Un the 6th January of the obrrent year, three decreee were pubiluhed। one permitting the teraporary importation of shect copper Into France by Freach vesseln, or direct from the conntry where it is produeed, free of duty; when it is intemied for the mannfacture of bollers or machinery. Its origin muat be certified by the French connul at the piace of Ite departure. Immediately on Ita arrival, the Importer ia bonnd to make a declaration at the cuatom-honse, of the num. ber and welght of the eheets, as well se of their length, brealth, and thickneas. The enatom-honso, after baving ascertalned the correctneas of such decharation, to enjoined to cause a stamp to be put on ench shect, in order to ansure the exportatlon of the same copper ; and a charge of 5 centhes for slamping, Including tho cost of the atamp, is made for erery sheet so atamped. Bond muat be given that the whole quantity of copper Imported ahall be neod, and re-exported, or placed in the publle atores (oxcepting such parts as may remaln from cutting or cornern of sheets, In which the duty muat be pald in the same proportlou as if they wero vhote shects), within six montha ; and the custom-honto is enjoined to a sbure ltself that the artlices mo mannafactored are equal in quantity, kiod, and quallit, so that, tomporarlly adsmilted, sheet eoppsr can only be exported from porta or phaces baring publie warchouses, or from pinces to which sach articles are allowed to be sent in trimait. By another, the temporary introductlon of old caat Iron belonging to for-elgn-bulit ateamboate, whieh may put into France for ropairs, la also admilted free of duty-the Importera fiving sufficient sccurlty for replacing in the entropits of France within six monthe, an equal quantity of Iron, proper for thipa' us, to that which may have been employed in such repair. Iron Imported under thle decree, and the article manufactured therofrom, can only the exported from piaces having government warehouses; and the cuatom-house is charged to see that the iron huportod and not used be brokon ap th euch way as to rendor it luppossitite of being used, otherwine.
The third deeree aubjecta forolgn vessels at the island of senegal to a rimple tax of $\mathbf{5 0}$ cenilmes per ton, without the alditional 10 per cent., but thla in limited to the port of Gurec. A decres relative to French nad forelgn pmigration was pronullgated on tho 15th of Jaunary, a copy of which, In eitenso, with a trauslation lato English, waa forwarded by me to the Dopartment on the 31at of that month. A eircular, dated 15 th danuary, exempte from tho tax of nombage, or leadimg, certain articles of French origin, or forelgn goods on wheh the duty lmposed by law has been palil, when they are sent by wuter from one part of the empire to another, procantions beligg taken to assare the ldentity of the goods on thedr arrival at the port of destlaation. Ity a circular, dated 16th Janoary, the decree of 20th December, prohibiting the suportation of forelgo moinaser, extomis to such oniy an la Intended for diatiliation; and the exemplion from duty on Franch molasses equally applien to such an is imported soidy fur distillation. Molsasen so lmported Is always under the aurvellance of the cuatems till after ite completion at the place of diatillation.
1ty another clrcular of the 27th of the mame munth, alcohoi froduced In Cornica, from the distillation of the bulbs of dstiodils, fige of the cactos (priekiy peara?), juniper and myrthe berrese, and atl other nubstancen, with the exception of fariancenta (the diatillstion from wheh substances the elrcalar continuea to prohilit), are milied to the number of aricles admitted free of duty. A decrec of the amme date modifies the daty on jualper nad myrtle berrles, and elso on table-frolta, and equalizes the duty ou the bulbes of daffodils aud fige of cactus, By a deeree of the 31at of January, forelga wlace of every description are admitied into the lslands
of Marinique, Guadaloupe, Guiana, La Róunion, and Benegal subject to a duty, when importod by French oblpas of 25 centlmes per hectolitre, and to that of 5 franne when ltaported by forelgn vescels. A circmiar of the lat of Felipuary exempta from nxamination, at the custom-houmes of France, the baggage of forelgners arriving from forelgn parts, to embark for places abroad ; and a decree of the 10th allowa the fres importalion of aall (foreign) Intended for the mackerel Anhery, whioh beretofore wat confined to that of France, from the 15th February of every year; and another decree of the 14th extende the poriod for Ite Introduction from the 1at of March to the 15th of June; previonsly to the date of that decree, It wan only admitted between the 10th of March and the 16th of June. A decree of the 14th of February Inaposee a duty on anerm or whale oll, Imported in French ohlps, fron conatrios beyond Capes Iforn and Good IIope, of 5 france per 100 kilogrammes on the grows welght f from othor countrles than Kurope, 7.50 frances, and by forelgn veamels, is franen per 100 kllogrammes. 11y zother decree of the samo date, fionr from Algeria la admitted free of duty into all parts of the empire.
On the 17 th of February a decree was lanued granting a drawback of 8.20 francs per 100 k lingrammen on white or mettled soap, composed of alkall and ollve oll, or from vegetable oil, entering for at least ono half in auch compoaltion, or for less than half if mixed with animal anbetances, On soap made wholly from animal subatanece, a drawback of 0 frane per 100 kllogrammen is allowed, and 4 franes per 100 xilogramiacs on sosp made from palm or cocos oil, mixed with ulmal subatancee or rosin. A circular of the 28 th of February speclftes the objecta which shall be conaldered as coming within the meanlig of the trealy concluded with Spain on the 16th November, 1853, which are beoks, dramatle and musical compositions, palntings, drewlogm, engravlogs, ithographs, sculptores, geographlcal mapa, and all other similar produc. tions, with the esception of worke of srt applieable to agri culture and induatrial manafacturea: prohibite the reproducthen of the works of either In the country of the other, and indicates the porta in France by which alone such works can be Iniroduced. A decres of the 10 th of March anthorizos the Introductlon into MartInlque, Guadelonpe, Gayenno, and 1a Réunlon, of salted provislons of every kind, from whetever country or under whatever flag they may be Imported, on the payment of an lnwaril duty of 50 centimos per 100 kilogrammes. The same provislots are allowod to be introdued Into Senegal (St. Luelas), at the same daty, if imported by French vesels, whether from forelgn countries or from the entrepot at Gorée. No change la made ln tho law actually hat exletence, wherpet to provinlone arriving at Senogal under a forelgm thag.

A decree of the 14th of April modiftes the inward duty on wools, arriving direct from countries situated beyond Capo Horn and the Capo of Good Hope, when Imported by French vensele, bot leaving the duty actually exlathg unchanged when insported from olher parts of the world. Another de cree of the same date repeals the export duty of 5 centimes per $100 \mathrm{kllog} r a z a m e a$ on lime: and thy another decree, under the samo late, the duty on Hipueurs imported from the French colonten is fixed at 16 francs por hectolitre of liquid.
On the 23 d of Aprit an allowance of five per cent. for logs In weight, whether from water or decay, was authorized by decree on refined salt, if imported by nea and ehipped in bulk at the place of production; asad a accond decree of the same date establishen the Inwarid doty on nitrates of soda nad potashes arriving by French vensels from countries altuated bevond Cape Horn and the Cape of Good Hope, at 1 franc per 100 kilogrammes; from placen in Einrope, 6 franca per 100 kllogratumes; frotu entreputas 8 framen per 100 kilogrammen.
Citrie uclide of all sorth imported from the colonles ot France, in French shipa, aro admlted free of duty: by forclgn vibsels, at a inty of 18 fanes por low kilogranmes.
A premlum or boanty of 5 rancs is allowed on the exportathon of every lth kilogranmes of net nitrice acil, and one of 20 eentimes on auphiuric acld. On the 2 ith of April a cirenlar was lsaud aulhorieing the temporary free admission into France of machinery, plass (for rectivering), bronzos, and other kimilar works, and books, when lmported separately, or in muall qumitites, for the purpose of belug repaired or finisherl, on condition of their belng re-exported within six months. lity a decreo of the 28 th of April, Iron work, in bars or sheela (withont distinctlon of origin) fit for the conatruction of elltiees or dwelltug.houses, ls allowed to be fmported Into Senegal by French vessele, free of duty, whether coming from the entrepita of the metropolis or that of Cioric. Another decree, of the same date, fixes the duty on oh worn-out type at 6 franes per $100 \mathrm{kllogrammes}$. May Sth orders the withlrawal from clrenation of all pold pieces of the value of 10 francs, bearing the ettigy of tho

precent emperor, to take plece en tha 15th of Oetober, 185\%. By erdennance of the Siet July and 4th December, 1814, all velmele arriving In Franee, in ballent, to take in mult, wers erempted from tomage dues. By a deeree of the 10th of May, 1805, forelgn vemele arriving with eargo enjoy the mamo privilege, but only in proportion to the guantity of aalt taken by tham; and by a circalar of the $\mathbf{2 4}$ of June the export dinty on mall is muppressed.
Alcohol distilled from daftodils in Aigiera in admitted into France free of duty, by decree of May 28d. Bya decree of tha 2d of June, the delay flxed for the introduction of provisions into Franco if prolonged to the OIat of December, 1858; by anothar of the 5th, the free admitaion of ahlpa fmporting grain, flour, rice, ote, is extended; and by a circular of the 11 th, the exportation of these artioles is prohibited during the aame period. A decree of the 28d of June socords the privilege of transporting grain and flom between Algaria and Franee to forelgn vessela, heving left their port of loading on or before the 81at Deomber, 1855. 'By another deeree of the same dato the exportation of oorn and barley from Algeria, to foreign conntries in prohisited, and by a thisd deeree, the importation of carol beans by Frepoh vesesles is admitted at $a$ duty of 26 centimes per 100 kilogrammen, and of 1 frane per foreign vesmels, A decree of the 7th July admite, free of duty, vanilla, imported by French vessels arriving direct from the French oolonies, Cayenne and Mayottel. A ciren. lar of 10th Jaly imposes a donble Abeime on the amount of all government tarea, to remain in force till the lat of Jan. nary, 1850 ; facrem the exine consmmption duty on hrandiles, eplicita, liquors, and brandy frulta, from 81 franes to 80 france per heotoiltre of alcohol, and from 60 franca to 66 francs, exclaalve of the double decime, the tax on theme articies on their admiation into Paris, and forther imposes a tax of 10 per oent, on the receipta of pascenger monoy by ralirond, and aloc ot the oonveyance of goods by fate or expreat frains. By a diearee of the 14thJuly, molasees imported for diatillation by French veseele from the colonies of France, India, gonth America, and the Weat Indies, is admitted free of duty, and from other porta at a duty of 8 frances per 100 kilogrammes. When imported hy forelgn vessela, tho duty in 3 francs per 100 kilogrammen.

A decree of the 16th July makes many changes and modincations in the tarifi of duties. They are too numerona to be imbodied in this rommunication. They will no donbt be published in one of the anpplements to the general tariff. Which aball be forwarded to the Department when published, with any othera which may have preceded it, or by which it may have boen follawed. The avowed object of theme modifications is to give additional enconragernent to its maritime commerce by the total repeal of duty on the raw material of certain artciet-the producs of distant conniries-when imported direet by French vessets, for the purpone of contributIng to the progroes of thelr own mannfacturom, and by totally repealligg the daty on cortain artielea of small productive revenue. Among the ment important of the modifcationa is the alteration of the duly on eaoutoheuc. The duty on thia artiole of 20 francs per 100 kilogrammen is continned when it is melted solely for artioies of manufacture. Untll the publication of this decree, when other anbetances were mixed with cautchone, or gatta percha, either for the purpone of giving oolor or adding atrength to the articie manufactinred, the daty wat 200 france per 100 kilogrammes. This tax is now reduced to 50 france. The duty of 200 franem will in future be payahle anly on articies composed af catoutchone ar gutta percha, wih whioh other mubatancen are combined, and when intended for other purposes than that of being melted. A deeree of the 31 st Auguat accorda the free admisulinn of game, pouitry, and ahell-flah (tortue); and one of the 88d September prulonga to the 81at December, 1858, the exemption from tonnage duty of all vesceln inden with grain. flour, rice, potatoes and dried vegetables
Tho inorease in the price of meats in France has been very great aince 184s; so munh so, that general complaint oxiate on the aubjeot. From 1858 te 1854 there has been an increase of price from 40 to 45 per cent. The attention of the governmeat of Frenoe having been cailed to thin fact, its effurts have been not only to prevent a further leorease, hut to affect a diminution from preaent pricea, To this end the tariffig have been revieed, and vory great reductions have been made upon the importailion of forelgn oalllo, to wif: from 1028 to 74 centa a head on beof, efo. Not only so, bat the dirent attention of the people of France hae been called to the une of salt meat, and the experiment of opening the market is belng made with muoh anceese. The duty npon this artiole has been acceessively rediced from 060 to 8879 , to 186 , and in the month of Ootober inst, to 01 canta the 291 poanda, or 100 kilogratamea. Under theese reduotions there

1854 the importation of mealn, freah and matt, resohed oniy 8697 quintaur, or T77,844 $58-100$, ponndet white in the fires month of the present year, the importation has reeohed 8780 . quintaux, boing mone than in the whole year of 1858 by 908 quintaux, or 41,769 62-100 pounds. I tranamit herewith an extract from the EBoho a'Agrioal, ahowing the natual mode of importing malt meats, with the rempeetive values of the feveral qualilies " Prime pork is the most common kind In brine of gray malt; barrele of 831+ibs. grom, or 198 90-100 lbe net: value from 81480 to $\$ 1581$ the barrel. Meem pork is $11 t 40$ imported and doem not find a sale, helag too fat. Prime maces, firat quallty, preeerved in brine with whito salt, from lean hoges, is from 1860 to $\$ 1963$ per barrel. Hams Ealted, sugared, and mooked, auntain a comparison with the bent we have in Europe, and find a ready male. Shoulderg, dry ealted, find a good deal of favor in Franes. They come In dry barrele, of $99440-100 \mathrm{Jbs}$ net; value from $\$ 1860$ to $\$ 19$ 53 the 221 ibe, or 100 killogrammen. Lard comes in barrels of $20520-100 \mathrm{ibs}$, or in frking of $4662-100 \mathrm{ibm}$ nel; value $\$ 18$ the $110+1 \mathrm{be}$, or or 50 kilogrammes." The foregeing extract whil indieate the kinds, manner of importation, and valnes, for the bemefit of importera. By a decree of the 10th of this month (March) the rates of dntion on malt meate into tha French coloniea have been reduced wa followe: Into Martiolque, Gaudaloupe, Gulana, and La Rénulon, malt meata of forelga make, from whatever conotry imported, and nuder Thateouver fiag, will pay a duty of 50 centime (9i cents) per kilogramme, or 221 lba. The eama duty fir required at St. Loula, Senegal, hat only when imported in French bottoma, elther direetly from abroad, or by extraotion from the entrep0t of Gorde. Thame menta imported into Senegnl, under a forelgn flag, are charged the duty in force before tha decree.

In Africs the French posesss Gorfe and some factories near the mouth of the Senegal. In the Fast they have the Isle of Bourbon, and Pondleherry, Chandernagore, and some smaller factories on the mainiand of Indla; and their veseels are, like the Americans, admitted to trade with Calcutta, Medras, and other British settlements, on payment of moderate dues. The retention of the Mauritlue hy England, at the peace of 1814, deprived them of the great receptacle for their privateere in the East; and on the continent of North Amorica, they retain nothing since the cession of Loulaians to the United States in 1808. Since 1841, when the eovereign of the island of Mnyoite placed himself under the protection of France, this Ieland, situated st the extremity of the Mozambique Channel, is to all Intents and purposes a Freach settlement. Mayotte Is capnble of foeding a population of 20,000 soula, and of regularly furnishing provisions to a squadron of ships, France also possesses an establishment in Aus-

tralin, for since the 22 d of March 1854, Captain Dnbouzet has been commandant of the Marchesas and imperial commisaary at the Society Iolands and New Caledonia. There is also an unimportant Freach settlement at Madagascar, and an attompt at a ponal colony has been made at Guiania, where, to the diagrace of the French government, political prisoners have beer mixed with the refuse of the galleys. In the seas of Europe, Corsica is almost the only insular pooseseion of the French. They have no great maritime fortresses, like Gibraltsr or Malta, and no dependenoies of the nature of the Ionian Ialands.
Commerce, etc.--The commerce of France with her colonien is regulated by the same narrow maxims as the other branches of her foreign trade. :The colonies and the mother country aro mutually bound to trade exclusively with eaoh other. The staple produce of the French Wost India colonies, as woll as the Isle of Bourbon in the East, is augar ; and it appears that the price of this article in the European markets will not repay the expense of ita cultivation in those countries. The coloniste, therefore, insist that all other augars shall be excluded by heavy dutian from the markets of France ; that they hall have the exolusive privilege of aupplying these markets ; sand on a complaint that the duties imposed on foreign sugars were not high enough to give them the monopoly of the home market, an additional duty was, in 1822, on the suggestion of the director-general of the customs, imposed on all forelgn sugars. In retarn, France possessen the exclusive privilege of eupplying the colonies with all the manufsctures and other Europesn goods which they require. On this principle of miutual monopoly the trade is now conducted. The effect of this system is to levy a tax on the inhabitants of France, in order to indemnify the coloniste for the losees which they incur In carrying on an unprofitable trade. They can not furnish a supply of sugar to France at the ordinary rate of the European market; and the price must therefore be artificially raieed in that country, in order to enable them to oarty on the cultivation of their estates; while, on the other hend, they are not at liberty to buy the goods which they require in the cheapest market, but muit take them at whatever price they can be afforded by the mother country.
Another evil of this colonial monopoly is, that the colonies supply more sugar than France can consume. But it can not be sold in othor countrien at the price which is poid to the colonies by the mother country; and hence it becomen necessary to find out the means of forcing a sale of the surplus which can not be consumed at home. A bounty is accordingly granted on all sugar exported from France; and in 1831, while the duty on the importation of sugar produced $£ 1,686$,030, there was paid back for bountios $£ 488,951$, which was more than one fourth of the gross receipts. The loss which France has incurred since the peace of 1814 by this erroneous system is estimated in "Bowring and Villiers' Report," at $\mathbf{£ 4 0 , 0 0 0 , 0 0 0}$ sterling ; and in return for these grest sacrificea, the colonies afford but a limited demand for the manufuctures of the mather country ; in 1852, it amounted to $28,482,000$ kjlogrammes; in 1858, to $26,481,000$ kilogrammes; in 1854, to 83,297,000 kilogrammes.

Colonies,--The colonisl pessessions of France are quite unsuited to her greatness in other respects. The insurrection engendersd by the first Revolution deprived her of the weatern half of St. Domingo, n rich and beautiful territory, contuining formerly more negroes, and exporting more produce, than all the British Weat Indies together. The French government geems to have relinquished the hope of regaining this country, at leset. by milltary means, and to limit ite ambition to the remaining colonies, Martinique, Guadsloupe, Cayenne, in the West Indies. The firat two are, like most of our West Indis islands, cultivated to a considerable extent, but eapable of much improve-
mont. The petty island of Marie Galante is in a aimilar atate ; but Cayenne forms a part of a most extensive tract, of which one comer only is as yet rendered productive, and which may eventually become a great eettiement ; though on the score of health it is as unpromising as the adjacent coloniee of Demerara and Surinam. Before the lose of St. Domingo the annual import into France amounted to 70,000 hhds. of mascovado or brown sugar, 60,000 hhds. clayed, and nearly 20,000 of fine clayed, Of this very large aupply there were exported nearly 40,000 hhds. of brown, and above $60,000 \mathrm{hhds}$. of clayed, forming, exclusively of any duty, an annual value of between $\mathbf{~} \mathbf{2}, 000,000$ and $£ 8,000,000$ sterling, and affording a most acceptable exchange for a number of imported commodities. The augar thus imported from St. Domingo has long been lest to France, no sugar being now exported from that country.
Algiers,-Among the colontes of France is Algeria, which the government has retained since its conquest in 1830. Of this dependency Algiers is the capital, the seat of government, of a prefecture, and of a bishop's see cince 1888. Algiers also possesses a government printing-office, an academy of public instruction. a court of appeai, a tribunal of first inatance, a tribtrnal, and s chamber of commerce. A bank has been recently established. Several newspapers are published at Algiers. The Moniteur of Alglers is the offl cial paper. There is also the Akhbar, the Modacher, the official journal in Arable, the Atlas, etc.

The population of Algiara, according to the last returns, amonnted to 55,682 Europeans, of whom 23,147 were French, and 24,096 nativen, of whom 17,858 were Mussulmans, 1380 negroes, and 5758 Jews. A Protestant church was commenced In Algiers in 1848 and finished in 1845. There are at. Algiers four large mosques and aboat thirty lesser onses, two great and twelve lesser aynagogues. There are few manufactories in the capital unlese of silks, carpetings, woolen tissnes, fire-arms, saddlery, jewelry, leather, etc. From the last pubilebed official returns there entered Alglers within the year 2279 shipe, measuring 209,642 tons; of these 255 were government vessels, 1134 French commercial bottoms, and 120 native; the rem maining veseels were under foreign flage. There sailed outward from Algiera, in the lest year of which we have any official records, 2217 ships measuring 208,810 tons. Of these 249 were government ohips, 1148 French shipa, and 117 nstive. By a decree of the present Emperor of the French, a bonrae was created st Algiers on the 16th of April, 1852. For a more detsiled account, see Alaiers.

All along the north coast of France, the fisherien consist of cod, mackerel, herringe, end pilchards. On the Atlantic, and atill more on that of the Mediterranean, are osught great quantities of sardines, a fish
of passage, whlch appears periodically in shoale, like the herring. The fishery of sardines is asaid to give employment to 8000 semmen, and the sales resulting from the prodace amonnt to between $8,000,000$ and $4,000,000$ of francs. The tupny, a fish not known in northern latitudes, is found in the Mediterranean in the early part of snmmer. It varies in weight from 10 to 25 pounds, and io in like manner caught in shoals.

These home fisheries, little calcninted for forming seamen, have been left to their natural progress, while repested attempts have been made by government to extend the fiehery in America; a design favored by the early possession by France of Newfoundland and Cansia, as well as by the long peace that followed the treaty of Utrecht. Toward the middle of last century the French fisheries in Americs cmployed annually about 6000 seamen; but the unsuccessfui contest with England in 1756 redoced them greatly, and deprived them of their principal atation, Cape Breton. The peace of 1783 was concluded under better auspices. The islands of St. Pierre and Miquelon were ceded to France by the treaty of Verasilles, and the rights of fishing and of drying fish from the Cape St. John to Cape Ray. In the Gulf of St. Lawrence her rights were subsequently recoguized, by the treaties of 1802 and 1814, st 3 leagues' dietance from the consts belonging to Great Britain ; but within the gulf, at a distance of 15 leagues from Isle Roysle, and 30 lesgnes from Now Branswick.
forbion Conmerce of fuancr witit ifa Colomies and the Fisuixe Banke.

For the
iragement of the French fisheries, enormous pectuatary ascrifices have been muile. By the law of the 2 ed of July 1851, bounties are granted to the fisheries tili 1861, st the rate of 120 francs the ton. A ship of 600 tons thas receives 72,000 francs bounty, which would be 2000 to 3000 franes per man. The only time they wers ever in a prosperous state uas, not when they were protected by the artificinl encourugement of the mother country, but when the French colonists, being in possession of a large tract of the American aeu-coast, were in consequence compelied to trunt to pradence and economy alone for the suceess of their adventuren. During the session 1833 of tho Chamber of Deputiea, a committee, appointed to incuire into this subject, made their rejort.

French Fisheries.-lligh honnties have, since the yeur 1767, been paid to those owning ships, ani to men emploved in the Frouch tisherics. In pursuance of ordmances dated the 24th of June, and 9th and 12th of July, 1851, the following bountles were granted for the encouragement of the French fisheries. They came into operation on the 1st January, 1852, and are to remain in force until the 80th June, 1861 :
"Cod-fishery.-Premiums for Chartering and Equipping l'easela,-For overy man engaged in the tisherlen, having drying or curing grounds, whether on the coasts of Newfoundland, Suint l'ierre or Mlqueion, or upon the great Newfonndand Bank, 50 frimes. For every man engageal in the flaheries, not having drylug or curing grouada, in the Icelandle Sens, 50 francs. For every man onguged in the fisherten, not having drytug or curing groundh, on the great New foundland bank, 80 francs. For every man engaged in the fisheries on the Dogger liank, 15 france.
"Bounties on the Produce of Fisheries.-On the Im-
portation Into the French colonien, whether in America or on the other side of the Cape of Good Hope, of every quintal of dried codfish, the produce of French fisheries on the coaets of Newfoundland, Saint Pierre, or Miquelon, or which may be taken from entrepôts in France, 20 francs. On the importstion into the above colonies, of every quintal of dried codfish, the produce of French fisheries, if the fish shall be exported from the French ports without having been there warehouted, 16 francs. On every quintal of dried codfish, the produce of the Franch fisheries, and innported direct from the same or from French entrepôts, into such foreign Mediterranean ports (except those of Sardinia and Algeria) in which a French consul may reside, 16 francs. On every quintal of dried codfish, the produce of the French fisheries, forwarded direct either from those fieheries or from French ports, and imported into Sardinian and Algerian ports, 12 france. For every quintal of coi-sounds that the fiahing-vessels may bring into Frunce, the produce of their fiehery, 20 francs."

Vessels departing for the fisheries with drying grounds, whether on the cosets of Newfoundiand, Saint Pierre, Miquelon, or the great Bank of Newfoundland, shall have a crew whose minimum is to be fixed by a royal ordinance.

Whale-fishery.-The bountiee granted in pursuance of the luwe of 24th June, and 9th snd 12th July, 1851, for the encouragement of the whale-fisheries, ohall be fixed as follows, to date from the 1st January, 1852, und to contlnue in force untll the 30th June, 1861:
"Bounties on the Departure of Vessels.-For every ton of shippling outwurd bound, with crews comjosed entirely of French ssilors, 70 francs $;$ and for vesseis with crews composed partly of French and foreign sailors, agreeably to the provision that the foreigners exceed not one third either of the officers or crew, 48 francs.
"Bounties on the Return of Vessels.-On esch ton of shipping where the crew is composed entireiy of French sailors, 50 france. On each ton of shipping with a mixel crew, 24.5 francs."

Under the conditions that the vosseis shali have fisied either beyond Cape IIorn, or to the east of the Cape of Good liope, as far as $62^{\circ}$ of latitude, and shall have been out at least 16 months. In addition to the above, thore ahall be allowed to vessols especially minned for the sperm-whale (cochalot) fishery; in the Pacific Ocean, after they have been at seu for the epace of at least 30 months, and during which time they may have reached as far as $28^{\circ}$ of north latltude, an additionai bounty of 15 frunce upon the eperm oil, etc., which they shall bring home. The bounty on the produce will only be accorded for an amount not exceeding 600 tons.

Colonial Tariffs.--The navigation betwcen France and her colontes is confined to French vessels measuring not less thun 40 tons, in which tho officers, and at least theee fourthe of the crew are Frenoh.

Frencis Guiana (Cayenne).-The tariff of this colony is estabished by lecrees of the local authority, sanctioned loy the metropolitan goverument.

Duties on Imports.--French merchandise (with the exception of tilat sulmitted free), imported direct from ports of Frunce or her colonies, in Frencis bottoms, pays 2 per cent. ad valorem. Foreign merchandisa (with the excepition of that admitted free) permitted to be imported, hoth under French and foreign linga, vkz.:
" 13eef, salted; butter; codfalh, green, dried, and salted; fish-oil ; wheat flour, rye flour, sud corn meal; lard; vegetables, fresh and dry; lime, slacked; malt pork ; rice; salt $\boldsymbol{j}_{\text {a }}$ ataves; atone cosl ${ }^{\text {tallow, and tal- }}$ low csudles ; tobacco, in leaves ; whalelone and whale-

- By a late decree, analted provtaiona under all flagn and from all countries pay 50 oentimes per 100 kiltogrammea
oll ; wood, and pitch-pine, pay 5 per cent. ad valorem. All articles not enumerated above, 10 per cent. ad valorem."

The following articles are prohibited importation for consumption, and are only admitted in entrepot (entrepôt fictif).*
"From French Colonies in French Vessels.-Cocoa, cinamon, clover, coffee; cotton, raw ; indigo, and propared roucon; all spirituous liquors, with the exception of brandy, French and Martinique cordials; Kirschenwasser and gin; natmegs, pepper; sugar, raw and whitened, and wool.
"From Foreign Countries and in Foreign Vessels.Clothes, ready made, comprising hats and all articles for the feet ; cotton, spun; gunpowder; sugar, reflned; tisgues of cotton, sllk, wool, and, hemp."
Tho following articles are admitted free of duty, without reference to their aonrce, under all flags:
"Animals, living; agrica"tural instruments imported for trial ; machines, and similar artlcles necessury for colonial industry; specimens of natural history; preciona metals in bullion and coin; quick-lime."
By French Vessels Arriving Direct from France.Utensils and implemants of husbandry, espectally shovels, hoes, hatchets, plows, pruning-hooks, and hurrows; salt beef; botlers for sugar factories; codfish and other salted fish; flour and all other farinacoous provisions ; vegetsbles, fresh and dry ; salt pork, red herrings.
Duties on Exports.-All products of the colony (except those which are free) exported to France or to French colonies, in French vessels, $\frac{1}{\text { p }}$ per cent. ad valorem. The aame exported to forelgn countries in Freach veseels, 2 per cent. ad valorem.
The following products of the colony are subject, on exportation, to the following additional duty, called (contribution foncière) "ground-tax :"

| Deomination of merchmullse. | $\begin{aligned} & \text { Number, wefo cut, or } \\ & \text { measare } \end{aligned}$ | In natlonal vessels. | TE furelgn veseals. |

"Foreign prohibited goods having been aeized and re-exported, 2 per cent. nd valorem. Foreign prohibited merchandise on lenving the "entrepdt fictif," $\ddagger$ of 1 per cent. ad valorom."
The following articlea are exempt from all exportation duties, whether for France or foreign countries:
"Cinnamon; egge, fresh; ginger-root, Indigo, nutmegs, pepper, pimento, simarouba, specimens of natural history, turmeric, turtles, vanilla, and wood."
Charges for Nationalizing Foreign Vessels.-Fora vessel of 100 tons and under, 1123.5 ; 101 to 200 tons,
$\$ 1888 \cdot 8 ; 201$ to 800 tons, 816 B6.6; over 800 for each additlonal 100 tons, $\$ 280 \%$.

Clearance Duties.-For the long course (forel-2 voyage) per veasel, $\$ 3 \mathbf{7 0 . 3 3}$; for the great and small coasting trade, 280.8 ; inacription duty (registration free) for changing the proprietorship, $\$ 111 \cdot 6$.

Pilot Dues.-If the vessel anchors in the roads or in the harbor:-For a vesael under 50 tons, great and small coasting trade, $\$ 555 ; 50$ to 09 tone, 9740.7 ; 100 to 149 tona, $8980 ; 150$ to 199 tons, $81128.5 ; 200$ to 299 tons, 13 88; 300 to 399 tons, $\$ 1666 \cdot 6 ; 400$ tons and upward, for each additional 100 tons, $\$ 080 \%$. If the vessel casts anchor in the roads:-Pilots' services in the roads, on demand of the captain, when not retained for conducting the vesael into port, for one tide, \$1 86; charges of snchorage in the harbor of Cayenne, $\$ 11^{\circ} 6$; delay of pilot on board of a vessel, either on demand of the captain, or because of quarantine, independent of board, which is to be furnished to him at the expense of the ehip, for 24 hours, $\boldsymbol{\$ 1}_{1}$ 11.6 ; pilotage from the harbor of Cayenue to the Point of Moncouria, without respect to the tonnage of the veasel, $\$ 55^{5} \cdot 5$.

The pilot dues are the eame for clearing as for cntering the port.

Mayotte and Dependencies.-There are only pilot dues to be paid at Mayotte.
Senegal and Dependencies.-Foreign vessels pay in Senegal 4 francs, or $74 \cdot 4$ cente, and in Gorée only 50 centimes per ton. They can, however, neither export nor import (except through Gorée), as the whole trade is open only to French ehipping and French manufactures, and is prohibited to all other nations.

French Settlements in the Enst Indies.-The porta of these dependencies are free, and therefore open to all nations.-Navigation Act of September 21, 1793.

Tariff.-Pondicherry, Knrikal, and Mahé, tonnage duty, without distinction of flag, 4 cents per ton. (1847.) Pondicherry alone, light-house dues, witiout distinction of flag, 3 conts per ton. Pondicherry alone, ferriage dues, without distinction of flag, $88 \cdot 8$ cents for one vessel.

St. Pierre and Miquelon.-Before 1846, American vessels were allowed to import into these islanda only such goods as the French trade could not supply, and which were required by the necessities of the population. These restrictions were abolished by a decree of the governor, of May 7th, 1846. American ahips sailing direct from the United States for Miquslon and St. Pierre, either in bnllast or loaded, enjoy the same privileges as French vessels coming from the United States, and pay no more duty than the aaid French veasels, with the exception only of a compensation for the interpreter-which, however, $b \gamma$ another decree of June 26, 1847, has become entire. $;$ optional : that is, If the captain or any one else on boarl understanda the French language, lie la not obliged to take an interpreter. The duties for American veseels are, therefore, as followe:

Oceanie.-The ports of the French dependencies in to 300 tons, $\$ 44$; for each 100 tons additional, 81 the Precific Ocean are free ports.
Tonnage Duties.-For vensels over 10 tons, 28.0 cents per ton; for vessela under 10 tons, $13 \cdot 8$ cents per ton.
Duties for Nationalizing.-For vesabls under 100 tons, 8187 ; from 100 to 200 tons, 8888.8 ; from 200

[^20]$11 \cdot 6$.

Duties for Clearance.-Decked veasela, \$1 11.6; without deck, $\boldsymbol{q}^{2} 18.6$.

These aro duties both for American and French veasels coming or going direct from or to the United States, in virtue of the alove-mentloned decree. If, however, trading indirectly, they are aubjected to the same dutlea as all other shipe, for which, both French and foreign, the duty is as follows:

Tarify Detims on Importation or Spigits in Formon Vegsela, ay a Decref of Novemage 14, 1847.

The same articles pay, in French or Tahitian veasela, only one half of these datlea. (1853.)-Com. Rel. U. S.

French West Indies.-The French colonial possessions in the West Indies formerly comprised a domain of great extent and value, agriculturally and commercially. The war conaequent upon the great Revolntion In France terminated In an almost total destruction of her power in the New World. Hayti was then wrested from her. Her necessities compelled her to dispose of Lorislana. At the close of the war in 1815, the naval power of Great Britaln had onathled her to nelze every one of the French islands, and drive the fleet of France from the seas. By the treaty of peace conanmmated in 1814, and confirmed In 1815, England released to her some of the captured tslands. Her poseesaions in that quarter now conslst of Martinique, Guadaloupe and adjacent islands, and the north side of St. Martln.

The interconrse between the Unlted States and the French islands (San Dominge heing then included) was originally regulated by an arríte of the French government, dated the 30th of August, 17K4. AmerIcan veskels of at least 60 tons were admitted into certain ports in these talands, laden with lumber of all kinds, dye-woods, live atock, anlt lreef, salt fiah, rice, raw hidea, peltry, rosin, piteh, and tar, which they exchanged for rum and molasses, and gooda of French manufacture, paying thereon the local duties, and one per cent. ad valorem on all imports and exports. A further fiuty of three livres was laposed on ever hundred weight of sult heef and fish, to form a fund for premiums to be given for fish from the French fisheries. The colonial legishatures were anthorized, In times of scarcity, to suspend this law. Prior to the French Revolution, the policy of France was in contrast with that of England. That of Fingland was to monepolize the carriage of the articlea exchanged; that of France, to monopolize the articlea themaelves. The former was willing that the United States should have sugar and coffee, provirled they wore cartied In Iritish bottoms; the latter was willing that the United States chould aupply her sugar and coffee plantationa with certain articies she was unable to furnish herself, but would not allow them to receive in return, the most raluable productions of the colonies. They were reserved for conaumption in the mother country, and to augment the national wealth. Under these regulationa, the Innited Atates were prompt in availing themselves of the advantages of the carrying trade to and from the French islands.

In 17A6, our exporta, domeatic and forelgn, to the French Weat Indles, were of the value of $13,263,000$ livree; and our laports from thence of the value or

7,263,000 livres;* and the American vessels engaged in the trade had an aggregate of 5095 tons' burden. Upon the declaration of war agalnat Great Britain, in 1703, France opened a free trade with all her colonies. She offered the United States the monopoly of this trade, on condition of a guaranty of her poesessions, which was wisely declined. Our trade with the islands during the war was nevertheless much augmented. Our proximity enabled us to seize the advantages in advance of other countrics. The following table exhibits the imports from and exporta to the Freach West Indies for the years designated:

| Yemars. | Inyorts. | Exports, |
| :---: | :---: | :---: |
| 1795. | 15,761,758 | 4,9,54,952 |
| 1796 | 15,743,774 | 8,408,946 |
| 1797 | 14,080,887 | 8,565,053 |
| 1798. | 15,800,091 | 5,844,690 |
| 1799. | 2,022,929 | 2,776,694 |
| 18101. | 0,845,111 | 0,128,438 |
| 1801. | 18,608,255 | 7,147,974 |

Tho exports of our domestic produce duing the years $1804,1805,1806$, and 1807 , were of the average value of $\$ 2,800,000$, and of foreign produce between $\$ 3,000$, 000 nud $\$ 4,000,000$. Our linports during the sams period were of much greater value ; but the principal part of them were re-ahipped to France and other countries. About the latter part of the year 1807 the English had become possessed of nearly all the French Islands; and they were not restored to France until 1814, and then with the loss of the most important one-San Domingo. Its loss greatly reduced the amount of commerce of those islands with the l'nited States, as is exhibited by the aubjoined statement of imports and exporta from 1821 to 1833 :

| Yeare. | Importa. | F20 | Years. | Im | Fxporic. |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1*21 | \%(90), 619 | 1-96,485 | 1828. | 1996,651 | 81,024, 71 |
| 1922. | 969,519 | 901,002 | 1899. | 777,902 | 1,012, 1017 |
| 1823. | 934,618 | 867,505 | 1840. | 518,687 | N15, 769 |
| 1824.. | 884,094 | 811,742 | 1881. | 671,442 | 717.57 |
| 1825. | 849,968 | 1,011,986 | 1882. | 67*897 | 624,975 |
| 1826. | 978,270 | 956,174 | 1888. | 8t1,242 | 613,119 |
| 1827.. | 921,330 | 1,(040, $8 \% 3$ |  |  |  |

The conditions of our commercial intercourso with the French West ludiea were again changed by a royal ordinance learing date the 5th February, 18:6, and an act of Congresa bearing dub the 9th May, 1828. By the former, it is ordained that, after the 1st July following, all vessels, either foreign or national, nay import into Guadalonpe and Martinique certain articles of merchandise, apecified in the tablo accompanying the ordinance, on paying the dutiea therein rejuired, without regard to their tlage. This ordinance also annuls all then exlating tarilf. The act of Congress ad. inits all l'rench veasels "coming directly from the islands of Martinique and Gualaloupe, and laden with articles the growth and manufacture cf either of naid islanils, and which ure permitted to be exported therefrom in Americun veskela," Into tho ports of the United States, on payment of no higher duty on tomnage or on cargoen than are impored on Ameriean versols, and on cargues imported In American vesaela. The French ordinance exempta foreign veasels also, importing the srticles thus authorized, from any other duties or tonnarge, or any port charges, but those to which the venscis of France are suljected. The lmportation of other ur-

| 1855............... | 44,484 | 400,701 |

On the 8th of December, 1849, the tariff of 1826 was somewhat modified by slightly enlarging the imports; but the equal conditions upon which nationsl and fureign vessels were placed in reapect to tonnage and port charges were not disturbed. The prospects of an increase of our trade with the French West India possessions, and the motives to impel us to strive to obtain it, will be found in a brief summary of their natural resources anc: she conditon of their population.

The island of Guadaloupe lies between $15^{\circ} 58^{\prime}$ and $10^{\circ} 13^{\prime}$ z. rth latltude, 20 miles north of Dominica. Its dependencies are Marie Galante, La Desirade, Les Ssintes, and a portion of St. Martin. The aggregate area of the whole of them is 309 square miles, and the populations of all $\mathbf{1 3 5}, \mathbf{0 0 0}$. The contral ridge of Guadaloupe ls a chain of volcanic mountains 3000 feet high. From its base a multitude of rivulets descend, watering the low lands to the sea. The Saintes are three small islands situated between Guadaloupe and Marie Galante; Desirade la 10 miles long und five miles broad. Marie Gulante approximates to a circle, and is 1.4 miles in diameter. The soil of Guadaloupe is light, and easy of tilloge. The climate is excessively hot, but much tempered by the sea-breeze. About 86 inches of rain falls during the year. About one half its surface is planted in sugar-cane. The improvement in machinery has added much to its productive powers. The live stock consists of black cattle, sheep, snd mules. Guinea-grass is the only forage grown. The annusl value of all the produce exported averages $25,000,000$ francs, and conslsts chiefly of raw sugars, rum, and inolasses, with some coffee, dyowoods, cotton, copper, etc. Nearly all theso exports go to France. The inports consist of salt meats and fish; flour, olive od, cotton, linen, and silk fubrica; wine, perfomery, etc.; the annual value of whieh equals that of the exports. Alout 500 vessels, measuring an aggregate of 50,000 tons, enter and depart during the year.
Martinique is situated between latltude $14^{\circ} 23^{\prime}$ and $14^{\circ} 52^{\prime}$ north. It is ubout 28 miles long, and 10 ln average breadth, with an area of 200 square miles, and a population of 15,000 . Mountains cecupy its centre, sloping into plains toward the sea-shore. About one third of the lslund is level lund, and cultivation asceods 1500 feet along the mountain-sides. The staple product is sugar; its other products are like those of Guadaloupe. The munual value of its exports ls a litthe umler $20,000,000$ frames, and the lmports are of a like valou. Alout 750 vessels, French and foreign, are engaged in the trade. Hoth these lslands aro diviied litu arrondissements, and have a governor nod legislative coancil, and judicial trlbunals. Slavery was abolished in all the French colonles sume years shece. The larger portion of their population is black.Com. Rel. U. S.

French vessels from the French islands of Martin. ique, Guadaloupe, St. Pierre, Mquelon, and Cayenne in French Gulana, wers exempted from tonnage duty under the special act of Congress of the 9th May, 1828, and, as to St. Pierre and Miquelon, by the proclamatlon of the President of the United States, dated the 20th of April, 1847, consequent on tho removal by France of the reatrictlons on vessels of the United States in sald islands.

A French vessel bringing fish from the banks of the British colony of Newfoundland, belng the product of the waters of that colony, is not exempt from tonnsge datles ; the act of the 8 d of March, 1845, exempts from such dutles only French vessels coming directly from the lslands of Miquelon and St. Plerre, elther in ballast or laden with artleles the growth or manufacture of either of asid islands, and there la no other provialon of law or treaty suthorizing an'exemptlon.

French Colonies.-Decree of September 29th, 1856.The Emperor Napoleon, has decreed as follows:

Anticle 1. The extension fixed by the decree of September 19th, 1856, for the operation of the modlficatlons in the tariff of custome in the colonies of Martlnique, Guadaloupe, the island of Reunten, and of Senegal, In all that relates to grains, breadstuffs, and drled pulse, is continued to December 81st, 1857.

Article 2. Our ministers, secretaries of state, etc., will see to the execution of this decree which will also be published in the "Bulletin des Lois." The United Statee' consul at Paris communicates to the State Department, under date November 10th, 1856, as fullowe: "I beg to point out to your notice a modification in the duties on wool, se published in the Moniteur of the 8th instent (which I herewith inclose), and of which the following is a translation: 'Viewing the law of the 27th July, 1856, which has modified the importation tariff on wool in bulk.' " Considering that it is necessary to place the duties eatablished on the importation of combed and dyed wool in unison with the exlsting dutles on wool in bulk, it is decreed:

Anticle 1. The custom-house dutles on the importatlon of combed wool and dyed wool are fixed as follows: Combed wool............By French vessels, per 100 kilo's ${ }^{7} \mathbf{7} 0$ Dyed wool of ail sorts...By Frenet vessels,
.. By forclgn vessels,
" 80

"St. Plerren January 22d, 1857.
"Since my last report there hue been a considerable change in the duty on tolacco imported from the United States. It has been raised from 20 france, or ahout $\$ 375$ per 220 lbs., to the enormous figure of 60 francs, or about $\$ 1125$ per 220 lbs., making an sugmentation of 200 per cent.
"Some slight ameliorations have been made with respect to the importation of pork and hams, which heretofore lisd to pass through a French port before admission, but which can now be importel direct froin the United States under a duty merely nomlnal.
"It is much to be dosired that the French government should oxtend this privilege to all articles indiscrininately that could be imported here from the United States.
"The importation of flour from the United States into this island has been much grester this year than doring previuus years. From the .30th June to the 31st December, 1856, upward of 10,000 barrole have been imported direct from the United States, and ubout an equal quantity of Unlted States' flour has been inported by way of French ports. Thls may be uccounted for by the duty having been ' mporurily reduced, and it is much to be regretted the measure is not a permanent one. The new duty (which expires to glve place to the oll one on tho 3lst December, 1857) is, on every 220 lbs of flour, 2 francs, or about $37 \frac{1}{4}$ cents. The old one is, on every 220 liss. of flour, 20 francs, or about 837 , a duty that of course rendered the Importation of flour impossible so loug as it
existed. You will observe from the returns, that this island exports almost nothing to the United Staten. The staple products are sugar, rum, coffee, and these are not allowed to be exported except to France. Some yeare ago there was a considerable exportation of molasess to the United States ; but thla branch of conimerce has completely dled out, owing to the great extension of dintllieries in the island and the consequent scareity of molasses.-Consular Returns.

In order to preaent an Engllsh view of the commerce and finances of France of late years, we add from Tooke's "Ilistory of Prices" (vol. vl., London, 1857) the following "Conelusions arising out of the Inquiry as to the Finances and Credit Institutions of France," contributed by William Newmaricir, Esq., to the new volumes of that work.
"That the revolution of February, 1848, ocenrred at a period when, ly the operation of numerous causes, the finances of the French government were already. eerlously embarrassed ; that among the most important of these causes were the lews of 1841 and 1842, nnder whleh the State had taken npon Itself the responsibilltles and the expenditure entailed by the construction throughout France of an extensive net-work of trunk lines of rallway ; the unproductive expenditure for a long series of yeara of large annual sums in Algeria; the unproductive expenditure of conslderable sums on public works, yielding no adequate retura either direct or indirect; and the maintenance for a long period of an excessive annual outlay on the army and marine; and that in inmediate aggravation of all these causes of financial disorder, there had ocenrred in France, in the closing months of 1846, and thronghout the - reater part of 1847, a commercial crisis (taking it' sin in the serious failure of the harvest of 1856) mure sovere and disastrous than had been experienceil in France for 20 or 30 years.

That the suspension of cash payments ly the Bank of France, adopted in March, 1848, and malntained for two years and a half, till August, 1850, was a measure whoily unavoidnble, in consequence of the prevalence in March, 1848, of extreme internal diseredit, which admitted of being met in no other form; that the prevalence, during these two and $n$ half years, of a very low price of corn in France; of a state of the external trade of France which estahlished a large yearly balnnce in favor of thot country; nnd of the absence of any political causes which rendered it necessary for the government to require excessive advances from the Bank of Frsnes, rendered the suspension practically unproductive of any depreciation or inconvenlence; and led to its removal in August, 1850, by the spontaneous accumulation in the Bank of France of an amount of treasure quite equal to the amount of notes in circulation.

That among the important circumstances which have contributed to atrengthen the position of the Bank of France eince $1 \mathrm{c} \cdot \mathrm{k}$, and to aill the government In its plans for fostering credit, has been the extension by $£ 12,000,060$ or $£ 14,000,000$ sterling of the dispowaile means of the Bank of France in consequence of the addition of that amount la the form of nmall notes to the former nverage circulation of the entabilishment.

That under the autocritic government, established in December, 18i1, there have lpen Introduced Into France a aet of financini princliples ; and there have been placed in course of trial a series of flnancial experiments, distlinguished by a novelty which finds no sanction in any successful precedent; hy a harlihood which set at naught almost every established canon of finance; and by a diaregarl of the future, which purchasen present popularity at any cont.
That the earlient purposes to which the new financial policy was devoted were the reduction, In March, 1852, of the intereat on the Frenels 5 per cent. deit ; the imposition on the llank of France of a new charter which compelled it at onee to lower the rate of dis-
count to 3 per cent. and to make large advances on stock-exchange securities; the conceeslons, on condltlons more or less onerous to the Stnte, of a large numbber of Ilnes of rallway; and the introdnction of neveral joint-atock companies, encouraged by every State appliance to foster the appllcation of credilt to pnrposes of apeculation.

That between thr early part of 1852 and the antumn of 1853 , the prosperity and progress whleh seemed to prevail in France were chlefly the resulta of the artifichal measures.
That the difficultles of various klads which have occurred in Frunce slnce the close of 1853 , and more especially the difficulties experienced by the liank of France in the antumns of 1855 and 1856, have arisen in a princlpal degree-allowing, of ceurse, for the war and the scarcity-from the embarrassmenta and disorders entalleel hy the policy whlch has forced upon France enterprises and speculationa dispreportionate to its resourees of available eapital.
That these embarrassments and dlaorders would have become altogether overwhelming if it hnd not been for the apringing up, aince 1849 , chlefly In the gold conntries, and in conssquence of the gold influx, of a demand for French manufactures and produce, so large and continuous that, during the 9 years 1848 - 56 , the balance of trade In favor of France has amounted to not mnch less than $\mathbf{~} 80,000,000$ nterling.

That nelther the apparent nucceas of the reduction of the French 5 per cents. In March, 1852, nor the apparent auccess for some time of the enforced maintelsance of a lov cate of disconnt; nor the setting up of popular discount and lonn hanks; nor the apparent alacrity with whel the subscriptlon lists of the war loans of $60,000,000$ were filled op; nor the maintenance for a long period of the schemes of selling bread at an artificially cheap price; nor the multiplieation of railway companies by means of guarantied dividends ; nor the apparent pronperity created by public worka and credit lustitutions, afford the smallest support, when examined minutely and fully, to the financinl principles and the financinl practices which have held the supreme place in France slnce Decenther, 1851.

That of the two great credit institntions called the Credit Foneler and the Crélit Mobiller, the former is directed to a useful and laudable objeet, hut is degraded and disfigured by the latrolnetlon of clements of gambling, empirical and pernielous ; and the latter, the Credit Motilier, seeklng to obtain large profits by exciting vlolent fits of stork-jobling, and to oltain large funds hy the lssue of obligntions practically not prasable in specie, approacher, in design and machinery, nearer than any institutlon of recent times, to the model afforled by Law's Bank of 1716, and the Conpagnie des Indes of the three following years.

That as the reault of the whole investigation concerning the financial polley of France aince 1847, there have been made npparent three principul facts, namely: 1st. That between 18.17 nad 1851, it was the abundant harvests and low price of food In Frunce, which contrihuted in the largent degree to preserve order, to restore cash paymente, und to re-eatablish an equililrium between the income nint expenditure. 2d. That hetween 1851 and 1857, it han been the $£ 100,000,000$ aterling, made avallahle to France ly the ceonomy of It metalle elreulatlon, and liy the demand for its siliks and wines in the gold countries, which has so far carried it throngh the perila of war, searcity, and extraw: agance; and, M1. That the reckless and socialistic fivancial poliey Introluced since December, 1xī1, has alrealy exposed France to fallures and perils quite ss formidnile an any that were threatened by the revolution of 1848, anid muless sulijected to early and severs restralnta, will assuredly prodnce the most diastroas consequencea." See Tookr's History of Prices, vol. vi., Lonton, 1857, ip. 130-134.

Frank, the name hy whlch the Turks, Greeks, Aralıs, etc., dealgaate a Chriatian. It probably orlginated during the cruaadee, in whlch the French (descendants of the Gers an Franks) partlenlarly distinguished themselves. Europa Itself, too, was named Frankistan, or the conntry of the Franks.

The Frank language, Lingua Franca, is a jargon which is epoken in the Levant, as the common medinm of cominunication between Europeana and the Inhabitants of the East. Its chief lngredient is Italian, and it probably eriginated during the crusades, whlch brought so many different nations together.

Frankfort-on-the-Maine (Ger. Frankfurt Am Maine), one of the four free cltles of Germany, and so called to distlnguish it from the Prasalan town of Frankfort-on-the-Oder. It toek its name (Framken Furf) from the river belng fordable at this polnt; and Is supposed to have been fonaded by the Franks in the fifth century.

From the earlfest times Frankfort has been closely connected with the other free citiea of Germany. During the anclent empire the cities formed together one corporatlon at the Imperial Diet, and enjoyed one vote In the public affalrs. Up to the disselution of the German empiro, In the year 1804, there exieted a great number of free towns, whlch had preeerved their aovereignty and independence agalnst the surrounding princer, depending only on the emplre, and enjoying various privileges granted to them by the emperors. These diaappeared, for the greater part, with the events of the Revolutlon. Of those which had survived the German emplre the towne of Hamburg, Bremen, and Lubec were Incorporated with the lirench empire; while Frankfort became the seat of the Grand Duchy of the same, created by Napoleon, and piaced under the rule of the Prince Primat Archbishop of Ratisbon. The overthrow of the French conqueror in 1813 restored these towns to their former independence, and they were reccived as soverelgn members of the confederation. The towne of Hamburg, Bromen, and Lubec once belonged to the Ilansa, that celebrated league which was fermed In the thirteenth century. Its real object was the protection and extension of commerce; but its power and influence increased in auci a way that it at length Incladed eighty-five towns; it equipped fleets, and declared war on nelghboring States. Englund and other powers concluded treaties with the Hausa, and were glad to enjoy its friendship. This league, however, was dissolved in 1630, when the last of its diets was held at Lubec; and from that time the three clices of Hamburg, Bremeb, and Lubec remalned alone, as the properly-called liaese Towns. These, with Frankfort-on-the-Maine, form the four free cities of the German Confederation. These four free cities are represented in the German Diet by one minister, and have together one cominon voice. Notwithstanding this joint representation, each one of the four cities has its own particular representative at the seat of the Diet. Wumburg is represented by Mr. KIrchenfrauer, Irenien ly ISurgomastor Smidt, Labec hy Sonator Eilder, and Frankfort by DeHarnier, senator and cldest burgomaster. The joint vote of the four cities la altornately intrusted to each of the tuwns for the perlod of a year. The free cities likewise have in common a supreme court of appual for law cases, and political questions, too, sitting at Lubec; and the control over which is alternately exercised by one of the four cities. Hesides that, there exists between thein a similituile of pelitical lnatitutions. Their form of govermment is that of a republic, the basis of which (excepting the short period of 1848-'50) has, nevertheless, alwaya been rather more of an ariatocratical than of a demacratical character. Their interests are closely unitel; they have the ame political friends and opponents.
The chlef manufnctures are carpets, table-covers, oil-cioth, cotton, woolon, and allk fabrics, jowelry, to-
bacco, playlag-cards, otc. . Frankfort was made a free port in 1881, and is also one of the four great emporiuma for aupplying Germany with merchandise. The river Maine, which is navigable to Bamberg In Bavaria, where commences the Donan-Malne Canal leading to Kelhelm on the Danube, and the numerous rallways which centre In Frankfort, render it the Industrial and commercial centre of the south-west and weat parts of Germany. No German elty, with the exception of Berlin, la the centre of ao great a number of rallways. Four great linea, and eeven others of a mere local character, meet in the clty. The Maiae-Necker railway leails sonthward to the Grand Duchy of Baden, whence railways proceed to Swltzerland, Wurtemberg, and Bavaria. The Taunus railway leads weat and nerth-weat to Mayence, and to Wiesbaden. From Mayence a railway goes to Lndwigshafen, the harbor of the Bavarian Palutinate opposite Manheim, thence to Strasbourg, and therefrom to Paris as well as to Switzerlund, Another branch from Ludwigshafen meets the Strasbourg and Paris railway at Nancy. From Wlesbaden a line is now (1855) in conrse of construction to Coblentz. The Maln-Weser rallway passes through the greater part of the two Heases to Cassel, and cominunicates with Haaover, Bremen, Hamburg, etc. On the right its branchee lead to Berlin and Suxony, and on the left a line will soon be opened to Cologne. The Hanan railway connects Frankfort with IIanan and the chlef places on the Nains to Bamberg, from which southward with Nuremiserg, Augsburg, Munich and Austria, and in another direction with Leipsic, Dreaden, and Bohemia. There are aiso local linee to Offenbach, the chief manufacturing town of Hesse Darmstadt, to $S a r$ on, a much-frequented bathing-place, and to near l'omburg, oae of the fumous spas of Germany. Frankfirt, however, is chlefly indebted for its great wealth to being the seat of extensive banking, commission, and finding transactions. In proportion to its size, it is probably the richeat city in the world. There are about twenty flrst-class bunking houses; among these are the Rothschilds, Gruneliun, Metzter, and others, well known in the commercial world. The nunber of these in the stock and exchange business amonats to at least 200. A city bank, with a capital of $10,000,000$ florias, was estublished last anmmer, and hus just (1805) commenced business operations. The two fairs of Easter und Michaelmas are still much frequented. Goethe wus bern here in 1749 . Civil population (1852) 62,361, belng 47,100 Protestanta, 10,66I Catholics, and 4600 Jews; military, 5650_1717 being Austrians, 1713 Prussians, 1391 Bavarians, and 829 natives. The population of Frankfort is but slowly iacreasing, on account of the old illiberal laws still In force as to admission to citizenship. Only auch are admitted as can prove their ability to maintain a family; so no merchant can be admitted unless he prove that he possesses at least 5000 flerins, and generally persons possessing that sum, or oven mere, are not admitted unless they marry a citizen's daughter, in which case the law is mure fuvorable. The ancient law is also still in force, that nene shall mend a shoe or drive a nail ualeas he be a muster and member of one of the corporations, and he can not become a member unlesa he be the sen of a citizen, or marry a citizen's daughter. The reatrictions to which the Jews were long subject have now moatly been removed. They are entitled to vete at the electlons of nembers to the legislative assembly, and may return four of their own number; they are also admisallile to all offices not connected with the sennte, the permanent assembly of the citizens, luw, religion, or education. The Inhabitants of Suchsenhausen are mostly of Suxon descent, und distiaguished from their fellow-citizens in manners, drees, and language, as well as occupations, being inestly employed in gardening, fiahing, etc.

The city, with a small territory of thirty-eight
square mile lying immediatoly around it, constitutea the free atate of Franlfort. The government is veated in a senate, a legislative amembly, and a pertuanent committee of citizens. The senate, which exercisea the executive power, is composed of 44 nembern divided into three branches-juatices, menators, and counselors, and having two presidents, one chosen from each of the two first-mantioned benches. The legisiativa asembly is composed of 04 members, of whom 20 are senators, $z 0$ members of the permanent committee of oitisens, 45 choeen annually by the cititens collectively, and 9 depnties from the rural districta. The permanent committee consist of 60 members chomen from among the citizens of all ranks. The legislative assembly meets annually in the month of November, and sits for six weeks; and its anction is requisite to all new laws, the budget, eto. With the free cities of Labec, Bremen, and Hamburg, Frankfort occupies the seventeenth place it the Germanio Confederation. It eajoys one vote in the general asaembly (Plemum), and furnishea a contingent of 683 men to the federal anny. Population of the State (1852) 77,971.

Franlefort-on-the-Oder, a town of Prusais, province of Brandenburg, and capital of the government of Frankfort, stands on the left bunk of the Oder, fifty milles east by south of Berin, with which, since 1842, it has been connected by railway. The town is regularly built, and aurrounded by old walla with towers and ditches. It has three auburbs, one of which stands on the opposite bank of the river, and communicates with it by means of a wooden brijge. The university founded here in $\mathbf{1 5 0 6}$ was removed to Breslau in 1810. Frankfort has a Roman Catholio and aix Protestant churches, a aynagogue, gymna*ium, obstetric achool, orphan asyium, work-house, theatre, etc. Being the capital of a government, it is the seat of a superior and uther judicial tribunals, of boards of taxation, agricuiture, etc. Though inferior to Its namesuke on the Maine, it la a place of coneiderable eommerclal nctivity, being situated on the high road from Berlin to Silesia, and on a navigable river communicating by canals with the Vistula and the Elbe. It has three annual faira in the monthe of February, Juif, and November, attended by merchanta not only from Germany, but ulso from other parts of Europe. It has manufactures of woolen and silk goods, atockings, gloves, leather, tobacco, sugar, brandy, mustard, etc. Immediately beyond the bridge is a monument to Prince Leopold of Brunswlek, who was drowned here in 1785 while attempting to rescue an unfortunate family from an innndation of the Oder. At Kunnersdorf, in the vicinity, Frederic the Great was defented with great loss by the Austrians and Russians on 12th Augnet, 1759. Population (1849) 29,969.

E'reebooters (Fr. fibusiers), a name given to a class of piratical adventurers of all nations, but especially of France and Eagland, who have obtained a place in history by the courage and intrepidity they diaplayed in executing the most difficuit enterprises. The origin of their history is involved in obscurity, nor has the derivation of thelr usme been precisely deternined; but the klibustiers of the French historians correspond to the bucaneers of our own writers. (See Bucanezens.) The South American ixiandis formed the chlef theatre of their exploits ; and such was the relentless hoatility they exercised against the Spanfards, that during the latter half of the seventeenth century their conmmerce in thone seas was almost utterly ruined. At the commencement of the follow* ing century these daring adventurers sustained a ecries uf disasters which sensibly diminished their numleers ; and their name, which during poriod of 50 years had been so redoulitable and Ireaded, ceased to be formidable from that tine. The term freebooter has been applied in a general sense to robbers and other plunderers. See Bucanbers.
to se Imperial Citien.-This appellation was beswwed, under the German empire, on certain cities which acknowledged no head but the eunperor, and were governed by their own magistrates. Some uf these cities, as Worme and Cologne, aequired various privileges and immunlties at an early period, in consequence of the assistance they readered the emperors in repressing the arrogance of the noblee; and commerce and manufactures graduaily eontributed to their importance. In this manner the imperial cities originated in the middle of the twelfth century, it would appear, however, that there were free cities in Germany which had existed from the time of the Riomans, though posmesaing little in common with those of later times, and which in the beginning of the six. teenth ceutury loat their most valuable privileges, and even the name of free cities, through the ignorance and carelessness of their magistrates. As to the nature of these privileges it will be sufficient to remark that they were such as to conatitute theus nothIng less than independent republics. The cities of Lombardy, enriched by comineree and encouriged by the popea, often ventured to resist thelr masters the emperors; and their examille was followed by those of Germany. In the middle of the thirteenth century two important confederacies were established for conmon oliject--the Hanseutic League in 1241, anI that of the Rhenish cities in 1246. The powerfol Ilanseatic League lasted nearly 400 years, and its dissolution was effected by neveral causes in 1630 . The remasats of this league, with the former confederacy of cities whici had its representatives in the German Ihet, as well es the free cities of Ilamburg, Bremen, and Lubec, were incorporated with the French empire in 1810. As these cities co-operated vigorunsly in the recovery of German independence, they were acknowledged, together with Frinkfort, us freo cities by the congress of Vienua; and as sulh they joined the German confederacy, June 8th, 1815 , and oltained the right of a vote in the Dict. See alno Hanse Towns.

Free Trade. A nation, possessing ali necessury physical resources, but inperfectly deveiopen, like England a century ago, like the United States now, may do one of two things. It may resolve to produce for itself, or resolve to iet othere produce for it. If it rosolve to use its own producte, it must resolve not to use the products of other nations. Now, what is a protective tariff; which prevents the sale of foreign products, but this resolution expressed by leginlation? Two things are necessury : 1st. Not to use the products of others. 2d. To produce for one's self. Tho first is protection. Now it is true, that without industry at houe, protection from abroad will a vail nothing, for there is nothing to protect. And without resources, neither protection nor industry will avaii any thing. We admit the necessity, tlrot, of natural resources; second, of industry; we ciaim, third, the necessity of protection.

Protection, then, is the resolution of a nation not to use foreign products; this is the negative side of the policy of hotite industry. I resalution to produce for itself is the aftirmative sid, and is necessary to compieto it. Such a resoiution in a nation is like self-control in an intividual, and protection is no more untatural in the one than aelf-control in the other.
It is a domestic poiicy, designed to keep foreiga goods out of the home market. Now, a nation may say it will not huy of others. This is protection. It can not sy $y$ others shall buy of itself. This is beyond the power of protection; and lingland reached this point years ago, we think as early as the beginuing of the century. During the European war whe enjoyed the most effectual protection, for we alinit the ting of the free-traders, that protection is sort of war, thus far, that it involves mutual exclusion. Bighand's finets a wept the seas. conveying around the world her merchantmen that carried the raw materials to her fac-
tories, and of the eartl pretended favored by ture.

"We have seen that, apart from forelgn trade, the population of every country supply their own wants to the extent of from 90 to 99 per cent. of their whole coasumption; that the business of furnishing this suppily is by extreme division of laber, apportioned among four fifths of a people; that thelr internal truile consists in distributing these products of industry ; that this distribution ls substantially an exchange anong the whole individuals of a population, of products for products, or products for services, or, in the last annlysis, of lator for labor ; that this exchange is made by the agency of morchants, and takes the shape of sales and parchases, that ls, leaving out of viow the medium of exchange, men pay with their own labor for what they neel of the labor of others; that all the agency of merchants, brokers, banks, and credit, is merely a moans of effecting this exchange, that the comuodities or lahor thus exchanged, are estimated at prices expressed in money of account, which prices are mainly governel by the price of 'sbor; that upon the regular mevement of this exchange, mainly depends the well-being and comfort, the energy and productiveness of labor; that if this arovement procecds rapldly and undisturbed, production and consumption will
go hand in hand, until individuale reach the frill power of both, and a greater ds ${ }_{6}$ o of general comfort and competency be enjoyed than has yet been known. We have seen that one of the great diaturbing causes of this system of domestlo distribution, of the comforts and neceasaries of life, was found in the occaslonal dorangement of the commercial agencies by which it is effected ; and wo have remarked apon the necensity of reformlag that agency with a view to the interente of humanity.
" We now proceed to conslder another disturbing cause. We remark first, however, that neither the labor nor the prodact of labor, nor the dietribntion, nor the means by which it is effected are the primary objects of consideration. The firot conalderatlon le the people, then, in their order, their labor, thelr products, and the detribution of them. The whole object of their lndastry is their well-being. An they can : nily purchase by their own labor what they need of the labor of others, it in absolutely necessary for all to work; whitever deprives men of the opportunity of labor, deprives them of bread, and of every other comfort and necessary of life. Nien consume freely and largely when they are fully pald for thelr labor; that 18, when they can purchase for their labor an equal quantity of the labor of others; In tois case, the nominal rate fs of little account, liecause it la labor for labor. If the $\mathbf{2 5 , 0 0 0 , 0 0 0}$ of people in the Uaited States, are consuming $\$ 10$ worth each of domestic woolen goods annually, upon the manufacture of which 250,000 of the people are dependent for their entire living, and if It be found that these same goods, which coat at home 83, can be purchased at $\$ 2$ per yard in Enrope, then, at first sight, it would aeem bnt reasonable, that the cheaper article should be imported from Europe. To Import $\$ 250,000,000$ worth is Imposslhle, because we can not pay for them, as we are constantly importing more than we can pay for, and that sum is the figure of our whole Imports. We import, then, say 10 per cent., or $\$ 25,000,000$ worth of woolen goods, and sell them in our great commercial marts, where prices are chiefly made, 33 per cent, cheaper than the domeatle article. Consumers fly to the cheaper article, and the domestic goods must come down to the same price. The annual domestic product must fall In price 38 per cent., und Instend of bringing ita manufactarers $\$ 250,000,000$, it will only bring them $\mathbf{a} 166,000,000$; their consumptlon of the products of others must be reduced one thlrd. The cffects of this reduction will extend until they are felt throughout a whole nation. The importation of $25,000,000$ of cheaper woolens, would thns inflict a direct loss by reduction of price upon the woolen manufacturers of $\$ 88,000,000$, and this loss is multiplied many times hy indirect results in the reductlon of consumption. The average consumption of cotton goods is about the same as that of woolens, and the same illustration is applienble. The introduction of cheaper goods, of a kind which our country must, after all, chiolly manufacture for itself, is introducing againat our own labor, the price of which is 81 per day, the lahor of other ceuntries, the price of which is less than 50 conts per day. This can not but inflict a serious blow upon the whole aystem of our internal hitustry, and If continued, must lead to the utter prostration of the domestic manufactine thus attacked, and the utter poverty and ruin of the hundreds of thousunds depending on it for a llving. The effect of this in the case of woolen goods, would be a reduction in the average consumption of woolens, of from $\$ 10$ to $\$ 5$, for the whole population, and a rise $\ln$ the prices above the original domestic rates. While, therefore, it may at first sight appear to be very plainly better to import certain goods which can be offered to consumers at lower prices than the corresponding domestic article, several questions must be asked before such a policy is adopted. As, Will the importation seriously injure any home manufacture? Will it throw many people out of cmploy-
ment if It is a great miatake to auppoen that such measares affect only employers in woolen and cotton manafactorlew, there are hundrede of men; women, and chlidren; depending apon every employer.' 'If we leesen our domentic production, will not our increased demand produoes peculation, and a higher foreign price for the article imported f if we reaolve upon Importing our whole supply of a necessary articin, are we sure that we can inervase our exports to a sufficlent axtent to pay for the additional Importation? Ara we aure that we ahall not, by this polley, deprive the poor of their supply of a needful iomastic product, anu convert it into a foreign product, chiefly aupplied for the consumption of the rich ? What moite can be adopted to secure anpply of these needful articles In time of war, or Inisrrupted commercial intercous se ? Alithese, and many more inquiries, ahould be made and faithfully atudied, before any braneh of domantic Induatry is broken up, nader the temptation of buying cheaper goods abroad. On the contrary, it should be well understood in every country, that many sacrifices may, with advantsge, be endured, to introiuce the manufacture of any artleio of general consumption, even though It can not be made as cheap as elsewhers. A manufacture can only grow and flouriah in an country where the people are willing to conaume its prolucta, and they can only consame them where their labor wlll purchase them. A people can consume largely of a domestic product even at high price, but may not be uble to consume even a smalt proportlon of a correaponding foreign article at a low price. Let any one think of the innumerable nrtieles which figure in our internal trade, and which go to pay for, as well as to make up our consamption of home commoditles, and he will ona the difference betwen purchasing abroad and at noure."-Latr's Pol. Ec., by S. Cotwertr.

Thone who wish to examine the literature of fivetrade, will find the principles fully diacussed in the following works: Honr's Mag., vol. iv., 227 (8. G. Arnold), 425 (H. Greft.fy), v., 168 (H. Frelght, the sum pald liy the merchant or other person hiring a ship, or part of a shlp, for the nse of such ahip or part, during a specified voyage or for a specified time. The freight is most commoniy fixed by the charter-party, or thill of lading ; lut In the alsence of any formsi atipulations on the subject, it would be due cecording to the custom or usage of trade. In the case of a charter-party, if the stipninted payment be a gross aum for an entire ship, or an entire part of a ahip, for the whole voyage, the gross anm will be payable although the merchant has not fully laden the ship. And if a certain sum be stipulated for every ton, or other portion of the ohlp's eapacity, for the whole voyage, the payment must lie accoriling to the number of tons, etc., which the ahip Is proved eapable of coniaining, without regard to the quantity actually put on board by the merchant. On the other hand, if the merchant have etipulated to pay a certain sum per caak or bale of goods, the payment must be, in the firat place, according to the num-
ber of caska and baten thlpped and delivored in id if he have furthar covenanied to fur ish a complete lad. ing, or a specifo number of easka or bales, and failed to do ao, he mast make good the loen which the ownors have austalned by hia fillure. If an entire ahip be hired, and the burden thereof he expressed in the charter-party, and the merchant bind himeelf to pay a certain sum for every ton, etc., of goodla which he ohall lade on board, but does not bind himself to furniah a complete lading, the ownerw oan only demand payment for the quantity of goods actually shipped, But if the marchant agree to load a full and complete cargo, though the ship be described as of less burden than she really is, the merchant must load a full cargo, accoriling to the real burden of the ahlp, and he will be liable for freight according to what ought to be loaded.

The delivery of goods at the place of destination is In general necessary to entitle the owner to freight; but with respect to living anlmals, whether men or cattie, which may frequently dle during the vovage, without any fault or negleet of the persons belonging to the ship, it is ruled, that if there lie no express agreement whether the freiglit is to be pald for the lading, or for the transporting them, freight shall be pald as well for the dend as for the liviag: If the agreement be to pay freight for the lading, then death certainly can not deprive the owners of the frelght; but if the agreement be to pay freight for traneporting them, then no freght is due for those that die on the voyage, becanse as to them the contract is not performed. These distinctions bave been made in the clvil law, and have been adopted into the modern systems of msritime law. Freight is moas freqzently contracted to he pall either liy the whole voyage, or by the month, or other time. In the former case the owners take upon themselves the ehance of the voyage being leng or short : but in the latter the risk of the duration falls upon tise merchant; snd if no time be fixed for the commencement of the computation, it will begin from the day on which the ship breaks ground and commences her voyage, and will continue during the whole course of the voyage, and during all unavoidabie delays not occasioned by the act or neglect of the owners or master, or by auch circumstances as occasion a suspension of tho contract for a particular period. Thus, the frelght will be payable for the time consumed in necessary repairs during a voyage, proviled it do not appear that the ship was insufficient at the outset, of that there was any improper delay in repalring her.

In the absence of an express contruct to the contrary, the entire frelight is not earned until the whol cargo the ready for delivery, or has been dellvered to the conaignee according to the contract for its conveyance. If a consignee recelve goods in pursuance of the usual bill of lading, liy which it is expressed that ha is to pay the freight, he, by auch receipt, makes hinself delitor for the freight, and may be sued for it. But n person who is only an ngent for the conalgner, and whe is known to the mater to le acting in that character, does not make himself personsify answeralle for the freight by receiving the goods, although he aiso enters them in his own name at the cuatumhouse. In some casee freight is to be paid, or rather an equivaient recompense made to the owners, although the goods have not been dellvered at the place of destination, and though the contract for converance he not atrictly performed. Thus, if part of the cargo he thrown overtonad for the necesaary preservation of the ahip and the remainder of the goonls, and the ship afterward reach the place of deatination, the value of this part is to be answered to the merchant by way of generai average, and the value of the freight thereof allowed to the owner. So, if the mase ter in compelled by necessity to sell a part of tha eargo for victuals or repairs, the owners inust pay to

derive an
the payn
the morchant the price which the suods would anve / the voyage performed, or pro ratd ilimeris peracti: and fetched at the place of deatimation $;$ and, therefore, are aliowed to oharge the merchant with the niuney that would have been due if they had been cenveyed thither.

When goods are deterlorated during a voyage, the merchant is ontitled to a compensation, provided the ileterioration has proceeded from the fault or neglect of the master or marinere 1 and of course he la not answerable for the froight, unless he nccept the goods, except by way of deduction from the amount of the compeneation. On the other hand, if the deteriorntion has proceeded from a principle of decay netarally juherent in the commodity itself, whether active in every situation, or in the conflnement and closeness of a ship, or from the perils of the sen, or the act of God, the merchant must bear the looe and pay the freight; for the master and owners are in no fault, nor doea their contract contain any inaurance or warrenty soainet such an event. In our West India trade, the freight of sugar and molasses is usualiy regulated by the weight of the casks at the pert of delivery here, which, in fact, la in every instance less than the weight at the time of the shipment : and, therefore, the loas of freight occasioned by the jeaksge neceasarily falls upon the owners of the ehip by the nature of the contract.

Different opiniona have been entertained by Valin, Pothier, and other great authoritiea as to martime law, with respect to the expediency of allowing the merchant to abandon his goois for freight in the event of their being damaged. Thia question has not been judicially decided in thit country. "The only point," says Lord Tenterden, "intended to be proposed hy me as doubtful, is the right to abandon for freight aloae at the port of destination ; and in point of practice, I have been informed that this right is never claimed in thie country."-Law of Shipping, part iii., c. 7. Freight being tho raturn made for the conveyance of goods or passengers to a particular destination, no ciaim ariaes for its payment in the event of a total loss; and it is lald ciown hy Lord Mansfield, that "in case of a total lose with salvage, the merchant may either take the part eaved, or abandon." $-A b b o t t$, part iii., c. 7. But after the merchant has made bis election, he must abide by it.

It often happens that a ship is hired by a charterparty to aail from one port to another, and thence back to the first ; as, for example, from London to Leghorn, and from Leghorn back to London, at a certain sum to be paid for every month or other period of the duratinn of the employment. Upon such a contract, if the whole be one entire voyage, nnd the ship sall in safety to Leghom, and there deliver the gooda of the merchant and take others on board to be brought to Louden, but happen to be lost in her return thither, nothing is due for freight, aithough the merchant has had the benefit of the voyage to Leghorn; but, if the outcard and homervard royages be distinct, freight will be due for the proportion of the time employed in the outward voyage. "If," said Lord Mansfield, in a caae of this sort, "there be one entire rayage out and in, end the ship be cast away on the homeward royage, no freight Is due, no wagea are due, because the whole proflt is lost ; and by express agreement the parties may make the outward and homeward voyage one. Nothing is more common than two voyages: wherever there are teo voyages and one is performed, and the ship is lost on the homeward voyage, freight ia due for the tirst."K. B., Trin. Term. 16 Geo. 3.

It frequentiy happens that the master or owner fails to cumplete his contract, either by not delivering the whole goods to the consignee or owner, or by delivering them at a place short of their original destination; in these cases, if the owner or consignee of the goods derive any benefit from their conveyance, he is liable to the payment of freight according to the proportion of
though contracte of this mature be frequently entire and Indivisible, and the master or owner of the ship can not, from their naturn, aue therwon, and recovar a ratable freight, or pro ratá ítineris ; jet he may do so upon a freeh implied contract, for as much as he deservea to have unless there be an express clause in the original charter-party or contract to the contrary; A freeh implied contract is inferred from the owner's or consignee's acceptance of the gooils. Many lifficulties have, indeed, arisen in deciding as to what shall amount to an acceptance: it is not, however, necessary actualiy to receive the gooda ; acceptance majy le made by the exprese or implied directions, and with the consent, of the owner or coneignee of the goods, hut not etherwiee.

It sometimes happens that the owner of the shlp, whe ia originaliy entitled to the freight, sella or otherwise diaposea of his interest in the ship: where a charteren shtp is sold before the voyage, the vendee, and net the vendor or party to whom he afterward assigns the charter-party, is entitled to the freight. But where a ship has been sold during the voyage. ".e. owner, with whom a covenant to pay freight bat in made, is entitled to the freight, and not the vendee. A mortgagee who does not take possegaion, is not entitled to the freight.
The time and manner of paying freight are frequently regulated by express atipulations in a charterparty, or other written contract ; and when that is the case, they must be respected; but if thern be ne expreas atipulation contrary to or inconsistent with the right of lien, the goods remain as aecurity till the freight is paid; for the mater is not bound to deliver them, or any part of them, without payment of the freight and other charges in reapect thereof. $P_{L^{\prime}}$ "the master can not detain the carge on board the vessel till these payments be made, as the merchunt wouid, in that case, have no opportunity of examining the condition of the goods. In England, the practice is, when the master la doubtful of payment, to send such gooda as are not required to lie landed at any particular wharf, to a public wharf, ordering the whartinger not to part with them till the freight and other charges are puid. No right of lien for freight can exist, unless the freight be earned. If the freighter, or a stranger, prevent the freight from becoming due, the ship owner or muster's remedy is by action of dumagee.

Fur further information and details with respect to thls aubjant see the article Charter-panty; Abbott (Lord Thestemden) on the Law of shipping, part iii., c. 7 ; Chitty's Commercial Law, vel. iii. c. 0, etc.

Freight is a common eubject of insurance. In common conversation, this word means sometimes the cargo carried, and sometimes the earnings of the abip by carrying the cargo. The latter is the meaning in mercantile law, and especially in the law of insurance. It includer the money to be paid to the owner of a ship hy the shipper of goods, and the carnings of an owner by carrying his own goods, and the amonnt to be paid to him by the hirer of his ship, and the profits of such hirer, either by carrying his own goods or by carrying for pay the goods of others.

An interest in freight begins as soon as the veyage Is determined upon and the ship is actually ready for sea, and goods are on board or reaty to be put on board, or are promised to be on board by a contract linding on the owner of the goods.

If a ship is insured on a voyage which is to consist of many passages, and sail without cargo, but a cargo is ready for her at the first port she is to reach and sail from, the owner has an insurable interest in the freight from the day in which he sails from his home port.

If one makes advances toward the freight, he is to pay, and this is to be re-paid to him by the shipowner; if the freight le not earned, the advancer has no insurable interest in what he advances; but if he
in to lose without repayment, if the ahlp be lost, or the freight not earned, he han an insurable intereat. --Parsonsin Mercantile Iaw; Boston: p. 418.

If the hirer takes the whole vessel, he may put the goods of other ahlj-owners on board (unless prevented hy expreas atipulation); but whether he fills the whole ahip or not, he pays for the whole ; and what he pays for mo much of the ship as is empty is sald te be paid for dead freight. This is calculated on the actual capacity of the ship, unless she ls agreed to be of specithed tounage. If elther party ls deceived or defrauded by any statement in the charter-party; be has, of course, his remedy agalnat the other party,-Page 358.

The freight is totally loat when the whip is totally lost or made unnavigabile, or is subjected to a detention of such a character as to lireak up the voyage. If there he a construtive total less of the shlp, the owner mny abandon the freight with the ship; but if the ship be netually lost, the freight may not be; for the mase ter has the right, and is under the duty, of transmitting the goods, if he can; and if he does, the owner of the ship is entitled to the whole of his freight, and the expeuse of the transmissiou ls all his loss. If the master might have done this, and falls to do it, the estimated expense of transmisslon is still all the loss for which the insurers are responsilhle.

So, ff the ship can be repaired, ned go on again and finish her voyage, the owner woull have the righi to holl on to the goods, and linally carry them, and earn his freight. And he has this right although the delay would be very long, and even if the goola are injured, and it would cost time nind money to put them in it condition of suffty fur the residue of the voyge. Still, the rhip-owner, by hila agent, may do nil thia, and then earn his frejght ; and, therefore, if it can be done, whether it is done or not, all the claim which the insured on freight can make on the insurers ls for the expense of doing it. The rule of 50 per cent. applles to frelght aloo. If, therefore, freight pro vata be puid, it will be a total loss by construction if less than half be pail. So If the whip he injured, and part of the cargo he lost, but the ship may be repnired and carry the remaining goods on, If thint part would pay more than half of the whole freight, it has been lield not to he tutal; mil otherwise, it is.
freight is fully earned if the gooda remuln aubatantially In qpecie, end are ao slellvered to the consignee, althongh there he a very great deterioration; but freight is lost, and the inaurers are reaponaible, if nothing is left of the goods but the mere prolucts of decomponition, an that they are lost in fact.

If, after some freight is earned, there is an abanionment of the ship, and, after the nbandonment, more freight is enrusi, the Americsn cases hold that the freight carned beiore the abanionment joes to the i. trers on frelght, while that earned after the aban--i. + I. it groes to the insurers of the shig. liut the $r^{*}$ a cib law is the reverse, nnd pursuen the rule in " 6 ne
lly the French law, an abandonment of the ship :3.: in the umilerw riters the benefte of the frelght seb. 1 k at the time of the loss. In the linited states it neems now to lie well nettled that the frelght earned prior to the loss goes to the underwriter on frelght, atel that earned sabsequent, to the underwriter on the ship. Thus it has been lecided in the Masamehuaetes Supreme Court ( 16 Minan, , 346): "Lintll the loss haprens, the property remalns in the assured, and the freight, or her earnings, lelong to bim till that thene, if he stands his own insurer for the freight; otherwise, to the inaurer on the freight; but after the lose has hapjened, the insurets, in virtue of the abnidomment, become the owners, and are lialle for the repalrs and expensen, atul entitled to the earnings of the ship."Jbid, 4ik.

Charter.-There are two kinds of contract for the carriage of goods. Firnt, The centract of affrcight-
ment by cho tter-party. Secoadly, the contract for the carriagr of gooda in a general ship. The first is whera the whole or the chief part of a ship in let out to hire. There is nothing to prevent this contruct from being verbal, but in practice it is alwaya roduced to writing, and the written instrument contalning the terma of it la called a charter-party. It may be under seal or not. If so, it takes effect from the day when it was sealed and delivered, unless it appear on the face of it to take effect from the day of date, when that is a different time. The construction of it la to be reasonable and so as to glve effect to the intentlon of the parties and also the usage of trade, both In general and of the particular department in question; and where terma are introduced relating to a utage, evidence of course may be given to prove whit that uage is. But this will not admit of a construction being introduced which ls not consistent with the plain and obvious meaning of the words. The partica to it are the ownere if present where the contract is made, and generally also the master, or the master alone if the owners are absent ; and the merchant whe hires the shlp, or his agent. If the charter-purty is by deed and executed ly an agent, he should be authorized by deed, or letter of attomey, to sign for his principal, and must sign in his nume. If the agent aigns in his own uame, actions on the charter-party will have to be brought by or against the agent. The merchunt hirinus is called the charterer or freighter. The letting la for one or more voyuges or some period of time: the money to be paid for the hire is called frelpht. This may consist of one sum for the wholo ship or part let, or so much for ench ton or cach piecs of merchandise, etc., the frelghter undertaking to find a full eargo.

If the payment is to be made by the ton there should be provision for payment at the same rate fur $a$ lesa quantity, Again, the puyment may be by a sum in gross for the whole time of the ship's employment, or at a certain rate per month or other perful of time, A month is understood to mean a calenilar month. The charter-party expresses the register tonnage of the ship more frequently by both the old and the new modes of measurement: nthe when the ship is chartered by the month the hire is 1 wid fer the number of tons, commonly old measurement, at which she is registered. When the freighter la to pay by the ton, freight is to he paid only for the actual tomage of the goods without any reference to the register tonnugo; trut the goods munt ine in suitable packnges, or otherwise the owner can claim for the lont room an deal freight. The worls, or thereabouts, ure generally understorl to mean ahout 5 toms; but in one case where a ship was described as of the burlen of 261 tons or thereabouts, and the frelghter undertook to tibul a full cargo, and no fraud was impitatile to the owiner, the reghter was held bound to tind an arthal full cargo, though the whlp carried 400 tons. Gools, however, may be packed accoriling to the constom of the loading port, and no undy form a full cargo although it may be prasible to puck them in lens compass. Thus stigar may he packed in hogshends if such is the curtom, though it would take less rom in theres.

A charter-party lecing an ngremment drawn up at tho discrition of the partien, thes may of course intronluce any terma they agree upon. The usual undertakings, however, as said by loon Tenterden, are on the part of the ow ners that the ship shall lie tight, and atrong, furmialed witth all necessurios for tho sopage, reuly ly a day upininted to recelve the carge, and wait a certaln number of days to take it on heand. Hint the obligation to remain the whise of the ruming days may be dispensed with by a distinct intimation from the merehant that no cargo will ine prowided, and that it las aseless to wait. That after lading she shall aet sail with the firnt fuir wind and opportunity, to the desthed port (the dangers of the ses excepted), wad
there delly in the sam and furthe ship shall b sufllcient $m$ owner's eur staunch, an be liable all so. The m in the tlme to pay the 1 duced relati hereafter.

The froighter me goods or rulet the ship has beon let
there deliver the goods to the merchant or his gssigns in the same condition ns they were received on board; and further, that during the course of the voyrage the ship shall he kept tlght, and staunch, and furnished with sutlicient men and other necessaries, to the best of the ewner's endeavors. If the ship prove not to be tight, stanuch, and sufficient, the owners wlil, nevertheless, be linite although they themselves believed her to be so. The merchant undertnkes to load or unload within the time appointed, or within a ressonable tlme, and to pay the freight. Provisions are also often introduced relative to demurrage, which will he explalned hereafter. The ship, and freight, and enrgo, are also eftem bound in a penalty by the owners or mater, and the freighter respectively, for the jerformance of their undertakings. But these clauses scem in thls country, at least, to be of no utility, for in an action for the failure of the undertaklug the plaintiff would recover to the nmeunt of the injuries he had onffered, and in no case, whatever pennity inight be introduced, couid he recover more. Neither could these clanses give any direct remedy as agninst the ship, or frelght, or cargo.

If either party be not ready by the time agreed on, the ether may seek a ship or cargo elsewhere, and also bring an netion for the insufficiency; or if the merchant nppears to be insolvent he may snfely mako up a cargo from other quarters. When the goods have been put on board, bills of lading are signed by the master. These are evidence that the particular goeds are shipped as the chnrter-party is of the contract for convey:ance. The ship owner has a lien upon grods in respect of which a payment is due to him, and muy therefore detain them till the pryment is maile. lhit he can not hy virtue either of the general law of lien, or of the elanses above nilnded to, detain the goods berause of the merchant's fallure to perform hif undertakings generally, as for instance his undertakings to pay demarrape ot port dues, ote. Moreover, n party can have no lien unless he has possession of the propcity over which he cinims to exercise it. An absolute uwner, therefore, of a ship who has so completely parted with the possession nid control of her as to cause the hirer to become the tempornry owner, will net have the right of lien over the goods conveyed on board his ship. Owners ought carefully to consider this consequence, becnuse if they part with the possession of their ship, and the liirer of it the not a requasible person, they will cease to have in their hands pse very convenient and direct means of seeuring remuration. Special terms of course may le introdued in the contl..ct ly which the ripht of lien muy either he entirely reteased, or it may be extended beyend what is conforrel by the general rule of law. If the following agreement the owner was held to hars $c_{a}$ - ted for himself $\mathbf{n}$ right of lien for the laiance due to him under the charte.amriy ins to all the lading, though purt hud been transfeired hy endorsement of a bill of inding indepenilently of the generni rule of law, or the question whether he remnined in possession of the ship. Tha ugreement hetween the parties was that ownership of the ship," shound remain trmiy nud be fully vested in the owner, and that he should at all times during tho said intended sogage and rervice, have $n$ fuit and complete lien upun the fading of the shij) as weli iss for all losses mul damage which the sald owner might sustain or be put $t o$ in eonsequence of nen-puyntent of uny of the lifis to be given for freight, etc., and shouid have full power sud nuthority to lowh and retuin the said goods until full puyment of ali much fosses, charges, dumages, and arrears of freight paid for on account of the charterer, mul which he of right onght to paty agreenHy to the trie intent of the charter-jarty."
Tho froighter may either till the ship with his own goods or rulet the whale or part to others. Where n ship hus been let to hire at so much a montis and the

13 $\mathrm{n}_{1}$
froighter lets at so much a ton, the owner has no right to detain the cargo for the amount the freighter has agreed to give him. The aciupl shippers are only liable for what they have agieed to give the freighter. The owner, therefore, may have no right to detain the goods of the actual shippers for the freight atated in the charter-party, hat he may for that whlch is montioned in the bill of lading. And he has a right to that in preference to the freighter. The bankruptcy of the charterer or any pledge or nssignment made ly him will not affect the owner's right of lien.

Sailing with the first wind, le held to mean ssiling without unnecessary delay. "Leave Ameterdnm," dees not necessarily mean to sall thence on the voynge. But "final sailing" means the final departure from port and being at sea, ready in all respects to proceed on the veynge. (See chapter on Marine Insurance.) If either party be not ready by the time agreed oll, the other may seek another ship or carge and bring action for the damages eausel by the delay. A devintion on the veyrage will not deprive the owner of his right to freight, though it may oubject him to netion if it ceases a loss of the Insurance to the freight-er.-Merranile and Maritime Guide, London, 1856.

Freight, in the common acceptation of the term (sceording to Kent's Commentaries-see vol. iil., chap. xlvii.), means the price for the actual transportation of goorls ly sea from one place to another, but in its moro extensive sense, it is applicd to all rowards or compensation prid for the use of shipa, including the transportntion of pasaengers. The personal obligntlon to pay frelghts rests either on the charter-party or on the bill of lading, by whieh the payment of frejghts is mule a condition of delivery ; and the general rule is, that the delivery of the gosids at the pince of destination, according' to the charter-party, la necessary to entitle the owner of the vessel to freight. The converance and dellvery of the cargo form a condition precedent, and must be fulfilled. A partini performunce is not sufticient; nor can a partinl payment or ratable freight be nilowed, exeejt in sjecial enses; and those cases are exceptione to the genernl rule, and malled for ly the principles of equity.

The amount of freight is usually fixed by agrecment hetween the parties; and if there be ne agrecment, the nmount is ascertained by the usage of the trale, and the reason of the cuse. If the hiring be of the whole ship, or fior min entire part of her, for the voyage, the murchant must pay the freight, though he does not fully load the ship) ; but if he agrees to pay in proportion to the mmount of goods put on bonrd, and does not agree to provide n fill enrgo, the owner can demand payment only for the cargo metually shipped. If the merchant gorges to furnish in return cargo, mui he furnlshes none, and lets the ship return in tullast, he must make compensation to the ninuunt of the freight; and this is sometimes terned dend freight, in contradistinction to freight due for the actual carriage of georls.

It is nupposed to be the doetrine of the case of Rell v. I'ullen, that the master woulil be entitied to frelght tor hringieg hark the out ward eargo, if it could not he disposed of, though the eharter-pharty was niiont an to the return enrge. It would stand upon the egaity of the claim to teml freight. The liench law, in surh n case, nliows freight fur bringing buck the enrgo because it rond not tre ald, or was not permitted to lie handed. Mr. Justice Stur:, in the case of the mbip Homper, United States' Circuit Court, Masaachusetts, May, 18:13, it Sumner, ble, had down tio general rule thut freight for the entire voynge rould only be earned by a due jerformane of the voyago; and that the only meknowledged exteption is whell titere is bo do. fanit of the carrier-ship to perform the voyage, and the ship-ownor is ready to forwarl them, but there is a default on the part of the owner of the cargo, or the waives a furtier prospection of the voyuge.

If part of the cargo be sold on the voyage from neceeaity, the owner, as we have meen, pays the value at the port of delivery, deducting the freight equally as If the goods had arrived. But If the goode be prohibited on entry by the government of the country, and auch prohibition taker place after the commencement of the voyage, and the cargo be brought back, the freight for the outward voyrage has been held to have been earned; and the case was distlnguished (though I think the ilstinction not very obvious) from that of a blockade of the port of destinatlon, and decided on the authority of the French ordinance of marine. "Nothing can be more just," observea Valin, "than that the outward freight ghould he allowed in such a case, slnce the interruption proceeds from an extraordinary cause, independent of the ordinary maring perils. The case of a blockade of, or Interdiction of, commerce with the port of discharge, after the commencement of the voyage, is held to be different; for, in that case, the voyage is held to he broken up, and the charter-party dissolved : and if the cargo, by reason of that obstncle, be brought back, no frelght is dne. Tha samo principle applies if the voyage be broken up nnd lopt by capture upon the passage, so as to cause a complete defeasence of the undertaking, notwithetanding thero was a subsequent recapture, na in the ease of the Iliram. On the other hand, an embargo detaining the vessel at the port of departure, or in the conree of the voyage, does not, of itself, work a dissolation of tho contract. It is only a temporary restraint, which suspende for a time Its performance, and leaves tho rights of the partiea in relution to each other untonched. If the ship be laden, and be captnred before she breaks gronnd, and afterward recaptured, but the voynge be broken up, the shipowners are not entitled to any freight, though, by the usages of the trade, the slif was laden at their expense.

It is requisite that the ahip break ground to give an inception to freight. It is the same thing with a hockade or hostile investment of the port of departure. Such an obstacle does not discharge the contract of freightment, because it is merely a temporary suspenaion of lits performance; and the ship-owner may detain the goods until he can prosecute the voyage with safety, or until the freighter tenilers him the full frelght. Thls was the decision in the case of Palmer v. Lorillard, in which the doctrine was extenaively examined; and it was shown, by a reference to the forelgn orlinances, and the sonndest classical writers on maritime lsw, that the manter, in the case of such an invincible obatade, of a temporary inture, to the prosecutlon of the voynge, ls entitled to wait for the removal of it, so that he mny earn his freight, unless the cargo conslsts of perishable erticles which can not enduro tho delay. Ile standa upon a principle nf equity which pervades the maritime law of liurope, if he refuses to surrender the cargo to the shipper without some equitable allowance in the shape of frelght for his Intermediate services.

When the goods lecome greatly deteriorated on the voyage, it has been a very litlgated question, whother the consignee was lound to take the goods, and pay the freight, or whether he might not abnndon the goods to the master in diarliarge of the freight. Valin and Pothier entertain different opiniona upon this question. The former insiata that the regulation of tho ordinance hulding the merchant liabie for frelgit on deteriorated goods, without the right to abandon them in diseharge of the freight, in too rigorons to be compatible with equity. lle says the cargo is the only proper fund and pledge for the freight, and that Casicregis wan of the same opinion. Pothier, on the other hand, was againes the right of tho ownei to abandon the deteriorated goods in discharge of the freight ; and this is the better opinion, and the me adopted in the case of Girisurold $v$. the Neto York Insurance Company. It is in accordanco with the ordinances of the marlne,
and of Rotterdam, and with the new commercial code of France ; and the latter puts an end to all further doubta and discnssion on the subject in France. The ship-owner performs his engagement when he carries and dellvers the goods. The right to his freight then becomes absolute, and the carrler is no more an insurer of the soundness of the cargo, as against the perile of the sea, or Its own intrinsic decay, than he is of the price in the market to which it le carried. If he has conducted himself with fidelity and vigilance in the course of the voyage, he has no concern with the diminntion of the value of the cargo. It may impair the remedy which his llen affords, but it does not affect his personal demand against the shipper.

If casks contain wine, rum, or other liquids, or sugar, and the contents be washed out, and wasted, and lost, by the perils of the sea, so that the cssks arrive empty, no freight is due for them; but the ehipowner would still be entitled to his freight, if the casks were well stowed, and their contents were essentially gone by leakage, or inherent waste, or imperfection of the caoks.

Should the cargo consist of live-stock, as is frequently the case in voyages from this country to the West Indies, and soms of the horses or cattle, for instance, should die in the course of the voyage, without any fault or negligence of the master or crew, and there be no express agreement reopecting the payment of frelight, the general rulo is, that the freight is to be paid for all that were put on board. Ilut if the agreement was to pay for the transpertation of them, then no freight is due for those that die on the voyage, as the contract is not, in that case, performed. The foreign marine haw allows freight paid in advance to be recovered back, if the goods be not carried, nor the voyage performed, by reason of any event not imputable to the shipper. Tho reason is, that the consideration for payment, which was the carriage of the goods, bas fuiled. lut the marine ordinances admit that tise proties may atijulate that the freight so previously advancel shall, at all ovents, be retained. In Whtson v. Duykinch, the rule of the msrine law was recognlzed, though it was not applied to tinst case, hecause the contract there appeared to be, that the frelght was paid for receiving the passenger and his goods on board; and, in such a case, the payment is to the retained, though tho vessel and cargo be lost on the voyage. The general principle of the marine law was adnsitted in the fullest latitudo in Girigys v. Anstin; and whether the price previonsly advancel is to he retained or returned becomes a question of intention in the construction of the contract. The French ordinunces require a special agreement to enable the finipowner to retaln the freight paid in edvance; and lulin alys that nany anthors on maritime jurisprudence, as Kuricke, Locceniun, and Stracehn, will not ailow oven ench a special agreement to bo valid. The linglish law la not so acrupulous, and does not require any anch oxpress stipulation, and allows the intention of the parties to retain the previounly alvanced freight to ise more easily inferred. In De silmule v. Kerdall, the Court of King's Benclı nulopted a direstly opposite principle, and observed, that if the ciarter-jarty was silent, the iaw would requiro a performance of the voynge before freight was due; but the parties uight stipulato that part of the frelglit be jaid in anticipatlon, and to male free from subsequent contingency of lons ly reason of lons of the subsequent voyare. If freigint be paid in advance, and there ho no יxpress atipulation that it shall ine rotured in the event of frelght not beling earned, the inference is that the parties did not intend that the paymont of tise part in ad. vance should lie antiject to tise riak of tite remainder of the voyage ; and without nome provision of that kind, a new lmpilied contract to that effect cuuld not be ralned. See Kent's Com., vol. ill. 1 J'altsons on C'mtratt, liort a; Merc. and Marit. Guide, Loudon, 180i*.

Frenco Painting, a method of painting with water-colors on fresh plaster while it ls still in a soft state, by which means the colors are incorporated with the plaster, and become as permanent as the material on which they are spread. The Italians, from whom we borrow the term, call it fresco (literally fresh), either hecanse it is executed upon fresh plaster, or because it is used on walls, alcoves, and other buildings in the open air. Vitruvius (vii. 4) calls it painting udo tectorio. Painting in freaco is a very ancient art. It was practiced by the eurly Greeks, and may be traced even to Egypt. It is generally executed on walls and vaulta, the plaster being laid on in successive portions, or so much only at one time as the painter can dispatch before it driea. The design is usually drawn previously en paper, to be chulked and transferred to the wall nbont half in hour after the plaster hus been laid. From the difficulty of making alterutions on the work when the colors are once absorbed, the design should be previeusly prepared with the greatest accuracy. When an alteration must be made, the part is usually cut entirely away, and relald with fresh pluster. The ancients painted on stucco; and we may remark in Vitruvius what infinite care they took in making the incrustation or plastering of thelr buildings, to render them beautiful and lusting; though the moderns find a plaster of lime and sand preferable for fresco paintint, both because it does not dry so hastily, and on account of its subdued and ogreeable tint. The plgments chiefly employed in this kind of paintiug are eartis, because their colors are not liable to be affected by the burning qualities of the lime. White is made of line alacked some time prevlously, or of white marhe dust; and the other substances used are red and yellow ochre, verditer, lapis-lazuli, black chalk, etc. These only require to be ground and mixed up with water. The bruahes and pencils should be long and soft, otherwise they are apt to rake and raise the surface. In order that the work may come out $\ln$ nll its beauty, the colors must be laid on quickly, while the plaster is still moist ; nor should they ever he retonched dry with colors mixed up with whito of ege, size, ot gum, as is sometimes done; becuuse such colors grow hackish, and soon tarnish.

Freshes, In sea lauguge, the increased current of an chbt tide by means of a flood of fresh water flowing out into the sen, by which its waters are often discolored for a greut distance from the coast.
Fresnel, Augustin Jean. The inventor of the light now generally used throughout Europe and in various parts of the United States, for light-houses. ile was distinguished for his practical application of opties to the useful arts with which inis name will ever be honorably nssociated. At least as carly as 1819 it necurred to him that lenses might be substituted for mirrors, for the purpose of clirecting paraliel rays of light from llght-houses, and thus preventing in a great measure the natural weakness, in consequence of its divergence, of light seen at a distanco. It further occurred to him that lenses of large size, and of moderate thickness, might lie buill up of segments of lenses. This dast ilea was not indeed new, for lluffon had proprosel to diminisi the weight aml thickness of lenses ly grinting them into zones whidh should have a conmon foeus; and Condorcet proposed to construct these zones of separate segments. Sir Davil Itrewster suggested, in 1811, a similar construction, umaware, it appears, of what Condorcet had written. Hut all of these writers described their contrivances as applicable to burning instruments for concentrating the solar riys. liresmel upears to have been unaware of what hif predecessors suggested, lut he has the far mreater merit of actunlly applying the suggestion to the impurtant perpose of lighit-house illumination. It was tirst carried intocffect in lirance, where polyzonal lenses were made by M. Soleil, and have gradually been intmbuced into other countries, first Into Hollnnd, and
then into Scotland. See article Light-Houszes. Not content with this great improvement, Fresnel exerted remarkable ingenulty in centriving further improvements in the mode of dlatributing light for the purposes of navigation under almest every concelvable circumatance; and he made copious use of the principle of the total reflection of light in glass, which had never before been applied to such purposes. In 1810 he was nominated upon the light-house commission; and in July, 1823, the Corduan Light-house, at the mouth of the Garonne, was completed upon the new plan.-E. B.

IIe was the nuthor of varieus works on the Diffraction of Light, on the Influence of Heat on Colors, on the Infuence of the Earth's Motion, on the Mutual Action of Polarized Light, etc. Through the instrumentality of Mesars. E. and G. W. Blunt, of New York, the Fresnel light was adopted in the United States in the year 1838, and is now in use generally in the light-houses of this country and of Europe.
Fresnel was berm May 10, 1788, at Broglie, in the department Ure, Nomaandy, and lied at Ville d'Avray, France, on the 14th July, 1827, aged 39 years.

Frigate (Fr. frégate (9); Lat. aphractus, a long undecked vessel); a ship of war, usually of two deck s , designed for swift sailing. Frigates mount from 20 to 44 guns, and sometimes more. The name was originally applied to.a long kind of vessel navigated in the Mediterranean with saila and oars. Frigatoon, a Venitian veasel with a square stern and withont a forenast, having only a main-mast, mizzen-mast, and bow-sprit.
Frith, or Firth (Lat. fretum, a narrow sea), is a term chiefly applied to a narrow and deep inlet of the sea upon a river, aa the Firth of Forth, In Scotland. This term corresponds to the fiord of the Danes and Norwegians, who, in all probability, borrowed it from the Engliah. Both Latin and Teutonic are derived not improbably from the same root, fahren, to pass over; whence ferry, ford, furt (Germ.), as in Frankfurt, Erfurt, etc.

Frobisher, Sir Martin, a celebrated English navigutor of the sixteenth century, was born (in whint yeur is not known), at Doncaster, in Yorkshire. He was the first Englishman that salled in quest of the north-west passage to China nud the Indies. "Heing thoroughly furnished of the knowledge of the sphere und nll other skilla pertaining to the art of navigation, and being persuaded of n new and nearer pasaage to Cutaya than by Cupo de Buona Sperança, which the Portugals yearly use, and knowing this to be the only thing of the world that was yet left undone, wherely, n notahle mind might be made famous and fortunate," l:3 applied to various English merchants to ussist him in his jrojected enterprise, but for 15 years without anccess. At the end of that period ho was enubled, through the assistance of Duiley, Earl of Warwiek, and others, persons of rank and fortune, to set out on the expretition. Jle sailed from Deptford, June 15th, 1576, with three small veasels, two of them, the Gaoriel and the Wichael, larks of 25 tons each, and the thirt $n$ small pinnace of 10 tons. As they passed Greenwich, the Queen, who lappened to be there with her court, "eommended them, and bade them farewell with slaking her hand ut them out of the whitow." After pussing the Sinethund Islands they eame in sight of "Freescland" (July 1Ith), where they were unable to land on account of the ice, and on the 28th of the same montis they reached that part of Greenland which Frohisher numed "Meta Incognita." On the 11th August they aniled through $n$ strait which Vrebisher called ly his own name. Pursuing their way they passed several islands, to which they gave nomes, and came on the 18th to Butcher's Island, where they lost n lont and part of their crew through the treachery of the nutives. After this they turned their prows homewurl, and reached England September 7th. Fro-
hisher had taken possesslon of the varioas places he touched at in the name of the Queen; and in token of thls he ordered his men to put on board ship whatever they first laid hands on. Among other things thus secured was a lump of black stone, which when Frobisher returned home, was accldentally discovered to contain gold. Thls discovery was soon nolsed abroad and in the following spring Froblsher readily found the means to fit out enother expedition, partly acientlfic and partly with a view to prosecuting the search for gold. The Queen lent him from the royal navy a ship of 200 tons, with which, and two smaller barks, he sailed from Harwich, May 31, 1577. On arriving at the scene of their former dlacoveries they found that little of the gold ore remained, but they opened forthwith communications with the natives for the purposes of traffic. One of these, "a man of large corporature and good proportion," they carried away with them neither in a very just nor handsome manner. They also caught an old womm, "whon they took for a devil or a witch," and stripped otf her basklng "to see if she were cloven-footed." After discovering and naming a good many places, and procuring a good deal of ore, he turned his prow southwand, August 234 , and reached home in the end of September. The ore when amelted was found to pay the expenses of the voyage and more; a thirl expedition wan fittel out in 1578 , which, however, through stress of weather and other cireumstancea, had no sooner reached the gold country than he was obliged to return from the lateness of the season. This was the last of Froblsher's polar voyages. It is not known how he was occupied during the next seven years, hut In 1585 he accompanied Sir Francis Drake on his expedition to the West Indies, and three years later did such good service against the Spanish armaila as to le rewarded with the honor of knighthood on loard his own ship by the lorl high admiral. In 1694, ufter various exploits against the Spanlards, he was sent to assiat IIenri IV. of France agalnst the Spaniurls, and the members of the lengue. The enemy had fortified themselves strongly In Croyzon, near Brest ; and in an attack on their position Frohisher was mortally wounded. He lived to take his fleet nafely home, and shortly after died at llymouth.-Bing. Brit.; Hakluyt's Collect. of I'oyages ; Stow's Anvales, etc., Pte.

Frobiaher Etrait, an nrm of the sea in 1ritish North America, letween Hudson Strait and Northumberland Inlet. It extends in a westerly direction from the entrance to Davis' Strait.

Fruit (Ger. Obst. F'rüchte; Du. Ooft ; Fr. Fruit ; It. Frutta, F'rutte; Sp. F'ruta; Rus. Owoschtsch; Lat. Fructum). This appellation is bestowed by contnercial men npon those apecies of fruit, such as oranges, lemona, almonds, raisins, currants, ajples, etc., which constitute articles of importution from foreign countriea. Gardening was undoubtedly among the flrat of the arts to which the attention of man was directed. If we would ascend into remote antlyuily, we can have recourse only to conjecture; for although, In the aacred writings, and in the earilest profane nuthors, allusions to gardens oceur, little is told us either of their productions or thelr culture. Judging, though, from the Itterature of the preaent dny, we shall searicly find uny art which receives more atiention.

Several varietien of frult are mentioned as having been Introxuced into Ituly, 70 nt . e., et aeq. Fxotic fruils and flowers of various klends, previonsly unknown In England, were lirought thither in the relgus of Henry VII, and Vill, and of Nary and Flizalseth, leet ween the years 1500 and 1588 . Sce Ciabrinnisu, Eincy. Brit. Among others of less note, wero muskmelons, plum-trees, and currant-plants of nundry sorts, the mask and damask rosen, tullin, ete. ; alse saffiron, woad, and other druge for dyeing, but these lant were attempted to lie cullivated without auccess. Haktuyt; Lobo Kames. The following are among
the fruits whose Introduction into England has bicen traced (Haydn):

The art of gardening becane well understooll in Enghand about A. D. 1500 ; hefore which time many of our vegetables were imported from IIrabunt. Thie ers of the urt was the relign of Elizubeih; but the modern mode of gardening wits introduced about 1700 . The following came from the countries respectively numed:

nud Paget Sound, with the Archipelago of Arro up to the 49th parallel, were all surveyed by the United States' Exploring Expedition. The whole is unsurpassed by nny estuary in the world. They comprise many fine hariors and safe anchorages, are entirely fres from dangers, and cover in area of about 2000 square miles. The country by which these waters are surrounded is remarksbly salubrious, and offers every advantage for the accommodations of a vast commercial and military marine, with conveniences for docks, and many sites for towns and citles, at all times well supplled with water, and capable of being provided with all needful supplies from the surrounding country, which is well adapted for agriculture. This strait is 95 miles in length; average width 11 miles (entriunce 8 miles in width). No dangers exist, and it may be safely navigated throughout. The winds blow for the greater part of the year from the westward, and at times strongly. The shores are bold, and anchorage is to be found in but few places; at some parts no bottom is to be obtainel, even within a beat's length of the shore, with 60 fathoms of line. The north shore (Vancouver Island), is rocky, and composed of conglomernte and a reddish granite. On this side there are several inlets, in which are anchorages: ameng them Port San Juan and Vietoria. Victoria is a sung harbor and a most important position. There is an inner and an outer bnsin, sufficiently commodious for large ships of war. Vanconver Island rises abruptly, and is very much broken ly mour.tain ranges, but well covered with timber. It is 240 miles long, and 30 miles wide.

The Gulf of Georgia and Johnson Strait are not well alapted for nuvigation, in consequence of tho raphlity of the tides, and the many sunken roeks nt the northern outiet. The harbors within them, both on the main land nini Vancouver Island, nre useless on account of the groat depth of water and the perpendicular lanks. Not a shoal exists within the Strait of Juan le Fuca, Admirulty Inlet, Puget Sound, or IIood Canal, that can in any way interrupt their navigation by a 74 gun ship. The shores of all the inlets and hays are remarkably fold-so much so, that in many places a shlp'a side would strike the sthere before the keel would touch the ground. Some few of them have creeks emptying into them, with water sufficient to turn mills. Those sreeks all have extensive mudflats at their entrances, with fertile prairies at their heads and along their banks. The spring tides rise 18 feet, those of the nenp 12 feet, affording every fneility for the construction of dry-docks, etc. The country on alf these salt water inlets is suid to be romarkathy healthy. The winter is represented to bo mild and but of short duration, and the channels nul harbors are never ohstructell liy iee.
Fuel (from the Frenci fiu, tire, nkin to the Latin focus, a hearth or fire-jpluce), $n$ word npplied to certain substances which are used in tho generation of heat, stich as wool, peat, coul, ete., tund also sometimes npplied to tho substances employed in geneathig ligit, snch as oil, nipirits of wine, muphthn, etc. In the present articlo the former appilieation will ulone be considered; for information respecting the latter, see Gis, Lamp, ete.
The ubuedance and consequent cheapmess of fuel has a great: Inlluence on tho prosperlty, halits, and manners of n nation. Where fuel is searen, factories languish, and commerce deelines. in cold climates seareity of fuel is individually $n$ great mamity, for it abrilges the hours of lathor, eausing persons to speml those hars in sleep which under other cireumstances womlit have been turned to prolltnible neconnt ; it nlso causes persons to crowl together for the suke of warmiti In a wny that is injurions to healtin and morals. Abamaner of fuel, on the contrary, with good roals and a system of inland navigation for its distrlbuthom, forms the basis of national prosperity, not only minis-
tering to the useful arta, but enabling the occupier of every house to create an artificial climate suited to his wants and wlshes.

The most common and wldely-distributed deacription of fuel is vood, a term applied to the trunk, roots, and larger branches of trees. Recently-felled wood consists chiefly of woody flbre, oap, and water. The woody fibre is a compound of carbon, hydrogen, and oxygen, and forma the chief bulk of plants; hoth it and the sap are combustible-that la, are capable, at a high temperature, of combining rapidly with the oxygen of the atmosphere and forming gaseous componnds. It is $\ln$ the act of this for ation that heat is generated. The sap, which form, only a emall proportion of the bulk of wood, varies in different kinds of trees: the sap of the pine tribe contains resin; that of the oak, tannin; that of the beech and birch, extractive. The quantity of water in wood varies greatly with the kind of tree, and with the time' of year when it is felled, it heing least in winter. As the water is not combustible, but must be got rid of at the expense of the heat generated by the perte which are so, it is obviously desirable to store the wood in a dry and airy situation before using it as fuel. By this means 100 pounds' weight of wond have been known to lose 20 pounds' weight in 10 or 12 montis. Wood, as commonly used for fuel, contains about one thrd of its weight of water. Wood also contains earthy and alkaline salta in the proportion of 1-30th to 1-70th, and these remain as an incombustlble ash.

Wood is distinguished from all other fuel by the valuable property of reproduction, and also by the fuct that it often passes through the various stages of beauty and utility to man before it becomes converted into fuel. The henting power of wood is conslderable, in consequence of its excess of hydrogen, which, in burning and forming water, requires for equal waights three times as much oxygen as the carbon does in forming carbonic acid; and it gives out in burning nenrly four times more heat than the carbon. The lighter woods contann more hydrogen than the heavier, so that they hurn with flamo longer than they incandesce as cinnrcoal; they also burn more eusily and give ont their heat more quickly than the hard woods. During the combustion of wood its volatile parts undergo some complicated chemical changes. When wood is burnt ont of contact with the air, the carbon is preservell hit the form of churcoal (see Chaincoal), which is a very useful fuel whon an lncandeseent heat free from flame and smoke is required; but when some of the volatile products ure to be collected, the wood is placed in lron retorts, which aro gradually raisel to a red heat. The volatile products form carburetted ibydrogen, carbonic acid, carbonic oxyd, and other gases, und also certain vapors which condense into liquid or soild products. Some of the liquids are soluble in water, such as pyroxylic spirit, pyroligneous achl, ete.; the insoluble products form tar sad certain oily substances.

In most uountries deposits of peat occur of greater or less extent. In IIollam, the north of Germany, Irelami, etc., peat deposits are of immense extent. The origin of jeat has been neconnted for in those districts where clay oceurs near the surfnce by supposing muldy ponls to have formed, round the edges of whleh arputic plants have taken root and gradually extended themsel ves into the centre, thus forming a bod where mosses necumulate, nui new plants take growth, while the old are decaying and becoming compressed into a solial mass thelow. This process goes on uatll the pools ure filled up with vegetable matter, and the surblus water ls discharged over the neighboring lands, where the process is repeated until a peat hog is formed. Even in mountain clistriet ${ }^{\text {, }}$, where the soil is impervlous, clouds ant mists may supply molsture, and a tog be formed ly the growth of one generation of vegetalile matter on the ruins of its predoceasor. As
the plants which form the pent are in different atagea of decomposition at various deptha, the character of the peat varies greatly. Near the sarface it la lightcolored, spongy, and the vegetable character but little changed; lower dewn it is brown and dense; while at the base of some bogs, which may be as much as 40 feet in depth, the poat is black, almost as dense as coal, and resembling coal in chemical composltion.

On the banks of the Rhine, peat is cut by means of a spade into blocks, and exposed to the alr to dry, the upper layer being first separated from the lower and denser portion. In Holland the peat in scooped out by means of spades; or If a considerable quantity of water be present, an instrument is ased conslating of a sharp Iron ring attached to a handle, a net or cloth being fastened to the ring for dralning off the water. The mindy peat thus collected la trodilen out by the feet of men, raked, and the stones pleked out; it is then thrown Into shallow wooden boxes, strewed with hny to pravent the peat from adhering, and the remaining water is allowed to drain off. In the course of a few days, when the mass has attained a certnin consistence, women, with flat boarcls strupped to their feet, stamp down the peat until it has atteined such a conalistency as not to take an impression from a common tread. It in next stamped with benters, and the cake, which is eight or nine inches thlek, is dlviled by masas of long laths into squares of about four inches, which are removed a few at a time from each box. The cakes are then dried by placing the first taken out transversely on the necond, the third upon the fourth, reversing the order when the pleces are piled up in store.

The value of pent depends greatly uron its drynens, density and firmmess; if porous and brittle, it crumbles during carriage or aft 3 it is stacked, nnd thus becones nearly worthess. In many cnses the value of pent depeads on its capability of belng alternated with the substances to be heated. Porous and almont valuelen. peat has been renderel valaable by being passed through a press, in which case a lunp of peat may lose as muci as one fourth of its weight of water. Peat may be nearly valueless as a fuel from the quantity of ash which It ationis, consisting of vegetable salts and the earthy matter of pent, and amounting in some cases to one thirl of tha weight of the peat. Wheo this large quantity of akh ocenrs in peat it renders the fuel very dusty, nad in mmelting processes it is objectionable on scrount of its chemical nction. It is remarkable that the carlonates of the alkalies are not found lu this ssh, lait phosphates, sulphates, etr. In some large towiss, pent, or iurf, ins it is also called, is imitated liy employing the refose bark of the tan-varl, which is mate into flat cakes, and chiefly used an fuel by the poor.

In the sandy plains of the Fast, camels' dung is dried and $u_{1}$ +il as fnel ; it was from tho nas of wuch fuel in Fggyt that asl ammoniac originated, the salt subliming during combustion. Hakluyt, in his loyages, vel. 1., p. 348 , says, "Win were forcell to une for fewell the dung of horses and camels, which we bought desre of the panturing people." A nobstance in the form of long sticks, saill to the made of camels' dung, is sometimes imported from the linst uniler the mane of chutnef, and is occasionally used instead of the ondinary match for lighting pipes and segara. It lurns alowly without fiane, nud cives out an odor not unlike that of the burning cuttiogs of trees and shrubs. Other descriptions of exerement are also used as fuel. The Chinese have long been nceustomed to mix cow dung and other refose vegetable matter with moft clay and the dust of coal to form balls which when dried in the sun become a cheap and useful fuel, burning with very little nmoke. These balls are largely manufartured in the coal districts of China, and are distributed ovor the empire by means of the canals. It is a curious fact that Sir Hugh I'latt, In 1594, indicated a
mothod of making coal balls with loam, and that Ray, in 1668 , nbserved this kind of fuel at Liège (Journey through the Low Countries, etc., 1673, p. 58), where they were called hot shots, serving to slake the heat of a fire and keep the coals from burning out too fast. We are Informed that in some parts of Wales stone cosl culm is made into balls with clay, and is a common form of fael in Pembrokeshire. The combastion is slow, and a long steady heat la kept up, well adapted for lime burning. In $18 \mathbf{3}$ a patent was taken out in Eagland by M. Ducayla of Berieaux for the manufucture of fire-balls of auch materials as cinders or aahes, wood or lignite, anthracite coal, pit coal, animal black, calcareous earth or clay, mold, etc.

The fuel, in every respect the most interesting, and one of the ch: : sources of wealth and prosperity, is conl. The very abundance of this article causes it to be used in so lavish and extravagant a mimner, that any general nttempts to economize it, and to fix its value as a fuel, scarcely laterest the public. There are, however, particulur cases in which it is desirable to economize coal as far as possible, as in the case of a steamshlp of a thousand horse-power, a single journey of which may require upward of 2000 tons of coal, or more than 80,000 cubic feet. Hence it is obvious from the detaila given of the various deseriptions of coal in the article Coal, that some varieties of coal are better fitted for the purposes of eteam navigation than others. A few years ago, when the lbitish government was establishing a steam navy, Sir 11, de la Beche and Dr. Iyon Playfair were requested to exannine and report on the coal suited to the atenm navy. The inquiry was conducted with great ability, and has resulted in two reports published in 18.48 and 1849, which the reader Interested in the subject will do well to consult. We will, bowever, state a few of the chief points elicited by this inguiry.
llearing in mind the oljeet of the linquiry, the commissioners considered that the chief test of the value of any coal submitted to their examination was its power of converting water into atenm, so that if a given wright of coul in a certain time converted a larger proportion of water lato steam than the same weight of another coal in the amme time, the evaporative power of the one would be greater than that of the other. It was found, however, that the coal best adapted to steamships of war, should also combine other cualities ; for example, the fuel should buns jaickly, so that atenm may be raised in a short time; it should not le bituminous, lest its snoke should letray the position of the shij, when it might be desirsble to conceal it; it should havo such n whesive power as not to be broken into fragments by the rolling motion of the vessel ; it should have such a density and structure as to bear stowing away in a comparatively small apace (a condition which in conls of equal evaporative value was found to involve a diffirence of more than 20 per cent.) ; lustly, the coal should not contain a large proportion of sulplur, nor be subject to rapid decay, or it might in eithor case lead to spontaneous combustion. Hut it was not found possible to unite all thase conditions in the aame coal. Anthracite, for example, has high evaporative power, bot not igniting easily its action is not quick; it is not easily lroken by the motion of the ship, but not being a eaking coal, it would not cohere in the furnace, and woald escape through the grate-bars during the rolling of the sl pin a gule; it gives off no smoke, but from the lintensity of its combustion, it causes the irun of the grate-hars and of the boiler to oxydize ripidly ; hence, with many ndrantuges, anthracite has a few defeets sufficiently prominent to preclude its use under ordinary ciremmstances. It was thought that a patent fuel might be formed with some of the antiracites of Walps, which should combine the advantages and elude the defects above referred to; but it was fond that the cementing tar of the patent fucl burat so
much more that the latt, the draft, or
The comm distinguish p that it is diff. data furnsishe trast the actu oretieal value with no loss one pound of expressed by height of one the formina sents water, of pound of conl. that $\eta$ pounds efficient for the the number of $1^{\circ}$ Fahr. ; and on the mechan one pound of w to 789 pounda $r$ ing to the expel ish engines are pounds to the 1 coal consumed, actual force gen twelfth of the $t$ t evaporative pow give very dissim rated $\overline{7} \cdot 88$ pound of Newcastle co pounds; Wickst of water from 8 which is equal to experiments mad wss found, after pound of coal eve $212^{\circ}$; and aecor Comwall, at the found that $11 \cdot 42$ every pound of $w$ sition to that of M At ordinnry te combustion under mosphere, evolvin mable gases, and explosions. This the higher tempe presence of moistu phar or iron pyrite so intense as to igr is therefore impor possible, and such least liable to this coal is kept ln iron with sea-water, the bon or coal forming thas prontoting oxy In the preat ex Co., in the Frenc "small purified en produce of $\mathbf{n}$ syste France, limgland, plan appears to be sulphurous coal, or also where the coa seams, and can not with slaty and ston (hemin de Fier du $N$ the lomonotives ; b evil was for the mos ash was also great ploved for purifying the jighing-1maching after heing stamperl
much more rapidly in the furnace than the anthracite, that the latter accumulated on the bars and obstructed the draft, or escaped through the grate unburnt.
The commissioners found that the quallilea whlch distinguish particular kinds of fuel are very varied, so that it is difficult to deduce general results. But the data furnished by their experiments enables us to contrast the actual value of a particnar coal with its theoretical value, suppasing lts combustlon to le attended with ne loss of heat. The actual duty oltained by one pound of coal from the boiler employed, may be expressed by the number of pounds raised to the height of one feot, a result whleh may the obtained by the formula $W \eta+065 \cdot 7 \times 782=x$, in which $W$ represents water, of which $\eta$ pounds are evaporated by one ponth of conl. This formula is deduced from the fact that $\eta$ pounds of coal multiplied by $965 \cdot 7$, or the coefficient for the latent heat of steam at $212^{\circ}$, indicates tho number of pounds of water which wonld be ruised $1^{0}$ Filur. ; and the number 782 arises from experiment on the mechanical force denoted by the elevation of one pound of water $1^{\circ}$ Fuhr. ; that force being equal to 782 pounds raised to the height of one foot, accoriing to the experiments of Mr. Joule. The best Cornish engines are said to be capable of ralaing $1,000,000$ pounds to the height of one font for every pound of coal consumed, but this is only about one elghth of the actaal force generated, and only one eleventh or one twelfth of the theoretlcal force. Experimenta on the evaporative power of coal mnde by different observers give very disslmilar results. Smeaton, In 17ĩ2, evaponited 7.88 pounds of water from $219^{\circ}$ with one pound of Neweastle coal ; Wall, in 1788, evaporated $8 \cdot 62$ pounds; Wicksteed, in 18.10 , evaporated $9 \cdot 493$ pounds of water from $80^{\circ}$ with one pound of Merthyr coal, which is equal to 10.746 pounds from $212^{\circ}$. In some experiments made at the United Mines in Cornwall, it was found, after a trial of six months, that every pound of cenl evaporated 10.29 peunds of water from $212^{\circ}$; and according to seme experiments made in Comwall, at the request of the commissioners, it was found tint 11.42 peunds of water were evaporited by every pound of Welsh conl of similar chemical composition to that of Mynyld Newyid.
At ordinary temperatures coal undergnes a slow combustion under the action of the oxygen of the atmosphere, evolving cartonic acid, nitrogen, and inflammalle gases, and in some cases leading to dangerous explosions. This slow combustion is facilitated by the higher temperature of hot climates, and by the presence of moisture. If the conl contain much sulphar or iron pyrites the chomical action may become so intense as to ignite the coals. In stowing coals it is therefore important that they should be as dry as possible, and such a variety should the sclected as is least liable to this progressive decomposition. When coal is kept in iron bunkers, and is liable to be wetted with sea-water, the iron raplaly corrodes from the carton or coal forming a voltaic circuit with the iron, and thus promoting oxydation.
In the prent exhibition of 1851, Messrs. Berard \& Co., in the French department, No. 51, exhibited "small purified coals, und residue of the amme, the proluce of a system for purifying coals, patented in France, England, Belpium, nind Germany." This plan appears to be well adapted to the puritlention of suipharous coal, or conl containing much fron pyrites; also where the enal deposits are in numerons sinall seams, and can not lie got out without being mixed with shaty and stony matter. The coal nsed on the Chemin de fier du Norl was so sulphurous as to injure the loenmotives; thit by naing the purfied fonl, the evil was for the most part remedied; the quantly of ash was also greatly reluced. The apparatus employed for purifying the coal ls simblar in princlple to the jigging-machline used in dressing ores, which, after belng stamped, in order to separate atony mat-
ter, are agitated in water and allowed to rest, when the verious portlons become arranged in layers, according to th $\quad$ specific gravitles. Thla purified coal ylelds a very pure coke.

Mr. Grace Calvert, of Manchester, has taken ont $u$ patent for purifying coke from sulphur. It consists in mixing the coal, before coaking, with from $1 \&$ to 51 per cent. of common salt, the proportlon varylng with the quantity of sulphur. The coking is then conducted as usual. By this contrivance, coal, which was formerly unserviceuble in smelting operatlons, can now be used with effect.

The following table, by Dr. Ure, shows the quantity of water raised from $82^{\circ}$ to $212^{\circ}$ by one pound weight of the different combustibles enumerated in the first column; it also shows the number of pounds of bolling water, which the same weight of fuel will evaporate, end the quantity of atmospheric alr absolutely consumed dnring combustion. 'The quantity of alr, however, as given in the last column, is much less than wonld be necessary in practice, where much of the air passes the fuel without coming into contact with it so as to have its oxygen consumed. The heating power also, as represented ly this table, can seldom be practically attained.

As various kinds of fuel afford different amounts of heat, and as heat can not be measured or weighed, and its quantity ascertained by direct experiment, the relative vaiues of fuels are ascertained by comparing them with each other under similar cheumatances. The heating power of a fuel is the quantity of effect produced by it in a certain time, and thia in conjunction with its market price gives its value os a fuel. One fuel may produce a certain greater or less effect than another fuel, and thus its reiative superiority or inferiority may be accurately ascertained, although the actnal amount of heat furnished by it may be entirely unknown. Laveisier and Laplace flxed these values ly making the substance nnder examination aet on lee, and the quantity of lee melted gave the value in ench case. Count Rumford measured the value of fuel by the increased temperature which it produced in a given quartity of water. Now, as the same quantity of heat which melts one pound of lee at $0^{\circ}$ Cent. is sutficient to raise the temperature of as much water $79^{\circ}$ Cent., or 0.79 lb . of water $100^{\circ}$ Cent., so also all gqual weight of aqueous vapor of any given temperature and elasticity is always formed from the same amount of heat, and always contains the same quantity of heat, and the quantity of heat whieh water at $100^{\circ}$ Cent. renders latent in order to become steam is $5 \cdot 5$ times sufficient to heat the same weight of water from $0^{\circ}$ to $100^{\circ}$ Cent., hence the water converted into vapor by tho heat required to melt one pound of iee is the forth part of the same pound, that is, it can convert into vapor $0 \cdot 154 \mathrm{lth}$. of water.

It was found by Despretz and Welter that the quantities of fuel which require equal amonnts of oxygen for combustion, glve out equal quantitles of heat; thus, 1 lb . of oxyen in emmbining respectively with hydrogen, churcoal, alcohol, etc., raised 29 lis. of water from $32^{\circ}$ to $2 \mathrm{I}^{\circ}$. A given weight of the diffirent combustibles haa its heating power represented i,y the number of pounds of water raised in tamperature, as in the following table. (Sce Journal

More recent researchea have, however, cast considerable doubt upon the law that any given quantity of uxygen evolves the same quantity of heat with whatever combustible body it may combine. From a serles of tabulated results given in Gaflis's Humh-Book of Chemistry, vol. i., p. 292 (Cavendish Soeicty's translatlon), it woull ratiser appear that oxygen developa a larger quantity of heat the atronger ita affinity for the combuatible substance.

Such experimenta as the above tend to confirm the modern verz of combustion which regards oxygen as a combustiblo as much as the fuel with which it combines (see Cuemistisy, vol. v., En. Br); so that when oxygen burns by means of any fuel, the heat evolved Increasea with the quantity of oxygen consumed. It was on this view that Berthier based hls process for detecting the quantity of oxygen refuired for comhustion, and the heating power of the combustible in one experiment. Llis plan ls to heat to redness a known quantity of the combustible with a conslderalle excess of pure litharge until the combuatible is entirely consumed by the oxygen of the oxyd of lead. On welghing the lead reduced by this process the amount of oxygen consumed is ascertainel, and also the heating power of the fuel under examinstion. In calculations of this kind, It will be remembered that if parts, or 1 equivalent of carlon, require 16 parts, or 2 equivalents of oxygen, for combustion ; that 1 part of hydrogen requires 8 parts a oxygen; that by subtracting from the hydrogen an quantity corresponding to the exygen in the coal, the calculation can be made for the carion only. Now, 1 part of pure carion requirea for combustion 2 -6ff of oxygen, and is capable, according to Despretz, of heating $i 8 \cdot 15$ parts of water from freezing to boiling. By multiplying each part of lead ohtainel ly $2 \cdot 265$, the weight of water is obtained which is capable of being heated letween these temperatures ly a unit of the ceal used in reducing the litharge.
The heating power of a particular fuel is the same, however that fuel may lie burnt. It is true, that the power may be more or less economically applied; the power may he expended with greater or less rajidity, greater, for example, in a furnuce than in an open grate, but sa the fuel during combustion combines with equivalent portions of oxygen, the same amount of heat is liberated whether the combination be rapind or slow. The rapidity of combustion depend not only upon the mole of arranging the draught or supply of air to the fuel, bint alse on the state of division of the fuel itself. A given weight of woul in the state of shavings will, from the large extent of surfuce expoeed, burn repidly, und produce its full henting effect in a few minutea, while tho ame weight of wowl, in the form of a log, may keep up a monlerate temperature for some hours. The division of a fuel may, howover, be carried so far that the air necessary for its combustion can not penetrate it. Such is the case with naw-ilust, powilered charconl, or peat, slack coal, ete. If the powdered coal be of caking quality, it may be bunt into complact coke, and thas be more useful than a fuel which in tis tirst form is compact, Int which falls to powder on tieing heated in the furnace. Small fuel may sonetimes be milvantageonsly applied by covering the furuace-bara with pieces of
sand-stone or llme-stone for the purpose of preventing the fuel from falling through, and for dlatributing the aupply of air among it. in the roasting of copper ores in South Wales a flaming coal is necessary ln the raveriberatory furnace where the operation is carried on. Hut as the flsmeless anthracite '3 much more aluandant in thia district than the bituminous coal, it is turned to account: In an Ingenleus manner. When burnt under ordinary circumatances it crumblen to powder, as already noticed, and elther slips through the lars of the grate, or chokes thom up. But when anthracite is ralsed to a very high temperature it forms a vitreous scoria or clinker, which in the ordinary furnace combines with the iron of the bars and chokes up the grate. In the Welah furnaces, the clinkers thenselves are lageniously arranged so as to perform the office of grate-bars, namely, to support the fuel, and to limit tho supply of air from helow. The elinkers are supported on lron bars placed at a considerable distanco apart, and are arranged in a layer 12 or 16 inches in depth. Ahove this layer the fuel of the furnace is in full combustion ; this fuel consists of anthracite mixed with about one fourth of its weight of amall lituminous coal, and also forms a layer of a depth almut equal to that of the clinkers: it is in this the hottest part of the flre that freshi cliakers are being continually formed, and while forming they cako with the numorons fragroents of bituminous conl helped up above them. As fresh portions of the fuel come into operation the clinkers descend toward the bottom of the grate, where, mect. ing with the numerous jets of air which stream up through the botton, the vitrified mass splits and cracks in all divections, forming new channels for the ancent of the draught, but not large enough to allow the small coal to eseape. As tho calciner-man heaps up frewh fuel alou", he hooks out a few elinkers from the hottom to mak way for tho descent of others. Under this arrangencat the oxygen of the air traversing the multitude of channcls formed by the cracks in the clinkers, combines with a protion of the fuel and forms carlonic acid, which is unluflammahle, but before reaching the vault of the furnace it la deprivel of a portion of its oxygen, and becomes convertad into carbonic oxyd which is inflammalle. Hut in order that thin gas may undergo combustion, uir is admitted through ajerturen in the sides of the furnace just above the ore, and in this way the whole surface of the ore ocupying an area of nearly 23 feet square, is phayed upon by a thin shert of ilame, produced from fuel which gives scarcely my dame ut all.
Common coal gas is sometimes usel as fuel, in which cano it is calculated that 1 lb , or 24 culic feet thereof, in lurning, will raise if llas. of water froin the temperature of freezing to that of loiling. Extending this comparison to the other forms of fuel, it is stated that 1 Ib . of dry wood will similarly leat 35 lbs of water, but only " $26!6$. if the wood ve not dry, or contain moistare to the extent of from 20 to 25 per cent. One lh. of goxi dry charcoal will sithilarly heat allis. of water, but if exposed to the air it absurtis at least 10 per cent. of moisture, and in burning gives a lime of carbaretted hydrogen (or rather, probathy, a mixture of cartonie oxyd and hydrogen), arising from the decomposition of the moisture. One llo of gool pit coal is saill to ralse Go lbs. of water from freving to loiling, 1 ll , of coke 65 lbs , and 1 lb . of turf or peat from 25 to in lis.- I3. K. Sec Cosi.
fivels, artificial. - It is curioms to note how many new "patent artiticial fuels" there now are. As experimenters tell us that different kimbls of coal and other nutural fuel proseres diffirent qualities, in indurement is eflered for the exerciso of ingenuity in devising various imitative conpositions. The lyyitraulie press is brouglit into ningular requisition in this art. Thun, Azalay's hard shining hocks of artilicial fuel aro simply formed of conl-dust. subjected to in-

Williams's fuel la a mixture of dried peat and bitumen. So of numerous other kinds; amall coal, bitumen, or peat, or two out of the three, are mixed with various other substances to form a compost fuel. It must lie owned, however, that auch fuel is not yet much used, even in places where natural fuel is scarce.-Inventions in Arts.

Fuhohau, or Fou-tchow-foo. See Fou Cnow.
Fullers' Darth (Ger. Walkererde; Du. Johiarde; Fr. Terre a faulon; It. Terra da purgatori; Sp. Tierra de batın; Kus. Schiffernaia; Lat. Terra fullonum), a apecies of clay, of a greenish white, greenish gray, alive and oil green, and sometimes spotted color. It is usmally opaque, very aoft, and feels greasy. It is used by fullers to take grease out of cloth before they apply the soap. The best is found in Bucklughamshire and Surroy. When good, it has a greonish white, or greenish gray color, falls luto powiler in water, appears to meit on the tongue like butter, comsmanicates a milky bue to wator, and deposits very little sand when mixed with boiling water. The remarkable detersive property on woolen eloth depeuds on the alumina, which should be at lenst one fifth of the whole, but not much more than one fourth, lest it become too tenucious.-Tuosson's Chemistry; Jameson's Mineralogy.
Fulling, the art of cleansing, scouring, and pressing cloths, stuffs, and stoekings, to render them stronger, closer, and firmer. It is otherwise called milliny. Pliny (vii. 56) relutes that one Nicias, the son of llermias, was the first inventor of the urt of fulling; and it appears by an inseription, quoted by Sir G. Wheeler in his Travels through Greece, that this same Nleias was agovernor in Greece in the time of the liomans. The asperities upon the surfuce of wool render the spinning of it and the making it into cloth difficult operations. In onder to sjin wool, anml nfterward convert it into cloth, Its filtres must bo covered with a coating of oll, which, filling the cavities, renders the asperitiee less sensible; in tho same way that dil rubbed on the surface of a very tine tile renders it less rough. When the piece of cloth is tinlahed, it is carried to the fulling-nill, where it is beaten with heavy stampers in a trough full of water in which some fuller's earth has been nilixed, for the purpose of cleansing it from the oil. The elay combines with the oil, which it separates from the eloth, and both sre washed away together lyy tho fresh water which is brought to it by the machine. Dut the scouring of the eloth is not the only object in view in fulling it. The alternate pressura given ly the stampers to the piece of eloth ocensions (espeeinlly when the seouring is pretty far advanced), in effect analogous to that which is produced unon felt by the hands of the hatter. The fibers of wool which compose one of the threads, whether of the warp or the woof, essume a progressive movement, introlnce them telves among those of the threads nearest to them, then into those which follow; and thus, by degrees, wll tho threads, both of the warp and the woof, becoms felted together. The cloth, after having by thia means become short-
ened In all Ita dimenslons, partakes both of the nature of cloth and ot that of felt, and may be cut without being sulject to ravel. Lastly, the eloth has acquired a grenter degree of thickness, and forms a warmer elothing. Knit worsted also may thus be rendered less apit to run in case a atitch happen to drop.

The fulling of cloths and other stuffs is performed ly" a kind of water-mill, thence called a fuiling or sconring mill. These mills, excepting in what relates to the mill-stones and hopper, are much the aame with corn-mills; and there are even some which serve indifferently for both purposes. The prinelpal purts of the fulling-mill are the wheel, with its trundle, which gives motion to the tree or spiulle, whose teeth comimunleate it to the stampers, whlh are therehy raised and made to fall alternately, as its teeth eatch or quit a kind of lateh in the middle of each stamper. The stampers and troughs aro commonly of wood; but sometimes the stampers are mado of polished iron, and the eloth is expesed during the process to the action of steam; by which means the uppearance of tho cloth, when finished, is sadd to the greatly luproved. These improvements formed the sulject a patent in 1825. In the course of the operation the fuller sometimes makes use of urine, sametimes of fuller's earth, and sometimes of soul. To prepare the stufts to receive the first impressions of the atamper, they are usually laid in urine, then in fuller's eurth and water, and lastly in soap dissolved in hot water. Soup alone would do very well, lut it is expensive, and fuller's earth is acarcely inferior to it ; but then it must bo well eleared of all gritty particles, else it is upt to make holes in the stuff.

Method of fulling cloths and woolen stuffs with soap. -A colored cloth of about 45 ells is to he laid in the usual mannor in the trough of a fulling-mill, without tirst soaking it in wator, as is commonly practiced in many places. To full this trough of cloth, 15 pounds of soap are required, one half of which is to be inelted in two pails of river or spring water made as hot as the haml can well bear it. This sulution is to be poured by degrees upon the eloth, as it is laid in the trough; and thus it is to be fulled for at least two hours, after which it is to lie taken out and stretched. This done, the eloth is iminediately returned into the samo srough, without any new soap, and thero fullod two hours more. It is then taken out and well wrung, to express all the grease and dirt. After the second fulling, the remainder of the soap is dissolved as in the former, and cast four different times on the cloth, which is taken out every two hours to streteh it, and undo the plaits and wrinkles it has aecuired in the trough. When it is perceived to bo sutliciently fulled, it is well scoured in hot water. With regard to white eloths, these full more easily nad in less time thim colored ones, and thus require only a third part of the son].

Fulminating Compounds. - Fulminates are of several kinds, being detonating compounds of tho fulminic acid with various bases. Such are the fulminates of gold, mercury, silver, etc. The old fulminating jowder is a mixturo of nitre, sulphur, and potash. The fulminute of mereury is largely used us a priming to tho percussion-caps for gans. See Cuemistny, vi., p. 474.

It has safe anchorage for shijs, where they are protected from tho swell of the sea, and where the anchors holil fast, the bottom heing stitf clay. Iatio $22^{\prime} 18$., long. $88^{\circ} 10^{\prime}$.

Fulton, Robert, a distinguished American engineer und mechanician, nmong the tirst who successfully applied steam to the propulsion of vessels, was a native of the State of Pennsylvania. At a very early age he gave decided indientions of mechumical genius.

While still a mere youth he began life in the elty of Phllailelphia as a portralt and Inmilsenpe painter; and in his 22d year, with n view to Improving hlmself in art, he vialted Englind, where he remained for aeveral years under the roof of his countryman West. Ile states that $\ln 1793$ he had conceived the deslgn of propelling vessels liy ateam, but his numerous engagements prevented him from carrying it into effect it that time. Hia time was completely engrossed in devialng a plane of double incline that should supersede the locks on canals, for which be obtalned a patent from the Britlah government in 1704. In tho name year he ohtained patenth for finx-rpinning and rope-twisting machines, and varlons other mechanical Inventions, bearing chletly upon the construction of canals, on which latter subject he pubJlahed a treatise. In 1797 he removed to l'aris, nil remained for seven years in the house of Joel lharlow, the American ininiater at the court of Napoleon I., prosecnting his selentitic atudies. During that period he projected the first panoramn ever exhibited In Jaris, and made important experiments on anbmarine explesives. It was also at this time that he first ancccedel, ofter repeated trials, in propelling in boit through tho water by the ail of ${ }^{\prime}$ ateam. In 180f he returned to America, and repeated the experiment on $n$ larger acale and with more decided smecess. In 1809 he took out hin first patent, and acemed to be on the high way to wealth and prosperity, when his righta were dinputed, and he became Invelved in legal proceedings, which embittered the remainiler of him oxistence, and prevented him from renping the rioh barvent to which his industry and genins fulrly entitled him. Falton died Fehruary 2.1, 1815. A minnte nccount of his life and inventions is given in lils hiography by Culwalluler D. Colden. See Strab Naviostion.

Fulton has, perhaps, contributed more than any other man of the present century, to the progress of commerce throughont the worli, The impetus given by his genius to the adoption of atenm navigathon, has been equally extended (if not more so), to the increase of sailing vessels. At the preaent day the stock of mechanical and practical knowledige, handed down by tradition, or, preserved hy means of the press, has lecome so enor nena, that the most brilliant discovery in the useful arts beara bat a mmall proportion to the whole extelt of homan knowledge. In remote times, the aids, which modern inventors derive from the records of the reasonings, and combinations, anll even the abortive attenipts of others, were wholly wanting ; and if no one of the liventions of antiqulty, when taken by itself, can rank in apporent importance with some of molern date, the former were in many instances far more conspicuons as steps in the progress of human improvement. In the dawn of civilization, inventions were ususlly unexpected, an'l though oftun caiculated to supply thie most preselng waite, excited surprise, because the wants theinuelves had not been percelved. At the present day discoveries often appear as the slmost inevitihle result of previous improvement. The higheat degroe of merit ls to he awariled, in the present age, to those who, aware of the wants of the commanity, or of the world at large, set to themselves as a task the discovery of the means of sulplying these wants. If we consider Fulton as an inventor, it may le difficult to any in what exact particular his merits consint ; but if we contemplate him in the light of a civil engineer, confidently buidting a finished and solid structure upon the incomplete foubdation left by others, we must rank him, In the extent of his uspfuiness to mannind, as second to Whatt alone. See Life of ドultom, ly J. Rexwick.

Itobert Fulton was lorn at little liritain, in Lancaster county, l'ennsyivania, in the year 1765. IIls parents were respectable, though far from affuent; hls father a native of Ireland, his mother lescended from an Irish family. Fulton himself attached no laport-
ance to circumstances of blrth, and took prida in belng the maker of his own fortnue. Except so far as elementary education was concerned, he wan uader little ohllgation to hia progenitors; being left without patrimony at the death of hla father, when three years old. A ware that he was to truat to his own exertions, aven for meana of subaistence, he cultivated from an early age a tante for drawing, in the hope of qualifying hlmself for the profesaion of a painter. Frem a famillar acquaintonce with his performancea an an artint at a later date, when he applied to the easel merely aa a relaxatlon, it may he ntated that there is little doubt that had he devoted himself to the profession of painting, he must have become highly distinguished as in professor of that art. At the early age of 17 he went to Phlladelphin, for the purpore of prac. ticing as a painter of landscapes, and was so auccessful as not only to support hlmself, but to lay up sufficient funds to purchase a small farn in Washingtou county, l'ennsylvanin, and to ald hia widowed mother. II is patrons in Philadelphia were at first among the huinbler classes, hut afterward he formed ecquaintancen who were loth able to approciate hls promalse as an artist, and to facilitate his plans of Improving himrelf as a palnter. lly their nilvice the went to England, and through a faverable introduction to West, he was treated by that great artist with even more than his usual liberality, and became an Inmate of his house, and remainet his gisest and pupil for several years. After leaving the family of West, Fulton proceeded to Exeter, where he lived two years, during which titne his intelligence and shility gained hlm many useful aequaintances. Among there, the most important were the Duke of I Bridgewater and Earl Stanhope. It appesis to have been at the instance of the former that he alonndoned painting as a profeasion, and entered that of a civil engiueer. We find hims next residing in Hirminghsin, engaged in the construction of canals, though probably in a subordinste station. Fulton's residence in llirmingham brought him into communscation with Watt, who had just nucceeded in giving t) his steam-engine that perfect form which tits it for unlversal application as a prime mover. While in Hirmingham, Fulton lissued a number of patented inventions and seversl published works. In 1693 he took out a patent for the introduction of the inclined plane in inland navigation, and three yeats later emlexhied it, with other projecta of a similar nature, in a work on Inland Navigation. This work can be quoted as exhibiting a high dogree of originality, ingenuity, and talent, but as inupplicable to uny nseful purpose. To his instrument for destroying vessels of war, he gave the name of the Torpedo. It consisted of an oval copper case, charged with gunpowder. To this he proposel to attach a lock, regulated by clock-work, which, after uny required time, might cause the lock to spring and thus communicate tire to the charge. Hut Fulton met with so much opposition in hringing this into practice duriug the war with Great llritain, that the only proofs of its value we can cite, were the sleeplens nights and anxious days of many Uritish commanders, who felt that the vicmity of Fulton's operations was attended with danger which could only be prevented ly unremitting diligence and attention.

Ibefore proceeding to the more important suljects which attracted the attention of Fulton, we have to onent lon some other fruite of his ingenuity. In 1704 he took out putents for a mill for sawing marble; a method of spinning thax and making ropes; and of excavators for digging canala. The latter objert may still remain a desideratum in practical meelanies; the two former at least served as steps in the career of improvement, and have been guides ami landumrks to fubsequedt inventors. Fulton undertook the conatruction of a vessel which might meve either at or beneath the surfare of the water, anl made the passage over the estuary of the Linn with ease and sufety.

The art wil connected as t of nuvigation founded on $t$ engine, and ce hal recelved When the prop the public, ma Ainong others, Symington, wl and Clyde, in 1 were made by Stevens, of II which he engag the asenclate o Roosevelt ${ }_{1}$ to inventor of bl Thames tunnel. unsuecessful, ar of livingaton a came intimate $u$ with funds nece Introducing the experiment wert original Impresh wheel over any in the yerr 1803 in length aud 8 adapted, ants the tittle doubt of diately taken to scale in the Unl from England, fr varied from the sketches furnlahe spplicatlon mado an exclusive pris State by steain w dered from Watt gland, and directe was completed at the vessel was fir in August, 1807. made, and a fer most skepticn] nn ject was obtained. periment, a voyag This city is distan the river, nenrly stances the sloop. performel the pas time was four dit in 36 hours, and ing with the wishe ages until the en nor arrangements the fartlity of wo the machinery, we culties were remos until the boat sheu next winter of 180 rebuilding the ves: was given. The art with whlch Fulton's name is Inseparably connected as the principal agent In its creation, is that of navigation by ateam. Ilis spplication of ateam was founded on the propertion of Watt's double-acting engine, and could not be used untll that Inatrument had recelved the last finlahing-touch of the Inventor. When the propertles of this engine became known to the publle, many hastened to apply it to navigatlon. Among others, were Miller, of Dalswinton, alded by Symington, who prit a boat in motion on the Forth and Clyde, In 1801. In the Unlted States, experimenta were made by Fitch and Rumsey; and in 1791, John Stevens, of Hoboket, commenced hils researches, whleh he engaged In for nine years, when he became the asaoclate of Chancelor Livingston and Nlcholas Roosevelt ; to thls assoclation was added Hrunel, the inventor of block machinery, and engineer of the Thames tunnel. The efforts of thls association were unsuecessful, and were broken up by the appolntment of Livingston as embassador to France, where he becane intlmate with Fulton, and offered to provide him with funds necessary for an ixperiment, and to sid In introduelng the methol In the United States, If the experiment were successfnl. Fulton had confirmed hls original lmpression of the auperiority of the padillewheel over any other means of propulsion, and, late in the year 1803 , commenced bullding a vessel 66 feet in length anal 8 in breadth. To this an engine was adapted, anca the experiment so ratlsfactory, ns to leave little douht of final snceess. Mensures were lmmediately taken to construct a steamboat on $n$ larger scale in the United States, An engine was ordered from England, from Watt \& IBolton, In 1803; its form varied from thoir naual models in conformity to sketches furnlahed ly Fulton. At the aame tlme, an application made to the legislnture of New York for an exclusive privllege of navigating the waters of that State ly stean was granted. Ilefore the engine ordered from Whtt was completed, Fulton visited England, and directed the construction of it in person. It was completed at lant, and rearhed New York in 1806; the vessel was finlshed and fitted with her machinery in August, 1807. An experimental excursion was made, and a fow minutes served to convince the nost skeptleal and doubiful that the long-lesired object was obtained. Within $n$ few days of the first experiment, a voyage was undertaken in it to Alhany. This eity is diatant from New York, by the channel of the river, nearly $\mathbf{1 5 0}$ miles. In a few remarkable instances the sloops which navigated the llhison hat performed the passage in 16 hours; bit the average time was four days. Fulton's stemmbont went up in 30 hours, and returned in 30 . Fulton, complying with the wishes of the puhlie, made regular voyages until the end of the season. Many of the minor arrangements for the convenience of phasengers, the facility of working, and wafety from accident of the machinery, were yet wanting; some of the difficulties were removed at the time, noll others remuined until the boat should be laid aside for the winter. The aext winter of 1807-8 was occupled ir remoteling and rebailling the vessel, to which the namo of Clermont was given. Fulton provided sach accommolations for passengers, as, in regard to convenience nud splendor, had never been npproached In other vessels of transportation. This was almost improvident likerslity; for a debt was contractel which new demands never permitted him to discharge. The Clermont, thus converted linto a tioating pnlace, commenced her course of passages for the month of April. The tirat voyuge was a complete failum; the hoiler, provided by Watt, was nut suitable, und Fulton had been persuaded to replace it ly one planned ly livingsten, composed of wood and copper, which emitted steam from the joints soon after leaving New York, and gave way contpletely, on the return passage, near that city, nfter a vegage prolonged for 56 hours. But a few weeks
sufficed to bulld a new boller, and In June, the Cleomont was again under way. In the hour of departure from New York or Albany the utmost regularIty was observed, whlch required no little perseverance and resolution at firat; but the benefit of this punctuality was soon perceptlble, and the same syatem was copled by other steamboat lines. At the end of the second aummer the boat became far too small for the passengers, who crowded to avail themselves of this new mode of transport, and Fuiton begun a second boat, called The Car of Neptune.

The most formldsble opposition made to the privllege of Fulton, for the exelasive navigation of the waters of New York, wan founded upon the discoverien of Fitch, who had constructed a boat which traveled between Trenton and Phlladelphla. Fulton, assalled In his exclusive privileges, took, for further protection, a patent from the general government in 1809, and another $\ln 1811$. Grs, were made to Fiteh by tho State of New Jorsey, and as a compromise could not be agreed upon by the two contendlng partles, the controversy, which often Interrupted the commaniestlon by atcam between Philadelphla and New York, was not adjasted until the grant, made to Fulton by the State of New York, was declared unconstitutional. A form of ferry-bnats, was soon after Invented by Fulton, which, with the substltution of a single hull for the twin bont, has in its arrangement and distribution unilergone little or no change. The steamboate on the Hudson were increused in number, before Fulton's death, to five. A sixth was built, under his direction, for the Sound, which plied for sone time on the IIurlson. In the construetion of this boat he had, in his opinion, exhausted the power of ateam in unvigationhaving given it a speed of nine miles an hour.

When death arrested Fulton in his great career, he was engaged in constructing an improved form of submarine vessel, but as he had made no one a confidant in his plans. at bis death no person was found willing or ahle to ui lertake the completion of the vessel. By exposure in is visits to the Navy Yard, in Brooklyn, he took a se ere cold, which his constitution, enfeebled by constant labors and anxieties, conld not resist. He died on the 2-fth of February, 1815. Rarely has it happened that the untural death of any citizen exeited so general monrning as that of Fulton. Cut off in the very height of hie usefuluess, und in the zenith of his reputation, his countrymen felt it as a loss almost Irreparable. See Life of Fulton, by James Renvick, L.1.I. ; Anol. Mag., v. 394. x. 177 ; Sranks's $A m$. Riog., x. is; Quar. Nev., , .. 347 ; I.ittell's Mus., xxxiii. 340 ; Nıles's Reg., xiii. 51, xxxiii. 15; IIunt's Mer. Mag., xv. 4is. A suitalle monument to the memory of Fulton has not yet been erected either by the United States, by any ono State, or by any association. It yet remuins for his native State (lennsylvanin), or for the State which fostered his early efforts (New York), to place in some great thoroughfure, an uppropriate column in memory of one who has so largely contributed to the growth of commerce throughout the civilized world.

Fumigation is the employment of fumes or vapors to purify artieles of apparel, and goods or apartments supposed to be imbued with some infections or contagious poison or funes. The vapors of vinegar, the fumes of hurning sulphur, and explosion of gunpowder, have long been preseribod and practiced; but they have, in all probubility, littlo or no cftiency. The diffusion of sueh powerful agents ne chlorin gas, muriatic acid gas, or nitric acid vapor, should alone bo trusted to for the destruction of morbitc eflluvin.

Funds. To the Venctians is ascribed the orign of the funding system, in A. D, 1171. Public funds were raised by the Medici family, at Florence, in 13-10. The English funding aystem, or the method of raising the supplies for the public serviee in Fingland, by anticips. tion of the publice revenues (the origin of tho national
delet), was Introduced at the Revolution, 1680.-Montimer'a Broher. The funding eystem is coeval with the cominencement of the Bank of Eingland.-Andimas. The three per cent. annuities were crented in $172 d$. The three per cent. consols were ereated In 1731; the three per cent, reduced, 1746 ; three per cent, annuities, payable at the South Sea House, 1751 ; three and a half per cent. annulties created 1758 ; long annuitles, 1761 ; four jer cent. consols, 1762 ; five per cent. annulties, 1797 and 1802 ; five per cents. reduced to four, 1822. See National Debt.

The following table has been calculated in order to show in which of the publie fund money may be Invented so as to yleld the greateat interest. is givea the prices, differing by one per cent, from 50 to 83 for three per cente., ete., at which they all must ine to yield the aione Intereat; wo that supporing the three per cents. to be at 80 , a sum invested in them, or in the 34 jer centu., will yleld tha same interest, proviled the latter loe at 984 ; if the $3 f$ per cent. be below this sum, it will, of course, be more advantageous in so liar at leart an intereat ia concerned, to invent in them than in the three per cents, ; while, if they be abore 934 , it wlll the leas advantageous.

To get the trwe ralue of the different funds at any partieular period, in order to compare them aceurately together, it is necessary to dednct from ench the amount of interest accruing now it from the pryment of the last dividend.

The public debt of the C'nited States, which amounted, at the close of the last war with Iireat Britain, to . $158,713,049$, was entirely paid off in $18: 15$. This procceding, so honorable to the United States, naturally tended to raine the character of American securities in the English market, and emabled the government to contract the loans required to carry on the late war with Mexico on vey favorable terms. The
delot of the Union, exlating on the 20th November, 1851, amounted to $\$ 62,560,395$, and is at present ( 1850 ) about $45,000,000$.
Hut In addition to the debt of the U'nlon, must part of the States, and several, alao, of the principa citien, have contracted pecullar delta of a less or grenter amount. In moat casem these wesg lacurred to promote the execution of some publio undertaking, such as the zonstruction of cauala or ruilwaya, the excavation of doeks, the arection of buildinga, the extabilishment of banks or In*urnnce companies, and so forth. Some of the debts no contracted have been alvan. tageously lahd out; but a large portion horrowed in 1835 , and other periode of whld excltement, were contracted on very diladvantageous terme, and expended on projects some of which lave turned out extremely III. This, however, was the affalr of the States themselvea, and did not afford so much as the nhadow of an excuse for the conduct of those Statea which have declined to provide for the patyment of their delits. It was not, indeed, to be wondered at that in the divtrass Into which the Linion wan thrown try the crash of 18:17, and the depression following thereon, some of the States ahould have been compelled to suspend jayment of their debis; but a necessity of this sort could be temporary only. The indebted Staten are all rich, and eminently llourishing and prosperous communilles, and it might have been exjected that they wonlh have made every effort to reaume payment in full of their debts at the earliest porsible moment. Ilut this, weare sorry to say, has not been the case with some of them.
Fundy, Bay of, an inlet of tinc Atlantic, sets up letween Caje Sable, the mouth point of Nova Scotia, and Mount Desert Island, In Maine, a distance of 150 milea. From Fastport to St. John, N. II., is 60 miles. The bay la divbled, in its north-east part, into two branches, the north ralled Chignecto Bay, the head of which is 170 milea from Eastport. The moutheeast part is called the llawin of Mines, 150 miles from Vastport. Passamaquoddy Bay upens into it on the northwest, near its mouth. Gypsum is ohtnined on the llasin of Mines, and grindstones on Chigoecto llay. 'lhis bay is very jeculinr; its shores, on lusth wides, are rocky and alirupt, while near its head, the tide, presseml and cootined within diminished limits, rushes with much violence over extensive and wide-epremd mod Hats, and rises generally foo feet or mere. its fishries are valuable and extensive. (See Pemery's valuable report on its fisheries.) Thero are 16 light-housen on the coasts of the lay of Fundy, viz., eight on the New Hranswick side, and eight on the Nova Scotia side.

Furl, in navigation, to roll the wail up, and confine it closely to the yard: the wall leing gathered up by the men on the gard, the beech or edge is passed ahong the yard to the middle or bunt, where the lody of the sail, the fort and clews, are collected in this Way the mails of a mantof-war aro removed nearly ont of view iu an ahnont incredible short space of tinte.

Furlong, an linglish ineasure of length, containing the eightio fart of a mile.

Furs, in rommerce, the skins of different numals, covered, for the mont part, with thick, fine hair, the inuer side being converted, ly a pecular process, into a noit of leather. Furs, previonsly to thear undergo ing this procesn, are denominated jeltry.

Heaver fur, from its extensive use in the hat manufacture, is a very important commerciul article. That made use of in this country is almost entirely lironght from North America. It Is gradually becoming searcer and dearer, being now obtainable only in considenble quantities from the most northerly and inarcessible districte. The fur of the middle-aged er yotmy animul, called cuth-ieaver, is most esteemed. It is the finest, most glosoy, and takes the best dye. Fitch, or the fur of the titchet or polecat, is prindpally imported fron thermany; it is soft and warm, but the unleasant smell which alheres to It dejresses its value.

Marten and mink, a diminutive species of otter, are principally Imported from the United Stater and Canada. The fur of the musquash, or muskrat, a diminutive species of beaver, is imported in vast quantitiea from our pessespions in North America, whleh alao supply us with conalierable quantities of otter-akine. Nutra-skins are principally hrought from Buenos Ayres. The more valuable furs, as ormine, sable, etc., come principally from Ruamla.
fiur Trude.-Thete 19, perhapa, no branch of commerce that has drawn forth a more daring and adventurolla spirit, or given rise to a more patlent and couragcous endurance of personal dangera, privations, and hatiahipa, than the fur trade, as is manlfest throughout its whole history. liy ita means we have become accurately acqualinted with nearly three fourtha of the continent of Nerth America. The indefatigabie exertions of the fur merchant, stimulated by the prospeet of large gains from his hazardeus pursuits, have made known numerous tribes of men and natlons partially acquainted with the arta and retinements of civilized llfe, who otherwise might have remained many agea, or fotever, immersed in heathen darkness, and annk in barbarity. Ner are the general advantages derived from the fur trade confined to a more accurate geographical knowledge of a vast range of country, and the extenaion of the arta of peace and soclal happiness. The adventurous fur trader has often been the precursor of the goapel misslonary, and has enabled bim to pursie his intpertant labors with comparative security and succesa.

Whence Fiurs were Introduced.-The use of furs scems to have heen introduced into Furope by the nerthern invaders of the Roman empire. In the alxth century the skins of sables were brought to liome from the ahores of the Aretic Ocean through the interveation of numerous parties, so that the cost to the consumer was very high. During нeveral centurien after that time, furs were not at all common in western Europe. In 1252, A.d., Marce l'olo mentions, as a subject of curiosity, that he found the tents of the khan of Tartary lined with the skins of anhles and ennines, which had been brought from countries far aorth, "from the land of darkness." In less than a century, however, from that time, the wearing of furs us a part of fashionable dress, had hecome rather prevalent in England, aince, In 1337, lidward 11I. commanded that all pernons among his sulijects should be prohibited the use of furs unless they could spend $\boldsymbol{£ 1 0 0}$ per annum.
Arctic Regions.-Farly in the 17th century the sheres of the Arctic seas were found tenanted by furred animals of great value; and the ilen of forming a settlement was suggested by Grosellez, a Frenchman. The suggestion was made first to his own government, but as it was coolly received, he olitainel, through the faglish embassader, an interview with l'rince Lapert, iefore whom he latd his plans. The prinee warmly entered into the project, and assisted lin fitting out a vessel, which reached, in September, 166 , the river then called Nemisco, to which the miventurers gave the name lupert, in honer of the princo. After winterimg there, with less difficulty and suffering than they hal anticipated, they returned, nod gave so favorable a report that lriuce liupert, the Duke of Albemarle, the Earl of Craven, lord Ashley, ame others, fonued themselves Into a Company, and subserihed fl0, 000 for the purpose of commencing a traflic in furs. A charter of incerporation was granted by Chatles 11. in 1670, giving to the lludson's lhay Company full possession of ${ }^{6}$ all the lands and territories upon the conntries, const, a.sl contines of the seas, base, lakes, rivers, creeks, and sounds, in whatsoever 'atitude they slall be, that lie within the entrance of the straits, commonly called Mudson's Straits, that sre not alrealy actually pessessed by or granted to say of our sulijecte, or possessed by the subjects of
any other Chriatian prince or atate." And the charter proceeds to grant further, that "the whole and entire trade and traffic to $p$ from all havens, hays, crisks, rivers, laken, anil an.5 into which they shall find en* trance by water or land out of the territorien, Ilmite, or places aforesalil ; and to and with all the natived and people inhabiting, or which shall inhabit within the territories, limits, and placen aforesnid ; and te and with all other natlona inhabiting any of the coasts adjacent to the sall territorlen, limita, and paces which are net alroady possessed as aforesald, or whereof the sole liberty or privilege of trade and traffic is not granted to any other of our suljects." On Kupert's River the Cempany immediately formed a nottlement; and in 1674 stations were settled on Moose River, and a few yeara later on the Albany, and soon after two more on the Nelson and the Severn.

F'rench Settlements and Seizures.--By these vigerous measurea the French court was awakened to a sense of It neglect, and Grossellez, already detached from the Einglish aervice, was sent out, In the year 1682, to found a factery on the River IIayes, which he accempllshed, and aiso surprised the Britlah factory on the Nelson. After this time hostilitles became frequent between the French and the Inglish eettlers; yet notwithstanding immense losses anstained ly the Company from 1682 to 1688 (amounting to $£ 118,014$ ), they were alle, in 1684, to pay to the sharehelders a dividend of 50 per. cent. Again, in 1688 , an equal dividend was made, and in 1689, one of 25 per cent. In 1690, without any call being made, the stock was trebled, while at the same time a dividend of 25 per cent. was paid on the increased or sawly-created stock. Hy other cuptures of their fuctories by the French in the years $1692,1694,1696$, and 1697 , the Company ouffered further loss to the amount of $\$ 97,500$. At the peace of Utrecht, in 1713, however, these captured factories wero restored to the Conipany; who, by 1720 , hal sgain trebled their capital, with a call of only 10 per cent. on the shareholdera. Now they strengthened the old forts and formed aeveral new ones in the interior; but in 17.19 a question arose in Parliament concerning the rights of the Company, which was deciled in their favor. Again, in 1i82, several of thelr factories were tuken by the French under La Perouse; still their traffic seems to have continued very lucrative until the invasion of their righte and territories by a strong rival assochation, designated the Nerthwest Company, whose fieree competition caused much animosity and bloodshed. This was not only very dentructive to the fur trade, but most injurious to the Indians.

Management.-The North-west Company consisted of 23 partners, comprising some of the most wealthy and enterprining settlers in Cauadn, and employed about 2,000 persons as clerks, interpreters, guides, and boatmen (voyageurs), whe were atationed over the vant regions of Canada ceded lu $\mathbf{1 7 6 3}$ by the French to the English. Shureholders who engaged actively in the trado were called agents, some of whom resided at the different prots established by the Company in the Indian territory, and others at Quebec and Montreal, cach attending to the affairs of the Company in his appointed district. Theso active partners met annually at Fort William, one of their stations on lake Superior, where they discussed mitters connected with the nffuirs of the association, and arranged future plans. The clerks of the North-west Company were mostly young Scotchmen, of rexpectable families, who were willing to underge the hardships attendant upon a residence of seme years in these inlospitable regions, in order that they might thus seeure tie alvantage of succeeding in turn to a share of the protits of the undertaking, the custom being to take from mong the clerks as partners those whe had acquired the $x$ perience necessary for the management of the business. The liunters of this Company crossed the lhocky

Mountaina about the year 1805, and eatablished atatlons on the northern hend-watere of the Columbla. In 1813 they purehased Astoria on this rlver, which was relinquished by Mr. Astor, ${ }^{*}$ of New York, and his partners, in conseçuence of the war between the United States and Great l3ritain. At length the Hudson's 13ny Company, belng roused by the activity of the North-west Association, exercised for the first thme its ehartered right to colonize, and sold, in 1812, a tract of Innd on Iake Winnipeg and the Red River, to Lord Selkirk, who Introduced a considerable number of persons from Sootland. The consequence was an open war between the partizans of the rival Companies. After a war of two years, the Red River settlement was destroyed by the masacre of the governor, Mr. Semble, and many of his assoclates, while the survivors were Iriven nway. Jut this melancholy and barbarous state of mattere was pat an end to by the union of the rival Comprnies in 1821 , since which the trade has been peacefully and auccessfully prosecuted. When the partnership of the North-west Company was ahont to expire in 1821, the three london reprementatives of the firm offered to merge their interests In those of the IIulson'a Bny Company. This was agreed to, and an act of Parliament was passed (let and 2d (ieo. IV., enp. 66), under which the crown grants to the liudson'a Hay Company and to the three representative partners of the North-west Company in Inndon and Montrend a license of exclusive trade for 21 yeurs in the "Indlan territories;" that is, over all those tructs that might not he included in the charter given hy Charles II., and ilso over those tracts whleh by mituil consent were open to the anhijects of Entgland and to those of the United States. The three North-went Compmay egents merged into the Jludson's liay Compnny; the exclusive truting license whs surrendered i ; ishs ; and, nfter careful investigation on the part of the government, the enown granted on the 30th of Mas, 1:36, another license for 21 yeare of excluaive trade over the Indian and neutral territories.
The affalrs of the IIndson's Bay Company are at present conducted by a governor, deputy-governor, and a committee of seven, elected by 249 proprietorm, representing a rapital of $\mathbf{E 4 0 0}, 000$. Of the $2: 19$ proprietors, 65 have more than two voten. $\mathbf{£ 9 0 0}$ of ntock must be held for six months hy each voter previous to voting, except such atock be acquired iny lequest or marriage, and each nember of the conmittee must hold not less than $£ 1,800$ stock. The mode of election, oaths to he administered, government, ete., are presiribed hy the charter of Charles II. alrendy i ferred to. AcconiIngly, the Company las estahlished at the Ited Hver settlement a governor, council, reconder, sheriff, coroner, ete., for the projer government of the affilis of the Assiniboin, or Jied Kiver Territory, and for the carefol and legal administrution of juatice thronghout Rupert's land. Though not enjoined hy the charter of 1bion, trial by jury was introbluced hiy sir George Simpson usuler the direstion of the Iludqon's Biay ailthorities in Fingland. l'rine is comparatively rare in Rupert'e Land; and juxtice is andininistered under the

Traffic.-The traftic of the (ompminy in furs and peltry" la regulated by a Ibed IPoll, dated March 2 ith 18:1, when the North-west ('ompany and it united; and by another Deed 1'oll, dated June bith, 18:H, "for accertaining the rlylts and prescribing the dutien of the chief factors and the clidef trulera, and for canducting the trale." The bushens of the company is superlitended hy the 23 chief factors nt the respective atathons: nnd under them the 28 cblef tradern carry on the traffie with the indlans. The clerks aerve under both the fartora and the traters; and the very himi-

* A most Intereating nccount of the North-west Far Com. pany fogiven by Wiahington Irviog In lila Aefonia.
bleat clerk, by good conduct, may rise to the chlef positions in the eervice of the Company. The sularies of the elerks range from $\mathbf{C 2 0}$ to $\mathbf{C 1 0 0}$ per annum. Three chief fuctors and two chief tradera are allowed to leave the country annually for one year.

Free Trade in F'urs.-The Iudson'e Bay Compsny have no monopoly, as some suppose, of the Importation of furs into England; they liave to compete with the furs of the Unlted States, of Russia, of Norway, ete.; and if othor traders can undersell the Company the public have, of course, the benefit. Beaver and other skins are now much lower In price than formerly, when so much used in the manufacture of hata; and the gradual reduction in price of forelgn furs has boen chlefty brought about by the stearly supply from Jludson's Ibay territories. Hence London is the most oxtensive for market in the world. The fall in the prices of all furs has beell very great; but as heaver constitutes the largest item in value, the reduction of profit to the Company will be seen by comparison with the prices and amount of sales. In 1839 a beaver skin was worth 27 a . fil. ; in 1846, 8s. [4l. The number of skins sold in 1839 was 55,486 for $\mathcal{E 7 6}, 712$; those aodd in $1846 \cdot 15,389$ for $£ 7856$. There is almo great varlety In the prices of articles of shuilar denomination; but the Company are olliged to pay the same price to the Indians for all sklus according to tariff; whether the skins are grood or bad, the Company must buy thens. Hence the profits of the ehareholders are not to be estimated by the difference in price betwoen the cost of a skin at ono of the Company's forts in the interior, and its anle jirice in london. The annual divilend is (18:5) alrout 6 per cent.

The lludson's Ihy Company have now about 140 estahlishments, hesides hunting expeditious and shipping, employing 25 chief fuctors, 28 chief traders, 152 clerks, 1240 regular servunts, hevidas employing in occasional labor, the services of a large number of the nativen; a steam vessel and five sailing vessels of from 100 to 800 tons, all armed. Their forts or stockaded positions extend from the coast of labrador to the Pueitic, and from the northern boundaries of Csaada to the chores of the Arctic Ocean. At every large trading establishment there is an "Indlan Jospital," from which the natives derive the greatest bentit; and neveral inedienl men are maintuined by the Company at different forts. Ministers of the pospel of every demomination nre encouraged and protected by the Company, and a bishop of the Church of Fingland now presides over the diocese of llupert's Land.

Thn fur trule is prosecuted in the north-westem territories of the United States by an association called the Nurth Americun Fur Company, of which the chief manapers revile nt New Xork. Its principul atation la Michilimackinac, to which are linnught nll the peltrles cullected at the other ports of the Nississippl, Mianouri, and Yellowstone Kivers, and bll over the vast range of country extenuling thence to the llocky Mountains. This tompany in matmirably organized and munaged: it employs steaminats for uscending the rivarn, which nlso penetrate with case to regions whil'h conld furmerly be explored only through the most painful chlorts in barges and keel-boats, of by anall jartles our fout or on horneback. A great many pucksges a? furx are now brought from that nection of the comitry, mid from what is called the lied liver of the morth, by way of St. l'nul in Minnesuta, and thene hy way of river to St . louin nad other cities. It has bren proposed to build a ruilroal from St. I'anł up the valley of the Saint Crole to the valley of the lied Rlver; nind for this parpose large gisats of land have been set amde muflciont to build this railroud. A road once bulit to this region worla make a wonderful and complete revolution in the fur trade.

Fiur Skins Importecl.-Ahout $5,000,000$ skinn of aninals mplicable as furs, are nunually improted into

F'ur-אkianed Animals.-The northern and aretic regigns abound with races of animals, which are thickly cevered with fine hair or fur, und whose akins ure very beautifui and valuable as articles of clothing. The animula that are captured for their fur, aro:-The Raswian Sable, Mrutela zibellina. Thia rieh and beattiful skin has long been eateemed one of the most valasbie and useful furs that have been brought to our coantry. About 25,000 are annually collected in the Russinn territeries, of which only a small number is imported Into England. The fur is brown, with some gray spots on the head. Tho darker varleties ure the most lighly valued, a single akin being frequently sold for 5 t, though the avernge value does not exceed $£ 2$ or £ii. Nnturallatis are not; agreed whether to consider the animal from which the skin is procured ss a distinct species. Some nre of opinlon that the Russian Sable, the Stone and Plne Martens, as well as the Iludsnn's Bay Sable, aro but one apecics, on which the differences of food and cllmate have produced some alight variations in form and color. To the furrier, hewever, the Ruasian Sable in carily distinguishabiln, from the length and fullness, as well an the darker color of the for. The une of this choice variety is necessarily limited to the wealthy, on account of Its acarcity. In the relgn of lienry Vill., by a law which sought to regulate the expeuses of the different classes, and to distinguish them liy peenliarity of costume, the use of the Suble was confined to the nobility shove the rank of viacomnt.

Marten.-The Hulson'a ilay Sable (MmatrluC'mailen-ais).-The ashle akins next in mpute to the liusshun are these imported by the Ifudson's lay Company, of which ne less than $\mathbf{1 2 0 , 0 0 0}$ are annually brought into Great flitain. An the natural color of the skins is much ilgiter than the provailhig taste, it is the practice to dye many of them a darker molor, and the firs thus treated are suruely inferior to the matural sable. The thum, or P'ine Marten (Mustrla abirtum).-The Sables innported undor this name aro the produce of liuropee. The mimul is fonnd in extensive forests remote from the habitatlons of man, nud preying on hirets and unalier nulumls. They arn distingulshed from tho Stone Marten lyy the yellow color of the thront ; other parts of the skin are brown. When dyed, thoy have a similar nppearance to the loent rable. The Stome Marten (Mustele ackorum).-Thila Marten is generally found in mountainous aml atoury places, though a froquent visltor to furm-yarls and homesteads. It is generaliy diantrlhuted through most Europenn countries. The under fur is a blulah-white, with the top
hairs a dark brown. The throat of this variety is usually of a pure white, by which character it ia generallv distinguiohed. The French manufacturers excel In dyoing thia fur, from whlch circumatance it is frequently called French Suble. It is also dyed in thla country, the excellent qualities of the akin adapting it to a great variety of purposea to which furs aro applied. The Fisher,-There are about 11,000 of these skins annually brought to this country from North Anserica; they are larger than the sables, and the fur is longer and fulier. The tail is long, round, and full, gradually tapering to a point, and quite black; a few years eince it formed the common ornament to a national eap worn by the Jew merehants of Poland, and at thit time was worth from 6s. to 0a., but its present value does not exceed Gul, to Orl.
Minc.-The Minx (Mustela rison).-Thero were 245,000 aklus of thia littie snlmal brought to thia :ountry in 1850 from the possessions of lludson's Hay Company and North America. The fur resembles the sable in color, but is considerably shorter and more glosay. It is a very durable and useful fur, und is exported in large quantities to the Continent. The Brmine (Alustela erminea).-'lhia snimal is aimilar in form and habit to the common weasel of this country; but in Sileria, Russia, and Norway, from whence the akins are imported, the little animul, during winter, becomes as white as the snowy regions it inlubits, and is esteemed as the whitest fur known, though its summer dress is a dingy brown. The tail of the skin, of which the lower half is jet black, is genernlly introduced as an oruament to the purely white fur. It is worn oll state occaslons, and in the relgn of Edward III. its use was restricted to the royal family. The Fitch or Iolecnt (Mustelu putorius).-These akina are produced throughout Europe, and in . phace of botter quality than in Great Itritain. The ground of the fur is a rich yeliow, while the top luir is a jet hack. Thie fur is at present very little used in Great llritain, but ia much worn in America. It is very durable, but the natural smell of the fur, which ls rather unpleasunt, is difficult to counteract. The North Americau Skunk (Mephitis Ansericana).-The skins known under thls nume are imported by the Hudson's Bay Company. The animal from which they aro taken is allied to the polecat of Jurope, and, from the fetor it emits when attacked, whleh has been known to affect persens with siekness at 100 yards' distance, ban recelved the goubriquet of "l'Enfan tu Disble." It has a aoft black fur, with two white strijes running from the head to the tail, which is ahort and bushy. The skins, though imported into Engiand in small numhers, ure usualiy re-exported to the continent of Europe. The Kolinkaki (A/ustele Siberica),-The Kolinkski or Thartur salite is of $n$ brighit yediow color, and is sometimes nsed for ladies' dress in its metural state, but it is more frequently dyed brown to imitnte other ablble, to which it bears a stroug rosemblance. It is remurkable for the uniformity of its color, having no spot or diflerence of shade In any purt of the berly. The tail, which is of the same color, is exclusively used for the heat artista' pencils.

Mushrat-Tha Musquash or Muskrat (riber ziboth-icus).--'ine mimal known under this name is found in great numbers in Norti America, freguenting swamps mul rivers, mul, fike the heaver, building its babitntions of muil with great ingenuity. Dr. Rlehardson staten, that it has three litters of young in the course of the summer, promucing from three to seven at a littor. The muinai has a peevilar smell, similar to that of musk; lut it must not be mistaken for the mimal from which the musk of commeree is prowned, which is a nutlve of '?hilet. About $1,060,000$ skius ure brought lnto lingiand sunuaily ; tha fur resembles that of the beaver, and is used liy hat manufneturers. The akliss are ulmo dyed by the furrier, and manufactured lito many cheaj; and ueful urticles.

Nutria.-The Nutria, or Coypou (Myopotamus coy-pus).-This rodent quadruped is an expert swimmer, and frequents the neighborhood of water, where it lives In burrows; it is amaller than the boaver, and considerably larger than the musquash, but has a resemblance to both these animals in Ita natural habita, and in the qualities of lts fur. Untll lately thla fur was very much used by hat manufacturers, and as many as 600,000 skins have been anuually imported from Iluenos Ayres and Chili, in which countries the animal abounds. Owing to the wars that continue to be carried on between the different States of Buenos Ayres, and the consequent withlrawal of tho trappere from thoir accustomed ocenpations, the importations have fallen to 3000 akins, which are dressed and dyed as a mubstltute for the coatly fur seal. The Hamster (Cricetus rulgaris).-About 100,000 of the skins of the hamster are annunlly collected in central Germany, where the animal abounds; it has a poor, short, niul coarse fur, and is almost exclusively used for cloak lisIngs by the Greeks; the color of the back la a redilisht brown, the belly black, with a few light spots The animal is nbout nine inchea in length, and lives under ground, forming severs] apartments for storing grain sepanta frem its own hybernaculum. It is so induatrious and provident, that when the peasants go " hamster nesting" in the winter, they possess themselves not only of the skin, l, ut of tho valunble atore of good grain, which is sald frequently to exceed two bushels. Tho l'erwitzky.-The skin of thls animal is leautifully marked like tortolse-shell, and is brought from the south-enstern territories of Asiatic Russin ; the fur is short, gixing little warmth, and is chietly made into cloak lininga nnil used by the Rusaians, Tho lleaver (Castor itmericanus).-- Heaver akins are imported liy the IJudson's Ibay Company In less quantlties than formerly; the use of the fur in our hat manufactories has greatly dimlnished sinee tho introduction of silk hats, and a conslderable depreelation has takion place in their value. This leautiful fur la sometimes used fur articles of dress. In order to prepare the skin for this ajpropriation the coarse hairs are removed, and the surface la very evenly cut by an ingenious machine, sonewnat similar to that used in ilressing eloth. The fur thus prepared has a beautiful apparance, not unliko the costly South Sen otter, and has the anvantage of lightness, with durability nul cheapness. The white wool from the under part of the beaver still olitains a high prive, and is lnrgely exported to France, where it is manufactured into lidies' bonnets. There is ne doultt that the beaver was formerly an libhbitant of the Iritish Islen, and Pennant remarks that two or three waters in the princlpality of Walea atill bear the name of Llyn yr afange, or the Beavars' Lake.

Otter.-The inter (I.utra evigaris, Intra f'analensis). -The large supply of otter skins used by the lussians and Chinewe is ilerised primeipally from North America, The quality of the fur is. in most respects, similar to the otter of the ltritish lales, of which there are about 500 whins collected annually. This nommal has frequently been tamed, and from its extreme apility in the water, has been rendered serviceable in eatching fish for the use of its owner. The Americun otter is much larger in size than the European, being about five fect from the nowe to the tip of the tall; a monaller variety niounds in the bast luthes, the fur of which is very short. 'The Sea otter ( Andhydro morina). The sen otter hav a very thick, moft, woolly fur, and is mont highly frizel ly the lusmians anil Chinese, to Whom most of the okins ara exported. In its hatilts it is allied to the seal, but has nover been met with in large numbers, It is fombl in the North laritie, from Kamscharka to the Yellow Sea on the Ariatle coasta, and from Alanka to California on the American coant, The annual produrtion is ahout 1000 skins, of which 100 are impurted Into Great Iritain by the Iludnon's Ihay Company.

Seal (Phoca).-There are nnmerous variaties of these animals, some of which are found on the western coasta of Scotland, Ireland, and Wsles. They frequent, In immense numbers, the consts of Nowfountland, Greenland, and Labredor, and the Importations into this country frequently exceed 500,000 in one season. Tho young seals of some speclea lncrease in alze with great rapldity, and It is asserted by the seal fishers that they double thelr bulk in elght days. The greater portion are tanned and enameled with black varnish for ladles' shoes; other descriptions aro well alapted for fur, ospecially the seal of the South Seas and the north-west coast of America, Before they can be nied ns a fur, it is necessary to remove the very coare hairs whlch cover a beautifnlly fine nud silky fur. The roots of these hairs are deeply seated in the substance of the thick pelt, while the fur is stronkly attached to the upper surface of the skin. Ify shaving the pelt to half lts natural substance the roots of the coarse hairs are cut through, anil they easily fall out ; but tho sams effect is produced by a nutural process of formentation, which ensues when the skina are properly prepared and allowed to remain together. The soft curly fur of the seal is now rarclyused in its natural state, hut is dyed a deep Vaidyke brown, and has the apparance of tho richest velvet.

The Fox.-Of foxes' akins brought into Finghand there are many varieties; the bhack and silver foxes (liulpes fuleus, var, argentatna) from tho arctic regions are the most valualile. Many of the skias when highly dressed nre worth from 10 to 10 gulneas. They are purchasel for the Ruseian market, being highly prized in that country. The cross und real foxes (inipes, fiulrus) are used by the Russians, Turks, and Greeks for cloak-linings and collars. The blue and white foxes aro uned In this and other countries for ladies' dresses. The white foxes (Vipes Ligopus) are reprosentes ly arctic voyagers an exceetingly numerous, and migreting in troope over the frozen seas at the approach of the rigorous season. They are easily caught, fifteen having been taken from one trap in four hours. The Wolverine (finlo luacws). $\rightarrow$ This animal, which is only met with in North Atnerien, Norway, and Swedon, is now generally considered by zoologists as identical with the glatton of old writers. It is extrensely mischlevous to the fur trader, and will follow the marten-hunter's path rouml a line of traps extending 10 or 50 n illen, morely to come at the bait. The fur is generally dark nut-irown, paswing, in the depth of winter, alnost linto black, and is clietly used in (ierinany and other northern countries for cloaklintur.

The Bear (Ursms).-There nro several descriptions of bear-nkins used by the furrier. Tho skin of the black lear of North America (l'vans Americmane) is used in thls country for milltary purposes, for rugs, and carriuge hummeriloths. In fussia it is frequently manufactured for sleigh coverings, and the skin of the cal, hear is highly valued for trimmings and coatlinings. 'I hat of the grizzly liear (Drbua firar) is applieal to similar uses. That of tho white jular bear, of which the supply is very limited, is frequently mate hato ruge, bririlered with the black and griazly bear akins. The fur of the brown or Isabotha bear ( Lrsus lsebollinus) has frequently been very fivhionahe in this country, when its value has been tenfull the present price. It in will consilerably used for various artlelos of ladies' druss.

The Ihare.-The wool ur under fur of the Eurenean gray hare (Ifpus timidus) is extensivoly usel for masufacturing felt hate, both in liurne and Amerina. I few of these are iressed for the purpuse of being worn us a protection to the chest. Tho white hare of Ras. shanil the polar regious (Ifpus glurialis) was furmerly much worn in its pure white atate as a lining for ladien' cloaks, and ua a nubatitute for the white foz,
but the skin purpose has frequently dy very durahle.
The Rabbit both in its plentiful onp dyed in imita fito a great $\boldsymbol{v}$ middle classes tured intor pe by far the gre hatters' purpos originally a bre attention was formed in vario variety are con where they are paratively high besutiful in the skin is ao fragi alight wesr, the drees. The Cat.--In IIoll bred for its fur: it I until the fur nrrives
aumbers are also col
but the skin being exceedingly tender, its use for this purpose has heen discontinued. The white have is also frequeatly dyed $\overline{\text {. it looks exceedingly rich, but is not }}$ very durable.

The Rabbit (Lepus cunioulus).-The English rabbit, both in ita wild and domeatio atate, affords a very plentlful onpply of usefal fur. When dressed and dyed in imitation of other skins, it is manufactared into a great variety of cheap and useful articlea for the middle classes. The wool has recently been manufactured into a pecnliar cloth adapted if r ladies' use, but hy far the greater number of skins sre still used for hatters' purposes. The English sllver-gray rabblt was originally a breed pecular to Lincolnshire, where great attention was paid to $\mathrm{ft}_{!}$but warrens have since been formed in various parts of the country. Skins of this variety are continually exported to China and Russia, where they are much esteemed and command a comparatively high price. The Hudaon'a Bay rabbit is beautiful in the length and texture of its fur, but the skin is so fragile, and the fur so liable to fall off with slight wear, that it has little value as an article of dress. The white Pollsh rabbit is a breed peculiar to that country; its skin is often made into linings for ladles' cloaka, and baing the cheapest and most useful fur fer that purpose, the animal is exported in great numbers. The Squirrel (Sciurus vulgaris).-Thls attractive little animal abounds in mest countries, especially in Slleeria and the nerth of Europe. It is from the Russian dominiona that we derive our principal supply of the skins of this agile creature, which exceeds in number that of any of the fur-producing animals. It is said that $15,000,000$ are evory year captured in Russia, our supply from thence exceeding $3,000,000$ annually. The fur of the squirrel, of which there are several varieties, is light, warm, and durable; some of the lighter colors are dyed in imitation of sable. The color of the Siberian aquirrala varies from a pearl-gray to a dark blue-gray; the under parts, which are white, are frequently eut out and made into cionk-linings, remarkabie for their llghtness; the tails are manufactured Into boas for forsign markets; they are also extensively used in the manufseture of artists' penciis.

The Chinchilla (Chinchilla lanigera).--There are two difef varieties of chinchllia, the produce of South America: those from Lima are short in the fur, and inferlor in quality to those from Buenos Ayres and Arica; the coler is a silvery gray, Arica producing the darkest and best-colured skins. The general appearance of the animal places it between the squirrel and the rubbit: is its nutaral abodes it has the egility of the former, and resembles the rabbit in living in holes and burrows. The extreme softness and delleaey of the fur sdapt it eniy for ludies' use. Thongh much admired and frequently wern in this country, it is mere extensively consumed in Frunce, Germany, and Russia.

The Racoon (Irocyon lotor).-The racoon is an inhabitant of North America: the shins are imported into this country in Immense numbers; but merting with no demand for our heme trude, are exported by merchants who parchase them it the periodical sales. They are used throughont (iermuny and Russia for lining shabes and coats, and, being of a durable mature and moderate in price, are exteemed among the most usefui furs. The Common lladger (Heles rulgaris); American Badger (Meles Jabrudoria).-The skin of the Emropean badger, from the wiry mature of its hair, is tenerally used for the manufacturo of nuperior klods of shaving brushes; bat the skins expurted from North America luve a soft, fine fur, which remders them suitable for many purposes for whleh tho larger furs are used.

The Cat.--In Molland, the cat (Felis domesticus) is bred for its fur: it is fed on thah, and curefuliy tended until the fur arrives at lts grentest parfoction; large aumbers are also coliected In Eagland and many other
conntrias. The wild cat (Felis catus) is much larger and longer in its fur, and is met with in extensive foreate, particularly in Hungary ; the coler is brownishgray, mottled, aad epotted with black. The softness and durability of the fur render it very suitable for cloak-linings, and it is also made into wrappers for open carriages and railway traveling. The Canads Iynx (Felis Canadensis); Lynx Cat (Felis rufa).The fur of the lynx is long, soft, of a grayish color, and sometlmes, as in the Norway lynx, cevered with brown epote ; the belly is white, silky, and not unfrequently apotted with black. The change of fashion has for some time discarded it from this ceuntry; but it is dyed, prepared, and exported in considerable quantities for the Amarican market, where it is much valued and admired. It is generally used for cloaks, llnings, and facings, for which parposes it is very appropriate, being oxceedingly soft and light.

Preservation of Furs.-Tha fur of most animals is in its greatest perfection at the approach of winter, and before the animal has attained its greatest age. It is the ebjact of the furrier, by dyeing the inferior akins, to imitate the more perfect specimens. Some difficulty has attended this process, as the nature of the akin will admit of dyes being used only in a cold state ; but the method which has been practiced in Paris and London has been so far successful that the permanence of the color in the dyed sable is frequently found of equal durability to that of skius of the nutural color. Considerable excellence has been attained also in dyeIng rabbit and inferior furs of those colors which are more suitable to the prevailing taste.

The firet process of the fur-dresser is to prepare the skins from the raw state, and render them fit for ornamental dress. In this country, the usual pructics is to trample them in closed tubs with a littla salt butter, turning them over and over for several bours. By this means the skins are made into suft and plintle leather. The next process is to rub them on the flesh side over a blunt iron in order to remova loose piecea of integuments, and to reduce the substance, after which it is necessary to eleanse the for and skin completely from the grease. For this purpose it is again trampled with saw-dust-usually thut from mahogany, which bolng beaten out and repeated soveral times, conduces to render the fur glossy and clean, and to fit it for the cutter to fashion into any shape that may be necessary.

Furs are subject to injury by several species of moths, whose instincts lead them to deposit thair eggs at the roots of the fine hairs of animals. Linneus mentions five speeles that prey upon eloth and furs, of which Tin' p pellionella, T. testionella, and T. topetzella are the nost destructive. No sooner is the worm hatched than it eats its way through the fur, and continues increasingly destructlve until it arrives at its full growth, and forms itself a silken covering, from which in a short time it aguin emerges a perfect moth. A nother eunse of the clecay of furs is the molsture to which they are frequently exposed; the deliente structure of the fine under-fur call not be preserved when any dampness ls aliowed to remain in the akin. This fact is well known to the leather manufacturer, who, having wetted his skins, allows them to remain in a dampecellar for a few days for the purposo of removing the hair, which is pulled out whth the greatent facility ufter remalning only one week in a moist condition. It follows from these observations, that to preserve furs it Is necessary to keep them dry, and to protect them from meths ; if exposed to damp or rain, they must ho dried at a moderate distance from the fire ; and when put by for the summer shonld bo combed and benten with a smali eane, and very earefully secured in a dry brown puper or hox into whieh moths can nut enter. During the summer they should be examined once a month, to be again beaten und aired, if the situntion In which they have been placed be at ull damp. With
these precantions, the most valuable fars may be preserved uninjured for many yeara,

Monufacture of Furs for Felting Purposes.-In the manufacturing of fure for the making of hats, the principal kinds of skins used are the hare, rabbit, beaver, and nutria. All thene kinds of skins, in the northern parts of Eorope, as well as in America, are divid$s$ by furriers into two diatinct sorts, viz., the seasomed and unseasoned skins. The former are those which are taken off the animal in winter, when the fur is at Ita full growth, and in the highest state of perfection as to fineness; the latter are those obtained in apring, summer, and autumn. The for in the unseagoned skins is ahort, coarse, and hniry, and is generally not worth more than a third of the value of furs cut off the best-beasoned akins. The mode of manufuctaring both descriptions is, however, the same; of which we shall now endeavor to give a brief account.

Hare-skins.-The first mechanical operation performed on the hare-skin, is to open it wlth a knife down between the middle of the forelegs, taking great care that the skin be not tom; for there is a considerable waste of the fur If this precaution be not attended to. The skin must now be rubbed with what is calied a rake, which resembles in rommon dinner-knife, with teeth like a saw. This is used for the purpose clearing away all impurities and dried blood which may happen to be upon the skin. This clearing is of very great importance ; for the smallest particle of dirt or blood will greatly injure the fur for felting purposes. The operation requires to he carefully and judiciously performed for another reason. If the workiman be not attentive, be will tear up, along with the blooly and dirty parts, a considerable part of the good clean fur, and thus great loss will be incurred.

Hare-skina, after being thus opened and cleaned, must be damped on the pelt side with a little watur, and placed under a heavy weight, pelt to pelt, to press them, eo that all ridges and inequalities in the pelt may be removed. The skins are now fit for what is called shearing. Their antsides are all covered over with a kind of hair, which possesaes no felting properties whatever; and this must be taken off with hand shears. These are of two kinds; the one the common shears used for elipping the wool off sheep; the other kind resembles the cutting ahears of tailors, only the bowl is made equally large on heth siles for the mimission of all the fingers. Some furriers prefer one kind of shears, and some another. Those like tailors' shears make the nentest work when akillfulty usel; but the others require less time for their mansgement. The shearing of the akins forms a very important part of thelr manufacture; for if one cuts too far fown, he will serionsly destroy loth quality and quantity of the fur, as well as disfigure ita nppearance. On this nccount many furriers confine a part of their work-people to this branch of the buainess alone: for the greater part of the pirofits of a master depenid upen the munner in which the sheari ug process is performed.

After a hare-skin has been submitted to the proenss of ahearing, it presents an appearance aitogether different from what it did before. A novire would not know it to he the amme akin. Previously, it was of a unifurm lirown edor; now, it is down the whole of the luack of a most henutiful Jet black, which gradmaliy becomes fainter as it approches the silles of the skin. After it undergoee the prowess of rounding, which consists in taking off nil the irregular or nogular pieces of skin, and making the prit smowth aud even, it is then fit fur the cutting-iosami.
Tha cutting-boards of furriers are made of the wil-low-t ree, and are commenty ahout twornty inches wide, and from two to three feet broad. They ought to be mointened with water at short inturvais, when used, to make the wood soft, and prevent the edige of the cut-ting-knife from being taken off too scon. These kuives are rometimes nade of conmon sheet-lron, lut
more frequently of ateel, which are to be preferred to the formes, on account of keeping their edge longer and beiag much lighter for the hand. A fine edge wili not cut the fur off tha skins; it must be a rough edge, whioh is obtained from rubbing the knife about every two or three minutes upon a piece of common freestone, of not too fine a grain. These knives are from five to eix Inchise in, length and three in broudth, and resemble in some measure those knives used by grocers for the cutting up of cheeses. The skins are all, before cutting, split down the middle of the back into halves. The cutting then commences at the hesd or cheeks of the skin, and always in the line of direction in which the fur lies. The cutting-knife is run quickly backward and forward againgt the first joint of the finger across the skin: while at every two or three strokes the hand must be lifted up, to gather in the fur that has been cut, and preserve it in as ticecy a form as possible. Care must be taken against chopping the fur; because, when this takes place, the felting principle in all furs is considerably weakened, and in some entirely destroyed.

An important point in the getting up of furs for sale ia, to keep them in as unisroken or flecey consistency as possible. This, ahatractly consideren, is of no consequence to their felting power; but the practice of the trade as to this mutter has arisen from a desire to keep the different kinds of fur from heing mixed with one another, and therely in some degree to prevent adulteration. From this cause the above mode of cutting the hare-skin has been long since much improved by the use of instruments made of tin, ugainst which the cutting-knives run, and which are so contrived as to gather in the whole fur off the largest skin with as much ease as the fur of a calf skin could to gathered by the hand when the knife runs agrinat the fingers. This simple invention preserves all the most valuatile parts of the skin in one lump or fleece, and enables the workman to sort the fur with more ease and readiness than before.

Rabbit-skins.-The rablit-skin is cut in precisely the same manner as that of the hare, oniy there is a considerable difforence in the mede of dressing or preparing the former. The rablit-nkin is covered over on the peit side with large quintities of greasp or fat, from which the bare-skin is comparutively frec. This must he removed when the rabbit-skin is first opmed. The knife used in opening the skin must he pressed down upon that jart of the peit where the faty substance is , tiij it ifets beneath the cuticle on winch it rests, when the whule of the greasy matter may le removed, and a little whiteming rubbed on the sjot. if this operation lie not well attendied to, the grease wiii get mixed with tho fur, and damage it convidetably. The rablit, like the hare sikin, is cosered wer with huir upon the top of the fur; lut this hair can nut be taken off by shoaring, as in the cuse of the firmer, but must be removed by pulling it out. This is dome with a short knife abont three imbes fong, which is heh se as to grasp the hair hetween the thumb and it, which is sectured from injury by having a piece of lurkskin leather phaced over it. The hand of the workman ought to fail lightly upm the skin, otherwine the jair will be cat and the fur palled ent also, which will deteriorato its quality and diminish its punntity very cumsilerably.
hener-skins,--'the skin of the beaver is manuface tured in the same way as that of tho rabbit. The fat, howevar, in the furmer is much greater in inantity and morn tirmly imbedded in the juit than in the lattor; and of course grenter care and tromilio are toquired to remove it. Fuilers' enrth mixmi with whit. ening is used to imbine the fatty particles. The juiling the ontside hair off Is of great inuportance. The cutting of than heaver han lwen for sume years performed by muchines; the thirkness and regularity in the prett affording facilities for this unde of
operation, not. The fur different ki the skin b comparativ drab hath.
Nutria-sk only the he stronger the knife and g are full of fa pulling proc and boiling downward, a brush, till must then be is extracted made for the fare a atove o through the o Both the 1 used for hat of blowing. them of thone the fur after it machine consis the fur is place ated within it, by reason of $t$ boltom, and lea and rabhit furs for the nap or o Though the are the staple sre other furs conjunction wit otter, the seal, is fully as fine a: oljection hatter retain a good bl: shadc. The seal ishes dull upon much used at $p$ The mole is the , felting purposes cutting. Its fur withstanding its prevent its being facture.

Within the last made to apply ma ous kinds of fur, far, these nttemp snccessful. The chinery for cuttin the surface, and the peit in differe the fleshy part of injure it ; so mute than a pin's head circumstance has hringingrymithiner are, however, nt th in the cutting of but mutil they und sre tot likely, from to reaiza the expe by thase empleyi, labor, or in the au mannufactured.
Sany experimel with the usual prod of fur with knives to the preits, no ns make it lime the force. Lime has of
operation, which the generality of other skins do not.

The fur of the beaver is sorted into three or four different kinds ; but that which is cut off the cheek of the skin bears the highest price. White beaver is comparatively scarce, and is much esteemed for fine drab hats.

Nutria-skins.-These are dreseed like rabbit-skins, only the hair on the outside of the skins is much stronger than in the rabbit, and requlres a oharper knifo and greater strength to move it. Nutris-skins are full of fat; and before they are submitted to the puling process, they must be well washed with soap and boiling water. The skin is laid with the pelt downward, and well scrubbed on the fur side with a brush, till the grease Is entirely removed. They must then be well washed in cold spring water, whlch is extracted from among the fur by a piece of wood made for the purpose. After this they are placed before a stove or hot fire to try, and are then fit to go through the other manufacturing processes.

Both the beaver and nutria furs, before they are used for hat purposes, must go through the operation of blowing. This is done for the purpose of clearing them of those short black hairs which remain nmong the fur after it is separated from the pelt. A blowing machine consiats princlpally of a cylinder, into which the fur is placed; and by means of a fly-wheel, situated within It, the stuff is thrown up, and the hairs, by reason of their greator specific gravity, fall to the bottom, and leave all the fine fur upon the top. Hare and rabbit furs are also pnrtialiy used in a blown state for the nap or outside covering of hats.

Though the hare, rabbit, beaver, and nutrin furs are the staple articles of hat manufacture, yet there sre other furs occasionally used in their stend, or in coajunction with them. These are the furs of the otter, the seal, musquash, and the mole. The otter is fully as fine ns the benver itself; but the principal objection hatters have to ita nse is, that it does net retain a good black, but acquires a brown or coppery shade. The seal is not so tine ns the otter. It finishes dull upon a hat, and, in consequence, is not much used at present. Musquash is a useful fur. The mole is the only akin known to furriers which for felting purposes needs no preparatory dressing hefore cutting. Ita fur is alike tine throughout. But notwithstanding lts fineness, it is so very short as to prevent its being extensively used in the hat manufacture.

Within the last century many attempts have been made to apply machinory to the cutting of the various kinds of fur, but, with the exeeption of the beaver far, these attempts have hitherto been but partially snceessful. The great difficulties in the wny of nuichinery for cutting purposes are, the unevenness on the surfuce, and the Inequalitles in the thlekness of the peit in different skins. The smallest particles of the fledily purt of the akin getting among the fiur will injure it ; ao much so, that a plece of peit not larger than n pin's head will destrey the finest hat. 'This circumstance las greatly increased the difficuity of briming machinery to bear upon the fur trade. There are, however, it this moment some machines employed in the rutting of hare and rabhitoskins in Ponchand; hut until they undergo numerous inprovements, they are not likely, from the ohatacies atove ndverted to, to realiza the expertatlons of gain at first entertalned by those employing them, either in the saving of falor, or in the superior manner in which the fur is manufartured.

Many experiments have niso heen made to dlapense with the usuai processes of cutting the different kinis of fur with knives, by applying chemical aubstances to the peits, so as to loosen the roots of the fur, and make it leave the pelt upon a silight application of force. Lime has often been tried for this purpose, by
using it in the same manner as skinners do in the management of sheep-skins. Some furriers have also tried a partial state of putrefaction; but this, as well as the IIme proparation, has proved abortive. Tho fur obtalned off different kinde of skins by such means looks in every reapect as well to the eye as if it had been manufactured in the usual manner; but the felting principle is by all such meana entirely destroyed.

Carroted Fur.-Suiphuric acld has the property of increasing the felting power of most kinds of fur. When this is applled the fur is called carroted, from the color which the ncid gives it. The most common kind of fur submitted to this procoss is that helonging to the rabbit-skin; and it is generally employed in small quantities for the manufacture of all fine stuff hata. Carroted coney wool is made in the following manner:-Mix one part of sulphurio acid with two parts of pure spring water, in a dish of atone-ware; then take and wet the rabblt-akin with a brush all over, making the Ilquid penetrate as near to the bottom of the fur as posslble; care being used, in this process, net to tonch the skin with the fingers, lest they be burned, but with a piece of iren hoop doubled so us to resembie a pair of tongs. When the skins are thus wet, they must he placed over a very hot fire to dry; but they must not be placed too near, leat they take flre, which they are very apt to do from the application of the acid. Instead of drying them before the fire in thla manner, some run a hatter's finishing iron, heated to a certain degree, over the akins, and nilow them to dry gradually in the sun. This is feund to be a very gool plan. When the skins are dry they ought to be gently besten with a rod, and moistened on the peit aide with water, previous to their belng put under the pressing stone. They are then cut in the usunl manner. Skins prepared in thls woy attract a great quantity of moiature from the atmosphere; and carroted fur always feels to tho hand as if partindly wet.

The fur off the rahbit-akin improves in its felting capabilities by being kept a moderate length of time after being taken off the skin; but hare fur does not. Great attention ought to be pald by hat manufacturers, who keep conslderable stocks of fur on hand, as to the place in which they are deposited. If it he too damp, they whil rot; if too dry, they will diminish in weight ; therefore $n$ molerntely dry and cool place ought to be chosen. The great enemy to all fure is the common mith. Thls destroys the felting principie. Whenever the silghtest appearance in the fur Indicntes the aecure lodgment of this little creature, it ought immodintoly to the uaed; or, if this can not be done, it should be taken out of the paper hags, and lroken all over with a small switch rod, or, what will anawer the purpose still hetter, $n$ hitter's bow. The same rules apply to the keeplng of skins in good condition as to fur. The situation ought to be coul, dry, und well aired. They will seldom keep longer than tweive or eighteen months wlthout running great risk of suffering injury from the moth or hack beetle. Ton many ought not to he heaped together, and particulariy if they he rablit-skins, hecause the fat or greuse about these skins will get beated, run among the fur, and hecome of suld an aerld nature as to corrode the very pelt itself. It was formeriy the practice to kesp inare and rabhit skins a long time, under the itlen tiat the fur upon them will Inerense in length from the molature left in the pelt. Thls is an entirely erroncous epinion. Any one who will make the experiment vill thal that the umount of fur obtained off nny given quantity of skins is much greater in weight when manufactured immoliately nfter they ure taken off the animai, than aftor having been kept for six or tweive menths.

The qualities of ail kinis of furs dlfier very considerahly, from cilmato and other locai circumstanees. The best rubinit fur, used for the manufacture of the
finent London hato, is commonly coneldored an the produce of the east coaet of England, particularly from Lincolnahire to Berwick inclusively. The rabbit fur is always stronger in the felting principle when got off rabbits bred on the saa-coast, than in those found in inland places, however favorable in other respects these places may be for the rearing of the animals. The aking along the tract of coast alroady mentioned seem all of the same size and quality. North of Berwick the rablit-skin becones smaller, and the fur weaker and ahorter; and the further north, along the coast, the more inferior it is found. Hare fur in Great Britain is anperior, for hat purposes, to any in the world.

The skins and fura imported by or for our manufacturers are more varied and more numerous, perhaps, than would generally be supposed. When we consider, too, how many countries must be ransacked to produce this variety-the beaver, the bear, the ermine, the otter, the racoon, the chinchilla, the wolf, the fox, the musquash, the sable, the marten, the squirrel, the fitch, the mink, the scal, and others-it will be plain that the commerce in furs must be considerable. In 1850, the squirrel furs imported exceeded $2,000,000$; the musquash, $1,000,000$; the racoon, 500,000 ; while the rest made up the total number to nearly $5,000,000$ not hides for tanning, be it remembered, but skins imported for the sake of the fur. The beanty of a fur does, most unqueationably, in the eyes of a purchaser, depend largely on the price he pays for it; and this price deperids on the scarcity in the supply. Why else should a black-and-silver fox fur command a price of 30 or 40 guineas, or a sea-otter skin still more? It is true that fashion also tends to determine the price; and it seems that the different tastes of different countries curiously illustrate this. Thus, the black-sndsilver fox skins are mostly purchased for the Russians and Chinese: the red-fox skins are in demand in the Fast for cloak linings and dress trimmings; the otter skin is used in the same regions for caps and cellare; the beaver fur, now getting out of use for hats, is being made avaiiable as a beautiful kind of cloth for dresses; the lynx, now out of fashion in Eingland, is a favorite in America. The wolf yields a coarse fur, which the IRussians employ for cloaks and coats. The sable has long been a favorite in England, and when dark in color commands a high price; the $\min x$ (the choicest specimens) is said to be now in high favor in Paris; the musquanh is largely used In England, it being made to do duty for more costly furs by a little "doctoring ;" the fur of the black bear is chietily appropriated by military mea, fur caps, holsters, rugs, han-mer-clotha, etc.; the sea-otter fur ia a royal fur in China, and a noble fur in Kussia, and hence commands highi priees in those countries.

Dlost of the furs nanied in the above paragiaph are procured from North Anerica, through the medium of the Iludson's lhay Compsay ; but there are some Eurojean furs which command an extravagent prico. The Kussian sable, for instance, will sometimea sell for as much as 10 guineas a skin; and so many of these are employed to form a lining for a cloak, that such a lining has not unfrequently involved a cost of 1000 guineas. The corporation of Landon display their sable-furred gowis or roles on official occaniona. The fur called French abble is really that of the ntone marten, which the French whow inuch skifl io dyeing. The erwine or mine ver, from Hussis and Sveden, is one of the moat romarkuhle of furs, natural!y as well as aocially. Its beautiful and delicate white can only be insured loy killing the animal in winter, when all is white except the tip of the tail. In social dignities, the ermine, perhaps, takes the lead of al! furs; for, not onfy in many countries of the Continent, but in less despotic England, there is a aumptuary law or custom respecting the ermine; the sovereign, the royal family, the ocers, the peeresses, and the judges, s!i wear
ormine on etate occaelona ; and this ormine is 'pow. dered' (as the horalds term it) with small black spots or stripes of some other fur; the number and arrange. ment of the spots and stripes being Indicative of the rank of the wearer, and no devlation therefrom heing permitted. For the equirrel fur, which is used in larger quantities in England than sny other, we are chiefly indebted to Russia. It is chesper than any other equal to It in appearance; and some of ths white portlona are admired for their beauty. The fitch, with its strong and durable fibres, has latterly been passing out of favor. The lamb-skin, at a tender age, has all the beanty of fur; and some of the foreign opecimens command a high price. The cat-akin is now used largely in England as a fur, greatly to the danger of the domestic "puss" in general. Tho rabbit is also an extensively used fur; and tho whito varieties are made to do duty as substitutes for ermine. The little chinchilla yields a suft and delicate fur, much ased in England and France. Angora gont-skin was at ono time worn extensively as a fur; but it is now more customary to remove the hair or wool, and manufacture it into cloth. Seal-skins, when to be worn ss furs, have the long coarse hair removed, and the rich silky down which lies beneath it is dyed of a brownish color.
When these various furs are gathered together from every quarter of the globe, and conaigned tu the hands of the furriore, they undergo certain processes, which tranaform them from quadrupeds' attire into bipeds' attire. The "pelt," or under surface, of eacil fur has to be converted Into a kind of leather, by greasing, and pressing, snd scraping, and other processes; and the hairy or downy surfuce has to be dyed and prepared in various waya, to develop all the beauty which nuturally belongs to it, and somatimes to impart extraneous beanty to it.
When the light fiocculent down from birds is em. ployed as a fur, it requires much patient labor to adjust all the little fibres to their places, since there is no natural "pelt" or skin attached to the down when removed from the animal. As instances of this kind of work, wa nay adduce the Persian muff and bos lately made from the down of a bird called the egret : their valne was 160 guineas. There had been only three similar sets previously made-for the Empress of Russia, the Princess Adelaide and the Duchess de Berrie.

The Fur Trade in Minnesota.-Four or five years ago the fur trade was the parsmount commerclal and industrial interest of the Territory. Two or three years further back, and it was not only the paramount but the sole business interest. The population of the Territory was composed almost entirely of its employers and ottachés. St. Paul derived its whole Importance (a small importonce then) from being the dépôt of the Winnehago and Chippewa outfits; while Mendeta, the seat of the Sioux outfit, gave laws to the immense region occupled by the Dokotas and chains of trading-posts as fer as I,ac qui Parle on the Minnesota; and Pembina, on the Red River, held the whole country like a dependent ehlld at the feet of the magnetes of the principal agoncies of Pierra Choteau, Jr., \& Co. The profits of the fur trade even then had begun to decline. The infiux of a while population consequent upon the establishment of a Territerial governmentthe increase of competition in the Indian trade, co carring with the gradual decresse of its products, and causes that lay beyond these, and thet have been gradually but surely promoting the docline of the western fur trade in general-all contributed to weaken the efficiency of the Fur Company's organization in our Territory, und to render it undesirable to maintain its expensive establishments any longer than wse sufficient for settling its affairs. It bas accordbagly had no practicul existence slace the consummstion of the Sioux treaty in 1852, from which the traders received a parting token of eeveral hundred thousand dollars in payment of the accumulated buek debts of eome thirty yeurs. Since then twe trate has been carried on entirely by private individuals, foremost anning whom, however, are some of the old treders. Two houses alone, Messrs. Forlies \& Kittson, and Mesars. Culver \& Furrington, are connected at this time with the fur trude in this city. The disorganization of the Indian trale on the Minnesota River, and the diversion of the Iudians from hunting, by the pernicious system of annuities, has vastly diminished the productiveness of the fur trade on the Minnesata Kiver.
The trade is ulmost entirely limited at present to the Pembina or led River regions. alul around tho head waters of the Mississippi. The buffalo robus come almost entirely from this sourco, tho thiffalu runges being restricted to the region north of the Cheyenne, and west of the Itmen River. The Minnenota River country lus fallen off in luffaloes very considerablythe whele receipts for export from that reglon not smounting to more than 1200 robes. This does not laclude, however, the large numbers reserved for hune consumption. The table given below, for which we
are Indebted to N. W. Kittson, Esq., exhibits the total exports of furs from St. Psul for the present year: 64,292 rats, $\$ 11,57256 ; 8276 \mathrm{minx}, \$ 18,621$; 1428 marten, 83,$570 ; 1045$ fishers, $\$ 470250 ; 876$ red foxes, $\$ 1095$; 3400 coons, $\$ 2550$; 10 wolverines, $\$ 25$; 364 badgers, $991 ; 2,082$ wolves, $\$ 3048$; 405 otters, $\$ 141750 ; ~ 586$ beaver (ponnds), $4882 ; 2542$ kit foxes, $\$$ I27I; 610 bear-skins, $\$ 6700 ; 20$ cross fox, $\$ 100 ; 8$ silver fox, $\$ 400 ; 50$ lynx, $\$ 125 ; 7500$ robes, $\$ 41,200$. Total, $\$ 96,75050$. A notable feature of the fur trade fur the seversl years past, is the gradual but sure decline of its productiveness-corresponding with a growing demand in Europe and our own country for fure. Each of these causes has assisted the other to enhance the price of furs-and they have grown expensiveand all these causes concurred to advance prices lsst year to a sum they never before reached in the American market. Nevertheless it will not do to calculate too surely on last year's prices for the products of the present year, as the consumption of furs is, after all, entirely dependent on the evanescent caprices of fushion.

Before closing this artlele, we will devote a few lines to the charicter of the men engaged in the fur trade. The character of the hunters and trappers engaged in the fur trade throughont the extreme northwest is peculiar and original. The trade is not carried on now, as in former times, by means of batteaux and eanoes, which, under the old French and English systems, enlivened the rivers and lakes of our old Northwestern Territory. Tho fur-hearing animals hava been Uriven from a great portion of their borders by the advance of emigration, nnd their shores have become, to a great extent, the sites of substantial farm-houses and prosperous settlements. The canoe has given place to the steambost, the trading-post to the city. The great bulk of the trade has been transferred to the region of the mountains, whose wild recesses contain no lukes where they eun disport their canoes, no streams which ean float their furs to market. These traders and truppers trunsport their goods or furs upon packhorses, or curry them on their own backs to a navigatule stream. They move from place to plece on horselack, sumetimes conveylng their traps upon their shoulders through deep ravines, up steep precipices, insecessible to the lorse, in search of places which contain their favorite game. The life of tho trupper hecorres a reene of toil and privution, and yet of passionute excitement. Ilis vlews are exaggerated, his hubits unsettled, his sentiments, generally, noble and genorous, like those of a sallor, for tho cunses which net ujon him are slmilar in their character; and, lika the sailor, he is nowhere contented except when lead-
ing his life of danger and oxcitement. Such is the life and character of the active agents of the fur trade, the sturdy hunters and trappers of the north-weat. See IIurr's Mer. Mag., iil., 185 (J. H. Lanman), ili., 252 (II. Murray), xiv., 582 (W. Sturgis); Journal of Science, xxv., 311 ; Edin. Rev., 1., 142.
Fur-skin Dresaing. Fur-skine are nanally dressed by placing them in their dried state in tube, where they undergo a treading operation with men's feet, untll they are sufficiently soft and bend easily. The skins, if large, are sewn up, the fur being turned inward; but if small skins, such as ermine, are being dressed, they require no sewing. This sewing is preparatory to the greasing with hutter or lard, and is intended to protect the fur from the grease, and to promote the softening in the succeeding treading operation. The skins are next wetted, and their flesh is removed; or they are fleshed and then hung up to dry. They are aguin subjected to treading in tubs containing sawdust, and afterward in tulss containing plaster of Paria, or whitening, sprinkled between the skins. They are then beaten with a stick and combed: when the dressing is comploted. M. Picrre Thirion proposes, in his patent of June, $\mathbf{1 8 4 5}$, to soften the skins, not by treading, but by beating-stocka, of a conatruction like the falling-milli. They are next sewn up, and agaln fulled in a strong vessel, where they are forced upward by the beaters, turned over and over, and thus speedily softened. They are now fleshed, and then returned to the beating-stocks, and mahogany or other sawdast is sprinkled upon the fur, before the beating is renewed. They are next placed in a heated barrel, furnished within with radial pins for turning the goods over and over, in order that they may be acted upon by various dry sutstances, which are thrown into the barrel, and alosorb the fat from the sklns. Through the hollow shaft of the barrel, steam is introduced, which heats the skitss, softening the fat, which is then alsorbed by sand, flour, or any other desiecative powder. It is broper to take the akins out of the barrel from time to time to comb them. Such as have been suffliently acted upon may then le set saide. They are lastly freed from the dust by being subjected to a grated cylinder in a state of rotation, and then combed by hand.

Fusel Oil is the German name of tie offensive smelling oil which exists in alcohol, ae listilled from the fermented infusions of malt, and corn meal of all kinds, as also from the fermented wash of potatoes, nad of leets, etc. A like oil occurs in the alrohol distilled from the fermented must of grapes, nud the juices of many sweet fruits. This oil is not, however, identical from these several sources; as may indeed he inferred from the diversity in the flavors of the different liquors. Jut they all agree in being somewhat less volatiie thun water, and therefore make their apjearance chiefly in the spirits towarl the end of the distillation process. It is to tho presence of thls oil that the milkiness of the last, and also sometimes of the first, portions of tho spirit that come over, cailed feints, owe their opaleacence and their penetrating odor. When the milky fluid is redistililed, alcohol and water first pass over with very little oil, but if the heat of the still be molerate, the oii may the made a residuum, and oltained in a tolerably concentrated state.

Fustian (Ger, Barchent; Dt. F'ustein; Fr. Futaine; It Fumagno, Frustagno; Sp. F'ustan; Ras, Bumasea; l'ol. Burchan) is a sirecies of coarse, thick tweeled cotton, and is generally dyed of an olive, leaden, or other dark color. Hesides the common fusthan, which is known ly the name of plllow (probably pilaw), the cotton stuffs calied conluroy, velverett, velveteen, thicksett, used for men's wearing apparel, belong to the same fabric. The commonest klad is
merely a tweel of four, or sometimes five leaves, of a very close stout texture, and very narrow, seldom exceeding 17 or 18 inches in breadth. It is cut from the loom in half pleces, or ends, as they are usually termed, about 35 yards long, snd after undergoing the subsequent operations of dyeing, dressing, and folding, is ready for the market.

Of velvet, there are properly only two kinds, that with a plain, and that with a tweeled, or, as it is Lere called, is Genoa ground, or bnck. When the materlal is silk, it is called velvet; when cotton, velveteen; and this is the sole difference. In the sume way a common tweeled cleth, when composed of silk la called satin; when of cotton, fustian or jean ; of woolen, plaiding, serge, or kerseymere; and in the linen trade is diatingulahed by a variety of nantes according to the quality or fineness, or the piace where the artlele is mannfactured.

Fustio (Ger. Gelbholz, Fustic; Du. Geelhout; Fr. Rois juune de Bresil; 1t. Legno giallo de Brasilio; Sp. Palo del Rrasilamarillo), the wood of a species of mulberry (Morus tinctoria), growing in most parts of South America, in the United States, and the West India Islunda.

It is a large and handsome tree; and the timber, though, like most other dye-woods, brittle, or, at least, easiiy aplinteren, is hard and strong. It is very extenslvely uaed as an ingrellient in the dyeing of yellow, and is Iargely imported for that purpose. Of 10,800 tons of fustic imported into Great Britain in 1850, 3285 tons were bronght from New Granada, 2076 from the British West Indies, 1639 from Cuba, 945 from the United States, 750 from Mexico, and 669 from Mrazil. Fustic from Cuba fetches fuli 80 per cent, more in the Inndon market than that of Jamaica or Colonbia. At present the price of the former varies from $f 9$ to $£ 910 \mathrm{~s}$. a ton, while the latter varies from $\mathbf{4 5} 58$, to $£ 6$ a ton. The consumption amonnts to about 6,000 tons a year. The duty on fustic wis abolished in 1845.
Zante, or young fustle, is really a species of sumach (Rhws cotinus, Jin.), and is quite distinct from the Morus tinctoria, or old fustic; the latter being a large American tree, while the former is a small European shrub. I: grows in Italy and the south of France, but is principaliy exported from the Ionian lslanda and Patr as in the Moren. It imparts a beautiful tright yellow dye to cottons, etc., which, when proper mordants are used, is very permanent. It is conveniently atowed among a cargo of dry goods, as it may be cut into pieces of any length without injury. Only a small quantity of this apecies of sumach is imported. Its price fluctuates considerably.-Trees of $A$ merica,
There aie several kinds of fustic-trees which might be formed into a peculiar group, from their baccate seeds. The tree fustic of dyers (Morus tinctoria) is a large tree 60 feet in height, bearing sweet, edible fruit about the size of a nutmeg, and is a native of Central Ameriea, Yucatan, Cuba, Jamaica, cte. The whole plant abounds in a silghtly glutinous milk, of a sulphureous color. The wool is reliow, and is much used in dyeing, for which purpose it is chiefly imported into Furope anil the United States, under the nsme of fustic-scood. There is a variety of this speciea, called Bustarl Funtic, a troe smailer in stature, and less valuable as a dye, and is found from "ucutan to the southern parts of Fiorida and the Bp ma Ishands.Bnowne's T'rees of A merica, p. 460.

Futtocks, in a ship, the timbers raised over the keei, or the encompaasing timbers which form het breadth and capacity. F'uttock plates are iron plates crossing the sides of the top-rim perpendicularly. The dead eyes of the topmast rigging are fitted to their "pper ends, and the futtock shrouds to their lower elsds.-Dava's Seaman's Manual.

Cage, a pledge or pawn given by way of security. II. Gage, a challenje to combat; that is, a gauntlet, glove, cap, or the like, cast on the ground by the challenger, and taken up by the accepter of the challenge. III. Gage, in nautical language, the depth of water a vessel draws, i. $c_{\text {., the }}$ the nuber of feet ahe siaks In the water. In a different sense, when a shlp ls to windward of another, ahe la sald to have the weathergage of auch vessel. IV. Gage, among letter-founders, a plece of hard wood variously notched, uaed to adjust the dimenslons, slopes, etc., of the different sorts of letters. In joinery it denotes an instrument to strike a line parallel to the straight side of a board. Sliding-gage, among mathematical instrument-makers, a tool for measuring and setting off distrnces. $\mathbf{V}$. The term gage, lmplying measure, as of depth, height, force, quantity, atc., Is frequently used in composition to denote partlcular klnda of instruments; as, scagage, tide-gage, wlnd-gage, lain-gage, etc.

Galaoz, or Galatz, a town of Moldavia, on the left bank of the Danuhe, between the confluence of the Sereth and Pruth with that river. Lat. $45^{\circ} 25^{\prime}$ N.; long. $28^{\circ} \mathrm{l}$. It $:$, Ill-huilt and dirty, though in these respecta it has latterly been much improved. Population supposed to amount to 25,000 . The trade of the town is chlefly carried on by (ireek merchants; but, withln the last few years, various English and other forelgners have formed establlshments in it. Though at a considerable distance inland, Galacz ls in the best position for becoming the port of the Danube. At present, however, it ls little more than the port of Moldavia, Jbralla, or Brahilow, ahout 12 miles further inland, being the port of Wallachis. The commercial importance of these perts, and Indeed of the Danube, dates only from the treaty of Adrianople in 1829. Previous to thst epoch the trade of the princlpalities labored under the most oppressive reatrictions, and was principally carried on by land. luat all artleles of native produce may now be freely exported either by ses or land, on paying moderate duties; and the duties on imports are alse, for the most part, comparatively moderate. The probability, indeed, seems to be that Galacz, "the Alexandria," us it has been called, "of the Scythian Nile," will at no very distant period lecome a first-rate emporium. The rescuing of Moldarla and Wallachia from Turklah misgovernment has heen of signal advantage; and it is to lo hoped that they may never again be subjected to ita paralyzing Induence. The establishment of a regular intercourse by mesns of steam parkets between Vienna sad Galacz, and thence by the Bhack Sen, with Constantinople and Trebizend, has already done a great deal, and will every day to more, to introduce a spirit of improvement inte the vast and fertile, but long neglectel, countries traversed by the Danuhe in the lower part of its conrae. The capacities of this great river as a conmercial highway are certainly unequaled by those of any other European stream; and their full develepment wonld be of immensurable alvantage, not merely to tha countries on its banks, but to ull commercial nations.

Eirports and Imports.-Moldavla and Wallachia are very proluctive provlaces, being fruitful both of corn and cattle. Tha high prices of corn in France, Italy, and Eagland, in 1896 and 1847, gave an extraordinary stimulus to the export trade of Galacz and Ibralla, The exports of wheat from looth ports, in 1817, amounted to no fewer than 570,978 quarters, worth on
board ship, $£ 875,603$; the exporta of Indlan cern durIng the same years, were 937,720 quarters, worth £1,172,150; and among the other exports were about 820,000 quarters of barley, and $42,000 \mathrm{cwt}$. of tallow, with a variety of inferlor artlelea. The total value of the exports from the two porte during the above year, amounted to the very large aum of $£ 2,368,472$, of which about two thirds were from Ibralla. The quality of the wheat, which ls partly hard and partly aeft, was, a few yeara ago, very inferior, being generally damp, and having an earthy amell from ita being kept in pits dug in the ground. Latterly, however, it has been much improved; and the finer asmples now fetch, in Merseilles, Genoa, and Leghorn, within from 3 to 4 per cent. of the price of Odessa wheat. In 1852, we imported 80,140 quarters of Wallachian and Moldavian wheat, with no fewer than 626,714 do. Indiun corn. Both provinces fatten large herds of cuttle, particularly DIoldavia, which annuslly sends grest numbers to the Austrian States. Tallow may be had in large quantities, its annual produce, In Wallachla only, being estimated at about $\mathbf{3 , 0 0 0 , 0 0 0}$ okes, or $8,500,000$ pounds. Until within these few years, the tallow shipped at Galacz was burdened with a heary export duty, which checked its sale, and consequently, also, Its growth. LIappily, however, that duty is now ioduced to 3 per cent., and the exportation is rupidly increasing. The quality of the Danubiun tallow la excellent. Among the other articles of exporta are wool, tlmber, hiles, and skins, lard, butter, bristles, bones, jerked beef, linseed, barilla, yellow-berries, coarse cheese, etc. Timber of the finest quality may be had in any quantity; but as it can only be adventageonsly exported in large ahips, which can not when laden make their way over the bar, the trade in it has hitherto been confined within comparatively narrow limits. One, howaver, would be disposed to think that thla difficulty might be obviated by sending down the timber in rafta and laading outside the bar. Notwithatanding the recent period at which the navigation of tho Danube has been opened, and the barbarons state of the countrics in the lower part of its course, the value of the exports from Galacz and Ibrails probubly in 1853 exceeded $£ 1,800,000$ a year, of which from $£ 750,000$ to $£ 800,000 \mathrm{may}$ be from the former. But, considerable as this is, It is nothing to what it certainly would be were civilization to make any considerable progress ln the countries traversed by the Danube after it leaves the Austrian dominions, and still more were the river to become, as it naturally ls, the princlpal channel for the conveyance of products to and from Ilungary und Transylvania. The great articles of import are manufactured cotton goods, and cotton twist, principally from England, the demand for which is rupidly increasing; with sugar, coffee, and other colonial products; olives and ollveroll, iron and steel, hardware, ete,

Sintrance to Galacz--Of the three principal mouths of the river, the Soulineh (mlddle) month, in latitude $45^{\circ} 10^{\prime} 30^{\prime \prime} \mathrm{N}$. , leng. $29^{\circ} 41^{\prime} 20^{\prime \prime}$ E., is the only one accessible by vessels of considerable burden. The depth of water on the bar, at its entrance, half a mile from the shore, varies from 10 to 13 and 14 fect, according to the season of the year, and the direction of the wind. When the latter blows from the east, it is opposed liy the current of water flowing from the west, so that the bar is rapidly Increased by the depowit thereon of the mud brought down by the river; and when, on the contrary, the current and the wind colncide, the mud is carried out into the sea, and the depth of water on the bar ls progressively augmented. The assistance of a powcrful dredging-machine, or
machine fitted to stir up the mad, or other deponit forming the bar during the prevalence of westerly winds, would be of great importance; and it is belleved that with ita agency the channel might be very materially deepened. Great complaints have been made of the atate of the navigation of the Danube during the present year (1853). It appears to have been occaaloned partly by difficultles arising out of the disputes between Russia and Turkey, und partly by the prevalence of easterly winds. But it would be oasy, by erectlng a light-houss, to mark the entrance to the river, and omploying a dredging-machlue and steam-tugs, to obviate the physical obetructions to the navigation. From the bar to Galacz and Ibraila, there is nowiere less than 18 feat of water, and In many places from 60 to 70 . Veseels of 300 tons lie close to the quays at Galacz. The shores at the mouth of the river being low and bordered with reeds and shoala, vessele intending to enter the river generally make the small rocky iflet of Phidonlal, or Serpent's Isle, in lat. $45^{\circ} 15^{\prime} 15^{\prime \prime}$ N., long. $30^{\circ} 10^{\prime} 30^{\prime \prime}$ E., whence the Soulineh mouth hears west by south, distance 23 miles. According to Mr. Cunningham, the first objecte seen, on nearing the shore, are the masts of vessels in the river and tho houses in the town of Soulineh, which, however, are very low. Hagemeister says that there ls a wooden tower on the south shere at the entrance to the river; but though the contrary has been often affirmed, and Its positinn given in Arrowsmith's map, there ls certalnly no light-house. When a shlp appronches the entrance, a boat from the Russian captain of the port goes off, and by waving a red tag lodicates the course to he kept. Lightera are generally statloned without the har, Into which large ships discharge a part of their cargoes ; and pilote may generally be obtalned from them or other vessels. As the current is sometimes very atrong, and difficult to stem, a proper establishment of steam-tugs at the month of the river would be a great advantage. An E.S.E. wind carries a vessel from Soullieh to Galacz through all the different reaches of the river; bat otherwise the navigation is difficult, and towing is in parts necessary.
Frost usually sets in on the Danabe $\ln$ the monii of December, and continuea till the month of March; In 1833, however, there was no frost. Frelghts in the ports of the Danube are alwaye from 20 to 25 per cent. higher than in Odessa; premiums of insurance, on the contrary, are not hlgher than at the latter, except on such vessels as, on nccount of their size, are obliged to discharge outside the bar.

Money, Weights, and Measures.-Thess are mostly the aame as at Constantinople, which see. Accounts are kept in piastres and paras. 1 piastre $=40$ paras.
Galacz.-Ducat bianc $=$ pia. 44. Silver ruble $=15$ pia. Spanish dollar=19 pia. 32 paras. Turklsh yermelik, old coinage $=19$ pia. 32 paras ; Turkish yermelik, new colnage $=17$ pia. 15 paras. Austrian swanzikers $=3$ pla. 5 paras. It is to be observed that when exchanges are so high that it is requisite to remit $\ln$ specie, any of these colns may go to a premium, according as it suits better than othera for the remittance; and just now, owing to the want of blils to remit to Austria, the ducat blanc $=44$ pia. 20 paras.

Jbraila has two rates of currency; the one for charges, which is the same as in Galacz, and the other for the purchase of merchandise, as follows:-Ducat blanc=32 piat. ; Spanish dollar=141 pia.; Turklsh yermelik, old coinage $=11$ pia.; Turkish yermellk, new coinage $=12$ pia. 28 paras; twanziker $=2$ pia. 12 paras. Note. -The same as in Galacz, any of thees coins may go to a premium.
Galacz and Ibraila.-All duties are paid in both places, In the course of the Treasury, as follows:Ducat llanc $=s 31 \frac{1}{2}$ pif, $;$ silver rubleza 10 pia.; Spanish dollar $=14$ pia. ; Turkish yermelik, old $=14$ pia. swanziker $=2 \ddagger$ pis.

The ducat blane weigha 1 Turkish drachm.
Exchanges.-Bille can generally be soid on the following places, and the present (1842) rates ara as noted it must be observed, however, that these rates are very high; and when a great deal of paper is offering, they may go 4 per cent. lower.

Weights.-Galacz and Ibraila. 400 drams $=1$ oke. 44 okes $=1$ cantar.
Measures.-Galacz and Ibralla. 20 banalza $=1$ kilo. 8 kllo of Galacz $=2$ kilo of Ibralla.

The ports to which these vast quaritities of grsin are shippod, will be aeen from the following return of the export trade during the same years:
than Galacz; but they are much less considerable in point of commercial importance. Having little importation, their trade is confined almost entirely to the exportation of corn, and even in this respect they are very infertor to Galacz and Hrahiliow. They are aubject to the Russian duties and regulations. We have gleaned these particulars from a variety of worka, but principally from the valuable Report by Mr. Cunningham, now vececonsul at Brahilow, printed at Galacz in 1841 ; the work of IIagemeister, On the Commerce of the Black Sea, Eug. trans. pp. 83-95, ete. ; Purday's Sailing Directions to the Black Sea, p. 193, etc.

The port of Varne is sitnated on the W. coast of the lliack Sea, at the bottom of a rather amall bay, about 8 miles N.W. Cape (ialata, the latter being in lat. $43^{\circ}$
$10^{\circ}$ N., long. $27^{\circ}$ ges F. The ordinary anchorage lis to the S.E. of the town, in 7 or 8 fathoma, lottom sand and oase. It is $O_{0}, 4$ to all winda between E . and 8.8.E. Vessels ic $\mathcal{U}_{\text {. }}$ and unlond by means of lighters, It being dangeroun to appromeh within leas than one quarter of a mile of the shove. lloth hard and soft wheat are shipped from Varna, the value of the former being from 30 to $\mathbf{4 0}$ per cent. greater than that of the latter. An export duty la charged on wheat when exported, and being a fixed duty of about 2n. 8d. n quarter, it is high when priees are low, and low when they are high.

Steam to Gnlacz.-Stenm navigation was firat eatals lished on the Danube in 1830, aince which tha undertaking has gone on prospering, oo much so, that the communication between Vienna cind Conatantinople is now maintained by a line of 7 or 8 steam veasels, The Austrian Steam Company, which was the firat In the field, have extended their scheme by starting vessela bet ween Vienna and Linz, and a Bavarian Company commenced in 1838 running vessels 'jetween Ratisbon and Lhaz. At preaent (or very recently) steamboats ply on the Danube as long as the river is free from ice (usually from February or March to November), from Ratisbon to Lina, once a week; Llnz to Vienna, 10 hours, once a week; Vienna to Presturg a.d Peeth, twice; Pesth to Drencova, once a week; Gladova to Galacz, onca a week; Galacz tr 'onstantinople, once a fortnight. The voyage from Vienna to Conatantinople, including stoppages, is aeldom pertormed in less than If daye, and sometimes oceuples 17 ; in returning against the stream it takes at least a month, including 10 daye' quarantine at Ormova. The fare was lately, first place, 134 florins, ahout $\mathrm{C13}$; econd place, 94 florins.

The navigation of the Danube by ateamers is unfortunately Interrupted for about 50 miles, between Drencova and Gladova, by rocks ond raplids, the lowest and most considerable of which is a sort of entaract, called the "Irongate," about 3 miles below the liungarian frontier. It is worthy of remark that the most illustrious of the Itoman emperore, Trajan, allve to all the advantages to be derived from the easy navigation of the IVanube, had with equal industry and sagacity formed a road, or towing path, along the river's edge, for facilitating the operation of towing, of which the remains are still extant, with an inseription commemorative of the completion of the works, It has theen proposed to overcome the difficulties in the way of the navigation ty reaovating the old Koman road, and deepening the channel contiguous to it. Hut it rarely happens that attempts to Improve the navigation in the bed of a river, under any thing like gimilar circumstances, are oven tolerably auceessful. The better way undoubtedly would be, were it practicable, to construct a lateral canal, or rather a canal from tho mouth of the Bereska to Palanka, which wonll not only avoid the rapids, but also shorten the navigation by getting rid of the bend of the river by Orsova. lut the difficulties in the way of auch an undertaking, from the nature of the ground, are salil to the insuperable; and it is, therefore, probalile that the distance of 50 miles along the rapids will continue, if not always, at least for some consilerabile time, a portaye. The inconvenience, bowever, of this break in the navigation hus been diminished, as far as possible, by the construction of an admirable carriage road, at great expense, by the Hungarian diet, froni Molduva to Orsova. In the extent of excavations in the rock, and terraces of masonry, upon which it is carried, It is not inferior as a specimen of engineeriug to the finest roads over the Alpe. Several steamera have heen traneported down these rapids at the season of floods, small barges pans them at all times, and little troats, laden with wax and wool, are towed up by men and oxen. The paseengers and goods conveyed by the steamers are transforred from Moldova in row-
boats, to Cladova, below the Irongate, where they embark on another steamer.-Geog. Dict, art. Danube. A raliroad is completed from Brunn, the capitai of Moravia, to Vienna; another railroad diverges, from the Danuive at Ling, north to Bodwels in Bohemia, where it reaches the banka of the Maldan, nand through it communicates with the Ellbe.

Jumetion of the Danube and tha Rhine.-The long projected canal to unite the Danube and Nhine, the favorite scheme of Charlemagne, baving been undertaken by the llavarian government, was completed and opened in 18-16. It extenda from llamberg, by Frlangen and Nuremberg, to Neumark, joinleg the Danutie at Kellieim, a fow miles above Retisbon. The distance between the Maine near liamberg, and the Danuhe, fo about 112 miles; but the actual extent of canal is leas, the communication boing in part effected by the leggnita, a tributary of the Maive, and the Altmuhl, a tribatary of the Danube. There is now, consequently, an Internal commusiention by water throughout all the vast country, atretching from the shores of the Netherlands to the Black Sea; so that proluce shipped at Rotterdam or at Galacz may be conveyed from the one to the other In the same vesael.

Galangal (Ger. Gulgant; Du. and Fr. Gnlanyn; lkus. Kalgan ; Jat. Ginlanga; Arab. Kussthlk; Chin, Iauundon), the root of the galurga, brought from China and the East Indies in pieces alout an inch long, and hardly balf an Inch thick. A larger root of the sama kind (grater galangit), an Inch or more in thickness, ls to be rejected. It has an aromatic smell, not very grateful ; and an unpleasant, bitterish, extremely hot, biting taste. It should be chosen fult and plump, of a bright celor, very firm and sound. 12 cwt. are allowed to a ton.-Lkwis's Mat. Mefi. ; Meinurn'a Orient. Com.
Galapagos, ngroup of ialands in the Paelfic Ocean, oo called frou the Spunish galipago, a land tortoise, from their ahounding in that animal. They consist of six prinelpal and aeven amaller islands, lying hetween $1^{\circ} \mathrm{N}$. and $2^{\circ} \mathrm{S}$. lat., and between $89^{\circ}$ and $92^{\circ} \mathrm{W}$. long., about 700 nilea from the continent of South Anerica. The largeat, Albemarle luland, is 60 mifies In length, by about 15 in lreadth. The highest part is 4000 feet atove the nea. 'They are all of valeanic origin; and along their shores black dinmal-lookiag heaps of broken lava everywhera meet the eye. In many places the lava cliffs are very high, while close to them the water is oo deep that a ship can not anchor even in a calu. In the interior are some valleys and plains of moler"te extent and of great fertility. T: land tortoises, called the great elephant tortois:s, their feet belngit like those of a small elephant, are allmerous, and grow to a grent nias, frequently welghing several hundred pounils. A amall colony has been established on Charlea Island, in a plain about 1000 feet atove the sea. They cultivate bananas, sugarcanes, swect potatoes, and Indian corn, and supply with these articles the whalers who resort to the injand. The climate is henlthy, and the heat moderate, considering the geographical position of these inlands.

Galatz. Sea Galacz.
Galbanum (Fr. Galbnnum; (ier. Mutterharz; It. Gialbano; I.at. (iaibanum ; Arab. Aarzud), a species of gum resin olstained from a pereunial plant (allanum of: jicinale) ere int: in Africa, near the Cape of (iood liope, and ha Syria aad l'ersia. It is brought to this country from the levant in cases or chests containing from 100 to 30 lbs. each. The teat is in ductio masses, composed of distinet whitish tears agglutinated together by a pale lirown or yellowish aubatance. It is generally much mixed with stalka, seeds, and other imparitips. The acparate tears are conshlered as the best. When the color in dark brown or blackish, it is to be rejected. It has a atrong peculiar odor, and bitterish, warm, acrld taste.-Tuosson's Dispensatory.

Gale of Find. The sea term for a continued storm of wind 1 the loweet degree in the fresh gale, the naxt a strong gale, and the next a heavy or hard gale.

Galena, a city of Jo Daviess coanty, Illinois, 230 milen north-west of Snringfield, situated on Fever or Bean Il'ver, and on the Galena and Chiesgo Railroad, and the metropolis of the great lead region. It is aix miles above the month of the river, which is navigable to this place, at all stages of the water, for the largent steamboats.: It has an intercourse by stesmboat with St. Louia, New Orleans, Louisville, Cincinnati, and other places on the Minesalppl and Ohio Rivara. The amount of lean ehipped from Galena and viclnity annueily is $42,000,000$ of pounds, valued at $\mathbf{4} 1,780,000$, employing about 2000 peraona. The moat prodactive ores of zino and copper, sulphnret and cartonate of zinc and sulphuret of copper every where abound in this region. Thousands of tens of zine lie upon the surface, and are neglected, because, in the alssence of coal, it can not be profitably amelted. It is popularly known there as Dry Bones and Black Jack. Sui, inate of iron is found in sheets of larger extent, ranging from a few inches to neversl feet in thlckness.

Galena (Fr. Plomb sulfure; Ger, Rleiglanz), is a metaliic-looking substance of a iend-gray color, which crystullizes in the enbical aystem, nad is susceptible of clanages parallel to the faces of the cube; specific gravity, $7 \cdot \boldsymbol{7} 592$; can not be cut; fusibie at the blowplpe witit exhulation of solphurous vapors ; is earity redaced to metaliic lead. Nitric acld first dissolves it, and then throws down sulphate of lead in a white precipitate; the molution affording, with plates of aine, brilliant laminie of lead (arbor Saturni). It censista of sulphur, 13; lead, 85 ; with a little iron, and sometimen a minute quantity of siliver. This js the richest ore of leud, and it occura in almost cvery geological formation, in veins, in massee, or in beds. It is almost siway accompanied ly sulphuret of zinc, different salts of lead, heavy nier finur apar, etc. Galens in powder, called alquifoux, is employed as a glaze for coarse stonework.

Galipot is a name of a white seml-solid viscid resin found on fir-trees; or an inferior sort of turpentine, jwor in oil.
Galleone. Certain Spanish treasure-ships with three or four decks, formerly employed is communicatlag with Peru.
Galley (Fr. galere), a low-luilt veasel propelled by aqils and oars, either on a single tier, or on tiers of beaches one above the other. The war vessels of anltiquity were all galleys. Among the Greeks, those chiefly mentioned are the pentecontori, which appear to have had 60 oars disposed in a single tier; nud tho trieres (Iat. triremen), vessels with three bunks of oara, concerning the disposition of which mueh controversy has taken place. It is commonly supposed that a trireme had three banks of oars, one alwove the other; but this is rendered improbable hy the circumetance of Pliny making mention of galieys having 30,40 , and even 50 banks of oars; for it seems hurdiy credible that se many conld have been arranged directly above each other. Some have suggesterl that the rows of oars in the trireme were disposed, not herizontally, but obiliquely; in which case an increase in the number of banks of oars would nugment the length, and probably the height woald be increased in proportion. See Mribomius, De Fulrica veterrm Trieremium.
Galleys were likewise cblefly employed by the maritime nations of the middle ages in the Mediterranean. Their use in naval war hardly ceased until the end of the $\overline{7}$ th century; and the Venetian republie, down to the period of its extinction, always inalntained a number of war-galleys. The Venetian galleys had $a$ single ther only, and all modern galleye followed the sume conatruction. These were formidable vessels in a calm, but unilit for sea, and accordingly found chietly In the

Mediterranen. The Venetians had also a large highpooped aort of galley calied geleazza, whence the word galioass and gailiott in o.d Englinh writers.
The Deal galley tia a long nurrow boat used by the Deal boatmen, and managed, on the most hazardous 00 casions, in saving the cruws of stranded vemaels, with consuinmate skifi. It is also used ly smugglers, on accoant of ite velocity. The galley is also the kitchen of a ahip.

The puniehment of the gralleys, i. e., the employment of condemned eriminala in the toilsome employment of rowing them, ia said to have originated under the Greek empire, as well at the name I'a $\lambda$ eapot, or galley-slaves-in French, gateriens. It was used by all the nations bordering on the Mediterranean. In France, under the eld juriaprudence, the punishment of the galleys wan the severest after that of denth. About the end of the reign of Louie XIV., when galleys themselves began to be dinused, the galley-slaves were employed in hospitaln, publio worka, ete.; and the name of the punishment was changed by the Constituent Assembly (1789) to travaux forces, compulsory labor, whence the word fiorcat for a er sinal so condemned. Under the code of the empire, the punishment was accomprnied with forfeiture of property, infamy, and branding, Isy an alteration of the law, effected in 1832, the brand was abolished; and the crimiasla, who had hitherto been intermingled in the three penal fortresses (Toulon, Rochefort, and Hrest), were elassitied. Toulon is now appropriated to those condemned for 10 yeare and under, Brest to those from 10 to 20, Rochefort to the condemned for life. The name Bagne, which is applied in France to prisons in which those condemned to compulsery labor are confined, is derived from the famous Bagnio prison at Constantinople, so called on account of nome bathe aituated $t^{\circ}$ ere. The principal arimes now punished in this manner by the French law are-nome acts of violence against the government or public law, coining and forgery, assaulta, followed by death, on legal officers, murder, unless under such aggravated circumstances as are punished by death, cutting and maiming, rape, abduction, burglary, highway robbery, burning of jnsulated buiidings, threntening letters, perjury, etc.
Gallipoli, a seaport town of south ltaly, kingdom of Naplea, province Terra di Otranto, on the east shore of the Gulf of Taranto, on the rocky isjet at the west extremity of n narrow peninsula, to which it is joined by a liridge; lat. $40^{\circ} 3^{\prime}$ N., long. $17^{\circ} 88^{\prime} \mathrm{F}$. It is fortified, has a castle, and is well built. Population abont 7000 (6709 in 1843). It is the principal port of the Mediterranean for the shipment of olive oil, and has, in consequence, a considerable trade. It is indebted for this distinction partly to its being situated in a country where oll is produced in the greatest abnndance, but more, perhaps, to the circumstance of the cisterns cut in the limestone rock on which the tewn is built, being peculiarly well fitted for the preservation of the oil. They do not differ much In appearance from a common water-tank. They are usually under the houses of the inhabitants; are arched over, with the exception of a circular hole, into which the oil is poured, and through which it is again druwn up. It will keep in these cisterns for an indefinite period ; and is materially improved, not oniy in clearness, but also in flavor. When the oil is to be shipped, it is drawn off from the cisterns into uteri, or akins, which are carried on men's backs to the shore, where the casks, being tilied, are conveyed in lighters to the ships.

Gallipoli has no harbor, but a bay or roadstead north-east of tho town. The latter has from 10 to 12 fathoms water; but it shoals toward tho shore; and vesnels of considerable burden shouid not conse within less than a musket-shot of the land. Those that come nearest to the shore, moor with their heada to the northwest, with two cables out ahead and two astern, in

## GAL

from 16 to 20 feet of water. The only danger in antering or leaving the roads is a blind rock at thelr entrance, about 500 yards N.N.E. from the fort. It has only about from five to seven feet of water; and as it is not marked by any buoy, pllots should be employed by foreigmers. A tunny fiahery is carried on inside the bay; but the nets are easily avoided. Winds from the north and north-weat throw In a heavy sea. About $1 \frac{\text { miles west from the town is the low, fat laland of }}{}$ St. Andree. It is sald, in Nories's Sailing Directions for the Mediterraneas, that there is a light-honse on this island. But, though a light-house on it would be of great service to shlps making the port, and though it be laid down in some of the charts of thla sea, the truth ls that none auch really exists, nor la there even a tower on the ialand 1 There are some lesser lslands between St. Andrea and the main-land. There is deep water bet ween the former and the neareet islands, but not between the latter and the town. A dangerous shoal lles about balf a mlle south of St. Andrea.

Crallipoll Oil is a coarse ollve oll, containing more or less mucilage, imported from a ses-port, so named, of the province of Otranto, in the kingdom of Naples.

Galle, or Gall-Nuts (Fr. Galles Noix de Galle; Ger. Gallapfel, Gallus ; It. Galic, Galluze; Lat. Gale; Arab. Affs; Hind. Majouphal; l'er. Mazu), are excrescerces produced by the attacks of a small Insect, which deposits its eggs in the tender ehoots of a speclea of oak (Quercus infectoria linn.), abundant in Asia Minor, Syria, Persla, etc. Galle are inodurous, and have a nauseously bitter and astringent taste. They are nearly spherical, and vary in maguitude from the aize of a pea to that of a hazal-nut. When good, they are of a black or deep olive color; their surface is tabercular, and almont prickly; they are heavy, brittle, and break with a tlinty fractore. They are known in commerce by the numes of white, green, and Gwe. The white galls are those which have not been gathered till after the insect has eaten lts way out of the nldus and made its eacape. They are not so heavy an the others, and are of a lighter color, and do not fetch so high a price. The green and blue palls are gathered hefore the inseet has escaperl; they are heavier and darker than the former, and are said to afford about one third more of coloring matter.

Galls are of great lmportance in the arts, being very extensively uaed in dyelng, and in the manufactnre of lnk, of which they form one of the principal ingredienta. They am the most powerful of all the vegetalle aatringents ; and are frequently used with great effect In medicine. Galls conaist principally of three aubatances $/$ tannin or tannic ach; y yellow extractive; and galle ack. The decoction has a very astringent and unpleanant bittor taste. The ancienta reckoned the gall-nuts of Syria superior to every other, and they atlll retain their pre-eminence. They are principally exported from Aleppo, Tripoll, Sinyrna, and Sald; those brought from the first come chiefy from Moanl, on the wastern bank of the Tigris, about ten days' fourney from Aleppo. 'The real Mosui galls are unquestionably the beat of any; but all that are gathered in the surrounding country are sold under this name. Those fmon Caramania are of a very inferior quality. The gulle nuet with In India are cearried thither fron Perain by Arabian murchanta. It la not unusual to dye the whitinh gall-nuts Dloe, In order to increane their value. Ihe fraud if, however, decected by the deeper blue tlage that lis thus imparted to them ; and by thelr being perforated and lightor thas the genoine blue galls,-llanchort on Coders; Ainaliz's Mat. Indica, elc.
The Giallonul Oak (Quercus lifectoria), \& native of Persia, Asia Minor, Arabla, Haypt, Moroceo, and Algeria, in its natural habitat, fa an ovargreen ahruh, whth a erooked stem, and seliom attaina six feet in helght. From the circumstance of its growing neur I'aria, whers it bears the wluter quite woll in the open
nir, though looing lte leaves In the autumn, it donbtless would be adapted to the cllmate of our middle and southern States. On thls shrub, It may be unnecessary to etate, is found the well-known "gall-nuts" of commeree, which are extensively used lit the manufacture of writlng-ink, and In dyelng. Thess excrescences are the product of the gall-fly (Cynips scriptorum), a suall ineect of a pale-brown color, which may often be found Inclosed in the galls sold in the shops of the druggists, collectorl before the fly had mude lta appearunce.
Galvanised Iron, ls the name given to lron tinned by a peculia patent process, whereby It resists the ruating influence of damp alr, and even molature, much longer than ordinary tin-plate. The following is the preacribed process: Clean the surfuce of the iron perfectly by the joint action of dllute acd and friction, plunge it into a bath of melted alnc, covered with sal-ammoniac, and atir it about tlll it be alloyed ouperficially with this metal; when the metul thus prepared lis exposed to humbdity, the zine is suid to oxydise alowly by a galvanic, action, and to protect the Iron from ruating within it, whereby the outer surface remains for a long period perfectly white, in circumstances under which lron tinned in the usual way would have been supericlally browned and corroded with rust.

Gabanized Tinned Iron,--One of the moat remark. able advancements in the Iron munufacture in recent years has been the Introduction of galvanized tinned iron for an almost innumerable variety of purposes. This material consists of Iron plate coated with tin, not by the ordinary tin-plate process, but by galvanle deposition. It eerves as a aubatitute for plaia Iron, for tiu-plate, for zinc, and for load, under certain opecial circumstances. It is stronger and more duralile, for muny purposes, thun lead or zinc; it la better than plula iron where rust is to be avolied; it is superior to lead or zinc in warm elimates, inasinuch as it does not expand and contract to so great a degree. Whthinside a bouse and without, in vessels mind in utensils, in towns and in the country, in manufuctures and In tomeatie economy, we now find this eubstance employed. We have galvanized tinned iron corrupated plates for roofing, and for the sides and doors of hooses ; in another form there are plaln plites for the same purpose; roofs for sheds, roofs and sidea fur atore-houses, and many similar purposes. Then, beshles the aheet form, there are round and square bars, hoop-iron, wire, tuben, and pipen, nails, rivets, bolts, screws-all formed of iron thus protected by the gal-vano-tin process. There is this advantage also, which Is unattainulile by the ordinury tin-plate process, that articles can be tinned after they ure made in the proper form of lron, provided they are of enall dimensions. The plutea are really a combination of three metals ; for, in the firat place, a layer of tin is precipitated on the iron plates from a solution of chlorid of tha by the galvanic process; and then a layer of ainc is obtained by dipping the sheets into molten zinc.

Galveston, city, pert of entry, wil caplad, Gal. veaton conuty, 'lexas, 350 miles from the $S$. W. P'assage of the Miasisslppi River. Jast. $29^{\circ} 18^{\prime} 32^{\prime \prime}$ N., loug. $6^{\circ} 44^{\prime} 38^{\prime \prime} \mathrm{W}$. It is altuated on the east end of Galveston feland, and is the great commercial eluperium of Texas. It was settled in 1837. It containa a bank, capital $\$ 300,000$, a steam foundery, 4 printing-oflices lasulng 2 tri-werkly; 1 aemi-weekly, and 1 wookly newnjaper, 3 cotton-preases, 50 stones, ma.i pejulation, in 1856 , alwut 6000 . Tonnage in 1851,6183 toss.

The bar outelde Galveston harbor and bay, beween the northeant end of the islund and I'oint Bolivar on the malaland, has not wore than $\mathrm{I} \frac{1}{\frac{1}{9}}$ foet of water at the higheat aprings, and but 10 feet at ebb; hence the amaller clasa of veasale, or thone under 200 or 250 tons are most aulcuble for tha trude of the part, as well as fur that of almont all the other ports ou the north and east aldes of the gulf, the deticiency of water

## Increase.

The value lase than that whan the valu
belng all but universal. Though the land be low, the $/$ and foreign, $\mathbf{8 7 6 , 2 4 0}$-total, $\mathbf{6 4}, 418,498-$, Texas has houses of Galveston may be seen from the mast-head at a'diatence of eaveral miles. Vessels drawing eight feet of water and upward nhould, however, not approach tho bar nearer than six fathoma, without heav-ing-to and making the signal for a pilot, which ia promptly attended to. Vessels drawing less than oight feet of water may approach the bar tili the water shoula to four fathoms before heaving-to. Veasels making the port in the night ahould invariably anchor In five or six fathome ; and the holding ground being excellent, those who are well found in anchors and cables have nothing to fear. Pilot-boats are conatantly on the look-out ; and shipe should on no account attempt croasing the bar tili thoy have got a pilot on bourd. In the harbor there ia from 18 to 30 feet of water. The bay, which atretches abour 35 miles from north to south, and from 12 to 18 miles from east to west, has not generally more than nine feet of water, and is intersected by a bar, on which there la only from tive to six feet of water.-Kennedy'a Texas, p. 20. Several very conaidarabie rivers have their embouchures in the bay, so that the town has a conaiderabio commund of Internal navigation.
The present year ( 1856 ), ciosea an epoch in the growth of sugar in Texas. The almost total destruction of the plant by the unprecedented cold of last winter will reduce the product of the coming year to almost nothing. Shouid all who have heretofore produced sugar deterinine to go on, It is doubtful whether the growing crop of cane wili afford much more than seed sufficient for a re-commencement. The receipts of Texas sugar und molasses, at thls port, for the calendar years named below, were as foliowa :

|  | Molasag, bbla, | ${ }^{\text {arf }}$ h had |
| :---: | :---: | :---: |
| 1851 | .... 2,48 | 1,086 |
| 1842 | . 8,578 | 1,829 |
| 1853 | . 8,086 | 4,076 |
| 185 | 0,398 | 4,754 |
| 185 | 6,728 | 4,781 |

For the commercial year ending August 31, 1855 , the receipts of sugar were $6: 175$ hihids, against 7570 hhds. for the year just cioned; and the recelpts of molasses were then 7504 bble against 8668 blis. for the year last past. We apprehend that two years will be required tu bring the production again up to thoso figurea
The following is a comparative statement of shipments of the lending articios of export from Galvestou fur ench calendar year aince 1853 :

Of vessela belonging to the port of Galveston the custom-house booka of the present year (1856), show that there are:

The amount of tonnage of vessels cleared at this port for the year juat ended was 106,670 tons against 94,118 the year prevlous. Tha number of peraons employed on board was 8467-of whom but two were boys-belng an increase of but two employed during the year.
There ls, we beliove, no article grown, for human consnmpition, In any State of the Uuion, which ia not alroady, or may not be produced in some portion of Texua, such is the variety of aoli, climate, and general clrcumstances. In the production of the great staples of wheat, corn, beef, cotton, and sugar, no State in the Union approaches it, ao great is the extent and productiveness of the soil adapted to these articies. It is eatimated that the augar region is capable of producing a crop of $3,000,000$ of hogeheada, or much more than is necessary to aupply the inhubitants of the whole Uulon. $60,000,000$ of ueree of the landa of the State are situated within the cotton-producing reglon, and one third of this number are believed to lie well miapted in point c. soil to the growth of that plant. Thero is no doulit of the capacity of the country to produce a much iorger crop than ia now yielded by the whole Sunth, wille the expenae of production is much lesa than the genurni average in other Statos. -Ciahreston Price Current and Census Peports.

Galway, the connty town, formeriy dealgnated the Liberties of Galway, und a county la itasif, having an exciusive local juriadiction, extending two milies on every sile except the south. It atands on the northern ahore of the liay of Galway, Ireland, on the eastern lank of the river of the aame name. It is auppos."' by aome to bo the Nngnatia of Ptolemy. it cortainly was considered .. position of much importance from the earlient period, as in tho divisions of tite isiami into north and south, ut first made by the descendants of lleremen, and afterward repeatad by Comn and logan, it was ilxod nipon as the easturn extremity of the line of clenurention, whilei proceeded eastward to Dublin. Galway la likely to become a pince of aome note, being tho proposed eastern terminus of the subnarine tolegraph communication between Burope anil the United States.

Gama, Vasco da, the tirst European who reachod India by doubling tho Cupe of Good Hope, was born int Sines, a small sua-port of Portugal. Of his eariy history so littio has been recurded, that even the date of hia birth ia unknown. On attalning manhood, he found that the auccess of Columbua had given a powerful impulse to the opirit of maritime adventure.

On the 4th of July, 1497; Vasco da Gama sailed from Lisbon with a squadren of three vessels manned by sixty sallors, bent on making hin way to Indla round the Cape of Good Hope, then known as the Cabo Tormentoso, or Stormy Cape. The hardships and dangers to be encountered were sppalling, and led to a mutiny, whleh was with difficalty quelled by the firmness and prudence of the commander. He doubled the Cape at length, and reached in sufety the small tuwn of Melinda, where he secured the services of an Indian pilot. In 23 days they reached Malabar, and on the 20th of May 1498 they came to anchor at Calicut. Guma wus well received by the zamarin; whom, though not without difficulty, he convinced of the advantsges that would acerue to his country by the establishment of a commercinl treaty with Portugal. Gama than turned his prows homewnrd; and, having touched at various points on the Asiatic and African coasts, he once more cast anchor in the Tagus in the September of 1499 , after an absence of 2 years and 2 months. Emmanuel received him with great honors, ennobled hlm, and gave him the title of sdiniral of the Indian, Persian, and Arabian seas. The effect of Gama's voyage was soon visible in the ruined trade of the Italian commerclal republics, which had hitherto monopolized the traffic of the East. In prosecution of Gama's discoveries, another fleet was sent out to India, under Cabral, who accidentally discovered the Brazils, and on reaching his destination established a factory at Calicut. The natives, instigated by tho Moorish merchants, who were jealous of the lortuguese, rose up in arms, and muriered all whom Catiral had left behind. To avenge this eruelty, the Portuguese fitted out a powerful armument, of which the command was given to Gamm. The almiral set sail, and devastated those parts of Africa and India whero he had formerly been recelved In a hostilo spirit. He exceuted especial vengeance upon Culicut, which he lombarded nud reduced to ashes, at the same thme hanging the ssilors of the vesuels in the harbor which had fallen Into his hands. Ile then sailed away to Cochin, where he established a fuctory, from which the power of Portugal ralliated nver India. In 1503 he returned home, und as before was welcomed with honors and titles, but was not limmedintely reappointed to the commanil in Indin. He remalned at home in inuction during nearly 20 years ; but in 152. (some years after the denth of the great Albuquerque, wholad been consolidating the Portupuese power in the East), Guma was appointed viceroy' of Portupuese Indi. Not long after arriving at Cochin, Gama lied, in 1525, and was buriel there; but 13 years later his bones were dininterred and conveyed to Dortugal by order of John III., king of that country.

Vasen da Gama was a man of great ability, courage, and enterprise; but he possessed none of these qualities In a higher degree than many others of his cotemporaries who have lonig since pased into obslivbun. lle owes no small portion of his fime to the fact of his being the hero of the national eple of Porturgh. The moment of him doubling the Cape of Gond llope, and secing in the clouds the Spirit of that atormy region, has been often seized by painters as a at riking subject for pictorial delineation. Ine of the most remarkable of these pirtures is that liy the late Davil Scott, of Elinhuris.-E:. If.

Gamboge (Fr. Gomme gutle; (ier, Gummigutt; It. Giommn gulls; Jat. (iummi gultre, C'umbogia; Arah. Oasirareirund; Slamese and C'malngan, Rom! $)$, a concrete vegetable juice, or gum reain, the produce of the Cirrinias Cambogin, a forest-tree of the genus which affind the mangostein, the most exgulate frult of the Fant. The dintrict which yield gamonge lie on the eant alde of the Gulf of Siam, hetween the latitules of $10^{\circ}$ and $12^{\circ}$ north, comprosing a portion of Sian nud the kingdon of Cambrija, whence Ita Engliwh nance. It is obtained by making inelstons In the bark
of the tree, from which it exudes, and is collected in vessels placed to recelve it. In these it assumes a firm consistence; and being formed into orbiculur masses, or more frequently cylindrical rolla, it is at once fit for the market. It is of a bright yellow color, opaque, brittle, breaks vitreous, has no emell, and very little taste. Specifle gravity 1.22. When taken Internally, it operntes as a inost violent cathartic. It forms a beautiful yellow pigment, for which purpose it is princlpally used. The Dutch began to import it sbout the middle of the seventeenth century. The greater part of the gamboge of commerce first finds its way to Bangkok, the Siamese capital, or to Suigon, the capital of lower Cochin China; from thence it is carried by Junks to SIngapore, whence it is shipped for Europe. Its price at Singapore variea, according to quality, from 30 to 80 dollars per picul. Dark-colored pieces should be rejected.-Cinaw ronsis Embascy to Siam, p. 425 ; Thomson's Chemistry.
Ganges, the principal river of Ilindoostan, through the north part of which it fiows from west to east, traversing the centre of the British presidencies, lienral sud Agra, almost in their entire length. It rives by two principal heads, Bhagirathi and Alakananda, in lat. $31^{\circ}$ N., and long. $7^{\circ}$ E., from sn immense mass of anow at an elevation of 13,000 feet ; flows at first S.W. to IIurdwar and thenceforward inostly E: S.E. to the Buy of Bengal, which it enters by numer. ous mouthe, its eastmost arm uniting with the Megna or Brahmaputra, and its west branch being the llooghly River. Total course estimated at 1500 miles. In Its course it reccives 11 affluents, sume of which sro equil to the Rhine, and none smaller than the Thames; the principal are the Jumna, Ramgunga, Goomty, Goggra, Sone, Gunduck, Koose, Mahanuddy, snd Teesta, which have courses varying from 300 te 660 miles in length. On its banks are numerous cities and towns. Between Ilurdwar and Allahabad it is usually from 1 mile to $1 \frac{1}{4}$ niles across; below which its breadth increases frequently to 3 miles, and at 560 nilles from the sen it is 30 feet in depth, and so continues to near its mouth, where, however, the quantity of deposit it brings down often forms bars and shoals. In tho annual overflow of the river, when it is at its helght in July nud August, the waters rise to 32 feet. The annunl deposit of mud at its delta is estimated at $6,(0) 0,000,000$ cubic fect. It is crossed by no bridges after it leaves the mountains. The (anges is the sacred river of the JIindoos, and is so called as Howing through Gang, the carth, to heaven.
Gangway, a narrow jlatform or range of planks lad horizontally along the upper part of a ship's side from the quarter deck to the forecastle, preculiar to $\left.{ }_{k}{ }^{2}\right]_{j}$ w that are waisted, for the convenience of walking
se expeditiously fore and aft than by descendin; into the waist. It is fenced on the ontside hyinn st mehions and ropes or rails, and in vessels of war with a netting in which part of the hammoeks are stowed. In merchant ahips it is called the ganglowari.
finmoray is also that part of a shiphen side, botio within and withont, by which persons enter nind de pirt. It is provided with a nuficient number of steps or cleats nailed upon the ship's side nearly as low as the surface of the water, and sometimes furnishel with a ralled nceommodathon ladder resembling a fifght of staits projecting from the ship's sido aud sceured by inon litaces.
(inngray is ulsu) used to nignify n narrow pasakge left in the lolil when a ship is laden, in order to entef any particular piace as occasion may require, whethe: tu examine the situation of the provisiona or cargo, , $^{\prime}$ discover and stop a leak, or to bring out uny article that is wantel. Jinally, gangway implies a thoroughfare or narrow pasmage of any kind.

Tu bring to the gnagray; a phraso algnifying to punish a semman by weizing him up and togging him with a cat-o'-nluetails.

Gantlet, or Gauntlet (Fr. gantelet, from gam, a we value the quantity of light given by $1 \mathbf{l b}$. of tallow glove), a kind of iron glove, with fingers covered with small plates; formerly worn by cavallers when armed at all points, and which used to be thrown down as token of challenge. Ganntlets were introduced about the 13th centary.
Garnet, Garnets (Fr. Grenats; Ger. Granaten, Granatstein; It. Granati; Lat. Granati; Rus. Granatnoi hamen; Sp. Granadas). There are two specles of garnet, the preclous, and the common. The color of the first is red; and hence the name of the mineral, from its supposed resemblance to the fiower of the ponegranate; passes from Columblne red, to cherry and brown red; commonly erystallized. External lustre glistening, internal shining, vitreous; transparent, sometimes only translucent; specific gravity 4.08 to 4.35. The color of the common garnet is of various shades of brown and green. Different colors often appear in the same mass: tranglucent; hluck varieties nearly opaque : specific gravity' from $3 \cdot 66$ to $3 \cdot 75$.Tuosson's Chemistry. The finest varieties come from India, and some good specimens have been received from Greenland. When large and free from flaws, garnets are worth from $£ 2$ to $£ 5$ or $\mathbf{£ 6}$, and even more; but stones of thls value are of rare ocqurrence, and always in demsnd.--Mawe on Diamonds, etc., 2 ed., p. 113.

Gas. This Intlammable seriform fiuid was first evolved from cosl by Dr. Clayton, in 1736-1739.Phil. Trans. 1te application to the purposes of illumination was first tried by Mr. Murdoch, in Cornwall, in 1792. The first diaplay of gas-lights was made at Boulton and Watt's foumilery, in Birmingham, on the occasion of the rejoicings for peace in 1802. Gns was permanently used to the exclusion of lampe and candles at the cotton mills of l'hillips and Lee, Manchester, where 1000 burners were lightel, 1805. Gns-lighte were flret latroduced in London, nt Goldenlane, Aurust 16, 1807. They were used in lighting Pall Mall, in 1809; and were general through London in 1814. They were first used in Duhlin in 1816, and the strects there generally lighted in Octoher, 1825. The gis-plyes in and round London extend to 1100 miles.-Hayms.

Every one must have remarked that most apecies of caul, when lgnited, give ont large quantities of gas, which burns with nuch brilliancy, ylelding a great quantity of light as well as of heat. Dr. Clayton scems to have heen the first who attemptel, about 1736-1739, to apply this gas to the purposes of artillicial illuminution; but his experiments were upon a very limited scule, and no further attention was paid to the sulject till more than half a century afterward. At length, however, Mr. Murdoch, of Soho, institutel a series of judkeous experiments on the extrication of gas from coal; and, by hils ingenuity and angacity succeeded in estahlishing one of the most capital inprovements ever made in the arta. Mr. Murdoch found that the gas might he collected in reservoirs, purifled, conveyed ly plipes to a great distenco from the furuace where it was generated; mol that it nifords, hy its slow combustion, when allowed tu escape through small oritces, a beautiful and steady light. 'This great diseovery, which places Mr. Murloch in the tlrst rank among the benefartors of mankind, was flrat hrought Into practice at Redruth, in Cornwall. In 1802, it was applied to light Mr. Murdoch's manufactory at Solor; in LNo5, it was adopted by Messrs. Phillips anil Lee, of Manchester, lio the lighting of their great cotton mill; and la now employ ed in the lighting of the atreets, theatres, and other pulilic buildings, factories, ete, of all the considerable towns of the empire, and also in most consillerabie tuwn of Einrope and America.

Gas llght is indehtel, for its rapld dlffusion, not more to lts peculiar suftness, clearness, and unvaryling intensity, than to its comparative cheapness. Accoriling to Dr. Thomson (Encyc. Brit., art. (ias Laures), if

In candles at 1s., an equal quantity of light from cosl gas will not cost more than 24 y ., being less than a fourth part of the cost of the former. Oll and other anbstances have been used in furnishing gas for the purpose of Illuminatlon, but none of them has answered so well as coal. Most of the oil gas eatablishments have been abandoned. The construction of gas works on a large scale, and the earrying of pipes through the atreets and into housea, etc., is very extensive, and requires a largo outlay of capltal. Hence most of the gas lights in the different towne are sapplied by jointstock companies. Many of them have turned out to bo very profiable concerns.
The first attempt to supply elties in the United States with gas was made at Baltimore in 1821, and at New York $\ln 1823$. Both of these attempts were unsuccessful. The New York Gas-Light Company, with a capital of $\$ 1,000,000$, was incorporated March 26th, 1823. It was reorganized in 1827, and then commenced a euccessful bueiness. The Manhattan GasLight Company was ineorporated with a capital of $\$ 2,000,000$, liebruary 26th, 1830. Upon these two Companles the city of New York is now entirely dependent for gas. The former Company aupplies all that portion of the city which is below Grand-street, and the latter Company all that portion which 10 hetween Grandetreet and Serenty-ninth street. The New York GasLlght Company has 130 miles of pipes laid through the streets of the city, rauging from 4 to 18 inches in dlameter. In 1855 this Company made $300,000,000$ cubic feet of gas, consuming about 45,000 tons of coal. It furnished gas to 3,200 street lamps, and to 9,000 private consumers.
The Manhattan Gas-Light Company has 200 miles of pipe laid through the strcets of the city, ranging from 3 to 20 inches in diameter. In 1850 this Company made $470,000,000$ eubic fect of gas. It lighted 7,148 atreet lamps, and furnished gas to 17,300 private consumers. These Companies jointly light and keep in order for the city about 10,150 street lamps, for which they are paid \$25 per aunom for each lamp. This payment nets the Companics, according to their estlmate, only $\$ 150$ per 1000 cubic feet of gas consumed in the lamps, which ta just one half the sum charged to their private customers for gas, but la doultess protitable even at that low rate. The gas is manufactured from rich bituminous coals, such as Cannol coal, Newcastle ronl, and the Albert coal of Novn Scotia. A chaldron of Noweastle conl, welghing 27 ewt ., will yiold:

A chaldron of Cannel coal will yield nn average of 12,000 culice fect of gat. The gits coul used in New York costs akout $\% 10$ per chaldron. The coke, or shell of the coal ufter the gas is extracted, is worth ahout \$4 per chaldrom, and makes a very pleasant fire in a grate. The bitumiuous coml is thrown in a hot iron eylinder, or returt, as it is culled, whose mouth is closed num sealed tight with solt clay. The vapor of the coal, disthling in the retort, passes thruugh a tulie, by which it escappes into a series of vessels e.tled the condenser, whero it cools and deposits all its tar and other combensible impurities. Thence it passes through nuother series of vessels called the purifler, contahing quicklime, of the consinten y y eream, which cleanses the vapor of its sulphurous intermixtures. liron the lime the purilied vapor of the coal, or, in other woris, the gas, now flowa into the gasometer, and is ready fur use. From the gasometer it Is driven, through main and service pipes, lato the consumera' hurners.
The machinery of all gas manufactories is the same in principle, anal seems now to be almoat perfect. The chief limprovements maile lately in the machinery consist in tho manner of applying to the gusometer the pressure which regulates the force of tho gas.

A very careful and accurate analysis and photometric examination of wood gas have heen made by two eminent analytical chemiats (Dr. Woleott Gibbs, of New York, and Dr. F. A. Genth, of Pbiladelphla), whose report of their chemical results furnishes a highly antisfactory explanation of certain curious phenomena that accompany the combustion of this gas.

Thes examined two varicties of gas, one made from old fleld pine, the other from small second-growth oak, with the following resulta :

These gases were collected at tho Ninth Ward Works, and taken to New York for analysis. Their flluminating power was tested and found to be over / 26 candlea for a five-feet burner.

Mr. Murdoch in 1797 exhllited publicly the results of his more matured plana for the preparation of coal gas. The following year (being then connected with Messra. Houlton and Watt's enginoering werk-shop) he constructed an apparatus at the Soho founilery for lighting that estallishment, with suitable arrangements for the purification of the gas ; and these experiments, Dr. llenry states, "were continued with occasional interruptlons until the epoch of the peace of 1802 , when tha illumination of the Soho manufactory afforded an opportunity of making a public display of the new lighta; and they were made to constltute a principal feature in that exhibition."
In 180t-5 Mr. Murdoch had an opportunity of carrying his plans into effeet un a still larger scalv, by means of the apparatus erected under his superintencience in the extenaive cotton milla of Mesars. 1'hilips and Son of Mancheater.
It has been alleged that gas-lights were used in France before they were known in Fingland; but as the earlieat exhaltition of thead lighta, on which the claim of priority of discovery is founded, took place at Paris $\ln 1802$, it is cevldent, from the foregoing statemente, that the exhlbition alluded to was ten years nubsequent to the first experiment of Mr. Murdoch on the aubject.
The practicability of lighting by means of coal gas having been domonstrated lyy Mr. Murioch, a number
of aclentific men applled their talents to the further dovelopment of the art. Dr. Henry, the celetirated chemist, lectured on the sulject in 1804 and 1805, and furnished many hinta for the improvensent of the manufacturo. Mr. Clegg, an engineer in the ewployment of Boulton and Watt, was a worthy suecessor of Murdoch, and for many yeara was the moat eminent gas engineer of England. A good deal of the machinery of the gas-honse in ita present form was contrived by Mr. Clegg, and to hlm, also, we are indebted for the ingenious wet gas-meter. In 1813 Westminste: Bridge was first lighted with gas, and in the following year the atreeta of Westminster were thus lighted; and in 1816 gas became common in London. So rapld was the progress of this new mode of illumination, that la tho $\mathbf{c}$ : arae of a fow yeara after it was first Introduced, It was adopted by all the princlpal towns in the kingdom, for lighting strects as well as shops and public odifices. In private houscs it foond its way more slowly, partly from an apprelients, n, not e.atirely groundless, of the danger attending the use of it, and partly from the anoyance which was experienced in many cases through the carelesa and lomperfect manner In which the service-plpes were at first flted up. Thees inconveniences have been in a great measare, if not wholly, removeil by a more enlarged kuowledge of the management of gas; and at present there are few private houscs In large towns which are not cither partially or entirely lighted up by it. As the demand for gas increased, various improvements were from time to time Introducel, hoth lin the mechanical arrangementa and ln the chemical operationa of tho manufacture. The rapid Increase in the population of the metropolis, and of all large towns, has naturally led to an Increased consumption of gas; and the application of gas to the purposes of warming anil cooklug lias also further increased the demand for it. Hence it has been nat only necessary that new gas-works should be erected for the supply of new diatricts, but that the resources of old works should be enlarged. It is only a few years ago that a gas-holder capable of storing 250,000 cuble fect of gas was regarded as of enormous size; at the present time gaa-holders are mate of doulife that eapacity, and we oceasionally hear of them of the capacity of upiwaril of a million cubic foet. There Is one auch at Philadelphia; it is 140 feet in diameter and 70 feet in height. Nor will sucb dimensions ss these be regarded as superfluous when it is atated that some of the large metropolitan works send out each from a million to $\mathbf{a}$ million and a half enbic fect of gas it one uight in mld-winter.

Gauging, the art of measuring the contents of easks or vessela of any form. Gauging forms a part of mensuratinn, but is frequently practiced by persona unscquainted with its theoreticnl principlea, who work by certain rules, with the ald of a ganging-rod, and by the sliding rule. The ordinary gauging-rod consists of four rules made of box-wood, each a foot long, and united by brass joints, so that it may be folded together. The term gauge or gage is applled in various ways, but always with reference to measure or proportion; or, in the literal sense of the word, to that which bounds or confines something else. Thus, in physics, it is applled to several instruments or apparatus for measuring the atate of a phenomenon; such as the wind-gage, raln-gage, the barometer-gage for measnring the degree of pressure of the air within the receiver of an air-pump, etc.; in architecture, to the length of a slate below the lap; in ruilway engineering, to the space between the rails, and the like. See Gage.
Gazette, a paper of publle intelligence and newa of divers countries, first printed at Venice about the yesr 1620, and so called (some say) because una gazetta, a suall piece of Venetlan coin was given to buy or read it. Othera derive the name from gaza, ltalian for magpie, i. e. chatterer.-Truslen. A gazette was printed in France in 1631; and one in Germany in 1715.Nour, Dict, Hist.

Gauze. Brass wire-gauze o. eloth is now mede of such exquisite fineness that the separate threads can only be detected by close inspection. Messrs. Estivant, who carry on the brass manufacture on a scale of great magnitude in France, produce wire of remarkable minuteness. There were in the French department of the late exhibition several specimens of brase gauze, each showing the lituit of fineness to which the nanufacturers had attained at the date of the sev: eral industrial expositions in France. Each date displayed a degree of flneness greater than that of any previous date; and the specimen for 1851 was the finest of all. It almost exceeds belief that metal could be wrought to such an exquisite degree of minuteness as in this web. There were 67,600 meshes in one square lnch of this lrass gauze, or 260 parallel threads ia one linear inch. The wire-drawing in the first instance, and the weaving afterward, must have been very carefully conducted.

Geelong, a township of Victorin colony, South Australia, comprising five contiguous villages, at the heal of the west arm of Port Philip, 40 miles south. west of Melbourne, with which it hins constant comnunication by steam. Population in 1846, 2,065. It has an inerensing trade in wool and grain, though large vessels can not upproach it within seven miles. The liver larwon flows past its west border to the Soathern Ocean.

Consiguecs, Masters, and Lightcrs at Geelong.-We find the following declaration on the respective rights and duties of consiguces, mnsters, und lightermen, In the proceedings of the Geclong Chantur of Commerce. The motion of which notice had been given by Mr. MeKellar, "thant the committee consider tho subject of the delvery of gools by lighters," was brought under discussion, and nfter careful examinntion of the law relating thereto, it whs clearly ascertained that It is the duty of the master of the vessel, as soon as the arrival of the ship has heen reported, to gire notice thereof to the owners or consignees of the gools on board; that he can not escape from his liability by immedintely landing goods at a pulhle wharf, without giving such notice, beenuse the wallvery at the wharf is not a dellvery to the consignee; that if they are landed wlthont such notice being given, and are destroyod upon the wharf by an aceldental fire before the conslgnee las had an opportuuity of taking them away, the alip-owners will be responsible for the 'ess, but that the lighternan or master of the vessel is

1) 1,
bound to keep the gooda on board or on the wharf at his own risk for a reasonable time, to enable the conaignea or his assigns to come and fetch them; and that the lighterman is not released from his responsibility untll he has obtained a receipt for the goods upon their delivery to the consignee.

Gelatine (Eng. and Fr.; Gallert, Leim, Germ.) is an nnimal product which is never found in the humors, but it may be obtained by boiling with water the soft and solid parts; as the musclea, the skin, the cartilages, bones, ligaments, tendons, and membranes. Isinglass consists almost entirely of gelatine. This substance is very soluble in boiling water; the solution forms a tremnlous mass of jelly when it cools. Cold water has little action upon gelatine. Alcohol and tannin (tannle acid, see Galifnuta) preclpitate gelatine from its aolution; the former by abatracting the water, the latter by combining with the substance itself into an insoluble compound, of the nature of leather. No other acid except the tannic, and no alkali, possesses the property of precipitating gelatine. But chlorine and certain salts render its solution more or less turbid; as the nitrate end liehloride of mercury, the proto-chloride of tin, and a few others. Sulphuric acid converts a solution of gelatine at a boiling heat into sugar. Gelatine consists of carbon, $47 \times 88$; hydrogen, $7 \cdot 91$; oxygen, $27 \cdot 21$.

Gelatine Casts.-The beautiful may often be created out of mere refuse ; an example of this is afforded by the articles now made of gelatine. The French show peculiar tact in procuring gelatine from the waste remnants of the skins, bones, tendons, ligaments, and other gelatinous tissues of animals. The well-ordered abattoirs of Paris and other large towns, afford facilities which we do not possess, for the economical application of all the waste parts of the slaughtered animals. M. Grenet has been the first to fabricate, on a largo scale, out of various residues of animal bodies, henutiful and diversified products which have hitherto been mado of the more costly material isinglass. He produces different kinds of gelatine, in thin sheets; pure and white films eut into threads for the uso of the confectioner; very thin, white, and transparent sheets, called "papier glace," or ice-paper, for copying drawings; dyed, gilt, und silvered gelatine shecta, adapted to the fabrication of artificial flowers and to the production of an almost endless variety of ornamented articles; and sheots embossed or stamped with elegant patterns. The gelatine is used, too, ns n material in the dressing of etuff gools, and ulso ns a refining ingredient in the clarification of wine.

Gem (Lat. gemma), in seulpture, a precious stone, used for the purpose of senlpture. The pructice of enrving gems is of remote nntiquity, though it is doutitful whether they were able to eut the tiamond or use the omerald and topaz for sculptural purposes. The stones usually selected are rock-crystal of different colors, jasper, chalcedony; onyx, cornellan, and blood-stone. Among the Greeks the art was carried to great perfection; but having fallen with the other arts into disuse, its revival was effected in Ituly in the 15th century, and modern masters lave more than rivaled some of the nucient productions.
Geneva (Du. Genever; lir. Genierve; Ger. Gaud, Genever; lt. Jequa di Ginepro; Lat. Junipera aqua; Sp. Agua de Encbro), n spirit olitained by distillation from grain, rectitied with the ndition of juniper herries. The latter gives to the spirit that peculiar flavor by which it I- dlatinguished, und are niso said to render it liuretic. Geneva is n corruption of gevierre, the Fromeh term for the juniper berry. By far the best geneva is made in Holland, where its manufacture is enrried on to a very grent extent. The distillerios of Schlerdam have long been famous, and are at present in a very prosperous condition. Schiedann geneva Is made solely of spirit obtained from rye and barloy; tlavored with juniper berries. It becomes milder, und
acquires, as it gets old, an oily flavor disiliked by Hollandery; hence nearly the whole of the "Schiedam" is exported, principally to the East Indles. There cre no fewer than 100 diatilleries in Schledam, 200 in other parts of Holland, and not more than 40 in Belginm. The entire annual produce of the distillery in Helland is astlmated at $2,000,000$ ankers, or $20,600,000$ wine gallons, of which about two thirda are exported.-Cloest, Description Géographique des Pays Bas, p. 82.

Crenoa, a maritlme elty of Italy; once the capital of the famous republle of that name, now of a province of the kingdem of Sardinia, at the bottom of the extensive gelf to whlch it givea its name; the lighthouse being $\ln$ lat. $44^{\circ} 24^{\prime} 18^{\prime \prime}$ N., long. $8^{\circ} 54^{\prime} 24^{\prime \prime}$ E. Population in $1848,100,382$. Genos is one of the fineat cities of Europe, and noted as the birth-place of Christopher Columbus, in the year 1441. In general, the atreets are Inconvenlently narrow; but some of the principal ones are moderataly wide, nud consist almost entirely of puhlic bulldinge and privato palaces orected during the period of her prosperity. Being built on a rising groind, in the form of an amphitheatre, the appearance of the town from the sea is most magnificent, and justifies the opithet given to her of " la superba."

Its ancient inhabitants were th ugueres, who aubmitted to the Romans, 115 n.c., and underwent the revolutions of the Roman empire tlll A.D. 950 . The Genceae revolt against their count, choose a doge and other magistrates from among their nolility, and became an ariatocratic republic, 1030 to 1034 . Several revolutions occurred up to 1528 , when the celebrated Andrew Dosia rescued his country from the dominion of forelgn powers. Bombardel by the French In 1684, and by the British in 1688 and 1745. Genor wias taken by the Imperialists, December 8th, 1746 ; but their oppression of the people was auch, that the lutter anddenly rose and expelled their conquerors, who again besieged the city the next year, August 17, without effect. Genoa lost Corsica, 1780. The celebrated bank failed 1750 . The city austained a miege by a British fleet und Austrian army, until literally atarved, and was evacuated by capitulation, May, 1800 ; but it was surrendered to the French soon after their victory at Marengo. The Ligurian republic was founded upon that of Genoa, in 1801, and the doge solemnly investeci, August 10, 1802. Genoa was annexed to the French empire, May 25, 1805. It aurrendered to the combined English and Sicilian army, April 18, 1814 ; and was transferred to the kling of Sardinia in 1816. Insurrection against Victor Einmanuel, April 1st ; nubulued, April 11, 18.19.

Port.-The harbor is semicircular, the diameter being about 1000 fathems. It is artitheinl, being formed by two gigantic moles having apposite directlons. That on the east shle, called the olid mole (molo wechio), projectis from the centre of the city west by south. It is alout 260 fathoms in leugth, and has a battery near its midille. The new mole (molo nuoro), on the opposite side of the port, adjolins the sonthern extremity of the auburb of St . Pietrod'A rena, projecting about $\mathbf{2} 10$ fathoms from the ahore in an K.S.E. direction. The mole healk hear from each other N.F. by F. and S.W. by W., the distance between them, forming the entraisee to the hartor, being about 350 futhoms. The llght-house is without the port, on the west aide, near the extramity of a proint if land, and contiguonn to the lottom of the new mole. It in a lofty aquare tower; and as it atands on a high rock, and in palnted white, it in visible fo clear weather at a great dastance. There is also a hacoor light at the extremity of the new mole. The.e is no dillienity in entering the harbor; the ground is cloun, and there is plenty of water, particularly on the shle next the new inole; eare, however, must be taken. in coming from the went, to glve the light-house joint il good offing.

Moderate-sized merchantmen commonly anchor inside the old mole contiguoua to the porto franco, or bonded. warehousea; having a hawser made fant to the mole, and an anohor ahead. Men-of-war, and the largeat class of merchantmen may anchor inside the new mole, but they must not come too near the shore, Shlps somatimes anchor witheut the harbor in from 10 to 25 fathoms, the light-house bearing N. $\frac{1}{3}$ W. 1 dlatant 2 or 3 miles. The aouth west-wind occasions a heavy awell, but the lottom is clay, and holds well. Withln the town are two rather shallow buains dealgned for galleys and amall trading-vesaels. There is also an arsenal.

Money,-Accounts ware formerly kept at Genoa in lire or 20 soldi, each soldo containing 12 denari, and money was divided into banco and fuori di bonco. But since the 1st of January, 1827, the anclent method of reckoning has ceased, and accounts are now kept in lire Itallane, divided into cents. The weight and fineness of the new coins ara precisely the same as those of France; so that the par of exchange $=25 \cdot 20$ lire per $£ 1$, if estimated in silver at be. 2d. an oz., and $25 \cdot 5 \cdot$, if estimated ln silver at 5s. un oz. 6 old lire di bat.co are equel to 5 new lire very nuarly,-Manuel de Nelken. brecher.

Weights and Measures.-Those formerly in use in Genos are described $\ln$ the old editions of M'Cuthocn's Dict. In 1847 the French system of weights and moasurea was introdured, the only difference being the substitution of Itallan for French names. Thus, the chilogramma (kilog.) $=2 \cdot 2$ Ibs. avoirn. ( $50{ }_{4}$ chilog. being very nearly equal to 112 lha.); the libbra (livre) or ponnd $=\frac{1}{3}$ chilog. $=1 \cdot 1 \mathrm{lb}$. avoird. ; the quintale centinajo, or cwt. $=220 \mathrm{lbs}$ avoird. ; and the ettolitro (hectolitre), llquid measure $=22 \mathrm{imp}$. galla. ; ditto, dry mensure $=24$ lmp. lush. ; the metro (metre) $=$ $89 \cdot 37$ inches, etc. A larrel of oil $=591$ chillog. $=144$ imp. galls. All tares of usage were abolished at the anme tine that the French metrical ayatem was intro. duced.
The Bank of Genoa, or of St. George, was one of the most ancient and celebrated banks of circulation and deposit In Europe. Until 1746, when the bank was pillaged by the Anstrlans, it was customary to make all bills of exchnage drawn upon Genon payable in banco; but slnce then they have generally been made payalile in money fuori di bonco. In 1800, when the French were besieged in Genon by the Austrians, they took the treanure of the bank to puy their troeps. The establishment han neser recovered from this blow; some warehouses, and a part of the town's revenue, were amsigned to it, but they yield a very poor dividend. It is no longer used as a place of deposit for money.

Trade, elc.-Genos is the entrepot of a large extent of country; and her conmerce, theugh inferior to what it once was, la very conslderable, and has latterly been lucreasing. She la a free port ; that is, a port where goods may lie warehoused and exported free of duty. The exporta consint juartly of the raw proincts of the noljacent country, auch as olive oil (sn article of great value and lmportance), rice, frnits, cheere, rags, ateel, argol, ete.; partly of the proulucts of her munufacturing Industry, such as silks, damasks, and velvets (for the produetion of which she bas been long fameus), thrown silk, prper, soap, works in marble, alabanter, eoral, etc ; the printed cottens of Switzerland, and the other products of that country and of the western parts of lomonrily, intendell for the south of Buroje and the levant ; and partly of the various forejgn products lirought hy rea, and placed in porto froneo, The importn prinelpally consist of cotton and woolen stitfis; cotton wool, moatly from Kikypi; corn from the llack Sea, Nicily; and liarbary; sugar, salted thah, splces, coffee, cochineal, indigo, hiles, iron, and naval stores from the Ihaltic $;$ hardware, and tit plates from Fingland ; wool, tobacco, lead (princlaslly
from Sp cotton, $\mathbf{r}$ the coun vant, etc. so great tha vario charyed o Sardlnlen enee on th the import lin, as wel produce.

Gentian (Ger. Linzian; Fr. Gentiane; It. Genziana; Sp. Jenciant; Rus. Enzian; Lat. Gentiama), tho roots of two alpine plants, Gentians lutea and Gentiana purpurea, fonnd growing in Switzerlund and Austria, the

Apennines, the Pyrenees, and in North America. Those brought to thls country come from Germany, Thoy are In pleces of various lengthe and thickneas, twisted, and wrinkled on the outside, and covered with a brownlah-gray cuticle. They have no partlcular odor; and the taste is inteasely hitter, without being nause-oиs.-Tномsом's Dispensatory.

Geodesy (Gr. $\gamma \eta$, and datw, I divide), literally slgnlfies the division of the earth, in which sense it is aynonymons with land-surveying; but it is usually employed ln a more general sense to denote that part of practical geometry which has for its object the determination of the magnitude and faste aither of the whole earth, or of sny given portion of its surface. In this sense it comprehends all the geometrical or trigonometrical operations that are necessary for constructing a msp of a country, measuring the lengths of degrees, etc. In order to construct an accurate map, or deter wine the form and dimenalons of a country, it is necesasry, in the first place, to determine the absolute distances between the several stations or polnts; secondly, to determine the avimuths of the lines thus maasured, that is, their situation with respect to the meridian; and thirdly, the differences of latitude and longitade of the etations. The operations necessnry for determining the absolute distances, comprehending the masurement of a base, the observation of angles, the computation of the sides of the triangles, and their reduction to the asme level, are called the geodesical or geodetical operationa ; while those which are requlred for determining the azimutha and latitudes are called the astronomical operations. The delermination of the figure and dimensiona of the earth is a problem of very great imporlance to astronomy and geography, and has accordingly at all times been a subject of much interest to mathematiclans; but it is only slnce toward the middle of the last century that operationa on an adequate scale for its aolution have heen undertaken in different parts of the world. For the resulte of the more important of these operations, see Degree.

Geography. The first correct record we have of geographicai knowledge ia from Homer. IIe describes the ehield of Achilles as representing the earth, surronnded by the sea.-Iliad. He accurately describes the coun'ries of Greece, Islands of the Archipelago, and site of Troy. The priests taught that the temple of Apollo at Delphos was the centre of the world. Annxinnnder of Miletus was the inventer of geographical maps, about 568 n. c. Hipparchus attempted to roduco gengraphy to mathematical bases about 185 n. C. It was first brought to Europe by the Moors of Barbary and Spain, about A. D. 1201.-LexgLET. The invention of the mariner's compass is the important connecting link between ancient and modern geography, The modern maps and charts were iutroduced ints England by Bastholomew Columbus to illustrate his hrother's theory respecting a weatern continent, A. D. 1.189.-Hayd. The term Geography, derived from two Greek words, $\gamma \varepsilon a$, the earth, and $\gamma \rho a \varphi \omega$, I urite, signities a description of the earth. The description to which this title is applied may be more or less freneral; either embracing such truths as only belong to the earth considered as one whole, or extending to particulars which belong to and distingulah the aeveral countries sprend over its surface. In whichsoever of theso two asperts the aubject be rogarded, a vast field opens to the vlew of the observer. In order to give a fuil and accurate description of the earth, it weald be requisite to consider it in reference to its metion, figure, and magnitude; in reference to its relation to the other bodies of the universe, and more especially to the planctary system of which it forms a part ; in reference to lts surfuce, as diversified by land and sen, mountuins and valleys, lakes nnd rivers; in reference to the materiuls which compose lta crust, and to its internal structure ; in reference to the constitution
of the atmosphere with which it is surrounded, and the effects arising from the variations in atmospherieal pressure, tamperature, and humidity. Nor would it be enough to consider the earth only as a mass of inort and unorganized matter; it would be necessary to regard it in its relations to vegetable and anlmal life; and to trace the phenomens which these, in their endless variety, present in its varions divisions and provinces. It would still further he necessary to vlew It as the abode of man himself, anil an modified by his existence; divided into states and klogdoms; sdorned with clties, and all the noble monuments of civilized life.

Such is an outline of the picture which geography, in the mont unllmited meanling of the term, should exhlbit of the globe. To fill up thla picture in all its parta, it would evidently he necesmary to call In the aid of the whole eircle of the aciences. But the descriptlon is usually of a less extended charncter, being confined chiefly to the more obvious and striking features of the various reglons and countries of the earth.

In the wide range which the subject presents, several diviaions and subdivisions are auggented by the different views in which the earth may be consirlered. The three following divisions are the most Important :

1. Mathematical Geography, which illustrates, on astronomical principles, the figure, magnitude, and motion of the earth; teaches how to determine the positions of places on its surface; explains the construction of globes, with their application to the alution of problems; and shows how the whole or any portion of the earth's surface may, on the principles of projection, be delineated on a map or chart.
2. Physical Geography, which treats of the mutual relations of the diversitied objects found on the surface of the earth, includiug the atmosphere by which it is surrounded; and explains the causec, whether of a chenical or mechanical description, that produce the modificatlons and changes which are continually taking place in them.
3. I'ditimal, or Ihistorical Geography, whirh descrives the earth as divided Into countries, occupied hy various nations, and improved by human art and industry. It tracea the circumstances nnd character of the different races and tribes of mankind, explaining their social institutions, and ascertaining the place which each occunies in the sente of civilization.

From this general arrangement of the subject, it is evident that geography depends for its rank ne a sclence on its intimate connection with various branches of knowledge, which, taking their rise from investigntions instituted in reference to the nature nod mutual relationn of the objects on the earth, or connected with it, furnish thone accurate viows which must be obtnined before any thing like a precise description can he given of the grobe we inhmbit, or of any portion of it. With regard to what belongs to l'hysicul fieogrupliy, we muat refer the reader to the articles l'iramea, Geonrapizy, Minehatooy, Meteonologr, etc., in the new edition of the Eiacyc. Brit. What lelonge to Iolitical or Ilistorical Geography will be found under the names of the respective countrien. The following srticle will be limited to a view of the progress of Gengraphleal Discovery.

I'ougress of Gicogrophical Discotery,-There are many circumstances in the coudition of man which connect him so closely with the glote which he inhabits, as to render absolutely necessary to his existence a knowledge of at least the nelghborhood of tho spot where his lot is cast. It is from the earth that he must derive the means of nulasistence and accommodation, the inaterials on which hin industry is to be exerted, and those oljects in the exchange of which commerce consists. In every atage of his progross, therefore, from barbarinan to civilization, he must employ eome attention and observation, in order to dlscover in what respects the objects with which he is
surrounded are qualified to contribute to the aupply of his wants, and to his comfort and convenience. Even while he roams the forest in the savage state, he must make himeelf acquainted with many circumstances, s knowledge of which is necessary either to give him success ln the chase, or to direct him in retracing hin ateps to the place where he bas fixed his dwelling. But it is not nutil men have united in society, and that neighboring communitiea have begun to hold mu. tual intercourse, that those feellngs and passions are effectually aroused which othmulate to the arduo $\cdot$ s pursuits of geographical discovery. Commerce and wur, with the apirit of adventure which usually accompany them, heve, without doubt, heen among the first causes of geographical research. In the train of these havo followed the workings of avarice and the alms of ambition. As the humsn mind has advanced in Its career of improvement, curioslty, with an enlargemert of views and desires, has been called into action; and voyeges have been undertaken for the ex. preas purpose of discovering new countries and exploring unknown seas.
In tracing the effects which these causes have produced in the grailual increase of geographicul knowledge, it will contribute to distinctness to keep in view a threefold division, which the sulject naturnlly assmmen, namely, ancient geography, extendlug from the earliest periol of history down to the time when, the Iloman empire having been overrun by larbarons nations from soveral quarters, Europe was overwhelmed in the darkness which preeeded tho revival of leaming; the geography of the middle ages, extending from the revival of letters to the fifteenth century, when the discoveries of the Portuguese begau to lay a wider foundation for the science ; und modern geography, which enbrncen the most recent discoveries, and is progreastvely improving by the accessions which it is recelving from the labors and science of modern travelers and nuvigators.
The Phoulicians are the eurliest comunercial people of whose illscoveries we have any correct accounts. This people seem first to have explored the const of the Mediterranean. Their navigntors at length extended their voyages through the Straits of Gades, now called the Straits of Gibraltar, eutered the Athantic Ocean, and vislted the western coasts of Spain und Africa. In many places to which they resorted they planted colonies; and songht, by inntructing the inhabitants, in some mensure, in their arts and improvements, to open $n$ wider sphere for their commerco. The learned lochart, led by the analogy between the Phenician tongue and the oriental languages, has endeavored to follow the tracks of the Phomicianas, both along the shores of the Mcditerranean and those of the Athantic. These analogies are not always sure guides; but there seema no reason to doubt that Cadiz was originaily a Phoenician colony, and lt is not likely that this was the only one formed by that enterprising people.

The Arablan Gulf, or Red Sea, offered to the Pheniclans another field of naval and conmercial exer. tlon, to the Improvement of which the distance of Tyre, the emporium of their tralo, was the only ebstacle. This indured them to make thomselves masters of Rhlnocrura or Ihinocolura, the port in the Mediterranesn nearest to the led Sea. Commodities pmrehnsed In Aralin, Fithiopia, and India, were landed at Elah, the safest harbor in tho led Sen toward the nortli ; thence they were conveyed overland to lhinocolura; and being thero reshipped, they were carried to Tyre, whence they were distributed over the world.

The wenlth and power which acerued to the Ihenicinns from their loing ln the sole possession of the lucrative trade of the Fast, incited the Jews, their neighbors, under the prosperons reigne of David and Solomon, to denire a participation in lta advantages. Their conquest of Idumen, which stretches along the Red Sea, put it in tho power of Solomon to fit out a fleet;
while hla him to ce conductln, of Maheln dian Ocea they trade three year: gaged in their inatl preserve th the develo monarcha y with the di mon, prov mercial peop the nutions of geograph to llx with e graphical res difficulty the out by the $n$ they traded. age, and the a few other the only par mination. Pheniclans ascertained homeward or consisted of peatcocks." been entertait country, the I situsted on th Sefala. Tot to point ; nad in the way, in region, and $t$ ndmit of belng of time requir naval skill, a the monarches
The regions most remote $w$ were acquainte and Dedan, th Without enteri what appear to regsed to the $p$ names wero al which two voyn made; one by ver, lead, and t the other by $t$ other productio ages, though at posed to he made by supposing th which monopol Spuin and Brita the commoditie that the name o tended to the w Isles are the wh ing elther of ro is the southern Arhila which b lies upon the opp Galf. These co in consequence were imported and into the la traficic cesried o caravans, and b uinn." The Riv Euphrates, Go, the hlgh fableola
while his allinnce with Hiram, king of Tyre, enabled him to command the akill of the Phenieians for the condueting of the voyage. Paseing through the Straits of Habelmandel, they carried on commerce in the Indian Ocean ; and so dietant were the countries to which they traded, that the voyage occupied no leas than three year. But though the Jews thns for a time engaged in the parsuits of trade, yet the tendency of their institutions, which were expresely deaigned to preserve them a separate people, was unfavorable to the development of the commercial apirit which their monarcha wished to foster among them. This, joined with the division of the kingdom on the death of Solomon, proved fatal to their rising greatness as a commerciai peopie, and excluded them from ranking among the nations who have contributed to the advancement of geographical knowledge. It is perhaps impossible to fix with certainty the limita which bounded the geographical researches of the Phoenicians, on aceountof the difficuity there is of assigning the precise places marked out by the names then given to the conntries to which they traded. The length of time ocenpied in the voyage, and the nature of the cargoes brought home, with a few other circumstances of the same vague kind, are the only particulars afforded to direct us in the determination. Thue, the conntry of Ophir, to which the Phenicians navigated the shipe of Solomen, must be ascertained by the faets that the voyage thither and honoward occupied three rears, and that the cargo coosisted of " gold, and wiliver, ivory, nnd apes, and pescocks." Among the varioun opinlona which have been entertained respecting the position of this distant country, the most probnble appears to be that it was situated on the eastern const of Afries, as far south as Scraia. To this quarter every indication seems ciearly to point; nnd whitever objeetions may appear to stand in the why, in consideration of the remoteness of the reginn, and the difficulties to be encountered, these admit of being answered ly a reference to the length of time required rie the voyage, and to the wealth, navai skili, and ample reaources, at the command of the nomarcha engaged in the traffic.
The regions aiways apoken of in Seripture as the most remete with which the lIebrews and Phencicians were acquainted, are Turshish, Ophir, the Inles Sheba and Dedan, the rivers Gog, Magog, end the North. Without entering into any discussion, we may give What appear to be the most probalie conclusiens with regard to the positions of the countriea to which these names were applied. Tarahish is a country from which two voyagen are apoken of in Seripture as being made; one by the Mediterrance 4 , bringing iron, silver, lead, and tin, the proluce of Spain and Britain; the other ly the Red Sea, bringing gold, ivory and other productions of tropleal Africa. These two voyages, though et first they nppear incongruous, if anppased to be nade to the same country, may be reconciled hy supposing that Tarshish is fundunentally Carthage, which monopolized aimost entireiy the commeree of Spain and Britain, and was the medium through which the commodities of the West were distributed; and that the nnme of this great African metropolis was exteaded to the whole of the continent of Africa. Tho trles are the whole sonthern consta of Varupe, consisting either of real islanda or peninaular tracts. Shebs is the sonthern portion of that part of the coast of Arabia which horilers on the Red Sea; white Dedan fies upon the opposite coust, that borders on the Persian Goif. These countries rose to commercial importance in consequence of the valuable commotities which were imported into the former from the African coant, and lato the latter from India. Thence arose the traffic carried on by "the companies of Stheib," or caravans, und by "tho traveling companies of Dednuins." The River was the name aiways applied to the Euphrates. Gog, Magog, and the North, appear to he the high table-land in the interior und nortis of Asia

Minor, Phrygia, Galatia, Cappadocis, and Paphlagoo nin, regions in which may be recognized the peculiarly rade and formidable aspect whith beionged to the countries to which in ancient times the names in question were epplied. See Eincyclopedia of Geography, by II. Morhay, Esq.

The Carthagivians, a Phcenician colony, retained in full vigor the commercial aplrit of the parent State. They did not, however, attempt to divide with Tyre the wealth and power which she derived from the monopoly of the trade carried on in the Arabian Guif. They directed their efforts to the opposite quarter, and asiling through the Straits of Gades, puehed their researches far beyond the bounds which had been reached by the mother country in this part of the globe. They visited not only all the coast of Spain, bnt likewise that of Gaul, and penetrated at length as far as the south-western coast of Britain, where they obtained tin from the mines of Cornwall or in traffic with the natives. Nor was it only toward the northward that they directed their efforts; they explored also the regions southward of the Straits, and aaling slong the western coast of Africa almost as far as the northern tropic, they planted colonies, as the Phoenicians of Tyre had formerly done, with a view to prepare the natives for carrying on commercial intercourse. The Atlantic Ocean was deatined to conceal for ages from the inhabitants of the old world the immense regions which lie beyond it. But the Carthaginians extended the boundary of navigation westward by the discovery of the Fortunute Islande, now known by the name of the Canaries.
The enlargement of views gradually generated by thia apirit of comanercial enterprise led at length to voyages of which discovery was the special object. The circumnavigation of Africa was one of the earliest attempts of this kind made by the ancients. The direction whioh the coast takes beyond the Mediterranean on the one hand, and the Red Sea on the other, suggested the idea of a peninsula which it might be possible to sail round. This voyage was tirst undertaken by the Egyptians; a people exeeedingly averse to engnge in naval affairs, hut who at this time were ruled over ty Neeho, a monarch whose active spirit prompted hin to engage some Phoenicians to descend the Arabian Gulf, and, coasting along Africa, to endeavor to return by the Struits of Gades. Herodotus narrates in a few words the resuit of this enterprise, which was undertaken sbout 604 years before the Chriatian era. Ile say-9, "the Phoenicians, setting sail from the Red Sea, made their way into the southern sen; and when autumn approached they drew their vessels to land, aowed a crop, and waited until it was grown ; when iney reaped it, and again put to sea. Ilaving spent two years in this manner, in the third year they reached the lillars of IIerculea, and returned to Eyypt, reporting what does not find belief with me, but may rerhaps with some other person; for they said that in passing Africa, they had the sun on their right hund. In this manner Libya was first known." This passuge has given rise to much controversy among the learned. But the voyage here so briefly descrihed does not seem to involve any impossibility, notwithstanding the then infant state of navigation; and the circumstances which the historian ohjeets to as incredible, is the very point, which, from its colncidence with wint we know should have happened, rendera the atory more worthy of belief.

Xerxes, ling of Porsia, sccording to Herodotue, gave a sinniar commisaion, about 480 years before the Christian era, to one of his satraps, named Sataspes, who, for a heinous offenso, had been condemncel to die. If auccessful in the accompliahment of this voyage, Sataspes was to eacape a cruol death. But the difliculties were too great to be surmounted by a navigator brought up amid the luxury and Induigence of the Persian court. Having
procured from Egypt a veasel and crew, he pansed through the Straits of Gadea, entered the Atlantic Ocean, and, bending his course toward the eouth, coasted the continent of Africt, nitil, after meveral monthe, he probably reached the coast of Sahara. The frightful and desolate shores along which he sailed, and the tempentuous ocean which beat againat them, combined to fill his mind with aiarm and to shake his resolution. He retraced his course to the Straits ; and hoping, perhaps, that the labors he had undergone in the partial accompilshment of the task imposed on him would be accepted by his royai master as a sufficient atonement for his offense, or that the offense itself inight in a great measure be forgotten he returned home and presented himseif before Xerxes The cause which be assigned for the failure of the ultimate object of his mission was, that he had encountered a sea so full of herbage that his pasaage was completely obstructed. This reason (the grounds of which have never been satisfuctorily explained, though it has been alleged that obatacles of thin description occur in that part of the sea which lies between the Cape Verd Islands, the Cansries, and the coast of Africa) appeared so ridiculous to Xerxes, that he ondered the sentence of death by crucifixion, which had been pronounced upon Sataspes, to be Immediateiy executed.

But the most ceiebrated voyage of antiquity undertaken for the purpose of diseovery was the expedition under Hanno, fitted out ty the authority of the Senate of Carthage, and at the public expense, and that with a view of attempting a complete survey of the western coast of Africa. Of all the voyages performed by the Phaeniclans and Carthaginians, this is the only ons of which we have an authentio narratine. Mercantile jeaiousy prevented these two great commercial atates from communicating to other nations the knowiedge which they acquired of the remote regions of the earth; and from this cause, when the maritime power of the former was annihilated by Alexander's conquest of Tyre, and the empire of the latter was overthrown by the Roman arms, all monuments of their great skill in navai affairs appear in a great meanure to have perinhed. Even the account of the voyage of IIanno (Periplus Hannonis) has been considered by its learned aditor, Mr. Dodweil, as a spurions work. But the arguments of M. de Miontesquieu and of M. de Ibougainvilie appear filiy to establish its authenticity, which the tearned worid now generaily admit.

Hanno set sail with a fleet of 60 vesmeis, so constructed that, according to the mode of aracient navigation, he could keep close in with the coast. We are told that, in tweive days after leaving the Straits of Gades, he reached the inland of Cerne; that proceering thence, and following the direction of the coant, he arrived, in 17 days, at a bay, which he called The Weat Horm. From this he advanced to anotiner bay, which he named The South Horn. The ebjects which are clescribed as having been ween by llanno in his progress belong to tropical Africa. But in attempting to ascertain the places which lee visited, or the utmost distance which he sailed southward, mueh difficuity and uncertainty are experienced. Bougainville supposea lianno to have reached the Gulf of Benin, and contends that this ilsoit, distant en it is, can not be regarded as beyond what may be conceived to have been accompilished by the moat okiliful navigator of satiquity. Major Rennell shortens the distance conaiderably by conceiving the voyage to have been extended no further eouthward than Sherbro Sound, a little beyond Sierra Leone. Iie thus olitaius the advantage of avoliling a difficuity luvoived in the hypothesin of M. de Bougainville, namely, the supposition of ancient ships having sailed upward of 70 geograph ical miles in a day. At the same time, the arguments which support the one bypothesia are equaily applicable to the other.

According to the views of M. Gosselin, however,
the voyage munt be confined to much narrower line ith southward than even those aseigned by Major Renneil. He aupposes it to have terminated about the River Nun-an opinlon which he supports by ai loging that, in such a voyage, the progress must neces. marily have been slow. J'ae Carthaginian navigator had to encounter ail the obstacles and dangera incident to a coarse held along a shore, and in a ses, which were equally unknown. He must bave found himseif impeded by tho requisite examination of every part of the coost, as well as by the many precautions which the safety of the fleet under his cominand must have rendered constantly necessary. With regaril to tho circumstances given In the narrative which appear to point to tropicai Africa, M. Gosaeilin supposes that the ame aspect of life and nature may, at that dise tant period, have helonged to Morocco, then thinly peopled by the rude native tribee, which is now spe. cially characteristic of the more southern regions.

Amid such diversity of opiniun among the learned, It is not easy to decide in reference to a sulject befet with so many difficulties. If we assume either of the more ramote distances assigned for the termination of the voyage, Cerne must be identified with the isie of Arguin; and, on Major Kenneil's hypothesis, the (iulfs of Biasago and Sherbro present those numerous islunda deacribed by Hanno, to which there are no ialands corresponding on any other part of the coast. Un the whole, however, the most ilmited distance seems preterabie, if we admit that part of M. Goseelin's hypothesis which assigna tu Morocco features of man and of nature that are usually held to be characteristic of tropical Africa.

The circumnavigation of Africa was an enterprise which in ancient times not oaly called forth the naral efforts of the most powerful maritine States, hut nhich also awakencd the ambition of private adventurers. Eudoxus, a native of Cyzieus, being aent on a mission to Alexandria, at that time the reat of naval enterprise and geographical knowledge, his ardent mind, naturally biased to these pursuits, was eroused to action hy the spirit which prevailed in that city. He began his career under the auspicea of 1'tolemy Euergetes, the reigning Egyptian monarch, who fitted out a tleet and placed it unter his command. According to the destination assigned him, Eudoxus descented the Arubian Guif, and proceeded probably as far as the southern shore of Arabia. Thence he appeurs to have returned after a prosperous voyage, with a valuabis cargo of aromatics and preclous stones. Ilut of this wealth he appears to have been deprived by luergetes, After the duath of this monurch, which in a short time wok piace, hia wilow Cleopatra sent Eudoxus en another voyage, in the course of wisich he was driven by unfavoruble winds on the coast of Ethiopia, where he was kindly received by the inhabitanta, and earried on with them an advantageous traffic. After other viclssitudes of fortune, he wan insluced by circumstances which oceurred in his adventurous life to leave the court of lifypt, and repair to the commercial tity of Cadiz, In Spain, and there to fit out an expredition for the purpose of African discovery. At Massilia (Marseilles), and other maritimo pisces which be passed on his way to Cudia, be took eare to make known lis views and hopen of success, und to javite all who were actuated liy any spirit of enterprise to acconpany him. He succeeded in fitting out a ship and two large boate, on board of which he carried not oniy goods and provisions, but artisans, medical men and even players on musieal instruments. Thas was no doubt proceeding on a nugnificent scalo; hut his erew was ill calculated to second his hold undertaking. To avoid the danger of atranding, Euloxus was unxious to keep the open sea. Ilis compunious, however, alarmed at the awell, furved hisn to adopt the unal mote then followed of sailing along the shore-a measuro which led to the disaster which ho had asici-
pated. With one vessel of a lighter construction, on board of which was put the more valuable part of the cargo, Eudoxue pursued his voyage until he reached a part of the coust lnhabited by a race of people that sppeared to him to speak the same language with those whom he had found on the opposite side of the continent. Judging from this circumatance that he had ascertnined the main objeet of his voyage, he raturned and endeavored to ohtain the assistance of Bocchus, king of Mauritania. Suspecting, lowever, treachery on the part of that monarch, he again had recourse to Spain. Ilere he was again successful in equipping another expedition, consisting of one large veesel fitted for the open sea, and another of emailer size for the exumination of the cosst. This was a judicions preparation for the accomplisiument of the object in view ; but with regard to the issue of the voyage no accounts of any authority have been preserved.

Such are the leading circumstunces connected with the voyages of Eudoxus, which are narrated by Strabo; and, notwithstanding the skepticism and sovere criticisme of that geographer, there is really nothing to which the candid reader can reasonably refuss his belief. Prejudices, founded, for the most part, on his own want of information, led Strabo to treat likewise as fahulons the relation of the only ancient voyage having Europe, and more particularly the British isles, for its object, of which we have any detaiied account.
Pytheas, a Massilian navigator, undertook an expedition about 320 years hefore the Christian ers. IIe steered northward; and after examining the cousts of Spain and Gaul, he sailed reund the island of Albion; and, stretching still further to the north, he discovered an ixland, the Ultima Thule of the ancients. What island this was, the learned are not agreed. It has been supposed to be tise modern Iceland; but this impiies too great an extent of open sea for an ancient navigator to traverse; and liesides, six days, the period during which he is said to have navigated to the northward of Albion before he made his discovery, is too short a time to admit of his reaching Iceland. Others, anong whom is Malte-Brun, have considered Jutland as Ultima Thule. But it should be kept in view that l'ytheas uniformly regarded Thule as British, a character which he could scarcely conceive to beiong to Jutiand, seeing he could have reached that peninsula only by a long course along the coasts of Germany, which must have impressed on his mind the idea that he had left far behind him every thing belonging to Britain. On the whole, Shetland seems best entitled to beconsidsred as the ancient Thule, und suits weli with the sppellation which Pytheas gives it, when he expresely calls it the "furthest of the Britains."

Strabo endeavors to throw discredit on the statements of Pytheas, ly starting objections long known to be of the most groundless description; and it is an advantage which the traveler aud navigator possess who describe faithfuily the grand features of mature, that, however prejudice may dim their reputation for a time, yet will their accuracy as well as veracity at length, in the progress of knowienge, apiear, and secure for them the respect and applause of mankind. At the same time, it must be admittel that, in describing what he aaw heyond his Uitims Thule, the statement given by l'ytheas, as reported by Strabo, assumes a somewhat fabulons character. Ho asserted, it seems, that beyond Thule there commenced what was neither earth, bea, nor air, but a confused Mending of sll the three. liut even here some ullowance is to be inade for the workings of imagination under very peculiar circumstances, and a readiness, not unnatural, to believe reports which represented him to have ratiched the extremity of the halitable globe. If his language is not too literuily interpreted, it wiil be found to convey atrongiy figurative, but not alto-
gether imperfect, description of the state of the sea and sky in those climes, wnich have heen so little favored by neture.
The conquests of Alexander the Great, by making known the East, enlarged the hounds of geographical knowledge. Though the course of his expedition was for the moat part by land, his mind was equaliy intent on commerce and maritime discovery. Checked as lis had so long been in the career of his victories hy the opposition and efforts of the republic of Tyre, he had an opportunity afforded him oi observing the vast resources of a maritios power, and at the same time of forming a judgment respecting the innmense wealth to be derived from comnerce, especialiy from that carried on with India, which he found to be wholly In the hande of the Tyrians. With a view to secure this commerce, as soon as he hat completed the conquesi of Egypt, he founded the city of Alexandria, and thus estabifished for it a atation preferable in many respects to Tyre. After his final victory over the Persians, his march in pursuit of Bessus, who had carried off Darius into Bactiana, often led him near to India, and among people accustomed to much intercourse with it, from whom he leurnse many thinge concerning the state of the country, that served so to confirm and inflame a desire which he liad long cherished, of extending his dominion over those regions, that he was induced to conduct his army from Bactria, for the purpose of invasion, across that ridge of mountains which form the nortinern barrier of India. After passing the Indus, Alexander directed his march to the Ganges, which, from the accounts he heard of it, and of the countries through which it flows, he was eager to reach. The route which he found it necessary to follow, in consequence of being successively engaged in hostilities with varions native princes, led inim through ons of the richest and best-peopled countrics in India, now called l'unjab. In his ultimate ohject, howevor, he tailed. His march being performed during the rainy season, his troops had already suffered so much, that, notwithstanding the high degree in which be possesmed all those qualities that secure an ascendancy over the minds of soldiers, he was unabie to perauade them to advance beyond the banks of the Hyphasis, the modern Beyah, which was accordingly the utmost limit of Alexandsr's progress in India.

By this expedition, Alexander first opened the knowledge of India to the peopie of Europe; and as he was accompanied, wherever he went, by skillfui surveyors, Diognstes and Baeton, who measured the length and determined the direction of every route taken by the army, he furuished a eurvey of an extensive district of it, more accurate than conld have been expected from the short time he remained in that country. The memoirs drawn up by his oticers likewise afforded to Europeans their first authentic information respecting the climste, the soii, the productions, snd the inhabitants of India.

Though Alexander did not penetrate to the Ganges, his expedition prepared the way to the knowledge of that magniticent strean. For soon after, So. ucus, one of his successors, sent Megasthenes as his embassalor to Pulibothra, the capital of a powerful nation on the hanks of the Ganges. The site of Palibothra was probably the same as that of the modorn city of Allahabad, at the junction of the River lumna with the Ganges. This embassy brought new and opulent provinces of India into viow, an acquaintance with which served to raise still higher the iden generally entertained of the value and importance of the country.

The island Tuprobane, so celebrated anong the ancients, which appears, notwith itanling some great mistakes with respect hoth to its extent and position, to he the modern Ceylon, seems not to have been known in Europe even by name before the age of Aiexander. In consequence, however, of the cnilightened and active
curiosity witic whlch he explored every country whleh he aubined or visited, noms knawledge of it was at length obtalned; and, after his time, it is mentioned by almost every auclent gengrapher. While Alexander wan attemptlig to penetraie Into India, a numerous fleet was assembled by officers whom he had left on the banks of the IIydsejees, the modern Behat or Chelnm, whth orders to bulld and eollect as many shilps an they condd. The destinntlon of thin fleet was to sall down the Indus to the ocean, and from Its mouth to proceed to the Perslan Gulf, with a vlew of opening in communleation between Indla and the centre of his dominions.

When Alexnnder reached the banks of the IIydaspes on hls return, he committed the conduct of this expedition to Nearchus. The voynge down the Indus derived splendor from the greatness and magnificence of the armament, which conslsted of an army of 120,000 men, and 200 elephanta, and of a fleet of nearly 2000 vessels. Alexander himself nccompanied Nearchus in his navigntion down the river, with one thirl of the troops on board; while the remainder, In two divlsions, ons on the right and the other on the left of the river, accompanied them In thelr progress. Having reached the ocean after the lapse of nine montlis, Alexnnder left Nearchus anin inis crew to pursue thelr voyage, and conducted his army back by land to Persin. A consting voynge of seven months brought Nearchus, with the fleet, in safety, up the Persian Gulf into the Eusphrates. It was at the mouth of the Indus that the (ireeks witnessed for the first time, nnd thit with astonishment and terror, the ebl) and flow of the sen; a phenomenon scarcely perceptible in the Mediterranean, to which their nuvigation had formerly been contined. In the progreas of the voysge they were niso struck with surprise on observing phenomena helonging to the midsummer of the tropica. At noon objects were observed to project no shajows, or to project amall shadows declining to the south. Their attention was atill further attracted by the new appearance of the aky. Stars which they had been sccustomed to nee high In the henvens were now seen near the horizon. Some stars to the north disappeared, while other atars formerly Invisible were seen in the south.

The opening of a communication lietween the Red Sea and the lersian Gulf was with Alexander another great object of ambition. But though with this vlew he seems to have aent expeditions dows troth seas, he fuited in his attempts to nccomplish this preject. Among the Romans, navigation and commerce, the handniaids of geographieal sclence, were never biade objects of pursuit, except in wo far as they were found to be necessary to forward their achemes of unlversal dominion. Their conquests opened indeed the West, as those of Alexander had made known the East ; and It might be truly anid of that great people, that as they were the conquerors, so they were tbe nurveyors of the world. Every new war produced a new survey and itinerary of the countries which were the scenes of action; so that the materials of geograjihy were accumulated by every adaitional conquent. Some fragments of the itincraries thus composed still remain. The most memorable is that which bears the nanse of Antoninus, and whleh may lie described as n mere akeleton road-trok, exhifiting nothing more than the nanses of placea, and their distancen from each other. The Jerusalem itinerary, which details minutely the route from Bordenux to thint holy city, is of the sume deacription.

A inore reniarkalile monument, however, in the Peut ngerian Table, which forme a map of the world, cons ructed on the mont aingnalar principles. The map is twenty feet long and only one focit broan, no thit we can easily conceive how incorrectly the proportion of the different parts is exhibited. Along the high road which traversea the Roman eimplie in the general direction of east and weat, objects are minutely and
accurately reprenented/ but of those objects whlch lia to the north and aouth of It, only wome general notlon is conveyad. The Peutlnigerian Table serves as a apecimen of what are called Itinera Pieta, the " palnted roads" of the nrcientn, intended for the clearar direction of the mareh of their armies.

While the Romans by thelr anrveys contributed much to increase the mase of materials out of which the at ructure of geographical acience was to the reared, they never nttempted themselves to combine these muterials Into one harmonious syatem. They Imbibed In no degres the commercial spirit of the grent maritime States of the anclent world, Carthage, Greace, and Ekypt, wideh thelr valor and diselpline obligged to sulimit to their doninion. Jut while the trade of the conquered countrien continued to be carried on through nearly the former channels after they were reducel to the form of Bonas provinces, the wealth accumulated In the capital of the world gave rise to a demand for Inxuries of every dencription. Thin, combined with the comparative pence and secarity which for a lang time prevalied after the complete establinhment of the Roman dominion, gave new vlgor to commercinl enterprise. Alexandria continued the grest centre of naval affairs. Obstacles which in the tine of Alexunder were deemed Insurmountable, were completely ovrrcome. Trade with Indin through Egypt aequired new energy, and was carried on to a greater axteat. Continued Intercourse with the shores of India at length made known to navigators the perlodical winds which prevail in the Indian Ocean; and taklag advantage of these, pilots were emboldened to abandon the slow and dungerous course along the coasts, and to make the open sea their highway. This course was from Geelis, at the mouth of the Aralian Gulf, to Nelkunda (Nelisuram), on the western shores of the Indian continent (the coast of Malabur), which seems to have been the utmost ilmit of the anclent navigntlon in that quarter of the glohe. Tho extenslve regiona which atretch beyond this to the east were very imperfectly known by the reports olitalned from a few adventurers who visited them by land.

If we now bring into one vlew the amount of information porsessed by the anclents reapecting the hablable giole, we shall find that it was extremely limited. It wan at those places on the earth where the human mind displayed greatest activity and enterprise that this knowledge was naturally accumulatei. I'roceedlng from these stationa, the boundary which separated the known from the unknown part of the wor-d was gradually enlarged; but the regions comprehended within It constituted stlll but a small portion of the whole. In Europe the extensive provinces in the eantern part of Gernany were lout little known, while the whole of thant vast territory which now forms the countries of Denmark, Sweden, Prusaia, l'oland, and Jfussla, wan buried In the deepest olscurity. The inhospitable and dreary elimes within the arctic circle were yet unexplored. In Africa, little wns known beyond the countrice atretching along the Mediterranean Sea, and those bordering on the western ahore of the Arahian Guif. In Anla, the rich and fertile countries beyond the (inngen, whence the conmerce of modern thes has drawn the most valuable commoditiea for the comfort and embellisiment of civilized aocicty, were known, if known at all, only by the most vague and uncertuin report. The immense regions on the north oceupled by the wandering trikes called lin aucient times by the general names of Sarmathns or Scythiana, and which aro now inhahited ly varions tribes of Tartars, and ty the Asintic subjects of ltassin, neem never to have lieen penetrated. Adil to this, that the fertle and poputoun regions withill the torrid zone were Imagined to be zninhabitable; and we have ample proof that the geography of the ancients wis very imperfect.

Having thus far given a succinct view of the pro-

gressive steps by which the earth's surface, considered merely ss trscts of territory inhabited hy men, gradually became known, it will be proper next to trace briefly the advances made toward arranging into a systomatic form the materials accumulated. Seience required that the relatlve ponitions of placea, with their distances from each other, should be ascertained in such a manner as to furnish fixed prinelples on which the whole, or any portion, of the surface of the earth might be represented or dellneated with due regard to its figure and dimenaions.

The first rude attempt made by the early geographers to determine the position of places appesrs to have depended on the division of the earth into climates, diatinguished by the specien of animals and plants produced in each. Thus the appearance of the negro, the rhinoceros, and the elephant, suggested to them the llne of division where the torrid zone begrun toward the north, and ended toward the sonth. Iut instead of thin very vague method, a nother was aoon adojited, which consisted in observing st places the length of the longest and shortest day. This was determined with some accuracy by means of a gnomon, a method of observation much nsed by the ancients. An upright pllar of a known height leing erected on a level pavement, by observing the lengths of the merldian shadows, they wero enabled to trace the progress of the aun from tropic to tropic. The most ancient observation with the gnomon which we meet with ie that of Pytheas, in the days of Alexander the Great. Pytheas observed at the summer aolstice at Marseilles, that the length of the meridian shadow was to the height of the gnomon as $218 t$ to 600 ; an observation which makes the meridian altitude of the sun at Marseilles on that day $70^{\circ} 27^{\prime}$. The merit of the iavention of the gnomon in Greece is ascribed to the astronomical school of Miletus, and particularly to Ansximander and Anaximenes. There is reason, however, to believe that this method of observation was originally invented by the Egyptlans; and that Thales, who travelei into Egypt, carried thence the knowledge of it into Greece. It has even been conjectured that the Fgyptian pyramils and abelisks were intended for the same purpose with the gnomon ; and, though it would be extravagant to imagine that this was their sole use, this opinion appears to be coontensnced by the fact of their being placed in the direction of the four cardinnl points.

The determination of the length of the meridian shadow st the solstices for different parts of the earth, by observitions made with the gromon, is important as 'h ng the first step toward connecting geography with astronomy ; and, when combined with just concefitions of the globular figure of the earth, leads, by a simple troin of thonght, to the motion of latitude by which the position of a place is fixed relatively to north and south. The position with regerd to east and west is the only other element necessary for fixing the sbsolute situation of the place on the surface of the earth. It might have been supl. ased not to be more than a reflecting mind could easily accomplish, to reach the conception of both these elements, and to apply them to use. Yet so elow was the progress toward the apprehension of the principles on which an accurate system of geography might be founded, that from the days of 'lhales and his immediate auccessors, who flourished in the sixth century beforo the Christian era, there appears to have been little done for the improvement of geography, ns a science, nntil the establishment of the famous astronomical school of Alexandiria. Pythagoras had indeed maintained the true aystem of the world, by placing the sun in the centre, and giving the osrth both a diurnai and aunmal revolution; but thin doctrine was so much in advance of the age in which he promulgated it, that it was soon lost sight of.
Eratosthenes was the first who reduced geography
to a regular system, and laid its foundations on clear and solld prinelples. Under the patronage of the Itolemien, he had access to the materinla collected by Alexander, his generals and nuccessors, sa we!l as to the immense mass of documents accumulated in the Alexandrian library. At an early period of the biatory of astronomical science, the vulgar opinion that the earth is a flat surface, with the heavens reating upon it as a canopy; was rujected; bnt it was not at once that distinct conceptions of its gin',alar figure were nequired. It was only as astronomical observations incronsed that the doctrine of its spherielty was fully estabilshed. This polnt had been gained when Eratosthenes began his labors; and what he endeavored to accomplish was to delineate, in atrict sonformity with this principle, the known parts of the earth's surface.

With this view, founding his system on the uee of the gnomon, he supposed a line to be traced through certain places, in ali of which the longest day was known to be exactly of the same length. This line would evidently lie a parallel to the equator. But though his method was correet in prinuple, the want of accurate observations rendered it uncertain in practice. The line was supposed to comprise all the leading positions which lay near it, though they did not nctually come within its range. Its western extremity was the Sacred Promontory of Iberia (Cape St. Vincent) ; thence it passed through the Straits of (Gades. lroceeding eastward, it passed through the Sicilian Sea, and near the southern extremity of the Peloponnesus, and was continued through the island of Rhodes, and the Bay of Issus; whence entering Cilicia, and crossing the Euphrates nnd the ligeris, it was extended to the mountains of India, and trominated at the remote city of Thine, situated on the Eastern Ocean. The parallel thus drawn was understood to pase through all those places where the longest day was $14 \frac{1}{2}$ hours. It stretched the whole length of what was supposed to be the habitablo word, and measured about 70,000 atadia; a distance corresponding, according to the estimate of Eratosthenes, to about 1.40 degrees, which is rather more than one thirl of the circuit of the globe.

This first parallel drawn throurh Rhodes was ever aftorward preferred as the basis of ancient maps; inasmuch as it was traced through the middle of the Mediterranean, along the coasts of which were situnted the principal nations of antiquity. Following ont the same happy thought which he had thus successfully made the groundwork of his system, Eratosthenes wae induced not only to trace other parrallels at certain intervals from the first, as one through Alexandrin, nnother through Syene, and a third through Meroe; but also to trace, at right angles to these, a meridian, passing through Rhodes and Alexandria southward to Syene and Meroe. As the progress which he thus made towird the completion of what he had so skillfully conceived, naturally tended to enlarge his ideas concerning geographical science, he attempted what soemed a still more diffieult undertaking, namely, to determine the circumference of the gloho by the actoal measurement of a segment of ono of its great circles. The method he parsued has been clearly pointed out in the article Astnonomy, Kincy. Prit. There is a difference among ancient authors respecting the rosult obtained by Eratosthenes. The great inajority, however, state it to he 252,000 stadia, which give exactly 700 stadia for a degree of the equator, antl 555 atudia for the degree of longitude upon the parallel drawn through Rhodes.

The knowledge of the circumference of the earth ie a necesnary element in the construction of mape; and hence the most eminent of the ancient astronomical geographers made repeated endeavors to determine it with nceuracy. Possidonias, by an nstronomical observation, determined the aro of the meridian between

Rhodes and Alexandria to be a forty-elghth part of the whole circumference. With regard to the distanc: letween these two places, 5000 stadia were the reputed distance; but Eratosthenes had made it only 3700 at alia upwaril of 170 years beiore, and betwixt these two l'ossorlonius hed to make choice. The former number gives 243,000 stalia fer the whule circumference, the latter 180,000 stnilia. Of this luat result, which gives 500 atadia for a degree of the equator, Possidonius is reported by Strato to have approved. For want of the knowledge of the true length of the stadimon, it is now h. ossible to judge of the actual quantity asslgned either by Eratosthenes or Pusvidoniun ms the measure of the earth'н circumference; bint the great uncertainty alout the sistance between the points of observation in the case of the determination of the latter astronomer renders his concluston of wo value.

Nutwithstanding the soundness of the principles which had now been luld down for the clelineation of the glabe, much remained to be done, in the way of ohsservation, before an acenrato representation of che whole, or a portion of the aarth's surface, could the given. Iboth the latitudes und longitudes of the anclents are erroneous; more expecially the latier. 'This is what might be expuected at that early period. Hat in se*ting out from the Sacreà l'romentory of Deria. the meridian of which the ancients mado their dirst meridian, the hours in longitndo accumulat, as we mivance east warl, with a regularity, as well as rapitity, which is very rorprising, The regularity of their increase induced I. Cinsselin to momelude that they were to be att ributell, not tis the imperfection of independent observations, but to mome general canse, whinh ho endeavorell to assign ly imagining that liratosthones had access to qome early map, fouml probahly by Alexanter or his generals in some conntry in the liant, where astronomy has been successfully cultivated; and that mbsapprehensions respecting the principle of delineation employed, which M. Gosselin aupposes to have been that on which the pitane chart is constructed, had lell him into a regulat system of errors. In the plane map the lenath of a degree of longitude is suppased to the the same at all ilistatwesa frem the equato. By taking for granted that Eratosthemes towk his ilis:ances from a map of this kind, on which the parts of the glole had been accurately lahd down, but that he divided the stadia expressing these distancen, not by 700, the number of stadia in a degree at the equator, as he ought tuhavedone, bailiy $\mathbf{b i s}$, the number curresponding to the prallel of lilurles, M. Cinsselin obtains results which have a womberful cwinchlence with the positions actually pition hy liratosthones, These results, however, are dedued from a bypothexis which is unamported by any evibence, execpit what may ine auppesed to arise from this colnchlence. I nore probable molution neeme tos the that lirasthenes detormined this lomgitades from the itinerary measures, which he roduced to degrees at the cate of 200 stalia to a dogree at the equator, and of asis to a degree at the parallel of Rhonles: and that the errors aro the conseyturese of the exagerated areomats whids merchants and travelers of that age wave of the distances over which they pessump; their exaggerations, of conrse, bearing some propartion to the length and hariships of the journeys undertakin.

Thu knowledige an yet possemped by gengruphera with rersith to the outline of the habitnthe glohe was far from lowng such as to whablo them to delineate it with any deprece of precinjon. This circumatance, conblaed with the whavoidable errorn in latitude and longituile, prodacesl verv :greet distortions lis the repres. ecitations given of the countries on the surface of the globe, linder the goldance of nound principles of sciance, huwever, it was now certain that these Injerfoctions would gradually ilisnjpmar.

The inprovements introluced linto geografiy by

Eratosthenes were perfected in princlple ly Hipparchus. This celebrated astrenomer, who flourished between 160 and 135 years befure the Christian era, was the first who undertook the nrduous task of forming a catalogue of the stars, and tixing their relative posithons. Ilis object was to transmit to posterity a knowledge of the state of tha heavens at the perioi of his observations. The extrenities of the inaginary axis round whleh the heavens perform their diurual revolution suggest $t$ wo fixed puats by which the pusition of the grent circte of the celestial sphere cilled the equator is cletermined. If a great circle be suppased to pass through these points and any war, the pasition of the star will be ancertained if we measure in tegrees mud parts of a degree the are of the meridian circle intercepted between the star nitl the equator, and alas the are of the equator interceptell hotween a given pelnt in it, and the meridian circte passing throug! the star. Upon this priwiple did Hipparchus arrange the stara aceurling to their places in the heavens, a work in which he appears, however, to have been in some moasare anticipated by Timocharis and Aristillus, who began to olserve atout 295 rears before the Chrintian era. The grent inprovement which he introflaced into geography comsistel in this, that he applied to the determiaing of the position of muy ;oint on the nurface of the earth the same artitiee which he had alrealy so happily fintroulnced in the arcangement of the constellations; and thus furminhed tise means of asedtaining the relativo situations of places with a precision which no itinerary measurements could possibly attain If we suppore the earth to the a gishe concentrie with the celestial sphere, and intersected by the plames of the celextial equatur and meridian, the principle on which the application of this artitice to the terrestrial sphero depends hecomes at once ubvious. Ilipparchus made a considerable nunilier of olservations of latitude, and pointed ont how tongitules might be detormbed by obsersing the eclipses of the sun und mown. Cireat as this lmprosement was, its impurtare seeme not to have heen duly estimated until the days of I'toleme; for none of the intermediate authore, such as Stralo, Vitruvius, and Iliny, have give" she leant hint of the latitule and longitule of any one place in clegreen and minutes, thongh all of them have given minately the gerographical positions of places aceording to the heogth and Nhalows of the gromon. St ralu, inded, even jnatities hila neglect of the astronomical parinciples introluced by llippardhas. "A geograjher," Rays he, "is to pay (1) attention to, what is out of the arth; nor will men enfure: in conducting the affitirs of that part of the carth which $i_{1}$ inhabited, deem the distinction ant divisions of Ilipparehus worthy of notice."
The true primelples of geography lowing painted out by the aplication of atitulo and longitule to places on. he carth, the way wats opened for the irapros cment of majn, which, with the single exception of the map drawn by Eratosthenes, hal hitherto been little mope than ruile suthines and topographieal whet hes of the diffrent conatries. Nomaps more ancient than those formed to illustrate l'tolomy's gemgraphy hava reduch modern times: but the eartient of whith there is any atecount are thone of Senontris, of whom it is sath, that having traveroma great part of the carth, he chand his marches to be recorded in mapa; and that he gate copples of these mape not unly to the ligy tians, tut to the sicythians, whove antonishment he thes greatly exeiteil.

Some have Inagined that the dews made a map of the Iloly land when they gave the dilleront purtinas to the nina trilus at shiloh. For on that oncasjon, as we are hformed liy the nvered historim, men wre sent "to watk through the land, and to cleserilue it ;" und when they but weomplished the objent of their mis. whon by deacritine: "it be cities into seven parta, in a book," they returned mito Joshua. What is hare rad,
however suration regularl map. I Anaxima conjectur known w same wit dexignath few partic llat nol early day, tagoris, $k$ ly Ilerode which wa showell to duce him t ace at Susa their nucie countries $t$ not interpr iterally, и whole circu ocean, und oi geograph cludel, that pression, the therefore the more partie midalle of $p$ Halys, the 1 otus mention dition in que line, calted tions or plae Susa, so thit The princi, map we have extent, it seen States of Giree of Aleximider marches of th idea respeetlu, had acyuired such a concep outline on a ct he was quito many, and Itri the coasts of the tries fowaril th Nistances of pla The distance o sents at 15,0140

hewever, does not fully determine whether their mensuration of the lamil was only recorded in numbers, or regularly projected and digested intn the form of a map. The ifrst tireclan map on recerd is that of Aunximander, mentioned by Strabo, which some have conjectured to have been a general map of the then known werld. It has further been imagined to be the saine with that referred to by alipparchus under the designatlen of The Ancient Mfap, and which in some few partlculnrs he preferred to that of Eratosthenes.
lut some lidea of the nature of the maps of those early days will be beat ohtained from the map of Arlstagoras, king of Miletua, whin is minutely described ly llerodotus. The histnrian telld us that this map, which was traced on brass or copper, Aristagoras showed to Cleomenes, kling of Spurta, in order to lnduce him to attapk the king of Persia, even in his palare at Suss, for the purpose of restoring the loniana to their anclent freedom. It contained the intermedinte conntries to be traversed in that march. We must not interpret, however, the wonds of llerolotins tio literally, when he describes it as containing "the whole circumference of the earth, the wholo sen or ocean, and all the rivers." Keoping in vlow the state oi geography at that period, it mיy justly be eoncladed, that netwithstanding "his pompous form of expression, the sen meant only the Mediterranean, and therefore the earth or land the coasts of that sea, and more partlcularly Asia Minor, extended toward the middle of l'ersia; by the rivers must be meant the Halys, the Euphrates, and the 'Ilgris, which Herodotus mentions as neeessary to be crossed in the expedition in queston. The map contained one stralight lioe, called the royal highucay, embraciog all the stations or places of encimpment between Sardia and Sasa, so that it was properly an itinerary.
The prinelple on whieh Eratosthenes constructed his map we have alrendy consilered. With regar $l$ to its exteat, it seems to have contained little more than the States of tirecee, and the dominions of the successors of Alexunder, dligested from the surveys of the marches of that great general. Ile had some faint idea respecting the westeru parts of Europe, which he had acquired from the voyage of I'ytheas; but not such a concepition an to emblile him to detineate thelr outline on a chart. Accorling to the report of Strabo, he was quite unacquanted with Spain, tianl, tiermany, und Iritain; he was equally hanorant of ltaly, the consts of the Adriatic, Pontus, and of ath the conntries toward the north. Ilis ermors with regard to the distances of phaces were in some linstances enormons. The distance of Carthage from Alexandriat he represents at $\mathbf{1 5 , 0 0 0}$ stalla, instemi of $\mathbf{1 0 0 0}$.

It was but unthl !'tolemy commencell his labors that the improsemenis pointed out hy llippurchus were effeciatily applied to perfect the gystem which Eratosthenes hal so linpily begun. P'tolemy composed his system of geos :aphy, which excaped nmid tha general wretk that romst, indil so many other anclent howks of science, iuthe reign of Antoninus l'ias, slout liso years after the opening of the Christian era. At this puriod the ibman empire had remehed its utmost extent, unl ull the provinces had heen surveyed, nul were well known. The miterials then in existence, and in the possession of J'miemy for completitig his great work, were the propurtions of the helpht of the gnomon und its shadow, at the time of the equinores and nolstices, taken ly ditlerent nstronomers ; ralculations finunded on the lemgth of the longest days; the mensures or computed distancea of the principal roads contation in the surveys and Itinerariea; and the varlous reporta of travolers and navigators, whose determbations of the distances of phaces often rested, hewerer, on no better foundation than hear ny and conjecture. Anom; these varlous partioulars, there evilontly exinten cons. shlerable ilfferences in point of uathority. Ilut I'to-
comparing and reducing into one syate 1 , which ahould possess the order and beauty of science, this apparently ineongrueus mass. Ie converted and translated the whole inte a new mathematicel language, expressing in degrees and minutes the latitude and Iongitude of euch phace, according to the principles ladd down by llipparchns, but which had been allowed by geographers to lie useless for upward of 250 years. It is in Ptolemy's work, which censists of eight books, that we find for the firat time the mathematical principles of the constructlon of maps, beth genernl and particular, as well as of soveral projections of thsphore.

Notwithstanding that the llght of accurate acience thus directed the steps of the tirst geographer of antiquity, he v is ur from reaching the precislon at which he aimed. This arose from the imperfection of the original materials upon which his work is bnaed in reference to its detalls. With regarl $\mathrm{t}_{0}$ the remoter boundaries of the then known world, in all its quarters, a wonderful udvancement in knowledge hnd been mule since the days of Eratosthenea and of Strabo. Ilut still that mblitional information was nou fitted to make up for the want of ustromomical observations, by which nlone nccuracy could be secured. Besides, in relation to places situated beyond the limits of tho loman empire, and therefore out of the range alike of astronamers and surveyors, it was almost impessible for I'tolemy not to commit mistakes. Thus his errors urose from the lynorance of the age; und are of auch a character as to admit of heing removed only as opportunities are afforded of oitsining the requisite data by the ntriet application of the principles derived from mathematical and astronomical seienco

I'tolemy adopted the measure of n degree at 500 stadia, according to the standurd of Possidonias, in steal of following the measurement of lirutosthenes, which gives 700 shadia to a degree. Hat M. Gusselin has necused him of un error of a more serious kind; lecause, if really committed, it would have ladicated a strange neg'ect of what a geographer ahould make his Arsi carc. This error conslists in assuming one measure for the degree of latitule (the measure of Eratosthenes, 700 ntadia) and another for the tegree of longitude at the equator. Such a hypothesls wonld evidently be inconsistent with the globular figure of the earth. It may reasonably be doubted, however, whether M. Gossolin's accusation is well founded; for, though it neems supported by the fuct, that while I'tolemy has changed materialiy all the longitudes of Fratosthenes, the lititudes along the great line remuin the same, and aro in general correct, this ciremmatance may be accounted for suthelen.ly from other cunses. Rhoies, and several other points of this areat line, were flxed with regurd to latitude by observations approximathing to the truth, while the elements for determining the longitudes wete derlved entirely from the itheraries. 'To the morth and sonth of the great central line, which alona was flxed upon mound data, errors in latitude necumulate an rapidly as those in longitude are fomed to do in proceding eastward.

One of tho most remarkuble errors th the geographisal work of l'tolomy is the great length nsuigned to tho Mediterramean. Reckoning from the straits of Gimles to the linttom of the Hay of lasias, where Aloxandretta, or Seamidroon now riands, be makes the difforemen of lompitulo no less than fis dogrees, which is upwaril of 20j depre os nbove the truth. 'This amataing error, which affert ad ali our maps more or less until the begimenup of $\therefore$ is last erentury, was produced in eonsequence of his having put tor much contldence in the supposed surveys of ilitiorent persons of reputation rocorded by Nitraho, and who mipeared to contirm the aceuray of each other's womputation. Aerording to their united testhmony, thu whald length of the Mediterrauman was bbut $\%$ (i,501 stalla, which, being con, verted into degrees of lengltudo accoriling to tho
method of Ptolemy, of allowing 400 stadia to a degree the measurement of mountains. He found the height of longituile on the parallel of Rhodes, give about $66^{\circ}$ 15'. This is $4^{\circ} 15^{\prime}$ more than what are given by Marinus, whom in thia particnar Ptolemy strictly follows.

Pliny quotea from Agripps a computation of the length of the Mediterranean, which makea it $\mathbf{a}, 4.10$ Roman miles; but in quoting it be adda a suspicion that there is an error in the numbers. When converted into degrees of longitude, the result of this computation gives $68^{\circ} 20^{\prime}$. As, however, the length given by Strabo amounted, as we have seen, to $66^{\circ}$ 15', Ptolemy seems to have chosen a middle path be$t$ ween these two erroneous computations, und to have adopted $62^{\circ}$ for the difference of longitude in question. But there, another nncient compitation quoted also by Illiny from Polyblus, according to which the length of the. Mediterranean is stated to be 2,440 Roman miles. IInd Ptolemy followed thla estimate, he would hare obtained for a result $41^{\circ} 4^{\prime}$, which is not far from the truth. Thus we see that the circumstances unde: which Ptolemy wrote, rendered it impossible for him to avold mistakes, and that he might we inisled even when more accurate results were within his reach.

The great obstacle with which the anclenth had to enntend, was the finding of the longitude with neenracy, a problem for the solution of which it was long before there was discovered any method aufficiently exact. This necounts for the erronenus longitudes of Ptolemy, and more especially for tho length of time, even many centuries, during which the remarkable error, with regard tos the length of the Mediterransan, remained undiscovered and uneorrected.

We huve now traced the history of geography from the earliest periot of which we have any information, to the time when it assmmes a s-ientific character. We shall conclude our aceount of onclent geography by shortly noticing the principal geographers of antiquity, some of whom have not yet lieen mentioned, whils others have only lieen quozed in tracing the rise and progress of the science.
The intimate connection between geography-nnd the aciuce of geometry and astronomy, rendered the former an object of atieution to many who nnciently cultivnted the latter. ive have alrealy mentioned Anaximander and Anaximenes, of the school of $\mathrm{Mi}_{\text {; }}$ letus. Democritus, Eudnxus of Cnidus, and Parmenldea, are also reported to have itmproved geography; and to the last is nttributed the division of the carth into zones. Thens were followed by Eirntoathenes, who lived about 240 years lefore the Christian ern; by llipparchus, about 80 years afterwarl ; by l'olybius, tieminus, and Possidoulus. Fratesthenes wrote three looks on geography, some passages of which Straho criticises, though he frequently defends him ngainat Ilipjarchus, who appenes to opposer his opinions with some degree of affertation. Polytime ulen wrote on geography ; an dill likewise timminus and Posniloniua, who are frequently quoted by Straioo. I'otyhius, accorling to Gominus, urgoed with consideration acuteneas for the ponalibilty of the torrid zome beinf inlatited; and he even addi,ced phanible argnmenta to prove that the countries under the equator enjoy a more temperato climate than the countrieg do that are nituated near the tropies.

We munt not hore omit ugeographer and geometer who lived alumet the time of Alexander the Great. This was flicearihus of Menalna, $\mathbf{n}$ diaciple of 'Theophroatus, who wrute a description of fireece in iomble verses, of which mone fras aenta yet ipmain. Wht what chietty render him remarkalilo in, that he menaHred geometrionlly neversl mountains, to which an excensive height had been hefore naslgneal. With Dicearchns we may notice nother geometer, Xrinagoras, a disciple of Ariatotle, mentionct hy Phitarele in his life of faulus similiam, whooceupled himeelf in
the measurement of mountains, He found the height
of Mount Olympus to be 15 stadia. In some of the latter perioda which preceded the Christian era, there were several writers on geography, as Artemilorus of Ephesus, who wrote a geographiceal work of eleven books, of which nothing remalns; Seymnus of Chio, author of a deacription of the earth in iambic verses, which remain in a very mutilated atate; Isidorue of Chnrnx, who gave a description of the Parthian empire ; and Scylax of Caryndes, author of a voyage round the Mediterranean, which is still extant.
Tho works of all these geographers are, however, but small in comparison with the geography of Strabo; a work in 17 books, which has come down to us entire. This is one of the most vnlualily worka of antiquity, hoth from the apirit of discussion which runs through it, and the number of curious particulare which the nuthor has collected from different geogiaphers and navigators who preceded him, and of whose works nothing remains except these extracts. Strabo tived in the reigns of Angustus end Tiberius, and was nearly cotemporary with Pomponius Meln. This latter gengrapher wrote a work De Situ Orbis, whlch, though little more than a bare summary, is valuable, as it gives us a sketch of what was known in his time respecting the state of the halitable globe. Besides Mels, Rome profluced, in the most fluurishing ers of its literature, another eminent geoprapher, Pliny. Ile devoted two books of his extenaiva work on natural history, to a system of geography. Ilis intimate connection with the irsocrial family, nnd with many of the most eminent commandern of the time, appears to have given him access to atl the military measurements, as well es to the general survey of the Roman empire. Thus fornished with a greater store of nuthentic materials tha: any former writer, he has introduced a great number of itinerary details, which are for the most part necurate and valuable. Julin. 3 Solenus has atso treated of geograplyy in his Polyhistor, a compilation sufficiently valuatie from the number of curions particulars which are there collected. Marinus of Tyre, was another geographer who ajpenrs to have teen distinguishel, though his works have perished. Jiven under the Loman empire Tyre continued to he the seat of an extensive commerco; indeed the commercial relations of her citizens mpear to lave extented over n willer portion of tho enrth's surface than ever. The enlarged muterinis furnisi ad by the lengthened journeys of his countrymen, which brought them even to tie confines of China, Marinus collected, and sought to apply t" theur the astronomiend principles of llipo parchus, an that he might give to geography a neve aul more aceurate form. l'tolemy, whom Marimes preceled by a short time, employs a grent part of his first look in liscumsing the means employed by the Tyrian geographer fur tixing; the rehative position of phaces; an? from the referenees and extracta it apo para that the system of Marinus purtook largoly of the imperfections of a first effort.

The enlarged and scientifio vewn of l'tolemy we have already comaidered. Some time after P'tiemy llved Donysina, commonly called the l'eriegrtic, from the titje of a work in verse composed by him, namely, his Jeriegrain, or Survey of the Worli. This work was translated into Jabin verse ly Priscianus, and afterwaril by Avienns. There in, hesidea, n description hy Avimus, of the maritime roats, In lambie versen, of which there remain about 700 . 'The difthenlty of proworing tho ambli and arattered pineen of mont of thone nuthors, with thos, of a few others not bere enmmerated, indieed the learned Hudson to culf lect them into one work, consisting of four volumen ortavo, which were publinhed in the years 1 159N, 1702, 1712, under the titio of Cirographie reteris Sirriptores Gireri minorrs. The orlginnla are nccompanied with Latin transintiona, and noter and diasertations on each by Doiwell. 'This ls a very valuable collection.

We now proeeed to consider the progress of geography during tho middle ages. From the days of Ptolemy until the revival of letters In Europe, little was done for ite eolld improvement. The calamities that are long overwhelmed the Roman empire, were followed by a general Intellectual darkness which eettled down on the world and extinguished even the imperfect knowledge pessessed by the ancient geographers. Whlie barbarotus nations poured in from eeveral quarters, art and science cessed to be cultivated. The union by which the Roman power had bound together mankind being now dlssolverl, Europe was divided into small and Independent, and, for the mosi part, hostile communities, which had but vague conceptions respecting the situation of each other, while no intercoursu subsisted between their members. With regard to remote reglone all knowledge was lost ; their situations, their commodities, and almost their names, were unk nown.

Amid this ignoranco there wore but few channels open through which knowledge could be obtained. One eircumstance, however, prevented commercial intercourso with foreign nations from being altogether suspended. The opulence and luxury of imperial Rome had long given life and energy to commerclal enterprise ; that stimulus was now withdrawn; but Constuntinoplo still remained, the last refuge of anclent arts, and taste, and elagance, when the rest of Europe was oversproad with barbarism. Fortunately that city bid escaped the destructive rage of the flerce inver: st there, under the cherishing finfuence of a ne: a, .at for foreign productions and lixxurles, commerce continued to flourish. Alexandria continued to be the emporium whenco were imported the commoditios of the liast Indies, until Egypt, falling under the power of the Arabimas, coased to be a province of the Roman empire. After this event the industry of the Greeks succeedod in discovering a now channel $\mathrm{by}^{*}$ which Constantinople might still be supplied with * productions of lindia. These were tirst conveyed : ' ne Indus as far as that river ls navigaWe, thence by land-carriago they were brought to the Oxus, and were carried down the river to tho Casplan Sea, lintering thero the Volga, they were conveyed up it, and thence were again transported by land until they reached the 'Tanals, down which they were convered to the liaxino Sea, where vessels from Constantinople awaited their arrival. ley this circuitous route was a channel of intorcourso kept open with tho most distant conntrios of the Bast ; and an extensive knowledge of romoto reglons was atill preserved In the capltal of the Groek empire, while the rest of Eurspe was sunk. In the grossest hanorance.

The missions seut for the conversion of the northern pagans to Christlanlty, served somewhat to fllustrate the geography of Europe; though there is mullecient proot that tho monks employed were, in many instaners, themselves grossly lignornant, some not even knowing the capital of their own ceuntry, or the cities nearest to their own. Something was ulso done ly the great sovereigns of Burope toward dispelling the presailing Ignorance of the age on matters commerted with geography: Nor did the piratical exploits of the Daner und Norweginas under their grat sea-kings fail to make them uequaluted with the seas mul maritime coasta where they carried on their devastations. lhot it was in the Bast that a gleath of light mul knowledge hegan now to appar, which was tho harbinger of the noon-day splendor of selenee that was destined to atweed the darknesm of ignorance whits had so long oppressed the human mind. Diader the influence of a fanatichem which prompted them to own no law hat the Koran and the sworl, the followers of Mohammed hal rushed from the heart of Arabia, and had carrhed their conquents over half the world. At lsagil, huwover, under a race of humana and pollshed prineres, laving contracted a rellah for the sclences of
the people whose empire they had contributed to overturn, they etood for some time distinguished as the most learned of nations. They translated into their own language the books of several of the Greek phllosophers. The valuable work of Ptolemy was one of the first; and hence the study of geography became an early object of their attention. But the advancement which the science made in their hands toward precision was slow; for they copled and retailed all Ptolemy's principal errors. Still, in all the countries that were under Mohammedan dominion numerous observations were made, whlch, though not always strictly correct, were entitled to be considered as a step beyond the calculations msde merely from the itineraries by the Alexandrisn geographers. In the beginning of the ninth century, undar thelr caliph Almamon, who may rank among the most distingulished patrons of sclence that evar filled a throne, they measured a degree of latitude on the plalus of Sinjar, or Shlnjar, near Babylon, with a view to determine the circumference of the earth. The tables of Aholfeda and Ulug Beg, and of Nazir Eddin, edited by Gravins, and republished by IIudson, furnish materials that are still of use in the construction of the maps of the interior of Asia.
The progress and success of the Moslem arms removed the ubscurity in which many countries hud until then been concealed, as well as the barbarism in which they had been sunk. And even boyond the limits of the Molammedan world they pushed their reseurches, by sending missions buth to the east and to the west, which they explored to their renotest llmits. At that time Europe remained Ignorant of the improvements made ly the Arablans, though she was destined in subsequent ages to perfect their discoveries.

At length the long period of barbarism which accompanied and followed the fall of the Roman empiro, during which the traces of whatever had emhellished society, or contribinted to the comfort and convenienca of life, wero almost entiroly effaced, drew to a close. Industry began again to thed its blessings on mankind; and Italy was the country where its lenign infiuences were first pereeptible. IIaving from the operatlon of varlous causes again obtained liberty and independence, the Italians soon began to feel the impulse of thoso passions which eerve most powerfully to arouse men to activity and enterprise. The reviving demand for the comforts and luxuries o: life led to the revival of forelign cemmerce. The valuable commodities of the last were at first ohtained at Constantinople. But the exorbitant price demanded at that mart, in consequence of the circuitous routo by which they wore conveyod thither, induced the Italians to resort to other jorts, us Aleppo and Tripoll, on tho Syrim const, and at length to Egypt itself. After the Soldans had revivet the comnerce with lndia in its uncient chamel by tho Arablan Gulf, Veaice, Genou, and IT, a, roso from inconsiderable towns to wealthy and populous eities. Their trade extended to all the ports ln the Mediterranoan, and even heyond the Strifits to the towns on the coasts of Spain, France, the Low Countrios, and Euphand; and from theso points they diffused through Europe a tasto for tho Juxuries and enjoyments of civilized life, which they at the same time furnk hed the menns of gratifying.

It was not long ere an event oreurred, tho most extraordinary, pert:aps, in the history of humbin soclety, which gave n new impulse to the buropean mind, and forcithly directesl its vlew oastwarl, to the regions of Asia. Vituler the intluenee of a high-wrought enthuslasm, the martial mitit of the liuropeans was aruased, und vast armins, composed of all the natlous of Christendom, marched toward Asha on the wild enterprise of delivering the lloly Land from the dominien of Infidels. The crusales, however blind the zeal from which they took their rise, lad a very favoralile intlit enco on tha intellecturl state of Europe, and prepured
it for receiving the light of science which was soen to dawn upon it. Interesting regions, known hitherto only by the acanty reports of ignorant and credulous pilgrims, were now made the oljject of nttention and research. Not only was the way opened for the Eurepean nations acquiring a correct knowledge of the Holy Iand, with the kingdoms of Jerusalem and Edessa, fonnded by the victorlous crusaders, but the extensive regions over which the Saracens and the Turks had extended their empire began to loe explorel. Seareh was now made in the writings of the ancient gengrophers; nor is it improbable that some light was derived even from the Arabian writers. Religious zenl, the hope of gain, combined with motives of mere cariosity, induced severnl persons to travel by land into remote regions of the East, far beyond the collutries to whieh the operatlons of the crusiders axtended. Prompted by superstitions venerntion for the law of Moses, and by a desire of visiting hia countrymen in the East, whom he hoped to find possessed of wealth and power, Benjamin, a Jew of Tudela, in the kingdom of Navarre, set out from Spain in the year 1160, and traveling ly land to Constantinople, proceeded throngh the countries to the north of the Enxine and Caspian Seas. He then journeyed towaril the south, and traversed various provinces of the further India, until, having rearhed the Jndian Ocenn, he embarked and vlsited aeveral of its islands; and at length, after 13 years, returned ly the way of Egypt to Enrope. In his progress he had acquirell much informntion respecting a large portion of the globe, until then altogether unknown to Europeans.

Various missions were sent by the pope and by Christian princes, for purposes which led them to traverse the remote provinces of Asia. Finther John de Plano Carpini, at the herd of a mission of Francisenn monks, and Father Ascolino, at the head of another mission of Doniticans, were, in the year 1246, sont by Innocent IV. to enjoin Knyuk Khan, the gramison of 7.ngis, who was then at the head of the Tartar empire, to embrace Christianity, and to cease from desolating the word by his arms. In fultilling the commands laid upon them hy the heal of the Christlan church, the mendieants liad an opportunity of visiting a grent part of Isia. Carpini, having taken his ronte through Poland and Russia, traveled through the northern provinces as far as the extremities of Thibet, while Ascolino, who appears to have lamed somewhere in syria, alvanced throngh the aouthern provinces into the interior parts of Persia,

Father William de Rnlirnopia, a Francisean monk, having heensent in the year $1 \mathbf{2 5 3}$ on a mission liy St. lonis of France, in search of an linaginary personige, a powerful khan of the Tartars, who was reported to lave eonlraped the Christian faith, made a cirenit through $t^{*}$ interior parts of Asin more extensive than
 lle has, it of heing the firnt modern traveler that $g^{\prime \prime}{ }^{z}{ }^{\circ} \quad$ account of the Caxplan, which had been corr. (descrilmel by the parly tireeks as un inland separa e sen; but n notion nfterwarl prevailed that it was comnerten! with the Northern theat: Ruhrmiguia nacertalnet that it land no connection with the wenn or any other aea. The account of his journey was an little rearl, however, that the old error was repeateal in lanks of geograpisy long ufter his time.

Whiln the republies of Italy, and, nime all, the State of Venice, wers enagaced in dintributing the jewds, the spicea, and the tine cioths of Indin over the wentern wotil. it was impessibte that motives of curlocity, as well as a desire of commercial atvantage, should not low awakened to such $n$ degrue ns to lmjed some to hrave ail the alwtacles and dancers to be encountered in wialting thome remote montries where these precions and protitable commodities were promducel. A consideratile number of persons aceordingly are recorted as having penetrated a greater or less
depth into the intarior of Asia. But the fame ef ell the other old travelers in eclipsed by that of Marco Polo, who has always ranked among the greatest discoverers of any age. This extraordinary man was a noble Venetian, whone family, according to the custom of his country, engaged in extensive commerce. Nocolo Polo, and Maffeo Poln, the father anil uncle of Marco, were merchants, who, in partnerahip, traded chiefly with the East ; and, in purnuit of thetr mercantile speculations, had already vlaited Tartary. The recital of their travels on their return fired the youthful Imagination of Marco, then between 17 and 18 years old. Having, when in the Fast, gained tise contidence of Kublai Khan, the rreat conqueror of China, at whose court they had resided for a long timn, they were sent laek hy him to Jtaly, accompunied by an officer of his court, that they might repair to Rome as his embassulors to the pope, of whom and the potentates of the western world, they had given him an ample account. After many lelays, they were now, alout the year 1265, to set out on their return to the court of Kublai, bearing the papal letters and henediction; and it was resolved that young Marco sheuld accompany them. After a journey that occupied no less than three and a half years, and in the progress of which they passed through the ehief cities in the more cultivated parta of Asia, they reached Yen-kligg near the spot where l'ekin now stands, where they wero honorably and graciously received hy the grand khan. Struck with tho appearance of young Marco, the khan condeseended to take him under his protection, and caused him immediately to be enrolled nmong his attendants of honor. By pridence and fidelity Mareo gained so high a place in the exteem and conlidence of his pratector, that for 17 years, during which he remained in his service, he was employed in contidential malsions tu every part of the emplre and its dependencies. Ile male more than one voynge on the Indian Ocenn, nnd traded with many of the isinnds. Lesides what he learned from his own observation, he coilected from others many things coneerning countries which he did not virit. Considering the very favorable circumstances in which he wns phaced for geographical researeh, as well as his pinssion for traveling, which seems to lanve inereasell with his opport unities of gratifying it, it is not surprising that, after the long period of his wanderings in Asia, he ahould have returned to Firope possessed of the knowleclge of many particutars, until his time unknown, rer pecting the rastern parts of the word. Marco, being afterwatl mude a prisoner hy the Genoese, was inducel, with a view to hegrule the tediousness of his continemint, to dintate a narrative of his travels. His informntion was so far in alvance of the age, that his veracity was expoxel to the most injurious suxplicions. Hut, if we make allowance for some tincture of credulity, clumacteristic of the times in which lee lived, hos narrative is supjorted in all its essentind pointe tom modern informa. tion.

While great accessions were thins male to the atock of :nowhedge possensed by the nations of Europe reepecting the hatiathe globe, there hieas were, at the same time, produally enharged; taml un adventurous spirit was generated, which prepared them fur attempting further disuovaries. Still their effirts were limited hy curtain trotinds, in conserflene of the imparfect atato of navigation. Whatever eomopitima a darlug nind might venture to form respecting the exintence of unhuown repions, separated from the known continmes hy the mights expmese of the Atianthe Ctrean. Hunkind hal not wet so chetained the deminfon of the neas as to beathe to hrimg suche conceptions to the test of experiment. It was not until the fortumate diseovery of the palarity of the magnotio neeHe, and the consequent comatruction of the marimers' compmes, that man was embled to visit every purt of the gluhe which be inhatits. The hupretant ilisens.

Mean while th to have heen knt
cry was made by Flavio Glola, a eitizen of Amalf, a alght of, had heen discovered in 1446 ; and soon aftertown of considerable trade in the kingriom of Naples, abont the year 1302. Encouraged by the possession of this sure guide, by whleh, at uil times and in all places, he could win ev vainty oteer his course, the navigater gradually abandoned the timid and sjow method of sailing aleng the shore, and boidly committed his bark to the open rea. At the commencement of the 15th century, however, navigation appears to have advanced very little heyond the state which it hat reached before the downfall of the Roman empire. But it was now destined to make rapld progress. The growing apirit of enterprise, combined with the increasing light of seience, had prepared the States of Larope for entering upon that great eareer of discovery, of which the detaile constitute the materials fer the history of modern geography.
Portugui took the lead in this new and brilliant path. ller first attempt wns to discover the unknown countries situnted along the western coast of Africa. Netwithstanding the vieinity of that great continent, and the strong Inducement afforded in the fertility of the conntries already known in it, to its further exploration, Cape Non had hitherto limited the resarches of the Portuguese, and had been regarded as an impassabie barrier. In the year 1412, however, ships sent out for diseovery doubied this formidable promontory, and reached Cape Ilojador, 160 miles to the southwari, which became in ite turn the houndary of Portuguese aavigation; and it continued to be ao for upward of 20 years. Under the coasting system, which atill continued to be practiced, it was not likely that the olistacles presented by its rocky eliffs, whieh streteh a considratie way into the Atlantic, would goon have heen overcome. But a sudden squall of wind having driven ont to rea the vessel next dispatehed, this event fortunately ied to the discovery of the small ishame Porto Santo; whence, in a littie time, Madeira was discoveref, being tirst mistaken for a small black cloud in the borizon; and at length, when the Portuguese, by their voyages thither, had gradnally become accuscomed to a loolder navigation, Cape Hojador was doulied. Thus, be repented efforts, the Portuguese navigators graduntly approached the northern bonadary of the torrid zone. llere their progress was for some time arrested, not by any physical difle lties, lut in consequence of the influence which the opinion of the ancient mathematicians and gengraphers whom they hall hitherto fillowed as their gnides, had apon their minls, ly leading them to believe that excessive beat rembered the mitalie regions of the earth undnhatitalle. Experience, however, at length enabied them tu trimphover ignoranco and projudice. A powerfni Hect, fittem ont in 1.181, aft' " diseoverimg the kinghoms of Benin and Congo, ndraneed about 1500 miles beyond the equator. 'Iheir Intercourse with the natives enabled them to obtain luformation comerning those part of the comatry whieh they had not vivited. Not only had they detected the error of the ancients in reference to the torrin zone, but they found also tint the direction of the eonst was very dillerent from what the description glven by I'toiemy hal led them to expect. They naw reason to conclade that the continent gradually became narrower as they proceederi sonth.wand; to that there was reon to holieve that the ancient accounts resperting the circumavigation of Africa were really fommed in truth. New ami more extenvive prospects were thas oudted to them; and the linding of a possage to India liy salling romed the sumbern extremity of Afrien hecame a fivorite pros ject, in the year 1.188 , the lofty promontory which terminates that continent was dieserien by barthonemew illaz; but it was not until about 10 years afterward that it was dondion, and the reast of Daiamor reached, by Viaseo de Gimba.

Bean while the Cape de Versi lsiands, which are waid to have been known to the ancients, but afterward iost
ward the Azores Isles. When we consider the diatances at which these two groups of islands lie from the land, the former being upward of 300 miles from the coast of Africa, and the latter distunt 900 miles from any continent, it $n_{4}$. $y$ be conciuded that the Portuguese, when they entered so boldly irte the open seas, had mude no ineonsiderable progresa in the art of navigation.

But hrilliant as is the lustre which these diseoveries shed around the Portugnese name, their glory would have been still more dazzling had they seconded the profound views of Christopher Columbus, which led him to the discovery of the New Werld. That Jllustrious man and sklliful navigater, hy revolving in his nind the principles on which the lortuguese had founded their schemes of discovery, and carried them into execution, was led to conceive that he could inprove on their plan, and aecomplish diacoveries which they had hitherto attempted in vain. From the time that they had doubled Cape de Verd, the great objeet at which the Portuguese almed was to find a passage by sea to the Last Indies. The direction in which their efforts were made implied necessarily a long and hazardous voyage, should they even be sitceessful in accomplishing their design. But as the Athantic Ocean stretches west ward to an unknown distance, was it not possible that it might reach the shores of those very countries to which it was thought so desirnble to find a naval route? This supposition was perfectiy consistent with the known globular figure of the earth ; and it was evident, on the same principie, that the further India stretches to the east, the nearer it must nppronch to the western shores of Vurone and Africa. Such was the idea anggested to the mind of Colunbus, hy the knowledge which he possessed of navigation and geography, both in theory end practice. While he found his vlews contirmed by a eareful comparison of the observations of modern pilots with the hints and conjectures of ancient authors, he beeame thoroughiy eonvinced that the mavigator who should have the boldness to cross the Atiantic Ocean would have hia toils rewarded by the most important discoveries.

These ideas had presented themselves to the mind of Columbus as carly us the year 1.74; but it was not until the year $14!2$, after several yenrs of fruitiess solicitation, and of discouragements and disappointments of the most rexations kind, that he olitained the patronage of Ferdinned and Iambela, who then governed tho united kingdoms of Castlie and Arragon, and was live them put in possession of tho means of carrying his sehemes of discovery into execution. With no more suitable an ammant for his great enterprlse than three amall vessels, having 90 men, mostiy snilors, on board, and victualed fer 12 months, he saited from the port of lalos in Andahusia on tho ial day of Augnst, and steered for tho Canaries. Taking then his departure from Gomera, one of the most westerly of these ishands, he stretched into unknown seas ; and holding his course due west, reached Guanahani, one of the ihahama iniamos, on the 12th day of Detobur. After employing some time in making further ilisooveries, he returned to Span to amonnee the success of his undertaking, the fame of which soon apread over $\mathfrak{l}$ arope, and excited general attentinn. It was mo pasv matter to determine what relation the newly- iscotcred eountries bore to the regions formery known. ('olmultus's own views on the suliject were in strict rmformity witi the lina which had taken so firm a hold of his mini, namely, that Indis might he ronched hy salling towari the west. Ife lmagined that the ishamds he had visited were some of those which were sulid to lie contighous to thas remote shores of dsia. In this opinion he was contirmed by the coincideneo which he thought he couk trave betwern certain names riven to phaces by the matives and the apperintions knowi to belong to countries sit-
uated in Indin. He thought he could recognize, in the answer given to his inquiries after the situation of the mines whleh yielded gold, the name Cipango, by which Marco Poto and other travelers in the East desIgnated the isiand dupan. Ignorant of their language, and unaccustomed to their pronunciation, he even suppesed that they spoke of the great khan; and hence concluded that the kingdom of Cathay or Chinn, described ly Marco lolo, was not far uff. The same erroneeus opinion was still further rlveted in his mind, ly what he suppesed an ldentity between the animsal and vegetable productions of the East Indlee and those of the countries which be had discovered.
llis second veyage led to the discovery of several more of the group of inlands now called the West Indies, a name glven them in conformity with the ortginal notions of the diseoverer. It was on his third voyage that he discovered the vast continent of America, Ifaving unexpectedly found the ishand of Trinldad, with the nelghboring land, he encountered, hefore he was aware of danger, the adverse currents and tumultueus waves occastoned by the resistance which the waters of the Orineco oppose to the tides in the ocean. His attention was thus forcibly catted to the Immense body of water which is here poured inte the Atlantic. This he was convinced was vastly too great to be supplied lyy nuy island; and henco be concladed that he hat now reached the continent which he had songlit through so many dungers.

The Aneriran cuntinent, in its northern portions, had been discovered in or before the eleventh century. Toward the cluse of the ninth century a Norwegian pirate, while attenpting to reneh the Faroe Islands, which had already heen visited hy the lrish, was driven by storms to the coast of leetand. This led to the tirst settlement of the Norwegians in Jceland in $87{ }^{5}$. From that time the liurve lshands and lceland may be regarded as intermediate stations and starting-points for attempts to reath the northern whores of America. Greenland was early seen; but it was not until 983 that it was peopled from lceland. Colonization was carried through Greentand in a south-western direction (1) the new continent, and for some length of time an inconsillerable intercourse was maintalned with the newly colonized erontries. Hut a strong lino of separation uast be drawn between this early discovery of tome parts of the high northern latitules of Amerlea, wall the diseovery of its tropinal regions ly Columbus in the close of the tifteenth centory. In consequance of the uncivilized condition of the people by whom the former discovery was male, as well as tho nature of the eomintries to which it was limited, it prodaced no important or permanent resulta in relation either to commerce or science; the latter, on the other hand, has beren attendel with events of the utmost importance to mankint, as it has proved the opening of a new source of wealth, glory, and hnowtedige. The discovery of the new continent in the west, like the original discovery of its northern regions, may le sadid to lee acedental, inasmuch as the object which Columbus had in view was to find a western passage to lidia. Int the expedition inder Columbus porsessel this distinguishing feature, that it manlfested the perfect charater of being the following ont of a phan sketched in accorlance with the principles of melence, and intelligently condocted to a sucesssful issuc.

The tenacity with which an lugenlous and enterprising mind allapses to a wheme which it las onco proposed to itself as an object of oursuit, was wtrikingly evlucel by tobumbus, whose thoughts atill dwelt with eagerness on him original ant favorite plan of opening a new patampo to hidin. It was not enough that he hat astonished mankind lig tinding a new continent; the conceived the iden that lreyond it there luight lie a mea extending to the coasts of Aria, and that lig diligent search some strait might be found
whlch would conduct hlm into this sea, or some narrow meck of land, by crossing which it might he reached. To determine this important point, though hltherto hls services had met with the most unworthy returns, though years crept apon hlm, though worn out by fatigue and broken with infirmities, he attll undertook with alnertty another voyage. By a lueky conjecture he directed his efforts toward the east of the Gulf of Darien; lut he searched in vain for a etralt ; and though he frequently went on shore and ndvanced into the country, he never penetrated so far as to enable him to descry the great Southern Ocean.

After the first ateps had been taken, the progress of discovery over the globe was astonlshingly raphd. No expense or danger leterred even private adventurers from fitting out fieets, crossing oceans, and encountering the rage of savage nations in the most distant parts of the earth. Before Columbuas had reached the continent at the mouth of the Orinoco, Newfoundland had been discovered by Cabot, a Yeue: thun by descent, but suiling under tho auspices of singland. He had also coasted along the present territory of the United States, perhaps as far as Virglnia. In the next two or three years, the Cortereals, a daring family of Portuguese navigntors, began the long and unavailing search of a passage round the northern extremity of America. They sailed along the coast of Iabrador, and entered the spacious inlet of Hudson's Bay. Two of them unfortunately perished in this enterprise. In the ycar 1501 Alvarez Cabral, a Portuguese navigator, destined for India, having stood out to sea in order to avoid the variable breezes and freguent calms which he was sure to meet with on the African const, to his surprise, came upon the shores of an unknown country, the const of Brazil, which he claimed for Portugal. Amerigo Vespucei, a Florentine gentleman, who hai already sailed along a great part of Terra Firma and Guiana, now made two extensive voyages along the brazilhan coast. Soon after lis return he drew up and transmitted to one of his combtrymen an account of his ndventures and discoveries, in which he insinnated that to him belonged the honor of huving tirat discovered the continent in the New Worhl. 1 lis performance, which was the first description published of the new-dlacovered comatries, circulated rajidly, was read with admiration, amille. came the menns of procuring for its author the high honor of giving his mane to the whole contiment. Not many years clapsid the fore the conjecture of co. lumbus respecting the existence of an orean beyond the continent which he had discovered was futud to be true; and bis favorite project of opentug a passage to India by stcering westward was actuatly accomplished. Ily crossing the narrow isthmas of pamama, Nunez llaboa reached tho fachile thean in the year 101:t; and in 152l Magellan discovered and saited through the famous straits which bear his name. After eto days owcupied in navigating this datugerons chanmel, be belaeld spread ant before him the lomms. tess expanse of the great Southern Ocemn. Wirecting his course to the N.W., he continued his voyage for nearly $\&$ munthe without diseovering land. From want of provisions and from sirkness, ho and his cres sutfered Jreadful distress. But when ahwit to sink under their sutferinge, they fell in with the ladrone Inlands, where they found refreshments in altundance. From these intes he promereded un his vogage, an! was not long in diswovering the Philigpines. Here, in an unfortunate guarrel with the natives, he was shaln, with several of his principal otherer. Hat his survis. Ing companions, pursuimg their voyage, and retarning to Eurozs hy the C'ape of Gionl Iloper, solved the great problem of the rircumnavigation of the earth.

Aftor the discovery of the l'acifie Ocoun by thathe, the investigation of the western cuasts of Amprica went apeedily forwarl. Expeditions were soon sent out both northward and southward; so that nearly a

full view was obtained of the immense range of coast which the American continent presents to the Pacific Ocean, and at the same time of its great interior breadth. On the other hend, discovery In the Rastcra World was no less rapld. Within 20 years from the time that Gama reached India by the way of the Cape of Good IIope, all the coasta of lilndoostan, those of eastern Africa, of Arabia, and Persia, had been explored. Navigators had penatrated to Malseea and the Spice Islands. They had learned the existence of Siam and Pegu; and It was only the eharucteristio jealousy of the ralera of the Colestial Empire that prevented them from entering the ports of China.

The seientific geographer hal now abundance of materials to arrange and digest into one systematic whole. He was now called upon to give auch a deliacation of the earth's surfuce as should connect together the ranges of eastorn and western discovery, and should exhibit the true outline and relative positious of countries, as these had been demonstrated by the astronomer and navigator. The ancient system of geography, to which the Arabs geem elosely to have alhered, was founded on the lidea of the whole earth being surrounded by an ocean es ly a great zone. This the Arabians characterized as the "Sea of Darkness," an appellation most usually given to the Athantic ; while the northern sea of Europe and Asis, us inspiring still more gloomy and mysterious ideas, was styled the "Sea of Pitchy Darkness." Such notions could not now keep possession of the hnman mind, though it was only ly degrees that mankind could be expected to be enlightened by doetrines which were not only new, but seemed likewise to be contrudicted by the avidence of sense. The fundamental principles of a systematic arrangeinent had, as we have alrealy seen, been known from the time of litpparehus, and had been reduced to praetice by Ptolemy. But the want of astronomical observations, or even of eccurate surveys, which navigators seldom furnished, and for whleh science had not indeed yet proviled suitable instruments, placed it still beyond the resourees of modern geography to give any thing like a just representation of the two hemispheres. 'The Venetian geographers were tho first who attempited a systematic arrangement of the immense regions rerently diszovered, atjusting them to ench other, and to the mass of information previously possesed. Hat a series of Venctian maps, preserved in the king's library, show how much their will was counteracted ly the dittheulties with which they had to contend. Instead of exinibiting the vast ocean which separates the eust coast of Asia from the west cuast of Ameriea, the two continents are represented either as meeting, or as separated only by a narrow strat. The voynge of Magellan actoss the Sonthern Ocen hal not shown with sullicient distinctness the presentation of the opposito consts, to emable the geographers of the time to avoid this error. When maps of different dates are compared, we tind, as we descend toward motem times, a gralnal jrogress toward arollracy in the representations given of the earth's surface. This is what might be expected; for all maps should lie considered as untlinshed works, in which there will n'ways be something to bo corrected, or something new to be insertel.
At the periol of tho revival of letters in Burope, the latitules and lougitules as given by l'tolemy were universally recelved with limplicit contidence. When checkel, however, by actual ohservation, they were foum to differ materially from the truth. The latitales in many instanees were found very orroncous; that of llyzantiun., for example, exceeded the truth by two degrees. As nearly the same excess was found to exist in some other cases, many geographers, unwilling to renounce the authority of P'tolemy, concluded that this difference had arisen from a change
jis is is
having taken place in the position of the earth's axir, in consequence of whleh the latitudes of all the places In Earope were increased. The progress of observation showed that tilis opinion ras untenable, and that before geography could rest on a stre basis, a general revision of ancient graduation was indispensably necessary. The only observations employed by the anclents for rietermining longitudes were those of the eclipsas of the moon; but It was found that the results deriveci from this source could not be depended on. In the year 1610, Galileo, having discovered three of Jupiter's satellites, pointed out the use which might be made of their eelipses for finding longitudes. But this method, which glves the greatest degree of accurucy, was turned to little account, untll 1668, when Cassint pablished his tathes of the revolutions and eclipses of these sateinites. Three years afterward, by means of simultaneous oiservations made by him and Pleard at Paris, and by Tycho-Brahe at Copenhagen, the differonce of longitude of these two important points, which had been long a matter of dispute, was finally determined. Since that time, other accurate methods of finding the longitude have been discovered; and the Instruments employed in observation have been brought to a high degree of perfection. The refinements and improvements of modern science have been brought to bear upon the great problem of determining tho figure of the earth, which, though nearly, is not exactly spherical. (See Figuie of the Eantif.) The labors of scientfic men to obtain aecurate results on this antject, bave contrihuted much to the imprevement of geography. The expeditiona aent out under Maupertuis to the arctic circle, and under Condamine to the equator, afforded an opportunity of making various observations of latitude and longitude in regions of which no delineation reating upen proper lata had hitherto heen given. Within the last 50 years, trigonometrical surveys of France and England have been exceuted, whleh have nearly completed the delineation of these countries.
Much advantage has accrued to geographical selence, in point of aceuracy and precision, from the application in modern times of a sumbl and judietous critleism to the immense mass of materials which had been accumulating for ages. The labors of M. d'Anville, in the 18th century, were employed with great suecess in this department. LIe undertook the revision of the whole aystem on which the delineation of the world, and of the countries into which it is ditiled, had hitherto been made; and by unhesitatingly rojecting evury particular that did not rest on positive autiority, he removed uany false or uncertain features, and clearly distinguished the known from the unknown parts of the ghole. Mnjor lennell has skillfully arranged and ilhustrnted the important materials collected respeeting lntis. Various authors have in modern tines cultivated another interesting field of inquiry, the comparison between ancient ani modern geography, and the tracing of the rise and progress of early discovery. These researehes were diligently pursued by Vossius, llochart, and other learned men of the 17 ths century, and with still more suecess by lennell, Vincent, and Mannert, who appear to have pashed them as far as they admit, though much darkness atill rests on some parts of the loquiry. Gosselin, notwithstanding that ho has applied to the subject a great extent of invertigation, as well as much skill and force of criticisu, has failed, on account of tho peeuliar views in which he indulged, to make any sold addition to the science.

The discoveries male hy the Spaniards and Portuguese ladd greatly inerensed the stock of geographical information. Still much remalned to be done. The lesire of Ilnding a short and convenient route to India continued to supply a sthmulus to exertion in the way of discovery. Tho English and Duteli mado extraordinary efforts, and encountered fearful dangers and:

ber, whence he steered through a channel called Prince of Wales's Stralt; whleh, ranning north-east, appearnd a most promising course for reaching the sea south of Melville Island. Near the northern extremity of this strait, the Investigator was frozen in from the 8th of October, and remained stationary during the winter. l'arties being aent out to explore, it was soon ascertained that the channel opened Into Barrow's Strait ; and thus was the existence of a north-vest passage established. On the 14th July, 1851, the Incestigator was again fairly afloat, the lce bsving opened without any prescure. The great object now to be gained was to pase through the strait ; but notwithatanding their utmost exertions, the oxpedition was completely arrested ly stroug north-east winds, Iriving great masses of lice to the southward. Thus baffled, Captain M'Clure resolved on running to the soathward of the island forming the western boundary of Prince of Wales's Strait, which he had named Baring Island, and then to sail northwaril along its western side. This navigation, in which he was subjected to many delays and encountered many formilable obstacles, he accomplished, and succeedel in reaching the north side of the island on the 24th of September. Had open water existed to the enst the rest of the passage might have been ensily perfer,ned in this way, for Barrow's Struit lny before them, the navigation of which, from their position to Lancaster Sound, was khown to be practicable. 'The hopes of this intrepid navigntor were destined ngain to be disappointed. On the night of the above-mentioned bay the Inesestigator was frozen up, and at this point, in latitude $74^{\circ} 6^{\prime}$ N., and longitude $117^{\circ} 54^{\prime}$ W., they had their winter quarters $\ln 1851,1852,1853$. In April, 1852, a pnrty erossed the lee to Melville Island, and defosited there a document giving an account of their proceedings, and of the position of the Investigator. This document was happily discovered by the officers of Captain Kellett, who luel been the last pers,n with whom Captain M'Clure held communication when he entered the ice on the west, and was now, singularly enough, th's preson to reseue him nt the expiration of three ;ears on the side of Melville Island on the east. Step were immediately taken to commanicate with the party in their ire-prison, Lieutenant Pim being appointed by Captain Kellett to the srrvice. Kventaslly it was found necessary that Captain Meture and his galtant companions should abandon their ship, however unwillingly; so that the navigation of the north-west passagu has not yet been accompished.

The discovery of n new continent freatly enlarged, as we have seen, the views of mankind respecting the constitution of the glole. I But imngination, no longer limited in its range by the notion of a circtmambient ocean that could not be passed, soon gave rise to the infief of a southern continent, which was suphesed necessary to balunce the lind in the nore hern regions of the earth. $T$, immense boily of water that was found to oremy so larom a portion of the known regions of :ics aputhern. dea isphere pave maplo room for suppooing this unknown antinent to be of vast dimensions. It was inngined that it might eqnal in extent, ns well as in wealt'?, the American continent. Nor was it considered nocessary to exclude it from the map of the world till its existence should be proved. It appears ball the early maps as an inmense mass of law "purrombling the south pole, ans: presenting to the ocean one untroken const. "he ith covery of certain great insular tracts in the south seas, whim, from ignorance or their tran mature, mavirators might matake lur continerital promontories or portions of const, no doabt at first gave some comintenance to the belief of the existence of antaretic !and. lint tho dre lasion was gradually dispelleed tefore the light afforiled fy further diservery. Tho l'ortuguese, in less than 20 yenrs after thele passago of the Cape of (iood llope,
prahed their researches to the most remote islands in the Indlan Ocean, Including Java and the Molncens. They appear also to have observed nome part of the coast of New Guinea. The Spaniards, during their early and adventurous carcer, put forth strenuous exertiona to explore the Southern Ocean, and eeveral of the groupe of lslanas cattered over its surface were discovered by their naviontors. In 1607, the Dutch having wrested Java andi the Sjice Islands from the. Portuguese, established in then the centre of their Indian dominion. A great maritime power being thus placed so near to the northern ehores of the largest portion of land on the globe that is regarded as an island, it became almost impossible that New Holland could long remain unknown. It was dizcovered early in the 17 th century, and was long supposed to form a part ef the great southern continent. Van Diemen, the Dutch governor of lndia, sent out several vessels successively to explore its coasts. Hertog, Carpenter, Nuytz, and Ulaming made very extensive observations on the northern and western shores, but found them so dreary nnd uninviting that no settlement was attempted. In the year litiz Abel Jansen Tasman was commissioned to proceed on a voyage to ascertaln its extent. On the 1 It August he sailed from Botavia, directing his courso first toward the lsle of lirance. He again set sail on the Bd October, and preceeding southward and eastwarl, beyond the limits reached by his predecessors, he discovered and doubled the southern extremity of Van Diemen's Land, to which he gave its name; but he failed to diacover that it is a sepnrate island. Pursuing nfterward his course eastwarl, having reachel about $42^{\circ} 10^{\prime} \mathrm{S}$. lat., and $170^{\circ}$ E. long., he found himself in view of $n$ high and mountainons country, which he named Staaten Land, but which is now known as Now Zealand. He sailed along the const towarl the north-east, nul aftor being detained by the variableness of the weather, he resumed his voyage and returned home by the Friendly lslands, discovering many islands in his progress. Ho arrived at lhatavia on loth June, 1643. Tasman's voyage provel that New llolland was no part of the southern continent, even if such a continent should be found to exist. Cook, who had been appointed in 1763 to conduct a vovage into the Soath Ineifie Ocean for astronomical noll geographical purposes, suiled southward in 1769 in quest of the unknown continent. lofty mountains wero seell on the 6th October, and it was supposed that the ohject of their aeareh was found. lut the land proved to he New Zealand. This land he circunmavigated, and found that it consisted of two large islands separated by a narrow channel. After six months employed in this manner, he directed his course west ward, and reached the eastorn side of New Holland early in 1770. Lhy his evcensive operations In that quarter-iaving run down the coast from latitude : $\mathrm{S}^{\circ}$ to its nurthern extremivy at Torres Straithe left little more to be done there in the way of diseovery. l'assing down New llolland nad New Guinen, ise continued his voyuge hy 'limor and the south coast of Java to latavia; whence, after repuirit ig the ship, le saited for lingland, and reached the Iowns on the 12th lune, 1751, with his crew weakened nnd reduced in number by the fatigue and dardshipis of their long vovage. By this voyage it was proved there was no such rontiment as that supposed to exist to the northward of $40^{\circ}$ south latitnde. Hut ns many ingenious and well-informed men still adherel to the opinion that there did exist a southern continent, fovernment determined to semd out a wreond experdition under ('ook, to hatak imeh me exploration of the l'acitic Ocean in the higher southern latitules as should tinally and satinfactorily settio this. uch agitated question.

Cook was instructed to circumnavigate the globe in high latitudes, prosecuting his researches as near to the suth polo as possilile, and to traverse every part of the Sonthern Ocan whero the supposed contizent
could ponsilily lie. The experition salled from Plymouth 13th July, 1772, and quitted the Cape of Good Hope 22d Novemtrer. Pursulng hils course enatwarl, Cook, during three yearn, omployed the aummer monthe in those reglons (correaponiling to our win. ter months), in navigating high latltudes towarl the Sonth pole, and the winter months in adding to hin discoveries in the South Pacific Ocean. Not withatanding, however, that he varled his course, anil traverved in every direction whleh he thought afforded the alightent likelihood of finding land, and actually got on far south as $71^{\circ} 10^{\prime}$ of latitude, he wan unsuccensful. Having thus acrupulously and completely accomplished the alject for which he was sent out, he directed his course homewari. He had encompnased the glole in hlgh latitudes, and was lerl to conelude that the southern pole is aurrounded only ly inles and firm fields of lee, so that the hypothesis of an auntrnl continent had no foundation. He reached the Cape of Good Ilope 2241 March, 1775, and anchored at Splthead on the 30th July, having, in the space of 3 years and 18 days, nalled 20,000 leagrues, mostly in finhos pitable climates and unknown seas. In the course of this and bls former voyage the same great navigator secured glory to his country and to himself ly likewise completing the survey of the great Paeitle Ocenn. Some of the interesting gronps of islunds seattered ovet its vast su-face had already lieen made known ty the previous voyages of Myron, Wallis, and Carteret. Cook fully traced the great chain of the Society [s]. ands and the Friendly Islanils. He deternined also the ferm and relations, not only of New Zealand, turt of New Caledonia and other lants and islands in that region of the glithe.
The extensive island est New Holland has recently hecome deully Interesting from the important relutions which now sulsist between it and Europre. In the year $1 ; 88$ the extablishment of a liritish culony on the east coast paved the way for in more complete survey. Hy the different expelifions undertaken from 1795 to 1799, chielly under the direction of Bass and Flinders, the east coast, together with Van Diemen's Land and Hase's Strait, which separaten that island from New Ilolland, were adeguately explored. In 1801 an expedition was sent out by the llritish government under the command of Captain Finders, for the purpose of surseying a large portion of the coast. "these aurvey were prospented with unremitting arior and perseverance. At the rame time that Captain Flinders was carrying on his survey, the French captain Baudin was employed on the same service, and in some parts the discoveries of these navigators intermingle. Some adilitional oiservations lave more recently leeen made; and ly these various expeditions the whole coast of New Holland and Van Jiemen's land has been accurately surveyel, the position of every puint bas been ascertained, and every Intet num thay has been traced to itn termination.

The atrong presmantion which the researches of Captain l'rok in the Southern Ocesn furnicheol of the non-existence of an austral continent. seemed to leave no roum to expect that any further doubt wonlin the entertainct on the subject. licutenant C. Wilkes, commander of the expedition fitted ont in lxak ty the government of the l'nitel States, for tho exploration of the antarctic reglone, has, however, claimed for him country and for himself the honor of ut length diswovering a enntinent within the antarctic circle. While this claim is pertinaciously adherrel to, we distinct and unequivecal prowf is prowlaced that the rontinene alleged to have been seen by the Afmerican expelition has a eulntantial existence. No centinent or island was landed on; and, on the other hand, it in supposed that the llitish expedition, under the cunmand of Sir James C. lloss, *ailow over the very pot in mouth latitude $66^{\circ}$, and east longitude $163^{\circ}-166^{\circ}$, where Lieutenant Wilkes supposed he aaw mountain-
ous land. This latter expedilion was fitted out hy the British government, for scientlio purposea, in 1839 , and arrived in Van Diemen's Land In August, 1840, The French government had likewlee sent an expellition Into the nouthern seas, under the command of Captaln Iumont dUrville, about the name time. To avoid huterferences with the French and American discoveries, Sir James lloss deternined on a more easterly meridlan-that of $170^{\circ} \mathrm{E}$. - In which to endeavor to penetrate to the sonth. The expedition sailed from Holart Town on 13th Novensher, 1840, and on 27th Decemiker encountered a chain of lecherga. On the 5th January, 18:41, they entered the pack-ice, through which having forced their way, the lee having at the same thme nomewhat elackened, they found themselves on the ith January again $\ln$ a clear sea. Soun ufter 2 oelock, A. M., of the 11th January, they diseovered land, which, us they advanced southwaril, was found to extend continuously from tho 70 th to the 79 th degree, with several adjacent islanils. This land they called Victoria land. It presented to their view ranges of mountuins whose lofty peaks, covered with eternal snow, rose to elevations fron $\mathbf{7}$ to 10 or even 12 thouanall feet alove the level of the ocean. The intervening valleys were filled with glaciers, which, deacending from near the monntains' summits, projectel In many places several miles into the sea, and terminated th perpendicular clifis. The rocka breaking through in a few places their covering, afforded the only indication that land formed the nuclens of this, to appearance, enormous iceberg. On the $2 x t h$ danuary, when they had nearly reached their highest latitucle, about is $8^{\circ}$ S., they found that what appeared when tirst seen at a distance to be a high istand, was a nountsin 12,387 feet in helght emitting tlames and smoke in great profusion. This volcano lies in latitude alout $\nabla_{i \frac{1}{3}}{ }^{\circ} \mathrm{S}$., and in longitule aloout $16^{-2} \sigma^{2} \mathrm{E}$. From the niost eastern point of land ut a cape not far from the foot of this mountain, an iey burrier was found to extenl eastward as far as the eye could dis. cern. This turrier was a perpendicular wall of ive from 150 to 201 feet in height, and streichell 250 miles ha one muliroken line, as was found on a secend visit to the same literesting tocality in February INt2; nor were they able to turn its extremity, so an to resch a higher latitude. At a point where the hright of the barrier diminished to nhout wn feet, they perceived from the mast-headn that it gradually rase to the sonth. warl, presenting the appearance of very lofty mountains preffertly covered with snow, hut with a varied and undulating surface. Anll hence Sir James loss, with nearly all his companions, felt assured that the presence of land there amounts nhmost to a cert:inty. Still, Sir lames is of opinion that the recent discoveries in the antarrtic regions made by the Firench aml Aumer. irain navigators, and thy himself, do not prove the existance of a great mouthern continent, but rather of a -hain of icanls.
In trani.g the hintory of geographical disevery, it can nut fail to be olserved that while discuvery by sea adonits of treing parsuel with great advantuge, on account of the rapidity of its progrems and the extent of its range, it din a not supersede the rlower and more contined operations of the discoverer lyy lamp, which are no less tercosary to make know the interiur fatures and circumatancen of the dilferent comtries.

The llitixh dominlon in India has led to much addi: tional infurmation respecting the interior of Asia- ' infuro mation which is, however, in many respects, only the revival of ancient kuowledge. The great mountainoms chain which forms the northern loundary of India, has treen traced and fund in many places to tower to suct heights na to exceed the Andes, long supposeel to te the highest monataina In the world. The solure of the Ganges, and that of the Indus, with the eariy courses of these great rivers, have been found to bi

The mountalnous territorien of Cabul and Cashmere, the bigh interior tablie-land of Thibet, and the vast anndy plains of Meckran, have all been more or iess explored. Information of an authentic character has also been recently obtained respecting the formerly celebrated espitale, Bochara and Samarcand. But a wide fleld stili remalns for future researeh.

The continent of Africa, however, is the quarter of the globe which, more than any other, has baffled the efforts of those whe would expiore its interior. The vast sandy deserts, high mountains, and impenetrable forests which occur on its aurface, joined with the unremitting wars carrled on between the petty tribes, as well as the deeply-rooted antipathy of the African Mohammedans toward the Franke, hive presented obtacles of the most formidnble kind. 'The anclents, whose knowledge of the African coasts was very imperfect, except where they border on the Mediterranean and the Red Sea, were nccustomed to penetrate into the inland provinces, and are said to have been acquainted with many parts of it which are now nitogether unknewn. At an early period of modern history, reports that Prester John, the Christian I'rince, who had been sought for in vain in the Fast, was to be found in the interior of Afrien, induced the Portuguese to explore Ahysainia; but the nccounts which they gave of the extent of that country were greatly exnggerated. From the western coast they dispatched embassies inte the interlor in quest of the chjectef their search; and on one occasion they appear to have renched the city of 'limbucton, and to have ols ained at Benin some information concerning the great iutcrior kinglem of Ghana. The maritime nations of south-western Europe early formed settlements on the west coast of Africa, and, for commercinl purposes, were naturally prompted to seek a knowledge of the nelghoring nations. Ilut it wrs not until the formation of the Afriean Association in 1783 that any wellsustained etforts were madie in the irosecution of discovery in the interior. There were two ohjects connected with the interior of Africa which had for a long time fixed the attention und awakened the curiosity of the nations of Europe. These were the city of Timbuctoo and the grent central river, the Niger. Timbuctoo has been for many centuries the grand emporiun of the central trado of Africa, and hence there has prevailed throughout Europe, ever since the rise of discovery and commercinl enterprise, $a$ atrong desire to visit it, and to establish with it $n$ fricndly interconne. The discovery of the course and mouth of the Niger has now openci up to commerciai speculation what it is hoped will give a rendy necess to 'Timbuctoo as well as other piaces of tratlic. The interest with which, in n geographical point of view, however, the Niger has been regariled, luas arisen from the remarkahle nature of the regions through which it dows, and still more from onr ignorance, comhined with the varions and contralictory rumors which were so long alruad, respectiug its course and termination. liemotus is the enriiest author who utlords nuy ideas applicable to this sulject. lie mentions no expertition into the interior of Afrien, undertaken by some Nussamonian youths, who, being made prisoners, were earried to a great city inhabited hy negroes, und situated on the linnks of a river which Howed from west to east. This strenm he conjectures to the the remoto source of the Nile, but the partieulars given appear to feave fittle doutht that it was the Niger. A similar hypothesis was nodopted by Strabo, Meia, and Pliny, identifying the waters of these two great rivers. liut Ptoleny, whose residence in $\mathbf{A}$ :smandria atforded him ample means of information, rejects aitogether the idea of any commanication between them. He describes the Niger as terminated on the west by Mount Manorus (Mandingo), and as giving rise to several ex- journey from its nource, he returned to the Gumbia by
tendive lakes as it proceeds in its course. Hls statements do not, however, invelve any thing positive as to the direction in which it fows. The Saracens or Arabians are the next great source of information; for, it the course of the diseensions whlch took place among their dynastles in northern Africa, large bodies crossed the desert and founded kingdoms on the eastern part of the ehore of the Niger, of which the kingdon of Ghana was the most splendid. According to their testlmony, the Niger flows from east to west, and diacharges itself into the sea, by which they understood the Atlantic, or great circumnmbient ocean. With regard to its source, they generally regarded it as the aame with that of the Egyptian Nile, jdentifying the two rivers in the eurly part of their course. Some were of opinion that the waters of the Niger did not reach the sea; so that they must have supposed them to be discharged into a lake. The system adopted by modern Luropenns was derived from Leo Afriennus, who retnined the delinentions of the Niger as flowing from east to west, and failing into the ocean; but, instead of deriving it from the Nile, supposed it to rise from a lake lying deep In the interior of Africa. Following this hypothesis, all the carly European navigators, when they saw the two broad estuaries of the Senegsl and Gumbia, concluded that one or both gave egress to the waters of the Niger. In the begioning of the 17th century, the French and English, baving each formed a settiement, the one on the Senegal and the other on the Gunbia, were induced by the hope of gain to seek a route up these rivers to the city of Timbnctoo; and in this enterprise they proved the faisity of the opinion which bid been so long held. The atreame were traced so near to thelr source as to become little more than rivulets ; while the explorers were still far from the great central emporium of Africa, and from the great jlain through which the Niger was understood to flow. This result led the two great French Heographers, Delisle and D'Anville, to ecastruct maps in which the Niger, after the lapee of so many ages, was again represented as flowing to the eastward. Inatend of a single strenm pursuing a conrse across the whole brealth of Africa and falling inte the Alantic, 1'Anville distinguivhed three rivers-the Senegal, tlowing westward; the Niger, tlowing east ward into a lake in Wangrara; and another river still further east, and flowing In the opposite direction. The data on which this scheme resta were never fully made public.

Still new doutt was thrown around this suliject by the reports collected ty Mr. Lucas, whe traveled under the nuspices of the African Association, and who was assured at Tripoli, by a native merchant, that the river flowed with rapidity in a westerly direction. The time, however, at last arrived, when these conHicting opinions were to be silenced, and when new light was to he thrown on the subject, by the labors of our illustrious modern truveler, Mr. Mungo Park. In his tirst expedition, in 1795-96, he proceeded from the west const in the direction of the River Gambia, until at Medina he left it, and turned to the north. Javing passed through the kingloms of llondon, Kasson, tind Kaartit, he renched Sego, the canital of Hambarra, where he teheld "the long-sought majestic Niger gittering in the morning sun, as broad ns the thames at Windsor, und flowing slowly to the enstward," directing his course into the depths of the interior of Africa. 'This stream, he found, was called by the matives the Joliba, or Great Water. Purk ativancel heyoud titis point to another town called Silia on the same river, and acquirel niso somo valuable ir.formation respecting the further course of the stream which was the olject of his research, as weil es respecting the position of 'limbuctoo, which hr. was toll was not more than 200 miles from Silla. Following upwarl the course of the Joitha until he remened journey from its aource, he returned to the Gambia by
a more aoutherly tract. In 1805 thla adventarous traveler was nent out at the public expense on his necond expedition. After reaching Silla, he embarked at a pluce in its neighborhood on the Jolibs or Niger, with the determination of nalling down the stream until he ahould reach its mouti, whithersoever its course might conduet him. Ile in ascertalned to have passed successively the cities of Jenne, Timbuctoo, Yaour or Yaourl, and to have reached llousan, s whort distance further down, where be was kllled. No part of hia journal, however, after he embarked on the river, haa been recovered. In the menn time, s atrong and general interest being now excited in reference to African geography, Information flowed in from various sources reapecting the regions in the interior, ss well as some parts nearer the coast. Mnny particulsrs hecame known concerning the countries to tinc east of Timhuctoo, especially the kingdom of Hornou, then the most powerful State of contral Africa. The knowledge possessed of the people of the interior was also considerably increased. These circumistances prepared the way for a more nucceanful attempt than any hitherto made to explore the interior of Africa, when Major Denham asd Lientenant Clapperten were sent out in 1822. Netting out from Tripoli with a raravan of Aruh merchants, these truvelers crossed the desert, and reached the great inlund sen or lake called Trhad, whileh is the receptacle of immense volumes of water collected from the nost diatant recesses of inner Africa. Major Denham examined the coanta of this lake to then cast ant sonth; while lieutenant Clapperton directed his researchen westwarl, through the kingdom of Bornou and the country of the Feilatahs, until he arrived at Sackatoo, aituated on a stremm which prohably flows into the doliba. In the course of this journey, Clapperton olstained a great mass of information concerning those hitherto unvisited regions which lie eastwand of Timbuetoo; but with regaril to the course of the unexplored part of the liver Niger (or Quorra, as it was called at Sackatoo), he heard little that could be depended upon. Llaving returned to England, he was again sent out by the govermment in command of n new expedition, with hastructions that be should endeavor to pentrate to the niene of his former adventures from the const of Guinea. In the execution of thle plan of research the reached the Niger at lloussa, where l'ark perisined; and, after traversing some of the adjuiting regions on the further side of the river, as fur as the great commercial city of Kano, the capital of llousaa, where he had been in his former journey, he turned again to the went, and having reached sackatoo, there died. Ilis servant, Richard Iander, with a praiseworthy zeni, embarked on one of the branchea of the Niger for the purpose of finally determining. if possible, its terminution by sailing down the stream ; but he was atopped liy the nastlves, and compelied to turn hack. The city of Timbuctoo was in the mean while reached by Major laing, who succeeded, in August, $1 \mathrm{~N}: 6$, in making his way' thither across the desert from Tripoli. In this famouis city he spent some weeks, that he was maniered in the desert on his return; nor dill the rosults of his inquiriea and ohservatiens ever reach liurope. Such are the formidabte difficultien and dangura which have bitherto encompased the patis of diseovery in the interior of Africa. Still, ly renewell efforts, the olsject of researcli has been grained. Tho grand guestion of the termination of the Soliba, Quorra, or Niger, has at tength been fully reaslved-a dis.overy which is the resuit of the fortunate ant weil-ronducted enterprise on which Hichard lander and his brother were sent out in $\mathbf{j \times w}$. Having followed nearly the same route which had been takon by Clapperton in his sec. ond journey, these two travelers rearhesl lloussa on the 17th June. They first ascended tho river as far an Yaouri, and then retumed to Ibousas. After remain. ling there for some time, they embarked on the river to
follow the stream In its course downward, hoping that it would condret them to the sea. In this expectation they were not disappointed ; for they reached the llight of Benin by the larger branch, whleh la there called the IRlver Nirn. There in another great branch a little further to the south; snil by these two outlets, with several smaller channels, the river known in Jurope by the name of Niger discharges ita water into the Atlnntic.

The zeal for dineovery in Afrien, which has heen so active during the iast six years, has sent forth a suca cesaion of travelers (mianionaries and othera) to explam the southern regions of that vast continent. We can mention brietly only the most remarkable reaulta of their researehes.

It is now ( 1856 ) nbout six years sineo Intelighence was recelved in Europe of the diacovery of snowy monntains in eastern Africs. The discovery was in itself so remarkuble, that the report was not at first mineranlly credited. It was, however, subaequentiy confirmed. The mountains in question are Kiliman. juro, in about latitude $92^{\circ} \mathrm{N} .$, and longltude $37^{\circ} \mathrm{E}$. ; and Kenia, in nlont latitude $1^{\circ}$ S., and Iongitude $2 \times j^{\circ}$ F. They were discovered by the missionaries Repmann and Krupf, stationed near Momhus, Kilimanjaro is an isolnted and very conspicuous peak, probully connected on its wextern side with the table-land of inner Africa. The missionaries have become acquainted with its eastern, southorn, and northern aspectas ; lut Mount Kepia has been acen only from the south, at a distance of six days' journey, or about *0 geograpisical milea.

Anot' ar important discovery mada in the interior of Africa ${ }^{-}$ithin the same time is that of Iake $\mathbf{N}$ '(Gami, hy the misuionary the Rev. Dr. Bivingston, accompasnied by Mr. Onwell and Mr. Murruy. It sectas to be situsted almat $19^{\circ}$ south latitude-ahout Stion niles N.N.W. of Kololeng, the scene of Ir. Livingston's misaionary lalors, and the head-quarters of the Haquain tribe. These and other explorers have made as in nome measure acyuainted with an extenvive syatem of rivers, between $10^{\circ}$ und $22^{\circ} \mathrm{S}$. latitude, runaing eastwarl, which, when further research whall have mado them fully known, may be found cupatle of leing rendered subservient to commercial intercourse with the surromuling countries, and to their consequeut eivilization. Dr. Iivingston has lately returned from his explorations to the north of lake N'Gani.

An important expedition to eentral Africa, headed hy Mr. James Richardaon, left Tripoli in March, 1900. it was sent out under tha orders and at the expense if the ll ritish government. 'The olject of this mission was to survey lake 'ichad, and to explore the neighiroring count ries. The scientific interests of the expedition were intrusted to two German gentiemen, Dr. llarth and IVr. Overweg. Instand of traveling from Tripoli neross.the desert with the great caravan, the mission fommed a amall caravan of its own, amounting to about 100 jrersons, and as many camels. The jour. ney from Tripoli to Murzuk and thenco to that is less interesting than that from the latter place, where they entered on entirely new ground. Hut even in the fovmer part of the march many important discoveries were made, as the travelers nelected new routen not before explored, and thus rendered every part of the journey suliservient to the parposes of the mission. At Ghat their personal danger was increased to such n degree that they found it necessary to trust for protection to the friendship of the sultain of the Kolow, in whose country they were detaimed about three months, during which timie Ir. Harth made an interesting joumey to Agadez, while murit valuatile information was also collectes hy Mr. Riehardsun and ly in. Overweg, who had remained. At the close of ldion the party reached Zinder, where the three travelers sep. arated, each proceeting with his followers hy anathet route. Mr. Richardson took the direct way to Kuha,

While Dr. Bar feilow-traveler wa Thls lake is descrl
not far from the ahores of Iake Tchad, and the capltal of the emplre of Bornou. At Kuka all the three hoped agsin to meet very soon afterward, but thla hope waa diappolnted. Mr. Hehardaon was of a weak conatltution, yet his health appeared to suffer little from the fatigue of croasing the desert; but he sunk before he reached Lake Tehad, whleh was the termination of hla misaion, and from which he was to return by direct road to Tripoh. He died In the country of Hornou at Ungurutua, a place six days' journey from Kuka, during the night intervening between the 31 and ith of March, 1851. Thus was added another name to the large number of thoas who have fullen a sacriflee to the cause of African discovery.

The two aurviving travelers, uninunted by the prospect of danger, proponed as the plan of their operations to approneh the Upper Nile, as soon ns they had exploret the vielnity of Lake Tehail, proviled they were supported by the Iritish and l'russian goveminents; and to be realy even to pursue their researches from Kuka to the Indlan Ocesn. The ronte In a straight line to Mombas lies neurly south-east; but from all they conlil learn, the route more to the south, In the lirection of Lake Nynsel, seensed more practicable. The gigantic journey which they thus contemplated, lay through mmy jowerful klngdoms, densely peopled, intersected by numerous rivers, very fertile, and abounding in forests, but where the most formidable obstacles were to be expected from the warlike dispositions of the surrounding natlons.

In the mesn the they prosecuted with zeal the hm meliate objects of the mitssion, embracing every opportunity of collecting information. On the 20th May, 18:11, 1)r. Barth started from Kuka to visit the kinghom of Allamana, which, from the accounts be hat received, he judgred to be the mont bentiful country of central Africa. Ite reached Yoh, the capital, on the did June, where he was permittell to reman only three diays. He was kinully received, however, both by the sultan and by the Inhahitants, nnd at his departure was treated with consideration and honor. four days' journey before reaching Yohn, he had to cross at the point of their junction the two principal rivers of Alamana, the llemeh nud the Faro, the latter being a tributary of the former. The Benueh he describes as the largest and most lmposing stream which he hud seen aince leaving Europe. Ife found it half a mile broad and about 10 feet deep. The distince of the rource from the point at which he erossed it was abill to be bine days' journey. This anguiticeot river is in fact the upper course of the Tehadda, which itself falls into the Quorra or Niger, not far from its mouth. The discovery thus male of the identity of the two atremns, the lenueh nnd the Thadin, has opened up a way of access to the very heart of inner Africa, which seems destinel eventually to becone the line from the west along which the hlessings of commerce and civilization are to flow to the surrounding nations. The consideration of the inmense impmetance of following up this discovery, and of the advantages which might be expected to accrue from it, auggested the idea of sending out a steamboat expedition from Englame to ascend the Tehadda. Former attempts to reach central Africa ly ascending the Qnorra had been attended with very disastrous consequences. llut the experlition which left the British shores in May, 185:, to aseend the Tehadda was eminently anccessful, while not a single life was lost. It reached the mouth of the Quorra In the begituing of July, and, entering the Tchadda, ascended the stream to within about 50 miles of the contluence of the Ilenueh and the Firo. Thus it has beeen full: proved that this lmportant river is naviguble to Yola, the capital of Allamana.
While Dr. Harth was prosecuting thla journey lis fellow-traveler was ensployed in surveying lake Tehail. This lake is deecribed as an lmuense marsh, the only
-artion fit for navigation beling a deep channel formed $y$ the River Shary, which pours into the lake a vaist volume of water. What Major Ileaham has deacribed as small islands, were found to be extensive meadowlands of much greater ourface than the lake litaelf, The explorations of 10r, Overweg led to resulta considernilly at variance with what had heen reported by Denham; but the diacrepancies are perhnps more apparent than real, and may find their explanation In the fact that the lake ls augmented during the rainy seeson to an Immense body of water; but during the season of crought la so much reduced by evaporation as to appear at times to be almost dried up.

In tha course of the summer of 1852, Dr. Barth, setting out from Kuka, made a journey in a southeasterly direction toward the Nile ; and so near did he approach to the eastern boundary of the basin of that grent river, that he was able to collect information likely to throw light on same Intricate questions connected with it. Ite succeeded also hin exploring a portion of Ilagirmi, a powerful kinglom letween Lake Tihad and the Upper Nile, which had never lefore been visitul by any Europenn. In uniting. Iy means of his itineraries, Hagirmi with Dar För, he has coinpleted a line of direct route aeross centril Africa from the Quorrra to the Nile ; and thus from the Gulf of Guines to the led Son and the Indian Ocean.
Dr. Overweg left Kuka at the aame time with I)r. Bartin, but took a south-westerly direction toward the Quorra. Hetween the end of March, the time of his setting out, and the enil of May when he returned, he suceesafully performed an important journey, which brought him within 150 English miles of Yacoba, the grent town of the Fellntalis. I)r. Iarth's journey oceupied a considerably longer thme; and it appears that Dr. Overweg's anxiety to await the return of his coinpanion, which was bot until the 20th August, induced him to remain at Kaka, notwithstanding the danger to be uppreheniled from too long exposure to the influence of the unhealthy senson. The consequence was, that his constitution becmme so seriously affocted that, though he set out immenliately after I)r. llarth's arrival, on an excursion to healthier regiona, yet the udvantage deriven proved only temporary. IIe died on the zith September, 1852, at Muduara, about ten miles east of Kukn, and near Lake Tehal.
As it was known that the travelers hail expected to be ready to sturt from Kuka townrd the Indian Ocean in August or September, 1853, it was intended by their friends in England, that before they left Kuka they should be joined by an additional follow-latorer to take n part in their arduons undertaking. Dr. Vogel, an astronomer and botanist, was accordingly sent out accompanied by two chosen volnnteers from the corps of the Nappers and Miners. Iby a singular coincidence, on the very morning on which 1)r. Vogel and his companions went on board the vessel which was to take them to Malta on their way to Tripoli, letters from Dr. Barth were receivel in London announcing the death of Dr. Overweg.

Though now left alone, as being the only surviving member of the mission, Dr. Harth continued to proseeute with zeal the work in which he was engaged. Up to the 231 November, $1: 32$, he was still at Kuka; but he had fixed on the 25th of the same month to leave that pluce, and to enter on his journey to Timbuctoo. All his journals and papors, arrunged and completed up to that date, he iutended to forward to I'ripolh, there to bo deposited with the linglish consul. By the heginntug of March, 1853, he had performed more thm one third part of his journey, and bad reached the capital of the territories of the Fellatahs, whose frieulship and assistance he hal secured. After belng suljected to the disuppointments nnd delays incident to the traveler in that part of the world, he reached at length the termination of his perilous journey. During his stay at Timbuctoo his life was exposed to
great danger, from the influence of unfavorable elimate, a.d mach more so from the hoatile disposition toward Christians of the most fanstical Mohammedan populasion of northern Africa. He thus describes his distressing situation during his sojoura in that magnifisent city-the "Queen of the Desert," as it is justly called by the natives:-" Like a helplesa vessel on the ocean waves, am I thrown about on a sea of uncertainty, between the power and passion of contending parties. Every day brings aomething now-now of a satisfactory kind, thon again of the reverse. Death, captivity, safe return home, are my visions by turns, and it is yet impossible to say which shall be my fate." To have left Timbuctoo without sufficient protection, would hava been to expose limself to certain death. Hence his atay in this place of danger was nnavoidably protracted to nearly a year, when he wae at last succorod by Anab, the chief of a Tuarick tribe inhabiting the reglons east of Timbuctoo, along the Quorra, who came with an eacort of a hundrel horsemen, and condacted him in safety through his dominions, on his way back to Sackatoo.
The news of Dr. Vogel's having been dispatched frEurope to join him had reached Timbuctoo hefore 1.q. Barth left that place. On the let December, loot, he had the inexpressible pleasure of meeting him at Bundl, a small town situated at about 200 geographicai miles due west of Kuka. Once more he lonked upon the face of a European-his countryman-and grasped the hand of a friend in whom he could place implicit confidence. Exactly six years had elapse. 1 since he left Europe, in company with Mrr. Richardson and Dr. Ovarweg. Since tire decease of the latter he had been isolated from civilized soclety, and had lieen left to contend single-haniled with manifold hardships and dangers. To revisit Europe he now considered indispensable for the preservation of life and health; and accordingly he moved on to Kuka, whence he intended to proceed homawarl without further deiay. We are happy to say that he arrived at Marseliles early in September, 1855.

The limits of the great unexplored rerion of Africa may be roughly indicated as extending between the parallele of $10^{\circ}$ north and aouth of the equator, and from Adamana in the west to the Somauli country in the east. Thia extensive region has just been touched by the routes of recent travelers. But in all parts of the habitabie globe the epirit of research, which has already done so much, is still active; nor is it directed only to the determining of the onlines of continents and countrien, or to the marking of the leadiug feat ures of mountains, rivers, and cities, with their relative prsitions and diatances. These are regarded thy the geographical inquirer merely as afforiling a proper hasis on which to rest the dee $\mathrm{H}_{\mathrm{i}}$ tiun of the earth evonillened an the hahitation of mau, and as afforling him amply the means of improvement and hajpiness. The picture can be completed only by the continued habors of the ecientifle obecrver, who makes the earth, with its various productions, whether natural or artitiviai, the treasures hid in its losom, the animala found upon its surfuce, and, abwve all, the human beings who people its different regions (and these in ali their mutund bearings and velations), she otyects of attentive examination and atuly.-E. 11. See Coast Schyfy-Lat-itede-Langitubg-Tur Eartit.

Georgetown (formerly Stabriek), the cajital of British (iuiana, is situated on the east lank of tire Demerara, at ita mouth, which is there alout three niles wide, in north iat. $6^{\circ} 49^{\prime} 30^{\prime \prime}$, weat iong. $58^{\circ} 11^{\prime} 30^{\prime \prime}$. Thn town itself is ine of the prettiest in the Went Indies i and Its streets are wide and atraight, intersecting each other at right angles. The hotuses are of wood, with open verandahs in frout, and neally jainted in cool and quiet culors; they are mhaded and almost hidden liy trees and shrube, and look more like a collestion of vilian than town. The street along the
river side-where all the stores and shops are situated, and where business is chiefly transacted-furms, howover, an exception; there every thing ia plain, bare, and business-like. The ships lie alongside the wharfs or at a short distance in the stream, which is also crowded with numerous smaller vessels engaged in the island trade, or in brirging produce from the more divkant estates. The hall of the legislative ebuncil, courts of justice, custom-house, treasury, and all the other public offices, are in one building of considorable extent and architectural beauty, with ehady porticos, and marble-paved galleries or verandahs supported en cast-iron columns. The chief of the other public edifices are the cathedral and churches, several liberally maintained hoapitals, barracks, market-place, and icehouse. Below the town is the "Fort," as it is called, but which looks more like a green flokd, with a few guns pointing towand the sea, and a house or two for a single officer and a dozen artillerymen. Population, (1851,) $25,508$.

Georgia, lies betwron $30^{\circ} 30^{\prime}$ and $85^{\circ}$ north lat., and between $80^{\circ} 60^{\prime}$ ead $86^{\circ} 6^{\prime}$ west iong. from Greenwich, and between $3^{\circ} 52^{\circ}$ and $8^{\circ} 47^{\prime}$ west ng. from Washiagton, It is $\mathbf{3 0 0}$ milez long from north to soisth, and 240 brosd, containing 58,000 square miles. Population in 1790, was 82,584; in 1800, 162,686; In 1810, 262,433; in 1820, 348,989; in 1830, 516,667 ; in 18-10, 691,392 ; and in 1850, 909, ct4. The State in 1850 was divided into 95 counties.
Early History of Georgia.-Uutil the year 1732, the territory of the State of Georgis wam included in the names of Carolann and Carolina. For promoting its settlement, King George II. separated from Carolina the ter ritory between the Ilivers Savanuah ani' Altamasha, and erected this territory; by a charter of the 9th of June, 1732, inte an independeat and separate government, which was called in honor of that king, the province of "Georgia." It was probably from thi beginning, the intention that thia colony shouid go as far down as the St. Mary's River ; for the patent says "it chould go so far south as the southernnost branch of tie Altamaha River." And on the maps of that time we cee that it was then beliered that Altamaha River had a sol thern branch which condueted into St. Mary's River, and the mouth of this river was therefore considerer! also to be the mouth of the Altamaha. The bourdaries were, $h$.wever, in later times actually conducted so far south. With this exceptien the limits of th:c province of Georgia suffured no changes on the coant, though in the interior the chauges were great. These interiur changes have, however, no relation wilh our hyilrographical re-searches.-Koul.

Froin the ocean. for a distance of seven mijes, there is a chain of isianda intersected by river, crecka, and Inlets comanuniceting with each other, and forming sa Inland navigetion for vassels of 100 tons' bunienalong the whole coast. These islands cousist of ealt marsh and land of a gray theh soil, which produces sea-island cotton of a sujerior quality. Thr coast on the main land for four or five iniles is a salt marah. Hark of this there is a narrow margin of lenil, nearly resembling that of the islands these are partially or wholy overilowed at the return of the tide, anil constitute the rice plantations. Then commence the piun barrens, which reach from 60 to 90 miles from the coast. Heyoad this is the country of sand hilis, 30 or 40 miles wide, intermpersed with fortile tracta, nud extending to the lower falls of the riverx, Biack walnut nad mullerry. trees grow abundantly in thin soll. The forests proluce oak, pine, hiekory, and cedar. Deposits of iron ore are widely diffused throughout the State; gold is frund in the northern : art i granite, marbie, liatestone, are quarrind in inany placea.

Value of home-mado manufactures, $\$ 1,838,968$.
The rivers are the Suvannih, 600 miles long, bounding the State on the north-east, navigable for ships 17 milies to Savannah, and a part of the year for steamboats 250 miles to Auguats ; the Altamina, which is navigable for large vessels 12 miles to Darien, la formed by the junction of the Cconee and the Ocmulgee, and la navigable for sloops of 80 tons by the former to Dublia 300 miles from the ocean; the Ogeechoe 200 miles long, and naviguble for sloops 40 miles.

Fint River, which rises in the north-west part of the State, and after a course of more than 200 miles, joins the Chattahoochee, forming the Apalachicola. eThe Chatchoochee, on the west border of the State; whlch is navigable $3(0)$ miles by eteamboat to Columbus; the St. Mary's River is in the south-west part of the State.

Georgia, in 1856, hai 1013 miles of railroad built, and about 800 in construction, being in advance of all the southern Statee except Virginia.

Manufacereres, efc.--There wers in the State in 1850, 85 cotton factories, with a capital inveated of $\$ 1,736$,156, employing 873 males and 1,899 remales, and producing $7,209,202$ yards of oheetings, and $4,198,851$ pornds of yara, valued at $\boldsymbol{\%} 2,185, \mathrm{C} 4 ; 3$ woolen facto. ries with a capital of $\$ 68,000$, employing 40 males and 38 females, manufacturing 840,680 yands of cioth, valued at 888,$750 ; 8$ establishments making pig iron, with a capital of $\$ 26,000$, employing 188 persons, producing 900 tons of pig iron, etc., valued at $\$ 57,300 ; 4$ establishmeats, with a capital of $\$ 35,000$, employing 39 persons, and making 415 tons of cattings, vaiued at 846,$200 ; 3$ establishmente, with a capital of 89,200 , emprisying 27 persons, and mannfactnring 90 tons of wrought iron, valued at $\$ 15,884 ; 830$ flouring and grist-mills, 389 saw-mills, 49 pinting-offices ; 5 daily, 3 tri and semi-weekly, 37 weekly newspapers, and 6 monthly publications. Capital lavested in manufactures, $\$ 5,375,490$; value of manufactured articles, $\$ 7,084,585$. On the 1st of January, 1854, there were 15 railroads, 884 miles of which were completed and in operation, and 440 miles in course of construction.

Foreion Connerge of the State of Georoia, from Octoeea 1, 1820, to July 1, 1856.

- Nine months to Juno 80, and tho fiseal year from this timu begins July 1.

Principal Ports of Georgia,-Brunswick, eity, and $\mid$ tons. It is proposed to niske this a naval atation, and port of entry, lat. $81^{\circ} 10^{\prime}$ north, long. $81^{\circ} 83^{\prime}$ west. It has a apacious and commollone harior, having 18 feet if water on the bar at the lowest tides, It is altuated on Turtie River, 14 miles alove the bar. The commerce of the port ls amall, in 1856 being ouly 754
to construct a rallroad from thile city to Penascola.

Savannalh, city, and port of entry, altuated on the right bank of the Savannah River, 17 miles from its month, lat. $32^{\circ} 4^{\prime} 66^{\prime \prime}$ north, lomg. $81^{\circ} 8^{\prime} 18^{\prime \prime}$ west. The harbor in good. Vesaels drawing 14 fect whier
come $n p$ to the elty, ard larger vessele anchor at Five Fathom Hole, four miles below the clty. The commerce of the place ranks next to Mobile, and is the most important port, except Charieston, from Baltimore to Moblle. The grester part of the trade of Georgla centers at Savannah, the prineipal articles of which are cotton, rice, and lumber. The Savannsh River affiorda great facilitiea fer internal eommetce; and thls river is connected with the Ogeechae River by a canal 16 milea long, which terminatea at Savannsh. The tonnage of the port, in 1856, was 81,686 tons. See Strivens's Hist. Geo. ; Dellow's Rev., vili., 39, x. 65, 243, 375 ; No. Am. Rev., xxili. 211 (by An Dhew Noxtox), xxiv. 466 (J. Spanks) ; lxvil. 291 (by C. W. Upham) ; Bo. Quar. Rev., xiil. 470, xviil. 24, 才ii. 40 ; Ch. Exam., xxix. 113.
Crermany.-This name was given by the Romans to a country inhabited by various tribea of different names, but nearly alike in manners, customs, language, and religion. But they comprehended under it net only the country now calted Germany, but also Denmark, Norway, Sweden, Hinland, Livonia, and Hrussia. The modern Inhabitanta call themselves Deufseh; and their conntry Deufschland; but, as to the origin, meaning, and primary application of both names (German and Deutsch), German antiquaries are far from being agreed, thongh most of them seem to the of opinion that Geronan is a genuine Deutsch werd, compounded of ger, or gerra, a spear, and man, and consequently meauing spearman, or warrior. Deutsch seems to have been knewn to the Carlovinglans, and it first occurs in a document of the year 813 ; but it is only aince the time of the Emperor Otto I. (A.D. 936-73) that it has been ln use as the general name of the German nation.

The Rhine on the west, and the Viatula on the east, seem to have been generally considered as the foundaries of Germany; while on the north it extended along the ocean and the Baltic Sea, and on the south was terminated by the Kiver Danube. Hut such boundariea were by no meaus definite; for many German tribes inhabited the southern banks of the Rhine as far as the Schelut.

Situction and boundaries.--Germany may be cunsidered la two points of view, either politically, as the country included within the limits of the Germanie Confederation; or ethnologically, as the country inhahited by the people who speak the vatious branchea and dialects of the Deutsch or German language. In the latter reapect, the Deutsch or German nationa are found to extend in a compact masa along the whores of the German Ocean and the Haltic or Fiast Sea, from a point between Calals and Gravelines, sear the Stralts of Dover to the Guif of Kiga, and from that leng line of boundery southward, with dinnensiona continually narrowing to the Alpa and the Alriatic Sea. l'olitically considered, Germany la altuate thetween $45^{\circ}$ and $64^{\prime} 50^{\prime \prime}$ N. lat, and $5^{\circ} 43^{\prime}$ and $20^{\circ}$ $60^{\prime}$ E. long., bounded nerth by the German Oeean, Denmark, and the Ihaltic Sea; east by Weat I'russla, Posen, I'oland, Gallicia, llungary, and Crostia; aonth by the Gulf of Venice, Italy, and Switzerland; weat by France, Ikelglum, and Holland. Its whole extent, inelnding rivers and lakes, is alout 246,750 aquare Finglish miles, which la about the 1tith part of Europe, the 215th part of the whole dry land, and the e00th part of the whole surfice of the globe.
face of the coworry.-The annthern and the central parts of (iermany are oceupied by numerous raygea of hilis and mountains, sometimes sepritated only by narrow valley, and elsewhere forminy; large elevated plaina or table-ands, while the northern portion of the country sinks lato a wide sandy mooriah jlain, but little raised ahove the level of the sea, The Tyrol and the south-eastern provinces of Austria are oceupted by liranehes of the $A l$ ins, which preaent long marrow valleys, diomal precipleea, catarsets, and gho-
ciers; and the northern berder of this alpine region nry be defined by the towna of Bregenz, Southofen, Fuesesn, Traunsteln, Salzburg, Gmnnden, Steier, St. Polten, and Maden. Immediately to the northward lea the valley of the Danube, which stretches alnost across the breadth of Germany, declining from' an elevation of about 2200 feet, nesr the source of the river, to about 350, on the borders of Hungary. In passing through Bavaria the valley expands luto a plain of considerable extent, which, at Ratiohon on it eastern border, hat an elevation of about 1000 teet, and gr. sually rises as it approaches the mountains that surround it. Further north the middle region of Germsny is occupled by varieus rangea of hilla, terminating northward In a line drawn through the towns of Aachen, Duren, Krefeld, Dortmund, Soest, Paderborn, Bielefeld, Teklenbarg, Benthelm, Furntenau, Rehburg, IIanover, Brannachwelg, Magdeburg, Dessau, Halle, Weleaenfels, Wurzen, Meissen, Bautzen, Goerlitz, Liegnitz, Brealau, Kamslau, and Rosenberg. These hills form a series of elevated valleys and table-lands, the most remarkahle of which is the valley of Bohemia, which hae all the appearence of havir.g been a lake before it was drained hy the bursting of its mountaln barriurs. This region is much diversif ${ }^{1}$ ed hy pleturesque seenery, and abounds in verdant und well-wooded valleys, watered by clear atreama. The banks of the Meyn, the Fulda, and the Mosells, are remarkable for their varied scenery, and the valley of the Rhlne unites the grandeur of a fine lundscape with the appearance of a highly fertile conntry. Te the northward again of the hilly regien, the country sinks into plains, which fall very gradually from an elevation of about 300 feet at the foot of the hllls to the level of the sea. These plains extend through Lower Silesia, Lasatia, IIrandenlurg, Pomerania, Meeklenhurg, Holatein, IIsnover, and the lower part of Weatplailla. To the west of the Elbe the flat country ia alnost entirely destitute of trees, and presents only a succeskion of lievel tracts, covered with heath and junijer, and of moora conaistling chietly of deep beda of turf Interseeted by sivers which flow in depresslons from 100 to 200 feet below the general level of the plains. To the east of the Elthe the country fa more sandy, but the sandy trsets are corered with pinea, and interspersed with fertile spaces of sometimes conalderable extent. The bedo of the rivers also are generully wider and less deep than in the western part of the plain. 'Ihrough the northern part of this plain a higher triet may the traced from west to cast, from Oldealo In Molstein to Sehweit on the Oder, shout 70 miles from the sea. Eastwarl of the Olar it continuea for some distance due east, then gradually approaches the aea, terminuting on the tanks of the Niemen nesr Grodno, It stents to have formed at one time the shore of the sea, and it is on itn northern sldes that are found those numerons erratic hloeks or boulders that have attracted mo much of the attention of geologinfs. Theugh it does not rise into liils, it forms the water-shed between a numlier of small atreams that run direet to the Buttic, and ethers that run aonthward to the lilbe, the Gder, and the Vlatuia. To the Alpine region belong the teriteries of Diechitenstefn, Tyrol, nouthern Mavarla, Styrin, Salzhurg, (arinthia, and Ilyria; to the middia region, Jaden, Wurtemberg. Hohenzollern, the greater part of Pavarla, the n, pei ern portions of Anstria, including Hobetnia and sioravia, llessen, Nasam, J.uxembirg, Sehwartzhurg, leusn, Saxony, aud Aahalt ; ta the low country, Hanover, Ohlenburg, lirauns-liwelg, Lippe, Ilolsiein, Necklenburg, and nearly the whole of Truasis.
The conl meanurea are widely distributed in many parta of Cermany, an Hohemia, Naxony, Silenis, Rlienish Iavaria, and Rhenish Pruasia, from the last of which Ifolland is aupplied with coala.

Climath. In raspeet of In lts differe ence of $9^{\circ}$ of ern burders,
snce of mineral productions, and in no pari of the world are the mines worked with so much skill or so much economy. Precions stones are discovered in many parts; rock crystal, amethysts, topszes, are found in Davarla; chalcedony, agate, petchstein, and porcelain-jasper, in Bohemia; barytes in many parts; marbles, gypsum, cand alababter, in Bohemia; alum, near Toplitz ; rocksalt and Glauber salts in varlous parts ; and abundance of the eartha calculated for making eartien ware, firm the eom ent description to the fingst porcelain. Fossil coal is fu and in many districts, and much of it is consumed; but the cheapnese of wood, and the prejudices of the people against the use of it in their houses, have operated to provent the mines from being completely explored or worked to any thing approaching the extent of which they are capable. Gold is pron cored, though in vory amall quantities, ly washing, in Salzburg, in Bohemia, in the Rammelsberg, and in Silesia. Silver and cinnabar are ralaed from the mines of the Erzgebirge in Saxony. 1ron, copper, tin, lead, calaunine, bismuth, cobalt, nickel, titanium, arsenic, and almost every other mineral, is moro or less raised from the mines. Tiie abuudance of $\mathbf{m i n}$ eral substances everywhere scattered, and which it would be difficult to enumerate, has promoted the study of mineralogy, and given birth to the school of Freyburg, whence the pupils of Werner carried the acience to evory part of the world.
Soil.--The soil is generally productive. The plains in the north have indeed much arid sandy land; but usture has provided somo rich and fruitful soils along the horders of the rivers, where the most abundant harvests are gathered. The south has also on its rountainṣ much barren or slightly productive land; but the beautiful valleys and plains among the hills rival in fertility the best alluvial lands on the banks of the northern ri":rs. In general the soil in tho north is heavy, and in the south, light ; the former most sdapited for corn, and the latter for wines. The best eoil is in the middle, between the mountains and the sandy plains. In Bohemia, Silesla, Fruconia, Suxony, and on the Rhine, the proportion of good aoil is much greater than in the north or the sonth.
Rivers.-Germany has seven large rivers which pass through it to the sea, and in their course receive about 500 smalior streame, alout 60 of which are nnvigable, either naturaliy or by means of artificial inprovement. These sre the Danuie, Rhine, Weser, Elbe, Oder, Etsch or Alige, and Ems, some of which will be found described under their own names.
Lakes.-The chief of the Germsn lakes is the Roden See, or Lake of Constance, on the borders of Switzerland. (See Fincy, Brit.) To the eastwarl, among the valleys of the Alph, are soveral lakes of linconsiderable dimensions, as the Walchen, Kochel, Anmer, Wurm or Starenberger, Tegern, Schleier, Chiern, Grundel, Mallstadter, Trium or Guanden See, Mond, and Kammer or Alter, lakes. Aloug the southern sheres of the Baltic or Eunt Sea there is a number of lakee, which form the western portion of an innumerable eeries, extending through Prussin Into llussia and Finlund, and ocenpying comparatively higher ground than the adjoining plains and river channels. Some of these are of considerable extent, ns the lake of Schwerin in Mecklenburg and the Splrd'ne See in Past l'rusia, the latter, however, heyond the politleal limits of Germany. At the ensturn base of the Harta are the salt and the sweet lakes (Salzige and Sasse Seen), and to the north of Minden, to the east of the Weeer, in a considerable sheet of water called the Steinhuder Afeer; and to the west of tha Weser is a smailer lake euiled the Dummer See.

Climate.-The climute of Germany is vory uniform In respect of the degrees of cold or heat experienced In its differsut regions; for though thero is a difference nf $9^{\circ}$ of latitude between Its southern and northern bordera, that difierence la compensated by tho
different elevations of the country, the northern part being lowland on the sea, while the midland and southern regions rise to a considerable elevation. Thls is indicated by the following table of places from north to outh.

| Places. | Laltudee. | Elevation above the res in feet. | (Fwhenhell.) <br> Menn temperniure of the ellmata. |  |  |

$i n_{n}$. intelligent practice of agriculture some of the - anns are not behind the most advanced of the ot. 4 y : suntrics of Europe. Meeklenburg, in particular, and Holstein are distinguished for their excellent husbandry ; and in Hanover, Ilrunswick, Bohemia, Saxony, and some parte of Pruspia and Austria, it is scarcely inferior. Generally speaking, agriculture is the rrincipal occupation of the Germans, particularly in Buvaria, Wurtemberg, Baden, Hesse, Nassan, Hanever, Brunswick, Oldenburg, Prussia, Alhalt, Holstsin, and Mecklenburg; while in the Saxon duchies, Scliwartzburg. and Reuss, somo diatricte of Prussia, Bohemis, and the kingdom of Saxony, manufactures employ at least an equal, and in eome casea even a grenter, number of the people. The greatest contrast in respect of agricultare is to be seen in Mecklenburg and Wurtemberg. In the former, farming is conducted on a large sealo; in the latter, as woll as in other provinces, the land is divided into small parcels, cultivated by small preprietors or tenants, whr follow ancestral usages, and are unprovided with means to make any improvoments, by druining or otherwise. In the former the Schlagvirthschaft prevails, according to which one immense field is covored with whest, while another is covered with oats, a third with clover, a fourth is being plowed and inrrowed, nnd a fifth is feeding herds of cattle, the common size of farms being so much as 600,000 equare ruthe, or almost 2000 acres; in the lattur, every thing is grown checkerwise, in small patches, more like gariening than farming, the usual size of Wurtemberg farms being only from 5 to 20 square ruthe, or from 1-40th to 1-10th of an acre.
There are three systems of husbandry at present practiced in Germany. In the first, called the threelield husbandry, whito ono field is sown with winter corn, and another with summer corn, a third lies fallow; but sometimes, instead of a fallow the third field is sown with green crops, peas, potatoes, ete. In the secoud system, called the four-field husbandry, the principle le that the same tleld shall not be occupied two years together with corn, without at least one fullow intervening; ns, for example, one year, rye; second, clover; third, onts, or barley; fourth, potatoes; fifth, again winter corn. This is also called the rotntion system ( 1 'ruchtirechselvoirthschaft). Tho ihird system, called the Sehlag or Koppelvirthschaft, uracticed in Holstein and Mecklenburg, divides a farm into an number of large parcols of equal slizo (atuche, kn, pelin, or schlige), which, uftor aneveral years' continuous bearing of grall or otimer produce, are allowed for soveral years more (3 to 7 ) to lie fallow, or in grass for nummer pasture. For these two countries this system is fouml very suitable, for the population there is comparatively thin.
In the different provinces of Germany different kinds of corn olitalu the preference, and are most cultivated, as in the following list, where the different articles follow each other in the order in which they are numell. Ravaria-Rye, oats, barley, spelt, whent. Wurtembery and Brden-Spelt, oatn, barley, rye, wheat, maizo. Messe-Rye, harloy, outs, wheat, apelt,
maize. Mecklenburg-Wheat, barley, rye, oats. Bruns-wick-Barley, rye, wheat, oats.
In Germany generally, and in Mecklenburg in particular, the prodactlon of grain is greater than the consumption. Assaming the productiveness of the kingdom of Saxony as a standard, Germany could malatain about $54,000,000$ of tahabitants, or $12,000,000$ more than at present. The cultivation of the potato is now largely extended, partlcalarly in I'russia. In the north-east of Germany, buckwheat is also cuitivated; but the cultivation of oil plants, pens, beans, turnips, and other roots, flax, hemp, and hops, is net large enough to dispense wlth the importation of these articles. About three fourthe of the Germans are employed in agricultare ; and many parte of the country are crowit 1 with small proprietors or tenants, who necessarily live in a state lower than that of hired laborers. Of the great bulk of the people the food is of the pocrest kind-rye-bread or potatces; and it is chlefly owing to this general misery that Germany ean export corn in most years. In bad aeasons the listress la sometlmes dreadful; the agricultural populistion baving no meane of procuring foreign suppliesnothing to give in exchange for bread.
Naturally; In accordance with climate and other phyeical circumatances, the production of wine and fruits (Obst-und-Weinbau) la greater in the south and west than in the north and east. The districts on the Khine, the Lower Maine, and the Neckar, are the beat ; hut, even la the south of Germany, there are districts, as in Old Baveria, between the Inn and the Leech, that are less proinctive of fruit than even Mecklenhurg and Brandenburg. In both quantity and quality, however, the south excels the north, where the best kiads of fruit oaly ripen with difficulty. The princlpal places for the production of wine have been already noticed. The quantity is eatimated at about $3,000,000$ of eimerf, worth about $18,000,000$ of thater $=a t r o n t$ $\mathbf{~} 8,000,000$ aterling yearly. The cultivation of Preat trees is now more scientifcally practiced in Germany than In any other country, wad the care of the government is now directed to the restoration of the forests, which, till recently, were completely neglected and left exposed to ever; klud of destructive agency. In all the States likewise, inatitations for the $j$ romotion of agriculture, in all Its brancher, have been or neo being formed. The relative proportions of ground occupied in agriculture and other natural productions is the different Statea is shown in the following table:

Gt rmany is suitable for the cultivation of all the kinds of useful plants that belong to the temperate zomes ; and, owing to the equality of the climate, they are spread over ail the country. The highlanda of the midlie reginn, an well an the northern lowlunds, grow the different species of cereais ; and in the eantert part of the lattor region there are tracte of land which will besr comparison with those that are cailed the granary of Europe. Wheat, rye, barley, and oata are the cereals most generally cultivated; but in soine districta to these are alded spelt, buck whent, millet, ommer (Triticum dicocrum), einkorn (z'riticum momou coccum), and maize. The potato is largely cultivated, not marely for food, but for the purpose of diatillation mto brandy.

The following table shows the absolute quantities (In English acres) of the ground so occupled:

Metals and Minerals.-The whole Austrian territory produces yearly about 7000 miarks of gold, whereof tlve sixths in Hungary and Transylvania; silver, 180,e20 marks, whereof three afths in IIungary and Transylvania; copper, $\mathbf{1 5 , 0 0 0}$ centners, whereof fout fifths in IIungury and I'ransyivania; Iron, 2,040,(00) centuers, whereof only one seventh in Ilungary aad Transylvania; quicksilver, 6000 centners; load, 110, 000 ; clunabar, 1000 ; zinc, 12,000 ; tin, 9 : 0 : conl, $7,600,000$; salt, $5,500,000$; cohalt and nlickel, 20,000 ; arsenic: 1800; aulplinr, 18,000; alum and vitriol, 160,000 ; sraphite, $\$ 0,000$; and about an much sulphuric achl. Of the German provincer, Hehemis produces silver, thi, Iron, vitriol, and coal, the last equal to three fiftlis of the proclucts of the whole empire; Austria and Styrin produce half of the whole quantity of Iron; Itlyria, the quicksilver ant movt of the sent ; and Gallicia, mont of the salt.
I'rassia.-No rold; 2a,000 marka silver; 40,000 centhere of lead; 36,000 of copper ; 230,000 uf zinc; T(10) of smalt ; 3360 of arsenic; 35,000 of vitriol; $4,500,000$ of iron ; $4 t, 000,000$ of stone-coal ; $11,000,000$ of hrown coul; $1,750,000$ of salt ; and stene quarries to the value of $1,600,000$ thalers, $=\mathcal{C 2} 40,0100$. Silesia producen zinc, iron, coal, arsenic, vitriol, anl nulphar; Saxony, "ilver, copper, Irua, etc.; the lhine provinces Iron and coai; Wentphalia, coal, and some untal and sait. Nearly $8,000,000$ tons of coal are extracted yearly from the coal-field on the hanka of the liuhir; and 4 miles above llonn are the iarge brown mal mines and alun works of Frieaderf. 'The produce of the other States amounta to about 60 marks of gold, ani 125,150 marks of silver; $1,200,000$ centners of iron; and the varisus other articles above mentioned in comparatively manall quantities.

Manufuctures.-In many branclies of manufacturing induatry the Germana have reached a high degree of excelience. Geruan linen is known to the whola
world; ticular Of late and the greatly formerl and the With th the last made gri mereiy e of Engla manufact Meravia, which it cetton ma extending the silk Vienua, 1 and other and stcel, quantitles phalia, and Rhenish I and silver Pettery an of perfectle Meissen, is the fincnes, elegance of It to be met facture of le Prassia; of places. P'a and of late Sugar-refinin dam, and oth tent in Hava a still greater the connecte German indu of mathemati struments ; tl being Munich clocks and wo and other mot of the world. have made in chiefly the re part of the $\mathbf{G}$ industrial sche and in alt the tutions fur ins

A speolal paym
world; and the linens of Bielefield and Silesis in pirticular are equally valued in America as in Enrope. Of late years, however, tha introduction of cotton, and the high pricea obtained for corn, have tended greatly to lessen the cultivation of flax, which was formerly a principal stapla of agricnltural indastry, and the linen manufacture has anffered in consequence. With the improvement of the breeda of aheep within the last hali century, the woolen manufacture has made great progress, the German cloth being now not mereiy equal but even superior in quality to the cloths of England and Belgium. The chief aeats of the cloth manufacture are in: Brandenburg, Saxony, Bohemia, Moruvla, and the Prusaian IRhenish provinces, from which it is exported to all parts of the world. The cotton manufacture has been eatablished and is rapidly extending in Saxony, Austria, and along the Rhine; the silk manufacture is carried on succesafully in Vienna, Roveredo, Gorz, Berlin, Elberfald, Erefeld, and other places. Works in meta!, especially iron and steel, are produced in great perfection, and large quantities in Styria, Austriu, Rhenish Prussia, Westphaifi, and the district of the Hartz ; brase work, in Rhenish Prassla, Bavaria, and Brandenburg; gold and siiver work in Augaburg, Vienna, and Beriin. Pottery end glass-making have reached a high degree of perfectlon; the porcelain of Vienna; Beriln, and Meissen, is much in request, on account not only of the fineness of its material, but also for the tasteful eiegance of its forms and ornaments. Bohemian glass is to be met with in all parts of the world. The manafacture of leather ja particularly extensive in Rhenish Prassia; of aoap, tallow wares, and wax, in many places. l'aper-making is carried on to a great extent, and of late has been very much improved in quality. Sugar-refining is carried on in Hamhurg, Berlin, Potsdam, and other places; brewing of heer, to a grent extent in Bavaria; and ardent apirits (Branntwein), to a atili greater extent in the north. Ship-huilding and the conuected trades are of little importance; but Gernan industry is much distinguished in the making of mathematical, physical, surgical, and musical iristrumente; the chief seats of these brinches of trade being Munich, Vienna, Berlin, and Cassel. German ciocks and wooden articles, manufuctured in the Tyrol ade ethar mountain provinces, are exported to all parts of the world. The great progreas whici the Germans have made in manufacturing industry aince 1815 is chiefly the result of extraordinary exertions on the part of tho German governments. In every district, ladustrial schoois have been established or extended; and in all the chief towns there are schools and institutions for instruetion in tho higher branches of art,
where pupils are trained in both theory and practice at the expense of the government. Numarous eocieties also have been formied for the promotion of art and industry.

Commerce.-The commerce of Germany has always been extensive; but the abolition of the innumerahle State custom-housea and tolls, and the long-continued peace, have given an immense impulsa to ita activity. Germany exporta corn and timber to England and the Netherlands ; linen to Spain, Portugul, Poland, Rusaia, America, and Africa; woolen cloth to weatern Asia, and even to China; iron wares to every part of Europe; and lead to France. The exportation of fat cattle to England ia also becoming a great trade. The other prirelpal articles of export ars horsea, glase wares of all kinds, vobalt, galmei (siliceo-carbonate of zinc), potash, porcelain, bidea and skins, honey, wax, lime, gypanm, copper, horns, bones, rags, mill-stones, turnip aced, swina's hristles, vitriol, tin, and spirits. The chicf articles of import are sugar, coffee, tea, cacao, rice, vanilla, rum, and other colonial produce, spices, drugs, dried fish, cheese, tobacco, olive oil, and southern fruits, Frencl, Spanish, and Portugueae wines and liquors, cotton, raw silk, cotton and silk stuffa, leather, truin oil, and many smaller articlea. ide intarcourso within Germany is much facilitated by oxcellent carriage roads; and all the chief towns are now connected by railways. The principal rivera are also made available for the transport of bulky commodities, and were conmected by govaral canala before the introduction of the far auperior metlod of locomotion by rallwaya.

The priscipal aeata of the inlund trade wre Vienna, Prague, Reiehenberg, Brunn, Olmütz, Troppau, Linz, Steyer, Salzburg, Grïtz, Botzen, Roveredo, and others, in the Austrinn provincea; Berlin, Breslau, Cologne, Magdeburg, Frankfort-on-the-Oder, Naumburg, Poaen, Traustadt, Aachen, Cohlentz, Ellserfeld, Erfurt, Munster, Minden, and others, in the Prussian territory; Leipzig, in Saxony; Munieh, Augsburg, and Awrnberg, in Bavaria; Frankfort-on-the-Maine, Caasel, Brunswick, llanover, Mentz, etc. But of all these places four hold the first rani: ; Vienna for the south east ; Augshurg for the south-west ; Frunkfort-on-theMaine for the north-west ; and Leipzig for the northeast. Large faira are held twise or thrice a year in Lejpzig, the two Frankfo:to, Brunswick, and other phaces; but it is only in those named that these fuirs are of much importance. Those of Leipzig are celebrated for the aale and exchange of hooks. Great wool-markets are likewise hell in Berlin, Brealau, Dresden, Magdeburg, Prague, Stettin, etc. See Fains.

"Complied from the otticlal "Centralblatt der Abgaben," ete., Berila, 1359. By J. G. Fltigel, U. A. Conaul, Lelpzig.
\$The thaler ts very nearly worth 701 cents of our money; thore exactly, it is equal to 70.09 ounts.
\& Frankfort is regulated by a apectic arrancement, ant not by populatton.
a speolal paymeat by Prusala, on acoount of the Unton.

The prinoipal commerchal sea-ports are Hamburg, Bremen, and Embden, on the North Sea; Lubec, Rostock, Stettin, Dantzlg, Königsberg, and Memel, on the East Sea; and Trleste on the Adriatlc. Hambarg le one of the princlpal commercial towne of Europe, and with ita neighbors Altons (in Holstein), Bremen, and Embden and the Baltio porte, connecta Germany with the countriee of the north and west, and with Aimerica, India, etc. Trieste forma the communlcation with the south of Europe and the Levant.

Commerce was not a little impeded by the different money ayetems of different parts of Germany; but, on the other hand, it was much facilitated by the eatablishment of banks and exchanges in the principal towns. Of late years also the postal system has been vuiy grently improved, but the German governments have not yet eeen their way to the adoption of the British penny postage. They can not indeed expeet, in the circumstances of their country, that enormous lncrear of the number of letters that would compensate the diminution of rates.

The internal trade of Germany has been greatly faellitated thy the formation of the customs unions and eommercial treatles, of which an aceount has been given in the articles Furope and Il ' maeatic Leagde.

The preceding table shows the proportions of revenue drawn by the different Stater.
Pelitical State.-As settled by the treaty of Vienna, In 1815, Germany was divided into 40 sovereign States, or portions of States; but the number is now reduced to 35 , ns atated in the following table:

Tanle of tha Timett-Five Sovirriov States.

The Saxun princedom of Gotha beeane extinct in 1826 ly the decunse of the inst grand duke, and his territories were divided by compact among the collaternl reiativen, the princes of Coburg, Meiningen, and Hidburghawsen, the last of whom cc.led Ilidilurgliausen to Meningen, and assumed lastend the additional titie of Altenturg, from the chief town of that portion of the Gotha territory that fell to bia mare. The prince of Coburg-Haalfeld likew ise ectedi Saalfeld to Meiningen, and received Gotha in its stead. In 1846, the iordistip of Knipinusen wus aborbed in

Oldenburg; in 1847, Anhalt-Cothen became ennexed to Anhalt-Dessan; and in 1849, the two princes of Ilohenzollern abdicated the government of their States in favor of their kinsman, the king of Prussia.

Confederation.-These States exhlbit every form of government from absolute autocracy to demoeracy; but even in those that are conetitutlonal the authority of the aovereign is but feebly limited by lise States. They are all united into a bund, or confederation, the olject of whieh is the maintenance of the external and internal security of Germany, and the independence and inviolability of the several States. The Confederation is represented by the Diet, whieli in composed of the plenipotentiaries of all the States, and is the constitutional organ of its will and action; but the DJet has no power of eelf-actlon, the plenipotentiaries that compose it acting only aecording to the special instructions of their respective soverelgns; and there is no central executive government to carry its reso lutions into effect. In fact, it has been found that there is no power of insuring the combined action of the members for any object or purpose whatever, either civil or military; though, baving many interests in common, and the territories of the smaller States, in multifarious parcels, being so interningled thnt with must of them separate action wouid be limpossibie, they naturaily follow the same conrse of policy, modified by the influenee of the powerful ueighbors at whose mercy they would seem to lie. The management of the ordinnry business of the bund is intrusted to an ordinary and permanent Diet, et which the plenipo tentiary of Austria presides ; but there are only 17 votes to be divided nmong the 85 States, Austria, Prussia, and the larger States having one each, and only six being aliotted to the smaller States and cities. When fundamental laws are to be made or changed, when measures are to be taken that relate to the federal act itseif, when changes of organic institutions or other arrangemente of genernl interest are to be niopted, when war or peace is to lie made, or when a new member is to be admittenl, the Iliet hecones a general assembly, a plenum, In wisich 70 votes were orginally distributed among the members in ciasses, Austria, I'russia, Ilavarin, Saxony, Ilanover, snd Wurtemberg, having each 4 ; live others having each 3 ; three having each 2 ; and tho sinaller States each 1 vote. The IViet holls its aittings at Frankfort-on-tieMaine, and has ostensibly at its disposai, in terms of the federal aet, a numerous army, of whose constitution and efficiency we have aiready given an account in the articio Eivnores.

Ghent Gent), a city and Lys, i town forme other as to are connect number of $t$ pieasing fe markulbie extending town is we most liurof of houses of the city, agreeablo.
The colto Ghent, emp ing upward alout 1,000 Sugar-retini other inpor linens, Han isee, threud mathemutic ware, bronz blue, etarel
lons of brandy at 25 degrees over proof, the other con- trade are in corn, oil, seed, Flemish linens, and wine. stituents being coloring and sweetening matters and unfermented grape-juice. But the proportion of spirits and the description of the other ingredients whlch enter Into its composition, and which are sometimes of a very noxlons character, vary very widely in iliffereot samples. Generally, however, geropiga may be said to be strong, sweet, and high-eolored. Besides being mixed with port, sherry, and other wines, it is sulistituted in varlous bevirages, eapecially in the United States, for splrits and sugar. This villainous compound ls allowed to be imported at the same duty ss wine, provided the proof spirits in it do not exceed 33 per cent. of its quantity. It ls also permitted to be mixed in the bonded warehouses in the docks witi wine in the same proportions relatively to its strength as brandy; that is, when it is oniy balf the atrength of the jatter, douhle the quantity may be used, and so en. This license has been much, and, as we think, justly, objected to. There can, of course, bo no cheek, and, perhaps, no good oljection, to the compounding of wines in Portugal ; but ona sh muld think that the facilities for adulteration in the shops of the dealers are here quite enoagh without legitimating the practice in the docks. It is difficult, Indeed, to see what purpose can be served hy this indulgence, unless it be to execute and facllitate the commission of fraud. Gerepiga being confonnded in l'ortugal with brandy and here with wine, the quantity exported from the former and imported into the latter is not easily ascertained. It appears, however, that $\ln 1848,481$ pipes were shipped from Oporto for England, and 1063 pipes for the United States. See Parliamentary paper, No. 314, Session 1855, ete.

Ghee, a kind of butter much used by the natives of India. It is prepared by boiling fresh-drawn milk (geaerally that of buffiloes) in earthen pota for an hour or more, und adding, after it has cooled, a little cardled milk ealled tyre, in ord- to promete its coaguiation. When this process ls completed, the curdled mass is ab:enad for half ant hour, gome hot water is adived, and the operation of churning continued for half nus inour longer, when the butter forms. Its tendcacy to become rancid may be obviated by bollieg it until all the water that may be mixed with it is evaporited, and then adding some tyre and salt, or betelleaf, and excluding it from the air in closed jars. In this way it may bo preserved for many months. Ghee is an article of considerable commercial inportance in many parts of India, though from its strong ameli and flavor it is considered unpalatable by Europeans. See Butter.

Ghent (Lat. Ganda; Fr. Gand; Flem. Gend; Ger. Gent), a city of Belgium, standing on the Rivers Scheldt aad Lys, whose numerous branches traversing the town form canals in sil directions, and so intersect each other as to partition the town into 26 islands, which are conneeted by 42 largo and 40 small bridges. The number of fine promenades forms another striking and pleasing feature of Ghent. Of these the most remarkable is the Ceupure, formed by rows of trees extending along the Bruges Camal. In generul, tho town is well built, and occupies a larger area tian most liuropean towns, in proportion to the number of houses and the population. Tho general aspect of the city, without being highly pictarestue, is very agreeable.

The cotton manufacture ls exteusively carried on in Ghent, employing atout $£ 1,800,000$ of capital, engaging upward of 20,000 persons, and annualiy produeing about $1,000,000$ pieces of plain nad printed calicees. Sugar-retiniog is also extensively enrried pu. 'The other important manufactures are common and tuble linens, tlannels, serges, woolen cloths, silks, ribhons, iaco, thread, hosiery, wux-eloth, oll, chemicals, armor, mathemutical, physical, nnd sumpical instrument, hurdware, bronze, and crystal, carriuges, paper, tobacco, blue, starch, delft, etc. The importunt branches of

About 20,000 pieces of linen are exposed for sule every Friday ; and the annual fairs are very numerously fre. quented, besides the horse-falrs held in mid-lent and on 23d July. The great general fair is held in Auguat. The governor of the province resides in Ghent, which is also the sent of a tribunal of first resort, as well as of a court of appeal, which has jurisdiction over all the province of Flanders. Ghent also gives title to a bishop, and is the hesd-quarters of the first of the four divislons of the army of Belgium. From 1792 to the overthrow of the power of Napoleon, Ghent was the capital of the department of the Seheldt. In 1814 Flanders became part of the klngdom of the Netherlands; and the same year the treaty of peace was signed here between Great Britain and the IJnlted States, which put an end to the war of 1812-'15. In 1815, on the return of Napoleon from Elbs, Louis XVIII. took refugo in Ghent; and in the revolution of 1830 , this city, with the rest of Flisnders was comprised in the new kingdom of Belgium. The city seems now as prosperous as ever, and is inereasing in population as well as in all the elements of wealth and power. Ghent is in lat. $51^{\circ} 3^{\prime} 12^{\prime \prime}$ N., long. $3^{\circ} 43^{\prime} 51^{\prime \prime}$ F.., at the intersection of tie railways connecting Lille with Antwerp, and Ostend with Malines, from which towns it is respectively distant $42,32,38$, and 33 miles. The population in 1851 was 106,704 .

Gibraltar, $n$ fumons fortress near the southernmost extremity of Spain, and contiguts to the narrowest part of the Strait, to which it gives its name, joining the Atluntie and Mediterranean. Lat. $36^{\circ}$ $6^{\prime} 30^{\prime \prime}$ N., long. $b^{\circ} 21^{\prime} 12^{\prime \prime} \mathrm{W}$. It is situated on the west side of a rocky mountain or promontory, the Jfons Calpe of the ancients, projecting into the sea, in a sontherly direction, about three miles, being from one lalf to tiree quarters of a mile in width. The southernmost extremity of the rock is called Europa Point. Its northern side, fronting the isthmus which conneets it with Spain, is almost perpendicular, and wholly inaccessible; the east and south sides are 80 rugged and precipitous as to render any attack upon them, oven if they were not fortlied, next to inpossible; so that it is only on the west side, fronting the bay, where the rock declines to tho sea, and the town is built, that it can be attacked with the least ehance of success. Here, however, the strength of the fortificatlons, and the magnituie of the batteries, are such, that the fortress scems to he impregnable, even though attacked by an enemy having the command of the sea. It was taken ly the English in 1704, but the fortifications were then very inferior to what they aro at present. Towerd the end of the American war, it was attacked by a mest formidable armament, fitted out jointly by Spain and France; but the strength of the place, and the bravery of tho garrison, defeated all the efforts of the combined powers. Population ubout 16,000, exclusive of the treops, which usinally amount, in time of peace, to about 3,000 .

Trade.-Giliraltar is of eonsiderable consequenco as n commercinl station. Being il freo port, subject to no iluties, and few restrictions, she is a convenient entrepot for the English and other forelgn goods destined for the supply, principally through illegitimato channels, of the contiguous Spanish provinces. Its lmportanco, in this respect, inereased rajidly during the 10 years ending witil 18.10 ; 80 much so, that while the declared value of the various articles of British produce and manufacture exported to Giliraltar in 1833 amount ed to only $£ 385,460$, they amountod to $£ 1,111,176$ in
 eral system began to be introduced into Sjaln, the ex ports of British products to Githraltar have declined. In 1851 they wero valued ut $£ 481,286$. Vingland also sends to Gibraltar considerable quantities of foreign and cionial merehandise, most part of which are des tined for the supply of Spain.

 and the direction of the currenta are marked in the chert. Variation in the stratth, $\$ \mathrm{~s}^{\prime} 31^{\prime}$.

The Bay of Gilbraltar is spacious; and, being protected from all the more dangerons winds, affords a conveaient atntion for ships, Two moles have been constructed, at a vast expense, for the protection of the shipping. The old mole jrojects from the north end of the town. N.W. by N. 11 wet finto the ax: ; the new mole is $1 \frac{1}{2}$ milea more to the south, extend $;$ outward about 7e0 feet ; it has ani elbow formed by the shore, and in winter large vessels anchor inside; the furthest out in from five to mix fathoma. The plan glven a better lidea of the paskion of Cllbraltar, as well as of the Straits, than comla be derived from any doecrijtlon, It lataken from Captaln Smyth's chart of the Meliterranean.

Gibraltar is of great Importance to Great IIritain in a military and naval point of view, heing, in fact, the key of the Mediterraneau, und affording a convenient and secure station for the outfit, refrembent, repmir, and accommodation of nany shlps of war and merchantmen. The revenue collectod in the town amonats to
 defray the public clvil expenditure of the place. The expense anumally incorred is (ireat Britain on accomet of the garrison, in time of peace, amounts to about $\mathcal{C} 200,000$-a sinall sum compared with the lmportant polltical and commercial advantages it is the means of securing.

Money.-The effectivo or hard dollar $=0105$; the current dollar heing estmater as of hatd dollars $=70$ cents. Iivals and quarters of both haril and current dollars are the mane, being, the formor, $=441$., and the latter 1 1-12l.

Accounta are kept in current dollars (pesos), divided into 8 reals of 16 puartos each; 12 reals rurreacy make a colv or hard dollnr, liy which goods are bonght and sold; and 3 of these reals are considered equal to 3 Spanish reals vellon.

Gibraliar draws on london in effetive dullars of 12 renla, and London on Gibraltar harent dollars of $x$ reals. The exchange of Gibraltar und tiodag, sad other cities of Sipain, is lu hard dollars at a per rentage, whled varies considerably, and nootly in favor of (iibraltar.

Weights ond Measures are those of Fingland, exiepting the arroba, $=25 \mathrm{l}$ bs, Enklish. Graillis sull by the fanega, 5 of which make 1 Winchenter quarter. Wine is sold hy the gallon, 100 of whilhare equal to 109.4 Fuglish wine gallons.

The commucrial relations between the E'nited States and Gibraltar are regulated liy ensctinent of the inperial I'arliment, and are lurilened with but few reatrictlons, heyond the usual jort charges, harhor and pollce regulations, quarantine laws, and a tarit? of dutles which compreliond nut more than five or alx ar

Gild, or Guild, a conipany of merchant" or mnnufacturers, whence the balls of such companies are denominated Gill or Guild Halls. See Guind.
Gilding. First practiced at Rome, about 145 B. c. The capitol was the firet bullding on which this enrichment was bestow'ed.-Iling. Of gold leaf for gilding, the Romans made but 750 leaves, 4 ingers square, out of a whole ounce.-Pliny. It consequently was mose like our plating.-Trusler. A single grain of gold may now the stretched oult under the hammer into a leaf that will cover a house.- Dr. Hafky. Gilding with leaf gold on bale ammoniac was first introduced by Margaritone, in 127:3. The art of gilding ont wood, previounly known, was improved in 1680.-Haydn.

Gilding ia the application of a superfictal cont of gold on wood, netal, and ot ber miterials. The bearuty and durabilty of gold render it the most valuable of ail ornamental substarices; but, on account of its welght and high price, ita use in these respects would be exceedingly limited, were it not the most extensiHe and divisible form of matter, so that it may le made to cover a larger surfaca than an equal quantity of any other loody. Metals are usually covered with gold by the process of rezter gilding. It consists in perfectly eleaning their surfuce, and then, in the case of silver, for Instance, rubbing it over with a solution of gold in mercury, called amalynm of gold: the veesel is then heated over a clear chareonl fire, by which the mercury is driven off, and tho gold left adbering to tho siliver surface, upon which it is afterwand burnished. The surface of enpper or brase is usually prepared ly cleaning and rutbing it over with a molution of nitrate of merctury, which amalganates
the surface, and enables tho gold amalgam, when subsequently applied, to arthere ; heating and burnishlag are then remorted to as before. Brass and copper hot. tons are gilt in this way; and the requisite quantity of gold is so small that twelve dozen buttons of one tneh diameter may be completely gilt upon looth sorfaces hy five grains of gold. Other kinds of gilling are performed by goll leaf, which, if intended for outs dour work, is laid on ly the help of gold size, which is elrying oil nixed with calcined red oehre; or, if for pictare and looking-glase frames, they are prepared by a size made by bolling parehment clippings to a atiff jelly, and mixed with fine Paris-plaster or yellow ochre. The leaves of books are gilt upon the edges by brushing them over, while in the binder's press, with a composltion of four parta of Armenian bole and one of powdered sugar candy mixed np with white of efg; this roating, when rearly dry, Is amouthed by the burnisher, then slightly moistened, and the guli leaf applied and burnished. To impross gllt figures on book covers, tho leather is dustel over with finely. powdered mastic : the lron toel by which the figure is made is then moderately heated and pressed upona piece of leaf-gold, which slightly alheres to it ; being then immediately applied to the leather with a certain force, the tool nakes an Impression, an!', seftening the inastic, transfers and fixos the gold. In pilding glass and proelain, powdered gold is blended with gun-water and a little horax, and applied ly a camel. hair penell; the artlele is then put into an oven or rurnace; the gum burns off, and the horax, by vitrifylag, cements the gold to the surfach, upon which it may afterward be polished by the burnisher. Wiltin the lant few years nearly all the gitt articles manufice
tared at Birmingham, such as buttons, neck-chains, ear-rings, and so forth, have been gilt by a procese in which, after the articles havo been properly cleaneed by a weak acid, they are iminersed in a hot solution of nitro-muriate of gold, to which a considerable excess of bicarbonste of petash has been added; in the course of a fow reconds they thus recelve a beautiful anid permanen ${ }^{*}$ coat of gold.
Gllead-tree, the Baleam of (Amyris gileadensis), is a native of Arabia, and growe spontaneously in the mountains of Yemen. Aithough not indigenous to Judea, it was cultivated with great perfeetion many years before Christ, in the gardens of Jericho, on the banks of the Jerdan; and it is from Gilead, in that country, whence the merchants brought the resinous product to Egypt, that is derived the appeliation of "Balsam- of Gilead." This shrub, or tree, which seldom exceeds $1:$ foot in height, has a trunk 8 or 10 incles in diameter, with many spreading, crooked, purplish branchea, having protuberant buds, leaded with aromatic resin. The great value set upon this drug in the East is traced to the earlicst ages. When Alexander the Great was in Judea, a spoonful of the bolsam was all that could be coilected on a summer's day; and, in the most plentiful year, the great royal park for these trees yielied only six gallons. It was consequently 80 dear that it sold for double its weight la silver. That of the best quality is said to exude naturally, but the inferior kinds of the present day are extracted by boiling the branchos. It is at first turbid and white, of a strong, pungent, agreeable, aromatic odor, and of a slightiy bitter, acid taste; upon being kept, it becomes thin, limpid, of a greenish hue, then of a golden yellow, and at length of the consistency of honey. This balsam is highly prized among eastern nations, particularly by the Turks and Arubs, both as a medicine and sn odoriferous unguent and cosmetic. It has been highly extelled as a powerful anti-septic, vulnerary, and preventivo of the plague. Its great acarcity, however, has prevented it from coming into use among Europesn and American practitloners. It is extremeiy liable to adulteration, and, from its high price, and difficulky to be obtained, it is believed that not a single ounce of the genuine article can be found In this country, nor even in Europe.-J. J. Browne's Report, U. S. Patent Office, 1805.

Gill, a measure of capacity. See Wercurs and Measures.

Gimbals (Lat. gemellus, twin), the two brass rings or boops within which a ship's compass is suspended in its lox, in order to counteract the effect of the ship's motion and keep the card horizontal. Tinese rings move eno within the other, euch perpendicularly to its plane, sbout two sxes placed at right angles to esch ether. By this contrivance the compass, having a free motion in two directions at right angles to each other, maintainn a vertical position, and oonsequently the card is herizontal. Gimbals are also applied to other instruments, such as the portablo or mountuin barometer, etc.

Gimleting the anohor. Turning it by the stock round its shank as an axis, like a gimlet.

Glmp. Silk twist, interiaced with lirass or other wire.

Gin. (Fr. geniëvre, juniper.) Ardent apirit fiavored by the essential oil of juniper. It was originaliy made by the Dutch, and is hence distinguished in this cquntry by tho name of Hullands. The liquor bearing the above name in this country is of British manufacture, and in frequently flavored by oil of turpentine, and readered biting upon the palate by caustic potash. In IIollund, the flinest gin bears the name of Schiedam, the principal place of its manufacture, and where there are many distilieries.

The English act for laying an excise upon gin passed July, 14th, 1730 ; it had beon found, in the
preceding year, that in London only, 7,044 honses sold gin by retail ; and it was so cheap that the poor could intoxicate themselves, and be disabled from labor for one penny. The heavy exciee of 5 shillings per gallon, and obllging all retailers to take out a license, in a great measure put a stop to this depopulating evil.-Sulmon. About 1,700 of these houses were suppressed in London in 1750.-Clarke.

The Dutch have been long famous for their manufacture of an ardent spirit flavored with juniper, and known by the names of Mollands, Schiedam, Gin, and Geneva; the last being derived from the word "genievre," the juniper berry, and the word gin being a contraction thereof. The distillers at Schicdam seem for the last 60 years at least to have followed very mueh the same practice in the manufacture of this spirit, most of the accounts published during that period hy Individuals who have gone over to study the manufucture, agreelng in the details. Generally 112 lbs. of malt of big, weighing about 87 lbs . per bushel. and 228 lba . of best unmalted rye from Riga, weighing about 54 lbs. per bushel, are mashed in about 100 gallons of water of the temperature of $162^{\circ}$. The tun is then carefully covered and left undisturbed for about 2 hours. The contents are then well stirred up, when the clearest part of the spent wash of a previeus distillation, and as much cold water as will reduce the strength of the wort to about 33 of Dicas's hydrometer, and lower the temperature to about $80^{\circ}$ are added. About half a gallon of good yeast is then added ; active fermentation is thus excited, the temperature rises to $90^{\circ}$, and the whele is over in two days. The whole wort (grains and all) is then transferred to the still, and the distillation is ecutinued till spirit ceases to come ever. A ver weak spirit is thus obtalned, as used to be the case in this country with the old form of still. This, or the lowo wines as it is termed, is sulijected to a second distillation after having mixed with it soms juniper berries and hops. Old juniper berries are preferred for this purpose, and they are added in the proportion of 2 lbs , of berries to the 100 gallons of low wines; a quarter pound of salt, and a handful of hops, are often also added. These ingredients give the spirit that peculiar flaver which has led it to be styled genlèvre-geneva-gin. The quantity of spirit oltained varies from 18 to 21 gallone por quarter of grain, a quantity fully as great as is ylelded by the brest conducted distilleries in this country.

According to recent exsminations and experiments to detact the adulteration of liquors, gin appears to be generally diluted for the purpose of lowering the price, and various decoctions are subsequently introduced to supply the peculiar properties supposed to beleng to the puro spirit. Many of these articles, however, although "possessing very terrifying names, as oil of vitriol, or sulphuric acid, can not in the proportions in which they are used, be looket upon as poisons." It is, for instance, believed that pure gin-that is, alcohol fiavored with juniper-herry, is net to be met with, inasmuch as all rectifiers appear to use "gin-flavorings," made from various aromatic and carminative substances, such as orange peel, coriander, etc., which please the palate of the consamer hetter than pure gin, of which, indeed, the public scarcely know the tasto. If a retailer "never sold any thing but absolute alcohol, it could not be drank by the public without their being greatly injured. The publican would then have to dilute it with such a quantity of water as would render it suitable as a beverage." The pubilican does not profess to sell absolute alcohol, and the public knowing nething of the natare of the manufuctu e of gia, are centent with what is usually sold under that denomination; the term gin being merely conventional, and applying equally to the mixture sold by the publicnn as to the spirit sent out by the distiller, and is, in fact, more
genorally anderstood to represent the mixtare. For the aame reason the revenue does not austain loss, because no man could drink proof apirits, and if the publican did not dilate the spirit, ha " mast fall back upon the wholesale deaier and have it made up to the atrongth he requiren, sweatened and ail."-Report to House of Commong, July, 1850. See Laone Levi'a Ifmals of Brisiah Legislation, Part ix., Dec., 1856.

Gin, in Mechanies, a contrivance for raising hesvy weighte, driving piles, etc., which consists of three apars set up in a pyramidal form, and furnished at top w.th a tackle which is worked hy a windlase beneath. Tha name gin is also appiled to a machine with which the fibres of cotton are disentangled, by means of a aeries of revolving apikes. This operation is termed ginaing. See Cotton Maxupactube.

Ginger (Ger. Inseer; Du. Gember; Fr. Gengembre; It. Zenzero; Sp. Jenjibre; Agengibre; Rus. Inbir ; Jat. Zingiber; Pors. Zungeoel; Arab. Zingibeel), the roots of a plant (Amommm Zingiber), a native of the Fast indies and China, but which whs early carried to and sncceeds very well in the West Indies. After the roots are dug, the best are selected, scraped, washed, and dried in the ann with great care. This is called white ginger; while the inforior roots, which are scaided in boiling water before being dried, are denominated black ginger. Preserved ginger is made by acaiding the green roots, or the roots taken up when they are young and fuil of sap, till they are tender; then peeling them in cold water, and putting them into a thin syrop, from which they are shifted Into the jars in which they come to us, and a rich syrup poured over them. Dried ginger has a pungent, aromatic odor, and a hot, biting taste. It is imported in bags, each contalning about a cwi. The white brings the highest price, being more pungent and better favered. The external characters of goorlness in both sorts of dried ginger are, soundiness, or the being free from worm holen, hesviness, and firmnesa ; the plecen that are smali, light, and soft, or very friable and fibrous, should be rejected. The best preserved ginger is nearly translucent ; it should be chosen of a bright yellow color; rejecting that which is dark-colored, fibrous, or otringy. - Marburx's Orient. Commerce; Tiomson's Digpensatory. The ginger plant could without doubt be grown to advantage in many of the southern States. The amonnt of ginger annualiy imported Into the United States is valued at upwarl of $\$ 60,000$.
Chnseng (Du. Ginseng, Ginsem; Fr. Ginseng; Ger. Krafticerzel, Ginseng; It. Ginseng; Sp. Jinseng; Chin. Lansam; Tart. Orhota), the root of a small plant (Panax quinquefolium Lin.), growing in China, Tartary, and reveral parts of North America. The latter la what we generally see in England, snd is an articie of trade to China, which is its only market. Large quantities were formerly exported from this country; but it is now carried direct to China iy the Americans. It is sometimes exported crude, and sometimes cured or clarified. Within these few years, is has been discovered $\ln$ the Ilimalays mountaina, and small quantitiea have been thence sent to Canton; but the apeculation has not ancceeried. It is only about 40 years since it began to be sent from America to China. Previously to the preaent century, the Chinese drew their aupplies from the widds of Tartary, and the root brought an exorbitant price. Crude ginseng now sells in the Canton market at from 60 to 70 dollare per pical, and prepared at from 70 to 80 dollars. In 1452, there were sent from the United States to China, $158,455 \mathrm{lbs}$, ginseng, vaiued at 102,073 dol-lars.-Papers laid befure Congress, January 1st, 1853.

Claoler, a name given to masses of lice which descend from anowy mountains into the adjacent valleys, where they obtain a lovel often far below the upper limit of the surrounding vegetation. The following are the avnenyms for a glacier in some different lan-
guages and dialecta: In French, glacier; German, gletacher; Itallan, ghiacciqja; Tyrolese, fern; in Cab rinthia, kdee; In the Vallais, biegne; In part of Italy, vodretto; In Piedment, ruise; in the l'yrenees, sermeillo; In Norway; iusbre or iisbrede; in Lapiand, geilina or jegna; In Iceland, jokull or full-jokull. The characteristio appearance of alacier can be nowhere better studied thair In Swltzerland and Savoy. The loy mass of the glacler of llossons at Chamenn-which descends linmedintely from the highest part of Mont Blanc, but lles, aummer and winter, in the valley at a helght of ne mere than 3500 Engliah feet (the height of perpetual snow being about 9000 feet), where it is emboamod emong luzwriant wood, and is alnost In contact with corn-fields-exhib. its a spectacle which mone who have once aeen it can forget, and which attracte more interest and curioaity the more carefully it is considered. The lower glacier of Grindelwald, descending to 8400 feet, is another familiar example of the same phenomenon. In the aretle regions true giuciers also exist, whlch, deseend. ing the valieya (often of great width and iittle inclina. tion), enter the sea, and, breaking off, supply the floating ice-islanids or icebergs, which frequently drift into consparatively low latitudas. These glaciers do not essentialiy differ from those of Alplne ceuntrics.

The diminution of temperature as wa ascend the slopen of mountains, is indicated by snccessive tones of vegetation, and finally by the occurrence of perpetual snow. Thus in the high mountains of the Andes and Himalaya, letween the tropics, the commencement of perpetual snow is found at from 15,000 to 18,000 , or even 19,000 feet, accorling tn circumatances; while in routhern Europe, the level is from 8000 to 9000 feet, and in Norway from 5500 to 8000 feet, according to the latitude and the distunce from tho sea. It was first ahown by Haron Ilemboldt and Von Huch that the linit of perpetual anow depends principally on the temperature of the summer, and not upon that of the whole yenr. It has been already explained that an sccumulation of snow, even frozen snow, does not constitute prcperiy a glacier. A glacier is a mass of ice, having its origin ln the hollows of mountains where perpetnal nnow accnmulatea, but which makes its way down toward the luwer valleys, where if gradualiy melts, and it terminates exactiy where the melting, due to the contact of the warmar air, earth, and rain of the valley, compensates for the bodily descent of the ice from the snow reservoirs of the higher mountains. From this it is evident, without any formai measurements, that A olacten is ICE in моtio:.

Geographical Distribution of Glaciers.-Glaciers are not peculiar to any country or region of the asrit. It may be that there are extensive snow; :" sutains wholly devoid of them, as is suppesed to the the case In tropical South Ainerica; but even this exception requires confirmation. There are peculiarities in the forin of mountaina, and atil] more in climate, which, as we shall see, favor the formation of glaciera, or may even totally prevent it.
Glaggow, a great commercial and manufacturing city of Lanarkshire, in Scetland, situated on the nortiern bank of the Hiver Clyde. According to the determination of Dr. Wilson, the latitude and longitude of the Macfarlane Observatory, in the college garden of Glasgow, are $55^{\circ} 51^{\prime} 32^{\prime \prime} \mathrm{N}$. , and $4^{2} 17^{\prime} 54^{\prime \prime} \mathrm{W}$. Glasgow ia therefore nearly elght miles further sonth, and $1^{\circ} 1^{\prime}$ further west. The difference between the clocks in Edinburg and Glasgow is $4^{\circ} 27^{\prime} 4^{\prime \prime}$.

Glasgow owes its present greatness to its advantageous situstion on a fine river, in one of the richest coal and mineral districte of the empire. Originally, however, the Clydu was much incumbered by forls and shadlows, and for a iengthened period it served rather to excite anil disappoint expectation, than to confer any real commercial advantage on the city.

In 1662, magistrat which Po stands, $w$ dock, the considerati and lits ne by land ca new and $t$ quay woas as 1775 no Glasgow, a plan, pro Chester, fo thes, wes nee of num to 18 feet 0 tained. In 1662, after sevwral othor achentes had falled, the magistrates of Glaygow purchaned the groand on which Port Glasgow ( 16 miles down the river) now stands, where they formed a harbor and a graving dock, the first work of ito kind in seotland. For a consideruble period the intercourue between Glasgow and its newly-acquired port wat principally carried on by land carriage ; but from 1665 attempts were every now and then made to deepen the river. In 1688 a quay was formed at the Broomidaw; but even so late as 1775 no vessel drawing six feet of water coald reach Glasgow, except at spring tides. At length, however, a plan, proposed in 1769 by Mr. Goibarn, engineer of Chester, for deepening the rivar to seven feat at neap tides, was adopted, since which time, by the continned ane of numerous dredging machines a depth of from 10 to 18 feet of water at high water neaps has been obtained. In the year onding the 80th June, 1854, 25 shipe drawing 18 feet of water, and 4 drawing 19 feet, came safely to the Broomielaw, while the largest steam vessel afloat, the Persia, of 8,600 tons' br:i 'en, was launched in 1855 into the river, about one mile below Glasgow, and came np to the harbor to receive her machinery. The work of deepening and straightening the river is still vigorously prosecuted. Six dredging machines and two diving bells are in constant employment. The river, for seven milas below the city, is very much widenad, and forms neariy a straight line-the sloping banks, formed of whinatone, being constructed in imitation of ashlar. The accommodation for shipping at the Broomiclaw, or harbor, is now slso very greatly extended. It comprises about 48 acres of water. The quays extend about two miles in length, are amply furnished with sheds for goods, cranee, etc., and have the important advantage of being directly connected, by means of the General Terminus Line, with the various raliways that centre in the city. The parliamentary trustees for managing the river have, slso, aequired ground on the north side of the harbor, on which they have power to construct exteneive docks. Thay may, alao, construct a basin on the sonth side.

The total expenditure on the river and harbor, including works, purchasea of ground, etc., down to 1854 , was above $£ 2,000,000$, of which about $£ 1,500,000$ has been raised as revenue. The influence of theas improvements on the shlpping and trade of Glaggow has been most striking. At present, a greater namber of sailing veassis and of steamers belong to Glasgow than to any other Scotch port, and the harbor is constantly crowded with ships from forelign ports, coasting vessels and steamers. The steam-packets belonging to the Ciyde that ply to Liverpool, Dublin, and Belfast, are among tho finest veasels of their class in the empire. In all, there belonged to Glusgow, on the 81st December, 1854, 601 vessels of the aggregate burden of 192,895 tons.

The Clyde, npon which the city of Glasgow is situated, is one of the prineipal rivera in Scotlund, and has its rise among the mountains that saparate the counties of Dumfries and Lanark. The langth of this - iream, from its source to its junction with the western sea, is about 100 miles. Along its wholo courso it ia beantified by magnificent natural scenery and embelilshmenta of art. Its banks are crowded with the abodes of industry and a thriving population. The site of Glasgow occupies both sides of the river; and though at the distance of above 30 miles from the influx into the saa, the tide, which fiows a conslderable way above the town, gives it a command of trada and means of ready conveyance for commercial purrobes to evory quarter of the globe. See articies Clyde, Great Bittain, and Scotland.
The first ateam-engine in Giasgow connected with cotton-apinning wha arected in 1792 ; but it was not till the begianing of the preasut century that any considerable quantity of yarn was spun in Scotland. In

1850 the number of upindles employed in cotton-spinning, connected with or dependent on Glaggow, amounted to $1,683,003$, and the cotton consumed amaunted to about $45,000,000$ pounds, or 120,000 bales. At present (1850) the consumption does not appear to have increased. The power-loom wan firat introduced Into Glasgow in 1798 by Mr. Jumes Robertson, who brought two from the IIulks in the Thames. In the following year 40 looma were fitted up at Milton, and in 1801 Mr. John Monteith had 200 looms at work at Pollockshawa, near Glasgow. In 1831 the powerlooms in or dependent on Glasgow had increased to 15,187 ; in 1850 they amounted to $\mathbf{2 3 , 5 6 4}$, and produced the daily average of 625,000 yards of cloth; at present (1856) thare are abont 26,000 or 27,000 power-looms, and consequently the daily produce is not only greater from thls cause, but also from an increase in speed. The number of parsons employed in the cotton factories throughout Scotland, and which may be said to be all connected with or dependent on Glasgow, in 1850 was 8797 males, and 27,528 females, total 80,825 ; whils the motive power was, steam, 71,005 horse-power; water, 2812. In addition to the cotton epun for weaving, there sre several very large manufactories of sawing thread; and to that of power-loom weaving there must be added all the beautiful fabrics that are still made by tho hand-loom, and which amploy a vast number of persons and a large capital. Thase conalat of muslins, plain and fancy harness-curtains, jaconets, cambrics, ginghams, checks, and colored tiasues of all kinds; while, of late years, mixed fabrics, consiating of cotton and silk, cotton and linen, and cotton and wool, have all been manufactured to a great extent. To the many thousand hand-loom weavers that atill reaida in Glasgow, must be added those who reside in all the villages for many miles round, and oven in some of the more distant towns in Scotland and north of Ireland, to form any adequate idea of the extensive and wide-apread textile manufacturing interests of Glasgow. See articles Embroideny, Clyde, and Steam Navigation.

The next great branches of induatry, of which Glasgow is the central mart, are lta coal and iron trades. Although coal, from a pretty remote period, has been wrought round the city chiefly for domestic uses, it has only been since the introduction of the steam-engine, and atill more since the discovery of the economical mode of smelting iron by the hot blast, that the vast and closely-packed minaral wealth of its nelghboring districts has bean at all fully developed and turnad to profit.
Steamship-building.-Of all the branches of industry belonging to Glaggow and its harbor, there is none of modarn date which has made auch rapid progress as that of steamboat-building, and marine engine-making. From the first start of the little Comet, in 1812, till 1820, thers were at the most only one or two river steamars launched yearly, and of a tonnage so amall as to be scarcaly worth notice. Abont that period this manufacture received a new impulao, and began at once fairly to dovelop itself. From 1821 to 1830 there ware 38 steamara built, with a tonnage of 4,200 ; from 1831 in 1840 thare ware 94 steamars, with a tounage of 17,6 w from 1841 to 1850 thare were 167 steamars, with a tonnage of 81,447 ; while ciuring the three years from 1851 to 1853 there were 206 steamers, with a tonnage of 111,718 . The present magnitude of this industry may, however, bo best appraciated from tha fact that during the yoars 1853 and 1854 , the then 82 ship-builders on the Clyde had constructed or contracted for no fewer than 266 vassals, including both staain and sailing, having an aggregate tonnage of 168,000 , for which also marine enginas were constructed or in progress, of 29,000 horas-power; the avorage of these veasels being 630 tons, and involving the enormous cost of nearly $£ 5,000,000$ sterling.

The whola number and tonnage arriving at tha har-
bor of Glasgow daring the yeara 1828－1854，were an follows：

| Years． | －Allimg rumele， |  | TFEAM VMaskia |  |

Glangow
which Giasgow is the central mart; there were, in 18:4, $6,448,000$ tons of coal drawn from the plts, of which $2,152,800$ tons were consumed in the manufacture of pig Iron. 667,200 in the conversion of plg jron Into malleable lion, making in all, 2,520,000 tona uaed in connection with the manufacture of imon, while 926,221 tons were shippea, and 148,812 tons sent beyend the boundaries by railways, leaving for the manufaciuring consumption and domestic use of the Glasgow district $2,853,427$ tona. The produce of pig Iron in the counties of Lanark and Ayr, in 1854, amounted to 717,600 tons, 122,684 tons of which were shlpped direct to forelgn countries, 294,194 tons were sent coastwise from the Clyde, Port Dundes and the western ports of the Clyde estuary, while 22,865 tons were aent nway iy railways, and $17 \mathrm{I}, 360$ tona were coaverted into malieable lron, lenving the remnining 106,497 tona for foumdery and other proposes of the district. Mulleabie iran during the same year was manufactured to the ertent of 122,400 tons. The value of the whole coal and irm business to the diat rict $i n 1854$ may be reckonel at about $£ 1,872,000$, of which $£ 1,973,000$ was pald in wages to 31,900 persons.

Tins chemical products of Glasgow are multifarions, consisting of sulphuric, muriatic, nitric, and acetic achls and their varions saits; blenching-powder, soda, soap, cudbear, bichromato of potash, sugar of lead, ledine, salts of ammonla, nlum, pruseiate of potash, naptha, pitch, oll, animal charconl, bone tar, cream of tartar, etc., otc. The works of St. Rollox, situate in the north-east quarter of Glasgow, constitute perhaps the largest chemical catabllehment in the world. They cover about 12 acres of ground, employ alove 1000 inen, consuming annunlly about 20,000 tons of common salt, and 80,000 tons of coal, and producing of soda, bleaching-powiler, sulphuric acid, and sonp, etc., about 25,000 tons. The lofty chimneys of St. Rollox nre among the curiosities of the city, one of them bring 450 feet high, 50 feet ilametor at the hase, and 14 feet at the top. While conmerce and manufactures had thus given the city a stlmulating and ouward progress, science and art had also added their mighty aid in effecting limprovoment. As a proof of this it may too be montloned that in 1759 the iirst act for deepening the River Clyde was ohtalued; and that, in 1764 , Jamos Watt made in Glaggow his fitst model of a steam-engine.

Irpulation.--If the foregoing tahies give some ldoa of the advance of Glnsgow as a cominercial and manufacturing clty, the following taile of its progressive population during the present century will render this more apparent:

| Years. | Manas. | Fenumen. | Tuat. |
| :---: | :---: | :---: | :---: |

Glass (Ger. and Du. Glas; Fr. Vitre, Verre; It. Vetro; Sp. Vidrio; Rus. Stello; Lat. Vitrum), a transpurent, brittle, factitious body. It is formed by mixing together some sort of siliceons carth, as fine sund, or pounded flint with an alkali,' such as suda, pot-aeh, or pearl-ash, and aubjecting them to a strong hent. 13y this meuns they are melted into a transpareut, soft, tenacious mase, that may, when lot, ie formed into thin plates, bent and shaped in every possible way. When cool it becomee brittle, and ls denominated ghas. Litharge, minlum, borax, tho black oxyd of manganeae, etc., are rometimes used in the manufncture of glass, accorling to the purposes to which it is to be applied.
The kinds of glass, and their ingredients, are stated by Dr. Ure as follows:
"Thero are flve distinct kindn of glass at present manofactured : 1. Filint glass, or giana of lead ; 2. Plate glase, or glass of pure noda; 3. Crown glaes, the beat window glasa; 4. Bread glass, a coarae window glase; 5 . Hottle, or coarse green glase.
"1. Flint Glass, eo named becauso the siliceous ingredicat wae originally employed ta the form of ground fints. It is now alade of the follewing componition:

> Purifled Lynn savil............................................... $100{ }_{60}^{\text {Torta. }}$
> Litharge or red tead.
> lurittod Poarl-ash.

- Tucorrect the green color derived from cembuatble ma ter, or exyd of tron, a littie black exyd of mangances is addod, aud mometimea uitre and arnenle. The fuilon ta accomplished ueualiy in about 80 hours.

14. Plate Glaws.-Goed carbonate of soda, procnced by decompoaing common alt with praci-anh, is empleycd as the Hux. The jroportion of the materiala is,

Coumon sand and thing, wlth a fltte common elay anil sea malt, form n eheapmixture for buttle glag-"

Historical Notices teith respect to Glass.-The manufacture of glase is one of the very highest beauty and utility. It is most probable that we are indebted for this wonderful art, as we are for the gift of letters, to the Phcenicians. According to Pliny. (Ilis, Nat., lib, xxxvi., c. 26), glass had been made for many sges, of sand found near the mouth of the amall River Bejus in Phconicia. "The report," asye he, " $\mathrm{f}_{\mathrm{s} \text {, that the crew of a mer- }}$ chant abip laden with nitre (foesil alkali) having used some pieces of it to support the kettles placed on the fires they had made on the sand, were surprised to see pieces formed of a translucent aubstance, or glans. This was a sufficient hint for the manufacture. Ingenuity (astuta et ingeniose solertia) was Immediately at work, to improve the process thus happily suggested. Hence tho magneticai stone came to be added, from an idea that it contained not only iron, but glass. They also ased clear pebbles, shells, and fossil sand. Inclian glass is said to be formed of native crystal, and is on that account superior to every other. Phoenician glass is prepared with light dry wood, to which copper and nitre are added, the last behig principally brought from Ophir. It is occasionslly tinged with different colors. Sometines it is brought to the desired shape by being blown, sometimes by being ground on a lathe, and sometimes it is embossed like silver." Sidon, he adds, is fanous for this manafacture. It was there that mirrors were first invented. In Pliny's time, giaan was made in Italy of fine sand on the shore between Cums and the Lucrine Bay. If this be a correct description of the glass of Indin in the age of Pliny, it has since fallen off very much; Indian glass being now about the very worst that is made. At present, the Hindoos manufacture it of fragments of broken glass, quartz, and impure soda, an article fonad native in many parta of India, particulariy in tho south. The furnsces are so bad that they can not melt our common bottie glass.-Hamilion's Mysore, vol. ili., p. 870. The glass of Chine is much better than that of India, though atill very inferior to that of Europe.

The general term glaes is empioged by chemists to denote all mineral substances which, on the appllication of heat, pass through a state of fusion into hard and brittle massea, and which, though not aiways transparent, exhibit a lustrous frasture when broken. The glass of commerce, however, to which our remarkn are rentricted, or the transparent and artificial substance which is usualiy distinguished by the generic naine, is produced by the igneous fusion of siliceous earth with certain alkaline earths or salts, or with metallic oxyds. The etymology of the word has been much disputed. It is derived by somo from the Latin glacies, ice, its resemblanco to which is thought to have suggested the titic. (ithers have remarked, that the common latin designation of this nubatance is sitrum ; and as thi l lomans applied this term in common with the word glastum, to the plant which we call woal, they have dednced it from the latter of these, either tecsuse the ashes of this plant were used in the mannfacture of glass, or liecanse it exhihited nomething of the bluish color which is procured from woad. Gluasum, the name given to ainber by the anclent Gauls aisil Itritons, has ulso heen ass! gned as the origin of the worl. But none of theme etymans appenr very natiafactory. The most plussible theory in that which derives the term from the Siaxan verh glis-mian, or the the German gleissen, pplendere, which are proinably contractions of the Anglo-Saxon ge-liran, to shine, tu be bright. This view is in a great degree confirmed by the mense in w!ich the term glase and its derivatives are inupoun y our ofider writers, who freguently apply it io ahining or glittering anintancen, without reference to esior or tranajarency.

In the mont remote agen the art of hioning glass into bottief, making it into vases, coloring it to imi tate prucious atones, melting it into enoimous massen
to make pillars, rolling and poliahing it into mirrors, and tinting it into parts, were all perfectly woll knowr. For its origin we must look to Egypt, the parent of so many colinteral arts. The atory of the Ianelites having net fire to a forest, and the heat beconing so intense that it madu the nitre and send molt and flow along the mountain aide, and that they afcerward did artificially what bad been the reault of sccident, may be set down as equally fabulous with the atory of the pirates, who are eaid to have landed on the sen beach, and wishing to make their cacldron boil, piled up some vitreous stones and placed on them a quantity of seaweed and blocks of wood, cansing so strong a heat that the stones were softened and ran down on the asand, which, meiting and mixing with the alkaji, became a diaphanous and giassy mass. The fictitious character of both these atories is proved by the simple fact that it requires the most intense furnace heat to inaure the combination of the sand with the nitres

Ender these circumetances wo are justified in believing that glasn-making bad its origin at the same time with the baking of bricks and pottery. The smelting of ores, too, required a furnsce sufficiently intense to fase the silicates analogous to glass, and hence it may be anfely inforred, that in the age when meiting and working metal was known, the art of making glass was also practiced. In the look of Joh the most precious thinge are compared to wisdorn, but still more precious are gold and glass. The llebrews must have becoms acquainted with ginss while in Egypt, and in consequence of their proximity ta the Phonicians; and it is now generaliy believed that these two nations had the merit of originating and establishing its manufacture. The Athonian embassadors, in order to give an idea of the magnificence displayed at the court of the great king of Jersin, said, that they drank in cupe of glase and gold. Some writers affirm that the Egyptians in some instances sealed up their dead in a coating of glase, and glasshouses are anid not to lave been uncommon in that wonderful country. Some anthers ascribe, with vary plausibie reason, the discovery of glass-making to the priests of Vulcan at Thetres and Memphis, the greatest chemists in tha ancient world. The Egyptians smo niso known to have made enamels of divera colers which they applied on pottery, magnificent specimens of which are atill extant, and are cailed Fgyptian porcelain. These are chiefly covered with beautiful hife or green, and group* of thowers or designs are traced in black. (ilass heads and other ornaments made of that aulatance, akilifuliy manafactured and heautifuliy cohsed, have heen found udorning mummies, which are known to be ujward of 3000 yenrs old. It is certain that Tyre, Silon, and Alexinilria, were long celebrated for their glass, and furnished the greater proportion of that used at lome. Inder the Roman empire the Jisyptians stil] preserved their superiority in the nrt of glasm-making, and it ia suid that Aurelian cansed them to jay their tribute in that msnufacture. Adrian mentions that ho had received drinking-glasses of varioua colura from $n$ priest of a famous temple in Fify it, and gives instructions that they are net to be naed hut on the greatest oceasions, nid on the most solemn feast days. To theso places the art was ex. clusvely confined for some centuries, and was an article of luxury, being chicfiy in tho form of urns or drink-ing-eups of the moat elaborate workmanshij, and exquinitely embeltished with raised, chasel, or ornamented ilguren. The liarberini or Jortland vuse, eompased of deep blue giass, with figuren of a dejiente white ofacue substance raised in relief, is a splenilid spacimen, and was found in the tomb of Alexander Severus, who died A. 11.285 .

cus. It is highly probabla that thene workmen were imported from Egypt. The use of glass seema rapidly to have Increased, and to have become very common, for we find an emperor in the third century of the Christian ers saying, that he wes diagnsted with so low and vulgar an object as glass, and that he would only drink from vessels of gold. By this time the manufacture of glass was so considerable that an impost was laid on it, and it was extenslvely emplojed in the decorations of buildinga, while in glass mosaics were comblned the most brillisnt colors.
Glass was manufretured at Rome into various articies of convenience and ornament. Pliny mentions that Nero gave 6000 eesterces ( $£ 50,000$ recording to the ordinary method of reckoning), for two glase cups, each having two handles! These, however, must have been of an immense size and of exquisite workmanship; for glass was then in common uüe hur drinking vessels, and was used even in the form of bottles In which to keep wine.-Mart., Epig., lib. ii., 22, 40, snd lit. iv., 86.
From the circumstance of colored glase beads and amnlets having been found among Druidical remains in this country, it has heen argued by Pennant and others that tha art of making glass was known in Britain before its invasion by the Komans. It can hardly, however, be beliaved that a people whe had made very trifling advances in civilization, and who, it is known, were entirely unacquainted with any other art, should be founc not only conversant with the manufacturo of glass, a complicated and highly ingenious process, but should excel in it ; for tise beads and annulets apoken of are of exquisite workmanship, and beautifulty colored in imitation of the rarest and most precious atones. There seems little doubt, therefore, that the sncient Britons procured these in the course of traflic with the Syrians, whe visited the island as we do those in the South Seas, to drive a trade with their sa vage inhabitants in toys and trinkets, giving them these in exchange for skins or other natural proluctions. By whatover means, however, these ornamunts came into Britain, it is certain that thay were in extensive use, though principally for religious purposes, long prior to the Roman invasion, ss they are found in barrows or tumali of a much older date. One at Stonehenge, in particular, on beiag opened wus found to be filled with them.
Glain Neidyr, or Druidical glass rings, genarally sbout half as wido ss our finger-rings, but nuch thicker, have frequently been found. The vulgar superstition regarding these was, that thoy were produced by anakes joining their heads together and hissfige, when a kind of bubble like a ring was formed remnd the head of them, which tho others, continuing to hiss, blew on till it came off at the tail, when it immediately hardened into a glass ring. Success was thought to attend sny one who was fortinate enough to find ons of those anake-stones. They were evidently beads of glass employed by the Druids, under the name of charms, to decelve the vulgar. They are usually of a green color, fut some of them are blue, snd others varicgated with wavy streaks of blue, red, and whilte.
Glass utensils have been found in Iferculaneami, which city was destroyed by an eruption of Mount Vesurius in the reign of 'Titus (A. 1. 79). A plate of glass also found there has occasioned much speculation as to its uses. Similar plates, to which l'ling gave tho aame of ritrew eamerve, stem to have been employel, in a manner not very well understood by us, ns paneling for their rooms. It is illsputed whether or not glass was ustd in Ilerculaneun for windows.

Dion Cassius and Petronius Arbiter coneur in thair account of the diseovery of malicable or ductile glass by a celebrated Roman architect, whose auccoss in the reatoration to its position of a partico which leaned to one side, had roased tite envy and joalonsy of Ti-
berius, and occasioned his baniahment from Rome. Thinking that his discovery would disarm the omperor's wrath, the artist appeared before him bearing a glass veesel, which he dashed upon the ground. Notwithstanding the violence of the blow, it was maraly dimpled, as if it had been brass. Taking a hammer from his breast, he then beat it out into its originsl shape; but inst ad of giving him the reward which he had expected, the emperor ordered the unfortunato. artisan to be beheaded, remarking, that if his discovery were known, gold would soon be held of as little value as conmon clay. This is probsbly snother version of the story told by Pliny, of an artificer who made the eame discovery, and whose workshop was demolished by those who had an intereat in preventing the introduction of an article which would lower the valua of gold, silver, and brass. Althengh it might not be juntiiisbie to givo unqualified diabelief to these stories, yet the knowledge we at present poseess would restrict the possibility of such a discovery within the narrowest limits. The union of the properties of malleability and vitrification sceins to be incompatible. Some metallic subatanoee, by the application of intense heat, are reduced to the state of glass, but at tho same time lose their malleatility; which fact would seem to imply that it is impossible to communicate the latter property to glass. The axtraordinary stories aloove inentioned have, however, been rationally enough explained by modern chemists. It has been observed by Kunckel, that a composition having a glassy appoarnnce, and sufficiently pliant to be wrought by the hammer, may be formed; and by Neumann, that, in the fusion of muriate of eilver, a kind of glass is formed, which may be shapad or baaten into diffarent figures, and may be pronounced in some degree ductife. Biancourt in his L'Art de la l'errerie, mentions an artist who presented a bust of ductile giass to the Cardinal Richelieu, minister of Louis XIII. Fut he does not seam to have been wore fortunate then $t$ is predecessors; for he wae deomed to iuprisonment for iife, for "the politic reasone," as Blancourt with much simplicity observes (we quote from the translation pubisished in 1699), "which, it is believed, tho cardinul entertained from the consideration of the consequences of that secret," which no doubt led him to fear lest the established intereate of French glass manufacturers might be injured by the discovery. From expressions used by Blancourt in othar parts of hia work, we think, that by malleablo glass, such as was produced by this artist, he understood some composition similar to those which Kuncke? and Neumann diacoverel, and was not very exact in limiting the term to that vitroous substance which we now generally understand when we speak of glass.

The precise period at which the making of window flass came into practice is not now certainly known. The Roman windows were filled with a semi-transparent substance called lopis specularis, a fossil of the class of miea, which readily splite into thin smoeth lamina or plates. This sulistance is found in masses of 10 or 12 fuches in breadth, and three in thickness; and, when sliced, very inuef resembles horn, instuad of which it is to this day often employed by fanternmakers. The liomans wero chiefly supplied with this article from the ibland of Cyprus, where it ahounds. So good a substituto for glase it is said to have been, that, besides being euployed for the ndmission of light into the lioman houses, it was ulso used in the construction of hot-houses, for raising und protecting delicate plants; so that, by using it, the Emperor Tïberlus had cucumbers at his table throughout the whole yeur. It is still much employed In Russia instead of glass for vindows.

There is no positiva mention of the use of glass for windows befure the time of Lactantius, at the close of the third century. llut the pasaage in that writer which recorda the fact (De Opyf. Dei, cap. 8), also
ahows that the lapia specularis atill retained lts place. Glasa windows are diatinctly mentioned by St. Jorome, as being used in his time (A. 1. 422). After this period we meet with frequent mention of them. Joannes Phllipalnne (A, D, 630) states that glass was fastened into the windwa with plaster.

The Venerable Bede asserts that glass windows were first Introduced Into England in the year 674, by the Abbot Renedict, who brought over artificara skillsd in the art of making window glass, to glaze the church and monaste: $y$ of Wearmouth. The use of window giase, however, was then, and for many centuriea afterwars, confined entirely to huildings nppropriated to religlous parposes; but in the 14th century it wat 80 much In demand, though stlll confined to sacred edifices and ornamental purposes, that glazing had become a regular trade. This appears from a coutract entered Into by the cluurch authorities of York Cathedral, in 1338, with a glnzier, $t$ glaze the weat windowa of that structure; a piece of work which he undertook to perform at the rate of sixpence per foot for white glass, and one shilling per foot for colored. Glass windows, however, did not become common in Engiand till the close of the 12th eentury. Until thia period they were rarely to be found in private houses, and were deemed a great luxury, and a token of great magnificence. The windowe of the housea were till then filled with olled paper, or wooden lattices. In cathedrale, there aud sheets of linen supplled the place of glass till the sth ecntury ; in meaner edifices lattices continued in use till the 18th.

The glass of the Venetians was superior to any made elsowhere, and for many years commanded the market of nearly all Lurope. Their most extensive glasaworks were established at Murano, $n$ small village in the neightorhood of Venice; but tho produce was always recognized by the name of Venction glas6. Baron von Lowhen, in his Analysis of Nobility in its Origin, etates that, "so useful were the glass-makers at one period in Venice, and so great the revenue aceruing to the repulbic from their manufacture, that, to encourage the men engaged in it to remain in Murano, the senate made them all burgesses of Veniec, and allowed nobles to marry their danghters; whereas, if a nobleman married the daughter of any other tradesman, the isnue were not reputed noble."
The skill of the Venetians in glass-making was especially remarkable in the excellence of their mirrors. Beeknan, who has minutely investigated the subject, is of opinion that the manufacture of glasa mirrora certainly wan attempted, but not with complete suecens, In Slion, at a very eariy period; but that they fell into disuse, and were almost forgotten until the 13th century. Previously to this period, plates of poliahed metal were used at the toilette: and in the rudeness of the firit ideas which suggested the substitution of giass, the pilates were made of a deep black color to imitate them. Hlack foll even, was laid lehind them to increass their opacity. The metal mirrurs, however, renualned in use long after the introduction of their fragile rivals, bit at length they wholly dinappeared; a result effecteal chietly by the akill of the Venetians, who imgroved their manufactare to such a degree that they squedily ncyuired a celebrity whleca secured an Inmense sale for them throughont all Europe.

Italy.-From Italy the art of glans-making found its way into France, where in tempt was made, lis tha year 1634, to rival the ' + . whe in th manafacture of
 other, made in lofio, under tho fis ge ot t'se celo brated Culliert, in wheh Frenct whet'nen whu hat acquired a knowledge of th a art at murano were em-

 mandy, was also threate, , rin irj is whery
or rather improvement in the art of glass-waking, effected by one Abraham Thezart. Thla improvemant conaisted in casting glase of much larger dhevenaions than it had hitherto been deemed possible to do, Thevart's first plates were cast at Paris, and aston'shed every artlst by their magnitude. They were 84 inches long and 50 inches wide, whereas none previcusly made exceeded 45 or 50 laches in length. Thevart was bound by his patent to make all hla plates at lea ot 60 Inches in length and 40 in breadth. In 1605 the two companles, Thevalis and that at Tourlaville, united thelr intereat, but were so unancceasful, that, in 1701 , they were nnable to pay their delits, and were, in consequence, compelled to discharge moat of their workmen, and abandon aeveral of their furnaces. Next year, however, a company was formed under the management of Antoine d'Agincourt, who re-engiaged the discharged workmen; and the works reslized conaiderable profits to tha proprietors, a clreumstance which is attributed wholly to the prudent manogement of IVAgincuurt.

France.- Varly in the 14th century, the French government made a concession in favor of glass. making, by deerecing that not only should no derogation from nobility follow the practice of the art, but that none aave gentlemen, or the sons of nohlemen abould venture to engage In any of its branches, even as working artisans, This limitation was accompanied by a grant of a royal charter of incorporation, conveying impostant privileges, under which the occupation became eventually a eouree of great wealth to several families of distincthon.
England.-1t has been said that the manufacture of window glass was first introduced Into lingland in the year 155\%. liui a contract, quoted by llorace Wal. pole in his Aneclotes of Painting, proves that this artcle was made in England npward of a century hefore that period. This curious document is dated in 1439 and bears to be $n$ contract between the Countess of Warwiek and John Prudde of Westminster, glazier, whom she employed with other tralesmen, to erect and embellish a wagnigicent tomb for the carl, her hus. band. Johin Prudde is thereby bound to use "no glass of England, but glaxs frum beyond seas ;" a stipulation which, lesides showing that the art of making window glass was known and pructiced in England in the 15th eontury, neems also to indicate that it was inferior to what could be obtained from abroad. The finer sort of window ghase was made at Crutched libiurs, London, in 15:7. In the year 1635, Sir lobert Maxwell introluced the use of coal fuel Instead of wuol, and procured workmen from V'enice; hut many ycars elapsed before the linglish minufuctorien aqualed the Venetian and French in the quality of these articles. The first flint glass made in England was manufactured at the Savoy Ilouse, in the Strand; and the first plate glase, for looking-glabses, coach-wiaduws, and aimilar purposes, was made ut hambeth by Venetian workmen, hrought over in $10 \% 0$ by the Duke of llack. inghamr. From that period the Englinh giass mannfactories, sided hy the liberal bountien granted them in cash whon giase sold for export, liecame powerful and successfal rivalo uf the Venetian and l'rench manufactories. The bounty on giasa experted, which the povernment palal to tho manufacturer, was not derived from any tax by linpont, or exciso. previounly iaid; for sil sueh were returued to the manufacturer together with the hounty, theroby iesscning the actual coat of tho articlo from $25^{\circ}$ to 50 per cent., and coniliug the linglish exporter to compete successfuity in fureign market 4. Thif lounty provision was annutied durig the premierahip of Slr Rohert l'eel, together with all the exclise daty on loome consumption.

Secolamd.- T's art of glass-making was lintrodured finto ficotloni the reign of James Vi. An exclawive right it manufarture it within the king iom for | the npace of 31 yeara, wan granted by that monatd to

Lord George Hay, in the year 1610. This right hls lordship transferred in 1627, for a conslderable sum, to Thumas Robinson, merchant-tailor In London, who again disposed of it for $£ 250$, to Sir Robert Maneell, vice-admiral of Eagland. The first manufactory of glaes in Scotland, an extremely rude one, was established at Wemysa in Fife. Regular works were afterwards commenced at Prestonpana, Leith, and Dumbarton. Cruwn glaes is now manufactured at Warrington, St. Helens, Eccleston, Old Swan, and Newtown, Lancashire ; at Birmingham, IIunslet near Leeds, and Bristol. It is aiso menufactured of excellent quality on the Tyne and Wear. Grest improvements have recently been made in the mannfacture of crown glass; and we belleve this article, as made in England, is superior In quality to that of any ather nation.-E. $\mathbf{I}$.

Colored Glass.-It has already been stated thist the Romans combined the most brilliant colors in their mosaics; and there can be little doubt that these mosalcs gave the first ldea of painted or stained glass for winulows in the early Christian churches. In all the eariy specimens of Norman glass, similar coloring and design are to lee traced. Starting from the fourth century, there is frequent mention of colored glase windows by Greek' and Latin outhors. St. John Chrysustom and St. Jerome talk of "wind'ows of divers colors;" and Lactantius says, "that the soul perceives oljects through our bodily eyes as through windows garnished with transparent glase." The early basilicas were all adorned with colored glass, and the early Christian poets sung in ecatacies of the effect produced by the windows at sunrise. In the sixth century, Prudentla, speaking of one of theso structures, saye:-"The magnlficence of this temple is truly regal. The pious prince who consecrated it has cansed the vaults to be painted at great expense, and has clotied it with golden walls, so that the light of day may repent the fire of the morning. In the windows is placed glass of various colors, which shine like meadows decked in the fiowers of spring." An inseription on Sta. Agnese states, that that basilica, rebailt by the Emperor llonorius, wue decorated with glass, whieh produced the most magnificent effect. In the sixth contury, Santa Sophia, ot Constantinople, also received painted windows, which I'aul the Silent praises highly, Procoplus says, that day suemed to be bern under the vaults of the temple; and after such glowing descriptions it can not be doobted that the glass w.1e stained, not colorless. The use of colored glass, however, was not contineil to Greece and Italy. It rapidly nppeared la Gaul. Gregory of Tours, in the sixth centary, also tells us that the church of St. Julien de lirionde, in that town, had colored glass windows ; and the lishop of Poletiers, describing Nótre Dame of Paris, admired the effeet prolucell hy the light falling upon the vaults and walls after pussing though the painted glass, and compures it to the first tints of the morning sun. There are many good reasons for supposing that the art of coloring glass is coeval with the art of glses-making itself. It is certaln that the ard was known in Egypt at least 3000 years ago. We have already mentioned the beautiful initations of precious stones, found adorning mumunies which are known to have existed for that time. We meet with frequent mention of apecimens of eastern workmanship of consummate beauty, upon which great value ws 3 placed. The works of Caytus and Winkelmann furaish some striking instances of ancient skill in the formation of pletures by means of delicate glans fibres of various hues, which, after leilug fitted together with the utmost nicety, were conglothated hy fusion into a solid mass. The art of combining tho varicus colors so as to produce pictures, such as is now practiced, la comparatively of recent date. The carliest specimens of this kind of werk discover a tictitions oining of diffarent pieces of glass, differently tinged,
and arranged so as, by a species of mosalc wrirk, to procicice the figure or figurea wanted. The rarioua pleces are held together generally by a vein cf lead, run upon the back of the pletare, precisely at their junction. Bee article Glass, En. Brit.; Uee's Dict.
Painted Glass.-In England, St. Wilfred, who lired early in the 8 th contury, is said to have been the first to Introdnce painted glasa windows, and for that purpose hed workmen brought from France or Italy. The first painted glass exeented in England was in the time of King John; previously to this, ali stained or palnted glass was imported from Italy. The next notice of it occars in the reign of Henry III. The treasurer of that monarch orders that there be palnted on three glass windows in the chspel of St. John, a little Virgin Mary holding the child, and the Trinity, and St. John the Apostle. Some time after, he lesues another mandate for two painted windows in the ball. Even at thls early period, however, England boasted of eminent native artlats in glass painting, among the first of whom was John Thornton, glazier, of Coventry. This person was employed in the time of Henry IV., by the dean and chapter of York cathedral, to palnt the eastern window of that aplendid edifice; and for the beautiful and masterly workmanship which he exhibited in this specimen of his skill, he recelved four shiilings yer week of regular wages. IIe was bound to finish the work In less than thiree years, and to rsceivo, over and above tho weekly allowance, 100 s . for each year; and if the work was done to the satlafaction of his employers, he was to receive, on lts completion, a forther sum of $\mathbf{x 1 0}$. From this period downward there have been many skillful native artists, although the Reformation greatly impeded the progress of the art, by banishing the ungodly ostentation of ornsmented windows from charches; indeed, so serious was this interruption, that the art had nearly altogether disappeareil in the timo of Elizabeth. Among the most eminent glass painters who first sppeared upon the revival of the art, were Isaac Oliver, born In 1616, and Willian Price, who lived about the close of the seventeenth century. This artist was suceeeded by a person at Birmingham, who, in 1757, fitted up a window for Lord Lyttleton, in the church of Hagley. To hlm succeeded ona Pecket of York, who attained cousiderable notoriety, but who was entirely ignorant of the true principles of the art.

During all this time, however, and Indeed until s comparatively recent date, palnted glass was regurded as too costly and too magniticent an article to bootherwise employed than in decorsting religlous edifices or the palnces of nobles; and even in the latter case it was but sparingly used. Wodern impmovement has placed this beautiful ornament within the reach of very ordinary circumstances; ant the art of atalaing glass is now prscticed with great auccess, and is extensively used ln lecorating our domestic as well as our palatial and eccleaiastical urchitcetare. The colore of modern artists, wo venture to allege, not withstanding what is often urged to tise contrary, equal in variety and richnoss those ci tho ancients, and, with tho superlor knowledge which we now possess of the principles of drawing, and of bringing several colors together on a single sheet, encouragement alono is Wanting to nttract artists of talent and in ventive genius to the pursuit of the art, and to carry it to a greater helght of excellence than it has ever reached In the hands of their predecessors.

United States.-Tho manufacture of glass was introduced into the American Stntes in 1700 by Robert Hlewes, a citizen of lioston, who erectel a factory in the then forest of New liampahire. Tho chief alm of Mr. liewes was to aupply winlow glasa, bot he did not succeel. Another attempt was made in 1800, when a factory was built in Iloston for making crown whatow glass; but this was also unsuccessful, till a German hamed Ilint. In $1 \mathrm{N003}$, took charge of the works, and
the State of Massachusetts agreed to pay the proprieters a bounty on every table of wiadow glass they made; after which the manufacture wes carried on successfully, the glase steadily improving in quality, and becoming famed through all the States as Boston windew glass. The same Company, in the year 1822, erected new and more extensive works at Boston. The mystery attached to the art of glass-making, followed it into America. The glass-blower was considered a magician, and inyriads visited the newly-erected works, looking on the man who-could transmute earthy and opaque matter into a transparent end brilliant eabstance, as an alchemist who could transmute base metal into gold.

Since the manufacture of flint glass was introduced into tho eastern States, there have been above 40 companies formed from time to time, nearly 30 of which have proved fallures. There are now 10 in operation, two of which are at East Cambridge, three at South Boston, ons at Sandwich, three near New York city, and one at Philadelphia. 48,000 tons of coal, 6500 tons of silex, 2500 tona ach, nitre, etc., and 3800 tons of lead are annnally consumed in the manufacture of flint glass. In the viclaity of Pittslurg, in the weatern States, are niae manufactorier of flint glass and 10 of window glasn, and in the river towns are 15 window giasa factories, The following sinte ment of the imports of glass is from official sources.

Gloves (Ger. Handschuhe; F'r. Gontz; It. Giuamti; Sp. Guontes; Rus. Jukauriai, I'ertschatki, Golizii), well known articles of tress used for covering the hands, insualiy maile of leather, but frequently also of cotton, wool, silk, etc. The lenther used in the manufacture of gloves is not, properiy speaking, tanued, but prepared by a peculiar process thint renilers it soft and yuliable. Some sorts of leather gloves almit of being washed, and ithers not. It is, however, impossible to ohtain any truat worthy accounts of the numbers produced. Gloves are sometimes aewed by machinery; but this is done only to improve the work by rendering the stitches more correetly eduidiatant, as it is not cheaper than mannal inloor. I,lmerick used to lie famous for the manufacture of a nort of ladies' gloves, called chicken gloves. Large quantities of cotton gioves are made at Nottingham and Leliceater.
The use of gloven is of hish antiquity. There la reason to helieve the ancient l'ensians wore them, since it is meationed in the Cymperia of Xenophon that on one occasion Cyrus went without his gioves; anll we know they were usel by the Greeks and Homans in certain kiuls of manmal labor. Suring the misille nges, gloves were worn by eccleaiastical dignitaries and whers an a mark of diatinction; hut as civUization alvanced they grabinally licemme common to all classea of the eonamuuity. The glove manufacture has long liern an important branch of industry. The materiais enjoloyed are very various, inclating the akin of the chamoin, khi, Jumb, beaver, doe, elk, and other snimals, lesidea cotton, worl, silk, linen
 skins with alum, which reniers thens soft and pliable.

The kid gloves of France continue to maintain their auperiority over the kid gloves of LIritish make, and are very iargely inported into this country. This also hoids true of the ordinery French lenther, the durability of which, combined with superinrity of style and fitting, has uccasioned the French lowts and shoes to be preferred to those of Britlsh manufacture. Machinery is sometimes employed in ae wing und pointing leather gleves, though only on a very fimited scale In this comutry, slinost the whole being mode by the hand, and for the most part ly females; hut in I'aris it is much used, and is said to have had the effect of reducing the price of gloves 30 per cent. below thein furmer wholesale prices.

Glue, insplasatel nuimal jelly, much usel as a ceo ment, espeelally for weord. it in made from tarions animai substancea, according to the uses for which it is designed. C'ommon glue is prepared from the parings of hides, hoofs, and other offal, which are litst digested in limewater to free them from grease and all extraneous matter, then washird in water, and afterward boiled. The viscid solution tham ohasined is first etrained through a wicker banket, anil then gently evuporated to a proper consistence. The heat is gencrally so regulated as to keep, the higuid noar the Priling jevint, withont entering into ebullition. The liquid give is poured into flat molis; and when it has become firm, it is cot up into miuare piecen, and placod on a coarse net to dry. (ifus improwes ly ago, und thast is connidereci an the hest whirh, If at"epert in cold water for 11 or 4 dnys, awelin withont metting, and resumen ita former dimenainas after being driei. The clear pala brown plase is the hent, though the darker and less pure is often ighorantiy priferrei. A tuanso

The uncrysta has a sweet tas who discovored or glycerin, fron
parent and beantiful glue ie made of the slireds and parings of vellum, fine white leather, or of isinglasa. See also Grlatine.
A proparation of glue, convenlent on account of the facility with which it is rendered fit for immediate use, is made by adding a amall portion of any good spirit, or of wood naphtha, to meited glue. It is to be kept ln a well-corked bottle, and when rcquired for use may readily be liquefied by placing the bottle in hot water. It answers all the purposes of ordinary glue.
Indian Glue, as it is called, consists of common glue melted with a little augar, and molded for convenience into sinall flat cakes. When uaed, the edge of the cake in moistened, and rubbed upon the aurfaces to be united. It is a slight cement, used only for auch purposcs as mending printe, etc.
Jeffery's Marinc Glue.-This powerful cement bas been successfully used as a substitute for pitch in the seams of decks, as weli as for strengthening large timbers for naval purposes. It is said to consist of caoutchouc dissolved in coal naphtha, to which shailuo (provieusly dissolved in wood naphtha ?') in proper proportiens is afterward added. The joinings of built masts secured with this cement are asid to have resisted separation $b_{j}$ the wedge after ten years' service.
Liquid Glue.-Under this name is frequently sold a comsnt consisting of shellso dissolved in wool naph-tha.-EE. B.
Gluten, a viscld, elastic, grayish-colored substance which exists in greater or less quantity in most plants that afford farina, as well as in the leaves of many esculent vegetables (such aa the csbbage for instance), but inore particulariy in whest, which of all the cerealia appears to contain, in proportion to its bulk, the grestest nmount of nutriment, a property derived from jits abounding in this substance. Gluten may be readily obtained from wheaten flour by making it into apaste, and then working the muss with the hands belew a stream of water, when the sturch and other soluble matter are carried away, and the gluten remains in a pure state. In its properties, gluten bears a strong resemblance to aninul substances; and, ? deed, it is found by chemleal analysis to contain a large portion of nitrogen. Hence it may be considcrell as the mest animalized of vegetable products.
Glycerin. Oils and fata, whether of animal or vegetable origin, are compounds of certsin acids, such as the stearic, margaric, and olele, with a base named glycerin. (See Ort.) Fatty substances may, in fact, be represented as saits of glycerin, and as such are capable of being resolved into their proximate elements like other salts. Thus, in the process of soap-making, a fat or an oil is sapooified by meana of potash or soda ; that is, the caustic alkall unitea with the stearic, margaric, or oielc acid, and glycerin is set free. If for example, the stearate of glycerin he treated with caustic sods, the stearic acid unites with the seda, and forms stearate of soda, while the glycerin is liberated. A fatty body mayy also be decounposed by means of oxyd of leas, ns in the process for making diachylon plaster (Einplustrum plumbi). liy boiling a matare of tincly pulverized or newly preriphisted oxyd of lead in water with any ordinary fat or oil, the lead unites with the fatty neids, and forms a soliti compound, while the plycerin lissolves in the water. The solution contains a considerable portion of leal, which may be separated by passing suiphuretted hydrogen through it, and fiterimg; the solution is then evaporated to the consistence of syrup, and the evaporation is compieted in vacuo, in tho presence of anlphuric acid, untii it ceases to lose weight.

The uncrystaliizabie inolorous syrup thens obtained has a aweet taste, and was hence termed by Scheelo, who discevered it in 1789, the acect principle of oixs, or glycerin, from $\gamma^{\lambda 1 v}$ res, sweet ; but it was not un til

Chevreul undertook the inveatigation of fatty oubatances in general that the true chemical relstions of thin body were underatuod.-E. B.
Gobelin Tapestry. Tapeatry, wo called from a noted house in Paris, in the subuŕb of St. Marcel; formerly possessed by famous wool-dyers, whereof the chief, called Gilea Gobelin, who lived in the reign of Francis I., la said to have found the secret of dyeing scarlet, which waa from him called the scarlet of the Gobelins; the house and river that runs by it alao took the same name. This house was purehased by Louis XIV., for a manufactory of all manner of curious works for adorning the royal palaces, under the direction of Monsleur Colbert, aspeclally tapestry ; designs for which were drawn by the celebrated Le Brun, by appointment of the king, A. D. 1666.-Du Fresnoy.
Gold (Ger. Gold; Du. Goud; Da. and Sw, Guld; Fr. Or; It. and Sp. Oro; Port. Oiro, Ouro; Rus. Soloto; Yol. Zloto; Lat. Alurum; Arab. Tibr and Zeheb; Sans. Suarna; Malay Mdes), the most precious of all the metals, aeems te have been known from the earlicst antiquity. It is of an orange red, or reddiah yellow color, and has no perceptlble taste or amell. It lustre is considerable, yielding only to that of platinum, steel, silver, and mercury. It is rather softer than silver. Its specific gravity is $19 \cdot 3$. No other aubstance is equal to it in ductility and malleability. It may be beaten out inte leaves so thin that one grain of gold will cover $56 \frac{8}{3}$ square inches. These leaves are only $1-282000$ of an inch thick. But the gold leaf with which silver wire is covered has only 1-12th of that thickness. An ounce of gold upon silver is capable of being extended more than 1300 miles in length. Its tenacity is considerable, though in thla respect it yields to iron, copper, plathum, and silver. From the experiments of Seckingen, it appeers that a gold wire 0.078 inch in diameter is capable of aupporting a weight of 150.07 lbs , avoirdupois without breaking. It melts at $32^{\circ}$ of Wedgwood's pyrometer. When melted, it assumes a bright bluish green color. It expauds in the act of fusion, and consequently contracta while beceming solid more than most metals; a circumstance which renders it less proper for casting in molds.-Tromson's Chemistry.
Gold is, next to iron, the mest widely-diffused metal on the fuce of the earth. It occurs in granite, tha oldest rock known to us, and in all the rocks derived from it; it is also found in the vein-stones which traverse other geological formations. From other metala it is readily distinguished by its reddish-yellew color, and from metallic compounds of a similar tint by its high specific gravity, which varies from $10 \cdot 2$ when it is fused, to $19 \cdot 1 /$ or 19.5 when it is hammered. Its chemical equivaient on the hydrogen scale is generally taken as 98.5 , but some prefer to double this and make its utomic weight 197. Its symbol is $\boldsymbol{A} u$, from the Latin Aurum. Uulike the great majority of the metals, it ders not rust, i. e., oxydize in the nir, neither does it, if pure, tarnish hy exposure. In this respect, it contrasts strikingly with silver, whicl, though indifferent to the rusting action of oxygen, is rapidly blackened by the sulpharetted hydrogen of the atmosphere. Exposed gilding tarnishes, but only because it is alloyed with silver and copper, on which this prejudicia! gas can act.
Gold is readily crystallizable, and always nssumea one or other of the symmetricai shapes, such as the cule, or regular octahedron, which charscterizes the simplest crystullographic system. It is softer than silver, and nearly us soft as lead, so that in tenacity it is inferior to copper, silver, iron, and platinum, and a wire 1-10th of an inch in diameter will support, without breaking, only 191 lbs. On the other hand, it is the mest ductile and malleable of the metals. One grain can be hammered Into leaves aufficient to cover 504 squaro inches, and the thickness of the gold-leaf
will not then exceed $\mathbf{1 - 2 8 2 0 0 0}$ of an inch. When of this temper it fa transparent, and transmits a faint but beautiful huiah-green light. Gold melts at a high whito leat, and remalns unchanged in the hottest furnaces. In the focus of a lens, however, it is vaporized by the sun's rays; and the nxyhydrogen blow-plpe or a large voltale battory can also develop heat aufficient to volatillze it. It contuacis in the eat of solidifying from a state of fusion, and can not, In consequence, be made to receive sharp impresslozs by casting it in molds. Colns, arcordingly, and plate are atamped or embossed, and afterward ebased and carved, is necessary, by cutting toola.

Ciold dees not dinsolve in nny of the ordinary acids, such as the nitric, aulphuric, hydrochloric, or neetle, but a rare acid, the seleple, can dissolve it. Its beat soivent is a mixture of hydrochlorio acid, with some oxydizing agent like nitric acid or oxyd of raanganene, which causea the liydrochloric achl to part with lts chlorine. If the gold be in leaf, chlorine at once unites with lt, and the resulting chlorid is readily soluble In water. Hromine nets in the same wry on the metal; and it may also be dissolved hy botling it with sulphur, potash, and water. The nider chenists speculated on the possilility of Moses having dissolved the golden calf of the Israelites In this way. Gold is also soluble in mercury, and advantage is largely taken of thin property of quicksilver to dissolve the precious metal from lts ores. The golitanalgam resulting from the union of the metals is also axtensively employed in gilding. The most important chemical compounds of gold are the following, In referring to which the equivalent of gold la taken as $98 \cdot 5$.

The chlorids are two in number. The sesquichloril. Au $\mathrm{Cl}_{3}$, la prepared in the mode nbove men-tion.-: : forma orange-red crystals, but in nqueous ohli.. wrs yellow. It is very easily decomposed lig heat, light, orpanic suhst inces, and ali deoxydizing or reducing agents. fintion of thin salt in aufphuric ether is ametime, sed for gilling steel. The aquevus solution is employed in photography, and from lt nearly all the other useful preparations of gold are made. When this salt is lieated cantionaly to ahout $392^{\circ}$ Fahr., It loses two thirds of its chlorine, and becomes the aulb-chlorid $\mathrm{Au}_{2} \mathrm{Ct}$.

The oxyds correspond to the chlorids, and are obtained from them. Tho only inportant, is is the sesquioxyd $\mathrm{Au}_{2} \mathrm{O}_{3}$, preparel ly precipitating, f*ic corresponding chlorid hy magnesia, and waylisg the precipitate with nitric acid and water. Thin osyel is of a yellow or lrown color, and ly solution in potash, in cyanlde of potasslum, or sulplite of sola, turms a liginid which in used in gilding. A solution of the oxyd in byposulphite of soda is employed to protect and make more visible dajnerreotype portraits on wilver. The sulphurets of golld are not linportant.

Gold is readily ldentified ly' chemical teats. Whim Its color and aperlfic gravity ean not he appealed to as neans of identiflcation, its behavior with the ntronger liquor re-agents is hidi recourse to. It resints the solvent action of the most powerful acids or alkalien taken aingly, but at once dinsolven in nqua regia (a mixture of nitric and hyilrochloric acids), or $\ln$ any aimilar liquill contahuing free chlorine. The reanttlng solution is teated-1. 1ty adding to it a aolution of protomuljhate of iron. This causea the gold to separate in the condition of a very fine powiter, which res mains fur loours suspenilel in the liquid, although it is more than nincteen timen heavler than watar. The fincly-diviled metal appears brown by reflectend, and hifish-green lyy transmitted light, and if dried ant rulined loy any month molinl, acciuiren the characteristie color anil lustre of the metal in nuass. 2. 11y ueutrallaling the solution with carbonate of poitaxa or aoda, and bobling with excesn of oxalic achl, when the goll aejp arates in highly characteristic splencent flakes. 8. By adding to the solution diluted, a few drops of solution
of protochlorid of tin, when a rloh purple preclpltats falls. Very winute traces of gold may be discovered In thls way. The precipitate, which has gone for centuriea ly the name of Purple of Casolus, appears to bo a compound of oxyd of gold and oxyd of $\operatorname{tln}\left(\mathrm{Au}_{8} \mathrm{O}\right.$, $\mathrm{Sn}_{3} \mathrm{O}_{4}$ ). It is used to atain glaas ruby-red, and to give to porcelair and enamel a rose-pink, crimson, and purple color.

Gold is found only in the metallie state, sometimea crystallized in the cube, and ita derivative forma. It occurs also in threads of varione sizes, twisted and interlaced into a chain of minute octahedral cryatals ; as niso in spangles or roundish grains, which, when of a certain magnitade, are called pepitas. The small graing are not tragmenta brokien from a greater mass; but they show, by their flattoned ovoid shape and their rounded outlines, that this la their original atate. Tha apecitlc gravity of native gold varies ff m 13.3 to 17.7 . Humboldt states that the largeat pej ita known was one found in Perv weigbing about 12 kilogrammes (261 lha, avoirdupois); but masses have been quoted In the province of Quite which welghed nearly four tlmes as much. Anothor ore of gold is the alloy with silver, or argental gold, the elvetrum of Pliny, so called from ita amber shatle. It secias to to a definite compound, contain'ing in 190 parts, 64 of gold and 36 of ailver. The mincrat formations in which this metal occurs are the cryatalline j ,imitive rocks, the compact transition rockw, the trachytic aud trap rocks, and al. luvial grounds. It never predonninates to such a degree as to constitute veina lby ltself. It is either dis. seminated, and as it wero impasted in suiny masses, or spread out In thin platos, or grains on the surface; or lastly, planted in their eavities. uates the shape of tilamenta or erystallized twigs. The minerals com. posing the veins are either quartz, calc. sjuar, or sulphate of haryta. The orea that accompany the gold in these veins are chiefly iron pyrites, copper pyrites, galena, blende, and mispickel (araenienl pyritea).

In the oren called auriferous pyrites, this metal occura either in a visible or invisible form; and though invisible in the freah pyrites, beconea visible by its decomposition ; as the hydrated oxyl of lron allows tho native gold particles to shine forth on their reddishbrown ground, oven when the precious metal may constitute only the five milllonth part of its weight, as at Rammelsherg, In the llartz. In that state it has been extracted with profit; most freplisently by amalganntion with mercury, proving that the gold was in the native state, and not in that of a sulphuret.

Gold exists anong the primitive atrata, dissemirated in small grains, spanglea, and crystala. Ilrazil sffords a remarkable example of this apecies of gold nine. Beda of granular quartz, or mleaceona apecalar irou, In the Slerra of Cocien, $1:$ lengues beyond Villa Mica, which form a portion of a inica-slate district, include a great quantity of nutive golid is spangles, which in this ferriginous rock rephaco miea. (iobl has never been olserved in any secondary fommation, but pretty abundantly in ita true nul primary locality among the traprovks of igneous origin; implanted on the aides of the fiswures, or dismeminated in the velus.

Thes auriferous ores of 11 ungary and Transylvania, composed of tellurium, silver pyriten, or sulphuret of ailver, and native sulll, lie in masaes or powerful veins In a ruck of trachyte, or in a decomposed felispar sulb ordinate to it. Such is the lovality of the gold ore of
 kay, in Ilungary, and prohably that of the pold ores of Kapnick, Melsobanya, etc., in Tranyylvanha; on arrangement nearly the same with what occurs in equa. torial Anierica. The auriferuus veins of Guanswato. of Real del Monte, and of Villaipando, are ainilar to thome of Shemnitz, in llungary, as to magnitude, relative position, the nature of the orea they inchuce, and of the rocke they travenve. Thewe districts have impreased all mineralogista with the oridence of the
action of vo described the the crater of trachytes, rocks Includ garded as o seem, howev not in these greenstone p and Tranegll for gold ham Euganesn M tin, of those upongranite

Finally; if of gold in the ample, and a this metal in Gold is, ho vial grounds rocks just de the form of a! ferruginons as in their ro-ent and after stor supposed that beea torn out tives rocks, searched, but streams, for The gold in washed by the ion, suggested born, Guettar just observatl frequently, at spangles of go of the aurifer gold after stor other circuma that gold is fot very circumact their sunds cen come from the shudantly ne known that $t$ the l'ont to It: forls go'd on sequently, far traversing a 1 into which w monutains mt gives more though the la The sands of gold, while th that in, from to Efferding plains below. the eands of $t$ among the m from its entra bouchure in $t$ and are even

action of volcanio fire. Breislak and Hacquet have described the gold mines of Tramsylvania as altuated in the crater of an ancient volcano. It la certahn that the trachyten, wheh form the principal pertions of the roeks inclading gold, are now almeost universally ri garded as of igncons or voleanic origin. It would seetin, however, that the primary source of the gold la not in these roekn, but rather in the sieuites and greenstone porphyries below them, which in Hungary and Transylvanha are rich in great auriferous deposits ; for gold has never been found in the trachyte of the Euramean Mountains, of the mountains of the Vicentin, of those of Auvergne; all of which are superpoeed apon granite roeks, barren in metal.
Finally ; If it be true that the ancients worked mines of gold in the island of Ischia, it would be another examplo, and a very remarkahle one, of the presence of this metal in trachytes of un origin evidently volcanic.
Gold is, however, mueh more common in the alluvial grounds than among the primitive and pyrogenoun rocks just llescribed. It is found dissominated under the form of kpangles, in the silicious, argillsceons, and ferruginons aands of certain phains and rivers, especiatly in their re-entering angles, at the season of low water, and after storms and temporary floods. It has been supposed that the gold found in the beds of rivers had beea torn out by the waters from the veine and prinitives rocks, which they traverse. Some have even searched, but in valn, at the soures of auriferous streams, for the native bed of this precious metal. The gold in them belonga, howover, to the grouads washed by the waters as they glide along. This opinjon, suggeated at first by Delius, and supprorted by Debom, Guettard, Robitant, Bulbo, etc., is founiled upon just observations. 1. The sell of these plains contains frequently, at a certain depth, and in seversl spots, spangles of gold separable by washing. 2. The beds of the nuriferous rivers and atreamleta contuin moro gold after storms of rain upon the pluins thun in any other circumatances. 3. It happens almost aisuys that gold is found among the sands of rivers only in a very eircumscribed space; on ascending these rivers, their sands cease to afford gold ; though, did this metal conie from the rocks ahove, it shonld be found more shundantly near the source of the rivers. Thus it is knowa that tho Oreo contsins no gold, except from the Pont to its junction with the Po. The Ticino affords goid only below the Lago Maggiore, and, consequently, far from the primitivs mountains, after traversing a lake, where its course is slackened, and into which whatscevar it carried down from these monutains must have been deposited. The Rhine gives more gold near Strashurg than near Basle, though the latter be mueh eloser to the mountains. The sunds of the Danube do not contain a grain of pold, whie thla river runa in a mountainous region; that is, from the frontiers of the bishopric of Равнаи to Ufferding; but its sanids becoms auriferous in the plains below. The same thing is true of the lims; the sands of the upper portion of this river, as it flows amung the mountaina of Styria, Include no gold; but from its entrance into the plain at Steyer till ita emboachure in the Danube its annds become auriferous, and are even rich enough to toe washed with profit.
The greater part of the auriferous sands in Europe, Asia, Africa, and Amerien, are black or red, and consequently ferruginous; a remarkablo circumstance in the geological prosition of alluvial gold. M. Najoine anjuposes that the gind of these ferruginous grounds is due to the decompusition of auriferous pyriten. The auriferous and occurring in Hungary aimost al ways in the neighlorhood of the heds of ligmites, and the pet. rified wood, covered with gold graina, found buried at a depth of 55 yurds in clay, in the mine of Vorospatak, near Alrabanya, in Transylvania, might lend us to presumo that the epoch of the formation of the nuriferous alluvia is not remote from that of the lignites.

The same association of gold ore and fossil wood occure in South America, at Moco. Near the village of Lhoro have :'een discovered, at the depth of 20 feet, large trunks of petrified trees, surrounded with fragmenta of trap-rocks, interspersed with apangies of gold and platinum. But the allavial soil afforis likowiss all the charact of the basaltic rocks; thus, in France, the Ceza and the Gardon, auriferous rivers, where they afford most gold, flow over ground apparently derived from the destruction of the trap rocks, which oceur in situ higher up the country. This fact had atruck Reaumur ; and this celebrated observer had remarked that tho sand which more immediately accompanies the gold spangles in most rivers, and particularly in the Rhone and the Khine, is composed, like that of Ceylon and Expally, of hack protoxyd of iron and smali grains of rubies, corindon, hyacinith etc. Titanium has been observed more recently. It has, lastly, been remarkei that the gold of alluvial formations is purer than thit extracted from rocks.

Principal Gold Mines.-: jpain anciently posseased mines of gold in regular veins, especially in the province of Asturias ; but the richness of the Anserican mines had made them to be neglected. The Tagus, and some other streams of that country, were baid to roll over golden sands. France contains no workable gold mines; but it presents in several of its rivers auriforous sands. There are some gold mines in Piedmont; particularly the veins of anriferous pyrites of Maeugnagna, at the foot of Monte Rosn, lying in a monntuin of gnoiss; and although they do not con$\operatorname{tain} 10$ or 11 grains of gold in a cwt., they have long defrayed the expense of working them. On the southern slope of the Pennine Alpa, from the Simplon and Monte Rosa to the Valley of Aoste, several anriforous districts and rivers occur. Such are the terrent Evenson, which has afforded much gold by washiag; the Oreo, in its passage from tho Pont to the Po; the reddish grounds over whleh this little river runs for several miles, and the hilis in the neighborhood of Chivasso, contain gold spangles in considerable quantity.

Ireland.-In the county of Wicklow, in Ireland, a quartzose and ferruginous sand was discovered not long ago, containing many particles of gold, with pepitas or solid pieces, one of which weighed 22 ounces. No less than 1000 ounces of gold were collected.

Stvitzerland.-There are auriferous sunds in some rivers of Switzerland, as the Reuss and che Aar. In Germany no mine of gold is worked, oxcept in the territory of Salzburg, emid the chain of mountaina which separates the 'Tymal and Carinthia.

Hungary.-The mines of Hungary and Transyivania are the oniy gold mines of any importance in Europe; they, are remarkable for their position, the peouliar metals that accompany them, and the produet, estinated nt ahout 1,430 unds avoirdupois anmually. The principal ones are In Mungary. 1. Thoso of Könlguterg. The native gold is disseminated in ores of sulphuret of silver, whieh oceur in smali masses and in veino in a decomposing foldspar rowk, nmid conglomerate of pumice, constituting a portion of the irachytic formation. 2. Those of Borsom, Schmeitz. And, 3. Of Felsobany; ores also of auriferous sulphuret of silver, ocour in veins of sienite and greenstone porphyry. 4. Those of Telkebanya, to the south of Kaschau, are in a deposit of auriferous pyrites nmid trap rocks of the most recent formation. In Transylvnnia the gold mines occur in veias often of great magnitude, aix, eight, and somsetimes forty yards thick. These veins have no side piates or wall stones, but abut without intermediate gangues at the primitive rock. They consist of carious quartz, ferriferous limestone, houvy spar, ther spar, and sulphuret of silver. 'The mine of Kapnik deserves notice, where the gold is associated with: orpinent, and that of Voroapatak in granite rocks; those of Offenbanya,

Zalneng, and Nagy-Ag, where it is ansoelated with tellurium. The last in in a sienitlo rock on the Ilmits of the trichyte.

Northeri Europe, -In Sweden, the mine of lidelfors in Smoland, may he mentloned, where the golid oceurs native and in anriferous pyritea; the veins are a hewn quastz, in a monntaln of foliated homstone. In Siberla, native gold occurs in a hornitone at Behlangetitery or Zmoof, and at Zemeino-garak in the Altal Monntahis, accompanied with many other orea.

Fivesia.-The gold mine of Berezet in the Oural Mourtatins has been long known, conainting of partially decompond asrifrowa pyrites, disseminated ln a vein of greasy quartz. About 1820, a very rich deposlt of natle guld was discovered on the eastern slde of the Onral Mountulns, Alsseminated at sonse yurda* depth in an arglllaceons loam, and accompanied with the debris of rockn whleh usually cempose the auriforons alluvial moilh, as greenstone, serpentine, protoxyd of iron, corandem, ete. The rivera of this district possuss aurifemita annda, The product of the gold mines of the Oaral, in 1845, wan 11,803 pounde avolrdupols, and in $1846,11,827$ prounds; that of Siberia, in $1845,37,57 \mathrm{C}$ pounds, and lis $1846,48,863$ pounds. In these accounts the pood has been reckoned at 36 lus. It is belleved that in 1847 and 1849 the yielid was atill larger, hat it mast shee have naterinlly fallen off, as
 will not exceed 20,000 pennids troy.

In Asis, and erpecially in its anathem districts, there aro many minea, treama, rivers, and wastes, which contain this metal. The Pactolus, a small river of Lydila, rolled over such gohlen sands that it was supposed to contain the origin of the wealth of Crosus. But these deponits are now poor and forEntten. Jippan, Furmosa, Ceylon, Java, Sumatra, lorneo, the lhilippines, and some of the islands of the Iadlan Archipelago, are rich in gold miner. Thone of Thmeo are werked by the Chinese in an alluvial soil on the western coast, et the foot of a chain of voleanle inotintalns. Jitth or no pold comes into Earrope from Asia, lecause its acrvile inhabitants place their furtune in treasure, and love to hoarl up that precions metal. Numerons golil mines ocenr on the two slopes of the chain of the Callas Mountains in the Oundes, a prosince of Little Thllest. The gold Hes in quartz veins whilch traverse a very crumbling, reddish granite.

Africa Was, with Spain, the source of the greater portion of gold possessod hy the anciente. The gold Which Africa still trings into the market is alwaya in dust, showing that the metalis oltalned by washing the allavial soils. None of it is collected in the north of that continent ; three or four districts only ato remarkable for the quantitv of gold they produce. The first mines are thowe of Kordofan, letween Dnrfour and Abysainia. The negroes transport the gold in quills of the ostrich or vulture. These minen seum to have been known to the ancionts, who ionsidered Ethiopla to afomil in goid. Herodotes relates that the king of that conntry exhiblted to th.e ambassalors of Cambysea all their prisoners lound with golden chains. The second and chief exploitat'on of goll dust is to the sonth of the great desert of Sahara, in the wentern part of Africa, from the mouth of the Senegal to the Cape of Palms. The gold occars in spangles, chiefly near the surface of the earth, in the bed of rivalet, and always in a ferruginous earth. In some places the regroes dig wells in the soll to a depth of about 40 feet, unaupported by any props. They do not follow any rein ; nor do they conatruct a paliery. By repeated wablings they soparato the golll from the eathy mattern. The sanue district furnishes also the gleatec part of what is carried to Monocro, fes, and Alyiers, by the caravans whleh go from Tlmbuctoo on the Niger, ncross the great desert of Sahara. The goll which arrives by Sennanr at Cairo and Alexandria
cones from thin same quarter. From Mungo Park' description, it appears that the gold apangles are found usually in a ferrugineun amall gravel, burisd under rolled pebbles. . The thlnd spint in Africa where gold la collected is on the south-asat coast, between the 35th and the 22d degree of aouth latitude, opposite to Madngascar, in the country of Sofala. Some per. ann think that thilg was the kingdom of Ophir whence Sulomon obtained his gold.
There is little gold i". ie northern part of America. In 1810, a mana of all .vico vold, voighlng 28 pounda, was found in the gravia : of the aroeks of Rockhole, district of Lohanou, in North Cerolina.

South A merica,-Previously to the important dien coveries in Califoraia, Brasil, Choco, and Chill, ware the regions which farnished moat gold. The only contributor of Chilian olfects to the great exhibition was one whe forwarded a lump of gold ore weighing 8 cwt., which was brought up from a deep mine on the back of a miner, from a depth of 45 yands heneath the aurface.

The gold of Mexico is la a great measure contained in the argentiferous veina, 80 numeroua in that country, whose princlpal localitles are mentioned under ths artiele Silver. The allver of the argentiferous ares of Guanaxuato contains one 360th of Its weight ef gold; the annual product of the minea being valued at from 2,640 to 3,300 liss. avoirdupois.

- Oaxaco contsing the only auriferous veina exploited as gold mines in Mexico ; they traverse the rocks of gneiss and mica siate.

Ail the sivers of the province of Caracas, to tea degrees north of the line, flow over golden sands.

Pera is not rich in gold ores. It the provinces of IIuailas and Patar, thla metal is mined in veins of greasy ¿uartz, varlegatod with red, ferruginous spots, which traveree primitive rocks. The uines called pacos de oro, conslat of ores of iron and copper oxyds, containing a great quantity of gold.
All the gold furniahed by New Grenada (New CoInmhia) in the product of washinge established in allu. vial grounds. The gold exists in apangles and in gralns, disseminated among fraginents of greenstone and porphyry. At Choco, aleng with the goh and platinum, hygeinths, sircona, and titanium occur. There has been found, as already atated, in the aurif. erous localitios, large trunka of petritied trees. The goid of Antioquia is 20 carats fine, shat of Choco, 21 ; and the largest lump or pepita of gold weighed slout $27 \frac{1}{2}$ pounds avoirdupola. The geid of Chlli also occurs in alluvial formations. Brazil does not contain any gold mine, properly so called; for the veins containing the metal are selidon worked. It is in the sands of the Mandi, a branch of the Rio Dolce, at Cntapreta, that the auriferous ferruginens sands were first diseorered in 1682. Since then they bave been found almost eve "where at the foot of the immerse chain of mountains, which runs nearly parallel with the coast, from the 5 th degree south to the 30 th. It is particularly near Villa Rlea, in the epvirons of the village Cocics, that the numerous washings for gold are establlshed. The pepitas occur in different forms, often adhering to micaceous rpecular iron. But in the province of Minas Gerales, the gold oecurs also in veinh, in beds, and in grains, disaeminated anong the alluvial loams. It has been eatimated in annual proinet, by several author, at alout 2800 pounils avairdupois of fine metal. Wo thus ree that alnost all the gold brought into the uarket comes from alluvial lands, and is extracted by washing. The gold roin of the ancients was male ehlefly out of alluvial goll. for In those early times tho metallurgle arts were not sufficiently advanced to enable them to purify it. The golid dust from Bambouk, in Africa, is of $22 t$ earats the, and some from Morocco is even 28. The goid of Giron, in New Grenada, is of 23 earats-being the purost from Anerica. "For those whe traflic in goid,"

Of the general results arising from the large increase in the praduction of gold since 1849, Mr. Jooke, In his Hisfory of Jrices (1857), says:
"(1.) That from first to last the whole of the manifold and powerful effects produced by the new gold in the countries of lts production, resolve themselves into cconnuical changes apringing in rupid succession, and in an infinitude of forms, from tho expenditure of trebled or quadrupled lneomes obtained by the labor-
ers. And (2.) That hitherto the whole of the compllcated proceases by which the new gold has become distributed-In the first Inslance, smong the population of the gold regiens, and in the second instance, over considerable pertions of the commerclal world-are to be explained hy the application of one simple princlple, viz. : That the diatribution has taken place in the precles proportion ln which the extended demand for commodities, originally proceeding from the earllest laborers who picked up the gold, has gradually get in motion increased numbers of laborers and increased mounts of capltal, to supply the requirements, not merely of the population of the gold countries, but also more or lese of the population of all the countries produclag raw materiale or manufactured goods upon which incomes are at present expended.
"Springing up around these two general resulta, there are a multitude of subsidiary, whlch, if we conld thoroughly pursue them to the end of their course, we should discever to be tributaries and effishoots of the two greater princlples.
"Foremost In thls eecond category are the proofs and illustrations which meet us evorywhere, that the changes flowing from the gold discoveries are princlpally indebted for the rapidity of their effects to the single circumstance, that of all known aubstances (silver in aome respects excepted) gold ls the only commodity which admits of being extracted from the soil in a perfectly marketable state; in large quantities, and by tho rudest labor; and of being at once employed as a universal hastrument of purchase of intrinsle value. A suddenly-Increased supply of no other commodity would produce effects so decided and rapid, for the simple roason that (say) a tenfold quantity of no other commodity could find an instantancous and impatient market. The Burra-Burra copper mine in South Australia, for example, might have become ten times as productlve as it had been previously, without producing any effects more violent or rapid than, first, an increase of dividend to the shareholders; and, gradually, a full in the price of the kinds of machinery and bardware in which copper is the principal metal.
" In the next place the rise of two or threo hundred per cent., which occurred at once in the gold countries in the prices of all kinds of forelgn commodities, was speedily corrected by the impulse imparted, almost in a singlo day, to the resources avallable for ineressed production in those foreign countries. And, after the first excitement had abated, tho incressed production has continued year by year, because the effective demanl, in the form of new gold, has continued in the gold countries, year by year. But there has been this most inportant collateral offect, via., that, year by year, the circle within which the demand for cominodities goes on increasing, is a circle of rapldly-expanding nrea. Originally; but for a short time only; it included merely the gold countrics; it thon embraced those particular districts-Lancashire and Birmingham for examplo-liest able to meet the most urgent demands for special articles; it then hecame exteniled to the districts which supplied the raw matertuls of thoso articles; and pursuing the same order of progression, the area of the lacreased domand for commolities, or what is a better term, tho area within which incrensed incomes are expeniled, is necessarily whler in each succeeding month. Tho same genoral reusoning applics to the process by which the wages of labor lave been reduced in the gold countries by means of lmmigration.
"The liscovery of the new goll was, in its immediate region, the samo thing, practically, us rendering labor four times as effective as it had been in the production of those commoditics not meroly possessing intrinsic value, but instantly exchangeablo all over the world for all other commoditics possessing intrinaic value. Tho immigrants drawn to the gold coun-

Photographic Sciences Corporation
tries by the prospects of high wages and sudden fortune, transferred, in some specifio proportion, the benefits of this increased officacy of labor to the countries from whence they atarted; and in two modes, namely: in the first place, by establlshing at once, as was sean in this country in 1852-1853, a prodigionslyincreabed prica for amigrant vessels, and therefore for the services of all persons cennected with ehtp-buildIng; and, in the second place, by leaving behind them vacancles which could only be supplied by the absorption of labor previously a burden in some form to the commnnity, as was also seen in 1852 and 1853 by the diminution in the number of destitute persone relieved under the Poor Law.
" We seem to arrive, then, at a furtber generalization, namely: (1.) That within the gold countries the effects of the diecoveries have been to create, rapidiy and largely, accumnlations of real wealth and real resources. Tha adult population of these countries bas been increased three or four fold within as many years. The erection of housee, the cultivation of the soil, the reclamations of waste lands, the construction of railways, the embelishment of towns, the provision of harbors and decks, the foundation of schools and universitles, and, more conspicuous than all, tha ostablishment almost at a single stride of an enormous forelgn trsde-in a few words, the vigorous prosecntion of every enterprise, and the awift advancement of every art which can render a country opuient and powerful-are results which have been nearly all accomplished in the gold conntries, by the exportation to otber coantries, year hy year, of the aupplies of new gold. (2.) That within these other countries to which the gold has been rent in exchange for commodities, the continuous effective demand for commodities has produced the same effects, but in a limited degree, which have taken place in Australla and Californie. In the United Kingdom, for example, the continuance, year by year, of an effective demand for commodities, has ind to improvements and extensions in the means of production; bas led to accumulations of capital as ravings out of the larger incomes of capitalist and laborers; and has diminished within the country the pressure of unemployed and destituto persons.
"It is manifest, then, that the influx of the $\mathbf{~} 174,000,000$ of gold since 1848, has accomplished something very different from, and something very much beyond, the barren addition of a considorable percentage to the previonsly-existing amount of metallic circulation in this and other couatries, and has also accomplished changes far more important than any barren increase (merely hy reason of enlarged qusntity) In the prices of commodities. It is, moreover, manifest, unless all the previous facts and reasouings are erroneous, that the real and vital changes which have taken place, are additions to the real wealth of the world, ly means of greater production and more active enterprise ; and that the elements of circulation and price hava so far not been ultimate results, but inferior and Intermediate agencies employed." See Tooke's Ilistory of Prices (london, 1857); nee, also, Colna and Precious Metals, pozt; Rankers' Mag., 1851-1857.

Cold-beating. The art of gold-beating is of great antiquity, being referred to hy llomer; and lliny atates that one ounce of gold was extended to 750 leaves, each leaf being four fingers square, whieh is three times the thlckness of the ordinary leaf gold of the present time. The ancient Peruvians made very thin abeets of gold, and nailed them together on the walls of their temples of worship; on the coffins of the Theban mummies, specimens of original leafgilding are met with where the gold in in so thin a state that it resembles modern gilding. The art seams to have been practleed in Indla, judging from the rude specimens of gllding at Tippo Saib's palscest Bengalore. In modern times it has been practleed in the
capitale of the principal commercial countries of Europe. In England it was confined to. Loadon until within the present century. It has been introduced into Scotland and the United States of America within that period. It is now practiced in several towna in England, and to a amall axtent in Ireland, at Dublin ouly. The manufacture being attendent upon an advanced state of the arts, it is only found in old estallished countrics, and is not yet practiced in any of tho British colonles. From the existence here of eome now obsoleta toole, similar to these at present ln nes at Paris, it would appear to have traveled to England from that quarter. "The art has nowhere been se perfected as in London; but of late years, from intercourse with English gold-beaters, efforta have been made on the continent, with the aid of Engllsh goldbeaters' skin, to rival the extremo fineness of the English product.

The ordinary size of a leaf of gold is 3 it inches, for the production of 2000 leaves of which from 18 to 19 dwts. of gold wore allowed to the workmen fifty years since in London, but now, owing to the improvement in the quality of the skin, and superier skill on the part of the workmen, not mora than an average of 16 dwts . are required, and with very akillful workmen it is sometimes accomplished with 14 dwts. This, howover, is not to be taken as any test of the extrome malleability of gold; it is only the point to which it is desirable to attuin for commercial purposes.

Experiments have been made to ascertuin to what degree of thinness gold and, silver could be reduced: it was found that one grain of gold was spre ad to the extent of 75 square inches, and the same wuight of silver to the still more extraordinary dimensions of 98 square inches. Tuking one cubie lnch of gold at 4900 grains, it will be found that the gold was the 367,650th part of an inch in thickness, or abont 1200 tlmes thinner than ordinary printing paper. Thus, If this nuaiber of leaves of gold were placed on one another, they would constltute a pile an inch high; the same number of leavea of paper would form a pile half the height of the Monumont of London. Tho silver, though spread over a much larger suface, was thickest, owing to the difference in its specific gravity; but, calculated iy welght, silver is the most malleable metal with which wo are acquainted, considorably exceeding that of gold. This experiment does not, howaver, determine the extent of the malleability of either metal, as the means employed to test it were found to fall hafore there was any eppoarance of the malleability of the metals loeing exbausted.

The gold used by the gold-beator is varionsly alloyed according to the varicty of color required. Fingegold is commonly supposed to be incapable of being reducel to thin leaves. This is an error. It is objectionable for commorcial purposes on account of its greater cost. It also adherea on one part of a leaf touching another thus causing a waste of labor by the leaves being epolled; but for work exposed to the weather it is mach preforablo, as it is more durablo, and does not tarnish or change color. The opecimens of goll leaf exhibited by Mr. F. S. Marshall, gold-beater of London, at the great exhibition of 1851 , and for which the prize medul was awarded to him, were twelvo in num. ber, and embraced a regular gradation in color from red down to nearly white, viz., red, paln red, extra deop, deep, orange, lemon, doop pale, pale, paie-pale, deep party, party, and fine gold. The decjeer calors were alloyed with from 12 to 10 grs . of copper per oz., lut without any silver, as any alloy of silver with this quantity of copper would considerably linpuir the nal. leablity. The middle colors contalied from 12 to 20 grs. of silver, and from 6 to 8 grs , of copier to the ounce; the paler golds contuined from 2 to 20 dwts of silver to tha ounce, lut no copper, for the banio reabon that the silver was omitted in the red golds.

The process of gold-beating is thins conducted. The gold having been alloyed according to the color desired, it is melted in a crucible, at a higher temperature than is shaply necessary to fuse. It, as ita malleabllity is improved by exposure to a greater hest; sudden cooling does not interfere with itis malleable properties, differing in this property from aome other metnls. It is then cest into an ingot, sad flattened into a ribbon of $1 \frac{1}{2}$ inch wide sad 10 feet in length to the onnce. After being fiattencd it is annesled and cut into small pieces of about 6 grs. each, sad placed between the leaves of a cutch, which is about half an inch thick and $3 \geq$ inches square, contalning abotit 160 leaves of a tough paper manufactured in France. 'Formerly fine veilum was used for this purpose. The cutch is beaten on for slout 20 minutes with a 17 -ponnd hammer, which rebounds by the elasticlty of the skin, and saves the labor of lifting, by which the gold is spresid to the size of the cutch; each lenf is then taken out, and cut into four pieces, and put between the skins of a shoder $4 \frac{1}{2}$ iaches square nnd $\frac{8}{4}$ ths of an inch thick, containing ebout 700 skins, which have been worn out in the finishing process. The shoder requires abont two hourg' besting upon with a 9 -pound hammer. As the geld will spread unequally, the shoder is beaten upon ofter the larger leaves bave reached tho edges. The effect of this is, that the larger leaves come ont of the edges in a state of dust. .Thia allows time for the smaller lesves to resch the fuli size of the shoder, thus producing a genecal evenness of size in the leaves.

Each leaf is again cat into four pieces, and placed between the lases of a mold composed of ahout 900 of the finest skins, 5 incbes square and hths of an inch thick; this is' the last and most difficult stage of the process; and on the fineness of the skin und judgment of the workman the perfection and thinness of the leaf of gold depend. During the first honr the hammer is allowed te fall principally upon the centre of the mold. This causes gaping cracks upon the odges of the leaves, the sides of which rendily coalesce and unite withent leaving any trace of the nion after being beaten upon. At the second hour, when the gold is about the 150,000 th of an inch in thickness, it for the first time permite the transmission of the rays of light. In pure geld, or gold but slightly alloyed, the green rays are transmitted; nnd in gold highly slloyed with silver, the paie violet raye pass. The mold requires in ail about fonr hoars' benting with a 7-1b. hammer, when the gold will have nerived at the ordinary thinness for the goid-leaf of commerce. It is then taken out of the mold, and the rough edjes are cut off by slips of the rattan fixed in parallel grooves of an instrament cailed a wagon, the leaf being laid upon a leathern cushion for that purpose. The lenves thus prepared are placed into a book capabio of holding 25 leaves each, which have heen rubbed over with red ochre to prevent the gold clinging to the paper, and is used for gilding picture-frames, books, and for numerous other ornamental purposes.
The dryness of the cutch, sheder, and mold, is a matter of extreme delicacy. They require to be hotpressed every time they are used, altiough they may be ased daily, to romove the molsture which they acquire from the atmosphere, except in extremely frosty weather, when they acquire se little moisture that then a difficulty arises from their over-dryness; the brilllancy of the gold is diminished, and it spreads very slowiy under the hammer. On the contrnry, if the cutch or shoder be damp, the gold will hecome that which is technically termed hollew or sieve-like; that is, it is plerced with innumerabie amnll microscopical hoies; and in the molda in its more attenuated state it witl become reduced to a pulverulent atate. This coniltion is more ensily produced in alloyed golds than in fine goll. It ia necessary that each skin of the mold should be rubbed over with calcined gypaum (the
frinated variety) each time the mold may he used, in order to prevent the adhesion of the gold to the aurface of the akin in the process of beating.

Dentist Gold is gold leaf carried no further in the process than that of the cutch; and should be perfectly pure gold. By the above proceas ailver is beaten, bht not 80 thin, the inferiot value of the metal not rendering it commercially desirable to beatow so much labor apor it: Copper, tin, zinc, palladium, lead, cadminm, platinum; and slumininm can be beaten into thin leaves, but not to the extent of gold or silver.
Shell Gold, used in painting and illaminating, is made by grinding gold leaves with heney, and afterward separating the honey from the powdered gold by means of water. When the honey is washed away, the gold may be pat on paper or kept in shells. When used, it is commonly diluted with gam water. The German gold powder, prepared in this msnner from the Dutch gold lest, is generally used; and when it is well secured with varnilh, it snswers the end in japanners' gilding tolerably well.

Gold Size, for burnished gilding, is prepared of $1 \frac{1}{3}$ pounds of pipe clay, $\frac{1}{3}$ an ounce of red chalk, $\frac{1}{2}$ of an ounce of black lead, 40 drops of sweet oil, and 3 drams of pure tallow.... The clay, chalk, and blaok lead are to be ground very fine, separately, in water, then mixed together; the oil and tallow are next added; and the mixture is ground to a due consistence.

Gold Thread is formed of flattened gold wire wrapped closely over a thread of yellow eilk, by means of a wheel nud iron bobbins.
Gold Wire is made by taking a oylindrical ingot of silver which has been superficially costed with gold, and drnwing it successively through a series of holes In a hardened steel plate, each of which is a degree amslier than the preceding hole, and proceeding thns until the requisite degree of fineness is attained. It mny be observed that in this process, however fine be the wire, its gilded surfaee exhibits no flaw even when viewed by the microscope. Flattened gold wire is the same wire after it has been passed between rollers of polished steel.

Gold Coast, cosst of Africa. The whole coast has been arbitrarily divided into five parts: 1. The Sierra Leone district, from Cape Verga to Cape Mesursdo. 2. Malagueta, Pepper or Grain Const, from Cape Mesurado to Cape Palmas. 8. The Ivory Const, from Cape Palmas to Cape Three Points. 4. The Gold Coast, from Cape Three Points to the River Volta. 5. The Slave Coast, or Benin district, from the River Volta to the Cameroons.
Geld Ceast, a country of Guinea, west Africs, extending along the Atlantic Ocean, from the River Volta on the east, to Cape Lahu on the west, and hounded north by Ashantee. It was discoverod by the Portuguese, who founded an establishment at Fort Eimina in 1482. The Fingilsh first settled here in 1664. The country is fertile; deer are plenty in the interior, and fish nlong the coast. Legisiature of the Iritish settlements composed of $n$ governor and a legislative council of four members. Salary of lieu-tenant-governor, $£ 800$. The principal European establishments are Cape Coast Castie, Accra, Axim, Dixeove, Elmina, and the establishments lately ceded by lenmark to Great Britnin.
The following returns to Parliament (as published by the London Shipping and Mercantile Gazette), show the increase of exports to the West Coast of Africa, and of importations from the saine coast :

| Years. | Kxports. | Imports. | Tiluni. |

This is Independent of the British colonies of Sierra Leone, the trade of which ameuntod in 1854 to 1,421 ,865, and of the British possessions on the Gold Coast and the River Gambia, amennting to $\begin{gathered}61,547,285 \\ \text { more ; }\end{gathered}$ and of those at the Cape of Good Hope and in sonth Africa, ewelling the amount $88,883,090$ more; making in all an aggregata of over $\mathbf{\$ 2 8 , 0 0 0 , 0 0 0}$ in $\mathbf{1 8 5 4}$, for the western const of Africa entire.

It has of late been arged that a line of steamere should be established between the United States and the western cosst of Africs, to afford greater fecilities for commercial interconrse ; and the planting of aettlements In the interior, as now proposed, remote from the malarious influence of the coast, furnish additional reasons for persevering in this landable design.

Gold Discovery in California. In September, 1847, one Captain Suter or Sutter was a bold, prosperous, enterprising, intelligent settler in Upper California. He was a Swiss by birth; he had served Charles X. as one of the Swiss Guard at the Tuilleries; he emigrated to Missouri after the Bourbon revolution of 1830; he removed thence to the Oregon territory in 1836; he made a further advance, in 1839, to California, where he built a fort named New Helvetia on the River Sacramento; he gradually accumulated around him 4000 exen, 1500 horses and mules, 2000 sheep, a vast acreage of land under grain crops, and two trading vessels In the river; he had his fort supplied with 12 pleces of artillery, and defended by a garrison of 70 men; and he was thas, in all probability, the wealthiest and most inftuential man beyond the Rocky Mountains. The month above named was an important one to this bold captain, and to the world at large. IIe contracted with a Mr. Marshall to construct a eaw mill near a pine forest. The supply of water to this mill was so altusted as to wasli down much mud and gravel from the higher course of the stream; and Mr. Marshall, watching the progress of his works one day; saw some gllttering particles in this mud. Ile formed his own conclusions of the nature of these ahining morsels; and having shown some of them to the cap' in, it was agreed to keep the matter a secret for a

Such secrets, however, do not keep; they will
keep; It was soon noined sbrosd that soln had been discovered at the American fork of the Sacramento, and a gold fever thereupon sprang up. A few laborers collected nome of the gold-dust, and took it for rale to San Francisco, at which town the Sacramento enters the Pacific; hundreds flocked up the river; Indlans were hired, soldiers and sailors denerted, shop-keepers closed their shops, and San Francisco became alnost abandoned.

Galden Fleece, in $\mathbf{N} /$ ythology, the fieece of the ram upon which Phrixus and IIelie crossed the sea to Colehin, and whileh, being sacrificed to Jupiter, was lung ujon a tree in the grove of Mars, guarded by two brazen-hoofed liulls, and a monatrons dragon that never nlept. The fleece was earried otf by Jason and the Argonauts. Many authora have enleavored to show that this fable is an allegorical representation of some rest history; while others explain it by the profit of the wool trale to Colehis, or the gold which was gathered in the rivers of that country by means of fieeces.
Gold-Lace. Gold-laee is a thin covering of gold applied to a surface of silver, which again has a foundation of silk. The ailken threads for making this material are wound round with gold wire, no thlekly as to conceal the silk; and the making of this gold wire is one of the most singular meehanical operations imaginable. In the tirnt place, the rether prepares a solid rod of allver, alout un inch in thickness; he heats this rod, applien upon the narface a coathig of gold-leaf, burnlahes this down, applies another contlug, burnishes thin down, and so on, until the gold is alout one hundredth part the thickness of the nilver. Then the rod is subjected to a train of processes which bring it
down to the state of a fine wire; it is passed through holes in a steel plate, lessening etep by step in diameter. The gold never dsserts the silver, hut adheres closely to it, and shares all its mutations; it was one hundredth part the thickness of the sllver at the beginning, and It maintains the same ratio to the end.
Aa to the thinness to which the gold-coated rod of silver can be brought, the limit depends on the dolicacy of human skill; but the most wondrous example ever known wae brought forward by the late Dr. Wollaston, a man of extraordinary tact in minute experiments. This was an example of a solid geld wire, without any silver. IIe procured a small rod of silver, bored a hole through it from end te end, and inserted in this hole the smallest gold wire he could procure; he subjected the silver to the usual wire-drawing process, until he had brought it to the flnest attalusble atate; It was, in fact, a silver wire as fine as a buir, with a gold wiro in its centre. How te Jeolate this gold whe was the next point: he suljected it to warm nitrous acid, by which the silver was dissolved, leaving a gold wire one thirty-thousandth of an inch in thickness-perhaps the thinneat round wire that the hand of man has yet produced. But this wire, though beyond all comparison finer than any employed in manufacturee, does not approteh in thinness the fllm of gold on the surface of the silver in gold-lace. It has been calculated that the gold on the very finest silver wire for gold-lace is not more than one third of one millionth part of an inch In thicianess; that is, not above one tenth the thickneas of orlinary leaf-gold !
Gold-Leaf is an extromely thin cissue uf gold, prepared by heating the gold motal until the requisite degree of fineness has been oltained. It is found that a ninuto percentage of silver and copper la necessary to give the grold for gold-leaf a proper malleable qual-Ity-a percentage of perhaps one in 70 or 80 . The refiner manages this alloy, and bringe the costly proluct to a certain stage of completion; he melts the gold and the cheaper alloys in a black-lead crucible; Le pours the molten metal into an ingot mold, six or elght inches long; he removes the solidified anil cooled ingot from its mold, and passes $3 t$ repeatedly between two stcel rollors until it asaumes the thickness of a ribbon; and this ribloon, sbout one eight hundredth of an inch in thickness, and presenting a surface of ahout 500 square inches to an ounce, pasees next into the hands of the gold-heater.
The working-tools, the process, and the products of a goll-heater, are all remarkable. That pu\%zing naterial, "gold-heaters' skin," is an indispensable aid to him; it is a membrane of extreme thinuess and lelicary, but yet tough and strong, procured from the Intestides of the ox; 800 piecos of this skit, four Inches rquare, constitute a packet with which the goldbenter labors ; and thue le proceeds: 150 lits of rib-bon-gold an inch square, are interleaved with as many vellum leaves four inches square ; they aro beaten for a long time with a ponderous hammer on a smooth marble slah, until the gold has thinned and expanded to the aize of the vellum. IIow the workman maages so as to heat all the pieces equally, und yet beat nome into holes, he alone run answer ; it la one of the mysteries of his craft. Tho gold is Ilberated from its sellun prison, and each plece cut into four ; the 150 have thus become 600, and these are interleaved with tion pleces of geld-beaters' skin, which are then packel Into a compact mass. Another heating then takes place $\rightarrow$ more carcful, more delicate, more precise than the former-until the gold, expunded like the silk-worm, as far us its envelop, will ulmit, requires to be again released. 'I'ho leaves aro ugain divided lito four, by whith the 600 becomo 2.400 ; these are divided lato three purcels of 800 each, and cuch parcel in suljected to a third beating. lleuvy as the hammers ure, there are yet degrees of heaviness: first, a slxteen-pounder gives its weighty thamps, then a twelve-poundor, and

In this last operation a hammer of ten pounds is employed. See '̛old Beatina.

Cold-woighing Machine. Mr. Cotton's machine seems, hy general consent, to be deemed the most delleate evei jrat constructed for weighing gold coin. Its precision is indeed most exquisite. In the transactions between the Bank of England and the pabllc, the weighing of gold coin his been a most anxlous and tedious process. As between the bank and the mint, the labor is not so minute; for 200 sovereigns being first accurately weighed, all the rest are weighed in groups of 200 . The mint officers are allowed a deviation of 12 grains in about 50 sovereigns; but they generally work to within half of thls amount of error; and if the groups of sovereigns are correct within the prescribed limits no closer weighing is adopted. In the transactions between the ba'sk and the publie, however, matters must be trented in more detail. Each customer demands that his sovereign should be of pioper weight. Hence arises an important part of the daily routine at the bank. Sovereigns which were issued from one counter at the bank as being of full welght, were refused at another counter as heing light. The scsies mny not have been equally delicate, or the linbility to error on the part of the weighers may not have been exactly equal. An expert weigher could weigh about 700 sovercigns in an hoar by the old balance; but the agitation of the air by the sudden opening of a door, the breathing of persons nenr the apparatus, the fatigued state of the hand and eye of the weigher-all led to minute crrors.

The machine is a pretty, delicate, light affair. There is, in the first place, a small vertical tube, in which a pile of 20 or 30 sovereigns is placed, in singla column. The lowermost sovereign rests upon a movalie plate; when a bandle is turned by the nttendant, the plate moves sideways, and the sovercign is brought upon an exquisitely gensitive balance; if the weight is correct, a littl- rever, arm, or pusher, gives the edge of the sovereign a smart impuise and drives it off into a box; but if the weight be deficient even in the most minute degree, nnother pusher attacks the sovereign on a different side, and drives it into another box. As the handie is continned in motion, 2 or 3 sovereigns may be in different stages of the welghing process at one time.
As the Bank of England does not take cognizance of gold coins which are too heavy, this machine merely separates sovereigns into two groups, the full and the light ; and it does not indicate by how much the light sovereign is deficient. It is therefore only by actunl trial that the delicucy of the machine bas been tested; If $n$ difference of even a bundredth of a grain existed lretween 2 sovercigns it is said that this mnchise would detect it. On a rough average, 30,000 soverelgns pass over the bank counter every day; ench machine can weigh 10,000 soverelgns in 6 hours; and there are 6 machines; so that the bank can weigh all its issues of gold by these means, nill have reserve power to spare. One of the machines is adjusted for half soverelgns. Between 18.44 and 1848 there were $48,000,000$ gold coins weighed by these machines nt the hank; and bankers and private persons place undouliting rellance on the correctness of the process. Farh machine requires an hour's cleanlng once $n$ week; the machines cost abont $£ 200$ each, and are said to lee peculinrly free from liability to disarrangement. llesides antisfying the bank, the bankers, and the public, these machines save $£ 1000$ a year to the hank in welighers' wages.
Gomuti, or Djoo, a species of pulm (Rorassus Gomuths), growing in the Indian islands. A valunhite prolluct ls olitained from this pulm, resembing black horse hair; it is found between the trunk and branches, at the insertion of the latter, in a nutted form, interspersed with long, inrd, woody twigs of the same color. When freed from the latter, it is
manufactured by the natives Into cordage. Its flises are stronger and more durable, but leas plisnt, than those of the cocos nut, or coir (see Coir); and is, therefore, fitter for cables and atanding rigging, but less fit for running rigging. The nstive shipping of the eastern islands of all kiads are chiefly equipped with cordage of the gromuti; and the largest European shipping in the Indies use cables of it. It undergoes no preparation but that of spinning and twisting ; no material similar to our tar and pitch, indiapensable to the preservation of hempen cordage, being necessary with a substance that, in a remarkable degree, possesses the quality of resisting alternatlons of heat and moisture. The gomuti of Amboyna, and the other Spice ielands, is the best. That of Java hae a coarse ligneous fibre. Gomati ls generally sold In twisted ehreds or yarns, often as low as 1 dollar a picul, and aeldom more than 2. Were European ingenuity applied to the improvement of this material, there seems littie doubt that it might be rendered more extensively useful.-Cnawfond's East. Archip., vel. iii., p. 425 .

Gondola, a kind of barge used chiefly on the canals of Venice, where gondolas supply the place of carriages. The gondolu is flat-bottomed, very long and narrow (nveraging about 30 feet hy 4 ), and its two sharply-pointed e tremities are curved upward to the full height of a man. It is also provided with a amall chamber piaced near its centre, and elevated to a convenient height above the line of the gunwaie. It is propelled by ours or a pole, by the gondolier, who stands at the stern. The word gondola is derived by Du Cange from the modern Greek кovvтє $\lambda_{\text {as, }}$ a bark or little ship; Lancelot again deduces it from $\gamma_{0} v \delta v$, a term in Athenæus for a sort of vase. The gondoliers of Venice were formerly an interesting part of the popuiation, and were noted for the practice of whiling away time by singing alternately stanzas of poems, particularly of Tasso's Jerusalem Delicered, though with great changes from the original ; but this castom has become almost entirely obsolete.

Gong, a Chinese musical instrument of percussion, formed entirely of inetal, which sields a very loud and peculiarly harsh sound when struck with force. It is made of an alioy of tin and copper, and in form it nearly resembles the common tambourine. Gongs are much used in China for making loud sonorons eignals, particularly on the canals, as well as for adding to the clanger of martial instruments.

Good Elope, Cape of. Strictly speaking, a small promontory, nearly the most sonthern point of Afrien, but It gives its name to the large tract of country which forms the most southern part of that continent, and is now a colony of Great Britain. It lies for the most pu $t$ between S. lat. $29^{\circ}$ and $34 \frac{y^{\prime}}{}$, and $\mathbf{F}$. long. $18^{\circ}$ nnd $28^{\circ}$. It is bounded on the north by the Orange and the Gariep Rivers, on the east by the River Kelsknmma and Kafrarin, on the oouth by the Suuthern Oceun, and on the west by the Atiantic. Its extreme breadth is from north to south nbout 450 miles, and its length from east to west abont 600 miles, its area contaialng ahout 250,000 square miles. The country rises from the sea by a series of terraces, of which the supporting walls are nearly paralied chains of rugged and barren mountains intersected by deep ravines, the beds of streams, feeble or dry in the etuminer, tuit rushing down in torrents in the winter. Tho first of these mountain ranges of which Drackenstoin, liottentots' Holiand, and Lange Kloof form a part, rans from the north-west round the colony toward the enst, where it terminates in tie promontory of Cape St. Francis. lietween It and the sea, on the west coast, the country is sandy and sterile, but on the sonth mid east coast it possesses some good soli, and is clothed with vegetation. The second great chain, containing the Karroo llerg, Oilphant's Iliver, Cold Bukkeveld, and Zuurbergen

Slountaine, runs parallel to tho. first and tarminates near the mouth of tha Groen Fish River. if Its ayarage height is about 4000 feet, and its, greatest about 6500 . Between this chain and the first the surface is varied, some parts consieting of arid plains and hilis, othors of good arable aoil with a large portion of exoellent grasing land. The third great range also runs nearly parallel to the others, and includes the Kammies Borgen, Roggeveld Borgen, Niouwveld, and SneeuwBergen Mountains. This is the highest part-of the colony, and from it the lapd gradually deacenda to the Orauge River. Between this range and the encond is the vast desolate plain called the Great Karroo, nearly 300 milea in length aast and weat, and about 00 in brealth nerth and south. Its soil: to a sand mixed with clay, and particles of jron: all soil of a aimilar character in other parts of the colony is called karioo ground. These mountain chains are montly composed of sandstone resting upon a base of granite, which are the provailing rocks, the next in abondance being clay slato, grauwacke, quartz rook, and dolerite. in some parts the ironatone is traversed by vains of red tron ore. Depotite of coal are sald to have been digcovered in Kafiriand and Victoria division, and coppor ore has been found in seme abundance In Namaqua land.
The Rivers, with exception of the Orange River, are mall; thoy all more or less partake of the oharacter of mountain streams, having numerous falls, and being low and feelle in the dry season, but awollon and rapid in the rainy weather. They are of course not anvigable, and their moutha are mostly barred with asnd. The Knyena, the Cowe, and the Briede are howevor accessihle, for a ahert distance from their entrance, to small vessels. Tho chief rivers, are, on the weat coast, the Orange, the Elephant, and Great Berg Rivers ; on the nouth coast, the Brieie Knysua, Sundey, Cantoos, Great Fish, and Keiskamma. The ouly one of them deserving epecial notice is the Orange River, which, rises in Kathlamiva or Drackenberg Mountains, flowa for nearly 1200 miles generally in a westarly direction, and dischargea iteelf into the Atlantic, forming the northern boundary of the col ony. It is on the whole a nolde stream, and in seme parts its banks are shaded by huge willows.
The Soil.-It is considered that about two fifthe of the colony consist of arid mountain ridgee and sandy plaina, unfit either for agriculture or pasture. The remainder is not generally fit for agricultural purposes, although it containg some vory fertile spots; a large portion of lt, however, aspecialiy in the eastern part, affords excellent pasturage for cattle end sheop.
The cosat la indented by various beya and inlets; few of than, however, efford convenient hariors. Saldanha Bay, on the west coast, is one of the most extensive snd secure havens in this part of the world, but it is rendered comparatively uneless by the want of a aufticient quantity of fresh water near it for the supply of shlpping. Slmen's Bay, near the botiom of Palise Bay, is a good harbor, and is used as a atation for the royal navy. Table Bay, though somewhat protected by Roblen Isiand, is little better than an open roadstasd. It afforls ahelter, however, to shipe during the aummer months, but in the winter, from May to September, it ie very unaafe. Algoa Bay is an open mondstead, but it is the ohief port of the enstern province, and is much froquented by shipa, which in certain winds can lie in It aafely. Monsel Bay and the Cowie are also resorted to liy amall veseals, hut they are little hetter than open roadsteails.

Tho cllmate is generally milder and drier than that of Eingland. December, January, and February are the aummer montha ; June, July, and August the winter. In the western part the summer is dry and ciear, but $\ln$ the east it is wet arid stormy. In the vicinity of Cape Town, the highest temperature is about $84^{\circ}$, the lowest about $40^{\circ}$, and the mean of the
year about $65^{\circ}$. In the mpuntainous diatricts and elevated plains, the heat of summer and stie cold of winter are greater.
The vegetation of the colony is remartably rich and varied. Some of the finest botanical apecimens that new adorn the gardens of Europo havo been derived from this region. In no ether place do bulboue plants and heaths exhibit $s 0$ many besutiful varietiea. Besides, a number of other ornamental tribes, there are some plants which might be used in medicine and dyeing. The aloe, however is the only one which has been made an artioie of export. The mot remarkable trees are, the silver-tree, which only grows in the vicinity of Table Monntain; the Protea; and in the eastern province, the Eupherbia There is on the whole, a scarcity of indigenous timber, thuugh there are in some parta extensive forests. Some of the native woods furnish materials for furniture and the wood-work of houses. The oak, fir, and other Europoan foreat trees, ksve, however, been long since Introdnced, and thriven very well; some of them have attained a great size, and their wood is extensively used. There are few indigenous fruits, but most of the fruits both in the north and south, of Europe, such as grapes, figa, oranges, mulberries, apples, pears, peaches, nectarines, and, others, are, grown in abundance ; but strawberries rarely come to perfection, and the gooseberry can not be raised.

- In regard to the zoology of the Cape, thare is little to distinguish It from the rest of Africa, under the head of which will be found aufficient information on this aubject; we may, however, notice the dounestic animals of the celons. Sheep, cattle, and doga, of an inferior breed, wore all possessod by the natives on the discovery of the country. Ilorses, asses, mules, goata, and loferior breeds of cattle and sheep, have been introduced, and thrive well. The Merino eheep, in particular, has proved a valuable acquisition to the colony... Among the game birds are the busturd, called by the Dutch the pcuw, and a amaller kind called the coran, wild duck, teal, snipe, and partridge. - Listory.-Thls Cape was discovared by Bartholomew Diaz, the Portuguose navigstor, in 1493, who first landed at Algoa Bay, having, after exploring the west coast, been driven out to sea by a storm, and thus accidentally donlling the Cape which be saw on his way back, giving it the name of the Cape of Storms (Cebo Tormentoso). The King of Portugal, however, gave it' the nore suspiclous name it atill bears, as ita discovery afforded a hope of a new and easier way of reaching India, the great object of all the maritime expeditions of that age.
The great navigator Vasco de Gama doubled the Cape in 1497, ai:d carried the Portuguese flag into the Indian seas. . Ilis countrymen, however, attructed by the richos of the East, made no permanent settlement at the Cape, although they frequently touched there on the voyage to India., But the Dutch, who, on the decline of the Portuguene power, established themselves in the East, early saw the Importance of the place as a station where their vesseis might take in water and provisions. They did not, howerer, colonize it tili 1650, when the Dutch East India Company directed Jan Van Riebecek, with a amall party of colonists, to form a settlement thero. The couutry wus at that time Inhabited by a people called Quniqua, but to whom the Dutch aeem to have given the name of Hottentots. The Riebeeck settlers had at first great difif. culties and hardships to endure, and their territory did not extend beyonil e few miles round the site of the prosent Cape Town, where they first fixed their abode. They graduslly, however, extended thelr limitn, by driving the native luack or redireing them to serfdom. These coloniats, although under Dutch authority, were not wholly of that nation, but consisted partly of persons of varlous nutions, especialify Germans and Fleminga, with a few loles und lortu-
guese. They ware for the mont part people of low station or indifferent. charncter; there. was, however, a small number of a higher class, from whom was seiected a council to assist the governor - About the year 1686 the European popplation was increamed by a namber of the French refugeea who left their country on the revocation of the edict of Nantes. ., Our limita forbld our attempting to trace the history of the Cape Colony during the lengthened period it remained under the Dutch government. .. We may, however, mention some of ite prominent incidents, the effecte of which are visible in the colony to this hour.
1st. The Dutch, partiy by so-called contructs, partly by force, gradually deprived the Hottentote of their country. 2d. They reduced to slavery a largo part of that unfortunate people whom they did not destroy. 3d. They introduced a nnmber of Malays and negroes as blavee. Ath. They established that narrow and tyranulcal ayntem of policy which they have adopted in other colonles, prescribing to the farmers the natare of the crope they were to grow, demanding from them a large part of their produce, and harassing them with other exactions tending to discourage lndustry and enterprise, We are of opinion that to this miechievous pollay is due the origin of those unsettled habits, that dislike to orderly government, and that desire to escape from its control, which characterize a considersi ? e part of the so-called Dutch boers of the present day, qualitiea so utterly at variance with the character of the Dutch in thelr native country, but. which were atrongly manifested at the Cape long before they came under British rule, and under those influences to which eome exclusively attribute the insubordination of those men. The attempts of the boers to escape from the Dutch power, and so form an independent government beyond the bordera of the colony, especially in the district since called Graaff-Reinet, are strikingly similar to their proceedings at a later date under the British govermment. 5th. The Gamtoos River formed the boundary between the Hotteatot and Kair races, and was early adopted by the Dutch as their eastern limit; but about the year 1740 they began to pass this river, and came into collision with the Kafirs, and in 1780 extended thelr frontier to the Grest Fish River.

In 1795 the coloniste, having imbibed the revolutionary principles then prevailing in Europe, attempted to throw off the yoke of the Dntch, upon which the Britiah sent a fleet to support the anthority of the Prince of Oraigge, and took possession of the country in his name. As, howsver, it was evident that Holland would not be abie to hold it, and that at a general peace it would be made over to England, it was ruled by British governors till the year 1802, when, at the peace of Amlens, it was again restored to IIolland. In 1806, on renewal of the war, it was again taken by the British undor Sir David Baird, and has since remained in their possession, having been finally ceded by the King of the Netheriands at the pence of $1810^{\circ}$.

Population.--The total population of the colony is stated in the returns as 217,921 , of which 118,088 are persoas of color. The latter conslst of Hottentots (so called) Malayy, Negroes, aud Kafira. The white population is chiefly composed of colonial Dutch and British.

The aborigines of the conary had originally the generio name of Quaeques, and received the name of Hottentote from the Dutch. Owing to intermarriages with Malaye, negroes, and others, and illicit intercourse with whites, tho race has lost much of its distinctive character. Indeed, a pure Hottentot is scarcely to be found in the colony, although the poople, in whom the blood of that race proponderatee, are still known by that name. There is no return of their number, but we do not think it can exceed 25,000 . The Maluys were introduced by the Dutch as slaves; their descendants still retain the Mohammedan reilg-
fon, and most of the distinctive habits and oustoms of their race. We have no means of ascertaining their number, but it can not be large. They reside for the most part in the Cape divislon. The negroea are montly from the eastern coasts of Africa. The Kafirs residing within the colony aro chiefly composed of the section of them called Fingoes, who originally came from Natal and its vicinity, whence they were driven by Chaka, king of the Zulus, and took refuge with Kafirs on the frontier of the Cape colony, by whom they were reduced to serfdom, from which they were liberated by Sir Benjamin D'Urban, and have, up to this time, remained faithful allies of the Britiah. Their number may be about 25,000 .
The exact proportion which the white population of Dutch descent bears to the Britioh is not known ; bnt there is no donbt that it still greatily preponderatos. We have called the people Dutch for sake of convenience, as they speak that language, but many of them sre descended from Europeans of other countries-a oonsiderable number' from the Frunch refugees. The latter have lost the language, but still retain the namea of their forefathere, such as Du Pleasis, De Villiers, Marais, and :others. The British and their descendants require no special remark.

Traule.-The following table, giving the amount of imports and exports in eeveral years, taken at intervals, exhibits the progress of the commerce of the colony:

| Years. | Imports. | Exports. | stipplog. |
| :---: | :---: | :---: | :---: |
| 1886 | £541,038 | ¢882,230 | ${ }_{184}^{\text {Tonst }}$ |
| 1840 | 782,494, | 775,000 | 184,442 |
| 1849. | 944,585 | 594,940 | 204,049 |
| 1880. | 1,277,101 | 687,2092 | 224,126 |
| 1858 | 1,651,697 | 1,049,884 | 823,884 |

These exports do not entirely consist of colonial produce, but partly of goods re-exported. The value of colonlal produce alone exported during 1853 was $\boldsymbol{£ 7 3 2 , 2 4 5}$, of which $£ 297,346$ was from Cape Town, and $£ 435,899$ from Port Elizabeth. The amount of tonnage, however, of vessela entering Table Bay is much grester than that entering Port Elizabeth, on account of the larger number of Indiamen and other vessels calling at the former for provisions; but the actual trade of the latter is much greater, as shown by the exports.

The following is a table of the chief articles of colonial produce and manufactures exported during 1853, from Cape Town and Port Elizabeth reapectively:

|  | $\left\lvert\, \begin{aligned} & \mathbf{P}, \mathbf{E N I L I L}_{2}^{2} \\ & \text { abeth. } \end{aligned}\right.$ | $\begin{aligned} & \text { Cape } \\ & \text { Town. } \\ & \hline \end{aligned}$ |  | Port | Cnpe |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Aloes. | 11,280 | \$1,546 | Hides. | ¢9,180 | £7,804 |
| Argol........... |  | 1,161 | Horns.......... | 1,022 | 1,988 |

| Flour |  | 29,788 | splirts, brandy |  | 8,85 |
| Onta... |  | 18,709 | Tallow ....... | 1,887 |  |
| Wenthers | 1,519 | 8,800 | Wlae,Conatan |  |  |
| Flsh (enrod). | ${ }^{1} 898$ | 9,976 | Ordiasry |  | 26,799 |
| Fruits (dried). |  | 20,274 | W001 ... | 890,687 | 110,498 |

The most important export le wool, and the foilowing table shows the progress of the export of this article:

| 1888. | Port Ellzaheth. 89,758 lbe. | Cape Town. 78.824 lbs |
| :---: | :---: | :---: |
| 1849. | 1,220,830 | 684,877 |
| 1353. | 8,160,916 | 1,708,002 |

There were imported into London from the Cape territorles 22,700 bales of wool in 1853; 22,602 in 1854 ; and 28,087 in 1855.

By the summary of an official table in the Cape Govermment Gazetto, the custon-house returns of groods
imported for the first aix monthe of 1854 and 1855 give the following results：For the first six months of 1854，goods irpported，$£ 879,788$ ；for the same monthe of 1855，£622，218，making for those 12 monthe，£1，－ 602，006．Goode entered for consumption for the first eix monthe of 1854， $\mathbf{x 8 2 7 , 7 0 2 \text { ；for the same months of }}$ $1855, £ 643,485-$ for thoes 12 monthe，$£ 1,471,187$ ．The exports of articles the prodace of the colony for the first eix monthe of 1854 were valued at $£ 315,579$ ；for the eame monthe of 1855，at $£ 440,816$－for those 12 months， $\mathbf{E} 756,395$ ．The excess of importa for con－ aumption over the estimated value of colonial produce exported during the 12 monthe referred to is thus shown to be $£ 714,792$ ．
In these returns we have the amount of custome dutlee collected only for the first six monthe of 1855. They amounted to $£ 31,770$ for the first quarter ；and to $£ 35,106$ for the eecond；total for alx months，$£ 68$ ，－ 878．The two chief articles of export are wool and wine．On both，the increase has been very great． The wool exported during the first aix months of 1854 was valued at $£ 221,865$ ．In the same monthe in 1855，at $£ 297,885$ ．The wine for the eame months re－ spectively was valued at $£ 13,425$ and $£ 33,169$ ．WIne was once the etaple export，emounting in seven years to between $£ 80,000$ and $£ 100,000$ ．The quantity pro－ daced ls supposed to be as great as ever it was，but it has found a more profitable market within the colony．

Port Rrgulations，Duties，etc．－－Fintrance or clearance of a vessei， 1144 ；lundlug or shipping cargo of s vessel， 8360 ；clearance of a coaster，$£ 036$ ；manifest of export cargo，\＆ 36 ；permit to laud or silp met．
chandise nnder valne of $886, \$ 018$; above \$36, 036. A wharfsge duty is also charged on all goods, wares, or $n$, rchandise landed.
An export duty is charged on all staples shipped from any of the ports of the Cape; but the exporter of any qusntity of good Cape wine shall be entitled to enter, duty free, one gallon imperisl measnre of spirits of the strength of Skye's hydrometer, in respect of every ten gallons imperial messare of wine ao exported. For the accommodation of shipping, tankboats are slways in readiness with force-pumps and hose, carrying from 20 to 40 tons of water. A protective duty in favor of British produce and manufactures exists at the Cape porte ; and the ad valorem of 12 per cent. on all goods to which no specific duty is assigned, is reduced to 5 per cent. In favor of Great Britain.-Com. Digest U.S. See Cape or Good Hope.

Goodwin Sands, a range of sand-banks lying about four or five miles off the east coast of Kent, between the North and Sonth Forelands. They are about ten miles in length from north to south, and vary in breadth from one and a half to three miles. They are divided into two portions by a narrow chnnnel, navigable by small boats. They are in many places dry at low water, and from their shifting and loose nature are very dangerous for shipping. Beteen them and the mainland is the roadstead termed the Downs. These sands are said to have at one time formed part of the Kentish land, and to have been submerged sbout the end of the reign of William Rufus, or the beginning of that of Ifenry I. Sevoral lightvessels are fixed hero as beacons; and during foggy weather gongs are sounded every ten minutes.

Gonaives, s sea-port of linyti. There entered this port in 1849 and 1850,182 vessels, measuring in the aggregate 29,801 tons; and there cleared 187, with an aggregate of 30,196 tons. The former prosperity of this port resulted from the immense quantitities of ehinisterre (cabinet-maker's wood) and dyewoods, which accumalated at the mouth of the Artibonite from every point of its course, prior to the independence of Dominica; but such is the change that has taken place, that, to-dsy, it exhibits scarcely the shadow of its former commerce. Its exports, with their average quantities and valuce, are classified as follows:

Formerly large quantities of wax, pitre, and cocoa, were exported from Gonaives; but this trade has of late yeurs greatly declined. The exports at present consist of ccreals and coffice, not oniy from the neighhoring communes, but from the whole arrondissement of St. Mare, which is a closed port. Tise coffeo of this port is of the very best quality, and commands the highest price. Ifence it is, that vessels which can not make up their cargoes of coffee at Port-au-Prince, tonch nt this port for such quantities as they can obtain. The imports in 1850 reached a value of about $8,000,000$ francs. Of this, the United States supilied provisions, lumber, and cotton goods to n value of neariy $1,500,000$ frines ( 8279,000 ), or one half of the whole. England, France, and the German States figure chicfiy in the other half-the trade of the two latter seeming rather on the declinc. There are at Gonaives 2.1 foreign merchunts; and of the commercinl houses, nine are French and four Engligh, while but one is American. The following summary of the trade between the United States and the port of Gonaives during the first six months of 1855 is mude up from officind retarns: Number of vessels (American) entered and cleared, 00, with an aggregate of 4,317 tons. Value of cargoes inward, not given in official returns; value of eargnes
ontward, $\$ 2,038,429$ 95, Haytien currency-aboat 18 Haytien dollars being equal to 1 American. Cargoes inward consisted of provisions and lumber. Several vessels touched at the port, isden in part, to complete cargoes. Outward cargoes consisted of coffee, mahogany, and logwood.

Gordonia. (Gordonia Lasianthus), A tree known in France as Gordonia d feuilles glabres, in Germany as Iangstielige Gordonie, and in the United States as Loblolly Bay. The Gordonis Lasianthus, in its native conntry, is a beautiful aub-evergreen tree, growing to the height of 50 or 00 feet, with a diameter of 18 or 20 inches. This tree appesrs to be confined to the maritime parts of the United Statea, from Virginis to lower Louisiann. According to Michaux, tracts of 50 or 100 acres are met with in the pine-barrens, which, being ${ }^{1}$ ower than the adjacent ground, are kept constantly moist by the waters collected in them after great rains. These apote are entirely covered with this species, and are called bay-sicamps.

The wood of the Gordonia Lasianthes is extremely light, a cubic foot of which, when dry, does not weigh more than 20 pounds. In trunks of these trees which exceed more than 15 inches in diameter, four fifthis of the wood is heart ; it is of a rosy, or mahogany hue, and of a fine silky texture, which render it very proper for the inside of furniture, though the cypress is generally preferred. When seasoned it is exceedingly brittle, and rapidly decays when exposed to the alternations of moisture and dryness. The bark may be taken off this tree during three montha of the yonr, which shows that the sap is in vigorous motion e much longer period than it 's in most other trees. The value of the bark in tannin ${ }_{k}$, compensates, in some measure, for the uselessness of the wood, for which purpose it has been employed in times past, throughout the maritime ports of the southern States and Florida. A1though this branch of industry wss never so extensively practiced in the southern as in the northern parts of the United States-the regions where this tree abounds do not afford a sufficient quantity of bark proper for tanning, to supply the wants of the inhabitants. IIence, nearly all the leather and articles manufuctured therefrom, consumed in the southern States, are carried from the north. A bark suitable for the purpose of tanning, is more valusble in the United States than ut first sight might be snpposed. Although there are a great variety of oaks, and many of the species profusely multiplied, yet there are but a very fow of them that are sufficiently rich in tannin to he worth using.-Broune's Trees of A merica.

Gosport, a fortified sea-port and market town of England, county of IIsnts, on the western side of Portsmouth harbor, neur its month, directly opposite and sbout a mile from Portamouth, with which it $i_{3}$ connected by a floating bridgo moved by a steamengine working on two fixed chsins. It forms no part of the borougit of Portsmouth, but is governed by trustees under an old act of Parliament. It is fortified on the land side by a line of bastions extending from Weovil to Alverstoke, and laving the appearance of being a segment of the fortificstions of Portsmouth. Witbin the fortifications is the Royal St. Clurence Victualing-yard, with brewery, cooperage, powder-magazines, biscuit-baking estnblisliment, nnd store-houses for various kinds of provisions for the royal navy. To tho south is the magnificent IIaslar Naval Hospital, capable of containing 2000 patients. Gosport has also an extensive establishment for the manufucture of anchors and chain cables. It communieates with Lanion by the South-western Rniliwny. The coasting-trade is considerable. Population (1851) 7,414.

Gossamer, a fine, filmy substance, like a cobweb, observed floating in the air, especially in autumn. It is often seen in stubble-flelds, and upon furze amd other low bushes, and ls probably produced by a specios of spider.

Gothe Canal. The fullowing Information rstative to the Gotha Cenal lo extracted from Macernaon'u Comnercial Tariffa and Regulatione of Nomeay and Swedew:-"The inlets, Lakea, and rivert of Sweden heve always afforded great facillities for the tranaportation of the produce of her foresta and mines, A canal, to avoid the long and tortious navigation of the Sonnd and Sound dues, was projected at an early period. by Sweden, . ' The Maaler, a deep Inlet, enters Sweden at Stockholm from the Bultic, and branchee north to Upsala, and weat $\mathbf{7 0}$ miles among a multitude of islands, to within a few milen of the lake Ilielmar. The Ar boga Canal, opened during the latter end of the last century, la navigable between the Masler and that lake| and it was then considered that it might be continued from the Hielmar to the Wettern Lake, but the project was found inpructicable; the distance between the Macler and Sodree Barker, near the confines of Dalecarlia and the mining districta, was opened at the same jeriol by means of the Stroemsholm Canal and the Lake Fredra, and rivers. The Goths River, which runs from Lake Wezern (s) largest in Europe except the I andoga) into the sea of Gothenburg, though in many parts deep and navigable, was interrupted by falls and islands. These were finally surmounterl, after extraordinary diffieulties (the whole of the gigautic works having been once swept off by the impetuosity of the water), by the execution of the Trollhatta Canal In 1800. It is three miles long, and has eight sluices to ascend and desceud 112 feet. At one place it was cut 70 feet deep through the rocks. The whole expense was about $\mathbf{8 8 0 , 0 0 0}$. The Lake Weneru was afterwand joined hy a canal to the Lake Wettern, and finally the canslization of the whole distance to Soderkoping and the Batic was completed in 1832."

Riegulations for Ships passing through the Gotha Cumal. --Sec. 1. Ships and cargoee from all countries, and coming from or golng to whatever place or places, are permitted, without ohstruction, in pase through the canal, unlese the nation or nations to which the ships or cargoes belong are known to be in open bontility with Sweden; and the canal transit dues, both on veswels and cargues, shall be equal for all nations. 2. The canal dues on all shipping are to be paid according to their tonnage, making no difference whatever whether luden or empty. 3. The canal lues on vessels are to be pail at the rate of 12 skillings Swedinh banco per last, equivalent to 10 skillings Swedish banco per commercial lant of 2 linglish tons. In this charge is not included pilotage on the lakes, nor payment for the trailiug lyy oxen or horses on the Gotha Canal, which charges are opecially fixed lig the directors.
4. In calculating the tonnage of vessels paasing through the canal, and also the quantity of merchandise, it is to he observed, with regarl to the first naured, that such vessele as are provided with Swedish measure-hills will pay the dues accorling to the burden stated in raid bille; but such as are without, will le charged pursuant to a table reduced, conformably to usual practice, from the forcign laste, tons, otc. to Swealish lasts; and, further, as relates to goods, that the weights and measures stated in the tariff of pounds, ship-poands, barrels, etc., are meant Swedish pounds, and ship-pounh comnaercial or vietuals' weight (excepting iron, and other metals, by which are meant Swedish atople welghts), and Swedish barrela containing 32 kappes molid measure ; and further, that such forelgn pounds, ship-pounde, barrels, last.s, ote., as may be inserted into iten hills of lading and sbip" pupers, are to be reduced to S wedinh weighte and measures, in conformity to a fixed table to be nuede out for that purpone. 6. With regeas: to tare, or the welght of the case or outer covering, no chargo will be made. The canal daes are to be pail, accordiug to the tariff, only on the quantity in welght or measure as inerrted in the bill
of lading or shlp's papers, whether apecified in groam or net. A barrel of grain, salt, etc., shipped in bulk, or barrels or bagn, are charged alike $\{$ plpe-clay, coala, ete., in bulk or packed in caske, the same $\mid$ as also winea and other liquids, whether in larger or amaller canks 1 and only in such cases where the last-named are in bottles, then the additional duty must be paid for tho bottlea, accoriling to the tariff, the same ain if they were ahipped empty, for themselvea.
6. If any veasel, entered st the inward customhouses at Gothenlurg or Sollerkoping, only to pase through the canal from sea to sea, should discharge any part of her cargo without the most pressing necessity; either In tha River Gotha-Elf, or any of the lakes, or on the canal, such vessel to be forfeited, and the maater aubjected to the penalty of the law for the unlawful importation of goods; and further, to be fined, accorlling to the clrcumatances, In the sam of 100 rixdalera to 500 rixdalers bunco. The mame law will le put into executio against all vessels receiving other cargoes or more gools on board, during the passage to and from one or other of the ports of Gothenhurg and Soderkeping. Ships' huebands, or owners of goods, convictel of knowlag, abetting, and aldiog in the illegal loading or nnlouding of goods, as aforesaid, will he suljected to the same penalties. The value of the confiscated vessel, which shall be determined by sale by publio auction, will be responsible for the full phyment of all tlues which the vessel and cargo would huve been suhjected to, accorling to the tariff, for the whole pasagge from sea to sea $;$ and the aurplus of the proceeds then remaining to be divided, two tifths in equal shares to the informer and those who prove the Illegnl fact, and three fifths to the canal pension fund and the board of customs, also in equal shares.

There are other regulations, exemptions, and privileges applicalile to tessels passing through the Gotha Canal, between the Baltic and the North Sea, which, as they are glven in full in the "Digeat of the Existing Commercial Regulotions of Foreign Countries," trusmitted to Congreso from the Treasury Department in 1833, and hava been modifed hut alightly, if at all, since, are not inserted in this volumg. They may the found in that work, under the caption "Sweden."

The whole length of this canul is thus estimated:

Tegether. ...................... 837
Cottenburg, or, more properly, Gothaborg, on the south-west coast of Sweden, at the head of a fiord near the $C$, egat, which receives the Rivor Gotha, lat. $57^{\circ} 42^{\prime} 4^{\prime \prime} \mathrm{N} .$, long. $11^{\circ} 57^{\prime} 46^{\prime \prime}$ E. Population 39,000, and increasing. Vessels do not come clase to the eity, but lis in the rivor or hartor, at a elurt distance from the shore, goonls being conveyed from and to them liy lightera that navigate the canals by which the lower part of the town is intersected. The depth of water in the port is 17 feet, and there is no tide, bar, or shallow. A vessel entering the Götha must take a pilot on board, whose duty it is to meet her half a leugue west of Wingo beacon. After Stockholu, Gottenburg has the most oxtensive commerce of any tow $n$ in Sweden. Iron and steel, the former excellent, but the latter inferior to that madu in limgland, form the principal articles of export. They are brought from the rioh mines of Wermeland, distant alout 200 miles; being conveyed partly liy the lake Wenern

partis'by the Trollheetta Canal (see Canala), and partiy hy the River Gothe. The exporte of iron in 1847 amounted in all to 27,447 tone. The original cout of lron is ampposed to be increased about five per cent. by the expense of ite conveyance to Gottenburgi and the shippling charges, inclualve of the export duty, are about 10 per cent, additional. The next great article of export is timber, particularly dealn, which are also furnished by Wermland. Of these, the exporta in 1847 were 227,000 dozen, but this is abeve the average. The other articles of export are, linen, asil-cloth, tar, copper, alum, glass, cobalt, manganese, linseed, oak bark, bones, juniper-berries, eranberries, rock-mosa for dyeing, etc. Grain is somotimes imported, and sometimes exported. The principal articles of import are sugar, coffee, tobaceo, cotton yarn and twist, salt, Indigo, and dye-wooda, South Sea oll, rice, herriags, wine, splcea, ete. There belonged to the pert in 1847, exelusive of river craft, 126 vensels of the aggregate burien of 13,254 Swedish lasts, or aboat 30,000 English tons; and ship-building has siace been going on briskly. The opening of the Gotha Canal, by whioh Gottenburg comn. ieaten with a large portion of the interior of Sweden, has exercised a powerful and beneficial influence over hor commerce. She carriss on an extensive trade with England, and English is genorally understood. Stpraners run once a week between Gottenburg and Hnil for eight months of the year ; but in winter the finte"-ourse with Eingland is kept up by the tedious route of Lubec and Hainburg. The openiag of the Gotha Canal has greatly beaetited its commerce, by bringing it into conmunication with a large portion of the interior of Sweden. In 1849, 718 vesvels entered, nad 1402 cleared in the coasting trode; and 1018 vessels entered and 1011 left for forelign ports, exelusive of steamers, of which the number that entered and cleared out at the port were 88. Soe Gotir. Canal.

Herring Fishery,_Gottenburg used, at no distant period, to be one of the princlpal seats of the herring fishery ; but at preseat this branch of industry is quite oxtinct, snd it has always been very capricious. From 1556 to 1088 grest quantities of horrings were taken; from 1588 to 1660 , they left the coast; during the next 15 years they were again abundaat; but from 1675 to 1747 they entirely disappeared. From 1747 to 1770 they were abundant, 186,614 barrels being taken in 1763, and 101,483 in 1768 . From 1786 to 1799 the fisbery was very good, from 110,000 to 190 ,000 barrels beiag anuually exported. In 1804 the export was 79,512 barrels. In 1808 and 1809 fish were very scarce; and in 1812 they ontirely disappearet, and have not hitherto returned; so that Gottenburg, instead of exporting, at present lmports considerable supplies of herrings.
lioth iron and timber pay clutios on exportation, but they are not heavy.

Custom-house Hegulations and Port Chargra,--On arriving in port, no person is allowed to board or to leave a vessel till she the in custody of tho oflicers; who, having laspected the manifest and papers, send them to the custom-house. An officer is appointed to superintend the unloading, and also the loading. The public charges of all sorts on a Swedish ehip and on a foreign ship not privileged, each of 300 tons' burden, unloaring and loading mixed cargoes at Gottenburg, would be, on the former, $\mathcal{C} 24 \mathrm{bs}$. $\mathbf{7 d}$.; on the latter, £49 be. 7d. On a privileged foreign ship the charges are the anme as on a Swedish ship.

Warchousing System.-Goods inay be bonded for any length of time, on puying one half per cent. ad valorem for the tirst two years, and one haif per cent. nnnually thereafter.

Commission, Credit, etc.-The nsual rate of commission is 2 por cent. Goods are commonly sold on credit. Kaw rugar at 9 months' with 8 months' interost to the solior. Other goods at 3,4 , and 6 months.

Das "ing, eto-There are no publico or privato baakJag esuablishments at Gottenburg for the issue of notes I but the national bank bas two offices. here which advance limited sums of money, at five per ceat., on seeurity of goods, and in discount of bilis. Some of the kinglish lasurance companies have agente here, who do a goud deal of husiness.

Sea Stores, Water, etc.-These may be had here of excellent quallity, and cheap. Beef, $1 \frac{1}{1} d$. per lb., best rye bread, 2 fd , per lb ., and butter, 6 d per Ib .
Money, Weights, Measures, eto., bune aa at Stockhelm, which see.
In eomplling this article, we bave made use of Consulur Returne, Coxe's Travels in the North of Europe, vol. iv., pp. 267-275, and aome valaable private communications.

Grace, Daya of, in commercial law are certain daye allowed by the custom of merchants to bo added to the time requisite for presentment of a bill. Thus, If an instrument drawn in this country be payable "a certain time after date," three days of grace are added: a blil drawn on the 27th of August, payable "two monthe aftor date," is therefore due on the 30th of October. So if a forelgn bill be drawn at one, two, or more " usances," the days of grace are added to the usance. The usance between Loadon and Paris is one calendar month. A bill drawn in Loadon on Paris "at ons usance," on the 2d January, is consequently due on the 5 th February. The number of days of grace variea in different countries. In France none are ullowed. See Days of Grace.

Grain, the name of the smallest weight in common use It ls the 24th part of a pennywaight troy, and the 20th part of che scruple in apothecariea' welght

Grain Markets. There were receivel at Baltimore during the past year (1856) 3,440,000 bushels of wheat, $4,081,000$ bushels of corn, 847,800 bushels of oats, 228,200 bushels of rye. 025,000 harrels of thour wero received.
At Buffalo, N. Y., the receipts of flour were 1,143,085 barrels ; of wheat, $8,843,117$ bushels, and of corn, 9,845,790 bushels.

At Oswego, N, Y., 114,143 barrels of flour, $8,437,027$ bushels wheat, $3,548,521$ bushals of com.

At Chicsgo the receipts of grain of all kinds were $24,000,000$ bushels, and the shipments about $20,000,000$ bushels.

We give below a table showing the c nparative inportance of tho princlpal dépôts of the world; from which it will be seen that Chieago and Buffalo rank nearly equal, allowing for the increase of one year in the former place. Enough is shown to make evident the greater importance of some of our new prairie cities over the old established grain dépóte of Europe. Chicago, in 1828, was deacribed by Major Long, in his "Expedition to St. Peters," as n " villige presonting no choering prospect," and ons not promising unch in commercial importance.

Grains of Paradise, bot, acrid, aromatic seeds, produced on the coast of Guinea, and supposed to be derived from two distinct species of plants, viz., the Amomum Grana-paradisi of Linnens, and tho A. Meleguetta of Roscoe ; porhaps, also, froln others. Thoy
are of a gloses dark-bresm color, are longer and rounder than the aeeds of the true cardamom, and have a allght flavor of camphor. Thene needn are much esteemed as a aplce among the APrieana, but are chlefly employed to give a fletitious ítrength to beer and aplrits. Ancien's Eioonomic Rotany.

Cranada, a town of Central America, State of Nlearagua, on the north-weat lank of the Lake of Nlearagua. By mesns of the Lake and the Klver San Juan, it communleater with the Carlbisean Ses, and thus carries on a conslderable trade. Population about 12,000 .

Granary, a hullding to store corn in. Granarica are generally bullt of brick, with quarters of timber wrought In the inalde, to which the boarde, with which the Inalde of the granary inast be lined, or nalled so close to the bricks that there may be no apace left for vermin to harbor in. There in an udvantage in having many atories, because the shallower the corn lies the letter and more earily it ls turned.

The two great requisites in the erecting of granariea are-to make them auficiently atrong, and to give them an exposure to the mont drying winds. In many parts of Fingland, particularly in Kent, cern is trented In the following manner: To separate it from duat and other impurties after it is threshed, it ls tossenl with ahovels from one and to the other of a foug and large room; the lighter substances fall down in the middle of the room, and the corn only in carried from side to side, or from end to end of it. After thls, the corn is acreened; and heing then brought into the granary, It is apread about haif a foot thiek, and turned from time to time, about twice a week; the sercening of it Is also repested once week. Thin nort of management is continued atrout two months, after whieh it is lald in foot thiek for two monthe more ; and during this tlme it is turned once a week, or twlee if the season the damp, and now and then acreened. After abont five or alx monthe, it is risired to two feet thickneas in the heapa, and then turned once or twice in a month, and sereened from thme time. After syear, it is laid two and a half or three feet deep, and turned once In three weeks or a month, and screened proportionally. When It has Jain two years or more, It is turned once In two months, und sereened once a quarter; and however long it the kept, the oftener the turning and sereening are repeated the better will the grain be preserved. It is proper to leave an area of a yard wide on every shle of the heap of corn, and other enpity apaces Into which the corn may be turned and tonsed as often an required. In Kent, two aquare holes are mule ut each end of the floor, and a round one in the middle, by means of whieh the cors is thrown ont of the upper lnto the lower rooms, and no upagain, that it may be the better turned and alred. The sereens are mule with two partitions, to separate the luat from the corn, which falls into a log; and when aufficiently full, this is thruwn away, while the pure antl gool corn remains lehind. Corn has by these means been kept 30 years; noll it has been observed, that the louger it is kept the more flour it yields, In proportion to the com, and the purer and whiter the bread $1 s$, the superfluous humbIty ulone evaporating in the keeping. At Zurich, in Swhzerland, corn has treen kept 80 years, or longer, by methods of sianilar descrijtion.

The jublic granaries at Dantzie are seven, elght, or nine torien in helght, and have s funuel in the mhlst of each floor, to let dewn the corn from one to another. They are buitt so securely, that though evory way surrounded by water, the corn contracts no demp, and the veasels have the convenience of coming up to the walls to he loaded. The linasians and others prenerve their corn In bubterranean granarion of the figure of a augar-loaf, wide below and narrow at tol, the sldes being well plastered, and the top covered with stones. They are careful to have the corn well dried before it is Lald Into these store-housex, and often dry it by means
of ovena, eapeclally where the aunim dry weather is too ahort to effeet thla anficiently. 'fhis method of atoring arsin has been practiced in many countries from remote antiquity ; and In Slelly, in particular, at the present day, many of the granaries are simply exeavatlons In the caleareous rock.

Some recommend that the roofs of granarios should be composed of tiles, lrecause in the worst neasons, when the regular apertures can not be opened with eafety, there will olway loe a conslderalile inlet for freah air at their jolnings, and also an lanue for the exhalations given out by the grain; whlle others prefer a very close roof, as of lead or ainc, for the perfect excluslon of Insects and vermin. If there happen to be any windowa to the aouth, care must be taken to shut them In molat weather, and in the time of the hot southern winds. There mast be no cellar or othar damp place under a granary, nor ahould it ever be built over stables; for In elther of these casen the corn will certsinly suffer by the oxhalatlons-be rendered ilamp in the one, and II-tasted in the other.
M. Duhamel and 1)r. Hatlea have recommended varionn contrivances for ventilsting or hlowing fresh alr through com laid up In granaries or shipe, In ordar to preserve it sweet and dry, and to prevent its being attaeked liy weevils or other Inseets. Thls may be done by nnilling wooden bars or laths on the floor of the granary, about an Inch diatant from each other, when they are covered wlth halr-cloth only; or at the dintance of two or three inches, when cosme wlre-work, or basket-work of owlers, Is laid under the hair-cloth, or when an Iron plate full of holen le lald upon them. Theae laths may leo laid across other laths, nalled at the diatance of 15 hichen, and two or more Inches deep, that there may be a free passage for tha alr under them. The under lutha munt come alout six laches short of the wull of the granary at one end, on which a boadd Is to be ret edgewlse, sloping agalnat the wall ; for by thin dinponition a large alr-plpe is formed, whlch havIng an open communication with all the intersticea between nud under the barn, will admit the pasaage of alr below forcilily through $s$ hole at the extremity, and consequently carry of the molst exhsiatlons of the corn. The ventllators for supplying fresh air may he flxed against the wall, on the Innide or outaide of the granary, or under the floor, or In the ceiling; but wheraver they are fixed, the hanile of the lever that worke them must be out of the gransry, otherwise the person who works them would be in danger of suffocation when the corn is funigated with burning brinatone, an in nometimes done for destroylng weevile. Small movable ventilntors will answer the purpose for ventilating corn in large tins in granarlea, and may casily to moved from one bin to another. If the Lranury or corn-shlp le very long, the main sir-pipe may pass lengthwise along the middle of it, and convey air on both sides under the corn. In large granaries, deuble ventilators, Jaid upon each other, may be thed at the middle, and near the top of the granary, that they may be worked by a windmill fixed on the roof of the bullding, or by water-mill. The air in conveyed from the ventilators throngh a large trunk or trunks, renching down through the several doors to the bottem of the granary, with branching trunks to each floor, ly means of which it may be made to pass Into a large trunk along the adjoining cross-walls; and from thene trunks severul lesser trunks, about four Inches wide, branch off at the dintance of three or four feet from one unother, and reach through the whole length of the granary, thelr further ends belng clored. Seatis of one tenth or one twelfth of an inch should slwo the left open at the four joininge of the hoard, where they are nailed together, that the alr may pass through them into the corn. In sono of these lesser trunks there may bo alliling ahutters, to wtep the passage of the air through those trunks which are not covered with Iron, or to ventilato one jart of the gran-
ary more hriskly than othara, is there may be orcaalon. There should also be wooden' shatters, hung on hinges at their upper part, ro as to shut eloee of themaelven; and these ahould be fixed to openinge in the walls of the granary on their outside; by which meana they will readlly open to give a free pasaage for the ventliating air, which ascends through the corn, but will instantly shut when the ventllation ceasea, and therehy prevent the admlsaion of damp from the external air. The ventilation ahould be unde onily in the muldile of dry days, unless the corn, when first put in, be cold and damp.

Gianite, a compound rock, constituting the loweat of the geological formations, according to older geologiata; but it has lately been found resting even on secundary fornsations in the Aips. It (easentially) censlata of quartz, feldspar, and miea. Its great durability as a masterial for luilding la attested by many of the ancient Egyptian monumenta, in which the atone exhibita no appearance of decay even after a lapse of 3000 years. There are aome granites, however, which shake and crumble down in a very few yeara, particularly those in which feldspar predominates. This rook becomes refractory to work after it has been some time quarried; and it is usual to keep it for some time under water before it is wrouglit into ornamental objects.

Granulation of metals, an operation aimply performed by alowly pouring the melted mass through an iron cullender into water, which is kept in agitation by means of a bundle of twigs. By this method metals may be reduced to minute grains.

Granville, the ancient Grannonum, a fortified seuport town of France, department of La Manche, at the foot of a steep, rocky promontory projecting into the English Channel, 80 miles south-west of St. Li. It is surrounded by atrong wulls, and the streets are narrow und steep. The only renurkable building is the pariah church, a venerable Gothic edifice. The harhor is spaciuus and secure, but dry it low water. Works, however, are now in progress for the improvement of the harbor generally, and for the construction of wet donks. The Inhabitants are chiefly engaged in the coasting trade, or in the cod end oyster fisheriea. Shipbuiding is also carried on. It has a tribunal of commerce, is hospital, public baths, and a naval sehool. Granville was bombarded and burned by the English in 1695 , and partiy destroyed by the Vendean troops in 1793. Population, 834.

Grape-shot, in Artillery, consists of a quantity of shat piled round an iron spike which is placed in a strong canvas bug, the whole being firmly cord Itogether so as to form a cylinder adapted to the culibre of the cannon. It differs from canister or case-shot in that the iatter kind is composed of bails packed into a tin canister with a woolen lottom.

Grapes (Ger, Trunben; Fr. Raisins; It. Grappoli, Grappi; Sp. Ubas, Racimos ; Iat. Uree), n well-known fruit produced from the vine. France, Spain, Portugall, and Italy, as well as some parts of Germany and Ifungary, produce grapes which yield wines of various qualities and thaver, many of them excellent. We import green grapea from Lision, and other parts of Portugal, Malaga, etc. They are bronght packed in jurs, and secured from damage by means of suwlust, plentifully strewed between the layers of fruit. The grapes grown in Great Britain in the upen air are much smaller, and by no meuns so fuscivus, as these of forelgn countries; but these ruised in hot-liouses are quite equal, if not superior, to the latter. Grapes are imported not only in their natural state, but dried and preserved, in which latter state they are denominated reising. [Sice llaisins.] 'ihe most valuable grupes grown in the United States are from the Cutawba and Isabella vines, which are natives of Anerica. These grapes are of a purple color, und have as luscious a taste as the best grapes of Europe. A amuller grape also abounds, culled the fox grape, which, although
not as pleasant to the taste, is very much used in a dried atate, and is also premerved in large quantitioa. See Wine.

Graphite ( $\gamma \rho a ́ \phi \omega$, I write), oihervise called plumbago, and often impwoperly black lead, is a mineral carbon with a alight admixture of lron. It may be made artificially hy exposing iron with. excess of carion to a violent heat for a considerable length of time, when a real carburet of lron will be formed; whereas in the native apecimens the iron and charcoal are only mochanically combined. The tineat graphite occurs at Borrodale In Cumberiand, and is appropriated exclualvely to the manufacture of penclis. The coarser varietles are used for making cruclblea and portalile furnaces, for which purposes thls suhatance ls peculiarly fitted from ita infuslbility; avd it is aleo much used for giving a gloss to tho surface of cast-iron goods, as well as to diminlah friction between rubhing surfaces of metal or wood in machinery.

Grapnel, or Grapling, a kind of amall anchor with fuur or five flukes or claws, chlefly used to secure small boats.

Grass Cloth. The folloring er ract from the Roport of Mr. Nathaniel Wilson, e' ter of the Iletanical Gardens at Hath, in Jumaica, G. scribes the auccessful introduction into that island of the Chins grassecloth plant (the Rhee of Assam), and the propriety of tursing to profitable account their numerous indigenous fibrous-ylelding plants, which are at present quite neglected: "I have now the happiness of recording my entire success in the cultivation of the Cibina grasscloth plant (Boehmeria nivet), introduced in 1854, and a more valuable introduction could not have been made. I find the plant thrives here with a luxuriance equal to any of our native plants, and probably with more vigor than it does in ita native elime. This plant (as is now well known), produces che best filire for textile purpeses witn which we are acquainted, and, according to nndonbted anthority, is worth in the London market from $£ 80$ to $\mathbf{£ 1 2 0}$ per ton; which is surely sufficient to render the plant worthy of all the attention we can beatow on it, if new staples for general and profitable caltivation be desirable. I have no hesitation in saying, that, by its spontancous and luxuriant growth, a more desirable and appropriate plunt for tropical culture has never before been submitted to the notice of the public. I have 36 of these plants ready for distribution, and could, by a small expenditure, fincrease the number to any reasonable extent.

Gravesend, a municipal borough, river-port, town, and parish of England, county of Kent, on the right bunk of the Thumes, 20 miles E.S.E. of Iondon. Area of borough, Including Milton parish, 1541 acres. Population of Gravesend and Mititon, 16,633. The older part of the town, near the river, has narrow streets, the upper town is more open, and has many tasteful rows of houses and detached villas; the sumnit of hilli, on which it is built, is crowned by prospecttowers, commanding views of the Thames, and is a favorite holiday resort. Former trade consisted in supplying ships with stores, vessels from London being obliged, intil lately, to clear out here. Its more recent, and still rapidly increasing prosperity dates from the establishment of steamboats, which run to London in two hours, and during summer, especially on Sundays, bring innmense crowds of visitors. Many also of the woulthier class of trailespeople reside here. A ruilroad, to unite with the London and Greenwich line, is in course of formation, and will unite with one which passes through a tunnel, upward of two miles in length, und connects the town with Rochester, distant about seven miles. There is a ferry across the 'Thames to Tilbury Fort. Murket, Wednesday and Naturday. The borough is a polling-place for West Kent. The town was burnt by the French in the time of liehard II. On its weat side ure the garden and suburb of Lioshervile.

Great Britain, the most consiferable of all the Enompenn islande', fs altantexl between 50 and bal dogrees of north latitude. It is bounded on the north hy the North Sen, on the enst by the German Ocein, on the anuth iy the English Channel, and on the weat by St. George'n Channel and the Atlantlo Ocean." From north to south It extends about 880 milies in length; ity greatent hreadth, from the North Forelanilin Kent, to the Land's End in' Cornwall,' is about 870 'mhes; and its asperfictal area is computed at 87,500 aquare miles. The figure of this island is trregular; somewhat resembling that of a wedge, to which fardeed it was compared thy the anclents, from its gradually narrowing towanl lis northern extrenity; and its whole Hine of coast is deeply Indented liy bays, creekn, and estuarles, whlch, not withrtandlug its boldneas 'sind raggedness in many parta, afford afe and commodious harhors. From its geographical position, therefore, no less than from its natural adivantages, this island seems to have been deatined by nature to beconte the seat of a great and powerful nation.
Its eastern coast forms a waving, contintous, and rarely-broken llne, but the western coast lis extremely irregular, nnd deeply Indented with many baye and arms of the sela, interspersed with numerous islands. The south-east part of Britain in a level, alluvial surface; the centre, undulating and hilly; the western and north-westem," mountalnoiss and irregular. In the north'and west, primary atrata and granito rocks prevail ; in the nifdde diatricts, coal, line, anlt, and Ironstone are ahundant; and these are ancceeded in England, on its enst and south-enst vallera,') hy oolite chalk and the newer geological formatlons. Amountain range, mere or less elevated, extenis from *outh to north of the tiland, maning through Cornwalt, Devonshire, Somersetahlre, and thence through Wales, varying in elevation from 1500 to 8500 feet. Another branch extends from the Cotswold hills, Gloncestershire, and runs through Derhyshire, Staffordshire, Yorkshire, Cumberland, Westmoreland, and Northnomberiand, with elevarions from 2000 to 8000 feet. Succeeding these are the Chaviots, the Lammermoors, and the great Gramplan range, which inteviect Sentland, and whose extreme altitudo is meanured by Ben Nevis on the weat, and Ben Maclhul on the northenat, looth attaining an elevation of upward of 4300 feet. The most considerathe rivere aro the Severn, Medway, Dee, Mersey, Clyde, na the weat comast, and the Thanes, Trent, Humiver, Tyne, Forth, Tay, and

Apey, on the enst conat. The primolpal lakes are those of Oumberinnd and Weatmorelaind in Englund, :and Locha Lomund, Tay; Maree, ete. in Scotland.:"The princlpal baye and entuaries are the Bristel Channel, Ganilgan Bay, Laneaater Bay, the Solway Firth, Mirth of Clyde on the weat, and the Thaniee mouth, the Waah, the Humber, the Firthe of Finth, Tay, Marray, and Cromarty on the east, while on the sonth there are Palmouth, Plymouth, Portsmoath, and other important haye and harbors.

The Britioh Ielands Inclade Ireland, the Isles of Wight, Anglesea, Man, the Scilly Iaiands, Bute, Arman, the "Hebrides; Orkney; and Shetland Islende. The elimate of Iritain is greasly modifiad by Its insuInr aftaation, the extremen both of summer and winter temperatare being wiuch less than that of correspondlug latitudes on a continental surface. The mean annual temperature le ehont $49^{\circ}$ Fahrenheit. The extreme nummer heat aeldom exceeds $80^{\circ}$. Fahr., and the winter cold, with rare exceptions, doen not extend beyoud $25^{\circ}$ to $32^{\circ}$. WThe annual fall of rain averages about 32 inches. Meat raln fulla on the weat slide of the island (from 88 to 40 Inchers), the east const being comparativaly dry ( 25 Inches), but a cold north-enat and eant wind prevalla more on the enat ecoast, while a warm west and wouth weent blows on the west ; from this reamon, foined to the nature of the abil and eleva. tion of the nurface, the enatern half of the infand is move an agricultural, whlle the went is move a graxing country. Though variable; the climate of Britain is found, in in taliles of longevitry, to the one of the mowt salubrious in the word, while the very geneml fultivation and dralnage of the have removed those malailies that originate in marsh effluvia. Within the last century the nverage longevity of the jopulution has teen greatly increased. In 1800 the average mortality in Fagland was 1 in 82, in 1847 i $\ln 45$. The area of Uritain in 90,088 square miles 1 inelading Ireland, the total area la 122,550 square milen, or $78,482,048$ neres. In 1710 the population of Eingland and Sootland amountell to $6,16,337$; in 1801 to 10,942,646; ir 1821 the population of the Inited
 $24,410,429$; in 1811, $27,019,658$; and In 1851, 27,675,324.

The following table shows the population of tirest Britain and Ireland, the area in statite acres and equare milen, also the number of acres to a permon, and the numbler of persons to each mquare mille:

The litith population is apread e - agreat mulritude of lelands which rise bet ween the Atlantic Ocean ard the North Sea, the large Islanit of Gerat Britain being the ehlef of the group. This Iuland is aurrounded thy the Inle of Man, Anglesea, the Rellly Iflauds, the Isle of Wight, the sutlaying Channel Iflands, the Shetland Inlamis, the Orkieys, and the Mebrides, 300 inlanda have leen nombered, liut InhabItants were only found on owe hundred and seecenty-fire islands in the day of the censun in 1wis. The Mritish Isles extend over 11 degrees of latitude an! 10 degrees of Iongituife: consemuently, In the mont aortherly of the Shetlanils, the night in the aummer molatice is three houns shorter than In lersey; and the sun rines and seta on the east coast of lingland 47 minutea before it risen and sets on the wext coast of Ireland.

In the esrilent period of our written listnry, theme Islands were peopled ly Celts ; Britaln wan their holy
[nland, and the seat of their schools und most sacred grover. The indes of Anglesea and Man, hoth knowa nuder the name of Munn to the Inmane, wero the meats of the I)ruldic hierarchy and worshlp. Luna, or Ieolmakil, a amall inhand in the lietridien, now emitain. Ing fiel Inhahistants, is celebirated as an early weat of Christianity. It wam the ati:tion of St. Coluuatha, who founded an orier of missinnaries them, and thus contributed to the diffusion of Christlanity over Hritain. The celebrated ruins on the intand consint of a catheIral, a nunnery, and St. Oran's ehapel, together with many anctivnt tomblom and crosses. This Ishand in often visited ly tourist a th the wentorn llighlanis, and is only 10 milles from the far-famed Staffi.
The population of the Ixland of fireat Mrituin in
 baliteanta; Anglesea, the noxt mont populout In the group, hall $6 \overline{6}, 318$ Inhabitants; Jersey, 57,020 ; the

Iole of Man, 52,844 ; the Isle of Wight, 80,324 ; Guernsey, 29,757; Lewla, 22,918; Skye, 21,528; Shetlind, 20,936; Orkney, 19,668; Inlay, 12,834; Bate, 9851 ; Mull, 7485 ; and Arran, 5857 ; 17 islands contained a population ranging from 4006 to 1061; 52 had a population ranging from 947 to 105 ; and the rumaining 92 Inhabited lelands ranged from a population of 92 downward, until at last we come to an isiand inhabited ty one solitary man.
Divisions,-The shlre is an importat sub-division of the kingdem; each has a lord-lieutenant, who is also keeper of the arohiven; a sheriff, an under-sheriff, and jastices of the pence, all appolnted by the crown; each shire hae aiso a county treasurer and a clerk of the peace, each appointed by the lord-lientenant; and a county coroner, elected ly the frechodlors. The revenue of the shires is chiefly derived from rates struck by the justines of the peace in connties at quarter sesslone, and la for the most part appriprinted in maintaining bisilges, lunatic asylums, jails, priaonera, and police. The terms "hundreds" and "tythings" had their origin in a syatem of numeration, but whether thoy represented persons, fumillies, or holdings, is difficult to deterninu. In process of time, what wis once a number hecame a name, und for a lorg period the terms have ceased to messure either arda or population, as is evidonced by the fact that the handreds in the sarvey after the Conquest, und the handrets atlll remaining, differ widely in both elements, and, thoreover, the present hondred is different in extent in the varlous counties; for instance, in Gioucestershire, tho hundred contains on an average 29.090 acres ; in Herefordshiro, 49,000 ; and in Shropshire, 63,000 . The hide was the lot or share of the first ettler.
The sessional divisions existing in all the counties of Englund and Wuies, for the purposes of special and petty sessions, are in genoral insed on tho hundreds and other ancient county sub-divisions. Tho justices have power to alter these divisions for the convenience o' holding sessions, but they have no anthority to alter the ancient huadreds. There are t60) semsional divisions in Eingland and Wales, and for the parpose of assize and jail delivery, eight circuits, bonide tho jurisdiction of the central criminal court. 1 Saxon burgh, or borough, was a hundred, or an ussemblage of handrells, sarrounded by a moat or wall. As ancient boroughs fell into decay, new onos spirung njp, and many tow us not formerly horoughs, have heen created boroughs for purpoaes not very intelligilide. The affairs of mumicipul boroughs are administered by a mayor, aidermen, and othar functionaries.
'The 196 reformed toroughs in Eughand and Wales co., tain a tutal pojulation of $4,355,269$ inhabitnntes; the popalution of $6: 1$ range under $5000 ; 43$ from 5000 to 10,000 ; Ge from $10,0(4)$ to 50,000 ; 14 from 50,000 to 100,000 , Ifrom 100,000 to 200,000 ; and 3 nheve $2(0), 000$. The rity of iondon la still unrefirmei, and therefore not inclidelel in tiese. Seothand cuntains 83 rayui and manfeipal hurghe, having a total iopulation of 752,377 inhalitants ; bis huve a popuintion under 5000 ; 11 from 5000 to 10,000 ; 11 from 10,000 to 70,010; null 1, 148,000.
The suinor sulbdivisions of townshiph, parishen, and manurs, were re-distrihuted hy Williun the Comqueror, after the hattle of Hastings, und apportioned among the chieftains in his army. The ceelesiasticai llistricts and dioceses wore demigned exilusively for spiritual purpoens; tieir themudiaries are quite ignored by tho general public, und rarely known hy any kecular otherrs, whillo, in many casea, even the clergy tiomselves, unprovided with mapes or phans, are uncertain as to the limits of thoir respective cures. Tho division of the conutry, ecelesiasticaliy, in Dieceses, Archlinacomries, and Deaneries, took place at a very early period. Moat of tho present binhoprica were fimmichl in Saxon thes. The dincesen, on their tirst formation,
had their linits co-oxtensive with the boundaries of the kinglom of the sovereigns who formed them; but sub-divisions were soon discovored to be uecessary, and various princes subeequently made repeated ulterations, until at length the whole arrangement settiod into ita existing ahape.
The indigenous vagetation of Britain partakes of the charactor of that of the contiguous parts of Europe. All the graing and grasses, and the common European fruits, grow in almost all districts and situations, not too elevated, and hoth agricuiture and horticulture have been brought to a great degrec of perfectlon. The broeds of horses, cattle, sheep, and other usoful animals, are ulso of the best description. Of wild unimals, the fox, budger, will cat, stoat, martin, otter, squirrel, hedgebog, dormouso, mole, mouse, hare, and rablit, are the principal. The wolf, bear, beaver, and wild ox have hecome extinct for several centuries. The stag and fullow deor are stili abundant in eeveral localities. The great bustarl and capercallzie are the only birds known to have becone oxtinct in Britain. The bittern, eaglo, and ether birds of proy are becomIng dxily more raro. Grent Britain is the most favored ceuntry in the world for the development of mineral industry. Fuel, the indispensable agent in the trentment of metalliferous ores, and the most powerful element in the proluction of motive forec, is cistributed unequally threughout England, Scetland, and Ireland. The coal fermation in these three divisions of the Britlsh empire, occupies rich and widely-spread basias, several of which, eapecially those of Newcastlo-onTyne, Scotland and Wales, being near the sea, are enabled to export the conl to those places whero the metalliferous ores exist in abundance, but where, as in Cornwall, the absence of fuel renders their heing werked heth costly and diffeult. The ores of iron, abundantly distributed in severul of the conl bnains, udd greatly to the yalue of these. Kach one so circumstunced has become the centre of a metnliferous district, whero numerous works produce iron at a price so modorate as almost to defy competition. The insular position of Great llritain, which facilitates the shipment of coul to the phaees where it is required, is elually important in transporting tho iron ly sea to any of the eea-ports of tho wurli. These highly-favornble causes have given great development to the operations of coal-mining and the manufacture of iron, und especially since the application of cast iron for tho purposes of constructing riiiroads. The quantity of cast ison produced in 18000 was $2,250,000$ tons. Tho quantity of 'oal raised was estimated at $84,750,000$ tons. These sources of woulth in cond and iron, which are alone sulticient to place a country at the hend of mineral industry, are net the mily ones possessed by Britain. Nature has given it mines of cupper, tiu, und of leal, of preat riciness. The annual production of copper is $1 \geq, 000$ tons; of tin ore, 11,000 tons; nad of lead, 68,001 tons. The coai-heds of kingland, contained in the cartoniferous system, ure fouml in Northumberland and Durham, South Yorkshire, Nottingham and Derhy, South L,ancashire, Statlorlshire, Warwickwhire, Anglesea, Finint, Sulop, Worcestorshire, Gioucestorsinire, and tho northern jart of Somerset, South Wales, and near Whitehaven in Cumberimad. Iron in found in inexhustihle quantitien in ali the formations. Lead is found chietly in the mountuin iimeatone; copper in tho grunite and older prinury stratilied rocks; tin in Cornwall aud bevon. Sait gipringe, ybiding large quantities of salt, are found in Chealiro and Woreastersilire. As to mineral trenaures, the enstern counties of England, to the south of Yerkshirc, are remarkble for coutaluing no mines, elther of conl or metal. Theae valuable dejosits are found in the more uneven districts of the north and west.

The following table presents at one view turritury helonging to Cirent liritain, its area in square miles, and the hast census ha every portion attahatho:

The revenue for the year ending 1854 amounted to £51,784,118.
Great Britalu is less fertile in grain than France, hat affords beiter pasturage, possesses an extensive
line of aea-cost, with numerous harbors, a natural and weil-defined frontier, which no invading army can pase on foot, a good commercial position, and the largeat fields of coai in Europe ; but all these advantages have contributed less to her aggrandizement than the excellence of her laws and poittical constitution. , The progress of Britain within the last hundred yeara, and especiaily within the last half century, has been wonderfully great. Tho British isles contain about 76,000,000 of ecres, of which about two thirds are in cultivation, and more than one third waste or nucultivated. Abont haif of the waste land is in Scotiand, where the cultivsted soil forms little more than a fourth part of the total area of the country, while in England it forms about 67 per cent., and in Ireiand 70 per cent. of the surface. So great, however, has been the progress of agriculturai improvement, that, though the population has doubied itaelf within the iast fifty years, the production of food has fully kept pace with it. The progress of Britain in manufacturing industry has been atill more rapid and more remarkable than even in agriculture; and in this respect her natural advantagee are more exclusive. She has a good supply within herself of the raw material of her staple manufactures of wooien cloths, iron, and linen; and her means of procuring siik and cotton are equal at least to those of her neighbors. In enterprise and commercial activity, her merchants take the lead among the natione of Europe; and the removal of all restrictions, and the full introduction of the principles of free trade have given such a stimuius to their exertions as transcends ali former exampie. The number of ships empioyed in her foreign and colonial trade in 1853 was 35,303 , with a burden of $7,797,530$ tons ; and the number of registered British seamen was 253,896 .
 1552-58; tha atrbaor Rate of Produck peg Acke; the total Pronuck; the Anoukt of Serd; the Produor under Drduction of greo; and the total Value of aucit Produck.

Manufactures,-In the orier of their importance, we whole exports, is remarkabio. The raw materiai is of begin with cotton. The history of this manufacture, vegetable orfgin, and is olitained from the intornal coatwhich now employs more hands than any ether within Britain, and furnishes above one thind in value of the 11 II
and others as an annual herbeceous plant．It is from the latter that the far greater part of the sapply is ob－ tained；and for this anpply Britain is entircly dopendent on othor countries．Cotion grows in India，and would undoubtedly thrive well in many of the colonios；but the prosent enpply is derived from the United States of America．In so far，therefore，as regards the raw material，Britain has no advantage in the market

 mach or thr yive oneat Divibions of the Globe．
over other competitors ；bat her superiority heretofore has been in the admirable perfection of the machinery employed．The inventions of Arkwright，Hargreavea， Compton，snd Cartwright，have given adventages to a country possesaing，like Britain，exhanatieas flelds of coal，vast accumulations of capital，and a dense and industrioua population．．For extended lnformation in regard to theae inventions see Corton and Woor．

Woolems.-This is the most ancient, and was for centuriea the great ataple manufacture: The flocke of Britain furniahed wool of peculiar excellence, and in abundance for home demand, and a lerge surplus for exportation. Though the manufactare can not boast of an extension like that of cotton, it holds the next place to It ; and besides working up the greater part of the wool grown In Britain, draws largely on other countries for additional auppliea. In the finer broadcloths, Britain has formldable competitore in the Belgisns, from whose forefathers the Britons may be suid to have learned this branch, and alao in the Saxons; but in other branches of the woolen manufacture the British superiority is decided. The chief aeata of the woolen manufacture in England are Yorkshire, Lancashire, Gloucestershire, and Wiltshire, the latter being the most distinguished for, broadeloths; Norfolk for worated atuffs; Leicestershire snd Nottinghamshire for woolen hosiery; blankets and fasnnels have numerous localities; but for the finer qualities the weat of England and aeveral of the Welsh counties are most celebrated. Carpets of every quality and pattern are extenaively made at Kidderminster, Clrencester, Worcester, etc., but those of Wilton and Axminster are so superior as to euffer little by comparison with the celebrated fabrics of Turkey and Persla, snd the matchless Gobelin Tapestry of France. A particular specles of woolen manufucture, in which the resources of modern ingennity are signally displayed, is that of shoddy. Its ruw material is weolen rags, which, after various purifying procesaes, are reduced to their original wool, then re-spun, re-dyed and remanufactured. Formerly the article produced was so coarr , as to be fit only for padding and similar purposes; but now, either alone or with a partial mixture of raw wool, shoddy is made into flushings, drugget, pilot and uther great coats, carpets and table coverssome of the last of great beanty. The principal seat of the shoddy trade is Dewsbury, sbout eight miles from Leeds. The woolen manufacture of Ireland is on a very limited acale, heing confined to $a$ few brosdcloth factorlea near Dublin und Cork, and a few blankets and flannels, the former in Kilkenny and the latter at Wicklow. Scotland has made much more progress. The chief seats of the Scotch woolens sre, Aberdeen for cloths, chiefly coarse, and the spinning of worsted; Kilmarnock for carpets, bonnets, and shawis; Stirling and its neighborhood for carpets and tartans; Galashiels, Jedburg, and also a number of small towns along the foot of the Ochils, for narrow cioths of several varieties, tartans, shawls, plaida, etc.; Inverness for Turtans; and Ifawick for hoslery.
linen.-In England the spiming of flax is carried on to a great extent, but its manufacture into eloth is comparatively limited. A considerable quantity of damask and diaper is made at Barnsley. Linen ls the great staple of Ireland, and was long, in regard to textile fabrice, the staplo aiso of Scotland. In the former, extraondinary means were employed to foster it. It early fixed its seat in tho north, particularly near Belfast, and there the great chunges which have taken place in the mode of manufacture, by the substitution of spinning-inills und factories for the domestic wieel and loom, appear only to have fixed it more permanentiy. Alınost the only form into which flax is manufactured in lreland is plain linen, chiefiy shirtings. In Scotiand the manufarture assumes greater variety. llesldes plain linen, it has nanufactures of Osnaburghs, sheetings, saii+cloth, sacking, etc., principaily at Dundes; and of diaper and damask at Dumfermine. The stapjes of both towns are by far the most important of tieeir kind in ifritain.

Silk:-llere the raw material is, like cotton, entirely of furelign production. This is a great branch of manufacture, lu which, at least In liner fubrics, Britain must yield the palin of superiority to the Frouch und Beigians. The number of silk-nills is conaiderabie,
and confined chiefy to England. : Paislay is almost the only town in Scetland whare it is carried on to a great pxtent, and even there the shawls of unrivaled excellence are generally a mixed fabric of silk and wool. The chief seats of the uilk trade in England are, the district of Spitalafield in London, Manchester, and Coventry.

Beaides the manufactnres already mentioned, there is a great number which, though aoparately of leas Importance, absorb Immanse sums of espitsl, exhibit many of the most wonderful apecimens of haman ingenuity, and give aubsiatence to millions of the population. We can do ${ }^{14}$ tile more than name the most prominant. Of iro', the first process fs converting ores finto metals; and thence the additional atep of converting it from its first smelted atate into mulleablo iron, whence, by undergoing a new process, ateel is produced. Vast processea remain behind, and coustitute numerous branches of manufacture under the general name of hardware. Several of the articles produced are of great bulk and magnitude, and many of them are ao small as to be almost microscopic. To the former class belong iron bridges-no longer suspension only, but tubular-one of the structures of this kind now spans the Menai Strait ; immense steam ongines, and machinery of every kind, adapted to all the improvements of the age. Of the minor artlcles of hardware, the artlsans of Sheffiela and Birminglism produce a grest variety ; and of the precious metals, plate, jewelry, and watches are made extensively, but nowhere more perfect than in London. Porcelaln, clasaic in shapes, gorgeons in colors, and exquisite in designa; and the potteries of Stafford are far-famed. The manufacturea of glass, too, wrought into nnmerous forms of beauty and utility in the establishments at Newcastle and South Shields, excite the admiration. Another manufacture is that of paper, of vast extent, snd its processes exhibit some of the highes triumphs which human ingenulty has yet attained. In connection with it are various manufactures of whict it may bo considered as directly or indirectly the source-type-founding, printing books, etc. The mannfacture of lenther, including ita various subdivisions of tanning, currying, shoe, giove, and harnessmaking, with numerous minor branches in whlch leather is employed.
The value of the produco and mannfactures of
the United Kingdom exportod from Great
Britaln and 1 reland to forolyn parta, according
to the real or declared value, amounted in

£ $24,251,502$
 To the various British dependeneles.. $\quad$ 19,514,060 To Brazil and South American States. $\quad 8,220,628$
"From which It appears that the United States of Americs consume nearly one fifth of our exported produce and manufactures, and that the countriea culonized by Great Iritain, and those dependent on lier, are her customers for neariy half of all the produce and manufactures which sine sells to tive world. There is every reason to expect that, under the wise and liberal constitution granted to the British colonies, increasingly popuious and prosperous nstione will extend over the present unexplored wildernesses; and as the United States of America are repidly enlarging their loundarics to the west and the south, and as their increasing population has been uniformly attended with a proportionate increase of trade, it is obvious thst the prosperity of llritain is especlally bound up with the prosperity of her colonies and with that of the United States. Britain is not less interested in the increasing wealth and prosperity of the other countries of the world; for the richer and more prosperous they ure, the inetter customers will they be for our goods, and the more wlll they be able to contribute to our comfort nud enjoyment by the produce which they will be able to export to our shores."-Ency. Erports, Imports, etc.-In 1800 the annual exports of the British and Irieh produce amounted to $£ 35,903,-$ 000 ; the exports of foreign and colonial produce to $£ 7,271,000$, being a totnl of $£\{3,174,000$. The imports for the samie year amounted to $£ 24,066,000$. In 1852, the British and Irish exports to forcign countries were £ $72,049,367$; to the colonies, $£ 20,430,369$; total, $£ 92,-$ 479,736. The Imports for the same year amonnted to $\varepsilon 109,355,409$. The total number of vesseln, their tonaage, and number of persons navigating the same, were, in $1852,34,402$ vessels, 1,225 of which were propelled by steam; tonnage, 4,424,302; navigated by 243,512 men and boys. The total length of railrouds authorized loy Parliament up to the 31st Decenner, 1851, amounted to 11,962 miles; capital, $£ 368,428,000$. The total length of railroads completed in Great Britain and Ireland at the end of the yesr 1853 was 7774 miles; cost of construction, up to July, 1853, £263,636,320, equal to $\$ 1,315,000,000$. An almost inatantaneous communication by electric telegraph has also been estahlished throughout great Britain and Ireland. Of other associated industrial companles,
 gas companies, $£ 6,415,295$; insurance companies, ©6,000,000. The gross revenue of the post office for the year ending January 5th, 1852, was $£ 2,422,168$; the cost of management was $£ 1,30 t, 163$; the uet revenue, $£ 1,118,004$. The total numher of letters in 1851 was $360,647,187$, of which $86,512,640$ were in scotland, and 85,982,782 in Ireland. The payment
made to the various railroad companies for the convayance of mails for work done within the yenr, was $\mathbf{£ 1 5 5 , 5 7 5}$, and $\mathbf{£ 8 7 , 2 7 2}$ for work done in previous years. The total number of money ordera issued in the year 1851 was $4,661,025$; the amount, $£ 8,880,420$. In 1851, the persons employed were, in England and Walea, 13,012; in Ireland, 1927; in Scotland, 2190, and in the colonies, 939 . The total amount paid to these persons was $\mathcal{C 7 2 7 , 1 2 0}$.

British Erports in 1855.-A return has juat been issued by the Boarrl of Trade of the declared values of British and Irish produce and manufacturas exported from the United Kingdom in the year 1855, apecifying the amount to eaclo country and colony. From this document the following list has been compiled, showing the order in which the various communities of the world runk as her customers. The total is $£ 95,688$, 085 , against $£ 97,298,900$ in 1854, and $\mathbf{£ 9 8 , 9 3 3 , 7 8 1}$ in 1853. Owing to the revulsion from over-speculation in the Anstralian and Canadian trades, the proportion taken by her own possessions, amounting in the two precering years to alout a third of the whols, presents a falling off of $57,000,000$, although Indis, which, from the prosperity conseguent on the demand for subatitutes for Russian produce and the outlay for railways, exhibited in 1854 an increase of $\mathrm{fi}, 800,000$, figures agniu for an increase of $£ 900,000$. With regard to foreign countries, the effects of the chronic pressure which has continued to prevsil in the New York money market have again been shown in a diminution of the

exports to the United States. In 1854 there was a
 \&4,092,2H3 is now observalile. The amoant to Germany has been awollen by the overland trade to Rinasla, the augmentation being $£ 1,222,776$. France exblbits the extraordinary increase of $\mathbf{\Sigma 2 , 8 3 5}, 368$-equal to 90 per cent.- a result due partly to the purchase of war materiala in thle coantry, and partly to modifieationa in her tariff. To Turkey, an might have been expected, the exports have more thinn doubled. Hussis is of conrse entirely out of the list, but the con-

8 ignments to ILiaklava and the other ports in her ewn possession amounted to nenrly $\mathbf{£ 5 0 0 , 0 0 0}$. Anomg the countries which ahow an indprovement are Sweden and Norway, Irazil, and Now Liranada, the differease in each of these cases belng large, The trade with Syria and Paleatine, in consequence of the war, has experienced a great development. The exports direct to the Danubian Irinclpalitlea, which declined frem $\mathbf{£ 1 7 9 , 8 1 0} \ln 1853$ to $£ 16,402$ in $185 \cdot 1$, utand in the prosent return at $\mathbf{4 5 , 3 3 7 \text { . Belgium, Greoce, lialy, Mex- }}$ ice, Peru, Venezueln, and China, are all on the favor.

Progress of the Britioh Mercantile Marine aince 1842.-The atatisticsl abetract of the Jnited Kingdom for the last fifteen years, whlch has just been lasued by the Board of Trade, contain a series of tablea of considerable fintorest to ship-owners, as showing the progress of the mercantile marine during a period in which has occurred the adoption of free trade snd the repeal of the navigation laws. In 1842 the total tonnage of veasels entered with cargoes and in ballast at British ports was $4,500,028$ tons, and with cargoes only 8,655 ,280 tons ; the former amount comprised 8,204,725 tons of British and 1,205,803 tons of foreign shlpping, In 1856 the totel entries with cargoes and In ballast represented $10,558,134$ tons of shipping, and with cargoes only $8,241,604$ tons. In fifteen years, therefore, the tonnage had more than doubled, but the increase in British and foreign shipping was not at the same rate. The entries with cargoes and in baliast comprised $6,800,715$ tons of British and 4,162 tona of foreign shlpping. While, therefore, the British tonnage had nearly doubled, the foreign had been inultiplled by almost 81. Down to : 0 ' 5 the rate of increase was nesrly equal, but slightl, in favor of the Ibritish flag; in 1849, the British tonnage had increased one half, while the foreign entries show an increase to two thirds. In 1850, the foreign tonnage which entered British ports had doubled, and the entries under the national flag declined, continuing to do so, as compared with 1847, down to 1853 . Since the last named date British tonnage has again advanced, though not ao rapidly as foreign, which tripled in fourteen years, the entries in 1855 having been $3,680,447$ tons. The British entries in the same year amounted to $5,270,795$ tnas, whereas, if the lincrease had been at tho same rate as forelgn shipping, it would have been more than 9,880 , 000 tons. The return of the number and tonnage of registered vessels, and the number of men employed therein, prepared by the register-general of stamen, commences with 1846 , the statistics of previous years not being procuruble. The total increase of vessels during the eight years was 1049 , of tonnage $1,059,735$ tons, and of men 21,307, exclusive of masters. This includes Channel Island vessels, but not those belonging to British possessions abread. This table is so classified as to show the proportionate increase in each branch of the shipping trade, sailing vessels being distinguished from steamers, and the home trade from the foreign. The whole trade includes the coasts of the United Kingdom, and continental ports between Brest and the Elbo; and the foreign trade all perts beyond those limita. There are many vessels, bowever, which are engaged partly in the forelgn trade, and these are classed separately. In 1849 the number of salling vessels was 17,807 , and of steam vessels 414 ; in 1856 the former numbered 18,419 , and the latter 851. While sailing vessels, therefore, had increased little more than a thirtieth, steam vessels had more than doubled. In 1849 there were 9298 suiling vessels enguged in the home trade, 6612 in the foreign trade, and 1897 partly in one trade and partly in the other. In 1856 the home trade employed 9390 sailing vessels, the foreign trade 8059, whilo those engaged partly in one trade and partly in the other numbered but 970 . This gives an increase of 92 in the first class, and of 1447 in the second, while in the mixed class there was a decrease of 927 , or nearly half. The statistics of the steam trade give results very different. In 1849 the home trado employed 312 steamers (exclusive of rivor vessels), the foreign trade 82, and of those enfaged in part in both trades there were 20 . In 1856 the numbers wore respectively 317,422 , and 42 , showing that while the home steum trade had increased scarcely 2 per cent., the mixed class had doubled, and the for eign-going steamers had been multiplied by six. There renisins for notice the table giving the number and tonnage of the sailing and steam vessels built and registered in the United Kingdom during the fifteen

years since 1842. In that year 914 veseele, having an quadrnpled, while the increase of sailing vessels was aggregate tonnage of 129,929 tonn, were built: in 1856 the number was 1160 , and the tennage 244,578 tone. In 1842 the sailing ressels numbered 956 , and the teamers 58 ; in 1854 the formes were 921 , and the latter $\mathbf{z : 2 9}$. Steamers, therefure, have been nearly only aloat 7 per cent.

The following returns embrace vessels belonging to the Channel Islands, but not veesels regintered in the llritish plantations. The marked increuse in steam veasela should clahin the attention of our shiphuilders.

Declir vin the real value of the exports.-The great in- the fall in their real value shows that alie is selling crease In the official, and the comparative decline in the real or declared value of the experts, since 1815, lass given rise to a great deal of irrelevant discushien. It bas been looked uron as a proof that Fingliah commerce is daily hecoming less prospereus, whereas, in point of fact, s precisely opposite concluslen should be drawn from it. The rates according to which the effichal values ef tho exports are determined were fixed as far back as $1696 ;$ so that they have long ceased to be of importance as affording any criterion of the actusl value, their only use being to show the fluctuations in the quantifies exported. Te remedy this defect, a plas was furmed during the early part of Mr. Pitt's administratlon, for keeping an account of the real valne of the experts, as ancertained by the declarations of the experters. Those who contend that her trade is getting into a bad condition, argue that the great increase in the official value of the exports alnce 1815 shows that the quantity of the arthelee exported has been proportionally augmented, whlle
this larger quantity for a smaller price, a result which, they affirm, is most injurious. Ilut the circumstance of a manufacturer er a merchant selling a large or a suall quantity of protuce at tho same price, affords no critorion by which to judge as to the advant:ige or disadvantage of the eale; for, if, in censequence of improvements in the arts or otherwise, a particular article may now be produced for half the expense that its production cost 10 or 20 years ago, it is obvious that double the quantity of it may be afforded at the same price without injury to the producers. Now this is the case with some of the most important artlcles which are exported from England. Cottons and cotton-twlet form a full thind or more of her entire exports; and nince 1814 there has been an extriordinary fall in the price of these articles, occasioned partly by cotten wool haviug fallen from about 1s. 6 d . per lb, to abont bel. per lb., but more thy improvements in the manuiacture. Hence, while the official value of the exports of cotton goods and twist has in-
croceed from about $\mathcal{L 1 8 , 0 0 0 , 0 0 0}$ in 1814, to about $\mathcal{L 1 0 0 , -}$ 000,000 In 1853, their declarod value has rison only $\mathrm{m} u m$ sbout $£ 20,000,000$ at the former period to abont C $83,000,000$ at the latter. Surely, however, this in, If any thing can be, a proof of incroasing prosperity it shows that ohe ean now oxport and eell with a pmali (for unless such were the case, doed any one Imagime the exportation wonld continne?) nearly four tin. the quantity of cotton goods and yarn which she exported in 1814 for about tha same price. See Cortos Manupactirk.

The commercial interesta of Enaland long auffered from the Inextricable confuaion of her martitime lawe. From the Revolution down to 1788 some hundreds of acta were paesed, each enacting some uddition, diminution, or change of the duties, drawbacka, bounties, and regulations previonaly existing in the customs. Mr. Pitt has the mertt of having first introdnced something like order into this chaoe. Under his auspices all the soparate custom-dutien exinting in 1787 were reponied, and simple and intelligible onea sabstituted in their atead

In the report of the Lords' Committee on Foreign Trade in 1820, it in atated that the laws under which the commerce of the country was regulated amounted to upward of 2000 , of which 1600 were in force in 181b. After this report was printed, Mr. Huskeyson introduced great reforms into the laws affecting shipping and uavigation. And since his time the repeal of a vast numier of custom-duties and the many important and beneficisl changes effected by Sir lobert Peel, have vastly simpilfied the commercial leginlatlon of Eagiand. Variona improvenients have also been introduced by the iate chancellor of the exchequer, Mr. Giadstone ; and the Custom: Consolidation Act of $\mathbf{1 8 5 3}$ has brought the various laws relating to the customs into a concise and simplie form. It comprises the whole law renpecting the importation, exportation, warehousing, smuggling, etc., of goods, with the regulationa to be observed in the coasting and colonial trades, etc., and is at once brief, comprebensive, and so clear as to be level to the compretension of those least acquainted with such matters. Healdes condensing and simplifying the varions lawa reapecting the custome, this act has also introdnced some moot important changes. The menchant is 70w no longer obliged, when auccessful in a auit, to pay his own expenses, as was formerty the case; nor are goods in dispute now detained till the point loe inquired into and deelded, but are given up on the amount claimed teing deposited. If the claim is found to have been unjust, the sum overcharged is returned, with interest at the rate of 5 per ceut., and the expensee of the suit. The merchant may also, if be consider himself aggrieved by the decision of the board, have the case lrought into open court before a commissioner, where he may meet the officer, and leara by examination the real facts of the case. The evidence so taken is reprorted to tho board, who may thereapon confirm or modify their decislon; it being optional with the merchant elther to abide hy it, or to carry the case lefore a competent tribunsl. If the duty or penalty claimed be under $\mathbf{5 1 0 0}$, or the case be of a simple kind, it may be tried before magistrates, connty courts, or other inferior tribunals.

Shipping. - In order to promote the shippling interest in Britain the navigation laws were passed, which were long considered the anfeguarids of British commerce. By these lawa certain enumerated articles, which in fact comprehended every thing that was of impertance in commerce, could be brought to her ehores onjy in British shipe, or in the shipe of the country of which the goods were the produce, or in ships of the country from which the gools were to be brought. Experience provel that these restrictione which were intended for the benefit of British commerce, operated oaly as fetters upon trade. By the act passed in 1849,
the restrictive provisions of the old acts wore repealed trom and after the 1st of January, 1R' $\mathbf{0}$. Great alarm Was ervated among the shiphulldera ind othera, by the change, which, as they approhended, was fraught with ruin to the trade and comuleree of th.s country; but juntead of that, the trade licreased more rapilly than before. The emount of tonnage built in 1849 wan 121,266, in 1861 It was 140,600 , snd in 1853 it was 203,171.

The increase has been more remarkalile in ateam than in alling vesseis: in 1850 the number of steamvessels buift was 36, and their tonnage a885; in 1853 the number of steam vessels built was 153, and their tonnage 45,218. Another circumatance which is romarkabie, is the recent extraordinary sabistitution of Iron for wood in the conatruction of steam veesels. Of the 158 built in 1853 , no less than 117 were iron. Dr. Strang, in a communication made to the British Association in 1852, atates, that during the last 7 years there have been constructed, or were constructing, in Glasgow and neighborhood, 123 vessels, 122 of which were iron. At Greenock and Port Glasgow, during the same period, there were constructed cf steam vessela, 13 of which were of wood and 53 of iron.

The " merchant shipping act, 1854," which came into operation May 1st, 1855, contains some lmportant changes in commercial regulationa. Sections 20,21,22, 23, and 24, lnstitute new modes of messuring ohips; and as all American shlps hereafter to te ineasured in that country muat be measured according to one or other of its provilions, and pay dues on the tonnage thus ascertained, it is a change Jargely affecting our vessels. As far as the present short experience of it denotes, the effect, as a general rule, will be favorable to auch as are sharp or with fine lines, and unfavorulile to such as are full built; but it may reamonaidy be anpposed that most new vessele will belong to the former ciass, and it will be seen (sectlon 27) that the measurement of ships already measured is not compulsory; but may he made on application therefor. By tife 29th section, the commissioner of customs, with the eanction of the Treasury, may alter or molify the modes of measurement. Section 102 requires fiom every master, clearing outward, a declaration of the nation to which the vessel claima to belong, and authorizes the detention of the vessel until it is made. Section 329 containa important proviaions reapecting the shipment and carriage of dangerous goods. Section 353 renders the employment of duly qualified piluts compulsory ; but, under section 332, any pllotage autherity, by ly-law, made with the consent of her majeaty in councii, may exemit the master of any ahips, or clanses of ships, from being compelled to employ qualified pilots. Part 8 remodels the law relating to wrecks and salvare, and contains some importnnt provisiona, particuiarly as regards forejgn vesnels, and salvage services by government vessels. The remainder of the act is composed of laws, or parts of laws previously in furce, the object being " not so much a change of laws as bringing existing laws into a consolidated shape." The last of the series of acts wnich completely changed the commercial system of this country was paseed March 23d, 1454, and opened the coasting trade to foreign veasela; and England has obtained ly treaty the concession of the coasting trade of Tuncany and Sardinia. By a minute of the Lords of the Treasury, in September, 1856, it was announced that the trunser should then take place of the control of the Cummisioners of the Customs to that of the Lords of the Admiralty. Since that period the control has vested in tha Admiralty.-U. S. Consular Returns.
The subjoined tahles give a complete view of the shlpping belonging to the different ports of the Britlah empire, and of the navigation with foreign countries, in 1852 and 1853.

The following table is an abstract of the number of vessels and tonnage entered inward and cleared outward al each of the 12 principal ports of the United Kingdom daring the year 1854 , and also a retarn of the declared value of British and Irish produce and manufactures exported from the respective porta to foreign countries and British possessions during the same year.

| Ports. |  |  | outwand. |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Venme. | Tonrage | Vesselc. 1 | Tonbegro. |
| Ion | 10,948 | 2,6a7,823 | 8,174 | 2,187,419 |
| Liverp | 4,498 | 2,105,404 | 4,551 | 2,161,265 |
| 11all. | 2,769 | 0:14,849 | 1,894 | 874,859 |
| Bristol. | 694 | 162,698 | 296 | 101,278 |
| Newcastlo | 8,048 | 441,198 | 6,071 | 1,129,126 |
| Southamplo | 878 | 962,276 | 801 | 279,068 |
| Ialtb...... | 2,088 | 180,586 | 898 | 71.45 |
| Glango | 514 | 125,482 | 814 | 256.519 |
| Greanoc | 877 | 144,159 | 179 | 71,579 |
| Dublin. | 887 | 71,602 | 148 | 4,789 |
| Cork. | 401 | 87,423 | 825 | 89,671 |
| Boluas | 204 | 68,88: | 128 | 84,988 |
| Total | 25,814 | 6,816,564 | 24,524 | 8,697,688 |

An malysis of the calculations upon which these tables are bnsed would doubtlesa show that the real difference between Liverpool and London is much less than it appeara above, a large proportion of tho trade of London being carried on by coasting vessels making ahort tripa. The export returns are thus stated:

| ondon | ,880,279 | Clasgov | 24,906,557 |
| :---: | :---: | :---: | :---: |
| Liverpoo | 46,719,177 | Oreenock. | 554,508 |

| Nowcastle. | 1,521,552 | Belfa | 29,755 |
| Southampton | 2,884,141 |  |  |
| Lelth. ...... . | BET,607 | Total. | c89,806,07\% |

Showing that considerably more than one half the entire foreign trade of the 12 principal ports of Great Britain goes from Liverpool.

From the atatistics of Glasgow, publiahed by Dr. Strang in 1855, we loarn that the tonnage of steamboats built on the Clyde during 30 yoars, from 1820 to 1850, amounted to 103,270, while in the 3 jeara 1851, 1852, 1853, it amounted to 141,718 in 200 vessels, which were almost entirely of iron. And to show the magnitude of this great department of Scottish industry, he adds that, during a period of 12 montha, embracing the greater part of 1853 , the tonnage of all vessels built in the ports of the Clyde was 64,114 tons, whereas the total tonnage of vessels built in London In 1853 was only 62,745, and In Liverpool, 45.' 32 . In the years 1853-4, there were no lez than 266 vossels bnilt at Glasgow, including both atoam and salling veseels, with an aggregate of 168,000 tons.

Commercial Intercourse betieven Grvat Britain and the United Stnies.-The dethite treaty of peace between the linited Statea and Great llritaln, in 1783, contalus enly one stlpulation it any manner relating to commercial intercourse. Article vili. proviles that the navigation of the Miasissipyl, from lts agurce to the ocean, shall forever remain frce and open to the subjects of Great lritnin and the citizens of the United States. It was not until $1 \mathbf{1 0 9}$ that eommercial intercourse between the twa mations was defned by trenty atipulations. The treaty of that year regulates traie between the high contracthig parties, on the continent of Amerla, In the bast Indies, the territorien of Great Iritain in Enrope and In those of the United States. It provides that no other or higher dhaties shall he pail by the ahips or merchandise of tho one party in tha ports of the other, than suels as aro paid hy tho like vesacts or merchamilise of all other mations; that no ether or higher duty alall the lmposed in one comentry on the importation of any articles, the growth, promiuee, or manuficture of the other, than are or shall be payahle on the limportation of tho like artieles heing of the growth, prombec, or mamfaturn of any other forelga country; nor whall any prohibition in imposed on the exportation or Importation of any articles to or from the turritories of the two partien respertively, which ahall not equally extend to all other mations; the Iritish government reaerving to itmelf tha right of imposing on American vessels entering into the Iritish parts in Vinrope "a tomage duty equal to that whinh shall he payable by British vessels in the ports of Amerina, und also such duty as may be adequate to countervail tha difference of duty now payable on tha importation of European and Asiatic goods when imported into tho United States In IIritishor In Americans vessels." The other stipulations respecting commerce
relate chietly to the trude with the West Indles. The duration of this treaty, so far as it regalates the commorce between the United Statos and the Vuropean possesslous of Grent Britaln, is limited to 12 yeara. During the literval which elapsed from the treaty of peace in $178: 1$ to the ratillention of the treaty of anity, conmeree, and navigatlon, in 1791, the commercial relatlons between Great Britain and the Unitel States wero regalated hy the separate and distinet leglslation of the several States on the one side, and hy general orilers in council on the other. See articlea Corosn . 4 and Uniten States.

The navigntion laws of Groat Iritain, Immediately after the proclamation of peace, were enforced against the ressels and commorco of the United States. The Itrst in the series of thege laws was tho art of 1651. It provided that no geoda of commorities whatever, tho growth, production, or manufacture of $\mathbf{A s i a}, \mathbf{A}$ frica, of Amerlea, shoukl bo imported elther into linglatel or Ircland, or any of the glantations, except in Einglishbullt ships, and telonging either to Empland or to Einglisls plantation subjects, and of whblh the master and threo fourths of the crow were also linglish; and that no giods of the growth, production, or manaficture of nuy country in birope should bo importad into Greai liritaln, Ireland, or the plantations, except in Ifritish shijs, or in auch khips as wero the real property of the people of the country or phace in which the goods woro produced, and from which they rould only Le, or were usually exported. 'This uct was nover eniforced, nor intensiud to bo enforced, in the 13ritish North A merican colondes. It was expecially aimed at the Dutch, who wero at this jerlot tho great earrlers of the werlic. llaving but few ataples of their own to export to foreign eomintries, thelr merchant ships were found in every port, and were even employed in briug-

Ing home the products of the British colonies to the mother country.

After the Restoration, the navigatien act was reenacted; with such amendments, however, as seemed still necessary to give more effective protection to British interests, and curh the Dutch yet further. Amoug the provislons of the naw act of 1660, It was declared that no "sugar, tobacce, cotton, wool, Indigo, ginger, fustle, or other dyeing woods of the growth or manufacture of our Asian, African, or American colonies, shall be shipped from the said colonles to any place but England, or to some other of his majesty's sald plantations." Whatever relaxations were permitted in the operation of these navigation laws in the North American colonies, the United Statea became sabjected to them in all their rigor Immediately on assuming an Independent existence. In the language of Lord Liverpool, "The connaction whielı had so long subsisted bet ween Great Britain and the count riea now forming the United States of Ameriea was finally dissolved by the acknowledgment of their independence in the year 1783 ; the anclent commercial system arising out of that connection of course ended with it; and the laws by which the traile of these countries, considerd as colonies, had hitherto been regulated ceased to have etfect." The king, by and with the advice and consent of his privy council, was, however, vested with authority to regulate the future commerce between Great Jritain and the United States, The first onder in council issued ufter the independence of the United States had heen acknowledged by fireat Jritain, estathlished the following regulations:
Fiust. That any goods, the importation of which into this kingdom is not prohibited by law, being the growth or production of any of the territorles of tho United States of America, imay be imported directly from thence into any of the ports of the kinglem, not only In Mritish ships, owned by IIritish nuhjocts, and navigated eccording to law, but, also, in ships built in the conntries lelonging to the United Staten of Ainerlea, and owned by the sulijects of the said States, and whereof the inaster and threo fourtha of the marines, ut least, are subjects of the United States. Secondly. Tha: any goobls, being unmanufactured (except tish-oil, blubber, whale-fins, and spermaceti), and also any pig-iron, har-iron, piteh, tur, turpentine, rocin, putash, jeari-ash, indigo, manta, yards, nud bowaprits, being the growth or produrtion of any of the territories of the linited States of America, may the inported directly from thince into any of the ports of Great Ilritaln, upon payment of the same duties as the like sort of goods are, or may be subjected to, if imported from any British island or plantathon in Amerlea; and that the excepted articlea, an well an all others not enumeruted, the growth, production, or manufacture of the said Cnited States, shall be mimitteal on the payment of the same duties as are levied on simflar articles when imported from the must favoren nation, except such nations only with which treation of reciprocity have treen established, Thirdly. It was ordered that gompand merchundine, heing the growth, proluction, or manafactume of the territories of the I'nited states, though inaported In abips liclonging to the muljerts of the raid stated, Nhoubl be exempted from the alien's duty, fonrthly. It was jermitted to The imported into the other American nad Went ladian jorsexsions, from the jorts of the linited Stater, in Brifich shipa only, sucharticles of the growth, jrualuction, or manufacture of any of the said staten (excepte aalted frevinions and the prombee of the limheriem ), as might by law, hefore the independence of the L'niteal states, have been imported from the maid staten: hat prohibiting all intercourse between the Linited Staten and the asid Americun and Weat Indian posserssions in ahips belongligg to ritizens of the C'nited States.

The first three orders, it will the perceived, nuspend, In faver of the Cnited States, that provision of the
navigation lawa of Great Britain which enacts "that no goods or commedities whatsoever, of the growth, production, or manufucture of any part of Amerles, are to he lmported into any of his majesty's European dominions in any other ship or vensel than such aa do truly belong to his majesty's suljects, and navigated aceording to law, in the manner thareln dascribed, under the penalty of forfeiting sil such gooks and tha ship or vessel In which they are broaght.". The commerce of the United States, with reapeet to certain articlas enumerated (and it la admitted that theso articles formed a principal pertion of the Amarican export trade at that period), was also allowed the same preference as was granted to the romalning American possessions of Great Britain. The privileges conferred on American commerce by this order are shown in the following tathe:

The last regulation opernted to exelude United States, vessels from the ports of IIritish possessions in America, including the West Indien, und to restrict the importation of the products or mannfactures of the said States in such possessioas to British ships only, navigated accorling to law. The order was dictuted by a spirit of ililberality and seltishness, universally condenned both in Eugland sud the United States; nnd furnished a prolitie suhject of diplomatic discussion between the two govermments, until the question was delinitely and satisfactorily settled towanl the close of the year 18:10, The following summary exhibits a brief almatract of the separate acts of the different State legislaturuffecting liritish commerce, passed between 1is83 and 1789: Hy laws pasued In New Hampshire, Massachaketts, and thode island, vessels owned, in whole or in part, by the subjects of Great Ilritain, were prohibited from taking on board, in these provinces, any goods or merchandise of the growth or manufacture of these States, or of any other of the Unitel St ates; and such vessels, soloaded, were, together with thir cargoes, made subject to seizure and condennation. The legislature of lemosylvania verted in Cengress a [ower to prohilhit for 15 years tho importatitin or ex. portation of all merchandise in vessela belonging to or navigated by the subjects of any nations with which Congress aluall not have formed treation of commerte.

Hy laws pareed in Massachosetts and Ithode Ishad, (congress was empowered to ;rolitit the impartation of Iritinh West India prodice in Hritish vesvels. Another law was enartel, In Jennsylvania, imposing a duty of As. Gid. (currency) per ton on the vevols of every nation wihb which Congress ham not made treaties of commerce. In Maryland, a duty of Is, perton was innowed on all formign shipping except Ilritish, and on Irritish in duty of GN. per ton. In 1 iss Virginia powed a law himposing a tuty of tis. per ton on Iriti-h vessels, and half that amonat on all other forejgn wosils, In North Carolima the dincrimination whs still greater; tho duties on liritinh vesisels entering the purts of that State being fis, per ton, while that on all ither foreign vemels was only Is, jer tum.

The inuport iluties of the dilferent states on Hritinh cargoes were equally characterizal by a similar pinit of retahatlen. New IJamplise, Massachusetts, Nilowe I hand, Virginia, Maryland, South Carslina, and
 tol 100 per ernt. on liritinh cargoes over those hevied on similar merchandine imported in other foreiga vessuls.

The effert of thene countervaifing ann relaliatory measurve cun be traced in the following taliles:

npon an average of six years before the war of independence, ending with $1774, \$ 13,118,778$; of six years ending with $1789, \$ 11,201,486$; annual decrease since the war, $81,912,287$. Annual value of exports from the Unlted States to Great Britaln, upon an average of six years before the war of independence, ending with $1774, \$ 8,410,281$; of six years since the war of independence, $\$ 4,361,452$; annual decrease since the war, $4,048,829$.

A close analyals of the officlal returns of trade during this poriod will show that tobacco and rice were the articles upon whit this decrease chlefly fell. The quantity of tobscco exported to England decreased annually, upon an average of six years, 44,774,458 pounds, valued at $\$ 2,798,390$; and the anoual decrease in rice exported to England from the United States was $259,035 \mathrm{cwt}$., valued at $\$ 913,326$; making a total decrease in tobacco and rice of $\$ 3,741,716$. The tonnuge employed in the trade during the two periods ahove designated can not be ascertalned with accurucy. We are enabled, however, to supply from British authorities the number and tonnage of vessels employed in the trade bet ween tho two comntries for two periods -of three years befure, and subsequent to, the ;var of independence:

Number and tonnage of vessels annually clearing from Great Brituln fur the United States, on an average of the years 1770,1771 , and $1772,628-81,951$. Number and tonnage of vosaela annually entering Britial ports from the United States, on a like sverage, 69991,510 ; tutal, $1327-173,491$. Number and tonnage of liritish vessels clearing from British ports, annually, on an sverage of the years 1787, 1788, and 1789, 27255,785 . Number and tonnage of United States' vessels clearing, annually, from British ports, on like average, $157-25,725$. Number and tonnage of 13ritish vessels clearing from the United States for llitish ports, annually, on an average of the years 1787, 1788, and $1789,261-52,595$. Number and tonnage of United States' vessels elearing from the United States for British ports, annually; on a like average, 163 26,564 ; total, $853-160,669$. Showing a decrease, during the periods comparel, of $471-12,822$.

Thus, in the very infancy of our commerce, the disastrous effects of restrictions, and of the retallatory measures which they provoked, were exhibited as well in the spirit of commercial illiberality and untagonism which they engendered between the two countries, as in the general decreaso of navigation and trade. That the olject as well as the effect of the varions orders in council relative to the trade betwoen (ireat Britain and this connty, lesued from 1783 to 1794 , was to paralyze the efforts even then made in the United States to compete for a portion of that trade which bingland had, long anterior to this perioi, wrested from llotland, and now seemed to regard ns legitimately her own, can not be doubtel. A Iritish statesman (Lord liverposil), in in work on this subject, pulbished in 1792, remarks:-"That thls lucrease In our shipping is to be ascribed to our narigation sysfom may be made to appear from recent experience in the npplication of it to the trade of the United States. When those countries were part of our plantations, a great portion of their produce was transhipued to Great Iritain and our West Indin Islands in A mericon bottoms ; they had a sharo in the freight of sugars from those infands to Great Britain. Hat since the independenco of those Status, since their chips have heen exchnded from one pitantations, and that trade is wholly confined to BritishUnite ships, we have gained that share of our carrying trade from which they aro nou exchuded, and we noreover enjoy a ronsiderable proportion in tho carriage of the produce of the United States."

The conmercial policy of the Vnited States, from the very infaney of tha govermment, has been to encourage reciprocity, and frechlom of commerco with all nations willing to adopt a simiar principie. In tho
report from the Treasury Department on the subject of commerce, submitted to Congress In 1791, the basis of a commercial system was suggested, in which the Secretary arguod that duties imposed upon imports would te disadvantageous in bullding up, trade. "Instead," the report adds, " of embarrassing commerce under piles of regulating laws, dutles, and prohibitions, it should be relleved from all its shackles, In all parts of the world. Would even a slagle nation begin with the United States this systam of free commerce, it would be advisable to begin it with that nation." In the spirit of thls suggestion, the United States, soon after the peace of 1783 , proposed to enter into treaties of commerce, not only with Great Britain, hut also with France, Spaili, and Portugal. Every overture, however, to that end, was, under various pretexts, rejected; and it was not untll five years after the adoption of our present Constitution that Great Britain could be induced to listen to any propositions on the part of the United States, having in view the equalization or reciprocity of commercial relations between the two nations,-SEynert's Statistical A nnals, page 58. Under the operation of their navigation laws, the productions of Asia, Africa, and America, could only be imported direct from the places of their growth in British vessels. As respects the United States, this restriction was suspended, as already ohserved, by orilers in council, and proclamations issued in pursuance thereof, intil the treaty already cited was ratified.

The following tables exhibit tive letails of the inport and export trade between Great llritaln and the United States from 1795 to 1807 , and from the latter year to 1815 , when a convention of reciprocity was entered into and ratified thetween the two governments:

| Yeara. | Esporta from Great Aritain to the U. S. | Imporis into Grent aritain from the U.S. | Years. | Esporta from Greal Britaln to the U.S. | Importa lato Grent Britain from thaU. 8 . |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1705 | *26,270,590 | \$0,769,690 | 1801 | \$37,087,650 | \$13,532,590 |
| 1796 | 30,270,160 | 10,404,850 | 1 s 02 | 26,647,450 | 9,617,520 |
| 1797 | 25,233,995 | 5,877,560 | 1803 | 26,964,055 | 9,570,490 |
| 1798 | 27,901, 845 | $8,913,600$ | 1804 | 31,992,130 | 8,257,935 |
| 1799 | 35,2*2,790 | 9,094,005 | 1805 | 82,733,845 | 8.882,780 |
| 1800 | 30,427,970 | 11,789,615 | 1806 | 43,065,010 | 9,999,420 |

The preceding table is derived from 13ritish authoritles; und though it exhilits a variance in almost every instance, more or less, from the United States' onicial reports, it is believed to epproximate the netual value of the imports and exports in the linglish market. From 1803, when the stipulations of the treaty of 1791 , relative to conmerce, expired, there was no treaty regnlating the commercial intercourse between the two countries until 1815 . It is true a trenty was ngreed to, December 31, 1806, between Messrs. Monroe and l'inckney und the commissioners appolnted liy Great Ilritain for that purpose; but so restrictive were some of its stipulations, erpecially as respecting American commerce with the East Indies, that it was rejected by the l'resident, withont having been aubmitted to the Sonate, notwithstanding it contained a stipulation for an equalization of tonnare and other duties in tho intercourso between the linited States and the dominions of Great llitain in linrope. This principle was recognized and admitted in tho commercial convention of duly 31,1815 , entered into between the two countries, with the limitation, however, on the part of lingland, to her dominions in liurope. l'rior to the adopition of thi crenty, the United States pussed nut att repealing all the diseriminating duties of import and tomage in regard to the vessels of such nations as whould extend similar fivors to the shipping and proluce of the United States; thus carrying into pracetical working, und reoommending by legislative exmmple, the suggestlon of Mr. Jeflerson already quoted, that if "even a single nation would begin with the United States tho syntem at freo commerce, it would be advisable to begin it with that nation." We reeur, bowever, beforo proceeding to trace the operation of
this convention In the anbsequent retnras of trade, to the tables, resuming at the year 1806 :

| Years. | Syports from Ormat Britaita to the U. 8. | Imperts lato Greme Britala from the U,s. | Yames. | Kaporta from Oreal Brinsla to the U. S. | Imperts lato Oromal Bricala from thaU.8. |
| :---: | :---: | :---: | :---: | :---: | :---: |

| 1807 | 89,605,600 | 14,287,610 | 1818 | 20,677,960 | 6,470,760 |
| 1908 | 10,960,295 | 4,181,710 | 1818 | Avenrin dyatr | ayed by 8 mra |
| 1809 | 25,948,065 | 11,026,65\% | 1814 | 80,515 | 118,106 |
| 1810 | 38,006,085 | 18,672,025 | 1815 | 59,682,005 | 11,81t,440 |

In Seybert's Statistical Annals we find a minute analysle of the trade between the United States and Great Britaln during the years designated in the prevlous tables.

In the year 1793, exporte from the United Statee to Great Britain were eatimated, in a report of the Secretary of the Treasury, under date December 23, 1793, at $\$ 9,363,416$, and the Imports Inte the United States from Great Britain at $\$ 15,285,428$, leaving a balance in faver of Great Britain of $\mathbf{8 5}, 922,012$. From 1793 to 1800 , the amonat of manufactures imported into the United States from Great Britaln exceeded in value the amonnt of similar exports to all the nations in Europe, as will be seen from the following table, taken from British returns:

Amount of reanufacturex exported from Greal Brltain to

| Years. | Britain |  |  |
| :---: | :---: | :---: | :---: |
|  | Nationa in Earope, |  | The t'nired Sister. |
| 1793. | 17,650,280 | ...... | 116,968,625 |
| 1794. | 22, 291,915 | . .... | 17,94,445 |
| 1795. | 21,113,910 | . | 24,462, 060 |
| 1796. | 21,488,415 | ...... | 29,178,200 |
| 1797. | 18,68, 150 | ...... | $24,854,6)^{0}$ |

| 1507 | 59, 2321,565 | 1,257,145 | 902,899,825 | 51,0t8,941 |
| 1 1\%15 | 26,205,685 | 815,615 | 204.408,305 | 45,440,975 |
| 1499 | 86, 292,500 | 1,01t,840 | 251,218,415 | 78, 84.785 |
| 19t0 | 54,608,76) | 1,444,665 | 248,478, 170 | 68,638,4i5 |
| 1011 | 9,206,265 | 169,820 | $178,546,405$ | 45,111,695 |

The aggregate valne of Itritish manufactures and produce export to to the L'nited States during the seven years denlgnuted above, was $\$ 302,088,2 \%$, making an anmual average of $\$ 43,296,896$; the aggregate value of British produce and manufactures exported to all parts of the werld, indudling the Vnited Staten, during the same perionl, was $61,504,041,650$, making an ansnual average of $\$ 214,863,043$. The sggregate value of foreign and colonial merchandise exported from tireat liritaln to the United States thring tho same perient was $48,782,070$, making mun mual averagn of © $1,254,852$; the aggregate value of similar exports to all parts of the world, Including the Inited statea, was $3 \boldsymbol{3} 2,204,150$ ). The preceding figures exhithit many lateresting facts relative to the trade luetween the two countries, cluriug the period which intervened teetween 1793 and $1 \times 16$. The exports of forejgn and colonial merehandme from Great liritain to the Inited Staten show that Fingland enjoyed but a small share of
our carrying trade; while a comparisen between the totale of domsatio manufactures exported to the United States, and to sll other parts of the world, will exhibit the importance to Great Britain of nnreatrieted commerclail Intercourse with the United Statea.

The effect of the restrictive and retaliatory measures which were, at this period, adopted. by hoth countries, Is even mere fully illustrated in the tonnage employed In thia trade by each, respoctively, from 1790 to 1816. The number of British vessele which enterad and cleared between the United States and Great Britain amounted to 1715, with an aggregate tonnage of 382 , 502 tons. The number of American vessels which entered and cleared in the same trade, during the same period, was 8245 vessels, with an aggregate tonnage of 516,702 tons. In 1790,557 British vessels were employed in the cominerce between the two countries; in 1800 this number was reduced to 139. In 1790 the American veasels employed in this trado amounted only to 464; in 1800 this number reached as high as 1057. In 1789, 253 British vessels engaged in this trade entered British ports from the United States, whila 358 vessels cleared in the aume trade. In a period of 10 years, up to 1799, the number that entered from the United States was reduced to 42 vessels, while the number that eleared fell to 57 . In $1806,56 i$ vessels employed in the trade with the United States entered British ports ; of these only 56 were under the British flag; and of the 5.5 vessels that cleared frum British ports in the same trade, only 39 were 13ritish.

These statistics, which are ehiefly compiled from Soybert, show an augmentation of tonagge $\ln$ the United Sitates, and a diminution in the tonnage of Great liritaia engrged in the trade between the two countries, well calculated to excite alarm among the ship-owners in England, and even to arrest the attention of the British government. And when it is considered that it was at that period-if it has not always Ireen-the policy of Great Britain to aacrifice, If necessary, the interests even of commerce and trade to the great object of strengthening her naval power, it will not be a subject of rurprise that orders in council and acts of l'arliament were issued, in quick auccession, avowedly designed to check this rapld progress of American uavlgation, nud drive American ships from the carrying trate, even as respected the exportation of the products of the United States to other countries. "Trade," suit the report of the privy council, to whom the sulject was, at this time, referred by his nujesty's orders, "was considered prinelpally as the means of promoting the employment of sbips, sml was encouraged chletly as it conduced to the one great national object-the naval strength of the ceuntry:"

It was the universal prevalence throughout lingland of this sentiment, exhibited upwarl of a century in her navigation laws, in her prohibitions and restric. tions, in her differential duties, and, above all, in her colonial system, that emboldened the frivy council to recommend to his majeaty "that, notwithitanding their (the L'nitel States') extreme anxlety for an arrangemont on the princlple of reciprocity, if Congress should jropose (as they certainly will) that the principle of equality should be extended to the ports of our colonies, anil that the ships of the Uniter! States should be there treated as Britiali ahiga, it whonld be answered, that this demami can not be admitted even as a subject of negotiation." Hence, but little could be experted from the truaty of 1794 , in which thin prinejple was earrled out to the fulleat extent of rigoroms restricton; anil hence, also, the serien of regulating orders, nity, and counter-acta, which were made the inatruments of eommerelal warfare between the twa countries for upward of a quarter of a century. It would to a tedlons task to present even a aynopsis of the different restrictive and retallatory measuec adopted by the two governments during this long period. Were it even otherwise, it woulil he super
finous $t$
both go effects sucelnet] this Dep It will trade and tlon that ures, and prohibitio cial indus nation. ployed in the navig commereia which she 15 , vol. il. whether th gation law even as a lieneficial in prosperity aldherence cited, that shackles in the enlighte Great lirita remoto perio tion amd supl men, Mr. Pit fallacies upo has demonst years, that E chant-marlue every port in nlal, for the s an unrestricte A liberal ta prime necessit even should ries, is all th present comm The present d cent. alove pr of 1815 , betwe was llmited to treaty provide and tonnuge in ports of the 13 spect to import articles being of the respectio the Ceited St American colon ions of the con in complete po such intercours canvention, the front the praym duties, only wht nry of the grow Rritish dominlo Innited States, $i$ ish ports on ter purt duties, whe cargoes consiat or manufacture this convention, "pon the shippil no excepition to
upon roummerce upun commerce they are linposed In the practic as was stated by delluered in liur? lan to another $p$ serving, appeare
fluous to go into minute details, as the legislation of both governments during thls period, as well ss its effects upon the commerce of the two conntries, are suecinctly set forth in the former reports issued from this Department.
It will, therefore, suffico to refer to the tables of trade and tonnage alresdy given, as the best illustration that can he offered of the operation of these messures, and of the total inadequacy of restrictions and prohilitions as a necessary means of fostering commerclal industry, or of augmenting the naval power of a nation. The ahlest peris in England have been employed In demonstrating that it is to other canses than the navigntion laws that Grent Britain owes her vast commercial graatness, and that naval ascendaney which she has so long mnintalned (Mcfinegon, Part 15, vol. ii., p. 1370) oud it ls a question still unsettled whether the adoption by the United States of the navigution laws and the restrictlve policy of Great Britain, even as a means of protection or self-defense, was as teneficial In its ultimato rosults npon the commercial prosperity of the country, as would have been a strict adherence to the maxim of Mr. Jefferson, already cited, thut "coinmerce should ho relleved from nll its shackles in all purts of the world." Be thls ns it many, the enlightened policy which now rules the counclls of Great Britain-a poliey which, nt thls distant and remote period in liritish history, received the co-operntion aud support of two of lingłand's greatest stntesmei, Mr. Pitt nod SIr Rohert Peel-has dlasipated the fallacies upon which past legislation wns hased, and has demonstruted already, in the brief period of five years, that Eugland can best compete with the mer-chant-marine of the world by placing the trade of cerery port in her vast douinlons, European and colonial, for the shlips of all countries, upon the footing of an unrestrieted constlng-trade.
A liheral tariff of duties, especially npon articles of prime necessity among the great masses of her people, even should they be classed in the categery of luxuries, is all that seems now wanting to perfect the present commerciul code of this powerful klnghlom. The present duty on raw tolineco ls, at least, 1000 per cent. above prime cost. The commercial convention of 1815 , between Great Britaln and the United States, was limited to four years. The second article of this treaty proviles for an equality of duties on imports and tennage in the ports of the United States nud the ports of the Britlsh territories in Europe. With respect to imports, thls equality of dnties npplles only to stticles heing the growth, produce, and manufacture of the respective countries. The intercourse hetween the L'aited Stutes and tho British West Indies and Auerican colonles is not to be affected hy nny provis. ions of the convention; "but each party is to remnin in complete possession of its rights with respect to such intercourse," Under the stipulations of this conventinn, the vessels of Grent Britain are exempted from the payment of the ertra tonnago and luport dutics, only when they arrive from, mal their cargoes arn of the growth, produce, or manufacture of, the Iritish domlnions in Europe; nad the vessels of the I'nited States, in like manner, are admitted into British ports on terms of equality as to tomagen and linport duties, with liritish vessels, only when their cargoes conslist of merchandse the growth, prodice, or mumufacture of the linited States. The effect of this convention, enpecially of its restrictive clanses, apon the shipping laterests of Great Britain, formed now exception to the general rule, that all shackies upon commerce ultimately. reruil upon those hy whom they are huposed.
In the practical consequences of this arrangoment, as was stated ly the celelirated lluskigson, in a speech delivered in Parliament, the ntherenco of Great Hritian to another part of her mavigation laws, instend of serving appeured to that statesmun to have shackled
the shlpping intereste of that country. And he thus Mlustrates his position: "An American vessel, on her voyage to England, is freighted with a cargo wholly produced in the United States. For her return to America, she may losd in British ports, with a cargo partly the produce or manufacture of any other conntry. This a l3ritlah ehlp can not do; for if a British shlp were to bring to the United States a single cask of brandy, or a pipe of wine, she wonld be liable to seizure and forfeltnre." And yet, at this very period, and up to the year 1830, the representatives of the American government were pressing upon the cablnet of England the justice as well as the policy of unrestricted commercial interconrse bet ween all the ports of the two countries, but withont anceess.

In 1818 another convention was ratifled hetween the two governments, by the 4th artlcle of which that of 1815 was continuell in force for the term of 10 years from that date; and in 1827 it was indefintely extended and contluned, either party being at liberty, on glving 12 months' notice to the other, to annul and terminate the said convention. No terms, however, would be acceded to by the British government reapecting the trade with her American colonies. A recapltutation of the various acts of Parliament and orders in council, ns well as the general history of the commerclal antngonism and reciprocal exclusion which marked thls period, leelangs more properly to the digest of our commercinl relations with the English colonial prossessions. It is true, it would not be dificult to trace the influence of thls controveray in the commercial legisintion, more particularly in relation to the tarriff regulations of theth countries, during the entire perind of its contlnuance. Still, the general subject belongs to a review of our trade with the colonles uf Girent Britnin, and to that portion of this digest reference is made.
It has been nlrendy stated that, in the convention of 1827 , it was agreed that the provisions of the convention of 1815 should the indefinitely extended and continued; but that it should be competent, nevertheless, to either of the partles, on givlng 12 montha' notice, to annul and abrogate the eald convention. No such notice has heen given hy either party, and, consequently, the convention stili remains in force. Slace that perion, however, the commercial policy of Great Itritain has tetally changed. The vast plld of navigatlon luwa which eontributed to build up her naval power, and extend her commerce to every corner of the globe, has been swept away by the reforming hand of a more llberal legislation; the whole framework of her tarlif policy has been demolished; the heavy duties on the various classea of raw material have been removed; and, with the exception of a few articles on which, for revenue parposes only, heavy dutlea are still retained, the raw produce of the world is brought to the stere-honses of her manufueturers, unineumbered with those custom-house charges whleh, lefore this perion, niserbed so large a share of the protits of thelr industry and skill.

The act of 12 and 13 Victoria, chapter 29 , passed on the 2tith June, 18.19, introduced this new era in the commercial history of Great liritain. The lending proviskins of this net, ns well as of the yarious acts, orters ln conncil, proclamations, nte., which it superseded, will is found at length in a report from the Department of State in 1853, entitled " Ex. Doe. No. 52, Senate," pages 9-16. Section 21 of this act declnres that it shall eome into operation on tho 1st duy of hanuary, 18io. Thus, it length, the ibuls of British conmerce were sreed from the pintions by which it was fetterel for upward of two centuries. The visions of Mr. Pitt were realized in the liheral policy of sir Robert l'eel's enlurged and enlightened stateamanship. This net extublishes the couprehensive principle of aimitting into tho ports of Grent Britain, or into any British possessions, gools of any sort, in a shlp of
any country, from any part of the world. Such prohlhitions and restrictions, however, as were, before the passage of this act, deemed necessary elther for the safety or for the protection of revenue and mercantile Interests, still remain in force. The following is a brief aummary of auch prohlbitions and restrictions, $s o$ fur as they affect the commercial relations of the United Statas with Great Brltaln:

Books, wherein the copyright ohall be first subsisting, first composed, or written or printed in the United Kingdom, and printed or reprinted in any other country, as to which the proprietor of such copyright or his agent shall have given to the commissleners of customs a notice In writing that such copyright subsists, such notice also stating when copyright shall explre.

Coln, viz.: False money or counterfeit sterling; sllver coin of the renin, or any money purporting to be anch, not being of the established standard in weight or fineness; extracts, essences, or other concentrations of coffee, chicory, tea, or tobacco, or any admixtures of the same; malt. Prints, indecent, or obscene ; paintings, books, carils, Jithographic or other engravings, or any other lndecent or olsscene nrticles. Snuff-work: tobacco-stalks stripped from the leaf, whether manufuctured or not ; tobacco-atalk fluur.

The following goods prohibited to be limported except in transit, und suliject to such regulations and restrictions as the Commissioners of the 'Treasury mny direct, and duly reported as groods in transit: I. Articles of foreign manufacture, and any packages of such articles lrearing any nnmes, brasula, or marks, being, or purporting to lee, the names, brands, or marks of manufacturers resident in the United Kingdoin. II. Parts of articles, viz. : Any distinct or separate part of any article not accompanied hy the other part or all the other parts of such articles so as to be complete and perfect, if such articles lie subject to duty necorling to the value thereof.

The following goods prohibited to be imported, except subject to restrictions on importation (arms, ammanltion, gunpowder, or any other foods, may be prohibited by proclamation or orler in council): I. Sill:-Manufactures of silk, being the manufactures of Europo, unless into London, Liverpool, If ull, Southampton, Leith, Duhlin, or perts appointed by the comsmisaloners, or into Dover or Folkestone, dlrect from Calais or Boulogne, and unless in ships of tot tons' burden or upwand. II. Spirits, not being perfuased or medicinal spirits, unless in ships of 50 tons' burilen at least, and in casks or other veswels, each of such canks or other vessels being of the contents of 20 galloms at least, and duly reported, or in glass inttles, or stone bottles, not exceeding the size of three-pint bottles, and being part of the cargo of the importing shlp, and July reported. III. Tobacco, innuff, Segrrs, Cigaril. Los or Cigarettos,-minleas in shipe of not less than I 20 tons' burden, and into ports approved liy the C'ommis sioners of the Customs. IV. Tolasces, segars, or snuff, unless in packages each containing not less than 80 pronnds' net weight. Tobacco and muff for private nee, in packages under the legal size, may tre adait. ted hy speelal leave of the Boarl, provided it he for the use of the person to whom it is consigned, and he inserted in the manifent and report, the application and proor being inade ly, auch permon. V, thanillos or el;garetton, unless in packages each cuntaining not less than 75 pronnts' net weight. VI. If any goods Je imported contrary to the foregoing probibitions and restrictions, the same to be furfeited.

The following are the only ports Into which tobaceo and snuff can be imported, viz. :

Eingland.-Iondon, Liverpool, Southampton, Fal. mouth, Lancaster, Whitehaven, Plymouth, Newcas. tle, Swansea, Mull, Preaton, Cowes, Bristol,

Scolland,--Glasgow, l'ert Glasgow, Aberdeen, Lelth, Greenock.

Ireland,-Dublin, Belfast, Cork, Galway, I.lmerick, Londonderry, Newry; Sllgo, Waterford, Wexford, Drogheda.

The 43 d section of 16 and 17 Victoria provides that no goods shall be deemed to be imported from any particular place, unless imported direct from such place, and shall have leen there laden on board the lomporting ship, either us the first shipment of such gools, or after the same shall have been actually landed at such place.

Section 41 (chapter 107) of 16 and 17 Victoria declares that it shall be lawful to import Into the Cnited Kingdom any goods not prohibited, and to warehouso such as are subject to duties of customs, in duly nip. proved warehouses, without payment of duty on their tlrat entering; but the duties on the fullowing goorls, and such other gools as the Commissioners of the Treasury may, from time to time, direct, shall be puid on the first importation thereof, viz. : corn, frain, meal, and tlour, and wool goods from liritish poosesssions. No goods except diamonds, bullion, lotsters, and fresh tish of British taking, nod imported in lifitIsh ships, which may be landed without repurt or entry, shall bo unshipped or he landed on Sundiys or holidays, nor on any other days except hetween 8 o'clock in the morning und foclock in the afternoon from the 1st of March until the 1st of Novemher; and hetween $90^{\circ}$ clock in the morning and $40^{\circ}$ slock in the afternoon from the 1at of November until the 1st of Murch, or during such other hours as may be appointed ly the commissloners; nor shall any gools the unshipped or landed, unless in the presence or with the authority of a customs officer; nor shall they he landed, except at some legal 'quay; wharf, or ither duly-appuinted place; nor shall any goods, after having been transhippell, le removed Into any other craft, without permission of such officer, under the penalty of forfeiture; nad if any goods shull be unshipped for the prrpose of belng landed after due entry thereof, they shall be forthwith removed to and landed nt the place at which the same are intended to be landed ; and lu default thereof, sach goorls shall lio furfeited, together with the barge or other vessel unployed.
'the master of every ship, whether laden or in ballast, shall, within $2 \cdot \frac{1}{}$ hours after arrival froms ports leyond the seas, and hefore bulk be broken, make due report of nuch ship in the form following,* or to the same effect, embracing the several particular indicated therein ; and if the cargo of such ship shall havo hecu laden at soverad places, he shall state the names of those places, in the orler of time in which the same were Inden, oppors te to the particulars of the groods so laden ; and failius so to do, or if any of the particulark containedi in such report be false, the master shall fur. feit $\boldsymbol{C 1 0 0}\left(\frac{1}{5} 500\right)$. The master of every ship arriving from ports beyond the aeas, at the time of making report, if required, shatl deliver to the collector of comptroller the bill of larliug, or a copy thereof, for any part of the cargo laden on board, and shall answer all such questions relating to the ship, "argo, "rew, nod rogage, as he shall put to him ; and in case of fail-

[^22]ure or refasal, or to answer truly, or to produce such bili of lading or copy ; or if the same be false ; or if any bill of lading be uttered or produced by any master, and the goods npecified therein shall not have been bona fide shipped on board such ship; or if any bill of iading uttered or produced by eny master shall not have been signed by him, or any such copy shall not have been received previously to his leaving the place where the goods expressed therein were shipped; or, If after the arrival of any ship within four leagues of the coast of the United KIngdom, bnlk be broken, or any alteration made in the stuwage of the cargo so as to facilitate the unlading of any part thereof; or if any part be staved, destroyed, or thrown overboard, or any package be opened, in every such case the master shali forfeit $£ 100(\$ 500)$.
A perfect entry shall be made before unshipnent, by the importer or his agent, of all goods liable to duty and intended for home use on the landing thereof, and the particulars thereof shall egree with those of the report, and any certificate of origin or other document conferring a henefit by the distinction; and whenever the value of any goods is required to loe stated in the entry, the importer or his agent shall declare to the same at the foot thereof. It is competent, under the provisions of 16 and 17 Victoria, ehapter 107, section 57, for the officers of the customs to detain goods which appear to them to le undervalued; in which case, they shall forthwith give notice in writing to the party entering the aame, and stating the value theroof as estimated by them; either delivering such notice in person, or trsnamitting it by post to the address stated in the entry; ; and the commisaioners shall, within seven days after the detention of auch goo'- determiae elther to deliver them on the entry or retain them for the use of the crown; in which latter case, they shall cause the value, as atated in the entry, together with 5 per cent. additional, anil the duty already paid, to be paid to the party entering them, in full satisfaction for sueh goods ; or, on application, may permit such person to amend his entry at such value.

Sections 66 to 73 of the act already eited require that, with each entry, two or more dnplicates shall be delivered, in which all sums or numbess may be expressed in figures, and tho number of duplicates shall be such as the collector or comptroller may require. Importers or agents willfully fasiling to comply with these regulations, so far as applicable to the goods entered by them, shall pay $£ 20(\$ 100)$. No entry shall be valid unless the goods are properly lescribed there in by the denominations, and with the character and circumstances according to which such goods are charged with duty, or may be linported either for home use, or to be warehaused for exportation only. If nny goods or other things shall be found concealed in any way, or packed to deceive the officrers, in any packnge landed in jursuance of any entry, such packnge and its entire contents shall be forfoited; and if ony goods not daly entered whall be taken or delivered from any ship or warehomse, the same shall be forfelted.

It is proviled, however, that no entry sluall be required in respect of pussengers' buggage, which may he landed, examined, and deliverod as the commissionors may direct ; bit if prohibited or uncustomed goorls he found concealed therein, bither hefore or ufter land. ing, the same shall he forfeited, tugether with the other atticles of the package. Surplus stores, not buing merchandise, nor deemed excessive, may be entered for privato use, or warehonsed for future use as ship stores, although they ran not be legally imported ns merchandise. At perts where agents for the clearance

[^23]of ships, goods, or baggage shall be required to be licensed, any person not so liceased, or duly appointed a clerk to a person licensed, acting as such agent or clerk, or, whether licensed or not, making entry of any goods without the authority of the prapristor or consignee, shatl for such offense forfeit $£ 20(\$ 100)$; but no such penalty shall extend to persons acting for dock companies, or otherwise authorized by law to pass entries, or to any merchant, importer, or consignee of goods, acting himself in respect thereof; or any clerk or servant exclusively employed by him, or by any such person in copartnership, Officers of customs may require of persons applying to transact busibess on account of othere a written authority, and, in default of its production, refuse to transact such business. Officers of customs may take samples of goods fur examination, for ascertaining the duties payable thereen, or for auch other purpose as the commissionere may deem necessary, and dispose of the asme in the manner they nay direct.

If within fourteen days after the arrival of the ship (exclusive of Sundays and holidays), the importer shall not make entry of his goods, or, having entered, shall not within that time, or within such further period as the commissioners shall direct, lnnil the same, the officers may convey the same goods to the queen's warehouse ; and whenever the cargo of any slip shall have been discharged within fourteen days, excepting only a small quantity, the officers of customs may forthwith convey such remaining goods to the queen's warehouse ; and, also, at any time after arrival, may convey any small parcels or packages of goods to the queen's warehouse, there to remain during the remainder of such fourtcen days, for due ontry; and if the duties ou goods so conveyed to the queen's warehouse be not paid within three months afterward, or within snch further period as the commissioners may direct, together with all charges of removal and warehouse rent, such goods may be sold, and the proceeds thereof be applied, first, to the payment of freight and charges, next, of duties, end the overplus, if any, shall be paid to the proprietor on his application for the same; but if such groods be of a perishable natare, the commissiouers may forthwith direct their sale, and apply the proceeds thercof : provided, always, that, if, 48 hours, or any earlier period after the report, is apecified ill the bills of lading for the discharge of cargo, the importer, etc., neglect to enter and land the same within such 48 hours, the master or owner of such ship may then himself enter and land such goods. Whenever goods shall remain on bourd ship beyond the period of 14 days after arrival, or beyond any farther periul the commissioners may allow, such ship shall be detained by the proper officer until all expenses be paid for watching and guarding such goods beyond the preseribed period, nut excecting bs. (\$1 20) per diem, nind for removal to the queen's warchouse, provided they he removed.

If goorls be removed from any ship, quay, wharf, or other place, previons to the examination thereof by the proper oficer of the customs, unless under the care or anthority of such officer; or if goods entered to be wurehoused, or re-warehoused, shall be carried into the warehonse, unless with the authority or under the care of the proper oflicer, and in such manner, by such persons, within such time, nul hysuch roads or whys as the oflicer siall direct, such goods shall be forfeited. All goorls warehoused shall be deprosited in the packuges in which they shall have been imported, excejt auch goots as are permitted to de shipped* on tho quay, or bulked, sorted, lotted, pucked, or ro-pucked in the warehouse after the landing thereof, in which case they shall lie deposited in the puckages in which they shail he when the account thereof is taken by the

* The temporary transfer of goods from oue packagu tc anether.
proper officer; and if anch goode are not so deposited, or if any alteration shall afterward be made In them, or in the packing thoreof in the warehonae, or if they thall be removed withont the preance or aanction of the proper officer, except for delivering nnder the proper warrant, order, or authorlty for that parpose, they ahall be forfelted.

All goode deposited In warehousen shall he clenred, elther for heme nee or exportation, at the explration of five years from the date of warehousing, or within such further period and in auch cases as the Commlasloners of the Treasury shall direct, unless the owner or proprictor of auch goods be desirous of re-warehouking them; In which eare they whall be examined by the proper offeers, and the duties due on any teficlencies or difference between the quantity nacertained on landing and the quantity then foynd to exist, subject to such allowances as are by law permitted in respect thereof, together vilth the neccesary expense attendant thereon, shall the mid down, and the quantity so found shall be re-warehoused In the name of the thed owner or proprietor thereof, in the name manner as on first importation.

If nny warehoused goods shall not the duly ciearel, exported, or re-warehoused, and the duties due on the deficiencles shall not he paid dow a at the expiration of five years from the previous entry and warehonsing, or within such further perlod as whall be direeted, the rame, if worth the duty, after one month's untice to the warehonse-keeper, shall, with all concenient speed, be aold eltier for home use or exportation, with or without the consent of the varehouse-keeper, and the proceeds thereof be applied to the payment of the dutles, warehouse rent, and chargen, anil the surplas, if any, be paid to the owneror proprietor, If known; but If he can not be found, the surplus ahall be carriell to the crown's acconnt, to abide the claim of anchi party on his appearing and making it good; and if such goois he not worth the daty, then, after one month's netice, the same may be exported or destroyed, with or wlthout the concurrence of the awner thereof, or the proprietor of the warehouse, at the commlasioners shall see fit : and the duties due ujan any deticiencies not nllowed by law shall be paid hy the proprietor of the warebouse.

The commisuloners of enstoms may pernitt any goods to be taken out of the warehonse without payment of daty, for auch purpose or for guch prerioil as to them shail appear expedient, and in such juantitles, and unter anch regulations and reatrictions, and with such secirity, by fond, for the due return thereof or the payment of the ducles, as they may dir rat. No warehoused goods nhall be taken or delivered from the warehouse. except upon due entry for exportation, under the care of the proper otlicers, or upand due entry and payment of the full duties for home use, exeept gools delivered lnto the charge of the searchers to be shippel as storem, in such quantities an the collector or comptroller shall allow, snibject to the regulations of the comminslomers.

Eion the entry of gookle to he cleared from the warehoume for home ase, the $I^{n}$ raon antering the anme slanll deliver a bill of entry und duplicates thereof, in like manncr and form, and containing the wame partieulars, an are herein infore required on the putry of goods to be delivernd for home une on the landing thereof, an far as the name may be applicatile, and shall pay down to the propar ofticer of the customs the full dutles thereon, not bring legs in amonnt than according to the accomit of the $\mathrm{q}^{\text {a aintity taken by the }}$ proper allicer on the firat entry, except an to the following goods, viz, : tobacco, wine, spirits, flgn, eurranta, raisins, and augar; the daties whereon, when cleared from the warehouse for home use, whall be charged upon the quantity ameranined liy weight, measure, or strength, at tho time of actual delivery thereof, unfess there is reasomable gronnd to auppose
that any portlon of the deficiency between the weight ascertained on landing and first examination, and that aecertained at the time of actual dellvory; has been caused by illegal or improper meane in whioh cese, the proper officer of customs shail make auch allow. ances only for losa as he may conalder fairly to have arisen from natural evaporation or other legitimate cause. When any deficiency ocoure in goods chargeable to pay duty according to value, the value thereof shall be eatimated, as nearly an conveniently may le, by the officers of costoma, according to the market price of the like mort of goods. No duty shall he charged in respect of any leficiency In goods entered and cleared from the warehonse for exportation, unless the officers of customa have reasonable groand to suppose that such ilefleiency or part thereof hats arisen from illegal abatraction.

No ontry for home consumption, from and after the passing of this act (customn consolidation act, 16 and 17 V'et., chap. 107), shall be received for any tiniber or wood goods in bond, for a less quantity, at any one time, than 5 loads, unless such wood goods shall be delivered by tale, in which case the entry may be passed for any quantity not less than 240 pieces; and no less quantity ahall ise delivered in virtue of any such entry, at any one time, than 1 load of such timber or wool gools, or than 90 pieces, If delivered liy tale. No pack or parcel of playing-enris iniported hite the United Kingdom shall be sold or kept for sole. without being separately inclosed in a wrapper provided by the t'ommiseioners of Inland Revenue, with wuch device thereun as they may illreet, and securely fastened, ao that such wrapper can not be opened without heing destroyed ; and persons belling or offering for aale any pack or parcel of playing-cards not separately Inclosed, etc., shall te liahle to a penaity of flo ( $\% 60$ ), and the groods to neizure.

The first and Immediate effect of these itheral re. forms, latroduced by the nets and regulations just cited, and briefiy condensed so far an they relate to forelgn commerce, is, that in largo balk nf our trade with France In now casried on by means of tramsit through Engliah poria. This branch of trate $\ln 1851$ increased the eonnmerce and ablpping of England to the extent of $011,413,195(E 2,282,639)$, and in $1 \times 52$ to the extent of $\$ 12,422,145$ ( $£ 2,564,429$ ), ${ }^{*}$ The in. creasc in liritish tonnuge in 4 years after the passage of the act ( 12 and 13 Victorin, chap. 20), was as high as $\boldsymbol{z} 60,000$ toms, and the number of mailore was augmented to the amonnt of at least 20,000 . Thus Grest Iritain heraclf derived the tirat fruita of a policy sa comprehensive and liferal. The only rentriction-if we except her turiff datien which bear with xpectal rigor upon one of our lending staples $\dagger$-which the ait of 1 isia ham left untouched, was that which related to the coasting trade of (ireat Ilrituin and her colonial dominions.

In INinI (March 16), Iond Stanley Introluced in the Ilonse of lands his bill for the repeal of the regulations which thengoverned the coasting trade of Great Itritaln. Dle was of npinion that it would he a narpon: and foollwh course of reasoning to mikk the commeme of tircat lbritain in any way depentent on the fears on inexperience of other mations. "We shoula," he remarked, " ょ" on fearle 'y and independently in our course of luproveme: ., mal thow our condibuce in the principles we adrocated by tho siberity and energy with which we cuforced them. Ily the repeal of the lawn of this country with reference to our coasting trade, there was no doult that America would, in thme, soe that it was ta bers alvantage to hohd eut to us the same lenefitn we extended to her, and the countrica woull do the same. With regard to the

bill, b contri! ond a pendes
bill, he had no doubt lt would eventually be found to contribute, in must important respecta, to the benofit and advantage of all classen connected with, or dependeat in any way on, the shlpping interests."

The preceding extract is given for the purpose of exhlbiting the motives and viaws of Britlah atatesmen in admitting fereign vessels to the coasting trade of European ports of Great Britain. The blll met with but little serious opposition; and by the uct entitled 17 Victoria, chapter 5, foreign ahlpa sre admitted to the coasting trade, aubject, as to ntorea for the use of thoir crews, to the same lawa and regulationa as British shlpa. The regulatens for this trade are prescribed in sections 1, 2, 3 , and 4 of the act. The first wection empowers her majesty to exercise In respect of ships and merchandise empleyed and conveyed in the coasting trade, like pewers as ure conferred in respect of forelgn ahlps and merchandise employed and conveyed in the over-sen trade. Section eecond aubjects forelgn ahips engaged in the ceusting trade, in respect of atores and as te other custom-house ragulatlene, to the aame laws te which British ehips, when so employed, are now sutiject. Section third equalizes foreign with British ships as to all ducs, duties, and charges whatever, the employment of pilots, and as to all restrictlons or extra charges whatever of private persons or bodies corporate. Section fourth subjects foreign stearn-vessela, carrying passengers in the coasting trade, to the previsions of the stcam-navigation act. The following is a aummary of the rales applicable te British vessels engaged in the coasting trade, 'Ad, by virtue of the act above cited, also to foreign vessels which may avall themselves of the privileges granted by the act :
"All trade by sea from one part of the kingdom to any other part thereof shall the deemed to be a coasting trade and all shipa employed therein shall le deemed coastiag ships; and if doubt shall at any time arise as to what or to or from what parts of the coast shall be decmed a passage by sea, the Commissioners of the Treasury may determine in what cases the traile by water from one place to another in the United Kingdom shall or shatl not be deemed a trate by sea."

Coasting ships confined to coasting roynge.-No goods shali be laden on hoard any ship in the United Kingdom, to be carried coastwise until nll goods bronght in such ship from parts lieyoud the seas shall have been unladen; and if any goods shall he taken into or put out of any coasting ship nt sen or over the soa, or any auch ship deviato from her voynge unless forced . unavoidable circumstances, and in either case, if the master shall not declare the same in writIng, under his hand, to the collector or cemptroller at the port where auch ship shall aftorward first arrive, he shall forfeit $\mathbf{2 1 0 0}(\mathbf{*} 500)$.

Times and places for lunding nud shipping.-If goods whall be unshipped from any ship arriving coastwise, or be shipped or water-lorne to be shipped on Sundays or holldays to he carried constwise, or unless in the presence or with the authority of the proper offlcer of the costoms, or unless at the times and places appointed, the name shall be forfeited, mud the master of the ship shall forfeit $£ 50(\$ 250)$.

Wuster to ketp a cargo-book, nud pennlties for fulse entries.-The master of every cousting ship, ahall keep a cargo-book, stating the names of the ship, the master, the port to which she helongs, and, on each vorage, of the port to which sho is tound ; and at every port of luding, an account of all goods taken on beard, stathg the descriptions of the packnges, the quantltles and descriptions of the goods, whether packed or stowed loose, the names of the shippers and consignees, so far as aneh particulars are known, and at every port of discharge elall note the daya on which any are delivered, and the times of departure; and minch master shali produce such took on demaud of any offleer of customs, who may make any remark
therein ; and If, npon examination, any package entered in the cargo-book as containing torelgn gooda whall be found not to contain auch gooda, that package, with its contenta, shall be forfeited; or If any package ahall be found to contain foreign goods not entered in auch book, such goods shall be forfeited; and If the master shall fail to keep such cargo-book, or to produce it, or if at any time there be found on board gooda net entered in auch book as laden, or any goods not noted as dellvered, be not on board, the master shall forfelt $£ 20$ ( $\$ 100$ ).

Account previous to departure to be delivered to col lector, and commiasioners may grant general transires.Befere any ceasting shlp shall depart from the port of lading, an account, in duplicate, signed by the master, shall be delivered to the collector or comptroller, and he shall retain the duplicate, and return the original, dated and aigned by him, and auch account shall be the clearance of the ship for the voyage, and the transive (pass) for the goods expressed therein ; and if any such account be false, the master slall forfelt $£ 20$ ( ${ }^{(1000)}$.

Provided that the Commissieners of Customs, whenever it shall appear expedient, may permit general transires to be given for the lading and clearance, and for the entry sad unlading of any coasting ship and goods.

Notice of arrital, excise goods and forfeiture.-WithIn 24 heurs after the arrival of any ceasting ahlp at the port of discharge, and befere any gooda be unladen, the tramsire, with tho name of the place where the lading is to be discharged neted thereon, ahall be delivered to the collector or comptroller, who shall note thereon the dste of dellivery; and if any goods on board be aubject to any duty of excise, the same shall not be unladen without the authority or permission of the proper officer of exciso; If any goods ohall be haden or unladen contrary to any net relating to the customs, such goods shall he forfeited.

Officers may go on board and examine any coasting ship.-Any officer of customs may go on board and search any coastiag shlip, and examine ali goods on bourl, and all goods then lading or unladiag, and demand all documents which ought to be on beard such ship; and the collector or comptroller may require that such documents shall be brought to him for ln spection; and the master refusing to produce auch documents on demand, or to bring the asme to the collector or comptroller when required, shall forfeit $£ 20$ ( 100 ).

Eremptions from coasting regulations.-Steam vessels and muiling vessels employed in the conveyance of passengers and their haggage ceast wise, are to be placed precisely on the smine footing, and in neither case are the baggage and effocts of passengers to be suljected to conat regulations, or the veasels to tonuage duty ; and all articles of apparel and heusebeld forniture, tiquors, and provlsiens, taken by passengers for their privute use, or small quantitles of shop gools taken by tradesmen, passengers on board such vessels, are to be considered as baggage, and exempt from const reguiations; as are ulso exempt packages, live fish, chippings of granite, cobble stones, whin stones, kelp, Kontish rag stones, flints picked off land, pebbles, gravel, and chalk, faggots or bavins for bakers' use, hay, straw, fresh meat, soap, ashes for manure, conl-ashes, iron-stone, and all stone quarried ln the country; benes for manure, bricks and British tiles, slates, antive timber, and wood for plt-props and sleepers, also china clay. It is net known positively how many nations have se far reciprocaced the coasting trade privileges thus granted by Great Britain to forelgn nations. On the 6th day of February, 1855, Tuscany entered into a convention with Great lbritain for that purpose. The tirst article of thia treaty stipulates that the sulyjects and ships of each of tho high contracting partlea shall enjoy in the dominions

## GRE

and territories of the other the aame rights with reapect to the coanting trade, and shall be treated in ovary case with regerd to that trade in the aame manner as native subjecte and nutional vessels. A simHar treaty was negotiated with Sarilinla, March 22d, 1855. So long, however, an the reatrictiona with respect to the colonial coasting trade continue in force, it in very doubtful whether any of the great commerclal nations of the world will be diaposed to abolish or relax their present cousting trade regulations. As respecta the Unlted States, there would be no equivalent whatever.

The effect of the aet of 1854, opening the consting trade of Great Britain to foreign vessels.--During the month ending July Eth, 1852, the tonnage entered inward (in all Britioh European ports), in the consting trale was $1,044,862$ tons. For the aame month in 1853, it reached $1,097,472$ tons, and in the correspond1 gig month of 1854 , it was $1,069,384$ tons. The ciearascea outward (in the aame trade), for July, 1852, were 1,131,561 tons; for July, 1853, 1,196,188; nnd for the same month In $1854,1,189,513$. With but one or two exceptions, the whole of the tounage given abeve was Britlsh; a fact which a comparison of the figures representing this trade during the mame month in 3 consecative yenrs, as given in the Ilritish official returns of trade, will at once exhihit.

The following condensed sumnary will explain the regulations whleh must be complied with hy every veasel, from the period of arrival in port until her diseharge is completed; and with respect to exportations, the necessary proceedingn from the entry ontward until the vessel'a final clearance, will also be Indicated. They are presented somewhat at length, кo that a comparison between them and the Vnited Staten' custom-house regulations and laws may be the more easily made.

Importation, as legally defined, taken piace lmmediately the importing ship comes within the limilts of the port, and the "time of a ahip's arrival" in that at which the report thereof shall or ought to have been made. Exportation ia, In like manner, determined to be the time at which goodn ahall be shipped on lroard an export vensel; and tinal ciearance, the time of her departure. The master of every $n$ chant vessel, within $2 t$ hours of entering the port of arrival, is bound, under a penalty of $£ 100$ ( $\& 000$ ), to repurt his carge to the chlef ufficer of eustoms. The chief ofticer of any ship in commission from her majesty or any foreign State, having foreign goonls on bonril, is required, in like manner, to deliver an account in writing ander hia hand, and to the best of his knowledge, of the description and particulars of such gooda. Hefure, however, the master is allowed to report, he must declare before nome person duly authorized lis the postmaster-general, that he has delivered at the pestoffice all letters that were on !waril his whip. And, likewise he must, under a penalty of $£ 20$ ( $\mathbf{~} \mathbf{*} 100$ ), anil tho further sum of $\mathbf{\Sigma 1 0}$ for each alien mot inciudonl in the declaration, truiy decian to the number of adiens on hoard, or landel from his ship. At the time of making his reqort, the master is to deliver, if required, to the collector or eomptrolier, the bill of lading, or a copy thereof, for every part of the cargo. and to answer such questions as shall lee put to him, as to the abip, cargo, erew, and voynge, The manter, officer, erew, or passengers retalining letters after the delivery of the mhip's letters at the just-oftice, shall forfeit 85 ( 625 ) for each letter; and for detaining letters after ilemand by the officer of customs or person authorized by the jewtmaster-general, $£ 10$ (*50) each.

So noon as a vessel has reported, the importers, agenta, or consigmeen of the cargo, having beeen ndvised by recelpt of billa of lading, or other iotimation may each enter their several goods. A intitude of 14 daya is allowed by law for this purpore; but, In order
to clear the vessel more apeedily, olght ontries are permitted to the master or owner of any ship lying alongalde tha legal quaya, or nufferance wharvsn, seuth of the Thamea froin London bridge eatward to Duck-head-the regulations and legal provisions given in the summary are these that are followed at the port of London, hut the general regulations are the same at other ports-under auch general deacription as in contained in the report, for any goods that shall not have been entered by the owners thereof withlu forty-elght hours from the day of the report (or earlier, if a briefer limit of time be set forth in the bill of lading), upon condition that perfect entry bee made by the proprietor within one month from the date of landing. Goode so circumatanced are only labie to seizure from inacearacy of entry after the lapae of a month. When a value is required to be stutcl, the luporter or his agent Is to subaeribe a declaration verifying such value; and false dectarations render the party making them lialife to n penalty of $£ 100(\$ 600)$.

The following tuhuiar etatement exhibits the port chargen at the principal ports of England, scotiand, and Ireland, condensed from official at..noritiea :

The act of 6 and 7 WIlliam IV., chapter 79, enacts that, from the first of January, 1837, all British and forelgn privileged veasels, not wholly in ballast, whlch shall pass any Seotch light-house, or derive any benefit therefrom, shall pay one cent per ton for each time of passing.

Jrish Lights.-Forelgn vessels, one cent per ton for each light passed, except harbor lights, which are only chargeable to veseels entering the ports within which they are sltuated. Iritlsh and Irish, and equalized vesaels, half a cent per ton (quarter cent If in ballast) for each light, except as above, with a duty of 24 cents on every "entry, cockot (a duplicute ehipping bill), or warrsnt," when from forelgn ports, but not otherwiee. The charters of most of these private light-houses suthorized the levying of higher fees from foreign than from Uritish shipplng. When England, thorefore, entered into reclprocal treatles with forelgn powers, the government had to make these light-houses compensation for the dininution that consequently took place $\ln$ the charges on foreign shlps. The 'rinity corporation, however, has long since surrendered its right to such compensation, and tho act 6 and 7 Wi lian IV, forbids auch compensation being made thereafter.
rilotage.-Pilots are established, in various parts of the kingdom, by ancicnt charters or by particular statutes. The most lmportant of these are those of Trinity Ilouso of Deptford St rand; the fellowship of the pilots of Dover, Deal, and the Isle of Thanet, commonly ealled the Cinque I'urts pilots; and the Trinity Ilouse of Hull and Neweastlo. A corporation for the regulation and licensing of pilots in Liverpool was estalifished by 5 George IV., chapter 73. The law provlden, also, that no veseel in the coasting trade is to pay for less than elght feet of water, nor any vessel to pay for odd lnches under half a foot. No coasting vessel, inward or outwarl bound, of the burden of 100 tons and upward (unless she he in balhast), is to refuse a phlat, at option, as the master or ownor is to pay foll pilotuge if one be offered.

Ilarbor and Dock Dues-Foreign Trade. (Peract 51 George III., chapter 5.)-All parts of Europe to the northward of Cape Finisterre and to the west ward of the North Cape, and without the Cattegat and Baltic Sea, nud including the ishunds of Guerusey, Jersey, Aderney, and Sark, the l'aro Isles, and Jceland, is cents per ton.

All ports within tho Cattegat and Bnitie, ineluding the whole of Sweden, the Whito Sen, und al' ports to the eastward of the North Cnpe; all ports in Europe to the southward of Cape Finisterre, without the MedIterranean, Newfoundland, Greenland, Davin's Straits, Cumaries, Western Islands, Madelra, and Azores, 24 cents per ton.

All ports on the east const of North America, the West Indies, the east cuast of South Americn, to the northward of lio do la Plata, huclusive; all parts of the west coast of Africa, and islunds to the northward of the Cape of Good llope; nnd all ports within the Mediterranean, including the Adriatie and Illack Seas and Archipelago, the isfands on the Archipelago, tho islands of St. Melena, Aseension, and the Cape Verd lafamds, 36 cents per toll.

All ports in South America to tho south of Jio de In Plata, in tho Paeille Ocenn, in Africa and Abia, to the eastward of the Cape of Good llope, 36 cents perton.

For more complete information respecting the port charges, etc., of the various count ries alove montioned, see articles under the hoads of these countries.

Anchoraga-Manicipal Corporation Girant by I'urchase from King Charles the First.-On elnnses one, two, and three, 24 cents per veasel. Classes four to seven, 30 cents.  to the liant Indlen, $\pm 9,127,656$ ( $4 \cdot 15,637,780$ ). The princial limports were graln and tleur, cotton, wool, wood, timber, deals, and staves; wine, butter, tea, and tallow. The principal exports were cotton goods, cottun yarn, woolen gools, linen, silk, woolen yarn, millinery und haberdashery, apparel, hardware and catlery; iron, unwrought and wrought, earthenware and pittery, caals and coke, and tin. The number of vesseis entercd at ports in Fingland during the year 1853 was: British, 10,345 , with an aggregate of $1,933,-11$ tone ; foreign, 16,509 , with an aggregate of $2,953,018$ tons. Of the alove, there entered the port of Lomlon 30:33 British, mensuring an aggregate of 361,342 tons ; and 5058 foreign, with an aggregate of $910,55^{2}:$ tons. The entries at Liverponl were: tritish, 1524 vensels, measuring 488,405 tons; and forelgn, J682 vessels, with an agregate of 787,10011 tons. The number of vessels engaged in the forelgn trade entered st ports in Scotland during the year $1 \times 53$ was: I Iritlsh, 1863 , with an aggregate of $\mathbf{4 0 2 , 8 7 2}$ tons; farelgn, 2503 vessels, measurlig in all 289,752 tons. The total number of vessels that entered the ports of Irvland durimg the year $1 \times 53$ was: Iritish, 1159, measuring 24,842 tous; and fureign, 1195 , with an aggregate tonnage of 237,409 tons. In the ports of the Ide of Man and the Chanuel islands, there entered during the sanse year: in the former, British vearels, 7 I aggregate tonnage, 952 ; foreign, 31 ; aggregate tonnage, 3404 ; in the latter, Brilish ressels, $100^{-2}$, with an argregate tonnaye of 48,141 ; foreign vessels, 213 , with an aggregate tonnage of 14,852 . The total nunlier of stenu-vessels that entered the ports of the United Kiugdom dariug the yenr 1803 was: Ilritish, 396 ow , with an aggregate of $1,171,911$ tons ; foreign vessels, 821 , with an aggregate of 158,812 tons. The number of steum-vessels that cleared from all the ports of the United Kinglom in 1853 was: British, 3594, with an aggregate of $1,067,381$ tons; foreigu vessels, 507 ,
measuring in all $\mathbf{1 6 8 , 1 8 4}$ tons. In 1864; the official value of Imports Into the United Kingdom vas $£ 124$, 888,478 ( $6821,692,390$ ) ; and of exports from the United Kingdom $£ 29,821,656(140,108,280)$.

A new nystem has been introduced Into Great Britain of elving in the nnnual returns of tratie, the "reul" inatead of the "officlul" value of lmports and exporta. The standard of the latter having olitained, without any change or alteration, for a period of more than 200 yearr, could be of but ilttle lenefit in comprating the value of the furelign trade of Great Britaln, and has been allisered to so long nolely for the purpose of nupplying data for general comparisen. The real value of the imports and exports above given la thus
 A115, 833,704 ( $1520,10 \mathrm{~B}, 520$ ).

In the preceding pages, the lawa, regulations, and customs of a permanent character, which constitute the commercial legislation of Great Iritain as reapects her Intercourse with the United States, have been succhactly stated. Vurious modifications in tariff duties, navligation laws, etc., have necessarily resulted from auch changes commercial legialation as ars invariably incldent to a atate of war. These have, In aubstance, been noticed elsewhere, so far an they have come to the knowledge of the Department. They are, however, gencrally limited in their duration, and are designed either for financlal or protectlve parposes during the conthuance of the present difliculties with Kussia. It is not deemed necessnry, therefore, to lengthen this digest by any detailed enumeration of sueli modilications, for the reason that it is to he unticlpated* that all such temporary modifications, demanded ly the exigencles of whr, will ere long hava Ifeen superseded liy the permanent commercial legislatlon of the United KIngilom.

In 1787 there were imported into Great Iritain $22,600,000$ pounds of cotton, oltained from the followIng sonrces:

From tha United Sintos. $\qquad$
The following tables have been complied from the official reports of the United States' Treasury Department, and are entmitted for the purpose of illustrating the commerce between the United States and Great Britain, especially with reference to our lending staplas, during a period of 26 years.

The first table exhibits the quantities and value of cotton exprorted from the Linited States to Great Britain during the periol indicated. Generally speakligg, the imports of cotton inte Great Britain are concentrated at tho prot of liverpol. This is shown by the nnnexed table, oxhiliting the imports of cotton into Great IBritain in $1 \times 5 \mathrm{~s}$ :

| 3nto | Bales. | Tons. |
| :---: | :---: | :---: |
| Liverpoul. | 2,205.738 | 365,000 |
| Isandon. | 43,700 | N,000 |
| 110 ll and liristol. | 27,200 | 8,140 |
| scotland. | 75,700 | 18,40) |
| Total. | 2,937,8ik | 891,006 |

The imports into liverpol of raw cotton during a period of 10 years, ending with 18,5 , were as follows:

| Yrate. | Hales. | Tons, | Years. | Hates. | Tous. |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1543 | 1,56\%,597 | 260,040 | 147 | 1,546,000 | 202,000 |
| 154 | 1,400,954 | 218,000 | 1-19 | 1,782,7(4) | $25 \times 1006$ |
| 1355 | 1, 9 \%2, 781 | 276,010 | 1*50 | 1,578,100 | 963,000 |
| 1846 | 1,184,194 | 159,000 | 1851 | 1,748,046 | 291,000 |
| 1347 | 1,057,063 | 1,2,000 | 1.52 | 2,205,743 | 863,000 |

The countries from which the cotton was imported in 1852 are given in the following table, which will also sorve to show the relative importance of liverpool

- Thia has been realised alnce the above was written.
ts compared with other British ports, as the great em porium of the cotion trade: !

Before giving the general table of exports of this staple to Great Britain, the following summary, condensed from a treatise on the cotton crop of the United States, etc., recently puhlised, will prove interesting. Provious to 1791, Great Britain obtained her anpplios of cotton from the West Indles, South America, and the countries around the eastern parts of the Mediterranean. In 1784, there were 71 lags shipped frum
the United States to Great Britain, and there seized, on the ground that Americe could not produce 50 much. See Cortor.
. In 1853, Greut Britain exported upward of 147,000, 000 pounds ; of this upward of $82,000,000$ were derived from the United States, end over $59,000,000$ frm Indis.

The returus of trade for 1855 show that notwithatanding the war, the consumption of cotton in Great Britain from 1st January to 81st August was $1,449,980$ bales, against $1,289,300$ for the anme period in 1854, g ving the large increase of 160,780 bales. The stock in Liverpool on 31st August, 1855, was 269,820 bales less thai in the 31at August, 1854.

From the East Indies, Great Britain imported-

Tobacco Trode betreen the I'nited States and Great Britain.-It is ascertained, by liritish statinticians that the yearly consumption of tolsaceo in Great Britain and Ireland amounta to 26,000 tons, about one half of which it in supposed is anuggled, owing to the excessive dutlea (upward of 1000 per cent.) levied on the sticle under the tariff syutem of that kingdom. The quantity of segars and anuff imported does not exceed two or three hundred weight per annum. The foilowing table, compiled from parliamentary returns, shows the importa of tolnacco into the United Kingdom, and the quantities entered at each port, during the year 18in):

 the Vniten Kingion or fiaeat likitain and lagLAND, YROX 1801 TO ISBS, INCLTHIVK, DKSIONED TO AHOW ting oenghal Fombigs Trade of that Kinodom wede inu tie Pigion ngeionated.

Jaurs and Itrguhatims Rehtrier to I'ussengers' Dagyage in England ond the C'nited States, Exphawed and Cem-pared.-The laws and Treasury onders regulating the admienton of laggage, personal effectr, ete., Into the ports of Great liritain and of the United Staten, reapectively, aro based upon principlen so totally disnimillar, that a comparative vlew of toth can only to presented by extibiting a aynopsis of each. The pol-
icy of Great Britnin would seem to be to restrict the privilege of free entry to such articles of vearing apparel as have been worn, and not made up for the purpose of being iutroduced into the country, free of duty; while the reguintions in foree at the different ports of the United States exhiblt a spirit of the utmost liherality in that regard, enabling passedgers, whose "bagrage and personal effecte" have leen lionestly made up, and faithfuliy manifested, to proceed to their destination, without delay or coest, or leing subfected to the many thouaand vexatious annoyances which a leas liberai poliey, in regard to "pmasengers' bnggage, personal effecta," etc., must inevitabiy produce. The American poliey on thia subjeet is, beesilies, bighly benelicent to the large classes of emigrants whe seek an asylum on our shores, literaliy carrying with them their "hed and baggago," their weasing. loons, apinuing-wheola, and other articies and impie. ments of handicraft, all of which are admittel, under the tariff act of 184t, free of duty.
In the United Stater, the nimiankon of personal lag. gage, etc., is regulated by schedule one, Tariff Act of 1841, and of various decinjons of the Treasury Depart. ment aubaeqeuntly ianued. The several provisions of the alove-named schedule, and of the Trensury decis. lons, may be classified as foliows: 1. Household ef feets, old and in use, of personn or famiiies arriving from forelgn countries, if used alroad by them, and not Intended for any other person or persons, or for sale, free. 2. Wearing appurel, in actual uso, and other personal effects, not merchandize ; professional Leown, lmplements, instruments and tools of trade, ocenjution, or employment of persona arriving in the l'uited Statea (provided that thits exemption shail not extend to or include machinery or other articles ins. portell for use in any manufacturing eatahlisiment, or for sale), free, 3. l'ersonal and household effects (not merctiandise) of citizens of the Vnifed Statey dying aliond, free. Tho exempition from duty cont ennpiated hy law iu the linst clause, alove cited, muat he conflined to such artictes as are generally used ta howekeeping, andi $x$ hich had actualiy been in une ing the indio vidual or funiiy while Iving alrond, and wini impurted for nale, barter, or trafic. Tha exomption srom duty of wearing aiquarel, and other personal elliects, provided fur in tho recond elaune yuoted, must bo contince to such articles as are penerally used on or alwut the person, and nat connidered as merchandise; the articles admitted under this clause to the limited to an ex. tent aot exceeding in number, quantity, or value whal Ia usaal for a traveler, or uther gresson, to wear, keep,

Regulations as to Passengers' Baggage, Personal biffects, etc., in Great Britain.- $H$ Honrs of attendance st the difforent baggage warehonses ns followe: From 1st March to 31st October, from 8 o'elock A. M., antil 7 o'clock P. M. ; and from 1st November to 28th Fobruary, from $9 \mathrm{~A} . \mathrm{M}$. untll 5 sim .
After all baggage shall have been landed, those passengers having only single packages will be entitled to have them first examined ; the remaining passengers will then be ealled into the examination-room in rotation, according to the list furnished by the captain [paspengers thomaelves mist ese that their names are properly inserted in the captain's list]. All wearlug apparel, after exsminntlon, will be Immediately delivered, provided it appears thint the apparel has been zorn, and not made up for the purpose of being Introduced into the United Kingdom without payment of duty. All dutiable articles forming a part of paesengers' baggage will be delivered inimedintely efter exsmination, on the smount of dutlee duo thereon belng dejosited with sach accredited person as may be nutherized to recelve the asme, and slao a emall aum for passing the entry, All merchandise lrought with baggage is liable to seizure. Such goodn mist be ragulsriy reported and entered, and the regulatione of the law strietly complied with. If any passenger ahall, upon being questioned by the proper officer of customs, deny that he or she has any goods llable to duty in his or her possession, and euch gools loe subsequently tllscoverel, they will lee lable to seizure, and the passenger to a penslty of treble the value thereof.

Fereign newspapers found in tho bagigage of passengers, if bound, are to be charged with duty as "goods manufnetured," 10 per cont. ad ralmem; if unbound, they are duty free. Fowling-pleces, the property of parties retarning to Englund, may te delivered free, upon deelsration thut they are of Jritish munufuctare. A pair of platols, a oingle rlfle, or a aingle fowliugpiece, brought by a pussenger with his baggage, may be dellvered duty free, upon a declaratlon that the same is for private use ouly.

Duty is not to be charged on any quantity lean than a pint of onlmary drinkable aplrits, of whatever strength; or half a pint of eall de Cologne, or other conlial water, or any medlicated or perfimed aplrits ar ligururs, luported for private use. Passengera who ate not frequent vistora, may inelude with their binggage, entliled to free cutry, an mmonnt of segars or manufactured tobaceo under the weight of half a pound. On half a pound nud upward the dity on the whole weight in to be charged. l'ussengers, however, from the West Indies or other long voyages may enter muy quantity of seggars or manufuctured tobnceo not exceeding eovan pounds' welight. Ilooks nud musical instruments, though for private ine, nre dutialile.

All packages of lagggage landed by "snffarance," when not eleared from the examining floor of the atation, at whieh they may linve heen landed, within rix working dn*s, are to be forwarded to the queen's warchonas for security of thatles. l'assengers who may be unwllinge or unable to clear auch artieles of baggage as may be lialile to duty, cun either abandon the same, or they may be left in tha queen's whrehouse for eix months, In erder ta give thelr propirietors an opportunlty of taking them lonek without payment of duty.-llekdell's British Tariff; 18b4-'5, pp. 82 to 87.

Regulations relative to the Entry of Vessela into the Ports of Great Britain and of the United States com-pared.--Vessols entering any ports in Great Britain are subject to the following regulations, vls. : So soon as a vossel has reported, the importers, agents, or conslgnees of the cargo, having been sdvised by recelpt of bille of lading, or other Intimation, may each enter their several goods. A lstitude of 14 days is allowed by law for this purpose; but, in order to clear vessels more opeedily, sight entries are permitted to the master or owner of any ship lying alongside the legsl quays, or sufferance wharves, soath of the Thames from London Brldge enstward to Dockhead, under such general description as is contulned in the report, for any goods that ehall not have been entered by the awners thereof within 48 hours from the day of report, upon condition thst perfect entry be made by the proprietor withln one month from the date of landing. Goods so circumstanced are only liable to seirure for inaccuracy of entry after the lapso of a month, or after the proprietor's perfect entry has leen passed. If perfect entry be not made at the end of a month, or a delivery order obtained, the goorls may then be sent to the queen's warehouse, and dealt with as if landed by "bill of sight."-I3. M., 1st June, 1850.

The master of every merchant-vessel, within 24 hours of entering the pet of arrival, is bound, under a penalty of $\$ 500$, to report his eargo to the ohlef officer of customs. Before, however, the master is allowod to report, ho must deolsre, before some person duly authorized by the postmaster-general, that he has deliverad at the post-office all lettere that were on bsard his ship. And likewise, he must, under a penalty of $\$ 100$, and the further sum of $\% 50$ for each alien not included in the deciaration, truly declare to the number of alions on board ar lsnded from his shlp. Gools generally are liable to seizurs for heing landed without entry; and packages uncleared from tho queen's warehouso are sold after the expiration of the tollowing perlods, via. : Merchandise, 3 months ; passengers' bagguge, 6 monthe ; and ships' surplus storea, 12 monthe. 1f, after the arrival of any shlp within four leagues of the coast of the Unitelk Kingriom, bulk shall be broken, or any alterution made in the stowage of the cargo of such shlp so as to facilitute the unlading of noy part of such cargo ; or if 'any part be staveil, destroyed, or thrown overboard, or any package be opened, unless accounted for to the aatiafaction of the commissioners of customs, in every such case wueh master slall forfeit tho sum of $\$ 500$. For willfully muking a false report, or if the particulars, or uny of them, of anch report be false, the mastor aliall forfeit the sum of $\$ 500$. ( 16 and 17 Vetorin, chap. 107.)
lly the act of Congrese of March 2, 1199, masters of vessels are required to proluce n munifest of cargo on loord, on the arrival withln four leagues of the coast of the United Staten, to sueh oflicer of a revenuecutter, or othor oflieor of the enstoms, us shall first come on board sach vessel, fur his inspection. The law requires that the manifent whall be in writing, slgned by the master of nuch vessel, and shall contalin the name, descriptlon, Imild, and true tonnage of such vessel, the place to which ahe belongn, with the names of the owner or owners, the name of the master, the mumos of the places where the goorls ahall have heen taken on boarl, and the places wlthin the linited States to which they ure respectivoly consigned, partienlariy noting the poods dentined for cach place respectively; und a just and particular necount of all the gools so luden on boari, whether in packngee or ntowed loose, of any klal whatever. The uamen of the passengers on boari, npecifying the umbler and tescriptlon of prekages belonging to each, together with the remalnIng sea-storen, if any, are to bo truly stated. If any goods be imported in any auch vessel without laveIng a manifest on lsoard, ngreable to the foregoing directlons, or which shall not be included thorein, or
shall not agree therewith, the maater of auch vesael shall forfeit and pay a aum of meney equal to the value of the gooda not in luded therein; and all auch merchandise not included in the manifeat, belonging or consigned to the master, mate, officers, or crew of anch vessel, shall be forfeited. No addition, orasaro, substitution, or aiteration whatsover, can be made in the manifest of the cargo of any anch vensel after her arrival within four leagues of the coast of the United States, without suhjecting the master of auch vessel to the penalty of the law. On any veasel arriving from a foreign port, the master ia to report to the collector within 24 hours after his arrival; and within 24 hours thereafter further to report, in form, all the particulars required to be inserted in his manifest, and shall declare to the truth of auch manifest. No vessels permitted to enter until the master ahall have delivered all letters directed to persons within the United Statea, Merchandise unladen without permit from the proper officers of the customs to be forfeited; and the master and mate, each, forfeit $\$ 1000$. Before departure for a foreign port, the master of every vesael munt deliver to the collector a manifest of the whole cargo and the value thereof, and obtain a clearance, rnder the penalty of $\$ 500$.

Colowial Posecssions of Great Britain.-As a necessary preliminary to a clear exposition of tho laws and regulations which govern the existing commercial relations letween the United Statea and the colonial possessions of Great Britain, it will be necessary to take a brief retrospective glance at the rise and progress of American commerce, from the earliest nettlement of the colonies down to the present perior. Aithough these preliminary remarks will be more especiaily adilressed to the commercial intercourse between the United States and the colonial possessions of Gireat. Brituin in North America, the: will equally apply to ail the other porsessions of that power throughout the worid, by reason of the general appulication of that liberal and enlightened wyntem of commercial policy adopted by the British l'arliament in 1849, and inaugurater as the future commercial law of that kingriom on the 1st day of January, 1850.

From the earlient settloment of the different cc'onies on the North American continent by the governments of the Old Worid, a myatem of colonial legislation, similar in effect, and oppressive in operation, was commenced lyy each, reapectively, prohibiting all commercial intercourse with any other than the mother country, and reudering the infant colonien drpesident on her alone for the supplies neceasary for their sulssistence and conifort. The effects of such a policy were son exhibited in the anomalous and destitute conditon to which the earlier colonista were reduced. Carrying with them, as they did, into the newly discovered widernesa of the western coutinent, that adventurms and enterprising mirit which had led them to forsake the homes of their chijibooni, nid to brave the periis of a voyage acroan the Atiantic, it may easily be imagined, that they didi not quictiy nubmit to an ilibieral and short-nighted poilicy, which reducerl them to a condition of Induntrial and commercial vassalage that had well-nigh crushed overy effort to develon the abundant treasures which naturn had wo lavishly wpread before them, and which, under a different system, would noen have brought within their reach the rich exclanges of an extensive commerce. They were, in the language of one well maquainted with our earlier colonial history; "preventel from manufacturing for themselves, or from engaging largely in whip-buiding or commerce; isolating them from the reat of the worid, leaving them ne trade exeept to the mosher country."

The selfish ami monopolizing mpirit which governed the liritiah leginlature in the enactment, as well as in the rigoroan enforcement, of these restrictions on the colonies which ahe had pianted in North America, may
be understood from a remark elicited from Iord Chatham by a remonatrance against this oppreasive policy, to wit: that "the British imorican colonies had no right to make even a nail for a horse-shoe." "In and out of Parliament," enys the Treasury report of 1832, "as a political right and an national privilege, an ahsolute monopoly was demanded for supplying the coloniea with every article of consumpton, and of tranaporting the whole of their produce to Europe."

In the charter of Virginia there was an expresa stipulation empowering the colonists to carry on a direct intercourse with foreign states. This privilege naturally drew their attention to the cultivation of the soil, and to the prodiction of auch articles as would be most likely to tind a foreign market, and yield them such returns as were most suitable to their condition and their necessities. Accordingly we find them, at a very early period, successfully ongaged in the cultivation of tobacco. This article found a ready demand in the markets of Holland, and warchouses were soou establinhed for its reception at several of the principal ports of that republic. This privilege, however, was not long jernittel; the British merchants, stimulated by an unworthy spirit of cupidity, soon perceived the advantages which this direct trade bet ween the colonies and llolland conferred upon their commercial rival, and at once adopted active measurea $h$ suppreas it.

The interesta and power of the British government were appenled to, until, with a total disregard to the necessities and claims of the colonista, and in palpabile violation of the rights and privileges guarantied to thera by nolemn compact, they were forbidilen to carry their produce to Ifoliand or to any other foreign country, and were compelled to shiji direct to liritish ports, and commit their commercini operntions exclusively to the management and contrel of liritisin merchants.

Seversl acter of Pariannent follucied, prohibiting sli foreign trade with the colonics, and rostricting them to a direct interconne with the mother country. The first act which indicated the future policy of Great Britain toward her colonien, and bore with much severity upon their industry and enterprise, was that of 1650 , rentricting their trade to Iritish or coloniai-built ships. This was the commencement of the system begun by Oliver tromwell, and continued with aa. abated rigor down to the period of the lievolution.
The act of $16 \mathbf{o b l l}^{\prime}$ was followed by another passed during the reign of Charien 11. (1660), prohibiting the exportation to any foroign country, of certain enamerated articles, the prodace of the colonies, and requiring that vesmeis laden with anch artleles shenh proceed direct from the colonies to a British port. Non-enu. merated articles, including lish, salted provivions, grain, flonr, atc., could, for a period, be carried direct to any port in the world-a privilege, however, which was aulisequently materialiy abridged; but, lest the diejendence of the colonies upon the mother country whould be in any degree relaxed, the return cargoes were, with the excejtion of malt, to be relanded in England for reshipment to the colonies.

The policy which dictated thia restrictive measara was renderedi still more oppresslve by an art jussed in 1663, proviling that " no commodity of the growth. profluction, or manufacture of Europe whall be im ported into the ibritints plantations, but such as are laden and put on boani in lingland, Wales, or llerwick. upon-Tweed, and in liuglisi-built shipping, whereof the master and thrue fourtine of the crew are linglish,"

Under the haneful intiuence of thin aystem of un. wise, unjust, and apipressive iegislation, it nusy seem aimost Incredilie that the colomies should have been able to maintalin any mivaucentent in commerer, population, or wealth; get, If we follow them in their ntrugulen and privations from the commencemeat of thla biliberal and unjust policy, during the Comenonwealth under Cromwell, down to the perion of the

Revolution, we shall find them steadily, thongh slowly, increasing in all these elements of a nation's prosperity. This was mainly attributable to the privileges of cemmercial intercourse between the colonies themselves, continentai and insular, which was permitted to thein as a part of the Britieh dominions. To this unfettered and profitsble trade the American colonies were chiefly indebted fo: whatever commercial progress they had made prior ts the Revelution. The following table exhlblts the extent and value of this trade in 1769 : Imports, $\$ 18,000,000$; exporte, $\$ 12,000,000$; total, $\$ 25,000,000$. Of this aggregate of trade, that with the West Indles atood thus: Exports, $83,700,000$; imports, $97,950,000$; tetal, $\$ 11,650,000$.

At the commencement of the revolutionary war, the colonies enjoyed the privilege of trading with England, the liritish West Indles, and that part of Europe sonth of Cape Finisterre; and though oppressed by anjust exactions, and burdened by lliheral reatrictions, they unt only contributed to the wealth and material prosperity of the mother country, but gave every promise of thriving, and achieving n name of thoir own.-Dre Bow's Review.

During the revelutlonary war, all commercial operations were auspended, nnd the peace of 1783 found the trade of the new thirteen independent soverelgnties in a most feeble and langaiahing condition. Their independence made them a foreign conntry to the North American and West Indin colonles; and by a rigorous syatem of colonial non-intercoure, they were cat off from ali trade wita those who were their natural commercial neightors, and, prior to the Revolution, their most profitable customers.
The exhausted condition to which the severnl States were now reduced rendered the first few years after the ciose of the war n peried of the most intense solicitude. The confederated States were fully sensible of the absoiute necessity of opening a foreign trade, and especiaily of recovering their lost intercourse with the Iritish West Indies; but every proposition to that end, urged through their accreatited ministers, was met by a decided refusal.

As early as 1783, Mr. Pitt, then Chancellor of the Exchequer, proposed a bili in the British Parlinment based upon the liberal principlo of "almitting to nil the ports of the lritish doninions American vessels loaded with gools, the growth or produce of these [the United] States, on the same terms as liritish vessels and goods," but the prepesition at once startied the fears of the Iritish merchnuth, who, with the aid of Lori North, Mr. Fox, and Lord Sheftield, succeeded in trinsferring the whole subject to the discretion of the king anl his conncii. The consequence wns, that an order was immediately issued, not only excluding American vessels from ail participation in the colonial trade, hut prohithiting the exportation from the United States of provisions and fish, even in Uritish bottoma.
Two years after Mr. Pitt's unsuccesaful motion for reciprocal trade bet ween the deminions of Great Britain nud the United Staten, John Alams, American minister nt the court of St. Jnmes, was instructed to renew the proposition; but it met with no more favorabile recpption than it did in 1783, lard Liverpool decharing "that lt ceulii not be ndmitted even as a subject of negotiation."
In 1789 , another effort was made by the United Stater to negotiate with (ireat IIritain a commercial treaty, partionlarly with reference to the coloninl trude, hined nipon principles of a more liberal reciprucity.
Mr. Morria, then in Janion, wan especially instructel to efiect, if ponaible, a negotiation admitting American productiona, in s-merican bottona, into liritish Nurth American possessions, and bringing, in return, the prodnctiona of thone celonies to our own ports nnd markets. 'The result of these renewed efforts was communicated to the geverninent of the

United States by Mr. Morris, in his dispstch of Sep. tember 18, 1790, and was, in effect, that no arrangement by tresty could be made.

From this period down to the year 1822, the ports of the Britlah American colenies were virtually closed against the commerce of the United States, some olight relaxations haviag been granted, abating, however, to no perceptible extent, the atringency of the measures adopted by the British Parliament, with a view to confine, within the very narron st limits, the commercial enterprise of a country ln which, even at that early period, she descried a future rival for maritime supremacy. Thess relaxstions permitted a direct trale with the British West India Islands in certain specified articles, and under certaln restrictions, but were not accepted by the United States.

During the period which elapeed between the years 1790 and 1822, several efforts were made to place our trade with the British American colonles upon a bssis of equality; these efforts proving fruitless, the United Statee determined to submit no loager to a policy so detrimental to her commercial prosperity, so obstinately persisted in, and hitherto resisted only by the unavailing force of diplomatic remenstrance.

Before resorting, however, to any extreme messurea for the proper vindication of our commercial rights, the government of the United States, still anxious to avert, by means of concilistory legislation, a total suspension of trate and commerce with Great Britain and her American colonies, announced, by aet of March 3, 1815, the principlos npon which she was desirous of maintaining commercial relations with all foreign nations.

This net repealed all discriminating duties of impost and tonnage on foreign vessels in regard to all conntries which should adopt a similar policy in favor of the United States. This fair and liberal proposition was followed by a convention between Great Britain and the Unitad States, in wihich the provisions of the act referred to were adopted, so far as they wore applicable to the trude bet.veen the United Stutes and the dominions of that power in Europe, but refusing to place her colonial trade on the same basis. A more extended notice of tise provisions of this convention, more properiy came under the preilminary remarks on the commercial relations of the United States with Great Brituin. It wiil suffice to olserve, in this piace, that the restriction respecting colonial trude wss made the subject of a special stipulation, in the following words, viz.: "The Intercourse between the Unitod States and his llritannic majesty's possessions in the West Indies, and on the continent of North America, shall not be atfected by any of the provisions of this article [article 2], but each purty shall remain in possession of its rights with respect to that intercourse."

The act of April 18, 1818, was the commencement of the mensures of retaiation by which the government of the Cuited States had now determined to force Great Britain luto a more just and iiberal syatem of commercial legishation, by excluding :rom American ports all ships belonging to that mation coming foom any colonies to which vessels of the United States were not admitted.

The second section of this act required bonds to be given in tha ease of all iritish vesssis departing from ports in the United Statea, conditioned that the carsoes should not be landed in such coionies. This was foliowed by a similar act, passeci in $\pm 820$, proilibiting the purts of tho United States to British vesseis coming by sen, from nily perts or places in nll the American possessions of tireat llitian; and providing further, that no produce sibould be brought into the United States from such colonies, unless imperted diroet from the place of production.

The effect of these severnl retailatory enactments upon the commercial interests of Great Iritain led some of her utost sagacious statesmen to hestow upon
the whole subject thelr serious attentlon, and repeated efforta were made In the British Parliarnent to renuve the reatrictions upon coloninl trade; of whleh the American guvernment eo justly complained; and so sacceseful were these effortn, that the United States guvernment was informally advised that the plan proposed by Lord Goderich, for a more liberal colonial pollicy, would he carried out by the British Parllament. To renove all difficulty on the part of the govermment of the United States, In glving effect to ony plan bared upon princlples of equality, and, at the same time, to show that the retaliatory measures adopted In 1818 and 1820 wers purely defensive, and resorted to only after overy means of negotiation had falled, the net of May 2, 1822, was pasmed, anthorlaing the Presldent to declare the porta of the United Seater open to British veasels trading to and from the coloniea, "on recelving satisfactory evldence that the ports of the lelauds or colonles of Great Britain hnve been opened to the vessels of the United States."
This was followed soon after by an aet of Parlia. ment fully meeting the contingency provided for in the act of Congress above reforred to; and, in August following, the President's prociamation was lssined, declaring, in the language of the net of Congress, "the porta of the United Stnten open to British voasels truding to and from the colonies." This act of Parllament, howeve. $\quad \ln$ ngrent menaure rendered mugatory by the insertion of a clause restrleting American vessels to a direct trade with the colonies, and by the tetimn of the Treanury circular of 24th September following, nubjecting llrithali versels coming from the colonies to heavy discrimimating duties. This anorse was justitled ly the government of the lnited Stutem, on the ground that it became necessary, na a menna of countervailing the discriminating duties to which American produce was subjectell when imported into the colonien, or from the colonien to tireat Iritaln, In British bottoms. In a sulsequent part of these remarks, It will be seen that, In effert, this equality, with some few exceptions, has prevailed rine the atm olition of imperial dutien on colonial importations: but the prineljle which it involves, that of formign $\ln$ terfererce with the colonlal tariffs of Great Britain, was never adnitted by that government, nor was it ever pressed hy the United States. Indeed, the correctuens of the vewn expressed on thle auliject by the Earl of Aleedeen, In a dispateh to Mr. Barbour, six rears suliwequently to this periol, has nover been questioned hy the government of the United States; and their application has been eontinued to this day, In the discriminating dutien jast nlluded to as exceptions, withost any objection or remonstrance on the part of the Amerian government. As the policy of these countervalling duties involven a funclamental priacipie of commerclal law, the langunge of the liarl of Abenleen in reference to it is not deemed inapprogriate in this pince:
" It never could be intended to agree that, under no cirrumstances, should the vessels of the one [the mother conntry] have no advantage over those of the other; and the underslgned is not aware of any instance in which one rountry has remonstrated with anuther country, having colonies, upon the terms on which it has regulated lte own intercomene with thome colonies. * *
"The intercourae letwean a conntry and her colonien is as abolutely out of the meope of ntipulation, negotiation, or remonstrance, as is the intercourse between one laland or purt of the mother conntry and another."

The olfject of "reat Ilritain, durimig thim grotrseted controversy wit. ate government of the linited statee, for commercial eynality in colonial trade, wan avowediy to secure to liritinh navigatom all the advantagen derivable from an exclacive trade with lier cololonies, even in the productions and manufactures of
the United Statea-an object easilly promoted, if not virtually aocomplished, by the nataralization of Amerlean productions imported Into the colonles, and their exportation thence in British vessela, at the low dutles ascignahle to goods, wares, and morchandise, the produce of the culonies.
It was a part of a syatem chiefly designed to enconrage British navigution, and, Incidentally, to quote agaln from the Bari of Aberdeea, "for extending the commercial transactions of Britlah colonists, giving them the advantages of a trade of doposit, and lucilities for colleeting a revenue."

Notwithatanding these restrictlons, equally lajurious to the commerce of both countries, the United States atill maintaiued an netive and profitable trade In supplying the Wert India colonies with her stapl. productlons through the noutral and other oolvuies with which she was permitted to carry on a direct iatercourse. The 1British interdict of 1826 closed the ports of all the British American possewsions, with the exception of the northorn colonies, Including the Bermuds Iflands, to Amerlcan vessels; still, the statistlcal returns of that period exhibit a atendy and vigorous Indirect trade carried on through the circuitous ruutes just ladicated.

The following tables, compiled from oflicial returns, whow the vnlue of our exporta and imports to and from the British American colonial posseasions, from 1821 to 1830, during which period the restrictlve and countervailing measures of troth governinents were, to some extent, relaxed, and our tride with these posspesions was relieved from the onerons inposts of indirect and circuitons chamels. During a portion of this period, as will lee seen by glancing over the folluwing tables, and nuting the disparity in the amonnts during the vears desiguated, American trade was barely able to struggle through the reatristions and burdens which pressed apka it. The romarkn already submitted with reference to the legialation of that period, buth in Grent Ibritain and the Linited States, will sufficiently explain the discrepancles.

The foregoing tables will exhibit, at a glance, ties injurious eflects consequent upon the differeut acts of retaliatory leginlation resurted to and enforced by both mations during this prolonged and uayiolding contest. Othor tables will be introduced in the proper place, showing the value and extent of traile between the United states and the Ibritislt colonial porsessions subs sequently to the yoar 1830, when a policy, bused apon the just princlples of reciprocal benetit and generons competition, nucceeded the illiberal and unwise measurea by which the commorvial intercourne of both countriea luml, for nearly lanlf a century, been diverted from its naturnl channela.

It will be reoollected thint loy the act of Congress of 18:3, passed an soon us coull be after the 'lreasury cirenlar of St, rember 14, 1822 , alrouly referred to, had Ineen insued, the claim to an equality witls Gireat Britain as to duties on importations lito the colonies was reasserted, and the terms of the I'resiclent's proc. lamation of Auguxt of the mame year were athimed. Great IIritnin coold not lee induced to jield this point: ber object being to emable her to "protect the stsples of her own aubjects, by levying diseriminating dutiea on the like productions of forelga countries." With-
ont such imposts, the British government contended "that the productions of her North American colonies would be totally excluded from the markets of the Weat India Iasands, as they could not poasibly compote with Bimilar productions of the United States."

This determination, and thesn discriminating duties, led to the refual by Cangress to accopt the terms on which the ports of the Britiah colonies were opened to American trade by the act of 1825.
The conditions on which this trade was offered were not deemed admissible, inasmuch as they demanded that the commerce and navigation of Great Britain, and her ponsessions abroad; with the United States, should be placed on the footing of the most favored nation ! while discriminstions existed in such colonial possessions, not only unequal as respected Great Britain, but exclusively applicable to the commerce of the United States.

These different acts are recurred to for the purpose of elucidating more clearly the illiberal policy and narrow jealoustes which preceded the new ora in tae commercial policy of both countries, upon which they at langth entered.
In 1829, Mr. McLane, the American minister at London, in pursuance of instructions to thet effect, proposed to the British cabinet "a restoration of the trade between the United States and Grent Britniln, with special reference to her American possessions, opon a tuais of reciprocal concession, and announced the willingness of his government to accede to the terms prescríhed by the act of Parlisment of 1825."
In opening this negotiation, Mr. McLane introduced the proposition which he was authorized to submit, by referring to "the misunderstandinge and jeslousies which had hitherto characterized the commercisi relations of both countries," observing, "that it was the interest of both governments to extinguish these causes of mutual bitterness; to correct the errors which may have interrupted the harmony of their past intercourse; to discard from their commercial regulations messures of hostile monopoly; and to adopt instead a generous system of frank and amicaile conipetition." Such, in Mr. McLane's judgment, would be the happy resuit of the proposition he was irssiacted by his govemment to submit, namely, " that the government of the United States would now comply with the conditions of the act of Parliament of Jily 5, 1825, by an express law opening their ports for the admias on of British veszela, and by aliowing their entry with the same kind of British colonial produce as might be imported in American bottoms, the vessels of both countries paying the same charges; suspeuding the alien duties on British veaseln and cargoes, and abolishing the restrictions defined in the act of Congress of 1823, on the intercourse between the United States and the liritish coionies; and that auch a law shonld be immedistely foilowed by a revocation of the British orier in councif of the $\mathbf{2 7}$ th July, 1826, the aboition or suspension of all discriminating duties on American vessels in the Britiah coionial ports, and the enjoyment by the United States of the advantages of the act of Parliament of Sti July, 1825."
In submitting this proposition, Mr. McIane distinetiy declared that, "whatever mas be the dispoaition which his majesty's government may now be pleased to make of this subject, it must necessarily be final ${ }^{\prime \prime}$ " a declaration which, doubtiess, contributed momewhat to the satiofactory and liberal arrungement which soon foilowed.
In anticijation of a final and satisfactory adjustment of this queation, and, at the same time, to manifent the liberal apirit which animuted the government of the United States in its solicitude and wilingness at all timen to terminate a conteat equaliy detrimental to the cominerce of both nations, on act was passed in May, 1830, clothing the President with power, on receiving satiafuctory evidence of the willingneas of the

British government to accede to the proposition aubmitted by Mr. McLane, to lssue his prociamation ratifying the terms of that proposition, and tendering to British vessels engaged in the colonlal trade the advantages which it secured.
$\because$ On the 17th of August following; Mr. McLane was officially notified by the Earl of Aberdeen; that his government was prepared to accept the terms on which it was proposed to relax their colonial syatem, and permit a direct trade between the United States and the North American possessions, and only awaited the neceasary action on the part of that government to promulge the requiaite ordere to that end. Accordingly, on the 5th day of October following, the Preasideat, by virtue of sine authority conferred on him by the above-mentioned act, lasaed his proclamation, declaring that the act "concerning navigation," passed on the 18th day of April, 1818, the act supplementary thereto, passed on the 15th day of May; 1820, and the act entitled "An' act to regulate the commercial intercourse between the United States and certain British portn," passed on the lat day of March, 1823, were absolutely repealed ; and that the ports of the United Staten were, from the date of the proclamation, open to Britiah veesels and their cargues, from the islands, provincea, and colonies of Great Britsin, on or near the North American continent, and north-east of the United States.

These aeveral acts, it will be borne in mind, constituted the whole aystem of retaliatory measures adopted by the government of the United States, daring the continuance of the commercial controversy now brought to a closo. Corresponding orders in council were also promulged by the British government, giving full validity to the arrangement, and placing the United States on an equal footing, with respect to colonial trade, with the other nations that had complied with the act of 1825.

The commercial intercourse between the United States and the American colonial possessions was now established on a hasis, in some respects, it is true; restrictive, but still sufficiently liberal and broad to inspire with renewed energy the commercial interests of the nation, and direct them in the more equal competition on which thoy vere permitted to enter.

Nearly 50 years before this period, the policy to which Great liritain now gave her assent was auggested and urged with great earnestness by Mr. Pitt, then Chancellor of the British Exchequer. His proposition, already noticed, was to the effect that American vessels loaded with goods, the growth or produce of the United States, should be admitted to all the ports of the British dominions. Every administration, from the formstion of this govornment down to the Jear 1830, directed its best cnergies to effect a negotiation with the British government, recognizing this princiciplo; but whether from a real desire to protect and foster its own navigation and commeree, as was avowed, or to repress the spirit of commercial activity which, from the very earliest period, had characterized the United States, overy obstacle that diplomacy could create, and every sophistry that ingenuity could supply, neemed interposed whenever the question was prossed upon the attention of the British cabinet.

How disastrous this restrictive policy proved to the commorcial interests of both countries, and especially to those of the West India colonies, which naturaliy looked to the United States for the necessary supplies of subsistence, may the gathered from the tables already given. The increase of the total trade of the United States from this period may be shown as follows:

Commerea of the Unitre States.

|  | Exporis. | 1 m |
| :---: | :---: | :---: |
| 330 | 178,843,508 | \% $70,876,920$ |
| 1845. | 121,693,57T | 149,505,743 |
| 1840. | 182,085,046 | 107,141,619 |

The progreas and almest incredible augmontation of tinie trade under the new arrangement may
be seen from the following comparative atatement of imports and exports:
Orfional Value of Impozta and Expoats or taz Unitan Btatwa to and prom the Britibi Nobti Amirioan akd Wrat Impla Posarasions yor 1880 and 1840, araphetivelv; showino, also, the rronease of Tonmaor pumine that Prriod.

| colowns. | marumis. |  | mxponse, |  |
| :---: | :---: | :---: | :---: | :---: |
|  | 1830. | 1240. | 1830. | 140. |
| Brit. N. Amer. posessatong. | \} 8650,808 | 1,007,767 | 4,756, 878 | *6,083,250 |
| Brit. W. Indies. | 168,579 | 1,048,165 | 1,001 | 2,965,684 |

From the foregoing table it will be seen that the aggregate trade with the British American colonies lr. creased during the period designated from $\$ 4,436,676$ to $\$ 8,601,917$, or nearly 100 per cent. ; and the incrense in the trade with the Britlah West Indies in the same period was equal to 2400 per cent.

This vart increase in the value of the trade necessarily supposes a corresponding augmentation in the amonnt of tonaage. As illustrative of the elastic and enterprising spirit of American commerce when freed from the shackles of illlberal restrictlons, and permitted a fair competition, on equal terms, in addition to the preceding table, the following statements, exhibiting the augmentation in tonnage under the new arrangement of 1830 , will prove interesting.
The average tonnage which entered in the United States from tha Britigh, Swellish, and Danish West Indies during the years speclfied was as follows:

| Is 1828. 1599, and 1880. . | Tone. <br> M8,688 |
| :---: | :---: |
| In 1832. | 114.651 |

Increase..................................... 26,018
The average tonnage which departed from the United Stater for the British, Danish, and Swedish West Indies, in the same ybars, was as follows:

| In 1889, 1839, and 1880. | 9t, 4 tis |
| :---: | :---: |
| In 1882. | 184,996 |
| Increasc. |  |

During the first period, viz., $18: 2 \kappa,{ }^{\prime} 29$, ' 30 , the principal trade to the Hritish West Indies was Indirect and circuitous; during the latter (I832), under the new arrangement, it was direct. Similar results followed the liberal polley of $1 \times 10$, in the trade of the United States with the North American colonies; and, as we are now spproaehing a new era in the commercial intercourse between the United States anil these colonies, the advent of which was announced by the repeal of the Britlsh navigation laws in IMI9, the following tables are introluced for the purpose not only of exhibiting the augmentation in that trade during the two periods, but also of indicating its probable future increase under the beneficent effect of the late reciprocity treaty.

The a verage tonnage entered into the United States from the North Anerican colonies during the years specified, is as follows:

| In 1928, 1929, and 1593. | $\begin{aligned} & \text { Tone } \\ & \text { ph. } 4.4 \end{aligned}$ |
| :---: | :---: |
| In 1**). | 182,672 |

151,529
It will have already been percelved, from the foregolng tables, thit so soon as American commerce was llberated from the thrulldom of opprasive and prohibItory reatrictions, It at once challenged a competlition with the flags of all nations in supplying the markets of the British West India and North Amerlcan possessions, and in maintaining with thom a profitable and an extenaive trarle.

Indeed the benefits reaulting from the measures adopted In 1830, not only to the United Statea and Greut Britaln, but te the West India and other American possesslona, beenne so manifest, in the vast increase of capital, tonnage, and the value of trade, and the commercial relations between the two nations had become, year by year, so closely united in the bonds of mutual Interest and of a more enlightened policy, that it is not surprising that the Britiah nation recelved with much favor the first advance, taken by Sir Robert Peel, toward the system of free trade, whileh now conatitutes the busis of Ifritish commereial legislation, and, In lts results upon the general proaperity and wealth of that nution, fully vindicates the wladom and foresight of its distinguished author.
l'rior to 1847, American exports to the Hritish colonies were burdened with double duties-those Imposed by the British l'arliament, styled Imperial duties, and those prescribed by the local legislatures of the different colonies. The revenue derived from the former was, at all timea, Inadequute to meet the expensea of the colonial system; and, in consequence, the British civil llst was annually Increased by large appropriations for colonial purposes. The enbarrassed condition of the British finances at this period co-operated very opportunely with Sir lohert l'eel'n predilections in favor of free-trade policy, in inclining the British gov. ernment to recoive favorably hls proposition to mbandon all control over colonial tarlfis, and throw their foreign possessions on their own resources. This neasure was at once udopted; and in the season uext succeeding, the Canadian Legislature abolished the discriminating and prohibitory duties on imports inland, thua placing the mother country in the same relative position as foreign nations. The abolition of the Britiah corn-laws next succeeted in this liberal jolicy ; and, lin 1849, the crowning act of Sir llobert treel's life-the ropeal of the Lritish navigntion lawsconsumnated the aystem of ineasures introduced by that ntatesman, ao far at least as that system affected the intercourse of foreign nations with British colonies throughout the worll.

By these several acta of imperial legislation, the comprehensive princ.jple was establisherl of adimitting into Great Ilriuin, or into nuy Iritish possession, gods of any sort, lil a ship of any country, from any part of the world, subject only to nuch prohibitions and restrictions as wers deemel neceasary, either for the safety of the State, or for the protection of revenue and mercantile interests.
Uniler the class of abmolute probibitions, the fuliow. ing articles are inclinded, vla.: gunpowder, suma. nition, arms, or utensils of war, except frous the Luited Kinglom or any llritish possession, and base or counterfeit eoin. These are probilited to be imported into the Iritish jossessions in Anerica or the Mandius. Other prohibitions and restrictions will the found es juerially set forth in l'art 11., Com. Rel. U. S., 1837.

The only imports to which the commerce of the Unitel States with the colonies of Great Iritain is now sulject, are the colonial duties imposed by the lueal leg. isiatures of the respectlve colonies ; and these appo? with sume few exceptions, which aro nothed in their proper place, equally to Britlah importations and lintish bottoms. These duties are generally very under.
ate, designed solely to meet the neceassry expenses of thr colonies, snd are st least one third leas than the duties levied in the United States, on simllar descriptions of merchsndise, by the tsriff set of 1846.

We have noticed the wonderful progress and atesdy increase in the value and tonnage of American commerce with her colonial neighbors which followed the nagotiation of 1830 , and the subsequent acta and regulations of the British government. Each auccessive year brings its tribute of augmented returns snd expanding eommerce to lilustrate the wisdom and the far-seelng sagacity of those atatesmen, in both conntries, who originated this Ilberal syatem.

The commercial intercourse of the United Statea with the Weat Indies and the eastern posaesslens of Great Britain remains nnchanged since 1850 . Although this intercourse is still dependent on the regulations of the mothor conntry, as a genersl rule, the impost dutles are eqnal on all bottoms, but alight discriminatlons exiating even in favor of Britiah vessels. With the North American provinces, however-that is, with "Canada, Nowfoundiand, New Brunswlek, Nova Scotia, Prince Edward's Island, and the several ishands thereunto adjacent"-a aystem of the most llberal and unrestricted charueter has been adopted, which, to a grest extent, places commercial intercourse between the United States and those posseasions, respectively; on the footing of an unfetedred coasting trads. The Reciprocity Trenty of 1854 eatablished a fres trade between the colonies sbove named and the United States, in the principal raw staples of both countries, snd concedes to the citizens of the latter among other privileges, "the right to navigate the River St. Lawrence, and the canals in Canada, used as a mesns of communicsting between the grest lakes and the Atlantic Ocean," as well ss of "taking, curing, and drying flah of every kind on the sea-coast and shoals, and in the bays, harbors, and creeks of Canada, New Brunsv:ck, Novs Scotia, Prince Fdward's Island, and of the seversl islands thereunto adjacent, without heing restricted to any distance from the shore, with permisaion to land upon the cousts and shores of those colonles and the islands thereof, and siso upon the Msgdulen Islands, for the purpuse of drying their nets and curing their fish."
'The thirl article of this treaty provides that the articles cnumerated in tho following sehedule, belng the growth und produce of the aforesaid British colonies or of the United States, shall be admitted into each culuntry, respectively, free of duty:

Scheclute,-Grain, flour, and brenulstuffs of all kinds; onimals of all kinils; fresh, amoked, and salted meats; cotton, wool, seeds, and vegetables; undried fruits, dried fruits; fishof all kinds ; products of fish, and of all other creatures living in the water; poultry, eggs; hitles, furs, 6 kins , or tails, undressed; atone or marlle in its crude or unwrought atste; slate; butter, cheese, tallow; lard, horns, manure; ores of metals of all kinils; coal ; pitch, tur, turpentine, ushes; timber and lumber of ail kinds, round, hewed, and aswed, unmanriactured, in whole, or in part ; fire-wood; plants, sirubls, and trees; pelts, wool ; flsh-oil ; rice, broom-corn, and bark; gypsum, ground or unground; hewn or wrought or unwrought burr or grindstones; dyestuffs ; flax, hemp, and tow, unmanufactured; unmanufacturel tobiseco; rags.

Articies of manufacture, it will be perceived, are not einbraced in the shovo schedule; indeed, these possessions, being abandoned by the Itritish Treasury, by the act of 1847, already referred to, are nnw vompelled to support themselves; and their tariff rin manufactured articles is the principal sonree of reveaue on which they must depend to meet their heavy loans and support their reepective governments.

The same tonnage duties are payable upon ships or boats of the United States of America importing goods into Upper or Lower Canada, as are or may be payable
at the same time In the United Statea of America on British crsft entering the harbors of the State from which such goods ahisll have been imported. (17 and 18 Viet., chap. exxil., sec. 178.)

The following comparative tables exhlbit the value of trade between the United States and British Nurth American possessions during the years 1851, '62, '58, '64, '55. A reference to tables slresdy given will show how lsrgely the totals since 1850 exceed those prior to that pariod. The figures sre taken from the United States' Treasury reports on "Commerce and Navigation."

British Provinces,-Under the impetus communieated by the Treaty of Reciprocity, the trade of the United States with the Canadas has greatly increased, notwithstanding the formidable diminution of nearly $8,000,000$ in our exportation of foreign goods. The aggregates for the laet two years we have arranged as followe, for purposea of comparison :

|  | 1885. | 1858. |
| :---: | :---: | :---: |
| Dornestle produce exported to $\}$ the Canades. | 10,950,764 | -15,104,783 |
| Forelgn goods............... | 8,709,580 | 5,688,453 |
| Domestlo proluce exported to $\}$ the Tower Provinces | 5,805,878 | 7,019,909 |
| Porelgn guods ...................... | 8,999,799 | 626,199 |
| Imports from tho Canad | 12,182,814 | 17,488,187 |
| Imports from the Lower Pravínces | 2,011,420 | 3,822,224 |
| Total trale. | (12,989,754 | (30,839,730 |
| Total trade with the Canailas..... | 630,909,658 | 638,871,438 |
| Total trade wilh the Lower Pravinces. | 819,087,009 | 811,908,832 |

The total aggregates of trade dering the last five yeary, are as follows:

The chief articles of export and their values were for 1855 and 1856:

|  | 1885. | 1856. |
| :---: | :---: | :---: |
| O11, soap, and candlos. | \%217,000 | 8880.000 |

| Whisky. | 187,010 | 290,000: |
| Molassce | 87,000 | 140,000 |
| Fornitu | 182,000 | 823,000 |
| Hats. | 100,000 | 116,000 |
| Shoes and leathe | 289,000 | 804,000 |
| Glase | 65,000 | 114,000 |
| Books and paper | 94,000 | 148,000 |
| Salt. . | 159,000 | 808,000 |
| Manufactaren of cotto | 470,000 | 914,000 |
| Coal. | 960,000 820,000 | $1,517,000$ 408,000 |

The most netable increase, it will be observed, hae taken place in animal products. For more axtended information about Great Britain, see Enoland, Ireland, ard Scotland. Also Coloniks, Cotton, and Fiahknies.

Creat Cirole Bailinc; the manner of conduct lig a ship In, or rather pretty near, the are of a great circle that passes through the senith of the two places, via.: from whonce she carae, and to which she is bound.

Creeoe. The continent of Greece, Including Albanis and Macedonla, ls nearly shnt in on the north by a cbaln of mountalna known anclently by the namea of Rhodope, Scomius, and Orbelus; it ls bounded on the west hy the Adriatle and Ionlan Seas, on the sonth by the Mediterranean, and on the eaet by th Cigean Sea, or Archlpelago. It extende from $86^{\circ} 10^{\prime}$ to $42^{\circ}$ $40^{\prime}$ of north latitude ? and from $19^{\circ} 45^{\prime}$ to $24^{\circ} 40^{\prime}$ of east longitude from london. Its length, from Cape Matapan to Mount Orbelus, or Argentaro, la 460 English milles Its greatest breadth from Durazzo to Cavale, at the foot of Mount Pangeus (a branch of Rhodope), $\mathbf{2 3 5}$ mlles ; and it embraces an area of 57 ,750 square mlles, exclusive of all lts islande except Bubcea. But, as our fleas of the extent of the country have always a reference to those ancient Stated which comprised but very minute portions of its surface, it is necessary that its dimensions should be deseribed more in detail.
The country recognised as Greece before the rise of the Macedonian power, comprehended the Norea or Pelononnesus, Attica, Eubrea, Beotia, Phocis, Doria, Aitolia, Acarnania, Theasaly, and Magneala; and oven teveral of the Statea Included within these limitn had little or no share in those aplendid actions which have shed so much glory over the country. The surface of Peloponnesus, which Included seven different Stutes, is about 9000 English square miles; that of the countries just named, without the peninsula, including Fubes, is 14,800 ; and heth together smount to 23,800 aquare miles-an extent of surface not exceeding two fifthe of England, or one fifth of the IritIsh Isles. If to this we add 16,000 square miles for Albania or Epiris (including the basin of the Irino), 18,000 for Macedonla, and 1000 for the Cyclades, the whole surface of Greece and its lslands will be 58,800 square miles, which is almost exactly the area of England. Whlle Greece preserved Its Independence, however, all these territoriea were never united lnto one lody politle, nor was their confederated force ever appliad to the prosecution of any common enterprise. The communlties whose warlike achievementa and brilliant career In arts and philusophy raised the Grecian name so high, occupied but very minute portiona of the country ; as the following table dcduced from measuremente will show:

Fing. *q. miles.
Attiea tacladiag Megaris and Salamls, bat not Eubura. 1,190 Bientis.
Laconis (without Messenta)
Achala (the twelve cttes with thetr territorice. $\qquad$ many colonies in the Cuclades 'Thrice, and ather parta ; and Sparta helil Sessenia long in suljection; bnt, In great strugglen, these colonies and deprendenclen often shook off their allegiance, and the parent State was olliged to rely on its own resonrces. Such was the energy of these small communitiex, that Attica, which scarcely upports, at present, a pupulation of 50,000 souls, sent out sometimes colonies of $\mathbf{1 0 , 0 0 0}$ men at once (Diod. Sic., lib. II.); and Sparta furnished $\mathbf{8 0 , 0 0 0}$ soldiers to fight the l'ersians at llatiea. The territorics of Corinth, when whe farmed a separate State were much smaller than any of these; her wealth and power depending chiefly on commeren.

Greece forms a long and rather narrow peninsula, aingularly iodented on three sides ly arms of the sea, and having a greater jroportion of its surface oceupied by mountalas than any other country in Juroje of equal extent, except Switzeriand. It has been justly obeerved, that those phyaical features which distingaish Europe from the uther quarters of the world belong, in a peculiar manuer, to Greece, and distin-
guish It In the same proportion from the other parts of Europe. Of these urms of the sea, the most conniderable are the Gulfs of Contessa, Salonica, Volo, Eigina, and Nauplin, on the east ; those of Kolokythis and Coron on the South; and those of Lepanto and Arta on the west. Of the mountalns, the first in orier are those which pass along the northern frantior. Mount Argentaro, the ancient Orbelus, placed at the northern extremity of Greece, near the 4 Sd degree of latitude, may be considered as the centre of the whole aystem of mountains In Europenn Turkey.
-Money.-The drachm, which ls the unit of the currency, is about 8 id. English money. It is divided into 100 equal parts culled lepta. There are copper colins of $10,5,2$, and 1 lepta, the only (ireek money thut circulates in the country. The nilver coins of 80 and 25 lepta have been multed down or exported. These of 1 drachm are very rare. Those of 5 trachins are now only to be found in Turkey. The gold pieces of 20 drachms, called othos, alao have ilsappeared.

Weighte and Measures.-A very complete scale of welghts and measures was established by the government in 1836 ; but the people adhere for measire of length to the plque $=27$ inches. Then for welghtthe principal one known, even in the capital, is the oke, a Turkish welght equal to $2 \mathrm{lbs}, 12$ oz., which is divided Into 100 drania 18 Eng. dranus, The cantaar or quintal la generally 4.1 okes $=121 \mathrm{Jbs}$. The kllo or quilot of corn is 22 okes, or 60 lbs . The land measure le the strema equal to about one fourth of an English acre.

Cultieated Iamel.-It appears that not half the aurface is susceptible of cultivation; and at least two thinls of the cultivated, and four fiftha of the uncultivnted soil helong to the State. One great dismdvantage to agriculture la the scanty supply of runuing water; but the peasants arovery dexterous at taklng advantage of the smallent rill to lrrigate their tillage. Money rent is little known; the lands being farmed on the metuyer system, accorling to which the landlord receives a certain proportion of the net produce-usually a third. Ile has frequently to furnlsh the seed, and sometlmes the oxen for tillage, the cost of which, with high interest, ia deducted from the profits lefore nny division is made. On this system, there is little inducement for the proprietor to expenil cupital on improvemeuts ; atill less is there for the metayer, who has no interest in the land beyond the season. Consetuently, inclosure and drainaje are scarcely thought of; and the stones having never been remozel, lie so thick together that in nome places it ls scarcely eredible that they can have nccumulated naturally. The dwelings of the peasants are extremely poor, conslating of atonen und fragments of tile and pottery beld togetier l,y mud. Glass casements are rare even in provincial towns; and in the country cottagea the liglit is most frequently admitted only by the door-way.

Productions.-The arable soil of Greece ls devoted chiefly to the cultivation of corn, vines, mulberrytrees, and fruit trees. Wheat, rye, harley, anil maize, succed pretty well in the stony districts where the moll is but a few inches doep. Oats render but a middling crop, and the potato is quite unsultable. Itut the legumina krow well, and rice might he raised on the wet mils. In many parts of the country cakes of malae flour form the staple article of food. (See Eary. Brit.) At the head of all the agricultural proluctions for exportation are the Corinth grapes, which we corruptiy call currants, and whlch are cultivated from the isthmus to Arcadia, alongy wlmost all the northern und western shores of the Morea. This frult is ot a violet color, and hangs in long loose bunches. They are gathered at the aame time nu ather grapes, dried in the aun, und packed. Very few of then are uaed in tircece, few anywhere except in Eingland. The cunnequence of this ls , that the effect of raising a large crop ls merely to luwer the price in the London mar.

ket; whereas, If France, Amerlea, and Russla, nsed plum-puddings to the eame extent as the Eaglish, Greece would have had in thls one article an Inexhaustible sonrce of revenue. All kinds of grapes succeed weil, and the best vintage is that of the laland of Santorin, where above 60 varieties are reckonel. The Rusalans are very fond of Sentorin wine, and import $£ 20,000$ worth yearly. The art of expressing and fermenting the juice of the grape is quite in Its infancy ; and unfortunately the (ireeks have no wine-eellara, and very few easks. The wine is kept in sklng, and rosin is put into it to keep it from epoiling. It is at first exceedingly dleagreeable to the taste; but the nativea prefer It to the cholcest heverages of France and Spain; and even foreignera become reconciled to it with nse.

Next to the vineyards as a sonirce of revenue are the muiberry plantations. There is demand for silk in every market in the world, and the climate of Greere affords facilitiea for an unlimiterl extension of this branch of Industry. The south of the Morea generally, and all the lslands of the Figean Sea, are adapted for it, and here the house of almost every peasant is in part glven up to the rearing of the worm. The spawn or eggs are nestled in the bosoms of the women; and the worms hatched in spring are abunilantly supplied with the yofing mulberry leaves then shooting. The cocoons are placed in the sun, and the heat kills the worms. In 1836 some Greek merchante, who had resided in the silk districts of Italy, Introduced Italisn workmen with their families into the Mores, to improve the mode of winding ; and a fow years have greatly sivnnced this braveh of industry and placed it on a firm and extensive hasis, giving pronise of a lucratlve and increasing trade. Two silk-throwing manufactories have been established at Ather. 3 with great success. (For Purther particulars see Vincy. Brit.) The Moniteur of Parls of 16 th and 17 th October, 1855, pays a high compllment to the quality of the Greek silk In the Paris Exhibition, which gainel the first prize.

The olive next elaims attention. Being luligenous, the trees are found in a wild state in every direction, and seen only to require grafting to yield excellent fruit. Grafted olive-trees are very namerons; and many people live all the year round on little but olives, indifferently pickied in torine. The oil ts extracted in the rudest manner, after which it is either run into cisterns or jars. There is a large cousumption of it in the country, nothing else being used for light, and a great deal belng consumed in food and cookery; but still there remalns a good quantity for exportation. Cotton succeeds well wherever it is sown, eapecially in the plain of Argos, and in the islands. It doee not form an important Item in the exports, owing to the large consumption of it in the country. Maduter thrives well in the northern districts. Greek tobacco is suld to be of good quality, and to have a delicious perfune. It is cultivated at little expense.

The cultivation of fruit trees might be a profitable branch of industry. The figs of Attica have not degenerated since the olden time; the apricote, the pomegranates, oranges, and lemons are delicioas.

First anung its natural productions may be mentioned valonia, the cup of the acorn of the Quercus Eigilopa, an oak, of which considerable forests axiat in the neightorhood of Marathonisi, Cape Papa, Arcadia; also in Attica, the island of Zéa snd other places. The acorn is a powerful astringent, used in tanning und dyeing, und for this purpose is shipped for Englandand Italy. Another species of oak-the Quercus coccifera, commonly called galls-grows in great quantities on Mount Taygetus, and breeds the insect known as kermes. In the process of drying the insect 'assumes the appearance of a amall brittle berry partly filled with powder, which, from time immemorial, has cansed some to look upon it as the berry of the plant, while others consid-
ered it to be a awelling caused by the puncture of a partlcular kind of fly. It is used in dyeing the red Tunla cape both of the Grveks and Turks, and a good deal is exported to Tunis and Alexandria. The dried leavea of the lentisk, also, under the name of Z Xotvó фuryov, are used by the tanners la Greeee and the Levant. Turpentine la obtalned in large quantitlea from the pine foreate of Mount Clthwron and other districts.

Notwithstanding the immense clearances made by the ravagea of war and other causes, Greece containg $2,800,000$ aeres of forest, filled with timber treea of the best quality' yet wood is bought abroad for house and ship-building, as for want of roads these forests can not be worked. The shepherds make a practice of setting fire to the coppice woods, in order that their fiocks may find aome tender aprouts to crop in spring. It is not unuausl in the neighborhood of Athens to find large black patches covering half a square leagua; and if an explanation be required, the answer is, "Only a shepherd who has been making pasturage for his sheep."

The principal places of trade are Syra, Patras, Plreus, Kalumnta, and Nauplia. The trade of Patras is chiefly Import; Ilydra, Spezzia, and Gulaxidl, come more properly under the denomination of ship-owning ports. The exports a.d chiefly the artleles we have enumerated, with others of minor Importance; the imports are chiefiy iron-ware and woven fabrics ; besidea coffee, sugar, and spices.

The carrying trade is very considerable, especially anong the islands. Some of the Greek vessels are hetween 600 and $\mathbf{0 0 0}$ tons register, and a good many from 300 to 400 tons; but the great majority of them are boats of six or seven tons, having a large hatch in mid-ships. (See Ency. Brit.) It is customary for a ship-owner to bargain with a captain and crew, taking up a certain sum at interest, generally secured on bottomry lond; with this money a carge is purchased on the ship's accomit, and the prolit is divided between the vessel and the crew, the latter sharing among themselves according to their special agreements. In this way the Girecks carry on exteasive speculations In corn whenever bad harvests or other circumstances present openings in the ports of Turkey, Italy, Spain, or France. Hesides this, they export tha various productions of Turkey, Greece, Ebypt, Persia, and soathern Rusaia, to London, Marseilles, end Trieste. The great advantage which the Greeks have over foreigners in jrosecuting this trade is that of having relations and connections in the interior on whom they can rely for the collection of small parcels; and thus they avold the impositions of agents and the profits of middlemen. The Greek trader desplses nothing, and wilt gaticer $n$ few bags of rags, or a ton or two of bones and horns, while he is chartering 50 vessels to load with corn and tallow. Then the same vessels supply Turkey, Persia, and Greece with the manufactures of England and Germany. The extenslve Greek establishments at Manchester for purchasing, examining, and packing goods, attest the importance of this branch of commerce. They have almost quite superseded the English traders here, chlefly from their thorongh knowlerge of the countries to be supplied, and their readincss to execute the smallest as well us the largest conmissions for the shopkeepers of the East. The Greek traler slips in everywhere, neglects no business, distains no expedient, and changes his flag as often ns he inds it his interest to do so.

The Greek goverament does notling for maritime trade. There is but one light-house on the coasts ; and, not withstanding the shipwrecks that are recorded every whater, the ministers turn a deaf ear to the appeals of the mariners. A slmillar neglect is shown concerning the means of internal communication. There are only seven roads, amounting in all to a length of 30 leagues, and thia is in a country where
thu State owns more than halr the land, where ovicslons are easily effected, and whore the peamants are willing to lend thelr hands for works of publio utility. There it no highway from Athena to Sparta, or to Coriuth, or to Patrus, which, owing to the trade in currants, is becoming the commerelal capital.
The banking and exchange operationa form perhaps the moat remarkable part of the commercial ayatem. The national bank was founded at Athens in 1842, the capital being in the first instance fixed at $5,000,000$ drachms. Branchen have alnce been opened at Syra and Patras. The exchange operation throughout the country are ruled ehlefly by the transactions at Athens, where bills a Londun, Paria, Maneilles, Trieste, etc., are negotinted with fuclilty. The most sarious hinderance to the progress of indastry in Greece is the high rate of interest. The legal rate is 10 per cent. for onilnary loans, and 12 per cent. in commerelal business. High as this 1 s , most of the loans are effeeted at atlll higher rates; and the governinent can not suppress the naury. From a atstement inserted in the Spectateur de COrier ' of Athens, it appears that the bank has paid interest to the sharebolders, from 1849-64, at $8 \frac{1}{4}$ to 91 per cent. per annum ; that Its capttal amounts now to $6,000,000$ drachms, and a reserve fund of 400,000 druchms to provide againat emersen-cies.-F. B.
The manufactures of Greece are few and slinple, tue value of the raw material theing little enhanced by the lator; yet the peasantry are entirely clothed in cotton and woolen fabiries of thelr owi. manufacture. The papotes, not only of the fireeks, but of the whole inaritlme population of the Mediterranean, are made of a wolien atoff, the peculifr manufacture of the Wallachs ; and Kalamata is fnmous for a sllk ganee, bighly prized in the Fast for bed-curtains. Eintroilery in gold, ailver, silk, and cotton, is brought to great perfection ; and marble-rutting and aenipturing have made great progrens. At the great loudon Exhlbition of 1851, the emtiroldered dresses in red and gold, and in blue and silvor, were highly praised. The san.ples of marbles were not in a condition of manufacture to da mand moch notice as apeciajens of industry. Commendntory mention is made, in the report, of lithographic stonen from Measina, , amples of ateatite (the French chalk of commeice), of a fine natural cen ent of puzacolan, of varieties of flexilile apouge, and some other objectr. In the Iondon Ext.llition of 185!, only four mednls were given for varions productions of art and manafacture irom tireece.

The following statistice show that the prugress which the tireek nation has made is lifghly creditable, thugh at the ame thine showling that the productire powers of Greece are not fully develnjed.

We have no accounts of 1854; but there in no doubt It will show an Increase on 1853, in consequence of the permission of the czar for the Greek Hag to enter the Danube.
4.-Poriliation.

8.-furonta and Expomte or Gnkeok.

The minister of finance states that the great ducrease in exports for the last three yeary is owing principally to the failure in the currant crops, the result of the disease in the vine.
Of the 13,995,195 dra. exported In 1861, 8,359,196 drs. were of Corinthian curranta alone. In 18022 the expors of curranta were $2,844,058$ drs, only, or neurly $6,000,000$ less than 1851 ; in 1853 there is no account of the currants exported inserted; and in 18.51 only the small amount of 9046 dra. aro included in the ainouut of $6,799,21 \mathrm{drs}$.

Conntares Thabina witt tusker.

It will be meen from this exhibit, that Euglund has the largert commerce with Greece of the counulits enmneratea. Turkey, however, ranking tirst in amount of import.
The commercial relations of the United States with fireece are regulated by treaty of Decentier 10, 14.37. This treaty is smanel upon principles of entire reciprocefy in navigation and commeree between the two condrien. It prinelpat atipulationn are, that the vesnels of exch nation, whether lauen or in ballast, from whatever place they come, shall to trentect, in the porte of the other, on their entrance, during their stay, and at their departure, upon the name fincting as national veasels coming from the same place, with reapect to the dution of tomnage, Hyht-hounen, pliotage, and port charges, an weil an tu the perquisiten of pullic officent, and all other dutlea ar chargea levied in the name or to the proft of the government, the local als. thoritien, or of any' private entailinhmient whintever. Whatever trerchandise may he lawfully imported inco elther natlon by lt, own veanela, may alno be inuported in the vessels of the other, from whatever place they
may cor chargen the nam authorit sels. S exports. nation : other, un products ilegea of allowed common

may come, withont paying other or higher duties or charges, of whateve kind or denominatlon, lovied in the name or to the profit of the government, the local patheritlos, etc:, than when imported in national vessels. Similar equality is stlpulated with renpect to exports. No prohlbitions to be eatablished in elther nation upon the products of the soil or industry of the ather, unless such prohibltions shall also apply to aimilar products, the growth of any other countr:-. All privilegea of transit, and all bountles and drawbarks aliowed in elther ration, shall immediately become common to the other.

Dutios in each conntry, on cargocs imported in vesrels of the othor, shall be charged only on such portions thereof as may be landed, and eraned from the manifest of the $\mathrm{ir}_{\mathrm{a}}$ porting vessel ; int all iluties, lm posta, or chargee whatanever, which are or may hecome chargeable upon the vessels themselven, must he pald at the tirst port where thoy shall break bulk, or unlado part of their cargoes. It is also stlpulated that the vessels of each nation arriving in the ports of the other, provided with a hill of health; granted by an officer having competent power to that effect, nt the port whence such vesaels shall have sailed, shall be subjected to no other quarantine than such as may be necessary for the vlait of the health-offleer of the port where such vesseis shall arrive; after which, suld vessels shall be allowed immediately to enter and unload their eargoes, whject only to such casualtles na may havn occurred during the voyage. The other stlpulations relate to consular priviliges, etc. The tieaty to continne in force 10 years, with the usual stipulation respecting lts duration after that period.

Notwithatanding the llieral stipulations of the treaty, of whlch the preceding is a summary, the trade between the United States and Greece is very inconaldernble-few Anerican vessels over making the direct royage to any port In that country. At the principal port of Greece (Pirmus), no Amerienn vessel entered from the commencement of 1851 to the close of 1853. During tite yeur first named, there entered that port from all countries, $355^{\circ}$ vessels, mensuring 42,159 tons ; and thero cleared 254 vessols, aggregating 30,148 tons; making a total of 609 vessels, with an sggregate of 72,307 tons. These vessels were mostly uniler the Greek, Turkish, Engl:, 'h, or Frenti tiagsthe latter two numbering, together. only 122 vensels entered and cleared. During the nawe ycar, 120 Ause trian steam-veasela measuring an aggrogate tonnago of 27,000 toma, entered the port of litaus, viz., 72 from 'Trleste, and 48 from Turkey.

The value of Imports at the port of lirmus $\ln 1851$ was 8924,420 ; that of exports a little over $\$ 80,000$. In 1852 there entered 822 vesseis, measuring 41,1 itis tons; anil cleared, 287 vesseje, of $45,00 \mathrm{~d}$ tona 1 making a total of 609 vessels, with an aggregate tounage of $x!174$ tons. These vessels were undel the (ireek, Tarkish, Einglish, or French thags, ranking in number In the orker, respectively, to which they are numed,

The imports if all kinde into Mreus in Inŏt were \$924,42t1, and in the year 1852, $, 757,020$; showing a decruase in 1852 of $\$ 167,400$.

The importa into tirese through this port, are, grains, angar, coffee, yam of cotton and wool, silkn, iron anil other metala, timber, cod and other anited thah, wines and apirita, paper, ete.
'The conntries uanaily partichpating in the foreign trade of the port of lirwus, are-

Though Anstria lolda but the recond rank in the ahove sabio, the uatasliy enjoys the largest share of
the forelgn commerce of thls port. An average nalculation for a series of 6 or 10 years would give the following result, without much variatlou $:$

The next port of importance In Greere, after the port of Athens, la Syra: This port ls situnted nmong the Cycladen, on the eastern shore of the Grecian archlpelago. Ite commerce is rapidly increasing, owing, in a great measure, to it belag a princlpal statlon of the Mediterranean steamers golng to and from Constantinople. The imports average annually about $\$ 3,500,000$, end the exports about $\$ 1,500,000$. The flags participating in the forelgn trade of thia port are Greek, Finglish, Austrlan, 'urkish, and French, in the orler, us to rank, in which they are usmed. The chilef articlen of import are, cottons, woc ens, manufactures of Iron, grains, cotton yara, coffee, timber, sugar, hides and skius, provisions. Lxports of domestic produce are incondiderahle, though an extensive trade is carried on in re-exporting to other ports of the archlpelago the imports of foreign nutions. The numher of vessels entering end clearing at this port annually, is about 6775 measuring 879,000 tons. The mercluat mine of Greece in i853, was $\$ 320$ vessels, measuring an aggregate of 247,016 tons. Of these there were-

In the ather ports:

For all other charges, port regulations, eto., sees Consular Return, "Athens, fireece, February bth, 1N55."-Com. Relntinns, U. N.
The average price at which currants are solil is $\$ 12250$ per 1006 pounds ; and the nverage returns, of ratiner gross receipts, aro onnusily siont $\$ 700,000$. The exportation of ollive-oil is another leading source of revenue to the fonian Isiantis. The following aummary gives a fair average exhibit of exports mmually :

The average nonual price la 5950 per barrel, which would raise tho amount derived from ollve-oll, If the whole mmount were moll, to en, in5, 000 per nummm. Great efforts have heon made to promote the cultivntinn of tolineco lin these imlamis, int with very doubtful success, owing to the want of soil adatided to the plant. Corfu, Cephalonia, and Sabta Maura are the only lalanils on which it ean lo ralsed ; but the quality is inferior, and even the guantity in ao inconslderable that eargoes of tohmeen are reguiarly imported © a supply the consumptlon of the inlanis. Among the articles of Import, sugar and coffee are those in which Anmerican bottons coulat, were the navigation dues equal, sue. cessfilly compete with the Europeon flags. In 1855

Holland alone Imported 900 tons of augar inte the isl-
ands. The coffee is usually Imported direct from Brazil. In 1855 the quantity imported reached $1,200,000$ pounds.

The usual exports of the United States, which reach the Ionian republic, are coffee, rosin, segars, tobacco, and mannfactured articles, auch as furniture, cottons, etc., the annual value of which can not be accurately ascertained. In 1852, the value of coffee, roaln, segars, and furalture, exported from the United States to one of the Ionisn ports (Zante), was $\boldsymbol{s}^{5}, 499$ 32, on which the Ionian treasury received, in dutles, $\$ 76684$.

The exports from the same port to the United States were:

|  |  | Yat | Exporiduty |
| :---: | :---: | :---: | :---: |
| 153t.. Curranta. | 870,412 | -29,196 | 8. |
| 1859.. | 471,746 | 16,076 | 9,7\%1 |

Under a system of commomial equality with privileged nations, the Unitect States' flag could successfully compete with the fags of all other nations in the importation of wheat, flour, Indian corn, rice, sea-bread, aalted meat, and salted fish, tobscco, sugar, ceffee, and timber. As regards the quantities of these ataples, re nectively, which might find a market in the Ionian pa s, there are no data accessible upon which to base any calculation. These staples, however, are ulways in demand in the different ports of the Ionian repubIlc; and on approximate estimate as to the quantitles which mizht, with aafet: be annually exported from the United States to these markets may be formed from an oflicial return from one port (Jante), in the possession of the Department. This return gives the aggregate value of these ataples annually consumed in that consular district at $\$ 1,539,528$. Wheat, Indian corn, cured fish, coffee, rice, and timber occupy the tirst rank in these stapnes.

In 1853, there enterell at the different ports of the Ionian Islea 1380 vessela, measuring, in the aggregate, 153,652 tons; and cleared 138.1 veasela, with an aggregate of 152,768 tons; making a total movement of 2763 vessels, and 306,320 tona. An analysis of the trade in $1 \times 53$, as compared with that of the preceding year, will alㄱw e decrease of, entered, 160 vesneld, measuring an aggregate of 25,979 tons; and of cleared, 101 rensels, with an aggregate of 22,700 tons. The number of veancia under the IIritish, Austrian, and Greek dags diminished; the latter ahowing the greatest dirutution.

The value of inports in IN53 was as fillow:

| For ennsumption. | Franes. $17,070,804)$ 6,242,620 |
| :---: | :---: |
| Total. | 23,889,200 |
| Value of exporta : |  |
| Iomestle producta. | $\begin{aligned} & \text { Trimhes. } \\ & \text { R } \\ & \hline \end{aligned}$ |
| Forelign ** | 2,564,970 |

Compared with the trate of 18052 , the imperts of this year ahow an incronme of $3,70.500$ francs, anl the exports an Increase of $\$, 2 \times 6,600$ francs; or a total increase of $5,064,560$ fraties, Of thin incream, cervals, augars, and tisaues of cotton and wool, ail from Enghand, bure the principal part. In exparta, the increase frll almost exclusivety on olivenild and curranta, if we except $1,695,300$ francm, the value of various kinde of tinnum re-exported from the different porta of the inhanis. The value of mon and wine, also products of the inianle, alow an increase of 356,000 frases. In remarking upon the chief provlucts of the loulan Isiands, it in atated, in reference to the moap manufactured at Zante and 'orfu, that, for some time past, they have used in it. preparatlou a hind of chaik imported from England in the tassels of that kingden. The use of this earth in the manufacture of map deteriorates its quality, and will reault, unquentionaliy,

In throwing it allogether out of the forelga market. The trade of 1854 glvea the total zumber of vessels entered and cleared at 2,778, measuring an aggregate of 309,387 cons. Compared with 1853 , theae figures show an increase of, entered and cleared, 15 vessels, with an aggregate Increase of 8,067 tons. These all entered, with the exception of 1 vessel of 1,781 tens. In 2854, the value of trade was:

| Imponts.-For consumption.... Warehoused........ | Fmancs. <br> $19,524,400$ $9,346,000$ |
| :---: | :---: |
| Total. | 25,834,900 |
| Exponts.-- Domestio products. | Frnies. $0,239,175$ 8,529,2 225 |
| Total.............. | 17,868,400 |

The total trade of 1854 was thus $46,703,300$ francs. In comparing this wish the figures for 1853, an increase is shown in imports of $5,471,700$ francs, und of exports, 2,186,100 franes; making a total increase of $7,657,-$ 800 francs. In imports, about :nree fifthe of the increase in value fell upon grains, though la quantity there was a decrease of 35,000 hectolitrea* compared with 1853 . This was occasioned by the high price of grain of all sorts. The remaining two fifthsof the increase fell apon cattie, coffec, sugar, tissues of cotton, and miscellaneous articles. The nations that supplied the ishands in 1854 were, chiefly, Englani, Germany, Greece, Turkey, und Russia. lirance sent crystalo, hides, augar, tissucs, wines, and oundries, to an amount, in value, of alout $2,000,000$ francs. The sugars were shipveu from the refineries of Morseilles, and were bor:te under the Greek flag to Corfo. In exporta, olive-oil, soap, wine, and some uther necondary products of the soil and industry of the islands, wero the chief articles which exhibited an increase over the returns of 18533 . Notwithrtanding the had yjeld of currants In 1851, over 6,000 hertolitres ol wine wero exported to Trieste, Venice, and Malta. See Ionian Isbanirs.

The value of the commerce of Great Britain with these islands is thus g.ven:

|  | ${ }_{\substack{\text { Vranss. } \\ \text { 1823. }}}$ | Franes, 1ast, |

Greenland, or Groenland, a very largo leland, of, probably, assemblage of islands, lying to the northeast of North America, and for the mest part comprehended withln the Arctic Circle. In early times it was supposed to form a part of the Anserican continent ; but the discoveries of modern navigators have proved, whit Indeed the very Idea of a north-west passage from the Atlantle oo the Pacific Ocean supposed, its insularity. And the latest discoveries have, moreover, ehown, or all hut proved, the entire separation of the lands on the west side of Baffin's Bay, or rather, what we would now venture to designate Baffin's Sea, from those of the opposite shores, so as to linit Greenland to ths country on the eastern side of that great channel. From Cape Farewell, in lat. $50^{\circ} 49^{\prime}$ N ., it stratches on the west side in a north-north. westerly direction through Smith's Sound, and then more easterly into a high northern latitude. On the other side, the Greenland coast runs first north-north-easterly; then north-exsterly, and finally (so far as yet traced), In a northerly direction, bending eastward in the 75th and 76th paraliels of Intitude. It expands from Cape irnewell, the southern peint, up to latitude $70^{\circ}$, where it attains a width of aboust 600 miles, which is pretty evenly maintained to the ne rthern extent of our rescarches on the eastern side. This side of Greenland has been dcnominated liast or Old Greenlanl, the other Weat Greenland.
In general, the discoveriea which have been effected In this quarter of the glohe have resulted from attempts made to diseover a north-west passuge to Indin through the Aretic Soa. The existence of such a communicatien is a suliject which from time to time has occupied the attention of the British government for the last three centuries; nnd although much valuable information had been olstained by menns of theas voynges, the great problem remained unsolved until the very recent researches after the fate of the lamented voyager Sir Iohn Franklin, when Captain M'Clure, in his researchen, vid Behring's Strait, eastward, detormined the fact of a sea communication between the Pacific and Atlantic Oceans. This he effected by sailing till within sight of Cnptain I'arry's diseoveries at Mclville lsland, and thence completing the personn! transit by ice-traveling and voyaging to the shores whence he had departel. Hut heyond the determination ef the geographical fact, it was found, as luad been conlidently predicted, that no practical use could be made of a channel so thickly encumbered with impenetrable, or all but impenetrable, ices.

Greenland was first discovered by an Icelander named Gunbiorn, who was driven ly storm upon this const, about the leginning of the ioth century, and carried thek intelligenee of its exintenco to Iceland. Toward the end of the same contury-nucorillng to some writers in 980 -an Jeclandic chief nsmed Jirie Raude, or liric the Red, having killed another powerfal chief, and being obliged to quit the country, determined to follow up, Gunbiorn's diseovery. After having spent two or three years in exploring the country, he returned to leeland, giving an exaggerated account of the fresliness and verlure of the country, which the ealled (ireenland. In reasequenco of this, a fleet of 25 aail was equipped and ment oat, laden with persons of both sexes, cattle, nod other necessaries for forming a settlement. Only alsout the hoif of the vessela reached their deatination! hut other adventurers setting out, not only from leeland, lut from Norway, the Orkney, and other ishumds, in a few years a consideratle culony was formed, mal a regular traile estabilished. The real josition of these eariy adventures has been a sulject of much learned inventigatlon nad no littie controversy. Ilut it seems highiy probable that the eriginal colony of (Ireenland begain about the southern promontory, near Capee Fiurewell, and gradually extmined itself along the coast in a north-westerly directiou. Beyond this first settlement
another proceeded farther to the west. The former was called GEstre Bygd, or the eastern settlement, and the latter Vestre Bygd, or the western aettlement. Christianity having been introduced about the beginning of the 11th century, nunerous churches and convents were built, and the country was divided intu regulur parishes, to which monks and other spiritual instructors were attached. The colonists, although compolled to lead a life of aevire privation and hardshlp, continued to increase, and te extend to the north. The zeal with which the early Scandinavians pushed their settlements to the northernmpst parts of Greenland is strikingly attested by a eurious monument which was discovered in 1824. It consists of a stone carved with Runic characters, which was found etanding erect in the ground on the island of Kingliktorsoak, under the parallel of $73^{\circ}$.

For some senturies the commercial intercourse betweon ( about the beginning of the 15th century all intercourse ceased, and the unfortunate colonists were cut off from the rest of mankind. The Esquimaux, the nutives of the country, whom in derision the Norwegians called Scrallings, or Dwarfs, on account of their diminutive stature, uttackod the western colony, which was compelled to seek assistance from that which lay to the south-oast. There can be little doubt that the scunty population was reduced by theso savage invaders; but it was more effectually thinned by that dreadful pestilence called the blurk death, which desolated Europe frum the year 1.102 to 1404, and which extended its ravages even to Greenland. Those who escaped the plague probably soon fell victhas to the Esquinuux ; at least, nothing is known of them after the commencement of the 10th century. The terms eastern and western being used in reference to the original settlements, naturally led to the belief that the eastern as well as the western side of Greenland had been colonized; and a notion very generally prevaijed for a long time that the western settlement only had perished, the eastern one having escaped the culanity, but, from the vast accunulation of ice, had heen secluded from all communication with the rest of the world. During the last century the court of Denmark regeatediy dispatched ships to ascertain if any settlers still remalned on that part of the coast which is now ealled East or Old Greenland, but withnut success. A moro recent hoating oxpedition in 1829-30, under Captsin W. A. Granh, of the Danish Royal Navy, has, however, in extent of research on the castern side of C'upe Furewell, yieided by far the most astinfactory information. IlJ examined the coast as far nerth is $65^{\circ} 45^{\prime}$, but found nothing to indicute that this const had over been colonized; and we are thus led to the conclusion that the notion of any of the Norwegians haviag gettied on the easterin mores must be a mistake; a mistake arising from a misapprehension of the words east and west. In 1721 llans ligede, a clergymun from Vangen, in Norway, accompanied by his wife anil family, left his native country to settle $r^{n}$ a misnionary in (ireonland. He landed at thals iliver in N. lat. $61^{\circ}$, mal called the place Goaltlazab, or Good Iiope. Since that time the Danes lave extablished unmerous settlements upon the western const of Greonland, lying hetween $60^{\circ}$ and $\overline{i n} \mathrm{~N}$. lat. The whale If heries have greatly contributed to the allvancenent of the colonien; and from the intimate intereourso which is now kept up with buropeans, their condition Is at present more llourishing than at any former period. The aeal tishery is nlso of great importance to firoenland-the ficah of the seal forming their common food; and from their akin is made their boats and olething. See artlden Fishifimes and Seals.

There are, at present, 13 Danishe lonies in GreonInnd, besides some smaller establishments termed factorien, For alministrative purposes, they ary formed into two inppectorships, called respectively North and

Sonth Greenland. South Greonland lise sonth of N. lat. $67^{\circ}$, and corsprises six colonies as followa $:$ or lars

Julianehaab is the most southern as well as the most important of these. Its district extends to the most southern point of Greenland, Statenhuk, and beyoud it for some distance along the east side. At Piskenzeset the Danes carry on an extensive seal fighery by means of nets, etc. In its vleinity is the Moravian station of Lichtensels, founded in 1758 . Godthath is the residence of the inapector of South Groenland; and in the vicinity is the Moravian gettlement of New IIerrnhut. Lukkertoppen takes its name from three pointed hills in the vicinity, resembling sugar loavea, and has one of the beat and safest harbors in the country. North Greenland liea north of N. lat. $67^{\circ}$, and comprises seven colonies as follows:

We shall now give a hrief nutline of the jusovery of the various apetin of the conatn of Greenland, with occasional referencen to researches atwout proximate lands with whieh thowe on Greenland were mowe or less mixed up. This will leal us again to notice the enterprisen of the 16 th centary in seareli of a paapage by the north-weat from the Atlantic Into the l'aclific Ocenn.

Huring the reign of Queen Filiasheth, Frohluher, a diminguinhed English navigator, made several royagea to this quarter of the globe. In 1577 he dincovered the aralta which have lieen catied after hing. In the year 16as, inavia, another able meaman, came in olght of high land, whleh he calied Mount Lialelgh, supposed to lie aomewhere on the weet of the atraitn lrear-

Ing the discoverer'a nama. In 1610 Hudson discovered the straits and the bay which are called after him, in which he experienced a disastrons termination to his useful carear. To certain rocky Islands, lying about the 64th parallel, he gave the name of Isles of God'e Mercy. He also discovered two capes, one of whioh was called Digge'a Cape, and the other Willoaghby Cape. In 1616 Baffin, one of the most distinguished of onr English navigators, discovered the large expanse northward of the Strait of Davis, now kuown as Baffin's Bay. Sailing in a little vescel of only abont 65 tons' burthen, he effected one of the most extraordl. nary voyages on record. Under the Imperfect appllances of the age for navigation, Baffin, with one small veasel, clrcumnavigated to Smith's Sound, on the north of that bay or sea whlch, northward of " Hope Sanderton, the furthest land Master Davis reached, lying between 72 and 78 degreen," was an utterly un. known region; thua adding some 1,100 miles of discoveries, reckoned by the mere coastinguline, to the knowledge of these ice-encumbered ehores. His exploratlon nort hward reached, it would appear frem the brief but graphically-told atory of hls voyage, as given among the Pilgrimages of Purchas, in high as abont $77^{\circ} 47^{\prime}$ of latitude, where he obtained a clear view into Sir Thomas Smlth's Sound, which he deacribes as ranning " to the north of $78^{\circ}$, and belng the greatest and largest In all the bay."

For 200 yeara from the tlme of Baffin, the knowledge of this great inlet (excepting some llmited and unpublished Informntion oltained thy occasional enterprizea of the whalers) had not been idvanced. In the year 1818, however, in consequence of information, we believe, coinmunicated thy Captaln Scoresby to Sir Joseph llanks, the admirelty fitterl out two expeditiona; one of which, under the command of Captaln Ross, was deatined for the discovery of the nurth-west passage; and the other, nt the head of which was Captain Huehan, had for its object to attempt a voyage across the pole. On the western side of Greenland, the first-mamed navigator lincovered a high mountainona region to the north of Upernivik, to whleh, from national predilections, he gave the name of the Aretie Highlands. It lo little else than a mass of rockn, itsterningled witt Immense blockn of ice. Ife then proceeder toward the northarn extremity of lhaffin's Hay, which he explored as far ns the ice would permit, looking from a diatance Into Smith's Sound. He nurvoyed the coast generally, ascertuined the positions and the appearance of the land, the aituation of the islanda, and the general configuration of the great inlet, from the 78th down to the 6isth parallel. The discoveries of Baffin, wish sume had disputed, were thua signally confirned; firr while the form of the bay, aa given mainly from conjectural applieations of liaf. fin's ifescriptions, was found to be thonoughly erroneous, the several deep inlets and other remarkable features of the comat-line, wa noted by this ulmirable royager, were not only easily recognized, but the latitudes and more otriking particularities were found to be characterist ically correct.

Hat the limited period of a mere aummer'a voyaga having left several polints in liosa'a course defective and inconcluaive, eaprecially as to the aupposed clowing up of Lancaster sound ly eontinuous fand, another expedition wan sent out the year following nider (laptain I'arry, who succeeded nut only in paning through this famous inlet of lhofing, but in liscovering a navigable channel among iniande oxtending far weatward, which was anceanfuliy purninal for about the degrees of longitnde legamil luas'a furthest. Ihut an these remearcher, with the general boly of the discoverien since then made, fall beyond the limits of our present article, wa muit reier, for an abstract of them, to the general account of the Auctio teckas. The ehief alditious to our kmowledge of weatern (iremilaad which remain to be woticed, consist of certain corree-

Capuair aglaf $\sim$. ${ }^{2}$, In the Isabel, fitted ont by Lady Franklin, having the advantage of an auxiliary steam power, made an advance northward of Baffin's furthest of sbout $\overline{B 0}$ miles, reaching within Smith's Seund to $78^{\circ} 28^{\prime} \mathrm{N}$. lat., and obtainlng the view of a sea oxpanding again conslderably beyond.

The expleratlon of this new expanse into the maln Arctio Ocean (with whlch the Greenland Sea in the east, and Behring's Strait in the west; communicated), by the second American search-expedition under Dr. Kane, completes our aketch of the progress of discovery on the western slde of Greenland. Thla herdy and intelligent adventurer, in a little solltary vessel, the brig ddvance, pushed hla way through Smith'a Sound in the month of August, 1853, and crawled along ehore within a cram of dangerous icea which all but filled the passage, to a position higher in latitude (abaut $78^{\circ} 40^{\prime}$ ) than had ever before been taken as a wintering station in these western regions ly Europeass. In this position the $\mathrm{br}^{\prime} ;$ was frozen in, early in September, and so remained throughout the ancceeding sammer, and with so little prospect of release as to occaslon her abandonment, after a protracted adherence to her of above 20 montlis,

From thle hlgh position in latltude, explorations (furthared for a the by the effectlve ald of their Esquimaux dogs) were perseveringly made, and rewarded by resulta of the most interesting nature in geography, hydrography, and glaciology. The coast of Greenland, forming the eastern boundary of Smith's Sound, was traced northerly and easterly, untll the expleration was diverted by a stupendous glacler of a vast extent, with a preclpitous face about 500 feet in height abutting the aea. The geographical discoveries were pushed atill further toward the pole, and new lands as high in latitude as $82^{\circ} 30^{\prime}$ acded to our charts. The lands on the twe aldes of this channel were found to be connected by apparently perpetual lecs, having, at the time of the examination, an open sea beyond entirely free from valble encumbrance, whese wavea were dashing with sublime action and force againat the face of the icy barrier. Fere an area of about 3000 square miles was seen entirely free from ice, the commencement and margin, as has been inferred, of an open unfreezing polar ses. On this question, however, which cones in more fitly for discussion in our article on the Polanll lhoions, we here only remark, cautionarily, against a premature conclusion, that Captain Scoresby, in his account of tha aretie regions, descriter in open ses, which he himaelf ence observed and navigated, to the northward of Spltzbergen, running ahout E.N.E. and W. S.W. fur 309 miles within the latitudes of $80^{\circ}$ and $81^{\circ} 30^{\prime}$, and having an aren of from $15,0,40$ to 20,000 stuare miles, or from the to six times the extent of that traced hy Dr. Kane; yet this apparently upen polar ocean was found to be but a mitsglacial sea! Besiles, the extreme lowness of the temperature In Dr. Kane's caat-being the lowest, lit the mean, ever observed on the face of tho globe-afforded sufleient evldence that there could be no sucli sea remaining open to the pole, beyond an luchtental lake.

It does not comu within the seope of our present urtide to dwell on the particular faets, and lnei' nts, anil processes of this admirable researeh by itr. Ánne, except to notice the falling in with lisquimuox living in "region further north than nny they had before met with. Agreeing, as these natives in their general characteristics do, with other Greenlandens, they were tound to have Ineldental pecullarities in their habits and moden of living. They mupluy dog-sledgea of
great efficlency and apeed, but hava no boata or kaijaks; Thay surround themeelves in winter with walls of mess, and, at that season, live mainly npon raw. walrus flesh -habits of life which, for the seasen, Dr. Kane and his party found it expedient, and, after a little exper rionce, not unpleasant, to imltsta and adopt. Under this new dletary, education, raw walrus flesh soon became palatable; and even tallow candles, when they could be spared for such s purpose, were pronounced by the chlei of tiae expedition to be very good! Useful and friendly as these natives wers in their intereourse with Dr. Kane and his party, they nnfortunately possesed the lufirmity (ehall we call it?) too characteriatic of the Esquitnaux, of an Insatiable habit of aelf-appropriation-stealing unscrupulously whatever they could manage to seccrete, equally regardless of the damage to the owners, or of any possible use of the articles to themselves.

We may add that Dr. Kane, in the Advance, started on his expedition from New York on the 31et May, 1853, baving along with him, in crew and associates, seventeen men. Three of this number, the cook, the carpenter, and a seaman, died in the arctic regions, and the remainder returned safe to port on the 11 th of October, 1855. The party left their.veesel still fast in the lee on the 20th of May, and traveled over the lee to the navigable watere of Baffin's Sea, whence by mesns of their boats they proceeded to th. settlement of Upernivik. They there to $k$ pasaage in a Danish trader; and when, in the progress southward, they reached Lievely, in Disco Island, they met with the expedition of lieutenst H. J. Hartstein, which had been sent out by Congress in search of them.

As to the eastern side of Greenland, all our accurate knowledge, except a few purtlculars referring to the coast near Cape Farewell, is of recent attainment. A cousi-line, indeed, of the more southern parallels was to be found in our charts of the arctic regions, and In maps by Egede and Crantz, traced to a considerable exteat, withan eluborateness of flexure that weuld indicate real and careful exumination; but subsequent researches ha ye by no means verified the supposed configurutions.

Nerthward of the 70th parallel of iutitude, all the geographical information we had of that coast previous to the voyage of Captain Scoresby (now the Rev. Dr. Scoresby) in 1822, consisted of the nut very dellnite notilication of certalin points of land discovered by the adventurous lludson in 1607, with a few touches on the coast, and notices of land being seen by whalers, chietly Dutch, in 1654, 1605, and 1670. In 1822, however, Captain Sceresby, while engaged in the Greenland whale tishery, and successfully pursuing the commercial olject of his voyage, penetrated the ice westward, as he had previouly provided for attempting, to the coast of eastern Greenland. But the posithen of the coast, and its line of direction, were found to he widely different from thosu ascribed to them in the charts, whether English or Dutch; for the real place of the land in latitude $74^{\circ}$ was found to be from $8^{\circ}$ to $15^{\circ}$ of longitude further west, and the line of direction from $69^{\circ}$ to $74^{\circ} 80^{\prime}$ N. by E., Instead of N.E., or E.N.E.E, its formerly laid down.

The tirst land seen by Captain Scoresby, stretehing from N.W. liy N. to N., extended to about $7 t^{\circ} 30^{\prime}$ N., the nearest headland being estimated at 50 miles' dis tance. This was on the fth of June, und so carly in the scason as to prevent any near uppromeh to the comst, from the intervention of a chain of heavy tield ice northward of $73^{\circ}$. Hut after tracing a proximate ontlino of tha more northern part of the coast, Captain Storeshy was gradually enabled to upproach the shore as, with the advance of the season, he proceeded southwart ; and, In the course of the exploration, succeeded in landing on four or tive different positions letween the 70th and 7 idd parallels. The const from $74^{\circ} 30^{\prime}$ to $69^{\circ} 10^{\prime}$ was generally surveyed, and names were given to tha more particular lieadlands, islands, and inlets.

Two very remarkable Inlets were observed and partlally examined, one in latitude $72^{\circ}$, which was named Dary's Sound, and the other in $70^{\circ} 15^{\prime}$, which recelved the name of Scoresby's Sound, on account of the first examination of It ever known to have been made baving just been accomplished by the navigator's father. In thls way, slogle-handed and withont cost to the country, some 600 miles of new coast line (reckoning its various flexures and inlets) were added to our Greenland charts ; and mneh novel Information on the geography, hydrography, and natural hiatory of those regions was communlcated to the pulilic in the Journal of the Foyage, which appeared In the succeedlng spring. One circumatance of geographleal intereat it may be proper more particularly to notlee, vlz., the convletion conveyed to the mind of Captain Scoreaby by hls observatlons on the current aytting Into Davy's Sound and Scoresby's Sound, that these fine expanses of water, which, In certaln westerly directlons, were clear of lee or land to the utment extent of vision, were actual channels of communleation between the Sea of Greenland on the east, and that of Baffin's on the weat. Hence the great prohability of the supposition already noticed, that Greenland conslats of an assemblage of Islands.

In the year 1823, Captain Clavering, In command of the Griper sloop-of-war, under adminalty onders for pendulum experimenta, advanced on the same coast as that first approached by Captain Scoreaby ; and, belng ahout a month later In the season, was enablel to get close In shore, and to enter a considerahle bay In lat. $74^{\circ}$, aupposed to be that originally discovered liy Gael Habkes, a Dutch navigator, in 1654. The line of the more northerly part of the coast, as laid down by Scoresby, vas now corrected, and new coast lines, including Shannon Island, with dottinga of headlands resching from $74^{\circ} 30^{\prime}$ to $76^{\circ}$, ndiled to our charts. Southward of Gael IIamkes'a Bay the coast was traced pretty close along to Cape P'arry of Seoreshy, nad then finally left. The general contiguration of the coast, excepiting some 10 or 15 leagues in the furthest borth, seen by Captain Scoreshy only in the distant horizon, was singularly verified tiy Captain Clavering'н inshore researchen, For though the first exploner was not able to approach the land het ween $71^{\circ} 30^{\prime}$ and $7.1^{\circ} 30^{\prime}$ N., nearer than from 40 to 45 geographical milea, the positions ascritbed by the two navigators to the headlands of Gael Ilamkea's Hay, and other leading points (withitackson's Island, which had treen first laid down at atrout 30 miles' distance), proved to be all but ilentical.
This coast presenta many remarkable and interestIny features. On the liverpeol coast of Scoreshy there is a mountainous chain of 300 mi to 4000 feet in hel,ght, forming precipitous clifs, which terminate In nimerous paaks, cones, pyramils, or series of perpendieular perinted pointa. In the interior were geen peaks supposed to be almoet twice the rlevation of the lofty coast. The coal formation of Jampan's IJJand, In Scoreshy's Sound, was amonj; the mont interesting of the gengraphical particulare ohserved.

The final rewarchea, which terminate our iearrige tion of the eatern coast of Gircendand, were those mado hy Captsin Cirath in the years 1803 nnd 18:0, bererder of the kIng of thenmark. The lealing ohipet was to search for the loat coloniem, and trace the coast, If practicable, in bouta, from Cape Forewell up, to latitude $00^{\circ} \mathrm{N}$., the nonthernmost poine dlacovered by Captain Scorexby. The expelition consisted of two momen's buits of the cointry", rowed liy women, earrying the banen of the party (t'mptain Viranh nutd three othera), and attendell hov five men in their kaligks. From the nouthern ioand, Cape Farrwell, up to latitude $65^{\circ}$, the coant was found to tronel atmout N.N.E., : and from thence, for to to the miles (ay far as they were able to trace it), the line was about N.E. The highest point on Captain Grash's chart wxtends to $65^{\circ}$
$45^{\circ}$, leavigis the luterval of alout 310 milea (in a north.
easterly direction) yet uncertified and unknown. The presalng of the lee in close contact upon the land prevented the further navigation of these eastern shorea,

Greenock, a sea-port town of Renfrewshlre, Scotland, on the south bank of the Firth of Clyde, 22 miles below Glasgow, In N. lat. $55^{\circ} 67^{\prime} 2^{\prime \prime}$, W. long. $4^{\circ} 45^{\prime} 30^{\prime \prime}$. In front of the town there is a fine and extenalve bay, formerly known by the naine of the Bay of St. Lawrence, from a religlous heuao that anciently atood there. Behind the town the land riees into a pleturesque ridge of hilla, alvout 800 feet high, between which and the bay Greenock atretches for upward of 24 milles along the shore, bat its breadth is inconalderable. Its name is aupposed to be derived from the compound Gaellc word Grianaig-Girian signifying aun, and dig port or bay-the bay being direetly oppoaite to the rising aun.
Various acts of Parlisment having reference to successive enlargemente and alterations of the harbora were from tlme to time procured, at the increase of trade rendered such necessary, so that now of the original erections scarcely a vestlge remains. In 1785 a dry dock was built In the western rivision of the old harhor, the expense of which was defrayed by subseriptlon; and in 1818 tho magistrates and conncil contracted for and built another, and greatly larger, entering from what is now known aa the Eist India Harbor, and whleh was finlshed in 1824 at an expense of $£ 20,000$. On the 29 th day of May, 1805, was lald the foundation-stone of the Eant Indla Ilarior; and alinost cotemporaneously with thls large addition to the dock accommolation of Greenock, a general ins. provement and renovation of the quays and breasts of the older portions of the harbor were undertaken. These works, which were very extensive, and involved an expenditure of upward of $£ 120,600$, wers not conipleted till September, 1810.

The steadily increasing trade of the port rembered a further extension of dock accommodation absolutely necessary; and in 1810 an act was procired for the construction of an entirely now harbor and dock. Six years autsequently the work was commenced on a site directly east of the Fast India llarlor, and on the lith Octotur, 18.00 , the new dock was formally epened under the denignation of Vietoria ilarbor. It consista. of a tilal basin, covering an area of shout 6 arres, and exceeding to teet in depth. The east and west wally are earh btas feet long; and the outer guay wall, dividell by the entrance, 150 feet wide, is $17 i j$ feet long on the west, and tio on the east side. The avirage width of the quays on the enst, west, and wouth, is upward of 85 feet, anul on the north, towarel the riser, it is $\mathbf{7 0}$. The depth of water within the husin is ?f feet at high tide, anil it feet at low water. The whole work, which is of the most substantinl character, cost upward of fl llo, tou ; mul, as a tidal harloor, has not, in reaject of ita size and depth, its equal in the world. Un the east side a masmive crane, capabla of lifting from 70 to su tons, has been erected; and here many of those gigantic atean veasels, fur which the Clyde has liecome miversally fanous, are litted with their engines. A crane has also theen crected at the East Indin llarlmor capablo of lifting to tens.

The old graving ducks having become aitogether in adeguate, the harbor trusteea loave recintly purchased,
 in:z Albert Unay, and liere fo in in contemplation to construct thew harlor, with the requisite dack aco commodation for repmiring the targest vessils. The following measurementa show the extent of the existing dee'k and quas mevombolation:

The earllest trade seems to have been in herrings, and It is still continued, the amount oured annually averuping about 19,000 barrels. Trading in tobaceo was also carried on at a very early period. It was first brought from the colonles, and then exported to the conthent. The Greenland whate-fishing commenced as far back as 1752, but it never rose to be of any importance, ant la now discontinued. The American war greatly interrupted the progress of Greenock, as the princlpal trade of the port was then with that country; but after the peace in 1783 it specdily revived, and within the seven following years the shipping trade was tripled in amount. At present the principal intercourse is with the East and Wett Indies, Australla, and North America. Newfoundland and South America have also employed a considernble quantity of shlpping. The gradual increase of trade is shown by the following tables:
account of the onons Rreript of Cuatoma at the Port of Grernock durino 1t28, ano vamiots bubsequint Mearb.

The stationary state of the duties of late years is ascribed partly to their reduction, and partly to the improvements effected $\ln$ the navigation of the Clyde, which caable vessels that formerly hail to load and unloud here or I'ort Glasgow, to ascend te Glasgow.

Greenwich Exospital, tireenwich, Englnnd, is a royal foundation, erected by the mnniticence of William and Mary (originating, as is generally telieved, with the queen), hy letters patent of the 2ith of Octolier, 1691. The hospital occupies the site of the eld palace, called Creenurich House, whilh was from very early times a residence of our sovereigus. Bdward III. hat a pulace there, Henry IV. resiled much at direenwich, and his will ls dated from his manor of tireenwich. It was grantel lyy Ilenry V. to the youngest son of Johm of (inunt, and reverted again to the crown on his death (sith lienry Vl.). Bilwarl IV. took great lelight in the palace, nomenlarged it at much cost. He granted it to his queen, Blizabeth. It afterward camo into the possession of Itenry VIJ., who enlarged and latatitied th, and resided much there, llenry VIII. whan at great expense to render the palace worthy of i.is sumptuous court. Ile called thls his manor of pleasaunce, and held there many great bauquets and royal ceremunies. Queen

Elizaheth made many additlons to the bullding, and realded much there. James I. laid the foundation of the House of Delight, which afterward became the resIdence of the governor of the hospital. Charles I. realded frequently at the palace; and his queen furnlshed, with extraordinary magnificence, the building begun by his predecessor. At hls death lt was taken possession of by the officers of the Commonwealth who excepted it, for their own use, from the general ordinance passed July $16 \mathrm{th}, 1649$, for the sale of the crown lands; but upon their subsequent necessitles for the support of the nayy, lt was ordered by the House of Commons, November 27th, 1:52, to be immediately sold for ready money. Preparatlons to give effect to this order were made, and some snacall part of the out-balddings was sold. The palace and park were, however (with other of the royal palaces), assigned by the Huuse of Commons for the accommodation of the Lord Protector, and happily reverted to the crown on the restoration of Charles II., by whom the west wing of the present hoapital buildlings was added, as part of an extensive design. (Hasted's IIistory of Kent.) The pelace remained in the unfinished stute in which Charles II. left it, when it was assigned by the patent of William and Mary to certain of the great officers of the state, as commlsaionera for its conversion into a hespital for seamen. This was followed in the succeeding year by a patent, dated September 10th, 1695 , which recited that the object of the institution was to make some competent provision that seamen who, by age, wounds, or other aceldonts, should become disabled for further service at sea, and should not be in a condition to malntain themselves comfortatily, might not fall under hardships and miseries, but might be supported at the public charge; and that chil.1ren of such disubled seamen, and the widows and children of such seamen as should happen to he slain in the king's service, might, in some reasenable manner, be provided for and educated. The patent oppointed l'rince George of Dennark, several of the great officers of state, noblity, blshops; und others, to be commissioners for these purposes; and retuired them to consider how they might be best carried out, and the palace best converted for the charitable object to which it was assigned, and also to frume for his majesty's upproval a charter of foundution. The government of the hospital has been continued in sintilar commlssions in subsequent reigns, and the mest distinguished persons havo been appointed commlssioners. George 111., by his charter of December ith, 1775 , incorporated the commissioners, vesting the goods and revenues of the hospital in them, and gave to them and their sincessors a perpetual succession.

The revenues of the hospit.ll have been derived from several sonrces. William III., contributed by grant f2000 a year towarl perfecting the work, and authorized the cummissioners to receive voluntary gifts and subscriptions in aid. Above $\mathbf{L 5 0 , 0 0 0}$ had been expended, on Queen Anne's nccession, upon the build ings, which though still very incomplete, were so far in a state of realiness that, in December, 1705, 100 disabled seamen were tnken into the hospitul. On the lat of inly, 170 x , the numiver amomited to $\mathbf{3 5 0}$, and the income was estimatel nt $£ 12,000$ a year ; half of which was applied to the maintenance of the seamen, and the other half to the completien of the buildinga.

The revonuo of the hospital in 1849 (for whlth year the latest accomints are printed), was-

Estimated by oye, the height of the uppermost la about 40 feet above the water line; but I was of course unable at that diatance to compare the levels of the succeasive leiges with those oluerved between Cupes Spencer and Innes on the opposite sido. About tea-time, we saw a set of hill-tops to the north by west, apparently of tha same configuration with the hilla around us. The evast of Cemwallis Island now receded to the west ward, and an Intermedlate apace, either of water or of very low beach, separates it from the naw land to the north and east of us. Whether this be a cape from a northern Terra Incognita, or a new bend of the opposite shores of North Devon, I am not prepared to say. We took gextant bearings. From this date we may claim the diseovery of that land, which we were able afterward to deline satisfactorily. "Grinnell Land," as it was afterward named by our commnnder, was thns discovered nearly 8 months before it was delineated and named by Captain I'enny in May, 1851.

September 22,-This day of reat (Sunday), which opened with elear, cold serenity, gave us an opportnnity of seelng the unvisited shores of Wellington Channel. Our latitude by artificial horizon was now $75^{\circ} 25^{\prime}$, ol about 60 miles north of Cape IIotham. Cape Bowden on the eastern side hud disappeared, and on the west a dark projecting cape from which we took onr aextnnt anples, was been bearing to the west of south. To the northward and westward low land was see $\boldsymbol{y}$ having the appearance of an Islund, although it may have been connected with the shoro by an unseen atrip. Its eastern termination was more elevuted. The hend of the westerm shore Kus now clearly to the westward. It was rolling with the terraced shingle benohes before observed, and ended or apparently ended, abruptiy. After and befond these to the north, without risible land intervenIng, were the mountain tops which turminated our view. These were two in number, one higher than the other. A third summit, more distant thun the others, was seen by me from tho mast-head, but the bases of all these, as is often the case with distant mountains, coull not be traced to the horizon. Without the nid cf a known height, and in an atmosphere so deceptive, 1 could not venture to give their distance In miles. Lieutennat De llaven eatimated the middle peak the noarest and most conspicnous, nt 50 miles."
llere Dr. Kane is direct und positive ILe is not compelled to resort to "a divlsion of opinions," nor a "lirst idea," nor an "if." Ile la plain nund outright. He says-" Gunnet.f. Lanu, as it was afterward named by our commander, was thas discovered nearly 8 months before it was delineated and named by Caj)tain l'enny in May, 1851."
lieutenant Griffin, commander of the Reseue, In his narratise of De llaven's voyage, is as clear and pesitive as De liaven and Kane, as to the discovery: $\mathbf{A}$ succession of southeriy gales ocenrring, we were drisen, with all the lee in sight, up Wellington Channel, cutil we reached the latitude $75^{\circ}$ 20'. From that position much new land was seen. A range of high monntains very josily recelved the name of (irinnelf. is wha: nel lealing to the north-weat was mamel after the distinguished gentleman at the head of tho Nationul Oingervatory, Mr. Maury. Capes and lalots never before seen, unless by tho misalng navigatore, wete named. lly gazing on that which was entirely new to man, the spirit of cuterprise hecume animated -we felt disposed even then to lome the slodige, und ail slowly in the direction of the mountain range, Captrin l'erny, t? e foliowing sjringe, without knowledge of our having hers ahead of him, gave Eughish names to the above land, calling Grimneli Land, A1hert Iand; Maury Channel, Vietoria Channel, ete, The mistake, as soon as it is explained, 1 suppose widl be corrected on the Einglisk charts.
I. I. 1.

Liautenant Griffin erred in his anpposition. The "mistaks" was eufficiently explained zfore Penny'a, or Arrowsmith's, or any other chart or the Arctic Discoveries in 1850, was publisined. The Lords of the Admiralty recelved officially an explanation of the " miatake," more than two months prior to the date of the Admiralty chirt, of Ap-1l 8th, 1852. Thelr " mistake" has not yet been corrected, They atill adhere to the name of "Albert" land.-Colonel. Force's Pammilet on Grinnoll Land.

Grise. The fore part of a shlp. To gripe, the tenden of a ship to bring her head up to the wind when carrying sall on the wind.

Groat, an old English silver coin, equal to fourpence. Other nationa, as the Dutch, Poles, Saxons, Bohemians, and French, have likewise their groats, groots, groachen, gros, and the like. In England in the Saxon thmea, no eilver coin larger than a penny was struck, nor after the Conquest till the reign of Edward II .., who about the year 1351, coined grosses or great pleces, which went for fourpence each; and so the matter stool till the relgn of Heary VIII., who, in 1504, first coined shillings.

Groats, outs deprived of the huska
Grosen, tho number of 12 dozen.
Groses Weight, in commerce, the weight of merchandise and goods with the duat and dross, as also of the bag, task, chest, etc., in which they are contained; and out of this gross welght allowance is to be made for tare and tret.

Guadaloupe, or Guadeloupe, one of the leoward greup of islands in the West Indies, and one of the moat important colonlea of France, and situated in north lat. $16^{\circ} 20^{\prime}$, west long. $62^{\circ}$. It consista properly of two islands separated from each other by a narrow channel, about five miles in length, by from 30 to 100 yards wide, and with depth sufficient for veasels of 60 tons. This channel, called La Rivierre Salée, or Salt River, runs nearly norti nud south, and has a large bay at each end, that on the north being ealled the Grand C'ul-de-Sac, that on the south the Petit Cul-de-Sac. The western or larger island, called Guadaloupe proper, or Basse Terre, is 27 miles in length, by 15 in breudth; the eastern, or Grande Terrs is nearly 30 miles long, by from 10 to 12 broad. Guadaloupe proper is of volcanic formation, and is traversed from north to south by a rluge of hills having a medium height of 2296 feet. Its principal peaks nre Ia Souffriere, an active volcano 6108 feet high, and GrosseMontagne, Deux Mamelles, and Piton de Bouillante, extinct volcanoes. It is copiously witered by numerous small streams, twe of which, the Goyade and the Lezarde, are navigable for sinall craft. The soil is fertile, and the surface ls agreeably diversified by hill and dale, wood and garden. Tho products, mitural and cultivated, are those of the West Indies generally. The principal town, Basse Terre, stands on the south-west coast. It is the resiclence of the governor, and hus some tine public huildings, fountains, and gardens, and ha', about dou0 inhabitants. Girande Terre, unlike Gundaloupe proper, is marshy, sterile, and that, now here rising: more tian 115 feet above tho sea. Its chicf town, st. Sonis, or Point a Pitre, the former capital of the island, is at the south entrance to the Salt liver, uad has an ex ellent harhor. It formerly contained atout 15,000 inhaintunts, but was almost entirely destroyed by an earthquake on 8 th February, 18.43, on which ocension 4000 of its inhabitants perished. The clinato is humid, and hurricanes and enrthuakes are frequont. 'The rainy season lasts from the middle of July to the middle of (ictober. 'The chief exports aro sugar, molasses, sum, cotton, mffee, tyo-woods, and copiper. The sugar crop amounta to about 60,000 hogsheads unmually. A consilerable quantity of fish is taken in the neighhoring seas. The government consista of a governor, W. a a privy council of 6 , and a colonial council of 80
members. The government of Guadalonpe comprisea benlden that island, those of Marie-Galante, Deaivade, Les Saintes, and the northern portion of St. Martin. Marie-Galante lies 14 miles south sonth-eant of Guadalonpe, and la about 12 miles in length by 8 in breath. It is traversed from north to south by a range of hills running parallel to the east coast, where it preenents a front of high nnd precipltous rocks. The west and north aldes of the island are level; and paraliel with the former ia a narrow lagoon, 7 or 8 miles in length, separated from the sea hy a low narrow tract of land. The liland abounds in woods, particularly the wild cinnamon-troe. Ita principal town, Grandboury, or Busse Terre, stands near the sonth-went point. Dessirade, or Deseadn, lles about 4 miles east from the south-ent extremity of Grand Terre, and in nbout 8 miles long by 8 wide. It rises from the sea with a ateep ascent, and then extends in a table-land, wheh conslats of limestone rocks, in whieh many caverns oceur, but it is without water. The soil in some places is of a deep black mold, and fertile; in othere it is sandy and unproductive. The only anchorage is at the Anse-Galet, on the east nlde of the island. Let Saintes sre a group of rocky intets 6 or 7 miles south of Guadsloupe, and connint of lofty and steep peakx, some of which are united by flat ground and ridges of inferior elevation. The two largeat are called Terre d'en Hrut and Tegre d'en Bras, St. Martin is a mmall island immediately south of the Britinh jalinnd of Anguilia, in notith lat. $18^{\circ} 5^{\prime}$, and west long, $69^{\circ} 6^{\prime}$. Its form is nearly that of an equilateral triangle, each side being ahout 7 miles in length, and comprising an area of about 33 squire milen, It in deeply indented with bays and lagoons, some of which affori good anchorage. The surface is generally hilly, the highent poirt being 1361 feet alove the sea. It was colonized hy the Freneh and Dutch in 1638, but thene were expelled hy the Spanianin, who themsel ven ahandoned the island in 1750, and the original nettlera renumed possession. The southern protion of the island belonged to the Dutch. Gualuloupe wan discovered by Columbus in 1493 . In 1635, the French entablished a settlement upun the island, and retainel posaession of It till 1759, when it wan taken by the Einglish. It wax aubsequently, on neveral occasiona, taken and retaken by these nations, and war finally ceded to France in 1814. Population ( 1854 ) 132, 810. Slavery was alolJahed here br a decree of the French heapublic in 1848, at which time alout 100,001 persons were emanejpated.
Guafacum or Lignum Vitee ( Fr . fiayac, Bein Soint; Ger. Iorkha/n; It. Givmjan; lat. Givoiacum, Ligmum ritice; $\mathbf{S p}$. (Gugyacn), the wood of a tree, a na tive of Jamalca, Haytl, and the warmer parts of AmerJea. It is a dark-looking evergreen, growing to fomm 40 to 50 feet in height, and from 14 to 18 ir.chen in diameter. The bark in hard, anooth, and liritte ; the wood is externally rellowish, and internally of a blackish-hrown color. Lignum vite is the waichtient timber with which we are actuaintel, its ape ie gravity being 1.3x3. It is exceedingly hard and dirfcult to work. It can harily be oplit, but breake into pieces like a stone, or crystalized metal. It in full of a resinons jujee (guriar), which prevents oil or water from working into it, and renders it proof ngaiust decay. Its weight and hardnesa make it the very bext timber for stampera nend mallets ; and it is ndmirabily sitapited for the sheaves or pulleys of blocks. and for friction roliers or castons. It is exteanively unet by turners. The graiar; of guin, piontaneously exudes from the tree, and concresen in very pure teara. it in Imported in cankn or mats; the former contalining from one to four hundred weight, the latter generally less than one hondred weight each. Its color differs considerably, being partly brownish, partly reddish, and partly greenith: and it altrays wecomes green when left exposed to the light in the
open air. It has a certaln degree of tranapareacy; nad breaks with a vitreoun fracture. When pounded, it emits a pleasant balramio smell, but hae scarcely any taste, although when swallowed it exeltes a burning zenaation in the throat. When heated, It melts, diffueing, at the same time, a pretty atrong fragrunt odor. Its speelflo gravity is 1.229 . See Vegt. Sub., Lib. of Eintert. Knondedge; Tuomaon's Chemistry, etc,
Guano or Hianso (the Peruvian term for manuro), a auhatance used as a manure, found on certain small imlands off the coast of Peru and Bolivia, and on parts of the shore of the maln land. It is friaile, and easilly reduced to powder. Ita color varies from a dull red to a dirty white, and it has a strong smeil aud a fat, unctuous feel. At an average, it may weigh froma 00 to 60 Jbs, a bushel. Humioldt was either the first, or one of the first, by whom this important subatance was brought to Europe; but it was described at a much earlier date by Ulloa (Voyage au Perou, i. 481); and has been used as a manure by the Peruvians froin the age of the lacas downward. Very different opintons have been enturtained an to its nature and origin. Many have aupposed that is was a peculiar mineral or earth. Ulloa, however, was elearly of oplnion that it consisted of the excremeats of the sea-birds which are found in prodiglous awarns all ulung the Pernvian and Bollvian shorea; and there is no longer any doubt that such is the ease. The localitien where the depasit in priacipally=net with being within a rainleas region, it is aecomulated with a rapidity of which we have no idea. Guano is of very different qualities: some authorltles give the preference to the whitish varieties, which are believed to be more recent, while others prefer the red. According to Klaproth, a quantity of guano represented hy 100 contained, urate of ammonia, 16 parts; phosphate of lime, 10 do. ; oxalute of lime, $12 \boldsymbol{q}$ do. ; sillea, 4 du. ; commen salt, $\frac{1}{}$ du. ; sand, 28 do, and water, organle and cumbuntible matter, $2 \times \frac{1}{d} \mathrm{don}_{\text {; }}$ but lts composition is found to differ very materiaily,' The best is that which containe the greatest proportien of ammoniacal salts.
Guano has not been long lotrolaced; and there is a good deal of discrepancy in the stutements that have been put furthas to its operation. There cant, however, ir no doult that it is a most efficient manure, and that akout 2 to $2 \frac{1}{2} \mathrm{ewt}$. per acre of average guano, mixed with about two thirde the anuual quantity of farin-yard manure (which is required to keep the soil loose), will prok!ere, when applied to land thit is well drained, nearly double the ordiuary quantity of putstoes. In turiip husbandry, splendid crops are produced by the agency of gumo only; but in this case from 4 to 3 cwt. per acre should be applied. It has ulso a jowerful intuence in lmproving erops of corn und the pauture following such crops. The effect of guato Is very materially increased by ite being covcred up to some considerahle depth as soon as it is laid on the ovil; and top-dressing in certainly the most wasteful way in which it can be applied,- - (I'rinate infurmation.) It is, $\ln$ fact, the mont valuable of manures; and under such circumstances it becomes of lupartance to leara the probabio aupply of the deposit, and the price at which it may be imported and midl in Eiur.pe

Cafortunately, however, uir Information oa both these pointa is less complete thun might the desired. Since it hegan to be largely exported to this and other fureign evuntries, an apjirehension began tu kin gromad in l'eru that tho dejemity would in no very long time be whelly exhansted; and an this would of caxion the ruin of those extaten along the comast of l'ert, and the department of Arequipa, in which guans bas long been ext msively used as a manure, govermment has been called urou to avert this catastroghe ify prohibiting its export. We are, however, well convined that thin apprehension is entirely groundiess, und that the deposity are in fact all but inexhauntible, At present, guano is principully obtained from the Chincba

Islands, opposite to Pisco, in Lower Peru, in nbont lat. $18^{\circ} 65^{\prime} \mathrm{S}$., and long. $76^{\circ} 90^{\prime} \mathrm{W}$., and the Lobos Islands, opposite to Lambayeque, in Upper Peru, in iat. $6^{\circ}$ to $7^{\circ} \mathrm{S}$.. and long. $81^{\circ} \mathrm{W}$. It has heen stated by Sir B. H. Wileon, late Engllsh consul at l'eru, that though mbout 800 tona a year are appposed to have Lieen carried for centuries from Chincha, the principal islund of the group to which it gives lts name, to the opposite coast, there ls still upon it the enormons quantity of $17,000,000$ tons ; and, supposing this eatiwate to be tolerathly accurate, we may safely renkon the entire mase of guano in this group at from 20 to 25 millions of tons! The atock of guano on the Lobos falands, though not eo extenaive as that on the Chincha Islands, is yet very large. And, exclusive of these, there are other islands whence guano is sh!pped for Arequipa, ote. Deposits have alao been discovered on the coast of the maln land, especially nuar La Mar or Colija; so that, making every allowance for exaggeration, the supply of guano may, for all practicsl purposes, be regarded as inexhaustible.
The lalands where the gunno ls found being unlnhalited except by those employed in its ahlpment, it would, but for the interference of government, cost nething save the expense of putting $i t$ on board and the freight home. But the governinents of Peru and Bolivia were elther so little awnre of the value of the article, and of their duty to their constituenta, or ao corrupt, that they eoli, Ir 1839, to private partles (Messrs. Qulros, Allier, \& Co. of Limu), for a mere trifle ( 860,000 ), the aole right to shlp guano for the term of nino years; so that these partles had it in their power to exnet any price they ; ilensed for the article. Thls contract was, however, too ralnous to be allowed to continue, and was canceled by the $\mathrm{Pe}-$ ruvian government in 1841, on the ground of enormoas public lesion, and of lgnorance of the value of the privilege that had been conceded. For some time after this the trade wis comparatively free, and large quantities of guano were imported in 1844 and 1845 ; hut the monopoly system hus been agaln revived.
There ran not he a doult that the l'eruvian government would gain largely thy throwing the trade $\ln$ guano open under the condition suggested above. And we de not know that any thing could be devised that would be more likely to prove advantageoas to our ayriculture nnd ahlpplng than the carrylng out of auch s plan. Perhaps the best way to effect an arrangement of the sort would be to purchise one or more of the gaano islands from the Peruvian government. And if the latter sheuld perversely decline to agree to such a sale, or to mollify the present monopoly aystem, the question of her right to approprinte such valuable deposits, and to deprive others of any equitable participr' 'on in thelr advantages, will force itself on the pullic attentlon. Should such the the cuse, it will probally the found that the claim of the Perurlans to the exclusive possesion of the gunno islands is of a very questionable description; and that In grasping n.t nill they may not limprolnuly lese all.

Loton de Afucra ls fully 50 miles from the nearest peint of the main land. And it seems rather too much for a government like that of Peru, without any thing worthy of the nsme either of a merenntile or warlike fleet, to pretend to hiniler nthers from earrying away the dung of wild hirds from un unoreupied roek nt so great a Ilstance from its territules.

No grano has ever been imported equal to that from l'eris. And unless it come from a rainless region it ia werth comparatively little; for otherwise the ammoniacal aalts, which nre a most valuable portion, are either partlally or wholly washod away by the rains.
Guano is fonnd In the caves frequented by swallaws, pigcons, bats, etc., in Java, Suinatra, nnd other pincea in the Eastern Archipelago. And not being exposed to the raln, It may very probably be of good quality.

The reader will, perhaps, be aurprised to learn that
lurge quantlites of guano have, of late years, been lmported into Spain. It ls principally omployed in manuring the huertas, or low rich grounds of Murcia and Velencia. Iltherto it has been mostly sent at secondhand from Fingland. But very recently the Peruvians have begun to export it on their own eccount to Allcant, Valencla, etc., and have established agents in these towns for its sale.

Legation of the United States, Lima, April, 18, 1856.
Sin: In reply to diapateh No. 45, dated the 18th nitimo, I have the honor to inform you that neither the governments of 3paniah America nor their citlzens have the privilege of purchasing guano from the Chinchas, or any other is lands belonging to Peru, at a certalu stlpulated price, by treaty, through municipal regulations or sufferance. All the guano exported from Peru is shipped for accoant of the government and gold in forelgn marketa, under a pecial contracts, by agents, who receive a commlssion for chartering vessels, and on the sale of the article. No exception is made in favor of any forelgn natlon, or lte citizens. Peruvian citizens are permitted to take from the Chincha Islands and " l'abellon Pica" wlthout charge a aufficient quantity for the agriculture of tho country; but the government is very careful to prevent any portion of it being exported. The followlng is a transiation of the provialons of the "commerclal regulations" of Peru in relation to this subject. See Dispatch No. 98, April 18, 1852 :

Chapter 1, Article 14th. "It Ia not permitted to anchor $\ln$ any of the anchorages at the islands, the property of the Republic, without a written llcense from the government."

Art. 15. "Vessels which load with guano for abroad will do so only at the Islunds of Chincha. Those leading it for the agriculture of the country will take 1. from ' I'abellon Plca' or from the said islands."

Chup. 14. "Exportation."
Art. 114. "Guano can only be exported in vessels chartersil by the gevernment or its agents."

Chaf. 23. "Confiscations, fines, and other penalties."

Art. 213. "Vessels anchoring at the anchorages of the isliands the property of the Republle, shall be confiscated; und if leaidea guano should be found on boarl, their captains and crew shall be delivered over to justice, to be tried as gullty of robbery."

See also the decree of Don Manuel Menendez, actIng I'resilent of Peru, of the 21st of March, 1842, for the stringent formalitiea to le observed iny Peruvlan vessels going to the Chinchas or "Pateellon Pica" to load with guano for the agriculture of the country.Documents to dispatch No. 114, dated October 25, 1852. I reference to my dispatches, Nos. 159, 164, $172,187,218,210$, and 255 , will show still further that no favors are granted In the exportation of guano from I'eru to other nations not enjoyerl by the United States. You will perceive, therefore, that the representation made to the Department mentioned In dispateh No. 15 is eutirely erronenus, and must have originated in inere rumor.

I inclose a copy of a letter from a gentleman in Arequipa to a friend in lima, showing the manner of uging guano in the agriculture of that district.

1 licve the honor to he, sir,
Your obedient servant,
J. Raninompi Clay.

To IIon. Wm. L. Mancy, Seeretary of State.
Ancquipa, March 20, 1856.
Dear Silu: We here reply to your note of the 13th lustant, akking for informution relative to the mauner of using gmano in this district.
Guano brought from the Chincha Ialands to Islay is there sold to the chncreros (furmers) round Arequipa at from four to slx rerid tho fanega: the fauega
weighe five arrobas, or about 125 lbe. The price varies from four to alx reals; at present the latter price is anked. This wonld make the Finglich ton worth about 18, or eay $\mathcal{E 2}$ 10s. In Islay.

It is applled to two crops oniy, males (Indian corn) and potatoes, carefully by the hand. The majae, when the plant is about two montha old and about three fourtha vara high, one half a handful is applisd neur each root. A larger quantity is sald to be prejudiclal, by "burning the plant." The guano is thea covered with earth, and a amali quantity of water (liy irrigation) is appiied "to fix the guano." If the state of the soil does not absolutely require it, no more water is applied uutil after aix or eight days.

The quantlty required for each "topo" of 5000 varas (about if acre) is four fanegas, or say 500 lha. For potatoes the quantity required is the same and is applied mnch in the same manner as rugurds the age of the plant, and a amall quantily of water "to il $x$ the guane." The atalk of the potato is then about one fourth vare in holght, and the earth heaped up in ridges the same as in Britain. A person insertu a spade in the top of the ridge beside each plant, while the woman followa peuring about half a handful of guano into the hote thus made, and covering it with earth, so that the ridge remalna the same as trefore the application of the guano.

To wheat the application of guano is not approved, principally, we believe, on account of the rankness it produces in the stalk, thereby delaying the ripening of the grain-a point of great limportance in landa where they count on obtaining two crops a year.

Titoman lieuncy.
The New Gmano Islands.-The foilowing gives the resulta of an analyais of guano from one of the ialands of the American Guano Company:

I have analyzed four samples of guano for the AmerIcan Guano Company, taken by myself from four parcels in a box opened in the presence of the Company. They yield as followa:

No. 1-Top Parcel.
Sniphate of lima..... 69.51 Phosphate of lime... 800 Orbante matter yleld.

Ing ammont yield
Ing ammonia. Chlorlil nf sodlum.... Oxyd of Iron. Whiter with loas....

only appear st the broeding neason. The policans do not appear to produce much guano, as thay al most always inhabit the cllffs, and their excroment falls into the ocean. The same may be aald of the specles of Carbo. The apecies of Sula contribute more to the daposit, their numbers being greater, and their habita tions beling more in the interlor of the islands. The specles of I'lotus and Khyncops are very rare; those of Larus more numerous. The Sternas only viait the ialanda to lay their eggs; but their numbers are so very great that they muat contribute In a great meas. ure to the formation of guano. The Spheniscus abounds in the southern island, which is inhahited. These birda, not belng able to fly, bollow out habled. tiona for themselves in the guano. The birda which proluce the largest quantity of guano are the l'ufl. narlas: their number Is incalculable.- Year Hook of Facts, 1857, p. 221.-Lidinb. Jhil. Juur.

The vast deposits of guano (c.lled huano-a term of Indian origin-by tite I'oruvians) on the Chincha Inl. ands, alluded to in the commencemunt of his article, furm the chlef basla of the forelgn trade of Peru, eqpeclally with the United States. It has been deement not inappropriate, therefore, to append, in detail, sneh official and other reliable information on this subject as is in the possession of the Goverament. According to a roport made by a commission eapecially deputed by the I'eruvian government in 1858 to survey the Chincha Islands, the quantity of guano in the deposits at these islands was $12,376,100$ Peruvlan tons, equal to 11 . 050,0t8 tons Eaglish; the northera island containing $4,189,477$ tona, the middio island $2,505,948$ tons, and the southern isiand $5,680,675$ tuns. This estimate, if correct, would, at the jresent rate of exportation-say about 300,000 tons jeer annum-afford to the markets of the worid a aupply of guano from the Chinchas for about forty years; after which period recourve might be had to the Lobos and other lalanis. In view of the fact now geuerally conceded, that land which has been once manured with Peruvian gunno, will alwaya require that atimulant, it may be intereating to ascertuin what prospect there would be of procuring a permaneat supply, sufticient to meet tho agricultural wants of the worid, at other deposits, or in other countries, suppos. ing that the efforts of science may not succeed in dis. covering a substitute for that popular fertilizer. The facts bearing upon this inquiry are copied or coniensed from official reports of the l'eruvian government, of from official communteationa to the Department of State of the United States, and may, therefore, be viewed as generally correct.

Guano has been found along the coasts of leru, Bolivia, and Chili; but the principal deponits are upon, the three islanda of Chiucha, near l'isen, and the lobos Ialands, between Lambayeque and l'aila, in l'ern. The aupply of guano at the Chincha Isiande, slone from whence only the exportation is permitted, can not be exhansted during the present century at leanl. The quantity exiating at the loolos is estimated, from a recent survey maile by un Americar angineer, to be not less than $2,000,000$ of tons, and $o^{\prime}$ quality ejual to that of tho Chincha Inianda. (Guano is also fund in many spots along tho coast of Bhiivia, l'açuica, In the desert of Alacama, is the primipal lolivian port for shipping it. The guatho is, however, so mixed with sand, or so buried and inaccessible, as to be nearly valuelens, it la fike mining to get it from uniler the sand, and costs from 到11 to *12 per ton to put it on board. The first cargnes sent from there cost about $\frac{87}{7}$ per ton; and only 21,794 tons have keu shipled during the lant tive yeary, of which 5,915 tons was the quantity exported in 1817. It is hecomiag daily moro scarce and expensive, and may be set down on of little injortunce, and not likely to interfere with the guano of Peru. The present Ifritish eontracturs with the I'eruvian goverumeut have also an unexpired contract wlth Bolivia, umler which they hold an ex-
cluaive 10,000 complet ian gov loan on terms; article moment it may quantity the bort hausted.

clurive privilege for the further shipment of about 10,000 tons. They pratend that, if the centract were enmpleted, there would be none left. The late Boliv. ian government, however, endeavored o obtain a amal] loan on its guano, but no offer was made, upon any terms ; thns showing the little esteem in which the articie is held, and how little danger there is, for the moment, of competition with that of Peru. Guano, it may be suid, does nnt exist in Chili; the amali quantity of inferior quality that was found there, on the borders of the desert of Atacama, being exhausted.

Ceneerning the situation and character of the deposits of goano (huaneras) in the republic of Icru: neariy the whole coast of Peru, from the 6th to the 21st degree of mouth latitude-the point at which the River foa emptles its waters into the Paciffe-affords deposits of guane of excellent quality, in prodigious abundance, and promising Immense revenue. The formation of the jalnnden and ellffs on which the guano is sceumalated is generally primitive rockn, composed of granite, bornbiende, gnelas, quartz, and feldepar. The guano fa found in layers or strata, more or leas thick, anil in a horizontal direction, though sometimes they are so inelined as to hecome neariy vertical-a phenomenon which, as in the undulating luyers, induces the heilef that the ioundation has undergene subterranean' changes subsequent to the formation of the deposits. As it is observable in some of the deposits, that the gunno lies under masaes of alluvia from 2 to 3 yards in depth, containing impressions of marine shella, which, in their turn, are bencatin superpored guano, siso envered with aand, it is probatile that they are of a date anterior to the deluge, or to the partiai cataciyams and commotions that the giohe has since experiencel. The deposits are, for the most part, covered with a top-erust from 4 to 6 lnches thick, though, occasionally, it is even 8 or 4 feet deep-cailed by naturalists "enliche," composed of salt and sand. No experimenta have been made to try the effect of this substance upon vegetation, hut it probably contains a great proportion of ammonia, and is so intimateiy connected with the guano, that, nithough this manure is found in the deposits without the crust, yet the calishe is invariabiy an indication of the existence of guano. The color of gunno in the deposits varies from white to liright red, passing through the intermediate sbades of light gray, dark gray, ond brown; the last of which is mixell with excrement of the seafion, and is of ilttie use to the agricuiturist. The specific gravity of guano seems to be in direct proportion with its color and quantity, an the dark gray nad retldish are the heaviest. For this reason, it is difficuit to ascertain exactly the weight of a cuble varn of gunno of different colora. The variation in the experiments having been from 1200 to 1600 pounds, it was determined to assign the welght of half a ton to the cubie vara of guano. To facilitate the examination of the guane deponits, it is proper to divide them into three grand sectiona; the seuthern, embracing the const from the loundary of Bolivin to Arica; the central, comprising those hetween Arica and Callno; and, finaliy, the northern, including the remainder between Cailao and Paita.
southern Deposit.-Chipana.-The deposit bearing this name is situnted in $21^{\circ} 22^{\prime} \mathrm{S}$. lut., und consleta of a table rock between 25 and 80 varas above the level of the sea. its greatest length is 357 varan, by 181 varas in breadth, making u muperficies
 glish inches.
Huanillas.-This deposit lies in $21^{\circ} 18^{\prime}$ S. lat. It contains four valieys, or quebroulas, in which the guane is acenmulated; the superticies is 138,242 square varan, or $3,825,010$ culic varas of guano.
fluma de Iobos.-A salient point in iat. $21^{\circ} 6^{\prime} \mathrm{S}$, is called by this name. It in composed of miea nad
granite. The guano lies in the valleys, or quebradus, in layern, whose mean height is from 15 to 20 varas. The length of the deposit is abont 1500 feet. The anperficies is equal to 188,579 square varas, or 2,921 , 680 cuble varas of guano.

Pabellom de Pica.-The tent-shaped appearance and proximity of thia hill to the village of lica have given it this name. It in situated in lat. $20^{\circ} 57^{\prime} \mathrm{S}$. The guano of thin deposit is found in crevices of different deptha, the superficies being 240,801 square varas, or $5,050,000$ cubic varas.

Puerto Jngles (Finglish Port) is at a little upward of a quarter of a mile from the Pabellon, on a amall peninsuia, the form of which indientes that it was an island in remote ages. The guano in this deposit forms an eminence upward of 500 varas long, by 250 to 300 varas in breadth, giving a superficies of 159,251 varan. Taking these data together, with the mean height of the benk, the quantity may be estimated at 2,585,020 cuble varas of gusno.

Islands of Iquique and Patillos.-To the north of the Pabelion and Puerto Ingléa, in lat. $20^{\circ} 46^{\prime}$ gouth, lio the Inlands of Patillos and Iquique-the iatter in the bay of that name. Botil were important deposita in bygone ages, but they are now exhausted, and, ns they contain only the small quantity dally ieft by the birds, it is all new. Notwithstanding the scarelty of tise necumuiation, the farmers of the neighborhood take all the guano away perlodically; and, as the regeneratlon of the deposite, which, for more than two centuries, supplied the wants of a great part of the country, is thus prevented, it would be well to prohibit ail acceas to these isianda, and otiver islets aimilarly sltuated on the coant, so that the birds may resort to them without disturbance, and reserves of manure be created for tinie of need.

Punfa Grande.-The promontery situated in latitude $20^{\circ} 23^{\prime}$ south, at four leagues' distance from Iquique, is called "Punta Grande," and the ganno in this deposit is found in several valleys facing the sen. The nucieus of the locality is composed of quartz, intersected by veins of feldspnr, more or less compact, with a calcaerous auperficies. Punta Granite, being in proximity to the Morro of Tarapach, whleh is a kind of anndy mountain, the guano in the deposit is covered with heavy layers of sand, so that it would require considerable excavations to obtain it. For this reason, these are cuiled "subterranean deposits;" and it is difficult, on that account, to estimate the quantity they contain. Nevertheless, in the opinion of experienced persons, the amount must be immense. There are many reasons, also, for believing that these deposita were ased in the time of the Incas; and, not withatanding the extensive excavations made up to the present time, there are many deposits still untouched. The quality of this guano is very fair, the dominant colora being reddish and ashy.

Other Deposits.- Besiden those already deseribed, there are smalier deposits of white, fresh guano, upon different rocks and points between Iquique and Punta Graude; and at Piangua, a arnali landing-plnce to the north of the Punta, from which the manure is taken for the use of the coast. There are, also, localities helonging to individuais; but the quantity in them is so laconsiderable as not to merit purtieular mention. 'The totn' quantity of guano Sn the southern deposits, or huaneras, mentioned above, may be estimated at $15,819,811$ cubie varus, or $7,921,407$ tons of guano, as exhltited is the following talle:

| Deposits. | Cuble varas. | Tuns. |
| :---: | :---: | :---: |
| Chtpana. | 861,204 | 9:30, (in)2 |
| Ifuantilas | 3,825,010 | 1,912,505 |
| Punta le Lobos | 0,921,580 | 1,480,7019 |
| Pabeiton do I'tea | 5.950,1000 | 2,975,000 |
| Puerto Ingles | 2,085,020 | 1,298,510 |
| Total. | 15,842, 514 | 1,922,407 |

Central Deposit.-Tho three magnificent deposits
formed on the islanda of Chincha, at $12^{\circ} 32^{\prime}$ south iatitude-that is to say, at the distance of 12 miles from Pisco-constitute In themselves the middle hy aneras; for, although some manure is foond on the clifts of Correlas and Viejos, and on the amail Isiand of Ballesta, it is fund npon rulnts visibly inacces silile, and the entire quantity doen not monount to 30,000 tous' weight. As no one is ignerant that the ialands of Chiacha form the richen of Peru, nnd that the guano sent to foreign markets in extracted from them, and that the quantity accumulated there is greater thin in all the hwaseras collectively, it is deemed admlssilite to enlarge somewhat upon the produce of these inlands.
The Chiucha Islands, when compared one with another, differ very little in their general charncter They rise gradually from the sea to a point or ridge which is about 100 varas (or 800 feet) above the level of the ocean. Their geologieal atructure eonsiats of well characterized granito, and the guano is found deponited in parallei layers or strata, varyjos at times to undulating. The predominant colors ar. wark gray; light gray, ash colored, dirty white, and reddiah brown. The color, however, does not vear to be indicative of the quality of the guanc
he same fecundating principle exists, whaterer any be the colur of the coating. Nevertboleare, the lighter-col ored guano contsins the greater quantity of ammonia. Pure ammonia has been fuund at the Chinchaa, which substance is uearly white.
Notwithstanding thut noarly all the huaneras are covered with a mechanical crust called "coliche" (ealrulus), those at the Cbinchas are an exception to the general rule, as the guano is pure, even at the iupertices ; and the thousands of birds whileh prodncedtiese veins of wealth built their neates in excavations mate by them in the deponits. The dejosits in question were measured in 1842, by Jon José Villa, and also by Sefior klvem futur yeans later. The former calculated the quantity at $50,000,000$ tons ; the latter reduced this estimate by twn thirits; aml to explain the cause of the enormous ilfference between their calculations, he says: "The mean helght of , he salient poinsts of the island in 10 varas, and of the parta at the greatest distanco from the shore, 20 varan ; aud it is only in the ceutral jarta that the dopnh of the guano is 40 varas. Sefier Vilia beiteved that the amount uf the successive cuttings, up to the prineipal one, was -10 varas, whereas it slid not exceed 15 ; and to this he added 40 more, for the princital cuttings. A grand mistake; for, mimittiog it as a probable term on whish to base a calcuintion, it were required that this centen cutting should extend in a uniform tarer to the very sbore, prementing a depth of 80 varas. And, not emitent with this hypertwie, he added that there were pointa still higher, where, accorving to hip opinion, the guano muet be 104 varas depp, or more, when the iniande theluneiven are scarcely as high above the level of the urean!"

After making these ubservationa, and adding that he had excavated at the bottom of the deeprest cutting only three varus hefore coming tu the rock, Mr, ỉivero gives the following as an apposimate extimate of the quantity of guano contained in the three inlands of Chincha:

|  | Oble raras |  | To |
| :---: | :---: | :---: | :---: |
| Northern toland. | 14,906,000 | Of | 7.amp, min |
| Mulde |  | $\cdots$ | 6,480, 8 MO |
| southern | A,400, (1as) | , | 4. $\mathbf{1}$ (1), 0100 |
| Total. | 84,500,000 | $\stackrel{ }{*}$ | [8.850, (0x) |

This atatement, therefure, nhows that the faland af Chincha contain, ujon a reasonable adowenurement, at lezst $18,2: 5,001$ tonn of ganno.

Northery leposils.-These are, without loult, inferior to those already demeriled, an they are, for the mont part, ujon amall islands, very low, and conatantly loeaten by the winde from every quarter; and the lagers of guano are usually not very deep, and are
frequently mixad with sand. In their present state the Northern Deposits would yield berely sufficlent guano to aupply the foreign domand for a very fow yeara; but the qualley it goud and they have become the resort of tie innumerable clouds of birds which, Aightened from the south and centro by the increased commeree along the coast, have taken refuge In those aolitary places, This part of the coast is destined to renew the spurces of public wealth, when the springs whleb are used to-day shall be dried up and exhausted. The islands to the north may be divided into four heads, and the Iolos de Sierra are first in importance.
'The Iobo de Sierra lie 25 milles nouth-weet of Lambayeque, in latitode $5^{\circ} 6^{\prime} 30^{\prime \prime}$ south. The group consists of one large island, and three (rocky) smuli islots adjacent to it . The principal isiand is an lm mense oval, narrowing toward the centre and nerth. The rocks are only partiully and vory unequally covered with guino; the deporits being interrupted by points of rock and ravinee. Fistimating together all the manure found in different parts of the island, on the point called "Punta Corcobacir," and the point opposite t.. inlet "Feilx Genzales," the quantity is about 150,700 cubie varas, cr 75,450 tons. A hish promontory, upon the island is called the "I'unta Curcobada," fron. its pecullar shape. The supertices is extremely irregular, and contalns a large quantity of whitish guano, apparently of recent formation; the stratum is not deep, but in of very fine qualiey. The structure of this locality is very fuvorable for the accumulation of guano; and as, in addition to this, it is protocted from the winds, and as, moreover, the biada congregate to it in greater numbers than to any other place in the section now being described, there is every reason to hope that it will become, in time, a vein of rreat limportance. The auperfielai extent of the l'unta Corcobada is 113,940 aquare varas. or 244,760 culic varas, equal to about 112,380 tons of gaano.

Island of Bermejn.-At the diatance of 100 yanls to the weet of the main islant, and connected by reafs of rocks which are under water at high thie, lies the islet of Ilermeja, in the form of a spatula. Its length is 495 varan ; breadth, 220 ; height, 30 to 35 varas. It is cevered with an abundant deposit of guano, of excellent quality, and han the crust of saitpetre, so comanon in tae southern hwonerns. The area of the Bermeja la $5 \Sigma, 926$ aquara varas ; ita areatent depth, 36 feet, and the quantity of guano found therela is athout 317,056 cubje varan ; equal to 158,778 tons.

The Isiet af F'elix Gionzales is one mile distsnt from the I'unta Corrobuila, to the mouth-west. It is 90 varsa long, $\mathbf{7 0}$ broad, and 15 yaras abova the level of the ocean. The guano found on it is of the very best quality, from 4 to 5 varas in depth. The area is 6550 square varas, or $\mathbf{2 6 , 3 0 0}$ cubic varas, equal to 18 , mo tons of guano.

Coderado /siet.-This islet is situated to the south. east of the main lsiand, and ts 316 G varas long, $1 \times 0$ broal, and 85 to 30 varum above the lovel of the orean. The rock is entircly covered with guano, tc the dejuth of 39 fect. The color of the ginno, as the name ti the inland Indicates, is reddish; but tuwaril the centre of is the layers are gray and ashocelored, with a strongotor of ammonia. Inmense flocks of hirds congregate at the island, to buitd their nesta in the grano and in the caverus. The supwrticial measure of the guano is 31,510 muare varas, or 236,300 cubic varam, equal to $118,11 \%$ toms.

The rezult of the adavaanrement of the prinepal island, and the rocky isiets iyiug near it, gives the foflowing as the quantity of guano at the Lobon de Sierra:

|  | Cublo varas. |  | T |
| :---: | :---: | :---: | :---: |
| Prenelpal talands. | 151,900 | or | 15,4iv |
| Tunta Coreebada | 24, 70, | " | (12.840) |
| fala liarmeja | $817,0 m 4$ | " | tiski74 |
| Pellx f muales | 25,904 | 4 | 18, (10) |
| Indet Colormio. | $236,801)$ | $\ldots$ | 114,150 |
| Total | 05S, 116 |  | 4it,48 |

$\underset{\text { latitu }}{\text { Lo }}$
They mare south irreg appea (lobios birds north could his es varas, cuble

Lobos de Fuera.-TTwo iolands, lying in $7^{0} 8^{\prime}$ aouth latitude, are known by the name of Lobon de Fuera. They are soparated from each other by a channel not more than 180 feet in breadth, zanning north-east and south-west. The furcuation is slate; supericies very irregular. There in an nbundance of guano, to all appearance toixed, w'th the excrement of sea-llons, (lobos), which are vary numerous. Inmense flocks of birds (chiefly divers) frequent these islands. As the northern is not easily accessible, the public engineer could only survey the southern one. According to his estimute, the latter has an area of 202,380 square varas, and the body of guano it contains is $531 . / 36$ cuble varee, or 265,743 tone.
Islands of Guañape,-These two islands are altucted in $8^{\circ} 36^{\prime}$ south latitude, at about tive miles from the coast. They are of granito, and rise out of the ocean to the height of 500 feet. The northern laland contains guano; but being pyramidal in form, great quantities are blowa off hy the winds. Notwithatanding the periodtcal loss, there are atill about 159,600 cubla varas of guano remaining, or an estimated quantity of 79,800 tons.
Islamd oy' Santa.-The lisland of Santa lies in $9^{\circ} 11^{\prime}$ $5^{\prime \prime}$ south, and contains only a few tons of guaro of recent formation. Although it may not bo iutereating at present, it is probably destined to becomo of great importunce. Accoriling to the reports madid by the fishermen who visit this ialand, the superficies of the island was a bare rock, unfrequented by birds some 15 or 20 years ago. The aspect in different at present. The guano begins to accumulate; clouds of birds resort to the island; and its vast area, not long since silent and deserted, wiii, without doult, become the centre of new deposits, prepared ly Providence for future gonerations.
Island of Ferrol: situatal :E. istitudo $9^{\circ} 7^{\prime}$ south, of a triangular form, and containe an area of $\mathbf{6 1 , 4 0 0}$ cubic varus.
In aldition to the deposits above enumerated, guano is also found in small yuantitios on the istand of Malalurigo, in latitude $7^{\circ} 49^{\prime}$ south, San Martin, or Donia Naria, $11^{\circ} 4^{\prime} ;$ Mazrogur, $11^{\circ} 25^{\prime} ; 1^{\prime}$ escadoren, $11^{\circ}$ $46^{\circ}$; Las Hormigas, $11^{\circ} 56^{\prime}$; El Peiado, $11^{\circ} 35^{\prime}$.
The quantities of guano contained in the notihorn deposits is shown by the futlowing tuhle:

| Deporits. | Cuble vnras. | Tons. |
| :---: | :---: | :---: |
| Lobus de Tterra............... | 905,716 | 478.488 |
| Labus de Fuera, or do Afuera. | 891,486 | 264,743 |
|  | 159,600 | 70,800 |
| Ferrol. | 61,4190 | 80,700 |
| Total. . . . . . . . . . . . . . . | 1,708,202 | 806,101 |

It may be added to the foregoing, that, according to the report of a new commission appolinted to examine, aurvey, and report upon tho guano doposits, it appears that there were not more than $8,000,000$ tons of guane renaining at the Chinchas in 1851 . [This estimate, it has been stated, was underratod designcdly.] The Poruvian government has not yet off1cially publishod this :ipert, hut the informution has treen given in the I eruvian wewspapers. if the statement le correct, the quantity accumulated at those islands would be only suftcient to sujply tho demands
of the markets of the United States and England for about 20 yeary, at the present rate of exportation.

The following possage, translated from an article in the "Mensagero," a newspuper published in Lima, affords interesting information on the subject of guano deposits, of later duto:
"Mr. Rivero exumined, scientificaliy, the principal deposits of guano known on the coast at that time; and hls statement in other resestcies in which he has been engaged having proved correct, reltance may be placed on his report. Since then, other deposits of guano have been discovored, especially in 'Independence Bay;' beyond Iisco, where the quantity is said to equal that of the Clincha Islands. No regular ourvey has been mado of this deposit, and it is surprising that the government shnuld be so dilatory in obtainIng minute information in a matter of such vital importanco to its credit and-it may be sain-to its very existence. Making allowance for any exaggorations in tho reports, It can be safely asserted that the quantity of guann existing in the deposits on the coasts of Peru is sufficient to supply the demands of furelgn markets for a coutury to come, partieulariy as It is probable that the day is not far distant when the researcher of science may discover in other substances a fructifying principto, which will serve as a substitute for this singular product."
The guano from the lelands of Lobos has been recently analyzed by Mr. Raymondl, an Italian chemist employed by the Peruvian goverument for the purpose. Annexel is $n$ statement showing ite compusition as compared with that from the islands of Chin cha, from latagonia, and from Saldanha Bay. The etrength und value of guano are eatimated by the proportion of ammonia end phosphates it contains. That from the Lobos Ialanis, therefore, according to the anatysis of the three anmplus, is more valuabite for agricultural purposes than that of Patagonia or that from Suldhana Bay. It is the policy of the l'oruvian government to diacredit the lolos guano, ao that it may be kejut out of the market until the dopoaits on thes Chincha Inlands ahatl havo been exbausted. The samples employed for the analysis were, consequently, taken from near the top of the Lobos deposits, and are not a falr apecimen of the product of the iniands. The lower luyers are, undouhtedly, of better quality; and althongh, drabitiens, interior to the beat from the laiands of Chincha, it is still more valuable than any other manure that can bo furniaied at the sume price:

The total impertation of guano, into the United States during the elght years ending June 30, 1855, was 495,047 tons. The largest Importatlons were frum Feru, and the emallest from Africa. In 1854, the importations of guano nearly quadrupied those of any preceding year, and exceeded those of 1855 by 1888 tons. The number of American vessils and their tonnage dlapatcined from the Chincha Islands each month in 1853, and each of the first six monthe of 1854, is stated as followa:

Sale, erportation, etc., of guane.-An the nystem of exportation and male of guano is complicated, and not generally underntwod in the United States, it has heen thought proper to condense, from reliable mources, chiefly oflicial, all the facta relating to the auliject which are in posseasion of the State Department.

The expense of loading guano at the Chincha inlands is alout 2 doliars per ton, lacluding the cont of bage for a ground tier in every vessel ; but this cost may increase to a maximum of 3 dollarn, perhapa, an the distanee from the piace of deposit to the vensel increases. The freightw have been as high as $\mathbf{3 0}$ dollars per ton; lut the increased navigation in the l'aelfic, consequent upon the aequiaition of California ly the United States, has reduced shia sum to 20 and 15 dollars, and even to as low as 12 dullars.

The exportation of the article to England first commensed in 1826, hut was tried merely as an experiment. It was not until more than 18 years subaequently that guano was considered an article of commerce; Indeed, it would seem, that even at that period the great Importance and value of this fertllIeer were not well understood by the Peruvian goveroment; for it appears that the Chincha Islande, and all the guano fonnd upon them, were then sold for the sum of $\$ 60,000-$ sale whieh, had it not been subsequently annulled by fudicial proceedlngs, wouid have placed the agriculturists of the world at the many of an irresponsible monopoly of individual stock-jobbera. The first guano contract was then made with the Peruvian gevernment by the same parties whose purchase of the islands had just been canceled; and in less than a year this contract was merged in another made in February, 1842, providing for a loan of $\$ 525,000$, in conalderation of the excinsive privilege of shipplug 126,000 tons within 5 years. In July, 1847 (after the oxplration of the first contract), a nother was made by the same partles, provid. ing for a loan of $\$ 600,000$ in eash and $\$ 100,000$ in scrip (equal to $\$ 615,000 \mathrm{ln}$ cash)--in all, $\$ 700,000$ good money - In consideration of the privilege of exporting only to Europe 40,000 tons within six monthe.

In December, of the ame year, a thlrd contract was entered luto with the aame parties who had negotiated the two former, by which, In consideration of the privilege of shipping 100,000 tons of guano, a new loan was effected of $\$ 850,000$. The prinelpal stipulations of this contract were as follows: The loan was to lie pali- 400,000 in cash, and the beiance in monthly payments of 50,000 , the contractors were to enjoy the exclusive privilege of exporting to any or ail parts of the world 100,000 tons, register meas-urement-equal to nearly 140,000 actual neasurement. The time aliowed for the ahipment of the 100,060 tons was limited to 18 monthe from June, 1848, allowing an extension of the time (without exciusive privilege), in case a suffelent ncmber of vessels could not be chartered to convey the whole quantity within that periol. Thu guano was to he consigned directly to the coutractors in Fingiand, or to their agents elsewhere. The guano was to be sold for account of tie l'eruvian government, the contractors being authorized to charge the usual comulission and guaranty (about. 4 per cent. on gross males), and an interest of 5 per cent. upon all expenses, laciuding freights allvanced in England or elsewhere. The payment of the loan of $\$ 850,000$ (tise pound sterling being computed at $\mathbf{j})$, with intereat at the rate of 1 per cent. per month, is provided for: first, from the balances of account exiating ln favor of the Pernvisu governinent on the books of the contractors (that in, balances arialng from the former eontracts) ; ind second, from the net proceeds of the eales of guano shipped under the contract; one fourth part of the nat moreeds to be accounted for in the serip of the government, at par value, with the lnterest added. This scrip, with the accruing interest added, cont the contractors, It is stated, about 10 centa to the dollar.

How much the contructorn reallzed from this contract of December, 1847, can not well he known. The following estimate, however, has been mado:
tiross sales of 180,000 tons of gusno, at 860 per ton
( $\$ 6,500,0(0)$ ), on which the cotamission, it 4 por ecut., was. .

the number of tone contracted for, np to the year 1848, were:

Subsequently to the contract of December, 1147, another was made, by which the consignment o: all guano shipped to England and the continent of Liunope from December 18, 1849, to Decembur 18, 1851, was conceded to the samo parties, and a atill iaser contract was antered into by the Peruvian minister in England, on behalf of his govemment, guarantying to the London house of Gibles \& Co. the consignments of all guano shipped to Great Britain and the continent of Europe, with thas except:-n of France and Spain, from December 10, $48 / 3 i$ Decomber 18, 1805. By these latter cantr'. . , loans were made, at different times, amount'ing, th wine aggregate, to about $\$ 2,000,000$; the last coan of $\$ 1,200,-$ 000 being at a reduced interest of 5 per cent. In beth the last contracts, the London house of Gihbs and Co. were made the agents for the payment of the Peruvian bonde held in England, amounting in 1850, back interest, etc., to about $\$ 20,000,000$. For the payment of this delt, one haif the proceeds of the guano eold there ls now appropriated. The consumption of guano in Great Britain and on the continent of Europe is estimated at about 90,000 tons ennually.

The first shipment of guano to the United States was made, it is atated, in 1845. In 1846, the Peruvisn government contracted for the building of a war steamer, and appropriated the proceeds of 5,000 tons to the payment thareof. In the contract with Gibbs \& Co., of December 22, 1847, it will be remembered that the exclusive privilege of shipping guano to ail parte on? the worid was conceded to that firm. This $W_{i s}$ the first contract by virtue of which guano was shipped to the United States. Upon its expiration (December 18, 1849), the Peruvian Congress, by an act of January 25, 1850, authorized the Executive to contract for a loan of $\$ 384,000$, to be paid from the salies made in the United Statea, and the Minister of Finance advertised for proposals. Bids were immediately sent in from five American houses of undeubted responsibility. One of these bids proposed the purclase of 50,000 ragister tons of guano at the Ohincha Islands, at $\$ 20$ per ton, to be shlpped within 5 years; aivanciug the loan of 8384 ,000 at 6 per cent. Interest, with the naunl articies regulating the commissions, exclusive privilege, chartering vessels, etc. This proposal, guarantying to tise leruvian government $\mathbf{8 2 0}$ per ton (all previous contracts not yleiding to the governinent more than ( 15 net), was tire most advinntageous that had been made so far; yet it was rejected, throngh the influence of European competiters, and the loan was nilvanced by the house of Gitilis \& Co., at 6 per cent. interest, to be repaid out of the proceeds of saies in Great isritain.
Thare hat heen no formal cesaion, sinve the termination (December 18, 1849), of the contruct of Deceinlier 22, 1847, of the right of the market in the United States, until the contract made with Barreda and others. Special iicensea have been, from time to time, granted by the Execu ive to Cibin \& Co. ; and this firm hava therafore continued, through their agenta, to control the consignments an much as ever. The l'eruvian government seems unwilling to enter into any arrangements either to seii at a fixed price at the ialands, or that the article should be nold in the United states at a fixed price, and that a suflicient supply shoulil be alwaya in the market. The countriea to which guano is oxported from the islandy, by virtue of thene several contracto, are: the Unitei States, Great Britain, Framee, Spain, the Mauritius,

China, the West Indies, and Venezuela. Ia tha United States, the agents are Barreda \& Brotber in Baltimore, and J. W. Riley in New York; Great Britsin, Messrs. Giblus \& Co., who also have the agency in Beigium and Sardinia; for the Mauritius, Kondall \& Co. ; for Spain, Marrieta \& Co. of London; for China, Sevilla \& Co., of Lima. The agency of the West Insies is intrusted to Barreda \& Brother; and that of Venezuela, under a recent contract, to Don Leocadio Gurman, the envoy of that republic in Lima. All these agents are paid commissions, varying from 6 to 71 per cent., for aelling guanj, Areighting vessels, etc. Thay are siso allowed interest, at the rate of 6 per cent., upon all sums of money adranced to the govermment.
These contracts claim a general Interest in the United States, as throwing light upon the complicated syeteu which regulates the exportation and sale of guano; hut the contract for aupplying the United States themsclves, possesses more immediate interest to the consumers in this country, and demands a brief additional notice-the facts and statements being copied or condensed from reliable sources.
The contract batween the Peruvian government and Mesars. Barreda \& Brothere, for the exclusive axport and sale of gunno in the United States during 5 years, was concluded on the 22d of August, 1851. According to its stipulations, the agents are entitied to charge $6 \frac{1}{4}$ per cent. commiasion upon the grose product of the saies, in fuil for ail their services as ngents in seliing the aubstance, chartering vessels, guaranties, etc. They are allowed six months to render an account of the different aales made by them; which term is absolute, unless good cause can be shown for dalay. They are also authorized to charge 6 per cent. upon all money advanced to the gevernment.

The consumers in the United Statee have complained that the enormous profits which acerne to tiose interested in the contracts with the Peruvian governmant for the asle of guano, have combined with other causes in keeping up the high price of the articie. The chief ground of these complaints geems to be, that large profits beyond those legitimately incident to these contracts are realized in tie shape of interest, premiums, etc., which are puid in the flrst Instance by the l'eruvian government, but finally fall upon the consumer of ganno. These extra commissions amount annualiy to a heavy charge upon Amerlcan shipping, and must necessarily tend to keep up the cost of guano to the consumer. In 1853, for instance, the amount of Peruvian guano exported to the United Statea, as stated from I'eruvian returns* Was 137,135 tons register, or about 161,562 tons' weight. The freight on thin, nt $\$ 17$ per ton, amounted to $\$ 2,-$ $797,55 \mathrm{H}$. Five per cent. on this would lee $\$ 139,87770$. This added to nbout $\$ 16,000$ commissions, or port ugency in l'eru, wouid make a tutal of 155,88770 levied as extra commissions, not authorized by the contract, as is complained.

These facts bear inaterialiy upon the consumption and sale of this useful fertilizer in the United Statea. The intereat felt upon the subjuc has been evinced, as is weil known, by large ani respectable conventions of citizens concerned in ngriculture, which have been held in variouts sections of the country, and by propositions introciuced into (Congrese, baving for their oibject auch legisiation an would lend to apectal negotiations with the government of Peru respecting the mode of exportation and nule of her groat staple. $\dagger$

- The Uptted Staten' Treanary Report on Commerce and Navigation for 1843 , given onty 25,852 toan; but for 1854 , onken tha number of tone 163,062 .
- An one of the reeutte of these movementa, way be named an act of Congress, approved August 18th, 1850, "to authorize protection to be given to ettizena of the Uuited $8 \mathrm{t}^{\circ}$. who may discover depoaita of glanio."
$\therefore$ No deposits of guano; which will at all compare with those of Perv, seem as yet to have been discovered, alticugh most extenalve explorations have been prosecnted; nor does sclence seem yet to have succeeded, though Inventive skill has been tasked to the utmost, in manufacturing a anbstitute which would supersede the nse or lower the price of the Peruvian fertilizer. - Indeed, the very latest reports exhltit rather an appreciation in its price, and a large Increase in its comanmption,-Com. Hel., U. S.

Guaranty, in law, an obligation undertaken by one party that another shall pay or perform that for which he is or may become liable to a third party. In mercantile transactions in Scotland It may be conttituted in any way by which the consent of the guaranty obligant is truly and freely given; but it can only be proved by his oath or writing. The evidence of witnesses is inadmissible, unless the obligstion was undertaken as an integral part of a transaction relative to moveables, provible by witnesses, or that simething followed on the falth of lt, with the knowledge of the guaranty obligant, by which the rights of parties were materially affected. In England it is enseted by statate, that "No action shall bo lirought whereby to charge the defendant upon any apecial promise to answer for the debt, etc., of another person, unless the agreement on which auch action shall be brought, or note thereof, shall be in writing, and signed by the party to be charged therewith, or aome other person thereunto hy him lawfully authorizet." The construction of all such obligations is never extended beyond their obvious meaning, and tiey are only understood to apply to future, unless they er; ressly Includa past transactions. All their conditions and limitutions must be carefully regaried, otherwise they become void. If so expressed or Intended, however, such obligatlons may le of the most unyualified character; thay may be unimited in amount, and indetinito as to time. When the guarisnty obligant is compellerl to pay, he hats an action of rellef against the prinelpal debtor; but that party, hel, , firimarily liable, tnust first be sued by the creditur; and whatever he does toward tise extinction of the cisim of the creditor, or whatever the creditior recover from hlin or his estate, goes so far to relleve the guaranty wbllgant, who can also plead against the creditor any defense whlch could ine competent? plesded by the principal delitor. Where more persons than one are boond together in a guaranty obligation, any of them seoking relief from the others of a share of his loas must communicuts to them a rhare of any security which he may hold or the estate of tive principal debter, of of any ibotrinent bis may have olitalned from the creditor. A geararty oblipation may be exsingaished by the extreme neylect of the ereditor; as, for example, by his falling to take advantage of a security $\ln$ his poirer, omitting to negotiote a bill, Inadvertently giving $u_{i}$, funds of the princlial debtor over which he had a right of lien or reteation, o: ranouncing auy security over lis eatate. In like manner, If lie compound with, or discharge the princspal debtor, without the concurrence of the guaranty obllgant, the guaranty iw at an ead; excepting under a commisuion of Dankruptey In Fingland, oz a sequectration in Scotiand, where the rreditor may, by aequisacence, allow the jrincipal delitor to be diacharged. and may accept a conipowition, withnut diweharging the guaranty, provided the guaranty obligant has prevsonsly been duly warned and called on to antiafy the debt.

Cruatimala, or Gautemala, one of the republies of Contral America, occuples most of the talle-iand of Cautimals, with the mountalnous dietrict lietween it and the Gulf of lionduras, Besiden a portion of the table-land of Yucatan. Ita extreme latitudes are $13^{\circ}$ $29^{\prime}$ and $18^{\circ} 12^{\prime} \mathrm{N}$. , and longitudes $88^{\circ} 10^{\prime}$ and $93^{\circ}$ $22^{\prime}$ W. It in bounded on the noth by the Mexican

State of Yucatan, on the weat by Chiapa, on the aouth by the Paclfic Ocean, sonth-east by the republic of Salvador, east by Henduras, and north-east by the Gulf of Honduras, and the British IIonduras, or Jelize. The tetal area of Gautimala is ahout 49,000 square miles. It is divlded into 17 Departments, and contained, according to the returns of 1852, a population of 872,000 , diatributed as follows :

| Dopartmema. |  |
| :---: | :---: |
| Guatimala. | . 80,500 |
| Chimalte | 86,400 |

The surface of Guatimala is wholly mountuinous, the main chain of the continustion of the Andes traversing it from south-east to north-west at an incunslderable distance from the Pacific shore, and branchIng off in various ramifications toward the Atlantic; forming many valleys, but inclosing few jifains, Along the main chnia oceur numerous volcanocs, all near the Paclfic. The culninating point of the surface is in N. lat. $15^{\circ} 30^{\prime}$, betwoen the towns of Totonlcapana and Gueguetenango. The eastern border of the plateau deacending to the Gulf of Honduras is cut by deep valleys, which extend to a great distance, and in some places advance to the very shores. The country lying to the weat and the north-west of the Golfo Duice is a low plain, while all between tho platean and the Ilay of Ionduras is a succession of ridges and valleys. In masay places the shore is rocky, with rocky barriers lying off it.

Numerous streama drain this State. The most im. portant ate, the Lacantun, forming part of the Mexican boundary ; the Motagua and the I'olochic, which fall through the Duice into tie Bay of llonduras. The most important lakea are, the Dulce, odvantageous for forelgn truling vessels; the Amatitlian, is miles south-east of Guatinula, is 9 mlles by 3 , of great depth, and is muci resorted to as a bathing-place by the inhsbitunts of Guatimala, from February till April; near it these are several mineral and hot apringa ; the Atithan, 80 milea north-west of the city $0^{f}$ Guatimala, la ghont 20 miles long thy 9 iroad, surrounded by lofty heights, including the voleano of Atitlan, and in rouarkable for its very great depth, and being without outlet, though neveral small rivers enter It ; the l'uten, near the frontlers with Yucatan, about 30 aniles long, sud 9 broad.

The climate of the table-lund is that of perennial apring, the thermometer scarcely varying throughout the year, and it resembles very much the climute of Valencia in Spain in almost every particular. In the northern part of the Stste, in what is called Ioss Alfos, the highlands, the average la lower than any other part of the country. Stow sometimes falls in the vicinity of Queaaltenango, the caprital of this Department, but noon disalprears, the thermoneter sellon remaluing at the freezing point for any comsiderable thene. In tife vieinity of the city of Guatimala, the range of the thermometer is from $65^{\circ}$ to $80^{\circ}$, averasIny aiout $72^{\circ}$ of Fisin. Vers 1'az, the uortheeasterin I:epartment of Ciuatimala, and embracing the cuart below Ineatan to the Gulf of Dulee, is nesriy 10 degreen warmer. Thia coast froni lielize downward to Iabal and Ban Tome is hot and unhealthy. Frum May till Ocfober is the rainy sesson. Thunder jrevalls in Jine, and turfife atorms from the aouth-west aweep along the I'acillo count In Auguat and Seprember. Earthquaken are very frequent.

The roil is genetally very fortile, producing excellint rice, and all the cereala in great varity and abundance. Agriculture, however, is in a very barkward atate from the want of enterprise and the igno-

rance of the people, as well as from the want of roads. As articles of commerce, the mort important products are cochineal and indigo. Cotto.: cacao, augar, vanilla, tobacco, and coffse, are grown In conaiderable quantities. The table-land is almont destltute of trees and even bushes, oxcept on the deelivities of the hilly ranges which so extensively traverse it. Trees of very lurge size form extenslve foreste on the lower lanils along the Pacific. These are a source of great natural wealth. Among tha trees the most valuable are the cedsr, mahogany, Brazll, Sants Marin, pimento, guuiacum, etc.; and abundance of medicinal plants are also found and turned to some account. The vegetation is luxurious and vigorous along the low tract by the Buy of Honduras. Sheep are reared in considerable numbers, especially over the northern districts, and their wool is used for native manufactures. The horse is small, hardy, and handsome, and mules are numerous, being the chicf beasts of bur' den. Pigs and $\psi^{\text {oultry }}$ are very abundant, and of excellent quality.

Salt is manufactured along the coast of the Pacific. Jasper, marble, and trimstone, are obtahued in considerable itmantity in the veinlty of some of the volcanoes. Lead is worked by the Indians In Tetonlcapán. The manufactures are mostly limited to thase for domestic use. The cotton mannfucture, once extensive, is now confined to the Departmente of Guutimala and Sucatepec. Coarse woolen cloth is now more manilfucturel, especially gerga, which is made into a peenliur black called poncho, in which much taste is displayed,-E. B.
Siuse 1847, Guatimala has been an Independent ropublic, und in 1851 a new constitution was adopted, by virtue of which the President is elected every four years; to whon, in conjunction with an Assembly Geperal, compused of 59 members, the powers of the government are confided. It is divided ioto 17 Departments, and its capital is Nueva Guatimala. 'Tho great commerclal staple of the republic is cochinenl, of which upward of 20,000 bales are annually produced. In addition to theso articles, consideruble attention has been given of late to the cultivation of tobacero, sugar, coftec, cotton, vanilla, and indigo. Gold, silver, and other minerals have been found in several sections of the State. The exports consist of cochineal, indigo, segars, sarsaparilla, mahogany, coson, hilies, dyewoods, and some silver. Tho total vulue of exports amounts, annually, to about $\$ 1,880,000$, and the inports to about $\$ 2,000,000$.
The cominercial relations hetween tho United States and (inatimaln are regulated by the treaty of March 3, 1849, and by the local legrislation of that republic. The trenty is ono of peace, amity, conmerce and navigation, and atipulates for perfect equality and entire reciprocity of commerve and muvigation. Fach natlon extends the anme privlleges to the vessels of the other that uro appileable to its own. The right of residence, commerce, and trade is extended to citizens of each in the territories of the other, with the same rights, privileges, exemptions, und restrictions, which apply to native eitizens-the coastiag trale excepted, which la reservel to the partles, respectively, according to their own separate lawn. 'ithe high contracting partlen moreover molopt, with respect to each other, the principle that free nhips inake free goods. The treaty ls to eantinue in fore during 12 years, and contains the usual provision of one year'a notice after the explration of that period. The local regulations of tiuatimala are altered from thme to time by decrea, nunctioned by the executive officers, and promulgated under anthority of the l'reaident of the republle. The latest decree of thls charmeter, of which our Government is in possesalon, nuollifes the taritf of 18:37, so fur as it relates to tonnago duties. It bears date May 6, 1852, and auljolned is a translation of its provisions:

Artlele 1. Every vessel which shall anchor in the porta of the repubilic, no matter whence It may come, shall pay a tonnage duty of two reals ( 25 cents) for each ton of messurement. This measurement shall be ascertained from the register, the certificate of nationality, the patent or clearance under whlch it anils.

Article 2. Shall be free of tonnage duty-1st. Small vessels engaged in transporting merchandise from one port to another of the republic; 2 d . Vessels whlch anchor in ballast to take in water, provisions, or fruits of the country; provided they discharge no cargocs; 3d. Veasels of war, and regular mail or stesm-packets, provided they do not discharge merchandise over 20 tons; 4th. Merchant vessels which, exceeding 1000 tons of reglscerad measurement, discharge not exceeding 20 tons of merchandise; 5th. Vessels which receive on board, for exportation, produce of the country, excepting cochineal, ss provided for in decree of March 31, 1849.

Article 8. This decree shall take effect from and after the first day of July, enauing.

Guatimala, la Antigua, a city" of Central America, in the republican State of Guatlusala, and about 27 miles W.S.W. from Guatimala la Nueva. It stands in a wide and fertile valley, at an elevation of 5820 feet above the aea-level. The place was abandoned after the earthquake of 1773 , which partly destroyed it ; but it now contains a population of nearly 20,000 . There is collected here a considerable quantity of cochineal ; and there are some insignlficunt manufactories. The city is regularly laid out, but a great part of it is atill In ruins. Prior to the earthquake the population amounted to about 60,000 .

Guatimala la Nueva, the capital of the republic of Guatimala, in Central America. Its situation is in N. lat. $14^{\circ} 36^{\prime}$, und W. $\operatorname{lng} \mathrm{g} .90^{\circ} 30^{\prime}$, at the extremity of a pluin 22 miles $i_{11}$ length by 7 in breadth, with a deep ravine on three siles, and elevatol above the sen 4970 feet. The form of the town ls quadrangular ; and the streets are wide, straight, and clean. On account of the frequency of enrthquakes the houses are only one story in height. The l'laza or Great Square menaures nhout 150 yards on ach side, and is surrounded on three sldes thy colonnades. Were are the principal touillings in the town-the eathedral, the archblshop's palace, the old royal palace, the Collegs ales Infantes, and the variuus government offices. In the centre atunda a large and elegant fountain. The town is well supplied with water brought by pipes from the mountains upward of two leagues distant. llesirt she eathedral, there are 26 other churches and chapels; and, beside the l'laza, several other squares, each with a fountain in the centre. At the south side of the city there has recently been erected a fort mounting 20 guns. There aro several private achools in Guatimala; and seversl printing establishments, whence two weokly newspapers are issued.

Thompson, in his Officinl Visit to Guatimaln, states that "the nemn heat" of the city of Guatimala "during the day, from the first of , lanuary to the first of July, is $75^{\circ}$ of Fuhr. ; at night, $63^{\circ}$. In the summer months the average may be taken ut 10 degrees hlgher." Fruits, vegetables, provisions, and all articles of ordinary consumption are abmulant, at moderate jrices, while many descriptions of Iritish manufacture are as cheap as $\ln$ Iiritaln. The manafactures are muslins, gauze, cottons, eurthenware, porcelain, jewelry, begars, ete.

I'he lnhabitants are courteons and hoapitable to atraugers, but live very much apart from ench other, their only recroation belng their incessant religious procesalous. The suburis are occupied mostly by latinos (mulattoes) and Indians. The huildiugs of this city were liegun in 1776, three years after the fearful earthquake of 1733, which completely destroyed Ohl Guatimala, the former capital. 'lhe population is variously estiunted from $\mathbf{3 5 , 0 0 0}$ to $\mathbf{5 0 , 0 0 0}$.

Guava, tho fruit of the Pisidium pyifferum and $P$. pomiferum, nat. ord. Myrtacess, the palp of which la made Into a jolly of a peculiarly dellciens flavor. This aweetment is imported in cousiderable quantlties from tho West Indies.

Guayaquil, a clty and port of Columbla, on the weatern coast of South Amerika, lat. $2^{\circ} 11^{\prime} 21^{\prime \prime}$ south, long. $79^{\circ} 43^{\prime}$ west. Pupulation 20,000 . The town $i_{8}$ situated on the banks of the river of the same name, abont alx or seven leagues from the Isla Verde, or nine leagues from the Isla Pufia, In the Gulf of Guajaquil, opposite to the mouth of the river. Shlpe bound for Guayaquil generally call at the Isla Puna, where expert pllots may be had, who carry them up to the town by night or by day, according to the state of the tldes. The town is old; but as the hounes are of
wood, and it has frequently suffered from fros, mach of it is comparatlvoly modern, and has a good appearance. There is a dry dock on the south bauk of the river, where several shlps of a auperior censtruction have been ballt. Tho datrict in whleh Guayaquil is altuated has for a conslderable period formod a part of the republic of Ecusdor or Aqquator. 'Like the other South American States, it has been suljected to per-petually-recurring revolutions; but Guayaqull has, not withatanding, continued to enjoy conalderable commerce. Its princlpal artlcle of export is cocoa, of whleh large quantities are shipped ; and next to It are straw hata, timber, tebacco, hiden, hark, etc. The princlpal artleles of import are manufactured cottona and hardware, sllks, wine, flour, etc. The following tables show the commerce and navigation of Guayaquil:
 1849, 1850, ANO 1551.

The Guayaquil River is the principal in weatern Fecuador. It is formed by the union of numerour at reams from the Andes, and becomes navligable for commerclal purposes at Baybahoyo or Caracol, 70 or 80 miles from Its mouth-river boats ascending to one or other of these julaces according to the season. Below Guayaquil the channel is Impeded by numerous rocks and emall islands, while at its mouth is the larger island of l'ana. Where the river falla into the Pacific it ls known an the Giulf of Guayaquil, the extreme polnts of whlch are 70 miles apart.

Guaymas, a rea-port town of Mexlco. See Mirxtco.

Cuayra, Ios, the principul sea-port town of the republic of Venezuela, province of, and 11 miles nurth north-weat of Caracas. It is an unhealthy aituation, and in closely surrounded by high mountains and rocks. The chain of mountaliss which mejarates it from the hlgh valley of Caracas descends almost directly Into the ses; and the houses of the town are backed ly a wall of nteep rockn, leaving searcely 100 or 140 fathoms' breadth of flat gromnd letween this wall and the sea. The town is joorly bullt, and contains no editice worthy of notice. The port is unwheltered, but has good anchorage in from aix to thirty fathoms, and in well defended by land batteries. It chlef exports are coffee, cocoa, ladigo, and hilles, with some cotton and sugar. I'opulatita alout 8000.

Cuiana, Guyana, or Guayana, sn extensive territory In the north-eastern part of South America, comprehending in Its widest accepration all that extent of country IyIng between the Iliven Amazen and Ori-
noco, between lat. $3^{\circ} 30^{\prime}$ mouth, and $8^{\circ} 10^{\prime}$ north, and long. $60^{\circ} 22^{\prime}$ and $68^{\circ} 10^{\prime}$ weat. It is bounded on the north ly the Orinoco and the Atlantie, east ly the Atlantle, amath by the Amazon and the Itio Negro, and west liy the Orinoco and the Cassiguiare. its greatent length from east to weat is alonut 1200 miles, and Its greatest breadth about 850 miles; eathated area $\mathbf{7 0 0 , 0 0 0}$ rquare millen. This vast territory is divjded Into Brasilian (formerly Iortuguene) (iulana, Veneznelan (formerly Spanish) Giniana, and Colonial Guiana. The two former, comprising alout five sixths of the entire region, are now included within the linits of their rengective conntries ; whlle Colonial tiuiana is that to which the general term of Guluna is now commonly applied. it la aubdivided into liritish, Dutch, and P'rench (iniana.
fininna, frilish, the most weaterly of the three colonies, is bounded on the north and north-eant by the Atlantic, ennt ly Imteh Guiana, from which it is neparated by the Itiver Corentyn, south ly IIrazil, and west by Venezuela. It lies between north lat. $0^{\circ} 10^{\circ}$ and $88^{\circ} 40^{\circ}$, and weve long. $67^{\circ}$ and $61^{\circ}$, amd has an estimatell area of 76,000 square milis: ; hut the jnisses. sion of much of this has been disputen ly firazil and Venezuela. It ts divinded into three counties, Jemerara, Fssequilso, and Berhice, so named from the three principal rivers whlef drain them. Demerara, nituated lutween the other two, oceupies the centre of tha seabnaril for neariy 90 milen. T'e the north-wert the county of Essequibo etretches along the conat towand the wwaupm and forents of the western frontier; and to the mouth-eant lien the county of lierbice.

The entire coast of British Guiana is low, and genorally bordered with e andy flat extending far out to sea, au that vessels drawing more than 12 feet of water can not approach withln three or four miles of land. The rivers, too, lepoalt at their mouths large quantities of mud, and sand, and are thus insecesslble to vessels of large size. Extending from low-water mark to a distance of five or six miles luland, is a tract of rich alluvlal soli, of recent formation. This is succeeded by a flat narrow reef of eand running exactly purallel whth the present line of coast., Here remsina of stranded vessels and anchors eaten through with rust have been found, Indlcating that withln a comparatively recent perlod it had been washed by the waves of the Atlantic. . Running parullel to this reef, at Irregular diatancea, varying from 10 to 20 miles, ls a second and higher range, composed of coarae white sand; and which, st a period more remote, probably formed the zes limit. In the wet seasons the Intermediate tract between these two reefs becomes the bed of extensive aavaunahs; for the ereeks being then unable to carry off the torrents of ruin which fall, overflow their level banks, and inundate the surrounding country to the depth of five or six feet. On the return of dry weather the waters gradually subside, leaving behind them a thick layor of decayed grasses and uquatic plants whlch had floated und flourished on their surface, and these in time produce a vegctable nold of considerable thickness. Beyond the second reaf are swampy plsins, Interaected by asid-reefs, and extending to the mountainous regions of the interior. The high land does not rise immediutely from the plain to a great elevation, but begins with a range of sand hills of from 50 to 200 fect above the plain. Behind these the high land stretches out in level or undulating pluins, rlsing here and there hito eminences. About north lat. $5^{\circ}$, a mountain chain, an offset of the Orineco Mountsins, and composed of granite, gneiss, and other prinitive roeks, runs from west to east through thls territory, forming large cataracts where it is crossed by the rivera, and rising frequently to the height of 1000 feet above the sea. About a degree further aouth is the Pacaruina chain, which, in like manner, runs from west to east, and is of primitive formation. Its highest point, called by the natives Roraima, in north lat. $5^{\circ} 9^{\prime} 30^{\prime \prime}$, west long. $60^{\circ} 47^{\prime}$, is $\overline{5000}$ foet nbovo the level of the sen. The plains aonth of this range are in general level, and form extensivesavanmahs, covered with grassea and plants. The Sierra Acarai ls a densely wooded chaln of mountains forming the aonthern boundary of Guianu, and the water-slied between the basins of the Amazon and the Essequlto. This chain rises to the helpht of 4000 feet. The Conocou, or Cannucu Vountains, running south-east and north-west, connee', the l'ucaraima with the Slerra Acarai.

The principal river of Brit، wh Guiana is the Fssequilo, which rises in the Siarra Acarai, and nfter a course of at least 600 miles discharges itself into the ocean by an estunry 20 miles in width, in north lat. $77^{\circ}$, west long. $58^{\circ} 40^{\prime}$. In the estuary of the Essequibo are a group of beuutiful islands partially cultivated, the principat of which are Varken, or Ilog Island about 21 miles in lengti by 3 in brealth, Wakenamin and Leguan, each about 12 miles by 3, and Tliger Island, about half that size. The entraneo is difficult and dangerous, even for vessels of small size, on account of the bunks of mus and sand. Its course lies thronerh forests of the most gipantic vegetutlon. In north lat. $3^{\circ} 14^{\prime} 35^{\prime \prime}$, it forms a great eataract, nanned by Schomburgk, King William's Cataract. In north lat. $3^{\circ} 57^{\prime} 30^{\prime \prime}$, and west long. $68^{\circ} 33^{\prime}$, it reccives the IRupunoony, which has a course of about 220 niles. At various points ot its course it forms rapids and cataracts which impede its navigution. About 60 miles from lts mouth oceur the last of these, the Falls of Etabally, after which it pursues its cuurse
through the low alluvial plain. In this part of its course ic receives the united waters of the Cuyual and the Massaroony. The Demerara, or Demerary rises probably near north lat. $B^{\circ}$, and after a northward course nearly parallel with the Essequibo, of more tham 200 miles, It enters the Atlantle near north lat. $6^{\circ} 80^{\prime}$, west long. $588^{\circ} 20^{\prime}$. It is navigable for 85 milea, and at ita mouth at Georgetown It is more than a mille and s half acrosa. Further east runa the Berbice, whose source ls probably about north lat. $3^{\circ} 40^{\prime}$. It joinn the Atlantlo by an eatuary five milea in wldth, 10 millos narth of New Amsterdam, and in north lat. $6^{\circ}$ 21', west long. $87012^{\prime}$. It la navigable for 165 miles from the aea, by veasels drawing seven feet water. The Corentyn whlch forins the eastern houndary of Britlah Gulana, and probably has its source In the Sierra Acaral, flows generally northward and fulla Into the Atlantle in north lat. $\}$, weat long. $57^{\circ}$. It is navigable for boats for 150 miles. The mineral productions of Guiana are necessarily but imperfectly known. Clays of varlous kinds, including excellent plpe-clay, sre fonnd near the coast. The chief rocks are granite, porphyry, gnelss, clay-slate, andstone, etc. Traces of iron are found in various parts; and gold has been recently (in 1852) discovered in considerable quantities on the upper Essequito.
The climate of Guiana ia more healthy than that of inost places in the West Indies. Its salubrity has been much increased sinco the oceupation of the couutry by Europeans, the gradual clearing and cultivation of the aurface having done much to mitlgate those dlseases so fatal in 16 low, marehy, and hot region. The hurricanes so dentructive In the West Indiea are unknown here, and gales are unfrequent. Thunderatorms oceur only during the ralny seasona; but, like the few occasional shocks of esrthquakes, are not attended with danger. The year is divided into two wet and two dry seasons. The long rainy seasu a sets in about the middle of Aprid, when light showers begin to fall. The raln increases till the middle of June, when it fulla in torrents; In the beginning of July these hesvy rains begin to decrease, and in Auguat the long dry seuson begins, and continues till November. December and January constitute the short rainy season, and Februsry and March the short dry season. The winds during the rains are generally westerly; in the dry season they blow mostly from the ocean, loaded with moisture, and thus reader the heat less oppressive than lt would otherwlse be. The thermometer seldom rises sbove $90^{\circ}$, and rarely fulls below $75^{\circ}$ Fah. The mean annual temperature at Gcorgetown is $81^{\circ} 2^{\prime}$; the totul annual full of rain averages alout 100 inches.

The regetation of Gulana is most laxuriant. The interlor is thickly wooded with vulusble tlmber, with the exceptlon of the swamps of llerbice and the eavanwahe. The trees are of great size, and many of them are valuable for their timber, or their fruits, or as dyewoods. Medicinal plants, Including quassia, gentian, the castor-oll plant, and many others, are atundant. Arnolto, so extensively used lin the coloring of cheese, grows wild in profusion on the bonks of the upper Corentyi. The lurgent of the water-lilies, the Victoria Regia, was first discovered here by Mr. Sclomburgk on the banks of the lertice. The hai-arry, an indigenous plant deserving of notice, is a papilinacesus vine, the root of which contains a powerful narcotle, and is commonly used by the Indians in poisoning the waters to take the fish, which are not thereby leteriorated. The domestio unimais nre the same as those in lingland, and the wild animals ure those common tu tropical South Anerica generally. Llack cattle here attuin a largar sizo than in liurope, but their tlesh is not so tender nor so the flavored. The wool of the sheep is converted into lalir. Gaine, chieily deer, range the upper savannahs. Tigers, little inferior in aize to those of Asia, but different in character, being
rarsly known to attack man, abound ; an do also jaguar, which prey upon the herda of wild cattle and horses that graze on the extensive plaina among the monntains. Among the other animals ere the tapir, armadilis, agoath, ant-bear, eluth, and a great variety of monkeys, lizards, anakes, and allgators are numerons. There are beveral kinds of parrots, macaws, and hamaling-biria; alao the Ap mingo, muscory duck, toucan, spoonlill, and vampire bat. Tsuuble some insects are numerous, as milght be expected from the swampy nature of the coast districts. The rivere ant coast abound with a great variety of fieh.

The cultivated partion of IIritish Guiana is merely a narrow strip along the sea-coast, and for a few milen up the rivers, inclivdlag a portion of the islands of fissequibo. The whole aurface of the coast landn being on a level with hlgh-water mark, when these lands are dralued and enltivatell they consolidnte and become fully a foot below it, so that the estatea require to be protected from inundation by dams and alw os. Jach estat : va, theretore, a atrong clam or ent ${ }^{\text {ivex }}+$ ment in inuar ; whilc a slmitar erecel ra a che bes: inland boundury, as wetl an on each dite, ia reub to keep of the immense toxly of water accumul ${ }^{\text {ed }}$, the savannahs durisg the wet seasons, and w: h, ts not repelled, would rush down to the sea carrying every thing before it. The etate of his dams, therefore, requires the planter's unremitting attention: not the alighteas hole or latakge is allowed to exist in them, and by law their williul injary is conshlered felony. One inundation desiroys a aligar estate for eighteen montha, and a coffen one for alx years, "The original cost of damming and cultirating is fully prid lyy the first cnop, and the duration of the crops is from 30 to 50 rears : mis that thongh great eapital is required for the first outlav, the or marative expense of eultivacion is a mere trilie rempared wh that of the Weat Inilia Islands, notwithetanding that the expense of workn, buildings, and machinery; may be treble or unadruple, teing buitc on an achogunto seale for half a century of certain promiction."-(imog. Jokr., vol. iv., 393. Inside, and at the foot of these dams, are trenches I: to is fect wise, and 5 feet derp, romning round the whole plantation, and luto these, smaller trewhes and
open Iralus couvey tbe water that fills upon the land. These large trenchen discharge thelr contenus into the aea throluch one or inore sluices, which are cpened at the tide ehbs, and sliut agalast the returning flool.

The staple productlone of the colony are sugar, coffee, and cotton. From in official table of the exports of British Guiana from 1826 to 1851, we find thut in 1827, 15,904 bslee of cotton were exported, but from that period this caltivation gradually gave place to sugar, ard In 1844 ceasea to eppear in the table as an article of export. Sinco 1851, however, V, seems to have recelved more attention, for among i, he exports from Britlsh Gulana Into the United King lom in 1854 we find 1093 cwt. 0 : cotton. Coffee, from upward of $\mathbf{9 , 5 0 0 , 0 9 C}$ the in 18.30, gradually fell off to only 3198 lise, in 1851. As to sugar, making a due allowance for the sifference of seasons, the quantity exported remaisid pretty ateady from 1826 to 1837 , the year preceling the , rmlnation of apprenticeships-averaging about $\mathrm{S}_{4}, \mathfrak{j u}$, hads.; but in the year following that
 t. $16, n$, aly 88,270 bids. In 184t, it had sunk as 29 2id hers., owlngs in a great measure to a prought through a great part of that season.
WHy hhls. were exported. In proportion to angar chty the quantity of molusses is large, owisy par the dofecta of the conmon process of preparation. but iniefly to the fact that the soil is so rich an alluviua, and so abandant in alkaline and earthy saline matter. Little of the molasses is loiled down into sugar in the colony; it ix chiefly made into run, or sold to the retiners, hy whon it is mueh prized. In 1851 the quantity of nolases exported was 9530 puncheons. Although the rum priduced in this colony doen not equal in character that of Jamaica, it yet occupies a reapectalalo place In the market. The quan. tity exported in $1 \times$ and was 15,818 puncheons. With respect to the caltivation of the sugar cane, hy reason of the lownes of the land and the plan of lrainage in use-nameiy, that known as the open-lrain and roundbed metion-the system of cuitivation remains exuetly as In the timen of siavery, every part of the operations of culture being performed by mantul lahor. The follow. ligg atstistics have been compiled from official nources:

Ar export duty is charged in the parts of thene col- crease. In 18int the IValted statea laperted from liononies on their staple pinatuesions. Hoth In Horduras and Itritish Guiamn, American vessels mujoy all the privileges extended to tho vensels of the most fivored astlon: anil, as the following tables for 1854 and 1853 will alow, Amorican conmerce is generally on the in-

 blat pepper, f100\% A tatal of $\$ 137,710$, or nearly one half of the untiee imports from this colony fur that ycar. From Hriisel Guinna, the leabling linjorts in

1854 were old and gerap iron, copper, brasa, hides, sugat, ad $\boldsymbol{A}^{A}$ rum, amounting to nearly $\$ 40,000$, of whic'1 copper alone reached 15,615 . Demersra contalns a pripulation of 74,922 wifites and free blacics. Ber'ice contains a population of 21,080 , of $*$ hom 21,000 are íree blackg.
The following comparative statement exhiblt the trade between the United States and the two colonies, Demerara and Jurbice, of which British Guisns is composed :

The fillowiriz table will show the eompara't. a imul. ance of tie trale of the three Cismas in th the United States during the year endiug June 30, 1856 :

Dutch Guiana.-I Iutch, or Surinam, lies between British and French Gulsna, leing separsted from the former on the weat by the River Corentyn, and from the tatter on the east by the Maroni; on the north it has the Atlantic, and on the south Brazll. It lies between istitade $1^{\circ} 80^{\prime}$ and $6^{\circ}$ north, end longitude $53^{\circ} 30^{\prime}$ and $57^{\circ} 30^{\prime}$ west, being alyout 300 miles in length, from north to south, snd 260 in extreme breadth. Area, about 38,500 square miles. In physfeal geography, climnte, productions, etc., it differs but littie from British Gulana. The principsl river is the Surinam, which flows northward through the centre of the territory, $f$ d falis into the Athantic after a course of nearly 300 sailes. It is navigable for large ships for about four leagues from its mouth. Aiong the coast, and on the banks of the river, are many settlements and plautations; and the higher parts of the country are occupied chiefly ly the Maroona, the desceudants of runaway negroes. In the last century they wero very troublesome to the colonists, but they
have now adopted more settled habits. Slapery hae been recently abolished lere by the Datch government, bnt in lleu of compensation, the slaves reinain apprenticed, and work withont wages to their proprietors for 12 yeara.' The colony is ruled lyy a goverrior appointed by the crown, and a council elected by the freehoiders. Justice is administered by a supreme c'urt, courts of minor jurisdiction, and a court of inheritanct, and orphans. The receipts in 1850 amonnted to : 39,485 ; the expe nditure to $£ 85,564$. On 278 plantations, consisting of $36^{r}, 548$ acres, 48,815 acros wero under cultivation. The chiet productions are sugar, rum, molasses, cof.․ tacau, and cotton. Its chief trade is with It ${ }^{\prime}$ les.d. Imports, in 1851, $£ 171,395$; exporta, $£ 286,162$. At the close of 1850 , the colony numbered e 1,080 Inhnbitante- of whom $\mathbf{3 2 , 4 0 1}$ were Europeinas and creoies, 8000 bush negroes, 1000 Indisias, and 39,679 slaves. Of the roligious sects, the Moravians amounted to 17,933 , and the Jews to about 680. The live stock conslsted of 168 horees, 59 mules, 5564 cattle, 8155 sheep, 454 goats, and 4664 hogs. The army consists of 610 men of all arms ; and the navy of 11 vessels, chlefly small. Paramarilo, the capital, is situated on the right bank of tho Surinum, abont 10 miles from its month. It is buile in the Dutch style, with whle and straight streets, planted with orange-trees; and the houses are generally two stories in height, and built of wood. Population about 20,000 . A little north of the town is the fort of Zeelandia, where the governor resides, and where are also most of the government establishnients.

Surinam whs declared a free port by proclanation dated May 1, 1848. Accounts ars kept in doilars of 8 reala, or 50 stivers ( 100 cents), and in pounds sterling. Exchange on London, s480 to 8485 per pound sterling. Aves island, one of the leeward group of the West Indies, het ween $15^{\circ}$ and $16^{\circ}$ nort! hatitude bolongs to the Duteh government. In the year $18 \mathrm{i}^{\circ}$ extensive deposits of guano were diacovered on the island of Aves, by two American ship captains, but wo do not as yet learn that any shipments have been made from it. Cuffee, the product of a possession of the Netherlands direct from cueh possessions, or from the Netherlands, Imported into the United States In a vessel of the Netherlands, is admitted free of duty, undor the treaty of August $26,1852$.

This colonial territory of Holland comprises an urea If 10,4100 square miles, and contains a popalation of nearly 60,000 souls. Its chief prolucts are sugar,
coffee, cotton, cocoa, rice, capara, fino woods, gums, drags, timber, nud molasses; the hart ranks next to sugar in value as an export. The quantity of sugar
ennually exported is atated at about $25,000,000$ pronnds, and of coffee at about $4,000,000$ pounds.

The annual average production of the leading ataplee of thia colony are thes given: Sugar, 28,012,163 Ils. $;$ coffee, 1,355,8i6 lbs, ; cocoa, 151, 250 lba.; cotton, 765,823 Ibn.; rum, $92,183 \mathrm{gala}$; $\mathbf{~ d r a m}$ ( a kind of irandy; 227,965 gals. ; molasses, $1,210,463 \mathrm{gals}$. Ansual average value of lealling staples, $\$ 1,500,000$.

The valoe of importa into Dutch Guiana in 1853 antonnted to 4816,474 , showing an lncrease over the im po'ts of the preceding year of 871,473 . Of the total amount, there were from the Netherlanai, 400,482 ; from the United States, 179,236 ; ${ }^{\prime}$ and from other countriee, $\$ 176,750$. The exports amounted to 1,812 ,118 ; ahowing 101,253 increase over the exporte for 1852. Of this sum, $\ddagger 844,103$ were sont to the Netherlands, 201,794 to the United Staten, and 266,221 to other countries. The principal articles imported Into Surinam from the United States are aalted fish, amounting, in 1853, to $⿻$ (58,892; salted and amoked nient, about $\$ 50,(000$ per anaum. The imports into tho Uuited States from Surinam are sugar ( $\$ 131,052$ in amount in 1852), molasses ( $\$ 58,833$ ), and cocoa ( $\$ 32,026$ in 1853). In 1853, there arrived 201 vessels, masuring 36,858 tons. Of theee, 66 , of 18,960 tons, were under the Dutch fla 1 and 21, of 8196 tons, American. In the same year there cleared 190 veasele, measuring in the aggregate, 86,858 tons; of which 55 , of $17,8: 7$ tons, were I)utch; 31, of 15,150 tons, American ; and the othera under the English and other fagg. A.n analysis of the trade of 1)utch Guiana show that tho United States has about one fourth of the whole comraerce of the colony.
Fromen Guiana is the smaliest and noont eastorn of the three colonies, known as English Guiana, Dutch Guinna, and French Gniana. It lies between $2^{\circ}$ nnd $6^{\circ}$ N. lat,, nnd $51^{\circ} 30^{\prime}$ and $54^{\circ} 80^{\circ} \mathrm{W}$. long., being bonnded on the north and northeast by the Atlantle, east and sorth by Brazil, and west by Dutch Galans. It is sbout $\mathbf{2 5 0}$ miles in length, from worth to south, and varies In breadth from 100 to 150 miles. Aroa, 27.560 square miles. It has a coast line of 200 miles, extending from the Maroni to the Oynpoc. The low alluvial tract along the coast is of great fertil!ty: The mountain chains run east and weat, and are alinost whoily of granite, but do not attuin a great elevation. The country is nbundantly waterel, anu the coast-fandel appear to be less unhealliy than in Iritish Guiana. The vagetation of Guiana is very luxuriant, and the interior is thickiy
wooded with trees valuable for their timber, fruits, and dye-woods. Medicinal plants, including quasela, gentlan, the castor-oil plant, and arnotto, used in coloring cheese, are all abundant.

This island of Cayenne, at the mouth of the Oyak, is about 30 miles in circumference, and is aeparuted from the contiaent by a narrow ehannel. The roalatead at the mouth of the Oyak, thongh amall, ia the best on the ooast, having every where from 12 to 13 feet of water. The capital, Cayenne, is situated va thn northern aide of this isinnd, and contains $5,220 \mathrm{in}$ habitauts. The new town ie well bulit, and has gool atreets; the government house is in the old town. The larbor is protected by a fort and several batteriss. The colony is divided into two diatricta, Cayenna and Sinnamary, and 14 communce. The government is vested In a governor, a privy council, and a colonial council, composed of 16 members, clected by tie coloniats. The cultivated landa are eatinated to be alout one ejghtieth of the whole territory. Beaides the ktaples of British and Dutch Guiana, its productions compriso pepper (including Cayenne, which is so calied from the inlanil of that name), cloves, cinnamon, and nutmegy. Trude is chiefly with France and its colonlea. In 1854, the afficial value of the importe into France from Freuch Guiana was $£ 20,000$; exports, E192,000. The French firat mettled in Cayenne in 1604 ; the British and Portuguese capturel the colonyin 1809, but restorel it to the French in 1814, In whose possession it atill remains. It has recently been madia a place of banishment for French political offenders; and, in 1852, 2,500 of these were aent out. l'opulation nhout 22,000 , of whom about 15,000 are emancipated alaves.

Cayenne, sea-port, town, and capital of French Guina, on the north-weat extremity of the isiand of that name, in let. $4^{\circ} 50^{\prime} \mathrm{N}$., long. $62^{\circ} 15^{\prime} \mathrm{W}$. It contains about 500 houses, moetly of wood, and is divided Into the old and new towns, the lattor clean and well built. It is the seat of a court of assize, and has s handsome church, Jesuit coliege, governnient honse, and sevaral large warehonses. The harbor is shallisw, has two quayer, and is protected by a fort and several batterics. Population about 6,000 .

Freneh vessels from Carenne in French Guiana are admitted into the ports of the United States on equal terms, as to duty and tonnage, with veasels belonging to the Enited States, when direct from Guiana, either in ballast or with articlea the growth or manufacture of that couritry.

A decree of the Fronch government, isened In 1822, und continued by a decree of the govsmer of the colony, dated the 28d of Decamber, 1883, givea an advantage to Froneh goods shlpped directly from French ports in Fronch vessela, and to French goods and products of French colonios brought in French vessola, over the foreign trade, in the rate of duties they impose. The prodncts of the colony carriad to France, in Frensh vessels, have also an advantage over pro'acts carried to other countrien In foreign vessels. The only duties pald by French or forelgn veasels remaining. In port over's2 hours, wlthout putting ont or taking in any cargo, are pilotage and fees to the custom-house guards.
Cuyenne ls the mont eusterly of the three colonles. It extends along the coast from the Hiver Maronl to the Ozapoh, the boundary of Brazil. It lles between $2^{\circ}$ and $6^{\circ} \mathrm{N}$. lat. Its length, from north to sonth, ls 250 miles, and the breadth varien from 100 to 190 miles, comprising an ares of 27,560 square miles, and containiag a populatlon of 5,056 whites, and 10,592 blacks. The coast is an alluvial tract of great fertility, and the uplands are also very fertile. There are upward of twenty rivers of tolerable size, whlch sre navigable, from 80 to 60 miles, for small craft. Ahout one eighth part of the surface is occupied; the remainder is left to Indians and willd beasts. The articles cultivated are the sugar-cane, eoffce, cotton, cocoa, cloves, onnatto, pepper, clanamon, nutmegs, oorn, etc. There are about 40 large establishments for the manufacture of sugar, and about 60 augarmills, most of which are worked by team. The imports are chiefly from France, being; sbeut $2,675,000$ france in value. The imports from other countries smoant to about 550,000 francs. The exports aro of the valae of $3,128,000$ francs, and are nearly all shlppad to France. Abont 40 French vessels, of the aggregate burien of 7000 tona, usually enter, and about the same number clear from Gulama every year. Some 20 or 30 foreign veasels enter and depart each year. These statistics are not exact, hut probably approximate nearly enough for practical legislation in reference to them.

Guild (from the Saxon guildan, to pay), signifies a fraternity or company, because every one was gildare, that is, had to pay something toward the charge and support of the company. As to the origin of guilds or companies in Britain, it was $e$. law among the Saxons that every freeman of fourteen years of age should find suraties to keep the peace, or be comnittel. This led to the formstion, smong neighbors, of associations, each consiating of ten families, which becane hound for one another, either to proiuce him who committed an offense, or to make satisfaction to the injured party; and that they might the better do this, they raised a sum of money among themselvea, which they put lnto a common stuck, and when one of their pledges had committed an offense, and fied, then the other nine made eatisfaction out of this stock, by payment of money, according to the offense. Becasuse this association conslsted of ton families, it was called u decenary; and hence arose other kinds of fril ternities. Ilut as to the precise time when these guilds had their origin In England there is nothing certain to he found; since they were in use long before suy formal license was granted to them for such meetings. It seems to have been about the close of tho 11th century, according to Anderson (History of Commerce, vol. i., p. 70), that merchant-guilda, or fruternitles, which were afterward etyled corporations, came firat luto general uss in many parts of Furope. Madox (Firma Burgi, chap. l., sect. 9) thinks they were hardly known to our Saxon progenitors, and that they might probably have been brought Into Eingland by the Normans, although they do not seem to have been very numerous in those days. The French and Normans might perhaps have borrowed them from the free clties
of Italy, where trade and manufactures flourished at a much earller period, and where auch nommunitles appear to have been flrst in use. These guilda are now companies or associatlons haviag laws and orders made by themselves, in virtue of authority from the prince to that effect. See Gild.

Guild in the royal burghs of Scotland, is still used for a company of merchants, who are free ven of the burgh. Every royal burgh has a dean of build, who is the noxt magistrate below the provest.

Guild, Gild, or Geld, is also nsed by anclent writers to signify a compensation or mulct for an offense.

Guinea, a gold coin formerly struok and current in Britain, and so denominated because the gold of whlch the first specimens were atruck (temp. Car. II.) was brought from the coast of Guinea; and for a like reason It orlginally bore the impression of an elephant. The value of the guines varied greatly at dlfferent pariods, but latterly it was worth 21 shillings. Its weight was 5 dwts. $9 \cdot 4125 \mathrm{grs}$. On the introduction of the sovereign-first coined In 1817-the old guinea coinage was gradually superseded.

Guinea, the name asalgned to a large tract of country on the west cosst of Africa, commencing at Capa Verga, In about $10^{\circ} \mathrm{N}$. lat., and terainating with the Cameroon Mountains in the Gulf of Biafra. These are the limits more commonly given to what is called Guinea; by some they are greatly extended, so as to comprise the whole of the Portuguese settlements south of the equator, under the name of Sonthern Gainea, while the coust north of the equator is called Northern Gninea.
The term Guinea is not of African origin, or at least not among those to whom It is applied. Thero is, according to Barbot, s district of country north of the Senegal known by the nume of Genahoa, the inhabliants of which were the tirst blacks that the Portuguese encountered In their explorations along the coast in the 15th century; and they applled this name indiacriminately afterward to all the black nations which they found further south. In the $t$ roo succeeding centuries it was applied in a more restricted sense to that pertion of the coast which is now better known as the Gold and Slave Coasts ; owing to the faet, perhaps, that this region for a time offered a larger number of slaves for the forsign market than any other part of the country. The natives here acknowledge this term as applied to themselves, but it was undoubtedly borrowed in the first Instance from the Portaguese.

Tho physical aspect of the country, as might be inferred froin the large extent we have under conslderation, is very variatile, but is charscterized overywhere by excessive richness of natural scenery. In the regiou of Sierra Leone, Cape Mount, and Cape Mraurado, the eye rests on bold headlands and high promontories covered with the richest tropical verdure. In the vicinity of Cape Palmas thero are extended plains, slightly undulating, and covered with slimost every variety of the palm and palmetto. On the const of Drewiss the country rises into table-lands of vast extent, and apparently of great fertility. The Gold Coast presents every variety of hill and dale; and as we nipproach the equstorisl region we are saluted by mountain sconery of unrivaled beanty and surpassing magniticence.

The inhabitants consist chiefly of the following tribes:-The Vais, tho Manou or Kru, the Kovakeras or Avekroom, the Inta, the Dahomey, Ashanti, and the Benin. There are no large or extended political organizations, with the exception, perhaps, of the kingdoms of Aahantl and Dahomey, and neithor of theso has a larger population or greater oxtent of territory than the maller kingdema of Europe. For the most part, the people live together in Independent communities, of not more than 8 or 10 villages, and with an aggregate population of from 2000 to 25,000

M м M
er 80,000 . In these difierent commanitioe they have so writton forme of law, but are governed for the moet part by certain trailtlonal usages that have been handed dawn from generation to generation. Nomiaally, monarchy is the only form of government acknowledged among them ; bat, when closely scrutlnised, their systems ahow much more of the popular and patriarchal than of the monarchical element. They are easentlally a pagni people; but in thelr reIlgious notlons and Idolatroun worahip they Giffor very much from each other. There are many decided tracee of the Jewlsh origin. Among these may be apecifled the rite of cireumeialion, which, with the exception of the Kru or Manou family, is, wa believe, miveraal ; the divislon of the tribes into familles, and In some cases Into the number of 12 ; bloody sacrifices, with the sprinkling of blood upon their altars and door-posts; the observance of new moons; a formal and apecitied time for mourning for the dead, during which period they whave their head and wear tattered clothes; demoniscal possessionn, purificatlonn, and various other uasges of probable Jawish origin.

Respecting the natural producta and trading eapabilities of the country, the articles exported consist chietly of giager, gum, mendobl (Gainen graina, a apecies of seed), palin-oll, some ivory, a wood used for dyeing, calleil camwood, and which le worth In Eingland about $£ 15$ sterling a ton. Vessels visiting that coant take on boarl-at Sierra Leone, or on the conat of Malagueta, between Cape Mesurado and Cape Pal-mas-sone black sailors, called krumen, who are of great use in doing the heavy work on board, and for boat service; thus saving the European seamen from expeaing themselves too much to the sun's ravs, etc. The services of these krumen are recompened with two or three pieces of cotton cloth per month each. Their chief food is rice, which may be purchased at a very cheap rate on the const of Malagueta; the price of a "kru" (a mensure of capacity welghing about 80 lbs.), being a fathom and a half of cotton cloth, or any other article of proportionate value.

On the coast of Malaguets (Grain Coant), the artlcles received principally in barter are rice and millet; also ivory, paim-oll, and camwood, especially at Monrovia, the capital of Liberia. At Slerra leone, the pepper-tree (called malagueta), is cultivated on an extensive scale, and its fruit-Guinea pepper-after being dried, in purchased In large quantitiea by the Americans, and inportel Into the United States.

English muskets, gunpowder, ram, and tobacoo, are the prineipal articlee of traffic on the whole of the coast as far as Unim at the bottom of the Ilight of Ilenin.

At Jaque Lahoo and Jaque Jaque, two considerahle towns, situated at the extremity of the bight formed by Cape l'almas and Cape Three Pointa, commences the trade in goldduat ; here also a conalierable quantity of palm-oil and some lvory are found. After painsing these towns, the Furopean settlements commence. The first are Great lassam and Aanine, helonging to France, and situated at the moutha of the riven of the same names. Five leagues to the west of C'ape Three Points, in the mmall l)utch fort of Axem; and on the other side of the same cape is the English port of Dick', Cove. From Cape Lahoo to Acora, and to all the Earopean settlementa on the coast, the monesary atandard is the "ake" (ackie) of gold-iust, which weigh half a dram Finglish, and is worth nearly 5 s. The kru on thin part of the coast is almost double that asalgned to it on the coant of Mala-gueta-averaging \&50, more or leas.

Hetween Ihick' Cove and the cantle of St. George of the Mine ( $N$. Jorge da Mina), are altuated the mall forte of Serunde. Sance, and Commendo; after which we come to the firet large Furopean eettlement, viz., the cantle of St. George of the Mine, ivelonging to Holland. The castle is a Portuguese structare, and
wan formerly the mont Important of tha Portnguene colonies on this coast. Next to it is Cape Coast Castle, belonging to Fingland, and situated In sight of the former. The next place is Annamaboo, \& small En. glish fort, formerly abaudoned, but where for some years past trade has been again in some degree devel. oped. To this fort succeed othera in rulng, as Winebah and Assam. Millet is found in abundance at thesa places, as well as palm-oil and gold-duat. lroceed. Ing along the coast, we come to tha grast English set. tlement of Acora, where there ane at present two fortressea. The firat, that of St. Jamen, was bullt by them many yesra alace; the second, that of Chrinthanhurg, was purchased from I?snmark, tegether with all its poesesaions on that const, In the year 1850 . Then follow the mall settlementa of Ningo; after pasaing whleh, Cape St. Peul, a Ittle to the east of Hio da Volta ("Return Kiver"), ba doubled.

From Cape St. Panl to Onim or Lagos, many negro towns or villages are met with stationed along the coast. These communicate with each other by meuns of the lake situated at no great distance inland from the leach ; and then the ford converges to the prinelpal pointa, which are Quita, Popo-pequeño, Ajuils, 1'orto Novo, and Onim. The trade which formerly flourished at all these places was that In alaves; fint for some years past that in palm-oll, or den-den, has greatly developed itself, the quantity produced amounting annualiy to more than 7000 tons, which aro shipped to Fingland, America, and France. On this section of the coast there are no Europeen establishments, properly no called; but at Ajuda, Porto Novo, and Onim, there are factories ; and Europeans are also resident in the country, and traffic with vessels, as they do at those establishments. The trade of the Ilenin, Brasa, Bonny, Calabar, and Cameroon Rivera, is all in palin-oil, and carried on exclusively by the Engliah.

Gulf of Guinea. The Gulf of Guinea forms a caldron snd a furnuce, and apreads out over the South Atlantic an air-chamber for heating up in winter and keeping warm the extra-tropleal reglons of south America, Fvery traveler has remarked upon the mild climate of I'atagonia and the Falkiand Islunds. "Temperature in high southern latitnden," suys it very close ohserver, who is co-operating with me in collecting materiala, "differa greatly from the temperature in northern. In southeru latitudies there seem to be no extremes of heat and cold, an at the north. New. port, Khosle lsland, for Instance, latitule $41^{\circ}$ north, longitude $71^{\circ}$ west, and Kio Negro, latitule $41^{\circ}$ suuth, and iongitude $6 a^{\circ}$ west, an a comparison: in the former, cattle have to be stabled and fell during the wis. ter, not being able to get a living in the tiphls on account of nnow and ice. .the latter, the cuttle feed in the fields all winter, thi FC 'ring pienty of vegetation and no use of hay. On the Falklani Islands (latitude 51-52 ${ }^{\circ}$ south), thonsands of Imillocks, sheep, and horsea are running wild over the country, gathering a living all through the winter." The water in the equatorial caldron of Guinen can not escaje nurth -the shore-line will not permit it, it must, therefore, overflow to the south, as that of St. Wiugue does to the north, carrying to l'atagonia and the Fulkland Islands, bevoond $5 n^{\circ}$ south, the winter climate of Charleston, South Carolina, on our side of the Yorth Atlantic, or of the "Emerald Inland" on the other.Maviry's /hys: Geog.
Gulf of Mexdco, a large indentation on the past coast of North America, wamhing the shoris of the United Staten and Mexico, mearuring about lyomiles from east to west, and 800 miles from north to south; estimaterl area, 800,000 aquare miles. it is partly formed by the projection toward each other of the peninsulas of Florids and Yucatan, nearly in a line lectween which lles the Inland of Cuba, leaving a communication on It, north with the Atlantic, through the flor.

GTI.F. STYKLLM AND DRIFT bV LIECT. MAORY U.A.N.

ida Channel and on its south with tho Caribhean Sea, through the Channel of Yucatan. The Gulf is free from banks, and contains only a few amnll rocky lslands on the coast of Yucatan, with the Florida Reef near its eastern extremity. The shores are low, and generally lined with flat sandy islanda, not far from tho land, and numerous legoons. There are few harbors ; and the rivers which fall into it are obstructed by bers at their mouth, which render them all, except the Misaissippi, nearly inaccessible for vessels of large draight. A current of water entering the Gulf from the Caribbean Sea is soon divided into two portions, the one running east along the coast of Cuba, the other west, in a curved line through the middle of the Gulf, round toward the Florids Channel, where it meets the other curreni, and the two united form the Gulf Stream (see Atlantic). The temperature of the Gulf of Mexico is $86^{\circ}$ in summer, and $6^{\circ}$ higher than that of the ocean in the aame parallel. At high tide, the Pscific rises aeveral feet alove the levol of the Guif, and at low water it falis as far below it.
The depth of the marine basin which holds the waters of the Gulf of Mexico is, in the deepest part, nthout three quarters of a mile. The officers of the United States' ship Albany ran at line of deep sea-soundings from west to east across the Gulf; the greatest depth they reported was about - $\mathbf{7 0}$ feet. Subsequent expcriments, however, indu e the belief that the depth is nut quite so great. We should therefore have, by stopping up the chaumels between the Gulf and the Atlantic, not a sea-level in the Gulf, but we should havo a menn level between evaporation and precipitation. If the former were in necess, the lovel of the Gulf waters would sink down until the surface exposel to the air would be just aufficient to return to the atmosphere, as vapor, the amount of water discharged by tho rivers-the Mississippi nnd others-into the Gulf. As the waters were lowered, the extent of evaporating surface would grow less and less, until Nature should estabiish the proper ratio between the ability of the air to take up and the capacity of the clonds to let down. Thus we might have a sea whose level wonld be much further below the water-level of the ocean than is the Dead Sea.-Mavny's Phys. Geog.
Gulf Stream. There is a river in the ocean. In the severest droughts it never fails, and in the mightlest floode it never overflows. Its bunks and its bottom are of cold water, whie its current is of warm. The Gulf of Mexico is its fountain, and its mouth is in the Arctic Seas. It is the Gulf Strenm. There is in the world no such majestic flow of waters. Its current is more rapid than the Mississippi or tho Amazon.
Its waters, as fur out from the Gulf as the Carollua coasts, are of an indigo-blue. They are so distinctly marked that their line of junction witi the common sea-water may be traced by the eje. Often one linlf of the vessel may he perceived floating in Gulf Stream water, while the otier half is in the common water of the sea; so sharij is the line, and such the writ of affinity letween those waters, and the reluctanco on the part of the Gulf Stream to mingle with the common water of the sea.-Mauny's Phya. Geogrophy.
Various causes of the Gulf Stream havo been assigned. At ono period, tho Mississippi River; but this hypothesis was soon exploded, for it is estimated that it wonld take 1000 such rivers, us tite velocities of the river and Gulf Strenm are nbout equal. The most phansilde hypothesis yet nilvanced, nad the one which seems to ho entertalned now ns true, is, that tio motive power is due to the difference of teuperaturo between tite equaturina and northern parts of the ocean. This differeace would give a cause commensurate with such an cffect as the Guif Streau, and is tho only one yet advaneed where the cause and effect approach equalty. It is probablo, however, that this is but one of tie many fortes brought to boar. Tho forces varying from the potent one mentioned, to nthers
"llght as the zephyr." And, in many cases, forces produced by the Gulf Stream react upon it; as, from the difference of temperature of the north and south, aided by the Gulf Stream in some cases, are produced the trade winds, 80 these trade winds have no alight effect upon the Gulp Stream.

To form some idea of the magnitude of the stream, we can take a crose section at Cape Hatteras; approximately, it may be given as 75 milos wide and 700 feet in depth, with a velocity of three knots en hour. The stream becomes smailer in its progress north, yielding portions of its heat on its way, and so allowing portions of the stream to assimilate with the rest of the ocesa.
Ae the Gulf Stream is but a current of water of high temperature from the sonth to the north, it would be natural to suppose its course would be from south to north. This would be the case were it not for the rotation of the earth to the east, for a current starting from the equator, having a velocity of 1000 miles an hour eastward in common with the earth, when its current reaches latitude $60^{\circ}$, where the velocity of the earth is only 250 miles an hour, it will be so many degrees of longitude east as the diference of velocities would force it, minus the retarda:ions. This would be aufficient to explain why the rourse should be northeast, independent of the effect of the contour of the continent.
The course and dimensions of the Gulf Stream may be readily seen from the accompanying chart of Manry's. (See Plate II.)
The amonnt of water forming the Gulf Stream, and going north, must be returued into the fountsin-head, the seas near the equator-and so we have streams or oceanic currents going south equally as important in their effect, and givin; as interesting phenomena, but not as readily observad, because they ars under-currents, and not as appreciated becnuse they most affect other parts of the world. The water from the north flows to the south in many comparatively s mall under currents, and rises to the surface st various points, tnking for their general course tho African shore, and making a circle uniting with the Gulf Stream in the Caribbean Sea. For the snme reason that the course of the Gulf Stream is north-east the returning currents are south-west

One large returning current crosses the Gulf Stream nour the Banks of Newfoundiand, bringing icebe'gs which melt in contact with the warm stream. The deposits have formed, and are forming, the Banka of Newfoundland.
The influence of the Gulf Stream, like tho distance of the Axed stars, san be conjectured, but we fall as much short in one cenjecture as in the othor.
Our complaints of a varable climate would not be without foundation were it not for the beneficial influence of streams of water from the tropics. giving us warmth and moisture; mnking the climate of New York in winter equal to a place in a latitude $10^{\circ}$ bouth, and in summer giving the henlth of a place as many degrees north. Maury suys:
'No part of the world affurts a more diffcult or dangerous navigation than the approxches of our northern coasts in winter. Before the warmth of the Gulf Stream wns known, a voyage nt this season from Eumopo to New Engiand, New York, and even to the capes of the Deinware, or Chepapeake, was many timos more trying. difficult, and dangerous than it is now. In making this part of the const, vesseis are frequently met ly snow-starms and gales which mock the seaman's strength, and set at naught his skill. In a little while his bark becomes n mass of ice, with her crew frosted and holpless; she remains obedient to her helm, and is kept away for the Gulf Strean. Atter a few hours' run, she reaches the elge, and almost at the next hound passes from the midist of wiater into summer hent. Now the ice disappears from her; the
sailor bathes his stiffened limbs in tepid watery; feeling bimself invigorated and refreshed with the genial warmth about him, be realize out there at sea the fable of Antæus and his mother Earth. He rises up and attempts to make his port again." And though be may fail again, he always has the same resource. Nor is this all ; it afforde an excellent water "landmal s," an outside shore of the country, against which no ship in lost; but giving definite longitude to the storm-tossed mariner, and warning him that land ia near, saves him often. Commerce iteelf, defining it as the interchange of commoditles, is but an Imitation of the Gnil Stream. The Golf Stream, taking the heat of the tropics to the shivering northmen, and the icebergs of the north to the feverish nstive of the torrid zone-giving h to to some, food to othera, and in some way affecting ali.

Gums, Resins, Gum-resins. In commerce, the term gum is not only applied to gums properly so called, but also to resins, and gum-resins. But though these aubatancea have many properties in common, they are yet sufficiently distinct.
I. Gum is a thick, transparent Iaid, that issues spontaneously from certain opecies of plents, particularly such as produce stone-fruit, as plom and cherry-trees. It is very adhesive, and gradually hardens by exposnre to the atmosphers. It is usually obtained in emsli pieces, like tears, moderately hard and ac mewhat lrittle while cold; so that it can be reduced by pounding to s fine powder. When pure, it is colorless; but it has cominonly a yellowish tinge; it is not destitute of lustre; It has no smell ; its taste is insipid; its spocific gravity variea from $1 \cdot 3161$ to $1 \cdot 4817$; lt readily dissolves in water, but is lasoluble in alcohol. Gum is extensively used in the arts, particularly ln calicoprinting, to give consistence to the colors, and to hinder them from spreading. It is also used in painting, In the manufacture of ink, In medicine, etc.

The only important gums in a commercial point of view, are gum Arabic and gum Senegal; but lac is popularly, though improperly, ranked among the gums.

1. Gum Arabic (Fr. Gomme Arabique; It. Gomma Arabica; Ger. Arabische gummi; Arab. Tolh), the jrodace of the Acacia vera, a tree growing in Arabia, and in many parts of Africa. The gum exudes naturally from the trunk and lranches, and harclens by expose ure to the air. "The more siekly the tree appears, the hore gum it yieids; and the hotter the weather the more prolific it is. A wet winter and a cool or mild summer are unfavorable to gum. "-Jackaon's Moroceo, p. 84. It is in Irregularly-shsped pieces, hard, brittle, and semi-transparent. When pure it is aimost colorless, or of a pale, vollowish hue; being insipid, inodorouil, and diasolving completely in the montl. Speclfic gravity 1.31 to 1.43 . It is often mixed with gum Senegal. East India gum Arahic is, though a useful, a spurious article, not being the produce of the acacia vera, but of other apecies of plints. The best gum is either imported direct from Alexandria, Smyrra, Tripoli, Mogadore, Tanglers, ete., or at second-hand from them through Gibraltar, Malta, and other Italian ports. The price depends principally on its whiteness and molnbility, increasing and diminish-
 4. Th lan m e or lans of these qualities.-T'momson's

The tosis a Gum 1, whic tree (Acucia vera) which afforla to an ate t gum Arabic of commerce, is a native of tle sandy ungerts of Arabia, Figypt, und the went-

1. ${ }^{7}$ juruse', Hurbery, whas the tree

 thasa, th. "t'me of the branches is of a yeliowish-

there are two opposita anl-shaped spines, growing noarly erect, and having a slight, glandnlar swelling below. The wood is hard, and takes a good polish. Its aeeds, which grow in a hard coriaceous pod, resemble those of the lupine, yitd a reddish dye, snd are used by tamners in the prepar stion uf leather.
The gum exudes spontaneously from the bark of the trunk and branches of the tree, in a soft or nearly fluid state, and hardens ly exposure to the air, or to the heat of the sun. The more sickly the tree, the more gum it yields ; and the hotter the weather, the more prolific it is. A wet winter and a cool or mild summer are unfavorable to the crop. It legins to flow in De. cember, immediately after the rainy season, near the tine of the flowering of the tree. Afterward, as the weather becomes hotter, incisions are made through the bark, to assist the exudation of the juice. The gum, when new, emits a faint smell, and when stowed in the warehouse, it may be heard to crack spontuneouriy for several weoks; and this cracking is the surest criterion of new gum, as it never docs so when old. Several kinds of gum, yielded by different trees, are occasionally to be met with, but that which is commouly substituted tor it is brought from the Island of Senegal, on the coast of Africa, and is called "Gum Senegal."

The Mrastic tree (Pistacia lentiscus), is a native of the south of Europe, the Levant, and the west of Asin, and probubiy could be cultivated with suecess in California, and perhaps in some parts of the South. This tree, which selilom exeects 12 feet in height, with a trunk 10 inches in diameter, is covered with a smooth, irownish bark, and produces the resin knewn in commerce under the name of "mastic." It is cultivated in various parts of continental Europe, particularly in Italy and Portugal.
2. Gum British.-An excellent artificial gum is now largely made for the use of calico-printers and others, and is sold under the name of British Gnm, or dextrine. It is made by roasting starch, and the manufacture is very skillfully conducted; stsreh has hence risea in manufacturing importance, whilo gum Arabic (a much more expensive article) has been to some extent superseled. Not only has starch become thus applied to new purposes, but the starch itself is olitained from a grenter variety of sources than heretofore. The oid customary mode has been to obtain stareh from wheat or other grain, by a process of fermentation, which is not applicalie to rice; but excellent starch is now obtained from rice and from sago, by improvel chemical methods, ant the atarch is bleached to a degree of great purity.
3. Gum Senegal, principally brought from the inland of that name on the coast of Africa, is ottaned from various trees, hut chiefly from two, one calied lereck; which yields a white gum; the other enlied $\mathrm{S}_{\mathrm{t}} \mathrm{b} u=l$, which yieids a red gum; varieties of the acucir gummifera. Gum Aralice is very often mixed with grm scnegal. The latter is neariy as pure as the former, lat it is usmally in larger masses, of a darker color, and more elaminy and tenacions. It is the sort of fum principally employed by calico-priuters.-Tumson's Chemistry, Titomson's Dispensutory, Aisstie's Materia Indica, etc. The trate in gum Senegal is principaliy in the hands of the lirench.
11. Resina, for the most purt, exude spontaneously from trees, though they are often ohtained byartifclai wounds, and are not unconmoniy, at first, comhined with rolutiic oii, from which they are separated by distillation. They are solid substames, naturally brittie; have a certuin degree of transparency, and s color most commonly inclining to yellow. Their taste is nore or less nerid, and not unifice that of volatile oils; but thoy have no zomell, unless they happen to contain somo foreign botiy. They are all heavier than water, their specific gravity vurying from 1.0182 1.1062. Thuy differ from gams in beling instlubie in
water, whecher cold or hot; while they are, with a few excoptions, soluble in alcohol, eapecially when assisted by heat. When heated, they malt ; and if the heat be increased, they take fire, burning with a strong yellow fiame, and enitting a vast quantity of amoke. Common resin furnishes a very perfect example of a resin, and it is from this aubstance that the whole genus have derived their name. Rosin is, indeed, frequently denominated resin. The principal resins are Animi, Elemi, Copal, Lac, Labdanum, Mrastic, Rosin, Sandarach, Tacamahac, etc.; which see, nuder their respective names.-Tiomson's Chemistry.
III. Gum-resins, a clasa of vegetable substances consisting of gum and resin. They differ from resias in this, that they never exade apontaneously from the plant, being obtained either by bruising the parta containing them, and expressing the juice, which is always in a etate of emulsion, generally white, but sometimes of a different color, or by making ineisions in the plant, from which the juice flows. The juice, being exposed to the action of the sun, is condensed and inspissated, till it forms the gum resin of commerce. Gum-resins are usually npaqne, or, at lenst, their transparency is inferior to that of resins. They are always solid, and most commonly brittie, and have, sometimes, a fatty appearance. When heated, they do not melt as resias do, nelther are they so combnstible. Heat, however, commonly boftens them, and causes them to awell. They burn with a flame. They have almost always a atrong smell, which, in several instances, is allinceous. Their taste, also, is often acrid, and always much stronger than that of resins. They are usually heavier than resins. They are partially soluhle in wator, but the solution is always opaque, and usually milky. Aleohol purtally dissolves them, the solution being transparent.
The most common gum-resins are, Aloes, Ammonia, Euphorbium, Galbanum, Gamboge, Myrrh, Olibanum, Sagapenum, Scammony, etc. ; whicis sec, under their respective names.-Lovdos's Ency. of Agriculture; Tuomron's Chemistry.
Gum-tree (Nyssa biflora), or Twin-flowered Nyssa -known aiso as the Tupelo-tree, yellow gum-tree, sour gum-tree, Peperidge-tree, wild pear-tree-in an uncultivated stato, seldom rises above 40 or 50 feet, with a trunk 15 or 20 inches in diameter. The Nyssa bifora begins to appear in the lower part of New Hampshire, where the elimate is tempered by the ocean; and, in progressing southward, it is found most abundantly in the easterly parts of New York, New Jersey, and Pennsylvania. But in Virginia and Carolina, it is more sparingly preduced, and, as in the north, it always occurs in moist ground or in watery places.

The Nyssa biflora holds a middle rank between soft and hard-wooded trees. When perfectiy seasoned, the sap-wood is of a slight reddish thit, and the heart-wood is of a deep brown. Of trees exceding 15 or 18 inches in diameter, frequently more than half of the truak is holiow. The ligueous fibres whiel compose the body of most other trees are closely united, and usually ascend in a perpendicular direction. But, on the contrary, the trees of this genus exhibit a constant peculiarity of organization-the fibres being united in hundles, and are interweven like a braided eord. This property gives it a decided superiority for certain uses. In the parts of the country where it nbounds, it is employed for the naves of wheels destined for heavy inurlens. It is also empioyed for the heads of the shafts of wind-mills; and, sawn into boards, it is used for lining carta. Wooden bowla are mado of it, which are henvier than those made of the tulip-tree (Lirib(dendron), and are less lialle to split. From the irregularity of the fibre, the "gum-tree" is not admitted as evidence in the courts of Pennsyivania, in cstablishing boundaries to lands, etc., from the number of years which have elapsed since the trees have been blazed.

As fuel, this word burna slowiy, and diffuses a grest heat.-Browne's Trees of America.
Cun-cotton. Cotton is rne of the numerons forms of lignine, a compound of carbon, oxygen, and hydrogen; but when it is subjected to the action of nitrio acid, nitregen, which exista in moat exploaive bodies, enters into its composition. The action of nitric acid on lignine had long attracted the attention of chemists; but the nearest appreach to the formation of gan-cotton' was made by Pelouze, who, in 1838, writes in the Comptes Rendus of the preperties of a subatance named Xyloidine, from $\xi v \lambda o v$, wood, discovered by Braconnet in 1883: "It is very combustible, taking fire at $356^{\circ}$ Fahr., burning with great rapidity, and almost witheut residue. This property has led me to an experiment, which I think susceptible of seme application, especially in artillery. By plunging paper in nitric acid of $\mathrm{sp} . \mathrm{gr} .1 \cdot 5$, leaving it there the requisite time 'or the acid to permeste tho paper, which ia usually accomplished in two or three minutes, then withdrawing it, and lastly, washing it in water, we obtain a kind of parchment impermesble to meisture, and extremely combustible. "In 1846, Schōnbein exhibited to the British Association at Southampten specimens of cetton, which appeared to be as explosive as gunpowder; but it was not till April, 1847, on the enrolment of the patent, that the methed of preparing this cotton was known, although, in the interval, Otto of Brunswick, Morel of Paris, and Böttger of Frankfort, published recipes for making explosive cotton. Schönbein's method consisted in mixing three parts of sulphuric acid, sp. gr. $1 \cdot 85$, with one part of nitric acid, sp. gr. 1.45 to $1 \cdot 50$; and when the mixture had cooled down to between $50^{\circ}$ and $60^{\circ}$ Fahr., clean rough cotton, in as open a state as possihle, was immersed in the acid; when well soaked, the excess of acid was drawn or poured off, and the cotton pressed lightly in order to separate the principal portion of the acid. The cotton was then covered over and left for half an hour, when it was presaed an: thoroughly washed in running water to get rid of all free acid. After being partially dried by pressure, it was washed in an alkaline solution nume by dissolving one ounce of carbonate of potash in a gallon of water. The free aeid leing thua got rid of, it was put into a press, the excess of alkaline solution was expelled, and the cotton left nearly dry. It was then washed in a solution of pure nitrate of potash, one ounce to the gallon, and being agais pressed, was dried at a temperature of from $150^{\circ}$ to $170^{\circ}$. It was stated, that three parts of the gun-cotton thus prepared were equal in force to eight parts of Tower-proef gunpowder.

Gun-cotton has also been employed in blasting, especially on the Manchester and Huddersfleld railway in Standedige tunnel, and on the works in the Stour Valley, near Birmingham. It has been stated that gun-catton produces a much greater effect, weight for weight, than gunpowder, in the proportion of five to one. This seems an exaggeration; but the disruptive effect really seems to be greater from gun-cotton; and as it gives no amoke, in confined situations the worimen are enabled sooner to resume thoir werk.

Cotton gains considerably in welght by the above treatment, but is scarcely changed in color or in general appearance, if the process has been carefully conducted ; it is, however, harsh to the touch, and gives a crepitating Bound when pressed by the hand. It diffore from common entton by its electric excitability, the slightest degree of friction causing it to be powerfally attracted anil repelled by other bodies ; and also by its action on a ray of polarized light, which it dees not depolarize like ordinary cetton. It exploinen ta a temperature of from $850^{\circ}$ to $400^{\circ}$, with euch r : onsty as to interfere with iss practical application, i. $r$, if applied to the purposes of artillery, it may burat the gun before it has tinie to move the shot, and some of
the products of its combustion make it also objectlonable for fire-arms. Among these products water may be mentioned, and, should not the cotton heva been well waahed, nitrous acid. Anether great impediment to the use of gan-cotton is its hygrometric condition, for if exposed to a damp atinosphere, it wll! $\ln$ an hour or two absorb a considerable portion of moisture. Many attempts have been made to apply it to mining purposes on account of its enormoua force, and the amall quantity of smoke which it produces; but the objections to its use are numoroua, the most fatal objection being its liablity to apontancoua lgnition.

Nevertheless, gun-cotton continues to be an object of great interest, on account of ita application to the beantiful art of photography. When the cotton la propared ln such a way as to burn slowly, it is not liable to apontaneous ignition, and in this atate it is perfectly soluble in sulphurio ether, whleh the more explosive cotton ia not. If the etherial solution called collodion, be poured on the gurface of cold water, a paper is produced which is prepared for the use of the photographer. Thls paper ls a very active electric, and is perfectly soluble in ether. Collodion has also been made use of in eurgery, by applying the ethereal solution to a wound, when a thin delicate artiticial skin is formed ly it, which perfectly excludes the air.

In the preparation of gun-cetton, nitric acid is the active agent in the formation of xylo dine; the sulphuric acid has no direct action on the h nine, ita use being to retain the water abstracted froil the cotton, and prevent the solution of the compound which takes place to a greater or less extent in nitric ecid alone. The purity und exact strength of the aeids a re matters of great importance. Mr. Halow found thit the lest mixture for prodacing collodion wool is obisinod by mixing 89 parts ly weight of nitrio acid, sp. gr. $1 \cdot 424$, with 104 parts by weight of aulphuric , cid, sp. gr. 1.833.

On trying the effecta of variona $r$, ents on guncotton, Dir. Iladow foriad that sowd be perfectly restored to the original cotton, without loss of forns, by means of an alcoholic solution of hydro-sulphuret of putassium. On this, and other points connected with the chemistry of gun-cotton, we must refer to Mr. Liadow's paper, published in the Transactions of the Chemical Society.-E. 13.

Gunpowder (Ger. Puleer, Schiesspulver; Du. Bushruid; Da. Krull, I'ulecr; Sw. Krut; Fr. I'oudre; It. Polvere; Spi and l'ort. Polvora; Rus. I'oroch; Pol. I'roch; Lat. I'ulris pyrius). This well-known inflammable powder is composed of nitre, sulphur, and charcoal, reduced to powder, and mixed intimately with each other. The proportion of the ingredients varies very considerably; but gool gonpowder may be composed of the following proportions; viz., 76 parts of nitre, 15 of charcoal, and 9 of sulphur. These ingredients are first rednced to a fine powder soparately, then mixed intimately, and formed ioto a thick paste with water. Aftor thly has dried a little, it is placed upon a kind of sieve full of holed, through which it is forced. By this process it is divided into gruins, the size of which depends upon the size of the holes through which they have been squeezed. The powder, when dry, is put into barrels, which are made to turn ronnd on their axis. Ity this motion the grains of gunpowder rub against each other, their asperitics are worn off, and their surfaces ure mule smooth. The powder is then said to be glazed. -Tinosison's Chemistry.

Itr. Thomsoa, whose learning is equal to his science, las the following remurks with respect to the introduction of ganpowder tato warlike operations: "The discoverer of this compound, and the person who first thought of upplying it to the purjoses of war, are unknown. It is certuia, howover, that it was used la the fourteenth century. From cortain archives quotcia hy Wleglel, it appenra that camiona were employed in Germany before the year 1372. No tracee of it can be
found in any European auther prevloualy to the thirteenth century; but it seema to havo been knewn to the Chinese long before that period. There le rer son to believc that cannons were used in the battls of Cressey, which was fought in 1846. They seem sven to have been used three years earlier, at the aie ge of Algesira3; but before this time they muat have been known in Germany, as there ia a plece of ordnacice at Amberg, on which la inscribed the year 1303. Ruger Bacen, who died in 1292, knew the propertles of gunpowder; but it does not follow that he was acquainted with its appllcation to fire-arma."-Thoмaоv's Chemistry.

The invention of ganpowler is by semc. ascribed to Bertholdus or Michael Schwartz, a Cordolier monk of Goslar, south of Rrunswiok, in Germany, about A.d. 1320. But many writers maintain that it was known much earlier in varion parts of the world. Some say that the Chineas possessed the art a number of centuries before. Its composition, moreover, is expressly mentloned by our own famous Roger Bacen, in his treatise De Nullitate Magice, whimis was published ut Oxford in 1216.-Ilayd.

Composition of Gunpouder.--The present composition of the Chinese gunpowder corresponds so nearly with our own that the difference is nearly insensible; but whether it hud errived at thut degree of perfection in their anclent periods, we have no means of knowith. Neither can we judge of its nature and power as known to the Arabs. But in our own country it was late in arriving at its present atate of perfection; nor do the various proportions given by one of the eurliest English writers on the aubject, argue muclt in favor of their chemical knowledge. Peter Whitehorne, who wrote in 1573, gives numerous proportions, without secalaing to be well aware of their respective values; and, respecting some of them, it is easy to see that they were scurcely fit for squibs, much less for the purpose of proiecting shot. Such is nitre, eulphur, charcoal, equal parts; while, in the very opposite extreme, we huve nitre 12 parts, sulphur and charcoal, of each 3 parts; and, still worse, nitre 27 to 3 of the other two ingredients; or nitre 48 parts, with 7 of sulphur and 3 of charooal. Here, such as these compositions nre, want of experience can acarcely be pleaded, as they ure not better than thore given by Nye in 1380. In France, ulso, the composition, ut no very remote period, was-nitre 50 , sulphur 16 , charcoal 3 ; from which it varied to, nitre 67, aulphur 13, chareval 20 ; nnd to nitre 84, sulphur 8, charcoul 8; these dif. furences being anjposed to be necessary for the lurger cannon, and the smaller progressively, the last being their musket powder.
l3ut as we can not afford space to describe the gradual progress of limprovement in the cempesition of guopowder, we will state the proportions at present in use in different nations. They do not materially differ from euch other, although it is unquestionabile that they are not oll of equal power.

Whthout any knowlodge of the law of defnite prow portions, hal eren iefore that law was known to ex. ist, each mation had experimentally hit upon nearly the hest propartions of the three ingredients, namely; I equivalent of n'tre, 1 of sulphnr, pad 3 of charmal, ot 75 per cent. of nitre, 11.77 of sulphur, und $13: 23$ of
charcoal. In practice the proportions used for the mannfacture of 100 lbs of gunpowder are-saltpetre 77 t lbs., sulphur $10 \frac{1}{4} \mathrm{lbs}$. , charcoal $16 \mathrm{lbs} .=104 \mathrm{lbs} .$, the extra 4 lba. being allowed for waste.

The plsportions in the commercial gunpowder vary Indeflintely, nocording to the views of the manufacturer respecting the markets, the price, and other matters. Cheapneas beling the leadlog object where it is only made for sale, and the nitre beling the only expensive article, the proportion of this is diminished, and those of the other two ingredients increased. We have never met with any apecimen in which there was less than 62 of nitre; but we have reason to believe that some of the inferior kinds do not contaln more than 50. For the nse of miners it is also made with a low proportion of nitre, producing advantages in mining not intended by the makers, whosconly object is to manufacture a cheap article. Bat the proportions of all the commercial powders are very inconstant, even when furnished bond fide to the government.E. B.

Gunny (Hind. Tat; Ben. Güni), a stong coarse sackcloth manufactured in Bengal for makiag into bags, sacks, and packing generally, answering at once the two purposes for which canvas and bast are used in Europe. The material from which this artlele is manufactured is the fithre of two plants of the genus Corchorus; viz., Corchorus olitorius, and Corchorus capsularis (Bengall pat); both, but partlenlarly the first, extensively cultivated throughout Lower Ilengal. Hesides a large domestic consumption of gunny, the whole rice, puidy, whent, pulses, sugar, and saltpetre of the country, as well as the pepper, coffee, and other foreign produce exported from Calcutta, ara packed in bsgs or sacks made of this article. There is also a considerahle exportation of manufnctured bags, esch commonly capable of containing $t$ wo maunds, or about 160 lbs. weight, to Prince of Wates Island, Malacea, Siagapore, Java, and Bombay. In 1841-42 there were exported from Calcutta $5,350,899$ gunny bags, of the value of 499,426 rupees ( $£ 49,942$ ), and 95,412 pieces of gunny eloth, worth 433,321 rupees ( $£ 43,332$ ).-W WL ncir, Roxburg; Review of the External Commerce of Bengal for 1841-42.

Guns and Fowling-pieces, Three European nations are distinguished for their production of these arms--the English, Belgians, and French. Small arms for war and for the chase are mannfacturel at Birmingham, the one with due selidity, the other with refinement of workmanship. In respect to Belgium, Liege is the lirmingham of that country, and manufactures guns on a very large scale. The Belgians, on account of cheapness combined with good execution, sell a great quantity of small arms to other nations, particularly to Russia. France, for the manufucture of smail arms for war, is now perhaps more ad vanced thm any other mation. St. Etionne is the town principally easployed in the manufacture of muskets; but Paris proluces the most finished weapons, combining all the perfection that can be requirol for precision of firiag and beauty of ormament. Sharpe's rifles are manufactured in the United States in large numbers, ulso a variety of small arnis.

Gunter, Bdmund, an Ingenlous English mathematichan and machinist, was born in Hertforlshirg about the year 1581. He was educated at Westminster, and afterward at Christ Church College, Oxforl, whero he graduated. Though he took holy orders in 1614, mathematics, which hat been his favorite stinly from his youth, continued to engross his attention, and la 1619 he was chesen to the chair of astronomy In Gresham College, where he remained till his deuth In 1626. Of Gunter's written works the chief are his C'anon Triangulorum, s table of logarithmic sines and tangents, exteadnd triseven decimal places, and forming a sort of complament to the logurithms of nstural numbers by his colleague Brigg.

Gunter's Line, s logarithmic line, usually laid down upon scales, sectors, etc. It is also called the line of lines and live of numbers; beling only the logarithms graduated upon a rulor, which therefore serves to solve problems lastrumentally in the same manner as logarithme do srithmetleally.

Gumter's Quadrant, an lastrament made of wood, brass, or other substance, contaiaing a kind of stereographle projection of the sphere, on the plane of the equinoctial; the eye beling supposed to be placed in one of the poles; so that the trople, ecliptic, and horizon, form the arcs of circles; but the hour-circles are other curves, drawn by means of several altitudes of the sun for some particular latitude every year. This Instrument is used to find the hour of the day, the sun's azimuth, etc., and other problems of the globe; as also to take the altitude of an object in degrees.

Guiter's Scale (generally called by seamen the Gunter), ia a large plane seale, usually 2 feet long by about $1 \frac{1}{4}$ laches broad, and engraved with various lines of numbers. On one side are placed the natural lines (as the line of chords, the line of sines, tangents, rhumbs, etc.), snd on the other side the corresponding artificial or logarithmic ones. By means of this lastrument, questions in navigation, trigonometry, otc., are solved, with the aid of a pair of compasses.

Gunwale (pronounced gunnel), the uppermost wale of a bhip or boat, or that plece of timber which finishes the upper part of the hull. The raised werk above this is called the bulvark.

Gutenberg, or Guttemberg, Johann (whose real nams was Gensfelsch), was born at Sorgenloch, near Mertz, in 1397. It is now generally admitted that to him is due almost the entire credit of isventing the art of printing by movable types. The respective clains of Fust, Gutenbere and Schoeffer, are fully discuased under Fust.-F 1

Gutenberg, after a life of much , hitivitis and hardship, died at Mentz in 1468, in great Posterity has done him the justice denied uin by his cotemporaries. The statue by Thorwaldsen, erected In his honor at Mentz in 1837, furnished un example which has since leen followed by nuny towns in Germsny. The Gutenberg Society keeps his name in memory by an annual festival. No books are extent that aro known for certsin to have been printed by Gutenberg. 'The fumoua Mazarin Bible, Donatus' Grammar, and the Catholicon of Janua, are believed to have issued from his press. See Printing.

Gutta Peroha. This veluable substance has only been known within the last few years. It is the concrete juice of a large tree (fsonandra gutta), growing in certain parts of the Malayan Archipelagohitherto chlefly obtained from Singapore. The first specimen of the inspissated juice which appeared in England was presented to the Society of Arts in 1843, but two or three years elapsed befure a just sense of the importance of the substance began to gain ground. In 1845 the importation of gutta percha into England amounted to only $20,600 \mathrm{lbs}$; in 1848 it had reached $3,000,000 \mathrm{lbs}$; in 1852 it amounted to $30,580,480 \mathrm{HIs}$. -a rate of increase which gives serious cause to doubt whether the supply will long be adequate to meet the demand; for it is unfortanately the case that the trees which yield gutta perchas are not only limited in their growth to certain districts, and less abundant in quastity than indin-rubber trees, but they have heen eubjected for several years to the barbarous and wasteful mode of cutting down the trees for the sake of the sap. Whatever European Industry may be able to do in checking this destractive system, and extending the cultivation of the gutta perchu tres, there is yet reason to doult whether this slow-growing tree can be reared in sufficient quantities to counterbalance the havoc alrealy made. The Isonandra gutta helongs to the natural order Sapotacea, and is the only tree which yields gutta percha. It rises to the height of 60 or 70
feet, and the trunk is 8 or 4 feet in dlameter. The tree flourishes in allovial aolls, at the foot of hills, and sonetimes forms the chief part of the jungle in such altuations. The foliage is of a pale green on the upper part, and covered with reddish-brown hairs benenth. The wood is soft, fibrous, sponyy, pale in color, and traversed by longitudinal receptactes or reservoirs flled with the gum, forming ebony-black lines. This gum has unany of the propertles of indis-rubber, but it has also sperial properties of lits own wblch allmit of its being applied to uses for which caoutchouc is net adapted. It posseases the same indestructibility ly chemical agents whict makes Ir.lia-rubber so valuable, and It has also the peculiarity of becoming soft and plastic on beiag planged into boiling water. In this at ite it can be molided into any desired form, which form it permanently retaina on cooling. The great convenience and utility of such a aubatance could not fail to strike the natives of the countries in which it is produced; and accordingly, we find that, long before gitta percha became known to Europeans, it had been fabricated by the Malnys Into whips, basina, jugs, shoes, etc., thus at length exciting the attention of travelers, and lealing to the introduction of some of these articles into Europe under the nanse of india-rubber, or, earlier still, of mazer-roond.

The bonor of having drawn attention to ity real nature and usea is due to Drs. D'Almeida and W. Mentgomeric. The latter, writing from llengal, remarked on the ordinary name of the piant thus:-"The word is a pure Malayan one-gutta meaning the pam or concrete juice of a plant, and percha the particular tres from which this is procured. The ch is not pronounced hard like $k$; but like the oh in the English word perit." In $18.13 \mathrm{13r}$. Wm. Montgomerie, of the Indian Medical Service, observing certaln Malay knife avi kris hantles, inquired the nature of the material fr. . ich they were male; and from the crule natlve unooufacture inferred at once the extensive uses to which the gutta percha might be put in the arts of Europe. He purchased a quantity of the raw material, sending from Singapore part of it to Hengal, and part to Europe, and augresting some of the uses to which he thonght it might be applied. The quantity sent to Eingland secured ( ) him at once, as the discoverer, the gold medal oi che Soclety of Arts. The gurgical uses of gutta perch. were carly discoverad hy Dr. Oxley of Singapore, vito declared it to be "the hest and enaiest substance ever discovered for the managenent of fractures, combining case and comfort to the putient, and very much lessening the trouble of the surgeon."

Gutta percha arrives in lumps or blockn of several pounds' weight, but these often contain impurities, such as stoues, earth, etc., introduced by the Malays for the sake of increasing the wright. 'Ibe poriticatien and preparation of this substance on a large scale are conducted as follows:-The lumps of gutta are subjected to the action of a vertical wheel, on the face of which are fixed three knives which, as the wheel revolves at the rate of 300 revolutions per minite, cut the lumps into thin slices. These are then aoftened in het water, and thrown into a notating machino, where they are further reduced by the action of jugged teeth. From this machine they again fall into water, and are further cleansed. They are then kneaded into a paste in hot water, and rolled letween lieated cylinders. The masa has now become uniform in texture, and is either rolled out into sheets between steel rollers, or ls passed in the maxs through heated iron cyllinders; after which it is ready for use. Inutta percha is scarcely attected by boiling alcuhel, but it disselves nearly completely in benzine and in spirit of turpentine with the aid of heat, and almo in naphtha, coal-tar, sulphuret of carbon, and in chloroform. Its solution in aulphuret of carbon or in chloroform may he almost entirely deprived of color by filtering, the process
being conducted under a glans jar, in order to rrevent lose by evaporation. If this aolntion be exposed in a flat dish to the air, the nolvent will evaporato, leaving a solid cake of white gutta percha, which retains sil the properties of the common gutta; sind it may be melted by a gradual increase of temperature without acquirlng any perceptible eclor.

The parposea to which gutte percha is applied are too numerous for recapitulation. Only a fow of the more important uses can be liere mentloned. It realsts the actlon of water, and is at the asme time a bad conductor of electricity; it is therefove employed for Inclosing the metalle wires used in the electrie telegraph. The efficiency of the submarine telegraphly largely due to this valuable subatance.

Various other maritime uses have been found for it In the construetion of boys, life-boat apparatus, ete, Manufacturers and agricultnrlats have applied gutta percha to use in bands and straps for machincry, tubea, buckets, etc. Arcbitects have accepted its aid in the interlor ornamental work of houses, such as cornices, centres foi ceillngs, etc. Sclentifie men are alded in tidef electrical experlments by ita high insu. lating power. Miners, rallway officiala, and others, find the value of apeaking-tubes made of this substance; deaf persons are also greatly benefited by its power of conducting sound. Stereotype plates have been made is guita percha. A nuld is taken by pressure of a page of trpe with woodcurs in gutta pertha; from this mold a cast is obtained on a cylinder of gutta percha, and from thals last the printing is carried on. The dentiat einpleya puta percha in fixing or stopping tecth. The chemist ls indel:ted to it in the preservation and conveyance of aclds which corrode g!ass or metallic vessels. It in also nxtensively used In the manufacture of waterproof clothing, waterproof shoes, etc.

Within the last few years a substlute for guta percha has been discovered In tbo juice of the mudhar (Aselepias gigantea), n common plant in Indin, which also afforls a valuable kind of hemp. Care is required in the collection of che milky juice, on account of its exceedingly acrid nature; but when exposel to the air it hardens into a substance closely resenbling gutta percha, and having many of its valuable properties. It la, howcver, unfitted for electrical purposes, for it is found to conduct electricity at frecly as a piece of untanned hide.-F 13.

Gutta Trap, a substance evldently allied to gutta perchn and caoutchouc, enioloyed at Singapore in the manufacture of birl-line. It is the inspisasted juico of an artocarpus; andit in highly probable that there are several similar vegetable pnductions, such as the mangegatu (F'icus inlica), from Visagapatam, which mlght advantageonaly bo introduced into commerce, and employed in the arts for purposes aimilar to those for which caoutchouc and gutta percha are now ro pxtensivel; employed.

Guy, a mpe used to stendy any weighty horly while it is being hoisted or lowered; also, "t tickle to contine a boom forward to prevent the sail from subing. (ity likewise denoter a largo rope extending from the head of the main-mast to that of the fore. mast, to sustain the tackle used for loading and unloading a ship.

Gybing, the shifting of the boom of a forc-notaft sail from one side of the mast to the other, either to slter the courne of the veasel aulidenly, or to atcommodate the sall to a change of wind.

Gypsum, or Euiphate of Lime, is fount in varinue parts of the tontinent, In Derbyshire and Notthighamshire, and in Nova Scotia, whence it is lurpdy exported. When reluced to a powder, and furmed into il paste with water, it is termul plaster of Perin, and la much used for forming eants, etc. It is also used for laying floors, and has been advantagceusly employed aa a manure.

## H.

Hackney Carriages are carriages staticued in the strects or other publle placen, and bound to carry such personn as require thelr services, for certain rates of hire according to the diatsnces traveled. They have generally been licensed by autherity, and suljected to certain regulations, intended to excmpt strangers, and othera using them, from fraud and imposition. It may be doubted, however, whether these regulntions have had any good effect; and whether the public would not be as well accommodated, it least in all large towns, by thzowing the business open, and trustling to competition to rectlfy abuses. Hackney coaches are of French origin. In France, a strong klad of cobhorse (haquende) was let out in hlre for ahort journeys: these were latterly harnensed (to accommednte several wayfarers at once) to a plain vehicle called roche-d. haquené: henco the name. The legend that traces their origin to Hackney, near London, is a vulgar error. They were first licensed $\ln 1662$, and subjected to regulatlons, 6 Wliliam and Mary, 1694.-Surrey of London. The number plying in Iondon fixed at 1000 , and their fare raised, 1771. The cabriolets are of Parisian orlgin ; but the aristncratic taste of Englishmen suggested the propriety of obliging the drlver to be sested on the outside of the vehicle.-ILAypn.
Hainan, a large island In the Chinese Sea, lying south of the province of Canton, to which it is annexed, and separatling the Gulf of Tonquin from the Chiness Sea. It is separnted from the southern extremity of the province of Caiten by the Strait of Luichan, 15 or 16 miles wide, and lles between N. lat. $18^{\circ} 10^{\prime}$ and $20^{\circ} 54^{\prime}$, and E. long. $108^{\circ} 25^{\prime}$ and $111^{\circ}$. It is about 150 miles in length hy 100 in lireadth, and has an aren of ahovs, 12,000 square miles. The $\ln$ terior of the island is mountainous; some parts of it rise alove the onow line, and it is Inhabited by ahoriginal tribes. The Chinese inhabitants are mostly deacendnnta of emigrants from Foklen, and are ngticultaral, trading, or piratical in their vocation, ncenrding to circumstances. The soil is mostly sandy, hat some of the plalne, particnlarly on the west coast, nre of great fertility. Timber constitutes its most valunble product, the sides of the mountalns being covered with extensive forests of sandal, rose, braziletto, ebony, and other trees. Its other products are chiefiy rice, augar, tobsecn, indlgo, conton, sweet potatoes, and various fruits. Wax also forms an important erticle of export; it is proluced by an insect called the pelatchang, or white wax insect, when laying its egg. Hainsn ia divided into 13 dlstricts. The capital, Kiungehanfu, Is a very populous town, it the mouth of the Limn River, on the lalchan, and has an excellent harbor. Several of the other towns are very populous. The Island is said to contain about $1,500,000$ inhabitants.
Hair, Human (Ger. Jaare, Menschen-haar; Du. Hair; Fr. Cheecun; It. Cnpelliumani ; Sp. Cabellos; Lat. Capilli). "Hummn hair makea a very considerable article in commerce, especially since the mode of perruques has oltainel. IIair of the growth of the northern countries, an England, etc., is valued much beyond that of the more eouthern ones, as Italy, Spain, the southern parts of France, etc. Good hair is well fed, and neither too coarae nor too slender ; the blgness rendering it less susceptihle of the artificial curl, and disposing it rather to frizzle; and the smaliness making its curl of too short duration. Its length should be about 25 inches ; the more it falls short of this, the less value it hears."-M.

Hair of Beasts (Ger. Haare, Huhuare; Dn. Innir; Fr. Poil; It. and Sp. Pelo; Lat. Pelles).-The hair of horess is extenalvely used in the manufacture of chairs,
sofas, saddles, etc. 1 whlle the halr or wool of ber vers, hares, rabbits, etc., is much employed in the mannfactare of hats, etc. Halr, in it. mechanical nature, msy he regarded as a cendensed form of cuticle. The feathers of hirds may be consldered as analogous to hair; whle the only two classes of animals that are wholly devald of any kind of hair are the fishes and reptiles. The variety in the conformation of halr is very great, ranging from the finest wool to the quills of the percupine, or the horn of the rhtnoeeros, which last is nothing more than an assemblage of many hairs in one compnet mass.
Huir Manufactures.-The various nses to which hair is applied ara famillar to every one. The most valuable kind is human hair. It is procured chlefly from the north of France, Belgium, and Germany. The Hghter colored halr, which bears the hlghest value, is the production of Germany; the darker shades are imported from Frince, where a peasant girl will sell the halr off her head withont any sense of degradatlon; whereas in England thls traffic is resorted to only by females of the lowest class. Indeed so common is the practice ln France, that agents are employed to traverse certaln districts annually at a particolar sesson for the purpoese of collectling the crops of human hair which are asslduonsly cultivated for the sake of the purchase-mnney, or its equivalent in gewgaws. A head of halr, such as is bought of the peasant girls in the districts alove named, welgha from $1 \frac{1}{2}$ to $1 \frac{18}{4}$ pounds.
The hair used for weaving consists of the long hnir from horses' talls. It is procured principnlly from South America and from Russln. All the black and gray hair is dyed for the mannfacture of black haircloth for covering furniture. The white is reserved for dyeing of the brighter hues, such as green, elnret, crimson, etc. The quality of the cloth, as well as the brilliancy and permanency of the colors, depend in a great degree on the nature of the warp, which may be either of cotton, linen, or worsted. In the manufucture of halr-cloch, elther plaln or damasked, the weaver uses a sort of hook-shuttle, which he passes between the threads of the warp, or shed, toward his left hand; the asslstant, or "aerver," places a single hair over the end of the hook, and the weaver draws it through the wnrp. The placing of the hairs one by one renders thls a tedious operation, and one that does not admit of the applicat $n$ of machinery, which is so advantageously einploycai In fabrics where the shot or weft consles of a contlinuous thread.
Hair Pencils, or Brushes, for painting. Two oorta are made; thoso with coarse huir, as that of the awine, the wild boar, the dog, etc., which are attached usaally to shoort wooden rods as handles; these are commonly enlled brushes; and halr pencils, properly so called, which are composed of very fine hairs, as of the minever, the marten, the badger, the polecat, etc. These are mounted in a quill when they are small or of moderate size, hut when larger than a quill, they are mounted in white Iron tubes.
Hair Powder (Ger. Puder; Fr. Poudve is poudrer; It. Polvere di cipri; Sp. Polros de peluca) is used ns an ornmment for the hair, and genernlly made from starch pulverized, and eometimea perfumed.

Hake, a klnd of fish, the Gadus merlucrius, common in the Atlantio geas and the Mediterranean, and often prepared as stock-fish. See Fisilenies.

Halifax, a city and sea-port, capltal of colony and province of Nova Scotia, founded in the year 1749. Situated on a declivity near the const, and the centre of the peninaula, and on the west alde of a deep Inlet of the sea, called Halifax harbor, which extende eev-
ernl milea inland；lat． $44^{\circ} 39^{\prime} 42^{\prime \prime}$ north，long． $63^{\circ}$ $83^{\prime} 30^{\prime \prime}$ west．Including Its aubnrina it in 2 4 milee long， and alout one half mile wide．Population 1852，26，000； $18: 5,30,000$.

The best mark In aalling for Halifax is Sambro light－honse，on a mmall lalayd ofl⿱宀八 the cape of the sams anane，on the weat side of the entrance to the harlor， In lut． $44^{\circ} 30^{\circ}$ ，longg． $63^{\circ} 32^{\prime}$ ．The light，which is fixed，is 210 feet ubove the level of the sea；and a de－ tarhment of artiliery，with two 24 －pounders，lis upon duty at the Ight－honse，firing at regular intervals dur－ ing the continuance of the dense fogs with which this past of the coast is very much infented．－Cowlier，Ta－ bles des Princijules Positions（iemgraphiques，p．78．The course into the hartor for lavge ships，after passing Sambrn llght，is between the muin lanil on the weat， and McNab＇s island on the east．On a apit project－ lng from the latter，a light－house has lieen conat ructed； and when this is seen，sbips may run in the harbor without fear．The harbor is devended by several pretty strong forts．Ships usually anchor abreast oi the towo，where the harbor is rather more than a mile in width．ister gradunlly narrowing to alwout one quarter of that width，it auddenly expands lnto a no－ ble shect of water，called Iledford Basin，completely land－loeked，with deep water throughont，and capmile of accommorlating the whole suavy of Cireat llritaln． I had harbor is accessible at all timen，and is rarely lm－ peded liy ico．There lanan extenaje royal dockyand at II alifax；which，during war，is an important naval station，being particularly well catculated for the shel－ ter，repair，and outfit of flects crulaing on the Amer－ lean cosat and in the Wiest Indles．Mr．M＇Giregor has severely，nal，we bediove，justly censured the project for the removal of the dockyard from IIalifix to Ber－ mulat－Con，Dirt， 1856 ．

Tradt，etc．，yf llaligar and Nora Scotia．－IIalifax is the seat of a consideratile fishery；but the Ibritish col－ onists seem to le，for what reason it la not ensy to say， less enterprising and aucceanful tishers than the New Englauders．The principal trade of the town and province is with the Went Indies，Great Iritain，and the United States．To the former they export dried and pickled tish，Jumber，coals，grindstones，cattle， flour，botter，cheese，outs，potatoes，etc．They export the manie articlea to the southern porta of the United states，and gypam to the easten ports of New En－ gland．Tu Great Iritain they send tinsher，deals， whale，cod，and seal oil ；furs，etc．The principal ex－ ports of timber nre from l＇ictou on the St．Lawrence． The imports consist principally of colonial produce from the Wess，Indies；all sorts of manufactared gools from（ireat Britain；and of flour，provisions，etc．， from the United Statea，in part for exportation to the West Indies．In IN26 a company was formed for mak－ ing a canal aerose the country from llalifax to the Hasin of Ilinas，which unites with the botton of the Bay of Fundy．The navigation will be formed，for the most part，by Shûbenacadie Lake and River．The legislature gave $\pm: i 5,000$ to this undertaking．The excavated part of the canal in 60 feet wide at top， 36 fect at lootcom，and will admit vessels drawing 8 feet water．It neeme very questionable whether thin eanal， if constructed，will be profitable to the shareholdars； I，ut it will alli to the trade of llalifax．There are twol chartered banking companles at Haltfax．Ac－ counts are kept in pounds，shillings，and jence．The pound being equai io＊4 linited States＇carrency；the shitliug， 20 cents；and tho welghts and meanures are shoo the wame as in Fingland．Atrout 120 large square－ rigged vesmels，and alout the same number of large sehoonere，with sereral smaller craft belong to IIal－ Ifax．The ateamshlps conveying the maiis to Iritish North America，ply between this port and llonton （Mass．），semi－monthly，and Liverposl．The fare to Halifax or Iloston from liverpool，Including provisions and steward＇s fee（but excluding winea and liquors），

140 dollars．On arriving at Halifax，pansongers were formerly conveyed ly coaches acroas the penitusula to Picton，whence they were carried by ateamers to（Quelsee and Nontreal．The only commercial changea in the province of Nova Scotia，during the year ending 3otli September， 1855 ，were those cauned by the acceptunce of the＂reclprocity act，＂or treaty，made between the United States and Great Britain，and agreed to hy the provincial legislature In December，1854，whereby ma＇${ }^{\prime}$ nrolucta of the United States are now adnitted In tav orovince from the United States free of duty． d．See lbacon and Poink trade．

Ilainhurg was visited loy a most dentructive fire in May．18．12．Hut，notwithstanding the heavy lorses that wore in consequence incurred，and the paralysis it occasioned in trade and Induatry；the shock was less severe than might have been anticipated．The syotem

## HAM

of mutual insurance having been generally adopted, the proprietors of houses, and other property were subjected to a tax, to dafray the Intereat of a loan of $32,000,000$ marcs-banco raised to inilemalify the aufferers, and to enable them to rebuild their houses. And we are glad to bave to atate that all traces of the devastation have nearly disappeared; and that here, as In most other places exposed to a sinilar calunity, it has led to a great improvement of the town, which is now better bullt, and more commodiously lakd out than formerly.

Hamburg owes its commerclal distinction princlpally to Its situation. Indeed, the resources of Hamburg, as well as the other Hanse-towns, so far as they are dependent on their territorlal limits, are of but little consequence. Their trade is, as it were, passive, depending entirely for its maintenance and activity upon the conmercial movementa of other conntries. The eity of IIamhurg has but a very limited territory surrounding It , comprising the adjolning district, the towns of l Sergdorf and Ritzebuttle, the districts of Vierlanden (the soveraignty of which is alared by Lubec), Cuxhaven, some islunds In the Elbe, and some detached portions of the territory enclosed by the Dunlsh anil Hunoverlan dominions. These, together, constitute the republic of Ilamburg. The aren is about 137 square milles, and the population 188,054 s unls; of whom 115,866 live In the clty ; 16,731 In St. George; 16,157 in the faubourg of St. Paul; and 39,300 in the country around.-Com. Rel. U. s.

The River Elbe is the chicf commerclal artery which gives life and energy to the trade of Germany. It rises in liohemia, near the Carpathlan Mountains, and, flowing through that country, receives the Moldau and its tributaries, and the Eger. Leaving Hohemia, thls noble river flowa by Dresden and Magleburg, recelving In its course the Mulle, Elster, and Haval; all of which rivers, branching off into different streams, unito their waters with the Elbe immediately below IIsinhurg. The depth of water admits the largest ships; anil, about 75 miles below Hamburg, the Elbo merges into tha waters of the ocean. In respect to the navigation of the Elbe, the Stade duties lovied by Hanover, at the castle of Irunshausen, were Justly complained of, not only as arbitrary, but onerous and oppressive upon the commerce of the world. The principle, says McCulloch, was diatinctly laid down by the Congreas of Vionna in 1815, that the navigation of the Rhine, the Elbe, and the Weser, etc., should be quite froe along their whole course. But, no general tarlft of duties belng then established, this declaration has, until lately, had no practical effect. On passing Stade every eaptain or master was obliged to send his papers, including the manlfest, bills of lading, and cockets, on shore, that the amount of tho duties coald be calculated, and certified. These duties were paid at IIamburg, where tho IIanoverian governmeot had an agent to recelve them; and, until tho receipt was proluced, the vessel could not proceed to unload. See Elie Riven.

Stade Dues.-An intelligent correspondent of tha State Department at Hamburg, who has given much attention to the subject, has furnished the fellowing information concerning the Stade Dues:
"About twenty-five miles below Hamburg, at a narrow place in the Elie, the Schrominge, a small river, empties itsclf, on the lmuks of which, back a few miles from Its mouth, is situated the town of Stade. At this place a 'toll,' under the name of Brinshausen, or State Dues, is levied on all vessels coming from the sea, except on those of IIamburg.
"These 'dues' owe their origin to a grant from Conrud II., Enperor of Germany, who in the year A. 15. 1038, granted permission to the Arclibishopric of Ilamburg to establish a fair or market at Stade; and he appropriated the duties which wero to be leviel thereon, to the henofit of the church at IFamburg, which
had been sacked and destroyed by the Pagans, as all outeiders were callod in those days. Nothling beyond a market toll, a daty to be levied on goods brought to the murket of Stude, was contemplated in thla grant. But the Archbishops, particularly after the trangfer of the aee to Irramen, were not alaw in converting, by an arbltrary and unjust Interpretation, the Stade market privilege, with the trifling daty attached to it, into a zource of lucrative revenue for their treasary, and in place of a slmple right of holding a market at Stade, they feigned a privilege of compulaory market, viz., that no vessel salling upward from the sea had a right to pass, but should lay to and pay a aort of trnusit, or rather passage duty, for the purpose, as it were, of buy Ing off the right of sale pretended to have been granted ut Stade-a right which could be easily enforced, from the circumstance that vessels, as alrealy mentioned, were obliged to sail close by the Stale river, Schwinge. On ao groundless a fiction rests the origin of tho Stade dues. In the year A. D. 1189 the German Emperor, the great Frederic Barbarosa, granted to Hambarg the privilege which bears his name, besides other privileges and immunities in favor of the trade af Hamburg. Tho emperor, by this privilege, granted to her citizens, for their shlps and merchandise, a free navigation from the sea to the clty, wlth an entire exemption from all dues. At the peace of Westphalia, the territories of the Archbishop of Bremen were ceded to the crown of Sweden; which government, in consequence, clahned the right to levy the ducs, as a customary right. In A. D. 1691 a trenty between Ilamburg and Sweden was formed, wherein the rights of the former wore acknowledged in the broalest sense; and a tariff was formed by Sweden for the rest of the world, and fixed the rate at alrout one sixteonth per cent. Soon efter this treaty was fermed, Stade, with the Duchies of Bremen and Verdun, was accucupled by the Danes, and finally ceded by them in A. D. 1710 , to the electorate of Itanover; which cession was brought about by the cabinet of Georgo I., of England, who, at that time, was Elector of Hanover, and for which, the British government paid Denmark $£ 150,000$ storling. These tolls or dues have ever since been collected by Hunover, except tor some four or five years during the elder Ronaparte's wars, when IIanover was in possesslon of the French, none were collected, but the lower Elbe was left as free as any part of the North Sea.
"For a correct understanding of this question it is proper to premise that the Lower Elbe, as it is called, (that is, from Manuburg to the North Sea), is, strictly sjeuking, a part of the sea, an arm of the sea, and has ever bo been considered by all the European nations in their official acts and intercourse. Even at the great Congress of A. D. 1815 , when the commerce of all the German rivers was regulated, tho Lower Elbe and Stude dues were especially omitted for the roason ns-signed-that they wero neutral ecaters, and the 'dues' were sea tolis. IIenco, in my opinion, it rests alone upon the same foundation which the Danish Sound ducs do, or which the ald Tripolitan tribute did, and no other ; and if the former is, and the latter was, illegal and unjust, so are the Stade dnes. It should be borne in mind that Denmark has tho territory on the right bank of the Elbe below Hamburg, and Hunever on the left bank, except at Ouxhafen, where IIamburg owns some territory. Neither Hanover nor Denmark has evor contributed one dollar to the fimprovement of the navigation of the Lower Elbe; but, on the contrary, have ever declined to do so, while Hanburg has ever borne the whole burden of making such Improvements, and keeps them up at her owit expense. In this respect Denmark has decidedly the advantage over Hanover, for she has done something to add to the aafety of the navigation of the Sound."

A British writer, of great commercial experience,

## IMAGE EVALUATION TEST TARGET (MT-3)

Photographic Sciences Corporation

eays, in reference to this Bibe toll, "In equity, the drties levied at Stade should be, hereafter, is: umount, only equal to the expenses of light-horises, buoys, and pilotage for maintaining the asfe navigation of the Elbe, and thould only be imposed for that purpose on the connage of vessels, insterd of, as at present, on morchandise, and paid into the Hanoverian treasury." This policy, we are glad to aay, has been recognized; and the following notification appeared in May; 1855: "With the view of encouraging the shipping interesta of Hamburg, Hanover has abolished the Stade dues on the Elbe for all shipe and goods entering Harburg sean ward." The manufacturing induatry of Hamburgi, especially ite augar rofineries, iron works, and various works in metals and other materisle, rope-wsiks, distilleries, and brewerien, give employment to a large portion of its popuistion. Its grest importance and wealth, however, are owing to its advantageous position as the chief emporium of the trade of Germsny. The principal articles exported from Hamburg to the United Statee are silk, woolen; and cotton manufac tures, including piece 'goods and hosiery, and the produce and manufactores of the German States generally. The principal articies exported from the United States to Hamburg are cotton, tobscco, rice, coffee, esaves and other articies of wood, naval stores, whale and other fish oil, and whalebone.

Hamburg recelves supplies of raw cotton not only from the United States, Mravil, and other countries of South America, in the illrect trade, but also from Enclioh ports, and other entrepita of Earope. A con-
siderable diminution is perceived in the importation of English twists (apun cotton) at Hamburg. This is attribntsble to the fact that the manufacturers of Prussia and Saxony have, of Iate yeary, ordered their supplies direct from Great Britain.

The following statement exhibits, in continuation, the number and tonnage of American vessela arriving at and departing from the port of Hamburg during the six months ending with June 80, 1855. The letter sccompanying the er nsular return contains the following pasarges: "The direct imports to this port from the United States will ahow a great falling off from last season; most of our vessels brought cargoes (chiefly augar) from Cuha, deatined, via Prussia, for Russia. The exports have also been much less than last year. But few of our ships left for American ports direct; most of them left in ballast for English ports, to load coal or iron ; seversl took, at low rates, long chartere for South Ameriean ports. The number of emigrants for the United States from this port will hardly reach half as high as last year. There belng no American shipping-houses at Hamburg, It will always be difficult for our flag, as the regular Hambarg passenger lines must tirst be filled, to participate fairiy in this trade. In the article of saltpetre, destined for Russia, our flag had the preforence when coming from our ports; but, generally, the Hamburg flag and property being exempted from the Stade toll dues, this can not ba the case." Number of vessels, barks, 13 ; tonnage, 5,143 . Ships, 4 ; tonnage, 2,167 . Total number of vessels, 17, and total tonnage, $\mathbf{7 , 3 1 0}$. Cargoes consiated principally of,-

Inward,-Arrack, seeds, cassia, dye-wood, Indiarubber, rice, suger, tamarinds, pot-pshes, household goods, cotton, honey, ginger, whalebene, tobacco, clocks, segars, preserves, tortoise-shells, gums, rosins, hops, oll, machinery, raislns, shoes, coffee, turpentino, furs, earsaparilla, plano-fortes, and genoral merchusdise.

Outword.-Passengers, pig-lead, plates of speltor, willow, succory flower, cinnabar, glne, gypsuin, rags, tow, worsted yarn, woolens, wormaead, hair cloth, glass-ware, china, hardware, Iron-ware, sheet-zinc, musical lnatruments, bristlea, shates, drugs, earthenware, straw goods, and general morchandise.

Belonging to tha port, Dec. 81, 1855, 184, Tonnate ovition is that of Dacember 29, 1851. Monies, 1 marc-banco $=16$ ahillings $=\$ 0 \cdot 85$ United Statea' currency. Dutics on Imports.-These duties amonnt to not more than $\frac{1}{3}$ or 1 ; per cant. ad valorem ; and the duties on exports to not more than one eighth of 1 por cent. ad valorem. The following articles are exempt both from import and export duties : apparel of travelers, brought in by the respective partien, or by a special permit of the Director of Oustoms, bark unground, barley, bonea, bronze metal, buckwheat, copper for sheathing shlpa, brass, old, also in plates or sheets, coal, stone, gold and silver bullion or coin, open samples of goods under 70 pounds' weight, exported and then re-imported, through the same gate, linens, with or without eotton mixture, linen bagging; malt, oats, oil cakee, potatoes, printed matter, musical and scientific maps, rags, woolen or cotton, rape-aeed, rye, wool, sheep'a and lamb's raw, wheat, zinc, crude. The following articles are free of import duties only : articles not exceeding 5 marcs-banco ( $\$ 175$ ) in value; those also subjected to excise duties not over 20 marcsbanco in value; timber, staves, fire-wood, and turf. Those free of export duties are, all articles under 20 marcs-banco (\$7) In value, regardless of quantity ; all manufactures of the city of Hamburg; all provisions for the immediate use of vessels lying in the harbor; articles not exceeding 100 pounds in weight, and not of greatar value than 100 marcs-banco. Transit Du-ties.-All goods re-exported within three months from the date of arrival, are free of any transit duty, if yet in the hands of original importers.-U. S. Commercial ingest.

Money is generally reckoned in Hamburg in marce, 16s., each of 12 pfennings ; and is of two aorts, banco, and current. The former consists of the sums inscribed in the books of the bank, opposite to the names of those who have deposited specie or bullion in the bank, or get it transferred to them at the rate of 278 marcs-banco to the Cologne mare of fine silver. The value of the marc-banco, taking silver at 58 . an 0 . ., is, consequently, 1s. 5 dd., which makes the par of exchange 13 mares $10 \frac{1}{2} \mathrm{e}$. bancu per $£ 1$ sterling. Banco is worth about 231 per cent. more than currency ; the aglo varying from 120 to 125 s. Speaking generally, the value of the current marc may be taken at $1 \mathrm{~s}, 24 \mathrm{~d}$. or 18. 2d. sterling. The ailver coins current in Hamburg are, epecie dollars (of which $9 \%$ are equal to a marcCologne, fine silver) ; Prusslan current dollar (14 dollars to the mare fine); new 2s. 3d pieces (18 to the mare fine) ; Danish grob. current, and Hamburg current (34 to the maro, fine). The gold coins comprise ducats=9s. 4d. sterling, Louis and Frederic dollars. The ugios of these different coina, with hanco, constantly vary. Kamburg has for many yeare ceesed to cain monies, with the exception of ducats and the smaller coina.

Measures and Weights.-A new regulation of these was effected by an act passed on the 16th January, 1843. There are in Hamburg three different sorts of pound weights. 1. The bank or ailver weight (foruerly the Cologne weight). 2. The commercial weight. 3. The apothecary welght. One pound bank, or silver welght, ls $=2$ mares; 1 marc (Cologne) is $233 \cdot 85489 \mathrm{grains}$, or $4865^{\circ} 57$ Duteh As $=100$ mares $=62 \cdot 6554$ English troy pounds. The old relation between the coumerclal weight and bank weight, by which the commercial pound is equal to $335-32 \mathrm{oz}$. bank weight, has been confirmed by the late act. 1 centner $=112$ com. pounds; 1 pound $=32 \mathrm{oz}$; $10 \mathrm{oz} .=$ 4 drachms; 1 drachm $=4$ pfennings. By the United States' Commercial Digest the centner ls made equal to $119 \cdot 504$ avolrdupols. 100 commercial pounds $=106.838$ English pounds avoirdupois; $48 \cdot 4609$ kilugrammes; 86.5355 pounds Vienna; 96.9219 pounds German cus-
toms union. One "achiffpfund," in commercesw21 centners, ot 20 " liespfund" of 14 potnds each, or 280 pounds; 1 pfund $=1.067$ pounds avoirdupola. One "schitrpfund" by land-carriage has 20 "llespfund," each of 16 pfund; ls, therefore, $=820$ pounds. A plpe of oil la 820 pounds; 1 barrel of butter (amall wlllow and hoops) is taken at 224 pounds; but with common hoope, at 280 pounds nett.

Long Measure.-The Tamburg foot, divided Into 12 Inches of 8 parts each $=0.28657$ metres $=127.056$ Parisian IIneser11'289 Engliah inches.: Hence, 100 Hamburg feet $=94 \cdot 021$ English feet; $\mathbf{2 8} \mathbf{8 6 5 7}$ French metres ; 91 -807 Prussian or Rhenish feet; 90.664 VLenna feet. The IIsmburg ell (shorti ell)=2 Hamburg teet. $05 \cdot 7814$ metres $=254 \cdot 072$ Paris lines. 100 Ham burg ellsen $62 \cdot 681$ English yards. The Brabant ell (or long ell) most commonly used in Hamburg, in measurement of plece-goods $=27 \cdot 585$ English Inches.

Liquid Sfeasure, -1 fuder $=6$ anms, 14 aum $=1$ ankers or 5 elmers; 1 anker $=5$ viertels; 1 viertel $=2$ stabchens; 1 etubchen $=2$ kannens ; 1 kannen $=2$ quarters of Oessel; 1 oimer $=4$ viertels; 1 hogshead $=1 \frac{1}{1}$ aums, or 6 ankers, or 30 viertels, each of 8 quartiers or bottles. The atolichen contains 266 IIamhurg cuble Inehes $=3 \cdot 62$ litres. 100 Hamburg vietrels $=159 \cdot 89$ Engliah Imperial gallons; 724-18 French Iltres ; 632-45 Prusslan qnarters; $611-88$ Vlenna maass. The full beer barrel contains 48 stobehens, or 192 quartiers ; the small barrel only 32 stotichens, or 128 quartiers. The vinegar barrel contains 30 stabchens, or 120 quartiers. The whale and fish-oil harrel contains 82 stabchens, or 128 quartiera; 2 whale-oll barrels $=1$ quarteel.

Grain Mearnre.-One lass=60 fass; 1 fass $=2 \mathrm{hlmp}-$ ten; 1 himpten $=4$ spint. The wispel of wheat, rye, and pens is 20 fass; but of oats and barley, 80 frss. The scheffel of wheat, rye, and peas, is 2 fass ; of barley and oats, 8 fass. The fuss contains $8,8,2$ IIamburg cubic Inches $=52.734$ litrea, and $2658 \cdot 45$ Parislan cuble inches ; and 100 IIamburg fass $=18 \cdot 185$ imperial quarters; $\mathbf{6 2 . 7 3 4}$ bectolitres; $95 \cdot 947$ Prusalan echeffels; 85.765 Austrian hetzen. 10 Mamburg lastg $=108.81$ imperial quarters. The mode of measuring grnin has hitherto been by the metres throwing or pitching it
the fass, and striking off the surplua with a in unien roller pressed lightly atong the upper edge; but an alteration is expected on a new corn law, now projected, coming into operatlon; there will probably bea new fass measnre (of 4085 llamburg cubic jnches), equal to the l'russian scheffel. In practice, 1 Jamburg last is taken at 11 imperial quarters, 31 liectolitren, 57 Prusalan scheffels, 25 Danish barreln, and 161 Russian chetwerts. The coal barrel contains (when the 1458 Hamburg cubic inches of head or heaped measure is added) 16,438 culbic inches. The IIsmburg ship last, or last of conumerce, really welgha 6000 pounds, or 8 tons (not 4000 pounils, $s_{8}$ is generally stated).

Narigntion of the Elbe, Pilotage, etc.-The month of the Eibe is covered with manil-hanks. The channel leading to Cuxhaven ls bounded on the north by the Vogel Sands and North Grour 'A, and on the sout!. by the Schanrhom Sands and Neuwerk Island. On the latter there are two light-heuses and two beacons, and on the Scharhorn is another beacon. The light-houses on Neuwerk Island are abont 700 yards apart; the most southerly; which la also the most slevated, belng in lat. $53^{\circ} 54^{\prime} 67^{\prime \prime}$ N., long. $8^{\circ} 29^{\prime} 40^{\prime \prime} \mathrm{F}$. It 18124 feet high, being twice the helgit of the other. The channel i , in ame places, harilly three quarters of a mile wide. The onter red buoy in the middie of the channel, at its mouth, heara firm lieligoland southeast by mouth, distant nearly $2^{\circ}$ miles. But the beat mark in entering the Fllie la the flonting light, or alignal shlp, moored two miles north-west by north of the red luoy, In 11 fathoms at low water. This vessel never leavea her atation, unless compelled by too in the winter season. lly ulght ahe exhbita a lantern-light,

88 feot above deck, and in foggy weather rings a bell every quarter of an hour. $\mathbf{A}$ second slgnal ship is etatloned $8 \frac{1}{2}$ miles south-east by east from the first, at the woatornmost point of a sandi-bank dividing the fair way of the river. She is rigged like a galliot, to distinguish her by day from the firat algnal ship; and during the night she exhlbita two lights, one 18 feet above the other. The diatance from the outer red huoy to Cuxhaven is about 16 milea ; thence to Glackstadt the course is east, 28 miles; from tha latter to Stade the course is south-easterly, 9 miles ; and then easterly to IIamburg, 18 milea. The channel throughout is marked with black and white buoye, whick are numbered and specified in the charte. The black ones sre to be left, in pasaing up the river, on the starboard or right-hand oide, and the white on the larboard sids.
Every vessel coming from sea into the Elbe, and drawing four feet water, is directed to take a pilot on board, and must pay pilotage, though she do not take one. However well the algnals, lights, beacoua, and bnoys, may be arranged, an experienced pilot is very neoeasary, in case of a fog in the night, or of a storm. To take in a pilot, a versel must heave to ly the pilot galliot, which lles, in good weather, near the red buoy, and In bad weather N.E.N. from Neuwerk, and is known by having at the flagstaff an admiral's fiag, and a long streamer flying at the top. If the pilot boat have no pllot on board, or if the weather be so bad that the pilot can not leave her, she lowers lier flag, and then the veasel coming in must sail, with the sigual for a pilot hoisted, to Cuxhaven, and hesve to there, where she is certain of getting one. See Elink.

There are no docks or quays at llambnrg ; and it is slngular, conaidering the great trade of the port, that none have been constructed. Vessels moor in the river outaide of piles driven into the ground a short distance from shore; and in this situation they are not exposed to any danger unleas the piles give way, which rarely happens. There is a sort of inner harbor formed by an arm of the Elbe which runs inta the city, where small craft lie and discharge their cargoes. Larger vosseis load and unload from their moorings, by means of lightors. Thene carry the goods from and to the warehouses which front the various small arms and channels of the river, and the canala carried from it into different parts of the city. The charges on account of fighterage are extremely moderate.

Port Ciarges.-The chsrges of a publle nature parable by vessels entering the port of llamburg, ualoadling and loading, are pilotage and laatage. The separate itema of which are given in the following tables:

Pilotage Eimed.-The pilotage fees ase earned if vessels are lrought as far an Freyburgh or Glackstsidt, and when from streas of wind or weather, which seldom happena, the Hamburg pilots take the vessel to Wittenberg or Neumubien, they are to pas, without distiuction,

Pilotage oll the way,--For pilntage the while way from Cuxhaven to llamburg there is no talle of rates, for, generally speaking, the Hamburg pilots do not take vessels up beyond boesche.

Pilotage and Instage.-The Ilamburp pilots, gen. erally spenking, take charge of vessela only from the lied linoy to Freyburgh or Ginumatadt.

Jolf lilotage only.-In came the llauburg pilats enter a veasel only within the first buoy beyonil tho liosshacken, Strangfly, or Cuxhaven, fialf the above-menthoned pilotage is pald. Also half pilotage mast be paid at all events, whether the vessel has taken a pilot from the pillet gallut or not.

From llocsche to llambitg,-Vessela are generally plloted from looesch to Iambarg ty l)anlsh or ilanoverian pilota, to whom it is customenry to pay three mares,

## HAN

Lantage and Custom-house Charges.-British and other foreign vessels pay the same as Hamburg vessels. For clearing in and clearing out, no separste charg 38 ate made; visiting the port is considered as one voyage, and the charges on vessels are pald as follows : For vesaels arrived with cargoes from the nndermentioned places, viz. :

| Plases. | Late of $5,000 \mathrm{lba}$. |  |
| :---: | :---: | :---: |
| The | $\begin{aligned} & \text { Mancos. } \\ & 80 \end{aligned}$ | (1). |
| West Indies, North and Bonth America. |  | 08 |
| Pertugal, Epain, and the Mediterranean. |  | 02 |
| The rest of the Earopena por | 18 | 01 |
| lioliand, Fast F'riesfand, the Weser, Egder sad Jutland. | 012 | 0101 |
| For vessels nader 20 commercial lasts without distinetion. |  | 0 0 81 |
| Vessels arriving and depariog in baliast, of upward of 80 commeroial lasts. |  |  |

It is difficalt to determine the exact ratio of a last to a ton; but it may be taken at about 3 oc $2 \frac{4}{4}$ to 1 . But in llamburg all vessels are measured hy the harbor mastor; and it is upon his repert that the lastage is calculated.

For all vessels laden with coals, wood, or turf, no lastage is pald, provided they do not take return cargoes. Vessele arriving in ballast and daparting with a cargo pay half the above lastage, accoriling to their destination. Exclusive of the above dues, which are all remarkably moderate, vessels coming to the port of Ilamburg are obliged to pay certain dues to Hanover, called Stade or Brunshausen dues. See post.

Custom-house Regulations.-On a vessel's arrival at IIamburg the broker reports her to the enstom-house, and gives his guaranty for payment of the dutles, and delivers her papers; and, upon a recelpt being producel for the Stade duties by the IIanoverian authoritics at Ilamburg, the vessel is allowed to unload. On clearing, a manlfest of the outward cargo, together with the consul's certificate of the regularity of the ship's papers, must be produced at the custom-honse by the broker, whe obtains in retnm a clearance certificato, authorizing the vessel to go to ses.

Quarantine.-Ships are visited at Cuxhaven, a IIambarg possession at the mouth of the Elbe. Suspected vessels are generally sent to a station on the Norwegian coast ; but veasels which have undergone quarantine in an English port, or come from beyond the Cape of Good llope or Cape llorn, or direct from the Biver Plate, are permitted to come directly to Hamburg.

Credit, Brokerage, efc.-Almost all goods are solld for realy money, with an allowance of one per cent. for discount. Sometimes, but not frequently, sales are maile at two or three montha' credit ; and in auch eases ligher price is obtalned than for cash. Sometimes, sugar is sold to the sugar-baker at this credit.

Brokers are positively forbidden to act as merchanta or factors. They are licensed by the Senate, and must conform to the established regulations.
Banking, Insurance, efc.-For an account of the Bank of llamburg, aee Hanks. All sorts of insursncee are effected at Hamburg. A municlpal regulation compels the insurance of all houses within the city, the rate varying according to the number of firea and the amonnt of loss. Marine lnsurance is principally effected by joint stock companies, of which there are several; heir competition has reduced the preniums to the lowest level, and the busineas is not understood to be profitable. The high daties on policles of insurance in this country has led to the insuring of a good many linglish shlja at llamburg. Life insurance is not prosecuted in Germuny to any considerable extent ; but some of the English companies have agenta here, who are suld not to be very gerupulous.

Homkruptcy.-Conaldering the vast number of merchants and tradespeople at Mamiburg, bankraptey toes not seom to be of frequent occurrence. Nuch of the
business transacted at Hamburg being on commisaion and for account of houses abroad, the fallure of foreign merchants is a prevalent source of bankruptcy. . Another source of bankruptcy is losess on goods imported or exported on speculation, prid occaslonally lossas in the funds, in which a good deal of gambling goen on here. Expensive living is not nearly so provalent a source of bankruptcy here as in London and other pisces. See Com. Rel. U. S.; Hunt's Mer. Mag., xxili., 177, xv., 177 ; Westm. Rev., xxxviii., 437.

Elammook or Eiamac, (Span. hamáca-a word of Indian origin), a kind of hanging bed, whleh is auspended between trees or poste, or two hooks. The true Indian hammock is a long narrow net made of atrong cord, and terminated at each ond hy amall ropes for suapending it. The hammock used on board ship consista of a plece of stout canvas, about six feet long snd three broad, gathered at the ends and auspended by cords. The sailor's hammock is an oblong plece of hempen cloth; at each end are fastened several amall linea, meeting in a grummet or iron ring: these form the clews. The whole, having mattresses, plllows, etc., placed in it, is hoisted up into its place by small ropes called laniards, between two battens or screws in the besms of the deck over head, about nine feet distant asnnder. The hamnock is a very agrese able bed, especially in cold weather; but some little practlee is requisite at first in getting in and out anccessfully. During tl. day, the hammocks, lashed up tight in the form of caterpillars, are stowed in the nettinge along the upper edge of the bulwark.

Eampton Roads, Va., a branch of Chesapeake Bay, off the mouth of James River, between Old Point Comfort on the north and Willoughby Polnt on the soath. It is aufficiently deep for the largest ships of war, and la an important naval rendezvous. On Old Point Comfort, there have been caded to the United States 250 acres; $-a$ fortification called Fort Monroe luas been erected, which mounts 335 guns, generally 32 and 48 -pounders, 130 of which are under bomb-proof covers. On the opposite point, one mile distant, is Fort Calhoun. The foundation is made by throwing in stones, and it covers about seven acres. This fort is designed to mount 265 guns, 24 's and 82 's, and nearly all under cover. These completely commsnd the entrance to Hampton Rosds. On the north side of the entrance is Old Poin Comfort Light, lat. $37^{\circ} 6^{\prime}$, long. $79^{\circ} 18^{\prime}$ W., showing a fixed light on a white tower, and elevated 40 feet above the surfaca of the sea. On the soutli side of the entranca the W'illoughby Spit Light Vessel showa fixed lighta, elevated, the one 32 and the other 41 feet above the sea-level; and here is a fog-bell also. The channel leading from the Capes of Virginia to llampton Roads is reducel at Old roint Comfort to a narrow width. The shoal water, under the action of ' $1 e$ sea and the reaction of the bar, Is kept in an unremitting ripple; which circumstance has given to this place the name of the Rip Raps.

Eandkerohiefs. Handkerchiefn, wronght and edged with gold, used to be worn in England by gentlemen in thelr lute, as favors from young ladies, the value of them being from tive to 12 penco for each, in the relgn of Elizatieth, 1558.-Stow's Chron. 1landkerchies were of early manufacture, and are mentioned in onr oldest works. Handkerciefa of the celebrated Puisley manufacture wero first made in that town in 1748.

EIandspike is a stong wooden bar, used as a lever to move the windlass and capstan in heaving up the anehor, or raising any beavy weights on board a ship. The handle is sinooth, round, and somewhat taper; the other end is aquare, to fit the holes in the head of the cnpstan, or barrel of the windlasa.

Hang-Chau-Fou, on important city of China, eapital of the province of Che-kiang, on a phin near the River Trientang, about 40 miles from its mouth, and 140 miles sonth-east of Nanking. It is surmunded

Hy high and etrong walle, alid to be nimo mileo in circumforence; and edjoining. It are very extontive anburbs. The Governor-Gemeral of Che-kiang and Eukion resider in thin eity, and aleo the governor of the provinue, which, with their courte and troope, in addition to lts great trade, render this one of the mont important and richent citien in the empire. A portion of the space within the walls is divided off for the accommodation of a garrison of 7000 troope. . The Grand Canal has ite moutherm cormination here, in a large irregular basin. The atreete are well paved, and: the shopa and warehouses are large, and well atored with goode. There are numerous rich temples and elegant publio buildings ; and altogother, this city presants the appearance of great waalth and splendor. It is noted for its ailk manufactnrea, which omploy a large portion of its inhabitinta. The population is said to be about $1,000,000$.
ERanover, a kingdom in Germany, formed out of the duchies which formeriy belonged to aeveral famllies of the junior brapch of the house of Brunswick. In the course of the revolutionary war, under the.influence of France, the dukedams of Bavaria, of Sazony, and of Wirtembrarg had been raised to the rank of kingdoma; and when the overthrow of Bonaparte was accomplished, the dukedoms which hal composed the electorate of Hanover were tbought by the allied powers of aufficient consequence to be elevated to the same dignity, 29 , with the additiona then made to them, they were neariy equal in extent and population to the other portions of Germany whose rulers had received that rank. lt accordingly assumed thit grade in 1814, noder George III., and was acknow]. edged as anch by all the powors of lurope.

The kingdom of Hanover lies between lat. $51^{\circ} 18^{\prime}$ and $58^{\circ} 52^{\prime}$ N., and long. $6^{\circ} 43^{\prime}$ and $11^{\circ} 45^{\prime}$ E.; and is bonnded on the north by the German Ocesn, northeast by the Fibe, which separates it from Denmark, Hamburg, and Mecklonburg, enst end south-east by Prassin and Brunswick, nouth-west hy Hesse-Cassel and Prussia, and weat by Holiand. The boundaries inclnde the duchy of Oidenburg, which ainost completeiy eeparates Hanover into two large portions, the connection being maintained by a narrow atripof land, not more than six miles in width, wouth of the duchy. A smail portion in the south is eoparated from Ilanover proper by the interjection of part of Burnswick. The entire area amounts to about $9,464,446$ scres, or 14,788 square miles, as fotlown:

The whole of the kingdom of llanover dipa towarl the north, and the courses of ali the rivery are in that direction. These are, first, the Elbe, which borders a large part of the dominion, and receives into it the Ohre, which risea in the province of I aneburg; the Aland and Jeetze, which come out of I'russia, and are navigable hefore they terminate in the Elbe; the IImeneau, which becomes navigable at Juneburg; the Este, which is navigable to Buxtchude; the I.uhe, navigable to LIornburg; the Schwinge, by which vesaels reach Stade; the Oste, which passes IIarburg, and is navigable to Kirchosters ; and the Medem, which runs through the Indeln-land, and admita large vessels as high as Otterndorf; second, the Weser, which enters the dominion of Hanover at Manden, being there formed by the junction of the Fuldes and the Werra. It is navigable for bargee from the apot at which ita name cominences; and it receives in its coure the llamel, the Aller, the Oertze, the Leine,
the Bohme, the Eyther, the Wumme, which, In the iower part of its course, takes the namo of Losum, the Geeste, and the Hunte; all of which are Hanoverin rivers, and continue their urited course till they ars loet in the German Ocean, near Bremen ; third, the Ems, a river riaing in the Pruscian province of Wesi phalia. After entering IIanover, it receives the waters of the As, the Hase, the Else, and the Leda. Before reeching the sea, it fallis into the Dollart, near Emden, which is the principal sea-port in the kingdom. It is navigable for flat-bottomed vessela from Rheina downward, and for sen-going ships from Halte and Weener. About $1,200,000$ thalers $(\$ 87,000)$ have been expended in improving the navigation, and it has become in consequence a very important channel for the inland trade of the country. Fourth, the Vecht, a river of short course, sising in the Prusian province of Westphalis, and terminating in the Zayder Zee. Its princlpal importance is derived from a nevigable canal, which commences at the city of Manster, and is the channel of some trade through the Vecht to Amsterdam.

Though Hanover is generally a aandy soil, it has some smali fresh-water laken. The Dummersee, in Diepholtz, is alvout 12 miles in circuit. The Stelnhu. dermeer, in the province uf Kalenburg, is about four miles long and two broad; and the Dollart, at the mouth of the Ems, which is rather an estuary than a Lake, is 12 miles acrose. The canals are all of short course. The Aurich Canal, between Aurich and Enden, is 15 miles long ; the Bromen Canal, between the Oste and the Sch winge, servea both for draining and for transport; the Papinhurg Canal, between Pspinburg and the Ems, is unimportant.

Manufucturing industry prevails less in Hanover than in the other States of Germany. Linen yarm and cloth are the principal liranches. Wooien cloths ase made to a considerable extent in the southern part of the kingdom; and this branch of trade has lately beea increasing. In the west stockings and gloves are made. Cotton-spinning has also increased, but is still insignificant, and the same may be said of silk. Potteries, tile-works, and tobacco-pipe works are numerous. There are nine glass-houses, and 52 paper. mills, which produce yenrly about 20,000 bsles of paper. Wax is bleached to a considerable amount, and there are numerous tohacco factories, tanneries, breweries, vinegar works, and brandy distilleries, the produce of which last has of late very much increased. East Friesland produces gin. The most thriving branch of industry however is that of metal wares. The whole population of the llartz lives hy the miniog and furging of metals, excavating conl, and manufacturing wooden articles. Founderics and forges, and works of Iron, copper, lrass, wire, silver, and lead, vitriul and enflhur, are in the utmost activity. These mines and associated works support about 35,000 persons. About 20,000 workmen were very recentiy employed in the Ilartz, and the yearly value of the produce was $5,000,000$ thalere ( $\mathbf{f 7 5 0 , 0 0 0}$ sterling). The latest retarus give the following quantity for one year, for lisnover and 13runswick together: gold, 82 cuc. ; silver, $375,833 \mathrm{oz}$.; iron, 377,812 cwt. ; copper, 540 ; vitriol, 5400 ; guicksilver, 510 ; coal, $2,160,000$; salt, 842,000 .
As may be supposed from the smali quantity of surplus production, the trade of Ilanover is not extensive. The principal jort, Emden, has some export and import trade; but from the state of the roads between that placn and the more popuious parts of the kingdom, more of its trade jasses through liamburg and Bremen than through that elty. Besides the more conaideralle articles made from flax, Its honey, wax, foathers, and large quantities of timber, are sent to llamburg and lirenien. Wool, horses, and cattle, wheat and uther grain, lutter and cheese, tolncco and mineral productions, are among the chief exports. Hops, rape-seed, oil-cake, fruit, hamas, and sausages,
form also articles of export of amall amount. The imports consist principally of Englioh manufactures, colonial produce, fruite, wines, jowelry, and silks. As the roads to the great fairs of Lelpsic and Frankfort pass through Hanover, the transit of goods for theee used to create a pretty large commiasion trade, and give employment to many wagons, horses, and men, as well as to the barge owners. These, however, are now in aome degree auperseded by rallways, the clty of llanover having become a central station, from which these diverge in different directions to IIamburg, Brunswick, Hildeaheim, Bremen, and Minden. Hanover has jolned the Zollvereim or General Customs Union from ist January, 1864,

The commerce between the other States of the German Customs Union and the United States la not of much importance. The linens of Hanover always find a ready market; and, ware interposing import dutles in both countries modified or altogether abollshed, the linens, raw wool, lead, rapeseed, homp, and flax of thls klagdom would be much more extenaively exchanged for American rice, sugar, tobacco, and simllar produce. The direct exports from the United States to Hanover in 1852 were, beaides staves and flour (In value $\$ 115$ ), 186 hhde. of tobacco, valued at $\$ 5,791$. The value of exports from Hanover, via Hamburg and Bremen, in 1853, was $\$ 15,841$, and the exports from the United States direct to Hanover were 143 hhde. tobacco, valued at $\$ 6,290$. All other A -rican exports found their way to the markets of Hanover through the ports of Bremen and Hamburg. The value of exports from Hanover in 1855 was $44,-$ 277, of which there reached the United States via Bremen $\$ 43,409$, and via Belglum \$868. The tobacen onnually produced in the kingdom of Itanover is valued at alout $\$ 50,000$, from which about $2,500,0001 \mathrm{bs}$. of amoking tobacco is annuslly manufactured. Were the Zollverein duty on tobacco abolished, as it has been on raw cotton, the cultivation of the inferior quality produced in Hanover would not only cease altogether, but her tobacco munufactories (346 in 1843), would be multiplled, und the manufacturling industry of the kingdom more profitably developed. The principal sea-ports of Ilanover sro Emben, IIarburg, and some minor ports or shlpping places on the Weser, in the diatrict of Aurich, or that part of llanover west of Oldenburg. The Hanoverian trade from the Elbe centres at Ilamburg, that of the Weser at Bremen.
The commerce of the port of Harburg, on the libe, has, within a few years, assunied conslderable importance. In 1849 the number of vessels srriving at this port was only 49. The following exhibits the results of threc yeurs, ending with 1854: See Elue River.

| Years. | Vesela entered. | Veautio eleared. |
| :---: | :---: | :---: |
| 1852. | 691 |  |
| 1858 | 884 | 869 |
| 1854 | 1,038 | 1,027 |

The preceding summary indicates the rapidiy increasing commerce of thils port. The vessela chiefly come from the coantries of northern Europe, but some even from the Mediterranean. Thus, in 1854, thore proceeded from the Mediterranean ports 580 vessels under the IIanoverian flag, 152 under the lsritislı flag, 135 under the Danish, 81 under the Dutch, and 3 under the French flag. Of these, 265 entered, and 679 clenred in ballast, or with par*'al frelghts. The remaining vessels were laden chiefly with wood, stone, oll-cakes, and sundries. The marine service nf IIarlurg consists of 1 three-master, 6 barks, 3 brigs, 2 brigantines, 1 schooner, and 0 smaller craft; making in all 19 sail, excluslve of one bark on the stocks.
The rlver (Elhe) arrivals, during the anme poriod, were:

Notwithstanding this rapidly increasing prosperity of the port of Harburg, and the commercial facilities which it reoeives from the Hanoverian goverament, Hamhurg, on the opposite side of the river, is the princlpal centre of Hanoverian trade. Wlthin the past ten years the number of vessels belonging to Hanover has tripled in this port. In each of the years 1852 and 1858 , there arrived 1,100 vessela under the Hanoverian flag, measuring, in the aggregate, s tonnege of about 15,000 commercial lasts, of 6,000 pounds each, or an aggregate of 44,000 tons. In the navigation of Hamburg, Hanover holds the third rank as reapecta tonnage-the tonnage of the port liself rankIng first, and that of England second. The freights in 1853, in Hanoverian bottoms, exceeded thnse of the preceding year 100 por cent., and many years the freights are threefold greater than those given for the years immediately preceding.

The Hanoverian flag particljatea proportionally in the general forelgn trade, and enjoys a conslderable share in the movemente with trans-Atlantic constries. In 1854 the number of Hanoverian voseels in the port of Hamburg largely exceeded that of any former year. It reached as high as 1,830 veseels, moasuring an aggregate of 20,836 lssts, or nearly 60,000 tons, entered, and 1,817 vessels cleared. The amaller craft, exclusively engaged in the river trade, are not comprised in these totals. The commercial movements at the port of Emden in 1854 present the following resulta :

8,785,469 thslers equal to. . . . . . . . . . . . . . . . . $2,065,806$
The thaler (gold), or Bremen thaler, equals 78 get cents. The import trado employs 5,895 veasela, and 4,107 vehicles for the land trade. The imports consist chlefly of cereals, butter, and cheese ; and the exports are mostly of the same character. These latter employ, for the home trade of the port of Emden, 391 vessels. Fingland, Hollsnd, and Belgium are the principal countries to which the exports from this port nre destined. The mercantile houses of Emden engaged in the direct trade between that port and the Russian ports of the White Sea, the Baltic and the Black Seas, own about 8,000 tons of the marine service employed in that ccinmerce. The cultivation and manufacture of flax, hemp, etc., yielded, in the export trade of LIanover, in 1853, 8,500,000 francs, or nearly $\$ 1,700,000$. This sum exceeded the value of slmilar exports In 1852, namely: of flax exported, $\mathbf{7 2 4 , 0 0 0}$ francs; and of tlsaues, $1,070,000$ francs.

The tissues nf Ilanover are in high repute in foreign markets; and at the German Industrial Exposition, held at Munich in 180̈4, they were favorably noticed. As the cultivation and manufacture of flax and hemp constitute the chief agricultural and industrial wealth of the kingrlom of lianover, the annexed table, showing the quantities of tiseues manufactured, and their values, from 1840 to 1853-a period of 14 years-is compiled from the official returns of that government :

## HAN

The ell of 2 feet $=22.01$ English inches ; 12 pfenning $=1$ groaehen; 24 groschen $=1$ thaler $=73$ cent.
The tissuen and yarns of Hanover ara exported directly from Ilanoverian ports for Priesland and the countries below the Elbe, Sweden and Norway, Mecklenburg, Holland, and the Statea of the Zollvereln.

From Bremen, for New York, Baltimore, Havana, St. Domingo, Porto Rlco, Porto Cabello, Laguayra, Veneauela, Mexico, and the Canary Islen.

From Hamburg, for the citles and countries above deslgnated, and also for Brazil, New Orleans, Cuba, and the Weat Indles.

Effective merchant marins of Hanover in 1855.-Sailing vessela : total, 701; aggragate tonnage, a4,741 tons. Coasting and river craft; total, $1, \mathrm{~s}: 9 \cdot \mathrm{mggro-}$ gate tonnage, 88,121 tons. Steam vessels: total, 8 ; aggregate tonnage, 551 tons.

Effective merchant marine of Harburg in 1855...Sailing vessels: total, 18 ; aggregate tonnage, 6,102 tons. Steam vessels : total, 2 ; aggregate tonnage, 810 tons.

Adjacent to the town of Stade, on the Elbe, atanda the caatle of Brunshausen, near which a vessel is stationed to recelve toll on all vessela pasaing up the river. American vessels passing ap to Hansburg are subjected to vexatious and onerous duties at this point, seriously, and in violation of the treaty of June 10 , 1846, with Hanover, affecting American commerce with that port. Hambury property and the Ilamburg flag are exempt from any duty at lirunshausen.

The 3d section, article 1, of the treaty of 1846 , is in these words: "And further, it is egreed, that uo higher or other toll shall lie levied or collected ut Brunshausen or Stade, on the River Elbe, upon the tonnage or cargoen of vessels of the linited States, than is levied or collected upon the tonnage and eargoes of vessels of the kingdom of Hanover." Article 7 is In the following words: "The high contracting parties engage, mutually, not to grant any particular favor to other natlons, in respect of navigation and duties of customs, which shall not immediately becone conmon to the other party; who shall enjoy the snme freely, if the concession were freely made, or on allowing a compensation, as near as posaible, if the concesslon was conditional." It is proper, however, to adll, that it is clained that the concession ls conditional, viz: services rendered to the IIanoverian custom-house in the compatation and collection of duties, etc., by the officials of Ilamburg. If the flag and property of Hamburgians pass Stade exempt from any tell or duty, the imposition of either on American vensela is clearly in vlolation of treaty stlpulations.

The duchy of Oldenburg is nearly inclused within Hanover, having, however, a sea frontier of from $\$ 0$ to 50 miles, and the Weser bounding it on the west. The duchy liea in the basin of the North Sea, and is entirely flat, and in many places marshy, though in several jarts it possesses excellent pasturage, ou which horses, cattle, and sheep are extensively raised. The soil is not well adapted for agricultural purposes ; and, hence, the agricultural jroductions are not sufficient for the consumption of the inhabitants. Its commerce with the United States is small. In 1852 , Oidenlsurg sent, via France and England, to the United States, merchandise amounting to 478 . This ducliy entered the Zollverein league, January 1, 1854.—Com. Rel., $\boldsymbol{U} . \boldsymbol{B}$.

Eianseatio League, an association of the principal cltles in the north of Germany, Prussia, ete., for the better carrying on of commerce, and for their onutual safety and defense. This confeleracy, so cele-
brated in the early hlstory of modern Enrope, contributed in no ordinary degree to introduce the blassings of civilization and good goverament lato the north. The oxtenalon and protection of commerce was, however, Ite main object $;$ and hence a ahort acconnt of it may not be deemed miaplaced in a worls of thle descriptina.
Origin and Progress of the Hanseatic League.-Hemhurg, founded by Charlemagne in the ninth, rad Lubec, founded about the middle of the 12th century, were the earliest mombere of the League. The distance between thom not being very conslderable, and being alika interested in the repression of thone disorders to which most parts of Europe, and particularly the coast of the Baltle, were a prey in the 12th, 13th, and 14th centuries, they early formed an intimate political union, partly in the view of maintuining a asfe intercourse by land with each other, and partly for the protection of navigation from the attacks of the pirates, with which every sea was at that time infeated. There Is no very distinct avidence as to the period when this alliance was conaummated; some ascribe lta origin to the year 1159, othera to the year 1200 , and others to the year 1241. But the most probable opinion seems to be, that it would grow up by alow degrees, and be perfected according as the advantage derivable from it became more obvious. Such was the origin of the Hanseatlc League, so called from the old Teutonic word hansa, signifying an association or confederncy.

The Hanse-Towns (so called from the old Teutonic word hansa, signlfying an masoclation or confenlerncy), or the free JIanseatic republics of Lubee, Bremen, snd llamburg, are all that now remaln of the once powerful confederation which conatltuted the Hanseatic league. Formed, it is supposed, about the year 1164, partly for mutual protection and safe intereourse by lani, and partly for the protection of navigation from the piraten who infested the Baltic and the coasts of the North Sea, thls League haa become justly celebrated In the early history of the elvilization and governments of modern Europe. The first and principal members of this Confederacy piere Hamhurg, founded hy Charlemagne toward the close of the $8 t h$, and Luhec, founded about the middle of the 12 th century. "The wild, enthuslastlo expeditions of the Cruanders, in the 11th and subsequent centuries, the introduction of the diatillery into Europe in the 12th century, and the conquest of the Teutonic Knigints of the Cross in Irussia and Livonla, were," says the authur of "lex Mercatoria," "annong the causes whici originally brought forwaril the navigation and trade of northern and weatern liurope, and combined in forming this celelirated asmociation.'

The disorters to which most parts of Europe, and particularly the coant of the Baltic, were a prey, luring the 12th and followiog centuries, first invited the cities of Labec, Hamburg, and Bremen, to unlte in this Confederacy. Soon, however, they were joined by most of the trading towns of Europe. The cities which were eatablished aleng the coast of the lbaltic, and in the interior of the countries bordering upon it, eaperly sought admisaion into a league which guarautied them ample protection against the robler-princes and barbarians by whom they were aurrounded. londos Rouen, Hordeaux, St. Malo, Hayonne, Marseilles, lbarcelona, Seville, Cadis, Jishon, Antwerp, Dort, Ansterlam, Brugen, Rotterlain, Ostend, Junkirk, Ieghorn, Messina, and Naples; Hergen in Norway, Novgorod in Russia; all the towns on the lille and Weser; Emden, Cologne, and other eities, sucerssively united with this formidalse association, until it was able, In a war against one of the northern powers, In the 14th century, to call Into netive service 40 kbj s of war and 12,900 troops, exclusive of seamen. It thia period, neveral of the European fowers, expecially the kings of France and of southeril Burope, becoming alarmed at the extraordinury and formidable pregres
of an aseociation, whoae merchanta, traders, and emiasaries were found in every port, city, and village throughout Earope, and -whose decreea were pro$\dot{C i}$ imed as the eupreme law in their reapective dominiona, withdrew their towns and their merchants from a League which threstened to annihilate their severeignty and give lawe to the world.

It has been urged, and with much ferce, that the decline of the Hanse-tewns was owing mainly to their having beceme warlike, instead of remaining altogether commercial. There can be no doubt that this was, ut least, one of the causes, and, perhapa, the predominating cause, of their decline." Every where they clatned apecial concessiona and special privileges. They demanded and obtained the entire custodianship of Bishopegate, one of the principal entrances to Londen; and when certain privileges were attempted to be withdrawn from them, they boldly deciared wp against England, and immediately drove her vessela from the Baltic, until Edward IV. restered them all their privileges, and even exempted them, in maritime cases, from the authority of the admiralty court. Referring to the treaty cencluded with the Hanseatic League, at this period, McCulloch remarks: "The privileges of the merchante of the Hanse-towns were renswed, and the King assigned to them, in absolute property, a large apace of ground with the huildings upon it, in Thsmes-streat, denominated the Steelyard, whence the Hanse merchants have been commenly denominated the Aasociation of the Steolyard. It waa further agreed that the particular privilegea awarded to the Hanse merchants ahould he published, as often as the intter judged proper, in all the sea-port towns of England, and such Englishmen as Infringed them should be punished. In return for these concessions, the Englioh acquired the liberty of freely trading in the Bultic, and especially in the port of Dantzic, and in Prussia. This treaty," he adda, "settled the diffculties with the Hanse-towns on terms which were any thing but henorable to the English." In 1641, oven when the power of these cities had declined, and their organization had become comparatively dismemhered, we again find them converting their merchant vessels into ships of war, and disputing with Denmark her pretensions to tax the cominerce of the world at the castle of Cronberg. Indeed, it may be remarked, in passing, that the Hanseatic Leaguo never quietly submitted to the protensions of Denmark in the imposition of the Sound tax upon the commerce of the Baltic.

Prior to the treaty with Sweden in the 14th century, the collection of thia toll was succesafully reaisted by the league. Being then in the meridian of its greatness, it obtained, on its own terms, a free passage for its ahips and cargoes through the Sound-a privilege enjoyed until Denmark, perceiving that the Ilansestic League held her authority in utter contempt, deemed it judicious to invite other nations to engage in the trade of the Baltic, permitting the vessels of England and Holland to pass through the Sound on the payment of mere nominai tolls. This was intended to strengthen the arms of Dennark in any conflict in which her abrogation of the privileges enjoyed hy the League might involve her. Lubec, in the name of the other IIsnae-towns, ineffectually protested against this eneroachment upon their long undisputed sovereignty of the Baltic, and demanded the inmediate oxclusion of the Dutch from that ses. Their power, however, was now declining ; their demand was refused, and we find them, in 1500, submitting to a convention with Denmark for the adjuatment of the question of the Sound dues, reaulting in the tresty of the Odeusee between "tite king of Denmark and his suljects on the one part, and the right honoruble Ianseatic cities and the merchants thereof on the other part." So rapid was their decline from this period, that when Denmark, three years after the conclusion of this
treaty, made her war with Sweden a pretext for increasing the Sound duea against the Hanse-towna, in violation of the stipulations of that treaty, the latter. being now shorn of their former power, were cempelled to aubmit. Toward the close of the 17th century, the IIanseatic League may be cousidered as having ceased to exiat in a federal capacity. But, about that period, individual citiea which formed the league, ospecially Hamburg, not only regalued their former cemmercial aplendor, but, aince that time, have gradually risen in wealth and prosperity.
Notwithatanding, however, the warlike attitude in which the Hanaeatic League so frequently appeared, whether in aaserting new, or in maintaining old privilegea and conceasions, other causea, no leas fatal to their aupremacy, and more certain in reault, combiued to bring about their dissolution. The progress of civilization in Europe-the diacoveries of the pasaage to India by the Cape of Good IIope, and of America-the riae of IIolland, and the consequent rapid cemmercial progress of the Dutch-these causes combined, opened new and hitherto unknown channe's for navigation and commerce, and created changea in the cemmercial world for which ancient trading establishments were neither adapted nor prepared. Thus we aee that the decline of this once powerful Lesgue was mainly brought about by that very progreas of imprevement which it had contributed no inueh to promote. Its disaolutien was hut the natural consequence of the improved civilization, and of the development of the commercial spirit which it had fostered and spread throughout the different nstions of Europe. The cities of Lubec, Hamburg, and Bromen, were all that continted to acknowledge the au hority of the League, and all that now remain to rep.resent its ancient aplendor and power. The freeder. of these cities was gaarantied by the Cengreas of Viennn, in 1815 ; and aince that period navigation and trade have advanced and prospered, especially the trade of Hamburg and Bremen, without any interruption, until the disastrous fire of 1842, which destroyed so large a portion of the city and property of limmburg ; from which calamity, however, it has now almost entirely recovered. This conflagration commenced on the 5th of May, 1842, and burned 61 streets and 120 passages and courts, and left heuseless 19,955 of the population. Since that period a great pertion has been rebuilt according to a regular pian.
Tie Ifanse-towns, especially Hemburg and Bremen, have eatathished in every part of the world, possessing any commercial importince, numerous mercantile houses, under the management of merchants of great intelligence and energy. These establishments centribute largely to the prosperity and augmentation of the foreign commerce of the Hanse-towns. Of the 343 henses and comptoirs which represent the commerce of Germany in forelgn countries, 227, or two thirds, belong to Mamburg and Bremen. In the United States alone, in 1846, there are atated to have been $\mathbf{7 6}$ commereial houses of this description, namely : At New Yoik, 35; Philsdelphia, 7; Baltimore, 14; New Orlesns, 7 ; Louisvile, 2 ; St. Louis, 5 ; Texas, 3; Cincinnati, 3. These were exclusive of 61 other Cerman houses in the United States. Since 1846 the increase of commercial houses in the United States, from the llanse-towns, has been very great.

There are 37 Iianseatic commercial houses in Mexico, of which there are in the city of Mexico, 11; Vera Cruz, 11; Tampico, 4; Mazatinn, 5 ; other places, 6. In Guatemala, 1 ; Cuba, 14 ; Porto Rico, 3; Ilayti, 6 ; St. Thomas, 4; the other Antilles, 6; Venezuela, 23 ; l'era, 5 ; Chiii, 8 ; Brazil, 29 ; ether German houses in South Amerien, 21. In the ports of the La PlatsHanse honses, 2; other Gerinan houses, 8. In Fcui-dor-German heuses, 2. In China and Chinese IndiaHause houses, 7; other German houses, 7. In Africun ports-Hanse houses, 9 ; ether German houses, 2.

The aggregate amount of Sound dues paid by the Hanse-towni from 1846 to 1851, both inculsive, waa: francs, $471,354=89,557$; annual average, franca, $78,650=14,926$.

In connection with thls subject, it la proper to add, that arrangements are now being actively brought towurd consummation, which will exercise a marked influence on the foreign commercial movements through the ports of the Hanse-towns. These lave for their object the opening of a route between the North Sea and the Haltic: 1st. Across Schleswig, by the conatruction of a railroad bet ween Tonningen and Husum, on the one aide (the wast of Schleswig), and on the other, through Filensbury (on the eastern oide); and 2. Acrosa aouthern Sweden, by ateam navigation on the Gotha Canal.

It need not be addel that either route will aupersede the passagge of the Sound and the impost which ia there lavied-ylelding to Lenmark so larye n portion of her Sound-dues revenue-mand must necesaarily, to a great extent at least, divert from the latter route the transitage thruugh the llanse-towns destined for the Sesudinavian countriea and those bordering on the Baltic. The steam navigatiou of the Gotha Cunal has been granted to an English company, denominated "Navigation Company between Hull and St. I'eterso burg." This company commenced the construction of four ateamers in 1853, at the shipyards of Motala, two of which were completed towaril the end of that year, and the other two in 1854. These atcamera are even now insufficent for the heavy freights offered for trunsit, and it is understool that others will soon he adiled to the line. The railroad referred to has also been granted to an English cominny, which has long since commenced operations. When completed, it will place Iondon within $\mathbf{3 0}$ houra' distance of Flensburg.

The commercial relations bet ween the Lnited States and the Hanae-towns are regulated by the treaty of December 20, 1827. This treaty stipulates entire recijrocity of traide and perfect freedom of conmerce between the two high contracting parties, no matter from what country or jort the veaseia and cargoes may come. The sixth article stipuiates that it shall be wholiy free for all merchants, commander of shipa, and other citizers of both partien, to manare, themselves, the:- مnn bushess, in all the ports and phaces aubject to the jurisdiction of each other, as well with respect to the conaignment and aule of their goorls and merchandise by wholesaie or retaii, as with respect to the londing, undoading, and sending off thelr ships;
aubmitting themeeives to the lawn, decreas, and usagea there setablished, to which native oitizens are subjected; "they, in all cases, to be treated as citizens of the republie in which they reside, or, at least, to le pleced on a footing with the citizens or aubjects of the most favored nations ;" and all favors granted hy elther party to other natlons, to become common to the other party on equal conditions.
The pollicy of allowing to the Hanseotowns, by treaty atipulation, the priviloges of their flag to all Yeasels owned instead of build wlthin their dominions, as in the treaty been the Ilanse-towns and Great Britain, has been a question of conslierable doubt aung eminent merchants of the United States. By virtue of thia stipulation, the Ilanse-towns bring to the United Stuten the productions of the ilfferent States of Germany, and carry back, in return, the cotton, rice, and tobacco, with which the atore-bouses of these towns, espechally Bremen, are $p^{\prime}$ waya supplied. The effect of this privilege has, undontutedly, been to throw almost the entire carrying trade, from the Ualted States for German markets, Into the hands of Hanse ship-ownera. This is more particularly true with reapect te the port of Broman, as appears from the followlog aummury of the navigation returns of that port. The vessels engaged In the trade between the United Stutes and Iremen were:

The Cotton Trade.-Cetton and toliacco are the leading imports of the Hanse-towna from the Cnited States. The value of the former inportad during the 12 months ending June 30,1853 , was nearly $83,000,000$; of the latter, more than $\$ 2,500,000$; while the value of all other donestic produce imported into llrenien and llamburg from the United States was upward of $\$ 9,000,000$. The export of cetton from the United States to the countries of nerthern Europe commenced some 60 yearsago. In the yoar 1800 , Ilvolland, including the territory now known as the kingdom of Belgium, received 79,604 lis. ; in 1855 the aggregate quantity exjorted to the two countries was $17,160,967 \mathrm{lbs}$. In 1803 Norway and Denmark first imported American cotton, amounting that year to $18.1,193 \mathrm{lbs}$. in 1855 the aggregate quantity exported to these two countries, Including Sweden, was sonce 7,000,000 liss. I'russia and Sweden legan importing cotton from the United States in 180.1. Itussia, in 1809, received cotton from the ITnited States, for the first time, and to the amount of $500,000 \mathrm{ibs}$; while In 1853, the year jrlor to the commencement of the late war, the ex. portation to that country ameunted to more than $21,000,000$ llis. The Ilanse-towns received cotton from the United States jurior to the year 1800 ; and the progress of the trade with these cities, which is exhihited in the aulijoined statement, strikingly cx-emplifir- in connection with the remarks whill have precedea, and the general statement which fullows it, the rapid nad powerful advancement of the king: staple, not of the United States only, but of the commerelal work. The following statement shows the quantities of cotton exported from the V'nited States to the llanse-towns every 10 ycars, for a period of 51 years, from 1805, to 1855:

Tobacco is borne in direct veyage from the L'nited States; not so, however, with cotton, in the carry-

- The Ifanse-towns are given for this and the following periods; Bremen and IIamburg being untted under the offhat tiata, under that deskigation. liremen, however, averages moro than three fourtios of the aavigation betweea the Cntted States and the Ilansertowns.

## HAN

ing trade of which Great Britain has been for many yeare un active competitor. Entering the ports of the United Kingdom free of duty, her merchant fag can reallize a proftable trade in ith re-exportation to the varions ports of continental Europe. Thus the Itnneo-towns receive their aupplies of raw cotion not only from the United States, in the direct trade, hut also in the indirect trade, from English porta and other entrepots of Europe. The annual average quantity of cotton exported from the United States to the lianno-towns, inclading Prussia, during the four years from 1851 to 1854, both inclusive, was $24,811,626$ lba. whlle the annual average exported from Great Britain during the four years ending December 31, 1854, was $36,563,906 \mathrm{lbs}$.

The annual average quantities of cotton exported from the same countriea, renpectively, during the same porioda, to other nations of nordern Europe, exhiblt similar resulta. Those facts are cilustrated by the subjolned atatement, and suggest a strong argument for the serinus corsideration, hy the navigation Interesta of the United Statos of such measures as would be likes, to promote tha direct exportation
of out weat ataple from our own ports, in our own veasels, to those of the countries by which it is connumed.

This statement, made up with care and labor, from'fore, be viewed as embracing a period of 70 years, sources officinl and unofficial, and often conflicting, although not, perhaps, statistically exact, is yet, probably, enough ao for those purposes of gencral comparison for which it is submitted. For obvious reasens, the aggregate of the exportation and consamption of cotton can not be expected to bnlance the production In any single year, Independently of stocks on hand from preceding years. An average, yenr with year, of some $70,000,000 \mathrm{lbs}$, consumed for houschold and other naes, and of somo $3,000,000 \mathrm{lba}$. lost or dostroyed, and of some $500,000 \mathrm{lts}$, of imported cotton consumed, are, also, items to be considered in striking this balance; es well, morcovor, as the fact that the sums nte in round numbers, and that the only figures In the statement which can be viewed as at all statistical, are those giving the amounts and values of exportation; those for the consumption being derived from the unofficial declarations of mnnufncturers, and those for the production being estimated from all the other items put together. The aggregates, however, of consumption and exportation, for the whole period of 63 yeare, lalance the production and importation within some $6,000,000 \mathrm{lhs}$. The data for quantities, values, and prices derived from the Treasury Reports, do not, it will be perceivel, niways afforl results entirely consistent. Prior to 1802, forelign cotton was united with domestic in official accounts of exports. The capacity of the bale is computed, agrceably to uagge, at 400 lbs., In changing bales into pounds, for this statement, although an nverage of 450 lbs , to the bale would, prohably, be more exact. The unusunlly large triennial average of cotton imported in 1842, 1843, and 1844 , is to be ettributed to the fact, that, during those years, Texas was an independent repuhlic. Foreign cocton, from January', 1791, to 1812, paid a duty of three cents per pound; from July, 1812, to April, 1816, slx centa; and from April, 1816, to July 30, 1840, thiree cents, when it was made free. The $\mathbf{7}$ th decade terminates in 1801. The statement may, there-

## from 1792 to 1861 inclusive.

Tariff Regulations.-Bremen.-The tariff is that of December 23, 1850.

Moneys.-One rixdoliar $=72$ grotes $=78$ 年 cents $;$ 1 grote $=11.10$ cent.

Weights and Measures. One centner $=100 \mathrm{lhs} .=$ 109.8 Ibs. nvoirdupois; 1 lisprand equals 14 lba. United States' welght 11 atone of wool equala 10 lbs do. ; 1 stone of flax equals 20 lbs. do. 11 scheffel equals 2 buahels United States' measure; 1 last quals 80 bushels do. ; 1 Bremen foot equala 11.38 inches do.

Inport Duties.-These duties consist of $t$ wo thirds of 1 per cent. ad valorem on the valuation given in the invoices, including at the same time freight und ineurance.

Export duties conslst of one third of 1 per cert. ad valorem, according to invoices.

Transit Duties.-All merchantlise which has been entered at the custom-house as transit goods, is subject to a duty of one groat ( $1 \mathbf{1 - 1 0}$ cent.) per centner (or 109.8 lbs . avoirdupois), if re-exported wlthin three months from the date of the entrance. From this, howevor, the following articles are excepted, and pay only one half grote per centner : Alum, asphalt, empty batrels, coul, bomb-shells, bexes, cunnons, cheese, copper (crudo), earth for coloring, gypsum, hair (cow), herrings, iron in sheets, castings, hars, rods, and bulls, juniper berries, llme, linseed, mangnncse, marble (unmanufactured), metnlic enrths, mortars, oak-bark (ground or not), whre, clay pipes, pitch, raga, rnilroad materials, as rails, wheels, and axles, gutters (roof), rosin, salts, кcraps of paper, sea-grass, succory (or chicory), tnr, vitrjol, wnate paper, wrapping material cominon inanufactures of wood, slac (in blocks).

The following pay one quarter grote per centuer: Ashes (ley), birdis, bones, bone-black, sugar-lox botrrls, dye-woods, fresh fruits, grass, hay, Iron (old or crude), lead ore, oil cakes, ores, potatoes, slates and pencils, sulphuric earth, timber (hewn), woed, ebony, mahogany, and timber for earjenters.

The following pay one slxth grote per centner: Athes (not ley), birch, brooms, blood, bottle cases, bricks, cement, chalt clay (brown or stone), earth (eommon), earthenware (cominon), fayence (common), glass (broken), slue, leather, affal of tanneries, gravel, guano, marl, mill-stones, oyster-yhells, potters' earth, shall-lime, atones (hewn or not), sugsr-bakers' clay, ougar seum, tiles, winb-utonen, treea for planting, turf, fire-wood, houps, shingles, maceriala for banket-makers, and posts for fences. Gools not exprorted after three months, by paying 25 per cent. of the tranait duty, may have a further prolongation of three monthe.

Hambury.-The tariff is that of Decemier 29th, 1851.

Soneys. -1 marc-inanco $=16$ shlllings $=35$ cents.
Wëights and .1frasures. -1 centner $=119.504 \mathrm{lbs} ; 1$ $\mathrm{pfund}=1.067 \mathrm{liss}$. avolrdupois.

Iluties on Imports.-These duties amount to not more than $\frac{1}{2}$ of 1 jer cent. ad valorem; and the duties on exports to not more than $t$ of 1 per cent. ad valorem.

The following articlea are exempt loth from lmport and export duties: spparel of travelera, brought In by ths respective parties, or by a special permit of the director of customs ; lark, ungreund; barley; bones ; bronze metal ; buck wheat ; copper for sheathing ahlpe I bruss, old, also in plate or sheets; coal ${ }_{1}$ stone; gold and silver bullion or coin; open samplen of geode under il llas. Weight, exported and then re-imported through the same gate ; linens, with or withuut cotton mixture; linen bagging; malt ; oats; oil cakea; potatoes; printed matter; musical and scientilie maps ; raga, woolen or cottun ; raje-sced; rye; woul, sheep's and lamb's, raw ; wheat ; ginc, crude.

The following articles are free of import duties only: articles not exceeding 5 marcm-baneo ( 1175 ) in value; those also aubjected to excise duties not over 20 marcs laneo in vajue; limber, nlaves, tire-wood aud turf.

Those free of export dutien are: all articles under

20 marcs-banco (4) in value, regardless of quantity ; all manufactures of the city of IJamburg; all provis. lons for the immedate nse of vensels lying in harhor: artleles not exceeding 100 l bs . In weight, and not of greater value than 100 mares-banco.

Transit duties.-All goods re-exported within three months from the date of arrival, are free of ang* transit duty, if yet In the hands of original importers.
I.ubec.-The tariff le that of December Sth, 1851.

Ifoneyn. -1 mare $=\mathbf{1 6}$ кehillings Lubee courant $=$ 28.79 rents.

Weighta and Meosures, -1 whlp-pound $=23$ cwt. of 112 lbs. Finglish, each=280 $\mathrm{lba}, 1$ hispound $=14 \mathrm{lbs}$,

Duties on $/ m p o r f$ n.-All goods, whether of foreigu or home production, pay one half of one per cent. ad valorem, as given in the lnvolees, except the fulluwing articles, which are free of import duties:

Transil goods re-exported within three months after entry ; effects of travelers ; bousehold furnilure used; wool brought for the Lubee fair, and delivered at the wool warehouse ; goods on board vessels not consigned to Lnbee; wares on board ships entering the port of Travemnnde in distresa.

Goola where the value ean not be ascertained from the invoices, will the estimated at the lubec market prices. Articles of wood, as timber, boardn, shingles. plauks, mants and spars, staves, aud fire-wood, pay, alway, one half of one per cent. on the lubec market prices. Articles which pay an ad valorem duly, if their value does not amount to 25 mares ( 47 ), are free; from 25 to 75 mares ( ${ }^{7} 7$ to 21 ), the duty in levied on 50 mares ( $\% 14$ ); from 75 to 125 mares ( $\$ 21$ to $\$ 305$ ), the duty is levied on 100 mares (28), and so on. None but citizens, or their agente, have the privilege of clearing goods in the custom-house. Anuerican vedsels, however, are exempted from this regulation. $-U$. S., Com. Relations; M'Ccllocu's Commercial Dictionary; aee, also, Foreign Commerce United Statid, snd Quarterly Review, vol. vil., p. 130.

EIarbor, EIaver, or Port, a plece of water comb munlentlag with the sea, er w'th a navigable rirsr or lake, having depth sufficient to float shipa of conalderable burden, where there is convenient anchorage, and where ahips may lie, load, and unlead, ecreened from the winds, and without the rench of the tide.

Qualities of a good IIarbor.-There ls every variety in thin form and quality of harbors. They are elther natural or artificial ; but, however formed, a good haphor should have alfficient depth of water to admit the largest ships at all times of the tide; it ahould be eany of acceas without having too wide an entrance; the bottom should be elean sad good; and shipe ahould be able to lie close alongeide quayn or piers, that the expense and Inconveniance of louding and unlouling by meana of lighters may be avoided. Shipa lying in a harbot that is land-locked, and surrounded by high grounda or bulldings, are, at onee, without the reach of storms, tidee, and cyrrents, and may, in most casea, be essily protected from hestile attacks. Har harbors are thuse that have bare or banka at their entrances, and do not, therefore, admilt of the ingress or egress of large shlps except at high water. These are mest commonly river harbersmethe and and mud breught down by the stream, and driven back by the waves, naturally forming a bar or bank at their mouths.
The designing of hurbors censtituten confessedly one of the most diffleult branches ef civil engineering. In making such designs, the engineer, in order to avail himself of the advantage which is to be derived from past experience, must endeavor to the best of his power to institute a comparison between the given locslity and some other, which he supposes to be in pari casu. Perfect Identity, however, in the physical pecullarities of different stations, seldom, if ever, exists, and all that can be doue ls to select an existing harbor, which appears to be as nearly as possible simIlarly circumatanced to the proposed work.

In censilering the subject of the construction of harbors in exposed situations, the first and most linportant subject deserving eur attention is the thestructive nction of the element with which we have to deal - what are its energies when exclted by storms, and what the direction of its furces on the barriers which have been raised to control it ?

Smesten, in his history of the Bddystore, when speaking of the objection that might be ralsed agalast the necessity fer using joggles in the inasonfy of that building, says, "When we have to do with, and to endenvor to control those powers of nuture that are subject to no calculation, I trust it will be deemed pr adent not to omit in such a case any thing that can without difficulty the applied, and that would be likely to add to the necurity." This etatement of our greatest mariae engineer, ladleates the propriety of carefully collecting any facts that may help us to a mere accurate estimation of those forces which he regurded as being "suiject to no calculatiou." We shall therefore state a few facts which have been $B$ recorded of the destructivo powers ef the waves in intand lakes, and in the open есени.
At Port Sonnchan, In England, where the fetch is under 14 miles, a stone, weighing a quarter of a ton, was torn out of the masonry of the landing-slip and overturned. Mr. D. Stevenson, in his Enginetring of North Americu, descriling the harbors in Iake Frie, mentions having seen one stene, weighing upward of half a ton, which had been taken out of its thed in the pier at Buffalo, moved several feet and overturned. The Comte de Marsill, in his Histoire Physique de ia Mer, published at Amsterdum in 1725, states thut the highest wave observed by him

Dec.
on the ahores of Languecice in the Medicerranean wat, where the breadth is about 600 millea, wan 14 feet 10 Inches, At the mouth of a harbor on the German Ocean, with a fetch of about 000 milem, the writer had obmerved for him the height of the wavein duriag ecuth-easterly galen, and on one occusion the result was 131 feet from the crest of the wave to the trough of the aea. In deeper water, and with a north-emsterly gale, there in no doubt that the waven of the German Ocean will attala a height considerably greater than thin. In November, 1817, the waves of the German Ocean overturned, juat after it had been finished, a column of freestone 06 feet high and 17 feet buse. The diameter at the place of fraeture was abont 11 fest. In the Atlantic Ocean, Dr. Scorealyy stated, in a communicution to the British Association In 1850, that daring several hurd gales he had measured many wavea of about 30 feat, but the highest was 45 feet from the hollow to the crest. Waves of such magnitude could acarcely, however, reach our artiflefai iarbors, from the shallewness of the water near the shore. To these facts it may be added, thut of a block of 50 tons' weight being moved by the sos at Barrahead, on 1 of the IIebrides ; and what is far more extruordin. .y, blocks of nine tons' weight have been quar 1 , or broken out of their beds in situ, on the toju wa the Bound Skerry of Whalsey, in Zetlund, which ls elevated 85 feet above the level of the sea. The lound Skerry and neighboring recks, which are in the German Ocean, certainly furnish by far the mest wonderfui proof that has yet been discovered, of the great force whlch is developed by the billows of the ocean when auddenly checked by opposing rocks.

It has been stated (in the Trams. Roy. Sec. Edinburg) that, from elbservatiens which were made with the marine dynamometer (a self-ragistering linstrument dewigned by him for the purpose), the force of the waves of the Germun Ocean, during hard gales, had been found to be $1 \frac{1}{2}$ lons per superficial foot st the Hell llock; and of the Atluntic Ocesn to be 3 tona per auperficial foot at the Skerry vore Light-heuse. But these resulta may still be far short of the maxima. As the marine dynamemeter has been often found useful in indicating the force of the waves in situations where harbors were to be built, it muy be proper to give such a description of it as will enuble any one to have it made.

DE F D is a cast-lron cylinder, which is firmly belted at the protecting flanger $G$, to the rock where the experiments are to be made. This cylinder has a circular flange at D. I. la a door which is to be opened when the observation is to be read off. $A$ is a circular dlec on which the waves lmpinge. Fastened to the disc ars four guide-rods 13, which pass through a circular plate $C$, which ls screwed down to the flange

$\left.\begin{array}{lllllllllllll}0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 & 11 & 12\end{array}\right)$ nches.

Fig. 1.

D, and also throngh the holes in the bottom EF. Within tho cylinder there is attached to the plate $\mathbf{C}$ a powerful steel spring, to the other or free end of which la fastened the small circular plate K , which egain is secured to the guide-rods $\mathbf{B}$. There are also rings of leather, 'I, whlch slide on the guide-rods, and serve as Indices for replatoring how far the rods have been pushed through the holes in the bottom, or, lin other words, how far the spring has heen drawn out by the action of the waves against the dise $\mathbf{A}$.

In comparing an existing harbor with a proposed one, in order to ascertain the dimensiona which are necessary to inaure stability, perhaps the most obvious element is whet may be termed the line of marimum exposure, or, in other words, the line of greatest fefch ur reach of open sea, whleh can to easily measured from a chart. Hut though ponsessed of this information, the engineer still does not know in what ratho the helght of the wave lncreases in relation to any given increase in the line of exposure.

As this inquiry is ono of great moment in the practice of marine ongineering, and has not lieen in nny way Investlgated, the writer has for rome time lack been making ocemsional oloservatons on the subject, when favorahlo dircumstances occurred. Theso observations have heen but limited in extent, and can not be regarded as deserving of confidence unless in cases where the two harhors aro not far different in their lines of exposure. So far an these experiments have gone, the waves sems to increase in hetght most nearly in the matio of the square root of their distances from the arimetrond shore.

It does not follow, however, that the line of maxlmum exposure is in every case the line of maximum effective force of the waves; for this must depend nut only on the length of reach, but also on the angle of incldence of the wates on the walls of the harlor. What may he termel the line of maximum effertive ex. poanre is that which, after being corrected for obliguity of impact of the waves, produces the maxinum result, and this can only the taken from the chart after successive trials. Let $x=$ the greatest force that can askail a pler, $h=$ height of waves which produco (after being corrected for obliquity) the maximum effect, and which are due to the line of maximum effective exposure. Sin $a_{\text {- }}$ - ine of azhmuthal angle formed between directions of pler and line of maximmo effertive exposure, radius helug noity. Then $x \times h \sin ^{2}$ a when the force in resolved normal to the line of the pler; hut if the force is resolved again in the direc. tion of the waves themselves, the expression heromes $\boldsymbol{r} \propto h \sin ^{3}$ a.*

It shoull nut the forgotten, in conncetion with this subject, that there are variona qualifying elements to which succial uttention reguires in some cases to the given. The waves, for eximple, may often the nuticel, when approaching the layd obliguely, to alter their dirertion when they pet close to 're shore (ln conserucuse of the depth changine", as to atrike it more nearly at right angles to ti... general line of the heach. In this way a swell from the ocean may enter a loay which is not directly exposed to it. it ahould also be ohserved, that the lines of expmanure can not te directly compared if the depthe of the water through which they bass are materially different.

The tiden, tio, exert lin many phaces a very deeded effect on thu nature uf the billows, in amo places canslog waves of un unusually dangeroun character, while ut others they are funm to run duwn the vea. If a marime work is xituated in a more or rapld thlom way, such, for example, as those called "roosta" in tirkney and shothand the masonry whll be expesm to the ation of a very trying and dangerous higherresting sea. An ant exumple of this, we may refer to I'ort-l'atrick in Wigtonshire, where the violenwo of

[^24]the waves is, we have no doubt, much due to the rapldity of the tides. If, on the other hand, the race or roost runa in such a direction as to be entirely uutside of the harbor, and at somo distance off, It will have a decided tendency to shelter the works, and to act an a breakwater. Thus it appears, from observations at Sumhurg Iland Light-house in Shetland during a southwosterly storm, that no long as tho Sumburg roost (one of the most formidable in those seas), was cresting and breaking heavily, one could have caslly landed in a small boat at a croek or bay called the West Voe; but no sooner did the roost disappear toward high water than there camo in towerlog billows that totally submerged eliffs of very consiterable helght. The study of the modifying and intensifying effeets of tidecurrents on the waves of the sea soems to have been entirely neglected in the late disenssione regarding the merits of vertical and sloping walls, which will be reforred to in another section of thia artlele.

From careful inquiries, as well as from hetual personal experience, of such formidable breaklag waters as the lloar of luncanstay, and the Merry Men of Mey in the l'ontland lirth, and sevoral othorn, we are of opinion that the true cause is the smell of the sea encountering a tilal current running in a direction more or less opposed to that of the waves. While it is obvious that two rapill tides may meet eneh other without any dangerous effects, it la also quite true that when two tides meet each other in a rough sea, as In coming round such lwhands na Stroma or Swona in the Pentlanil Firth, the eifect of their unbon being to lncrease the current nt that place, there will be produced a highly dangerous sean; lut the fact of their meoting, though ealeuInted to aggravate, Is not, we think, the primary cause. The races which occur in open seae, as, for lnstance, off heallamels and turning-points of the coast, are certhin prortions of those sens in which the wavea break to n greater or less extent, although the water may he very deep, and there may be no wind at the time. At nll such places it will be found that there are rapid tides. The roosta on the weat comat of Orkney ur uf the l'ent'iad Firth, for exumple, are wrarst with thh tides and resterly awolls, because the Athantic swell amd current of ebh are opposed. Thone again on the east coast are wornt with fhood tides and cas'erly swella from " similar cause. Thus at the east eal of the l'mit. lamil Firth tho lioar of lluncansbay is well knowis to rage with easterly swella and a tlood tide; whereas, at the west end of the amme firth, tho Merry Men of Shy are equally well known to be wont with (bh) tide and a weaterly awell, at which tlme no boat conld vinter thent without the risk of leing overturned. The danperous surf which exiats at the monthe of some risers is, we believe, not soldy dhe to the want of depthat the dar, hut also to the meeting of the outward current with the waves of the sea.

When a swell encounters a rapid opposing current, the ouward motion of the wases aeems to lowatrested, and their width leeomes vinibly decreased. They git hlgher and stepjer, creat, and at last break, som times rery partially, und at other times almost as they would on it shelving heach. It uppears to us poossible that several waves may ultimately combine in such dis. turbed waters bito one monitainous billow; for the wave that has parthally broken may have its onward mothon so much chenked as to allow the wave behind to overtake it, amblaving than coalesced, they mas, as one large wave, acquire a muperior velueity, मo an to over. tahe elume in front and te further angun nted ly the uniint of other waves wheh have retlected from the shore.

towne in Englend wonld, without any donht, be weshed Into the sea during the first stormy winter. As a further proof of the great effect of the tldes in exaspernting the waves, we may mention that the time when moat damage is dene to aca-works whlch are in tolarably deep water, is from one to two hours beforo uni after high water, which nearly corresponds to the time when the tide runs atrongest outalde. We have found thia to hold true at many different parts of the Pinglish coast, and rofer to one well-marked Instance. It l'eterhead harbor, which projects prominently into the sea on an lsthmuf, the thles, nt hit a ahort ilistance seawarl of the harbor, run very rapilly. On the 10th of January; 1819, there was a very heavy sea, and a crowd of people were down, nbout tiro hours before high wrter, helping to secure the whalers and other vessels in the harbor, when three successive waves curried nway 315 feet of a bulwark, foumeled $9 \frac{1}{2}$ feet above high-waier springs, which had atood for many years. One piece of this wall, welghing 13 tons, was noved 50 feet. After this outbreak of the nea the waves became more moderate, until ahout tro hours "ffer high ocnter, by which time the large whaters had taken the ground, when other three enormous waves again swept over the harbor, subuerging the qua; a to the depth of from 6 to 7 feet of solid wnter, hy which 16 people were drowned. These waves filled the harhor to such a depth as to set all the whalers afloat again, and they continued so for several minutes, until the excess of water had run out through the harbor month. These gigantle waves were, in our opinion, clearly the result of some such netion as has heen attempted to bo describel. We should mot have dwelt at such length on this suliject were it not that we wigit again refer to the faets when wo come to treat of the sulbect of vertieal and slophig walls for harbors of refuge, where it is of importance to show that even in the deeprent water, the waves are not purely oseillatory, but thint wherever there la a tihe-way the waves will more or less partuke of the gualities of waves of translation.

Relution beturen height of wates ant depth of water. Anether circumstance affecting the exposure of my marine work is the depth of water In front of it. Tho great mountainous billews so commonly met with in the Ailantis: Heean can not he generated lu tho slatlower waters of the therman Ocean, unless perhaps in surh preullar circumstunces as have just been miverted to. It becomes, therefore, of great consequence to asertain the maximun possible wave la a given depth of water.
Sr. Scott luasell, whose oliservatlons on what may he called the marine branch of hyalrodymames are of such groat value, has atated that if waves be propatfated in ot channel whose depth diminishes unlfurmily, the waves will break when their helght above the surfare of the level huid becomen equal to the depth at the hottom helow the surface ( 10.125 Mith. Aseme. Rep. on Wares). 'This rtatement, the menning of which seems doubtful, Mr. Ruswell elsewhere (Instif. I'ib. Ang., p. 1ibi), deflines thus: "The nuthor has never noticod a wave so much us 10 feet high in 10 feet of water, nor so muelh nis 20 feet high in 20 feet water, nur 3 be feet high in 6 fathoms water; but ho has seen "aves "pproach very nearly to these limits." It is presumed that the ditum here referred to is the mean lowet of the surface of tho sem. W'o have had too opfurtunitien of verifying these ohservations: hut as the sulijoct is very important-lacame the depth of water in front of a work may be sald to the the rullig plemont which determines the amount of fore which it has to resist, whatever the the line af maximmen expo-sure-we slull simply state what has eome within our "wn hawledge and oharvition. Wo have repentedly seen at altionent prarts of the count lirenking waices of from Ito 5 fuet, messuring from hollow to crowt, in from 7 feet 8 lnehes to 10 or 11 fret of whter,
measuring from the hottoin $n \mu$ to the mean level; and on one ocension we were toll of waves which were estimated at $9 \frac{1}{2}$ feet $\ln 13$ feet water. It must, however, be berne in mind thint these olservationa, and we conceive alno those of Mr. Russell, apply only to common waves of the sen, or those short, steep, and snperfielal waves whieh are due to an exlating wind, nud not to the ground awells which are almost constantly to be found in the open ocean, and whleh may be the result of former gales, or are tho telegrnjh, as Mr. Russell terms them, of those which are yet to come.

From what has heen atated, it woull appear that in mest cases the heaviest waves whould assull any tidework at high water. Thls, however, ns mentioned in the last sectlon, is not always the ease, the greatest damage behig often fount to oceur at the tlme when the thide rana atrongest. Mr. Jeslle found that the Arbronth IIarbor-works were In genernl less severely tried by the very henviest waves than by n elass of waves somewhat smaller than these, owing to the outlylug rocks, which, from the small depth over them, lud the effect of tripping up the heavier seas, and thus destroying them before they renched the lurbor, while the depth was sullielent to allow the smaller waves to pass ofer the slimals unlroken. In some cases of acvare exposure the waves miflit to some axtent he reduced by dropping very largo siones ontside of tho hurhor, so as, by forming an urtificinl shonl, to canse them to crest and lireak. One great diflenity connected with the suliject of the generation of wises still remalns unsolved, via, - What are the minimum lite of exposure and area of sen whlle are compatlhle with the existence of a ground swell? This question, we fear, ean not the answered in the present state of our knowledge.
Deep: I'uter Harbors-- Warhors of refuge are distinguished from tidal harbora mainly lyy the superior depth of water which they possess, bud the larger area which they inelose. The requisltes are shelter during storms, mid easy aceess for shipping at any time of tide. There has been much disenssion its to whether piers for harbors of refuge should he rertical or shoping. tol. Jones, R. Fi., has espechally monated the superior merits of the vertical watl; and the discussions on his plan at the Institution of ('ivil Engineers, und the able protest hy Sir Iloward Houghes, will ho fomme, from their interest and importane, to merit a eareful perumal.
The principle which is asserted is, that ocomic wavea in deep water are purely osellatory, und weuld oceasion no lumate agatinst vertical harriers, whilh would lie the mont eligible, as they would anly luve to encounter the simple hydrostatic pressure diue to the height of the apronching hillow, and would rethort the waves without cansing them to braks. Were it even admitted that the waves were purely oscillatory, and were rollected by a vertical harrior, would no fores, it may he anked, he expended when the motion of the particles was reversed? The rellection of a wave is equivalent to the nearly instantaneous creation of a wave in the oplosito direction, fur which a very considerable force mast surely he required.

We beliove, lowever, that from the etbont of tile eurrents, to which we have alroady referred, and perhaps from other catwes whose artion seems to have been overlowked by the mlvocates of the upright wall, any form of thrifor, In whatever depith it may have been erected, mist be ocrasionally smbjeeted to heavy impart. We comedve that the possibillty of waves of transhation belng generated in the deepest water has lewn already estalisished, if wo sucereded lin sutisfylug the reader of the truth of the following nsser-thons:-Hirst, That waves break In deep water during calm weather: "finet which is appurent to the eyo, and fanillar fis all sailors: and, sroondly, and negatively, That to leewaril of thone races or porthons of' broken water, whish ecrtainly do not reflect the inceming
waves, there is comparatively amooth water both at sos and on the adjoining shores, until anch time as the strength of the tide is exhauated, and the roost has disappeared, whon violent action is again fully manifested.
If It may be argued that theae are extreme casea, and that augh high velooitios in the current of the tide are soldiom met with. $\lambda$. This objection has, no doubt, truth in it ; but atill the tendency is shown, and though the velocities may be less in other quarters, there may yet be quite enough to destroy the condition of atagnar tion which the oscillatory theory assumes. The bresking of waves at sea, and the existence of races, seem to prove boyond question that waves of translation are possible in the deepent water. Is it not also a probable case that waves which have been reflected by a vertical wall, and have (irrespective of the queation of tide currents) combined with the advancing waves may then become waves of translation, possessing all the elementa which endanger the stability of a sea-work? Or, again, how much more damage would reault to a vertical wall than to a slope of loose etones, from the alnking of the foundations, or from their getting underwashed by the reaction of the wavee? It therefore appears that the method generally resorted to of fotming deep water harbors of masses of rubble stone with long slopes, so as to form an artificial beach for the waves to spend on, is, in most circumatances, the best and cheapest kind of conatruction. We inclino, however, to the adoption of an npright wall, founded on the rubble as a basis (aimilar to that at Cherbourg, about to be described), in preference to long paved slopes, as there is ulway's experienced a great difficulty in founding the toe of such tulus walle among the loose rubble. When pitehed slopes are adopted, great benefit will be found to accrue from leaving at the bottom or toe of the slope a wide foreshore. Much, however, depends on local peculiaritios in selecting the best deaign for any work ; and the nature of the iottom is all-important. Where the lottom is soft, e vertical wall can hardly, if ever, be attempted.

In making these remarkn, we mukt not be understood as condemning the adoption vertical walls in cases where the foundation is good. All that we assert is the opision, that waves of translation do exist in deep water, and, therefore, that hariora of refuge will prove failnres unless they aro built in such a manner as to reaist the impact of those waves of trunslation. The Cherbourg breakwater has leen often referred to as a succesaful instance of the appileation of a vertical wall, and has been contrasted with the Plymouth breakwater, which has a loug alope. Ilut tints appeal is quite fullacious, as the profiie of that work is, as alreaiy hinted, of a composite cimaracter, consisting of a talua wall sloping at the rate of 10 horicontal to one perpendicular, aumnounted by a plamb wali ; so that whatever merit may be suppomed to belong to the vertical prefte is entirely nuliified at Cherbourg by the atrong talus wall in front, on which the violence of the waves is mueh liroken. Moreover, the heaviest waves at Cherbourg come from the north-weat, and do not sasail the break water at rightangles te its direction, but come more nearly end on to the work, so as to a great extent to run along the outer wall. The north-west waves are propagated from the Atlantic, winile the waves which are most trying to the work come from the north, in whicis direction the line of exposure is oniy about 21 leaguea. These facta we obtained during a recent vialt to Cherhourg, undertaken for the special purpose of ascertaining the physical characteristics of the place. 'I'he attempt to make out a paralleliam bet ween Plymouth, which faees the Athantio directly, and Cherbonrg, which is comperatively land-locked, can not, in our opinion, stand the test of a candid inq̧uiry.

Other comparisons may be referred to which have been advanced on equally untenable grounds. Thus,
the old pier of Dunleary, which ia vertical, and has stood well, has been compared with the talus walls of Kingstown harber, which new protect Dunleary; and which have often recelved much damage. The allimportant element of depth of water has been in this instance entirely overlooked; for at Kingatown there la a depth of 27 feet, while Dunleary la all but dry. An able writer on the same questio vexata, in comparing different sea walla in the Firth of Forth, has, in like manner, not sufficiently adverted to the great differences in the depths opposite the works to which he rofers.
An important advantage of the sloping wall la the small resistanco which it offere to the impinging wave, but it should also be borne in mind that the weight resting on the face stones in a talus wall is decreased in proportion to the aine of the angle of the slope. If we suppose the waves which assail a sloping wall to act in the horizontal plane, their direct impulae, when resol ved into the force acting at right angles to the sloping surface of the talus wall, will be propurtionul to the aine of the angle of Incidence. The effective force when eatimated in the horizental plane, will be proportional to the square of the sine of the angle of incidence. But if we assume the motion of the impinging perticles to be horisontal, the number of thom which will be intercepted by the sloping surface will be also reduced in the ratio of the aine of the angle of incidence, or of elevation of the talus wall. Hence the teadency of the waves to produce horizental diaplacement of the wall, on the assumption that the direction of the impinging particles is horizontal, will be proportional to the cube of the sine of angle of elevation of the wall.
If it further happens that there is obllquity of action in the azimuthal as well as in the vertical plune arising from the relative direction of the pier and of the waves, there will the another aimilar reduction in the retio of the squares or cubes of the angle of incidence according as the force is resolved into that at right angles to the line of the pier, or to that of the direction of the waves.

Iet $\phi=$ vertical angle of incldence or angle of elevation of wall ;
$\phi^{\prime}=\approx$ azimuthal angle of incidence ;
$f=$ horizoatal force exerted on unit of surface at right angles to the line of harbor wall; $h=$ height of gresteat assalling waves; $f \propto h\left(\sin \phi \sin \phi^{\prime}\right)^{3}$.
The above expression assigns, we think, to great a reduction, as the motion of the particles may not be horizontal, and no account is taken of the effects of frietion agalast the rougis surfuee of the masonry. Experiments are therefore wanting to dutermine the constant for correcting the theoretical reaulte due to this expresaion.
Parabolic I'mfile.-Mr. Scott Russell recommends the parabolic curve as that best suited for the protile $v$ here the oliject is to break the waves, and not to reflect them, as is the cane in sloping breakwaters. This curve posmesnes, according to Mr. Mussell, the advantagen of zuperior strongth, of economy in the naterials, of breading the wave carly, and of concinuing an uniform action over the iongest perion of time. When the tide is low, the toe of the slope, which springs out of the foreshore and forms the vertex of the parahola, wouid, we fear, be found rather weak, and perhape diffleuit to form. Ou the whole, wa rather incline in such cases simply to throw in the materials, and to allow the sen to form is own siope.
According to Sir Join Hennie (A ccount of I'lymonth Bnalionter), rubbio breakwaters with slopes formel at the angle of repose, were adopted by the Greeks in the moles of Tyre and Carthage, and by the Romans at Athens and Haliournusaus. The same denign was also followed at Venice, Genon, IRochelle, IJarceiona, and other places, In this kingilom tho first exampie on a large seale which we find is at liowth. Kiagstown, Holyheal, and the noble breakwater at Piymonth, were afterward enrried out on the aame princi-

ple, and chiefly under the direction of the late.Mr. Rennie. The great nationul harbiors of refuge at present in progress in Great Britain, according to Mr. Rendel's designs, at Holyhend and Portland;'are on a similse principle'; while those under Mesaris. Walker, Bargeas, and Cooper, at Dover, Alderney, and Jerieay, are more nearly vertical.

Forms of Walle for Tidal Harbors.-Having now considered the few facte of which wo are in possesaion, regarding the disputed astare of the impulse of the waves In deep watere; we shall direct the reader's inttention to their effects in ohallow water. : These in deep water were chiefly whole waves, and regarded by many as being purely oscillatory, whillo those in shoal waters are breaking waves, and therefore regarded by all as waves of trenslation. Wo have hitherto been considering breakwaters erected In deep water, and which were conatantly exposed to the waves; we now tarn to plers und sen-walis which are placed within the range of the surf, and which are exposed to its force for a limited period only, being sometimes left nearly, or altogether dry by the receding tide.
The impulse of the waves agsinst a sea-wall or pier may be resolved practically into four directions:-1st. The direct horizontal force which tends to shake loose, or carry before it, the blocks of which the opposing mseonry consista. This force may slso blow up the pitching, or overturn the inner or qnay-wali by condensing the nir, or preseing upon the water which occapies the interstices of the rubble. We know two csses in the German Ocesn where, in consequence of want of width in the pler, coupled, in one inatance, with insufficlent workmanship, the inner orquas-walls were observed first to bulge and fall, before the neawall was injured. One of these piers messured 26 feet 4 inches, and the other 24 feet, on the rosdway. 2 d . The vertical upward force which may act on any projecting atone or protuberance. Bd. The vertical downward force of the water which results either from the wave breaking upon the toe of a talus wall, or from the wave passing over the parapet, and falling upon the pitching behind, so as to plow it up. 4th. The back-draught, which tends by reaction from the wail to plow up the soft bottom, and thus to undermine the lower courste of the work, or perhaps by suction to pull ont the face-work. We may conclude from the above, that the pointe which require to be carefully sttended to are-1st. The contour and quality of masoary of the wall itself; 2d. The parapet, which, if not of suffieient height, or built in a proper direction, leade to damage in the pitehing behind it; and 8 d . The foindation-ceurees, in the design and coastruction of whiok, if similar precantions be not attended to, underwashing of the hottom may in some situationa take place, so as to leave the lowest courses without protection.
We shall in the first place consider how far thone rensirks are applieable where the bottom is solid rock. Sueh s anpposition will render unnecesmary any precautions arisling from the wasting of the inttom, and, ceteris paribua, there does not seam to be my reason for preferring a talus to a vertical wall. The question of preference in such a case will in the main depend upon the kind of material which ean the oltained. Should the atone be searco or costly, and the quality surh as to warmant the introduction of masonry of tho best description, the vertical wall may be found to be the most economical. Where freestone is to be uned, it is not only desirable that it should be got in large blocke, but that the face stones sheuld nossens cousiderable hardners. This precnution ls particulariy necensary in selncting the stones, for the lower courses, and especialiy where the beach consists of hnrd gravol. For tie same reason, it is highly imiortant that all stones which are subject to decay from atnospheric influence thould be either entirely rejected or assembled in the upper conrses of the parapet.
(1.Where the materials are abundant, but of an nn: worksble nature, a long talus wall will generally be found most economical. For such walls the rate of slope must depend very much upon the exposure of the place, and upon the plentifulness of rubble-stone hearting. The easily-dressed and naturally flat-bedded materials, which the stratifled rocke of the secondary formation very often furnish, are especially applicable for the constraotion of vertical walls; while the uncouth blucke of the primary and igneous formatione are better mited for talus walle. * Such mocks as gneiss, the sohists, basalts, greenstones, amygdaloids, and the teugher kinds' of granite; are beat fitted for this purpose. With some of those rocka the angularity of the pieces, and the oxcessive difficulty of dressing, render it necessary to assemble them without slmost any alteration of their ohape, by an adaptation of their saliont and re-entrant angles; so as to make a kind of random rubble face-work. In this kind of work, mortar is very seldom omployed. The parapet generally consiste of squared masonry, eurmounted by a heavy cope, and it should in every case be eet in good lime mortar,
Where the materials are light and of emall sizes it is desirable to equalize the action of the sea over the whole work, and not to concentrate it against any particular piace. Mr. Ruseell states that the cycloidal form was recommended for this purpose by Franz Gerstner, of Bohemia. The only instance with which we are acqualated of the adoption of this curve was ist a sea-wall erected at Trinity, near Edinburg, by the late Mr. Robert Stevenson, in 1822. It has been already stated that irrespective of the quality of the masonry, the two points in the structure which are weak or dangerous are the top and bottom of the wall. With a mocky bottom the risk of failure at the foundations la removed; on the other hand, where the shore consists of rotten rock, moving shingle, or sand, it is obvious that provision must be made for both those sources of ovil. In fact, if we consult the history of our harbors, we shall find that by far the most frequent cause of damage is the renction of the sea againet the shore.
The genersl slope of a fragmentury beach must depend upon the size and nature of the particles and the force of the sea. The dissimilarity between the slopes of a beach near the levels of high and low water, srises from a decrease in the force of the waves, owing to their being broken before they reach the high-water zaark. The great object, therefore, is to design the profile of our wall so as to alter as little as possible the symmetry of the beach. Where isoluted rocks or large boulders are eeen projecting above the surface of a aandy heach, there will generally be formed around them hollowa, corresponding in depth to the kind of obetruction wbish the rocks present. The principal point in the dosign, therefore, must be to avoid great and suddea obstructions to the movement of the witer. The best form whioh could be adopted ln any situation would of course be the same ns the cross section of the bench itself, but this would answer no possibie purpose ; and, as the wall is to consist of heavy blovks of stone instead of minute particles of sanil, it is clenr that a muel steeper slope may be adoptell than the profile of conserrancy of the coast, provited the lowor part of the slope be finttened out so as to smons the sand at a low angle. The sction of - tuiwark is to arrest the waves before they reach the general high-water mark, and to change the horlzontal motion of the fluid particies to the vertienl plane, or to compel the waves to destroy tibentselves on an artificial beach consieting of heavy stoues. To prevent underwashing, the two following requisites should therefore be as far as possible secured:-1st. The foundation courses or bottom of the wall should riee $n t$ a very amnil angle with the beach, so that their top surfaces may be coincident with the profle of conservation of that portion of the
beach out of whlch the wall springs; 2d. The outline of the wall ahonid be such is to allow the wave to pass oeward without any audien check till it shall have reachod the strongest part of the wall, which ohould be as far from the foundation as porsihle.
Those two requinites show clearly how Inappllcable a vertlcal wall must in most cases be for $n$ sandy beach. Instead of altering the direction of the wave at a dls tance from its foundation, the whole charge is produced at that very point; and nnless the wall be founded at a great depth, its destraction is all but certaln. Where the materials are costly, but admit of being easily drossed, we are disposed to think that a herizental, or nearly herizontal, wall, connected with a vertical one by a quadrant of a eircle, may be found auitable. Such a form will prevent, to a considerable extent the danger of reaction, by causing an alteration in the ferm of the wave at that part where the wall is atrong' est and at the greatest distance from the toe or curb course. Where the materials are abundant and of a rougher nature, a cycloidal wall, with vertical and horizontal tangents, somewhat similar to that erected at Trinity, to which we have already referred, may be adopted with nivantage.
A special caution may not be out of place regarding clayey bottoms. Many are apt to suppose that there can be no better foundation than clay; and it is indeed true that aome kinds of hard ciny form a satisfactory subsoil. But there are others of a softer kind, and permeated by sandy beds, which are extremely treacherous. If there be the slightest dip seaward, there is niways a risk of any jifer that may be bnilt on auch a base rlipping, loodily into the sea. This holds especially true of ininnd locks, where the siden very often nlope suddenly. In one instance, the particulars of which we got on the apot shortly after the accident, a pier built on a clayey bench, sloping below water at the rate of one in 12s, auddenly begen to move, and after two honrs it had slipped reaward 150 feet, and had by that time descended bodily a height of 34 feet, the top of the pier being then no less than 23 feet leelow low-water apring tides.

Construction of Ifarbors,-Our $n$ nace will not admit of our going much further into the subject of the construction of harbors than the few remarks we have already made. A knowledge of such mattera may, to some extent, be acquired by n careful perusal of the published historien of marine works; lut, nfter all, it must be confersed that the only valuabie tencher in this wide practical fleld is experience. It In, In truth, impossible to lay down any general rules of guidsnee as to matters of this kind. Ali thut can the done withIn our apace in to notice very briefly some of the more important methois of working. And first, with regand to that invaluable piece of apparasus, the diving-bell we would refer to the article on the sulsject in thin werk, and to Smeatox's Arrount of Ramagate IIarbor, published in 1721, where it was firat applied hy him to inrior workp. The diving-helenet is a most useful and convenient modlifation of the diving-liell, and is now very generally employed.
(If late years, the use of beton as a subwtitute for backiniz has been introducel. This artificial moncrete in sometimen uned in enormous masses. We have seen at Cherbourg blocks of 50 tons prepared in loxen, whose nides and tops are removed sfter the concrete han aet, in order to the again aimilarly employed. The projortions used at Cherhouriz by M. Rebelle were two of and or fine gravel to one of Portiand cement.

We may also mention that the method of aasembling stones on their edger, instemi of on their beds, which formerly wan in twe in mome old Scottish hashors and men-walli, as at St. Ardrews, I'restonpans, etc., dezerves to the more generally known sind adopted from its muperior strength.

The proposal of Mr. IIremner, of Wiek, for putting it the foundations of low-water piers nlen merits no-
tice. Mr. Bromner proposes to construct, in some adjoining place of shelter, enormeus pontoons of timber on which the ander parts of the work are hailt, und afterward fleated to the deaired apot in favorable weather, and carefully grounded. Sach a plan might, we have no doubt, bs found economical and nseful in some situations.

Mr. Rendel'a Mfethod.-Mr. Rendel has introduced an improved method of assembling the pierres per dues or rubble used in the cenatruction of large break. waters; this method he employed at Millbay Pier, near Plymouth, in 1838, in a depth of 88 feat; and he is at present carrying out the amme principle on a still larger scale, in the construction of the hreakwaters at Holyhead and Portland. The improvement consists in depositing the rough materials from stagings elevated a considerable height above high water. The stonea are brought on the staging in wagonn, through the bottoms of which they are discharged into the aea. The principle on which the stagings are designed is that of offering the smaliest posaitle reaistance to the sea, the under-atructure consisting of nothing neere than single upright piles, there being only one fine of piles for each road way.

Harbors of Refuge.-Mr. Rendel statea: "I use no timber braces of any kind, as these offer more resist. ance to the aea than strength to the staging. At Portland, England, where any accident would be a serious evil, owing to our employing cenvicts in the quarrics, we stay the piles with iron gays, fixed to Mitehel's crew moorings, and aiso truss the outer piles in each row with iron rods. We also fix the piles in the ground with a screw. At Holyhead, however, we only attach to each pile bexes filled with small stoncs, for the purpose of getting them into a vertical position, and use no stays or guys of any kind. The superstructure conaists simply of balks of timber, with rails laid on them to carry the wagons. The pules are placed In rows 30 feet apart; and the ease ond certainty with which the staging is constructed is auch that is length of 80 feet, including the serewing in of the piles, the laying down of the roadways, nad ail minor works necessary to make them fit to carry the wagons, never occupies anore than one working day and a half, and eften less. The lengti of the piles tinat we are now using varies from 84 to 90 fect, the depth of water at both Holyhead and Portland being about 11 fathoms.
" Of the atrength of the stage you may judge from its earrying on each roadwny as much as three wagons, weighing in the gross 12 tons each. The alvantages of the staging ara obvions. It contributes greatly to the consolidation of the stone, It makes a greater length of breakwnter to the under construction at the same time, and it enables the deposits to be earried on without interruption almost in the heaviest weather. As an lisatance of thin, imny remark that my resident at Portland informs the that the wagons and lecomotives were engrued yesterday at $\boldsymbol{n}$ time when such a sea was running that large bodies of spray were thown bis fect above the water-level. As a proof of the farilities which the atags afford for rapidity of construction, I whould state that we have deponited this year at liolyhead, where free lator is entployed, nearly 1,000, , in toun of atonea. The losen from arcildent to the stage is comparatively amall on ita tirst ceast, and when spread over the coat of the whold work it is a mere tritie. I fud the sen-alepes nre, in the ilecp water and exprised parta, from five and a half or six to one hetwern six feet above high.water, and froin 12 to 15 befow fowwater, from which point they rapldly becone alsout one to one. The inside alopea are never more than one and a quarter to one, and seddom more tian one to one. The mnterialn are excelient for our purpose."
Aiderney, Jersey, Ihower, uwd I'lymouth.-Mr. Walker has also contributed poms fuets connected with the construetion of the great works now going ont at Jer-

sey, Aldarney, and Dover. At Alderney, which is a very exposed place, the base, up to 12 feet below lowwater, Is formed by atones thrown, or rather dropped, Iu from barges. Up to low-water, the work is all done by diving-halmets. The wall ls faced wlth granIte, backed with blocks of beton made of sand, shingla, and Portland eement. Above low-water it la faced with stone of the lsland, a kind of millstone-grit, and is backed with bloeks of rubble set in Roman cement. The millstone-grit Is raised in very large blocks. The profile is to consist of a quay, an esplande, and a parapet. Jersay is much the came as Alderney, but the pell-mell work la carrled to low-water, having nearly vertlcal walle of conglomerate built above. Dover has nearly vertleal walls, faced with granite from the very bottom, which is now 45 feet below low-water. This work was done with diving-lells. Sir J. Rennie, in his Account of the Plymouth Breaknoater, says: "From the bottom to within elght feet of low-water springs, we find that the slope is two and a half or three to one. IIere the effect of the waves Is comparatively emall, being neutralized hy the mass of water. From thence to low-water of spring-tldes the slope Incraases from three or four to one, but between low-water of springtides and hlgh-water, when the effect of the waves la greatest, there wo found that the rubble would not lie at less than five to one, while on the Inside, the slope stands generally at from one and a half or two to one." The above interesting details regarding these national works show, from tho varlety which they exhiblt, how diffieult it is to lay down any general rales for the conatruction of harbors, and confirm the prlaciple that each wark must be judged of per se.

Miscellaneous Observations.--The nltlinste object of cot trneting harbors is, by lowering the height of the waves, to preserve the tranquillity of the area of water whieh is inclosed by the piers; and this property is varlously possessed by harbors of different forms, and depends much upon the relutivo wilths of the entrance, and of the Interior, the depth of water, the shape of the entrance, and the relation between tho direction of lts opening and that of the line of maximum exposure.

The only formula of which we are nware is that by the writer In this article (Edin. New Phil. Journal, 1853), which gives an approxination to the reductive poser, or is, In other words, a numerical form of expressing how much a wave of given height becomes reduced after it has entered a harbor. 'lhough the results oltained by the formula may not bo absolutely correct, this will bo no objection where the object is merely to oltuin a comparativa value; as, for example, In comparing one design for a harbor with another. When the piers are high enough to screen the ianer area from the wind, where the depth is unifurm, the width of entrance not very great in comparison with the width of the wave, and when the guay walls are vertical, and the distance not less than 50 fectlet

II $=$ height in feet of waves in the open sen.
$x=$ reducel helght of wayes in feet int place of obrervation in the interior of the harbor.
$b=$ breadth of entrance to harbor in fect.
$B=$ breadth of harbor at place of ohservation in feet.
$\mathrm{D}=$ distance from mouth of harior to place of observation lin feet.

This furmula has been found to give good approximatloas at several harbors where the hoights of tho wavea were registered. When $I I$ is assumed as unity, $x$ will represent the reductive poter of the larbor. In situations where the highest waves cross the hurbor mouth st an ohlique angle, a further reduction is ilue to this cause. Wo tuave been nabla to find any observations
that have been made on this eubject by others, and for want of better, we shall give three obsorvatlons made under our directlons at Latheronwheel herbor:

Thase must however be ragarded as but approximations. It is obvlous that as the wave may be deflected through more than $860^{\circ}$, the eurve representing the reduction must be spiral ; but more observations are wanted to determine of what kind.

Booms are loga *timber placed across the mouth of a harbor, or thi entrance to an innor basin or dock, having thelr ends secured by projecting lato groovas cut in the masonry on each slde of the entranee. The booma are droppad into the grooves to the number of from 10 to 20 , or as many more as will insure closa contact of the lowest one with a sill-piece placed in the bottom of the harbor, without which precaution the awall is found to anter the harbor from below the booms. By this contrivance, which forms a temporary wall, the waves are completely checked and prevented from apreading Into the Interior basin. The longeat booms we have seen are ahout 45 feet; and in some places, as at Hartlepool and Seaham, in Durhamshire, thoy are taken out and in I•V steam-power. Though perfectly successful In their tranquillizing effect (provided they are kopt in contact with the sill-plece at the bottom), booms are not suited for the mouths of harbors whare there is much traffic, as the shlpping and unshipping of so many logs of timber can hardly take less than a quarter of an hour-a delay whieh might In may cases be attended with serious consequences.

It is very desirable, and In some cases essential, that thare be either a considerable internal area, or else a separate busin opposite the entrance for the wavea to destroy or spend themselves. Such a basin should, if possible, be nude so as to preserve a portion of the original shore for the waves to break upon; and when eir.umstanees rendered this inpossible, there should at least be a tlat talus of two or three to one. Talus walls of ono to one, or steeper, will not allow the waves to break fully, but will reflect them in auch a manner as might in some cases make the entrance diffleult, or even dangerous, of aceess, and the berthage within unsafe. There are many inatances of harbors being materially injured by the ercetion of a quay-wall across a beach where the waves were formerly allowed to expend their force. It may be observed that when there is an inuer harbor or stilling-basin, the elliptleal form seems to be the most promising. Let one focus be supposed to be on the middla line of tho entrance, and to coincilo with the point from which the waves in oxpandiag into the interior radiate as from a centre (whilch they do approximately); and If the other focus is situated inland of high-water mark, the waves will tend to renssemble at the landward foens, and on their way will be deatroyed by breaking on the beach. This appears from the well-known property of the ellipse, that if two radii vectores be drawn from tho two fori to any point in the curve they will make equal angles with the tangent at that point; and us the angles of incidence and rofloctlon of a wave from any obstacle aro practically equal, each wave will be nearly concentrated at the focus opposite to that from which It emanated.

Indiscriminate Derpening.-Another cause of disturbance in harbors, which la often not sufliciently conshlered, is the indiscriminute deppening of the entranee without it proportionate enlargoment of the internal area, or the exeeution of other works for counteracting the effect. As the depth of the water is more and more incraased, waves of greater height become possible at the entrance, so that larger waves gain admisaion to the interior. The writer has had repeated
proofe of this ln the course of his practles. At the pert of Sunderland Mr. D. Stevenson recommended the removal of nearly the whole of the sonth etona pler, and the substitution of works of open frame-work in order to tranquillise the interior. These works, which have been quite successful, were rendered necessary by the frequent dredging of the channel at and near the ontrance.

Artificial Scourisg.-The preservation of the depth of harbors where there is a tendency to deposit is often attended with great difficulty and expenst. Where the deposit of sllt is confined to the apace betweon high and low water marki, the scouring by means of salt or fresh water is in genoral comparatively easy, but where there is a bar outelde of the entrance the case becomes most materially changed. The efficacy of the scour, so long as it is not impeded by encountering stagnant water, la kept up for great distances, but soon comes to an end on its meeting the sem. Probably the only way in which this diffienlty might to some extent be obviated would be by conducting the water in iron pipes to the ber, a plan which the author proposed in 1843 for Ilynish harbor, but the expense was considerable and the success doubtful. When the volume of water llberated is great compared with the alreus or channel through which it has to pass, the objection based on the stagnancy of the water originally occupying the channel does not hold to thi same extent as when the scouring is to be produced by a enddun fiate momentum. In the one case the scouring power depends simply on the quantity liberated in a given space of time, while in the other it depends on the propelling head and the direction in which the water leaves the slnice. Mr. Rendel's scheme for Birkenhead was on the former principle. The first example of artificial scouring in this country seems to be due to Smeaton, who used it effectually at Ramsgate in 1779.
At Bute Docks, Cardiff, Wales, deal ${ }_{\text {or }}$ ded by SIr W. Cubitt, the aceess to the outer basin is kept open most succesafully by means of artificlal scouring on a glgantio scale. The entrance was cut through mul tanks for a distance of ebout three fourths of a mille senward of high-water mark. The luitial discharge when the reservoir is full, is stated to be 2500 tons per minute. The writer has known even so limited a dlacharge for an hour or two an one ton a minuto, produce very useful effects in keeping a small tidal harbor clear of saud.

Floating Brealwaters.-Many proposals have from tlme to time been made for mooring In the open sen flontlig frameworks of timber with the view of elieltering the epace inclosed by them. The oljections to tlouting breakwaters are so great and obvious that there seens little chance of their ever being much used. From what was stated on the aubject of booms, it will be recollected that it is a requisite that they should fit closely to a sill piece at the bottom, otherwise the run is found to extend inte the harbor. From what will te afterward stated regarding the liabllity of timber to speedy destruction from the marine worm, and to iron liy cheuical action, it is obvioue that floating etructures of wood, connected by iron and noored ly Iron chains, can not possibly be of long duration. If to all theme sources of evil we add the risk of their being broken by the sea, we think the case may be almoxt regarded as hopeless. No doubt green-heart mighit le employed so as to renist the ravages of the worm, but ita high specific gravity and its great e::pense would prove bars to lts employment.

Surpension Pierf.--In some situations where thero is a long shallow beach, a harhor or pier of thinter or masonry may be made at or noar the low-water mark, which may be connected with the ehore by means of a surpencion bridge. The inducements to adopt the suspension prineiple are lth eronomy, and the free passage it afforde to the currente which in thle way are prevented from forming accumulations of sand, silt, or
gravel. These advantagen are, however, much reduced by the great wear and tear consequent apon the perishable nature of the atructure. The late Sir Samuel Brown erected two chain plere, the one at Brighton, and the othar at Nowhsven, near Edinburg, both of whleh are atill in exiatence.

Advantages of twe Entrances to a Harbor.-In every situatlon where it is eailly practicable to make two entrancen to a harbor, it will be found well worth the extra expence, provided they can be 80 placed that the one shall be available when tise other bas beoome difficult of access. In harbore whlch have but one mouth, vessels are often detained for a great langth of time by the continuance of the wind in the direction which throws a heavy sea into the ontrance. Whereas if thore are two entrances altuated as we have supposed, vessels are et once nbls to take their departure by the sheltered sile. At the port of Peterhead, the north and south harbars were some years ago united by a canal, according to the writer's plans, and there the advantage has been of the most marked description. Vessels can now clear out at soon as loaded, either by the north or south mouth, according to the state of the ses. Some caution is necessary, however, as the run is apt to extend from the one harbor to the other unless there be conolderable area.
IIarbor Repuirs.-There is generally much prudence required in the alteration or repairs of existing marine works. The riak of having the whole structure destroyed by a gale coming suddenly on while there is an open breach in the worke, must be obvious; and in one Instance, whero the expoaure of the place was great, end the evil was a hilden one, the writer could not recommend the facework being disturbed. The cause of failure In this instance was supposed $t$ be the decay of the backing, which having deprived the face-stones of support allowed them to be driven inwand by the force of the waves. Instead of removing the face-work, the only recommendation that conld be given was to inject the whole pler with fluid cement, so as, if possible, to render the mass monolithic. An alternative of this kind is obviously of very doubtful auccess, and can be regarded as nothing short of a last resort, for there is but a small chance of getting the injected fluid to permeate the whole nuss of the pier. The nyatem of permeating the masonry with fluid matter could, however, be employed with more chance of success in the formation of a pier, while each course lies open to view. In 1844, at a harbor that had stood for very many yeara, two or three faulty stomes had been incautiously taken out of the facework by a masou who intended to replace them by others, when a oudden gale came on, and nearly the whole of the work was leveled with the beach.

As an exumple of the snddenness with which the eastern conet of England ls visited by gales, and as indicating graphically the relative ellgibility of the summer and winter montha for carrying on harbor worka, we give the accompanying dlagram of the heights of waves, as observed for the writer, by Mr. William Mhdllemise, resident engineer at Lybater harbor. (See next page.)

Timber Piera.-In landlocked baye, where a deepwater landing-place is all that la required, und where the bottom is sandy or soft, timber nuy be employed with great advantage. liven in exposed situations, timber can ulso le used, but the futal disudvantage uttending its enployment in most phaces where there is no uhinixture of fresh water, is the rapid destruction oceasioned by murine worms. The danage occasioned tu hariors in this way la noticed by Semple in his trestiae On Juilding in H'ater, in 1776, and very probably by much eariler writers. Indeed, the ravages of the Teredo navalis are very ludicrously descrited by Hector lloece in his Croniklis of Scotland, printed at Filinbarg circa 1530. In the Atluntle Ocean the Teredo wavalis, aul at many places in the German

Ocean the Limnoria terebrans, are the anlmals whlch | ed to a force which it can only resist by its own lnertla, sre found to deetroy ariy atructure or timber which is exposed to the water. They are found to eat most rapidly between the bottom and low-water mark, but above low-water the damage is not so great ; and what is slngular, they do not appear to exist at all below the bottom where the pile is covered with sand. These observations do not, however, quadrate with Mr. Hartley's at Liverpool, for he found the parts which were aiternately wet and dry to decay faster than the parts which were constantly linmersed. Even solld limestone is often destroyed by the persevering efforts of another marine animal called the Pholas.
The late Mr. R. Stevenson made several experiments on the ravages of the Limnoria terebruns at the Bell Rock, in 1814, 1821, 1837, and 1843, by fixing pieces of different kinds of timber to the rock, and getting regular reports on their decay. From those experiments it appeared that green-heart, beef-wood, and bullet-tree, were not attacked by the worms, while teak stood remarkahly well, although suffering at lust. The kyanizing fiuld and other preparations have heen tried, but were not found to be of permanent service. In addition to these experiments on timber, no fewer than 25 different kinds and combinations of iron were tried, including specimens of galvanized irons. Although separate specimens of each were tried in places where they were always under water, and also in places where they were alternately wet and dry, yet all the ungal vanized specimens were found to oxydize with much the same readiness. The galvanized apecimens resisted oxydation for three or four years, after which the chemical action went on as quickly as $\ln$ the others.

Green-heart timber is now generally had recourse to in places where the worms are destructive. It appears to have been first used by Mr. J. Iartley of Liverpool, who published In the Minutes of Institution of Ciril Engineers an account of its virtues in 1840, as ascertnined at the Lherpool Docks. Its cost is considerally greater than memel or than most of the other timbers generally used. Memel logs for the inner piles of piers might, perhaps, from their not being oxposed to abrasion from ships, he clad with green-heart planking at those parts which are exposed to the worm. Copper shenthing and scupper nailing are often and auccessfully employed as protections for plies in exposed situations. Areaming or scorching the wooi, and nfterward saturating it with traln oil, also forms a partial protection.

It is much to be regretted that timber is so expensive in Great Iritain, and that some simple and cconomical specific against the worn has not been discovered for protecting memel and the cheaper kinds of pins. The grand desideratum in the harbor works, which is the rount of continuity in the structure, would then te supplicd. It follows, from the known haws of flidis, that each individual stene in a pier which is eqnally exposel throughout its whole length, is sulijected to a force which it can only resist by its own laertla,
and the friction due to its contact with the adjoining atones. The stability of a whole hydraulio work may therefore be periled by the use of amall stones in one part of the fabric, while it is in no way increased by the introduction of heavier stones into other parts. By the use of long logs of tlmber carefully boited together a new element of atrength is obvlously obtained. A pier could be erected almost free of saa risk if constructed of rectangular or other shaped priems, consisting of logs of timber treenailed and bolted together, so as to form boxes, say 10 feet square and 80 or 40 feet long. The interior of the boxes would be filled with rubble or beton. The first layer would be arranged across the pier, so as to fit the irregularities of the bottom, and above that, they might be arranged lengthwise of the pier, so as to form its outer and inner walls, the space between being filled with common rubble or beton.
In many ports the original depth has been decressed by the deposit of silt, sand, and gravel. This 1s, indeed, a great evil, and one which unfortunately is most difficult of cure. So olscure and apparently capricious are the canses which lead to the formation of shoals, that in the present state of our knowledge it would be little sliort of quackery to lay down any general rules for the guidance of the engineer. In fixing on the site for a harbor, all existing obstructions ehould be examined to ascertain whether there be a tendency to deposit, and the works should be kept as far as possible from places where the tendency is most strongly developed. The agents which occaslon bars at the mouths of harbors are the waves, the tide currents, and land streams, where thay exist. Rivers are often moro pernicieus than beneficial in their effects, especially where they intersect a gravelly soil ; hut in some cases the descending gravel may be sum cessfuliy intersected by the erection of weirs from which the accumulntlons must be from time to time removed. We agree with Sir H. De la Beche in believing that the bars at the mouths of rivers are most generally formod by the constant tendency of the waves to preserve the continuity of the beach profite. it is, therefore, not to be wondered at, that heavy galpa should distort nud fill up the narrow trench which the back waters cut in gravelly or sandy lieaches. The grection of broakwaters on each side has undoubtedly a good effect in protectlng the channel, but stili a bar is very apt to form ontsicie of the broak waters. In some cases the depth of the track might probally he maintained by driving, on each side of the mid-channel, dwarf piles to which contiguous wallings should be attached so as to confine the current at low water. The timber frame-work should not project more than a foot or two alove the bottom, which in snme cases might be planked. This, however, is but a hint, and has, so far as the author is aware, never been trled. The principle on which the proposal is based is that of contracting the low-water
channel to a amaller width than that of the high-water channel, and thus by fixing the low-water track, to provent a tortueus channel. The aume priaciple was adopted by the writer with success in controlling and fixing the meanderings of a gravelly siver, which is sulject to very sudden and heavy freshets.

The want of suflicient funds oecasions a great national loss in the construction of Einglish harbors. The history of a iarge majority of thome ports which have been erected by private or local enterprise, presents but a record of the building of piers at one period when the funda were small, and of taking them down nt
another when the trade had Incroased and more room and accommodation were required. Want of fundr often prevents the original works from being earried within deep water, and in consequence the most expenalve part of the protecting break water is often put down juat in the very plact which bae afterward to be converted, at great expense, lito a deep water accesa or berthage. Sometimes, indeed, a whole line of pler ie, from motives of economy, placed in such a manner as to interfere moat materially with what might have been by far the best and safent berths for shipping, eo that in the further extenelon of the works a great part. of the old harbor has to be demolished. Want of a proper marine survey has aleo often led to very serious errora $\ln$ the position of the piers. To auch an oxtent has thla syatem provailed, that were an engineer called on to value many of the works in tisey exist at present, his eatimate, however falily and fully made out, would fall tementably short of the actual cost. This eatimate would proceed on a measurement of what he sees, while the actual cost would inciude the building of piers and jettiea which had long nince ceased to exist. For these reasons we conceive there could hardly be a more advisable expenditure of the public money than by a aystem of grants for supplementing the local funds on a lileral seale. With sucb aid the authorities on the spot would be enabled to protect and improve the existing physical advantages whlch the shores possese, by preventing the construction of proposed improvementa on too usrrow a scale. But a comparatively alight incresee of the means would, in lastances of which the writer is aware, have inclosed a great extra area, and necured a deeper access with superior lnternel tranquillity, the want of which new cripples the trade, and is the subject of lasting re. gret to all frequenting the harbors.

Good harlore aro of essential importance to a maritime nation; and immenso sumb have been expended in ail countries ambitious of naval or commercial greatuess in their improvement and formation. British Harbors,-l'urtamonth, Milforil Laven, and the Cove of Cork, are :he linest harkers in the Hritish isslands, being surpassed by very few, if say, in the world. Of these, l'ortmonth in entitled to the pre-cminence. This adinirable harlor is alout as wide at its mouth as the Thames at Wentminster Bridge, expanding within into a nohe baxin, almost auflicient to contain the whole navy of Great liritalin. Its entrance is unobatructed by any bar or ahaliow ; and it has, throughout, water adequite to float the largent men of war at the lowest tiden. The anchorage ground is excellent, and it in entirely free from sunken rocks, sand-banks,

or any similar obstructions. The western side of the hasibior is formed by the islanil of Portnes; and on its south-wentern extremity, at the entrance to the harbor, is aituated the town of Portamouth, and its large and important anburh Portses. 'Here are docks and other establishments for the building, repalr, and outfit of ahips of war, constructed upon a very large scale, and furnished with every convenience. The fortifications that protect this grest naval dépot are supetior, foth at reapects' strength and extent, to any other in the kingdom. "Thus," to nse the words of Dr. Cump-" bell, "it appears that Portsmonth derives from nature all the prerogatives the most fertlle wits and most intelifgent judges conld devise or derire ; and that these have been well seconded ly art, without considerntion of expense, which, in national improvements, is little to le regarded. Add to all thin the striking excelience of its situation, which is such as if Providence had exgressly determined it for that une to which we see it applied, the bridlling the power of France, and, if I may so speak, the pecaliar reeidence of Neptune." portamouth harbor hai the additional and important sdvantage of opening into the celebrated road of Spithead, between the Hampshire const and the Isle of Wight, forming a safe and convenient retreat for the largest fleets. Miliford Haven deeply Indents the southern part of Pembrokeshire. It is of great extent, and has many subordinate bayn, creeks, and roads. The water is deep, and the anchorage ground excellent; and being completely land-locked, ships lie as safoly as If they were in dock. Cork barbor has a striking resemblance to that of Portsmonth, but is of larger extent; it has, like It, a narrow entrance, leading into a capnelous basin, affording a recure unylum for any number of ships. Plymouth, which, after Portsmouth, is the principal naval dépòt of England, bas an admirable douise harbor. The rondstead in liymuuth Sound has recently been much improved by the construction, at a vast expense, of a stupendous lireakwater more than 1,700 yards in length. This artificial bulwark protects the ship lying inside from the effects of the heary awell thrown into the Sound ly southerly snd south-easteriy winds.
London stands at the head of the river ports of Great Britain. Considering the limited course of the Thames, there is, probaily, no river that is navigable for large ships to so great a distance from sea, or whase mouth is less obstructed liy banks. Iondon is mainly indebted for her untivaled magnitude to her favorable situntion on this nohle river; which not muly gives her all the advantages of an excellent port, accessible at all times to the largest nhips, but renders her the emporium of the extensive, rich, snd populons country coulprised in the basin of the Thamos. The Mersey, now the hirst commercial river in the empire, is more incommoded by banks than the Thimes; and is in all respects inferior, as a ehannel of navigation to the latter. Stili, however, it gives to Liverpool very great advantages; and the channels boing well huwyed und marked, the largest ships have littie difficulty in reaching the port. The priacipal channels are huid down in the map of Liverpool and its environs attached to the article Docks, Ency. Mrit.
Bristol and Hull are both river ports. Owing to the extraundinary rise of the tile in the Bristol Channel, the former is accessithe to the largost shipg. The Hamber is a gool deal hmpeded by hanks; but it also ${ }^{5}$ navigable us far as linll, by large vessels. The Tyne admits vessels of very conaiderable bumlen an far as Nowenatie. Sunderland, at tho mouth of the Weir, is the principal ship-building port in the United Kingdom and has, after Liverpool und London, the greatest amount of shipping. The shallowness of the Clyde from Greenock up to Glangow has been a serious drawbuek upon the conmmercinl progress of the lntter. Largo sums have heen expended in attempts to contract the course and to deepen the bed of the river;
and they have been so far succesuful, that ships drawing 19 and oven 20 feet have coms up to the city at high water. In 1852; 74 veseels druwing 17 feet of water, and 18 drawing 18 feet, ar.ived at, Glasgow, which is now one of the principal commercial ports in the empire. Generaliy apeaking, the harbors on the enat cosats, both of Grest Britain and Ireland, are, with the axception of the Thames, vary inferior to those on their seuth and weet coast. Several harbora on the shores of Sussex, Kent, Lincoln, etc., that once admitted pretty large ships, are now completely choked up by annd. Large sums have been expended upon the ports of Yarmouth, Boeton, Sunderland, Loith, Dundea, Aberdeen, etc. Dublin harbor boing naturaliy bad, and obatructed by a bar, a now harbor has heen formed, st a great expense, at Kingstown, without the bar, in deep water.-mee Tidea.
Ports.-Tbe reader will find the principal commerclal harbore deecribed in this work at considerable length under their reapective tities. The principal French ports for the accommodation of men-of-war are Brest, Toulen, and Cherbourg. The latter has been very greatly Jmproved ly the conatruction of a gigantio breakwater, and i excavation of immense bssins. Besides Cadiz, the priucipal ports for the Spaniah navy are Ferml and Carthagena. Cronstadt is the principal rendezvous of the Russian navy; Landscrona, of that oi Swodon ; and the Helder, of that of IIoliand.

A similar tut shorter table in now generally used, in which dinmond is rated at 10 .
Hardwase (Ger. Kurze wharen: Du. Yeeriramery: IH. Isenkramrarer; Sw. Jimkram: Fr. Clinquaillerie, Quincailerie; It. Chincaglin: Sp. Quinquilleria; Port. Quincalharia: Rus. Mjelntzchnne toncarii) Includes every kind of goods manufactured from metals, comprising imon, brass, steel, and copper urticles of all descriptions. Hiriningham nad Shetlield are the principal seats of the liritish bardware manufartures : and from these, immense quantities of knives, razors, acissors, filt and plated warr, flire-srms, etc., are supplich, as well for exportation to mont parts of the word, an for home consumption. The hariware mannfacture in one of the most important carried on in fireat Britain, and from the abundance of Iron, tin, sud copper ores in the country, and the ineshamstibie coal miner, it is one which seems to be motatilished on a very secure foundation. The late Mr. Stevenson, in his elatorate and excellent article un the statistices of England, in the Edinderg Encychpurdix, publidhed in 1 kla , estimated the value of all the articlen mate of irm in Great Britain, at $£ 10,(N),(0) 9$, and the jersons employed lut the trade at 200,040 . Mr. Stevenwon entimated the value of all the articles made of lraxs and copper at $\mathrm{Ea},(\mathrm{KNO},(\mathrm{KM})$, and the presoms emphoyed at 50,006: and he further eatimated the value of steel, platel, and hardware artieles, including toys, at Ef:ono,OMO, and the jersons empleyed at $\mathbf{0} 0,000$. So that, assoming these eatimates to be nearly correct, the total value of the goods produced from different worts of metals in England and Walem, in 1815, must save amounted to the sum of $\angle 17,060,000$, and the
persona employed to 820,000 . There is reason to believe that this estimate, in so fur, at least, as respects the value of the cadnufacture, was at the time decidedly too high; but at this momant it ls noat probably within the mark. There has been a very extraordipary augmentation of the quantity of bar and pis Iron produced withln the last 15 years; and the rapld increase of Birmingham and Sheffield, as well as of the smaller seata of the hardware manufacture, shown that it has been Increased in a correspending proportion. We have been assured, by those well acquulinted with most departmenta of the trade, that If to the Iron and other hurdware manufucturen of Englund be adaue those of Scotlani, their total aggregate value can not now be reckoned at leas than $£ 17,500,000$ a year, affording direet employment, in the various departments of the trade, far at least 360,000 persens.
Fill of P'ricea.-Owing partly to the reducell cost of Iron, , but incomparably more to linprovements in manufacturing, a very extraordinary fall has t.ken place in the price of most harlware artleles during the last 15 or 18 yeara. In some articles the fall excects 80 per cent. ; and there are but few $\ln$ which it dees net exceed 30 per cent. In eonnequence, the pourest individuala are now atile to aupply themselvea with an infinite variety of commodluus and useful articles, which, half a century ago, were either wholly miknowu, or were too dear to be purchased by any hut the richer classes. And those who reflect in the importance of the prevalence of halits of cleunliness and neat jess, will readily agree with us in thinking that the substitutien of the convenient and beantiful hardware und earthenware hounehold articlen, that are now everywhere to be met with, fur the wooden and hurn articles used by our ancestura, has been in no ordinary degree advantageons. Hat it ls not in this respect only that the cheapnesa and improvement of haritware in essential. Many of the most powerfil and indispensabie toola and instrumente used by the lit trorer come under this description; and every one is aware how important it in that they sinoulh lie at once cheap and eflicient. See Cutheny and Inon.
Dr. Friedenberg in hia Germau translation of Bubbuge: Econsmy of Machinery and Munyfactures gives some curious information concernin- the Herlin casting. Such are the fineneas and celicacy of the separate arahesques, rosettex, medallivns, etc., of whicb the larger ormaments are composel, that it sometimes requires nearly $10,0,01$ of them to make a pound weight. The gray iron from which they are made may he taken as leing worth abont biv. per ent.; and the following talle drawn uip from the price-list of a Hertin manfacturer, a few years ago, will show to what an alount ineredible height this valuo per cwt. is increased :

We here tind that iron in the form of shint hathan commanded a market at a price nearly 10,000 times as great as that which it sold for an gray iron! And about the year 1820, when the fughion was at its heighth, the vulue was still greater ; for these iron ornaments then soll for nearly their welght in gold. The graat saleable value of these productions has led to a result similar to that which to many other brancien of industry exhibit; obsenre manufacturers make modds from tha casta which others hul been at the expeniso

of dealgning and modeling, and prodace inferior and cheap spacimena from theae molda. The real Berlin casting worthy of the name (auch we may presume E: those which graced the Great Exhlbltion), must alwaya cemmand a high price if eold at all, from the extraordinary eare required in their production.-DoDn's Curiosities of Induatry, Iondon, 1856.

Earmonica, a masical inatrument, conalsting of a number of glase cupe fixed npon a revolving spindlo, and made to vilirate by friction applied to thei: edgee. Mr. Puckeridge, an Irishman, ia sald to have been the firat to uae a set of drinking-glasaen, fixed on a table, and tuned to form a sealo by putting more or leas water into each. They were made to sound by passing a wet finger round their edges. These were iuproved by Mr. Delaval, and atill further by Dr. franklin, and were called "the musical glassea." Their tone is aweet and melunchely, and of a peenliar timbre, which produces a painful effect on the nervee of sume persons. It appears, however, that the use of musical drinking-craases was described in n work (Mathematische und Philonophische Eirquickistunden), publlkhed by G. P. Haradorfer, at Nuremberg ln 16i7. What was called a harpaichord-harmonica, in which finger keys like those of a piano-forto were used instead of direct contact of the fingera with the revolving glasses, was invented ly Rolling at Vienna, and Klein at I'res. hurg. Another harmonlea was Invented by the Abste Mazzucall, who employed the friction of a hair-how to produce the seunds of the glases. A stringed harmonica was invented at Augusta, in 1788, by John Stein, an eminent ergan-builder. It consisted of a doulle stringed (wirt 1 ) plano-forte, cembined with a zort of apinnet, to he used together or separately. Its effects are sald to have been remarkable.

Harp. It is traced to the earliest nations. David played on the harp hefere Sasl.-1 Sam. xvi. 23. The lyre of the Greeks is the barp of the monlerns. The Romans had their harp; so had the Jews, hut it had very few strings. The Cimbri or Englinh Sax us had this instrument. The celebrated Welsh lit $p$ was strung with gut ; and the Irish harp, like tis mere ancient harps, with wire.

Earpagines (i, $i \pi \dot{\gamma} \gamma \eta$ ), in Autiquity, grapplingirons whlth were flung with violence against the rigging of an enemy's ahip, and, when entingled there, were used to drag the ship within reach, so that it might be boarded to mere advantage, or destroyed.

Harpings, the fore part of the wales which encompuss the bow of a ship, nud are fastened to the sten, heing thicker than the after-part of the wales, in order to atrengthen the ship in this place, where she sastains the greutent shock of resiatance In plunging into the sea, or dividingit, under a great pressure of sall.

Harpoon, or Harping-Iron, a spear or javelin used for striking whales, ete. The $g^{\text {on}}$-horyoon is a weapon used for the same purpose, but it is lired from a gan instead of heing thrown hy the hand. It is formed entirely of metal, nod has a chain attuched to it, to which the line ls fatened. Sce Sconesur's Arctic Reyions. Harpooner, the man that throws the harpoon in fishing for whales.

Eats (Ger, Hitue; I)u. Hoeden; Fr. Chapeaur ; It. Capelli; Sp. Sombreros; Rus. Schlopü), coverings for the head in very generat use. They are made of very varlous forms and sorts of material. They may, however, be divided inte two great classes, viz, those made of fur, wool, silk, etc., and theae made of straw; the former being prinelpally wern by men, and the later by women. Itat is a term of Saxon derivation, from huet, $n$ cover for the liead. It is sometimes called custor, from its being made of the fur of the castor or beaver. As a piece of drese, the period of its introduction is net certain, although it may with great probalitity be referred to the early distinctions of Reman Catholic dignitaries. Frolsant ehronicles, that it was "suide to the cardynala, Sirs, advyso you

If ye delyvere ns a Pope Romayne, we be content, or els we woll malke your heddes reeder than your hattes be:" from which, and from many othor documents, it appara that at thin period, as well as for mome centuries after, hats were generally of a acarlet or red color, and made of "a fine kinde of haire matted thegither." A "hatte of blever," about the middlo of the 12th century, was worn by some one of the "nobela of the lande, mett at Clarendem;" and Frois asrt deaeribes hats und plames which were worn at Edward'a court in 1340, when the Garter order whs institnted. In the dlary of Henry's secretary, there is "ane scarlet beever hatte" presented on New Year's day, 1443. Even at this early period hats were of various ahapes, both In the crowns and the brimsthe latter bsing chiefly broad, sometimes narrowing toward the back, and a little bent up and scooped la front. In IIenry's privy purse expenses, during his congress with Fruncla I. in 1520 or 1521, there is "pell for "atte and plume for the king, In Boleyn, $\mathrm{xv}^{\text {.. ;" }}$ and in Wolsey's Inventery, taken on hila resigniug the great seal to Sir Thomas More, there are ne fewer than five mentioned. The fashion of this article was then much more diversely capricious than oven now, as will appear from an extract from Srnsn's Anatomie of Abusen, published alout 1585: "Sometimea they use them sharpe on the crowne, pearking up like tho spire or aliaft of a steeple, standing a quarter of a yard above the crowne of theire heads; some more, soms lease, us please the fantasige of their inconstant, minclea. Othersome be fiat, and broade on the crowne, like the battlements of a house. Anether sorte have rounde crownes, selnetimes with one kind of hande, semetimen with anether; now black, new white, now russed, now redde, now grene, now yellow ; now this, now that; never cortent with one colour or fashiou two dales to an end. And as the fashions lee rare anil strunge, so is the stuffe whereof their hattes be madis divers also; fer seme are silk, some of velvet, some ot taffetie, some ef sarsnet, seme of wool, and which is more curions, some of a certalne kinde of tine hairo; these they eall lever hattea, of $\mathbf{x x}$. $\times x \times$. or xl. shillings price, fetched from beyonde the seas, from whence grent sorte of other vanities doe ceme besides; and so common a thing it is, that every servyng man, countreiman, and other, even all indifferontly, doe werre of these hattes." Abeut the beginning of 1700 , the crowns of lats were mostly round, much lawer than before, and lind very brond brims, resembling what are now occusienally called Quakers' bata, the protusive incumbrance of which soon suggested the cons, ience ef their leing turned up in frent; fashion dictuted the uphending of anether side or flap, sad ultimately a third, so that by this progress, in 1704, the regular three-eocked hat hecame the order of tho day, when feathers ceased to be uaually worn. Near the middle of the 18th century, a round-edged but flattopped and full-brimmed hut got into very general use, and the flat and other cocked hats now dwindle nlmost into a mere distinction of real or assumed rank. 25 years after this, u very near approsck to that of thes present times heeane fashionable, and, within 10 years, altogether superseded the ordinary use of tho cumbrous nud antique cock.

Phmes, jewels, silk loops, rosettes, badges, gold and silver bunds and loops, have at various periody ornamented this article of dress; metal bands and loops being now extecmed preper only to naval und military "men of honor," nad the humble liveried attendants on state, rank, and official dignity. The opera or enft-folding hat is the only relic ut present in general use of the hats worn by our grandfathers, althongh it is not improbable that the mutations of fashion may re-introduce the elegat Spmish hat a4 the precursor, perhaps, of various other styles, ns well as the eocked hat, which are not yet entirely discarderl.

In the Great Exhibition of 1851 several very novel
atylen of hat were Introduced by oxhbitors. It is remarked in the Jury Report renpecting them that "in an article of mashion and of nuech conotant nae as hata, It doea not appear to be easy to change the hablta and tanten of the wearere, or to induce them to adopt a new contume."

Uneli recent tires hats were chlefly prodoced by the art of felting, an art which some personn si pose to have been practiced by the nations of antiquity. It is thought that lama coneta, used for soldien' cloakn and for lacedemoniun hats, was felted wool, but others atate that It wat only knitted wool. In Roman Cutholle countries, $8 t$. Clement ic the reputed inventor of felt. This personage ls said to have put carded wool Into his mandala to protect hie feet daring a pilgrimage, and that the offert of the moistnre, warmth, and friction converted the wool into a folted eloth. The hatters' annual featival is on the 2 d Novemier, 85. Clement'e day.
llat-making embracen two dietinet kinds of mannfacture, vis.; of felled and comered hatn-the covering of the latter being generally pluah. Felfed hats comprehend two classen, difrering chleffy In the materials used in making-the processee being nourly identleal. The lower claten lis marked by inferior ingredients, uninixed with benver, and embrace: wool, photed and ahort nap hatn. Wool hatn are maie entirely of coarse native wool and halr ntiffened with glue. Before the emenelpation nct thene bats were largely exported for negroes' wear; but the manufacture in now almont oxtinet. Ihatea have anap or pile rather finer than their borly, anil are sometimea senterprowf stiffened. Short mapu are illetinguiahed from pates by additional kinds of wool, viz., hare'n back, seal, netuter or nutria, musquash (Muscory eat), and are all waterproof netiffened.
The aecond clans may be said to comprehend two orders, called atuff and bewerer hatn. The first incloden mottled and stuff bodiea. The latter term in not nsed generaly, wa all amffo are understond to the of this sort when mottled is not expressel. Motted bodiea are made chiefly of fine Spaninh wool, and Inferior rablit down or coney wool. Stuff bodies consiast of the best hare, Saxony, and redi wools, mixed with Caahmere buir and ailiks. Stuff hata are napped, that in, covered with pile of mixed neal, neuter, hare'm back, inferior beaver, and musquash. Bearer hath are, or ought to be, napped with beaver only; the lowerpriced qualities with broen mama taken from the back; the mnre valuable kinda with cheek and whice wooma, euch befing the finent parts of the fur found on the beliy and cheekn of the beaver.
The manufacture of a benver hat involven a namber of curioun and interesting procenees, the mont important of which !a felting, or the art of combining animal fibrea in anch a way na to form, withoat weaving, a thick compact eloth. The felting property of animal fibres dependa on their peculiar atracture, which, an revealed by the microscope, appears to be notched or jugged at the edges, with teeth directed fmm the root toward the extremity. Wool in the yolk, or with the natural grease adhering to it, does not readily felt, the Jagged portions being anoothed over or filied up with the oll ; but when the filmen of elean wool or halr are made to undergo a gentle friction ander the influence of moisture and beat, they rendily feit tngesther.
Several of the furs mentioned above are used for hats. The beaver has ineen no assiduounly hunteri during many years that it is now becoming a rarity, and the fur of other animala is sutestituted fir it. The coyty furnizhes nutrin akin; the musplankh or muakmat, the hare, and the rabtit, yield fur for the naj) of the hat, while the trody is inade of lambis wool, or of the woclly hair of the llamn or vicuna. A beaver hat, properly mo called, has a looly or foundation of rabibits' fur, with a beaver nap, althnugh the leaver, for the reason above stated, is often mixed witt a more com.
mon far. Sueh a hat has a ploceant softnese and plaselelty, and readlly molda ltself to the ahape of ths hoad, presenting a marked contruu to the hapd, horny; allk hat, whloh han nearly aupwrew ded it. Still, howaver, them miant alwaya be certagr perione whe, not objeeting to the price, whl continuo to keep alivn this, the mout Interestlag branch of the bat manufacture. See Fer Tradm.

Patorila, as ons of the puranits of the agricultural |hatchway is a little abaft the foremant, ar at the hreak population of Italy. . We ara ignorant of the period when the manufacture of straw plaft first became of iniportance in thut country; but it sppears from Corxat's Crudities, pesbllahed in 1611, that "the mont delicate etrawan hata" were worn ly both inen and women in many piaces of Piedmont, "many of them having at least an hundred coames.". It lo ovident, therefore, that the art of atraw plaiting muat have arrived at great perfection upward of two centurioa sinee; but it doee not appear to have boen foilowed in England for more than 70 or 80 years, as it is within the remembrance of some of the old inhabitants of the straw distriets, now allive, that the wivos and daughters of the farmers ased to plait straw for makiog their own bonnata, before atraw-plalting became eatablished as a manufaeture. In fact, the cuatom, amsong the women of Engiand, of weating bonnets, is comparatively modarn. It is acarcely 100 years aince "hoode and pinaera", were generally worn, and it was only the ladies of quality who wore emali silk hata. See Malcolm's Manneri and Customs.
Hatoh, in mining, an opening into a mine, or in search of one. The term hatches is also applied to the earthen dams used in Cornwall to prevent the water that issues from the atreum-worka and tin-washee from running into the freah rivera. Hatch, or hatches, properiy the grate or frame of croma-bars laid over a ship's deck, now denominated "hatch-bars." The Ild or cover of a hetohway is also called hatchen. Hatch is sonvotines appiied to the opening in the ship'a deck; but this is properiy called the hatchway.
Fatohway, a square or oblong opening in the deck of a ahip, affording a pasaage into the hold, or from one deck to another. Hatcliway is also applied to the pasage through a falling door in the top of a house. In ahipe, tha main-hatehwuy la placed before the mainmast, and is the largeat in tha ahlp; the fore-
of the forecastle; and the after-hatchray between the mainmant and the miason.

EV ' $\downarrow$, the sen term for puling unon a rope direotly. To $A$ :w the wind, to bring a ahlp to sall clowe, by the wind after runolug in some other direction.

EIavana, or Eiavannah, on the Dorth coast of the noble island of Cuba, of which it if the ecpital, the Moro castio being according to Hymbolde, in lat. $28^{\circ}$ $8^{\prime} 15^{\prime \prime}$ N., long. $82^{\circ} 22^{\prime} 45^{\prime \prime}$ W. Whe pepulation of the city and suburbs is sadd to be (1851), Ittele short of 200,000 . In 1827, the resident population amounted to 94,023 ; via., 40,621 whites, 8,215 free colored, 15,847 free blacks, 1,010 colored slaves, and 22,830 black slaves, The port of Havana is the finent in the Weat Indiea, or, perhspa, in the isorld. The entrance is narrow, but the water is deep, without, bar or obstruction of any sort, and within it expands into a magnifcent bay, capable of accommodating $\mathbf{1 0 0 0}$ large shipe ; veasela of the greateat draught of weter coming ciose to the quays. The oity lies along the antrance to, and on the west alde of, the bay.

From it poaition, which commanda both iniete to the Gulf of Mexico, its great strength, and excellent harbor, Ilavana is, in a palitical point of viow, by far the most important maritime atation In the Weat Indies. As a commercial city, it aiso ranks in the firat class; being, in this respect, second to none in the New World, New York only exceptod. For á long period, Havana engroased almest the whole forelgn trade of Cuba; but aince the relaxation of the old colonial aybtem, varioua ports, auch, for instance, os Mutanzas, that were hardly known 30 years ago, have become place of sreat commercial importance. The rapid extension of the commerce of Ifavens is, therafore, entirely to be ascribed to the freedom it now enjoys, and to the great increase of wealth and population in the city, and gezarally throughout the island.

The suburb Regla is on the opposite alde. The Moro and Punta castles, the former on the east, and the latter on the wert alde of the entrance of the harbor, are etrongly fertified, as is the entire eity; the citadel ja also a place of great strength; the fortiflentions have been erected on such of the neighboring heights as command the eity or port. The arsenal and dockyand lie toward the western angle of the bay, to the south of the city. In the city, the strects are narrow, inconvenient, and filthy; but in the aul)urbs, now as extenaive as the city, they are wider and hetter laid ont. Latterly, too, the pollee and cleanliness of all parts of the town have been materially improved.

The advance of Cuha, during the last half century, has leen very great; though not more, perhaps, than might have licen expected, from its natural advantages, at least since it a ports were freely opened to forelgners in 1800. It is at once the largest ant the best situated of the Went India Islands. It is about 605 miles in leagth; but its breaith from north to south nowhere exceeds 117 miles, and is in many places much less. Its total aren, exeluslve of that of the numerous keys and Isiands attached to it, is about 33,000 square miles. The climnte is, generally apenking, delightful ; the refreshing sea-breezes jreventlig the heat from becoming excessive, and titting it for the growth of a vast variety of products. Ifurricanes, which are so destructive in Jamaica and the Carihinee Islunds, are here conparatively rate; and, when they do occur, far lese violent. The soil la of very varions qualities: there is a considernble extent of awnmpy marshes and rocks untit for any sort of cultivation; but there ls much soil that is very superior, and capnWe of affording the most luxuriant crops of sugar, coffee, maize, etc. The ancient policy of restricting trade to two or three prorts, caused all the population to congregate in their vicinity, neglecting the rest of the inland, and allowing some of the finest land and best situations for planting to remain moceupied. Ihit since a different and more liberal policy has been followed, poppulation has begun to extend ftaelf over ald the most fertile districts, wherever they are to be mot witn. Stili, however, only a very small proportion of the thest land of the iwhand is under cultivation, and its products and population might bo douhled or trehied with the ntmost facility. The flrat regular census of l'uba was tuken in 1755, when the whole resident popubation amounted to 170,370 souls. Since this period the increase has been as follows: $1791,272,140 ; 1817$, 551,998 ; and 1827, 704, 8477; exclusise of strmugers. We aubjoin a
Claseification of the popitation of Cuma accobino to the (enatxes or $1 / 75$ and 1 Hz .

Another cenaga was taken in 1812, accoriling to which the population is sala to amount to $1,007,620$, vi\%. : whites, 418,221 ; free colored, $1022, x i s$; and slaves, $4: 66,491$. Jut it is alleged that loth the mave and white population, expecially the former, in underrated in this census, and that the population ks, int prosent (14.il), little, if at all, whort of $1,430,000$ or $\cdot 1,4)_{1,1,40}$ ).
 paily to la ascribed to the continued importation of ninves fron. Africa. In mone years, since the peace of 18.5, as many as 40, (x) biacks are leelieved to lave been imported into Colm in a singlo year. Siain had indeed mgreed by treaty in $\mathbf{x}: 0$ to abolinth the tratio; but this treaty was liftie better than a devad letter, and it in onty since 1458 , when a more eflicieut treaty
with Spain was entered into that the trade has sus. tained any considerable dlminutlon. But though it he no longer unter the Spanish flag, it is continued, though to a much less extent, under other fligg. At present, hewever, not more than from 2000 to 3000 negroes are aupposed to be annually imported. llut though it were to be wished, as well for the interests of the island us of humanity, that the further importation of alaves should be put a atop to, we nre not of the number of those who think that it would be gool poliey rashly to agitate the queatlon of the emaneipation of slaves in Cuba. Their treatment in thst lalnad, as in all the other colonien of Spain, has alwiys been aingularly humane ; and the reaults of their emancipatien in Haytl and the llitiah islands have not been such ns to offer much inducement to the autiorities in Cuba to take up this difficult question. It may, no doubt, bo forced on their consideration; and the emancipation of so mnny slaves in their immedlate vicinity will materially increase the difficulty of majntaining the existing order of things. Under these circumstances, good polky would seem to suggest that timely provixion should the made for the gralual bringing alosut of that emancipation which is, perhaps, inevituble, coupling it, If that lo practienhle, with soms scheme for insuring the supply of some sort of compulsory lator.

Whatever opinion may be formed of slavery in the ubstract, we hellieve it would not be difficult to shew that it has contrlbuted, in ne orilinary degree, to the rapid advancement of Cuba. Induatry will always he proportioned to the strength of the motives by which it is occasioned; and in countries like Culn, of great natural fertility and under a tropical sun, where a hatf or more of the articles indispensable In Europ, vonll he useless, it were absurd to innagine that the inhabitnuts, supposing them to the free, should exhihlt the persevering industry of free Inborers in the temperate zone. 'The doles fur niente is in surh countries the summum borsm; and we helieve it will be found that the extensive cultivation of augar, and of most other commercinl puadnets within the tropics, depends on the maintename of slavery, or of compuisory labor of one kind or other. The preople of Engind may ho thet little ntiected, at least directly, tiy these censiderations, and may, therefore, on the principle of firt justitia, ruat colum, think themselves warranted in using their influence to enforce the abolition of alavery wherever it exists. Hut to the Cubans, Bramilians, the inhatitants of the southern States of dmerias, and a host of others, this question is of the last intportance. Were the slaves cmancipatet, not in liaw merely, but practically and in fact, the protahility is that neither Cubn ner llrazil would, in a dezen years, export a single ewt. of sugur. Why whow they do no any more than Ilaytif Tho blacks, were the really emancipated, would be mble to suppret themselves in that state in which they wish to live, without engaging in any thing like tho severe labor of sugar planting ; and under surla circumstances it wonlal be a contradiction to suphose they should engage in it. But it might be difficuit, perlaps, to ahow what fowl ronsequences would result from such a change, it isat all events clear that the commerec of the worh and the comforts of ald civilized nations would the serimuly impnired; mal it is by no means clear that the condjtion of the blacks would le sensibly, or at all, imsproved, Deniden shavea, the phanters employ lino lalarern, montiy of ais Indian mixod breed, who work for moderatu wages. These, however, ure little ungonged in the fieids, but in other branchers of labor, and jarticulariy in bringing mugar from the intoriar to tha shippiag poits. The articies principaily exported irom t'mban ure, sugar of the linest guailty, collen, cipper ore, tohnceo, leeswax, honey, molasmes, etc. Of these, the ilrst is deedediy the mowt important.

Hut, exclusive of the exporta from Llavama und Matanzar, considerable quantities sugar is shijaed from

Clenfuegos, Nuevitas, Holguin, Manzanilla, and other ports; and a good deal la also shipped without entry or payment of duty. We may, therefore, asfely add 10 per cent. to the other quantitles for the omisslons now referred to ; which will make the total exporte in 1840, $408,200,000$ lbs, or 180,000 tons. Since then the production has conslderably increased ; and the total exports may at present (1856) be safely estimated at above 335,000 tons. The consumption of the island is suppoad to amount to about 20,000 , 80 that its total produce may be taken at from 350,000 to 360,000 tons.
Next to sugar, coffee was the most valuable vegetable production of Cubs. Its cultlvation incrensed, for a while, with unprecedented rapldity. In 1800, there were but 80 plantationa in the Island; in 1817, there were 779 ; and in 1827 , there were no fower than 2,067 , of at least 40,000 trees each I In 1804, the exportation from Ilavana was $1,250,000 \mathrm{Jbs}$; in 1809, it smounted to $8,000,000$ lus.; from 1815 to 1820 , it averaged annually $18,186,200 \mathrm{lls}$ s ; and in 1827 it amounted to $\mathbf{3 5}, 837,175 \mathrm{lls} .1$ The exports from the other ports increased with equal rapidity: They amounted, in 1827, to $14,202,406$ lbs.; making the total exportation for that year $00,039,581 \mathrm{lbs}$. llut the subsequent low prices, or rather, perhaps, the
greater attention pald to the culture of sugar, not only checked the further increase of the coffee plantntions, but made several of them be abandoned. More recently, however, the incroaso in the price of coffee and the low price of sugur has occasloned a reaction, and the culture of coffee is aguln extending. The exports of it in 1848 amounted to $17,354,425 \mathrm{ll} \mathrm{s}$. , to which 10 per cent. may be adiled for deficient entries.

Tobnceo differs much in quality: but the segars of Cuba are esteenod the finest in the world. (Sce Tobacco). Formerly, the culturg and sale of this important plant were monopolized by gevernment; but slnce 1821 , this munopoly has been wholly relinquished, there being no longer any restrictions either on the grewth or sale of the article. The cultivator pays a duty, which, however, is to a great extont evaded, of 1 per eent. al valorem upon his crop. In consequence of the freedom thas given to the business, the culture and exportation of tobacco ure both rapilly exteniling; so much so, that the vulue of the produce of tobaceo in 18.19 was estimated at ubove $5,000,000$ dollars, being considerably more than double the value of the cotice produced, Molusses, rum (talia), wax, and honey, are also largoly produced and form important articles of trade. Sce Cuna.

Thin table shown that the American tonnage emploved in the liavana trime, las incremased threefold daring the last ten years, mid that its amount, relative to the entire tomuge, has nearly dombled, while buth the Spanish and linglish proportions lave diminished in relative lmportance, and even the ulisolute anount of liritish tonnage employed in this buanesa, has fallen off more than 25 per eent. 'The only other mation which onjoys any considerable share of this trade ls Franee. The Frendi tomuago in 18:16 was

7,213 or 225 per cent. of the whole, und in $1 \times 505,33$, 522 or $5 \frac{1}{2}$ per cent. It would appear from these facts, that the Caitel States are rapidly advancing toward a comparative monopoly of the currying trado from Havama.

The rates of freights for the list ten years have been subjeet to great thuetuation, rates to Now York varying from 4 rials in September 18.19, and August $1800^{\circ}$, to 19 rials in March $185 \cdot 1$. Murch a $\mid \Lambda_{p r i l}$ seem to lave been the most favorable mondis for American freights, und Fehruary and March for Linropena. Tho yearly avorages of freight show that While 1850 naw the rates at their highest point, 1855 fomm them depressed almost to the lowest. F m March 185.5, when the rate to Cowes and a market was Lis l2s. tid, nud to Now York 19 rinls, there was a regwhar and rapid fall, hardly thecked oven by the mpring monthas, until in Angint $\mathbf{1 8 5 5}$, tho rato to Cowes was ©1 15 s., thel to New lork, 4 rials, Aqthis point rates began to recover.
lhe price of sugar hans llactuated from 3 3-5 rials in August 18.8 , to 9 rials in Vecember 18505 . From March of last year when the price of brown sugar was $53-8$ rinas, there was a stendy rise to the emil of the year, be that the average price for the year, ti.6i5 riala, was higher tham for any of the previous years, itie lowest yearly average being 4.50 rials fur 18.18.

Moneya-One dollar $=8$ reals plate $=20$ reale vellin. Une dubhoon $=17$ dollars. The merchants reckon H4 dollars $=\mathbf{E 1 0 0}$, or 1 dollar $=4 \mathrm{~s}$, 6d, very mearly. There is an export duty of $1 \frac{1}{6}$ per cent. on gold, ani 24 per cent. on silver. It is a curious fact that no deactiption of puper money has ovor circulated in Cuba.

Weights and Measures.--One qnintal $=100$ lbs., or 4 arrohas of 25 ths.; 100 lba . Spanish $=101$ s the. Fnglish, or 46 kllogrammes. 108 varas $=100$ yards; 140 varas $=100$ French ells or aunes ; 81 varas $=100$ Brabant ells; 108 varas $=160$ Hamburg ells. 1 funegs $=3$ bushels nearly, or 100 lbs. Spanish. An arroba of wine or apirits $=4 \cdot 1$ Engliah wine gallona nearly. A hogshead of sugar $=1300$ ths. ; a bag of coffee $=$ 150 lbs. ; a hogshead of molasses = 110 gallons; a plpe of tafis or rum $=120$ gallons; and a bale of tobacco $=$ 100 liss.

The usual commission charged liy merchants on the sale of goods ia 5 per cent., with a del credere of $2 \frac{1}{2}$ per cent. If the sales are on credit and guarantied, and a further commission of $2 \frac{1}{2}$ per cent. for the returns, whether ln bills or produce. On purchases the commission la $2 \frac{1}{3}$ per cent., and a further $2 \frac{1}{j}$ per cent. if drawn for $\ln$ bills of exchange. For procuring frelght 5 per cent. is charged, and $2 \frac{1}{2}$ for insuring the amount. For advoncea of money the rute is 5 per cent. when no other commission is chargeable. Hili businesa is done at varioua rates, from 1 to 24 per cent. according to its magnitude. These are the rates of the foreign houses; those of the Spanish and Creole merchants are generally higher. There is no olistacle whatever to the establlshment of forelgners as merchants in the island. The law says that those who are naturalized in Spain may freely carry on trade with the same rights and obligationa as the natives of the kloglom, and that those whe have not been naturalized, or have a legal domiciie, may atill carry on traie under the regulations stipulated in the treaties In forre between the respective governments ; and in default of such conventional regulations, the same privileges are to be conceded as those enjoyed by Spaniarils carrying on trade in the country of which anch foreigners are natives. In practice, this inat condition is not much attended to; as forelgners aro allowed to estabilish themselves as merchants without any inguiry as to the rights and privileges enjoyed by Spaniards in the country they come from. As to manufucturers and mechanics, the only difficulty that can arise regards their religios. On entering the island every stranger is required to find security ln the following terma: "I ain responsiblo and become aucurity in every ease for the peraon and conduct of A. B., arrived from (C, In the shij: D., binding myself to present hlm if called on hy the government, and to conduct him at my expense to any place that may he designated." This security is easily obtained, ani, in fact, encouragement la given to mechanles, and white peoplo of all classes to mettie In the island. After ianding it is only necessary to ajply for a letter of tomicile, nul to present a certficate that the applicant is of a respectabie character, and profexses the loman Catholis religion. Free colored people, however, by a royal order of the 12th March, 1837, are prohibited fromi landing under any pretense whatever ; and so rigorousiy is this omler enforced, that such persons, though arting as seamen, are, on their arrivai, taken out of the vessel In which they have come, and are kept in eustomy until her departure, when they are compelied to proceed again on boarl and leave the inland. Tise bushess of a broker is oxerised uniter a royal license, and no foreigner is eligible to the oflice unleas naturaliged in the firm pre. scribed by law. In every commerehai town a rertaln number only in ailowed, corresponding with the jeprilation and trade of the place. In the great citles, the busineas of merchant is often combined with that of planter; and sometines, also, the importing merchant keeps a shup or atore, where he selin bis goods liy retail. The foreign merchants are generaily regarled as transient visitors, who go there for the jurpone of accunulating such a fortune as may enable them to live with some degree of comfort in their own country. As a clasa they are not conslidered wealthy, but they are almost all in the fuii enjoyment of credit. The
mercantlle capital, as well as the proprietary wealth of the idland, may be anid to be concentrated in the hands of the Creoles. When the emigrents from the Peninaula make fortunes in the island, they seldom think of returning to Europe. See Cuba.

Exaven. (Germ. hafen.) The mame an harbor. See article Harbor.

Eavre, or Eavre de Grace, a commercial and strongly-fortified sea-port town of Frence, on the English Cisannel, near the mouth of the Seine, on its northern bank, lat. $49^{\circ} 20^{\prime} 14^{\prime \prime}$ N., long. $0^{\circ} 66^{\prime} 38^{\prime \prime}$ E. Populatlon, in $1851,28,984$, to which may be added 5,000 or 6,000 more for the crewa of the shipping constantly in the port. It was a aaying of Na poleon that "Paria, Rouen, Le IIavre, ne forment qu'une aeule ville, dont la Seine est la grande rue." Havre boing, In fact, the sea-port of Paris, most of the colonlal and foreign products destined for its consumption are imported thither. Nearly double the quantity of goods, estimnted by welght, is annually Imported at Marseillen; but the total value of the imports at Havre amounts very nearly to that of those at the former port. The principal tmports are cotton, sugar, coffee, Ulnen threal and linen gools, rice, indigo, tobacco, hiden, dyewools, spices, drugs, timber, iron, tin, dried tish, etc. : grain and flour are nometimes imported and sometimes exporteal. The priacipal exprorts are silka, woolen and cotton atuffs, lace, gloves, and shoes, trinkets, perfumery, champagne and other wines, brandy, glase, furniture, books, etc.

The Harbor, which is the best and most accessible on this part of the French coast, consints of $\mathbf{3}$ thasing separated from each other and from the outer port ly 4 locks, and capable of accommodating about 450 shipis. A large body of water being retained by a sluice, and discharged at elbo tide, clears the entrance to the harbor and prevents the accumulation of tifth, sand "te. Caje de la lleve, forming the northern extremity of the Seine, lies N.N.W. from Havre, dlstant about $2 \frac{1}{3}$ miles. It is elevated 390 fect above the level of the sea, and is aurmounted by 2 light-houses 50 feet high. These, which are 325 feet apart, exhibit powerful fixel iights. There is also a brilliant harbor light at the entrance to the port, on the extremity of the western jetty. Ilavre has 2 roadsteals. 'The greater or out road is about a league from the port, and rather more thas $\frac{1}{2}$ leagho W.S.W. from Cape do la lleve; the little or inmer road is about $\frac{1}{2}$ league from the port, and ahout \& of mile S.S.E. from Cape de la Ieve. They sre scparated by the aand bank calied leclat; between which and the bank called Les Hautes de la Rade is the north-west pasage to the port. The Hoc, or sonthern passage, lies between the last mentioned bauk and that of Amfar. In the great road there is from 6 to 71 fatioms water at ebls; and in the littie, from 3 to 37 . Jarge ships always lie in the former. The rise of the tide is from 22 to 27 feet : and by taking advuntage of it, the largest class of merchantmen enter the port. Tho water in the inarbor does not liegin perceptilly to subside till about 3 hours after high water-a peculiarity ascribed to the current down the Seine across the entrance to the harbor being suaticiently powerful to dam up for a whilio the water in the latter. Large tlecta, takime advantage of this circunstance, are abie to leave the port in a sinkle tide, and get to sea, even though the wind shoud be unfavorable, See Han af harre, pubilished by Laurie; Annunire du Commerce Naritime; Coulier sur lis Jhares, p. 69, etc. The Chamber of Cummerie of IIavre have recentiy pubilisied the following information and instructions for the use of vessels frequenting the port :
chive buoya have been moored in the ahailows Ruvin, under the dexignation of the Bauc du i'rechat, and Ilauten de in Hade.
"'Thene buoys are similar in form, lut of ditlerent colors, viz.: The tinst to the northward lis white; the

second, white with a blisek top; the third is black; the fourth ls black with a white top; the fifth is red.
"Veasela must always come to anchor at a distance of at least Ilve cables' length outside the line of these buoys, which they may not pass without dunger before one hour and a half prior to high water, or four hours after ebb; and they must at all times pass at a distance of five cables' length from the black as well as from the red buoy, both of whleh are moored on the shallowest parts of these banks. Nevertheless ships may at all hours of the tide frequent the north-western passage, comprised wetween Cape La Heve and the two northernmost buoys.
"All vessels usiag the north-western pasange, and bound into the inner roadstead (Petit Rade), must steer for the white buoy, the furthest north, and after leaving it a little distance on the starboard hand, should then stand toward the second white buoy, taking care never to come ao close to the shore as altogether to lose sight of the lantern of the northernmost lighthouse on Cape La lleve. When the light of the northwestern pier head hears by compass S.E., and the light-houses on the Ileve bear by compass N.N.E., the ship may be broaght to an anchor.
"Besides the five buoys herein described, one of lesser dianensions has been moored on the shallows of the inner roadstead, at about five cables' length W.N. W. of the north-west pier head. Vessels of light drabght of water coming to an anchor in that part of the road, should give this buoy an othing of ut least one calle's length."

Most part of the goods imported into Inavre are destined for the intermal consumption of Frunce. 'The coasting trade has increased very largely of late years, as is proved ty the great increase of French wines, soaps, and other produce imported at laris from llavre, instead of being sent to the cupital by land. The coasting vessels transfer their cargoes partly to steamers and partly to large barges, called ehalimels, which are towed by stean tugs as far as Rouen, and thence by horsea to Paris. The foreign trade of the port is also very extensive. There annually enter the port sbout 800 ships from ports out of Europe. Llnes of sailing packets are established between Hayre and New York, New Orlenns, etc. A regular intercourse by means of stean packets is kept up with London, Southampton, and other ports. The entrances to the basias are too narrow to almit the passage of the largest steamers, which have, in consequence, to remain in the outer port imperfectly sheltered from the winds. Indeed the port ls ut present inadequate to the proper accommodation of the great and growing trude of which it is the centre, and extensive works have leen undertaken for its improvement. There belonged to the port, on the 31 st Decentier, 1851, 368 sailing vessels of the aggregato burden of 71,363 tons, and 32 stemuors, Hggregate burilen 4,259 tons. The custems duties which in 1837 produced $18,123,993$ franes, had increasod in 1851 to $26,164,000$ fruncs. The Moneys, Weights, and Mensurvs of llavre are the same as these of the rest of Frame; for which, secartleles llonneavi, Coins, Funce, and Weigirts and Measules.
pilutage.-From the outer roadstead 28 fruncs per 1st 100 tona; 25 frumes $2 d$ do.; 24 frumes idd do. ; and the pilat to be fed. If the vessel be boarded nearer the port tho charge is lessened necordingly. Bonts, from 9 to 30 francs according to the dintance.

Piert Charges.-With coals, 75 per cent. per ton in doek; 371 do. in harbor. General carpo, 2 frunes 50 centimes if in lock; 1 frune 15 centimes if in harbor. Salvage dues, 5 centimes, and 10 pur eront. Tomage do. 66 centimes and 10 per cent. No charge for lights, buoys, or heacons.

Rallast delivered nlongaide.-Clem, 1 franc 95 centimes per ton; common do. 1 franc 14 centimes do. The ton of clean ballast may be estimated to weigh
sbout 15 or 16 cwt . The ton' of common ballast, about 20 cwt.; a cart marked $\frac{1}{2}$ metre ls one ton; a cart marked 1 metre is two tons. Cost of removal of ballast landed frem ship, 64 centimes per ten, without distinction of quality.

Harbor Rules.-1. It ls forbidden to have fire, or lighted candle, or to amoke on board ships in the harbor.
2. Vessels coming into and lying in the docks must have the lower and topyards topped up, jib-booms and martingales rigged In, and anchors taken in. The wharf alongside the vessel must be swept every evening.
3. No gunpewder (whatever may be the quantity), is allowed to remain on beard, and muat be deposited in the gunpowder warehouse.
4. All foreign sailors found away from their ships after 100 'clock at night, from the 1st of April to the 1st of October, and after 9 o'elock from the 1st of October to the 1st of April, shull be conveyed to prison and fined. Suilors are forbidden to wear sheathing knives ashore.
5. The manifest of the cargo, signed by the captain, must be exhibited to and signed by the custom-house officers before being taken ashore. The vessel must be reported at the custom-house within 24 hours after urrival.
6. Tobucco, snuff, segars loose or in boxes, belonging to the captain, oflicers, and mariners, to be declared as exactly as possible. All the tobaceo, snuff, and segars declared or not declared, to be exlibited to the custom-heuse officers, when they come and make the visit on board. After such exhibition, if any quantlty of tobacco and segars be found on hoard, it shall be seized, the captain shall be condemned to pay a tine which may be as high as 500 franes, und the ship shall be contiscated.

Note A.-The treatiea of rectprocity entered Into wilh the ocontries herenfter mentioned, Introduce the following deviations from the above rales of duty :

United States - The product of the United States, except that of the fieheries, direct from the United Btates In United Statef vessels, paya the same duty as if ímpurted hy Frenoh vessela from the l'ulted Stale:
Brazits and Mexico. -The produce of the Brarifa and Mexlco, Imported direct in national vesseda, enjoys atso the above privilege.

England.-The preduce of Africa, Asla, or Anerica, imported from any country whatever in British venseis, or from any port of the British domioioon in Eiurope ettiter in French or forelgn reseele can only be admitted in bond for re-espertstlon.

The mame reguiation is applicalite to all European produce (except that of Great Itritalu and ite peresessioen in Fiuropes) imported by Britala wessels from other ports than thowe of Great Britain or Ita ponensious in Europe.

The weikht of 50 kllogrammee is expal to $110+$ ponnde Fingilish, or 103 pounda English are equal to 55 bt-iOw kilogrammes, and the Cw . equal to $5070 \cdot \mathrm{j} 00$ kilogrammee.

Credit.-Four and a half noonthe, exception coffee, phmento, peppers, quicksilver, and clayed nugarg, which are sold at $3_{f}$ monthes, and wheal at $2_{1}$ montis.

China, and places bepond the Sumda Ialanda.-All naturai produce, augar ezcepted, imported direct, by French veswela, from countries altuated beyond the Straits and the Suoda Isiande, elther to the north of the 3d degree of northern latitule, or to the east of the lolith degree of eastern longitule, in admitted at four fifths of the lowent rates of duty of the tarif, the French oolonial duty ulone excepted.

Hawkers and Peddlerm. It la nut very easy to ilistinguish letween howkers and pedllers. Hoti are a mort of itinerant relall sealers, who carry about their warea from place to place; but the former are supposed to carry on buniness on a larger scale than the latter.

Hawse. The jurt of the lown elose to the cubles. The cables pass through the harar-holes, which are made In the timbers, and in the harse-pirce outnide. When the shigs has two anchors down, and the cohber diverge from each other, the hawm is mill to lae elear: when cossed by the whip turnitg half round, there is a eross in the hawse. Another cross makes ant ellowe; then a mund furn: In the laxt two cases the lawse in nuid to he fiowl. The procens of disengaging the eable is called rlearing haver. The danger of a fonl liawse is, that if it rames on to blow tho cubter can not be veered from their friction againat earlh other. Thls term also denotes any sinall distanee a-head of $n$ ship, or between her head and the anchors, employed to ride her; as, a vessel mails athwart the hawse, or anchuns in the hawse of another vesael.

Freshening hawee is veering out a Ilttle cable to expose n new surface to the friction in the hawse-hole, or across the cutwater.

Athwart hawse implies across the bews of a vessel at anehor.

Hawse-holes, the holes in the bows of a shlp on each alde of the stens, throngh which the cables piss.

Eawser, a large rope, intermediate hetween the cable und tow-line of the ship to which it helongs, It is used for various purposes, as warping for a mpring, etc.

Hay (Ger, Hew; Du. Hovi; Er, Foin; It, Fieno; Sp, Heno; Lat. Fannon), any kind of graya, cut and irled for the food of eattle. The great olijact i.l preparing grass for hay 3 to preserve the green color of the grass as much us porsible, and to have it juicy, fresh, anil free from all sorts of mastlners. The hay and fodiler erops, including the dried Whies, khacks, and tops of Indian corn, as well as of the sueculent corn plante and other green forage, eultivated solely for soiting, or for drying into folder, chopped witraw, the hunlm of heans, pens, potatues, etc., which are hy no means ineonsliderable, are far the mont valuable of any in the United States. The culture of hay is at present principally confined to the eastern, mildle, and western States, from which the southern markets are mainly supplied in the form of pressed packages or bules. In the earlier settlement of the Atlantic States north of Virginia, the cattle of the Inhabitants were chiefly dependent upon the wild, indlgenous grassessuch ua the white clover, herd's griass (red top), wire grans, Indian grass (andropegan), and the coarser lierloage of salt marshes, beaver meadows, and wher swampy grounds. In the middle and suthern colnulew they foraged upon tho wild heringe of the eomintry, in the same manner as the existing cattle for on the huffaly grase of Loulsiann, Texar, New Mexion, etc., us well as on the laver loughs, and fruit of trees. The prinelpal indigenous grassea which have been sticcessfully cultivated in the United States are-the kirntueky blue grass, the red top (herd's grass of l'enisylvania), the white clover, und the fowl meadow (or bird graan), the latter of whieh formerly grew in abundance around Massachusetis liay, and was much relished by the cows, horses, hogs, and goats of the early settlers, und upon which they thrlved.

I'uodection of liay in the Uniten states.

## HAY

ranks pre-eminent. It is aaid to have recelved the name of 7imothy from Its first introducer into Mary. land, Mr. Timothy Funson. It is a native of England, and la caltivated as a favorite in Nwerlen and other parts of northern Europe. 'The next in extent of enltivation, among our forige erope of ferelgn origla, is the common red clover, whleh is widely naturalized, and is dillgently cultivated ly all good farmers, The precise perial of its introduction is not known $\mid$ but, on the authorlty of Watson, in his "Annalf of Philiadelphia," John Bartram had tlelda of it prlor to the American Revolution ; and, according to Ir. William Darliagten, it was introduced into general cultivation in Chester county, Pennsylvania, lietween the years 1790 and 1800 . Ita congener, the creeping white elover, indigenous or naturalized in Furope, is extensively cultivated in the middle and northern Statea from Imperted seed. The other Eumpen grasses, which have been only partially introduced into thls country, and which have met with favor, are the cock's-foot, or orchard grass, and the perennlal ray grass. The latter efforis a toleralily good pasture, and makes a handaome sward for a yurd or lawn; but as a meadow grass for hay it is regarded as inferior in value to nny of the preceding. According to the census returns of 1840 , the hay crep of the United States was $10,248,108$ tons; of $1850,13,838,579$ tums, showing an Incresse of 3,590,470 tons.
Hayti, Haiti, Ban Domingo, or Eispaniola, one of the largest and most fertlle of the West Indla Islauls, extending in length from east to weat 390 miles, and in breadth from 60 to 150 miles, is situated between lat. $17^{\circ} 37^{\prime}$ and $20^{\circ} 0^{\prime} \mathrm{N}$., and between long. $68^{\circ} 20^{\prime}$ and $74^{\circ} 28^{\prime} \mathrm{W}$. It is called llayth, or the llifhland country, by the natives, from the mountains with which it abounds, expecially in the northern part. The country was formerly divided teetween the Spanlarls, who were the earlieat Furopean colonists, and the French. The line of demurcation which aeparated these two divisions commenced on the south slde from the l'edernales or Flint liver, and extended in a waving directlon to the River Massacre on the north slde. The conntry to the weat of this line belonged to the French, while that on the east s! : tormed the Spanlsh part of the island. Ily far the greatest portion of the country was in the pessession of the Spanlards; their division treing reckoned 220 miles in length by 120 in brealth, of which, though a considerable part conalsts of mountains, these are sail to be little inferior in fertility to the champagne comintry, and to be equally capatile of cultivation. The French divislon is of an extremely Irregular tizare. The land is deeply penetrated by the Gulf of Gonalve, und is in some parts 170 miltes in length, while in others it is not 80 . It is nearly of the amme breadeh ins the Spanish division.

A great part of the const of this island is rocky and dangerons, uffording but an imperfect sholter to vessels overtaken by storms. Nany of the shipping-places on the southern shore are uothing more thum open hays, which lie exposed to the atorms and hurricanes of the autumual months. The lurtor of San Domingo, formerly thought so commolious and secure, has beeone too shallow to admit vessels of large bunlen. There are, howevor, bestles rondsteads and several small harbors, the lhay of Neyba and Ocos on this const. Into the furmer tlows the River Neyba, which recelves vessels of 30 tous' burilen: its strean before entering the ocean divides itself into various channels, which, unnually changing, confound the pilot, and render the navigation difficult. Ocoa lhay is a large and convenient watering-phaee, whth several small rivers fulling Into it. The entrunee is two leagnes across, and it gradually widens to nearly six. On the east sifle of thls bay is the safe and eapreions port of Calidera. On the south-east coast is the grent Bay of Samana, which, in point of size and situation, is one of the most important on the island. From Cage Ratiael, which
forms the southern point of entrance into the Bay of Sumana, to the opposite side of the island or peninaula of Samana, the distance is 18 miles, whlch is closed in by bulwarks of rocks and sand, the entrance only beIng left clear, with a onfe and deep channel between the shore of Samana and several detached islands. This bay is ahout 60 miles long, and is sarrounded on every alde by a fertlle country, suited to all the parposea of trade. Withia the compass of this bay whole fleets might ride at anchor in perfect security. The River Yuna, after heing joined by the Cambu, and meandering through the rich plains of La Vega Real, falls into the Bay of Samana after a course of nearly 100 miles. Bahia Ecossaise, or Scotch Bay, which ia situnted on the north side of the peninsula of Samena, is a dangerous rocky place. Thence to Puerto Plata the coast extends about 60 mlles in a north-westerly direction, and in thls space standa Balsama Bey, which has only 14 feet depth of water, and la of difficult navigation. The harbor of Puerto Plata was first discovered by Columbus; the entrance is narrow, but anfe, and the neighborhood is rich in every species of timbertrees. There are several other amall harbors and baya on this side of the island, but the coast la in general rocky and dangerous.

Soit and Surface.-A country of such magnitude as Ilayti, containing mountains of great height, with velleys of corresponding extent, necessarily comprises great varicty of soil. In general, however, it is fertile in the highest degree, being every where drained ly copious streams, and yielding in abundance every species of vegetable produce which can minister either to the luxury or comfort of man. The coil consists principally of a rich clay, semetlines mixed with gravel, lying on a substratum of rock. That part of the island formerly occupied by the French is mountainoua, but fertile and well wooded, and containing mines both of silver and irou. The Spanish part of the island is monntainous in many parts; while in other parts the country is spread out into extensive plains. These are generally in a state of nature, covered with herbage, or with woods of immense growth and the most luxuriant foliage. The mountains intersect the island in two principal chains from east to west. From these secondary and purtial ridges diverge irregularly in different directions, forming beautlful and fertile valleys, with numerons st reams. The highest mountains of the interior, particularly those of C'ibao, riss to the height of $\mathbf{7} 200$ feet above the level of the sea. To the north of the capital is the valley called Vega Real, or Royal Plaln, which is by far the largest and finest in the island. Westward it extends to the old French line of temarcation, and in this purt it is drained by the River Yacki ; to the east, where the Rlver Yuna flowg for the space of 50 iniles, It projects to the hatd of the llay of Samuna, and is Iralned by numerous smaller streams, which cross it in various directions. This valley may be said to extend in length about 140 miles, and in breadth from 20 to 30 . Other plains elso, of less extent, but of equal fertility, and of ensy access, are everywhere found interspersed among the mountainous tracts. Weatward from San Domingo, ulong the southern coast, is the valley of the River lanis, extending from Nisao to thon. llere the pastare is good; lint the country is not so well watered as In the ether parts of the island; an incovenience which is sensibly felt by the cattle thring the dry months. Further to the westward and to tho north other valleys are found; but where the land, as in this islimi, is everywhere interspeted ly ranges of mountains, it is impossible, in :uny general nketch, to describe purticularly that eontinual succession of hill and dale whirh diversitles the face of the country. Eastward from the eapital are those immense pluins called Los Lhanos, which stretch out to a vant extent on a dead level. They are covered with therbage, and the eye winders unobstructed over tho
wide expance of waving grase, which ia occaslonally diveralted by natural elumps of shrubs. These plalns occury almost one sixth part of the island, extending nealy to itn enstern coast, heing a distance of more than 90 miles, by about 30 wlde. They form an fm mense natural niealow, covered with pasture for vast herds of cattle which belong to more than 100 different owners.

Climate.-San Iomingo has a hot moist climate, lnt the hent is mitigated by the regularity of the seabreeze, and by the contlguity of the mountains. In the plains the thermemeter rises to $96^{\circ}$, sometlines to $99^{\circ}$, but $\ln$ the mountuinous tracts it seldenn rises above $78^{\circ}$. In the most elevated part in lire la frequently necespary. In those situations mat may be kept for neveral days, and in the morning hoar-frost is frequent. The seasonn, as in tropieal countries, are divided into the wet and the dry. The ralns are perlodical, and are heaviest In May and Iune, when the river, which at other then searcely supply water for a contioned stream, overflow their banks, and, with nn impetuons torrent, sweep over the neighboring plaias. The elimate of San Domingo is unhealthy to Furopeans, owing to the violent heata and heavy rains : and hence all metals, however bright their original polish, soon contract a tarniwhel appearance. This is more observable on the sea-coast, which is also more unhealthy than the Interior of the island. Hurricanes are net frequent, but in the sonthern parts of the ishand violent gales of wind, generally preceded by it closeness and sultriness in the atmosphere, frequently occur. These however re not nttended with nuch fatal effeets as the hurricanex in the Windward Inlands.

Ricers.- The island of Hayti abounds in rivera and smaller streams, which flow from the mountains in the interior, in different directlons, to the sea. Of these the principal are the Ilaina, the Nigua, the Nizao, the Ozama, the Neyba, the Geoa, the Yane, und the Santhgo or Rlver of Monte Cliristi. Near the south part of the French line of demareation is the beautiful lake of Heariquillo, which is about 60 miles in circumference : and though it is alout 25 miles from the nea, lts water is perfectly salt, and of the same apecitic gravit in as that of the ocean. The same fishes are also found $n$ it. such as the shark, seal, porpoise, ete.

I'egetable Productions.- The fortile aoil of Ifevti is distinguished ly the variety of ita vegetable productions, many of whel are rare and valuable. The ma-hogany-tree grows to a great size, and is of very fine quality. The manchined-t ree affords n lieautiful species of wool, sichly veined like marble, and suscep,tthe of the thaest polish. Several apectes of dye-vorls are produced in the forests. There is a trece called the jagua, the fruit of which is arcounted a deliency ly the natives; and of winch the julce, an clear as water, makes a stain on linen which is inclelible. Hifferent kimle of guadacum are fommi, ss also of apeveral other womals with the same properties, which grow unnuticed and nameloss In thove thexplored forest o. The sideroxylon or iron-woml, remarkahle fur hardures, as its name implies, fatumdant; and the rak ulan, which diflera in appearance from the Furopean oak, frequent I. formishes lieams of frum 60 to $\boldsymbol{i} l$ feat in length. On the north xide of the ixhand are extensive farests of pine, which is nurlo ased for the purgoses of nhipr building ; and Brazil-wood is fouod on many parts of the coast. The natin-woml of this island is heaviar than that of the Fanct Indien, and it takes son time a pal1.h that it does not require to be varnished. The cot-ton-tree is tho largent of all the vegetable prombithons, and in formed into the lighteat athl most capacious canoes. Every varicty of the phan-tree is foum in the woods, of which they form a prlaelpal onament. The palmetto or monntain-cablage is an erect ann] noble tree, which grows to the height of fil feet, with esculent leaves at the $t$ op. In the eongenial soil of this fertile island the sugar-cane, cotton, and coffee-plants,
grow In the greateat luxuriance. There ls also the calabanh, the frult of which eerves as a substltute for earthenware; the plantaln, the ataff of lifo In the Weat Indlea; vanilla, which is fonnd Indigenous in the unfrequented woods; quakaia or simaroubs, which is a tull and atately plant, waving gracefully in the wind; sarnnparlla, indlgo, tobaeco, turmeric, glnger, and riceplants. The fruits and nutritlve roots of San Domingo are nearly the snme as those of Jamaica; but they are more abundnat, and extremely fine. Of these may le enumerated the choux earaib, or Indian kale, with a variety of other vegetables that coas under the same denominatlon; the avocate or vegetatile marrow, the melon, sapadillo, guava, pine-apple, lread, and jack-fruit, mango, nuts, rose-apple, plums, rte., of many different species. Flowers in endless variety and nplendor adorn the wild scenery of the woorls, and exhale their fragrance In the deaert air.

Little is known of the geolegienl structure of the IAland, hut a llmestone containing vestiges of marine shells is the prevailing formation. Mineral springs exist in several parts. The most noted in che eastern part of the island are these of Ilanica, Yaye, and Paryatal; and in the west, the chalybeate of St. Rose, the saline of bean Rabel, and the alkaline soljhur waters of Ialinarie. The mineral products are various and rich, and inelude gold, platinn, allver, quiek silver, copper, Iron, tin, aulphur, banganese, antimony, rocknalt, bitumen, jasper, marlhe, opal, lazulite, chalcedony, etc. The rold nines of the Chitoon Memntains, which, in the lith century, were very proluctive, have leen abandonetl, and it the present diny rold is ohtained only from the washings in the northern rivers. None of the mines, Indeed, are snceessfully worked, and hence these sources of wealth are reserved fir the industry of future generations.

I nimals.-The indigenons quadrupeds of thes island were contined to four apecies, which the Indians called Ilutia, Quemi, Mohny, and Cory. Of these, ull are helievel to be extioet except the first. Horned cattle, hogs, shecp, goats, horsen, nules, and asser, have been introduced frem Eurupe, and have multiplied prodigiously in the wild and exteasive pastures of the interior. Whl fowl are ahundant, consinting of various *recies of ducks, pligeons, the flamingo, the wild preacock, the mimie thrush or mocking-bird, the hamana birl, the Guinea fowl, the ortolan, num parrits of variwus species. The rivers abound with lish, some of which are very delicate. Turtle of all kinds aro taken, and the land-erab is muth entremod. Tho rerpents are not Ireaded; but the eentipedes, which are frepuent in old huildings, are large and damgerous. The morpion is rarely seen' ; but the venomots crabspinder, which is equilly dangerous, is sumutimes met with.
Hintary,-This island was discovered by Columbus in 1 fln , and was som filled with adventurers, who crowded frum liarope to the new worlid for nudiden wealth. The natives were reduced to slavery by these acttlers, whongrem themelves aver the ishand, and hy their indnstry the colony incrased rapindly in wealtis and fromperity. But as it was didefly ? $\because$ the desire of gold that settlers ware attracted to this distunt shore, San bumiogo was in its turn abandonsal fir other conatrien of reater reputed wealth; and the cotatry gradually a red, and, instoul of yichling a revenue, became a horden on the mother comatr: About the midde of the lith century the iname of st. (Christopher was take'n jossession of by a minet colony of 'rench and English, who luing attachet by the Spaniards, were forced to tly to the larren inte of tortuga, whare they extablished themselves, ant grew formidatile, under the well-known nupalation of buccancers. They at last oltained a frm footing in Sin bomingo, into which they had made only riedatory incursions: and by the treaty of liyswick, that part of the iyhand of which they had ohtained $1^{\text {wimecsion }}$

was ceded to the King of France, who acknowledged these adventurous colonlats as his suljects. The French colony languished for a while under the galling restrictlons imposed on Its trade by the mother country; but these belng removod about the year 1722, It soon attuined a high degree of prosperity, and was in a very flourishing state when the French Revolution cemmenced in 1789.

The revenue of Haytl arises chlefly from customs and port-dues, territorial Impoats, sale of lands, etc. In 1850 the customs' recelpts amounted to $£ 170,000$; and in the same year the expenditura amounted to £216,856. Tho estabilahed rellgion is Roman Cutholic; hut other forms of worshlp are not prohibited. Church affeirs are superintended by a vlcar-general. In 1854 there were in the State 62 schools and 4 collegea, having in all about 9,000 or $\mathbf{1 0 , 0 0 0}$ pupils.

Commerce.-The forelgn commerce of llay'tl is $\ln$ the hands of forcign merchants, who are permitted to reside only at certaln ports, under irksome and injurious restrictlons. The foreign commerce loes not now exceed $£ 1,000,000$ of annual value. The exports are chiofly malingany and other timber, dyewoods, coffee, tolacco, und cotton. The imports ure British cotton and woolen gools, hardware, entlery, fire-arms, gunpowder, glass, garthonware, etc. From France aro imported brandy, wines, sllk, and fancy gools. The pepulation of Ilayti is estimated at about 740,000 .

The emperor has constituted Cape llaytien, formerly Cape Français, the eapital and seat of govermment of the empire. It stands on the north coast, in N. lat. $1^{\circ 2} 46^{\prime}$, and W. long. $72^{\circ} 10^{\prime}$, and contains about $1 \cdot 1,000$ inhabitants.

Port-an-l'rince, the capital of Nayti, or St. Domingo, in lat. $18^{\circ} 33^{\prime} 42^{\prime \prime}$ N., long. $72^{\circ} 27^{\prime} 11^{\prime \prime} \mathrm{W}$. Iopulation variously estimated-probably from 18,000 to 20,000 . It is situated on the west coast of the island, at the hottom of a large and deep gult. It was fountel in 1749, sinco when, with few intervals, it has heen the enpital of Fronch St. Dominge, as it is now of the entire island. It is partially fortilied-the harbor being protected by a battery on in smail islami, at a little distance from the shore. The comntry ronnd is low and marshy; and the hent in the sammer months being excessive, the climate is then exceedingly unhealthy. The huidings are principally of wood, and seldom exceed two stories lin height. The entrance to the harior is between White inland and the southern shore. The lepth of water varies from about 18 feet at ebb tide to abont 21 fect at full tide. If to customary, bit not compulsory, to employ a pilot in cutering the harbor. They are always on the lookout. Ships moor head and stern, at from 100 to 500 yaris from shore, loading and molonding be means of iroats.

The Dominican repmblic clams for its territory the whole of the Spanish portion of the inland. "It is divided into the provinces, and has an area of about If, 5 hon sphare miles. The bominicans are ahmost entirely un agricultural penple. The staples of the southern provinces consint chietly of the prodacts of the forests. In soybo, however, the raising of cattle is the chief occupation. Ihat by far the mont imdustrions part is the northern, generally called the Cibao;
where the ataple article is an excellent quality of tobacco. The artleles of export are mahogany, satinwood, lignum-vita, and brazll-wood, tohacco, hides, otc. The lmports are chlefly flour and provisions from the United Statee, and general merchandise from Europe. The constitution of the republic is based on that of Venezuela. The Congress, which assembles annually, censlats of 15 deputles-three from each province-who form the Tribunado or Lower Chamher, and five senatora-one from each province-constltuting the Coneejo Coneervador or Upper Chamber. The executive power is vested in a Presilent, who la elected for four years, and who must be a Dominican by birth, and at least 35 years of age. The jndlelary ls evercised by a supreme court and various Inferior and local courts, and the French code has heen adopted in legal proceedings. In 1852 the revenue amomnted to 576,853 , emd the ordinary expendltures amount annually to about $£ 51,300$. No foreign debt is owing; but there exists a large home deht, on which the currency is hased, and which is of low and thetuating value. The army umounts to 12,000 men, and may he ralsel to 16,000 . The nuvy consists of three corvettes and flve schooners equipped as war vessels, end mounted with $4 t$ guns. The prevailing religion is Roman Catholie, but other denominations are tolerated. Population about 130,500 .

The chief seats of commeree are San Domingo city nod Samana, a small town on a peninsula of the same mme. The city of San Domingo is situnted at the mouth of the Ozamu, on the southern coast, in N. lat. $181^{\circ}$, and W. long. $70^{\circ}$, and is the oldest Luropean settlemont in the New World, having been built by Columbus in 1504. The popalation is about 14,000 , and the town is defended lyy substantial fortifications. The cathedral is nore than three centuries ohl. The harbor is capacious, but owing to a bar at its mouth, vessels drawing above 13 fett of water are obliget to anchor in the open roadstanal.

Prpulation.-In 1789, the French part of Hayti was by far the most valuable and tlourishing colony in the West Indies, The propilation was estimated at $5: 4,000$; of which $: 11,000$ wero white, 27,500 peoplo of color, and 465,560 slaves. The Spanish part of the inland was much less densely peopled-the number in 1785 heing estinated at 152,640 , of which 122,640 were free peopie of all colors, mostly mulattoes, and the rest slaves. The population of the entire island, in $18 \cdot 2$, was estimated hy Hlumbolit at $8: 0,010$, of whom 30,000 were whites; lut thero are good grounds for thinking that that estimate was exiggerated, and that the present propulation loes not exceed b00,000 or 700,000 .

Esports.-There has been an extraordinary decline in the quantity and value of the articles expurted from Hayti shece 1789. Sugar, for example, has fallen off from 141,000, th0 pounds to almost nothing; coffee from ahout $77,000,000$ pounds ta fittle more than $2 \pi, 000,000$ pounts ; cotton from $7,000,000$ pounds to perhaps tis0,000 pounds; indigo from $-58, t h 10$ pounts to nothing, ete.! Mahugany is almost the only article the exparts of which have increased of late yeats. The following talle illustrates what has now been stated:

Gum Qealacum, In 1822, 7,338 pounds-1843, 18,006 peunds-1s24, 63,692 pounds.

Imports.-The princlpal articles of Import are provislons: much as flour, rice, mess and cargo beef, fish, etc., and timber from the United States; cotton gooda of all sorts, Iriah and Sotch Inens, carthenware, cutlery, ammunltion, etc., from England; winea, gatina, Ilqueurs, jewelty, toys, habordaahery, etc., from France, and llnens, canvas, gin, ete., from IIolland and Germany.

The deatructlon caused by the excesees which accompanied the revolution explalna a part of this extruordinary falling off; but the grenter part is to be accounted for ly the change in the condition of the inhalitants. The blacks, being no longer compelled to labor, and regarding with abhorrenco the culture of sugar and the other occapations in which they had treen princlpally engaged, sunk into a atate of Idleness and apathy. The conilition of all the great branches of Industry that were formerly carried on became, in consequence, nust deplorable, and the commerce of the Island wan reducel within the narrowest limita. Ita anccessive rulers have endeavorel, thoogh with little success, to bring about a revival of indostry. The Code Rumel, enacted for thls purpose ly Boyer, 1826, is exceedIngly atringent, Ita principal provialons being in fact copled from the regulations an to alaves embodied in the C'ode Noir. But even thls corle had little influence; aud as n proof of the low atate of Industry in the island, we need only state that sugnr han whollydisappeared from the list of exports, and that the exports of coffee and mont ot her articles neem to be ntatlonary or dimlnlshing. And this reanlt is, after all, only what shonld have been antlelpated. To exject that half-civilized Africans, under n borning son, and without the wants or deslres of Eumpeans, whould he equally industrious, is to expeet what la contradletery, and all hot absurt.

Commerce with the United States.-There being nn traty hetween the Inited States and Mayti, the conimerce letween the two countrien is governell ly such local laws and regulations as may from time to the be enacted. These are always nuiject to changen and alterations, sometimes no autden-decrees of to-lay superseding the laws in force but yeateriay-that conimercial interests, esjecially the of the linited States, have been, in many inatances, most seriotaly. affected. The l'nited States' commercial agent, in a dispatch to the Ibepartment of State, written in He comber, 18.49 , thas refers to this rulnous uncertainty of Ifaytien commercial leglalation: "There is one sulject to which I beg for a moment to draw your attention; that 1 , the sudden changee in the laws affecting commercinl Interests. 1. Within the luat six montlis we have had the elosing of the ports of Aquire, St. Marc, Mragoane, l'ort de l'alx, and l'Aused Habianlt. 2. An adilitional duty of five per cent. on coffee, and of seven per cent. on logwood ; and, lastly, we have hall those modiflcations in the monopoly law. * * Almost all these measites were enforced on the day of their pulilication, merchants only being apprized of the intentions of the government by n vague rimer. With such hasty legislation, the mont carcful mind diareet are rotrajpeed, and thins all calcuJaffon dreated, and frequently heary loss entailed."

Advies mare revently receised reprosent hat little amelioration iu this unetiled stato of romumereial legivation. It is true, American commerie has heme phaced on a much hetter fonting than it enjowed at that jertoul. I'p to June 25, $3 \times 50$, a law was in force suln jaeting the vembels of all nutions that hat not ack now ledsed the independeme of Ilayti to an additlonal duty of 10 gier cent. The independence of the rimpire not having bernformally recognized ly the tinited staton, dmerken vessels wore brought within the operation of this law, and could not, in consegnence, comprete with the vesmels of such uations an had autistied its requirements, oven in exporting to llayti our own staples. In January, 1850, the State Department was officially

Informed that this reciprocity duty of $\mathbf{1 0}$ per cent. additional, was, by a law then Intely published, appiled to Amerienn merchandise lroaght in vessels of any other nation whatever. Thls was an alvuntage to our nhip-awners, as one or two vessels, under forelgn flage, were then running an packets from the United Statan to Haytl, and almo from the adjacent lilands, bringing Amerlean goods ubiler the preference of 10 per cent. over Amerioun bettoms. It placed the Amerfean flag on an equality with that of other nations in the carrying trade of our ataples exportel to Haytl; and an Increased American tonnage engaged in the trade, and so general activity in the commerilal move. ments between the two countrien were immediately percelved.

Still, American commerce In this quarter had to encounter a difticulty no leas, if not even mure, formidiHe than the discrimination juat aloolished. This was a deeree and accompanying tariff, which took effect Janaary 1, 1850, the $\mathbf{3 l}$ article of which was in those words: "The articlea designated in the tariff, annexed to the present decrees can not be so' "above the prices tixed by atid taritf." Articles 1, 6, and 8 run thus: "I'here shall be eatablished In each of the ports of lort-atu-l'rince, Aux Cayes, Chpe IIaytien, Jacmel, Gomalven, and Jeremie, warehousen, into which shali be put In dépoit, after having regularly pa.sed through the cuntom-honses, wuch articles of merchandisn as are desiguated in the tarlff annexed to the prescont deeree."
"Coffee shall only be divided amons ltuporters of articles included in the tarill; which division shall he male pro rata, acconling to the atquired rights of ench." " * "The government reserves to ltself the right of retalning, out of the quantity of coffee declared for division, a certain portion, to be disposed of according to the necessitios of the moment ; such portion shall not, however, excerd one tfth of the existing quantity." The low tariff prices tixed upon most American goods, and those to the Haytlens of the firat necesslty, when contrasted with the more liberal prices ankigued to the merchandise of other nations, almont parulyzed for a time American trade. A dispateh from Aux Cayes, written at that period to the bepartment of state, suys: "Whlle the citizens of Fruse are scarcely afferted in their importutions to 1]aytl, the Amerlcans here import, mad our merchants at home export, ncarcely my article that :s frue." Still, in the face of these annoy. ances, and dexpite the embarrassments which they muat have wemslonem, one half, at least, of the formign trade of Ilayti is in the hands of American merchants. Naturally indolent, and unhappily depriwed of all leplalative stimulus to industry and lamor, the matives have lost that epirit of emblation amd arricultural enterprise which condueted them to a comparatively high state of prosperity muler the alministration of earlier rulers. The degree of this prosurerity, thus attainel, may be inferred from the following tatement, exhihiting the quantitios and values of the produce exported from to. Bomingo to Frince, from January 1 to December 81, 1790. The figures and other diats are derived from a rare ratistical chart, jublished in France, by the government, that yar,
 partip F'ruupoiss de St. Domingue."

The free population of this pertlon of the inland in 1700 was :-whites, $3 \times, 360$; blacks, 8:374. The numbber of negroes employed in lahur was $455,0 \mathrm{~m}=$. The unsigatinn returns show the number of vessels entered to have been 763 , with an aggregate mensurement of 65, alk tens ; and the mumber cleared $22 l$, monsuring 53, 12 1 tous. The total value of agrieultural property; Inclucling: negroes, rtock, ete., in the French distion, in 1750 , is atated at about $8208,297,400$. The number of coffee plantations was $2 \times 10$; of cotton, 705 ; of indigo, 30:57 ; and of cocoa, 69. inclusive:

The tetal quantity of acajou-a species of mallog-any-expmrtet during 11 of the years devignated was 18, $113,2,2 \mathrm{i} 2 \mathrm{lbs}$. The exportation of pitre-a specifes of aloes, which furnishes a substitute for hemp nad llaxappears to have commenced in 184ti, ami, in the four ensuing years, had amounted to an nggregate of $112,-$ 8 it ths. In 1835, 8500 cigars ; 1097 lhes. sugar ; 31,951 hiles: 31,192 lbe, of rags ; 10,903 liss. of wax; mud $8: 69 \mathrm{H} / \mathrm{s}$. of ginger were exported; while the ensuing year, the figures were, respectively, $3: 1,000, \mathrm{If}, 8: 11$, if $, 801,275$, and 15,509 -suffichently ludicative of the freat fluctuations to which the forcign trate of Hayti was sulject.
A ghare at the statemente presented will shew that 8 great change took place in the character of the exprotation from Hayti during the tio pars Latweren tix9 and 1819. Sugar, indigo, mud tubace, which were staples of export in 1789, hand mutirely diaspprared from the tatije in 1849; the exportatiof of coffie and cocon had (if we ex. apt two years) remainen narty statomary, while the expurtation of hogwoml hai vastly augmented, and that of cothon ham greatly diminished. The quantities of the article fast maned, imported from Hayti into the i'nitesl states durine the

 and an average, each year, of $1: 2$, ,62 in .
The quatity of ciffere expurted in 18 on was ahout $15,000,410$ thes, white in $18: 31$ it excented $50,000,000$ los. ; mit in 18.52 the quantity produced must have reachel sib, 00,000 pounds, as the fifth part thereof, claimed ly the guvermment, amotated to $11,200,900$ ibs. As regurds tobaceo, since the political division of the tsland, tis cultare and its trade are in the hands of the Deminicans. There is, however, consiterable
traffic in this article at sume of the ports of Haytl ; but it is imported by the cossters from the ports of the republic. In view of the statistice of Hayti, thus pregented, it is ovidel. that the $r$ vement of the country has been vastly petrograde since it was a possession of France. In 1789 it exported, as we have seen, 150,000,000 liss. of sugar, and nearly $1,000,000 \mathrm{lbs}$. of indigo; in 18.9 it exported none ; in the former year it exported $77,000,000 \mathrm{lhs}$. of coffee, and more than 7,000 , 000 ils. of cotton; in 1849 the exportation of the former amounted to less than $31,000,000 \mathrm{lbs}$. , and of the latter, to ilttle mure than $500,000 \mathrm{lbs}$; while the total vnlue of exportations from Huyti, whieh, in 1789, are given at $205,000,000$ franes, 40 years later were but $3,500,000$ francs I A foreign resident at the capital of Hayti, In view of these fucts, writes as follows, unier recent diste:-" This country has made, since its emanelpntion, no progress whatever. The ropula thon partisily live : tpon the produce of the grown-wild coffee plantations, remaants of the French dominion. I'roperly apeaking, plantations nfter the model of the English in Jnmalea, or the Spmish in Cuba, do not exist here. Slaytl is the mest theautiful and the most fertile of the Antiifes. It has more mountains than Cutia, anil more epace than Jamaica. Nowhere the coffee-tree could better thrivo than hete, as it eapecially likes a mountainous soli. But the indolence of the negroes has lirought the onee splendid plantations ti decny. They now gather the roffee only from the Hrown-wild trees. The eultivation of the sugar-cane has entirely disnppeared; nud the island that once supplied one half of Europe with sugar, now supples its own wants from Jumaica and the United Scates."
The following statement exhilits the general navigation and trade of the port of Cape Haytien during the year 1841, and the sharo thereof assigned to the Initel States:

The navigation of 1881 , empared with that given above for 1850 , shows a falling of $\ln$ number of vessels of 260 , meawuring 44,421 tona; and the returns for 1852 show a line lecrease over thone of 1850 of 165 vessels, of 22,409 tons, but an lacrease over those of 1851 of 98 vessels and 22,012 tons.

General Remark. -The trade between the United States and Haytl in becoming, overy year, more important and necessary to buth countriee. Heretofore, the imports into the empire from the U'nited States consiated alnost exelusively, of provinions, for which were exchanged coffee, logwood, mahogany, etc. Articlea of apparel, cetton manufactures, and fawhionable goods were supplied chiefly from France, Fingland, Gerinany, etc. Under the flacriminating, or, rather, the rec'procity duty-nam . , 10 per cent. aclditional duty upon the cargoes of reasels belonging to nations that have not recognized the independence of Hayti -Unitel States' merchants offered no aerious competition to those of the privileged nationa, except in regard to auch merchundise as was indispenaable to the natural wants of the Haytiens, and in respect to which our undisputed monopoly of the trade enabled our merchants to ceuntervail the discrimination, and atill maintain a briak and profitable trade. In cotton and other manufartures, and generai cargoes, the Isritish and French hẹld the firat rank in the llaytien markets. With the aloolition of the reciprocity duty, the United States' thag entered the liaytien porta on terms of perfect equality with those of other nationn; and our merchants, at onee, disputed the pre-eminence hitherto held ly other nations In the generat trade of IIayti. American cotton and other manufactures flled the warehonses at the different ports ; and, from the superiority of thelr quality; and the lower priee at which they could be soid. were soon generally preferred and aought after ly Haytien purchasers. Inatend of oceacupying, as heretofore, the third or fourth rank among foreign nations traaing with this country, the United States now elain fully one half of its entire forelgn commerce.

The French authority which has alrealy been quoted In thin IHgest, says: "Favored ly thelr proximity to Hayti, the Anericans are determined on reducling the price of their asalt provisions, their flour, moap, etc., to so low a figure, that European competition is out of the queation. They export from their warchonses at New York,* at low prices, wines, hardwares, hats, caps, French silke, Finglish manufacturea, etce. They also furnish the llaytiens with the oils and pastes of Italy, and monowolize the sale of candles, tapers, cheese, and timber for building. They maintain the ame superiority in the export trade. They take three fourths of the different woods eut in IIayti, two thirds of all the coffee exported, and are the exclusive exportere of pitre, fustic, and nearly a of tor-toite-shell. In finc, the commercial superiority of the United Statea extenis over every part of the empire, and, in its raphd progrese, bhin fair to exclude aitogether the veascls, as woll as the merchants of Europe. * *

[^25]"Ameng the countries with which the United States have commerelal intercouree, Haytl holds the ninth rank as reapects tonnage. All the States are tnore or leas interested in the Haytien trade. The north-epust. orn States find a market there for their finh nnd other merehandise ; lennaylvania, northern Virginia, Maryland, Ohio, Indlana, Kentucky, Illinols, and Missonri, for their salted pork; Vermont, New York, Manssehusetta, Illinola, and Ohlo, for thelr anlted theef; Philadelphla and lloaton, North and South Carolioa, Vircinis and Kentueky, for their household furniture, their rice, and tobacce. The manufucturers of New England, Now York, and Pennsylvania, have alrealy secured an extensive market $\operatorname{sn}$ Liayti for ticir cheap cotton textilea, and succeasfully compete with Euiopean manufactures.'

The extent and value of the commerce of the Uniteil States with the inland of San Domingo, in tha year ending 30th June, 1850, was as followa:
Imports Into the Vinted States...
Exports from the Untted Btatex.

Iomentic produce and manufactare
Forelgn produce and manufacture
$81,962,523$
$26 ; 661$

"The official returns of the United States show that Mexico, with a pojulation of $8,000,000$, impurtel from the different porte of the Union, in 1851, leas ly wiali,507 than IIaytl.* The trade of the United States wlth the latter country in, therefure, more profitubic than that with Mexice; Indeed, American vessels genorally return in ballast from Mexican ports, or go to other States in reareh of freight ; while in IIayti they nlwaya find cargoes, if nut of coffee, at least of arajou, compeche, and jitre, which are alwaye In alumilance. In 1851, the United States exported to llayti cetton goods valued at $\$ 296,000$, while the value of similar merchandiso exported to Cubn reached only *2t,000. The moap exportel from the United States to the former country exceeded $1,928,682$ hoves; to the latter, only 345,744 . 1hayti receiven from the United Stutes three times as much Hour as Cuha, and six times as much salted pork."

Whth the exception of the errore alrealy noted, and a fow cthers of the press, the artcle in the Freach statiatical work, of which the preceding summary gives the aubstance, jresents a generally accurate revew of the commerce of the United States with Ilayti. Notwithatamling the United Staten has not yet reeg. nized the independence of llayti, nor entered into any treaty with ita governinent, the restrictions and petty annoyances to which our mercha - -nd citians in that country have heretofore been suturcted are now removed, sud the fruits of this mo. e literal and frimatly feeling ure witnessed in our annaally increasing com. nerce, and the preponderance of, anil preference for, American merchandise in the market of Ifayti. This liberal state of things may, however, at any moment, change. In the aboence of any commercial treaty between the two countries, our relations with ilayti are dependent on the will or cuprice of the emperor. In this reapect, France and lingiand are on a sufer footing than the Inited States.

It In stated, on the authority of private letters from lort-all- Prince, that the emperor has recently published an edict prohibiting the further cutting of mahogany, und also the transportation to the seatobard of what worl is now ent in the lnteriar. The ream assigned for this messure bat that his majesty wives to turn the attention of his peoplo more to the culica-

C'ustom-house Regulations.-1)n arrival, the master of the ressel proceeds to the custom-housen with the interpreter, where he makes his declarntion whether he discharges the cargo in the port. If he diseharge, his invoices are translated, and the goods verified in the presence of the consignee, who is allowed to land and ntore them. On clearing out ward, the merchant pays the daties on the cargoes loth ways, and exhibits a receipt at the oflice of the commissaire te guerre, commandante de phare, and commandante do port, who sign a certilicate that the vorsel may depmit.

I'arehossing.-The warehousing and bonding system in established by law, lint there are at prosumt no baildings appropriated to the reception of tonded poods. Lutil very recently, goods ware permitted to be londed under this law in the merchants' stores; a late order has, bowever, suspended that indulfente. The rate is 1 per cent. per year, and no allowance made for waste or loss. Goods exported in the same
wharfage fees.

Moury.-The weight of the dollar is 216 grains; the $\frac{1}{f}$ and $t$ dellar being in proportion. But nearly $\frac{1}{\frac{1}{2} \text { the }}$ weight of the coin consists of tin or other alloy; so that the valne of the dellar does net exceed 1s. Gal. sterling.

Weights in Ilayti are lividel as in avoirdupois and apothecurles' welght; lut they are about 8 per cent. heavier than British welghts.

Measures,-Same as these used in France.
Regulations as to Trade.-It is enacted, that all persons exercising any trale or profession, excepting that of eu!tivating the soil, must he provided with a patent or license to carry on such trade or profession; that all witrangers admitted as merchants into the repulilic must, in the first place, procure the permissien of the president to take out a patent, which, when obtained, only autherizes them, under howy pemaltes, to carry on a wholesale business, not with each other, but with the lhaytians, in the open ports, which are Port-anI'rince, Conaives, Cape IIaytien, Port-à-Phate, Sunto lomingo, Jamel, Les Cayes, and dóremie. The mininum quantities of goods that may he sold are fixed by the samu law. The llaytian consignee may be also a retailer, on taking out a corresponding patent.
A charge of 2000 dollars is male for each patent to forigner traling to I'ort-an-l'rince; $\$ 1800$ for Les Cayes, Cape IItytlen, and Jacmel ; and $\$ 1600$ for each of the remalning ports.

Intics. - The duties on all imported commoditios consigned to foreign merchunts are $17 \frac{1}{8}$ per cent. on
an established tariff, whether they be brought in native or foreign ahips, with the exception of those from the United Statea, which pay an additional 10 per cent. on the amount of the duties. Goods consigned to native merchanta pay only $16 \frac{1}{2}$ per cent.

The following artleles are duty free In all bottoms: Shot of all sizes, grenates, howitzers, bomb-shells, and other projectilen of artillery; Iron and bronze cannon, mortars, muakets and bayoueta, carbinen, pistols, and cavalry sabres, briquets, or short aworda for infantry; machines and instruments for simplifying and facilitating the cultivation of the soil, and the preparation of its products ; horses and cattle, mules, asses ; gold and silver cein; classical and elementary works, sewed in boardn, or boond in parchment, for the ln struction of yonth.
The following is a list of articles alsolutely prohihited, without reference to their place of gr wth :

Mahogany, logwood, lignum vitw, fuatic, coffee, cotton, wool, cacao, raw and clayed sugar, rum, tafla, syrup, molasses ; canes, whips, and umbrellaa, containing awords, atilettoea, or othor arms ; books and other works opposed to good morala.

Bealdes the export, there is aloo a torritorial duty levied equally on the produee of the soll, whether ex ported in natlonal or foreign abips.
The export of the following articles is atrictly prohibited : Gold and silver coin, side and fire-arms, munitions, and other articles of war ; old or new iron, copper; horses, brood mares,-mules, asses, and wood for lip-bullding.
The coasting trade is entirely coafined to Haytian citizens.
The following tabular statement exhibita the forcign trade, import, and export, of Cape Haytien for the year endlog December 81, 1852 :

Cape Haytien.-This port has not yet entinely recovered from the effects of the enthquake of 1842, nor has its general commerce regained the high rank which it held prior to that period. Stiii, its uavigntion ia not unlmportant. In 1850 there entered and cleared 65 vessels, with an aggregate of 8509 ions more than in 1849. In 1829 the imports at this port amounted to $2,500,000$ france, and in 1850 to $3,243,16 \mathrm{cs}$ francs. The large bulk of this trate in in the hands of American merchanth. A French statistieal work, referring to this fact, offers two explanations of the great preponderance of American trade, not only at thin port, but in liaytl generaliy, an follows: "The United States conduct atwout one half of the forvign navigation of Hayti. In 1850 their progress wan accelerated beyond alt precelent, showing an augmentation over 1849 of 124 venseis, with an aggregate of 15,000 tonn. The theility with which they open with their paigblors a credit which in often refused them in Europe, together with the effirts of their propagandints of difforent mests acattered over the isiand, is eminently favorable to the inereame of American influence." If there were even any plausibility in thin auggention, it would prove, perhava, inore than the author intended; for, ambitious as France confessedly
in, and has ever heen, to extend her commerce, and foster her mercantile inleresta, even by resirictions and discriminatious, which are now aluost universally iliscardel, the assertion of her atatistician, ahove quoted, would imply that thin source of American commercisi preponderance in liayti was not available to her ; hut some other cause munt be looked for, in viaw of the fuct, that, while Amsrican merchants do sonetionesnay, very frequently-" give credil" to their consignees and purchasers in Ifayti, they Invariality pay wash, or its equivalent, for all their exports. For such articles as are monopolized by the government, the llaytian law is peremptory as to that modo of payment.

The other expianation ankigned is moro reasonalile. It is in these worde: "Always on the look-ont for new sourcea of trade, the Americana jurchase ni C'ape Haytion red-peppers, and orange and lemon peci. 'This new branch of trade, as weli as the purchave of raka, has nucceoded beyond expectation. Nany houses at New York receive fuil cargoen of thane dencriptions of merchandine, actually pricelesa in llayti, on which they realize large profits." This ia, at least, a more commercial explanation; and, taking it to be true, as there is no evilience to the enntrary, it ahows that our
merchants relations w in exchang harlware, $\mathbf{t}$ and haberds terial for the any one of rualy ale a

Head. The fore extremilty of a ship. It genersliy meana the cutwnter, which is adorned with a figure. By the head, implies that tho ship's head ia depressed in the water. Head sails, head yards, are the sails and yards in the fore part of the ship.
Headiand. In Geography, a term noarly aynonymous with cape, mull, or promontory; which ace.

Heath, or Ereather. In $n$ general sonse the term heath is applled to waste land in which the prerailing plants consiat of one or moro of the common species of heath-Culluna and Firica. (Calluna rulgaris, Ssl. The kirica communia of Linneus.) This plant covers many hundreds of acres in the Highlands of Scotland, in. .eland, and in similar climates on the Coatisent. It attains, in many places, the belght of 3 or 4 feet; and is used for thatehing houses, making besome, sull for a varisty of other purposes. The tender tups form a substitute for mattresses in IIlighland cottages ; and they are also eaten green and in $n$ dried state by horses, cattle, and sheep, in countries where the grasses and clovers do not begin to grow till late in the apring.

Heave, in nautical phrase, to employ force to move great weights ly the lever, etc.; us to heare up the anchoi by the capstan or windlass; to hence dover the ship, or pull ' c over on one aide to get at a leak; also to heare taught (tight), or turn the capstan till the rope or chain applied to it becomes thight.

Hebrides, The, or Western Islands of Scotland, consist o: about 200 islands or istets, ${ }^{\text {l- }}$ ing between N . Int. $55^{\circ}$ and $58^{\prime} 51^{\prime \prime}$, nuil W. long. $55^{\circ}$ and $7^{\prime}$ 52', Their anciont name uris Mrbudar or Hibula, ned the alteration was ainply the result of a printer's error in un early edition of the works of the renerabie bede, pulilahed in l'aris. l'rom the censua returns it appesers that in 1851 the number of inhabited islands in the Hebrides wan 70, having a population of 116,367 ; from 20 to 30 mot 2 are partially inhabited daring the summer and grazing season. The mont gonthern of the group are situated on the Firth of Clyde-as Bute, Arran, the Cumbrayn, Lamlanh, and fuchmarnoch. The geologienl formation of thene blands includes granite, gneias, alate, trap, sandatone, sad linestone. Arran is jeculiarly rich in attractions both to the geologist and boianist, and posaesses inigh-
ly picturesque scenery. The ether ialands are usually divided into the Outer Hebrides, or Long Islend, nad the Inver Hebrides. Tho former consists of tho Lewis, IIarris, North and South Uist, Benbecula, llurra, and a number of smaller islands-the whole length from Barra-IIead to the Butt of Lewis being about 180 miles. The Immer Icbrides include Islay, Skye, Mull, Jura, Coll, Colonsay, Rum, Tiree, Ulva, Llnamors, etc.

Heel. The after extremity of the ship's keel; also the foot of a mast. To heel over, to incline to one alde.

Helena, St., an island In the South Atinntic, inclonging, to liritain; S. lat. $15^{\circ} 55^{\prime} 26^{\prime \prime} ;$ W. long. $5^{\circ}$ $42^{\prime} 30^{\prime \prime}$. It is about midway letween Africs and Sonth America, 1800 miles from the Cape of Good Hope, and 600 milies from the island of Ascension. Its extrel. breadth is 7 milea; and lts greateat length 11 miles; Its area is 30,300 Eriglish acrea. The geology of St. Helena is Interesting. The island may be considered as the highest peak of a range of mountains traversing tho South Atlantic, and ia most probailly and extinet tertinry voleano. Geologista bave been unable to fix with exnctnesa ita chronological position. The voleanie forces which have proxluced the complicatod tisturbances eo conspicuous throughout the island, must have ceased at a very remote perion, as it has evidently retained for agas its existing conformation.

The climato of St. Helenn, though within the troples, is tem, orate and healthy, nad not unfavorabie oven to Furopesn constitutions. In Jamea 'lown ( 600 feet atove nea-level), the thermometer neldom rises above $80^{\circ}$; lunt in calm weather the heat reflected from the sides of the valley is often oppresaive. In the open country the temperature is more uniform and mild, acareely ao hot and never aceold as in Fingland. During some soasons the highest polnt of the therr.ometer during the aummer has been only $72^{\circ}$ in the interior; and the ondinary range during wiuter from $55^{\circ}$ to $50^{\circ}$.

The soil of St. Ifelens is elsyey, and in many placea of consilerable depth, Vegetation is very luxurintit in the laland, which is alundantiy amplled with water froul 160 excellent welis. In some parts of the island
fron ore has been found, but the scarcity of fuel prevents it from belng smelted. Gold and copper have been observed in small quautitles. Concrete limestone is excellent in quality and abundant. The hills are covered with furze and various Indigenous slirubs and trees. Of the latter the most abundant is the gumwood, of which there are three kinds, the common, the bastard, and the dwarf gum-tree. Other native trees are stringwood, dogwood, redwood or ebony, and the cablhage-tree, of which the last two are very duralle as building timber. Oaka, cypress, and plnaster, have been introduced into the plantations, and thrive well. The ferns of St. Itelena are numerous, and the myrtle grows to the belght of 30 feet. The cotton plant ulso thrives very well. Fruits ripen beat in the valleys near the const, hut overy farm produces in abnadance the common fruits and vegetnbles both of the tropical and temperate zones. The attempts to grow cereals have not succeeded. Of the 756 apecies of plants now found in the island only 52 are natives. The eattle, sheep, and goats on the island are of English origin.
St. Jelena was diacovered by the Portuguese in 1501. They succeederl in concealing the position of St. IIelena from other European untions till 1588 , when It was descried and visited by Captain Cavendish on lits way home from a voyage round the world. Soon after this it becaine well known to the buteh and Spaniards. In course of time it was abandened by the Portuguese, and taken possession of liy the Dutch, who in turn abandoned it on the extablishment of their colony at the Cape of Gooll Hope in 1651. On their departure the English East India Company formed a rettlement upon St. Ilelena, and about ten years afterward obtained from Charles JI, a charter for its posression. In 1665 the Dutch successfully attacked the inland, but in a few months were driven out of it hy the Euglish. Agaln, in 1672, the Datch recaptured it, through the treachery of the planters; hut it was almost immediately recovered hy an English squadron, under Captain Munden, and agnin restored to the East India Company. As the trule of the East India Company fucreased, the importance of the island became daily more apparent.
But the chief historical interest of St. Helena centres in Longwood House, the revidence of the exiled Emperor Napoleon from 1kis till his death, May b, 1821. The house in which the emperor lived han been allowed to fall gradually into deeay ever slace hits hocly was rembed to France in 1841 .- Hnoose's History of the Ishum of St. Hetena; Jonssons's Acconent of St, Iftemi; Bigatsos's Tructs relutive to the Iadaul of si, Melena, etc. In 1N0J, the lmpulation was 3078 ; in 182:3, 4381 (composed of 1201 whites, 911 in the civll and military establishments, $10 \overline{4} 4$ slaver, $7,2,4$ free colored, 442 Chinese, and 24 Iaset i; In 18:19, 4205; in 1849, the watal military force amomited to alout 1500 regular triopss, bexides four volunteer companies of white and black militia. Solliers are sonethes placed at St. Helena to undergo a seasoning previous to lielug sent to Judia; ant thin island and the Cape of tional Hope aro the principal stations to which eaptured slaves are brought, and employed in publle workn.
Holl Gate, Holle Gatt, or Hurl-Gate, formerly a dangeroan pass in the stralt called the East River, hetween (ireat Barn Island and Long Inland, near the elty of New lork. It in "ormed by projecting rocks, which confine the water to a narrow and crooked channel, occanioning atrong eddy currents, dangerous to vesseln at certain timea of the tide. The channel has leen deepened by blasting the rockn, wo that there is now 21 feet of wate; at low tide throughout it.
Helm, implien the mechanian of the stecrage, especially the tiller: an, to put the helun a-starberad, is to put tho tiller over to the right sile; aport, to the
left side; up, to the weather aldo; down, to the lce side.
Helmuman. The man who steers. A goos helmaman oppeses In time the tendency of the aliip to devlate from her course by a small motion, which ho relaxes as soon as the effect is felt, and thus disturbs her salling as little as possible. A bad helmismun glves her too nulnch helm, and keeps her perpetually: yawing from one side to tho other. The steerage, therefore, is of the utmost consequence $\ln$ ehase.

Hemlock, tho Conium maculatum of botanists, is an umbelliferous plant possessing narcotic and powerful poisonous properties. It may readily be distinguished from most other umbelliferous plants by the numerous dark purple spots which cover ite smosth stem and leaf stocks, and by the strong heavy oder, resembling that of mice, which it exhales. The poisonous properties reside in every part of the plant, and are owing to the presesice of a peeuliar volatile oleaginous alkalohd, ealled conia or coneine, capable of forming salts with acids, which aro equally energetic as the conia itself.

Hemp (Ger. Hanf; Du. Hemnig, Kennip; Da. Hamp; Sw. Hampa; Jr. Chaurre; It. Canape; Sp. Canamo; Ras. Konopli, Kouopel; POl. K onope), a valuable plant (the Connabis sutixa of Limneus), supposed to be a native of India, but long sinee naturalized and extensively cultivated in Italy, and many countries of Earopo, particularly Russia and Poland, where it forms an articlo of primury commercial importance. It is also cultivated in different parts of Auerica, though not in such quantities ns to supersede its in. portation. It is stronger and coarser in the fibre than thax; but lts uses, culture, and management are pretty much the same. When grown for seed, it is a very exhausting erop; but when pulled green, it is considered as a cleaner of the ground. In Great Britain its caltivation is not deemed prolitable $;$ so that, notwithstanding the encouragement it has received from government, and the excellent quality of English hemp. it ix but little grown, except in some few districts of Suffolk and Lincolnshire. The quantity raised in Ireland is also inconsiderible.-Louvon's Eincyc. of Agricult.

Flax was first planted in England, when it was directed to be sown for fishing-nets, A.D. 153.1. Buallthes were paill to encourage ita cultivation in $18 \times 3$; and every exertion should be made hy the government and legivlaturo to acconplish such a national gend. In 1785 there were huported from Russia in Jritish slips, 17,695 tuns of hemp ond thax.-Sir John Siurlair. The annual limportations of these articles now amount to ulvout 100,000 tons. More than 180,0100 lis. of rough hemp, are used in the cordage of a first-rate man-of-war, including rigging and mails. See Flax. -Ihaydn.

Exceedingly goow huckaback is made from hemp, for towels and common tablecloths. Low-priced helupen cloths are a general wear for hoshanduen, servants, nud laloring manufacturess; the letter sorty for work. ing farmers and tradesmen in the country, and the finer ones, 务 wide, are preferrel hy somu gentlemen for strength and warmeth. They powsess this advantake over Irish and other linens-that there colur innproves in wearlug, while that of linen deteriorates. Bat the great consumption of hemp, is in the manufacture of mailcloth ard conlahe, for whid purguses it is peculisaly Iltted by the strength of its tibre. Einglish hemp, when properly prepared, is said to he stronker than that of every other comastry, liassia nut excepted: and would, therefore, make the hest cordage. It is, huwever, but little used in that way, or in the making of saileloth; belng princlpally made linto cloth for the uses already atated.
Hemp has been cultivated in Hengal from the remotest antiquity, but nut, as In Europe, for the purpose of being manufactured into cloth and cordage.

In the III malt ; a fi belnt prod which it is : merce, etc.

In the Hindoo economy it serves as a substitute for malt; a faverite intoxieating liquor, called banga, being produced from it! This, also, is the use to which it is applied in Egypt.-Milnurv's Orient. Commerce, etc.
The price of hemp flucrnated very much during the war of 1812. In consequence of difficultles in the way of its importation, it etood at a very high level from 1808 to 1814 . This was the principal clrcumstance that origiunlly brought iron cables into use; and the extent to which they are now introduced, has contributed materially to diminish the consumption and importation of hemp.-Tooks on lligh and Low Prices, 2d ed., p. 3-5.

We horrow the following particulars, with respect to the hemp trade of Petersburg, from the work of Mir. Borrisow on the commerce of that clty:

Hemp forms a very important articie of export from Petersburg, and deserves particular notice. It is assorted, nccorling to its quality, Into clean hemp, or firsts; out-shot hemp, or seconds; half-clean hemp, or thirds; and hemp codilla. Of the first 3 sorts there are annually exported nbout $2,000,000$ poods, the greatest part in English nid American bottoms. It is brought to Petershurg, from the interior beyond Moscow, by water; and its quality depends very mueh on the conntry in which it is produced. That brought from Karatshev is the best; next to this, that produced in Ilelev; hemp from Gishatsk is considered inferior to the latter. As soon as the hemp is brought down in the spring, or in the course of the summer, it is selected and made up in bundles; buth operations being jerformed by sworn selectors (brackers), and binders appointed by government for this purpoce; and it is a well-known fact, that this is done with great impartinlity and exnctness. A lundle of clean hemp weighs from 55 to 65 poods; ditto out-shot, 48 te 55 ditto; ditto half-clean, 40 to 45 ditto. ( 1 pood $=36 \mathrm{lbs}$ avoirdupois.) Blading of hemp ls paid for at the rate of 2 roublea 50 copeeks for elean, 2 roubles for out-shot, and 1 rouble 60 copecks for half-rlean, per bundle; oue luif is paid by the seller, and the other half by the purchaser, and is eharged aecordingly by their igents. 'The expense of selecting hemp is 50 copecks per hereevitz (or 10 poods), and is tho same for every eort. To every bundle of nasorted hemp is attached a tleket with the names of the selector, hinder, and owner, and the date and year. Erery bundle has also affixed to it a picee of lend, stamped on one side with the mane of tho selector, and on the other with the sort of hemp and the time when it was selected. The external marks of good hemp are, its being of an equal green color and free from splits; but its good quaity is proved by the strength of the fibre, which should be fine, thin, and long. The first sort shoukd the quite clean and free from spills; the out-shot is less so; aut the hutf-clean contnins a still greater portion of spllis, and is moreover of mixed qualities und colors.
As u perfect knowledge of the qualities of hemp and thax tan only he acquired hy experience and attention, agents usually employ men constantly oceupied in this husiness, by which means they are sure of getting geol of the best quality, noll have the best chance of giving antlafaction to their prinepals; because, although the hemp is selected hy aworn selectors, yct, owing to the quantity of binsiness nud the apeed with which it must he executed, etco., them are often grout differences in the same sorts. The charges are in this way somewhat lncrensed; but thin is tritling in comparison of tho alvantuge gained. The part separated, or jucked out in cleaning hemp, is called hemp condilla; it is generally made up fin small bundles of 1 proi, which are ngaln, when shlpped, bound together in large tundien, ench consisting of about 30 small ones. Purticular care muat be taken to ship hempand flax in fine dry weather; if It get wet, it heats num is to-
tally spoiled. For this reason every vessel taking in hemp or flax is furnished with mats to prevent its getting damp. Memp, being light and bulky, ls, when stowed, forced into the hold by means of winches, whleh renders the operation of loading rather siow. It may be taken as a general rule, that the prices of hemp are highest in the months of May, June, July, and the early part of August; the demand for this article being then greatest, and the exportation to North America being principaliy effected at this eeason. Again, the prices of hemp are lowest in the month of September; the reason of whleh is, that the less opulent hemp-merchants return at the end of this month to their own country in order to make new purchnses for the ensuing year; and rather than be detained, sell the remainder of their stock some roubles below the market price. This causes a general decline; although an unusual demmat for the article linppening at the anme time, or political events or rumors, ocensionally produce a contrary effect. Two lnrge warehonsea, calied ambares, are buitt in Petersburg for the special purpose of housing hemp, where the greatest oriler is olserved.
/femp (Mfanilla) commonly called Manilla white rope. Mr. Crawford gives the following account of thia nrticle: "Of the wild bmana, one kind (lfusa textilis) grows in vast abundance in some of the most northeriy of the spice islnnds. In the great island of Mindanao, in the Philippines, it fills extensive forests. From the tibrous hark or epidernis is mnnufactured a kind of cloth, in frequent use among the natives. It also affords the material of the most valunble cordage which the indigenons products of the Archipelage yield. This is known to our readers and navigators under the name of Manilla rope, and is equally applieable to enbles, nid to standing or running rigging."-Hist. of Archipelago, vol. i., ]. 412.

ITemp (Indian), or Sunn and Jute.-Sunn conslsts of the fibre of the crotolaria jumeea, $n$ totally different filant from the cannnhis sativa, which, as already stated, is never used by the Ilindoos for cloth or coriage. Sunn is grown in varions places of Hindoostan. The strongest, whitest, and most durable species is produced at Comercolly. During those periods of the late war when the intercourse with the Ihaltic was interrupted, and hemp bore an enormous price, large quantities of sunn were imported; but after the intercourse with the Continent was renewed. the importation of sunn ceased for several years. But within the lnet dozen years it has heen again imported to a considerable extent. It is, however, deficient in toughness.

Jute conslats of the fibres of two plants, called the chonch and isbund (Corchorus olitorius and Corchorus capsularis), extensively cultivated in Bengal, and forming, in fact, the material of whieh gunny bags und gunny doth are made. It fetehes neurly though not quite as high a price as sumn. It comes into competition with llax, tow, and cadilin, in the manufacture of stalr nod other earpets, lugging for cotton und other roots, and wach like fabrics, being extensively used for these purposes in lhondee. Lut it is masuitable for cerdage ant other articles into which hemp is mnnufuctured, from its snupping when twisted, and rotting in water. The quantities imported, and the prices, have thuctmoted very freatly during the last diozen years ; but from fic to exs a ton appears to be a fair averuge price. When tirat introduced into this country, in 1815 , the price of jute varied from $£ 35$ to f. 10 a tom. It was then, however, very little used, and did not, in fact, liegin to come lnto any thing like general use as lagging till 1827 or 1828 .

Chisa-gross.-The attention of practleal men has bong been directed to the remarkabio qualities of the thinn-grass, very similar to the Calooe hemp or Rhea thire of Indin. 'I'his grase is very strong and benatiful in the flbre; and a simple but efleaclous mode of
proparing it has lately been devised. Thia metk ul depends chlefy on the solvent powers of a hot solustion of carbonate of sodn, and is so aatisfactory that mixel fabrics are now made with China-grass as one of the component fitires; and there seems scarcely any Ilmit to the probable aupply of the grass from India.

Culture in Russia.-Next to the eulture of cereala and the rearing of domentic animals, the cultare of fiax and hemp, both as textile planta and as oleaghous graing, is the most linportant branch of Russian husbandry. The gross value of these products amounts, at a very modernte estinate, to about $55,500,000$ of silver roubles ( $\$ 43,500,000$ ) ; and both soil and climute are exceedingly favorable to their culture throughout a great part of the empire. As their production greatly exceeds the wants of the home manufacture, the extension of their culturo cssentially depenils on the facility with which they find an ontlet in the forelgn market. Flax and hemp have always formed two of the principal exporta; and, if to these we add oleaginona grains, which consist principally of the seeda of hemp and flax, we ehall find that the export of these three articles, taken as a whole, exceeds in value that of any other product. In the conrse of 29 years, from 1824 to 1850 , inclusive, there were but four, namely, $1830,1831,1846$, and 1847 , in which the value of exported cereala was greater than that of theas.

From the custom-houae returne, we find that, during the period in question, the total value of exports for Earopean commerce amounted to $\% 1,427,586,225$, ahout $124-5$ por cent. of which was in flax, $101-5$ per cent. in hemp, and $83-5$ per cent. in oleaginous seeds. These figurea forcibly show the luportance of the culture of these textiles to the foreign commeree of Russia, as well as for her domeatic manufactures. In this braneh of agrieulture, she has not hitherto met with serious competition, as the other countries of continental Europe, in which these articles are prodnced, not having mueh land to spare fur that purpose, and finding it, from their greater relative population, more profitable to eultivate other eropa, do not raise enongh for any considerable exportation; for, nowhere in Furope can they lee cultivated in anch abundance as in Russia. Of other countriea, it in the Fast Indies and the l'illippine Islanda that furmiah Fngland the largest supplies, say, from 10,000 to $12,(500$ tons per annuin, and the United States, which export at present not over 5000 tona. Fingland, moreover, imports from Egypt and other parts of Africa about 200 tons of llax and hemp, an amount comparatively inslgniticant.

Notwithotanding the heary blows continnonsly dealt out to it, ly the linereasing use of cotton goods, the linen manufacture atill maintaina the foremont rank in Russia, in point of extent and importanee. It is not, like the cotton manufacture in Great Iritaln, the I'nited States, and other conntries, concentrated in large establiahments, which atrike the eye ly their size, their machinery, and the numbers of workmen collected on the premises; liut, conducted within the morest wulla of the peasants' cottages, it is iliffused over the whole length and lirealth of the lnnd. There is searcely a sillage withln the whle limits of the entpire, where the wheel, the distaff, and the lown are not to the found. With regaril to the extent of chia specion of Industry, It is averral that lisen forms onn of those articles of prlme necessity which no limilividual in Rusala, rieh nor porr, con entirely dinpense with. ISeckoning only 10 yands, $2 x$ inches in whith, for sach inhablitant, jer annom, it wonll! refuire for the popuslation of fri, 500,000 (ineludlog l'oland), in consumption of $605,0001,000$ yarda. The culture of tlax fur evilimerce ls moxt extenslvely carried un in the governments of Wologila, Whatka, Saroslaw, Wladamir, Novgorol, l'gkow, Livobla, Courland, Smolensk, Wilna, and Witetws, and that of hemp in the guvernmente of Tachernigow, Koursk, Orel, Toula, and Tainlxow. Thin limportant branch of rural economy has
attracted the special attention of the Russian government.

Culture in the United States.-During the last half century grost efforts have been made in Europe, and, to soms extent, of late, in the United States, to increase and improve the production and manufactore of flax and hemp. Formerly they were considered as indispensable crops among our planters and farmers, but their use has been sapersented in a measure by the cotton of the South. Common tinx is a native of Iritain, where it his been cultivated from time inmemerial, and froin lts hardihood and allaptation to a wide runge of temperature, it has been grown in almost every country on the eastorn continent, from Egypt to the polar circle, and in North America, from Texas to Newfoundland. Iemp, which is supposed to be a native of India, but long slace acclimatized and extensively cultivated in Spain, Italy, and several other countries in Europe, particularly in l'oland and lisssia, as well as in different parta of Americu, also forms an article of primary importance in commerce, and is of extensive utility. Hoth of these products were in. troduced Into the North American colonies swon aft ?r their settjement by the English. They are mentioned na growing in New knghnd prior to 1632; and homnties were offered for thelr cultlvation in Virginia as early as 1751. Captain Matthews sowed yearly boda henp anil flax, which he cauaed to be span and woven, prior to the year 16:18. In 1662 an edict was passed requiring each poll in Virginia to raise nnnually and minofncture six pounda of linen thread; but, from the ehange of the laws and the cessation of the bounties, the culture declined.

In the late Exhibition at Iondon, of the Works of Industry of All Nations, Loth of these materials held a conspicuous rank. Flax was exhibited, the growth of Great Iritain, Ireland, Ilolland, Belgimm, France, Spuin, lortugal, Italy, l'rassla, Germany, l'ohand, IRassia, Turkey, Epypt, Indi., Van Dicman's Iand, Canaln, and the Unlted States, and hemp from all of these countries, except Ilritain, Ireland, Canala, and Van Dieman's Land. The fibre of flax and hemp has never been proluced in this country in sufficient almulance to form much of an article of forcign connmerse, but finx-seed was formerly shipped to lurope in larce Iuantities. There were exported from New dersey in 1751, 14,000 lbs. of hemp; from Sivannah, in 17:0, 1860 lbs.; from the Juited States in 1850- 51 , 4itio cwt. The amount of flax-seed exported from Phila-
 bushela ; in 1771, 110, (ti2 bushels; from New Virk in 1755, 12,5:2 hhds. ; from the liritish North American colonles, in 1770, 312,612 luskels; from the l'nited
 els; in $1810,240,579$ bushels; in $1 \times 20-21, ~: 661,310$ bushels; in 1si10-'11, 120,702 luashels; in $18.10^{\prime} \cdot 11$, 32,243 busliels ; in $1850-51,9185$ bushels.

Aceorting to the census roturns of 18.60 , there were ralsed in the Vnited States $95,251 t$ tons of thax and bemp; of $1 \times 50,35,003$ tons of hemp und $7,715,961$ hlas. of thax. The correctness of the returng as to hemp, in the seventh evosus, has not yet hern fully writiel. There has been mome donht whether, in a mumbe of instancea, the marshals have not writuen toms where they meant lbs. If, however, the returns aro all allowed to stand withont reduction, it would appar that the cultivation of hemp or thax has materially chamged since 1810 . In the returns of that year, as atated alove, both of these articlen were included mutar the same head. In 1840, thowe of Virgmia mave $2 .$, ,ill tons of liemp, and lax together. In 1800, anly 1.11 tons of hemp and bow tons of bax were returied. Such a falling eif wonld amount to almont an aboudunment of the calture of homp lin that State, which there is no reason to suppose has taken phace.

The discovery of new mothonds for wiparating the Abrous from the woorly parts of the llax plaththas
doubtless gi in the Unite lirst attract Theugh cons dreed in for for the seed, The want of the textile fr sioned a va country. Sh male to app duetion of th creat import only alone, b as it appears other ifbres.

Hemp-se 1t. Comipueci opljanoe sienja seed is that wi rubived. It is vil, or as fookl lowied with a reduced to 1 . pealed.

Herat or espital of Shat of Afghunistin milles north of tile valluy. miles went of' earthen mound ditch. Vrom upward of 10 mirth cml of 1 a ditch amel ma is the liuge m further the go Reza. As the
doubtloss given a vigoreus atimulant to its cultivation in the United States. The process of Chevalier Clansen lirst attracted general nttention among us in 1850. Though conshlerable quantities of flax have been produced in former years, it has been raised principally for the seed, which commanded a remunerating price. The want of a cheap and speedy process for separating the textile from the refuse parts of the atalk has oecasioned a vast annual loss of useful material to the country. Should the ittempts which have lately been made to apply Clausen's invention succeed, the production of tlax in the United States may become of great importance, and be advantageously used, not only alone, but in the manufacture of mixed fabries, as it appears capable of belug span with wool, silk, and other tibres.

Native-grown hemp is coming Into use very generatly. Mr. W. 13. Shubrick, Chief of the Bureau of Constraction, Nary Department, in a report to the Seeretary of the Navy, recomments greater attention to the detail of cultivation, euring, and packing native-grown hemp, which, in the opinion of the burenu, would be found to be very beneficial in effect, and, in course of time, make the navy altogether independent of a foreifa market for a materiai so important for maval purposes. Mr. Gardiner, Superintenilent of the Rope-walk of the United States' Navy Yaril at Memphis, in a report of his depurtment, further substantiates theoe views, concluding, that with proper care, "American hemp may, as experiment has ;roved, be mude to equal if not to ex cel, any forelga Importation."

Kentucky unt Missouri nre our alef hemp-growing States; the former producing superior hemp as a better system of prepuration prevails.
Production of Ifrup in the Uniten States in 1550 .

Hemp-seed (Vr, Chenevis, Chenemi; GerMamfant ; 1t. Canumucria; Lat. Semen cannabinum; lius. Kanopljanoe Nenja), the seed of hemp. Tho hest hempseed is that which is brightest, and will not break when rubbed. It is used either as seed, or for crushing for oil, or as food for fowls. Previously to $1 \times 39$, it was loaded with a duty of eg per quarter, which wis then reduced to is. pur ditto, and in 1815 was wholly rem pealet.
Herat or Herant (nnciently Arid or Artucomn), eapitul of Shah Mahmori's State, on the west frontior of Afthanistan, eron feet above the sea-level, three miles north of the llary liver, In a beautiful nud fertile valhy, lat. $31^{\circ} 22^{\prime}$ N., long. $62^{\circ} 9 \prime \mathrm{~F}$, ; $166^{\circ}$ miles west of C'atrol. It is entirely surroumed by an earthen mound, 50 fect high, hy two trenches, nod a ditch. Firom the momil rises a wall 25 feet high, und upwand of 100 hastons on unburnt brick. At the north end of the town in a strong eitudel, defendel hy a ditch und massive towers, To the north of the town is the luge mound raised by Nadir Shah, mind a little further the gergeons ruins of the Moosuliah of Immin Heza, As there is nu drainage, the town is oxtremely
filthy, althongh in the 15 th and 16th centuries it was one of the finest citles in the world. Commercially, the position of Merat is important. It receives shawle, iniligo, sugar, splees, chiutzes, muslins, brocades, scarfs, leather, and hiles from Afghaniatan; tea, sugar, porcelain, glass, silk, cetton, cloth, woolens, carpets, and hardware from Persia, Russia, and Turkey. The Ilerat carpets are fumous. The annual revenue of Herat is estimated at, perhaps, $£ 100,000$. It was unsucceasfully besieged by the Persians in 1838. Population lesa than 45,000 .

Ferrings, and Herring Fishery. The horring (Clupea harengus of Linnæus) is a fish too well known to require any description. It is everywhere in high esteem, both when fresh and when salted.
"Herrings are found from the highest northern latitudes yet known, as low as the nerthern ceasts of France. They are met with in vast shoals on the coast of America as low as Carolina. In Chesepreake Bay is an annual inundation of those fish which cover the shore. We find them again in the seas of Kamschatka; and proliably they reach Japan. The great winter rendezvous of the herring is within the Arctic Circle : there they continue for muny months, in order to recruit themselves after the fatigue of spuwning; the seas within that space swarming with insect food in a far greater degree than those of our warmer latitudes. This mighty army begins to put itself in motion in spring. They begin to appear off the Shetland Isles in April and May, These are only the forerunners of the grand shoal, which cones in June; and their appearance is marked by certain signs, such ns the numbers of birds, like gannets and others, which follow to prey on them; but when the main hody approaches, jts breadth and depth is such as to alter the uppearance of the very ocean. It is divided inte disthact columns of five or six miles in length, and three or four in breadth; they drive the water bofore them, with a kind of rippling. Sometimes they sink for the space of 10 or 15 minutes, and then rise again to the surface; and in line weather reflect a variety of splendidl colors, like a field of the most precious gems. The first cheek this army meets in its march southward, is from the Shetland Isles, which divides it into two parts; one wing takes to the east, the other to the western shores of Great Britain, and tlll every bay and creek with their numbers; the former proceed toward Yarmouth, the great and ancient mart of herrings; they then pass through the liritish Channel, and after that in a manner disappear. These which take towarl the west, after offering themselves to the Hebrides, where the great stationary fishery is, proceed to the morth of Ireland, where they meet with a second intorruption, and are obliged to make a second division: the one takes to the western sile, und is scarcely perceived, being soon lust in the immensity of the Athantic ; but the other, that passes into the Irish Sen, rejoiees ant feeds the inhabitants of most of the coasts that horder on it. These hrigades, as we may call them, which are thus sep rated irom the grentor columms, are often eapricious in their motions, and do not show an invariable nttachment to their hunts. 'This instinct of migration was given to the herriugs, that they might deposit their sjuwn in warmer seas, that would mature and vivify it more assuredly than those of the frozen zone. It is not from defect of foul that they set themselves in motion; for they come to us full of tat, and on their return ure almost universally observed to be lean anst miserablo. What their food is near the pole, we ure not jet informed; lut in our seas thoy teed much on the oniscus matinne, a erustaceous insect, and sometimes on their own fry. They are full of roe in the end of Juse, and continue in perfection till the beginning of wintor when thoy deposit their spinwn. The young herrings hefin to approach the shores in, July and August, and ure thon from one half an inch to twolnches long. Though
we have no particular authorlty fhr it, yet, as very few young herrings are found in our aens during winter, it seems most certaln that they must return to their parental haunts lienenth the kee. Soma of the old herrings continue on our ceast the whole year."-l'p.rnant's British Zoology.
The herring was unknown to the ancients, belug rarely, if ever, found withln the Mediterranenn. The Dutch are said to have engeged in the finhery in 1164. The Invention of pickling or aalting herrings is ascribed to one lienkels, or llenkelson, of Hiervllet. near Sluyk, who died In 1397. The emperor, Charles V., vislted his grave, and ordered a magnifieent tomb to be erected to his memory. Since this early period, the Dutch have uniformly maintained their aacendency In the herring fishery; bot, owlog to the Keformation, and the relaxed oliservance of Lent in Cathollc countries, the demand for herring* upon the Cortinent is now far less than in the 14 th and 15 th centuries.

It is shown by a parlinmentary return of $18 \ln _{6} 6$, that the tntal quantity of herring cured in Grent Britain, during $\mathbf{1 8 0 5}$, wan 766,609 harreln ; the quantity branded, 280,581 barrels ; and the quantity exported, 442,264 harrels--heing an increase over tho preceding year of 130,141 bnrrels cured, $68,73{ }^{\circ}$ branded, and 80,567 exported. The quantity caught, lut not eared, amounted in 1855 tn 830,759 barrels, leling an increase of 26,970 bartels over 1804 . The tntal produce of the herring Ilsheries in 1855 a sted to 897,463 burreln, being 157,111 more than 1.1854 . Of cod and ling, during $1855,113,561 \mathrm{cwt}$. was cured dried, anil 6316 barrels cured in plekle ; total quantity exported being 29,151 cwt, of the former, and 25 barrels of the latter. This was an increare as compared with 1854 of 9507 cwt . cured, nul 25 barrels exported. The total gluantity canght, but not cured, amonnted to bin, $6: 9$ ewt., being an increase over the preceding year of 5197 cwt ., and when added to the quanlity cured, makes the produce of the col und ling fisheries for $18525,177,100 \mathrm{ewt}$. and 691t barrels, helng an increase over 1854 of $9: 173 \mathrm{cwt}$. and 160 harrels. In $1855,11,747$ hoats, manned by 41,402 thenermen and loys were employed In the shovecuring department; and the total number of persons engaged in the lisheriea was 94,105 , being an tucrease over the preceding year of 856 boats, 12.43 fishormen and $\mathbf{1 6 , 3 2 1}$ persmes in the total namier employed. The value of hoats, nets, and linew amounted in $1 \times 5 \mathrm{~s}$ to $\mathcal{E}[18,48.3$, being an incrense, as compared with 1851 ,

Elidage (Hidagium) was an extrantinary tax pay. nhle to the kings of Englant for every hide of land. This tax was levled in money, provision, nrmor, and other articles; and when the I anes Innded in Sandwheh in 994, King lithelred taxed all hils landes by bides, so that every 810 hbles furnished one juck ninj one anddle, to arm for the defense of the kinglom. Sometimes the word hidage was used to signify exemption from that tax; and this immunity was also called hidegild, and Interpreted, from the Saxon, a price or ransom pald to save one's skin or hide from beating.

Eides (Ger. Halte; Du. IVuiden; Fr. Peaur; It. Cuoja; Sp. Pellejos, Pieles; Kus. Koshi), signlfy, get. erally, the skins of hessts, but the term la more particniarly applled to those of large cattle, such as bullocks, cowa, horses, elc. llides are raw or green; that ia, in the state In which they are taken off ine carease, or dressed with ealt, alnm, and nalt [etre, to provent them from putrefying; or they are enred or tanned. The hides of South Anerica are ln the highest repute, and vast quantities of them are inported.

Jhuring the year 1856 the lmports of hite inte various ports of the United Statea were greater than in previous yenrs, ns fullows:

High Seas. The high seas mean the water of the ocean without the boundary of any conntry, ann they are within the exclusive jurisoliction of the adniralty up to high water mork, when the tide ls full. The open ocean which washes the sen-coast is used In contradistinction to arms of the sea inclosed within the fances terra, or narrow headlands or promontorien; and under this head is included rivers, hurbors, creeks, hasins, hays, etc., where the tide ebbs and fiows. Ther are within the admiralty and maritime jurisoliction of the United States; but if they are within the boly of a county of any particular State, the State jurisuliction attaches.

The extent of the jurlsdiction of the district courts of the United States, as courts of admirulty and maritime jurisdletion, was very fully examiner, and with great ability and rescarch, by the Circult Court of the Unitel States for Massachusetts, in the insurance case of De Lovio r. Boit. It was maintainel, that in very early periods the admiralty jurisdiction, in civil cases, extended to all maritime causes and contracts, and, in criminal cases, to all torts and offenses, as well in ports and havens within the ebb and flow of the tide, as upon the high seas; and that the English adnimalty was formed upon the same common model, and was co-extensive, in point of ;urisdiction, with the maritine courts of the other commercial powers of Europe. It was shown, hy an exposition of the ancient cases, that lord Coke was mistaken in his attempt to contine the ancient jurisdiction of the admiralty to the high seas, and to excluile it from the narrow tide-waters, and from ports and havens. The court agreed with the aiminalty civilians, that the statutes of 13 lR . II., and 15 K . 1 I ., and 2 II . IV., dild not curtail this ancient and uriginal jurisdiction of the admiralty, and that, consistently with those statutes, the almiralty might excreise jurisdiction over torts and injuries upon the high seas, and in ports within the ebl, and flow of the tide, and in great streams lielow the first fridges; and alsu over all marltime contracts, as well as over all matters of prize and its incidents. It appeared, from a hastorical review of the progress of the controversy for jurisdiction, which lasted for two centuries, between the admiralty and the courts of common law, that the latter, by a sllent and stealy mareh, gained ground, snd extended their linits, until they acquired coneurront juriadiction over all maritime canses, except prize causes, within the cognizance of the admiralty. The common law ductrino was, that the sea, ex ri termini, was without the boty of uny country; but that all ports and havens, and all navigable tide waters, where one might see from one land to the other what was dolng, were within the boty of the county, and under the exclusive juriadictlon of the common law courts. On the ses ahore or coast, ligh and low water mark determined what was parcel of the sen, and what was the line of division between
the almiralty and the courts of law; and it was held, that it ought to be so considered by parity of reason, where the tide ebles and flowe, in ports and havens; end that the admiralty jurisdiction extends to ull tide waters in ports and havens, and rivers lienesth the lirst bridges. It was admitted, however, that the common law originally had jurisdictlon on the high seas, concurrent with the admiralty; and that in cases manifestly within the admiralty jurisdictlon, loth civil and criminal, the common law now claimed concurrent jurladiction.-Keat's Com., vol. i., pp. 399, 400.

Crimes on the bigh seas, such as piracy and robbery, are, by the laws of the United Statee, punished with death. Persons charged with such crimes must he tried at the port where they first arrive or are brought. Acreinaries shall also suffer leath. Concoaling a pirate, or larborling property taken by a pirate, is punished by imprisomment not over three years, and fine not over $\$ 500$. For revolt on shiphoard, or abetting a revolt, seamen will be imprisoned not over three years, and fined not over $\$ 1000$.-DunLar's Digest; pp. 7ó, 76.

Highway. In the civil law, the banks of public rivers and the sea shore were held to be public. Ripurtm publicus usus est; littorum quoque usus publicus est jure gentium, The law of nations was here used for natural right, and not international law, in the nodern sense of it; and it is stated in the Institutes of Justinian, that all persons have the same liberty to bring their vessels to land, and to fasten ropes to the banks of the river, as they have to navifate the river itself. These liberal doctrines of the lloman law have been introduced into the jurisprudence of those nations of Europe which have fullowed the civil, and made it essentially their municipal, law. Thus, in Spain, the ses shore is common to the public; and any one may fish, and erect a cottage for shelter. The banks of navigable rivers may also bo used to assist navigation. In the French law, navigable or floatahlo rivers, as they are termed, have always been regarded as dependencies of the public domain, and the lands on each side subject to the servitude or burden of towing paths for the benefit of the public. Sir Matthew IIale, in his De Jure Maris, concludes that individuals had a right to a tow-path for towing vessels up and down rivers, on makiag a reasonable compensation to the owner of the land for damage. In the year 1789 it wus decided in Enyland, 3 Term Rep., 253 that there was not, and never had been, any right, at common law, for the public to tow on the banks of mavigable rivers. It was admitted, that on many navigable rivers, there was $s$ custom to tow on the hanks; but the privilege in that case rested on the special custom, and not on any common law right. The statutes which lave given a right of towing on parts of the Severn, 'Trent, and Thames, are evidence that no such general right hefore existed. In New York it hass been alljudged, nfter a very ablo and thorough oxamination of the question, that the public have not the right to use and occupy the soil of an indivitual adjoining navigable waters, as a public landing and place of deposit of property in its transit, against the will of the owner, although such user had been continued upward of 20 years, with the knowledge of the owner. On the other hand, it is held in Missouri, that navigutors and fishermen are entitled to the temporary nse of the banks of asvigalle rivers in that State, though owned by private individuals, for the purpose of landing and repuiring their vossels, and exposing their sails and merchandise. But this use ie for trunsient purposes only, and under restrictions.

It is a settled princlple in the English law, that the rlght of aoil of owners of land bounded by the sea, or on navigable water, where the tide eblis and flows, extends to high-water mark; and the shore below common, but not extraordinary, higlowater mark,
bolongs to the State as trustee for the public; and in England the crown, anil In this country the people, have the absolute propriotary intereat in the same, though it may, by grant or proseription, become privite jroperty. The public have, at common law, a right to navigate over every part of a common nav. lgable river, and on the large lakea, The public, in cases where the rlver is navigable for hoats and rafts, have an easement therein, or rlght of pasaage, sulject to the juz publicum, on a publle highway.-Kent's Com., vol. Hil., pp. 52t-526.

Each proprietor is entitled to a larger or amaller proportion of the alluvlal formation and ahare line, according to the extent of his original line on the shore of the river. In the case of rivers not nave lyable, it belongs to the owners of the adjoining land. This princlple of the common law is recognizal and prevaila In the States of Mahe, Now Ilampshire, Massachasetts, Connectheut, Nuw York, New lersey, Marylani, Ohlo, Virginla, North Carolina, Lonialana. -Ibid., $5 \approx 7$.

Eimalaya, a Sanserit worl, compounded oi "hima," coldl or anorr, and " alnya," place of (Wllson'a Sanscrit Dictimary), is the nane given to the rangea of monntains which lound India on the north, from the lend of the Indus on the west to that of the IIrahmaputra on the east. (In the sonth they are bounded ly the phains of Indin, and on the north by the Tibetan courses of the alovenamed rivers. $i$ traverse section of the Ilhmalaya nowhero presents tho appearance of a slimple range, that of severil more or leas parallel chaina, neparated ly valleys of very great depth and steepness; this is becanse the secondury ranges that ramify north and sonth from it are of great iength, breadth, and complexity, and from bending to the east or to the west, often run for many miles parallel to one mnother and to the main range, liesilles rising luto eminences loftier than any on the latter, for which they are sometimes mistaken. The axis of the Ilimalaya is, moreove, not marked ont ly any contimous rilge or succeasion of peaka, lint la often broad, ojen, and low, compared with the nelphbaring isolated cuinences. Hence the line of watershed trecomes the only geographically determinable axls; and this, as In all mountain chains of any extent, follows an extronely sinnons course. No doulit this line, which throws the waters in two opposite directions throughout the wholo extent of the range ( 1.1 .60 miles), is also that of greatest elevation, or that along whlch the land is uninterrajtedly the most lofty.

Hetore, however, the real nature and geographical limits of the Ilimalaya, an atove defined, can the rightly understoknl, it is nesessary to consider this range in its relation to the little known mountain systemw of Ceatral Asia, of which it jerhaps forms a lesa important part than is usually supposed. On reference to the maj of Aria, the watershed of that continent will be found to follow a tortuous line, running diagonally from the peninsula of 'iujerat to Dehring' Strait. Across the phains of India this line is for the mont part indicated liy the Arewali chain, north of which it erosses the llimalaya olsliguely in a north-enst direction to the soarcen of the Indua and liralimapntra, whence it trends westerly to the source of the ()xus, and then again north-ensterly along the Altal to the south of lake Baikal, till it becomen the lablonol Mountains, and finally terminates in the prolongation of that range which traverace the conntry of the Telonktchi. Iate and Interestimg information reaperating these plains ean le fund in Ilve's 7rorels, 1 s.in.

All the great rivers of Asia rive in this watershed; those from its western aluge flow north intu the I'ular Ses, west into the Casminn or Aral, and south-wist into the Aralian sa; those from Its eantern mlope fluw east and south-esnt into the l'acitio, and sonth into the Indlay Ocean. Enornous mountain chains brauch off to the east and west of this main mxis, incloning
the valleya of the rivers; and of these chaina the sonthermmost is the IIimalaya.

In thelr Tibetan courses the Indus and Brahmaputra occtupy valleys of great elovation, and the opposite directions taken by them indleates the division of tha IIlmalaya Into two portions, the eastern of which stretehes from their sonrces at the peak of Kallas to the bend of the lrahunaputra, and the western termbnates at the bend of the Indus. These limits are more natural than is usunlly anpposed, since the prev. Alent lilea that the lirahmajuira enters Assam through a defile cunsed by a break in the chain is errumeous; on the contrary, the Himulaya gradually declines in elevation in liast liontan; uni the nppe : valley of the Ithong (as the IIrahmaputra at Its liond is called), is, accoriling to the best information hitherto procured, broad, open, and hot-riee being cultivated there on the very confines of eastern Tibet. So also tho Indus at the western extremity of the chain is unually desuribed as flowing throngh a defile; but though ita valley to the west of Kashmir is contracted and rugged, and overhung by atupendous mountains, it dives not in thia reapect differ materially, if at all, from the remainiler of its Titsetan course; nor is the fall of its bed between Jskario and the plains of tho ['unjal, greater in jroportion to the length of lts course than it is alove that town.

The branches or secondary ranges of the western Ilinalaya are so long und lofty, that aome diflurence of opinion exists as to which of them should be most "ppropriately considered as the continuation of the chain letween the peak of Kalhas and Kahhmir; and we have consideral the line of watershed hetween the tributaries of tho Inlus to the north, and the rivers that flow to the plains of India to the south, to tee the axis of the chain, since it both indicates the lhe of mean greatest elovation, and is the only deliaable axis in a geographical point of view. Of the scconilary chains we shall speak at length in connection with the rivers they inclose. Their direction is often prependicular to the main clain, lut they are so often oblique, and even parallel to the main chain, especially at their upper parts, that where very lofty and heavily showed, they are freqently taken by local ohservers for the axis of the llimalaya Itself; an error to which may be traced that miaconception regariling the relative amount and duration of the snow on the northern ant southern slopes of the Himalaya, whieh has led to so mush fruitless controversy in India and liurope.
'l'he general direction of this Iilmalaya throughout its length of 1440 miles, is east and west, but it trends northwarl from the centre towarl its westem extremit $y$, its extremes liehig respectlvely in N. lat. $2 x^{\circ}, \mathrm{F}$. long. $05^{\circ}$, and N. lat. $35^{\circ}$, JL. long. $73^{\circ}$. Its lireadth varies in different jarts, but has been acrunately ase rertained in the western portion only, where it deviatea hut littlo from 190 milies.

It has been atated that the mountain rauges of the Ilimalaya and the Koueulnn have no spectal existence as ehains aplart from the general elovated mass of Tibet, and that that rugged country forms the summit of a great or rainy, interior or intermediato, and Tilietan or arid llimalaya. The tropical lelt extends from the 'lerai to $6(M)$, and even 7000 feet in the humill central provinces ; and to 3000 to d000 in the extreme western. It conists of a lixuriant forest of Malayan and insular types of treen in the eastern provinces, which to a great extent disappear to the westwarl, where they nre partially replaced by l'erwian, lipyptian and Afghanistan types-among these trees the palms, plantains, tree-ferns, wal (whorea mbusti), wissoo (Italbergia sissoo), toon (C'adryla Tunon), and wome oaks, are the most conapleuous, and comumercially the nuost fimportant, eapecially to the east ward.

The temprerate belt extends from binn feet tome upper limit of furest, which varien from 12,000 to 13 ,000 feet, according to the dryness of the climate. It

use of
shounda in European, Levuntine, and Chinese genera anil even speciea, with but few Malayan mountaln ones; of theas the European are moat abundant in the western provinces, and the Chinese and Japanese in the eastern, where are aiso a few American genera, and aome belonging to the Maiayan and insular moontain flera. Among the most consplcueus planta of this region are oaks, birch, maple, apple, hornbeam, pojilar, ash, cherry, aider, ceitis, pine, juniper, yew, willow, and pinea (Abies, Webbiana and Brumoniana), which abound throughsut the range ; beaides which, there are to the westward of Nepal, deodar, Pinus Gerardiana, hawthern, cypresa, horse-chestnut, ollve, myrtle, evergreen oak, sloe, black poplar, and many other European genera and aven apecles; while to the eastward, luarel, magnolia, rhododendren, larch, Abies Brunoniana, and chestnut, more especialiy prevuil

The alpine belt, which commences above the forest region, ascends in extreme cases to $\mathbf{1 0 , 0 0 0}$ feet; it abounds In Sitherian, l'olar, and Earopean aiploe jlunts throughout the whole extent of the chain, the Furopean speciea and genera being moat prevalent to the west. Saveral hundzed common Engllah plants are also natives of the Jilmalaya, and eapecinily of the temperate and alpine zones; and the total numher of tlowering plants inhabiting the whole range probably amounts to 5000 or 7000 specios. Cultivation in the Illmalaya la carried on as high as 14,000 , and even 15,000 feet, where summer crops of whent and barley exist in Tlbet, but quite exceptionally; also buckwheat, turnips, radishes, mustard, potatoes, and various pulses, are grown abundantly between 8,000 and 12,000 feet, as summer crops. Rice, maize, millet, and other tropical cereals, are grown helow 6000 feet, with buckwheat, and variens species of chenopodiam, yams, capsicum, egg-apple, legumes, and sugar-cane.

The IIlmalayan fruits cultivated by the natives in the eastern and ceutral provinces are plantains, oranyes, pine-apples, walnuts, indifferent peaches and apples; in the western, excellent apples, pears, apricots, paches, cherries, mulberries, grapes, and walnuts. The cultivation of tea is now successfully carried on. on a large scale in the weatern Ilimalaya, at elevationa of 2000 to 5000 feet, and might probably be pursued with more or less success in ull parts of the cluin.

The timber trees of the llimalaya are extremely numerous, bat few of them are of great value, and some of the best inhabit inaccessitble rerpiens. The sal (Shoren robusta), is decldedly the most valuable; and, from growing at the foot of the hills, close to water-carriage, is the only one much felied for export. The tion (Cedrala Toown), and sissoo (Dalbergia Sissoo), are aiso exported from the same regions; and the deodar and other conifers from the north-western provinces. The other pines, the walnut, aaks, and the chestnuts, meatly produce indifferent timber; but, though there are exceptiens, the use of these $i$ is principally contined to the nelghlorhoon where they grow. Of ornamental woods, few are known, and none are in ceneral use. lamboos prevail everywisere, and rat-tan-canes to the castward. Owing, probably, to the humid elimate, the woods of buropean generia are, almost without uxception, inferior to those of their western ullies. Teak is unknown in the llimalaya; and the other woxds of eastern liengal and of both the indian peninsulas are either contined to the malarious forests of Assam, or are altogether ubsent. The vegetalife cconomic products are also very few and un-importani-such as splees, gums, resins, oils, waxes, fibrea, and other textile materials. Of Irugs, the baneful aconite and hemp are the best inown; inferior rhubart, and a few bitters of secondary importance in the pharmacoporia, are also collected for export. Attempts have been made to cultivate drugs for the use of the Indian medical cstablishments, but hitherto
with very limited success. Wild madder is extensively collected and exjorted, as are bamboon, canes, and a few other products: and latterly potatoes in Sikkim. There is no doubt that the vegetable riches of these exter.sive regions are bat very little known, and are capabie of immense extension; but hitherto the efforts have been limited. On the nerthem or Tibetan parts of the range the trees are extremely few and amall, and confined to willows, poplars, junipers, elneagnus, and tamarisk; and of bushes, the wellknown dama or furze, that supplies fuel, is the most familiar to travelers,-F. 13. See Quar. Rev., xvil., xxil., xxiv. ; Westm. Rev., xxxvii., 29t; Monthly Rev., xcv., $225,409$.

In mineral products the lilmalaya is remarkablypoor, so far as is at present known. There ia nothing which can compare in abundunce or value with the mines of the Ural, Andes, or European Alps. Red hamatite is worked with profit in Knmoin, and copper exista in Nepal and the Sikkr.- nillis. Iron (disseminated), oceurs in various $p^{\prime}$ sces, and graphite is common. Salt, berax, and ioda are procared in ubundance in the dry elimate of Tibet, where they are articles of commerce; there also gold-washing is carried on upon a most limited acale. Geld is known to be extremely abundant in many parts of eastern Tibet, where, however, the jenlousy of the Chinese government preventa lts being worked. Slates, lime, gypsum, lead, sulphur, and mugnesia, are also 11lmalayan producis. There la a surprising and almost total absence of gems, or minerals of rarity or beauty in the Ilimalaya; garnets, actinelites, and tourmalins, are perhajs the only exceptions of frequent occurrence, and these are of the coarsest description.

Hot aprings abound, chiefly at elevations of 10,000 to 18,000 feet ; they usually emit sulphuretted hyirogen gas, and maintain temperatures of $100^{\circ}$ to $130^{\circ}$. There is no active velcano anywhere in the range, nor any traces of extinct ones. Some of the districts, especially toward the north-west, have been visited by violent earthquakes, but these do not appear to be connected with any endemic phenomena; they have generally commenced far south of the Himalaya, and have been propagnted across the range. Remarkable local subsidences and clevatione have occurred in tho valley of the Jhelun in Kashmir, which have been clescribed by IVr. Thomson.

Hobart Town, situated in the southern part of the island of Van 1)ieman's Iand, on the west side of the liver Dennert, near its junction with Storms Bay, in lat. $42^{\circ} 4 \cdot 4^{\prime}$ S., and long. $147^{\circ} 28 \mathrm{E}$. The water is deep, and the anchorage is good; and a jetty has been constructed accessible to the largest ships.

Hogs. The prevailing breeds of swine in the middle, nerthem, and western States, are the Berkshire, the Leicestershire, the Suffolk, the ISsex, the Neapolitan, and the Chinese. From these and other varietics various crosses have been produced, the more important of which are the Byfield, the Woburn, the Iledford, tho Grass, and the Mackay. The Neapelituns are partirulariy well adapted for a southern climate. See De low's Rev., xii., ti; ; IIunt's Mag., xiv., 371 . See Uniten States-live Stock ore.

We give some statistics showing the number of hogs packed in the West in 1800-51, also anether tatile comparing the number packed in 1855-56 and 1856-57:

| Where paeked. | 1851-52. | 1850-81. |

Total defieteuey, 1556-87.... 671, 0 84
This deficieney, compared with last neason, ls equal to about 27 jer cent.

As regards the filling off In welght, having examInel the retonis recelved with reference to this point very carefully, the following lo the result.
We ohtalned the comparative welghts from 121 places, and find that the aggregates of almilar number of hoge jacked at these places, each senson, aro as follows:

Assuming this to be a fair indication of the comparatlve weight of the whole number packed, according to the returns, we place the falling off in wolght at 7 per cent., which is slightly less than the atove figurea Indirate. Alding this to the falling off in number, the total deficlency in awelled to 34 jer cent., as compared with the busineas of the season of $1853-66$.

The crop, then, as compared with a few previous spasons, stands as follows: See Ponk Thadpe.

$$
\begin{aligned}
& 84 \text { per cent tess than that ef. . } \\

Hogshead, measure of eapacity, containing 5et gallona. A hoguliead la equal to $\frac{1}{2}$ a pijpe. See Weigints avis Measi:hen.

Holidays are undervtond to lne thome daya, exclusive of Sundaya, on which no regular pulilic business In transacted at jarticular public offices. They are vither fixed or variable. Hanks and pntblic oftices are only closed on tixed holidays. In Fingland, the holidays otmerved senerally are, tiond f'riday, tueen's Ilirthilay; ('oronation Ihay' (June 'ax), I'rince of Wales' Ifirth-day (Nuvemiker 9), 1 'hristmas. In the Linited States, the holidays are, Fourth of July, Thankegiving fay (Noveminer), thrintmas. At New lork and some other cities New Years day in alno otservel, and at New Orfeana, January Wth.

Eogue, or EIague, Cape de la, a lold headiand of France, forming the north-wext extremity of the Iepartinent of Manche, 16 mileo nurth ly weat of Cherioarg. Of this polat the combined English and Ihteh fleets defeated the Firunch sed May, 1692.

Exold (Sax, hsaldan), the inside of the bottom of the shlp. It is divided into compartments by bulk. beada acrons ! and contalna the ballast, water, coal, and wood, provisions, and cargo.

EIolland Is a European kingdom, formed in part of Islanis, but chlefly of that part of the Continent where the mouths of the Rhine are divided into several branchea befese it enters the German Ocean. This distrlct ls ealif to have owed the ancient name of Ihatavia, by which it was known to the lkomans, to ane Bato; but at what jerlod he flourished ls unknown; and the name ls now searcely uned exceptiog nuong the poets of the dintrict. By acconnts collected trum
the works of Cresar and Tacleus, we learn that the an the works of Cresar and Tacleus, we learn that the anclent trlises who inhatited thls jortion of Europer had been able to maintain their independence $\ln$ apite of the attenupts made to sutrilue them by the Teutones, the Clinbri, and other natlons, who hal conquered the reat of what wus then called Gaul. The liatavians, anys the last of these historians, excelled all the other people on the Rhine ln military apirit. When subdued by the Romann, they palif thelr tritute in soldiers; and from them was formed a cavalry, which composed the mont efticient part of the Roman armies. They astoninhed the Ducians by the dexterity and bravery with whlch, completely armed, they swam their horsea across the I anabie to attack these joople; and for a long periol they formed the guard of the Roman emperors. A body of latavians accompuntiel Agricola on hix expedition Into Britain, and were of great assistanee in securlng hia conquests in the island.

William 1I. dying in 1819, was succeeded thy the present sovereign, Willlam III., horn 19th Fetiruary, 1817. Ile was married on tho 18th Iune, 1839, to the l'rincess Sophia Frederiker Mathllda of Wurtemberg. They have two nons, Wllliam Nicolaq, l'rince of trange, born 4th September, 1840, and Willianu Alexander, born 25th August, 1851.
The kingrom of the Netherlanila comprises the territory of the ancient republic of the Seven Unitel I'rovinces, with nome portions of Jlmburg. It does not include that portion of luxemburg which the King of the Netherlanda posasoses, with the title of Cirand luke, as a part of tho tierman Confederation. It is situated loetween N. Int. $50^{\circ} 41^{\prime}$ and $53^{\circ}: H^{\prime}$, and $E$, long. $1^{\circ}: \mathrm{NO}^{\prime}$ and $\boldsymbol{7}^{\circ} 10^{\prime}$. It ls bounded on the east by Germiny, from which it la not separated by any nstural barriers, on the north and weat by the German Ocean or North Sen. and on the south by Belgium.

The greater part of this country has been formed of mul deposited lyy rivers in the same msnner as the Figyptian lbelta in formed by the Nile. Hy tracing the course of these rivers wa oltain an ifiea of its conformation. The Rhine enters Holland at : colith, a little below Emmerich, where it is $23(1)$ fect troald; and then divides Into two branchen, the mothern recelving the name of the Waal. At Weatervoort, the northern lormeh is again divided, and there lta right arm in called the New Yeael. Then the teft branth, taking a wexterly direction, is agalu separated at Why Into two, and the left branch is called the ladk. The right branch thows on to Itrecht, and being there divided for the fourth tinue, receives fur its right arm the name of Voelt; while the left, which atill retains the name of old IStine, taking a westerly direction ly Waerden and Leyden, tinally makes its way st Kaiwyk to the North Sea.
'The Mense entars the Netherlanis' territory alove liysuden in limhorg, und Howing northwatl, unites with the Waal, near loeventeirt then divides near Itort, forming the ixland isselmonde. the right branch at Krimper ia joinel by the lek, then flowing weatward hy lotterdam, divides near Flardingen into two liranchen, and so forms the laland Rosenburg. These liranches uniting near lifielle, reach the sea at Oont vourn.

The S lunds at islande of The left right lira North Bra the bslant north of 1 North 11r channeis, the left and finall.

The Bie

The Scheldt touches the kingdom of the Notherlanis at Fort-Bath, where it divides, forming the lslanils of South and North Bevsland, and Walcheren. The left branch reaches the sas at Vllssingen. The right branch flows northward between Zeeland and Nurth Brabant ; dividing near Bergen-op-Zoom, it forma the Island Tholen, anil the left arm reaches the sea north of Walcheren. The right branch atill meparating North Brabant from Zecland, divides into numerous channels, by which ita waters, mingled with those of the left branch of the Meuse, farm numerous lslanda, and tinally reach the sea.

To establish a firm footing amid ao many rivars, the iuhubitants have kept them as far as posslble within prescribed ehannels hy cmbankments, and have formed numerous canals to recelve the superfluous waters, and to serve as means of internal communicaton. The cunntry is thus a net-work of rivers and canals from the one ond to the other. The aystem of irainage, of what wonld otherwlse have heen oll immense mudbank, well leservea to be ranked among the wonders of the world. The land thius rescued from the rivers is nowhere much elevated above the sea, and in many places is even below the aea-level, so as to require still more wonderful defenses agninst the ocean. Theso detenses are in part supplied by the operation of nature, casting up sand-hilla along grent part of the coast; but where these havo not been formed, their place is supplied by dykes of vast extent, built in the course of ages, partly of huge blocks of granite brought from Norway, and partly of bundles formed of young trees, reared expressly for the purpose. These dykes stretch for hundreds of miles along the coust, and with those which line the rivera nud camals, and with the requisite slnices, drawbridgea, and hydraulle works of overy kind, are estimated to have cost not less than $\ddagger 300,000,000$ aterling. They form in ao small a country a most astonishing monument of human industry. Yet they are not greater than the gituation refuires. They ure barely aulleient to preserve the country from the dominion of the waters. The motto on the arms of one of the provinces, "Inctor-et-Emergo," still describes the struggles of the Invincible Hollanders, requisite for maintaining the ground they stand upon. A destructive inundation ocecurred so lately as March, 1855. The rivers, augnented by the anows of winter, burst through the dykea in several provincea. A fourth part of Gelderland was abbmerged. The whole province of South Ilolland was in the most imminent danger. The embankment of the Rhine having burst in five places in Gelderland, admitted the llood, where it had not extended during 150 years. In Utrecht and Sorth llrabant, the people of many communes had to abandon their property to the waters, and sought refuge for thenselves on the roofa of housea and on trees. The neighborhood of Zatphen was very apeedily converted inte a vast lake, and the villagera hastily betaking themselves to bonts and rafts, reached with the greatest ditheuity the ramparta of the city. The tlood which happily subsided ater somo days, exhibited, while it continued, the promptitude anil energy with which the ILollanders have alwaya contended against the peculiar difieulties of their situation. The king immeliately repaired in person to the seene of danger, and took his station in the centre of the inundated country, lirecting all the operations, and giving every possible assistance. A colloction orderod by tho king for the sufferers produced $\pm: 11,667$, and private collertions reacheil un equal amomit. 'This sum was humediately diveributed anong the distressed families, whose habitatlons and lands hal leen laid waste. To drain off the remainder of the tloor, to rebnill the dykes, to repalr the lihiae railway, a conslderavle part of which had disappeared, could not be so quickly done, l,at all this the patriotisin of the llollanders has completely aceomplished.

The Biesbosch, in the nelghliorhood of Dort, was
formed $\ln 1491$, burying 72 villages under water, and drowning 100,000 persona. Of these villagen, 31 have been rebuilt, as the progress of drainago permitted. The Duteh method of dralning la highly ingenlous. A marah or lake is 'aclosed with a dyke to prevent any water from flowing linte it. Wind-mills are then erected on the elge of the dyke, each of which worka an Archimedean acrew, and the water thua ralsed is discharged lnto a canal, whleh convey it to the aea. The Lase of Haarlem was the most eelelirated of these oceasloned by the overflowing of rivers; and its drainage by the application of ateamis a great improvement on the old method of draining by whd-mills. See Ilasklem, Ency. Brit. Besidea these Inundations from the rivera, IDolland has experlenced many others from the sea, which have left large tracta of country aummerged, of which the Dollart and the Zuyder-Zee are the moat extenslve.

The Dollart between Groningen and Faat Friesland originuted in 1277, and was greatly extended in the three following years. One town, 35 vlllages, and several hamlets were overwhelned. It has froni time to time been nuch reduced by trainage. The ZayderZee was formerly only a lake, known by the name of Flevo, communicating by two ehannels with the North Sea. Subsequently the sea covered the lowhands, and the channels of communication were multiplied. Now the expanse of water is 80 miles long, and from 20 to 40 miles broad. Proposals for its drainage have heen nuile to the government, and are under serious consideratlon. As means of communication between Amsterdam and the North Sea, the Zuyder-Zee has long been unsatisfactory, on secount of the Pampus bank and numerous shallows. Sometlmes, in consequenco of long-continued northerly und easterly winda, its bed is almost dry, and vessels nre everywhere lying on the sanils. A substltute has accordingly been provided for it in the great North IIolland Canal, one of the most atupendous works of the kind in existence. It was begun in 1819 , and linished in 1825 , at a cost of about $£ 1,000$, 000 sterling. It is about 00 English miles in length. Its breadth, ut the surface, is $124 \frac{1}{2}$ linglish feet, at the bottom 36. The depth la 20 feet 9 inches. 1ta level is that of the high tides of the sea, from which it receives lts supply of water.

While the country poasesaes abundant means of communication by rivera and canals, it eldo has excellent roads. The highways in the central provinces wre anong the hest in Europe. They run for miles in a straight line aloug the sumnits of the dykes, and are thus at once elry and elevated, commanding extenslve views. Between the large cities they are broad, and usually paved with a kind of small hard brieks, called klinkers, mate of sand, mixed with the clayey mud obtained in cleaning the canuls. They are fitted so exactly to each othor when laid down that acarcely a erevice is to be seen; and being well covered with sea-sand, they sustain little injury from carriages. Railways have also been made, or are in progress in ull directions. Those hetween liotterdam and Amsterdam, and between thu latter city and Arnheim, have been in operation for several years. Rotterdam is also in eonmunication by railway with Utrecht via Gonda, and with Antwerp. There is $n$ branch bet ween Antwerp and Hroda. Maestricht. in Limbarg, is also in connmunieation with Alx-la-Chapelle.

The genetal aspect of thia country is different from that of any other in Europe. The roads and canals aro usually lined with willuws and other trees, which atlurd an ugreeable shale and relievo the uniformity of the laudscape. Innumerable villas are seen deco rated with the uthost nicety of art. Spires, chureh towers, villages almiruble for neatness and cleanliness, large and well-built cities, rapidly succeeding one enother; meadowa in vernal groen, varied by sheets of water, cattle in large herds, barges towed by horses, or spreadiug a sail to catch a favoring breeze-
every thing and avery place in the higheat order and | I abundance, and In ronpuet of whleh it has no parperfectlon; atuch are the shghte which Ilolland supplien ablel in any other part of the worle,

| Groning | 35,124 | Slola-le-duc | 21,4 |

Climate.-In respect of climate, It llatad lators muler many disadvantages. In winter it is much coller than Fingland, and the waters are frequently fozacin for three months. Even the \%uyder-\%ee is sometimes frozen over. The temperatore lias heen sometimes as low as $23^{\circ}$ below zero of Falis, and sometimes as ligh as 102 ${ }^{\circ}$. In summer, cold nights often succeed to dayes of intenae lieat. The climate generally is varintic. The atmophere, especially in the western provinces, Is loaded whth mokisture, and there ngues, dropsien, plearisies, and rhemmatisma, are frequent. Cielderland is the healthiest province, lint all the easteru side of the country is eomparatively salubrious. Holland 1s frequently sulbect to violent gales of wind, which, when they flow from the wext or north-west, are apt to canse inumbations of the sea.
Agricultur,--This remarkahle country largely rewarla the akill and latar of the agriculturist. The south and central provinces are the most fertle. As has leep shown aluye in one of the tables, there ore still extensive tracta of mucultivated land, although much haw been reclaimed of hate vears. The firms in the hest farts of \%eeland vary in extent from 16if to 330 acrea each. In South Holland the propmortion of pasture to aralije land is alsut 2 to 1 . In Friesand the quantity of pavture is more than eight timen that of arable land. In lieflerland there are larpe plantathona of apisle, pear, and cherry-trees. Tullpa anl hyacinths are extenxively cultivated in the neighturheord of Haarlemin fielda of several acrew earli. P'ulse and garden vegetables are everywhere raisel in great alupdance, also wond and madder. Flax is largely cultivated in the month, and experially in the nelghloorhood of burt. Utrecht and Gelderland produce
conaiderable quantitiea of tolacco. The fullowing are the statinthes of the harvent of 145il:

The rearing of live atock, however, and dairy hinslanulry, are much more important aources of mational wealth than tlllage. The lean cattle brought from Jenmark and Giermany futten with great rapiditr in the Duteh polilers. Large herds of benutiful cows yield great abundance of the richest milk. Ifutter and cheese of the lest quality are larely exported, and Iring great wealth to the peasantry. The i)utch horves are gool, and well adapted for draught ; the hest are those of Friesland. The breeda of aheep, nowever, are not partlenlariy gomed.

The atatistice of 1853 , December 31, give the follow ing numbers for the whole kingriom:

In North and South IIolland, Groningen, ami Itrecht, there are inade $115,000,0001$ lbse of checse annuilly, the lomo consumption of which loes not ex. ceet one twentleth. This large tuantity at its average price promeces $\& 1, \mathbf{N} 0(1,000$ aterling unnually. The value of the butter la about $\pm 2,010,000$ aterliner more of wheb their own consumption amounts to onc tenth.

Hutter and eloeese thgure anomg the grant articles of the inluatry and the commerce of ! Iollanl. It aljurire from one of the puilished talles, that from lxis; to 1450 the export of butter has constantly increasel, sat as to have been quadrupled In half a century. From $: 337$ toms in $1 \times 0: 1$ lt arrived at $11,9,1 /$ tons in $1 \times 5 \%$. The expert of cheese was 0 onzil tons at the begioning of the ceatury. In $1 \times 52$ it was $1!1,646$ tonc. For 1with, instead of a general statement wuch as the nhove, we have funnd indicutions regarding particular come moditles, the trade in whels wan very netive. The importation of raw sugar in $3 \times 54$ was 10 , i-16 tuns. ngalunt 102,101 In 1853. The export of raw sugar rome ts oib, $^{2}$ bit tons, being 4420 tons more than in $1 \times 0^{\circ} 3$. The importation of coffee from dava, on the other hamd.

 1N04, only 928,200 thaga. The trado in indko, however, whe progreasalug. 'The fingerts in 1854 were $11,1: 30$ chenta, against 10,200 In $1 \times 3: 1$, wian in $1 \times, 0_{2}$, and $650 \ln 1851$. The importation of cowhineal was equally lncreasing: 1535 cheats In $1 \times 51$ against wis in 1801. I'olacco held also a principal place in the inporta of $185^{5}-$ There were recelved 13,550 barruls
from Mary Banca Port revived, an portance. In IR50 it h quadrupled The ace an fivorahle rect traile enterprise Its agricult: In $1 \times 54$, the 13,261 $\ln 1$ being 982 m head of oxe $204,14 \mathrm{R}$ shee

The Netherlands' and forelgn ships were, 1858, in the following projortion:

To have a full vlew of the trade of Ilulland, we must not oniy learn ite atate as carried on hy sea, but; also by the rivers. which carry a great amount of it. Tables have been published of tie merchnudine which arrived, and was forwarded by way of the lhine, in 1854. There was an increase above 1853 of 7260 tons from Amsterdam to placea on the Rline, and of 12,328 tons from the Khine to that city. Coffee, rice, and the oleaginous grains are foremoat in this progreusive increase. The export of rice to Germany has had a remarkable incresee. In $1842-52$ it was ouly 8606 quarters per annum. In 1853 it was 46,459 . The quantity of grain seut from Amsterdam to the Hhine in 1834 was 15,100 tons.

The vessels engaged in the river navigation were in 1833 :

|  | Cleared laward. |  | Clearod out ward. |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Yousic. | Tonn | Vreselt. | Tunnake. |
| Laulen. | 15,973 | 1,134,74 | 9,84 | 797,145 |
| In ballast | 2,218 | 142,680 | R,197 | 821,975 |

with 127 wood-rufte, mensuring $24,3: 8$ culse ells.
The proportion of these belonging to the Netherlands was:

Of laden vessels $8,679 \quad$ Tonnage 811,879 Inward
The remainiler belonged prineipally to lielginm nad Prussia, and, in amaller propertions, to Hanover, llailen, Niasiu, Ilesne, Invaria, Frankfort, and Wurtemberg.

On the 31st Iecember, 1853, the merchant fleet of Holland counted in all 2037 vessels $=239,601$ lasta burien. There were 142 frigates $=56,142$ last $* ; 33$ harks $=93.001$ lastn $; 66$ hrigs $=\$ 489$ lasta; 168 schooners $=13,1166$ lasts ; $783 \mathrm{koffs}=46,465$ lasts: 260 tjalkn $=i 259$ lasts. The number of ateamers belonging to the Netherlands ai 1 s:if was only 30 with bs enginea of $t: 20$ horse-power. In 1859 there were 100 steansers, with 118 enginea of 6911 horse-power, not lncluding thase of the royal navy. It ta atated in the tablea that, inilprenilently of the Netherlands' trule, there were employed during 1833 in the carrying traile beIfeen foreign parts, Netherlands' ahips which made no lews than 2:26 voyages, with 207,204 lasts of lading. The Duteh consuls at forelgn ports furnished the thata of this enumeration, which was made in 18\%:3 for the first time. In connertion with the great emigration to the gold-tields of Australla, more than 50 Duteh ahips were freighted in different British ports for that distant country during the flist aix monthe of 1854.
To these details, gathered from the statiatical publl-
entions of the Dutch government, by which it has been attempted to cosvey an idea of the present atate of the traile of Hiallami, we will only add one remark, that with the oxception of the oll East India Company's mnneproly above mentloned, tha commerolal poilicy of Ilolland for a lengthened parlod wea more literal than that of any uther nation. I'the same onlightened pollcy, if partially departed from during recent years, has beon again corilaily entered into after the recent example of (Ireat Iritain. A law enacted on 1at Septem1854 abolished the import dutlen on a great number of articles of merchandise ; and the Netherlands' tariff, thus modified, equaln, if it does not even aurpass, in Iherallty all other tarlfif is oxistence. It has ovidently been In consequence of this enlightened policy, having for many generutions been generally underatood and practicel by the Dutch government, that a country not more extenaive than Wales, and naturally not more fertile, recovered, indeed, in a great meaaure from the waters, and kept from being ogain auhmerged, by constant watchfulness, and a heavy expenditure; accumalated a population of more than $3,000,000$; maintuined war of unexampled duration with the mont powerful monarchlea; and bendea laying out immense atma In works of utility and ormament at home, lent hundreds of a lliuns to foreigners, Not withatanding their want of native timber and iron, they are abundantly supplled with all the materials of carpentry, bip-huifding, and manufacturea. And though their commerce, not withatanding its revival in later years, is much diminished from ita earlier preeminence, the Dutch, even at thil moment, are the richest and nunt comfortable people of Europe.

On the 27th Angust, 1751, William IV., I'rince of Orange, presented to the States Genernl of IIolland n remarkable memoir on the state of that republic, which Is atill preserved in a work entitled "Ia Richesse de la Hollancle" published in Iondon In 17世8. That prince requested the opinions of several leading merchants, and others of large mercantile experience, on the following questions, viz. : 1st. What is the actual state of conmerce? and if the same should to found to he diminished and fallen to decay, then to incuire: $2 d$. What arrangements nnd means may support it, nud, if possible, restore it to its former prosperity and grandcur? These questlons elicited a statement, or, more properly, in elaborato and lengthy report, on the enuses lyy which the trade and navigation of the I'nited l'rovinces rose and flourished. This report is dle vided into three hends, viz.: 1st. The natural and jhysical causes; 2d. The moral canses, and, 3 d . The accklental, adventitious, or external causes.
l'nder the first head are classed the ulvantageons aituation of the country, near the rea, and as the mout ha of large navigabie rivers; its central situation, which rendered it the general market to which thi merihants of northers and southern Europe were accustomed to liring their merchandise, nud exehange the same for such goods as they wanted. The sterilIty of the country, and the consequent want, it is represented, have contributed in nnmating the spirit, real, industry, and genius of the people to acek in fiteign counirien those things which they most need at lome : and this could only he effected by meana of trade. This they were enalled to for by the great ubundanee of this in the nelghthoring sea, which furnished an equivalent for the exchamge of theae thinge which the has renness of their own comitry, and their lisited patent of nrathe lands, denied then at home. Amonif the mornl cansea, the report cited al sinvariahte maxim and tundaniental lnw of the Stute, which jermite tho frue exercise af all religlons, and regards toteration In this respect as the mont effoctual means of uttracting foreigners from niljacent count cies, atd, the that means, to augment the population of these provinces. The constant puliey, it is remarked, of thia reputhe has been to make this country a safe anylum for peracerted and oppressed forcigners ; and nu allanere, ro treaty, no molicitation of any potentate in the world has ever heen capathe of dextruying the protertion and recurity arcoriked to thase who have songht its refuge. Thin fundanurit maxim of the repulilie has caused many penple to flee from the mpression* and jerseentions exerclapd in wther countries, and to seek rofupe, ne well as employment, hringing with ihem not waly their momey and their valuable effects, lut alam their inluntry. They have established many tradea, manufarturien, and arte, uetwithatanding the firat materials for the suil mannfature were almest wholly wathig in the Netherlands, and only to be fromend, at great expeane, from uther countrien,
The eonatitution and the form of government, and the civil liberty thin exteniled, furnike nomother emuse to which the growth of trmbe anil the prowicrity of commeare are attrilutivi. The wimiom and pridemee of the alministration, the courage anil ilmonean of the conncita, the filelity with whith eontracts and ensigro
menta were wont to be fulfilled, are also classed among the moral causea under which their conmerce had reached so high a degree of prosperity and spleudor. Among the accidental or external canses are cnumerated the clvil wars in France, and afterward in Germany, England, and other countrias, which contributed largely to tha encouragement of the manufacturing industry of IIolland; while the religlous peraecutlon in Spain, Brabunt, Flanders, and other statea und empires, also contributed to the advancement of its cominerce. After dv elling at. length on theas three heads, this celebrated report then diaewases the actual ntute of the trade of the country, and shown that the tirst two-the natural and inoral causes-still remuin un. changed; while the third-the accidental ano external causes-had almost entirely dianppeared. Persecutions in other countries had ceased ; indolence and contempt for trade had given place to Industry and commerial enterprise; their own example had been imitated hy England, which for a century had been straining legislation to ettract tho trude no long enjoyed ly the republlc, and which now prohilited the exportation of the wool which formerly fed the fuctories of IIolland; while many other countrien had successfully introducel those bmanches of induntry which in forner dnyes had flumrinhed In the Nutherlands alone.
The great numier of chops which had heen elosed in the principal towras, especially in Ansterdum; the difficulty of procuring reamen to man the whips; the fourishing commerce of Inmburg and uther towns, which now anpply (iermany with all kimbs of colomial prodice, of which Amstenlam was formerly the reat emporimm ; the extinction of Duteh conumercial houses in Spain, and of lutch trade in the levant : all of these were elted an proofs of the present decline of the trade and commerce of IJolland. This report, of which a trief sketeh has thus been given, closer with a revoniriendation to permit all raw materials to be entered free of duty, as well as all forelgn goonls plased in entrepit, or for tranait ; baning thia recommendation upon the maxim, that the lighter the lurdens were, the greater would he the trade. Nearly 200 years jrior to the date of this revort, the revolt of the Netherliands apainst Spain eomuienced. The Duke of Alva, then the Spanish gevernor of the Netherlands, was defeatelt ; all the Spanish whips on the const of the Netherlamis wero destroyed; several Spanish toun. were taken, and Spanish troops were expelted from the cities mad towne of Holland, Zealand, and West Fíeslami, whome citizens johned in the revolt, mid swore allegiance to the l'rinee of ( range.
In 157!, the famons umion of the States of Inotlanes l'riesland, Zealimi, and l'trecht was formed at the latter piace, and a molemm compact enterd into to mate no one confederation, mal, as such. to adsise of pence, war, mod taxter, and to baintain prosonal and religinus liborty. Wrorysel and limmingen soms af. ter folined the binion: and, in a fow years, lisere wesen I nited I'rovinces lacame the most powerfal repobidic which the world had seen since the decline of anvient fione. Fromithis perion intil the treaty of Wiesphis lin was migned (lits), we thad the Inteli growing rato inly in [awer, commeree, asd wealth; semdin? their whipe to every quarter of $t$ a glober ; successfulty resinting the Naninh and l'ortughene tlages, on whativer seat

splees, cinnamon, ans other Sast India productlonsas high as 621 per cent. on the capital ateck invested.

A West Indla Company was also organized about the year 1621, orginally for the purpose of driving the Portuguese out of Brazil, and the Spaniards out of leru, in whleh they were not so successful as in their East India adventures. They captured, however, the Spanish fleet $\ln$ those reas; acoured and plundered the coasts of Cuba; took possession of Pernambuco and the lslands of Curacoa, St. Eustace, and others, whlch they still retain.

Tho first check to this extenalive and almost nudlsputer dominion of the nea, which the Dutch experienced, was the celebrated navigation act of the Rump Parliament, enforcel by Cromwell, and 10 years afterward legallzed by Charles II. The Dutch, at this period, enjoyed a profituble carrying trade between England and her American colonies. By thls aet, it was provided that no merchandlae, the produce of Asia, Africa, or Amerlen, should be imported Into England in any but Einglish-built shlps, commanded by an En$g^{\text {lish }}$ master, snd navigated by a erew three fourths of whom should be Englishmen; nor any fish exported from or Imported into Fingland or Jreland, except of English takling. As might have been, and confessedly was, expected, a war soon after broke out between Holtand and England, exclusively naval, which was carried on with the utnosi desperation on both sidea. After several is see and boody engagements, the Dutch were defented, and were compelled to sue for pence. A treaty followed, imposing the most humilhiting terms upon the harily republic; among others, that "of striking their flag, and lowering their toprails, whenever the Jutek ships should meet nny of the ahins of war of the Engllsh commonwealth in the IIrit lah seas." Several other wars occurred het ween the Duteh and Einglish, ami, in 1672, between the former and the English and French combined. Toward the clese of the war of the Amerlenn Revolution, hostilities were again declared agalnst Ifolhand by Great Britain, on the pretense that the dock yards and arsenals of France were furnished with munitions of war, and the Amerlean troops with supplies, hy louteh vessels. A discovery, accilentally male by the lritish in the following year, that a secret treaty, recognizing the independence of the I'nited States, ind treen negotinted in liars, het ween Ilolland and the Ame:iemn Congress, inflamed the nirealy excited naimosity of England against the Dutels, to mo high a pitch, that war was linmediately dechared. Huring the existence of these hostilities the Butel lost their Wext India persessions; snd, during the subseguent wars of the l'rench Revolntion in whleh the Netherlands were forced to co-opeate with the l'rench, the whole of their East India passession mased into the hands of the lritish.
In 181.1, the independence of IIbland was restorm, and lelgimm and llolland were erected into whe klisidam. In the ronventom of 1015 , Java and all the Dutch colenies were ceded to Ilolland, with the excepre tion of the Cape of Good lloper, and the settlements of Demerara, Basequibo, and lerbice. The Itritish, also, witaind the cessason of the rettlement of Corhin and its alpmulenctes, on the const of Malabur. The porssessions of the Dutch In the least Indies nere now reduced to the island of Javi, the Molucons, Sumatrin (for which they gave Fort Molncea in return), Macasmir, t'ulebes, Itamda, Amioynn, and Tornate. They possess several forts on the coast of tiunca: in the West Indies, Curnyoa, Sit. Wustace, Suha, and part of St. Martin; and in south Amerien, $n$ portlon of Nurlnan, or Gutch Gulann. The revolution in lielgitum in 1 N:0 0 resulted, as alrealy atated in the article on that kingtom, after a fuw days contest, in the sepaisiton of 'lelgium from Holland, and lits erection intor an linde;endent kinglom. Since T830, Holhand has uninterruptelly pursued the arta of peacolinl commerce, fidustry, and trade. Her navigution is ammull!
oxtending ; and her great cemmercial marts, Amsterdam and Rotterdam, bid fair to regaln their former prosperity.

The United States.-In their commerclal relations with the United States, the Netherlands have always manifeated a spirit of liberality. Several treaties of amity, navigation, and commerce have been entered Into between the two countries-the last bearing date August 26, 1852. This treaty of 1852 is based upen the prinelple of entire reeiprocity and perfect freedom of comneree, and applies, with all its privilegea, to the Intercourse lietween the United States and the colonies sad dominions of Ilolisnd beyond seas. It reserves to llolland the right to levy disciminating dutiea of import and export in favor of her direct trade with such celonies and dominior but should American vessels enguge in such direct trade, they are to enjoy perfect equality with the national fiag. The Unipgl States is alse at liberty to continue to levy the alsc. Imimating doty imposed by the tariff of 18.16 on tea and coffee, in favor of the direst importation of these articles from the places of their growth, but also withont discriminating between the flags of the two countrles. This treaty is to contlnue $\ln$ force two yenrs, commencing six weeks after its ratitication, with the usual 12 months' 'otice by either narty wishing to terminnte its action. Before the date of this last treaty, the reciprocity and freedun of commerce between the Netherlands and the Unlted States applied only to the direct trade between the two countries. All restrictions, not ouly as regards entire reciprocity and perfect equality in tho direct trude between the two nations and their flags, respectively, but, as it respects our trade with the Dutch colonies, were by this treaty ubolished, and tho two flags were nssimilatel (the consting trade and fisheries excepted), on overy sea, und in every port.

Numigation Lans.-The laws umending the Netherlumds legishation with respect to muvigation were prepared in 18.18, luat not proclaimed as ia operution tutil the year 1850, when the abolition of the British navbration acts rendered nee $\quad$ asary the immediate adoption of that step. The new aystem agreed to by both the Climmbers of the States Gieneral is contained in a collection of rules embolying the legal dispositions and schelules. These are too numerous und tengthy here to be inserted; but the following summary will convey ngeneral blen of their purport, and show how benelicially the liberal spirit, which has of hate years guided Hritish commercial leglslation, enters into and molds the commercinl systems of nelghboring countries. Whatever faror the system of "free trade" may hereafter meet with among the commercial nations of the earth, there can lie little doubt that the apirit of free navigation has entered upen its beneflcent mission, and ulready shapes the legialation of those nations which lave thriven and hourished most ly commerce. Tho countries of Furope which still retaln their metieval commercial policy-and, inileed, those on our own continent which have lnherited from their luropean propernitors shmilar aysteus of commercial litercourse with foreign nations-must either alandon their restrictivo pricy, and adogt, in its widest seuse, and with all its privileges and rights, the common-law defisitions of mare liberum, or find themselves lsolated from the rext of the commercinl world. When this spitit has alrendy hurst through the barriors which, from n time "to whlel the memory of man rimneth mot to the contrary," blosed China and Japan arainst every appronch of civilized commeree, it cin not be drabided that its inthume will soon or late be felt and mekno-lelged by thoso nations which would erect munchal lurricades aeross the highway of mations, r.nd linterdict the importation of lread to feed, and fubries to clothe, their destitute subjects. The present mavigation has of England are but the commencement of a now era in the commerchal legrislation of

Europe．The example of Holland，of Belgium，of the Hanse－towns，and the Zollvereln（though，as regards the latter，there is still much to be done），can not hut hasten this liberal reformation $\ln$ tho navigatlon lawe of neighloring governments．The leading features of the new navigntion laws of the Netherlands may he gathered from tho following summary．It embraces the chlef hases upon whlch they rest：
1．Unconditional repenl of discriminating favors granted to the Dutch flag，by suppression of the rules allowing to this flag preforence above foreign flegs． 2．Conditional ainillarity of flag in the nevigation to and from the Netherlands colonles．3．Stipulations by law concerning the trado and navigation in the colonies of the realm，carried on by other nations of the world．4．Repeal of the interdiction to grant Netherlands registers to forelgn－luilt vessels，by ad－ mittance for registry（naturalization）of such veasels at a duty of four per cent．of thelr value．5．Diminish－ lag of import duties or．principal miterinks for ship－ building．6．Suspensinn of the shipping dutirs on the Rhlne and Yssel．7．Total atolition of tranalt duties，
The principal olyect of all these measurea is to pro－ mote trade，hy relleving navigation，as much as poa－ sible，of the impodimente against its development which reaultel from past legislation．The general system comprehends a plan of establishing，in ne general law，lastead of by complientel trentios of com－ merce with the different nations，the principlo of mm － mediate and uncoultional＂free navigation，＂and， consequently，the general and nuconditionnl nesimila－ tion of flaga，by granting to the vessels of all nations the privileges enjoyed ly thosn of the Netuerlanda； reserving，however，the right of retaliation，shuuld cir－ cunatances rente：its exercise necessary，which，in most cases that can happen，will he linited to an ang－ meatation of shipping taxes，or of import duties ；und saving，aiso，certain rextrictions and conditions relative to importationa from Netherlands colonies．In tine， the navigation laws of Holland are framed so an to open，as far an possible，all Netherlands ports for ships of all nations；＂to prochaim，＂ns annonnced in the offichle expuation，＂a reacwel adherence to the liberal commercial poliey which the Netherlands was the firat nation to adopt，in orier to stimulate other sations to abandon all nystems of protections and prohinitions； to aloulsh all exclusive protections of the Netherhuda flag，so that nur（their）marigation may，with goom ancress．kepl pace with that of ct＇ier nations，and our （their）commerce may unt remaln behind th the newly－ opened compatition resulting from the repeal of the navigation lawe of Einglanul．＂Under the regulations condensed above，as well as under the treaty with the I＇nited Staten of 1802 ，the Ameriman flag in ansimillated to that of the Netherlanda in the colonial trale．Ia－ deed，in all respucts，whthout nuy condition or qualiti－ cation whatever，the thass of hoth nathon enfer entire and perfert equality．（in the 5th of August． 1811 ，the then Secretary of the Tremasury addrensel to coll tors and naval utieern circular fnatrystiome，In which the following puragrapha oceurrol：

[^27]that coffee imported in the vessela of the Netherisnds，frox thelr ports in Europe，is exempt from duty．Therefere，auch dutleus as have been so levied apon eoffee，no as aforedald tm－ ported，In vesmels of the Netheriands，from their ports in Europe，mast be rofunded；and，in future，colfice so imported must be admilted free of duty．＂

From these instructions it necessarily followed in practice，that while the coffee of Java，imported in vessels of the Nethorlands，from ports of the Nether－ lands，has been exempted from duty on its arrival in the Unitod States，the aame article，when imported in Amerlcun vessels，from the same ports In the Nether－ lands，has been suhjected，under the provisions of the 10th section of the tariff act of 30th of August，18．42， to tho payment of a duty of 20 per cent．ad valoren， as a non－enumerated articlo．On the 11th of Septem－ ber， 1845 ，thas：instructions were countermandel，ly Treasury circular of that date，as not warranted by the provinions of the treaty of 1839 ；the word＂ 80 ，＂ which qualilied tho imporration or exportation，having been overluoked in preparing the circnlar first referred to．A different construction would give to the ressels of Ilolland an advantage over American versels en－ gaged in the same trade，as already Intimated，of 20 per cent．－an advantago which could hardly have heen lnteaded to he given by uny treaty with a foreign power．All anbiguity or doult on this suliject is removed hy the tariff art of 1846 ．Under the provis－ ions of that act，however，the Netherlands thig still enjoya an advantage over that of the United States in the coffee carrying trade．This， 9 hedula 1 of the act provides，that＂colfee，the growth or prodection of the possessions of the Netherlands，imported fromi tho Netherlands in Ameriean vessela，or in fureign vessels entitled hy reciprocal treaties to be exempt from discriminating duties，tonnage，nud other charges，＂shall be free．The export duty on eoffee at Java，is 12 per cent．，lmiff of which is rembtted in favor of direct importation to the Netherlands in national ur equalized boltoms．Consequently，a Intid vessel，carrying lava coffee fimm llolland into the Vnited States，can undersell the American importer who bringe it lutu pert direct from Java，the amonat of the differential export duty；or six per cent．win the value of his eargo．

The value of the total trade between Holland and the United States for $\mathbf{1 8 5 4}$, as glven in the United Slates' Treasury Report on Commeree and Navigation, is $84,138,636$, or $\$ 934,150$ less than that given by the Datch official report.,
The chief articles exportal from the United Statee to Ilolland are cotton tobaceo, rice, breadstuffs, etc. The leading imports into the United States frota Holland are spirits (principally gin), coffee, mateler, spices, pictures, paintings, negars, tin, etc. There entered in 1853, in Dutch ports, from foreign connt'ies, 6302 vessels, meusuring $1,064,243$ tons; of which number 70 , measuring 26,765 tons, bore the flag of the United States; and 18 vissels, under the Dutch flag, sailed direct from our ports with American produce.

During the same year, there cleared from the Nctherlands to forelgn countries, 4,413 shlps, messuring 776,889 tons; of which there were under the American flag, for United States' ports, 22 vessela, measurin11,383 tons; and for the same deatination, 27 vessels belonging to other nations.

In 1853 there entered at the ifferent ports of Hol. land 1006 steam vessels, laden, measuring in the aggregate, 304,329 tons; 105 steam vessels in ballatt, measuring in the aggregate, 72,800 tons; in all, 1201 vessele, tonnage, 377,129.

The vessels in ballast were ell under the English flag; thoee freighted were distribnted as follows:

| Under the | flay | Veanelt. | Tona, |

U. S. Foreign Com.

Holly-tree. Geography and History,-1'he Hex aquifolium, or luropean holly, is indigenous to most parts of the middle and south of liurope, and it is said to be foand in China and Japan. It does not appear to be a native either of Amprica or of India, unless the llex opaci of the United States, and the Ilex dipyrena in the Ilimalayas, should prove, by cultivation, to be varieties of it. According to Pallas, it sareely oceurs within the ancient limits of the Russian empire, thongh frequent on the southern side of Chucsasus, where it forms a low, brinching shrub, about 10 feet hifh. In liance it is abundant, more particularly in Hrittany. In tiermany, it abounds in many forests, especially th the southern and middle States; where, when sholtered by lofty trees, it rttains the height of 20 fect ; but in exposed situations, it doos not excred a height of 6 or 8 feet. This tree "ppears to attain a larger size in lingland than in uny other part of the globe. It abounds in that country, more or less, in the remains of all aboriginal foresta, and perhaps, at present, it prevails nowhere to a greater extent than In Needwood Forest, in Stalforlshire. In Scotiand it is fouml in most natural woods, as an madergrowth to the ouk, the ash, and the pine. In Irelund, the lolly is nut very common; but about the lakes of Killarnoy if attuins a large size.

The wool of the holly is almost of 83 wory whiteness, except near tho centre of very old tranks, where it is of a brownish liue It is very hard and empmet, with a tine grain, and suseeptible of a high degree of polish, whieh renders it well milapted for muny purposes in the arts. When dry, it weighs 47 it pounds to a cubie foot, and is very retentive of its sap, in conse-
quence of which it is liable to warp, unless it is well drled and seasoned before being used. It readily takes a durable color of almost any shade, and hence it is much used by cabinet-makers In forming what are technically called "strings and borders," in ornamental works. When properly stained black, its color and Iustre are little inferior to those of ebony. It may be applied to a great number of purposes by jolners, cabinet-makers, turners, engineers, matheinatical instrument-makers, and, next to the box and pear-tree, It is the best wood for engraving upon, as it is compact, and stands the tool well. Amc $f$ its principal uses in Eagland at present, ls, when dyed black, to be substituted for ebony, in the handles of metallic teapots, etc. In France, the young shoots and the branches are given to sheep and deer during winter; and the stronger straight shoots, deprived of their bark, are made into whip-handles and walking-canes. The bark of the holly contains an abundance of viacid matter ; and, when mascerated in water, fermented, and then separated from the tibres, it forms bird-lime. Medicinally, the bark of thls tree is mucilaginous, emollient, and solvent, and is said to possess strong febrifagal powers. The berries are purgative, and 6 or 8 of them when swallowed, will cause violent vooniting; though they aro considered as poisonous to men, they form the fool of some hirds, more especially of the thrushes.

The wood of the American holly resembles that of the European species, except that it is rather browner at the heart. It is compact, heavy, of a fine grain, and is susceptible of a brilliant pelish. Its principal use is for inlaying mahogany furniture, and for turning into small boxes for druggists, and for small screws. When perfectly seasoned, it is very hard and unyielding, which renders it well adapted for pulleys used in ships. It may be dyed of various colors, so as to resemble many foreign woods. The back may be umployed for making bird-lime, in a similar manner as that of the preceding species. Medicinally it is emetic nud cathartic. The berries, taken to the number of 15 or 20 , will excite vomiting, and will also act as a purgative.

The emetie holly is found in moist, shaty places, from Virginia to the Floridas, and was introduced into liritain in 1770. It was cultivated by Niller in the plysic garden at Chelsea, and in several other collections in the neighborhood of London, till the severe winter of 1789 , when most of the plants were destroyed. Other plants were afterward raised from seeds in that country, and lave ever since resisted the cold of ordibary winters without protection. The leaves and young shcats of the cassens are inodorous, the tasto sul-nromatic and fervid, being aseful in stomach fevers, diahetes, small-pox, etc., as a mild emetic; but the " black lrink" of the ladians is a strong decoction and a violeut, though harmless vomitive. At a certatin season of the year they often travel a distance of some hundred milos, from parts whero this tree does not grow, to procure a supply of the leaves. They make a lire on the ground, and putting a kettio of water on it, filled with leaves, place themselves around it, and with a wooden vessel holding about a pint, conmence by taking large draughts, which, in a short time, eause then to vomit freely. Thus they continne drimking and vomiting for two or three days, intli they are sufliclently purilled, when they return with large quantitics of tho leares and boughs, to their homes. The leaves and young shoots of the llex cassema und dahoon, and of many other shrubs, appear to bo substituted indincriminately by the ludians for making their "black driak." In North Carolina, it is suli, the inhabituuis of the sea-side swamps, having no gool water to drink, diaguise its taste by hoiling in it a littlo cassenn, or other plants of a similar natare, and use it constantly warm, as the Chinese do their daily tea. This circumstance gavo rise to the opinion
that this apecies was the Ilex Paraguariensla, and was erroneoualy called "Paraguay Tea."-Bnownn's Tr. of America.
Elolm. (Sax. and Danieh.) An island, or fonny place anrrounded by water. Two well-knewn islands In the Bristol Channel are called the Steep Holm and Flat Holm.
Ely Alliance, The, a lengue formed by the principal sovereigns of Earope anter the defeat of Napolem at Waterioo. The bails of thls alliance was drawn up' by Aloxander of Russla (September 26, 1815), and recelved the signatures of Pranels of Austrin nnd Frederic William of Pruselia. ${ }^{4}$, Ite name, which waa dictated in accordance with the popular rellglous enthusiasm of the time, was fitly exprenalre of the vague principles of religiens charity and peace on wbich it professed to th based. It gained atrength by the accession of England and France, but theneeforward became an alliance simply for the establishment of exlating dynasties in Europe, as may be seen from the declaration of November, 1819, and from the restila of the Congreases of Troppan;, Layhach, and Verona. Atter the aoceasion of England and France the boly allance becime practically obsolete. See North Amer. Rer., xvll.; For! Quar., vili.; Ed. Rer., xxxvill., xxxix ., x1.;'Westminster Rec., $1 ., 18$; Nil.sa' Reg., $\mathbf{x x} .$, , 318, $\mathbf{x x i v . ,} 805$.

Eolyhead (Welah, Caer Gybi, i. e., fort of Gybl), a sea-port, and market-town of North Wales, on an Inland at the western extremity of the county of Anglesea. "It la connected with the main pait of the county hy a vast embankment, $\frac{t}{4}$ of a mile in length, asd of an average height of 16 feet, with a bridge near the centre through whieh the tide rushes with amazing velocity and force. The town, formerty a emall fahing village, has acquited importance in consequence of ta being the nenrest and most convenient place of embarkation for Ireland. It is the point of termination of the great parliamentary ronds from London and Chester, and of the Cheater and Holyhead railway, in connection with which steam-packets !aave the harior several times a day for Kingston near Dutrlln . The vast amount of labor and money expeaded on public works connected with the barbor has materially contriluted to attract and snpport an active and thriving mpulation. Holyhead has heen aelected by the llitilh government for a harbor of refnge. The works, when completed, will Inclose an area of abont 816 ncres, with a depth of at least 61 fathoms water. The pier extends nearly 1000 feet, and apon it is an arch of iiona marble commemorative of the vialt of George IV. in 1821. At the extremity of the pier is a light-house, exhibiting a white Ught 80 feet above sea-level. ${ }^{\text {th }}$ On Bouth Steck an isolated mek 8 milea west, Is amother light-honne ponnected with the har hor, and of easential servico in faclltating the access. The light, which is 212 feet Ainve high-water mark, is produced by 21 lamps whth powerfol refectors. The inhabltante are chlefly engaged in the coasting trade and in abipbuilling. The coast is extremely wild and rugged, preeenting numeroas wave-worn cavarnh, which form the haunt of innumentile aen-binds,-E. B.
Eoly-wtone, a large ntone used for cleaning shipa' deckn. It receives its name from the unwillingnean of salion to submit to the drudgery of using it.

Home, in naval langusge, is said of ary thing that is close in its place; it in applied to the shereta of the sails, the shot and cartridge in a gun, and nny articie of stowage.
Eomer, or Omer, the largest dry mensure among the Helirewa. It was In later timea replaced by the Cor, and is estimated at $7,898,000$ l'aris grains.
Eonduras, British, Relise, or Bolize, a 11 ritimh mettiement on the eant conat of Central America, between N. Int. $15^{\circ} 14^{\prime}$ and $18^{\circ} 80^{\circ}$, and W. long. $88^{\circ}$ and $89^{\prime} 80^{\prime \prime}$. It is bounited on the north by Yucatan, west and sonth by Guatemala, and east by the

Bay of Honduras. It has a coast line of about 200 miles between the moutbs of the Honde and Saratan, and is about 100 milen is breedith. This coast was discovered by Columbus in the year 1502, bat little that can be rollod upon is known of ita early aettloment. The aboundance and fine quallty of the wood, particularly mahogany and logwood, weem firat to have drawn attention to it ; and at a pretty early period it wan occablonally resorted to by wood-eattors.. But the first permanent eatablishment of British woodcuttera was mada at Cape Catoche by, aome adventurera from Jamalea, whose numbers increasing. theyoxtended as far sonth as the Rivur Belize, and as far weat as the neighborhood of Campeachy. The Spanjands, however, did not quietly aubmit to this uaurpatlon of their torritorial dominion. Several expeditions were fitted out agalant the settlera, but they were nilformly uneaccesaful; and on two occasiona, in 1659 and 1678, so complete was their discomfiture, that the town of Campeachy itaelf was taken by the logwoodcuttera, with only the assigtance of the seamen. engaged in the trade. This last repuhe oceurred eight years after a treaty had been coneluded with Spain, by which the territorial right of Britain to the occupancy of IIonduras was generally, although not specifically, embraced. The auccesser of the settiers aroused the jealousy of the Spaniards, and led to a renewed dincussion of their right to the territory which they occupied. This would appear to have been again generally admilted; but the Spaniarda finally succeeded in driving the woodmen from the Campeachy shore, and confining them to the limite of the present settlement. An attempt was again macie in 1618 to diapossecs the British of the territory on tho River Leelize; but the firmness of the wood-cutters deterred the Castillans from effecting any thlug, oxcopt the erection of a fortificatlon, which in a few years they abandoned. In 1754 an expedition was undertaken to externinate the colony; but by a treaty of peace concluded in the year 1763, the Spaniards were compelled to admit the right of occupaney to the british coloniats, which, however, they sulbequently attempted to annul. In 1779 the Spuniardy ngain attacked the nettlement, and after deatroying property to a considerable amount, they took a number of the colonista priaoners, and marched them off in irons to Merila, whence they were ehipped to the llavanaah, and there confined till 1782. In 1784 Britaln obtained from Spain a epecific grant of "the lands allotted far the cutting of logwood;" and in 1790 an aet of Prarliament conferied on Eislize all the privileges of a British collony. The last attack on the rettlement was made during the war in 1799, but the expedition, which conaisted of 3000 men, was gallantly repulsed; and ainee that period the colony has remained undirturted by forelgn aggression.
The coant of the llay of Itonduras is low, and the shore is atudded with a number of low lalands or keys, which, however, are verdunt. As we recede from the const, the land risen into a wold and lofty countrr, Interspersed with rivers and lagoona, and coverei with kigantic foresta. The lagoona or sheets of water, and the fally and rapids of the rivers, constitute subilme and beautiful featares in the general aspect of the country. The llonde Itiver, which forms the northern houndary; is a the atream, A few miles ssuth if it ts the New lifiver, which has ita source in an extenalve lagoon. The ifelize has a uertheast ly east course of alove 200 miles, and discharges liself into the Bay of Nonduras by two mouths aiout 暗 miles apart, the mouthern branch dividing the lown of Belize into twa parts. The river and lagoon of Manatee, which is situated 10 leagues south of Beilize, Is considerei as ex. tremely grand. At about a milo from the mouth of the river is the lagoon, a magulticent sheet of water, extending fur sevaral leagues in a northeriy direction. In many placos lofty hills ancend from its margin,

HON
overtopping large valloys and woed rangen of great extent, where the faguar, capybara, armadillo, farge wearel, oposanm, racoon, and several species of deer, abound. "Among the fenthered triben there are numbe:s of quails, plovere, plgeoni, pheasante, and willd turkeys. The deficiency of Etresms among the monntain ridges la snpplied by thie presence of large marshy spots or shallow ponds, the basks of which are froquented by almost every species of water gamo. Fish abound during a great part of the year in these ponda, but the latter dry up in the season'of drought, and then vast flocks of sea-fowl "congrogate around them to proy upon the fish which have been left dry by the evaporation of the waters.' 'The alligator is also a foquent visitor; and, to pertake of this repast thus yearly provlied for him, he has been known to traverse trackless wilda, and make long journeys into the interior. The rapids of the Manatee commence about 8 or 10 milea from the Ingoor, and the high mecky banks of the river assime a romintic and beauilful appearance. Further on there is a rapld of abolit a quarter of a mile in length, and of considerabie acellv: ity. A cluster of beautiful caves, through which the river wlads its way, and beneath which the triaveler must pass, la next reached. They have been described as equally singular and grand. "These magnificent natural excavations of the mountains are semicircular at the entrance, and abont five yards in diameter. Within the cave the arch rises to the height of 100 fect, and leads to another low arch, which being passed; a second cavern of large size opens; teyond which is a third with a circular orifice, 'throngh which the river entiors. During the floode the mouthe of the caverns are illed with water, which boile up with prodigione fury, and this detalns travelers many days before they ean pass through the caves or tunnels. In the rainy season, se the water increases on the uppor or inland sides of the mountaina, the river forces its passage throngh the interstices and openings in Its sides with tremendous noise. forming an Indescribably grand cascade of from 40 to 50 feet high, lasuing from a hunired orifices." Of the other rivers of Honduras little is known.

Productions.-The country is technically divided into tho Pine and the Cahoun ridges. The soll of the former has a substratum of loose reddish sand, and its indigenous producta consiat of these varieties of vegetation the assinillative powere of which are strong and pereunial. Extensive pralries expand over this noll, and the pine, frum which it derives its name, is oxtromely abundant. The soll of the Cahoun ridge consiats of a decp ioam, capable of growing every apecies of European as well as of tropical allment. It ferthity oceaslons the growth of much brushwood, and it is covered with the wild cotton-tree and other giante of the forest. Fruits, spontaneously produced, are exceedIngly abundant, and consiat of orangen of excellent quality, shaddocks, limes; mangoes, melons, pineapples, water-melons, avocato pears, cathew, cocosnuta, and many others.' Thoy are all found in the neighlorhood of Belize, but are sometimes brought In large quantitles fromi more elevated plantations. The mahogany and logwood-trees are at present the staples of Honduras. The former is found beet in elevated situations; and growing generally solitary, it is discernible at a great distance, from the yollow hue of ita folinge. It is cut down at about is feet from the ground, and when folled the logs are dragged to the banks of tho atreams and fioated down ln rafts. The boughe and limbe are alad to afferd the finest wood, hut it is the size that is principally looked to in commerce. The logwood is found in low swampy grounds, growing contlguons to fresh-water reeeka and lakes, on the edgen of which the :ote, the most valnable part of the wood, ramify. They are felled during the dry season, and carried off when the wet season has ladd the groand under water. There is another valu-
able tree called the Pinus accidentalia, whlch growa tu the height of 60 foet, and covers many thcusand acres of country. The pine-weod contains an immense quantity of tar and turpentime, and is consequently highly inflammable. In thle respect it is very valuable to the poor, who make, torohes of it. It likewise powerfully resists decay, and is in consequance muoh used by buildors. The cahonm or cohoon-tree yielde a vulaable oil, which, when unadulterated, is almost colorless, destitute of any disagreeable taste, and when burned as a lamp ofl it emits a beautiful palish flamo without smoke or amell, There are various othor kinds of wood of beantifal vein and cluse toxture, such as Iron-wood, clay-wood, roee-wood, palmaletta, and the like. Among minerels, strata of fine marble and formations of alabastor are known to exist. Several valuable specimene of eryatala have been found, and gold has ocearionally been detected in some of the atreama. Laboring Creek, which Has on the Belize, about 100 milee inland, is remarkable for the petrifying properties posseused by its waters. They have also a powerful cathartic effiet on htrangers, and when applied externally to an olcer hdo a healing property. The country abousde with all kinds of animuls fit for the food of man. Except in very rough weather, the sapply of salt-water fiah of excelient quality is abundant. The common gruen turtle, when in a healthy condition, is a staple commodity in the market. "The hawkebill turtle le often five feet long, and weighs from 200 to 250 lbs.
Belize, the capital of the settlement, standa on as low fist shere immediately open to the sea, and guarded by numeroua omall ielande, densely covered with treen and shraba, and 60 similar as to render the navlgation exiremely difficult. It in further divided into two parts by the river, which is croased by a substantial wooden bridge of 220 feet apan and 20 feet in length. The part of the town which is aituated upon the south or right bank of the river, along the eastern elge of a point of land, is completely insulated by a canal on its western side, which runs across from a small arm of the sea, and bounds the town on lts south sido. The houses are about 500 in number, and are in general well built, spaclonn, and even elegant. They are for the meat part conatructed of wood, and raised 10 reet from the ground on pillars of mahogany. The streets are regular, and cross each other at right angles. The main one runs in a north-aasterly direction to the bridge from the government-honse, which ls situasted on the south-east point or angle of the ialand on the right bank of the river, and bounded on the south and east by the ses. Behind the governmenthouse is the church, on the east slde of the main atreet. The whole town is embowered in groves and avenues of the cocoa-nut and tamarind-trees. Fort George is situated about half a mile from the river, on a amall low islet. In the neigbborhood of Belize the natural heat of the climate la tempered by the sea breezee that prevail during nino months in tbe year, so that, even in the hottest season, the thermometer seldom rises above $83^{\circ}$ Fahr., and during the wet season it sinks to $60^{\circ}$. In June, July, August, and September, heavy and frequent rains fall, and thees are the most unhealthy menths of the year, from the decomposition of animal and vegetable matter in the adjacent lowlands and owamps.

There are various classes of society in the settlement, including Europeans, colored people, Indians, and Mosquito men. The blacks of Ilonduras are distinct from the aborigines of the country, boing of African descent. In general they are incliaed to indulge those low propensitios which are exhlbited in a state of barbarism. Having been derived from various regions, they still retaln all their national peculiarities, and keep themselves dlatinct from avery other tribe. The blacka, an a boly, have upon the whole littie intelligence, and their dulluess of comprehension is

## HON

remarkable. It is asserted, however, that some of them exhibit an or!ginality of talent and a degree of mental activity Ilttie Inferior to their Firropean brethren. They are much attached to their country, and with a native of his own land a Honduras black will ahare hin last plantain. The colored popniation has resulted from the Intercourse of Europerns with Africans or Indians. They of course, morally apeaking, assume a medinm atatus, and partake more or lese of the qualities of black and white, according to their distance from either. The Mospuito Indians abound in the colony. They are remarkable for a fine mascular formntion of body, but in their countenances they oxhibit an utter deatitution of intelligence, and their habits are most barbarone. They acknowledge the existence of a good and evil apirit; and the little power of thought which they possesa la diaplayed in their conduct toward their deities. The good spirit is neglected, because, say they, his goodness is so great that notbing is to be feared from his wrath, while on the other hand, the evil spirit is propitiated, in order to deprecate his malevolence. The whole wealth of a Mo quis." man consistr it his canoe, paddle, and harpoon. With these he satisfies the cravings of natnre, and his groveling nature s.sks tor no more. The $/ n-$ dians, the real aborigines of the place, are a thinid, inoffensive race, apparently more under the infuence of instinct than of reasun. They perfo:m the most astonishing journeys through woude, as trackless as the sea, and impervious to all ins thamselves with infallible correctness of direction and amazing rapidity. Although freo from vindictive or malleions pripensities, they are addieted to drunkenneas to an excensive degree. The population of the colony is estimatel at about 12,000 .

Ifonduras has an Increase of $\mathbf{3 9 , 6 0 0}$ square miles, and Its population In 1855 was eatimateed at 350 , $(\boldsymbol{n} \mathbf{v}$, exclusive of the Indian tribes. It la divided into seven departments as followa:

| Deparimenta. | Entmated pop. fa 1845. | Deparmenia. | Eatimated pop. In 1Mss. |
| :---: | :---: | :---: | :---: |
| Cobiayagan. | .. 70,009 | Graclas....... | . 53.000 |
| Teguciralpa. | . . 60,000 | Yoro... | 20,000 |
| Cholutera. | ... 50,000 | Olancho... | 45,000 |
| Santa Barba | ... 50,000 | Total. | 800 U00 |

The rivers of liondu"as wre numerons, and some of them of great size. The primelpal are the Chamelicon, Ulua, Aguan or Roman, Tinto or Black River, Patuca, and Wanks or Segovia, flowing ints the AtInntic; and the Cholnteca, Nacaotne, and Gonseoran, flowing into the llay of Fonseca.

The llay of Fonseca, the greater portion of which belonges to Honduran, in apwaril of 50 milles in length, by about 30 averuge breadth, with an entrance 18 miles wille, between the volcanoes of Conchagua ( $3 \times 00$ feet in helgbt) und Coseguina ( 3000 feet in helght). $-\mathrm{F}_{\text {. }} \mathrm{II}$.

The const alluvions of Honduras are geserally densely wooded, the devated valleys of the aterior sprear out in broal savannahs, and the mountain plateaux are covered with foreste of acattered pines, relieved by cecasional clungs of onk. Upon the northern coast, in the broal plain through which the Uina and (hamelicon flow, the country is so low as to be occavionally overtlowed for conalderable distancen. liere grow inmense torests of cedar, mahogany, caiha, In-dia-rubber, and wither large and valuable treem, thickly Interspersed with pulins. Further to the eantwand ofl the same coast the beavy firesta are contined chiefly to the river valleyn, and give place at inlont dintances inland to sandy asvananhs, sovered with course grass and clompa of pituen an? neacian. The alluvions of the l'achic coast are alro densei; wonled, bue not extensive. At short distances inland they give jlece to nomerous mavannalis, studded with clumps of acacias, and covered with grasi ; lut she pine does not appear bere except upon the singee oi the hiile, at ar altitude of alout 1200 feet. The valleva of the rivers on botil
coasta are thlckly wooded; but as thoy ascond toward the interior, vegetation diminiahes, and is reduced to a narrow fringe of trees and bushea upon their Immediate banks. These valleys in the high interior country often expand into broad and beautiful plains-half asavanalis and half woodland-whore the palm and the plne flourish alde by side. The mountains which rise around these valloy are ascended by terraces crowned with forests of pines and oaka, and covered with grase. The aummits of the mountains sometimes riae in peaks, bnt generally conatitute bread table-lands, more or less undulating, end often spreuding out in savannaha, traversed with long ridges of verdure and green belts of traes.

Woods,-Of the vegetable productions of II onduras the mahogany-tres stands fizat in linportance, and from its vast aize and magnificent follage, is deservediy entitled "king of the forest." It if to be found in nearly all parts of IIonduras in the valleys of the various atraams. It is, however, most abunilant upon the lower valleys of the rivers flowing into the Bay of Honduras, where the cortes (cutting) are chiefly curried on by the Spaniarda. A fixed anm is paid to the government for each tree cut down. Rosewood is cor mun ox the northern coat, where it is begrnai is to form en artlele of commer: . Lignam vitue abounds in the valley of the Ulua, on the river benke in the plain of Comayagun, and In other parta. Among the namerons dyewoods for which Honduras is celebratel, nay be mentioned fustic, Brazil wood, yellow sanders, dragon's-blood-tree, Nlearangua wood (a variety of Urazil woud), end the anotce. Among the gum and medicinal trees, ara the gum-arabic-tree, copuiba-ifee copal-trea, 1 1! 1 id ander, castor oil, ipecacuanha, nnd the Herea clustici. Among the more common of the others anc tbs iung-leevid or pitch-pine, cedar, ceiba or silk-cotton-tree, live oak, mangrove, iron-wood, calabash, varlous kinda of onk and pulm, lime, lemon, orange, cveoa, pimento, eltron, tamarind, and guava. Sarssparilla id obtained in great abundance and of superior quality. The augar-cane grows iuxuriuntiy on the plains and among the mountains, at elevati nis of 3000 to 4000 feet. Coffee, indigo, tubacco, maize, wheit, rice, and potatoet are also grown.

The IIouluras Inter-oceanic Railway,-At a recent meeting of the Liverpool Chamiser of Comnere, Mr, William Irown, a meaber of Parlianent, gave many interesting particulars in relation to the llonduras Inter-aceavic Railway, The distance letween Naw York and Sun Franciaco, vhia lanamia, is stated to he 0224 milen, whereas the distance viâ llonduras is only 4121 miles. Difference 1103 milen. Tho distance from Liverpool to San Francisco via I'anama, touching at Kiugnton (Jamaica, la 7712 ulles; via llonduras, 6k81 miles ; saving of 11 onduras over lanama, 831 miles. The distance from Liverpool to Syiney, viś Honduras, has loeen calculated with care, and found to be $11,8: 20$ miles. At an averagu rato of steaming of 12 milea per hour, und allowing three days t. . coaling and trans-shipmovt, the voyage could be performed in exactiy 43 days $u \cdot d 12$ houra. We subjoin a table vi diatances:

Ths time between New Yerk and San Francisco, vid Honduras, is estinated at 13 days and 4 hours. This cnlculation is based on an assumption of 20 miles per hour by rall, and 12 miles per hour by steamer.
Captain Fitzroy, in an official report, alludes to the Ave distinet lines that have heen proposed, and thus proceeds to refer to that by wsy of Honduran:
"Looking especially to European commanication, it may be ohserved, that a main or trunk line of stenmers, calling at Jamaica, in traveraing the West India Archipelago, would find a auitahle terminus at l'ort Caballos, in Honduras Bay, where the north end of the railwny will he; and that Fonseca Gulf, at the other end, is in the region of steady winds, and well situated for a direct track across the Paclfic Ocean, either to China or Australssia. The climato, productions, and popalation of Honduras, are more in favor of such a work, as a ruilway from sea to sea, than those of any other part of the great Isthmus, without exception ; but, as the length and elevation are grest, these difficulties should be well considered.
"1. As to length. This is a question of 160 miles against 40 (other things being equsl, which, however, they are not), involving first cont, constant expense, and comparative lucal advantages. The continual
outlay on the Panama Railwsy, consuquent on the nature of the locality, and many pile-supported atructures, is great ; whilo in Honduras, there will be comparative durability of works. Fucl muat be carried to Panams from distant perts, but it abounds near Fonseen Gulf. Rain prevalia in the eastern part of the Isthmus of Panama, much more than it does in Honduras, where the climate is auch that European trees sui fruit thrive on the higher grounds.
" $i$, With regurd to the elevation, which eeemn at firas aight rather deterring, it should be borne in mind that the greatest incline or gradient proposed is 1 in 88, and only for a short interval, in a county where ice or snow is unknown; the general gradients leing remarkably uasy. Also, that aa the country lies favorably, thu line running along valley's, near rivers, and without crossings of any consequence, it is likely to be an economical line in this respect. All requisite materials, as well as native labor, ure on the spot ; and the Honduras woed-cutters are well known."

A company has been fully organized in England with reference to this great enterpriso, and among the directore are some of the most prominent citizens of Liverpool and London. For a comparison of the advantages of the different transit routes, sce Transit Routes.

Commpace of the United Statks with Honouras, Campeachy, fto., fhom Octobes 1, 1820, to Jithy 1, 1 Rso.

Principal Ports.-The princlpal ports of Honduras |tected from the N.N.E. and N.W. winds, which aro on the Allaretic are Puerto Caheito, Omon, and Truxillo. Puetto Cabello, the firat port established by the Spsniarils on tho northern cosst, is in lat. $15^{\circ} 49^{\prime}$ no:th. Cortez, in his expedition into Hondurns, founded a settlement here for tha purpose ot making it the grand entrepot of New Spain. For upward of two centuries it was the prineipal establishunent on the const ; but, during the time of the biccaneers it was removed in Omoa, because of the large size of the bay, which could not he properly' defended. This bay is not lass than nine miles in circnaference, of ample depth-two thiris of it being from 6 to 12 fathomsand has secure holding-ground. It is perfectly pro-
those that prevaic on this eoast. The port of Omoa, is amall but secure, and is defended by a atronge fort. The anchorage is good, in from two to six fathoms. Truxilio is situated on the western shore of a noble bay, in lat. $15^{\circ} 55^{\prime}$ north. Population in 1842, 2500 ; 1000 whites and Ladinos, and 1600 Caribs.

The chief exports of British Honduras to the United States are mahngany and varions descriptions of dyewoods. Copjer, scrap-iron, and other old metals. The following statement exhibits the value of the trade 3tween the United Stater and Ilonduras during the yeara 1853, 1854, and 1855, np to June 30th of each year:

Companative Tantr of tur Paonver of Bremwax and
 United States Cenaug.
This trade, although small and lrregular, and apparently from this exhibit not Increasing in -alue, in very favorable to the United States, as la shown by the exceas of exporta to over the imports from Honduras.
Hone or Elone-mlate. These are various slatystonen wrought into the form of atraight slais, nod used for whetting or sharpening the edges of tools after they have been ground. They conslat chlefly of the following: 1. Norway rag-stone, the coarseat variety of the hone-sintea 1 it gives a finur edge than the sandstones. 2. Charnley forest stose, which is ueed as a eabetitute for Turkey eil-stone. 3. Ayr stone, Senteh stone, or alate atone, used for polishing marble ans copper plates, but the havder kinds for whetstones. 4. Jdecall or Hielsh oildstone, nned for small articles of eutlery. 5. Deconshire oiletone, for sharpening thin-eilged broal tools. 6. Cutlera' green-stone, from Snowdon, which is very hatd and close, and is uned for giving the last edge to lancets, ete. 7. German razor-home, ned almost entirely for razors. It is obtained from the slate mountaing near liatisbon, where it forms a yellow veln in the blue slate. It is anwn into thin slala, and cenented to a slab of slate, which norvea as a support. 8. Blue poliahing stone, a dark niate of uniform texture, used by workers in nilver and somo ©ther metals, for polishing of the work. 9. Gray poliching zt:one, somewhat coarser than the biue. 10. Welsh clearing atone, a soft variety of hone-slate used by curriers for giving a fine edge to their broud kniven. 11. Perucian hone, for sharpening large tools. 12. Arkansas atone, from North America. 13. Bohemian stoncs, used by jowelers.
I urkey ci-dome is superior to every other sulantance as a whetstone: it will alirade the lurdest ateel, and is aufficiently compact to reniat the pressure required for sharpening a graver. The lhack variety is somewhat hanler than the white. Theso stones are imported from Turkey in irregular masses, seldom exceeding three inehes sauare, and ten inches tong, nond are cut up hy meana of the lapidary's plitting-mill and din-mond-jowder, then rubled smeoth with sand or omery on an iron plate, inlsld in wood, and secured by ginzier's putty. Sperm or neats'-feot oil, or nome oil which doea not readly thicken, thonld be used with them. Oii-stone powder is used fo: grinding together the lirass or gun-metal fittiogs of mathemutical inetruments, and alao instead of pumice-stone for polishiug superior lirasa-work.
The following analysea throw an interesting light on the nature of prolishing-stones:

Eoney (Du. Honig, Moming; Fr. Mid; Ger. Homig; It. Mele; Lat. Mel; Itus. Mril; Sp. Miel), a vegetahle juiee collected by bees. "It suries according to the nature of the flowers from which it is zollected. Thas, the heneys of Minora, Narionne, anil England are known by their flavorn; and the heney prepared in different parts even of the mame couptry differs. It is seperated from the comb hy dripping and by expression: the first method afforde tho pnrest sort; the second separates a lesa pure honey; and a ntill inferior kind is olitained by heating the comb before it is pressed. When oltalned from young hires, which have not swarmed, It is denominated virgin honey. It is sometimes adniterated with fiour, which is detected by mixing it with tepid water: the honey dissolves, while the flour remains nearly unaltered.' - Tnoxgox's Dirpensatory.

Honfleur, a nen-port town of France, Department of Calvadon, and arrondissement of Port l'Eveque, on the southern shore of the entuary of the Seine, eight mlles south-east of Havre, with which it has regular steam communication. The town is old and ill built. The harlor is accessible only at hikh water, and is chiefly frequented by fishing or small coasting craft. The herring, mackerel, and whiting fisheries are actively prosecuted; nnd numerous vessels sail amailly for the cod, whale, and seal fisherien. Hunfeur sends weekly to Fiagland alout 7000 dozen of eggs, besides butter, .ruit, etc. Its commesca, formerly couriderable, has boen almost entirely abisorhed by liwre. The chief manufactures are hosiery, lace, chemieal proluets, and hantware. There are ulso ship-luilding: ynals, rope-walks, and saw-mills. The chapel of Notre Dame de Grace, on the hill alove the town, is mueh frequented hy sailora, and filled with their votivo offerings. Population 9380 .

Hong Kong, a minall island, now a British culony, lying off the const of China, at the mouth of the Canton River, about 40 miles enat of Macao, in lat. $22^{\circ}$ $16^{\prime} 30^{\prime \prime}$ N., long. $114^{\circ} 14^{\prime} 45^{\prime} \mathrm{E}$. It is alout nino miles In length by eight In liceadth, and is spparated from the main land thy a narrow atrait, varying from less than a mile to four or five miles in wilth. The a ${ }_{j}$ pearazce of the istiand is barten and unprepossessing. It consist, for the most part nf ram.es of rocky hills, rising sometimen to the height of 1700 or 1800 fect alove the eca. The highest peak is $1 \times 25$ feet in height. There are no trees of any size on the island, and few valleys of any extent. The rocks of IIong Koug conaist of granite intermixed with gnartz, mics, and felspar, affording excellent materials for buiding. Among the vegetable productions of the island are mango, llehee, longan, orange, pear, rice, aweet potatoea, and yams. A small quantity of tiax in grown and prepured for houselold uses by the villagers. Since the occupntion of the island hy the English, the potato of Europe and the fruits of Canten and Macno have been latrolluced, and, lately, many European seeds have been sent out. The land-tortoise, a few small deer, and armadillos, and several kinds of snakes, are found on the island. The elimate of liong

Kong, like that of Mscao, is not generally unhealthy, though from the numerous deatha that occurred in 1842 snd 1843 , this was supposed to be the case. Subsequent years, inowever, have shown that the climate here is no more prejudicial to health than that of various other eastern tropleal posesestions. Hong Koug' was lirst coded to Britain in January, 1841, and again by the treaty of Nankin, in August, 1842. The goverament is administered by a governor, sided by an executive council of three members, Ineluding the communier of the troops. There is also a legleiative council, prealded over by the governor. The government offlces are at Vletoria. The following talle exhibits the progress of Hong Kong from 1848 to 1358, tnclusive:

| Y ante. | Populalion, ex. eluatre of troepo | Revenue. | $\|\underset{\text { grahi. }}{\substack{\text { Parliantant }}}\|$ | Espomillure.' |
| :---: | :---: | :---: | :---: | :---: |
| 1848 | 21,614 | £25,091 | \$20,0(0) | 2622,659 |
| 1849 | 29,007 | 93,617 | 25,000 | 88,286 |
| 1880 | 88,298 | 29,595 | 20,000 | 84,814 |
| 185 t | 82,983 | 28,721 | 15,500 | 84,115 |
| 1859 | 87,058 | 21,381 | 12,000 | 84.765 |
| 1843 | 89,017 | 24,700 | 9,200 | 84,418 |

With referenca to these six years, the governor romarks," that the call on the home goverminent for a partiamentary grant has been reduced from $£ 25,000$ to $£ 8500(£ 9200)$ ) for the currrent year ; that the expenditure has been reduced from $\mathbf{L}^{\prime} \mathbf{C 2} 2,658$ to $£ 36,418$; that the number of square-rigged vessele frequenting the poirt has lucreased from 700 to 1103 , while the tonnage is neariy double; snd that the population has in like manner alvanced 82 per cent. drring the part six years. In conclusion, I have no suaitation in maylog, that were this colony taxed in the same way ns are the settiements in the Stralts, under the government of the East india Company, it coald in a year or two be made to pay its own expenses without the efficiency of the government being impaired."-E. B. See IIunt's Mer. Mag., x., 459.

A parliamentary document relating to IIong Kong has lately been printed, which posseases considerabte interest, as it describes the exact position and prospects attained by the colony ahortly before the breaking out of the war. It conslsts of a dispatch from Sir John Bowring, Inciosing a copy of the last annual report minde to him loy the Colonial Secretary on the progress of the island. It appears that the place has benefited not only by the increase of the Chinese trade during the past few years, lut by the effects of the rebeltion in promoting emigration from Canton. A censequent improvement was observable in the character of the Chincse popuiation; and many of the natives, growing in weulth, had also grown in respectalility. The lncreasing disposition to settle on the laland was Lannifested especiaily among the better class of traders; and the generat tendency to prosperity was further stimulated by many of the chief commerchal houses in China, both British and Angerican, having lately mule Joag Kong their central point of estahlishment. "The development of steam navigation," it is said, "the rapid extension of trading relatlons with Australia and Califorina, the increase of trade on the coasts of Chinn, the oprening of Slam, and tho security which the flag of Great Irituin offers against piraticai uttacks, nee among the causea which hive led to these results." The popuintion, which in 18.18 \%as oniy 24,000 , amounted, at the beginning of 1856 , to 72,600 . Owing to the happy fact of the absence of any' castom-house, there are no means of furnishing statistical detnlla of the imports and exports, but the signs of nn active and rapitty-increasing trade were everywhere visibite, and were corroborated by the rate of interest heing as high as 36 per cent. per anmam; although the latter circumstance is partly to be attributed to the comparatively needy ondition of the smull Chinese tralers. The goverument-house has just been completed, ut a cost of $£ 15,000$, and many other public Improvements wore
in progress. Althongh the exlating jall buildiags are pronounced totally inadequate, it was only because lar. cenies and petty offenses had incressed with the influx of popalation, crime of the more serious kind belng rare. The impression as to the unhealthiness of the oolony seems to be disappearing| and notwithstanding the large lncrease in the number of inhabltants ln the year 1855 , the town of Vlctoria was found very favorable for forelgners. The Chinese constder the place not unore inimical to heaith than the towns on the main land. Many improvements remain to be effected, which would doubtless add much to its afety; but the revenue, even at its recent rate of increase, would admit only of moderate undertakings. To meet all requirements, the Colonial Secretary revlved a suggestion for the finjosition " of a differential duty of, say, 1d. jer lb. on teas ahipped for Erggland from Hong Kong." Sir John Bowring, bowever, In harmony with the views now universaliy established among comuncrial men, declined to support the recommendation.
Eoniton, a munleipal and parifamentary borough and market-town of England, county of Devon, near the left bank of the Otter, 16 miles north-east of Exeter. It consiats of one wide and well-paved strect, along which runa a small atroam, supplying the town with water. 'The houscs have generally a neat and respectable appearance, having been mostly built since the destructive flres of 1745 and 1765 . The parish church, about half a mite from the town, was built by Courtney, Blshop of Exeter, alout 1482, and is remarkable for a curiousiy earved sereen. A modern Gothic church stands in the centre of the town. It has a free grammar school, nutlonal achool, hoopital, and several charitles. The serge manafacture was formeriy extensively carried on herc, bat now its chief manufuccure is IIouiton luce. IIoniton is governed by a portreeve, and returis two members so Parifunent. Population in 1851, 8427.
Honolulu, or Honoruru, the principal town of the Sandwich Islands, and the residence of the king, is situated on the aouth side of the island of Wouhoo, in iat. $21^{\circ} 18^{\prime} 1 x^{\prime \prime} \mathrm{N}$., tong. $157^{\circ} 55^{\prime} \mathrm{W}$. It forms an entrepot for Kuropaan and Indian goods, whence they are reshipped to America. It is also a general rendezvous of wheling veskels; and sometimes 80 sail of them, each from 300 to 500 tons, are at anchor here together. In 1851, 446 merchant ships arrived at the port ; in 18i22, 235 ; and in 1853, 194. The inports in $1 \times 53$ anounted to $\$ 1,240,976$, and the exports to क27: 2,588 . Popuiation alout 7000 . See Sandwici Islanisg.

Eooghly, an extenalve district In the provinco of Bengat formerly calted Santgong, situated principally between the $22 d$ and $23 d$ degrees of north latitude, and extending a cousiderable distance along the right bank of the River llooghly, It is bounded on the worth lyy the district of thiriwan, on the south by the district of Hidjelee, on the east lyy the River IIooghiy, and on the weat by Midnapoor. This district conslats of low flat land, very fertile; but that part whleh is nearest to the sen la very thinly inhatited; it is called the Sunderbund, is swampy, covered with wool, and renurkably unhenlthy. The right of the East India Company to the diatrict originated in the treaty concluded with Meer Cosin in 1760.

Houghly, an anclent, and formerly a large town in the province of Ilengai, situnted on the western bank of the lionghiy, nearly 26 miles above Cuicutta, and supposed to have been founded hy the lortuguese about the year 1538. During the Mogul govermment, it was a town of great consequence, being the port of the western arm of the Ganges, where the duties on merchandise were coltected. It very soon drew away all the trade from Saatgong, whlch had been before the governusent port of Bental. During the provalence of the l'ortuguese dominion hu India, IIooghiy wus for-
tifed, and continned to fouriah till the year 1632, when It was atfacked by order of the emperor Shah Juhan, and, after a siege of three monthe and a half, wan taken by the Mogul troops, 1000 of the Portugueee belng killed, and 4400 men, women, and children, taken prinosers. From thin period Hooghly became the imperial port. After thla perfod every encouragement was given to commeree ; and Hooghly, whleh wat called Bukhshy Bunder, become a great commerclal emporium between Europe, Pereia, Arabia, and India. In 1686 hostilitien commanced between the Finglish and the Nawaub. An actlon enaued, in which the Nawanh's tmope were defeated! and at the mame time the town of Hooghly was cannonaded, and 500 houses hurbed. In 1700 the Eant India Company's factory was tranaferred from Hooghly to Caleutta. The popnlation of Hooghiy is now estlinated at 12,000 . The town is situate on the line of railroad recently constructed from Calcutta to Burdwan. E. long. $88^{\circ}$ $22^{\prime}$, N. lat. $22^{\circ} 54^{\prime}$.

Hooghly River, properly the Bhagirutty, a river of Bengal, formed by the junction of the two westernmoat branchea of the Gangea, the Cosalmbazar, and the Jellinghy. Thla is the port of Calcutta, being the only branch of the Ganges that la navigated by large vessels; yet the entrance to the river in renilered extremely dangerous and dificult, by reason of numerous sandbaaks in It, which are frequently shifting. There is indeed a rumor sfloat that the river is gradually sliting up, and must oventually ceane to be navigable. This would prove a fearful lifow to the trade of Caleutta, and the proposed reinedy is to connect the Itiver Mutwal with the capital by railway or ship canal. During the prevalence of the nouth-west nionsoon, when a atrong current seta in from the lhay of Bengal, the extruordinary phenomenon, terined ly Furr pans the "liore," occasionally presents Itself. It rises in waves 12 or 15 feet high, and rushea in at the rate of 20 miles an hour. It commences at llooghly I'oint, where the river first contracts itself, and is perceptille above llooghly town; and though the distance is above 70 miles, it traverses this space in about four hours, running along the opposite bank to the Calcutta side, whence it crosses at Chitpoor, about four miles atrove Fort William, and rushes with great vilolence past Barnagore, Duckingsore, etc., frequently oversetting boata and driving shlpa from their anchorage. At Calcutta it sometimes occaslons an instantancous rise of five feet: The tide does not rise more than 30 miles alove Calcutta; and during the rainy season its influence is chacked by the large borly of water that comes down the river. The liooghlycontains several kinda of good fish, particularly Cipriwes Anjant, the mango fish, or Polynemuz paradorwa, and prawns ; and it abounifs also in crocodiles and sharks. It is about three quarters of a mile broal at Culcutta, and 8 or 10 miles whide at the mouth. It is only mavigable for ships as high as the tide reachen, and the upper part of it is nearly dry during the hot aeason; yet there are few rivers that can hoant of a more extennive commerce, its banke beiag studded with numerous towns and villages. It is esteemed hy the Jlimiloos to be the nost nacred liranch of the Ganges, and it is on this account that those who can not afford to bury their deal throw them into the Hooghly.-LF. H. See ('ascutra.
Hookah, an oriental plpe used chietly in Turkey, by which the smoke of the tobacco is made to pass through water in order to cool it and render it more grateful to the mouth.

Hoorn, a fortified mea-port town of Helland, province of North llolland, on the Zuyder-Zee, 20 miles north by east of Amstemam. It carries on a considerable trade, though in this respect it is mach inferior to what It once wan. The exports are chlefly butter, cheese, cattle, herrings, and other kinila of provisions. The manufactures compriee woolen clotha, carpets, etc. Ship-bullding and the herring fishery are exten-
aively carried on. It has a naval collage. Hoorn was the birth-place of Schonten, who in 1616 discovered Cape IIorn, and named it after hia native town and of Tasman, the diecovarer of Van Dleman'e Land and New Zealand. Population about 9000 .
Eope (Ger. Hopfen; Du. IIoppe; Fr. Houblon; It. Isappoli, Bruscandoli; Sp. Oblon; Rus. Chmel; Lat. Humudus Lupulua). The hop in a perennlal rooted plant, of which there are several varietles. It has an annual twiolng atem, whlch, when aupported on polea, or trees, wlll reach tha helght of from 12 to 20 feet or more. It la a native of Britain, and moat parts of Furope. When the hop was first used for preaerving and inproving beer, or cultivated for that purpose, is not known; hut lts culture was introduced into Eingland from Flanders In the relgn of Merry VIII. Jiope are first mentloned In the Statute Book in 1552, Filward VI. I and It would appear from an act passed in 1603 that hops were at that time extensively cultivated In England. Walter Bithe, in hls Improver Ime proved, published in 1649, has a chapter upon linprovement by plantations of hops, in which there is this striking passage. Ife observes, that "hops were then grown to be a nutional commodity; but that it was not many yeara slnce the famous city of London petitioned the l'arilament of England against two nuisances; and these were, Newcastle coals, in regaril to their atench, etc., and hops, in regard they would njoyl the taste of drink, and endanger the people; and hal the l'arliament been no wiser than they, we had been in a measure pined, and in a great measure starved; which is just answerable to the principles of those men who ery down all devices, or ingentous discoveries, as projects, and thereby atifle and choke inprovement." After the hops have leen picked and dried, the lirightest and finest are put into the pockets or tine bagging, and the brown into coarse or heavy bugging. The former are chietly used la the brewing of tine ales, and the latter by the porter brewers. A pocket of hops, if they be good In quality, well cured and tight troblden, will weigh about 11 ewt. ; and a bag of hops will, unier the anme conditions, weigh alwout 2f cut. If the weight of either exceeds or falls much short of this medium, there la reason to suspect that the hops are of an Inferior quality, or have bern thadly manufactured. The brigliter the color of the hops, the greater is the estimation in which they are helid. Furnbam hops are reckoned best. The expense of forming hop plantations in Great llritain is very great, amounting In some instancen to from C70 to 4100 an acre; and the produce is very uncertain, the erop being frequently laqufficieut to defray the exprenses of cultivation.

Accorling to Anderson's Anmala of Comamerre, hops were intronluced from the Netherlunds inte lingland A.II. 1021, and were used in brewing; but the physicians having represented that they were unwholesome, J'arliament was petitioned againat them as leing a wicked weed, and their use was prohilited in 1508. At prenent there are between 50,060 and 60,000 acres, on an average, annually under the cult e of hops in England. They are grown chlefly in I' eforl, Kent, and Worcestershire.-Mavins.

Hops produced in the L'nited States.-A gratifying Increase has taken place in the culture of this useful article. The gain has been nearly 206 per cent. At. most the whole of the increment, however, has treen In the State of New York, which, from less than half a million of pounds in 1810 , now produces more than two and a half millions, which exceeds tive sevenths of the whole crop of the Linited Staten. In connertion with this circumstance, it may be mentioned that New York also stands foremost in the production of ale, beer, and purter, in the manufacture of which the larger part of the hops ralsed is consumed. The breweries of this State produced 615,000 harrels of ale, etc., in 1850 , belng more than a third of the quantity
ald to Office $R$ artlelen
asid to be prodnced in the whole Union. See Patent Office Rep. U. A.; Hunt's Mag., xiv., 395. See aiso articies Ale and Bern Brewing.

Horizon ( $\delta \rho \iota \zeta \omega, I$ bound), the plane of a great eircuit which diviles the upper or visible from the lower or luvisibie hemisphere. See Geoonapity.
Horn (Du. Hoorn; Fr. Corne; Gor. Ilom; Lat. Cornu), a substance well known to manufacturers. Horns are of very considerable importance in the arts, being applied to a great varioty of useful purposes. They are very extensively used in the manufacture of handies for knives, anil in that of aponss, combs, ianterna, anuff-boxes, etc. When divided into thin phates, horns are toleralily transparent, and were formcriy used inatead of glass in windows. Glue is sometimes made out of the refuse of horn.
The projecting weapons on the head of the ox, the sheep, the anteiope, and the rhinoceros, consiat of a sheath of horn on a core of bone. Horn is composed chiefly of coaguiated nibumen, gelatine, and a amall portion of phosphate of iime. It is ossentialiy distinct from bone and ivory; the antiers of the atag, atthough sonnetimes ealied horns, consist entirely of bone. Moditications of horns may be noticed in the scaies of the armadiiio, the piate armor of the tortoise, the spines of the porcupine and hedge-hog, the quilis of birds, and the hoofs, claws, and nails, of animals. For manufacturing purposes, the horns and hoofs of the buil and cow are in request, and there in a large import of these from South America, southern Afriea, and from Russia. The horns of the tison and buffilio, the chamois and the antelope, are used for the better kinds of work.
The manufacturer firat detaehes the horn from the bony core, by macerating the horn in water for a month or six weeks, when the membrane ly whien the horn is sttached to tho core putrifles and allows the two to be separated. The ash of the cores makes excelient cupels for the assay of goid and silver. The solid tips of the horn are sawn off, and nre used for handies for knives, for buttons, ete.; the other portion of the horn is cut into short lengthe, or souked whole in boiling water, or heated at a fre, the effect of which is to soften it, and aliow it to to spread out necriy tat. The fluts are next pressed between warm and greased iron piates, the pressure varying according to circumstances. If intended for lanterns, the pressure is continued until the hom separntes into distinct plates; these are placed on a board eovered with hide, and seraped with a knite having a wire edge. Some of the
ahavings which come off are nomotimes dyod and cus into various forma, and are so eensitive at to ourl up by the warmth of the hand. They are sold at toyehops under the name of "apnaitive leavea." After the seraping, the sheete of horn are polished with a woolen cloth dipped in charcoal dust and waler, next with rotten-atone, and lastiy with horn ohavings.
The effect of heat and pressure on Ilght-colored horn is to render it transparent; but most of the articles made of horn are coiored artiftciaily by boiling the horn in infusions of coloring matter. If the horn be intended for combs, the pressure mast be moderated, or the teeth will be brittie; if intended for drinking cups, the horn is cut into lengths, ecaided, roasted, and motded in a cone of wood, and a wooden plug ia driven into it for pressing the horn Into the required shape. After this, the cup is turnod and polished at the fathe, and a groove is cut to receive the bottom; this cut out of a flat piece of horn by means of a crown saw, and the bettom of the cup having heen eoftened at the fire, the disk is forced into the groove, and the horn contracting in cooiing makes a water-tight joint. For knife-handle and simiiar warka, the horn is cut neariy to the required form, and is moided in dies with the assistance of heat and a powerfui acrew-press. The work is finished lyy scraping and buffing with Trent sand and oil, or rotten-stone and oil. Horn is sometimes used ав в vehicle for applying polishing powders to the flat works of the watchmaker. In the Great Exhilhition of 1851, there were sundry small artieles of chamois horn, consisting of brooches, shirt-buttons, rings, and watch-keys, by a Swiss exhititor; there were also some transparent horn psintings from Hamburg, and a pair of poliahed ex-horns from Port Natal, with the head complete, masauring from tip to tip 8 ft .4 in ., and 21 in . circumference. The best coliection of artielea in horn-work was, however, from Turkey.-E. B.
Horn Manufacturen. Horn is employed for all the purposes of tortoise-sheil ; and its much greater chenpness gives it a more extended application. Knife-handies, buttona, umbrelia-handies, whip-tops, beli-puiss, driwer-knobs, sides of ianterns, and comlis, are among the numerous articles made of horn. For the larger huik of these manufacturas in England, oxhnrns are chiefly used; but those of the ram, the antelope, the buffalo, the deer, ete., are employed for special purposes. To ahow how enormoua the conaumption nust he, it is aufficient to dtste that Liverpool imported, in 1850, no less than 120 tons of buffulo tips, 200 tons of buffilo horns, 280 tons of deer horns, and 700 tona of ox and cow horns. Horn is brought into manufactured forms by processes bearing some analogy to those employed in the gutta-percha mannfacture, by heat and mnisture; a higher temperature being, howover, required for the horn.

Horn, or Hoorn, Cape, commoniy considered the southern extremity of America, is not a part of that continent, but the moat southeriy point of a small ixfand of the Tierra dej Fuego group. S. Iat, $56^{\circ} 58^{\prime}$ $40^{\prime \prime}$, W. long. $67^{\circ} 16^{\prime}$. It consists of a lofty, precipitous, bare black rock, running far out into the sean; and was formerly considerod dangerous to pass on account of the strong westerly galos that prevail in its neighborhood during aummer, bat as those are reatricted to the vicinity of the eape, vessels avoid the difficilty ly saiiing in a higher latitude. It was discovered in 1616 by tho Dutch navigator Schouten, who named it after his native town, lfooru. Seo Care houn.

Horse-ohestnut. The horse-chestnut is a tree of the fargest size, with an erect trunk, and a pyramidal head, sometimes attaining a height of 90 or 100 feet. Tho leaves are large, of a deep green, and singularly interesting and beautiful, when first developed. When inclosed in tho lind, they are covered with a puboscence, that fulls off, as they bocome expanded, which
occurs sooner or later, accordlug to the dryness or molstness of the season.

Geography and History,-Tlis nstlve country of the common horse-chestnut, Mr. Royle observea, "is yet unknowa, thongh stated in some works, to be the north of Inda." He says that he never met with It, though often visiting the moיntains of that country, where, if anywhere, It was likely to $b-$ found, and where the Indian horse-chestnut was fuund in abundance.
According to M. Hon do Saint-IIlaire, the hersechestuut passed from the mountains of Thibet to England in 1550, and thence to Viennn, by Cluslus, and afterward to Paris, by Bachelier. It is also stated by Clusius, In his " Rariorum Plantarum IIistoria," that there was a plant of this species at Vienna, In 1588 , which had been brought there 12 years before, lut which had not then toweres. It has also been auld that this tree was first raised in Franoe, from seeds procured from the Levant, in the year 1515 , by one Bachelier. Iarkiuson, in 1629, says, "Our Christlan world had first a knowledge of it from Constantinople." The same author placed it in h!. wehard, as a fruit-tree, between the walnut and the mulberries. We afterward find it mentioned in $\mathrm{J}^{3}$ ' on's edition of Gerard's "Herbal," in 1633, as thes or , "ng in Mr. Tradencant's garden, at South Lambetit. From this period till the time of Millet, it appears to have attracted great attention, and uequired a high reputation as an omamental tree, as he represents it in 1731, as being very common in Fingland, and extensively empleyed in the fermation of avenues and public walks.
The wool of the horse-chestnut is white und very soft, and according to Louden, when dry, welghs from 35 to $\mathbf{i z}$ ponnds to a cubie foot. It is untit for use where much strength and durability in the open air are requircd; nevertheless, there are muny purpeses for which it is apllicable, when sawn lnto bourde; such as for tlooring, lining to carts, packlng-cases, etc. In France, salots, or wooden shoes, are made from it ; and it is said to be uned by carvers, turners, ete. Houtcher says, that it is suitable for wister-pipes that are to be kept constantly under gromnd; and it is also recommended for this purpose by Du lis utal. The chareosl made of this species may ine nsed f:: the manufacture of ginpowder ; aml the ashes of every $p^{\text {phrt of }}$ the plant, more especially of the fruid, afforil pat-aslı in considerable quantity. The bark, which is rery litter, is employed for taming, and also for dyeing yellow ; and it has been used mediejnally as a subsstitute for lesult's lark. In Turkey, the nute nre ground, sud mased with horse-fonk, espechally when the animals ara broken-whoded; and in their crude state, they am raten hy goats, sheep, deer, and hogs. They are used in Ireland to whiten linen, and for thas purpose are rasped Into water, in which they are allowed to macerate for some tloe. The sapronacous juice whid they contsin is very useful, not onl:" In beaching, but in washing linens and other atiffs. The nute must be peeled and gromal, and the tiour of twenty of them in sullicient for ten puarta of wator; and either linens or woolena may be waslied with the infuxion, withent nus soalp, as it effectually wralicates whots of sll kinds. Tho clothos, howeser, should afterward the rinmel lin clean water. The nuts, when gronnd into thor, and mixed in the propurtion of an thir I with the flone of wheat, are aid to and to the strength of luaktimimer's pante; and when atereped In loot water, and mixal with an equal proportion of bran, it maker n antritions fored for filpa and peulery. M. Vergand han proposed to change the ntarch contahad in the flens, futo angar, and ufterward emplay it in dietillathen.-lhaw xe:'s Tress of damerion.

Horme (lier. lyord; lu. jurard; Da. Hest; Sw. Must; Fr. Cheral; 1t. C'arallo; Sp. C'uballo; liua. Rosehoul; lol. Kon; lat. Kiguts; tir. 'Itros), a domeatic: quadruped of the highest utility, being by far
the moat valuable acquieltiou made by man among the lower animals. The people of Theasaly were excellent equestrians, and probably were the first, nmong the Greeks at least, who rade upon horses, and broke them in for service in war; whence arose the fable that Thessaly was originally Inlinhited by centaurs. And Suloman had 40,000 stalls of horses for hls ehariots, and 12,000 horsemen.-1 Kings, iv. 26. The power of the horse is equal to that of five men.-Smk. ToN. A horse can perform the work of alx men.llosauft. The Greeks and Romans had some covering to secure thelr horses' hoofs from lijury. In the 9th century, horses were only shod in the time of frost. The practice of shoeing was introduced into Fingland by Wlliam I., 106t. In England there are $2,000,000$ draft and pleasure horses, and $100,000 \mathrm{ug}$ rleultural horses, which consume the proluce of 7,000 ,000 arres. The horse-tax was imposed $\ln 1784$, and was then levied on all samille and coach horses in England. The existhg duty upon " horses for riding" only, in England, amonnts to nhout $\mathbf{E 3 5 0 , 0 0 0}$ per year. -llaxinn. It may be fairly estimated that there ure in Great IBritaln from $1,400,000$ to $1,400,600$ horses employen for various purposes of pleasuro and utility. They mar, prolably, he wortis at an average from f 10 to $£ 12$, raking their total value from $£ 13,000,000$ to $E 16,800,000$ sterling, exclusive of the young !omses.

In the United States, there were, in the year $1 \times 50$, $4,355,358$ horses, the largest numbier ( $(1661,001)$ being in the State of Ohio. Sce Censtes llfport $C$. S. Sice alno, Unimed Statis, live Stuch of; Living Agr, x., 305 , xxi., 411 ; Quar. Ree., xxviii., 26. The most reliable und valualile work on the horse, is by liank Fohestin, 8vo., New York, 1857.

The first animals brouglit to America from Fiurope were inported liy Columbus, in his second voyage, in 1.193. Tle left Spuin sa admiral of 17 ships, iringing a coliection of European trees, plants, and seeds of various k!nds, a number of horses, a bull, and sever.l cows. The first lurses brought into nny part of the territory at present embraced in the United States, were lumed at Florida, ly Cabeça de Vaca, in 15: 7 , 12 In number, all of which perished or were otherwise killed. The next lmportation was slso brou.ght to Florila, by De Soto, In 1539; whieh consisted of a Inrge number of horses and swine, among which wers 13 suwn, the progeny of the latter soon increasing to several hundred. Tho principal breeds of horses, adaj ed for spectic purposes, in the middle, northern, and wentern stater, are the Norman, the Camadian, the Morgan, the Conestoga or l'ennsylvanian, the Virdmina, and the Kentuckian. For carriages of heavy dranght the Comestogas are regarided ly mamy an the best. For the saddle, Iranglit, and wether uncful purposes, the Morgans are highly prizen, poperially In New York. For roadsters, the Nomann and t'anadimns wre frequently sought. For Howl, the Virginhus and Kentueklans generally take the dead.

Horse Latitudes. On the pilar sinde of the zomes of colus, bordering the north-east trale-winds on the north, and loonlering the south-east trate-winds on the solth, there is a broad hand extendiag ip into the polar regions, the prevailing winds within which are the opposites of the traile-winde, viz., sumbli.west in the nurthern und north-west in the menthern hemiaphere. The equatorlal edge of thene calne helts is near the tropiea, and their average be mith is $10^{\circ}$ or $12^{\circ}$. "th one shle of these belts the whuls blow pro petunlly towar! the equater; on the other, their pres valling diration ba toward the prome. They are called the " horse latitudes" by seanen. "!use calin zunes vibrate upand dewn with the trade.wind zones, partaklog of their motlons, nud following the declination of thin sun. Aloing the polar lurilers of these two calm lielts (\$ 190) we have another region of precigitation, thougn generaly the ralna here are nut so cunat int as they are in the equatorial rallus. The

preclpitstion near the tropical calms is nevertheless sufficient to mark the seasons ; for whenever these calm zenes, as they go from nerth to sonth with the sun, leavo a given pirallel, the ralny season of that parallel, If it be in winter, is sald to commence. ilence we may explain the rainy season in Chill at the south, and In Culfornia at the north.-Maury's Phys. Geog.

Eorse-pnwer, n unit of force introduced by Watt to enable him to determine what size of engine to send to his customers to supersede the number of horses which the new power was to replace. Watt ascertained at one of the London breweries tha: the average furce exerted by the strongest horse was anfficient to ralse $33,000 \mathrm{lbs}$. one foot high in a minute thus, un engine of 200 horse-power would be a force equal to that of 200 horses, each lifting $83,200 \mathrm{lbs}$, ons foot high per mhate. Wstt had two methods of eatlmating and comparing his engines-viz., by the pover, and ly the duty. By the power is mesnt the quantity of work which an engine cen effect in a given time ; ly the duty is meant the quantlity of work which it can effect by a given expenditure of fuel. Now, it is evident that whout any change in the size of an engine, but simply ty increasing the pressure of the steam, the power of an engine may be greatly in-creased-that is, the lond remaining constant, the speed of the plston may be increased, the munber of strokes may bo luereased, and, consequently, the work done per minute will be increased niso. Hence it is difficult to apply a limit the power obtninable from the sma!lest cylinder, provided the boiler be large enough to evaporate the Increased quantity of wster, and strong ennugh to resist the increased thrsting pressure, in fact, no size of cylinder can be reckened as having a particular yower, since the power depends not on size bit ois strength. Nevertheless in modern enginearing the term horse-porer refers mather to the elae of the eylinder than to the power everted, and the value of the unit has undergone many changes; so that in n modern engine, a horse-power may inply $52,000 \mathrm{lbs}$., or $60,000 \mathrm{lbs}$, or $66,000 \mathrm{It}$. , one fort high per minute. The plan now adopted for ascertaining the performances of different engines $t=\frac{b}{}$ an instrument ealled an irdicator. This consists of a small eylinder fitted with a piston, which is pressed down by a apring. By the height to which this piston rises against the spriag the steim pressure within the cylinder of the engine is indicated ; and the number of puands pressure on the square ineh muitiphled inta the number of square inches In the uren of the cyllnter, and by tho number of fect traveled through by the piston per minute, gives the impelling power ; deduct in large engines about one tenth for friction, and the remalnder is the effecient moving power, which, divided hy $: 33,000$, gives the actund horse-power.- I. Is.

Hospltal, Hospitale, in cloisters, the place of shelter for strangers, whether rich or peor; thus equivalent to our hetel, the Xenowlocheion of the Cirreks, the Hoapitium of the Romans. The horpitalia of the lomans correnomi vith our inus. They were small erections on the right and left of the main bonse. In Greefe, "persin who bad dume any great public serviec might he rewarlod with money and provisions, hit be required tu look afier a jutare of atoole himself. Dearing some resemblituce to our present hospitala were the publie bulldings for the aged women of Delos, buitt on the lsland calleal khone ; and thore huiltings which, at n later perion, were erected near the templo of Nisellapius, for slek persons coming in mearch of lowalth. It was possibly a similar Institution which Antonius huilt at lipidaurus, Another appears to have existed on the island of the Tiler nt llome, to which sick slavea were brought to be healeal. Rethesin (house of mercy), with flve porchen, was a place lit Jernsalem to which the slek were brought to await the moving of the waters.

Also the Taberna .Meritorum at Rome appears to have been a hospital for linvalids. Hospitals for the poor and slek are prominently characteristle of ChristianIty. So sarly as the Counell of Nice, A. D. 325, they' are spoken of as commonly known. The first celebrated hospital was that of Cessarea, A. D. 370-880, rlchly endowed by the Emperor Valens. It was of immense dimensions, After it followed the hospits! of Chrysestom, at Constantinople. In the ninth century theie were 24 hospltale in Rome alone. A foundling hespital was first established at Mitan, A. D. 787 ; a lazaretto about the same time in Constantinople; and an orphan hospital in the same eity, A. 1, 1090, by Alexluy I. LIespitals are now unlvereally established in all parts oi Christendom, and appropriatel for nll elasses of the community, snd for all kinds of diseases. See Ghemenicit Moarital. See Living Age, xviil., 174; F'raser's Mag., xxxvii., 539 ; Dublin Unir., vil., 222.

By the laws of tho United States, foreign seamen arriving in the Unlted States pay each 20 cents per month to the collector of the port, as hospital money, snd pay 25 conts per day when in hospitals under medical treatment. Marine hospitals are crected by the United States at New York, New Orleans, Boston, aud other ports, for the accommodation of disabled and sick senmen, under the supervision of the Treasury Department. For disabled raval officers and seamen, navy hospitals have been erected at Philadelphia, Ilrooklyn, N. Y., Norfolk, and other sea-ports, supported by grauts by Congress, and from contributions of one ration per day from each inmate,-Duniap's Digest Lates U. S., 320,441 , 822.

Houssa is the name of an extensive portion of Central Africa, which, along with Bornou, bears the general name of Soudan, or Land of tho South. It conslists of varions petty kingiloms or states, which oceupy territory stretching enst and west from the upper course of the Yeon nearly to the Niger, the boundaries of which on the south, and notth, and west have now for the first time heen determined by Dr. Barth, This region nppears iu sevoral respects to he superior to the countries on either side of it. It is less sultry; an mbantage which it probably owes to its higher clevation. The faco of the country bears marks of greater enltivation, the fiolds being covered with large crops of several kinds of Indian corn, two of which are nnnually produced; and, to prevent the grain from teing destroyed by iusects, it is secured in granaries ralsed on poles. 'The soll is well watered by the Rivers Sokoto, Marindi, Zyrmle, Bugga, Zoma, uni others, which, with several tributaries, flows west ward to join the Niger. On its eastern quarter it is traversed by the Yeon, and on its southern by the Benueh or Chadia. llesides these natural supplies of water, artificlal irrigation is diligently practipal.

The dominant people in lloussa nre the Fellatas, this country forming, in fact, a considerable portlon of the empire of Sokoto, which again comprises the eastern part of the Fen'ata dominlons.

In the western tanets of lloussa thers are few towns of any importance: some were visited, and lave leen described hy C'uptain Clapperton.
