur Company, at St. Louis, established a trading post beyond the Rocky Mountains, on the head-waters of Lewis River, the first ever fermed on any of the waters of tho Columbia. In 1810, the Pacifie Fur Company, under Juhn Jacob Astor, of New York, was formed; and in 1811, they founded Astoria, at the mouth of the Columbla, as the principal trading post, and proceeded to establish othors In the interior. A little later in the same year, the Northwest Company sent a detachment to form establishments on the Columbia; but when they arrived at the mouth of the river, they found the post occupied. In consequence of the exposure of Astoris ly the war of 1813 , the post was sold out to the Northwest Company. At the close of the war, Astoris was restored, by order of the liritish government, to its origiaal foundere, agreeably to the first artlele of the Treaty of Ghent ; but Britain still persisted In claiming this territory, south to the 42d degree of latitude, until $18+5$. In 18:31, the Iludson's Ilay and Northwest Company, who had previously been rivals, were united, and since that time have greatly extended their establishments in the region of Oregou. It was heid in jeint oecupancy until the treaty of 1815, when Britaln gave up all claims south of the 49th parsllel of north latitude. It was organized with a territorial zovernment in 1848. Tho portion now the Territory of Wushington was set off by an act of Congress, March, 185\%.

Organs. The invention of the organ is attributed to Archimedes, ahout 220 n.c. ; but the fact does not rest on sufficient authorlty. It is also attributed to one Ctesibils, a barber of Alexuatria, about 100 n.c. The ergan was brought to Euroje from the Greek em-
ples, and was first applied to religious devotions in churchea in A.d. 658.-Bellarmine. Organs wers used in the Western churches by Pope Vitallanus in 658.-Amмоnits. It is affirmed that the organ was known in France in the time of Louis L, 815, when one was constructed by an Italla.i priest. St. Jerome mentions an organ with twelve pairs of bellaws, which might have been heard a mile off; and another at Jerusalem whlch might have been heard cn the Monnt of Olives. The organ at Haerlem is one of the largest in Europe; it has 60 stopa and 8000 plpes. At Seville is one with 100 atops and 5300 plpes. The organ at Ansterdam has a set of pipes that imitate a chorus c? human voices.

Orgol. See Argol.
Orinooo, one of the princlpal rivers of South Amerlea, ranking in size and lmportance lmmediately after the Amazon and Plata, north of which former its bssln lies. It rises in the Sierra Nevada, Venezuclan Gulana, winds suceessively west, north, and east, through the centre of the Venezuelan territory, and enters the Atlantic by numerous mouths, in lat. $8^{\circ} 40^{\circ}$ N., and long. $61^{\circ} \mathbf{W}$. Total course estimated at 1600 miles, for more than the latter half of which, or to the raplds of Atares, it is uninterruptedly navigalie. Ares of its basin, 252,000 square miles. It receives numerons large affluents, principal the Meta and Apure, rach having a navigable streem of 500 miles, the Guaviara and Caroni. By the Cassiqulare it has a slngular navigable communication with the Rio Negro and Amazon; and in the upper part of its course are several large cataracts and long rapids. At 200 leagues from the ocean, its breadth is alout three miles; and at the city of Bolivar, between 250 and 300 miles from its mouths, to which place the tláe reaches, It is four miles across, : ind, vhen lowest, 65 fathoms deep. About 100 miles from thee ocean, it separates into a delta of numerous $m$ saths. It rises gradaslly from March to September, yearly, usually from 60 to 70 feet, but in one narrow place to 120 feet. Its banks are clothed with dense forests, which, like its waters, abound wlth animul life. Like ail great rivers, its upper waters separate into several brauches, and it does not appear that the main source lias beon azeortained with any degree of certainty. According to La Cruz d'Oltnedilla, it lssues from a small lake called Ypava, situnted in north latitude $5^{\circ} b^{\prime}$, whenee, by a bend of a splral form, it onters the Lake Parima; but altheugh the existence of this sheet of water has been determined, doubts are entertained whether it may not owe its orlgin only to the temporary overflowing of the river. Fron this lake it is said to issue by two mouth; ; and after a very circuitous route of upward of fifteen hundred miles, including its windings, it flows Into the Atlantic Ocean, opposito the island of Trinidad, by about tifty mouths, seven of which are navigable. The Grand Esca, or principsl month, which is six leagues wide, is sontheast of 'rinidad, is: lat. $8^{\circ} 30^{\prime} \mathrm{N}$. , and long. $59^{\circ} 50^{\prime} \mathrm{W}$.

Orpiment (Ger. Operment; Fr. Orpiment; ft. Orpimento; Sp. Orqpinente; Lat. Auripigmentum), the name usually given to suiphuret of arsenic. When artificially peepared, it is in the form of a fine yellewcolored powder ; but lt lis found nusive in many parts of the world, particulariy in Bohemla, Turkey, China, anil Ava. It is exported from the last two in considerable quantities, and is known in the East liy the name of hartal. Nati $\%$ orpiment is composed of thin piates of a lively geid colcr, intermixed with pieces of a vermilion red, oi a shattery foliaceous texture, tlexible, soft to the touch like tale, and sparkling when broken. Speclfie gravity, $3 \cdot 15$. The inferler kinds are of a desd yellow, inclining to green, and wait the bright appearunce of the best spectmens. Its principal use is as a coloring drug among puinters, hookbladers, ete.-Thomson's Chemistry; Milnern's Orient. Comm,

Ornedew, Oraidue, Manheim or Dutoh Gold (Ger. Flittargold; Du. Klatergoud; Fr. Oripeau, Oliquant ; It. Orpello; Sp. Oropel), an inferior sort of gold leaf, prepared of copper and zinc. It ia mometimes called leaf brass. It ia principally manufactured in Manheim.
Ontrich Feathers. See Featheras.
Oswrego. Oswego is one of the most thriving citles in the Union. With a population of 20,000 , it does as much buainess as many cities of twice its popuiation. The Welland Canal has given it advantagea over even Buffalo, and hence lts trade grows enormously. Its increase has been so ateady that it will continue to grow with every improvensent in the Western States.

Showing an increase in 1856 of $6,717,717$ buaheis over 1854, and 3,064,564 bushela over $1855^{\circ}$.
The numual review of ita commerce for 1856 says, of the grain warchouses of Oswego, "There are ten elevators; which are capuble of elovating in the aggregate over 37,000 huahels of grain per hour, and storage room for over teo million bushels." This ls about the aame as Milwauke. There are In Oswego sixteen mills, with eighty-six run of atone, capable of manufaeturing 8600 barreia of tlour a day, or over $1,800,000$ barrela in a year.
Out of Trim, the atate of a shill when she is not properly balanced for the purposea of navigation, which may le occasioncd by a defection: in the rigging or in the stowage of the hold.
Outriggar, a atrong beam of timber, of which there are severai, fixed upon the side of a ship, and projecting fromit, in order to securo the stasts in the act of careening, by counteracting the strain they suffer from the effort of the carcening tackles, which, beIng applied to the mast-head, draw it downuard, so as to act upon the vessel with tha power of a lever, whose fulcrum is in hor centre of gravity. Outrigger is aleo a amail boom, oceasionaliy used in the top to give adtditional security to the top-mast.
Owners of ships. Tho ownership or tith to a ship can be acquired in several waya, as by purchase, building, or cajiture. In regard to the first, it is generally done by a biil of sale, of which there are two kinds: the first is where the ship passes from the builder to the first purchaser, and is calied the grand lill of saie; the second is where the owner of the ship not being the limilder, transfers hin interest to another purchaser. L'pon the death of the owner, his Interesta devolve mion h'vexecusars or hila persuial rupresene tives spacial conditions may be litroduced
 an. wn the , wherty may not have heen eompicted, voradan pay ment of a certain pact of the purchasemonev when a mart of the veneel has 'wen eompieted;
 swid the wille' cata. mat require lisito accept any oth
er.-Abbot. A ship's boal does not constitute a part of a vessel'a ta akle, apparel, furniture, atc.
Property ir. ships la sometimes acquired by capturc. Daring war thipa and private ahipa having letters of marque, are entitied to make prizes. But befere the captore acquire a legal title to auch prizes, it is neces. aary that they s.ould be condemned in the admiralty or other court constituted for that purpose. When this ia done, the captora sre considered to be in the saino situation, with reapect to thom, as if they had buit or purchased them. - See articles Privateris, Lesttena of Marque, Phezes, and Smis and Shifinci.
Oyater, a well-known edible shicll-llsh, belenging to the genua ostrea, occurring in noost parts of the world. The European oyater ( 0. edulis), which furms a considerable articie of trado on the coasta of Eugland and France, is taken by dredging, after which the animals are placed in pits formed for the purpose, furwished with sluices, through which, at apring tiles, the water is auffered to flow. In these receptacles they acquire the green tinge so remarkabla in the European oyster, and which is considered as adding to their value. This color, which at one time was aupposed to be owing to some mineral impregnation, has recently been ascertained to arlae from the confirre, and other marine vegetable matter, on which the animal feets. The oysters brought to the different markets in the United States aro furnished by aeveral species, which It is extremely difficult to discrininate, and are known among the venders and eplcures of this food ly appellationa derived from the places from whence they are brought. The buainess of taking these shell-fish etuploys a great many handa, and no inconsiderable amount of tonnage. In many places oysters are planted, as it is called; that in, large artificial leds are formed in favoralle situations, where they are parmitted to fatten and Increase. The breeding-tinie of oysters is in Aprii or May, from which time to, Iuly or August the oyater 1 are aald to be sick or in the milh. This is known by the appearance of a milky sulstance in the gills. Oyatera attain a size fit for the talle in about a year and a hnif, and are in their prime at three ycars of ago; though what the natural tern of their lives may he, it ia diffeult, if not Impossibie, to determine with any degree of accuracy. Many curious discussions have arisen an to whether oysters possessed the faculty of locomotion. It to well known that, in general, they are firmly attached to stones er to ench other; and it has been stated, and generally helieved, that they wero not endowed with any powers of chang. ing thei. position. From the observations nad experiments of naturalists, however, it appeara that they can move from place to place by suddenly ciosing their ahella, and thus gecting the water contained between them with sufticient force to throw themselver bish ward, or in a lateral direction. Oystera form the basis of many culinary preparations, but are much more digestibie in their raw state than after any mede of cooking them, as this process, in n great measure, deprives them of the nou; lshing antmal jeliy, which forms so large a portion of thelr sulstance. The shell of the oyater is composed of carlonate of lime and suinal matter, and was at one time aupposed to possess pecullar medical properties; hut analysis has shown that the omly advantage of these animal carhonates of lime over these from the mineral kingiom arises from their containing no adimixture of any metalicic subtance. The lime obtalned from the calcination of oyster-shelts, though exceedingly pure and white, is hetter suitedfor work which daes not rr fulre grvat tenarly, as lior phatering rooms, than for the common purposes of building, as it does not corm as luard a compound with anind as the mineral limes.

## P.

Paofic Ooean, a vast watery expanse extending the Gulf of Yedo, where Its maximam velocity, as shown from the Arctic to the Antarctic clecle, through $127^{\circ}$ of lat., and between America on the east, and Aala, the Mulay Archipelago, and Australia on the west. In Its widest part, at the equator, it is 10,000 miles aeross; it narrows especially toward the north, where it eommunicates with the Aretic Oeean by Behrlng's Strait; anul, ineluding the Indian Ocean, it contains upward of $70,000,000$ of square miles, or more than all the dry land on the globe. Its coast line on the American side, though generally bold, is very little breken by inlets; on the Asistic side it ls very irregular; and the Celobes, Chins, and Yellow seas, with the aeas of Japan, Oklotek, and hamtschatka, are inlets of this ocosn. It is studded with a great number of island groups, the principal of which, proceeding from west to east, are the Ladrones, Carolines, Solomon, Queen Charlotte's, New IIcbrides, Feejee, Friendly, Society, Low, Marquesas, Snndwich, and Galapagos lalands, and New Zealand, besides a vast multitude of solitary lslands, reefa, and sand banks. The great equatorial current of this ocesn originates in the Anturctic drifl current, which flows north slong the shores of South America, and then west through the Pacific, where it occuples the eatire space between the tropics. Strong land currents sweep round the shores of East Australis and Jspsn. The northeast trade-wind prevails uninterruptedly between lat. $5^{\circ}$ and $23^{\circ} \mathrm{N}$. ; che southeast trsde-wind commonly blows from the equator to int. $26^{\circ} \mathrm{S}$. ; between them is the region of calms, extending over $5^{\circ}$, and varying in position according to the seasou. Greatest equatorial temperature of Pacilic $88^{\circ} \cdot 5$ Fahr. In lat. $56^{\circ} 26^{\prime}$ the tempersture of the sea throughout its depth is $39^{\circ} \cdot 5 \mathrm{Fahr}$. This occan became first known to Earopeaus in 1513; it received its name from Magnhacus, who sailed across it in 1521. In the 18 th century its different parts were explored by Belsing, Anson, lyron, Bougainville, Cook, Vancouver, Broughton, La Perouse, etc. In the present century by D'Entrecasteaux, Krusonstern, Beechey, Fitzroy, D'Urville, Wilkes, and Sir James Ross.
Current of the Pacific.-Lientenant Bent, of tho United states navy, recently read a paper beforo the Geographical and Statistical Society of New York, of which the fellowing is an abstract, upon "the grent ocean current of the l'acific," corresponding with the Gulf Streani of the Atluntic. The Japanese have known it for many years, and call it the K.rosiao, or Black Stream, from its dark biuc color compared with that of the adjacent ocean. The fountain from which this stream springs is tho great equatorial current of the Pacille, which in maguitude is in proportion to the vast extent of that ocean, when compared with tho Atlantic. Extending from the tropic of Caneer on tho north, to Capricorn, in all prolastility, on the south, it has a wldth of nearly three thousand miles. With a veloclty of from twenty to sixty miles per day, It sweeps to the west ward in uninterrupted grandeur around three-elghths of the eircumference of the globe, until, diverted by the coutinent of Asia, and aplit jnto lanumerable sureams hy the loolynesian Ialunds, it spreads the genial influenee of its warmth over regions of the earth, sume of which, now teeming in prolific abundance, would otherwise be but barren wastes. One of the most remarkable of these offeshoots is the Kuro-Suro, or Japan Strean, which, separuted from the parent country by the luagee Istanils and south end of Formosa, whero its streugth anll character are as deeidedly marked ne those of the Gulf Stream on tho const of Florida. This northwardly course continues to the parallel of $26^{\circ} \mathrm{N}$., when it lears of to the northward and enstward, washing the whole southeastern coast of Japan as far as the Straits of Sangar, and Increasing in strength as it advances, until reaching the chain of dslands to the sonthward of by our observations, ia 80 miles per day. Its average strength from tie aouth end of Formosa to the Straita of Sangar is found to be from 35 to 40 miles per twen-ty-four hours at all seasona that we traversed it.-Scientific Annual, 1857.
The Pacific Trade of the United States. -The whole number of arrivala in the United States from ports in the Pacific doring the year 1856 were 69 ; and in 1855 ,

Package, Scavage, Balllage, nnd Portage, were doties eharged in the port of London on the goods imported and exported ly aliens, or ly denizens heing the sons of aliens. During the Dark Ages it was usual to lay hifger duties upon the croods imported or exported by aliens, whether in Iritis! is forelgn ships, than were lald on similar goods whe mported or exported hy matives. lhat according as somider and moro enlarged primeiples prevailed, this illiberal dis-
tinction was gradually modified, and was at length wholly abolishod, in eo far at least as it was of a public character, by the act of 24 Geo. III. The dutles th.us preserved to the city were not vory heavy; but the principlo on which they were imposed was exceadingly objectionable, and their collection was attended with a great deal of trouble and inconvenience. Not belog levied in other places, they operated to the prejudice of the trade of the motropolis. The aet 3 and 4 Will. IV. c. 66, authorized the Lords of the Treasary to purchasc up the dutios in question trom the cily. This was done at an expense of about $£ 140,000$, and the duties were aboliahed.

Packet, in Navigation, meant originaliy a vessel appointed by govornment to carry the mails between the mother country and foreign countries or her own dependencies. It is now used as nearly symonymous with an ordinary veasel, cinefly of amall burden, that freights goods or passengers.-See New Yoric, Pasaengers, and Pont-office.
Pack-horee, a horse employed to carry gools on its back in bundles, called packages or packs. In countries not yet intersected by regular roads this is the only mode of transporting goods from one part to another. In Britain, herses were formerly employed for this purpose, but for these carts and wagons are now substituted. In Spain, inules and asses are still so mimployed, and in Asia a'dl Africa camels and dromedariea.
Padang. This settlement lies on the west coast of Sumatra, and receives ita inports almost exclusively from Java. It has no $d$ reet importations from foreign countrias. Port, harbe, and other commercisi regulations the same as at Java, to the government of which island Padang is subserlin. te. Undar the uperation of high tariff duties, especia liy on American colton goods, the trade between the United States and Padtung is insignificant.

Padater In Navol', ";uage, a rope used to fasten a twat eituer along' . do of the ship to which it belongs, or to some wharf, quay, etc., as occasion requires.

Palermo (anclently Panormus), a large city and sea-port, the capital of the noble island of Sicily, on the north coast of which it is situated, the light-inuse being in lat. $38^{\circ} 8^{\prime} 15^{\prime \prime}$ N., long. $13^{\circ} 21^{\prime} 56^{\prime \prime}$ E. Population, 170,000 . The Bay of Palermo is alout five miles in depth, the city being silasted on its soulhwest shore. A line mole, fully a quarter of a mile in length, having a light-house and battery at its extromity, projects in a southerly direction from tho arsensal into nine or ten fathoms water, forming a convenient jort, capable of containing a great number of vessels. This immense work cost aiout $£ 1,000$, w aterling in its constraction; lut the light-house, though a sjlendid structure, is sald to be very Ill lighted. 'There is an inner port, which is reserved for the use of the arsenal. Ships that do not mean to go within the mole may suchor about half a mile from it, in from sixteen to twen-ty-three fathoms, the molo light bearing N.W. I W. A heavy seas sometimes rolls into the hay, hut no dangen need be apprehended by ships properly found in anchors and chatn eables. In going into the liay, it is uccesaasy to keep clear of the nets of tho tunny fishory, for these are so strong and well moured as to le capathe of arresting a ship uniter sail.-Smitis's Sicily, p. 70, and dppend. p. 4.
Imports und Exports.-The great articles of export
from Siclly are, ollve oil, grain, partinularly wheat and barley, sllk, brimatone, wine and brandy, barilla, lemons and oranges, lemon juice, manna, shumac, liaseed, fruit, salted tish, and salt; with argol, liquorice, pum-ice-stone, rags, akins, boney, cotton wool, saffron, etc.
Antoles Expoiftid fiow ant laporited into baldeno in 1852.

Wheat is largely exported. It is of a mixed quality, hard, and is generally solld from the pullie magazines, or caricatori, hy mossure, without weight. But the best hard whent, grown In the neighborbood of Palermo, is sold by the salma of 272 rottoli $=476 \mathrm{lbs}$. English; the dlitirence between weight and measure belarp made good by the seller or buyer, as tho ease may be. Wine ls prlnclpally shipped from Marsula; lemons, oranges, and lemon-juice from Messina; salt from Trapant; and harilla from the southern coast. But all the artleles to he found on the coast may, for the most part, be had at l'nlermo ; unless, however, the quantity required be small, it is usually best to ship thom from the ontports, the expenso of their conveyance to l'alermo belng very heavy. The crops of hurilla and shumac come to market in August ; but brimstone, salt, oll, whe, rags, ete., may generally be land ail the year round. The flist shipments of lemons and oranges may be mado in the beginning of November.

Purchases of produce are always pald for in cash, gen-
arally half on making the purchase, and the other arally half on making the purchase, and the other half on dolivery, when in Palermo, and on receiving order for deilivery, on the coast. The imports consist of cotton yarn, wool, and stuffis ; sugar, coffee, cocoa, dye atufis, Iron, earthen-ware, apices, tin, hides, Newfoundland cod, timber for building, etc. The best of the old accounts of the trade of Sicily that we havo met with is contained in Swivnuine'a Travels in the Two Sicilien, 4to ed., vol. Ii. p. 401-413.
Palm (Lat. palma, the hand). An ancient measure of leagth taken from the exteat of the hand. There were two different palms; one corresponding to the leagth of the hand, and the other to the breudth. The Roman palm was about eight and a half Engliah lnches, The English palm is understood to be three inches.

Palm Oil (Ger. Palnol; Fr. Huile de palme, Huile de Senegal; It. Olio di palma; Sp. Aceite de palma) is obtained from the fruit of several species of pulms, but especially from that of the Llais Guineensis, growing on the west coast of Africa, to the south of Fernando Po, and in Brazil. When imported, the oil is about the conaiatence of butter, of a yellowish color, and scarcely any particular taste; by long keeping it becomes rancid, loses its color, which fades to a dirty white, and in this state is to be rejected. It is sometimes imitated with hog's lard, colored with turmeric, and sceated with Florentine iris root. The iuhabitante of the coast of Guinca employ palm oil for the same purposes that we do butter. Our supplies of palm oil are almost wholly derived from the west coast of Afrles, of which it is the ctaple article of export.Lewis's Materia Mfedica; Thomson's Dispensatory.

Candles are nuade of palm oil and cocoa-nut oil, of which many thousend tons per annum are now employed. This modern subst ${ }^{\text {i }-4 \text { inn }}$ of vegetable fat for animal fat is remarkable. tis is is inging Cantral Africa into intinate comme; ;ai rolasons with civilized countries. The paln oil is $\therefore$, Afriea, but it assumes a solid state in a colder climate. The casks containing it have atcann forced into them, by which the oil is meltod and made to flow out; and the oil is thon purified and bleached to various degrees of whiteness, according to the purpose to which it is to be applied. The whitened cakes of pulm oil are cut into slices by a machine ; the alces aro deposited on mats of cocos-nut fibro; tha mate are piled in heaps, with iron platea between them; tho heaps are placed in hydraulic presses, where intenae pressure brings the palm oil to the state of dry, thin cakes. After a Little more purification, the palm oil is fitted for melting, provious to the making of candles.
Imports of Palm orl into tige Unitidy States yoe the
likar minding done 30, 1850.

Palms, called by Limaus, from their nohle and stately appearance, the princes of the vegetable kingdom, are a natural order of arborescent endogens, ehietly inhabiting the tropics, dislinguished by their fleshy; celorless, six-parted flowers, inclosed within spathes; their minute embryo, lying in the midst of albumen, and remote from the hilum ; and rigid, plaited or pinnated inarticulated leaves, sometines cailed fronds. Wine, oil, thax, flour, sugar, and salt, says Ilumboldt, aro the produce of this trile; to which Von Martius adds threal, utonsils, wenpons, food, and habitations. The most common apeeies is the cocoa-nut. Their wombed stema, or spathes, yield in abundance a suc-
charine fuid, known in India by the name of toddy. Tha succulent rind of the daie is a most nutritlous as well as agreeable fruit. Sago is ylelded by the irterior of the trunka of nearly all, except Areca catechu, the well-known pianmg, or betel-not. The fruit of the latter species is remarkable for lta narcotio or intoxicating power. The common canes or ratans of the shojes are the flexible stems of apecies of the geaus Cilamus.

Pampar The name given to nne of the great systema of South American plains, which san scareely, whth propriety, be called deserts, inasnuch as they are covered with luxuriani herbage, and Inhabited by vast herds of wild cattle and droves of herses. The region of the Pampas forms the basins of the Paraguay and La Ilata, and inciudes the vast plains of lluenoe Ayres, extendling froms the foot of the castern ridge of the Andes to the "sen-like Ilata," and stretching southwari into the deserts of l'atagonia. - Tnathle's Physieal Geog maphy. See Quarterly Reriev, $x \times x$., 114 (Poneut Sonthey).

Pamphlet, a small book, usually printed in the c'stavo or duodecimo form, and atitched with paper cover, popularly understood to comprise from fifty to two hundred pages.

Panama, a city and sea-port of New Granaia, or. the Pacitic, thirty-eight miles sontheast from Chagres, lat. $8^{\circ} 56^{\prime} \mathrm{N}$. ; long. $79^{\circ} 31^{\prime} 2^{\prime \prime} \mathrm{W}$. Population, 7000 . It atands on a rocky peninsula, projecting into the bay of Panama, and has an imposing aspect fore the sea. Its streets are well ventilated, and it is suid to be cleaner than most Spanish-American cltles. It is enclrcled byirregular and not very strong fortifications, constructed at different periods. The houses are partly of wood, straw, and other fragile materials; but many are sul. stantinlly built of atone, the larger having court-yards, or patios, in the ofd Spanish style ; and no doubt it has been much improved within the last two or three years. Its roadstead is one of the finest in the vorlit. There are n number of islands a short distance from the mair. land, which afford secure anchornge for ships of any burden, and from which supplies of provisions, including excellent water, may aasily be obtained. The tides dally rise and fall from twenty to twentyaeven feet, s: 'bat it is peculiarly well fitted for the repair and but 'latig of shipa. Previously 101740 , when the trade witt be Pacific first began to be earried on round Cape licrn, Panama was the principal entrepott of trade between Eurog? and Western America. From that periud, however. it fell off; and its decay was peculiarly rapid after tue independence of Seuth America, and the opening: o: the other porta of the I'acific. But since the occupation of California by the Americans, and especially since the discovery of the auriferons deposits in that country, it has again rapidIy increased. And now that a raliway la carrled acrosa the isthans, it will in all probability attain to greater commercial distinction than ever. In the course of the year 1855 aa many as twelve steamers wore employed in the trade between Panama and San Francisco.
There is a treaty of commerce letween the United States and New Granada, the terms of which are comspliod with by New tiranarla, but are Nometlmes broken by the local government of the provinee, which placed a tax npon passenger-carrying vesselx, at the rate of one dollar for each passeuger, which has been recently annulled by tho supreme government of New Branala. The commercial intercourse of the lnited States is nlone dependrnt on the regulations marle ly the general government of New Giranala, which latter, lyy an act of Congress, has made l'anama and other perts on the isthmus free porta of entry slice the 1st of danuary, 1850. There are no privileges permitted to the commeree of other natlons which are denled to the Ithited States, and there are no reatrictions imposed on tha commerce of other natlons other than what are
imposed upen that of the United States. The sum of \$6 40 is collected from each American vessel; viz. $\$ 480$ to the captain of the port, and $\$ 60$ to the interpreter. The aame chargs is made agalnst New fra nadlan vessela, exeept the interpreter'a fee. 'The traus shipment of gooda trom one port to ancther in New Granadia, or to a foreign country, by United States ships, is permitted without restrictions. The curnacy of this country, by a recent law, is established at ten dimea to the dollar. The weights and measures are the same as used in France, but as yet are mot bronght into use in thia country. The French silver, by a law of New Granada, ia mada a legal tender at the raterf twenty centa to the one-frane plece, although, com pared with the value of United Statea silver, it wouk only be worth 18.6 cents. Nuw Granada does not export any thing from here other than a very few hises, and the hmporta of the United States to this placo consist only of coal and provisions for the stcanmers which carry passengers to and from the lsthmua. The lahorer in thin consular juriadietion receives from two to three dollars per day; meci-anics from six to eight dullars per day; and clerks from 81500 to 85000 per annum. There are no pricemenrrent sheets pulilished in this consular jurlsdiction,-Commercial Relations if the Crited States.

Panama, or Darien (Isthmus of), conucets North (or rather Cunirgl) and Sonth America, and is comprised In the republic of New Granada, sec., 1sthmus, ic:mir, $y$ a province bet ween lat. $9^{\circ}$ and $10^{\circ} \mathrm{N}$., and iong. $77^{\circ} 30^{\prime}$ and $81^{\circ} \mathrm{W}$., having nerth the Caribbean Sea end Guif of Darien, and south the Gulf of l'anama, Length, west to east, about 200 miles, average breadth 40 nilles, but in loug. $79^{\circ}$ it is narrowed to less than 30 riles, Surface undulating, the hlll chains which extend thretigh the isthmus, wnitlng the mountain systems of Central and South America, are, near Panawa, not more than 260 feet aliove the level of the Pacific. A great quantity of rain falls; in the months of July, August, and September it rains incessantly. Suil very fertile; producis coosprise flne timber, in great variety, fruits, rice, maize, sugar-cane, coffec, cocoa, caoutchone, vanilla, dyes, drugs, hides, limestone. On its noril! coast are Aspinwall (colony), Puerto-Bello, sud Chagres; on lts seuth slde is I'anama. A vonnection between the Atlantic and Fecific oceans lias tien proposed nt different points of Contıal Ancrica; viz., at Tehuantepec, at Chiquimula, at Nicaragua, and at the narrowest part. where a railroad has been constructed between Aspinwall and Panama.

I'assige across the Istimus of Punama or Darien.Latterly, or since the diacovery of the mineral riches of California, the isthmus has become a great thoroughfare, vast numbers of Individuals having crossed from the pert of Chagres on the Caribbenn Sea to I'anama on the Pacific Ocean, and conversely. The port of Chagres is withln the nonth of the river of that natne, in lat. $9^{\circ} 18^{\prime} 6^{\prime \prime}$ N., long. $55^{\circ} 59^{\prime} 2^{\prime \prime} \mathrm{W}$. A har at the month of the river has only from 10 feet to 12 feet water, though within the bar the river deepens to from four to six fathoms. It is probable that the ba: might be derpened without much difficulty, und a canal might be cut from the bottom of the Bay of Manzanilla to the river, from which it is only three miles distant. A short while ago tho town (if 80 it tuight be called) wss a mere cluster of huts, unhealthy, and without any accommodation for passengers. But having latterly beconse one of the starting-points in the nearest and shortest route from tho east to Califomia, it has been consid. eralily improved. A johnt-stock company was formed In New lork for the construction of a railway from or near Chagres, at the hottom of Manzanila Hay, to Panama, a distance of about 3 or 35 miles. Jhis railway has been completed, and is now in operation. The undertaking reflects great credit on American chterpriso and perseverance. The ditliculties to the overcome were of a very formidable deser,ption, partly from

The resjuect
the uature of the ground, which not unfrequently consisted of deep marshes, but mort from the luxuriance and strength of the vegetation through which it was necessary to penetrate, and the heat, molsture, and unhealthlnese of the elimate. Unluckiiy, the dealre to accomplish their task In the shortest time and at the least expense, tempted tho engineers to execute the work In a very superflcial manner, aubatitutiog brldges, vuaducts, pillars, etc., of wood for those of stone, mortar, and iron. In a country where the decomposition of vegotable matter is so very rapld this was as false and spurious a species of econamy as can well be insagined. Alrealy several milies of the rallway have had to be repairett, or rather reconstructed, by the substltution of lignum ritas and other hard woods for the softer ones that were lirst used. This, however, will do little more than palliate the evil; and there can be no douitt that oventually stone and lron bridges and viaducts will have to be used instead of wooden ones every where along the line. Trains take about four hours in passing from sea to sea; but were the railway properly finished, the passage might be performed in less than half that time. A atation, called Aspinwall, has been erected en Manzanilla Island, in the Caribbean Sea. Hut it ls extremely unhealthy, and there is little prospect of its ever becoming a place of much lmportance. -Toses's Panama Railrıad, Naw York, 1855, passim.
But supposing (which ls not tho case) that this railway were every thing that could be deslred, still it ls plain that the grand desideratum la the carrying acro6s the isthuns of a water comannication between the Atlantic and Pacific oceans. We do not mean by this a canai suitable ouly for conaters, or vessels of comparatively small burden. Such a channel would be of little use, except to the countries contiguous to its termini. What is really wanted is a canal that will admit ships of the largest burden, and bound on the longest voyafics. The advantages that would result from having the isthmus perforated by such a channel can not be easily exaggerated. No other project that appears to be within the limits of possibility, perhnps not even the carrying of a ship canal across the Isthmus of Sucz, would give so great a stiunulus to commerce and navigation. It wonld romove the barrier which renders the navigation between the eastern and western coasts of Amertca so tedious and difficult. And, by doing this, it weuld enable ships from Europe to reach the latter and the lracific in lesa than half the time they de at present, while it would greatly facilitate the voyage to Australia and China.
And a grand project of thls sort is on foot. It is proposed to cat a canal that shall admit ships of 1000 tons hurden and upwaid, between Porto Escoces (lat. $8^{\circ} 5^{\prime}$ N., long. $77^{\circ} 21^{\prime} W^{\prime}$.), near Point Calcdonia, in the Gulf of 1)arien, on the Caribbean Sea, aad the Rio Savana, which falls into the Gulf of San Niguel, on the l'acitic. The intervening space (abeut 38 or 40 miles) is said to be comparatively flat; the ports at each extremity nre easy of accoss, and have deep water; and it is preposed that the comal should be censtructed throughout on the same lovel, and have no locks. The cost of the project is estimated at from 12 to 15 millions sterling. And considering the vast importance of euch a work to the United States, to England, and, indeed, to ali maritime uations, this oxpense, heavy as it may apirear, should be reckoned a subordinate matter. Were the country threugh which it is to pass in the pessession of Emgland or the United States, it would niest prebably have been undertaken. But tho unsettled state of Central America, and tha knetty questions that might eventually arise as to the preperty and management of the eanal, are serious otatacies to its being proceeded with.-See, for ample details on this interesting subject, the work of Dr. Culles, entitled Isthmus of Darien Ship Canal.
The route by which the railroad passes is in every respect the most desirablu for this purpose, and the
means by which the character of the country could be best known, as far as lts topography and the features essentlal to the object in ylew could be seen. It s/as, in fact, the direct means for the accomplishment 'f the purpose. It is supposed that the canal whll br, united with the waters of the Pacific on elther elde 0 ? the elty, and that a channel might be drodged to thi depth of thirty feet, to meet the navigable waters for shipe of large draught. The bay then expends Into an ample harbor, where the winds are eaid never to blow with violence, sufficiently comprehensive for the commeree of the world, and atudded with lalands, convenient for all the great purposes that the condition of things would call for, by the construction of a canal through the 1sthnus.
The lathmus itself seems to present ne sericiss obstacie to science for the construction of a camal. The whoie extent, from the Atlantic to the Pactic, is made up of swamps, hillis, and plalus; and the highest point of land where the rallroad passes is not more than 286 feet above the level of the sea. On the whole route, most if not ail tho hilla through which the canal would pass would be required for embankments over the piains and swamps; and there are no lnsuperable obstacles to plercing the highest part, so as conveniently to make the waters of the Chagres, Oblspo, and Rio Grande available for the wants of a catral. In a climate less unfaverable to the white man, the question of "feaslbility" would not be raised. 't seems to be conceded, from experience, that the Afrienn race alone persiatently Jabor In this cllmate. A few thousand of free blacks might be obtalned from the West India Islands; but thia resource would be inadequate, as was experienced by the operations on the I'anama Rosd. The want of men to labor would seem to be the great obstacle to the successful accomplishenent of a work of so much magnitude.

On the Atlantic side the canal would enter the Bay of Aspinwali. In approaching this polnt, it would pass a fow milles from the Chagres, and enter the bay rear the Biver Mlindl. Mere, it whll be seen, as in the Bay of Panatia, extensive dredging for a chanael to meet the deep water would be necessary. The bay expands for the distance of about five miles, between two headlands, and is open to the sea. A breakwater would the necessary here. With such an one as would afford the necessary protection against the ocenn swell, the Bay of Aspluwall, like the Bay of Panama, would afford ample room for the comenerce of Europe as well as America; and in contemplating these tvo bays with the eye of a seaman, and in reference to the great work in question, it would look as though nature had provided them ${ }^{f} r$ the aspecial convenience of man in his laborious uncurtakings in the extension of commeree, at: ' a place where all nations may meet, iu their varied pursuits on the great highway of the ocean. In a work like that of a cnual throngh the Isthmus of Darien, it is to be supposed that the requirenents of commerce and navigation, in its most extended application, would alone be considered; and, taking this for a standard, a canal two hundred feet whle and tbirty feet deep would seem to be the appropriate timensions. With such an avenue from the Atlantlc, the stormy and distant sas of the South would be abandoned by Europe as well as America, and we should meet there on nentral ground, pursuing with a commen purpese the paths of peace and iulustiy, which by its meana, wa may suppose, would effect a moral revolutien such as the world has never known, and surpsssing in importance that which would be effected in the revolution of the commercial world.
Appended is a paper aulmitted by Colonel G. M. Totten, contalning dimensions and other data for the proposed ship-canal across the Isthmus of Panama:

Dimensims and other Data of the proposed Ship-Canal across the Isthmus of Panama.-Length frem ahore to shore, $45 \frac{1}{2}$ miles. Length from five fathoms vater
in Navy Hay, on the Atlantle, to three fathoms water in J'anama Bay, on the Paciflc, 48 z miles. The prian of water to be 150 feet wlde at the bottom, 270 feet wide at narfice, and 31 feet deep. The locks to be 400 feet in clear length of chamber, and 90 foet in clear wildth. The aummit level will be $\mathbf{1 5 0}$ feet above mean tide of the Atlantio and Paciffe oceans. The suinmit cut will be about four miles long. Tha deepest cutting on thia level will be 136 feet, and i. aver. age depth of the cut will be 49 feet. The Kiv. (!n: red yields an ample napply of water for the can. .. all seasons of the year. The summit level will be nuppllied hy a feeder about twenty-font milea long, which will tap the Rlvet Chagres about twenty-one miles above the town of Cruces, where the level of the river is atiout one hundred and elghty-five feet above mean the, and about thirty-five feet above the summit level. The cost of this canal, including the requlaite harhor improvements at euch ead, will not exceci $\$ 80,000,000$. --Commonoru Pavlitive's Report to the Navy Depuertment, United Statee, 1837.

The following figures will show the comparative distances from New York to San Francisco of the font rontes, exclusive of the land travel:

Papal States. This portion of Italy comprisea an area of 17,210 aquare inllea, and contained In 1850 a population of $3,006,771$ inhablante. The chicf productions of the Papal States are whent, maize, pulse, henup, wine, oil, and tobacco. There are numerous mhes of iron, lead, sulphur, alum, vitriol, and other voleanic products ; but, with the exception of the nalphur mines near Riminl, they are unproductive. The quantity of this articie annually manufactured amounta to about $81,000,010$ pounds. The manufactures of the Pepal Statea comprise allks, leather, gloven, paper, muaicnl stringn, Iron and glass ware, a fow cotton goods (at Kome), crape and sausages (at llologna), and cordage, soap, cream of tartar, and glue. There is no direct irade between the Uulted States and the I'apal Statea-the Intter deriving their stepplies of sotton, sugar, coffee, cocoa, rum, etc., from the porta of fienoa and Trieste. The foreign commerce of these atatea Is conducted chiefr through the porta of Ancona and Civlta Vecchia-the former with the western shores of the Adriatic, and the latter with the Mediterranean ports. The celebrated Roman cemeni is exported from the port of Civita Vecehia.

Foreign Trade.-In 1850, the iurefgn trade of Aneona represented $9,461,000$, viz., imports, $2,976,000$; exports, $1,4 \times 8,000$. This trado was distributed beiween Anstria. England, and its depeusencies in Enrope, these countriea appropriating mon than threefourthe of the whole. Juring the same year the foreiten trade of Civita Vechia amounted to $\mathrm{e} 3,821,928$; viz., imports, $2,929,31 \mathrm{i}$; exports, $892,614$. The conntriea participating in this trado were Franee, Sardinin, England, Holland, and the Two Sicilien. The whole forelgn commerce of the Papal States in 1850 amounted to $19,208,680$; and In 1851 to $20,454,240$. All forign veasels are permitted to engage in the coasting trade of the States on the frayment of the fol-
lowing dues: A cherage, on French, Auatrian, and American vessels, three hajocchi per ton-abont three cents. Korelign vessels pntting into harber, elther for anchorage or through atress of weather, pay half of tha above-named duty,-stee Italy.
Clearance Duty,-For each vessel of from 1 to 149 tons, ten bajoechi (ten centa); and for 160 tons and upward, twenty bajocehl (twenty cents). No versels enjoy an exemption from the custom-house dutien on importa and exporta. These dutle have recently nndergone several reductions, applicable chiefly to articles of necessity; on articles of luxury, in whicle sugar ia included, the duties have been proportionably raised. -Commercial Relations of the United States.

Paper (Cier. and Dn. Pupier; Fr. Ihpier ; It. Carta; Sp. Papel; Hnas. Bumaga; lat. Churra; Arai. Kar Pers. Kaghas). This highly useful subetance to every one knows, thin, flexible, of different colora, lut most commonly white, being used for writing and printing upon, and for various other purposes. it is manufactured of regetable matter reduced to a sort of pulp. The term paper is derlved from the Greek word тanipos, prpyrve, the name of the plant on the inner hark of which (liber, Bijhos, whence eur woril book) the ancients used to write, Paper is made up Into sheets, quirep, and rrams, each quire consisting of twenty-four wheets, and each ream of twenty quires.

Ihisorienl Sketch of Prper. Differince betereen ancient and mondern Poper.-Some of those lenrned and lugenious persons who have inveatlgated the arts of the ancient world have expressed their surprise that the Grecks and Romans, though they posressed an immense number of tooks, and approached very near to printing in the atamping of worde and letters, and aimilar devices, ahould not have discovered the art; the first rude nttempts at typgraphy being kufficiently obvioun, though much tince and contrivance have been required to bring the process to lta present state of perfection. But they should rather, perbapa, have wondered that the more clvilized nations of antiquity did not invent paper, an invention which, it may easily be whown, necessarily preceder that of printing. But thia was an exccedingly difficult task; the more no, that the rast importance of peper could not be appreciateal, or cyen imagined, till after it had been genevaliy introduced. At first, the memory of important evel'ts appenrs to have been handed down ly inscriptions ent on rockn, pllars of atone or marhle, and the wells of edifices; and this primitive usage is atill retained in the monuments in our churches and cemeteriea. In a later, thongh atill very remoto age, men were accustomed to write upon portable surfaces of various kinds. Every liorly knows that the Decalogue was w ritten upon tables of atone; ami Joshua wrote a copy of the law apon the like materials.-Josh. c. viii., v. 32. The Greeks and Homans engraved laws, treatles, contracts, and other important documents, on piates of hrass ; and it is atated that a fire which broke ont in the capitol, in the reign of Vespaslan, consumed alove 3000 such bronze munlments. - Noureau 7 raite de Ifiplomatique, 3. 451. Jut exclosive of plates of this nort, which were necensarily inconvenient, costiy, and guite untit for ordinary use, thin and fiexibie plates of lead and other metais (/us, c. xix., v. 2!, 21), thin pieces of wood, skina, parehment, linen, and a variety of simijar mubatances, were used in writing. Cheajur materials, such as the leav and bark of trees, palans, etc., were also used from a very remote period for the astne furpose: lut leaves (rujprat, ehartir) being, when iry, apt to aplit in the direction of the tibres, it was found to be necessury, in preparing them for wrising, to glue them together, so that the fibres might cross each other In ofpersite dilrections. The texture of the leaf, or sheet, if we may so call it, in thus greaty atrengthencd; and when it ias been smoothed, poi. Ished, and fitted for use, it is less inconvenient and bettep Iooking than might be pupposed. Such, in

for wri
er; by
fact, is the principle on which the paper of the anciente was formed. This, however, which was called Charta Egyptiacn, from the place of ita manufacture, did not conaist of leaves, but of the inner bark of the famous reed or rush, the Cyperus Papyrus, found along the banka of the'Nile, or rather in the pools and ditchea which commanicate with the siver. The ancients applied this useful plant to an immense varisty of purposes; but here we shall only notice that from which it has acquired an immortality of rentown. The inner bark having been divided by a needle or other aharp instrument Into very thin and bread layers or filaments, portions of these were placed side by side longitudinally, and glued together at the enda; another portion being glued eross-wise on the baeka of the latter, to give the page the reqnisite strength. Pliny and other writers have described the procesa (IIist. Nat. lib. xili. c. 11, 12, 13), which has been further elucitated by Ilardouin and other commentators. But the fullest and ablest diacuasion of this curloun aubject is contained in the very learned and elaborate work, the Noureau 7raitd de Diplomatique (i. p. 448-524), where the most interesting partieulara respectlag the history and manufacture of papyrus, as well as of the greater namber of the other writing materiala used in antiquity, havs been collected and set in the clearest point of view.-See aiso tho Dictionnaire Diplumatique of De Vaines, art. Parien, if. 165-174. Bruce has given a summary of the authoritiea in the soventh volume of the octavo edition of his Travels; and, not aatisfed with this, ha attempted to make paper from tho papyrus, in which, not being very auccesaful, he imputes his fallure to errors in the atatements of Pliay; aot reflecting that, had ho endeavored, trusting to written directions, without experience and traditional srt, to make modern paper, or even a pair of shoes, he would most probably have been equally infelicitous. Eyypt enjoyed for a lengthened period a natural monopoly of this valuable articlo, and even attempted, in anticipation of a later policy, by prohibling tho growth of the papyrus, except in certain localities, and limiting its supply, to sell its produce at an artilicially enhanced price!-Ameilion, Commerce des Egypticns, p. 238. But this policy ceased on the conquest of Egypt by the Romans, who, having imported the plant into Rome, succeeded In preparing from it a very superior articic. Pliny enumeratea the various kinds of paper, from the coarsest, which was used, like our brown paper, for packing, to the most expensive and finest. The Jutter, which was made of tho innermost filaments, was of a snowy whiteness; and when properly dressed and polished, was easily written upon. The consumption was very considerable; and being, after the foundation of Alexandria, principnlly made in that city, it formed an important article in her commerce, and furnished employmenc for many workmen and much eapital. Flavius Vopiscus relates that, in the third century, the tyrant Firmus used to say thero was so much paper there, and so large a quantity of the glne or sizo used in its preparation, that he could maintain an army with it: "Tantum habuisse de chartis, ut publices srepe diceret, cxercitum se alere posse papyrd et glutind." We may doubt whether the value of the paper nt present belonging to any aingle city would do the like. Charta Eyyptiaes is very ancient, having, notwithstanding the assertion of Varro and Pliny to the contrary (Ilist. Nat. lib. xiii. cap. 11), been in common use long before the ago of Alexander. This is evident from the atatement of Ilerodotus, who, though ho lived abont a century before that conqueror, tells us that in former times, when papyrus was searce, the Ionians wrote on the skins of goats and sheep, and that that practice continued to be cuatomary among several barbarous nations.-Lib. v. cap. 68.
Though white, amooth, durable, and not ill adapted for writing, ancient paper was not auited for the printer; by reasen of the eloseness of tho grain, it woutd
not have recelved the ink from typea moro kindly than ahavings of wood, and such lika materials; and lta textura was so very brittle that it would have shivered to pieces under the presa. It waa, in truth, an inartlficial masa ("viscera nirea rírentium herbarum"), no great invention or ingenuity being discovered in ita preparation. Modern paper, on the other hand, ia wholly artificial ; and the contrivaneea for lte manufacture are marvelous alike for the sagacity evinced in thelr deaign and their practical efficiency. Like the paper of antiquity, it is formed of the flamente of varloua sorts of vegotable nubatancen, derived principally from the tearing to plecea or pounding cotton and linen rags, and aimilur materiala, mixod with water. Thia procesa is called beating them into pulp; and when examined with a mlcreacops, the floating fildmenta are found to be well fitted for adhering togethar, being jagged and rough, and mixed in overy poaslble way. A portion of this mixture or pulp being, when properly prepared, poured upon moulds or sievea of fine woven wiro, the water is drained off, and the suspended fibrea falling to the bottom, form a layer or shect, which, being consolidated by presaure and dried, becomes paper, ita strength and goodness depending, of course, in a grest measure, on the quality of the rag or other material of which it is made. Paper used to be manufnetured by dipping sieves or frames into the pulp, the pertion of tilaments so lifted up forming the sheet of paper. But tha application of rotary motion to the manufacture has effected n total change in the modo in which it was carried on: instead of dipping the sleves or frames Into tho cistern of pulp, a eircular wab, or round towel of woven wire, revolves horizontally under the vessel (technically called the vat), receives the depesit, conveys it away, and, ly an aljustment of extraordinary delicacy, trans fers it uninjured, though as fragile as a wet cobweb, to a similar revolving towel of felt; thus an endless web of paper is spun, as long, at least, as the machine continues to move and pulp is aupplied.

The pervious and apongy texture of paper make it readily imbibe aad retain the ink impressed on it by types in printing, and tyy the pen in writing; its toughness hinders it from being easily torn; and, in a wellbound book, under favorable circumstances, its duration is indefinite, and, for all practical purposes, eternal! It is true that legal documents are sometimes written or printed on parchinent, which is less liablo to be torn or injured by rubling; the luxury of typography occasionally, also, exhibits n few impressions of a splendid work upon vellum; and it is further true that these substances were used for writing upon by the ancients; but they aro necessarily expensivo, and the cost of either far exceeds the means of the great majority of book buyers-so that it would be attogether unprefitable to cast types, to construct pressea, and to incur the various and lieavy charges of an establishment for printing, unleas we possessed a chenper material on which to print. Almoat all the more ancient and valuable existing Greek nnd Latin manuscripta are written either on parchment or vellum, but generally on the latter. It is singulnr, however, that whilo such is the ense, all or almost all the very old charters nnd diplomas are written on papyrus. Indeed, the learned authors of the Nouveau Traité de Ihiplomatique affirm that no parchment charter has been discovered nuterior to the sisth century.

It nppenrs to be sufficiently established that paper, fnbricated like that now in use, of cotton nud other vegetatle materials, and of ailk, has been mannfactured in China from a very remote epocis-. Voureau Traité de Diplomatique. The Arnh historians stato that similar paper was manufactured in Mecen in tho beginning of the elghth century (Anones, Origine e Progressi d' Ogni I.etteratura, and Ginnox, ix. 379); and most probnbly the modo of its production was then also knewn to the Greeks. It appears to have been
